2000 V AC @ 1 minute (power input to FG; isolated on the power supply module)

FUNCTIONS

■ OUTPUT HOLD or OUTPUT OFF

In normal conditions, the module outputs the signal from the preferred bus A.

When an error is detected, the output is switched to the data from the bus B.

• Output Hold

If both are in error, the module holds the signal and stands by until one of the communications recovers.

•Output OFF

If both are in error, the module outputs -15 % and stands by until one of the communications recovers.

At the startup, it outputs -15 % until the communication is established and normal data is received.

SCHEMATIC CIRCUITRY & CONNECTION DIAGRAM

*1. For dual redundant communication.
 *2. To use shield line, connect it to SLD terminal and ground the terminal 20.
 Note: Do not use void terminals.

• Unused Output Channels

Close across the unused output terminals as shown below.

Unused channels left open are equal to the wire breakdown, which turns the red ERR LED on and sets a burnout flag at the PLC or the host device. Unused channels can be specified and set so on the PC Configurator Software (model: R3CON) without needing to short at the field terminals.
