# 2 SAMPLE LADDER

## 2.1 Standard Deviation Calculation

### Name

Standard Deviation Calculation

### Outline

Standard deviation of the target data for logging can be calculated in ladder.

### Programs used

This program is targeted for FX5U and FX5UC.

The projects used in this program are indicated below.

No.	Project name	Program name	Remark
1	LD-FX5U_CPU_Logging_V100A_E	01_Standard Deviation Calculation	This project is created with FX5U/FX5UC.

### Devices used

The devices used in this program are indicated below.

#### ■Input device

No.	Device name	Data type	Kind	Device comment	Remark
1	M0	Bit	Input	Execution command	ON: The program starts. OFF: The program does not start.
2	M1	Bit	Input	Logging trigger	ON: Trigger present OFF: No trigger present When this device is ON, the logging target device value is input, and the standard deviation and average values are calculated.
3	D0	Word [signed]	Input	Logging target device value	Input the data for the logging target device. [Valid range (DEC)] -32768 to 32767
4	D1	Word [unsigned]/bit string [16-bit]	Input	Number of logging points	Designate the number of points to be logged (to calculate standard deviation). [Valid range (DEC)] 1 to 32768

## ■Output device

No.	Device name	Data type	Kind	Device comment	Remark
1	M100	Bit	Output	Execution status	ON: Execution command ON OFF: Execution command OFF
2	M101	Bit	Output	Normal completion	When this device is ON, it indicates that logging is in progress.
3	M102	Bit	Output	Logging completed	ON: Logging completed OFF: Logging incomplete When this device is ON, the number of points specified with number of logging points have been logged, and the calculation of the standard deviation has been completed.
4	Y0	Bit	Output	Error completion	When this device is ON, it indicates that an error has occurred in the program.
5	D100	Word [signed]	Output	Error code	The error code that occurred in the program is stored. [Error code (DEC)] 10: Number of logging points is out of range.
6	D102 to D103	Single-precision real number	Output	Standard deviation	The standard deviation value obtained from the input data is output as a single-precision real number. A 2-word area is used.
7	D104 to D105	Single-precision real number	Output	Average value	The average value obtained from the input data is output as a single-precision real number. A 2-word area is used.

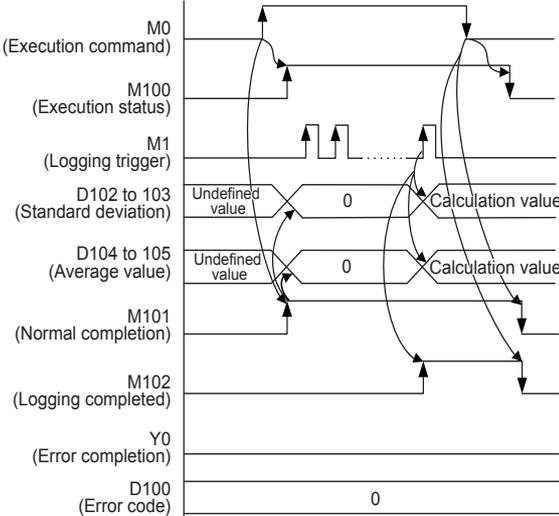

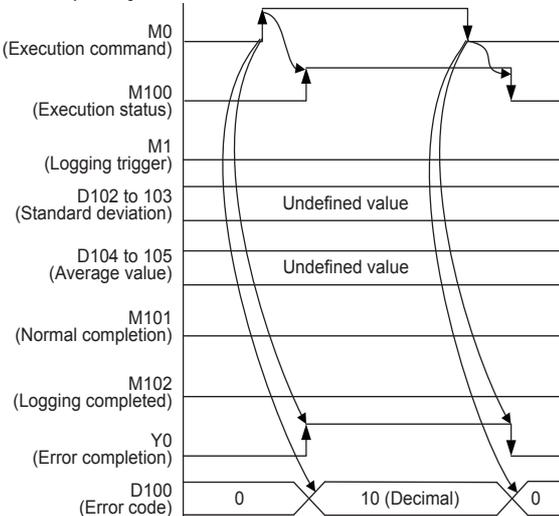

## ■Internal device

No.	Device name	Data type	Kind	Device comment	Remark
1	M200	Bit	Internal	Setting data check command	The setting data check command flag is retained.
2	M201	Bit	Internal	Main process execution command	The main process execution command flag is retained.
3	M202	Bit	Internal	Execution command of process before starting main process	The execution command flag of the process before starting main process is retained.
4	M203	Bit	Internal	Program completed	The program completed flag is retained.
5	M204	Bit	Internal	Main process execution completed	The main process execution completed flag is retained.
6	M205	Bit	Internal	Program error	The program error flag is retained.
7	M206	Bit	Internal	Pulsed execution command	The pulsed execution command flag is retained.
8	M210	Bit	Internal	Calculation execution switch	The calculation execution flag by the logging trigger ON condition is retained. This flag turns ON at each logging trigger ON condition, and turns OFF when the logging target data value has been imported.
9	D50 to D51	Double-word [unsigned]/bit string [32-bit]	Internal	Number of logging points	The specified number of logging points is retained.
10	D52 to D53	Double-word [unsigned]/bit string [32-bit]	Internal	Number of logging data input points	The number of storage points for the logged data is retained.
11	D54 to D55	Double-word [signed]	Internal	For logging data value calculation	This is used to calculate the total sum of the logging data.
12	D56	Word [signed]	Internal	Logging data value	The specified logging target device value is retained.
13	D58 to D59	Single-precision real number	Internal	Total sum of logging data (single-precision real number)	The total sum of the logging data (single-precision real number) is retained.
14	D60 to D61	Double-word [signed]	Internal	Total sum of logging data	The total sum of the logging data is retained.
15	D62 to D63	Single-precision real number	Internal	Square of arithmetic average (single-precision real number)	The square of the arithmetic average (single-precision real number) is retained.
16	D64 to D65	Single-precision real number	Internal	Logging data quantity (single-precision real number)	The logging data quantity (single-precision real number) is retained.
17	D66 to D69	Double-word [signed]	Internal	Results of square of X/N division	The results of the square of X/N division are retained.

No.	Device name	Data type	Kind	Device comment	Remark
18	D70 to D71	Double-word [signed]	Internal	Sum of quotient	The sum of the quotient is retained.
19	D72 to D73	Double-word [signed]	Internal	Sum of remainder	The sum of the remainder is retained.
20	D74 to D75	Single-precision real number	Internal	Sum of quotient (single-precision real number)	The sum of the quotient (single-precision real number) is retained.
21	D76 to D77	Single-precision real number	Internal	Sum of remainder (single-precision real number)	The sum of the remainder (single-precision real number) is retained.
22	D78 to D79	Single-precision real number	Internal	Variance value (single-precision real number)	The variance value (single-precision real number) is retained.
23	D80 to D81	Double-word [signed]	Internal	Square of logging data	The square of the logging data is retained.

## Details of functions

Item	Description
Applicable devices	CPU module FX5U CPU, FX5UC CPU
	Engineering tool GX Works3 Version 1.030G or later CPU Module Logging Configuration Tool Version 1.64S or later
Languages used	Ladder
Number of basic steps	333 steps The number of FB steps integrated in the program varies depending on the CPU module used, the input/output definition, and the setting options of GX Works3. For the setting options of GX Works3, refer to <a href="#">GX Works3 Operating Manual</a> .
Description of functions	<ul style="list-style-type: none"> <li>When Execution command (M0) is turned on, the Execution status (M100) outputs ON to start the logging data standard deviation calculation process.</li> <li>When the input value is incorrect, Error completion (Y0) will be turned on, and the processing will be suspended. The error code is stored in Error code (D100). For the error codes, refer to the Error code (D100) in the devices used.</li> <li>If the input value is correct, Normal completion (M101) ON is output.</li> <li>When the Logging trigger (M1) changes from OFF to ON, the Logging target device value (D0) is imported.</li> <li>If the specified number of logging points is not reached, Logging completed (M102) remains OFF (Logging incomplete). If the number of logged points reaches the specified number of logging points, Logging completed (M102) turns ON (logging completed), and the Standard deviation (D102, D103) and Average value (D104, D105) are output.</li> <li>When logging is completed, a calculation will not be executed even if the Logging trigger (M1) subsequently turns ON.</li> <li>To execute the calculation again, change the Execution command (M0) from OFF to ON, and input the Logging trigger (M1) and Logging target device value (D0).</li> </ul> <p>* Supplement: The standard deviation of the data collected in the SD memory card by the data logging function can be obtained. Refer to <a href="#">Page 9 Methods</a> for linking with data logging function for details.</p>

Item	Description
Timing chart of I/O signals	<p>[For normal completion]</p>  <p>[For error completion]</p> 
Restrictions or precautions	<ul style="list-style-type: none"> <li>• This program does not include the error recovery processing. Program the error recovery processing separately in accordance with the required system operation.</li> <li>• This program cannot be used as an interrupt program.</li> <li>• The usage methods are limited when obtaining the standard deviation of the data collected in the SD memory card in sequence with the data logging function. Refer to  Page 9 Methods for linking with data logging function for details.</li> <li>• The standard deviation and average value calculation results are 32-bit single precision real numbers, so there are seven significant digits. Hence, if the value exceeds seven significant digits, the eighth digit is rounded off.</li> </ul>

## Error code

Error code (DEC)	Description	Handling method
10	Number of logging points (D1) is out of range. Number of logging points is set to a value other than 1 to 32768.	Review the setting, and then execute sample ladder again.

## Explanation of process

■The processes of this program are given below.

Each time the Logging trigger (M1) changes from OFF to ON, the logging target device value is imported as logging data. When the number of imported logging data points reaches the specified number of logging points, the standard deviation and average values obtained from the logging data for the number of logged points are output as single-precision real numbers. The standard deviation  $\sigma$  is obtained with the following method.

When the logging data are assumed to be  $X_1, X_2, \dots, X_n$ , the arithmetic average can be obtained by the following formula.

$$\bar{X} = \frac{1}{n} \sum_{i=1}^n X_i$$

At this time, the values obtained with the following method using the average is the variance.

$$\sigma^2 = \frac{1}{n} \sum_{i=1}^n (X_i - \bar{X})^2$$

The positive square root of the variance is the standard deviation  $\sigma$ .

$$\sigma = \sqrt{\frac{1}{n} \sum_{i=1}^n (X_i - \bar{X})^2}$$

As an example, set 5 for the Number of logging points (D1), which is the input device, and set the values in the following table as the Logging target device value (D0) each time the Logging trigger (M1) turns ON. The Standard deviation (D102, 103) and Average value (D104, 105), which are the output, will be the values listed below for the output device.

Input devices			Output devices	
Number of logging points (D1)	Logging trigger (M1)	Logging target device value (D0)	Standard deviation (D102,103)	Average value (D104,105)
5	1st trigger	2	2.828427	6.0
	2nd trigger	4		
	3rd trigger	6		
	4th trigger	8		
	5th trigger	10		

## ■Methods for linking with data logging function

The method for obtaining the standard deviation of the data collected in the SD memory card by the data logging function is explained below.

### 1. Data set with CPU Module Logging Configuration Tool

With the CPU Module Logging Configuration Tool, the logging type is set as continuous logging and the sampling interval as condition specification, and the type of device specified with the condition specification is a bit device.

The screenshot shows the 'Logging type' screen of the CPU Module Logging Configuration Tool. The interface has a top navigation bar with tabs: 'Logging type' (selected), 'Sampling', 'Data', 'Binary output', 'Save >', 'Movement', and 'Finish'. The main content area is titled 'First off, select a logging type.' and contains two sections:

- Logging type:** A section with the instruction 'Select a logging type.' and two radio button options:
  - Continuous logging**: Logging is carried out continuously at the specified data sampling intervals. Interval at which or conditions under which to carry out logging can also be specified.
  - Trigger logging**: By monitoring data, data before and after a condition held true is logged.
- File format:** A section with the instruction 'Output data by binary file format in FX5CPU. Data in a file can be checked in GX LogViewer.'

The screenshot shows the 'Sampling' screen of the CPU Module Logging Configuration Tool. The interface has a top navigation bar with tabs: 'Logging type', 'Sampling' (selected), 'Data', 'Binary output', 'Save >', 'Movement', and 'Finish'. The main content area is titled 'Specify the sampling interval and start conditions.' and contains a section for 'Sampling interval' with three radio button options:

- Each scanning cycle**: Samples data at each sequence scanning cycle.
- Time specification**: Includes two input fields and a dropdown menu. Samples data at the specified time interval.
- Condition specification**: Specifies data sampling timing by device data conditions. Below this are several input fields:
 

Device	Conditional formul	Radix	Value
M1000	PLS		

 Below the table is a 'Data type(K)' dropdown menu set to 'Bit'.

### 2. Data input in sample ladder

Input the ON/OFF state of the bit device specified in the sampling interval condition specification of the CPU Module Logging Configuration Tool to the sample ladder input device logging trigger. The value of the device that is the collection target for the CPU Module Logging Configuration Tool is input for the input device logging target device value.\*1

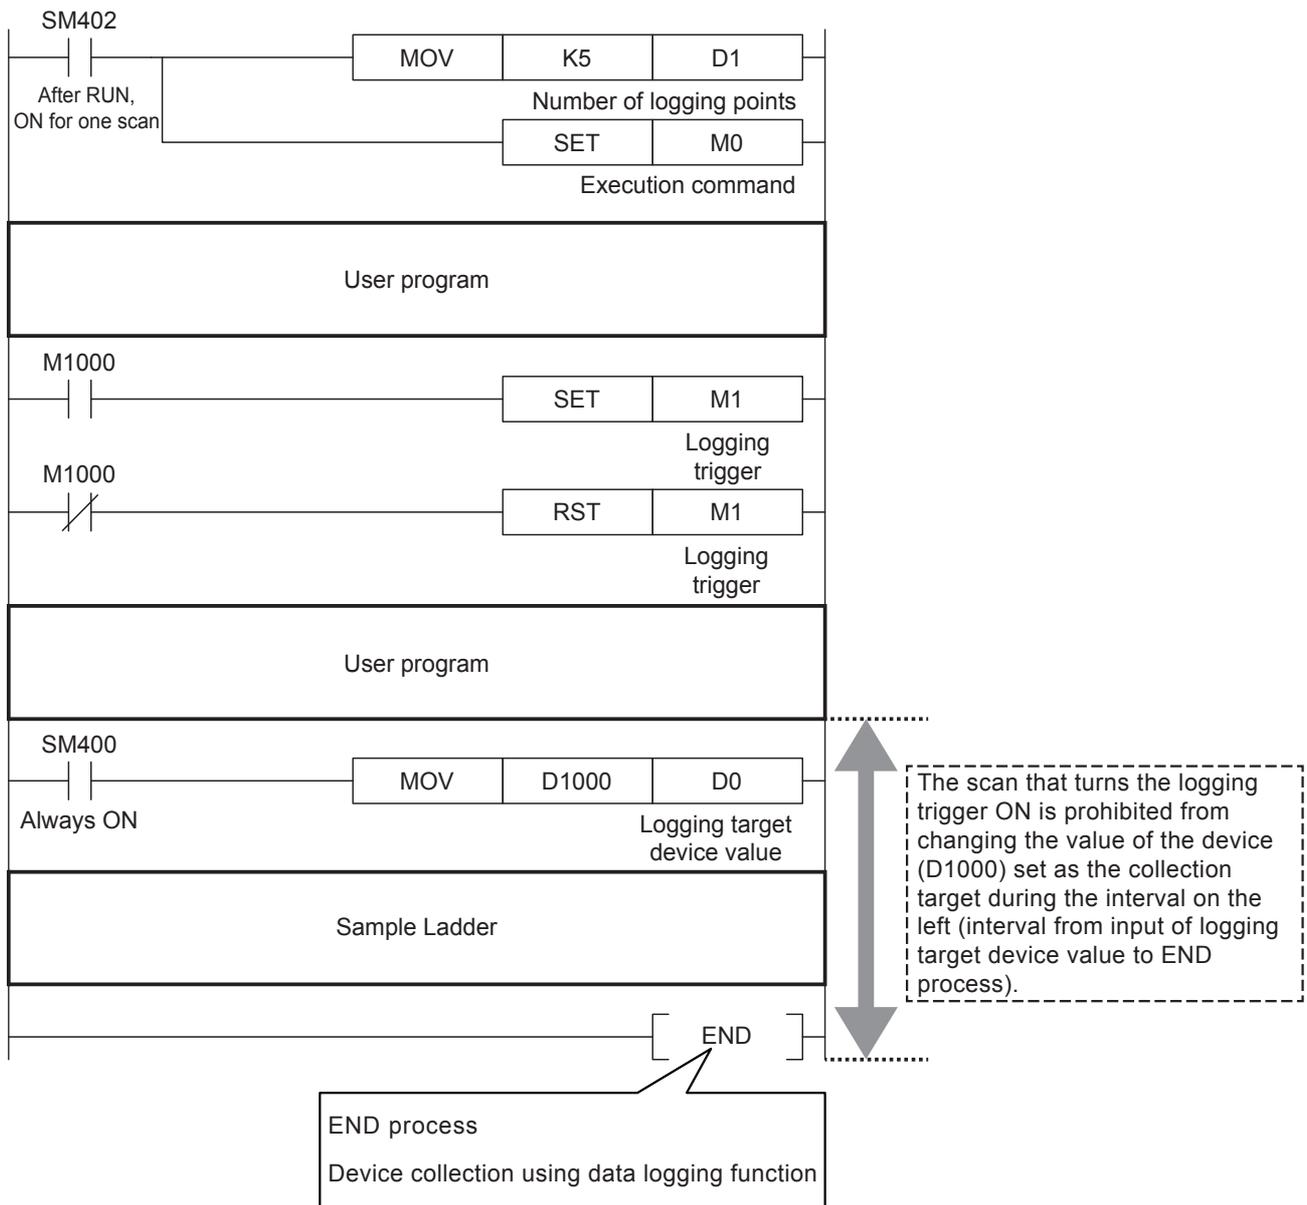

\*1 The usage methods are limited to make the data logged in the SD memory card the same value as the data input in the sample ladder. Refer to [Page 10 Logging a device for which the value is updated in a process other than the END process \(data register, etc.\)](#) and [Page 11 Logging a device for which the value is updated with the END process \(special register, etc.\)](#) for details. For a device in which the value is updated in the END process, refer to the END process in [MELSEC iQ-F FX5 User's Manual \(Application\)](#).

## ■Logging a device for which the value is updated in a process other than the END process (data register, etc.)

An example of inputting to the sample ladder with the CPU Module Logging Configuration Tool when the internal relay M1000 rising edge is specified for the sampling interval condition specification and the data register D1000 is specified for the sampling target is shown below.

To make the data logged in the SD memory card and the data input in the sample ladder the same value, in a scan that turns the logging trigger ON, the value input in the logging target device value of the sample ladder's input device must not be changed until the device collection is executed with the data logging function at the END process of the same scan.

To prevent the value input in the logging target device value from being changed unintentionally, the ladder that inputs the value in the logging target device value and this sample ladder should be placed just before the END process.

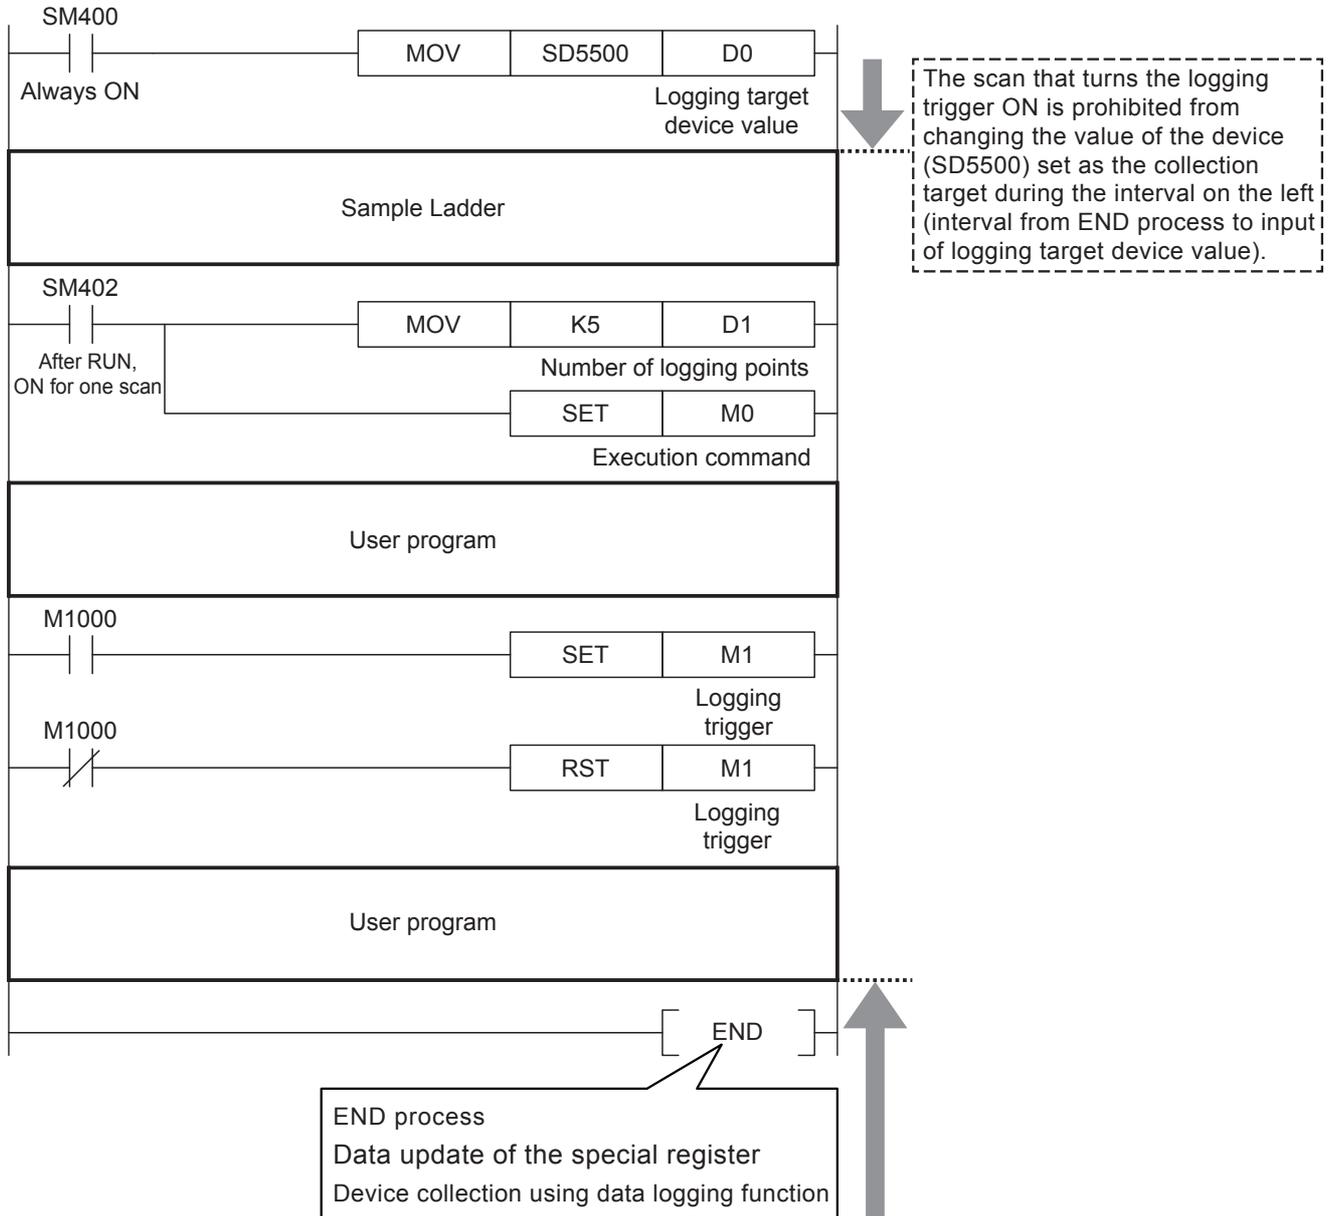

**■Logging a device for which the value is updated with the END process (special register, etc.)**

An example of inputting to the sample ladder with the CPU Module Logging Configuration Tool when the internal relay M1000 rising edge is specified for the sampling interval condition specification and the special register SD5500 (device for which value is updated with END process) is specified for the sampling target is shown below.

To make the data logged in the SD memory card and the data input in the sample ladder the same value, the device collection by the data logging function in the END process must turn ON the logging trigger at the next scan executed, and execute the sample ladder.

To prevent the value input in the logging target device value from being changed unintentionally, the ladder that inputs the value in the logging target device value and this sample ladder should be placed at the head of the program.
