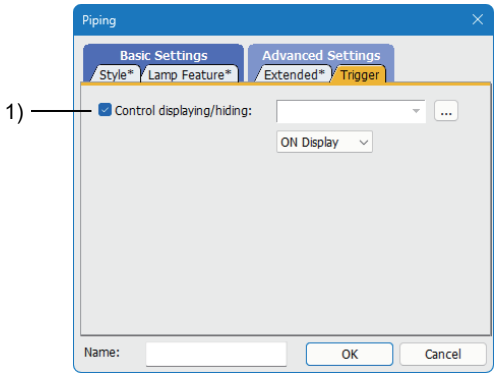
		If either of the following settings is configured, [Backmost] does not appear. • [Use lamp attribute] is selected in the [Lamp Feature] tab • [Control displaying/hiding] is selected in the [Trigger] tab
		When [Front] or [Back] is selected, the figure is processed as an object. ☞ Page 1035 Processing a figure as an object
2)	[Category]	Select the category to which the figure belongs. ☞ Page 1121 Managing figures and objects by category

[Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the figure only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off

26.12 Filling the framed area of the figure

GT37 SoftGOT3000

Fill the area or figure enclosed by lines with the specified color.

Point

Paint is not available when either of the following items is selected in the [Type Setting] dialog ([Basic Setting]).

- [Enable the antialiasing]
- [Expand base screen sizes]

☞ Page 519 [Basic Setting]

If the above items are selected with a paint placed on the screen editor, the paint is deleted.

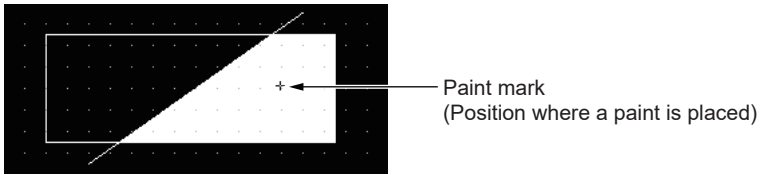
Setting an area to be filled with a paint

A figure drawn with solid lines is used as demarcation lines to set an area to be filled.

Set the same color for the figure (demarcation lines) and for [Boundary Color] in the [Paint] dialog.

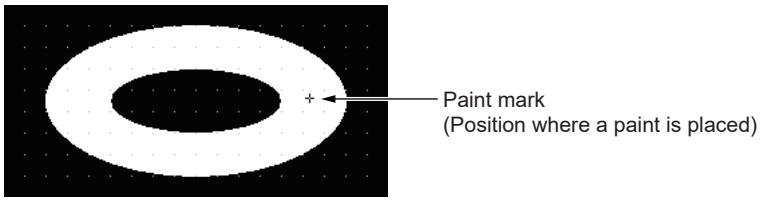
Ex.

Filling the area enclosed by a line and a rectangle



Ex.

Filling the area between the two circles



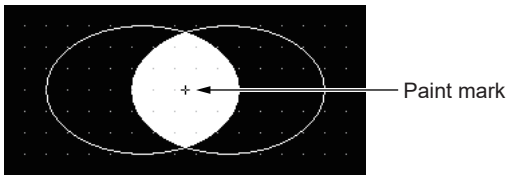
PART 7

Placing a paint

Operating procedure

1. Select [Figure] → [Paint] from the menu.
2. Place the cursor over the area to be filled, and click the area.

A paint mark is placed on the screen and the area within the frame is filled.
The paint mark is displayed on GT Designer3 only.



3. Double-click the paint mark to display the [Paint] dialog.

☞ Page 1176 [Paint] dialog

4. Set a fill color, pattern, and others, and click the [OK] button.

The paint setting is completed.
For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

Precautions

■Precautions for demarcation lines

Precaution	Description
Layer on which demarcation lines are placed	Place the figure used as demarcation lines on the rearmost layer.
Stacking order of demarcation lines and a paint	Place a figure (demarcation lines) behind the paint mark. If not, unintended areas will also be filled.
Color of demarcation lines and background color of the area to be filled	Set different colors for demarcation lines and background color of the area to be filled. If the same color is set, filling is not performed.
Placement of demarcation lines	Enclose the area without any clearance between demarcation lines. With even a little clearance between the lines, unintended areas will also be filled.

■Precautions for display on the screen editor

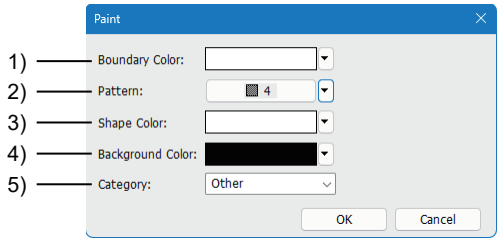
Precaution	Description
When part of the area is unfilled on the screen editor	In some cases, part of the area is unfilled. Redisplaying the screen editor will solve the issue. ☞ Page 296 Redisplaying a selected screen editor

■Precaution for placing an object on a screen

Precaution	Description
When placing an object on a window screen with rounded corners set	Even if rounded corners are set for the window screen on which a paint is placed, the radius setting is fixed at "0".
When the position of the paint mark is outside the window	The fill is not displayed in the following cases: • The paint mark is not displayed in the window on the screen editor. • The paint mark is placed outside the range of the displayed monitor screen.  When the paint mark is displayed　When the paint mark is not displayed

26.12.1 [Paint] dialog

GT37 SoftGOT3000



Item		Description
1)	[Boundary Color]	Set a color for the demarcation lines of the area to be filled. For details on the color, refer to the following. ☞ Page 988 Color settings
		If the same color is selected for [Boundary Color] and either of [Shape Color] or [Background Color], the area may not be filled. In such a case, shift the position of the paint mark.
2)	[Pattern]	Select a fill pattern for the area.
3)	[Shape Color]	This item is enabled when [None] is not selected for [Pattern]. Select a pattern color.
4)	[Background Color]	This item is enabled when [None] is not selected for [Pattern]. Select a background color.
5)	[Category]	Select the category to which the figure belongs. ☞ Page 1121 Managing figures and objects by category

26.13 Pasting an image file

GT37 SoftGOT3000

Import an image file to GT Designer3, and paste it on the screen.

26.13.1 Specifications of importable image files

GT37 SoftGOT3000

Files in the following formats can be imported.

- BMP format
- JPEG format
- PNG format

The following shows details on importable file formats.

Item	Specifications of importable file formats		
	BMP format	JPEG format	PNG format
Extension	*.bmp	• *.jpg • *.jpeg • *.jpe	*.png
Supported format	• 2 colors (monochrome) • 16 colors • 256 colors • 24-bit color	Full-color RGB-compatible baseline JPEG (JFIF, EXIF)	• RGB 24-bit PNG • 32-bit PNG data with RGB + α channel (α channel (transparency information) supported)
Number of colors	16.77 million colors		
Size of images that can be pasted	6000 × 6000 pixels		
Editing after pasting	Available	Available	Not available

Transparent and semi-transparent areas (α channel) of a PNG file

The transparent and semi-transparent areas of a PNG file become transparent according to the data (value of α channel) before import.

- Transparent area (α = 0): Displays the background color.
- Semi-transparent area (0 < α < 1): Combines the background color.

For an object using a PNG file containing an α channel as its shape, the appearance of the semi-transparent area differs depending on the color settings of the layer where the object is placed or the front layer.

Layer	Transparent color of the front layer	
	Enabled	Disabled
Front layer	For an object that using PNG file containing an α channel as its shape, if another figure or object is placed behind the object, the semi-transparent area becomes transparent. If no figure or object is placed behind the object, the semi-transparent area is combined with the transparent color of the screen. Because the combined color is different from the transparent color of the screen, the semi-transparent area does not become transparent.	The semi-transparent area becomes transparent.
Back layer	The semi-transparent area becomes transparent.	
Backmost layer		

Precautions

If the image file is large, the memory of the GOT may be insufficient.
If the memory is insufficient, only the frame of the placed image file is displayed.

PART 7

26.13.2 Pasting an image file

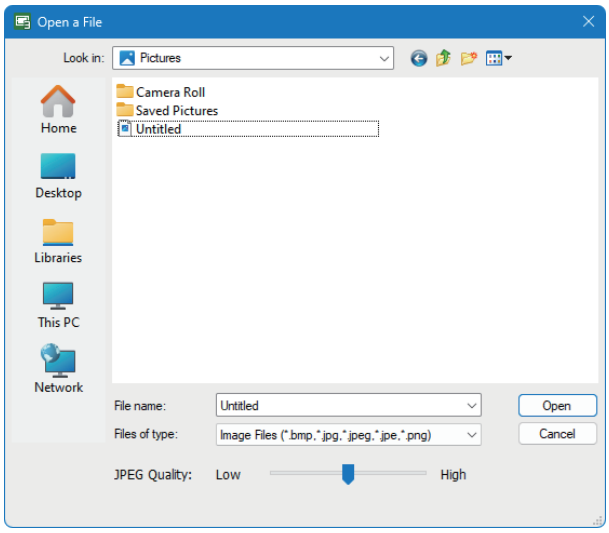
GT37 SoftGOT3000

Point

The color of an image may appear slightly different between in GT Designer3 and on the GOT.

Pasting from the menu

1. Select [Figure] → [Import Image Data] from the menu to display the [Open a File] dialog.
2. Select an image file to be pasted, and click the [Open] button.



When you paste the JPEG file, set [JPEG Quality].

[Low]: The image quality deteriorates, and the file size becomes smaller.

[High]: The image quality improves, and the file size becomes larger.

3. Click an intended position on the screen editor to paste the image.
4. Resize or reposition the image to fit it into the screen display area.

The part extending to the temporary area is not displayed on the GOT.

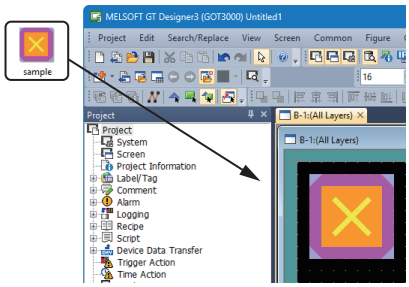
Pasting is completed.

For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

Pasting by drag operation

1. Drag an image file onto the GT Designer3 screen editor.
2. Release the mouse button at an intended position to paste the image.



3. Resize or reposition the image to fit it into the screen display area.

The part extending to the temporary area is not displayed on the GOT.

Pasting is completed.

For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

PART 7

26.13.3 Editing the pasted image

GT37 SoftGOT3000

The pasted image is editable or not editable depending on the file format and operating environment of GT Designer3.

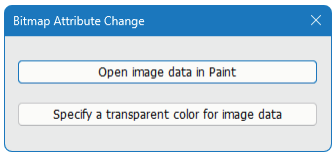
File format	Editing of the pasted image	
	In Windows11	In other than Windows11
BMP format	Pasted images are not editable. To edit an image, use image editing software and paste the edited image to the screen.	Editable ☞ Page 1180 Editing a BMP image
JPEG format		Editable ☞ Page 1182 Editing a JPEG image
PNG format		Pasted images are not editable. To edit an image, use image editing software and paste the edited image to the screen.

Editing a BMP image

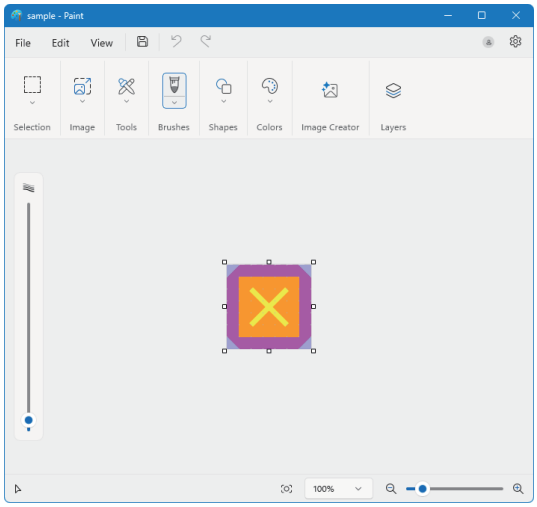
☞ Page 1180 Editing an image
☞ Page 1181 Setting a transparent color

■Editing an image

1. Double-click the image to be edited on the screen editor to display the [Bitmap Attribute Change] dialog.



2. Click the [Open image data in Paint] button to start Paint in Windows.

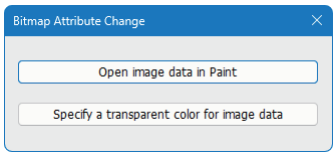


3. Edit the image, and select [File] → [Save] from the menu.

The paint window is closed, and editing is completed.

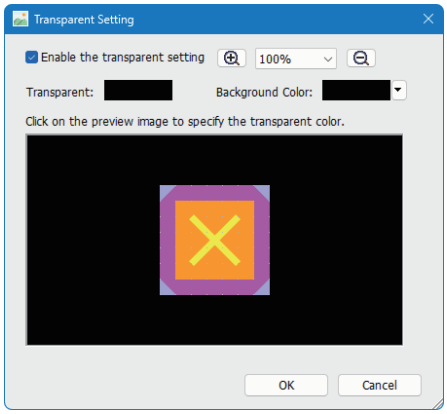
■Setting a transparent color

1. Double-click the image to be edited on the screen editor to display the [Bitmap Attribute Change] dialog.



2. Click the [Specify a transparent color for image data] button to display the [Transparent Setting] dialog.

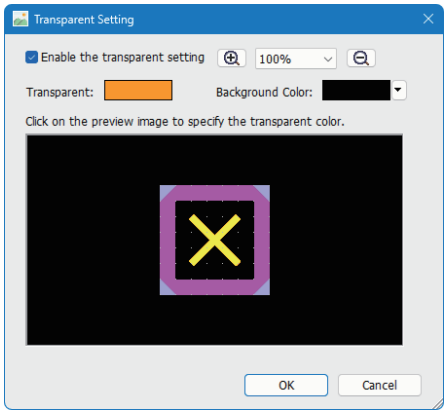
☞ Page 1183 [Transparent Setting] dialog



3. Select [Enable the transparent setting].

4. Click the preview image and select a color to become transparent.

The preview image changes to an image with the selected color transparent.



5. Click the [OK] button to confirm the transparent color setting.

Editing a JPEG image

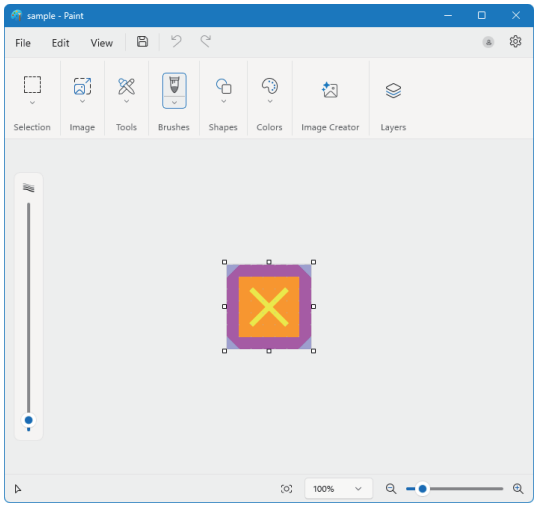
Point

In the following cases, the image quality may deteriorate.

- When the pasted JPEG file is in the JFIF format, and not the baseline JPEG
- When the pasted image of the JPEG file is edited

To avoid the image quality deterioration, use the BMP file.

1. Double-click the image to be edited on the screen editor to open Paint in Windows.



2. Edit the image, and select [File] → [Save] from the menu.

The paint window is closed, and editing is completed.

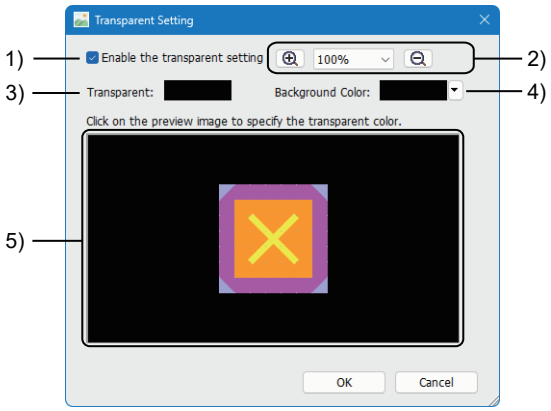
26.13.4 [Transparent Setting] dialog

GT37 SoftGOT3000

Set a transparent color from the image file displayed in the preview.

To display this dialog, perform either of the following operations.

- Double-click the BMP image on the screen editor to display the [Bitmap Attribute Change] dialog, and then click the [Specify a transparent color for image data] button.
- Click the [From image] button in the [Image File Setting] dialog of a parts display object.



Item		Description
1)	[Enable the transparent setting]	This item is displayed only when a transparent color is set for the image file pasted on the screen editor. Select this item to enable the setting.
2)	Preview image scaling	Zooms in or out the preview image.
3)	[Transparent]	Displays a transparent color. The color of the part clicked on the preview image is set as a transparent color.
4)	[Background Color]	Set a background color of the preview image. For details on the color, refer to the following. ☞ Page 988 Color settings
5)	Preview	Displays the image for which a transparent color is to be set. The color of the part clicked is set as a transparent color. 
26.14 Pasting DXF Data

GT37 SoftGOT3000

Import the data of the DXF file (AutoCAD Data Exchange Format file) to GT Designer3, convert the data into the figure data of GT Designer3, and paste it on the screen.

26.14.1 Specifications of importable DXF files

GT37 SoftGOT3000

The following shows details on importable file formats.

Item	Specifications of importable DXF files
Extension	*.dxf
Version	• R12 • R13 • R14
Maximum importable file size	2048 × 1536 or smaller Regardless of the unit, the dimension 1 on the DXF file is converted to 1 dot in GT Designer3. If the width or height exceeds the maximum size, the file cannot be imported.

For the specifications of DXF file conversion into a figure, refer to the following.

☞ Page 1185 Specifications of DXF file conversion

26.14.2 Pasting a DXF file

Point

Some DXF files may require 10 minutes or more for importing.

Pasting from the menu

1. Select [Figure] → [Import DXF Data] from the menu to display the [Open a File] dialog.
2. Select a DXF file to be pasted, and click the [Open] button.
3. Click an intended position on the screen editor to paste the figure data.

Pasting is completed.

The figure data of the pasted DXF file is grouped.

For how to edit a grouping of figures, refer to the following.

☞ Page 1021 Grouping two or more figures and objects or ungrouping them

For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

Pasting by drag operation

1. Drag a DXF file onto the GT Designer3 screen editor.
2. Release the mouse button at an intended position to paste the figure.

The figure data of the pasted DXF file is grouped.

For how to edit a grouping of figures, refer to the following.

☞ Page 1021 Grouping two or more figures and objects or ungrouping them

26.14.3 Specifications of DXF file conversion

☞ Page 1185 DXF file tags and conversion rules
☞ Page 1186 Specifications of other conversions

DXF file tags and conversion rules

☞ Page 1185 Converting the figure data
☞ Page 1186 Converting the line
☞ Page 1186 Converting the color

■Converting the figure data

The following shows the specifications of conversion into a figure.

DXF file tag (Before pasting)	Figure in GT Designer3 (After pasting)	Remarks
ARC	Arc	—
ATTDEF	(Skipped)	—
ATTRIB	Text	• The text size is converted to the nearest one within the range of 0.5 to 8 dots. • The text orientation is converted to the nearest one in 90-degree increments. • The text style and inclination angle are not converted.
CIRCLE	Circle	—
DIMENSION	Group	The color and line style are converted based on the definition of BLOCK instead of the layer of DIMENSION.
ELLIPSE	Circle or arc	When the main axis is inclined, the figure is converted so that its main axis will be rotated to vertical or horizontal.
INSERT	Group	• The color and line style are converted based on the definition of BLOCK instead of the layer of INSERT. • The scale and rotation angle are not converted.
LEADER	Freeform line*1	The figure is converted to the freeform line by connecting vertices with straight lines.
LINE	Line	—
LWPOLYLINE	Freeform line or polygon*1	• The figure is converted to the freeform line or polygon by connecting vertices with straight lines. • The figure with curved lines is not converted.
MLINE	Freeform line*1	• MLINESTYLE is not converted. The color and line style of the freeform line are determined by the layer definition. • Cap processing is not supported.
MTEXT	Text	• The text size is converted to the nearest one within the range of 0.5 to 8 dots. • The text orientation is converted to the nearest one in 90-degree increments. • The format code and text style are not converted.
POINT	Circle, rectangle, or line	—
POLYLINE	Freeform line or polygon*1	• The figure is converted to the freeform line or polygon by connecting vertices with straight lines. • The figure with curved lines is not converted.
SEQEND	(End of sequence data)	—
SOLID	Polygon	—
SPLINE	Freeform line or polygon*1	The figure is converted to the freeform line or polygon by connecting each fit point with the straight line.
TEXT	Text	• The text size is converted to the nearest one within the range of 0.5 to 8 dots. • The text orientation is converted to the nearest one in 90-degree increments. • The text style and inclination angle are not converted.
TRACE	Polygon*1	—

*1 If the converted freeform line or polygon has 2000 vertices or more, the 2000th vertex and later are not displayed on the GOT. Edit the figure in GT Designer3 so that the number of vertices will be 1999 or less.

■Converting the line

The line width is converted to 1 dot.

The following shows the specifications of line style conversion.

DXF file tag (Before pasting)	Line style in GT Designer3 (After pasting)	Image
CONTINUOUS	Straight line	
DASHED	Coarse broken line	
HIDDEN	Coarse broken line	
CENTER	Speck chain line	
PHANTOM	Two-dot long and two short dashes line	
User definition	Straight line	
Others	Straight line	

■Converting the color

The following shows the specifications of color conversion.

Color in the DXF file (Before pasting)	Color in GT Designer3 (After pasting)
Red (0x01)	Red (#FF0000)
Yellow (0x02)	Yellow (#FFFF00)
Green (0x03)	Green (#00FF00)
Light blue (0x04)	Light blue (#00FFFF)
Blue (0x05)	Blue (#0000FF)
Purple (0x06)	Purple (#FF00FF)
White (0x07)	White (#FFFFFF)
Black (0x08)	Black (#000000)
Dark red (0x09)	Dark red (#BF0000)
Dark yellow (0x0A)	Dark yellow (#BFBF00)
Dark green (0x0B)	Dark green (#00BF00)
Dark-light blue (0x0C)	Dark-light blue (#00BFBF)
Dark blue (0x0D)	Dark blue (#0000BF)
Dark purple (0x0E)	Dark purple (#BF00BF)
Dark white (0x0F)	Dark white (#7F7F7F)
Others	White (#FFFFFF)

Specifications of other conversions

■Layer of the DXF file

The data with the layer off cannot be converted.

■Conversion supported character code

Only shift JIS code texts are supported for conversion in GT Designer3.

No texts other than shift JIS code texts are converted.

■Category of the figure pasted in GT Designer3

[Category] of the pasted figure is set to [None].

26.15 Pasting IGES Data

GT37 SoftGOT3000

Import IGES data (Data Exchange Format among CADs) to GT Designer3, convert the data into the figure data of GT Designer3, and paste it on the screen.

26.15.1 Specifications of importable IGES files

GT37 SoftGOT3000

The following shows details on importable file formats.

Item	Specifications of importable IGES files
Extension	• *.igs • *.ige • *.iges
Format	IGES files created with Autodesk Inventor manufactured by Autodesk, Inc. in a wireframe format

For the specifications of IGES file conversion into a figure, refer to the following.

☞ Page 1190 Specifications of IGES file conversion

Point

For an IGES file that cannot be imported, capture the file's image displayed with software that support display of IGES file, and paste the image on the screen editor.

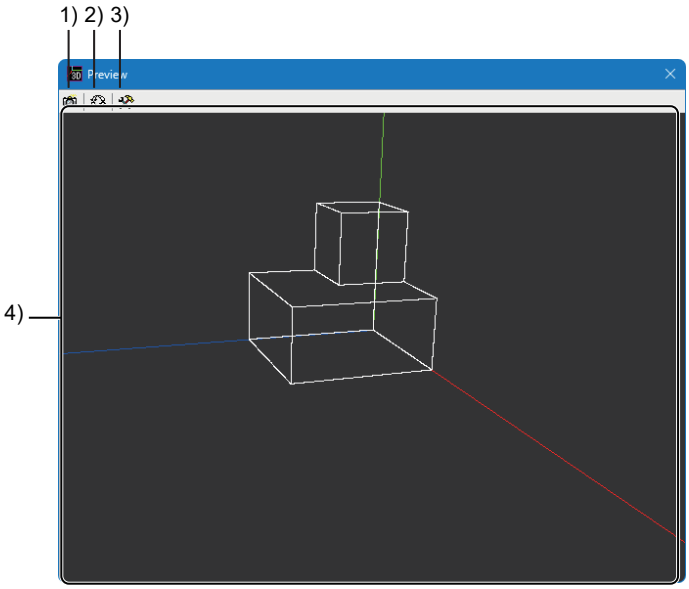
26.15.2 Pasting an IGES file

GT37 SoftGOT3000

1. Select [Figure] → [Import IGES Data] from the menu to display the [Open a File] dialog.

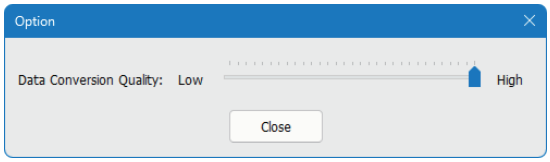
2. Select an IGES file to be pasted, and click the [Open] button.

The [Preview] dialog appears, and the figure data is displayed.



Item		Description
1)	Confirmation button	Confirms the editing of the figure to be pasted on the screen editor. The [Preview] dialog is closed, which is followed by pasting operation onto the screen editor.
2)	Reset button	Resets the status of the display section.
3)	Option button	Displays the [Option] dialog. Set the optimization level for converting the curved line to freeform line.
4)	Display section	Image of the figure to be pasted on the screen editor. The figure can be rotated or zoomed in or out by mouse drag operation.

3. Click the option button in the [Preview] dialog to display the [Option] dialog.



4. Set the optimization level for converting the curved line to freeform line, and click the [Close] button.

[Low]: The image quality deteriorates, and the data size becomes smaller.

[High]: The image quality improves, and the data size becomes larger.

5. Adjust the size and orientation of the figure data in the [Preview] dialog.

The figure data is pasted on the screen in the size and orientation displayed in the [Preview] dialog.

- Dragging with the left mouse button pressed: The figure data rotates in the direction of dragging.
- Dragging with the right mouse button pressed: The figure data moves in the direction of dragging.
- Dragging upward with both mouse buttons pressed: The figure data is zoomed in.
- Dragging downward with both mouse buttons pressed: The figure data is zoomed out.

6. Click the [Save] button to close the [Preview] dialog.

7. Click an intended position on the screen editor to paste the figure data.

Pasting is completed.

The figure data of the pasted IGES file is grouped.

For how to edit a grouping of figures, refer to the following.

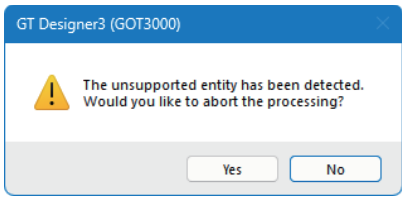
☞ Page 1021 Grouping two or more figures and objects or ungrouping them

For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

Precautions

When the IGES file has unsupported entity, the following dialog is displayed.



Clicking the [No] button displays the [Preview] dialog; however, the unsupported entity and subsequent ones are not imported.

The following shows the examples.

Example	Processing
Parent entity (importable)-child entity (importable)-grandchild entity (not importable)	Although the parent entity and child entity are imported, the grandchild entity is not imported.
Parent entity (importable)-child entity (not importable)-grandchild entity (importable)	Although the parent entity is imported, the child entity and grandchild entity are not imported.
Parent entity (not importable)-child entity (importable)-grandchild entity (importable)	As the parent entity is not importable, no entity is imported.

26.15.3 Specifications of IGES file conversion

Importable entities

GT Designer3 supports the entities defined by JAMA-IGES.

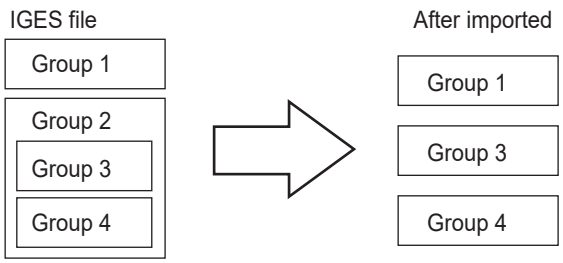
The following shows the importable entities.

Entity name	Entity ID
Circle	100
Ellipse	104
Line	110
Transformation matrix	124
Rational B-spline curve	126
General note	212
Subfigure definition	308
Color definition	314
Subfigure entity	408

Nested format groups

When some groups are nested in the IGES file, only the bottom level groups are imported.

Exa



27 Placing a touch switch

GT37 SoftGOT3000

☞ Page 1192 Overview of a touch switch
☞ Page 1195 How to use touch switch
☞ Page 1197 Specifications of touch switch
☞ Page 1198 Setting touch switches
☞ Page 1199 [Switch] dialog
☞ Page 1215 [Bit Switch] dialog
☞ Page 1217 [Word Switch] dialog
☞ Page 1220 [Go To Screen Switch] dialog
☞ Page 1227 [Change Station No. Switch] dialog
☞ Page 1230 [Special Function Switch] dialog
☞ Page 1249 [Key Window Display Switch] dialog
☞ Page 1251 [Key Code Switch] dialog
☞ Page 1257 Settings common to touch switches
☞ Page 1273 Relevant settings

27.1 Overview of a touch switch

A touch switch is an object placed on the monitor screen that allows an operator to execute the action set to the switch by touching it.
For example, you can change a specific device value and switch the screen displayed on the monitor screen to another one. Also, setting an action, such as importing/exporting recipe data, for a switch allows the operator to execute the action with a single touch without complicated operations.
There are two types of touch switches: ones for which only one action is set and ones for which multiple actions can be set. Touch switches for which multiple actions can be set are called [Switch].

Touch switch type	Description	
Switch	Multiple actions can be set for one switch (multi-action switch). Up to 136 actions can be set, and the execution order of them can be set as well. ☞ Page 1199 [Switch] dialog	
	The following shows the settable actions. Although the switch can be configured with the same functions as individual touch switches, the [Sound output] function is unique to the switch. For switches with an extended function set, no other actions can be assigned. ☞ Page 1202 [Bit] ☞ Page 1203 [Word] ☞ Page 1204 [Extended] ☞ Page 1204 [Screen Switching] ☞ Page 1205 [Station No. Switching] ☞ Page 1206 [Key Code] ☞ Page 1208 [Key Window Display]	
	Sound output	Plays or stops a sound. Also, it can be used to mute or unmute the sound.  Set a sound file used for the sound output in the [Sound File List] dialog. ☞ Page 1209 [Sound Output]

Touch switch type	Description	
Bit switch	Turns on or off a bit device. ☞ Page 1215 [Bit Switch] dialog The following shows the four bit device types.	
	Bit set	Turns on the specified bit device when the switch is touched. 	Bit reset	Turns off the specified bit device when the switch is touched. 	Bit alternate	Alternates (ON←→OFF) the current status of the specified bit device when the switch is touched. 	Bit momentary	Keeps the specified bit device on while the switch is being touched. Word switch	Changes the value of a word device. ☞ Page 1217 [Word Switch] dialog 	
	Constant	Writes the specified value (constant) to the word device being monitored.
	Indirect device	Writes the value of the specified word device to the word device being monitored.
	Constant + Indirect device	Writes the total value of the specified value (constant) and the value of the specified word device to the word device being monitored.
Go to screen switch	Switches the screen displayed on the monitor screen. This applies to base screens and window screens. ☞ Page 1220 [Go To Screen Switch] dialog 	
	• Switching to the screen with a specified screen number • Switching to the screen with the base screen number previously displayed • Switching to the screen with the specified screen number by turning on or off the specified bit device • Switching to the screen with the specified screen number when the current value of the specified word device corresponds to the set conditional expression	

Touch switch type	Description
Change station No. switch	Switches the device of the currently monitored object on the same network system to the same device with another station number. Multiple controllers (station numbers) can be monitored in one monitor screen. ☞ Page 1227 [Change Station No. Switch] dialog 	• Switching the monitoring target to a specified station number • Switching the monitoring target to a specified station number by turning on or off the specified bit device • Switching the monitor target to the specified station number when the current value of the specified word device corresponds to the set conditional expression
Special function switch	Switches the screen to the utility screen, add-on function screen, or other screens. ☞ Page 1230 [Special Function Switch] dialog Key window display switch	Displays the specified key window at the specified position. The specified key window must be the one set in the key window settings for each project or screen. Also, a cursor can be displayed on the specified object. ☞ Page 1249 [Key Window Display Switch] dialog Key code switch	Specifying key codes enables control of the key input on the numerical input or text input object, alarm display, recipe display (record list), historical trend graph, historical data list, document display, and screen gestures. ☞ Page 1251 [Key Code Switch] dialog 
27.2 How to use touch switch

GT37 SoftGOT3000

☞ Page 1195 Safely performing operation with touch switches
☞ Page 1196 Converting the touch switch to lamp

27.2.1 Safely performing operation with touch switches

To prevent unexpected system operation and ensure the safety of the operation, the following functions are available.

Delay function

The delay function can execute operation only when a touch switch is touched and held or pressed twice.
Also, you can set the touch switch to turn off after a specified time period instead of turning off immediately.
This prevents the action from being executed immediately in case the switch is touched by mistake.
This function can be set in [Delay] in the [Special Function Switch] dialog for the touch switch.
☞ Page 1230 [Special Function Switch] dialog

Simultaneous press prohibition function

While a touch switch with this function set is being touched, the function disables touches in any other areas on the GOT screen.
This prevents multiple actions from being executed at the same time in case two or more touch switches are touched by mistake.
This function can be set in [Simultaneous Press] in the [Special Function Switch] dialog for the touch switch.
☞ Page 1230 [Special Function Switch] dialog

27.2.2 Converting the touch switch to lamp

When the [Convert to Lamp] button is clicked in the setting dialog of each switch, the switch is convert to the lamp.

Types of the lamp to be converted to

The type of the lamp to be converted to differs depending on the setting of [Lamp (Timing to change shape/text)] in the setting dialog.

If no setting item for [Lamp (Timing to change shape/text)] exists , the touch switch is converted to the bit lamp.

Setting of [Lamp (Timing to change shape/text)]	Description
[Key Touch State] [Bit-ON/OFF]	The touch switch is converted to a bit lamp.
[Word Range]	The touch switch is converted to a word lamp.

Settings to be deleted

When the touch switch is converted to the lamp, settings that do not exist in the lamp are deleted.

Settings that only exist in the lamp are configured with the default values of the lamp.

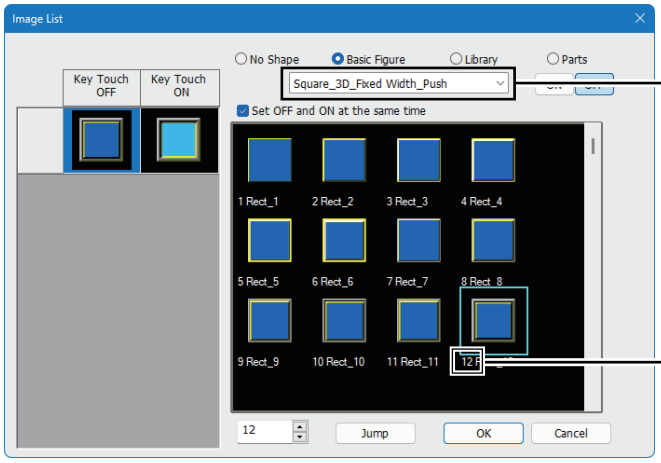
Converting a basic figure

For converting the basic figure from the touch switch to the lamp, the figure of the switch is converted to the corresponding figure with the same number on the lamp.

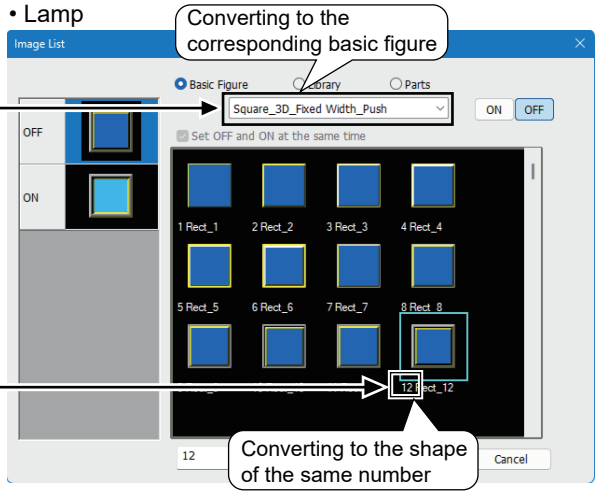
Ex.

Converting the touch switch to the lamp when the basic figure [Square_3D_Fixed Width _Push] is set for the touch switch

• Touch switch



• Lamp



When the touch switch is converted to the lamp under the following conditions, the default basic figure is set.

- No basic figure on the lamp has the same number as the basic figure set for the touch switch.
- The basic figure [Toggle] is set for the touch switch.
- The basic figure [Selector] is set for the touch switch.

Even if the shapes have the same reference number, there may be difference between the touch switch and the lamp. Check the shape after the conversion to see if it can be properly used.

Restoring the lamp to the touch switch after the conversion

To restore the lamp to the switch after conversion, select [Edit]→[Undo] from the menu.

Even if the lamp has been converted back to the touch switch, the previous settings cannot be restored.

If the [OK] button is not clicked, clicking the [Cancel] button cancels the conversion even after the [Convert to Lamp] button is clicked.

27.3 Specifications of touch switch

GT37 SoftGOT3000

The following shows the specifications of the touch switch.

27.3.1 Maximum number of objects that can be placed on one screen

A total of 1024 touch switches and other objects can be placed on one base screen, while 512 can be placed on one window screen.

27.3.2 Size of touch switch

The following shows the minimum and maximum sizes of the touch switch.

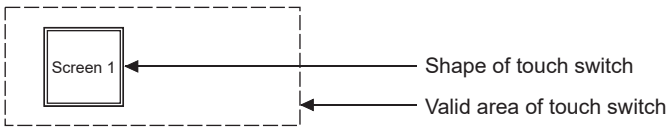
Size	Size (dot)
Minimum	2 × 2
Maximum	6000 × 6000

27.3.3 Valid range of the touch switch

The touch area of the touch switch can be automatically adjusted to the largest size that will fit within the object size.
When the following two items are set, the size automatically adjusted is further adjusted so that each of its four sides becomes 1 dot smaller.

- [Edit] → [Edit Touch Area] → [Self-adjust] or [Constant Self-adjust] is set.
- In the [Edit] tab of the window displayed by selecting [Tools] → [Option] from the menu, [Adjust the touch area to be smaller than its object size by 1-dot at the time of touch area self-adjust] is selected.

Selecting [Edit] → [Edit Touch Area] → [Manual Edit] allows you to set the sizes of the touch switch and valid area individually.
☞ Page 1030 Adjusting the touch area of an object (size, position)



27.3.4 Superimposition of touch switches

For the touch switch superimposition specifications, refer to the following.
☞ Page 1057 Touch switch superimposition specifications

27.3.5 Precautions for using parts as touch switch shapes

When writing the project with only parts data edited to a GOT to which the project has already been written or deleting the parts data which has been written to the GOT, review the setting of the touch switch shape.
If the parts data has been updated, the data of all the touch switches and lamps which uses the updated parts needs to be updated. Therefore, saving the project data or opening the communication dialog may need longer time than usual.

27.4 Setting touch switches

GT37 SoftGOT3000

Use the following procedure to place a touch switch and configure the action settings.

Operating procedure

1. Select [Object] → [Switch] → the touch switch to be placed from the menu and click the intended position to place the touch switch.

☞ Page 1001 Placing figures and objects

2. Double-click the placed touch switch to display the setting dialog.
3. Configure the operation settings in each tab of the setting dialog.

Refer to the dialog of the corresponding touch switch.

☞ Page 1199 [Switch] dialog
☞ Page 1215 [Bit Switch] dialog
☞ Page 1217 [Word Switch] dialog
☞ Page 1220 [Go To Screen Switch] dialog
☞ Page 1227 [Change Station No. Switch] dialog
☞ Page 1230 [Special Function Switch] dialog
☞ Page 1249 [Key Window Display Switch] dialog
☞ Page 1251 [Key Code Switch] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 1037 Settings common to objects

27.5 [Switch] dialog

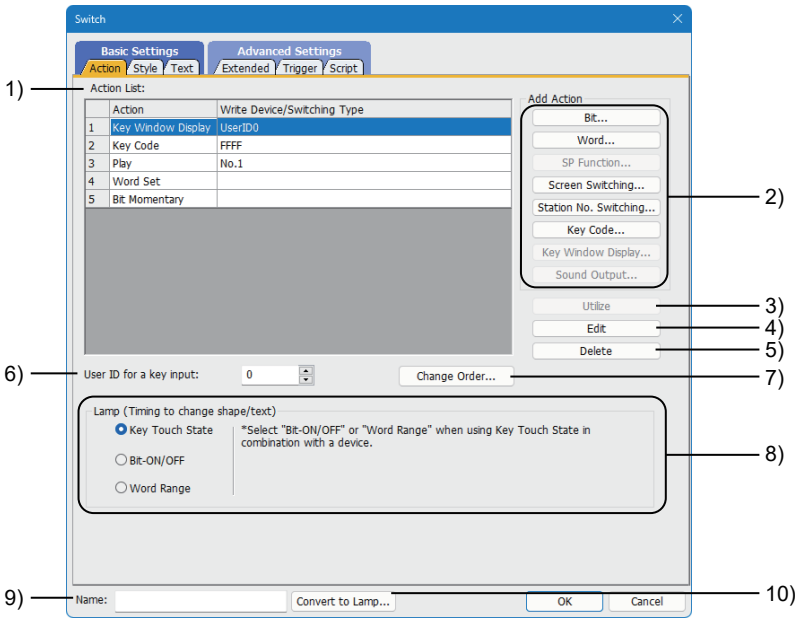
GT37 SoftGOT3000

☞ Page 1199 [Action] tab
☞ Page 1257 [Style] tab
☞ Page 1260 [Text] tab
☞ Page 1266 [Extended] tab
☞ Page 1270 [Trigger] tab

27.5.1 [Action] tab

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description
1)	[Action List]	Displays the actions assigned to the switch in the list. Actions are executed in the order set in [Action List]. To change the sorting order of actions, click the [Change Order] button and correct the order. The setting of each action can be changed in the edit dialog displayed by double-clicking the action in [Action List].
2)	[Add Action]	Click the button of the action to be added to the switch to set the action. The set action is added in [Action List]. ☞ Page 1202 [Bit] ☞ Page 1203 [Word] ☞ Page 1204 [Extended] ☞ Page 1204 [Screen Switching] ☞ Page 1205 [Station No. Switching] ☞ Page 1206 [Key Code] ☞ Page 1208 [Key Window Display] ☞ Page 1209 [Sound Output]
3)	[Utilize] button	Select an action from [Action List] and then click the [Utilize] button to copy the action to [Action List]. If you select an action that cannot be utilized, this button is grayed out and the setting is inaccessible.
4)	[Edit] button	Select an action to be edited from [Action List] and then click the [Edit] button to edit the set action.
5)	[Delete] button	Select an action to be deleted from [Action List] and then click the [Delete] button to delete the action.

Item		Description
6)	[User ID for a key input]	Specify the user ID of the object to be operated using the key code set in the action list. The setting range is [0] to [65535]. Set [User ID for a key input] of the switch and [User ID] of the operation target object to be the same. Switch setting  Operation target object setting (example: alarm display)  Set the same value.
7)	[Change Order] button	To change the order of the actions set in [Action List], click this button to display the [Change Order] dialog and change the order. ☞ Page 1210 [Change Order] dialog
8)	[Lamp (Timing to change shape/text)]	Select how to switch touch switch images (shapes of on status and off status). For details, refer to the following. ☞ Page 1201 Action of [Lamp (Timing to change shape/text)]
9)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be entered.
10)	[Convert to Lamp] button	Converts the object type to the lamp. ☞ Page 1196 Converting the touch switch to lamp

Action of [Lamp (Timing to change shape/text)]

Select how to switch touch switch images (shapes of on status and off status).

To switch the touch switch image using the lamp on and lamp off status in combination with the key touch on and key touch off status, refer to the following.

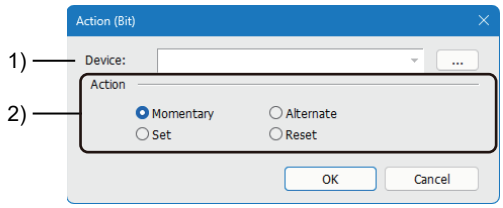
☞ Page 1257 [Style] tab

Item		Description
[Key Touch State]		The shape of the key touch on status is displayed while you press the touch switch. The shape of the key touch off status is displayed while you do not press the touch switch.  The shape of on status is displayed while you touch the touch switch.  The shape of off status is displayed regardless of the device status while you do not touch the touch switch.
[Bit-ON/OFF]		When the bit device set in [Device] turns on, the shape of the lamp off status is switched to the shape of the lamp on status. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags Example) Bit: When M100 is set  The shape of on status is displayed when M100 is on.  The shape of off status is displayed when M100 is off.
[Word Range]	-	When the word device set in [Device] is within the range specified in [ON Range], the shape of the lamp off status is switched to the shape of the lamp on status. After selecting this item, set the followings.
	[Data Type]	Select the data type of the word device.
	[Device]	Set a word device. ☞ Page 834 How to set devices, labels, and tags
	[ON Range]	After setting the specified word device, click the [Exp] button to set the switching range between the shape of the lamp on status and the shape of the lamp off status. ☞ Page 988 Color settings

[Bit]

Set the function to turn on and off a bit device for a switch.

Set it in the [Action (Bit)] dialog displayed by clicking the [Bit] button.



Item			Description
1)	[Device]		Set the device to which the value is written. ☞ Page 834 How to set devices, labels, and tags
2)	[Action]	-	Select the function to be performed for the bit device as the destination when you press the switch.
		[Momentary]	Keeps the bit device on while the switch is being touched. ☞ Page 1216 Touch switch action with the bit momentary
		[Alternate]	Switches the ON/OFF status of the bit device with each touch of the switch.
		[Set]	Turns on the bit device when the switch is touched.
		[Reset]	Turns off the bit device when the switch is touched.

Precautions

■Cause of the bit device remaining on

If the following events occur while you press the touch switch for which the bit momentary is set, the bit device may remain on even after you release the finger from the switch.

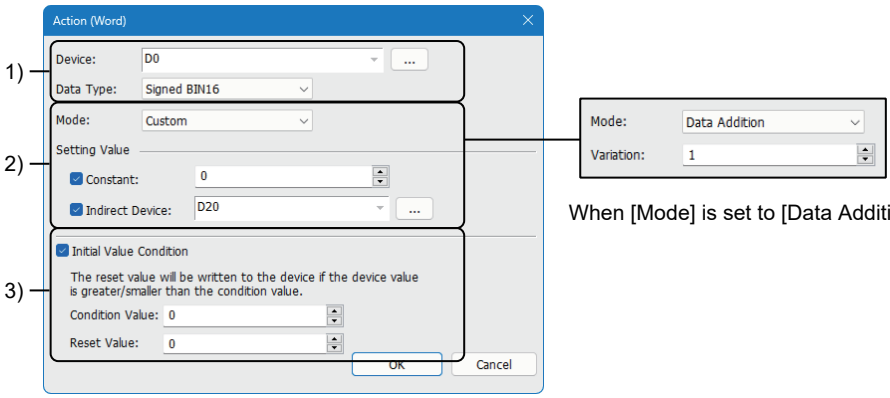
- Hardware failure of the GOT
- Power-off of the GOT
- Communication error with controllers

As appropriate, set the timeout period of the on-status duration for the bit device, and set the operating condition so that the controller forcibly turns off the bit device in the case of the timeout.

[Word]

Set the function to change a word device value for a switch.

Set it in the [Action (Word)] dialog displayed by clicking the [Word] button.



When [Mode] is set to [Custom]

When [Mode] is set to [Data Addition] or [Data Subtraction]

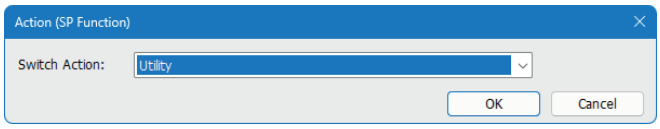
Item			Description
1)	[Device]		Set the word device to which a value is written. ☞ Page 834 How to set devices, labels, and tags
	[Data Type]		Select the data type of the values set in [Setting Value] and [Initial Value Condition]. ☞ Page 857 Data type of devices
2)	[Mode]		Set the writing mode for the specified word device. • [Custom] Select this item to write the value set in [Setting Value] to the specified word device. • [Data Addition] Select this item to add the value set in [Variation] to the value stored in the specified word device. • [Data Subtraction] Select this item to subtract the value set in [Variation] from the value stored in the specified word device.
	[Setting Value]	-	Set a value to be written to the specified word device when [Mode] is set to [Custom]. When [Constant] and [Indirect Device] are both selected, the value [Constant] + [Indirect Device] is written into the word device.
		[Constant]	Select this item and set a constant to write the constant to the specified word device. The setting range depends on the setting of [Data Type].
		[Indirect Device]	Select this item and specify an indirect device to write the value of the indirect device to the specified word device. ☞ Page 834 How to set devices, labels, and tags When the value set in [Indirect Device] exceeds the maximum value of the specified word device, the value is written with the excess rounded down. At this time, no system alarm occurs.
	[Variation]		Set this item when [Mode] is set to [Data Addition] or [Data Subtraction]. The setting range depends on the setting of [Data Type]. When [Mode] is set to [Data Addition], pressing the word switch adds the set value to the value stored in the specified word device. When [Mode] is set to [Data Subtraction], touching the word switch subtracts the set value from the value stored in the specified word device.
3)	[Initial Value Condition]	-	When the device value is above or below [Condition Value], [Reset Value] is written to the device. [When [Mode] is set to [Custom], select both [Constant] and [Indirect Device] to enable this setting.
		[Condition Value]	Set a condition value that is a trigger to write [Reset Value] to the specified word device. The setting range depends on the setting of [Data Type].
		[Reset Value]	Set a reset value. The setting range depends on the setting of [Data Type].

[Extended]

Set the function to switch the screen to the utility screen, add-on function screen, or other screens.

Select the function to be set for the switch in [Switch Action] in the [Action (SP Function)] dialog displayed by clicking the [Extended] button.

Multiple actions cannot be set when [Extended] is set as the action.



The settable actions and supported models are the same as those for special function switches.

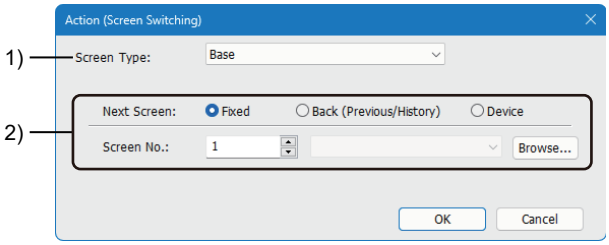
For details, refer to the following.

☞ Page 1231 Settable actions

[Screen Switching]

Set the screen switching function for a switch.

Set it in the [Action (Screen Switching)] dialog displayed by clicking the [Screen Switching] button.

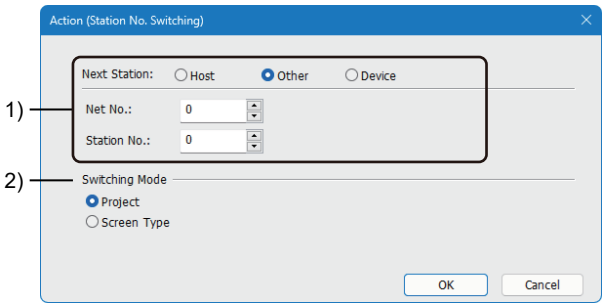


Item		Description
1)	[Screen Type]	Select the type of the screen to be switched to. The selectable items vary with the screen type. In either of the following cases, [(*)] is appended to the item selected for [Screen Type]. • [Close the window when switching base screens] is selected in the [Detail Setting] dialog in the [Environment Setting] window ([Screen Switching/Window]). • [Close the window when switching mobile screens] is selected in the [Detail Setting] dialog in the [GOT Mobile Setting] window ([Screen Switching/Window]).
2)	[Next Screen]	Select an action for screen switching.
		• [Fixed] Select this item to switch to the screen having the specified base screen number or window screen number. After selecting this item, set the screen number of the base screen or window screen as the destination screen in [Screen No.]. The screen can be selected from [Screen Image List] displayed by clicking the [Browse] button.
		• [Back (Previous/History)] You can select this item only when the screen after the switching is the base screen. Select this item to switch to the screen having the base screen number previously displayed. The switching action has the hierarchy mode and history mode. For details, refer to the following. ☞ Page 1223 Hierarchy mode and history mode
		• [Device] Select this item to switch to the base screen or the window screen having the specified screen number according to the on or off status or the current value of the specified device. Before specifying the device, select the data type of the device to be monitored. (Bit, Signed 16-bit binary data, or BCD16) After setting the device, click the [Detail Setting] button and configure the action settings for screen switching. ☞ Page 1221 [Details of Action] dialog

[Station No. Switching]

Set the station No. switching function for a switch.

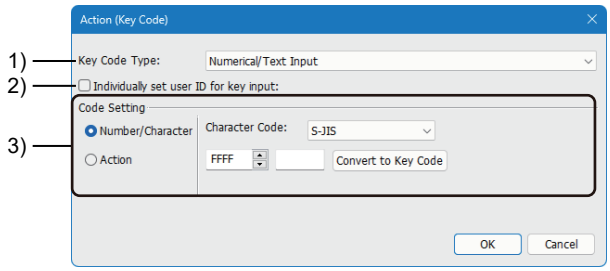
Set it in the [Action (Station No. Switching)] dialog displayed by clicking the [Station No. Switching] button.



Item		Description
1)	[Next Station]	Select an action for station number switching. • [Host] Select this item to monitor the station connected with the GOT. • [Other] Select this item to switch the monitoring target to another station. Set the destination network number in [Net No.] and the station number in [Station No.] in decimal. • [Device] Select this item to switch to another station according to the on or off status or the current value of the specified device. Before specifying the device, select the data type of the device to be monitored. (Bit, Signed 16-bit binary data, or BCD16) After specifying the device, click the [Detail Setting] button and configure the action settings. ☞ Page 1228 [Details of Action] dialog
2)	[Switching Mode]	Set the target to be switched. • [Project] Select this item to switch the whole project by the station number. • [Screen Type] Select this item to switch only the specified screen by the station number. When [Screen Type] is selected, select the screen after switching from [Screen Type].

[Key Code]

Set the code to be input to a numerical input object or a text input object with keys or code to operate an object.
Set it in the [Action (Key Code)] dialog displayed by clicking the [Key Code] button.



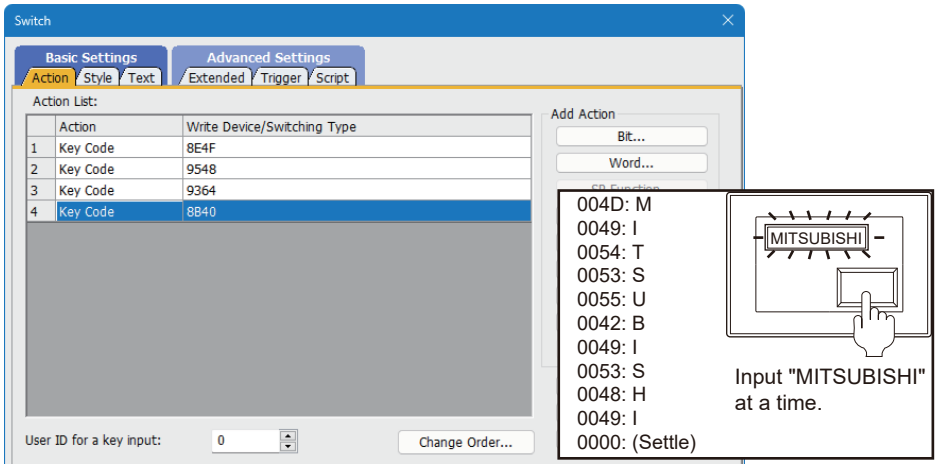
Item			Description
1)	[Key Code Type]		Specify the key code type. For the output conditions of the key code, refer to the following. ☞ Page 1253 Output conditions of key code For the settable key codes, refer to the following. ☞ Page 1253 Settable key codes
			• [Numerical/Text Input] Inputs a key code for the numerical input or text input where the cursor is displayed. ☞ Page 1306 Overview of the numerical display and numerical input objects ☞ Page 1308 How to use the numerical display and numerical input objects ☞ Page 1346 Overview of the text display and text input objects ☞ Page 1348 How to use the text display and text input objects
			• [Alarm Display] Inputs a key code for the alarm display (user), alarm display (system), or simple alarm display. ☞ Page 2132 Viewing alarm events (Alarm display) ☞ Page 1521 How to use the simple alarm display
			• [Recipe Display (Record List)] Inputs a key code for the recipe display (record list). ☞ Page 1551 Specifications of the recipe display (record list)
			• [Historical Trend Graph/Historical Data List] Inputs a key code for the historical trend graph or historical data list display. ☞ Page 1693 Specifications of the historical trend graph
			• [Document Display] Inputs a key code for the document display. ☞ Page 1821 How to use the document display (for Document Converter output files)
2)	[Individually set user ID for key input]		To specify the objects for the input individually, select this item and specify the user ID of the object for the input. Set the user ID set in this item and [User ID] of the input target object to be the same. When this item is not selected, the operation target is the user specified in [User ID for a key input] in the [Switch] dialog. The setting range is [0] to [65535].
3)	[Code Setting]	-	Select the action type of the key code. For the settable key codes, refer to the following. ☞ Page 1253 Settable key codes
		[Number/Character]	Set this item when [Numerical/Text Input] is selected for [Key Code Type]. Select this item to input numeric values or characters using the key code. Select the character code used from [Character Code], enter a numerical value or character in the input field, and click the [Convert to Key Code] button. The entered value or character is automatically converted to its key code. When [Not specify] is selected for [Character Code], no character code conversion is executed and the key code switch operates using the character code set in the linked text input.
		[Action]	Sets an action using its key code. Selecting [Switch window screens for text (screen no. specification)] displays a spin box. Specify the screen to be displayed. The setting range is [1] to [10].

■Specifying multiple key codes

Multiple key codes can be set to one switch.

Setting multiple key codes can create the switch that the character string can be input with a single touch of the switch.

For a single switch, key code actions whose [Key Code Type] is [Numerical/Text Input] and key code actions with other key code types cannot set.



When you arrange the switch, to which multiple key codes are set, on a user-created key window, only the first key code can be executed.

When multiple key codes are entered for alarms, only the first key code can be executed.

Precautions

If you set a key code shown below, the subsequent key codes become disabled.

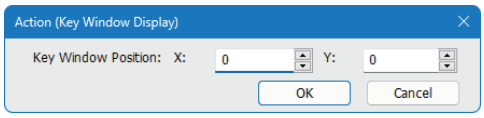
as the other key codes will not be executed if set after them.

[Key Code Type]	Key code (HEX)	Description
[Numerical/Text Input]	000D	Writes to the device and moves the cursor.
	001B	Hides the cursor.
	0080	Moves the cursor to the right.
	0081	Moves the cursor to the left.
	0082	Moves the cursor up.
	0083	Moves the cursor down.
	0084	Converts the entry to kanji or Simplified Chinese characters.
	0085	Displays the previous option.
	0086	Displays the next option.
	0087	Select/Not convert
	0092	Moves the cursor in the user ID ascending order.
	0093	Moves the cursor in the user ID descending order.
[Alarm Display]	FFB4	Changes the status of the selected alarm to "Checked" (Check)
	FFB5	Changes all the alarm statuses to "Checked" (Check all)
	FFB6	Deletes the selected restored alarm (Delete).
	FFB7	Deletes all the restored alarms (Delete all).
	FFB8	Displays the detail/Moves to the lower hierarchy.
	FFB9	Resets the selected alarm data.
	FFBB	Saves the alarm details to the data storage.
	FFC2	Moves to the upper hierarchy.

[Key Window Display]

Set the key window display function for a switch.

Set it in the [Action (Key Window Display)] dialog displayed by clicking the [Key Window Display] button.



Item	Description
[Key Window Position]	Specify the position (top-left coordinate) where the key window is displayed. The maximum settable value is one dot smaller than the vertical or horizontal size of the GOT screen. • [X] Specify the coordinate value of the X axis. • [Y] Specify the coordinate value of the Y axis. 
■Setting required for key window display

To display a key window with a switch, set the following.

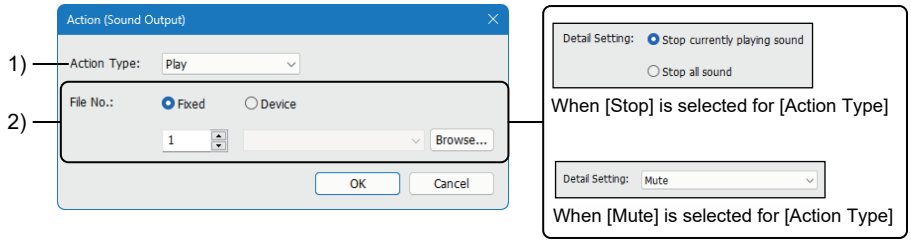
• Object having the same user ID as the one specified in [User ID for a key input] in the [Switch Action] tab

If the above is not set, the key window is not displayed even when the switch is touched.

[Sound Output]

Set the sound output function for a switch.

Set it in the [Action (Sound Output)] dialog displayed by clicking the [Sound Output] button.



Item		Description
1)	[Action Type]	Select an action of the sound output.
2)	[File No.]	Set the sound to be played when selecting [Play] for [Action Type]. • [Fixed] Select this item to specify a sound file number. After selecting this item, set the sound file number in the [Sound File List] dialog displayed by clicking the [Browse] button. The setting range is [1] to [500]. ☞ Page 2715 [Sound File List] dialog • [Device] Select this item to specify a sound file number with the value of a specified device. Select this item and set the device.
	[Detail Setting]	Set this item when selecting [Stop] or [Mute] for [Action Type].
		Set either of the following when selecting [Stop] for [Action Type]. • [Stop currently playing sound] Stops the current playback. The standby sound file plays subsequently. • [Stop all sound] Stops the current playback and cancels all standby sound files.
		Set either of the following when selecting [Mute] for [Action Type]. • [Mute] • [Unmute] • [Mute/unmute]

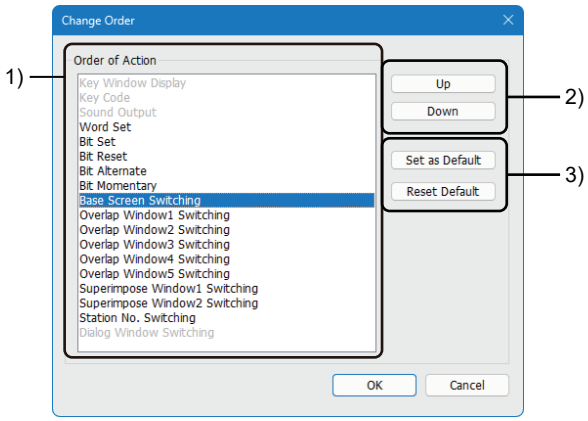
[Change Order] dialog

Set the execution order of actions in [Action List] in the [Switch] dialog ([Switch Action] tab).

The settable number and priority differ depending on the action type.

For details, refer to the following.

☞ Page 1211 Settable numbers and availabilities of order change of actions



Item		Description
1)	[Order of Action]	The actions are executed in the order from the top. The key code is executed first. Therefore the action order cannot be changed. You can change the order of the third and subsequent actions.
2)	[Up] button	Places the order of the action selected in [Order of Action] to one earlier.
	[Down] button	Places the order of the action selected in [Order of Action] to one later.
3)	[Set as Default] button	Sets the order currently set in [Order of Action] as default.
	[Reset Default] button	Restores the order in [Order of Action] to the default one.

■Settable numbers and availabilities of order change of actions

The following table lists the settable number and availability of order change of each action.

Default action order	Action type	Maximum settable value	Change of action order
1	Key window display	1	Unavailable
2	Key code	16	
3	Sound output	1	
4	Word set	20	Available
5	Bit set	20	
6	Bit reset	20	
7	Bit alternate	20	
8	Bit momentary	20	
9	Base screen switching	1	
10	Overlap window 1 screen switching	1	
11	Overlap window 2 screen switching	1	
12	Overlap window 3 screen switching	1	
13	Overlap window 4 screen switching	1	
14	Overlap window 5 screen switching	1	
15	Superimpose window 1 screen switching	1	
16	Superimpose window 2 screen switching	1	
17	Station number switching	9	
18	Dialog window screen switching	1	Unavailable This action is executed last.
Total		136	

- Reading/writing data from/to devices by using the touch switch are executed for all the set switch actions at once.
- The order in which the bit, word, and double-word devices are handled in each controller is determined by the specifications of the controller.

Accordingly, the actions (word set, bit set, bit reset, bit alternate, and bit momentary) that are set for the switch may not be executed in the user-specified order.

- If an error occurs while the GOT reads the data from the device, the GOT does not write the data to the device.
- If an error occurs while the GOT writes the data to the device, the GOT writes the data to the device for the other assigned actions.

Ex.

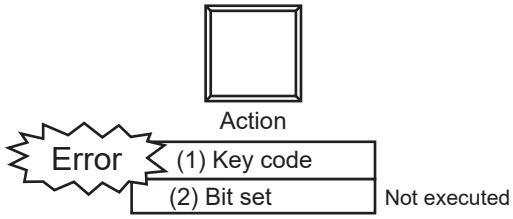
◇Action example 1

When the following actions and action order are set and an error occurs during the action of (1) Key code, the processing is interrupted.

Thus, the action of (2) Bit set is not executed.

(1)Key code: FFBBh (Save alarm contents to data storage)

(2) Bit set



◇Action example 2

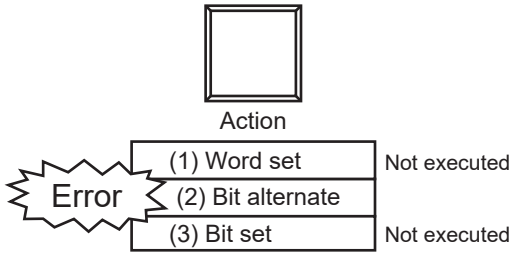
When the following actions and action order are set and an error occurs while the data (the previous value of the bit) is being read from the device for the action of (2) Bit alternate, the processing is interrupted.

Thus, both (1) Word set and (3) Bit set are not executed.

(1) Word set

(2) Bit alternate

(3) Bit set



◇Action example 3

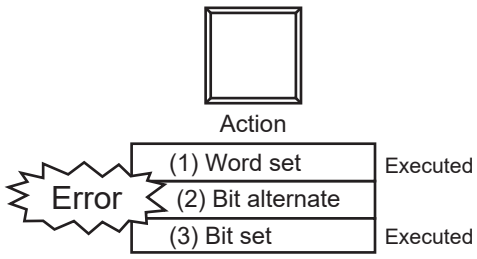
When the following actions and action order are set and an error occurs while the data (the alternated value of the bit) is being written to the device for the action of (2) Bit alternate, the processing is not interrupted.

Thus, both (1) Word set and (3) Bit set are executed.

(1) Word set

(2) Bit alternate

(3) Bit set



27.5.2 [Style] tab

The setting items in this tab are common to those in the setting dialog for each touch switch.
Refer to the following.
☞ Page 1257 [Style] tab

Item			Description
1)	[Device]		Set the device to which the value is written. ☞ Page 834 How to set devices, labels, and tags
2)	[Action]	-	Select the function to be performed for the bit device as the destination when you press the switch.
		[Momentary]	Keeps the bit device on while the switch is being touched. ☞ Page 1216 Touch switch action with the bit momentary
		[Alternate]	Switches the ON/OFF status of the bit device with each touch of the switch.
		[Set]	Turns on the bit device when the switch is touched.
		[Reset]	Turns off the bit device when the switch is touched.
3)	[Add] button		Switches to [Action] of [Switch]. ☞ Page 1199 [Action] tab
4)	[Lamp (Timing to change shape/text)]		Select how to switch touch switch images (shapes of on status and off status). ☞ Page 1201 Action of [Lamp (Timing to change shape/text)]
5)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be entered.
6)	[Convert to Lamp] button		Converts the object type to the lamp. ☞ Page 1196 Converting the touch switch to lamp

PART 7

Precautions

■Cause of the bit device remaining on

If the following events occur while you press the touch switch for which the bit momentary is set, the bit device may remain on even after you release the finger from the switch.

- Hardware failure of the GOT
- Power-off of the GOT
- Communication error with controllers

As appropriate, set the timeout period of the on-status duration for the bit device, and set the operating condition so that the controller forcibly turns off the bit device in the case of the timeout.

Touch switch action with the bit momentary

■Switching to the base screen or window screen

If the base screen switching is requested while you press the touch switch for which the bit momentary is set, the currently displayed base screen is switched to another base screen or window screen when you release the finger from the switch.

■When the operating condition of a touch switch being touched becomes unsatisfied

If the following cases occur while a touch switch is being touched, the set bit device turns off upon releasing the switch.

- The touch switch operating condition specified using [Operating Condition] becomes unsatisfied.
- The touch switch operating condition specified using [Control displaying/hiding] becomes unsatisfied.

■When the operating condition of a touch switch is unsatisfied

If you touch a touch switch while the bit device is on, the device turns off upon touching the switch even if its operating condition is unsatisfied.

Even if you select [Clear the input object] in the [Environmental Setting] window or the screen property, touching the switch turns off the device.

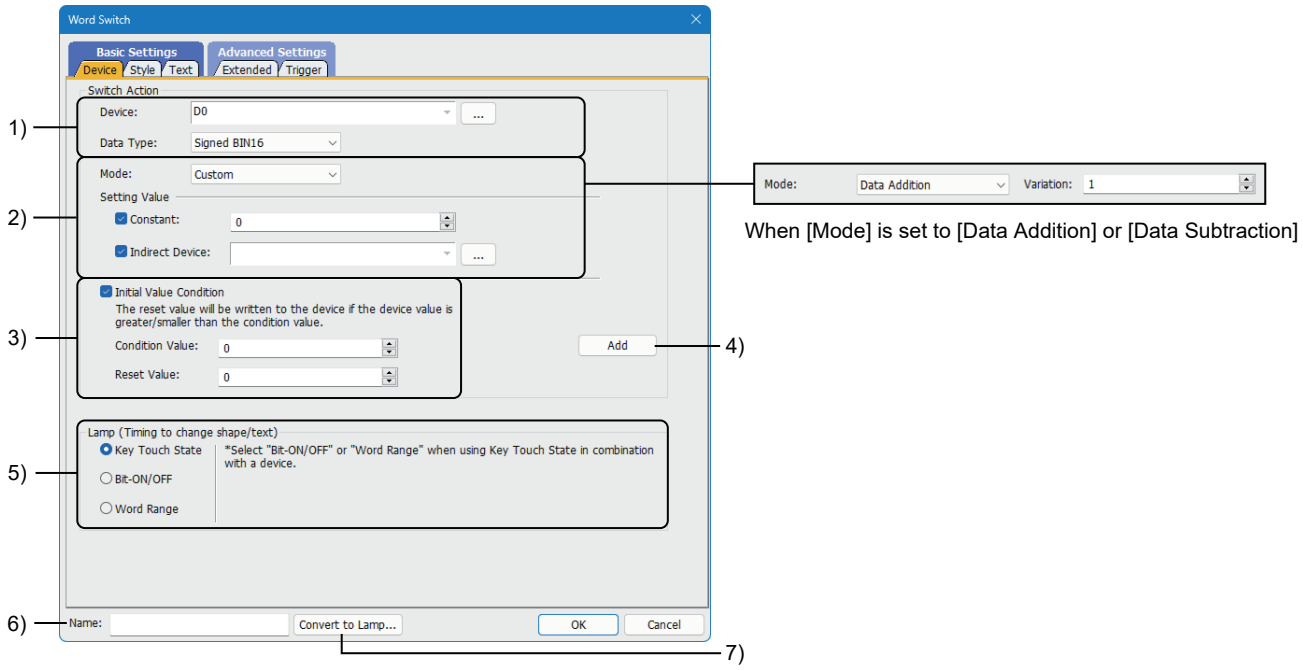
27.7.1 [Device] tab



When [Mode] is set to [Data Addition] or [Data Subtraction]

When [Mode] is set to [Custom]

Item		Description
1)	[Device]	Set the word device to which a value is written. ☞ Page 834 How to set devices, labels, and tags
	[Data Type]	Select the data type of the values set in [Setting Value] and [Initial Value Condition]. ☞ Page 854 Settable devices in GT Designer3

PART 7

Item			Description
2)	[Mode]		Set the writing mode for the specified word device. • [Custom] Select this item to write the value set in [Setting Value] to the specified word device. • [Data Addition] Select this item to add the value set in [Variation] to the value stored in the specified word device. • [Data Subtraction] Select this item to subtract the value set in [Variation] from the value stored in the specified word device.
	[Setting Value]	-	Set a value to be written to the specified word device when [Mode] is set to [Custom]. When [Constant] and [Indirect Device] are both selected, the value [Constant] + [Indirect Device] is written into the word device.
		[Constant]	Select this item and set a constant to write the constant to the specified word device. The setting range depends on the setting of [Data Type].
		[Indirect Device]	Select this item and specify an indirect device to write the value of the indirect device to the specified word device. ☞ Page 834 How to set devices, labels, and tags When the value set in [Indirect Device] exceeds the maximum value of the specified word device, the value is written with the excess rounded down. At this time, no system alarm occurs.
	[Variation]		Set this item when [Mode] is set to [Data Addition] or [Data Subtraction]. The setting range depends on the setting of [Data Type]. When [Mode] is set to [Data Addition], pressing the word switch adds the set value to the value stored in the specified word device. When [Mode] is set to [Data Subtraction], touching the word switch subtracts the set value from the value stored in the specified word device.
3)	[Initial Value Condition]	-	When the device value is above or below [Condition Value], [Reset Value] is written to the device. [When [Mode] is set to [Custom], select both [Constant] and [Indirect Device] to enable this setting.
		[Condition Value]	Set a condition value that is a trigger to write [Reset Value] to the specified word device. The setting range depends on the setting of [Data Type].
		[Reset Value]	Set a reset value. The setting range depends on the setting of [Data Type].
4)	[Add] button		Switches to [Action] of [Switch]. ☞ Page 1199 [Action] tab
5)	[Lamp (Timing to change shape/text)]		Select how to switch touch switch images (shapes of on status and off status). ☞ Page 1201 Action of [Lamp (Timing to change shape/text)]
6)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be entered.
7)	[Convert to Lamp] button		Converts the object type to the lamp. ☞ Page 1196 Converting the touch switch to lamp

27.7.2 [Style] tab

The setting items in this tab are common to those in the setting dialog for each touch switch.
Refer to the following.
☞ Page 1257 [Style] tab

27.7.3 [Text] tab

The setting items in this tab are common to those in the setting dialog for each touch switch.
Refer to the following.
☞ Page 1260 [Text] tab

27.7.4 [Extended] tab

The setting items in this tab are common to those in the setting dialog for each touch switch.
Refer to the following.
☞ Page 1266 [Extended] tab

27.7.5 [Trigger] tab

The setting items in this tab are common to those in the setting dialog for each touch switch.
Refer to the following.

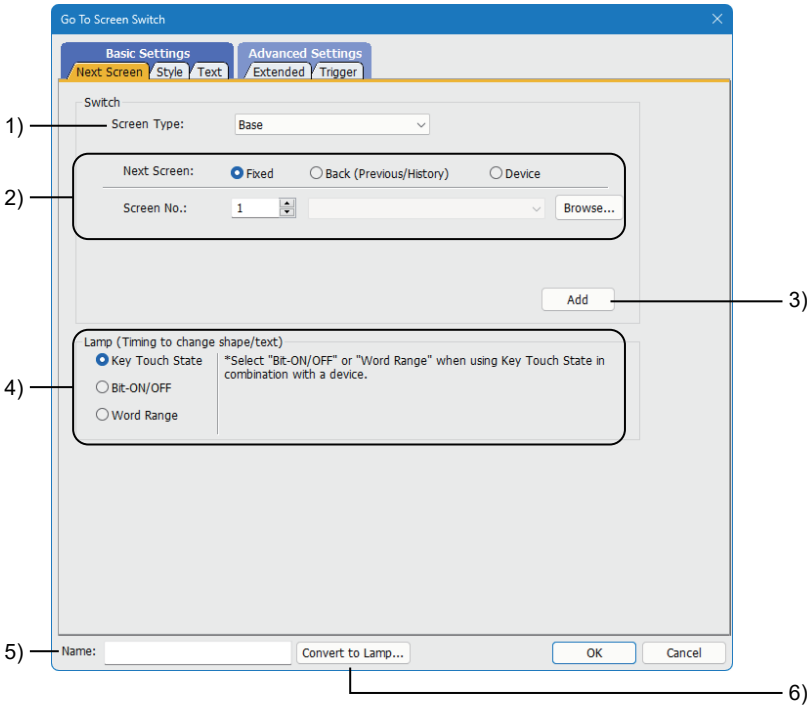
☞ Page 1260 [Text] tab
☞ Page 1266 [Extended] tab
☞ Page 1270 [Trigger] tab

27.8.1 [Next Screen] tab



Item		Description
1)	[Screen Type]	Select the type of the screen to be switched to. The selectable items vary with the screen type. In either of the following cases, [(*)] is appended to the item selected for [Screen Type]. • [Close the window when switching base screens] is selected in the [Environment Setting] window ([Screen Switching/Window]). • [Close the window when switching mobile screens] is selected in the [GOT Mobile Setting] window ([Screen Switching/Window]).
2)	[Next Screen]	Select an action for screen switching.
		• [Fixed] Select this item to switch to the screen having the specified base screen number or window screen number. After selecting this item, set the base screen number or the window screen number. The screen can be selected from [Screen Image List] displayed by clicking the [Browse] button.
		• [Back (Previous/History)] You can select this item only when the screen type is the base screen. Select this item to switch to the screen having the base screen number previously displayed. The switching action has the hierarchy mode and history mode. For details, refer to the following. ☞ Page 1223 Hierarchy mode and history mode
		• [Device] Select this item to switch to the base screen or the window screen having the specified screen number according to the on or off status or the current value of the specified device. Before specifying the device, select the data type of the device to be monitored. After setting the device, click the [Detail Setting] button and configure the action settings for screen switching. ☞ Page 1221 [Details of Action] dialog

Item		Description
3)	[Add] button	Switches to [Action] of [Switch]. ☞ Page 1199 [Action] tab
4)	[Lamp (Timing to change shape/text)]	Select how to switch touch switch images (shapes of on status and off status). For details, refer to the following. ☞ Page 1201 Action of [Lamp (Timing to change shape/text)]
5)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be entered.
6)	[Convert to Lamp] button	Converts the object type to the lamp. ☞ Page 1196 Converting the touch switch to lamp

[Details of Action] dialog

This dialog is displayed when the [Detail Setting] button is clicked after [Device] is set.

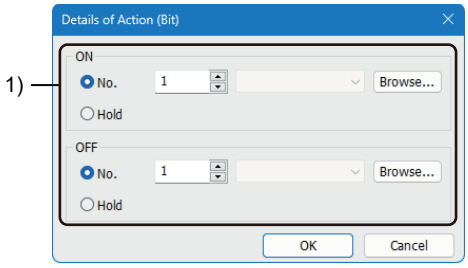
The displayed dialog differs depending on the device type.

☞ Page 1221 [Details of Action (Bit)] dialog

☞ Page 1222 [Details of Action (Word)] dialog

■[Details of Action (Bit)] dialog

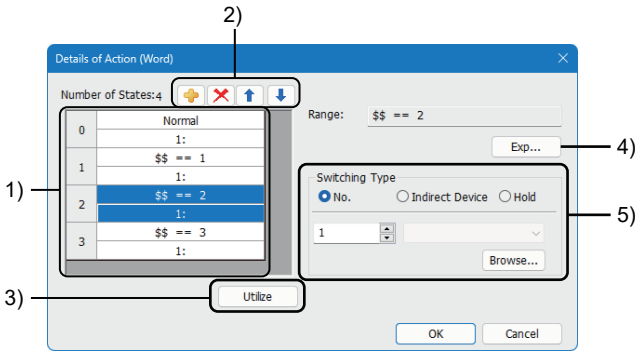
This dialog is displayed when a bit device is specified.



Item		Description
1)	[No.]	Select this item to switch to the base screen or window screen having the specified screen number according to the on or off status of the specified bit device. Set the destination screen number. The screen can be selected from [Screen Image List] displayed by clicking the [Browse] button.
	[Hold]	Select this item not to switch the screens when the specified bit device is on or off.

■[Details of Action (Word)] dialog

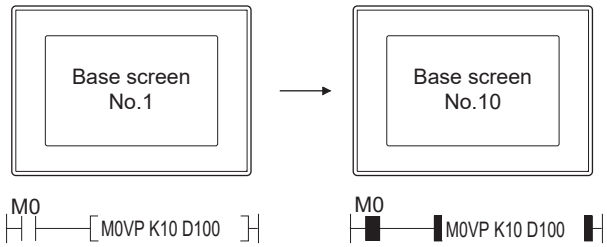
This dialog is displayed when a word device is specified.



Item		Description
1)	Preview list	Displays the set conditions in the list.
2)	Add button	Adds a new condition.
	Delete button	Deletes the condition selected in the preview list.
	Up button Down button	Changes the sorting order of the conditions in the preview list. The smaller the numerical value is, the higher the priority is.
3)	[Utilize] button	Creates a new condition utilizing the condition selected in the preview list.
4)	[Exp] button	Set the range of the word device value for screen switching using a conditional expression. ☞ Page 1043 [Edit Range] dialog
5)	[Switching Type]	Select the display type to switch the screen when the value of the specified word device satisfies the conditional expression set in [Range]. • [No.] The screen is switched to the base screen or the window screen having the specified number. The screen can be selected from [Screen Image List] displayed by clicking the [Browse] button. • [Indirect Device] The screen switches to the screen having the number equal to the value of the specified word device. • [Hold] The screen is not switched.

Point

In the sequence program, the value of the destination screen number is written as the value of the screen switching device. Base screens and window screens can be switched without using the screen switching function of the touch switch.



However, if the screen switching device for the base screen or window screen is the GOT internal device (GB, GD, GS), the screens cannot be switched with the sequence program.

Hierarchy mode and history mode

Selecting [Back (Previous/History)] for [Next Screen] allows you to use either of the following modes.

The mode is set for the whole project.

Mode	Description
Hierarchy mode (Default)	The screen returns to the base screen in the higher hierarchy when you touch the touch switch in the hierarchy mode. The screen can return to the base screen of up to the 10 level higher in the hierarchy. Example) After the screen is switched in the order of (1) → (2) → (3), the screen returns to the base screen 1 in the higher hierarchy by touching the previous screen display touch switch on the base screen 2. Historical mode	The screen returns to the immediately previous base screen when you press the touch switch. The screen can return to up to 10 previous base screens. Example) After the screen is switched in the order of (1) → (2) → (3), the screen returns to the immediately previous base screen 3 by pressing the previous screen display touch switch on the base screen 2. The screen returns to the base screen 2 then base screen 1 at every touch on the previous screen display touch switch on each screen. 
■How to switch the hierarchy mode and history mode

The default setting is the hierarchy mode.

Switch the modes with either of the following methods.

Switching method	Description
Setting the mode with GT Designer3	Set the mode by selecting [Back Screen Switching] in the window displayed by selecting [Common] → [GOT Environmental Setting] → [Screen Switching/Window]. You can switch between the hierarchy mode and the history mode. ☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])
Switching to the history mode with the GOT internal device (GS450.b14)	Using the trigger action function, turn on the GOT internal device GS450.b14 to change the hierarchy mode to history mode. Once you turn on this bit, the operation is performed in [Historical] until you power off the GOT even if you turn off the bit. Turning off the bit cannot change the mode to the hierarchy mode. For application examples, refer to the following. ☞ Page 1225 Enabling the history information to be saved in the memory card with the GOT internal device (GS450.b13)

■Retaining the hierarchy mode and history mode information

When the GOT is powered off, the hierarchy and history information becomes invalid.

When the GOT is powered off and on again, the screen does not return to the screen displayed before the power off even you touch the previous screen display touch switch.

As for the history information, saving it in the memory card allows you to read it from the memory card next time you start the GOT.

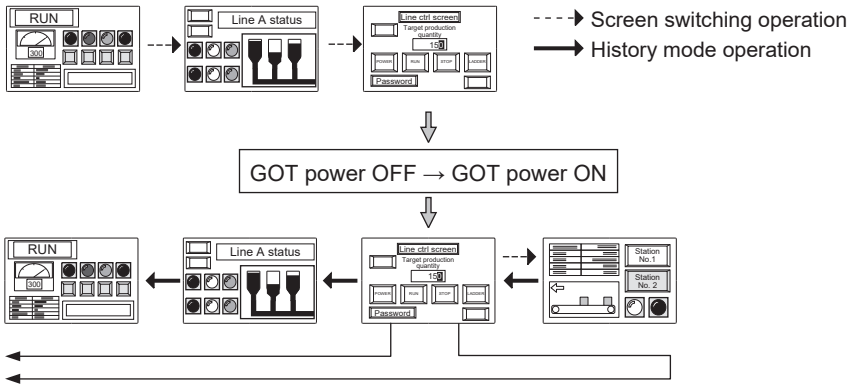
For details, refer to the following.

☞ Page 1224 Saving the history information in the memory card

Saving the history information in the memory card

In the history mode, the GOT can save a maximum of 10 screens in the history information to the memory card installed in the GOT.

Once you save the history information, touching the previous screen display touch switch can return the screen to the one displayed before the power off even after the GOT is powered off and on again.



Even after the GOT is powered on, the screen can be returned to the previous screen displayed before the power off.

The following shows how to save the history information in the memory card.

■Enabling the history information to be saved in the memory card in GT Designer3 settings

1. Select [Common] → [GOT Environmental Setting] → [Screen Switching/Windows] from the menu.
2. Select [History] in [Back Screen Switching], and then select [Store history to the memory card].

☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])

■Enabling the history information to be saved in the memory card with the GOT internal device (GS450.b13)

In the history mode (when GS450.b14 is on), turning on the GOT internal device (GS450.b13) enables the history information to be saved in the memory card.

Even if you turn off GS450.b13, saving the history information in the memory card is not disabled.

Ex.

The following shows the setting example for switching the mode with the GOT internal device using a trigger action.

Set a trigger action for changing the mode to the history mode in the first row in the [Project] tab of the [Trigger Action] dialog. This changes the mode to the history mode after the GOT is powered on.

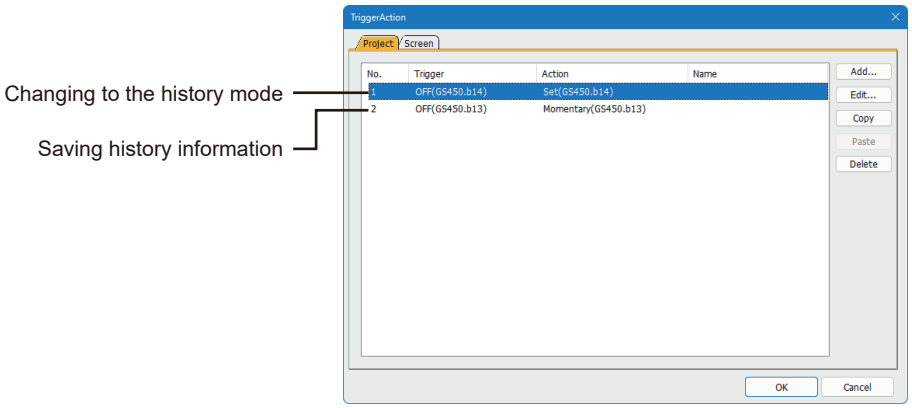
Then, set a trigger for saving the history information in the memory card.

For details on the trigger action, refer to the following.

☞ Page 2521 Operating a device as a trigger ([Trigger Action])

After screen transition is performed and then the mode is changed from the hierarchy mode to the history mode during monitoring, the GOT loses the screen information and thus the screen may not return according to the history.

If you use the history mode, set the history mode immediately after the GOT is powered on.



Precautions

When the history information is saved in the memory card, do not change the value of the screen switching device at the controller side while the GOT is powered off.

While the GOT is powered off, the history information is not saved. Therefore, the screen does not return according to the screen transition controlled on the controller side.

PART 7

27.8.2 [Style] tab

The setting items in this tab are common to those in the setting dialog for each touch switch.
Refer to the following.
☞ Page 1257 [Style] tab

27.8.3 [Text] tab

The setting items in this tab are common to those in the setting dialog for each touch switch.
Refer to the following.
☞ Page 1260 [Text] tab

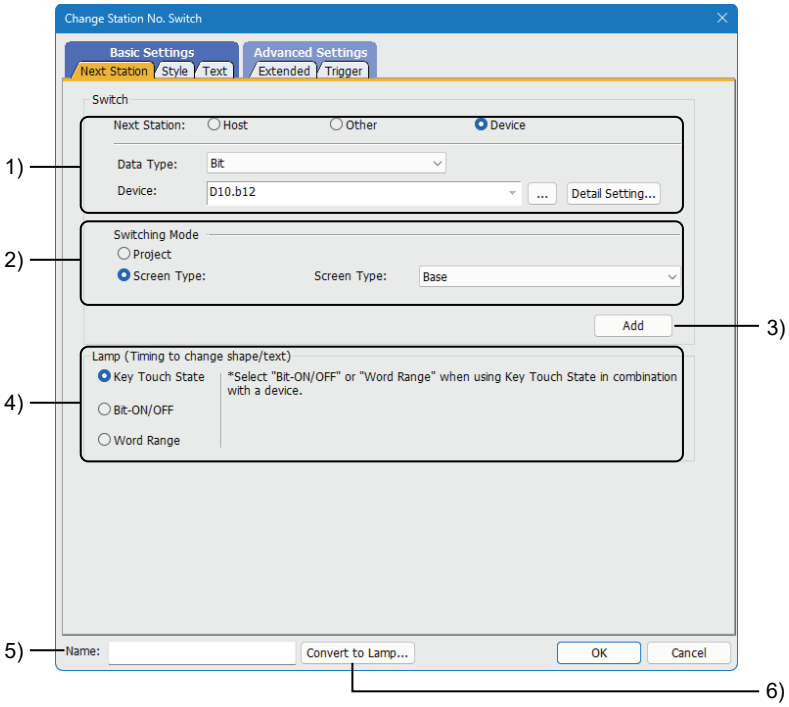
27.9.1 [Next Station] tab



Item		Description
1)	[Next Station]	Select an action for station number switching. • [Host] Select this item to monitor the station connected with the GOT. • [Other] Select this item to switch the monitoring target to another station. Set the destination network number in [Net No.] and the station number in [Station No.] in decimal. • [Device] Select this item to switch to another station according to the on or off status or the current value of the specified device. Before specifying the device, select the data type of the device to be monitored. (Bit, Signed 16-bit binary data, or BCD16) After specifying the device, click the [Detail Setting] button and configure the action settings. ☞ Page 1228 [Details of Action] dialog
2)	[Switching Mode]	Set the target to be switched. • [Project] Select this item to switch the whole project by the station number. • [Screen Type] Select this item to switch only the specified screen by the station number. When [Screen Type] is selected, select the screen after switching from [Screen Type].
3)	[Add] button	Switches to [Action] of [Switch]. ☞ Page 1199 [Action] tab
4)	[Lamp (Timing to change shape/text)]	Select how to switch touch switch images (shapes of on status and off status). For details, refer to the following. ☞ Page 1201 Action of [Lamp (Timing to change shape/text)]

PART 7

Item		Description
5)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be entered.
6)	[Convert to Lamp] button	Converts the object type to the lamp. ☞ Page 1196 Converting the touch switch to lamp

[Details of Action] dialog

This dialog is displayed when the [Detail Setting] button is clicked after [Device] is set.

The displayed dialog differs depending on the device type.

☞ Page 1228 [Details of Action (Bit)] dialog

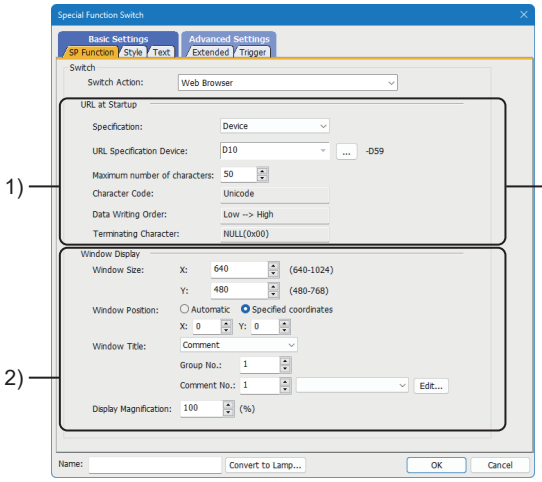
[File Manager]	Displays the file manager screen.	GT37 SoftGOT3000
[Video File Manager]	Displays the video file manager screen. ☞ Page 1247 Settings for [Video File Manager]	

[Web Browser] setting

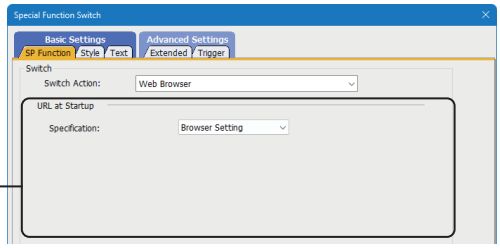
Set the operation and display of the web browser window opened by the special function switch.

For details on the web browser function, refer to the following.

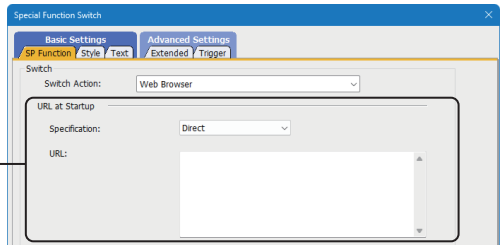
☞ Page 691 Setting the web browser function ([Web Browser])



When [Device] is selected for [Specification]



When [Browser Setting] is selected for [Switch Action]



When [Direct] is selected for [Specification]

Item			Description
1)	[URL at Startup]	—	Specify the URL of the page to be displayed when the web browser window is launched. Displayed items differ depending on the item set for [Specification].
		[Specification]	Select how to specify the URL. To specify a URL in the web browser window without using the special function switch, select [Browser Setting]. To specify a fixed URL, select [Direct] and set the URL. To specify a URL dynamically using devices while the GOT is operating, select [Device].
			When [Direct] or [Device] is selected, the URL to be entered must start with http:// or https://. If the URL does not start with http:// or https://, it is considered a format error and the website is not displayed. When [Browser Setting] is selected, the configured website URL is accessed. ☞ Page 709 [Web Browser] If a website URL is not configured, the startup URL when the web browser was previously launched is accessed. If a website URL is not configured and a valid URL does not exist, or if you start a web browser for the first time, a blank page is displayed.
		[URL]	This item appears when [Direct] is selected for [Specification]. Set a URL. Up to 512 characters can be set.
		[URL Specification Device]	This item appears when [Device] is selected for [Specification]. Set the start device for specifying the URL. The URL is specified using the number of devices set for [Maximum number of characters] from the start device. The data type is unsigned 16-bit binary.
		[Maximum number of characters]	This item appears when [Device] is selected for [Specification]. The setting range is [1] to [512].
		[Character Code]	This item appears when [Device] is selected for [Specification]. It is fixed to [Unicode].
		[Data Writing Order]	This item appears when [Device] is selected for [Specification]. It is fixed to [Low --> High].
		[Terminating Character]	This item appears when [Device] is selected for [Specification]. It is fixed to [NULL(0x00)].

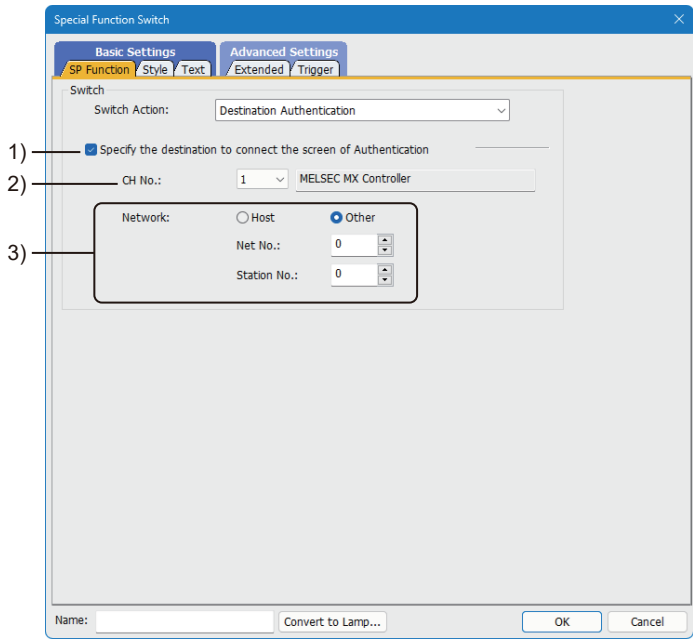
Item			Description
2)	[Window Display]	—	Set the size and display position of the web browser window when it is launched.
		[Window Size]	Set the sizes (vertical and horizontal) of the web browser window. The maximum settable value is the resolution size (vertical or horizontal) of the GOT.
		[Window Position]	Select the display position of the web browser window. When [Specified coordinates] is selected, set the coordinates of the display position in [X] and [Y]. The maximum settable value is the resolution size (vertical or horizontal) of the GOT.
		[Window Title]	Set the content to be displayed on the title bar of the web browser window. When [Comment] is selected, specify the comment to be displayed with [Group No.] and [Comment No.].
		[Display Magnification]	Select the display magnification of the page displayed in the web browser window. The setting range is [25]% to [200]%.

[Destination Authentication] settings

Set the connection destination for authentication using a special function switch.

To configure the destination authentication settings, set [MELSEC MX Controller] for [Controller Type] in the [Controller Setting] window.

☞ Page 729 [Controller Setting]



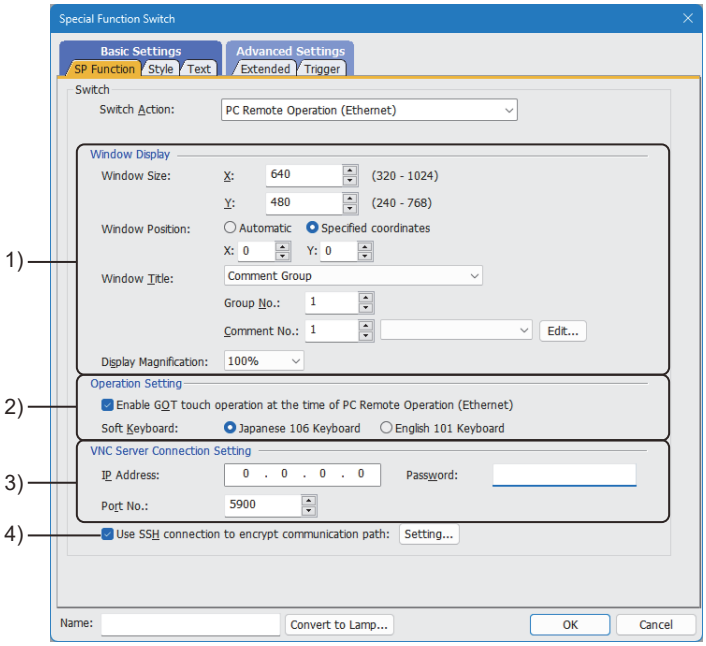
Item			Description
1)	[Specify the destination to connect the screen of Authentication]		Select this item to specify the connection destination for which authentication is performed or canceled.
2)	[CH No.]		Set the channel of the connection destination.
3)	[Network]	-	When [Other] is selected, set the network number and station number of the controller.
		[Net No.]	Set the network number of the controller.
		[Station No.]	Set the station number of the controller.

Settings for [PC Remote Operation (Ethernet)]

Set the personal computer screen on the GOT to be displayed.

For details on the remote personal computer operation function (Ethernet), refer to the following.

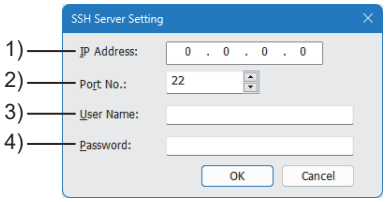
☞ Page 2613 Operating a personal computer by using the GOT (remote personal computer operation function (Ethernet))



Item			Description
1)	[Window Display]	-	Configure the window display settings on the remote personal computer screen.
		[Window Size]	Set the display size of the personal computer screen on the GOT in the window display mode. • [X]: The setting range is [320] to the horizontal resolution of the GOT. • [Y]: The setting range is [240] to the vertical resolution of the GOT.
		[Window Position]	Select the display position of the personal computer screen on the GOT in the window display mode. • [Automatic] The position of the overlap window displayed on the screen is automatically set as the window position of the remote personal computer operation (Ethernet). • [Specified coordinates] Set the top-left coordinates of the window position for the remote personal computer operation (Ethernet). If the window is placed beyond the screen, the coordinate is adjusted so that the whole window is displayed on the screen.
		[Window Title]	Select the title to be displayed in the title bar of the personal computer screen on the GOT. • [Display as "PC Remote Operation (Ethernet)"] Select [PC Remote Operation (Ethernet)] in the title bar. • [IP Address] Displays the IP address of the connected personal computer in the title bar. • [Comment Group] Displays the comment of a comment number specified in the title bar. Click the [Edit] button to edit the comment with the specified comment number. ☞ Page 3685 [Edit Comment] dialog
		[Display Magnification]	Select the display magnification of the personal computer screen on the GOT.
2)	[Operation Setting]	-	Configure the operation settings for the remote personal computer screen.
		[Enable GOT touch operation at the time of PC Remote Operation (Ethernet)]	Select this item to enable the touch operation on the GOT while the personal computer screen is displayed.
		[Soft Keyboard]	Select the soft keyboard type used on the personal computer screen.

Item			Description
3)	[VNC Server Connection Setting]	-	Configure the connection settings for the VNC server.
		[IP Address]	Set the IP address of the VNC server. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
		[Password]	Set the password for connection with the VNC server. Up to 31 uppercase and lowercase alphabetic characters, numbers, one-byte spaces, and the symbols below are usable for a password. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~
		[Port No.]	Set the port number for connection with the VNC server. The setting range is [1024] to [65535].
4)	[Use SSH connection to encrypt communication path]		Configure the SSH connection settings. ☞ Page 1237 [SSH Server Setting] dialog

■[SSH Server Setting] dialog



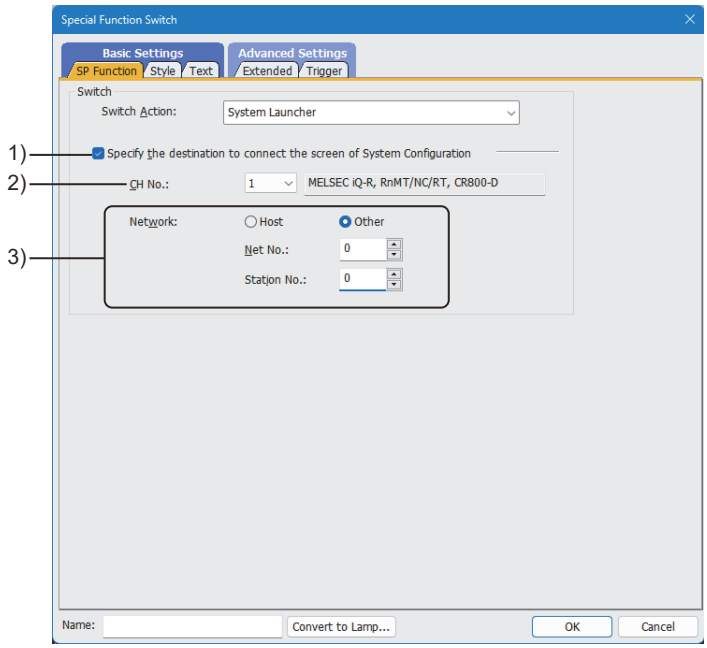
Item		Description
1)	[IP Address]	Set the IP address of the SSH server. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
2)	[Port No.]	Set the SSH server port number. The setting range is [22] and [1024] to [65535].
3)	[User Name]	Set the user name for connection with the SSH server. Up to 32 uppercase and lowercase alphabetic characters, numbers, one-byte spaces, and the symbols below are usable for a user name. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~
4)	[Password]	Set the password for connection with the SSH server. Up to 32 uppercase and lowercase alphabetic characters, numbers, one-byte spaces, and the symbols below are usable for a password. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~

Settings for [System Launcher]

Set a controller connected when the system configuration screen of the system launcher is called up with a special function switch.

For details on the system launcher function, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)



Item			Description
1)	[Specify the destination to connect the screen of System Configuration]		Select this item to specify the connection destination for the system configuration screen.
2)	[CH No.]		Select the channel number of the controller to be monitored. Only the channel number whose controller is any of the following models can be selected. • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700] • [MELSEC-L] • [MELIPC]
3)	[Network]	-	When [Other] is selected, set the network number and station number of the controller.
		[Net No.]	Set the network number of the controller. The setting range is [0] to [255].
		[Station No.]	Set the station number of the controller. The setting range is [0] to [120].

Settings for [Sequence Program Monitor (iQ-R/iQ-L Ladder)]

Set the ladder search method by the one-touch ladder jump function.

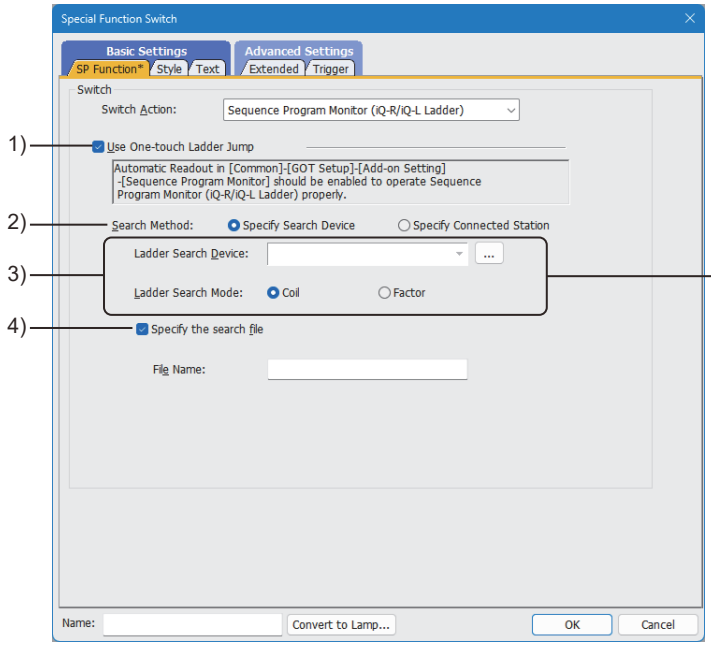
Before the ladder search setting, configure the following setting.

- Select [Common] → [GOT Setup] → [Add-on Setting] → [Sequence Program Monitor] from the menu.
- Select [Update the sequence program monitor setting], and then select [Automatically read out a sequence program] of [Operation when starting Sequence Program Monitor].

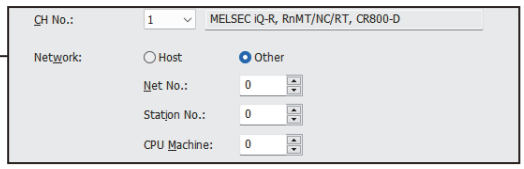
☞ Page 651 [Sequence Program Monitor]

For details on the sequence program monitor (iQ-R/iQ-L ladder) function, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)



Select [Specify Search Device] for the search method.



Select [Specify Connected Station] for the search method.

Item			Description
1)	[Use One-touch Ladder Jump]		Select this item when using the one-touch ladder jump function.
2)	[Search Method]		Select a search method used at the sequence program monitor (iQ-R/iQ-L ladder) startup. • Select [Specify Search Device] to search for files and devices. • Select [Specify Connected Station] to search for controllers and files.
3)	[Ladder Search Device]		When [Specify Search Device] is selected for [Search Method], set a device to be searched for at the sequence program monitor (iQ-R/iQ-L ladder) startup. ☞ Page 834 How to set devices, labels, and tags
	[Ladder Search Mode]		When [Specify Search Device] is selected for [Search Method], select the search mode.
	[CH No.]		When [Specify Connected Station] is selected for [Search Method], set a channel number to be searched. Only the channel number whose controller is any of the following models can be selected. • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELIPC] • Set a channel number to be searched for.
	[Network]	-	When [Specify Connected Station] is selected for [Search Method], set the controller to be searched. When [Other] is selected, set the network number, PLC station number, and CPU number of the controller.
		[Net No.]	Set the network number of the controller.
		[Station No.]	Set the station number of the controller.
		[CPU Machine]	Set the CPU number of the controller.
4)	[Specify the search file]		Select this item to specify the name of the program file to be searched for. A file whose name is up to 60 characters long can be searched for. A file whose name includes both two-byte and one-byte characters can also be searched for. A file whose name includes one-byte spaces or any symbol below cannot be searched for. (" \ / ; : ? < > | + = [ ] . ,)

PART 7

Settings for [Sequence Program Monitor (iQ-F Ladder)]

Set the ladder search method by the one-touch ladder jump function.

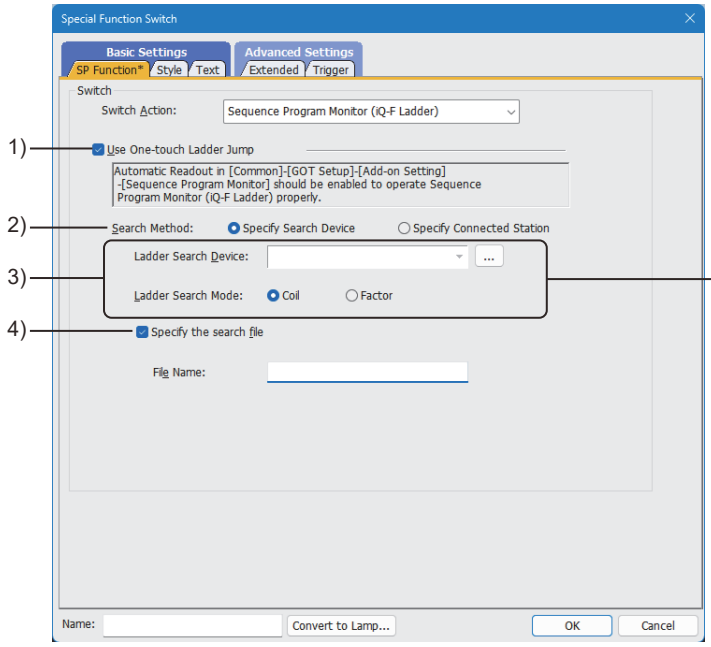
Before the ladder search setting, configure the following setting.

- Select [Common] → [GOT Setup] → [Add-on Setting] → [Sequence Program Monitor] from the menu.
- Select [Update the sequence program monitor setting], and then select [Automatically read out a sequence program] of [Operation when starting Sequence Program Monitor].

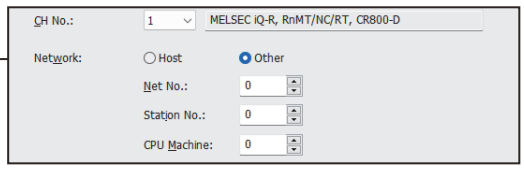
☞ Page 651 [Sequence Program Monitor]

For details on the sequence program monitor (iQ-F ladder) function, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)



Select [Specify Search Device] for the search method.



Select [Specify Connected Station] for the search method.

Item			Description
1)	[Use One-touch Ladder Jump]		Select this item when using the one-touch ladder jump function.
2)	[Search Method]		Select a search method used at the sequence program monitor (iQ-F ladder) startup. • Select [Specify Search Device] to search for files and devices. • Select [Specify Connected Station] to search for controllers and files.
3)	[Ladder Search Device]		When [Specify Search Device] is selected for [Search Method], set a device to be searched for at the sequence program monitor (iQ-F ladder) startup. ☞ Page 834 How to set devices, labels, and tags
	[Ladder Search Mode]		When [Specify Search Device] is selected for [Search Method], select the search mode.
	[CH No.]		When [Specify Connected Station] is selected for [Search Method], set a channel number to be searched. Only the channel number whose controller is any of the following models can be selected. • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELSEC iQ-F] • [MELIPC] • Set a channel number to be searched for.
	[Network]	-	When [Specify Connected Station] is selected for [Search Method], set the controller to be searched. When [Other] is selected, set the network number, PLC station number, and CPU number of the controller.
		[Net No.]	Set the network number of the controller.
		[Station No.]	Set the station number of the controller.
		[CPU Machine]	Set the CPU number of the controller.
4)	[Specify the search file]		Select this item to specify the name of the program file to be searched for. A file whose name is up to 60 characters long can be searched for. A file whose name includes both two-byte and one-byte characters can also be searched for. A file whose name includes one-byte spaces or any symbol below cannot be searched for. (" \ / ; : ? < > | + = [ ] . ,)

Settings for [Sequence Program Monitor (Q/L Ladder)]

Set the ladder search method by the one-touch ladder jump function.

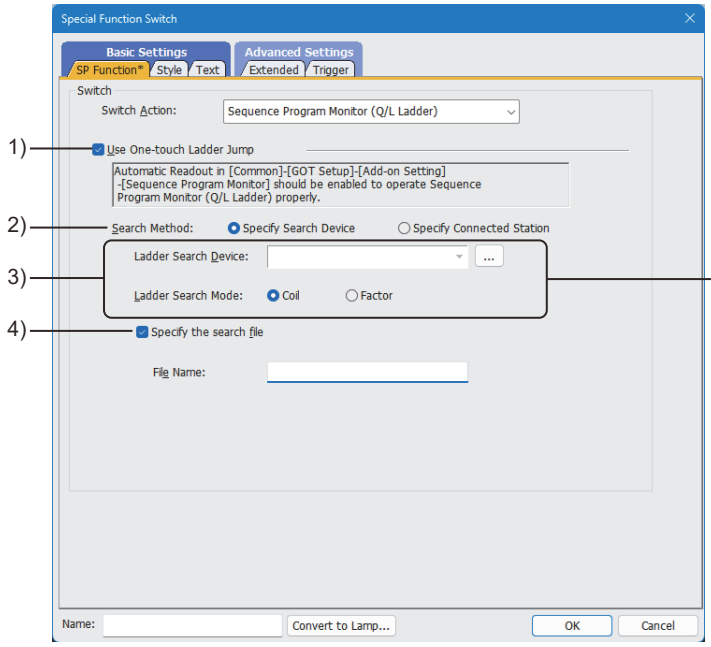
Before the ladder search setting, configure the following setting.

- Select [Common] → [GOT Setup] → [Add-on Setting] → [Sequence Program Monitor] from the menu.
- Select [Update the sequence program monitor setting], and then select [Automatically read out a sequence program] of [Operation when starting Sequence Program Monitor].

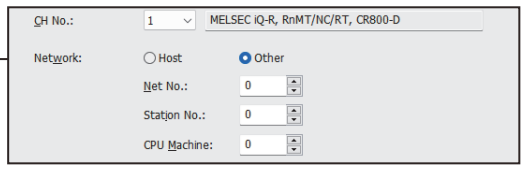
☞ Page 651 [Sequence Program Monitor]

For details on the sequence program monitor (Q/L ladder) function, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)



Select [Specify Search Device] for the search method.



Select [Specify Connected Station] for the search method.

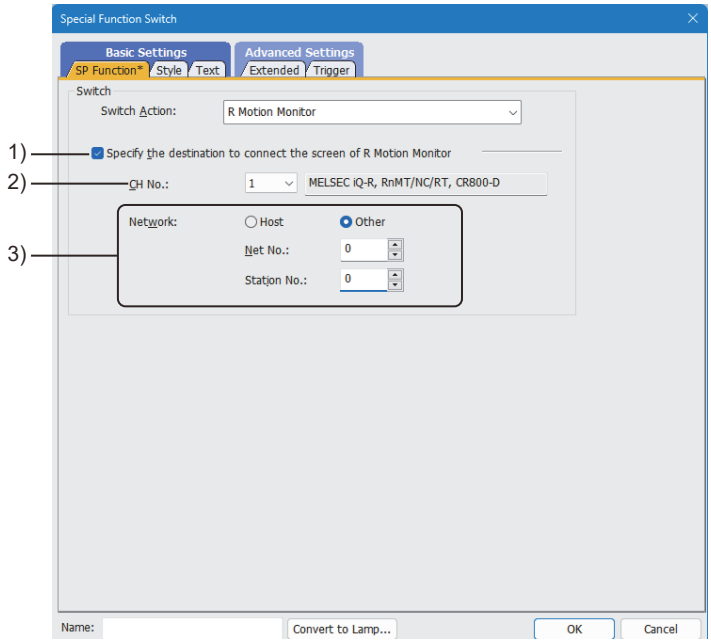
Item			Description
1)	[Use One-touch Ladder Jump]		Select this item when using the one-touch ladder jump function.
2)	[Search Method]		Select the search method at the sequence program monitor (Q/L ladder) startup. • Select [Specify Search Device] to search for files and devices. • Select [Specify Connected Station] to search for controllers and files.
3)	[Ladder Search Device]		When [Specify Search Device] is selected for [Search Method], set a device to be searched for at the sequence program monitor (Q/L ladder) startup. ☞ Page 834 How to set devices, labels, and tags
	[Ladder Search Mode]		When [Specify Search Device] is selected for [Search Method], select the search mode.
	[CH No.]		When [Specify Connected Station] is selected for [Search Method], set a channel number to be searched. Only the channel number whose controller is any of the following models can be selected. • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700] • [MELSEC-L] • [MELSEC-A] • [MELSEC-FX] • [MELIPC] • Set a channel number to be searched for.
	[Network]	-	When [Specify Connected Station] is selected for [Search Method], set the controller to be searched. When [Other] is selected, set the network number, PLC station number, and CPU number of the controller.
		[Net No.]	Set the network number of the controller.
		[Station No.]	Set the station number of the controller.
		[CPU Machine]	Set the CPU number of the controller.
4)	[Specify the search file]		Select this item to specify the name of the program file to be searched for. A file whose name is up to 60 characters long can be searched for. A file whose name includes both two-byte and one-byte characters can also be searched for. A file whose name includes one-byte spaces or any symbol below cannot be searched for. (" \ / ; : ? < > | + = [ ] . ,)

Settings for [R Motion Monitor]

Set a controller connected when the R motion monitor is started with a special function switch.

For details on the R motion monitor function, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)



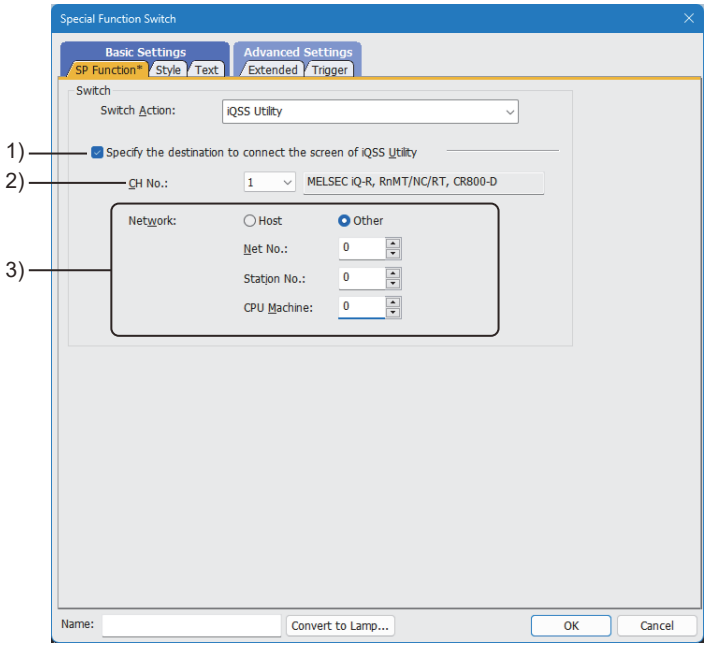
Item			Description
1)	[Specify the destination to connect the screen of R Motion Monitor]		Select this item to specify the connection destination for the R Motion monitor screen.
2)	[CH No.]		Select the channel number of the controller to be monitored. Only the channel number whose controller is any of the following models can be selected. • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELIPC]
3)	[Network]	-	When [Other] is selected, set the network number and station number of the controller.
		[Net No.]	Set the network number of the controller to be monitored. The setting range is [0] to [255].
		[Station No.]	Set the PLC station number of the controller to be monitored. The setting range is [0] to [120].

Settings for [iQSS Utility]

Set a controller connected when the iQSS utility screen is called up with a special function switch.

For details on the iQSS utility function, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)



Item			Description
1)	[Specify the destination to connect the screen of iQSS Utility]		Select this item to specify the connection destination for the iQSS utility screen.
2)	[CH No.]		Select the channel number of the controller to be monitored. Only the channel number whose controller is any of the following models can be selected. • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-F] • [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700] • [MELSEC-L] • [MELIPC]
3)	[Network]	-	When [Other] is selected, set the network number, station number, and CPU number of the controller.
		[Net No.]	Set the network number of the controller to be monitored. The setting range is [0] to [255].
		[Station No.]	Set the PLC station number of the controller to be monitored. The setting range is [0] to [120].
		[CPU Machine]	Set the CPU number of the controller to be monitored. The setting range is [0] to [4].

To use the iQSS utility special control, select [Specify the destination to connect the screen of iQSS Utility], and set the sensor device number to [Name].

Set [<iQSS=n>] (sensor device number) to [Name].

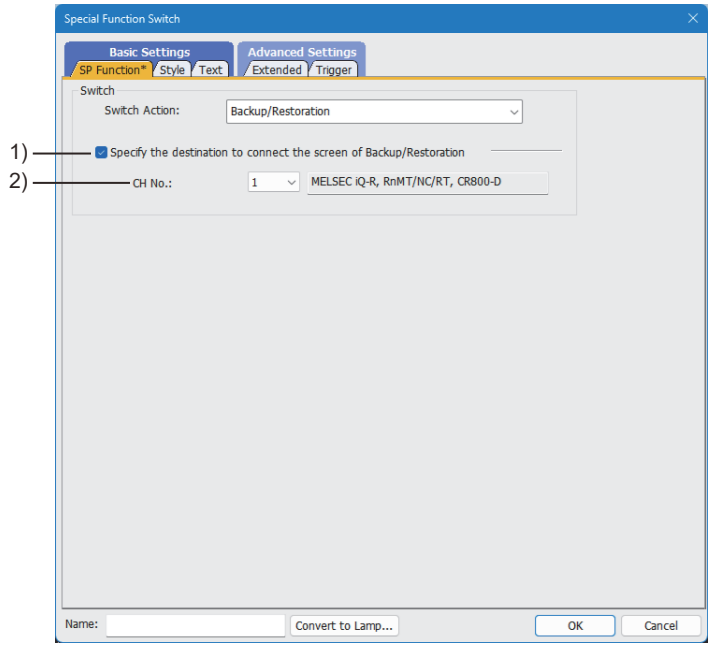
You can set 0 to 65534 to "n".

Settings for [Backup/Restoration]

Set a controller connected when the backup/restoration screen is called up with a special function switch.

For details on the backup/restoration function, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)



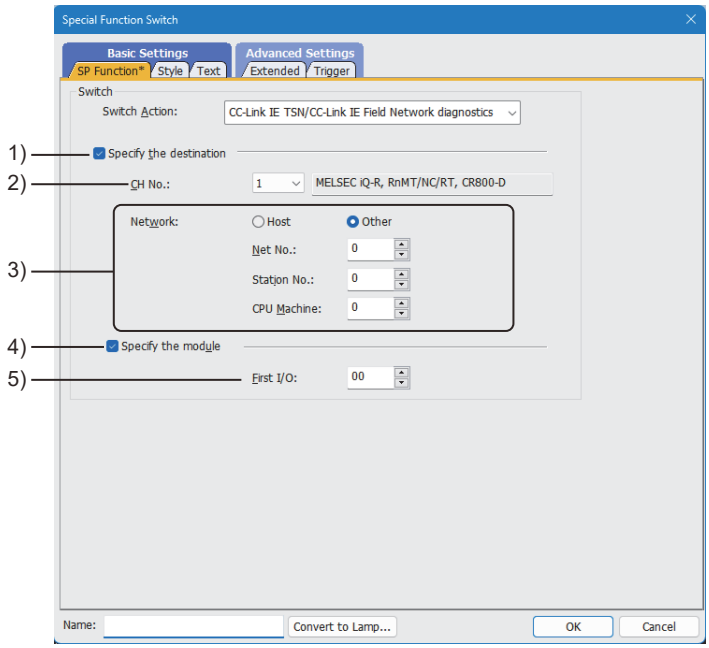
Item		Description
1)	[Specify the destination to connect the screen of Backup/Restoration]	Select this item to specify the connection destination for the backup/restoration screen.
2)	[CH No.]	Select the channel number of the controller to be monitored. Only the channel number whose controller is any of the following models can be selected. • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-F] • [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700] • [MELSEC-L] • [MELSEC-FX] • [MELIPC]

Settings for [CC-Link IE TSN/CC-Link IE Field Network diagnostics]

Set a controller connected when the screen for the CC-Link IE TSN/CC-Link IE Field Network diagnostics is called up with a special function switch.

For details on the CC-Link IE TSN/CC-Link IE Field Network diagnostics, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)



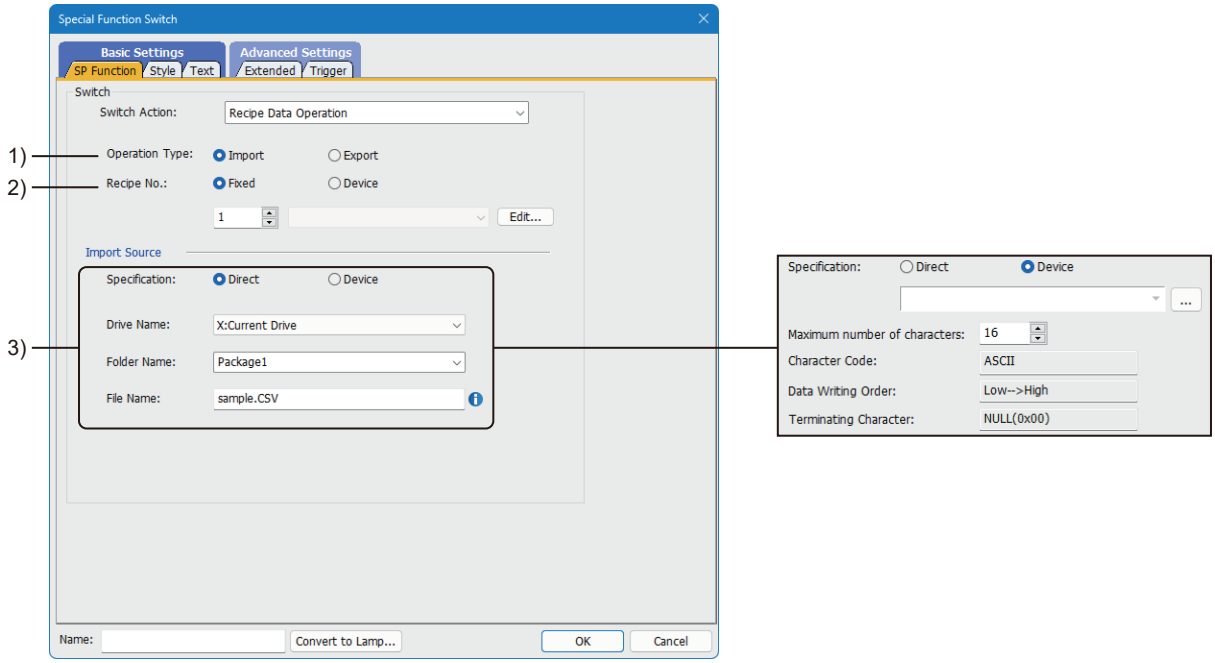
Item			Description
1)	[Specify the destination]		Select this item to specify the connection destination.
2)	[CH No.]		Select the channel number of the controller to be monitored. Only the channel number whose controller is any of the following models can be selected. • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-F] • [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700] • [MELSEC-L] • [MELIPC]
3)	[Network]	-	When [Other] is selected, set the network number, station number, and CPU number of the controller.
		[Net No.]	Set the network number of the controller to be monitored. The setting range is [0] to [255].
		[Station No.]	Set the PLC station number of the controller to be monitored. The setting range is [0] to [120].
		[CPU Machine]	Set the CPU number of the controller to be monitored. The setting range is [0] to [4].
4)	[Specify the module]		Select this item to specify the module to be monitored.
5)	[First I/O]		Set the start I/O number of a controller to be monitored. The setting range is [00] to [FF].

Settings for [Recipe Data Operation]

Set the detailed settings to import or export recipe data.

For details on the recipe function, refer to the following.

☞ Page 2243 Writing or reading values to multiple devices ([Recipe])



Item			Description
1)	[Operation Type]		Set the operation to be performed when the touch switch is touched. • [Import] Imports data from the recipe file specified with [Import Source] into the recipe data specified with [Recipe No.]. • [Export] Exports the recipe data specified with [Recipe No.] to the recipe file specified with [Export Destination].
2)	[Recipe No.]		Select how to specify a recipe number. • [Fixed] Specifies the target recipe data with a specific recipe number. Select this item, and then specify the recipe number of the recipe data to be imported or exported. The setting range is [1] to [32767]. If recipe names are set for each recipe data, the target recipe data is selectable from among the recipe names as well. Click the [Edit] button to display the [Recipe] dialog. Configure the settings of recipe data as necessary. • [Device] Specifies the target recipe data with a device value. Select this item, and then specify a device. You can specify an unsigned 16-bit binary word device or word-specified bit device.
3)	[Import Source] [Export Destination]	-	When selecting [Import] for [Operation Type], set the import source file. When selecting [Export] for [Operation Type], set the export destination file.
		[Specification]	Select the method of specifying a recipe file as the import source or export destination. When selecting [Direct] for [Specification], specify the path to the recipe file. When selecting [Device] for [Specification], specify the device that stores the full path of the recipe file. You can specify an unsigned 16-bit binary word device.
		[Drive Name]	Set this item when selecting [Direct] for [Specification]. Select the drive in which the import source file or export destination file is stored.
		[Folder Name]	Set this item when selecting [Direct] for [Specification]. Specify the path to the import source folder or export destination folder.
		[File Name]	Set this item when selecting [Direct] for [Specification]. Set the file name of the import source file or export destination file. The recipe file must be in the binary format (*.G3P), Unicode text format (*.TXT), or CSV format (*.CSV).
		[Maximum number of characters]	Set this item when selecting [Device] for [Specification]. Set the number of characters required for specifying the path of the recipe file. The setting range is [8] to [78].

Settings for [Video File Manager]

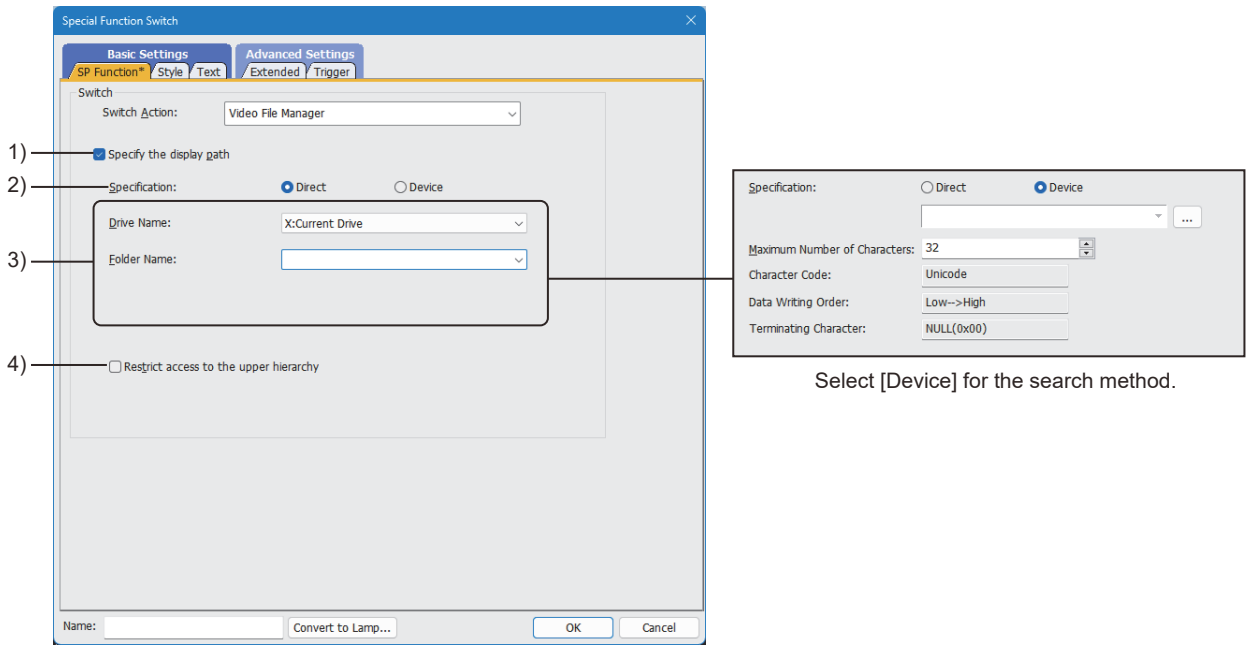
Set the folder to be displayed when the video file manager screen is called up with a special function switch.

To start the video file management screen, an operator with the operation rights for the following must perform authentication.

- Reading to the current drive
- Reading to and writing from drives other than the current drive

For details on the video file manager screen, refer to the following.

☞ Page 1858 Video file management screen



Select [Direct] for the search method.

Select [Device] for the search method.

Item		Description
1)	[Specify the display path]	Specify the folder to be displayed when the video file manager screen is called up.
2)	[Specification]	Select a method of specifying the folder to be displayed. • [Direct] Specify the folder path directly. • [Device] Specify the device that stores the full path of the folder. ☞ Page 834 How to set devices, labels, and tags
3)	[Drive Name]	Set this item when selecting [Direct] for [Specification]. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
	[Folder Name]	Set this item when selecting [Direct] for [Specification]. Specify the folder path. You can enter up to 72 characters, including the drive name.
	[Maximum number of characters]	Set this item when selecting [Device] for [Specification]. Set the number of characters required for specifying the path. The setting range is [1] to [72].
4)	[Restrict access to the upper hierarchy]	Disables the access to a parent folder from the folder that is displayed when the video file manager screen is called up.

27.10.2 [Style] tab

The setting items in this tab are common to those in the setting dialog for each touch switch.
Refer to the following.
☞ Page 1257 [Style] tab

27.10.3 [Text] tab

The setting items in this tab are common to those in the setting dialog for each touch switch.
Refer to the following.

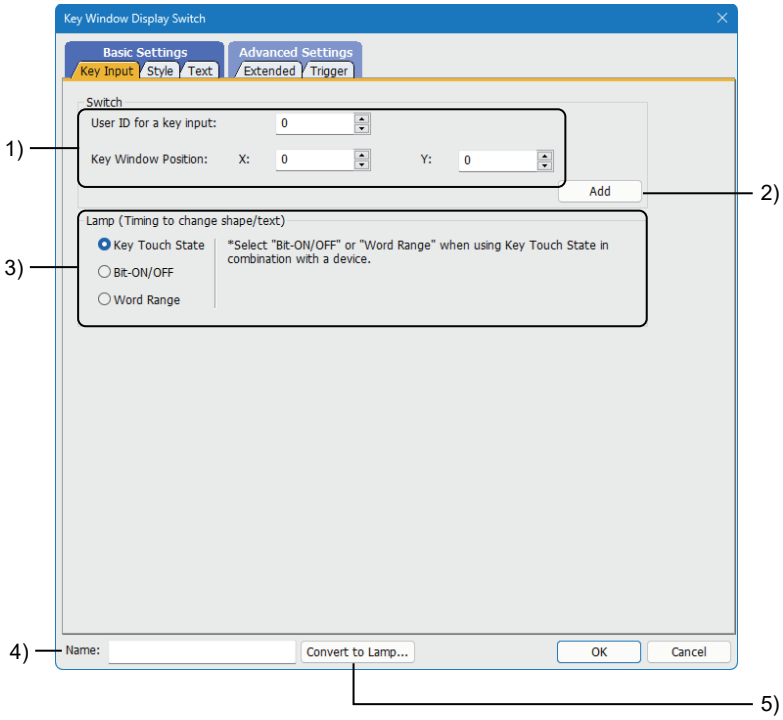
27.11.1 [Key Input] tab



Item		Description
1)	[User ID for a key input]	Set the user ID for the object on which the cursor is displayed when you touch the key window display switch. Set [User ID for a key input] of the switch and [User ID] of the operation target object to be the same.
	[Key Window Position]	Specify the position (top-left coordinate) where the key window is displayed. The maximum settable value is one dot smaller than the vertical or horizontal size of the GOT screen. • [X] Specify the coordinate value of the X axis. • [Y] Specify the coordinate value of the Y axis. 2)	[Add] button	Switches to [Action] of [Switch]. ☞ Page 1199 [Action] tab
3)	[Lamp (Timing to change shape/text)]	Select how to switch touch switch images (shapes of on status and off status). For details, refer to the following. ☞ Page 1201 Action of [Lamp (Timing to change shape/text)]

Item		Description
4)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be entered.
5)	[Convert to Lamp] button	Converts the object type to the lamp. ☞ Page 1196 Converting the touch switch to lamp

27.11.2 [Style] tab

The setting items in this tab are common to those in the setting dialog for each touch switch.

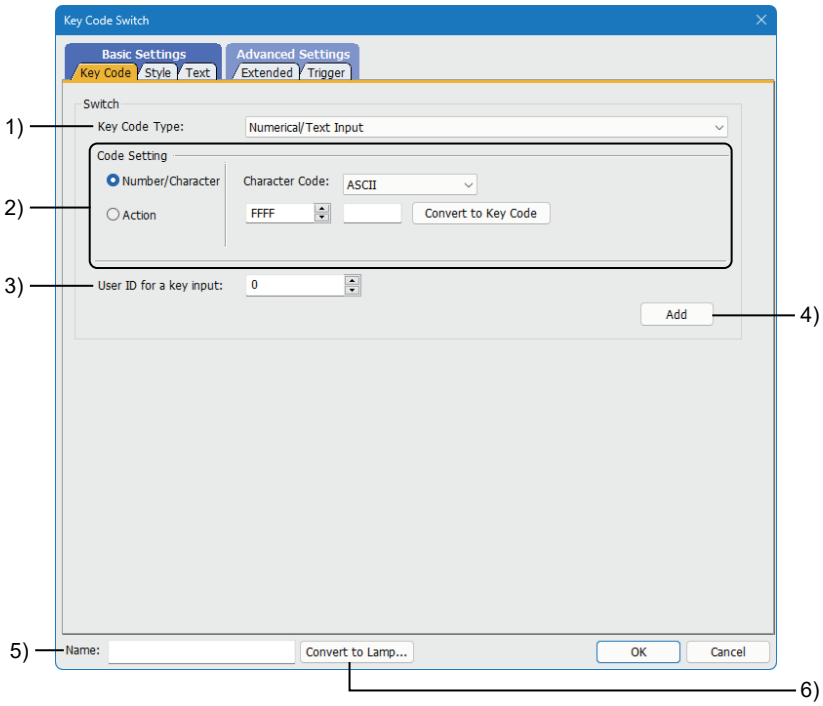
For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



PART 7

Item			Description
1)	[Key Code Type]		Specify the key code type. For the output conditions of the key code, refer to the following. ☞ Page 1253 Output conditions of key code For the settable key codes, refer to the following. ☞ Page 1253 Settable key codes
			• [Numerical/Text Input] Inputs a key code for the numerical input or text input where the cursor is displayed. ☞ Page 1306 Overview of the numerical display and numerical input objects ☞ Page 1308 How to use the numerical display and numerical input objects ☞ Page 1346 Overview of the text display and text input objects ☞ Page 1348 How to use the text display and text input objects
			• [Alarm Display] Inputs a key code for the alarm display (user), alarm display (system), or simple alarm display. ☞ Page 2132 Viewing alarm events (Alarm display) ☞ Page 1521 How to use the simple alarm display
			• [Recipe Display (Record List)] Inputs a key code for the recipe display (record list). ☞ Page 2246 Specifications of the recipe
			• [Historical Trend Graph/Historical Data List] Inputs a key code for the historical trend graph or historical data list display. ☞ Page 1693 Specifications of the historical trend graph
			• [Document Display] Inputs a key code for the document display. ☞ Page 1821 How to use the document display (for Document Converter output files)
			• [Screen Gesture] Inputs a key code for the screen gesture function. ☞ Page 502 Operating the monitor screen of the GOT using gestures (gesture function)
2)	[Code Setting]	-	Select the action type of the key code. For the settable key codes, refer to the following. ☞ Page 1253 Settable key codes
		[Number/Character]	Set this item when [Numerical/Text Input] is selected for [Key Code Type]. Select this item to input numeric values or characters using the key code. Select the character code used from [Character Code], enter a numerical value or character in the input field, and click the [Convert to Key Code] button. The entered value or character is automatically converted to its key code. When [Not specify] is selected for [Character Code], no character code conversion is executed and the key code switch operates using the character code set in the linked text input.
		[Action]	Sets an action using its key code. Selecting [Switch window screens for text (screen no. specification)] displays a spin box. Specify the screen to be displayed. The setting range is [1] to [10].
3)	[User ID for a key input]		Set the ID to specify the object for the key code input. The setting range is [0] to [65535]. Set [User ID for a key input] of the switch and [User ID] of the operation target object to be the same.
4)	[Add] button		Switches to [Action] of [Switch]. ☞ Page 1199 [Action] tab
5)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be entered.
6)	[Convert to Lamp] button		Converts the object type to the lamp. ☞ Page 1196 Converting the touch switch to lamp

Output conditions of key code

The following table lists the conditions for outputting the key code for each object.

Object name	Key code output condition
Historical data list	When only a single historical data list is placed on a single screen (including the called screen and window screen), the key code is output to it.
	When multiple historical data lists are placed on a single screen (including the called screen and window screen), if there is a historical data list having the same user ID as the specified user ID, the key code is output to it. If multiple historical data lists have the same user ID, the one with smaller object ID number is prioritized. When there is no historical data list having the same user ID as the one specified for the touch switch, the key code is output to the data list having the smallest object ID number.
Alarm (list, history)	When only a single alarm is placed on a single screen (including the called screen and window screen), the key code is output to it.
	When multiple alarms are placed on a single screen (including the called screen and window screen), if there is an alarm having the same user ID as the specified user ID, the key code is output to it. If multiple alarms have the same user ID, the one with smaller object ID number is prioritized. When there is no alarm having the same user ID as the one specified for the touch switch, the key code is output to the alarm having the smallest object ID number.
Numerical input	The key code is output to the numerical input where the cursor is displayed.
Text input	The key code is output to the text input where the cursor is displayed.

Settable key codes

The following shows the key codes that can be input for each [Code Setting].

☞ Page 1253 When [Code Setting] is [Number/Character]

☞ Page 1254 When [Code Setting] is [Action]

Precautions

Availability in the mobile screen differs depending on the key code.

If a key code already configured, which is not available on mobile screens, is copied and pasted on a mobile screen, the following operation is performed.

- Switch (for which [Key Code] is set in [Action])

The key code action in the action list is deleted.

- Key code switch

The key code type is changed to [Numerical/Text Input], and the key code is set to [FFFF].

■When [Code Setting] is [Number/Character]

○: Available in mobile screens.

—: Not available in mobile screens.

[Key Code Type]	Key code (HEX)	[Action]	Mobile screen
[Numerical/Text Input]	0030 to 0039 0041 to 0046	Numerical input	○
	0020 to 002C 002F 0047 to 007F	Text input (String code)	
	813F to EAA1	Text input (Shift JIS kanji code)	
	00A1 to 00DF	Text input (Shift JIS one-byte kana code)	

■When [Code Setting] is [Action]

○: Available in mobile screens.

—: Not available in mobile screens.

[Key Code Type]	Key code (HEX)	[Action]	Mobile screen
[Numerical/Text Input]	FFFF	None	○
	0008	Deletes the least significant digit and right-shifts all digits for one digit	
	000D	Writes to the device (execution)/Moves the cursor.	
	001B	Cancels the entry.	
	002D	"+/-" (reverse)/"-" (minus, hyphen)	
	002E	"." (dot, period)	
	0080	Moves the cursor to the right.	
	0081	Moves the cursor to the left.	
	0082	Moves the cursor up.	
	0083	Moves the cursor down.	
	0084	Converts the entry to kanji or Simplified Chinese characters.	
	0085	Displays the previous option.	
	0086	Displays the next option.	
	0087	Selection/Selects the next phrase.	
	0088	Deletes the value being input.	
	0089	Selects the previous phrase.	
	0090	Moves cursor to the right inside the object/extends the phrase.	
	0091	Moves cursor to the left inside the object/shortens the phrase.	
	0092	Moves the cursor in the user ID ascending order.	
	0093	Moves the cursor in the user ID descending order.

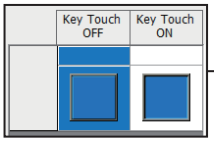
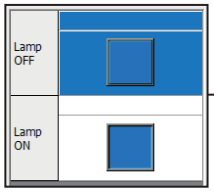
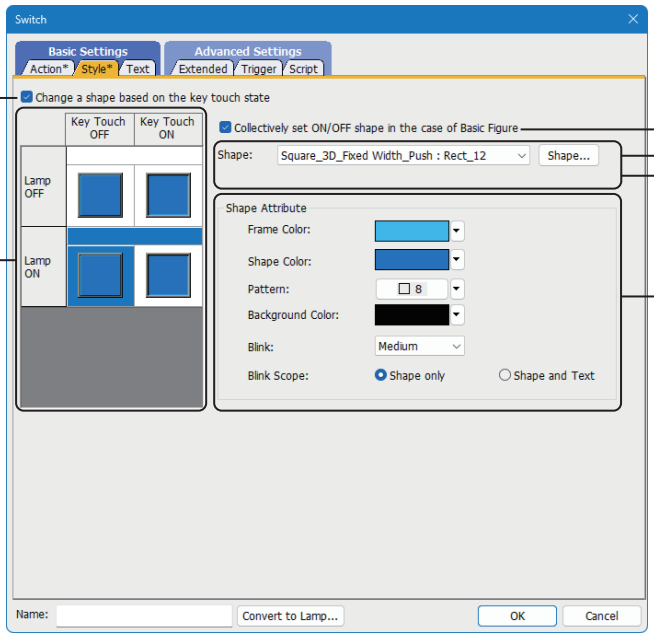
When [None] is selected for [Shape]



When [Key Touch State] is selected for [Lamp (Timing to change shape/text)]



When [Bit-ON/OFF]/[Word Range] is selected for [Lamp (Timing to change shape/text)] ([Change a shape based on the key touch state] is not selected)



When [Bit-ON/OFF]/[Word Range] is selected for [Lamp (Timing to change shape/text)] ([Change a shape based on the key touch state] is selected)

PART 7

Item		Description
1)	[Change a shape based on the key touch state]	This item is available when [Bit-ON/OFF] or [Word Range] is selected for [Lamp (Timing to change shape/text)]. You can set four different images using the lamp on and lamp off status in combination with the key touch on and key touch off status. According to the key touch on and key touch off status, the shape can be switched. However, the text cannot be switched. The following shows an example of the combination of image switching by the device status with shape switching by key touch status.  Preview list The touch switch images set in the [Style] tab and [Text] tab are displayed. (1) While M100 is off and you do not touch the touch switch  (2) While M100 is off and you touch the touch switch  (3) While M100 is on and you do not touch the touch switch  (4) While M100 is on and you touch the touch switch 2)	Preview list	Preview images of the touch switch are displayed. For the images when the device turns on or off, the touch switch is touched twice, and the touch switch does not function, you can configure settings individually. Select the image to set the style from the preview list, and set each setting item.
		The status of [Press Twice] is displayed only when [Press Twice] is set in [Delay] in the [SP Function] tab. The status of [When switch does not work] is displayed only when [Set the style and text settings for a switch in nonoperating state] is set in the [Extend] tab.
3)	[Collectively set ON/OFF shape in the case of Basic Figure]	This item appears when [Basic Figure] is selected on the [Image List] screen that appears when the [Shape] button is clicked. Select this item to use the same shape for when the key touch is on and off. Select this item to collectively change the shapes of the touch switches except [Press Twice].
4)	[Shape]	Set the shape of the touch switch. To use a readily available design set, select one from the list box. To set a shape to be used individually, click the [Shape] button and select a shape in the [Image List] screen. ☞ Page 1045 [Image List] dialog (shape) When a basic figure is set on the touch switch, reducing the touch switch in size may not display the figure properly.
5)	[Reverse Switch Area]	This item is settable when an image in a state other than [Press Twice] and [When switch does not work] is selected in the preview list and [Shape] is set to [None]. When [Enable the antialiasing] is selected in [Basic Setting] in the [Type Setting] dialog, this setting is grayed out and cannot be configured. The color of the touch switch is inverted. When [Change a shape based on the key touch state] is selected, the touch switch is reversely displayed by switching between the key touch on and key touch off status.

Item			Description
6)	[Shape Attribute]	-	Select a lamp color for the touch switch shape.
		[Frame Color]	Select a frame color for the touch switch shape.
		[Shape Color] [Pattern] [Background Color]	Select a fill color, pattern, and background color for the touch switch shape. The pattern is displayed in the shape color on the colored background. 		[Blink]	This item is not displayed when the image for [Key Touch OFF], [Lamp OFF], or [Key Touch OFF] + [Lamp OFF] is selected in the preview list. It is displayed when [None] is selected for [Shape] and [Reverse Switch Area] is selected. Select the blinking speed of the touch switch.
		[Blink Scope]	Select the blink scope.

27.13.2 [Text] tab

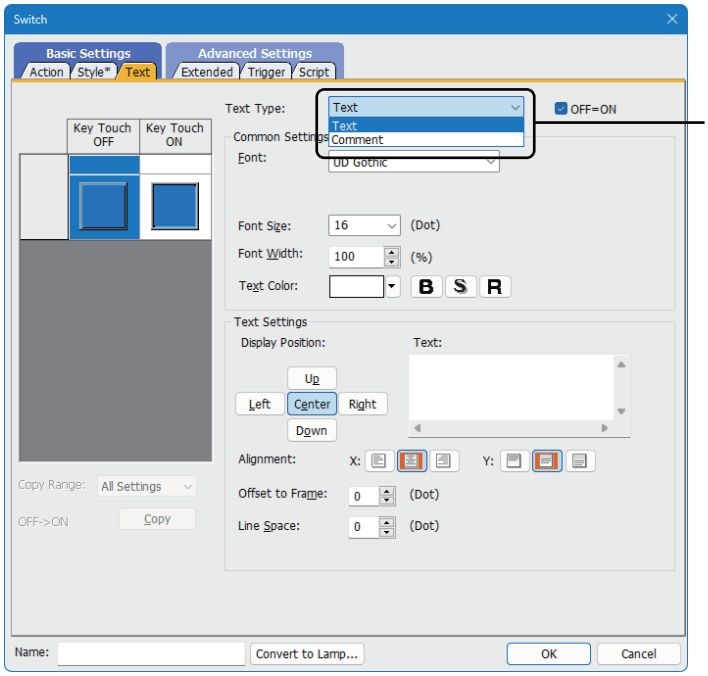
GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

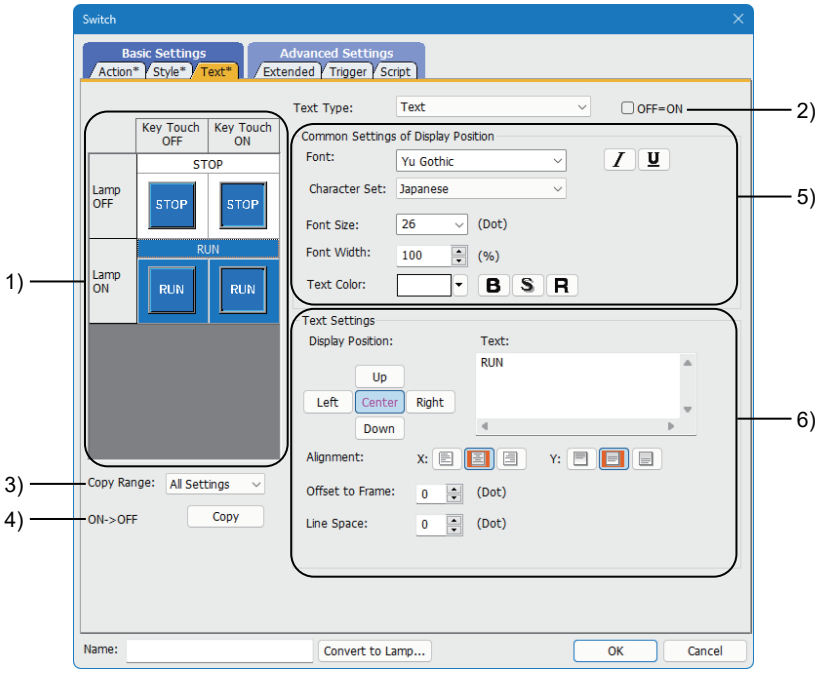
Set the text to be displayed on the touch switch.

The displayed text can be set by direct input or by specification from the registered comments.



Item			Description
1)	[Text Type]	[Text]	Directly enter the text to be displayed. The text can be displayed in five positions (top, bottom, left, right, and center) on the object. Text for [Up] Text for [Left] Text for [Center] Text for [Right] Text for [Down] For the setting method, refer to the following. ☞ Page 1261 [Text] If characters have already been entered in the [Text] field, switching the text type from [Text] to [Comment] enables you to register the entered characters in a comment group. For instruction on registering a comment group, refer to the following. ☞ Page 811 Registering the characters in the [Text] field to a comment group
		[Comment]	Set the text to be displayed using a comment set in a comment group. Only one text can be displayed within the object. Text For the setting method, refer to the following. ☞ Page 1263 [Comment] For the comment group settings, refer to the following. ☞ Page 776 Comment setting ([Comment])

[Text]



Item			Description
1)	Preview list		Preview images of the touch switch are displayed. For the images when the device turns on or off, the touch switch is touched twice, and the touch switch does not function, you can configure settings individually. Select the image to set the comment from the preview list, and set each setting item. Select [OFF=ON] to set the same comment for both when the switch is on and off.
			The status of [Press Twice] is displayed only when [Press Twice] is set in [Delay] in the [SP Function] tab. The status of [When switch does not work] is displayed only when [Set the style and text settings for a switch in nonoperating state] is set in the [Extend] tab.
2)	[OFF=ON]		Applies the same setting to both when the switch is on or off.
3)	[Copy Range]		Set the range to be copied for when the setting for on is copied to the setting for off or when the setting for off is copied to the setting for on.
4)	[OFF→ON] [ON→OFF]		Click the [Copy] button to copy the setting for on to the setting for off or copy the setting for off to the setting for on.
5)	[Common Settings of Display Position]	-	To display a text in the top, bottom, left, right, and center of the object, configure the settings common to each display position.
		[Font]	Select the font of the displayed text. When a Windows font is selected, italicizing and underlining text are available.
		[Character Set]	When a Windows font is selected for [Font], select a character set to be used.
		[Font Size]	Select a text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character is always within the range of [8] dots to [540] dots.
		[Text Color]	Set the color and style of the text. Only one style ([Bold], [Solid], or [Raised]) is settable. When selecting [Solid] or [Raised], set the color of the shadow.

Item			Description
6)	[Display Position]	-	Set [Text], [Alignment], [Offset to Frame], and [Line Space] for each display position. After selecting a display position of the text for [Display Position], set the following items.
		[Text]	Enter the text to be displayed. Up to 1024 characters can be set. Use the Enter key to insert a line feed. A line feed is counted as two characters.
		[Alignment]	Set the alignment position of the text.
		[Offset to Frame]	This setting is invalid when [Center] is selected for [Display Position]. Set a space between the object and the text. The setting range is [0] dots to [100] dots. 		[Line Space]	Set the space between lines. The setting range is [0] dots to [128] dots.

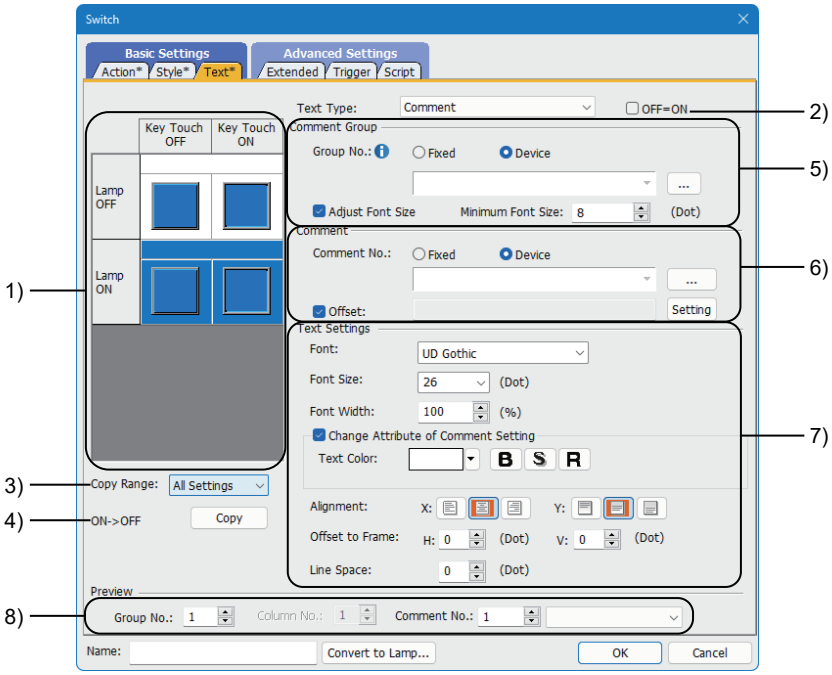
[Comment]



Item			Description
1)	Preview list		Preview images of the touch switch are displayed. For the images when the device turns on or off, the touch switch is touched twice, and the touch switch does not function, you can configure settings individually. Select the image to set the comment from the preview list, and set each setting item. Select [OFF=ON] to set the same comment for both when the switch is on and off.
			The status of [Press Twice] is displayed only when [Press Twice] is set in [Delay] in the [SP Function] tab. The status of [When switch does not work] is displayed only when [Set the style and text settings for a switch in nonoperating state] is set in the [Extend] tab.
2)	[OFF=ON]		Applies the same setting to both when the switch is on or off.
3)	[Copy Range]		Set the range to be copied for when the setting for on is copied to the setting for off or when the setting for off is copied to the setting for on.
4)	[OFF→ON] [ON→OFF]		Click the [Copy] button to copy the setting for on to the setting for off or copy the setting for off to the setting for on.
5)	[Group No.]	—	Set the group number of the comment group to be used.
		[Fixed]	Select this item to use the specified comment group. After selecting, enter a comment group number.
		[Device]	Select this item to use the comment group number corresponding to the value of the device to be set. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags
	[Adjust Font Size]		Adjusts the font size automatically according to the object size. When this item is deselected, a line feed is automatically inserted.
	[Minimum Font Size]		Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.

Item			Description
6)	[Comment No.]	—	Select the image to set the comment from the preview list, and then set the comment number of the comment to be used.
		[Fixed]	Select this item to use the specified comment. Select this item, and enter a comment number. If [0] is specified, no comment is displayed. To edit the comment to be displayed, click the [Edit] button to display the [Edit Comment] dialog. If an unregistered comment group number or comment number is set, create a new comment. ☞ Page 3685 [Edit Comment] dialog
		[Device]	Select this item to use the comment number corresponding to the value of the device to be set. Select this item and set the device.
	[Offset]		This setting is available only when [Device] is selected for [Comment No.]. Select this item to control the offset of the comment number dynamically using the offset device or add a constant. ☞ Page 834 How to set devices, labels, and tags Click the [Setting] button, and set the offset in the [Offset Setting] dialog. ☞ Page 1265 [Offset Setting] dialog
7)	[Font]		Select the image to set the comment from the preview list, and then select a font for the text to be displayed. [Windows Font] is selectable when [Group No.] is set to [Fixed]. Displays text in the font specified with [Windows Font] in the [Comment Group Property] dialog.
	[Windows Font Setting] button		This item appears when [Windows Font] is selected for [Font]. The [Comment Group Property] dialog for the group number specified by [Group No.] is displayed. Set [Windows Font] and [Character Set] for the target column of the comment group. ☞ Page 797 [Comment Group Property] dialog
	[Font Size]		Set a vertical text size. The setting range is [8] dots to [540] dots.
	[Font Width]		Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character is always within the range of [8] dots to [540] dots.
	[Change Attribute of Comment Setting]	—	Select this item to set the color and style of the text to be displayed on the object without using the attribute set in the [Comment List] window. When selecting this item, configure the following settings.
		[Text Color]	Set the color and style of the text. Only one style ([Bold], [Solid], or [Raised]) is settable. When selecting [Solid] or [Raised], set the color of the shadow.
	[Alignment]		Select the horizontal position (left-aligned, centered, or right-aligned) and vertical position (top-aligned, centered, or bottom-aligned) of the text.
	[Offset to Frame]		This setting is invalid when the center alignment is selected for [Alignment]. Set the space between the object frame and the text. The setting range is [0] dots to [100] dots. 	[Line Space]		Set a space between lines in units of dots. The setting range is [0] dots to [128] dots.
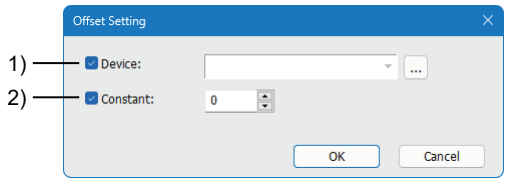
8)	[Preview]	-	Set the text to be previewed as a sample on the screen editor.
		[Group No.]	Set this item when selecting [Device] for [Group No.]. Set the group number of the comment. When [Fixed] is selected for [Group No.] of [Comment Group], the group number is fixed to the value set in [Comment Group].
		[Column No.]	Set the comment column number.
		[Comment No.]	Set this item when selecting [Device] for [Comment No.]. Set the comment number. When [Fixed] is selected for [Comment No.] in [Comment], the comment number is fixed to the value set in [Comment].

■[Offset Setting] dialog

Specify how to add values to the value of the device specified in [Comment No.].

When both [Device] and [Constant] are selected, the total value of [Device] and [Constant] is added.



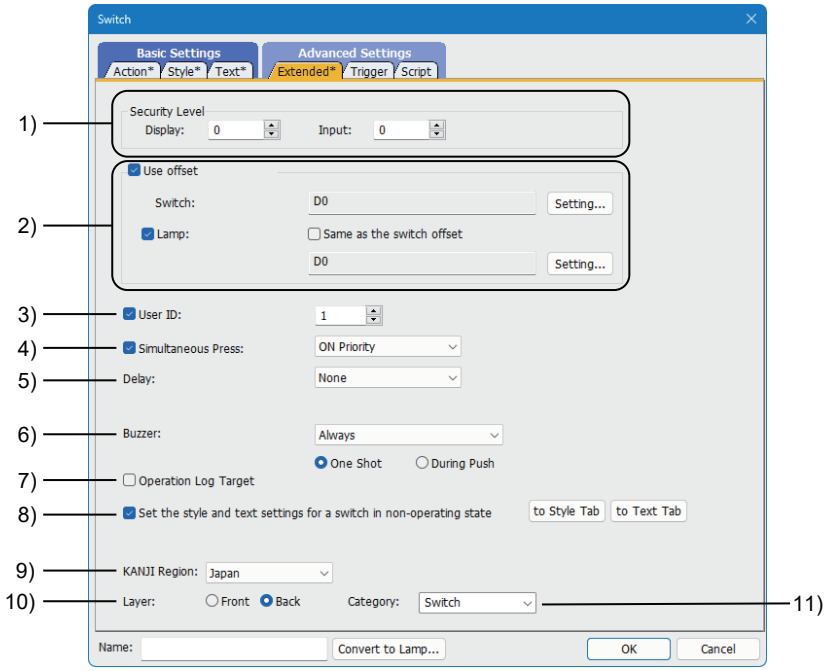
Item		Description
1)	[Device]	Set this item to add the value of the offset device to the value of the device specified in [Comment No.].
2)	[Constant]	Set this item to add the constant to the value of the device specified in [Comment No.]. The setting range is [-32768] to [32767].

27.13.3 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item			Description
1)	[Security Level]		Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security) The set value of [Input] must be greater than that of [Display].
2)	[Use offset]	-	This item is not displayed in the [Special Function Switch] dialog. Configure the settings to monitor the statuses of multiple devices by switching between them with a single device. After selecting this item, set the offset device. The monitored device is the one with the offset device value added to the device to be offset for each touch switch. The following shows the target devices. • [Switch] dialog The devices of the actions set in the [Action] tab are offset. • [Bit Switch] dialog [Device] in the [Device] tab is offset. • [Word Switch] dialog [Device] and [Indirect Device] in the [Device] tab are offset. • [Go To Screen Switch] dialog [Device] in the [Device] tab is offset. • [Change Station No. Switch] dialog [Device] in the [Next Screen] tab is offset. • [Key Window Display Switch] dialog [Device] in the [Key Input] tab is offset. ☞ Page 96 Offset
		[Switch]	Set the offset device for the switch function. ☞ Page 834 How to set devices, labels, and tags
		[Lamp]	This item is available when [Bit-ON/OFF] or [Word Range] is selected for [Lamp (Timing to change shape/text)]. Set the offset device for the lamp function. ☞ Page 834 How to set devices, labels, and tags • [Same as the switch offset] Uses the offset device set for [Switch].

Item			Description
3)	[User ID]		This item is not displayed in the [Key Window Display Switch] or [Key Code Switch] dialog. Select this item to set the user ID. The setting range is [1] to [65535]. Setting the user ID enables you to identify the objects used in the operation logs. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log]) When multiple objects are set on the same screen editor, the target object may not operate. To make sure that the target object operates, match the user ID with the user ID of the target object.
4)	[Simultaneous Press]		Select this item to disable the simultaneous press. When this item is selected, select whether to prioritize the on state or off state when multiple touch switches are simultaneously pressed. For details, refer to the following. ☞ Page 1195 Simultaneous press prohibition function ☞ Page 1268 Operation of [Simultaneous Press]
5)	[Delay]		Set the wait time (delay time) from the touch operation to execution of the action. • [None] Select this item to set no delay. • [ON] Select this item to allow the switch to turn on by pressing the touch switch for the set time. This setting prevents incorrect operation. • [OFF] Select this item to allow the switch to turn off after the set time passes since the touch switch is turned off. The switch is on during the set time. • [Press Twice] Select this item to allow the switch to function after you touch the touch switch once and then touch again within the set time. After selecting this item, configure the settings for [Press Twice] in the [Style] tab and the [Text] tab. Click the [To Style tab] and [To Text tab] buttons, and set [Press Twice] in the preview list. After selecting the delay, set the delay time. • [Delay Time] The setting range is [1] to [5]. For details on the delay operation, refer to the following. ☞ Page 1269 Action of [Delay]
6)	[Buzzer]	-	Select the timing of the buzzer when you press the touch switch. • [Always] The buzzer is sounded every time you touch the touch switch. • [Only if conditions are met] The buzzer is sounded only when you touch the touch switch with the operating condition satisfied. • [None] The buzzer is not sounded even when you touch the touch switch.
		[One Shot]	Set this item when [Always] or [Only if conditions are met] is selected. When this item is selected, the buzzer is sounded only at the moment you touch the touch switch.
		[During Push]	Set this item when [Always] or [Only if conditions are met] is selected. When this item is selected, the buzzer is kept sounding while you touch the touch switch.
7)	[Operation Log Target]		This item is not displayed in the [Key Window Display Switch] or [Key Code Switch] dialog. Select this item to record the operation log of the set object. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])
8)	[Set the style and text settings for a switch in non-operating state]		Select this item to set how the touch switch is displayed when the operating condition in the [Trigger] tab is not satisfied or when the touch switch does not function due to the unsatisfied security level. • [To Style tab] button Displays the [Style] tab. Set the shape displayed when the touch switch does not function. ☞ Page 1257 [Style] tab • [To Text tab] button Displays the [Text] tab. Set the text displayed when the touch switch does not function. ☞ Page 1260 [Text] tab
9)	[KANJI Region]		Select the KANJI region of the displayed text. ☞ Page 76 KANJI region This item is enabled when one of the following fonts is selected for [Font] in the [Text] tab. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho]
10)	[Layer]		Select the layer to place the object. ☞ Page 1055 Superimposition of figures and objects
11)	[Category]		Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

Operation of [Simultaneous Press]

■Touch switches that support disabling the simultaneous press

All touch switches support disabling the simultaneous press.

In the following cases, [Simultaneous Press] is selected, and the on/off priority is fixed to [ON Priority].

Touch switch type	Setting
Special function switch	The setting is always fixed to [ON Priority]. The setting is also applied to a switch to which [SP Function] is added as a switch action.

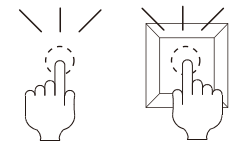
■Slide operation and simultaneous press

When you slide the finger from the touch key invalid area to the touch key valid area, the GOT recognizes the operation as touching multiple areas simultaneously.

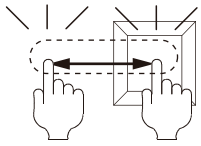
The GOT cannot distinguish between sliding the finger across multiple areas and touching multiple areas simultaneously using two fingers.

Therefore, the GOT recognizes sliding the finger from the touch key invalid area to the touch key valid area as touching multiple areas simultaneously.

Due to the same reason, the GOT recognizes sliding the finger from the touch key valid area to the touch key invalid area as the simultaneous press.



Touch the valid area and invalid area of the touch key simultaneously.



Slide the finger across the valid area to/from the invalid area of the touch key.

■Action for [ON Priority] and [OFF Priority]

Touch switch operation	Touch switch action	
	[ON Priority]	[OFF Priority]
• Slide operation from touch invalid area to the touch area 1. Touch an area outside the touch area of the touch switch. 2. Slide the finger to the touch area of the touch switch. 3. Release the finger from the touch switch. 	At operation 1.: Remains off. At operation 2.: Turns on. At operation 3.: Turns off.	At operation 1.: Remains off. At operation 2.: Remains off. At operation 3.: Remains off.
• Slide operation from touch area to area outside the touch area 1. Touch the touch area of the touch switch. 2. Slide the finger to an area outside the touch area of the touch switch. 3. Release the finger from the GOT screen. 	At operation 1.: Turns on. At operation 2.: Remains on. At operation 3.: Turns off.	At operation 1.: Turns on. At operation 2.: Turns off. At operation 3.: Remains off.
• When any other area in the screen is touched while a touch switch for which the simultaneous press is disabled is touched 1. Touch the touch switch. 2. Touch the area where no object is arranged. 3. Release the finger from the touch switch. 4. Release the finger from the area where no object is arranged. 	At operation 1.: Turns on. At operation 2.: Remains on. At operation 3.: Remains on. At operation 4.: Turns off.	At operation 1.: Turns on. At operation 2.: Turns off. At operation 3.: Remains off. At operation 4.: Remains off.

Touch switch operation	Touch switch action	
	[ON Priority]	[OFF Priority]
• When any other touch switch is touched while a touch switch for which the simultaneous press is disabled is touched 1. Touch the touch switch A for which the simultaneous press is disabled. 2. Touch the touch switch B. The touch switch action is the same whether the simultaneous press is enabled or disabled for touch switch B. 	Action of touch switch A At operation 1.: Turns on. At operation 2.: Remains on. Action of touch switch B At operation 1.: Remains off. At operation 2.: Remains off.	Action of touch switch A At operation 1.: Turns on. At operation 2.: Turns off. Action of touch switch B At operation 1.: Remains off. At operation 2.: Remains off.
• When multiple touch switches overlap with each other Arrange the touch switch A for which the simultaneous press is disabled on the front layer and the touch switch B for which the simultaneous press is enabled on the back layer. Then, touch the area where the touch switches overlap with each other. 	Action of touch switch A At operation 1.: Remains off. Action of touch switch B At operation 1.: Turns on.	

Action of [Delay]

■When [Press Twice] is set

If the touch switch has been pressed only once and another monitor screen is operated, [Press Twice] does not function properly.

■When [Press Twice] and the operation repeat are set

The operation repeat is invalid at the first press.

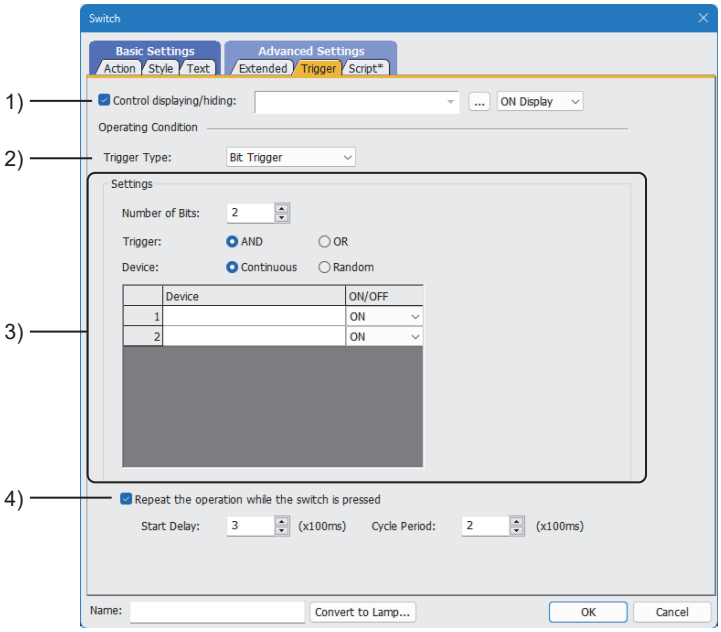
The operation repeat is valid at the second press.

27.13.4 [Trigger] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

Set the trigger condition to display the object.



Item			Description
1)	[Control displaying/hiding]		Enables the setting to display the object only when requirements are met. Set the following as requirements. • Control device (bit device or bit-specified word device) • When to display: When the control device is on or off
2)	[Trigger Type]		Select the condition of displaying the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Settings]		For the settings of each item, refer to the following. ☞ Page 968 Trigger type settings
4)	[Repeat the operation while the switch is pressed]	-	This item is not displayed in the [Special Function Switch] dialog, [Change Station No. Switch] dialog, or [Special Function Switch] dialog. Select this item to allow the switch to repeat the same operation while you press the touch switch. For precautions on setting [Repeat the operation while the switch is pressed], refer to the following. ☞ Page 1271 Action of [Repeat the operation while the switch is pressed]
		[Start Deley]	Set the time period from when you press the touch switch to when the operation repeat starts. The setting range is [1] to [20].
		[Cycle Period]	Set the cycle for the operation repeat. The setting range is [1] to [10].

Action of [Repeat the operation while the switch is pressed]

The following shows the precautions on setting [Repeat the operation while the switch is pressed].

■Supported touch switch types and precautions

The following shows the touch switches that support the operation repeat and the precautions.

Touch switch type	Precautions
Switch	When the operation repeat is set for the switch, do not set the special function, the screen switching function, or the station No. switching function. If the special function, the screen switching function, or the station No. switching function is set, the operation repeat setting is invalid.
Bit switch	If bit momentary is set for the action, the operation repeat setting is invalid.
Word switch	None
Key window display switch	In the following cases, the operation repeat is aborted. • A key window is displayed while the operation is repeated. • A key window is already displayed.
Key code switch	If a dialog window is displayed while the operation is repeated, the operation repeat is aborted.

■Touching simultaneously multiple touch switches for which the operation repeat is set

When multiple touch switches are touched simultaneously for which the operation repeat is set, only the operation of the last touched switch is repeated.

■Irregular operation repeat cycle

When communication time is longer than the preset operation repeat cycle, the cycle may be irregular.

To correct the cycle, take measures including setting a longer time for start delay or repeat cycle or reducing the number of monitor target devices.

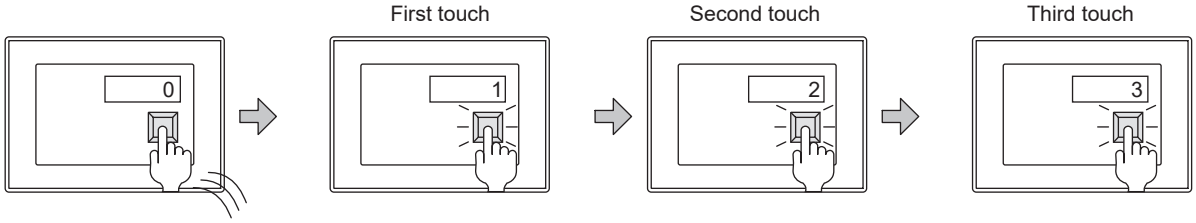
Ex.

When the operation repeat is applied to the word switch that adds one to the device value

Setting item	Setting
Device	D100
Constant	0
Indirect device	D100

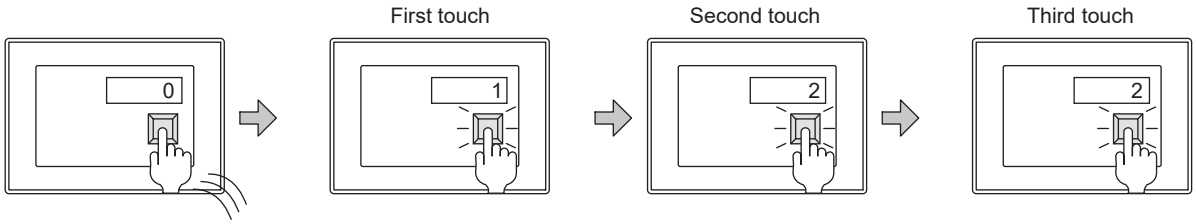
• When the operation is repeated normally

Every time the touch switch is operated, one is added to the device value.



• When the operation repeat cycle is irregular

Even if the touch switch is operated, the device value may not be increased.



■Abort of the operation repeat

If a dialog window is displayed while the operation is repeated, the operation repeat is aborted.

■Duration of touch on the touch switch and the process of writing to the device

While the value is written to the device, the GOT recognizes that the touch switch is touched.
Thus, even if the finger is released from the touch switch within the preset start delay time, a long device writing process may cause the GOT to recognize that the switch is pressed longer than the start delay time, and which may repeat the operation.
In this case, set a longer start delay time.

■Switching action while the touch switch is touched

Security switching, language switching, or station number switching is not executed while the touch switch is touched.
When the trigger device value for security switching, language switching, or station number switching has been changed while the touch switch is touched, the switching is executed when the finger is released from the switch.

27.14 Relevant settings

GT37 SoftGOT3000

Set the relevant settings other than the specific settings for the touch switch as required.
The following shows the relevant settings.
☞ Page 1273 GOT environmental settings ([Screen Switching/Windows])
☞ Page 1273 GOT environmental settings (key window), screen property
☞ Page 1274 GOT environmental settings (System information)
☞ Page 1274 Sound file list
☞ Page 1274 GOT internal device

27.14.1 GOT environmental settings ([Screen Switching/Windows])

Select [Common] → [GOT Environmental Setting] → [Screen Switching/Windows] from the menu to display the [Environmental Setting] window.
☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])

Function	Setting item
Setting the screen switching timing when you touch the Go To Screen switch. (ON synchronous/OFF synchronous)	[Operation Timing]

27.14.2 GOT environmental settings (key window), screen property

Set the following functions for each project (GOT environmental settings) or for each screen (screen property).
☞ Page 558 Setting key windows of the GOT ([Key Window])
• Settings for each project (GOT environmental settings)
Select [Common] → [GOT Environmental Setting] → [Key Window] from the menu to display the [Environmental Setting] window.
• Settings for each screen (screen property)
Select the screen editor on which the key window is to be set and select [Screen] → [Screen Property] from the menu to display the screen properties.

Function	Setting item
Displaying the key window when the operating condition is satisfied	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Key Window]
Displaying the key window when the screen is switched	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Display the key window]
Displaying the cursor when the screen is switched	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Display the cursor]
Displaying the cursor when the operating condition is satisfied	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Cursor]
Deleting the key window and cursor when the operating condition is not satisfied	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Clear the key window and the cursor] in [When operating conditions are not satisfied]

PART 7

27.14.3 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] window.

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Notifying the key codes set to the input keys when there is an input using a text input, touch switch, or other objects	[Key Code Input]
Disabling the key input (Read device: System signal 1-1.b9)	[System Signal 1-1]
Notifying a key input (Write device: System signal 2-1.b3)	[System Signal 2-1]

27.14.4 Sound file list

Select [Common] → [Sound] → [Sound File List] from the menu to display the setting dialog.

☞ Page 2719 [Touch Key Sound Setting] dialog

Function	Setting item
Using a sound file for the sound generated when you press the touch switch. (The sound file must be registered.)	[Use a sound file for touch key sound]
Stopping the current playback and all the standby sound files and playing the touch key sound when the touch switch is touched.	[Give top priority to touch key sound]

27.14.5 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Setting the operation timing of the touch switch in which the bit set, bit reset, or bit alternate action and the screen switching or station number switching action are set.	GS450.b12
Saving the history of screen transitions to the memory card.	GS450.b13
Changing the operation when the screen of the touch switch is switched from the hierarchy mode to the history mode.	GS450.b14

Setting the bit device operation together with screen switching and station number switching

When the bit device operation (set, reset, or alternate action) is set together with the screen switching or station number switching, the timing of the screen switching and station number switching differs depending on the status (on or off) of GS450.b12 as shown below.

Set GS450.b12 with the trigger action function or script function before the first action of the touch switch after the GOT startup.

Setting item	GS450.b12	
	ON	OFF
Screen switching or Station number switching + Bit set	When the finger is released from the touch switch	When the finger presses the touch switch
Screen switching or Station number switching + Bit reset	When the finger is released from the touch switch	When the finger presses the touch switch
Screen switching or Station number switching + Bit alternate	When the finger is released from the touch switch	When the finger presses the touch switch
Screen switching or Station number switching + Bit momentary	When the finger is released from the touch switch	
Screen switching or Station number switching + Word	When the finger presses the touch switch	When the finger presses the touch switch

Ex.

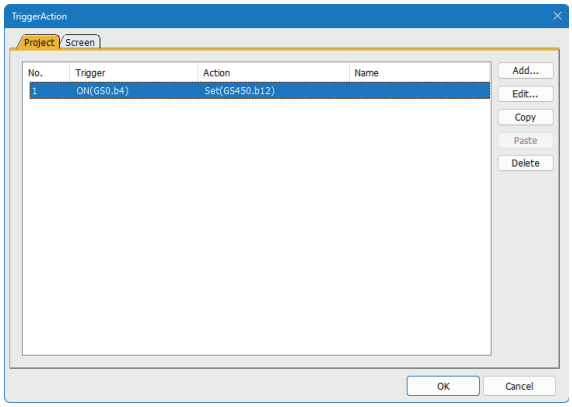
Example in which GS450.b12 automatically turns on after the GOT is powered on by using the trigger action

Set the GOT internal device (Always ON device: GS0.b4) as a trigger in the first row in the [Project] tab of the [Trigger Action] dialog so that GS450.b12 is on when the trigger is on.

After the GOT is powered on, the trigger action turns on GS450.b12.

For details on the trigger action, refer to the following.

☞ Page 2521 Operating a device as a trigger ([Trigger Action])



The following shows the operation when the following actions are set simultaneously for the touch switch.

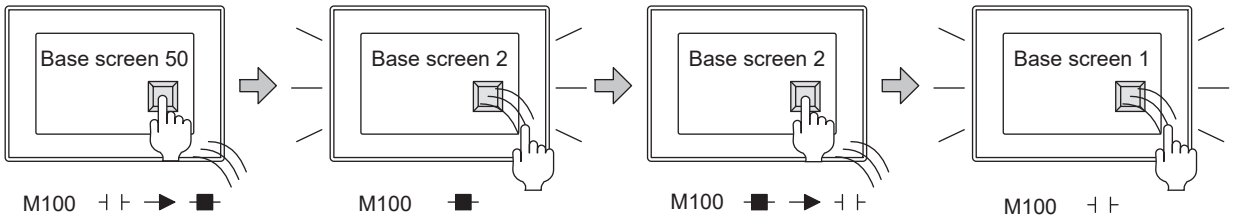
Bit alternate: M100

Screen switching: The screen switches to base screen 2 when M100 is on.

Screen switching: The screen switches to base screen 1 when M100 is off.

■Switching action when GS450.b12 is on

After the bit set, bit reset, or bit alternate action is executed, the screen or the station number is switched when you release the finger from the switch. The GOT operates with the value after the bit set, bit reset, or bit alternate action.



M100 turns on when the finger touches the touch switch.

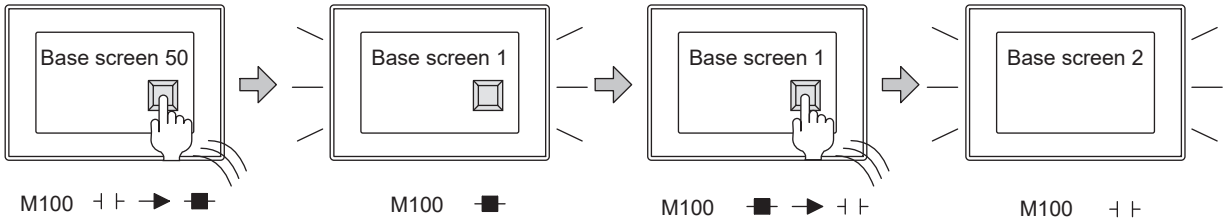
The screen switches when the finger is released from the touch switch.

M100 turns off when the finger touches the touch switch

The screen switches when the finger is released from the touch switch.

■Switching action when GS450.b12 is off

At the same timing as the bit set, bit reset, or bit alternate action, the screen or the station number is switched. The GOT operates with the value before the bit set, bit reset, or bit alternate action.



M100 turns on and the screen switches when the finger touches the touch switch. (The GOT operates with the value (M100: OFF) before the bit alternate.)

M100 turns off and the screen switches when the finger touches the touch switch. (The GOT operates with the value (M100: ON) before the bit alternate.)

PART 7

28 Placing a lamp

☞ Page 1277 Overview of lamps
☞ Page 1278 Specifications of Lamps
☞ Page 1279 How to use the lamp
☞ Page 1282 [Bit Lamp] dialog
☞ Page 1292 [Word Lamp] dialog
☞ Page 1304 [Lamp Area] dialog

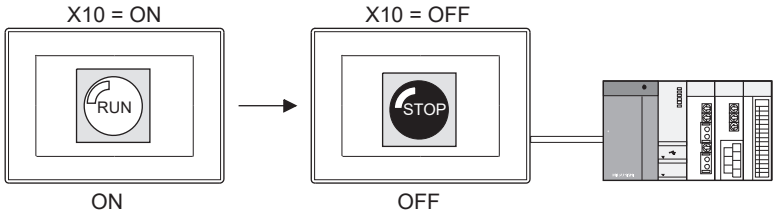
28.1 Overview of lamps

GT37 SoftGOT3000

This function monitors device values, and notifies the status of controllers with lamp indication.
There are three types of lamps: bit lamps, word lamps, and lamp areas.

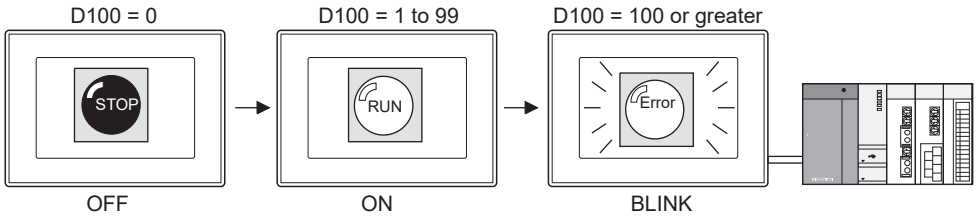
28.1.1 Bit lamp

A bit lamp turns on or off according to the status of the applicable bit device.
☞ Page 1282 [Bit Lamp] dialog



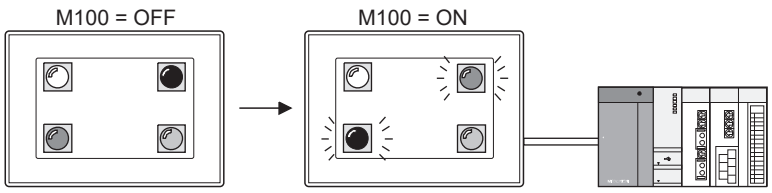
28.1.2 Word lamp

A word lamp changes its color according to the value of the applicable word device.
☞ Page 1292 [Word Lamp] dialog



28.1.3 Lamp area

The figures and objects in the lamp area are switched between two colors in units of dots according to the status of the applicable bit device.
☞ Page 1304 [Lamp Area] dialog



PART 7

28.2 Specifications of Lamps

GT37 SoftGOT3000

The following shows the specifications of the lamp.

28.2.1 Maximum number of objects that can be placed on one screen

A total of 1024 lamps and other objects can be placed on one base screen, while 512 can be placed on one window screen.

28.2.2 Minimum size of the lamp

The minimum size of the lamp is 2 dots (height) × 2 dots (width).

When the basic figure is set on the lamp, reducing the lamp in size may not display the figure properly.

28.2.3 Difference between the lamp and the figure to which a lamp attribute is set

When the lamp attribute is set to the figure, the color of the figure can also be changed like the lamp by turning on the bit device.

☞ Page 1131 Figures

For a figure having the lamp attribute, only the color of the figure can be changed by turning on the applicable bit device.

Use a lamp to set text or other items on a figure.

28.3 How to use the lamp

GT37 SoftGOT3000

The following shows how to use the lamp.

28.3.1 Placing a lamp

Place a lamp on a screen editor.

☞ Page 1001 Placing figures and objects

28.3.2 Editing a lamp

Edit a lamp on the screen editor.

☞ Page 1037 Settings common to objects

28.3.3 Setting the actions of the lamp

Set the actions of the lamp placed on the screen editor.

- Common settings for objects

☞ Page 1032 Settings common to figures and objects

- Settings of lamps

☞ Page 1282 [Bit Lamp] dialog
☞ Page 1292 [Word Lamp] dialog
☞ Page 1304 [Lamp Area] dialog

28.3.4 Converting a lamp to a touch switch

Click the [Convert to Switch] button in the [Bit Lamp] or [Word Lamp] dialog to convert the lamp to the touch switch.

Settings to be deleted

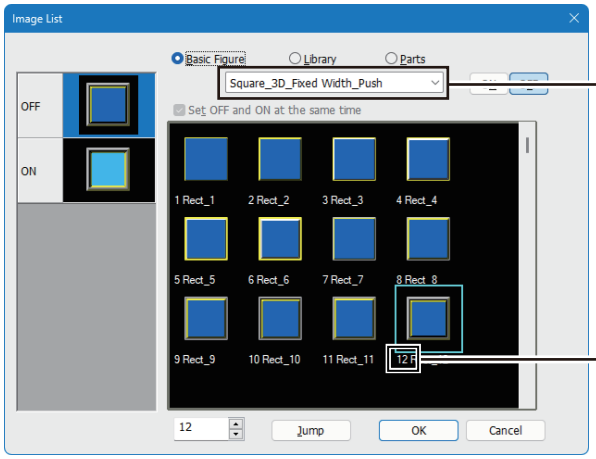
When the lamp is converted to the touch switch, settings that do not exist in the touch switch are deleted.
Settings that only exist in the touch switch are configured with the default values of the touch switch.

Converting a basic figure

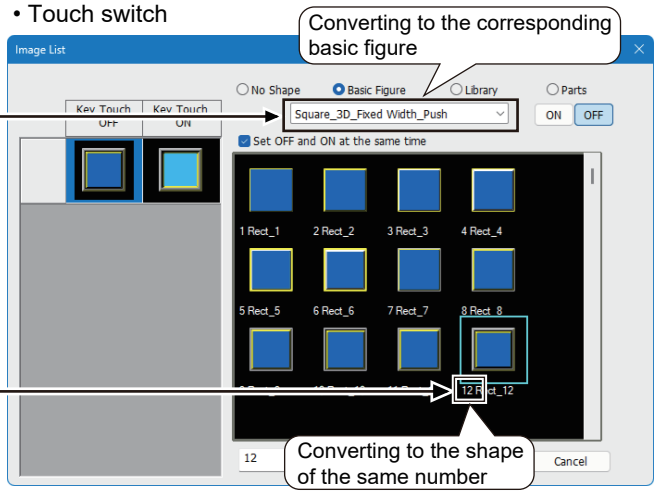
If the basic figure set for a lamp is applicable to a touch switch, the basic figure is converted to the corresponding figure with the same number for the switch.

Ex.
Converting the lamp to the touch switch when the basic figure [Square_3D_Fixed Width_Push] is set for the lamp

• Lamp



• Touch switch



Even if the basic figures for the lamp and the touch switch have the same number, the figures may differ from each other.
Check the basic figure used for the touch switch after the conversion.

Object size at conversion

When a lamp is converted to a touch switch, if they are incompatible in size, the touch switch is adjusted to an applicable size.

Converting a touch switch back to a lamp

To convert a touch switch back to a lamp, select [Edit] → [Undo] from the menu.
Even if the touch switch has been converted back to the lamp, the previous settings cannot be restored.
To cancel the conversion after clicking the [Convert to Switch] button, click the [Cancel] button instead of the [OK] button.

Type of the touch switch to be converted to

Both a bit lamp and a word lamp are converted to a switch.

28.3.5 Switching the specified two colors of figures and objects using the lamp area

To use the lamp area, configure the following settings for the figures and objects in the applicable area.

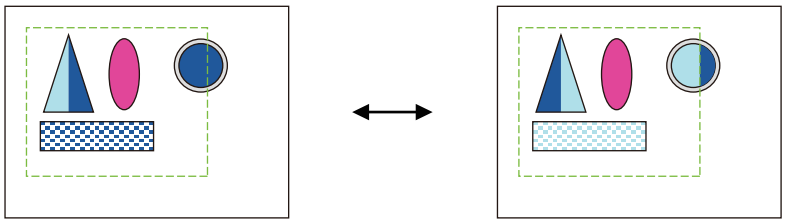
Applicable lamp area

The colors are switched within the lamp area regardless of the shape of the figures and objects.

The lamp area is only applicable to the figures and objects in that area.

Specify the applicable lamp area so that the figures and objects are within the dotted frame of the lamp area.

Example) When ■ and ■ are set for [Color Setting] of the lamp area



Layer for placement

A lamp area and the figures and objects in the area must be placed in the same layer.

Placement order

The figures and objects in a lamp area must be placed behind the area.

If the figure and object are placed ahead of the lamp area, they are placed behind the lamp area.

To change the placement order, right-click on the selected figure or object and select [Stacking Order].

Setting the switching color of the lamp area as the transparent color of the front layer

When [Enable the antialiasing] is deselected in the [Type Setting] dialog ([Basic Setting]), [Front Layer Transparent Color] can be set.

☞ Page 519 [Basic Setting]

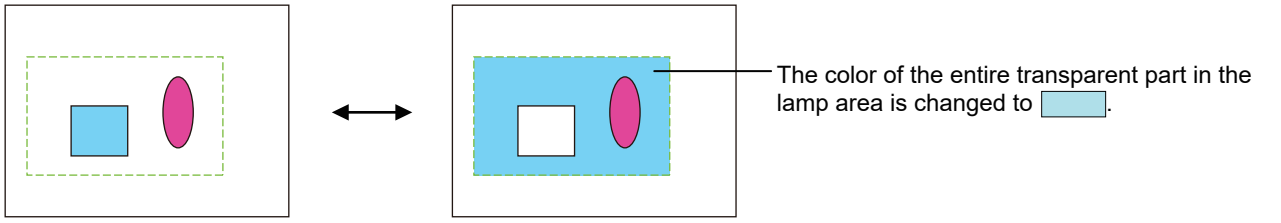
On the front layer to which the lamp area is applied, when either [Color 1] or [Color 2] in [Color Setting] is set to the same color as [Front Layer Transparent Color], the transparent color (The back layer is displayed.) and the other color are switched.

The colors are switched not only for the figures or objects, but also for the whole lamp area.

For details of [Front Layer Transparent Color], refer to the following.

☞ Page 313 Base screen properties

Example) When ■ and ■ are set for [Color Setting] of the lamp area and ■ is set for [Front Layer Transparent]



Checking the action of the lamp area in the preview window or the screen editor

The preview window and screen editor cannot be used to check that the colors are switched for the lamp area.

Precautions for the lamp area

The lamp area is used to switch specified colors.

If antialiasing or gradation is set for a figure in the lamp area, unintended color switching may occur.

28.4 [Bit Lamp] dialog

GT37 SoftGOT3000

A bit lamp turns on or off according to the status of the bit device.

Window

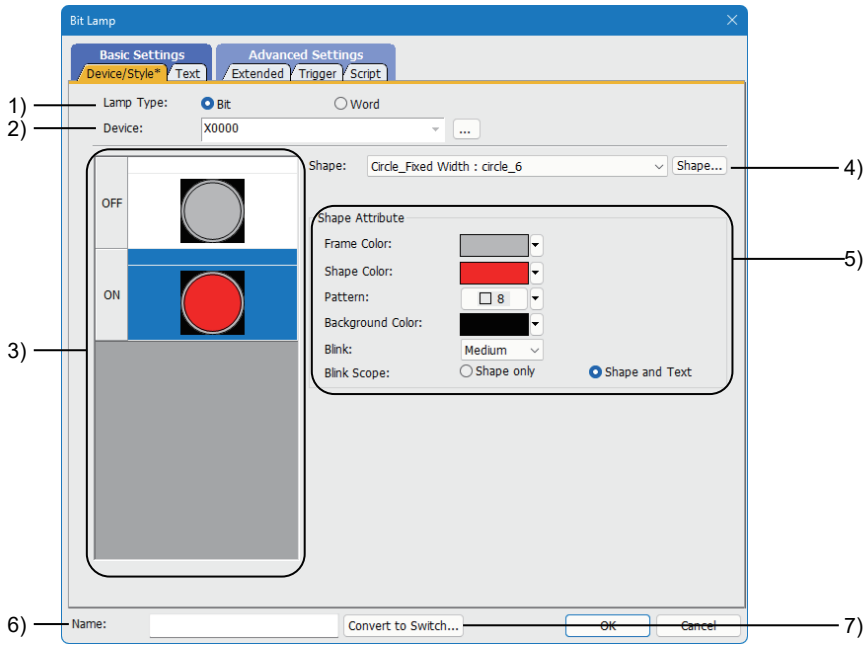
1. Select [Object] → [Lamp] → [Bit Lamp] from the menu.
2. Click the position to place a bit lamp.
3. Double-click the bit lamp to display the setting dialog.

☞ Page 1283 [Device/Style] tab
☞ Page 1284 [Text] tab
☞ Page 1289 [Extended] tab
☞ Page 1290 [Trigger] tab
☞ Page 1291 [Script] tab

28.4.1 [Device/Style] tab

GT37 SoftGOT3000

Set a device to be monitored and the lamp shape (figure and color) for the on and off states of the device.



Item			Description
1)	[Lamp Type]		Select the lamp type.
2)	[Device]		Set a device to be monitored. ☞ Page 834 How to set devices, labels, and tags
3)	Preview list		The images of the configured lamp in the ON and OFF states are displayed.
4)	[Shape]		Set the shape of the lamp. To select a shape other than those in the list box, click the [Shape] button. ☞ Page 1045 [Image List] dialog (shape)
5)	[Shape Attribute]	[Frame Color]	Select the frame color for the lamp.
		[Shape Color]	Select the shape color for the lamp. Changing the shape color individually enables different colors of the configured lamp shape.
		[Pattern] [Background Color]	Select the pattern and background color for the lamp. The pattern is displayed in the shape color on the colored background. Example) Shape color: Pattern: Background color: Pattern + Shape color Background color
		[Blink]	Select the blinking speed of the lamp.
		[Blink Scope]	Select the blink scope.
6)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.
7)	[Convert to Switch] button		Converts the object type to the touch switch. ☞ Page 1279 How to use the lamp

PART 7

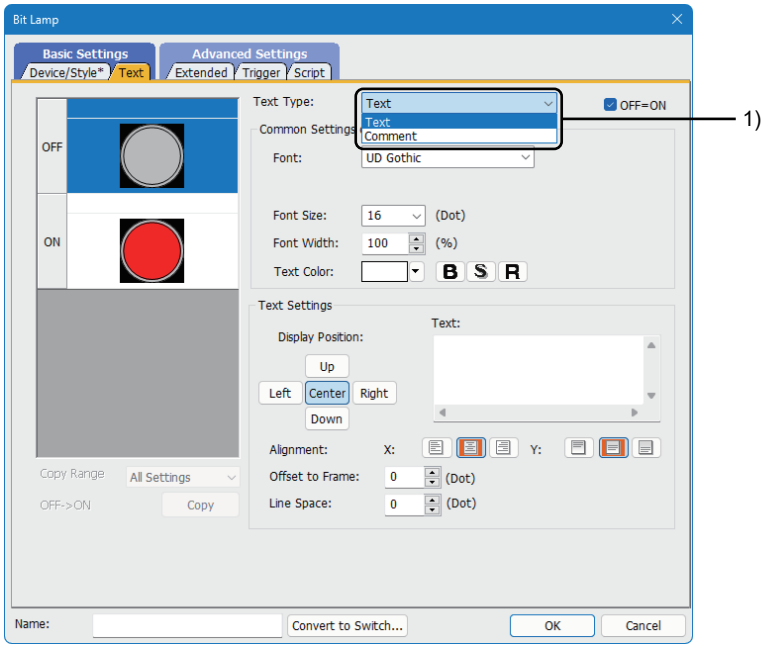
28.4.2 [Text] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Select the text type to use the directly input texts or the comments set in a comment group as a text.



Item			Description
1)	[Text Type]	[Text]	Directly enter the text to be displayed. If characters have already been entered in the [Text] field, switching the text type from [Text] to [Comment] enables you to register the entered characters in a comment group. For instruction on registering a comment group, refer to the following. ☞ Page 811 Registering the characters in the [Text] field to a comment group
		[Comment]	Displays a comment of the specified comment group on the object.

For the comment group settings, refer to the following.

☞ Page 776 Comment setting ([Comment])

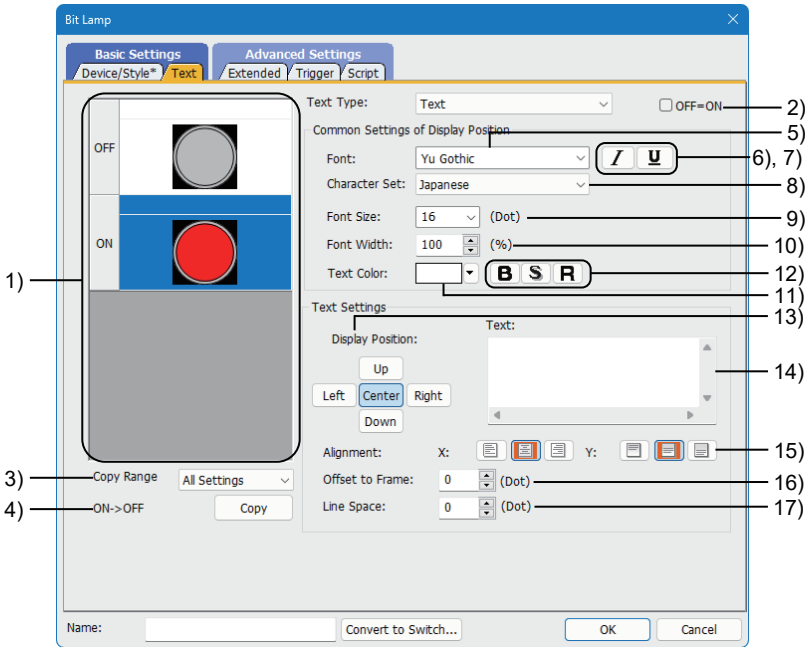
Setting items vary depending on the selected text type.

For the setting items for each text type, refer to the following.

☞ Page 1285 [Text]

☞ Page 1287 [Comment]

[Text]



Item		Description
1)	Preview list	The images of the configured lamp in the ON and OFF states are displayed.
2)	[OFF=ON]	Applies the same setting to both when the switch is on or off.
3)	[Copy Range]	Set the copy range. • [All Settings]: Copies all the text settings. • [Text Only]: Copies the text only.
4)	[OFF→ON] [ON→OFF]	Copies the text settings. • [OFF→ON]: Copies the setting for the OFF status to the setting for the ON status with the [Copy] button. • [ON→OFF]: Copies the setting for the ON status to the setting for the OFF status with the [Copy] button.
5)	[Font]	Select the font of the displayed text. ☞ Page 74 Specifications of displayable characters
6)	[Italic] button	Italicizes the text. This item is displayed when a Windows font is selected for [Font].
7)	[Underline] button	Underlines the text. This item is displayed when a Windows font is selected for [Font].
8)	[Character Set]	Set the language. This item is displayed when a Windows font is selected for [Font].
9)	[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots.
10)	[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
11)	[Text Color]	Set the color of the text to be displayed on the object. For details on the color, refer to the following. ☞ Page 988 Color settings
12)	Text style	Set a text style. Only one of the styles ([Bold], [Solid], or [Raised]) is settable.  • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.

Item		Description
13)	[Display Position]	Set the position of the text to be displayed on the object. A different text is settable for each position (center, up, down, left, and right). • [Center] button: Displays the text at the center of the object. • [Up] button: Displays the text on the upper side of the object. • [Down] button: Displays the text on the lower side of the object. • [Left] button: Displays the text on the left side of the object. • [Right] button: Displays the text on the right side of the object. 14)	[Text]	Input the text to be displayed. Up to 1024 characters can be set. A line feed is counted as two characters.
15)	[Alignment]	Select the horizontal position (left-aligned, centered, or right-aligned) and vertical position (top-aligned, centered, or bottom-aligned) of the text. 16)	[Offset to Frame]	Set the space between the object frame and the text. The setting range is [0] dots to [100] dots. 17)	[Line Space]	Set the space between lines. The setting range is [0] dots to [128] dots.

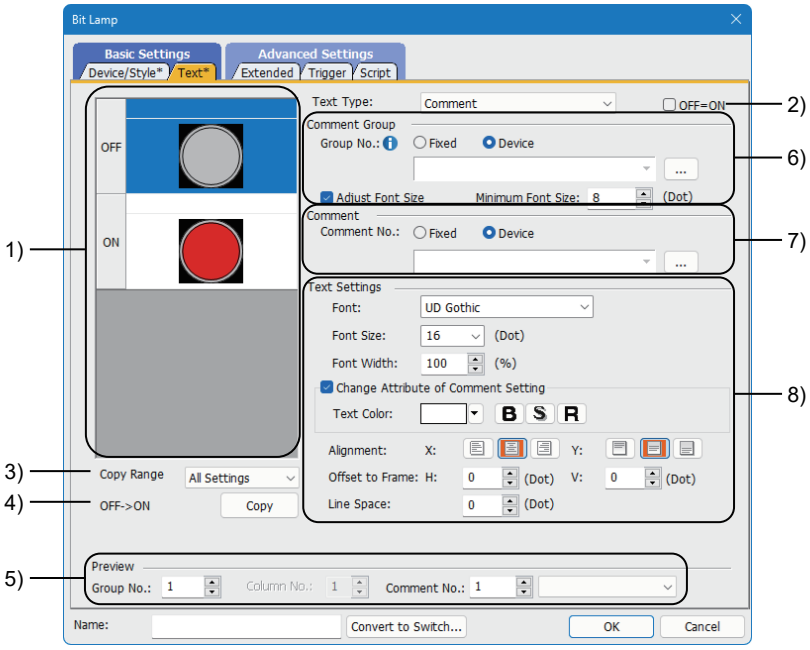
[Comment]



Item			Description
1)	Preview list		The images of the configured lamp in the ON and OFF states are displayed.
2)	[OFF=ON]		Applies the same setting to both when the switch is on or off.
3)	[Copy Range]		Set the copy range. • [All Settings]: Copies all the text settings. • [Text Only]: Copies the text only.
4)	[OFF→ON] [ON→OFF]		Copies the text settings. • [OFF→ON]: Copies the setting for the OFF status to the setting for the ON status with the [Copy] button. • [ON→OFF]: Copies the setting for the ON status to the setting for the OFF status with the [Copy] button.
5)	[Preview]	[Group No.]	Set the group number of the comment displayed on the GT Designer3 screen. When [Fixed] is selected for [Group No.] of [Comment Group], the group number is fixed to the value set in [Comment Group].
		[Column No.]	Set the comment column number of the comment displayed on the GT Designer3 screen.
		[Comment No.]	Set the comment number of the comment to be previewed on GT Designer3. When [Fixed] is selected for [Comment No.] in [Comment], the comment number is fixed to the value set in [Comment].
6)	[Comment Group]	[Group No.]	Set the group number of the comment group to be used. • [Fixed] Select this item to use the specified comment group. After selecting, enter a comment group number. • [Device] Select this item to use the comment group number corresponding to the value of the device to be set. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags
		[Adjust Font Size]	Adjusts the font size automatically according to the object size. When this item is deselected, the line feed is automatically applied to the text.
		[Minimum Font Size]	Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.
7)	[Comment]	[Comment No.]	Set the comment number of the comment to be used. • [Fixed] Select this item to use the specified comment. Select this item, and enter a comment number. To edit the comment to be displayed, click the [Edit] button to display the [Edit Comment] dialog. ☞ Page 3685 [Edit Comment] dialog • [Device] Select this item to use the comment number corresponding to the value of the device to be set. Select this item and set the device.

Item			Description
8)	[Text]	[Font]	Select the font of the displayed text. ☞ Page 74 Specifications of displayable characters [Windows Font] is selectable when [Group No.] is set to [Fixed]. Displays text in the font specified with [Windows Font] in the [Comment Group Property] dialog.
		[Windows Font Setting] button	This item appears when [Windows Font] is selected for [Font]. The [Comment Group Property] dialog for the group number specified by [Group No.] is displayed. Set [Windows Font] and [Character Set] for the target column of the comment group. ☞ Page 797 [Comment Group Property] dialog
		[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Change Attribute of Comment Setting]	Set the color and style of the text to be displayed on the object without using the attribute set in the [Comment List] window.
		[Text Color]	Set the color of the text to be displayed on the object. For details on the color, refer to the following. ☞ Page 988 Color settings
		Text style	Set a text style. Only one of the styles ([Bold], [Solid], or [Raised]) is settable.  • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
		[Alignment]	Select the horizontal position (left-aligned, centered, or right-aligned) and vertical position (top-aligned, centered, or bottom-aligned) of the text. 		[Offset to Frame]	Set the space between the object frame and the text. The setting range is [0] dots to [100] dots. 		[Line Space]	Set the space between lines. The setting range is [0] dots to [128] dots.

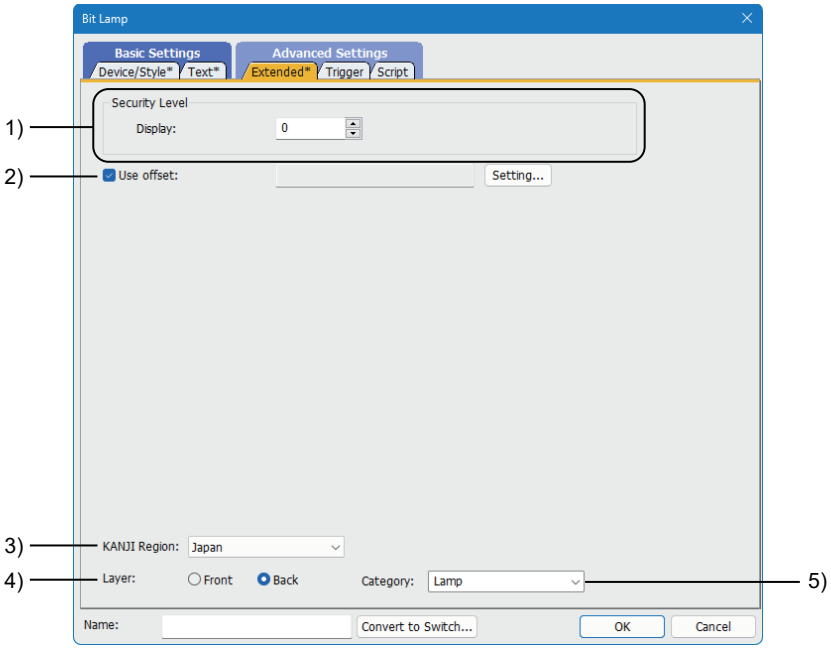
28.4.3 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set the security level, offset, layer, category, and KANJI region.

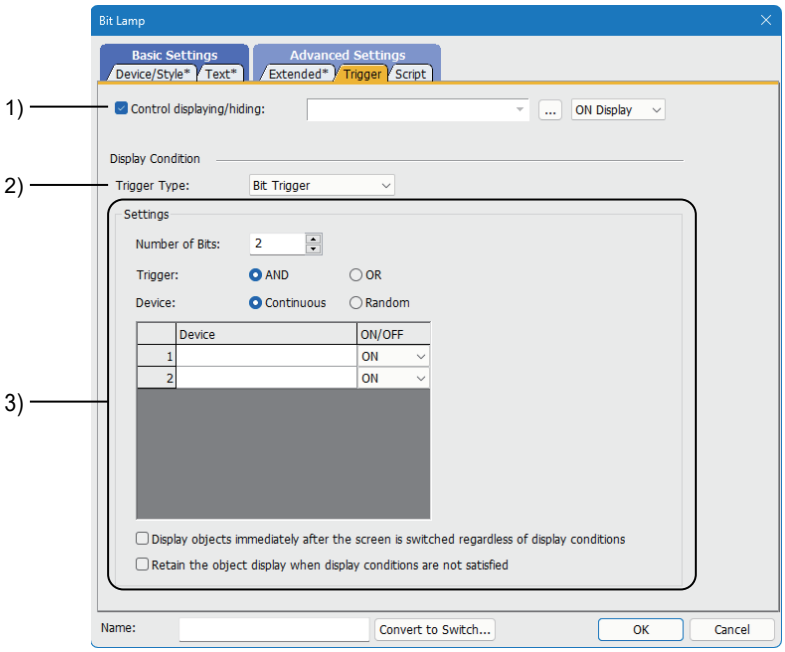


Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Configure the settings to monitor the statuses of multiple devices by switching between them with a single device. After selecting this item, set the offset device. The monitored device is the one with the offset device value added to the device set in [Device] in the [Device/Style] tab. ☞ Page 963 Offset
3)	[KANJI Region]	Select the KANJI region of the displayed text. ☞ Page 76 KANJI region This item is enabled when one of the following options is selected for [Font] in the [Text] tab. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho]
4)	[Layer]	Select the layer to place the object. ☞ Page 65 Layer
5)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

28.4.4 [Trigger] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.



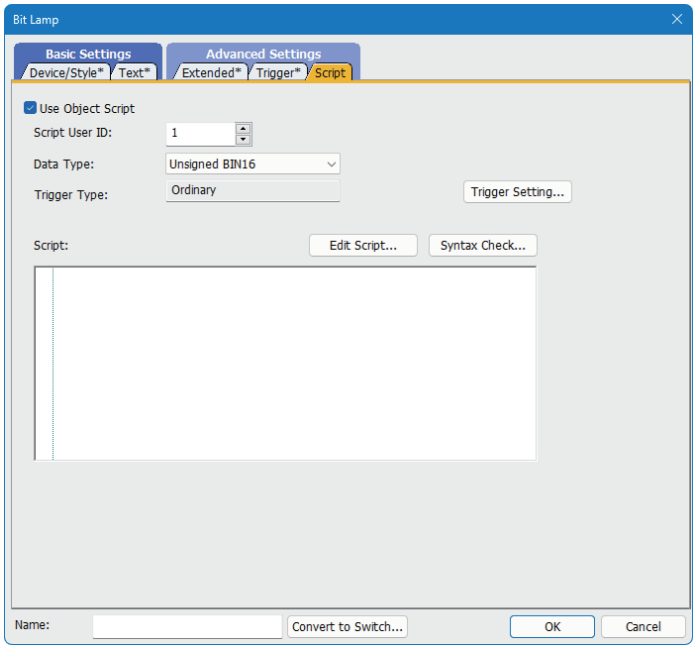
Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Settings]	For the settings of each item, refer to the following. ☞ Page 969 Trigger types settable for the object display condition

28.4.5 [Script] tab

GT37 SoftGOT3000

For the script settings, refer to the following.

☞ Page 2447 Object script



Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	Setting item	Property name	Read	Write	Timing for reflecting the setting change*1
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Extended]	[Security Level]	security	○	○	When the screen is updated

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.

☞ Page 2456 Timing at which the setting change of an object property is reflected

PART 7

28.5 [Word Lamp] dialog

GT37 SoftGOT3000

A word lamp changes its color according to the value of the word device.

Window

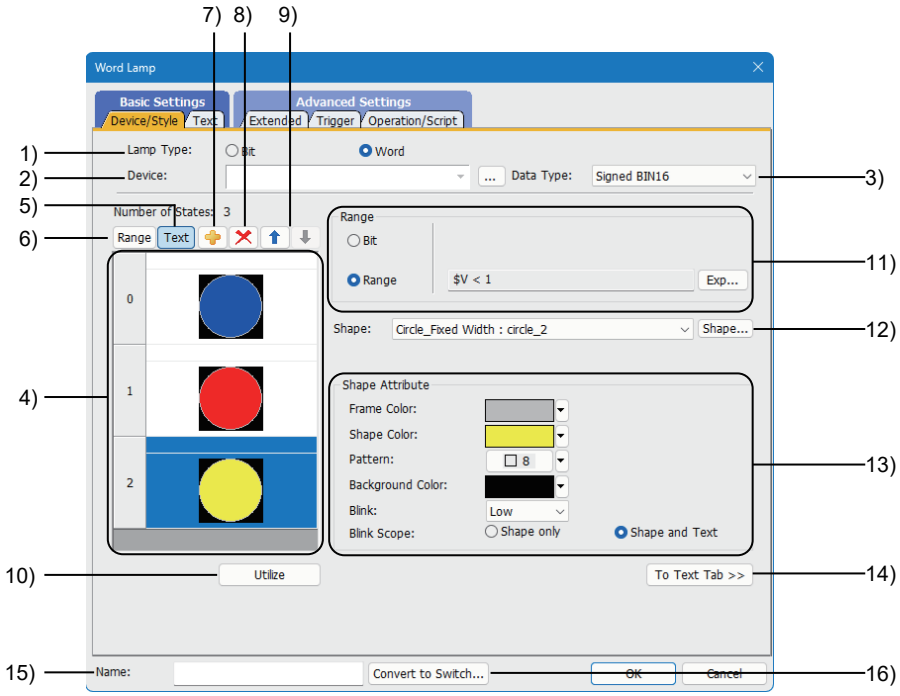
1. Select [Object] → [Lamp] → [Word Lamp] from the menu.
2. Click the position to place a word lamp.
3. Double-click the word lamp to display the setting dialog.

☞ Page 1292 [Device/Style] tab
☞ Page 1294 [Text] tab
☞ Page 1299 [Extended] tab
☞ Page 1300 [Trigger] tab
☞ Page 1301 [Operation/Script] tab

28.5.1 [Device/Style] tab

GT37 SoftGOT3000

Set a device to be monitored and the lamp shape (figure and color) corresponding to the device value.



Item		Description
1)	[Lamp Type]	Select the lamp type.
2)	[Device]	Set a device to be monitored. ☞ Page 834 How to set devices, labels, and tags
3)	[Data Type]	Select the data type of the word device.
4)	Preview list	The images of the configured lamp in the ON and OFF states are displayed.
5)	[Text] button	Displays the preview list in text.
6)	[Range] button	Displays the preview list in range.
7)	Add button	Adds a new condition.
8)	Delete button	Deletes the selected condition.

Item			Description
9)	Up button Down button		Changes the priority order of the conditions in the preview list.
10)	[Utilize] button		Utilizes the selected condition to create a new condition.
11)	[Range]		Set the condition to change the display attributes. When setting the word device value as the condition, click the [Exp] button to display the [Edit Range] dialog, and then set the conditional expression. For details on the conditions, refer to the following. ☞ Page 1038 Control with conditions
12)	[Shape]		Set the shape of the lamp. To select a shape other than those in the list box, click the [Shape] button. ☞ Page 1045 [Image List] dialog (shape)
13)	[Shape Attribute]	[Frame Color]	Select the frame color for the lamp.
		[Shape Color]	Select the shape color for the lamp. Changing the shape color individually enables different colors of the configured lamp shape.
		[Pattern] [Background Color]	Select the pattern and background color for the lamp. The pattern is displayed in the shape color on the colored background. 		[Blink]	Select the blinking speed of the lamp.
		[Blink Scope]	Select the blink scope.
14)	[To Text Tab] button		Displays the [Text] tab.
15)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.
16)	[Convert to Switch] button		Converts the object type to the touch switch. ☞ Page 1279 How to use the lamp

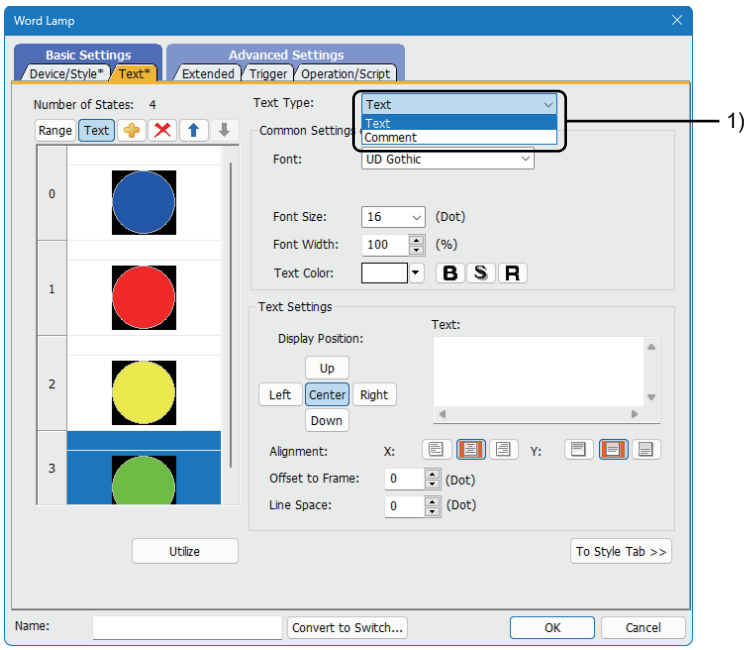
28.5.2 [Text] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Select the text type to use the directly input texts or the comments set in a comment group as a text.



Item			Description
1)	[Text Type]	[Text]	Directly enter the text to be displayed. If characters have already been entered in the [Text] field, switching the text type from [Text] to [Comment] enables you to register the entered characters in a comment group. For instruction on registering a comment group, refer to the following. ☞ Page 811 Registering the characters in the [Text] field to a comment group
		[Comment]	Displays a comment of the specified comment group on the object.

For the comment group settings, refer to the following.

☞ Page 776 Comment setting ([Comment])

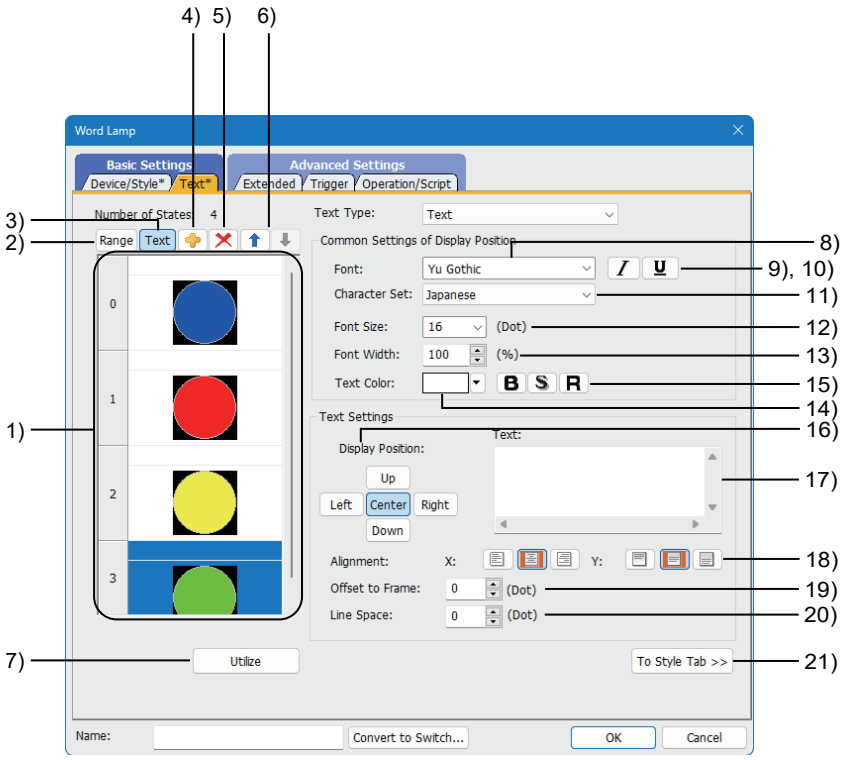
Setting items vary depending on the selected text type.

For the setting items for each text type, refer to the following.

☞ Page 1295 [Text]

☞ Page 1297 [Comment]

[Text]



Item		Description
1)	Preview list	The images of the configured lamp in the ON and OFF states are displayed.
2)	[Range] button	Displays the preview list in range.
3)	[Text] button	Displays the preview list in text.
4)	Add button	Adds a new condition.
5)	Delete button	Deletes the selected condition.
6)	Up button Down button	Changes the priority order of the conditions in the preview list.
7)	[Utilize] button	Utilizes the selected condition to create a new condition.
8)	[Font]	Select the font of the displayed text. ☞ Page 74 Specifications of displayable characters
9)	[Italic] button	Italicizes the text. This item is displayed when a Windows font is selected for [Font].
10)	[Underline] button	Underlines the text. This item is displayed when a Windows font is selected for [Font].
11)	[Character Set]	Set the language. This item is displayed when a Windows font is selected for [Font].
12)	[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots.
13)	[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
14)	[Text Color]	Set the color of the text to be displayed on the object. For details on the color, refer to the following. ☞ Page 988 Color settings

Item		Description
15)	Text style	Set a text style. Only one of the styles ([Bold], [Solid], or [Raised]) is settable.  • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
16)	[Display Position]	Set the position of the text to be displayed on the object. A different text is settable for each position (center, up, down, left, and right). • [Center] button: Displays the text at the center of the object. • [Up] button: Displays the text on the upper side of the object. • [Down] button: Displays the text on the lower side of the object. • [Left] button: Displays the text on the left side of the object. • [Right] button: Displays the text on the right side of the object. 17)	[Text]	Input the text to be displayed. Up to 1024 characters can be set. A line feed is counted as two characters.
18)	[Alignment]	Select the horizontal position (left-aligned, centered, or right-aligned) and vertical position (top-aligned, centered, or bottom-aligned) of the text. 19)	[Offset to Frame]	Set the space between the object frame and the text. The setting range is [0] dots to [100] dots. 20)	[Line Space]	Set the space between lines. The setting range is [0] dots to [128] dots.
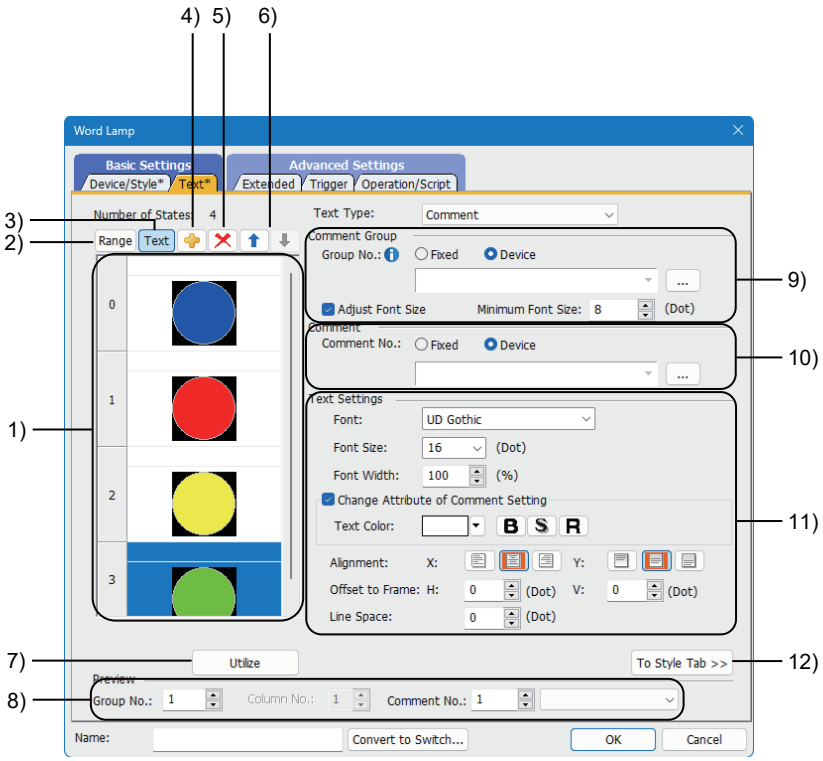
21)	[To Style Tab] button	Moves to the [Device/Style] tab.

[Comment]



Item			Description
1)	Preview list		The images of the configured lamp in the ON and OFF states are displayed.
2)	[Range] button		Displays the preview list in range.
3)	[Text] button		Displays the preview list in text.
4)	Add button		Adds a new condition.
5)	Delete button		Deletes the selected condition.
6)	Up button, down button		Changes the priority order of the conditions in the preview list.
7)	[Utilize] button		Utilizes the selected condition to create a new condition.
8)	[Preview]	[Group No.]	Set the group number of the comment displayed on the GT Designer3 screen. When [Fixed] is selected for [Group No.] of [Comment Group], the group number is fixed to the value set in [Comment Group].
		[Column No.]	Set the comment column number of the comment displayed on the GT Designer3 screen.
		[Comment No.]	Set the comment number of the comment to be previewed on GT Designer3. When [Fixed] is selected for [Comment No.] in [Comment], the comment number is fixed to the value set in [Comment].
9)	[Comment Group]	[Group No.]	Set the group number of the comment group to be used. • [Fixed] Select this item to use the specified comment group. After selecting, enter a comment group number. • [Device] Select this item to use the comment group number corresponding to the value of the device to be set. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags
		[Adjust Font Size]	Adjusts the font size automatically according to the object size. When this item is deselected, the line feed is automatically applied to the text.
		[Minimum Font Size]	Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.

Item			Description
10)	[Comment]	[Comment No.]	Set the comment number of the comment to be used. • [Fixed] Select this item to use the specified comment. Select this item, and enter a comment number. To edit the comment to be displayed, click the [Edit] button to display the [Edit Comment] dialog. ☞ Page 3685 [Edit Comment] dialog • [Device] Select this item to use the comment number corresponding to the value of the device to be set. Select this item and set the device.
11)	[Text Settings]	[Font]	Select the font of the displayed text. ☞ Page 74 Specifications of displayable characters [Windows Font] is selectable when [Group No.] is set to [Fixed]. Displays text in the font specified with [Windows Font] in the [Comment Group Property] dialog.
		[Windows Font Setting] button	This item appears when [Windows Font] is selected for [Font]. The [Comment Group Property] dialog for the group number specified by [Group No.] is displayed. Set [Windows Font] and [Character Set] for the target column of the comment group. ☞ Page 797 [Comment Group Property] dialog
		[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Change Attribute of Comment Setting]	Set the color and style of the text to be displayed on the object without using the attribute set in the [Comment List] window.
		[Text Color]	Set the color of the text to be displayed on the object. For details on the color, refer to the following. ☞ Page 988 Color settings
		Text style	Set a text style. Only one of the styles ([Bold], [Solid], or [Raised]) is settable.  • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
		[Alignment]	Select the horizontal position (left-aligned, centered, or right-aligned) and vertical position (top-aligned, centered, or bottom-aligned) of the text. 		[Offset to Frame]	Set the space between the object frame and the text. The setting range is [0] dots to [100] dots. 		[Line Space]	Set the space between lines. The setting range is [0] dots to [128] dots.
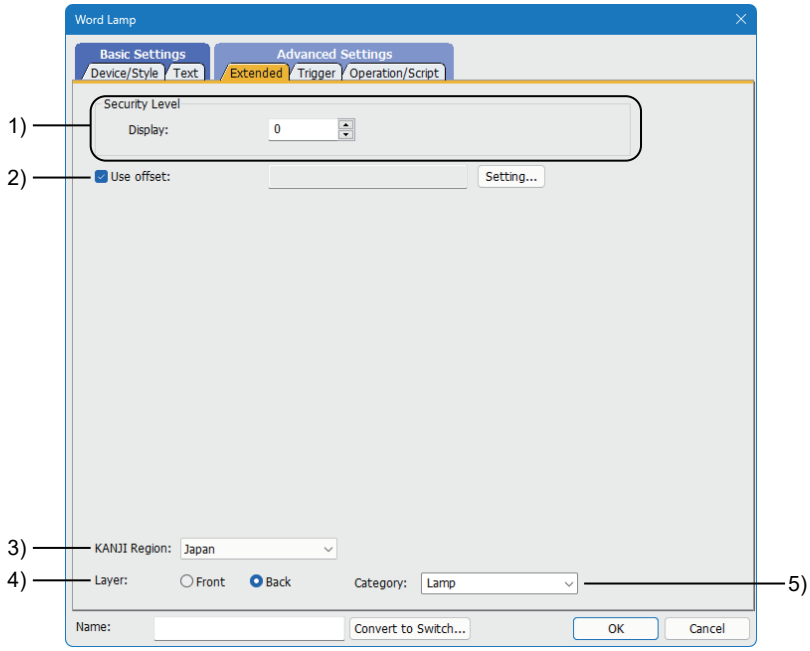
12)	[To Style Tab] button		Moves to the [Device/Style] tab.

28.5.3 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



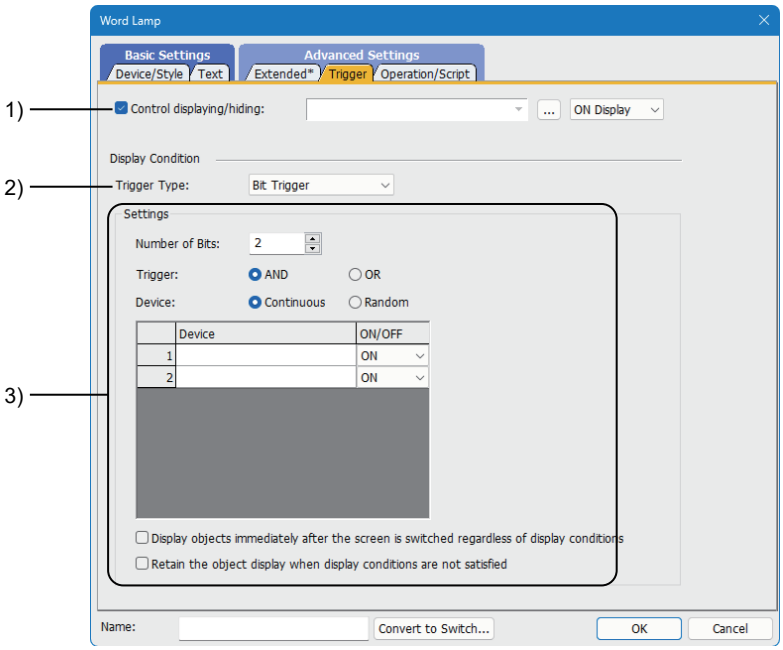
Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ 90 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Configure the settings to monitor the statuses of multiple devices by switching between them with a single device. After selecting this item, set the offset device. The monitored device is the one with the offset device value added to the device set in [Device] in the [Device/Style] tab. ☞ Page 963 Offset
3)	[KANJI Region]	Select the KANJI region of the displayed text. ☞ Page 76 KANJI region This item is enabled when one of the following options is selected for [Font] in the [Text] tab. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho]
4)	[Layer]	Select the layer to place the object. ☞ Page 65 Layer
5)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

PART 7

28.5.4 [Trigger] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Settings]	For the settings of each item, refer to the following. ☞ Page 968 Trigger type settings

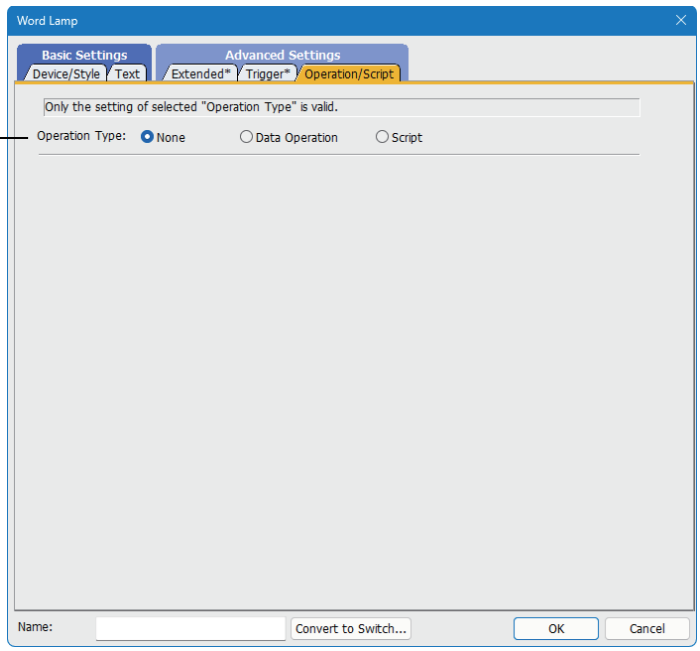
28.5.5 [Operation/Script] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set an expression when you perform monitoring with the data operation function or the script function.

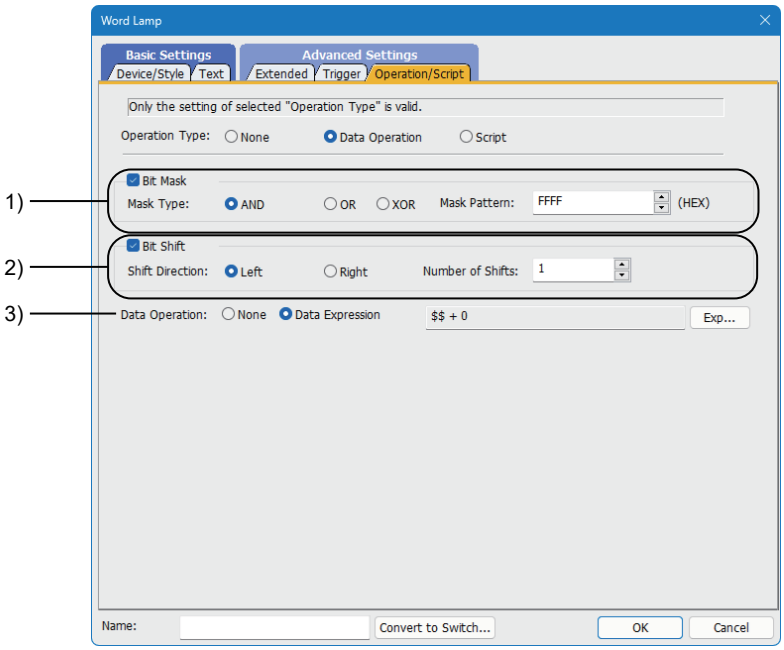


Item			Description
1)	[Operation Type]	[None]	Does not use the data operation function and the script function.
		[Data Operation]	Set the expression used for the data operation function. ☞ Page 1302 [Data Operation]
		[Script]	Set the expressions for the script function. ☞ Page 1303 [Script]

[Data Operation]

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation

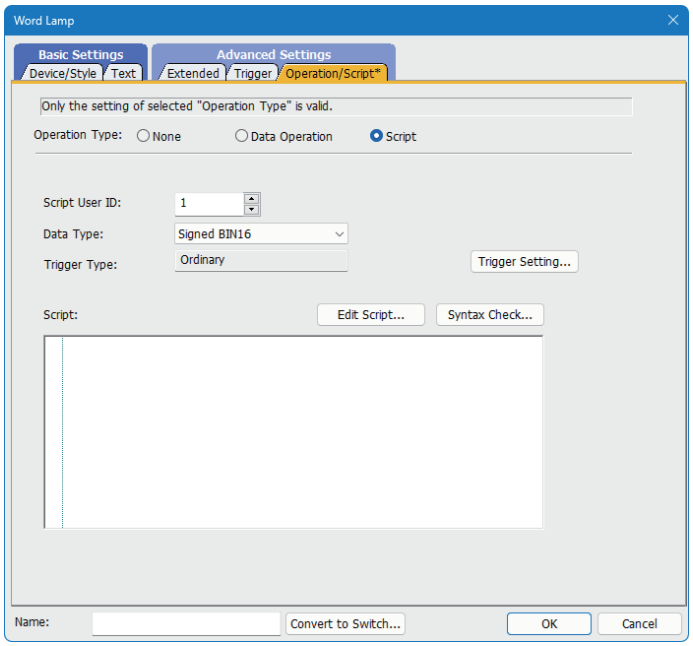


Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range depends on the setting of [Data Type] in the [Device/Style] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range depends on the setting of [Data Type] in the [Device/Style] tab.
3)	[Data Operation]	—	Set the format of the expression.
		[None]	Does not perform the data operation by using the expression.
		[Data Expression]	Performs the data operation by using the expression. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

[Script]

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	**Setting item**	**Property name**	**Read**	**Write**	**Timing for reflecting the setting change*1**
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Extended]	[Security Level]	security	○	○	When the screen is updated

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.

☞ Page 2456 Timing at which the setting change of an object property is reflected

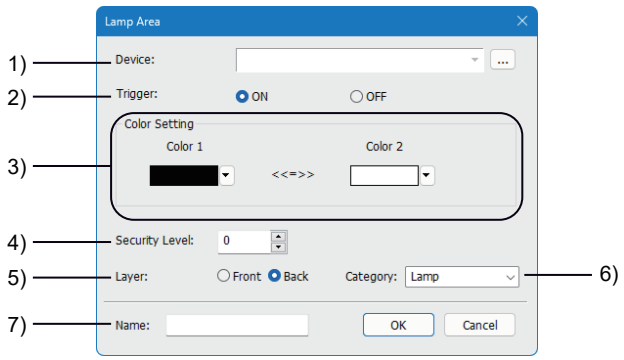
28.6 [Lamp Area] dialog

GT37 SoftGOT3000

The figures and objects in the lamp area are switched between two colors in units of dots according to the status of the applicable bit device.

Window

1. Select [Object] → [Lamp] → [Lamp Area] from the menu.
2. Click the position to place a lamp area.
3. Adjust the dotted frame to specify the applicable lamp area.
4. Double-click the lamp area to display the setting dialog.



Item		Description
1)	[Device]	Set a device to be monitored. ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger]	Select the ON or OFF status of the bit device as the trigger condition to switch the colors.
3)	[Color Setting]	Set [Color 1] and [Color 2] as the two target colors to be switched when the condition is satisfied. The set colors are switched every time the condition is satisfied.
4)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
5)	[Layer]	Select a layer on which the object is placed. Select the same layer as that of the figure and object to which the lamp area is applied. ☞ Page 65 Layer
6)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category
7)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. Up to 100 characters can be set.

29 Placing a numerical display or numerical input object

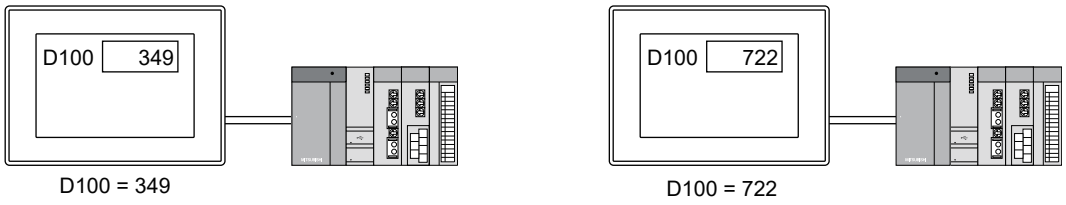
☞ Page 1306 Overview of the numerical display and numerical input objects
☞ Page 1308 How to use the numerical display and numerical input objects
☞ Page 1314 Specifications of the numerical display and numerical input objects
☞ Page 1316 Configuring the settings for a numerical display or numerical input object
☞ Page 1317 [Numerical Display] dialog
☞ Page 1328 [Numerical Input] dialog
☞ Page 1342 Relevant settings

29.1 Overview of the numerical display and numerical input objects

GT37 SoftGOT3000

29.1.1 Numerical display

With this function, the data stored in devices are displayed numerically on the GOT.



29.1.2 Numerical input

With this function, values entered into the GOT are written into devices.

Two methods are available for numerical input.

☞ Page 1306 Entering values with keys for entries

☞ Page 1307 Entering the numerical values read with a barcode reader or RFID reader

Entering values with keys for entries

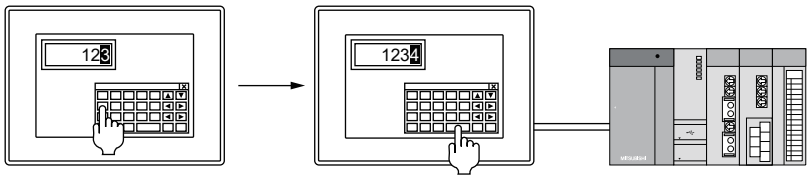
A value can be entered on a key window or using key code switches.

■Entering from a key window

A value can be entered on the key window displayed by touching the numerical input object placed on the base screen.

For the key window, refer to the following.

☞ Page 558 Setting key windows of the GOT ([Key Window])

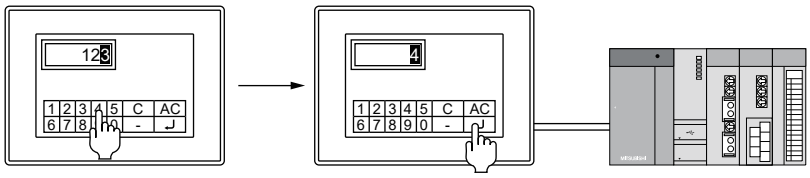


■Using key code switches placed on the screen

A value can be entered by using the key code switches placed on the base screen without displaying a key window.

For key code switches, refer to the following.

☞ Page 1251 [Key Code Switch] dialog



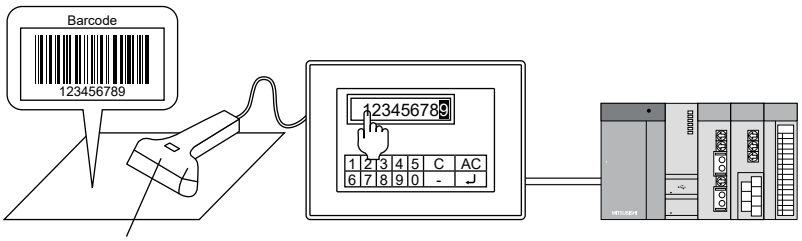
Entering the numerical values read with a barcode reader or RFID reader

A value can be entered with a barcode reader or RFID reader.

When entering data with a barcode reader or RFID reader, set the barcode function or RFID function.

☞ Page 2564 Using a barcode reader with the GOT (barcode function)

☞ Page 2588 Using an RFID with the GOT (RFID function)



Barcode reader

The corresponding numerical value is input in a touched numerical input.

Precautions

Item	Description
Reading data with a barcode reader or RFID reader during entry on the key window	Depending on the operation, the read data may not be entered. • While displaying dialog windows The data read with a barcode reader or RFID reader cannot be entered. • While not displaying dialog windows The value being entered on the key window is discarded, and the data read with a barcode reader or RFID reader is entered.
Performing key touch operations while the data read with a barcode reader or RFID reader is being entered	While the data read with a barcode reader or RFID reader is being entered, key touch operations are invalid and the data read with a barcode reader or RFID reader is entered.
When data is not numerical values or insufficient for the specified start position	When the data read with a barcode reader or RFID reader is applicable to the following cases, the data is not entered. • Other than numerical values • The format of the data is different from the setting of [Format] • The data is insufficient for the setting of [Start Position].

29.2 How to use the numerical display and numerical input objects

GT37 SoftGOT3000

☞ Page 1308 Superimposing on a level object
☞ Page 1308 Specifying the destination to which the cursor moves after the confirmation of a numerical value entry
☞ Page 1312 Specifying the input range for a numerical input
☞ Page 1312 Checking the input range while entering numerical values
☞ Page 1313 Displaying character strings instead of numerics

For the basic usage of the numerical display and numerical input objects, refer to the following.

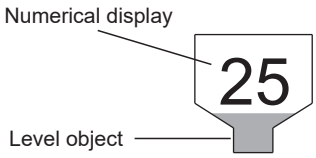
☞ Page 1306 Overview of the numerical display and numerical input objects

For information on how to place a numerical display or numerical input object, refer to the following.

☞ Page 1316 Configuring the settings for a numerical display or numerical input object

29.2.1 Superimposing on a level object

A numerical display or numerical input object can be superimposed on a level object.



For restrictions on superimposition on a level object, refer to the following.

☞ Page 1761 Placing a level object

29.2.2 Specifying the destination to which the cursor moves after the confirmation of a numerical value entry

When [User ID] is set, the destination to which the cursor moves after the confirmation of a numerical value entry can be specified.

[User ID] can be set only when the numerical input object is used.

☞ Page 1335 [Extended] tab

About [User ID]

The user ID is a number to identify the object.

When [User ID] is set, the following setting and operations are enabled.

☞ Page 1308 Setting the display position of the cursor when the screen is switched or the enter key is pressed
☞ Page 1309 Checking the timing for confirming numerical input with the system information
☞ Page 1310 Moving the cursor in ascending or descending order of user ID number
☞ Page 1310 Specifying objects that were used with operation logs

■Setting the display position of the cursor when the screen is switched or the enter key is pressed

In the [Environmental Setting] window ([Key Window]) or the screen property, the display position of the cursor when the screen is switched or the enter key is pressed can be set.

For details, refer to the following.

☞ Page 558 Setting key windows of the GOT ([Key Window])
☞ Page 313 Changing screen property

■Checking the timing for confirming numerical input with the system information

When an entered value is confirmed with the numerical input function, the corresponding user ID number is written in [Numeric Value Input Number] of [System Information], and the Numeric Value Input signal (System information 2-1.b4) turns on.

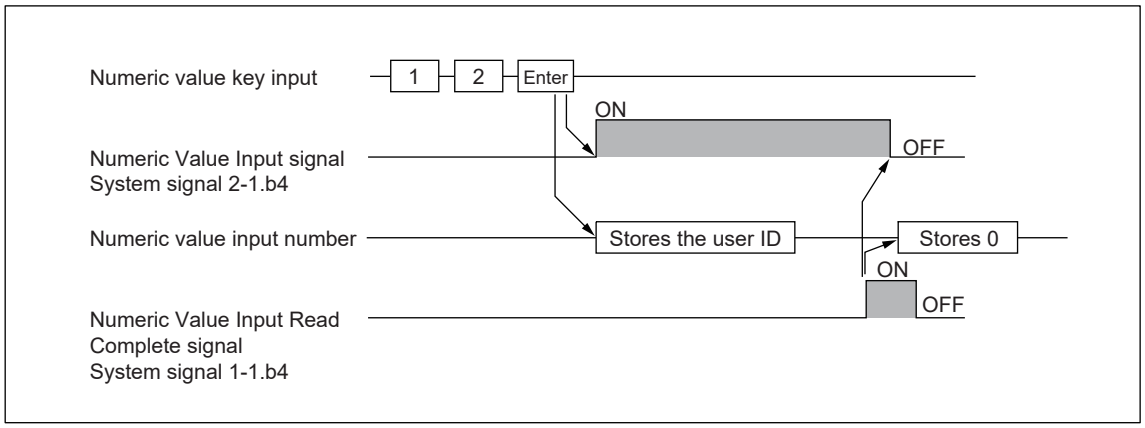
When deleting the user ID written to the numeric value input number or turning off the Numeric Value Input signal (System signal 2-1.b4), turn on the Numeric Value Input Read Complete signal (System signal 1-1.b4).

After clearing, turn off the Numeric Value Input Read Complete signal (System signal 1-1.b4).

Otherwise user ID numbers cannot be stored and bit devices cannot turn on even when numerical value entries are confirmed.

For details on the system information, refer to the following.

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

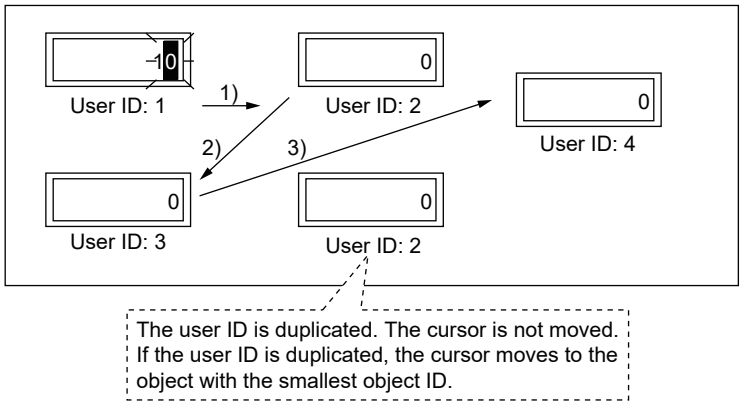


PART 7

■Moving the cursor in ascending or descending order of user ID number

When the following key code switches are used, the cursor can be moved in ascending or descending order of user ID number.

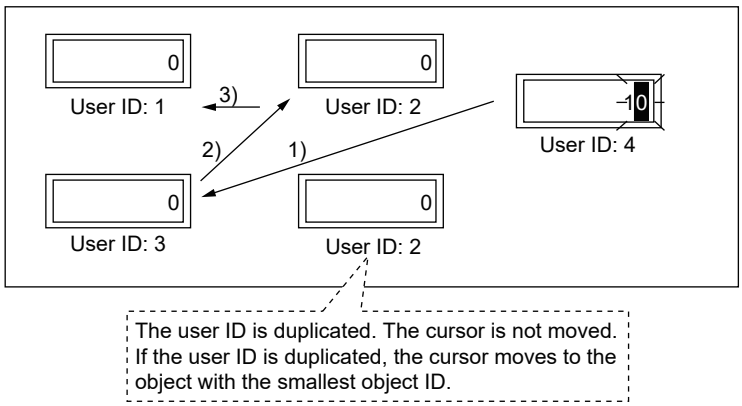
• User ID ascending order movement of cursor (key code: 0092h)



The cursor is moved in order of 1) → 2) → 3).

After 3), the cursor does not move because the destination user ID number does not exist.

• User ID descending order movement of cursor (key code: 0093h)



The cursor is moved in order of 1) → 2) → 3).

After 3), the cursor does not move because the destination user ID number does not exist.

For details on key code switches, refer to the following.

☞ Page 1251 [Key Code Switch] dialog

■Specifying objects that were used with operation logs

When input is performed with an object, the user ID is also recorded in the operation log.

Setting a user ID to the object enables you to identify the manipulated object.

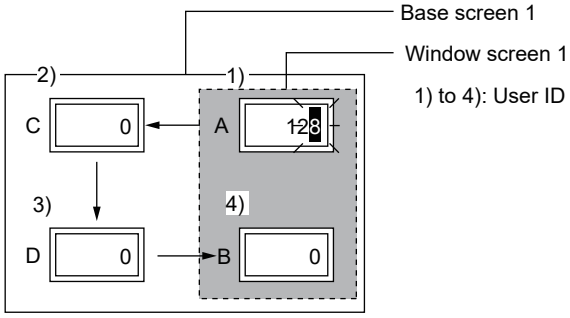
☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])

User ID setting

When controlling the cursor using user ID numbers, assign different user ID numbers to each object.
Also, when using overlay screens or superimpose windows, set screens in a way that different user ID numbers are assigned to each object.
When the same user ID number is assigned to different objects, the cursor operation may not perform normally.

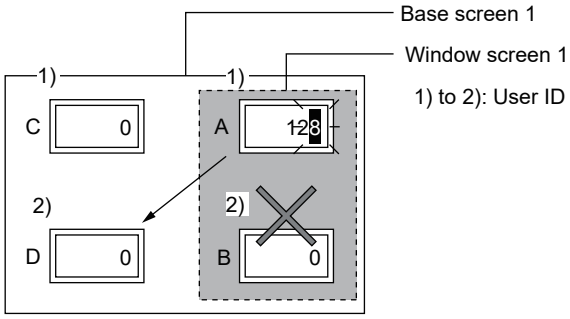
■When assigning different user ID numbers to each object

Even if a set overlay screen object or superimpose window is used, the cursor operation using user ID numbers is performed normally.



■When assigning the same user ID number

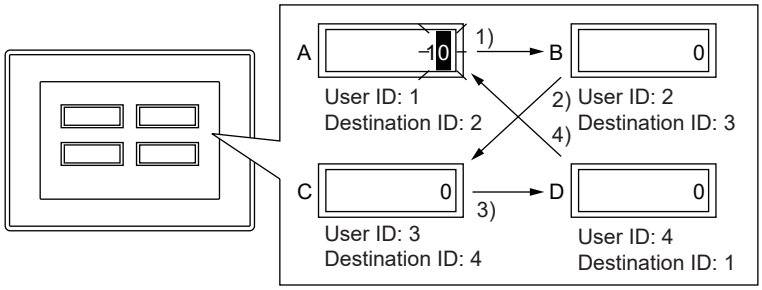
If objects having the same user ID exist on the screen (including set overlay screen objects and superimpose windows), the cursor operation using user ID numbers may not perform normally.



Relation between user ID and destination ID

Move the cursor to the object that has the same user ID number as the move destination ID number of the active object.
☞ Page 1335 [Extended] tab

Ex.
Moving the cursor using the destination ID number



29.2.3 Specifying the input range for a numerical input

The range of values to be entered with a numerical input object can be specified.

Set the condition for the input rage in the [Numerical Input] dialog ([Input Case] tab).

☞ Page 1334 [Input case] tab

29.2.4 Checking the input range while entering numerical values

Display the [Display Detail Setting] dialog from the [Environmental Setting] window ([Key Window]) or screen property, and select [Check the input range while entering numerical values] to check the range while inputting numerical values.

For details, refer to the following.

☞ Page 558 Setting key windows of the GOT ([Key Window])

☞ Page 313 Changing screen property

Set the condition for the input rage in the [Numerical Input] dialog ([Input Case] tab).

☞ Page 1334 [Input case] tab

Number of conditions that can be set

One condition can be set.

If two or more conditions are set, the input range is checked when the entry is confirmed, not when numerical values are being entered.

Settable conditional expressions

Set either of the following patterns.

If a conditional expression is not set using the following patterns, the input range is checked when the entry is confirmed.

Settable pattern for a conditional expression	Description of the symbol
$W < A $W <= A	• $W: Device set with a numerical input object • A: Constant, another device (positive value (+) only)
A < $W < B A <= $W < B A < $W <= B A <= $W <= B	• $W: Device set with a numerical input object • A: Constant, another device • B: Constant, another device (positive value (+) only)

Precautions during input

Item	Description
Inputting a negative value	To enter a negative value, first enter a minus sign (-), then enter a numerical value.
Inputting a decimal point	If the decimal point automatic adjustment is disabled and no data operation is set, the fractional portion is rounded down.
Timing of range check for lower limits	The input range is checked when the entry is confirmed.
Comparing with devices	In a case where comparison with a device is made, a message is displayed when the device value cannot be read.
Moving the cursor	When the cursor in the object is moved while a numerical value is entered, the range is not checked while the numerical value is entered. The input range is checked when the entry is confirmed. To have the range checked while entering a numerical value, hide the cursor (cancel the input status of the numerical input), and then execute the numerical input again.

29.2.5 Displaying character strings instead of numerics

Character strings can be displayed instead of numerics.

By setting conditions, you can display a character string when the device value is within a certain range, and change the character string according to changes in the device value.

The character string is set in the [Numerical Input] dialog or in the [Style] tab of the [Numerical Display] dialog.

☞ Page 1317 [Numerical Display] dialog

☞ Page 1328 [Numerical Input] dialog

29.3 Specifications of the numerical display and numerical input objects

GT37 SoftGOT3000

☞ Page 1314 Maximum number of objects that can be placed on one screen
☞ Page 1314 Numerical display when a data operation error occurs
☞ Page 1315 Operation when a numerical input object is placed on the base screen and a window screen
☞ Page 1315 Entering a space or symbol
☞ Page 1315 Entering an integer

29.3.1 Maximum number of objects that can be placed on one screen

A total of 1024 numerical displays, numerical inputs, and other objects can be placed on one base screen, while 512 can be placed on one window screen.

29.3.2 Numerical display when a data operation error occurs

If there is any of the following errors in an operation of the displayed data, the object displays the number of hyphens corresponding to the number of displayed digits.

- BCD-BIN conversion error
- Division by zero error
- 64-bit operation overflow

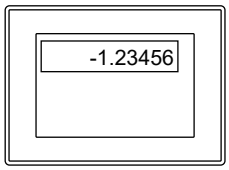
While the object displays hyphens, touch the input value area to display 0 in the area.

Display of a value containing a symbol or decimal point

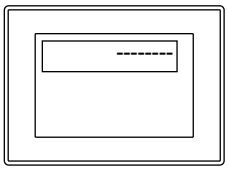
A symbol and a decimal point, which are contained in a value, are also displayed as hyphens.

Ex.

When the settings are configured as follows: display format: real, number of displayed digits: 8 (fractional portion: 5), and right alignment



Normal display



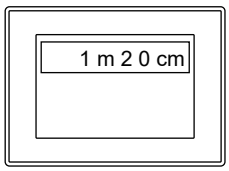
Display at an error occurrence

Display when characters and numerics are displayed together

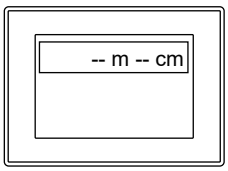
Of a character string specified as [Format String], numerics are displayed as hyphens, and characters are displayed as they are.

Ex.

When the settings are configured as follows: display format: decimal, specified character string: ##m##cm, and right alignment



Normal display



Display at an error occurrence

29.3.3 Operation when a numerical input object is placed on the base screen and a window screen

If a numerical input object is placed on both a base screen and an overlap window, displaying a cursor for input using a method other than a touch operation (special function switch to display the key window, etc.) displays the cursor on the overlap window.

To display the cursor for the numerical input on the base screen, press the numerical input on the base screen.

29.3.4 Entering a space or symbol

If you enter only a space or symbol using a numerical input object and then touch the Enter key, the entry is cancelled.

To enter only a space or symbol as a device value, use the text input.

☞ Page 1345 Placing a text display or text input object

29.3.5 Entering an integer

When you enter an integer using a numerical input object in a device that satisfies all the following conditions, the value to be stored in the device and the value to be displayed on the GOT differ.

- [Data Type] in the [Device] tab is set to [Real(32bit)].
- [Format] in the [Device] tab is set to [Binary] or [Hexadecimal].

Ex.

Entering 1 (integer) in the device for which [Data Type] is set to [Real(32bit)] and [Format] is set to [Hexadecimal]

- Value to be stored in the device: 1 (integer)
- Value to be displayed on the GOT: 0

29.4 Configuring the settings for a numerical display or numerical input object

Use the following procedure to place a numerical display or numerical input, and configure the operation settings.

Configuring the settings for a numerical display object

Operating procedure

1. Select [Object] → [Numerical Display/Input] → [Numerical Display] from the menu.
2. Click the position to place a numerical display object.

☞ Page 1001 Placing figures and objects

3. Double-click the object to display the setting dialog.
4. Configure the operation settings in each tab of the [Numerical Display] dialog.

☞ Page 1317 [Numerical Display] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 988 Color settings

Configuring the settings for a numerical input object

Operating procedure

1. Select [Object] → [Numerical Display/Input] → [Numerical Input] from the menu.
2. Click the position to place a numerical input object.

☞ Page 1001 Placing figures and objects

3. Double-click the object to display the setting dialog.
4. Configure the operation settings in each tab of the [Numerical Input] dialog.

☞ Page 1328 [Numerical Input] dialog

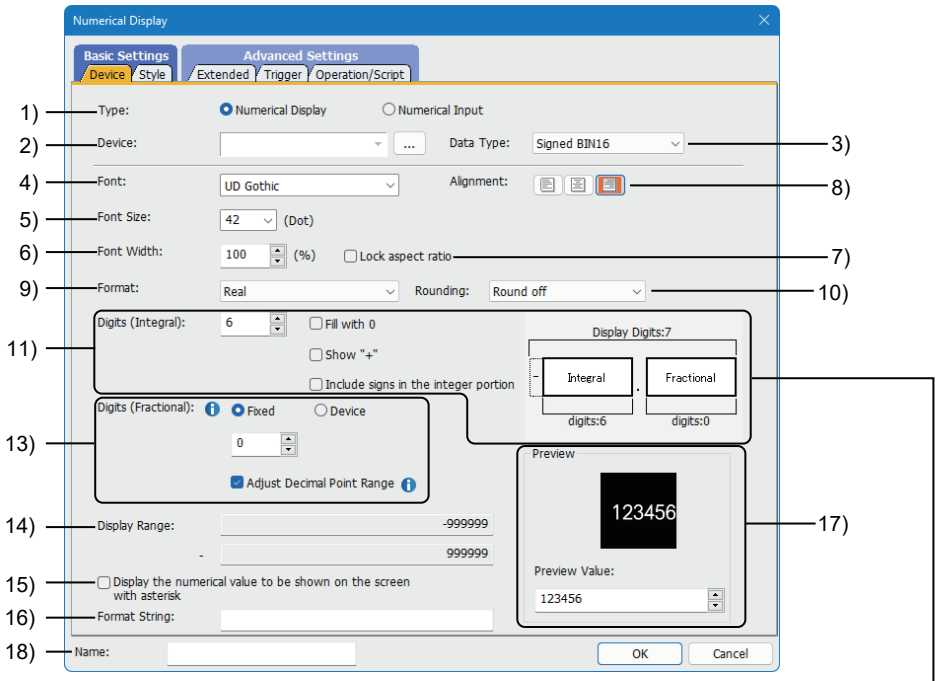
☞ Page 1325 [Operation/Script] tab

29.5.1 [Device] tab

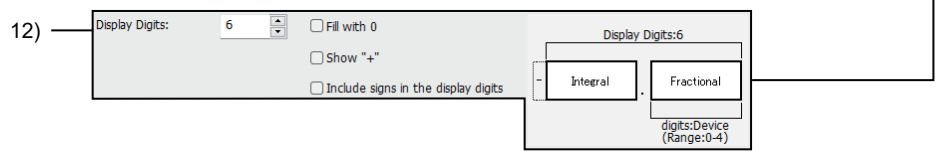
GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



When [Fixed] is selected for [Digits (Fractional)]



When [Device] is selected for [Digits (Fractional)]

Item		Description
1)	[Type]	Select the function to be used.
2)	[Device]	Set a device to be monitored. ☞ Page 834 How to set devices, labels, and tags
3)	[Data Type]	Select the data type of the device.
4)	[Font]	Select the font of the numerical value to be displayed. ☞ Page 74 Specifications of displayable characters
5)	[Font Size]	Set the vertical size of the numerical value. The setting range is [8] dots to [540] dots.

PART 7

Item			Description
6)	[Font Width]		Set the horizontal size of the numerical value. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
7)	[Lock aspect ratio]		The aspect ratio of the numerical value is retained even when the numerical value is resized by manipulation of the handle on the screen editor.
8)	[Alignment]		Set the horizontal position (left-aligned, centered, or right-aligned) of the numerical value. 9)	[Format]		Select the display type of the device to be monitored. The selectable items vary with the data type of the device. For details, refer to the following. ☞ Page 1320 Selectable range for [Format]
10)	[Rounding]		This item is displayed when [Format] is set to [Real]. If there is a numerical value that have digits to the right of the digit set for [Digits (Fractional)], select the processing method.
11)	[Digits (Integral)]	—	This item is displayed when [Digits (Fractional)] is set to [Fixed]. Set the number of digits of the integer part to be displayed. The setting range depends on the setting of [Format]. • [Signed Decimal] or [Unsigned Decimal]: [1] to [21] • [Hexadecimal]: [1] to [16] • [Octal]: [1] to [6] • [Binary] or [Real]: [1] to [32]
		[Fill with 0]	This item is enabled when [Alignment] is set to right alignment. The numerical value is prefixed with 0 according to the setting value of [Digits (Integral)]. Example) When setting [5] for [Digits (Integral)]  When [Format] is set to [Binary], the GOT displays the numerical value prefixed with 0, regardless of the setting of [Fill with 0].
		[Show "+"]	This item is displayed when [Format] is set to [Signed Decimal] or [Real]. When the numerical value is positive number, [+] is prefixed to the numerical value.
		[Include signs in the integer portion]	This item is displayed when [Digits (Fractional)] is set to [Fixed], and [Format] is set to either of the following items. • [Signed Decimal] • [Real] A sign is displayed as one of the digits of the integer part.
12)	[Display Digits]	—	This item is displayed when [Format] is set to [Real], and [Digits (Fractional)] is set to [Device]. Set the total number of digits of the integer part and fractional part to be displayed. The setting range is [1] to [32].
		[Fill with 0]	This item is enabled when [Alignment] is set to right alignment. The numerical value is prefixed with 0 according to the setting value of [Display Digits]. Example) When setting [Display Digits] to [5] 		[Show "+"]	This item is displayed when [Format] is set to [Signed Decimal] or [Real]. When the numerical value is positive number, [+] is prefixed to the numerical value.
		[Include signs in the display digits]	This item is displayed when [Format] is set to [Real], and [Digits (Fractional)] is set to [Device]. A sign is displayed as one of the digits to be displayed.

Item			Description
13)	[Digits (Fractional)]	—	This item is displayed when [Format] is set to [Real]. Select a method to specify the number of decimal places, and specify the number of decimal places to be displayed. The following shows selectable items. • [Fixed] Enter the number of decimal places. The setting range is [0] to [30]. • [Device] Set a device to specify the number of decimal places. The number of decimal places changes based on the device value. The data type of the device is unsigned 16-bit binary. Set the device value as follows. X > Y + 1 X: Value set for [Display Digits] Y: Device value to specify the number of decimal places If the device value is outside the valid range, 0 is assumed.
		[Adjust Decimal Point Range]	This item is displayed when [Format] is set to [Real], and [Data Type] is set to other than the following items. • [Real(32bit)] • [Real(64bit)] (When a value other than binary floating values is held in the monitor target device) the integer device value is displayed as a value with the decimal point. Example) Number of the digits to the right of the decimal point: 2 Controller device value: 20  The value is displayed as 0.20 on the GOT. Example) Number of the digits to the right of the decimal point: 3 Controller device value: 20  The value is displayed as 0.020 on the GOT. Automatic adjustment is performed for the following devices. • Monitored device • [$V] and [Other Device] used in the conditional expression for display attributes in the [Style] tab • [$$] and [Other Device] used for data operation in the [Operation/Script] tab
			When the data type is 64-bit and either of the following conditions is satisfied, 14 digits in the fractional portion are significant after automatic adjustment. • Data operation is set. • Object internal variables are used. ☞ Page 1050 Operating expression In the conditional expression for display attributes, 14 digits in the fractional portion are significant, and operation is performed with the value before automatic adjustment.
14)	[Display Range]		Displays the maximum/minimum value which can be displayed on the screen.
15)	[Display the numerical value to be shown on the screen with asterisk]		This item is displayed when [Font] is set to other than [7-Segment Font]. The numerical value, sign, and decimal point to be displayed on the screen are displayed with asterisks. The character string (except #) set for [Format String] is not displayed in asterisk. When saved as an operation log, the text is saved not as an asterisk but as a numerical value.
16)	[Format String]		This item is displayed when [Font] is set to other than [7-Segment Font]. Characters (such as alphanumeric characters, kanji, or symbols) are displayed in the numerical display object. Enter #s to the positions where the digits of a numerical value are to be displayed. The #s entered in setting this item are replaced with the digits of the device value. Each # is replaced with the digit of the value in the same position counted from the right. If the number of the digits of the device value is larger than that of #s, the digits overflowing from the left are not displayed. The digits of a real number to the right of the decimal point are processed according to the setting for [Rounding]. The sign included in the device value is also processed in the same way that processes the numerical value. For display examples, refer to the following. ☞ Page 1320 Display examples when a format string is set When a character is entered in the field for [Format String], the following setting changes occur. • The settings of [Digits (Integral)] and [Display Digits] become invalid. • The setting of [Alignment] becomes invalid and is changed to right alignment.
17)	[Preview]	—	Displays the preview of the screen.
		[Preview Value]	Set the numerical value to be displayed in the preview.

Item		Description
18)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

Selectable range for [Format]

○: Supported, —:Not supported

[Data Type]	[Format]					
	[Signed Decimal]	[Unsigned Decimal]	[Hexadecimal]	[Octal]	[Binary]	[Real]
[Signed BIN8]	○	○	○	○	○	○
[Unsigned BIN8]	○	○	○	○	○	○
[Signed BIN16]	○	○	○	○	○	○
[Unsigned BIN16]	○	○	○	○	○	○
[Signed BIN32]	○	○	○	—	○	○
[Unsigned BIN32]	○	○	○	—	○	○
[Signed BIN64]	○	○	○	—	—	○
[Unsigned BIN64]	○	○	○	—	—	○
[BCD16]	○	○	○	○	○	○
[BCD32]	○	○	○	—	○	○
[BCD64]	○	○	○	—	—	○

[Real(64bit)]	○	○	○	—	—	○

Display examples when a format string is set

Ex.

When the setting for [Format] is not [Real]

Format string	Digits in the fractional portion	Device value	Display
##m##cm	—	1234	12m34cm
		123	1m23cm
		12345	23m45cm
		-123	-1m23cm

Ex.

When setting [Real] for [Format] and [Round off] for [Rounding]

Format string	Digits in the fractional portion	Device value	Display	Description
##m##cm	0	12.345	m12cm	Since [Digits (Fractional)] is 0, only the integer part is displayed.
	2		12m35cm	Since [Digits (Fractional)] is 2, the digits from the integer part to the second decimal place are displayed. The device value is rounded off to the third decimal place.
####cm	2	12.344	1234cm	Since [Digits (Fractional)] is 2, the device value is rounded off to the third decimal place.
		12.345	1235cm	
##.##cm	2	12.344	12.34cm	
		12.345	12.35cm	

29.5.2 [Style] tab

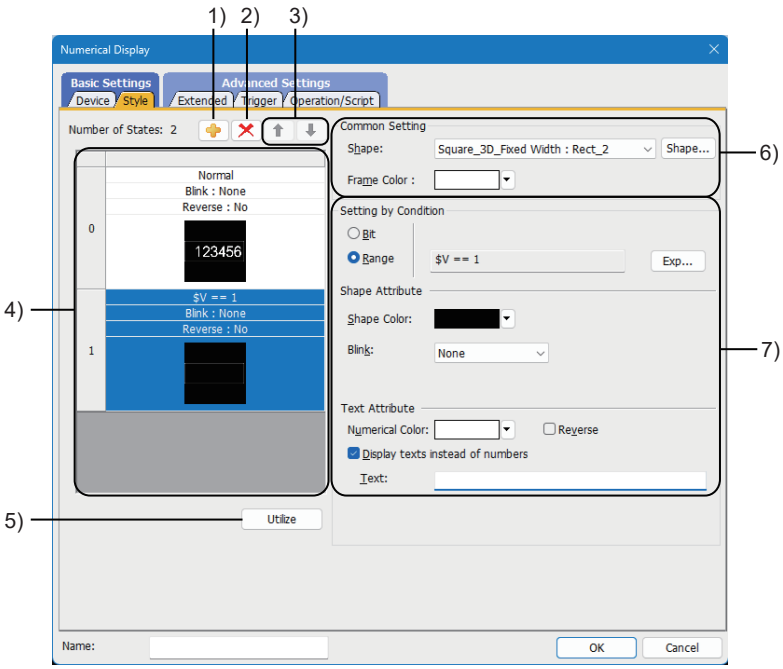
GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

For the conditions, refer to the following.

☞ Page 1038 Control with conditions



Item			Description
1)	Add button		Adds a new condition.
2)	Delete button		Deletes the selected condition.
3)	Up button Down button		Changes the priority order of the conditions in the preview list.
4)	Preview list		Displays the status set for each condition.
5)	[Utilize] button		Utilizes the selected condition to create a new condition.
6)	[Common Setting]	—	This setting is applied regardless of the satisfied condition.
		[Shape]	Select the shape to be set for the object from the list or with the [Shape] button. ☞ Page 1044 Object shape When the text to be displayed overlaps the shape frame area, the text cannot be displayed normally. Configure the settings so that the text and the shape frame area do not overlap. View in GT Designer3 → View on the GOT 123456 → 2345(Frame shape area Characters which overlap with the frame shape area are not displayed.
		[Frame Color]	Select a frame color for the shape. ☞ Page 988 Color settings

PART 7

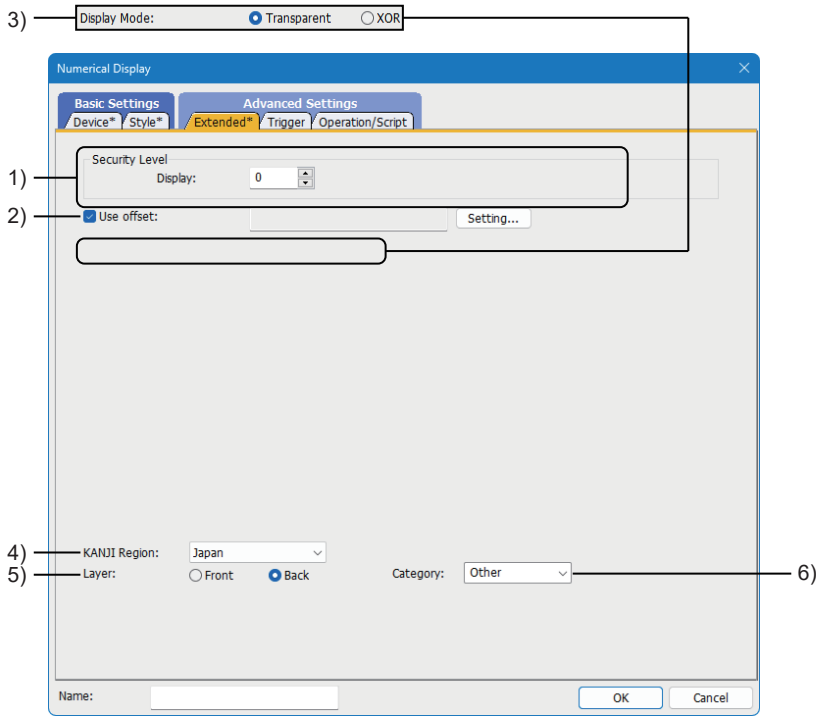
Item				Description
7)	[Setting by Condition]	—		Set the condition to be satisfied for the conditions selected in the preview list. When setting the word device value as the condition, click the [Exp] button to display the [Edit Range] dialog, and then set the conditional expression. For details on the conditions, refer to the following. ☞ Page 1038 Control with conditions The following setting items can be changed for each condition.
		[Shape Attribute]	[Shape Color]	Select the shape color. ☞ Page 988 Color settings
			[Blink]	Select the blinking speed of the numerical value and shape.
			[Blink Scope]	Select the area to be blinked.
		[Text Attribute]	[Numerical Color]	Set the color of the numerical value. ☞ Page 988 Color settings
			[Reverse]	Inverts the color of the numerical value.
			[Display texts instead of numbers]	Set the character string to be displayed instead of numerics. Up to 40 characters can be set. If you input 40 two-byte characters, the text may be truncated.

29.5.3 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description	
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)	
2)	[Use offset]	Configure the settings to monitor the statuses of multiple devices by switching between them with a single device. After selecting this item, set the offset device. ☞ Page 963 Offset	
3)	[Display Mode]	Display mode when the numerical display object is superimposed on a level object. This setting is not displayed when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). The operation when [Transparent] is selected is applied. ☞ Page 519 [Type Setting] dialog	
		[Transparent]	Displays the numerical value on the level object.
		[XOR]	The numerical value in a numerical display object is integrated into the XOR synthesis with a level color, to be able to be distinguished from the level object. 4)	[KANJI Region]	Select the KANJI region of the displayed text. ☞ Page 76 KANJI region This item is displayed when [Format String] is set in the [Device] tab or when [Display texts instead of numbers] is set in the [Style] tab.	
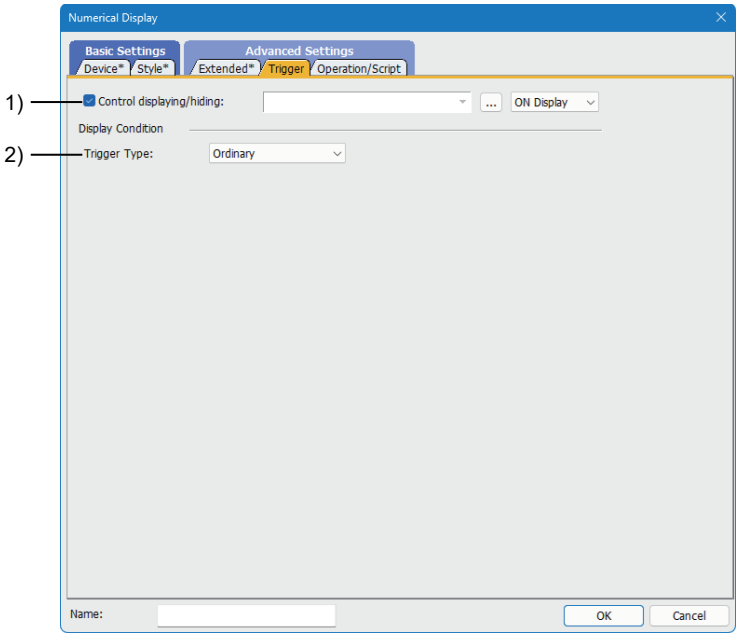
5)	[Layer]	Select the layer to place the object. ☞ Page 65 Layer	
6)	[Category]	Select the category to assign the object. ☞ Page 1092 Efficient Drawing with Templates	

29.5.4 [Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition

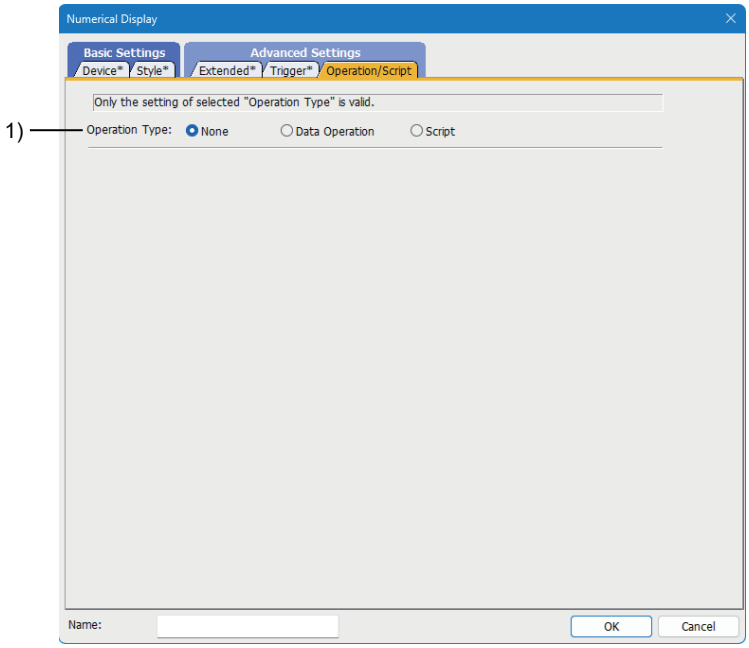
29.5.5 [Operation/Script] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set an expression for monitoring using the data operation function or the script function.



Item			Description
1)	[Operation Type]	[None]	The data operation function and the script function are not used.
		[Data Operation]	Set the expression used for the data operation function. ☞ Page 1326 [Data Operation]
		[Script]	Set the expressions for the script function. ☞ Page 1327 [Script]

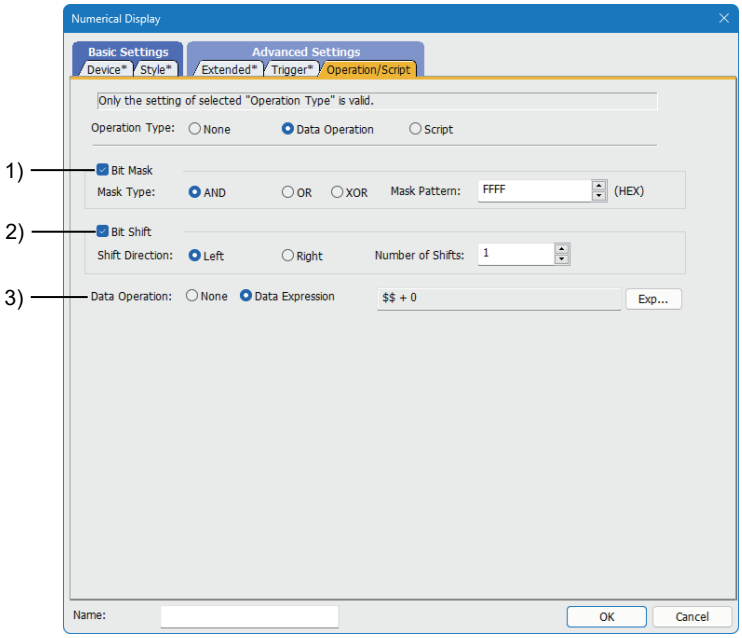
PART 7

[Data Operation]

GT37 SoftGOT3000

For details on the data operation settings, refer to the following.

☞ Page 1049 Data operation



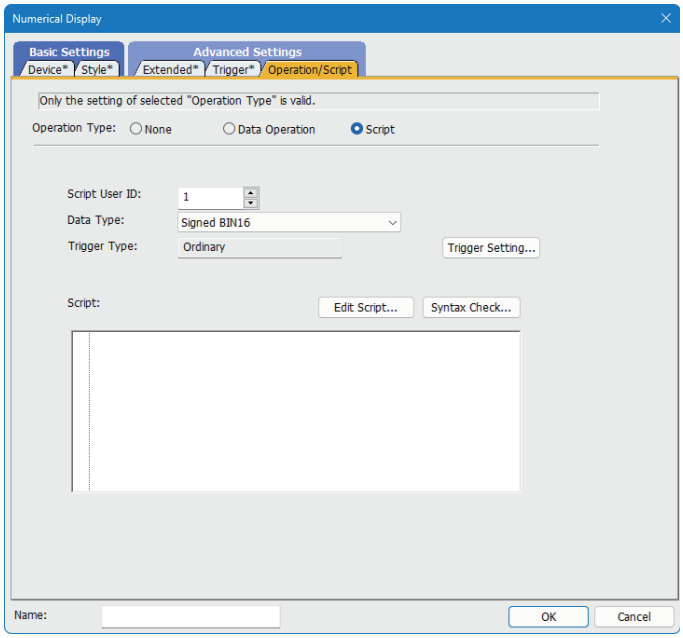
Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. The following shows selectable items. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range depends on the setting of [Data Type] in the [Device] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range depends on the setting of [Data Type] in the [Device] tab.
3)	[Data Operation]	—	Set the format of the expression.
		[None]	Does not perform the data operation by using the expression.
		[Data Expression]	Performs the data operation by using the expression. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

[Script]

GT37 SoftGOT3000

For details on the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	Setting item	Property name	Read	Write	Timing for reflecting the setting change*1
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
		text_width	○	○	When the object is updated
		text_height	○	○	When the object is updated
[Device]	[Alignment]	arrange	○	○	When the object is updated
	[Digits (Fractional)]	decimal_point	○*2	○*2	Upon the setting change
[Style]	[Frame Color]	frame_color	○	×	×
	[Shape Color]	plate_color	○	○	When the object is updated
	[Reverse]	highlight	○	○	When the object is updated
	[Blink] [Blink Scope]	blink	○	○	When the object is updated
	[Numerical Color]	text_color	○	○	When the object is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated
	[Display Mode]	draw_mode	○	○	When the object is updated

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.
☞ Page 2456 Timing at which the setting change of an object property is reflected

*2 Not available when [Device] is selected for [Digits (Fractional)].

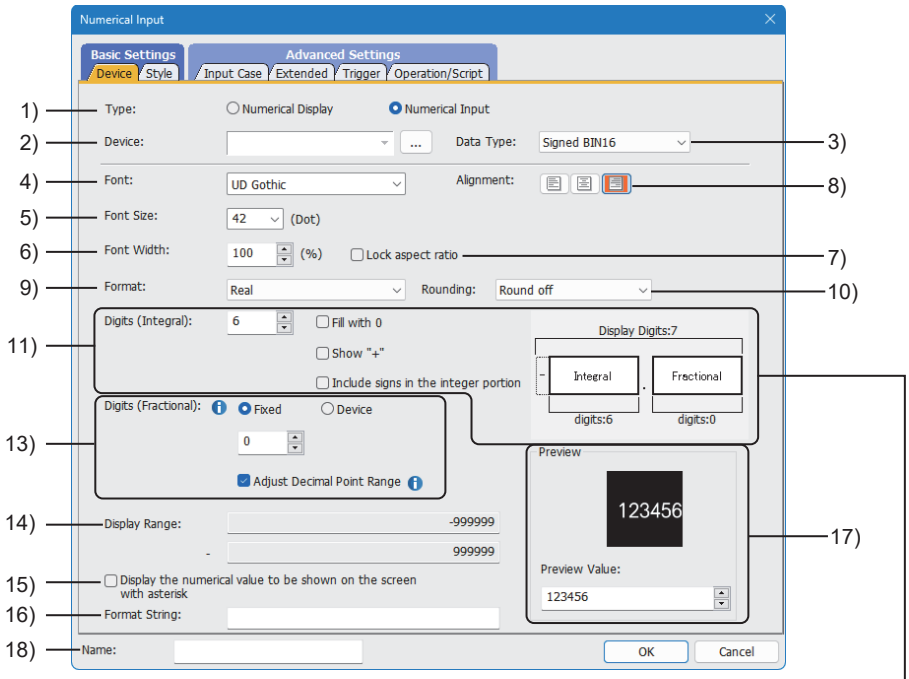
☞ Page 1337 [Trigger] tab
☞ Page 1338 [Operation/Script] tab

29.6.1 [Device] tab

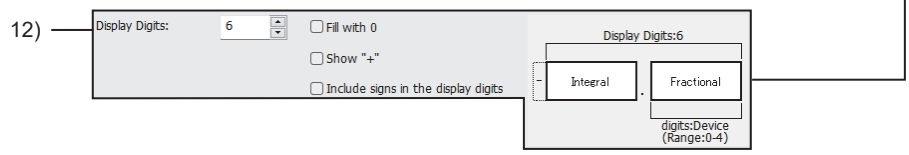
GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



When [Fixed] is selected for [Digits (Fractional)]



When [Device] is selected for [Digits (Fractional)]

Item		Description
1)	[Type]	Select the function to be used.
2)	[Device]	Set a device to be monitored. ☞ Page 834 How to set devices, labels, and tags
3)	[Data Type]	Select the data type of the device.
4)	[Font]	Select the font of the numerical value to be displayed. ☞ Page 74 Specifications of displayable characters

Item			Description
5)	[Font Size]		Set the vertical size of the numerical value. The setting range is [8] dots to [540] dots.
6)	[Font Width]		Set the horizontal size of the numerical value. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
7)	[Lock aspect ratio]		The aspect ratio of the numerical value is retained even when the numerical value is resized by manipulation of the handle on the screen editor.
8)	[Alignment]		Set the horizontal position (left-aligned, centered, or right-aligned) of the numerical value. 9)	[Format]		Select the display type of the device to be monitored. The selectable items vary with the data type of the device. For details, refer to the following. ☞ Page 1331 Selectable range for [Format]
10)	[Rounding]		This item is displayed when [Format] is set to [Real]. If there is a numerical value that have digits to the right of the digit set for [Digits (Fractional)], select the processing method.
11)	[Digits (Integral)]	—	This item is displayed when [Digits (Fractional)] is set to [Fixed]. Set the number of digits of the integer part to be displayed. The setting range depends on the setting of [Format]. • [Signed Decimal] or [Unsigned Decimal]: [1] to [21] • [Hexadecimal]: [1] to [16] • [Octal]: [1] to [6] • [Binary] or [Real]: [1] to [32]
		[Fill with 0]	This item is enabled when [Alignment] is set to right alignment. The numerical value is prefixed with 0 according to the setting value of [Digits (Integral)]. Example) When setting [5] for [Digits (Integral)]  When [Format] is set to [Binary], the GOT displays the numerical value prefixed with 0, regardless of the setting of [Fill with 0].
		[Show "+"]	This item is displayed when [Format] is set to [Signed Decimal] or [Real]. When the numerical value is positive number, [+] is prefixed to the numerical value.
		[Include signs in the integer portion]	This item is displayed when [Format] is set to [Signed Decimal] or [Real], and [Digits (Fractional)] is set to [Fixed]. A sign is displayed as one of the digits of the integer part.
12)	[Display Digits]	—	This item is displayed when [Format] is set to [Real], and [Digits (Fractional)] is set to [Device]. Set the total number of digits of the integer part and fractional part to be displayed. The setting range is [1] to [32].
		[Fill with 0]	This item is enabled when [Alignment] is set to right alignment. The numerical value is prefixed with 0 according to the setting value of [Display Digits]. Example) When setting [Display Digits] to [5] 		[Show "+"]	This item is displayed when [Format] is set to [Signed Decimal] or [Real]. When the numerical value is positive number, [+] is prefixed to the numerical value.
		[Include signs in the display digits]	This item is displayed when [Format] is set to [Real], and [Digits (Fractional)] is set to [Device]. A sign is displayed as one of the digits to be displayed.

Item			Description
13)	[Digits (Fractional)]	—	This item is displayed when [Format] is set to [Real]. Select a method to specify the number of decimal places, and specify the number of decimal places to be displayed. The following shows selectable items. • [Fixed] Enter the number of decimal places. The setting range is [0] to [30]. • [Device] Set a device to specify the number of decimal places. The number of decimal places changes based on the device value. The data type of the device is unsigned 16-bit binary. Set the device value as follows. X > Y + 1 X: Value set for [Display Digits] Y: Device value to specify the number of decimal places If the device value is outside the valid range, 0 is assumed.
		[Adjust Decimal Point Range]	This item is displayed when [Format] is set to [Real, and [Data Type] is set to [Real(32bit)] or [Real(64bit)]. (When a value other than binary floating values is held in the monitor target device) the integer device value is displayed as a value with the decimal point. Example) Number of the digits to the right of the decimal point: 2 Controller device value: 20  The value is displayed as 0.20 on the GOT. Example) Number of the digits to the right of the decimal point: 3 Controller device value: 20  The value is displayed as 0.020 on the GOT. Automatic adjustment is performed for the following devices. • Monitored device • [$V] and [Other Device] used in the conditional expression for display attributes in the [Style] tab • [$V] and [Other Device] used in the conditional expression for the input range in the [Input Case] tab • [$$], [$W], and [Other Device] used for data operation in the [Operation/Script] tab
			When the data type is 64-bit and either of the following conditions is satisfied, 14 digits in the fractional portion are significant after automatic adjustment. • Data operation is set. • Object internal variables are used. ☞ Page 1050 Operating expression In the conditional expression for display attributes or input range, 14 digits in the fractional portion are significant, and operation is performed with the value before automatic adjustment.
14)	[Display Range]		Displays the maximum/minimum value which can be displayed on the screen.
15)	[Display the numerical value to be shown on the screen with asterisk]		This item is displayed when [Font] is set to other than [7-Segment Font]. The numerical value, sign, and decimal point to be displayed on the screen are displayed with asterisks. The character string (except #) set for [Format String] is not displayed in asterisk. When saved as an operation log, the original values are saved, not asterisks.
16)	[Format String]		This item is displayed when [Font] is set to other than [7-Segment Font]. Characters (such as alphanumeric characters, kanji, or symbols) are displayed in the numerical display object. Enter #s to the positions where the digits of a numerical value are to be displayed. The #s entered in setting this item are replaced with the digits of the device value. Each # is replaced with the digit of the value in the same position counted from the right. If the number of the digits of the device value is larger than that of #s, the digits overflowing from the left are not displayed. The digits of a real number to the right of the decimal point are processed according to the setting for [Rounding]. The sign included in the device value is also processed in the same way that processes the numerical value. For display examples, refer to the following. ☞ Page 1331 Display examples when a format string is set When a character is entered in the field for [Format String], the following setting changes occur. • The settings of [Digits (Integral)] and [Display Digits] become invalid. • The setting of [Alignment] becomes invalid and is changed to right alignment.
17)	[Preview]	—	Displays the preview of the screen.
		[Preview Value]	Set the numerical value to be displayed in the preview.

Item		Description
18)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

Selectable range for [Format]

○: Supported, —:Not supported

Display examples when a format string is set

Ex.

When the setting for [Format] is not [Real]

Format string	Digits in the fractional portion	Device value	Display
##m##cm	—	1234	12m34cm
		123	1m23cm
		12345	23m45cm
		-123	-1m23cm

Ex.

When setting [Real] for [Format] and [Round off] for [Rounding]

Format string	Digits in the fractional portion	Device value	Display	Description
##m##cm	0	12.345	m12cm	Since [Digits (Fractional)] is 0, only the integer part is displayed.
	2		12m35cm	Since [Digits (Fractional)] is 2, the digits from the integer part to the second decimal place are displayed. The device value is rounded off to the third decimal place.
####cm	2	12.344	1234cm	Since [Digits (Fractional)] is 2, the device value is rounded off to the third decimal place.
		12.345	1235cm	
##.##cm	2	12.344	12.34cm	
		12.345	12.35cm	

29.6.2 [Style] tab

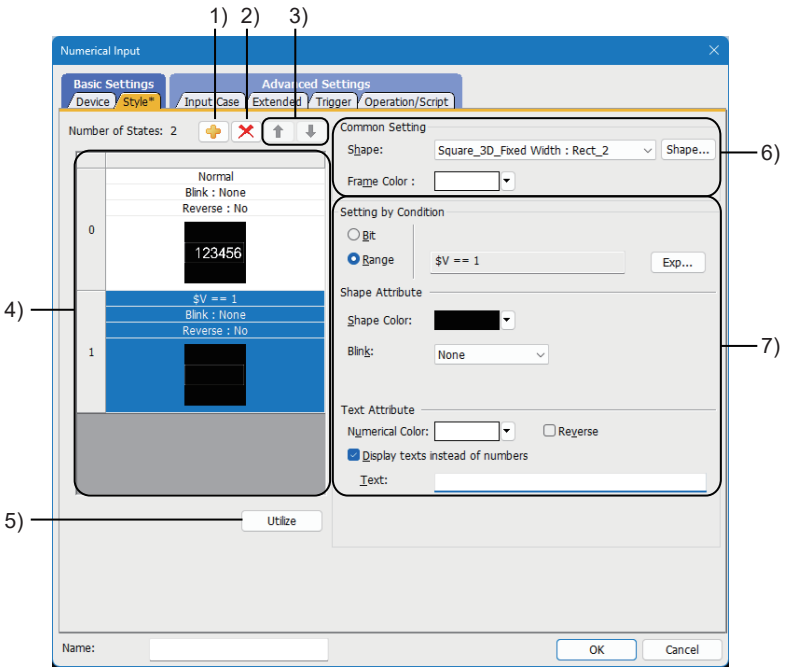
GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

For the conditions, refer to the following.

☞ Page 1038 Control with conditions

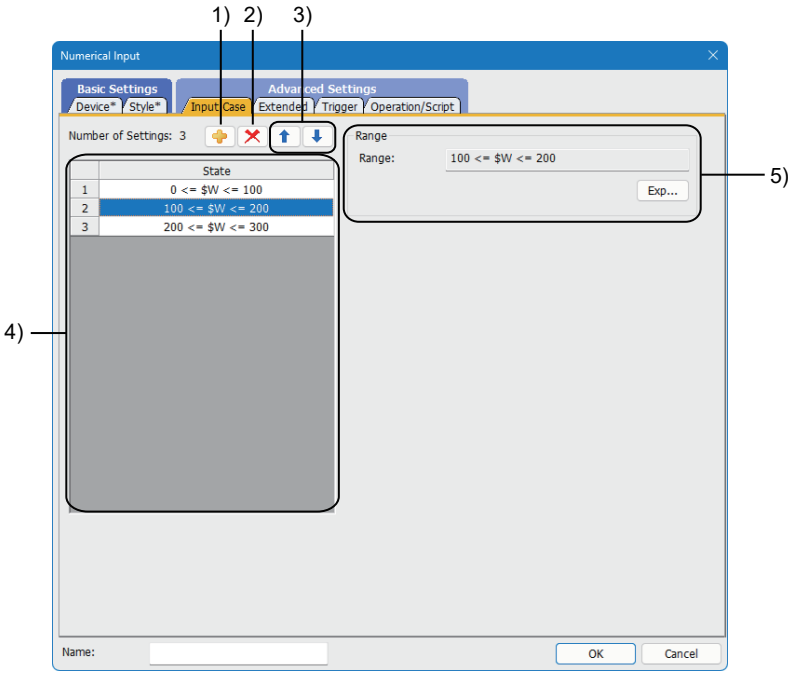


Item			Description
1)	Add button		Adds a new condition.
2)	Delete button		Deletes the selected condition.
3)	Up button Down button		Changes the priority order of the conditions in the preview list.
4)	Preview list		Displays the status set for each condition.
5)	[Utilize] button		Utilizes the selected condition to create a new condition.
6)	[Common Setting]	—	This setting is applied regardless of the satisfied condition.
		[Shape]	Select the shape to be set for the object from the list or with the [Shape] button. ☞ Page 1044 Object shape When the text to be displayed overlaps the shape frame area, the text cannot be displayed normally. Configure the settings so that the text and the shape frame area do not overlap. View in GT Designer3 → View on the GOT 123456 → 2345 Frame shape area Characters which overlap with the frame shape area are not displayed.
		[Frame Color]	Select a frame color for the shape. ☞ Page 988 Color settings

Item				Description
7)	[Setting by Condition]	—		Set the condition to be satisfied for the conditions selected in the preview list. When setting the word device value as the condition, click the [Exp] button to display the [Edit Range] dialog, and then set the conditional expression. For details on the conditions, refer to the following. ☞ Page 1038 Control with conditions The following setting items can be changed for each condition.
		[Shape Attribute]	[Shape Color]	Select the shape color. ☞ Page 988 Color settings
			[Blink]	Select the blinking speed of the numerical value and shape. The blink of the text display is paused when the input cursor is displayed.
			[Blink Scope]	Select the area to be blinked.
		[Text Attribute]	[Numerical Color]	Set the color of the numerical value. ☞ Page 988 Color settings
			[Reverse]	Inverts the color of the numerical value.
			[Display texts instead of numbers]	Set the character string to be displayed instead of numerics. Up to 40 characters can be set. If you input 40 two-byte characters, the text may be truncated.

29.6.3 [Input case] tab

GT37 SoftGOT3000



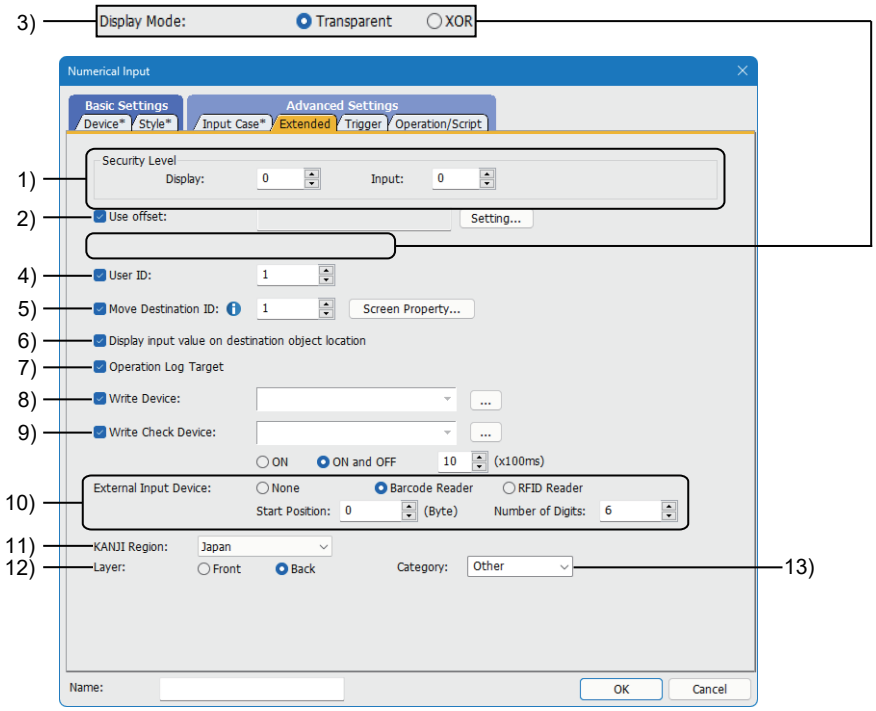
Item		Description
1)	Add button	Adds a new condition.
2)	Delete button	Deletes the selected condition.
3)	Up button Down button	Changes the priority order of the conditions in the preview list.
4)	Setting list	Displays the input ranges that are set.
5)	[Range]	Set the condition to specify the input range. Click the [Range] button, and set the conditional expression in the [Edit Range] dialog. The settings configured in this item are enabled only when input is performed using the numerical input object. If the input is performed by other methods, the settings of [Range] are disabled.

29.6.4 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. For [Input], set the same or a greater value than the value set for [Display]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Configure the settings to monitor the statuses of multiple devices by switching between them with a single device. After selecting this item, set the offset device. ☞ Page 963 Offset
3)	[Display Mode]	Display mode when the numerical input object is superimposed on a level object. This setting is not displayed when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). The operation when [Transparent] is selected is applied. ☞ Page 519 [Type Setting] dialog
		[Transparent]: Displays the numerical value on the level object.
		[XOR]: The numerical value in a numerical display object is integrated into the XOR synthesis with a level color, to be able to be distinguished from the level object. 4)	[User ID]	Set the number to identify the object. The setting range is [1] to [65535]. For the applications of the user ID, refer to the following. ☞ Page 1308 Specifying the destination to which the cursor moves after the confirmation of a numerical value entry

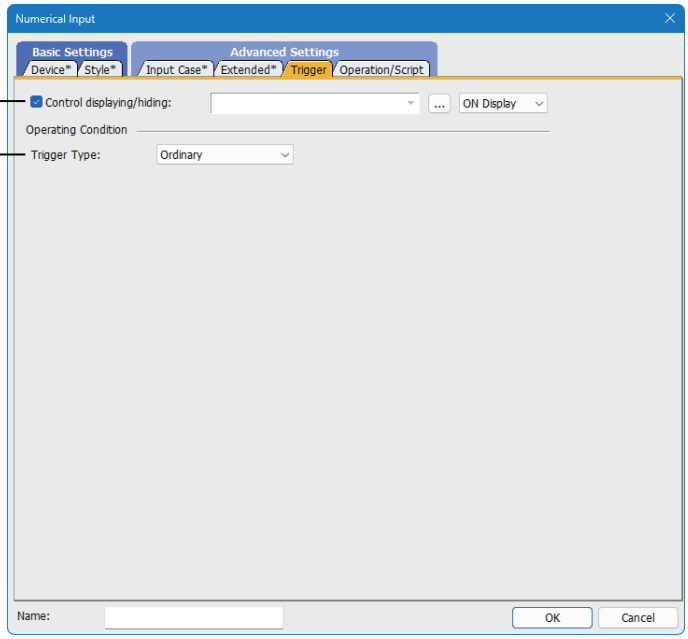
Item			Description	
5)	[Move Destination ID]		Set the user ID of a numerical input to which the cursor moves upon inputting a value. To move the cursor by specifying a user ID, a cursor movement setting must also be configured. Configure one of the following settings to enable the cursor movement per project or per screen.	
			To enable cursor movement in the entire project, set as follows in the [Environmental Setting] window ([Advanced Setting] tab of ([Key Window]). ☞ Page 572 [Advanced Setting] tab • Select [Control the cursor] for [Defined key action]. • Select [In order of user ID] or [Subsequently valid user ID] for [Cursor Move Destination].	
			To enable cursor movement only on the screen where the numerical input object is placed, click the [Screen Property] button to display the properties of the screen where the numerical input object is placed. ☞ Page 313 Base screen properties ☞ Page 323 Window screen properties Set as follows in the [Key Window Advanced Setting] tab. • Select [[Prioritize screen setting over project setting]. • Select [Control the cursor] for [Defined key action]. • Select [In order of user ID] or [Subsequently valid user ID] for [Cursor Move Destination].	
6)	[Display input value on destination object location]		Reflects the numerical values entered in the key window to the object on the screen immediately. To perform a write to a device, touch the enter key.	
			In the following cases, the setting of [Format String] is not reflected to the display on the object while a value is being entered. Consequently, the value is displayed on the object in the set digits (the number of the pound signs [#]). (The decimal point is not counted as one digit.) • [Format] is set to [Binary] in the [Device] tab, and GS450.b6 is off. • [Format] is set to [Octal] in the [Device] tab, and GS450.b7 is off. • [Format] is set to [Real] in the [Device] tab. To display the value on the object according to the setting of [Format String], confirm the entry.	
7)	[Operation Log Target]		Select this item to record the operation log of the set object. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])	
8)	[Write Device]		Set the device to store the input value before data operation, in addition to the monitor device to store the value after data operation. The input values before and after data operation can be managed separately.	
9)	[Write Check Device]		Set the bit device and operation to notify the completion of a numerical input. Prevent input while the write completion device is on, for example, by setting the off state of the write completion device as the trigger condition for the object. If input is continuously performed before the write completion device turns off, the write completion device does not turn off at normal timing. The following shows selectable items for the operation.	
			[ON]	Turns on a set bit device upon completion of a numerical input.
			[ON and OFF]	Turns on a set bit device upon completion of a numerical input, and then turns off the bit device after a specified time period. The setting range of the time from turning on to turning off the bit device is [5] x 100 ms to [30] x 100 ms.
				[Write Complete Device] can be set for numerical input and the text input objects. If [Write Check Device] is set to [ON and OFF] for multiple numerical input or text input objects, do not turn on 21 or more write completion devices simultaneously. Otherwise the write completion devices that turn on 21st and later do not turn off automatically.
				Even when screen switching (including switching to utilities) occurs while a write completion device is on, the write completion device does not turn off. The device remains on until a set time elapses.
10)	[External Input Device]	—	Set whether to enter the numerical values read with a barcode reader or RFID reader. ☞ Page 2564 Using a barcode reader with the GOT (barcode function) ☞ Page 2588 Using an RFID with the GOT (RFID function) When selecting [Barcode Reader] or [RFID Reader], set [Start Position] and [Number of Digits].	
		[Start Position]	Specify the input start byte of the data read with a barcode reader or RFID reader. • [Barcode Reader]: [0]th byte to [3997]th byte • [RFID Reader]: [0]th byte to [19997]th byte	
		[Number of Digits]	Set the number of digits of input data read with a barcode reader or RFID reader. The same or smaller number of digits as that set for [Digits (Integral)] in the [Device] tab can be set.	
11)	[KANJI Region]		Select the KANJI region of the displayed text. ☞ Page 76 KANJI region This item is displayed when [Format String] is set in the [Device] tab or when [Display texts instead of numbers] is set in the [Style] tab.	
12)	[Layer]		Select the layer to place the object. ☞ Page 65 Layer	

Item		Description
13)	[Category]	Select the category to assign the object. ☞ Page 1092 Efficient Drawing with Templates

29.6.5 [Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off
2)	[Trigger Type]	Select the condition of displaying the object. For details on the trigger types, refer to the following. ☞ Page 976 Trigger types settable for the object operating condition

PART 7

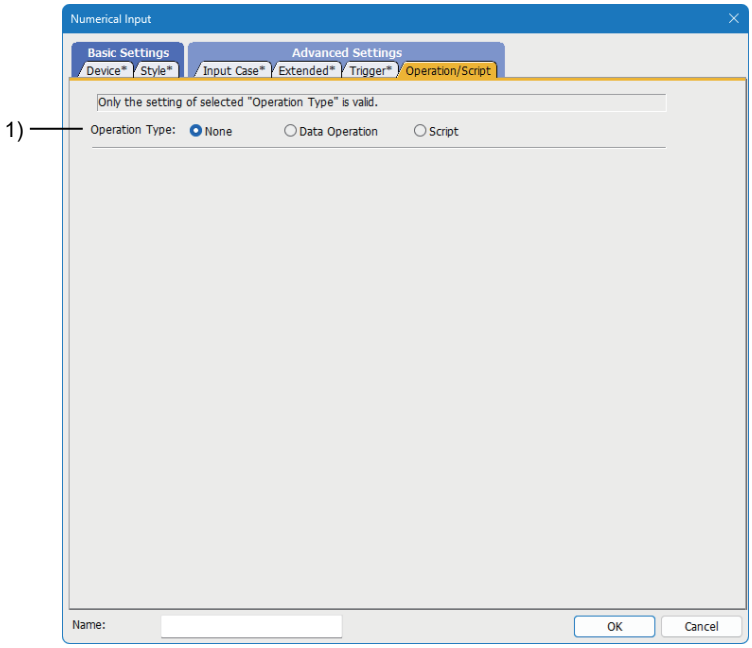
29.6.6 [Operation/Script] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set an expression for monitoring using the data operation function or the script function.



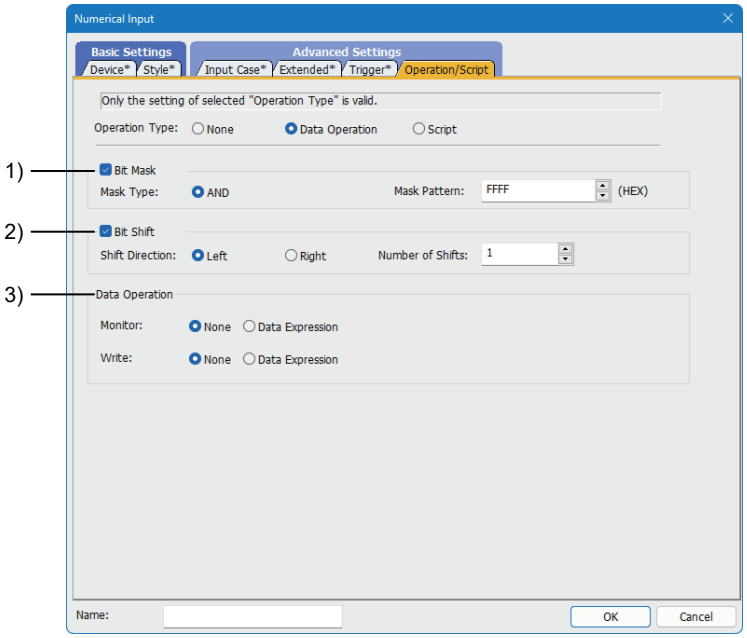
Item			Description
1)	[Operation Type]	[None]	The data operation function and the script function are not used.
		[Data Operation]	Set the expression used for the data operation function. ☞ Page 1339 [Data Operation]
		[Script]	Set the expressions for the script function. ☞ Page 1340 [Script]

[Data Operation]

GT37 SoftGOT3000

For details on the data operation settings, refer to the following.

☞ Page 1049 Data operation



Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. • [AND]: Logical AND
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range depends on the setting of [Data Type] in the [Device] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range depends on the setting of [Data Type] in the [Device] tab.
3)	[Data Operation]	—	Set the format of the expression.
		[Monitor]	Select the expression used when devices are monitored. • [None] Does not perform the data operation by using the expression. • [Data Expression] Performs the data operation by using the expression. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog
		[Write]	Select the expression used when values are written to devices. • [None] Does not perform the data operation by using the expression. • [Data Expression] Performs the data operation by using the expression. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

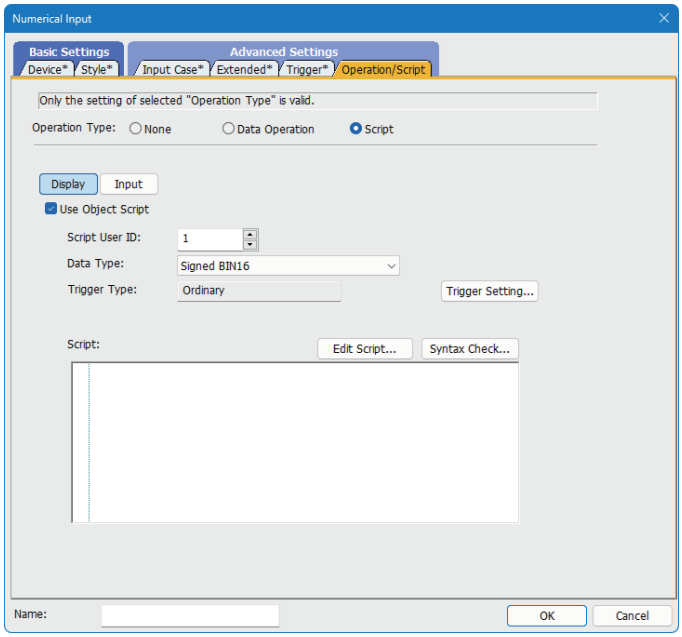
[Script]

GT37 SoftGOT3000

For a single numerical input object, both display object scripts and input object scripts can be set.

For details on the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	**Setting item**	**Property name**	**Read**	**Write**	**Timing for reflecting the setting change*1**
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
		text_width	○	○	When the object is updated
		text_height	○	○	When the object is updated
[Device]	[Alignment]	arrange	○	○	When the object is updated
	[Digits (Fractional)]	decimal_point	○*2	○*2	Upon the setting change
[Style]	[Frame Color]	frame_color	○	×	×
	[Shape Color]	plate_color	○	○	When the object is updated
	[Reverse]	highlight	○	○	When the object is updated
	[Blink] [Blink Scope]	blink	○	○	When the object is updated
	[Numerical Color]	text_color	○	○	When the object is updated
[Extended]	[Security Level] ([Display])	security	○	○	When the screen is updated
	[Security Level] ([Input])	input_security	○	○	Upon the setting change
	[Display Mode]	draw_mode	○	○	When the object is updated

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.
☞ Page 2456 Timing at which the setting change of an object property is reflected

*2 Not available when [Device] is selected for [Digits (Fractional)].

29.7 Relevant settings

GT37 SoftGOT3000

For the numerical display and numerical input objects, there are relevant settings other than the specific settings.
The following shows the functions that are available by configuring the relevant settings.
☞ Page 1342 GOT environmental settings (key window), screen property
☞ Page 1343 GOT environmental settings (System information)
☞ Page 1344 GOT internal devices

29.7.1 GOT environmental settings (key window), screen property

Set the following functions for each project (GOT environmental settings) or for each screen (screen property).
☞ Page 558 Setting key windows of the GOT ([Key Window])

• Settings for each project (GOT environmental settings)

Select [Common] → [GOT Environmental Setting] → [Key Window] from the menu to display the [Environmental Setting] window.

• Settings for each screen (screen property)

Select the screen editor on which the key window is to be set, and select [Screen] → [Screen Property] from the menu to display the screen properties.

Function	Setting item
Checking the input range while entering a numerical value	This item is enabled only when an input range is set. Display the [Display Detail Setting] dialog with the [Setting] button in the [Advanced Setting] tab or [Key Window Advanced Setting] tab to set this function with the following item. • [Check the input range while entering numerical values] ☞ Page 1334 [Input case] tab
Displaying the allowable input range as a message when entering a numerical value outside the input range	Display the [Display Detail Setting] dialog with the [Setting] button in the [Advanced Setting] tab or [Key Window Advanced Setting] tab to set this function with the following item. • [Display the valid input range when an invalid value is input in Numerical Input]
Displaying the cursor when the operating condition is satisfied	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Cursor]
Deleting the key window and cursor when the operating condition is not satisfied	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Clear the key window and the cursor] of [When operating conditions are not satisfied]
Setting whether to move the display of the key window or not by screen	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Key Window Position Correction]
Selecting when displaying the value being entered in the key window	Set this function with the following item the [Basic Setting] tab or [Key Window Basic Setting] tab. • [Display value during input]
Selecting when displaying the input range of data in the key window	Set this function with the following item the [Basic Setting] tab or [Key Window Basic Setting] tab. • [Display input function range]
Setting whether to display or hide the cursor when hiding the cursor and pressing the enter key or an arrow key	Display the [Display Detail Setting] dialog with the [Setting] button in the [Advanced Setting] tab or [Key Window Advanced Setting] tab to set this function with the following item. • [Display the cursor with a touch on the Enter/arrow key when the cursor is hidden]
When entering a value or text with a numerical input or text input object, displaying a dialog prompting you to confirm the entry when the enter key is touched	Display the [Display Detail Setting] dialog with the [Setting] button in the [Advanced Setting] tab or [Key Window Advanced Setting] tab to set this function with the following item. • [Display the input confirmation dialog when setting the function of Numerical/Text Input]

Function	Setting item
Displaying the key window when the operating condition is satisfied	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Key Window]
Displaying the key window when the screen is switched	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Display the key window]
Displaying the cursor when the screen is switched	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Display the cursor]
Selecting the method of displaying the cursor when entering a value using a numerical input or text input object	Display the [Display Detail Setting] dialog with the [Setting] button in the [Advanced Setting] tab or [Key Window Advanced Setting] tab to set this function with the following item. • [Cursor Type]
Displaying the key window at a touch input or deleting the key window by pressing the enter key	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Key Window] • [Defined key action]
When multiple numerical or text input objects exist, setting the order of input After an input is confirmed, moving the cursor to the next destination automatically	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Defined key action] • [Reference for determining cursor destination]
Setting the window screen to be used as a key window for numerical inputs (decimal or hexadecimal) and text inputs	Set this function with the following item the [Basic Setting] tab or [Key Window Basic Setting] tab. • [Key Window]

29.7.2 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] window.

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
When deleting the cursor, clearing the cursor information, such as the cursor display object ID and cursor display user ID	[Clear the cursor information when deleting the cursor]
Notifying the value (32 bits) before a change with the numerical input function	[Previous Numeric Value Input(32bit)]
Notifying the value (32 bits) confirmed with the numerical input function	[Current Numeric Value Input(32bit)]
Notifying the confirmation of an entry from a numerical input object (System signal 2-1.b4)	[System Signal 2-1]
Notifying the user ID of the numerical input to which an entry is confirmed	[Numeric Value Input Number]
Notifying the object ID of the object previously displayed under the cursor	[Previous Cursor Display Object ID]
Notifying the user ID No. of the object for which the cursor was displayed previously	[Previous Cursor Display User ID]
Notifying the key codes set to the input keys when there is an input using a text input, touch switch, or other objects	[Key Code Input]
Notifying that the key window is being displayed (System signal 2-1.b11)	[System Signal 2-1]
Turning off the Key Input signal (System signal 1-1.b3)	[System Signal 1-1]
Turning off the Numeric Value Input signal (System signal 1-1.b4)	[System Signal 1-1]
Notifying the object ID of the object currently displayed under the cursor	[Current Cursor Display Object ID]
Notifying the user ID No. of the object for which the cursor is currently being displayed.	[Current Cursor Display User ID]
Notifying the cursor is being displayed in a numerical value or text input (System signal 2-2.b11)	[System Signal 2-2]
Disabling all the key inputs (System signal 1-1.b9)	[System Signal 1-1]
Notifying a key input (System signal 2-1.b3)	[System Signal 2-1]
Notifying a value out of the input range is stored (System signal 2-1.b14)	[System Signal 2-1]

29.7.3 GOT internal devices

☞ Page 3581 GOT special register (GS)

Function	Setting item
Notifying that the object is ready for receiving an direct input with a barcode reader or RFID reader	GS243.b15
When entering a value or text with a numerical input or text input object, displaying a dialog prompting you to confirm the entry when the enter key is touched	GS450.b0
Checking the input range while entering a numerical value	GS450.b1
Storing 0 in the current cursor position device and other related devices of the system information when the cursor is hidden	GS450.b3
Displaying the binary key window when the display format of the numerical input is binary	GS450.b6
Displaying the octal key window when the display format of the numerical input is octal	GS450.b7
Notifying the upper-left coordinates of a numerical input object on which the cursor is displayed	GS694 GS695

30 Placing a text display or text input object

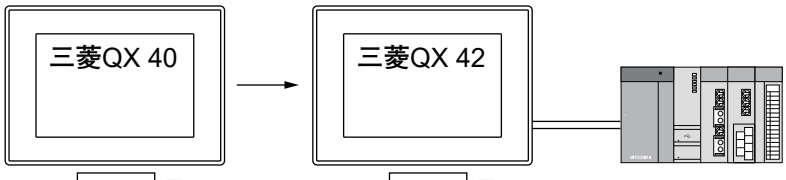
☞ Page 1346 Overview of the text display and text input objects
☞ Page 1348 How to use the text display and text input objects
☞ Page 1352 Specifications of the text display and text input objects
☞ Page 1356 Configuring the settings for a text display or text input object
☞ Page 1357 [Text Display] dialog
☞ Page 1362 [Text Input] dialog
☞ Page 1370 Relevant settings

30.1 Overview of the text display and text input objects

GT37 SoftGOT3000

30.1.1 Text display

With this function, the data stored in a word device is handled as text data and displayed as text.



D10	4F8Eh	(三)
D11	4895h	(菱)
D12	5851h	(XQ)
D13	3420h	(4 ␣)
D14	0030h	(0)

D10	4F8Eh	(三)
D11	4895h	(菱)
D12	5851h	(XQ)
D13	3420h	(4 ␣)
D14	0032h	(2)

30.1.2 Text input

With this function, text is written to a word device.

Two methods are available for text input.

☞ Page 1346 Entering characters with keys for entries

☞ Page 1347 Entering the characters read with a barcode reader or RFID reader

Entering characters with keys for entries

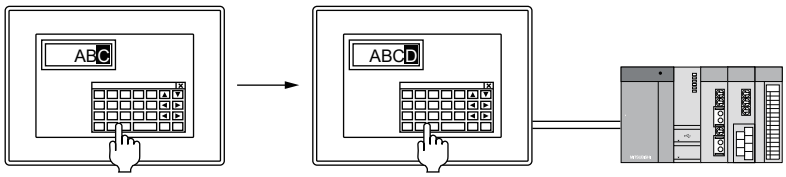
Characters can be entered with a key window or key code switches.

■Entering from a key window

Touch the text input object placed on the base screen to display the key window, and enter characters.

For the key window, refer to the following.

☞ Page 558 Setting key windows of the GOT ([Key Window])



Entering characters

Enter the input characters using the character code with the input key (key code: 000Dh).

D10	0000h	
D11	0000h	

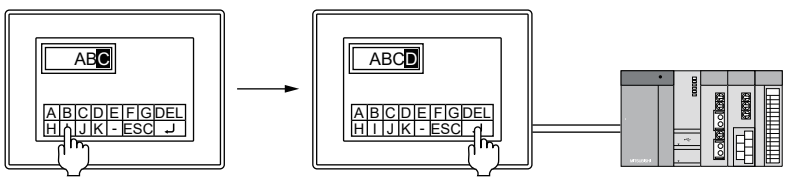
D10	4241h	(BA)
D11	4443h	(DC)

■Using key code switches placed on the screen

Characters can be entered with the key code switches placed on the base screen without displaying a key window.

For key code switches, refer to the following.

☞ Page 1251 [Key Code Switch] dialog



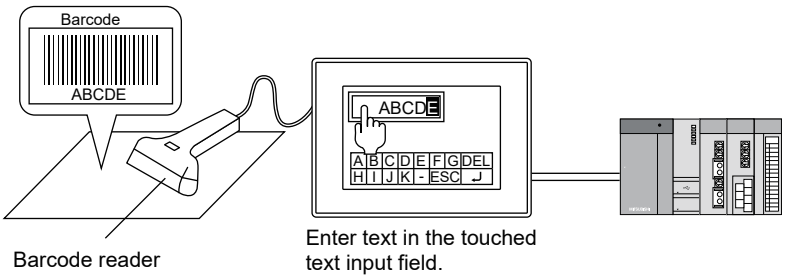
Entering the characters read with a barcode reader or RFID reader

Characters can be entered with a barcode reader or RFID reader.

When entering data with a barcode reader or RFID reader, set the barcode function or RFID function.

☞ Page 2564 Using a barcode reader with the GOT (barcode function)

☞ Page 2588 Using an RFID with the GOT (RFID function)



Precautions

Item	Description
Reading data with a barcode reader or RFID reader during entry on the key window	Depending on the operation, the read data may or may not be input. • While displaying dialog windows The data read with a barcode reader or RFID reader cannot be entered. • While not displaying dialog windows The text being entered on the key window is discarded, and the data read with a barcode reader or RFID reader is entered.
Performing key touch operations while the data read with a barcode reader or RFID reader is being entered	While the data read with a barcode reader or RFID reader is being entered, key touch operations are invalid and the data read with a barcode reader or RFID reader is entered.
Insufficient data for the specified start position	When the data read with a barcode reader or RFID reader is less than the setting of [Start Position], the data is not entered.

30.2 How to use the text display and text input objects

GT37 SoftGOT3000

☞ Page 1348 Specifying the destination to which the cursor moves after the confirmation of a text entry
☞ Page 1351 Operation examples of text display and text input objects

For the basic usage of the text display and text input objects, refer to the following.

☞ Page 1346 Overview of the text display and text input objects

For information on how to place a text display or text input object, refer to the following.

☞ Page 1356 Configuring the settings for a text display or text input object

30.2.1 Specifying the destination to which the cursor moves after the confirmation of a text entry

When [User ID] is set, the destination to which the cursor moves after the confirmation of a text entry can be specified.
[User ID] can be set only when the text input object is used.

☞ Page 1365 [Extended] tab

About [User ID]

The user ID is a number to identify the object.
When [User ID] is set, the following setting and operations are enabled.

☞ Page 1348 Setting the display position of the cursor when the screen is switched or the enter key is pressed
☞ Page 1349 Moving the cursor in ascending or descending order of user ID number
☞ Page 1349 Specifying objects that were used with operation logs

■Setting the display position of the cursor when the screen is switched or the enter key is pressed

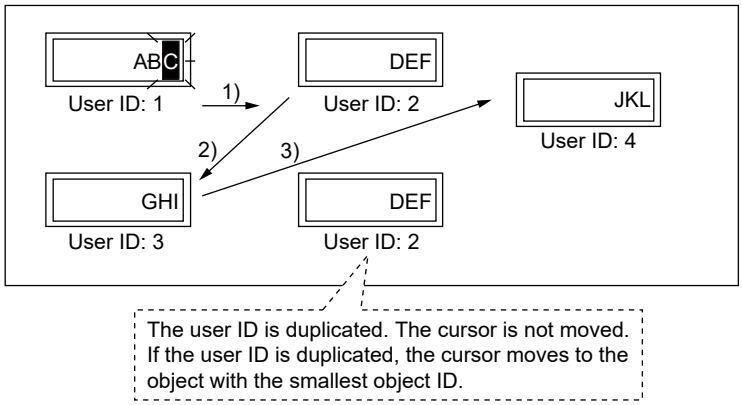
In the [Environmental Setting] window ([Key Window]) or the screen property, the display position of the cursor when the screen is switched or the enter key is pressed can be set.
For details, refer to the following.

☞ Page 558 Setting key windows of the GOT ([Key Window])
☞ Page 313 Changing screen property

■Moving the cursor in ascending or descending order of user ID number

When the following key code switches are used, the cursor can be moved in ascending or descending order of user ID number.

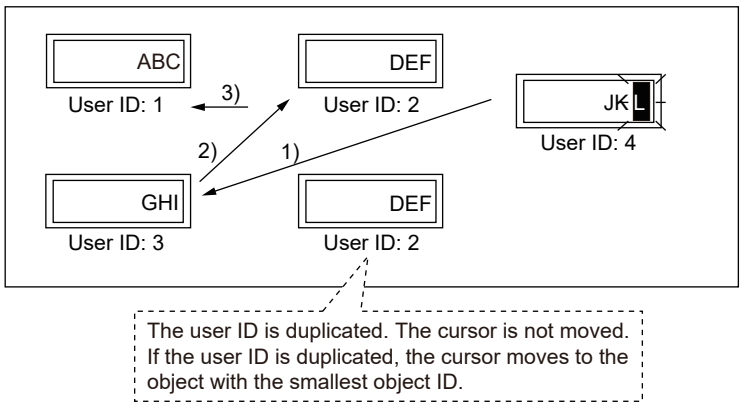
- User ID ascending order movement of cursor (key code: 0092h)



The cursor is moved in order of 1) → 2) → 3).

After 3), the cursor does not move because the destination user ID number does not exist.

- User ID descending order movement of cursor (key code: 0093h)



The cursor is moved in order of 1) → 2) → 3).

After 3), the cursor does not move because the destination user ID number does not exist.

■Specifying objects that were used with operation logs

When input is performed with an object, the user ID is also recorded in the operation log.

Setting a user ID to the object enables you to identify the manipulated object.

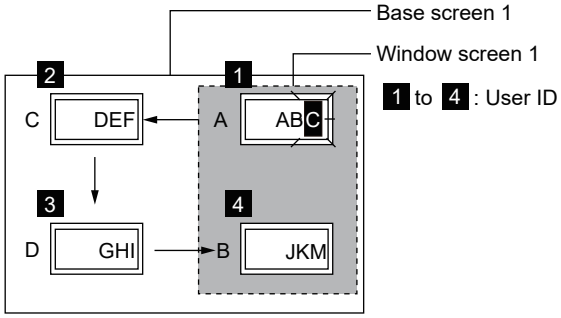
☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])

User ID setting

When controlling the cursor using user ID numbers, assign different user ID numbers to each object.
Also, when using overlay screens or superimpose windows, set screens in a way that different user ID numbers are assigned to each object.
When the same user ID number is assigned to different objects, the cursor operation may not perform normally.

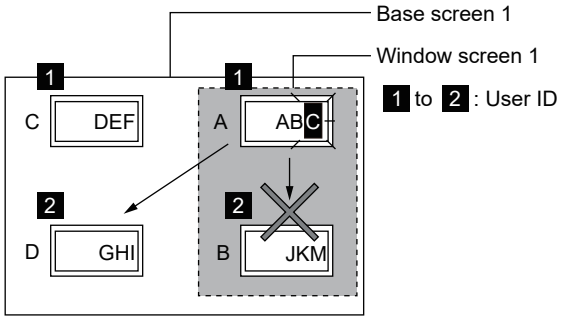
■When assigning different user ID numbers to each object

Even if a set overlay screen object or superimpose window is used, the cursor operation using user ID numbers is performed normally.



■When assigning the same user ID number

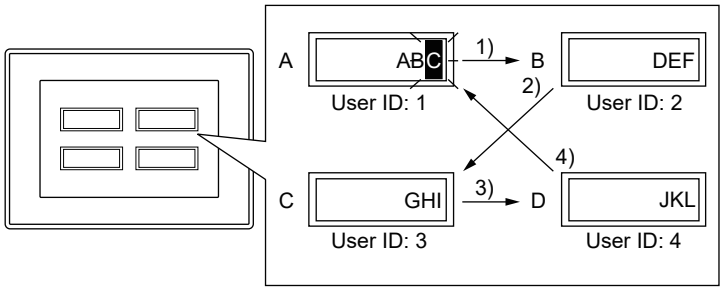
If objects having the same user ID exist on the screen (including set overlay screen objects and superimpose windows), the cursor operation using user ID numbers may not perform normally.



Relation between user ID and destination ID

Move the cursor to the object that has the same user ID number as the move destination ID number of the active object.
☞ Page 1365 [Extended] tab

Ex.
Moving the cursor using the destination ID number



Text input	User ID	Destination ID
A	1	2
B	2	3
C	3	4
D	4	1

30.2.2 Operation examples of text display and text input objects

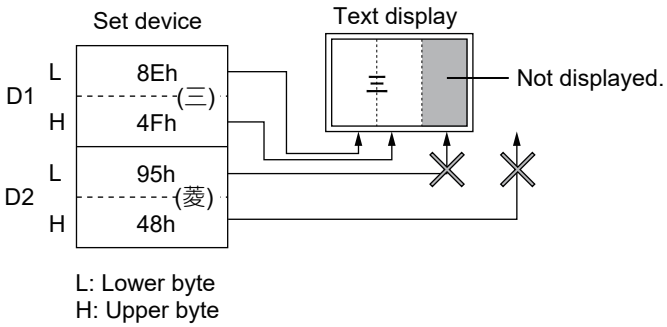
The following shows the examples of display and input operations when the character code is Shift JIS.

Ex.

When a text string is displayed in order of lower bytes to upper bytes in a text display

Setting device: D1

Number of displayed digits: 3

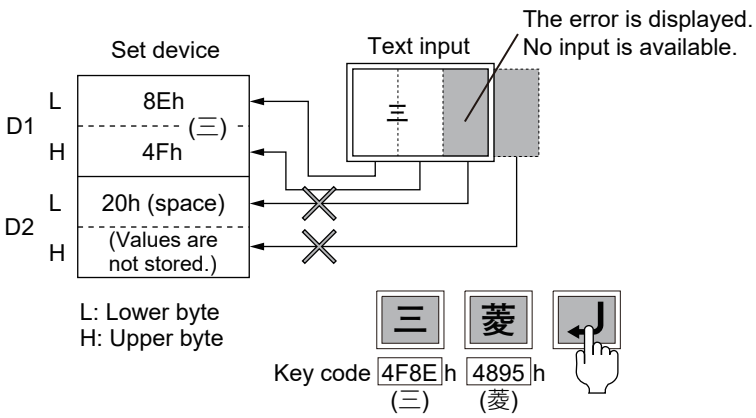


Ex.

When a text string is written in order of lower byte to upper byte using a text input object

Setting device: D1

Number of displayed digits: 3



30.3 Specifications of the text display and text input objects

GT37 SoftGOT3000

☞ Page 1352 Maximum number of objects that can be placed on one screen
☞ Page 1352 Supported character code
☞ Page 1353 Number of monitored devices and displayed digits
☞ Page 1354 Order of displaying and storing character strings

30.3.1 Maximum number of objects that can be placed on one screen

A total of 1024 text displays, text inputs, and other objects can be placed on one base screen, while 512 can be placed on one window screen.

30.3.2 Supported character code

For the character codes supported by the GOT, refer to the following.
☞ Page 80 Character codes supported by the GOT

Precautions

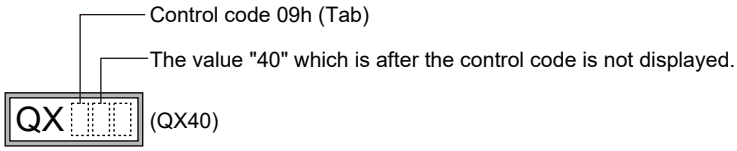
■When the character code is ASCII

If the following ASCII code is included in the target data of the text display object, the text that is after the ASCII code is not displayed.

- 0000h to 001Fh
- 0080h
- 00F0h to 00FFh

Ex.

When control code 09h (Tab) is included



D10	5851h	"X""Q"
D11	3409h	"4""09h (Tab)"
D12	0030h	"0"

■Character code setting when using a string-type label or tag

If you set a label or tag for the device of an object, set the character code according to the type of the label or tag.

- Global label: ASCII code, Unicode, or Shift JIS code
- OMRON NJ/NX tag: Unicode
- AB native tag: ASCII code
- OPC UA tag: Unicode

■Display variation due to font availability

Depending on the character code used and installed fonts, some one-byte and two-byte characters may not be displayed properly.

This can cause a difference between the actual display and the number of displayed digits, preventing the cursor from moving correctly on the object.

- When the character code is ASCII: If no fonts that support European languages are installed, some characters are displayed as two-byte characters.
- When the character code is GB: If any fonts that support European languages are installed, some characters are displayed as one-byte characters.

30.3.3 Number of monitored devices and displayed digits

The number of monitored devices differs depending on the device data type, character code, and the number of displayed digits.

Device data type	Character code	Number of devices to be monitored
16-bit	ASCII Shift JIS GB KS Big5	One word device is used for every two displayed digits. If the number of displayed digits is odd, it is treated as the displayed digits + 1.*1*2 Example) Number of displayed digits: 3, start device: D1000 Two word devices (D1000 and D1001) starting from D1000 are used.
	Unicode	One word device is used for each displayed digit. Example) Number of displayed digits: 3, start device: D1000 Three word devices (D1000, D1001, and D1002) starting from D1000 are used.
8-bit	ASCII Shift JIS GB KS Big5	Eight bit devices are used for each displayed digit. Example) Number of displayed digits: 3, start device: GB1000 Twenty-four consecutive devices (GB1000 to GB1023) starting from GB1000 are used.
	Unicode	Sixteen bit devices are used for each displayed digit. Example) Number of displayed digits: 3, start device: GB1000 Forty-eight consecutive devices (GB1000 to GB1047) starting from GB1000 are used.

*1 For a text display object, the lower or upper bytes of the last device are not monitored.
The position to be ignored depends on the display order of the string data.
High to low: Lower bytes of the last device
Low to high: Upper bytes of the last device

*2 For text input objects, NULL is written to the last monitored device.
The position of insertion depends on the storage order of the string data.
High to low: Lower bytes of the last device
Low to high: Upper bytes of the last device

30.3.4 Order of displaying and storing character strings

You can specify the order of displaying the character strings stored in devices and the order of storing character strings in devices.

The following shows the specifications of each character code.

☞ Page 1354 ASCII, Shift JIS, GB, KS, Big5

☞ Page 1355 Unicode

ASCII, Shift JIS, GB, KS, Big5

Specifications differ depending on the data type.

Data type	Specifications
When the data type is 16-bit	Low to high or high to low can be specified. b8 to b15 of a word device are handled as the upper bytes, and b0 to b7 as the lower bytes.
When the data type is 8-bit	Only low to high can be specified. When the start device is GB1000, GB1008 to GB1015 are handled as the upper bytes, and GB1000 to GB1007 are handled as the lower bytes.

Ex.

Storing 16 bit string data in D1000 to D1001

Display order and storage order	Behavior
Low to high	Example) Character code: Shift JIS  Upper: b8 to b15, lower: b0 to b7
High to low	Example) Character code: Shift JIS  Upper: b8 to b15, lower: b0 to b7

Unicode

Specifications differ depending on the data type.

Data type	Specifications
When the data type is 16-bit	Low to high or high to low can be specified. b8 to b15 of a word device are handled as the upper bytes, and b0 to b7 as the lower bytes.
When the data type is 8-bit	Low to high or high to low can be specified. When the start device is GB1000, GB1032 to GB1063 are handled as the upper bytes, and GB1000 to GB1031 are handled as the lower bytes.

Ex.

Storing 16 bit string data in D1000 to D1001

Display order and storage order	Specifications
Low to high	 Upper: b8 to b15, lower: b0 to b7
High to low	 Upper: b8 to b15, lower: b0 to b7

PART 7

30.4 Configuring the settings for a text display or text input object

Use the following procedure to place a text display or text input object, and configure the operation settings.

Configuring the settings for a text display object

Operating procedure

1. Select [Object] → [Text Display/Input] → [Text Display] from the menu.
2. Click the position to place a text display object.

☞ Page 1001 Placing figures and objects

3. Double-click the object to display the setting dialog.
4. Configure the operation settings in each tab of the [Text Display] dialog.

☞ Page 1357 [Text Display] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 988 Color settings

Configuring the settings for a text input object

Operating procedure

1. Select [Object] → [Text Display/Input] → [Text Input] from the menu.
2. Click the position to place a text input object.

☞ Page 1001 Placing figures and objects

3. Double-click the object to display the setting dialog.
4. Configure the operation settings in each tab of the [Text Input] dialog.

☞ Page 1362 [Text Input] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 988 Color settings

30.5 [Text Display] dialog

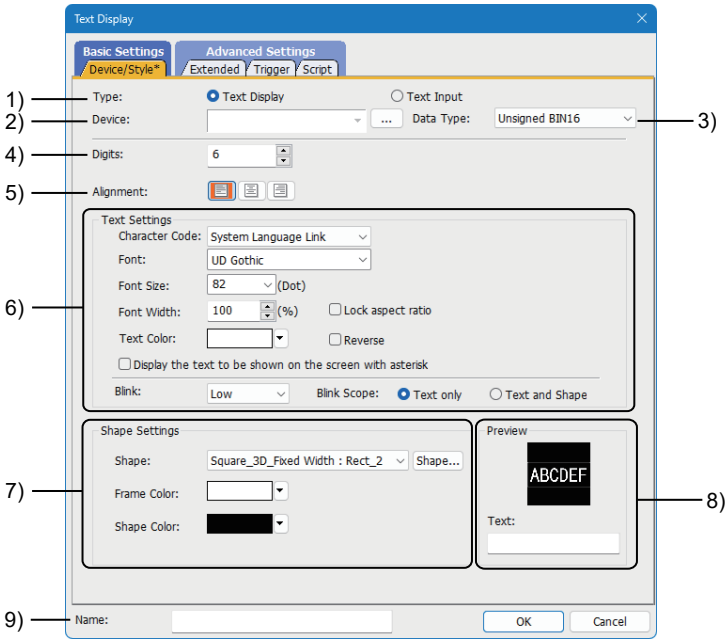
☞ Page 1359 [Extended] tab
☞ Page 1360 [Trigger] tab
☞ Page 1361 [Script] tab

30.5.1 [Device/Style] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description
1)	[Type]	Select the function to be used.
2)	[Device]	Set the start device of the devices to be monitored. ☞ Page 834 How to set devices, labels, and tags The number of monitored devices depends on the setting. For details, refer to the following. ☞ Page 1353 Number of monitored devices and displayed digits
3)	[Data Type]	Select the data type of the device.
4)	[Digits]	Set the number of digits of the text to be displayed. The setting range is [1] to [100]. A one-byte character is counted as one digit, and a two-byte character is counted as two digits.
5)	[Alignment]	Set the horizontal position (left-aligned, centered, or right-aligned) of the text. 
Item			Description
6)	[Text Settings]	[Character Code]	Select the character code of the text to be displayed. When [System Language Link] is selected, the following character codes are used according to the system language of the GOT. • When the system language is English: ASCII • When the system language is not English: Shift JIS
		[Font]	Select a font for the text to be displayed.
		[Font Size]	Set the size of the text to be displayed. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Lock aspect ratio]	The aspect ratio of the text is retained when you resize the text by manipulating a handle on the screen editor.
		[Text Color]	Set the text color. ☞ Page 988 Color settings
		[Reverse]	Inverts the text.
		[Display the text to be shown on the screen with asterisk]	Represents the text to be displayed on the screen with asterisks. When this item is selected, GS450.b4 becomes invalid.
		[Blink]	Select the blinking speed of the text and shape. The blink is paused when the input cursor is displayed.
		[Blink Scope]	Select the area to be blinked.
7)	[Shape Settings]	[Shape]	Select the shape to be set for the object from the list or with the [Shape] button. ☞ Page 1044 Object shape When the text to be displayed overlaps the shape frame area, the text cannot be displayed normally. Configure the settings so that the text and the shape frame area do not overlap. 		[Frame Color]	Select a frame color for the shape. ☞ Page 988 Color settings
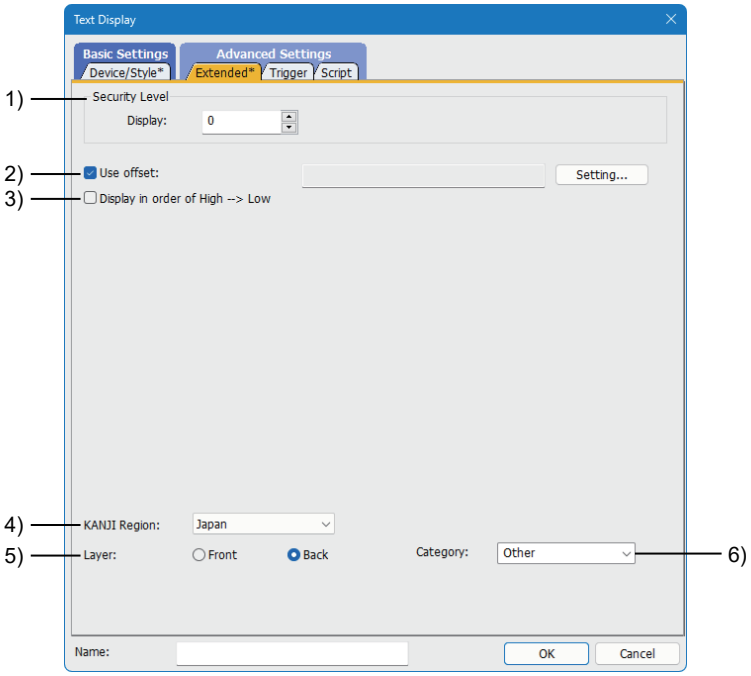
		[Shape Color]	Select the color of the shape. ☞ Page 988 Color settings
8)	[Preview]	[Text]	Displays the preview of the screen. Set the text to be displayed in the preview.
9)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

30.5.2 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

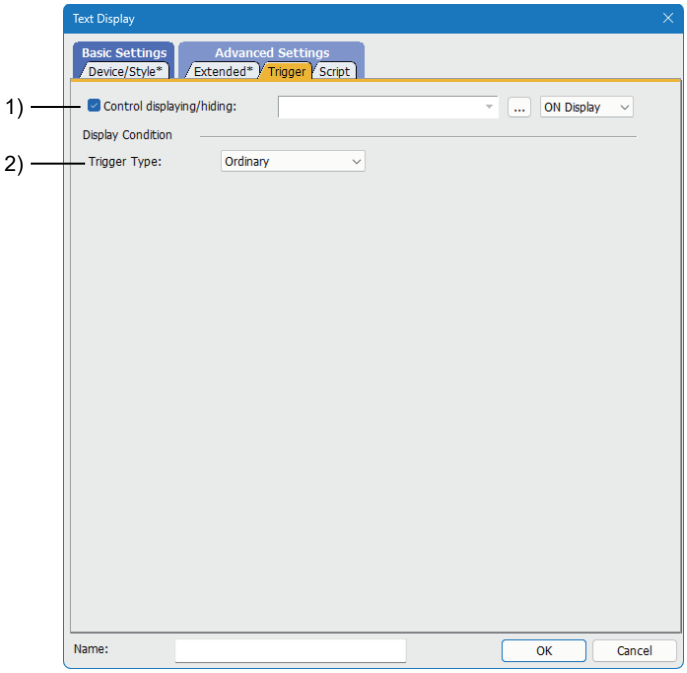


Item		Description
1)	[Security Level]	Set a security level when using the security function. The setting range is [0] to [15]. Set [0] when the security function is not used. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Select this item to monitor multiple devices by switching them. Set the offset device with the [Setting] button. ☞ Page 963 Offset
3)	[Display in order of High -> Low]	Select this item to display string data stored in devices in order of lower byte to upper byte. For details, refer to the following. ☞ Page 1354 Order of displaying and storing character strings
4)	[KANJI Region]	When selecting [Unicode] for [Character Code], select the KANJI region of the displayed text. ☞ Page 76 KANJI region This item is enabled when either of the following fonts is selected for [Font] in the [Device/Style] tab. • [UD Gothic] • [UD Mincho]
5)	[Layer]	Select the layer to place the object. ☞ Page 65 Layer
6)	[Category]	Select the category to assign the object. ☞ Page 1092 Efficient Drawing with Templates

PART 7

30.5.3 [Trigger] tab

GT37 SoftGOT3000



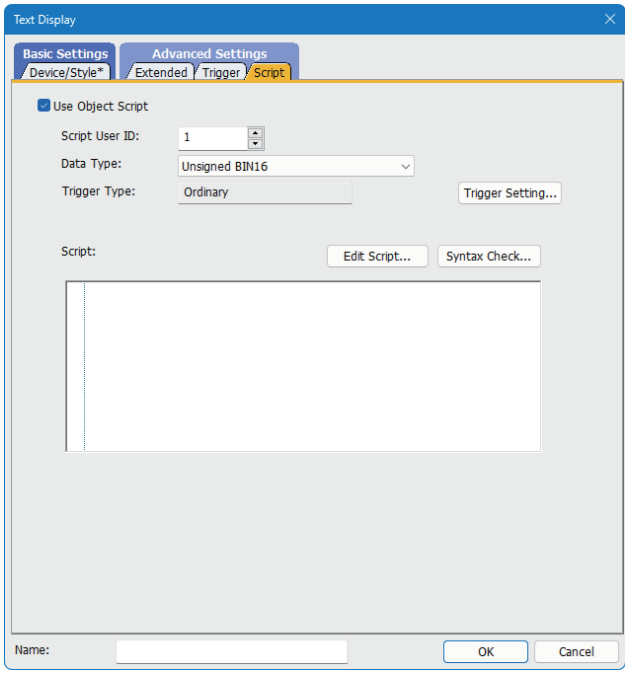
Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition

30.5.4 [Script] tab

GT37 SoftGOT3000

For details on the script settings, refer to the following.

☞ Page 2447 Object script



Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property

	[Blink] [Blink Scope]	blink	○	○	When the object is updated
	[Frame Color]	frame_color	○	×	×
	[Shape Color]	plate_color	○	○	When the object is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.

☞ Page 2456 Timing at which the setting change of an object property is reflected

PART 7

30.6 [Text Input] dialog

GT37 SoftGOT3000

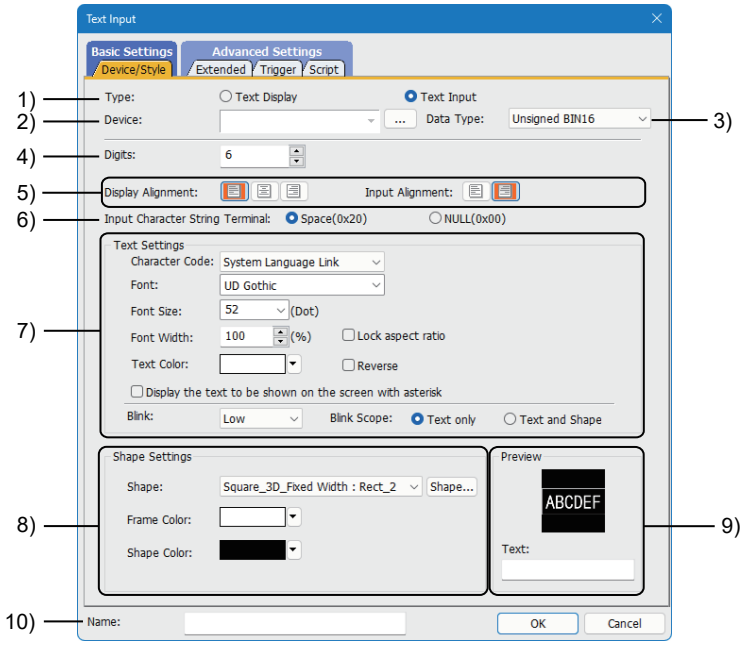
☞ Page 1362 [Device/Style] tab
☞ Page 1365 [Extended] tab
☞ Page 1367 [Trigger] tab
☞ Page 1368 [Script] tab

30.6.1 [Device/Style] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description
1)	[Type]	Select the function to be used.
2)	[Device]	Set the start device of the devices to be monitored. ☞ Page 834 How to set devices, labels, and tags The number of monitored devices depends on the setting. For details, refer to the following. ☞ Page 1353 Number of monitored devices and displayed digits
3)	[Data Type]	Select the data type of the device.
4)	[Digits]	Set the number of digits of the text to be displayed. The setting range is [1] to [100]. A one-byte character is counted as one digit, and a two-byte character is counted as two digits.

<table>
<tr><th colspan="3">Item</th><th>Description</th></tr>
<tr><td>5)</td><td>Alignment</td><td>[Display Alignment]</td><td>Set the horizontal position (left-aligned, centered, or right-aligned) of the text to be displayed.
 </td></tr>
<tr><td></td><td></td><td>[Input Alignment]</td><td>Set the horizontal position (left-aligned, centered, or right-aligned) of the text to be input.
 </td></tr>
<tr><td>6)</td><td colspan="2">[Input Character String Terminal]</td><td>If the number of input characters is less than the number of characters specified for [Digits] in the [Device/Style] tab, you can select the control code to be inserted to the lacked part.
The following shows selectable items.
• [Space(0x20)]
Insert the space (0x20) to reserve it as a space.
Reentering text deletes the inserted space, and confirming the entry inserts a space.
This item can be selected only when the left alignment is selected for [Display Alignment].
Example) When the entered text has three digits with [7] set in [Digits]
<table><tr><td>Text</td><td>A</td><td>B</td><td>C</td><td>(SP)</td><td>(SP)</td><td>(SP)</td><td>(SP)</td></tr><tr><td>Character code</td><td>(0x41)</td><td>(0x42)</td><td>(0x43)</td><td>(0x20)</td><td>(0x20)</td><td>(0x20)</td><td>(0x20)</td></tr></table>• [NULL(0x00)]
Inserts NULL(0x00) as the first character of the lacked part.
The characters before NULL are enabled, and the characters after NULL are ignored because they are indefinite.
The controller is enabled to detect the text end.
Example) When the entered text has three digits with [7] set in [Digits]
<table><tr><td>Text</td><td>A</td><td>B</td><td>C</td><td>(NULL)</td><td>-</td><td>-</td><td>-</td></tr><tr><td>Character code</td><td>(0x41)</td><td>(0x42)</td><td>(0x43)</td><td>(0x00)</td><td>-</td><td>-</td><td>-</td></tr></table>For GT37 and GT SoftGOT3000, even if [Space(0x20)] is selected, NULL (0x00) is inserted.
☞ Page 1353 Placing a text display or text input object</td></tr>
<tr><td>7)</td><td>[Text Settings]</td><td>[Character Code]</td><td>Select the character code of the text to be displayed.
When [System Language Link] is selected, the following character codes are used according to the system language of the GOT.
• When the system language is English: ASCII
• When the system language is not English: Shift JIS</td></tr>
<tr><td></td><td></td><td>[Font]</td><td>Select a font for the text to be displayed.</td></tr>
<tr><td></td><td></td><td>[Font Size]</td><td>Set the size of the text to be displayed.
The setting range is [8] dots to [540] dots.</td></tr>
<tr><td></td><td></td><td>[Font Width]</td><td>Set a horizontal text size.
The horizontal size is specified with the magnification relative to [Font Size] (vertical text size).
The setting range is [6]% to [1600]%.</td></tr>
<tr><td></td><td></td><td>[Lock aspect ratio]</td><td>The aspect ratio of the text is retained when you resize the text by manipulating a handle on the screen editor.</td></tr>
<tr><td></td><td></td><td>[Text Color]</td><td>Set the text color.
☞ Page 988 Color settings</td></tr>
<tr><td></td><td></td><td>[Reverse]</td><td>Inverts the text.</td></tr>
<tr><td></td><td></td><td>[Display the text to be shown on the screen with asterisk]</td><td>This item is not displayed when [Kana-Kanji/Pinyin Conversion] is selected on the [Extended] tab.
Represents the text and control characters (other than NULL) to be displayed on the screen with asterisks.
Since spaces (0x20) are also displayed with asterisks, if [Space(0x20)] is selected for [Input Character String Terminal], the number of asterisks may be greater than the number of characters.
When saved as an operation log, the original text string is saved, not asterisks.
When this item is selected, GS450.b4 becomes invalid.</td></tr>
<tr><td></td><td></td><td>[Blink]</td><td>Select the blinking speed of the text and shape.
The blink is paused when the input cursor is displayed.</td></tr>
<tr><td></td><td></td><td>[Blink Scope]</td><td>Select the area to be blinked.</td></tr>
</table>

Item			Description
8)	[Shape]	[Shape]	Select the shape to be set for the object from the list or with the [Shape] button. ☞ Page 1044 Object shape When the text to be displayed overlaps the shape frame area, the text cannot be displayed normally. Configure the settings so that the text and the shape frame area do not overlap. 		[Frame Color]	Select a frame color for the shape. ☞ Page 988 Color settings
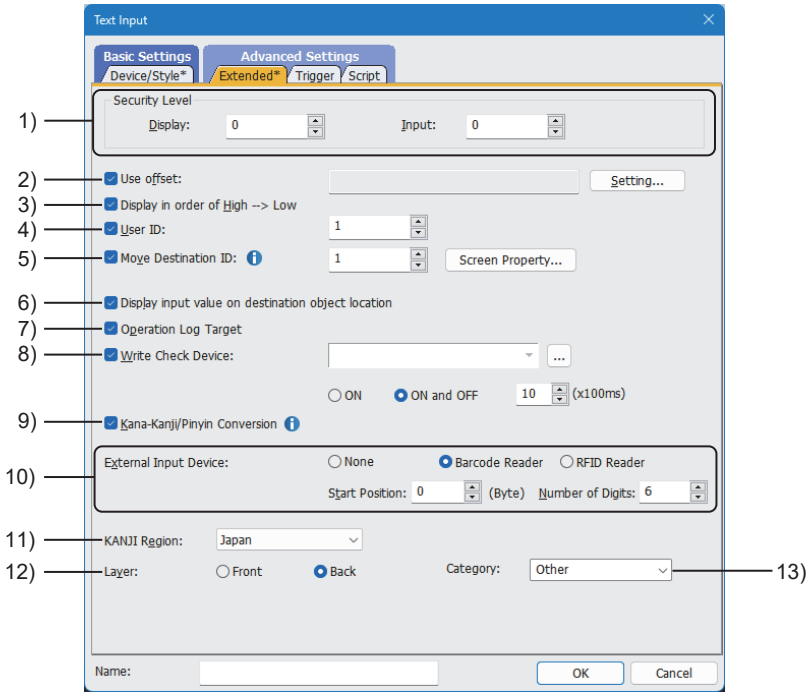
		[Shape Color]	Select the color of the shape. ☞ Page 988 Color settings
9)	[Preview]	[Text]	Displays the preview of the screen. Set the text to be displayed in the preview.
10)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

30.6.2 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

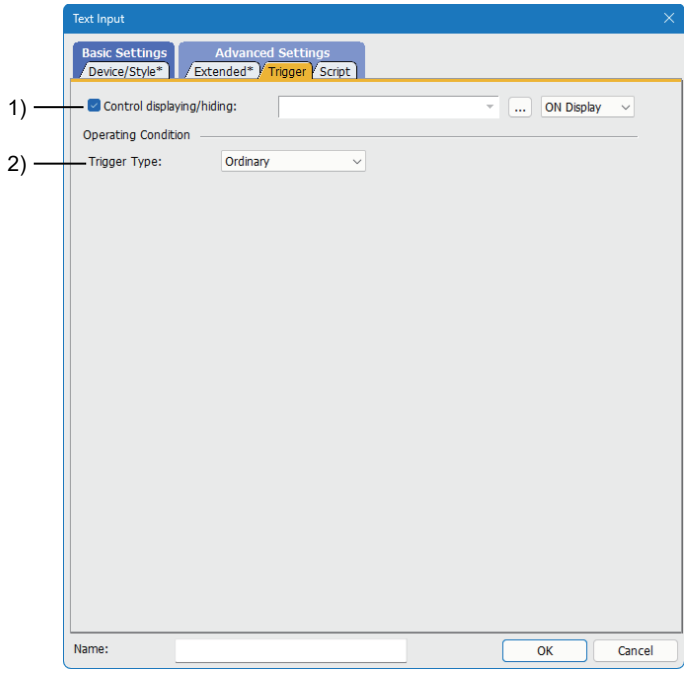


Item		Description
1)	[Security Level]	Set a security level when using the security function. The setting range is [0] to [15]. Set [0] when the security function is not used. For [Input], set the same or a greater value than the value set for [Display]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Select this item to monitor multiple devices by switching them. Set the offset device with the [Setting] button. ☞ Page 963 Offset
3)	[Display in order of High -> Low]	Select this item to display string data stored in devices in order of lower byte to upper byte. For details, refer to the following. ☞ Page 1354 Order of displaying and storing character strings
4)	[User ID]	Set the number to identify the object. The setting range is [1] to [65535]. For the applications of the user ID, refer to the following. ☞ Page 1348 Specifying the destination to which the cursor moves after the confirmation of a text entry
5)	[Move Destination ID]	Set the user ID of a text input object to which the cursor moves upon text input. To move the cursor by specifying a user ID, a cursor movement setting must also be configured. Configure one of the following settings to enable the cursor movement per project or per screen.
		To enable cursor movement in the entire project, set as follows in the [Environmental Setting] window ([Advanced Setting] tab of ([Key Window]). ☞ Page 572 [Advanced Setting] tab • Select [Control the cursor] for [Defined key action]. • Select [In order of user ID] or [Subsequently valid user ID] for [Cursor Move Destination].
		To enable cursor movement only on the screen where the text input object is placed, click the [Screen Property] button to display the properties of the screen where the text input object is placed. ☞ Page 313 Base screen properties ☞ Page 323 Window screen properties Set as follows in the [Key Window Advanced Setting] tab. • Select [[Prioritize screen setting over project setting]. • Select [Control the cursor] for [Defined key action]. • Select [In order of user ID] or [Subsequently valid user ID] for [Cursor Move Destination].

Item			Description	
6)	[Display input value on destination object location]		Reflects the text entered in the key window to the object on the screen immediately. To perform a write to a device, touch the enter key.	
7)	[Operation Log Target]		Select this item to record the operation log of the set object. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])	
8)	[Write Check Device]		Set the bit device and operation to notify the completion of a text input. Prevent input while the write completion device is on, for example, by setting the off state of the write completion device as the trigger condition for the object. If input is continuously performed before the write completion device turns off, the write completion device does not turn off at normal timing. The following shows selectable items for the operation.	
			[ON]	Turns on a set bit device upon completion of a text input.
			[ON and OFF]	Turns on a set bit device upon completion of a text input, and then turns off the bit device after a specified time period. The setting range of the time from turning on to turning off the bit device is [5] x 100 ms to [30] x 100 ms.
				[Write Complete Device] can be set for numerical input and the text input objects. If [Write Check Device] is set to [ON and OFF] for multiple numerical input or text input objects, do not turn on 21 or more write completion devices simultaneously. Otherwise the write completion devices that turn on 21st and later do not turn off automatically.
				Even when screen switching (including switching to utilities) occurs while a write completion device is on, the write completion device does not turn off. The device remains on until a set time elapses.
9)	[Kana-Kanji/Pinyin Conversion]		This item is not displayed when [Display the text to be shown on the screen with asterisk] is selected on the [Device/Style] tab. Select this item to enable Kana-Kanji/Pinyin conversion. For details on the Kana-Kanji/Pinyin conversion function, refer to the following. ☞ Page 604 Configuring the settings for converting a text into kanji or Simplified Chinese characters in the GOT ([Kana-Kanji/Pinyin Conversion])	
10)	[External Input Device]	—	Set whether to input the text read with a serial barcode reader or RFID reader. ☞ Page 2564 Using a barcode reader with the GOT (barcode function) ☞ Page 2588 Using an RFID with the GOT (RFID function) When selecting [Barcode Reader] or [RFID Reader], set [Start Position] and [Number of Digits].	
		[Start Position]	Specify the input start byte of the data read with a barcode reader or RFID reader. • [Barcode Reader]: [0]th byte to [3997]th byte • [RFID Reader]: [0]th byte to [19997]th byte	
		[Number of Digits]	Set the number of digits of input data read with a barcode reader or RFID reader. The same or smaller number of digits as that set for [Digits] in the [Device/Style] tab can be set.	
11)	[KANJI Region]		When selecting [Unicode] for [Character Code], select the KANJI region of the displayed text. ☞ Page 76 KANJI region This item is enabled when either of the following fonts is selected for [Font] in the [Device/Style] tab. • [UD Gothic] • [UD Mincho]	
12)	[Layer]		Select the layer to place the object. ☞ Page 65 Layer	
13)	[Category]		Select the category to assign the object. ☞ Page 1092 Efficient Drawing with Templates	

30.6.3 [Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off
2)	[Trigger Type]	Select the condition of displaying the object. For details on the trigger types, refer to the following. ☞ Page 976 Trigger types settable for the object operating condition

PART 7

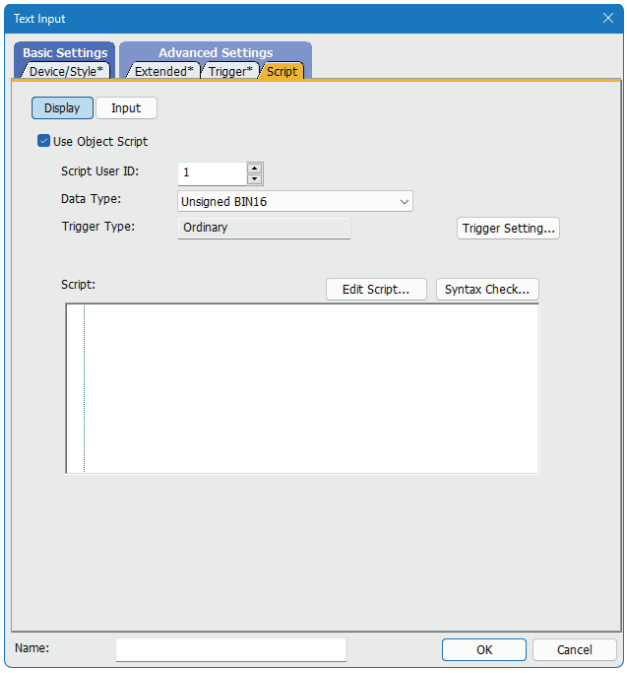
30.6.4 [Script] tab

GT37 SoftGOT3000

For a single text input object, both display object scripts and input object scripts can be set.

For details on the script settings, refer to the following.

☞ Page 2447 Object script



Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

☞ Page 2456 Timing at which the setting change of an object property is reflected

30.7 Relevant settings

GT37 SoftGOT3000

For the text display and text input t objects, there are relevant settings other than the specific settings.
The following shows the functions that are available by configuring the relevant settings.
☞ Page 1370 GOT environmental settings (key window), screen property
☞ Page 1372 GOT environmental settings (System information)
☞ Page 1372 GOT internal devices

30.7.1 GOT environmental settings (key window), screen property

Set the following functions for each project (GOT environmental settings) or for each screen (screen property).
☞ Page 558 Setting key windows of the GOT ([Key Window])

• Settings for each project (GOT environmental settings)

Select [Common] → [GOT Environmental Setting] → [Key Window] from the menu to display the [Environmental Setting] window.

• Settings for each screen (screen property)

Select the screen editor on which the key window is to be set, and select [Screen] → [Screen Property] from the menu to display the screen properties.

Function	Setting item
Displaying the key window when the operating condition is satisfied	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Key Window]
Displaying the key window when the screen is switched	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Display the key window]
Displaying the cursor when the screen is switched	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Display the cursor]
Displaying the cursor when the operating condition is satisfied	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Cursor]
Deleting the key window and cursor when the operating condition is not satisfied	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Clear the key window and the cursor] of [When operating conditions are not satisfied]
Selecting the method of displaying the cursor when entering a value using a numerical input or text input object	Display the [Display Detail Setting] dialog with the [Setting] button in the [Advanced Setting] tab or [Key Window Advanced Setting] tab to set this function with the following item. • [Cursor Type]
Displaying the key window at a touch input or deleting the key window by pressing the enter key	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Key Window] • [Defined key action]
When multiple numerical or text input objects exist, setting the order of input After an input is confirmed, moving the cursor to the next destination automatically	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Defined key action] • [Reference for determining cursor destination]
Setting the window screen to be used as a key window for numerical inputs (decimal or hexadecimal) and text inputs	Set this function with the following item the [Basic Setting] tab or [Key Window Basic Setting] tab. • [Key Window]
Setting whether to move the display of the key window or not by screen	Set this function in the following item in the [SP Function] tab or [Key Window Advanced Setting] tab. • [Key Window Position Correction]

Function	Setting item
Setting whether to display or hide the cursor when hiding the cursor and pressing the enter key or an arrow key	Display the [Display Detail Setting] dialog with the [Setting] button in the [Advanced Setting] tab or [Key Window Advanced Setting] tab to set this function with the following item. • [Display the cursor with a touch on the Enter/arrow key when the cursor is hidden]
When entering a value or text with a numerical input or text input object, displaying a dialog prompting you to confirm the entry when the enter key is touched	Display the [Display Detail Setting] dialog with the [Setting] button in the [Advanced Setting] tab or [Key Window Advanced Setting] tab to set this function with the following item. • [Display the input confirmation dialog when setting the function of Numerical/Text Input]

30.7.2 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] window.

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Outputting the input signal, input number, or others to the system information when the text input is executed	[Output object ID of Text Input to the system information device]
When deleting the cursor, clearing the cursor information, such as the cursor display object ID and cursor display user ID	[Clear the cursor information when deleting the cursor]
Turning off the Key Input signal (System signal 1-1.b3)	[System Signal 1-1]
Turning off the signal (System information 2-1.b4) that turns on when an input using a text input object is confirmed (System signal 1-1.b4)*1	[System Signal 1-1]
Disabling all the key inputs (System signal 1-1.b9)	[System Signal 1-1]
Notifying a key input (System signal 2-1.b3)	[System Signal 2-1]
Notifying the confirmation of an entry from a text input object (System signal 2-1.b4)*1	[System Signal 2-1]
Notifying that the key window is being displayed (System signal 2-1.b11)	[System Signal 2-1]
Notifying that the cursor is being displayed in a text input object (System signal 2-2.b11)	[System Signal 2-2]
Notifying the user ID of the text input object on which the input is confirmed*1	[Numeric Value Input Number]
Notifying the object ID of the object currently displayed under the cursor	[Current Cursor Display Object ID]
Notifying the object ID of the object previously displayed under the cursor	[Previous Cursor Display Object ID]
Notifying the user ID of the object currently displayed under the cursor*1	[Current Cursor Display User ID]
Notifying the user ID of the object previously displayed under the cursor*1	[Previous Cursor Display User ID]
Notifying the key codes set to the input keys when there is an input using a text input, touch switch, or other objects	[Key Code Input]

*1 To set the text input as the operation target of each signal, select [Output object ID of Text Input to the system information device] in the [Environmental Setting] window ([System Information]) or turn on GS450.b2.

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])
☞ Page 3640 Monitor Common Control (GS450)

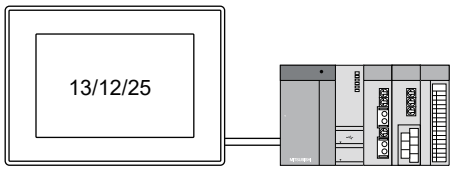
Notifying the upper-left coordinates of a text input object on which the cursor is displayed	GS694 GS695

31 Placing a date display or time display

GT37 SoftGOT3000

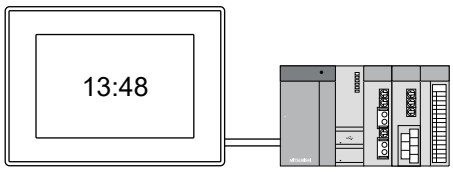
• Date display

This function displays the date on the GOT.



• Time display

This function displays the time on the GOT.



☞ Page 1374 Specifications of the date display and time display
☞ Page 1375 How to use the date display and time display
☞ Page 1376 [Date Display] dialog
☞ Page 1381 [Time Display] dialog

31.1 Specifications of the date display and time display

GT37 SoftGOT3000

31.1.1 Maximum number of objects that can be placed on one screen

The maximum number of objects on one screen depends on the screen type.

• Base screen

Up to 1024 date displays and time displays can be placed on one screen.

• Window screen

Up to 512 date displays and time displays can be placed on one screen.

31.1.2 Date data and time data to be displayed

The date display and the time display use the GOT clock data.

For information on the clock of the GOT, refer to the following.

☞ Page 635 Setting the GOT time setting method ([Time Setting])

31.2 How to use the date display and time display

GT37 SoftGOT3000

31.2.1 Placing a date display or time display

Place a date display or time display on a screen editor.

☞ Page 1001 Placing figures and objects

31.2.2 Editing a date display or time display

Edit a date display or time display on the screen editor.

☞ Page 1003 Selecting figures and objects on the screen editor

☞ Page 1007 Resizing

31.2.3 Configuring the settings for a date display or time display

Configure the settings of a date display or time display on the screen editor.

- Common settings for objects

☞ Page 1032 Settings common to figures and objects

- Date display settings

☞ Page 1376 [Date Display] dialog

- Time display settings

☞ Page 1381 [Time Display] dialog

31.3 [Date Display] dialog

GT37 SoftGOT3000

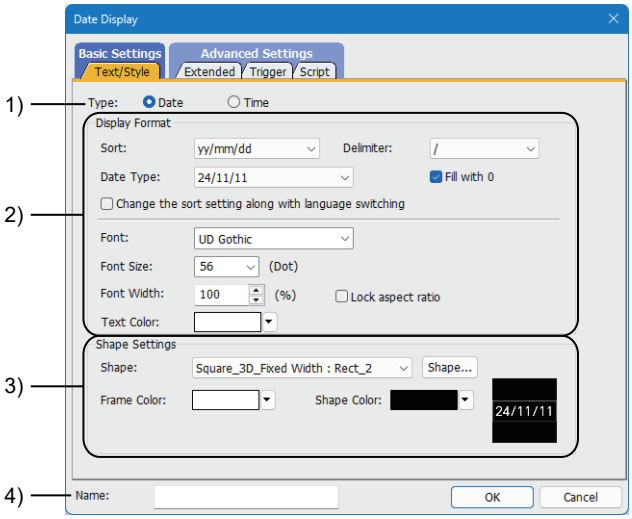
Operating procedure

1. Select [Object] → [Date/Time Display] → [Date Display] from the menu.
2. Click the position to place a date display.
3. Double-click the date display to display the setting dialog.

☞ Page 1376 [Text/Style] tab
☞ Page 1378 [Extended] tab
☞ Page 1379 [Trigger] tab
☞ Page 1380 [Script] tab

31.3.1 [Text/Style] tab

GT37 SoftGOT3000



Item			Description
1)	[Type]		Changing the selection toggles between the object types.
2)	[Display Format]	[Sort]	Select a sorting order by year, month, and day. When [Change the sort setting along with language switching] is selected, a sorting order cannot be selected.
		[Delimiter]	Select a delimiter used for separating the year, month, and day.
		[Date Type]	Select the display format of the date. The items to be displayed differ depending on the selected item for [Delimiter] and whether [Fill with 0] is selected.
		[Fill with 0]	When the month or day is a single digit, zero is displayed before the single-digit number.
		[Change the sort setting along with language switching]	Changes the sorting order of the date along with language switching. This function may not be settable depending on the item selected for [Date Type]. To use this function, set [Region Setting] for [Language Switching] of [Environmental Setting] window. ☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching])

Item			Description
2)	[Display Format]	[Font]	Select the font of the displayed text.
		[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Lock aspect ratio]	Select this item to fix the aspect ratio of the font. When this item is selected, the setting of [Font Width] is disabled.
		[Text Color]	Set the text color. ☞ Page 988 Color settings
3)	[Shape Settings]	[Shape]	Select the shape to be set for the object from the list or with the [Shape] button. ☞ Page 1045 How to set the object shape When the text to be displayed overlaps the shape frame area, the text cannot be displayed normally. Configure the settings so that the text and the shape frame area do not overlap. 		[Frame Color]	Select the frame color of the shape. ☞ Page 988 Color settings
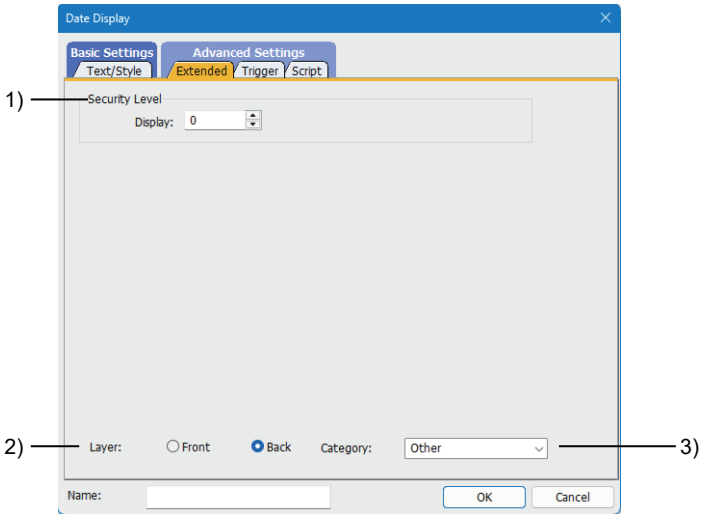
		[Shape Color]	Select the color of the shape. ☞ Page 988 Color settings
		Preview	Displays the preview of the screen.
4)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

31.3.2 [Extended] tab

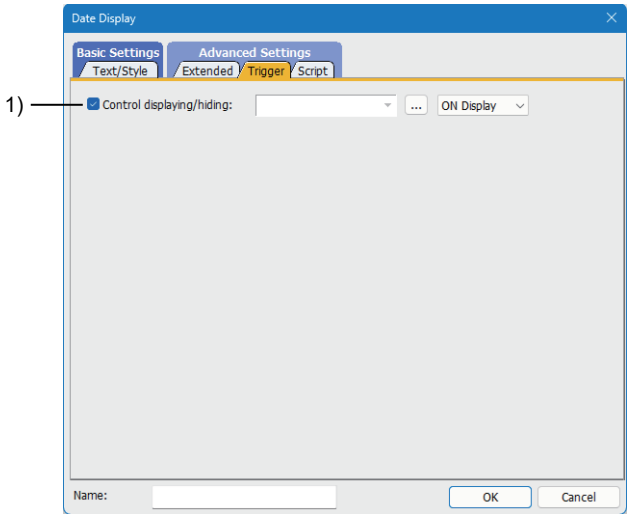
GT37 SoftGOT3000



Item		Description
1)	[Security Level]	Set a security level when using the security. The setting range is [0] to [15]. If you do not use the security, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Layer]	Switches layers to be placed.
3)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

31.3.3 [Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. ☞ Page 1121 Managing figures and objects by category

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.
☞ Page 2456 Timing at which the setting change of an object property is reflected

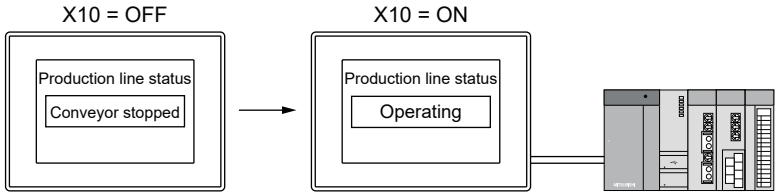
32 Placing a comment display

GT37 SoftGOT3000

• Comment display (bit)

This function displays the comment corresponding to the on/off status of a bit device.

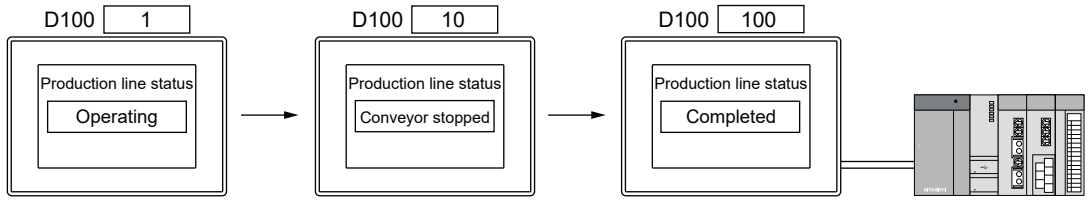


Comment of when the bit device is off

Comment of when the bit device is off

• Comment display (word)

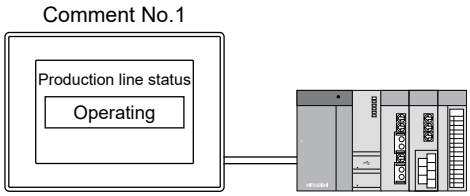
This function displays the comment corresponding to the value of a word device.



Comment No.1 is displayed. Comment No.10 is displayed. Comment No.100 is displayed.

• Comment display (simple)

This function displays comments without setting a device.



Comment No.1 is always displayed.

☞ Page 1387 Specifications of the comment display
☞ Page 1388 How to use the comment display
☞ Page 1390 [Bit Comment Display] dialog
☞ Page 1400 [Word Comment Display] dialog
☞ Page 1413 [Simple Comment Display] dialog

32.1 Specifications of the comment display

GT37 SoftGOT3000

32.1.1 Maximum number of objects that can be placed on one screen

Up to 1024 comment display and other objects can be placed on one base screen, while up to 512 can be placed on one window screen.

32.1.2 Comment to be used

The comment display uses the comment that is created in the comment group.

☞ Page 776 Comment setting ([Comment])

Precautions

If the nonexistent value (column No.) is stored in the language switching device, the comment is not displayed.

32.1.3 Superimposing a comment display on a level object

A comment display can be superimposed on a level object.

For restrictions on superimposing a comment display on a level object, refer to the following.

☞ Page 1761 Placing a level object

PART 7

32.2 How to use the comment display

GT37 SoftGOT3000

32.2.1 Placing a comment display

Place comment displays on the screen editor.

☞ Page 1001 Placing figures and objects

32.2.2 Editing comment displays

Edit comment displays that have been placed on the screen editor.

☞ Page 1003 Selecting figures and objects on the screen editor

☞ Page 1007 Resizing

32.2.3 Setting comment displays

Set comment displays that have been placed on the screen editor.

Common settings for objects

☞ Page 1032 Settings common to figures and objects

Comment display (bit) settings

☞ Page 1390 [Bit Comment Display] dialog

Comment display (word) settings

☞ Page 1400 [Word Comment Display] dialog

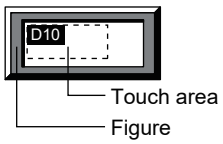
Comment display (simple) settings

☞ Page 1413 [Simple Comment Display] dialog

32.2.4 How to adjust the display position of shapes set for objects

Select [Edit] → [Edit Touch Area] → [Manual Edit] from the menu to adjust the display positions of the touch area and the shape.

☞ Page 1030 Adjusting the touch area of an object (size, position)



32.2.5 Displaying the comment that exceeds the display range

The display method for the comment that exceeds the display range can be set.

Select the comment display on the screen editor to display the numbers of digits and rows that are available for the object size in the status bar.

Precautions

Some comment cannot be displayed within the display range by language switching.

Set the display range of the object after considering the number of characters in the registered comment.

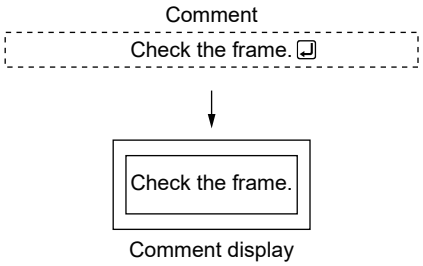
The display range of the comment can be checked on the screen of GT Designer3 by changing the preview column No.

☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching])

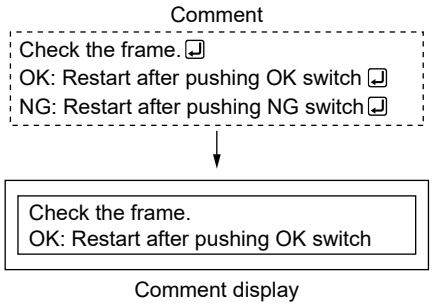
Displaying the comment with the word wrap

If a comment exceeds the display range horizontally, the comment is wrapped to the next line.

However, the word wrap is not applicable to the comment displayed in a Windows font.



If a comment exceeds the display range vertically, only the part of the comment within the range is displayed.



Displaying the comment without the word wrap

When [Adjust Font Size] is selected, [Font Size] is adjusted automatically so that the entire comment fits on the display range.

☞ Page 1392 [Comment] tab

☞ Page 1403 [Comment] tab

☞ Page 1413 [Simple Comment Display] dialog

32.3 [Bit Comment Display] dialog

GT37 SoftGOT3000

Operating procedure

1. Select [Object] → [Comment Display] → [Bit Comment] from the menu.
2. Click the position to place a bit comment display.
3. Double-click the bit comment display to display the setting dialog.

☞ Page 1391 [Device/Style] tab

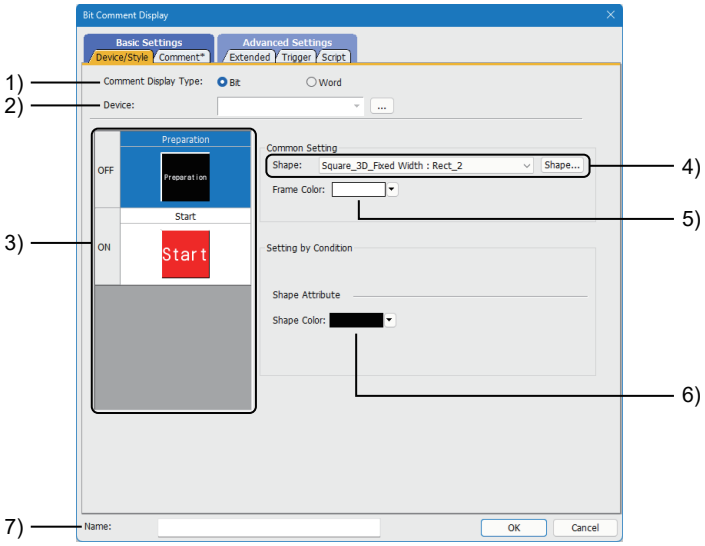
32.3.1 [Device/Style] tab

GT37 SoftGOT3000



Item		Description
1)	[Comment Display Type]	Select the comment display type. The following shows selectable items. • [Bit] • [Word]
2)	[Device]	Set the device to be monitored. ☞ Page 834 How to set devices, labels, and tags
3)	Preview list	Displays the shapes for the on and off status.
4)	[Shape]	Select the shape to be set for the object from the list or with the [Shape] button. ☞ Page 1045 How to set the object shape When the text to be displayed overlaps the shape frame area, the text cannot be displayed normally. Configure the settings so that the text and the shape frame area do not overlap. 5)	[Frame Color]	Select the frame color of the shape. ☞ Page 988 Color settings
6)	[Shape Color]	Select the color of the shape.
7)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

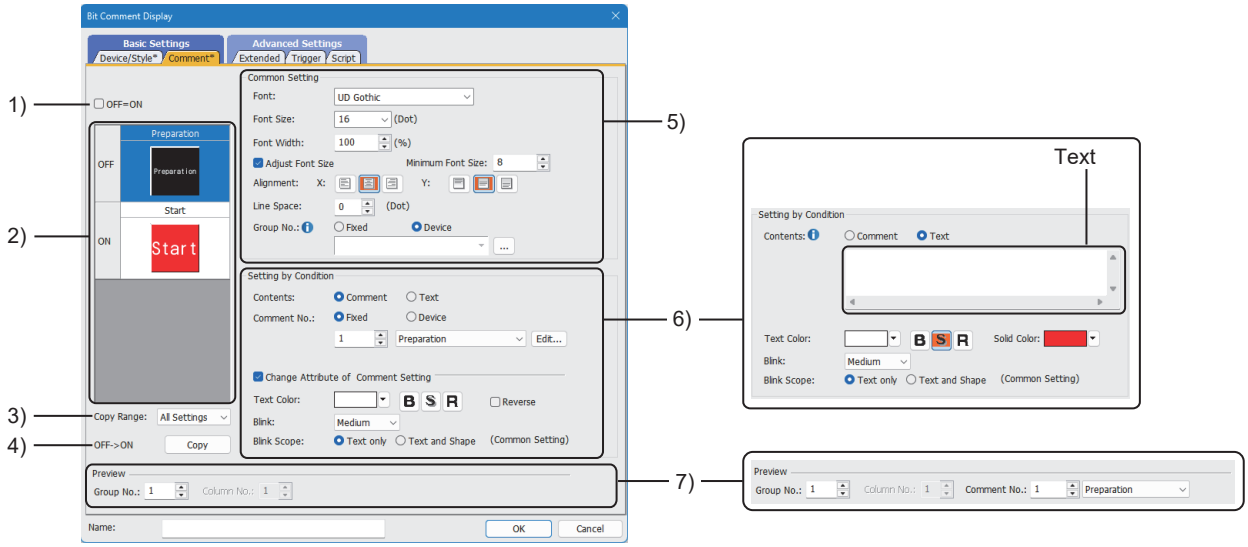
PART 7

32.3.2 [Comment] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description
1)	[OFF=ON]	Selecting this item applies the same setting to both when the switch is on and off.
2)	Preview list	Displays the shapes for the on and off status.
3)	[Copy Range]	Set the copy range. The following shows selectable items. • [All settings]: Copies all the text settings. • [Text only]: Copies the text only.
4)	[OFF→ON], [ON→OFF]	Copies the text setting. Depending on the selection in the preview list, the copy source and copy destination are different. • [OFF→ON]: Copies the setting for when the switch is off to the setting for when the switch is on by clicking the [Copy] button. • [ON→OFF]: Copies the setting for when the switch is on to the setting for when the switch is off by clicking the [Copy] button.

Item			Description
5)	[Common Setting]	[Font]	Select the font of the displayed text. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho] • [Windows Font]: This item is selectable when [Group No.] is set to [Fixed]. Displays text in the font specified with [Windows Font] in the [Comment Group Property] dialog.
		[Windows Font Setting] button	This item appears when [Windows Font] is selected for [Font]. The [Comment Group Property] dialog for the group number specified by [Group No.] is displayed. Set [Windows Font] and [Character Set] for the target column of the comment group. ☞ Page 797 [Comment Group Property] dialog
		[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Adjust Font Size]	The font size is automatically adjusted according to the object size. When this item is deselected, a line feed is automatically inserted.
		[Minimum Font Size]	This item can be set only when [Adjust Font Size] is set. Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.
		[Alignment]	Set the vertical and horizontal positions of the text.
		[Line Space]	Set the space between lines in units of dots. The setting range is [0] dots to [128] dots.
		[Group No.]	Set the group number of the comment group to be used. • [Fixed] Select this item to use the specified comment group. After selecting this item, directly enter the comment group No. to be used. • [Device] Select this item to use the comment group number corresponding to the value of the device to be set. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags

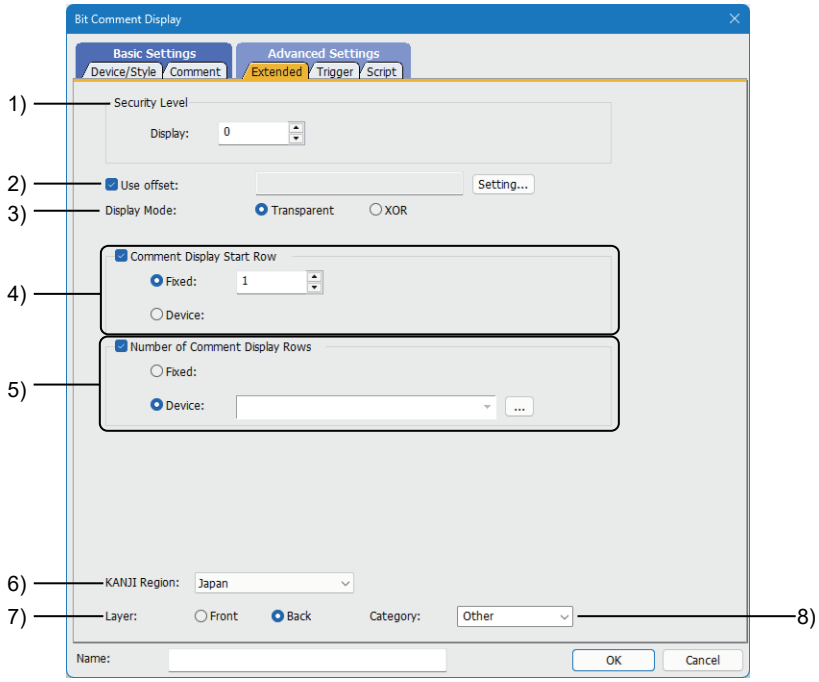
Item			Description
6)	[Setting by Condition]	—	The setting items differ depending on the selection for [Contents].
		[Contents]	Select the item to be displayed as a comment. The following shows selectable items. • [Comment]: Set [Comment No.]. • [Text]: Enter text directly.
		[Comment No.]	Select the target item in the preview list, then set the comment number of the comment to be used. • [Fixed] Select this item to use the specified comment. After selecting this item, directly enter the comment No. to be used. If [0] is specified, no comment is displayed. To edit the comment to be displayed, click the [Edit] button to display the [Edit Comment] dialog. If you specify an unregistered comment group number or comment number, a comment is newly created. ☞ Page 3685 [Edit Comment] dialog • [Device] Select this item to use the comment number corresponding to the value of the device to be set. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags
		[Change Attribute of Comment Setting]	Set the comment attribute such as [Text Color] and [Blink].
		[Text Color]	Set the color and style of the text to be displayed on the object. One style ([Bold], [Solid], or [Raised]) is settable only.  • [Text Color] Set the text color. ☞ Page 988 Color settings • [Bold] button Displays the text in bold. • [Solid] button Displays the text with a shadow. • [Raised] button Displays the text embossed. • [Solid Color] When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
		[Blink]	Select the blinking speed of the text and shape. The following shows selectable items. • [None] • [Low] • [Medium] • [High]
		[Reverse]	Inverts the text.
		[Blink Scope]	Select the area to be blinked. The following shows selectable items. • [Text only] • [Text and Shape] These settings are applied to all the conditions to be set.
7)	[Preview]	—	Set the comment to be previewed in the preview list.
		[Group No.]	Set the comment group No. to be previewed. This item can be set only when [Device] is set in [Group No.]. The setting range is [1] to [500].
		[Column No.]	Set the column No. to be previewed. The setting range is [1] to [30].
		[Comment No.]	This item appears when [Device] is selected for [Comment No.] under [Setting by Condition]. Set the comment No. to be displayed. The setting range is [0] to [32767].

32.3.3 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description
1)	[Security Level]	Set a security level when using the security. The setting range is [0] to [15]. If you do not use the security, select [0].
2)	[Use offset]	Select this item to monitor multiple devices by switching them. Sets the offset device with the [Setting] button. ☞ Page 963 Offset
3)	[Display Mode]	Display mode when the comment display is superimposed on a level object. This setting is not displayed when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). The operation when [Transparent] is selected is applied. ☞ Page 519 [Type Setting] dialog • [Transparent]: Displays the comment on the level object. • [XOR]: XOR synthesizes the comment using the level color so that the comment is distinguished from the level object. 
Item			Description
4)	[Comment Display Start Row]	—	When setting a comment having multiple rows, set the first row to be displayed. If a nonexistent line number is specified, no comment is displayed. If the comment is displayed as blank, check the number of rows of the specified comments.
		[Fixed]	Enter the start row directly. The setting range is [1] to [32767].
		[Device]	Set the device value as the start row to be displayed. ☞ Page 834 How to set devices, labels, and tags Example) When [Device] is selected and [D10] is specified 5)	[Number of Comment Display Rows]	—	When setting a comment having multiple rows, set the number of rows to be displayed.
		[Fixed]	Enter the number of rows to be displayed directly . The setting range is [1] to [32767].
		[Device]	Set the device value as the number of rows to be displayed. ☞ Page 834 How to set devices, labels, and tags If the device stores 0, no comment is displayed. Example) When [Device] is selected and [D20] is set 6)	[KANJI Region]		Select the KANJI region of the text to be displayed. ☞ Page 74 Specifications of displayable characters The following shows selectable items. • [Japan] • [China(GB)-Mincho] • [China(Big5)-Gothic]
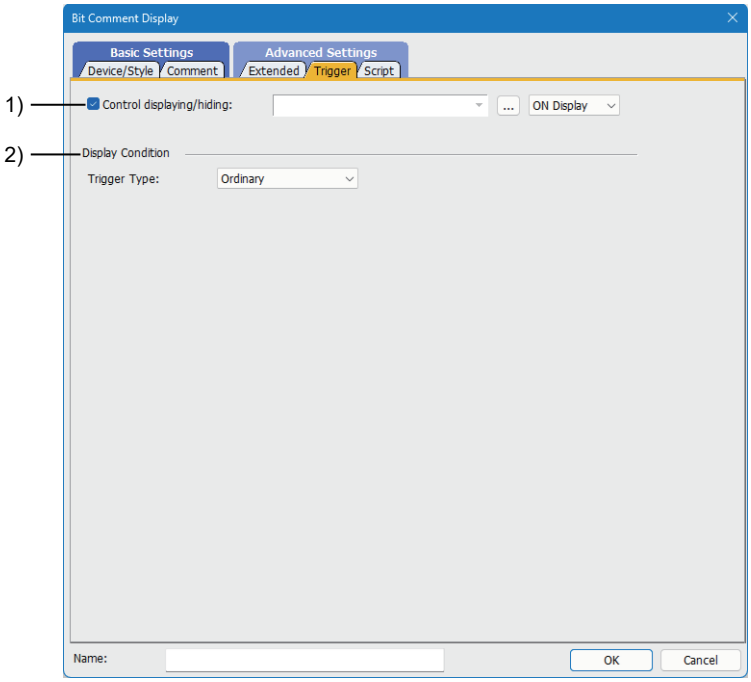
7)	[Layer]		Switches layers to be placed. The following shows selectable items. • [Front] • [Back]
8)	[Category]		Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

32.3.4 [Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger Type]	Select a trigger condition to display the object. The following shows selectable items. • [Ordinary] • [ON] • [OFF] • [Rise] • [Fall] • [Rise/Fall] • [Sampling] • [Range] • [Bit Trigger] • [ON Sampling] • [OFF Sampling] The selectable items vary depending on the GOT model. For details, refer to the following. ☞ Page 970 Specifications of the trigger types For the settings of each item, refer to the following. ☞ Page 968 Trigger type settings

Item		Description
1)	[Comment Display Type]	Select the comment display type. The following shows selectable items. • [Bit] • [Word]
2)	[Device]	Set the device to be monitored. ☞ Page 834 How to set devices, labels, and tags
3)	[Data Type]	Select the data type of the device. The following shows selectable items. • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN8] • [Unsigned BIN8] • [BCD16]
4)	Preview list	Displays set conditions.
5)	[Range] button	Displays the preview list in range.
6)	[Text] button	Displays the preview list in text.
7)	Add button	Adds a new condition.
8)	Delete button	Deletes the selected condition.
9)	Up button Down button	Changes the priority order of the conditions in the preview list.
10)	[Utilize] button	Creates a new condition utilizing the selected condition.

PART 7

Item		Description
11)	[Shape]	Select the shape to be set for the object from the list or with the [Shape] button. ☞ Page 1045 How to set the object shape When the text to be displayed overlaps the shape frame area, the text cannot be displayed normally. Configure the settings so that the text and the shape frame area do not overlap. 12)	[Frame Color]	Select the frame color of the shape. ☞ Page 988 Color settings
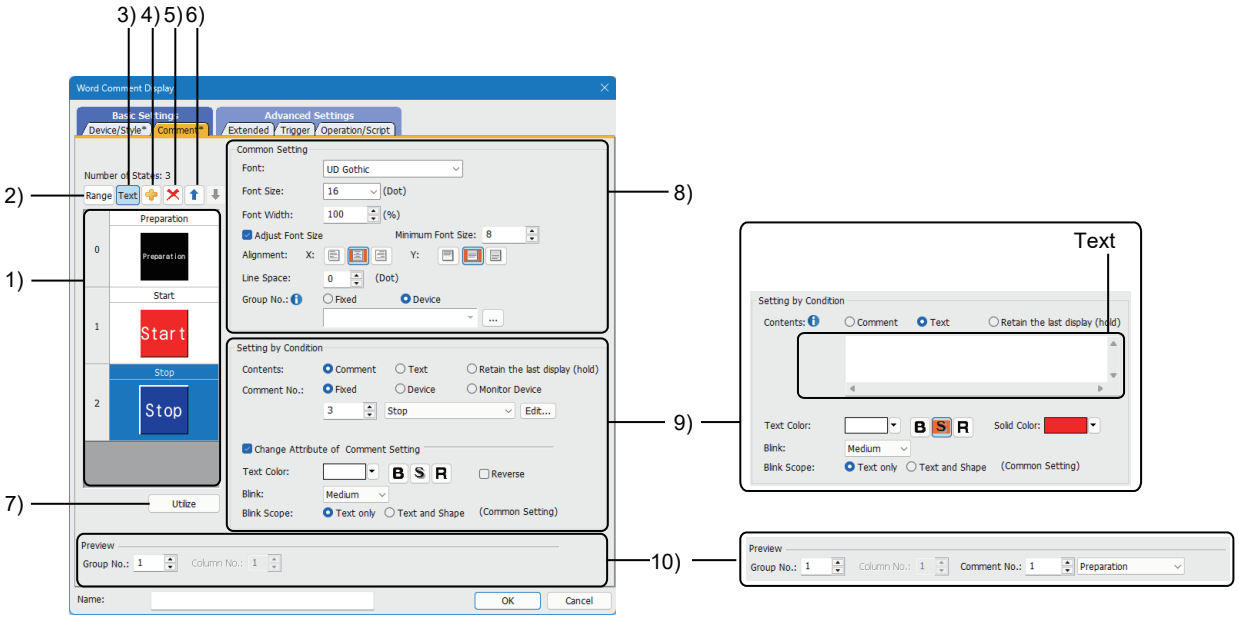
13)	[Range]	Set a condition which changes the display property of the lamp. Click the [Exp] button, and set the conditional expression in the [Edit Range] dialog. For details on the [Edit Range] dialog, refer to the following. ☞ Page 1043 [Edit Range] dialog
14)	[Shape Color]	Select the color of the shape. ☞ Page 988 Color settings
15)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

32.4.2 [Comment] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description
1)	Preview list	Displays set conditions.
2)	[Range] button	Displays the preview list in range.
3)	[Text] button	Displays the preview list in text.
4)	Add button	Adds a new condition.
5)	Delete button	Deletes the selected condition.
6)	Up button Down button	Changes the priority order of the conditions in the preview list.
7)	[Utilize] button	Creates a new condition utilizing the selected condition.

PART 7

Item			Description
8)	[Common Setting]	[Font]	Select the font of the displayed text. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho] • [Windows Font]: This item is selectable when [Group No.] is set to [Fixed]. Displays text in the font specified with [Windows Font] in the [Comment Group Property] dialog.
		[Windows Font Setting] button	This item appears when [Windows Font] is selected for [Font]. The [Comment Group Property] dialog for the group number specified by [Group No.] is displayed. Set [Windows Font] and [Character Set] for the target column of the comment group. ☞ Page 797 [Comment Group Property] dialog
		[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Adjust Font Size]	The font size is automatically adjusted according to the object size. When this item is deselected, a line feed is automatically inserted.
		[Minimum Font Size]	This item can be set only when [Adjust Font Size] is set. Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.
		[Alignment]	Set the vertical and horizontal positions of the text.
		[Line Space]	Set the space between lines in units of dots. The setting range is [0] dots to [128] dots.
		[Group No.]	Set the group number of the comment group to be used. • [Fixed] Select this item to use the specified comment group. After selecting this item, directly enter the comment group No. to be used. • [Device] Select this item to use the comment group number corresponding to the value of the device to be set. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags

Item			Description
9)	[Setting by Condition]	—	The setting items differ depending on the selection for [Contents].
		[Contents]	Select the item to be displayed as a comment. The following shows selectable items. • [Comment]: Set [Comment No.]. • [Text]: Enter text directly. • [Retain the last display (hold)]: Holds the comment being displayed.
		[Comment No.]	Select the target item in the preview list, then set the comment number of the comment to be used. • [Fixed] Select this item to use the specified comment. After selecting this item, directly enter the comment No. to be used. If [0] is specified, no comment is displayed. To edit the comment to be displayed, click the [Edit] button to display the [Edit Comment] dialog. If you specify an unregistered comment group number or comment number, a comment is newly created. ☞ Page 3685 [Edit Comment] dialog • [Device] Select this item to use the comment number corresponding to the value of the device to be set. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags • [Monitor Device] Select this item to use the comment number corresponding to the value of the monitor device set for [Device] in the [Device/Style] tab.
		[Change Attribute of Comment Setting]	Set the comment attribute such as [Text Color] and [Blink].
		[Text Color]	Set the color and style of the text to be displayed on the object. One style ([Bold], [Solid], or [Raised]) is settable only.  • [Text Color] Set the text color. ☞ Page 988 Color settings • [Bold] button Displays the text in bold. • [Solid] button Displays the text with a shadow. • [Raised] button Displays the text embossed. • [Solid Color] When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
		[Blink]	Select the blinking speed of the text and shape. The following shows selectable items. • [None] • [Low] • [Medium] • [High]
		[Reverse]	Inverts the text.
		[Blink Scope]	Select the area to be blinked. The following shows selectable items. • [Text only] • [Text and Shape] These settings are applied to all the conditions to be set.

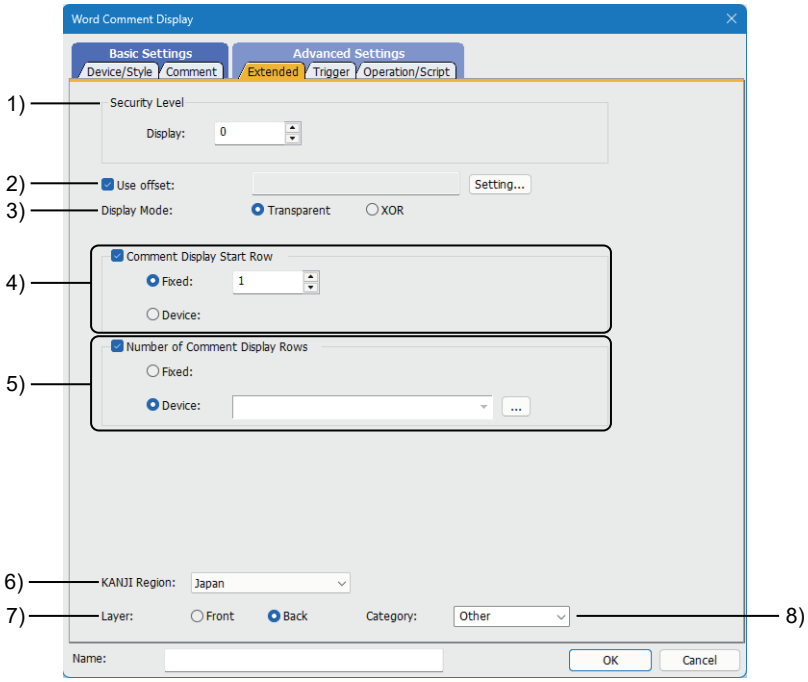
Item			Description
10)	[Preview]	—	Set the comment to be previewed in the preview list.
		[Group No.]	Set the comment group No. to be previewed. This item can be set only when [Device] is set in [Group No.]. The setting range is [1] to [500].
		[Column No.]	Set the column No. to be previewed. The setting range is [1] to [30].
		[Comment No.]	This item appears when [Device] or [Monitor Device] is selected for [Comment No.] under [Setting by Condition]. Set the comment No. to be previewed. The setting range is [0] to [32767].

32.4.3 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description
1)	[Security Level]	Set a security level when using the security. The setting range is [0] to [15]. If you do not use the security, select [0].
2)	[Use offset]	Select this item to monitor multiple devices by switching them. Sets the offset device with the [Setting] button. ☞ Page 963 Offset
3)	[Display Mode]	Display mode when the comment display is superimposed on a level object. This setting is not displayed when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). The operation when [Transparent] is selected is applied. ☞ Page 519 [Type Setting] dialog • [Transparent]: Displays the comment on the level object. • [XOR]: XOR synthesizes the comment using the level color so that the comment is distinguished from the level object. 
Item			Description
4)	[Comment Display Start Row]	—	When setting a comment having multiple rows, set the first row to be displayed. If a nonexistent line number is specified, no comment is displayed. If the comment is displayed as blank, check the number of rows of the specified comments.
		[Fixed]	Enter the start row directly. The setting range is [1] to [32767].
		[Device]	Set the device value as the start row to be displayed. ☞ Page 834 How to set devices, labels, and tags Example) When [Device] is selected and [D10] is specified 5)	[Number of Comment Display Rows]	—	When setting a comment having multiple rows, set the number of rows to be displayed.
		[Fixed]	Enter the number of rows to be displayed directly . The setting range is [1] to [32767].
		[Device]	Set the device value as the number of rows to be displayed. ☞ Page 834 How to set devices, labels, and tags If the device stores 0, no comment is displayed. Example) When [Device] is selected and [D20] is set 6)	[KANJI Region]		Select the KANJI region of the text to be displayed. ☞ Page 74 Specifications of displayable characters The following shows selectable items. • [Japan] • [China(GB)-Mincho] • [China(Big5)-Gothic]
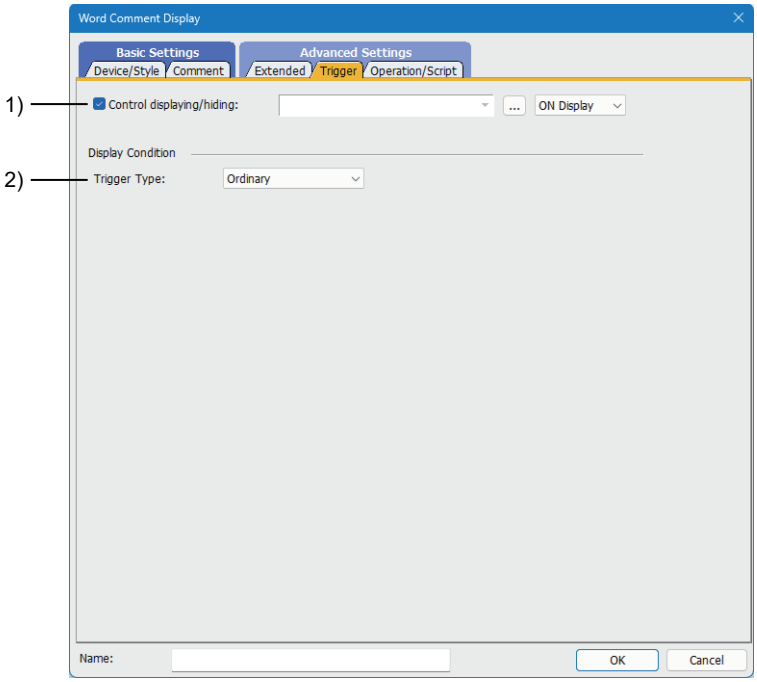
7)	[Layer]		Switches layers to be placed. The following shows selectable items. • [Front] • [Back]
8)	[Category]		Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

32.4.4 [Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger Type]	Select a trigger condition to display the object. The following shows selectable items. • [Ordinary] • [ON] • [OFF] • [Rise] • [Fall] • [Rise/Fall] • [Sampling] • [Range] • [Bit Trigger] • [ON Sampling] • [OFF Sampling] The selectable items vary depending on the GOT model. For details, refer to the following. ☞ Page 970 Specifications of the trigger types For the settings of each item, refer to the following. ☞ Page 968 Trigger type settings

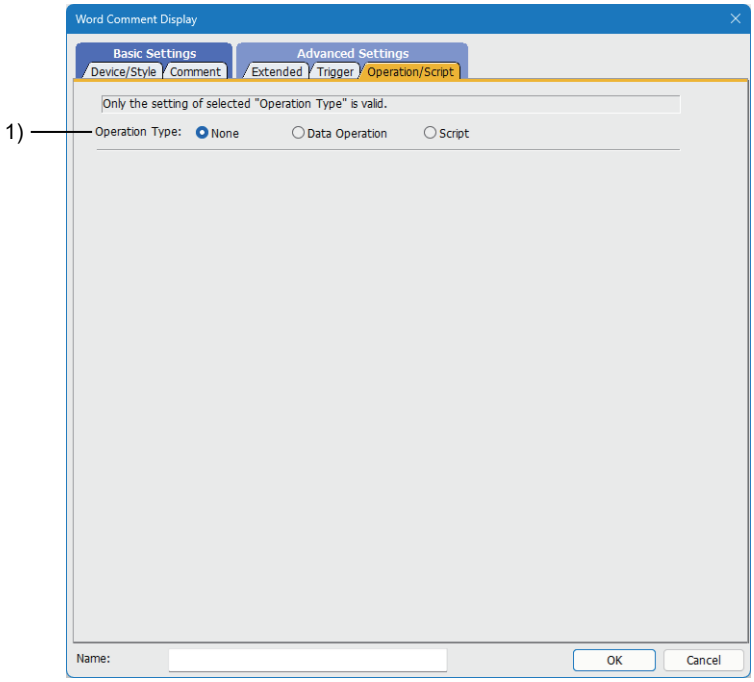
32.4.5 [Operation/Script] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

The setting items differ depending on the selection for [Operation Type].



Item			Description
1)	[Operation Type]	[None]	The data operation function and the script function are not used.
		[Data Operation]	Set the expression used for the data operation function.
		[Script]	Set the expressions for the script function.

The setting items vary depending on the selected function.

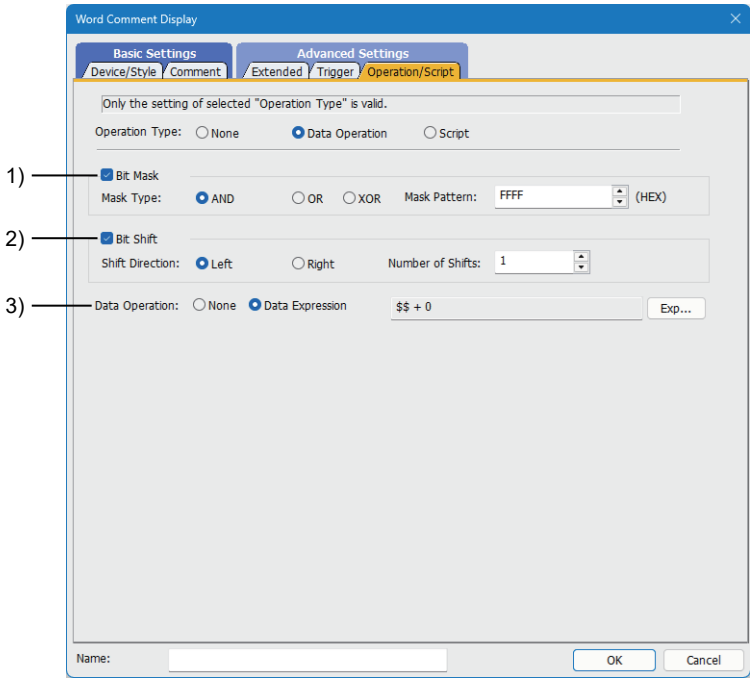
The following shows the settings for each function.

[Data Operation]

This item can be set only when [Operation Type] is [Data Operation].

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation



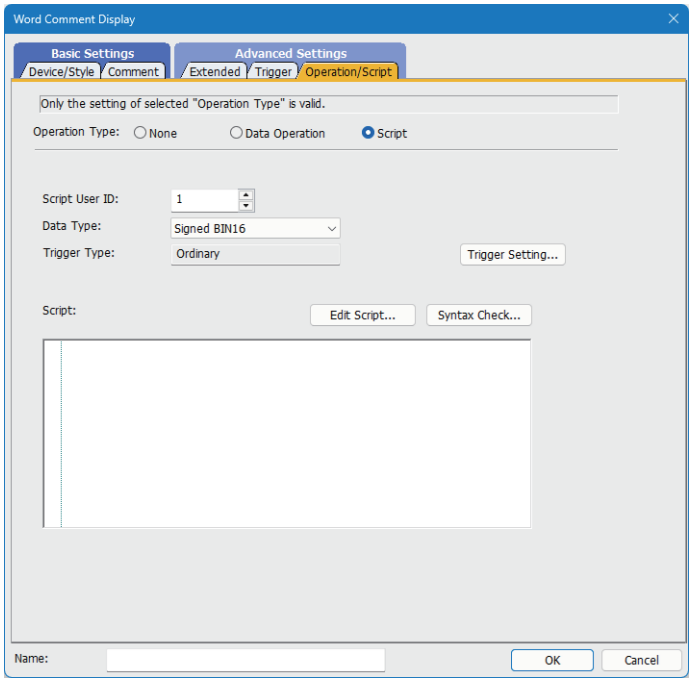
Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. The following shows selectable items. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range differs depending on the setting of [Data Type] in the [Device/Style] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction. The following shows selectable items. • [Left] • [Right]
		[Number of Shifts]	Set the number of bits to be shifted. The setting range differs depending on the setting of [Data Type] in the [Device/Style] tab.
3)	[Data Operation]		Select the format of the expression operating with the data operation. The following shows selectable items. • [None] • [Data Expression]

[Script]

This item can be set only when [Operation Type] is [Script].

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	**Setting item**	**Property name**	**Read**	**Write**	**Timing for reflecting the setting change*1**
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
		text_width	○	○	When the object is updated
		text_height	○	○	When the object is updated
[Device/Style]	[Frame Color]	frame_color	○	×	×
	[Shape Color]	plate_color	○	○	When the object is updated
[Extended]	[Text Color]	text_color	○	○	When the object is updated
	[Blink]	blink	○	○	When the object is updated
	[Blink Scope]	blink	○	○	When the object is updated
	[Reverse]	highlight	○	○	When the object is updated
	[Alignment]	arrange	○	○	When the object is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated
	[Display Mode]	draw_mode	○	○	When the object is updated

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.

☞ Page 2456 Timing at which the setting change of an object property is reflected

32.5 [Simple Comment Display] dialog

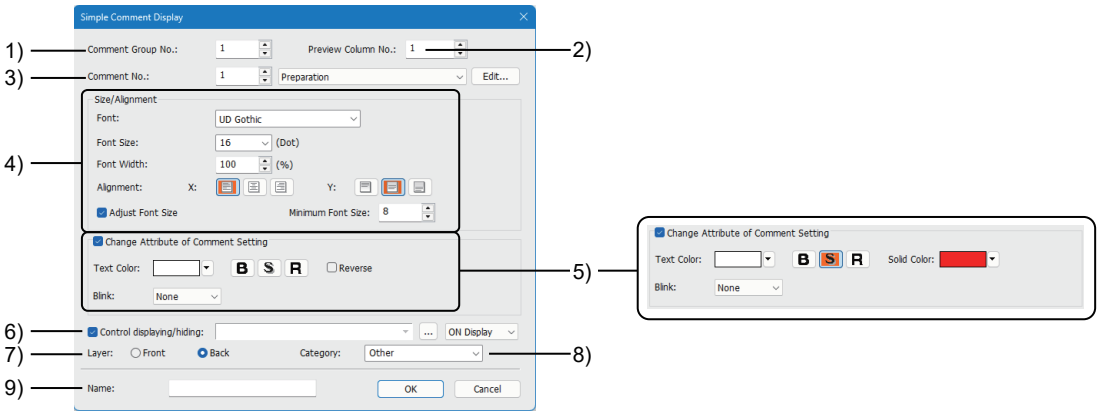
GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Operating procedure

1. Select [Object] → [Comment Display] → [Simple Comment] from the menu.
2. Click the position to place a simple comment display.
3. Double-click the simple comment display to display the setting dialog.



Item		Description
1)	[Comment Group No.]	Set the comment group number to be used. The setting range is [1] to [500]. When the nonexistent comment group No. is set, the comment is not displayed.
2)	[Preview Column No.]	Set the column No. to be displayed. The setting range is [1] to [30].
3)	[Comment No.]	Set the comment No. to be displayed. The setting range is [0] to [32767]. If [0] is set, no comment is not displayed.

Item			Description
4)	[Size/Alignment]	[Font]	Select the font of the displayed text. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho] • [Windows Font] This item is selectable when [Group No.] is set to [Fixed]. Displays text in the font specified with [Windows Font] in the [Comment Group Property] dialog. The following shows selectable items.
		[Windows Font Setting] button	This item appears when [Windows Font] is selected for [Font]. The [Comment Group Property] dialog for the group number specified by [Group No.] is displayed. Set [Windows Font] and [Character Set] for the target column of the comment group. ☞ Page 797 [Comment Group Property] dialog
		[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Alignment]	Set the vertical and horizontal positions of the text.
		[Adjust Font Size]	The font size is automatically adjusted according to the object size. When this item is deselected, a line feed is automatically inserted.
		[Minimum Font Size]	This item can be set only when [Adjust Font Size] is set. Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.
5)	[Change Attribute of Comment Setting]	—	Set the comment attribute such as [Text Color] and [Blink].
		[Text Color]	Set the color and style of the text to be displayed on the object. One style ([Bold], [Solid], or [Raised]) is settable only.  • [Text Color] Set the text color. ☞ Page 988 Color settings • [Bold] button Displays the text in bold. • [Solid] button Displays the text with a shadow. • [Raised] button Displays the text embossed. • [Solid Color] When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
		[Blink]	Select the blinking speed of the text and shape. The following shows selectable items. • [None] • [Low] • [Medium] • [High]
		[Reverse]	Inverts the text.
6)	[Control displaying/hiding]		Set the device that controls display/hide of all objects. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
7)	[Layer]		Switches layers to be placed. The following shows selectable items. • [Front] • [Back]

Item		Description
8)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category
9)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. Up to 100 characters can be set.

33 Placing a parts display

GT37 SoftGOT3000

This function displays a registered part, base screen, or window screen according to the device status.

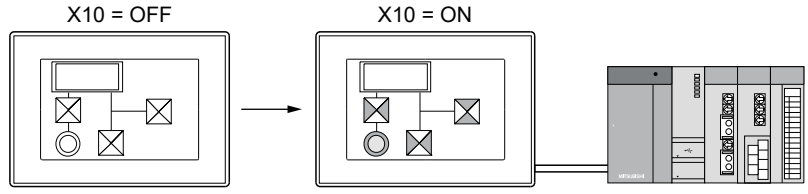
☞ Page 1416 How to switch parts
☞ Page 1417 Specifications of the parts display
☞ Page 1420 How to use the parts display
☞ Page 1436 [Bit Parts Display] dialog
☞ Page 1449 [Word Parts Display] dialog
☞ Page 1464 [Fixed Parts Display] dialog
☞ Page 1476 Relevant settings

33.1 How to switch parts

• Parts display (bit)

☞ Page 1436 [Bit Parts Display] dialog

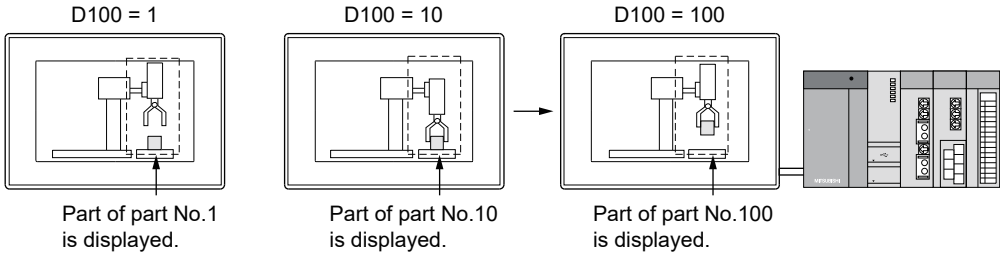
This object displays a part, base screen, or window screen corresponding to the ON or OFF status of a bit device.



• Parts display (word)

☞ Page 1449 [Word Parts Display] dialog

This object displays a part, base screen, or window screen corresponding to the value of a word device.

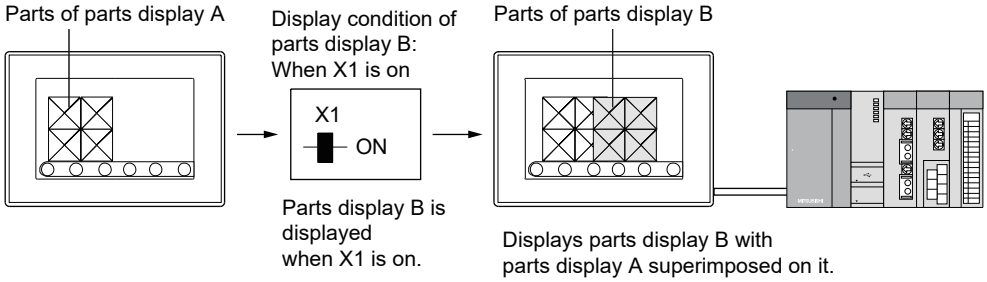


• Parts display (fixed)

☞ Page 1464 [Fixed Parts Display] dialog

This function displays the parts, base screen, and window screen corresponding to the rising edge or falling edge of a bit device.

The object can display only one type of part, but it can be superimposed on a different parts display object.



33.2 Specifications of the parts display

GT37 SoftGOT3000

☞ Page 1417 Maximum number of objects that can be placed on one screen
☞ Page 1417 Parts displayed by parts displays
☞ Page 1417 Types of displayable parts

33.2.1 Maximum number of objects that can be placed on one screen

Up to 1024 part display and other objects can be placed on one base screen, while up to 512 can be placed on one window screen.

33.2.2 Parts displayed by parts displays

The following two types of parts can be displayed by the parts display, and the parts need to be registered in advance.

- The parts data registered as the parts in GT Designer3 (registered parts)

☞ Page 812 Registering parts ([Parts])

- BMP, JPEG, and PNG files (BMP, JPEG, and PNG file parts) stored in the data storage

☞ Page 827 Using the image file stored in the data storage as a part

33.2.3 Types of displayable parts

Type	Description	Remarks
Parts	Displays the figure registered as a part. Example) Registrable figures as parts Figure Text BMP file, JPEG file, PNG file	• The parts need to be registered in advance. ☞ Page 812 Registering parts ([Parts]) ☞ Page 827 Using the image file stored in the data storage as a part • The user cannot register vector format shapes. ☞ Page 1062 Library data types
Mark	Switches the figure colors which are registered as the parts corresponding to the change of device status. Because one part can display different images, the registration of multiple parts is not necessary and the capacity of the GOT memory can be saved.  D100 = 0 D100 = 50 D100 = 100 The display color of the white space can be changed.	• The parts in BMP, JPEG, or PNG format cannot be used. • Draw the part whose color is to be switched in white. • While fixed parts are being displayed, switching to multiple colors cannot be executed. The display is only in a single color.
Base screen Window screen	Displays the figure on a base screen and window screen.  Base screen 1 Base screen 20 Screen display The figure of base screen 20 is displayed on base screen 1.	• The object set on a base screen or window screen is not displayed.

Precautions

■Display when a part extends off the screen

If a part is placed so that it extends off the screen, the display on the GOT differs depending on the components of the part and [Graphics Setting].

Part components	Part display
Image data + figures	The part within the screen is displayed. However, if a part extends above or to the left of the screen, the display differs depending on the GOT model used, as described below. • Other than GT SoftGOT3000 The figures within the screen are displayed, whereas image data even within the screen is not. • GT SoftGOT3000 or GT Simulator3 If the image file format is BMP or JPEG, image data within the screen is also displayed.
Image data only	The part within the screen is displayed. When an image file in the data storage is used as a part and the part extends above or to the left of the screen, system alarm 537 is output in the following cases. The data will not be displayed. • Other than GT SoftGOT3000: A BMP, JPEG, or PNG file part is to be displayed. • GT SoftGOT3000 or GT Simulator3: A PNG file part is to be displayed.

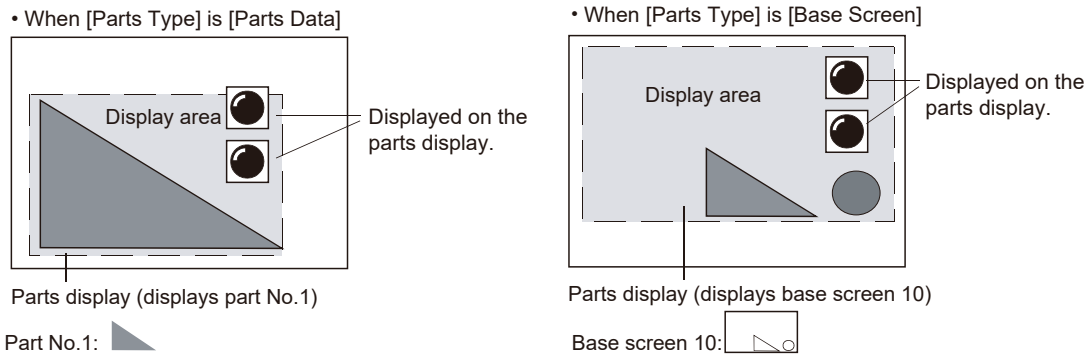
■When a part overlaps another object

Set the parts display in a way that does not make the part overlap with another object.

Otherwise, the overlapped object may not be displayed normally.

In such a case, set the parts display and the object in different layers.

This also applies to cases where an object overlaps with the display area as shown below.



33.2.4 Setting the parts displays to be integrated into XOR synthesis

BMP, JPEG, PNG file parts, or vector image parts registered in GT Designer3

PNG file parts and vector image parts cannot be integrated into XOR synthesis.
To execute XOR synthesis for BMP or JPEG file parts, set the parts to the back layer.

Point

BMP format images (with a specified transparent color) are not XOR synthesized on the screen editor of GT Designer3, but they are XOR synthesized on the GOT.
To check the XOR-synthesized images, use the GOT or GT Simulator3.

XOR synthesis of multiple superimposed parts

- Only fixed parts displays can be superimposed.
- Place all the parts displays intended for XOR synthesis on the same layer.
- If they are set on the front layer, the part on which no parts are superimposed is integrated into an XOR synthesis with [Front Layer Transparent Color] of the screen.

XOR synthesis of parts that include characters

In cases where the parts to be displayed includes an object whose character effect is set to [Bold], [Solid], or [Raised], the characters may be chipped or the character color may not be displayed normally when the parts are displayed.

XOR synthesis of parts with registered logo texts

To combine a user-registered logo text part with other parts or objects by XOR synthesis, select [Background Color] in the [Logo Text] dialog.
If [Background Color] is deselected, the logo text part cannot be combined with other parts or objects by XOR synthesis.

Precautions

■When specifying a screen for the parts type and XOR for the display type

- When the base screen or window screen is specified as the parts type of a parts display (bit part/word part) and XOR is specified as the display type, the parts that have been displayed are deleted and then a new screen is displayed.
- The area to be deleted is the same as that of the base/window screen around the drawing point of the parts display (screen (center, top left)).
- When an object is included in the base/window screen area to be deleted, the object is also deleted.

To prevent the object from being deleted, change the parts type from the screen to the parts and adjust the position in a way that does not make the parts overlap with an object or change the display type to overwrite when leaving the screen being specified as the parts type.
Because the parts that were displayed previously are left when an overwrite operation is performed, the same size of parts is required.

- In cases where the parts, base screen, and window screen to be displayed include an object whose character effect is set to [Bold], [Solid], or [Raised], the characters may be chipped or the character color may not be displayed normally when the parts are displayed.

33.3 How to use the parts display

GT37 SoftGOT3000

☞ Page 1420 Placing a parts display
☞ Page 1420 Editing parts displays
☞ Page 1420 Setting parts displays
☞ Page 1421 How to move the parts (control with the position device)
☞ Page 1427 Parts movement animation example
☞ Page 1427 Procedure for setting an movement animation
☞ Page 1428 Display methods for BMP, JPEG, and PNG file parts in the data storage
☞ Page 1433 Switching the image on a parts display object automatically
☞ Page 1435 Part No.
☞ Page 1435 Setting the image data of parts to a transparent color

33.3.1 Placing a parts display

Place parts displays on the screen editor.

☞ Page 1001 Placing figures and objects

33.3.2 Editing parts displays

Edit parts displays that have been placed on the screen editor.

☞ Page 1003 Selecting figures and objects on the screen editor
☞ Page 1007 Resizing

33.3.3 Setting parts displays

Set parts displays that have been placed on the screen editor.

- Common settings for objects

☞ Page 1032 Settings common to figures and objects

- Parts display (bit) settings

☞ Page 1436 [Bit Parts Display] dialog

- Parts display (word) settings

☞ Page 1449 [Word Parts Display] dialog

- Parts display (fixed) settings

☞ Page 1464 [Fixed Parts Display] dialog

33.3.4 How to move the parts (control with the position device)

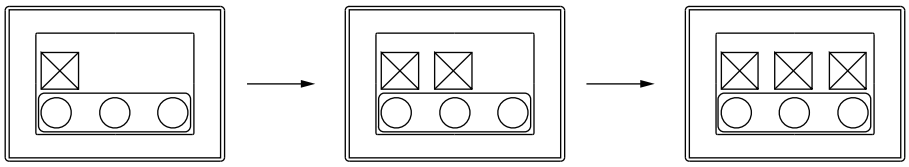
Display the parts movement as follows using the position device and parts switching device.

To display the movement of parts, select [Specify the moving animation] in the [Animation] tab, then set the movement method.

The following movement methods are available.

☞ Page 1421 Line
☞ Page 1422 Circle
☞ Page 1425 Route specification
☞ Page 1426 Coordinates specification

The locus display that leaves the locus can be used by setting [Display Mode] in the [Device/Style] or [Style] tab.



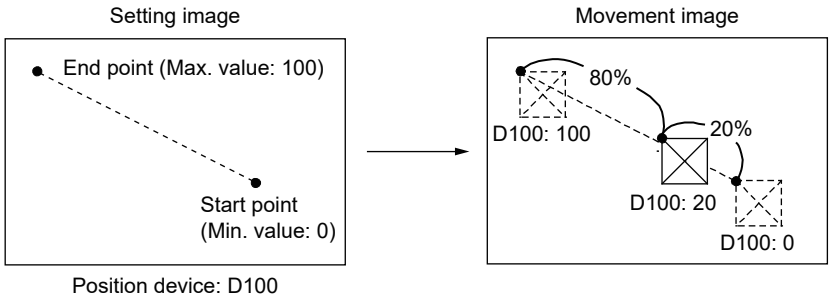
Select [Locus] for [Display Mode] to use the locus display.

☞ Page 1436 [Device/Style] tab
☞ Page 1449 [Device/Style] tab
☞ Page 1465 [Style] tab

Line

The part is moved across the set start point and end point.

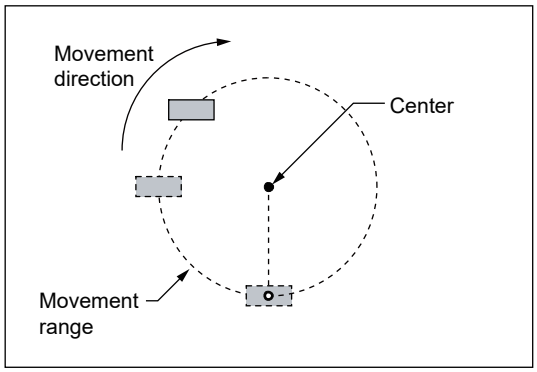
Set the minimum value to the start point and the maximum value to the end point. The part display position changes according to the position device value and is relative to the start and end points on the line across the two points.



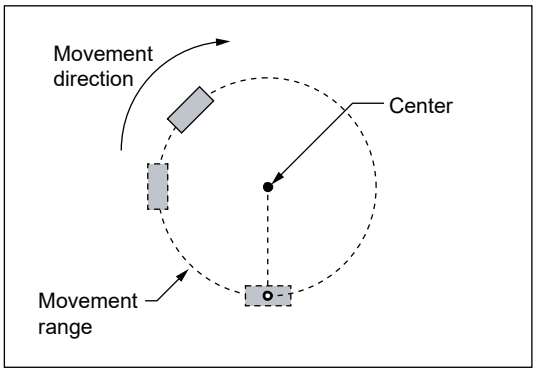
Circle

The circular parts movement is displayed around the set coordinates.

When [Enable the antialiasing] is deselected in the [Type Setting] dialog ([Basic Setting]), the object itself does not rotate.



Displayed object moved in a circular direction
+
Rotation of the object disabled

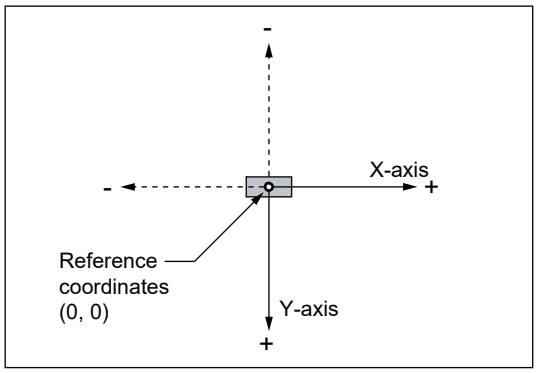


Displayed object moved in a circular direction
+
Rotation of the object enabled

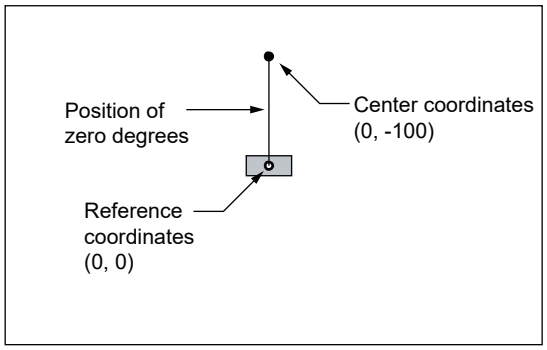
■Center coordinates

Set the coordinates relative to the position of the parts display as the reference coordinates (0, 0), regardless of the coordinates on the screen editor.

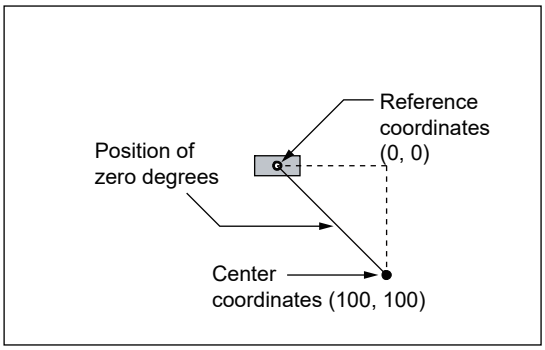
The X and Y axes of the center coordinates increase to the right and downward from the reference coordinates.



The angle between the reference coordinates and the center coordinates is regarded as 0 degrees.



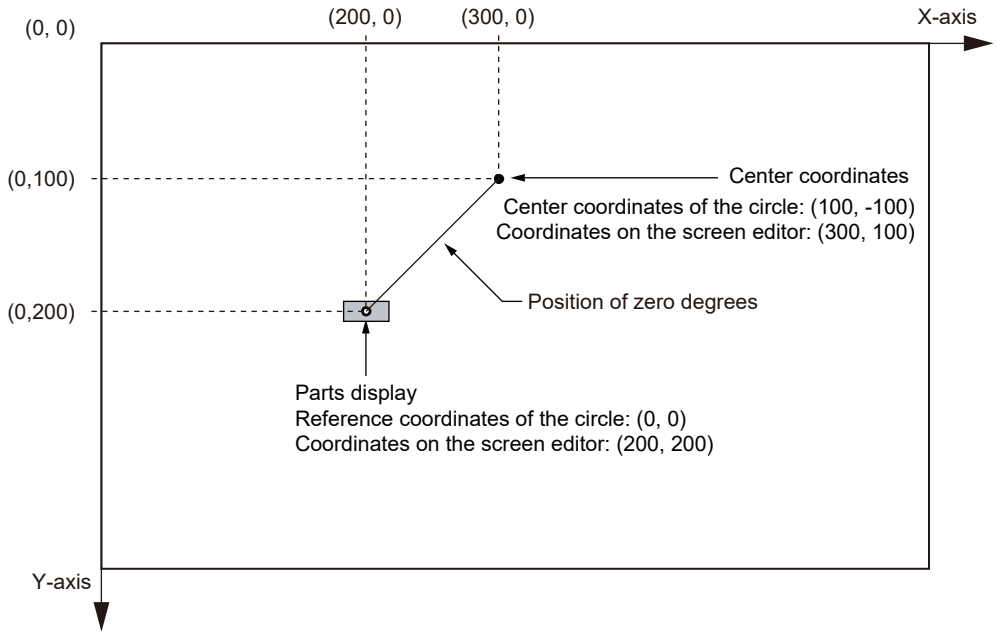
When the center coordinates are (0, -100)



When the center coordinates are (100, 100)

Ex.

Place the part display at coordinates (200, 200) on the screen editor and set the center coordinates to (100, -100).



■Movement range and direction

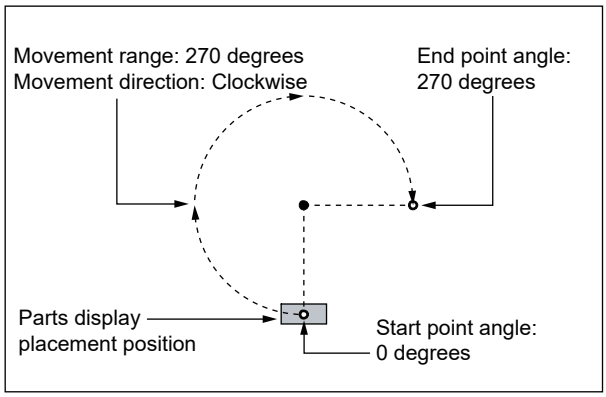
Set the start and end point angles to set the movement range and direction.

The movement range is determined by subtracting the start point angle from the end point angle.

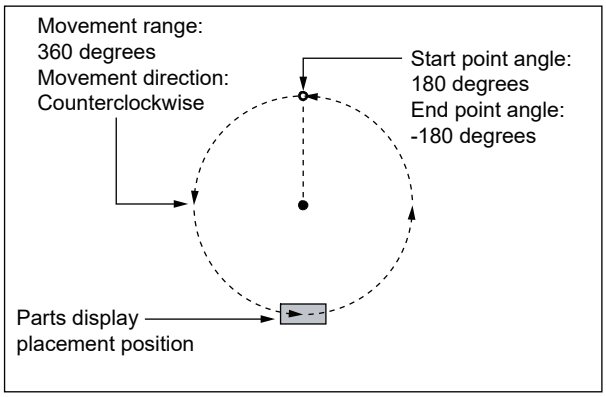
When the movement range is 0 or more, the part moves clockwise.

When the movement range is less than 0, the part moves counterclockwise.

Add the value of the position device to change the position of the part in the moving direction.



Start point angle: 0 degrees, end point angle: 270 degrees



Start point angle: 180 degrees, end point angle: -180 degrees

■Changing the display position

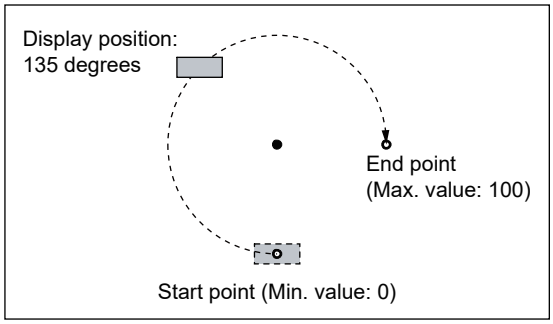
Change the display position using the value of the position device.

The minimum value set for the position device corresponds to the start point and the maximum value corresponds to the end point.

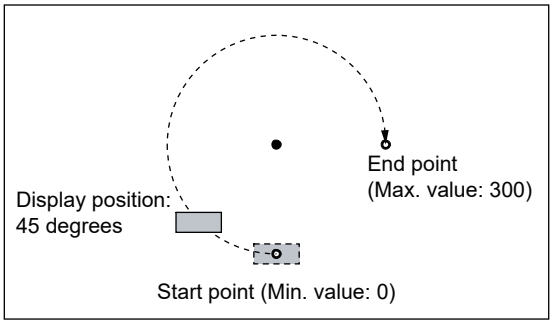
When the minimum and maximum values are changed, the display position differs even if the value of the position device is the same.

Set the value of the position device according to the minimum and maximum values.

Position device: D100
D100 = 50



Min. value: 0, max. value: 100



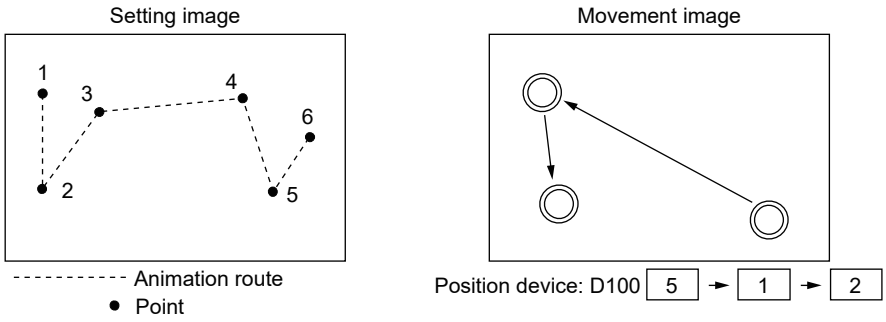
Min. value: 0, max. value: 300

Route specification

Parts are displayed at the specified display position (route).

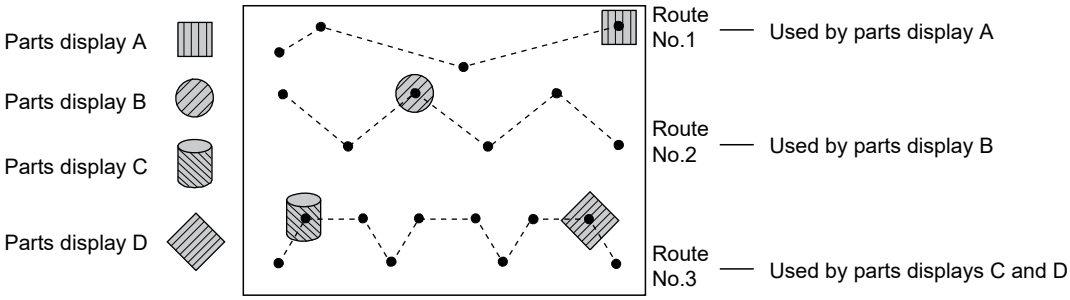
To set a route, register animation routes consisting of multiple connected points.

The part is displayed at the position with the same point No. as the position device value.



Set animation routes on screen basis. Up to 30 routes can be set for one screen.

The animation routes can be shared by multiple parts displays.



PART 7

Coordinates specification

Parts are displayed with the coordinates on one-dot basis.

For the coordinates, the values of two word devices are specified as X and Y.

By changing the value of the position device, the display position can be changed on one-dot basis.

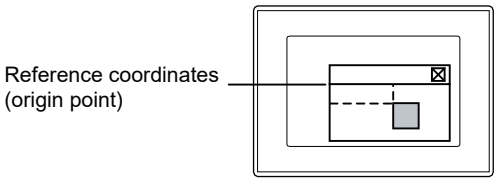
	1)	2)	3)
Position device (X-axis coordinate): D100	30	200	130
Position device (Y-axis coordinate): D101	90	16	170

■Reference coordinate

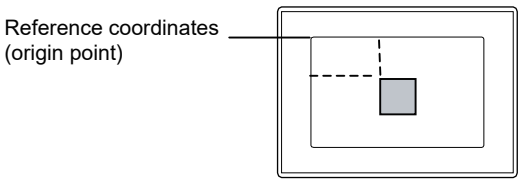
For the parts which are displayed in an overlap window, the top left of the overlap window is the reference coordinate.

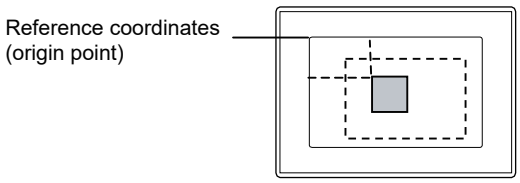
Ex.

For the overlap window



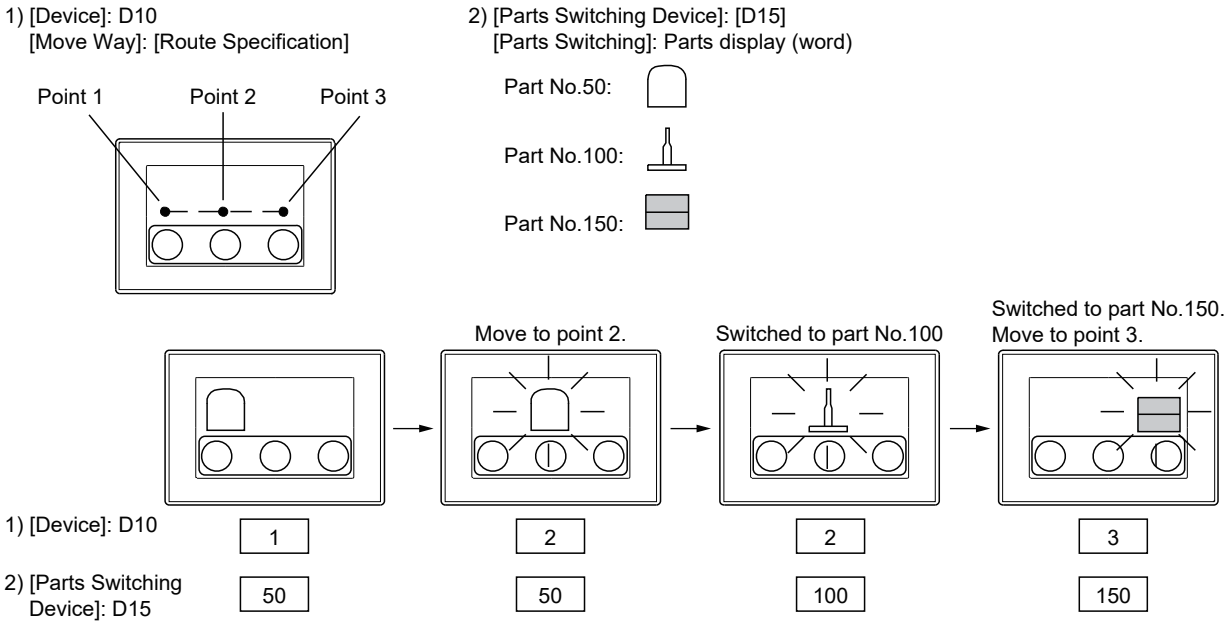
For other than the above (such as base screens and superimpose windows), the top left of the displayed base screen is the reference coordinate.





33.3.5 Parts movement animation example

Move and switch parts as follows using the position device and parts switching device.



33.3.6 Procedure for setting an movement animation

To set an movement animation, select [Parts Switching] and then [Move Way].

Operating procedure

1. Select the switching method of parts in the [Device/Style] tab (for the fixed parts, select it in the [Style] tab).

The method cannot be changed after a parts display object is set.

2. Select the movement method of parts in the [Animation] tab.

The method can be changed after a parts display object is set.

To move parts with route specification, configure the settings for [Animation Route] before configuring the settings for the parts display object.

☞ Page 1881 Configuring an animation route

PART 7

33.3.7 Display methods for BMP, JPEG, and PNG file parts in the data storage

BMP, JPEG, and PNG file parts can be displayed by object or project.

Display method by object (using image files)

Specify a BMP file, JPEG file, or PNG file stored in the data storage at each object setting of the parts display to display as parts.

Operating procedure

1. Save the BMP, JPEG, or PNG file to be displayed as parts in the data storage.

For the storing method, refer to the following.

☞ Page 827 Using the image file stored in the data storage as a part

2. When the display condition set for a parts display object is satisfied, the specified BMP, JPEG, or PNG file part in the data storage is displayed.

Set the following items in the [Device/Style] tab of the parts display and use the parts display.

- Setting image files
- Setting image file numbers

■Display example

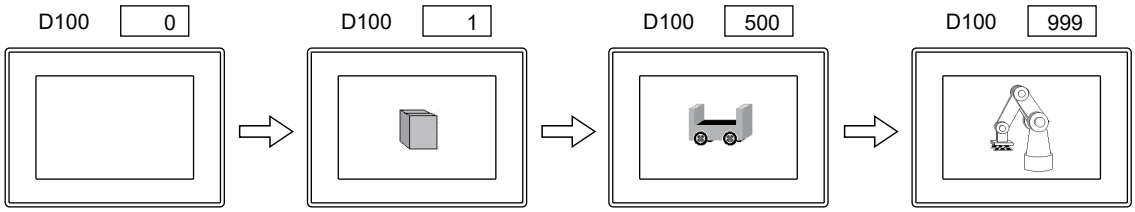
The following shows a display example of when a BMP file part is stored in the data storage.

Ex.

Displaying BMP images in the parts display (word)

Set image files and write part numbers between 1 and 65536 in a word device to display the BMP images.

- Word device used to display the parts: D100



Display method by project

To display BMP, JPEG, or PNG file parts in the data storage, specify a part number from 9001 to 9999.
To display BMP, JPEG, or PNG file parts in the data storage when a part number 9001 to 9999 is specified, follow the steps below.

■When using BMP, JPEG, or PNG file parts in the data storage

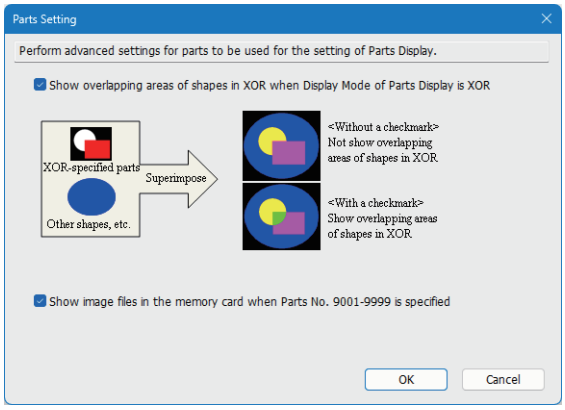
This method is applied to display BMP, JPEG, or PNG files in the data storage when the part number 9001 to 9999 is specified.

Operating procedure

1. Save the BMP, JPEG, or PNG file to be displayed as parts in the data storage.

☞ Page 827 Using the image file stored in the data storage as a part

2. Select [Show image files in the memory card when Parts No. 9001-9999 is specified] in the [Parts Setting] dialog and write the setting to the GOT.



3. When the display condition of a part (part number: 9001 to 9999) set for a parts display is satisfied, the BMP, JPEG, or PNG file part in the data storage is displayed.

Setting [Image File Setting] and [Image File No.] are unnecessary.

■When displaying BMP, JPEG, or PNG file parts in the data storage using GS450.b8

This method is applied to switch between the parts registered in GT Designer3 and the BMP, JPEG, or PNG file parts in the data storage when a part number 9001 to 9999 is specified.
To use GS450.b8, deselect [Show image files in the memory card when Parts No. 9001-9999 is specified] in the [Parts Setting] dialog.
If the above setting is valid, BMP, JPEG, or PNG files in the data storage can be used as parts regardless of the status of GS450.b8.

Part No.	GS450.b8: ON	GS450.b8: OFF
9001 to 9999	Displays the BMP, JPEG, and PNG file parts in the data storage.	Displays the parts registered in GT Designer3

Operating procedure

1. Save the BMP, JPEG, or PNG file to be displayed as parts in the data storage.

☞ Page 827 Using the image file stored in the data storage as a part

2. Turn on GS450.b8.
3. When the display condition of a part (part number: 9001 to 9999) set for a parts display is satisfied, the BMP, JPEG, or PNG file part in the data storage is displayed.

■Display example

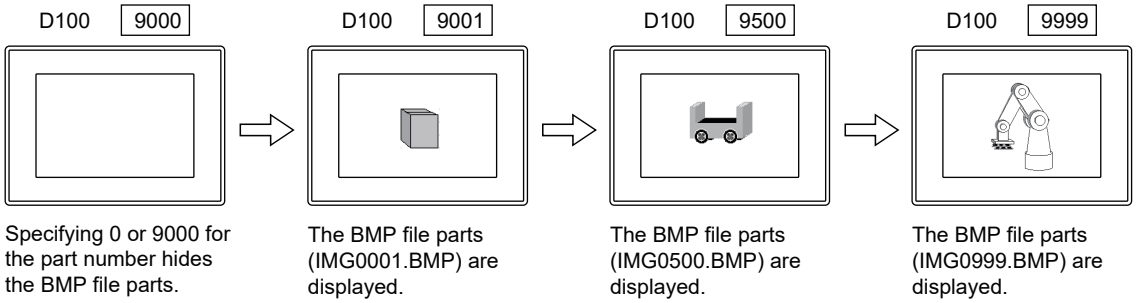
The following shows a display example of when a BMP file part is stored in the data storage.

Ex.

Displaying BMP file parts in a parts display (word part)

Writing a part number from 9001 to 9999 to a word device displays the BMP file part.

- Word device used to display the parts: D100



■When specifying a part number other than 9001 to 9999

Even if BMP, JPEG, or PNG file parts in the data storage are set to be displayed, parts registered in GT Designer3 are displayed when a part number outside the range of 9001 to 9999 is specified.

■When switching to BMP, JPEG, or PNG file parts in the data storage with the same part numbers (only when using GS450.b8)

To switch the displayed part (part number: 9001 to 9999) registered in GT Designer3 to a BMP, JPEG, or PNG file part with the same number in the data storage, follow the steps below.

Operating procedure

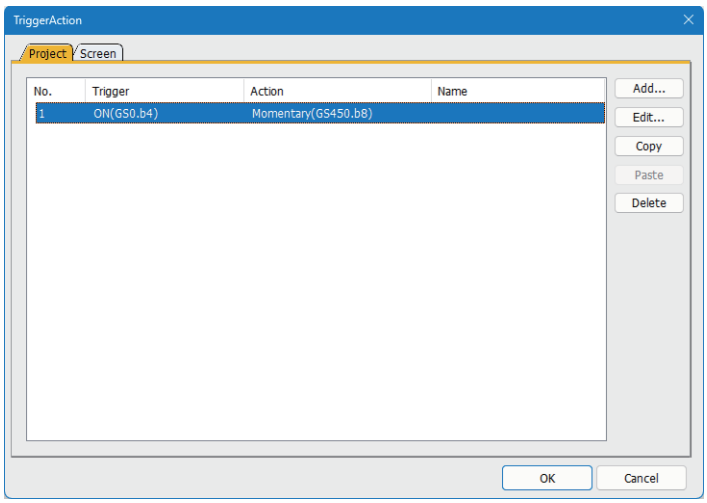
1. Turn on GS450.b8.
2. Specify part No. 0 or 9000 to hide the displayed part.
3. Specify the part number of the BMP, JPEG, or PNG file parts in the data storage to be displayed.

■Example of cases where GS450.b8 is automatically turned on after the GOT is powered on

The following shows an example of cases where GS450.b8 is automatically turned on after the GOT is powered on.
This method is useful when using GS450.b8 to display BMP, JPEG, and PNG file parts in the data storage from the beginning of operation.

Operating procedure

1. As a trigger action, make the GOT internal device (device always on: GS0.b4) as a trigger condition and make settings that store 1 to GS450.b8 while the trigger is on.
2. Store 1 in GS450.b8 with the trigger action after the GOT is powered on.



- Set in the [Project] tab of [Trigger Action].
- Set this trigger action in the first row of the list.

This stores 1 in GS450.b8 immediately after the GOT is powered on.
Parts displayed in parts displays at GOT startup may not be switched to BMP, JPEG, or PNG file parts.
(When the screen is switched, the parts are switched.)
Design screens under consideration for the above description.

- Select [Ordinary] for [Trigger Type].

Precautions

■Deleting parts

Use [Mark Data] and [Parts Data] of [Parts Type] to delete parts.

When [Base Screen] or [Window Screen] of [Parts Type] is used, parts are not deleted even if the parts are specified to 0. (When the screen is redisplayed after being switched to another, the parts are deleted.)

■While reading BMP, JPEG, or PNG files

While files are read, the monitor screen stops.

■When BMP, JPEG, or PNG file parts are incompletely displayed

When an error occurs while files are being on display step by step, the images may be displayed halfway.

In this case, display the parts again or check the BMP, JPEG, or PNG file.

■Displaying BMP, JPEG, or PNG file parts in the data storage

Do not disconnect the data storage from the GOT while displaying BMP, JPEG, or PNG file parts in the data storage.

■When stopping using BMP, JPEG, and PNG file parts in the data storage

Carry out either of the following operations.

- Change [Parts Setting] of GT Designer3 and write the project.
- Turn off the GOT internal device (GS450.b8).

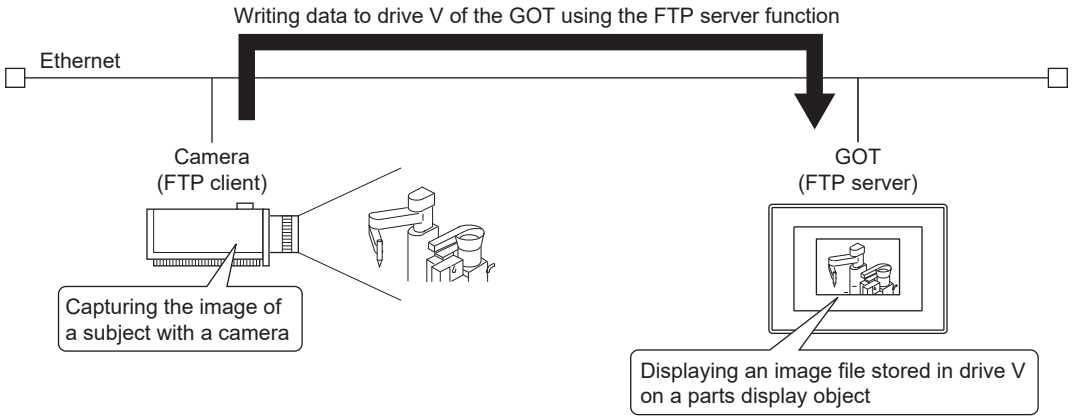
Even if disconnecting the data storage without the above operations, the BMP, JPEG, or PNG file parts may be displayed due to the following reasons.

BMP, JPEG, and PNG file parts displayed on the GOT are stored in the built-in memory of the GOT. (Only one BMP, JPEG, or PNG file part is retained.)

If a BMP, JPEG, or PNG file part with the same part number is played successively, the part stored in the built-in memory of the GOT, not the part registered in GT Designer3, is displayed.

33.3.8 Switching the image on a parts display object automatically

When an image file stored in drive V is updated, the image on the parts display object is automatically switched.
The image file can be displayed like a video playback when the file is frequently updated.
Write the image files in drive V using the FTP server function.



Displayable image files

The image files that satisfy all the following conditions can be displayed as parts.

- Storage designation: Drive V
- File name: IMG1, IMG2, IMG3, or IMG4
- File format: JPEG
- Resolution: QVGA, VGA, SVGA, XGA, WXGA, or full-HD

Specifications of drive V

Up to four files can be stored.
Up to 8 MB of data can be stored regardless of the storable number of files.
The status of drive V is not notified and the files stored in drive V are not manipulated.
The image files stored in drive V are deleted at the following timings.

- GT37

When the GOT is restarted
Note that the image files are retained if the package data is updated at the restart.

- GT SoftGOT3000

The files are deleted when monitoring starts with GT SoftGOT3000 or when GT SoftGOT3000 exits.

Settings of a parts display object

The following shows the settings required for a parts display and operating procedure.

Operating procedure

1. Select [Common] → [Parts] → [Parts Setting] from the menu to display the [Parts Setting] dialog.
2. Select [Enable the automatic update of image files].

☞ Page 831 [Parts Setting] dialog

3. Place a parts display object.
4. In the [Device/Style] or [Style] tab, configure the following settings.

- Select [Image File (automatic update)] for [Parts Type].
- Set the image file number to be used in [Detail Settings of Parts].

☞ Page 1436 [Bit Parts Display] dialog
☞ Page 1449 [Word Parts Display] dialog
☞ Page 1464 [Fixed Parts Display] dialog

Precautions

If you set a display condition in the [Trigger] tab, the image files may be updated even if the display condition is not established.

Configuring the FTP server and FTP client settings

The FTP server function to be used depends on the GOT model.

- GT37

Use the FTP server function of the GOT for settings.

☞ Page 2904 Transferring files between the GOT and peripheral devices (FTP server function)

- GT SoftGOT3000

Use the FTP server function of Windows for settings.

For the image files stored in drive V, configure the settings on the FTP client to be used.

33.3.9 Part No.

Depending on the part number, displayable parts and operations are different.

The following shows the relationship between part numbers and displayable parts.

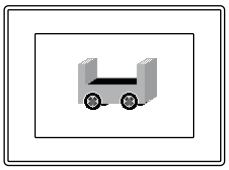
○: Can be displayed —: Cannot be displayed △: Display is deleted

Part No.	When BMP, JPEG, and PNG file parts in the data storage are set to be displayed		When BMP, JPEG, and PNG file parts in the data storage are not set to be displayed	
	Parts registered in GT Designer3	BMP, JPEG, and PNG file parts in the data storage	Parts registered in GT Designer3	BMP, JPEG, and PNG file parts in the data storage
0	△*1	△*1	△*1	—
1 to 8999	○	—	○	—
9000	—	△*1	○	—
9001 to 9999	—*2	○	○	—
10000 to 32767	○	—	○	—

*1 When [Indirect Device] is set for [Detail Settings of Parts] in the [Word Parts Display] dialog, the parts are not hidden. (The current display is held.)
For the method of hiding parts in the [Word Parts Display] dialog, refer to [Detail Settings of Parts] in the [Word Parts Display] dialog.
☞ Page 1436 [Device/Style] tab

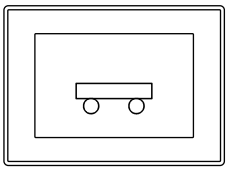
*2 Even if the parts registered in GT Designer3 are registered, they cannot be displayed.
Example) When a part registered in GT Designer3 is registered with the part No. 9123

BMP, JPEG, and PNG file parts are displayed.



When BMP, JPEG, and PNG file parts in the data storage are set to be displayed.

The parts registered in GT Designer3 (parts No.9123) are displayed.



When BMP, JPEG, and PNG file parts in the data storage are not set to be displayed.

33.3.10 Setting the image data of parts to a transparent color

When a transparent color is set for the image data of set parts, the setting of the transparent color is enabled.

(Transparent colors can be set only for the image data of BMP files.)

The following shows the method of enabling a transparent color setting for parts.

Operating procedure

1. Set a transparent color for the image data.
2. Register the image data for which the transparent color has been set as parts or into the library.
3. Set the registered parts or library as the parts.

☞ Page 1183 [Transparent Setting] dialog

33.4 [Bit Parts Display] dialog

GT37 SoftGOT3000

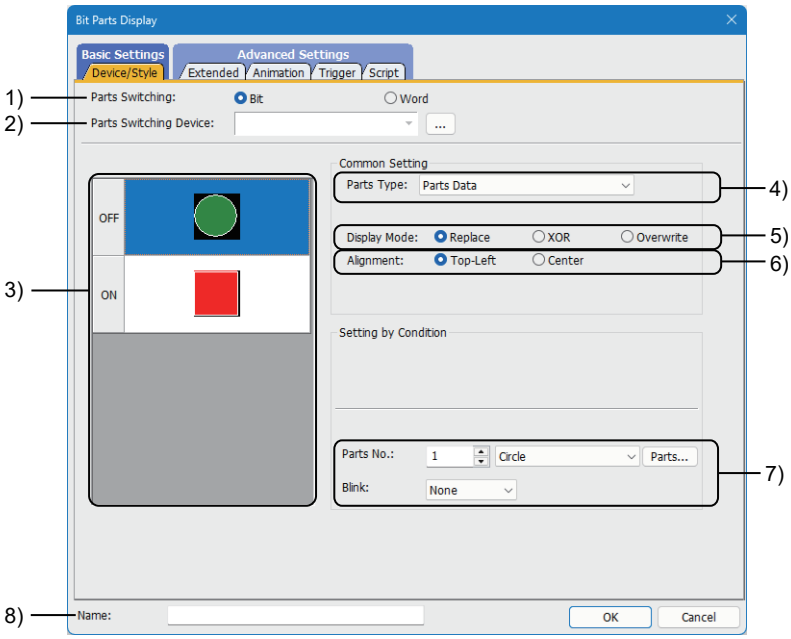
Operating procedure

1. Select [Object] → [Parts Display] → [Bit Parts] from the menu.
2. Click the position to place a bit parts display.
3. Double-click the bit parts display to display the setting dialog.

☞ Page 1436 [Device/Style] tab
☞ Page 1441 [Extended] tab
☞ Page 1442 [Animation] tab
☞ Page 1447 [Trigger] tab
☞ Page 1448 [Script] tab

33.4.1 [Device/Style] tab

GT37 SoftGOT3000



Item		Description
1)	[Parts Switching]	Select a parts display type. The following shows selectable items. • [Bit] • [Word]
2)	[Parts Switching Device]	Set the device to be monitored. ☞ Page 834 How to set devices, labels, and tags
3)	Preview list	Displays the shapes for the on and off status.

Item			Description
4)	[Parts Type]	—	Select the type of the parts for the parts display.
		[Parts]	Displays registered parts. When a transparent color is set for the image data of set parts, the setting of the transparent color is enabled. For the method of enabling the transparent color setting of parts, refer to the following. ☞ Page 1435 Setting the image data of parts to a transparent color
		[Mark Data]	Switches the white area of the registered part to another display color according to the change of the device status. After selecting, set [Parts No.] to be displayed. The setting range is [0] to [32767]. Click the [Parts] button to check the type of the registered parts. For the parts that can be displayed by mark, refer to the following. ☞ Page 812 Registering parts ([Parts]) When a transparent color is set for the image data of set parts, the setting of the transparent color is enabled. For the method of enabling the transparent color setting of parts, refer to the following. ☞ Page 1435 Setting the image data of parts to a transparent color
		[Base Screen]	Displays the registered base screens as parts.
		[Window Screen]	Displays the registered window screens as parts.
		[Image File]	Select an image file registered in the data storage to display the file as a part. Click the [Setting] button and select an image file in the [Image File Setting] dialog. ☞ Page 1440 [Image File Setting] dialog
		[Image File (automatic update)]	Select an image file on drive V to display it as a part. When the file on drive V is updated, the image on the parts display object is automatically switched. For details, refer to the following. ☞ Page 1433 Switching the image on a parts display object automatically Set the image file number to be used in [Setting by Condition]. When [XOR] is selected for [Display Mode], even though an image file on drive V is updated, the image on the parts display object is not automatically switched.

Item		Description
5)	[Display Mode] (When not specifying a movement animation)	Select a display method for the switched parts when [Specify the moving animation] is deselected in the [Animation] tab. ☞ Page 1442 [Animation] tab This setting is not displayed when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). The operation when [Replace] is selected is applied. ☞ Page 519 [Type Setting] dialog • [Replace] Deletes the parts displayed previously and displays the new parts. When [Parts Type] is [Base Screen] or [Window Screen], this item cannot be set.  • [XOR] After deleting the parts displayed previously, the areas which overlap with the new part are displayed with an XOR synthesis. For information on combining overlapped colors using XOR synthesis, refer to the following.  • [Overwrite] Displays a new part, base screen, or window screen on the part that has been displayed. 	[Display Mode] (When specifying a movement animation)	Select a display method for the moved parts when [Specify the moving animation] is deselected in the [Animation] tab. ☞ Page 1442 [Animation] tab This setting is not displayed when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). The operation when [Move] is selected is applied. ☞ Page 519 [Type Setting] dialog • [Move] Displays the parts movement by deleting the previously displayed part. • [Locus] Displays the parts movement without deleting the parts that have been displayed. 
Item			Description
6)	[Alignment]		Select the default display position of parts, base screens, and window screens. • [Top-Left] Sets the top left of parts, base screens, and window screens as the default display position. • [Center] Sets the center of parts, base screens, and window screens as the default display position. 7)	[Setting by Condition]	[Parts No.]	Set the number that has been assigned to the part, base screen, or window screen to be displayed. Click the [Parts Data] button to check the registered parts, base screen, and window screen. The setting range is [0] to [32767]. When 0 is set for [Parts No.], the part is deleted.
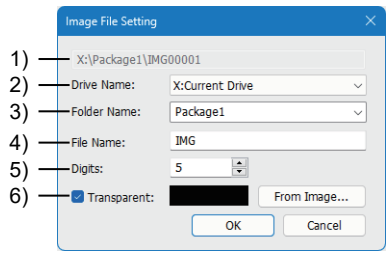
		[Mark Color]	When selecting [Mark Data] for [Parts Type], select the color of the area of the part to be switched from white.
		[Screen No.]	When selecting [Base Screen] or [Window Screen] for [Parts Type], specify the screen No. Click the [Screen] button to check the registered parts, base screen, and window screen.
		[Image File No.]	Set the image file number when you select [Image File] or [Image File (automatic update)] for [Parts Type]. The setting range varies depending on the setting of [Digits] in the [Image File Setting] dialog. Select [Image File] for [Parts Type]. • [Digits] is [5]: [0] to [65535] • [Digits] is [4]: [0] to [9999] • [Digits] is [3]: [0] to [999] • [Digits] is [2]: [0] to [99] • [Digits] is [1]: [0] to [9] Select [Image File (automatic update)] for [Parts Type]. • [0] to [4] When 0 is set for [Screen File No.], images are deleted. When displaying only images for the on status, set 0 for [Image File No.] for the off status.
		[Blink]	Select the blinking speed of the parts. The following shows selectable items. • [None] • [Low] • [Medium] • [High]
8)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

[Image File Setting] dialog

GT37 SoftGOT3000

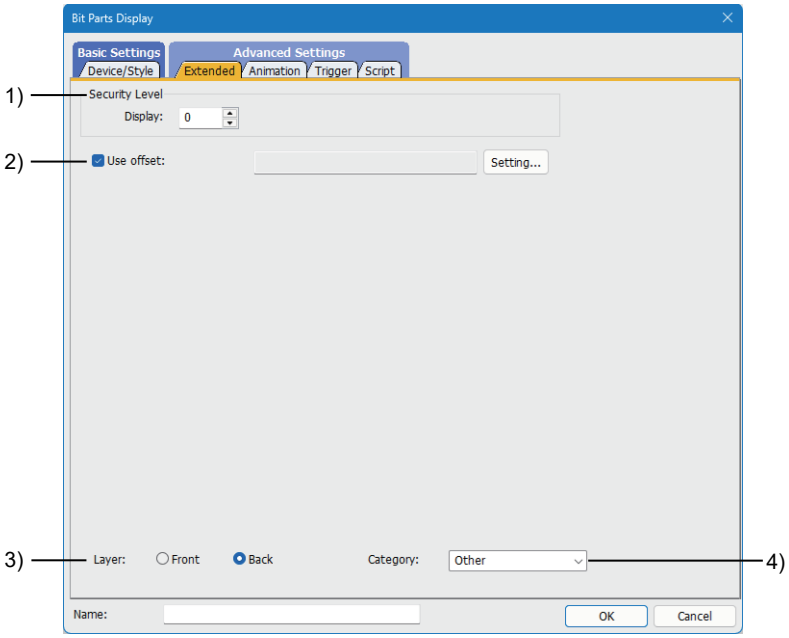
Select an image file to be displayed as a part.



Item		Description
1)	Image file path	Displays the full path of the specified image file. Set the path with 78 characters or less. Example) Using IMG00001.bmp stored in Package1 folder in drive X as a part  When [Image File No.] is set to [0], the path is not displayed.
2)	[Drive Name]	Select the drive to store the image file. The following shows selectable items. • [A:Standard SD Card] • [B:USB Drive] • [E:USB Drive] • [F:USB Drive] • [G:USB Drive] • [X:Current Drive] For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
3)	[Folder Name]	Specify the folder in which image files are stored.
4)	[File Name]	Specify the first character of the image file name.
5)	[Digits]	Specify the number of digits of [Image File No.]. The setting range is [1] to [5].
6)	[Transparent]	Set a transparent color for the image file selected in this dialog. This setting is only effective for BMP files. Set a transparent color in the [Transparent Setting] dialog. ☞ Page 1183 [Transparent Setting] dialog Click the [From Image] button to display the [Open] dialog. Select an image file to be used in the [Transparent Setting] dialog to display the [Transparent Setting] dialog.

33.4.2 [Extended] tab

GT37 SoftGOT3000



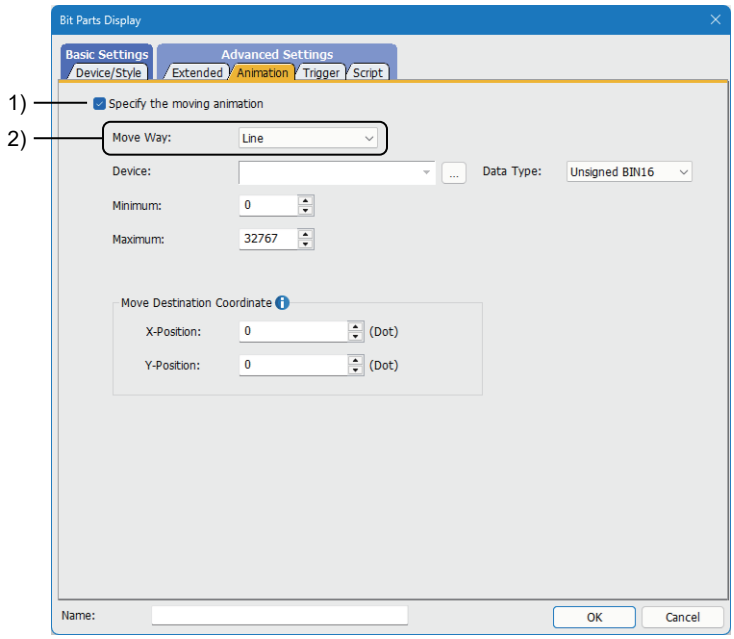
Item		Description
1)	[Security Level]	Set a security level when using the security function. The setting range is [0] to [15]. If you do not use the security, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Select this item to monitor multiple devices by switching them. Sets the offset device with the [Setting] button. ☞ Page 963 Offset
3)	[Layer]	Switches layers to be placed. The following shows selectable items. • [Front] • [Back]
4)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

PART 7

33.4.3 [Animation] tab

GT37 SoftGOT3000

The setting items vary depending on the selected movement method.



Item			Description
1)	[Specify the moving animation]		Set a movement animation for the parts display.
2)	[Move Way]	[Line]	Select [Line] to display the parts movement on the line across the specified start and end points. After the setting, perform the following operation on the screen editor. Click the start point on the drawing screen.  Move the cursor and click the end point. The line, which is the parts movement range, is set. 		[Circle]	Select [Circle] to display the parts movement on the circle around the specified center coordinates. For information on the circular movement display, refer to the following. ☞ Page 1422 Circle After the setting, place a parts display on the screen editor.
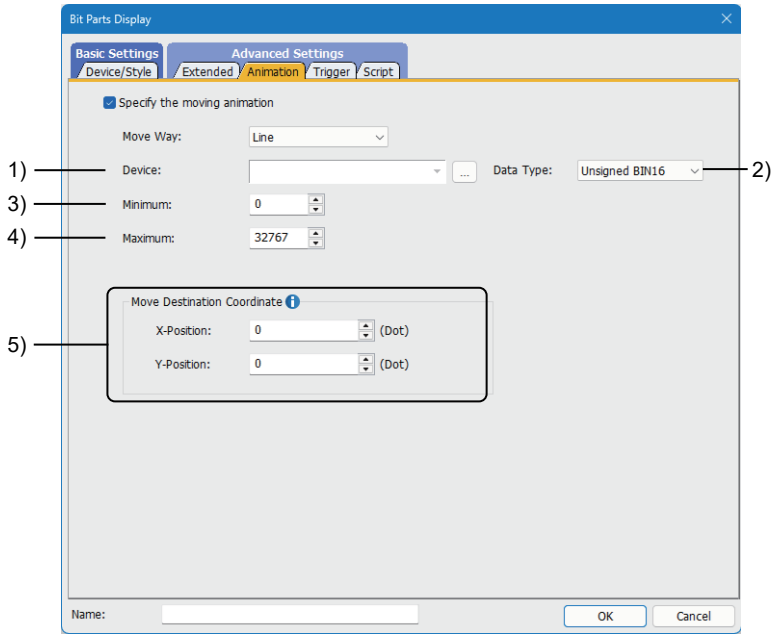
		[Route Specification]	Select this item to display the part at the specified display position (route). After selecting this item, set [Route No.] of the route on which to display the parts movement in the [Animation Route] dialog. The setting range is [0] to [29]. Set the animation route on the screen in advance.
		[Specified coordinates]	Select [Specified coordinates] to display the parts movement using the values of two word devices as the X and Y coordinates. After selecting this item, set the device that stores the coordinate position. ☞ Page 834 How to set devices, labels, and tags

For the settings of each movement method, refer to the following.

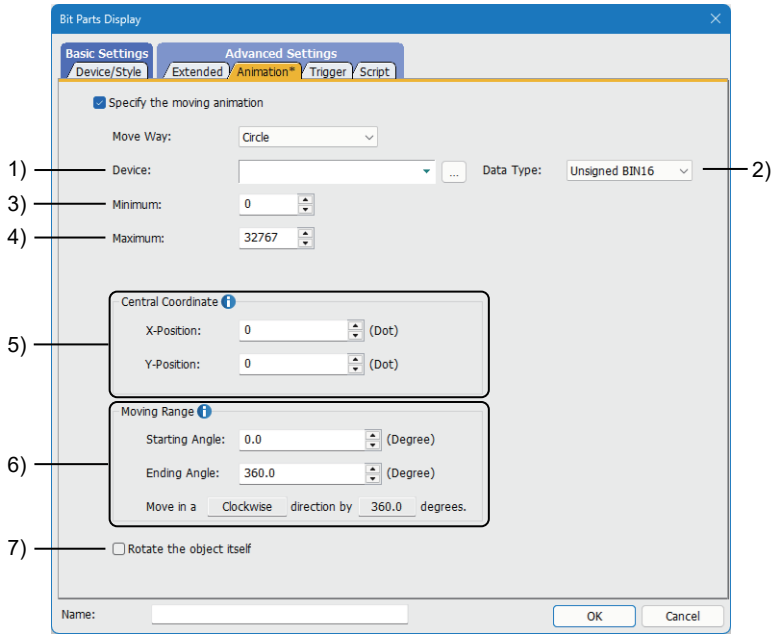
☞ Page 1443 [Line]
☞ Page 1444 [Circle]
☞ Page 1445 [Route Specification]
☞ Page 1445 [Specified coordinates]

[Line]



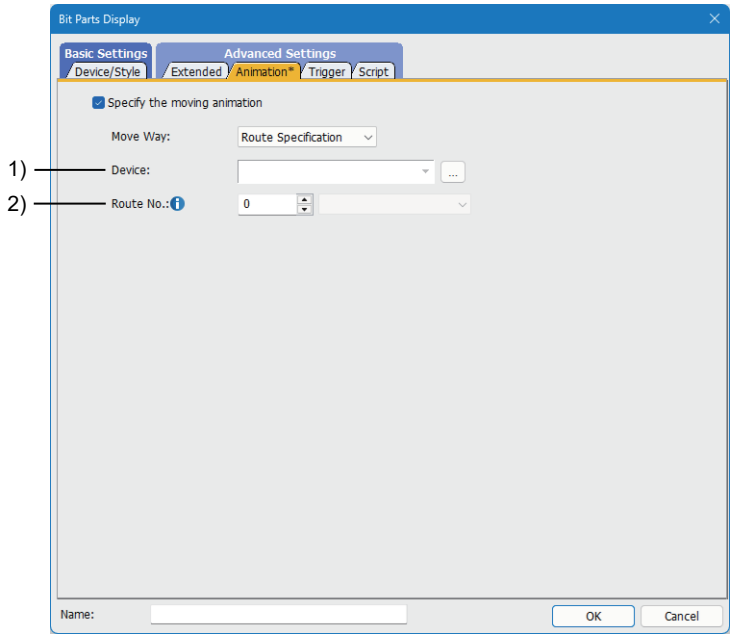
Item			Description
1)	[Device]		Set a device that stores the values relative to the start and end points.
2)	[Data Type]		Select the data type of the word device. The following shows selectable items. • [Unsigned BIN16] • [Signed BIN16]
3)	[Minimum]		Set the minimum value for the start point. The setting range is [0] to [65535].
4)	[Maximum]		Set the maximum value for the end point. The setting range is [0] to [65535].
5)	[Move Destination Coordinate]	[X-Position]	Set the X coordinate of the end point of the object's trajectory. The setting range is [-5000] to [5000].
		[Y-Position]	Set the Y coordinate of the end point of the object's trajectory. The setting range is [-5000] to [5000].

[Circle]



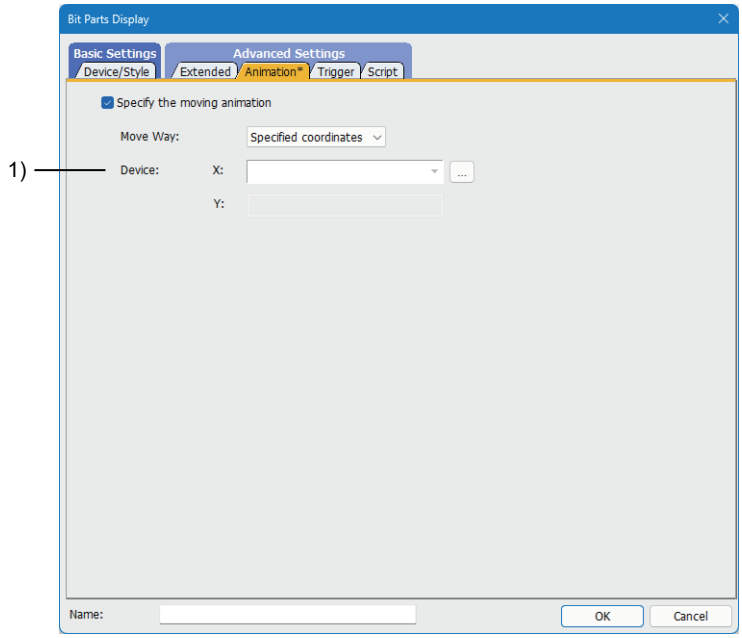
Item		Description
1)	[Device]	Set a device that stores the values relative to the start and end point angles.
2)	[Data Type]	Select the data type of the word device. The following shows selectable items. • [Unsigned BIN16] • [Signed BIN16]
3)	[Minimum]	Set the minimum value for the start point angle. The setting range is [0] to [65535].
4)	[Maximum]	Set the maximum value for the end point angle. The setting range is [0] to [65535].
5)	[Central Coordinate]	Set the center coordinates of a circle. The following shows the setting ranges. • [X-Position]: [-5000] to [5000] • [Y-Position]: [-5000] to [5000] Set the center coordinates relative to the coordinates of the parts display object. The angle between the coordinates of the parts display object and the center coordinates is regarded as 0 degrees.
6)	[Moving Range]	Set the start and end point angles to determine the movement range and direction for the part. The following shows the setting ranges. • [Starting Angle]: [-360.0] to [360.0] • [Ending Angle]: [-360.0] to [360.0] The angle is settable in units of 0.1 degree. The angle increases clockwise from 0 degrees.
7)	[Rotate the object itself]	This item appears when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). Rotates the part at the same angle in the same direction as the parts movement display settings based on the position selected for [Alignment] in the [Device/Style] or [Style] tab. The minimum rotation angle of the part is 1 degree.

[Route Specification]



Item		Description
1)	[Device]	Set a device that stores the display position (route).
2)	[Route No.]	Set [Route No.] in the [Animation Route] dialog to display the parts movement. The setting range is [0] to [29].

[Specified coordinates]



Item		Description
1)	[Device]	Set the device that stores the values of X-axis and Y-axis. The set device and the following device are set to store the coordinates of X-axis and Y-axis. (The set device is for storing the coordinate of X-axis)

Precautions

■Values to be stored in the position devices

The behavior when the value stored in the position device is outside the range differs depending on the setting of [Move Way] in the [Animation] tab.

• [Line], [Route Specification], or [Specified coordinates] is selected for [Move Way].

The part is not moved and the previous display is held.

• [Circle] is selected for [Move Way]

If the value is smaller than the minimum value, the display position changes according to the value set as the minimum value.

If the value is larger than the maximum value, the display position changes according to the value set as the maximum value.

■Precautions when [Circle] is selected for [Move Way]

• Displaying an image file in the data storage as a part

The image file is displayed but cannot be moved in a circular direction.

• Displaying a part containing a character

If a character set in the [Text] dialog is contained, the character is not displayed.

• Displaying a part containing a BMP file for which a transparent color is set

The outline color of the BMP file may be changed due to antialiasing.

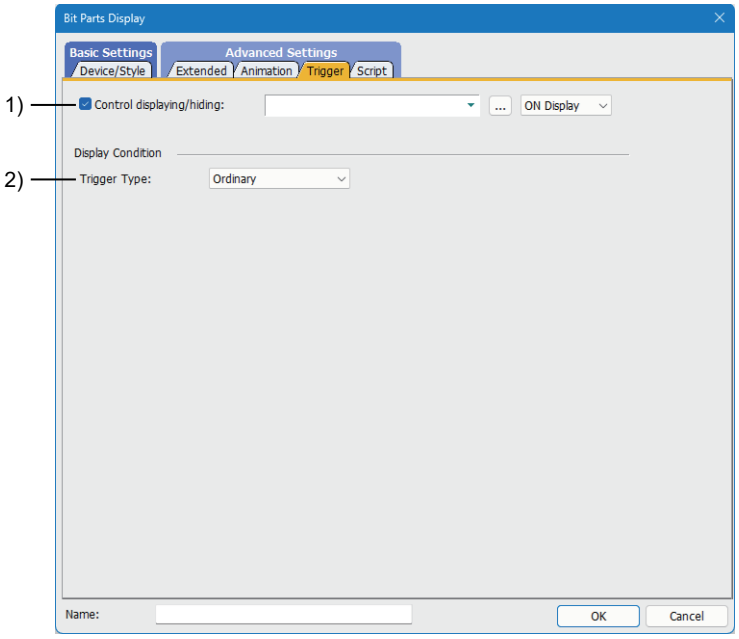
The color changed from the transparent color will not be transparent.

• Display position of parts

Depending on the start or end point angle or the value of the position device, the part display position may deviate.

33.4.4 [Trigger] tab

GT37 SoftGOT3000



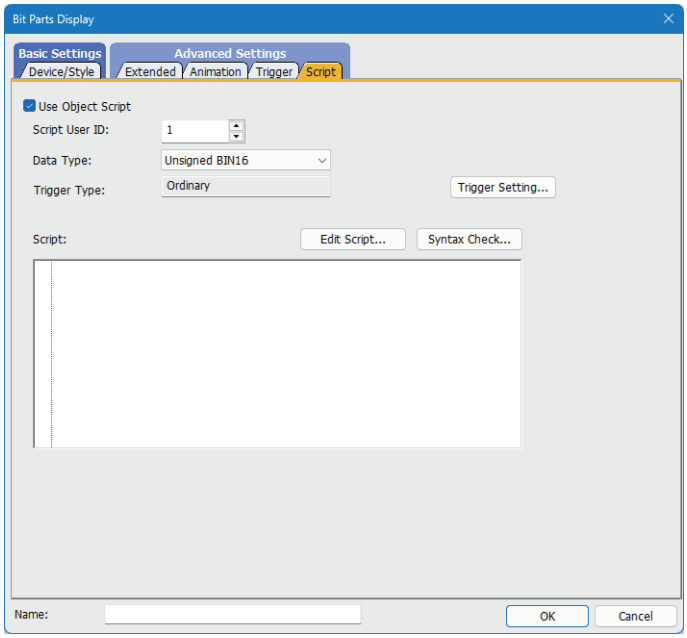
Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger Type]	Select a trigger condition to display the object. The following shows selectable items. • [Ordinary] • [ON] • [OFF] • [Rise] • [Fall] • [Rise/Fall] • [Sampling] • [Range] • [Bit Trigger] • [ON Sampling] • [OFF Sampling] The selectable items vary depending on the GOT model. For details, refer to the following. ☞ Page 970 Specifications of the trigger types For the settings of each item, refer to the following. ☞ Page 968 Trigger type settings

33.4.5 [Script] tab

GT37 SoftGOT3000

For details on the script settings, refer to the following.

☞ Page 2447 Object script



Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property

☞ Page 2456 Timing at which the setting change of an object property is reflected

33.5 [Word Parts Display] dialog

GT37 SoftGOT3000

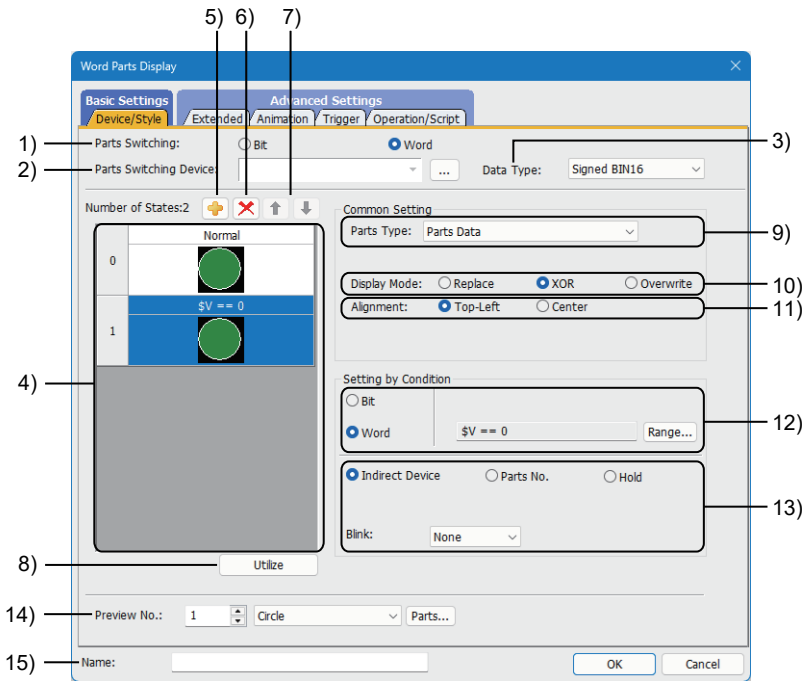
Operating procedure

1. Select [Object] → [Parts Display] → [Word Parts] from the menu.
2. Click the position to place a word parts display.
3. Double-click the word parts display to display the setting dialog.

☞ Page 1449 [Device/Style] tab
☞ Page 1454 [Extended] tab
☞ Page 1455 [Animation] tab
☞ Page 1460 [Trigger] tab
☞ Page 1461 [Operation/Script] tab

33.5.1 [Device/Style] tab

GT37 SoftGOT3000



Item		Description
1)	[Parts Switching]	Select a parts display type. The following shows selectable items. • [Bit] • [Word]
2)	[Parts Switching Device]	Set the device to be monitored. ☞ Page 834 How to set devices, labels, and tags
3)	[Data Type]	Select the data type of the device. The following shows selectable items. • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN8] • [Unsigned BIN8] • [BCD16]
4)	Preview list	Displays the set conditions.
5)	Add button	Adds a new condition.

Item			Description
6)	Delete button		Deletes the selected condition.
7)	Up button, down button		Changes the priority order of the conditions in the preview list.
8)	[Utilize] button		Creates a new condition utilizing the selected condition.
9)	[Parts Type]	—	Select the type of the parts for the parts display.
		[Parts]	Displays registered parts. When a transparent color is set for the image data of set parts, the setting of the transparent color is enabled. For the method of enabling the transparent color setting of parts, refer to the following. ☞ Page 1435 Setting the image data of parts to a transparent color
		[Mark Data]	Switches the white area of the registered part to another display color according to the change of the device status. After selecting, set [Parts No.] to be displayed. The setting range is [0] to [32767]. Click the [Parts] button to check the type of the registered parts. For the parts that can be displayed by mark, refer to the following. ☞ Page 812 Registering parts ([Parts]) When a transparent color is set for the image data of set parts, the setting of the transparent color is enabled. For the method of enabling the transparent color setting of parts, refer to the following. ☞ Page 1435 Setting the image data of parts to a transparent color
		[Base Screen]	Displays the registered base screens as parts.
		[Window Screen]	Displays the registered window screens as parts.
		[Image File]	Select an image file registered in the data storage to display the file as a part. Click the [Setting] button and select an image file in the [Image File Setting] dialog. ☞ Page 1440 [Image File Setting] dialog
		[Image File (automatic update)]	Select an image file on drive V to display it as a part. When the file on drive V is updated, the image on the parts display object is automatically switched. For details, refer to the following. ☞ Page 1433 Switching the image on a parts display object automatically Set the image file number to be used in [Setting by Condition]. When [XOR] is selected for [Display Mode], even though an image file on drive V is updated, the image on the parts display object is not automatically switched.

Item		Description
10)	[Display Mode] (When not specifying a movement animation)	Select a display method for the switched parts when [Specify the moving animation] is deselected in the [Animation] tab. ☞ Page 1455 [Animation] tab This setting is not displayed when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). The operation when [Replace] is selected is applied. ☞ Page 519 [Type Setting] dialog • [Replace] Deletes the parts displayed previously and displays the new parts. When [Parts Type] is [Base Screen] or [Window Screen], this item cannot be set.  • [XOR] After deleting the parts displayed previously, the areas which overlap with the new part are displayed with an XOR synthesis. For information on combining overlapped colors using XOR synthesis, refer to the following.  • [Overwrite] Displays a new part, base screen, or window screen on the part that has been displayed. 	[Display Mode] (When specifying a movement animation)	Select a display method for the moved parts when [Specify the moving animation] is deselected in the [Animation] tab. ☞ Page 1455 [Animation] tab This setting is not displayed when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). The operation when [Move] is selected is applied. ☞ Page 519 [Type Setting] dialog • [Move] Displays the parts movement by deleting the previously displayed part. • [Locus] Displays the parts movement without deleting the parts that have been displayed. When [Movement] is selected  When [Locus] is selected 
Item			Description
11)	[Alignment]		Select the default display position of parts, base screens, and window screens. • [Top-Left] Sets the top left of parts, base screens, and window screens as the default display position. • [Center] Sets the center of parts, base screens, and window screens as the default display position. 12)	[Range]		• [Bit] Select this item when changing the display according to the on and off status of the bit device. After selecting, set the bit device and device status (ON, OFF). • [Word] Select this item when changing the display according to the value of a word device. After selecting, set the conditional expression for the value of the word device with [Range] button.
13)	[Setting by Condition]*1	[Indirect Device]	Display the [Parts No.] corresponding to the value of the parts switching device. When deleting the parts, set $V==0 for [Range]. When the value of the parts switching device is 0, deleted the part. 		[Parts No.]	Set the number that has been assigned to the part, base screen, or window screen to be displayed. Click the [Parts Data] button to check the registered parts, base screen, and window screen. The setting range is [0] to [32767]. When 0 is set for [Parts No.], the part is deleted.
		[Mark Color]	When selecting [Mark Data] for [Parts Type], select the color of the area of the part to be switched from white.
		[Screen No.]	When selecting [Base Screen] or [Window Screen] for [Parts Type], specify the screen No. Click the [Screen] button to check the registered parts, base screen, and window screen.
		[Image File No.]	Set the image file number when you select [Image File] or [Image File (automatic update)] for [Parts Type]. The setting range varies depending on the setting of [Digits] in the [Image File Setting] dialog. Select [Image File] for [Parts Type]. • [Digits] is [5]: [0] to [65535] • [Digits] is [4]: [0] to [9999] • [Digits] is [3]: [0] to [999] • [Digits] is [2]: [0] to [99] • [Digits] is [1]: [0] to [9] Select [Image File (automatic update)] for [Parts Type]. • [0] to [4] When 0 is set for [Screen File No.], images are deleted. When displaying only images for the on status, set 0 for [Image File No.] for the off status.
		[Hold]	Select this item to hold the current display of the parts.
		[Blink]	Select the blinking speed of the parts. The following shows selectable items. • [None] • [Low] • [Medium] • [High]
14)	[Preview No.]		Displays the part of the specified part number on the screen of GT Designer3. The setting range is [0] to [32767].
15)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

*1 When an option other than [Indirect Device] is selected, conditions are required to be set.
The following shows how the parts are switched according to the setting of [Setting by Condition] and set conditions.

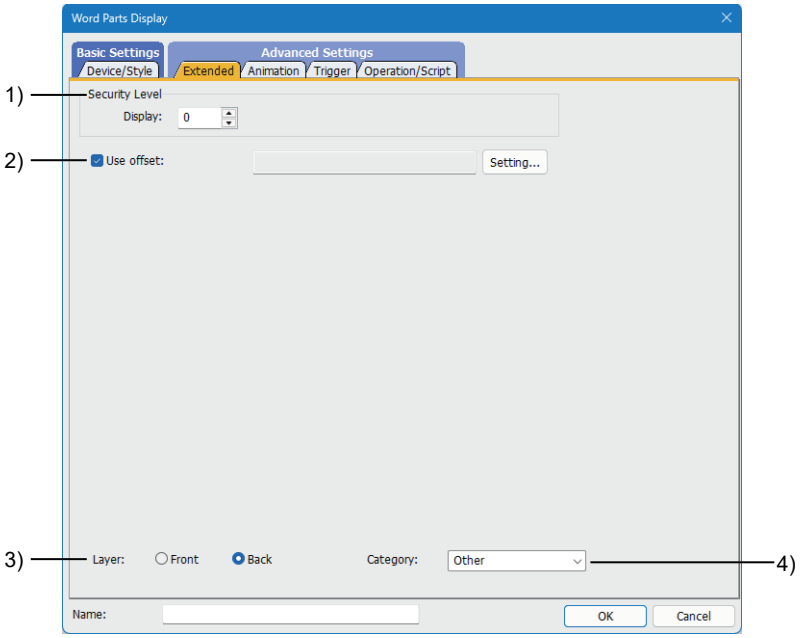
Type of [Setting by Condition]	Condition setting	
	Enabled	**None**
[Indirect Device]	Depending on a set condition, parts are displayed as follows. • When a condition is satisfied Displays the parts set for the condition. • When a condition is not satisfied Depending on the value of the parts switching device, parts are switched and displayed.	Set a condition as required. Depending on the monitor device value, parts are switched and displayed. Set a condition when switching parts according to the other conditions.
[Parts No.] [Mark Color]	Depending on a set condition, parts are displayed as follows. • When a condition is satisfied Displays the parts set for the condition. • When a condition is not satisfied Displays the parts set for [Detail Settings of Parts].	Make sure to set a condition. Otherwise, only one type of parts is displayed continuously. Switching to another part cannot be performed.
[Hold]	Depending on a set condition, parts are displayed as follows. • When a condition is satisfied Displays the parts set for the condition. • When a condition is not satisfied Holds the display of the parts set for the condition.	Make sure to set a condition. Without a condition, nothing is displayed.

For details on the conditions, refer to the following.

☞ Page 1038 Control with conditions

33.5.2 [Extended] tab

GT37 SoftGOT3000

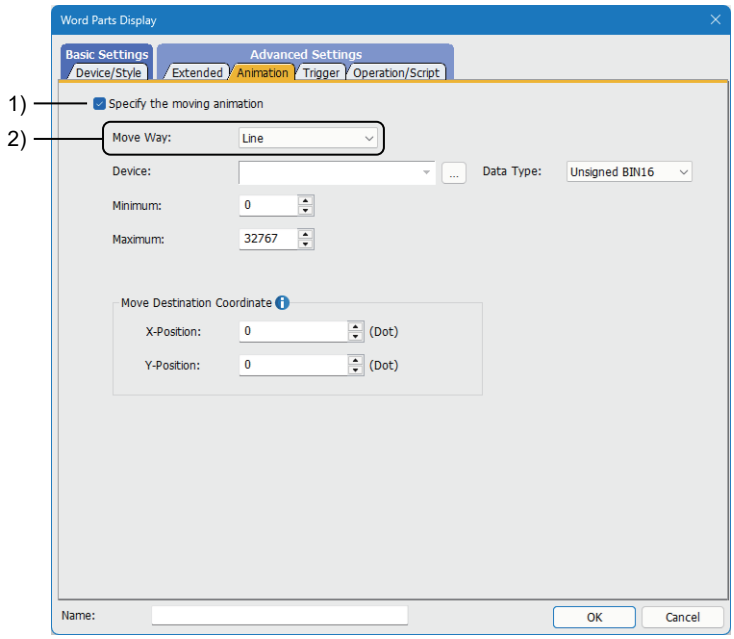


Item		Description
1)	[Security Level]	Set the security level when using the security function. The setting range is [1] to [15]. If you do not use the security function, select [0].
2)	[Use offset]	Select this item to monitor multiple devices by switching them. Sets the offset device with the [Setting] button.
3)	[Layer]	Switches layers to be placed. The following shows selectable items. • [Front] • [Back]
4)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

33.5.3 [Animation] tab

GT37 SoftGOT3000

The setting items vary depending on the selected movement method.



Item			Description
1)	[Specify the moving animation]		Set a movement animation for the parts display.
2)	[Move Way]	[Line]	Select [Line] to display the parts movement on the line across the specified start and end points. After the setting, perform the following operation on the screen editor. Click the start point on the drawing screen.  Move the cursor and click the end point. The line, which is the parts movement range, is set. 		[Circle]	Select [Circle] to display the parts movement on the circle around the specified center coordinates. For information on the circular movement display, refer to the following. ☞ Page 1422 Circle After the setting, place a parts display on the screen editor.
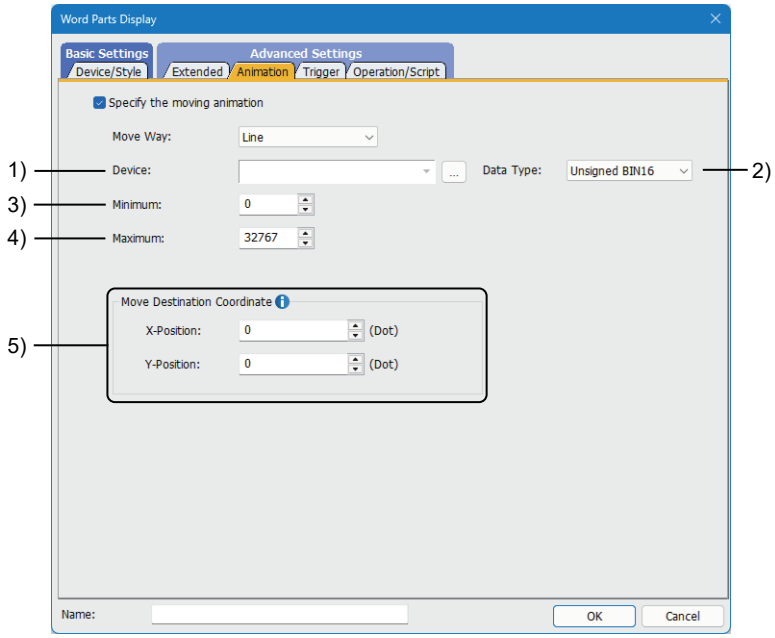
		[Route Specification]	Select this item to display the part at the specified display position (route). After selecting this item, set [Route No.] of the route on which to display the parts movement in the [Animation Route] dialog. The setting range is [0] to [29]. Set the animation route on the screen in advance.
		[Specified coordinates]	Select [Specified coordinates] to display the parts movement using the values of two word devices as the X and Y coordinates. After selecting this item, set the device that stores the coordinate position. ☞ Page 834 How to set devices, labels, and tags

PART 7

For the settings of each movement method, refer to the following.

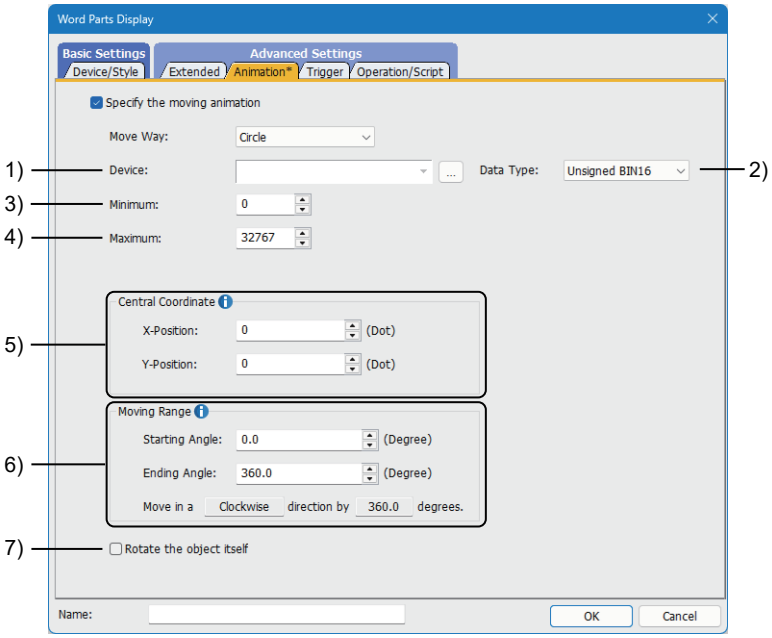
☞ Page 1456 [Line]
☞ Page 1457 [Circle]
☞ Page 1458 [Route Specification]
☞ Page 1458 [Specified coordinates]

[Line]



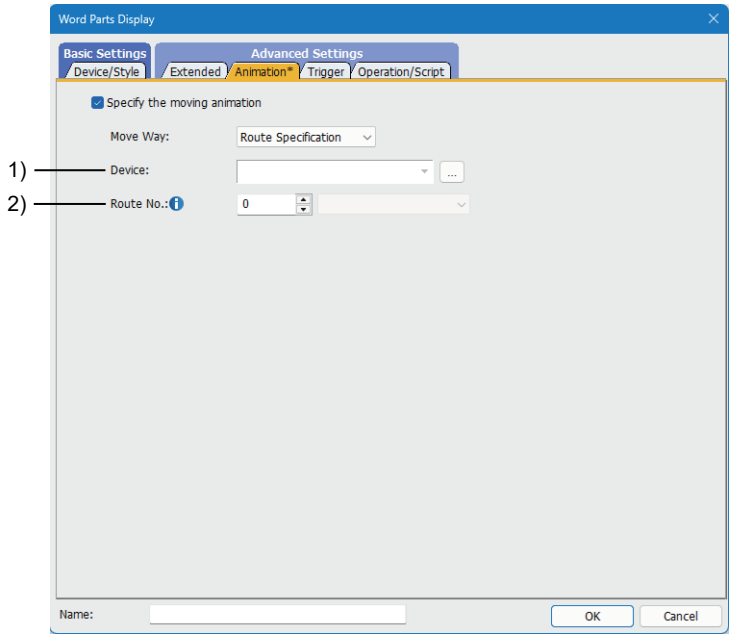
Item			Description
1)	[Device]		Set a device that stores the values relative to the start and end points.
2)	[Data Type]		Select the data type of the word device. The following shows selectable items. • [Unsigned BIN16] • [Signed BIN16]
3)	[Minimum]		Set the minimum value for the start point. The setting range is [0] to [65535].
4)	[Maximum]		Set the maximum value for the end point. The setting range is [0] to [65535].
5)	[Move Destination Coordinate]	[X-Position]	Set the X coordinate of the end point of the object's trajectory. The setting range is [-5000] to [5000].
		[Y-Position]	Set the Y coordinate of the end point of the object's trajectory. The setting range is [-5000] to [5000].

[Circle]



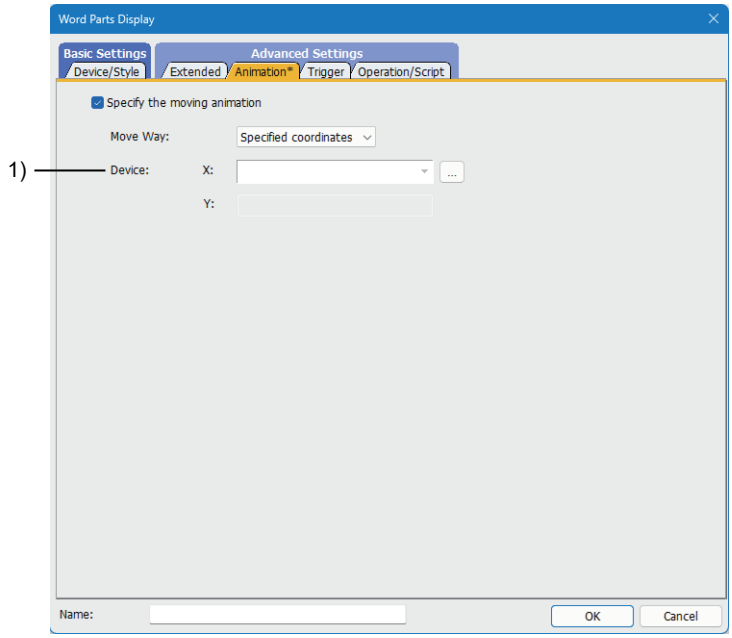
Item		Description
1)	[Device]	Set a device that stores the values relative to the start and end point angles.
2)	[Data Type]	Select the data type of the word device. The following shows selectable items. • [Unsigned BIN16] • [Signed BIN16]
3)	[Minimum]	Set the minimum value for the start point angle. The setting range is [0] to [65535].
4)	[Maximum]	Set the maximum value for the end point angle. The setting range is [0] to [65535].
5)	[Central Coordinate]	Set the center coordinates of a circle. The following shows the setting ranges. • [X-Position]: [-5000] to [5000] • [Y-Position]: [-5000] to [5000] Set the center coordinates relative to the coordinates of the parts display object. The angle between the coordinates of the parts display object and the center coordinates is regarded as 0 degrees.
6)	[Moving Range]	Set the start and end point angles to determine the movement range and direction for the part. The following shows the setting ranges. • [Starting Angle]: [-360.0] to [360.0] • [Ending Angle]: [-360.0] to [360.0] The angle is settable in units of 0.1 degree. The angle increases clockwise from 0 degrees.
7)	[Rotate the object itself]	This item appears when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). Rotates the part at the same angle in the same direction as the parts movement display settings based on the position selected for [Alignment] in the [Device/Style] or [Style] tab. The minimum rotation angle of the part is 1 degree.

[Route Specification]



Item		Description
1)	[Device]	Set a device that stores the display position (route).
2)	[Route No.]	Set [Route No.] in the [Animation Route] dialog to display the parts movement. The setting range is [0] to [29].

[Specified coordinates]



Item		Description
1)	[Device]	Set the device that stores the values of X-axis and Y-axis. The set device and the following device are set to store the coordinates of X-axis and Y-axis. (The set device is for storing the coordinate of X-axis)

Precautions

■Values to be stored in the position devices

The behavior when the value stored in the position device is outside the range differs depending on the setting of [Move Way] in the [Animation] tab.

• [Line], [Route Specification], or [Specified coordinates] is selected for [Move Way].

The part is not moved and the previous display is held.

• [Circle] is selected for [Move Way]

If the value is smaller than the minimum value, the display position changes according to the value set as the minimum value.

If the value is larger than the maximum value, the display position changes according to the value set as the maximum value.

■Precautions when [Circle] is selected for [Move Way]

• Displaying an image file in the data storage as a part

The image file is displayed but cannot be moved in a circular direction.

• Displaying a part containing a character

If a character set in the [Text] dialog is contained, the character is not displayed.

• Displaying a part containing a BMP file for which a transparent color is set

The outline color of the BMP file may be changed due to antialiasing.

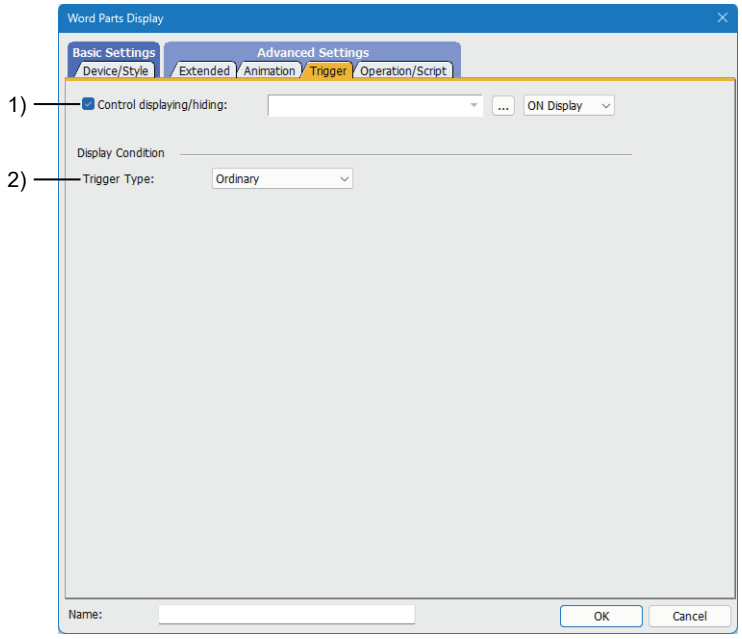
The color changed from the transparent color will not be transparent.

• Display position of parts

Depending on the start or end point angle or the value of the position device, the part display position may deviate.

33.5.4 [Trigger] tab

GT37 SoftGOT3000

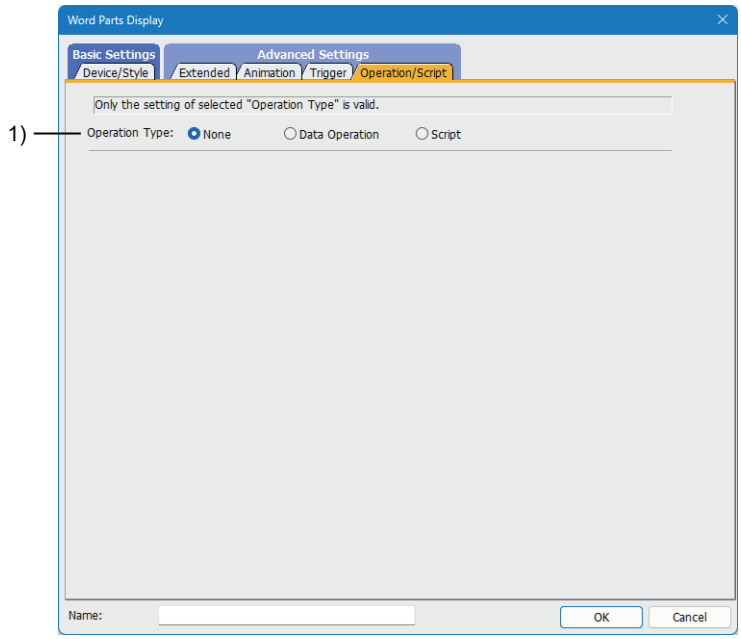


Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger Type]	Select a trigger condition to display the object. The following shows selectable items. • [Ordinary] • [ON] • [OFF] • [Rise] • [Fall] • [Rise/Fall] • [Sampling] • [Range] • [Bit Trigger] • [ON Sampling] • [OFF Sampling] The selectable items vary depending on the GOT model. For details, refer to the following. ☞ Page 970 Specifications of the trigger types For the settings of each item, refer to the following. ☞ Page 968 Trigger type settings

33.5.5 [Operation/Script] tab

GT37 SoftGOT3000

Set an expression for monitoring using the data operation function or the script function.



Item			Description
1)	[Operation Type]	[None]	The data operation function and the script function are not used.
		[Data Operation]	Set the expression used for the data operation function.
		[Script]	Set the expressions for the script function.

The setting items differ depending on the selection for [Operation Type].

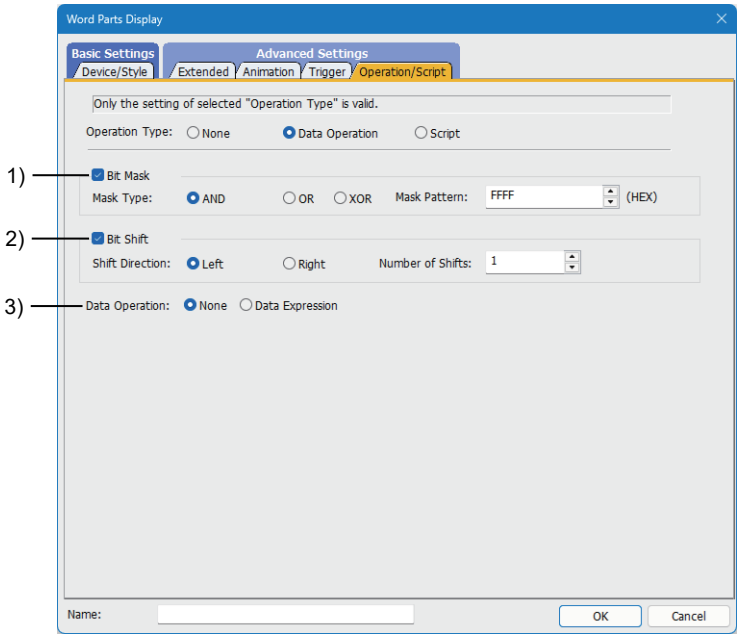
The following shows the settings for each function.

[Data Operation]

This item can be set only when [Operation Type] is [Data Operation].

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation



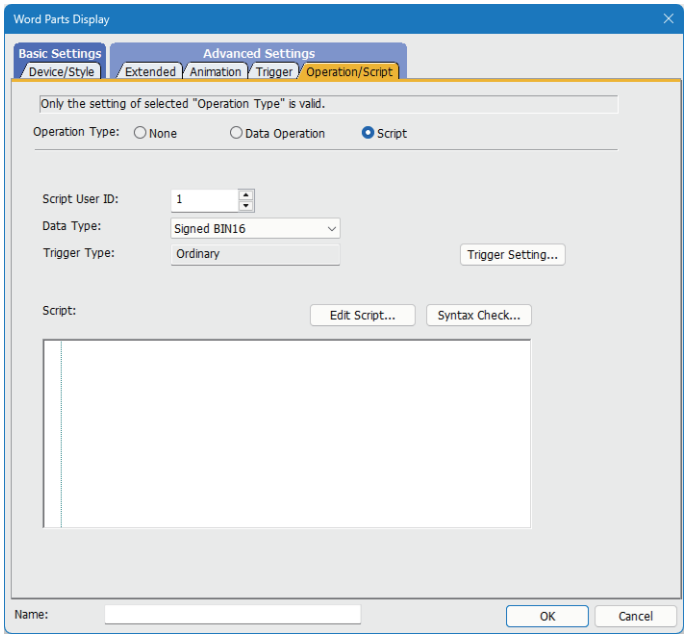
Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. The following shows selectable items. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range differs depending on the setting of [Data Type] in the [Device/Style] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction. The following shows selectable items. • [Left] • [Right]
		[Number of Shifts]	Set the number of bits to be shifted. The setting range differs depending on the setting of [Data Type] in the [Device/Style] tab.
3)	[Data Operation]		Select the format of the expression operating with the data operation. The following shows selectable items. • [None] • [Data Expression]

[Script]

This item can be set only when [Operation Type] is [Script].

For details on the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property				
Tab name	Setting item	Property name	Read	Write	Timing for reflecting the setting change*1	
					When not specifying a movement animation	When specifying a movement animation
—	—	active	○	○	Upon the setting change	Upon the setting change
		x	○	○	When the screen is updated	Upon the setting change
		y	○	○	When the screen is updated	Upon the setting change
[Device/Style]	[Display Mode]	draw_mode	○	○	When the object is updated	—
	[Parts No.]	part_no	○	○	Upon the setting change	Upon the setting change
	[Mark Color]	mark_color	○	○	Upon the setting change	Upon the setting change
	[Blink]	blink	○	○	Upon the setting change	Upon the setting change
[Extended]	[Security Level]	security	○	○	When the screen is updated	When the screen is updated

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.

☞ Page 2456 Timing at which the setting change of an object property is reflected

33.6 [Fixed Parts Display] dialog

GT37 SoftGOT3000

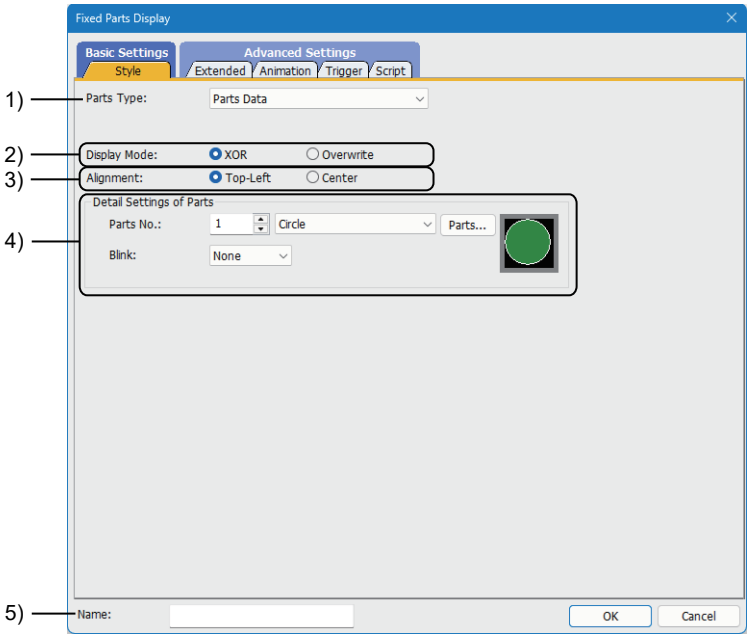
Operating procedure

1. Select [Object] → [Parts Display] → [Fixed Parts] from the menu.
2. Click the position to place a fixed parts display.
3. Double-click the fixed parts display to display the setting dialog.

☞ Page 1465 [Style] tab
☞ Page 1468 [Extended] tab
☞ Page 1469 [Animation] tab
☞ Page 1474 [Trigger] tab
☞ Page 1475 [Script] tab

33.6.1 [Style] tab

GT37 SoftGOT3000



Item			Description
1)	[Parts Type]	[Parts Data]	Select the type of the parts for the parts display. Displays registered parts. When a transparent color is set for the image data of set parts, the setting of the transparent color is enabled. For the method of enabling the transparent color setting of parts, refer to the following. ☞ Page 1435 Setting the image data of parts to a transparent color
		[Mark Data]	Switches the white area of the registered part to the color set for [Mark Color]. After selecting, set [Parts No.] to be displayed. The setting range is [0] to [32767]. Click the [Parts] button to check the type of the registered parts. For the parts that can be displayed by mark, refer to the following. ☞ Page 812 Registering parts ([Parts]) When a transparent color is set for the image data of set parts, the setting of the transparent color is enabled. For the method of enabling the transparent color setting of parts, refer to the following. ☞ Page 1435 Setting the image data of parts to a transparent color
		[Base Screen]	Displays the registered base screens as parts.
		[Window Screen]	Displays the registered window screens as parts.
		[Image File]	Select an image file registered in the data storage to display the file as a part. Click the [Setting] button and select an image file in the [Image File Setting] dialog. ☞ Page 1440 [Image File Setting] dialog
		[Image File (automatic update)]	Select an image file on drive V to display it as a part. When the file on drive V is updated, the image on the parts display object is automatically switched. For details, refer to the following. ☞ Page 1433 Switching the image on a parts display object automatically Set the image file number to be used in [Setting by Condition]. When [XOR] is selected for [Display Mode], even though an image file on drive V is updated, the image on the parts display object is not automatically switched.

Item		Description
2)	[Display Mode] (When not specifying a movement animation)	Select a display method for the switched parts when [Specify the moving animation] is deselected in the [Animation] tab. ☞ Page 1469 [Animation] tab This setting is not displayed when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). The operation when [Overwrite] is selected is applied. ☞ Page 519 [Type Setting] dialog • [XOR] Displays parts, base screens, and window screens with an XOR synthesis on figures or other parts displays. When the display condition is not satisfied, the parts, base screens, and window screens are deleted. Example) Display condition: While M100 is on  • [Overwrite] Displays parts, base screens, and window screens on figures or other parts displays. Even if the display condition is not satisfied, the display of the parts, base screens, and window screens are held. Example) Display condition: While M100 is on 	[Display Mode] (When specifying a movement animation)	Select a display method for the moved parts when [Specify the moving animation] is deselected in the [Animation] tab. ☞ Page 1469 [Animation] tab This setting is not displayed when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). The operation when [Move] is selected is applied. ☞ Page 519 [Type Setting] dialog • [Move] Displays the parts movement by deleting the previously displayed part. • [Locus] Displays the parts movement without deleting the parts that have been displayed. 
Item			Description
3)	[Alignment]		Select the default display position of parts, base screens, and window screens. • [Top-Left] Sets the top left of parts, base screens, and window screens as the default display position. • [Center] Sets the center of parts, base screens, and window screens as the default display position. 4)	[Detail Settings of Parts]	[Parts No.]	Set the number that has been assigned to the part, base screen, or window screen to be displayed. Click the [Parts Data] button to check the registered parts, base screen, and window screen. The setting range is [0] to [32767]. When 0 is set for [Parts No.], the part is deleted.
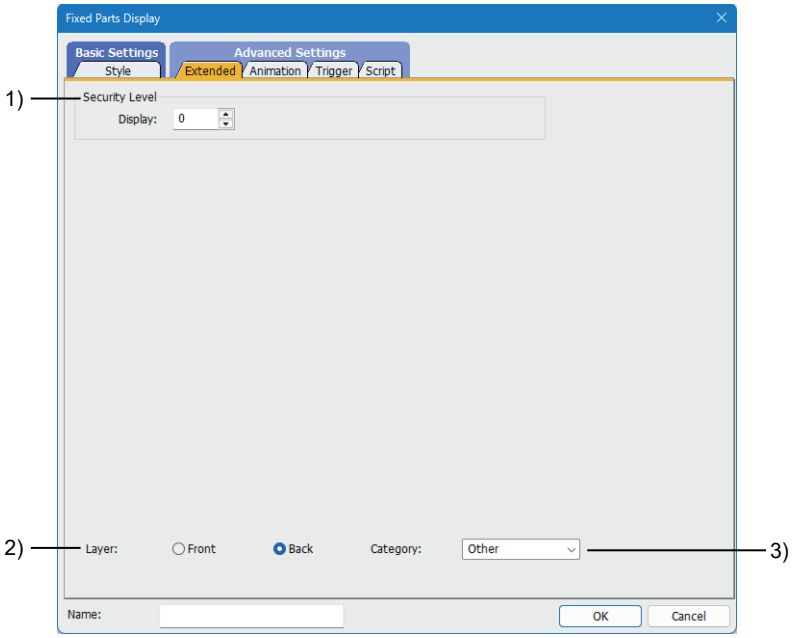
		[Mark Color]	When selecting [Mark Data] for [Parts Type], select the color of the area of the part to be switched from white.
		[Screen No.]	When selecting [Base Screen] or [Window Screen] for [Parts Type], specify the screen No. Click the [Screen] button to check the registered parts, base screen, and window screen.
		[Image File No.]	Set the image file number when you select [Image File] or [Image File (automatic update)] for [Parts Type]. The setting range varies depending on the setting of [Digits] in the [Image File Setting] dialog. Select [Image File] for [Parts Type]. • [Digits] is [5]: [0] to [65535] • [Digits] is [4]: [0] to [9999] • [Digits] is [3]: [0] to [999] • [Digits] is [2]: [0] to [99] • [Digits] is [1]: [0] to [9] Select [Image File (automatic update)] for [Parts Type]. • [0] to [4] When 0 is set for [Screen File No.], images are deleted.
		[Blink]	Select the blinking speed of the parts. The following shows selectable items. • [None] • [Low] • [Medium] • [High]
5)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

33.6.2 [Extended] tab

GT37 SoftGOT3000

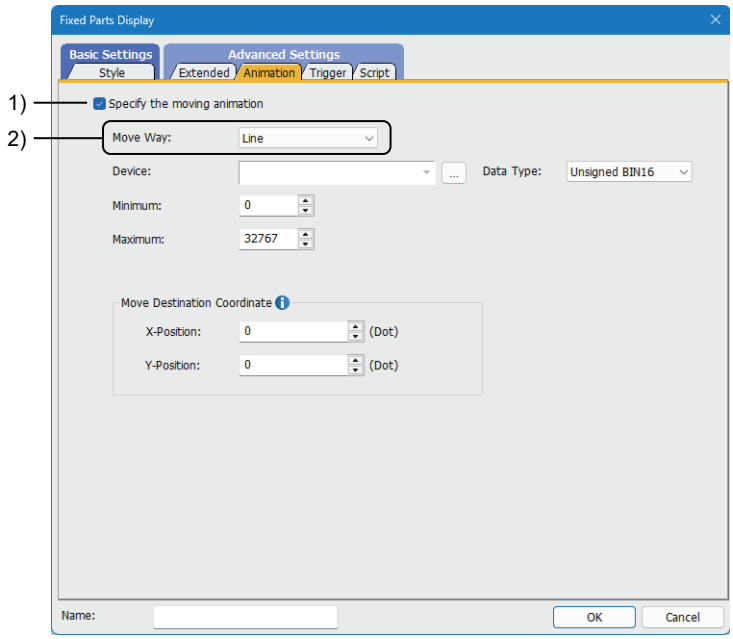


Item		Description
1)	[Security Level]	Set the security level when using the security function. The setting range is [1] to [15]. If you do not use the security function, select [0].
2)	[Layer]	Switches layers to be placed. The following shows selectable items. • [Front] • [Back]
3)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

33.6.3 [Animation] tab

GT37 SoftGOT3000

The setting items vary depending on the selected movement method.



Item			Description
1)	[Specify the moving animation]		Set a movement animation for the parts display.
2)	[Move Way]	[Line]	Select [Line] to display the parts movement on the line across the specified start and end points. After the setting, perform the following operation on the screen editor. Click the start point on the drawing screen.  Move the cursor and click the end point. The line, which is the parts movement range, is set. 		[Circle]	Select [Circle] to display the parts movement on the circle around the specified center coordinates. For information on the circular movement display, refer to the following. ☞ Page 1422 Circle After the setting, place a parts display on the screen editor.
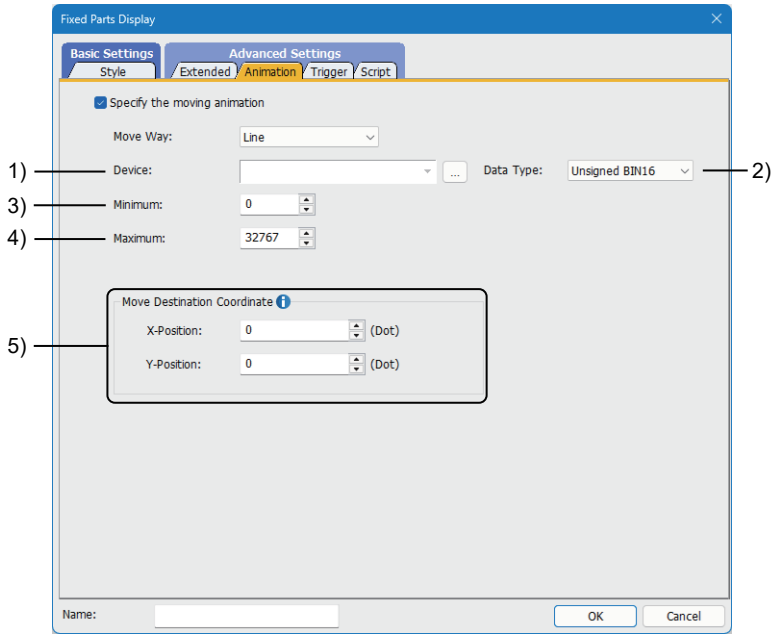
		[Route Specification]	Select this item to display the part at the specified display position (route). After selecting this item, set [Route No.] of the route on which to display the parts movement in the [Animation Route] dialog. The setting range is [0] to [29]. Set the animation route on the screen in advance.
		[Specified coordinates]	Select [Specified coordinates] to display the parts movement using the values of two word devices as the X and Y coordinates. After selecting this item, set the device that stores the coordinate position. ☞ Page 834 How to set devices, labels, and tags

PART 7

For the settings of each movement method, refer to the following.

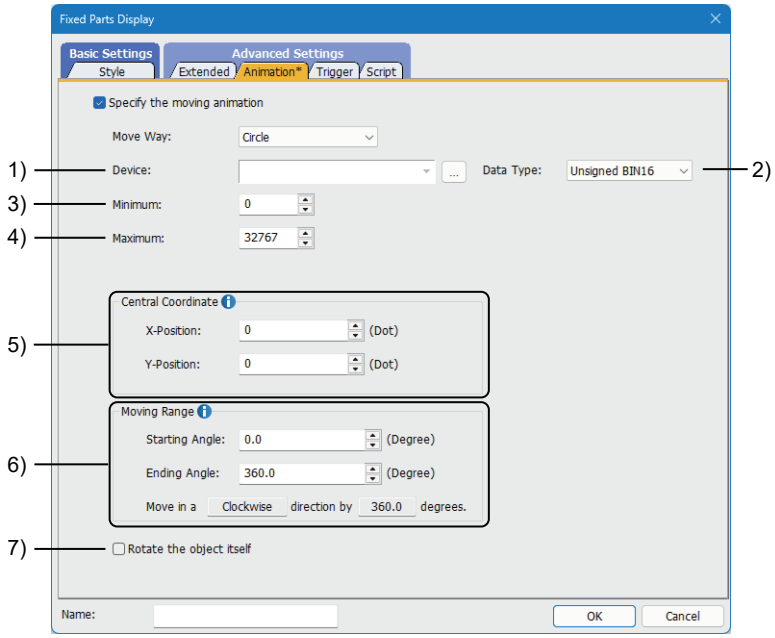
☞ Page 1470 [Line]
☞ Page 1471 [Circle]
☞ Page 1472 [Route Specification]
☞ Page 1472 [Specified coordinates]

[Line]



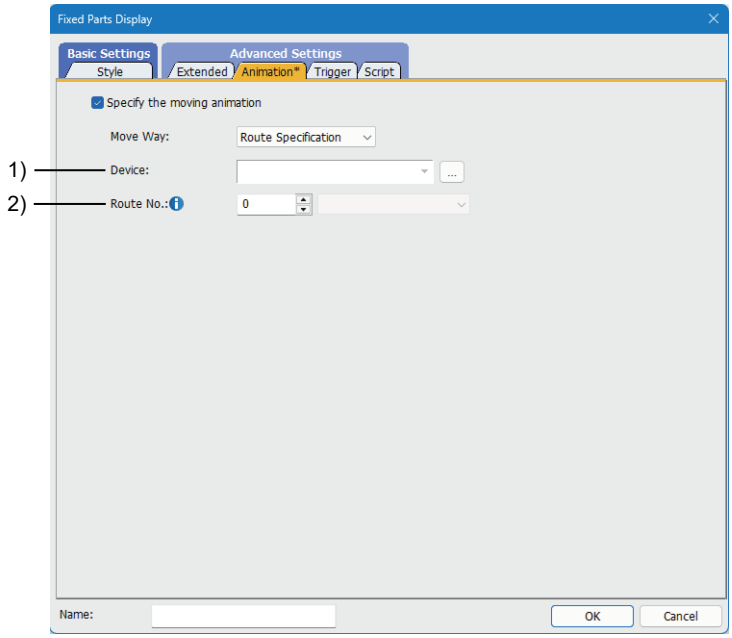
Item			Description
1)	[Device]		Set a device that stores the values relative to the start and end points.
2)	[Data Type]		Select the data type of the word device. The following shows selectable items. • [Unsigned BIN16] • [Signed BIN16]
3)	[Minimum]		Set the minimum value for the start point. The setting range is [0] to [65535].
4)	[Maximum]		Set the maximum value for the end point. The setting range is [0] to [65535].
5)	[Move Destination Coordinate]	[X-Position]	Set the X coordinate of the end point of the object's trajectory. The setting range is [-5000] to [5000].
		[Y-Position]	Set the Y coordinate of the end point of the object's trajectory. The setting range is [-5000] to [5000].

[Circle]



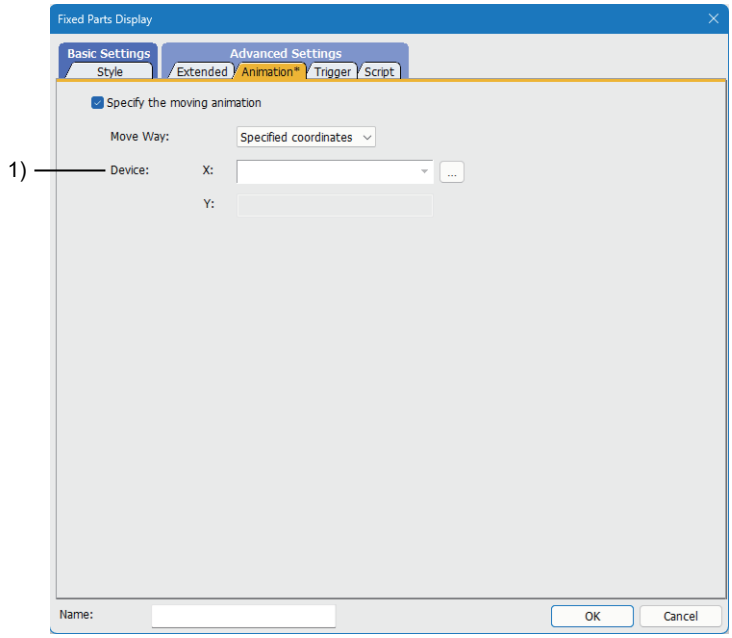
Item		Description
1)	[Device]	Set a device that stores the values relative to the start and end point angles.
2)	[Data Type]	Select the data type of the word device. The following shows selectable items. • [Unsigned BIN16] • [Signed BIN16]
3)	[Minimum]	Set the minimum value for the start point angle. The setting range is [0] to [65535].
4)	[Maximum]	Set the maximum value for the end point angle. The setting range is [0] to [65535].
5)	[Central Coordinate]	Set the center coordinates of a circle. The following shows the setting ranges. • [X-Position]: [-5000] to [5000] • [Y-Position]: [-5000] to [5000] Set the center coordinates relative to the coordinates of the parts display object. The angle between the coordinates of the parts display object and the center coordinates is regarded as 0 degrees.
6)	[Moving Range]	Set the start and end point angles to determine the movement range and direction for the part. The following shows the setting ranges. • [Starting Angle]: [-360.0] to [360.0] • [Ending Angle]: [-360.0] to [360.0] The angle is settable in units of 0.1 degree. The angle increases clockwise from 0 degrees.
7)	[Rotate the object itself]	This item appears when [Enable the antialiasing] is selected in the [Type Setting] dialog ([Basic Setting]). Rotates the part at the same angle in the same direction as the parts movement display settings based on the position selected for [Alignment] in the [Device/Style] or [Style] tab. The minimum rotation angle of the part is 1 degree.

[Route Specification]



Item		Description
1)	[Device]	Set a device that stores the display position (route).
2)	[Route No.]	Set [Route No.] in the [Animation Route] dialog to display the parts movement. The setting range is [0] to [29].

[Specified coordinates]



Item		Description
1)	[Device]	Set the device that stores the values of X-axis and Y-axis. The set device and the following device are set to store the coordinates of X-axis and Y-axis. (The set device is for storing the coordinate of X-axis)

Precautions

■Values to be stored in the position devices

The behavior when the value stored in the position device is outside the range differs depending on the setting of [Move Way] in the [Animation] tab.

• [Line], [Route Specification], or [Specified coordinates] is selected for [Move Way].

The part is not moved and the previous display is held.

• [Circle] is selected for [Move Way]

If the value is smaller than the minimum value, the display position changes according to the value set as the minimum value.

If the value is larger than the maximum value, the display position changes according to the value set as the maximum value.

■Precautions when [Circle] is selected for [Move Way]

• Displaying an image file in the data storage as a part

The image file is displayed but cannot be moved in a circular direction.

• Displaying a part containing a character

If a character set in the [Text] dialog is contained, the character is not displayed.

• Displaying a part containing a BMP file for which a transparent color is set

The outline color of the BMP file may be changed due to antialiasing.

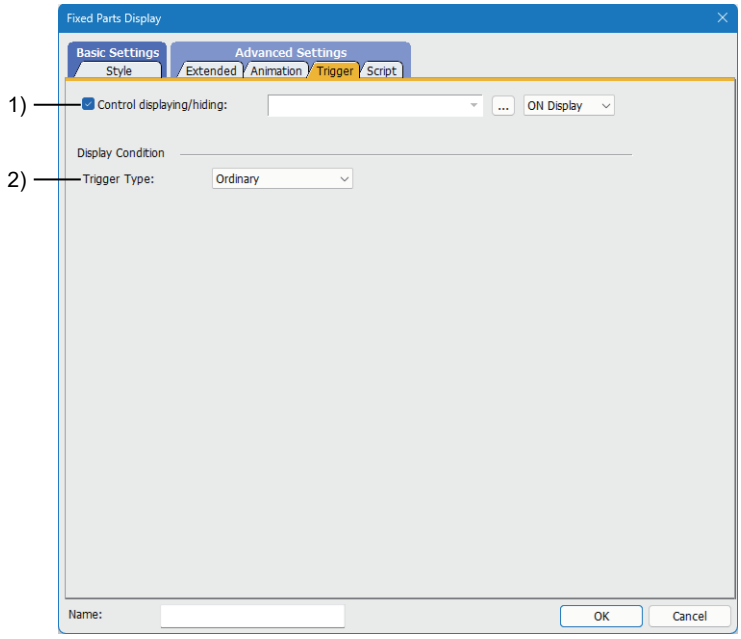
The color changed from the transparent color will not be transparent.

• Display position of parts

Depending on the start or end point angle or the value of the position device, the part display position may deviate.

33.6.4 [Trigger] tab

GT37 SoftGOT3000



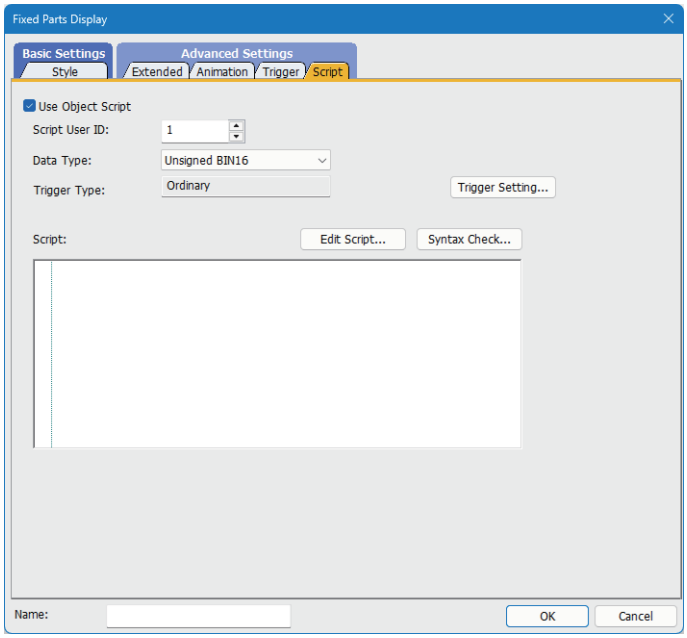
Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger Type]	Select a trigger condition to display the object. The selectable items vary depending on whether or not to specify a movement animation. The following shows selectable items. When deselecting [Specify the moving animation] in the [Animation] tab • [Ordinary] • [ON] • [OFF] • [Range] • [Bit Trigger] When selecting [Specify the moving animation] in the [Animation] tab • [Ordinary] • [ON] • [OFF] • [Rise] • [Fall] • [Rise/Fall] • [Sampling] • [Range] • [Bit Trigger] For the settings of each item, refer to the following. ☞ Page 968 Trigger type settings

33.6.5 [Script] tab

GT37 SoftGOT3000

For details on the script settings, refer to the following.

☞ Page 2447 Object script



Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property				
Tab name	Setting item	Property name	Read	Write	Timing for reflecting the setting change*1	
					When not specifying a movement animation	When specifying a movement animation

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.

☞ Page 2456 Timing at which the setting change of an object property is reflected

33.7 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the parts display as required.
The following shows the functions that are available by configuring the relevant settings.

33.7.1 Parts setting

Select [Common] → [Parts] → [Parts Setting] from the menu to display the [Parts Setting] dialog.
☞ Page 831 [Parts Setting] dialog

Function	Setting item
When the display mode of the parts display (except fixed parts) is XOR, integrating grouped figures into an XOR synthesis simultaneously	[Show overlapping areas of shapes in XOR when Display Mode of Parts Display is XOR]
Setting whether to use image files in the data storage for parts displays	[Show image files in the memory card when Parts No. 9001-9999 is specified]
When [Image File (automatic update)] is selected for [Parts Type], updating the image on the parts display object automatically when an image file stored in drive V is updated	[Enable the automatic update of image files]

33.7.2 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Using image files in the data storage as parts for parts displays (Read device)	GS450.b8

34 Placing a frame animation

GT37 SoftGOT3000

☞ Page 1478 Overview of the frame animation
☞ Page 1479 How to use the frame animation
☞ Page 1481 Specifications of the frame animation
☞ Page 1484 Configuring the frame animation settings
☞ Page 1486 [Frame Animation] dialog

PART 7

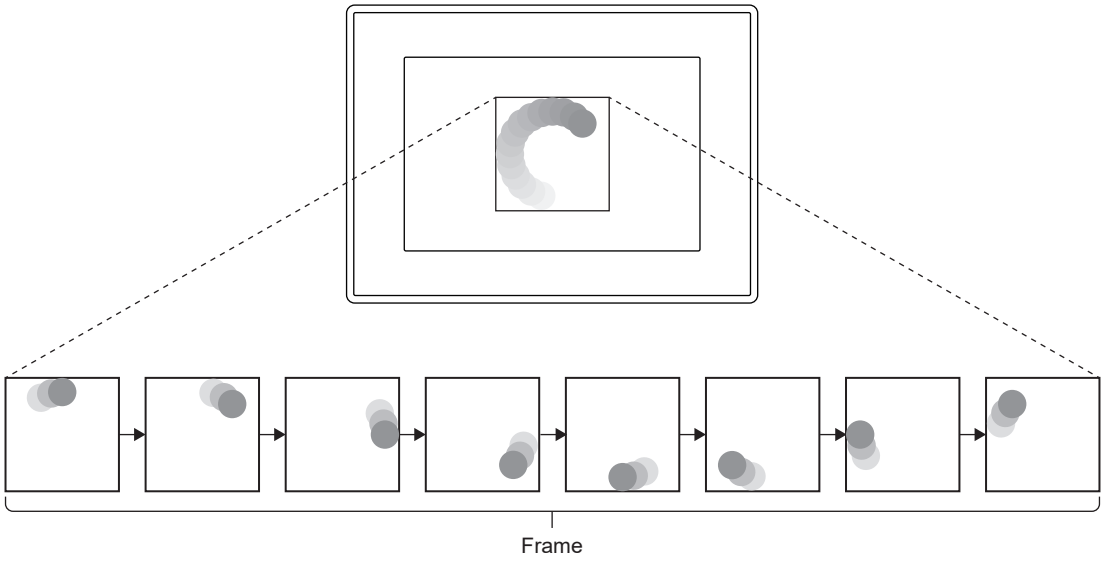
34.1 Overview of the frame animation

GT37 SoftGOT3000

This function displays a frame-by-frame animation.

A frame refers to a frame in a video.

By setting a different graphic for each frame and continuously changing the frame, it appears as though the graphic is moving.



34.2 How to use the frame animation

GT37 SoftGOT3000

The following methods are available for video playback using the frame animation.

☞ Page 1479 Playback in order from the first frame (cycle playback)
☞ Page 1480 Method for specifying a frame with a device (frame number playback)

34.2.1 Playback in order from the first frame (cycle playback)

In this method, a cycle (display time per frame) is specified and the frames are played in order from the first frame.

If the cycle is shortened, the frame rate increases and the animation becomes smoother.

If the cycle is lengthened, the frame rate decreases and the animation becomes rougher.

Ex.

Frame rate when the number of frames is 10

- When the cycle is 0.1 seconds, the frame rate is 10 fps
- When the cycle is 0.5 seconds, the frame rate is 2 fps
- When the cycle is 1 second, the frame rate is 1 fps

Set the cycle with [Frame Update Cycle] in the [Device/Style] tab.

☞ Page 1487 [Period]

34.2.2 Method for specifying a frame with a device (frame number playback)

With this method, the frame to be switched to is specified with a frame number device.

There are two ways to specify a frame with a frame number device; either directly or with a relative value.

Method	Required actions and settings
Specifying a frame number directly	Deselect [Frame No. Scaling Processing] in the [Frame Animation] dialog ([Device/Style] tab). When a value (frame number) is stored in a frame number device, the corresponding frame is displayed. Specifying a frame number with a relative value	Select [Frame No. Scaling Processing] in the [Frame Animation] dialog ([Device/Style] tab). When a range of relative values is set with [Lower Limit] and [Upper Limit], the relationship between the relative values and the frame number is calculated from the range of relative values and the number of frames. The relationship between the relative values and the frame number can be checked in the preview list. ☞ Page 1488 [Frame No.] When a value (relative value) is stored in the frame number device, the corresponding frame is displayed. Example) When the range of relative values is 0 to 99 and the number of frames is 5 Relationship between the relative value and the frame number Relative value / Frame No. 0 to 19 / 0 20 to 39 / 1 40 to 59 / 2 60 to 79 / 3 80 to 99 / 4 
34.3 Specifications of the frame animation

GT37 SoftGOT3000

☞ Page 1481 Maximum number of simultaneously displayed items
☞ Page 1481 Frame animation size
☞ Page 1481 Maximum number of frames
☞ Page 1482 Data that can be set as a graphic in a frame
☞ Page 1482 Displaying a frame in which no graphic is set
☞ Page 1482 Position of the graphic in the frame
☞ Page 1483 Display size of the graphic set in the frame

34.3.1 Maximum number of simultaneously displayed items

Up to 32 frame animations can be displayed simultaneously on the screens being displayed (including the base screen, window screen, set overlay screen, and window screen output for digital image display).

34.3.2 Frame animation size

The following shows the minimum and maximum sizes of the frame animation.

Size	Size (dot)
Minimum	2 × 2
Maximum	1600 × 1600

34.3.3 Maximum number of frames

Up to 64 frames can be created.
A frame number (0 to 63) is automatically assigned to each frame.
The first frame is frame No. 0 and the 64th frame is frame No. 63.

34.3.4 Data that can be set as a graphic in a frame

The table below shows data that can be set as a graphic in a frame.

Type	Description	Remarks
Library data	Images and videos registered in the library. ☞ Page 1061 Using the data registered in the library	—
Image file	The following shows the importable file formats. • BMP format: *.bmp • JPEG format: *.jpg, *.jpeg, *.jpe • PNG format: *.png The maximum size of settable images is 1600 × 1600 pixels.	Image files with different extensions can be mixed for each frame.
		The transparency information of *.png and *.apng files is enabled.
Video file	The following shows the importable file formats. • Animation PNG format: *.png, *.apng • GIF format: *.gif The maximum size of settable videos is 1600 × 1600 pixels.	When a video file is imported, each frame of the video is set as a graphic. If the video file consists of more than 64 frames, the 65th frame onward will be discarded.
		When a video is imported, the graphics in all of the frames are updated. To mix video files and other data (library data or image files), change the graphic in each frame after importing the video file.
		The transparency information of *.png and *.apng files is enabled.

Point

The imported image or video file is set as a graphic in the frame, but it is not registered in the library.
To set the same graphic for another frame animation, register the graphic in the library to eliminate the need to import the file again.
For information on how to register a graphic in the library, refer to the following.
☞ Page 1081 Importing an image file
☞ Page 1083 Importing a video file

34.3.5 Displaying a frame in which no graphic is set

Frames which have no graphic set in them are hidden.
Frames which have no graphic set in them can be played in intervals.

34.3.6 Position of the graphic in the frame

The graphic is displayed in the center of the frame animation placed on the screen.

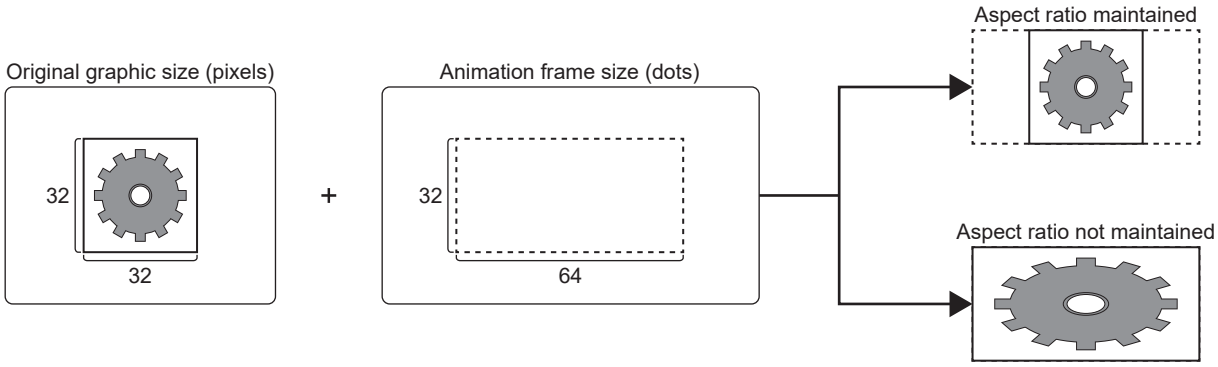
34.3.7 Display size of the graphic set in the frame

The graphic is resized according to the size and shape of the frame animation placed on the screen.

Select [Lock aspect ratio] in the [Device/Style] tab to maintain the original aspect ratio when resizing the object.

☞ Page 1486 [Device/Style] tab

Ex.



PART 7

34.4 Configuring the frame animation settings

GT37 SoftGOT3000

This section explains how to configure the frame animation settings for each playback target.

☞ Page 1484 Playing back video files and videos registered in the library
☞ Page 1485 Setting a graphic in each frame and playing the frames back

Point

Preconfigured frame animations can be used in other screens or projects by registering them in the library.

☞ Page 1068 Registering data in the library

34.4.1 Playing back video files and videos registered in the library

☞ Page 1484 Placing from the menu
☞ Page 1484 Dragging a video file to place it in the screen editor

Placing from the menu

Operating procedure

1. Select [Object] → [Frame Animation] from the menu.
2. Click a position to place the frame animation.

☞ Page 1001 Placing figures and objects

3. Double-click the frame animation to display the [Frame Animation] dialog.
4. In the [Device/ Style] tab, set the type of media to be played back.

☞ Page 1486 [Device/Style] tab

Media	Action	Remarks
Video file	Click the [Browse] button and select a video file to import. The selected video is divided into one graphic per frame.	If the number of video frames exceeds 64, the 65th frame onward will be discarded.
A video registered in the library	Frames are added according to the amount of library data to be played. Click the [Shape] button to display the [Image List] dialog (graphics). ☞ Page 1048 [Library] Select [Collectively set the animation] then select the library data. Once the [OK] button is clicked, the selected library data will be divided into one graphic per frame.	The library data is used only for existing frames. Even if the number of frames is less than the amount of library data, frames are not automatically added.

5. Configure the settings in each tab of the [Frame Animation] dialog.

☞ Page 1486 [Frame Animation] dialog

This concludes the frame animation settings.

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 988 Color settings

Dragging a video file to place it in the screen editor

Drag a video file (GIF/APNG) to the screen editor to place a frame animation.

Each frame of the dragged video file is set to the graphic in each frame of the placed frame animation.

If the number of video frames exceeds 64, the 65th frame onward will be discarded.

The size of the frame animation is the same as the resolution of the video file.

All other settings (excluding the setting of each frame) are set to default.

34.4.2 Setting a graphic in each frame and playing the frames back

Operating procedure

1. Select [Object] → [Frame Animation] from the menu.
2. Click a position to place the frame animation.

☞ Page 1001 Placing figures and objects

3. Double-click the frame animation to display the [Frame Animation] dialog.
4. Select the frames in the preview list in the [Device/Style] tab and set a graphic in each frame.

☞ Page 1486 [Device/Style] tab

5. Configure the settings in each tab of the [Frame Animation] dialog.

☞ Page 1486 [Frame Animation] dialog

This concludes the frame animation settings.

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 988 Color settings

34.5 [Frame Animation] dialog

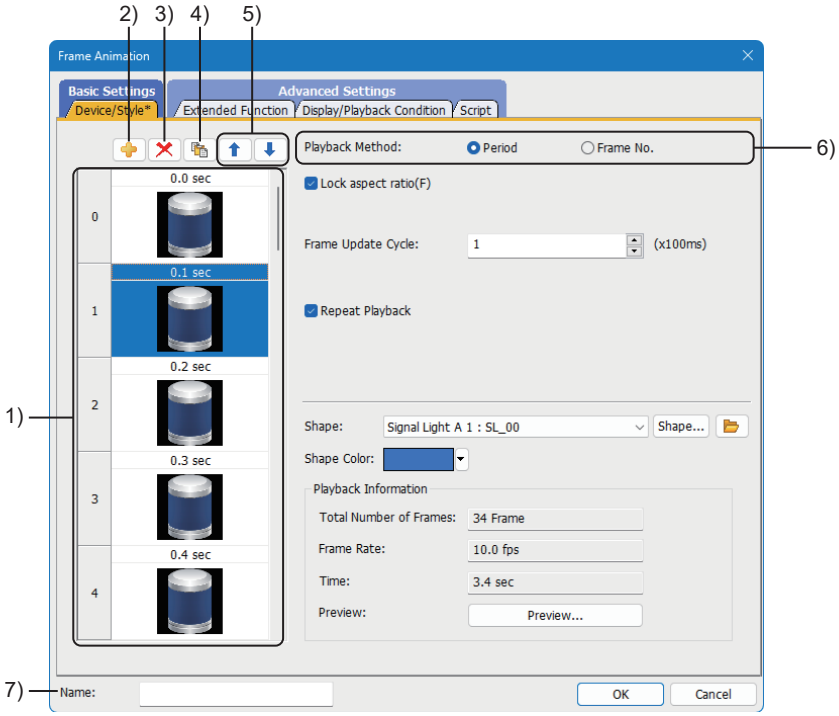
GT37 SoftGOT3000

☞ Page 1486 [Device/Style] tab
☞ Page 1489 [Extended] tab
☞ Page 1490 [Trigger] tab, [Display/Playback Condition] tab
☞ Page 1492 [Script] and [Operation/Script] tabs

34.5.1 [Device/Style] tab

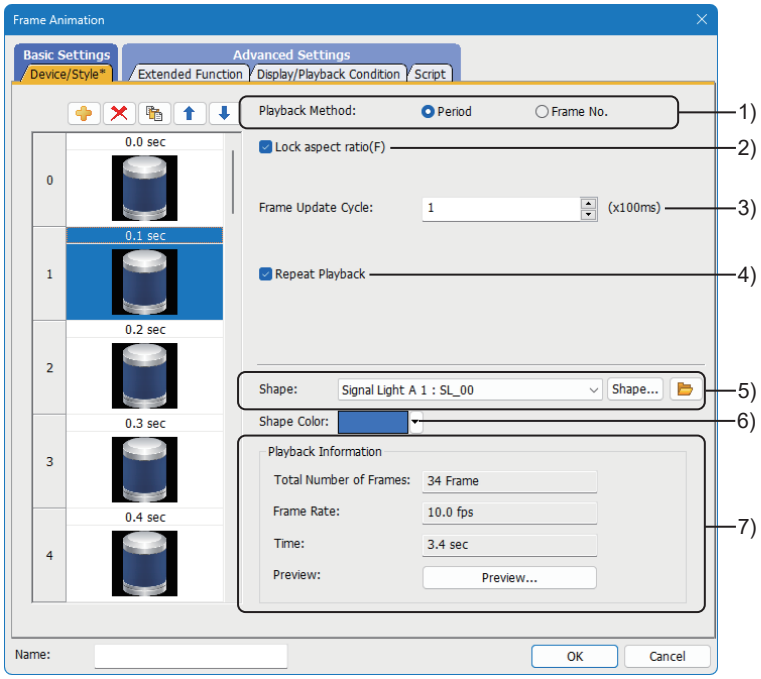
GT37 SoftGOT3000

Configure the playback method and frame-related settings.



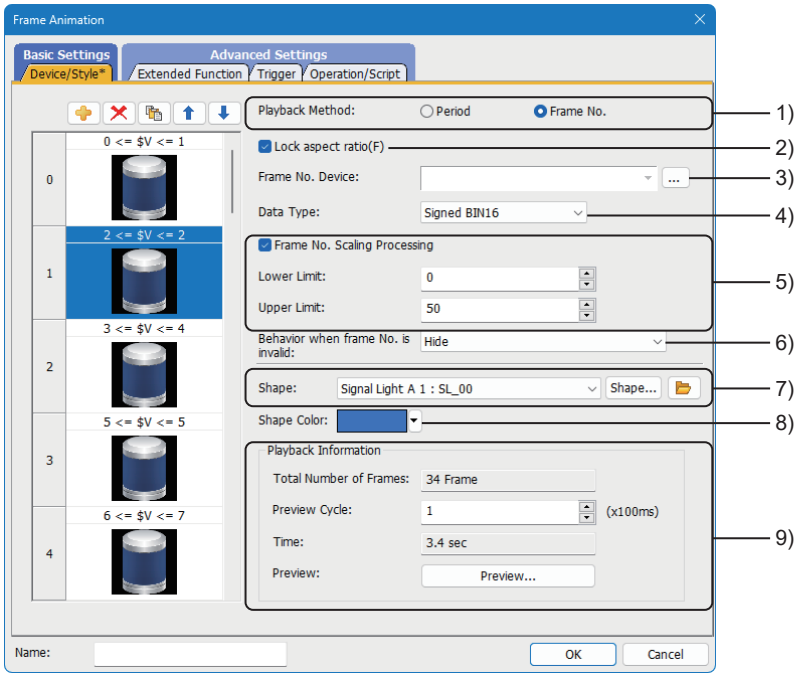
Item		Description
1)	Preview list	A list of frames.
2)	Add button	Adds a frame.
3)	Delete button	Deletes the selected frame from the preview list.
4)	[Duplicate] button	Duplicates the selected frame in the preview list.
5)	Up button Down button	Changes the order of the frame in the preview list.
6)	[Playback Method]	Selects the playback method. The settings in the [Device/Style] tab differ depending on the selected playback method. ☞ Page 1487 [Period] ☞ Page 1488 [Frame No.]
7)	[Name]	Enter a name for the graphic. The name is displayed in the data browser, property sheet, and others. The setting can also be changed in other tabs. Up to 100 characters can be set.

[Period]



Item			Description
1)	[Playback Method]		Select [Period].
2)	[Lock aspect ratio]		Select this item to maintain the aspect ratio of the image. Deselect this item to scale the aspect ratio of the image to the size of the frame animation.
3)	[Frame Update Cycle]		Sets the display time of each frame. The setting range is [1] × 100 ms to [100] × 100 ms. The playback start time (the time each frame is displayed for after playback commences) of each frame in the preview list will be displayed depending on the value set in this field.
4)	[Repeat Playback]		Once the last frame has been played, playback starts again from the first frame. The last frame remains displayed if playback is not repeated. Configure the following settings to repeat playback after an interval. • Duplicate the last frame at the end of the preview list. • Add an empty frame at the end of the preview list.
5)	[Shape]	—	Set a graphic to display using the frame animation. Select a frame from the preview list then select a graphic for that frame.
		[Shape] button	Click this button to display the [Image List] dialog and select a graphic from the library. ☞ Page 1045 [Image List] dialog (shape)
		[Browse] button	Click this button to display the [Browse] dialog and import an image or video file. When an image is imported, it is set as a graphic in the selected frame in the preview list. When a video is imported, the graphics in all of the frames are updated.
6)	[Shape Color]		Change the shape color of the shape in the selected frame of the preview list. This item appears when a shape in the System Library is set.
7)	[Playback Information]	[Total Number of Frames]	The total number of frames created in the preview list.
		[Frame Rate]	[Total Number of Frames] ÷ [Time]
		[Time]	The amount of time it takes to play all the frames set for [Frame Update Cycle].
		[Preview]	Preview the video with the applied settings. Click the [Preview] button to play the video in the [Preview] dialog.

[Frame No.]

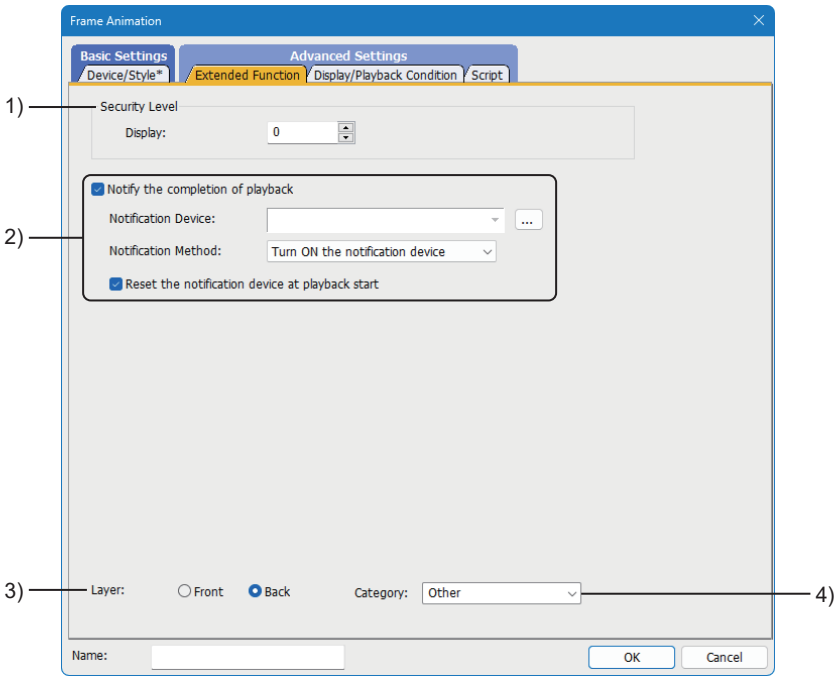


Item			Description
1)	[Playback Method]		Select [Frame No.].
2)	[Lock aspect ratio]		Select this item to maintain the aspect ratio of the image. Deselect this item to scale the aspect ratio of the image to the size of the frame animation.
3)	[Frame No. Device]		Set a word device to specify the frame number of the frame to be displayed. ☞ Page 834 How to set devices, labels, and tags
4)	[Data Type]		Select the data type of [Frame No. Device].
5)	[Frame No. Scaling Processing]		Specify a frame number with a relative value, not directly. ☞ Page 1480 Method for specifying a frame with a device (frame number playback) When a range of relative values is set with [Lower Limit] and [Upper Limit], the relationship between the relative values and the frame number is calculated from the range of relative values and the number of frames. The setting range of the [Lower Limit] and [Upper Limit] depends on the [Data Type]. • [Unsigned BIN16]: [0] to [65535] • [Signed BIN16]: [-32768] to [32767] • [BCD16]: [0] to [9999] The relationship between the relative value and the frame number can be checked via the range formula displayed in each frame in the preview list.
6)	[Behavior when frame No. is invalid]		Select the action when a value outside the range is written to the frame number device.
7)	[Shape]	—	Set a graphic to display using the frame animation. Select a frame from the preview list then select a graphic for that frame.
		[Shape] button	Click this button to display the [Image List] dialog and select a graphic from the library. ☞ Page 1045 [Image List] dialog (shape)
		[Browse] button	Click this button to display the [Browse] dialog and import an image or video file. When an image is imported, it is set as a graphic in the selected frame in the preview list. When a video is imported, the graphics in all of the frames are updated.
8)	[Shape Color]		Change the shape color of the shape in the selected frame of the preview list. This item appears when a shape in the System Library is set.
9)	[Playback Information]	[Total Number of Frames]	The total number of frames created in the preview list.
		[Preview Cycle]	Set the playback speed in preview.
		[Time]	The amount of time it takes to play all the frames set for [Preview Cycle].
		[Preview]	Preview the video with the applied settings. Click the [Preview] button to play the video in the [Preview] dialog.

34.5.2 [Extended] tab

GT37 SoftGOT3000

Set the security level and configure the settings that notify playback is complete.



Item			Description
1)	[Security Level]		Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Notify the completion of playback]	—	Uses a notification device to notify that playback is complete.
		[Notification Device]	Set the bit device to notify that playback is complete. ☞ Page 834 How to set devices, labels, and tags
		[Notification Method]	Select whether to turn the notification device on or off once playback is complete.
		[Reset the notification device at playback start]	Resets the notification device at the beginning of playback. When [Turn ON the notification device] is selected for [Notification Method], the notification device is turned off. When [Turn OFF the notification device] is selected for [Notification Method], the notification device is turned on.
3)	[Layer]		Select the layer to place the object. ☞ Page 65 Layer
4)	[Category]		Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

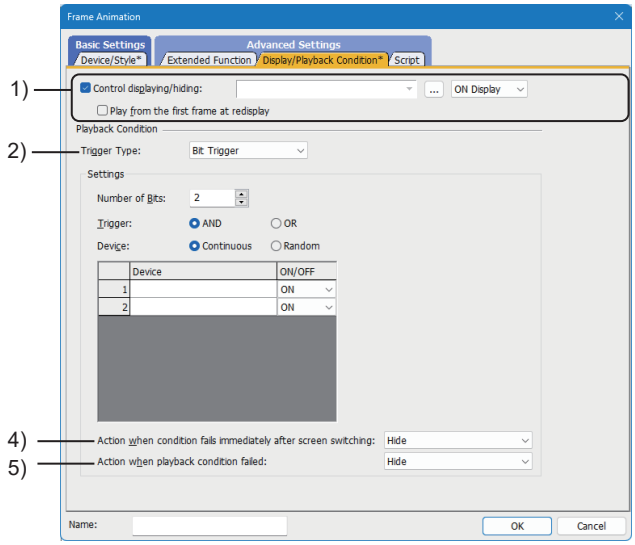
PART 7

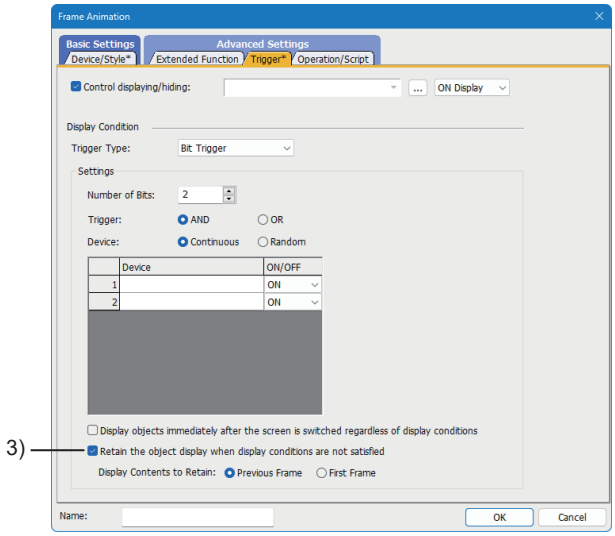
34.5.3 [Trigger] tab, [Display/Playback Condition] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.

Different tabs appear depending on the setting of [Playback Method] in the [Device/Style] tab.





Item			Description
1)	[Control displaying/hiding]	—	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off
		[Play from the first frame at redisplay]	Starts the animation from the first frame when the object status changes from not displayed to displayed.
2)	[Trigger Type]		Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Retain the object display when display conditions are not satisfied]		Displays the specified frame when the display conditions are not satisfied. The frame that is displayed when the display conditions are not satisfied is selected in [Display Contents to Retain]. For information on which frame playback will begin from when the display conditions change from not satisfied to satisfied, refer to the following. ☞ Page 1490 Frames that are played when the display conditions change from not satisfied to satisfied
4)	[Action when condition fails immediately after screen switching]		Specify the behavior of the object immediately after the screen transition while the playback condition is not satisfied.
5)	[Action when playback condition failed]		Specify the behavior when the playback condition transitions from the satisfied state to the unsatisfied state.

Frames that are played when the display conditions change from not satisfied to satisfied

Which frame playback will start from when the display conditions change from not satisfied to satisfied differs depending on the settings of the display conditions.

[Playback Method]	Display condition settings		Actions when display conditions change from not satisfied to satisfied
	[Retain the object display when display conditions are not satisfied]	[Display Contents to Retain]	
[Period]	Deselected	—	Playback starts from the current frame just as it is about to be hidden.
	Selected	[Previous Frame]	Playback starts from the paused frame.
		[First Frame]	Playback starts from the first frame.

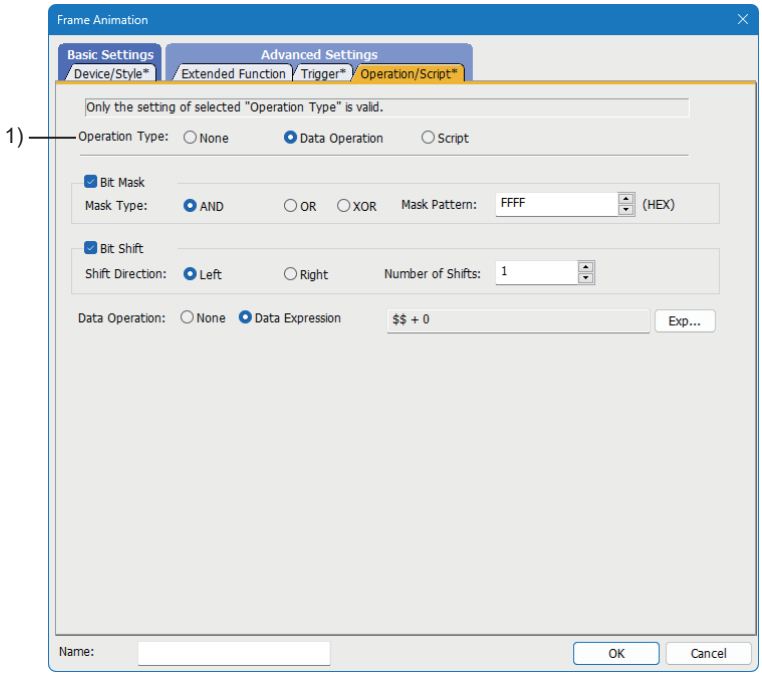
[Playback Method]	Display condition settings		Actions when display conditions change from not satisfied to satisfied
	[Retain the object display when display conditions are not satisfied]	[Display Contents to Retain]	
[Frame No.]	Deselected	—	Playback starts from the frame specified with the frame number specification device.
	Selected	[Previous Frame]	
		[First Frame]	

34.5.4 [Script] and [Operation/Script] tabs

GT37 SoftGOT3000

Different tabs appear depending on the setting of [Playback Method] in the [Device/Style] tab.

[Playback Method] settings	Description
[Period]	Displays the [Script] tab. Set the expressions for the script function. ☞ Page 1494 [Script]
[Frame No.]	Displays the [Operation/Script] tab. Set an expression when you perform monitoring with the data operation function or the script function.



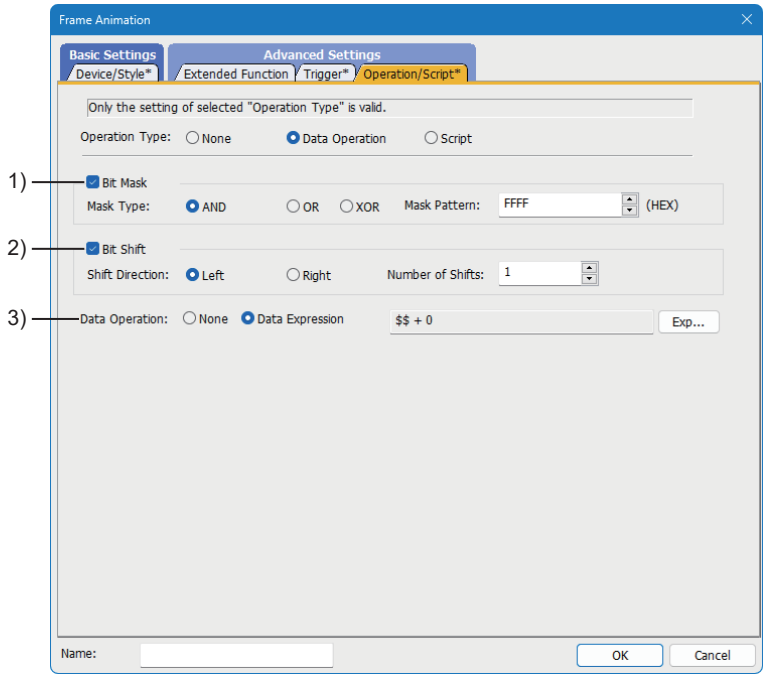
Item			Description
1)	[Operation Type]	[None]	Does not use the data operation function and the script function.
		[Data Operation]	Set the expression used for the data operation function. ☞ Page 1493 [Data Operation]
		[Script]	Set the expressions for the script function. ☞ Page 1494 [Script]

[Data Operation]

Configure the operating process for the frame number device.

For details on the data operation settings, refer to the following.

☞ Page 1049 Data operation

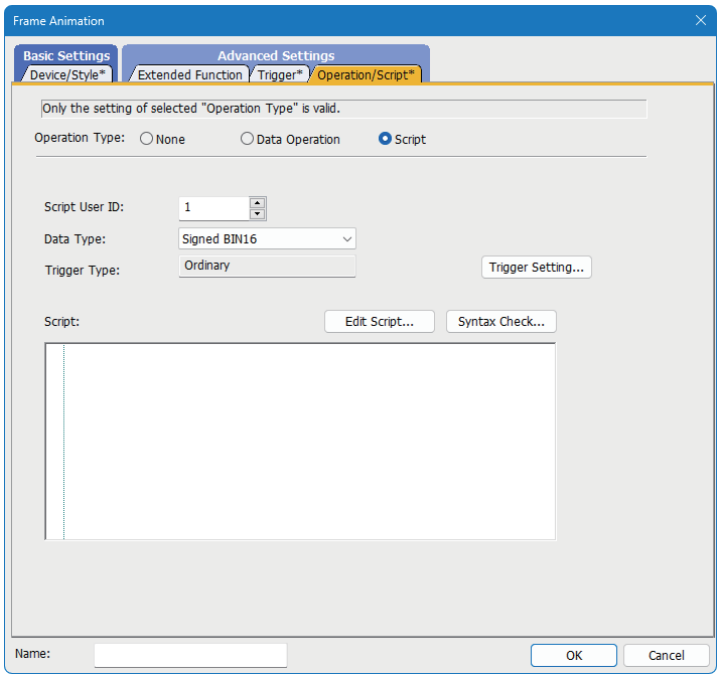


Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range depends on the setting of [Data Type] in the [Device/Style] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range depends on the setting of [Data Type] in the [Device/Style] tab.
3)	[Data Operation]	—	Set the format of the expression.
		[None]	Does not perform the data operation by using the expression.
		[Data Expression]	Performs the data operation by using the expression. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

[Script]

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	**Setting**	**Property name**	**Read**	**Write**	**Timing for reflecting the setting change*1**
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.

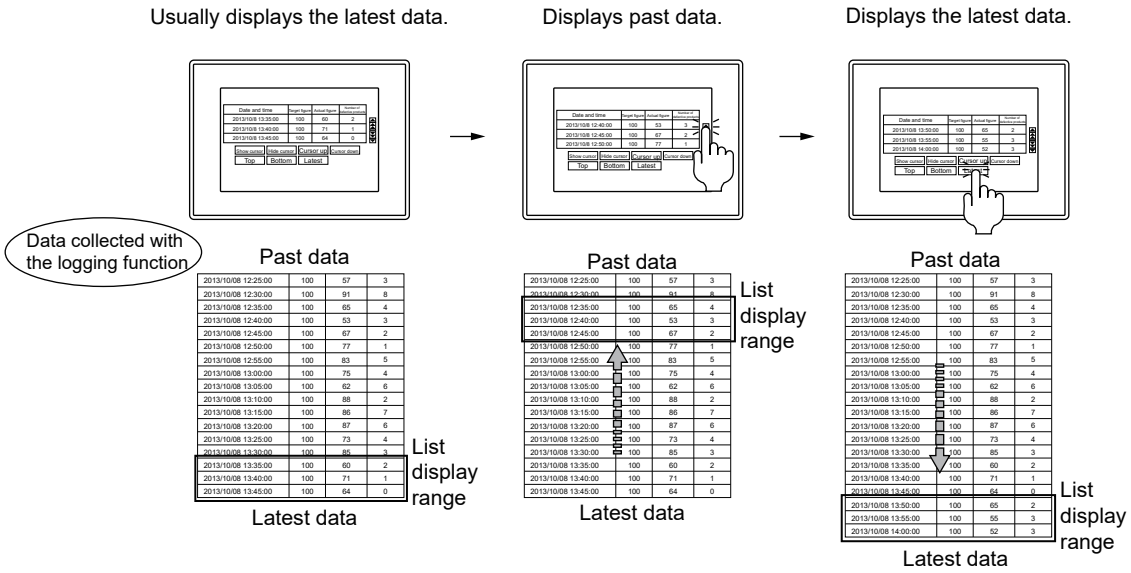
☞ Page 2456 Timing at which the setting change of an object property is reflected

35 Placing a historical data list display

GT37 SoftGOT3000

This function chronologically lists the device data collected by logging.

☞ Page 2194 Collecting device data ([Logging])



☞ Page 1495 Specifications of the historical data list display
☞ Page 1498 How to use the historical data list display
☞ Page 1504 [Historical Data List Display] dialog

35.1 Specifications of the historical data list display

GT37 SoftGOT3000

35.1.1 Maximum number of objects that can be placed on one screen

Up to eight objects can be placed on one screen.

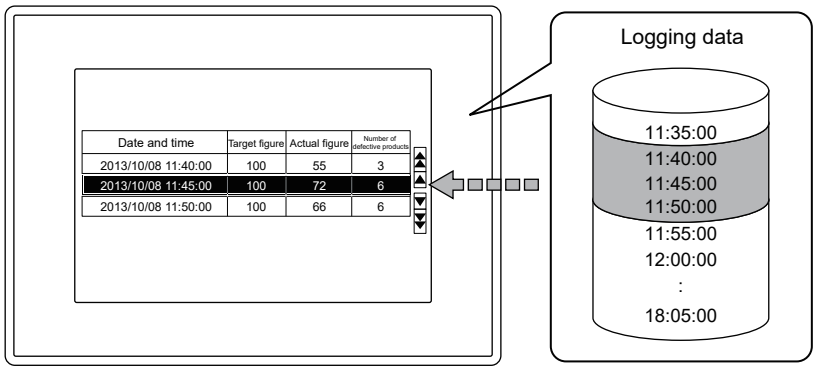
35.1.2 Relationship with the logging function

For information on the logging function, refer to the following.

☞ Page 2194 Collecting device data ([Logging])

Contents displayed by historical data list displays

The data collected or accumulated in buffering areas or data storage by the logging is displayed as a list with this function.
As the accumulated data are available, current and past information can be displayed as a list.



Displays accumulated data in a list.

Logging data which can be displayed with historical data list displays

One historical data list display corresponds to only one logging ID number for the display of data.
To display multiple logging ID numbers, set the same number of historical data list displays.

A logging setting required when historical data list displays are used

Make sure that the set value of [Number of Logs a file] in the relevant logging setting is equal to or larger than the set value of [Display Rows] in the historical data list display setting to secure performance.

☞ Page 1504 [Display] tab

Consistency check

The consistency between the setting of a historical data list display and the corresponding logging setting is checked at the following timing.

- When the setting dialog for a historical data list display is opened
- When devices of a historical data list are enabled and a data check is conducted

Precautions

If the logging devices of the logging settings are changed or the data of another project for logging is utilized after a historical data list display is set, the device of the logging setting may not match the device of the historical data list display.
In this case, set the device of the historical data list display again.
When the device type does not match, the historical data list display is not displayed.

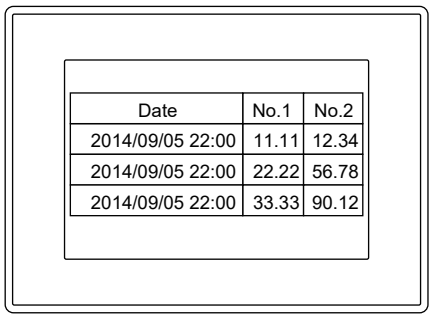
35.1.3 Display when a data operation error occurs

For the data operation, if a BCD-BIN conversion error or a division by zero error occurs, the object displays hyphens corresponding to the number of displayed digits.

Display of a value containing a symbol or decimal point

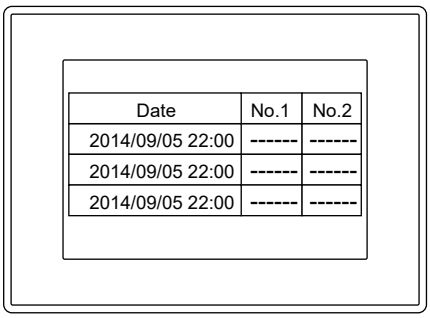
A symbol and a decimal point, which are contained in a value, are also displayed as hyphens.

Example) When the settings are configured as follows: display format: real, number of displayed digits: 5 (fractional portion: 2), and right alignment



Date	No.1	No.2
2014/09/05 22:00	11.11	12.34
2014/09/05 22:00	22.22	56.78
2014/09/05 22:00	33.33	90.12

Normal display



Date	No.1	No.2
2014/09/05 22:00	------	------
2014/09/05 22:00	------	------
2014/09/05 22:00	------	------

Display at an error occurrence

PART 7

35.2 How to use the historical data list display

GT37 SoftGOT3000

35.2.1 Placing a historical data list display

Place historical data list displays on the screen editor.

☞ Page 1001 Placing figures and objects

35.2.2 Editing historical data list displays

Edit historical data list displays that have been placed on the screen editor.

☞ Page 1003 Selecting figures and objects on the screen editor

☞ Page 1007 Resizing

35.2.3 Setting historical data list displays

Set historical data list displays that have been placed on the screen editor.

Common settings for objects

For the common settings for objects, refer to the following.

☞ Page 1032 Settings common to figures and objects

Setting historical data list displays

The following outlines the procedure for setting a historical data list display.

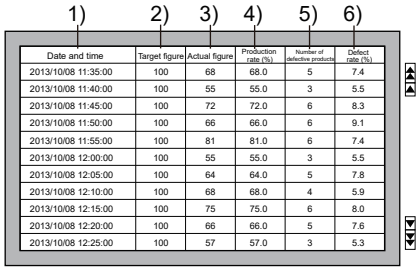
Ex.

A historical data list display that displays target figures and actual figures

D10, D20, and D30 are logged in a trigger sampling cycle of 300000 ms.

☞ Page 1504 [Historical Data List Display] dialog

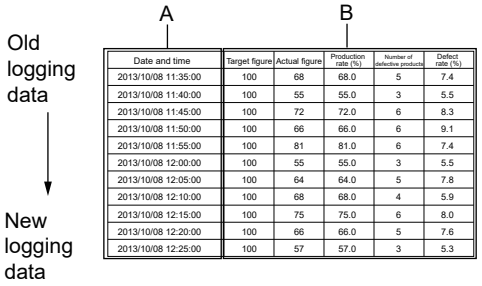
☞ Page 2194 Collecting device data ([Logging])



Date and time	Target figure	Actual figure	Production rate (%)	Number of defective products	Defect rate (%)
2013/10/08 11:35:00	100	68	68.0	5	7.4
2013/10/08 11:40:00	100	55	55.0	3	5.5
2013/10/08 11:45:00	100	72	72.0	6	8.3
2013/10/08 11:50:00	100	66	66.0	6	9.1
2013/10/08 11:55:00	100	81	81.0	6	7.4
2013/10/08 12:00:00	100	55	55.0	3	5.5
2013/10/08 12:05:00	100	64	64.0	5	7.8
2013/10/08 12:10:00	100	68	68.0	4	5.9
2013/10/08 12:15:00	100	75	75.0	6	8.0
2013/10/08 12:20:00	100	66	66.0	5	7.6
2013/10/08 12:25:00	100	57	57.0	3	5.3

Item		Description
1)	Date and time	Displays the date and time when logging data is obtained.
2)	Target figure	Monitors the value of D10.
3)	Actual figure	Monitors the value of D20.
4)	Production rate (%)	Displays the value that derives from "Actual figure ÷ Target figure × 100". (0 to 100.0%)
5)	Number of detective products	Monitors the value of D30.
6)	Defect rate (%)	Displays the value that derives from "Number of defective products ÷ Actual figure × 100". (0 to 100.0%)

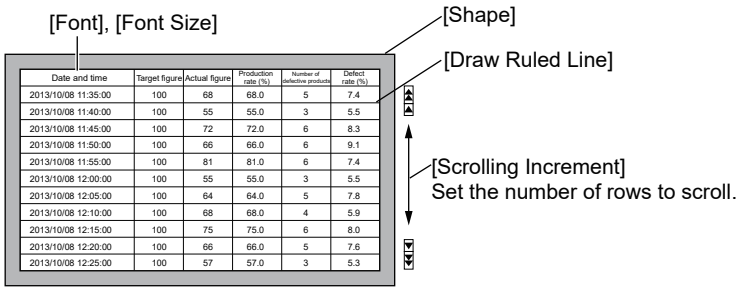
1. Set the number of rows and columns to be displayed, the device to be monitored, and the items to be monitored in the [Display] tab.



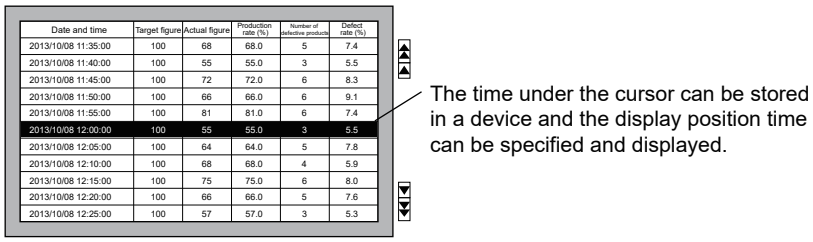
A Date column
Date and time stored in the logging data

B Data column
Device values are displayed according to the device setting.

2. Set the font, font size, ruled line, spacing, and figure in the [Text/Style] tab.



3. Set the security level, time of the cursor position, and time of the display position in the [Extended] tab if necessary.



35.2.4 Displaying and moving the cursor

The cursor can be displayed and moved in the list with a key code switch.

With the setting of [Single Touch Operation], the cursor can be displayed directly on and moved to a touched position.

When [Time Device] in the [Extended] tab of [Historical Data List Display] is set, a selected date and time are stored in a set device.

☞ Page 1512 [Extended] tab

Date and time	Target figure	Actual figure	Production rate (%)	Number of defective products	Defect rate (%)
2013/10/08 11:45:00	100	72	72.0	6	8.3
2013/10/08 11:50:00	100	66	66.0	6	9.1
2013/10/08 11:55:00	100	81	81.0	6	7.4
2013/10/08 12:00:00	100	55	55.0	3	5.5
2013/10/08 12:05:00	100	64	64.0	5	7.8
2013/10/08 12:10:00	100	68	68.0	4	5.9
2013/10/08 12:15:00	100	75	75.0	6	8.0

→

Date and time	Target figure	Actual figure	Production rate (%)	Number of defective products	Defect rate (%)
2013/10/08 11:45:00	100	72	72.0	6	8.3
2013/10/08 11:50:00	100	66	66.0	6	9.1
2013/10/08 11:55:00	100	81	81.0	6	7.4

2013/10/08 12:10:00	100	68	68.0	4	5.9
2013/10/08 12:15:00	100	75	75.0	6	8.0

[Time Device]
Device value: 2013/10/08 12:00:00

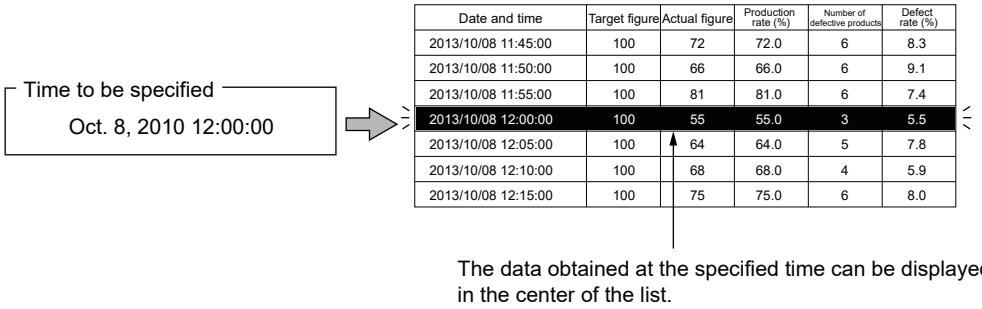
35.2.5 Displaying data obtained at a specified time

The data obtained at a specified time can be displayed with a key code switch.

When [Display Position Time Device] in the [Extended] tab of the [Historical Data List Display] dialog is set, the data of a specified time is displayed in the center of the list of the historical data list display.

☞ Page 1512 [Extended] tab

When the data of a specified time is displayed, the update of the list stops.



Date and time	Target figure	Actual figure	Production rate (%)	Number of defective products	Defect rate (%)
2013/10/08 11:45:00	100	72	72.0	6	8.3
2013/10/08 11:50:00	100	66	66.0	6	9.1
2013/10/08 11:55:00	100	81	81.0	6	7.4
2013/10/08 12:00:00	100	55	55.0	3	5.5
2013/10/08 12:05:00	100	64	64.0	5	7.8
2013/10/08 12:10:00	100	68	68.0	4	5.9
2013/10/08 12:15:00	100	75	75.0	6	8.0

35.2.6 Conjunction with historical trend graphs

By setting the same device to [Time Device] of historical data list displays and [Display Position Time] of historical trend graphs, the data obtained at time specified with a historical data list display can be displayed in a historical trend graph.

☞ Page 1512 [Extended] tab

☞ Page 1594 Placing a trend graph

Ex.

Displaying the data obtained at time specified with a historical data list display in a historical trend graph

Make the following settings.

- Set [D1000] for [Time Device] of the [Historical Data List Display] dialog.
- Set [D1000] for [Display Position Time] of the [Historical Trend Graph].

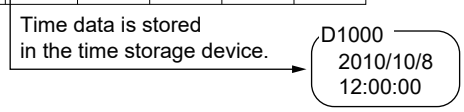
Operating procedure

1. Display the cursor in the historical data list display and move the cursor to the data to be displayed in the historical trend graph.

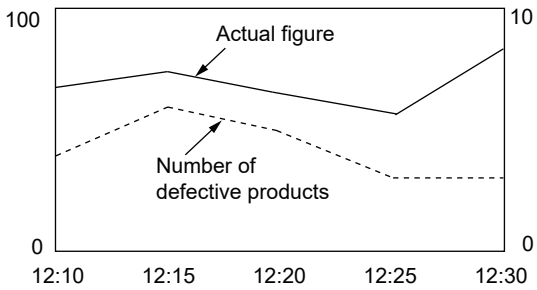
The time is stored in the time device (D1000). (Device value: specified time)

Historical data list display

Date and time	Target figure	Actual figure	Production rate (%)	Number of defective products	Defect rate (%)
2013/10/08 11:35:00	100	68	68.0	5	7.4
2013/10/08 11:40:00	100	55	55.0	3	5.5
2013/10/08 11:45:00	100	72	72.0	6	8.3
2013/10/08 11:50:00	100	66	66.0	6	9.1
2013/10/08 11:55:00	100	81	81.0	6	7.4
2013/10/08 12:00:00	100	55	55.0	3	5.5
2013/10/08 12:05:00	100	64	64.0	5	7.8
2013/10/08 12:10:00	100	68	68.0	4	5.9
2013/10/08 12:15:00	100	75	75.0	6	8.0
2013/10/08 12:20:00	100	66	66.0	5	7.6
2013/10/08 12:25:00	100	57	57.0	3	5.3



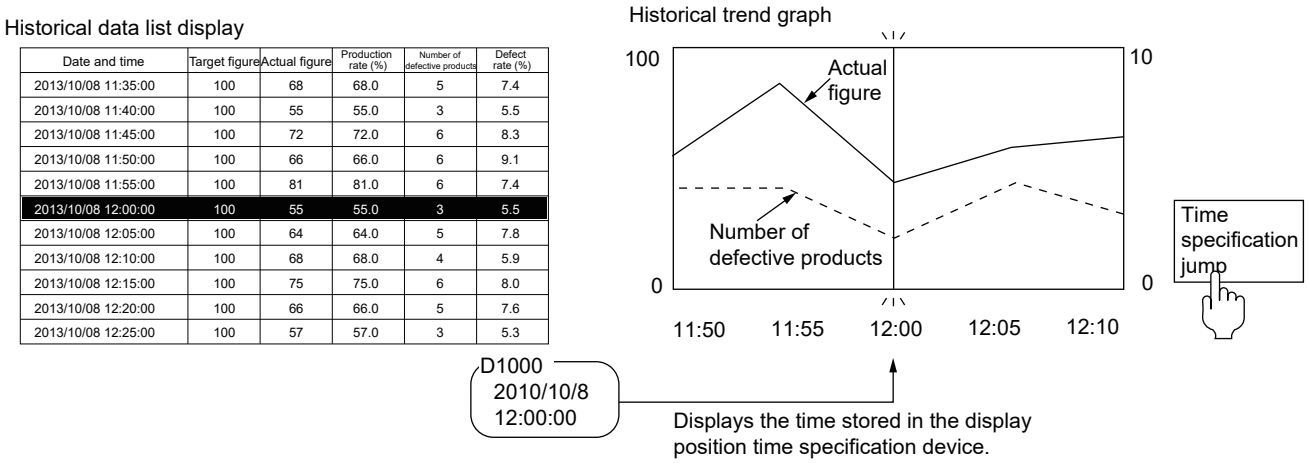
Historical trend graph



2. Enter the key code of the display position time specification jump (FFD4h) with a touch switch. The data obtained at the time stored in [Display Position Time Device] (D1000) is displayed in the historical trend graph.

Historical data list display

Date and time	Target figure	Actual figure	Production rate (%)	Number of defective products	Defect rate (%)
2013/10/08 11:35:00	100	68	68.0	5	7.4
2013/10/08 11:40:00	100	55	55.0	3	5.5
2013/10/08 11:45:00	100	72	72.0	6	8.3
2013/10/08 11:50:00	100	66	66.0	6	9.1
2013/10/08 11:55:00	100	81	81.0	6	7.4
2013/10/08 12:00:00	100	55	55.0	3	5.5
2013/10/08 12:05:00	100	64	64.0	5	7.8
2013/10/08 12:10:00	100	68	68.0	4	5.9
2013/10/08 12:15:00	100	75	75.0	6	8.0
2013/10/08 12:20:00	100	66	66.0	5	7.6
2013/10/08 12:25:00	100	57	57.0	3	5.3



Point

Displaying data of historical trend graphs in historical data list displays

By setting the same device to [Time Device] of historical trend graphs and [Display Position Time Device] of historical data list displays, the data obtained at time specified with a historical trend graph can be displayed in a historical data list display.

☞ Page 1512 [Extended] tab

☞ Page 1594 Placing a trend graph

Precautions

■When using the time specification jump function

If the time specification jump function is used, the update processing of the list stops.

To resume the update processing, touch a touch switch for which the key code (FFEFh) is set.

■When carrying out another operation while a time specification jump is performed

While the data obtained at a specified time is searched with the time specification jump function, the operations with functions other than the historical data list display cannot be performed.

■When multiple values of logging data are obtained around a specified time

If logging data are not obtained at a specified time, the data obtained at the nearest time is searched.

When the multiple values are obtained at the nearest time, the first detected value is displayed.

■When displaying the data obtained at the start of logging and the data obtained around the time when the latest data is obtained

When the logging data obtained at a specified time is the one obtained at the start of the logging or the data obtained around the time when the latest data is obtained, the data to be displayed may not be displayed in the center of the historical data list display.

■When performing a time specification jump without specifying time

When performing a time specification jump without specifying time (all the settings of [Display Position Time Device] are 0), the update processing stops and the latest data is displayed.

To resume the update processing, touch a touch switch for which the key code (FFEFh) is set.

■When there is no logging data that can be displayed in historical data list displays

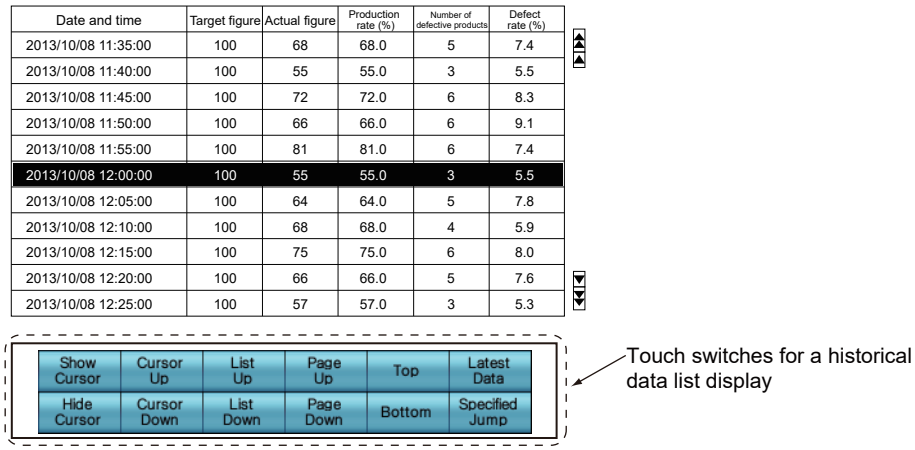
When there is no logging data that can be displayed in a historical data list display, no time specification jump is performed.

■When the logging data to be displayed are not shown in chronological order

When the logging data to be displayed are not shown in chronological order due to a time change of the GOT's clock, the data obtained at the time the nearest to a specified time may not be displayed.

35.2.7 Touch switches for historical data list displays

Touch switches for the historical data list display are available by reading from the library of GT Designer3.
The text and shape of each touch switch are user-changeable.
When key codes are set for touch switches, touch switches for the historical data list display can be created by a user.



Touch switch	Key code	Description
Show cursor	FFF0h	Displays or hides the cursor. Displays the cursor in the center of the list.
Hide cursor	FFF1h	
List Cursor Up	FFF2h	Moves the cursor upward or downward.
List Cursor Down	FFF3h	
List Displacement Scroll Up	FFF4h	Scrolls the cursor to the row a specified number of rows below or above. By setting [Scrolling Increment], the number of the rows between the original position and destination can be changed. ☞ Page 1510 [Text/Style] tab
List Displacement Scroll Down	FFF5h	
List Page Scroll Up	FFF6h	Scrolls the cursor to the row a specified number of rows displayed in the list below or above.
List Page Scroll Down	FFF7h	
Jump to the top of the list	FFD0h	Moves the cursor to the top of the list.

Touch switch	Key code	Description
Jump to the bottom of the list 	FFD1h	Moves the cursor to the bottom of the list.
Latest Data 	FFEFh	Displays the latest data.
Move display position to the specified time 	FFD4h	Displays the time data stored in the Display Position Time Specification device in the center. (Time specification jump function)

35.2.8 Operations performed using the object gesture function

The display of objects can be operated using gestures.

For information on operations using gestures, refer to the following.

☞ Page 507 Operating objects with gestures (object gesture function)

PART 7

35.3 [Historical Data List Display] dialog

GT37 SoftGOT3000

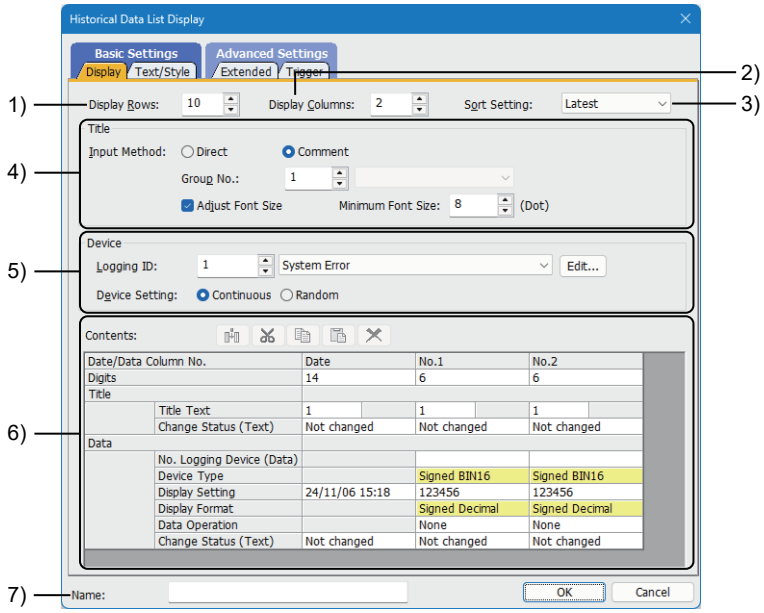
Operating procedure

1. Select [Object] → [Historical Data List Display] from the menu.
2. Click the position to place a historical data list display.
3. Double-click the historical data list display to display the setting dialog.

☞ Page 1504 [Display] tab
☞ Page 1510 [Text/Style] tab
☞ Page 1512 [Extended] tab
☞ Page 1517 [Trigger] tab

35.3.1 [Display] tab

GT37 SoftGOT3000



Item		Description
1)	[Display Rows]	Set the number of rows excluding the title row. The setting range is [1] to [47].
2)	[Display Columns]	Set the number of the data columns. The setting range is [1] to [32].
3)	[Sort Setting]	Select the method of sorting out the rows to be displayed. The following shows selectable items. • [Latest] • [Oldest]

Item			Description
4)	[Title]	[Input Method]	Select the method of setting the text to be displayed in the title. The following shows selectable items. • [Direct] • [Comment]
		[Group No.]	This item can be set only when [Comment] is selected for [Input Method]. Set the comment group number to be used. The setting range is [1] to [500].
		[Adjust Font Size]	This item can be set only when [Comment] is selected for [Input Method]. The font size is automatically adjusted according to the object size. When this item is deselected, a line feed is automatically inserted.
		[Minimum Font Size]	This item can be set only when [Adjust Font Size] is set. Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.
5)	[Device]	[Logging ID]	Set the logging ID number to be displayed. The setting range is [1] to [32767]. When the [Edit] button is clicked, the [Logging] dialog appears and the logging ID number can be edited. ☞ Page 2194 Collecting device data ([Logging])
		[Device Setting]	Select the setting method for [No. Logging Device]. The following shows selectable items. • [Continuous]: Set the number of successive devices counted from a set first device. The number of successive devices is the same as that of logging blocks. • [Random]: Set the number of devices one by one.

Item			Description
6)	[Contents]	Edit button	Edits display columns or others.  • [Insert Data Column] button Inserts a new column on the left of a selected data column. • [Cut] button Cuts a selected data column. • [Copy] button Copies a selected data column or character string. • [Paste] button Pastes a cut or copied data column or character string. • [Delete] button Deletes a selected data column.
		[Date/Data Column No.]	Displays the data column numbers of the number of the columns set for [Date] and [Display Columns].
		[Digits]	Set the number of digits to be displayed in each column. The following shows the setting ranges. • [Date]: [5] to [100] • Data column No.: [1] to [100]
		[Title Text]	Set the title of each column. Depending on the selection in [Input Method], the setting items are different. • If [Direct] is selected for [Input Method]: Enter the title in the text box directly. • If [Comment] is selected for [Input Method]: Set a comment No. or a comment. The setting range is [1] to [32767].
		[Change Status (Text)]	Displays whether the format of the title has been changed or not. • [Changed] • [Not changed] Click the [...] button to display the [Text Format] dialog. The format of the title is user-changeable. ☞ Page 1507 [Text Format] dialog
		[No. Logging Device]	In the [Device List] dialog, select a logging device of a selected logging ID number. When a logging device is selected in the [Device List] dialog, the order of the logging device and the device are displayed. 		[Device Type]	Displays the device type selected for [No. Logging Device].
		[Display Setting]	Depending on the column to be set, the setting item differs. • If the [Date] column is set: Set the display format of the date and time for [Date/Time Setting]. ☞ Page 3684 [Date/Time Setting] dialog (screen) • If a data column is set: Set the display format of the device and numerical value in the [Display Setting] dialog. ☞ Page 1508 [Display Setting] dialog (historical data list display)
		[Display Format]	Displays the setting of [Display Format] in the [Display Setting] dialog.
		[Data Operation]	Set an expression in the [Edit Data Expression] dialog. Signed BIN16 is used as the data type of the device specified in the expression. ☞ Page 1053 How to set the data operation When no expression is set, [None] is displayed. For a device capable of storing an integer only, refer to the following to display the device value as a real number. ☞ Page 1509 Displaying an integer as a real number
		[Change Status (Text)]	Displays whether the format of the data column has been changed or not. • [Changed] • [Not changed] Click the [...] button to display the [Text Format] dialog. The format of the data column is user-changeable. ☞ Page 1507 [Text Format] dialog

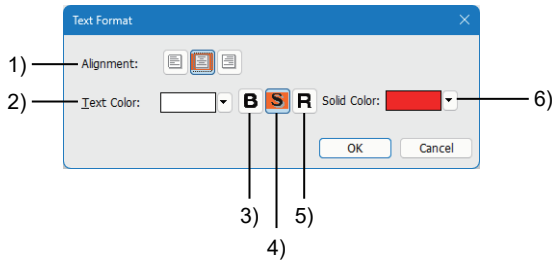
Item		Description
7)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

Precautions

When the bit is selected for the device type, the screen editor always displays the off status even if the display is switched to on.

In the GOT, ON or OFF status of the monitored device is displayed correctly.

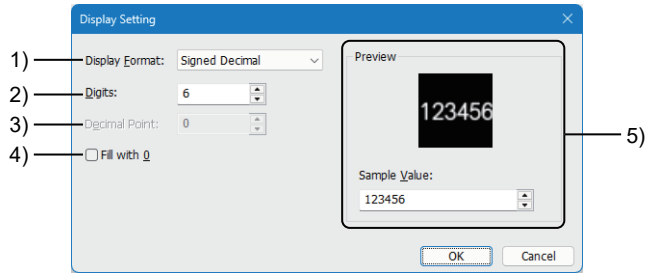
[Text Format] dialog



Item		Description
1)	[Alignment]	Set the horizontal and vertical positions of the text.
2)	[Text Color]	Set the text color. ☞ Page 988 Color settings
3)	[Bold] button	Displays the text in bold.
4)	[Solid] button	Displays the text with a shadow.
5)	[Raised] button	Displays the text embossed.
6)	[Solid Color]	When [Solid] or [Raised] is selected as the text style, set the color of the shadow.

PART 7

[Display Setting] dialog (historical data list display)



Item			Description
1)	[Display Format]		Select the display type of the device to be monitored.*1
2)	[Digits]		Set the number of the digits of the numerical values to be displayed. The setting range differs depending on the setting of [Display Type]. • [Signed Decimal] or [Unsigned Decimal]: [1] to [21] • [Hexadecimal]: [1] to [16] • [Octal]: [1] to [6] • [Binary] or [Real]: [1] to [32]
3)	[Decimal Point]		Set the number of digits to the right of the decimal point to be displayed. The setting range is [0] to [30]. This item can be set only when [Format] is [Real]. If there are digits to the right of a set rightmost digit, the value is rounded off and displayed. When 0 is set, the value is rounded off to the first decimal place. Example) When the device value is 6.57, and [Decimal Point] is set to [1] 4)	[Fill with 0]		Prefixes a numerical value with 0 and displays it. Example) When the device value is 5 and [Digits] is set to [5] 5)	[Preview]	[Sample Value]	Displays the preview of the screen. Set the numerical value to be displayed in the preview.

*1 The selectable items vary depending on the data type of the device.
○: Supported, —: Not supported

[Data Type]	[Display Format]					
	[Signed Decimal]	[Unsigned Decimal]	[Hexadecimal]	[Octal]	[Binary]	[Real]
[Signed BIN16]	○	○	○	○	○	○
[Unsigned BIN16]	○	○	○	○	○	○
[Signed BIN32]	○	○	○	—	○	○
[Unsigned BIN32]	○	○	○	—	○	○
[Signed BIN64]	○	○	○	—	—	○
[Unsigned BIN64]	○	○	○	—	—	○
[Signed BIN8]	○	○	○	○	○	○
[Unsigned BIN8]	○	○	○	○	○	○
[BCD16]	○	○	○	○	○	○
[BCD32]	○	○	○	—	○	○
[BCD64]	○	○	○	—	—	○
[Real(32bit)]	○	○	○	—	○	○
[Real(64bit)]	○	○	○	—	—	○

Precautions

■Displaying data which cannot be processed as real numbers

When [Real] is set for [Display Format] and the data to be displayed cannot be processed as real numbers, what are displayed depends on the values.

- If all the values are 0: [Inf] is displayed.
- If values are not 0: [NaN] is displayed.

For instruction on setting [Display Format], refer to the following.

☞ Page 1504 [Display] tab

■Displaying an integer as a real number

For a device capable of storing an integer only, configure the following settings to display the device value as a real number.

Item	Settings
[Device Type] in the logging setting	Select one of the following items. • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [Signed BIN8] • [Unsigned BIN8]
[Display Format] in the [Display Setting] dialog	Select [Real].
[Data Operation]	Set the operational expression: $$/(10 to the n-th power). The symbol $$ represents a device value, and the letter n represents the number of decimal places.

Ex.

When the number of decimal places is 2

In [Data Operation], set the operational expression: $$/100.

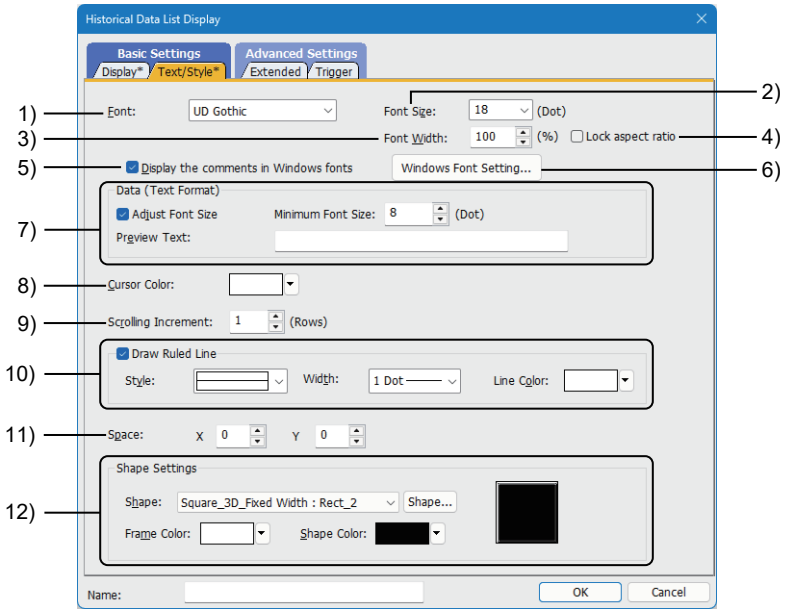
When the target device stores 12345, the displayed value is 123.45.

35.3.2 [Text/Style] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item			Description
1)	[Font]		Select the font of the displayed text. The following shows selectable items. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho]
2)	[Font Size]		Set the font size of the text to be displayed. ☞ Page 74 Specifications of displayable characters
3)	[Font Width]		Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
4)	[Lock aspect ratio]		Select this item to fix the aspect ratio of the font. When this item is selected, the setting of [Font Width] is disabled.
5)	[Display the comments in Windows fonts]		Displays the following registered comments in Windows fonts. • Comments set for the titles in the [Display] tab (when [Comment] is selected for [Specification])
6)	[Windows Font Setting] button		Displays the [Comment Group Property] dialog to list the properties of the comment group specified with [Group No.] in the [Display] tab. Set [Windows Font] and [Character Set] for the target column of the comment group. ☞ Page 797 [Comment Group Property] dialog
7)	[Data (Text Format)]	—	This item is settable only when [String] is selected for [Device Type] in any column on the [Display] tab.
		[Adjust Font Size]	The font size is automatically adjusted according to the object size. When this item is deselected, a line feed is automatically inserted.
		[Minimum Font Size]	Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.
		[Preview Text]	Set the text to be previewed on the screen editor.
8)	[Cursor Color]		Select the color of the cursor used for selecting logging data. ☞ Page 988 Color settings
9)	[Scrolling Increment]		Set the number of the rows for scroll operations on the list performed when the key cords for scrolling the list (up/down) (FFF4h, FFF5h) are entered. The setting range is [1] to [27].

Item			Description
10)	[Draw Ruled Line]	[Style]	Select the style of ruled lines. The following shows selectable items. • Solid line • Dotted line • Broken line • One-dot chain line • Two-dot chain line
		[Width]	Select the width of ruled lines. • [1 Dot] • [2Dot] • [3Dot] • [4Dot] • [5Dot] • [6Dot] • [7Dot]
		[Line Color]	Set the ruled line color. ☞ Page 988 Color settings
11)	[Space]		Set the space between the text or time display to be displayed and the ruled line of the table. The setting range is [0] to [32]. The actually displayed space is defined by the setting of [Font Size] as follows. Setting value of [Font Size] × setting value of [Space] Example) When setting [Font Size] to [2] and [Space] to [8] 12)	[Shape Settings]	[Shape]	Select the shape to be set for the object from the list or with the [Shape] button. ☞ Page 1045 How to set the object shape
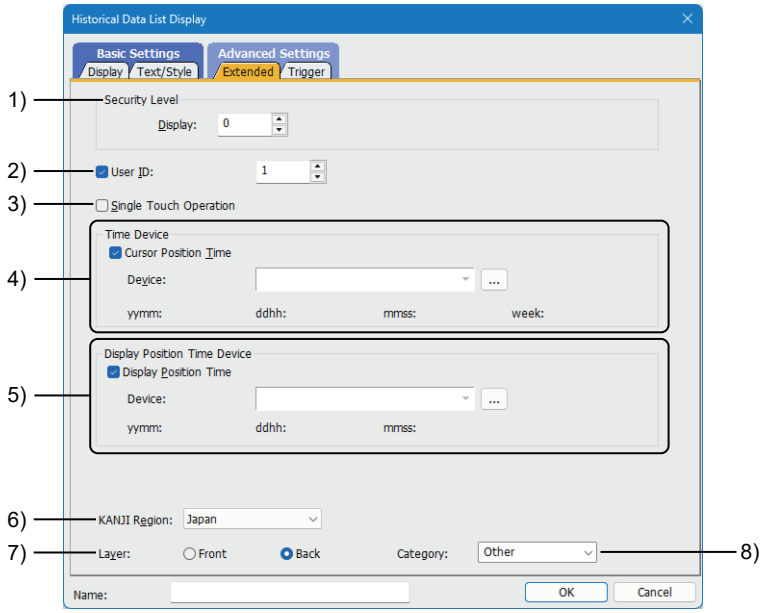
		[Frame Color]	Select the frame color of the shape. ☞ Page 988 Color settings
		[Shape Color]	Select the color of the shape. ☞ Page 988 Color settings

35.3.3 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description
1)	[Security Level]	Set a security level when using the security. The setting range is [0] to [15]. If you do not use the security, select [0].

Item		Description
2)	[User ID]	Select this item to set the user ID. The setting range is [1] to [65535]. With the setting of user ID, each object can have an ID number (user ID) and the target ID (object) for an operation can be specified with a touch switch. Hence touch switch operations can be performed as required. If user ID is not set Historical data list display A Historical data list display B  Touch switches for historical data list display A Touch switches for historical data list display B The touch switches for historical data list display A work for historical data list display B. If user ID is set Historical data list display A Historical data list display B (User ID: 1) (User ID: 2)  Touch switches for historical data list display A (User ID: 1) Touch switches for historical data list display B (User ID: 2) Although the same key codes are used, the target for an operation can be specified with IDs. Hence operations can be performed as required. To specify the user ID of the object to be operated with a touch switch, set [User ID for a key input] or [Individually set user ID for key input]. For information on touch switches, refer to the following. ☞ Page 1199 [Switch] dialog ☞ Page 1251 [Key Code Switch] dialog
3)	[Single Touch Operation]	Displays the cursor in the touched position directly.

Item			Description
4)	[Time Device]	[Cursor Position Time]	Writes the date and time displayed in the position where the cursor is displayed to a device as BCD data. Set a device for [Device] in which the date and time are stored.
		[Device]	Set the device that stores the date and time.*1*2*3*4 Set a GOT internal device for this item. When a controller device is used, the monitor speeds may become slow. ☞ Page 834 How to set devices, labels, and tags ☞ Page 3577 GOT internal devices
5)	[Display Position Time Device]	[Display Position Time]	Displays the data of a specified date and time. (Time specification jump function) Set a device for [Device] in which a specified date and time are stored.
		[Device]	Set a device in which a specified date and time are stored. ☞ Page 834 How to set devices, labels, and tags The successive devices from a set device are set to store the data of year and month, day and hour, and minute and second. By using [Display Position Time Device] and a touch switch, the logging data obtained at a specified date and time can be displayed in the center of the historical data list display. (The cursor is displayed in the position of the logging data obtained at a specified time.) If logging data are not obtained at a specified date and time, the logging data obtained at the nearest date and time is displayed. • Specifications of the time The following shows the data range. January 1, 2000 to December 31, 2099 • Required settings*5 • Operation example The following shows an example of a time specification jump function operation. Example) When setting D1000 as the display position time specification device and displaying the data of Oct. 8, 2010 11:45:00  For precautions of the time specification jump function, refer to the following. ☞ Page 1500 Conjunction with historical trend graphs
6)	[KANJI Region]		This setting appears when either of the following settings is configured. • [Direct] is selected for [Input Method]. • A device with a string data format is selected for [No. Logging Device (Data)]. Select the KANJI region of the text to be displayed. The following shows selectable items. • [Japan] • [China(GB)-Mincho] • [China(Big5)-Gothic]

Item		Description
7)	[Layer]	Switches layers to be placed. The following shows selectable items. • [Front] • [Back]
8)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

*1 How to store the data to the device

Time is stored in the upper eight bits and lower eight bits of a set device.

Example) When setting D100

D100	b15 to b8	b7 to b0
	(Year)	(Month)
D101	b15 to b8	b7 to b0
	(Day)	(Time)
D102	b15 to b8	b7 to b0
	(Minute)	(Second)
D103	b15 to b8	b7 to b0
	Not used	(Day of the week)

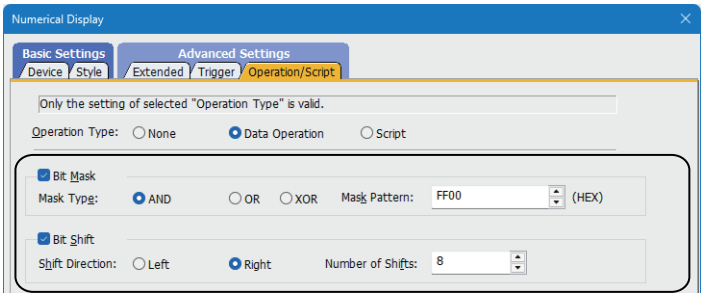
(0: Sunday, 1: Monday, 2: Tuesday, 3: Wednesday, 4: Thursday, 5: Friday, 6: Saturday)

*2 Monitoring set devices

When monitoring a device with a numerical display, select [BCD16], [BCD32], or [BCD64] for [Data Type], and set [Bit Mask] and [Bit Shift] of [Data Operation] as follows.

Example) Numerical display settings

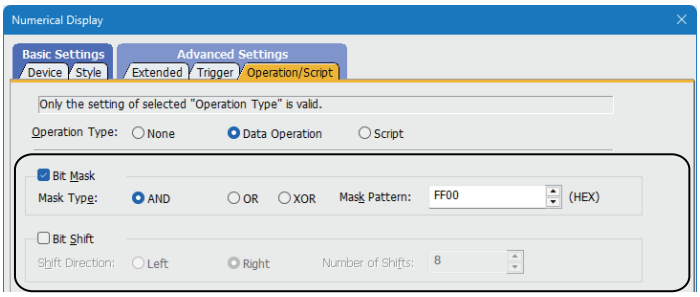
When displaying the year (upper 8 bits)



Lower 8 bits of D100 (b7 to b0): Masked

Upper 8 bits of D100 (b15 to b8): Shifted to the right by 8 bits

When displaying the month (lower 8 bits)



Upper 8 bits of D100 (b15 to b8): Masked

*3 Timing with which data is stored in devices

With the following timings, data is stored.

• When the cursor is displayed in the list

• When the displayed cursor is moved

• When the cursor is displayed and the historical data list display is operated with a touch switch

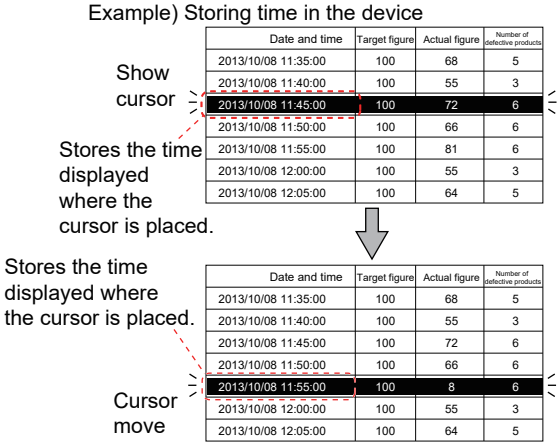
*4 Values to be stored in devices

If the cursor is displayed in the list, the update processing of the list stops.

Into a device, the value of the data and time displayed in the position where the cursor is displayed at the processing stop is stored.

Example) Storing a date and time into a device

Example) Storing time in the device



Date and time	Target figure	Actual figure	Number of defective products
2013/10/08 11:35:00	100	68	5
2013/10/08 11:40:00	100	55	3
2013/10/08 11:45:00	100	72	6
2013/10/08 11:50:00	100	66	6
2013/10/08 11:55:00	100	81	6
2013/10/08 12:00:00	100	55	3
2013/10/08 12:05:00	100	64	5

Date and time	Target figure	Actual figure	Number of defective products
2013/10/08 11:35:00	100	68	5
2013/10/08 11:40:00	100	55	3
2013/10/08 11:45:00	100	72	6
2013/10/08 11:50:00	100	66	6
2013/10/08 11:55:00	100	8	6
2013/10/08 12:00:00	100	55	3
2013/10/08 12:05:00	100	64	5

The data at the time the drawing process stops is stored in the device based on the timing of the cursor display or movement.

*5 Place the following objects on the screen and set them.

Object	Settings
Switch, key code switch	Read an applicable object from the library of GT Designer3 or create one. ☞ Page 1500 Displaying data obtained at a specified time When creating the objects, set [Action] of [Code Setting] to [Display Position Time Device] for each object. ☞ Page 1191 Placing a touch switch
Historical data list display	Select [Display Position Time] in the [Extended] tab and set a device. ☞ Page 1512 [Extended] tab

Precautions

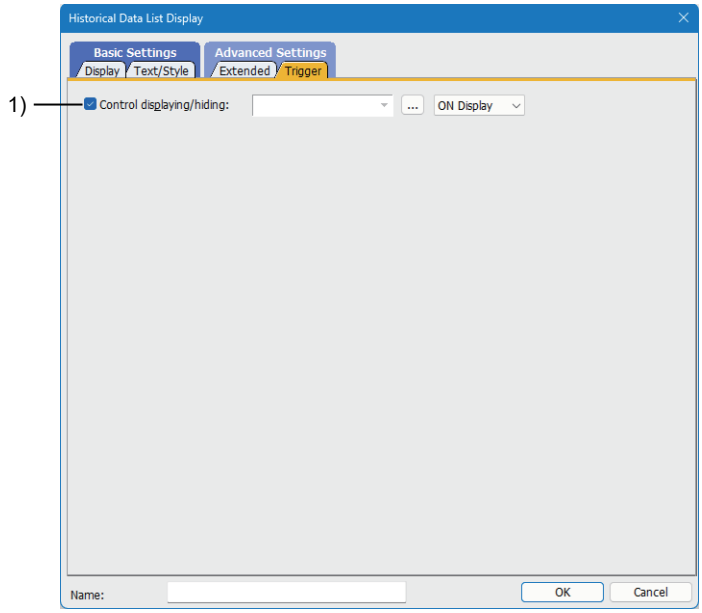
When setting [Single Touch Operation] in the [Extended] tab of the [Historical Data List Display] dialog, set the size of the part displayed in the list to a multiple of 16.

If a set size is not a multiple of 16, or a point not in the succession of a multiple of 16 is pressed, the following irregularities may occur.

- The cursor is displayed in a position away from a touched point.
- Touches do not receive any response.

35.3.4 [Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags

PART 7

36 Placing an alarm display

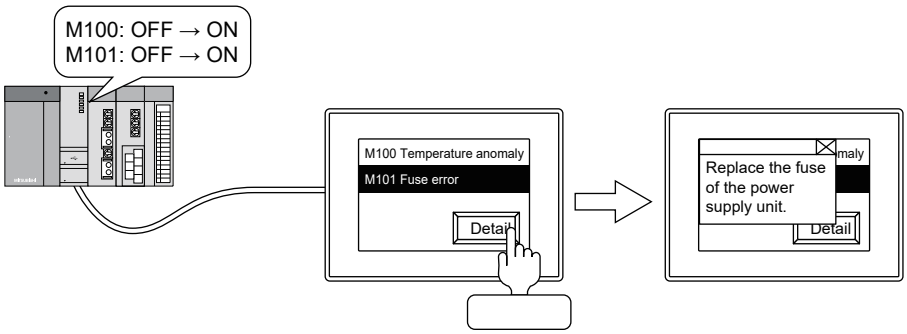
For information on how to place and set the alarm display, refer to the following.

☞ Page 2132 Viewing alarm events (Alarm display)

37 Placing a simple alarm display

GT37 SoftGOT3000

This function displays a user-created comment as an alarm message when an alarm occurs.
When multiple devices turn on, a comment is displayed in the order in which comments are set.



☞ Page 1520 Specifications of the simple alarm display
☞ Page 1521 How to use the simple alarm display
☞ Page 1533 [Simple Alarm Display] dialog
☞ Page 1541 Relevant settings

For details on alarms, refer to the following.

☞ Page 2022 Collecting alarms by monitoring devices
☞ Page 2075 Collecting alarms by monitoring the system

PART 7

37.1 Specifications of the simple alarm display

GT37 SoftGOT3000

37.1.1 Maximum number of objects on one screen

Up to 24 objects can be placed.

37.1.2 Detecting alarm occurrences and resets

Alarm occurrences and resets are detected only while the GOT displays a screen on which a simple alarm display object is placed.

If you switch the screen having no simple alarm display object to another screen having a simple alarm display object, the time of screen switching is displayed as the time of occurrence of an alarm event.

To detect alarm events regardless of the displayed screen, use an alarm display (user) object.

☞ Page 2022 Collecting alarms by monitoring devices

☞ Page 2075 Collecting alarms by monitoring the system

37.1.3 Displaying the time of occurrence

For the time of occurrences, the clock data of the GOT is used.

For the precautions and restrictions of the clock function which manages the GOT clock data, refer to the following.

☞ Page 635 Setting the GOT time setting method ([Time Setting])

37.1.4 Comments displayed in simple alarm displays

For the comments to be displayed, use a comment group.

For details on the comment group, refer to the following.

☞ Page 776 Comment setting ([Comment])

37.2 How to use the simple alarm display

GT37 SoftGOT3000

37.2.1 Placing a simple alarm display

Place simple alarm displays on the screen editor.

☞ Page 1001 Placing figures and objects

37.2.2 Editing simple alarm displays

Edit simple alarm displays that have been placed on the screen editor.

☞ Page 1003 Selecting figures and objects on the screen editor

☞ Page 1007 Resizing

37.2.3 Setting simple alarm displays

Set simple alarm displays that have been placed on the screen editor.

Common settings for objects

☞ Page 1032 Settings common to figures and objects

Simple alarm display settings

☞ Page 1533 [Simple Alarm Display] dialog

37.2.4 Number of alarms to be displayed

Select whether to display just one of alarms that have occurred or display more.

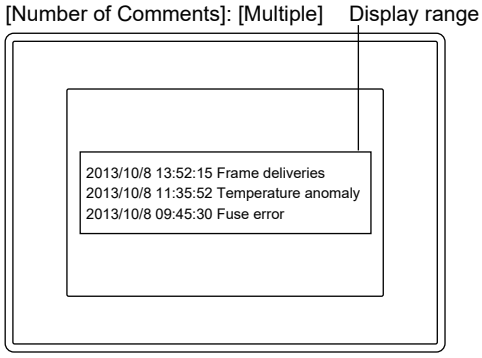
☞ Page 1534 [Device] tab

Displaying multiple alarms

One alarm is displayed in one row.

The part that cannot be displayed within a row is not displayed.

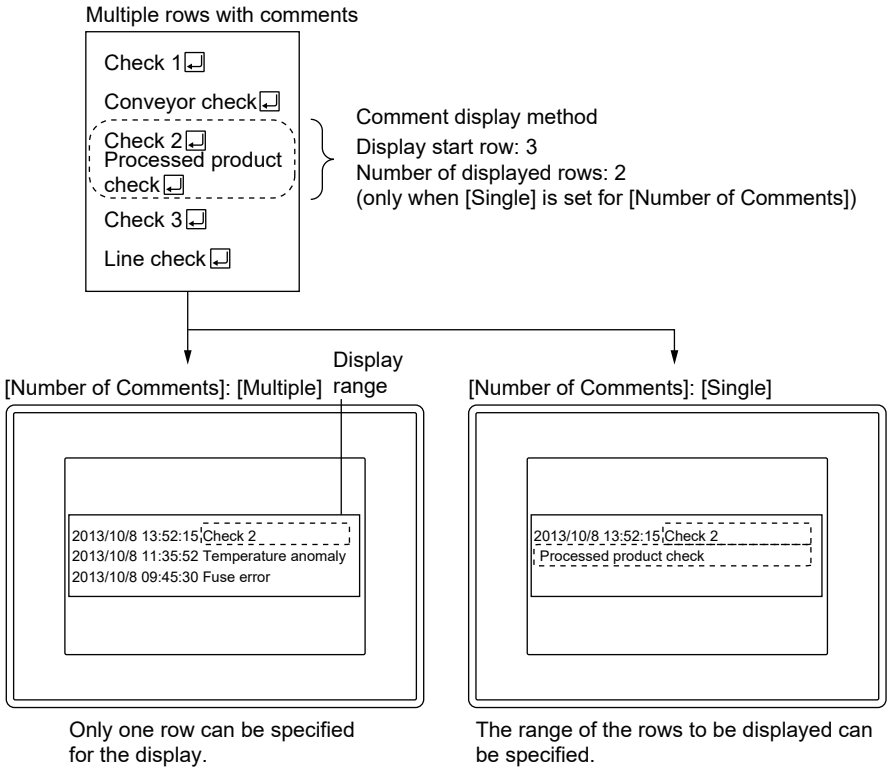
A comment that involves multiple rows cannot be displayed from its second row.



When multiple alarms are displayed, you can specify any line of the multiple-line comment to be displayed.

Ex.

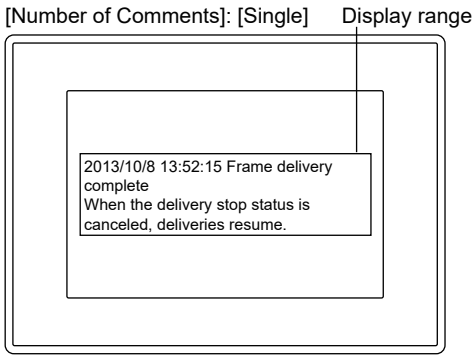
Displaying a line of the registered 6-line comment



Displaying one alarm

The part that overflows from the first row goes down to the next line.

A comment that involves multiple rows is displayed in more than two rows as long as the comment length is within the display range.



PART 7

37.2.5 Display order

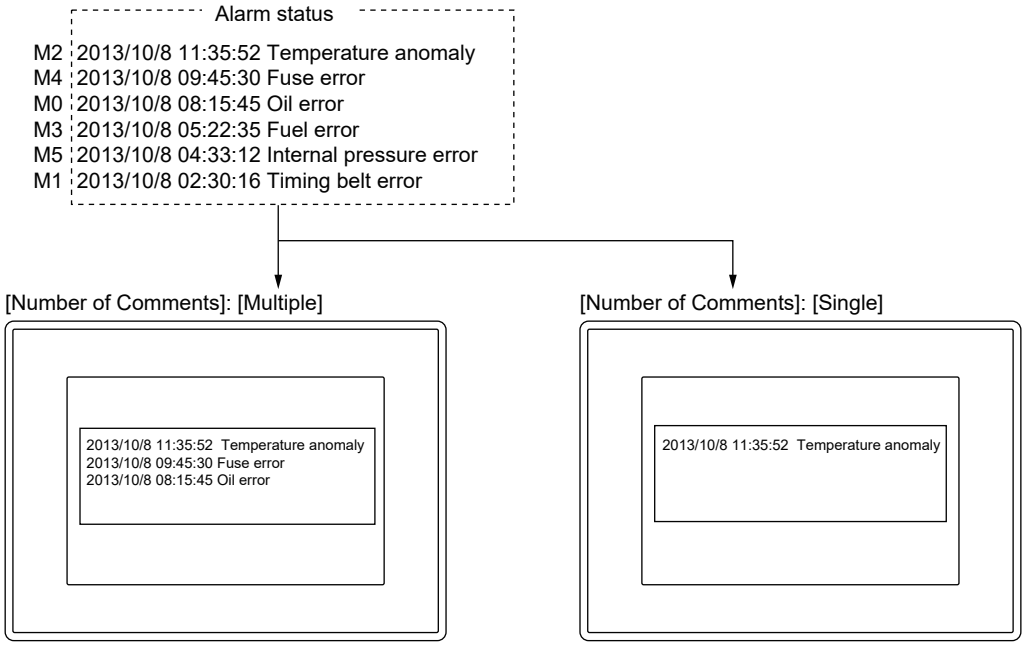
Set the order in which multiple alarms are displayed.

By the setting, alarms can be displayed in order of time of their occurrences or device number.

☞ Page 1537 [Style] tab

Ex.

When displaying alarms in order of time of most recent occurrences

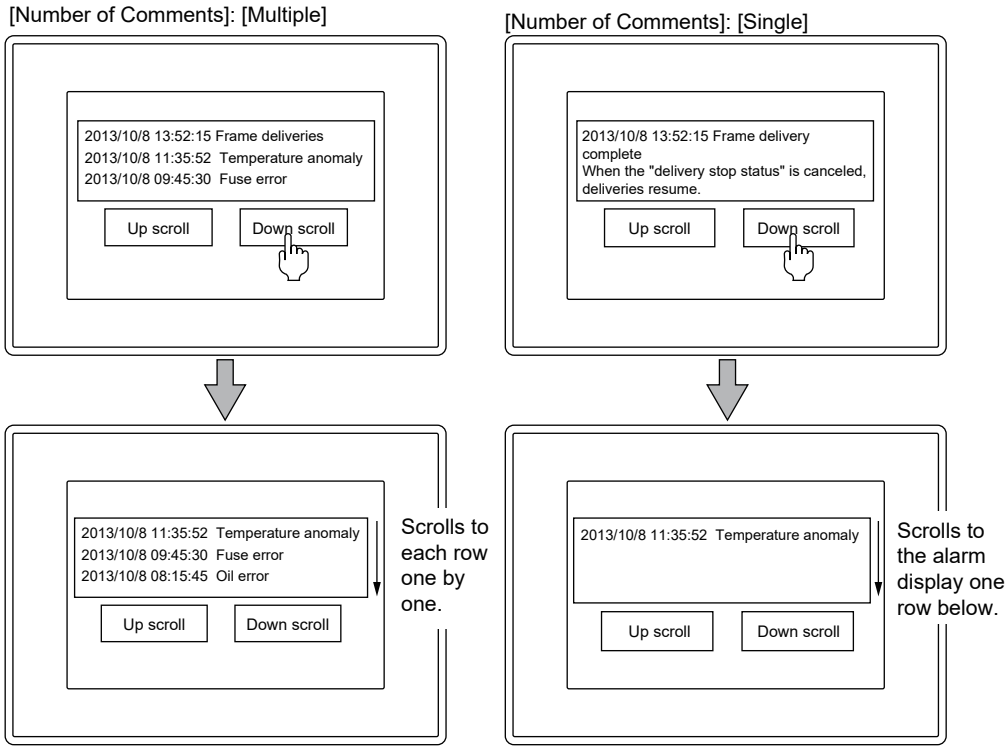


37.2.6 Scroll

The part of a comment that extends off the display range can be checked by scrolling the simple alarm to the part.

To perform scrolling, create a touch switch for the system alarm.

☞ Page 1530 Touch switches for simple alarm displays



37.2.7 About the detail display

The detail display can be set only when [Multiple] is selected for [Number of Comments] in the [Device] tab.

☞ Page 1534 [Device] tab

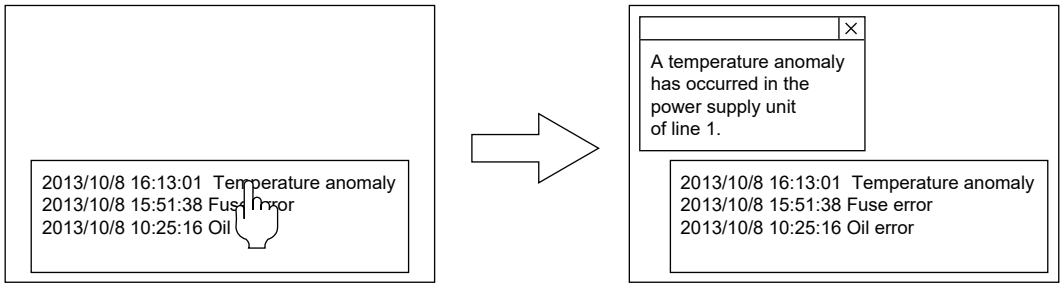
Available screens

When setting the causes of alarms and corrective actions as the target for the detail display, the screen used for the display can be selected from three types.

■Comment window

Displays a comment a user registers.

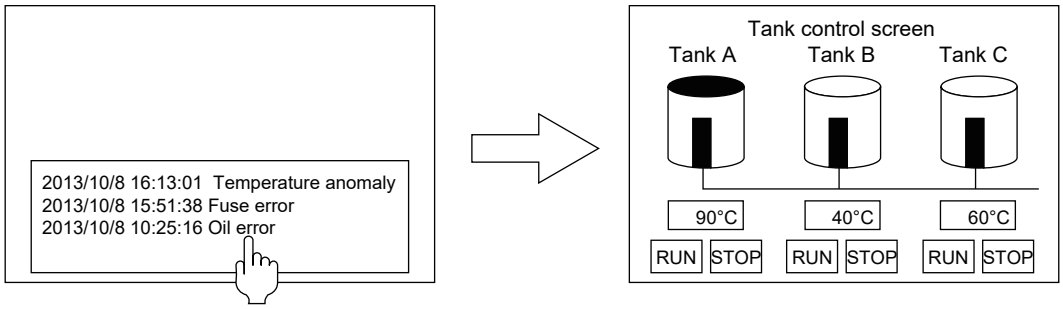
In the detail display, a comment different from the one for the simple alarm can be displayed.



Base screen 1 | Base screen 1 + Comment window

■Base screen

Displays the specified base screen.

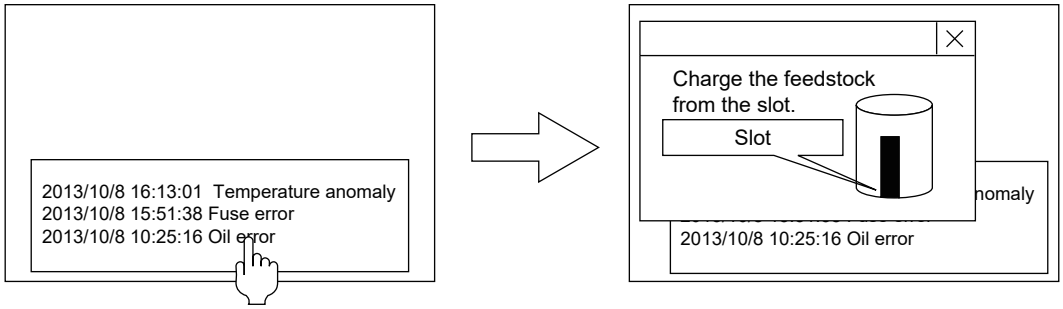


Base screen 1 | Base screen 5

■Window screen

Displays a specified window screen.

A specified window screen can be displayed using overlap window 1.



Base screen 1 | Base screen 1 + Window screen 10

PART 7

Relation between the screen where the simple alarm is set and the screen used for the detail display

Switching: Switches the screen where the simple alarm is set to the screen used for the detail display.

Simultaneous display: Leaves displayed the screen where the simple alarm is set and displays the screen used for the detail display.

Screen for which the simple alarm is set	Screen for the detail display		
	Comment window	Window screen	Base screen
Base screen	Simultaneous display	Simultaneous display	Switching
Overlap window 1		Switching	Simultaneous display
Overlap window 2		Simultaneous display	
Overlap window 3			
Overlap window 4			
Overlap window 5			
Superimpose window 1			
Superimpose window 2			

Specify the comment number to be displayed or the offset value of the screen number

When [Detail No. Offset] in the [Device] tab is set, the offset value for the detail display can be specified.

☞ Page 1534 [Device] tab

The targets which can be specified by the offset value for the detail display are as follows.

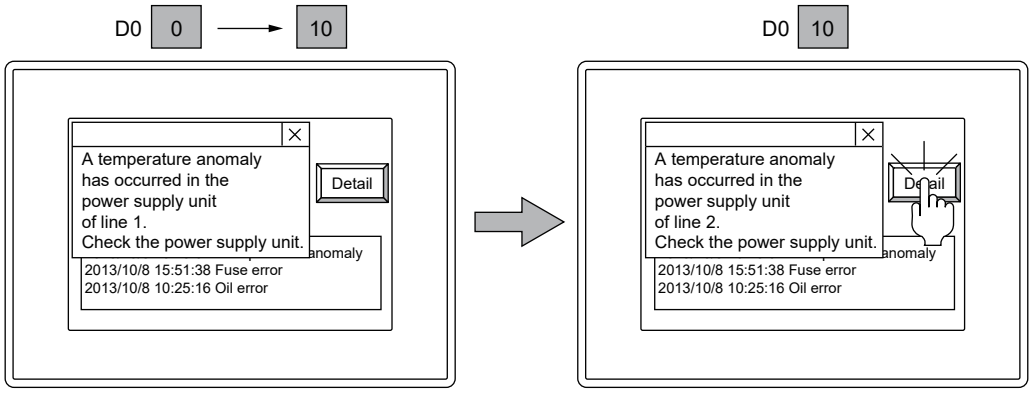
- Comment number to be displayed in the comment window
- Base screen numbers and window screen numbers

While monitoring with the GOT, you can switch the comment number or screen number with a device.

Ex.

When setting D0 for [Detail No. Offset] and registering comments as follows

Comment No.	Comment
1	A temperature anomaly has occurred in the power supply unit of line 1. Check the power supply unit.
2	Replace the fuse of the power supply unit of line 1.
. . .	. . .
11	A temperature anomaly has occurred in the power supply unit of line 2. Check the power supply unit.
12	Replace the fuse of the power supply unit of line 2.



Comment No.1 is displayed.

Comment No.11 is displayed.

Point

Changing comments of the simple alarm

Comments of the simple alarm cannot be changed in [Detail No. Offset].

When changing a comment of the simple alarm with an offset device, set [Comment No. Offset] in the [Extended] tab.

☞ Page 1539 [Extended] tab

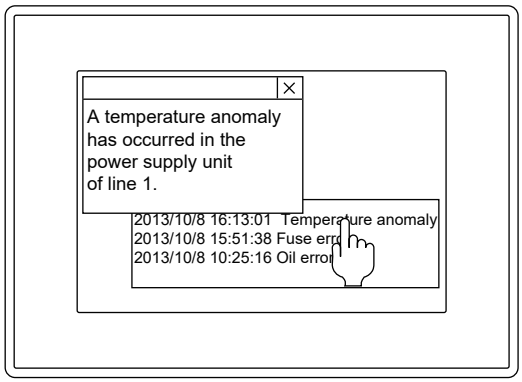
Display method

Select the method of displaying the detail display from the following two types.

■Touch operation

Touch the simple alarm directly to display the detail display.

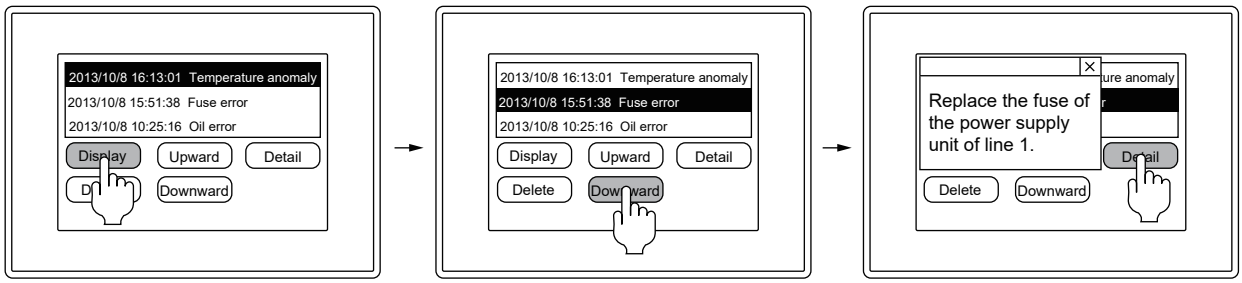
☞ Page 1529 Operating by pressing the simple alarm directly



■Touch switch

Create a touch switch for the detail display to display the detail display.

☞ Page 1530 Touch switches for simple alarm displays



Display the cursor.

Move the cursor to the alarm for the detailed display (upward/downward).

Display the details.

37.2.8 Operating by pressing the simple alarm directly

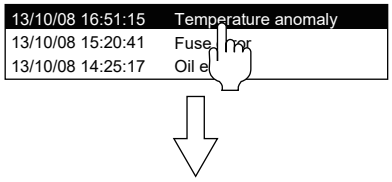
By setting [Touch Mode] in the [Device] tab, the following operations can be performed.

☞ Page 1534 [Device] tab

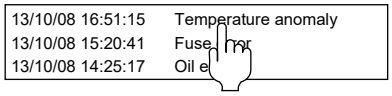
Selecting [Selection] for [Touch Mode]

An alarm can be selected at the direct touch of the simple alarm display.

The touched alarm is selected.



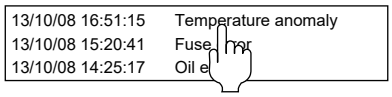
When the alarm is touched again, the selection is canceled.



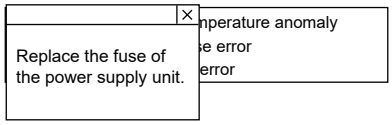
Selecting [Operation] for [Touch Mode]

The detail display can be displayed at the direct touch of the simple alarm display.

The touched alarm is selected.



When the alarm is touched again, the details are displayed.



PART 7

37.2.9 Touch switches for simple alarm displays

Touch switches for the simple alarm display is available by reading from the library of GT Designer3.

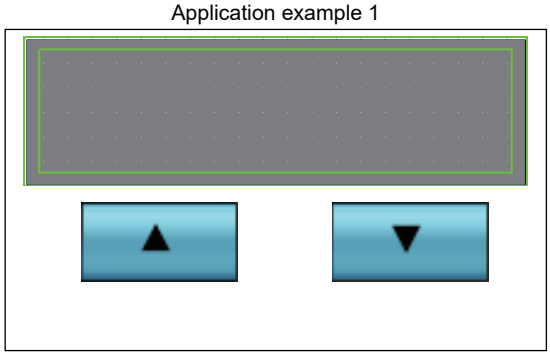
The text and shape of each touch switch are user-changeable.

When key codes are set for touch switches, touch switches for the simple alarm display can be created by a user.

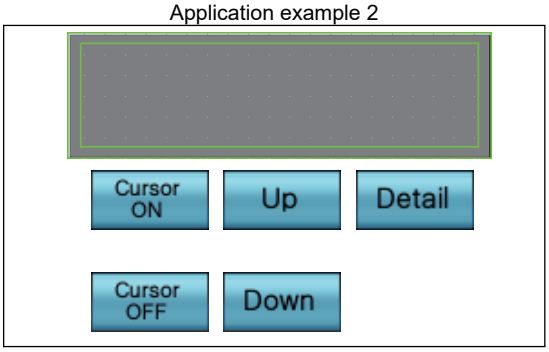
☞ Page 1199 [Switch] dialog

☞ Page 1251 [Key Code Switch] dialog

Application example 1



Application example 2



Touch switch	Key code (HEX)	Description
Scroll up by one line	00F2	Switches the display between one row above and one row below. This function is available only when the cursor is hidden.
Scroll down by one line	00F3	 Scroll down one row.
Show cursor	FFB0	Displays or hides the cursor.
Hide cursor	FFB1	 Display the cursor.

Touch switch	Key code (HEX)	Description
Move cursor upward Up	FFB2	• When the cursor is hidden Displays the previous page or next page. (by page)  Display the next page. • While the cursor is displayed Moves the cursor up or down. (by row)  Move the cursor.
Move cursor downward Down	FFB3	
Display detail Detail	FFB8	Displays the detail screen for a selected alarm.  Display the detailed screen.
Displays the ladder (sequence program monitor (iQ-R/iQ-L ladder)).	FFBA	Initiates the coil search and factor search for an alarm device automatically in a specified program file and displays the device in the sequence program monitor. (One-touch ladder jump function) Specify the search mode and the program file to be searched in the [User Alarm Observation] dialog. ☞ Page 2045 [User Alarm Observation] dialog  The ladder monitor screen of the specified device is displayed.
Displays the ladder (sequence program monitor (iQ-F Ladder)).	FFC3	
Displays the ladder (sequence program monitor (Q/L ladder)).	FFBD	

Touch switch	Key code (HEX)	Description
Displays the ladder. 	FFBC	Initiates the coil search and factor search for an alarm device automatically in a specified program file. The search hit is displayed on the following screen. (One-touch ladder jump function) • Ladder monitor screen of the sequence program monitor (iQ-F ladder) Specify the search mode and the program file to be searched in the [User Alarm Observation] dialog. ☞ Page 2045 [User Alarm Observation] dialog  Display the sequence program monitor! (The ladder of the specified device is displayed.)
Display first alarm	FFBF	Displays the first of the alarms, which are sorted in the order set for [Sort], in the top row. While the cursor is being displayed, touching this touch switch hides the cursor. Example) When [Latest] is selected for [Sort]  Display the first alarm.

Point

Touch switches working differently depending on the display status

There are touch switches working differently depending on the display status.

When the cursor is hidden, the move cursor upward (FFB2h) and move cursor downward (FFB3h) display the previous page and next page respectively by page. When the cursor is hidden, they move the cursor upward and downward respectively by row.

37.2.10 Operations performed using the object gesture function

The display of objects can be operated using gestures.

For information on operations using gestures, refer to the following.

☞ Page 507 Operating objects with gestures (object gesture function)

37.3 [Simple Alarm Display] dialog

GT37 SoftGOT3000

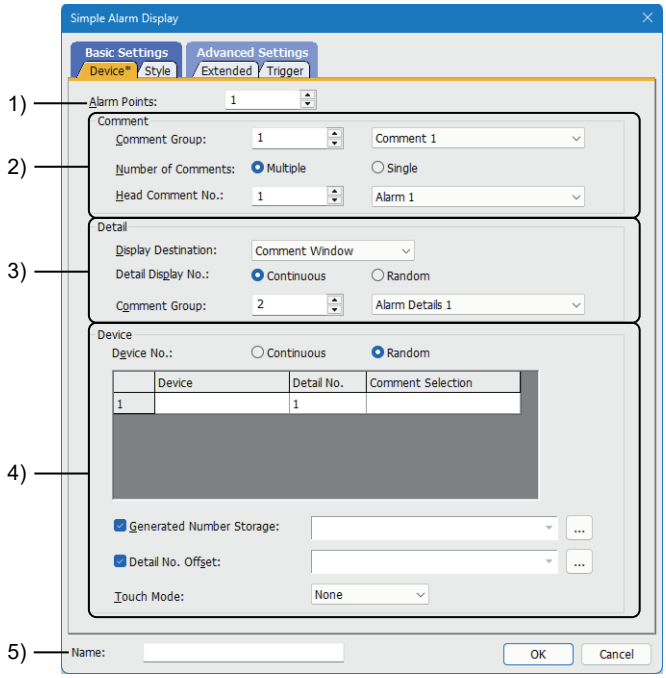
Operating procedure

1. Select [Object] → [Alarm Display] → [Simple Alarm Display] from the menu.
2. Click the position to place a simple alarm display.
3. Double-click the simple alarm display to display the setting dialog.

☞ Page 1534 [Device] tab
☞ Page 1537 [Style] tab
☞ Page 1539 [Extended] tab
☞ Page 1540 [Trigger] tab

37.3.1 [Device] tab

GT37 SoftGOT3000



Item			Description
1)	[Alarm Points]		Set the number of devices to be monitored. The setting range is [1] to [8192].
2)	[Comment]	[Comment Group]	Set the comment group number to be used. The setting range is [1] to [500].
		[Number of Comments]	Select the number of comments to be displayed in the display frame. The following shows selectable items. • [Multiple] • [Single]
		[Head Comment No.]	Set the comment number displayed when an alarm occurs. The setting range is [1] to [32767]. The comment number set for this item is assigned to the start device in the device tab. From the number set for this item, numbers are set successively. The number of the set successive numbers is the same as that of the devices to be monitored. Example) Start device: M100 [Head Comment No.]: 1 Monitored device Comment No. (basic comment) M100 ..... 1 Temperature anomaly ——— Head comment No. M101 ..... 2 Fuse error M102 ..... 3 Oil error } Comments are assigned consecutive numbers starting from the head comment number.

Item			Description
3)	[Detail]	[Display Destination]	This item can be selected only when [Multiple] is selected for [Comment]. Select the setting method of the detail display. The following shows selectable items. • [Not Display]: Does not display the detail display. • [Comment Window]: Displays the detail display in the window for the detail display. In the comment window, registered comments are displayed. • [Base Screen]: Displays a base screen for the detail display. • [Window Screen]: Displays a window screen for the detail display. The window screen is displayed using overlap window 1. The following shows the display method of the comment window. • Number of characters that can be displayed in a comment window Up to 418 one-byte characters (11 lines of 38 characters) are displayed. Up to 209 two-byte characters (11 lines of 19 characters) are displayed. • Display position of the comment window A comment window is displayed on the base screen. The window can be moved and closed in the same way that operates window screens. • Display of comments Text size is fixed to one time high and one time wide. Regardless of the settings made when comments are registered, a blink and HQ characters are not displayed. • Display of comment rows From the top left of the comment window, the registered comments are displayed. When a comment is longer than the display range of the comment window, the comment is wrapped around to be displayed. To display the comment in the center of the comment window, adjust the position of the comment by inserting line feeds.  When the comment is registered  When the comment window is viewed
3)	[Detail]	[Detail Display No.]	When [Comment Window], [Base Screen], or [Window Screen] is selected for [Display Destination], this item can be selected. Select the method of setting comment numbers, window screen numbers, or base screen numbers. The following shows selectable items. • [Continuous]: Sets consecutive comment numbers, window screen numbers, or base screen numbers starting from a set comment number, window screen number, or base screen number. • [Random]: Set the numbers one by one.
		[Comment Group]	This item can be selected only when [Comment Window] is selected for [Display Destination]. Set the comment group assigned to the comment to be displayed in the comment window. The setting range is [1] to [500].

Item			Description
4)	[Device]	[Device No.]	Select the display method of the device to be monitored. The following shows selectable items. • [Continuous]: Sets consecutive devices starting from a set device. • [Random]: Set the numbers one by one.
		[Device]	Set the device to be monitored. ☞ Page 834 How to set devices, labels, and tags
		[Detail No.]	When [Comment Window], [Base Screen], or [Window Screen] is selected for [Display Destination], this item can be selected. Set a comment number, window screen number, and base screen number. The following shows the setting range. • Comment No.: [1] to [32767] • Window screen No., base screen No.: [0] to [32767]
		[Comment Selection]	Displays the comment and screen title set for [Detail No.] of [Device]. A comment number, window screen number, or base screen number can be set by selecting a comment or screen title for this item.
		[Generated Number Storage]	Set a device in which the number of alarms that have occurred (number of devices that have turned on) is stored. ☞ Page 834 How to set devices, labels, and tags
		[Detail No. Offset]	When [Comment Window], [Base Screen], or [Window Screen] is selected for [Display Destination], this item can be set. The display of the detail display can be switched with a single device value. The data length of the set device is fixed to 16 bits. The device value set for this item is added to the comment number, base screen number, or window screen number set for [Detail No.] of [Device]. ☞ Page 963 Offset
		[Touch Mode]	This item can be selected only when [Multiple] is selected for [Comment]. Select the operation performed when the simple alarm display is pressed. The following shows selectable items. • [None]: Disables touch operations. • [Selection]: Selects a touched alarm. • [Operation] Displays the detail screen of a touched alarm.
5)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

Precautions

■Monitoring array-type global labels

When [Continuous] is selected for [Device No.] in the [Simple Alarm Display] dialog ([Device] tab) and an array-type global label is set, the device assigned for monitoring may not be monitored properly.

To solve the above problem, take one of the following corrective actions.

- Directly set the device assigned to the global label for the simple alarm display.
- Select [Random] for [Device No.] in the [Simple Alarm Display] dialog ([Device] tab).
- Use a multiple of 8 to set the number of array elements for the global label on GX Works3.

■Monitoring primitive data type global labels set using the consecutive device setting (one point)

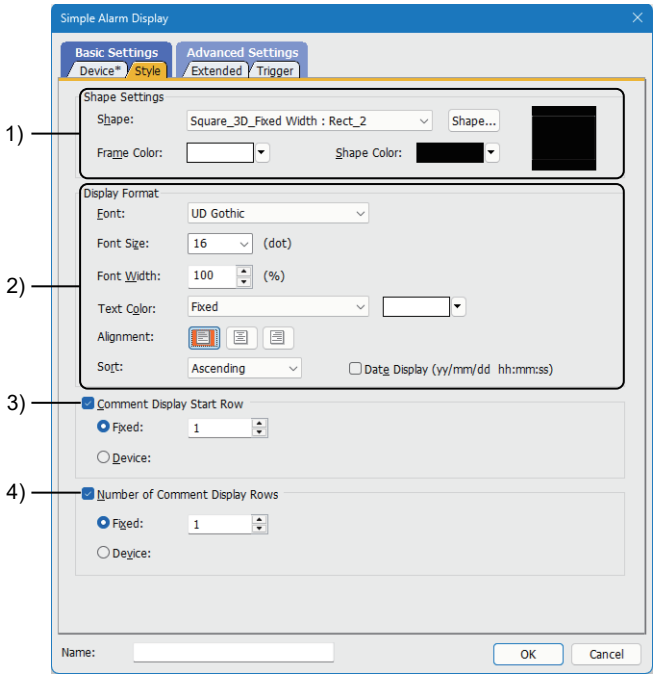
When [Continuous] is selected for [Device No.] in the [Simple Alarm Display] dialog ([Device] tab) and a primitive data type global label is set with one device point, the system alarm (326: The data type of labels/tags do not match.) occurs.

To solve the above problem, take one of the following corrective actions.

- Select [Random] for [Device No.] in the [Simple Alarm Display] dialog ([Device] tab).
- Set an array-type global label.

37.3.2 [Style] tab

GT37 SoftGOT3000



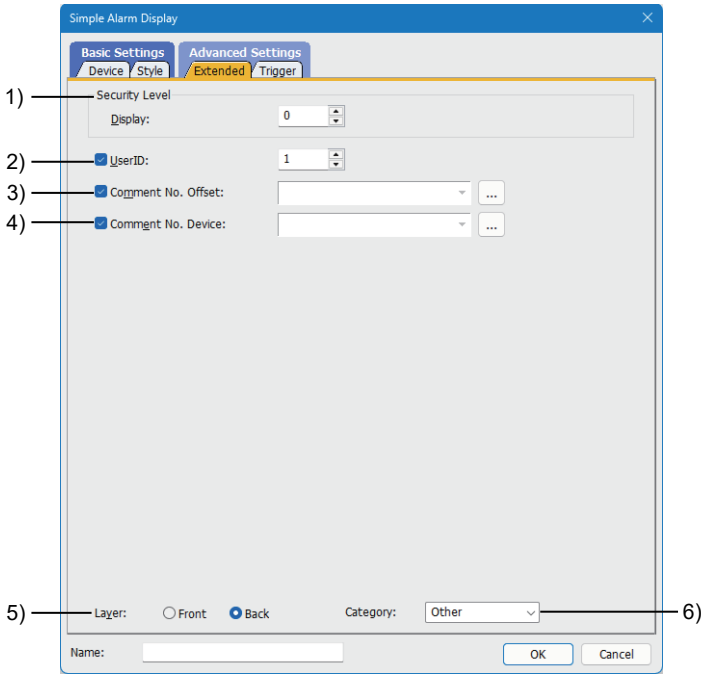
Item			Description
1)	[Shape Settings]	[Shape]	Select the shape to be set for the object from the list or with the [Shape] button. ☞ Page 1044 Object shape
		[Frame Color]	Select a frame color for the shape. ☞ Page 988 Color settings
		[Shape Color]	Select the color of the shape. ☞ Page 988 Color settings
		Preview	Displays the preview of the screen.

PART 7

Item			Description
2)	[Display Format]	[Font]	Select a font for the text to be displayed. The following shows selectable items. • [UD Gothic] • [UD Mincho]
		[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots. ☞ Page 74 Specifications of displayable characters
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Text Color]	Set the text color. ☞ Page 988 Color settings The following shows selectable items. • [Fixed]: Displays text only in the color set as a text color. • [Comment Attribute]: Selects the text color according to the character attribute set in the comment group.
		[Alignment]	This item can be set only when [Single] is selected for [Number of Comments] in the [Device] tab. Select the horizontal position of the text.
		[Sort]	Select the type of the order in which alarms are displayed. The following shows selectable items. • [Ascending] • [Descending] • [Oldest] • [Latest] When the devices to be monitored are set randomly and [Ascending] or [Descending] is selected, alarms are displayed in the order in which the devices are set.
		[Date Display (yy/mm/dd hh:mm:ss)]	Displays the date and time of the occurrences of alarms in the simple alarm display. For the year, the lower 2 digits are displayed. The time is displayed in the 24-hour time format.
3)	[Comment Display Start Row]		When setting a comment involving multiple rows, set the row from which the comment is displayed. Depending on the selection, the method of setting the row from which the comment is displayed varies. • [Fixed]: Set by entering directly. The setting range is [1] to [32767]. • [Device]: Set the device value as the start row to be displayed. ☞ Page 834 How to set devices, labels, and tags If the comment is displayed in blank characters, check if the row from which the comment is display is set outside the range of the comment rows.
4)	[Number of Comment Display Rows]		This item can be set only when [Single] is selected for [Number of Comments] on the [Device] tab. When setting a multiple-line comment, set the number of the lines to be displayed. Depending on the selection, the method of setting the number of lines to be displayed differs. • [Fixed]: Set by entering directly. The setting range is [1] to [32767]. • [Device]: Set the device value as the number of rows to be displayed. ☞ Page 834 How to set devices, labels, and tags

37.3.3 [Extended] tab

GT37 SoftGOT3000

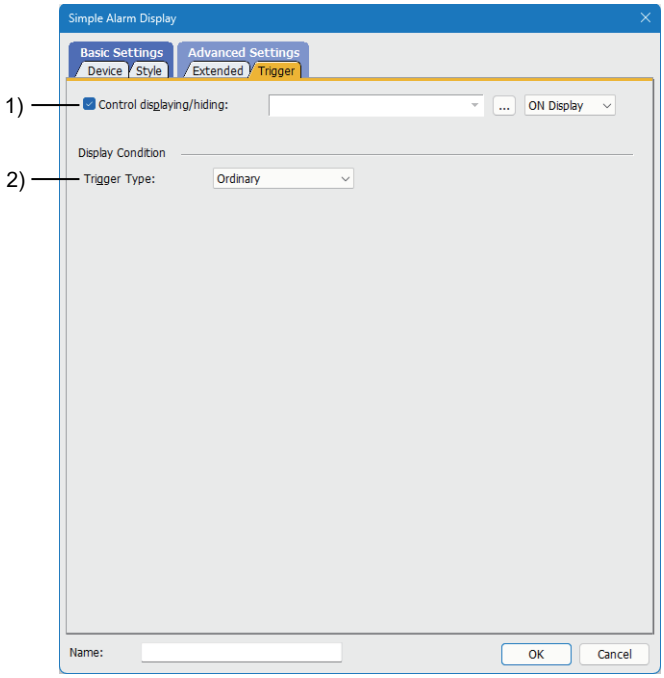


Item		Description
1)	[Security Level]	Set a security level when using the security function. The setting range is [0] to [15]. If you do not use the security, select [0].
2)	[User ID]	Select this item to set the user ID. The setting range is [1] to [65535]. With the setting of user ID, the target ID (object) for an operation can be specified with a touch switch. Hence touch switch operations can be performed as required. For secure operations of the touch switches for system alarm displays, set user ID. To specify the user ID of the object to be operated with a touch switch, set [User ID for a key input] or [Individually set user ID for key input]. For information on touch switches, refer to the following. ☞ Page 1199 [Switch] dialog ☞ Page 1251 [Key Code Switch] dialog
3)	[Comment No. Offset]	Comments displayed in the simple alarm can be switched with a single device value. The device value set for this item is added to the comment number set for [Head Comment No.] of [Device]. ☞ Page 963 Offset
4)	[Comment No. Device]	Set a device that stores the comment number of an alarm. Depending on the selection for [Number of Comments], the comment number assigned to the alarm to be stored in the device differs. • [Number of Comments] is [Multiple]: The comment number of the comment under the cursor is stored. • [Number of Comments] is [Single]: The comment number of the displayed alarm is stored. When displaying the cursor, make the following settings. • Select [Selection] for [Touch Mode]. • Place the touch switches for the simple alarm display. ☞ Page 1199 [Switch] dialog ☞ Page 1251 [Key Code Switch] dialog
5)	[Layer]	Switches layers to be placed. The following shows selectable items. • [Front] • [Back]
6)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

PART 7

37.3.4 [Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger Type]	Select a trigger condition to display the object. The following shows selectable items. • [Ordinary] • [ON] • [OFF] • [Range] • [Bit Trigger] ☞ Page 968 Trigger type settings

37.4 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the simple alarm display as required.
The following shows the functions that are available by configuring the relevant settings.

37.4.1 GOT environmental settings (System information)

GT37 SoftGOT3000

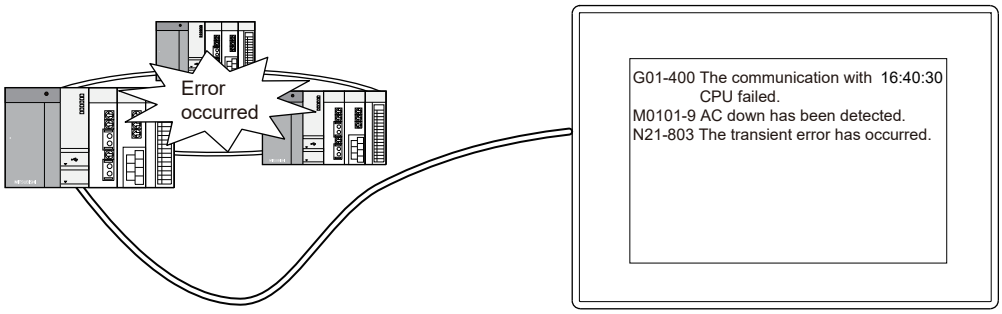
Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Notifying the key codes set to the input keys when there is an input using a text input, touch switch, or other objects (Write device)	[Key Code Input]
Turning off the Key Input signal (Read device: System signal 1-1.b3)	[System Signal 1-1]
Disabling all the key inputs (Read device: System signal 1-1.b9)	[System Signal 1-1]
Notifying a key input (Write device: System signal 2-1.b3)	[System Signal 2-1]

38 Placing a system alarm display

GT37 SoftGOT3000

This function displays the error codes and error messages of errors in the GOT, controller, or network.
The status an error causes and the cause of the error can be checked.
The registration of the comments to be displayed in the system alarm is not necessary. (They are registered in the GOT)



☞ Page 1543 Specifications of the system alarm display
☞ Page 1545 How to use the system alarm display
☞ Page 1547 [System Alarm Display] dialog
☞ Page 1549 Relevant settings
For details on alarms, refer to the following.
☞ Page 2075 Collecting alarms by monitoring the system

38.1 Specifications of the system alarm display

GT37 SoftGOT3000

38.1.1 Maximum number of objects that can be placed on one screen

One system alarm display can be placed on one screen.

38.1.2 Types of system alarms

There are the following three types of system alarms.

• CPU error

Indicates an error of a controller.

• GOT error

Indicates an error of the GOT.

A GOT Mobile error, which occurs on a GOT Mobile function client, is categorized as a GOT error.

• Network error

Indicates an error of the communication unit mounted on the GOT.

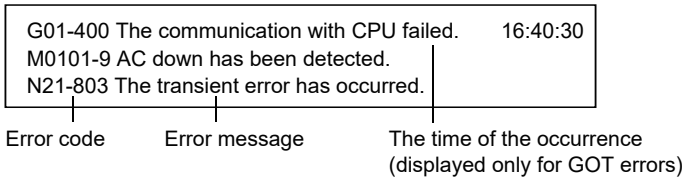
38.1.3 How to collect data

The data of alarm status is always collected in the cycle of 3 seconds and retained in the GOT, even if a screen on which no system alarm is placed is displayed.

38.1.4 Contents displayed in the system alarm

In the system alarm, error codes, error messages, and the time of occurrence are displayed.

The error codes and the error messages to be displayed are registered in the GOT as the default, so creating by a user is not necessary.



38.1.5 Displaying the time of occurrences of alarms

For the time of occurrences, the clock data of the GOT is used.

For the precautions and restrictions of the clock function which manages the GOT clock data, refer to the following.

☞ Page 635 Setting the GOT time setting method ([Time Setting])

PART 7

Precautions

■Controllers for which system alarms are not displayed in the GOT

Errors which occur in the following controllers cannot be displayed in the system alarm of the GOT.
Check the errors with the software for the controllers.

- SIEMENS PLC CPU
- Inverter

■How to delete the messages of GOT errors

GOT errors are not deleted from the system alarm even if the cause of the alarms is eliminated.
To delete the messages, turn on the following device for the system information function.
GOT Error Reset signal (System signal 1-1.b13)
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

■How to delete the messages of network errors

The messages of network errors that occur in the CC-Link communication unit are not deleted even if the alarm causes are eliminated until the GOT is powered off or reset.

38.2 How to use the system alarm display

GT37 SoftGOT3000

38.2.1 Placing a system alarm display

Place a system alarm display on a screen editor.

☞ Page 1001 Placing figures and objects

38.2.2 Editing a system alarm display

Edit a system alarm display on the screen editor.

☞ Page 1003 Selecting figures and objects on the screen editor

☞ Page 1007 Resizing

38.2.3 Configuring the settings for a system alarm display

Configure the settings of a system alarm display on the screen editor.

Common settings for objects

☞ Page 1032 Settings common to figures and objects

System alarm display settings

☞ Page 1547 [System Alarm Display] dialog

38.2.4 How to display alarms

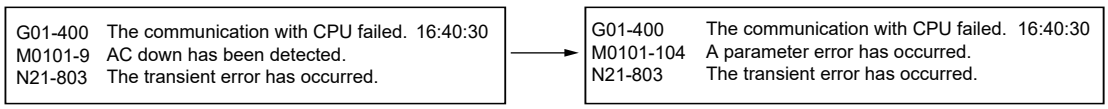
Maximum number of the alarms that can be displayed

The system alarm displays three types of alarms in different rows for each type, and up to three rows can be displayed.

When a new alarm is detected, the alarm display being displayed is updated.

Ex.

When a controller detects a new alarm (parameter error)



The error display of controllers is updated.
(M0101-9→M0101-104)

Order of priority in which alarms are displayed

If the display range is two rows or less, alarms are displayed in the following order of priority.

1) GOT error

2) CPU error

3) Network error

When the number of the occurrences of alarms exceeds the display range, low-priority alarms cannot be displayed.

Also, an error code, error message, or time that cannot be displayed in one row of the display range is not displayed.

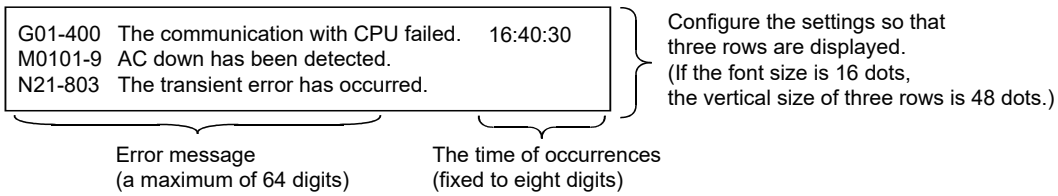
PART 7

38.2.5 How to adjust the display range

To set a display range in which alarm messages are fully displayed, adjust the range as shown below.

If the screen size of the GOT is smaller than the sizes shown below, reduce the font size.

Example) when [Font Width] is [100%]



If the font size is 16 dots, the alarms are displayed using 576 dots.
Enlarge the size until the time of occurrences on the right is displayed.

38.2.6 Corrective actions on the cause of the alarm of each type and error codes

For details, refer to the following manuals.

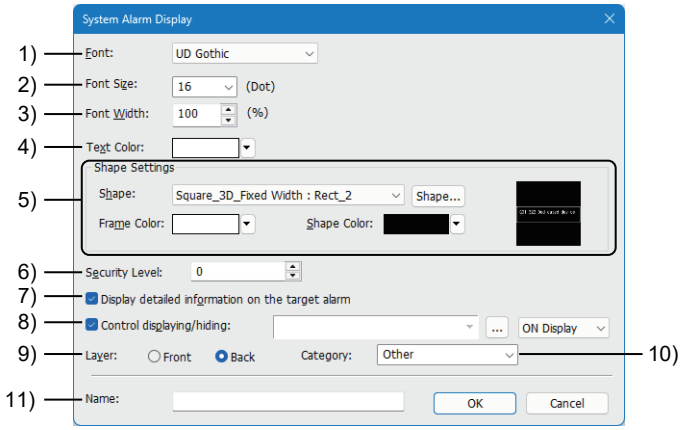
User's manual of the GOT used

38.3 [System Alarm Display] dialog

GT37 SoftGOT3000

Operating procedure

1. Select [Object] → [Alarm Display] → [System Alarm Display] from the menu.
2. Click the position to place a system alarm display.
3. Double-click the system alarm display to display the setting dialog.



Item			Description
1)	[Font]		Select the font of the displayed text. The following shows selectable items. • [UD Gothic] • [UD Mincho]
2)	[Font Size]		Set a vertical text size. The setting range is [8] dots to [540] dots. ☞ Page 74 Specifications of displayable characters
3)	[Font Width]		Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
4)	[Text Color]		Set the text color. ☞ Page 988 Color settings
5)	[Shape Settings]	[Shape]	Set a shape for an object. When [None] is selected, no figure is displayed. Click the [Shape] button to select shapes other than those in the list box. ☞ Page 1044 Object shape
		[Frame Color], [Shape Color]	Select the color of the frame of the shape and shape.
6)	[Security Level]		Set a security level when using the security. The setting range is [0] to [15]. If you do not use the security, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
7)	[Display detailed information on the target alarm]		Displays detailed information added to system alarms.
8)	[Control displaying/hiding]		Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags

PART 7

Item		Description
9)	[Layer]	Switches layers to be placed. The following shows selectable items. • [Front] • [Back]
10)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category
11)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. Up to 100 characters can be set.

38.4 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the system alarm display as required.
The following shows the functions that are available by configuring the relevant settings.

38.4.1 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Resetting system alarms and system information (GOT error code, GOT Error Detection signal) (Read device: System signal 1-1.b13)	[System Signal 1-1]

38.4.2 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Storing the channel No. that has been assigned to the channel where a system alarm (GOT error) occurs (Write device)	GS262
Storing the channel No. that has been assigned to the channel where a system alarm (CPU error) occurs (Write device)	GS263
Storing the channel No. that has been assigned to the channel where a system alarm (network error) occurs (Write device)	GS264

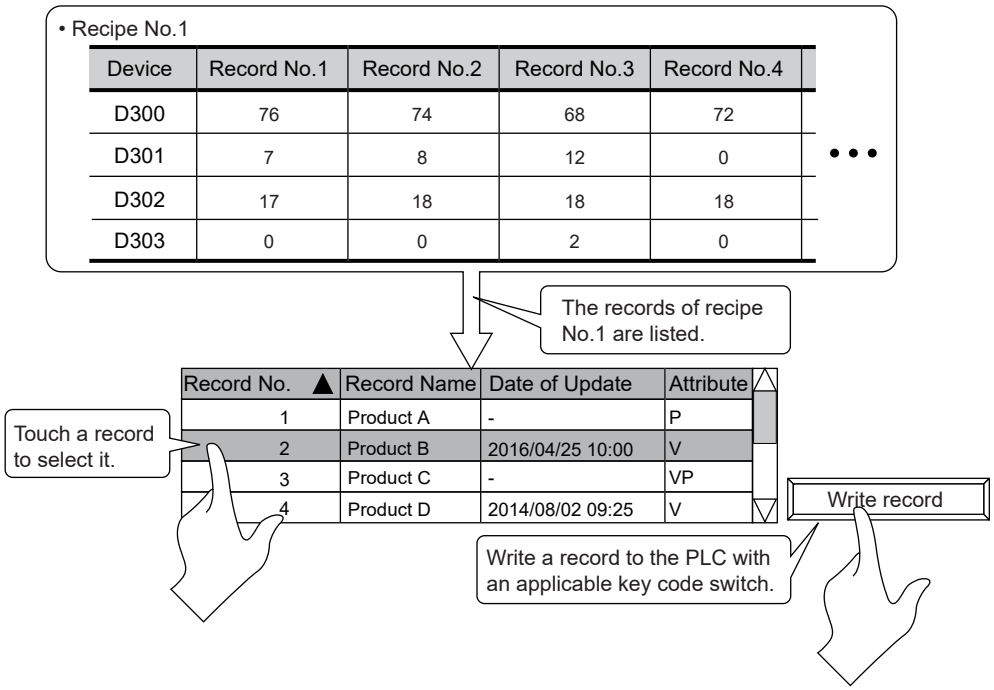
39 Placing a recipe display (record list)

GT37 SoftGOT3000

This function lists the records of a recipe on the GOT.

You can perform the following manipulations on the records listed on the object by using applicable key code switches.

- Renaming a record
- Reading a record
- Writing a record
- Verifying a record
- Deleting a record



☞ Page 1551 Specifications of the recipe display (record list)
☞ Page 1552 How to use the recipe display (record list)
☞ Page 1563 [Recipe Display (Record List)] dialog
☞ Page 1576 Relevant settings

This object function must be used in combination with the recipe function.

For details on the recipe function, refer to the following.

☞ Page 2243 Writing or reading values to multiple devices ([Recipe])

39.1 Specifications of the recipe display (record list)

GT37 SoftGOT3000

The following shows the specifications of the recipe display (record list).

39.1.1 System application (extended function)

To use the recipe display (record list), a system application (extended function) of [Recipe Display (Record List)] is required.
Placing the recipe display (record list) incorporates the application into the package data automatically.
☞ Page 1563 [Recipe Display (Record List)] dialog
To use the function with GT SoftGOT3000, the application is not required.

39.1.2 Maximum number of objects on one screen

One recipe display (record list) object can be placed on one screen.

39.1.3 Maximum number of objects displayed at one time

One recipe display (record list) object can be displayed at one time.
Multiple recipe display (record list) objects cannot operate simultaneously.
When a recipe display (record list) object is displayed on the GOT, even if you call up a screen having another recipe display (record list) object, the object does not appear on the GOT.

39.1.4 Maximum numbers of recipes and record rows displayed on the object

The records of one recipe can be displayed on the recipe display (record list) object.
When the recipe number is specified with a device value, switching between recipes is available.
Up to 64 record rows can be displayed on the object.

39.1.5 Key code switch

The recipe display (record list) is operable using key code switches.
Place the following key code switches on the screen as necessary.

Key code	Operation	Description
FFF0h	[Show cursor]	Display the cursor on a record row to select the row.
FFF1h	[Hide cursor]	Hide the cursor.
FFEFh	[Update list]	Update the list.
FFF4h	[List Displacement Scroll Up]	Scroll the list up the specified number of rows.
FFF5h	[List Displacement Scroll Down]	Scroll the list down the specified number of rows.
FFF6h	[List Page Scroll Up]	Scroll the list up one page.
FFF7h	[List Page Scroll Down]	Scroll the list down one page.
FFF2h	[Move cursor upward]	Move the cursor up one row.
FFF3h	[Move cursor downward]	Move the cursor down one row.
FFCAh	[Rename record]	Rename a record.
FFCBh	[Save record]	Read a record from the PLC.
FFCCh	[Load record]	Write a record to the PLC.
FFCDh	[Verify record]	Verify the device values of a record against those of the PLC.
FFB6h	[Delete record]	Delete a record.
FFCEh	[Cancel recipe operation]	Cancel the reading, writing, or verifying of a record.

39.2 How to use the recipe display (record list)

GT37 SoftGOT3000

39.2.1 Setting the recipe function

To use a recipe display (record list), the recipe function must be set.

☞ Page 2255 How to use the recipe

39.2.2 Placing a recipe display (record list)

The following shows the procedure for setting a recipe display (record list).

Operating procedure

1. Place a recipe display (record list) on the screen editor.

☞ Page 1001 Placing figures and objects

2. Upon placement of the recipe display (record list), key code switches are also placed.

The user ID of the recipe display (record list) is assigned to each key code switch.

Delete unnecessary key code switches.

Place additional key code switches as necessary.

☞ Page 1251 [Key Code Switch] dialog

3. Configure the settings of the recipe display (record list).

☞ Page 1563 [Recipe Display (Record List)] dialog

For the settings common to the objects, refer to the following.

☞ Page 1032 Settings common to figures and objects

Precautions

■User ID assigned to key code switches

If you change the user ID of the recipe display (record list), also change the set value of [User ID for a key input] for each switch.

Otherwise, the recipe display (record list) is inoperable using the switches.

☞ Page 1251 [Key Code Switch] dialog

■When placed from the [Recipe] dialog

If you place a recipe display (record list) by using the [Create a new recipe display (record list)] button in the [Recipe] dialog, the settings of the following items in the [Options] dialog are not applied.

[Place figures/objects sequentially]

[Deselect figures/objects once they are placed]

[Display the setting dialog once figures/objects are placed]

☞ Page 2311 [Recipe] dialog

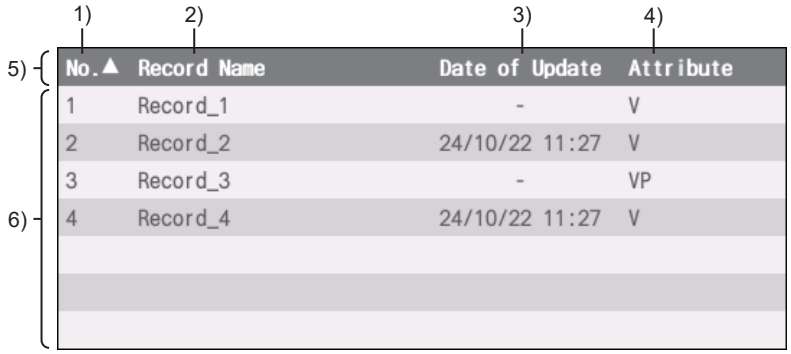
☞ Page 199 Customizing the settings related to editing operations

39.2.3 Operating a recipe display (record list)

The following shows how to operate a recipe display (record list).

List layout

The following shows the list layout of the recipe display (record list).



Item		Description
1)	[No.]	Displays the record numbers.
2)	[Record Name]	Displays the record names. If the name of a record is unspecified, the relevant cell is left blank.
3)	[Date of Update]	Displays the update date and time of each record. If a record is not read from the PLC, a hyphen [-] is displayed.
4)	[Attribute]	Displays the record attributes that indicate whether each record is readable or writable. [V]: The record can be written to a PLC. [P]: The record cannot be read to the GOT. (Overwrite-protected record) [VP]: The record can be written to a PLC, but cannot be read to the GOT. [-]: The record does not have an initial device value and can be read to the GOT.
5)	Title row	Displays the column headers. Touch a column header to sort the record list in ascending or descending order based on the column.
6)	Record rows	Each row displays one record. Touch a record row to select the record, and touch the row again to deselect the record.

Slide operation of the recipe display (record list)

You can slide the recipe display (record list) without using the object gesture function.

Reading, writing, or deleting a record

You can read, write, or delete a record selected on the recipe display (record list).

To perform these operations, use applicable key code switches.

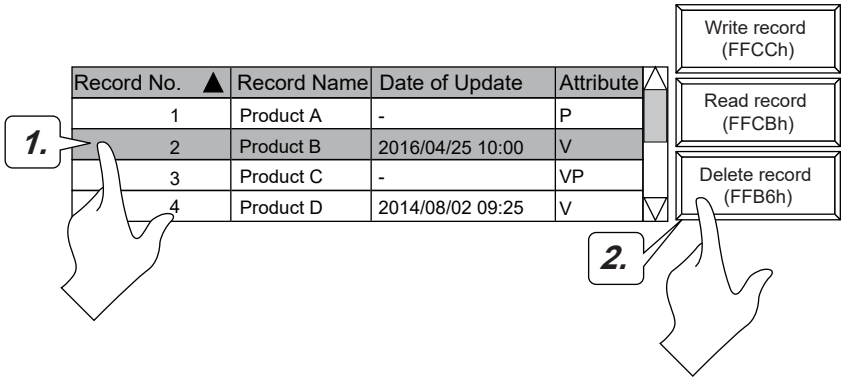
Place the following key code switches in advance.

- FFCBh: [Save record]
- FFCCh: [Load record]
- FFB6h: [Delete record]

Operating procedure

1. Touch a target record on the recipe display (record list) to select it.

2. Touch an applicable key code switch to write, read, or delete the selected record.



You can specify the name of the target record by using specific devices. To do this, enable the setting for the Control Target Record Name devices.

For details on the Control Target Record Name devices, refer to the following.

☞ Page 1557 Specifying the name of a manipulation target record by using specific devices

Renaming a record

You can rename a record selected on the recipe display (record list).

Up to 32 ASCII or Unicode characters are usable for a record name.

To specify a new record name, use the Control Target Record Name devices.

Set the Control Target Record Name devices in advance.

☞ Page 1573 [Extended] tab

☞ Page 1557 Specifying the name of a manipulation target record by using specific devices

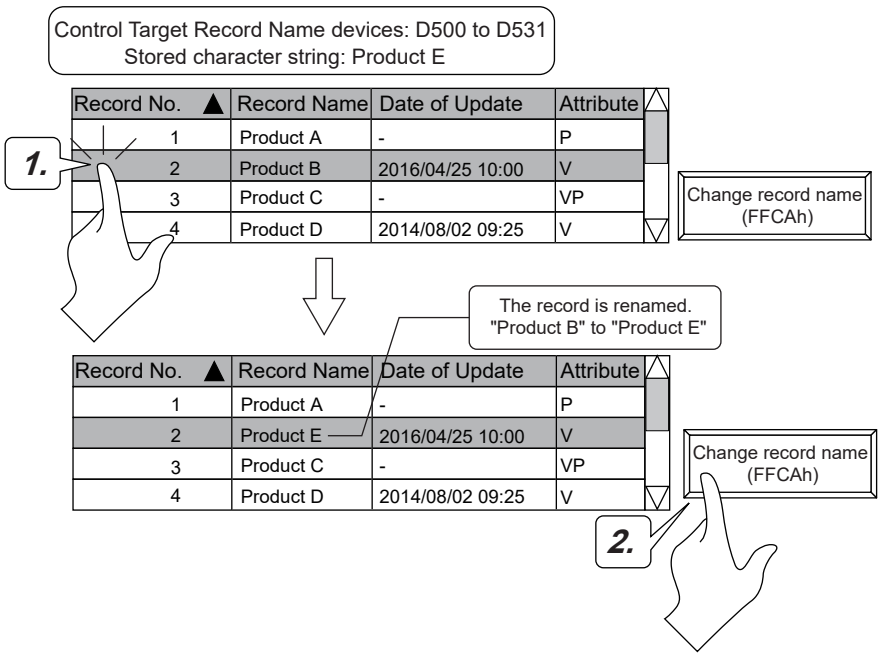
To perform the rename operation, use an applicable key code switch.

Place the following key code switch in advance.

- FFCAh: [Rename record]

Operating procedure

1. Touch a target record on the recipe display (record list) to select it.
2. Touch the applicable key code switch to rename the selected record.



Verifying a record

You can verify the device values of a record selected on the recipe display (record list) against those of the PLC.

To perform verification, use an applicable key code switch.

Place the following key code switch in advance.

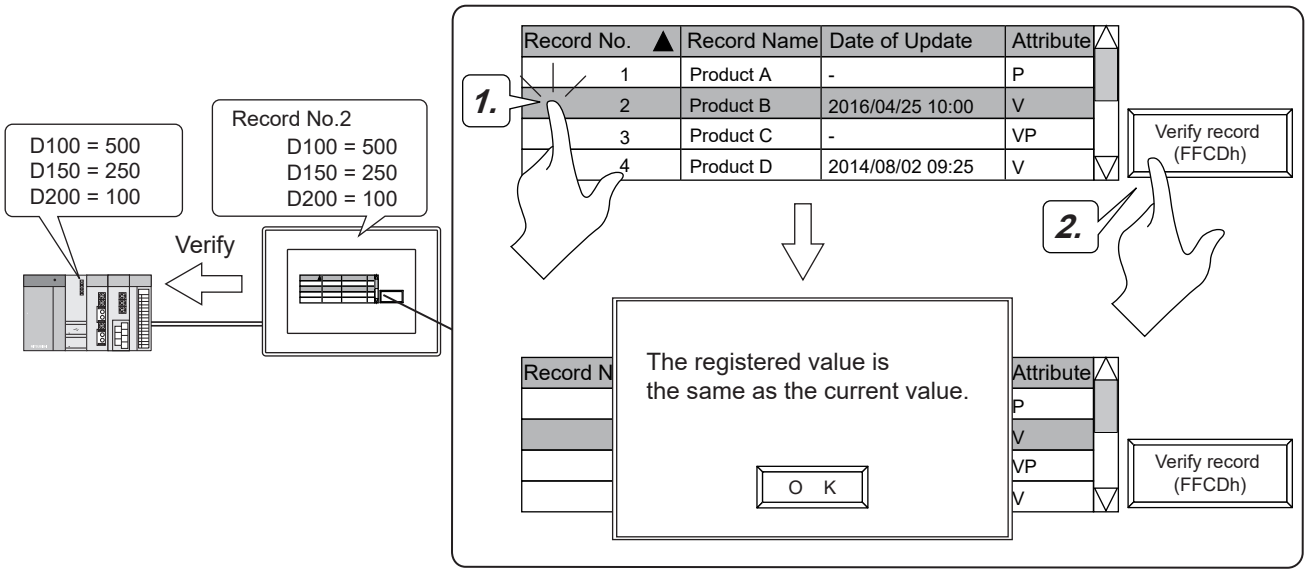
- FFCDh: [Verify record]

Operating procedure

1. Touch a target record on the recipe display (record list) to select it.

2. Touch an applicable key code switch to verify the device values of the selected record against those of the PLC.

The verification results are shown in a dialog.



You can specify the name of the target record by using specific devices. To do this, enable the setting for the Control Target Record Name devices.

For details on the Control Target Record Name devices, refer to the following.

☞ Page 1557 Specifying the name of a manipulation target record by using specific devices

39.2.4 Notification and control by using specific devices

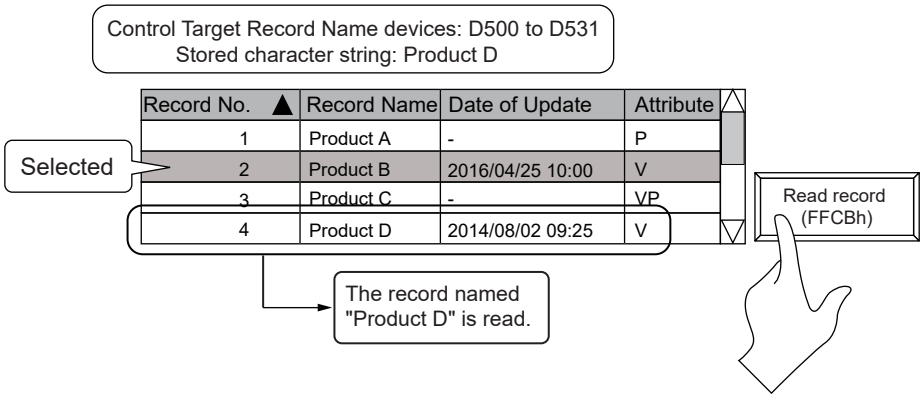
The following shows how to make notification or exercise control relevant to the recipe display (record list) by using specific devices.

Specifying the name of a manipulation target record by using specific devices

To use specific devices to specify the name of a record targeted for manipulation with key code switches, enable the setting for the Control Target Record Name devices.

The record whose name is specified using the Control Target Record Name devices always becomes the manipulation target even if another record is selected on the recipe display (record list).

Example) Reading a record



To specify the Control Target Record Name devices, set [Control target record name] on the [Extended] tab in the [Recipe Display (Record List)] dialog.

☞ Page 1573 [Extended] tab

You can specify a word device or word-specified bit device.

Specify the target record name within 32 ASCII or Unicode characters.

For storing ASCII characters as the record name, the number of consecutive devices to be used is half of the maximum number of characters set for [Cursor row record name].

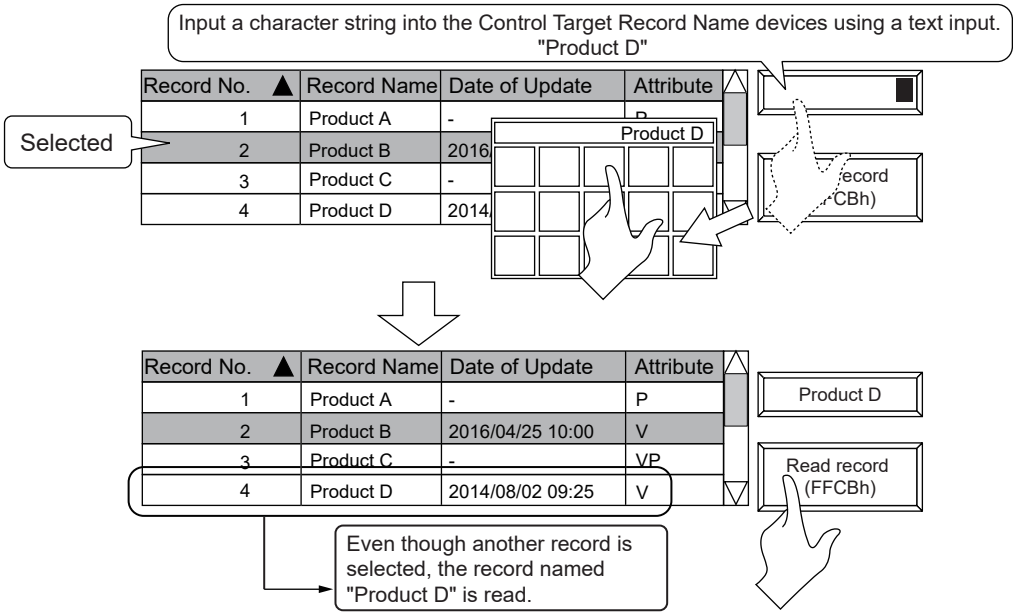
For storing Unicode characters as the record name, the number of consecutive devices to be used equals the maximum number of characters set for [Cursor row record name].

Point

When the record name selected on the recipe display (record list) differs from the one specified using the Control Target Record Name devices, the latter is always targeted for manipulation using the key code switches.

To manipulate a record selected on the recipe display (record list), clear the values of the Control Target Record Name devices first.

Example) When reading a record

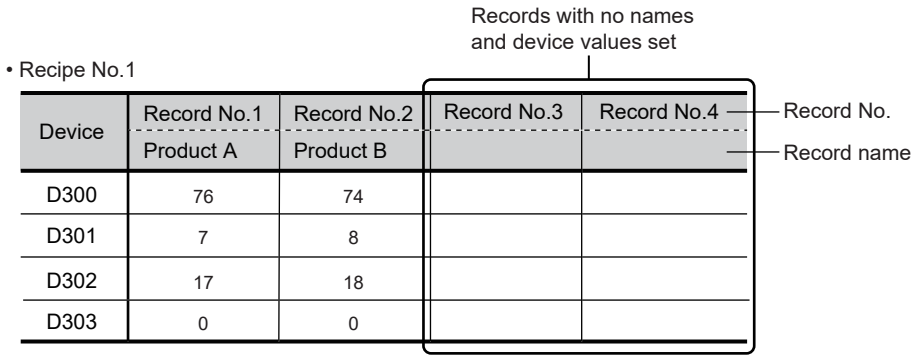


■Reading a record

The GOT reads the device values from the PLC to a target record when the applicable key code switch is touched. The character string stored in the Control Target Record Name devices is compared with the names of records in the target recipe. Consequently, the GOT reads the device values from the PLC to the record that has the exact match name.
If multiple records have the exact match name, the GOT reads the device values from the PLC to the lowest numbered record.
If the record selected on the recipe display (record list) has the exact match name, the GOT reads the device values from the PLC to the selected record.
If no record has the exact match name, the GOT reads the device values from the PLC to the lowest numbered blank record (that has no name and device value).
In this case, the record is named with the character string stored in the Control Target Record Name devices.
If the Control Target Record Name devices store no character string, the GOT reads the device values from the PLC to the record selected on the recipe display (record list).
If no record is selected, the GOT does not perform record reading.

Point

When you use the Control Target Record Name devices to read a record, preset a blank record that has no name and device value.
If the record specified with the Control Target Record Name devices is nonexistent, the read data is written to the blank record.
If a blank record is nonexistent, a system alarm occurs in the above case.
Moreover, the number of records in the recipe is unchangeable on the GOT.
However, if you preset several blank records, you can write the read data to the blank records on the GOT.
☞ Page 2255 How to use the recipe



■Writing a record

The GOT writes the device values of a target record to the PLC when the applicable key code switch is touched. The character string stored in the Control Target Record Name devices is compared with the names of records in the target recipe. Consequently, the GOT writes the device values to the PLC from the record that has the exact match name.
If multiple records have the exact match name, the GOT writes the device values to the PLC from the lowest numbered record.
If the record selected on the recipe display (record list) has the exact match name, the GOT writes the device values to the PLC from the selected record.
If no record has the exact match name, the GOT does not perform record writing.
If the Control Target Record Name devices store no character string, the GOT writes the device values to the PLC from the record selected on the recipe display (record list).
If no record is selected, the GOT does not perform record writing.

■Verifying a record

The GOT verifies the device values of a target record against those of the PLC when the applicable key code switch is touched. The character string stored in the Control Target Record Name devices is compared with the names of records in the target recipe. Consequently, the GOT verifies the device values of the record that has the exact match name.
If multiple records have the exact match name, the GOT verifies the device values of the lowest numbered record.
If the record selected on the recipe display (record list) has the exact match name, the GOT verifies the device values of the selected record.
If no record has the exact match name, the GOT does not perform record verification.
If the Control Target Record Name devices store no character string, the GOT verifies the device values of the record selected on the recipe display (record list).
If no record is selected, the GOT does not perform record verification.

■Deleting a record

The GOT deletes the contents of a target record when the applicable key code switch is touched. The character string stored in the Control Target Record Name devices is compared with the names of records in the target recipe. Consequently, the GOT deletes the contents of the record that has the exact match name.
If multiple records have the exact match name, the GOT deletes the contents of the lowest numbered record.
If the record selected on the recipe display (record list) has the exact match name, the GOT deletes the contents of the selected record.
If no record has the exact match name, the GOT does not perform record deletion.
If the Control Target Record Name devices store no character string, the GOT deletes the contents of the record selected on the recipe display (record list).
If no record is selected, the GOT does not perform record deletion.

■Renaming a record

The GOT renames the record selected on the recipe display (record list) when the applicable key code switch is touched. The record is renamed with the character string stored in the Control Target Record Name devices.
The record rename is not performed in the following cases.

- The Control Target Record Name devices are not set.
- The Control Target Record Name devices store no character string.

Narrowing down the records to be displayed

To narrow down the records to be displayed on the recipe display (record list) by specifying a character string included in the record names, enable the setting for the Narrow Down Record Names devices.

- Example

Narrow Down Record Names devices: D600 to D631
Stored character string: Bolt

Recipe display (record list)

No. ▲	Record Name	Date of Update	Attribute
1	Bolt M3	-	VP
2	Nut M3	-	VP
3	Flange Bolt M3	-	VP
4	Flange Nut M3	-	VP
5	Bolt M8	-	VP
6	Nut M8	-	VP
7	Flange Bolt M8	-	VP
8	Flange Nut M8	-	VP

Recipe display (record list)

No. ▲	Record Name	Date of Update	Attribute
1	Bolt M3	-	VP
3	Flange Bolt M3	-	VP
5	Bolt M8	-	VP
7	Flange Bolt M8	-	VP

The object lists the record names that include the character string specified using the Narrow Down Record Names devices.

To specify the Narrow Down Record Names devices, set [Narrow down record names] on the [Extended] tab in the [Recipe Display (Record List)] dialog.

☞ Page 1573 [Extended] tab

You can specify a word device or word-specified bit device.

Specify the character string (narrowing criteria) within 32 ASCII or Unicode characters.

For storing ASCII characters as the narrowing criteria, the number of consecutive devices to be used is half of the maximum number of characters set for [Narrow down record names].

For storing Unicode characters as the narrowing criteria, the number of consecutive devices to be used equals the maximum number of characters set for [Narrow down record names].

Precautions

You cannot specify a record name ending with a one-byte space by using Control Target Record Name devices. (The one-byte space is deleted.)

When you set a record name in the [Recipe] dialog, do not append a one-byte space to the record name.

Notifying the selected record name

To notify the name of a record selected on the recipe display (record list), enable the setting for the Cursor Row Record Name devices.

The Cursor Row Record Name devices store the name of a record selected on the recipe display (record list).

If you deselect the selected record on the recipe display (record list), the character string stored in the Cursor Row Record Name devices is cleared.

To specify the Cursor Row Record Name devices, set [Cursor row record name] on the [Extended] tab in the [Recipe Display (Record List)] dialog.

☞ Page 1573 [Extended] tab

You can specify a word device or word-specified bit device.

The record name is notified within 32 ASCII or Unicode characters.

■For the record name using ASCII characters

The number of consecutive devices to be used is half of the maximum number of characters set for [Cursor row record name].
If the number of the stored characters is less than the maximum number of characters, the stored characters are padded with NULL characters.
If the consecutive devices store an odd number of characters from lower-order bytes, 0 is stored in the higher-order bytes of the device that stores the last character.
If the consecutive devices store an odd number of characters from higher-order bytes, 0 is stored in the lower-order bytes of the device that stores the last character.

■For the record name using Unicode characters

The number of consecutive devices to be used equals the maximum number of characters set for [Cursor row record name].
If the number of the stored characters is less than the maximum number of characters, the stored characters are padded with NULL characters.

Notifying the record manipulation status

To notify the execution status of the manipulation performed on the recipe display (record list), enable the setting for the Notify Recipe Status device.
The Notify Recipe Status device notifies the execution status as shown below.

Bit number	Description
b0	Turns on when the GOT writes a record to the PLC by using the recipe display (record list). Turns off after the record writing is complete.
b1	Turns on when the GOT reads a record from the PLC by using the recipe display (record list). Turns off after the record reading is complete.
b2	Turns on when the GOT verifies the device values of a record selected on the recipe display (record list) against those of the PLC. Turns off after the record verification is complete.
b3	Turns on when the GOT acquires the records to be displayed on the recipe display (record list). Turns off after the record acquisition is complete.
b4 to b15	Use prohibited

To specify the Notify Recipe Status device, set [Notify the recipe status] on the [Extended] tab in the [Recipe Display (Record List)] dialog.
☞ Page 1573 [Extended] tab
You can specify a signed 16-bit binary word device or word-specified bit device.

Notifying the number of displayable records

To notify the number of records displayable on the recipe display (record list), enable the setting for the Number of Currently Displayed Records device.
To specify the Number of Currently Displayed Records device, set [Number of currently displayed records] on the [Extended] tab in the [Recipe Display (Record List)] dialog.
☞ Page 1573 [Extended] tab
You can specify a signed 16-bit binary word device or word-specified bit device.

39.3 [Recipe Display (Record List)] dialog

GT37 SoftGOT3000

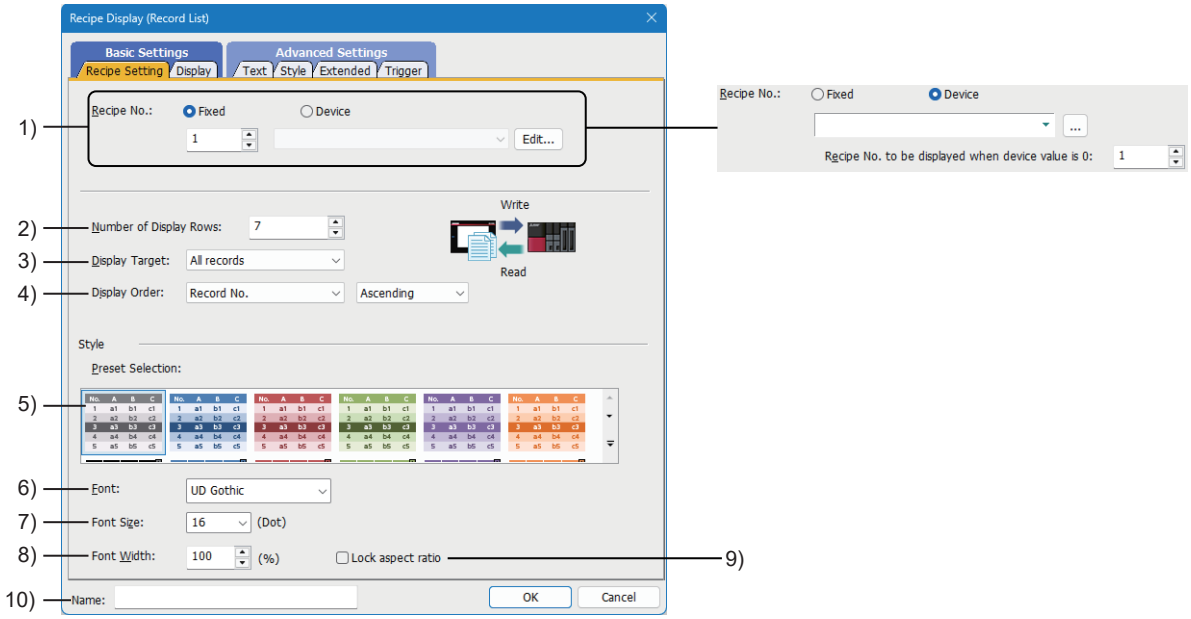
Operating procedure

1. Select [Object] → [Recipe Display (Record List)] from the menu.
2. Click the position to place a recipe display (record list).
3. Double-click the recipe display (record list) to display the setting dialog.

☞ Page 1564 [Recipe Setting] tab
☞ Page 1566 [Display] tab
☞ Page 1569 [Text] tab
☞ Page 1571 [Style] tab
☞ Page 1573 [Extended] tab
☞ Page 1575 [Trigger] tab

39.3.1 [Recipe Setting] tab

GT37 SoftGOT3000



Item			Description
1)	[Recipe No.]	—	Set the method of specifying a recipe number to display records on the recipe display (record list).
		[Fixed]	Displays the records of a recipe with a fixed recipe number. Select this item and enter a recipe number. The setting range is [1] to [32767].
		[Device]	Select this item to display the records of a recipe whose recipe number is specified with a device value. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags
		[Recipe No. to be displayed when device value is 0]	When selecting [Device] for [Recipe No.], set this item. Specify a recipe number to display target records when the set device stores 0. The setting range is [1] to [32767].
2)	[Number of Display Rows]		Set the maximum number of record rows to be displayed. The setting range is [1] row to [64] rows.
3)	[Display Target]		Select the records targeted for display. • [All records]: Displays all records of a recipe. • [Writable records]: Displays the writable records of a recipe. • [Readable records]: Displays the readable records of a recipe.
4)	[Display Order]		Set the order in which records are displayed for the first time. The selectable sort criteria are [Record No.], [Record Name], [Date of Update], and [Attribute]. The selectable sort orders are [Ascending] and [Descending]. 5)	[Preset Selection]		Select the design of the recipe display (record list). Click the pull-down menu button to display all designs. 
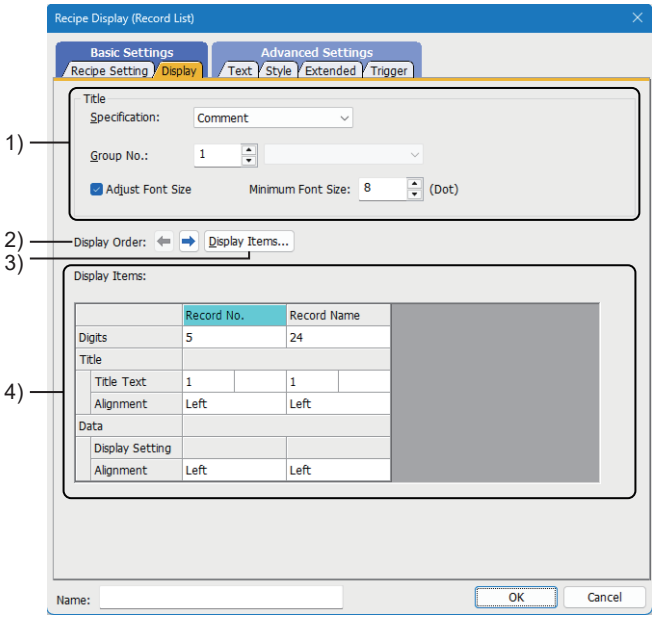
Item		Description
6)	[Font]	Select the font of the text to be displayed. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho]
7)	[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots.
8)	[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
9)	[Lock aspect ratio]	Select this item to fix the aspect ratio of the font. When this item is selected, the setting of [Font Width] is disabled.
10)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

39.3.2 [Display] tab

GT37 SoftGOT3000



Item			Description
1)	[Title]	[Specification]	Select the method of specifying the text to be displayed in the title. The following shows selectable items. • [Direct] Select this item to input the text to be displayed in the title directly into [Title] in [Contents]. • [Comment] Select this item to display the text to be displayed in the title using the comment in the comment group. • [None] Select this item not to display the title.
		[Group No.]	Only when [Comment] is selected for [Specification], this item can be set. Set the comment group number to be used.
		[Adjust Font Size]	The font size is automatically adjusted according to the object size. When this item is deselected, a line feed is automatically inserted.
		[Minimum Font Size]	This item can be set only when [Comment] is selected for [Specification] and [Adjust Font Size] is set. Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.

Item		Description
2)	[Display Order]	Set the order in which the columns of [Display Items] are displayed. Click the right or left arrow button to move the selected column. 3)	[Display Items] button	Displays the [Display Items] dialog. Select an item to be displayed on the recipe display (record list).  • [Record No.] Displays the record numbers. • [Record Name] Displays the record names. • [Date of Update] Displays the update date and time of each record. • [Attribute] Displays the record attributes that indicate whether each record is readable or writable.

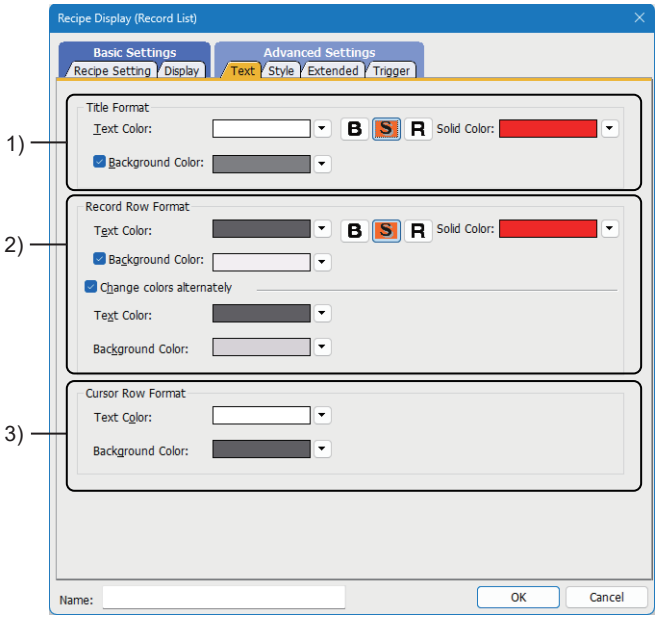
Item				Description
4)	[Display Items]	—		Set the details of the display items.
		[Digits]		Set the number of digits to be displayed in each column. The setting range is [1] digit to [128] digits.
		[Title]	[Title Text]	Set the column headers to be displayed in the title row. This setting depends on the selection for [Specification]. • [Direct] Enter text directly. The number of the characters must be within the set value of [Digits]. • [Comment] Set a comment No. or comment. • [None] Not settable
			[Alignment]	Select the horizontal position for the text to be displayed in the title row. The following shows selectable items. • [Left] • [Center] • [Right]
		[Data]	[Display Setting]	Set the display format of the update date and time. Click the [...] button to specify the date and time format in the [Date/Time Setting] dialog. ☞ Page 3684 [Date/Time Setting] dialog (screen)
			[Alignment]	Select the horizontal position for the text to be displayed in the record rows. The following shows selectable items. • [Left] • [Center] • [Right]

39.3.3 [Text] tab

GT37 SoftGOT3000



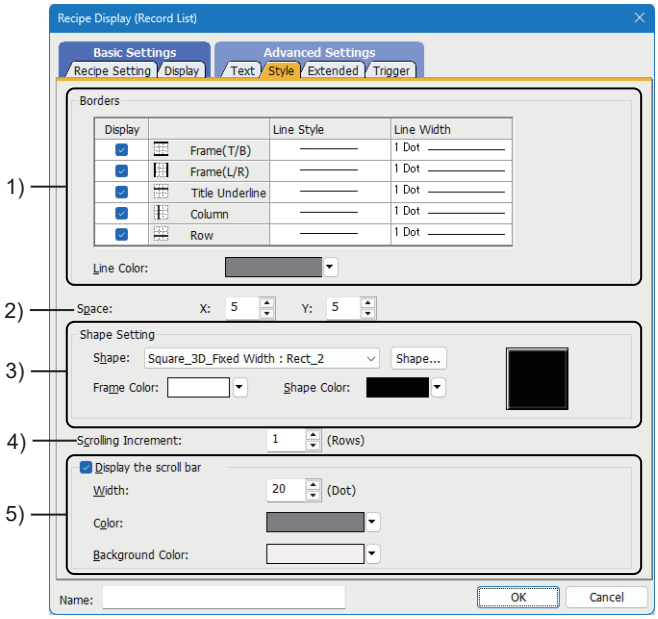
Item			Description
1)	[Title Format]	—	Set the format of the title row.
		[Text Color]	Set the color and style of the text to be displayed in the title row. One style ([Bold], [Solid], or [Raised]) is settable only.  • [Text Color] Set the text color. ☞ Page 988 Color settings • [Bold] button Displays the text in bold. • [Solid] button Displays the text with a shadow. • [Raised] button Displays the text embossed. • [Solid Color] When [Solid] or [Raised] is selected as the text style, set the color of the shadow. ☞ Page 988 Color settings
		[Background Color]	Set the background color of the title row.

PART 7

Item			Description
2)	[Record Row Format]	—	Set the format of the record rows.
		[Text Color]	Set the color and style of the text to be displayed in the record rows. One style ([Bold], [Solid], or [Raised]) is settable only.  • [Text Color] Set the text color. ☞ Page 988 Color settings • [Bold] button Displays the text in bold. • [Solid] button Displays the text with a shadow. • [Raised] button Displays the text embossed. • [Solid Color] When [Solid] or [Raised] is selected as the text style, set the color of the shadow. ☞ Page 988 Color settings
		[Background Color]	Set the background color of the record rows.
		[Change colors alternately]	Set [Text Color] and [Background Color] for the even-numbered record rows. ☞ Page 988 Color settings
3)	[Cursor Row Format]	—	Set the format of the selected row.
		[Text Color]	Set the color of the text to be displayed in the selected row. ☞ Page 988 Color settings
		[Background Color]	Set the background color of the selected row. ☞ Page 988 Color settings

39.3.4 [Style] tab

GT37 SoftGOT3000



Item			Description
1)	[Borders]	[Display]	Displays a border at the selected position. The following shows display items. • [Frame (T/B)] • [Frame (L/R)] • [Title Underline] • [Column] • [Row]
		[Line Style]	Select the style of ruled lines. The following shows selectable items. • Solid line • Dotted line • Broken line • One-dot chain line • Two-dot chain line
		[Line Width]	Select the width of ruled lines. The following shows selectable items. • [1 Dot] • [2 Dot] • [3 Dot] • [4 Dot] • [5 Dot] • [6 Dot] • [7 Dot]
		[Line Color]	Set the ruled line color. ☞ Page 988 Color settings
2)	[Space]		Set the space between the text to be displayed and the ruled lines of the table. The setting range is [0] to [32]. The following illustrates the space [X] and [Y]. 
Item			Description
3)	[Shape Setting]	[Shape]	Select the shape to be set for the object from the list or with the [Shape] button. ☞ Page 1044 Object shape
		[Frame Color]	Select the frame color of the shape. ☞ Page 988 Color settings
		[Shape Color]	Select the color of the shape. ☞ Page 988 Color settings
4)	[Scrolling Increment]		Set the number of rows to be scrolled in the recipe display (record list) when an arrow key on the scroll bar or a key code switch (FFF4h or FFF5h) is touched. The setting range is [1] row to [64] rows.
5)	[Display the scroll bar]	—	Displays or hides the scroll bar.
		[Width]	Specify the width of the scroll bar. The up or down button on the scroll bar is a square. Accordingly, the width and height of the button equal the width of the scroll bar. The setting range is [16] dots to [64] dots. 		[Color]	Set the color of the scroll bar. ☞ Page 988 Color settings
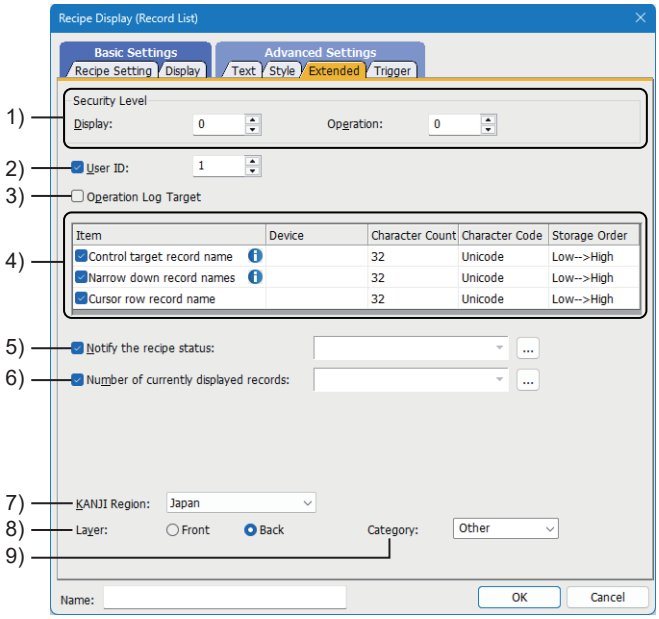
		[Background Color]	Set the background color of the scroll bar. ☞ Page 988 Color settings

39.3.5 [Extended] tab

GT37 SoftGOT3000



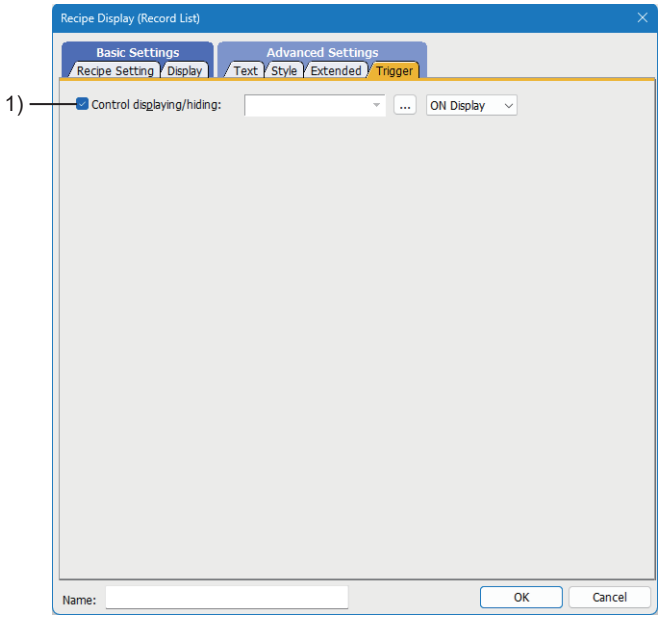
Item		Description
1)	[Security Level]	Set a security level when using the security. The setting range is [0] to [15]. If you do not use the security, select [0]. The set value of [Operation] must be greater than that of [Display]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[User ID]	Select this item to set the user ID. The setting range is [1] to [65535]. The following operations can be performed when user ID numbers are set. • Identifying the object that is operated with a key code switch ☞ Page 1251 [Key Code Switch] dialog • Setting the position where the cursor is displayed at screen switching ☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching]) • Identifying the object that is targeted for the operation log function ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])
3)	[Operation Log Target]	Select this item to target the object for the operation log. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])

PART 7

Item			Description
4)	Setting the devices for control and notification	—	Set the control and notification devices for the recipe display (record list).
		[Item]	Select necessary items for control or notification. • [Control target record name] ☞ Page 1557 Specifying the name of a manipulation target record by using specific devices Enables the setting for the Control Target Record Name devices. • [Narrow down record names] Enables the setting for the Narrow Down Record Names devices. ☞ Page 1561 Narrowing down the records to be displayed • [Cursor row record name] Enables the setting for the Cursor Row Record Name devices. ☞ Page 1561 Notifying the selected record name
		[Device]	Set the first device of consecutive devices to be used for control or notification. You can specify a word device or word-specified bit device. The number of the consecutive devices varies with the settings of [Character Count] and [Character Code]. When [Character Code] is set to [ASCII], the number of the consecutive devices equals half of the set value of [Character Count]. When [Character Code] is set to [Unicode], the number of the consecutive devices equals the set value of [Character Count]. ☞ Page 834 How to set devices, labels, and tags
		[Character Count]	Set the maximum number of characters to be stored in the devices for control or notification. The setting range is [1] to [32].
		[Character Code]	Select the character code of the character string to be stored in the devices for control. The following shows selectable items. • [ASCII] • [Unicode]
		[Storage Order]	Select the order in which character codes are stored. The following shows selectable items. • [Low → High] • [High → Low]
5)	[Notify the recipe status]		Enables the setting for the Notify Recipe Status device. ☞ Page 1562 Notifying the record manipulation status Select this item and specify the Notify Recipe Status device. ☞ Page 834 How to set devices, labels, and tags
6)	[Number of currently displayed records]		Enables the setting for the Number of Currently Displayed Records device. ☞ Page 1562 Notifying the number of displayable records Select this item and specify the Number of Currently Displayed Records device. ☞ Page 834 How to set devices, labels, and tags
7)	[KANJI Region]		Select the KANJI region of the text to be displayed. The following shows selectable items. • [Japan] • [China(GB)-Mincho] • [China(Big5)-Gothic]
8)	[Layer]		Switches layers to be placed. The following shows selectable items. • [Front] • [Back]
9)	[Category]		Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

39.3.6 [Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display]

PART 7

39.4 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the recipe display (record list) as required.
The following shows the functions that are available by configuring the relevant settings.

39.4.1 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Notifying that the recipe process (reading or writing) is being executed (Write device: System signal 2-1.b10)	[System Signal 2-1]

39.4.2 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Notifying the recipe number for the records displayed on the recipe display (record list)*1 (Write device)	GS1013
Notifying the record number selected on the recipe display (record list)*1 (Write device)	GS1014
Storing the record number of the manipulated record while GS1809.b0 is on. (Write device)	GS1015
Notifying the record manipulation result while GS1809.b0 is on. (Write device)	GS1016.b0 to GS1016.b2 GS1016.b11 to GS1016.b15
Displaying no confirmation or notification dialog during a record manipulation. (Read device)	GS1809.b0
Clearing the record manipulation result that has been notified by GS1016. (Read device)	GS1809.b15

*1 For information on how to link the recipe function with the recipe display (record list) by using GS1013 and GS1014, refer to the following.

☞ Page 2296 Link with the recipe display (record list) by using GOT special registers

Precautions

■Precautions for using the Recipe Display (Record List) Record Manipulation Result (GS1016)

If you manipulate a record while GS1016 is on, you cannot distinguish between the previous and current manipulation results. Before manipulation, turn on the Recipe Display (Record List) Control device (GS1809.b15) to turn off GS1016.

40 Placing a line graph

☞ Page 1578 Overview of the line graph
☞ Page 1580 How to use the line graph
☞ Page 1582 Specifications of the line graph
☞ Page 1583 Setting a line graph
☞ Page 1584 [Line Graph] dialog

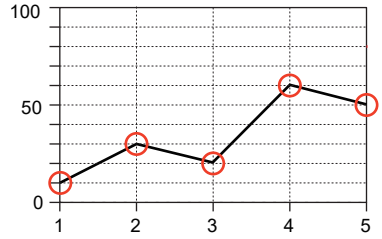
PART 7

40.1 Overview of the line graph

GT37 SoftGOT3000

The line graph is an object that collects the current values of a group of multiple devices in a batch and displays the values in a single graph.

A single line represents a group of devices. Each point (circled in red in the figure below) on the line indicates the value of a device in the device group.



Use a single line or multiple lines depending on the purpose.

☞ Page 1578 Expressing values of multiple devices with a single line

☞ Page 1579 Expressing values of multiple device groups with multiple lines

Expressing values of multiple devices with a single line

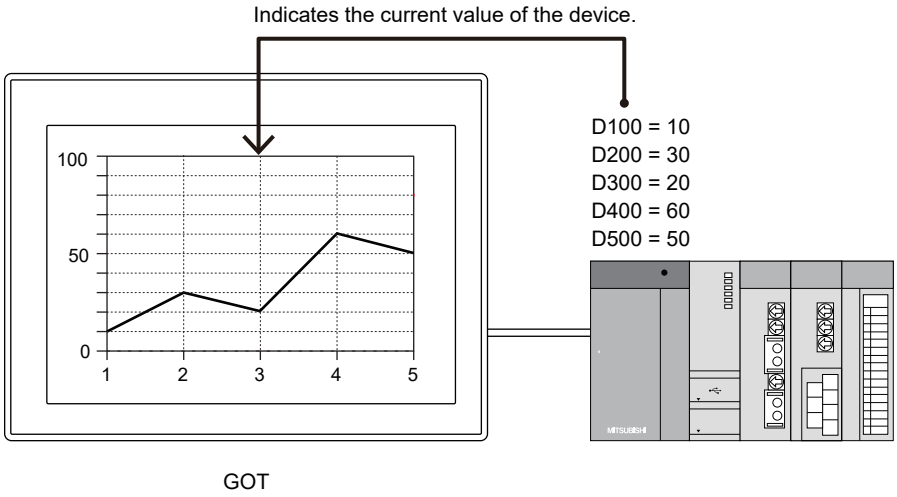
The following shows an example of expressing values of multiple devices with a single line.

Ex.

Expressing production volumes of lines 1 to 5 with a single line

The points on the line represent the values of the following PLC devices.

- [D100]: Production volume of line 1
- [D200]: Production number of line 2
- [D300]: Production number of line 3
- [D400]: Production number of line 4
- [D500]: Production number of line 5



Expressing values of multiple device groups with multiple lines

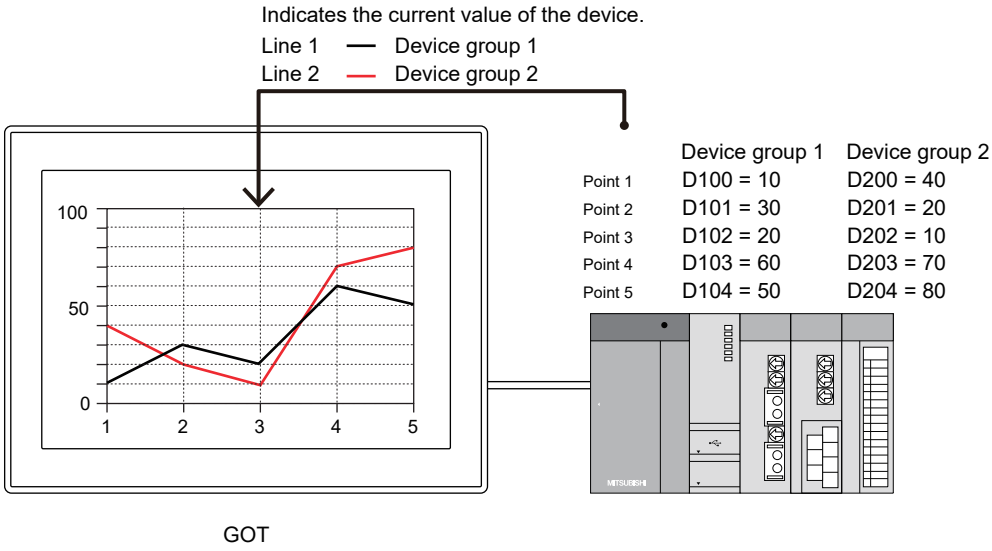
Multiple lines can be displayed on a single graph.

Since each line represents each device group, the graph visualizes the data sizes of multiple device groups.

Ex.

Checking the production status of each line by displaying lines for production control data sets of line 1 and 2

- Device group 1 ([D100] to [D104]): Data of line 1
- Device group 2 ([D200] to [D204]): Data of line 2



PART 7

40.2 How to use the line graph

Set two sets of values, the upper and lower limits of the device values and the vertical upper and lower limits of the graph scale values.

This enables you to use the graph in the following two ways.

☞ Page 1580 Indicating the device value

☞ Page 1581 Indicating the percentage against the total

Indicating the device value

When the same upper and lower limit values are used for the device values and the vertical scale values, each point indicates the device value.

Ex.

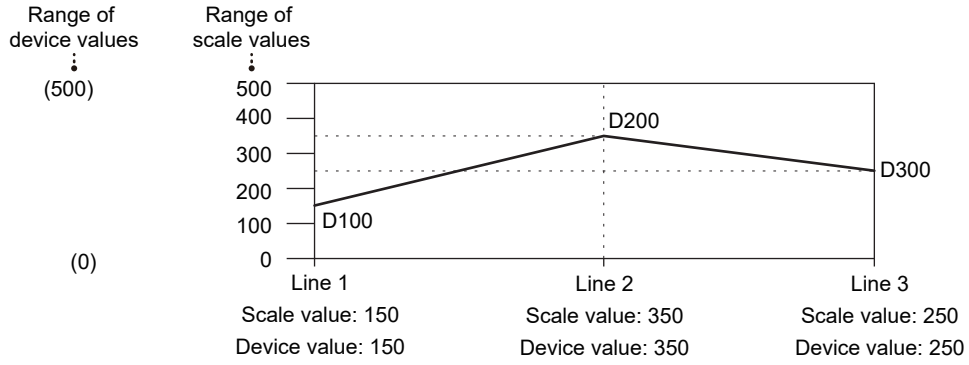
When monitoring the following devices and expressing the production volumes of line 1 to 3 in a line graph

Monitored device	Value to be stored
[D100]	Production volume of line 1
[D200]	Production volume of line 2
[D300]	Production volume of line 3

Range of the device value: 0 to 500

Range of the scale value: 0 to 500

The line graph shows the device values (production volumes).



Indicating the percentage against the total

When the different ranges are set for the device values and the scale values, each point indicates the position relative to the upper and lower limits of the device value.

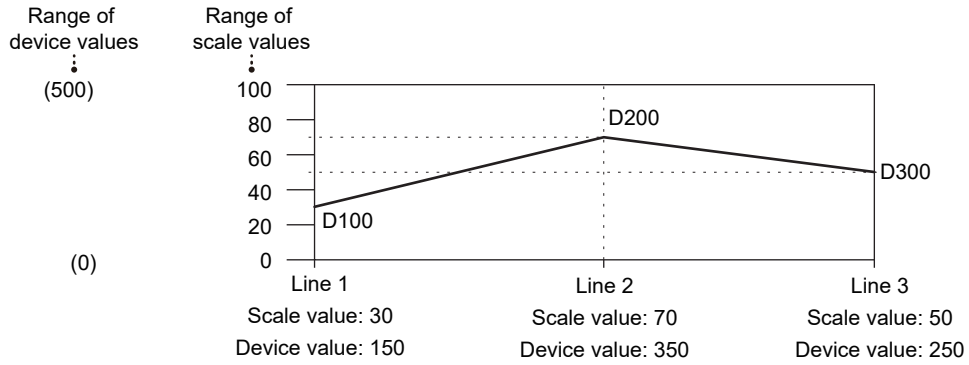
Ex.

When monitoring the same devices as above and expressing the production rates (%) of line 1 to 3 in a line graph

Range of the device value: 0 to 500

Range of the scale value: 0 to 100

The device values and the corresponding scale values are as follows.



Point

The following setting items are related to the above.

- [Lower Limit] and [Upper Limit] in the [Data] tab

☞ Page 1584 [Data] tab

- [Lower Limit] (vertical) and [Upper Limit] (vertical) in the [Style] tab

☞ Page 1587 [Style] tab

40.3 Specifications of the line graph

GT37 SoftGOT3000

☞ Page 1582 Maximum number of objects that can be placed on one screen
☞ Page 1582 Number of word devices that can be monitored
☞ Page 1582 Line graph size
☞ Page 1582 Display when the upper or lower limit has exceeded
☞ Page 1582 Conversion to a bar graph

40.3.1 Maximum number of objects that can be placed on one screen

Up to 32 line graphs can be placed on one screen.

40.3.2 Number of word devices that can be monitored

Up to eight lines can be displayed with one object.
With a single line, up to 500 word devices (points) can be monitored.

40.3.3 Line graph size

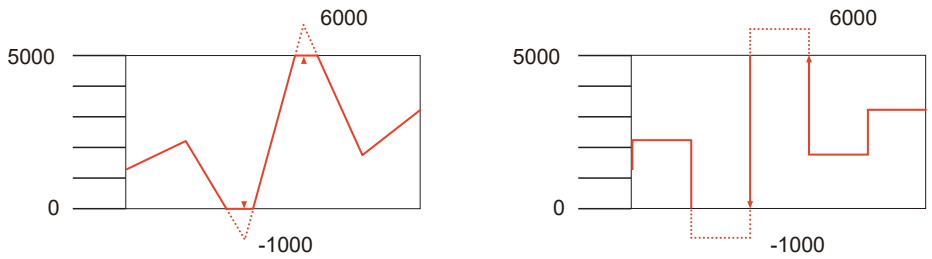
The following shows the minimum and maximum line graph sizes.

Size	Size (dot)
Minimum	16 × 16
Maximum	6000 × 6000

40.3.4 Display when the upper or lower limit has exceeded

If the monitored device value exceeds the upper or lower, ▼ or ▲ appears in the direction of protrusion.
▼ or ▲ appears in the color of the relevant line.

(Example of the display with steps)



40.3.5 Conversion to a bar graph

The object type can be switched between the line graph and the bar graph.

☞ Page 1584 [Data] tab

The common settings are retained even when the object type is switched.
When there are differences between the items on the screens before and after the switching, values in the deleted items are discarded, and initial values are set in the added items.
When there are differences between the settable ranges, values closest to the original values are set.

40.4 Setting a line graph

GT37 SoftGOT3000

Use the following procedure to place a line graph and configure operation settings.

Operating procedure

1. Select [Object] → [Graph] → [Line Graph], and click the position to place the line graph.

☞ Page 1001 Placing figures and objects

2. Double-click the line graph to display the [Line Graph] dialog.
3. Configure operation settings in each tab of the [Line Graph] dialog.

☞ Page 1584 [Line Graph] dialog

For the settings common among objects and editing except operation settings, refer to the following.

☞ Page 995 Basics of figures and objects

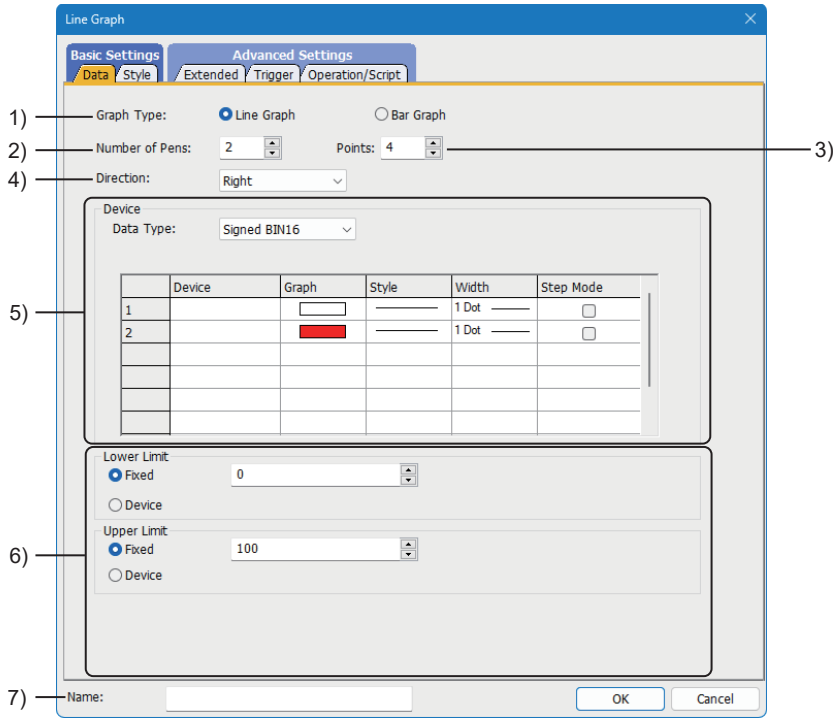
40.5 [Line Graph] dialog

GT37 SoftGOT3000

☞ Page 1584 [Data] tab
☞ Page 1587 [Style] tab
☞ Page 1589 [Extended] tab
☞ Page 1590 [Trigger] tab
☞ Page 1591 [Operation/Script] tab

40.5.1 [Data] tab

Specify the graph type, and set the device to be monitored, data type, upper and lower limits of the device value and others.



Item		Description
1)	[Graph Type]	Select [Line Graph].
2)	[Number of Pens]	Set the number of lines to be displayed. The setting range is [1] to [8].
3)	[Points]	Set the number of points (number of monitored devices) to be displayed on a line. The setting range is [2] to [500]. The interval between points is the value obtained by dividing the X-axis display range (dots) of the graph equally. If the number of points is set to be larger than the number of dots in the X-axis display range, the graph will not be displayed according to the specified number of points. Set the number of dots in the X-axis display range to be equal to or greater than the number of points. Example) X-axis display range: 100 dots, number of points: 5  X-axis display range: 100 dots

Item			Description
4)	[Direction]		Select the display direction of the graph. The devices are lined up in the order they are set. [Right] [Left] 5)	[Device]	[Data Type]	Select the data type of the word device.
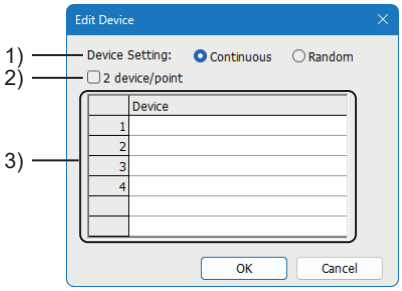
		[Device]	Set a word device to be monitored. Click a cell in the [Device] column to display the [Edit] button. The [Edit Device] dialog appears. Set a device to be monitored. For the [Edit Device] dialog, refer to the following. ☞ Page 1586 [Edit Device] dialog
		[Graph]	Select the color of the line.
		[Style]	Select the style of the line.
		[Width]	Select the width of the line.
		[Step Mode]	Select this item to display the line by steps. Display without steps  Display with steps  Either [Step Mode] or [2 device/point] can be enabled.
6)	[Lower Limit] [Upper Limit]		Specify the range of the device value (upper and lower limits). Specify fixed values or devices. If devices are used, the values can be changed dynamically. ☞ Page 834 How to set devices, labels, and tags The setting range depends on the selection for [Data Type]. For the graph display when the range of the device value has exceeded, refer to the following. ☞ Page 1582 Display when the upper or lower limit has exceeded
7)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

[Edit Device] dialog



Item		Description
1)	[Device Setting]	Select how to set multiple devices. Select [Continuous] when monitoring consecutive devices. Select [Random] when monitoring non-consecutive devices. When a PLC that supports continuous read is used, the screen display can be refreshed faster with [Continuous].
2)	[2 device/point]	Select this item to display two device values on the same vertical axis. With this function, each sets of two values can be displayed with a vertical line between them. [2 device/point]: Deselected One value is displayed per point.  [2 device/point]: Selected Two values are displayed per point. Twice as many devices are monitored.  Either [Step Mode] or [2 device/point] can be enabled. When [Step Mode] is selected, selecting [2 device/point] deselects [Step Mode] automatically.
3)	[Device]	Set a word device to be monitored. When selecting [Continuous] for [Device Setting], set the start device of consecutive devices in the first row. When the start device is set, the subsequent devices are automatically set according to the number set to [Points]. When selecting [Random] for [Device], set each device manually. ☞ Page 834 How to set devices, labels, and tags

Precautions

■When monitoring a global label

When monitoring a device of a primitive data type global label, select [Random] for [Device Setting].

If [Continuous] is selected, and a device of a primitive data type global label is set, system alarm 326 occurs.

When setting consecutive devices, set an array-type global label.

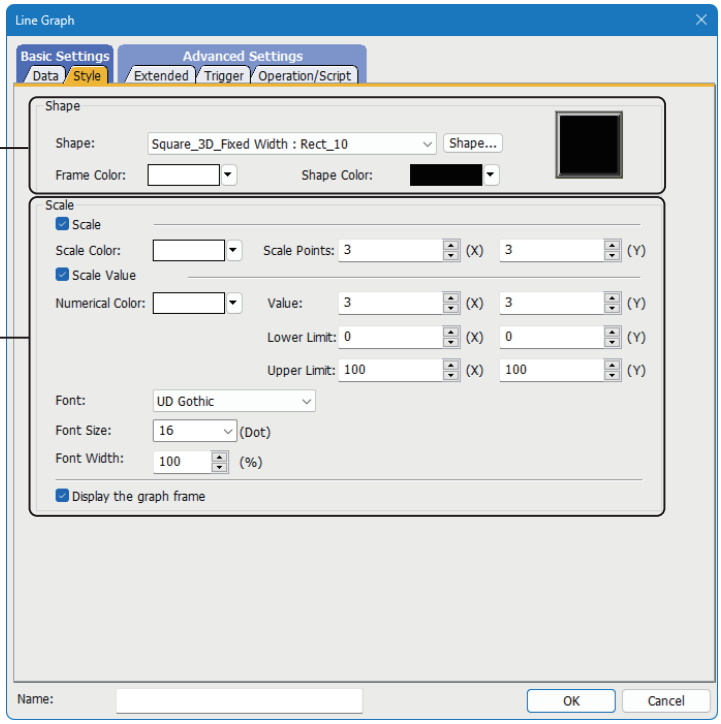
■Insufficient number of devices

If the number of devices is insufficient to display the specified graph, system alarm 307 occurs and the object is not displayed.

40.5.2 [Style] tab

For mobile screens, some setting items are not available.

Configure the frame shape settings, scale mark and scale value display settings, and other settings.



Item			Description
1)	[Shape]	[Shape]	Set the shape to be placed behind the line graph. Use this item when enclosing the object with a frame or others. This eliminates the need of placing another frame shape and enables automatic resizing according to the object size. To use a readily available design set, select one from the list box. When not selecting one from the list box, click the [Shape] button and set one on the displayed [Image List] screen. ☞ Page 1044 Object shape When selecting a shape from [Basic Figure], set a frame color and a shape color. 		[Frame Color]	Select a frame color.
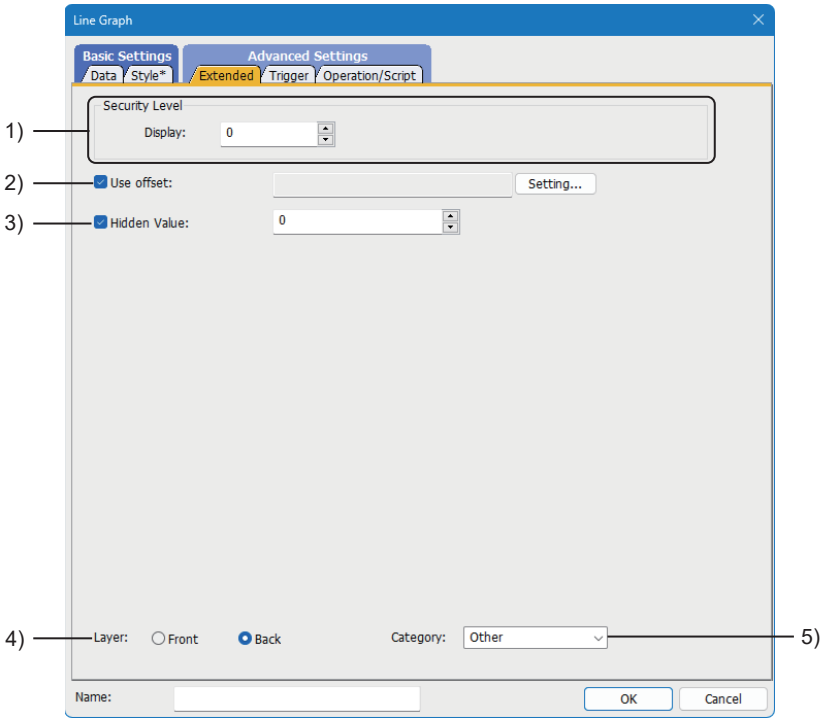
		[Shape Color]	Select a fill color of the shape.

Item			Description
2)	[Scale]	—	Select this item to display scale marks. When selecting this item, set the following items.
		[Scale Color]	Set the color of the scale marks. ☞ Page 988 Color settings
		[Scale Points] (X, Y)	Set the number of scale marks to be displayed on the vertical and horizontal axes. The setting range is [0] and [2] to [101].
	[Scale Value]	—	Select this item to display numerical values on the scale. When selecting this item, set the following items.
		[Numerical Color]	Set the color of the scale values. ☞ Page 988 Color settings
		[Value] (X, Y)	Set the number of scale values to be displayed on the vertical and horizontal axes. The setting range is [0] and [2] to [101].
		[Lower Limit] (X, Y) [Upper Limit] (X, Y)	Set the upper and lower limits of the scale value on the vertical and horizontal axes. The setting range differs depending on the setting of [Data Type] in the [Data] tab. The selectable range of 64-bit devices is the same as that of 32-bit devices. When [Upper Limit], [Lower Limit], and [Value] are set, the scale values are automatically calculated and displayed.
		[Font]	Select a font for the scale values.
		[Font Size]	Select a vertical size for the scale values. The setting range is [8] dots to [540] dots.
		[Font Width]	Specify a horizontal size for the scale values. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character is always within the range of [8] dots to [540] dots.
	[Display the graph frame]		Select this item to display the frame of the graph. With a graph frame  Without a graph frame

40.5.3 [Extended] tab

For mobile screens, some setting items are not available.

Set the security level of the object and use/nonuse of the offset function.



Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Configure the settings to monitor the status of multiple devices by switching between them with a single device. After selecting this item, set the offset device. The monitored device is the one with the offset device value added to the device set in [Device] in the [Data] tab. ☞ Page 963 Offset
3)	[Hidden Value]	To specify a device value not to be displayed on the graph line, select this item and set the target device value. When [Hidden Value] is not selected  When [400] is set to [Hidden Value] 4)	[Layer]	Select the layer to place the object. ☞ Page 65 Layer
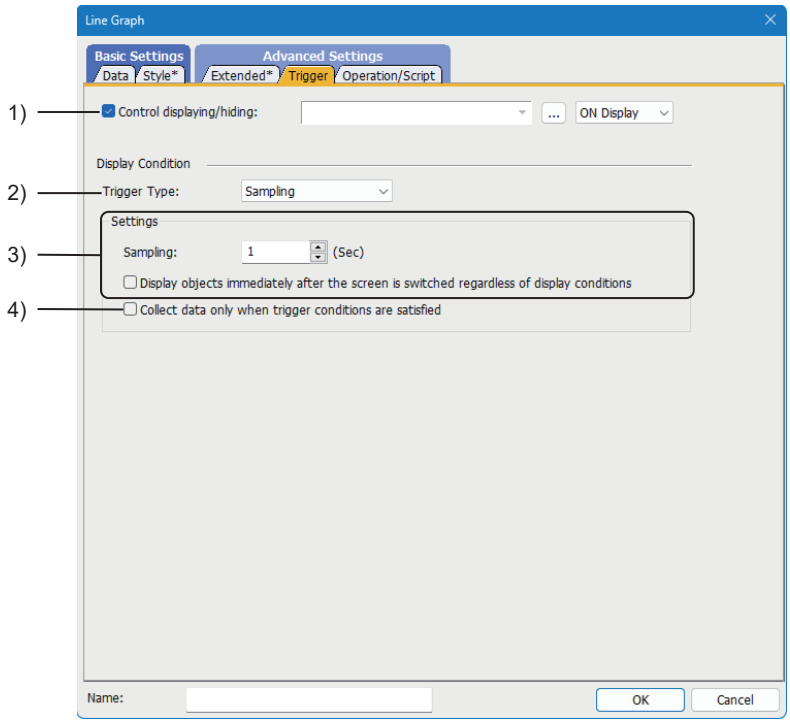
5)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

40.5.4 [Trigger] tab

Set the trigger condition to display the object.



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Control device (bit device or bit-specified word device) • When to display: When the control device is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition If there are many monitored devices, setting [Trigger Type] to [Ordinary] may delay the processing of the object. In that case, change [Trigger Type] to [Sampling] and set 2 seconds or more for [Sampling].
3)	[Settings]	For the details of each item, refer to the following. ☞ Page 972 Settings by trigger type
4)	[Collect data only when trigger conditions are satisfied]	This item is settable when [Rise], [Fall], [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling] is selected for [Trigger Type]. Select this item to collect data only when the trigger condition set to [Trigger Type] is satisfied. Normally, the GOT communicates with the controller even when the trigger condition is not satisfied. When this function is enabled, the GOT communicates with the controller only when the trigger condition is satisfied. The communication load between the GOT and the controller can be reduced. This is useful when the object display does not need frequent refresh.

Precautions

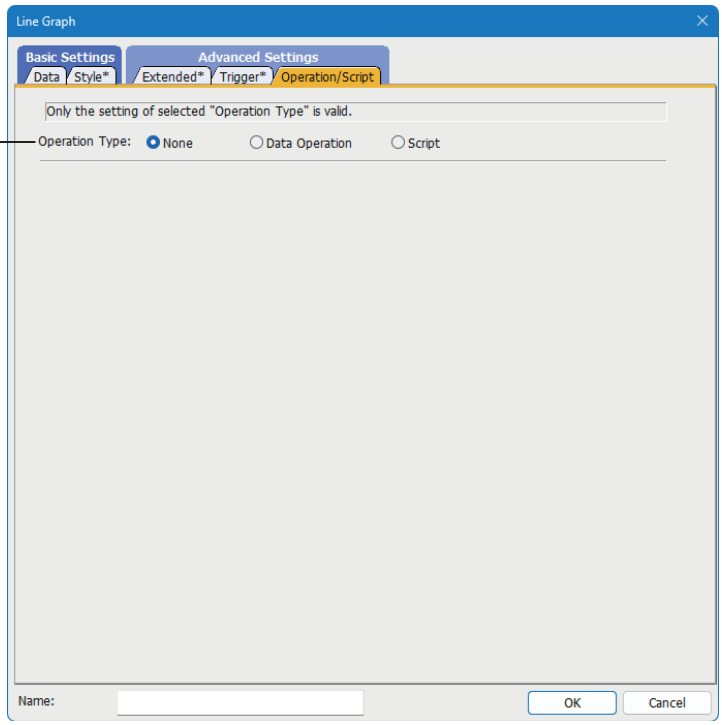
■About [Collect data only when trigger conditions are satisfied]

- If consecutive graph refresh and display is required, it is recommended to disable [Collect data only when trigger conditions are satisfied].
- When [Trigger Type] is set to [Sampling], [ON Sampling], or [OFF Sampling], if a short cycle is set, communication may be delayed, lowering screen refresh performance even if [Collect data only when trigger conditions are satisfied] is enabled.
- When [Collect data only when trigger conditions are satisfied] is enabled, a trigger satisfied for an object being refreshed by the previous trigger will become invalid.
- When [Collect data only when trigger conditions are satisfied] is enabled, the time from when the trigger condition is satisfied to when the object display is refreshed will be longer than when the setting is disabled.

40.5.5 [Operation/Script] tab

For mobile screens, some setting items are not available.

Set whether to perform an operation or a script with the device value handled by the object.



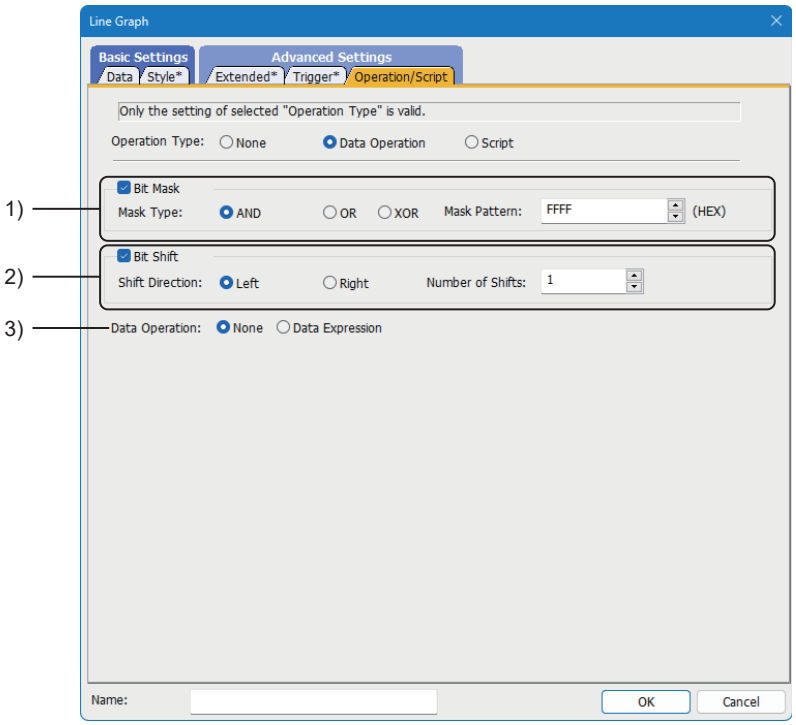
Item			Description
1)	[Operation Type]	[None]	Does not use the data operation function and the script function.
		[Data Operation]	Set the expression used for the data operation function. For the setting method, refer to the following. ☞ Page 1592 [Data Operation]
		[Script]	Set the expressions for the script function. For the setting method, refer to the following. ☞ Page 1593 [Script]

PART 7

[Data Operation]

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation

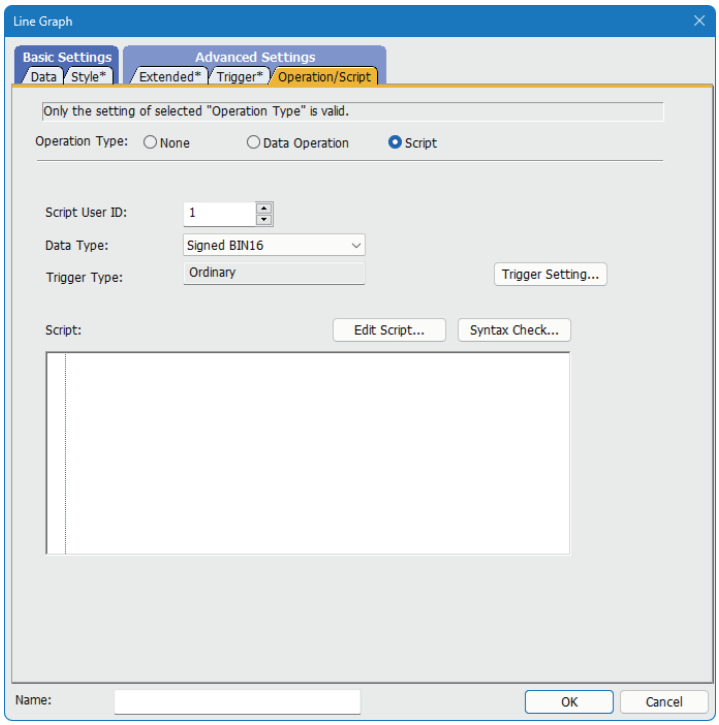


Item			Description
1)	[Bit Mask]	-	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. The following shows selectable items. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
2)	[Bit Shift]	-	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
3)	[Data Operation]	—	Data operation is performed with the value stored in the monitored device. The line graph displays the value after the operation.
		[None]	Data operation is not performed.
		[Data Expression]	Data operation is performed. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

[Script]

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	Setting item	Property name	Read	Write	Timing for reflecting the setting change*1
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Style]	[Frame Color]	frame_color	○	×	×
	[Shape Color]	plate_color	○	○	When the object is updated
	[Lower Limit] (X)	scale_min[0]	○	○	When the screen is updated
	[Lower Limit] (Y)	scale_min[1]	○	○	When the screen is updated
	[Upper Limit] (X)	scale_max[0]	○	○	When the screen is updated
	[Upper Limit] (Y)	scale_max[1]	○	○	When the screen is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.

☞ Page 2456 Timing at which the setting change of an object property is reflected

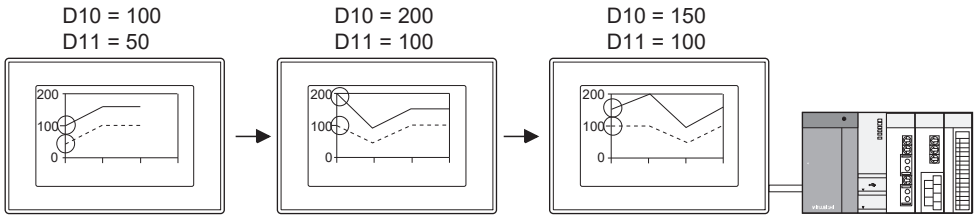
41 Placing a trend graph

☞ Page 1594 Overview of the trend graph
☞ Page 1595 Specifications of the trend graph
☞ Page 1596 How to use the trend graph
☞ Page 1605 [Trend Graph] dialog
☞ Page 1623 Relevant settings

41.1 Overview of the trend graph

GT37 SoftGOT3000

This function continuously collects and displays word device values in a graph.



Graph 1 (-): D10
Graph 2 (---): D11

The graph is displayed up to the edge of the display range.

As data collection continues, the graph will scroll to show the new data.

41.2 Specifications of the trend graph

GT37 SoftGOT3000

The following shows the specifications of the trend graph.

41.2.1 Settable numbers

Maximum number of trend graphs on one screen

Up to 32 trend graph and historical trend graph objects can be placed on one screen.
When [Collect data only when trigger conditions are satisfied] is selected, up to 256 objects can be placed for one project.
When multiple screens are opened using a set overlay screen, a total of 32 trend graph and historical trend graph objects can be placed on both the calling and called screens.
When multiple window screens are opened through an overlap window, superimpose window, user-created key window, or user-created dialog, up to 32 trend graph objects can be placed on each screen.

Maximum number of lines in one trend graph

Up to 32 lines can be displayed in one trend graph.

Maximum number of points

Up to 1024 points can be displayed on one trend graph line.

41.2.2 Difference between trend graphs and historical trend graphs

To accumulate data, use historical trend graphs.
Historical trend graphs displays data collected and accumulated with logging as graphs.
☞ Page 1669 Placing a scatter graph
☞ Page 2194 Collecting device data ([Logging])
Trend graphs do not accumulate collected data.

PART 7

41.3 How to use the trend graph

GT37 SoftGOT3000

The following shows how to use the trend graph.

41.3.1 Placing a trend graph

The following shows how to place a trend graph.

Operating procedure

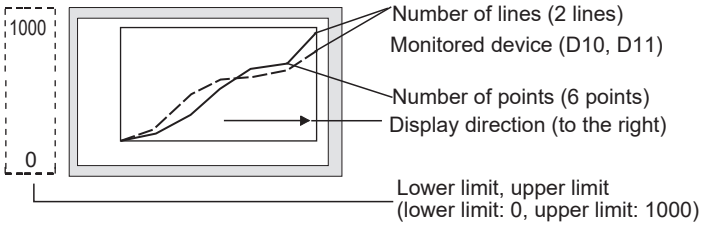
1. Select [Object] → [Graph] → [Trend Graph] from the menu.
2. Click the position to place a trend graph.
3. Adjust the frame size of the trend graph.
4. Double-click the placed trend graph to display the setting dialog.

☞ Page 1605 [Trend Graph] dialog

5. Display the [Data] tab.

☞ Page 1606 [Data] tab

6. Set the number of lines and points to be displayed in the trend graph.

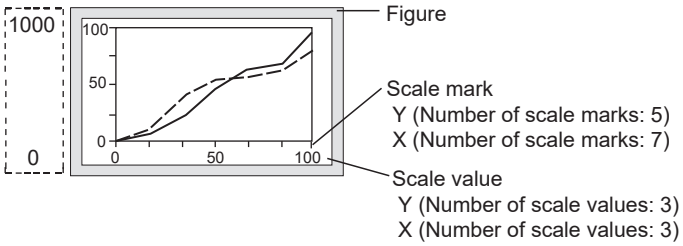


7. Set a device to be monitored.

☞ Page 834 How to set devices, labels, and tags

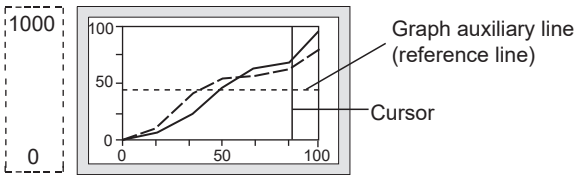
8. Set [Lower Limit] and [Upper Limit].
9. Set the scale and figure in the [Style] tab.

☞ Page 1612 [Style] tab



10. Set the graph assistance line and cursor attribute in the [Auxiliary Line/Cursor] tab.

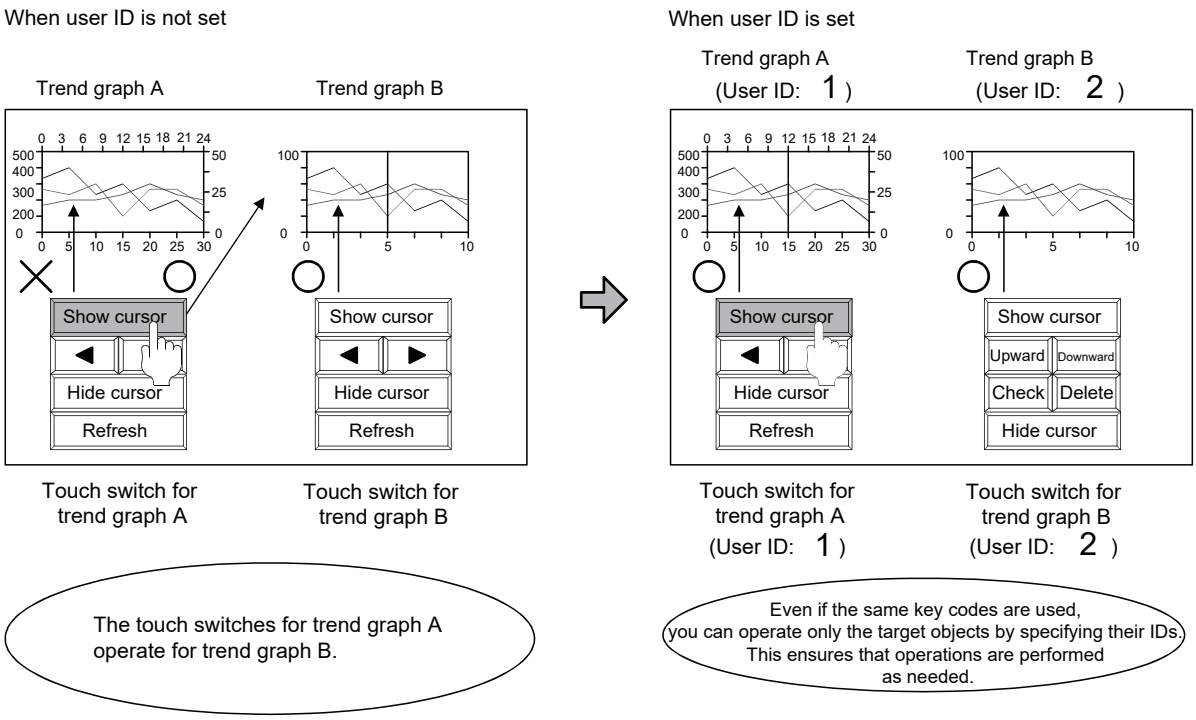
☞ Page 1615 [Auxiliary Line/Cursor] tab



11. Click the [OK] button to complete the trend graph settings.

41.3.2 Identifying multiple trend graphs (setting user IDs)

When you use touch switches to which key codes are assigned to operate multiple objects on one screen, touching a touch switch may operate an unintended object.
Setting a user ID limits the objects operated when the touch switch is touched.



The following shows the setting procedure.

Settings of a trend graph

Operating procedure

1. Double-click the trend graph placed on the screen editor.

The [Trend Graph] dialog appears.

☞ Page 1605 [Trend Graph] dialog

2. Enable [User ID] in the [Extended] tab, and specify the number.

☞ Page 1617 [Extended] tab

The number is used to define the target object as the object that operates when the touch switch is touched.

Do not set [User ID] that is already used for other objects.

Settings of a touch switch

Operating procedure

1. Display the [Switch] dialog.

For details on the switch, refer to the following.

☞ Page 1191 Placing a touch switch

2. Click the [Key Code] button in the [Action] tab.

3. Enable [Individually set user ID for a key input] and specify a number.

Set the same number as the number specified in [User ID] of [Trend Graph].

41.3.3 Storing the data of each graph in devices

The following values displayed in each graph can be stored in devices.

- Value under the cursor
- Maximum value
- Minimum value
- Average value

Even though data operation is set, the value before the data operation is stored.

How to store the data to the device

Set the devices to store values under [Graph Information] in the [Data] tab.

Set the devices and select the data options to be collected.

☞ Page 1606 [Data] tab

Timing when values are stored in devices

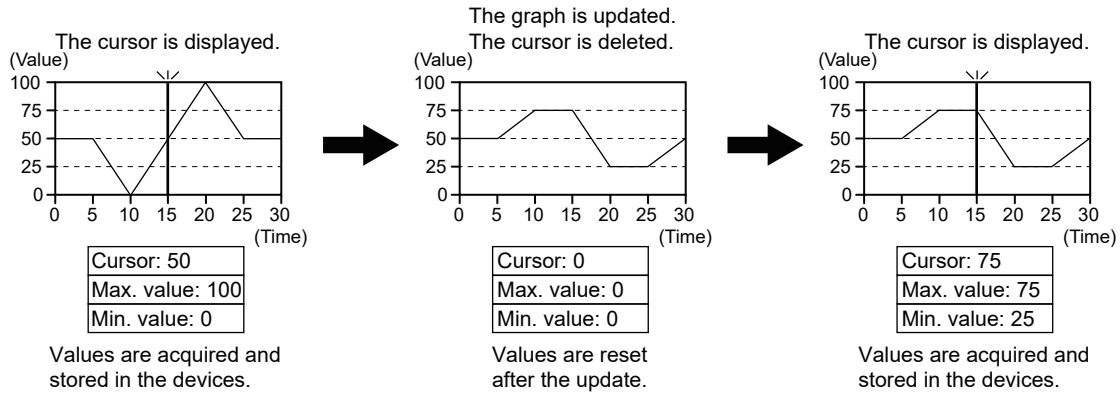
Values are stored in devices at the following timings.

- When a cursor is displayed on a graph
- When a cursor is moved
- When a historical trend graph is operated with a touch switch with a cursor displayed

The maximum, minimum, and average values are constantly acquired and stored in devices.

Ex.

Storing the value under the cursor, maximum value, and minimum value



41.3.4 Storing time data in devices

The time of the cursor display position, display range beginning position, and display range end position of the graph can be stored to the device by using the Time device.

How to store the data to the device

Data is stored in the upper eight bits and lower eight bits of set devices.
Numerical values are stored in BCD.

Ex.
When [Device] is set to [D100]

Item	Device	Description
[yymm]	D100	• b15 to b8: The year is stored. • b7 to b0: The month is stored.
[ddhh]	D101	• b15 to b8: The day is stored. • b7 to b0: The time (hour) is stored.
[mmss]	D102	• b15 to b8: The time (minute) is stored. • b7 to b0: The time (second) is stored.
[Day]	D103	• b15 to b8: None • b7 to b0: The day of the week is stored as a numerical value. The following shows the numerical values corresponding to the days. • 0: Sunday • 1: Monday • 2: Tuesday • 3: Wednesday • 4: Thursday • 5: Friday • 6: Saturday

Storage timing and values stored to devices

■Timing when the value is stored

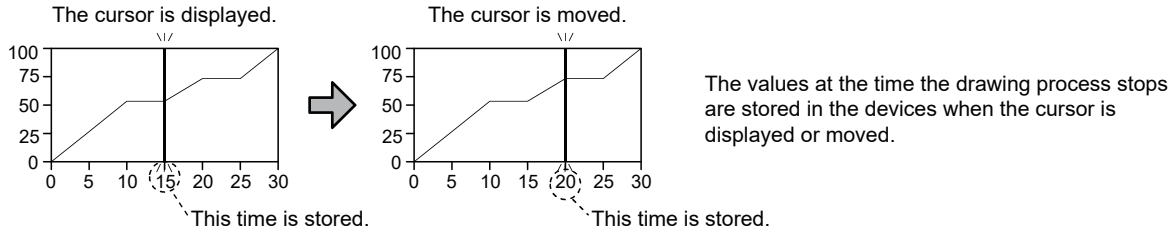
With the following timings, values are stored to devices.

- When a cursor is displayed on a graph
- When a cursor is moved
- When a historical trend graph is operated with a touch switch with a cursor displayed

■Values to be stored

When a cursor is displayed on the graph, the drawing processing of the graph stops.
The values at the stop of the draw processing are stored to devices.

Example) Storing a time in the device



The values at the time the drawing process stops are stored in the devices when the cursor is displayed or moved.

Displaying time data in the numerical display

Time data can be displayed in the numerical display.

The following shows the setting procedure.

Operating procedure

1. Display the setting dialog for the placed numerical display ([Numerical Display] dialog).

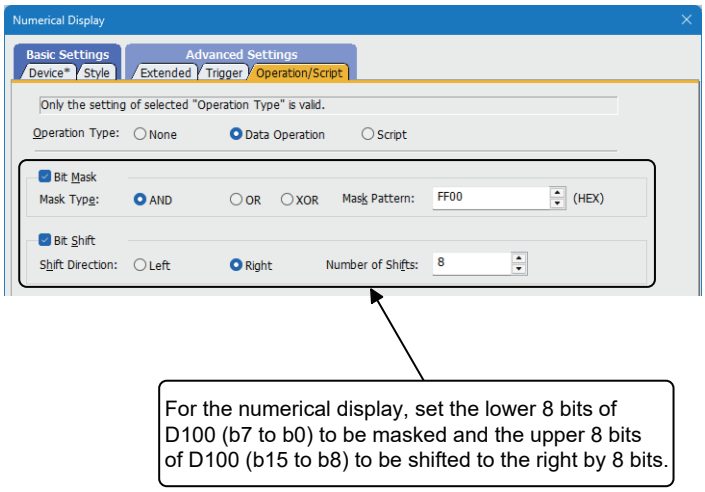
For details on the numerical display, refer to the following.

☞ Page 1305 Placing a numerical display or numerical input object

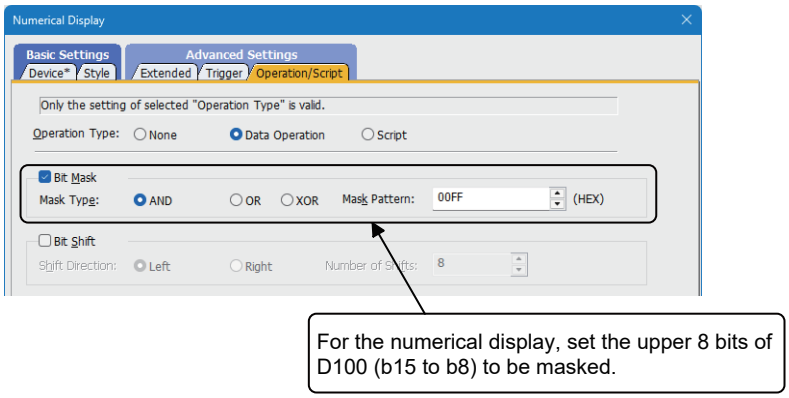
2. Select [BCD16], [BCD32], or [BCD64] for [Data Type] in the [Device] tab.

3. Set the mask processing and shift processing in the [Operation/Script] tab.

- When displaying upper 8 bits (year)



- When displaying lower 8 bits (month)



41.3.5 Displaying the data obtained at specified time in the center (time specification jump function)

By using the display position time device and a touch switch, the data obtained at specified time can be displayed in the center of the trend graph.
When no time is obtained at the specified time, the data which has the nearest specified date is displayed.
When the multiple values are obtained at the nearest time, the first detected value is displayed.

How to store the data to the device

Set a device to store the data in the upper eight bits and lower eight bits.
Numerical values are stored in BCD16.

Ex.
When [Device] is set to [D100]

Item	Device	Description
[yymm]	D100	• b15 to b8: The year is stored. • b7 to b0: The month is stored.
[ddhh]	D101	• b15 to b8: The day is stored. • b7 to b0: The time (hour) is stored.
[mmss]	D102	• b15 to b8: The time (minute) is stored. • b7 to b0: The time (second) is stored.

Setting procedure

■Settings of a touch switch

To use time specification jump function, the following touch switches are required.

- Touch switch for displaying the specified time
- Touch switch for restarting the drawing processing of the graph

If the time specification jump function is used, the drawing processing of the graph stops.
A touch switch for restarting the drawing processing of the graph is required.
The following shows the setting procedure.

Operating procedure

1. Display the setting dialog for the placed switch ([Switch] dialog).

For details on the switch, refer to the following.

☞ Page 1191 Placing a touch switch

2. Click the [Key Code] button in the [Action] tab.

3. Set the key cord according to the touch switch to be created.

- When setting a touch switch for displaying the specified time

Set [Code Setting] to [FFD4].

- When setting a touch switch for restarting the drawing processing of the graph

Set [Code Setting] to [FFEF].

Point

Using the library data

Touch switches are registered in the library.

☞ Page 1061 Using the data registered in the library

■Settings of a trend graph

Operating procedure

1. Double-click the trend graph placed on the screen editor.

The [Trend Graph] dialog appears.

☞ Page 1605 [Trend Graph] dialog

2. Enable [Display Position Time] in the [Extended] tab, and specify a device.

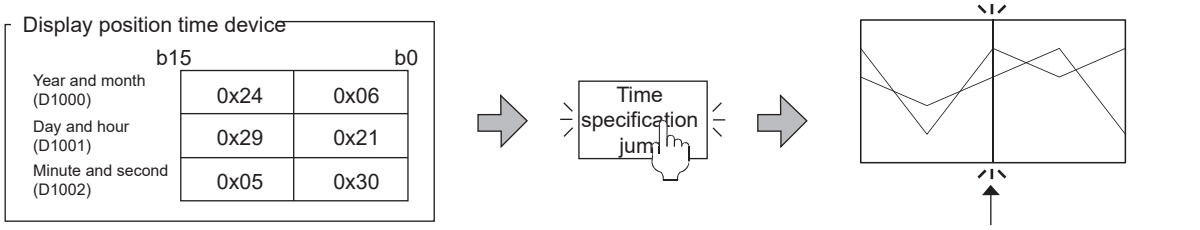
☞ Page 1617 [Extended] tab

Operation example

The following shows the operation examples.

Ex.

Setting [D1000] in [Display Position Time Device] and displaying the data of Jun. 29, 2024 21:05:30



Set the time to be displayed in the Display Position Time Device.

Touch the touch switch for which the key code (FFD4h) has been set.

The data obtained at the specified time (Jun. 29, 2024, 21:05:30) can be displayed in the center.

Precautions

■When time data is being searched for

When time data is being searched for, the historical trend graph cannot be operated.

■When no data can be displayed on the trend graph

When no data can be displayed on the trend graph, the time specification jump function is not executed.

■When displaying the data displayed near the start or end point

If the data obtained at specified time is near the start or end point, it may not be displayed in the center of the graph.

41.3.6 Setting [Collect data only when trigger conditions are satisfied]

Selecting [Collect data only when trigger conditions are satisfied] can reduce the number of communications.
Various graphs can be combined.
The following shows the setting procedure.

Operating procedure

1. Select [Object] → [Graph] → [Trend Graph] from the menu.
2. Click the position to place a trend graph.
3. Double-click the placed trend graph to display the setting dialog.

☞ Page 1605 [Trend Graph] dialog

4. Display the [Trigger] tab.

☞ Page 1619 [Trigger] tab

5. Select [Rise], [Fall], [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling] for [Trigger Type].
6. Select [Collect data only when trigger conditions are satisfied].

The [Collect data only when trigger conditions are satisfied] setting is effective if a graph does not require frequent refresh.
However, when the graph requires frequent refresh and display, [Collect data only when trigger conditions are satisfied] should be deselected (device values are collected through constant communication).
The setting of [Collect data only when trigger conditions are satisfied] may cause the delay of the screen refresh or incorrect display of the screen.

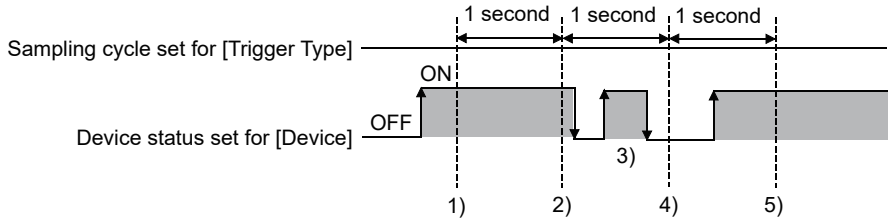
41.3.7 Cause and solution when the graph display is not refreshed in a specified cycle

If [ON Sampling] or [OFF Sampling] is selected, the graph display may not be refreshed in a specified cycle.

Cause

The device status is checked in the sampling cycles set for [Trigger Type].
If the condition is not satisfied at the timing of the check, the display is not refreshed.

Ex.
[Trigger Type] is set to [ON Sampling] and [Sampling] is set to [1] second



- The display of the trend graph is refreshed at timing 1).
- The display of the trend graph is refreshed at timing 2).
- At timing 3), the display of the trend graph is not refreshed because the timing does not match the end of one cycle and thus the condition is not checked.
- At timing 4), the display of the trend graph is not refreshed because the device condition is not satisfied.
- The display of the trend graph is refreshed at timing 5).

Solution

The sampling cycle set for [Trigger Type] does not depend on the device status.
(The sampling cycle does not change whether the device is turned on or off.)
The following shows the setting procedure to start the cycle according to the device status.

Operating procedure

1. Select [Rise] or [Fall] for [Trigger Type].
2. Create a sequence program that turns the device on or off when the display should be refreshed.

41.3.8 Operation to clear the collected data

The following shows the operation to clear the display of the graph or the collected data (to clear the device value to 0).

- The screen is switched.
- The utility screen is displayed.
- The language is switched.
- The security level is switched.
- The station number is switched.
- When the trend graph is displayed in the superimpose window, the base screen is switched.

41.4 [Trend Graph] dialog

GT37 SoftGOT3000

The trend graph is an object that constantly collects data in word devices and display it in a graph.

Operating procedure

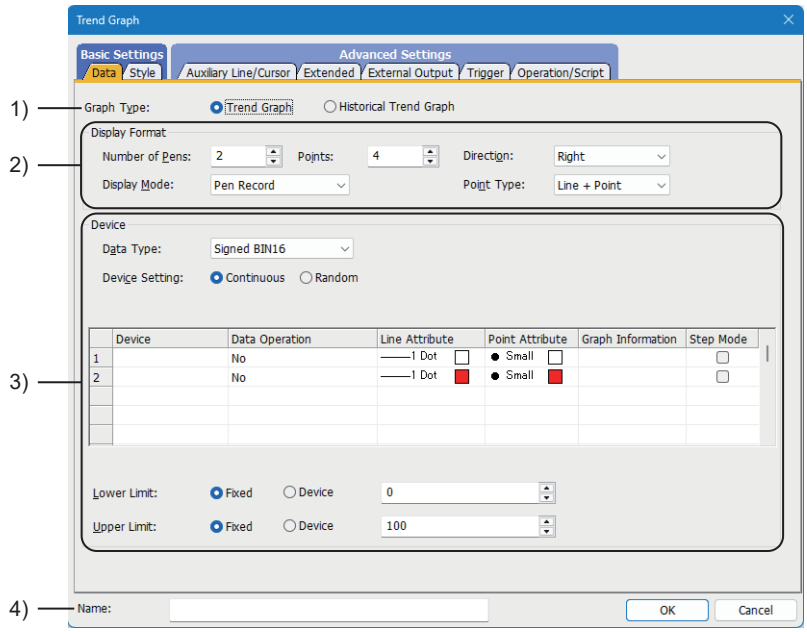
1. Select [Object] → [Graph] → [Trend Graph] from the menu.
2. Click the position to place a trend graph.
3. Double-click the placed trend graph to display the setting dialog.

☞ Page 1606 [Data] tab
☞ Page 1612 [Style] tab
☞ Page 1615 [Auxiliary Line/Cursor] tab
☞ Page 1618 [External Output] tab
☞ Page 1619 [Trigger] tab
☞ Page 1620 [Operation/Script] tab

41.4.1 [Data] tab

GT37 SoftGOT3000

Set the target device to be monitored and the scatter graph status corresponding to the device value.



Item			Description
1)	[Graph Type]		Select the graph to be set. The following shows selectable items. • [Trend Graph] • [Historical Trend Graph]
2)	[Display Format]	[Number of Pens]	Set the number of lines to be displayed in the trend graph. The setting range is [1] to [32].

Item			Description
2)	[Display Format]	[Points]	Set the number of points to be displayed on a line of the trend graph. The setting range is [2] to [1024]. Depending on the number of points and X-axis display range, the interval between points is adjusted automatically. Example) Number of points: 5 		[Direction]	Select the display direction of the graph. The following shows selectable items. • [Up] • [Down] • [Left] • [Right]
		[Display Mode]	The following shows how to draw the trend graph. The following shows selectable items. • [Pen Record] The line of the graph is drawn by moving the whole graph to [Direction]. The point indicating the latest value is always drawn at the graph edge.  • [One by One] The current value is displayed in the display direction. When the graph is drawn fully in a display range, the graph being displayed is cleared and a new graph is drawn.  • [Next Point Movement] The line of the graph is drawn to [Direction]. The point indicating the latest value moves to the display direction. Once the point indicating the latest value reaches to the graph edge, the point is drawn at the graph edge constantly. 		[Point Type]	Select the point type. The following shows selectable items. • [Line] • [Point] • [Line + Point] 
Item				Description
3)	[Device]	[Data Type]		Select the data type of the word device. The following shows selectable items. • [Signed BIN8] • [Unsigned BIN8] • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
		[Device Setting]		Select how to set the device. The following shows selectable items. • [Continuous] Automatically inputs consecutive devices in the table of [Device] when a start device is set. • [Random] Select this item when setting devices one by one.
		[Device]		Set the device to be monitored. ☞ Page 834 How to set devices, labels, and tags
		[Data Operation]		Set this item to execute the data operation. ☞ Page 1054 [Edit Data Expression] dialog
		[Line Attribute]	—	Set the attribute of the line. When [Line] or [Line + Point] is selected for [Point Type], set this item. 			[Style]	Select the style of the line. The following shows selectable items. • Solid line • Dotted line • Broken line • One-dot chain line • Two-dot chain line
			[Width]	Select the width of the line. The following shows selectable items. • [1 Dot] • [2 Dot] • [3 Dot] • [4 Dot] • [5 Dot] • [6 Dot] • [7 Dot]
			[Color]	Select the color of the line.

Item				Description
3)	[Device]	[Point Attribute]	—	Set the attribute of the points. When [Point] or [Line + Point] is selected for [Point Type], set this item. 			[Type]	Select the style of the point. The following shows selectable items. 0: ●, 1: ■, 2: ▲, 3: +, 4: ○, 5: □ 6: △, 7: ×, 8: ▼, 9: ◀, 10: ▶, 11: ◆ 12: ▽, 13: ◁, 14: ▷, 15: ◇,
			[Size]	Select the size of the point. The following shows selectable items. • [Large]: 9 dots • [Medium]: 7 dots • [Small]: 5 dots • [Very small]: 3 dots • [Point]: 1 dot Only when [0] is selected for [Type], [Very small] or [Point] can be selected.
			[Color]	Set the color of the point.

Item				Description
3)	[Device]	[Graph Information]	—	Set the device in which the information displayed on the graph is stored or device that clears the line of the graph. For the timings when values are stored in the devices set for [Maximum Data], [Minimum Data], and [Average Data], refer to the following. ☞ Page 1598 Storing the data of each graph in devices 			[Device Data Storage]	Set the device in which the graph information is stored. The successive devices following the device set in this item are assigned automatically to [Cursor Position Data] or later items. Set each item optionally. Using the GOT internal device is recommended for this setting. Even though data operation is set, the value before the data operation is stored.
			[Data Type]	Select the data type of the word device in which graph information is stored. Select the same data type as that of the device to be monitored. The following shows selectable items. • [Signed BIN8] • [Unsigned BIN8] • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
			[Cursor Position Data]	Select this item to store the value of device positioned by the cursor. The device is assigned automatically.
			[Maximum Data]	Select this item to store the maximum value of the device values displayed on the graph is to be stored. The device is assigned automatically.
			[Minimum Data]	Select this item to store the minimum value of the device values displayed on the graph. The device is assigned automatically.
			[Average Data]	Select this item to store the average value of the device values displayed on the graph. The device is assigned automatically.
			[Graph Line Clear Device]	Select this item to clear the line of the graph using a device. After selecting this item, set the device.
		[Step Mode]		Select this item to display the line of the trend graph by steps. 		[Lower Limit] and [Upper Limit]		Select whether to specify the display range (lower and upper limit values) of the trend graph with the fixed value or with the device value. The following shows selectable items. • [Fixed]: Specify a constant. • [Device]: Specify a device value. ☞ Page 834 How to set devices, labels, and tags The setting ranges of [Lower Limit] and [Upper Limit] differ depending on the item selected for [Data Type].

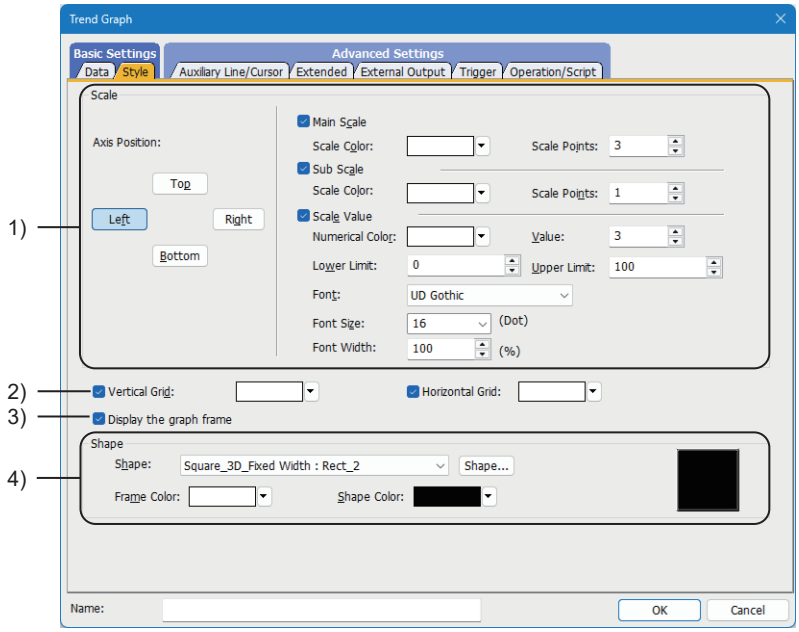
Item		Description
4)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

41.4.2 [Style] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item			Description
1)	[Scale]	—	Displays scale marks and scale values in the trend graph.  Scale mark display (X: 5) (Y: 5)  Scale value display (X: 3) (Y: 3)  Both scale marks and scale values are displayed.
		[Axis Position]	Select the position where the line or scale value is displayed. The following shows selectable items. • [Left] button • [Right] button • [Top] button • [Bottom] button After selecting the position, set the line or scale value. 		[Main Scale]	Set this item to display scale marks. • [Scale Color] Set the color of the scale marks. • [Scale Points] Set the number of scale marks. The setting range is [2] to [101].

Item			Description
1)	[Scale]	[Sub Scale]	Set this item to place scale marks between the ones set in [Main Scale]. • [Scale Color] Set the color of the sub-scale marks. • [Scale Points] Set the number of sub-scale marks. The setting range is [1] to [9].
		[Scale Value]	Set this item to display numeric characters as the scale value.  • [Numerical Color] Set the color of numeric characters. • [Value] Set the number of numeric characters. The setting range is [2] to [11]. • [Lower Limit] and [Upper Limit] Set the lower limit and upper limit of the numerical value. Changes in this setting are automatically applied to the display.  Depending on the item selected for [Data Type] in the [Data] tab, the setting range is different. The selectable range of 64-bit devices is the same as that of 32-bit devices. • [Font] Select a font for scale values. The setting range is [UD Gothic] or [UD Mincho]. • [Font Size] Select a font size. The setting range is [8] dots to [540] dots. • [Font Width] Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
2)	[Vertical Grid] or [Horizontal Grid]		Select this item to display the horizontal or vertical grid. The number of grids is the same as the number set in [Scale Points] of [Main Scale] and [Sub Scale]. The bottom and left setting in [Axis Position] is prioritized.  After setting this item, select a grid color.

Item			Description
3)	[Display the graph frame]		Select this item to display the frame of the graph. 4)	[Shape]	[Shape]	Set the shape of the trend graph. When [None] is selected, no figure is displayed. Click the [Shape] button to select shapes other than those in the list box. ☞ Page 1045 How to set the object shape When selecting a figure from [Basic Figure], set a frame color and a shape color.  • [Frame Color] Set the color of the frame. • [Shape Color] Set the color of the shape.  • Preview Displays the preview of the set shape.

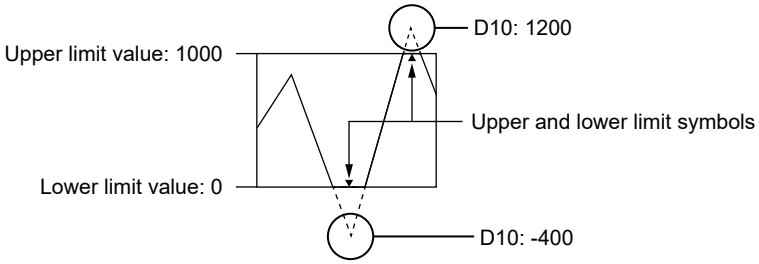
Precautions

The trend graph does not display a device value that is above the upper limit or below the lower limit.
In such a case, the upper or lower limit symbol appears at the position where the device value is hidden from view.

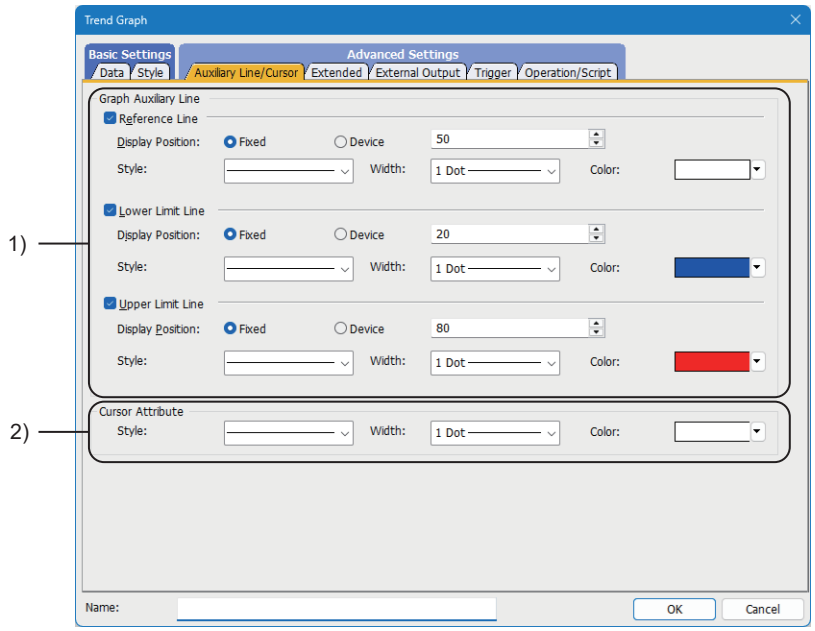


To hide the upper and lower limit symbols, turn on GS450.b10.
☞ Page 1623 GOT internal device

41.4.3 [Auxiliary Line/Cursor] tab

GT37 SoftGOT3000

Set the auxiliary line and attribute of the cursor.



Item				Description
1)	[Graph Auxiliary Line]	[Reference Line], [Lower Limit Line], and [Upper Limit Line]	—	Set this item to place a reference line on the graph.
			[Display Position]	Select whether to specify the line position using a fixed value or device value. The following shows selectable items. • [Fixed] Specify a constant. • [Device] Specify a device value. ☞ Page 834 How to set devices, labels, and tags
			[Style]	Select the style of the line. The following shows selectable items. • Solid line • Dotted line • Broken line • One-dot chain line • Two-dot chain line
			[Width]	Select the width of the line. The following shows selectable items. • [1 Dot] • [2 Dot] • [3 Dot] • [4 Dot] • [5 Dot] • [6 Dot] • [7 Dot]
			[Color]	Select the color of the line.

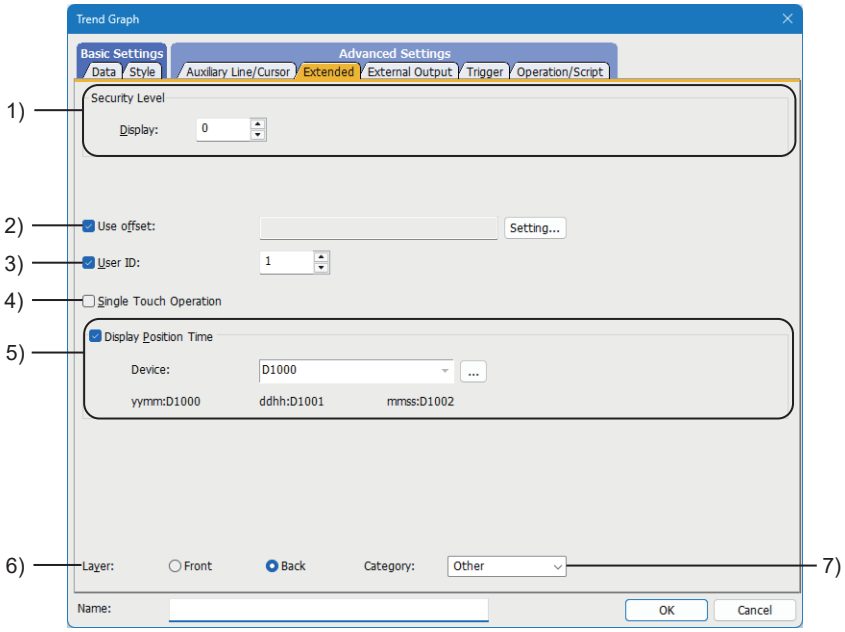
Item			Description
2)	[Cursor Attribute]	—	Set the attribute of the cursor.
		[Style]	Select the style of the line. The following shows selectable items. • Solid line • Dotted line • Broken line • One-dot chain line • Two-dot chain line
		[Width]	Select the width of the line. The following shows selectable items. • [1 Dot] • [2 Dot] • [3 Dot] • [4 Dot] • [5 Dot] • [6 Dot] • [7 Dot]
		[Color]	Select the color of the line.

41.4.4 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

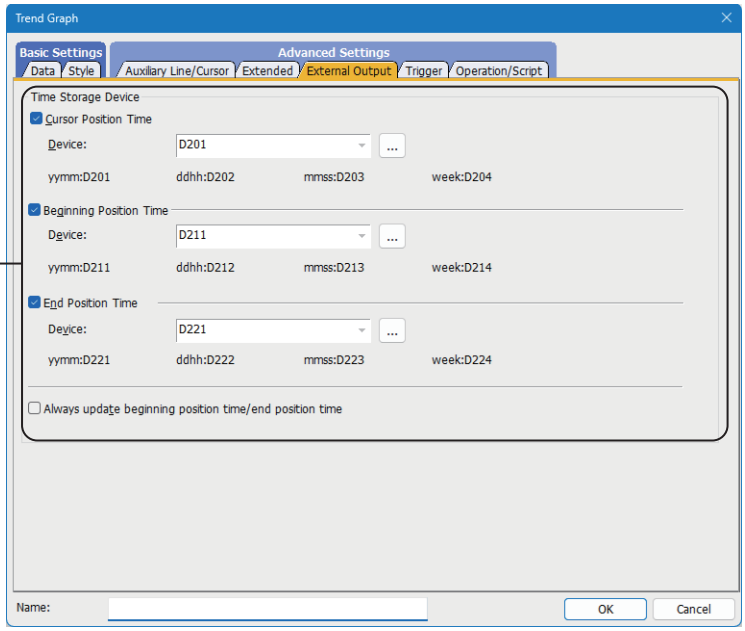


Item			Description
1)	[Security Level]		Set the security level when using the security function. The setting range is [1] to [15]. Set the level to [0] when the security function is not used. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]		Select this item to monitor multiple devices by switching between them. After selecting this item, set the offset device. ☞ Page 963 Offset
3)	[User ID]		Select this item to set the user ID. The setting range is [1] to [65535]. ☞ Page 1597 Identifying multiple trend graphs (setting user IDs)
4)	[Single Touch Operation]		Select this item to display a cursor at the touched place.
5)	[Display Position Time]	—	Set this item to display the data obtained at specified time in the center of the graph when the touch switch is touched.
		[Device]	Set the device in which the time data is stored. The three successive devices following the device set in this item are automatically assigned to [yymm], [ddhh], and [mmss]. The time data is stored in the upper eight bits and lower eight bits of each set device. The data type of the devices is BCD. ☞ Page 1601 Displaying the data obtained at specified time in the center (time specification jump function)
6)	[Layer]		Select the layer to arrange the object on. The following shows selectable items. • [Front] • [Back] ☞ Page 1055 Superimposition of figures and objects
7)	[Category]		Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

PART 7

41.4.5 [External Output] tab

GT37 SoftGOT3000

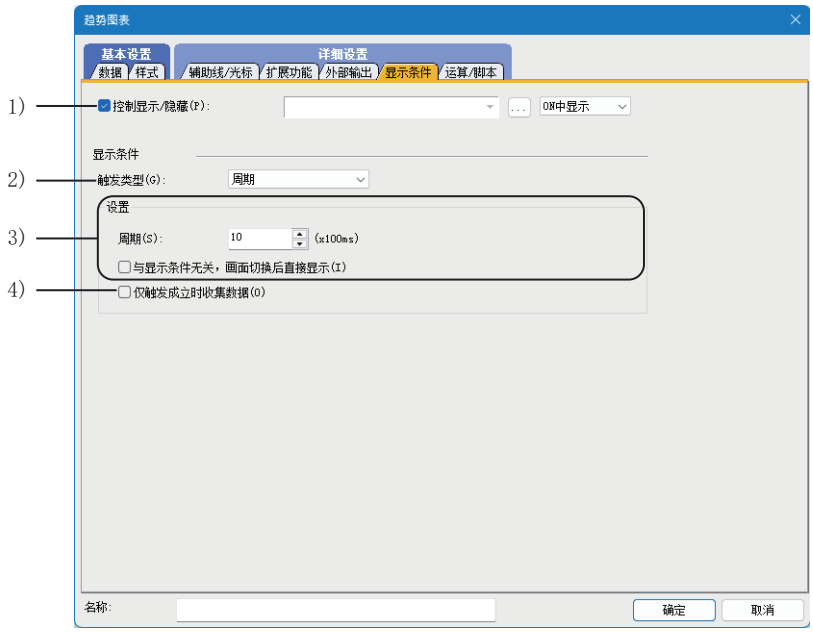


Item			Description
1)	[Time Storage Device]	—	Stores each time data. The four successive devices following the device set in this item are automatically assigned to [yymm], [ddhh], [mmss], and [Day]. The time data is stored in the upper eight bits and lower eight bits of each set device. The data type of the devices is BCD. For information on how to display the time data stored in the device in the numerical display, refer to the following. ☞ Page 1599 Storing time data in devices
		[Cursor Position Time]	Set this item to store the time of the cursor display position. After selecting this item, set the device.
		[Beginning Position Time]	Set this item to store the time at the beginning position of the graph. After selecting this item, set the device.
		[End Position Time]	Set this item to store the time at the end position of the graph. After selecting this item, set the device.
		[Always update beginning position time/end position time]	Select this item to constantly store the latest value in the Time device (beginning position time and end position time). New data obtained at specified time is stored every graph refresh.

41.4.6 [Trigger] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.



Item		Description
1)	[Control displaying/ hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger Type]	Select a trigger condition to display the object. The following shows selectable items. • [Rise] • [Fall] • [Rise/Fall] • [Sampling] • [ON Sampling] • [OFF Sampling]
3)	[Settings]	For details on each setting, refer to the following. ☞ Page 972 Settings by trigger type
4)	[Collect data only when trigger conditions are satisfied]	Select this item to collect data only when the trigger set for [Trigger Type] is satisfied. When [Rise], [Fall], [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling] is selected, this setting is available. The graph communicates with the controller even when the trigger is off. To reduce the communication load between the GOT and the controller, allow communications only when the trigger is on.

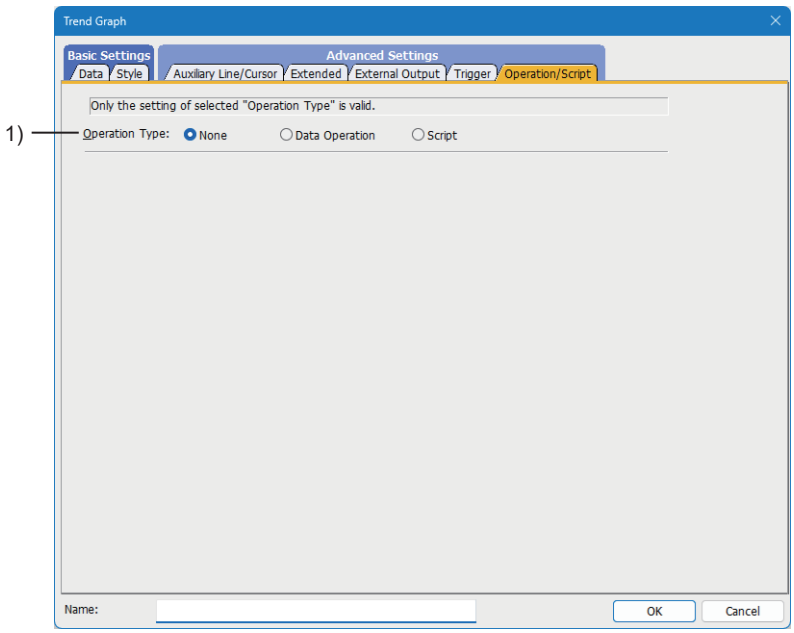
41.4.7 [Operation/Script] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set an expression for monitoring using the data operation function or the script function.

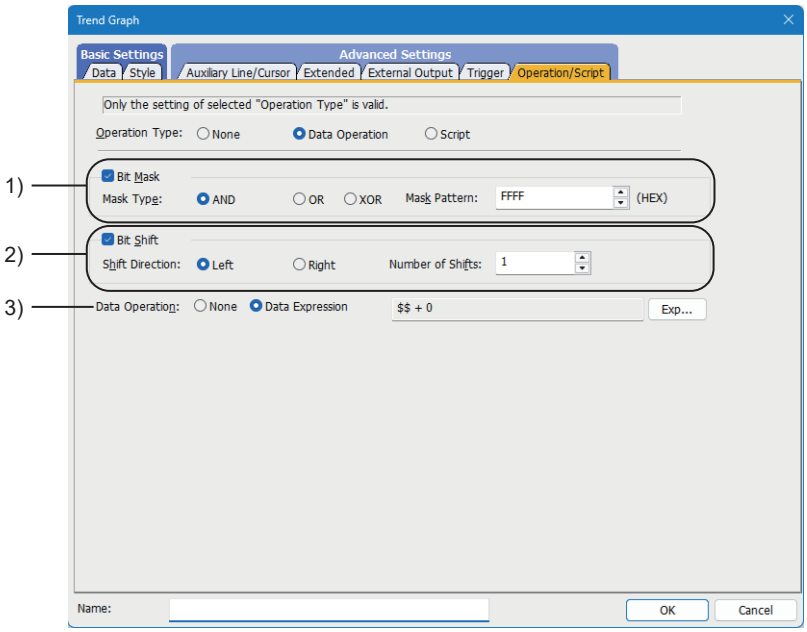


Item		Description
1)	[Operation Type]	To use the data operation or script, select an operation type. The following shows selectable items. • [None] Select this item if the data operation and script are unnecessary. • [Data Operation] Set the expression used for the data operation. ☞ Page 1621 [Data Operation] • [Script] Set the expressions for the script function. ☞ Page 1622 [Script]

[Data Operation]

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation



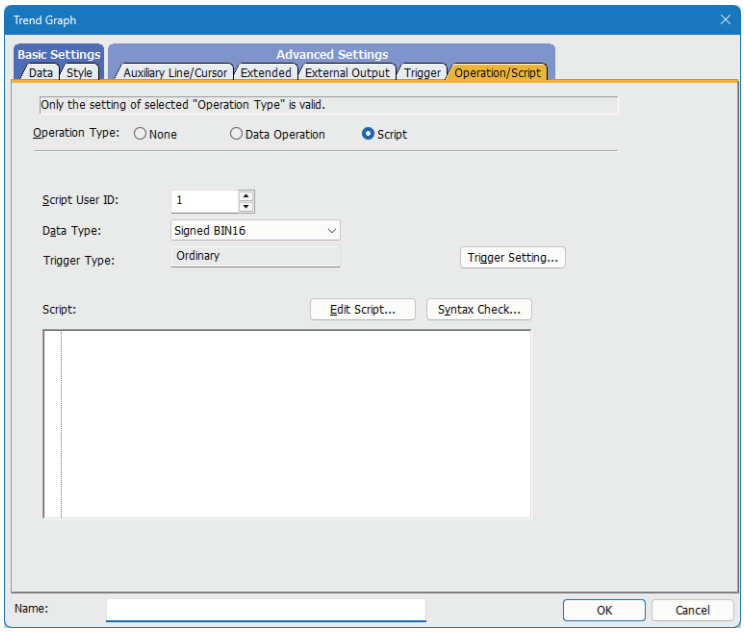
Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. • [AND] Logical AND • [OR] Logical OR • [XOR] Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction. • [Left] Shifts to the left. • [Right] Shifts to the right.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
3)	[Data Operation]		Set the format of the expression. The following shows selectable items. • [None] Does not perform the data operation by using the expression. • [Data Expression] Performs the data operation by using the expression. Click the [Exp] button to set the format of the expression in the [Edit Data Expression] dialog.

PART 7

[Script]

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between the relevant settings in the object setting dialog and the object properties.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	**Setting item**	**Property name**	**Read**	**Write**	**Timing for reflecting the setting change*1**
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Data]	[Lower Limit] (X (lower side))	scale_min[0]	○	○	When the screen is updated
	[Lower Limit] (Y (left side))	scale_min[1]	○	○	When the screen is updated
	[Lower Limit] (Y (upper side))	scale_min[2]	○	○	When the screen is updated
	[Lower Limit] (Y (right side))	scale_min[3]	○	○	When the screen is updated
	[Upper Limit] (X (lower side))	scale_max[0]	○	○	When the screen is updated
	[Upper Limit] (Y (left side))	scale_max[1]	○	○	When the screen is updated
	[Upper Limit] (Y (upper side))	scale_max[2]	○	○	When the screen is updated
	[Upper Limit] (Y (right side))	scale_max[3]	○	○	When the screen is updated
[Style]	[Frame Color]	frame_color	○	×	×
	[Shape Color]	plate_color	○	○	When the screen is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated

*1 For the timing at which the setting change of an object property is reflected, refer to the following.

☞ Page 2456 Timing at which the setting change of an object property is reflected

41.5 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the trend graph as required.
The following shows the functions that are available by configuring the relevant settings.

41.5.1 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Hiding the upper and lower limit symbols	GS450.b10

PART 7

42 Placing a bar graph

☞ Page 1625 Overview of the bar graph
☞ Page 1626 How to use the bar graph
☞ Page 1628 Specifications of the bar graph
☞ Page 1630 Setting a bar graph
☞ Page 1631 [Bar Graph] dialog

42.1 Overview of the bar graph

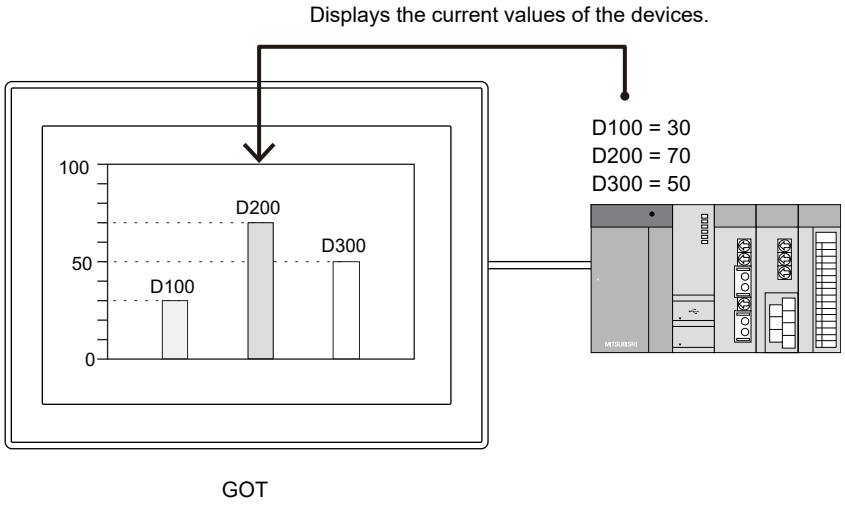
GT37 SoftGOT3000

The bar graph is an object that collects the current values of multiple devices in a batch and displays the values in a single graph.
The value of one device is represented by one bar.

Ex.
When the following three devices are monitored in the bar graph and the device value of each device ranges from 0 to 100

- [D100]
- [D200]
- [D300]

The values of the PLC devices [D100], [D200], and [D300] are represented by the bars in the bar graph.



PART 7

42.2 How to use the bar graph

Set two sets of values, the upper and lower limits of the device values and the upper and lower limits of the graph scale values.

Doing so enables the following two uses.

☞ Page 1626 Indicating the device value

☞ Page 1627 Indicating the percentage against the total

Indicating the device value

When the same upper and lower limit values are used for the device values and the scale values, each bar indicates the device value.

Ex.

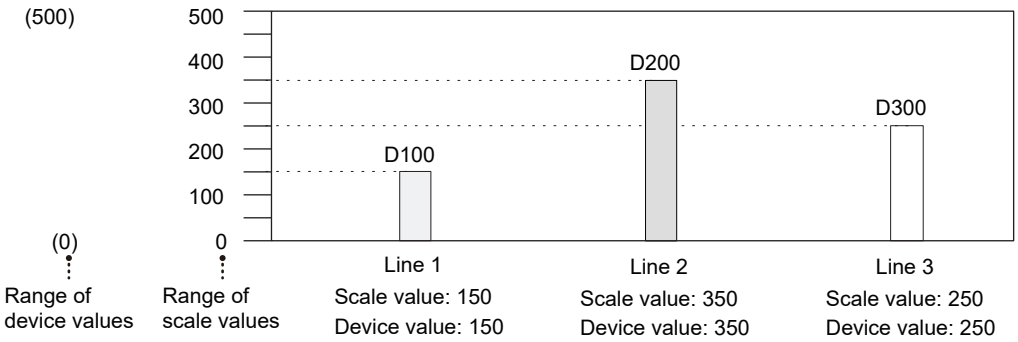
When monitoring the following devices and expressing the production volumes of line 1 to 3 in a bar graph

Monitored device	Value to be stored
[D100]	Production volume of line 1
[D200]	Production volume of line 2
[D300]	Production volume of line 3

Range of the device value: 0 to 500

Range of the scale value: 0 to 500

The bar graph shows the device values (production volumes).



Indicating the percentage against the total

When the different ranges are set for the device values and the scale values, each bar indicates the position relative to the upper and lower limits of the device value.

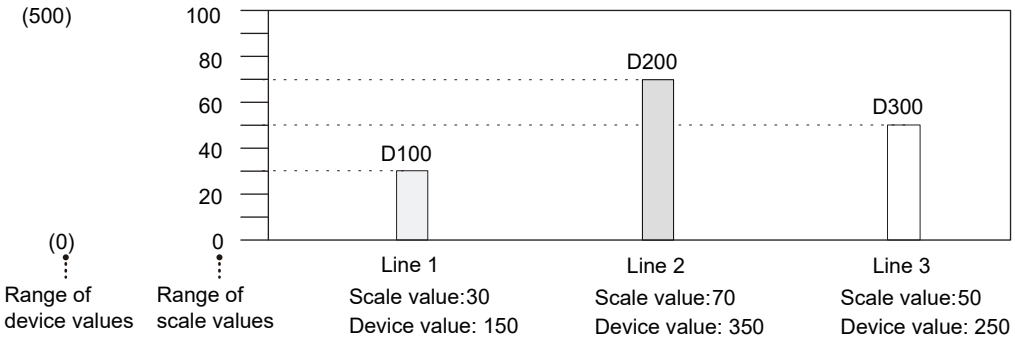
Ex.

When monitoring the same devices as above and expressing the production rates (%) of line 1 to 3 in a bar graph

Range of the device value: 0 to 500

Range of the scale value: 0 to 100

The device values and the corresponding scale values are as follows.



Point

The following setting items are related to the above.

- [Lower Limit] and [Upper Limit] in the [Data] tab

☞ Page 1631 [Data] tab

- [Lower Limit] and [Upper Limit] in the [Style] tab

☞ Page 1633 [Style] tab

42.3 Specifications of the bar graph

GT37 SoftGOT3000

☞ Page 1628 Maximum number of objects on one screen
☞ Page 1628 Number of word devices that can be monitored
☞ Page 1628 Bar graph size
☞ Page 1628 Display when the lower or upper limit is exceeded
☞ Page 1629 Conversion to a line graph

42.3.1 Maximum number of objects on one screen

Up to 1024 bar graphs can be placed on one screen.
Up to 256 objects for which [Collect data only when trigger conditions are satisfied] is set can be placed for one project.

42.3.2 Number of word devices that can be monitored

With a single object, up to 500 word devices (bars) can be monitored.

42.3.3 Bar graph size

The following shows the minimum and maximum bar graph sizes.

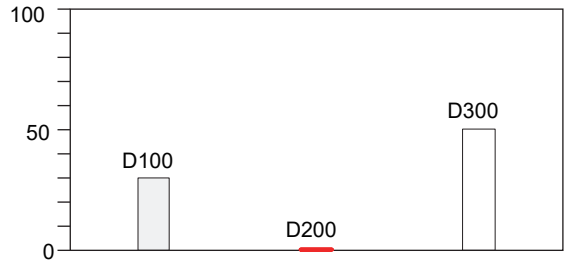
Size	Size (dot)
Minimum	16 × 16
Maximum	6000 × 6000

42.3.4 Display when the lower or upper limit is exceeded

If the monitored device value equals to or below the lower limit, the lower limit is indicated.
If the monitored device value equals to or above the upper limit, the upper limit is indicated.

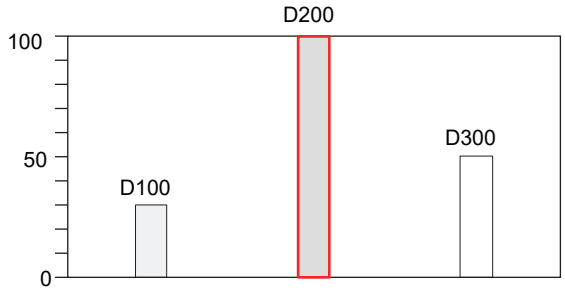
Ex.
A bar graph with the device value set to a lower limit of [0] and an upper limit of [100]
When the device value of [D200] is [-50], the lower limit [0] is indicated.
When the device value of [D200] is [180], the upper limit [100] is indicated.

When the value is equal to or smaller than the lower limit.



When the device value is [-50]
The lower limit [0] is displayed.

When the value is equal to or larger than the upper limit



When the device value is [180]
The upper limit [100] is displayed.

42.3.5 Conversion to a line graph

The object type can be switched between the bar graph and the line graph.

☞ Page 1631 [Data] tab

The common settings are retained even when the object type is switched.

When there are differences between the items on the screens before and after the switching, values in the deleted items are discarded, and initial values are set in the added items.

When there are differences between the settable ranges, values closest to the original values are set.

42.4 Setting a bar graph

GT37 SoftGOT3000

Use the following procedure to place a bar graph and configure operation settings.

Operating procedure

1. Select [Object] → [Graph] → [Bar Graph], and click the position to place the bar graph.

☞ Page 1001 Placing figures and objects

2. Double-click the bar graph to display the [Bar Graph] dialog.

3. Configure operation settings in each tab of the [Bar Graph] dialog.

☞ Page 1631 [Bar Graph] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 995 Basics of figures and objects

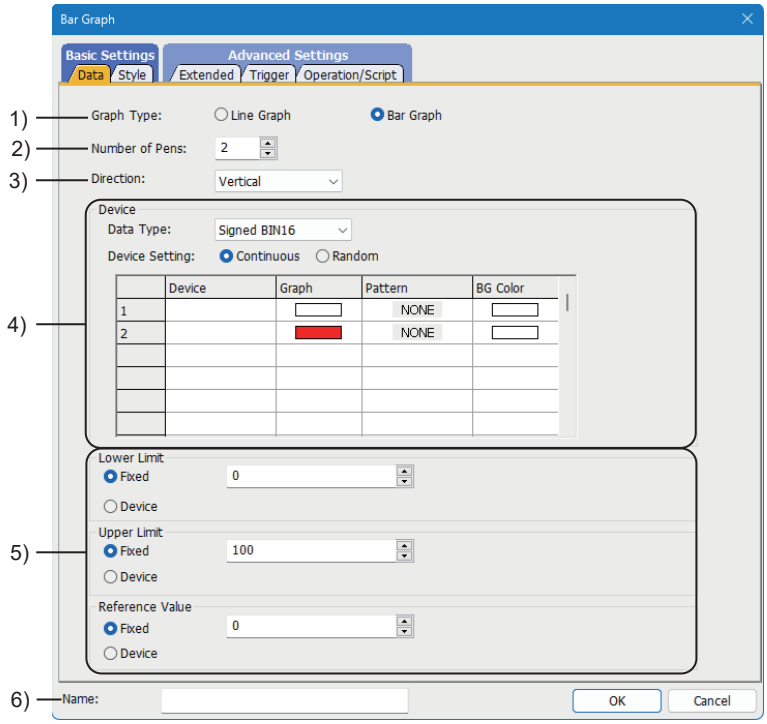
42.5 [Bar Graph] dialog

GT37 SoftGOT3000

☞ Page 1631 [Data] tab
☞ Page 1633 [Style] tab
☞ Page 1635 [Extended] tab
☞ Page 1636 [Trigger] tab
☞ Page 1637 [Operation/Script] tab

42.5.1 [Data] tab

Specify the graph type, and set the device to be monitored, data type, upper and lower limits of the device value and others.



Item		Description
1)	[Graph Type]	Select [Bar Graph].
2)	[Number of Pens]	Set the number of bars to be displayed. Set the number of bars to be displayed. The setting range is [1] to [500].
3)	[Direction]	Select the display direction of the graph. [Vertical]  [Horizontal] 
Item			Description
4)	[Device]	[Data Type]	Select the data type of the word device.
		[Device Setting]	Select how to set multiple devices. Select [Continuous] when monitoring consecutive devices. Select [Random] when monitoring non-consecutive devices. When a PLC that supports continuous read is used, the screen display can be refreshed faster with [Continuous].
		[Device]	Set a word device to be monitored. When selecting [Continuous] for [Device], set the start device of consecutive devices. When the start device is set, the subsequent devices are automatically set according to the number set to [Number of Pens]. When selecting [Random] for [Device], set each device manually. ☞ Page 834 How to set devices, labels, and tags
		[Graph] [Pattern] [BG Color]	Select the colors, patterns, and background colors for the bars. The pattern is displayed in the graph color on the background color. When [None] is selected for [Pattern], [BG Color] is not set. 5)	[Lower Limit] [Upper Limit]		Specify the range of the device value (lower and upper limits). Specify fixed values or devices. Devices can be used to change the values dynamically. ☞ Page 834 How to set devices, labels, and tags The setting range depends on the selection for [Data Type].
	[Reference Value]		Specify the reference value for the graph. The graph is displayed in the upper and the lower limit directions with the reference value as the boundary value. Example) Depending on the value of [Reference Value], the bar graph display changes as follows. [Lower Limit]: [0] [Upper Limit]: [100] 6)	[Name]		Set the object name. The name is displayed in the data browser, property sheet, and others. The setting can also be changed in other tabs. Up to 100 characters can be set.

Precautions

■When monitoring a global label

When monitoring a device of a primitive data type global label, select [Random] for [Device Setting].

If [Continuous] is selected, system error 326 occurs.

When setting consecutive devices, set an array-type global label.

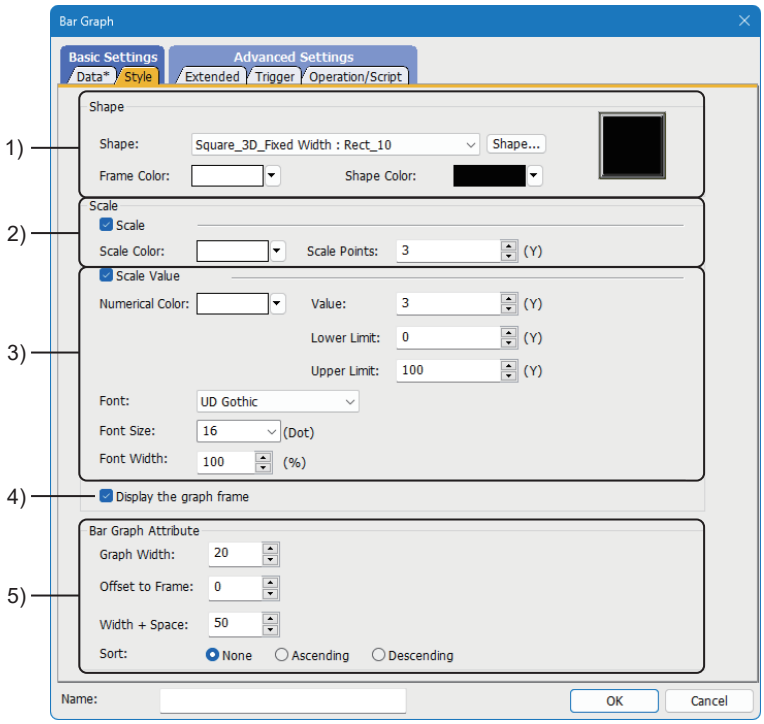
■Insufficient number of devices

If the number of devices is insufficient to display the specified graph, system alarm 307 occurs and the object is not displayed.

42.5.2 [Style] tab

For mobile screens, some setting items are not available.

Configure the frame shape settings, scale mark and scale value display settings, bar width and bar interval settings, and other settings.



Item			Description
1)	[Shape]	[Shape]	Set the shape to be placed behind the bar graph. Use this item when enclosing the object with a frame or others. This eliminates the need of placing another frame shape and enables automatic resizing according to the object size. To use a readily available design set, select one from the list box. When not selecting one from the list box, click the [Shape] button and set one on the displayed [Image List] screen. ☞ Page 1044 Object shape When selecting a shape from [Basic Figure], set a frame color and a shape color. 		[Frame Color]	Select a frame color.
		[Shape Color]	Select a fill color of the shape.
2)	[Scale]	—	Select this item to display scale marks. When selecting this item, configure the following settings.
		[Scale Color]	Set the color of the scale marks. ☞ Page 988 Color settings
		[Scale Points]	Set the number of scale marks. The setting range is [2] to [101].

Item			Description
3)	[Scale Value]	—	Select this item to display numerical values on the scale. When selecting this item, configure the following settings.
		[Numerical Color]	Set the color of the scale values. ☞ Page 988 Color settings
		[Value]	Set the number of scale values to be displayed. The setting range is [2] to [101].
		[Lower Limit] [Upper Limit]	Set the upper and lower limits of the scale value. The setting range depends on the setting of [Data Type] in the [Data] tab. The setting range of 64-bit devices is the same as that of 32-bit devices. When [Upper Limit], [Lower Limit], and [Value] are set, the scale values are automatically calculated and displayed.
		[Font]	Select a font for the scale values.
		[Font Size]	Select a vertical size for the scale values. The setting range is [8] dots to [540] dots.
		[Font Width]	Specify a horizontal size for the scale values. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character is always within the range of [8] dots to [540] dots.
4)	[Display the graph frame]		Select this item to display the frame of the graph.
5)	[Bar Graph Attribute]	-	Set the width, display spacing, and sort order for the bar graph. 		[Graph Width]	Set the width per bar. The setting range is [1] dot to [500] dots. The bar width includes one dot of the boundary line (vertical: left side, horizontal: top side).
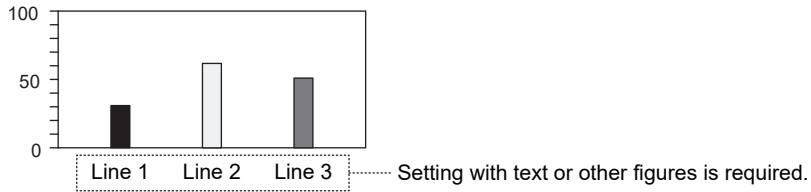
		[Offset to Frame]	Set the space between the origin point and the bar nearest to the origin point. The setting range is [0] dot to [100] dots.
		[Width + Space]	Set the interval from the start of a bar to the start of the next bar. The setting range is [1] dot to [500] dots.
		[Sort]	Select a sort order when sorting the bars by the size of the device value. • [None]: The bars are sorted in the order of the set devices. • [Ascending]: The bars are sorted by the device values in ascending order. • [Descending]: The bars are sorted by the device values in descending order.

Precautions

There is no function to set items in the horizontal or vertical axis of the bar graph.

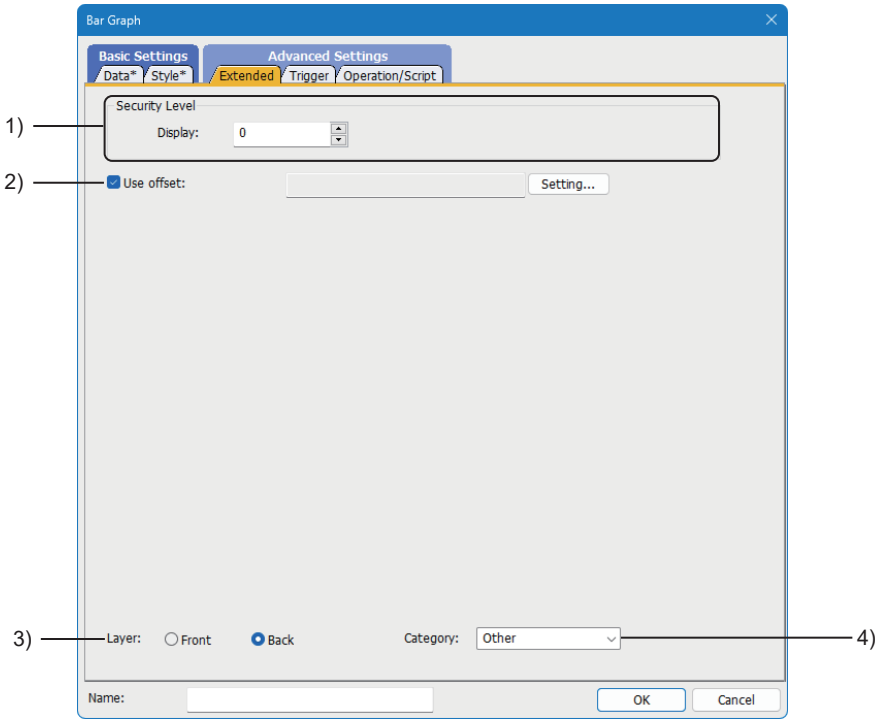
Use [Text] or other figures as necessary.



42.5.3 [Extended] tab

For mobile screens, some setting items are not available.

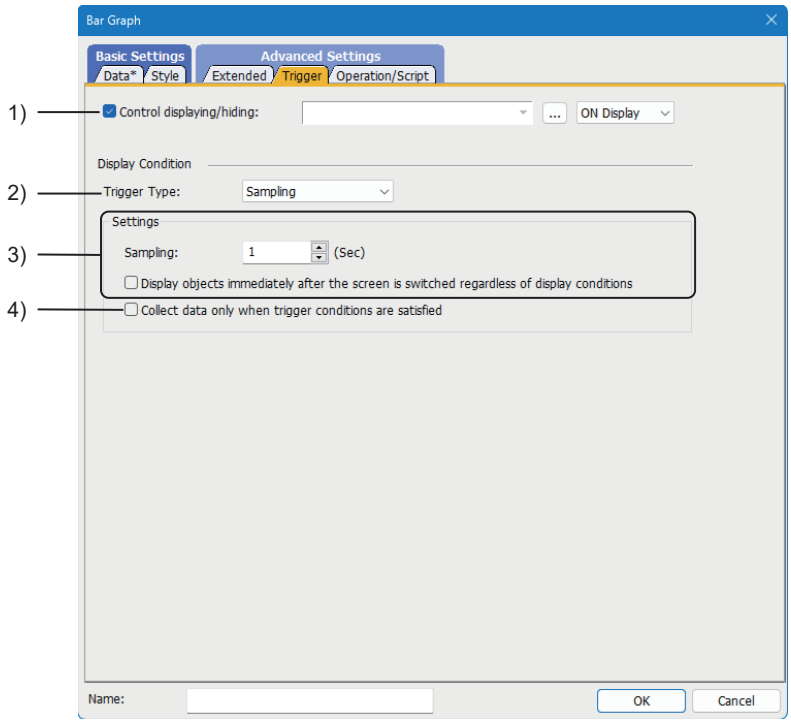
Set the security level of the object and use/nonuse of the offset function.



Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Configure the settings to monitor the statuses of multiple devices by switching between them with a single device. Select this item, and set an offset device. The monitored device is the one with the offset device value added to the device set in [Device] in the [Data] tab. ☞ Page 963 Offset
3)	[Layer]	Select the layer to place the object. ☞ Page 65 Layer
4)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

42.5.4 [Trigger] tab

Set the trigger condition to display the object.



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Control device (bit device or bit-specified word device) • When to display: When the control device is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Settings]	For the settings of each item, refer to the following. ☞ Page 972 Settings by trigger type
4)	[Collect data only when trigger conditions are satisfied]	This item is settable when [Rise], [Fall], [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling] is selected for [Trigger Type]. Select this item to collect data only when the trigger condition set to [Trigger Type] is satisfied. Normally, the GOT communicates with the controller even when the trigger condition is not satisfied. When this function is enabled, the GOT communicates with the controller only when the trigger condition is satisfied. The communication load between the GOT and the controller can be reduced. This is useful when the object display does not need frequent refresh.

Precautions

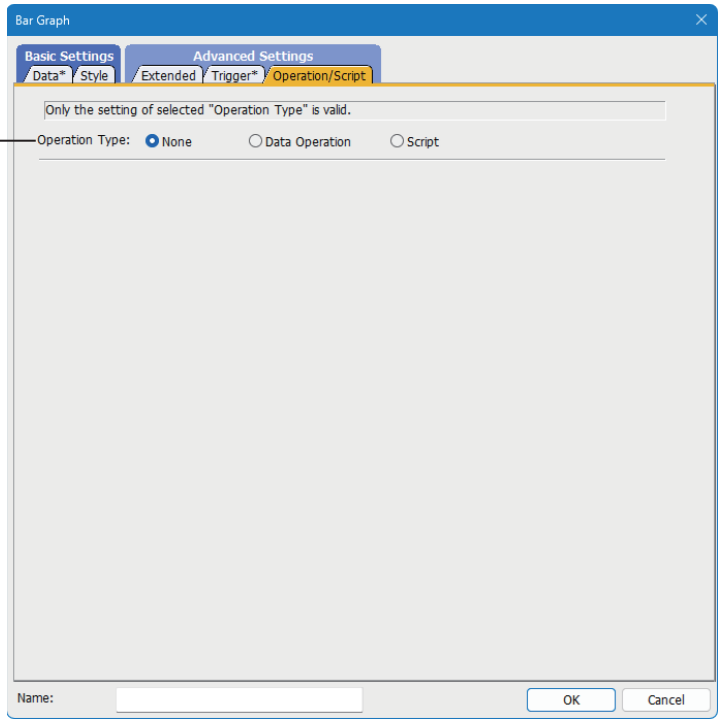
■About [Collect data only when trigger conditions are satisfied]

- If consecutive graph refresh and display is required, it is recommended to disable [Collect data only when trigger conditions are satisfied].
- When [Trigger Type] is set to [Sampling], [ON Sampling], or [OFF Sampling], if a short cycle is set, communication may be delayed, lowering screen refresh performance even if [Collect data only when trigger conditions are satisfied] is enabled.
- When [Collect data only when trigger conditions are satisfied] is enabled, a trigger satisfied for an object being refreshed by the previous trigger will become invalid.
- When [Collect data only when trigger conditions are satisfied] is enabled, the time from when the trigger condition is satisfied to when the object display is refreshed will be longer than when the setting is disabled.

42.5.5 [Operation/Script] tab

For mobile screens, some setting items are not available.

Set whether to perform an operation or a script with the device value handled by the object.

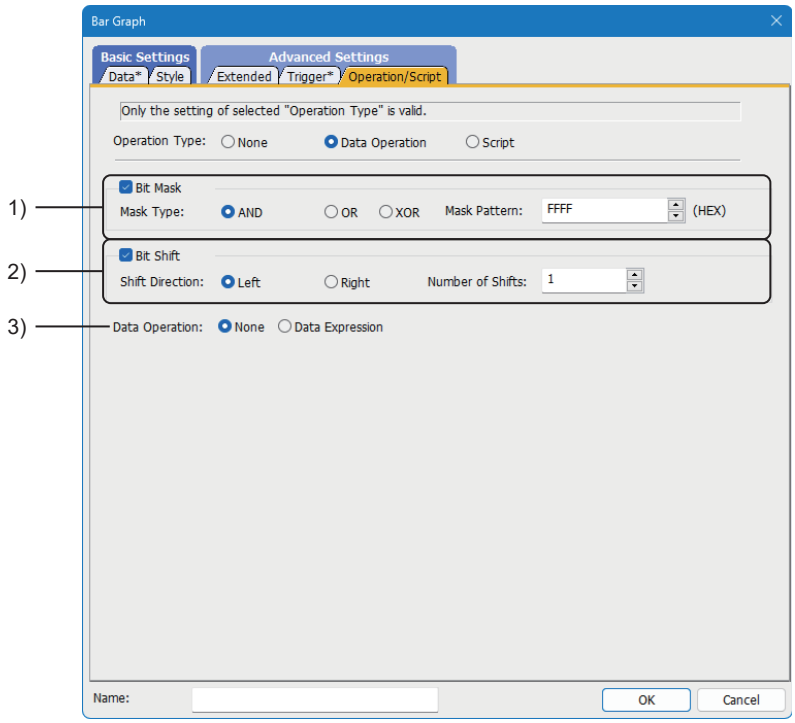


Item			Description
1)	[Operation Type]	[None]	Does not use the data operation function and the script function.
		[Data Operation]	Set the expression used for the data operation function. For the setting method, refer to the following. ☞ Page 1638 [Data Operation]
		[Script]	Set the expressions for the script function. For the setting method, refer to the following. ☞ Page 1639 [Script]

[Data Operation]

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation

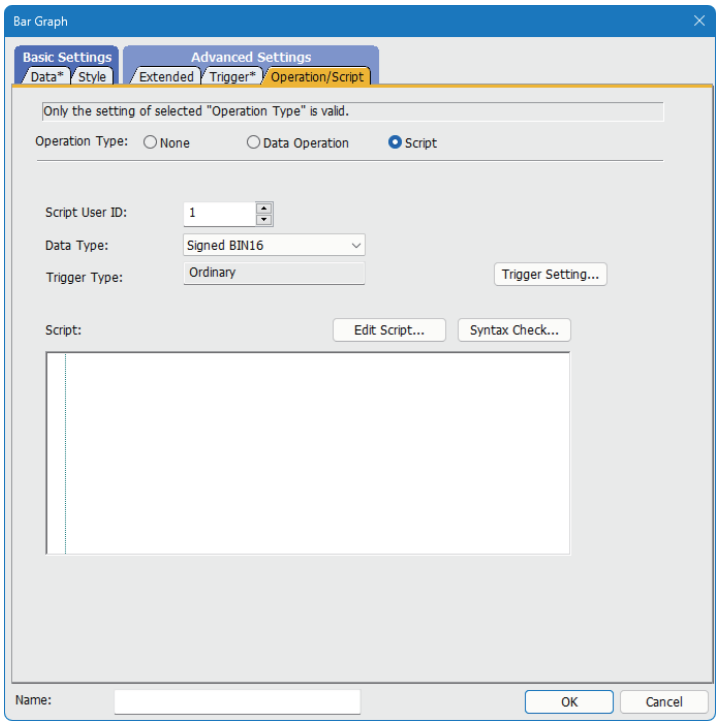


Item			Description
1)	[Bit Mask]	-	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. The following shows selectable items. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range depends on the setting of [Data Type] in the [Data] tab.
2)	[Bit Shift]	-	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range depends on the setting of [Data Type] in the [Data] tab.
3)	[Data Operation]	—	Performs the data operation using the value stored in the monitored device. The bar graph displays the value after the operation.
		[None]	Does not perform the data operation.
		[Data Expression]	Performs the data operation. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

[Script]

For details on the script settings, refer to the following.

☞ Page 2447 Object script



■Correspondence between the object settings and the object properties

The object settings can be read (referenced) or written (changed) using the object property.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	Setting item	Property name	Read	Write	Timing for reflecting the setting change*1
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Style]	[Frame Color]	frame_color	○	×	×
	[Shape Color]	plate_color	○	○	When the object is updated
	[Lower Limit] (X)	scale_min[0]	○	○	When the screen is updated
	[Lower Limit] (Y)	scale_min[1]	○	○	When the screen is updated
	[Upper Limit] (X)	scale_max[0]	○	○	When the screen is updated
	[Upper Limit] (Y)	scale_max[1]	○	○	When the screen is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated

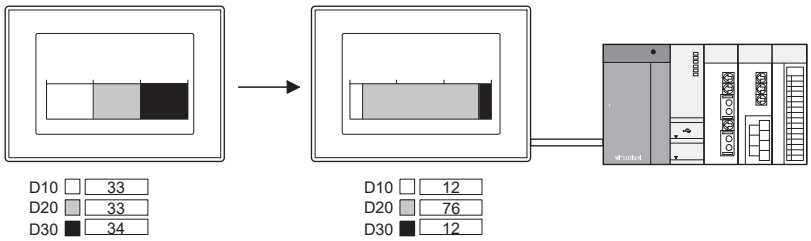
*1 For the timing at which the setting change of an object property is reflected, refer to the following.

☞ Page 2456 Timing at which the setting change of an object property is reflected

43 Placing a bar graph

GT37 SoftGOT3000

This function collects multiple word device values in a batch and displays the ratio of each value to all the collected values in graph form.



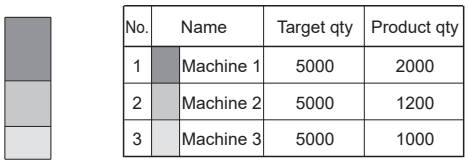
☞ Page 1641 Specifications of the bar graph
☞ Page 1642 How to use the bar graph
☞ Page 1645 [Bar(Rectangle)] dialog

Application example

■Displaying the graph on the same screen as the historical data list display

By displaying the graph on the same screen as the historical data list display, the device status can be described more effectively.

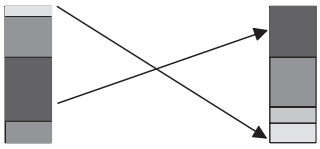
☞ Page 1495 Placing a historical data list display



No.	Name	Target qty	Product qty
1	Machine 1	5000	2000
2	Machine 2	5000	1200
3	Machine 3	5000	1000

■Sorting the graph segments according to the device values

The graph can be sorted in ascending or descending order of the device values.



43.1 Specifications of the bar graph

GT37 SoftGOT3000

The following shows the bar graph specifications.

43.1.1 Settable numbers

Maximum number of bar graphs that can be placed

Up to 32 bar graphs and pie graphs can be placed on one screen.

When [Collect data only when trigger conditions are satisfied] is selected, up to 256 objects can be placed for one project.

Number of values that can be displayed (number of word devices that can be monitored)

Up to 32 values can be displayed on one bar graph.

PART 7

43.2 How to use the bar graph

GT37 SoftGOT3000

The following shows how to use a bar graph.

43.2.1 Placing a bar graph

The following shows how to place a bar graph.

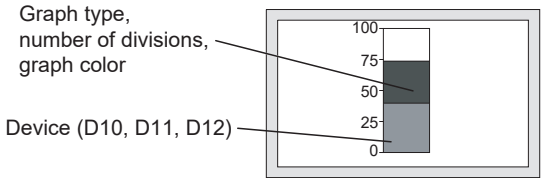
Operating procedure

1. Select [Object] → [Graph] → [Bar(Rectangle)] from the menu.
2. Click the position to place a bar graph.
3. Adjust the frame size of the bar graph.
4. Double-click the bar graph to display the setting dialog.

☞ Page 1645 [Bar(Rectangle)] dialog

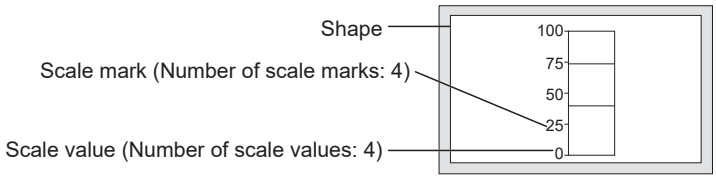
5. Set the number of divisions (number of the word devices to be monitored), devices to be monitored, and graph color in the [Data] tab.

☞ Page 1646 [Data] tab



6. Configure the figure and scale settings in the [Style] tab.

☞ Page 1648 [Style] tab



7. Click the [OK] button to complete the bar graph settings.

43.2.2 Setting [Collect data only when trigger conditions are satisfied]

Selecting [Collect data only when trigger conditions are satisfied] can reduce the number of communications.
Various graphs can be combined.

Operating procedure

1. Select [Object] → [Graph] → [Bar(Rectangle)] from the menu.
2. Click the position to place a bar graph.
3. Double-click the bar graph to display the setting dialog.

☞ Page 1645 [Bar(Rectangle)] dialog

4. Display the [Trigger] tab.

☞ Page 1651 [Trigger] tab

5. Select [Rise], [Fall], [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling] for [Trigger Type].
6. Select [Collect data only when trigger conditions are satisfied].

The [Collect data only when trigger conditions are satisfied] setting is effective if a graph does not require frequent refresh. However, when the graph requires frequent refresh and display, [Collect data only when trigger conditions are satisfied] should be deselected (device values are collected through constant communication).
The setting of [Collect data only when trigger conditions are satisfied] may cause the delay of the screen refresh or incorrect display of the screen.

43.2.3 Cause and solution when the graph display is not refreshed in a specified cycle

Refresh timing when [ON Sampling] or [OFF Sampling] is selected

The graph display may not be refreshed in the set cycle.

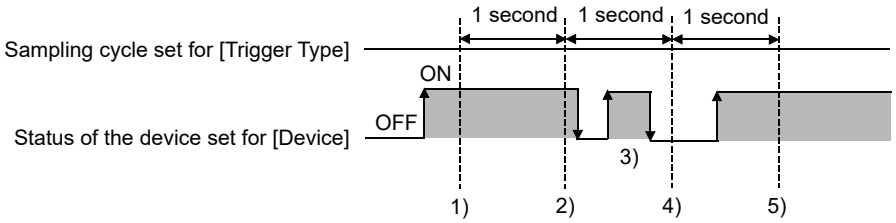
■Cause

The device status is checked in the sampling cycles set for [Trigger Type].

If the condition is not satisfied at the timing of the check, the display is not refreshed.

Ex.

[Trigger Type] is set to [ON Sampling] and [Sampling] is set to [1] second



- The display of the bar graph is refreshed at timing 1).
- The display of the bar graph is refreshed at timing 2).
- At timing 3), the display of the bar graph is not refreshed because the timing does not match the end of one cycle and thus the condition is not checked.
- At timing 4), the display of the bar graph is not refreshed because the device condition is not satisfied.
- The display of the bar graph is refreshed at timing 5).

■Solution

The sampling cycle set for [Trigger Type] does not depend on the device status.

(The sampling cycle does not change whether the device is turned on or off.)

The following shows the setting procedure to start the cycle according to the device status.

Operating procedure

1. Select [Rise] or [Fall] for [Trigger Type].
2. Create a sequence program that turns the device on or off when the display should be refreshed.

Refresh timing when [Sampling], [ON Sampling], or [OFF Sampling] is selected

The sampling cycle count starts and is reset at the following timing.

- When the bar graph is displayed (due to screen switching, a security level change, or other cases)
- When the language switches
- When the security level changes

After the execution of any of the events, the display is refreshed at the start timing of the sampling cycle.

43.3 [Bar(Rectangle)] dialog

GT37 SoftGOT3000

The bar graph object collects multiple word device values in a batch and displays the ratio of each value to the total collected values in graph form.

Operating procedure

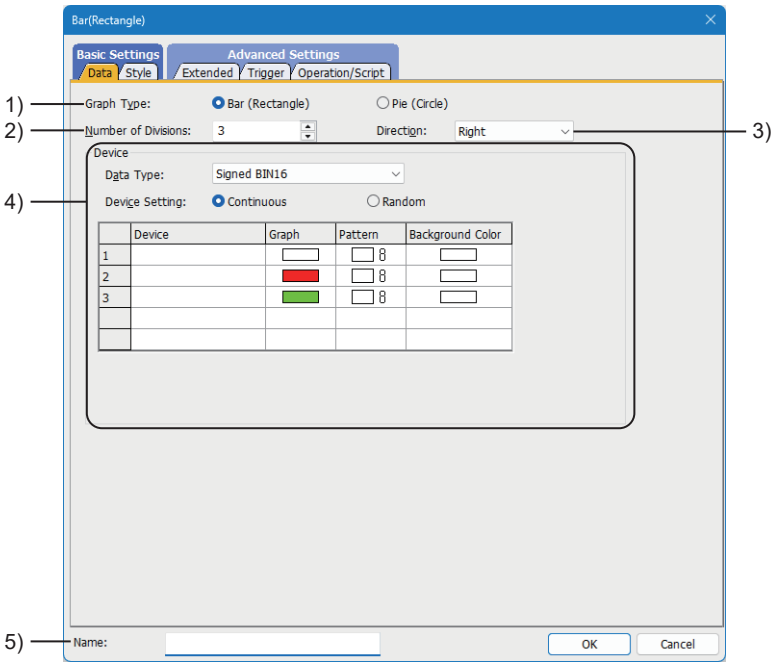
1. Select [Object] → [Graph] → [Bar(Rectangle)] from the menu.
2. Click the position to place a bar graph.
3. Double-click the bar graph to display the setting dialog.

☞ Page 1646 [Data] tab
☞ Page 1648 [Style] tab
☞ Page 1650 [Extended] tab
☞ Page 1651 [Trigger] tab
☞ Page 1652 [Operation/Script] tab

43.3.1 [Data] tab

GT37 SoftGOT3000

Set the device to be monitored and the bar graph status corresponding to the device value.



Item		Description
1)	[Graph Type]	Select the graph to be set. The following shows selectable items. • [Bar(Rectangle)] • [Pie(Circle)]
2)	[Number of Divisions]	Set the number of values that can be displayed (number of word devices that can be monitored). The setting range is [2] to [32].
3)	[Direction]	Select the display direction of the graph. The following shows selectable items. • [Up] • [Down] • [Left] • [Right] 
Item			Description
4)	[Device]	[Data Type]	Select the data type of the word device. The following shows selectable items. • [Signed BIN8] • [Unsigned BIN8] • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
		[Device Setting]	Select how to set the device. The following shows selectable items. • [Continuous]: Automatically inputs consecutive devices in the table of [Device] when a start device is set. • [Random]: Select this item when setting devices one by one.
		[Device]	Set the device to be monitored. ☞ Page 834 How to set devices, labels, and tags
		[Graph]	Select the color of the bar.
		[Pattern], [Background Color]	Select the pattern and the background color to be used for the bar. Example) [Graph] : [Pattern] : [Background Color]: 5)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The name can also be changed in other tabs. Up to 100 characters can be set.

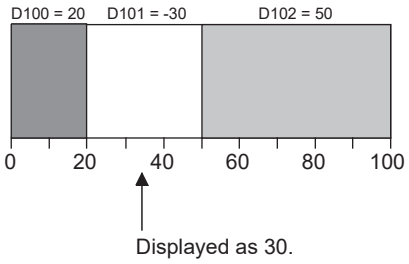
Precautions

■When the monitored device value is negative

When the monitored device value is negative, its absolute value is displayed in the bar graph.

Ex.

When the value of D101 is -30

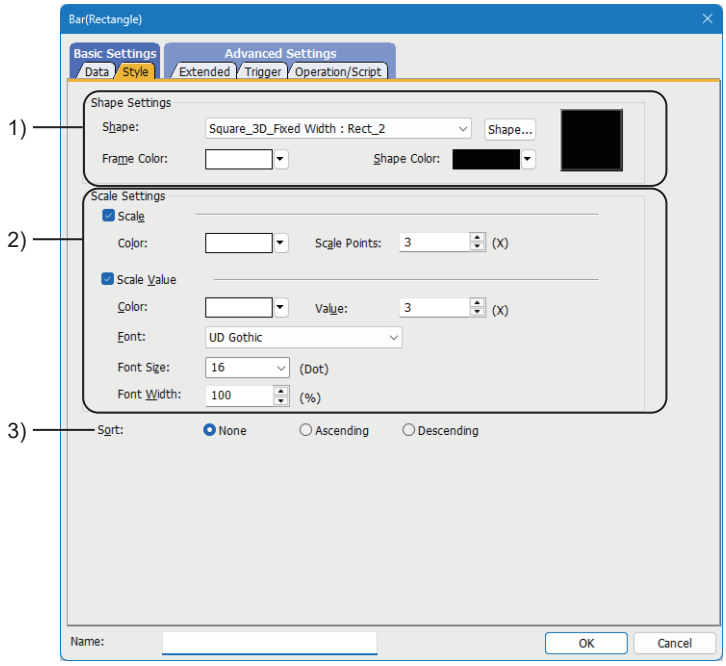


43.3.2 [Style] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item			Description
1)	[Shape Settings]	[Shape]	Set the shape of the bar graph. When [None] is selected, no figure is displayed. Click the [Shape] button to select shapes other than those in the list box. ☞ Page 1045 How to set the object shape When selecting a figure from [Basic Figure], set a frame color and a figure color.  • [Frame Color] Set the color of the frame. • [Shape Color] Set the color of the shape.  • Preview Displays the preview of the set shape.

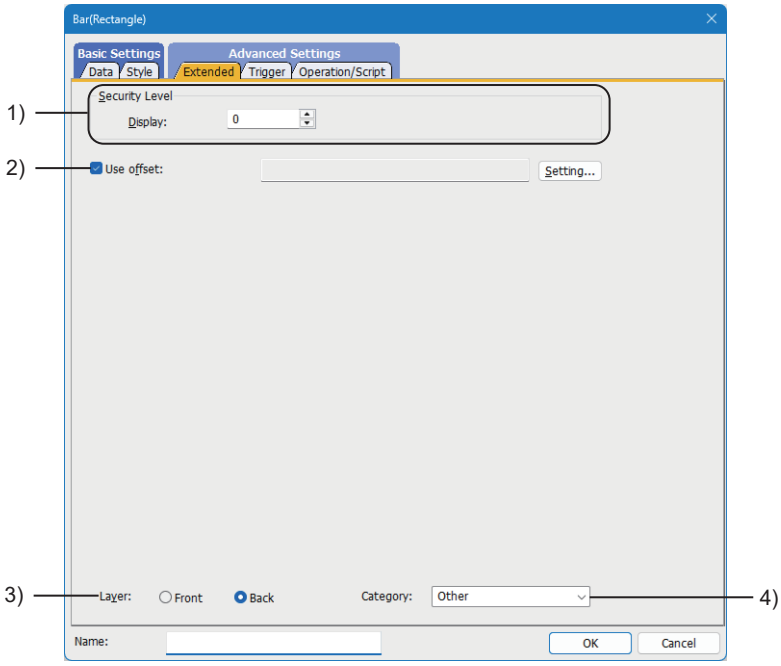
Item			Description
2)	[Scale Settings]	—	Displays scale marks and scale values in the bar graph.  Number of scale marks: 9  Number of scale values: 5  Both scale marks and scale values are displayed.
		[Scale]	Set this item to display scale marks.  • [Color] Set the color of the scale marks. • [Scale Points] Set the number of scale marks. The setting range is [0] and [2] to [101].
		[Scale Value]	Set this item to display numeric characters as the scale value.  • [Color] Set the color of numeric characters. • [Value] Set the number of numeric characters. The setting range is [0] and [2] to [101]. • [Font] Select a font for scale values. The following shows selectable items. [UD Gothic] [UD Mincho] • [Font Size] Set a vertical text size. The setting range is [8] dots to [540] dots. • [Font Width] Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
3)	[Sort]		Select the sorting order when sorting the graph in ascending or descending order of the device values. The following shows selectable items. • [None] • [Ascending] • [Descending] [Ascending] [Descending]

43.3.3 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

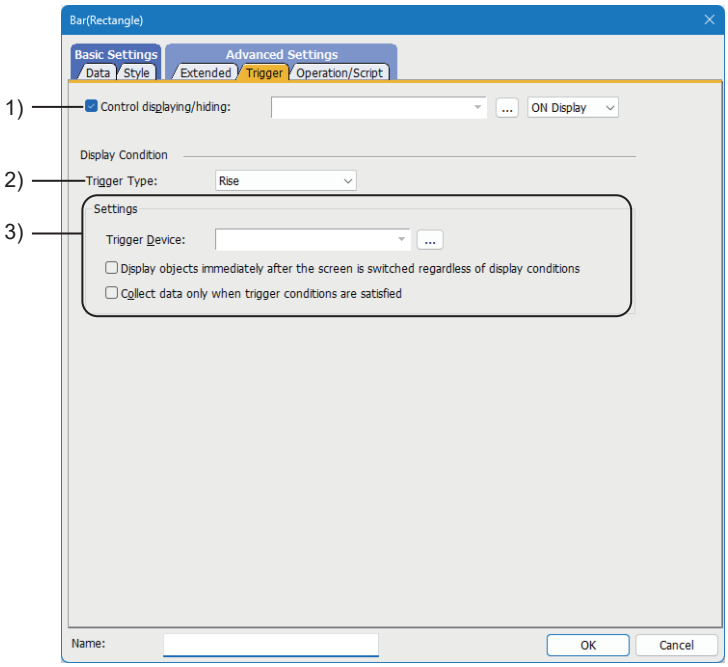


Item		Description
1)	[Security Level]	Set the security level when using the security function. The setting range is [1] to [15]. Set the level to [0] when the security function is not used. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Select this item to monitor multiple devices by switching between them. After selecting this item, set the offset device. ☞ Page 963 Offset
3)	[Layer]	Select the layer to arrange the object on. The following shows selectable items. • [Front] • [Back] ☞ Page 1055 Superimposition of figures and objects
4)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

43.3.4 [Trigger] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.



Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger Type]	Select the condition of displaying the object. The following shows selectable items. • [Ordinary] • [ON] • [OFF] • [Rise] • [Fall] • [Rise/Fall] • [Sampling] • [Range] • [Bit Trigger] • [ON Sampling] • [OFF Sampling]
3)	[Settings]	For details on each setting, refer to the following. ☞ Page 972 Settings by trigger type
4)	[Collect data only when trigger conditions are satisfied]	Select this item to collect data only when the trigger set for [Trigger Type] is satisfied. When [Rise], [Fall], [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling] is selected, this setting is available. The graph communicates with the controller even when the trigger is off. To reduce the communication load between the GOT and the controller, allow communications only when the trigger is on.

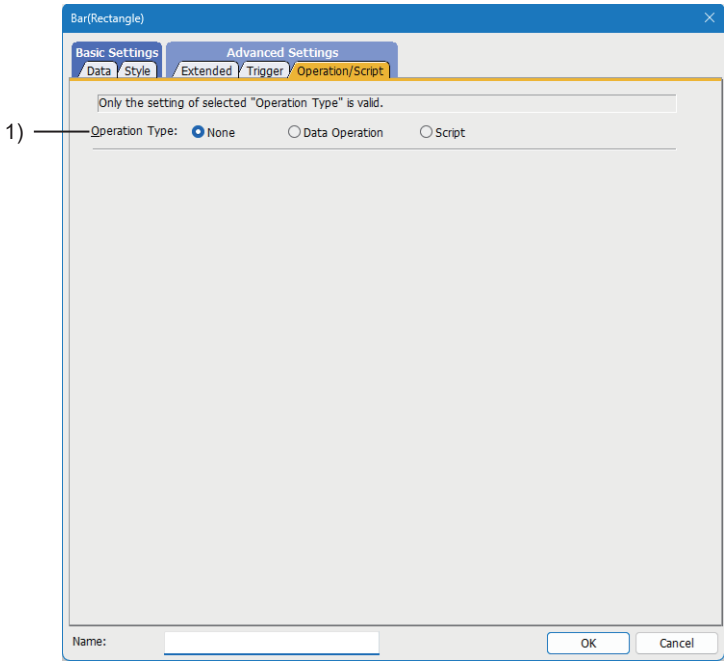
43.3.5 [Operation/Script] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set an expression for monitoring using the data operation function or the script function.

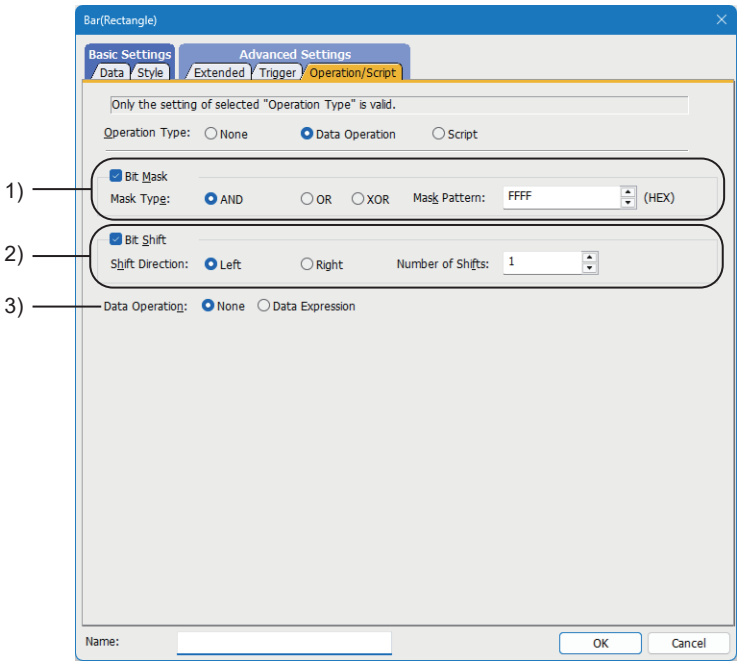


Item		Description
1)	[Operation Type]	To use the data operation or script, select an operation type. The following shows selectable items. • [None] Select this item if the data operation and script are unnecessary. • [Data Operation] Set the expression used for the data operation. ☞ Page 1653 [Data Operation] • [Script] Set the expressions for the script function. ☞ Page 1654 [Script]

[Data Operation]

For the data operation function settings, refer to the following.

☞ Page 1053 How to set the data operation

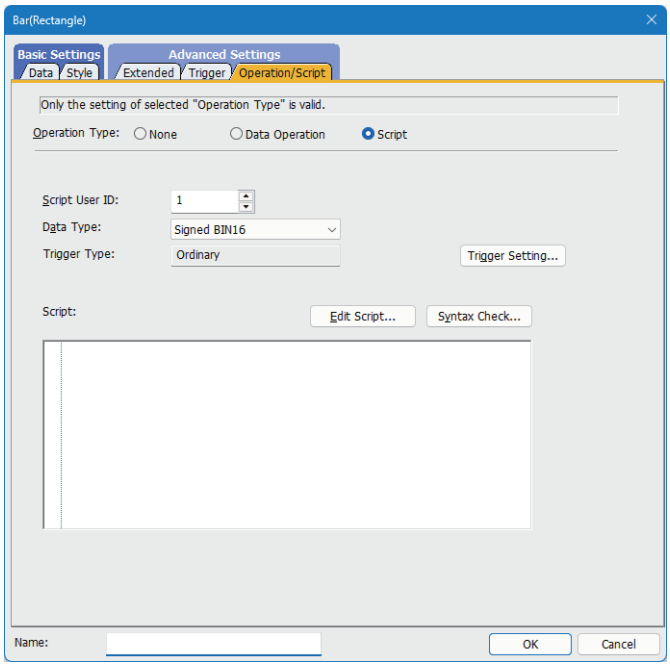


Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction. • [Left]: Left-shift • [Right]: Right-shift
		[Number of Shifts]	Set the number of bits to be shifted. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
3)	[Data Operation]		Set the format of the expression. The following shows selectable items. • [None]: Does not perform the data operation by using the expression. • [Data Expression]: Performs the data operation by using the expression. Click the [Exp] button to set the format of the expression in the [Edit Data Expression] dialog.

[Script]

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between the relevant settings in the object setting dialog and the object properties.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	**Setting item**	**Property name**	**Read**	**Write**	**Timing for reflecting the setting change*1**
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Style]	[Frame Color]	frame_color	○	×	×
	[Shape Color]	plate_color	○	○	When the object is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated

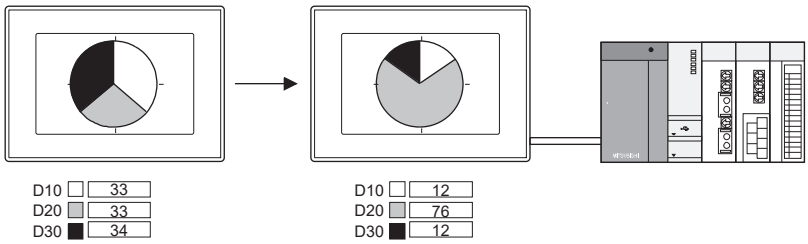
*1 For the timing at which the setting change of an object property is reflected, refer to the following.

☞ Page 2456 Timing at which the setting change of an object property is reflected

44 Placing a pie graph

GT37 SoftGOT3000

This function collects multiple word device values in a batch and displays the ratio of each value to all the collected values in a pie graph.

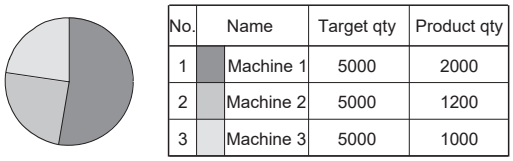


☞ Page 1656 Specifications of the pie graph
☞ Page 1657 How to use the pie graph
☞ Page 1660 [Pie(Circle)] dialog

• Displaying the graph on the same screen as the historical data list display

By displaying the graph on the same screen as the historical data list display, the device status can be described more effectively.

☞ Page 1495 Placing a historical data list display



No.	Name	Target qty	Product qty
1	Machine 1	5000	2000
2	Machine 2	5000	1200
3	Machine 3	5000	1000

• Sorting the graph segments according to the device values

The graph can be sorted in ascending or descending order of the device values.

PART 7

44.1 Specifications of the pie graph

GT37 SoftGOT3000

The following shows the specifications of the pie graph.

44.1.1 Settable numbers

Maximum number of pie graphs that can be placed

Up to 32 pie graphs and bar graphs can be placed on one screen.

When [Collect data only when trigger conditions are satisfied] is selected, up to 256 objects can be placed for one project.

Number of values that can be displayed (number of word devices that can be monitored)

Up to 32 values can be displayed on one pie graph.

44.2 How to use the pie graph

GT37 SoftGOT3000

The following shows how to use a pie graph.

44.2.1 Placing a pie graph

The following shows how to place a pie graph.

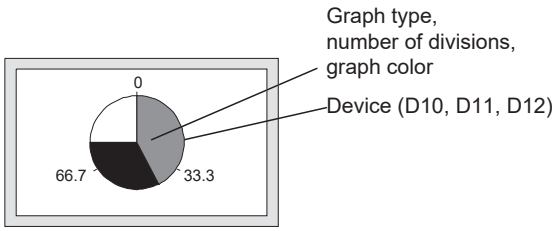
Operating procedure

1. Select [Object] → [Graph] → [Pie(Circle)] from the menu.
2. Click the position to place a pie graph.
3. Adjust the frame size of the pie graph.
4. Double-click the pie graph to display the setting dialog.

☞ Page 1660 [Pie(Circle)] dialog

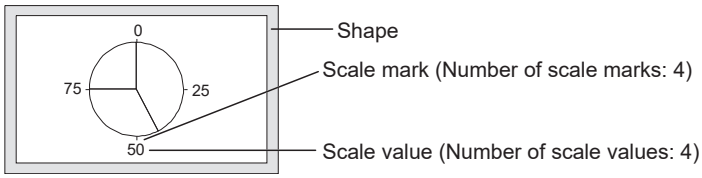
5. Set the number of divisions (number of the word devices to be monitored), devices to be monitored, and graph color in the [Data] tab.

☞ Page 1660 [Data] tab



6. Configure the figure and scale settings in the [Style] tab.

☞ Page 1662 [Style] tab



7. Click the [OK] button to complete the pie graph settings.

PART 7

44.2.2 Setting [Collect data only when trigger conditions are satisfied]

Selecting [Collect data only when trigger conditions are satisfied] can reduce the number of communications.
Various graphs can be combined.

Operating procedure

1. Select [Object] → [Graph] → [Pie(Circle)] from the menu.
2. Click the position to place a pie graph.
3. Double-click the pie graph to display the setting dialog.

☞ Page 1660 [Pie(Circle)] dialog

4. Display the [Trigger] tab.

☞ Page 1665 [Trigger] tab

5. Select [Rise], [Fall], [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling] for [Trigger Type].
6. Select [Collect data only when trigger conditions are satisfied].

The [Collect data only when trigger conditions are satisfied] setting is effective if a graph does not require frequent refresh.
However, when the graph requires frequent refresh and display, [Collect data only when trigger conditions are satisfied] should be deselected (device values are collected through constant communication).
The setting of [Collect data only when trigger conditions are satisfied] may cause the delay of the screen refresh or incorrect display of the screen.

44.2.3 Cause and solution when the graph display is not refreshed in a specified cycle

Refresh timing when [ON Sampling] or [OFF Sampling] is selected

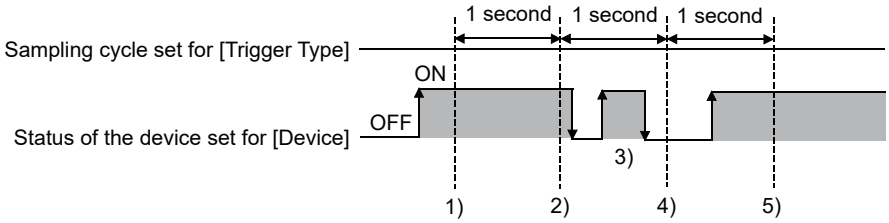
The graph display may not be refreshed in the set cycle.

■Cause

The device status is checked in the sampling cycles set for [Trigger Type].

If the condition is not satisfied at the timing of the check, the display is not refreshed.

Example) [Trigger Type] is set to [ON Sampling] and [Sampling] is set to [1] second



- The display of the pie graph is refreshed at timing 1).
- The display of the pie graph is refreshed at timing 2).
- At timing 3), the display of the pie graph is not refreshed because the timing does not match the end of one cycle and thus the condition is not checked.
- At timing 4), the display of the pie graph is not refreshed because the device condition is not satisfied.
- The display of the pie graph is refreshed at timing 5).

■Solution

The sampling cycle set for [Trigger Type] does not depend on the device status.

(The sampling cycle does not change whether the device is turned on or off.)

The following shows the setting procedure to start the cycle according to the device status.

Operating procedure

1. Select [Rise] or [Fall] for [Trigger Type].
2. Create a sequence program that turns the device on or off when the display should be refreshed.

Refresh timing when [Sampling], [ON Sampling], or [OFF Sampling] is selected

The sampling cycle count starts and is reset at the following timing.

- When the pie graph is displayed (due to screen switching, a security level change, or other cases)
- When the language switches
- When the security level changes

After the execution of any of the events, the display is refreshed at the start timing of the sampling cycle.

44.3 [Pie(Circle)] dialog

GT37 SoftGOT3000

The pie graph object collects multiple word device values in a batch and displays the ratio of each value to the total collected values in the form of a pie graph.

Operating procedure

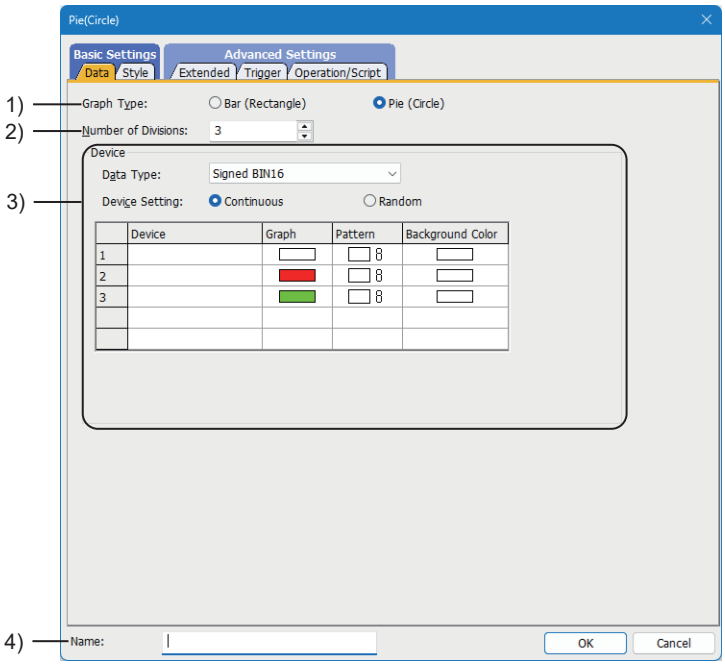
1. Select [Object] → [Graph] → [Pie(Circle)] from the menu.
2. Click the position to place a pie graph.
3. Double-click the pie graph to display the setting dialog.

☞ Page 1660 [Data] tab
☞ Page 1662 [Style] tab
☞ Page 1664 [Extended] tab
☞ Page 1665 [Trigger] tab
☞ Page 1666 [Operation/Script] tab

44.3.1 [Data] tab

GT37 SoftGOT3000

Set the device to be monitored and the pie graph status corresponding to the device value.



Item		Description
1)	[Graph Type]	Select the graph to be set. The following shows selectable items. • [Bar(Rectangle)] • [Pie(Circle)]
2)	[Number of Divisions]	Set the number of values that can be displayed (number of word devices that can be monitored). The setting range is [2] to [32].

Item			Description
3)	[Device]	[Data Type]	Select the data type of the word device. The following shows selectable items. • [Signed BIN8] • [Unsigned BIN8] • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
		[Device Setting]	Select how to set the device. The following shows selectable items. • [Continuous]: Automatically inputs consecutive devices in the table of [Device] when a start device is set. • [Random]: Select this item when setting devices one by one.
		[Device]	Set the device to be monitored. ☞ Page 834 How to set devices, labels, and tags
		[Graph]	Select the color of the pie.
		[Pattern], [Background Color]	Select the pattern and the background color to be used for the pie. 4)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The name can also be changed in other tabs. Up to 100 characters can be set.

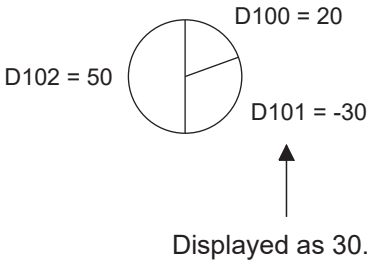
Precautions

■When the monitored device value is negative

When the monitored device value is negative, its absolute value is displayed in the pie graph.

Ex.

When the value of D101 is -30

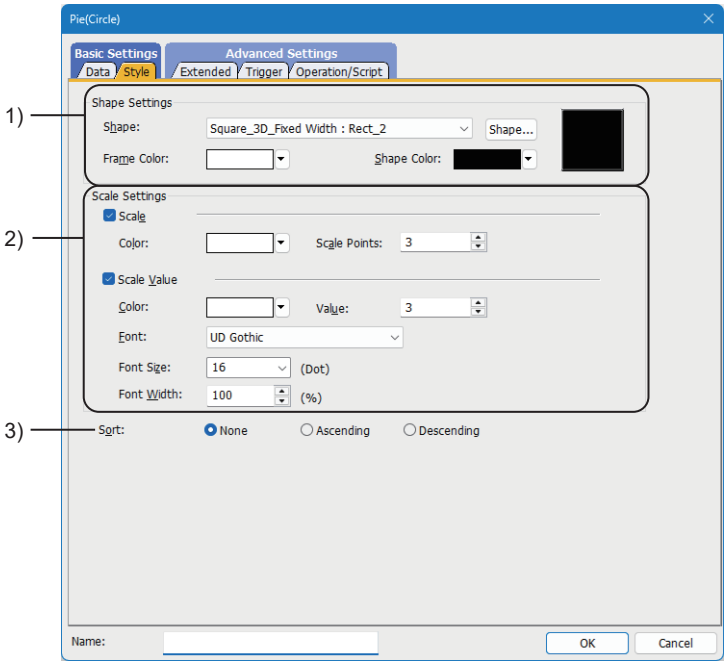


44.3.2 [Style] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item			Description
1)	[Shape Settings]	[Shape]	Set the shape of the pie graph. When [None] is selected, no figure is displayed. Click the [Shape] button to select shapes other than those in the list box. ☞ Page 1045 How to set the object shape When selecting a figure from [Basic Figure], set a frame color and a figure color. 		[Frame Color]	Set the color of the frame.
		[Shape Color]	Set the color of the shape. 		Preview	Displays the preview of the set shape.

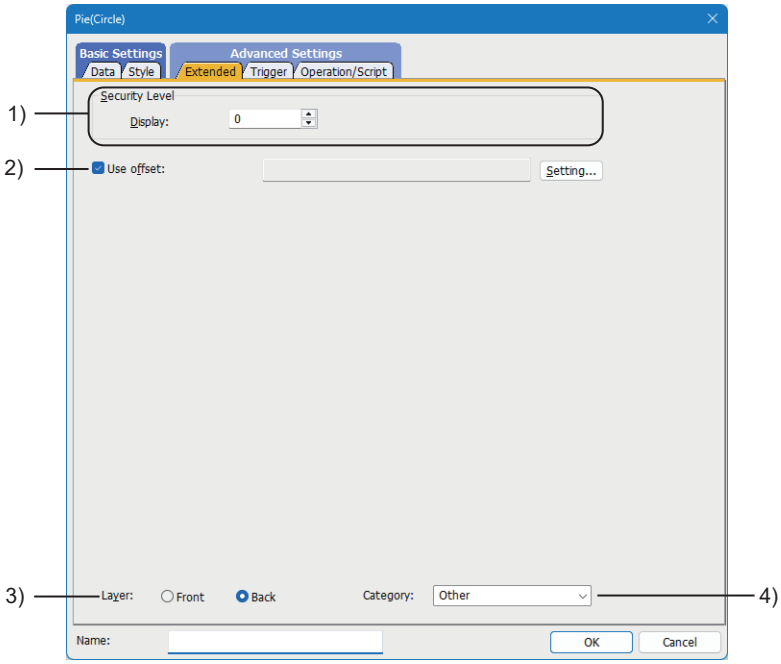
Item			Description
2)	[Scale Settings]	—	Displays scale marks and scale values in the pie graph.  Number of scale marks: 8 Number of scale values: 4 Both scale marks and scale values are displayed.
		[Scale]	Set this item to display scale marks.  • [Color] Set the color of the scale marks. • [Scale Points] Set the number of scale marks. The setting range is [0] and [2] to [101].
		[Scale Value]	Set this item to display numeric characters as the scale value.  • [Color] Set the color of numeric characters. • [Value] Set the number of numeric characters. The setting range is [0] and [2] to [101]. • [Font] Select a font for scale values. The following shows selectable items. [UD Gothic] [UD Mincho] • [Font Size] Set a vertical text size. The setting range is [8] dots to [540] dots. • [Font Width] Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
3)	[Sort]		Select the sorting order when sorting the graph in ascending or descending order of the device values. The following shows selectable items. • [None] • [Ascending] • [Descending] [Ascending] [Descending]

44.3.3 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

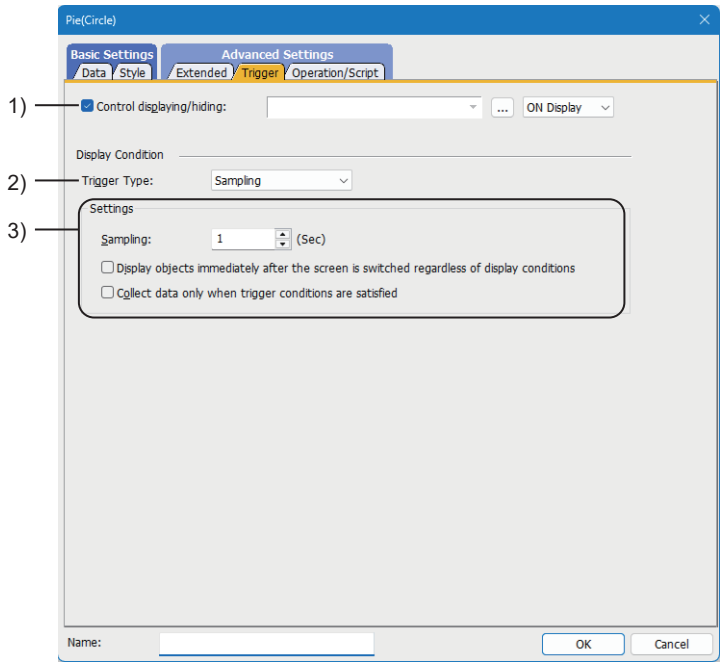


Item		Description
1)	[Security Level]	Set the security level when using the security function. The setting range is [1] to [15]. Set the level to [0] when the security function is not used. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Select this item to monitor multiple devices by switching between them. After selecting this item, set the offset device. ☞ Page 963 Offset
3)	[Layer]	Select the layer to arrange the object on. The following shows selectable items. • [Front] • [Back] ☞ Page 1055 Superimposition of figures and objects
4)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

44.3.4 [Trigger] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.



Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger Type]	Select the condition of displaying the object. The following shows selectable items. • [Ordinary] • [ON] • [OFF] • [Rise] • [Fall] • [Rise/Fall] • [Sampling] • [Range] • [Bit Trigger] • [ON Sampling] • [OFF Sampling]
3)	[Settings]	For details on each setting, refer to the following. ☞ Page 972 Settings by trigger type
4)	[Collect data only when trigger conditions are satisfied]	Select this item to collect data only when the trigger set for [Trigger Type] is satisfied. When [Rise], [Fall], [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling] is selected, this setting is available. The graph communicates with the controller even when the trigger is off. To reduce the communication load between the GOT and the controller, allow communications only when the trigger is on.

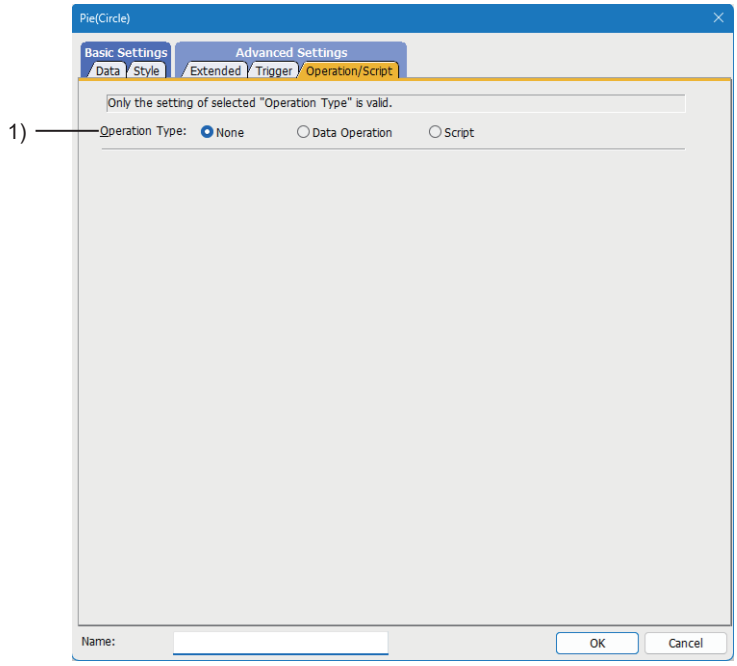
44.3.5 [Operation/Script] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set an expression for monitoring using the data operation function or the script function.

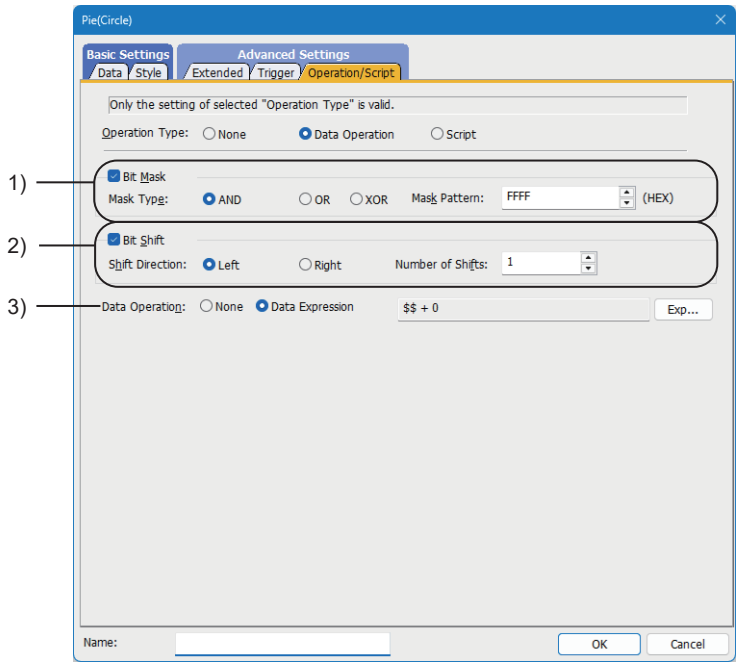


Item		Description
1)	[Operation Type]	To use the data operation or script, select an operation type. The following shows selectable items. • [None] Select this item if the data operation and script are unnecessary. • [Data Operation] Set the expression used for the data operation. ☞ Page 1667 [Data Operation] • [Script] Set the expressions for the script function. ☞ Page 1668 [Script]

[Data Operation]

For the data operation function settings, refer to the following.

☞ Page 1053 How to set the data operation

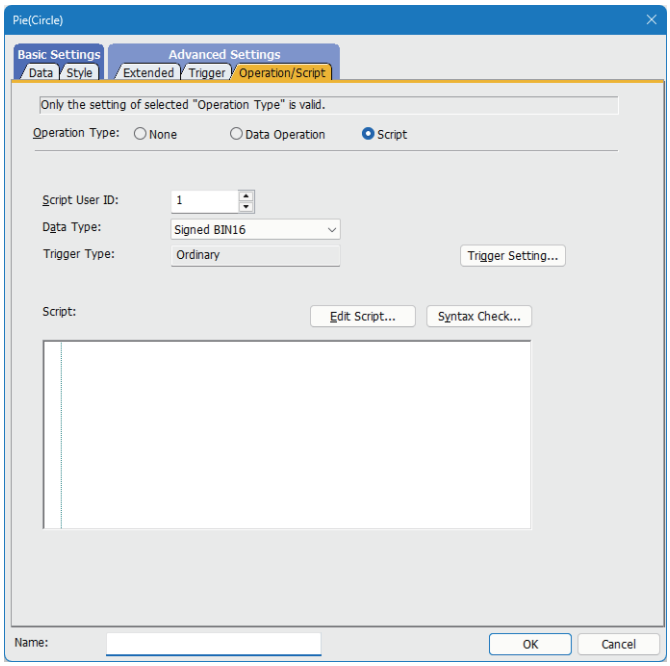


Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction. • [Left]: Left-shift • [Right]: Right-shift
		[Number of Shifts]	Set the number of bits to be shifted. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
3)	[Data Operation]		Set the format of the expression. The following shows selectable items. • [None]: Does not perform the data operation by using the expression. • [Data Expression]: Performs the data operation by using the expression. Click the [Exp] button to set the format of the expression in the [Edit Data Expression] dialog.

[Script]

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between the relevant settings in the object setting dialog and the object properties.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	Setting item	Property name	Read	Write	Timing for reflecting the setting change*1
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Style]	[Frame Color]	frame_color	○	×	×
	[Shape Color]	plate_color	○	○	When the object is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated

*1 For the timing at which the setting change of an object property is reflected, refer to the following.

☞ Page 2456 Timing at which the setting change of an object property is reflected

45 Placing a scatter graph

☞ Page 1669 Overview of the scatter graph
☞ Page 1671 Specifications of the scatter graph
☞ Page 1672 How to use the scatter graph
☞ Page 1680 [Scatter Graph] dialog

45.1 Overview of the scatter graph

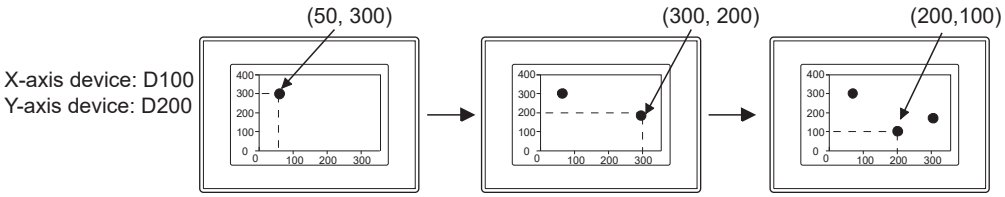
GT37 SoftGOT3000

This function displays a graph using the values of two word devices as the coordinates of X-axis and Y-axis.
The following two types of the scatter graph are available.

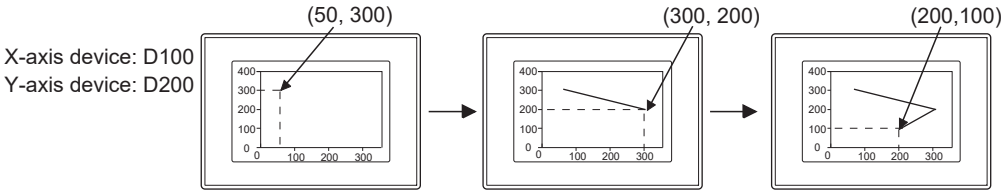
45.1.1 Sample

Collects two word device values and displays the values as a single point.
When the graph is refreshed, the new point is displayed with the previously displayed points. (Locus)

When the display attribute is set to "Point"



When the display attribute is set to "Line"



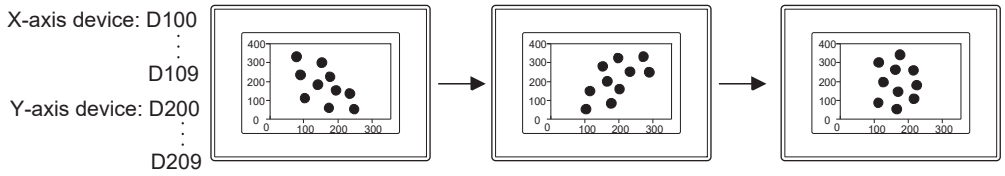
PART 7

45.1.2 Batch display

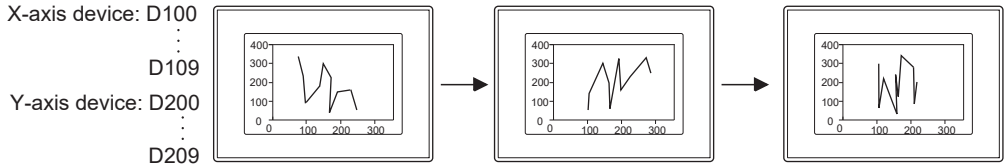
Collects multiple sets of two word device values and displays them as multiple points.

You can select whether the points displayed previously are held or deleted when updating the display of the graph.

When the display attribute is set to "Point"



When the display attribute is set to "Line"



45.2 Specifications of the scatter graph

GT37 SoftGOT3000

The following shows the specifications of the scatter graph.

45.2.1 Settable numbers

Maximum number of scatter graphs on one screen

Up to 24 objects can be placed on one screen.

Up to 16 scatter graphs for which [Store Memory] is set can be placed for one project.

When [Collect data only when trigger conditions are satisfied] is selected, up to 256 objects can be placed for one project.

Number of points that can be displayed (by two word device values)

Up to 500 points can be displayed on one scatter graph.

Behavior when the number of plots exceeds 1000

Under the following conditions, if the number of the plotted points or lines exceeds 1000, the oldest point or line is deleted and a new one is plotted.

- [Graph Type] is set to [Sample], and [Store Memory] is deselected.
- [Graph Type] is set to [Batch], [Display Mode] is set to [Locus], and [Store Memory] is deselected.

For information on the [Graph Type] settings, refer to the following.

☞ Page 1680 [Data] tab

PART 7

45.3 How to use the scatter graph

GT37 SoftGOT3000

The following shows how to use a scatter graph.

45.3.1 Placing a scatter graph

The following shows how to place the scatter graph.

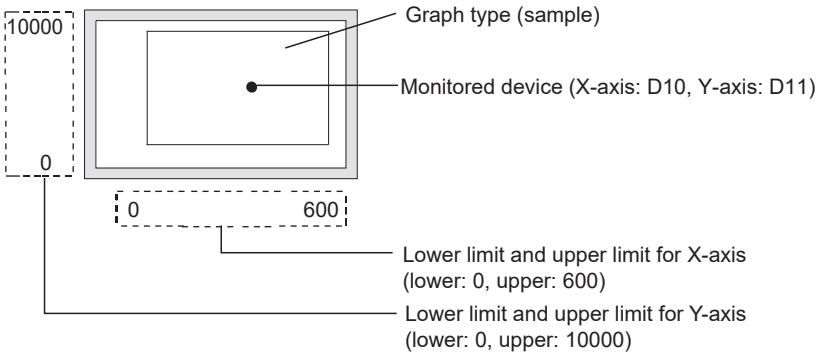
Operating procedure

1. Select [Object] → [Graph] → [Scatter Graph] from the menu.
2. Click the position to place a scatter graph.
3. Adjust the frame size of the scatter graph.
4. Double-click the scatter graph to display the setting dialog.

☞ Page 1680 [Scatter Graph] dialog

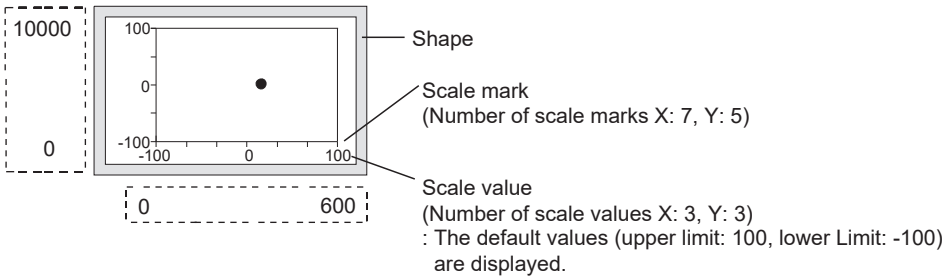
5. Set the graph type, device, upper limit value, and lower limit value in the [Data] tab.

☞ Page 1680 [Data] tab



6. Set the scale and figure on the [Style] tab.

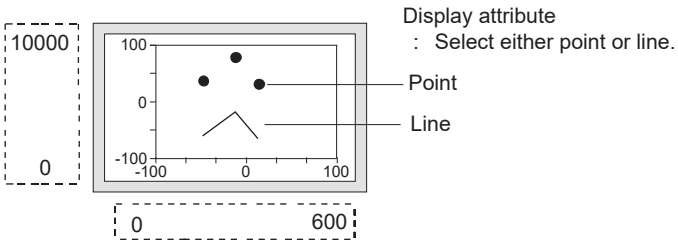
☞ Page 1682 [Style] tab



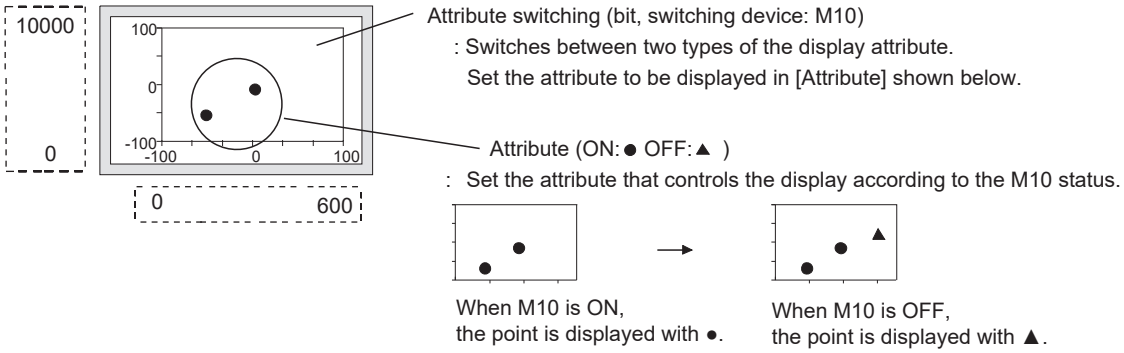
7. Set the display type and attribute switching of the graph on the [Point/Line Attribute] tab.

☞ Page 1684 [Point/Line Attribute] tab

• Display method



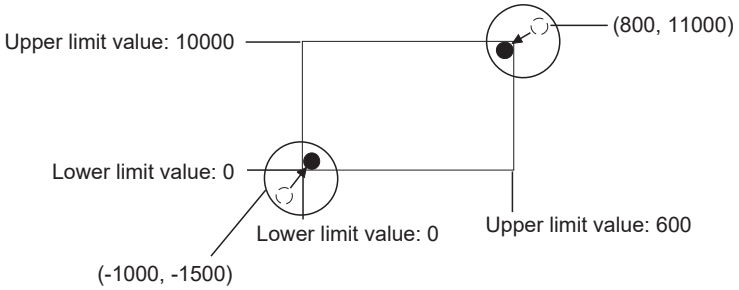
• Attribute switching



8. Click the [OK] button to complete the scatter graph settings.

Precautions

If the monitored device value falls below the lower limit, the lower limit value is displayed instead of the device value.
When the monitored device value exceeds the upper limit value, the display of the upper limit value is applied.



45.3.2 Setting [Collect data only when trigger conditions are satisfied]

Selecting [Collect data only when trigger conditions are satisfied] can reduce the number of communications.
Various graphs can be combined.
The following shows the setting procedure.

Operating procedure

1. Select [Object] → [Graph] → [Scatter Graph] from the menu.
2. Click the position to place a scatter graph.
3. Double-click the scatter graph to display the setting dialog.

☞ Page 1680 [Scatter Graph] dialog

4. Display the [Trigger] tab.

☞ Page 1689 [Trigger] tab

5. Select [Rise], [Fall], [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling] for [Trigger Type].
6. Select [Collect data only when trigger conditions are satisfied].

The [Collect data only when trigger conditions are satisfied] setting is effective if a graph does not require frequent refresh.
However, when the graph requires frequent refresh and display, [Collect data only when trigger conditions are satisfied] should be deselected (device values are collected through constant communication).
The setting of [Collect data only when trigger conditions are satisfied] may cause the delay of the screen refresh or incorrect display of the screen.

45.3.3 Cause and solution when the graph display is not refreshed in a specified cycle

Refresh timing when [ON Sampling] or [OFF Sampling] is selected

The graph display may not be refreshed in the set cycle.

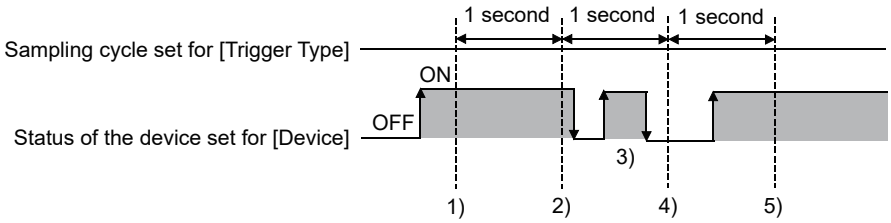
■Cause

The device status is checked in the sampling cycles set for [Trigger Type].

If the condition is not satisfied at the timing of the check, the display is not refreshed.

Ex.

[Trigger Type] is set to [ON Sampling] and [Sampling] is set to [1] second



- The display of the scatter graph is refreshed at timing 1).
- The display of the scatter graph is refreshed at timing 2).
- At timing 3), the display of the scatter graph is not refreshed because the timing does not match the end of one cycle and thus the condition is not checked.
- At timing 4), the display of the scatter graph is not refreshed because the device condition is not satisfied.
- The display of the scatter graph is refreshed at timing 5).

■Solution

The sampling cycle set for [Trigger Type] does not depend on the device status.

(The sampling cycle does not change whether the device is turned on or off.)

The following shows the setting procedure to start the cycle according to the device status.

Operating procedure

1. Select [Rise] or [Fall] for [Trigger Type].
2. Create a sequence program that turns the device on or off when the display should be refreshed.

Refresh timing when [Sampling], [ON Sampling], or [OFF Sampling] is selected

Depending on the setting of [Store Memory], the refresh timing is different.

■When the memory storage is to be executed

The following shows the start and reset timing of the count of the cycle.

- When the scatter graph is displayed (in screen switching, a security level change, or other possible cases)
- The language is switched.
- The station number is switched.
- The security level is switched.

After the execution of any of the events above, the display is refreshed at the start timing of the sampling cycle.

■When the memory storage is not to be executed

The following shows the start and reset timing of the count of the cycle.

- The GOT is started.
- Package data is written into the GOT.
- The drive information is displayed.
- An operation that resets the GOT is executed in the utility.

After the execution of any of the events above, the display is refreshed at the start timing of the sampling cycle.

45.3.4 Memory storage

The following operations clear the display of the graph or data (device value: 0). To save the data, set [Store Memory].
Set [Store Memory] in the [Extended] tab.

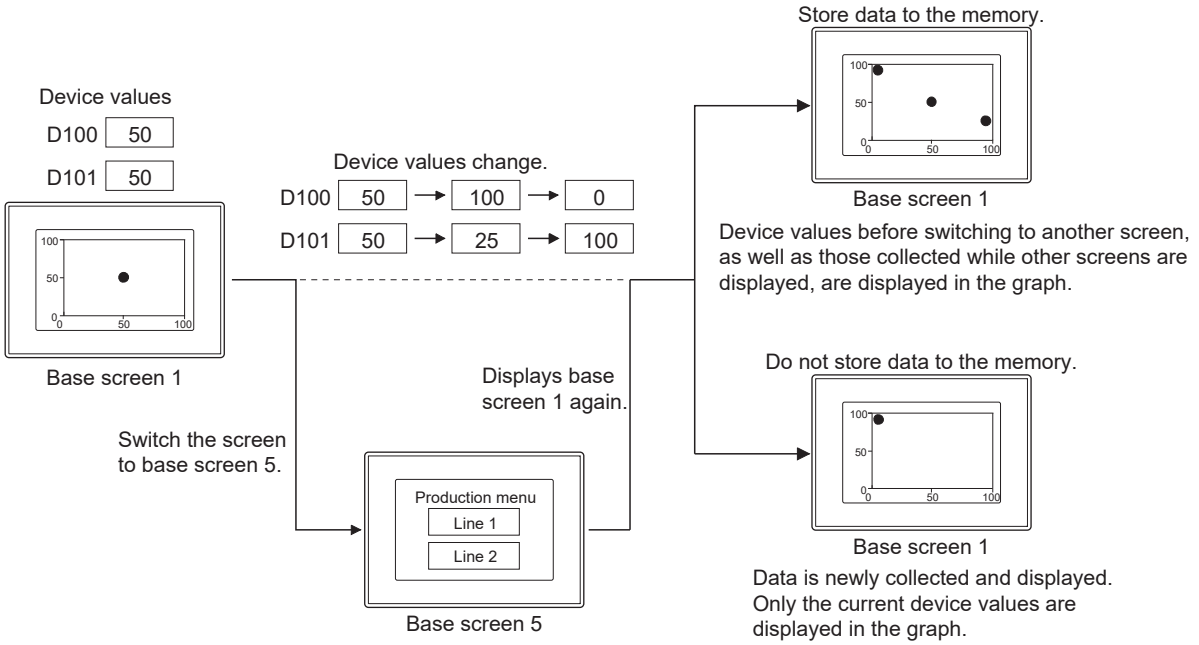
Item		[Store Memory] is deselected	[Store Memory] is selected
Switching the screen or utility	Switching from the screen for which a scatter graph is set to the screen for which no scatter graph is set	The device value is held.	The device value is held.
	Switching from the screen for which no scatter graph is set to the screen for which a scatter graph is set	• The display is cleared. • The device value is cleared to 0.	• The display is held. • The device value is held.
Switching the language switching device			
Switching the base screen while a scatter graph is displayed on the superimpose window			
Switching the security level*1			
Switching the station No. switching device			

*1 When [Store Memory] is not set, if you change the security level by selecting [Common] → [GOT Environmental Setting] → [Security] from the menu or with the set level device, the display of the graph is cleared and the device value becomes 0.

Ex.

Action at screen switching

- [Graph Type]: [Sample]
- X-axis device: D100
- Y-axis device: D101



Precautions

When [Store Memory] is set, system alarms do not display the following information.

- Screen number
- Definition screen number

Maximum number of displayed points that can be saved to the memory

Up to 4096 points displayed in the scatter graph can be saved in the internal memory.
The maximum number of data collections to the memory varies with the selection for [Graph Type] on the [Data] tab in the [Scatter Graph] dialog.
When [Sample] is selected: 4096
When [Batch] is selected: 4096/Number of displayed points (The fractional portion is rounded off.)
In [Operation at frequency over time] on the [Extended] tab, set the operation to be executed when the number of displayed points exceeds the upper limit.

- [Interrupt]: Interrupts the data collection.
- [Initialize and Continue]: Clears the data in the internal memory and the display on the scatter graph, and resumes the data collection.

Point

Using the system alarm
You can use the system alarm to display an error code and error message when the number of collections of device values saved in the memory exceeds the upper limit.
☞ Page 2075 Collecting alarms by monitoring the system

Clear timing of the display contents stored in the memory

The following shows the clear timing of the display contents stored in the memory.

- The condition of the clear trigger is satisfied.
- When [Initialize and Continue] is selected in [Operation at frequency over time], the number of collected points that can be stored in the memory exceeds the maximum.
- The GOT is reset or turned off.
- Package data is written into the GOT.
- The drive information is displayed.
- An operation that causes the GOT reset at the setup of the utility is executed.

45.3.5 Writing the cumulative count and average value

The cumulative collection count and average value of the data, maximum value, and minimum value collected in the scatter graph can be written to a device.

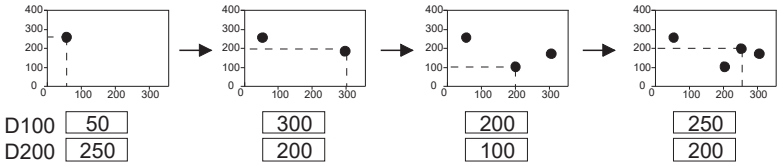
The following shows an example.

- X-device (horizontal): D100
- Y-device (vertical): D200

Detail		Written value
Cumulative count		4
X-axis	Average value*1	200
	Maximum value*2	300
	Minimum value*2	50
Y-axis	Average value*1	187
	Maximum value*2	250
	Minimum value*2	100

*1 The value rounded down after the decimal point is written to [Average Value Write].
When [Data Type] (in the [Data] tab) of the device to be monitored is a real number, a value including the decimal is written.
An average value is calculated from the values collected at each collection, and an error may occur.

*2 The device value exceeding the maximum value or minimum value of the scatter graph to be monitored is written as the maximum value or minimum value.



Maximum number of collections that can be counted in the cumulative count or average value

The maximum number of collections that can be counted in the cumulative count or average value varies depending on [Data Type] of the device set in the [Data] tab of the [Scatter Graph] dialog.

[Data Type]	Maximum number of collections	Remarks
[Signed BIN8] [Unsigned BIN8] [Signed BIN16] [Unsigned BIN16] [Signed BIN32] [Unsigned BIN32] [Signed BIN64] [Unsigned BIN64] [BCD32] [BCD64] [Real(32bit)] [Real(64bit)]	65535	For [Signed BIN8] or [Unsigned BIN8], data is written to the lower-order byte (0 to 255) of the device.
[BCD16]	9999	—

Set the operation that is executed when the cumulative count exceeds the maximum number of collections in [Operation at frequency over time] in the [Extended] tab.

- Interrupt: Data collection is interrupted.
- Initialize and continue: The internal memory and display of the scatter graph are initialized, and new data is collected.

Point

Using the system alarm

You can use the system alarm to display an error code and error message when the cumulative count exceeds the upper limit.

☞ Page 2075 Collecting alarms by monitoring the system

Initialization timing of the cumulative count, average value, maximum value, and minimum value

The value 0 is written to the cumulative count, average value, maximum value, and minimum value.

The following shows the initialization timing.

- The condition of the clear trigger (in the [Trigger] tab) is satisfied.
- When [Operation at frequency over time] is set to [Initialize and Continue], the cumulative count exceeds the limit.
- The screen is switched.*1
- The security level is switched.
- The station number is switched.

*1 When you switch a base screen or window screen having a scatter graph to another screen, the cumulative count and average value are retained. When you switch back to the base screen or window screen having the scatter graph, the cumulative count and average value will be initialized.
The scatter graph placed on the superimpose window is initialized when the base screen is switched.

When the cumulative count and average value are written and the memory storage are used simultaneously

Use [Cumulative/Average] and [Store Memory] simultaneously to collect the cumulative count and average value continuously, regardless of the screen switching.

Up to the maximum number of collections for the memory storage, the cumulative count and average value can be written.

For the maximum number of collections for the memory storage, refer to the following.

☞ Page 1677 Maximum number of displayed points that can be saved to the memory

45.4 [Scatter Graph] dialog

GT37 SoftGOT3000

The scatter graph is an object that displays a graph using the values of two word devices as the coordinates of X-axis and Y-axis.

Operating procedure

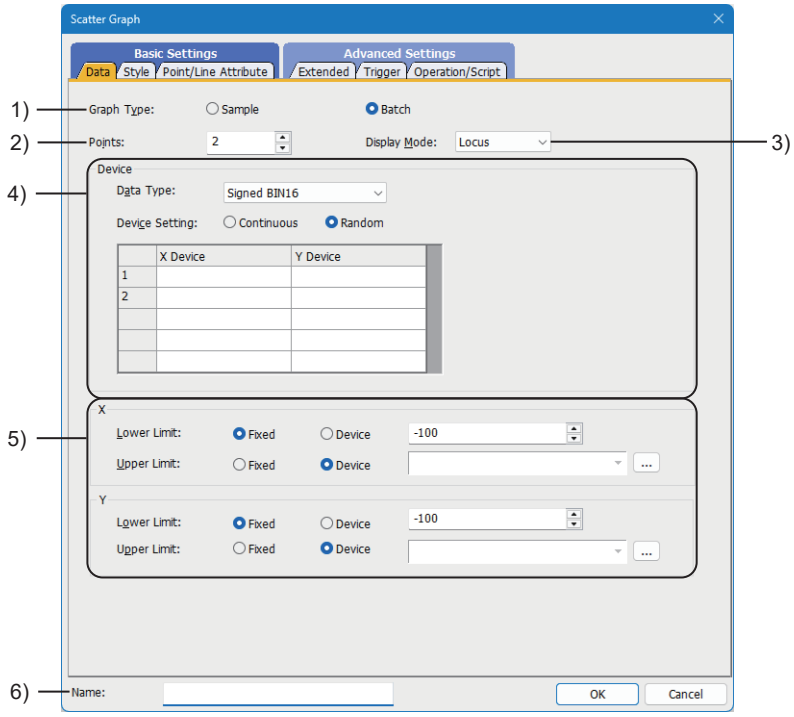
1. Select [Object] → [Graph] → [Scatter Graph] from the menu.
2. Click the position to place a scatter graph.
3. Double-click the scatter graph to display the setting dialog.

☞ Page 1680 [Data] tab
☞ Page 1682 [Style] tab
☞ Page 1684 [Point/Line Attribute] tab
☞ Page 1687 [Extended] tab
☞ Page 1689 [Trigger] tab
☞ Page 1690 [Operation/Script] tab

45.4.1 [Data] tab

GT37 SoftGOT3000

Set the target device to be monitored and the trend graph status corresponding to the device value.



Item		Description
1)	[Graph Type]	Select the graph to be set. The following shows selectable items. • [Sample] • [Batch]
2)	[Points]	Set this item when [Batch] is selected for [Graph Type]. Set the number of points to be displayed in a scatter graph. The setting range is [2] to [500].

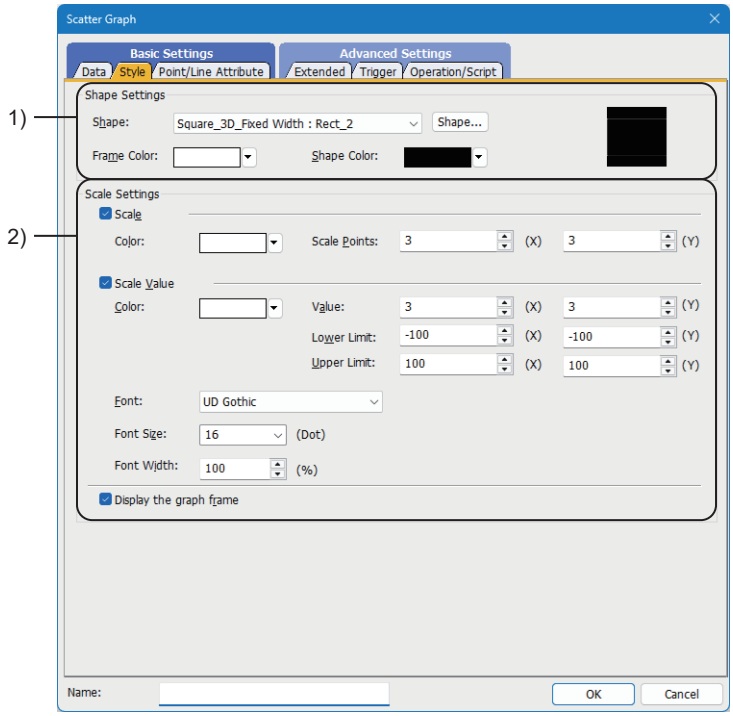
Item			Description
3)	[Display Mode]		Set this item when [Batch] is selected for [Graph Type]. Select the refresh method of the display of the graph. The following shows selectable items. • [Replace] Only the latest data is displayed. • [Locus] The latest data is displayed on the graph displayed previously.
4)	[Device]	[Data Type]	Select the data type of the word device. The following shows selectable items. • [Signed BIN8] • [Unsigned BIN8] • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
		[Device Setting]	Select the display method of the devices in each of X-axis and Y-axis. The following shows selectable items. • [Continuous]: Automatically inputs consecutive devices in the table of [Device] when a start device is set. • [Random]: Select this item when setting devices one by one.
		[X Device] and [Y Device]	Set the devices to be monitored for X-axis and Y-axis. ☞ Page 834 How to set devices, labels, and tags
5)	[X] and [Y]		Set the display range in the scatter graph (lower limit and upper limit) for each axis. Select whether to use a fixed value or device value. The following shows selectable items. • [Fixed]: Specify a constant. • [Device]: Specify a device value. ☞ Page 834 How to set devices, labels, and tags The setting ranges of [Lower Limit] and [Upper Limit] differ depending on the item selected for [Data Type].
6)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

45.4.2 [Style] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item			Description
1)	[Shape Settings]	[Shape]	Set the shape of the scatter graph. When [None] is selected, no figure is displayed. Click the [Shape] button to select shapes other than those in the list box. ☞ Page 1045 How to set the object shape When selecting a figure from [Basic Figure], set a frame color and a shape color.  • [Frame Color] Set the color of the frame. • [Shape Color] Set the color of the shape.  • Preview Displays the preview of the set shape.

Item			Description
2)	[Scale Settings]	—	Displays scale marks and scale values in the scatter graph. 		[Scale]	Set this item to display scale marks. • [Color] Set the color of the scale marks. • [Scale Points] ([Horizontal] and [Vertical]) Set the number of scale marks. The setting range is [0] and [2] to [101].
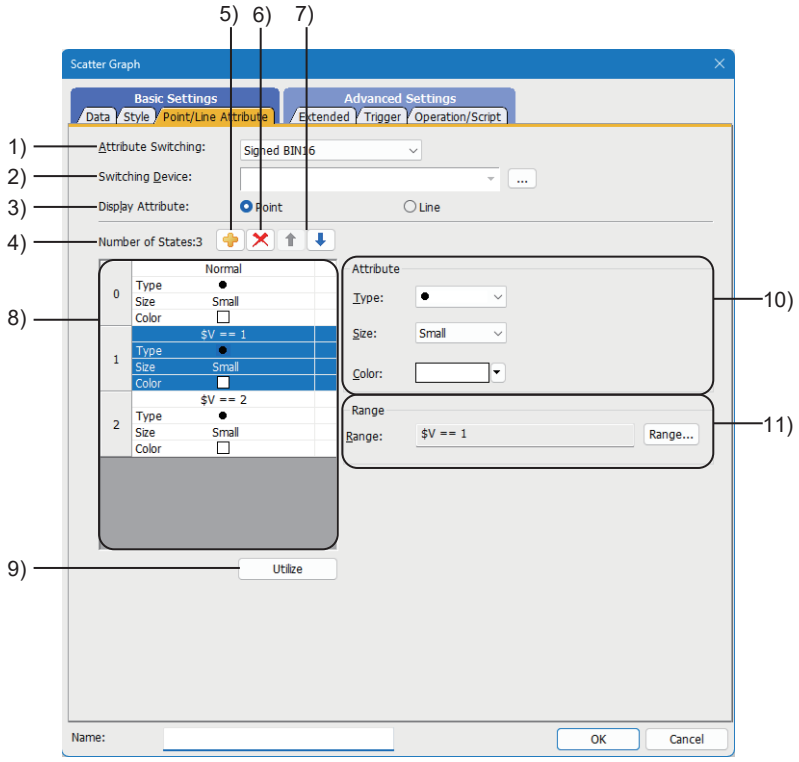
		[Scale Value]	Set this item to display numeric characters as the scale value.  • [Color] Set the color of numeric characters. • [Value] ([Horizontal] and [Vertical]) Set the number of numeric characters. The setting range is [0] and [2] to [101]. • [Lower Limit] ([Horizontal] and [Vertical]) and [Upper Limit] ([Horizontal] and [Vertical]) Set the lower limit and upper limit of the numerical value. Changes in this setting are automatically applied to the display.  Depending on the item selected for [Data Type] in the [Data] tab, the setting range is different. The selectable range of 64-bit devices is the same as that of 32-bit devices. • [Font] Select a font for scale values. The setting range is [UD Gothic] or [UD Mincho]. • [Font Size] Select a font size. The setting range is [8] dots to [540] dots. • [Font Width] Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Display the graph frame]	Select this item to display the frame of the graph. 
45.4.3 [Point/Line Attribute] tab

GT37 SoftGOT3000

Set the status of points or lines of the graph corresponding to the device value.

For the conditions, refer to the following.

☞ Page 1038 Control with conditions



Item		Description
1)	[Attribute Switching]	Select the switching type in which the display attribute of the scatter graph (type of points and lines, size, or color) is switched. The following shows selectable items. • [Fixed] The display attribute is not switched. Points or lines are displayed in the display attribute set in the [Style] tab. • [Bit] Switches two types of the display attribute according to the bit device status. • [Signed BIN8] Switches multiple display attributes with 8-bit devices. • [Signed BIN16] Switches multiple display attributes by the value of the word device (16-bit binary value). • [BCD16] Switches multiple display attributes by the value of the word device (16-bit BCD value). Example 1) • [Attribute Switching]: [Bit] • [Switching Device]: [M10]  M10: ON → M10: OFF The points are displayed with ●. → The points are displayed with ▲. Example 2) • [Attribute Switching]: [Signed BIN16] • [Switching Device]: [D10]  D10 = 1 → D10 = 10 → D10 < 100 The points are displayed with ●. → The points are displayed with ▲. → The points are displayed with ■.
2)	[Switching Device]	Set the display switching device. ☞ Page 834 How to set devices, labels, and tags
3)	[Display Attribute]	Select the display attribute of the scatter graph. The following shows selectable items. • [Point] • [Line]
4)	[Number of States]	The number of the set conditions
5)	Add button	Adds a new condition.
6)	Delete button	Deletes the selected condition.
7)	Up button, down button	Changes the priority order of the conditions in the preview list.
8)	Preview list	Displays set conditions.
9)	[Utilize] button	Creates a new condition utilizing the selected condition.

Item			Description
10)	[Attribute] (When selecting [Point] for [Display Attribute])	—	Set the attribute of the points. 		[Type]	Select the style of the point. The following shows selectable items. ●, ■, ▲, +, ○, □, △, ×
		[Size]	Select the size of the point. The following shows selectable items. • [Small] • [Medium] • [Large]
		[Color]	Set the color of the point.
	[Attribute] (When selecting [Line] for [Display Attribute])	—	Set the attribute of the line. 		[Type]	Select the style of the line. The following shows selectable items. • Solid line • Dotted line • Broken line • One-dot chain line • Two-dot chain line
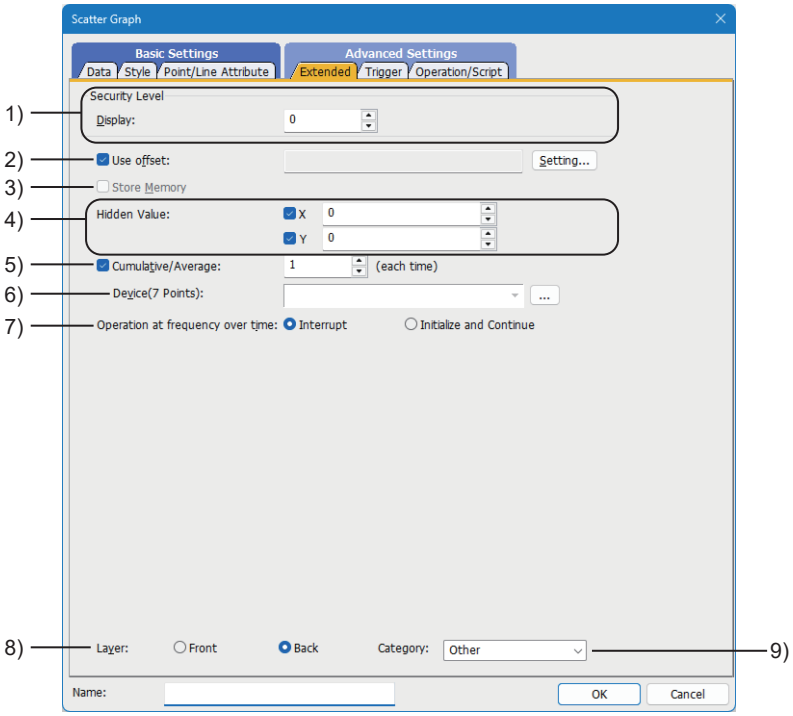
		[Size]	Select the width of the line. The following shows selectable items. • [1 Dot] • [2 Dot] • [3 Dot] • [4 Dot] • [5 Dot] • [6 Dot] • [7 Dot]
		[Color]	Select the color of the line.
11)	[Range]	[Range]	Set the display range of the conditions selected in the preview list. When setting the value of the word device as the condition, click the [Range] button to display the [Edit Range] dialog, and then set the conditional expression. ☞ Page 1038 Control with conditions

45.4.4 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



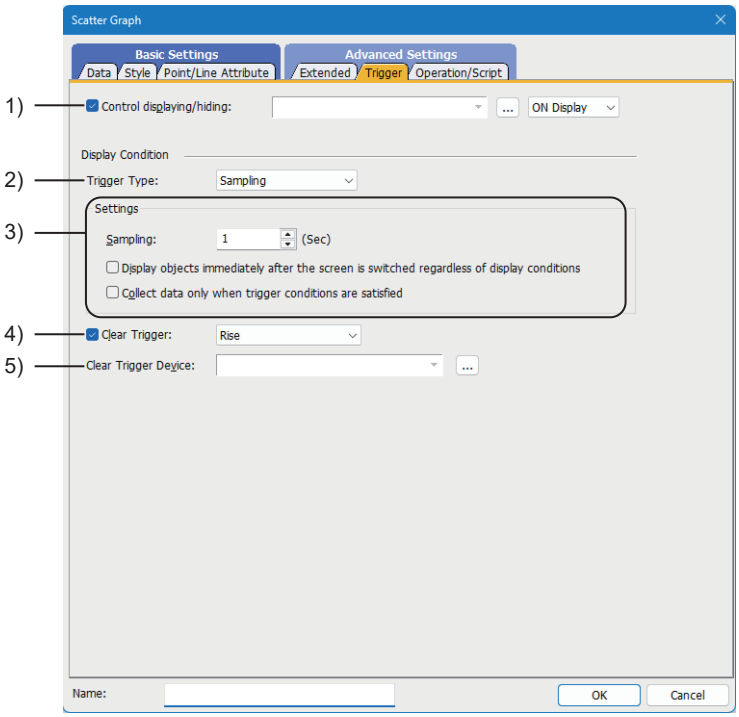
Item		Description
1)	[Security Level]	Set the security level when using the security function. The setting range is [1] to [15]. Set the level to [0] when the security function is not used. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Select this item to monitor multiple devices by switching between them. After selecting this item, set the offset device. ☞ Page 963 Offset If this item is set, [Store Memory] cannot be set.
3)	[Store Memory]	Select this item to continue data collection while a screen which displays no scatter graph is displayed. The data of the points displayed on the graph is stored to the internal memory of the GOT. ☞ Page 1676 Memory storage If this item is set, [Use Offset] cannot be set.
4)	[Hidden Value]	Select this item to hide a specific value in the scatter graph for each of X-axis and Y-axis. Example) [Hidden Value] is set to 0 for both of X-axis and Y-axis.  When the display attribute is set to "point"  When the display attribute is set to "line"

Item		Description
5)	[Cumulative/Average]	Select this item to write the cumulative count and average value, maximum value, and minimum value of the collected data to devices. ☞ Page 1678 Writing the cumulative count and average value After selecting this item, set the interval of writing the cumulative count, average value, maximum value, and minimum value to devices. The setting range is [1] to [36000]. The value set in [Hidden Value] is not included in the cumulative count, average value, maximum value, and minimum value. If the cumulative count, average value, maximum value, or minimum value is being written, the display of the object may be delayed when short intervals are set as the condition for the data storage or display.
6)	[Device(7 Points)]	Set the device to be used for [Cumulative/Average]. Seven successive devices are automatically set from the specified device.
7)	[Operation at frequency over time]	Select the operation that is executed when the number of displays of the memory storage or the number of data collections exceeds the limit. For the limit, refer to the following. ☞ Page 1677 Maximum number of displayed points that can be saved to the memory ☞ Page 1679 Maximum number of collections that can be counted in the cumulative count or average value ☞ Page 1679 When the cumulative count and average value are written and the memory storage are used simultaneously The following shows selectable items. • [Interrupt]: Data collection is interrupted and the display of the graph is not refreshed. • [Initialize and Continue]: After the display of the graph is deleted and the memory storage, cumulative count, average value, maximum value, and minimum value are initialized, the data collection resumes.
8)	[Layer]	Select the layer to arrange the object on. The following shows selectable items. • [Front] • [Back] ☞ Page 1055 Superimposition of figures and objects
9)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

45.4.5 [Trigger] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.



Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags
2)	[Trigger Type]	Select a trigger condition to display the object. The following shows selectable items. • [Ordinary] • [Rise] • [Fall] • [Rise/Fall] • [Sampling] • [ON Sampling] • [OFF Sampling] The selectable items vary depending on the GOT model. For details, refer to the following. ☞ Page 970 Specifications of the trigger types
3)	[Settings]	For details on each setting, refer to the following. ☞ Page 972 Settings by trigger type
4)	[Collect data only when trigger conditions are satisfied]	Select this item to collect data only when the trigger set for [Trigger Type] is satisfied. When [Rise], [Fall], [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling] is selected, this setting is available. The graph communicates with the controller even when the trigger is off. To reduce the communication load between the GOT and the controller, allow communications only when the trigger is on.
5)	[Clear Trigger]	Select this item to use the trigger that clears the display of the graph. After setting this item, select the clear timing of the display of the graph. The following shows selectable items. • [Rise]: The display is cleared at the rise of the bit device (OFF → ON). • [Fall]: The display is cleared at the fall of the bit device (ON → OFF). [Clear Trigger] clears the display of the graph, cumulative count, and average value stored in the memory.
6)	[Clear Trigger Device]	Set a device used for the clear trigger.

PART 7

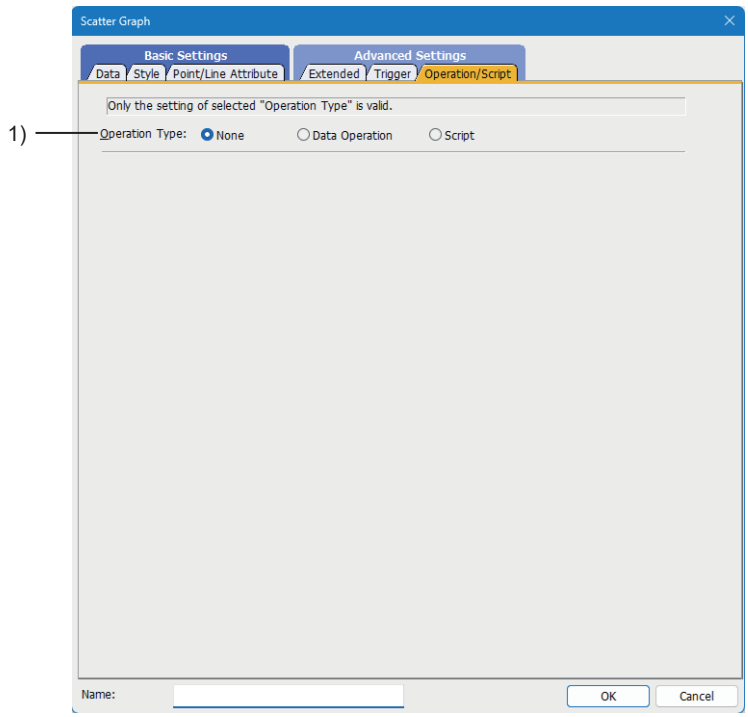
45.4.6 [Operation/Script] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set an expression for monitoring using the data operation function or the script function.

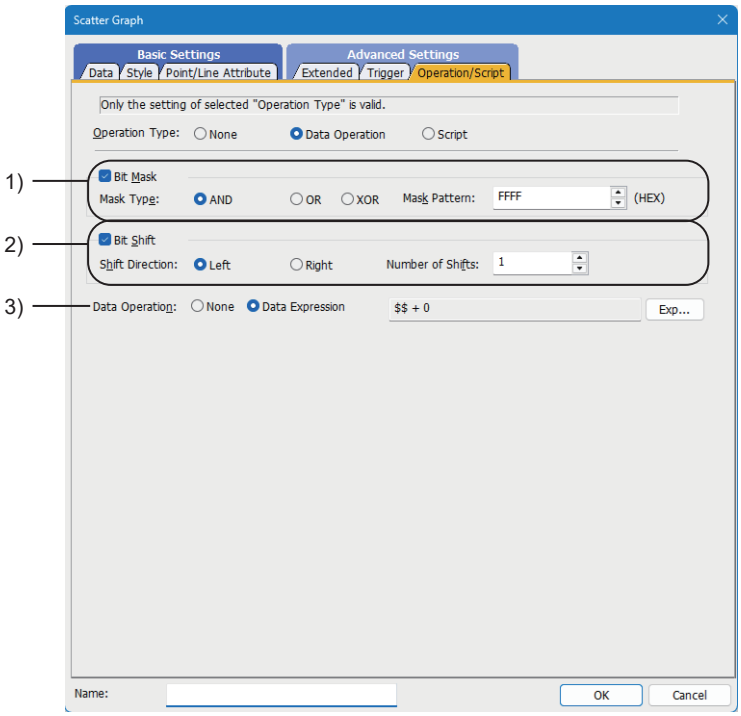


Item		Description
1)	[Operation Type]	To use the data operation or script, select an operation type. The following shows selectable items. • [None] Select this item if the data operation and script are unnecessary. • [Data Operation] Set the expression used for the data operation. ☞ Page 1691 [Data Operation] • [Script] Set the expressions for the script function. ☞ Page 1692 [Script]

[Data Operation]

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation

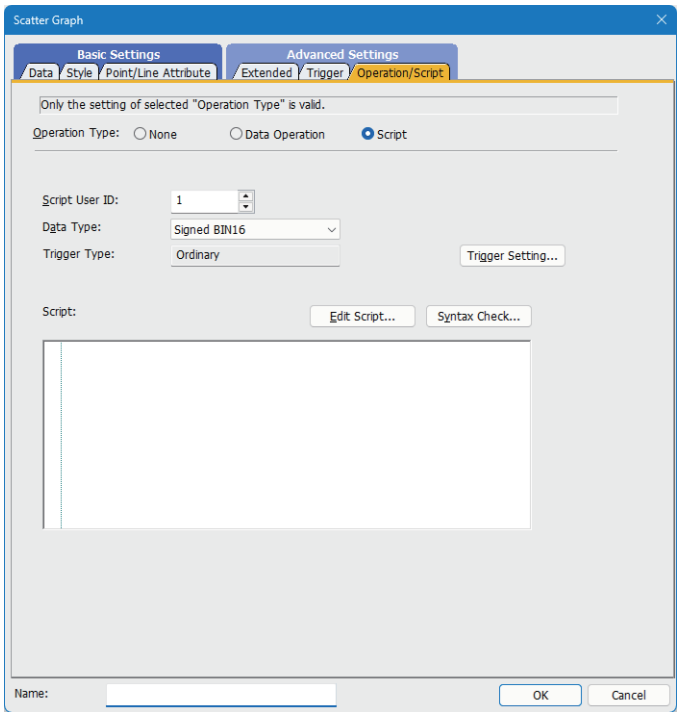


Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction. • [Left]: Left-shift • [Right]: Right-shift
		[Number of Shifts]	Set the number of bits to be shifted. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
3)	[Data Operation]		Set the format of the expression. The following shows selectable items. • [None]: Does not perform the data operation by using the expression. • [Data Expression]: Performs the data operation by using the expression. Click the [Exp] button to set the format of the expression in the [Edit Data Expression] dialog.

[Script]

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between the relevant settings in the object setting dialog and the object properties.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	**Setting item**	**Property name**	**Read**	**Write**	**Timing for reflecting the setting change*1**
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Data]	[Lower Limit] (X)	scale_min[0]	○	○	When the object is updated
	[Lower Limit] (Y)	scale_min[1]	○	○	When the object is updated
	[Upper Limit] (X)	scale_max[0]	○	○	When the object is updated
	[Upper Limit] (Y)	scale_max[1]	○	○	When the object is updated
[Style]	[Frame Color]	frame_color	○	×	×
	[Shape Color]	plate_color	○	○	When the object is updated
[Point/Line Attribute]	[Color]	graph_color	○	○	When the object is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated

*1 For the timing at which the setting change of an object property is reflected, refer to the following.

☞ Page 2456 Timing at which the setting change of an object property is reflected

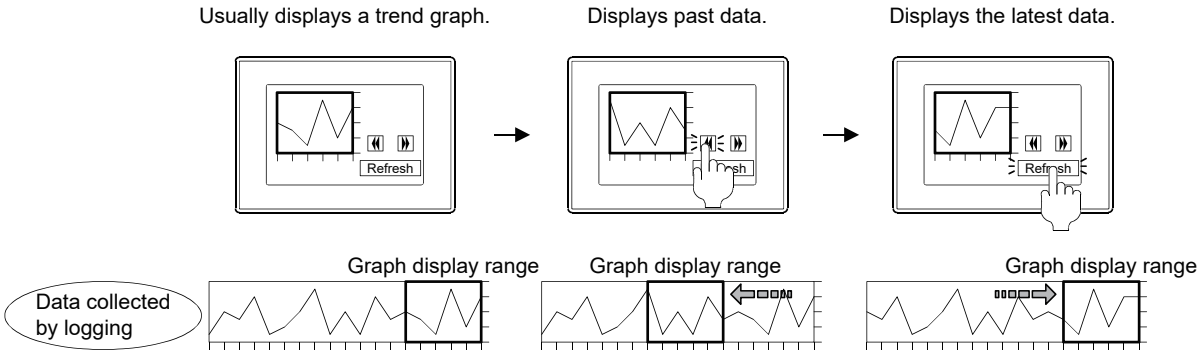
46 Placing a historical trend graph

☞ Page 1693 Overview of the historical trend graph
☞ Page 1693 Specifications of the historical trend graph
☞ Page 1702 How to use the historical graph
☞ Page 1710 [Historical Trend Graph] dialog
☞ Page 1729 Relevant settings

46.1 Overview of the historical trend graph

GT37 SoftGOT3000

This function displays the device data collected by logging in chronological order in a trend graph.



46.2 Specifications of the historical trend graph

GT37 SoftGOT3000

The following shows the specifications of the historical trend graph.

46.2.1 Settable numbers

Maximum number of historical trend graphs on one screen

Up to 32 trend graph and historical trend graph objects can be placed on one screen.
When multiple screens are opened using a set overlay screen, a total of 32 trend graph and historical trend graph objects can be placed on both the calling and called screens.
When multiple window screens are opened through an overlap window, superimpose window, user-created key window, or user-created dialog, up to 32 trend graph objects can be placed on each screen.

Maximum number of lines on one historical trend graph

Up to 32 lines can be displayed in one trend graph.

Maximum number of points

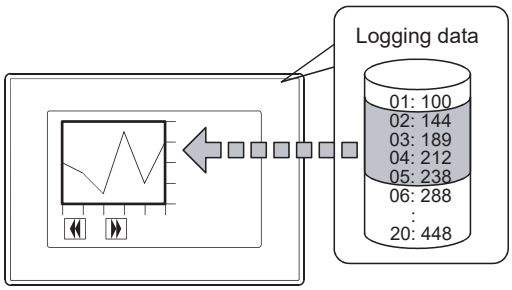
Up to 1024 points can be displayed on one trend graph line.

46.2.2 Relationship with the logging function

The data collected and stored in the buffering area or memory card by logging is displayed in a graph.

☞ Page 2194 Collecting device data ([Logging])

The stored data is used, enabling display of both the latest and old data in a graph.



Displays accumulated data in a graph.

A historical trend graph displays only the data of one logging ID.

To display the data of multiple logging IDs, set multiple historical trend graphs.

Precautions

■When the device type is set to the string in a logging setting

When [Device Type] is set to [String] in a logging setting, a system alarm occurs and the graph using the setting is not displayed.

■Precautions for designing a screen

If you place a historical trend graph by using the [Create a new historical trend graph] button in the [Logging] dialog, the settings of the following items in the [Options] dialog are not applied.

- [Place figures/objects sequentially]
- [Deselect figures/objects once they are placed]
- [Display the setting dialog once figures/objects are placed]

☞ Page 2228 [Logging] dialog

☞ Page 199 Customizing the settings related to editing operations

46.2.3 Difference from the trend graph

The trend graph collects data and displays it.

The trend graph does not require the setting of logging, and the data is not stored.

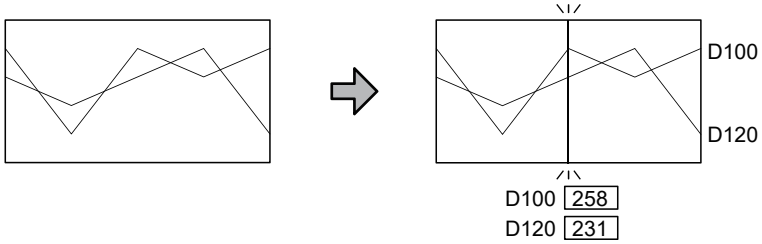
☞ Page 1577 Placing a line graph

46.2.4 Useful function

The following explains the useful functions for using the historical trend graph.

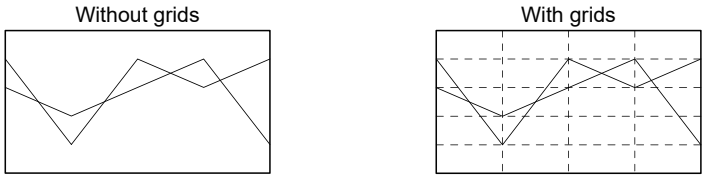
Displaying a cursor

A cursor can be displayed and moved on the graph using the touch switch to which the key code is assigned.
With the setting of the single touch operation, the cursor can be displayed on or moved to the touched position directly.
The device value of the position where the cursor is displayed can be output to the device set in the [Graph Information] dialog.
While a cursor is displayed, the display of the graph stops.



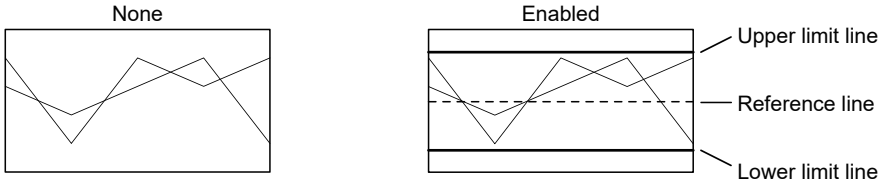
Displaying grids

Grids can be displayed on a graph.



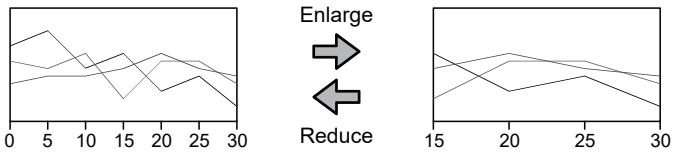
Displaying a reference line, lower limit lime, and upper limit line

A reference line, lower limit lime, and upper limit line can be displayed on a graph.



Enlarging or reducing the time axis

The time axis can be enlarged or reduced by using the touch switch to which the key code is assigned.



■Data displayed upon enlargement or reduction

When enlarging or reducing the time axis, you can select whether to always display the latest data or stop the graph update to display the current data.

■Displaying the magnification

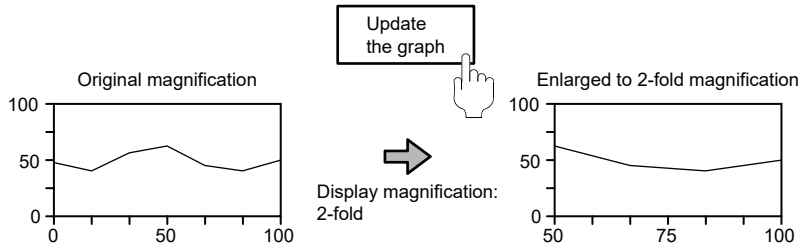
You can store the magnification factor being used to a specific device.
Thus, the current magnification is displayable with the numerical display.

Magnification for displaying the latest data

When the latest data is displayed with the touch switch, screen switching, or graph offset function, you can specify a magnification factor to display the data.

Ex.

When [Graph display magnification for latest data display] is set to [2-fold]

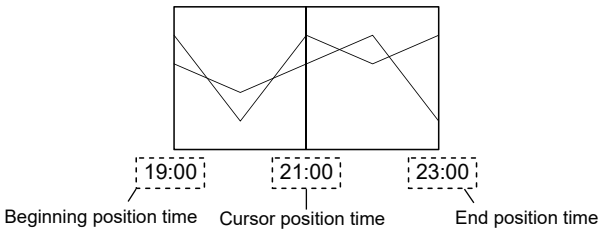


External output of date data

When [Always update Beginning Position Time/End Position Time] in the [Extended] tab is set, the latest beginning position time and end position time can be output constantly to the Time device.

The beginning position time, end position time, and cursor position time can be output to the Time device by using the touch switch to which the key code is assigned.

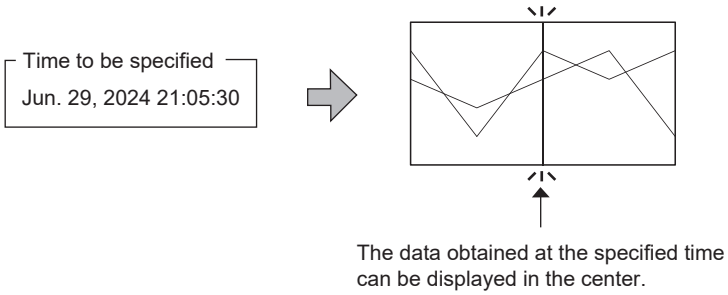
While the data is output to the device, the display of the graph stops.



Displaying data obtained at specified time

The data obtained at specified time can be displayed by using the touch switch to which the key code is assigned.

While the data obtained at specified time is displayed, the display of the graph stops.



Displaying data of historical trend graphs in historical data list displays

The data displayed with a cursor in a historical trend graph can be displayed in a historical data list display.

☞ Page 1495 Placing a historical data list display

Holding the graph display state displayed before screen switching

The GOT holds the display state of the historical trend graph displayed before screen switching and displays the same graph state after switching back to the graph screen.

Before using this setting, set the Logging Count device.

☞ Page 2194 Collecting device data ([Logging])

Use the Historical Trend Graph Display Mode signal (GS450.b9) to set the historical trend graph display mode.

- ON: Holds the display state displayed before screen switching.
- OFF: Not hold the display state displayed before screen switching.

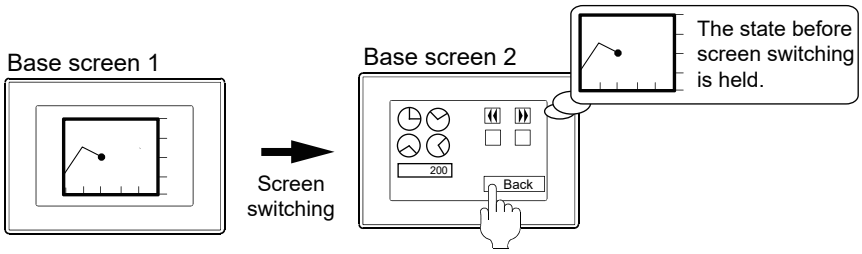
The GOT checks this signal every screen switching.

■Action at screen switching

If a screen is switched while GS450.b9 is on, the GOT operates as follows.

- Screen on which the historical trend graph is displayed → another screen

The GOT holds the display state of the historical trend graph.

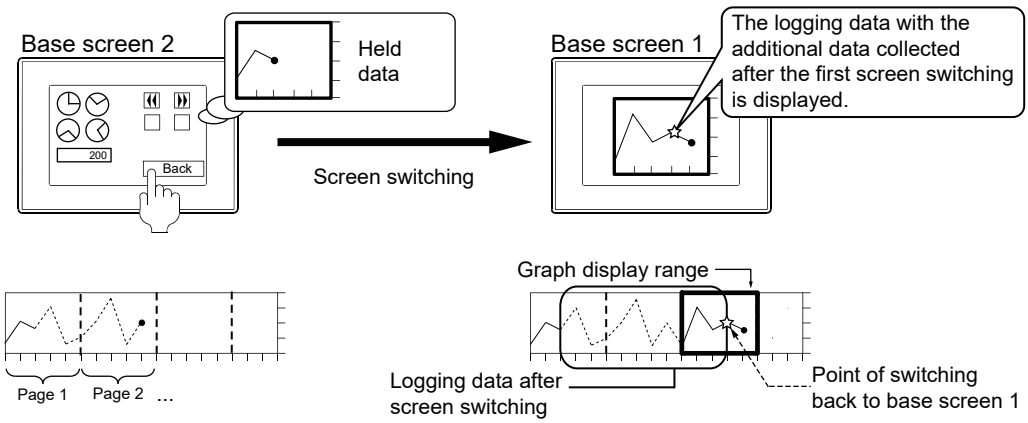


- Other screens → screen on which the historical trend graph is displayed

The GOT restores and displays the previous historical trend graph based on the held data.

When the amount of the logging data has increased since the first screen switching, the increased logging data is added to the graph.

If no data is retained, the GOT displays the latest logging data.

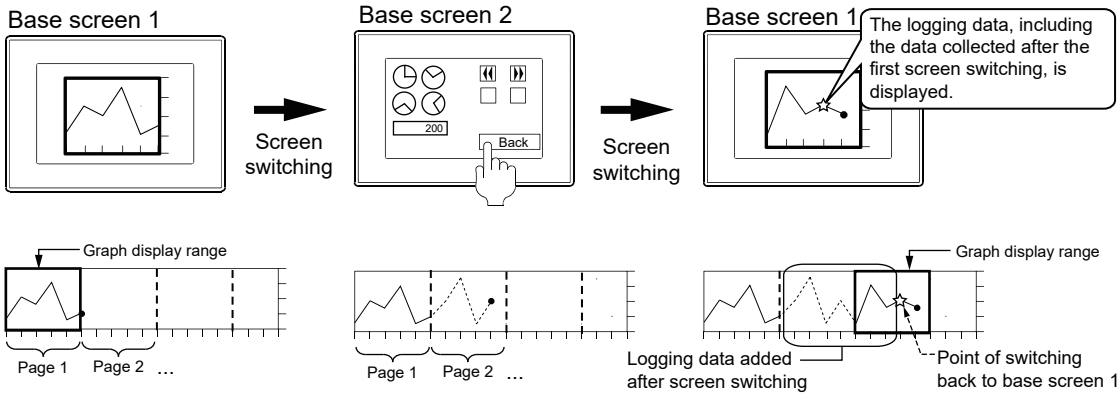


■Action example

The following shows an example of the following action: base screen 1 (on which a historical trend graph is placed) is switched to base screen 2, and then base screen 1 is displayed again.

• When GS450.b9 is on (displaying the latest data)

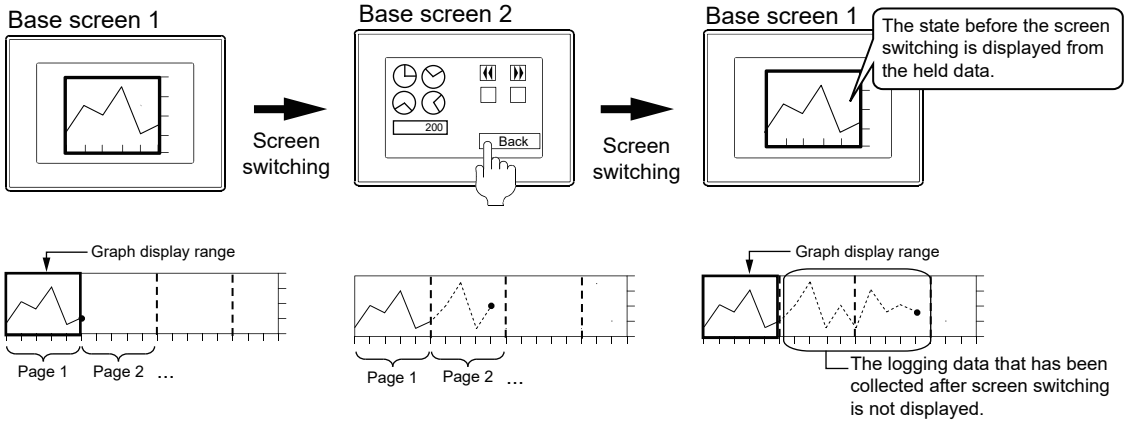
After the logging data that has been collected after the screen is switched is added to the held data, the logging data is displayed.



• When GS450.b9 is on (displaying the past data)

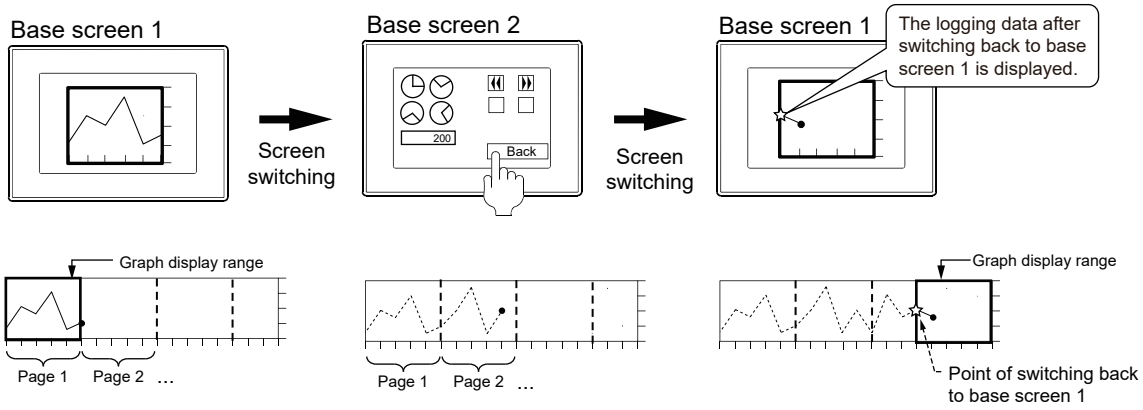
The state before the screen is switched is displayed.

The logging data that has been collected after the screen is switched is not displayed.



• When GS450.b9 is off

The logging data after base screen 1 is displayed again is displayed.



■Restrictions

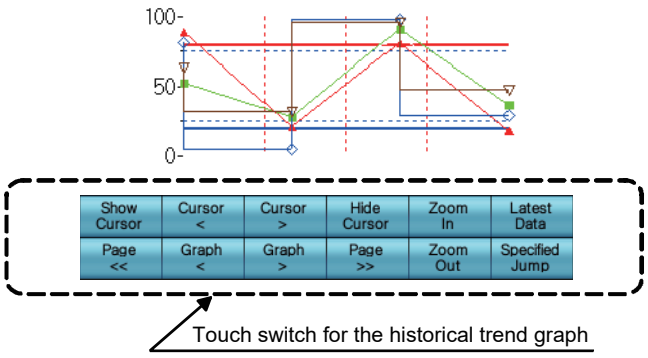
When the logging ID to be monitored by the historical trend graph is set using a device, pay attention when changing the logging ID.

If the logging ID to be monitored is changed after the display state is held, the display state is discarded.

Even when the screen is returned to the screen on which the historical trend graph is placed, the state before the screen switching is not restored and the latest logging data is displayed.

46.2.5 Touch switches for a historical trend graph

Touch switches for the historical trend graph are available by reading them from the library of GT Designer3.
The text and shape of each touch switch are user-changeable.
When key codes are set for touch switches, touch switches for the historical trend graph can be created by a user.



Touch switch	Key code	Description
Show cursor Show Cursor	FFF0h	Displays or deletes the cursor. Displays the cursor in the center of the graph. Hide cursor Hide Cursor	FFF1h	
Graph Cursor Next Cursor <	FFF2h	Moves the cursor to the new or past data. Example) When [Display Mode] is set to [Pen Record] and [Direction] is set to [Right] Graph Cursor Previous Cursor >	FFF3h	
Graph Next Graph <	FFF4h	Scrolls the graph right or left. Example) When [Display Mode] is set to [Pen Record] and [Direction] is set to [Right] Graph Previous Graph >	FFF5h	

Touch switch	Key code	Description
Graph Next Page Scroll 	FFF6h	Moves the graph right or left in units of page. Example) When [Display Mode] is set to [Pen Record] and [Direction] is set to [Right] Graph Previous Page Scroll 	FFF7h	
Time Axis Expansion 	FFF8h	Enlarges or reduces the time axis by using the axis of new data as the reference. You can enlarge the time axis until the graph displays two points. The scope of reducing the time axis varies with the setting of [Shrink the graph to be less than its full scale]. • When [Shrink the graph to be less than its full scale] is selected The time axis can be reduced to a magnification of 1/128. • When [Shrink the graph to be less than its full scale] is deselected The time axis can be reduced to the original magnification. For the setting of [Shrink the graph to be less than its full scale], refer to the following. ☞ Page 1721 [Extended] tab Time Axis Reduction 	FFF9h	
Latest data 	FFEFh	Displays the latest data. Move display position to the specified time 	FFD4h	Displays the time data stored in the Display Position Time Specification device in the center. (Time specification jump function) Using the time specification jump function may change the graph display magnification as shown below. • When a graph has been enlarged from the original magnification The graph display magnification returns to the original magnification after this function is used. • When a graph has been reduced from the original magnification The graph display magnification remains unchanged after this function is used. 
46.3 How to use the historical graph

GT37 SoftGOT3000

The following shows how to use the historical trend graph.

46.3.1 Setting logging

To use a historical trend graph, the logging setting is required.

☞ Page 2194 Collecting device data ([Logging])

46.3.2 Placing a historical trend graph

The following shows how to place the historical trend graph.

Operating procedure

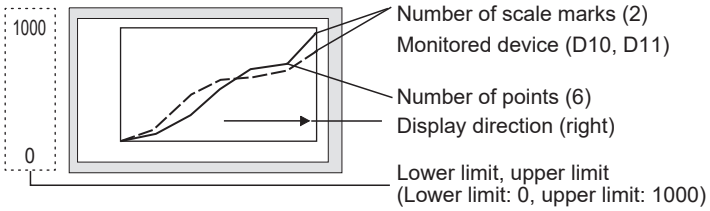
1. Select [Object] → [Graph] → [Historical Trend Graph] from the menu.
2. Click the position to place a historical trend graph.
3. Adjust the frame size of the historical trend graph.
4. Double-click the historical trend graph to display the setting dialog.

☞ Page 1710 [Historical Trend Graph] dialog

5. Display the [Data] tab.

☞ Page 1710 [Data] tab

6. Set the number of lines and points to be displayed on the historical trend graph.

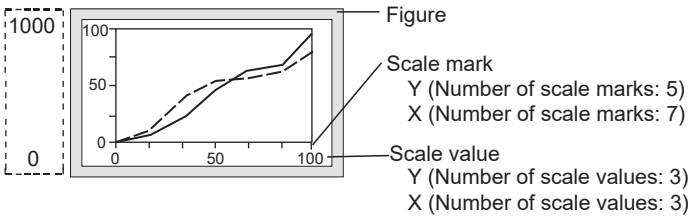


7. Set a device to be monitored.

☞ Page 834 How to set devices, labels, and tags

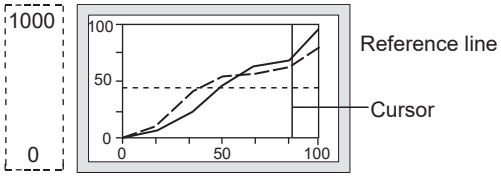
8. Set [Lower Limit] and [Upper Limit].
9. Set the scale and figure in the [Style] tab.

☞ Page 1716 [Style] tab



10. Set the graph assistance line and cursor attribute in the [Auxiliary Line/Cursor] tab.

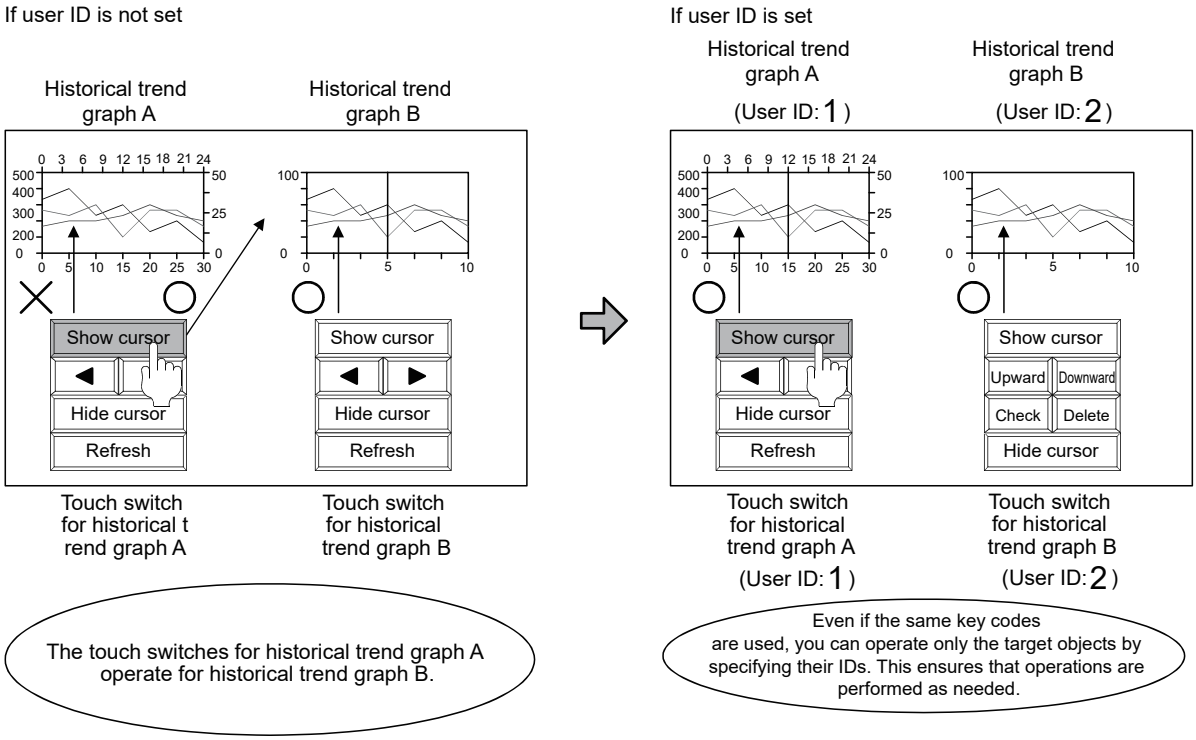
☞ Page 1719 [Auxiliary Line/Cursor] tab



11. Click the [OK] button to complete the historical trend graph settings.

46.3.3 Identifying multiple historical trend graphs (setting user IDs)

When you use touch switches to which key codes are assigned to operate multiple objects on one screen, touching a touch switch may operate an unintended object.
Setting a user ID limits the objects operated when the touch switch is touched.



The following shows the setting procedure.

Settings of the historical trend graph

Operating procedure

1. Double-click the historical trend graph on the screen editor.

The [Historical Trend Graph] dialog appears.

☞ Page 1710 [Historical Trend Graph] dialog

2. Enable [User ID] in the [Extended] tab, and specify the number.

☞ Page 1721 [Extended] tab

The number is used to define the target object as the object that operates when the touch switch is touched.

Do not set [User ID] that is already used for other objects.

Settings of a touch switch

Operating procedure

1. Display the [Switch] dialog.

For details on the switch, refer to the following.

☞ Page 1191 Placing a touch switch

2. Click the [Key Code] button in the [Action] tab.

3. Enable [Individually set user ID for a key input] and specify a number.

Set the same number as the number specified in [User ID] of [Historical Trend Graph].

46.3.4 Storing the data of each graph in devices

The following values displayed in each graph can be stored in devices.

- Value under the cursor
- Maximum value
- Minimum value
- Average value

Even though data operation is set, the value before the data operation is stored.

How to store the data to the device

Set the devices to store values under [Graph Information] in the [Data] tab.

Set the devices and select the data options to be collected.

☞ Page 1710 [Data] tab

Timing when values are stored in devices

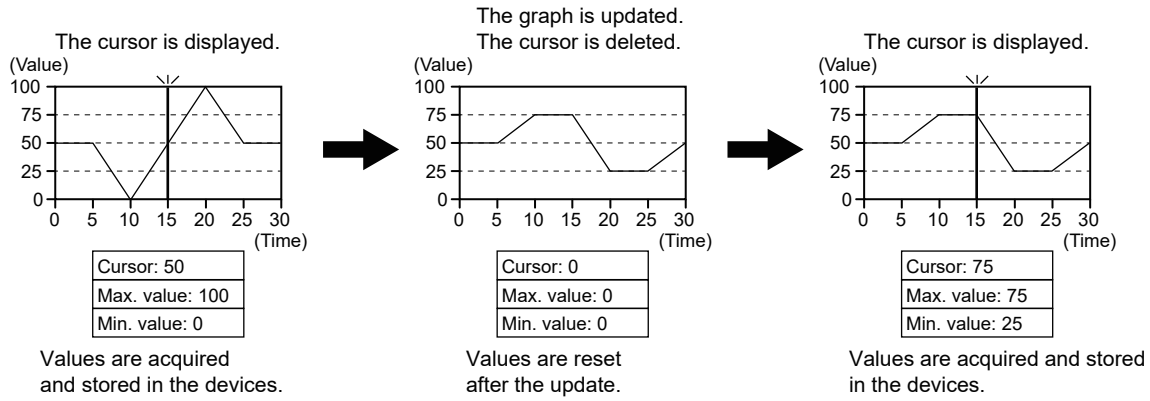
Values are stored in devices at the following timings.

- When a cursor is displayed on a graph
- When a cursor is moved
- When a historical trend graph is operated with a touch switch with a cursor displayed

The maximum, minimum, and average values are constantly acquired and stored in devices.

Ex.

Storing the value under the cursor, maximum value, and minimum value



46.3.5 Storing time data in devices

The time of the cursor display position, display range beginning position, and display range end position of the graph can be stored to the device by using the Time device.

How to store the data to the device

Data is stored in the upper eight bits and lower eight bits of set devices.

Numerical values are stored in BCD.

Ex.

When [Device] is set to [D100]

Item	Device	Description
[yymm]	D100	• b15 to b8: The year is stored. • b7 to b0: The month is stored.
[ddhh]	D101	• b15 to b8: The day is stored. • b7 to b0: The time (hour) is stored.
[mmss]	D102	• b15 to b8: The time (minute) is stored. • b7 to b0: The time (second) is stored.
[Day]	D103	• b15 to b8: None • b7 to b0: The day of the week is stored as a numerical value. The following shows the numerical values corresponding to the days. • 0: Sunday • 1: Monday • 2: Tuesday • 3: Wednesday • 4: Thursday • 5: Friday • 6: Saturday

Storage timing and values stored to devices

■Timing when the value is stored

With the following timings, values are stored to devices.

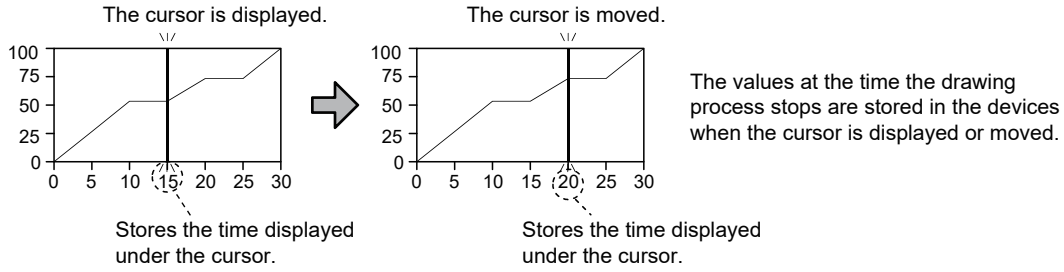
- When a cursor is displayed on a graph
- When a cursor is moved
- When a historical trend graph is operated with a touch switch with a cursor displayed

■Values to be stored

When a cursor is displayed on the graph, the drawing processing of the graph stops.

The values at the stop of the draw processing are stored to devices.

Example) Storing a time in the device



PART 7

Displaying time data in the numerical display

Time data can be displayed in the numerical display.

The following shows the setting procedure.

Operating procedure

1. Display the setting dialog for the placed numerical display ([Numerical Display] dialog).

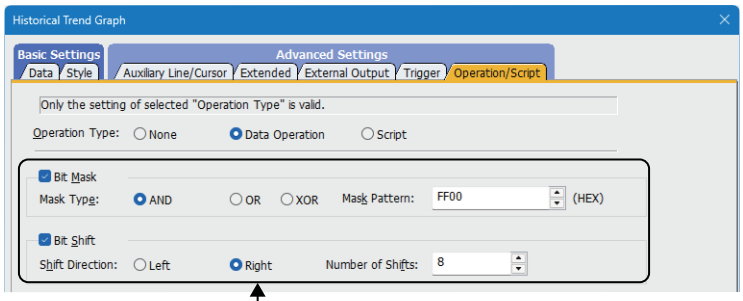
For details on the numerical display, refer to the following.

☞ Page 1305 Placing a numerical display or numerical input object

2. Select [BCD16], [BCD32], or [BCD64] for [Data Type] in the [Device] tab.

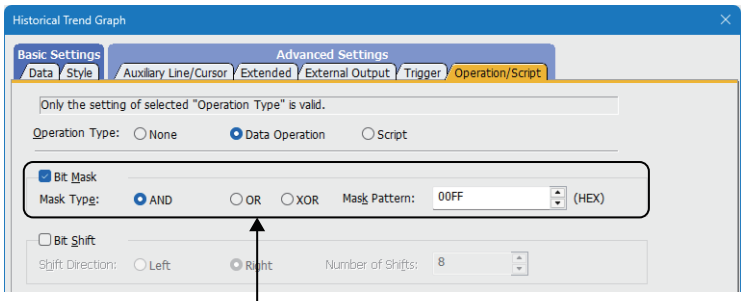
3. Set the mask processing and shift processing in the [Operation/Script] tab.

- When displaying upper 8 bits (year)



For the numerical display, set the lower 8 bits of D100 (b7 to b0) to be masked and the upper 8 bits of D100 (b15 to b8) to be shifted to the right by 8 bits.

- When displaying lower 8 bits (month)



For the numerical display, set the upper 8 bits of D100 (b15 to b8) to be masked.

46.3.6 Displaying the data obtained at specified time in the center (time specification jump function)

By using the display position time device and a touch switch, the data obtained at specified time can be displayed in the center of the historical trend graph.
When no time is obtained at the specified time, the data which has the nearest specified date is displayed.
When the multiple values are obtained at the nearest time, the first detected value is displayed.

How to store the data to the device

Set a device to store the data in the upper eight bits and lower eight bits.
Numerical values are stored in BCD16.

Ex.
When [Device] is set to [D100]

Item	Device	Description
[yymm]	D100	• b15 to b8: The year is stored. • b7 to b0: The month is stored.
[ddhh]	D101	• b15 to b8: The day is stored. • b7 to b0: The time (hour) is stored.
[mmss]	D102	• b15 to b8: The time (minute) is stored. • b7 to b0: The time (second) is stored.

Setting procedure

■Settings of a touch switch

To use time specification jump function, the following touch switches are required.

- Touch switch for displaying the specified time
- Touch switch for restarting the drawing processing of the graph

If the time specification jump function is used, the drawing processing of the graph stops.
A touch switch for restarting the drawing processing of the graph is required.
The following shows the setting procedure.

Operating procedure

1. Display the setting dialog for the placed switch ([Switch] dialog).

For details on the switch, refer to the following.

☞ Page 1191 Placing a touch switch

2. Click the [Key Code] button in the [Action] tab.

3. Set the key cord according to the touch switch to be created.

- When setting a touch switch for displaying the specified time

Set [Code Setting] to [FFD4].

- When setting a touch switch for restarting the drawing processing of the graph

Set [Code Setting] to [FFEF].

Point

Using the library data

Touch switches are registered in the library.

☞ Page 1061 Using the data registered in the library

■Settings of the historical trend graph

Operating procedure

1. Double-click the historical trend graph on the screen editor.

The [Historical Trend Graph] dialog appears.

☞ Page 1710 [Historical Trend Graph] dialog

2. Enable [Display Position Time] in the [Extended] tab, and specify a device.

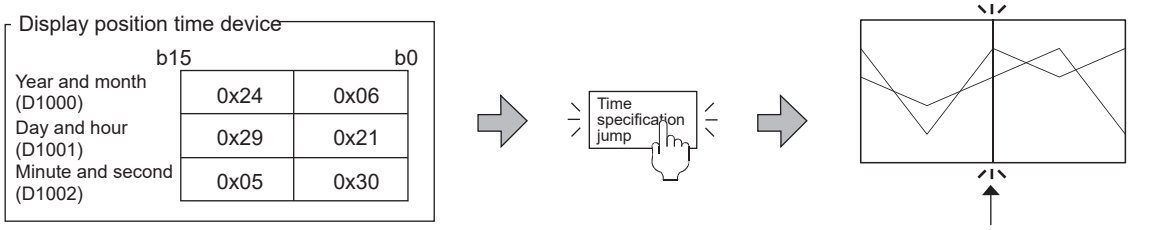
☞ Page 1721 [Extended] tab

Operation example

The following shows the operation examples.

Ex.

Setting [D1000] in [Display Position Time Device] and displaying the data of Jun. 29, 2024 21:05:30



Set the time to be displayed in the display position time device.

Touch the touch switch for which the key code (FFD4h) has been set.

The data obtained at the specified time (Jun. 29, 2024, 21:05:30) can be displayed in the center.

Precautions

■When time data is being searched for

When time data is being searched for, the historical trend graph cannot be operated.

■When no data can be displayed on the historical trend graph

When no data can be displayed on the historical trend graph, the time specification jump function is not executed.

■When displaying the data displayed near the start or end point

If the data obtained at specified time is near the start or end point, it may not be displayed in the center of the graph.

■Using the time specification jump function for an enlarged or reduced graph

Using the time specification jump function may change the graph display magnification as shown below.

- When a graph has been enlarged from the original magnification

The graph display magnification returns to the original magnification after this function is used.

- When a graph has been reduced from the original magnification

The graph display magnification remains unchanged after this function is used.

46.3.7 Operations performed using the object gesture function

The display of objects can be operated using gestures.
For information on operations using gestures, refer to the following.
☞ Page 507 Operating objects with gestures (object gesture function)

46.3.8 When a graph is reduced from the original magnification

Data displayed on the graph

If a graph is reduced from the original magnification, some pieces of data are thinned out and do not appear on the graph.
Thus, the data displayed on the graph before and after the reduction may differ.
To check specific data on a graph, display the graph at the original magnification or greater.

Elapsed time before a graph appears

If a graph is reduced from the original magnification, the graph may take a long time to appear.
In such a case, enlarge the graph close to the original magnification.

Storing the maximum value, minimum value, and average value of a graph to specific devices

If a graph is reduced from the original magnification, some pieces of data are thinned out and do not appear on the graph. The maximum value, minimum value, and average value of the reduced graph are stored to specific devices.
Thus, the actual maximum value, minimum value, and average value of the graph at the original magnification may not be stored.
Before storing the values, enlarge the graph to the original magnification.

46.4 [Historical Trend Graph] dialog

GT37 SoftGOT3000

The historical trend graph is an object that constantly collects data in word devices and display it in a graph.

Operating procedure

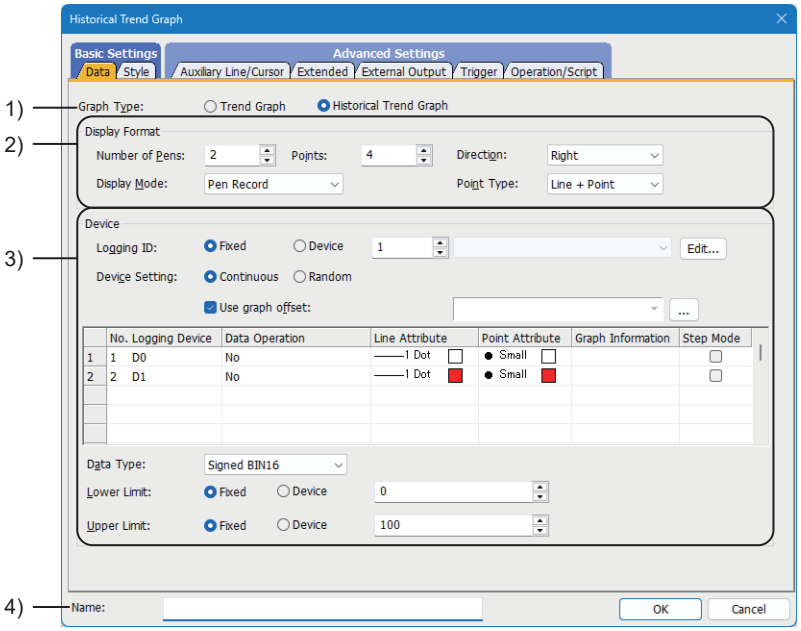
1. Select [Object] → [Graph] → [Historical Trend Graph] from the menu.
2. Click the position to place a historical trend graph.
3. Double-click the historical trend graph to display the setting dialog.

☞ Page 1710 [Data] tab
☞ Page 1716 [Style] tab
☞ Page 1719 [Auxiliary Line/Cursor] tab
☞ Page 1721 [Extended] tab
☞ Page 1724 [External Output] tab
☞ Page 1725 [Trigger] tab
☞ Page 1726 [Operation/Script] tab

46.4.1 [Data] tab

GT37 SoftGOT3000

Set the device to be monitored and the historical trend graph status corresponding to the device value.



Item			Description
1)	[Graph Type]		Select the graph to be set. The following shows selectable items. • [Trend Graph] • [Historical Trend Graph]
2)	[Display Format]	[Number of Pens]	Set the number of lines to be displayed on the historical trend graph. The setting range is [1] to [32].

Item			Description
2)	[Display Format]	[Points]	Set the number of points to be displayed on a line of the historical trend graph. The setting range is [2] to [1024]. Depending on the number of points and X-axis display range, the interval between points is adjusted automatically. Example) Points: 5 		[Direction]	Select the display direction of the graph. The following shows selectable items. • [Up] • [Down] • [Left] • [Right]
		[Display Mode]	The following shows how to draw the historical trend graph. The following shows selectable items. • [Pen Record] The line of the graph is drawn by moving the whole graph to [Direction]. The point indicating the latest value is always drawn at the graph edge.  • [One by One] The current value is displayed in the display direction. When the graph is drawn fully in a display range, the graph being displayed is cleared and a new graph is drawn.  • [Next Point Movement] The line of the graph is drawn to [Direction]. The point indicating the latest value moves to the display direction. Once the point indicating the latest value reaches to the graph edge, the point is drawn at the graph edge constantly. 		[Point Type]	Select the point type. The following shows selectable items. • [Line] • [Point] • [Line + Point] 
Item			Description
3)	[Device]	[Logging ID]	Set the logging ID with which the data to be displayed on the historical trend graph is collected. Select whether to specify the ID using a fixed value or device value. The following shows selectable items. • [Fixed] Specify the ID directly. You can select ID from the logging name as well. • [Device] Specify the value of the word device as a logging ID. ☞ Page 834 How to set devices, labels, and tags
		[Device Setting]	Select how to set the device. The following shows selectable items. • [Continuous] Automatically inputs consecutive devices in the table of [Device] when a start device is set. • [Random] Select this item when setting devices one by one.
		[Use graph offset]	Select this item to monitor the logging device that is set in the logging ID and specified by the value of the offset device. When a graph has multiple lines, the device to be monitored differs depending on the set value in [Device Setting]. After checking the device value, set the offset device. Example) When [Number of Pens] is set to [2] and offset device is set to [3] 		[No. Logging Device]	In the [Device List] dialog, select a logging device of a selected logging ID number. After the selection in the [Device List] dialog, the logging devices equivalent to the setting of [Number of Pens] are set. Example) When [Number of Pens] is set to [3] 		[Data Operation]	Set this item to execute the data operation. ☞ Page 1054 [Edit Data Expression] dialog The [Data Type] setting in the [Historical Trend Graph] dialog determines the data type of the device specified in the expression.

Item				Description
3)	[Device]	[Line Attribute]	—	Set the attribute of the line. When [Line] or [Line + Point] is selected for [Point Type], set this item. 			[Style]	Select the style of the line. The following shows selectable items. • Solid line • Dotted line • Broken line • One-dot chain line • Two-dot chain line
			[Width]	Select the width of the line. The following shows selectable items. • [1 Dot] • [2 Dot] • [3 Dot] • [4 Dot] • [5 Dot] • [6 Dot] • [7 Dot]
			[Color]	Select the color of the line.
		[Point Attribute]	—	Set the attribute of the points. When [Point] or [Line + Point] is selected for [Point Type], set this item. 			[Type]	Select the style of the point. The following shows selectable items. 0: ●, 1: ■, 2: ▲, 3: +, 4: ○, 5: □ 6: △, 7: ×, 8: ▼, 9: ◀, 10: ▶, 11: ◆ 12: ▽, 13: ◁, 14: ▷, 15: ◇
			[Size]	Select the size of the point. The following shows selectable items. • [Large]: 9 dots • [Medium]: 7 dots • [Small]: 5 dots • [Very small]: 3 dots • [Point]: 1 dot Only when [0] is selected for [Type], [Very small] or [Point] can be selected.
			[Color]	Set the color of the point.

Item				Description
3)	[Device]	[Graph Information]	—	Set the device in which the information displayed on the graph is stored or device that clears the line of the graph. For the timings when values are stored in the devices set for [Maximum Data], [Minimum Data], and [Average Data], refer to the following. 			[Device Data Storage]	Set the device in which the graph information is stored. The successive devices following the device set in this item are assigned automatically to [Cursor Position Data] or later items. Set each item optionally. Using the GOT internal device is recommended for this setting. Even though data operation is set, the value before the data operation is stored.
			[Data Type]	Select the data type of the word device in which graph information is stored. Select the same data type as that of the logging device. The following shows selectable items. • [Signed BIN8] • [Unsigned BIN8] • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
			[Cursor Position Data]	Select this item to store the value of device positioned by the cursor. The device is assigned automatically.
			[Maximum Data]	Select this item to store the maximum value of the device values displayed on the graph is to be stored. The device is assigned automatically.
			[Minimum Data]	Select this item to store the minimum value of the device values displayed on the graph. The device is assigned automatically.
			[Average Data]	Select this item to store the average value of the device values displayed on the graph. The device is assigned automatically.
			[Graph Line Clear Device]	Select this item to clear the line of the graph using a device. After selecting this item, set the device.
		[Step Mode]		Select this item to display the line of the trend graph by steps.   Display without steps Display with steps

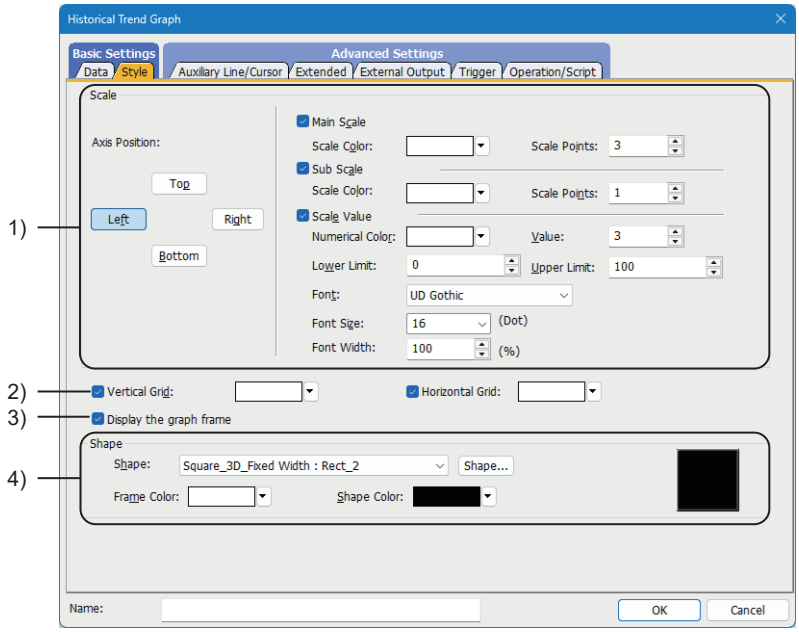
Item			Description
3)	[Device]	[Data Type]	Select the data type of the word device. The following shows selectable items. • [Signed BIN8] • [Unsigned BIN8] • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)] When the device data type is signed 64-bit binary, unsigned 64-bit binary, 64-bit binary-coded decimal, or real number (64 bits), select one of the following. Selecting a data type other than the following may disable proper data operation. • [Signed BIN8] • [Unsigned BIN8] • [Signed BIN64] • [Unsigned BIN64] • [BCD64] • [Real(64bit)]
		[Lower Limit] and [Upper Limit]	Select whether to specify the display range (lower and upper limit values) of the trend graph with the fixed value or with the device value. The following shows selectable items. • [Fixed] Specify a constant. • [Device] Specify a device value. ☞ Page 834 How to set devices, labels, and tags The setting ranges of [Lower Limit] and [Upper Limit] differ depending on the item selected for [Data Type].
4)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

46.4.2 [Style] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item			Description
1)	[Scale]	[Axis Position]	Displays scale marks and scale values in the historical trend graph.  Scale marks (X: 5) (Y: 5) — Scale values (X: 3) (Y: 3) — Displays both scale marks and scale values. Select the position where the line or scale value is displayed. The following shows selectable items. • [Left] button • [Right] button • [Top] button • [Bottom] button After selecting the position, set the line or scale value. 		[Main Scale]	Set this item to display scale marks. • [Scale Color] Set the color of the scale marks. • [Scale Points] Set the number of scale marks. The setting range is [2] to [101].

Item			Description
1)	[Scale]	[Sub Scale]	Set this item to place scale marks between the ones set in [Main Scale]. • [Scale Color] Set the color of the sub-scale marks. • [Scale Points] Set the number of sub-scale marks. The setting range is [1] to [9].
		[Scale Value]	Set this item to display numeric characters as the scale value.  • [Numerical Color] Set the color of numeric characters. • [Value] Set the number of numeric characters. The setting range is [2] to [101]. • [Lower Limit] and [Upper Limit] Set the lower limit and upper limit of the numerical value. Changes in this setting are automatically applied to the display.  Depending on the item selected for [Data Type] in the [Data] tab, the setting range is different. The selectable range of 64-bit devices is the same as that of 32-bit devices. • [Font] Select a font for scale values. The setting range is [UD Gothic] or [UD Mincho]. • [Font Size] Select a font size. The setting range is [8] dots to [540] dots. • [Font Width] Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
2)	[Vertical Grid] or [Horizontal Grid]		Select this item to display the horizontal or vertical grid. The number of grids is the same as the number set in [Scale Points] of [Main Scale] and [Sub Scale]. The bottom and left setting in [Axis Position] is prioritized.  After setting this item, select a grid color.

Item			Description
3)	[Display the graph frame]		Select this item to display the frame of the graph. 4)	[Shape]	[Shape]	Set the shape of the historical trend graph. When [None] is selected, no figure is displayed. Click the [Shape] button to select shapes other than those in the list box. ☞ Setting object shapes When selecting a figure from [Basic Figure], set a frame color and a figure color.  • [Frame Color] Set the color of the frame. • [Shape Color] Set the color of the shape.  • Preview Displays the preview of the set shape.

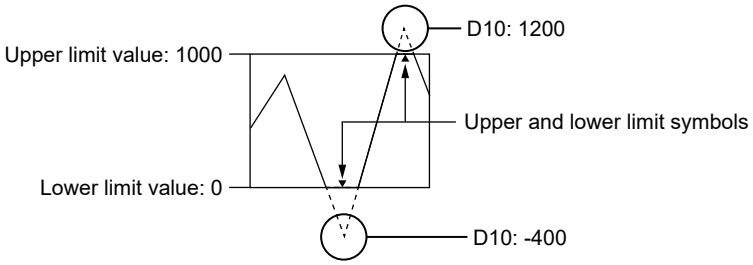
Precautions

The trend graph does not display a device value that is above the upper limit or below the lower limit.
In such a case, the upper or lower limit symbol appears at the position where the device value is hidden from view.

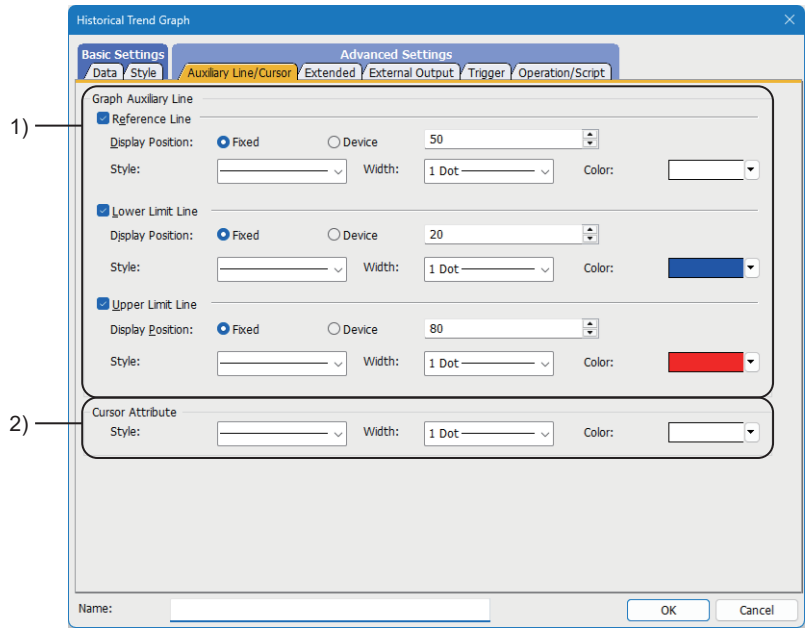


To hide the upper and lower limit symbols, turn on GS450.b10.
☞ Page 1729 GOT internal device

46.4.3 [Auxiliary Line/Cursor] tab

GT37 SoftGOT3000

Set the auxiliary line and attribute of the cursor.



Item				Description
1)	[Graph Auxiliary Line]	[Reference Line], [Lower Limit Line], and [Upper Limit Line]	—	Set this item to place a reference line on the graph.
			[Display Position]	Select whether to specify the line position using a fixed value or device value. The following shows selectable items. • [Fixed] Specify a constant. • [Device] Specify a device value. ☞ Page 834 How to set devices, labels, and tags
			[Style]	Select the style of the line. The following shows selectable items. • Solid line • Dotted line • Broken line • One-dot chain line • Two-dot chain line
			[Width]	Select the width of the line. The following shows selectable items. • [1 Dot] • [2 Dot] • [3 Dot] • [4 Dot] • [5 Dot] • [6 Dot] • [7 Dot]
			[Color]	Select the color of the line.

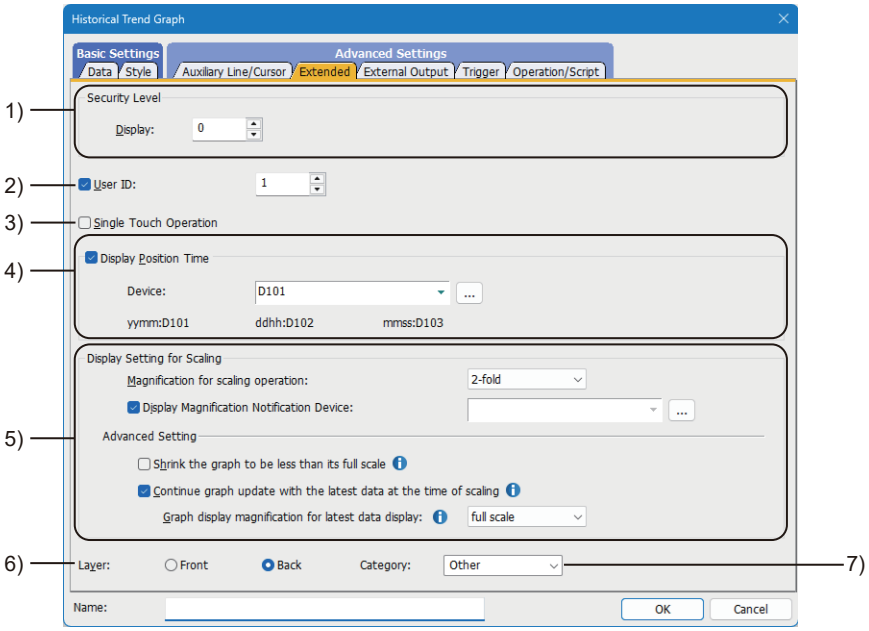
Item			Description
2)	[Cursor Attribute]	—	Set the attribute of the cursor.
		[Style]	Select the style of the line. The following shows selectable items. • Solid line • Dotted line • Broken line • One-dot chain line • Two-dot chain line
		[Width]	Select the width of the line. The following shows selectable items. • [1 Dot] • [2 Dot] • [3 Dot] • [4 Dot] • [5 Dot] • [6 Dot] • [7 Dot]
		[Color]	Select the color of the line.

46.4.4 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item			Description
1)	[Security Level]		Set the security level when using the security function. The setting range is [1] to [15]. Set the level to [0] when the security function is not used. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[User ID]		Select this item to set the user ID. The setting range is [1] to [65535]. ☞ Page 1703 Identifying multiple historical trend graphs (setting user IDs)
3)	[Single Touch Operation]		Select this item to display a cursor at the touched place.
4)	[Display Position Time]	—	Set this item to display the data obtained at specified time in the center of the graph when the touch switch is touched.
		[Device]	Set the device in which the time data is stored. The three successive devices following the device set in this item are automatically assigned to [yymm], [ddhh], and [mmss]. The time data is stored in the upper eight bits and lower eight bits of each set device. The data type of the devices is BCD. ☞ Page 1601 Displaying the data obtained at specified time in the center (time specification jump function)

Item			Description
5)	[Display Setting for Scaling]	—	Configure the settings to enlarge or reduce the time axis of a graph.
		[Magnification for scaling operation]	Select a magnification factor to enlarge or reduce the time axis of a graph by touching a touch switch, pinching in, or pinching out one time. The following shows selectable items. • [2-fold] • [4-fold] • [8-fold]
		[Display Magnification Notification Device]	Specify a device to store the magnification factor at which the time axis of a graph is being displayed. You can specify a word device or word-specified bit device. The data type of the device is signed 16-bit binary.
		[Shrink the graph to be less than its full scale]	Enables the setting to reduce the time axis of a graph from the original magnification. When the time axis is reduced, the number of points to be displayed remains unchanged, but some pieces of data are thinned out and do not appear on the graph. Example) When the time axis of a graph is reduced to a magnification of 1/2 The amount of data within the graph display range becomes twice as much as that at the original magnification. Because the number of points to be displayed remains unchanged, every other piece of data is thinned out and does not appear on the graph. 		[Continue graph update with the latest data at the time of scaling]	Always updates a graph when the time axis of the graph is enlarged or reduced.

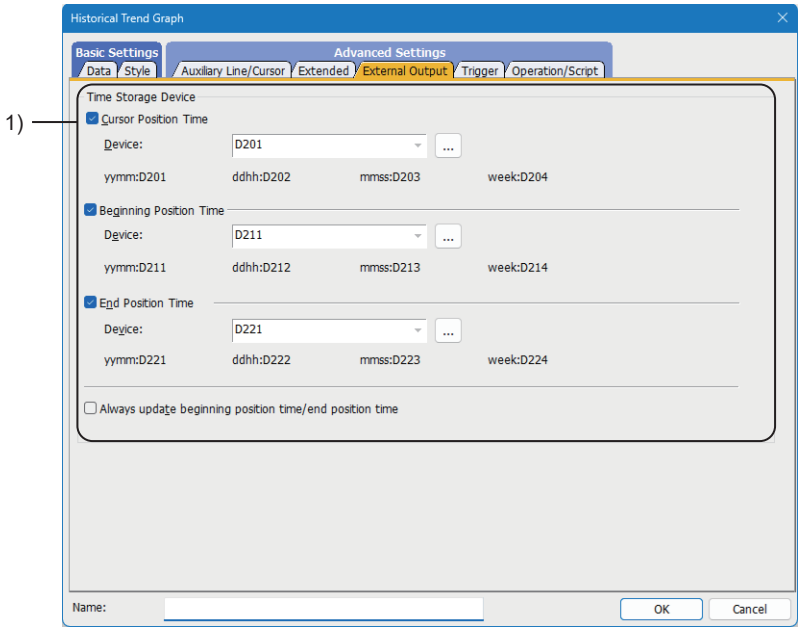
Item			Description
5)	[Display Setting for Scaling]	[Graph display magnification for latest data display]	Select a magnification factor for the latest data that is displayed with the touch switch, screen switching, or graph offset function. The magnification factors less than 1 are selectable only when [Shrink the graph to be less than its full scale] is selected. The selectable items vary with the selection for [Magnification for scaling operation]. • When [2-fold] is selected for [Magnification for scaling operation] [8-fold] [4-fold] [2-fold] [full scale] [1/2] [1/4] [1/8] [1/16] [1/32] [1/64] [1/128] • When [4-fold] is selected for [Magnification for scaling operation] [4-fold] [full scale] [1/4] [1/16] [1/64] [1/128] • When [8-fold] is selected for [Magnification for scaling operation] [8-fold] [full scale] [1/8] [1/64] [1/128]
6)	[Layer]		Select the layer to arrange the object on. The following shows selectable items. • [Front] • [Back] ☞ Page 1055 Superimposition of figures and objects
7)	[Category]		Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

46.4.5 [External Output] tab

GT37 SoftGOT3000

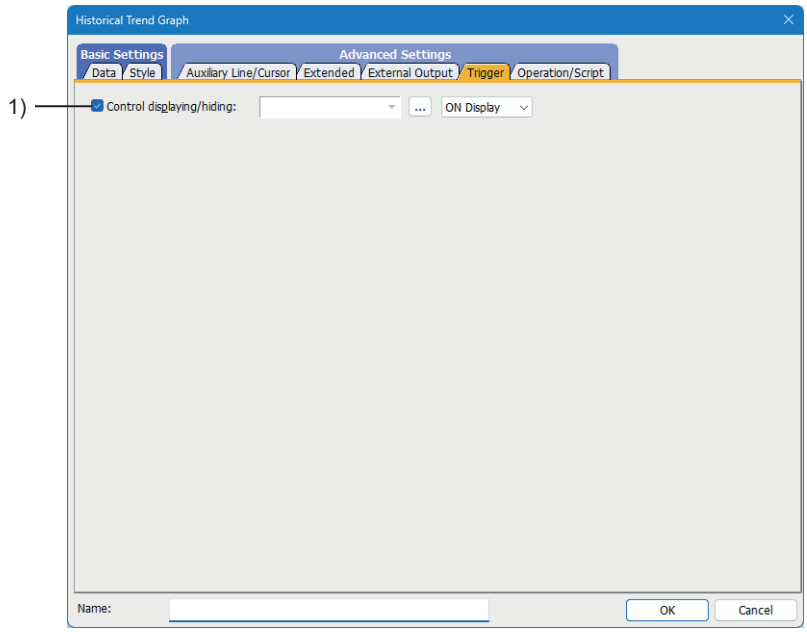


Item			Description
1)	[Time Storage Device]	—	Stores each time data. The four successive devices following the device set in this item are automatically assigned to [yymm], [ddhh], [mmss], and [Day]. The time data is stored in the upper eight bits and lower eight bits of each set device. The data type of the devices is BCD. Using the GOT internal device is recommended for this setting. For information on how to display the time data stored in the device in the numerical display, refer to the following. ☞ Page 1705 Storing time data in devices
		[Cursor Position Time]	Set this item to store the time of the cursor display position. After selecting this item, set the device.
		[Beginning Position Time]	Set this item to store the time at the beginning position of the graph. After selecting this item, set the device.
		[End Position Time]	Set this item to store the time at the end position of the graph. After selecting this item, set the device.
		[Always update beginning position time/end position time]	Select this item to constantly store the latest value in the Time device (beginning position time and end position time). New data obtained at specified time is stored every graph refresh.

46.4.6 [Trigger] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.



Item		Description
1)	[Control displaying/hiding]	Set the control device to display or hide all the objects including the shape frame. When the set device is in either the ON or OFF status, select whether or not to display the object. The following shows selectable items. • [ON Display] • [OFF Display] ☞ Page 834 How to set devices, labels, and tags

PART 7

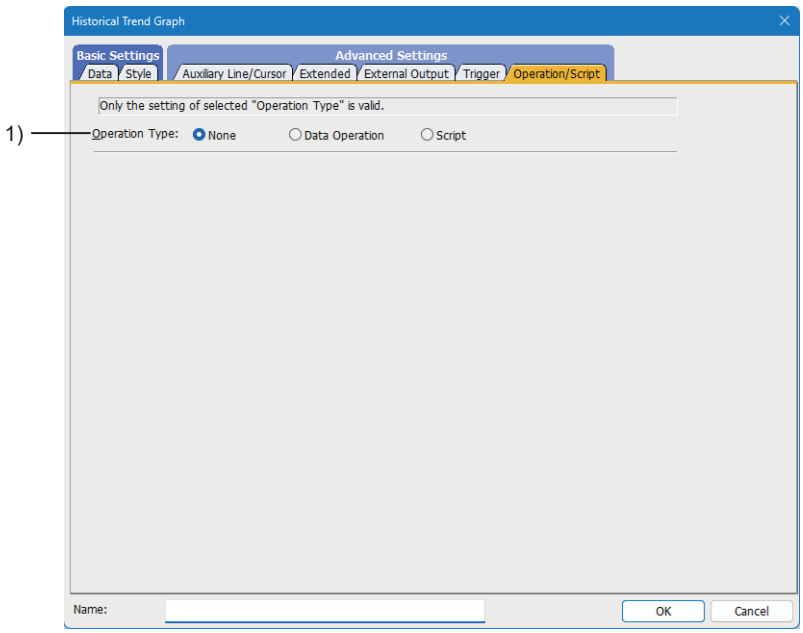
46.4.7 [Operation/Script] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set an expression for monitoring using the data operation function or the script function.

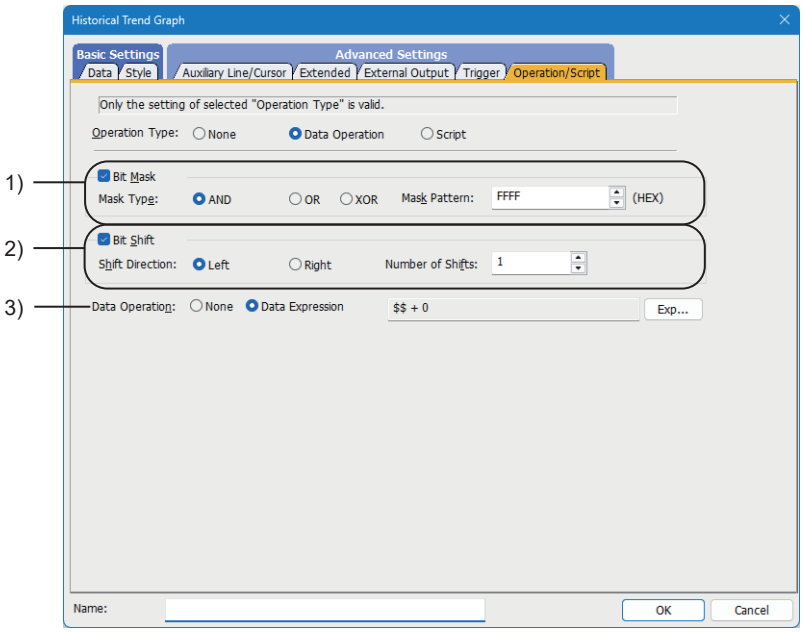


Item		Description
1)	[Operation Type]	To use the data operation or script, select an operation type. The following shows selectable items. • [None] Select this item if the data operation and script are unnecessary. • [Data Operation] Set the expression used for the data operation. ☞ Page 1727 [Data Operation] • [Script] Set the expressions for the script function. ☞ Page 1728 [Script]

[Data Operation]

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation

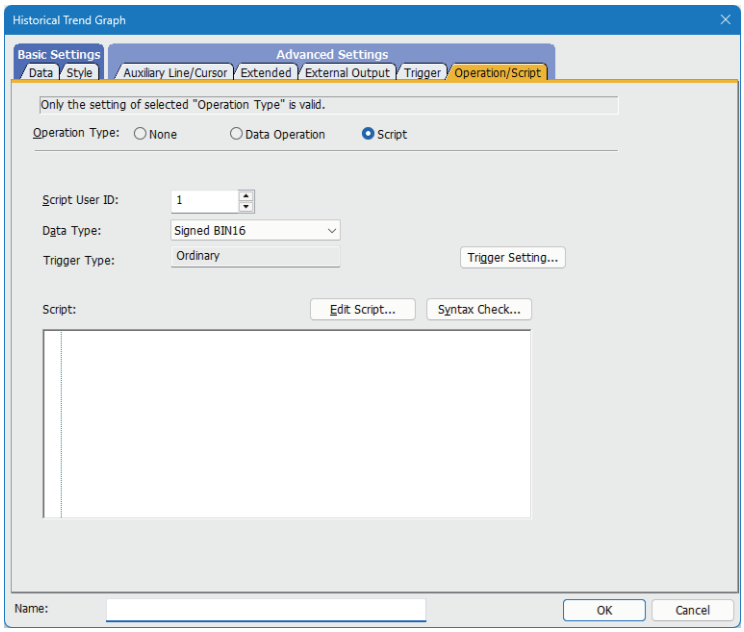


Item			Description
1)	[Bit Mask]	[Mask Type]	Set the operation of mask processing. Select the type of mask processing. • [AND] Logical AND • [OR] Logical OR • [XOR] Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
2)	[Bit Shift]	[Shift Direction]	Set the operation of shift processing. Select a shifting direction. • [Left] Shifts to the left. • [Right] Shifts to the right.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range differs depending on the setting of [Data Type] in the [Data] tab.
3)	[Data Operation]		Set the format of the expression. The following shows selectable items. • [None] Does not perform the data operation by using the expression. • [Data Expression] Performs the data operation by using the expression. The [Data Type] setting in the [Historical Trend Graph] dialog determines the data type of the device specified in the expression.

[Script]

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property

47 Placing a graphical meter

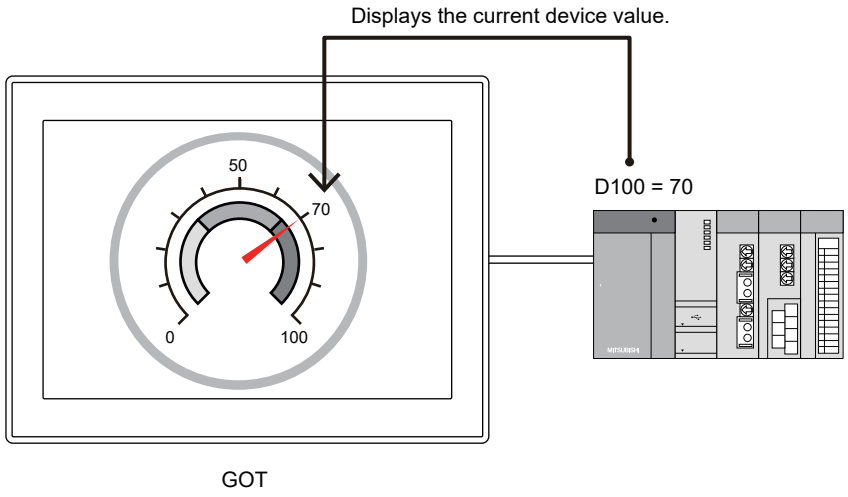
☞ Page 1731 Overview of the graphical meter
☞ Page 1732 How to use the graphical meter
☞ Page 1734 Specifications of the graphical meter
☞ Page 1737 Setting the graphical meter
☞ Page 1739 Editing the areas of the graphical meter
☞ Page 1742 [Graphical Meter] dialog

47.1 Overview of the graphical meter

GT37 SoftGOT3000

The graphical meter is an object used to indicate the current value of the device on the surface simulating a meter.
The current value of the device is visualized as to where it is positioned within the range.
The function is similar to that of the panel meter, but the graphical meter is supplied with many designs (presets) combined with the background shapes.
Selecting one from the preset list can create a visually appealing meter easily without complicated settings.
The design is customizable by editing each setting of the preset.

Ex.
Graphical meter with the device value 0 to 100
When the graphical meter monitors the device [D100]
The graphical meter displays the value [70] of the PLC device [D100].



PART 7

47.2 How to use the graphical meter

☞ Page 1732 Data to be represented by the graphical meter
☞ Page 1733 Warning by color

47.2.1 Data to be represented by the graphical meter

For a graphical meter, you will set the lower and upper limits of the device value and those of the scale value range separately. Doing so enables the following two uses.

☞ Page 1732 Indicating the device value
☞ Page 1732 Indicating the percentage against the total

Indicating the device value

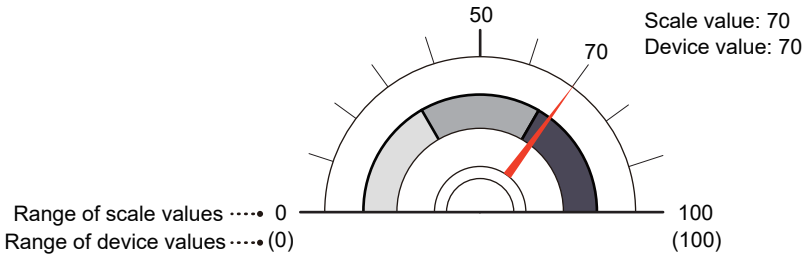
When the lower and upper limits of the device value and those of the scale value range are matched, the graphical meter indicates the device value.

Ex.

Range of the device value: 0 to 100

Range of the scale value: 0 to 100

The value indicated by the graphical meter is the device value.



Indicating the percentage against the total

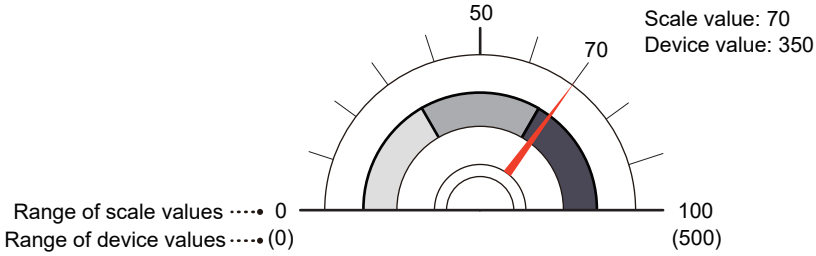
If the device value range and the scale value range are different, the graphical meter indicates the position relative to the lower and upper limits of the device value.

Ex.

Range of the device value: 0 to 500

Range of the scale value: 0 to 100

When the device value is [350], the graphical meter indicates scale value [70].



Point

The following setting items are related to the above.

- [Lower Limit] and [Upper Limit] in the [Device/Style] tab

☞ Page 1742 [Device/Style] tab

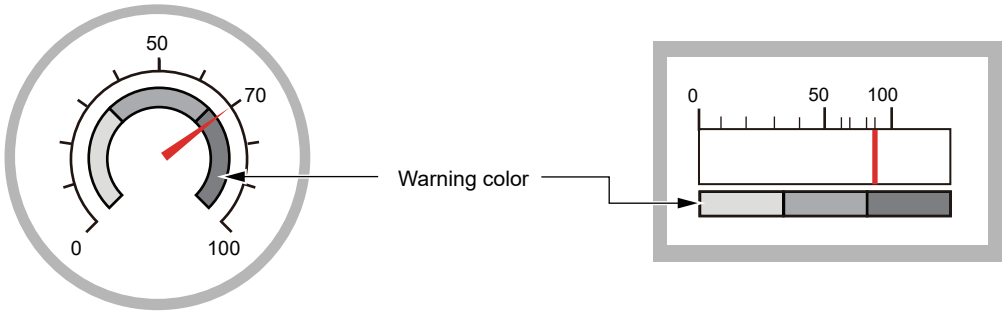
- [Lower Limit] and [Upper Limit] in the [Scale] tab

☞ Page 1749 [Scale] tab

47.2.2 Warning by color

Alert the operator by displaying warning colors on the graphical meter.

Warning colors can be displayed in up to three parts by specification of device values or percentages against the total.



For the warning color settings, refer to the following.

☞ Page 1752 [Extended Style] tab

PART 7

47.3 Specifications of the graphical meter

GT37 SoftGOT3000

☞ Page 1734 Maximum number of objects that can be placed on one screen
☞ Page 1734 Graphical meter shape
☞ Page 1734 Graphical meter size
☞ Page 1734 Display when the lower or upper limit is exceeded
☞ Page 1735 Graphical meter configuration areas
☞ Page 1736 Drawing order of the area
☞ Page 1736 Shape frame width and axis size

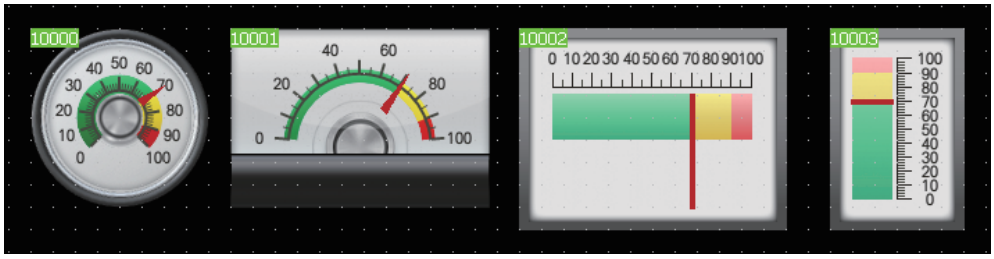
47.3.1 Maximum number of objects that can be placed on one screen

Up to 32 graphical meter objects can be placed on one screen.

47.3.2 Graphical meter shape

The graphical meter is represented by a sector, semicircle, or bar (rectangle) as shown below.

Some shapes are preset, but you can also set a sector with an intended angle by specifying the start and end angles.



47.3.3 Graphical meter size

The following shows the minimum and maximum sizes of the graphical meter.

Size		Size (dot)
Minimum	Sector, circle	7 (width) × 7 (height)
	Bar	4 (width) × 4 (height)
Maximum		3000 × 3000

47.3.4 Display when the lower or upper limit is exceeded

If the monitored device value equals to or below the lower limit, the lower limit is indicated.

If the monitored device value equals to or above the upper limit, the upper limit is indicated.

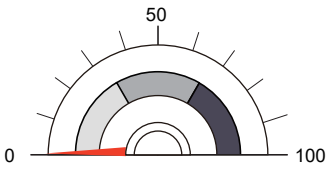
Ex.

Graphical meter with the lower limit [0] and higher limit [100]

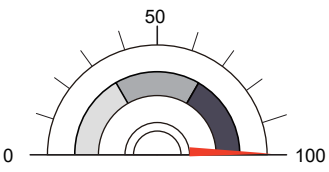
When the device value is [-50], the lower limit [0] is indicated.

When the device value is [180], the upper limit [100] is indicated.

When the value is equal to or below the lower limit



When the value is equal to or above the upper limit



47.3.5 Graphical meter configuration areas

The graphical meter consists of multiple areas as shown below.

Area	Sector, circle	Bar
Shape frame area	An area for displaying the background shape (image) for the graphical meter. The scale area, data area, and warning color area always fit within the shape frame display area.	
		Scale area	An area where a scale and scale values are displayed. The starting and ending edges of the scale area are determined by the angle, data width, and data height of the data area.	
		Data area	An area where a meter, needle, and fill are displayed. An upper limit and a lower limit are specified for the meter, and the device value is indicated by the needle and fill.	
	An area where a needle is displayed. The size is determined by the angle of the data area and the length (radius) of the needle. 	An area where a needle and fill are displayed. The data width and data height determine the size. Warning color area	An area where warning colors are displayed. The starting and ending edges of the warning color area are determined by the angle, data width, and data height of the data area.	
		
The position and size of the area can be edited by dragging it on the screen editor.

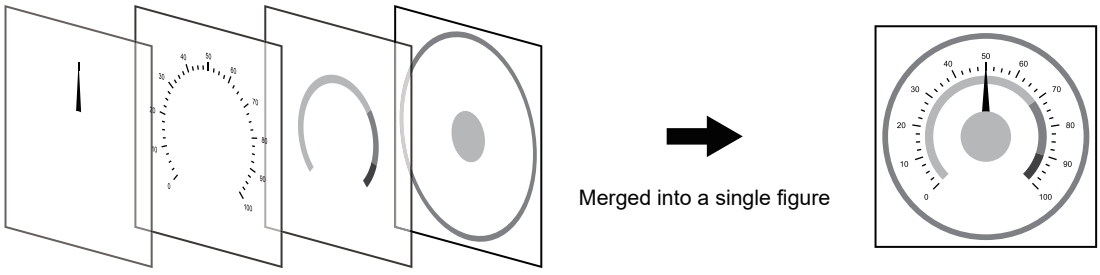
For details, refer to the following.

☞ Page 1739 Editing the areas of the graphical meter

PART 7

47.3.6 Drawing order of the area

The following shows the drawing order of each area on the screen editor.



Data (needle, fill) | Scale marks | Warning color | Shape frame

47.3.7 Shape frame width and axis size

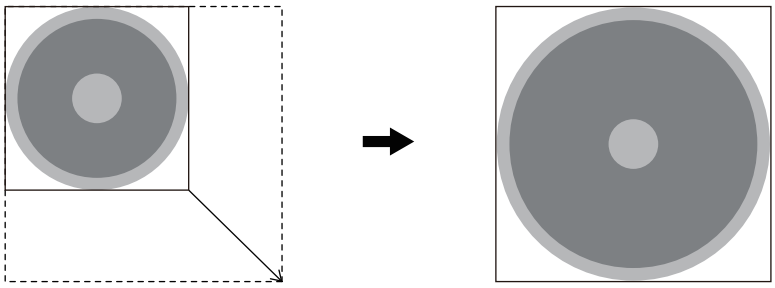
The width of the frame around the shape frame area and the axis size of the circle (for a sector or circle) can be specified.

Frame, axis
Shape frame area

When the frame width and axis size are specified, the shape can be scaled in the specified frame width and axis size when the object is resized.

For details, refer to the following.

☞ Page 1738 Resizing the graphical meter



47.4 Setting the graphical meter

GT37 SoftGOT3000

Use the following procedure to place a graphical meter and configure the operation settings.

Operating procedure

1. Select [Object] → [Graphical Meter] (intended shape) from the menu and click the intended position to place the object.

☞ Page 1001 Placing figures and objects

The shape of the placed meter can be changed.

☞ Page 1742 [Device/Style] tab

2. Double-click the graphical meter to display the [Graphical Meter] dialog.
3. Configure the operation settings in each tab in the [Graphical Meter] dialog.

☞ Page 1742 [Graphical Meter] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 995 Basics of figures and objects

PART 7

47.5 Resizing the graphical meter

The combination of the meter shape and graphic shape determines the behavior when the graphical meter is resized.
The graphic shape will be set by [Shape] in the [Scaling Setting] dialog.
For details, refer to the following.
☞ Page 1755 [Scaling Setting] dialog

<table>
<tr><th rowspan="2">[Shape]</th><th colspan="2">[Meter Shape]</th></tr>
<tr><th>[Sector], [Semicircle]</th><th>[Bar (Vertical)], [Bar (Horizontal)]</th></tr>
<tr><td>[Circle]</td><td>The graphical meter is resized while maintaining a perfect circle.
The following values are unchanged even when the meter is resized.
• A: Frame width
• B: Widths of the scale area and warning color area
• C: Axis radius

Frame, axis
Scale area, warning color area
  </td><td>—</td></tr>
<tr><td>[Square]</td><td>The graphical meter is resized while maintaining a perfect circle.
The following values are unchanged even when the meter is resized.
• A: Frame width
• B: Widths of the scale area and warning color area

</table>

47.6 Editing the areas of the graphical meter

You can move or resize each area of the graphical meter on the screen editor without opening the setting dialog.

Operating procedure

1. Click the graphical meter.

The rectangle handles and auxiliary lines are displayed for the warning color area and scale area, and the rhombus handles and auxiliary lines are displayed for the data area.

2. Drag a handle to edit the area.

The following edits are available.

- Moving the scale area or warning color area
- Changing the angle of the data area (for sectors and semi-circles)
- Resizing the data area (data width, data height) (for bars)

The editing operation depends on the combination of the meter shape and graphic shape.

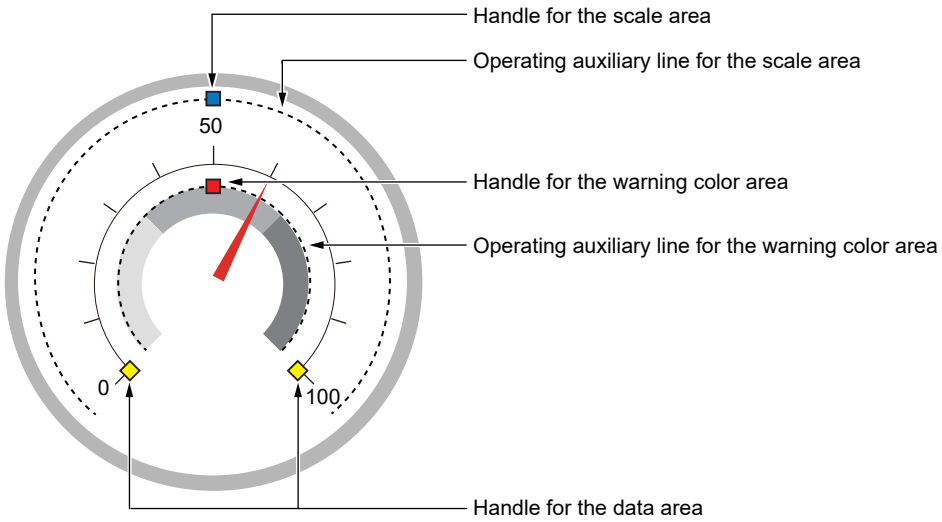
The graphic shape will be set by [Shape] in the [Scaling Setting] dialog.

For details, refer to the following.

☞ Page 1755 [Scaling Setting] dialog

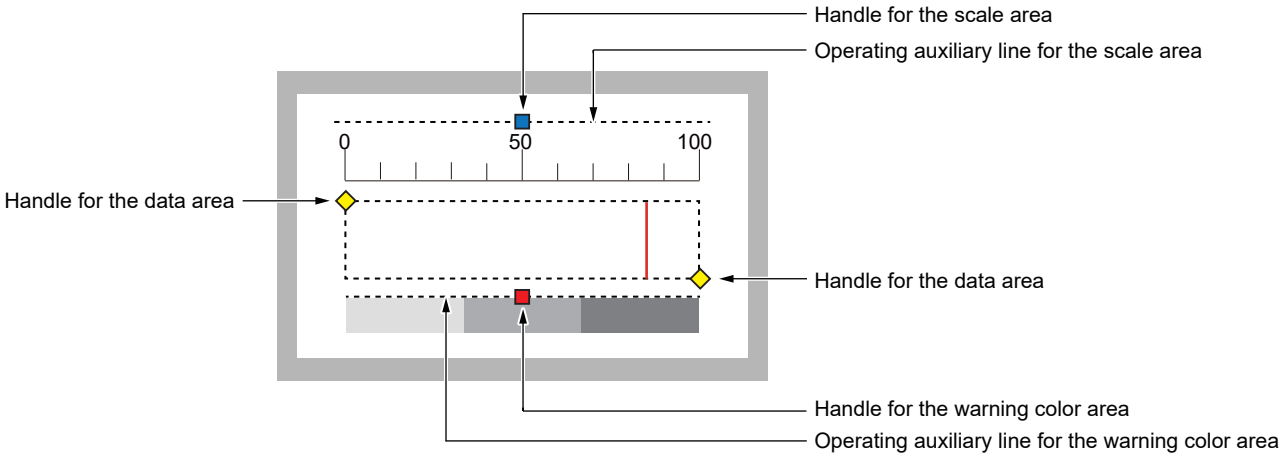
Ex.

Handles and operating auxiliary lines displayed for the areas of a sector meter



Ex.

Handles and operating auxiliary lines displayed for the areas of a bar meter



[Shape]	[Meter Shape]

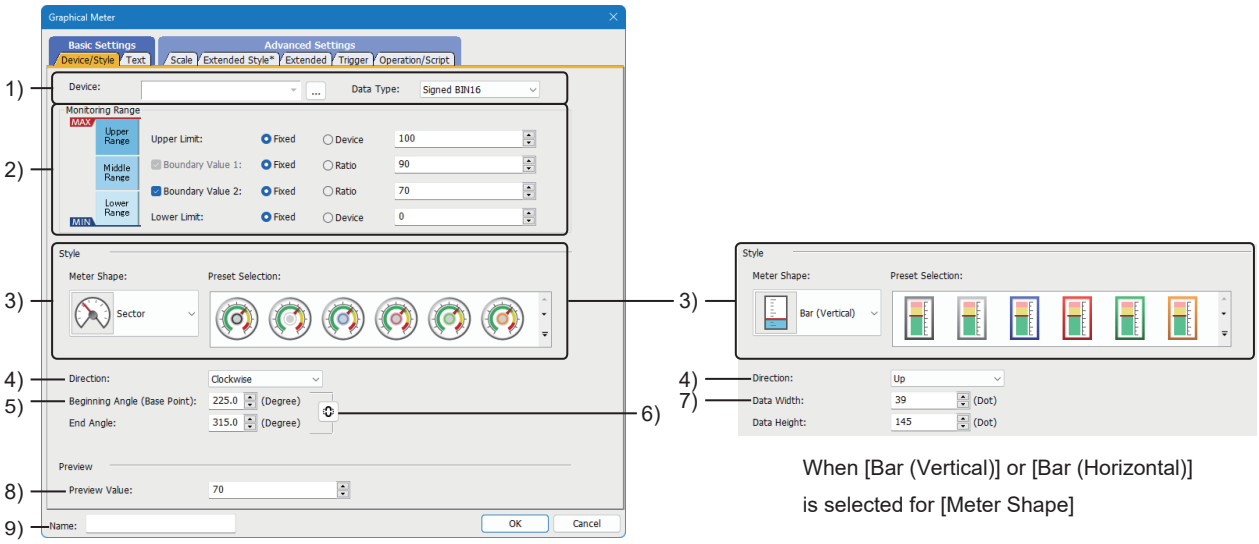
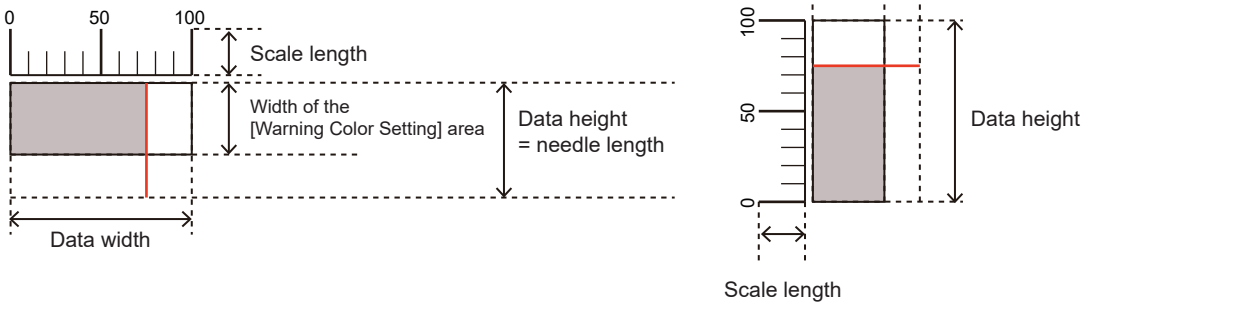
☞ Page 1756 [Extended] tab
☞ Page 1757 [Trigger] tab
☞ Page 1758 [Operation/Script] tab

47.7.1 [Device/Style] tab

Configure the display settings including the monitored device and its data type, upper and lower limits of the device, shape and size of the graphical meter.



When [Bar (Vertical)] or [Bar (Horizontal)] is selected for [Meter Shape]



Item			Description
1)	[Device]		Set a word device to be monitored. ☞ Page 834 How to set devices, labels, and tags
	[Data Type]		Select the data type of the device.
2)	[Monitoring Range]	[Upper Limit] [Lower Limit]	Specify the range of the device value (lower and upper limits). Specify fixed values or devices. Devices can be used to change the values dynamically. ☞ Page 834 How to set devices, labels, and tags The setting ranges for [Lower Limit] and [Upper Limit] differ depending on the item selected for [Data Type].
		[Boundary Value 1] [Boundary Value 2]	Select these items to divide and color-code the data area of the graphical meter or display the warning color area. When selecting them, specify the boundary line display position with a fixed value or a percentage (%). When [Boundary Value 1] is selected, the area is divided into two; if [Boundary Value 2] is selected, the area is divided into three, and color-coded. For color-coding of the data area and display setting of the warning color area, refer to the following. ☞ Page 1752 [Extended Style] tab
3)	[Meter Shape]		Select a graphical meter shape.
	[Preset Selection]		Select a graphical meter design. Click the pull-down menu button to display all designs. Pull-down menu button
4)	[Direction]		Select the direction in which the value increases.
5)	[Beginning Angle (Base Point)] [End Angle]		When [Sector] or [Semicircle] is selected for [Meter Shape], selecting a design from [Preset Selection] automatically sets [Beginning Angle] and [End Angle]. To change the angle, enter a value for [Beginning Angle] or [End Angle]. With the [Direction] setting determining 0 degrees at the 3 o'clock position for clockwise and at the 9 o'clock position for counterclockwise, set the start and end angles in 0.1-degree increments. The setting range is [0.0] degrees to [359.9] degrees. 6)	[Fix central angle] button		Set this item when selecting [Sector] or [Semicircle] for [Meter Shape]. Link [Beginning Angle (Base Point)] and [End Angle] to maintain the center angle when this setting is enabled.
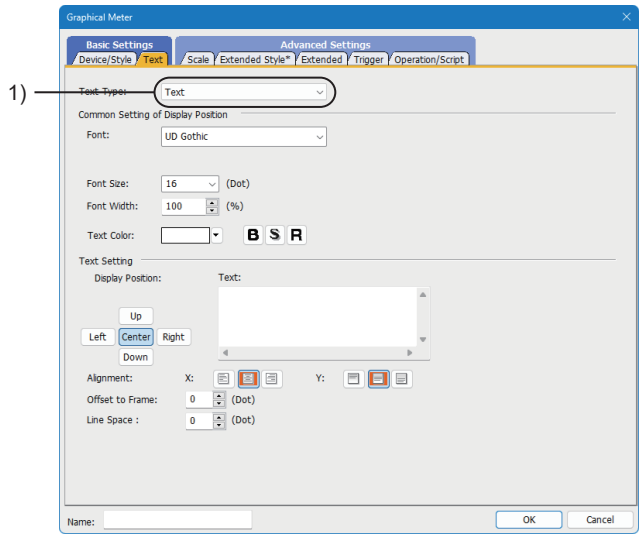
7)	[Data Width] [Data Height]		When [Sector] is selected for [Meter Shape], selecting a design from [Preset Selection] automatically sets the [Data Width] and [Data Height] according to the current object size. To change the size, enter numeric values in the [Data Width] and [Data Height] fields. When [Bar (Vertical)] is selected for [Meter Shape], the value set for [Data Width] is also set for [Needle Length] in the [Extended Style] tab. When [Bar (Horizontal)] is selected for [Meter Shape], the value set for [Data Height] is also set for [Needle Length] in the [Extended Style] tab.
8)	[Preview Value]		Set the value to be displayed on the screen editor. When selecting [Device] for [Upper Limit] or [Lower Limit], specify the value with a percentage (%).
9)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be entered.

47.7.2 [Text] tab

For mobile screens, some setting items are not available.

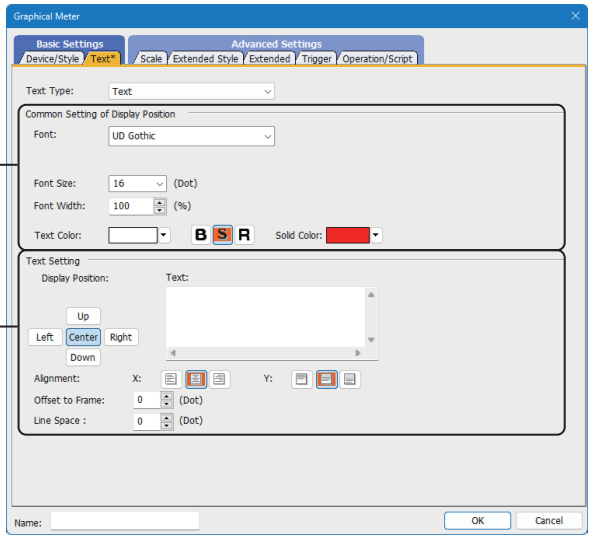
Set the text to be displayed on the graphical meter.

The displayed text can be set by direct input or by specification from the registered comments.



Item			Description
1)	[Text Type]	[Text]	Directly enter the text to be displayed. The text can be displayed in five positions (top, bottom, left, right, and center) on the graphical meter.  For the setting method, refer to the following. ☞ Page 1745 [Text] If characters have already been entered in the [Text] field, switching the text type from [Text] to [Comment] enables you to register the entered characters in a comment group. For instruction on registering a comment group, refer to the following. ☞ Page 811 Registering the characters in the [Text] field to a comment group
		[Comment]	Set the text to be displayed using a comment set in a comment group. Only one text can be displayed within the display area.  For the setting method, refer to the following. ☞ Page 1747 [Comment] For the comment group settings, refer to the following. ☞ Page 776 Comment setting ([Comment])

[Text]



Item			Description
1)	[Common Settings of Display Position]	—	To display a text in the top, bottom, left, right, and center of the graphic meter, configure the settings common to each display position.
		[Font]	Select the text font. When a Windows font is selected, italicizing and underlining text are available.
		[Character Set]	When a Windows font is selected for [Font], select a language to be used.
		[Font Size]	Select a text size. The setting range is [8] dots to [540] dots.
		[Font Width]	The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character is always within the range of [8] dots to [540] dots.
		[Text Color]	Set the color and style of the text. Only one style ([Bold], [Solid], or [Raised]) is settable. When selecting [Solid] or [Raised], set the color of the shadow.

PART 7

Item			Description
2)	[Display Position]	—	Set [Text], [Alignment], [Offset to Frame], and [Line Space] for each display position. After selecting a display position of the text for [Display Position], set the following items.
		[Text]	Enter the text to be displayed. Up to 1024 characters can be set. Use the Enter key to insert a line feed. A line feed is counted as two characters.
		[Alignment]	Set the alignment position of the text. 		[Offset to Frame]	This setting is invalid when [Center] is selected for [Display Position]. Set the space between the object frame and the text. The setting range is [0] dots to [100] dots. 		[Line Space]	Set the space between lines. The setting range is [0] dots to [128] dots.

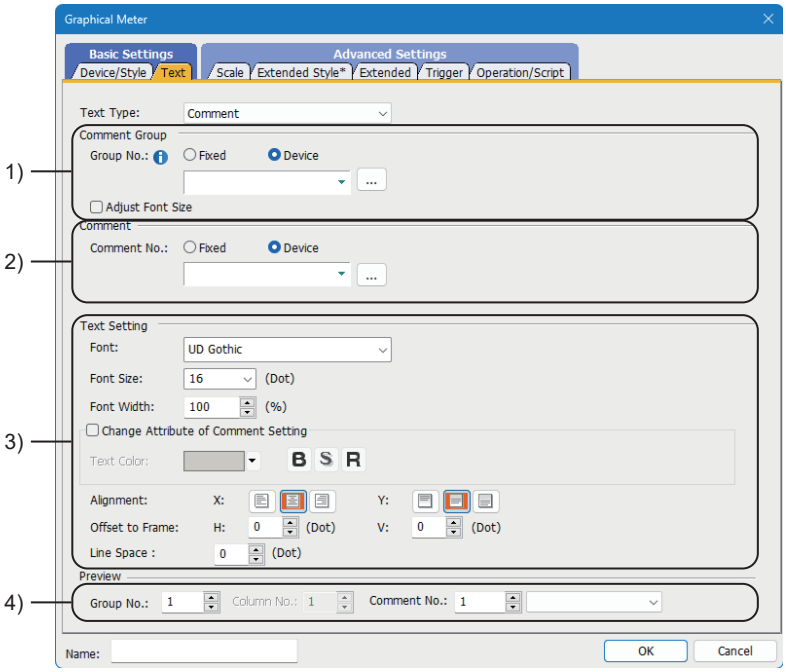
[Comment]



Item			Description
1)	[Group No.]	—	Set the group number of the comment group to be used.
		[Fixed]	Select this item to use the specified comment group. After selecting this item, directly enter the comment group No. to be used.
		[Device]	Select this item to display the comment group number corresponding to the value of the device to be set. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags
	[Adjust Font Size]		Adjusts the font size automatically according to the object size. When this item is deselected, a line feed is automatically inserted.
	[Minimum Font Size]		Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.
2)	[Comment No.]	—	Set the comment number of the comment to be used.
		[Fixed]	Select this item to use the specified comment. After selecting this item, directly enter the comment No. to be used. If [0] is specified, no comment is displayed. To edit the comment to be displayed, click the [Edit] button to display the [Edit Comment] dialog. ☞ Page 153 [Edit Comment] dialog
		[Device]	Select this item to display the comment No. corresponding to the value of the device to be set. Select this item and set the device.

Item			Description
3)	[Font]		Select the font for the text to be displayed. ☞ Page 74 Specifications of displayable characters [Windows Font] is selectable when [Group No.] is set to [Fixed]. Displays text in the font specified with [Windows Font] in the [Comment Group Property] dialog.
	[Windows Font Setting] button		This item appears when [Windows Font] is selected for [Font]. The [Comment Group Property] dialog for the group number specified by [Group No.] is displayed. Set [Windows Font] and [Character Set] for the target column of the comment group. ☞ Page 797 [Comment Group Property] dialog
	[Font Size]		Set a vertical text size. The setting range is [8] dots to [540] dots.
	[Font Width]		Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character is always within the range of [8] dots to [540] dots.
	[Change Attribute of Comment Setting]	—	Select this item to set the color and style of the text to be displayed on the object without using the attribute set in the [Comment List] window. When selecting this item, configure the following settings.
		[Text Color]	Set the color and style of the text. Only one style ([Bold], [Solid], or [Raised]) is settable. When selecting [Solid] or [Raised], set the color of the shadow.
	[Alignment]		Select the horizontal position (left-aligned, centered, or right-aligned) and vertical position (top-aligned, centered, or bottom-aligned) of the text.
	[Offset to Frame]		This setting is invalid when the center alignment is selected for [Alignment]. Set the space between the object frame and the text. The setting range is [0] dots to [100] dots. 	[Line Space]		Set the space between lines. The setting range is [0] dots to [128] dots.
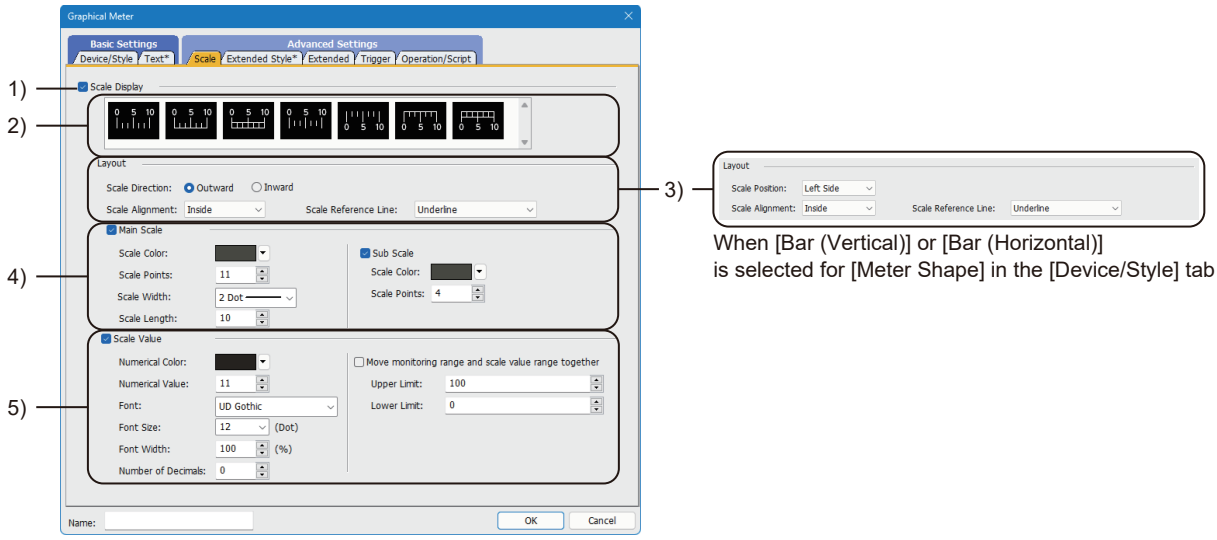
4)	[Preview]	—	Set the text to be previewed as a sample on the screen editor.
		[Group No.]	Set this item when selecting [Device] for [Group No.]. Set the group number of the comment. When [Fixed] is selected for [Group No.] of [Comment Group], the group number is fixed to the value set in [Comment Group].
		[Column No.]	Set the comment column number.
		[Comment No.]	Set this item when selecting [Device] for [Comment No.]. Set the comment number. When [Fixed] is selected for [Comment No.] in [Comment], the comment number is fixed to the value set in [Comment].

47.7.3 [Scale] tab

Configure the display settings for scale marks and scale values.



The scale marks are either main scale marks or subscale marks.

The main scale marks are placed at the start and end points, and between these points according to the number you set.

The subscale marks are displayed between main scale marks.

The number of displayed subscale marks is also settable.

A scale reference line can be drawn to help reading of the main and subscale marks.

Ex.

Number of main scale marks: 6

Number of subscale marks: 3

Main scale mark

Subscale mark

Item		Description
1)	[Scale Display]	Select this item to display the scale marks.
2)	Scale design	Select a scale design. According to the selected design, [Scale Direction]/[Scale Position], [Scale Alignment] and [Scale Reference Line] are automatically set.

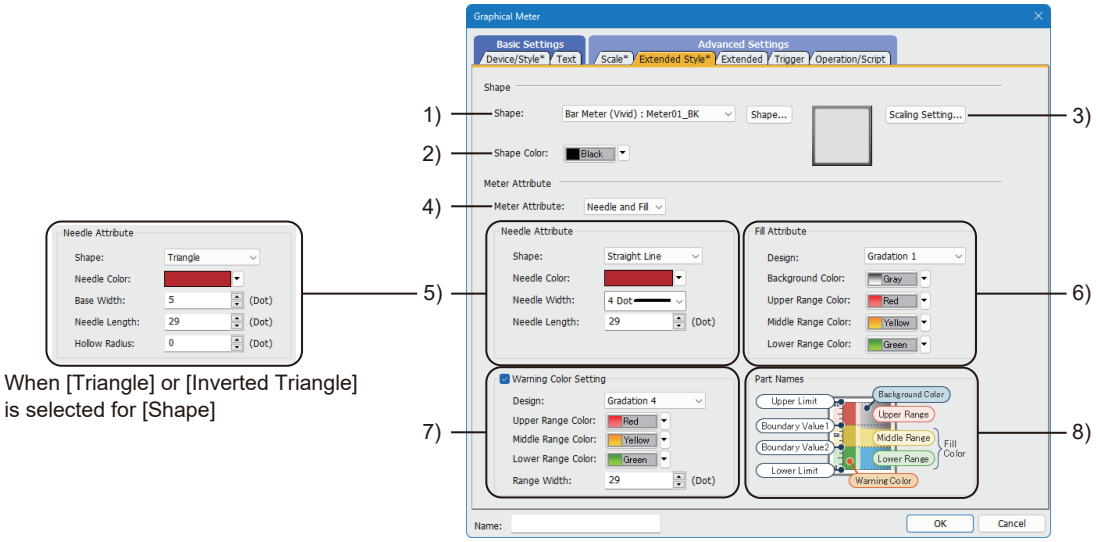
PART 7

Item			Description
3)	[Scale Direction]		Set this item when selecting [Sector] or [Semicircle] for [Meter Shape] in the [Device/Style] tab. The setting of the scale direction will not change the position and size of the scale area. Scale area [Outward] [Inward]
	[Scale Position]		When selecting [Bar (Vertical)] or [Bar (Horizontal)] for [Meter Shape] in the [Device/Style] tab, set the position of the scale marks. The selectable items vary with the selection for [Meter Shape] in the [Device/Style] tab. • When [Bar (Vertical)] is selected for [Meter Shape] [Left Side] [Right Side] • When [Bar (Horizontal)] is selected for [Meter Shape] [Upside] [Downside]
	[Scale Alignment]		Set the alignment of the main and subscale marks. [Inside] [Outside] [Center]
	[Scale Reference Line]		Set the reference line for the scale marks. When [Main Scale] is deselected, the reference line is not displayed. The selectable items vary with the selection for [Scale Alignment]. • When [Inside] or [Outside] is selected for [Scale Alignment] [None] [Underline] [Underline + Center Line] • When [Center] is selected for [Scale Alignment] [Center Line]
4)	[Main Scale]	—	Select this item to display the scale marks. When selecting this item, configure the following settings.
		[Scale Color]	Set the color of main scale marks. ☞ Page 988 Color settings
		[Scale Points]	Set the number of main scale marks. The setting range is [2] to [101].
		[Scale Width]	Select the width of main scale marks.
		[Scale Length]	Set the length of main scale marks. When [Circle] or [Square] is selected for [Shape] in the [Scaling Setting] dialog, the object is resized according to the specified length of the scale marks.
	[Sub Scale]	—	Select this item to display the subscale marks. The width and length of the subscale marks are halves of the values set for [Scale Width] and [Scale Length].
		[Scale Color]	Select the color of subscale marks. ☞ Page 988 Color settings
		[Scale Points]	Specify the number of subscale marks. The setting range is [1] to [9].

Item			Description
5)	[Scale Value]	—	Select this item to display numerical values on the scale. When selecting this item, configure the following settings.
		[Numerical Color]	Set the color of the scale values. ☞ Page 988 Color settings
		[Numerical Value]	Set the number of scale values to be displayed. The setting range is [2] to [101].
		[Font]	Select a font for the scale values.
		[Font Size]	Set the vertical size of the scale values. The setting range is [8] dots to [540] dots.
		[Font Width]	Set the horizontal size of the scale values. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character is always within the range of [8] dots to [540] dots.
		[Number of Decimals]	Set the number of decimal places of a scale value. The setting range is [0] to [6].
	[Move monitoring range and scale value range together]	—	This item is settable when [Fixed] is selected for [Upper Limit] and [Lower Limit] in the [Device/Style] tab. The upper and lower limits of the scale value range are identical to the values of [Upper Limit] and [Lower Limit] set in the [Device/Style] tab. When you change the set values of [Upper Limit] and [Lower Limit] in the [Device/Style] tab, the upper and lower limits of the scale value range are changed accordingly.
		[Lower Limit] [Upper Limit]	Set the upper and lower limits of the scale value range. These items are not settable when [Move monitoring range and scale value range together] is selected. The setting range depends on the selection for [Data Type] in the [Device/Style] tab.

47.7.4 [Extended Style] tab

Set the background shape, behaviors when resized, sizes, display colors for the data area and warning color area, and other items.



When [Triangle] or [Inverted Triangle] is selected for [Shape]

Item		Description
1)	[Shape]	Set the shape placed behind the graphical meter. Only the shapes in the library are selectable. Click the [Shape] button to select shapes other than those in the list box. ☞ Page 1044 Object shape
2)	[Shape Color]	Select the shape color.
3)	[Scaling Setting] button	Specify the frame line and axis sizes in the [Scaling Setting] dialog that appears when this item is clicked. ☞ Page 1755 [Scaling Setting] dialog
4)	[Meter Attribute]	Select the method of indicating the device value. The setting is fixed to [Needle] when [Sector] or [Semicircle] is selected for [Meter Shape] in the [Device/Style] tab. [Needle] [Fill] [Needle and Fill]

Item			Description
5)	[Needle Attribute]	[Shape]	When selecting [Needle] or [Needle and Fill] for [Meter Attribute], set the needle shape. [Straight Line] [Triangle] [Inverted Triangle] 		[Needle Color]	When selecting [Needle] or [Needle and Fill] for [Meter Attribute], set the needle color. ☞ Page 988 Color settings
		[Needle Width]	When selecting [Straight Line] for [Shape], set the needle width.
		[Base Width]	When selecting [Triangle] or [Inverted Triangle] for [Shape], set the base width of the triangle. The setting range is [3] (dots) to the set value of [Needle Length] (dots). Specify an odd number value. When [Base Width] is set to [3] dots When [Base Width] is set to [15] dots
		[Needle Length]	When selecting [Needle] or [Needle and Fill] for [Meter Attribute], set the needle length. When [Bar (Vertical)] is selected for [Meter Shape], the value of this item is applied to [Data Width] in the [Device/Style] tab. When [Bar (Horizontal)] is selected for [Meter Shape], the value of this item is applied to [Data Height] in the [Device/Style] tab. When [Circle] or [Square] is selected for [Shape] in the [Scaling Setting] dialog, the object is resized according to the specified length of the needle. The setting range differs depending on [Meter Shape]. • [Circle]: [3] dots to [1499] dots • Other than [Circle]: [3] dots to [2999] dots
		[Hollow Radius]	When selecting [Sector] or [Semicircle] for [Meter Shape] in the [Device/Style] tab, set the drawing start position of the needle from the meter center. The setting range is [0] (dots) to "[Needle Length] - 2" (dots). When [Hollow Radius] is set to [0] dots When [Hollow Radius] is set to [10] dots

Item			Description
6)	[Fill Attribute]	—	When selecting [Fill] or [Needle and Fill] for [Meter Attribute], set colors for the data area. The area from the lower limit to the device value is filled, and the other area is displayed with the background color. 		[Design]	Select a design for the display color.
		[Background Color]	Select a background color.
		[Upper Range Color] [Middle Range Color] [Lower Range Color]	Set a color that displays the area from the lower limit to the device value. The setting items vary by the setting for [Monitoring Range] in the [Device/Style] tab. • When not setting a boundary value: Set [Middle Range Color]. • When setting [Boundary Value 1]: Set [Upper Range Color] and [Middle Range Color]. • When setting [Boundary Value 2]: Set [Upper Range Color], [Middle Range Color], and [Lower Range Color]. 7)	[Warning Color Setting]	—	Select this item to display the warning color area, and set the following items.
		[Design]	Select a warning color design.
		[Upper Range Color] [Middle Range Color] [Lower Range Color]	Set a color for the warning color area. The setting items vary by the setting for [Monitoring Range] in the [Device/Style] tab. • When not setting a boundary value: Set [Middle Range Color]. • When setting [Boundary Value 1]: Set [Upper Range Color] and [Middle Range Color]. • When setting [Boundary Value 2]: Set [Upper Range Color], [Middle Range Color], and [Lower Range Color]. 		[Range Width]	Set the width of the warning color area. When [Circle] or [Square] is selected for [Shape] in the [Scaling Setting] dialog, the object is resized according to the specified width of the warning color area.
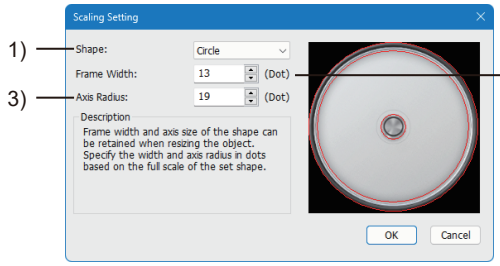
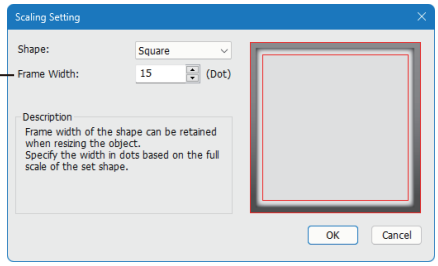
8)	[Part Names]		Displays the names of each part of the configured meter shape.

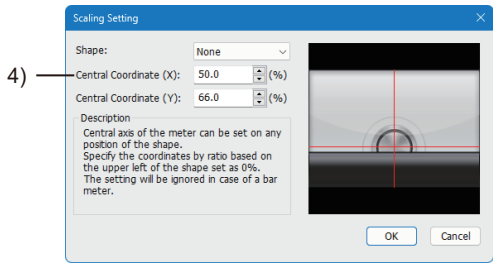
[Scaling Setting] dialog



When [Circle] is selected for [Shape]



When [Square] is selected for [Shape]



When [None] is selected for [Shape]

Item		Description
1)	[Shape]	Select the shape outline. When [Bar (Vertical)] or [Bar (Horizontal)] is selected for [Meter Shape], [Circle] cannot be selected. The shape of the graphical meter may not appear properly if you make different selections in the following settings: [Shape] in the [Graphical Meter] dialog ([Extended Style] tab), and [Shape] in the [Scaling Setting] dialog. Check the display of the shape, and change the selection for [Shape] in the [Scaling Setting] dialog if necessary. • [Circle] When the object is resized, the frame width and the axis part size of the shape can be fixed. • [Square] When the object is resized, the frame width of the shape can be fixed. • [None] The center axis of the meter can be specified at anywhere of the shape.
2)	[Frame Width]	When selecting [Circle] or [Square] for [Shape], set the width of the frame around the frame area. The settable minimum value is [0], and the settable maximum value varies with the shape size. When [0] is set, the frame width is changed while the graphical meter is resized. When a value other than [0] is set, the value of the frame width is unchanged even if the graphical meter is resized. The upper-left coordinates of the object on the screen editor are unchanged. Frame, axis Shape frame area
3)	[Axis Radius]	When selecting [Circle] for [Shape], set the axis radius. The settable minimum value is [0], and the settable maximum value varies with the size of the shape or object. When [0] is set, the axis radius is changed while the graphical meter is resized. When a value other than [0] is set, the value of the axis radius is unchanged even if the graphical meter is resized. Frame, axis Maximum object area 4)	[Central Coordinate (X)] [Central Coordinate (Y)]	When selecting [None] for [Shape], set the center coordinates of the meter. Specify the vertical and horizontal coordinates by ratio with the upper left corner of the shape set as 0%. The setting range is [0.0]% to [100.0]%.

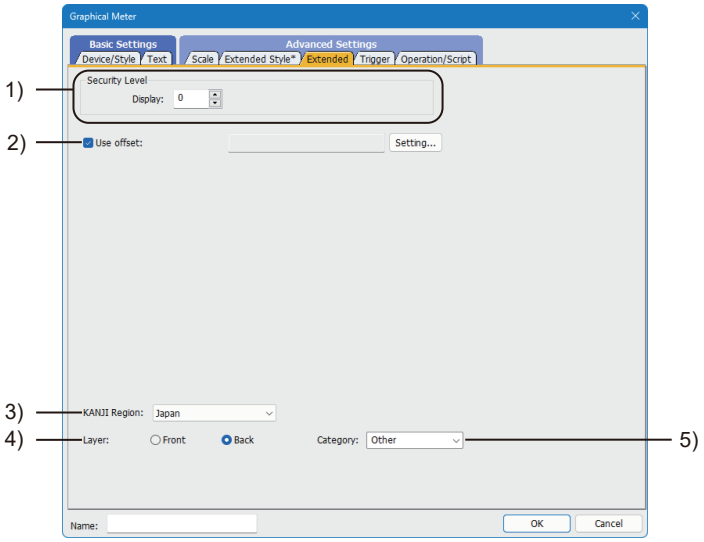
PART 7

47.7.5 [Extended] tab

For mobile screens, some setting items are not available.

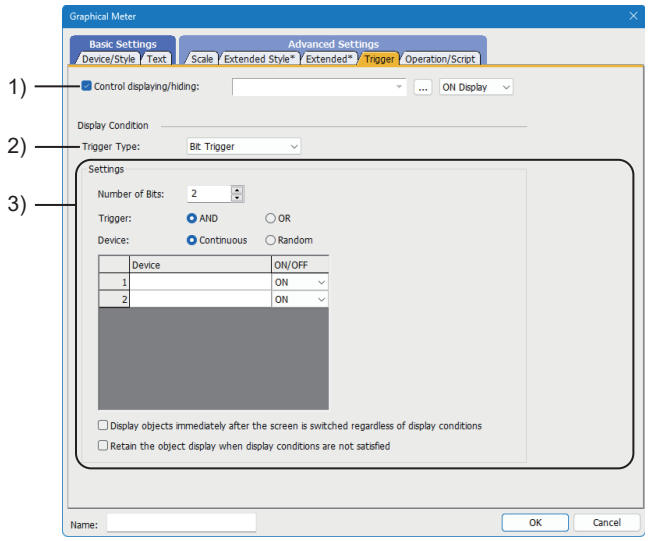
Set the security level of the object, use/nonuse of the offset function, KANJI region, layer for placing the object, and others.



Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Configure the settings to monitor the statuses of multiple devices by switching between them with a single device. After selecting this item, set the offset device. The monitored device is the one with the offset device value added to the device set in [Device] in the [Device/Style] tab. ☞ Page 963 Offset
3)	[KANJI Region]	Set the KANJI region. This item is enabled when one of the following items is selected for [Font] in the [Text] tab. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho] ☞ Page 76 KANJI region
4)	[Layer]	Select the layer to place the object. ☞ Page 65 Layer
5)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

47.7.6 [Trigger] tab

Set the trigger condition to display the object.



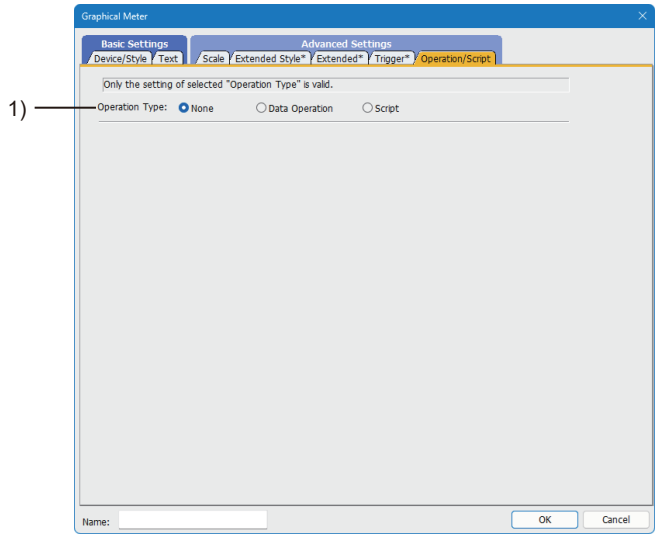
Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Control device (bit device or bit-specified word device) • When to display: When the control device is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Settings]	For the settings of each item, refer to the following. ☞ Page 972 Settings by trigger type

PART 7

47.7.7 [Operation/Script] tab

For mobile screens, some setting items are not available.

Set whether to perform an operation or a script with the device value handled by the object.

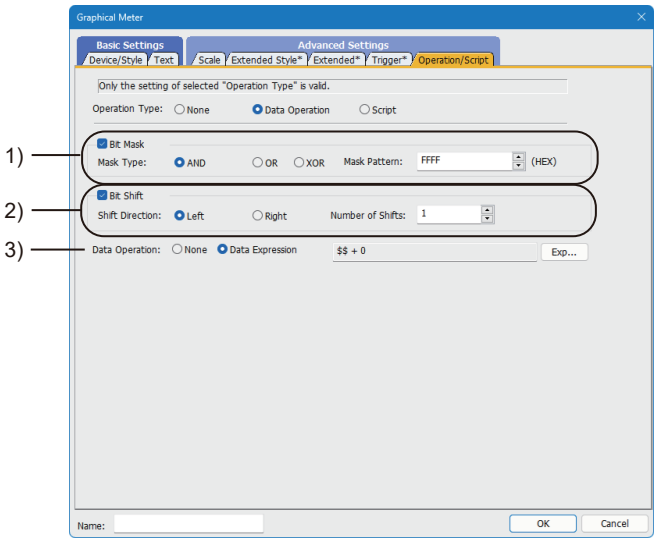


Item			Description
1)	[Operation Type]	[None]	The data operation function and the script function are not used.
		[Data Operation]	Set the expression used for the data operation function. For the setting method, refer to the following. ☞ Page 1759 [Data Operation]
		[Script]	Set the expressions for the script function. For the setting method, refer to the following. ☞ Page 1760 [Script]

[Data Operation]

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation

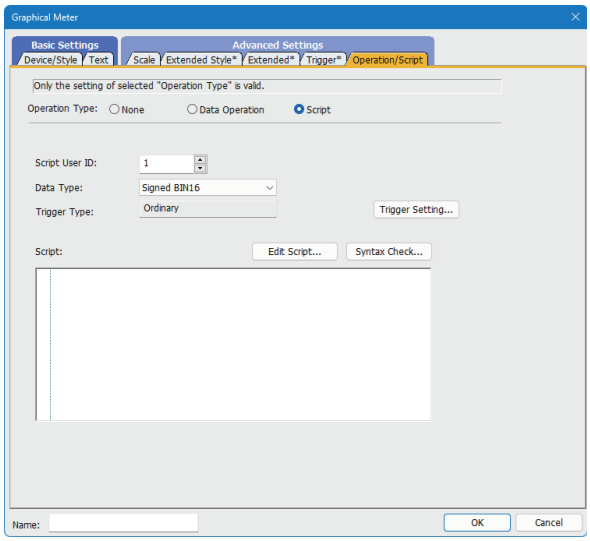


Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. The following shows selectable items. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range differs depending on the setting of [Data Type] in the [Device/Style] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range differs depending on the setting of [Data Type] in the [Device/Style] tab.
3)	[Data Operation]	—	Performs the data operation using the value stored in the monitored device. The graphical meter displays the value after the operation.
		[None]	Does not perform the data operation.
		[Data Expression]	Performs the data operation. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

[Script]

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	**Setting item**	**Property name**	**Read**	**Write**	**Timing for reflecting the setting change*1**
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Extended Style]	[Needle Color]	graph_color	○	○	When the object is updated
[Extended]	[Security Level]	security	○	○	When the screen is updated

*1 For the timing at which the setting change of an object property is reflected, refer to the following.

☞ Page 2456 Timing at which the setting change of an object property is reflected

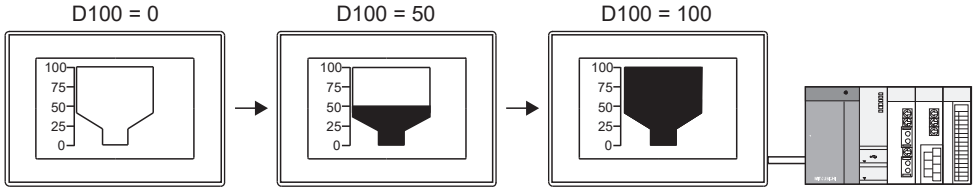
48 Placing a level object

☞ Page 1761 Overview of the level object
☞ Page 1762 Specifications of the level object
☞ Page 1763 How to use the level object
☞ Page 1771 [Level] dialog

48.1 Overview of the level object

GT37 SoftGOT3000

The level object is an object that monitors the word device value and fills the specified area with the user-selected color, based on the ratio of the device value compared to the set upper and lower limit values.
With this function, the device value can be displayed as a level in any closed figure.

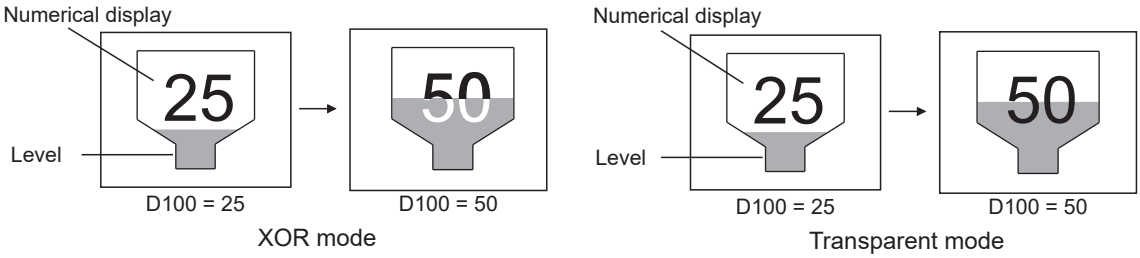


A value or comment is displayable on a level object by placing one of the following objects on the level object.

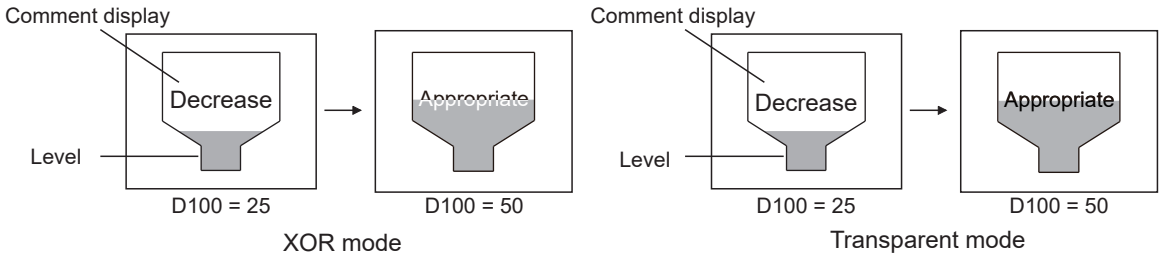
- Numerical display
- Numerical input
- Comment display

If any object mentioned above is placed under the level object on the same layer, this object still appears in front of the level object on the GOT screen.
When any object mentioned above is superimposed on a level object, the XOR mode or the transparent mode is selectable.
The XOR mode inverts the text color in the overlapping portion of the objects.
The transparent mode displays the text in the overlapping portion of the objects in the specified color.

- Example of superimposing a numerical display on a level object



- Example of superimposing a comment display on a level object



PART 7

48.2 Specifications of the level object

GT37 SoftGOT3000

The following shows the specifications of the level object.

☞ Page 1762 Maximum number of objects that can be placed on one screen
☞ Page 1762 Objects that can be superimposed on a level object

48.2.1 Maximum number of objects that can be placed on one screen

Up to 1024 objects can be placed on one screen.

Maximum number of level objects is calculated by subtracting the number of objects other than level objects from 1024.

48.2.2 Objects that can be superimposed on a level object

The following shows the objects that can be superimposed on a level object.

- Numerical display
- Numerical input
- Comment display (bit comment or word comment)

Multiple objects can be superimposed on one level object.

Regardless of the placement order, the overlapping object (numerical display, numerical input, or comment display) appears in front of the level object on the GOT screen.

48.3 How to use the level object

GT37 SoftGOT3000

The following shows how to use the level object.

☞ Page 1763 Drawing a figure in which a level is displayed
☞ Page 1764 Placing a level object
☞ Page 1765 Setting the level object
☞ Page 1767 Displaying a value or text on a level object
☞ Page 1769 Different displays depending on the display mode of the object to be superimposed

48.3.1 Drawing a figure in which a level is displayed

To display a level in a figure, draw the figure in advance.

☞ Page 1131 Figures

When drawing a figure, note the following.

☞ Page 1763 Drawing a figure on the back layer
☞ Page 1763 Setting the same color for [Line Color] of a figure and [Boundary Color] of a level
☞ Page 1764 Drawing a figure without any clearance between lines

Drawing a figure on the back layer

To display a level in a figure, use the following layer combination.

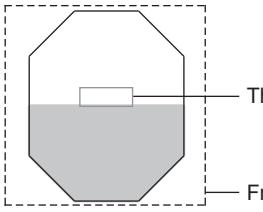
- Figure: Backmost layer
- Level: Back layer

If a layer combination other than the above is used, a level is not displayed in a figure.

Setting the same color for [Line Color] of a figure and [Boundary Color] of a level

The figure drawn in the same color as [Boundary Color] of the level is the target of the level display.

After placing the level object, set the same color as [Line Color] of the figure for [Boundary Color].



Precautions

When [Background Color] is enabled for the window screen, the boundary color is disabled if the level display with [Boundary Color] set overlaps with the following screens.

- Superimpose window
- Called screen (a screen displayed by the set overlay screen function on the basic screen (base screen or window screen where the set overlay screen is placed))

Set [Background Color] of the window screen in the [Screen Design] dialog or the [Window Screen Property] dialog ([Basic] tab).

☞ Page 310 [Screen Design] dialog
☞ Page 323 [Basic] tab

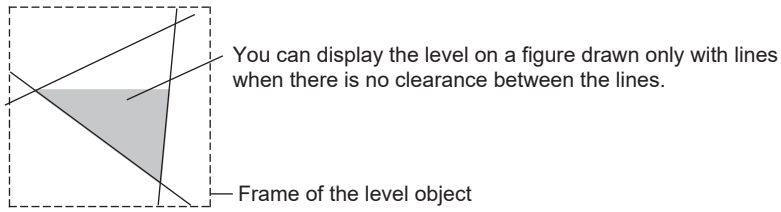
PART 7

Drawing a figure without any clearance between lines

A level can be displayed only with a completely-closed figure.

A figure drawn with multiple lines can also be used for the level display.

Draw a figure in which a level is displayed without any clearance between lines.



48.3.2 Placing a level object

The following shows how to place the level object.

This switch cannot be placed on mobile screens.

Operating procedure

1. Select [Object] → [Meter] → [Level] from the menu.
2. Click the position to place a level object on a screen editor.
3. Adjust the frame size of the level object.

To display a level in a figure, surround the figure with the frame of the level object and adjust the frame according to the figure size.

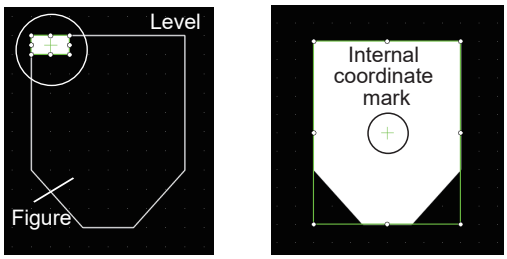
In this case, use the following combination to superimpose the figure and the level object.

- Figure: Backmost layer
- Level: Back layer

If the internal coordinate mark of the level overlaps the figure, the level is displayed within the figure.

The display status cannot be checked on the screen editor of GT Designer3 because the figure is placed behind the level.

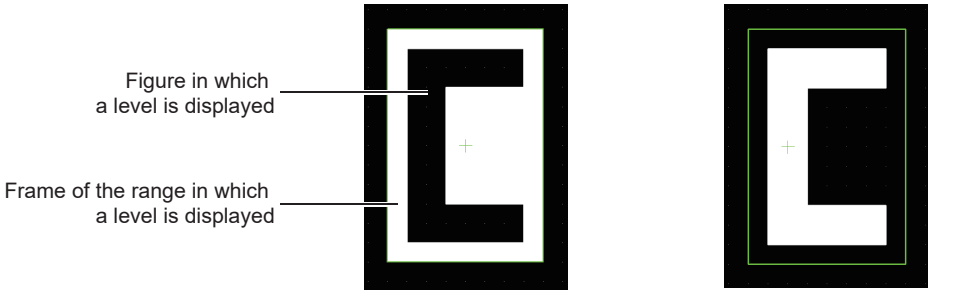
Check the display status by writing the project data to GT Simulator3 or the GOT.



If the level is not displayed within the figure, the internal coordinate mark of the level does not overlap the figure.

Move the internal coordinate mark manually.

Right-click the frame of the level object and select [Touch Area Edit] → [Manual Edit] from the menu to drag the internal coordinate mark.



The figure is not set as the target of the level display.

The figure is set as the target of the level display.

48.3.3 Setting the level object

The following shows how to set the level object.

Operating procedure

1. Double-click the level object which has been placed to display the setting dialog.

☞ Page 1771 [Level] dialog

2. Display the [Device/Style] tab.

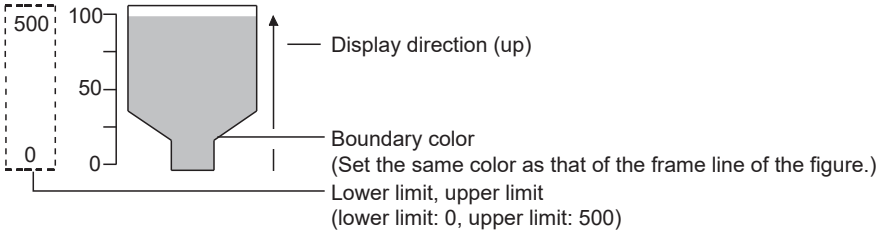
☞ Page 1771 [Device/Style] tab

3. Set a device to be monitored for [Device].

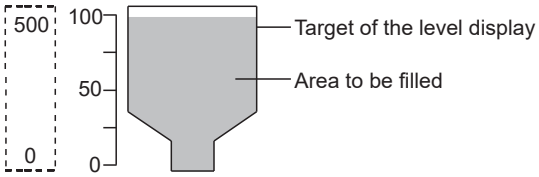
☞ Page 834 How to set devices, labels, and tags

4. Set [Direction], [Boundary Color], [Lower Limit], and [Upper Limit].

Set the same color as [Line Color] (frame line color) of the target figure of the level display for [Boundary Color].



5. Set the fill color with [Level Color], [Background Color], and [Pattern].



6. To change the fill color according to the device value, add conditions.

After adding conditions, set the following.

- Ranges corresponding to each condition
- [Level Color], [Background Color], and [Pattern] that are displayed when the conditions are satisfied

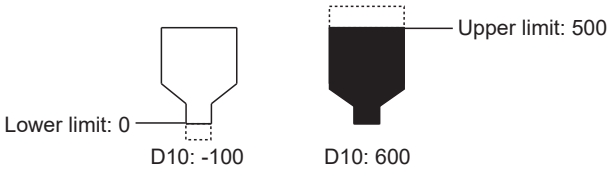
7. Click the [OK] button to complete the level object settings.

PART 7

Precautions

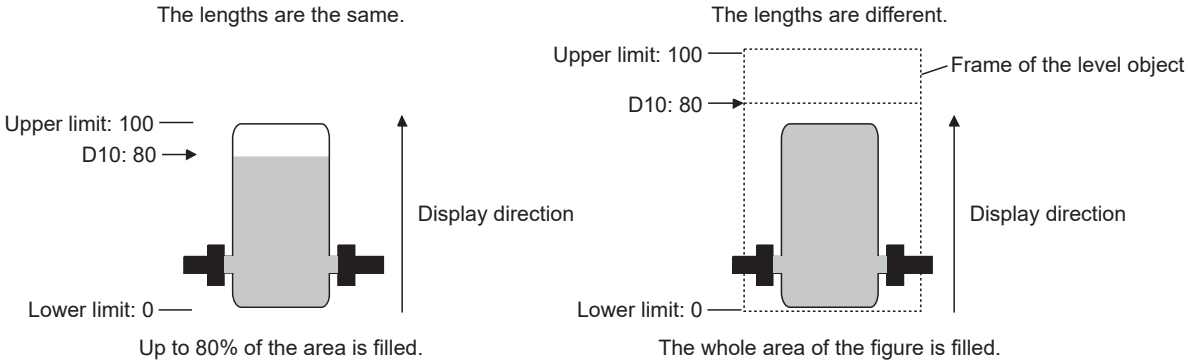
■Operations of when the monitored device value exceeds the upper or lower limit value

If the monitored device value falls below the lower limit, the lower limit value is displayed instead of the device value.
When the monitored device value exceeds the upper limit value, the display of the upper limit value is applied.



■Operations of when the lengths of the frame of a level object and a figure are different

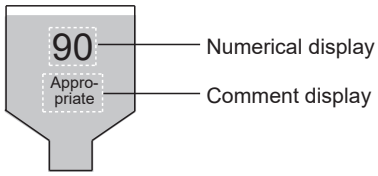
When the lengths of the frame of a level object and a figure are different in the direction of the level display, the figure is not filled corresponding to the ratio compared to the upper and lower limit values.
Adjust the frame length of the level object to the length of the figure.



48.3.4 Displaying a value or text on a level object

To display a value or text on a level object, place one of the following objects within the frame of the level object.

- Numerical display
- Numerical input
- Comment display (bit comment or word comment)



Regardless of the placement order, the overlapping object (numerical display, numerical input, or comment display) appears in front of the level object on the GOT screen.

Operating procedure

1. Place one of the above objects within the frame of a level object.

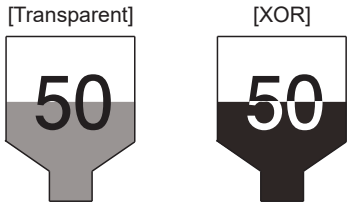
2. Display the object setting dialog.

For the setting dialog, refer to the following.

☞ Page 1317 [Numerical Display] dialog
☞ Page 1328 [Numerical Input] dialog
☞ Page 1390 [Bit Comment Display] dialog
☞ Page 1400 [Word Comment Display] dialog

3. Select the display color, which is used when the level area to be filled and the object are overlapped, in [Display Mode].

- [Transparent]: The color of a numerical value or characters is not changed.
- [XOR]: The color of a numerical value or characters and the level color are integrated into an XOR synthesis.



4. Click the [OK] button to complete the object settings.

5. When [Blink] or [Reverse] is set for the object, select [Common] → [GOT Type Setting] from the menu, and set [Adjust object display order in GOT to the one in GT Designer3].

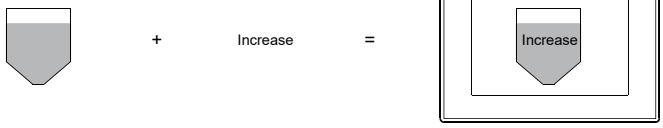
With this setting, the blinking display and reversing display of the object to be superimposed with the level are enabled.

The following shows examples of settings.

Example) Displaying the level with the comment display

Set the same condition (display range) for the level and comment display, and switch the level color and comment simultaneously.

Level setting　　Comment setting　　Display



Level
Device to be monitored : D100
Display direction : Up
Upper limit : 100
Lower limit : 0

Comment
Device to be monitored: D100
Display mode : Transparent
Registered comments : Comment No. 1...Increase
: Comment No. 2...Decrease
: Comment No. 3...Appropriate

Condition	Display range	Level color	Comment	Font image
1	71≤$V	Red	Increase	2	$V≤30	Yellow	Decrease	0 (normal)	-	Light blue	Appropriate	
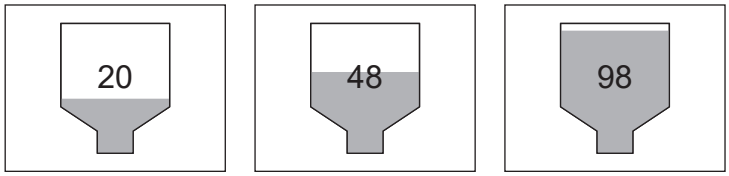
48.3.5 Different displays depending on the display mode of the object to be superimposed

The display of a level object varies depending on the display mode of the object superimposed on the level object.
The following shows application examples.

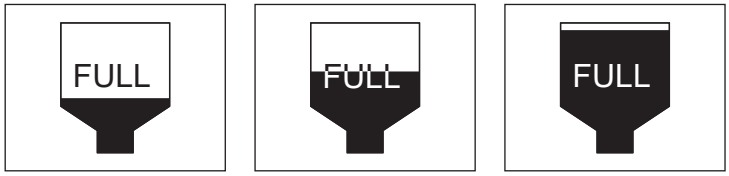
Ex.

When [Display Mode] is set to [Transparent] for a numerical display, numerical input, or comment display
The numerical display color and text color are displayed as is.



Ex.

When [Display Mode] is set to [XOR] for a numerical display, numerical input, or comment display
When the target object is superimposed on the fill color portion of the level object, the color of the overlapping portion is inverted in the target object.
However, inputting a value on the numerical input does not apply the fill color of the level object to the overlapping portion of the numerical input.
The new value is not reflected to the display until you touch the numerical input again.



PART 7

Precautions

■When part of the object is out of the level object frame

When part of the object (numerical display, numerical input, or comment display) is out of the level object frame, the level or the object is displayed incorrectly.

• When part of the object placed behind the level object is out of the level object frame

The area of the object within the frame of the level object is not displayed.

Only the area out of the level object frame is displayed.

• When part of the object placed over the level object is out of the level object frame

The level is not displayed only for the area superimposed with the object.

To solve the above problems, execute one of the following operations.

• Move the whole object outside the frame of the level object.

• Move the whole object within the frame of the level object.

• Set [Adjust object display order in GOT to the one in GT Designer3]

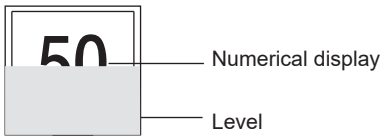
(This setting is available in the [GOT Type Setting] dialog displayed by selecting [Common] → [GOT Type Setting] from the menu.)

■When a level object and an object are placed in different layers

When a level object and an object (numerical display, numerical input, or comment display) are placed in different layers, the level and the object are not integrated into an XOR synthesis.

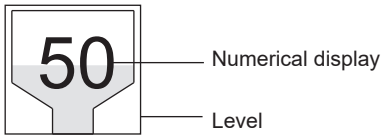
• When a level object is placed in the front layer and an object is placed in the back layer

If the level area to be filled is superimposed with the object, the object is hidden.



• When an object is placed in the front layer and a level object is placed in the back layer

The object is displayed over the level. However, the object and level are not integrated into an XOR synthesis because they are in different layers.



■Update timing of the displayed contents

The displayed comments of an object (numerical display, numerical input, or comment display) and a level are updated simultaneously.

The update timing set for the object (display condition) is invalid.

■Display at inputting a numerical value

While a cursor is displayed at the numerical input, the area superimposed with the level object is displayed incorrectly.

After the numerical input is completed and the level is updated, the area is displayed correctly.

■Text style of the comment display

When the text style (bold, solid, raised) is set for the comment display, the text or the text color may be displayed incorrectly.

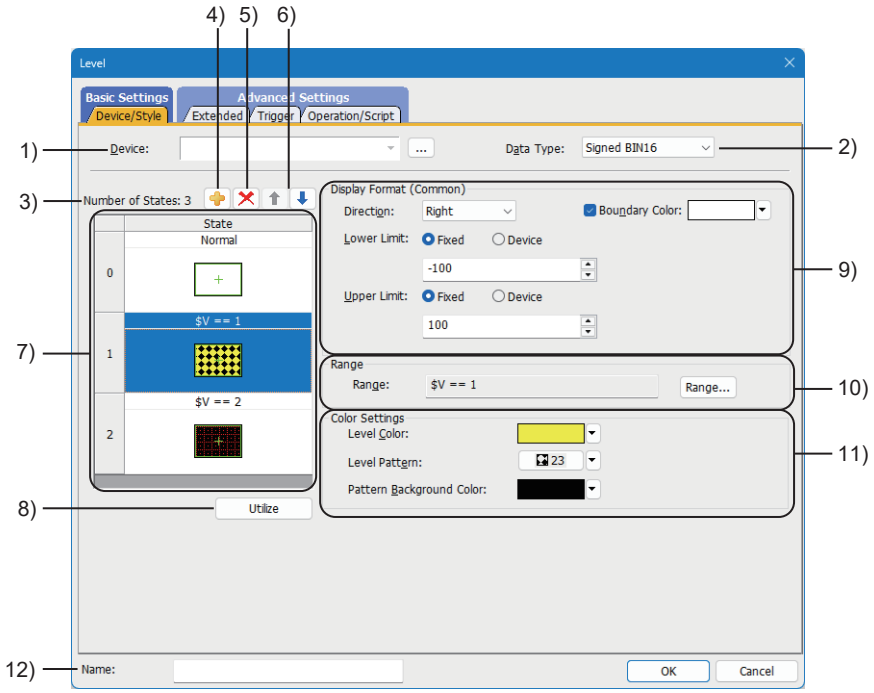
48.4 [Level] dialog

GT37 SoftGOT3000

☞ Page 1771 [Device/Style] tab
☞ Page 1773 [Extended] tab
☞ Page 1774 [Trigger] tab
☞ Page 1775 [Operation/Script] tab

48.4.1 [Device/Style] tab

Set the target device to be monitored and the level status corresponding to the device value.
For the conditions, refer to the following.
☞ Page 1038 Control with conditions



Item		Description
1)	[Device]	Set the device to be monitored. ☞ Page 834 How to set devices, labels, and tags
2)	[Data Type]	Select the data type of the word device.
3)	[Number of States]	The number of the set conditions
4)	Add button	Adds a new condition.
5)	Delete button	Deletes the selected condition.
6)	Up button, down button	Changes the priority order of the conditions in the preview list.
7)	Preview list	Displays set conditions.
8)	[Utilize] button	Creates a new condition utilizing the selected condition.

Item			Description
9)	[Display Format (Common)]	—	Set the level display that is common to all conditions.
		[Direction]	Select the direction in which the level area to be filled extends.
		[Boundary Color]	Set the same color as [Line Color] (frame line color) of the target figure of the level display. Set this item to display a level in a figure. Select this item, and set [Boundary Color].  If a color other than [Line Color] of the figure is set, the level is not displayed in the frame of the figure. Example 1) When [Boundary Color] of the figure and [Line Color] are the same  The figure is set as the target of the level display. Example 2) When [Boundary Color] of the figure and [Line Color] are different  The figure is not set as the target of the level display.
		[Lower Limit] [Upper Limit]	Select whether to specify the display range (lower and upper limit values) of the level with the fixed value or with the device value. The value can be changed dynamically by specifying it with a device. ☞ Page 834 How to set devices, labels, and tags The setting ranges of [Lower Limit] and [Upper Limit] differ depending on the item selected for [Data Type].
10)	[Range]	[Range]	Set the display range of the conditions selected in the preview list. When setting the value of the word device as the condition, click the [Range] button to display the [Edit Range] dialog, and then set the conditional expression. ☞ Page 1038 Control with conditions
11)	[Color Settings]	[Level Color]	Set the fill color.
		[Level Pattern] [Pattern Background Color]	Set the pattern and the background color to be used for filling. 12)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

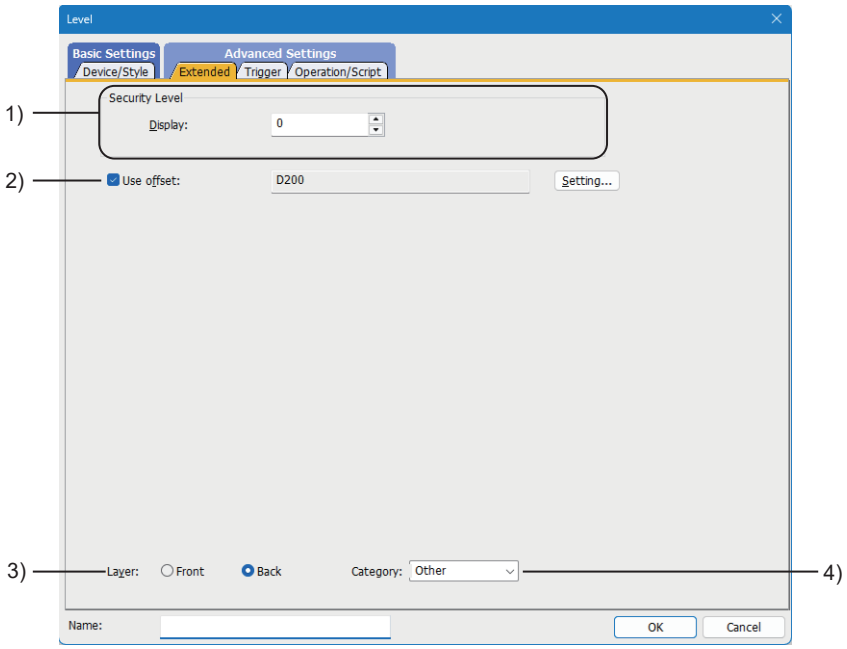
48.4.2 [Extended] tab

Set the security level of the object and use/nonuse of the offset function.

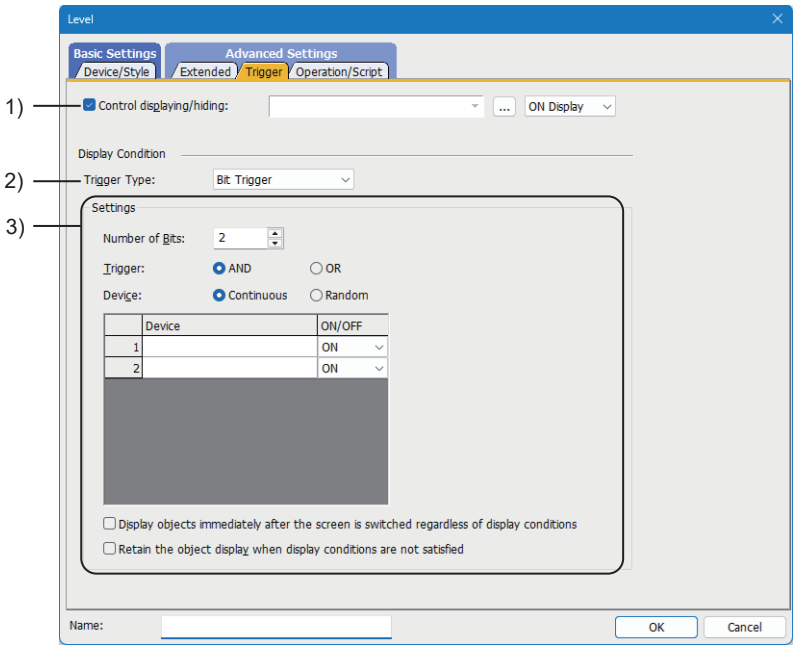


Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, set [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Configure the settings to monitor the statuses of multiple devices by switching between them with a single device. After selecting this item, set the offset device. ☞ Page 963 Offset
3)	[Layer]	Select the layer to place the object. ☞ Page 65 Layer
4)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

PART 7

48.4.3 [Trigger] tab

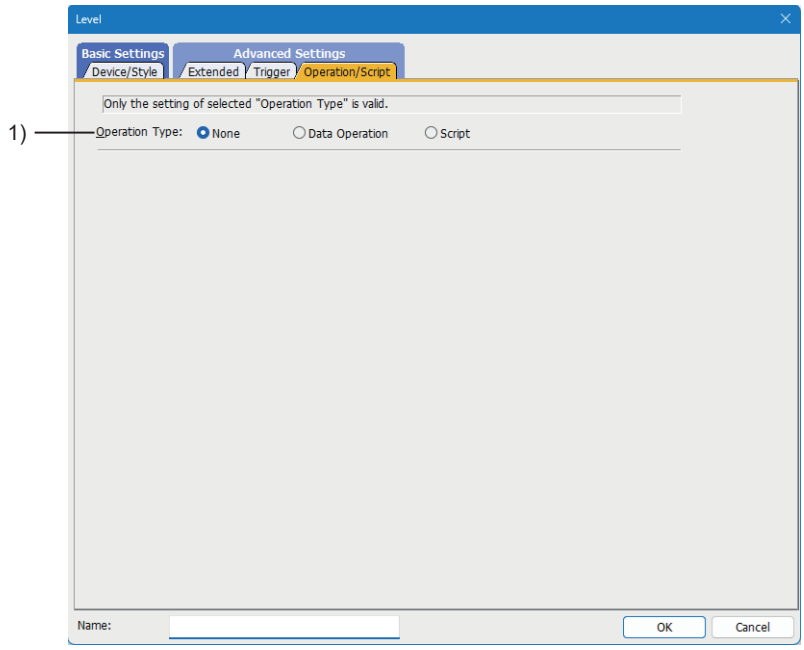
Set the trigger condition to display the object.



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Control device (bit device or bit-specified word device) • When to display: When the control device is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Settings]	For details on each setting, refer to the following. ☞ Page 972 Settings by trigger type

48.4.4 [Operation/Script] tab

Set whether to perform an operation or a script with the device value handled by the object.



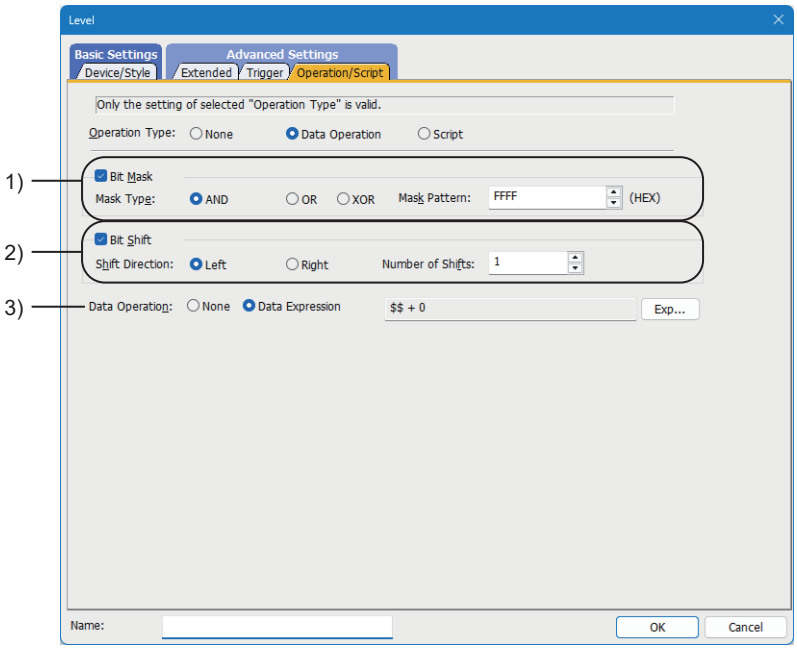
Item			Description
1)	[Operation Type]	[None]	The data operation function and the script function are not used.
		[Data Operation]	Set the expression used for the data operation function. For the setting method, refer to the following. ☞ Page 1776 [Data Operation]
		[Script]	Set the expressions for the script function. For the setting method, refer to the following. ☞ Page 1777 [Script]

PART 7

[Data Operation]

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation

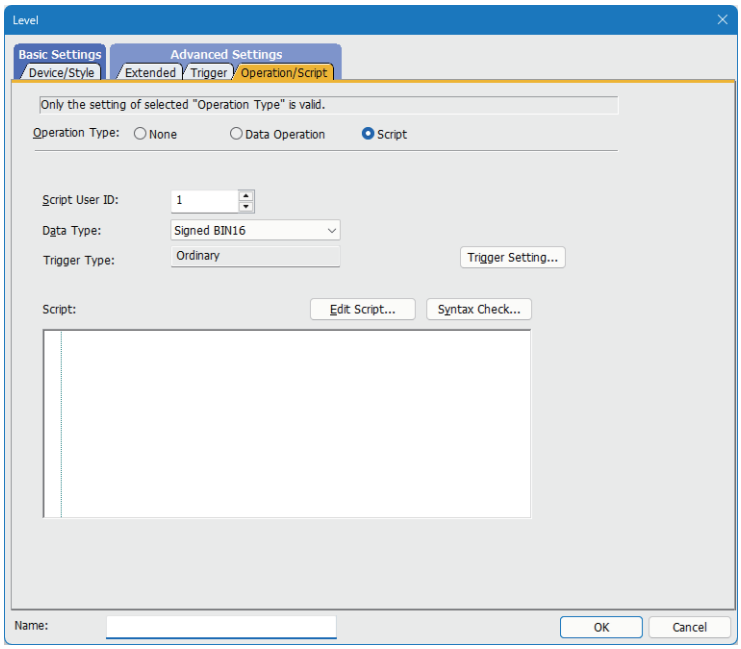


Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. The following shows selectable items. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range differs depending on the setting of [Data Type] in the [Device/Style] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range differs depending on the setting of [Data Type] in the [Device/Style] tab.
3)	[Data Operation]	—	Performs the data operation using the value stored in the monitored device.
		[None]	Does not perform the data operation.
		[Data Expression]	Performs the data operation. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

[Script]

For the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	**Setting item**	**Property name**	**Read**	**Write**	**Timing for reflecting the setting change*1**
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Device/Style]	[Level Color]	graph_color	○	○	When the object is updated

49 Placing a panel meter

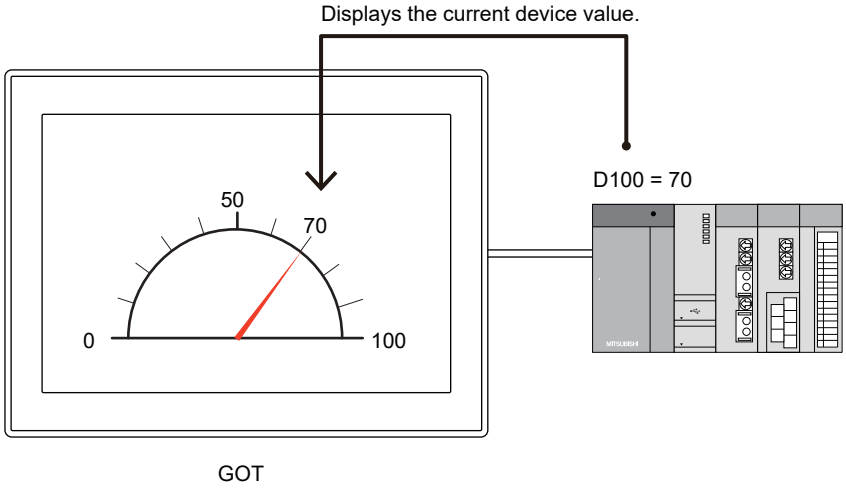
☞ Page 1778 Overview of the panel meter
☞ Page 1779 How to use the panel meter
☞ Page 1780 Specifications of the panel meter
☞ Page 1782 Setting a panel meter
☞ Page 1783 [Panelmeter] dialog

49.1 Overview of the panel meter

GT37 SoftGOT3000

The panel meter is an object used to indicate the current value of the device on the surface that simulates a meter.
The current value of the device is visualized as to where it is positioned within the range.

Ex.
A panel meter with the device value ranging from 0 to 100
When the panel meter monitors the device [D100], it displays the value [70] of the PLC device [D100].



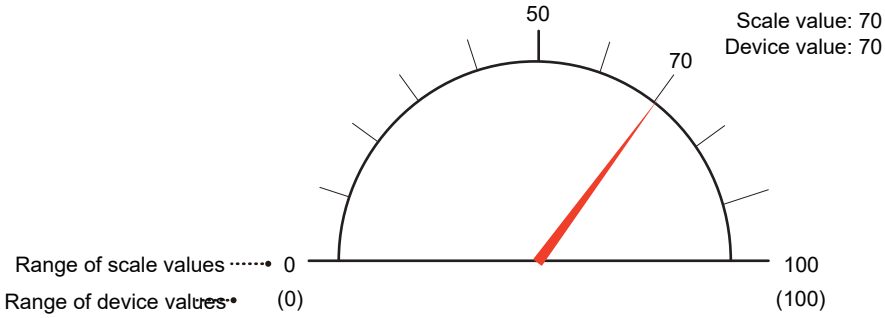
49.2 How to use the panel meter

Set the lower and upper limits of the device value and those of the scale value separately for the panel meter.
Doing so enables the following two uses.
☞ Page 1779 Indicating the device value
☞ Page 1779 Indicating the percentage against the total

Indicating the device value

When the lower and upper limits of the device value are matched with those of the scale value, the panel meter indicates the device value.

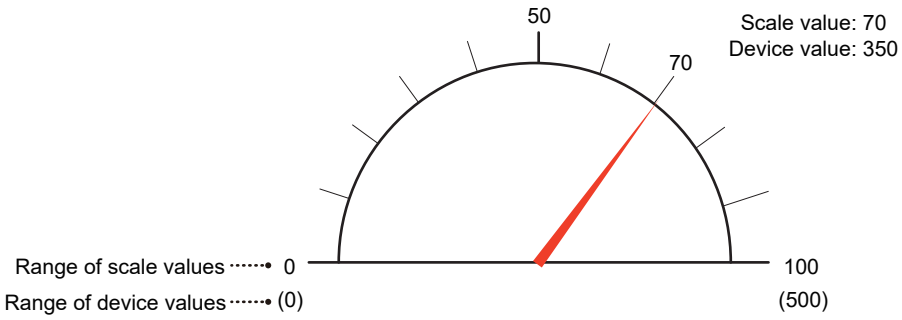
Ex.
Range of the device value: 0 to 100
Range of the scale value: 0 to 100
The value indicated by the panel meter is the device value.



Indicating the percentage against the total

If the range of the device value and that of the scale value are different, the panel meter indicates the position relative to the lower and upper limits of the device value.

Ex.
Range of the device value: 0 to 500
Range of the scale value: 0 to 100
When the device value is [350], the panel meter indicates the scale value [70].



Point

The following setting items are related to the above.
• [Lower Limit] and [Upper Limit] in the [Device/Style] tab
☞ Page 1783 [Device/Style] tab
• [Lower Limit] and [Upper Limit] in the [Scale] tab
☞ Page 1788 [Scale/Text] tab

49.3 Specifications of the panel meter

GT37 SoftGOT3000

☞ Page 1780 Maximum number of objects that can be placed on one screen
☞ Page 1780 Size of the panel meter
☞ Page 1780 Shape of the panel meter
☞ Page 1781 Display when the lower or upper limit is exceeded

49.3.1 Maximum number of objects that can be placed on one screen

A total of 1024 panel meters and other objects can be placed on one base screen, while 512 can be placed on one window screen.

49.3.2 Size of the panel meter

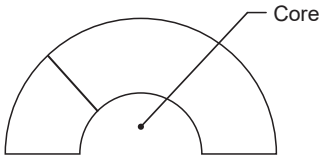
The following shows the minimum and maximum sizes of the panel meter.

Size	Size (dot)
Minimum	3 × 3
Maximum	6000 × 6000

49.3.3 Shape of the panel meter

The panel meter is expressed with a sector, semicircle, or full circle as shown below.
Some shapes are preset, but you can also set a sector with an intended angle by specifying the start and end angles.

Setting a core can create a doughnut-shaped panel meter.
The core is useful if you desire to enter the title, unit, or other information of the meter.



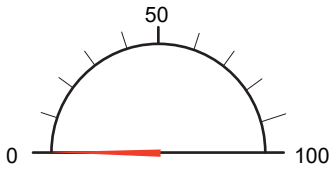
49.3.4 Display when the lower or upper limit is exceeded

If the monitored device value equals to or below the lower limit, the lower limit is indicated.
If the monitored device value equals to or above the upper limit, the upper limit is indicated.

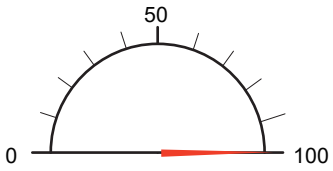
Ex.

A panel meter for which the lower limit [0] and the upper limit [100] are set for the device value
When the device value is [-50], the lower limit [0] is indicated.
When the device value is [180], the upper limit [100] is indicated.

When the value is equal to or below the lower limit



When the value is equal to or above the upper limit



PART 7

49.4 Setting a panel meter

GT37 SoftGOT3000

Use the following procedure to place a panel meter and configure the operation settings.

Operating procedure

1. Select [Object] → [Meter] → [Panelmeter] from the menu and click the intended position to place it.

☞ Page 1001 Placing figures and objects

2. Double-click the panel meter to display the [Panelmeter] dialog.
3. Configure the operation settings in each tab in the [Panelmeter] dialog.

☞ Page 1783 [Panelmeter] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 995 Basics of figures and objects

49.5 [Panelmeter] dialog

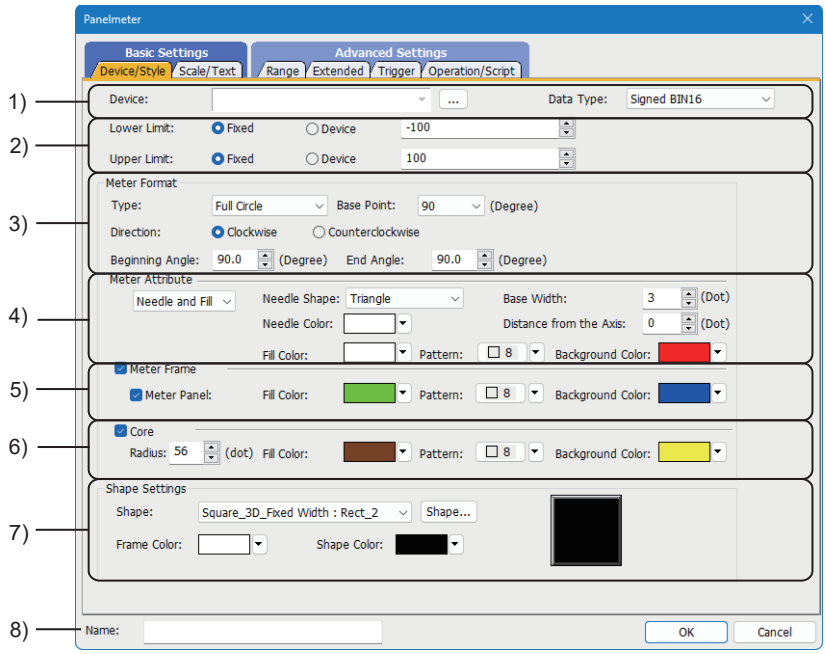
GT37 SoftGOT3000

☞ Page 1783 [Device/Style] tab
☞ Page 1788 [Scale/Text] tab
☞ Page 1790 [Range] tab
☞ Page 1791 [Extended] tab
☞ Page 1792 [Trigger] tab
☞ Page 1793 [Operation/Script] tab

49.5.1 [Device/Style] tab

GT37 SoftGOT3000

Set the device to be monitored, data type, upper and lower limits of the device value, shape and size of the panel meter, and other display setting items.



Item		Description
1)	[Device]	Set a word device to be monitored. ☞ Page 834 How to set devices, labels, and tags
	[Data Type]	Select the data type of the device.
2)	[Lower Limit] [Upper Limit]	Specify the range of the device value (lower and upper limits). Specify fixed values or devices. Devices can be used to change the values dynamically. ☞ Page 834 How to set devices, labels, and tags The setting ranges for [Lower Limit] and [Upper Limit] differ depending on the item selected for [Data Type].

Item			Description
3)	[Type]	-	Select a shape for the panel meter. When a shape is selected, the [Beginning Angle] and [End Angle] are automatically set. To set an irregular shape, select [Custom] and set angles to [Beginning Angle] and [End Angle]. [Top 1/6] [Bottom 1/6] [Left 1/6] [Right 1/6] [Top 1/2] [Bottom 1/2] [Left 1/2] [Right 1/2]  [Top-Left 1/4] [Top-Right 1/4] [Bottom-Left 1/4] [Bottom-Right 1/4] [3/4] [Full Circle]
		[Base Point]	This item is available only when [Full Circle] is selected for [Type]. The base point is the position where the lower limit (upper limit) is indicated. Specify the base point angle of the meter with the 3 o'clock position as the 0-degree position. 		[Direction]	Select the direction in which the value increases.
		[Beginning Angle] [End Angle]	Set the beginning and end angles of the panel meter in units of 0.1 degrees, with the 3 o'clock position as the 0-degree position. The setting range is [-360.0] degrees to [360.0] degrees. The value decreases clockwise and increases counterclockwise. You can specify a clockwise or counterclockwise angle. 
Item			Description
4)	[Meter Attribute]	-	Select the method of indicating the device value. [Needle] [Fill] [Needle and Fill] 		[Needle Shape]	When selecting [Needle] or [Needle and Fill] for [Meter Attribute], set the needle shape. [Straight Line] [Triangle] [Inverted Triangle] 		[Base Width]	When [Triangle] or [Inverted Triangle] is selected for [Needle Shape], set the base width of the triangle. The setting range is [3] dots to "the meter radius" (dots). Specify an odd number value. When [Base Width] is set to [3] dots When [Base Width] is set to [15] dots
		[Needle Color]	When selecting [Needle] or [Needle and Fill] for [Meter Attribute], set the needle color.
		[Distance from the Axis]	When [Needle] or [Needle and Fill] is selected for [Meter Attribute], set the distance from the meter center to the drawing start position of the needle. The setting range is [0] (dots) to "the meter radius -2" (dots). When [Distance from the Axis] is set to [0] dots When [Distance from the Axis] is set to [15] dots
		[Fill Color] [Pattern] [Background Color]	When [Fill] or [Needle and Fill] is selected for [Meter Attribute], select a fill color, pattern, and background color. The pattern is displayed in the fill color on the colored background. When [None] is selected for [Patten], [Background Color] is not available. [Pattern] + [Fill Color] Example) [Fill Color] : [Pattern] : [Background Color] : [Background Color] 
Item			Description
5)	[Meter Frame]	-	Select this item to frame the meter. The meter frame is displayed as a white line with a width of 1 dot. This cannot be changed. 		[Meter Panel]	This item is available when [Meter Frame] is selected. Select this item to color the panel meter surface.  When selecting this item, configure the following settings.
		[Fill Color] [Pattern] [Background Color]	Set a fill color, pattern, and background color. The pattern is displayed in the fill color on the colored background. When [None] is selected for [Patten], [Background Color] is not available. 6)	[Core]	-	Select this item to color the core of the panel meter.  When selecting this item, configure the following settings.
		[Radius]	Set the radius of the core. The setting range is [1] (dot) to "the meter radius -1" (dots). 		[Fill Color] [Pattern] [Background Color]	Set a fill color, pattern, and background color. The pattern is displayed in the fill color on the colored background. When [None] is selected for [Patten], [Background Color] is not available. 7)	[Shape]	-	Set a shape to be placed on the background of the panel meter. Use this item to frame the panel meter or for other purposes. Then, a separate shape for the frame is unnecessary and the frame is automatically resized according to the size of the object. To use a readily available design set, select one from the list box. When not selecting one from the list box, click the [Shape] button and set one on the displayed [Image List] screen. ☞ Page 1044 Object shape 		[Frame Color]	Select a frame color.
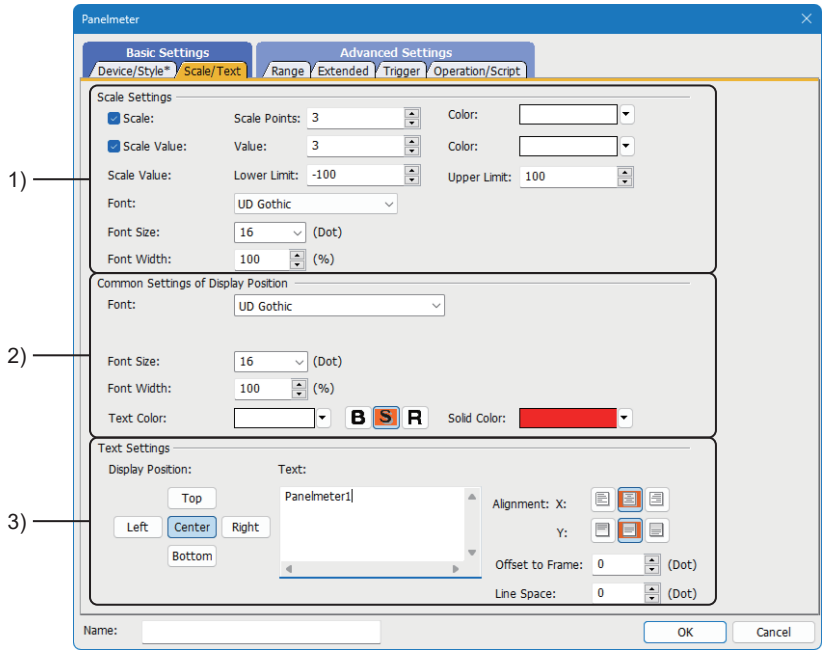
		[Shape Color]	Select a fill color of the shape.

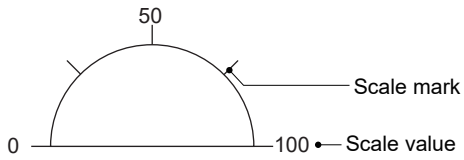
Item		Description
8)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be entered.

49.5.2 [Scale/Text] tab

GT37 SoftGOT3000

Configure the scale mark display settings, scale value display settings, and other settings of items displayed on the panel meter such as text.





Item				Description
1)	[Scale Settings]	[Scale]	-	Select this item to display the scale marks. When selecting this item, configure the following settings.
			[Scale Points]	Set the number of scale marks. The setting range is [2] to [101].
			[Color]	Set the color of the scale marks. ☞ Page 988 Color settings
		[Scale Value]	-	Select this item to display numerical values on the scale. When selecting this item, configure the following settings.
			[Value]	Set the number of scale values to be displayed. The setting range is [2] to [101].
			[Color]	Set the color of the scale values. ☞ Page 988 Color settings
			[Lower Limit] [Upper Limit]	Set the upper and lower limits of the scale value. The setting range depends on the setting of [Data Type] in the [Device/Style] tab. The setting range of 64-bit devices is the same as that of 32-bit devices. When [Upper Limit], [Lower Limit], and [Value] are set, the scale values are automatically calculated and displayed.
			[Font]	Select a font for the scale values.
			[Font Size]	Set the vertical size of the scale values. The setting range is [8] dots to [540] dots.
			[Font Width]	Set the horizontal size of the scale values. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character is always within the range of [8] dots to [540] dots.

Item				Description
2)	[Common Settings of Display Position]	—		To display a text string at the top and bottom, on the left and right, and in the center of the panel meter, configure the settings common to all the positions. 		[Font]		Select the text font. When a Windows font is selected, italicizing and underlining text are available.
		[Character Set]		When a Windows font is selected for [Font], select a language to be used.
		[Font Size]		Select a text size. The setting range is [8] dots to [540] dots.
		[Font Width]		The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character is always within the range of [8] dots to [540] dots.
		[Text Color]		Set the color and style of the text. Only one style ([Bold], [Solid], or [Raised]) is settable. When selecting [Solid] or [Raised], set the color of the shadow.
3)	[Text Settings]	[Display Position]	—	Set [Text], [Alignment], [Offset to Frame], and [Line Space] for each display position. After selecting a display position of the text for [Display Position], set the following items.
			[Text]	Enter the text to be displayed. Up to 1024 characters can be set. Use the Enter key to insert a line feed. A line feed is counted as two characters.
			[Alignment]	Set the text position relative to the panel meter display area. 			[Offset to Frame]	This setting is invalid when [Center] is selected for [Display Position]. Set the space between the object frame and the text. The setting range is [0] dots to [100] dots. 			[Line Space]	Set the space between lines. The setting range is [0] dots to [128] dots.

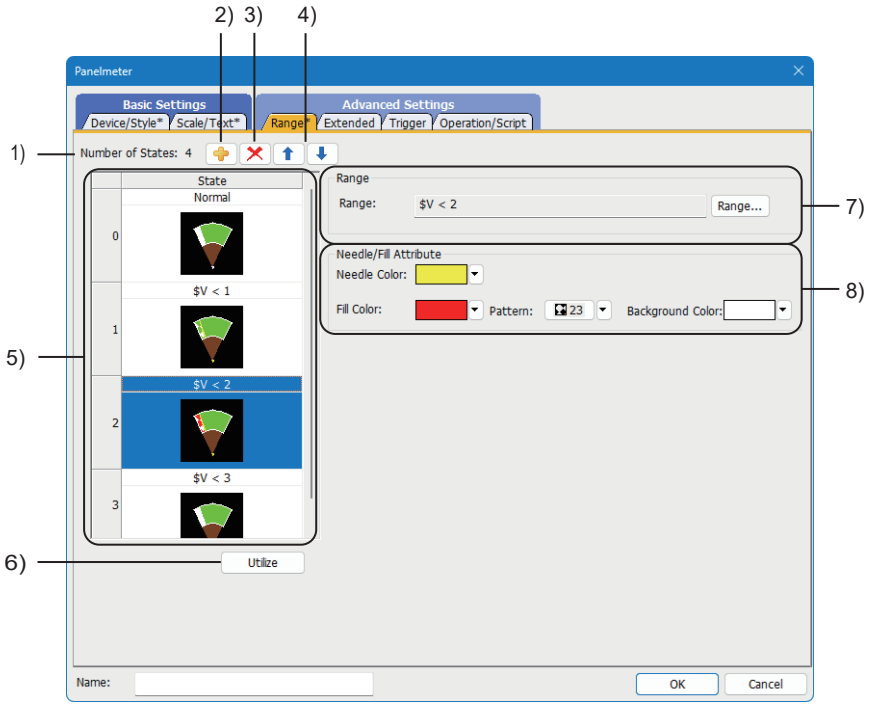
49.5.3 [Range] tab

GT37 SoftGOT3000

You can set conditions so that the needle color and the fill color will change according to the device value.
For example, set a condition so that the fill color will change to red when the device value is equal to or greater than [100] to alert the operator.
For the conditions, refer to the following.
☞ Page 1038 Control with conditions

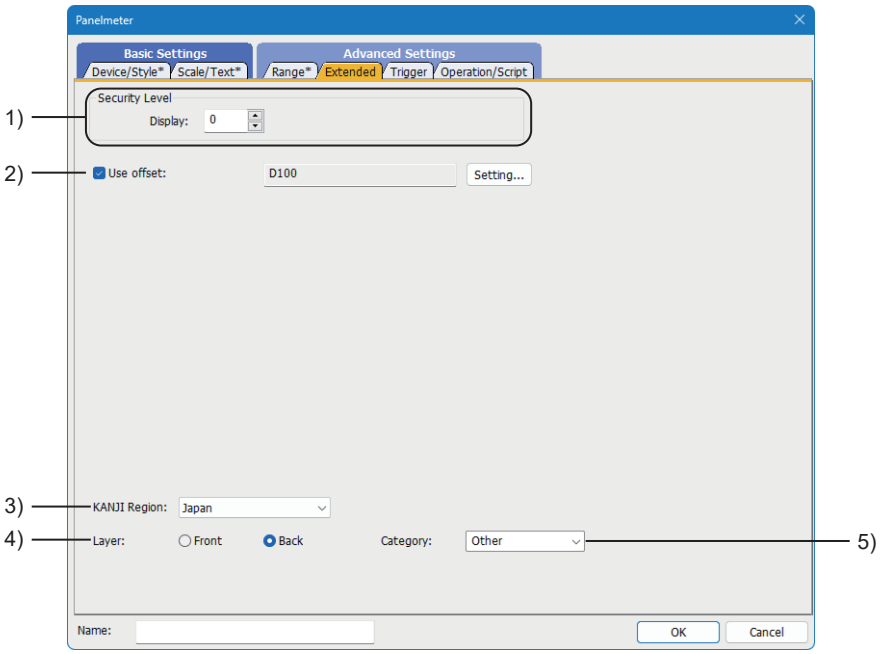


Item			Description
1)	[Number of States]		The number of the set conditions
2)	Add button		Adds a new condition.
3)	Delete button		Deletes the selected condition.
4)	Up button, down button		Changes the priority order of the conditions in the preview list.
5)	Preview list		Displays the set conditions.
6)	[Utilize] button		Utilizes the selected condition to create a new condition.
7)	[Range]	[Range]	Set the applicable range of the condition selected in the preview list. Click the [Range] button, and set the conditional expression in the [Edit Range] dialog. ☞ Page 1038 Control with conditions
8)	[Needle/Fill Attribute]	[Needle Color]	This item is available when [Needle] or [Needle and Fill] is selected for [Meter Attribute] in the [Device/Style] tab. Set the color of the needle.
		[Fill Color] [Pattern] [Background Color]	This item is available when [Needle] or [Needle and Fill] is selected for [Meter Attribute] in the [Device/Style] tab. Set a fill color, pattern, and background color of the panel meter surface. The pattern is displayed in the fill color on the colored background. When [None] is selected for [Patten], [Background Color] is not available. Example) [Fill Color] : [Pattern] : [Background Color] : [Pattern] + [Fill Color] [Background Color]

49.5.4 [Extended] tab

GT37 SoftGOT3000

Set the security level of the object, use/nonuse of the offset function, KANJI region, layer for placing the object, and others.

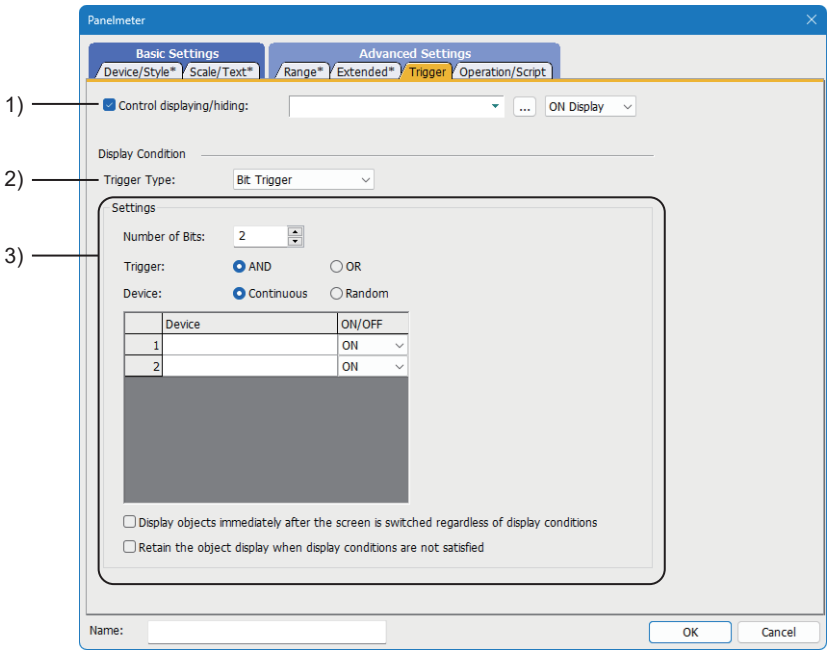


Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Configure the settings to monitor the statuses of multiple devices by switching between them with a single device. After selecting this item, set the offset device. The monitored device is the one with the offset device value added to the device set in [Device] in the [Device/Style] tab. ☞ Page 963 Offset
3)	[KANJI Region]	Set the KANJI region. This item is enabled when one of the following items is selected for [Font] in the [Scale/Text] tab. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho] ☞ Page 76 KANJI region
4)	[Layer]	Select the layer to place the object. ☞ Page 65 Layer
5)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

49.5.5 [Trigger] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.

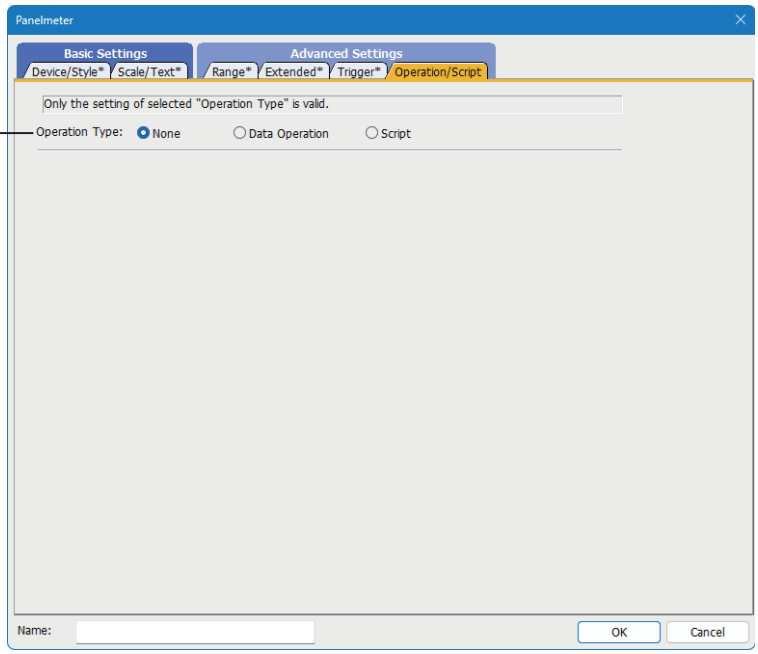


Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Control device (bit device or bit-specified word device) • When to display: When the control device is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Settings]	For the settings of each item, refer to the following. ☞ Page 972 Settings by trigger type

49.5.6 [Operation/Script] tab

GT37 SoftGOT3000

Set whether to perform an operation or a script with the device value handled by the object.



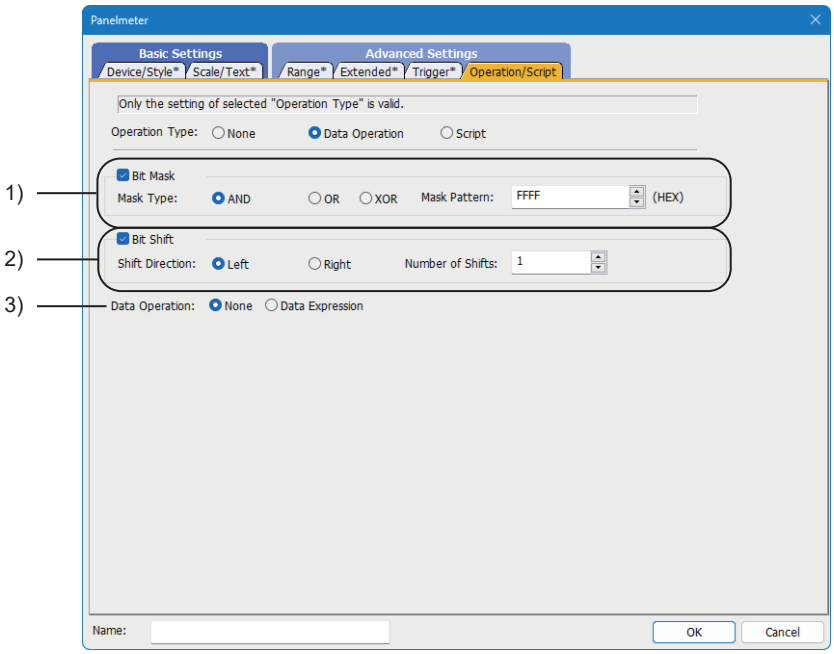
Item			Description
1)	[Operation Type]	[None]	The data operation function and the script function are not used.
		[Data Operation]	Set the expression used for the data operation function. For the setting method, refer to the following. ☞ Page 1794 [Data Operation]
		[Script]	Set the expressions for the script function. For the setting method, refer to the following. ☞ Page 1795 [Script]

PART 7

[Data Operation]

For details on the data operation settings, refer to the following.

☞ Page 1053 How to set the data operation

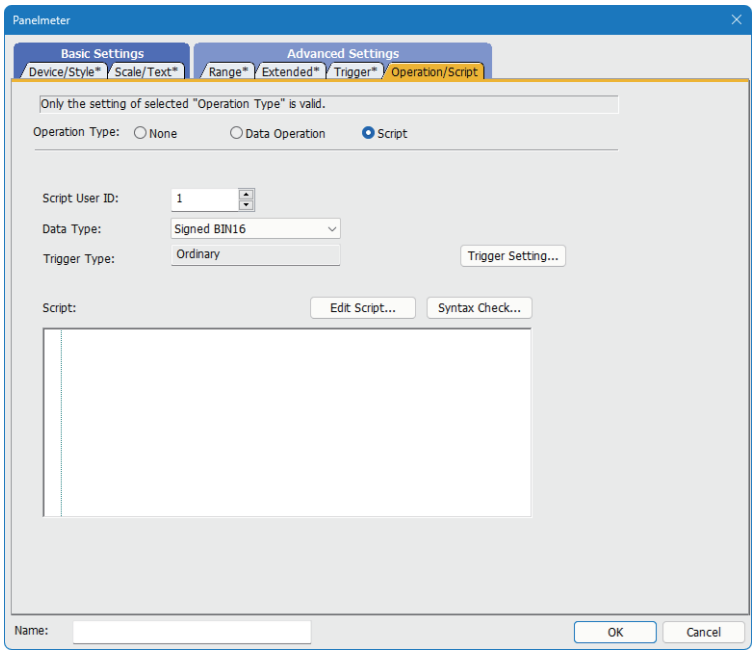


Item			Description
1)	[Bit Mask]	—	Set the operation of mask processing.
		[Mask Type]	Select the type of mask processing. The following shows selectable items. • [AND]: Logical AND • [OR]: Logical OR • [XOR]: Exclusive OR
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range depends on the setting of [Data Type] in the [Device] tab.
2)	[Bit Shift]	—	Set the operation of shift processing.
		[Shift Direction]	Select a shifting direction.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range depends on the setting of [Data Type] in the [Device] tab.
3)	[Data Operation]	—	Performs the data operation using the value stored in the monitored device. The panel meter indicates the value after the operation.
		[None]	Does not perform the data operation.
		[Data Expression]	Performs the data operation. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

[Script]

For details on the script settings, refer to the following.

☞ Page 2447 Object script



■Relationship between the object settings and object properties

Object settings can be read (referenced) or written (changed) using object properties.

The following shows the correspondence between readable/writable object properties and the setting items in the object setting dialog.

○: Available

×: Not available

—: No applicable setting item

Setting dialog		Object property			
Tab name	**Setting item**	**Property name**	**Read**	**Write**	**Timing for reflecting the setting change*1**
—	—	active	○	○	Upon the setting change
		x	○	○	When the screen is updated
		y	○	○	When the screen is updated
		width	○	×	×
		height	○	×	×
[Device/Style]	[Needle Color]	graph_color	○	○	When the object is updated
	[Frame Color]	frame_color	○	×	×
	[Plate Color]	plate_color	○	○	When the object is updated
	[Fill Color]	fill_color	○	○	When the object is updated
	[Pattern]	fill_pattern	○	○	When the object is updated
	[Background Color]	fill_bg_color	○	○	When the object is updated

[Extended]	[Security Level]	security	○	○	When the object is updated

*1 For information on how long it takes for object property settings to be reflected on the screen, refer to the following page.

☞ Page 2456 Timing at which the setting change of an object property is reflected

50 Placing a slider

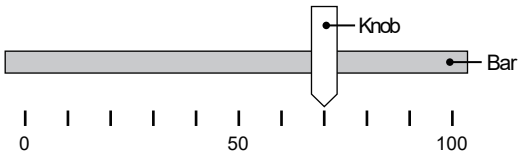
☞ Page 1797 Overview of the slider
☞ Page 1799 How to use the slider
☞ Page 1800 Specifications of the slider
☞ Page 1801 Setting the slider
☞ Page 1802 [Slider] dialog

50.1 Overview of the slider

GT37 SoftGOT3000

The slider is an object used to display the range of the device value with a bar. The current value of the device is indicated with the knob on the bar.
The slider has the following two functions.
☞ Page 1797 Indicating the current value of the device
☞ Page 1798 Writing the value to the device

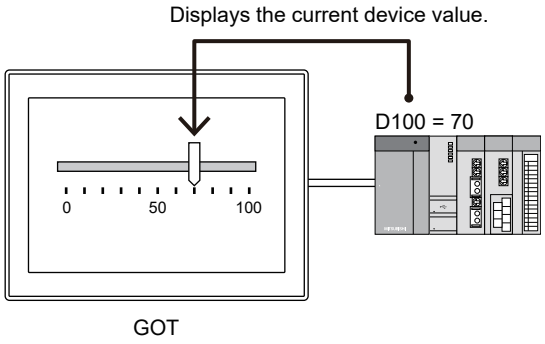
Ex.
A slider with the device value ranging from 0 to 100



50.1.1 Indicating the current value of the device

The current value of the monitored device is indicated by the position of the knob on the bar.
The current value of the device is visualized as to where it is positioned within the range.

Ex.
When the slider is used to monitor device [D100]
The slider indicates the value [70] of the PLC device [D100].



PART 7

50.1.2 Writing the value to the device

Write the value indicated by the knob to the monitored device.

The value can be entered by simply moving the knob on the bar without using a key window or other methods.

The following two methods are available to move the knob.

- Touch and hold the knob, and slide the knob left or right (up or down).
- Touch the position to which the knob moves within the slider arrangement area.

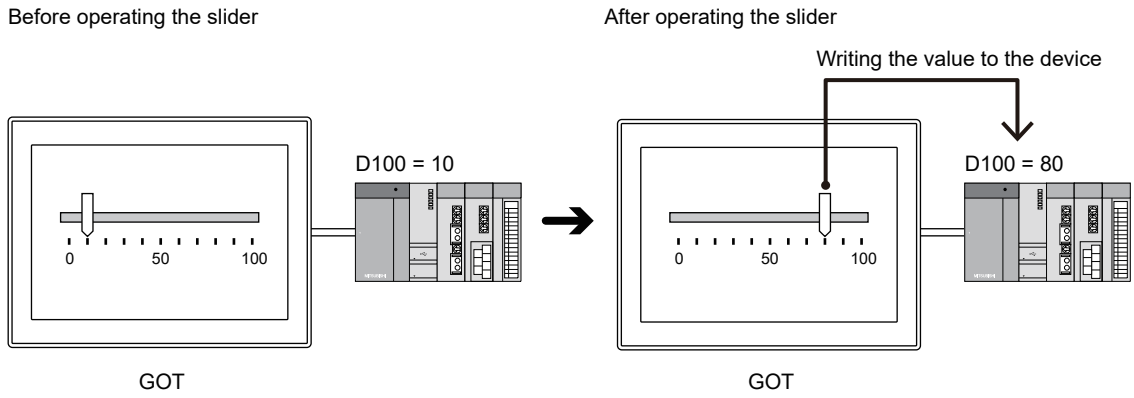
Note that this is not appropriate to specify an exact value.

When setting a slider, you can limit the range of the value to be entered by setting the upper and lower limits on the bar.

Ex.

When the slider is used to monitor device [D100]

When the slider knob is aligned with [80], [80] is written to the PLC device [D100].



50.2 How to use the slider

Set the lower and upper limits of the device value that can be entered and those of the scale value of the slider separately. Doing so enables the following two uses.

☞ Page 1799 Indicating the device value
☞ Page 1799 Indicating the proportion of the total

Indicating the device value

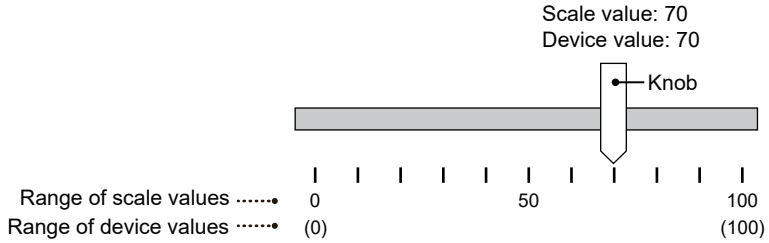
When the lower and upper limits of the device value that can be entered from the slider are matched with those of the scale value, the knob indicates the device value.

Ex.

Range of the device value: 0 to 100

Range of the scale value: 0 to 100

The value pointed to by the knob is the device value.



Indicating the proportion of the total

If the range of the device value and that of the scale value are different, the knob indicates the position relative to the lower and upper limits of the device value.

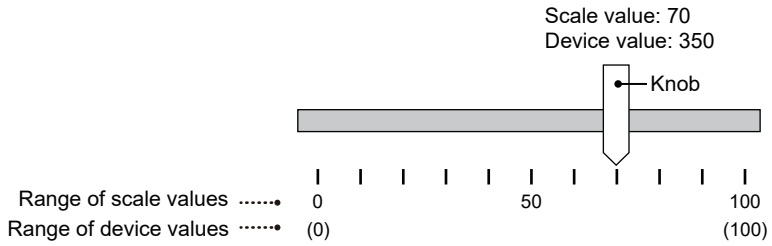
When the knob is moved, the device value is automatically calculated from the position relative to the knob and the value is written to the PLC.

Ex.

Range of the device value: 0 to 500

Range of the scale value: 0 to 100

When the device value is [350], the knob indicates the scale value [70].



Point

The following shows the related setting items.

- [Lower Limit] and [Upper Limit] in the [Device/Style] tab

☞ Page 1802 [Device/Style] tab

- [Lower Limit] and [Upper Limit] in the [Scale] tab

☞ Page 1805 [Scale] tab

50.3 Specifications of the slider

GT37 SoftGOT3000

☞ Page 1800 Maximum number of objects on one screen
☞ Page 1800 Orientation of the slider
☞ Page 1800 Size of the slider

50.3.1 Maximum number of objects on one screen

Up to 1024 sliders can be placed on one screen.

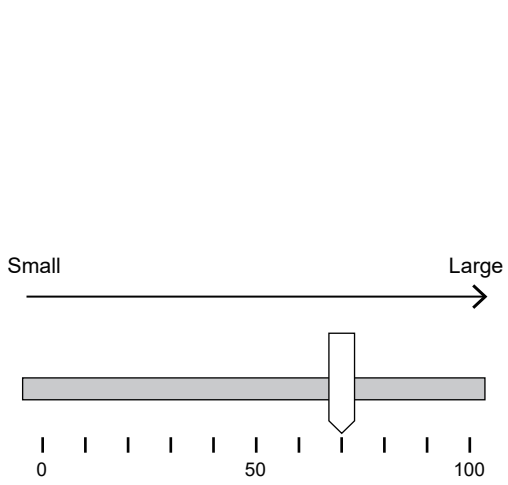
The maximum number of sliders is calculated by subtracting the number of objects other than sliders from 1024.

50.3.2 Orientation of the slider

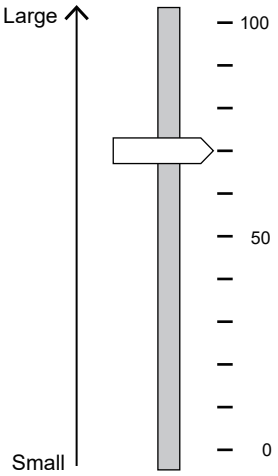
Horizontal sliders and vertical sliders are available.

Scale marks are displayed at the bottom for horizontal sliders and on the right for vertical sliders.

The value is incremented from left to right (bottom to top) by default, which can be reversed.



Horizontal slider



Vertical slider

50.3.3 Size of the slider

The following shows the minimum and maximum slider sizes.

Size		Size (dot)
Minimum	Horizontal orientation	18 (width) × 16 (height)
	Vertical orientation	16 (width) × 18 (height)
Maximum		6000 × 6000

50.4 Setting the slider

GT37 SoftGOT3000

Use the following procedure to place a slider and configure the operation settings.

Operating procedure

1. Select [Object] → [Slider] from the menu and click the intended position to place the slider.

☞ Page 1001 Placing figures and objects

2. Double-click the slider to display the [Slider] dialog.
3. Configure the operation settings in each tab in the [Slider] dialog.

☞ Page 1802 [Slider] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

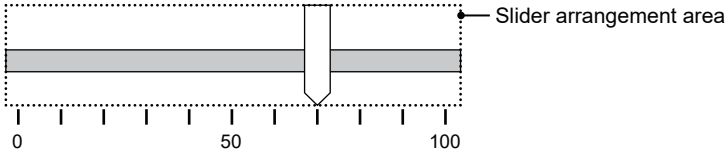
☞ Page 995 Basics of figures and objects

Precautions

■Positions of a slider and an input object

If an input object, such as a touch switch, is near the slider arrangement area, a malfunction may occur when you touch the input object during slider operation.

It is recommended not to arrange any input object in or near the slider arrangement area.



50.5 [Slider] dialog

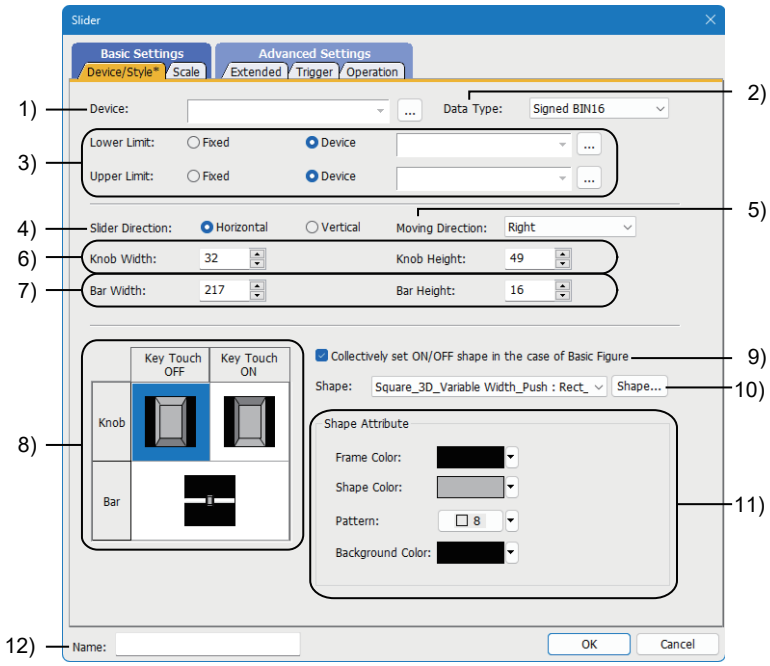
GT37 SoftGOT3000

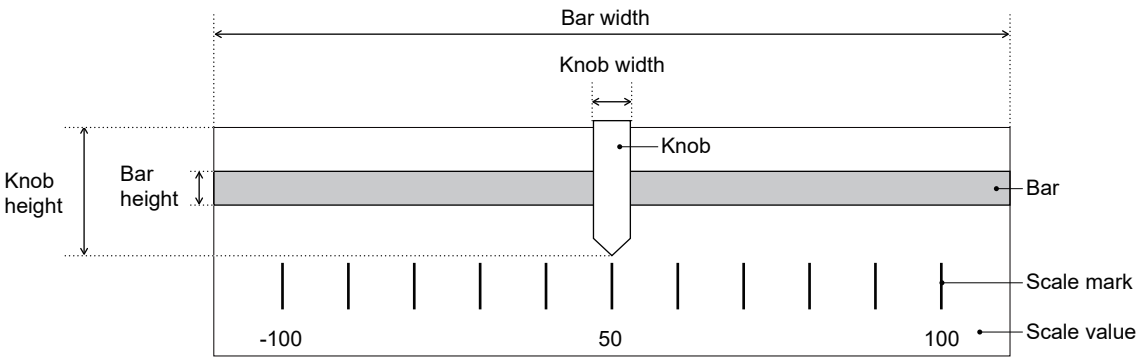
☞ Page 1802 [Device/Style] tab
☞ Page 1805 [Scale] tab
☞ Page 1806 [Extended] tab
☞ Page 1807 [Trigger] tab
☞ Page 1808 [Operation] tab

50.5.1 [Device/Style] tab

GT37 SoftGOT3000

Set the device to be monitored, data type, upper and lower limits of the device value, size and shape of the slider, and other display setting items.





Item		Description
1)	[Device]	Set a word device to be monitored. ☞ Page 834 How to set devices, labels, and tags
2)	[Data Type]	Select the data type of the device.

Item			Description
3)	[Lower Limit] [Upper Limit]		Specify the range of the device value (lower and upper limits). Specify fixed values or use devices to specify the values. Use of devices enables dynamic change of the values. ☞ Page 834 How to set devices, labels, and tags The setting ranges for [Lower Limit] and [Upper Limit] differ depending on the item selected for [Data Type].
4)	[Slider Direction]		Specify the direction in which the slider is operated.
5)	[Moving Direction]		Select the direction in which the value increases. The selectable items depend on the setting for [Slider Direction].
6)	[Knob Width] [Knob Height]		Specify the width and height of the slider knob. For the setting values, refer to the following. ☞ Page 1804 Setting range for [Knob Width] and [Knob Height] When the object is resized on the screen editor, the following settings will be changed accordingly. • [Knob Height] when [Horizontal] is selected for [Slider Direction] • [Knob Width] when [Vertical] is selected for [Slider Direction] When the setting for [Slider Direction] is changed, the values of [Knob Width] and [Knob Hight] are swapped.
7)	[Bar Width] [Bar Height]		Set the width and height of the slider bar. For the setting values, refer to the following. ☞ Page 1804 Setting range for [Bar Width] and [Bar Height] When the object is resized on the screen editor, the following settings will be changed accordingly. • [Bar Width] when [Horizontal] is selected for [Slider Direction] • [Bar Height] when [Vertical] is selected for [Slider Direction] When the setting for [Slider Direction] is changed, the values of [Bar Width] and [Bar Hight] are swapped.
8)	Preview list		The display of the knob and bar can be checked with the preview.
9)	[Collectively set ON/OFF shape in the case of Basic Figure]		This item is displayed when [Basic Figure] is selected on the [Image List] screen that appears when the [Shape] button is clicked. Select this item to use the same knob shape for when the key touch is ON and OFF.
10)	[Shape]		Set the design of the knob and bar. To use the readily available design set, select a design from the list box. To set the shape for the knob and for the bar individually, do so on the [Image List] screen that appears when the [Shape] button is clicked. ☞ Page 1044 Object shape
11)	[Shape Attribute]	—	Set the shape color.
		[Frame Color]	Select a frame color.
		[Shape Color] [Pattern] [Background Color]	Select a shape color, pattern, and background color. The pattern is displayed in the shape color on the colored background. When [None] is selected for [Patten], [Background Color] is not available. 12)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The name is changeable on the other tabs as well. Up to 100 characters can be entered.

Setting range for [Knob Width] and [Knob Height]

The following shows the settable values for [Knob Width] and [Knob Height].

Item	[Slider Direction]	Setting range (dot)
[Knob Width]	[Horizontal]	[16] to [5998]
	[Vertical]	[16] to [6000]
[Knob Height]	[Horizontal]	[16] to [6000]
	[Vertical]	[16] to [5998]

Setting range for [Bar Width] and [Bar Height]

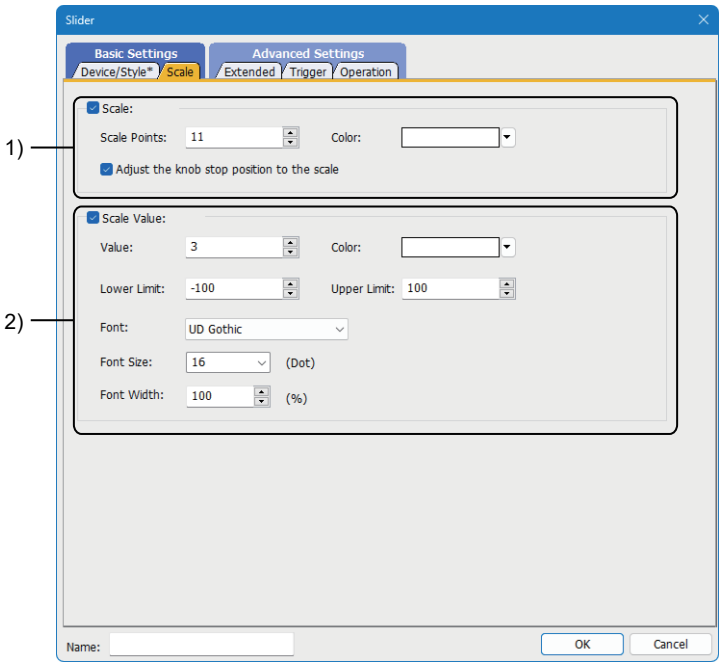
The following shows the settable values for [Bar Width] and [Bar Height].

Item	[Slider Direction]	Setting range (dot)
[Bar Width]	[Horizontal]	[18] to [6000]
	[Vertical]	[4] to [6000]
[Bar Height]	[Horizontal]	[4] to [6000]
	[Vertical]	[18] to [6000]

50.5.2 [Scale] tab

GT37 SoftGOT3000

Configure the scale mark display settings, knob stop position settings, and scale value display settings for the slider.

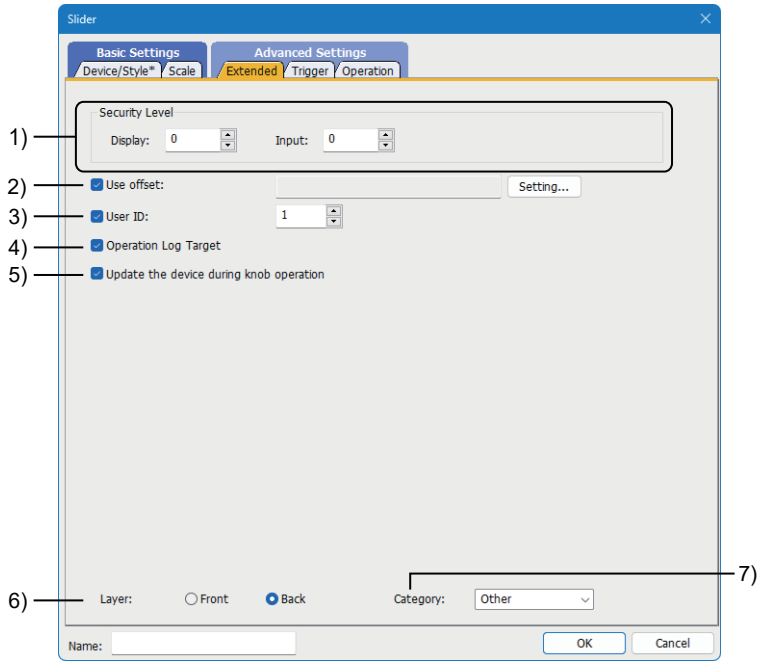


Item			Description
1)	[Scale]	—	Select this item to display the scale marks. When this item is selected, the following items are available.
		[Scale Points]	Set the number of scale marks. The setting range is [2] to [101].
		[Color]	Set the color of the scale marks. ☞ Page 988 Color settings
		[Adjust the knob stop position to the scale]	Select this item to stop the knob at a scale mark when sliding the knob. If this item is deselected, the knob can be slid in units of minimum movement. Even if this item is selected, the knob stop position cannot be aligned with a scale mark when both of the following conditions apply. • The data type is not a real number. • (Upper limit of monitor device - Lower limit of monitor device + 1) < Number of scale points
2)	[Scale Value]	—	Select this item to display numerical values on the scale. When this item is selected, the following items are available.
		[Value]	Set the number of scale values to be displayed. The setting range is [2] to [101].
		[Color]	Set the color of the scale values. ☞ Page 988 Color settings
		[Lower Limit] [Upper Limit]	Specify the lower limit and upper limit of scale values. The setting range depends on the setting of [Data Type] in the [Device/Style] tab. The setting range of 64-bit devices is the same as that of 32-bit devices.
		[Font]	Select a font for the scale values.
		[Font Size]	Set the vertical size of the scale values. The setting range is [8] dots to [540] dots.
		[Font Width]	Set the horizontal size of the scale values. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character does not exceed [8] dots to [540] dots.

50.5.3 [Extended] tab

GT37 SoftGOT3000

Set the security level of the object, use/nonuse of the offset function, the user ID, the layer on which the object is placed, and other items. Also, set the target operations for the operation log.

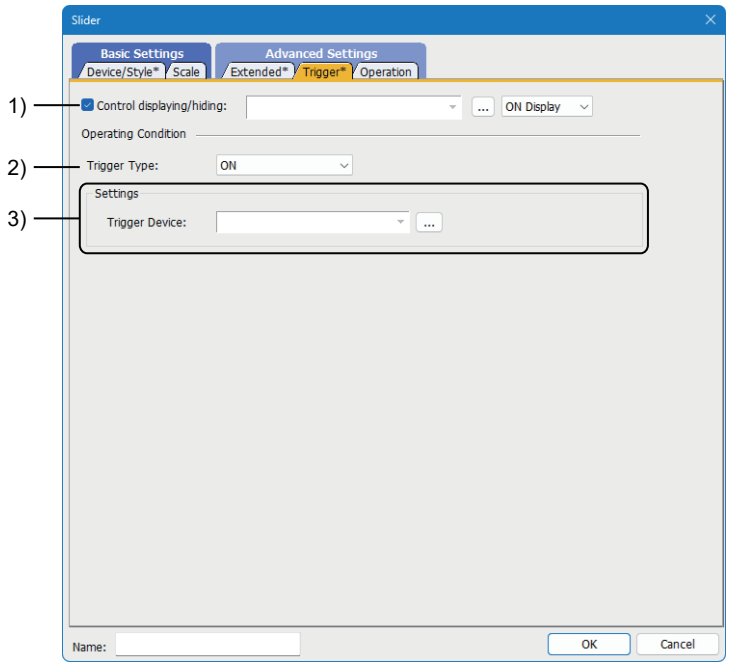


Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Use offset]	Configure the settings to monitor the statuses of multiple devices by switching them with a single device. Select this item, and set an offset device. The monitored device is the one with the offset device value added to the device set in [Device] in the [Device/Style] tab. ☞ Page 96 Offset
3)	[User ID]	Select this item to set the user ID. The setting range is [1] to [65535]. Setting the user ID enables you to identify the objects used in the operation logs. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])
4)	[Operation Log Target]	Targets the object for the operation log. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])
5)	[Update the device during knob operation]	When this item is selected, the value of the slider is immediately reflected in the device data even while the knob is being moved. If this item is deselected, the value at the time the knob is released is reflected in the device data.
6)	[Layer]	Select the layer to arrange the object on. ☞ Page 65 Layer
7)	[Category]	Select a category to assign the object. ☞ Page 1121 Managing figures and objects by category

50.5.4 [Trigger] tab

GT37 SoftGOT3000

Set the condition to display the object and to operate the object.



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Control device (bit device or bit-specified word device) • When to display: When the control device is on or off
2)	[Trigger Type]	Set the condition to operate the object. For details of the trigger type, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Settings]	For details of each item, refer to the following. ☞ Page 972 Settings by trigger type

Precautions

When either of the following conditions is not satisfied, the slider operation stops and writing a value to the device is not performed.

- Condition to display the object (applies to 1) mentioned above)
- Condition to operate the object (applies to 2) mentioned above)

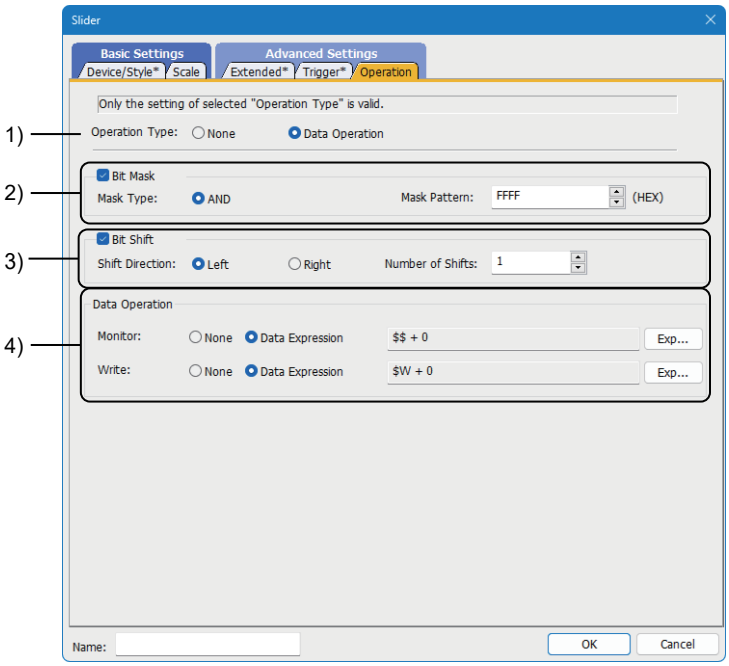
Therefore, the value written to the device may differ from the value of the knob stop position during slider operation.

PART 7

50.5.5 [Operation] tab

GT37 SoftGOT3000

Set whether to perform an operation with the device value handled by the object.



Item			Description
1)	[Operation Type]	[None]	Does not use the data operation function.
		[Data Operation]	Set the expression for the data operation function. ☞ Page 1049 Data operation
2)	[Bit Mask]	—	Set the operation of mask processing. This setting is invalid when the setting of [Data Type] is a real number.
		[Mask Type]	Fixed to [AND] (logical AND).
		[Mask Pattern]	Set a pattern value to mask in hexadecimal. The setting range depends on the setting of [Data Type] in the [Device/Style] tab.
3)	[Bit Shift]	—	Set the operation of shift processing. This setting is invalid when the setting of [Data Type] is a real number.
		[Shift Direction]	Select a shifting direction.
		[Number of Shifts]	Set the number of bits to be shifted. The setting range depends on the setting of [Data Type] in the [Device/Style] tab.
4)	[Data Operation]	—	Set the format of the expression.
		[Monitor]	The data operation is performed with the value stored in the monitored device. The slider knob indicates the value after the operation. • [None] The data operation is not performed. • [Data Expression] The data operation is performed. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog
		[Write]	The data operation is performed with the value indicated by the slider knob. The value after the operation is written to the monitored device. • [None] Dose not perform the data operation by using the expression. • [Data Expression] Performs the data operation by using the expression. Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

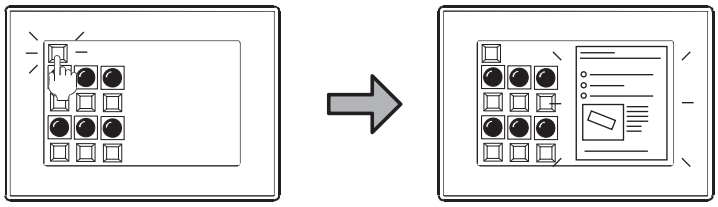
51 Placing a document display

☞ Page 1810 Overview of the document display
☞ Page 1811 Specifications of the document display
☞ Page 1814 Preparation for using Document Converter
☞ Page 1819 How to use the document display (for PDF files)
☞ Page 1821 How to use the document display (for Document Converter output files)
☞ Page 1825 Placing a document display
☞ Page 1827 Operating the document display
☞ Page 1837 [Document Display] dialog
☞ Page 1843 Relevant settings

51.1 Overview of the document display

GT37 SoftGOT3000

The document display object displays documents on the GOT, such as Microsoft Word files converted with Document Converter and PDF files.
With this function, the GOT can display specifications and manuals. Thus, you can utilize the documents for the screen of troubleshooting, or display the documents for the operation during monitoring.



Display the document for the operation of objects such as touch switches on the GOT.

51.2 Specifications of the document display

GT37 SoftGOT3000

The following shows the specifications of the document display.

☞ Page 1811 Usable document type
☞ Page 1811 Usable drive
☞ Page 1811 Document ID
☞ Page 1812 Displaying a cached document
☞ Page 1812 Maximum number of objects on one screen
☞ Page 1812 Number of objects that can be displayed at one time
☞ Page 1812 Displaying the [Search] or [Bookmark] window for a PDF file
☞ Page 1812 Precautions

51.2.1 Usable document type

The documents that can be used for the document display are JPEG files converted with Document Converter (hereafter, Document Converter output files) and PDF files.

PDF file

The PDF file under the following conditions is displayed without conversion to JPEG format.

- Any TTF font is embedded in the file.
- No password is required to open the file.

Document Converter output file

JPEG file that is converted from a document in another file format with Document Converter.

The following shows the documents that can be converted to JPEG format with Document Converter.

- Microsoft Word
- Microsoft Excel
- Microsoft PowerPoint
- PDF file
- Image file (JPEG, BMP)

51.2.2 Usable drive

The following shows the drives usable to store the files to be displayed on the document display object.

- Drive A
- Drive B
- Drive E
- Drive F
- Drive G
- Drive X (current drive)

For the available drives by GOT model, refer to the following.

☞ Page 81 Drive configuration and capacity of the GOT

51.2.3 Document ID

ID number that is set for a document to appear on the document display.

The setting range is 1 to 32767.

51.2.4 Displaying a cached document

PDF files are cached to speed up the display of the files on the document display.
A PDF file is cached or a cached PDF file is updated when the file is displayed.
The cached PDF file is stored in the CACHE folder on the drive where the source PDF file is stored.

Precautions

A document cannot be cached to display in the following cases.

- The data storage or file server is write-protected.
- The data storage or file server has insufficient free space.
- The data storage or file server is faulty.
- The Invalidate Cache signal (GS523.b0) is on.

The Cache Invalidated signal (GS276.b1) turns on when the cache is unavailable.

51.2.5 Maximum number of objects on one screen

One document display can be placed on one screen.

51.2.6 Number of objects that can be displayed at one time

One document display can be displayed for each document type at one time.
If the same document type is set for multiple document displays, these document displays cannot be displayed simultaneously.
Regardless of using the overlap window, superimpose window, or set overlay screen, the multiple document displays are unavailable.

51.2.7 Displaying the [Search] or [Bookmark] window for a PDF file

One system window is used for the [Bookmark] or [Search] window operation.
For system windows, refer to the following.
☞ Page 536 Using an overlap window as the system window

51.2.8 Precautions

In the following cases, a document is not displayable on the document display object.
The Document Error signal (GS276.b0) turns on when a document is not displayable.

- The specified file is nonexistent.
- The type of the specified file differs from the set document type.
- The specified file is corrupt.
- No data storage is installed.
- The data storage is unformatted.
- The SD card cover of the GOT is open.
- The SD card access switch of the GOT is turned off.
- A nonexistent document ID number or page number is specified.
- The size of a JPEG file exceeds the size of 1240 dots × 840 dots or 840 dots × 1240 dots.
- The size of a JPEG file converted with Document Converter exceeds 960 KB.
- The specified PDF file is not supported.
- The specified PDF file is password-protected.
- A page in the specified PDF file contains a large image file.

A document that contains a large image file may not be displayed.
Create a PDF file that does not contain a large image file.

- The page size (paper size) of the specified PDF file is large.

Create a PDF file with a reduced page size.

- A page in the specified PDF file contains many figures and objects.

Create a PDF file with reduced number of figures and objects in a page.

51.3 Preparation for using Document Converter

Before using Document Converter, install the following software in the personal computer.

☞ Page 1814 Installing Document Converter
☞ Page 1815 Installing Ghostscript (Free software)
☞ Page 1816 Installing the PostScript printer driver

51.3.1 Installing Document Converter

For information on how to install Document Converter, consult your local sales office.

For information on how to install Document Converter, refer to the following.

📖iQ Works Version 2 Installation Instructions

The following shows the operating environment for Document Converter.

Item	Description
Model	Windows-compatible personal computer
OS (English version)*1*2*3*4*5	• Microsoft Windows 11 Education (64-bit) • Microsoft Windows 11 Enterprise (64-bit) • Microsoft Windows 11 Pro (64-bit) • Microsoft Windows 11 Home (64-bit) • Microsoft Windows 10 Enterprise (32-bit, 64-bit) • Microsoft Windows 10 Pro (32-bit, 64-bit) • Microsoft Windows 10 Home (32-bit, 64-bit)
CPU	• Windows 11: 64-bit compatible processor with dual-core or more or System on a Chip (SoC)*8 • Other than Windows 11: Intel Core 2 Duo Processor 2.0 GHz or more recommended*8
Memory	• For Windows 11: 4 GB or more recommended • For 64-bit OS other than Windows 11: 2 GB or more recommended • For 32-bit OS other than Windows 11: 1 GB or more recommended
Display	Resolution: SVGA (800 × 600 dots) or higher
Hard disk space	• For installation: 10 MB or more • For execution: 100 MB or more recommended*6
Display color	High Color (16 bits) or higher
Other software	To display Help, the following software application must be installed. • Internet Explorer 7 or later recommended
	The following software must be installed. • Ghostscript GPL 9.55 or later (Free software) • PostScript printer driver supplied with Windows*7 • Microsoft Office 2003, Microsoft Office XP, Microsoft Office 2000*7

*1 For installation, the standard user or administrator account is required.
To interact with other MELSOFT applications which are used under the administrator authority, use GT Designer3 under the administrator authority.

*2 The following functions are not supported.
Application start in Windows compatibility mode
Fast user switching
Change your desktop themes (fonts)
Remote desktop
Setting the size of text and illustrations on the screen to any size other than [Small-100%]

*3 Operation is not supported when the text cursor indicator is turned on.

*4 The touch feature is not supported.

*5 Operation in not supported in a virtual environment such as Hyper-V.

*6 For execution, the hard disk space for storing the temporary data in conversion is required.
The required hard disk space is different depending on the document to be converted.
When the conversion fails, increase the hard disk space and convert the document again.

*7 Required to convert a file created with Microsoft Word, Microsoft Excel, or Microsoft PowerPoint.

*8 ARM64 and ARM32 are not supported.

51.3.2 Installing Ghostscript (Free software)

Install Ghostscript GPL9.55 or later.
Download Ghostscript from the following website.
https://www.ghostscript.com/releases/gsdnld.html
Note that the above website may be changed without notification.

Installation procedure

The following shows how to install Ghostscript GPL 9.55 as an example.

Operating procedure

1. Execute the downloaded file.
2. In the setup wizard, click the [Next] button.
3. In the license agreement window, click the [I Agree] button.
4. Select the installation destination, and click the [Install] button to start the installation.

to start the installation.

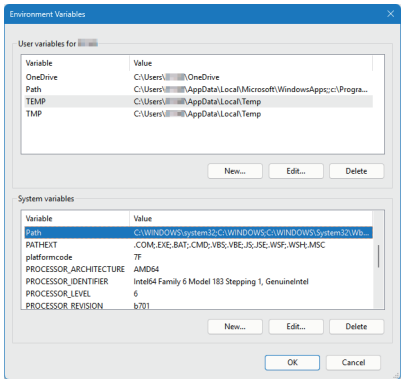
5. In the window notifying the completion of the installation, select options as necessary and click the [Finish] button.

Adding environment variables

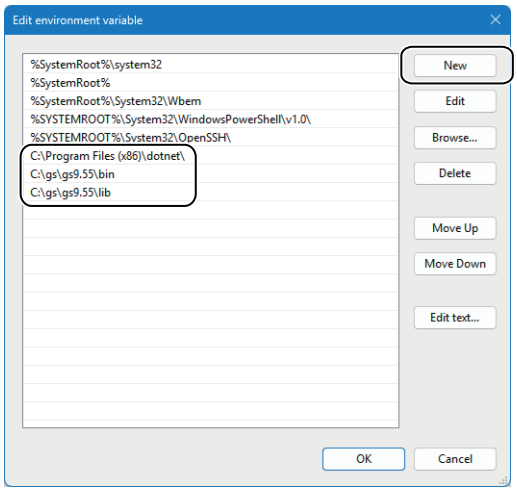
When setting [C:\gs] as the installation destination, add [C:\gs******\bin] and [C:\gs******\lib] to the path of environment variables after the installation is completed.
Input six characters consisting of upper five digits of the installation execution file name and a decimal number to ******.
(For gs9550w64.exe, input gs9.55.)
The following shows the procedure for setting environment variables.

Operating procedure

1. From the Windows start menu, select [All] → [Windows Tools], and double-click [Control Panel] in the displayed [Windows Tools].
2. In the displayed [Control Panel], select [System and Security] → [System].
3. Click [Advanced system settings] beside [Related links].
4. The [Advanced] tab in [System Properties] is displayed. Click the [Environment Variables] button.
5. Select [Path] in [System variables], and then click the [Edit] button.



6. Click the [New] button in the [Edit environment variable] dialog and add the path.
There is no need to add a semicolon (;).



7. Restart the personal computer.

51.3.3 Installing the PostScript printer driver

The following shows how to install the PostScript printer driver supplied with Windows.
For details on the operation of Windows, refer to the manual or help of Windows.

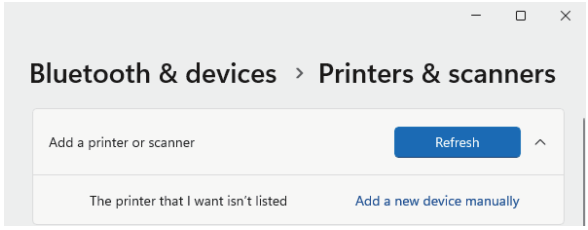
Operating procedure

1. From the Windows start menu, select [All] → [Windows Tools], and double-click [Control Panel] in the displayed [Windows Tools].

2. In the displayed [Control Panel], select [Hardware and Sound] → [Add a printer].

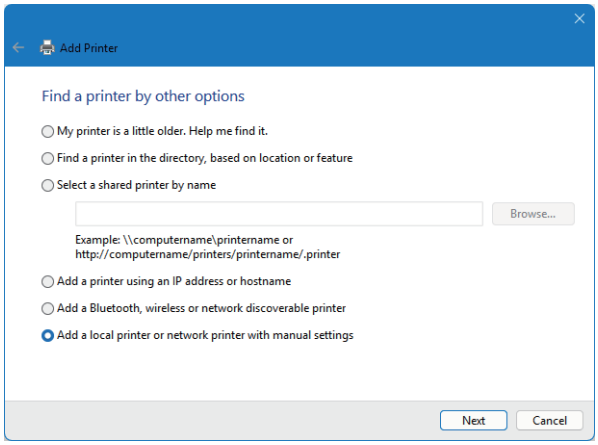
3. Click the [Add a device] button in the upper right of the displayed screen.

4. [Add a new device manually] button appears. Click the button.

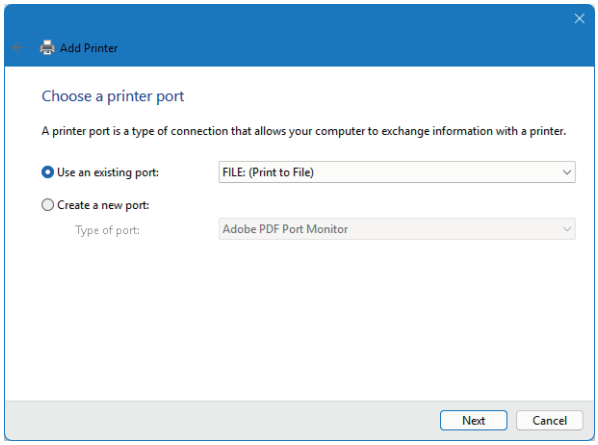


The [Add a printer] dialog appears.

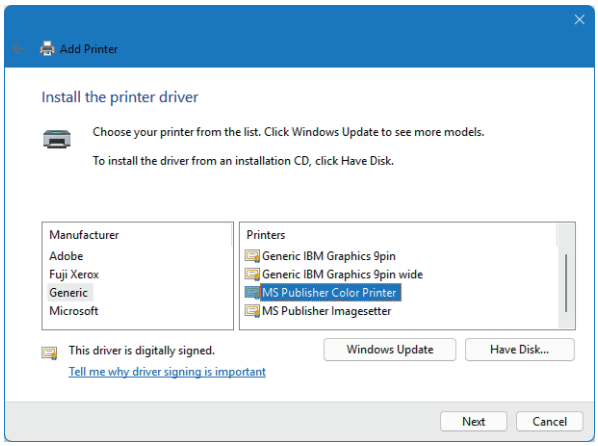
5. Select [Add a local printer or network printer with manual settings], and click [Next].



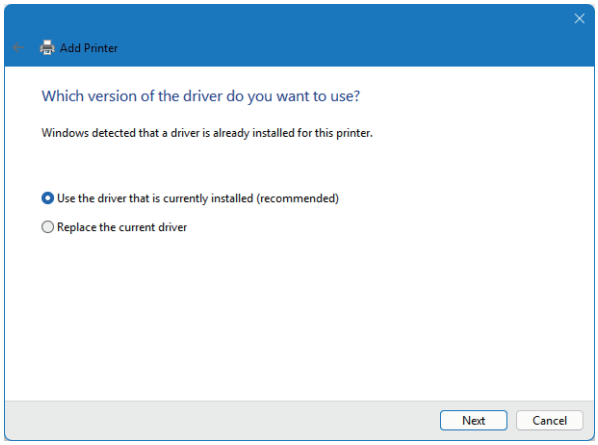
6. Select [FILE: (Print to File)] for [Use an existing port], then click [Next].



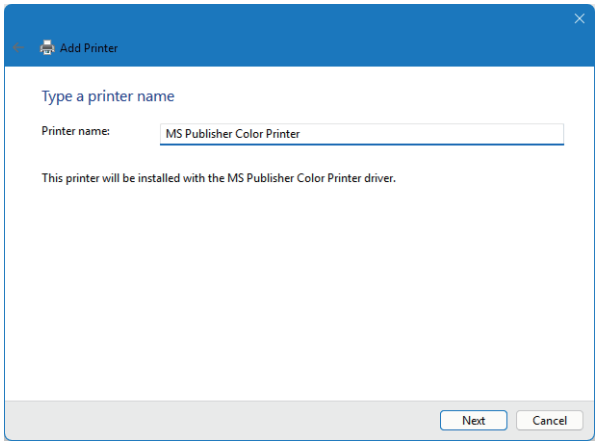
7. Select the PostScript printer driver (manufacturer: Generic, printer: MS Publisher Color Printer) supplied with Windows, then click [Next].



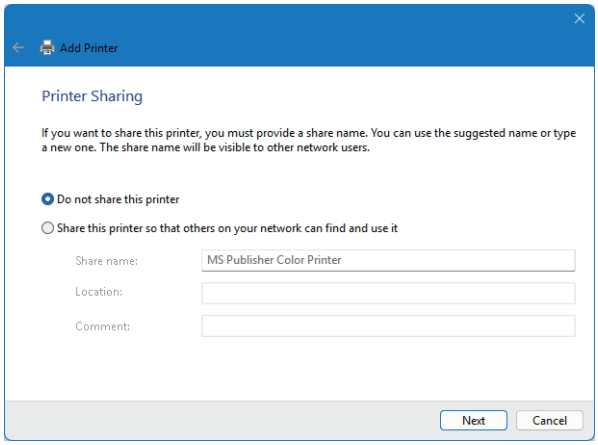
8. Select [Use the driver that is currently installed], then click [Next].



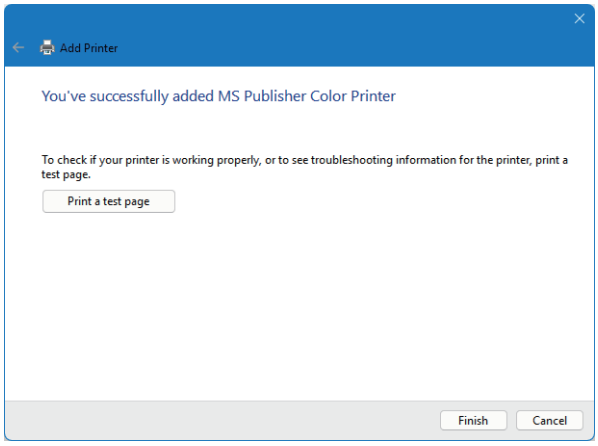
9. Confirm [Printer name], then click [Next].



10. Select [Do not share this printer], then click [Next].



11. Click the [Finish] button.



51.4 How to use the document display (for PDF files)

GT37 SoftGOT3000

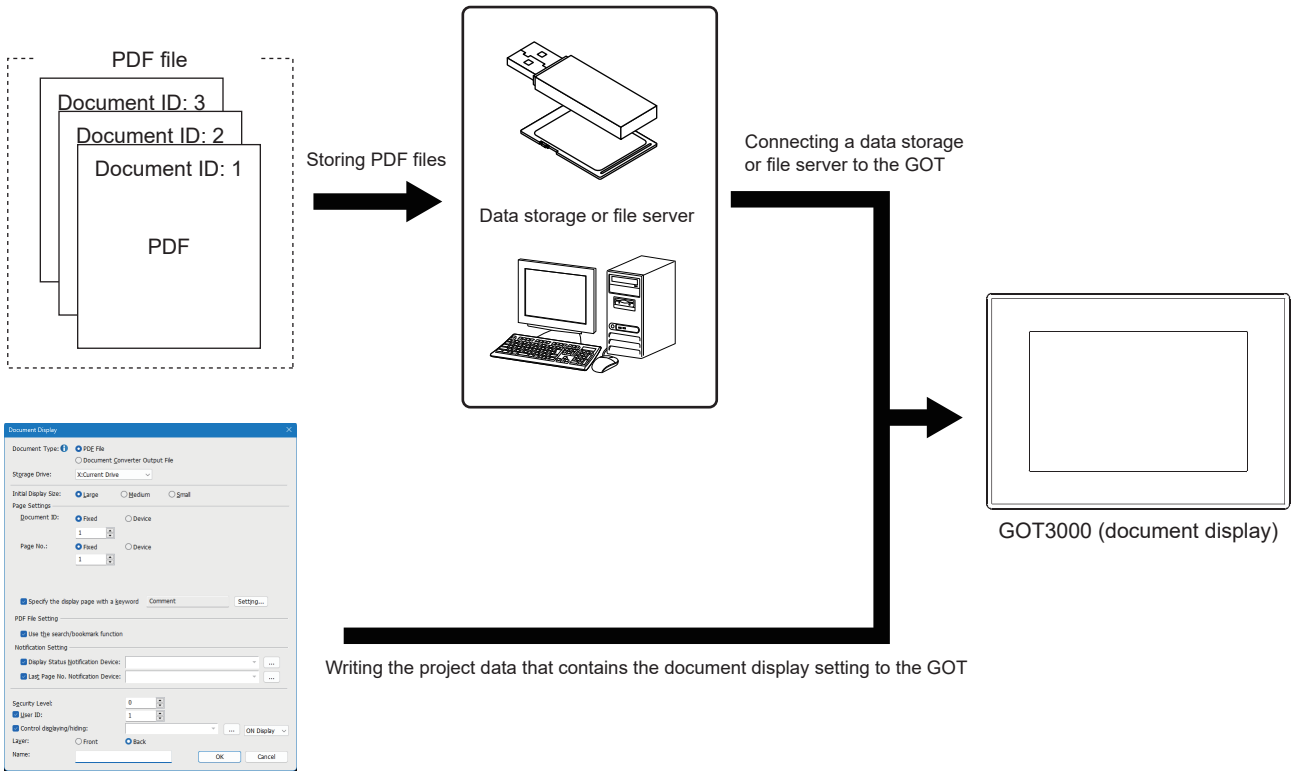
The following shows how to display PDF files on the document display.

☞ Page 1819 Outline of how to display PDF files

☞ Page 1820 Storing files on a data storage or file server

51.4.1 Outline of how to display PDF files

The following outlines how to display PDF files.



GT Designer3 (Object setting)

For details on the operations below, refer to the following.

- Storing PDF files on a data storage or file server

☞ Page 1820 Storing files on a data storage or file server

- Configuring the settings for a document display object with GT Designer3

☞ Page 1837 [Document Display] dialog

51.4.2 Storing files on a data storage or file server

In the root directory of a drive, create a folder named "PDFDAT", and store PDF files in the folder.

Create folders and files in the PDFDAT folder as shown below.

• Document ID setting

According to the hierarchical structure of the folders and files, set a document ID number in each folder name or file name.

A five-digit document ID number is settable.

The setting range is 00001 to 32767.

• Hierarchical structure of the folders and files

To store PFD files, use one of the following hierarchical structures.

If multiple hierarchical structures are used, an unintended PDF file may appear on the document display.

☞ Page 1820 Storing PDF files by document ID number

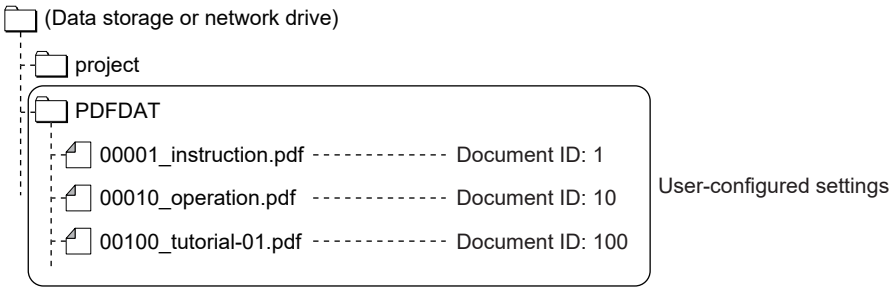
☞ Page 1820 Storing a PDF file to each folder named with a document ID number

Storing PDF files by document ID number

Store the PDF file whose file name includes a document ID number.

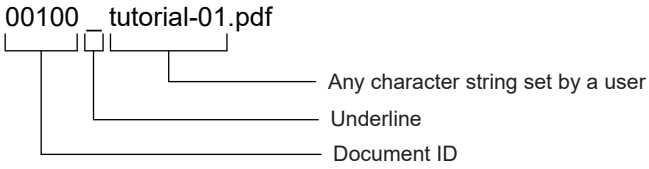
To store multiple PDF files, set a different document ID number for each file name.

• Hierarchical structure of the folders and files



• PDF file name

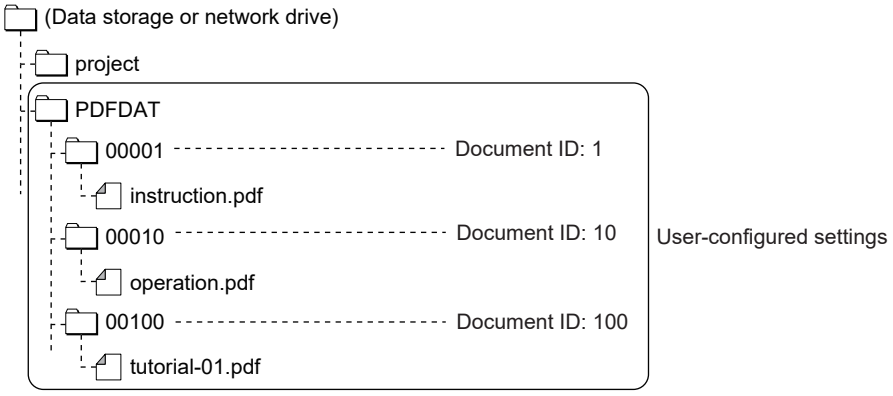
Set a PDF file name that includes a document ID number, an underscore, and user-specified characters as shown below.



Storing a PDF file to each folder named with a document ID number

Create folders named with a different document ID number, and store one PDF file to each folder.

Name the PDF file using user-specified characters.



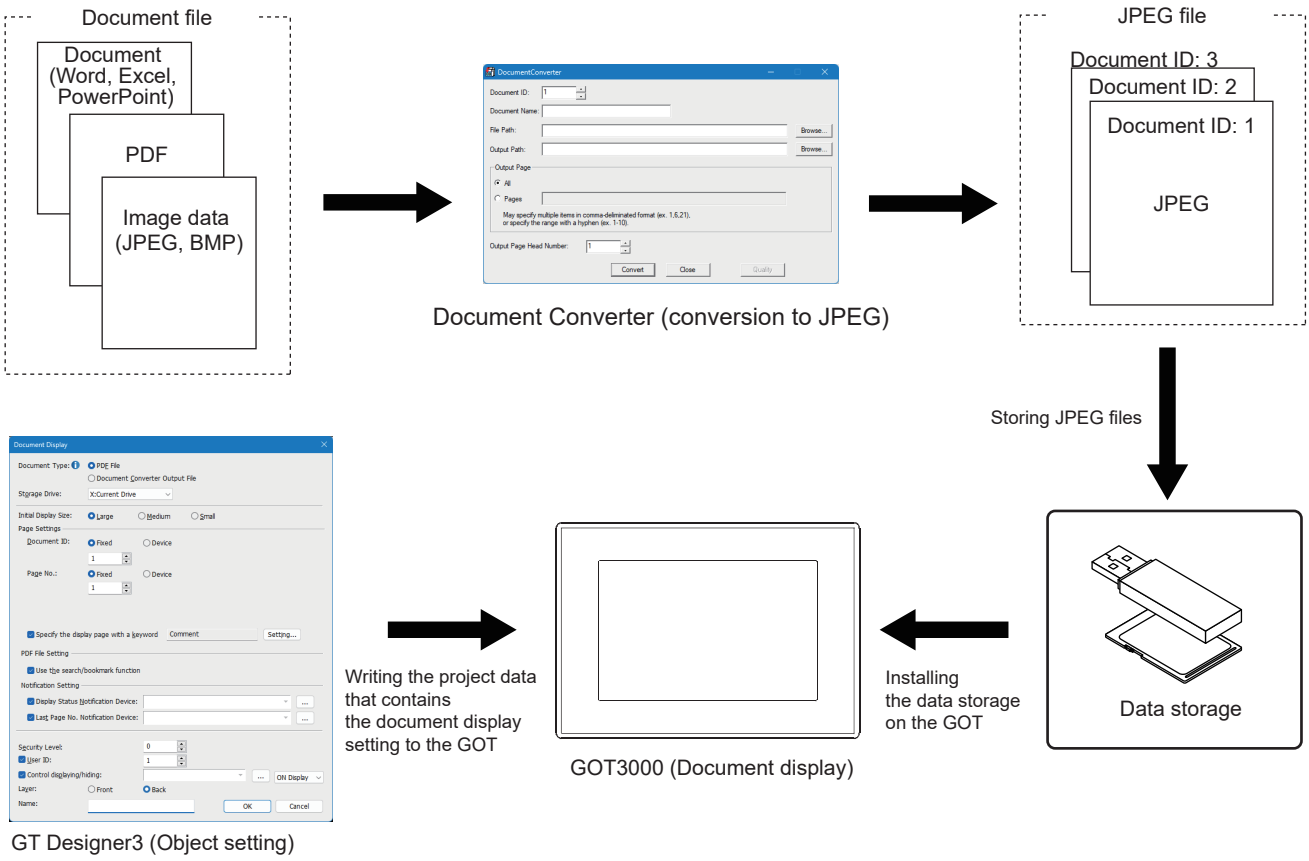
51.5 How to use the document display (for Document Converter output files)

GT37 SoftGOT3000

The following shows how to display Document Converter output files on the document display.

51.5.1 Outline of how to display Document Converter output files

The following outlines how to display Document Converter output files.



For details on the operations below, refer to the following.

- Converting files with Document Converter

☞ Page 1822 Converting documents to JPEG format with Document Converter

- Storing JPEG files to a data storage

☞ Page 1824 Storing JPEG files to a data storage

- Configuring the settings for a document display object with GT Designer3

☞ Page 1825 Placing a document display

☞ Page 1837 [Document Display] dialog

PART 7

51.5.2 Converting documents to JPEG format with Document Converter

The following shows how to convert a document to JPEG format with Document Converter.

Conversion procedure

The following shows the conversion procedure.

1. Start Document Converter.

When Ghostscript runs with administrator privileges, use Document Converter with administrator privileges as well.

For information on how to run the software with administrator privileges, refer to the following.

📖Manual and Help for Windows used

The [Document Converter] dialog appears.

2. Configure each setting.

☞ Page 1822 [Document Converter] dialog

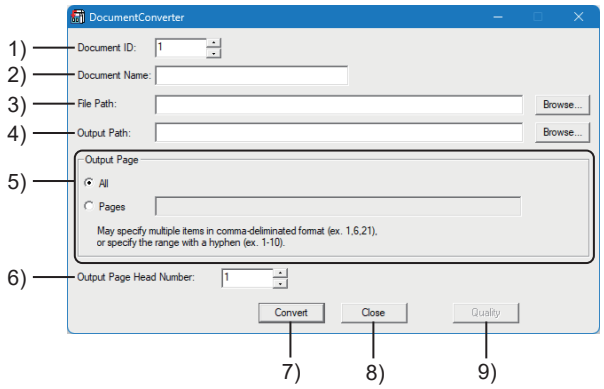
3. After the setting, click the [Convert] button.

The conversion starts.

After the conversion, the JPEG file is created in three sizes (large, medium, small) for each page.

Only the large size (816 dots × 1168 dots) is used for document display.

■[Document Converter] dialog



Item		Description
1)	[Document ID]	Set the document ID for the converted document. The setting range is [1] to [32767].
2)	[Document Name]	Se the name for the converted document. The name is displayed in GT Designer3 (such as the data view or property sheet) and in the operation log. Up to 32 characters can be set.
3)	[File Path]	Clicking the [Browse] button to specify the path name of the file to be converted.
4)	[Output Path]	Set the output destination (path) of the converted file. The following shows the folders and files after the path which can be set. (Output path)\DOCIMG\(Document ID)\(Output size: L, M, or S)\IMG*****.JPG As the output size, L means large, M means medium, and S means small. The string "******" represents a page number. Example) When [Document ID] is set to [1] and the output size is [L] (Output path)\DOCIMG\001\L\IMG00001.JPG
5)	[Output Page]	Set the page to be converted. Set this item when the file to be converted is Word, Excel, PowerPoint, or PDF file.
6)	[Output Page Head Number]	Set the start page number of the pages to be converted. The setting range is [1] to [65535] page(s).
7)	[Convert] button	Starts conversion.
8)	[Close] button	Closes the [Document Converter] dialog.
9)	[Quality] button	Set the image quality of the document. The setting is applied to the converted document. ☞ Page 1823 Quality adjustment procedure

Quality adjustment procedure

The following shows the quality adjustment procedure.

Operating procedure

1. Start Document Converter.

The [Document Converter] dialog appears.

2. Click the [Quality] button.

The [Quality] dialog appears.

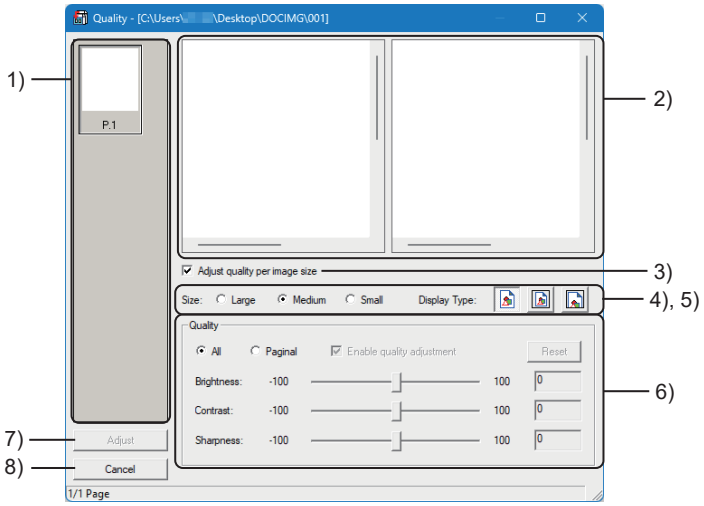
3. Configure each setting.

☞ Page 1823 [Quality] dialog

4. After the setting, click the [Adjust] button.

The [Quality] dialog is closed and the setting of the quality adjustment is completed.

■[Quality] dialog



Item			Description
1)	Page list		Displays the thumbnails for each page. Select the page whose image quality is to be adjusted from this list. When [Paginal] is set for [Quality], select the page.
2)	Preview window		Displays the preview of the image. The preview before the quality adjustment is shown in the left window. The preview after the quality adjustment is shown in the right window.
3)	[Adjust quality per image size]		To adjust the image quality, select this item, then select the intended image size using [Size].
4)	[Size]		Select the image size to be adjusted. For the document display, specify [Large] because only large-size images are used.
5)	[Display Type]		Select a display type at the preview window.
6)	[Quality]	[Reset] button	Set this item to adjust the image quality. Select the method of adjustment. The following shows selectable items. • [All]: Select this item to apply the same adjustment to all pages. • [Paginal]: Select this item to adjust the image quality per page. Select the page to be adjusted from the page list and set [Enable quality adjustment] to adjust the selected page. Clears the setting of [Quality].
		[Brightness]	Set the value of brightness. The setting range is [-100] to [100].
		[Contrast]	Set the value of contrast. The setting range is [-100] to [100].
		[Sharpness]	Set the value of sharpness. The setting range is [-100] to [100].

Item		Description
7)	[Adjust] button	Executes the set quality adjustment. Note that the setting cannot be restored after the execution.
8)	[Cancel] button	Cancels the set quality adjustment and closes the dialog.

51.5.3 Storing JPEG files to a data storage

When a document is converted with Document Converter, the DOCIMG folder is automatically created.

Subfolders for each document ID are created under the DOCIMG folder, where the converted documents are stored.

Copy the entire DOCIMG folder to the root directory of the drive.

Do not change the hierarchical structure of the folders and files in the DOCIMG folder.

Doing so cause the GOT not to recognize the files.

However, since only large-size images are used for the document display, deleting the [M] and [S] folders under each document ID folder does not cause any problems.

51.6 Placing a document display

The following shows how to place the document display (object).

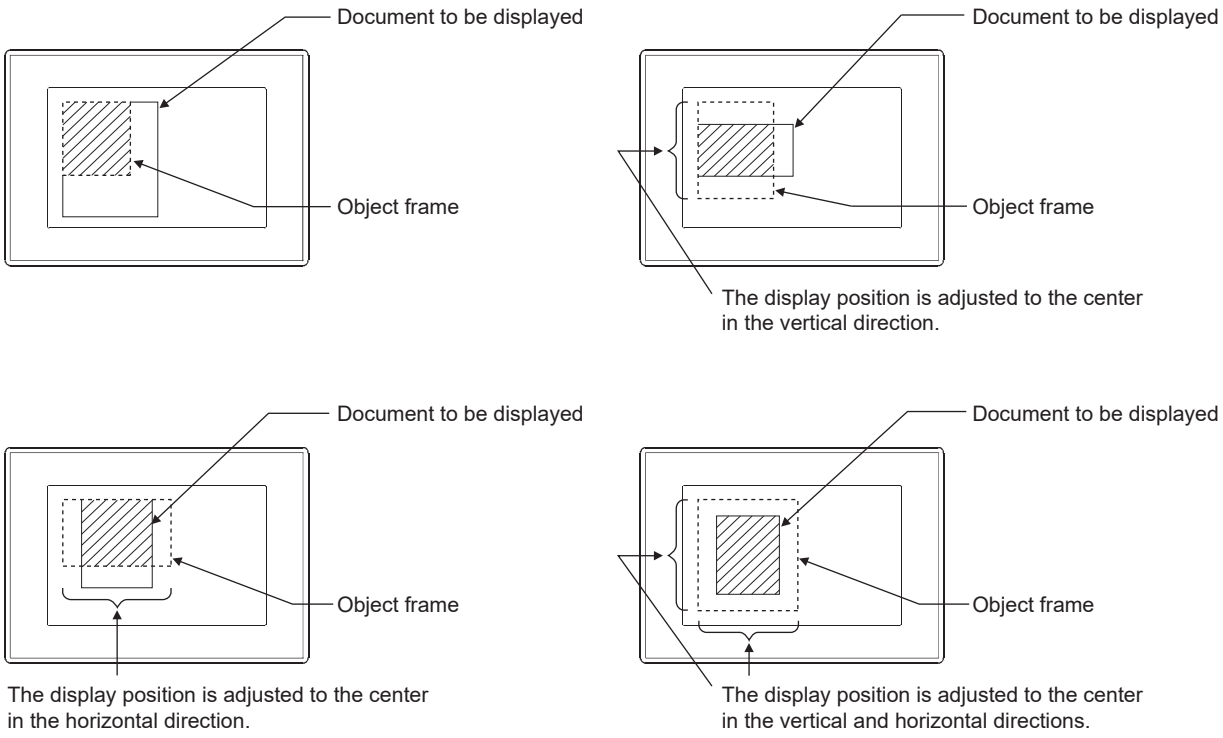
Operating procedure

1. Select [Object] → [Document Display] from the menu.
2. Click the position to place a document display.
3. Double-click the document display which has been placed to display the setting dialog.

☞ Page 1837 [Document Display] dialog

4. Depending on the frame size of the placed document display object and the size of a target file, the display is changed as shown below.

The shaded area is displayed on the GOT.



Point

More useful setting method

You can configure the object settings with the property sheet.

☞ Page 126 Checking and editing settings of screens and objects

PART 7

Image displayed on the document display object in GT Designer3

A sample image is previewed on the document display object in GT Designer3.

When the sample image is replaced with another image with the same file name, the replaced image is displayed.

The following shows the storage folders and file names of the sample images.

Item	Description
Storage folder	The following folder contains folders for each display language of GT Designer3. [(Path to the installation location of GT Designer3)\GTD3_3000\App] • Japanese: ja-JP • English: en-US • Simplified Chinese: zh-CN When the display language of GT Designer3 is switched, the reference folder is also switched.
File name	Sample images are stored in the folder of each language. • IMG00000L.JPG: Large size (816 dots × 1168 dots) • IMG00000M.JPG: Medium size (656 dots × 928 dots) • IMG00000S.JPG: Small size (400 dots × 584 dots)

51.7 Operating the document display

GT37 SoftGOT3000

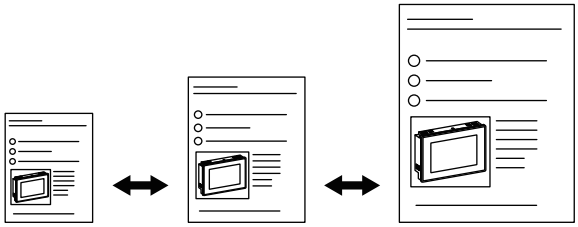
The following shows how to operate the document display.

51.7.1 Enlarging or reducing the display of a document

On the GOT, you can enlarge or reduce the display of a document on the document display object.
The frame size of the document display object remains unchanged even though the display of the document is enlarged or reduced.

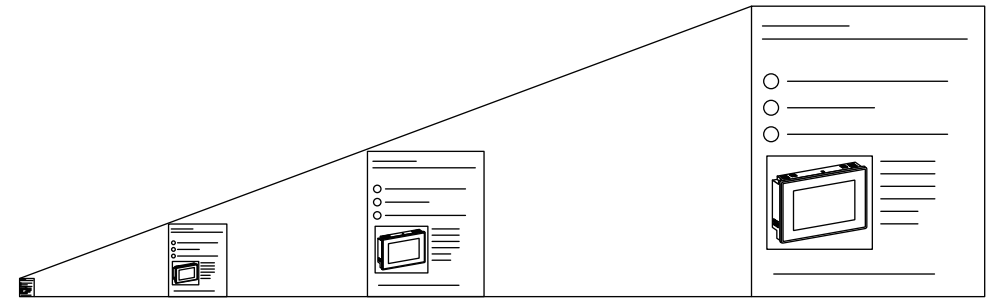
Enlarging or reducing the document using the [Initial Display Size] setting in the [Document Display] dialog

The initial display size of the document can be specified as large (100%), medium (75%), or small (50%).
☞ Page 1837 [Document Display] dialog



Enlarging or reducing the document using the object gesture function

The object gesture function enlarges or reduces the document to any size (25% to 400%) with the full size of the document being 100%.



Enlarging or reducing the document with a key code switch

When the document size is enlarged or reduced with a key code switch, one of the following magnifications is used.

Magnification (%)										
25	37.5	50	62.5	75	87.5	100	125	150	200	400

PART 7

51.7.2 Operating method of the document display

The following shows how to operate the document display.

☞ Page 1828 Operations by using touch switches
☞ Page 1829 Operations by using the object gesture function
☞ Page 1830 Page switching by using a device

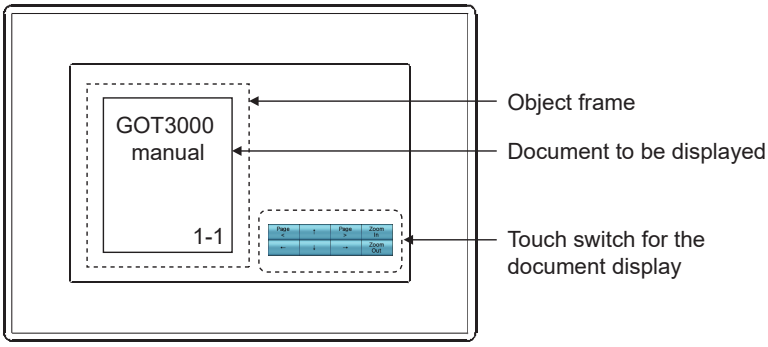
Operations by using touch switches

Using touch switches where the key codes for the document display are set, operate the document display.

Touch switches for the document display are available by reading from the library of GT Designer3.

The text and shape of each touch switch are user-changeable.

When key codes are set for touch switches, touch switches for the document display can be created by a user.



Touch switch	Key code (HEX)	Description
Next page	FFE0	Moves to the next page or previous page.  When the page No. is specified using a device, the device value is changed according to the key operation.
Previous page	FFE1	
Expansion	FFE2	Enlarges or reduces the display of a page. For details on enlarging or reducing, refer to the following. ☞ Page 1827 Enlarging or reducing the display of a document Reduction	FFE3	

Touch switch	Key code (HEX)	Description
Up Scroll	FFE4	Scrolls the page either upward or downward.  When the top or bottom of the page is displayed, or the vertical size of the document is smaller than the object frame size (at vertical centering display), the keys do not work.
Down Scroll	FFE5	
Left Scroll	FFE6	Scrolls the page either left or right.  When the left end or right end of the page is displayed, or the vertical size of the document is smaller than the object frame size (at horizontal centering display), the keys does not work.
Right Scroll	FFE7	

Operations by using the object gesture function

The display of objects can be operated using gestures.

For information on operations using gestures, refer to the following.

☞ Page 507 Operating objects with gestures (object gesture function)

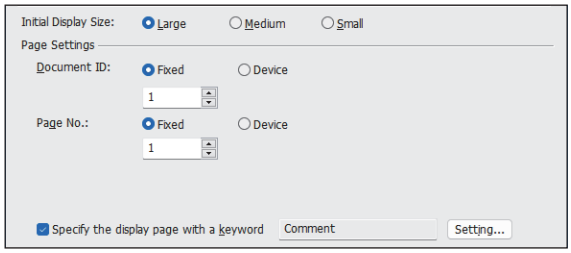
PART 7

Page switching by using a device

You can control the page displayed on the document display by using a device.

In the [Document Display] dialog, select [Device] for [Page No.] and set [Device].

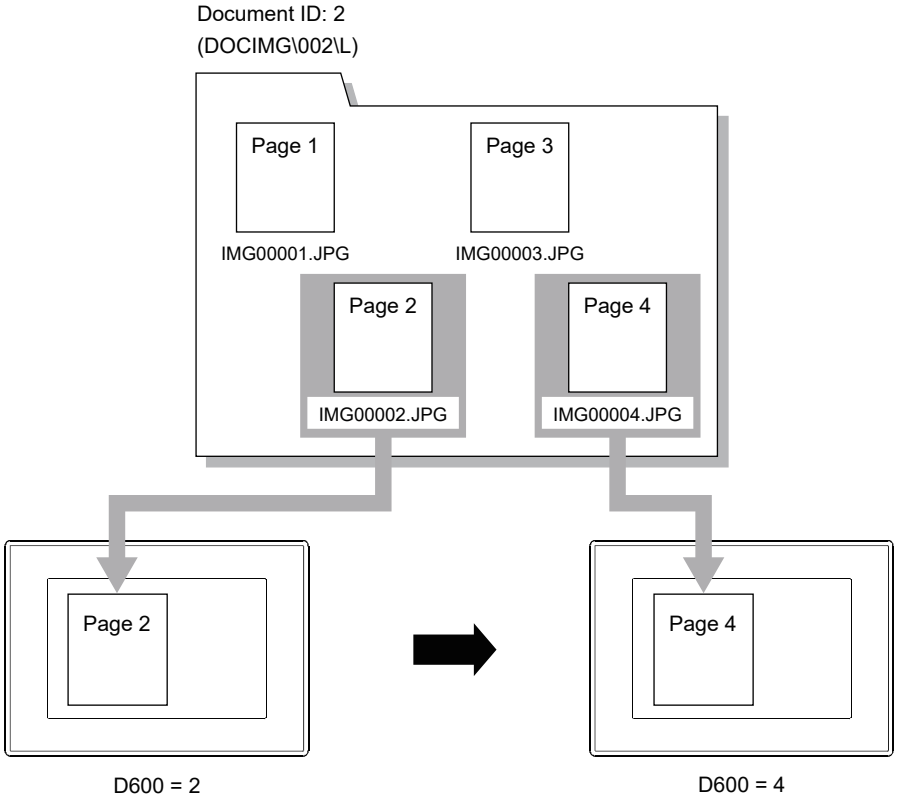
☞ Page 1837 [Document Display] dialog



Changing the set device value switches the page displayed on the document display.

Ex.

When [Document Type] is [Document Converter Output File], [Initial Display Size] is [Large], [Document ID] is [2], and [Device] is [D600]



Precautions

When a nonexistent page is specified during page switching, no document is displayed.

The Document Display Status Notification signal (GS276.b0) turns on.

Using bookmarks

This function is available only when the document type is the PDF file.

Touching a bookmark displays the linked page.

Up to 1000 bookmarks in 10 levels are displayable.

For a PDF file without bookmarks, nothing is displayed in the [Bookmark] window.

For the setting to use the [Bookmark] window, refer to the following.

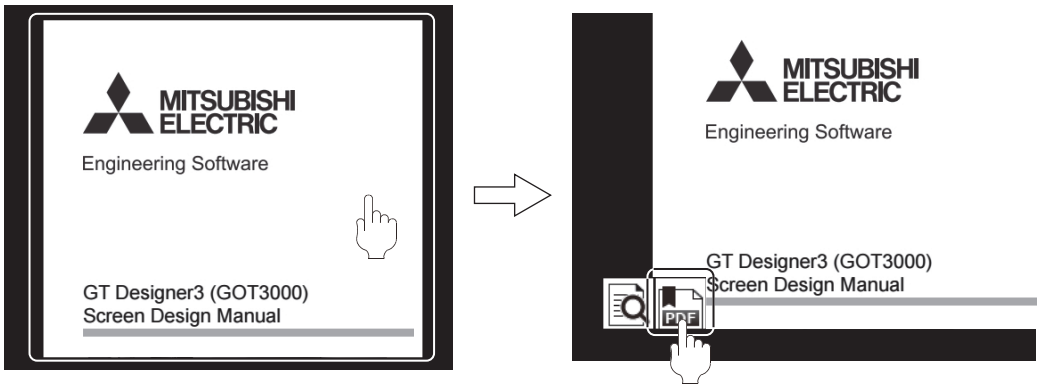
☞ Page 1837 [Document Display] dialog

The following shows how to operate the [Bookmark] window on the GOT.

Operating procedure

1. Touch a document display object to display the Bookmark button.

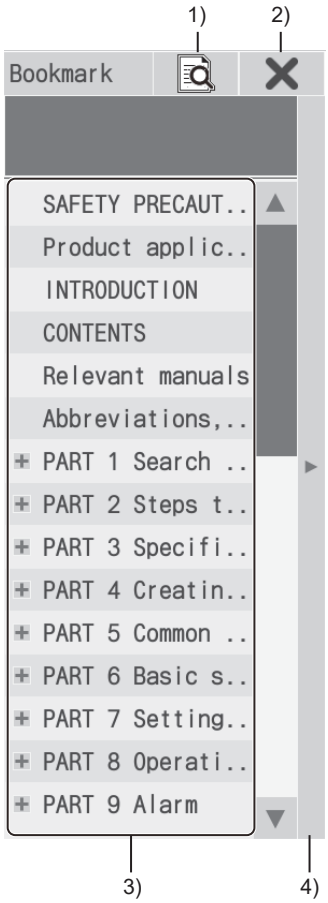
If no operation is performed within a certain time period, the Bookmark button is hidden.



Touch the document display object.

Touch the Bookmark button.

2. Touch the Bookmark button to display the [Bookmark] window.



Item		Description
1)	Search button	Switches to the [Search] window.
2)	[×] button	Closes the [Bookmark] window.
3)	Bookmarks	Touch a bookmark to display the linked page. To expand a bookmark, touch [+] beside the bookmark. In this case, only the bookmark and its child bookmarks are listed. To return to the parent level, touch [-] beside the bookmark.
4)	Change Window Width button	Changes the width of the [Bookmark] window.

Keyword search in the [Search] window

This function is available only when the document type is the PDF file.

In the [Search] window, enter a keyword to search for in a PDF file.

The following strings cannot be searched for.

- String split across a page boundary
- One-byte string split over two lines
- Bookmark or annotation

For the setting to use the [Search] window, refer to the following.

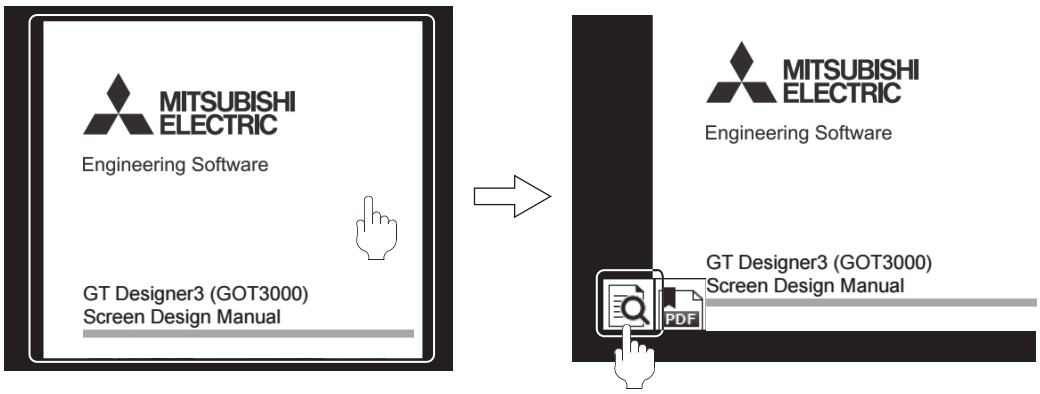
☞ Page 1837 [Document Display] dialog

The following shows how to operate the [Search] window on the GOT.

Operating procedure

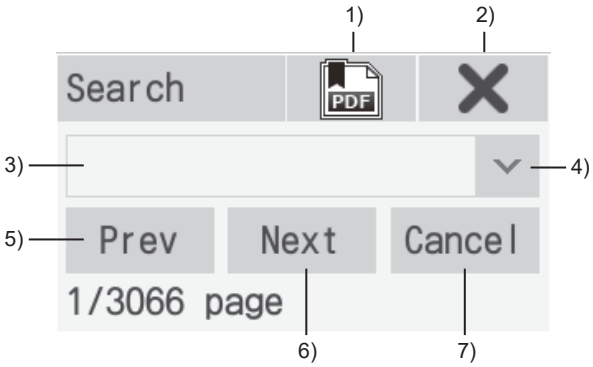
1. Touch a document display object to display the Search button.

If no operation is performed within a certain time period, the Search button is hidden.



Touch the document display object. Touch the Search button.

2. Touch the Search button to display the [Search] window.



Item		Description
1)	Bookmark button	Switches to the [Bookmark] window.
2)	[×] button	Closes the [Search] window.
3)	Search string entry field	Touch the entry field to display the key window for entering a search string. For the key window, refer to the following. ☞ Page 558 Setting key windows of the GOT ([Key Window]) Enter a string and touch the [ENTER] key in the key window to perform a search. The search is case-sensitive and only returns exact matches. Up to 47 Unicode characters can be entered. The 48th and subsequent characters are deleted when the [Enter] key is touched.
4)	Search History button	Lists up to 10 strings which are recently searched for. Select a string from the search history to perform a search. In this case, the selected string becomes the last-used one and moves to the top of the search history. When the Disable Search History Update signal (GS523.b1) is on, the search history does not updates. However, you can still perform searches using the strings in the search history.
5)	[Prev] button	Searches for the previous instance of a string from the current page.
6)	[Next] button	Searches for the next instance of a string from the current page.
7)	[Cancel] button	Cancels the search.

Specifying the first page to appear by keyword searching

This function is available only when the document type is the PDF file.
If screens are switched or the display conditions are satisfied, the document display object appears, and then the specified keyword is searched for in the document.
The document display object displays the page on which the first occurrence of the keyword is found.
To enable this function, select [Specify the display page with a keyword] in the [Document Display] dialog.
☞ Page 1837 [Document Display] dialog

A search is performed to find only the first hit when the document display object is displayed.
The hit will be highlighted.
No notification will be provided if an error occurs.
To go to another hit or to receive error notifications, enable the search control with devices.
☞ Page 1835 Controlling the search with devices
The following strings cannot be searched for.

- String split across a page boundary
- One-byte string split over two lines
- Bookmark or annotation

To specify a search keyword, select one of the following methods.

- Specifying a registered comment as the keyword

Specify a comment to search for with a comment group number, comment number, and comment column number.
Specify each number directly or with a device.
☞ Page 776 Comment setting ([Comment])

- Storing a string to be the keyword in devices

Use the string stored in devices as the keyword.
Up to 47 characters are usable in the string.
Set how to specify the keyword in the [Setting] dialog.
☞ Page 1839 [Setting] dialog (Search settings for the document display object)

The following shows an example of specifying a comment as the keyword.

Ex.

Using a switch to display a window screen on which a document display object is placed

Place a document display object on window screen 1, select [Specify the display page with a keyword], and configure the following settings in the [Setting] dialog.

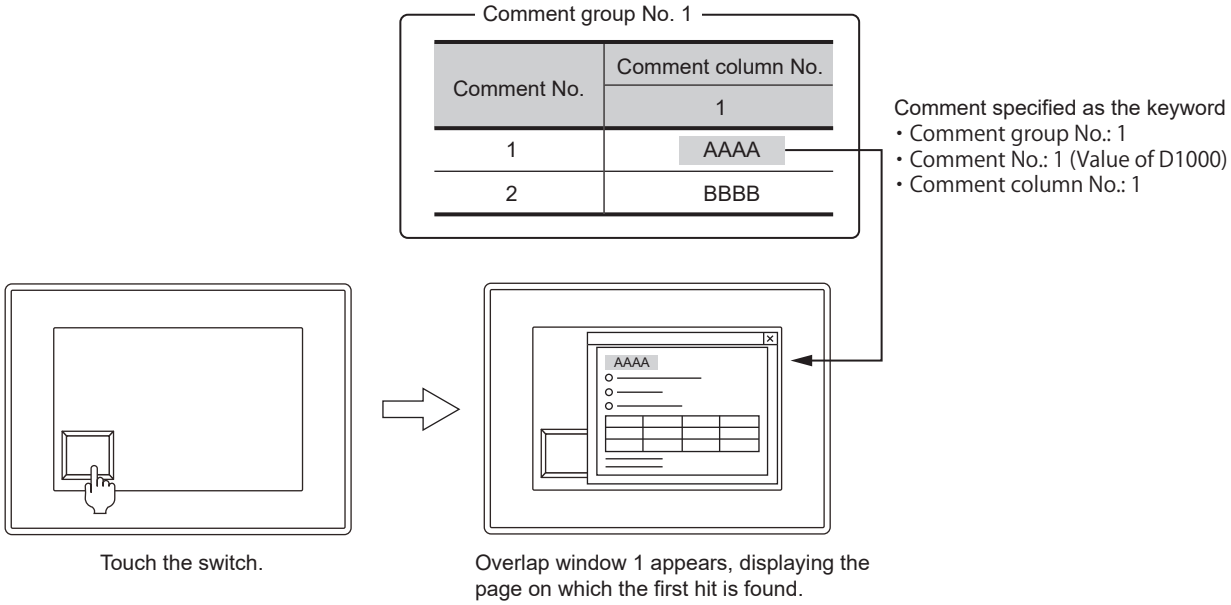
- [Keyword]: [Comment]
- [Comment Group No.]: 1
- [Comment No.]: Value of D1000
- [Comment Column No.]: 1

Place a switch on base screen 1, and configure the settings on the [Action] tab so that the following operations are performed.

- Word set: Storing comment No. 1 in D1000
- Screen switching: Displaying window screen 1 as overlap window 1

Touching the switch displays overlap window 1.

The document display object displays the page on which the first hit is found.



■Controlling the search with devices

To control the search and receive search-related notifications, use the search control device and the search status notification device.

- To start or abort a search, use the search control device.
- To receive notification of a search state or an error, use the search status notification device.

To set the devices, select [Control the search] in the [Setting] dialog.

For the function of each bit of the devices, refer to the following.

☞ Page 1839 [Setting] dialog (Search settings for the document display object)

If this search control is enabled, a search will not be performed automatically when a document display object is displayed.

To start a search, turn on the search trigger device (b0 of the search control device).

The following shows an example of controlling the search with the devices.

Ex.

Finding a hit after the document display object displays the page on which the first hit is found

Configure the following settings.

Item	Object or function	Setting

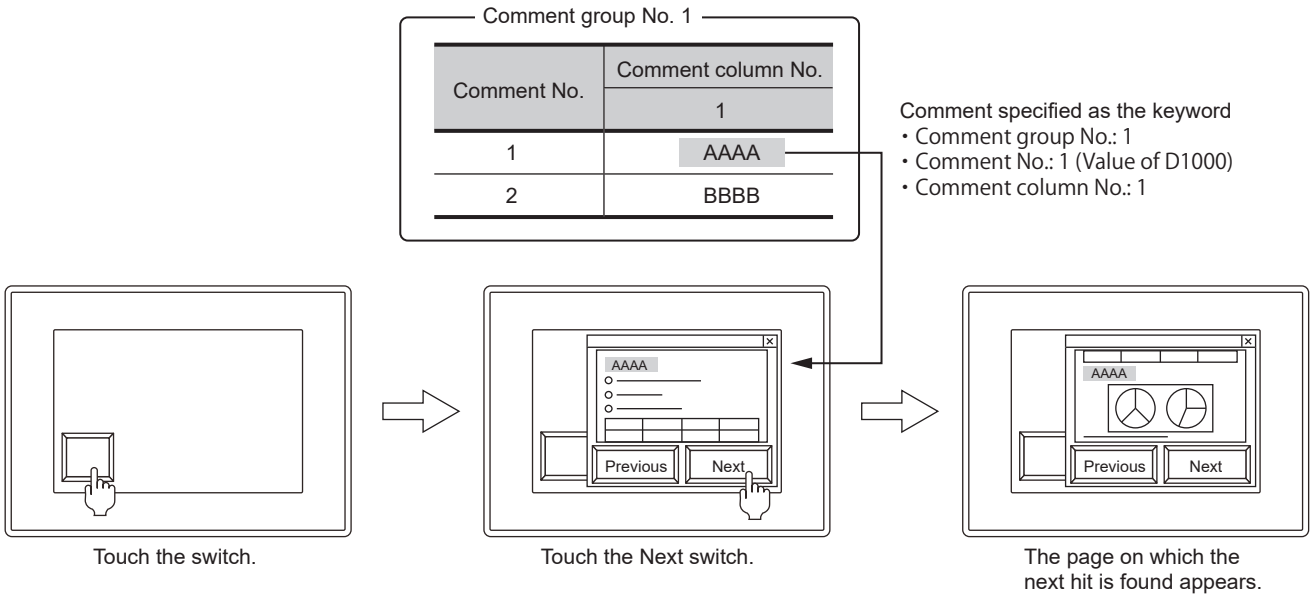
Common setting	Screen script	For window screen 1, set a screen script so that turning on the device notifying that a search is in progress (D3000.b0) turns off the search trigger device (D2000.b0).
		• [Trigger Type]: [Ordinary]
		`if([b:D3000.b0] == 1){`
		`  [b:D2000.b0] = 0;`
		`}`

Base screen 1	Switch	Switch to display the screen on which a document display object is placed. On the [Action] tab, configure the settings so that the following operations are performed. • Word set: Storing comment No. 1 in D1000 • Bit set: Turning on the search trigger device (D2000.b0) • Screen switching: Displaying window screen 1 as overlap window 1
Window screen 1	Document display object	Select [Specify the display page with a keyword], and configure the following settings in the [Setting] dialog. • [Keyword]: [Comment] • [Comment Group No.]: 1 • [Comment No.]: Value of D1000 • [Comment Column No.]: 1 • [Control the search]: Selected • [Search Control Device]: D2000 • [Search Status Notification Device]: D3000
	Switch (Previous)	Switch to go to the previous hit. On the [Action] tab, configure the settings so that the following operations are performed. • Bit set: Turning on the device that reverses the search direction (D2000.b1) • Bit set: Turning on the search trigger device (D2000.b0)
	Switch (Next)	Switch to go to the next hit. On the [Action] tab, configure the settings so that the following operations are performed. • Bit reset: Turning off the device that reverses the search direction (D2000.b1) • Bit set: Turning on the search trigger device (D2000.b0)

Touching the switch displays overlap window 1.

The document display object displays the page on which the first hit is found.

Touching the Previous or Next switch goes to the previous or next hit, starting from the first hit.



Even while the [Search] window is being displayed, you can perform a search using the search control device.

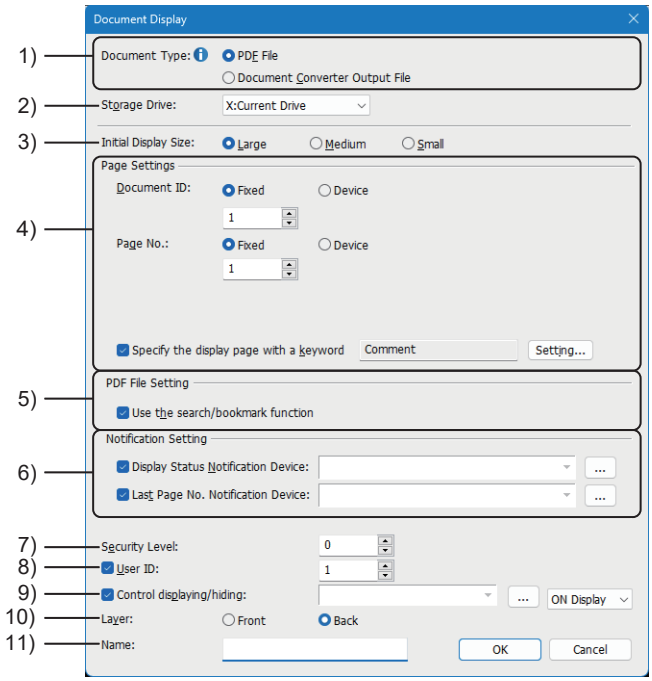
In this case, the entered keyword and buttons in the [Search] window are unusable.

If you perform a search using the search control device while a search in the [Search] window is in progress, the search will start upon completion of the search in progress.

51.8 [Document Display] dialog

GT37 SoftGOT3000

You can specify the document to be displayed using the document display, set the security level, and configure the device settings to control the display.



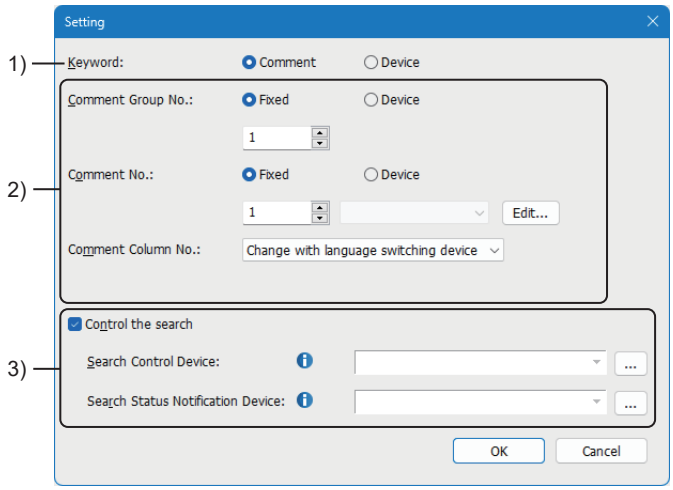
Item		Description
1)	[Document Type]	Select the type of a document to be displayed on the document display object. • [PDF File] Displays a PDF file as it is. For the storage location of the PDF files, refer to the following. ☞ Page 1820 Storing files on a data storage or file server • [Document Converter Output File] Displays a JPEG file that is converted from a document in another format with Document Converter. For the storage location of the JPEG files, refer to the following. ☞ Page 1824 Storing JPEG files to a data storage
2)	[Storage Drive]	Select a location to store files to be displayed on the document display object. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
3)	[Initial Display Size]	Select the initial size of the document display to be displayed at screen switching. • [Large]: Displays a PDF file or a large JPEG file at full size. • [Medium]: Displays a PDF file or a large JPEG file at 75%. • [Small]: Displays a PDF file or a large JPEG file at 50%.

Item			Description
4)	[Page Settings]	[Document ID]	Select how to set a document ID. If an nonexistent document ID is set, no document is displayed. The following shows selectable items. • [Fixed] Sets the document ID by entering a number directly. Set the document ID of the document to be displayed first at screen switching. The setting range is [1] to [32767]. • [Device] Sets the document ID by specifying a device value. Set a device that specifies the document ID. ☞ Page 834 How to set devices, labels, and tags
		[Page No.]	Select how to set the page to be displayed. The following shows selectable items. • [Fixed] Sets the page number by entering a number directly. Set the number of a page to be displayed first upon screen switching. The setting range is [0] to [65535]. • [Device] Select this item to specify a page No. with the device value.  • [Data Type] Select the data type of the word device. Set a device that specifies the page number. ☞ Page 834 How to set devices, labels, and tags
		[Specify the display page with a keyword]	This item is selectable when [Document Type] is set to [PDF File]. Displays the page on which the first occurrence of the specified keyword is found. ☞ Page 1834 Specifying the first page to appear by keyword searching Click the [Setting] button to display the [Setting] dialog. ☞ Page 1839 [Setting] dialog (Search settings for the document display object)
5)	[PDF File Setting]	[Use the search/bookmark function]	This item is selectable when [Document Type] is set to [PDF File]. Select this item to use the search in the [Search] window or the bookmark function. ☞ Page 1831 Using bookmarks ☞ Page 1832 Keyword search in the [Search] window In the [Environmental Setting] window ([Screen Switching/Window]), select [Use also as a system window] for the overlap window to be used as a system window. ☞ Page 542 [Screen Switching/Window]
6)	[Notification Setting]	[Display Status Notification Device]	Set a device that notifies the display status of a document. The device stores any of the following values according to the display status of the document. • 0: Normal • 1: The specified file is nonexistent or exceeds 3 MB. The data storage is inaccessible. • 2: The specified file is not an image file or is corrupt. • 3: The specified document ID is outside the range of 1 to 32767, or the specified document is nonexistent. • 4: A nonexistent page number is specified. • 101: The specified PDF file is nonexistent. The data storage or file server is inaccessible. • 102: The specified PDF file is not supported or is corrupt. • 103: The document ID of the specified PDF file is outside the range of 1 to 32767, or no PDF file corresponds to the document ID. • 104: The specified page number is nonexistent in the target PDF file. • 105: The specified PDF file is password-protected. • 107: The data size of a page in the specified PDF file exceeds 30 MB.
		[Last Page No. Notification Device]	Set a device that notifies the last page number of the document corresponding to a specified document ID.
7)	[Security Level]		Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
8)	[User ID]		Select this item to set the user ID. The setting range is [1] to [65535].
9)	[Control displaying/hiding]		Enables the setting to display the object only when requirements are met. Set the following as requirements. • Control device (bit device or bit-specified word device) • When to display: When the control device is on or off

Item		Description
10)	[Layer]	Select the layer to arrange the object on.
11)	[Name]	Set the object name. The name is displayed in places such as the data browser and property sheet. Up to 100 characters can be set.

[Setting] dialog (Search settings for the document display object)

Set how to specify a keyword to search for in the document, and set devices to control the search.

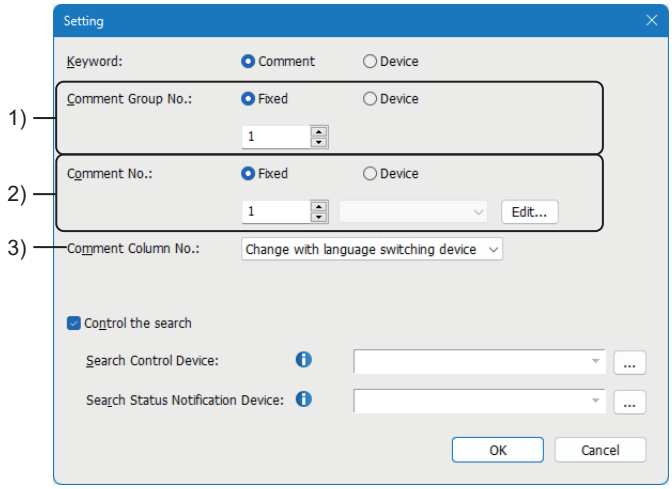


Item		Description
1)	[Keyword]	Select how to specify a search keyword. • [Comment] Uses a comment registered in a comment group as the keyword. If the specified comment has 48 or more characters, the first 47 characters are used as the keyword. ☞ Page 776 Comment setting ([Comment]) • [Device] Use the string stored in devices as the keyword.
2)	Keyword settings	The setting items vary according to the selection for [Keyword]. ☞ Page 1841 Specifying a comment as the keyword ☞ Page 1842 Specifying the string stored in devices as the keyword

Item			Description
3)	[Control the search]	—	Controls the search and receives search-related notifications with devices.
		[Search Control Device]	Set a device to control the search. • b0: Turn on this bit to start searching for the specified keyword. If a document display object is displayed while this bit is on, a search will start. Make sure to turn off this bit if b0 of the search status notification device is turned on. • b1: Switches between the search directions. While this bit is on, turning on b0 of the search control device goes to the previous hit. • b2: Turn on this bit to abort the search in progress. Make sure to turn off this bit. • b3 to b15: Use prohibited
		[Search Status Notification Device]	Set a device that notifies a search state. • b0: This bit is turned on when b0 of the search control device is turned on to start a search. This bit is turned off when the search in progress is completed and b0 of the search control device is turned off. This bit is turned off when the document display object is hidden because of screens being switched or other events. • b1: This bit is turned on when the search returns to the first hit. This bit is turned off when b0 of the search control device is turned on to start a search. This bit is turned off when the document display object is hidden because of screens being switched or other events. • b2: This bit is turned on when the search finds no hits. This bit is turned off when b0 of the search control device is turned on to start a search. This bit is turned off when the document display object is hidden because of screens being switched or other events. • b3 to b13: Use prohibited • b14: This bit is turned on when no keyword is specified, such as in the following cases. The comment to search for is nonexistent. The specified devices store no string to search for. This bit is turned off when b0 of the search control device is turned on to start a search. This bit is turned off when the document display object is hidden because of screens being switched or other events. • b15: This bit is turned on if the search fails. This bit is turned off when b0 of the search control device is turned on to start a search. This bit is turned off when the document display object is hidden because of screens being switched or other events.

■Specifying a comment as the keyword

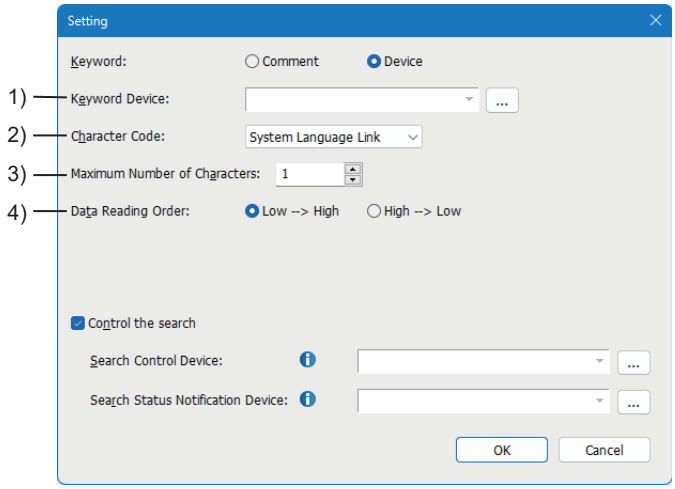
Set how to specify a comment group number, comment number, and comment column number.



Item		Description
1)	[Comment Group No.]	Select how to specify a comment group number. • [Fixed] Specify a comment group number directly. The setting range is [1] to [500]. • [Device] Specify a comment group number with a device. Select this item and set the device. If the specified comment group number is nonexistent, a search will not be performed. If a value outside the range of 1 to 500 is specified, it is assumed to be 1.
2)	[Comment No.]	Select how to specify a comment number. • [Fixed] Specify a comment number directly. The setting range is [1] to [32767]. If the specified comment number is nonexistent, a search will not be performed. Click the [Edit] button to display the [Edit Comment] dialog. For details on the [Edit Comment] dialog, refer to the following. ☞ Page 3685 [Edit Comment] dialog • [Device] Specify a comment number with a device. Select this item and set the device. If the specified comment number is nonexistent or a value outside the range of 1 to 32767 is specified, a search will not be performed.
3)	[Comment Column No.]	Select how to specify a comment column number. • [Change with language switching device] Specifies the value of the language switching device as the comment column number. If the specified comment column number is nonexistent or a value outside the range of 1 to 30 is specified, a search will not be performed. If [Display] is selected for [Alternative Display (when the language switching device value is out of the range (1-30) or comment column No. does not exist)], a comment in the specified comment column is used as the keyword. For details on the settings, refer to the following. ☞ Page 551 [Language Switching] ☞ Page 797 Creating a new comment group • [Fixed] Specify a comment column number directly. The setting range is [1] to [30]. If the specified comment column number is nonexistent, a search will not be performed. • [Device] Specify a comment column number with a device. Select this item and set the device. If the specified comment column number is nonexistent, a search will not be performed. If a value outside the range of 1 to 30 is specified, it is assumed to be 1.

■Specifying the string stored in devices as the keyword

Set consecutive devices that store a string to search for.



Item		Description
1)	[Keyword Device]	Specify the first device of consecutive devices that store a string to search for. As many devices as the set value of [Character Count] are used.
2)	[Character Code]	Set the character code of a string.
3)	[Character Count]	Specify the maximum number of characters in a string. The setting range is [1] to [47].
4)	[Data Reading Order]	Select the order in which data is read from the specified devices.

51.9 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the document display as required.
The following shows the functions that are available by configuring the relevant settings.

51.9.1 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Checking if the document is displayed.	GS276.b0
Notifying that a PDF file cannot be cached to display.	GS276.b1
Notifying the display quality when a PDF document is displayed.	GS276.b2
Notifying that the display size of the document has been changed by GS523.b3.	GS276.b3
Displaying a PDF file without caching the file.	GS523.b0
Using the PDF search function without creating or updating the search history file.	GS523.b1
Displaying a PDF document in high quality.	GS523.b2
Fitting the displayed PDF document to the object width.	GS523.b3

52 Placing a digital image display object

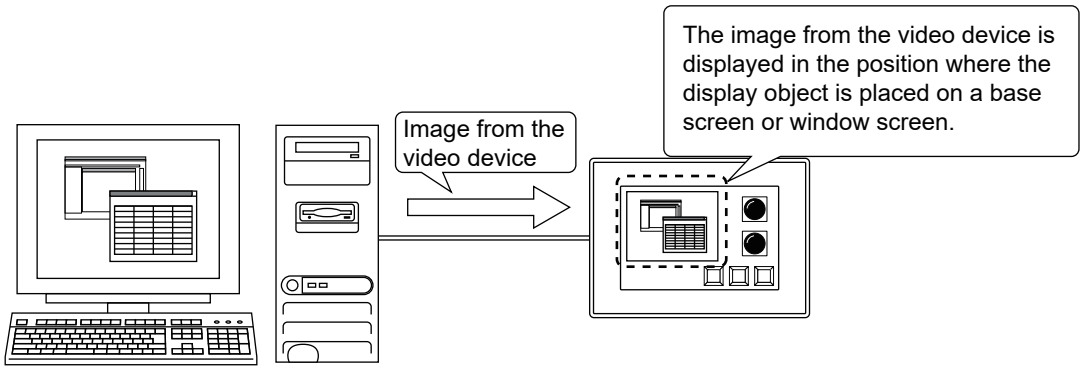
GT37 SoftGOT3000

☞ Page 1845 Overview of the digital image display object
☞ Page 1847 Specifications of the digital image display object
☞ Page 1855 How to use the digital image display object
☞ Page 1859 [Digital Image Display] dialog
☞ Page 1863 Relevant settings

52.1 Overview of the digital image display object

GT37 SoftGOT3000

The digital image display object displays the image of the personal computer screen and the image taken with a web camera and network camera on the GOT screen.
A similar function is the digital image input/recording function. However, unlike the digital image input function, which displays the full image from the video device in a separate window, the digital image display object is placed on the GOT screen like other objects.
This allows you to check the image from the video device and monitor or operate external devices on a single screen.
The digital image display object can also be used to customize the display of the image and play the image with touch switches.



The digital image display object has two operation modes: [Camera/PC Image Display] and [File Playback].
☞ Page 1846 Camera/PC image display
☞ Page 1846 File play

Precautions

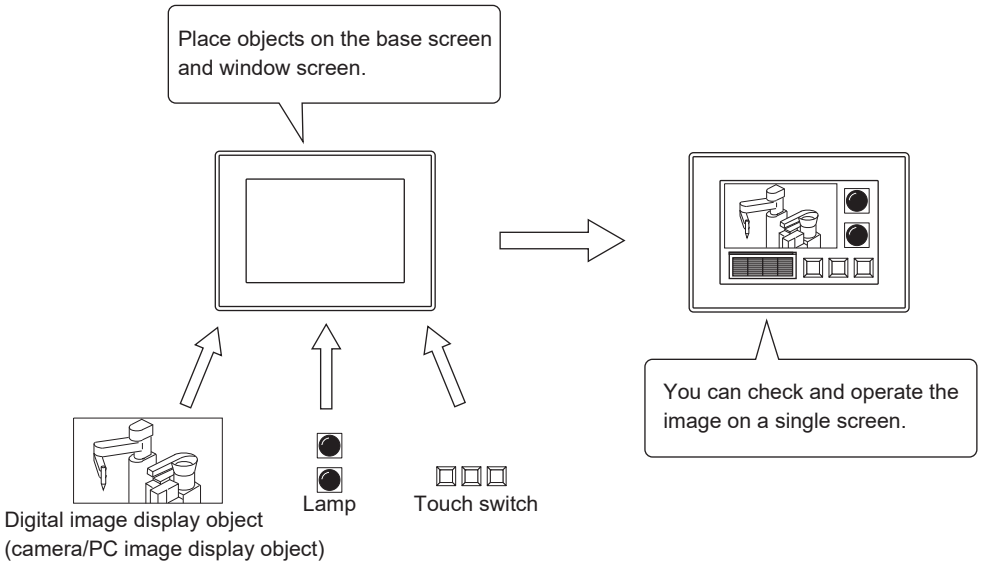
The following functions cannot be used when the digital image display object is used.
- Digital image input/recording
- Video output function

PART 7

52.1.1 Camera/PC image display

GT37 SoftGOT3000

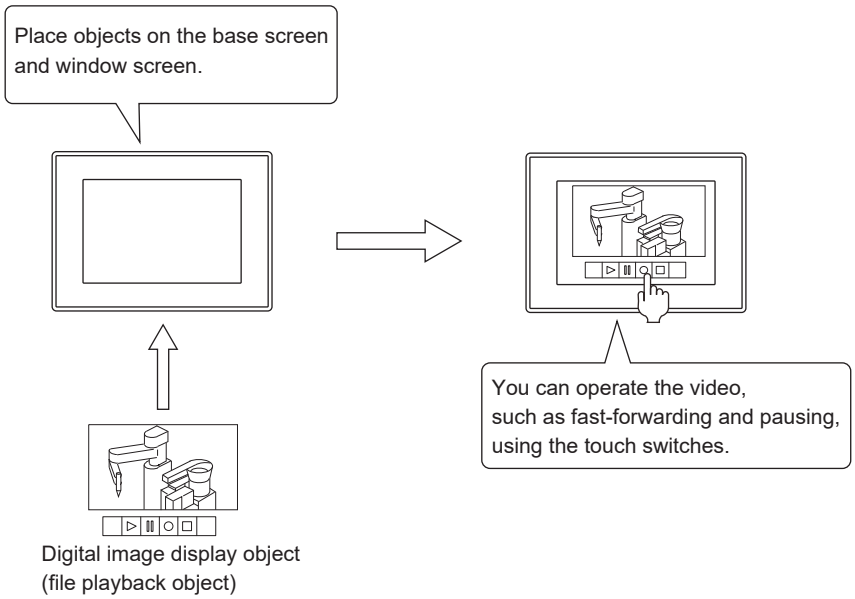
Camera/PC image display is placed by selecting [Object] → [Digital Image Display] → [Camera/PC Image Display].
Placing it on the base screen or window screen allows you to monitor or operate external devices while checking the image.



52.1.2 File play

GT37 SoftGOT3000

File play is placed by selecting [Object] → [Digital Image Display] → [File Playback].
When the file play object is placed, touch switches for operation are placed at the same time.



Precautions

After placing a digital image display object with the operation mode set to [Camera/PC Image Display], changing the mode to [File Playback] in the [Digital Image Display] dialog will not place any touch switches.

52.2 Specifications of the digital image display object

GT37 SoftGOT3000

☞ Page 1847 System application (extended function)
☞ Page 1847 Playable video files
☞ Page 1847 Resolution and frame rate
☞ Page 1848 Applicable channel
☞ Page 1848 Maximum number of objects that can be placed on one screen
☞ Page 1848 Applicable screen
☞ Page 1848 Size of the digital image display object
☞ Page 1849 Displaying an input image
☞ Page 1853 Display mode

52.2.1 System application (extended function)

To use the digital image display object, the following system applications (extended functions) are required.

System application (extended function)		Conditions automatically incorporated into the package data
[Digital Image Input/ Recording]	[Digital Image Input]	[Use the Digital Image Function] is selected in the [Digital Image Input/Recording] dialog.
	[Digital Image Input (Extended)]	[Use the Digital Image Function] is selected in the [Digital Image Input/Recording] dialog.
	[Digital Image Input(For USB Input)]	When all the following conditions are satisfied: • [Use the Digital Image Function] is selected in the [Digital Image Input/Recording] dialog. • [PC Image] is selected for [Input Device] in the [Digital Image Input/Recording] dialog.
	[Digital Image Recording/ Playback]	[Use the Digital Image Function] is selected in the [Digital Image Input/Recording] dialog.

52.2.2 Playable video files

Video files that meet the following conditions can be played using the digital image display object.

Condition	Value
Resolution	Up to Full-HD
File format	MP4
Video format	H.264 (Baseline profile)
Frame rate	Up to 30 fps
Bit rate	Up to 5 Mbps
Number of reference frames	1

52.2.3 Resolution and frame rate

The digital image display object supports the following resolutions and frame rate.

Resolution	Frame rate (fps)
Full HD (1920 × 1080 dots)	30
HD (1280 × 1080 dots)	
XGA (1024 × 768 dots)	
SVGA (800 × 600 dots)	
VGA (640 × 480 dots)	

52.2.4 Applicable channel

The number of channels that can be used in the digital image display object depends on the device to be used.

- Digital image input using a web camera and USB converter: 1 channel
- Network camera (Ethernet connection): 4 channels

52.2.5 Maximum number of objects that can be placed on one screen

Up to four digital image display objects can be placed on one screen.
The GOT can simultaneously display up to four digital image display objects placed on base screens and window screens.
The fifth and subsequent objects are not displayed.
Configure the setting to display a maximum of four digital image display objects on base screens and window screens simultaneously.

52.2.6 Applicable screen

Digital image display objects can be placed on the following screens.

- Base screen
- Overlap window
- Superimpose window
- User-created key window
- Dialog window

Precautions

Make sure that a window screen with digital image display objects does not extend beyond the GOT screen.
The input image may not be displayed properly if the screen extends off the GOT screen.

52.2.7 Size of the digital image display object

The position and size (width and height) of the digital image display object are settable in units of 4 dots.
The settable size range is 64 by 64 dots to 1920 by 1920 dots.

Precautions

■Placing a digital image display object on a window screen

The GOT can only display the digital image display object with the X and Y coordinates in units of 4 dots.
Make sure to place a digital image display object at least four dots away from the edges of a window screen.
If the digital image display object is too close to the edges of the window screen, the displayed input image may overlap the window frame depending on the position of the window screen.

■Moving or switching a window screen with digital image display objects

When digital image display objects are placed on a window screen, moving or switching the window screen may prevent the objects from being displayed at the X and Y coordinates in units of 4 dots.
In such cases, the X and Y coordinates of the objects are automatically corrected toward the input image origin.

52.2.8 Displaying an input image

Input images can be displayed in various ways by using the digital image display object.

The following shows the available functions.

☞ Page 1849 Display magnification
☞ Page 1850 Rotation angle
☞ Page 1851 Inversion
☞ Page 1851 Filling blank space
☞ Page 1851 Clip display

For the setting method, refer to the following.

☞ Page 1859 [Digital Image Display] dialog

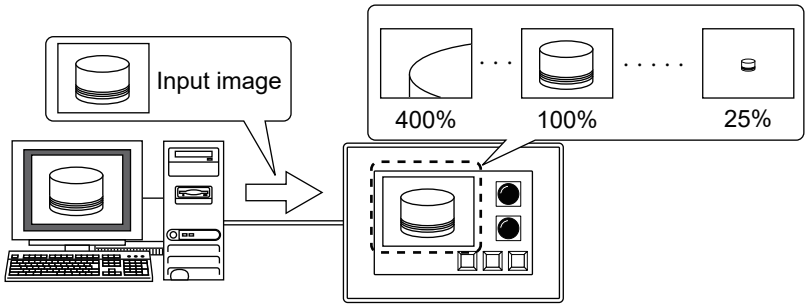
Display magnification

You can change the display magnification of an input image.

[Fixed], [Device], and [Auto-resizing] are selectable to specify the display magnification.

For [Fixed], the following magnification factors are selectable: [400], [200], [100], [87.5], [75], [62.5], [50], [37.5], or [25] (%).

Ex.



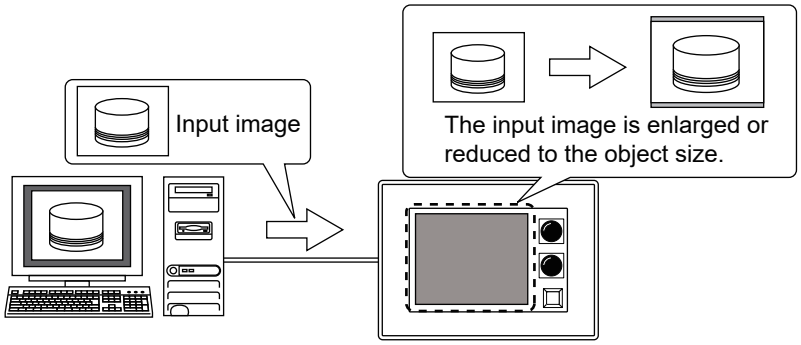
For [Device], the display magnification depends on the device value as shown below.

Device value	Display magnification
0	100%
1	87.5%
2	75%
3	62.5%
4	50%
5	37.5%
6	25%
7	400%
8	200%
9 to 24	100%
25 to 400*1	25% to 400%, or 100%
401 or more	100%

*1 When the object gesture function is enabled, the input device value is the display magnification.
When the object gesture function is disabled, the magnification of 100% is applied.

For [Auto-resizing], an input image is displayed according to the size of a digital image display object.
When the aspect (length-to-width) ratios differ between an input image and a digital image display object, the image is enlarged or reduced to the object size with the image aspect ratio unchanged.

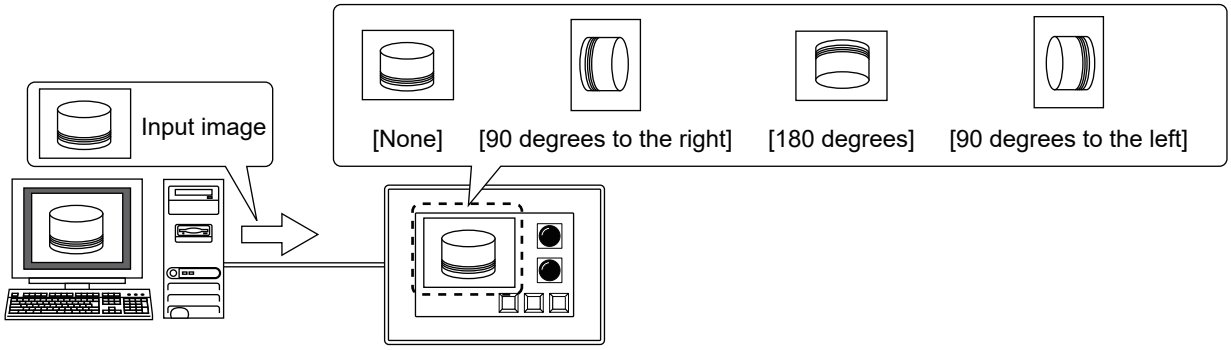
Ex.



Rotation angle

You can rotate an input image in units of 90 degrees.
[Fixed] and [Device] are selectable to specify the rotation angle.
For [Fixed], the following rotation angles are selectable: [None], [90 degrees to the right], [180 degrees], and [90 degrees to the left].

Ex.



For [Device], the display magnification depends on the device value as shown below.

Device value	Rotation angle
0	[None]
1	[90 degrees to the right]
2	[180 degrees]
3	[90 degrees to the left]
4 or more	[None]

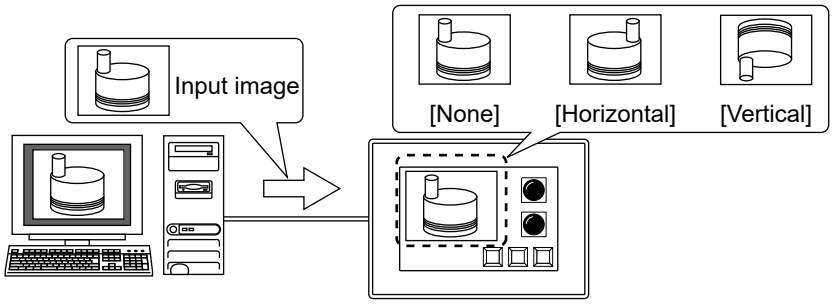
Inversion

You can invert an input image horizontally or vertically.

[Fixed] or [Device] are selectable to set the inversion method.

For [Fixed], the following inversion methods are selectable: [None], [Horizontal], and [Vertical].

Ex.



For [Device], the display magnification depends on the device value as shown below.

Device value	Inversion
0	[None]
1	[Horizontal]
2	[Vertical]
3 or more	[None]

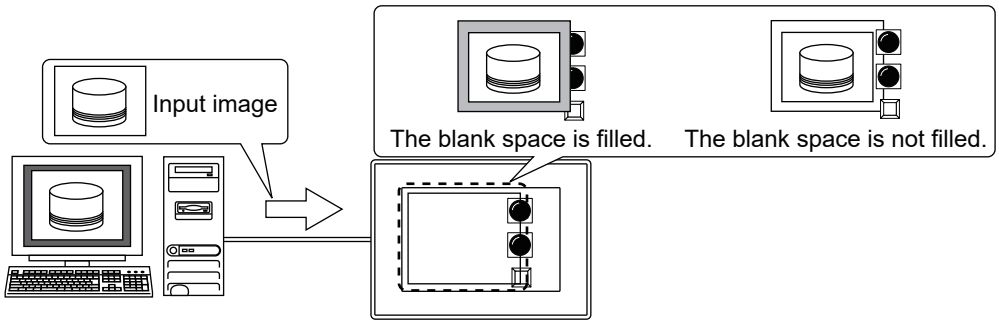
Filling blank space

You can select whether to fill blank space with a specified color when an input image is smaller than a digital image display object.

For filling blank space, 16.77 million colors are selectable.

When the blank space is not filled, other figures and objects under the blank space are displayed.

Ex.



Clip display

You can specify the clip origin to cut out a part of an input image to be displayed.

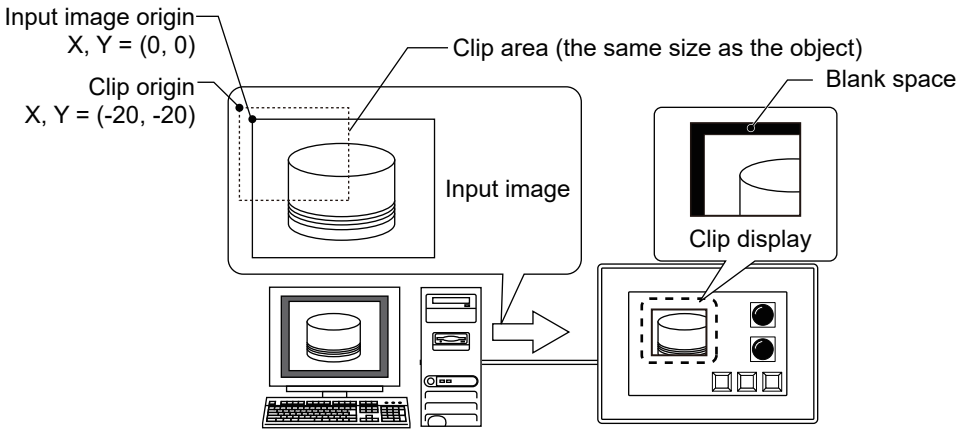
Specify the clip origin in units of 4 dots by using the X and Y coordinates of the input image as the reference.

The following shows the setting ranges for the X and Y coordinates of the clip origin.

- X coordinate: -1920 dots to 1920 dots
- Y coordinate: -1920 dots to 1920 dots

The clip origin is in the upper left corner of the clip area. The GOT displays the clip area in the same size as the digital image display object.

Portions of the clip area that extend off the input image are displayed as blank space.



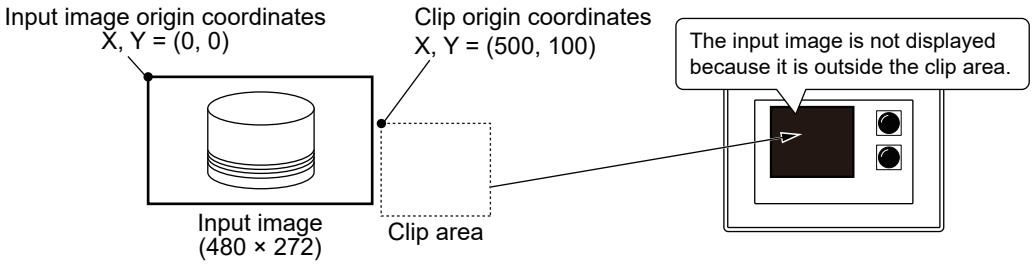
[Fixed] and [Device] are selectable to specify the clip origin.

When selecting [Device], set the first device. Two consecutive devices (signed 16-bit binary), the first device and the subsequent device, are automatically assigned to the X and Y coordinates of the clip origin.

- First device: X coordinate
- Second device: Y coordinate

Precautions

If an input image is outside the clip area according to the specified clip origin, the image is not displayed within the object. Set the clip origin while making sure that the image is within the clip area.



52.2.9 Display mode

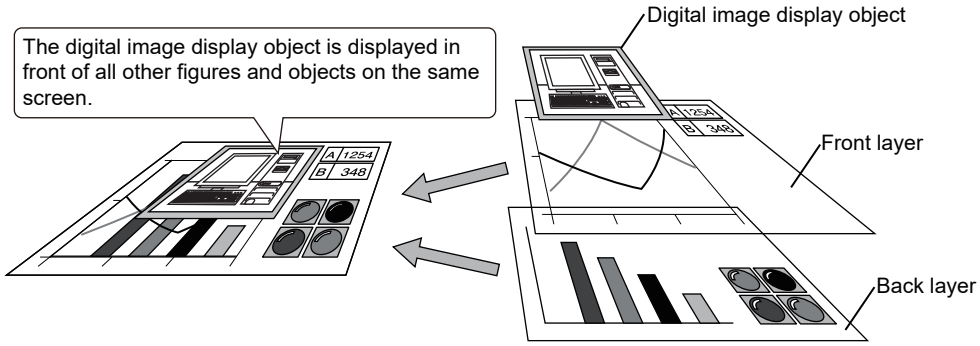
The digital image display object is displayed in front of or behind all other figures and objects on the same screen, regardless of the layers and display order of the objects.
When the digital image display object is displayed behind all other figures and objects, the transparent method and color can be specified.
Configure these settings using [Display Mode] in the [Digital Image Input] dialog.
For the setting method, refer to the following.
☞ Page 2688 [Digital Image Input/Recording] dialog
☞ Page 1859 [Digital Image Display] dialog

Precautions

The GOT displays the digital image display object either in front of or behind all other figures and objects on the same screen.

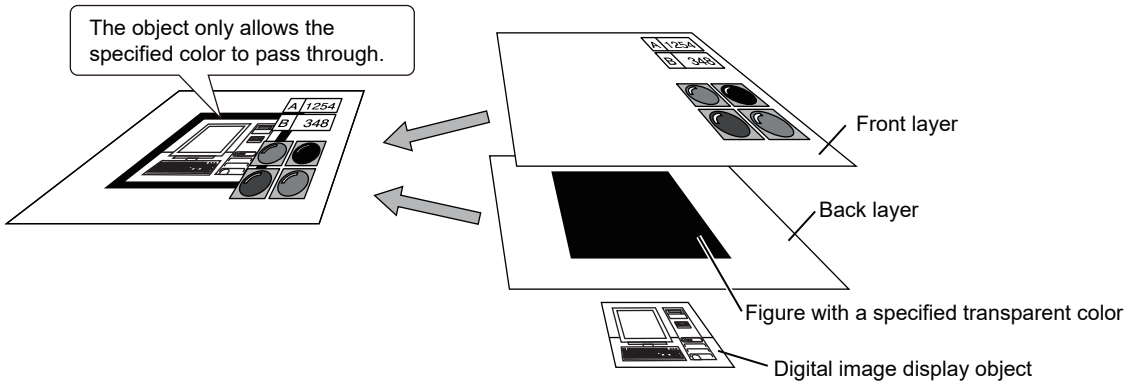
Display in the foreground

The digital image display object is displayed in front of all other figures and objects on the same screen.
Overlapped figures and objects are hidden under the digital image display object.



Display on the specified color area (behind all other figures and objects)

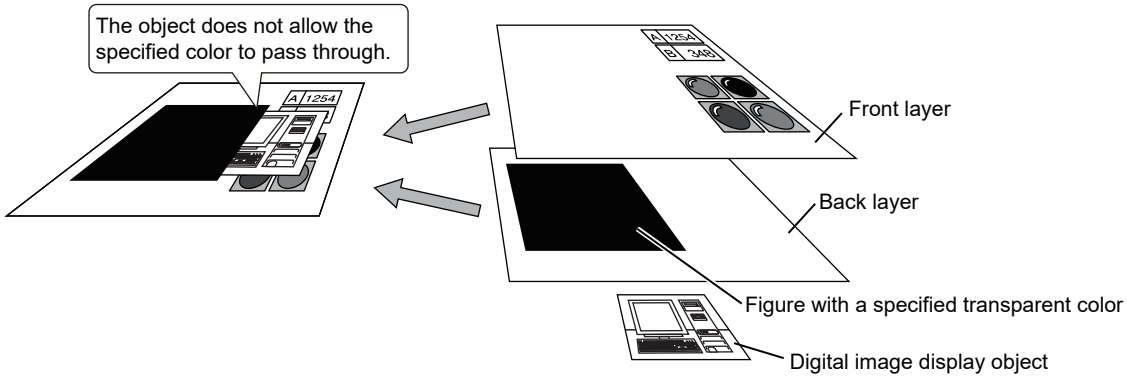
The digital image display object is displayed behind all other figures and objects on the same screen.
When a figure or object overlaps the digital image display object, the specified color becomes transparent through the object.



PART 7

Display on the area of other colors (behind all other figures and objects)

The digital image display object is displayed behind all other figures and objects on the same screen.
When a figure or object overlaps the digital image display object, the specified color does not become transparent through the object.
(However, the digital image display object displays all colors except those specified as transparent.)



52.3 How to use the digital image display object

GT37 SoftGOT3000

☞ Page 1855 System configuration
☞ Page 1855 Setting procedure
☞ Page 1856 Operation on the GOT

52.3.1 System configuration

For the system configuration required to use the digital image display object, refer to the following.

☞ Page 2664 System configuration
☞ Page 2681 System configuration

52.3.2 Setting procedure

Use the following procedure to place a digital image display object and configure the operation settings.

Operating procedure

1. Select [Object] → [Digital Image Display] → [Camera/PC Image Display] or [File Playback].
2. Click the position to place the digital image display object.
3. Double-click the digital image display object to display the [Digital Image Display] dialog.
4. Configure the operation settings in each tab of the [Digital Image Display] dialog.

☞ Page 1859 [Digital Image Display] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 995 Basics of figures and objects

PART 7

52.3.3 Operation on the GOT

To perform operation by touching the digital image display object on the GOT, set [Touch Mode] in the [Digital Image Setting] tab of the [Digital Image Display] dialog.

☞ Page 1856 Magnification switching (Loop)
☞ Page 1856 Magnification switching (Reciprocation)
☞ Page 1857 Gesture operation

When the operation mode of the digital image display object is file play, the image can be played with touch switches.

☞ Page 1857 File play

For the setting method, refer to the following.

☞ Page 1859 [Digital Image Display] dialog

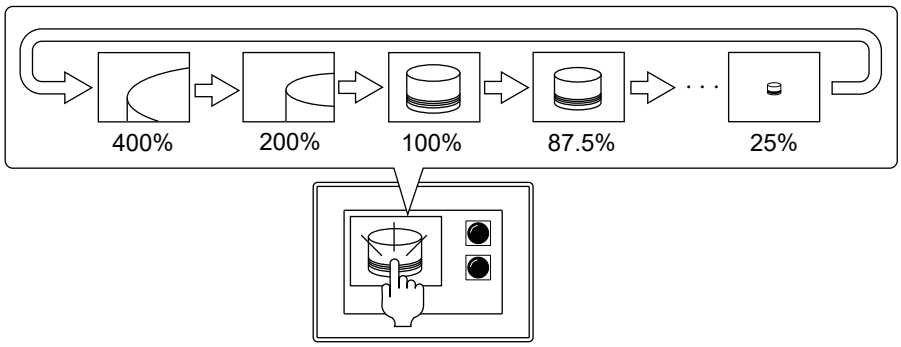
Magnification switching (Loop)

Enlarge or reduce an input image by one magnification factor according to the setting of [Change Direction] with a touch of the digital image display object.

The display magnification is wrapped around at its maximum or minimum factor.

Ex.

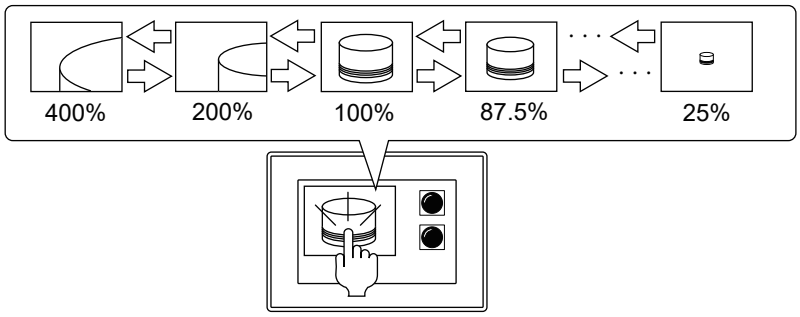
When selecting [Smaller ratio] for [Change Direction]



Magnification switching (Reciprocation)

Enlarge or reduce an input image by one magnification factor with a touch of the digital image display object.

The display magnification is switched in the opposite direction at its maximum or minimum factor.

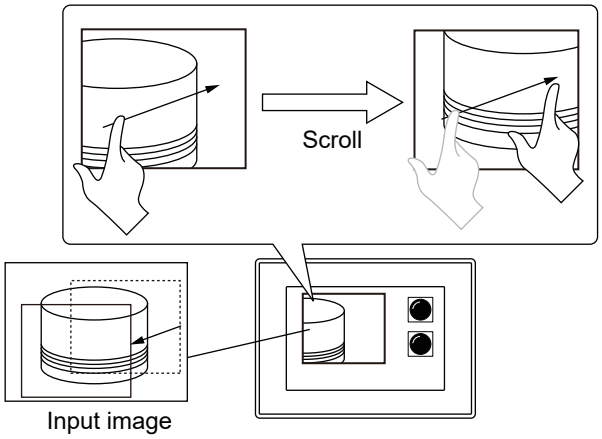


Gesture operation

Reposition the clip origin using the object gesture function.

To reposition the clip origin, slide the origin.

The clip area is scrolled by the slide operation.



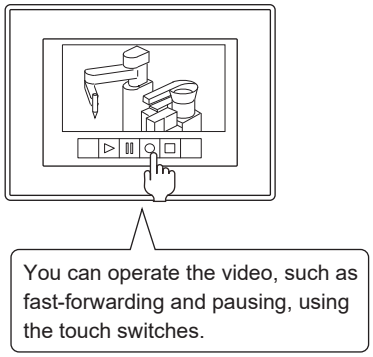
For details on the object gesture, refer to the following.

☞ Page 507 Operating objects with gestures (object gesture function)

File play

■Operating the image with touch switches

When the operation mode is file play, the image can be operated with touch switches.



If you select file play when placing an object, touch switches will be placed at the same time.

The following shows the touch switches to be placed.

Operation	Description
Jump to the beginning	Moves to the beginning of the image.
Play/file play mode	Plays the image normally.
Pause	Pauses the image playback.
Recording start	Starts recording.
Playback stop/recording stop	Stops the image playback or recording.
Video file manager	Starts the video file manager. For details on the setting, refer to the following. ☞ Page 1247 Settings for [Video File Manager]

The touch switches can also be set and placed by users.

For details, refer to the following.

☞ Page 1198 Setting touch switches

■Specifying the video file to be played

You can specify a video file in the data storage to play it.

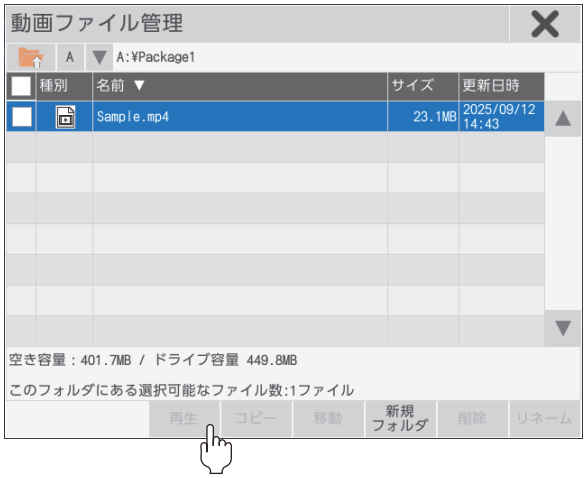
Operating procedure

1. Write a project data with the special function switch (video file manager) placed on the screen to the GOT.

For details on the special function switch (video file manager), refer to the following.

☞ Page 1247 Settings for [Video File Manager]

2. Touch the special function switch (video file manager) to open the video file manager screen.



3. Select the video file you want to play and touch [Play] to play the selected video.

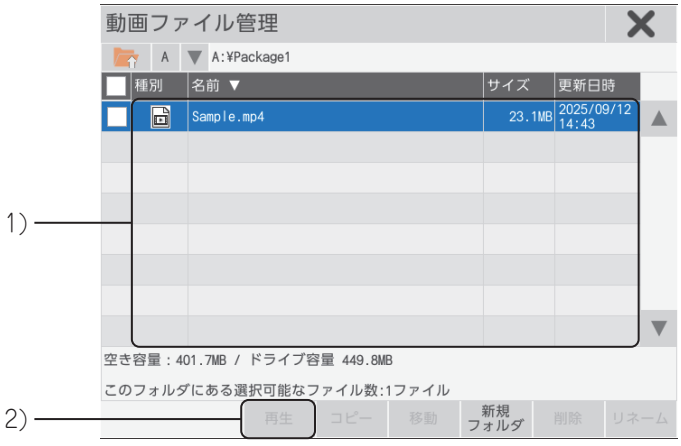
■Video file management screen

Touch the special function switch to launch the video file management screen.

The configuration of the video file management screen is almost the same as the file manager screen.

For the basic usage of the file manager screen, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)



Item		Description
1)	File list	Displays video files and folders.
2)	Playback button	Plays a selected video file.

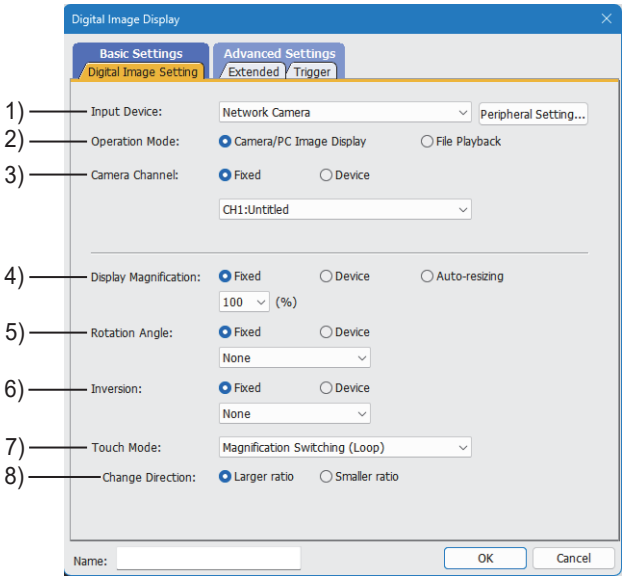
52.4 [Digital Image Display] dialog

GT37 SoftGOT3000

☞ Page 1859 [Digital Image Setting] tab
☞ Page 1861 [Extended] tab
☞ Page 1862 [Trigger] tab

52.4.1 [Digital Image Setting] tab

Specify the image to be displayed on the digital image display object, and configure the display settings such as display magnification, rotation, and inversion, as well as the actions when touched.



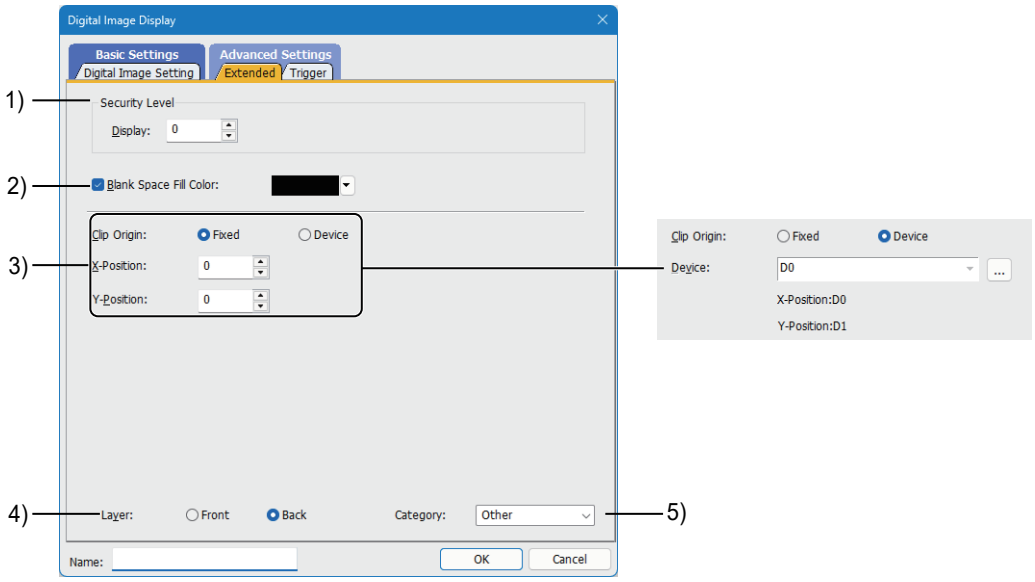
Item		Description
1)	[Input Device]	Specify the device that displays the image on the digital image display object. Configure the setting in the [Digital Image Input/Recording] dialog displayed when the [Peripheral Setting] button is clicked. ☞ Page 2688 [Digital Image Input/Recording] dialog
2)	[Operation Mode]	Specify the operation mode of the digital image display object. • [Camera/PC Image Display] Displays images sent from a camera or a personal computer screen. • [File Playback] Displays an image from the video file.
3)	[Camera Channel]	This item is displayed when [Network Camera] is selected for [Input Device] and [Camera/PC Image Display] is selected for [Operation Mode]. • [Fixed] Select this item to set a specific channel number. • [Device] Select this item to set the channel number to match the value of the device to be set. Select this item and set the device.
4)	[Display Magnification]	Select the display magnification of an input image. For details on the display magnification, refer to the following. ☞ Page 1849 Display magnification To specify the display magnification using a device value, select [Device] and set the device to be used.
5)	[Rotation Angle]	Select the rotation angle of an input image. For details on the rotation angle, refer to the following. ☞ Page 1850 Rotation angle To specify the rotation angle using a device value, select [Device] and set the device to be used.
6)	[Inversion]	Select the inversion method of an input image. For details on the inversion method, refer to the following. ☞ Page 1851 Inversion To specify the inversion angle using a device value, select [Device] and set the device to be used.

Item		Description
7)	[Touch Mode]	Select an operation to be performed when the digital image display object is touched. For details on the touch mode, refer to the following. ☞ Page 1856 Operation on the GOT The following shows selectable items. • [Disabled] Disables the touch operation. • [Gesture Operation] Enlarges or reduces an input image or repositions the clip origin by using the gesture operation. • [Magnification Switching (Loop)] Enlarges or reduces an input image according to the setting of [Change Direction]. The display magnification is wrapped around at its maximum or minimum factor. • [Magnification Switching (Reciprocation)] Enlarges or reduces an input image. The display magnification is switched in the opposite direction at its maximum or minimum factor.
8)	[Change Direction]	This item appears when [Touch Mode] is set to [Magnification Switching (Loop)]. Select the direction of the display magnification switching.

Precautions

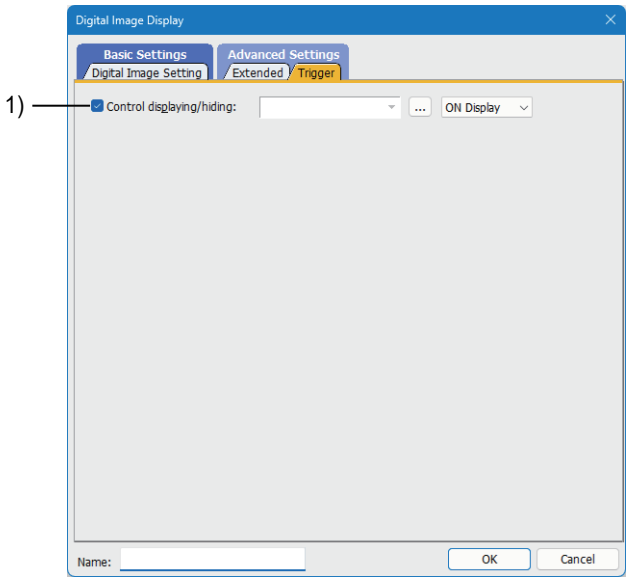
When placing an object requiring touch operation, such as a touch switch or numerical input, on the digital image display object, select [Disabled] for [Touch Mode] of the digital image display object.
Otherwise, the touch operation of the overlapping object is not performed properly.

52.4.2 [Extended] tab



Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Blank Space Fill Color]	Fills the blank space of the digital image display object. Select this item, and then select a color to fill the space. For details on filling blank space, refer to the following. ☞ Page 1851 Filling blank space
3)	[Clip Origin]	Appears when [Fixed] or [Device] is selected for [Display Magnification] in the [Digital Image Setting] tab. Set the clip origin for the clip display. For details on the clip display, refer to the following. ☞ Page 1851 Clip display The following shows selectable items. • [Fixed] Specify the clip origin within given ranges. Select this item, and then set [X Position] and [Y Position]. The following shows the setting ranges. [X Position]: [-1920] dots to [1920] dots [Y Position]: [-1920] dots to [1920] dots • [Device] Specify the clip origin with a device value. Select this item, and then specify the first device. Two consecutive devices (signed 16-bit binary), the first device and the subsequent device, are automatically assigned to the X and Y coordinates of the clip origin. First device: X coordinate Second device: Y coordinate
4)	[Layer]	Switches layers to be placed. This setting is valid only for filling blank space. For details on filling blank space, refer to the following. ☞ Page 1851 Filling blank space
5)	[Category]	Set the category to assign the object. ☞ Page 1121 Managing figures and objects by category

52.4.3 [Trigger] tab



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Control device (bit device or bit-specified word device) • When to display: When the control device is on or off

52.5 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the digital image display object as required.
The following shows the functions that are available by configuring the relevant settings.

52.5.1 GOT internal device

For details on the devices, refer to the following.
☞ Page 3581 GOT special register (GS)

Function	Setting item
Checking if the digital image input signal for CH1 is recognized	GS252.b15
Checking the status of the digital image input object for CH1	GS1030
Checking the horizontal resolution specified from CH1 of the GOT to the connected device	GS1031
Checking the vertical resolution specified from CH1 of the GOT to the connected device	GS1032
Checking the frequency of the signal input through the digital image input object for CH1	GS1033
Notifying that the required memory size reaches the upper limit when a USB converter is connected	GS2070.b0
Notifying the information related to video signal input	GS2071.b0 GS2071.b2 to b.5

PART 7

53 Placing a script parts object

GT37 SoftGOT3000

A script parts object is placed to create a script.
When the GOT displays the screen on which a script parts object is placed, if the trigger condition for the created script is satisfied, the script runs.
The following object manipulations are supported.

- Copying to another screen
- Grouping
- Registering to the library
- Adding to a template

A script parts object is visible only on the screen editor of GT Designer3.
The object is invisible on the GOT screen.
For information on how to place a script parts object and configure its settings, refer to the following.
☞ Page 2424 [Script Parts] dialog
For the types of scripts, refer to the following.
☞ Page 2325 Controlling operations with scripts ([Script])

54 Placing a screen on another screen

☞ Page 1866 Overview of the set overlay screen object
☞ Page 1868 Specifications of the set overlay screen object
☞ Page 1873 How to use the set overlay screen object
☞ Page 1876 [Set Overlay Screen] dialog
☞ Page 1877 Relevant settings

54.1 Overview of the set overlay screen object

GT37 SoftGOT3000

The set overlay screen is an object that calls other base screens and window screens (called screen) on a basic screen and display them as a single screen.

When the same objects are used on multiple screens, memory space can be saved.

• When using no set overlay screen object

Four touch switches need to be set.

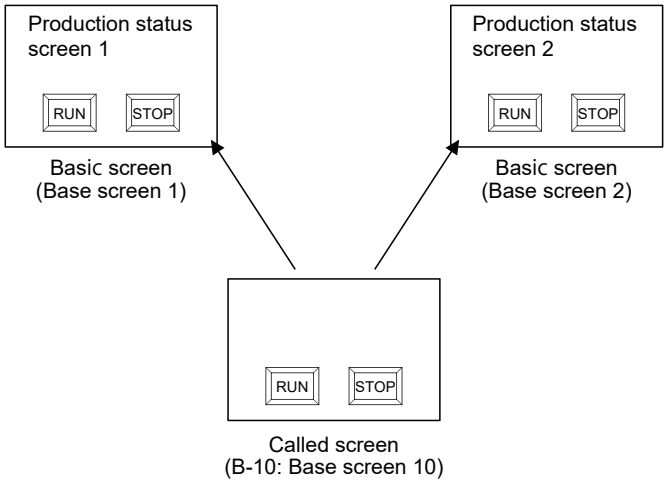
(Two on base screen 1 and two on base screen 2)

• When using a set overlay screen object

Only two touch switches need to be set.

(two on a called screen)

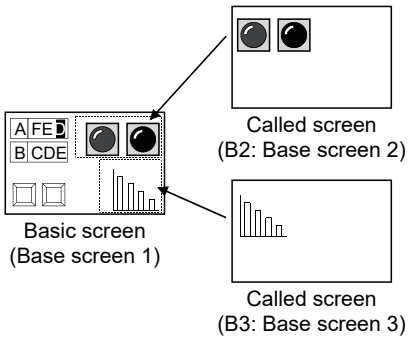
Because production status screen 1 and 2 display the touch switches on the called screen, touch switch settings are not required.



Create a dedicated screen for touch switches and call it from each screen.

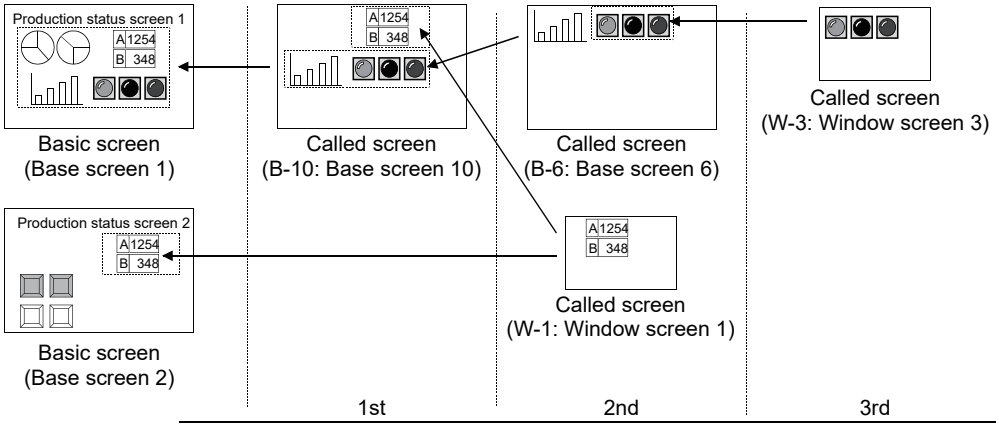
Ex.

Displaying multiple called screens on one basic screen



Ex.

Placing hierarchically and displaying



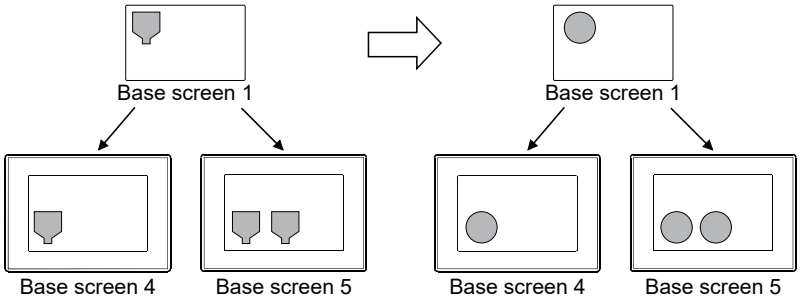
Precautions

■Editing a called screen

Called screens cannot be edited with the set overlay screens (object).

Open the called screens and edit them.

When called screens are edited, the edits are reflected to all the set overlay screens.



■Editing figures overlapping with set overlay screens

When figures are placed on a basic screen on the back of set overlay screens (object), the figures cannot be edited.

When selecting and editing figures on a basic screen, click the [Edit] → [Object of Selection] from the menu to deselect [Display Overlay Screen].

54.2 Specifications of the set overlay screen object

GT37 SoftGOT3000

The following shows the specifications of the set overly screen.

☞ Page 1868 Type of a screen that can be used as the basic screen
☞ Page 1868 Types of screens that can be used as called screens
☞ Page 1868 Number of set overlay screens that can be placed
☞ Page 1869 Hierarchy of called screens
☞ Page 1871 Display of called screens viewed when figures and objects are overlapping

54.2.1 Type of a screen that can be used as the basic screen

The following screens can be used as the basic screen.

- Base screen
- Window screen
- Mobile screen

For calling a mobile screen, refer to the following.

☞ Page 2742 Usable functions

54.2.2 Types of screens that can be used as called screens

The following screens can be used as called screens.

- Base screen
- Window screen
- Mobile screen

For calling a mobile screen, refer to the following.

☞ Page 2742 Usable functions

The trigger actions and screen scripts set for the called screens are executed.

54.2.3 Number of set overlay screens that can be placed

Up to 2047 set overlay screen objects can be placed.

54.2.4 Hierarchy of called screens

Number of layers in the hierarchy

Set overlay screens can be also placed on screens used as called screens.

The type of the basic screen determines the maximum number of layers of displayable called screens.

Screen type	Maximum number of layers
Base screen Window screen	16
Mobile screen	1

Relation between security levels of called screens and the display of the layers in the hierarchy

The security set for each called screen is valid.

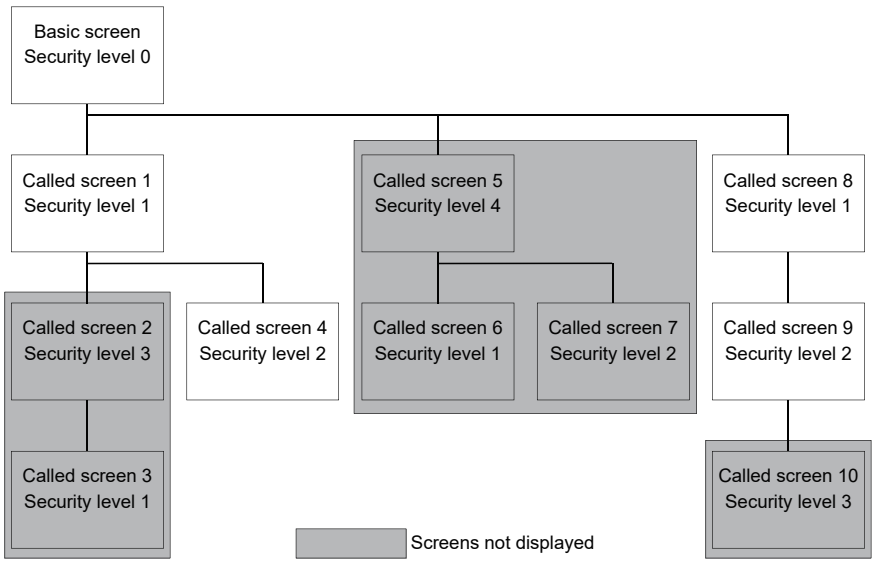
When a password entered on a basic screen is at a security level lower than that of called screens, the called screens are not displayed.

Screens called in nested structures from the screens that cannot be displayed are not displayed.

If a called screen is not displayed, the trigger action and screen script set for the called screen are not executed.

Ex.

Called screens that can be displayed with security level 2 password



Display order applied when multiple screens are called

When multiple set overlay screens are placed on one screen, the display order of the called screens is determined according to the order of setting with GT Designer3 and the layer in the hierarchy at which the called screens are set.

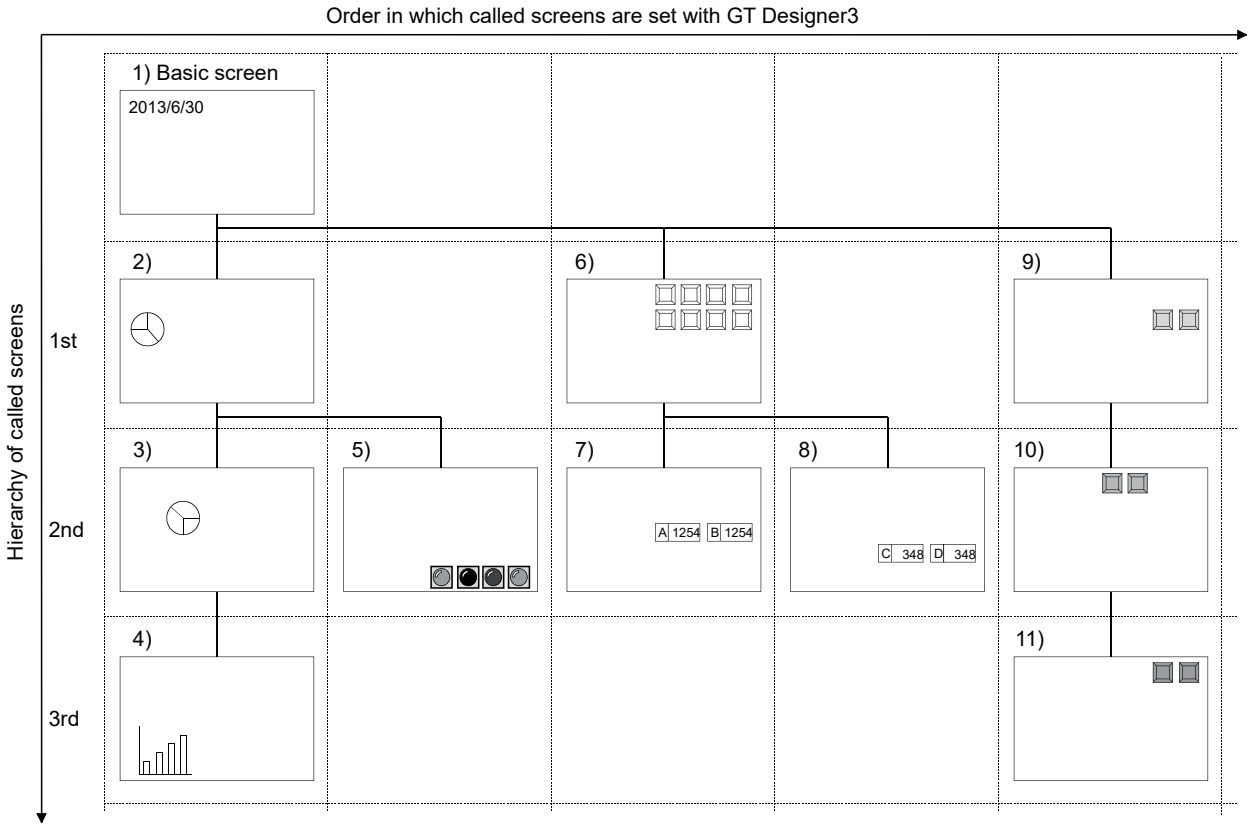
Called screens are displayed on previously displayed screens. Hence screens placed later in the display order are displayed in front.

The following shows the specifications of the display order.

- When multiple called screens are set on a basic screen, the screens are displayed in order of setting with GT Designer3.
- When called screens are placed hierarchically, the screens are displayed in order of layer in the hierarchy from the shallowest depth.
- When the above two settings are both configured, the order of layer takes precedence.

Ex.

When multiple called screens are set on one screen, and some of those screens are hierarchically placed, they are displayed in the order from 1) to 11).



Point

- Security function, trigger action function, and script function set for each called screen

The security function, trigger action function, and script function set for each called screen are executed in the display order of the called screens.

- How to check the hierarchy and order in which called screens are set

The hierarchy can be checked in the [Screen] window.

☞ Page 122 [Screen] window

You can check the order in which called screens are set in the data browser.

For information on how to use the data browser, refer to the following.

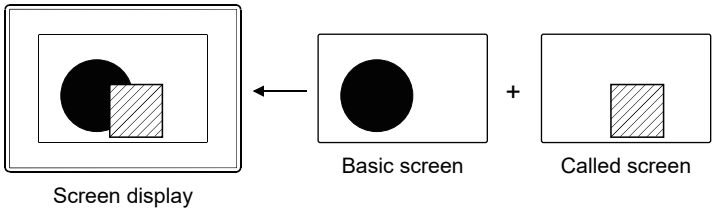
☞ Page 167 Searching for and editing a specific setting (Data Browser)

54.2.5 Display of called screens viewed when figures and objects are overlapping

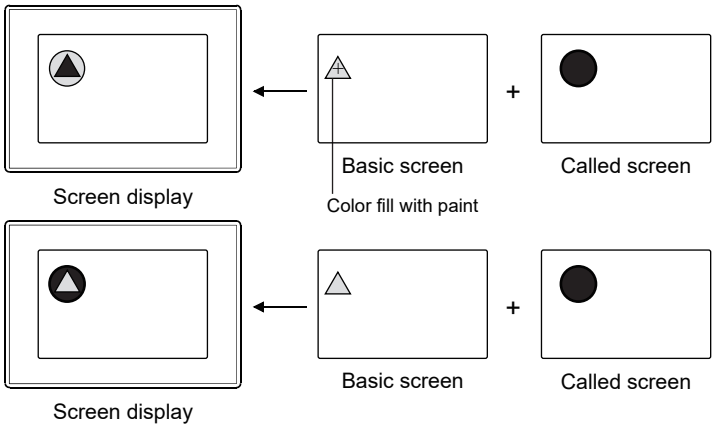
When called screens and figures/objects overlap in the same layer, they are displayed with the GOT as follows.
For details on superimposition, refer to the following.
☞ Page 1055 Superimposition of figures and objects

Figure

The shape of the called screen is displayed in front.

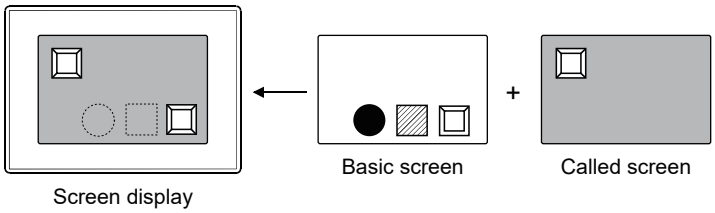


When paints are set for figures on the basic screen and the figures overlap with the shapes of called screens, the colors of the figures may not be displayed correctly.
When the color of a figure is not displayed correctly, set the color fill of the figure with the setting dialog for the figure.

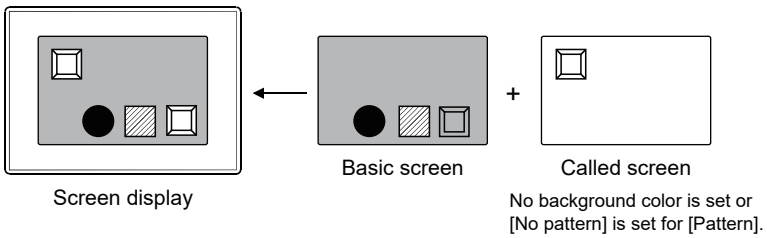


Screen Background

The background color of the called screen is displayed in front.
When the area of the background color overlaps with figures, the figures are not displayed.

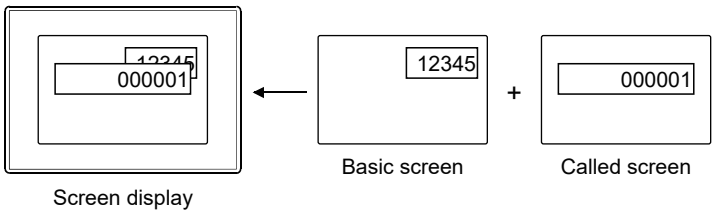


When no background color is set or [No pattern] is set for [Pattern] of the background color, the called screen displays the background color of the basic screen.



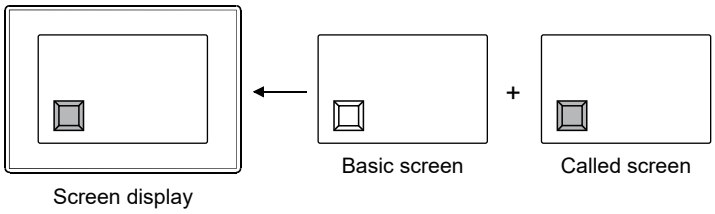
Object

Among the objects on basic screens and called screens, ones on which values change are displayed in front.



Touch switch

Initially, touch switches placed later in the display order are displayed in front.
Subsequently, those with display conditions changed are displayed in front.



Precautions

■Figures and objects placed in the temporary area

When figures and objects are placed in the temporary area for called screens, the figures are displayed but the objects are not displayed with the GOT.

■Displaying the objects of the types for which only one object can be set on one screen

Do not place on both a basic screen and called screen the objects of the types for which only one object can be set on one screen.
When they are placed, they are displayed but the functionality is limited and they do not work correctly.

54.3 How to use the set overlay screen object

GT37 SoftGOT3000

The following shows how to use a set overly screen object.

PART 7

54.3.1 Placing a set overlay screen object

The following shows how to place the set overlay screen.

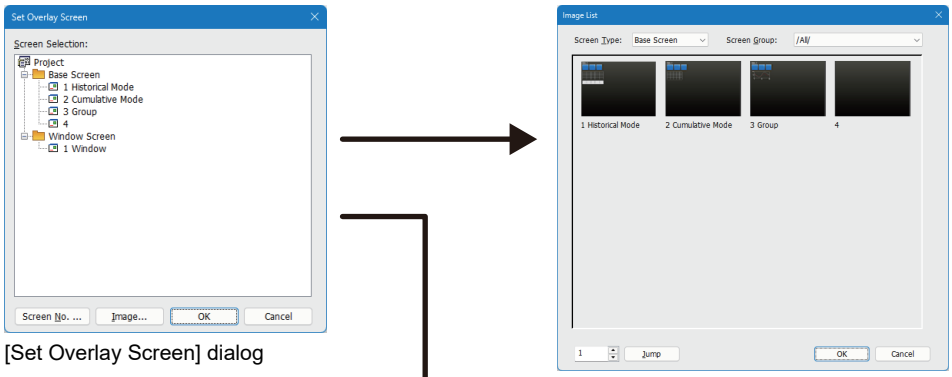
Operating procedure

1. Select [Object] → [Overlay Screen] from the menu.

The [Set Overlay Screen] dialog appears.

2. Select a called screen with any one of the following methods and click the [OK] button.

- Select a called screen from the window selection tree.
- Click the [Screen No.] button to display the [Number Specification] dialog, and specify the screen number that has assigned to the called screen.
- Click the [Image] button to display the [Image List] dialog, and select the screen to be called from among the screen images.



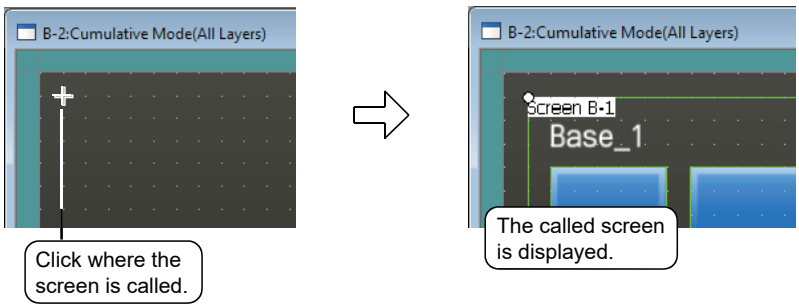
[Set Overlay Screen] dialog

[Image List] dialog

[Number Specification] dialog

3. On the screen editor, place the set over lay screen.

Click the position where you place the called screen.



Point

- Editing a called screen

Double-click the set overlay screen that has been placed on the screen editor to open and edit the called screen.

- Simpler setting method

Called screens can be placed by dragging them from the screen view tree.

54.3.2 Checking set overlay screen settings

You can check the set overlay screen settings in the [Screen] window.

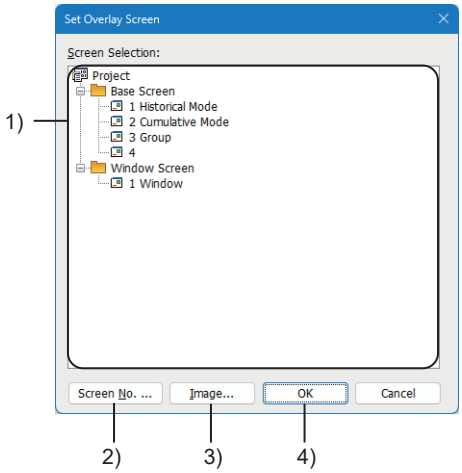
For details on the [Screen] window, refer to the following.

☞ Page 122 [Screen] window

PART 7

54.4 [Set Overlay Screen] dialog

GT37 SoftGOT3000



Item			Description
1)	[Screen Selection]		Select the screen used as a called screen from the tree. Screens being edited cannot be selected.
2)	[Screen No.] button	—	When specifying a called screen with a screen number, click this button. Displays the [Number Specification] dialog. 		[Screen Type]	Select the type of the screen used as a called screen. When the basic screen is a mobile screen, the selection is fixed to [Mobile].
		[Screen No.]	Set the number that has been assigned to the screen used as a called screen. The setting range is [0] to [32767]. Screen numbers cannot be set if the corresponding screens are non-existent.
3)	[Image] button		When selecting a called screen from the screen preview list, click this button. The [Image List] dialog appears. For details on the [Image List] dialog, refer to the following. ☞ Page 3683 [Image List] dialog (screen)
4)	[OK] button		After selecting the screen used as a called screen, click this button. Close the [Set Overlay Screen] dialog. After clicking this button, click where the called screen should be displayed.

54.5 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the set overlay screen as required.
The following shows the functions that are available by configuring the relevant settings.

54.5.1 GOT environmental settings (Screen switching/ window setting)

Select [Common] → [GOT Environmental Setting] → [Screen Switching/Windows] from the menu to display the [Environmental Setting] dialog.

☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])

Function	Setting item
Setting the position of a called screen in front of or behind the basic screen Regardless of this setting, if the basic screen is a mobile screen, a called screen is always positioned in front of the basic screen.	[Overlay Screen Positioning]
Setting whether to disable the background color of a called screen Regardless of this setting, if the basic screen is a mobile screen, the background color of a called screen is always enabled.	[Disable background colors of overlay screen when setting an overlay screen]

PART 7

55 Configuring an animation route

☞ Page 1879 Overview of the animation route
☞ Page 1880 Animation route specifications
☞ Page 1881 Configuring an animation route
☞ Page 1882 [Animation Route] dialog

55.1 Overview of the animation route

GT37 SoftGOT3000

An animation route defines a series of display points of a part as a route.
Setting display points on an animation route automatically specifies the values of the position devices associated with the points.
Select [Route Specification] in the parts setting dialog and specify the animation route to be used in [Route No.]. This will display the part at the points associated with the values of the part's position devices.
☞ Page 1472 [Route Specification]
Multiple animation routes can be configured.
One animation route can be used for multiple parts.

55.2 Animation route specifications

GT37 SoftGOT3000

☞ Page 1880 Maximum number of routes per screen
☞ Page 1880 Animation route size
☞ Page 1880 Configuration of an animation route

55.2.1 Maximum number of routes per screen

Up to 30 animation routes can be set on one screen.

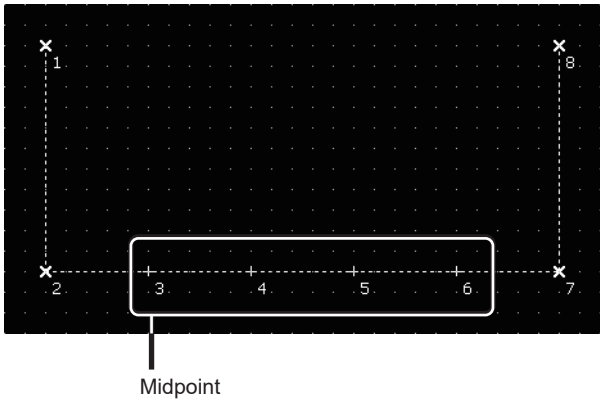
55.2.2 Animation route size

The minimum and maximum sizes of an animation route are shown below.

Size	Size (dot)
Minimum size	1×1
Maximum size	6000 × 6000

55.2.3 Configuration of an animation route

An animation route consists of multiple points and an auxiliary line that connects the points.
The range of an animation route is treated in the same manner as an object area, and handles are displayed.
These handles allow you to perform the same operations (such as size adjustment) as handles on an object frame.
Each point is assigned a serial number with the start point set as 1.
The serial number is automatically set in [Device Value] for each point in the [Animation Route] dialog.
The part will be displayed at the points associated with values of the part's position devices.



Display	Description
Point	Points are displayed as ×. On the above screen, 1, 2, 7, and 8 are points. The positions of points can be changed on the screen editor or in the [Animation Route] dialog.
Intermediate point	Intermediate points are set by dividing a distance between two points evenly into multiple sections. They are displayed as small crosses. On the above screen, 3 to 6 are intermediate points. Their positions cannot be adjusted.

55.3 Configuring an animation route

GT37 SoftGOT3000

Place an animation route by the following procedure.

Operating procedure

1. Select [Object] → [Animation Route] from the menu, and click the intended position to place an animation route.

☞ Page 1001 Placing figures and objects

2. Double-click the animation route that has been placed to display the [Animation Route] dialog.
3. Configure each setting in the [Animation Route] dialog.

☞ Page 1882 [Animation Route] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 995 Basics of figures and objects

Point

After placing an animation route, you can move, add, or delete vertices.
Select [Edit] → [Edit Vertices] from the menu to edit vertices.
For information on how to edit vertices, refer to the following.

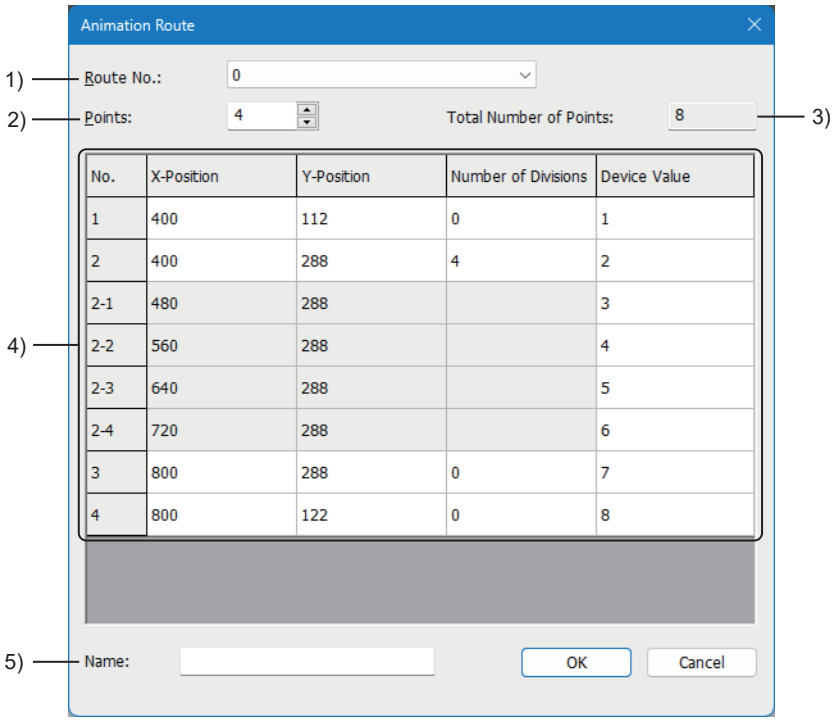
☞ Page 1026 Editing vertices to change the shape of a figure

PART 7

55.4 [Animation Route] dialog

GT37 SoftGOT3000

Specify the number of points and set the display position of each point.



Item		Description
1)	[Route No.]	Specify the identification number of the animation route. The setting range is [0] to [29].
2)	[Points]	Set the number of points on the animation route at which the part is displayed. The setting range is [1] to [100].
3)	[Total Number of Points]	The total number of points set on the route is displayed.
4)	[No.]	The point management number is displayed. For the intermediate points created by division, numbers using [-] (hyphen) are displayed.
	[X-Position] [Y-Position]	Set the X coordinates and Y coordinates of the points. The setting range is [-1000] to [4999]. If the animation route is moved or the position of any points is changed on the screen editor, the move/change is reflected in these settings.
	[Number of Divisions]	The distance between the current point and the next point is divided evenly, and intermediate points are inserted. Positions of the points displayed by this division cannot be specified using coordinates. The setting range is [0] to [98].
	[Device Value]	The values of the position devices to be associated with the points are automatically set. The values of the position devices are displayed as the serial number of each point on the screen editor.
5)	[Name]	Set the name. The name is displayed in places such as the data browser and property sheet. Up to 100 characters can be set.

56 Specifying the display position of a window screen

☞ Page 1884 Overview of the window position object
☞ Page 1885 Specifications of the window position
☞ Page 1886 How to use the window position

PART 7

56.1 Overview of the window position object

GT37 SoftGOT3000

This function sets the position of a window screen to be displayed on a base screen or mobile screen.

Point

• Operation on the GOT

An overlap window can be moved on the screen of the GOT.

A superimpose window cannot be moved on the screen of the GOT.

• Controlling the display position of the overlap window with devices

The display position of the overlap window can be controlled with the device value.

56.2 Specifications of the window position

GT37 SoftGOT3000

The following shows the specifications of the window position.

56.2.1 The type of the screen for which the window position can be set

The window position can be set for a base screen or mobile screen.

56.2.2 The type of the screen for which the display position can be set

The following shows the type of windows for which the display position can be set.

- Overlap window
- Superimpose window
- Key window (Not applicable to mobile screens)

Precautions

The window position setting is not applied to a screen with the window position setting if the screen is displayed as a set overlay screen.

For details on the set overlay screen function, refer to the following.

☞ Page 1864 Placing a script parts object

56.3 How to use the window position

GT37 SoftGOT3000

The following shows how to use the window position.

56.3.1 Setting the window position

The following shows the procedure for setting a window position.

Operating procedure

1. Select [Object] → [Window Position] from the menu, and select a window screen to set its display position.

Overlap windows 3 to 5 and key windows are not applicable to mobile screens.

2. Click the position where you display the window.

A mark indicating the window position is placed.

To display a key window at the position where a window position object is placed, configure one of the following settings.

- In the [Environmental Setting] window, select [Not move] for [Key Window Position Correction] on the [Advanced Setting] tab.

☞ Page 572 [Advanced Setting] tab

- In the [Key Window Advanced Setting] tab of the [Base Screen Property] dialog, select [Not move] for [Key Window Position Correction].

☞ Page 319 [Key Window Advanced Setting] tab

A key window appears near an input object by default.

Precautions

At setting of the window position, the size of the window screen is not considered.

When a window screen extends off the screen it is placed on, the display of the window screen may vary depending on the screen type.

■Overlap window

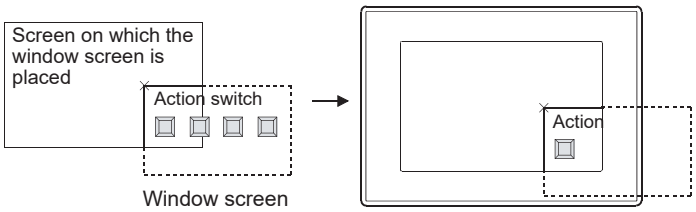
The display depends on the setting of [Display windows beyond the screen area] in the [Environmental Setting] window ([Screen Switching/Window].

For details, refer to the following.

☞ Page 542 [Screen Switching/Window]

■Superimpose window

The window screen does not move, and the part extending off the underlying screen is not displayed.



56.3.2 Displaying the preview on the screen editor

The preview of the window screen placed as the window position can be displayed on the screen editor.

For details, refer to the following.

☞ Page 340 Displaying the preview of a window screen on the screen editor

57 Placing an object to display the input information

☞ Page 1888 Overview of the object to display the input information
☞ Page 1889 Specifications of key window objects
☞ Page 1890 Placing the key window object
☞ Page 1891 [Input Value Area Setting] dialog
☞ Page 1892 [Input Range Area Setting] dialog
☞ Page 1893 [Input Maximum Value Area Setting] dialog
☞ Page 1894 [Input Minimum Value Area Setting] dialog
☞ Page 1895 [Previous Value Area Setting] dialog

57.1 Overview of the object to display the input information

GT37 SoftGOT3000

The key window object displays the relevant information when a numerical value or text is input to an object by using a key window.

For details on the key window, refer to the following.

☞ Page 558 Setting key windows of the GOT ([Key Window])

57.2 Specifications of key window objects

GT37 SoftGOT3000

The following shows the specifications of key window objects.

57.2.1 Key window object types

The following show the information that can be displayed on the key window objects.

- Input value area: Displays the numerical value or text which is being input to the object.
- Input range area: Displays the maximum and minimum values which can be input to the object.
- Input maximum range area: Displays the maximum value which can be input to the object.
- Input minimum range area: Displays the minimum value which can be input to the object.
- Previous value area: Displays a numerical value or text previously input to the object.

57.2.2 Types of the screen where the key window object can be placed

The following shows the types of the screen where the key window object can be placed.

- Base screen
- Window screen

57.2.3 Number of placeable key window objects

You cannot place each key window object more than once on a screen.
You cannot also place two or more objects in the same type on a screen.

57.2.4 Operations for displaying the key window object

The following shows operations that display the key window object except inputting numerical values or texts to the object.

- The security level is changed.
- The language is switched.
- The system language is switched.
- The station number is switched.
- The character code is changed by the Character Code Control (GS456).

57.3 Placing the key window object

GT37 SoftGOT3000

The following shows how to place the key window object.

Operating procedure

1. Select [Object] → [Key Window Object] from the menu, and select a key window object to be placed.

The following shows selectable items.

- [Input Value Area Setting]
- [Input Range Area Setting]
- [Input Maximum Value Area Setting]
- [Input Minimum Value Area Setting]
- [Previous Value Area Setting]

2. Click the position to place the object.

3. Adjust the frame size of the object.

4. Double-click the object to display the setting dialog to configure the relevant settings.

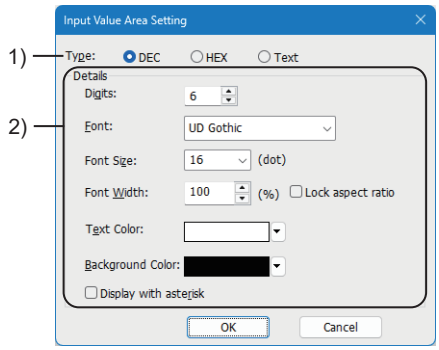
☞ Page 1891 [Input Value Area Setting] dialog
☞ Page 1892 [Input Range Area Setting] dialog
☞ Page 1893 [Input Maximum Value Area Setting] dialog
☞ Page 1894 [Input Minimum Value Area Setting] dialog
☞ Page 1895 [Previous Value Area Setting] dialog

5. Click the [OK] button to complete the object settings.

57.4 [Input Value Area Setting] dialog

GT37 SoftGOT3000

Set the input value area to display the numerical value or text which is being input.

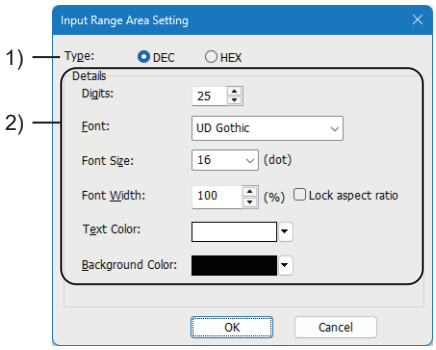


Item			Description
1)	[Type]		Select the display format. This setting only determines the setting range of [Digits]. The key window operates on the GOT according to the format of the input object. To create a key window for inputting decimal or binary values, select [DEC]. To create a key window for inputting hexadecimal values, select [HEX]. To create a key window for inputting octal values, select [DEC] or [HEX]. To create a key window for inputting characters, select [Text].
2)	[Details]	[Digits]	Set the number of digits to be displayed. The setting range varies depending on the selection for [Type]. • [DEC] is selected for [Type]: [1] to [33] digit(s) • [HEX] is selected for [Type]: [1] to [16] digit(s) • [Text] is selected for [Type]: [1] to [100] digit(s)
		[Font]	Select the font of the text.
		[Font Size]	Select a text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Lock aspect ratio]	Select this item to fix the aspect ratio of the font. When this item is selected, the setting of [Font Width] is disabled.
		[Text Color]	Set the text color.
		[Background Color]	Set the color for the object.
		[Display with asterisk]	Represents the displayed contents with asterisks.

57.5 [Input Range Area Setting] dialog

GT37 SoftGOT3000

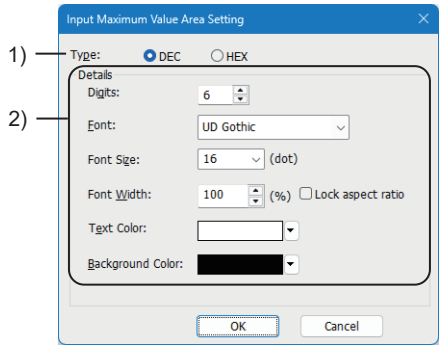
Set the input range area to display the maximum and minimum values which can be input.



Item			Description
1)	[Type]		Select the display format. This setting only determines the setting range of [Digits]. The key window operates on the GOT according to the format of the input object. To create a key window for inputting decimal or binary values, select [DEC]. To create a key window for inputting hexadecimal values, select [HEX]. To create a key window for inputting octal values, select [DEC] or [HEX].
2)	[Details]	[Digits]	Set the number of digits to be displayed. The setting range is [15] digit to [79] digits. When the device is set with a range expression and the device value exceeds the set number of digits, ? may be displayed. Set the number of digits in consideration of the device value referring to the following. Example 1) D100 <= INPUT <= D200 Required number of digits: D100 (Device value (-32767 to 32767)*) _ <= (1 2 1) _ INPUT (5) _ <= (1 2 1) _ D200 (Device value (-32767 to 32767)*) 6 digits + 13 digits + 6 digits Input range: Requires 25 digits. * For 16-bit signed decimal numbers Example 2) D100 < INPUT Required number of digits: D100 (Device value (-32767 to 32767)*) _ < (1 1 1) _ INPUT (5) 6 digits + 8 digits Input range: Requires 14 digits. * For 16-bit signed decimal numbers
		[Font]	Select the font of the text.
		[Font Size]	Select a text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Lock aspect ratio]	Select this item to fix the aspect ratio of the font. When this item is selected, the setting of [Font Width] is disabled.
		[Text Color]	Set the text color.
		[Background Color]	Set the color for the object.

57.6 [Input Maximum Value Area Setting] dialog

GT37 SoftGOT3000



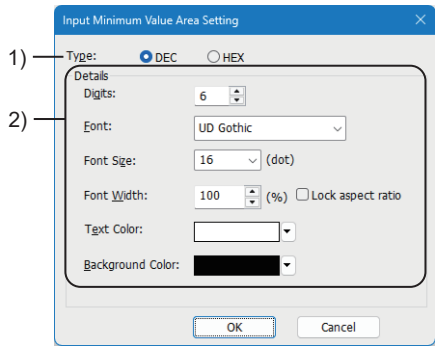
Item			Description
1)	[Type]		Select the display format. This setting only determines the setting range of [Digits]. The key window operates on the GOT according to the format of the input object. To create a key window for inputting decimal or binary values, select [DEC]. To create a key window for inputting hexadecimal values, select [HEX]. To create a key window for inputting octal values, select [DEC] or [HEX].
2)	[Details]	[Digits]	Set the number of digits to be displayed. The setting range varies depending on the selection for [Type]. • [DEC] is selected for [Type]: [1] to [33] digit(s) • [HEX] is selected for [Type]: [1] to [16] digit(s) When the number of digits exceeds the set value, ? is displayed.
		[Font]	Select the font of the text.
		[Font Size]	Select a text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Lock aspect ratio]	Select this item to fix the aspect ratio of the font. When this item is selected, the setting of [Font Width] is disabled.
		[Text Color]	Set the text color.
		[Background Color]	Set the color for the object.

PART 7

57.7 [Input Minimum Value Area Setting] dialog

GT37 SoftGOT3000

Set the input range area (minimum value) to display the minimum value which can be input.

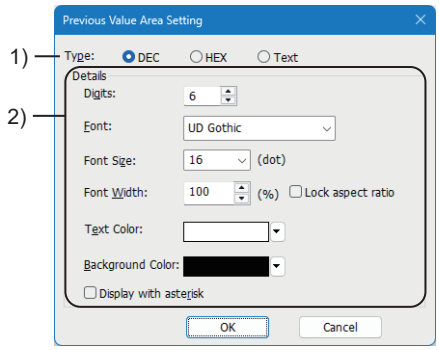


Item			Description
1)	[Type]		Select the display format. This setting only determines the setting range of [Digits]. The key window operates on the GOT according to the format of the input object. To create a key window for inputting decimal or binary values, select [DEC]. To create a key window for inputting hexadecimal values, select [HEX]. To create a key window for inputting octal values, select [DEC] or [HEX].
2)	[Details]	[Digits]	Set the number of digits to be displayed. The setting range varies depending on the selection for [Type]. • [DEC] is selected for [Type]: [1] to [33] digit(s) • [HEX] is selected for [Type]: [1] to [16] digit(s) When the number of digits exceeds the set value, ? is displayed.
		[Font]	Select the font of the text.
		[Font Size]	Select a text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Lock aspect ratio]	Select this item to fix the aspect ratio of the font. When this item is selected, the setting of [Font Width] is disabled.
		[Text Color]	Set the text color.
		[Background Color]	Set the color for the object.

57.8 [Previous Value Area Setting] dialog

GT37 SoftGOT3000

Set the previous value area to display the numerical value or text which is previously input.



Item			Description
1)	[Type]		Select the display format. This setting only determines the setting range of [Digits]. The key window operates on the GOT according to the format of the input object. To create a key window for inputting decimal or binary values, select [DEC]. To create a key window for inputting hexadecimal values, select [HEX]. To create a key window for inputting octal values, select [DEC] or [HEX]. To create a key window for inputting characters, select [Text].
2)	[Details]	[Digits]	Set the number of digits to be displayed. The setting range varies depending on the selection for [Type]. • [DEC] is selected for [Type]: [1] to [33] digit(s) • [HEX] is selected for [Type]: [1] to [16] digit(s) • [Text] is selected for [Type]: [1] to [100] digit(s) When the number of digits exceeds the set value, ? is displayed.
		[Font]	Select the font of the text.
		[Font Size]	Select a text size. The setting range is [8] dots to [540] dots.
		[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
		[Lock aspect ratio]	Select this item to fix the aspect ratio of the font. When this item is selected, the setting of [Font Width] is disabled.
		[Text Color]	Set the text color.
		[Background Color]	Set the color for the object.
		[Display with asterisk]	Represents the displayed contents with asterisks.

58 Placing a hyperlink on a mobile screen

☞ Page 1897 Overview of the hyperlink
☞ Page 1899 Specifications of the hyperlink object
☞ Page 1900 How to use the hyperlink object
☞ Page 1901 [Hyperlink] dialog

58.1 Overview of the hyperlink

GT37 SoftGOT3000

The hyperlink object is placed on a mobile screen to access a website or a file in the GOT public folder, or to make a phone call from a GOT Mobile function client.

For details on the GOT Mobile function, refer to the following.

☞ Page 2736 Monitoring a controller from tablets or other devices (GOT Mobile function)

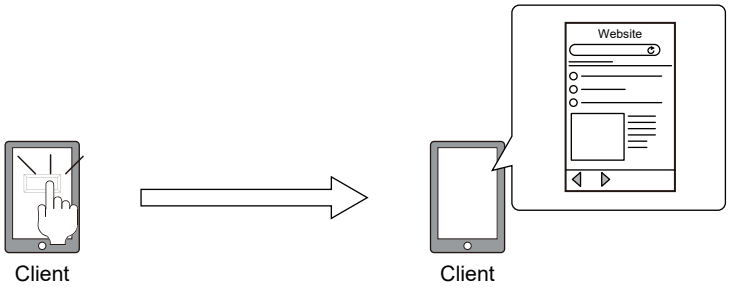
58.1.1 Application example

The following shows an example of using a hyperlink.

☞ Page 1897 Opening a website
☞ Page 1897 Opening a file in the public folder
☞ Page 1898 Making a phone call

Opening a website

You can access a website by specifying its URL.



Opening a file in the public folder

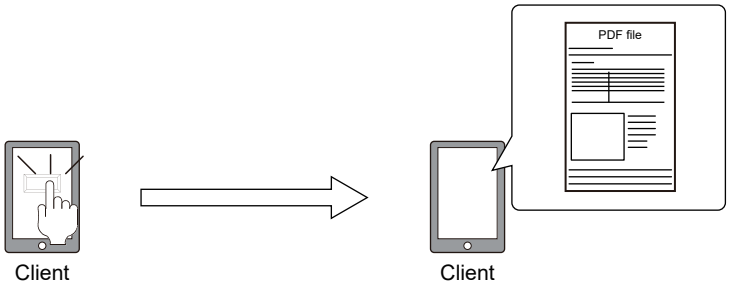
You can access or download a file in the GOT public folder through a browser.

For details on the public folder, refer to the following.

☞ Page 2760 Public folder

Ex.

When accessing a PDF file



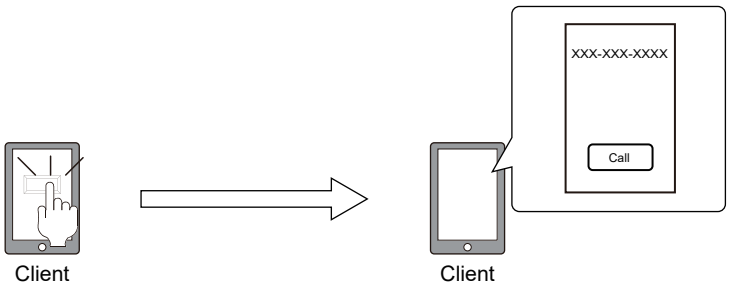
Precautions

To open a file in the public folder, the client to be used must have the application that supports the file format.

If the client does not have the applicable application, the file is downloaded to the client.

Making a phone call

You can call a specified phone number.



Precautions

To call a specified phone number, the client to be used must have a phone call function.

58.2 Specifications of the hyperlink object

GT37 SoftGOT3000

58.2.1 Maximum number of objects that can be placed on one screen

The maximum number of hyperlink objects and other objects combined is 1024 on one screen.

58.2.2 Applicable screen

The hyperlink object can be placed only in the mobile screen.

58.3 How to use the hyperlink object

GT37 SoftGOT3000

58.3.1 Placing a hyperlink object

Place a hyperlink object on the screen editor.

Operating procedure

1. Select [Object] → [Hyperlink] from the menu.
2. Click the position to place a hyperlink object.
3. Double-click the hyperlink object to display the [Hyperlink] dialog.
4. Configure the settings in each tab.

☞ Page 1901 [Hyperlink] dialog

Precautions

■When hyperlink objects overlap one another

If you touch the overlapping portion between hyperlink objects, the hyperlink object at the front operates only.

■When sliding your finger on a hyperlink object

If you slide your finger within the touch area of a hyperlink object, the object operates when you release your finger.

58.3.2 Editing a hyperlink object

Edit a hyperlink object placed on the screen editor.

☞ Page 1001 Placing figures and objects

58.3.3 Configuring the hyperlink object setting

Configure the setting for a hyperlink object placed on the screen editor.

- Common settings for objects

☞ Page 1037 Settings common to objects

- Hyperlink object setting

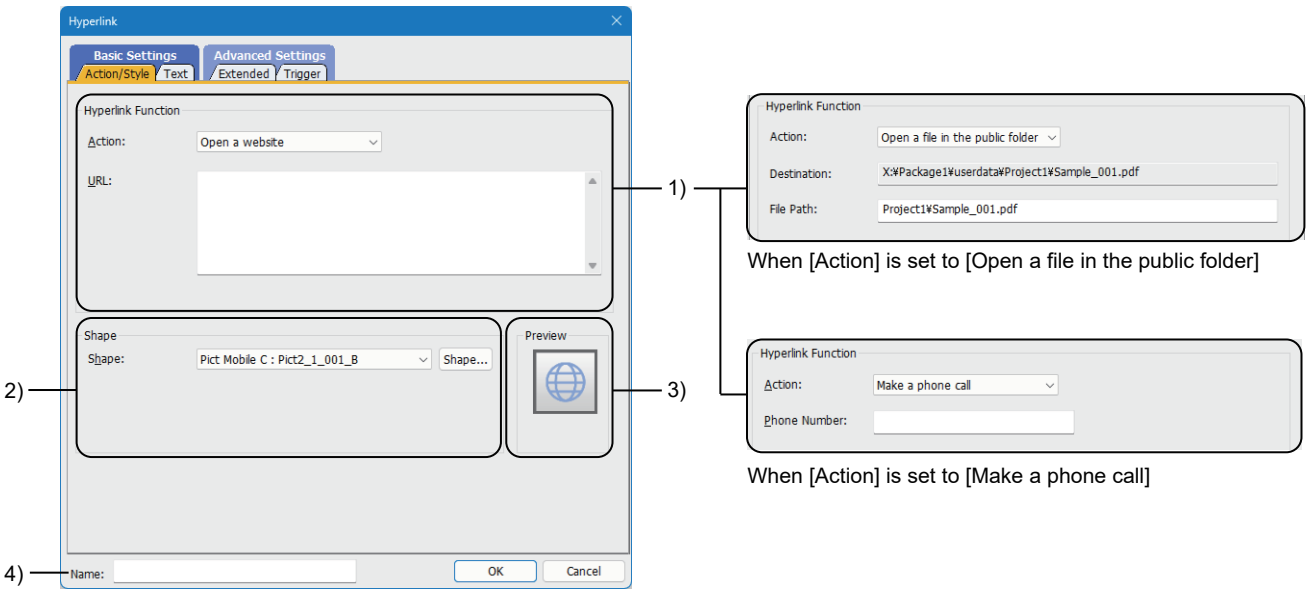
☞ Page 1901 [Hyperlink] dialog

58.4 [Hyperlink] dialog

GT37 SoftGOT3000

☞ Page 1901 [Action/Style] tab
☞ Page 1903 [Text] tab
☞ Page 1907 [Extended] tab
☞ Page 1907 [Trigger] tab

58.4.1 [Action/Style] tab



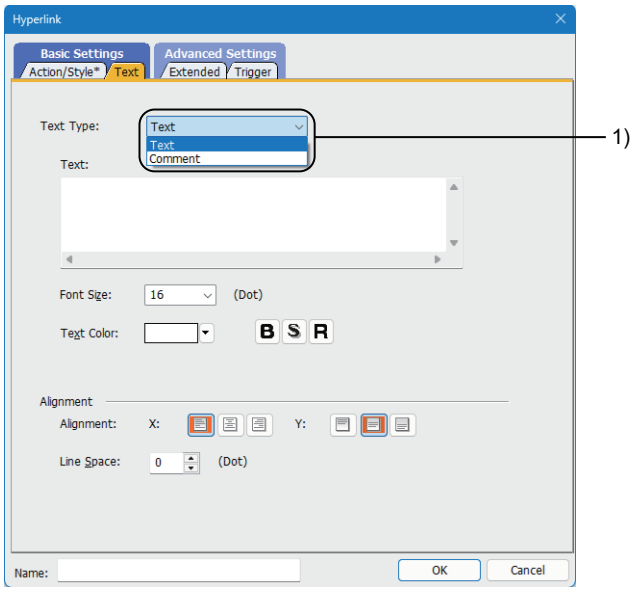
When [Action] is set to [Open a website]

Item			Description
1)	[Hyperlink Function]	[Action]	Set the function assigned to the hyperlink object. The setting items differ depending on the selection for [Action].
		[URL]	Set the URL when [Open a website] is selected for [Action]. Set the URL of a website to be accessed. Specify the URL with one-byte alphanumerics and symbols within 2083 characters.
		[Destination]	Set the destination when [Open a file in the public folder] is selected for [Action]. Displays the full path to the file to be opened in the GOT public folder. If a message saying [The public folder is not set] appears, select [Allow external access to GOT public folder] in the [GOT Mobile Setting] window ([Basic Setting]). ☞ Page 2818 [Basic Setting]
		[File Path]	Set the file path when [Open a file in the public folder] is selected for [Action]. Set the relative path to the file to be opened in the GOT public folder (including sub folders). Example) When opening Sample_001.pdf in the Project1 folder under the GOT public folder File Path: Package1¥Sample_001.pdf Set a folder name and file name so that the total number of characters used for the path is 78 or less. ☞ Page 84 Restrictions for folder names and file names used in GOT If you edit the [Package Folder Name] in the [Type Setting] dialog, the number of characters may exceed 79. ☞ Page 519 [Type Setting] dialog
		[Phone Number]	Set a phone number when [Make a phone call] is selected for [Action]. Set a phone number to be called. Specify the phone number with one-byte numerics and no hyphen within 15 digits.

Item			Description
2)	[Shape]	[Shape]	Set a shape for the hyperlink object. Click the [Shape] button to select shapes other than those in the list box.
		[Frame Color]	Set the frame color of the shape.
		[Shape Color]	Set the color of the shape.
3)	[Preview]		Displays the preview of the object.
4)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

58.4.2 [Text] tab

You can select the text type to display the entered characters or a comment in a comment group on the object.



Item			Description
1)	[Text Type]	[Text]	Directly enter the text to be displayed. If characters have already been entered in the [Text] field, switching the text type from [Text] to [Comment] enables you to register the entered characters in a comment group. For instruction on registering a comment group, refer to the following. ☞ Page 811 Registering the characters in the [Text] field to a comment group
		[Comment]	Displays a comment of the specified comment group on the object.

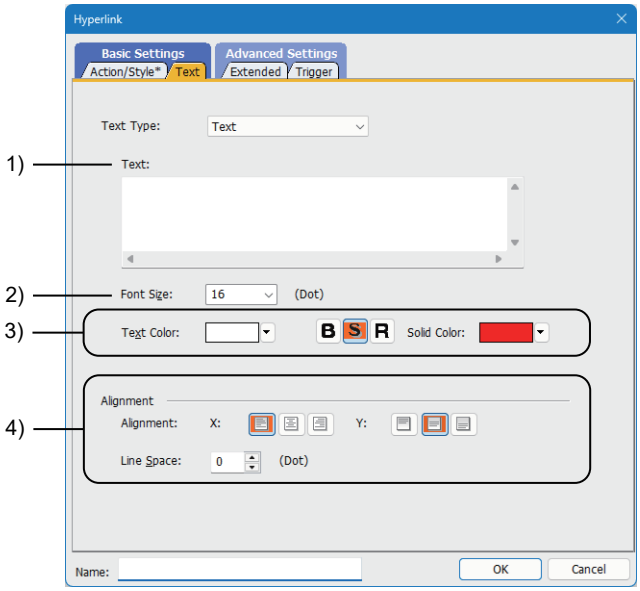
For the comment group settings, refer to the following.

☞ Page 776 Comment setting ([Comment])

Setting items vary depending on the selected text type.

The following shows the setting items for each text type.

[Text]



Item			Description
1)	[Text]		Enter characters to be displayed on the object. Up to 1024 characters can be set. To display the text in multiple lines, press the [Enter] key at the end of the text in each line. (When a line feed is inserted, two characters per line feed are added to the number of characters.)
2)	[Font Size]		Set the font size of the text to be displayed on the object. The setting range for the vertical and horizontal orientations is [8] dots to [540] dots (in 1-dot units).
3)	[Text Color]	—	Set the color and style of the text to be displayed on the object. One style ([Bold], [Solid], or [Raised]) is settable only. 		[Text Color]	Set the text color. ☞ Page 988 Color settings
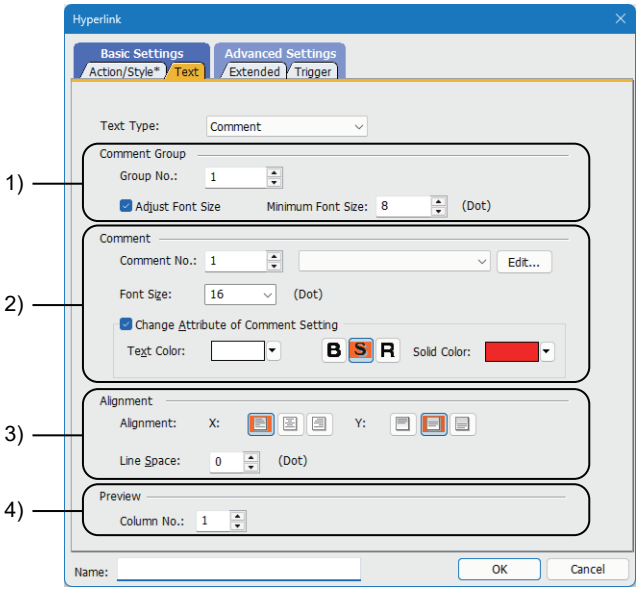
		[Bold] button	Displays the text in bold.
		[Solid] button	Displays the text with a shadow.
		[Raised] button	Displays the text embossed.
		[Solid Color]	When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
4)	[Alignment]	[Alignment]	Set the vertical and horizontal positions of the text.
		[Line Space]	Set a space between lines in units of dots. The setting range is [0] dots to [128] dots.

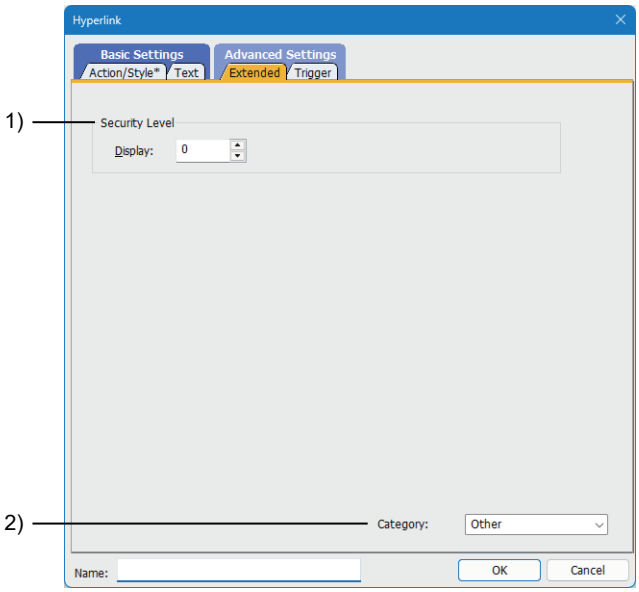
[Comment]



Item			Description
1)	[Comment Group]	[Group No.]	Set the comment group number to be used. The setting range is [1] to [500].
		[Adjust Font Size]	The font size is automatically adjusted according to the object size. When this item is deselected, a line feed is automatically inserted.
		[Minimum Font Size]	Set the minimum font size applied when the font size is automatically adjusted. The setting range is [8] dots to [540] dots.

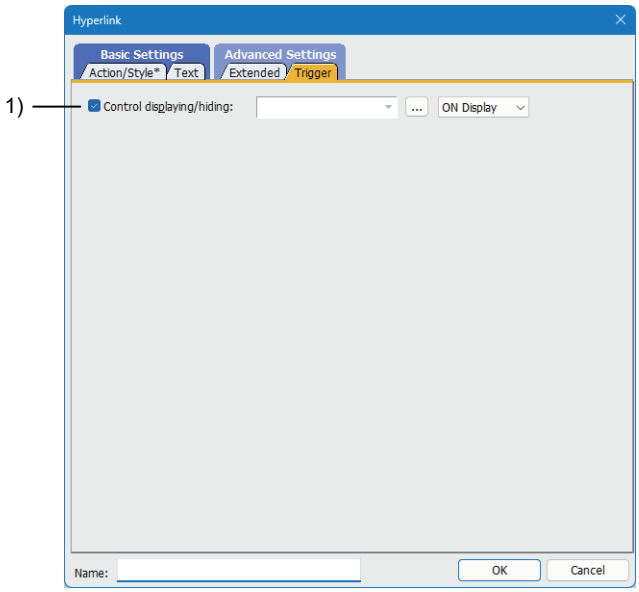
Item			Description
2)	[Comment]	[Comment No.]	Set the comment No. to be displayed. The setting range is [0] to [32767]. To edit the comment to be displayed, click the [Edit] button to display the [Edit Comment] dialog. If an unregistered comment group number or comment number is set, create a new comment.  • [Column No.] Select the column No. of the comment to be edited. • [Comment] Edit the comment in the comment group. If an unregistered comment group number, comment number, or column number is set, create a new comment. Up to 1024 characters can be set for the comment. The number of characters, digits, and rows of the input comment are displayed on the upper right of the comment input field. • Number of characters: A character is counted as one character. The line feed is counted as two characters.
		[Font Size]	Set the size of the text to be displayed on the object. The setting range for the vertical and horizontal orientations is [8] dots to [540] dots (in 1-dot units).
		[Change Attribute of Comment Setting]	Change the comment attributes. Set the color and style of the text to be displayed on the object. One style ([Bold], [Solid], or [Raised]) is settable only.  • [Text Color] Set the text color. ☞ Page 988 Color settings • [Bold] button Displays the text in bold. • [Solid] button Displays the text with a shadow. • [Raised] button Displays the text embossed. • [Solid Color] When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
3)	[Alignment]	[Alignment]	Set the vertical and horizontal positions of the text.
		[Line Space]	Set a space between lines in units of dots. The setting range is [0] dots to [128] dots.
4)	[Preview]	[Column No.]	Set the column No. of the comment to be displayed on the screen of GT Designer3.

58.4.3 [Extended] tab



Item		Description
1)	[Security Level]	Set a security level when using the security function. The setting range is [0] to [15]. If you do not use the security, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
2)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category

58.4.4 [Trigger] tab



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Bit device for control • Whether to display the object when the bit device for control is on or off

PART 8 Operation log

59 Configuring the settings for collecting the GOT operation history ([Operation Log])

59 Configuring the settings for collecting the GOT operation history ([Operation Log])

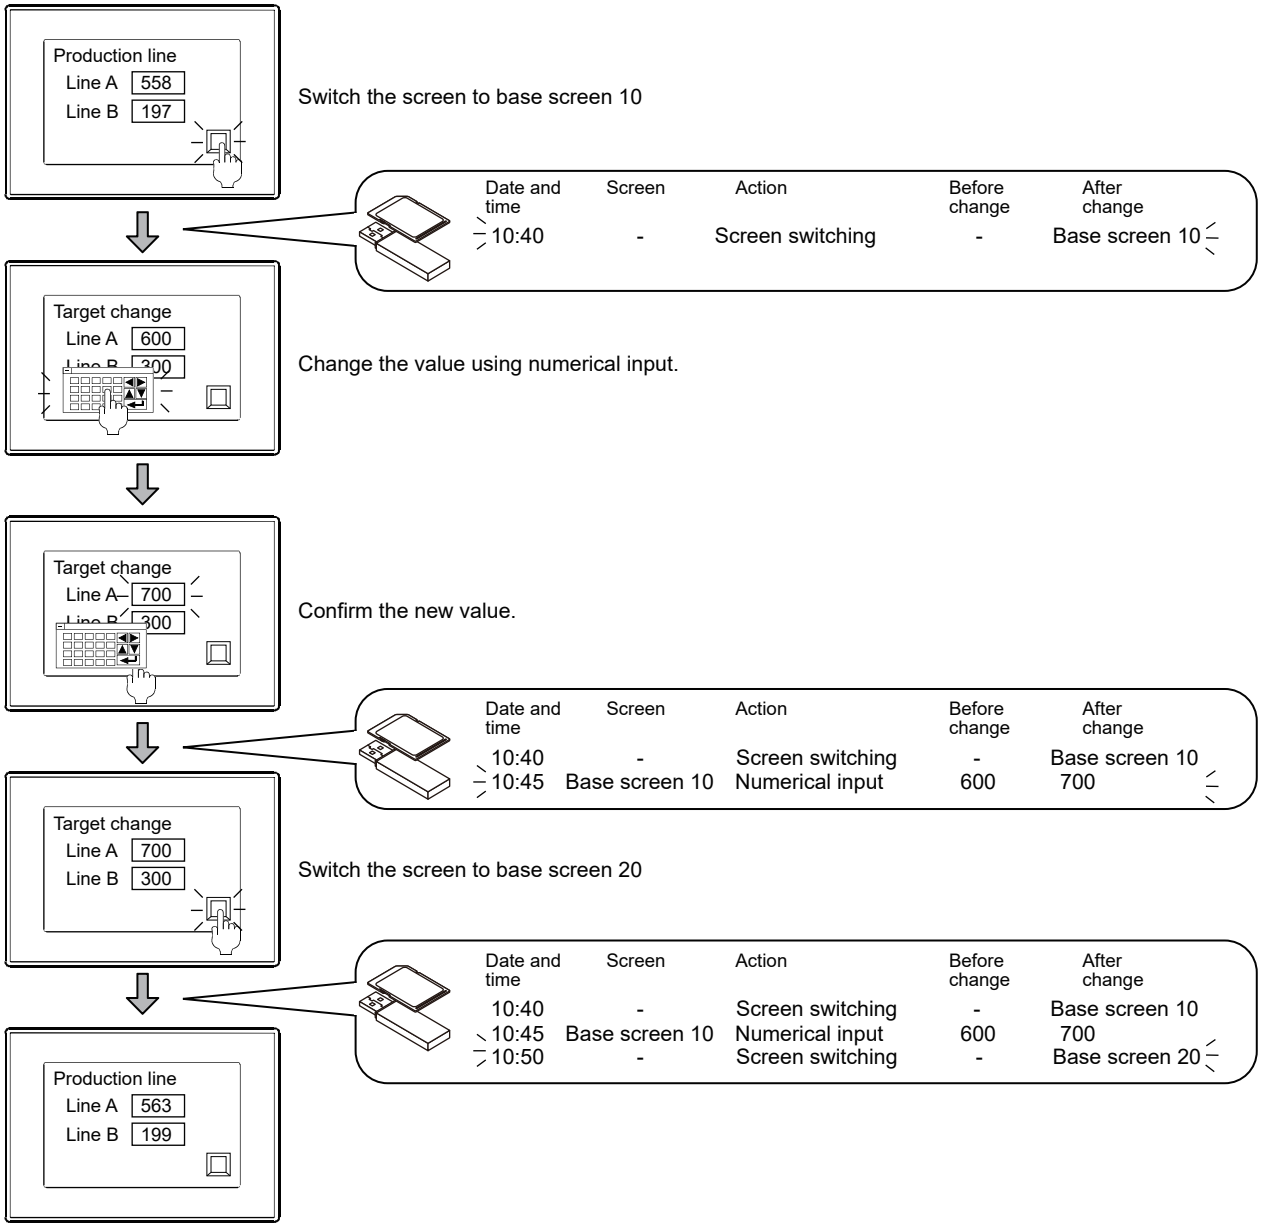
☞ Page 1910 Overview of operation logs
☞ Page 1911 Specifications of the operation log
☞ Page 1927 Log details by operation
☞ Page 2003 How to use operation logs
☞ Page 2011 Recording the operator name as the character string stored in the device
☞ Page 2013 [Operation Log]
☞ Page 2019 [Operation Log File Conversion] dialog
☞ Page 2020 Relevant settings

59.1 Overview of operation logs

GT37 SoftGOT3000

The history of operations performed on the GOT can be saved to data storage.
By saving operation histories, they can be used to investigate the causes of problems at the production site.
The saved history can be checked using the following methods.

- Using the GOT utility
- Using the text editor or other tools of the personal computer
- Using Resource File Viewer



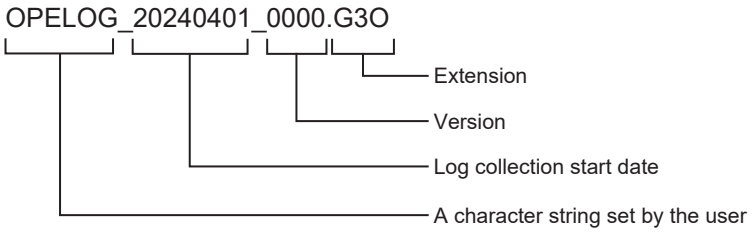
59.2 Specifications of the operation log

GT37 SoftGOT3000

☞ Page 1911 Operation log file name
☞ Page 1912 Save destination for the operation log file
☞ Page 1913 Time intervals at which operation logs are saved
☞ Page 1913 Size setting of operation log files to be saved
☞ Page 1913 Maximum number of logs in the operation log file
☞ Page 1913 Operation log file conversion function
☞ Page 1914 Operation log output types
☞ Page 1915 Functions to be recorded in the operation log
☞ Page 1921 Collection item

59.2.1 Operation log file name

GOT operation logs are saved in a special binary file (.G3O).
A file name is any character string set by a user, followed by the automatically added log collection start date (YYYYMMDD) for the file and the version.



A part of GT SoftGOT3000 operation logs is saved in an application log file (.G3O) separately from the GOT operation log file.
The file name of the application log is as follows:

SGTLOG_(5-digit module No.)_(start date of logging)_(version).G3O
Example) SGTLOG_00001_20241225_0006.G3O

The version starts from 0000, and is incremented by one every time a new file is created.
After the number reaches 9999, it returns to 0000 in the name of the next new file.
For the character type and the number of characters available for file names, refer to the following.
☞ Page 84 Restrictions for folder names and file names used in GOT
For instruction on setting file names, refer to the following.
☞ Page 2013 [Basic] tab

59.2.2 Save destination for the operation log file

The following shows the save destination of the operation log file and the GT SoftGOT3000 application log file.

Drives and folders for saving operation log files

Data storage is needed to save operation logs.

Specify drive A, drive B, drive E, drive F, drive G, or drive X (current drive) for the drive to save operation log files.

The default destination is the following folder on the same drive as the project file (drive X).

X:\(project folder name)\OPELOG\

For instruction on setting the save destination, refer to the following.

☞ Page 2013 [Basic] tab

Precautions

It is recommended to format the data storage before using it.

The number of files to be stored in a folder should be less than 500.

If 500 or more files are stored in a folder, the access performance may be degraded.

Repeated writing or deleting of data may degrade access performance, regardless of the number of files.

In such a case, format the data storage.

Save destination for GT SoftGOT3000 application logs

GT SoftGOT3000 application logs are output at the timing of operation regardless of the security mode of the monitored project.

In addition, files of the output application logs are encrypted with the password for the GT SoftGOT3000 application log file set at the first startup of GT SoftGOT3000.

The save destination of GT SoftGOT3000 application logs differs depending on the type of operation to be recorded.

Operation	Storage folder
GT SoftGOT3000 all data initialization	C:\Users\(user name)\AppData\Local\MITSUBISHI\SGT3000DELLOG
Others	C:\Users\(user name)\AppData\Local\MITSUBISHI\SGT3000\Multi\(5-digit module No.)\OPELOG

Point

Uninstalling GT SoftGOT3000 does not delete operation log files and application log files.

To delete all data, initialize all data first before uninstalling GT SoftGOT3000.

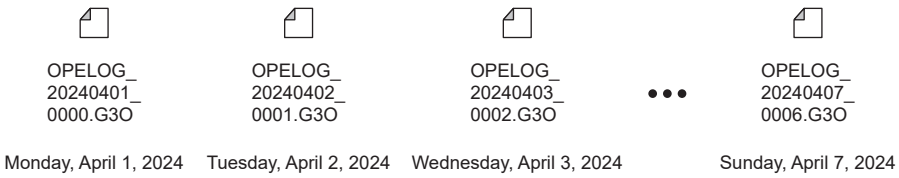
After that, retrieve operation log files and application log files from the storage destination as required, and delete the save destination folder, operation log files, and application log files.

59.2.3 Time intervals at which operation logs are saved

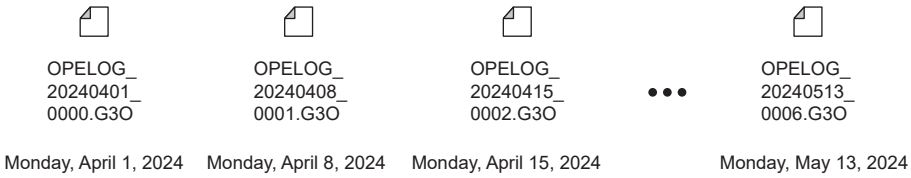
You can select the time intervals, in days or weeks, at which operation logs are saved.

Saved operations log files are stored for a certain period of time and then deleted automatically.

- Saving in days (every day)



- Saving in weeks (every week)



GT SoftGOT3000 application logs are saved daily (the date switching time is fixed at 0:00).

The logs are not deleted automatically.

However, if the storage destination drive does not have enough space, old logs are deleted to continue log collection.

59.2.4 Size setting of operation log files to be saved

The total size of all operation log files that can be saved in data storage can be specified.

When the size exceeds the specified one, the oldest operation log file is automatically deleted.

For GT SoftGOT3000 application log files, the size is unlimited.

59.2.5 Maximum number of logs in the operation log file

Up to 1,048,569 logs can be stored in one operation log file.

The maximum number of logs stored in one application log file of GT SoftGOT3000 is 10000.

59.2.6 Operation log file conversion function

Operation log files (.G3O) and GT SoftGOT3000 application log files (.G3O) in binary format can be converted to Unicode text files or CSV files.

To check the binary file contents, you need the GOT utility or Resource File Viewer. Converting a binary file to a Unicode text file or CSV file facilitates data viewing, processing, analysis, and transformation in other applications.

For details on operation logs, refer to the following.

☞ Page 2005 CSV file conversion or Unicode text file conversion of operation log file

For details on checking operations logs, refer to the following.

☞ Page 2003 Checking operation logs

59.2.7 Operation log output types

To output operation logs, either the detailed log or the regular log is selectable depending on degrees of detail.
The detailed log is saved in a special binary file (.G3O).
When converting the binary file (.G3O) to a Unicode text file or CSV file, you can select either the detailed log or the regular log to be output.
For details on functions to be output in the operation log, refer to the following.
☞ Page 1915 Functions to be recorded in the operation log

Operation log type	Description
Detailed log	All log collection items are output for all functions to be included in the operation log. You can check the output using Resource File Viewer or in a CSV file or Unicode text file converted with the detailed log.
Regular log	The following log collection items are not output in the regular log. • Operating device • Category • Type • Log type ID You can check the output in the list of operation log data in the utility, or in a CSV or Unicode text file converted with the regular log.

59.2.8 Functions to be recorded in the operation log

The following shows the functions to be recorded in the operation log.
Refer to the descriptions for ❶, ❷, and ❸ in the following section, and check the columns for ❶, ❷, and ❸ in the following table.

❶ Functions to be added to [Operation Log Target]
To enable recording in the operation log, some functions need to be added to [Operation Log Target] in GT Designer3 in advance, while others are recorded automatically.
For the addition to [Operation Log Target], select [Environmental Setting] → [Operation Log] → [Log Target] in GT Designer3.
☞ Page 2015 [Log Target] tab
Functions to be recorded automatically are always logged while the operation log is enabled.

❷ Functions to be output in regular log and functions to be output in detailed log
The availability of output in the regular log and detailed log depends on the type of functions recorded in the operation log.
The functions specified in [Operation Log Target] can be checked in the operation log data list in the utility or in the regular log.

❸ Operation log for the GOT Mobile function client
When performing operations on the GOT Mobile function client, some operations are not logged.

○: Applicable, ×: Not applicable

Function type	❶	❷		❸	Model

59.2.9 Collection item

In the operation log for each operation, some items are common, while others are collected depending on the type of operation.
Additionally, for the same operation, some items are only included in the detailed log, not in the regular log, and their order of output differs.
The following table lists the items included in the detailed log, along with their availability and the order of output in the regular log.
○: Applicable, ×: Not applicable

	Item	Description	Output in regular log	Output order in regular log
1	Date and time	Time when the event occurred	○	1
2	Operating device (type, details)*1	Function type and details (Ethernet, IP address, port number) when the operating device is in a remote area ☞ Page 1922 Operating device (type, details)	×	—
3	Operator name*2	Name of the operator who performed the operation ☞ Page 1923 Operator name, operator ID	○	6
4	Operator ID	ID of the operator who performed the operation ☞ Page 1923 Operator name, operator ID	○	7
5	Category*1	Operation log category (classification) ☞ Page 1923 Category	×	—
6	Type*1	Operation log type (error/warning/information) ☞ Page 1924 Type	×	—
7	Log type ID*1	Number to identify the function (operation)	×	—
8	Function abbreviation	Abbreviation to identify the function (operation) type (up to eight one-byte characters)?	○	3
9	Function type name	Name to identify the function (operation)	○	4
10	Screen No.	Number of the screen on which the operation is performed ☞ Page 1924 Screen No.	○	2
11	Operation name	Name of the object or function that was operated (user-specified)	○	5
12	User ID	ID to identify the object (user-specified)	○	8
13	Action No./Setting ID	• Number representing the order of operations when multiple operations are set for a single touch switch • ID for settings such as the alarm settings to be operated	○	9: (SUB_NO: Sub number)
14	Data type	Data type of the device to be operated ☞ Page 1925 Data type	○	10
15	Device name	Name of the device to be operated (including the communication channel number, device network number, station number, CPU number) ☞ Page 1925 Device name	○	11 (CH_NUM: Channel number) 12 (NET_STA: Network, station number, module number) 13 (DEV_NAME: Device name)
16	Change value	Value after the value or setting has been change by operation ☞ Page 1926 Change value, previous value	○	14
17	Change value (operation)	Value set by the operator on the GOT ☞ Page 1926 Change value (operation), previous value (display)	○	15
18	Previous value	Value before change by an operation or a setting change ☞ Page 1926 Change value, previous value	○	16
19	Previous value (display)	Value displayed on the object before change ☞ Page 1926 Change value (operation), previous value (display)	○	17

*1 Output only when the security mode is set to mode 2.
*2 The operating device and the operator name are output together in the regular log.

Operating device (type, details)

For remote control, the operating device type (function) and its details (route and other information) are recorded.

■Operating device (type)

The following shows the operating device (type) list.

Type	Output
(Operation on actual device, operation on GT SoftGOT3000)	—
Personal computer tool	PC Tool
VNC client	VNC
GOT Mobile	GOT Mobile "Connection No."
OPC UA client	OPC UA
FTP client	FTP
GT SoftGOT3000 Commander	GT SoftGOT3000 Commander

■Operating device (route)

The following shows the operating device (route) list.

Type	Output
USB	Src:USB
Ethernet (including via PLC)	Src: ([IP Address] of the connected controller):([Port No.] of the connected controller) For functions such as the VNC server and web browser functions for which a port number cannot be obtained, [-] is shown as the port number.

Operator name, operator ID

The log is recorded as follows according to the authentication method, [Level], [Operator], or [None].

Type	Authentication method	Output
Operator name	[None]	Level0
	[Level]	LevelX (where X is the current security level)
	[Operator]	Name of the logged-in operator
Operator ID	[None]	0
	[Level]	X (where X is the current security level)
	[Operator]	ID of the logged-in operator

■Regular log

The operating device and the operator name are output together in the regular log.

Type		Authentication method	Output
Operator name	Normal operation	[None]	Level0
		[Level]	LevelX X is the current security level.
		[Operator]	Name of the logged-in operator
	Operation performed on the VNC client	[None]	Asterisk (*) + Level0 + [Client IP address]
		[Level]	When the security level is X: Asterisk (*) + LevelX + [Client IP address]
		[Operator]	Asterisk (*) + Logged-in operator name + [Client IP address] Without login: Asterisk (*) + [Client IP address]
	Operation log for the GOT Mobile client	[None]	Connection No. 1: Asterisk (*) + Level0 + [M1:Client IP address]
		[Level]	Security level X, connection No.1: Asterisk (*) + LevelX + [M1:Client IP address]
		[Operator]	Connection No. 1: Asterisk (*) + Logged-in operator name + [M1:Client IP address] Without login: Asterisk (*) + [M1:Client IP address]
	Operation log for the GOT Mobile client (non-touch operations)	[None]	Connection No. 5: Asterisk (*) + [M5:Client IP address]
		[Level]	
		[Operator]	
Operator ID	Normal operation Operation performed on the VNC client Operation log for the GOT Mobile client	[None]	0
		[Level]	X X is the current security level.
		[Operator]	ID of the logged-in operator
	Operation log for the GOT Mobile client (non-touch operations)	[None]	—
		[Level]	
		[Operator]	

Category

The following describes the categories.

Definition	Output
All events related to access control such as operations for operator authentication	access control
All events related to errors Since they are recorded as system alarms, the information in the operation log is limited.	request errors
All events detected by the GOT3000 series unit	control system events
All events related to the GOT data package acquisition and restoration	backup and restore event
Events related to setting changes	configuration changes
Log operation events such as output to log files, log deletion, and external log output	audit log events
User-specified events	user screen events

Type

The following describes the types.

Definition		Output
Error	Failures caused by the GOT3000 series itself Since they are recorded as system alarms, the information in the operation log is limited.	error
Warning	Events related to deleting data and initialization performed by the operator	warning
Information	Operations related to security settings and security functions in the GOT3000 series, operations performed by the operator, and operations related to the system configured using the GOT3000 series	information

Log type ID, function abbreviation, function type name

Number, abbreviation, and name to identify the operation log type

For details, refer to the following.

☞ Page 1927 Log details by operation

Screen No.

When the user operates a screen, the type and the number of the screen are recorded in the operation log.

A prefix representing the screen type and the screen number is output.

When [0] is specified in [GOT Environmental Setting] - [Screen Switching/Windows] - [Screen No. of the window screen to be hidden], the screen number [0] in the operation log means that the opened overlap window is closed. When [-1] is specified in [GOT Environmental Setting] - [Screen Switching/Windows] - [Screen No. of the window screen to be hidden] and the overlap window 1 is closed, [OVL_-1] is recorded in the operation log.

Screen type	Prefix
Base screen	BASE_
Overlap window 1	OVL1_
Overlap window 2	OVL2_
Overlap window 3	OVL3_
Overlap window 4	OVL4_
Overlap window 5	OVL5_
Superimpose window 1	SPI1_
Superimpose window 2	SPI2_
User customize dialog	DLG_
Operation panel	PNL_1 (fixed)
Key window?	KEY_
Base screen (GOT Mobile)	MBL-BASE_
Overlap window 1 (GOT Mobile)	MBL-OVL1_
Overlap window 2 (GOT Mobile)	MBL-OVL2_
Superimpose window 1 (GOT Mobile)	MBL-SPI1_
Superimpose window 2 (GOT Mobile)	MBL-SPI2_

Data type

The following lists the data types for devices to be operated.

■Numerical value data

Data type	Output
Bit	BIT
Signed 8-bit integer	BIN8
Unsigned 8-bit integer	BIN8_Unsigned
Signed 16-bit integer	BIN16
Unsigned 16-bit integer	BIN16_Unsigned
Signed 32-bit integer	BIN32
Unsigned 32-bit integer	BIN32_Unsigned
Signed 64-bit integer	BIN64
Unsigned 64-bit integer	BIN64_Unsigned
16-bit BCD	BCD16
32-bit BCD	BCD32
64-bit BCD	BCD64
Real number (32-bit)	REAL
Real number (64-bit)	REAL64

■Text data

Character code	Output
Alphanumeric characters (ASCII)	ASCII
Japanese (SJIS)	SJIS
Chinese (Simplified) (GB)	GB
Korean (KS)	KS
Alphanumeric characters (Unicode)	Unicode
Chinese (Traditional) (Big5)	Big5

Device name

The device name of each operating device is recorded.

The device name is the same as the one set in GT Designer3. When a label or tag is specified in the device, the same name will be recorded in the log. When station number switching or the offset function is set, the recorded device name is that of the device actually used for writing after those operations are applied.

■Specifications for recording labels and tags

When operations are logged, label and tag names are also recorded.

The following shows the labels and tags to be recorded.

- Global label
- AB native tag
- OMRON NJ/NX tag
- OPC UA tag

Even if you change the label or tag set for an object or others, you can check the label or tag name at the time the operation log was recorded.

Note that the size of the log file becomes large if the recorded label or tag name is long.

When the station number switching function, the offset function, or other functions are used, the label or tag name recorded in the operation log contains the relevant information.

Ex.

When the global label name is LABEL_B, the station number is 2-3, and the offset device value is 500

The global label name is recorded as [2-3::LABEL_B(+500)].

Change value, previous value

The value after the change is recorded as the change value, and the value before the change is recorded as the previous value. When a device is operated, the device value is recorded.
Device values are output in bit format as [0/1], in exponential notation for real numbers, and as decimal values for other word formats.
Character string device values are output as strings as is.

Output item	Description
Change value	The value resulting from the data operation or object script operation is recorded.
Previous value	The value written in the device itself is recorded.

Precautions

Even if the device value cannot be written due to a communication failure or other reasons, the device change operation is logged.
Also check the system alarm history as required.

Change value (operation), previous value (display)

When an object is operated, the device value after the change (operation) and the value before the change (display) are recorded.
For touch switch operations, you can specify whether to record the value before the change or the value before the change (display) for each project.
Select [GOT environmental Setting] - [Operation Log], then select [Collect previous device values at the time of touch switch operation] in the [Log Target] tab.

Output item	Description
Change value (operation)	The value input on the GOT is recorded as is as character string.
Previous value (display)	After applying the settings for data operation, number of displayed digits, decimal point adjustment, display type, and format string, the resulting character string to be displayed on the GOT is recorded.

59.3 Log details by operation

GT37 SoftGOT3000

The following shows the items output to the operation log file for each operation.
For the list of operations to be logged, refer to the following.
☞ Page 1915 Functions to be recorded in the operation log

59.3.1 GOT startup

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the GOT was started or restarted*1	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Normal startup (with package data)	information
			Successfully started (project data password verification succeeded)	information
			Failed to start (project data password verification failed)	warning
7	ID	Log type ID	Normal startup (with package data)	10001
			Successfully started (project data password verification succeeded)	10002
			Failed to start (project data password verification failed)	10003
8	ACT_ABBR	Function abbreviation	Normal startup (with package data)	Start
			Successfully started (project data password verification succeeded)	SPassOK
			Failed to start (project data password verification failed)	SPassNG
9	ACTION	Function type name	Normal startup (with package data)	Start GOT
			Successfully started (project data password verification succeeded)	GOT successfully started
			Failed to start (project data password verification failed)	GOT failed to start
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	Project title of the project data at GOT startup It is not recorded in the following cases: • Failed startup • Normal startup before or after successful startup	Example) Project
12	USER_ID	User ID	Project ID of the project data at GOT startup	Example) 123456789
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	GOT ID of the started GOT	Example) GOT ID:1
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

*1 If no battery has been installed in the GOT, the clock is initialized on startup. Hence the date and time in initial state are recorded. When time synchronization is performed after the initialization, operation logs that were collected before the synchronization may be lost.
If the startup time needs correct recording, install a battery in the GOT.

59.3.2 GOT startup (system installation mode)

The log is recorded when security mode 2 is set, or when firmware update or package data operation is specified.

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the GOT started in the system installation mode	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Information	information
7	ID	Log type ID	Start system installation mode	10011
8	ACT_ABBR	Function abbreviation	Start system installation mode	SIMode
9	ACTION	Function type name	Start system installation mode	Start system installation mode
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	None	—
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.3 GOT termination

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the GOT was terminated with a GOT special register (GS639.b14)	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Information	information
7	ID	Log type ID	GOT termination	10021
8	ACT_ABBR	Function abbreviation	GOT termination	End
9	ACTION	Function type name	GOT termination	Terminate GOT
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	None	—

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.4 GOT restart

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the GOT was restarted without reset (simple restart by changing the GOT basic settings in the utility) or with reset	Example) 2025/07/14 19:36:47
			Date and time when the GOT was restarted with reset using a GOT special register (GS639.b15) (GT37 only)	
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Information	information
7	ID	Log type ID	GOT simple restart	10031
			GOT restart by reset	10032
8	ACT_ABBR	Function abbreviation	GOT simple restart	ReStart
			GOT restart by reset	ReStartR
9	ACTION	Function type name	GOT simple restart	Simple restart of GOT
			GOT restart by reset	Reset & Restart GOT
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	None	—
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.5 GOT offline mode transition

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when transitioning to the offline mode (monitor stop mode) occurred due to operations such as package data writing while monitor screens were displayed	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Information	information
7	ID	Log type ID	GOT offline mode transition	10041

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
8	ACT_ABBR	Function abbreviation	GOT offline mode transition	Offline
9	ACTION	Function type name	GOT offline mode transition	Shift to GOT offline mode
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	None	—
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.6 GOT background processing stop/restart

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when backup/restoration was stopped or restarted	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Information	information
7	ID	Log type ID	GOT background processing stop	10042
			GOT background processing restart	10043
8	ACT_ABBR	Function abbreviation	GOT background processing stop	BGStop
			GOT background processing restart	BGRStart
9	ACTION	Function type name	GOT background processing stop	Stop GOT background process
			GOT background processing restart	Resume GOT background process
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	None	—
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.7 Time zone setting

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Time zone change date and time	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	configuration changes	configuration changes
6	TYPE	Type	Information	information
7	ID	Log type ID	Time zone setting	10101
8	ACT_ABBR	Function abbreviation	Time zone setting	TimeZone
9	ACTION	Function type name	Time zone setting	Set time zone
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Time zone	Example) UTC+9:00
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.8 Application switching

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Application switching date and time	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Information	information
7	ID	Log type ID	Application switching	10051
8	ACT_ABBR	Function abbreviation	Application switching	AppChng
9	ACTION	Function type name	Application switching	Switch applications
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
16	CHG_VALUE	Change value	When monitor screens are displayed	Monitor
			When utilities are launched	Utility
			When the sequence program monitor (Q/L ladder) is started	Sequence program monitor (Q/L ladder)
			When the sequence program monitor (iQ-R/iQ-L ladder) is started	Sequence program monitor (iQ-R/iQ-L ladder)
			When the sequence program monitor (iQ-F ladder) is started	Sequence program monitor (iQ-F ladder)
			When the intelligent module monitor is started	Intelligent module monitor
			When the R motion monitor is started	R motion monitor
			When the setting screen for the backup/restoration function is displayed	Backup/restoration
			When the iQSS utility is started	iQSS Utility
			When the system launcher is started	System launcher
			When the file manager is started	File management
			When the CC-Link IE TSN/CC-Link IE Field Network diagnostics is started	CC-Link IE TSN/CC-Link IE Field Network diagnostics
			When the remote personal computer screen is displayed in full screen mode	Remote personal computer operation (Ethernet)
			When the setting screen for the operator authentication is displayed	Operator authentication
			When the list screen for the operator management information is displayed	Operator information mng. (list)
			When an unknown application is started	Unknown*1
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

*1 If [Unknown] is displayed, update the BootOS to the latest version.
The BootOS version may be earlier than that of the GOT which created the operation log file.

59.3.9 Application startup/exit

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the functions that use window screens, such as the web browser window, were started or terminated	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Information	information
7	ID	Log type ID	Application startup	10052
			Application exit	10053
8	ACT_ABBR	Function abbreviation	Application startup	AppStart
			Application exit	AppEnd
9	ACTION	Function type name	Application startup	Start application
			Application exit	End application
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	When the web browser function is used	Web browser
			When the remote personal computer operation (Ethernet) is performed	Remote PC operation (Ethernet)
			PDF search/bookmark function	PDF search, bookmark function
			Video file management	Video file management
			When an unknown application is used	Unknown
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	Overlap window 1 to 5	OVA1 to OVA5
			Superimpose window 1, 2	SPI1 to SPI2
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.10 Clock setting, time change

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Clock change date and time (recorded using the previous clock)	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	configuration changes	configuration changes
6	TYPE	Type	Information	information
7	ID	Log type ID	When notified from external devices	10102
			When changed using the GOT special register (GS)	10103
			When synchronized with SNTP	10104
8	ACT_ABBR	Function abbreviation	When notified from external devices	GetTime
			When changed using the GOT special register (GS)	SetTime
			When synchronized with SNTP	GetTimeS

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
9	ACTION	Function type name	When notified from external devices	Adjust (External device)
			When changed using the GOT special register (GS)	Adjust (GS)
			When synchronized with SNTP	Set time (SNTP)
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Time after change	Example) 2025/08/14 10:30:45
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	Time before change	Example) 2025/08/14 12:33:45
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.11 Security mode change

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Security mode change date and time	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	☞ Page 1922 Operating device (type) ☞ Page 1922 Operating device (route)	Example) PC Tool/Src:192.168.3.200:42033
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	configuration changes	configuration changes
6	TYPE	Type	Information	information
7	ID	Log type ID	Security mode change	10201
8	ACT_ABBR	Function abbreviation	Security mode change	SecMdChg
9	ACTION	Function type name	Security mode change	Security mode change
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Security mode after change	Example) Security Mode:1
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.12 Encrypted communication (unauthenticated)

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when encrypted communication without authentication was started or terminated	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	☞ Page 1922 Operating device (type) ☞ Page 1922 Operating device (route)	Example) PC Tool/Src:192.168.3.200:42033
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	access control	access control
6	TYPE	Type	Encrypted communication: Start (connection)	information
			Encrypted communication: Start failed	warning
			Encrypted communication: End (disconnected)	information
7	ID	Log type ID	Start of encrypted communication (connection)	10211
			Failed to start encrypted communication	10212
			Encrypted communication: End (disconnected)	10215
8	ACT_ABBR	Function abbreviation	Start of encrypted communication (connection)	CpCmCnct
			Failed to start encrypted communication	CpCmNG
			Encrypted communication: End (disconnected)	CpCmCut
9	ACTION	Function type name	Encrypted communication: Start (connection)	Encrypted communication: Started
			Encrypted communication: Start failed	Encrypted communication: Failure
			Encrypted communication: End (disconnected)	Encrypted communication: End
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Communication channel number, function, target device IP address, and port number after change When the communication channel is not used, the communication channel number is not output.	Example) Ch1/Dst:192.168.3.39:5007
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	Protocol and version of the encrypted communication before change When encrypted communication fails, only the protocol is recorded.	Example) TLS 1.3
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.13 Encrypted communication (authenticated)

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when encrypted communication with authentication was started or terminated	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	☞ Page 1922 Operating device (type) ☞ Page 1922 Operating device (route)	Example) VNC/Src:192.168.3.200:42033
3	OPERATOR	Operator name	Operator name at authentication For the OPC UA client function, [anonymous] is recorded when the user token represents an anonymous user.	Example) gotuser
4	OPE_ID	Operator ID	Authentication dedicated to encrypted communication: 0	0
5	CATEGORY	Category	access control	access control

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
6	TYPE	Type	Connection authentication succeeded	information
			Connection authentication failed	warning
7	ID	Log type ID	Connection authentication succeeded	10213
			Connection authentication failed	10214
8	ACT_ABBR	Function abbreviation	Connection authentication succeeded	CpCmLgin
			Connection authentication failed	CpCmLgNG
9	ACTION	Function type name	Connection authentication succeeded	Encrypted communication: Connection authentication successful
			Connection authentication failed	Encrypted communication: Connectionauthentication failure
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Communication channel number, function, target device IP address, and port number after change For the OPC UA client function, a combination of <Security mode>_<Security policy> is recorded.	Example) Ch1/Dst:192.168.3.39:5007
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	Protocol and version of the encrypted communication before change When encrypted communication fails, only the protocol is recorded.	Example) SSH2.0
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.14 IP filter

The IP filter function collects logs through external operations. Depending on the timing of collection and load conditions, logs may not be collected.

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when accessed from a blocked IP address	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Warning	warning
7	ID	Log type ID	IP filter	10221
8	ACT_ABBR	Function abbreviation	IP filter	IPFilter
9	ACTION	Function type name	IP filter	IP filter
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
16	CHG_VALUE	Change value	IP address, port number of send source and destination (GOT)	Example) Src:192.168.100.5:20052/ Dst:Ethernet Port1:80
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.15 Ethernet restriction

After an Ethernet restriction log is collected, another Ethernet restriction log is not collected for 10 seconds.

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Ethernet restriction start date and time	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Warning	warning
7	ID	Log type ID	Ethernet restriction	10222
8	ACT_ABBR	Function abbreviation	Ethernet restriction	EthCtrl
9	ACTION	Function type name	Ethernet restriction	Ethernet restriction
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	None	—
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.16 Displayed system language

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the system language was changed in the utility or using the system language switching device*1	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	☞ Page 1922 Operating device (type) ☞ Page 1922 Operating device (route)	Example) GOT Mobile No.1/ Src:192.168.3.100:42100
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	user screen events	user screen events
6	TYPE	Type	Information	information
7	ID	Log type ID	Displayed system language	12011
8	ACT_ABBR	Function abbreviation	Displayed system language	DspSysLg
9	ACTION	Function type name	Displayed system language	Display system language

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	System language after change	Example) English
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

*1 If the system language switching devices have been enabled, system language switching by using utilities is disabled.
In this case, if you try to change the system language with utilities, the corresponding operation log is output; however, the system languages are not switched.
You can check if the system languages have been switched by checking the operation log of [Display system language] that is output after system language switching.

59.3.17 System language switching

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the system language was changed in the utility	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	configuration changes	configuration changes
6	TYPE	Type	Information	information
7	ID	Log type ID	System language switching	12012
8	ACT_ABBR	Function abbreviation	System language switching	SysLang
9	ACTION	Function type name	System language switching	Switch system languages
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	System language after change	Example) English
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.18 Changing the time in the utility

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the clock was changed in the utility (recorded using the previous clock)	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	☞ Page 1922 Operating device (type) ☞ Page 1922 Operating device (route)	Example) VNC/Src:192.168.3.200:42033
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	configuration changes	configuration changes
6	TYPE	Type	Information	information
7	ID	Log type ID	Clock change	12013
8	ACT_ABBR	Function abbreviation	Clock change	ChngTime
9	ACTION	Function type name	Clock change	Change clock
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Time after change	Example) 2025/07/14 19:36:47
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	Time before change	Example) 2025/07/13 15:21:35
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.19 Time zone setting change in the utility

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Time when the time zone was changed in the utility	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	☞ Page 1922 Operating device (type) ☞ Page 1922 Operating device (route)	Example) VNC/Src:192.168.3.200:42033
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	configuration changes	configuration changes
6	TYPE	Type	Information	information
7	ID	Log type ID	Clock change	12013
8	ACT_ABBR	Function abbreviation	Clock change	ChngTZ

19	PREV_VALUE_DISP	Previous value (display)	None	—

Change value, previous value

If multiple entries are present in a sub field, the entries are separated by a slash (/). "n" indicates a numerical value.

Function type		Notation in CSV, Unicode text, etc.
Authentication type	Authentication with a password	(Operator name + password)
	Authentication with an external authentication device	External auth (serial)
	Authentication with an external authentication device and auxiliary authentication	Ext. auth. (serial)/Op. name + pwd.
	Authentication with an external authentication device	External auth (USB)
	Authentication with an external authentication device and auxiliary authentication	Ext. auth. (USB)/Op. name + pwd.
Automatic logout time	Automatic logout time	Example) 300 sec
Password expiration date	Expiration date	Expiration: 1000 days
	Prenotification	Example) Notification: 30 days
External authentication ID	Starting position	Example) Start: 1998 bytes
	Valid data length	Example) Data length: 16 bytes

Function type		Notation in CSV, Unicode text, etc.
Login block setting	Number of failed login attempts	Example) Continuous failure count: 10
	Login block time	Example) Prohibition: 3600 s
Operator lock	Number of consecutive failed login attempts to lock an account	Example) Continuous failure count: 10
Password requirements	Password requirement settings	Example) Middle
	Minimum number of characters in password	Example) Minimum: 32 characters
	Password character type	Example) Type: <No check>
Password history	Number of passwords saved	Example) History count: 5
Sub-administrative privileges	Enabling or disabling sub-administrative privileges (only when the security mode is set to mode 1)	Example) Enabled
	Showing of uneditable operator information	Example) Uneditable display: disabled
	Security level to change the function setting	Example) Level 15 or higher
	Editable groups (only when the security mode is set to mode 2)	Example) Group No.: 2,3,4
Group	Group number	Example) No. 3
	Group name	Example) Developer
	Operation authority	Example) Edit operator management information

59.3.32 Operator management (operator management information)

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the operator management screen was closed in the utility	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	Operator name of the administrator or sub-administrator authenticated by the administrator password authentication	Example) Administrator
4	OPE_ID	Operator ID	Operator ID of the administrator or sub-administrator authenticated by the administrator password authentication	Example) —
5	CATEGORY	Category	configuration changes	configuration changes
6	TYPE	Type	Operator added	information
			Operator deleted	warning
			Operator edited	information
7	ID	Log type ID	Operator added	12620
			Operator deleted	12621
			Operator edited	12622
8	ACT_ABBR	Function abbreviation	Operator added	OpMAddOp
			Operator deleted	OpMDelOp
			Operator edited	OpMEdiOp
9	ACTION	Function type name	Operator added	Operator management: Add operator
			Operator deleted	Operator management: Delete operator
			Operator edited	Operator management: Edit operator
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	Name and ID of the operator who added, deleted, or edited data	Example) narita(ID: 2715)

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
16	CHG_VALUE	Change value	• When the operator is added: Operator management information of the added operator • When the operator is deleted: Operator management information of the deleted operator • When the operator is edited: Operator management information after editing	☞ Page 1950 Change value, previous value
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None for added operator	—
			None for deleted operator	—
			Operator settings before editing for edited operator as follows: Operator management: Edit operator	Example) Level: 1/Group No.: 3
19	PREV_VALUE_DISP	Previous value (display)	None	—

Change value, previous value

If multiple entries are present in a sub field, the entries are separated by a slash (/). "n" indicates a numerical value.

Function type		Output
Level	Security level to which the operator belongs	Example) Level: 10
Associated group	Group number of the group to which the operator belongs	Example) Group No.: 3
Password	When the password was changed	Password change
Password expiration date setting	No expiration date	Permanent password: enabled
	With expiration date	Permanent password: disabled
Disabling an operator account	Operator disabled	Disable operators: enabled
	Operator enabled	Disable operators: disabled
Changing a password at the next login	Password change enabled	Change password next login: enabled
	Password change disabled	Change password next login: disabled
External authentication	External authentication enabled	External authentication: enabled
	External authentication disabled	External authentication: disabled
	External authentication ID changed	Change external authentication ID
Operator lock	Operator lock	Locked
	Operator unlocked	Unlock

59.3.33 Operator management (new file created at startup)

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the operator management information file could not be read and a new file was created at GOT startup	Example) 2025/07/14 19:36:47

iQ-R/iQ-L sequence program monitor_ladder (edit)	iQ-R/iQ-L Seq program monitor_ladder (edit)
iQ-F sequence program monitor_ladder (device test)	iQ-F Seq program monitor_ladder (test)
iQ-F sequence program monitor_ladder (edit)	iQ-F Seq program monitor_ladder (edit)
R motion monitor (parameter setting)	R motion monitor (parameter setting)
Unknown application	Unknown

59.3.57 Touch switch, operation panel

Because multiple actions can be set for a touch switch, operations are logged for each action.
For the operation panel, operations are logged for each input on the operation panel.

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the touch switch or the operation panel was operated	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	user screen events	user screen events
6	TYPE	Type	Information	information
7	ID	Log type ID	Bit set	32001
			Bit reset	32002
			Bit alternate	32003
			Bit momentary	32004
			Word set	32005
			Extended function	32006
			Screen switching	32007
			Station number switching	32008
			When auto repeat starts	32009
			When auto repeat ends	32010
			Screen gesture	32011
			Extended function (recipe data operation): Import	32012
			Extended function (recipe data operation): Export	32013
8	ACT_ABBR	Function abbreviation	Bit set	TSW_SET
			Bit reset	TSW_RST
			Bit alternate	TSW_ALT
			Bit momentary	TSW_MMT
			Word set	TSW_DAT
			Extended function	TSW_APP
			Screen switching	TSW_SCRN

			When auto repeat starts	TSW_REPB
			When auto repeat ends	TSW_REPE
			Screen gesture	TSW_GES
			Extended function (recipe data operation): Import	TSW_RCIN
			Extended function (recipe data operation): Export	TSW_RCEX
9	ACTION	Function type name	Bit set	Touch switch: Bit SET
			Bit reset	Touch switch: Bit RST
			Bit alternate	Touch switch: Bit ALT
			Bit momentary	Touch switch: Bit Momentary
			Word set	Touch switch: Word write
			Extended function	Touch switch: Application switching
			Screen switching	Touch switch: Screen switching
			Station number switching	Touch switch: Station No. switching
			When auto repeat starts	Touch switch: Start auto repeat
			When auto repeat ends	Touch switch: End auto repeat
			Screen gesture	Touch switch: Screen gesture
			Extended function (recipe data operation): Import	Touch switch: Recipe operation import
			Extended function (recipe data operation): Export	Touch switch: Recipe operation export

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
10	SCRN_NO	Screen No.	Fixed to [PNL_1] for the operation panel For touch switches, the screen number of the screen on which the touch is placed ☞ Page 1924 Screen No.	Example) BASE_10
11	OPNAME	Operation name	Name set for [Operation Name of Objects] in the [Log Target] tab in [Operation Log] of the [Environmental Setting] window ☞ Page 2015 [Log Target] tab The text displayed on a touch switch immediately before the first operation of the switch is recorded regardless of the settings of [Operation Timing] and [Press Twice]. If text is set for each display position (up, down, right, left, or center), only the centered text will be recorded. When [Text Type] is set to [Text], text is recorded under the following constraints. • The characters completely extending off the object area are not recorded. • Multiple-line text is recorded by merging the lines into one.	Example) Bit set
12	USER_ID	User ID	User ID of the touch switch or the operation panel If the user ID setting is not configured, [-] is recorded.	Example) 100
13	SUB_NO	Action No./Setting ID	Order of actions specified when multiple actions are set for each touch switch or for the operation panel	Example) 5
14	DATA_TYPE	Data type	Data type of the device set for the touch switch or the operation panel ☞ Page 1925 Data type	Example) BIT
15	DEV_NAME	Device name*1	Device set for the touch switch or the operation panel	Example) @2:1-3 D0.b5
16	CHG_VALUE	Change value	The following logs are recorded according to the action set for the touch switch or the operation panel. • [Bit Set], [Bit Reset], [Bit Momentary], [Bit Alternate], [Word Set] As a result of the actions, the values stored in the devices are output. • [Screen Switching] Records the screen numbers of the screens that appear after screen switching. • [Station No. Switching] Records the type of the switching and the new station number. Example) Switched to Network No. 1 and PLC station No. 2 by common station number switching: [CmnST_1-2] • [SP Function] ([Recipe Data Operation]) The recipe number of the import destination or the export source is recorded. The following logs are recorded when auto repeat is set for the touch switch. • When auto repeat ends Number of auto repeat operations	Example) 1
17	CHG_VALUE_CONT	Change value (operation)	Value input using the touch switch or the operation panel When [Recipe Data Operation] is set for [Action], the file name of the import source or export designation is recorded with the full path.	Example) 1
18	PREV_VALUE	Previous value	The previous device value is recorded. To log the values, select [Collect previous device values at the time of touch switch operation] in the [Log Target] tab in [Operation Log] of the [Environmental Setting] window.	Example) 0
19	PREV_VALUE_DISP	Previous value (display)	Previous device value displayed on the object To log the values, select [Collect previous device values at the time of touch switch operation] in the [Log Target] tab in [Operation Log] of the [Environmental Setting] window.	Example) 0

*1 In the regular log, the communication channel number, device network number, station number, and CPU number are output as follows:

CH_NUM: Channel number specified for the device set for the touch switch or the operation panel
NET_STA: Network number, station number, and CPU number specified for the device set for the touch switch or the operation panel
Example) When network No. 2, station No. 1, and CPU No. 3 are specified: '2-1/3

59.3.58 Numerical input

The numerical input operation logs are recorded in the operation log file every time input values are written to devices.

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the following operations were executed using numerical inputs • Storing input values in the monitor devices • Storing input values in the target devices for writing • Turning on the write completion devices	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used If operations are performed by VNC clients, the logs are prefixed with an asterisk (*).	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	user screen events	user screen events
6	TYPE	Type	Information	information
7	ID	Log type ID	Monitor device	32101
			Write device	32102
			Write completion device	32103
8	ACT_ABBR	Function abbreviation	Monitor device	NUM_VAL
			Write device	:NUM_WDEV
			Write completion device	NUM_WCHK
9	ACTION	Function type name	Monitor device	Numerical Input
			Write device	Numerical Input (Write device)
			Write completion device	Numerical Input (Write check)
10	SCRN_NO	Screen No.	Fixed to [PNL_1] for the operation panel For touch switches, the screen number of the screen on which the touch is placed ☞ Page 1924 Screen No.	Example) BASE_10
11	OPNAME	Operation name	Name set for [Operation Name of Objects] in the [Log Target] tab in [Operation Log] of the [Environmental Setting] window ☞ Page 2015 [Log Target] tab	Example) Data input
12	USER_ID	User ID	User ID of the numerical input If the user ID setting is not configured, [-] is recorded.	Example) 123
13	SUB_NO	Action No./Setting ID	Writing to the monitor device	1
			Writing to the write device	2
			Write Completion Device ON	3
14	DATA_TYPE	Data type	Data type of the device set for the numerical input ☞ Page 1925 Data type	Example) BIN8
15	DEV_NAME	Device name*1	Name of the write destination device for the numerical input When the offset function is specified, the recorded device is the result of adding the offset device value.	Example) D100
16	CHG_VALUE	Change value	Device value after change The execution results of data operations and scripts are also reflected to the device values.	Example) When the user operation value is [0] and the expression is [monitor device + 5]: 5
17	CHG_VALUE_CONT	Change value (operation)	Value input into the numerical input	Example) When the user operation value is [0] and the expression is [monitor device + 5]: 0
18	PREV_VALUE	Previous value	Previous device value	Example) When the device value is [100] and the expression is [monitor device + 5]: 100
19	PREV_VALUE_DISP	Previous value (display)*2	Previous device value displayed in the numerical input before key code input	Example) When the device value is [100] and the expression is [monitor device + 5]: 105

*1 In the regular log, the communication channel number, device network number, station number, and CPU number are output as follows:
CH_NUM: Channel number specified for the device of a numerical input
NET_STA: Network number, station number, and CPU number specified for the device of a numerical input
Example) When network No. 2, station No. 1, and CPU No. 3 are specified: '2-1/3

*2 While a key code is being entered, the corresponding device value is not reflected to the display on the numerical input object until the entry is confirmed.
If the device value is changed before the entry is confirmed, inconsistencies occur in the data of PREV_VALUE and PREV_VALUE_DISP.

59.3.59 Text input

The text input operation logs are recorded in the operation log file every time the input data is written to devices.

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the following operations were executed using text inputs • Storing input values in the target devices • Turning on the write completion devices	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	user screen events	user screen events
6	TYPE	Type	Information	information
7	ID	Log type ID	Writing to the monitor device	32201
			Write Completion Device ON	32202
8	ACT_ABBR	Function abbreviation	Writing to the monitor device	STR_VAL
			Write Completion Device ON	STR_WCHK
9	ACTION	Function type name	Writing to the monitor device	Input text
			Write Completion Device ON	Input text (Write check)
10	SCRN_NO	Screen No.	Screen number of the screen on which the text input was placed ☞ Page 1924 Screen No.	Example) BASE_10
11	OPNAME	Operation name	Name set for [Operation Name of Objects] in the [Log Target] tab in [Operation Log] of the [Environmental Setting] window ☞ Page 2015 [Log Target] tab	Example) Text input
12	USER_ID	User ID	User ID of the text input If the user ID setting is not configured, [-] is recorded.	Example) 111
13	SUB_NO	Action No./Setting ID	Action number when multiple actions are set	Example) 1
14	DATA_TYPE	Data type	Character code of the monitor device to which data is written ☞ Page 1925 Text data	Example) Unicode
			Data type of the write completion device that is on ☞ Page 1925 Numerical value data	BIT
15	DEV_NAME	Device name*1	Name of the write destination device for the text input	Example) D100
16	CHG_VALUE	Change value	Device value after change when data is written to the monitor device The execution results of scripts are also reflected to the device values.	Example) Character string after change
17	CHG_VALUE_CONT	Change value (operation)	Value input into the text input when data is written to the monitor device	Example) Character string after change
18	PREV_VALUE	Previous value	Previous device value when data is written to the monitor device*2	Example) Character string before change
			Records nothing when the write completion device is on.	—

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
19	PREV_VALUE_DISP	Previous value (display)	Previous device value displayed in text input when data is written to the monitor device	Example) Character string before change
			Records nothing when the write completion device is on.	—

*1 In the regular log, the communication channel number, device network number, station number, and CPU number are output as follows:
CH_NUM: Channel number specified for the device of a text input
NET_STA: Network number, station number, and CPU number specified for the device of a text input
Example) When network No. 2, station No. 1, and CPU No. 3 are specified: '2-1/3

*2 When the previous values are displayed, the new text codes are used.
If the text codes are changed after the values are changed, the previous values may not be displayed normally.

59.3.60 Object script

Operations are logged only when the trigger type of an object script is set to [Key Code Input], [Input Fixation], or [Device Writing].

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the object script was activated	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	user screen events	user screen events
6	TYPE	Type	Information	information
7	ID	Log type ID	Object script	32301
8	ACT_ABBR	Function abbreviation	Object script	ObScr
9	ACTION	Function type name	Object script	Object script
10	SCRN_NO	Screen No.	Screen number of the displayed screen to which the object belongs ☞ Page 1924 Screen No.	Example) BASE_10
11	OPNAME	Operation name	Name set for [Operation Name of Objects] in the [Log Target] tab in [Operation Log] of the [Environmental Setting] window ☞ Page 2015 [Log Target] tab	Example) Start switch
12	USER_ID	User ID	ID of the object for which the object script is set	Example) 2
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	Data type of the trigger device	BIT
15	DEV_NAME	Device name*1	Name of the trigger device	Example) M123
16	CHG_VALUE	Change value	Result of the object script operation*2	Example) 3
17	CHG_VALUE_CONT	Change value (operation)	Value input into the object by the operator	Example) 3
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

*1 In the regular log, the communication channel number, device network number, station number, and CPU number are output as follows:
CH_NUM: Channel number of the trigger device
NET_STA: Network number, station number, and CPU number of the trigger device
Example) When network No. 2, station No. 1, and CPU No. 3 are specified: '2-1/3

*2 If internal devices are used as the target devices for writing operation results, the results are not output to the operation log file.
When needing the logs of the operation results, use devices of external devices as the target devices.

59.3.61 Alarm display (alarm deletion)

This log is recorded only for operations (delete or delete all) related to occurred alarms.
Operations are not logged when any restored alarm is selected or no alarm is selected.

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Alarm data deletion date and time	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used If operations are performed by VNC clients, the logs are prefixed with an asterisk (*).	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	When deleting a user alarm	user screen events
			When deleting all user alarms	
			When deleting a system alarm	audit log events
			When deleting all system alarms	
6	TYPE	Type	When deleting a user alarm	information
			When deleting all user alarms	
			When deleting a system alarm	warning
			When deleting all system alarms	
7	ID	Log type ID	When deleting a user alarm	32401
			When deleting all user alarms	32402
			When deleting a system alarm	32411
			When deleting all system alarms	32412
8	ACT_ABBR	Function abbreviation	When deleting a user alarm	UALM_DEL
			When deleting all user alarms	UALM_DEA
			When deleting a system alarm	SALM_DEL
			When deleting all system alarms	SALM_DEA
9	ACTION	Function type name	When deleting a user alarm	User alarm: Delete
			When deleting all user alarms	User alarm: Delete all
			When deleting a system alarm	System alarm: Delete
			When deleting all system alarms	System alarm: Delete all
10	SCRN_NO	Screen No.	Screen number of the screen on which the alarm display is placed ☞ Page 1924 Screen No.	Example) BASE_10
11	OPNAME	Operation name	Name set for [Operation Name of Objects] in the [Log Target] tab in [Operation Log] of the [Environmental Setting] window ☞ Page 2015 [Log Target] tab	Example) Alarm display
12	USER_ID	User ID	User ID of the alarm display If the user ID setting is not configured, [-] is recorded.	Example) —
13	SUB_NO	Action No./Setting ID	Alarm ID of the user alarm [-] is recorded for system alarms.	Example) 11
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	None	—
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.62 Alarm display (device reset)

This log is recorded only for operations (reset) related to occurred alarms.
Operations are not logged when any restored alarm is selected or no alarm is selected.
Reset operations at higher or middle levels in the hierarchy are also not recorded.

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the device was reset for the alarm display	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used If operations are performed by VNC clients, the logs are prefixed with an asterisk (*).	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	User alarm: Reset	user screen events
			System alarm: Reset	audit log events
6	TYPE	Type	User alarm: Reset	information
			System alarm: Reset	warning
7	ID	Log type ID	User alarm: Reset	32403
			System alarm: Reset	32413
8	ACT_ABBR	Function abbreviation	User alarm: Reset	UALM_RST
			System alarm: Reset	SALM_RST
9	ACTION	Function type name	User alarm: Reset	User alarm: Reset
			System alarm: Reset	System alarm: Reset
10	SCRN_NO	Screen No.	Screen number of the screen on which the alarm display is placed ☞ Page 1924 Screen No.	Example) BASE_10
11	OPNAME	Operation name	Name set for [Operation Name of Objects] in the [Log Target] tab in [Operation Log] of the [Environmental Setting] window ☞ Page 2015 [Log Target] tab	Example) Alarm display
12	USER_ID	User ID	User ID of the alarm display If the user ID setting is not configured, [-] is recorded.	—
13	SUB_NO	Action No./Setting ID	Alarm ID of the user alarm [-] is recorded for system alarms.	Example) 107
14	DATA_TYPE	Data type	User alarm: Reset Data type of the reset device	BIT
			System alarm: Reset	—
15	DEV_NAME	Device name*1	Name of the reset device for user alarms No record for system alarms	Example) M123
16	CHG_VALUE	Change value	For use alarm, device value after change No record for system alarms	Example) 0
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	For user alarm, previous device value No record for system alarms	Example) 111
19	PREV_VALUE_DISP	Previous value (display)	None	—

*1 In the regular log, the communication channel number, device network number, station number, and CPU number are output as follows:
CH_NUM: Channel number of the reset device for user alarms (no record for system alarms)
NET_STA: Network number, station number, and CPU number of the reset device for user alarms (no record for system alarms)
Example) When network No. 2, station No. 1, and CPU No. 3 are specified: '2-1/3

59.3.63 Slider

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the following operations were executed using the slider • Touching the knob or the bar • Releasing the finger from the knob or the bar	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used If operations are performed by VNC clients, the logs are prefixed with an asterisk (*).	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	user screen events	user screen events
6	TYPE	Type	Information	information
7	ID	Log type ID	Slider control	32501
8	ACT_ABBR	Function abbreviation	Slider control	SLR_OPE
9	ACTION	Function type name	Slider control	Slider control
10	SCRN_NO	Screen No.	Screen number of the screen on which the slider is placed ☞ Page 1924 Screen No.	Example) BASE_10
11	OPNAME	Operation name	Name set for [Operation Name of Objects] in the [Log Target] tab in [Operation Log] of the [Environmental Setting] window ☞ Page 2015 [Log Target] tab	Example) Sound input
12	USER_ID	User ID	User ID of the slider If the user ID setting is not configured, [-] is recorded.	Example) 123
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	☞ Page 1925 Data type	Example) BIN8
15	DEV_NAME	Device name	Name of the write destination device for the slider When the offset function is specified, the recorded device is the result of adding the offset device value.	Example) D100
16	CHG_VALUE	Change value	Device value after change The execution results of data operations and scripts are also reflected to the device values.	Example) When the user operation value is [0] and the expression is [monitor device + 5]: 5
17	CHG_VALUE_CONT	Change value (operation)	Position of the knob The format is as follows: [Current knob position|Number of effective split points - 1]	Example) 15|20
18	PREV_VALUE	Previous value	Previous device value	Example) When the device value is [95] and the expression is [monitor device + 5]: 95
19	PREV_VALUE_DISP	Previous value (display)	Knob position before change The format is as follows: [Current knob position|Number of effective split points - 1]	Example) 3|20

59.3.64 Recipe display (record list)

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the recipe was operated for the recipe display (record list)	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used If operations are performed by VNC clients, the logs are prefixed with an asterisk (*).	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	user screen events	user screen events
6	TYPE	Type	Information	information
7	ID	Log type ID	When renaming a record	32601
			When reading a record	32602
			When writing a record	32603
			When deleting a record	32604
8	ACT_ABBR	Function abbreviation	When renaming a record	RVW_RN
			When reading a record	RVW_RD
			When writing a record	RVW_WT
			When deleting a record	RVW_DEL
9	ACTION	Function type name	When renaming a record	Recipe (record list): Change record name
			When reading a record	Recipe (record list): Read
			When writing a record	Recipe (record list): Write
			When deleting a record	Recipe (record list): Delete record
10	SCRN_NO	Screen No.	Screen number of the screen on which the recipe display (record list) is placed ☞ Page 1924 Screen No.	Example) BASE_10
11	OPNAME	Operation name	Name set for [Operation Name of Objects] in the [Log Target] tab in [Operation Log] of the [Environmental Setting] window ☞ Page 2015 [Log Target] tab	Example) Record list
12	USER_ID	User ID	User ID of the recipe display (record list) If the user ID setting is not configured, [-] is recorded.	Example) 123
13	SUB_NO	Action No./Setting ID	Recipe number for the record displayed on the recipe display (record list)	Example) 11
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Target record number	Example) RcdNo_1
17	CHG_VALUE_CONT	Change value (operation)	Target record name Record name after change when renamed	Example) Curry: Hot
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	Record name before change when renamed Otherwise, [-] is recorded.	Example) Curry: Mild

59.3.65 SoftGOT-GOT link (connection/disconnection)

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when SoftGOT-GOT linking was started or terminated	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	When SoftGOT is used in security mode 2 ☞ Page 1922 Operating device (type) ☞ Page 1922 Operating device (route)	Example) PC Tool/Src: 192.168.3.200: 49158
3	OPERATOR	Operator name	Name of the operator who performed the operation	Example) gotuser
4	OPE_ID	Operator ID	ID of the operator who performed the operation	Example) 1207
5	CATEGORY	Category	user screen events	user screen events
6	TYPE	Type	Information	information
7	ID	Log type ID	GOT side: When connected	20401
			GOT side: When disconnected	20402
			SoftGOT side: When connected	20403
			SoftGOT side: When disconnected	20404
8	ACT_ABBR	Function abbreviation	GOT side: When connected	SLCnctG
			GOT side: When disconnected	SLDCnctG
			SoftGOT side: When connected	SLCnctS
			SoftGOT side: When disconnected	SLDCnctS
9	ACTION	Function type name	GOT side, SoftGOT side: When connected	Connect SoftGOT-GOT link
			GOT side, SoftGOT side: When disconnected	Disconnect SoftGOT-GOT link
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	GOT side: The connection request source IP address (SoftGOT side IP address) is recorded for regular output. SoftGOT side: The connection request source IP address (GOT side IP address) is recorded for regular output.	Example) 192.168.3.40
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.66 SoftGOT-GOT (authorization transfer)

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the operation right was transferred via the SoftGOT-GOT link	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Logged only when transferred from the GOT to SoftGOT ☞ Page 1922 Operating device (type) ☞ Page 1922 Operating device (route)	Example) PC Tool/Src: 192.168.3.200: 49158
3	OPERATOR	Operator name	Name of the operator who performed the operation	Example) gotuser
4	OPE_ID	Operator ID	ID of the operator who performed the operation	Example) 1207
5	CATEGORY	Category	user screen events	user screen events
6	TYPE	Type	Information	information
7	ID	Log type ID	GOT side: Operation right transfer	20405
			SoftGOT side: Operation right transfer	20406
8	ACT_ABBR	Function abbreviation	GOT side: Operation right transfer	SLChCtlG
			SoftGOT side: Operation right transfer	SLChCtlS
9	ACTION	Function type name	GOT side, SoftGOT side: Operation right transfer	Shift SoftGOT-GOT link authorization
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Destination of operation right transfer and IP address	Example) When transferred from the GOT to SoftGOT SoftGOT: 192.168.3.40
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	Source of operation right transfer	Example) When the operation right is transferred from the GOT to SoftGOT GOT:
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.67 VNC server (connection/disconnection)

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when connected to or disconnected from the VNC server	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	☞ Page 1922 Operating device (type) ☞ Page 1922 Operating device (route)	Example) VNC/Src: 192.168.3.200: 42033
3	OPERATOR	Operator name	IP address of the client	Example) 192.168.3.200
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	access control	access control
6	TYPE	Type	VNC server connection	information
			VNC server connection failed	warning
			VNC server disconnection	information
7	ID	Log type ID	VNC server connection	20001
			VNC server connection failed	20002
			VNC server disconnection	20003
8	ACT_ABBR	Function abbreviation	VNC server connection	VSCnct
			VNC server connection failed	VSCnctNG
			VNC server disconnection	VSDCnct

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
9	ACTION	Function type name	VNC server connection	Connect VNC server
			VNC server connection failed	VNC server connection failed
			VNC server disconnection	Disconnect VNC server
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	None	—
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.68 VNC server (authorization transfer)

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the GOT obtained or released the operation right	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	Operating device	Example) —
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	access control	access control
6	TYPE	Type	Information	information
7	ID	Log type ID	VNC server authorization transfer	20004
8	ACT_ABBR	Function abbreviation	VNC server authorization transfer	VSChCtlC
9	ACTION	Function type name	VNC server authorization transfer	Shift VNC server authorization
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—

15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Agent name The agent name may not be obtained. If the name cannot be obtained, [-] is recorded.	Example) GOT
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.77 Web browser

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when accessing to the URL using the web browser function	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	None	—
3	OPERATOR	Operator name	Name of the logged-in operator when operator authentication is used If operations are performed by VNC clients, the logs are prefixed with an asterisk (*).	Example) gotuser
4	OPE_ID	Operator ID	ID of the logged-in operator when operator authentication is used	Example) 1207
5	CATEGORY	Category	user screen events	user screen events
6	TYPE	Type	Information	information
7	ID	Log type ID	Web browser access URL	20301
8	ACT_ABBR	Function abbreviation	Web browser access URL	WebAUrl
9	ACTION	Function type name	Web browser access URL	Web browser: Access URL
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Accessed URL (up to 2083 characters)	Example) https: //www.mitsubishielectric.co.jp/fa/
17	CHG_VALUE_CONT	Change value (operation)	GS2562.b12 is off (Disable JavaScript is disabled in the web browser)	JavaScript: Enabled
			GS2562.b12 is on (Disable JavaScript is enabled in the web browser)	JavaScript: Disabled
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.78 Log corruption information

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when logs could not be recorded in the file[*1]	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	audit log events	audit log events
6	TYPE	Type	Information	warning
7	ID	Log type ID	149	60001
8	ACT_ABBR	Function abbreviation	Log corruption information	LostLog
9	ACTION	Function type name	Log corruption information	LostLog
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Number of logs that were abandoned	Example) 5
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	None	—
19	PREV_VALUE_DISP	Previous value (display)	None	—

*1 When the log cannot be saved to a file, such as when a memory card is removed, the log information is stored in the internal memory, and upon reinserting the memory card, any log corruption information is recorded.

59.3.79 Unknown logs

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the unknown operation log was collected	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	(Operation on actual device)	—
3	OPERATOR	Operator name	None	—
4	OPE_ID	Operator ID	None	—
5	CATEGORY	Category	audit log events	audit log events

19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.84 Opening a project

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the project opening operation was executed	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	None	—
3	OPERATOR	Operator name	Windows login user name, or operator name at authentication Use ASCII characters for the Windows login user name.	Example) gotuser
4	OPE_ID	Operator ID	Fixed to [0], or operator ID at authentication	Example) 1207
5	CATEGORY	Category	configuration changes The category is [access control] for log type IDs 12501 to 12513 and 10211 to 10215, while it is [control system events] for all other log type IDs.	configuration changes
6	TYPE	Type	Information	information
7	ID	Log type ID	Open project: Success	53001
			Open project: Failure	53002
			Security mode change	10201
			Operator authentication	12501 to 12503, 12508, 12510 to 12512
8	ACT_ABBR	Function abbreviation	Open project: Success	ProjOpOK
			Open project: Failure	ProjOpNG
			Security mode change	Same as the notation used for the GOT operation log
			Operator authentication	
9	ACTION	Function type name	Open project: Success	Open project: Success
			Open project: Failure	Open project: Failure
			Security mode change	Same as the notation used for the GOT operation log
			Operator authentication	
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	Open project: Success	0
			Open project: Failure	(Error code)
			Security mode change	Same as the notation used for the GOT operation log
			Operator authentication	
17	CHG_VALUE_CONT	Change value (operation)	None	—
18	PREV_VALUE	Previous value	Open project: Success	—
			Open project: Failure	
			Security mode change	Same as the notation used for the GOT operation log
			Operator authentication	
			Encrypted communication	

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
19	PREV_VALUE_DISP	Previous value (display)	None	—

59.3.85 Snap shots

No.	Title in CSV, Unicode text	Corresponding item	Description	Notation in CSV, Unicode text, etc.
1	DATE	Date and time	Date and time when the snap shot was taken	Example) 2025/07/14 19:36:47
2	SOURCE	Operating device (type, details)	None	—
3	OPERATOR	Operator name	Windows login user name, or operator name at authentication Use ASCII characters for the Windows login user name.	Example) gotuser
4	OPE_ID	Operator ID	Fixed to [0]	0
5	CATEGORY	Category	control system events	control system events
6	TYPE	Type	Information	information
7	ID	Log type ID	Execute snapshot	53011
8	ACT_ABBR	Function abbreviation	Execute snapshot	SnapShot
9	ACTION	Function type name	Execute snapshot	Execute snapshot
10	SCRN_NO	Screen No.	None	—
11	OPNAME	Operation name	None	—
12	USER_ID	User ID	None	—
13	SUB_NO	Action No./Setting ID	None	—
14	DATA_TYPE	Data type	None	—
15	DEV_NAME	Device name	None	—
16	CHG_VALUE	Change value	None	—
17	CHG_VALUE_CONT	Change value (operation)	None	—

59.4 How to use operation logs

GT37 SoftGOT3000

☞ Page 2003 Output settings for operation logs
☞ Page 2003 Checking operation logs
☞ Page 2004 Operating operation log files (utility)
☞ Page 2005 CSV file conversion or Unicode text file conversion of operation log file
☞ Page 2007 Viewing the operation log file (Resource File Viewer)
☞ Page 2010 Checking the operation log status

59.4.1 Output settings for operation logs

Configure the output settings for operation logs in GT Designer3.

The collection setting is not required for GT SoftGOT3000 application logs and Windows event logs.

1. Select [Common] → [GOT Environmental Setting] → [Operation Log] from the GT Designer3 menu.

This displays [Operation Log] in the [Environmental Setting] window.

2. Select [Collect operation logs] and configure the settings for each item.

For details, refer to the following.

☞ Page 2013 [Operation Log]

59.4.2 Checking operation logs

Operation logs can be checked by the following three methods.

Method	Details
Using the GOT utility	Operation logs can be checked and the files can be managed by the [Operation Log Information] utility. Regular logs can be checked on the screen. For the operations of the utility, refer to the following manual. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions) The GT SoftGOT3000 application logs cannot be checked using the utility.
Using the text editor or other tools of the personal computer	Operation logs can be checked by using the text editor or other tools of the personal computer. To enable this, convert the operation log file (*.G3O) to a CSV or Unicode text file. When converting the log in the utility or using the [Resource Data Conversion] menu in GT Designer3, you can choose whether to output in the detailed log or the regular log. The regular log is output when converting with the Trigger File Conversion device. For information on how to convert the operation log file (*.G3O), refer to the following. ☞ Page 2005 CSV file conversion or Unicode text file conversion of operation log file
Using Resource File Viewer (independent startup)	If you launch the exe file of Resource File Viewer independently (hereafter "independent startup"), the operation log file (*.G3O) and application log file (*.G3O) are viewable on the personal computer without being converted in a CSV or Unicode text format. Detailed logs can be checked in the operation log file (*.G3O). In the CSV or Unicode text file, you can check the logs selected for conversion (detailed logs or regular logs). Using the search function, you can specify the date and time or other keywords to find the operation log history to be checked. ☞ Page 2007 Viewing the operation log file (Resource File Viewer)

59.4.3 Operating operation log files (utility)

The following operations can be performed on operation log files using the utility.

Item	Description
Creating a folder	Creates a folder where operation log files are stored. Folders are created by date or time period and operation log files are so managed.
Deleting a folder	Deletes a folder that stores operation log files.
Copying a file	Copies an operation log file. Perform this operation to back up an operation log file.
Deleting a file	Deletes an operation log file.
Renaming a file	Renames an operation log file.
Moving a file	Moves an operation log file to another folder. Perform this operation to back up an operation log file.
Converting a G3O file to a CSV or Unicode text file	Converts an operation log file (*.G3O) to a CSV or Unicode text file.
Search	Searches for an operation log in an operation log file by date of creation or time.
Latest display of the list	Updates the operation log list.

For the operations of the utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

59.4.4 CSV file conversion or Unicode text file conversion of operation log file

An operation log file (*.G3O) or GT SoftGOT3000 application log file (G3O) can be converted to a Unicode text file or CSV file.
The following three conversion methods are available.
The conversion method differs between the operation log file and the GT SoftGOT3000 application log file.
○: Available for output, —: Not available for output

Reference	Operation log file		Application log file
	Detailed log	Regular log	
☞ Page 2005 Converting with GT Designer3	○	○	○
☞ Page 2006 Converting in the utility	○	○	—
☞ Page 2006 Converting with the Trigger File Conversion device	—	○	—

Converting with GT Designer3

1. Transfer an operation log file (*.G3O) to the personal computer using either of the following methods.

• Transferring with GT Designer3

Select [Communication] → [Read from GOT] from the menu to transfer a file to the personal computer.

☞ Page 441 Reading the data from the GOT

• Storing in the data storage

Save the operation log file to the data storage and read the data using the personal computer.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

2. Select [Tools] → [Resource Data Conversion] → [Operation Log File] from the GT Designer3 menu.

The [Operation Log File Conversion] dialog appears.

3. Configure each setting and click the [Convert] button.

☞ Page 2019 [Operation Log File Conversion] dialog

When the operation log file is output with the information protection function enabled, the [Encryption Password Entry] dialog appears. Enter the encryption password accordingly.

☞ Page 3068 [File Protection]

For GT SoftGOT3000 application log files, enter the password for the GT SoftGOT3000 application log file set at the first startup of GT SoftGOT3000.

4. When the detailed log output confirmation message appears, click the [Yes] button to output detailed logs to the converted file, or click the [No] button to output only regular logs to the converted file.

The files are converted.

Converting in the utility

1. Start the GOT and touch the [Data mng.] tab.
2. Touch the [Operation log information] to display the [Operation Log Information] screen.
3. Select a file to convert, and touch either of the following buttons.

• [G3O→CSV] button

Converts an operation log file (.G3O) to a CSV file.

• [G3O→TXT] button

Converts an operation log file (.G3O) to a Unicode text file.

4. When you click the [OK] button and the output confirmation message appears, click the [OK (Detail)] button to output the detailed log file, or click the [OK] button to output the regular log file.

Converted files are saved in the same location as operation log files (*.G3O).

Precautions

When converting operation log files (*.G3O) to CSV files or Unicode text files in the utility, convert one file at a time.
Even if multiple files are selected at once, they cannot be converted.

Converting with the Trigger File Conversion device

To convert an operation log file (*.G3O) in which events are being collected to a CSV file, turn on the Trigger File Conversion device with an object such as a bit switch.
The regular log file is output.
Set the Trigger File Conversion device on the [File Conversion] tab in [Operation Log].
☞ Page 2017 [File Conversion] tab
Check the file conversion status using the Notify Operation Log Status device.
☞ Page 2010 Checking the operation log status

59.4.5 Viewing the operation log file (Resource File Viewer)

If you launch the exe file of Resource File Viewer independently (hereafter "independent startup"), the operation log file (*.G3O) and application log file (*.G3O) are viewable on the personal computer without being converted in a CSV or Unicode text format.

Since the search function is available in Resource File Viewer, you can specify the date and time or other keywords to find the operation log history to be checked quickly.

☞ Page 2007 Specifications of Resource File Viewer (independent startup)?
☞ Page 2007 How to use Resource File Viewer (independent startup)
☞ Page 2009 Screen layout of Resource File Viewer (independent startup)

Resource File Viewer can also be used from the GOT offline monitor, but in this case, not only operation logs but also alarm files can be viewed.

In the case of independent startup, only operation log files are viewed and the functions are slightly different.

Specifications of Resource File Viewer (independent startup)

■Operating environment

The operating environment is the same as that for GT Designer3.

For information on the operating environment of GT Designer3, refer to the following.

☞ Page 54 Operating environment

■Viewable operation log files

Files with the following extensions are viewable.

G3O, CSV, TXT

Point

If the operation log file has the extension .G3O, all detailed logs are displayed.

To display the log as a regular log, convert the operation log file to a CSV file or a Unicode text file containing the regular logs in advance.

■Number of Resource File Viewer modules that can be started

Up to 16 Resource File Viewer modules can be started simultaneously.

When a module is started, the smallest unused number from 1 to 16 is assigned to the module.

How to use Resource File Viewer (independent startup)

This section describes how to use resource files.

☞ Page 2008 Obtaining a resource file
☞ Page 2008 Starting Resource File Viewer
☞ Page 2008 Exiting Resource File Viewer
☞ Page 2008 Viewing the operation log file (Resource File Viewer)

The following functions are operated in the same way as Resource File Viewer used in the GOT offline monitor.

For details, refer to the following.

☞ Page 3120 Searching for histories in the resource files
☞ Page 3120 Changing the items to be displayed in the history display area
☞ Page 3121 Switching the display language for Resource File Viewer

■Obtaining a resource file

Before starting Resource File Viewer, obtain a resource file.

The following shows how to obtain a resource file.

Resource file source	Method to obtain	Reference
GOT	Obtaining a resource file using GT Designer3	☞ Page 465 [Communicate with GOT] dialog
	Obtaining a resource file output to a USB memory or SD card	
	Obtaining a resource file from the GOT using Data Transfer Tool	🕮Help For Data Transfer Tool
	Obtaining a resource file using the FTP server function	☞ Page 2904 Transferring files between the GOT and peripheral devices (FTP server function)
GT Simulator3	Obtaining a resource file from the working folder	☞ Page 365 Destination to save data
GT SoftGOT3000	Obtaining a resource file from a virtual drive	🕮GT SoftGOT3000 User's Manual

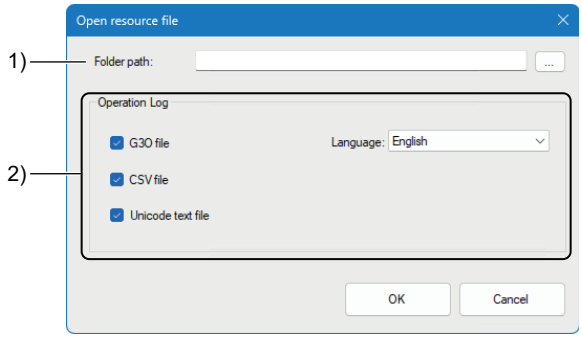
■Starting Resource File Viewer

Start Resource File Viewer by either of the following methods.

1. Double-click the Resource File Viewer exe in the directory: (Path to the installation location of GT Designer3)\App\GSS3_3000\RCFView\RCFView3000.exe.

The [Open resource file] dialog appears.

2. Configure the settings and click the [OK] button.



Item		Description
1)	[Folder Path]	Set the path to the operation log file to be read to Resource File Viewer.
2)	[Operation Log]	Select the extension of the operation log file displayed in Resource File Viewer. When selecting a G3O file, select the language displayed in Resource File Viewer.

If a password has been set for the operation log file, enter the password in the [Encryption Password Entry] dialog.

Resource File Viewer is started.

■Refreshing the Resource File Viewer display

While Resource File Viewer is running, if you change the resource file location or the extension of the file to be read, or if you update, add, or delete the file itself, the display will be refreshed accordingly.

Case	Display update method
When changing the resource file location or the file extension	Select [Project] → [Open] from the menu, and in the [Open resource file] dialog, change the [Folder Path] and extension settings as necessary.
When a resource file has been changed, added, or deleted	Click the [Update] button in the [Navigation] window of Resource File Viewer.

■Exiting Resource File Viewer

Exit Resource File Viewer by either of the following methods.

- Select [Project] → [Exit Application] from the menu.
- Click the [×] button.

■Switching the operation log display language

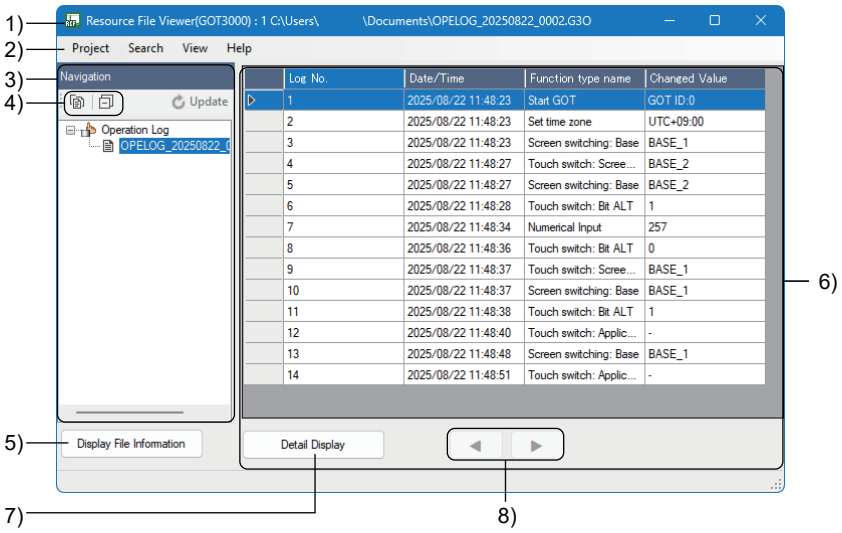
When the operation log file is a binary file, histories are displayed in the system language set on the GOT.

☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching])

Switch the display language before starting Resource File Viewer.

Screen layout of Resource File Viewer (independent startup)

The following shows the screen layout of Resource File Viewer (independent startup).



Item		Description
1)	Title bar	Displays the Resource File Viewer module number and path to the displayed resource file. The icons to minimize, maximize, and close the screen are also displayed.
2)	Menu bar	Displays the operation menus of Resource File Viewer. ☞ Page 2009 Screen layout of Resource File Viewer (independent startup)
3)	[Navigation]	Lists the resource files. • [!] Appears when a resource file has been updated, added, deleted, or renamed. • [Update] button Updates the resource files.
4)	[Unfold All] button [Fold All] button	Opens or closes the tree.
5)	[File Information] button	In the [Display File Information] dialog, displays the information of the operation log file selected in [Navigation].
6)	History display area	Displays the details (operation histories) of the operation log file selected in [Navigation]. Set the display items in the [Display Item Setting] dialog. ☞ Page 3126 [Display Item Setting] dialog (Resource File Viewer)
7)	[Detail Display] button	In the [Detail Display] dialog, displays the details of the history selected in the history display area.
8)	Arrow buttons	Switches between the operation log files displayed in the history display area.

■Menu bar

Menu		Description	Shortcut key
[Project]	[Exit Application]	Exits the Resource File Viewer module.	Alt + F4
	[Open]	In the [Open resource file] dialog, select an operation log file to be read to Resource File Viewer.	—
Search		Search for the operation logs read to Resource File Viewer. ☞ Page 3125 [Search] dialog	Ctrl + F
[View]	[Navigation]	Displays or hides [Navigation].	—
	[Display Items]	Set the items to be displayed in the history display area. ☞ Page 3126 [Display Item Setting] dialog (Resource File Viewer)	—
	[Switch Display Language]	Switch the display language of the Resource File Viewer module.	—
[Help]	[GT Designer3 Help]	Displays GT Designer3 Help.	F1
	[About Resource File Viewer]	Display the Resource File Viewer version.	—

59.4.6 Checking the operation log status

Check the operation log status by using the Notify Operation Log Status device.

Set the Notify Operation Log Status device on the [Basic] tab for [Operation Log] in the [Environmental Setting] window.

☞ Page 2013 [Basic] tab

The following shows the details on the Notify Operation Log Status device.

Bit number	Description
b0	Turns on when operation events cannot be collected. Turns off when collecting operation events is enabled.
b1 to b7	Use prohibited
b8	Turns on when an operation log file conversion is started by using the Trigger File Conversion device. Turns off when the conversion is completed and the Trigger File Conversion device turns off. b9	Turns on when an automatic operation log file conversion is started. Turns off when the conversion is completed.
b10 to b15	Use prohibited

Set the Trigger File Conversion device and the automatic operation log file conversion on the [File Conversion] tab for [Operation Log] in the [Environmental Setting] window.

☞ Page 2017 [File Conversion] tab

59.5 Recording the operator name as the character string stored in the device

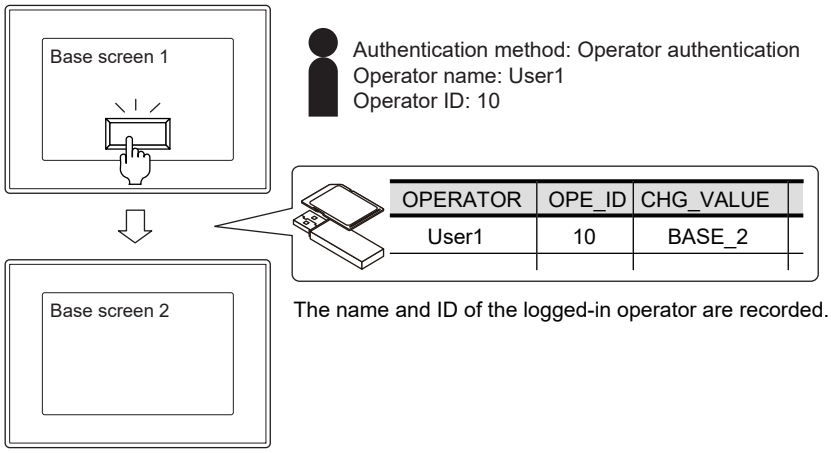
GT37 SoftGOT3000

The operator name, substituted by the user-defined character string stored in the specified device, is recorded in the operation log.

The character string specified using this function is prioritized over the operator name to be recorded when the screen security authentication method is operator authentication or level authentication.

Ex.

When this function is disabled and the operator authentication method is selected for screen security

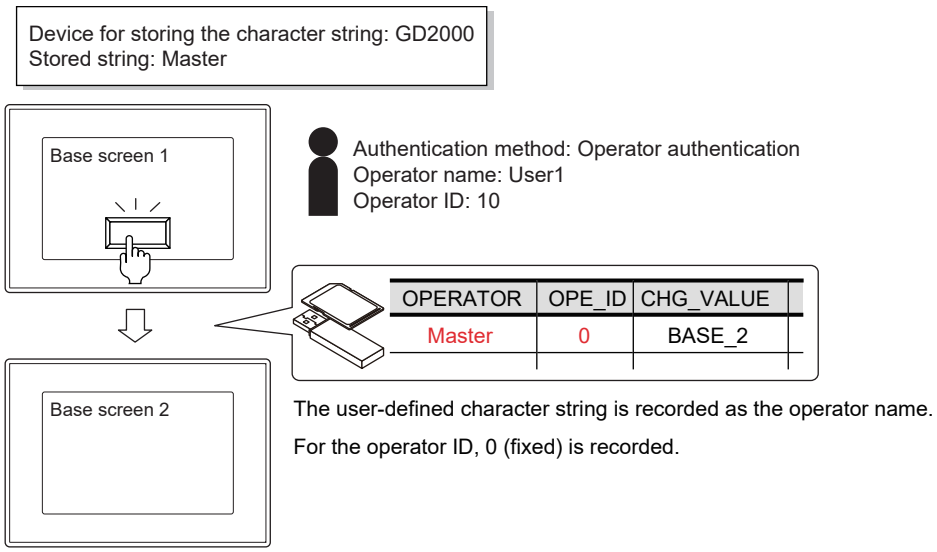


The name and ID of the logged-in operator are recorded.

Switch the screen to base screen 2.

Ex.

When this function is enabled and the operator authentication method is selected for screen security



The user-defined character string is recorded as the operator name.

For the operator ID, 0 (fixed) is recorded.

Switch the screen to base screen 2.

59.5.1 Operation logs in which the operator name is substituted by a character string

This function is available for operation logs in which the operator name (output item: OPERATOR) is recorded.
☞ Page 1927 Log details by operation
Note that this function is not available for operation logs when:

- A login attempt for the operator authentication fails.
- An operator switching for the operator authentication fails.
- An operator account for the operator authentication is locked.
- The operator management information is changed.

The operator name is not substituted by a character string for the operations performed on a VNC client or GOT Mobile function client.

59.5.2 Substituting the operator name with a character string

Select [Record [Contents]-[Operator Name] with the strings stored in the device (up to 16 characters)] on the [Log Target] tab in [Operation Log], and set [Device (8 points)].
☞ Page 2013 [Operation Log]
Store an operator name in eight consecutive word devices starting from a specified device.
Store an operator name in ASCII code (0x20 to 0x7E) in order from the lower bit to the upper bit of each device.
Store Null (0x00) at the end of the operator name.

59.5.3 When the substituted operator name is recorded in the operation log

After the substituted operator name is stored in the device, the operator name is recorded in the operation log.

Precautions

If you perform another operation before storing the substituted operator name in the device, the operator name is not recorded in the operation log.
Ensure that the operator name is stored in the device in advance.
While the GOT is being started or restarted, if an operation log is recorded at any of the following timing, the operator name may be left blank.

- Obtaining operation rights
- Releasing operation rights
- Failing to obtain operation rights

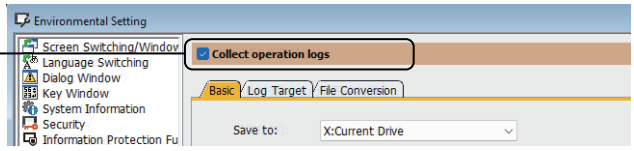
For details on substituting the operator name with a character string, refer to the following.
☞ Page 2011 Recording the operator name as the character string stored in the device

59.6 [Operation Log]

GT37 SoftGOT3000

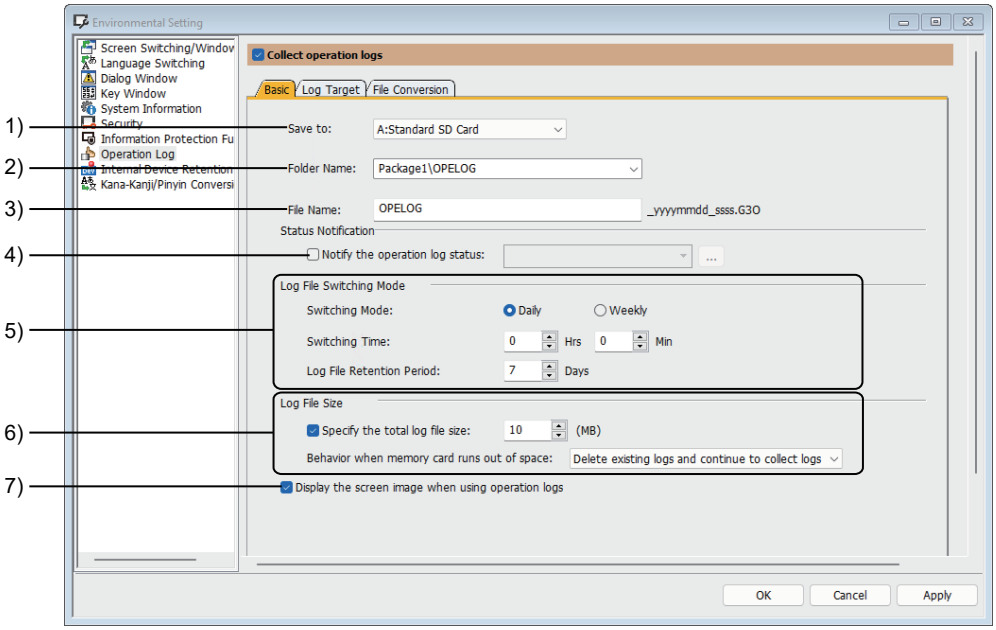
The output settings for operation logs can be configured in [Operation Log] within [Environmental Setting].
From the menu, select [Common] → [GOT Environmental Setting] → [Operation Log], and select [Collect operation logs] in the displayed setting screen.

Select this item.



☞ Page 2013 [Basic] tab
☞ Page 2015 [Log Target] tab
☞ Page 2017 [File Conversion] tab

59.6.1 [Basic] tab



Item		Description
1)	[Save to]	Select the save destination to save for the operation log file (.G3O). For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
2)	[Folder Name]	Set the name of the folder to which the operation log file (.G3O) is saved. For the character type and the number of characters available for folder names, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
3)	[File Name]	Set the file name of the operation log file (.G3O). The log collection start date (YYYYMMDD) for the file and the version are added automatically to the set file name. For the character type and the number of characters available for file names, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
4)	[Notify the operation log status]	Set devices for notifying the collecting status of the operation log. The word device is available. For details on the Notify Operation Log Status device, refer to the following. ☞ Page 2010 Checking the operation log status

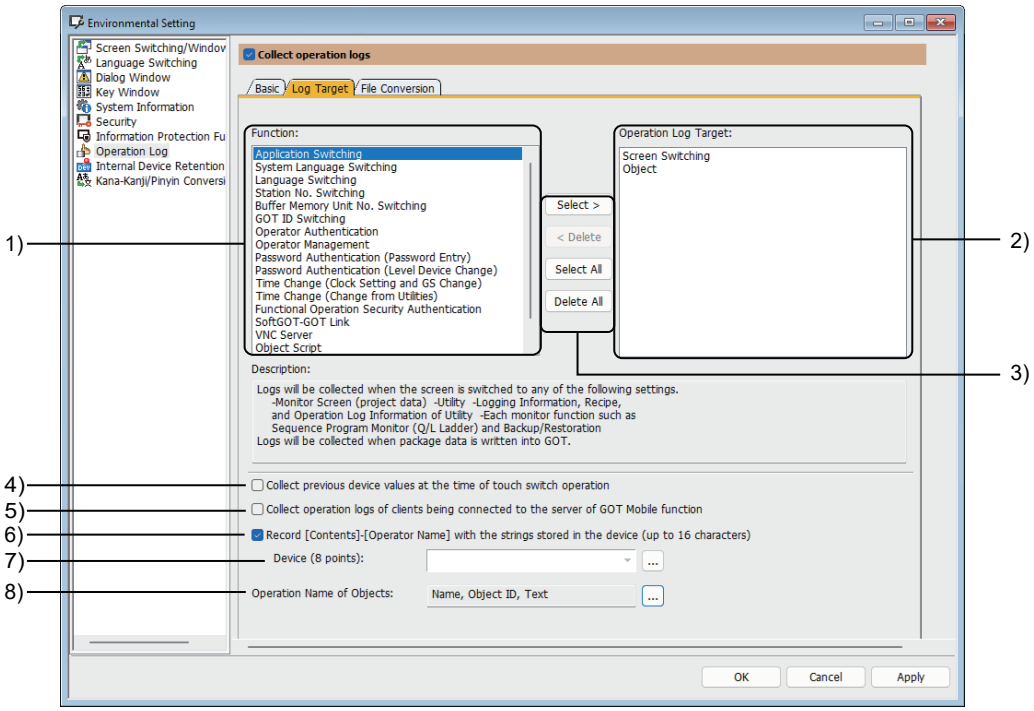
Item			Description
5)	[Log File Switching Mode]	[Switching Mode]	Set the switching mode, time, and storage period for the save destination file of the operation log. Select the switching mode for the save destination file of the operation log. The following shows selectable items. • [Daily]: Switches the save destination file once a day. • [Weekly]: Switches the save destination file once a week. After selecting this item, select the day to switch.
		[Switching Time]	Set the time to switch the save destination file. Set the time by minutes.
		[Log File Retention Period]	Set the storage period for the operation log file (.G3O). The following shows the setting ranges. • When [Daily] is selected for [Switching Mode]: [7] days to [100] days • When [Weekly] is selected for [Switching Mode]: [4] weeks to [53] weeks
6)	[Log file size]	[Specify the total log file size]	Set the maximum capacity of all the operation log files (.G3O) in the save destination folder and define the operation when there is insufficient capacity. Set the maximum capacity of all the operation log files (.G3O) in the save destination folder. When the capacity of all the operation log files exceeds the set capacity, the oldest operation log file is deleted. The setting range is [10] MB to [1024] MB.
		[Behavior when memory card runs out of space]	Select the operation if the capacity is insufficient when a file is saved.
7)	[Display the screen image when using operation logs]		Displays the screen image of the operation log selected in the operation log information screen. For the screen image, refer to the following. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

Precautions

The file size of an operation log cannot be calculated in advance.

To use a data storage in other functions as well, limiting the capacity used for an operation log file by setting [Specify the total log file size] in GT Designer3 is recommended.

59.6.2 [Log Target] tab



Item			Description
1)	[Function]		Lists the items which can be set as the targets of the operation log. The items in this list are not recorded in the operation log file. For details on each function, refer to the following. ☞ Page 1915 Functions to be recorded in the operation log
2)	[Operation Log Target]		Lists the items which are set as the target of the operation log. The items in this list are recorded in the operation log file.
3)	Manipulation buttons	[Select] button	The following buttons are used for selecting or deleting items. Moves the item selected in [Function] to [Operation Log Target].
		[Delete] button	Moves the item selected in [Operation Log Target] to [Function].
		[Select All] button	Moves all the items in [Function] to [Operation Log Target].
		[Delete All] button	Moves all the items in [Operation Log Target] to [Function].
4)	[Collect previous device values at the time of touch switch operation]		Logs the previous device value with each touch switch operation.
5)	[Collect operation logs of clients being connected to the server of GOT Mobile function]		Logs operations performed on the client in the GOT Mobile function. The operation log is saved in the GOT.
6)	[Record [Contents]-[Operator Name] with the strings stored in the device (up to 16 characters)]		The operator name, substituted by the user-defined character string stored in the specified device, is recorded in the operation log. For the operator ID, 0 is recorded. ☞ Page 2011 Recording the operator name as the character string stored in the device
7)	[Device (8 devices)]		Specify the first device of consecutive word devices to which a character string is stored. Eight consecutive devices starting from a specified device are used.

Item			Description
8)	[Operation Name of Objects]	—	Set the items to be recorded as OPNAME for an object. Click the [...] button to display the [Operation Name Setting] dialog. 		[Item]	Select an item to be recorded as OPNAME for an object. The following shows selectable items. • [Name] The name specified in the setting dialog of an object is recorded. • [Object ID] The object ID is recorded. • [Text] The text displayed on a touch switch is recorded. When [Text Type] is set to [Text], only the centered text will be recorded. This setting is applied to a touch switch only.
		[Order]	Set the order in which the selected items are recorded as OPNAME for an object. The setting range is [1] to [3].

Precautions

■Log target when recording an operation log per object

Do not select [Object] in the [Log Target] tab of the operation log setting.

Doing so sets all the objects as the target of the operation log function.

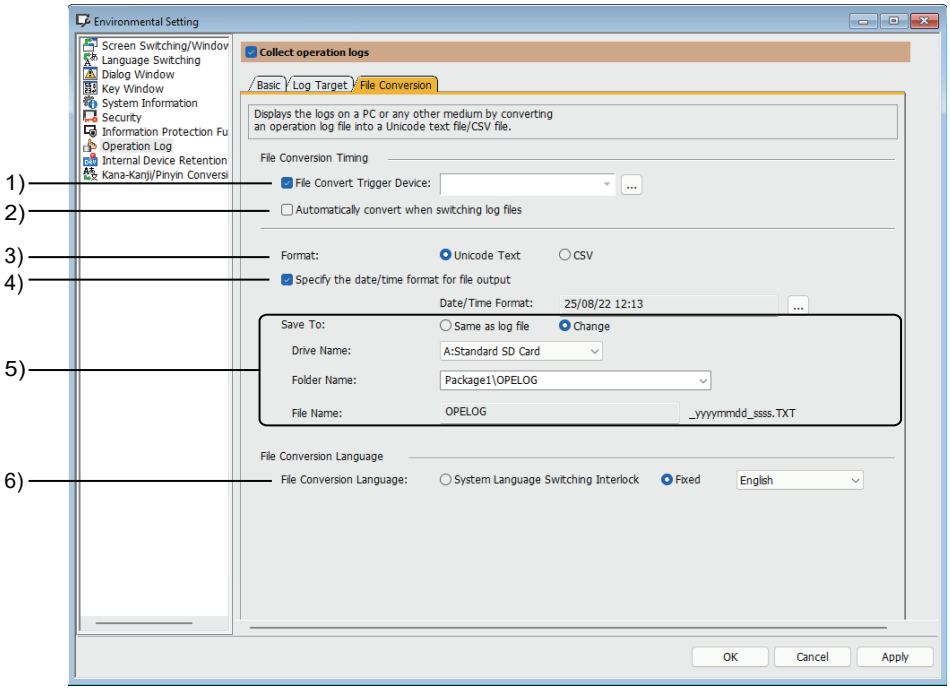
To record an operation log per object, select [Operation Log Information] in each object setting.

■Target function for an operation log

Do not set the function which is not set in GT Designer3 as the target of the operation log.

Doing so may record an operation log even though the function does not operate.

59.6.3 [File Conversion] tab



Item			Description
1)	[File Convert Trigger Device]		Set a trigger device to convert an operation log file (.G3O) in which events are being collected to a CSV or Unicode text file. The bit device is available.
2)	[Automatically convert when switching log files]		Converts a file automatically when recording of an operation log file (.G3O) is completed. 3)	[Format]		Select the file format after the conversion.
4)	[Specify the date/time format for file output]		Specify the date and time format for a conversion destination file. Click the [...] button to specify the date and time format in the [Date/Time Setting] dialog. ☞ Page 3684 [Date/Time Setting] dialog (screen)
5)	[Save to]	—	Select the save destination folder for a converted file. The following shows selectable items. • [Same as log file]: Saves a file to the same folder as that of an operation log file (.G3O). • [Change]: Set the destination to save a file. After selecting this item, set [Drive Name] and [Folder Name].
		[Drive Name]	Set a drive to save a converted file. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
		[Folder Name]	Set the folder name of the destination to save a file. For the character type and the number of characters available for folder names, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
		[File Name]	The file name after the conversion is displayed.
6)	[File Conversion Language]		*1

*1 Select the language of the converted file.
The following shows selectable items.
[System Language Switching Interlock]
Converts the file to the same language as the system language.
[Fixed]
Converts the file to the selected language.

The languages that are selectable differ depending on the format of the converted file.

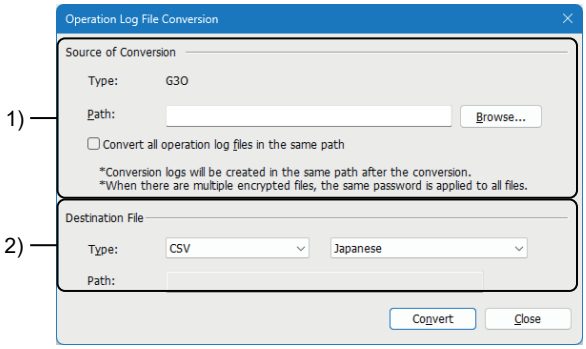
The file format of the file after conversion	
Unicode text	**CSV**
[Japanese] [English] [Chinese (Simplified)] [Chinese (Traditional)] [Korean]	[Japanese] [English]

Precautions

When [System Language Switching Interlock] is set for [File Conversion Language] in the operation log setting, an operation log file is not converted in the language specified in the system language switching device.
A file is converted in the system language set in the utility.

59.7 [Operation Log File Conversion] dialog

GT37 SoftGOT3000



Item			Description
1)	[Source of Conversion]	[Type]	Set the destination to save the conversion source file and the target file. The conversion source file type. [G3O] is displayed.
		[Path]	Set the destination path to save the conversion source file.
		[Convert all operation log files in the same path]	Select this item to set all the operation log files (.G3O) in the conversion source folder as the target of the conversion.
2)	[Destination File]	[Type]	Set the file format of the converted file and the destination to save the file. Set the file format and the language of the converted file. The settable language depends on the selected file format. The following shows selectable items. • [CSV] Converts an operation log file (.G3O) to a CSV file. [Japanese] or [English] can be selected for the language. • [Unicode] Converts an operation log file (.G3O) to a Unicode text file. [Japanese], [English], [Chinese(Simplified)], [Chinese(Traditional)], or [Korean] can be selected as the language.
		[Path]	Set the destination path to save the converted file.

59.8 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the operation log as required.
The following shows the functions that are available by configuring the relevant settings.

59.8.1 GOT internal devices

☞ Page 3581 GOT special register (GS)

Function	Setting item
Changes the character code to Unicode when a binary file is converted to CSV format.	GS522.b2
Disables all buttons except the [List] and [Latest] buttons on the [Operation Log Information] screen of the utility.	GS522.b3
Changes the date format used for the operation log information of the utility.	GS632.b0, GS632.b1

Precautions

Before converting an operation log file (*.G3O) in a language other than Japanese or English to a CSV file, turn on the Character Code for CSV Conversion signal (GS522.b2).
If this signal (GS522.b2) is not turned on, the characters are not displayed correctly.
For details on the Character Code for CSV Conversion signal (GS522.b2), refer to the following.
☞ Page 3581 GOT special register (GS)

PART 9 Alarm

60 Collecting alarms by monitoring devices

61 Collecting alarms by monitoring the system

62 Enabling the popup display for when an alarm occurs

63 Viewing alarm events (Alarm display)

64 Sending an e-mail from the GOT when an alarm occurs (mail send function)

60 Collecting alarms by monitoring devices

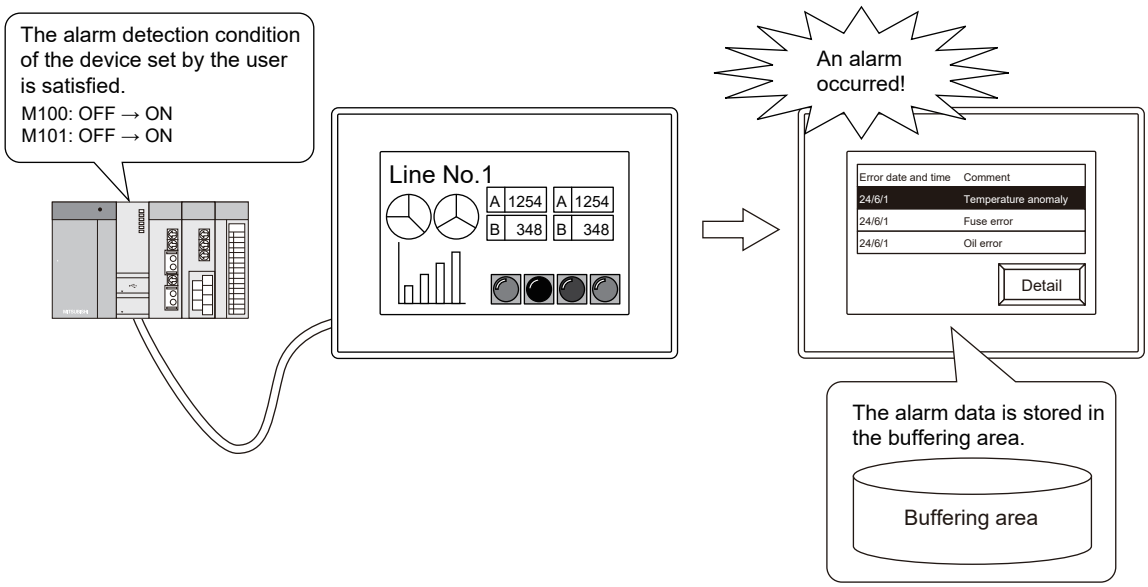
☞ Page 2045 [User Alarm Observation] dialog
☞ Page 2072 [Alarm File Conversion] dialog
☞ Page 2073 Relevant settings

60.1 Overview of the user alarm monitoring

In the user alarm monitoring, the time and comments are recorded as the user alarm data history in a built-in memory of the GOT when conditions set for alarm detection are satisfied for the specified devices.



This chapter describes the user alarm monitoring, which collects and stores alarms set by users.

To display the collected alarms on the screen of the GOT, configure the settings for the alarm display (user) or the alarm popup display in addition to the settings for the user alarm monitoring.

☞ Page 2022 Collecting alarms by monitoring devices

☞ Page 2022 Collecting alarms by monitoring devices

60.2 Specifications of the user alarm monitoring

GT37 SoftGOT3000

☞ Page 2024 Detection condition
☞ Page 2024 Collection cycle (monitoring cycle)
☞ Page 2024 Setting range
☞ Page 2025 Alarm collecting procedure and alarm history collecting method
☞ Page 2030 Storing and deleting the collected user alarm data
☞ Page 2031 Size and notification of the buffering area
☞ Page 2032 Effect of station number switching

60.2.1 Detection condition

- Rising (OFF → ON) or falling (ON → OFF) of the bit device
- When the value of the word device corresponds to the set range expression

60.2.2 Collection cycle (monitoring cycle)

The user alarms can be collected and updated to a buffering area of the GOT in a cycle set by the user regardless of a displayed screen.
The setting range of the cycle is 0.1 to 3600 second(s).

60.2.3 Setting range

Item	Description
User alarm monitoring setting	The setting specifies a pattern of collecting alarms. Each setting has an alarm ID, which is used to specify its corresponding setting as the target of the alarm display (user) or others. Up to 300 user alarm monitoring settings can be set. The setting range of the alarm ID is 1 to 32767.
Alarm points	The alarm points refer to the number of monitored devices. Up to 32767 devices can be set in one user alarm monitoring setting. Up to 65535 devices can be set in one project.

60.2.4 Alarm collecting procedure and alarm history collecting method

☞ Page 2025 Alarm collecting procedure
☞ Page 2025 Alarm history collecting method and information to be collected
☞ Page 2027 Example of displaying alarms for each history collecting method

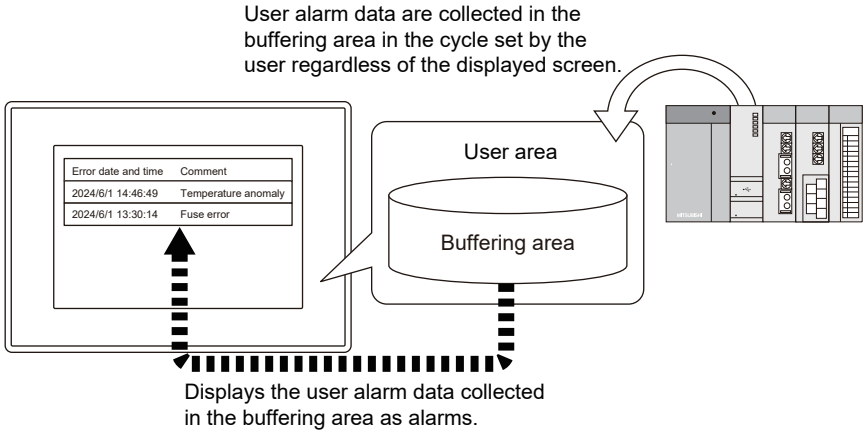
Alarm collecting procedure

The user alarm monitoring function collects alarm data to the buffering area of the user area in the user-specified cycle regardless of the displayed screen.

For the data collection cycle, refer to the following.

☞ Page 2024 Specifications of the user alarm monitoring

The buffering area stores the collected user alarms as histories temporarily, and displays them on the GOT as alarms.



For information on how to delete the data in the buffering area, refer to the following.

☞ Page 2030 Storing and deleting the collected user alarm data

The data to be stored in the buffering area of the user area differs depending on the history collecting method.

Alarm history collecting method and information to be collected

The following shows the alarm history collecting method.

Alarm history collecting method	Description
Historical mode	Collects the history of alarm occurrences. An event is added to the history every time an alarm occurs.
Cumulative mode	Collects the latest alarm status and the alarm counts or time together for each alarm.
Current alarm only	Collects the alarms that are currently occurring only. The history of the user alarms that have been restored are not stored.

For information on the setting of the alarm history collecting method, refer to the following.

☞ Page 2046 [Basic] tab

Depending on the collecting method, the types of information collected differs.

Ex.

Alarm display (user)

Error date and time	Comment	Alarm status	Restored	Checked	Frequency	Cumulative time	Down time	Level	Group	Occurrence log
2024/06/0120:00	Power supply unit error	-	-	-	1	-	-	1	2	
2024/06/0118:30	Hydraulic pressure failure	Checked	-	18:50	2	-	-	1	1	
2024/06/0116:10	Drive module error	Checked	16:30	16:20	2	00:40	00:20	2	1	
1)	2)	3)	4)	5)	6)	7)	8)	9)	10)	11)

○: Collected

—: Not collected

Displayed information		[Collection Mode] setting			Description
		[Historical]	[Cumulative]	[Only current alarm]	
1)	Error date and time	○	○	○	Displays the date and time when an alarm occurred.
2)	Comment	○	○	○	Displays the comment assigned to the alarm at the alarm occurrence.
3)	Alarm status	○	○	○	Displays the alarm status that is currently displayed. • Occurred: The alarm has occurred. (The occurrence of the alarm has not been checked.) • Checked: The occurrence of the alarm has been checked. • Restored: The monitor target already recovered from the alarm.
4)	Restored date and time	○	○	○	Displays the date and time when an alarm is restored.
5)	Checked date and time	○	○	○	Displays the date and time of when the occurrence of an alarm was checked. Check the occurrence of an alarm with the touch switch or device that is set for the alarm check. ☞ Page 2141 Key code switches for operating alarm displays ☞ Page 2048 [Device] tab Example) Operation with a touch switch 6)	Frequency	—	○	—	Displays the number of error occurrence.
7)	Cumulative time	—	○	—	Displays the total time of alarm occurrence including the past alarm occurrence time. 8)	Down time	—	○	—	Displays the time from the alarm occurrence to the alarm restoration.
9)	Level	○	○	○	Displays the levels set for alarms. The alarms can be classified into the level according to the alarm importance. You can display the alarm with higher level preferentially or display the alarms with specific level only. ☞ Page 2064 Narrowing the display by level or group
10)	Group	○	○	○	Displays the groups set for alarms. The alarms can be classified into groups according to the alarm contents. You can display the alarms in order of the group or display the alarms with specific group only. ☞ Page 2064 Narrowing the display by level or group
11)	Log on occurrence	○	○	○	Collects the value of the log collection device when an alarm event occurs and displays the value by embedding it in the comment. ☞ Page 2065 Log collection and embedding display in the comment

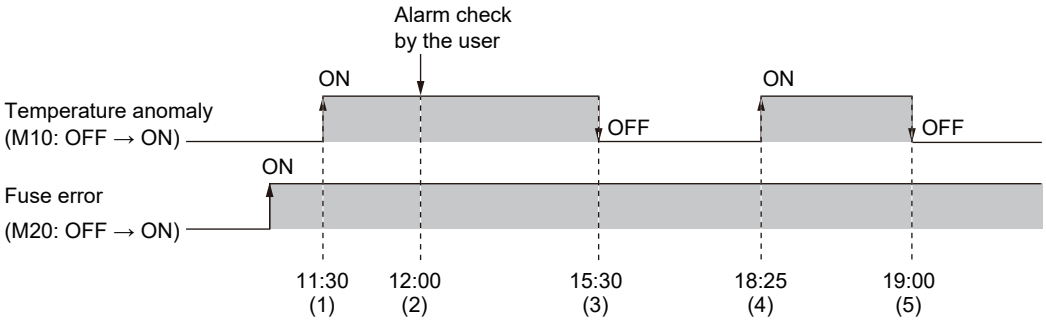
Example of displaying alarms for each history collecting method

The following shows the examples for displaying alarms at the time when the device values change as follows for each history collecting method.

To display the collected alarms, use the alarm display (user) of the object.

Ex.

Monitored devices: M10, M20



☞ Page 2027 Example of displaying historical mode
☞ Page 2028 Example of displaying cumulative mode
☞ Page 2029 Example of only displaying occurred alarms

■Example of displaying historical mode

Collects the history of alarm occurrences.

An event is added to the history every time an alarm occurs.

These items are not collected in the historical.

(1) A temperature anomaly occurs.

Error date and time	Comment	Restored	Checked	Frequency	Cumulative time	Down time
2024/06/01 11:30	Temperature anomaly		12:00			
2024/06/01 10:25	Fuse error					

← A temperature anomaly occurs.

(2) A temperature anomaly has been checked.

Error date and time	Comment	Restored	Checked	Frequency	Cumulative time	Down time
2024/06/01 11:30	Temperature anomaly		12:00			
2024/06/01 10:25	Fuse error					

A temperature anomaly has been checked.

Key code: FFB4h

(3) The system has been restored from the temperature anomaly.

Error date and time	Comment	Restored	Checked	Frequency	Cumulative time	Down time
2024/06/01 11:30	Temperature anomaly	15:30	12:00			
2024/06/01 10:25	Fuse error					

Displays the restored time.

(4) A temperature anomaly occurs again after the restoration.

Error date and time	Comment	Restored	Checked	Frequency	Cumulative time	Down time
2024/06/01 18:25	Temperature anomaly					
2024/06/01 11:30	Temperature anomaly	15:30	12:00			
2024/06/01 10:25	Fuse error					

← Displays the alarm in a new row added.

(5) The system has been restored from the temperature anomaly.

Error date and time	Comment	Restored	Checked	Frequency	Cumulative time	Down time
2024/06/01 18:25	Temperature anomaly	19:00				
2024/06/01 11:30	Temperature anomaly	15:30	12:00			
2024/06/01 10:25	Fuse error					

Displays the restored time.

■Example of displaying cumulative mode

Collects the latest alarm status, the alarm counts, and the time together for each alarm.

(1) A temperature anomaly occurs.

Error date and time		Comment	Restored	Checked	Frequency	Cumulative time	Down time
2024/06/01	11:30	Temperature anomaly			1	00:00	
2024/06/01	10:25	Fuse error			1	00:00	

← A temperature anomaly occurs.

(2) A temperature anomaly has been checked.

Error date and time		Comment	Restored	Checked	Frequency	Cumulative time	Down time
2024/06/01	11:30	Temperature anomaly		12:00	1	00:00	
2024/06/01	10:25	Fuse error			1	00:00	

← A temperature anomaly has been checked.

Key code: FFB4h

(3) The system has been restored from the temperature anomaly.

Error date and time		Comment	Restored	Checked	Frequency	Cumulative time	Down time
2024/06/01	11:30	Temperature anomaly	15:30	12:00	1	04:00	04:00
2024/06/01	10:25	Fuse error		12:00	1	00:00	

← Displays the restored time, down time, and cumulative time.

(4) A temperature anomaly occurs again after the restoration.

Error date and time		Comment	Restored	Checked	Frequency	Cumulative time	Down time
2024/06/01	18:25	Temperature anomaly			2	04:00	
2024/06/01	10:25	Fuse error		12:00	1	00:00	

← Displays the time when the alarm occurred again in the same row and increments the occurrence frequency by one.

(5) The system has been restored from the temperature anomaly.

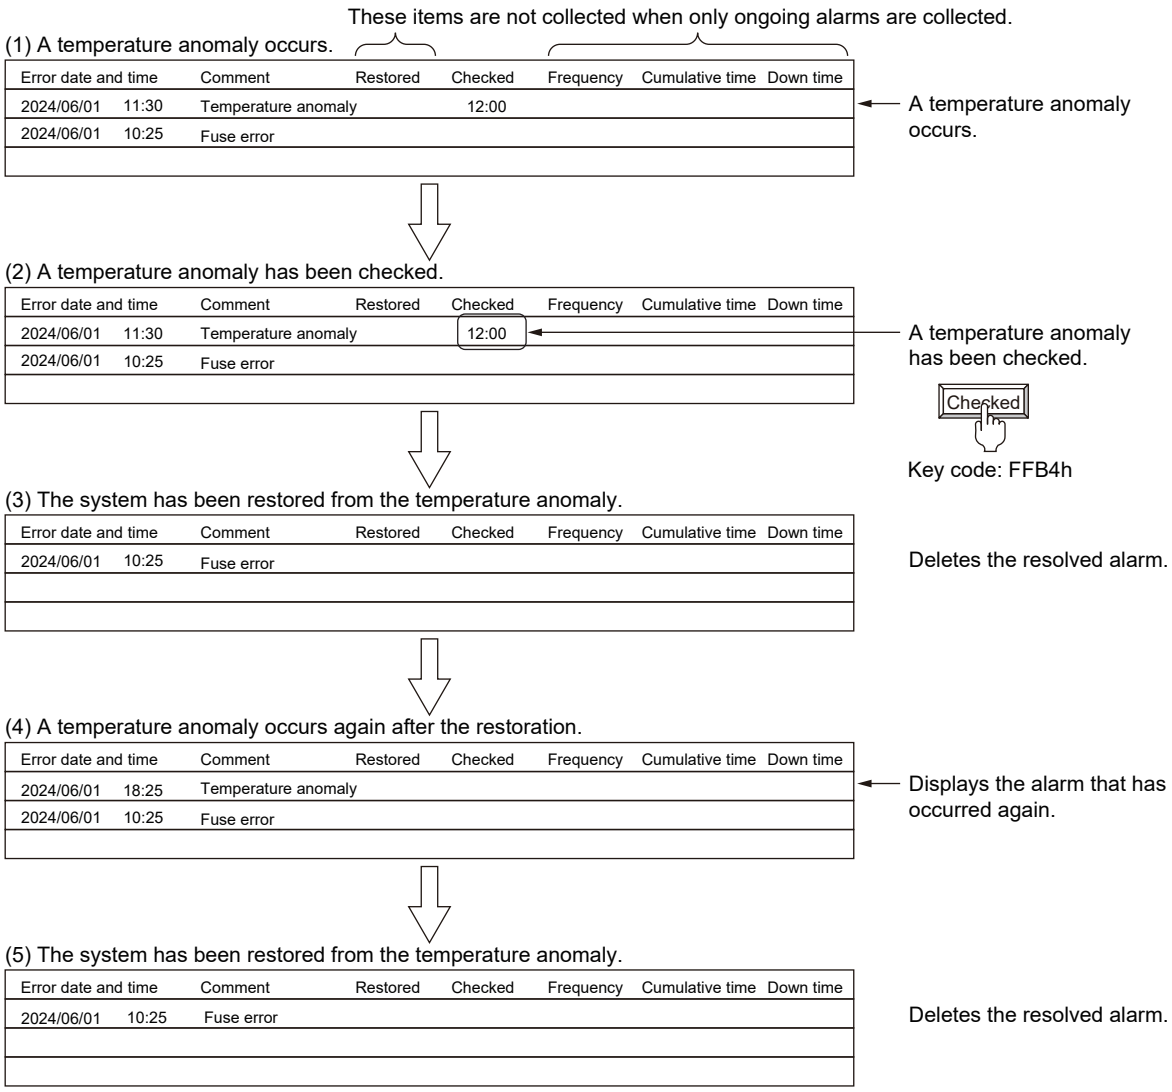
Error date and time		Comment	Restored	Checked	Frequency	Cumulative time	Down time
2024/06/01	18:25	Temperature anomaly	19:00		2	04:35	00:35
2024/06/01	10:25	Fuse error		12:00	1	00:00	

← Displays the restored time, downtime. The duration of the alarm is displayed in cumulative time.

■Example of only displaying occurred alarms

Collects the alarms that are currently occurring only.

The histories of the alarms that have been recovered are not stored.



60.2.5 Storing and deleting the collected user alarm data

The user alarm data are stored in the buffering area in the user area of the GOT.

The stored user alarms are deleted at the following timing.

Deletion timing	Description
When turning on the buffering data clear trigger device	Turn on [Buffering Data Clear Trigger Device] set in the [Basic] tab of the [User Alarm Observation] dialog to delete all alarm data in the "Restored" status. ☞ Page 2045 [User Alarm Observation] dialog  Turning on the buffering data clear trigger device
When inputting a key code for deletion using a touch switch	Use a touch switch to delete one or all alarm data items in the "Restored" status.  Key code: Delete one event. FFB6h Delete all events. FFB7h
When powering off or resetting the GOT	Power off or reset the GOT to delete alarm data. However, when the alarm data is stored in a data storage, the data is retained even after the GOT is powered off.
When changing the [Controller] setting in the utility	Change the [Controller] setting in [GOT basic set] in the utility to delete all alarm data in the "Restored" status.
When writing/deleting data to/from the GOT	Perform any of the following operations in the [Communicate with GOT] dialog to delete all alarm data in the "Restored" status. • Writing package data • Deleting an item from the drive information • Formatting a drive

60.2.6 Size and notification of the buffering area

Size of the buffering area used

The size of the operation memory (RAM) used by the user alarm monitoring buffering area increases or decreases depending on the setting.

The buffering area is reserved in the user area in the operation memory (RAM).

Because the user area in the operation memory (RAM) is used by multiple functions, adjust the size of the buffering area so that it does not exceed the upper limit.

The size of the buffering area required for the set user alarm monitoring can be checked in the [Basic] tab of the [User Alarm Observation] dialog.

☞ Page 2046 [Basic] tab

For information on the operation memory (RAM), refer to the following.

☞ Page 415 Transferred data and GOT storage destination

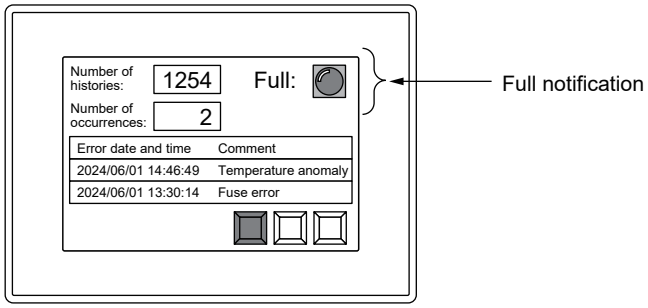
Operation when the buffering area is full

When the number of alarms temporarily stored in the buffering area reaches [Stored Number] set in the [Basic] tab of the [User Alarm Observation] dialog, the area becomes full.

Select the operation when the buffering area is full in [Action When Buffer is Full] in the [User Alarm Observation] dialog ([Basic] tab).

To execute the notification before the buffer area becomes full, set [Full Notification Signal Device] in the [User Alarm Observation] dialog ([Basic] tab).

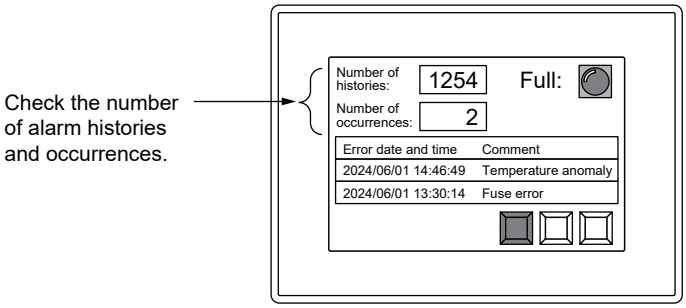
☞ Page 2046 [Basic] tab



Confirming the number of the alarm histories and the alarms

The number of histories and the number of occurrences temporarily stored in the buffering area are stored in the devices for output set in the [User Alarm Observation] dialog ([External Output] tab).

☞ Page 2071 [External Output] tab



60.2.7 Effect of station number switching

If station number switching is performed on the monitored device, the following effects occur.

Alarm history collecting method	Effect of station number switching
Historical mode Current alarm only	When station number switching is performed, the status of the alarm changes from "occurring" to "restored".
Cumulative mode	The accumulated value is cleared.

Precautions

Since the monitored device changes after station number switching, the data before and after the switching will be inconsistent.

60.3 Procedure for setting the user alarm monitoring

GT37 SoftGOT3000

1. Select [Common] → [Alarm] → [User Alarm Observation] from the menu to display the [User Alarm Observation List] dialog.

☞ Page 2044 [User Alarm Observation List] dialog

2. Perform one of the following operations to display the [User Alarm Observation] dialog.

- Click the [New] button.
- Select a user alarm monitoring setting and click the [Edit] button.

☞ Page 2045 [User Alarm Observation] dialog

3. Configure necessary settings in each tab in the [User alarm observation] dialog, and click the [OK] button to complete the user alarm monitoring setting.

Tab	Description
[Basic] tab	Configure the settings related to the alarm ID, history collecting method, and buffering area. ☞ Page 2046 [Basic] tab
[Device] tab	Set a cycle for monitoring, devices to be monitored for the detection, and comments to be displayed. ☞ Page 2048 [Device] tab
[File Save] tab	Set a trigger for storing the alarm log file, storage destination, file conversion using a device, and others. ☞ Page 2068 [File Save] tab
[Extended] tab	Select a device search method for alarms at the sequence program monitor startup and whether to notify alarms to Pocket GOT. ☞ Page 2070 [Extended] tab
[External Output] tab	Set the following items to save the number of user alarms and the occurrences. ☞ Page 2071 [External Output] tab

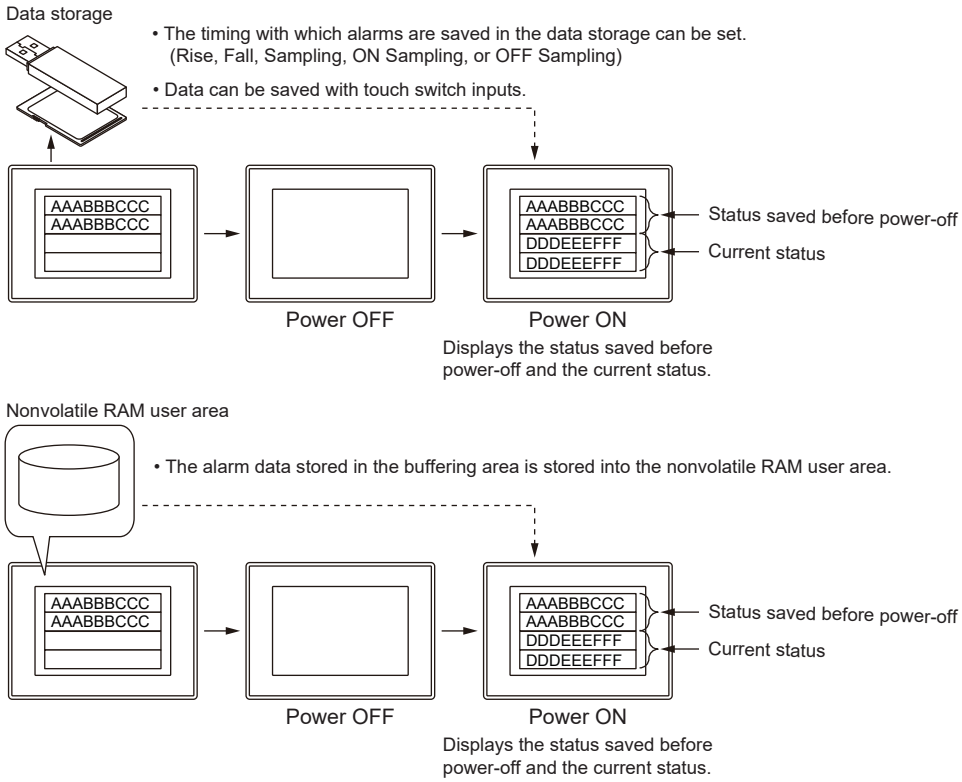
60.4 Power failure backup by storing the user alarm

GT37 SoftGOT3000

☞ Page 2034 Overview of the power failure backup
☞ Page 2035 Information to be stored
☞ Page 2035 Power failure backup by using a data storage
☞ Page 2037 Power failure backup by using a nonvolatile RAM

60.4.1 Overview of the power failure backup

Once the user alarm data is stored in a data storage or the nonvolatile RAM user area as the alarm log file, the data is retained even after the GOT is powered off.
When the GOT is powered on, the alarm log file (if stored in the data storage or the nonvolatile RAM user area) is automatically read and the user alarm history before the power-off is restored.



Point

To save the file in the data storage, it is recommended that you format the file before using it to maintain the file access performance.
The number of files to be stored in a folder should be less than 500.
If 500 or more files are stored in a folder, file access performance may be lowered.
Repeated writing or deleting of data may lower access performance, regardless of the number of files.
In such a case, format the data storage.

60.4.2 Information to be stored

The information in the alarm log file to be stored in the data storage or the nonvolatile RAM user area differs depending on the history collecting method.

☞ Page 2025 Alarm history collecting method and information to be collected

60.4.3 Power failure backup by using a data storage

☞ Page 2035 Required setting
☞ Page 2035 Backing up the alarm log file stored in the data storage
☞ Page 2035 Precautions for using a data storage

Required setting

Perform one of the following operations.

Storage method	Reference
Storage by the store trigger device	Configure the setting in the [File Save] tab of the [User Alarm Observation] dialog. Select [Save alarm log files] and set the storage destination for the log file and the storage trigger. ☞ Page 2068 [File Save] tab
Storage by the key code switch (key code: FFBB)	☞ Page 2141 Key code switches for operating alarm displays
Storage by GS520.b0	☞ Page 3647 Buffering And File Access Control (GS520) Because all the data in the buffering area are saved in the data storage, the storage process may take a few minutes to complete. To prevent the monitoring from stopping for a long time, save the data using any other method.

Backing up the alarm log file stored in the data storage

Select [Automatically backup at the time of saving] in the [File Save] tab of the [User Alarm Observation] dialog to store the alarm log file as a backup file when the alarm log file is saved.

Precautions for using a data storage

☞ Page 2035 Precautions for starting the GOT
☞ Page 2035 Precautions for removing an SD card
☞ Page 2036 Storage process
☞ Page 2036 Error occurred during the alarm log file saving
☞ Page 2036 Restoring the alarm histories when powering-off to on the GOT

■Precautions for starting the GOT

When reading and restoring the user alarm from the data storage, install the data storage on the GOT before powering-on the GOT.

After the powering-on the GOT, the data in the data storage cannot be restored.

In addition, when the data storage is installed after the power-on, the user alarm data in the data storage are overwritten when other user alarm data are stored in the data storage.

■Precautions for removing an SD card

When you open the SD card cover, the files are stored automatically.

Before removing the SD card, make sure that the file saving is complete by checking one of the following conditions.

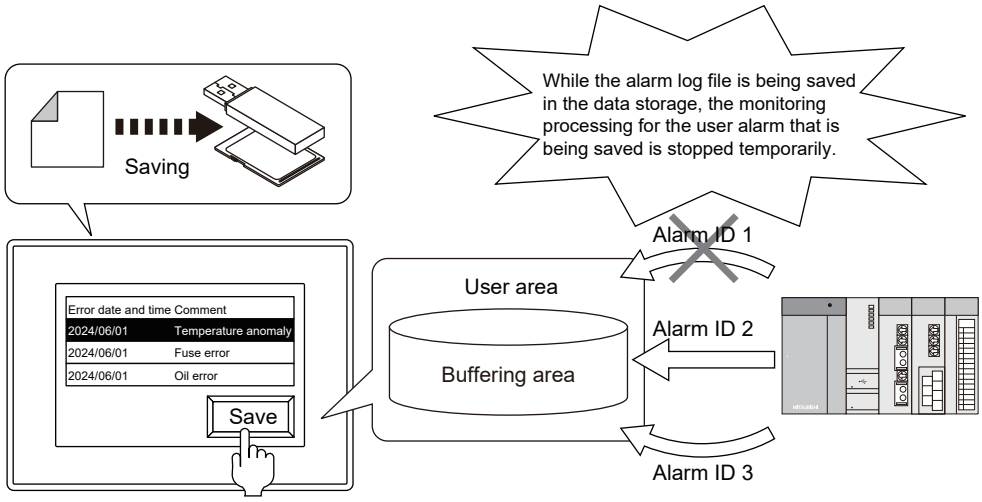
- The Drive Status Notification signal (system signal 2-2.b0, b1) is turned off.
- The SD card access LED is turned off.

Storing may take longer because all the user alarms and system alarms for saving the alarm log files are stored.

■Storage process

While the alarm log file is being saved in the data storage, the monitoring processing for the user alarm of the alarm ID that is being saved is stopped temporarily.

User alarms occurred or restored during the storing are not displayed.



■Error occurred during the alarm log file saving

When an error occurs during the alarm log file saving, the [Writing Error Notification Device] set in the [File Save] tab of the [User Alarm Observation] dialog turns on.

If the Writing Error Notification device turns on, check that the following conditions are satisfied.

- The SD card cover of the GOT is closed.
- The data storage works normally.

The user needs to turn off this device.

■Restoring the alarm histories when powering-off to on the GOT

When the alarm log file in the data storage is not created in the project in the GOT, the file cannot be read from the GOT.

In this case, an alarm occurs or a device turns on.

- A system alarm 525 occurs.
- The [Writing Error Notification Device] set in the [File Save] tab of the [User Alarm Observation] dialog turns on.

60.4.4 Power failure backup by using a nonvolatile RAM

☞ Page 2037 Required setting
☞ Page 2037 Storage timing
For the specifications of the nonvolatile RAM user area and operations performed on it, refer to the following.
☞ Page 3679 Specifications and operations of the nonvolatile RAM user area

Required setting

Select [Retain data in the embedded memory in GOT even when the power goes off] in the [Basic] tab of the [User Alarm Observation] dialog.
The size of the nonvolatile RAM user area used can also be checked in the [Basic] tab.
Up to 10 user alarm monitoring settings can be configured with the nonvolatile RAM power-failure backup function enabled.
☞ Page 2046 [Basic] tab

Precautions

The nonvolatile RAM user area is used by multiple functions, and thus its space is limited.
For the specifications of the nonvolatile RAM user area, refer to the following.
☞ Page 3679 Specifications and operations of the nonvolatile RAM user area

Storage timing

Every time the data in the buffering area is changed, the data is stored in the nonvolatile RAM user area.

60.5 Converting alarm log files

GT37 SoftGOT3000

Alarm log files generated by user alarms are binary format files (*.G3A).

To display and edit the alarm log files on a personal computer, convert them into Unicode text files or CSV files.

The following shows how to convert the alarm log files.

☞ Page 2039 Conversion using the utility

☞ Page 2040 Conversion using a device

☞ Page 2041 Conversion using GT Designer3

For the format of the converted file, refer to the following.

☞ Page 2041 Configurations of a Unicode text file and a CSV file

Precautions

■Character code and conversion destination file

If an alarm log file contains any character other than ASCII and Shift JIS characters, convert the file as shown below.

- Convert the file to Unicode text format.
- Convert the file to a CSV file by turning on GS522.b2.

■Precautions for a CSV file or Unicode text file

For the precautions for using CSV files and Unicode text files, refer to the following.

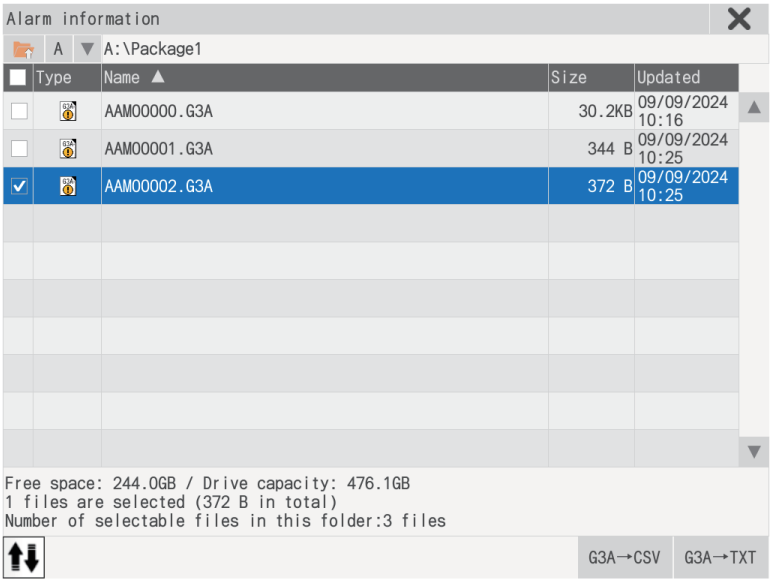
☞ Page 3668 Precautions for using CSV file

☞ Page 3669 Precautions for using Unicode text file

60.5.1 Conversion using the utility

Convert a binary file (*.G3A) stored in the data storage to a Unicode text file or a CSV file using the utility.
When a file is converted using the utility, the value of the language switching device is applied to the column number of the comment group used during conversion.

1. Select a binary file (*.G3A) in [Alarm information] of the utility and touch the [G3A→TXT] or [G3A→CSV] button.



2. Store the created Unicode text file or CSV file into a personal computer by one of the following methods.

Method	Description
Transferring with GT Designer3	Reads resource data from the GOT.
Storing by using the data storage	Stores the alarm log file to the data storage and reads the alarm log file from the data storage.

3. Display or edit the converted Unicode text file or the CSV file on a personal computer.

For the operations of the utility, refer to the following.
📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
To read the resource data from the GOT, refer to the following.
☞ Page 441 Reading the data from the GOT

Precautions

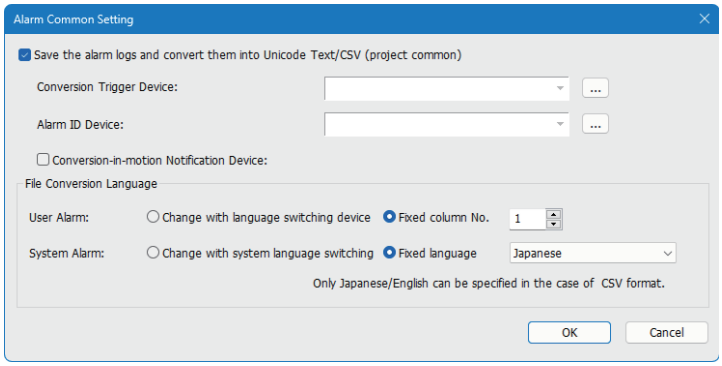
When converting an alarm log file (*G3A) into a CSV file or a Unicode text file with a utility, execute a conversion by each file.
Even if multiple files are selected at once, they cannot be converted.

60.5.2 Conversion using a device

Turning on a specified device converts a binary format file (*.G3A) stored in the data storage into a Unicode text file or a CSV file.

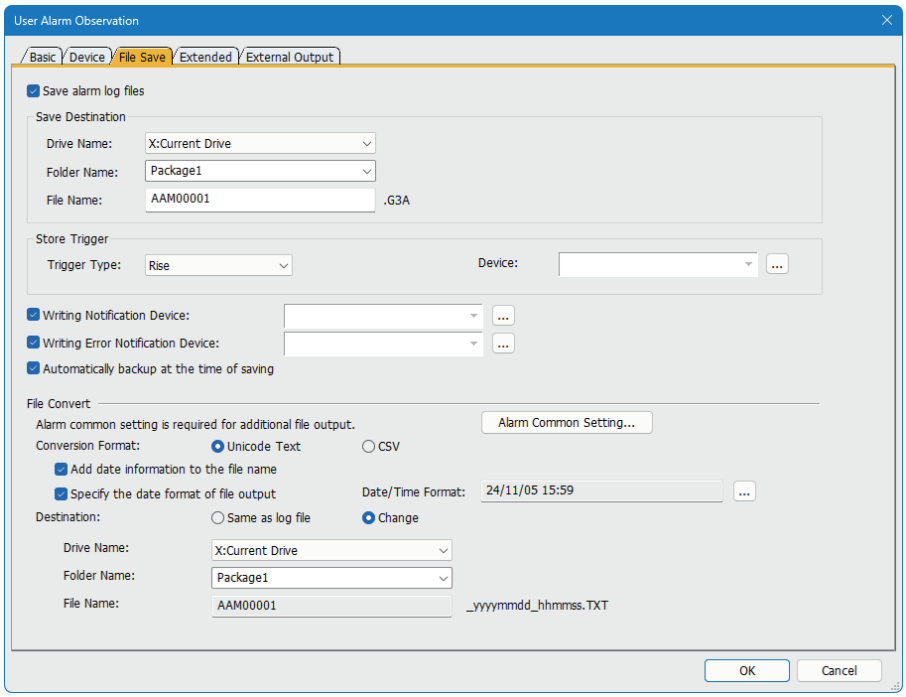
1. Configure the setting for control the alarm log file conversion with the device in the [Alarm Common Setting] dialog.

☞ Page 2043 [Alarm Common Setting] dialog



2. Configure the setting for storing the alarm log file stored in the buffering area to the data storage in the [File Save] tab of the [User Alarm Observation] dialog.

☞ Page 2068 [File Save] tab



Precautions

Before converting the alarm log files, write the user alarm monitor ID that generates a file to the alarm ID specification device.
When the conversion trigger device is turned on before the user alarm monitor ID is written, the alarm log file is not converted.
Make sure to turn off the conversion trigger device after the conversion of the alarm log file starts.
If the conversion trigger device is on even after the conversion is complete, the conversion notification device does not turn off.

60.5.3 Conversion using GT Designer3

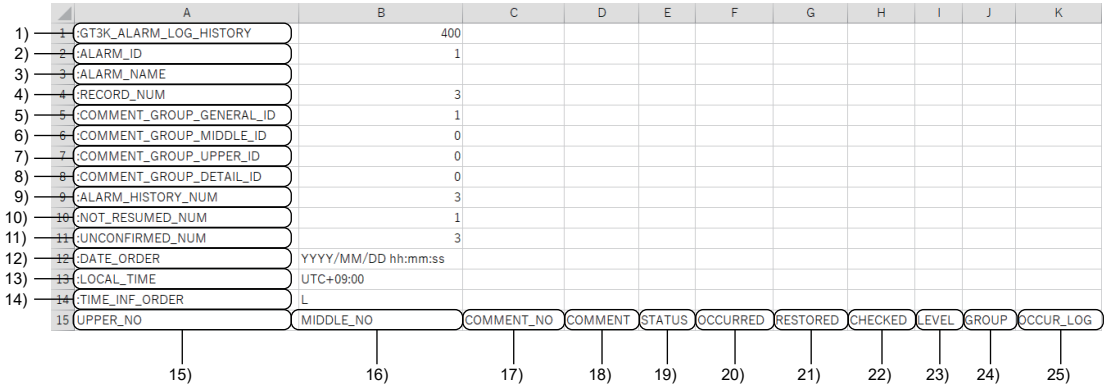
Convert a binary file (*.G3A) stored on the personal computer to a Unicode text file or a CSV file using GT Designer3. Conversion is performed in the [Alarm Log File Conversion] dialog.

☞ Page 2072 [Alarm File Conversion] dialog

60.5.4 Configurations of a Unicode text file and a CSV file

☞ Page 2041 Configuration of historical mode
☞ Page 2042 Configuration of cumulative mode

Configuration of historical mode



No.	Description
1)	Alarm collecting method
2)	Alarm ID
3)	Alarm name
4)	Number of data points
5)	Basic comment group number
6)	Middle comment group number
7)	Upper comment group number
8)	Detailed comment group number
9)	Number of the alarm histories
10)	Number of unrestored alarms
11)	Number of unchecked alarms
12)	Order of the dates
13)	Difference from UTC
14)	Order of the output time
15)	Upper comment number
16)	Middle comment number
17)	Basic comment number
18)	Comment for a basic alarm
19)	Alarm status (O: Alarm has been occurring, but has not been confirmed, OC: Alarm has been occurring, and has been confirmed, R: Alarm has been restored, but has not been confirmed, RC: Alarm has been restored, and has been confirmed)
20)	Date and time when an alarm occurred
21)	Date and time when an alarm is restored
22)	Date and time when an alarm occurrence is checked
23)	Level set for an alarm

21)	Date and time when an alarm is restored
22)	Date and time when an alarm occurrence is checked
23)	Level set for an alarm
24)	Group set for an alarm
25)	Number of alarm occurrences
26)	Total time of alarm occurrence including the past alarm occurrence time (total downtime)
27)	Time from the alarm occurrence to the alarm restoration
28)	Log collected when an alarm event occurs

60.6 [Alarm Common Setting] dialog

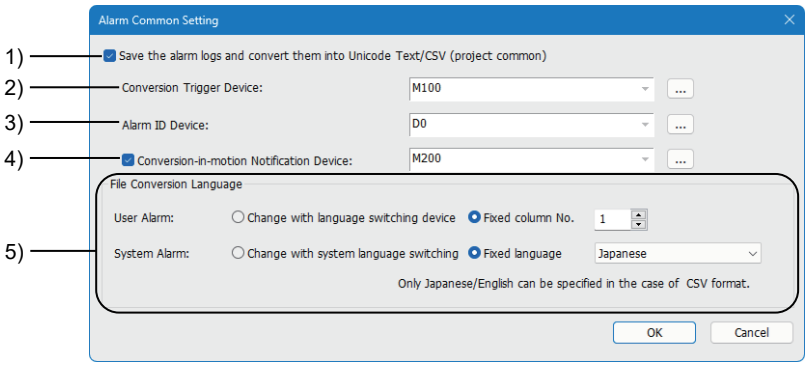
GT37 SoftGOT3000

Configure this setting when controlling the alarm log file conversion by devices.

Select [Common] → [Alarm] → [Alarm Common Setting] from the menu to display the following dialog.

To control the alarm log file conversion by devices, configure the [File Convert] setting in the [File Save] tab of the [User Alarm Observation] dialog.

☞ Page 2045 [User Alarm Observation] dialog



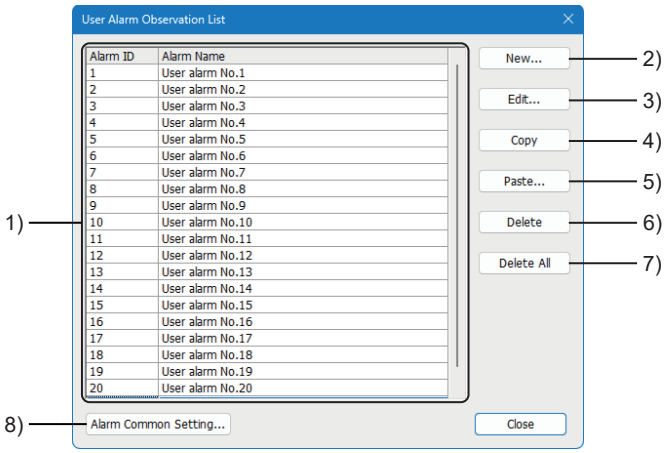
Item			Description	
1)	[Save the alarm logs and convert them into Unicode Text/CSV (project common)]		Configure this setting for controlling the alarm log file conversion by devices.	
2)	[Conversion Trigger Device]		Set trigger devices for the file conversion.	
3)	[Alarm ID Device]		Set the device that specifies the alarm monitoring ID for generating a conversion target file.	
4)	[Conversion-in-motion Notification Device]		Set the device to notify that a file is being converted. After the alarm log file conversion is started, make sure to turn off the conversion trigger device. If the conversion trigger device is on even after the conversion is complete, the conversion notification device does not turn off.	
5)	[File Conversion Language]	User alarm	Set the column No. of the comment group to be used in the file conversion.	
			[Change with language switching device]	Converts files with a column No. switched by the language switching device.
			[Fixed column No.]	Converts files with a set column No. The setting range is [1] to [30].
		System alarm	Set the system language to be used for the file conversion.	
			[Change with system language switching]	Converts files in the system language displayed on the GOT.
			[Fixed language]	Converts files with a set language.

60.7 [User Alarm Observation List] dialog

GT37 SoftGOT3000

Displays the list of the user alarm monitoring settings and manages the settings.

Select [Common] → [Alarm] → [User Alarm Observation] from the menu to display the following dialog.



Item			Description
1)	User alarm monitoring list	—	List of the user alarm monitoring settings in a project
		[Alarm ID]	Alarm ID for each user alarm monitoring setting
		[Alarm Name]	Alarm name for each user alarm monitoring setting
2)	[New] button		Displays the [User Alarm Observation] dialog. Create a new user alarm monitoring setting. ☞ Page 2045 [User Alarm Observation] dialog
3)	[Edit] button		Displays the [User Alarm Observation] dialog. Edit a selected setting. ☞ Page 2045 [User Alarm Observation] dialog
4)	[Copy] button		Copies a selected alarm ID.
5)	[Paste] button		Use a copied user alarm monitoring setting to configure a user alarm setting. In the displayed dialog, set which alarm ID is to be used for the copied user alarm monitoring setting.
6)	[Delete] button		Deletes a selected setting.
7)	[Delete All] button		Deletes all the settings.
8)	[Alarm Common Setting] button		Displays the [Alarm Common Setting] dialog. ☞ Page 2043 [Alarm Common Setting] dialog

60.8 [User Alarm Observation] dialog

GT37 SoftGOT3000

☞ Page 2046 [Basic] tab
☞ Page 2048 [Device] tab
☞ Page 2068 [File Save] tab
☞ Page 2070 [Extended] tab
☞ Page 2071 [External Output] tab

Precautions

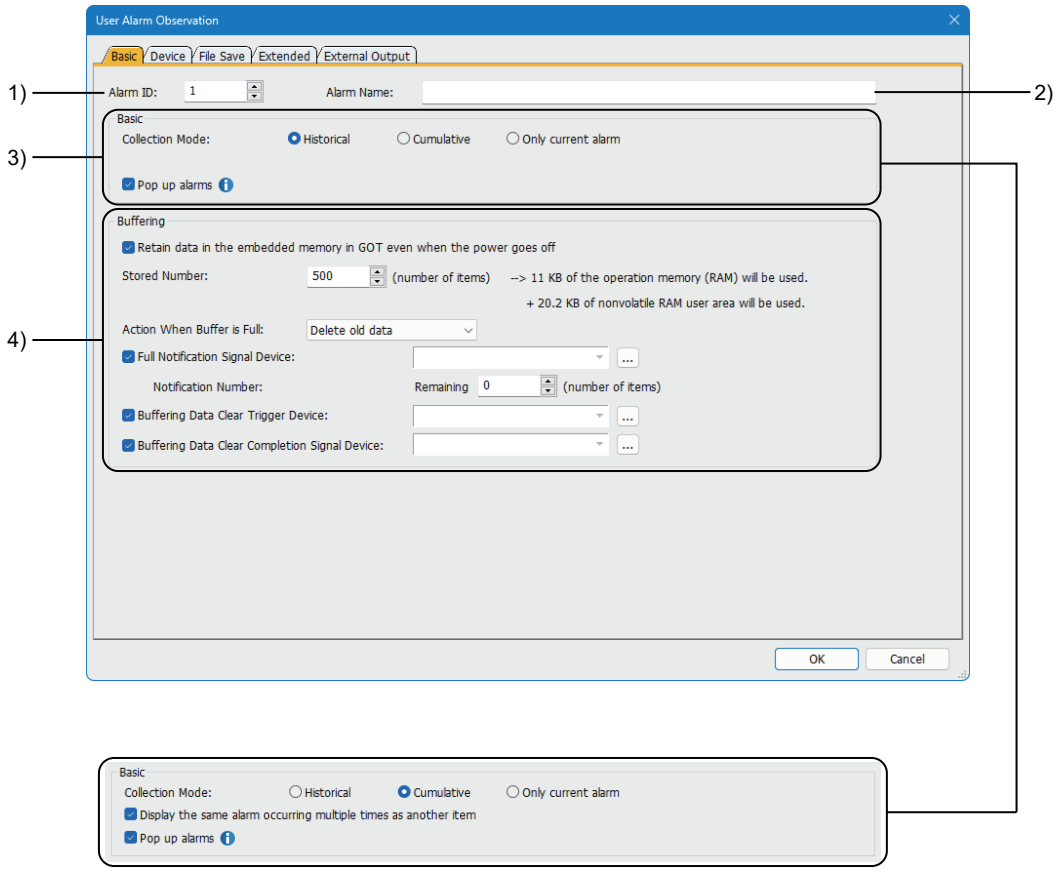
After the first settings and any change of the following setting items, if you change the settings again or import settings from a CSV file, note the following: The history data may be partially deleted or displayed incorrectly.
Before you change the setting, backing up the alarm files of the GOT is recommended.

- Alarm ID
- Collection Mode
- Stored Number
- Alarm Points
- Middle Comment No.
- Upper Comment No.

60.8.1 [Basic] tab

GT37 SoftGOT3000

Set the alarm history collecting method and the buffering that stores the alarm history.



When [Cumulative] is selected for the [Collection Mode].

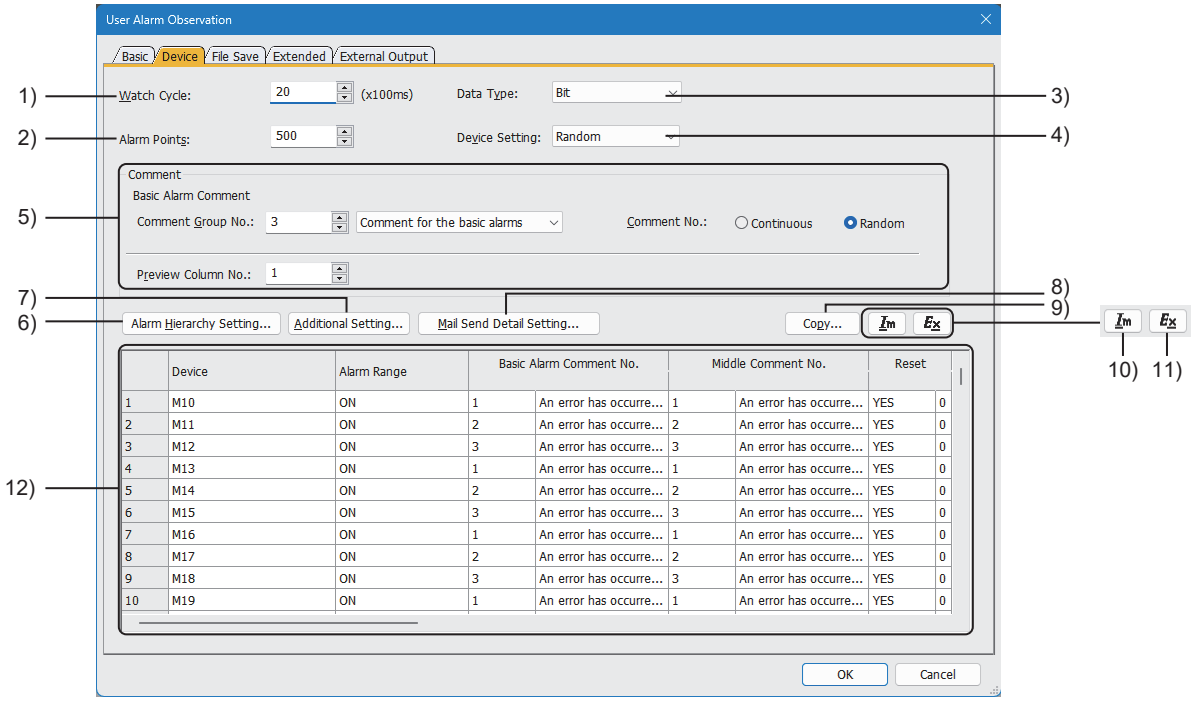
Item			Description
1)	[Alarm ID]		Set the alarm ID of the user alarm. The setting range is [1] to [32767].
2)	[Alarm Name]		Set an alarm name of the user alarm. Up to 32 characters can be set as an alarm name.
3)	[Basic]	[Collection Mode]	Select a user alarm collecting method. ☞ Page 2025 Alarm history collecting method and information to be collected
		[Display the same alarm occurring multiple times as another item]	This item can be set only when the [Collection Mode] is [Cumulative]. Displays the same alarm, which occurred multiple times, as another item at each time of occurrence.
		[Pop up alarms]	Pops up a user alarm message. Configure the following settings additionally. • Alarm popup display settings ☞ Page 2118 [Alarm Popup Display] dialog • Settings of the screen (base screen or mobile screen) where an alarm message pops up ☞ Page 314 [Basic] tab ☞ Page 2831 [Basic] tab

Item			Description
4)	[Buffering]	—	Configure settings for the buffering that stores the collected user alarms.
		[Retain data in the embedded memory in GOT even when the power goes off]	Select this item to store alarm data in the buffering area in the nonvolatile RAM user area. Up to 10 user alarm monitoring settings can be configured with the nonvolatile RAM power-failure backup function enabled. ☞ Page 2034 Power failure backup by storing the user alarm
		[Stored Number]	Set this item when setting [Collection Mode] to [Historical]. Set the number of user alarm history events to be stored. The setting range is [Alarm Points] set in the [Device] tab to [32767]. The buffer size increases as the number of the stored events increases.
		[Action When Buffer is Full]	Set this item when setting [Collection Mode] to [Historical]. Select the operation executed when the number of the user alarms stored in the buffering area reaches the [Stored Number].
		[Full Notification Signal Device]	Set this item when setting [Collection Mode] to [Historical]. Notifies that the storable number of user alarm histories becomes the number set in the [Notification Number] or less by the set device. ☞ Page 834 How to set devices, labels, and tags
		[Notification Number]	When setting [Full Notification Signal Device], set this item. Set the number of the user alarm histories for which the [Full Notification Signal Device] is notified. The setting range is [0] to [255]. Example) When [Stored Number] is set to 1000 and [Notification Number] is set to 10 [Full Notification Signal Device] turns on when the number of stored user alarm histories becomes 990 because the number of storable user alarm histories becomes 10.
		[Buffering Data Clear Trigger Device]	Deletes the restored user alarms stored in the buffering area by the set device. ☞ Page 834 How to set devices, labels, and tags
		[Buffering Data Clear Completion Signal Device]	When setting [Buffering Data Clear Trigger Device], set this item. Notifies you with a set device that deleting buffering data is complete. ☞ Page 834 How to set devices, labels, and tags

60.8.2 [Device] tab

GT37 SoftGOT3000

Configure settings for the timing for collecting user alarms or user alarm settings (devices set for user alarms, comments displayed at a user alarm occurrence, resetting user alarms, and level/group setting).



Item			Description
1)	[Watch Cycle]		Set a cycle at which the device is monitored. The setting range is [1] to [36000].
2)	[Alarm Points]		Set the number of alarms. The setting range is [1] to [32767].
3)	[Data Type]		Select the data type of the device.
4)	[Device Setting]		Select whether to set devices sequentially or not. [Identical] can be selected only when [Data Type] is other than [Bit]. Selecting [Identical] sets the same device for all the alarms. This helps you identify the alarm that has occurred by setting the same device for multiple alarms and setting different [Alarm Range] for each alarm.
5)	[Comment]	[Basic Alarm Comment]	Set [Comment Group No.] and [Comment No.] to be used for the basic alarm comment. For [Comment No.], select whether to set comment Nos. consecutively or individually.
		[Preview Column No.]	This item becomes enabled when the language switching device is set in the [Environmental Setting] window ([Language Switching]). Set the column No. of the comment to be previewed in the alarm setting list in this dialog.
6)	[Alarm Hierarchy Setting] button		In the [Alarm Hierarchy Setting] dialog, set the hierarchy level of alarms. ☞ Page 2049 [Alarm Hierarchy Setting] dialog
7)	[Additional Setting] button		In the [Additional Setting] dialog, set the items displayed in the alarm setting list. ☞ Page 2050 [Additional Setting] dialog
8)	[Mail Send Detail Setting] button		Displays the [Mail Send Detail Setting] dialog to set details for an email to be sent. ☞ Page 2051 [Mail Send Detail Setting] dialog
9)	[Copy] button		In the [Copy Advanced User Alarm Observation] dialog, copy the contents in the alarm setting list. ☞ Page 2052 [Copy User Alarm Observation] dialog
10)	Import button		Imports the alarm monitoring setting file to overwrite the settings of the [Device] tab.
11)	Export button		Exports the setting in the [Device] tab to a Unicode text file or CSV file. You can edit the exported file in spreadsheet software and others. The edited file can be imported with GT Designer3. ☞ Page 2053 Format of the exported alarm setting list ☞ Page 3668 Precautions for using CSV file ☞ Page 3669 Precautions for using Unicode text file

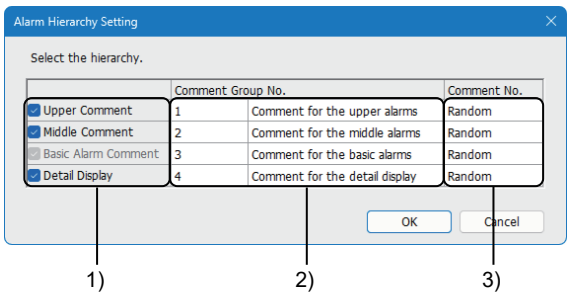
Item		Description
12)	Alarm setting list	Set devices to be monitored, comments to be displayed when an alarm occurs, and so on. ☞ Page 2055 Details of the alarm setting list

[Alarm Hierarchy Setting] dialog

Hierarchize the user alarms.

For the hierarchization, refer to the following.

☞ Page 2058 Alarm hierarchization

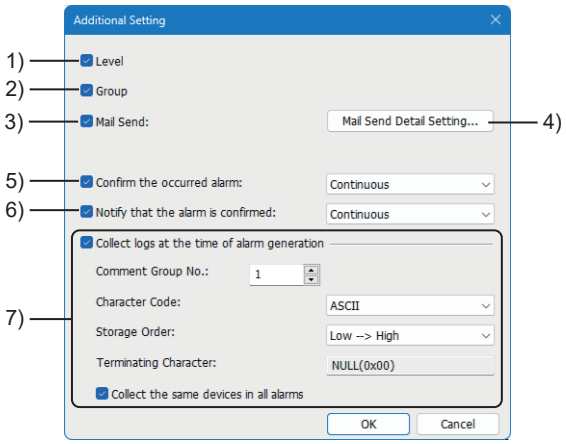


Item		Description
1)	[Hierarchy]	Select the hierarchy level to be added.
2)	[Comment Group No.]	Set the comment group No. of the comment. The set comment group name is displayed.
3)	[Comment No.]	Select whether to set comment Nos. consecutively or individually.

[Additional Setting] dialog

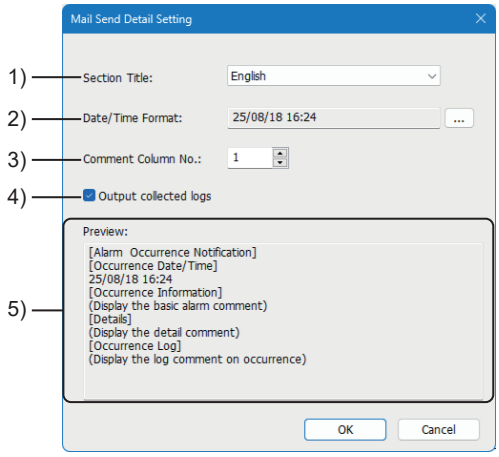
Adds items to the alarm setting list in the [User Alarm Observation] dialog ([Device] tab).

☞ Page 2048 [Device] tab



Item			Description
1)	[Level]		Adds a level setting.
2)	[Group]		Adds a group setting.
3)	[Mail Send]		Adds a mail send setting.
4)	[Mail Send Detail Setting] button		Displays the [Mail Send Detail Setting] dialog to set details for an email to be sent. ☞ Page 2051 [Mail Send Detail Setting] dialog
5)	[Confirm the occurred alarm]		Adds the setting of a device to change the status of an alarm to "Checked". Select whether to set devices sequentially or not.
6)	[Notify that the alarm is confirmed]		Adds the setting of a device to notify that the status of an alarm has been changed to "Checked". Select whether to set devices sequentially or not.
7)	[Collect logs at the time of alarm generation]	—	Adds the setting related to the log collection when an alarm event occurs. When a log collection device is specified separately from the device to be monitored, the value of the log collection device are collected when an alarm occurs. The collection device value can be displayed by embedding it in the comment. ☞ Page 2065 Log collection and embedding display in the comment When this item is selected, the following items are displayed.
		[Comment Group No.]	Set the comment group where the comment in which the collection device value is to be embedded is registered. Set the comment in which the collection device value is to be embedded in [Log Comment No. on Occurrence] in the alarm setting list.
		[Character Code]	This item is displayed when [String] is selected for [Data Type] in [Log Collection] in the alarm setting list. Select the character code of the log collection device.
		[Storage Order]	This item is displayed when [String] is selected for [Data Type] in [Log Collection] in the alarm setting list. Select the order for storing the string data in the log collection device.
		[Terminating Character]	This item is displayed when [String] is selected for [Data Type] in [Log Collection] in the alarm setting list. The setting is fixed to [NULL(0x00)].
		[Collect the same devices in all alarms]	Clicking the [OK] button with this item selected configures the same setting in [Log Collection] for all the alarms. To configure settings efficiently, select this item for items to be common to all the alarms and deselect this item for items to be different for each alarm.

[Mail Send Detail Setting] dialog

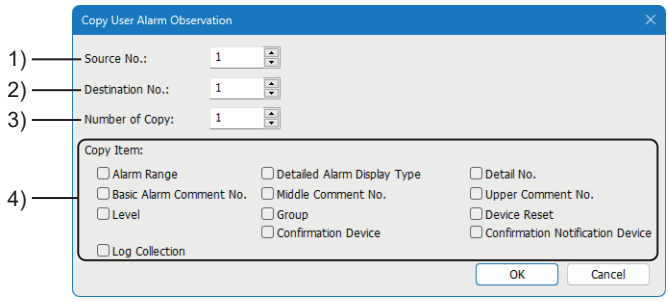


Item		Description
1)	[Section Title]	Select a language for the title.
2)	[Date/Time Format]	Set the date and time format. ☞ Page 3684 [Date/Time Setting] dialog (screen)
3)	[Comment Column No.]	Set the comment column number. The setting range is [1] to [30].
4)	[Output collected logs]	Outputs the log in the body of the email message.
5)	[Preview]	Displays the mail text.

[Copy User Alarm Observation] dialog

Copies the setting of the specified row to another in the alarm setting list in the [User Alarm Observation] dialog ([Device] tab).

☞ Page 2048 [Device] tab



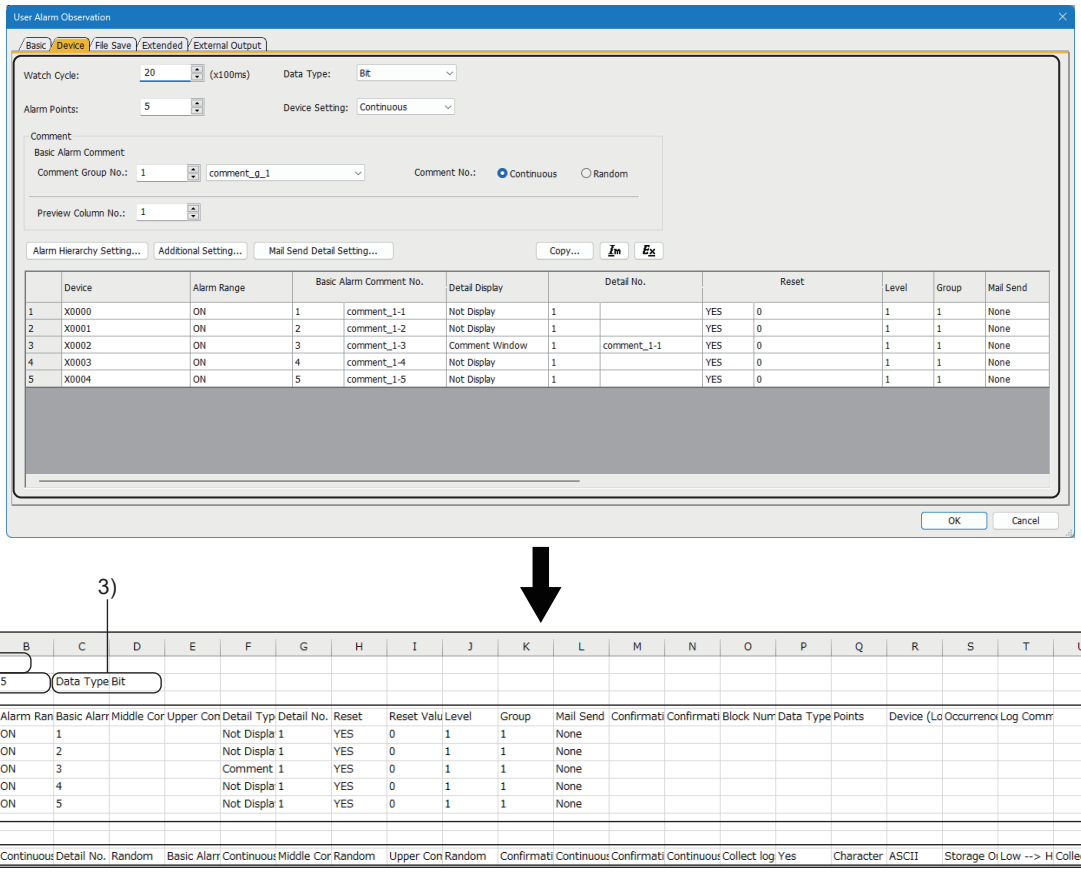
Item		Description
1)	[Source No.]	Set a line number to be copied.
2)	[Destination No.]	Set a line number where the copied contents are pasted.
3)	[Number of Copy]	Set the number of times the copied contents are pasted. Pastes the copied contents sequentially for the number of lines set in the [Number of Copy] from the line No. set in the [Source No.].
4)	[Copy Item]	Select items to be copied. Contents of the columns having the same names as the selected items are pasted to the column set in [Destination No.].

Format of the exported alarm setting list

The alarm setting list in the [User Alarm Observation] dialog ([Device] tab) is exported with the following format.

Ex.

When exporting the alarm setting list to a CSV file

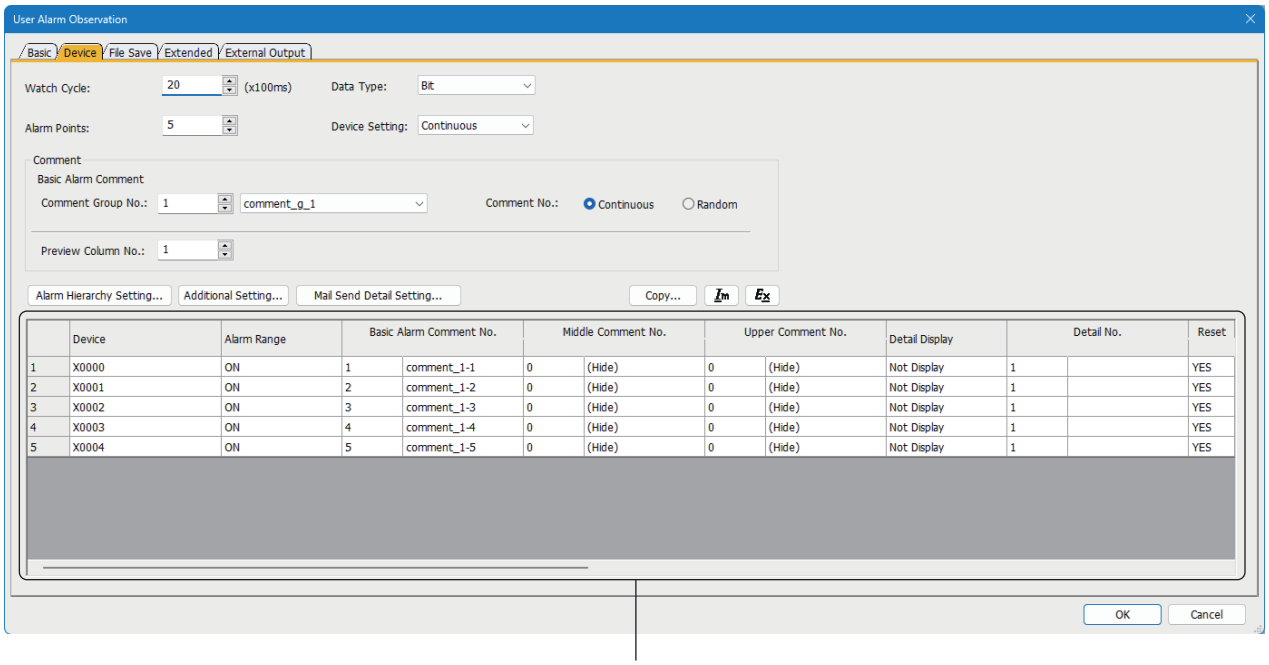


Item		Description
1)	[User Alarm]	Indicates that the file is the one in which the user alarm monitoring settings have been exported.
2)	[Alarm Points]	Setting value of [Alarm Points]
3)	[Data Type]	Setting value of [Data Type]
4)	Alarm setting list	Items and setting values in the alarm setting list

Item			Description
5)	Other settings	[Device No.]	Setting value of [Device Setting]
		[Detail No.]	Setting method of [Comment No.] for [Detail Display] in the [Alarm Hierarchy Setting] dialog
		[Basic Alarm Comment No.]	Setting method of [Comment No.] for [Basic Alarm Comment] in the [Alarm Hierarchy Setting] dialog
		[Middle Comment No.]	Setting method of [Comment No.] for [Middle Comment No.] in the [Alarm Hierarchy Setting] dialog
		[Upper Comment No.]	Setting method of [Comment No.] for [Upper Comment No.] in the [Alarm Hierarchy Setting] dialog
		[Confirmation Device]	Setting method of [Confirmation Device] set for [Confirm the occurred alarm] in the [Additional Setting] dialog
		[Confirmation Notification Device]	Setting method of [Confirmation Notification Device] set for [Notify that the alarm is confirmed] in the [Additional Setting] dialog
		[Collect logs at the time of alarm generation]	Whether [Collect logs at the time of alarm generation] is selected in the [Additional Setting] dialog • [Yes]: Selected • [No]: Deselected
		[Character Code]	Setting value of [Character Code] in the [Additional Setting] dialog
		[Storage Order]	Setting value of [Storage Order] in the [Additional Setting] dialog
		[Collect the same devices in all alarms]	Whether [Collect the same devices in all alarms] is selected in the [Additional Setting] dialog • [Yes]: Selected • [No]: Deselected

Details of the alarm setting list

The following shows the columns set in the alarm setting list in the [User Alarm Observation] dialog ([Device] tab).



Alarm setting list

Item	Description	
Monitored alarm number	The numbers displayed in the leftmost column of the alarm setting list. Monitoring alarm numbers can be used as a sort criterion for the alarm display (user). ☞ Page 2144 [Alarm Display(User)] dialog 	
[Device]	Set the devices to be monitored. ☞ Page 834 How to set devices, labels, and tags	
[Alarm Range]	Set the alarm occurrence condition. The setting item depends on the setting of [Data Type].	
	When [Data Type] is [Bit]	Select whether the alarm occurrence condition is when the bit device is on or off.
	When [Data Type] is other than [Bi]	Set the range expression to be the alarm occurrence condition. Click the [...] button to display the [Edit Alarm Range] dialog.  [$V] is the value read from the monitored device. When you select [Other], click the [Exp] button to display the [Edit Range] dialog and set the range expression. ☞ Page 1043 [Edit Range] dialog

Item	Description	
[Basic Alarm Comment No.] [Middle Comment No.] [Upper Comment No.]	Set the comment No. of the comment to be displayed at an alarm occurrence. For one alarm, set the comment No. of the comment used at each hierarchy level. To hide middle- and upper-level alarms, set [0]. For the alarm hierarchization, refer to the following. ☞ Page 2058 Alarm hierarchization	
	When configuring the following settings to comments displayed at an alarm occurrence, [No Message] is displayed at an alarm occurrence. • No comment is set ([0] is specified for the comment No.). • A comment is not registered in the set comment No. To prevent [No Message] from being displayed, register a space in the comment and specify the corresponding comment No.	
[Detail Display] [Detail No.]	Set the display method and content to be displayed in the detail display. ☞ Page 2062 Detail display destination When setting the [Detail Display] for each alarm, set [Comment No.] to [Random] in the [Detail Comment] of the [Alarm Hierarchy Setting] dialog. When [Comment No.] is set to [Continuous], the [Detail Display] of all alarms are set as same as the head alarm. ☞ Page 2049 [Alarm Hierarchy Setting] dialog	
	[Not Display]	The details are not displayed.
	[Comment Window]	The window for the detail display is set as the display destination of the details. The comment corresponding to the comment No. set in [Detail No.] is displayed.
	[Base Screen]	The base screen is set as the display destination of the details. Select the base screen where the details are to be displayed in [Detail No.].
	[Window Screen]	The window screen (overlap window 1) is set as the display destination of the details. Select the window screen where the details are to be displayed in [Detail No.].
[Reset]	Set the reset operation for the alarm.	
	[YES]	Enables the reset operation for the alarm. The bit device turns off the specified device. The word device turns the specified device value to the reset value. Set the reset value after selecting.
	[NO]	Disables the reset operation for the alarm.
[Level]	Set the level of alarms. The setting range is [1] to [255]. You can display the alarm with higher level preferentially or display the alarms with specific level only. ☞ Page 2064 Narrowing the display by level or group	
[Group]	Set the group of alarms. The setting range is [1] to [255]. You can display the alarms in order of the group or display the alarms with specific group only. ☞ Page 2064 Narrowing the display by level or group	
[Mail Send]	Set the mail sending method.	
	[None]	No mail is sent.
	[Occur]	Sends the date of occurrence or comment contents at an alarm occurrence (when a specified device condition is satisfied) by mail.
	[Restore]	Sends the date of restoration or comment contents at an alarm restoration (when a specified device condition is not satisfied) by mail.
	[Occur/Restore]	Sends the date or occurrence or restoration and comment contents at an alarm occurrence or alarm restoration by mail.
[Confirmation Device]	Set a bit device to change the status of an alarm to "Checked". ☞ Page 834 How to set devices, labels, and tags When the set device is turned on, the status of the corresponding alarm is changed to "Checked". The GOT monitors the set device in the cycle that is specified with [Watch Cycle].	
[Confirmation Notification Device]	Set a bit device to notify that the status of an alarm has been changed to "Checked". ☞ Page 834 How to set devices, labels, and tags When the status of the corresponding alarm is changed to "Checked", the set device turns on. You need to turn off the device after it is turned on.	

Item		Description
[Log Collection]	—	Specify a log collection device separately from the device to be monitored, and collect the value of the log collection device when an alarm occurs. The collected value can be displayed by embedding it in the comment. The maximum number of log collection devices to be set is as follows. • 512 per project • 16 per alarm The log collection device can be set when [Log on Occurrence] is set to [Valid]. For information on how to set the comment in which the collected value is to be embedded, refer to the following. ☞ Page 2065 Log collection and embedding display in the comment
	[Block Number]	Unit for setting the log collection device for each alarm For each block, set the log collection device, data type, and number of points.
	[Data Type]	Data type of the log collection device
	[Points]	Set the number of devices to be specified as the log collection device. When two or more devices are specified, set the log collection device for each row.
	[Device]	Set the log collection device. ☞ Page 834 How to set devices, labels, and tags
	[Log on Occurrence]	When [Valid] is selected, log collection settings for each alarm are enabled.
	[Log Comment No. on Occurrence]	Set the comment to be displayed with the value of the log collection device embedded when an alarm event occurs. Set the comment group in the [Additional Setting] dialog.

Alarm hierarchization

☞ Page 2059 Narrowing the alarm location
☞ Page 2059 Operation that can be executed to multiple alarms in a batch
☞ Page 2061 Operation that cannot be executed to multiple alarms in a batch

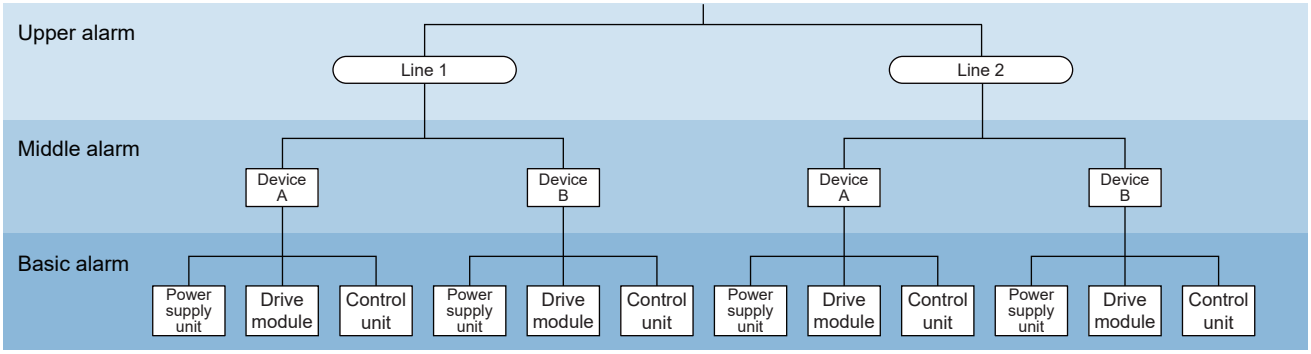
Hierarchizing alarms enables narrowing down alarm locations and batch processing for multiple alarms.

The following hierarchy levels are available and referred to as the alarm hierarchy.

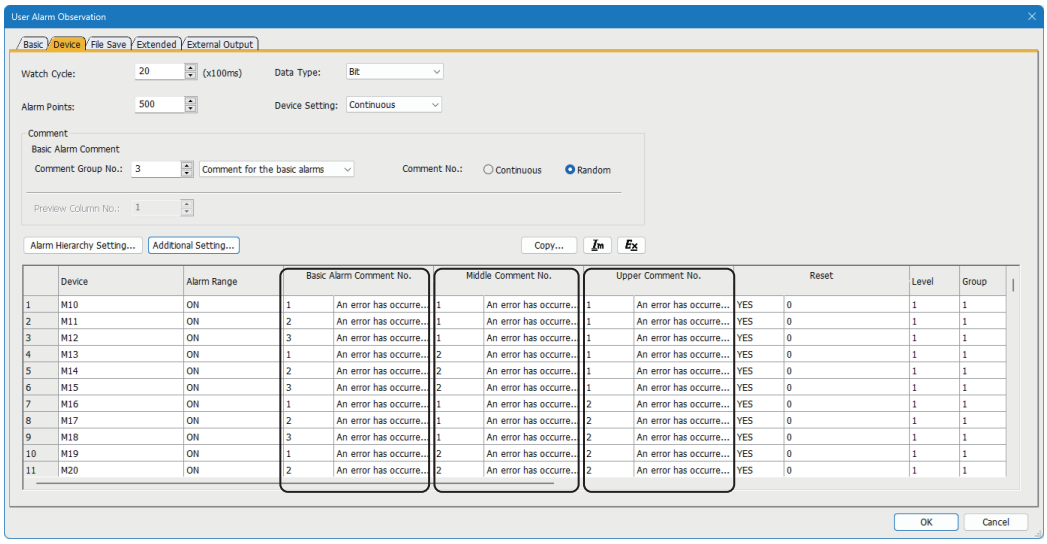
Alarm hierarchy	Description
Upper-level alarm	For upper-level alarms, the comment set as the upper comment is displayed.
Middle-level alarm	For middle-level alarms, the comment set as the middle comment is displayed.
Basic alarm	For basic alarms, the comment set as the basic alarm comment is displayed.

The following shows the settings and operation examples with alarms hierarchized as follows.

Ex.

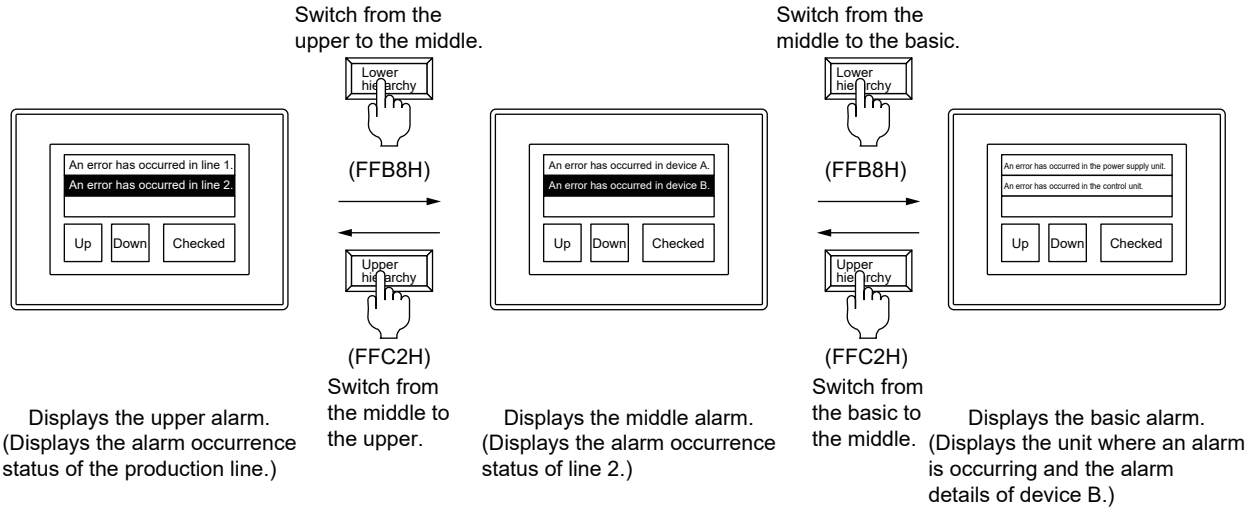


Classify the comment for each alarm level: upper-level, middle-level, and basic alarm, and configure the settings in the [Device] tab of the [User Alarm Observation] dialog.



■Narrowing the alarm location

The alarm can be displayed from the overview to the detail.



Displays the upper alarm. (Displays the alarm occurrence status of the production line.)

Switch from the middle to the upper.

Displays the middle alarm. (Displays the alarm occurrence status of line 2.)

Switch from the basic to the middle.

Displays the basic alarm. (Displays the unit where an alarm is occurring and the alarm details of device B.)

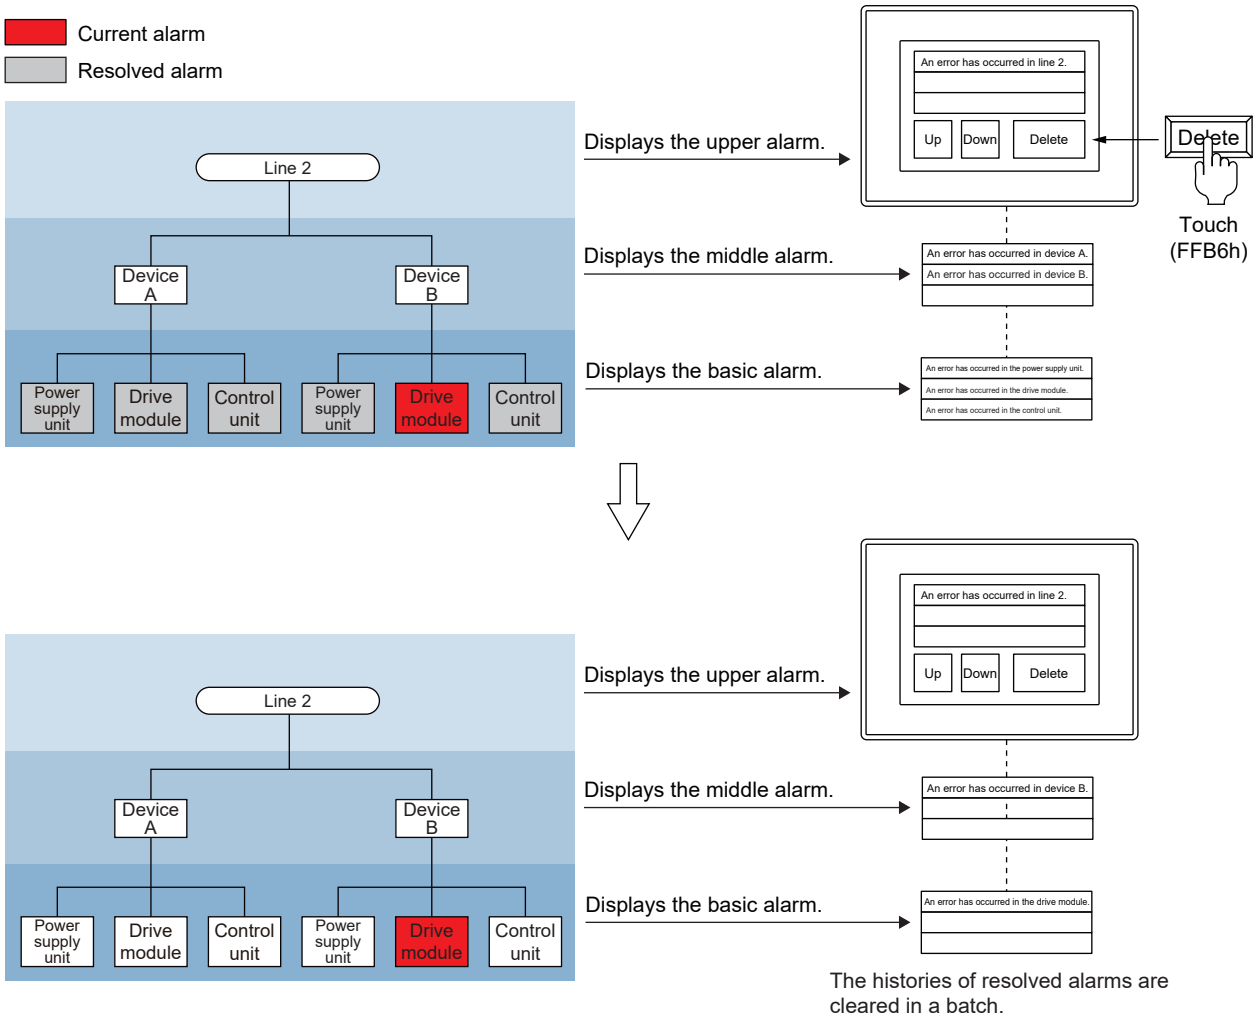
■Operation that can be executed to multiple alarms in a batch

The following operations can be executed in a batch for multiple alarms at lower hierarchy levels.

Operation	Description
Check	Records the date and time when an alarm occurrence has been confirmed.
Deleting a project	Deletes the alarm history that has been restored.

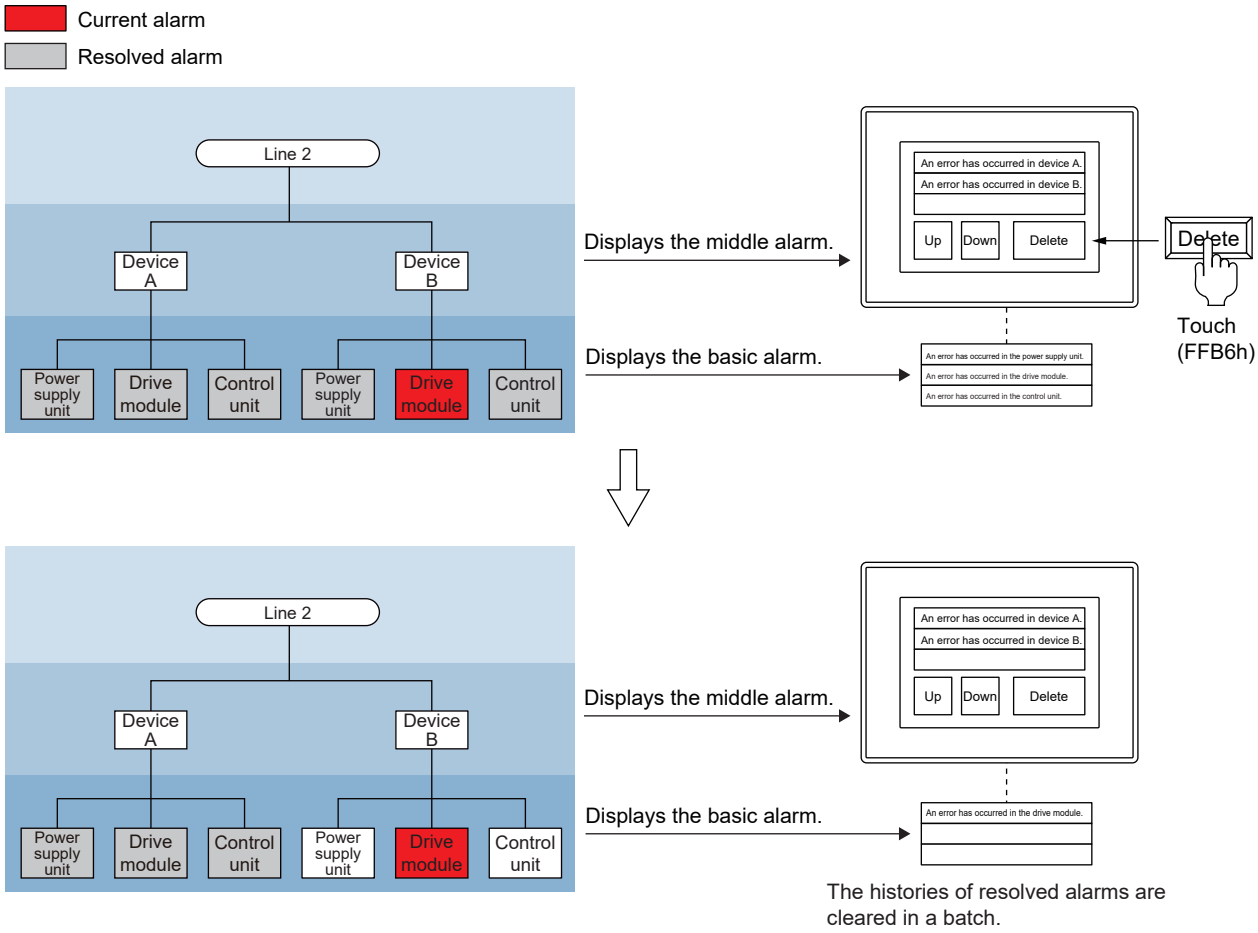
Ex.

Executing the check (FFB4h) or the deletion (FFB6h) in the upper-level alarms executes the same operation for the middle-level alarms and the basic alarms under the upper-level alarms.



Ex.

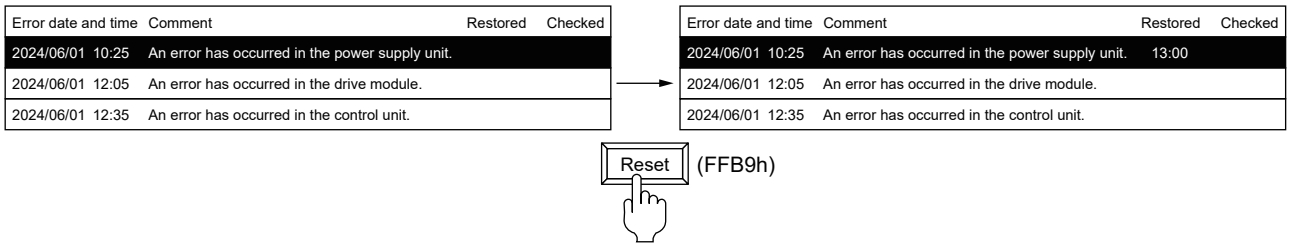
Executing the check (FFB4h) or the deletion (FFB6h) in the middle-level alarms executes the same operation for the basic alarms under the middle-level alarms.



■Operation that cannot be executed to multiple alarms in a batch

The operation to eliminate alarms (turning on to off or entering the reset value) manually by the reset (FFB9h) cannot be executed to multiple alarms in a batch.

Execute the resetting in the basic alarm display.



Execute the reset operation for each alarm.

Detail display destination

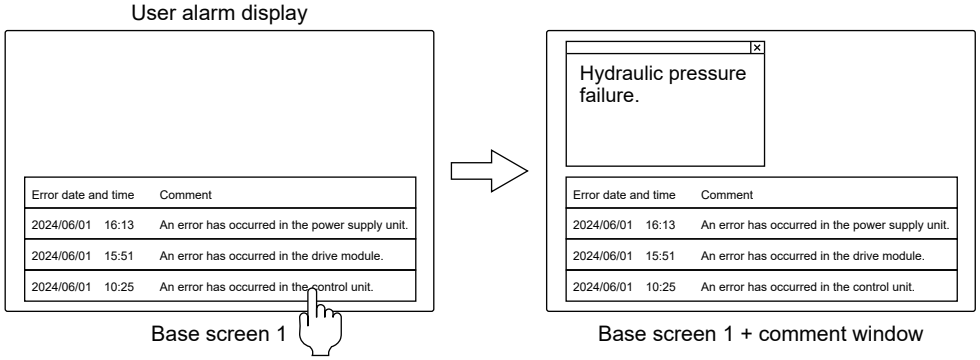
In the basic alarm, the detailed information such as the cause or measure of the alarm in the comment window, the base screen, and the window screen.

☞ Page 2062 Comment window
☞ Page 2063 Base screen
☞ Page 2063 Window screen

■Comment window

Displays a comment a user registers.

In the comment window, more detailed comments such as the measures for alarms are displayed.

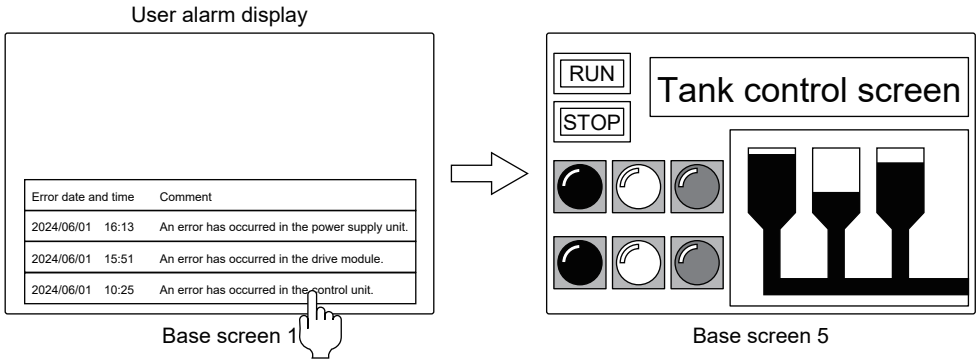


The following table lists the specifications of the comment window.

Item	Specifications
Number of characters that can be displayed in a comment window	Up to 418 one-byte characters (11 lines of 38 characters) are displayed. Up to 209 two-byte characters (11 lines of 19 characters) are displayed.
Display position of the comment window	A comment window is displayed on the base screen. The window can be moved and closed in the same way that operates window screens.
Display of comments	Text size is fixed to one time high and one time wide. Regardless of the settings made when comments are registered, a blink and HQ characters are not displayed.
Display of comment rows	From the top left of the comment window, the registered comments are displayed. When a comment is longer than the display range of the comment window, the comment is wrapped around to be displayed. To display the comment in the center of the comment window, adjust the position of the comment by inserting line feeds.

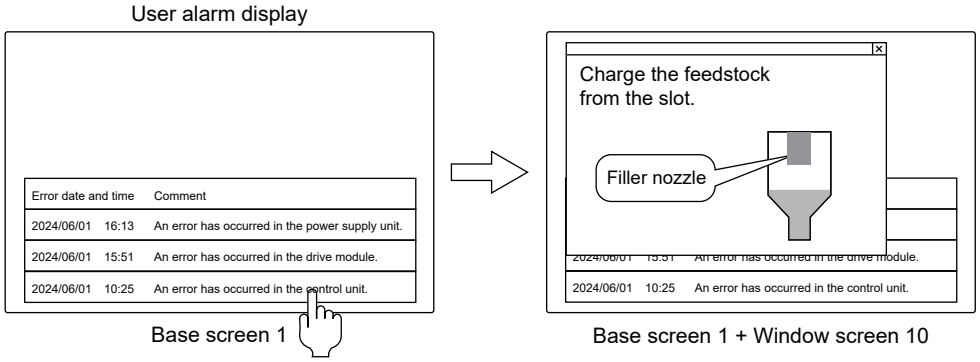
■Base screen

Displays the specified base screen.



■Window screen

Displays the specified window screen (overlap window 1).



Narrowing the display by level or group

Categorizing alarms by level or group in advance allows you to narrow the alarms to be displayed.

To narrow the alarms to be displayed, set the switching device for the following alarm display functions.

Function	Reference for setting
Alarm popup display	☞ Page 2124 [Extended] tab
Alarm display (user)	☞ Page 2155 [Extended] tab

When a value is stored in the device for switching the level or group, only the alarms categorized in the same level or group are displayed.

Displaying alarms in chronological order.

Error date and time	Comment	Level	Group
2024/06/01 16:51	Hydraulic pressure failure	1	1
2024/06/01 14:25	Cooling water hydraulic pressure drop	2	1
2024/06/01 12:25	Supply oil	1	2
2024/06/01 09:40	The amount of the remaining feedstock is low.	1	2
2024/06/01 07:35	Supply fuel	2	2

Level switching device (D32) 0

Group switching device (D33) 0

Only the alarms in level 1 are displayed.

Error date and time	Comment	Level	Group
2024/06/01 16:51	Hydraulic pressure failure	1	1
2024/06/01 12:25	Supply oil	1	2
2024/06/01 09:40	The amount of the remaining feedstock is low.	1	2

Level switching device (D32) 1

Group switching device (D33) 0

Only the alarms in group 2 are displayed.

Error date and time	Comment	Level	Group
2024/06/01 12:25	Supply oil	1	2
2024/06/01 09:40	The amount of the remaining feedstock is low.	1	2

Level switching device (D32) 1

Group switching device (D33) 2

Log collection and embedding display in the comment

☞ Page 2065 Format specifier
☞ Page 2067 Communication specifications of log collection

In the user alarm monitoring, the value of the log collection device is collected when an alarm is detected, and displayed by embedding it in the comment.

Set the log collection device separately from the device to be monitored for alarm detection.

Configure the log collection settings in the alarm setting list in the [Device] tab.

☞ Page 2055 Details of the alarm setting list

Ex.

Display the temperature as the log on occurrence when a temperature anomaly alarm event is detected.

■Format specifier

To embed the value of the log collection device, describe the following format specifier in the comment.

Format specifier	Comment description example
%{Output order}[Flag][Field width][.Precision][Type specifier]	Format specifier Temperature: %{1}-5.1d℃ Type specifier .Precision Field width Flag {Output order}

Always describe % and [Type specifier].

The following shows each element of the format specifier.

Item	Description
Output order	Specify which device (nth device) of the set collection devices is the output target. Enclose the value to be set in { }. Regardless of the data type, each device is counted as one in the output order. Example) When [Data Type] is [Signed BIN64] and [Points] is [3] Although D20 is the 9th device, its output order is 3rd.  Multiple collection devices can be described in a comment. When the output order is not specified, the log collection devices are output in the order described in the comment. For parts where the output order is specified, the device with the specified output order is output. Example) When the following five devices are set as log collection devices • 1st: D0 • 2nd: D1 • 3rd: D2 • 4th: D3 • 5th: D4 The following shows the relationship between the format specifier and the device to be output. Output order not specified %d %d %d %d %d 5th: D4 4th: D3 3rd: D2 2nd: D1 1st: D0 Output order specified %{5}d %d %d %d %d 5th: D4 4th: D3 3rd: D2 2nd: D1 5th: D4

Item	Description	
Flag	-	Left-aligns the output value when a field width is specified.
	+	Adds a sign before the numerical value to be output.
	Space	Adds a space before the positive value to be output instead of the + sign. Use this item to match the digits of positive values to those of negative values with the - signs.
	0	Pads spaces in the output value with zero when a field width is specified.
	#	Adds [0] (zero), [0x], or [0X] as a prefix when an octal or hexadecimal value (o, x, or X) is output. Adds the decimal point without fail when a real number (f, e, E, g, or G) is output. For g and G, unnecessary zeros after the decimal point are output in addition to the above.
Field width	Specify the number of characters to be displayed. The setting range is [0] to [32].	
Precision	Set the number of decimal points or the number of significant digits. The setting range is [0] to [30].	
Type specifier	c	Outputs a single character.
	s	Outputs character strings.
	d	Outputs integers in decimal numbers.
	lld	Outputs 64-bit integers in decimal numbers.
	u	Outputs unsigned integers in decimal numbers.
	llu	Outputs 64-bit unsigned integers in decimal numbers.
	o	Outputs integers in octal numbers.
	x X	Outputs integers in hexadecimal numbers. When the type specifier is X, alphabets are output in uppercase.
	llx llX	Outputs 64-bit integers in hexadecimal numbers. When the type specifier is X, alphabets are output in uppercase.
	f	Outputs real numbers. Double-precision real numbers are supported.
	e E	Outputs real numbers in scientific notation. When the type specifier is E, alphabets are output in uppercase. Example 1) For %e, "1.2345e-001" Example 2) For %E, "1.2345E-001" The exponents are displayed with three digits. Double-precision real numbers are supported.
	g G	Outputs real numbers in an optimal form. When the type specifier is G, alphabets are output in uppercase. Values are output in exponents when the exponent is smaller than -4 or equal to or larger than the precision, and they are output in real numbers in other cases. Zeros at the end of the fractional portion are eliminated. Double-precision real numbers are supported.
	%%	Outputs the character "%". (Specifying the corresponding device is not required.)
	T	Outputs a decimal point in the digit specified by the precision for integers.
	llT	Outputs a decimal point in the digit specified by the precision for 64-bit integers.
	K	Outputs a decimal point in the digit specified by the precision for unsigned integers.
	llK	Outputs a decimal point in the digit specified by the precision for 64-bit unsigned integers.

■Examples of describing format specifiers with comments

The following table lists examples of describing format specifiers with comments and the display of the collected logs.

Comment description example	Log collection device and collected value		Display of the collected log
Temperature: %{1}-4.1d°C	Number of log collection devices: 1 GD1000: 123		Temperature: 123°C
Remaining amount: %{2}04.0d/%{1}04.0d L	Number of log collection devices: 2		Remaining amount: 80/950 L
	1st device	GD2000: 950	
	2nd device	GD2001: 80	
Progress rate: %{1}05.2f%	Number of log collection devices: 1 GD3000: 35.70		Progress rate: 35.70%

■Communication specifications of log collection

Item	Specifications
When obtaining the value of the log collection device failed	No retry will be performed. In the format specifier field, "-" (hyphen) is displayed.
When the specified cycle ends before the collection of the device value is completed	Alarm monitoring is restarted after the collection of the device value is completed. If the alarm [Watch Cycle] is short, it may not be possible to collect alarms according to the specified cycle.

Precautions

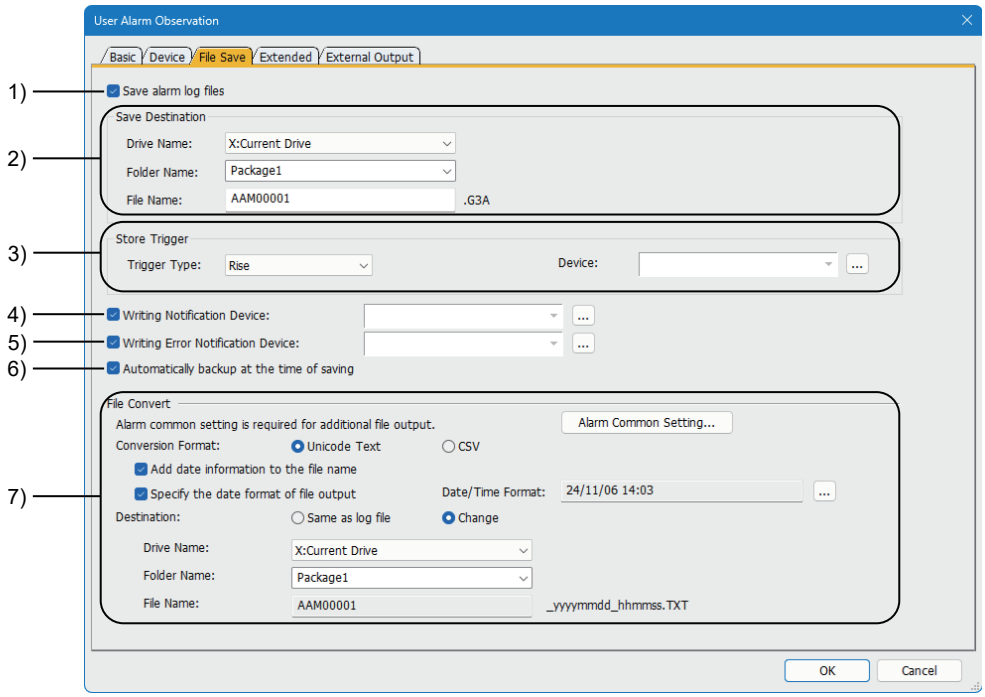
When a comment including a format specifier is displayed on the alarm display (user) or output to the alarm log file, the output string consists of up to 1024 characters.

The 1025th and subsequent characters are not output.

60.8.3 [File Save] tab

GT37 SoftGOT3000

Set the following items to save the alarm histories stored in the buffering area in the data storage.



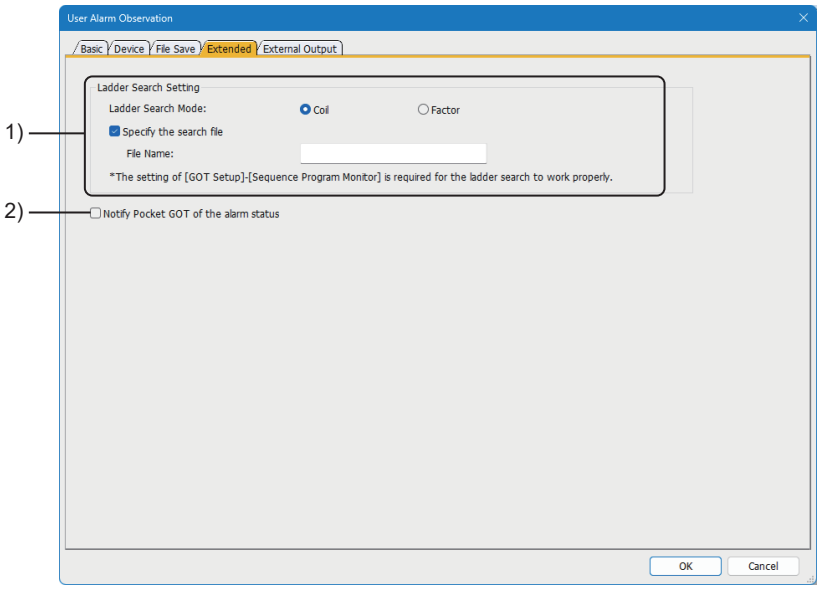
Item			Description
1)	[Save alarm log files]		Writes the history of user alarms stored in the buffering area to the data storage as an alarm log file when [Historical] or [Cumulative] is selected for [Collection Mode] on the [Basic] tab. Into data storage, the log file is written as a binary file (*.G3A).
2)	[Save Destination]	[Drive Name]	Select a destination drive. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
		[Folder Name]	Set the folder name of the destination to save a file. The default is set to the folder name that is specified with [Package Folder Name] in the [Type Setting] dialog. Alphanumeric characters and following symbols are available for the folder name. #$%&'()+-.=@[]^_{}~\ For the restrictions on the folder name used in the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
		[File Name]	Set the file name of the destination to save a file. As the default, AAM***** is set for the file name. (* indicates alarm IDs.) Alphanumeric characters and following symbols are available for the file name. #$%&'()+-.=@[]^_{}~ For the restrictions of the file name used in the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
3)	[Store Trigger]	[Trigger Type]	Select the timing when the user alarm stored in the buffering area is stored to the data storage. When setting [Sampling], [ON Sampling], or [OFF Sampling], set a cycle. The setting range is [1] minute to [1440] minutes.
		[Device]	Set a device used as a store trigger. ☞ Page 834 How to set devices, labels, and tags
4)	[Writing Notification Device]		Set a device which notifies that the alarm log file is in the process of being written. ☞ Page 834 How to set devices, labels, and tags
5)	[Writing Error Notification Device]		Set a device which notifies an error when alarm log file writing fails. ☞ Page 834 How to set devices, labels, and tags
6)	[Automatically backup at the time of saving]		Saves the alarm log file created immediately before it is saved as a backup file (*.BAK). If the name of the alarm log file is AAM00001.G3A, the name of the backup file is AAM00001.bak. The stored backup file is not displayed in the utility of the GOT.

Item			Description
7)	[File Convert]	—	Set the following items to convert files. To use file conversion, the setting of [Alarm Common Setting] is required. Click the [Alarm Common Setting] button and set the [Alarm Common Setting] dialog.
		[Conversion Format]	Set the file format applied after the conversion.
		[Add date information to the file name]	Date information is added to the name of the alarm log file.
		[Specify the date format of file output]	Click the [...] button, and set the date/time formats in the [Date/Time Setting] dialog. ☞ Page 3684 [Date/Time Setting] dialog (screen)
		[Destination]	Select the save destination folder for a converted file. When you select [Change], set [Drive Name] and [Folder Name]. The setting method is the same as that of [Destination] for the alarm log file. [File Name] is the same as that of the alarm log file. The file is saved as (*.TXT) if the conversion format is [Unicode Text] and (*.CSV) if [CSV].

60.8.4 [Extended] tab

GT37 SoftGOT3000

Select whether to notify alarms to Pocket GOT.

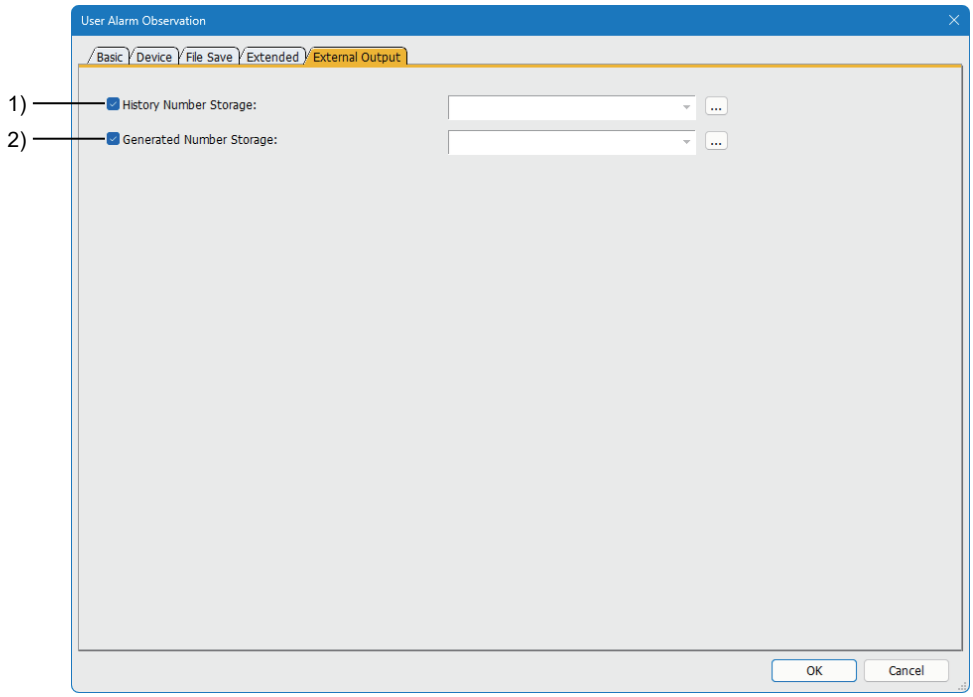


Item			Description
1)	[Ladder Search Setting]	[Ladder Search Mode]	Select a ladder searching method.
		[Specify the search file]	Select this item to specify the name of the program file to be searched for. A file whose name is up to 60 characters long can be searched for. A file whose name includes both two-byte and one-byte characters can also be searched for. A file whose name includes one-byte spaces or any symbol below cannot be searched for. (" \ / ; : ? < > ¦ + = [ ] . ,)
2)	[Notify Pocket GOT of the alarm status]		When a user alarm occurs, it is notified to Pocket GOT. When this item is selected in the user alarm monitoring setting, notification is enabled for the alarm ID. In one project, notification is available for up to 40 alarm IDs in ascending order. Notification will not be issued for alarm IDs 41 and later. Up to five latest alarms in the history are notified in one alarm ID. When you select this item, configure the settings in Pocket GOT to obtain alarm information. For details, refer to the following manual. 📖Pocket GOT Mobile App Operating Manual

60.8.5 [External Output] tab

GT37 SoftGOT3000

Set the following items to save the number of user alarms and the occurrences.



Item		Description
1)	[History Number Storage]	Select this item to store the number of the user alarm histories in the word device. All the errors in the status of "Occurred", "Checked", and "Restored" are included in the number of the histories to be stored. ☞ Page 834 How to set devices, labels, and tags
2)	[Generated Number Storage]	Select this item to store the number of user alarms that are currently occurring in the word device. ☞ Page 834 How to set devices, labels, and tags

60.9 [Alarm File Conversion] dialog

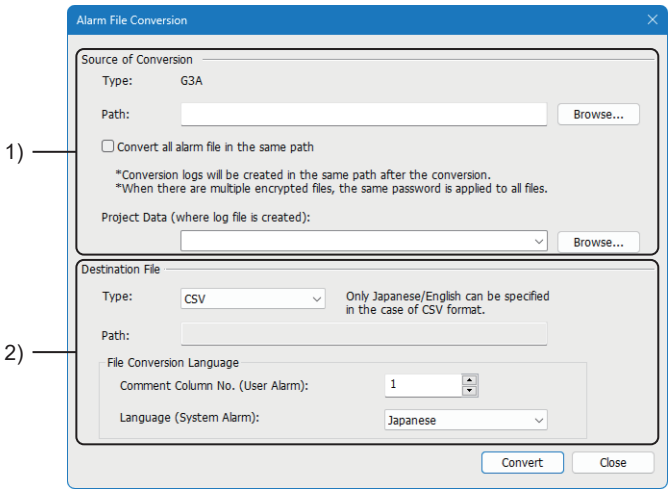
GT37 SoftGOT3000

The file format of the alarm log file is converted.

Select [Tools] → [Resource Data Conversion] → [Alarm File] from the menu to display the following dialog.

When the information protection function is enabled, a dialog to enter a password is displayed during file conversion.

☞ Page 3065 Protecting the files in the GOT (Information protection function)



Item				Description
1)	[Source of Conversion]	[Type]		The conversion source file type.
		[Path]		Specify a path of the conversion source file.
		[Convert all alarm file in the same path]		Select this item to set all binary files (*.G3A) on the same path to the conversion target. A conversion log is created to a destination with the set path automatically. You can check the full path of the converted files, the conversion results or the creation date of files with the conversion log.
		[Project Data (where log file is created)]		Select the project data used for generating the alarm log file for the conversion. If project security is set for the selected project data, user authentication is performed. ☞ Page 2972 Protecting a project by registering users (Project security)
2)	[Destination File]	[Type]		Select a file type of a file to be created after the conversion.
		[Path]		A path for a destination where a destination file is saved. The same path as the one of the conversion source file is displayed.
		[File Conversion Language]	[Comment Column No. (User Alarm)]	Select the comment column No. when the conversion source file is a user alarm.
			[Language (System Alarm)]	Select the language when the conversion source file is a system alarm.

60.10 Relevant settings

GT37 SoftGOT3000

Set the relevant settings other than the specific settings for the user alarm monitoring as required.
The following shows the functions that are available by configuring the relevant settings.

60.10.1 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Notifying the status of the access to the drive*1	[System Signal 2-2] System signal 2-2.b0, b1
Notifying that the free space in the drive is insufficient*1	[System Signal 2-2] System signal 2-2.b4, b5
Notifying the failure of the access to the drive*1	[System Signal 2-2] System signal 2-2.b7, b8
Turning off the Key Input signal	[System Signal 1-1] System signal 1-1.b3
Disabling all the key inputs	[System Signal 1-1] System signal 1-1.b9
Notifying the key codes set to the input keys when the keys are input to ASCII input, touch switch, or other objects.	[Key Code Input]
Notifying a key input	[System Signal 2-1] System signal 2-1.b3

*1 A signal which notifies the full during the access exists in the user alarm monitoring. The signal differs from that of the Drive status notification signal.
For details, refer to the following.
☞ Page 2073 Differences between the notification devices used for the user alarm monitoring and the system information

Differences between the notification devices used for the user alarm monitoring and the system information

The following shows the differences between the notification devices.

Notification details	Difference between the notification devices	
	User alarm monitoring	System information
Drive full notification	Notification device: Full Notification Signal Device Turns on when the number of log files reaches [Stored Number] set in the [Basic] tab.	Notification device: System signal 2-2.b4, b5 Turns on when the data storage is full.
Writing to drive notification	Notification device: Writing Notification Device Turns on while the user alarm is being written to the data storage.	Notification device: System signal 2-2.b0, b1 Turns on while any data is being written to the data storage.
Writing to drive error notification	Notification device: Writing Error Notification Device Notifies that an error has occurred due to any of the following causes. • The alarm log file in the data storage is not created in the project in the GOT. • No data storage is installed. • The SD card cover is open.	Notification device: System signal 2-2.b7, b8 Notifies that an error has occurred due to any of the following causes. • No data storage is installed. • The SD card cover is open.

60.10.2 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Saving the data in the buffering area to data storage*1	GS520.b0
Changing the character code to Unicode when a binary file is converted to CSV format	GS522.b2

*1 Only when [Save alarm log files] is selected in the [File Save] tab of the [User Alarm Observation], the data is saved. When [Save alarm log files] is not selected, the user alarm is not saved.
☞ Page 2068 [File Save] tab

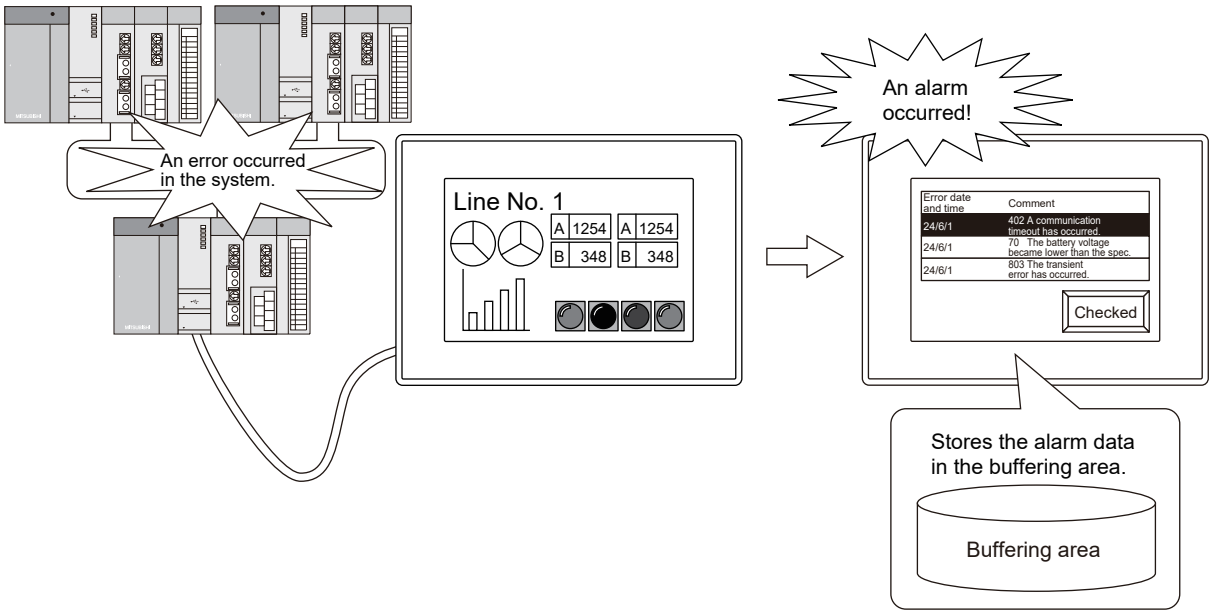
61 Collecting alarms by monitoring the system

GT37 SoftGOT3000

☞ Page 2076 Overview of system alarm monitoring
☞ Page 2077 Specifications of the system alarm monitoring
☞ Page 2084 Procedure for setting the system alarm monitoring
☞ Page 2085 Recovery from alarms
☞ Page 2088 Deleting alarm data
☞ Page 2089 Power failure backup by storing the user alarm
☞ Page 2093 Converting alarm log files
☞ Page 2097 [System Alarm Observation] dialog
☞ Page 2103 Relevant settings

61.1 Overview of system alarm monitoring

The system alarm monitoring logs errors occurred in the GOT, controller, or network as system alarm events in the GOT built-in memory.



This chapter describes the system alarm monitoring, which collects and stores alarms held by the system.
To display the collected alarms on the screen of the GOT, configure the settings for the alarm display (system) or the alarm popup display in addition to the settings for the system alarm monitoring.

☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])
☞ Page 2075 Collecting alarms by monitoring the system

61.2 Specifications of the system alarm monitoring

GT37 SoftGOT3000

☞ Page 2077 Target for the system alarm monitoring
☞ Page 2078 Alarm collecting procedure and alarm history collecting method
☞ Page 2083 Size and notification of the buffering area

61.2.1 Target for the system alarm monitoring

The following items can be monitored by the system alarm monitoring.

Monitoring target	Description
CPU error	Indicates an error of a controller.
GOT error	Indicates an error of the GOT. A GOT Mobile error, which occurs on a GOT Mobile function client, is categorized as a GOT error.
Network error	Indicates an error of the communication unit mounted on the GOT.

Set the type of system alarm to be monitored in the [System Alarm Observation] dialog.

☞ Page 2097 [System Alarm Observation] dialog

Precautions

■Controllers for which system alarms are not displayed on the GOT

The CPU errors which occur in the following controllers cannot be displayed on the GOT system alarm display (system). Check the errors with the software for the controllers.

- SIEMENS PLC CPU
- Inverter

61.2.2 Alarm collecting procedure and alarm history collecting method

☞ Page 2078 Alarm collecting procedure
☞ Page 2079 Alarm history collecting method and information to be collected
☞ Page 2081 Example of displaying alarms for each history collecting method

Alarm collecting procedure

The speed at which alarms are collected depends on the target.

Monitoring target	Description
CPU error Network error	CPU errors and network errors are collected in 3-second cycles in the buffering area in the user area of the GOT, regardless of the screen being displayed. The buffering area stores the collected system alarms as histories temporarily, and displays them on the GOT as alarms. GOT error	GOT errors are collected in the buffering area in the user area when alarms occur.

For information on how to delete the data in the buffering area, refer to the following.

☞ Page 2088 Deleting alarm data

The data to be stored in the buffering area of the user area differs depending on the history collecting method.

Alarm history collecting method and information to be collected

The following shows the alarm history collecting method.

Alarm history collecting method	Description
Historical mode	Collects the history of alarm occurrences. An event is added to the history every time an alarm occurs.
Current alarm only	Collects the alarms that are currently occurring only. The history of system alarms that have been restored is not stored.

For information on the setting of the alarm history collecting method, refer to the following.

☞ Page 2098 [Basic] tab

Depending on the collecting method, the types of information collected differs.

Ex.

Alarm display (system)

Error date and time	Comment	Alarm status	Restored	Checked
24/06/01 20:00	402 A communication timeout. Confirm communicat	-	-	-
24/06/01 18:30	70 Battery voltage low or equipment fault	Checked	-	18:50
24/06/01 16:10	803 Transient error	Checked	16:30	16:20
1)	2)	3)	4)	5)

○: Collected

—: Not collected

Displayed information		[Collection Mode] setting		Description
		[Historical]	[Only current alarm]	
1)	Error date and time	○	○	Displays the date and time when an alarm occurred.
2)	Message	○	○	Displays an error code and message when an alarm occurs. For error codes and the corrective actions, refer to the following. GOT3000 Series User's Manual (Utility & Maintenance Functions) Messages registered in the GOT beforehand are displayed as alarm messages. When the collection of detailed information is enabled, information for channels and other items in addition to error codes and error messages is displayed. ☞ Page 2080 Collecting detailed information
3)	Alarm status	○	○	Displays the alarm status that is currently displayed. • Occurred: The alarm has occurred. (The occurrence of the alarm has not been checked.) • Checked: The occurrence of the alarm has been checked. • Restored: The monitor target already recovered from the alarm.
4)	Restored date and time	○	—	Displays the date and time when an alarm is restored.
5)	Checked date and time	○	○	Displays the date and time of when the occurrence of an alarm was checked. Check the occurrence of the alarm with a touch switch for the alarm check. ☞ Page 2141 Key code switches for operating alarm displays 
■Collecting detailed information

Information to specify the point of alarm occurrence can be added to the information collected for the system alarm.

To add information, select [Get detailed alarm information] in the [System Alarm Observation] dialog ([Basic] tab).

☞ Page 2098 [Basic] tab

The following shows whether the data is collected depending on the setting.

○: Collected

—: Not collected

Information to be collected	[Get detailed alarm information] setting		Remarks
	Deselected	Selected	
Error code	○	○	—
Error date and time			—
Restored date and time			—
Checked date and time			—
Channel	—	○	—
Network No.			—
Station No.			—
CPU No.			—
Device			—
Screen No.			—
Definition screen No.			Screen number on which an object having an error is actually placed when the set overlay screen function is used.
Object ID			—
Function name			—
Drive name			—
MAC address			MAC address of the controller found to have a duplicate IP address. Collected when system alarm 425 occurs.

The information collected for each alarm differs. Unrelated and undetectable information is not collected.

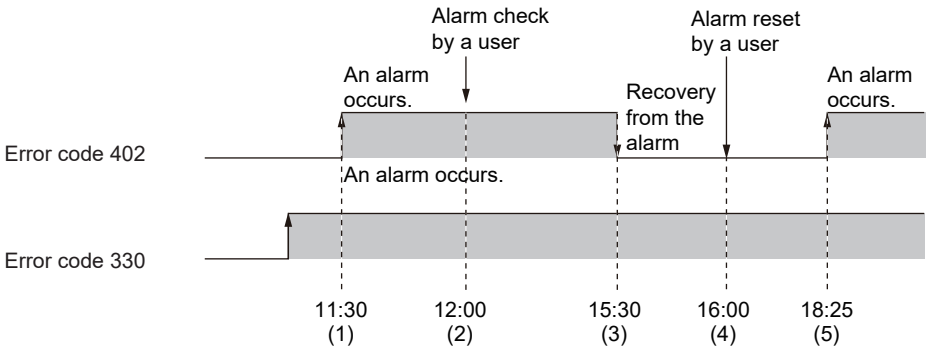
Even if system alarms with the same error code occur, they will be treated as different system alarms with different causes if the channels or other factors are different.

Example of displaying alarms for each history collecting method

The following shows the examples for displaying alarms with the alarm display (system) for each alarm collecting method.
To display the collected alarms, use the alarm display (system) of the object.

Ex.

Error codes 402 and 330 occurred.



☞ Page 2081 Example of displaying historical mode
☞ Page 2082 Example of only displaying occurred alarms

■Example of displaying historical mode

Collects the history of alarm occurrences.

An event is added to the history every time an alarm occurs.

(1) Occurrence of a communication timeout

Error date and time	Comment	Alarm status	Restored	Checked
24/06/01 11:30	402 Communication timeout. Confirm communic	Occurred		
24/06/01 10:25	330 Insufficient memory media capacity. Confirm drive capacity.	Occurred		

← A communication timeout has occurred.

(2) Communication timeout check

Error date and time	Comment	Alarm status	Restored	Checked
24/06/01 11:30	402 Communication timeout. Confirm communic	Checked		12:00
24/06/01 10:25	330 Insufficient memory media capacity. Confirm drive capacity.	Occurred		

← The communication timeout error has already been checked.

Checked

Key code: FFB4h

(3) Communication timeout restoration

Error date and time	Comment	Alarm status	Restored	Checked
24/06/01 11:30	402 Communication timeout. Confirm communic	Checked		~~12:00~~
24/06/01 10:25	330 Insufficient memory media capacity. Confirm drive capacity.	Occurred		

← The alarm status of the GOT does not turn "Restored".

(4) Alarm reset

Error date and time	Comment	Alarm status	Restored	Checked
24/06/01 11:30	402 Communication timeout. Confirm communic	Checked	16:00	~~12:00~~
24/06/01 10:25	330 Insufficient memory media capacity. Confirm drive capacity.	Occurred		

← The alarm was reset.

Reset

Key code: FFB4h

The alarm status of the GOT turns "Restored" and the recovery time is displayed.

(5) The communication timeout occurs again after the restoration

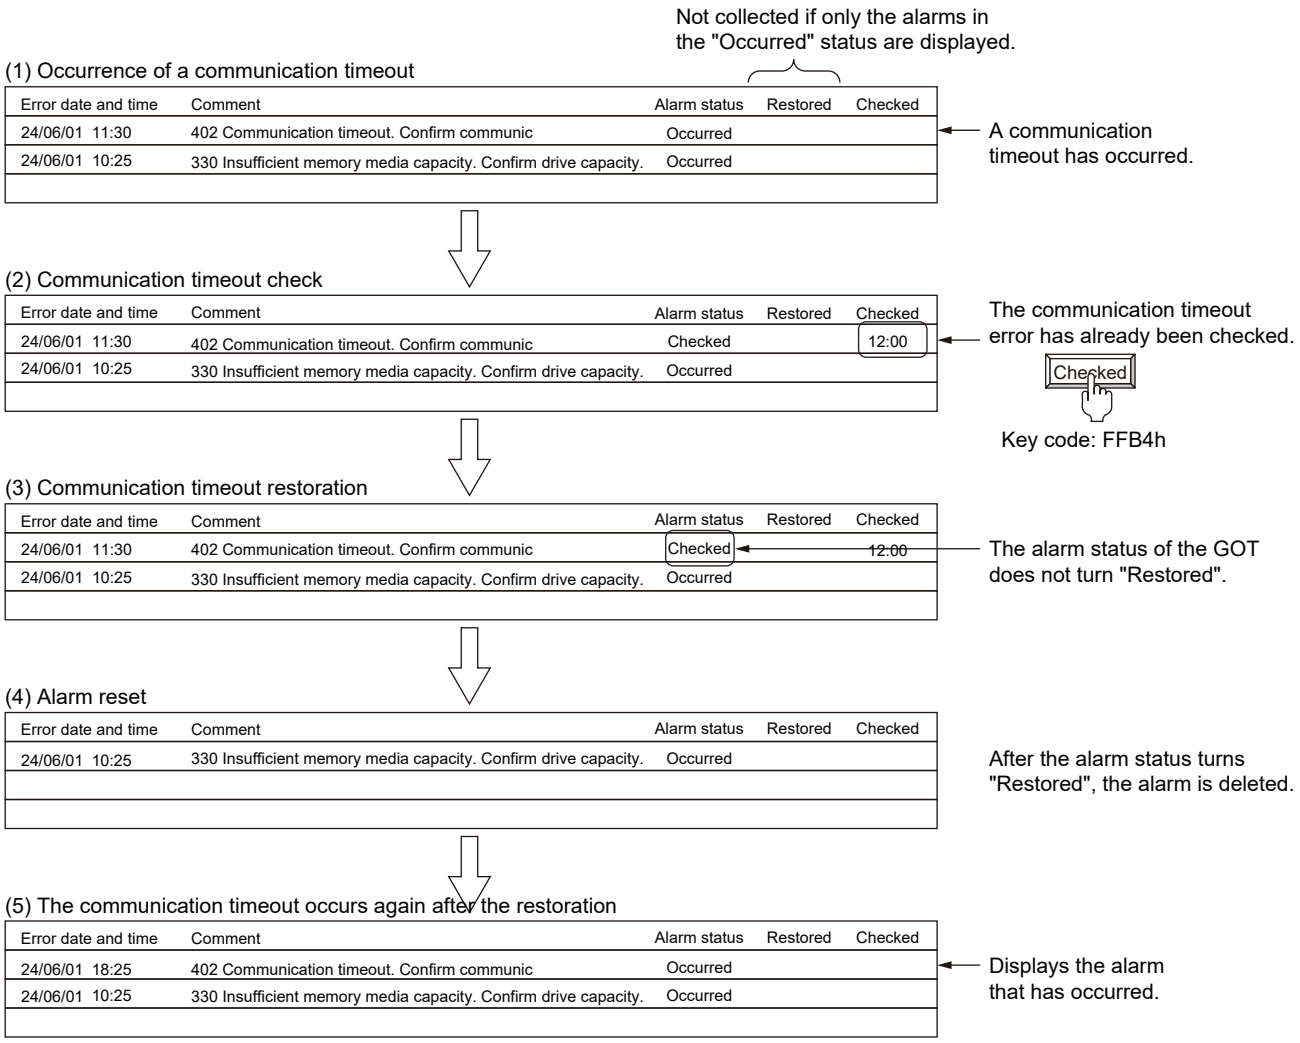
Error date and time	Comment	Alarm status	Restored	Checked
24/06/01 18:25	402 Communication timeout. Confirm communic	Occurred		
24/06/01 11:30	402 Communication timeout. Confirm communic	Checked	16:00	12:00
24/06/01 10:25	330 Insufficient memory media capacity. Confirm drive capacity.	Occurred		

← Displays the alarm in a new row added.

■Example of only displaying occurred alarms

Only the latest GOT error, CPU error, and network error are collected.

The histories of the alarms that have been recovered are not stored.



61.2.3 Size and notification of the buffering area

Size of the buffering area used

The size of the buffering area to be used for the system alarm monitoring varies depending on the setting.

The buffering area is reserved in the user area in the operation memory (RAM).

Because the user area in the operation memory (RAM) is used by multiple functions, adjust the size of the buffering area so that it does not exceed the upper limit.

The size of the buffering area required for the set system alarm monitoring can be checked in the [Basic] tab of the [System Alarm Observation] dialog.

☞ Page 2098 [Basic] tab

For information on the operation memory (RAM), refer to the following.

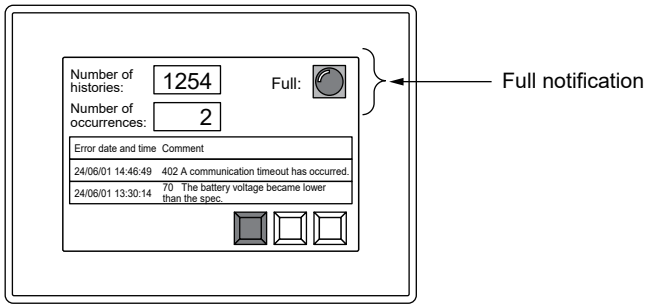
☞ Page 415 Transferred data and GOT storage destination

Operation when the buffering area is full

When the number of alarms temporarily stored in the buffering area reaches [Stored Number] set in the [Basic] tab of the [System Alarm Observation] dialog, the area becomes full.

Select the operation when the buffering area is full in [Action When Buffer is Full] in the [System Alarm Observation] dialog ([Basic] tab).

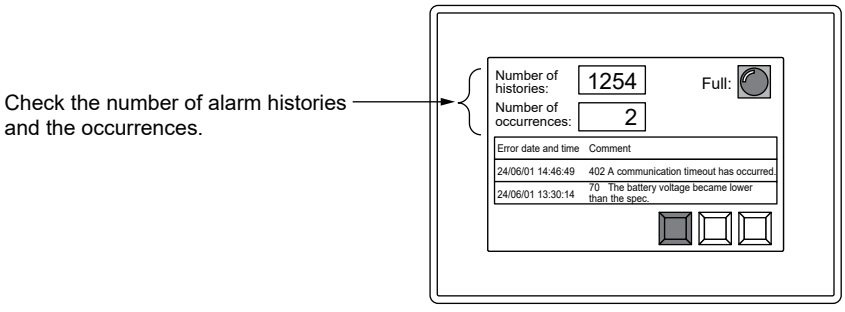
To execute the notification before the buffer area becomes full, set [Full Notification Signal Device] in the [System Alarm Observation] dialog ([Basic] tab).



Confirming the number of the alarm histories and the alarms

The number of histories and the number of occurrences temporarily stored in the buffering area are stored in the devices for output set in the [System Alarm Observation] dialog ([External Output] tab).

☞ Page 2102 [External Output] tab



61.3 Procedure for setting the system alarm monitoring

GT37 SoftGOT3000

1. Select [Common] → [Alarm] → [System Alarm Observation] from the menu to display the [System Alarm Observation] dialog.

☞ Page 2097 [System Alarm Observation] dialog

2. In the [Basic] tab, select [Use System Alarm].

3. Configure necessary settings in each tab in the [System Alarm observation] dialog, and click the [OK] button to complete the system alarm monitoring setting.

Tab	Description
[Basic] tab	Configure the settings related to the errors to be monitored, the history collecting method, and the buffering area. ☞ Page 2098 [Basic] tab
[File Save] tab	Set a trigger for storing the alarm log file, storage destination, file conversion using a device, and others. ☞ Page 2101 [File Save] tab
[External Output] tab	Configure the settings to store the history of system alarms and the number of occurrences in the device. ☞ Page 2102 [External Output] tab

61.4 Recovery from alarms

GT37 SoftGOT3000

The following shows the procedure to change the alarm status of each error to "Restored".

☞ Page 2085 CPU errors
☞ Page 2085 Network errors
☞ Page 2086 GOT errors

61.4.1 CPU errors

Eliminate all the alarm causes of the CPU error.

The alarm status of the system error caused by the CPU error turns "Restored" by eliminating all the alarm causes.

When the multi-channel function is used, the alarm status of all the channels turns "Restored" by eliminating the alarm causes of all the channels.

61.4.2 Network errors

Eliminate all the alarm causes of the network error.

The alarm status of the system error caused by the network error turns "Restored" by eliminating all the alarm causes.

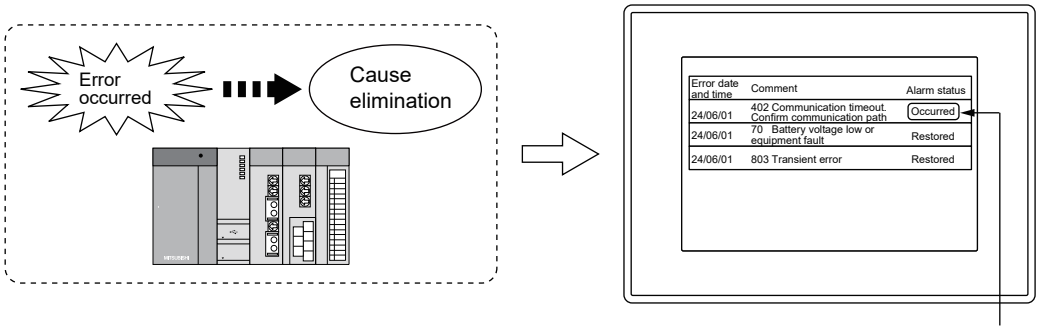
Precautions

The alarm status of network errors that occur in the CC-Link communication unit does not turn "Restored" even if the cause of the alarms is eliminated until the GOT is powered off or reset.

61.4.3 GOT errors

Eliminate all the alarm causes of the GOT error.

The alarm status of GOT errors does not turn "Restored" automatically even after the alarm causes are eliminated.



Eliminate the cause of the alarm of the GOT, a controller, or a network.

The alarm status of the GOT error remains "Occurred" even if the cause of the alarm is eliminated.

To change the status to "Restored", perform one of the following operations.

Operation	Description
Changing the alarm status of the selected error to "Restored"	Change the alarm status of the selected error to "Restored" using a touch switch. ☞ Page 2141 Key code switches for operating alarm displays Changing the alarm status of all the GOT errors to "Restored" using the system information	Change the alarm status of all the GOT errors to "Restored" by turning on the GOT Error Reset signal (System signal 1-1.b13). ☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information]) Changing the alarm status of all the GOT errors to "Restored" using the utility	Change the alarm status of all the GOT errors from "Occurred" to "Restored" using the alarm display (system) of the utility. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

Precautions

If the alarm status is changed from "Occurred" to "Restored" while the alarm cause of the GOT error has not been resolved, the same alarm will occur again.

Ex.

When the alarm of error code 460 occurs and the alarm is reset before the cause is eliminated

Error date and time	Comment	Alarm status
24/06/01 11:30	803 Transient error	Occurred
24/06/01 10:25	460 Communication unit error	Occurred

Reset

Reset the alarm.
(Turn on the System signal 1-1.b13.)

Error date and time	Comment	Alarm status
24/06/01 11:30	803 Transient error	Occurred
24/06/01 10:25	460 Communication unit error	Restored

The status of the GOT error turns "Restored".

Error date and time	Comment	Alarm status
24/06/01 12:00	460 Communication unit error	Occurred
24/06/01 11:30	803 Transient error	Occurred
24/06/01 10:25	460 Communication unit error	Restored

After the rest, the same alarm occurred again.

The error date and time displayed shows the date and time when the alarm was detected again after the reset.

61.5 Deleting alarm data

GT37 SoftGOT3000

Alarms in the "Restored" status can be deleted from the history.

To delete alarms, change the alarm status from "Occurred" to "Restored".

☞ Page 2085 Recovery from alarms

To delete alarm data, perform one of the following operations.

Operation	Description
Deleting with a device	Turn on [Buffering Data Clear Trigger Device] set in the [Basic] tab of the [System Alarm Observation] dialog to delete all alarm data in the "Restored" status. Deleting with a touch switch	Use a touch switch to delete one or all alarm data items in the "Restored" status. Powering off or resetting the GOT	Power off or reset the GOT to delete alarm data. When the system alarm data is stored in a data storage or the nonvolatile RAM user area, the data is retained even after the GOT is powered off. ☞ Page 2089 Power failure backup by storing the user alarm
Changing the [Controller] setting in the utility	Change the [Controller] setting in [GOT basic set] in the utility to delete all alarm data in the "Restored" status.
Writing/deleting data to/from the GOT	Perform any of the following operations in the [Communicate with GOT] dialog to delete all alarm data in the "Restored" status. • Writing package data • Deleting an item from the drive information • Formatting a drive

61.6 Power failure backup by storing the user alarm

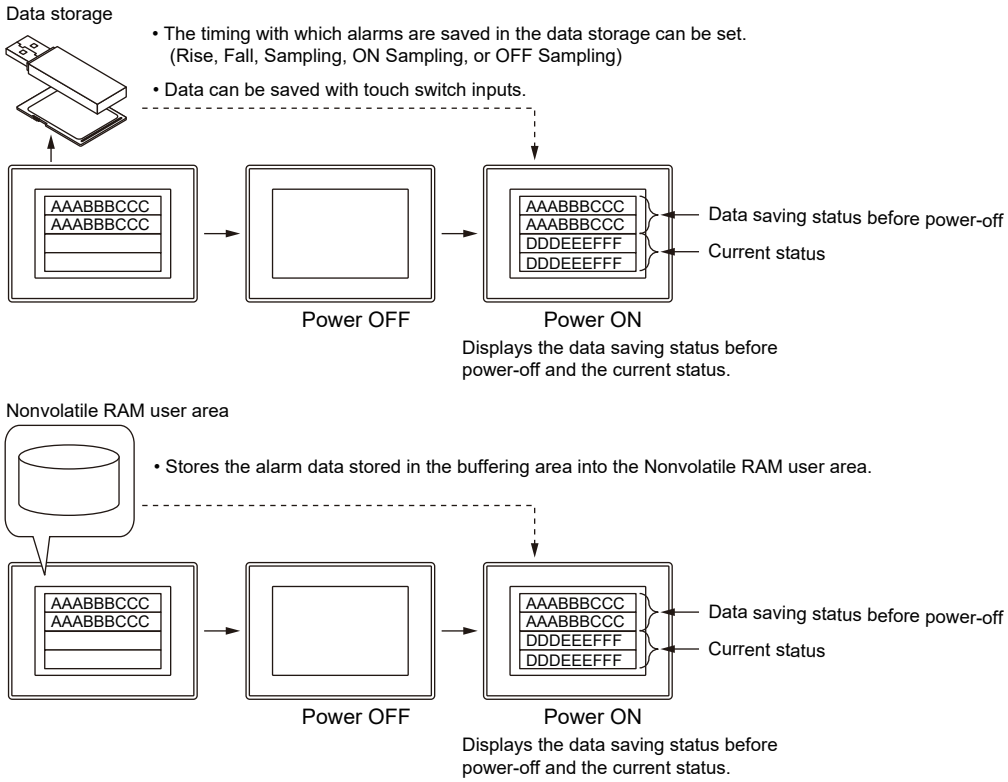
GT37 SoftGOT3000

☞ Page 2089 Overview of the power failure backup
☞ Page 2090 Information to be stored
☞ Page 2090 Power failure backup by using a data storage
☞ Page 2092 Power failure backup by using a nonvolatile RAM

61.6.1 Overview of the power failure backup

Once the system alarm data is stored in a data storage or the nonvolatile RAM user area as the alarm log file, the data is retained even after the GOT is powered off.

When the alarm log file is stored in the data storage or the nonvolatile RAM user area when the GOT is powered on, the alarm log file is read automatically and the system alarm history before the power-off is recovered.



Point

To save the file in the data storage, it is recommended that you format the file before using it to maintain the file access performance.

The number of files to be stored in a folder should be less than 500.

If 500 or more files are stored in a folder, file access performance may be lowered.

Repeated writing or deleting of data may lower access performance, regardless of the number of files.

In such a case, format the data storage.

61.6.2 Information to be stored

The information in the alarm log file to be stored in the data storage or the nonvolatile RAM user area differs depending on the history collecting method.

☞ Page 2079 Alarm history collecting method and information to be collected

61.6.3 Power failure backup by using a data storage

☞ Page 2090 Required setting
☞ Page 2090 Backing up the alarm log file stored in the data storage
☞ Page 2090 Precautions for using a data storage

Required setting

Perform one of the following operations.

Storage method	Reference
Storage by the store trigger device	Configure the setting in the [File Save] tab of the [System Alarm Observation] dialog. Select [Save alarm log files] and set the storage destination for the log file and the storage trigger. ☞ Page 2101 [File Save] tab
Storage by the key code switch (key code: FFBB)	☞ Page 2141 Key code switches for operating alarm displays
Storage by GS520.b0	☞ Page 3647 Buffering And File Access Control (GS520) Because all the data in the buffering area are saved in the data storage, the storage process may take a few minutes to complete. To prevent the monitoring from stopping for a long time, save the data using any other method.

Backing up the alarm log file stored in the data storage

Select [Automatically backup at the time of saving] in the [File Save] tab of the [System Alarm Observation] dialog to store the alarm log file as a backup file when the alarm log file is saved.

Precautions for using a data storage

☞ Page 2090 Precautions for starting the GOT
☞ Page 2091 Precautions for removing an SD card
☞ Page 2091 Storage process
☞ Page 2091 Error occurred during the alarm log file saving
☞ Page 2091 Restoring the alarm histories when powering-off to on the GOT

■Precautions for starting the GOT

When reading and restoring the user alarm from the data storage, install the data storage on the GOT before powering-on the GOT.

After the powering-on the GOT, the data in the data storage cannot be restored.

In addition, when the data storage is installed after the power-on, the user alarm data in the data storage are overwritten when other user alarm data are stored in the data storage.

■Precautions for removing an SD card

When you open the SD card cover, the files are stored automatically.

Before removing the SD card, make sure that the file saving is complete by checking one of the following conditions.

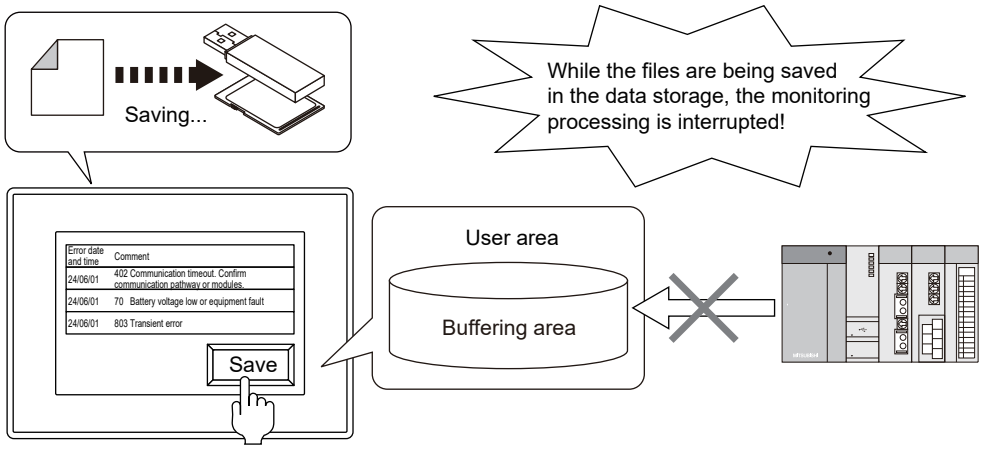
- The Drive Status Notification signal (system signal 2-2.b0, b1) is turned off.
- The SD card access LED is turned off.

Storing may take longer because all the user alarms and system alarms for saving the alarm log files are stored.

■Storage process

While alarm log files are saved in the data storage, the system alarm monitoring processing is interrupted.

System alarms occurred or recovered during the storing are not displayed.



■Error occurred during the alarm log file saving

When an error occurs during the alarm log file saving, the [Writing Error Notification Device] set in the [File Save] tab of the [System Alarm Observation] dialog turns on.

If the Writing Error Notification device turns on, check that the following conditions are satisfied.

- The SD card cover of the GOT is closed.
- The data storage works normally.

The user needs to turn off this device.

■Restoring the alarm histories when powering-off to on the GOT

When the alarm log file in the data storage is not created in the project in the GOT, the file cannot be read from the GOT.

In this case, an alarm occurs or a device turns on.

- A system alarm 525 occurs.
- The [Writing Error Notification Device] set in the [File Save] tab of the [System Alarm Observation] dialog turns on.

61.6.4 Power failure backup by using a nonvolatile RAM

☞ Page 2092 Required setting
☞ Page 2092 Storage timing
For the specifications of the nonvolatile RAM user area and operations performed on it, refer to the following.
☞ Page 3679 Specifications and operations of the nonvolatile RAM user area

Required setting

Select [Retain data in the embedded memory in GOT even when the power goes off] in the [Basic] tab of the [System Alarm Observation] dialog.
The size of the nonvolatile RAM user area used can also be checked in the [Basic] tab.
☞ Page 2098 [Basic] tab
Every time the data in the buffering area is changed, the data is stored in the nonvolatile RAM user area.

Precautions

The nonvolatile RAM user area is used by multiple functions, and thus its space is limited.
For the specifications of the nonvolatile RAM user area, refer to the following.
☞ Page 3679 Specifications and operations of the nonvolatile RAM user area

Storage timing

Every time the data in the buffering area is changed, the data is stored in the nonvolatile RAM user area.

61.7 Converting alarm log files

GT37 SoftGOT3000

Alarm log files generated by system alarms are binary format files (*.G3A).
To display and edit the alarm log files on a personal computer, convert them into Unicode text files or CSV files.
The following shows how to convert the alarm log files.
☞ Page 2094 Conversion using the utility
☞ Page 2095 Conversion using a device
☞ Page 2096 Conversion using GT Designer3
For the format of the converted file, refer to the following.
☞ Page 2096 Configurations of a Unicode text file and a CSV file

Precautions

■Character code and conversion destination file

If an alarm log file contains any character other than ASCII and Shift JIS characters, convert the file as shown below.

- Convert the file to Unicode text format.
- Convert the file to a CSV file by turning on GS522.b2.

■Precautions for a CSV file or Unicode text file

For the precautions for using CSV files and Unicode text files, refer to the following.
☞ Page 3668 Precautions for using CSV file
☞ Page 3669 Precautions for using Unicode text file

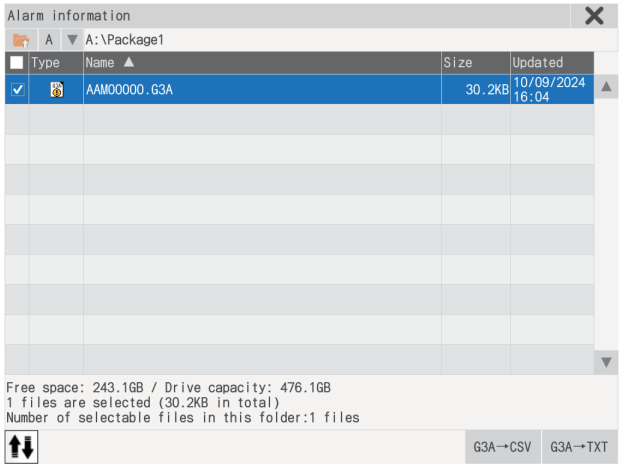
■System language applied at the conversion of the system alarm files

When [System Language Switching Operation] is set for [System Alarm] of [File Conversion Language] in the [Alarm Common Setting] dialog, system alarm files are not converted in the language specified in the system language switching device.
A file is converted in the system language set in the utility.

61.7.1 Conversion using the utility

Convert a binary file (*.G3A) stored in the data storage to a Unicode text file or a CSV file using the utility.
When a file is converted using the utility, the system language is applied to the system alarm language used during conversion.

1. Select a binary file (*.G3A) in [Alarm information] of the utility and touch the [G3A→TXT] or [G3A→CSV] button.



2. Store the created Unicode text file or CSV file into a personal computer by one of the following methods.

Method	Description
Transferring with GT Designer3	Reads resource data from the GOT.
Storing by using the data storage	Stores the alarm log file to the data storage and reads the alarm log file from the data storage.

3. Display or edit the converted Unicode text file or the CSV file on a personal computer.

For the operations of the utility, refer to the following.
GOT3000 Series User's Manual (Utility & Maintenance Functions)
To read the resource data from the GOT, refer to the following.
Page 441 Reading the data from the GOT

Precautions

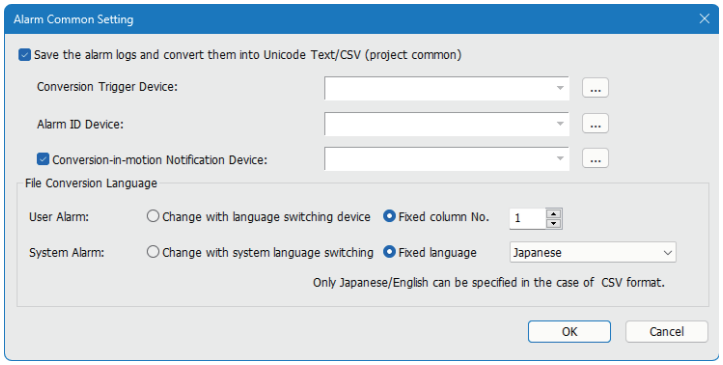
When converting an alarm log file (*G3A) into a CSV file or a Unicode text file with a utility, execute a conversion by each file.
Even if multiple files are selected at once, they cannot be converted.

61.7.2 Conversion using a device

Turning on a specified device converts a binary format file (*.G3A) stored in the data storage into a Unicode text file or a CSV file.

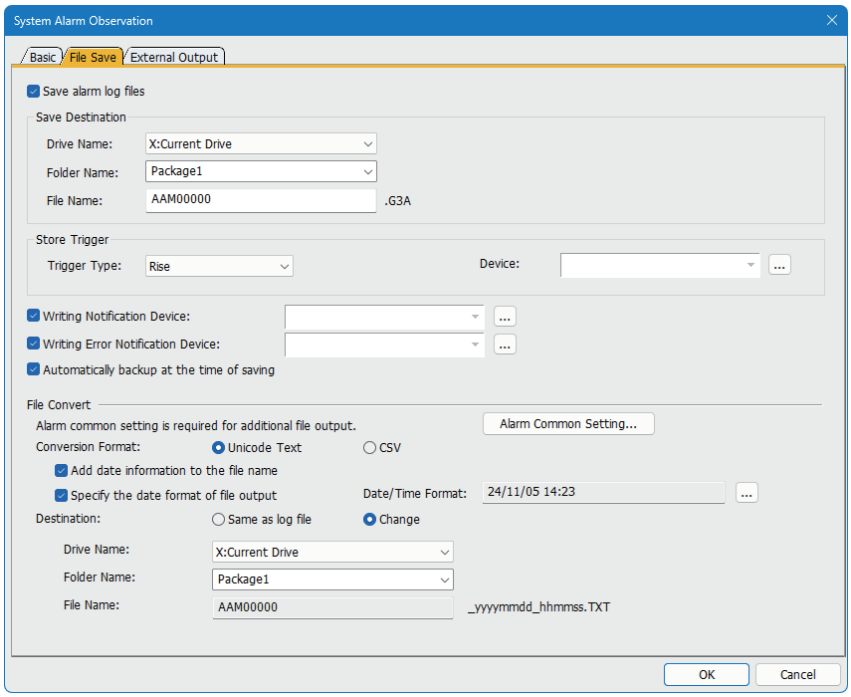
1. Configure the setting for control the alarm log file conversion with the device in the [Alarm Common Setting] dialog.

☞ Page 2043 [Alarm Common Setting] dialog



2. Configure the setting for storing the alarm log file stored in the buffering area to the data storage in the [File Save] tab of the [System Alarm Observation] dialog.

☞ Page 2101 [File Save] tab



Precautions

Before converting the alarm log files, store 0 to the device set in [Alarm ID Device] in [Alarm Common Setting] dialog.

Make sure to turn off the conversion trigger device after the conversion of the alarm log file starts.

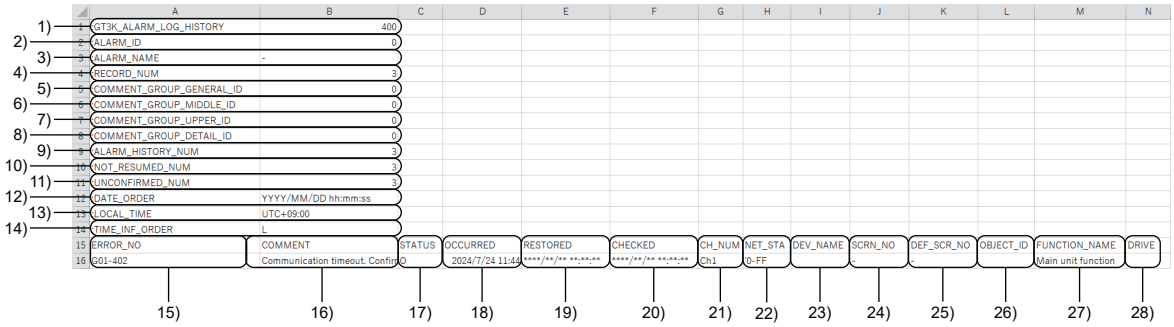
If the conversion trigger device is on even after the conversion is complete, the conversion notification device does not turn off.

61.7.3 Conversion using GT Designer3

Convert a binary file (*.G3A) stored on the personal computer to a Unicode text file or a CSV file using GT Designer3. Conversion is performed in the [Alarm Log File Conversion] dialog.

☞ Page 2072 [Alarm File Conversion] dialog

61.7.4 Configurations of a Unicode text file and a CSV file



No.	Description
1)	Alarm collecting method
2)	Alarm ID. For system alarms, this item is fixed to 0.
3)	Alarm name. For system alarms, this item is left blank.
4)	Number of data points
5)	Basic comment group number. For system alarms, this item is fixed to 0.
6)	Middle comment group number. For system alarms, this item is fixed to 0.
7)	Upper comment group number. For system alarms, this item is fixed to 0.
8)	Detailed comment group number. For system alarms, this item is fixed to 0.
9)	Number of the alarm histories
10)	Number of unrestored alarms
11)	Number of unchecked alarms
12)	Order of the dates
13)	Difference from UTC
14)	Order of the output time
15)	Error number
16)	System alarm message
17)	Alarm status (O: Alarm has been occurring, but has not been confirmed, OC: Alarm has been occurring, and has been confirmed, R: Alarm has been restored, but has not been confirmed, RC: Alarm has been restored, and has been confirmed)
18)	Date and time when an alarm occurred

*1 Collected when [Get detailed alarm information] is selected in the [System Alarm Observation] dialog ([Basic] tab).

☞ Page 2098 [Basic] tab

61.8 [System Alarm Observation] dialog

GT37 SoftGOT3000

☞ Page 2098 [Basic] tab
☞ Page 2101 [File Save] tab
☞ Page 2102 [External Output] tab

Precautions

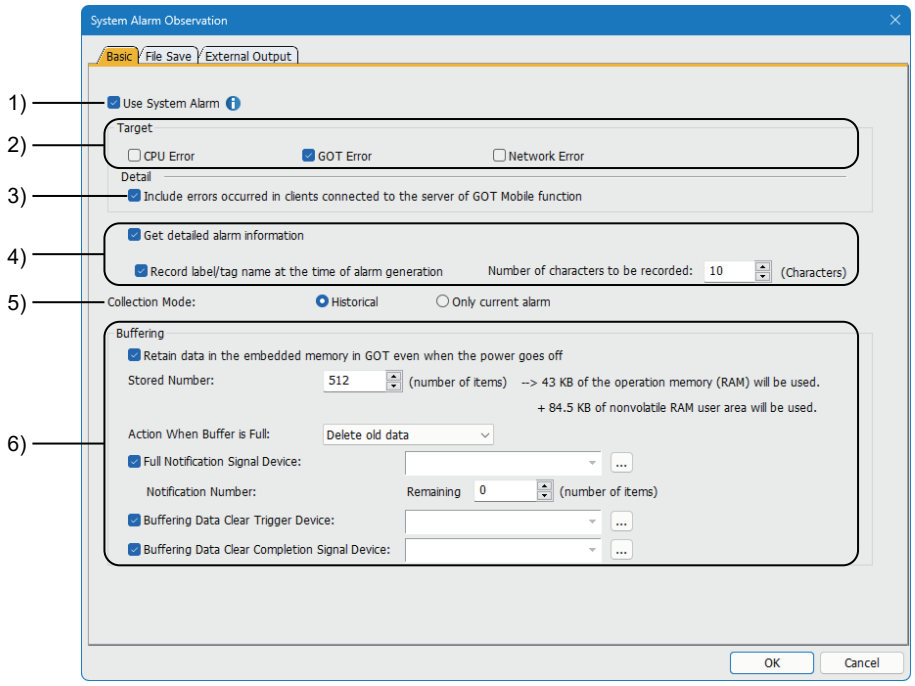
After the initial setting of the system alarm monitoring, changing the settings in the [Basic] tab affects the already recorded label names and tag names.

Setting	Details of the change	Influence
[Record label/tag name at the time of alarm generation]	When clearing this item after recording	The already recorded label and tag names are discarded.
	When selecting this item after recording	For the already collected system alarms, the label and tag names remain unrecorded.
[Number of characters to be recorded]	When decreasing the number of characters	Of an already recorded label or tag name, the characters up to the newly-specified number of characters remain and the rest is discarded.
	When increasing the number of characters	The already recorded label and tag names are retained.

61.8.1 [Basic] tab

GT37 SoftGOT3000

Set the type of the alarm to be monitored, alarm history collecting method and the buffering that stores the alarm history.



Item		Description
1)	[Use system alarm]	Set whether to enable or disable the system alarm function. To pop up an alarm message, configure the following settings additionally. • Alarm popup display settings ☞ Page 2118 [Alarm Popup Display] dialog • Settings of the screen (base screen or mobile screen) where an alarm message pops up ☞ Page 314 [Basic] tab ☞ Page 2831 [Basic] tab
2)	[Target]	Select the system alarm to be monitored.
3)	[Include errors occurred in clients connected to the server of GOT Mobile function]	This item is settable only when [Target] is set to [GOT Error]. Monitors errors of a GOT Mobile function client (GOT Mobile errors).

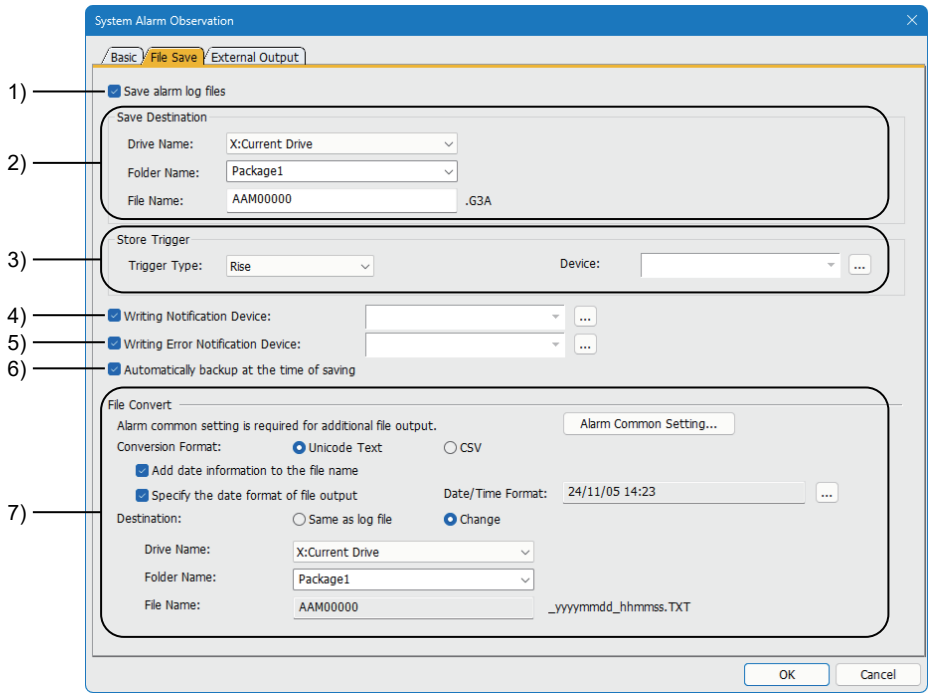
Item			Description
4)	[Get detailed alarm information]	—	Makes it easy to identify where the alarm has occurred by obtaining the detail information of the system alarm. ☞ Page 2080 Collecting detailed information
		[Record label/tag name at the time of alarm generation]	Records the label or tag name and the assigned device when a system alarm occurs. Even if you change the label or tag set for an object or others after the system alarm collection, you can check the label or tag name as of the system alarm collection. Specify the number of characters of a label or tag name to be recorded with [Number of characters to be recorded]. The more the numbers of recorded characters and stored items, the larger the used area of the operation memory (RAM). The following shows the operation when this item is selected. Example) When the global label name set for the numerical input is changed after system alarm collection  Even if this item is not selected, the label or tag name appears on the alarm display or others. The number of characters is unlimited. However, if you change a label or tag, the label or tag name as of the system alarm collection does not appear. The symbol (::) indicating a label or tag and the characters indicating the offset setting are displayed. When an alarm log file is converted to a CSV file or Unicode text file, the label and tag names are not output.
		[Number of characters to be recorded]	Specify the number of characters of a label or tag name to be recorded. The characters up to the set number of characters are recorded, and the rest is unrecorded. The setting range is [10] to [300]. The more the number of characters, the larger the used area of the operation memory (RAM) and the size of the alarm log file.
5)	[Collection Mode]		Select a system alarm collecting method. ☞ Page 2079 Alarm history collecting method and information to be collected

Item			Description
6)	[Buffering]	—	Set the buffering that stores collected system alarms.
		[Retain data in the embedded memory in GOT even when the power goes off]	Select this item to store alarm data in the buffering area in the nonvolatile RAM user area. ☞ Page 2089 Power failure backup by storing the user alarm
		[Stored Number]	Set this item when setting [Collection Mode] to [Historical]. Set the number of the system alarms to be stored. The setting range is [512] to [32767]. The buffer size increases as the number of the stored events increases.
		[Action When Buffer is Full]	Set this item when setting [Collection Mode] to [Historical]. Select the operation performed when the number of the system alarms stored in the buffering area reaches [Stored Number].
		[Full Notification Signal Device]	Set this item when setting [Collection Mode] to [Historical]. A set device notifies you that the number of system alarm histories which can be stored in the remaining space in the buffering becomes the same as [Notification Number] or smaller. ☞ Page 834 How to set devices, labels, and tags
		[Notification Number]	When setting [Full Notification Signal Device], set this item. Set the number of the system alarm histories for which the [Full Notification Signal Device] is notified. The setting range is [0] to [255]. Example) When [Stored Number] is set to 1000 and [Notification Number] is set to 10 The [Full Notification Signal Device] turns on when the number of stored system alarm histories becomes 990 because the number of storable system alarm histories becomes 10.
		[Buffering Data Clear Trigger Device]	Deletes with a set device the system alarms which the monitor targets recovered from and are stored in the buffering area. ☞ Page 834 How to set devices, labels, and tags
		[Buffering Data Clear Completion Signal Device]	When setting [Buffering Data Clear Trigger Device], set this item. Notifies you with a set device that deleting buffering data is complete. ☞ Page 834 How to set devices, labels, and tags

61.8.2 [File Save] tab

GT37 SoftGOT3000

Set the following items to save the alarm histories stored in the buffering area in the data storage.



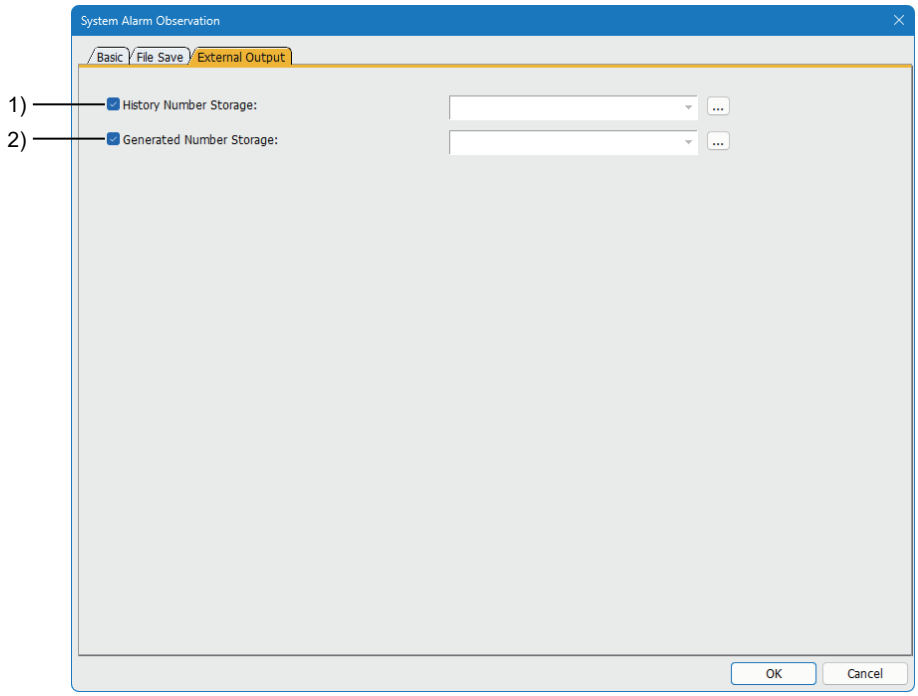
Item			Description
1)	[Save alarm log files]		Writes the history of system alarms stored in the buffering area to the data storage as an alarm log file when [Historical] is selected for [Collection Mode] on the [Basic] tab. Into data storage, the log file is written as a binary file (*.G3A).
2)	[Save Destination]	[Drive Name]	Select a destination drive. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
		[Folder Name]	Set the folder name of the destination to save a file. The default is set to the folder name that is specified with [Package Folder Name] in the [Type Setting] dialog. Alphanumeric characters and following symbols are available for the folder name. #$%&'()+-.=@[]^_{}~\ For the restrictions on the folder name used in the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
		[File Name]	Set the file name of the destination to save a file. The default is set to AAM00000. Alphanumeric characters and following symbols are available for the file name. #$%&'()+-.=@[]^_{}~ For the restrictions of the file name used in the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
3)	[Store Trigger]	[Trigger Type]	Select the timing with which system alarms stored in the buffering area are stored into the data storage. When setting [Sampling], [ON Sampling], or [OFF Sampling], set a cycle. The setting range is [1] minute to [1440] minutes.
		[Device]	Set a device used as a store trigger. ☞ Page 834 How to set devices, labels, and tags
4)	[Writing Notification Device]		Set a device which notifies that the alarm log file is in the process of being written. ☞ Page 834 How to set devices, labels, and tags
5)	[Writing Error Notification Device]		Set a device which notifies an error when alarm log file writing fails. ☞ Page 834 How to set devices, labels, and tags
6)	[Automatically backup at the time of saving]		Saves the alarm log file created immediately before it is saved as a backup file (*.BAK). If the name of the alarm log file is AAM00000.G3A, the name of the backup file is AAM00000.bak. The stored backup file is not displayed in the utility of the GOT.

Item			Description
7)	[File Convert]	[Convert Format]	Set the following items to convert files. To use file conversion, the setting of [Alarm Common Setting] is required. Click the [Alarm Common Setting] button and set the [Alarm Common Setting] dialog. Set the file format applied after the conversion.
		[Add date information to the file name]	Date information is added to the name of the alarm log file.
		[Specify the date format of file output]	Click the [...] button, and set the date/time formats in the [Date/Time Setting] dialog. ☞ Page 3684 [Date/Time Setting] dialog (screen)
		[Destination]	Select the save destination folder for a converted file. When you select [Change], set [Drive Name] and [Folder Name]. The setting method is the same as that of [Destination] for the alarm log file. [File Name] is the same as that of the alarm log file. The file is saved as (*.TXT) if the conversion format is [Unicode Text] and (*.CSV) if [CSV].

61.8.3 [External Output] tab

GT37 SoftGOT3000

Configure the settings to store the history of system alarms and the number of occurrences in the device.



Item		Description
1)	[History Number Storage]	Stores the number of system alarm histories in a set word device. All the errors in the status of "Occurred", "Checked", and "Restored" are included in the number of the histories to be stored. ☞ Page 834 How to set devices, labels, and tags
2)	[Generated Number Storage]	Stores the number of system alarms in the "Occurred" status in a set word device. ☞ Page 834 How to set devices, labels, and tags

61.9 Relevant settings

GT37 SoftGOT3000

Set the relevant settings other than the specific settings for the system alarm monitoring as required.
The following shows the functions that are available by configuring the relevant settings.

61.9.1 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Resetting system alarms and system information (GOT error code, GOT Error Detection)	[System Signal 1-1] System signal 1-1.b13
Notifying the status of the access to the drive*1	[System Signal 2-2] System signal 2-2.b0, b1
Notifying that the free space in the drive is insufficient*1	[System Signal 2-2] System signal 2-2.b4, b5
Notifying the failure of the access to the drive*1	[System Signal 2-2] System signal 2-2.b7, b8
Turning off the Key Input signal	[System Signal 1-1] System signal 1-1.b3
Disabling all the key inputs	[System Signal 1-1] System signal 1-1.b9
Notifying the key codes set to the input keys when the keys are input to ASCII input, touch switch, or other objects.	[Key Code Input]
Notifying a key input	[System Signal 2-1] System signal 2-1.b3

*1 A signal which notifies the full during the access exists in the user alarm monitoring. The signal differs from that of the Drive status notification signal.
For details, refer to the following.
☞ Page 2103 Differences between the notification devices used for the system alarm monitoring and the system information

Differences between the notification devices used for the system alarm monitoring and the system information

The following shows the differences between the notification devices.

Notification details	Difference between the notification devices	
	System alarm monitoring	System information
Drive full notification	Notification device: Full Notification Signal Device Turns on when the number of log files reaches [Stored Number] set in the [Basic] tab.	Notification device: System signal 2-2.b4, b5 Turns on when the data storage is full.
Writing to drive notification	Notification device: Writing Notification Device Turns on while the system alarm is being written to the data storage.	Notification device: System signal 2-2.b0, b1 Turns on while any data is being written to the data storage.
Writing to drive error notification	Notification device: Writing Error Notification Device Notifies that an error has occurred due to any of the following causes. • The alarm log file in the data storage is not created in the project in the GOT. • No data storage is installed. • The SD card cover is open.	Notification device: System signal 2-2.b7, b8 Notifies that an error has occurred due to any of the following causes. • No data storage is installed. • The SD card cover is open.

61.9.2 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Saving the data in the buffering area to data storage*1	GS520.b0
Changing the character code to Unicode when a binary file is converted to CSV format	GS522.b2
Storing the channel No. that has been assigned to the channel where a system alarm (GOT error) occurs	GS262
Storing the channel No. that has been assigned to the channel where a system alarm (CPU error) occurs	GS263
Storing the channel No. that has been assigned to the channel where a system alarm (network error) occurs	GS264

*1 Only when [Save alarm log files] is selected in the [File Save] tab of the [System Alarm Observation] dialog, the data is saved.
☞ Page 2101 [File Save] tab

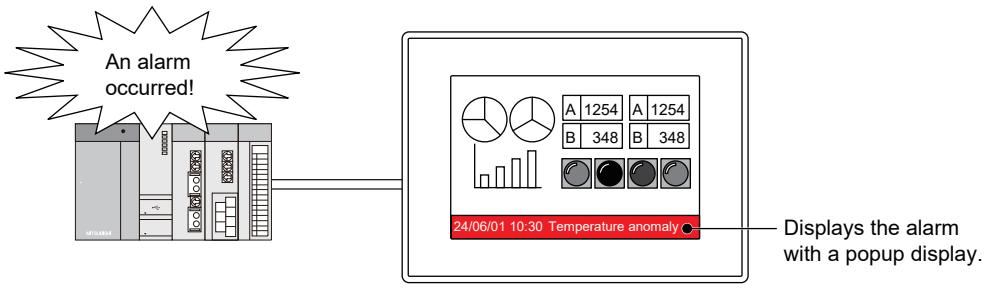
62 Enabling the popup display for when an alarm occurs

GT37 SoftGOT3000

☞ Page 2106 Overview of the alarm popup display
☞ Page 2107 How to use the alarm popup display
☞ Page 2114 Specifications of the alarm popup display
☞ Page 2118 [Alarm Popup Display] dialog
☞ Page 2131 Relevant settings

62.1 Overview of the alarm popup display

The alarm popup display shows the alarm details in front of all figures and objects on the same screen when an alarm occurs. With the popup display, you can notice alarm events even if the alarm list is not placed on the screen.



- The user alarm and/or system alarm can be specified as the display target(s) for each project.
- When specifying the user alarm as the display target, set whether to display the popup for each alarm ID of the user alarm monitoring.
- If user alarms and system alarms occur simultaneously when both are specified as the display targets, system alarms are prioritized.

User alarms do not pop up until the system alarms are eliminated.

- The popup can be displayed on base screens and mobile screens.

When there are multiple screens, specify whether to display the popup for each screen.

62.2 How to use the alarm popup display

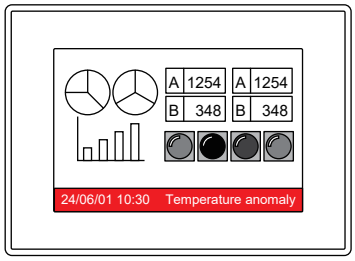
GT37 SoftGOT3000

☞ Page 2107 Setting the display position of alarm popup display
☞ Page 2108 Specifying whether to use the fixed display or scrolling display
☞ Page 2108 Specifying a text color and background color
☞ Page 2109 Switching to the specified screen by touch operation
☞ Page 2109 Switching the alarm hierarchy level (user alarms only)
☞ Page 2112 Switching the displayed contents according to the device values
☞ Page 2113 Writing the alarm information to devices

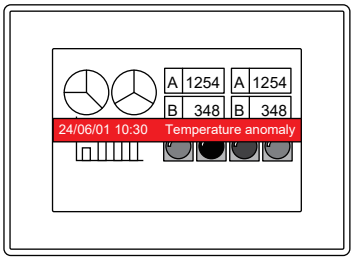
62.2.1 Setting the display position of alarm popup display

The alarm popup can be displayed at any one of the following positions: uppermost part, center, or lowermost part of the screen. The position can be specified for each screen.
For example, you can display the alarm popup at the lowermost part of base screen 1 and display it at the uppermost part of base screen 2.

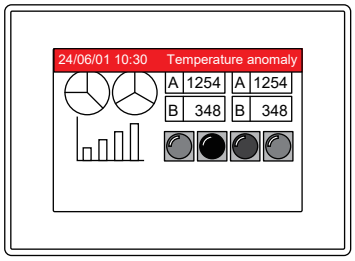
☞ Page 2117 Setting whether to display the alarm popup display and the display position (property of screens)



Displays in the lowermost part of the screen.



Displays in the center of screen.

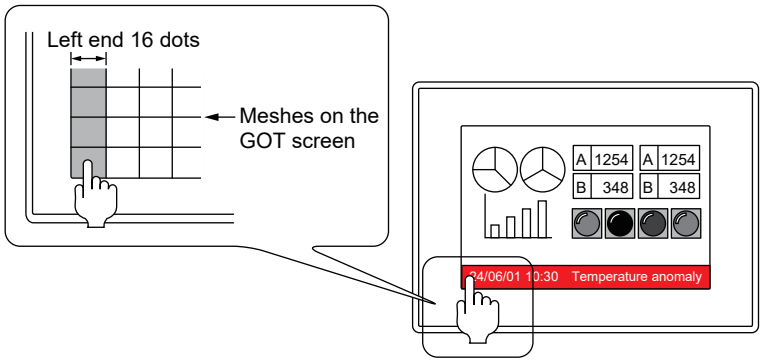


Displays in the uppermost part of the screen.

Switching display positions by touch operation

If another object is hidden under the alarm popup display, the hidden object cannot be touched.
For such a case, a function to switch the display positions by touch operation is provided.
Every time the operator touches the left end of the alarm popup display area (16 dots) on the GOT screen, the display positions are switched in the order of the upper part, center, and lower part of the screen.
Enable/disable this function in [Display Position Switching] in the [Alarm Popup Display] dialog ([Basic] tab).

☞ Page 2119 [Basic] tab



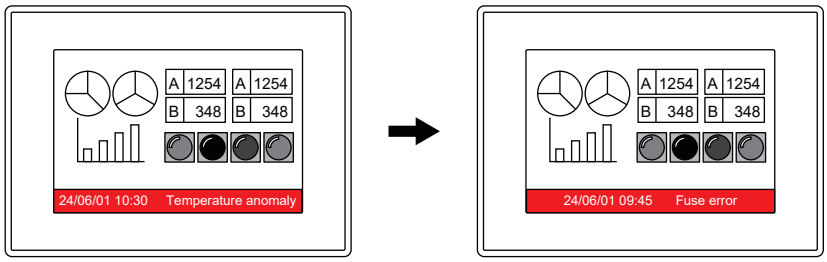
62.2.2 Specifying whether to use the fixed display or scrolling display

The text (comment) in the alarm popup display can be displayed at the fixed position in the display area or displayed by scrolling display.
This item is specified for a whole project. It cannot be set for each screen.
Configure the setting in [Display Type] in the [Alarm Popup Display] dialog ([Basic] tab).
☞ Page 2119 [Basic] tab

Display at the fixed position

When displaying the text at the fixed position in the display area, you can set the display cycle in seconds.
When multiple alarms are set to be displayed, comments of the alarms that have occurred are automatically switched and displayed according to the display cycle.
When the alarm comment spans multiple rows, only the first row is displayed; the second and subsequent rows are not.

An alarm displayed automatically switches to the next alarm.

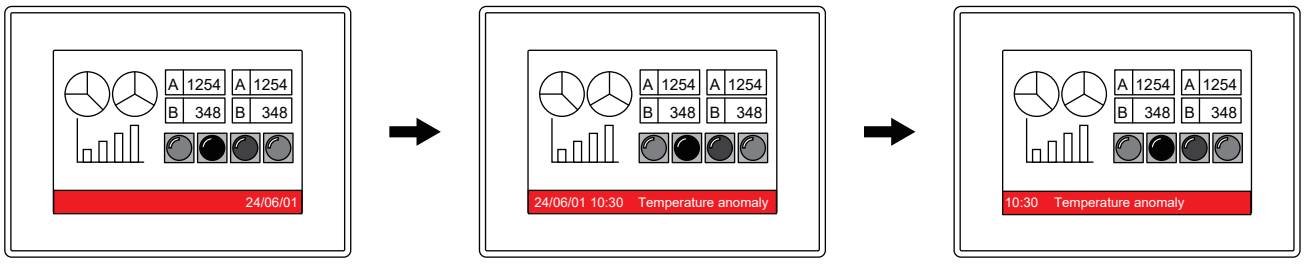


First alarm　　Second alarm

Scrolling display

The alarm text can be displayed by scrolling across the display area from right to left repeatedly.
Even when the alarm comment is long, the entire text can be displayed.
When a comment spans multiple rows, the first row is displayed initially, and the second and subsequent rows are displayed by scrolling.
When multiple alarms have occurred, comments of the alarms are displayed sequentially.

The character string flows from right to left.

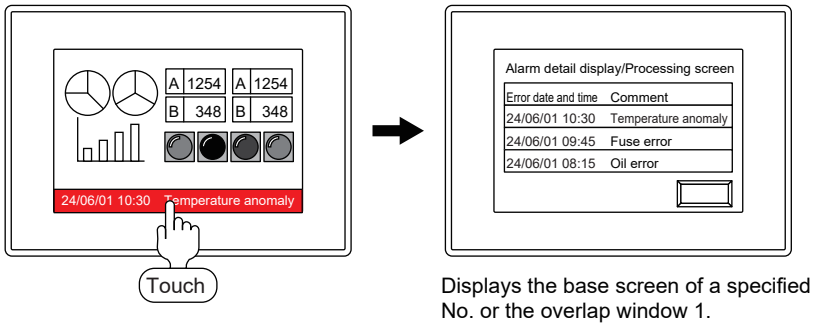


62.2.3 Specifying a text color and background color

You can draw the operator's attention by setting an effect for the text in the alarm popup display or setting the background color of the display area.
In addition, by setting the display color for each level or group set in the user alarm monitoring, each of them can be visually identified.
Configure the settings in the [Alarm Popup Display] dialog ([Text Format] tab).
☞ Page 2122 [Text Format] tab

62.2.4 Switching to the specified screen by touch operation

You can configure the setting to switch the screen to the base screen with the specified number or overlap window 1 when the alarm popup display is touched.
For example, you can transition the screen to the alarm list processing screen by touching the alarm popup display if the touch keys for alarm display and alarm operation have been placed on the destination screen in advance.
Configure the setting in [Touch Mode] in the [Alarm Popup Display] dialog ([Basic] tab).
☞ Page 2119 [Basic] tab



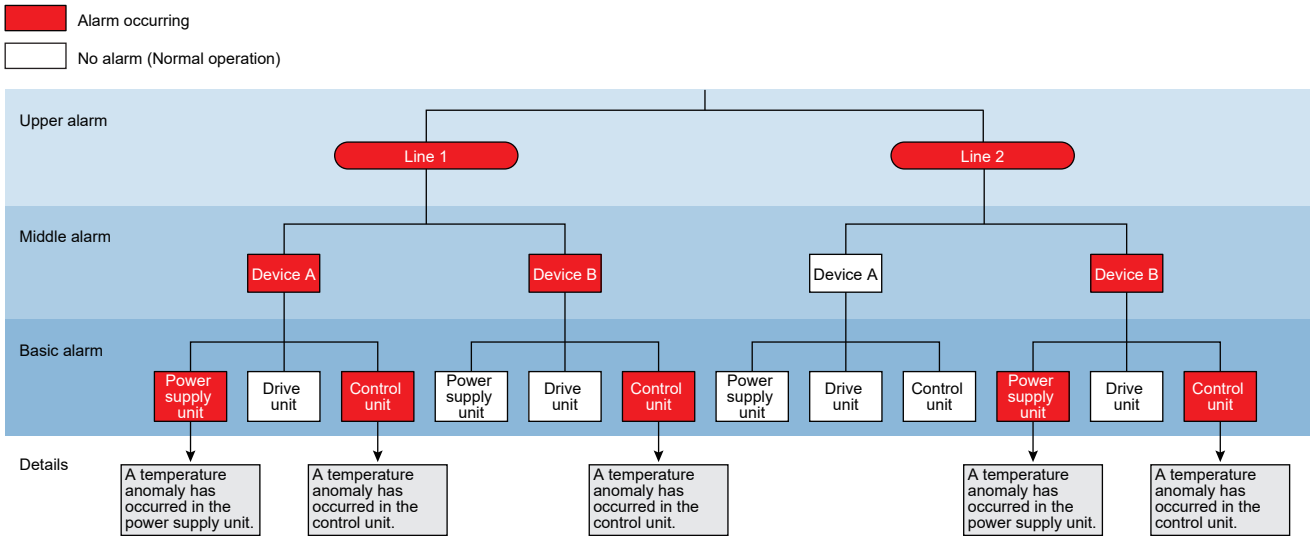
Displays the base screen of a specified No. or the overlap window 1.

62.2.5 Switching the alarm hierarchy level (user alarms only)

You can configure the settings to switch the hierarchy level of the currently occurring user alarm to another level.
The following two methods are available for switching the hierarchy level.

Switching method	Description
☞ Page 2110 Switching the hierarchy level using touch operation	Touching the alarm popup display will switch the hierarchy level down.
☞ Page 2111 Switching the hierarchy level using a device	Switches the hierarchy level to be displayed in the alarm popup display depending on the value stored in the device.

The display range differs depending on the switching method.
The following system examples show differences in display ranges according to the switching methods.



Point

To display hierarchized comments, it is recommended to set upper-level alarms to be displayed at the initial display hierarchy level.
Set the initial display hierarchy level in the [Basic] tab in the [Alarm Popup Display] dialog.
☞ Page 2119 [Basic] tab

Switching the hierarchy level using touch operation

You can configure the settings so that touching the popup display will switch the hierarchy level of the touched alarm down. Only the level below the touched alarm is displayed.

If no comment is set in the switching destination level or the comment could not be obtained, [No message] is displayed.

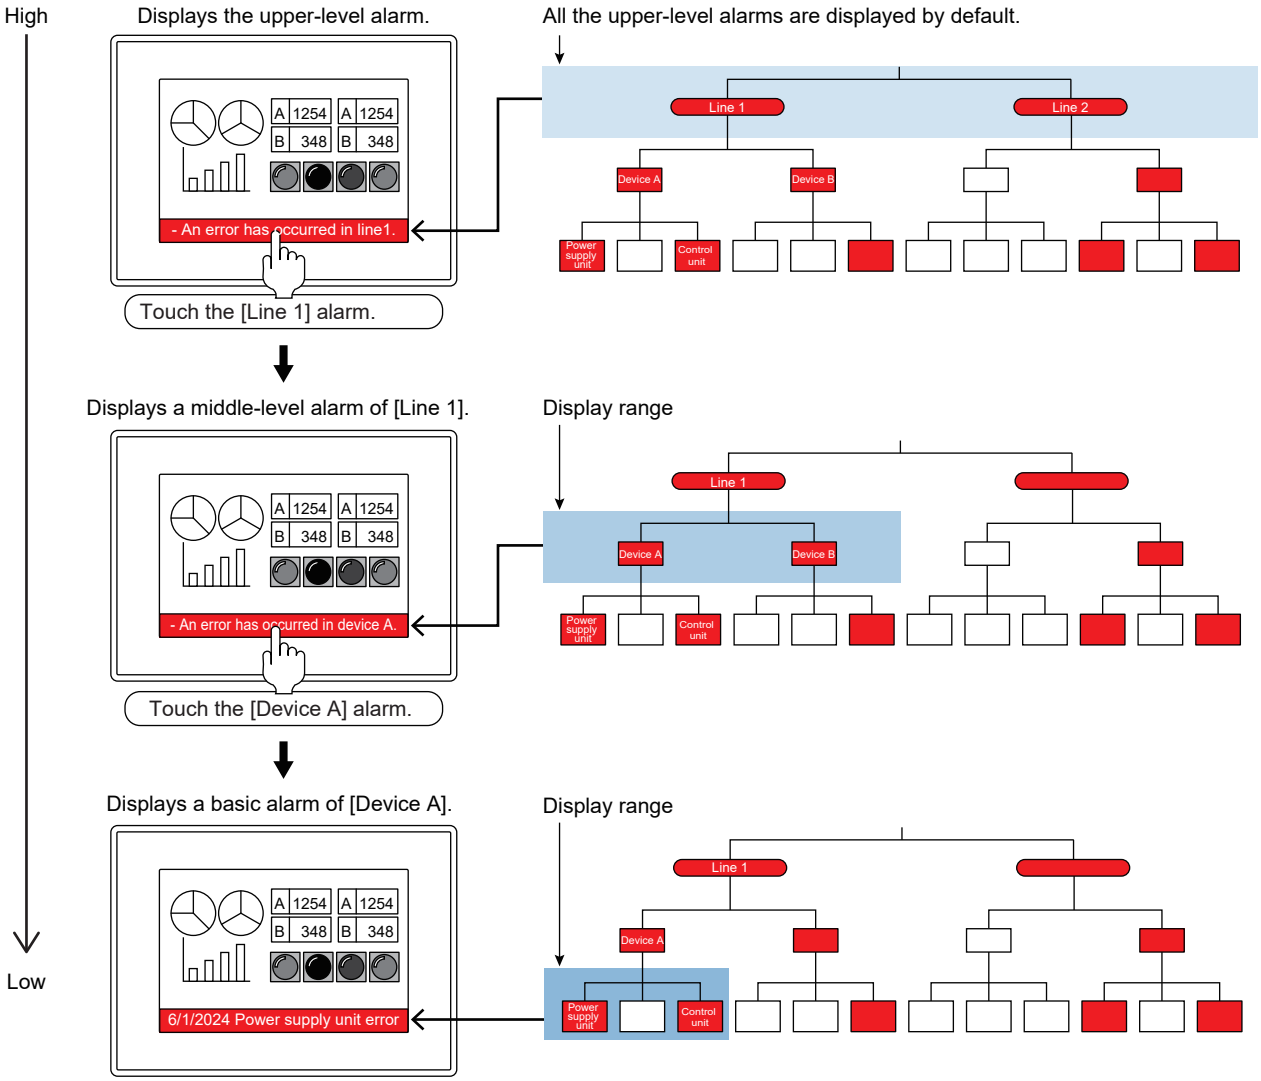
■Target of the alarm hierarchy change

The alarm hierarchy change applies to the alarm that appears in the popup display when it is touched.

When multiple alarms are displayed at the same time by scrolling display, the alarm displayed first is the target of the hierarchy change if any part of it is still displayed on the screen.

Ex.

When [Initial Display Hierarchy] is set to upper-level alarms in the [Basic] tab in the [Alarm Popup Display] dialog



■When the alarm is restored after the hierarchy level is changed

When the displayed alarm is restored after level switching by a touch operation, if there are other alarms, all of them will appear in the popup display at the level specified as the initial display hierarchy level.

■How to switch the hierarchy level up

Touch operation cannot switch the hierarchy level up.

To switch the hierarchy level up, use a device.

☞ Page 2111 Switching the hierarchy level using a device

Precautions

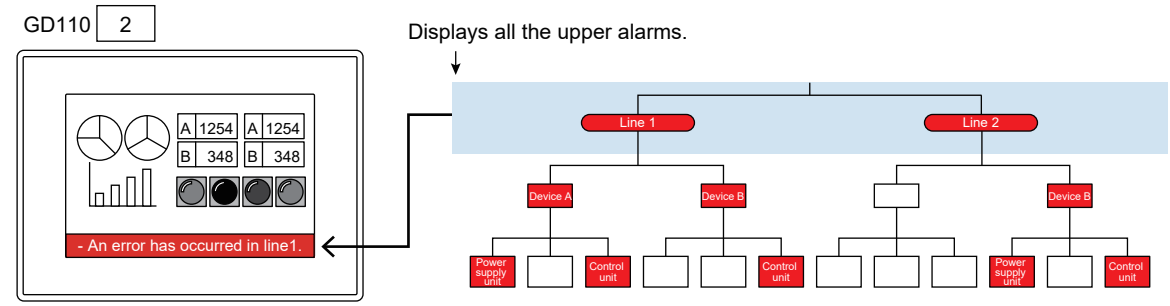
When an alarm from a lower hierarchy level is displayed, a newly occurring alarm from a different higher hierarchy level will not be displayed.
To display the new alarm, display all the alarms of the specified hierarchy level using the hierarchy switching device. Alternatively, specify an upper hierarchy level using the hierarchy switching device and change the hierarchy level of the new alarm.

Switching the hierarchy level using a device

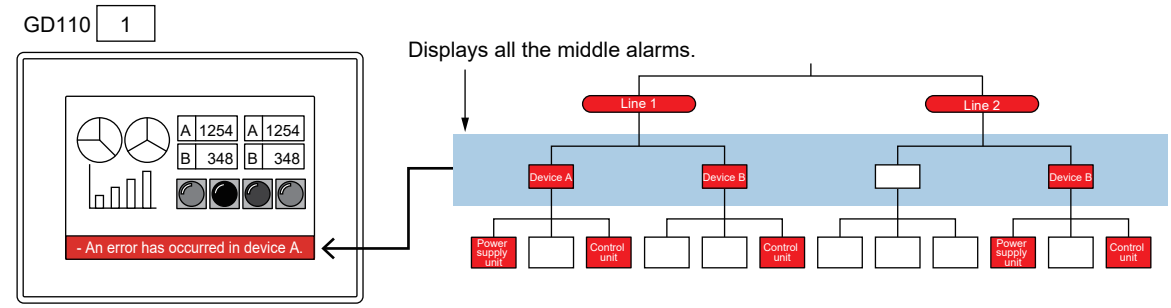
The alarm hierarchy of the alarm displayed on the alarm popup display can be specified using a device.
When levels are switched using a device, the comments of all the current alarms at the level specified by the device are displayed in the popup display sequentially unlike the level switching by touch operation.
Specify the hierarchy switching device in [Hierarchy] under [Switching Device] in the [Alarm Popup Display] dialog ([Extended] tab).
☞ Page 2125 [Hierarchy]
If no comment is set in the switching destination level, [No message] is displayed.

Ex.
When the hierarchy switching device is set to GD110

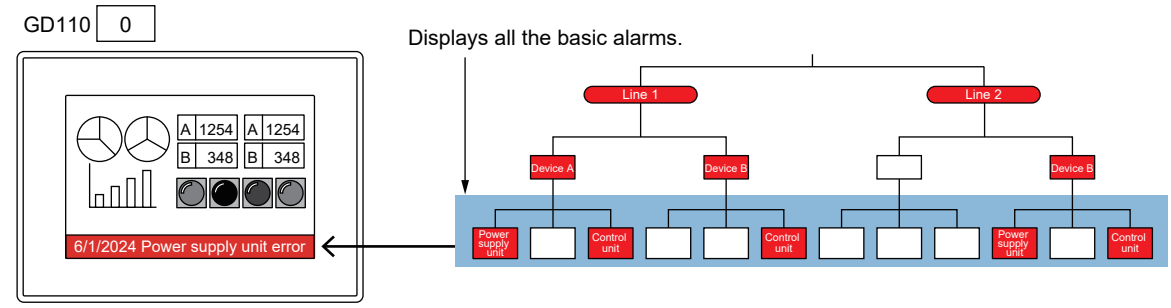
Displays the upper alarm.



Displays the middle alarm.



Displays the basic alarm.



62.2.6 Switching the displayed contents according to the device values

The contents displayed in the alarm popup display can be switched according to the device values.

Configure the settings in the [Alarm Popup Display] dialog ([Extended] tab).

☞ Page 2124 [Extended] tab

The following table lists the items that can be switched according to the device values.

Item that can be switched by using devices	Alarms to be displayed in the popup display	
	User alarm	System alarm
Hierarchy*1	The comments of all the current alarms at the specified level are displayed.	—
Level*1	The alarm events in the specified level are displayed.	
Group*1	The alarm events in the specified group are displayed.	
Priority display attribute	The display order is switched between the ascending order and descending order. Date and time of occurrence, level, or group can be selected as the basis on which the order is arranged.	
User alarm monitoring	The setting of the user alarm monitoring (alarm ID) to be displayed can be changed. Multiple alarms can be displayed by changing the alarm ID.	—
Basic comment group	The alarm events are displayed using the comments of the specified comment group. You can change the comments according to your purpose.	
Middle comment group		
Upper comment group		

*1 To set the hierarchy level, level number, and group for alarms, use the user alarm monitoring dialog.

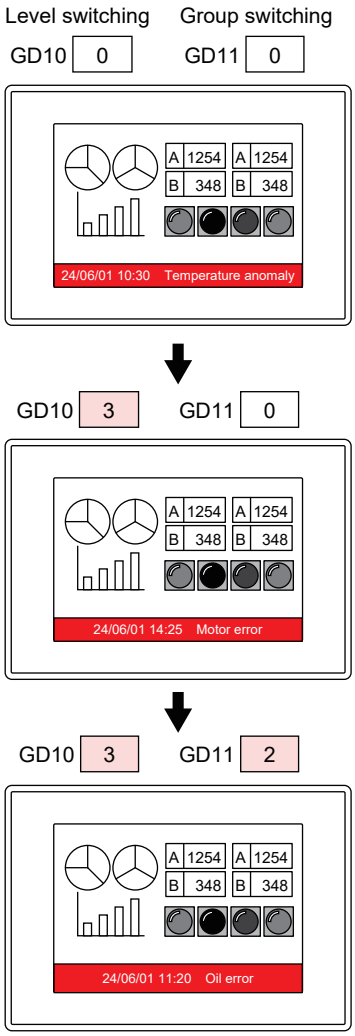
☞ Page 2045 [User Alarm Observation] dialog

Ex.

Example in which the following devices are set and the device values are changed

Level switching device: GD10

Group switching device: GD11



When the following alarms have occurred

Error date and time		Comment	Alarm status	Level	Group
24/06/01	10:30	Temperature anomaly	Occurred	1	1
24/06/01	14:25	Motor error	Occurred	3	1
24/06/01	11:20	Oil error	Checked	3	2
24/06/01	10:00	Fuel error	Occurred	3	2
24/06/01	08:10	Internal pressure error	Occurred	2	1
24/06/01	07:40	Fuse error	Restored	3	1

An alarm in the [Restored] status cannot be displayed in the alarm popup display.

Narrowed down to Level 3

Display target alarms

Error date and time		Comment	Alarm status	Level	Group
24/06/01	14:25	Motor error	Occurred	3	1
24/06/01	11:20	Oil error	Checked	3	2
24/06/01	10:00	Fuel error	Occurred	3	2

Narrowed down to Group 2

Display target alarms

Error date and time		Comment	Alarm status	Level	Group
24/06/01	11:20	Oil error	Checked	3	2
24/06/01	10:00	Fuel error	Occurred	3	2

62.2.7 Writing the alarm information to devices

A function is provided to write the information (such as the alarm ID, alarm status, and date and time of occurrence) of the alarm touched in the alarm popup display to devices.

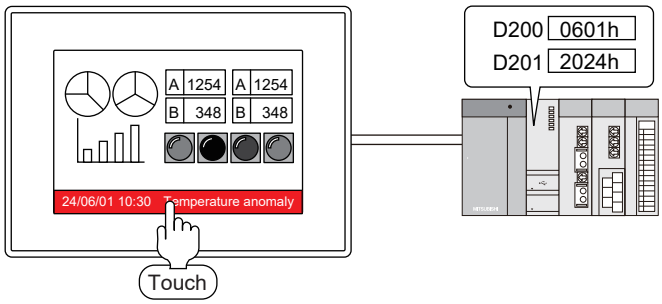
Information that cannot be displayed in the alarm popup display, such as downtime, can also be written to devices.

Configure the settings in the [Alarm Popup Display] dialog ([External Output] tab).

☞ Page 2128 [External Output] tab

Ex.

Writing the date of alarm occurrence to D200 and D201



62.3 Specifications of the alarm popup display

GT37 SoftGOT3000

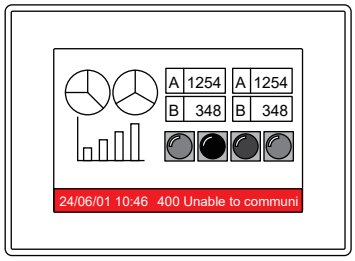
☞ Page 2114 Alarms that can be displayed in the alarm popup display
☞ Page 2115 Displayable screens
☞ Page 2115 Number of alarms to be displayed in the alarm popup
☞ Page 2115 Vertical length of the popup display area
☞ Page 2115 Precautions

62.3.1 Alarms that can be displayed in the alarm popup display

The user alarm and/or system alarm can be specified as the display target(s).
If the same system alarm occurs repeatedly, the date and time of the first occurrence is displayed.
For user alarms, only the alarms with the alarm ID numbers for which [Pop up alarms] is selected in the [User Alarm Observation] dialog are displayed.

Order of the priority given to displays

If user alarms and system alarms occur simultaneously, only the system alarms are displayed.



Displays the system alarm.

Current system alarms

Error date and time	Comment	
24/06/01 10:46	400 Unable to communicate with CPU.	← Displayed in the first row.
24/06/01 09:35	9 AC down detected.	← Displayed in the second row.
24/06/01 07:10	803 Transient error.	← Displayed in the third row.

Current user alarms

Error date and time	Comment	
24/06/01 10:30	Temperature anomaly	Not displayed until all the system alarms are eliminated.
24/06/01 09:20	Fuse error	
24/06/01 08:50	Oil error	

Status of alarms displayed in the alarm popup display

Displays alarms in the [Occurred] or [Checked] status.
When the alarm status becomes [Restored] (including already checked alarms which the monitor targets recovered from), the display is hidden.
Once system alarms are restored with the GOT Error Reset signal, they are not displayed in the alarm popup display.
If there is a current user alarm when the alarm status of all the system alarms turns "Restored", it is displayed in the alarm popup display.
For instructions on how to recover from system alarms, refer to the following.
☞ Page 2085 Recovery from alarms

62.3.2 Displayable screens

The alarm popup display can be displayed on the following two screens.

- Base screen
- Mobile screen

To display the alarm popup display on the screen, set whether to display the alarm popup display and the position of the alarm popup display for each screen.

Configure the alarm popup display settings in the screen properties dialog.

☞ Page 2116 Configuring the display setting of the alarm popup display ([Alarm Popup Display] dialog)

62.3.3 Number of alarms to be displayed in the alarm popup

Specify whether to display one alarm or multiple alarms in the alarm popup display.

Number of alarms to be displayed	Description
One alarm	Of the current alarms, only the highest priority alarm is displayed. The alarm with the most recent date and time of occurrence is displayed by default.
Multiple alarms	Current alarms are displayed sequentially. Alarms are displayed in descending order from the one with the most recent date and time of occurrence by default.

The priority criteria and sort order can be changed using devices.

For the setting method, refer to the following.

☞ Page 2126 [Priority Display Attribute]

62.3.4 Vertical length of the popup display area

The vertical length of the alarm popup display is the minimum height calculated by multiplying 16 by n dots (n is an integer) in which the specified font can fit.

This value cannot be set freely.

62.3.5 Precautions

- If a nonexistent value (column number) is stored in the comment group with the language switching device, [No message] is displayed in the alarm popup display.
- To the alarm popup display, a touch switch for storing alarms cannot be assigned.

To place a button for storing alarm data, make either of the following settings.

◇ Setting the store trigger device for the alarm monitoring

Set [Store Trigger] in the [File Save] tab in the [User Alarm Observation] dialog or the [System Alarm Observation] dialog.

◇ Storing alarm data with a touch switch for alarm display

Place a touch switch for alarm display on the screen where an alarm display object is placed.

☞ Page 2141 Key code switches for operating alarm displays

62.4 Setting the alarm popup display

GT37 SoftGOT3000

To display the alarm popup display, configure the settings described in this section.

Configuring the settings in multiple dialogs is required.

☞ Page 2116 Specifying alarms to be displayed in the popup display (alarm monitoring dialog)
☞ Page 2116 Configuring the display setting of the alarm popup display ([Alarm Popup Display] dialog)
☞ Page 2117 Setting whether to display the alarm popup display and the display position (property of screens)

62.4.1 Specifying alarms to be displayed in the popup display (alarm monitoring dialog)

After configuring the alarm monitoring settings in the relevant dialogs, configure the settings to display the alarms in the popup display.

Popup display target	Required setting
User alarm	Select [Pop up alarms] in the [Basic] tab in the [User Alarm Observation] dialog. ☞ Page 2046 [Basic] tab
System alarm	Select [Target] in the [Basic] tab in the [User Alarm Observation] dialog. The selected system alarm is displayed in the popup display.

62.4.2 Configuring the display setting of the alarm popup display ([Alarm Popup Display] dialog)

In the [Alarm Popup Display] dialog, specify the alarm type of the alarms to be displayed in the alarm popup display and set the number of displayed alarms and others.

These settings are configured for each project.

The procedure differs depending on whether alarms are displayed on a GOT or mobile screen.

Displaying alarms on a GOT screen

1. Select [Common] → [Alarm] → [Alarm Popup Display] from the menu to display the [Alarm Popup Display] dialog.
2. Configure each setting.

For details, refer to the following.

☞ Page 2118 [Alarm Popup Display] dialog

Displaying alarms on a mobile screen

Configure the setting in [Alarm Popup Display] in [GOT Mobile Setting].

For details, refer to the following.

☞ Page 2828 [Alarm Popup Display]

62.4.3 Setting whether to display the alarm popup display and the display position (property of screens)

Set whether to display the alarm popup display and the display position for each screen.

Configure the alarm popup display setting in [Pop up alarms] and [Display Position] in the property of screens.

- GOT screen settings

☞ Page 314 [Basic] tab

- Mobile screen settings

☞ Page 2831 [Basic] tab

Precautions

If the display position of the alarm popup display overlaps with other objects, the objects hidden under the alarm popup display are not operable.

To operate the hidden objects, switch the display positions of the alarm popup display by touch operation.

For details, refer to the following.

☞ Page 2107 Switching display positions by touch operation

62.5 [Alarm Popup Display] dialog

GT37 SoftGOT3000

☞ Page 2119 [Basic] tab

Window

• Setting the alarm popup display to be displayed on the GOT

Select [Common] → [Alarm] → [Alarm Popup Display] from the menu to display the dialog.

• Setting the alarm popup display to be displayed on a client of the GOT Mobile function

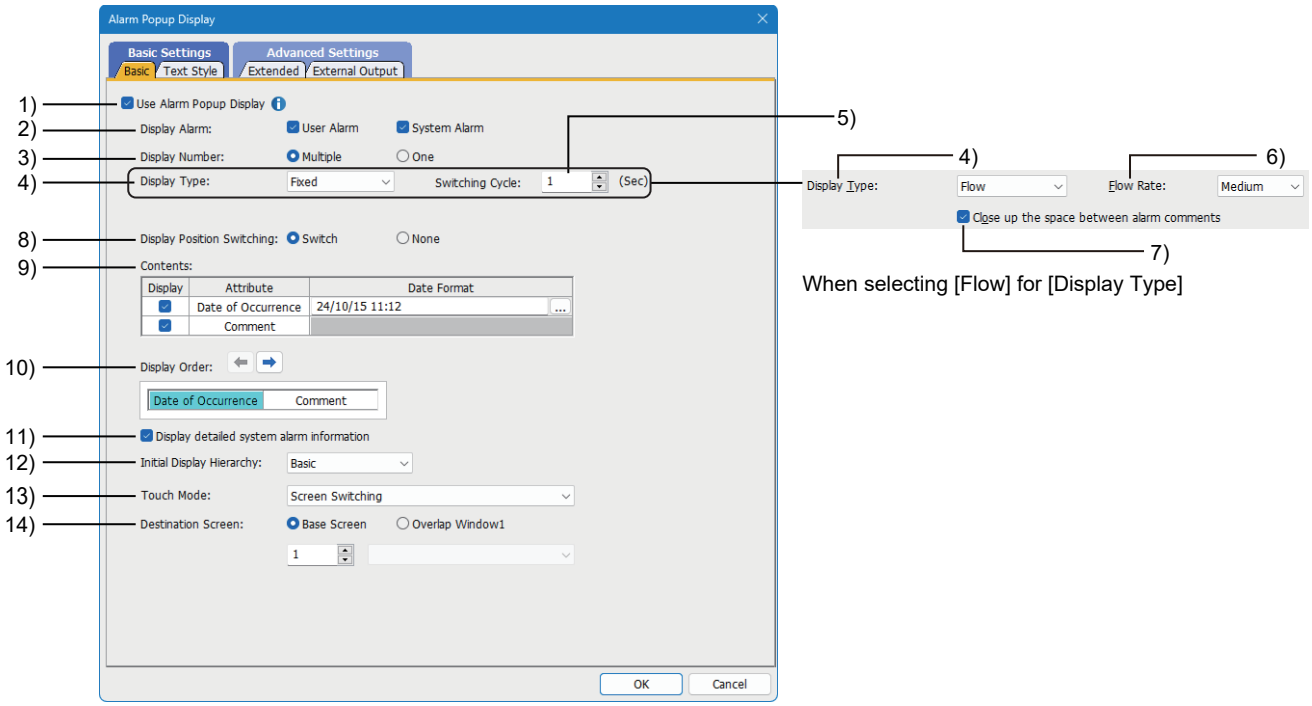
Display the dialog from the [GOT Mobile Setting] window ([Alarm Popup Display]).

62.5.1 [Basic] tab

Configure the type of alarms to be displayed in the alarm popup display, the number of alarms to be displayed, the display content, and the action when touched, and other settings.

Some setting items cannot be set in the [GOT Mobile Setting] window ([Alarm Popup Display]).

☞ Page 2742 Usable functions



When selecting [Flow] for [Display Type]

Item		Description
1)	[Use Alarm Popup Display]	Select this item to use the alarm popup display. To use the alarm popup display, configuring other settings is required in addition to this item. For details, refer to the following. ☞ Page 2116 Setting the alarm popup display
2)	[Display Alarm]	Select the alarm type to be displayed.
3)	[Display Number]	Select the number of the alarms to be displayed. • [Multiple] Current alarms are displayed sequentially. Alarms are displayed in descending order from the one with the most recent date and time of occurrence by default. • [One] Of the current alarms, only the highest priority alarm is displayed. The alarm with the most recent date and time of occurrence is displayed by default.
4)	[Display Type]	Select the display method of the comments for alarms. • [Fixed] Each comment is displayed in one row without scrolling. Part of a comment that extends off the display area, including the second and subsequent rows of multi-row comments, is not displayed. • [Flow] Comments are displayed by scrolling across the screen from right to left. For a comment that spans multiple rows, the GOT displays the entire comment, including the second and subsequent rows. ☞ Page 2108 Specifying whether to use the fixed display or scrolling display
5)	[Switching Cycle]	Set this item when [Display Type] is [Fixed]. Set a cycle at which alarms to monitor are switched when multiple alarms occur. The setting range is [1] to [60].
6)	[Flow Rate]	Set this item when [Display Type] is [Flow]. Select the speed at which the display is scrolled.
7)	[Close up the space between alarm comments]	Set whether to reduce the space between scrolling comments when [Flow] is specified for [Display Type]. When this item is selected, the space between comments is reduced to two one-byte characters. When this item is deselected, a space of a half the screen width is inserted between comments.
8)	[Display Position Switching]	Set whether to enable or disable the touch operation for display position switching of the alarm popup display.

Item			Description
9)	[Contents]	[Display]	Select the items to be displayed in the alarm popup display.
		[Attribute]	Displays the items to be displayed in the alarm popup display. • [Date of Occurrence] Displays the date and time of occurrence of an alarm. To display the date and time, set the display format in the [Date Format] field. • [Comment] Displays the comment which is set for the alarm.
		[Date Format]	Set the display format of the alarm occurrence date and time. Click the [...] button to specify the date and time format in the [Date/Time Setting] dialog. ☞ Page 3684 [Date/Time Setting] dialog (screen)
10)	[Display Order]		Set the display order when the [Display] checkboxes for both [Date of Occurrence] and [Comment] are selected. Select either [Date of Occurrence] or [Comment] (the cell turns blue), and click the left or right arrow button to move the display position.
11)	[Display detailed system alarm information]		When [System Alarm] is selected for [Display Alarm], select this item to display the detailed information on the system alarm when it occurs. For the contents to be displayed when this item is selected, refer to the following. ☞ Page 2120 Displaying the detailed information
12)	[Initial Display Hierarchy]		Set this item when [User Alarm] is selected for [Display Alarm]. Select a level in the alarm hierarchy to be displayed first when a user alarm occurs.
13)	[Touch Mode]		Set the action when the alarm popup display is touched. ☞ Page 2107 How to use the alarm popup display The following shows selectable items. • [NO] Select this item to disable touch operations. • [Screen Switching] The screen is switches when the popup display is touched. Set the destination screen in the [Destination Screen] section. • [Hierarchy Switching/Detail Display] This item cannot be selected when [Close up the space between alarm comments] is selected. The alarm hierarchy level switches when the alarm popup display is touched. The operations differ depending on the alarm being displayed. When upper- or middle-level alarms are displayed, the display is switched to a lower level in the alarm hierarchy. When basic alarms are displayed, the detail screen is displayed.
14)	[Destination Screen]		Set this item when [Screen Switching] is selected for [Touch Mode]. Set the destination screen when the alarm popup display is touched. After selecting [Base Screen] or [Overlap Window1], set the number of the screen to be displayed. The setting range of the screen number is [0] to [32767]. The title of the selected screen is displayed in the field on the right.

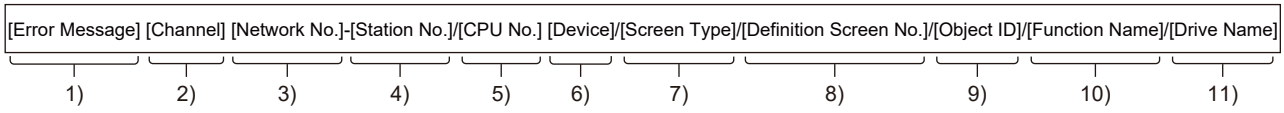
Displaying the detailed information

The following shows the contents displayed when [Display detailed system alarm information] is selected.

The information collected for each system alarm differs. Unrelated or undetectable information is not displayed.

If detailed information is displayed, the message becomes longer.

When all information is not be displayed, select scrolling (flow) as the display type.



Information		Description	Format, display example
1)	Error message	Displays the error code of a system error and the error message.	—

Information		Description	Format, display example	
2)	Channel	Displays the channel number.	DEV:Ch (Channel) (Network No.)-(Station No.)/(CPU No.) (Device)	
3)	Network number	Displays the network number.		
4)	Station number	Displays the station number.		
5)	CPU number	Displays the CPU number.		
6)	Device	Displays the device. For the device to which offset is specified, the device name and device number after the offset are displayed. If the device number after the offset is out of the range, ?? is displayed.		
7)	Screen number	Displays the screen type and the screen number.	Screen type:(Screen number) The screen number is displayed with five digits. When the number of digits in the displayed number is less than five, the number is displayed with zero(s) added. The following shows the formats for each screen type.	
			Base screen	BASE
			Overlap window	Example) Overlap window 1 OVL1
			Superimpose window	Example) Superimpose window 1 SPI1
			User customize dialog	DLG
			Key window	KEY
			Base screen (GOT Mobile)	MBL-BASE
			Overlap window (GOT Mobile)	Example) Overlap window 1 MBL-OVL1
			Superimpose window (GOT Mobile)	Example) Superimpose window 1 MBL-SPI1
8)	Definition screen number	Displays the definition screen type and the screen number.	Definition screen type:(Screen number) The screen number is displayed with five digits. When the number of digits in the displayed number is less than five, the number is displayed with zero(s) added. The following shows the formats for each definition screen type.	
			Base screen	B
			Window screen	W
			Mobile screen	MB
9)	Object ID	Displays the object ID.	ID:(Object ID) The object ID is displayed with five digits. When the number of digits in the displayed number is less than five, the number is displayed with zero(s) added.	
10)	Function name	Displays the function name. Languages are switched along with the language switching.	—	
11)	Drive name	Displays the drive name.	DRV:(Drive name)	

Ex.

Channel (1), device (X1000), screen No. (overlap window 3, screen No. 251), definition screen No. (window screen, screen No. 251), object ID (10000), function name (shape display)

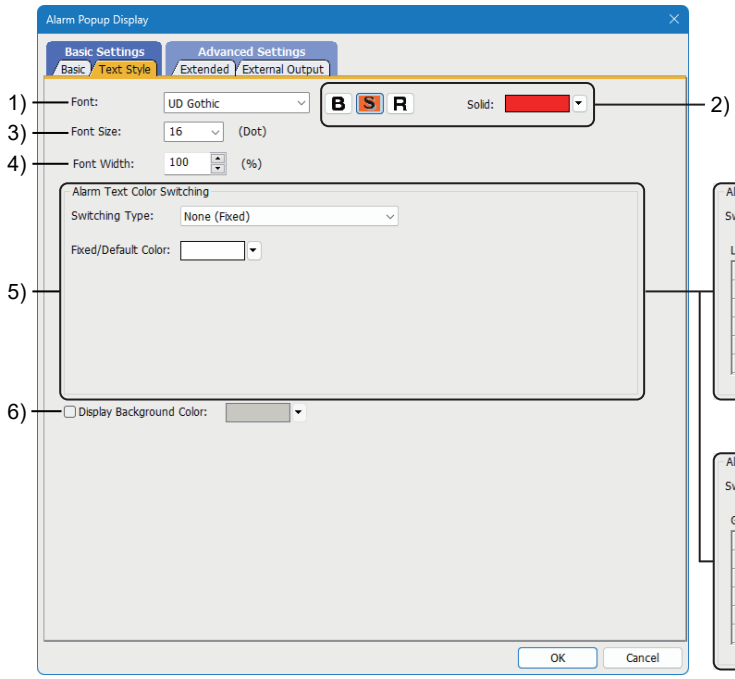
G01-322 The specified device No. is out of the range. Check the available range. DEV:Ch1 X1000/OVL3:00251/W:00251/ID:10000/Shape display

62.5.2 [Text Format] tab

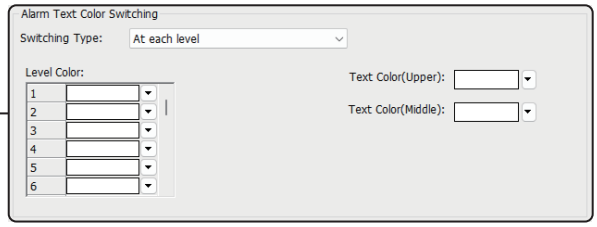
Set the text format of the alarm popup display.

Some setting items cannot be set in the [GOT Mobile Setting] window ([Alarm Popup Display]).

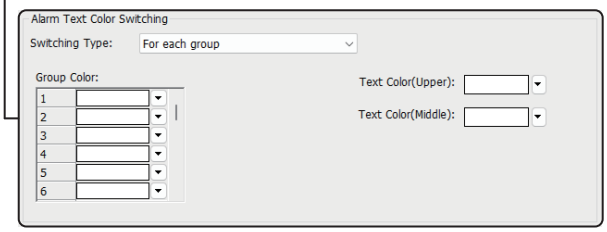
☞ Page 2742 Usable functions



When selecting [None (Fixed)] or
[Comment Color (System Alarm: Fixed)] for [Switching Type]



When selecting [At each level] for [Switching Type]



When selecting [For each group] for [Switching Type]

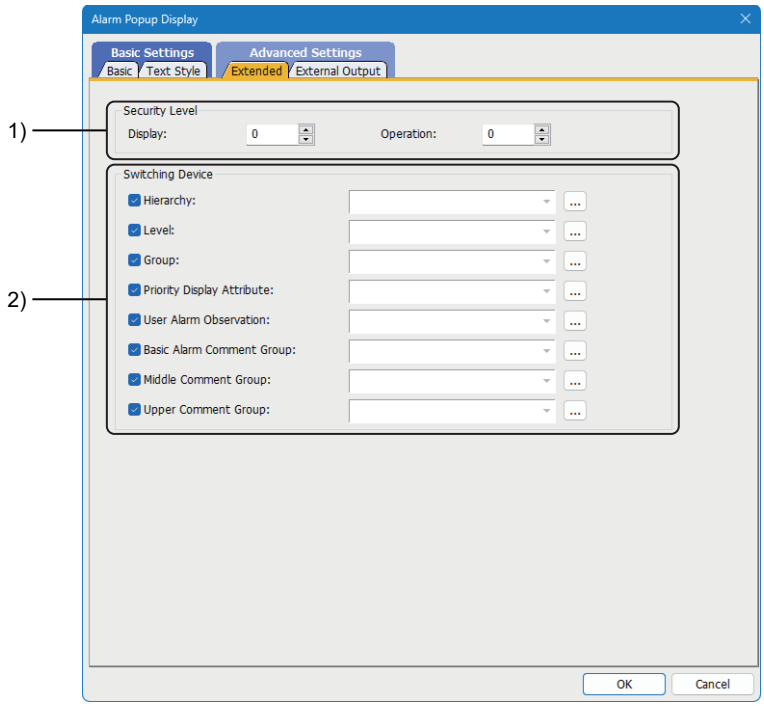
Item			Description
1)	[Font]		Select the font of the displayed text.
2)	Text style		Set the text style. Only one style ([Bold], [Solid], or [Raised]) is settable. When selecting [Solid] or [Raised], set the color of the shadow.
3)	[Font Size]		Select a text size. The setting range is [8] dots to [540] dots.
4)	[Font Width]		Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%. Note that the size per character is always within the range of [8] dots to [540] dots.
5)	[Alarm Text Color Switching]	[Switching Type]*1	Set the switching method of the text color. This item is fixed to [None (Fixed)] for system alarms. • [None (Fixed)] Displays texts in a single color. • [At each level] Changes the text color for each level. • [For each group] Changes the text color for each group. • [Comment Color (System Alarm: Fix)] Displays user alarms in text colors set for comment groups. The settings other than that of the text color are displayed in the settings of the [Alarm Popup Display] dialog. System alarms are displayed in the color set for [Fixed/Default Color].
		[Fixed/Default Color]	Select the text color when [None (Fixed)] or [Comment Color (System Alarm: Fix)] is selected for [Switching Type].
		[Level Color]	When [At each level] is selected for [Alarm Text Color Switching], specify a text color for each level.
		[Group Color]	When [For each group] is selected for [Alarm Text Color Switching], specify a text color for each group.
		[Text Color (Upper)] Text Color (Middle)	Set the text color when upper- or middle-level of alarms are displayed. These settings are prioritized over [Level Color] and [Group Color].
6)	[Display Background Color]		Select the background color of the alarm popup display. A semitransparent popup window appears in a user-specified color.

*1 The following shows the relation between the set text color and text color displayed.

Alarm to be displayed	Setting for [Switching Type] and applied text color			
	[None (Fixed)]	[At each level]	[For each group]	[Comment Color (System Alarm: Fix)]
User alarm	Displays in the color set for [Fixed/Default Color].	Displays in the color set for [Level Color].	Displays in the color set for [Group Color].	Displays in the color set for each comment group. In a case where no comment exists, displays in the color set for [Fixed/Default Color].
System alarm		Displays in the color set for [1] of [Level Color].	Displays in the color set for [1] of [Group Color].	Displays in the color set for [Fixed/Default Color].

62.5.3 [Extended] tab

Set the security level of the object and devices for switching the contents displayed in the alarm popup display.



Item		Description
1)	[Security Level]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security) The setting of security level of [Operation] must be set to the one exceeding the security level of [Display].
2)	[Switching Device]	The contents displayed in the alarm popup can be switched according to the device values. Select the items to be switched by using the switching device, and then set the devices (word devices and word-specified bit devices). ☞ Page 835 Setting a device in the device setting dialog Items that can be switched by using devices are as follows. When [System Alarm] is selected for [Display Alarm] in the [Basic] tab, only [Priority Display Attribute] can be set. ☞ Page 2125 [Hierarchy] ☞ Page 2126 [Level] ☞ Page 2126 [Group] ☞ Page 2126 [Priority Display Attribute] ☞ Page 2126 [User Alarm Observation] ☞ Page 2127 [Basic Alarm Comment Group] ☞ Page 2127 [Middle Alarm Comment Group] ☞ Page 2127 [Upper Alarm Comment Group]

Precautions

If the displayed contents are changed by using switching devices when the number of monitored devices is large in the user alarm monitoring, displaying the alarms may require a few seconds.

[Hierarchy]

This item is settable when [User Alarm] is selected for [Display Alarm] in the [Basic] tab.

The hierarchy level to be displayed is switched by using a device.

This device is referred to as the hierarchy switching device.

The hierarchy switching device has the following functions.

- Switching the display target hierarchy level (b0 to b7)
- Notifying the switching method and display target hierarchy level when the hierarchy level is switched (b15)

To switch the hierarchy level, write the corresponding value to b0 to b7 of the hierarchy switching device (refer to the following table).

The following shows the functions of each bit of the hierarchy switching device.

Bit	Description
b0 to b7	Switches the hierarchy level to be displayed by changing the device value. Comments of all the current user alarms at the specified level in the alarm hierarchy are displayed sequentially. The following shows the relationship between the device values and the displayed hierarchy levels. • 0: Basic alarm • 1: Middle-level alarm • 2: Upper-level alarm
b8 to b14	Use prohibited
b15	Notifies the switching method when the hierarchy level is switched. This bit turns on when the hierarchy level is switched using touch operation. It does not turn off automatically. While this bit is on, hierarchy level switching using b0 to b7 of the hierarchy switching device is not applied.

Precautions

- Alarm hierarchy setting

Configure the alarm hierarchy setting in the [User Alarm Observation] dialog in advance.

☞ Page 2045 [User Alarm Observation] dialog

- Display update when the level in the alarm hierarchy is changed

When [Display Type] is set to [Fixed] in the [Basic] tab of the [Alarm Popup Display] dialog and the display target hierarchy level is switched using the hierarchy switching device, the display is updated with the timing set for [Switching Cycle]. Therefore, the display may not be switched soon after the hierarchy level is switched.

■Initial display hierarchy level and hierarchy level switching device

In the alarm popup display, the hierarchy level specified in [Initial Display Hierarchy] is written to the hierarchy switching device at the following timings.

The hierarchy level to be displayed is switched.

- When screens are switched (user alarms only)
- When the alarm display (user) is displayed for the first time
- When the IDs of alarms to be displayed are switched by using the alarm ID switching device

Select the initial display hierarchy level for [Initial Display Hierarchy] in the [Alarm Popup Display] dialog ([Basic] tab).

☞ Page 2119 [Basic] tab

For the setting of the alarm ID switching device, refer to the following.

☞ Page 2126 [User Alarm Observation]

[Level]

This item is settable when [User Alarm] is selected for [Display Alarm] in the [Basic] tab.
The levels of the alarm to be displayed are switched by using a device.
To display a specific level, specify a level number within 1 to 255.
If a nonexistent level No is specified, alarms are not displayed.
To display all levels, specify the level No. 0 or a No. over 256.

[Group]

This item is settable when [User Alarm] is selected for [Display Alarm] in the [Basic] tab.
The groups of the alarm to be displayed are switched by using a device.
To display a specific group, specify a group number within 1 to 255.
If a nonexistent group No is specified, alarms are not displayed.
To display all groups, specify 0 or 256 or more.

[Priority Display Attribute]

Switch the items to be the sort criteria and sorting order according to the device values.
Store values to the device as follows to switch the order of alarm display.
While upper- and middle-level alarms are displayed, they can only be sorted by occurrence date and time.

Bit	Description
b0 to b3	Specify the sort criteria. • □000h: Normal (date and time of occurrence) • □001h: Date and time of occurrence • □005h: Level (User alarm only) • □006h: Group (User alarm only) If a value other than the above is stored, alarms are displayed in the order of the date and time of occurrence.
b4 to b14	Use prohibited
b15	Specify the ascending or descending order. • 000□h: Descending • 800□h: Ascending

[User Alarm Observation]

This item is settable when [User Alarm] is selected for [Display Alarm] in the [Basic] tab.
The user alarms to be displayed are switched by using a device.
Store the alarm ID of the user alarm monitoring to the device.
Alarm IDs for which [Pop up alarms] is not selected in the [Basic] tab of the [User Alarm Observation] dialog are also displayed.
When the alarm ID switching device is not set or 0 is stored in the device, alarms are displayed only when they have alarm IDs whose [Pop up alarms] setting of the user alarm monitoring is selected.
If a nonexistent alarm ID is specified, alarms are not displayed.

[Basic Alarm Comment Group]

This item is settable when [User Alarm] is selected for [Display Alarm] in the [Basic] tab.
Switch the comment group to be displayed in the basic alarm according to the device values.
If 0 is stored to the device, alarms are displayed with the comment group which is set for the user alarm monitoring. When a nonexistent comment group number is specified, [No message] is displayed.

[Middle Alarm Comment Group]

This item is settable when [User Alarm] is selected for [Display Alarm] in the [Basic] tab.
Switch the comment group to be displayed in the middle-level alarm according to the device values.
If 0 is stored to the device, alarms are displayed with the comment group which is set for the user alarm monitoring. When a nonexistent comment group number is specified, [No message] is displayed.

[Upper Alarm Comment Group]

This item is settable when [User Alarm] is selected for [Display Alarm] in the [Basic] tab.
Switch the comment group to be displayed in the upper-level alarm according to the device values. If 0 is stored to the device, alarms are displayed with the comment group which is set for the user alarm monitoring. When a nonexistent comment group number is specified, [No message] is displayed.

62.5.4 [External Output] tab

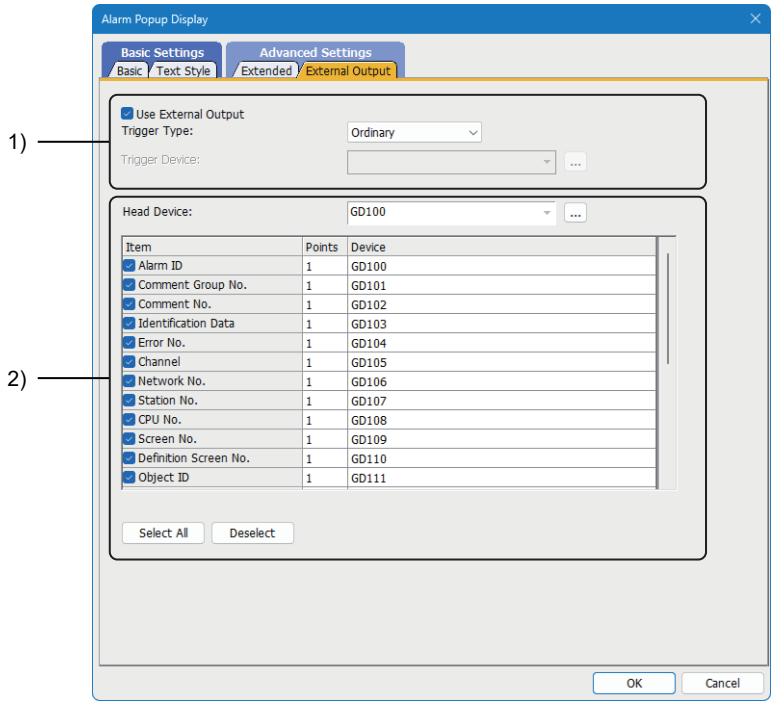
Configure the setting for writing the information of touched alarm in the alarm popup display into devices.

Precautions

To write the alarm information to devices, configure the following settings in the [Basic] tab in the [Alarm Popup Display] dialog.

☞ Page 2118 [Alarm Popup Display] dialog

- Select [Screen Switching] or [Hierarchy Switching/Detail Display] for [Touch Mode].
- Select [Fixed] for [Display Type].
- Deselect [Close up the space between alarm comments] when [Flow] is selected for [Display Type].



Item			Description
1)	[Use External Output]	—	Select this item to write the alarm information to devices. ☞ Page 2113 Writing the alarm information to devices
		[Trigger Type]	Select the timing to write the alarm information into a device. • [Ordinary] Writes the information of the touched alarm to the device. • [ON] Writes the alarm information into the device when the alarm display area is touched while the device is on. • [OFF] Writes the alarm information into the device when the alarm display area is touched while the device is off.
		[Trigger Device]	When selecting [ON] or [OFF] in [Trigger Type], set the device (bit device or bit-specified word device) to be a trigger. ☞ Page 835 Setting a device in the device setting dialog
2)	[Head Device]	—	Set the start device (word device) to which the information of the alarm is written. The bit device cannot be specified as the word device. ☞ Page 834 How to set devices, labels, and tags Selecting the items to be output externally sets consecutive devices starting from the head device as the external output devices for each item. For the targets and output specifications of external output, refer to the following. ☞ Page 2129 Targets and output specifications of external output
		[Select All] button	Selects all the output target items.
		[Deselect] button	Deselects all the output target items.

Targets and output specifications of external output

The following shows the target items and output specifications of external output.

The output target items differ between user alarms and system alarms.

○: Items to be output

×: Items not to be output

Item	Alarm type		Output specifications	
	User alarm	System alarm		
[Alarm ID]	○	×	—	
[Comment Group No.]	○	×	—	
[Comment No.]	○	×	—	
[Identification Data]	×	○	A system error No. is displayed.	
[Error No.]	×	○	—	
[Channel]*1	×	○	—	
[Network No.]*1	×	○	For the host station, the network No. is 0x0000.	
[Station No.]*1	×	○	For the host station, the station No. is 0x00FF.	
[CPU No.]*1	×	○	—	
[Screen No.]*1	×	○	—	
[Definition Screen No.]*1	×	○	—	
[Object ID]*1	×	○	—	
[Alarm Status]*2	○	○	The following bits of the word device are used to output the alarm status.	
			b0	• Occurring: ON • Restored: OFF
			b1	• Checked: ON • Unchecked: OFF
			b2	• When external output of the alarm status is enabled: ON • When external output of the alarm status is disabled: OFF
			b3 to b15	Use prohibited
[Occurred Date]	○	○	For the data storage specifications of date and time, refer to the following. ☞ Page 2130 Data storage specifications of date and time	
[Occurred Time]*2	○	○		
[Restored Date]*3	○	○		
[Restored Time]*2*3	○	○		
[Checked Date]*3	○	○		
[Checked Time]*2*3	○	○		
[Level]	○	○	—	
[Group]	○	○	—	
[Frequency of Occurrences]*4	○	×	If the occurrence frequency exceeds 1 word (65535), 65535 is output.	
[Cumulative Time]*4	○	×	The cumulative time (in hours and minutes) is stored in BCD code in two word devices. Example) When the cumulative time is 12 hours and 35 minutes Device value: 1235	
[Down Time]*4	○	×	The downtime (in hours and minutes) is stored in BCD code in two word devices. Example) When the downtime is 2 hours and 10 minutes Device value: 210	

*1 This information makes it easy to identify where the error has occurred.
The contents to be output differ depending on the settings configured for [Display detailed information on the target alarm] in the [User Alarm Observation] dialog.
In addition, obtained information differs depending on the system alarm. The information which is not related to the error is not output even if the information is set.

*2 For the output specifications when upper- or middle-level alarms are displayed, refer to the following.
☞ Page 2130 Output specifications when upper- or middle-level alarms are displayed

*3 This item can be selected only when the alarm history collecting method is the cumulative mode or history mode.

*4 This item can be selected only when the alarm history collecting method is the cumulative mode.

■Output specifications when upper- or middle-level alarms are displayed

When upper- or middle-level alarms are displayed, the output time includes the following information.

Item	Output specifications
[Occurred Time]	The occurrence time of the most recent alarm at the hierarchy level is output.
[Restored Time]	An invalid value (0) is output because restored alarms are not displayed in the alarm popup display.
[Checked Time]	The check time of the most recent alarm at the hierarchy level is output.

If any unchecked or unrestored alarm is included under the alarm currently displayed, the entire hierarchy is handled as unchecked or unrestored, and thus an invalid value (0) is output to the external output device.
If the levels or groups to be displayed are narrowed by the switching device, information is output only for the narrowed alarms.

■Data storage specifications of date and time

The date and time are respectively stored in two word devices.
The following describes the case in which the time of occurrence is written into D254 (2 points) and the date of occurrence is written into D256 (2 points).

Item	Data storage specifications
Date	Store the year, month, and day with BCD code. D254: b15 to b8 = Month (1 to 12), b7 to b0 = Day (1 to 31) D255: b15 to b8 = Two upper digits of year, b7 to b0 = Two lower digits of year
Time	Stores the hour, minute, and second with BCD code. D256: b15 to b8 = Minute (0 to 59), b7 to b0 = Second (0 to 59) D257: b15 to b8 = 00, b7 to b0 = Hour (0 to 23)

Ex.

Jun. 1, 2024 12:24:56

D254: b15 to b8 = 06 (Month), b7 to b0 = 01 (Day)

D255: b15 to b8 = 20, b7 to b0 = 24 (Year)

D256: b15 to b8 = 24 (Minute), b7 to b0 = 56 (Second)

D257: b15 to b8 = 00, b7 to b0 = 12 (Hour)

62.6 Relevant settings

GT37 SoftGOT3000

Set the relevant settings other than the specific settings for the alarm popup display as required.
The following shows the functions that are available by configuring the relevant settings.

62.6.1 Alarm monitoring setting dialog

The following shows the functions to be set in the alarm monitoring setting dialog.
After configuring the alarm monitoring settings, configure the settings to display the alarms in the popup display.

Popup display target	Required setting
User alarm	Select [Pop up alarms] in the [Basic] tab in the [User Alarm Observation] dialog.
System alarm	Select [Target] in the [Basic] tab in the [User Alarm Observation] dialog.

62.6.2 Property of screens

The following shows the functions to be set for each screen (screen property).
Select the screen where the alarm popup display will be displayed, then select [Screen] → [Screen Property] from the menu to display the screen properties dialog.
☞ Page 313 Changing screen property

Function	Setting item
Setting whether to display the alarm popup display or not for each screen Selecting the display position of the alarm popup display from among three positions: the top row, the center row, or the lower row	Set this function with the following items of the [Basic] tab. • [Use Alarm Popup Display] • [Display Position]

62.6.3 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Turning off the Key Input signal (System signal 1-1.b3)	[System Signal 1-1]
Disabling all the key inputs (System signal 1-1.b9)	[System Signal 1-1]
Resetting system alarms and system information (GOT error code, GOT Error Detection signal) (System signal 1-1.b13)	[System Signal 1-1]
Notifying a key input (System signal 2-1.b3)	[System Signal 2-1]

62.6.4 GOT internal devices

☞ Page 3577 GOT internal devices

Function	Setting item
Storing the channel No. that has been assigned to the channel where a system alarm (GOT error) occurs	GS262
Storing the channel No. that has been assigned to the channel where a system alarm (CPU error) occurs	GS263
Storing the channel No. that has been assigned to the channel where a system alarm (network error) occurs	GS264

63 Viewing alarm events (Alarm display)

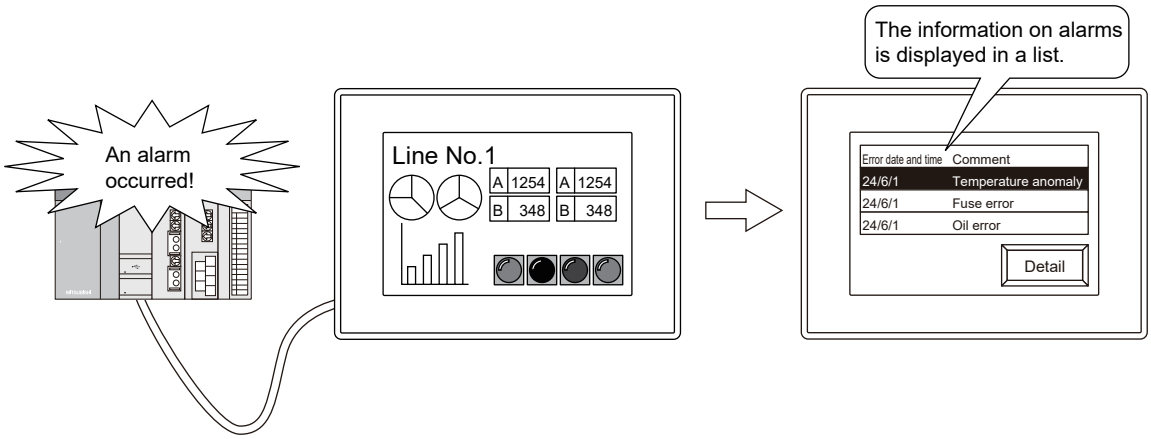
GT37 SoftGOT3000

☞ Page 2133 Overview of the alarm display
☞ Page 2134 How to use the alarm display
☞ Page 2139 Specifications of the alarm display
☞ Page 2140 Configuring the settings for an alarm display
☞ Page 2141 Key code switches for operating alarm displays
☞ Page 2144 [Alarm Display(User)] dialog
☞ Page 2164 [Alarm Display(System)] dialog
☞ Page 2178 Relevant settings

63.1 Overview of the alarm display

GT37 SoftGOT3000

The alarm display object lists the collected user or system alarm events.
Alarms can be checked or deleted using touch operations or key code switches.



This chapter explains the alarm display, which is an object to display the collected alarms on the GOT screens.
For collecting user or system alarm events, refer to the following.

☞ Page 1896 Placing a hyperlink on a mobile screen
☞ Page 1896 Placing a hyperlink on a mobile screen

63.2 How to use the alarm display

GT37 SoftGOT3000

The object to be used differs depending on the displayed alarms.

Displayed alarms	Object to be used	Reference for setting
Alarms collected by the user alarm monitoring	Alarm display (user)	☞ Page 2144 [Alarm Display(User)] dialog
Alarms collected by the system alarm monitoring	Alarm display (system)	☞ Page 2164 [Alarm Display(System)] dialog

The function differs depending on the object.

○: Supported

—: Unsupported

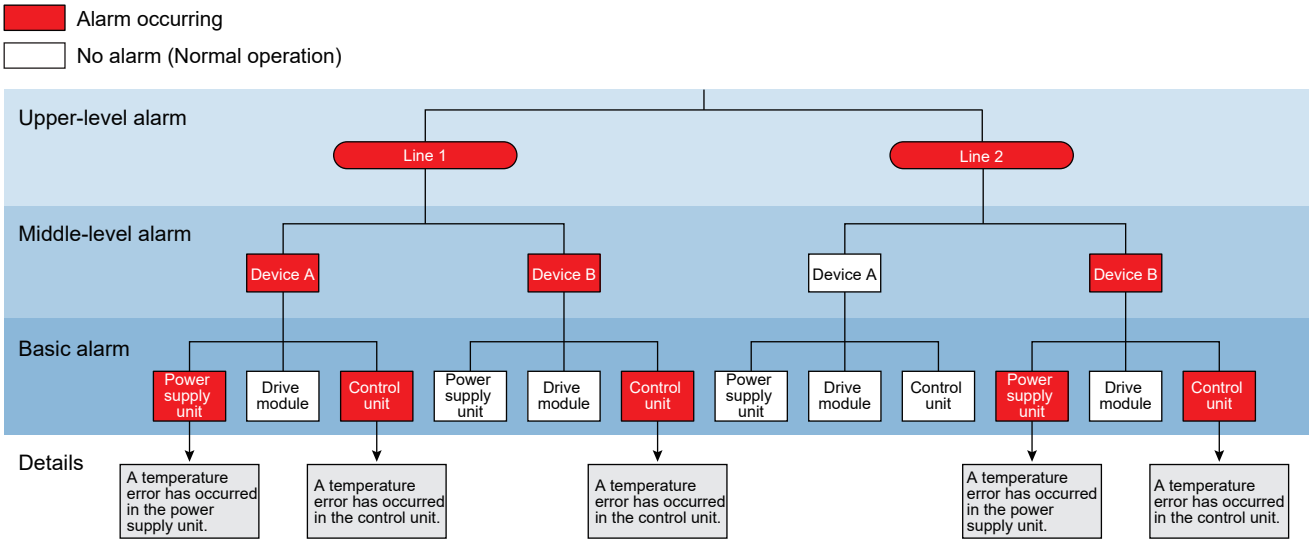
Function		Support by object	
		Alarm display (user)	Alarm display (system)
Scrolling display	Long messages that cannot be fully displayed in the object can be checked by scrolling them. Set the scrolling display in the [Alarm Setting] tab.	○	○
Sort order specification	The sort order of the displayed alarms can be specified. By using the priority display attribute switching device, the sort order can be switched dynamically. Set the sort order in the [Style] tab. Set the priority display attribute switching device in the [Extended] tab. Example) Sort condition: Date and time of occurrence (reverse chronological) Error date and time / Comment / Restored / Checked / Frequency 24/06/01 20:00 / Power supply unit error / - / - / 1 24/06/01 18:30 / Hydraulic pressure failure / - / 18:50 / 2 24/06/01 16:10 / Drive module error / 16:30 / 16:20 / 5 24/06/01 14:00 / Motor error / 15:00 / 14:10 / 4 24/06/01 13:30 / Light error / 14:30 / 13:50 / 1 Example) Sort condition: Frequency (descending order) Error date and time / Comment / Restored / Checked / Frequency 24/06/01 16:10 / Drive module error / 16:30 / 16:20 / 5 24/06/01 14:00 / Motor error / 15:00 / 14:10 / 4 24/06/01 18:30 / Hydraulic pressure failure / - / 18:50 / 2 24/06/01 20:00 / Power supply unit error / - / - / 1 24/06/01 13:30 / Light error / 14:30 / 13:50 / 1	○	○
Text color/style specification by condition	Setting text colors and styles for each condition such as the alarm status facilitates visual identification of alarm events. Set the text color and style in the [Text] tab.	○	○
Comment language switching	The following features of the alarm display support comment switching using the language switching device. • Title • Alarm comment (alarm display (user) only) For the language switching, refer to the following. ☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching])	○	○
Switching the hierarchy level	The hierarchy levels to be displayed can be switched, and the alarms to be displayed can be narrowed down. ☞ Page 2135 Switching the alarm hierarchy level (user alarms only)	○	—
Switching the displayed contents (narrow)	The displayed content can be switched according to the value of the switching device. Set a switching device for each item to be switched. ☞ Page 2138 Switching the displayed contents according to the device values	○	○
External output	The information of the selected alarm can be output to external output devices. Set the external output devices in the [External Output] tab.	○	○

63.2.1 Switching the alarm hierarchy level (user alarms only)

You can configure the settings to switch the hierarchy level of the currently occurring user alarm to another level.
The following two methods are available for switching the hierarchy level.

Switching method	Description
☞ Page 2136 Switching the hierarchy level using touch operation	Touching the alarm display (user) switches the hierarchy level down. The following operations switch hierarchy level down. • Touching the alarm display (user) • Touching the key code switch for switching the hierarchy level while the cursor is displayed on the alarm display (user)
☞ Page 2137 Switching the hierarchy level using a device	Switches the hierarchy level of the alarm displayed on the alarm display (user) depending on the value stored in the device.

The display range differs depending on the switching method.
The following system examples show differences in display ranges according to the switching methods.



Point

To display hierarchized comments, it is recommended to set upper-level alarms to be displayed at the initial display hierarchy level.
Set the initial display hierarchy level in the [Alarm Setting] tab in the [Alarm Display(User)] dialog.
☞ Page 2144 [Alarm Setting] tab
When you perform any of the following operations using a device, all the alarms set at the initial display hierarchy level are displayed regardless of the hierarchy levels displayed.

- Switching between alarm IDs
- Switching between languages

Switching the hierarchy level using touch operation

The following shows an example of switching the hierarchy level by touching the alarm display (user).
You can configure the settings so that touching the alarm display (user) will switch the hierarchy level of the touched alarm down.
Only the level below the touched alarm is displayed.
If no comment is set in the switching destination level or the comment could not be obtained, [No message] is displayed.

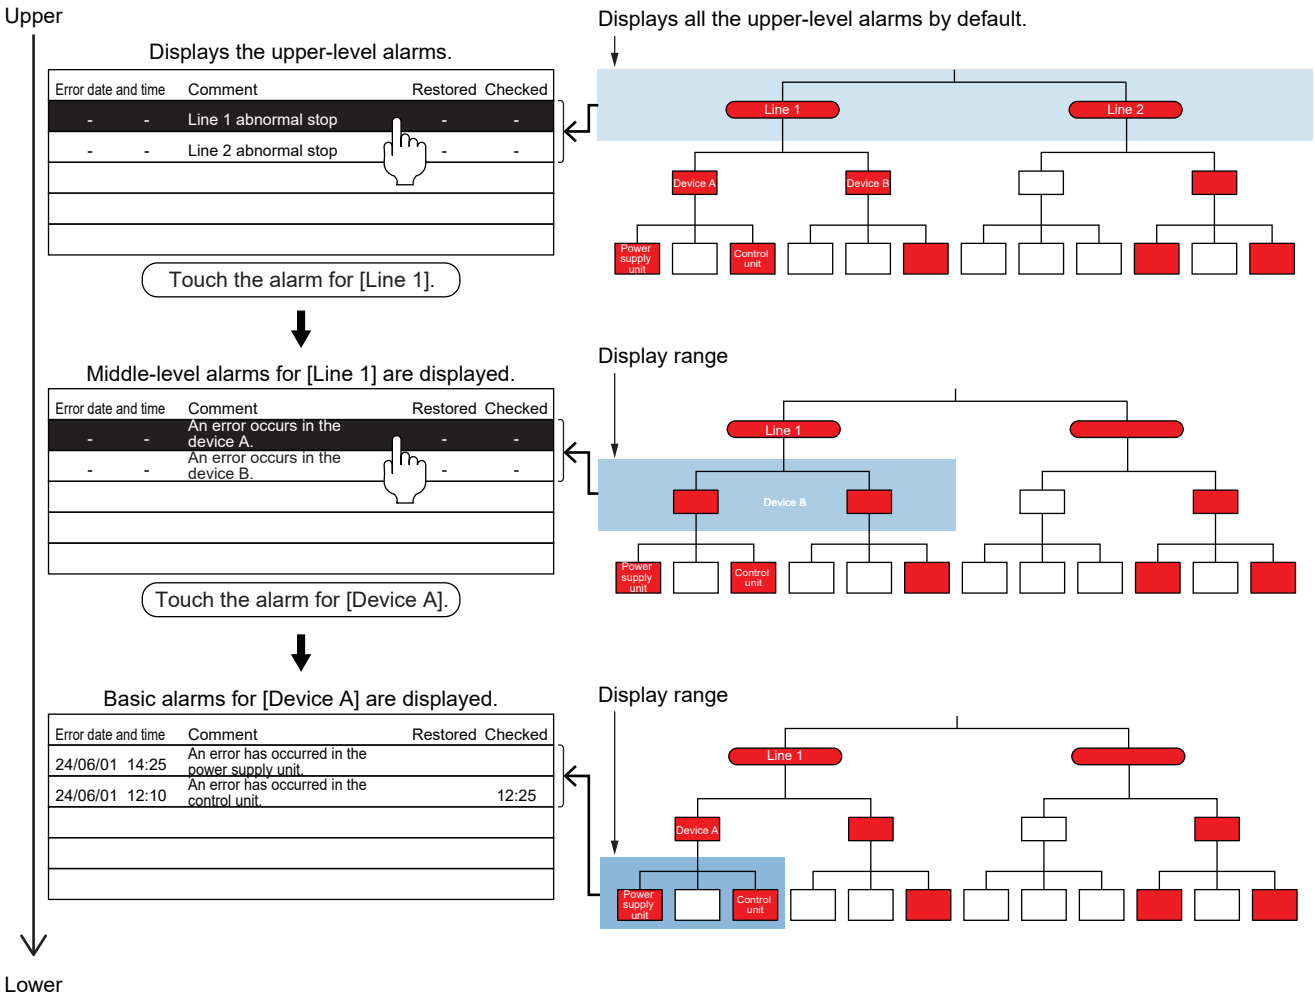
Precautions

If an alarm at the lower level in a tree of the hierarchy occurs while alarms at the lower level in another tree of the hierarchy are displayed, the new alarm is not displayed.
To display the new alarm, display all the alarms of the specified hierarchy level using the hierarchy switching device.
Alternatively, specify an upper hierarchy level using the hierarchy switching device and change the hierarchy level of the new alarm.

■Target of the alarm hierarchy change

The alarm hierarchy change applies to the touched alarm.

Ex.
When [Initial Display Hierarchy] is set to upper-level alarms in the [Alarm Setting] tab in the [Alarm Display(User)] dialog



■How to switch the hierarchy level up

Perform either of the following operations to switch the hierarchy level up.

Method	Description
Switching with the key code switch	Touch the key code switch for which the key code FFC2 has been set. ☞ Page 2141 Key code switches for operating alarm displays
Switching using the screen switching device	☞ Page 2137 Switching the hierarchy level using a device

Switching the hierarchy level using a device

The alarm hierarchy of the alarm to be displayed can be specified using a device.

When levels are switched by using a device, the comments of all the current alarms at the level specified by the device are displayed unlike the level switching by touch operation.

Set the hierarchy switching device by selecting [Hierarchy] under [Switching Device] in the [Alarm Display(User)] dialog ([Extended] tab).

☞ Page 2155 [Extended] tab

If no comment is set in the switching destination level, [No message] is displayed.

Ex.

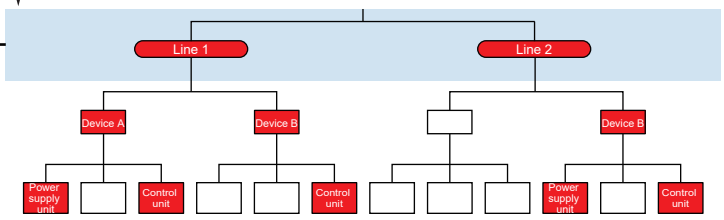
When the hierarchy switching device is set to GD110

Displays the upper-level alarms.

GD110 2

Error date and time	Comment	Restored	Checked
- -	Line 1 abnormal stop	-	-
- -	Line 2 abnormal stop	-	-

Displays all the upper-level alarms.

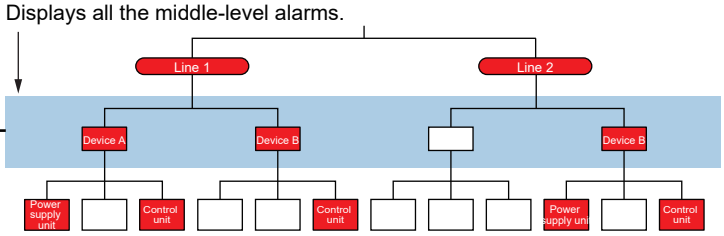


Displays the middle-level alarms.

GD110 1

Error date and time	Comment	Restored	Checked
- -	An error occurs in the device A.	-	-
- -	An error occurs in the device B.	-	-
- -	An error occurs in the device B.	-	-

Displays all the middle-level alarms.

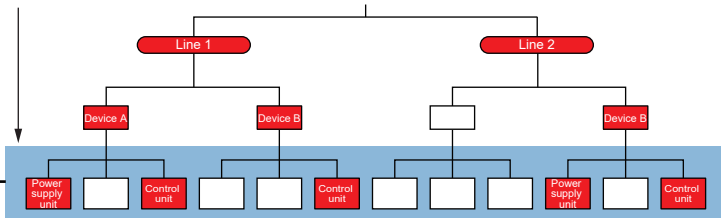


Displays the basic alarms.

GD110 0

Error date and time	Comment	Restored	Checked
24/06/01 14:25	An error has occurred in the power supply unit.		
24/06/01 12:10	An error has occurred in the control unit.		12:25
24/06/01 10:00	An error has occurred in the control unit.		11:00
24/06/01 09:15	An error has occurred in the power supply unit.	10:10	09:55
24/06/01 08:35	An error has occurred in the control unit.	10:20	09:40

Displays all the basic alarms.



63.2.2 Switching the displayed contents according to the device values

The alarm events can be switched according to the value of the specified device.

Set [Switching Device] on the [Extended] tab.

Object	Reference
Alarm display (user)	☞ Page 2155 [Extended] tab
Alarm display (system)	☞ Page 2172 [Extended] tab

The following table lists the items that can be switched according to the device values.

Items that can be switched for the alarm display (user)

Item that can be switched by using devices	Description
Hierarchy*1	The comments of all the current alarms at the specified level are displayed.
Level*1	The alarm events in the specified level are displayed.
Group*1	The alarm events in the specified group are displayed.
Priority display attribute	The display order is switched between the ascending order and descending order. For the relationship between the sort criteria and device value, refer to the following. ☞ Page 2157 Details of [Switching Device]
Basic alarm comment group	The alarm events are displayed using the comments of the specified comment group. You can change the comments according to your purpose.
Middle comment group	
Upper comment group	

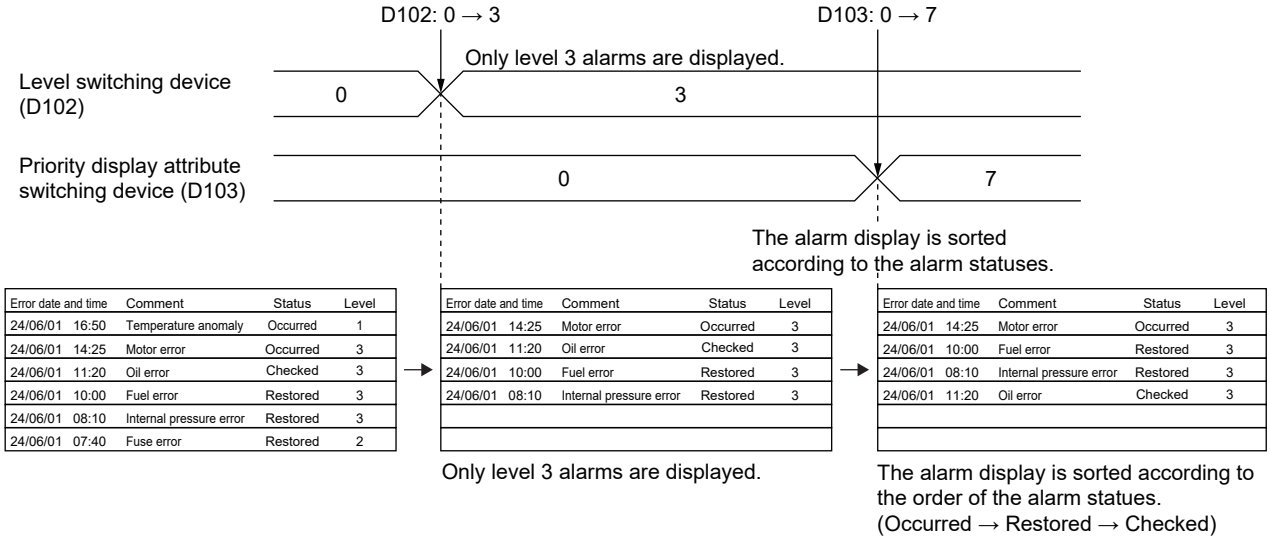
*1 To set the hierarchy level, level number, and group for alarms, use the user alarm monitoring dialog.
☞ Page 2048 [Device] tab

Ex.

Example in which the following devices are set and the device values are changed

Level switching device: GD102

Display attribute switching device: GD103



Error date and time	Comment	Status	Level
24/06/01 16:50	Temperature anomaly	Occurred	1
24/06/01 14:25	Motor error	Occurred	3
24/06/01 11:20	Oil error	Checked	3
24/06/01 10:00	Fuel error	Restored	3
24/06/01 08:10	Internal pressure error	Restored	3
24/06/01 07:40	Fuse error	Restored	2

Error date and time	Comment	Status	Level
24/06/01 14:25	Motor error	Occurred	3
24/06/01 11:20	Oil error	Checked	3
24/06/01 10:00	Fuel error	Restored	3
24/06/01 08:10	Internal pressure error	Restored	3

Error date and time	Comment	Status	Level
24/06/01 14:25	Motor error	Occurred	3
24/06/01 10:00	Fuel error	Restored	3
24/06/01 08:10	Internal pressure error	Restored	3
24/06/01 11:20	Oil error	Checked	3

Item that can be switched for the alarm display (system)

Item that can be switched by using devices	Description
Priority display attribute	The display order is switched between the ascending order and descending order. For the relationship between the sort criteria and device value, refer to the following. ☞ Page 2173 Details of [Priority Display Attribute]

63.3 Specifications of the alarm display

GT37 SoftGOT3000

63.3.1 Maximum number of objects that can be placed on one screen

The following table lists the maximum numbers of objects that can be placed on one screen.

Object	Maximum number of objects on one screen
Alarm display (user)	25 33 (total number of alarm displays (user) and simple alarm displays)
Alarm display (system)	8

Precautions

By using the set overlay screen function, another screen (called screen) can be called and displayed on the basic screen.
The basic screen and called screen are handled as one screen.
Therefore, make sure that the total number of objects placed on the basic screen and the called screen does not exceed the maximum number of objects that can be placed on a screen.
For the set overlay screen function, refer to the following.
☞ Page 1865 Placing a screen on another screen

63.4 Configuring the settings for an alarm display

GT37 SoftGOT3000

To display alarms in the alarm display, configure the settings described in this section.

Configuring the settings in multiple dialogs is required.

☞ Page 2140 Configuring the settings for collecting alarms

☞ Page 2140 Placing an alarm display object

63.4.1 Configuring the settings for collecting alarms

After configuring settings for monitoring alarms in the relevant dialogs, configure the settings to display the alarms.

Display target	Required setting
User alarm	Configure the settings for the user alarm monitoring. ☞ Page 1896 Placing a hyperlink on a mobile screen
System alarm	Configure the settings for the system alarm monitoring. Select [Target] in the [Basic] tab in the [User Alarm Observation] dialog. ☞ Page 1896 Placing a hyperlink on a mobile screen

63.4.2 Placing an alarm display object

Use the following procedure to place an alarm display object and configure the operation settings.

1. Perform the following operations according to the object to be placed.

Object	Operation
Alarm display (user)	Select [Object] → [Alarm Display] → [Alarm Display (User)] from the menu.
Alarm display (system)	Select [Object] → [Alarm Display] → [Alarm Display (System)] from the menu.

2. Click the position where you place the alarm display. Placing the alarm display is complete.

☞ Page 1001 Placing figures and objects

The relevant key code switches are placed together.

For key code switches for operating alarm displays, refer to the following.

☞ Page 2141 Key code switches for operating alarm displays

3. Double-click the alarm display which has been placed to display the setting dialog.

4. Configure the operation settings in each tab of the setting dialog.

☞ Page 2144 [Alarm Display(User)] dialog

☞ Page 2164 [Alarm Display(System)] dialog

For the operations common to all objects or editing operations except operation settings, refer to the following.

☞ Page 988 Color settings

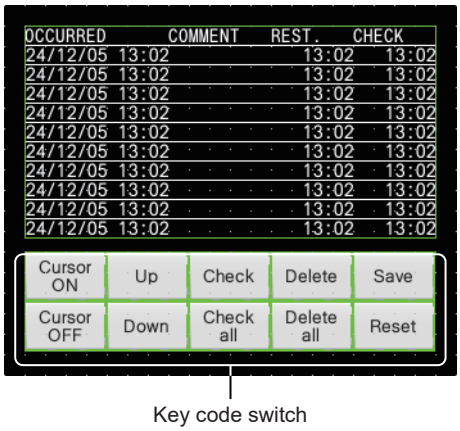
63.5 Key code switches for operating alarm displays

By touching a key code switch, the operation corresponding to the key code can be performed for the alarm display.

☞ Page 2141 Key code switches placed together with the alarm display
☞ Page 2141 Key code switches registered in the library
☞ Page 2142 Key codes for operating alarm displays

63.5.1 Key code switches placed together with the alarm display

Placing an alarm display on the screen places the relevant key code switches together.



Precautions

The user ID of the alarm display object is automatically assigned to the key code switches placed together with the alarm display ([User ID for a key input]).

If you change the user ID of the alarm display object, also change the set value of [User ID for a key input] for each switch. Otherwise, the alarm display object is inoperable using the switches.

63.5.2 Key code switches registered in the library

The key code switches for operating alarm displays are also registered in the library.

☞ Page 1002 Placing from the library or parts

63.5.3 Key codes for operating alarm displays

The following table lists the key codes for operating alarm displays.

For the key code setting with the key code switches, refer to the following.

☞ Page 1251 [Key Code Switch] dialog

○: Supported

—: Unsupported

Key code (HEX)	Operation	Description	Operation target	
			Alarm display (user)	Alarm display (system)
00F2*1	Scroll up by one line	Scrolls up the display by one row.	○	○
00F3*1	Scroll down by one line	Scrolls down the display by one row.	○	○
FFB0*2	Show the cursor	Displays the cursor.	○	○
FFB1*2	Hide the cursor	Hides the cursor.	○	○
FFB2*2	Move the cursor up	• While the cursor is displayed: Moves the cursor up by row. • While the cursor is hidden: Moves the view to the previous page.	○	○
FFB3*2	Move the cursor down	• While the cursor is displayed: Moves the cursor down by row. • While the cursor is hidden: Moves the view to the next page.	○	○
FFB4*2	Change the selected alarm status to "Checked" (Check)	Changes the status of the selected alarm to "Checked".	○	○
FFB5*2	Change all the alarm statuses to "Checked" (Check all)	Changes all the alarm statuses to "Checked".	○	○
FFB6*2	Delete the selected restored alarm (Delete)	Deletes the selected alarm (restored). The following operations are performed depending on the method for collecting user alarm monitoring history. • In historical mode: Target alarms are deleted from the history. • In cumulative mode (only available for user alarm monitoring): The down time, number of occurrences, and cumulative time are reset.	○	○
FFB7*2	Delete all the restored alarms (Delete all)	Deletes all the restored alarms. The following operations are performed depending on the method for collecting user alarm monitoring history. • In historical mode: Target alarms are deleted from the history. • In cumulative mode (only available for user alarm monitoring): The down time, number of occurrences, and cumulative time are reset.	○	○
FFB8	Display detail	Displays the detail screen of a selected alarm when this cursor is touched with basic alarms displayed.	○	—
	Move to the lower hierarchy	Displays the alarms at lower hierarchy level when this cursor is touched when upper- or middle-level alarms are displayed.	○	—
FFB9*2	Reset the selected alarm data	Resets the selected alarm. To use this key code switch for the alarm display (user), satisfy both the following conditions. • [Reset] is set on the [Device] tab in the [User Alarm Observation] dialog. • Basic-level alarm events are displayed on the object.	○	○
FFBB*2	Saves the alarm details to the data storage	Saves alarm events to an alarm log file in the data storage.	○	○
FFBA	Display ladder (sequence program monitor (iQ-R/iQ-L ladder))	Searches for the device assigned to the alarm and displays the ladder (sequence program monitor (iQ-R/iQ-L ladder)).	○	○
FFC3	Display ladder (sequence program monitor (iQ-F ladder))	Searches for the device assigned to the alarm and displays the ladder (sequence program monitor (iQ-F ladder)).	○	○
FFBD	Display ladder (sequence program monitor (Q/L ladder))	Searches for the device assigned to the alarm and displays the ladder (sequence program monitor (Q/L ladder)).	○	○
FFBC	Display ladder	Searches for the device assigned to the alarm and displays the ladder.	○	○
FFBE	Move display position to the specified time	Displays the data obtained at the time stored in the display position time specification device. (Time specification jump function) Set [Display Position Time Device] on the [Extended] tab. ☞ Page 2155 [Extended] tab ☞ Page 2172 [Extended] tab	○	○

Key code (HEX)	Operation	Description	Operation target	
			Alarm display (user)	Alarm display (system)
FFBF[*1]	Display first alarm	Returns to the top of the list. The cursor becomes invisible. Returns to the top of the list sorted in the specified order.	○	○
FFC2	Move to the upper hierarchy	Switches the middle or basic level to the upper level in the alarm hierarchy.	○	—

*1 The touch switches set together with FFB5 are invalid.

*2 Placing an alarm display on the screen places the relevant key code switches together.

63.6 [Alarm Display(User)] dialog

GT37 SoftGOT3000

☞ Page 2144 [Alarm Setting] tab

☞ Page 2149 [Text] tab
☞ Page 2154 [Style] tab
☞ Page 2155 [Extended] tab
☞ Page 2159 [Trigger] tab
☞ Page 2160 [External Output] tab

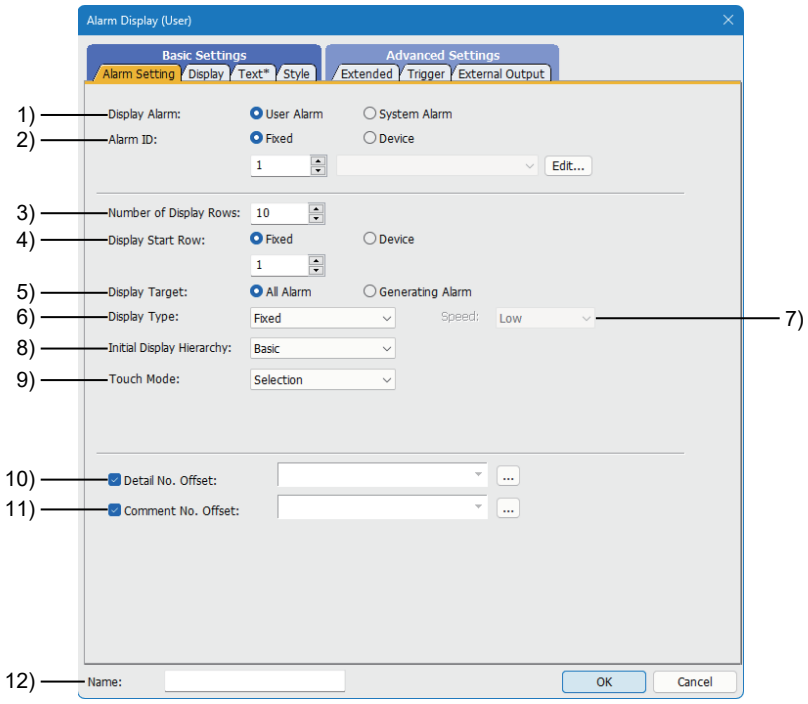
63.6.1 [Alarm Setting] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Configure the settings such as the alarm monitoring type to be displayed, message display method, and touch operations.



Item			Description
1)	[Display Alarm]		The alarm type to be displayed in the alarm display. Select [User Alarm].
2)	[Alarm ID]	—	Set the alarm ID of the user alarm to be displayed.
		[Fixed]	Enter the alarm ID directly. The setting range is [1] to [32767]. Click the [Edit] button to display the [User Alarm Observation] dialog. ☞ Page 2045 [User Alarm Observation] dialog
		[Device]	Set the device that specifies the alarm ID. ☞ Page 834 How to set devices, labels, and tags When 0 is stored in the set device, the alarm monitoring setting for alarm ID 1 is displayed. If an alarm ID outside the range or a nonexistent alarm ID is stored in the set device, the alarm ID is not switched.

Item			Description	
3)	[Number of Display Rows]		Set the number of rows displayed in a screen. The setting range is [1] row to [64] rows. The title row is not counted in the number of rows. Select the display setting of the title row for [Specification] in the [Display] tab. ☞ Page 2147 [Display] tab	
4)	[Display Start Row]	—	Select a row to be displayed in the top row when the number of alarms exceeds the number of rows set in [Number of Display Rows].	
		[Fixed]	Specify the start row number directly. The setting range is [1] to [32767].	
		[Device]	Set the word device that specifies the start row. ☞ Page 834 How to set devices, labels, and tags For the display examples according to the number of displayed alarms, refer to the following. ☞ Page 2146 Settings of [Display Start Row] and operation examples Even if the number of alarms exceeds the value set in [Display Start Row] when alarms are displayed on the GOT, the setting for [Display Start Row] does not become enabled. To enable the setting for [Display Start Row], switch the screen to another one, then switch back the screen to the one in which the alarm is displayed.	
5)	[Display Target]		Select the alarm to be displayed from the collected alarms.	
6)	[Display Type]		Select the display method of the comments from the display items of the alarm display. Up to 16 alarm display objects (alarm display (user) objects and alarm display (system) objects with scrolling display enabled) can be placed on one screen. The comment displayed for the 17th and the subsequent alarms is fixed. The following shows the selectable display methods.	
			[Fixed]	Does not scroll a comment displayed at an alarm occurrence. When a comment extends off the display area, the part outside the area and the second and subsequent rows are not displayed.
			[Flow all]	Scrolls a full comment displayed at an alarm occurrence from right to left.
			[Flow as required]	Does not scroll a comment fully displayed within the display area. Scrolls a comment extending off the display area and a multiple-row comment from right to left.
			[Flow the selected row]	Scrolls only the comment selected among the comments displayed at an alarm occurrence from right to left.
7)	[Speed]		This item is settable when [Display Type] is set to [Flow all], [Flow as required], or [Flow the selected row]. Select the speed at which the display is scrolled.	
8)	[Initial Display Hierarchy]		Select a level in the alarm hierarchy to be displayed first when a user alarm occurs.	
9)	[Touch Mode]		Select the operation performed when the alarm display (user) is touched.	
			[None]	Select this item to disable touch operations.
			[Selection]	Selects a touched alarm.
			[Operation]	Selects a touched alarm. Switches between levels in the alarm hierarchy with each touch of the selected alarm. Touching a selected upper alarm displays the middle alarm. Touching a selected middle alarm displays the basic alarm. Touching a selected basic alarm displays the detail screen. While GS450.b15 is on, even when a basic alarm is not selected, a single touch of the basic alarm displays the detail screen.
10)	[Detail No. Offset]		Set the offset device for the detail No. ☞ Page 834 How to set devices, labels, and tags The offset target differs depending on the setting of the detail display.	
			Comment window	The offset device value is added to the comment No. to switch the comments to be displayed in the comment window.
			Base screens and window screens	The offset device value is added to the screen No. to switch the screens to be displayed.
11)	[Comment No. Offset]		Set the offset device for the comment No. The offset device value is added to the comment No. to switch the comments to be displayed in the alarm display (user). ☞ Page 834 How to set devices, labels, and tags	
12)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The name can also be changed in other tabs. Up to 100 characters can be set.	

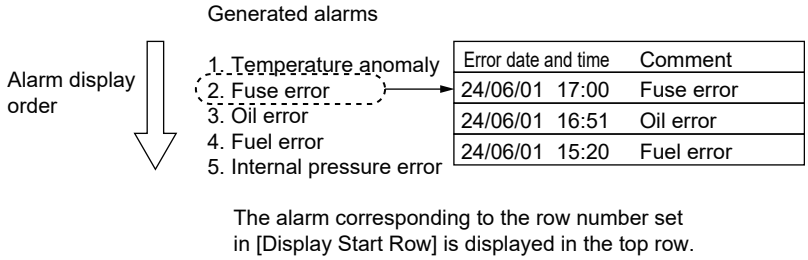
Settings of [Display Start Row] and operation examples

■When the number of alarms is larger than the value set in [Display Start Row]

The alarm corresponding to the row number set in [Display Start Row] is displayed in the top row.

Ex.

When [Number of Display Rows] is set to 3, [Display Start Row] is set to 2, and the number of alarms is 5



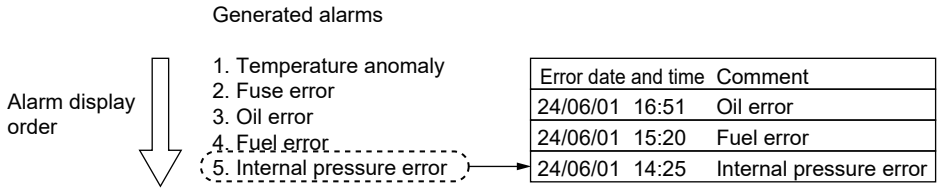
The alarm corresponding to the row number set in [Display Start Row] is displayed in the top row.

■When the number of alarms is smaller than the value set in [Display Start Row]

The last alarm is displayed in the bottom row.

Ex.

When [Number of Display Rows] is set to 3, [Display Start Row] is set to 10, and the number of alarms is 5



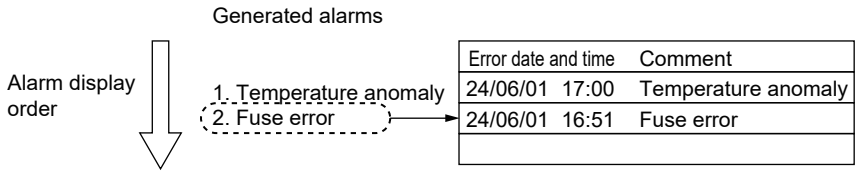
The last alarm is displayed in the bottom row.

■When the number of alarms is smaller than the value set in [Number of Display Rows]

The setting for [Display Start Row] becomes disabled, and all the alarms that have occurred are displayed.

Ex.

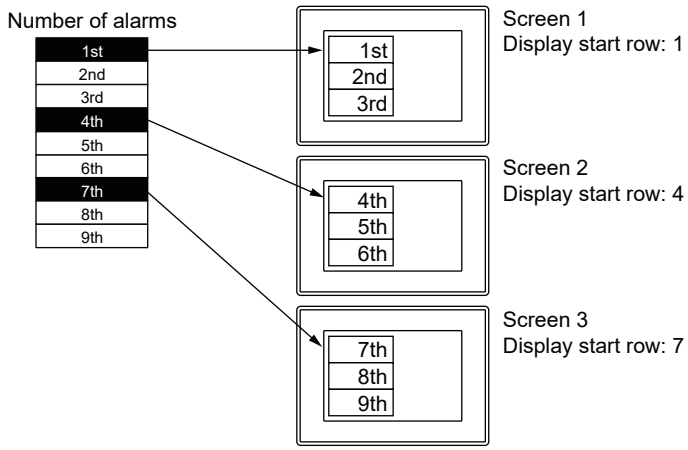
When [Number of Display Rows] is set to 3, [Display Start Row] is set to 3, and the number of alarms is 2



All the alarms that have occurred are displayed.

■Using the setting for multiple screens

When different values of [Display Start Row] are set for each screen, the alarm displays differ depending on the screens.



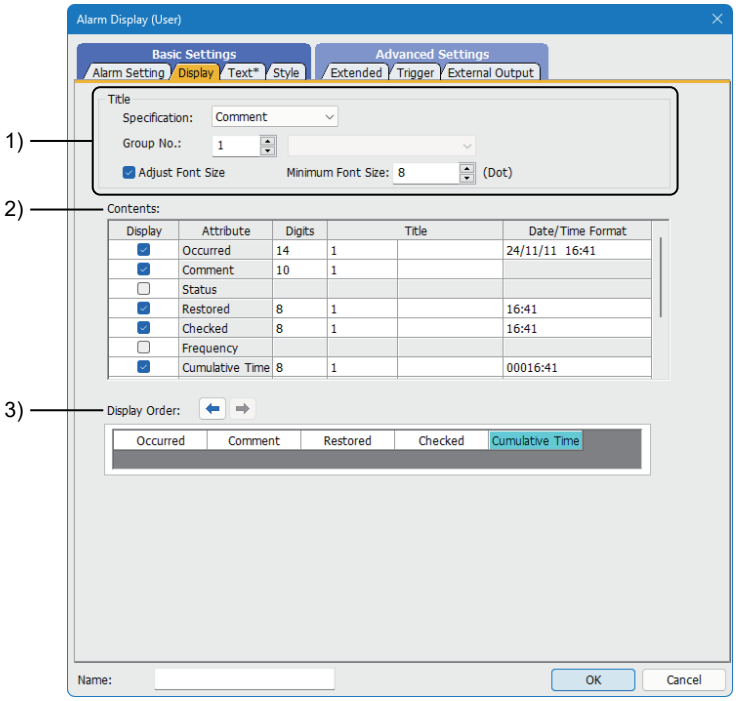
63.6.2 [Display] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set the items to be displayed in the user alarm and the display order.



Item			Description
1)	[Title]	[Specification]	Select the method of specifying the text to be displayed in the title.
		[Group No.]	Only when [Comment] is selected for [Specification], this item can be set. Set the comment group in which the text to be displayed in the title is registered.
		[Adjust Font Size]	Only when [Comment] is selected for [Specification], this item can be set. The font size is adjusted according to the width of the title. When [Adjust Font Size] is not selected, the text size is adjusted by inserting a line feed.
		[Minimum Font Size]	Only when [Comment] is selected for [Specification] and [Adjust Font Size] is selected, this item can be set. Set the minimum font size for adjustment. The setting range is [8] dots to [540] dots.
2)	[Contents]	—	Set the attributes to be displayed as the columns in the alarm display (user). For details on contents displayed for each attribute, refer to the following. ☞ Page 2148 Details of [Contents] (alarm display (user))
		[Display]	Select whether to display each attribute. Select the attributes to be displayed.
		[Attribute]	Attributes to be displayed in the alarm display (user)
		[Digits]	Set the number of the digits displayed in each item. Set a one-byte character as one digit and a two-byte character as two digits. The setting range differs depending on the attribute. ☞ Page 2148 Details of [Contents] (alarm display (user))
		[Title]	Set the title of each column. The setting depends on the value selected for [Specification]. When [Direct] is selected, input characters within the number of digits set in [Digits]. When [Comment] is selected, the comment No. and the comment to be displayed in the title are displayed. If [0] is set in the comment No., the comment is hidden. When [None] is selected, the title cannot be set.
		[Date/Time Format]	Set the date and time format for each attribute item. The setting method differs depending on the attribute. ☞ Page 2148 Details of [Contents] (alarm display (user))

Item		Description
3)	[Display Order]	Set the order in which the items set for [Attribute] in [Contents] are displayed. The items of [Attribute] which are set in [Display] are displayed. Move the display position of the selected item sideways by using the right button and the left button.

Details of [Contents] (alarm display (user))

[Attribute]	Description	Setting range of [Digits]	Setting range of [Date/Time Format]
[Occurred]	Displays the date and time of occurrence of an alarm.	[5] digits to [128] digits Set the number of digits equal to or greater than the one required to display the date and time. The number of required digits differs depending on the setting of [Date/Time Format].	Click the [...] button, and set the date/time formats in the [Date/Time Setting] dialog. ☞ Page 3684 [Date/Time Setting] dialog (screen)
[Comment]	Displays the date and time of occurrence of an alarm.	[10] digits to [128] digits	—
[Status]	Displays the alarm status.	[6] digits to [128] digits	—
[Restored]	Displays the date and time when an alarm is restored.	[5] digits to [128] digits Set the number of digits equal to or greater than the one required to display the date and time. The number of required digits differs depending on the setting of [Date/Time Format].	Click the [...] button, and set the date/time formats in the [Date/Time Setting] dialog. ☞ Page 3684 [Date/Time Setting] dialog (screen)
[Checked]	Displays the date and time when an alarm occurrence has been checked.		
[Frequency]*1	Displays the number of past occurrences for each alarm.	[5] digits to [128] digits	—
[Cumulative Time]*1	Displays the total time during which each alarm has occurred.	[8] digits to [128] digits	Select a time format of hours:minutes or hours:minutes:seconds.
[Down Time]*1	Displays the time from the alarm occurrence to the alarm restoration.		
[Level]	Displays the levels set for alarms.	[3] digits to [128] digits	—
[Group]	Displays the groups set for alarms.		
[Log on Occurrence]	Comment in which the value of the log collection device collected when an alarm event occurs is embedded For the log collection, refer to the following. ☞ Page 2065 Log collection and embedding display in the comment	[1] digit to [128] digits	—

*1 Information accumulated only when [Cumulative] is selected for [Collection Mode] in the [User Alarm Observation] dialog ([Basic] tab)
When the above condition is not met, no content is displayed even if the corresponding attribute is set.

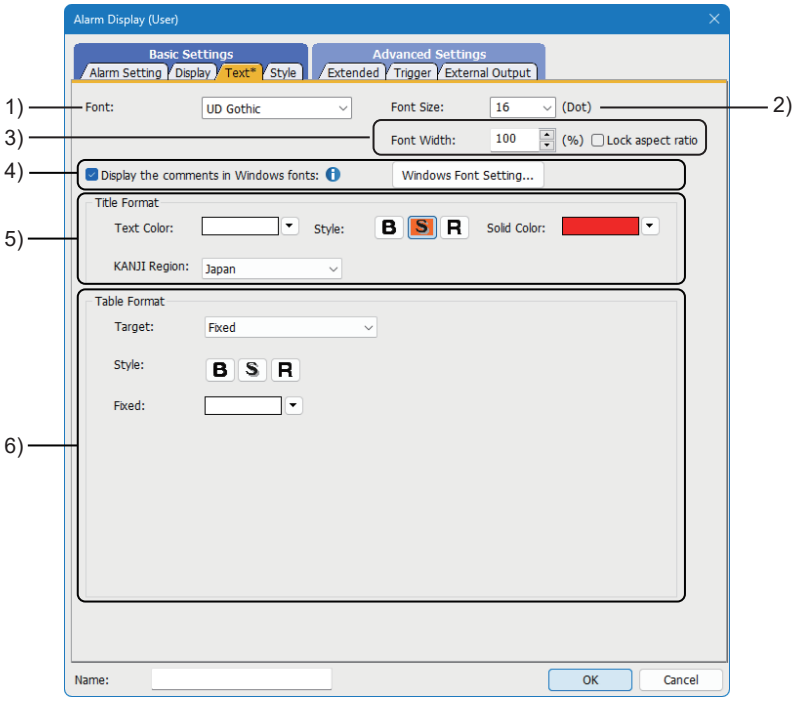
63.6.3 [Text] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set the font of displayed alarms.



Item			Description
1)	[Font]		Select a font for the text to be displayed.
2)	[Font Size]		Set the size of the text to be displayed. The setting range is [8] dots to [540] dots.
3)	[Font Width]		Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
	[Lock aspect ratio]		The aspect ratio of the text is retained when you resize the text by manipulating a handle on the screen editor.
4)	[Display the comments in Windows fonts]	—	Displays the following registered comments in Windows fonts. • Comments set in the user alarm monitoring settings (basic alarm comment, upper comment, middle comment, and detail display) • Comments set for the titles in the [Display] tab (when [Comment] is selected for [Specification])
			This setting is deleted when one of the following settings is made. • [Device] is selected for [Alarm ID] in the [Alarm Setting] tab. • An item other than [Fixed] is selected for [Display Type] in the [Alarm Setting] tab. • [Basic Alarm Comment Group], [Middle Comment Group], or [Upper Comment Group] is selected in the [Extended] tab.
		[Windows Font Setting] button	Opens the [Comment Group Property] dialog, which displays the properties of the comment group set for the basic alarm comment. Set Windows fonts to display comments. ☞ Page 797 [Comment Group Property] dialog

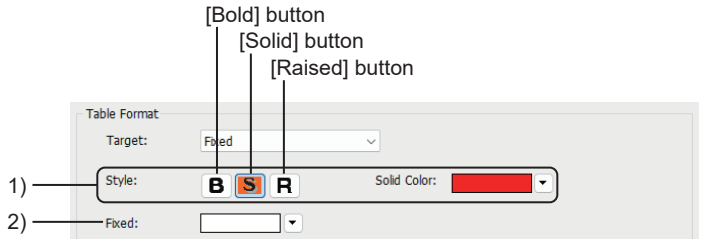
Item			Description
5)	[Title Format]	—	Set the format of the text displayed in the title of the alarm display (user).
		[Text Color]	Set the text color. ☞ Page 988 Color settings
		[Style]	Set the style of the text to be displayed. One style ([Bold], [Solid], or [Raised]) is settable only.  • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
		[KANJI Region]	Select the KANJI region. ☞ Page 76 KANJI region This item is enabled when either of the following conditions is met. • [Direct] is selected for [Specification] on the [Display] tab. • [Comment] is selected for [Specification] on the [Display] tab, and [Display the comments in Windows fonts] is deselected on the [Text] tab.
6)	[Table Format]	—	Set the format of the text displayed in the alarm display (user). The format can be changed according to the content to be displayed.
		[Target]	Select the target of the text format switching. Displayed items differ depending on the item set for [Target]. ☞ Page 2151 Details of [Table Format] (alarm display (user))

Details of [Table Format] (alarm display (user))

☞ Page 2151 When [Fixed] is selected
☞ Page 2151 When [Status] is selected
☞ Page 2152 When [Level] or [Group] is selected
☞ Page 2153 When [Level + Status] or [Group + Status] is selected
☞ Page 2153 When [Comment Attribute] is selected

■When [Fixed] is selected

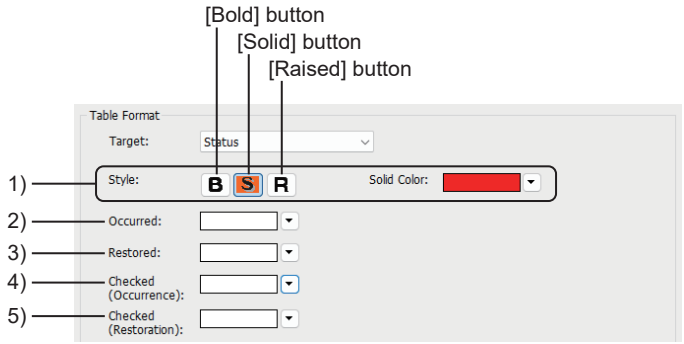
Text is always displayed in the same format without the formats being switched.



Item		Description
1)	[Style]	Set the style of the text to be displayed. One style ([Bold], [Solid], or [Raised]) is settable only. • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
2)	[Fixed]	Set the text color. ☞ Page 988 Color settings

■When [Status] is selected

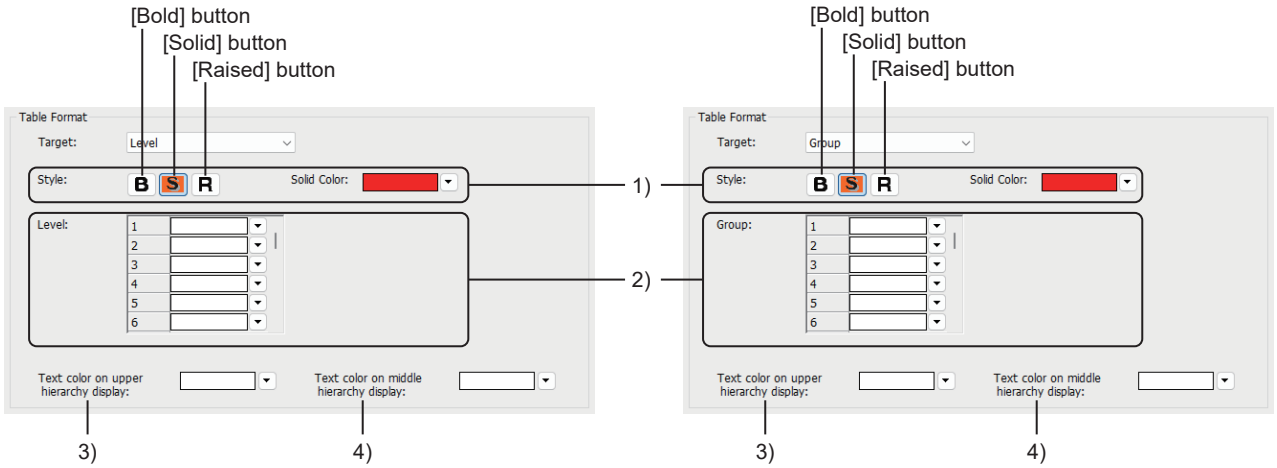
The formats are switched for each alarm status.



Item		Description
1)	[Style]	Set the style of the text to be displayed. One style ([Bold], [Solid], or [Raised]) is settable only. • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
2)	[Occurred]	Set the text color when the alarm status is "Occurred". ☞ Page 988 Color settings
3)	[Restored]	Set the text color when the alarm status is "Restored". ☞ Page 988 Color settings
4)	[Checked (Occurrence)]	Set the text color when the alarm status is "Checked (Occurrence)". ☞ Page 988 Color settings
5)	[Checked (Restoration)]	Set the text color when the alarm status is "Checked (Restoration)". ☞ Page 988 Color settings

■When [Level] or [Group] is selected

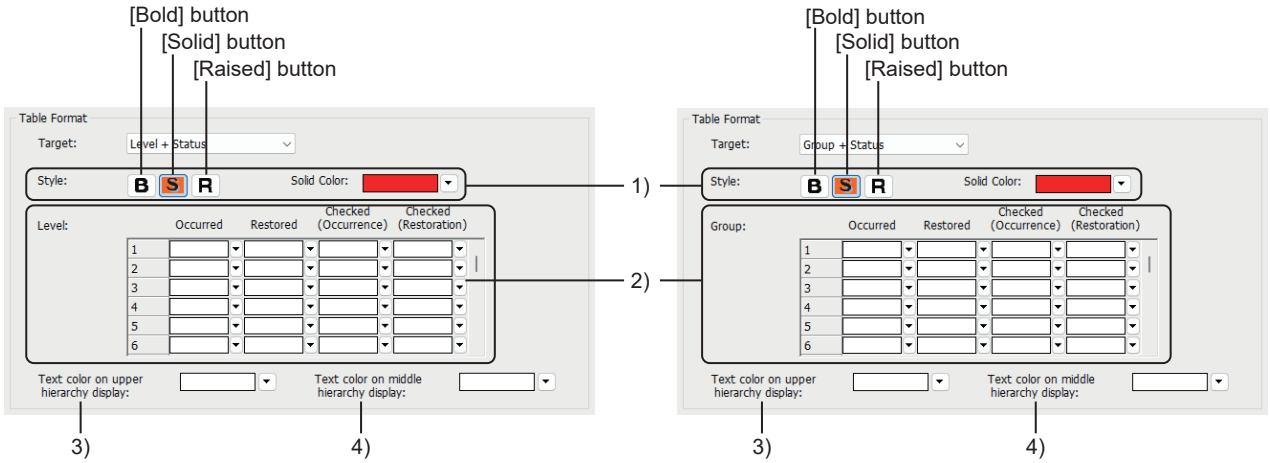
The formats are switched for each level or group.



Item		Description
1)	[Style]	Set the style of the text to be displayed. One style ([Bold], [Solid], or [Raised]) is settable only. • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
2)	[Level] [Group]	Set the text color for each level or group. ☞ Page 988 Color settings
3)	[Text color on upper hierarchy display]	Set the text color of the upper-level alarms to be displayed. ☞ Page 988 Color settings
4)	[Text color on middle hierarchy display]	Set the text color of the middle-level alarms to be displayed. ☞ Page 988 Color settings

■When [Level + Status] or [Group + Status] is selected

The formats are switched according to the combination of the level and alarm status or group and alarm status.



Item		Description
1)	[Style]	Set the style of the text to be displayed. One style ([Bold], [Solid], or [Raised]) is settable only. • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
2)	[Level] [Group]	Set the text color for each combination of the level or group value and alarm status. ☞ Page 988 Color settings
3)	[Text color on upper hierarchy display]	Set the text color of the upper-level alarms to be displayed. ☞ Page 988 Color settings
4)	[Text color on middle hierarchy display]	Set the text color of the middle-level alarms to be displayed. ☞ Page 988 Color settings

■When [Comment Attribute] is selected

The character property of each comment is applied.

☞ Page 791 [Comment List] window

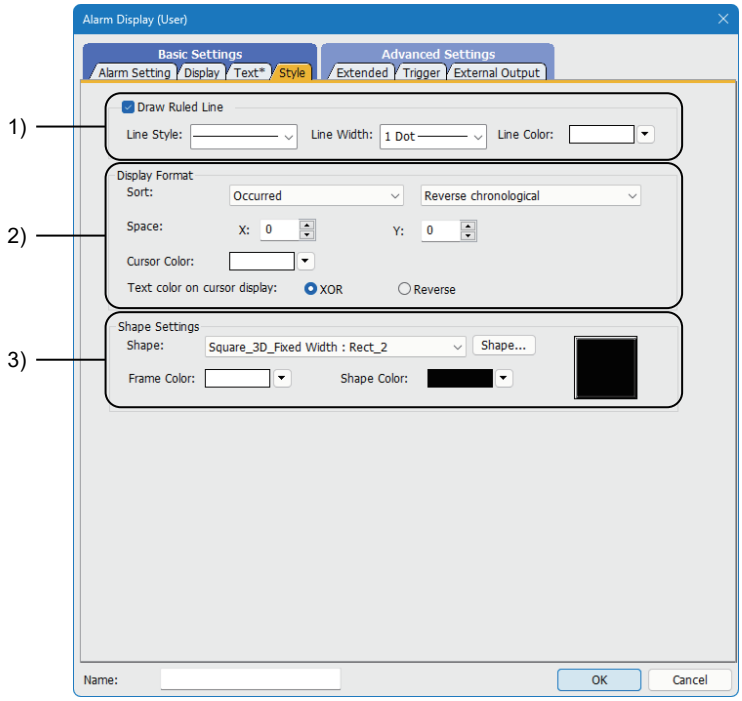
63.6.4 [Style] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set the ruled line and shape of the alarm display (user).



Item			Description
1)	[Draw Ruled Line]	[Line Style]	Select the type of the ruled line of the alarm display (user).
		[Line Width]	Select the width of the ruled line of the alarm display (user).
		[Color]	Select the color of the ruled line of the alarm display (user). ☞ Page 988 Color settings
2)	[Display Format]	[Sort]	Select the sort target and sort order. The selectable items for the sort order differ depending on the sort target.
		[Space]	Set the space between the text to be displayed and the line. Set the space in 1 dot unit. The setting range is [0] to [32].
		[Cursor Color]	Set the cursor color for selecting an alarm. ☞ Page 988 Color settings
		[Text color on cursor display]	Method to set the color of text on the cursor. • [XOR]: Displays the text in the synthesized color with XOR specification. • [Reverse]: Inverts the text. Example) When the text color is green and the cursor color is white [XOR]  [Reverse]
3)	[Shape Settings]	[Shape]	Set a shape for the alarm display (user). To select a shape other than those in the list box, click the [Shape] button.
		[Frame Color]	Set the frame color of the shape. ☞ Page 988 Color settings
		[Shape Color]	Set the color of the shape. ☞ Page 988 Color settings

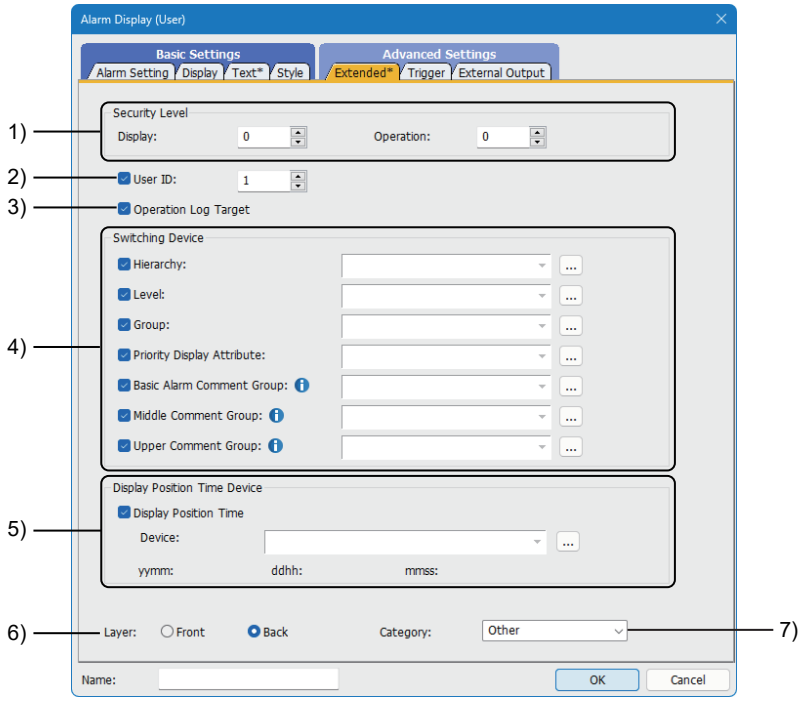
63.6.5 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set the operation of switching displays for the alarm display (user) by devices.



Item			Description
1)	Security level		Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security) The set value of [Operation] must be greater than that of [Display].
2)	[User ID]		Set the user ID. If an alarm display (user) and another alarm display are set on a screen, touch switches for the alarm display (user) may not function. For secure operations of the touch switches for alarm displays (user), set user ID for the alarm displays (user).
3)	[Operation Log Target]		Select this item to record the operation log of the set object. ☞ Page 1896 Placing a hyperlink on a mobile screen
4)	[Switching Device]		Controls the contents displayed in the alarm display (user) with the switching devices. Select the items to be controlled and set the switching devices. ☞ Page 2156 Details of [Switching Device]
			When there are many monitored devices in user alarm monitoring, if the number of alarms is narrowed down using a switching device, displaying the alarms may require a few seconds.
5)	[Display Position Time Device]	[Display Position Time]	Displays the data of a specified time. (Time specification jump function) Set a device in which a specified time is stored. ☞ Page 834 How to set devices, labels, and tags The successive devices from a set device are set to store the data of year and month, day and hour, and minute and second. For details on the time specification jump function, refer to the following. ☞ Page 2158 Details of [Display Position Time Device] (time specification jump function)
6)	[Layer]		Select the layer to place the object. ☞ Page 65 Layer
7)	[Category]		Set the category to assign the object. ☞ Page 1092 Efficient Drawing with Templates

Details of [Switching Device]

☞ Page 2156 [Hierarchy]
☞ Page 2156 [Level]
☞ Page 2157 [Group]
☞ Page 2157 [Priority Display Attribute]
☞ Page 2157 [Basic Alarm Comment Group], [Middle Comment Group], [Upper Comment Group]

■[Hierarchy]

Set the hierarchy switching device to switch the hierarchy level to be displayed.

The hierarchy switching device has the following functions.

- Switching the hierarchy level to be displayed
- Notifying the switching method and display target hierarchy level when the hierarchy level is switched

To switch the hierarchy level, write one of the following values to the hierarchy switching device.

- 0: Basic alarm
- 1: Middle-level alarm
- 2: Upper-level alarm

The following shows the function of each bit of the hierarchy switching device.

Bit	Description
b0 to b7	Switches the hierarchy level to be displayed by changing the device value. In addition, the displayed hierarchy level is notified when the level is switched using a key code switch or touch operation. The following shows the relationship between the device value and the hierarchy level to be displayed. • 0: Basic alarm • 1: Middle-level alarm • 2: Upper-level alarm
b8 to b14	Use prohibited
b15	Notifies the switching method when the hierarchy level is switched. This bit turns on when the hierarchy level is switched using a key code switch or touch operation. It does not turn off automatically. While this bit is on, hierarchy level switching using b0 to b7 of the hierarchy switching device is not applied.

The value of the hierarchy switching device is updated to the initial display hierarchy level at the following timings.

- When the screen is switched
- When the alarm display (user) is displayed for the first time
- When the alarm ID to be displayed in the alarm display (user) is switched with the device

Set the initial display hierarchy level in [Initial Display Hierarchy] in the [Alarm Display(User)] dialog ([Alarm Setting] tab).

☞ Page 2144 [Alarm Setting] tab

■[Level]

Set the level switching device to switch the levels to be displayed.

Only the alarms having the same level as the value stored in the level switching device (1 to 255) are displayed.

If a nonexistent level is stored, alarms are not displayed.

To display all levels, store 0 or a number equal to or greater than 256.

■[Group]

Set the group switching device to switch the groups to be displayed.

Only the alarms belonging to the same group as the value stored in the group switching device (1 to 255) are displayed.

If a nonexistent group is stored, alarms are not displayed.

To display all groups, store 0 or 256 or more.

■[Priority Display Attribute]

Set the priority display attribute switching device to switch the sort criteria.

The following lists the function of each bit of the priority display attribute switching device.

Bit	Description
b0 to b3	Specify the sort criteria. • □000h: Normal (date and time of occurrence) • □001h: Date and time of occurrence • □002h: Restored date and time • □003h: Checked date and time • □004h: Comment No. • □005h: Level • □006h: Group • □007h: Alarm status • □009h: Frequency • □00Ah: Cumulative time • □00Bh: Down time • □00Ch: Monitored alarm No. Occurrence frequency, cumulative time, and down time can be set only when collection mode is [Cumulative] in the user alarm monitoring dialog. If a value other than the above is stored, alarms are displayed in the order of the date and time of occurrence.
b4 to b14	Use prohibited
b15	Specify the ascending or descending order. • 000□h: Descending • 800□h: Ascending

■[Basic Alarm Comment Group], [Middle Comment Group], [Upper Comment Group]

Set the comment group switching device for each hierarchy level to switch the comment group of the comment to be displayed.

If 0 is stored to the device, alarms are displayed with the comment group which is set for the user alarm monitoring.

When a nonexistent comment group number is specified, [No message] is displayed.

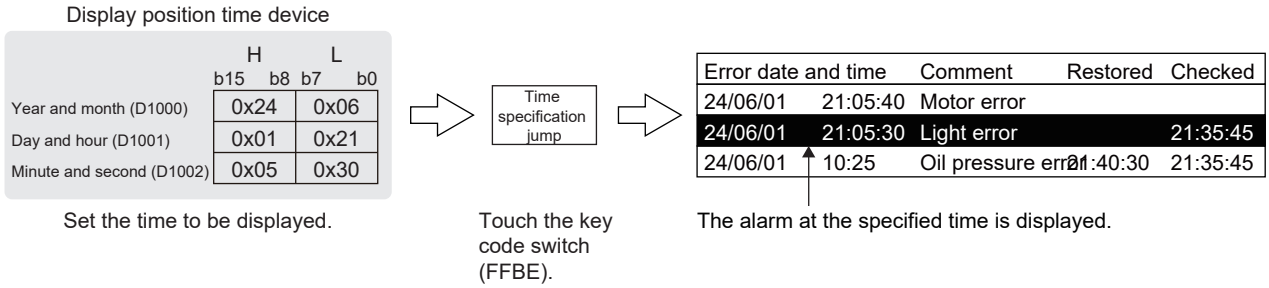
Details of [Display Position Time Device] (time specification jump function)

The time specification jump function allows you to display the basic alarms at the specified time by specifying the time with the display position time specification device and touching the key code switch (key code: FFBE).

If alarm data are not obtained at a specified time, the data obtained at the nearest time is displayed.

Ex.

When setting D1000 as the display position time specification device and displaying the data as of Jun. 1, 2024 21:05:30



■Specifications of display position time specification device

The data type is BCD16 (binary coded decimal).

The specification range is January 1, 2000 to December 31, 2099.

Specify the year with the lower two digits.

■Required setting

Place the following objects on the screen and set them.

Object	Setting
Key code switch	Read an applicable object from the library of GT Designer3, or create it. ☞ Page 2141 Key code switches for operating alarm displays When creating the objects, set [Action] of [Code Setting] to [Display Position Time Device] for each object. ☞ Page 1251 [Key Code Switch] dialog
Alarm display (user)	This object is required to be set for using the time specification jump function for the alarm display (user). Select [Display Position Time] in the [Extended] tab and set a device. ☞ Page 2155 [Extended] tab
Alarm display (system)	This object is required to be set for using the time specification jump function for the alarm display (system). Select [Display Position Time] in the [Extended] tab and set a device. ☞ Page 2172 [Extended] tab

■Operation when [Priority Display Attribute] is set

Alarms are displayed in the order set in [Priority Display Attribute].

The display order is "Restored", "Checked", and "Occurred".

When [Priority Display Attribute] is not set, alarms in a specified time are displayed regardless of the above order.

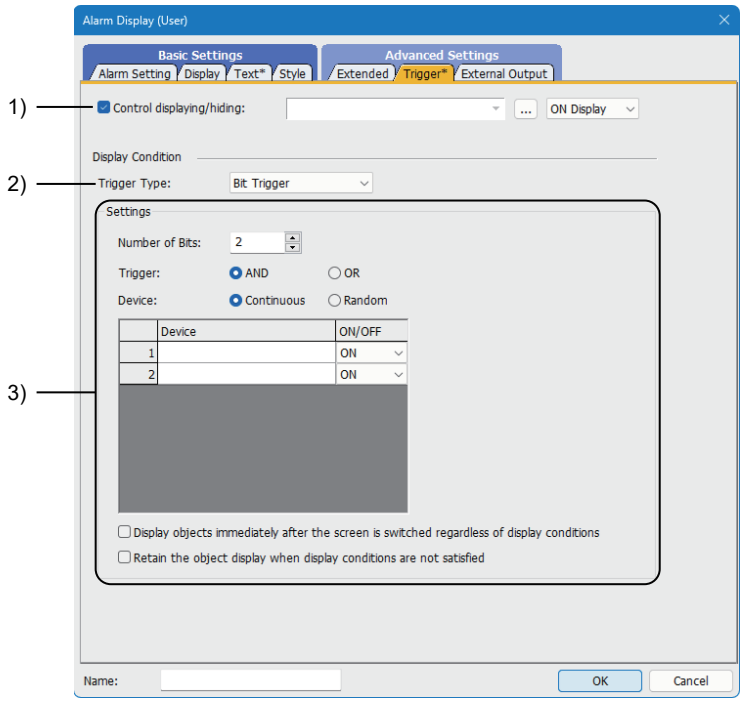
■Precautions

Precaution	Description
When carrying out another operation while a time specification jump is performed	While the data obtained at a specified time is searched with the time specification jump function, the operations with functions other than the alarm display cannot be performed.
When multiple values of alarm data are obtained around a specified time	If alarm data are not obtained at a specified time, the data obtained at the nearest time is searched. When the multiple values are obtained at the nearest time, the first detected value is displayed.
When displaying the alarm data obtained at the start of collecting the data and the data obtained around the time when the latest data is obtained	When the alarm data obtained at a specified time is the one obtained at the start of the collecting the data or the data obtained around the time when the latest data is obtained, the data to be displayed may not be displayed in the center of the alarm display.
When there is no alarm data that can be displayed in alarm displays	When there is no alarm data that can be displayed in an alarm display, no time specification jump is performed.
Levels in the alarm hierarchy available for the time specification jump function	Only the basic alarm is available for the time specification jump function. The middle alarm and upper alarm are unavailable for the time specification jump function.

63.6.6 [Trigger] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.

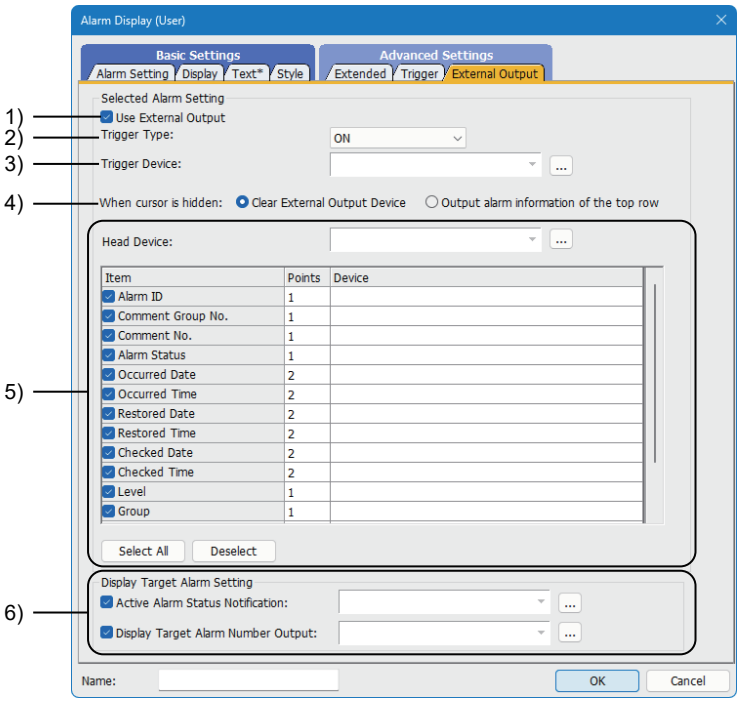


Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Bit device for control • Whether to display the object when the bit device for control is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Settings]	For the settings of each item, refer to the following. ☞ Page 969 Trigger types settable for the object display condition

63.6.7 [External Output] tab

GT37 SoftGOT3000

Configure the setting for writing the information of the alarm selected in the alarm display (user) into devices.



Item			Description
1)	[Use External Output]		Writes the information of the selected alarm into devices. ☞ Page 2134 How to use the alarm display
2)	[Trigger Type]		Select the timing to write the alarm information into a device. The following shows the timing to write each trigger.
		[Ordinary]	When an alarm is selected
		[ON]	When an alarm is selected with the trigger device ON
		[OFF]	When an alarm is selected with the trigger device OFF
3)	[Trigger Device]		When selecting [ON] or [OFF] in [Trigger Type], set the device to be a trigger. A bit device or a bit-specified word device is settable. ☞ Page 834 How to set devices, labels, and tags
4)	[When cursor is hidden]		Set the operation when no alarm is selected.
5)	[Head Device]	—	Set the start device (word device) to which the information of the alarm is written. The bit device cannot be specified as the word device. ☞ Page 834 How to set devices, labels, and tags Selecting the items to be output externally sets consecutive devices starting from the head device as the external output devices for each item. For the targets and output specifications of external output, refer to the following. ☞ Page 2162 Targets and output specifications of external output (alarm display (user))
		[Select All] button	Selects all the output target items.
		[Deselect] button	Deselects all the output target items.

Item			Description	
6)	[Display Target Alarm Setting]	[Active Alarm Status Notification]	Set the device that notifies the status of the displayed alarms. ☞ Page 834 How to set devices, labels, and tags The following bits of the word device are used to notify the alarm status.	
			b0 to b13	Use prohibited
			b14	Notifies that the specified display start row is out of the range. This bit turns on when a value greater than the number of alarms is input to the device set for [Display Start Row] on the [Alarm Setting] tab.
			b15	Use prohibited
		[Display Target Alarm Number Output]	Set the device that stores the number of displayed alarms. You can specify a word device or word-specified bit device. ☞ Page 834 How to set devices, labels, and tags	

Targets and output specifications of external output (alarm display (user))

The following shows the target items and output specifications of external output.

The output target items differ depending on the history collecting method set in the user alarm monitoring setting.

○: Items to be output

×: Items not to be output

Item	[Collection Mode]			Output specifications	
	[Historical]	[Cumulative]	[Only current alarm]		
[Alarm ID]	○	○	○	—	
[Comment Group No.]	○	○	○	—	
[Comment No.]	○	○	○	—	
[Alarm Status]*1	○	○	○	The following bits of the word device are used to output the alarm status.	
				b0	• Occurring: ON • Restored: OFF
				b1	• Checked: ON • Unchecked: OFF
				b2	• When external output of the alarm status is enabled: ON • When external output of the alarm status is disabled: OFF
				b3 to b15	Use prohibited
[Occurred Date]	○	○	○	For the data storage specifications of date and time, refer to the following. ☞ Page 2163 Data storage specifications of date and time	
[Occurred Time]*1	○	○	○		
[Restored Date]	○	○	×		
[Restored Time]*1	○	○	×		
[Checked Date]	○	○	×		
[Checked Time]*1	○	○	×		
[Level]	○	○	○	—	
[Group]	○	○	○	—	
[Frequency of Occurrences]	×	○	×	—	
[Cumulative Time]	×	○	×	The cumulative time (in hours and minutes) is stored in BCD code in two word devices. Example) When the cumulative time is 12 hours and 35 minutes Device value: 1235	
[Down Time]	×	○	×	The downtime (in hours and minutes) is stored in BCD code in two word devices. Example) When the downtime is 2 hours and 10 minutes Device value: 210	

*1 For the output specifications when upper- or middle-level alarms are displayed, refer to the following.
☞ Page 2163 Output specifications when upper- or middle-level alarms are displayed

■Output specifications when upper- or middle-level alarms are displayed

The following lists the time to be output.

Item	Output specifications
[Occurred Time]	The time of occurrence of the latest alarm in the alarms included under the currently displayed one is output.
[Restored Time]	Most recent time when an alarm was restored in the alarms under the currently displayed one is output.
[Checked Time]	Most recent time when an alarm was checked in the alarms under the currently displayed one is output.

If any unchecked or unrestored alarm is included under the alarm currently displayed, the entire hierarchy becomes unchecked or unrestored, and thus 0 is output to the external output device.

If the levels or groups to be displayed are narrowed by the switching device, information is output only for the narrowed alarms.

■Data storage specifications of date and time

The date and time are respectively stored in two word devices.

The following describes the case in which the time of occurrence is written into D254 (2 points) and the date of occurrence is written into D256 (2 points).

Item	Data storage specifications
Date	Store the year, month, and day with BCD code. D254: b15 to b8 = Month (1 to 12), b7 to b0 = Day (1 to 31) D255: b15 to b8 = The first two digits of the year, b7 to b0 = The last two digits of the year
Time	Stores the hour, minute, and second with BCD code. D256: b15 to b8 = Minute (0 to 59), b7 to b0 = Second (0 to 59) D257: b15 to b8 = 00, b7 to b0 = Hour (0 to 23)

Ex.

Jun. 1, 2024 12:24:56

	b15 to b8	b7 to b0
D254	06 (Month)	01 (Day)
D255	20 (Year)	24
D256	24 (Minute)	56 (Second)
D257	00	12 (Hour)

63.7 [Alarm Display(System)] dialog

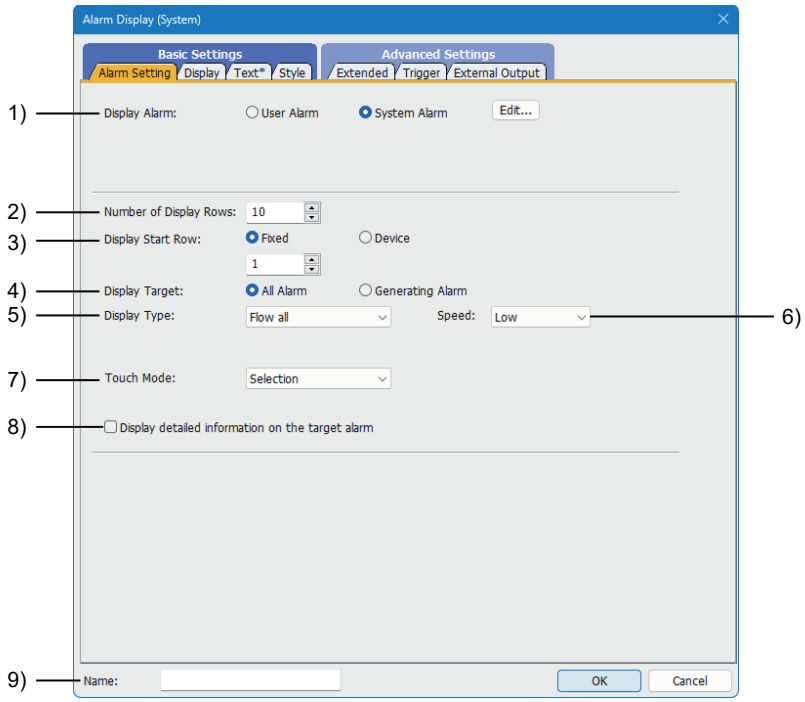
GT37 SoftGOT3000

☞ Page 2164 [Alarm Setting] tab
☞ Page 2167 [Display] tab
☞ Page 2168 [Text] tab
☞ Page 2171 [Style] tab
☞ Page 2172 [Extended] tab
☞ Page 2173 [Trigger] tab
☞ Page 2174 [External Output] tab

63.7.1 [Alarm Setting] tab

GT37 SoftGOT3000

Configure the settings such as the alarm monitoring type to be displayed, message display method, and touch operations.



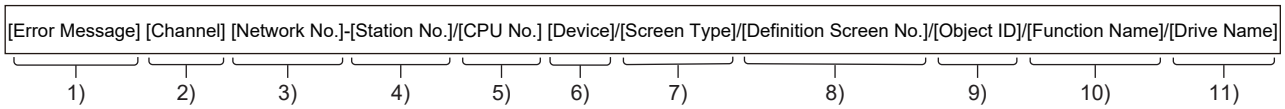
Item		Description
1)	[Display Alarm]	The alarm type to be displayed in the alarm display. Select [System Alarm]. Click the [Edit] button to display the [System Alarm Observation] dialog. ☞ Page 2097 [System Alarm Observation] dialog
2)	[Number of Display Rows]	Set the number of rows displayed in a screen. The setting range is [1] row to [64] rows. The title row is not counted in the number of rows. Select the display setting of the title row for [Specification] in the [Display] tab. ☞ Page 2167 [Display] tab

Item			Description	
3)	[Display Start Row]	[Fixed]	Select a row to be displayed in the top row when the number of alarms exceeds the number of rows set in [Number of Display Rows]. Specify the start row number directly. The setting range is [1] to [32767].	
		[Device]	Set the word device that specifies the start row. ☞ Page 834 How to set devices, labels, and tags For the display examples according to the number of displayed alarms, refer to the following. ☞ Page 2146 Settings of [Display Start Row] and operation examples Even if the number of alarms exceeds the value set in [Display Start Row] when alarms are displayed on the GOT, the setting for [Display Start Row] does not become enabled. To enable the setting for [Display Start Row], switch the screen to another one, then switch back the screen to the one in which the alarm is displayed.	
4)	[Display Target]		Select the alarm to be displayed from the collected alarms.	
5)	[Display Type]		Select the display method of the comments from the display items of the alarm display. Up to 16 alarm display objects (alarm display (user) objects and alarm display (system) objects with scrolling display enabled) can be placed on one screen. The comment displayed for the 17th and the subsequent alarms is fixed. The following shows the selectable display methods.	
			[Fixed]	Does not scroll a comment displayed at an alarm occurrence. When a comment extends off the display area, the part outside the area and the second and subsequent rows are not displayed.
			[Flow all]	Scrolls a full comment displayed at an alarm occurrence from right to left.
			[Flow as required]	Does not scroll a comment fully displayed within the display area. Scrolls a comment extending off the display area and a multiple-row comment from right to left.
			[Flow the selected row]	Scrolls only the comment selected among the comments displayed at an alarm occurrence from right to left.
6)	[Speed]		This item is settable when [Display Type] is set to [Flow all], [Flow as required], or [Flow the selected row]. Select the speed at which the display is scrolled.	
7)	[Touch Mode]		Select the operation performed when the alarm display (system) is touched.	
			[None]	Select this item to disable touch operations.
			[Selection]	Selects a touched alarm.
8)	[Display detailed information on the target alarm]		Displays detailed information added to system alarms. Select [Get detailed alarm information] in the [System Alarm Observation] dialog ([Basic] tab) in advance. ☞ Page 2098 [Basic] tab For the contents to be displayed when this item is selected, refer to the following. ☞ Page 2165 Displaying the detailed information	
9)	[Name]		Set the object name. The name is displayed in places such as the data browser and property sheet. The name can also be changed in other tabs. Up to 100 characters can be set.	

Displaying the detailed information

The following shows the contents displayed when [Display detailed information on the target alarm] is selected.

The information collected for each system alarm differs. Unrelated or undetectable information is not displayed.



Information		Description	Format, display example
1)	Error message	Displays the error code of a system error and the error message.	—
2)	Channel	Displays the channel No.	DEV:Ch (Channel) (Network No.)-(Station No.)/(CPU No.) (Device)
3)	Network No.	Displays the network No.	
4)	Station No.	Displays the station No.	
5)	CPU No.	Displays the CPU No.	
6)	Device	Displays the device. For the device to which offset is specified, the device name and device No. after the offset are displayed. If the device No. after the offset is out of the range, ?? is displayed.	

<table>

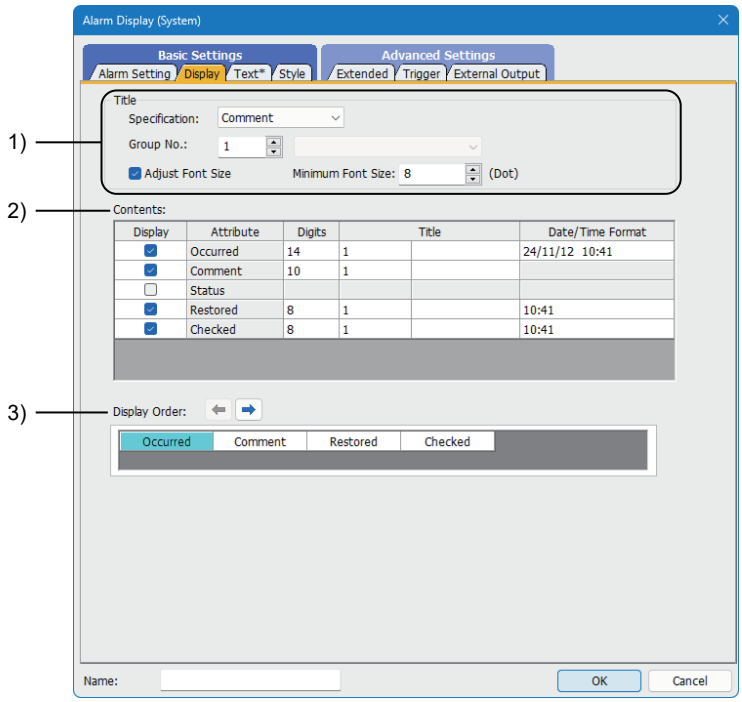
63.7.2 [Display] tab

GT37 SoftGOT3000

Set the items to be displayed in the system alarm and the display order.



Item			Description
1)	[Title]	[Specification]	Select the method of specifying the text to be displayed in the title.
		[Group No.]	Only when [Comment] is selected for [Specification], this item can be set. Set the comment group in which the text to be displayed in the title is registered.
		[Adjust Font Size]	Only when [Comment] is selected for [Specification], this item can be set. The font size is adjusted according to the width of the title. When [Adjust Font Size] is not selected, the text size is adjusted by inserting a line feed.
		[Minimum Font Size]	Only when [Comment] is selected for [Specification] and [Adjust Font Size] is selected, this item can be set. Set the minimum font size for adjustment. The setting range is [8] dots to [540] dots.
2)	[Contents]	—	Set the attributes to be displayed as the columns in the alarm display (system). For details on contents displayed for each attribute, refer to the following. ☞ Page 2168 Details of [Contents] (alarm display (system))
		[Display]	Select whether to display each attribute. Select the attributes to be displayed.
		[Attribute]	Attributes to be displayed in the alarm display (system)
		[Digits]	Set the number of the digits displayed in each item. Set a one-byte character as one digit and a two-byte character as two digits. The setting range differs depending on the attribute. ☞ Page 2168 Details of [Contents] (alarm display (system))
		[Title]	Set a title of the alarm display (system). The setting depends on the value selected for [Specification]. When [Direct] is selected, input characters within the number of digits set in [Digits]. When [Comment] is selected, the comment No. and the comment to be displayed in the title are displayed. If [0] is set in the comment No., the comment is hidden. When [None] is selected, the title cannot be set.
		[Date/Time Format]	Set the date and time format for each attribute item. The setting method differs depending on the attribute. ☞ Page 2168 Details of [Contents] (alarm display (system))

Item		Description
3)	[Display Order]	Set the order in which the items set for [Attribute] in [Contents] are displayed. The items of [Attribute] which are set in [Display] are displayed. Move the display position of the selected item sideways by using the right button and the left button.

Details of [Contents] (alarm display (system))

[Attribute]	Description	Setting range of [Digits]	Setting range of [Date/Time Format]
[Occurred]	Displays the date and time of occurrence of an alarm.	[5] digits to [128] digits Set the number of digits equal to or greater than the one required to display the date and time. The number of required digits differs depending on the setting of [Date/Time Format].	Click the [...] button, and set the date/time formats in the [Date/Time Setting] dialog. ☞ Page 3684 [Date/Time Setting] dialog (screen)
[Comment]	Displays the date and time of occurrence of an alarm.	[10] digits to [128] digits	—
[Status]	Displays the alarm status.	[6] digits to [128] digits	—
[Restored]	Displays the date and time when an alarm is restored.	[5] digits to [128] digits Set the number of digits equal to or greater than the one required to display the date and time. The number of required digits differs depending on the setting of [Date/Time Format].	Click the [...] button, and set the date/time formats in the [Date/Time Setting] dialog. ☞ Page 3684 [Date/Time Setting] dialog (screen)
[Checked]	Displays the date and time when an alarm occurrence has been checked.		

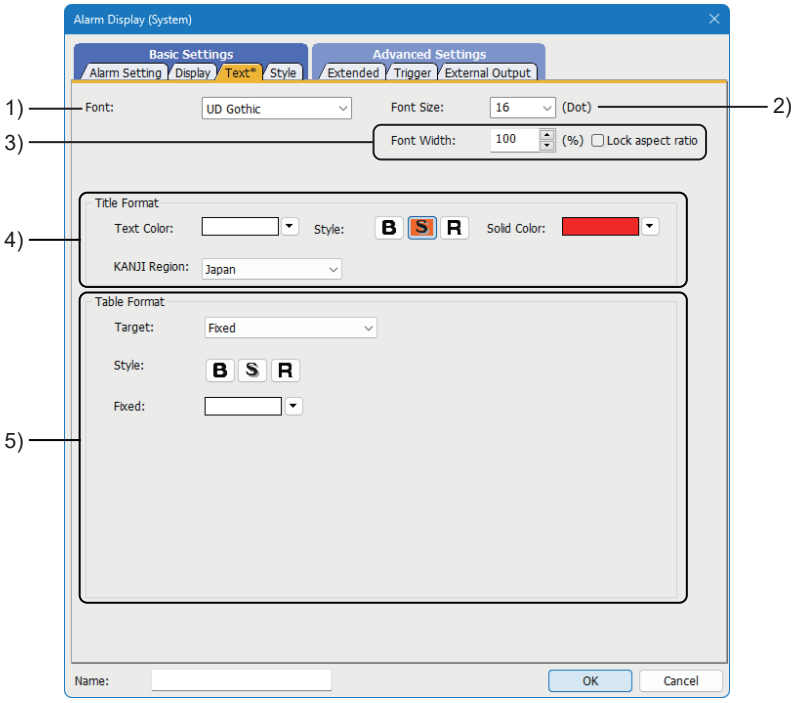
63.7.3 [Text] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set the font of displayed alarms.



Item		Description
1)	[Font]	Select a font for the text to be displayed.
2)	[Font Size]	Set the size of the text to be displayed. The setting range is [8] dots to [540] dots.

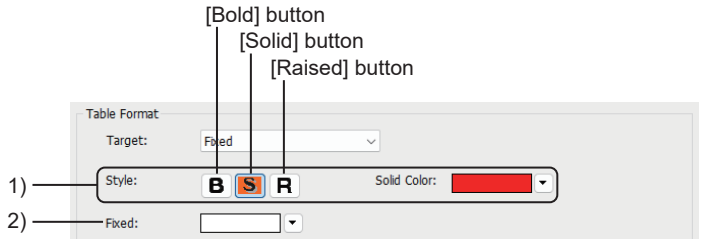
Item			Description
3)	[Font Width]		Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
	[Lock aspect ratio]		The aspect ratio of the text is retained when you resize the text by manipulating a handle on the screen editor.
4)	[Title Format]	—	Set the format of the text displayed in the title of the alarm display (system).
		[Text Color]	Set the text color. ☞ Page 988 Color settings
		[Style]	Set the style of the text to be displayed. One style ([Bold], [Solid], or [Raised]) is settable only.  • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
		[KANJI Region]	Select the KANJI region. ☞ Page 76 KANJI region This item is enabled when [Direct] is selected for [Specification] on the [Display] tab.
5)	[Table Format]	—	Set the format of the text displayed in the alarm display (system). The format can be changed according to the content to be displayed.
		[Target]	Select the target of the text format switching. Displayed items differ depending on the item set for [Target]. ☞ Page 2170 Details of [Table Format] (alarm display (system))

Details of [Table Format] (alarm display (system))

☞ Page 2170 When [Fixed] is selected
☞ Page 2170 When [Status] is selected

■When [Fixed] is selected

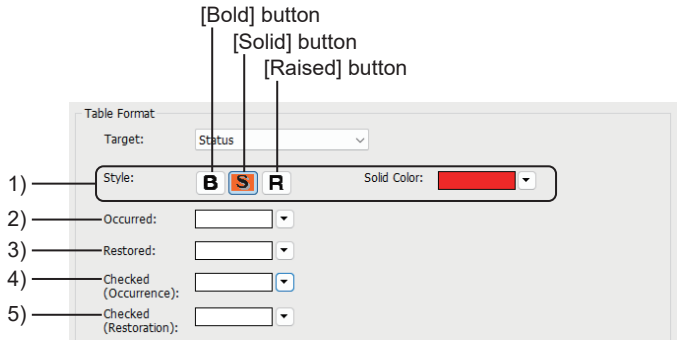
Text is always displayed in the same format without the formats being switched.



Item		Description
1)	[Style]	Set the style of the text to be displayed. One style ([Bold], [Solid], or [Raised]) is settable only. • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
2)	[Fixed]	Set the text color. ☞ Page 988 Color settings

■When [Status] is selected

The formats are switched for each alarm status.



Item		Description
1)	[Style]	Set the style of the text to be displayed. One style ([Bold], [Solid], or [Raised]) is settable only. • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
2)	[Occurred]	Set the text color when the alarm status is "Occurred". ☞ Page 988 Color settings
3)	[Restored]	Set the text color when the alarm status is "Restored". ☞ Page 988 Color settings
4)	[Checked (Occurrence)]	Set the text color when the alarm status is "Checked (Occurrence)". ☞ Page 988 Color settings
5)	[Checked (Restoration)]	Set the text color when the alarm status is "Checked (Restoration)". ☞ Page 988 Color settings

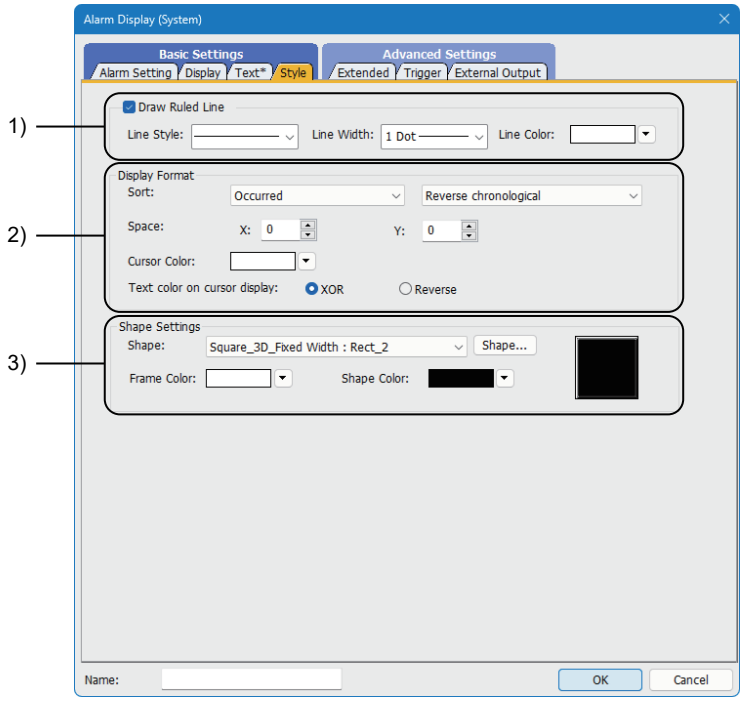
63.7.4 [Style] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set the ruled line and shape of the alarm display (system).



Item			Description
1)	[Draw Ruled Line]	[Line Style]	Select the type of the ruled line of the alarm display (system).
		[Line Width]	Select the width of the ruled line of the alarm display (system).
		[Color]	Select the color of the ruled line of the alarm display (system). ☞ Page 988 Color settings
2)	[Display Format]	[Sort]	Select the sort target and sort order. The selectable items for the sort order differ depending on the sort target.
		[Space]	Set the space between the text to be displayed and the line. Set the space in 1 dot unit. The setting range is [0] to [32].
		[Cursor Color]	Set the cursor color for selecting an alarm. ☞ Page 988 Color settings
		[Text color on cursor display]	Method to set the color of text on the cursor. • [XOR]: Displays the text in the synthesized color with XOR specification. • [Reverse]: Inverts the text. Example) When the text color is green and the cursor color is white [XOR] [Reverse]
3)	[Shape Settings]	[Shape]	Set a shape for the alarm display (system). To select a shape other than those in the list box, click the [Shape] button.
		[Frame Color]	Set the frame color of the shape. ☞ Page 988 Color settings
		[Shape Color]	Set the color of the shape. ☞ Page 988 Color settings

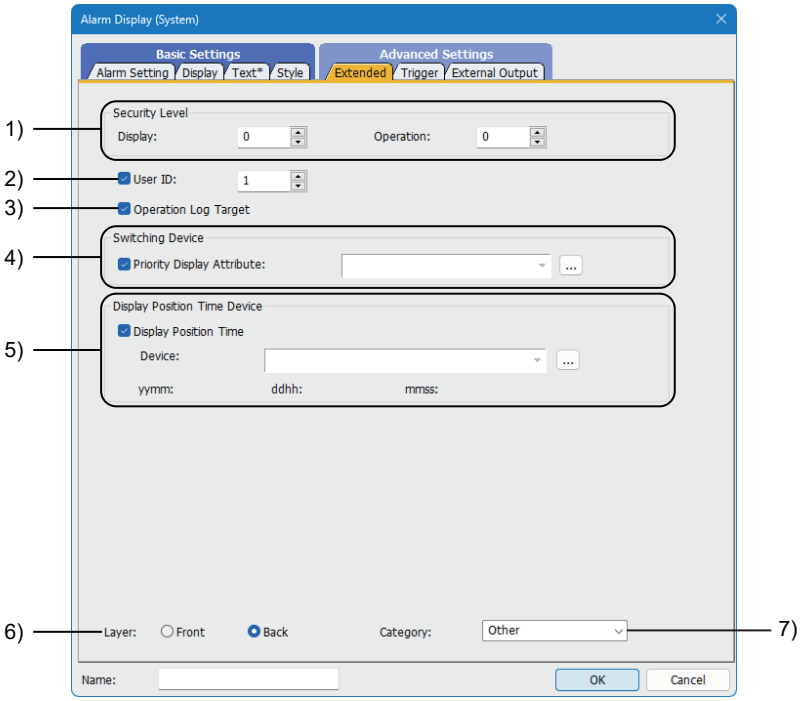
63.7.5 [Extended] tab

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions

Set the operation of switching displays for the alarm display (system) by devices.



Item			Description
1)	[Security Level]		Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 3038 Restricting display and operation on the GOT (Screen security) The set value of [Operation] must be greater than that of [Display].
2)	[User ID]		Set the user ID. If an alarm display (system) and another alarm display are set on a screen, touch switches for the alarm display (system) may not function. For secure operations of the touch switches for alarm displays (system), set user ID for the alarm displays (system).
3)	[Operation Log Target]		Select this item to record the operation log of the set object. ☞ Page 1896 Placing a hyperlink on a mobile screen
4)	[Switching Device]	[Priority Display Attribute]	Controls the contents displayed in the alarm display (system) with the switching devices. Select the items to be controlled and set the switching devices. ☞ Page 2173 Details of [Priority Display Attribute]
5)	[Display Position Time Device]	[Display Position Time]	Displays the data of a specified time. (Time specification jump function) Set a device in which a specified time is stored. ☞ Page 834 How to set devices, labels, and tags The successive devices from a set device are set to store the data of year and month, day and hour, and minute and second. For details on the time specification jump function, refer to the following. ☞ Page 2158 Details of [Display Position Time Device] (time specification jump function)
6)	[Layer]		Select the layer to place the object. ☞ Page 65 Layer
7)	[Category]		Set the category to assign the object. ☞ Page 1092 Efficient Drawing with Templates

Details of [Priority Display Attribute]

Set the priority display attribute switching device to switch the sort criteria.

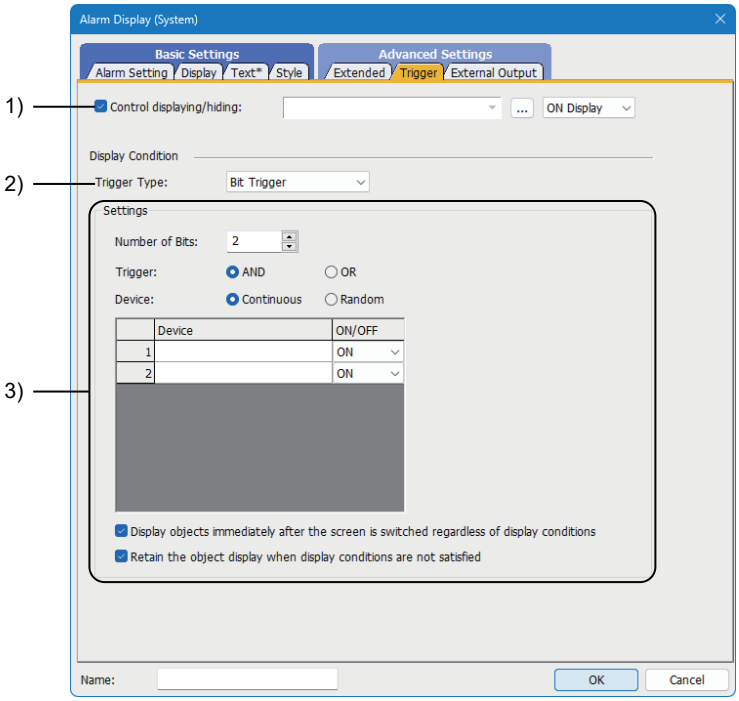
The following lists the function of each bit of the priority display attribute switching device.

Bit	Description
b0 to b3	Specify the sort criteria. • □000h: Normal (date and time of occurrence) • □001h: Date and time of occurrence • □002h: Restored date and time • □003h: Checked date and time • □007h: Alarm status If a value other than the above is stored, alarms are displayed in the order of the date and time of occurrence.
b4 to b14	Use prohibited
b15	Specify the ascending or descending order. • 000□h: Descending • 800□h: Ascending

63.7.6 [Trigger] tab

GT37 SoftGOT3000

Set the trigger condition to display the object.

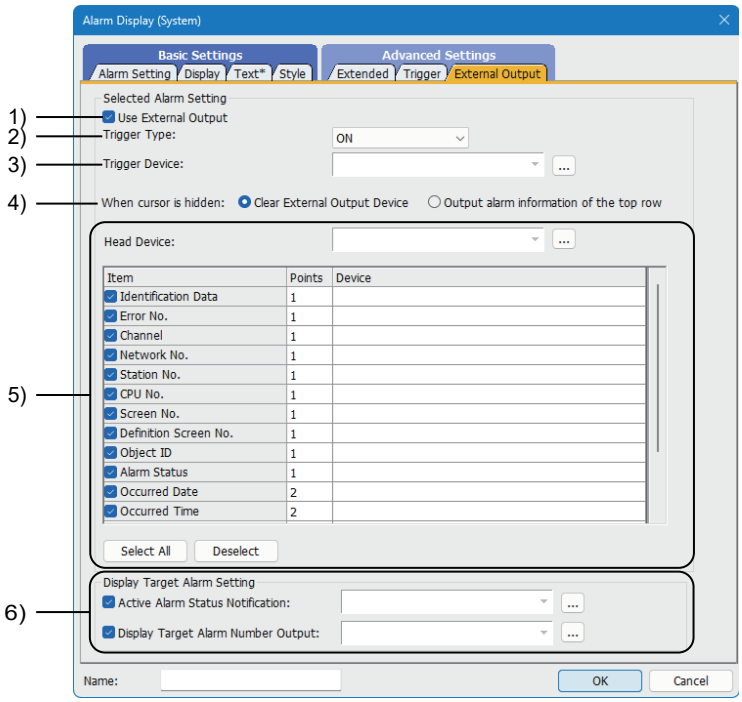


Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the object only when requirements are met. Set the following as requirements. • Bit device for control • Whether to display the object when the bit device for control is on or off
2)	[Trigger Type]	Select a trigger condition to display the object. For details on the trigger types, refer to the following. ☞ Page 969 Trigger types settable for the object display condition
3)	[Settings]	For the settings of each item, refer to the following. ☞ Page 969 Trigger types settable for the object display condition

63.7.7 [External Output] tab

GT37 SoftGOT3000

Configure the setting for writing the information of the alarm selected in the alarm display (system) into devices.



Item			Description
1)	[Use External Output]		Writes the information of the selected alarm into devices. ☞ Page 2134 How to use the alarm display
2)	[Trigger Type]		Select the timing to write the alarm information into a device. The following shows the timing to write each trigger.
		[Ordinary]	When an alarm is selected
		[ON]	When an alarm is selected with the trigger device ON
		[OFF]	When an alarm is selected with the trigger device OFF
3)	[Trigger Device]		When selecting [ON] or [OFF] in [Trigger Type], set the device to be a trigger. A bit device or a bit-specified word device is settable. ☞ Page 834 How to set devices, labels, and tags
4)	[When cursor is hidden]		Set the operation when no alarm is selected.
5)	[Head Device]	—	Set the start device (word device) to which the information of the alarm is written. The bit device cannot be specified as the word device. ☞ Page 834 How to set devices, labels, and tags Selecting the items to be output externally sets consecutive devices starting from the head device as the external output devices for each item. For the targets and output specifications of external output, refer to the following. ☞ Page 2175 Targets and output specifications of external output (alarm display (system))
		[Select All] button	Selects all the output target items.
		[Deselect] button	Deselects all the output target items.

Item			Description	
6)	[Display Target Alarm Setting]	[Active Alarm Status Notification]	Set the device that notifies the status of the displayed alarms. ☞ Page 834 How to set devices, labels, and tags The following bits of the word device are used to notify the alarm status.	
			b0 to b13	Use prohibited
			b14	Notifies that the specified display start row is out of the range. This bit turns on when a value greater than the number of alarms is input to the device set for [Display Start Row] on the [Alarm Setting] tab.
			b15	Use prohibited
		[Display Target Alarm Number Output]	Set the device that stores the number of displayed alarms. You can specify a word device or word-specified bit device. ☞ Page 834 How to set devices, labels, and tags	

Targets and output specifications of external output (alarm display (system))

The following shows the target items and output specifications of external output.

The output target items differ depending on the history collecting method set in the system alarm monitoring setting.

○: Items to be output

×: Items not to be output

Item	[Collection Mode]		Output specifications	
	[Historical]	[Only current alarm]		
[Identification Data]	○	○	The identification information is output as shown below. • Upper: Identification symbol (ASCII) • Lower: Classification code or manufacturer code Identification symbol, classification code, and manufacturer code differ depending on the system alarm type. For details, refer to the following. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)	
			CPU error	The identification symbol and error code are output.
			GOT error	The identification symbol (fixed to G) and classification code are output.
			Network error	The identification symbol (fixed to N) and classification code are output.
			GOT Mobile error	The identification symbol (fixed to W) and classification code are output.
[Error No.]	○	○	—	
[Channel]*1	○	○	—	
[Network No.]*1	○	○	For the host station, the value is 0x0000.	
[Station No.]*1	○	○	For the host station, the value is 0x00FF.	
[CPU No.]*1	○	○	—	
[Screen No.]*1 [Definition Screen No.]*1	○	○	The output specifications differ depending on the screen type.	
			Base screen	The uppermost bit is 0. The range of the value to be stored in the device is 0x0001 to 0x7FFF.
			Window screen	The uppermost bit is 1. The range of the value to be stored in the device is 0x8001 to 0xFFFF.
			Mobile screen	The uppermost bit is 0. The range of the value to be stored in the device is 0x0001 to 0x7FFF. Check that the screen is a mobile screen in [Identification Data].
[Object ID]*1	○	○	—	
[Alarm Status]	○	○	The following bits of the word device are used to output the alarm status.	
			b0	• Occurring: ON • Restored: OFF
			b1	• Checked: ON • Unchecked: OFF
			b2	• When external output of the alarm status is enabled: ON • When external output of the alarm status is disabled: OFF
			b3 to b15	Use prohibited

Item	[Collection Mode]		Output specifications
	[Historical]	[Only current alarm]	
[Occurred Date]	○	○	For the data storage specifications of date and time, refer to the following. ☞ Page 2163 Data storage specifications of date and time
[Occurred Time]	○	○	
[Restored Date]	○	×	
[Restored Time]	○	×	
[Checked Date]	○	○	
[Checked Time]	○	○	

*1 Select [Get detailed alarm information] in the [System Alarm Observation] dialog ([Basic] tab) in advance.
☞ Page 2098 [Basic] tab

■Data storage specifications of date and time

The date and time are respectively stored in two word devices.

The following describes the case in which the time of occurrence is written into D254 (2 points) and the date of occurrence is written into D256 (2 points).

Item	Data storage specifications
Date	Store the year, month, and day with BCD code. D254: b15 to b8 = Month (1 to 12), b7 to b0 = Day (1 to 31) D255: b15 to b8 = The first two digits of the year, b7 to b0 = The last two digits of the year
Time	Stores the hour, minute, and second with BCD code. D256: b15 to b8 = Minute (0 to 59), b7 to b0 = Second (0 to 59) D257: b15 to b8 = 00, b7 to b0 = Hour (0 to 23)

Ex.

Jun. 1, 2024 12:24:56

	b15 to b8	b7 to b0
D254	06 (Month)	01 (Day)
D255	20 (Year)	24
D256	24 (Minute)	56 (Second)
D257	00	12 (Hour)

63.8 Relevant settings

GT37 SoftGOT3000

Set the relevant settings other than the specific settings for the alarm display as required.
The following shows the functions that are available by configuring the relevant settings.

63.8.1 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Displaying the detail screen with a single touch of a basic alarm even when the alarm is not selected in the alarm display (user)	GS450.b15
Moving the cursor to a different alarm on the alarm display (user) when the alarm under the cursor is deleted	GS467.b0

64 Sending an e-mail from the GOT when an alarm occurs (mail send function)

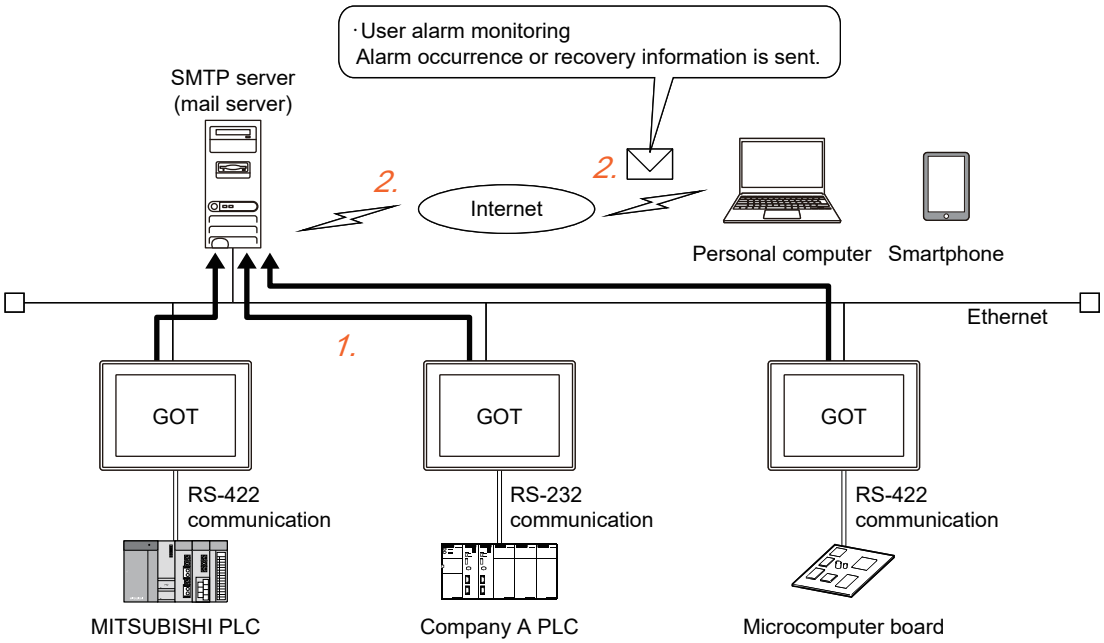
GT37 SoftGOT3000

☞ Page 2179 Overview of the mail send function
☞ Page 2180 Specifications of the mail send function
☞ Page 2183 How to use the mail send function
☞ Page 2186 [Mailing]
☞ Page 2188 Mail send function application example
☞ Page 2189 Relevant settings
☞ Page 2190 Troubleshooting

64.1 Overview of the mail send function

GT37 SoftGOT3000

The mail send function sends information about alarms generated in the GOT to a personal computer or smartphone via e-mail, in conjunction with the user alarm monitoring function.
An e-mail is sent when an alarm occurs and when it recovers.
When an alarm occurs in the GOT, the information is immediately sent to the production site and the administrative office, preventing missed alarms and enabling quick recovery actions.
For details on the user alarm monitoring, refer to the following.
☞ Page 2022 Collecting alarms by monitoring devices



1. When an alarm occurs in the GOT, the GOT alarm display issues an e-mail sending request to the SMTP server.

2. The SMTP server sends an e-mail in response to the request from the GOT.

64.2 Specifications of the mail send function

GT37 SoftGOT3000

☞ Page 2180 System application (add-on function)
☞ Page 2180 Number of mail send function settings for one project
☞ Page 2180 Specifications of mail sending
☞ Page 2180 DNS server setting
☞ Page 2181 Validated mail software
☞ Page 2181 Number of e-mails that can be sent at one time
☞ Page 2181 Applicable languages for mail sending
☞ Page 2181 Mail content
☞ Page 2182 Clock setting of the GOT
☞ Page 2182 Date/Time of mail sending

64.2.1 System application (add-on function)

To use the mail send function, [Mail Send] must be selected from the system applications (add-on functions).
Selecting [Use the function of Mail] and configuring the settings for [Mailing] in the [Controller Setting] window incorporate the application into the package data automatically.
☞ Page 2186 [Mailing]

64.2.2 Number of mail send function settings for one project

One setting can be configured per project.

64.2.3 Specifications of mail sending

- If the internet service provider allows direct specification of the IP address to access the server, e-mails can be sent via a router.
- Use the DNS client function to specify the host name to connect to the service provider and send e-mails.
- When using a mail server provided by the service provider, be sure to check connectivity in advance.
- You can encrypt communication with the mail server.

TLS1.2 and TLS1.3 are supported.

- SMTP authentication and POP before SMTP authentication are available, and the user name and password for authentication can be specified.
- You can specify the following items for e-mails.

◇Sender information (FROM)
◇Receiver (To), carbon copy (Cc), blind carbon copy (Bcc)
◇Subject

64.2.4 DNS server setting

To specify a mail server with the host name, the DNS server settings of the GOT must be configured.
☞ Page 717 [GOT Ethernet Common Setting]
For GT SoftGOT3000, configure the DNS settings in the personal computer.

64.2.5 Validated mail software

The following shows mail software whose operations have been validated by Mitsubishi Electric Corporation.
The GOT (mail sender) does not require the mail software.

Name	Manufacturer
Outlook	Microsoft Corporation
Yahoo! JAPAN Mail	LY Corporation
Gmail	Google LLC
iCloud Mail	Apple Inc.

64.2.6 Number of e-mails that can be sent at one time

The maximum number of e-mails that can be sent at one time is 16.
If 17 or more alarms occur or are recovered simultaneously, the details of first 16 alarms are sent.

64.2.7 Applicable languages for mail sending

Only Japanese and English are applicable.
For the other languages, the mail is sent as [?].

64.2.8 Mail content

The following information is output to e-mails.

Mail client information shown in the header of the e-mail sent from the GOT

When a target device receives an e-mail from the GOT, the header of the received e-mail has a line showing that the GOT has sent the e-mail as shown below.
The display format and details of the received mail differ depending on the specifications of the mail software installed in the target device.

Ex.
Display example of the header of the received mail

```
From: **********************
To: ************************
Cc: ************************
Subject:Module VI - Line A
                :
X-Mailer:GOT
```

Mail body content

The body of the e-mail includes the title, date and time, alarm information, detailed information, and word log in order.
The mail content differs depending on whether an alarm occurs or recovers.

At alarm occurrence

```
[Alarm notice]
[Date/Time of occurrence]
2025/4/20 10:38:15
[Alarm information]
Equipment A feed conveyor stopped
[Details]
Equipment A feed conveyor has been stopped.
Check the power supply.
[Log on Occurrence]
The motor speed at the time of error occurrence was ***
r/min, and the weight of the transported product was *** kg.
```

At alarm recovery

```
[Recovery notice]
[Date/Time of recovery]
2025/4/20 11:35:10
[Recovery information]
Equipment A feed conveyor stopped
[Details]
Equipment A feed conveyor has been stopped.
Check the power supply.
[Log on Occurrence]
The motor speed at the time of error occurrence was ***
r/min, and the weight of the transported product was *** kg.
```

Item	Content	
	At alarm occurrence	**At alarm recovery**
Title	[Alarm notice]	[Recovery notice]
Date and time (GOT local time)	[Date/Time of occurrence] The date and time of occurrence is displayed.	[Date/Time of recovery] The date and time of recovery is displayed.
Alarm information	[Alarm information] A basic alarm comment is displayed.	[Recovery information] A basic alarm comment is displayed.
Detailed information	[Details] The same information is output regardless of the alarm status. The contents of the detail display ([Detail Display No.]) set for the alarm display are displayed. Select [Comment Window] for [Display Destination] for the alarm display. [Details] is not displayed if [Not Display], [Base Screen], or [Window Screen] is selected.	
Word log	[Log on Occurrence] The comment specified for the word log is displayed.	

64.2.9 Clock setting of the GOT

Depending on the clock setting (time setting and time notification) of the GOT, a problem may occur, such as the clock data set in the GOT or the controller is not reflected.
For the clock setting of the GOT, refer to the following.
☞ Page 635 Setting the GOT time setting method ([Time Setting])

64.2.10 Date/Time of mail sending

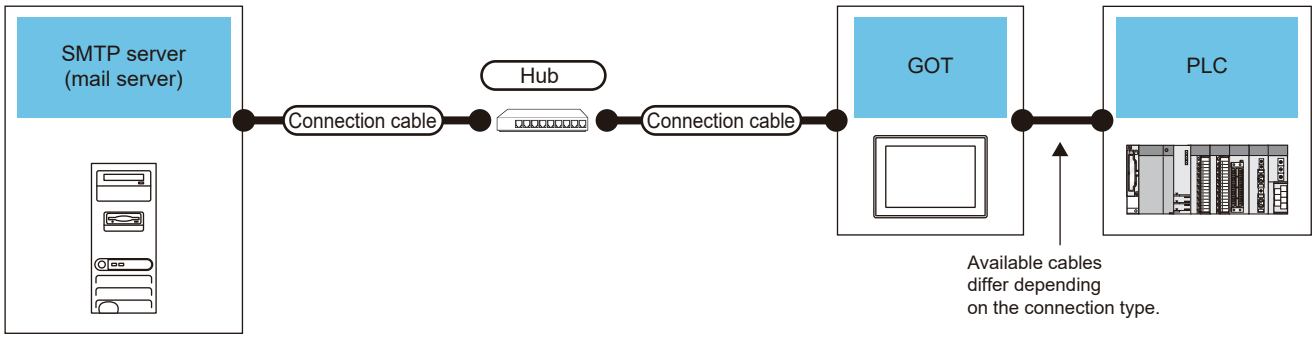
The date and time of the SMTP server at mail sending is attached to the mail.

64.3 How to use the mail send function

GT37 SoftGOT3000

☞ Page 2183 System configuration
☞ Page 2185 Setting procedure

64.3.1 System configuration



SMTP server	Connection cable	GOT		PLC
		Interface	Model	
Personal computer or others	Shielded twisted pair cable	Built-in Ethernet interface of the GOT	GT37 SoftGOT3000	For information on the system configuration between the GOT and PLC, refer to the following. GOT3000 Series User's Manual (Connection)
		Ethernet interface of personal computer	GT37 SoftGOT3000	

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

A straight cable is usable.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the Ethernet network system used.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.
The maximum length depends on the Ethernet equipment used.
The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

■Countermeasures against access delay

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.
The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

■Connection to the intranet

If the system needs keeping secure against unauthorized access to the intranet, consult a network service provider or a network administrator (a person who does network planning, IP address management, and others), and include your own countermeasures.
Mitsubishi Electric Corporation assumes no responsibility for any consequences that may arise from system troubles due to the intranet connection.

■When a firewall is used

If a firewall disconnects the communication of the gateway function, take countermeasures such as changing the port No. to be protected behind the firewall.
If the system needs keeping secure against unauthorized access in changing the port No. to be protected behind the firewall, consult the network administrator (a person who does network planning, IP address management, and others), and develop your own countermeasures.
Mitsubishi Electric Corporation assumes no responsibility for consequences that may arise from system troubles due to the change of the port No.

64.3.2 Setting procedure

The following shows the setting procedure to send e-mails.

1. Consider the configuration of the whole system.

- Configuration of the whole system including controllers and GOTs
- Controller settings (including device assignment)
- GOT settings (including IP address, network number, and station number)

2. Connect the GOT and the controllers.

☞ Page 2183 System configuration

3. In the [User Alarm Observation] dialog, click [Additional Setting] and select [Mail Send], and configure the other settings as required.

☞ Page 2045 [User Alarm Observation] dialog

4. Select [Common] → [Controller Setting] from the GT Designer3 menu to display the [Controller Setting] window. Select [Mailing] and configure the required settings.

☞ Page 2186 [Mailing]

5. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

6. Check the GOT operation.

☞ Page 2188 Mail send function application example

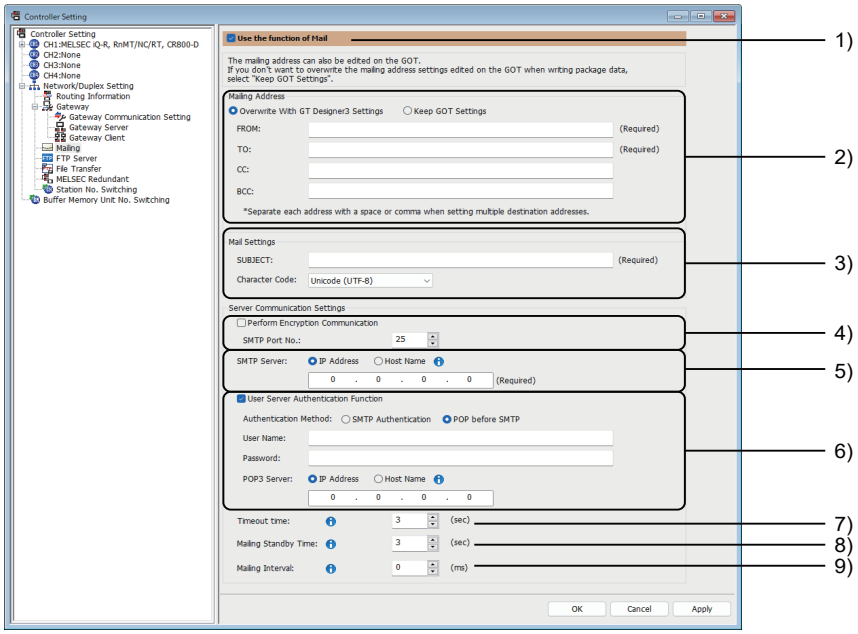
64.4 [Mailing]

GT37 SoftGOT3000

In the [Mailing] setting screen, configure the settings including mailing addresses, whether to enable encrypted communication, and the server authentication method.

Window

1. Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
2. Select [Mailing] in the [Controller Setting] window.



Item			Description
1)	[Use the function of Mail]		Select this option when using the mail send function.
2)	[Mailing Address]	—	The settings in this section can also be configured in the GOT utility. Select [Keep GOT Settings] if you do not want to overwrite the mail receiver settings set on the GOT with those on this screen when writing the package data. If you select [Overwrite With GT Designer3 Settings], configure the following settings. One-byte alphanumeric characters (uppercase or lowercase) and the following symbols can be used for these settings. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~
		[FROM]	Set the mail sender address within 64 characters. One address can be set. Set one of the following addresses since the GOT does not have its own address. • Address set to [TO] • Address you want to use as the return address
		[TO] [CC] [BCC]	Set the mail receiver addresses within 2141 characters (including delimiters). Up to 32 addresses can be set for each item. Specify each address within 64 characters. When setting addresses of multiple mail receivers, separate the addresses by commas or spaces. Commas are not allowed in the address.
3)	[Mail Settings]	[SUBJECT]	Set the mail title within 128 characters. When receiving e-mails from multiple GOTs, set a different subject for each GOT to identify the sender. One-byte alphanumeric characters (uppercase or lowercase), one-byte spaces, and the following symbols can be used. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~
		[Character Code]	Set the character code for the mail body.

Item			Description
4)	[Perform Encryption Communication]	—	Select this item to enable encrypted communication.
		[SMTP Port No.]	When [Perform Encryption Communication] is not selected, set the port number of an SMTP server. The setting range is [0] to [65535].
		[Encryption Communication Port No.]	When [Perform Encryption Communication] is selected, set the port number for encrypted communication. The setting range is [0] to [65535].
5)	[SMTP Server]	—	Set the address of an SMTP server.
		[IP Address]	Specify the IP address. The setting range is [0.0.0.0] to [255.255.255.255].
		[Host Name]	Specify the host name. To specify the server with the host name, configure the DNS server settings in [GOT Ethernet Common Setting]. Set the full computer name (the computer name + . (period) + domain name) for the host name. Up to 253 one-byte alphanumeric characters (uppercase or lowercase) and the following symbols can be used. - . When using e-mail service, set the specified SMTP server. For the e-mail service providers whose operations have been validated by Mitsubishi Electric Corporation, refer to the following. ☞ Page 2180 Specifications of the mail send function
6)	[User Server Authentication Function]	—	Select this item to use server authentication, and configure the following settings.
		[Authentication Method]	Select a server authentication method.
		[User Name]	Set the user name for server authentication within 256 characters. One-byte alphanumeric characters (uppercase or lowercase), one-byte spaces, and the following symbols can be used. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~
		[Password]	Set the password for server authentication within 256 characters. One-byte alphanumeric characters (uppercase or lowercase), one-byte spaces, and the following symbols can be used. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~
		[POP3 Server]	Set the POP3 server address when [POP before SMTP] is selected for [Authentication Method]. On the POP3 server, port 995 is designated for encrypted communication, and port 110 is designated for unencrypted communication. Connection to a POP3 server is not possible if these ports are unavailable. • [IP Address] Specify the IP address. The setting range is [0.0.0.0] to [255.255.255.255]. • [Host Name] Specify the host name. Set the full computer name (the computer name + . (period) + domain name) for the host name. Up to 253 one-byte alphanumeric characters (uppercase or lowercase) and the following symbols can be used. - . When using e-mail service, set the specified POP3 server.
7)	[Timeout time]		Set the time for communication timeout when there is no response from the mail server due to the load condition of the server.
8)	[Mailing Standby Time]		Set the wait time between the establishment of the mail sending trigger and the actual sending of the e-mail.
9)	[Mailing Interval]		When multiple mail sending triggers are established at the same time, e-mails are sent one by one at the set interval. Configure this setting when e-mail sending fails due to server restrictions triggered by sending a large number of e-mails simultaneously.

Precautions

If you change the GOT type to GT SoftGOT3000 with [Keep GOT Settings] selected for [Mailing Address], [FROM], [TO], [CC], and [BCC] settings will be blank.

64.5 Mail send function application example

GT37 SoftGOT3000

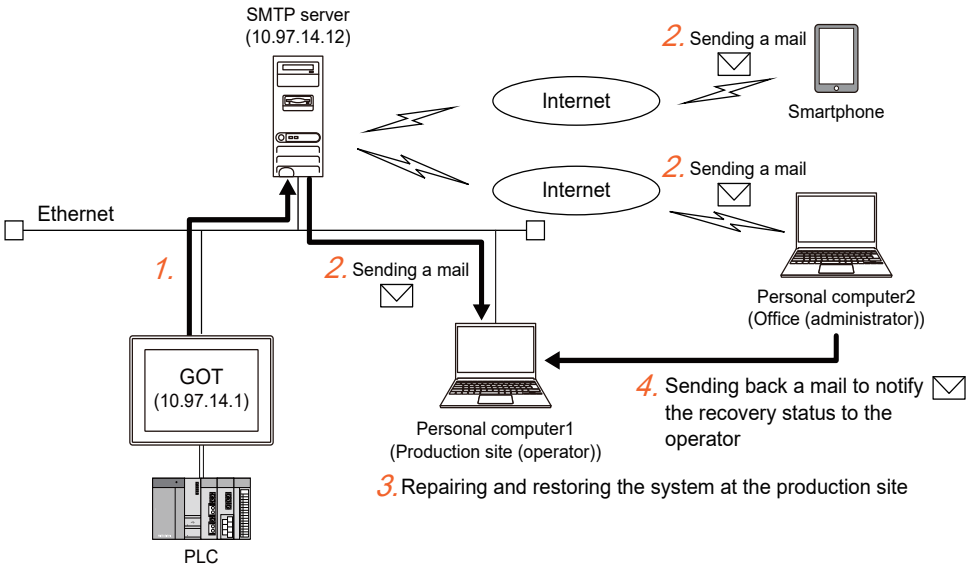
The following shows an application example of the mail send function.

Ex.

The following shows an example of sending e-mails to notify the production site and office of the details of an alarm occurring in the GOT.

GOTs cannot receive mails. Thus, set the mail address of the personal computer at the production site for FROM.

If the mail address of the personal computer at the production site is set for FROM, the office (administrator) can send back an e-mail to the production site to obtain the information about the latest recovery status.



1. When an alarm occurs in the GOT, the GOT issues an e-mail sending request to the SMTP server.

2. Upon the request, the SMTP server sends an e-mail to personal computer 1 (production site (operator)), smartphones, and personal computer 2 (office (administrator)).

3. The production site receives the e-mail, and repairs and recovers the system.

4. The office sends an e-mail to the production site to request a report about the latest recovery status.

The following shows an example of the settings in GT Designer3.

Set the comments displayed in the alarm display in advance.

Item		Description
Controller setting	GOT IP address	10.97.14.1
	Send delay time	0 (ms)
	Communication timeout time	3 seconds
	Startup time	3 seconds
Mail setting	SMTP	10.97.14.12
	FROM	Mail address of personal computer 1 (production site (operator))
	TO	Mail address of personal computer 1 (production site (operator))
	CC	Mail addresses of personal computer 2 (office (administrator)) and smartphones
	SUBJECT	Module VI - Line A
Alarm display (Alarm display screen)	Device	Controller device to be monitored
	Mail sending	When an error occurs and recovery is completed

64.6 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the mail send function as required.
The following shows the functions that are available by configuring the relevant settings.

64.6.1 GOT internal device

Function	Setting item
Holding the on status while the mail send function can be used.	GS200.b0
Turning on when the error has occurred in the mail send function.	GS200.b11
Storing the number of the errors that have occurred in the mail send function.	GS201
Storing the codes of the errors that have occurred in the mail send function.	GS202
Storing the year (upper byte, two lower digits of year) and the month (lower byte) of the error occurrence date/time when the error has occurred in the mail send function in BCD code.	GS203
Storing the day (upper byte) and the hour (lower byte) of the error occurrence date/time when the error has occurred in the mail send function in BCD code.	GS204
Storing the minute (upper byte) and the second (lower byte) of the error occurrence date/time when the error has occurred in the mail send function in BCD code.	GS205
Notifying the type of the function that has caused the error in the mail sending process of the mail send function.	GS206
Clearing the errors (GS200.b11, GS201 to GS206) of the mail send function.	GS400.b11

64.7 Troubleshooting

GT37 SoftGOT3000

☞ Page 2190 Troubleshooting for the mail send function
☞ Page 2191 Error information of the mail send function
☞ Page 2191 Error code and error message of the mail send function

64.7.1 Troubleshooting for the mail send function

The following shows the troubleshooting for the mail send function.

Symptom		Details of error and cause	Corrective action
The mail send function does not work.	When all the bits of GS200 are off and the GOT does not respond to Ping *1*2	The system application (extended function) for the mail send function is not installed on the GOT.	Write the package data, which contains the system application (extended function) for the mail send function, to the GOT. ☞ Page 408 Transferring data to the GOT
		No IP address has been set for the GOT.	Set the IP address for the GOT in the utility of the GOT.
		The port number of the personal computer (MX Component) is different from that of the GOT (5011).	Set the same port number for the personal computer (MX Component) as that of the GOT (5011).
	If any bit of GS200 is on and the GOT responds to Ping *1*2	—	Refer to the troubleshooting for the functions corresponding to the bits that are on, and take corrective actions.
Mail cannot be sent.		The SMTP server is not working properly.	Check with the network administrator that the SMTP server is working properly.
		Mail sender address is not properly set for FROM.	Set the proper sender address for FROM
		The GOT attempted to send 17 or more mails at a time.	Send 16 or less mails at a time.
The time when the mail has been sent is not correct.		The time on the SMTP server is incorrect. (The GOT refers to this time when sending mails.)	Set the correct time for the SMTP server.
The whole text of the e-mail is not displayed on the smartphone.		The number of characters that the smartphone can send (receive) has been exceeded.	Reduce the number of characters in the e-mail so that the smartphone can send (receive) the e-mail.
One-byte katakana is converted to two-byte katakana.		One-byte katakana cannot be used in the body of the mail. One-byte katakana is sent after converted to two-byte katakana.	This symptom is not an error.

*1 For the details of the Gateway Common Information (GS200), refer to the following.
☞ Page 3581 GOT special register (GS)

*2 To check if the GOT responds to Ping, give the ping command through the personal computer to the GOT.

64.7.2 Error information of the mail send function

The error information of the mail send function is stored in the GOT special register (GS).
Monitor the following GOT special registers to check the error information of the mail send function.
For the details of the GOT special register, refer to the following.
☞ Page 3581 GOT special register (GS)

Device	Function		Description
GS201	Mail send function	Error counter	Stores the number of errors that have occurred.
GS202		Error code	Stores the error code. ☞ Page 2191 Error code and error message of the mail send function
GS203		Error date and time	Stores the year (upper byte, two lower digits of year) and the month (lower byte) of the error occurrence date/time in BCD code.
GS204			Stores the day (upper byte) and the hour (lower byte) of the error occurrence date/time in BCD code.
GS205			Stores the minute (upper byte) and the second (lower byte) of the error occurrence date/time in BCD code.
GS206		Mail sender	Notifies the type of the function that has caused the error in the mail sending process. • 0: No error • 1: User alarm monitoring

64.7.3 Error code and error message of the mail send function

The following lists the error codes that are stored in the GOT special register GS202 (Mail Send Function Error Code).

Error code	Description	Corrective action
2	No sender address is set for FROM.	Set the sender address for FROM. ☞ Page 2186 [Mailing]
3	The SMTP server is not set.	Set the SMTP server. ☞ Page 2186 [Mailing]
4	No receiver address is set for TO.	Set the receiver address for TO. ☞ Page 2186 [Mailing]
5	Mail address is incorrect.	Check that the mail addresses for FROM, TO, CC, and BCC are correct. ☞ Page 2186 [Mailing]
6	Alarms may occur in excess of the number of e-mails that can be sent.	Check the number of alarms that have occurred. Up to 16 e-mails can be sent at a time to notify the alarm.
10	The connection with the SMTP server has been failed.	• Check if the SMTP server is functioning normally. • Check if the IP address or host name of the SMTP server is properly set. • Contact the network administrator to check the router address and the subnet mask, and then setup the GOT. • When the network is protected by a firewall, contact the network administrator to check that the specified port number of the SMTP server is allowed to pass through the firewall.
11	A timeout has occurred in the connection with the SMTP server.	• Check if the SMTP server is functioning normally. • Specify a longer communication timeout period. ☞ Page 729 [Controller Setting]
12	The SMTP server notifies the error.	• Check if the SMTP server is functioning normally. • Contact the network administrator to check that e-mails can be sent without the authentication including POP3.
13	The SMTP authentication has failed.	• Check that the user name and password for the SMTP authentication are set correctly. ☞ Page 2186 [Mailing]
32	The POP3 server address is not set.	• Set the IP address or host name of the POP3 server. ☞ Page 2186 [Mailing]
34	The connection to the POP3 server has failed.	• Check that the IP address or host name of the POP3 server is set correctly. ☞ Page 2186 [Mailing] • Check that the POP3 server is not down.
37	Authentication of the POP3 server has failed.	• Check that the user name and password for the POP3 server are set correctly. ☞ Page 2186 [Mailing]
40	A DNS server is not set.	Set a DNS server. ☞ Page 2186 [Mailing]

Error code	Description	Corrective action
42	The host name of the server cannot be resolved.	• Check that the address of the DNS server is set correctly. • Check that the DNS server is not down. • Check that the host name of the SMTP server and POP3 server are set correctly.

PART 10 Logging

65 Collecting device data ([Logging])

65 Collecting device data ([Logging])

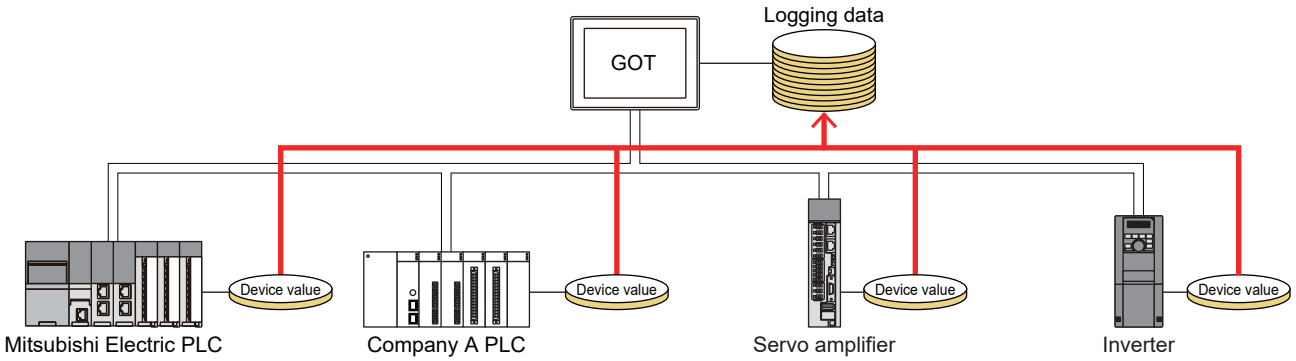
☞ Page 2195 Overview of the logging function
☞ Page 2197 Useful information
☞ Page 2198 Basic flow of data collection and storage
☞ Page 2200 How to save logging data (logging mode)
☞ Page 2210 Specifications of the logging
☞ Page 2214 Control triggers used for logging
☞ Page 2217 Notification devices used for logging
☞ Page 2221 How to use the logging
☞ Page 2227 [Logging List] dialog
☞ Page 2228 [Logging] dialog
☞ Page 2240 [Logging File Conversion] dialog
☞ Page 2241 Relevant settings

65.1 Overview of the logging function

GT37 SoftGOT3000

Logging is a function that collects and accumulates device values from the controller connected to the GOT at user-specified timings or at regular intervals.

The collected and accumulated device values (hereafter, logging data) can be used for data analysis and error analysis.



Logging has four main functions:

Data collection

The logging function of the GOT can collect device values from the controller without using the logging function of the controller.

This eliminates the need for the controller to perform logging and reduces load on the controller.

The conditions for starting device value collection from the controller are referred to as logging triggers. Available trigger types include rising, falling, and sampling.

Logging triggers enable data acquisition at the required timings.

☞ Page 2214 Logging trigger

Data storage

Two modes are available. File save mode stores large volumes of data as logging files (*.G3L), and buffer historical mode retains logging data only in the buffering area of the GOT and enables high-speed data collection.

Select the mode according to the intended application.

☞ Page 2201 File save mode

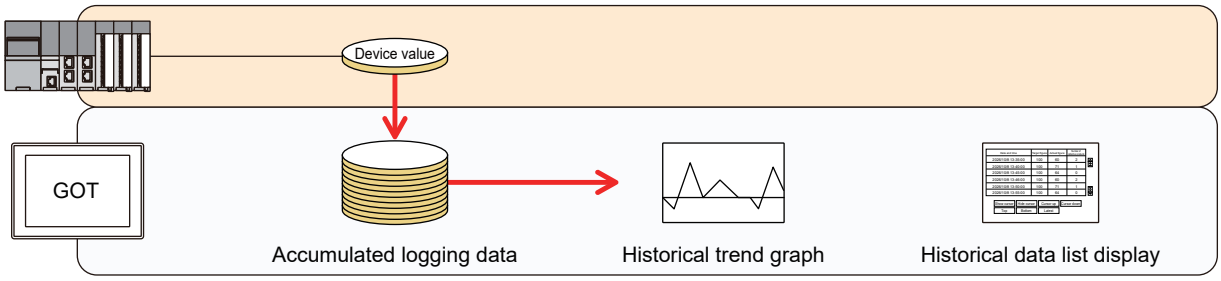
☞ Page 2205 Buffer historical mode

Data visualization

Linking logging data with [Historical Trend Graph] or [Historical Data List Display] object visualizes the changes in device values in real time on the GOT screen without using a personal computer.

This enables immediate on-site data checking and a quick response to errors.

Object type	Description
Historical trend graph ☞ Page 1693 Placing a historical trend graph	Displays the device values collected by logging as a time-series graph. Changes in the data values can be checked visually.
Historical data list display ☞ Page 1495 Placing a historical data list display	Displays the device values collected by logging in a chronological table format. Actual values and any anomalies can be checked.



Data output

Logging data can be saved as a logging file (.G3L), a CSV file, or a Unicode text file.

When saved, the data is always output first as a logging file (.G3L).

Depending on the settings, a CSV file or a Unicode text file can be saved in addition to the logging file (.G3L). Saving the data as a CSV file or a Unicode text file enables its use for aggregation, graphing, and detailed analysis on a personal computer.

Even without additional file saving, the logging file (.G3L) can later be converted to a CSV file or a Unicode text file.

For information on the conversion method, refer to the following.

☞ Page 2223 Converting a logging file to a CSV file or a Unicode text file

For information on the format of the output file, refer to the following.

☞ Page 2225 Logging data format

65.2 Useful information

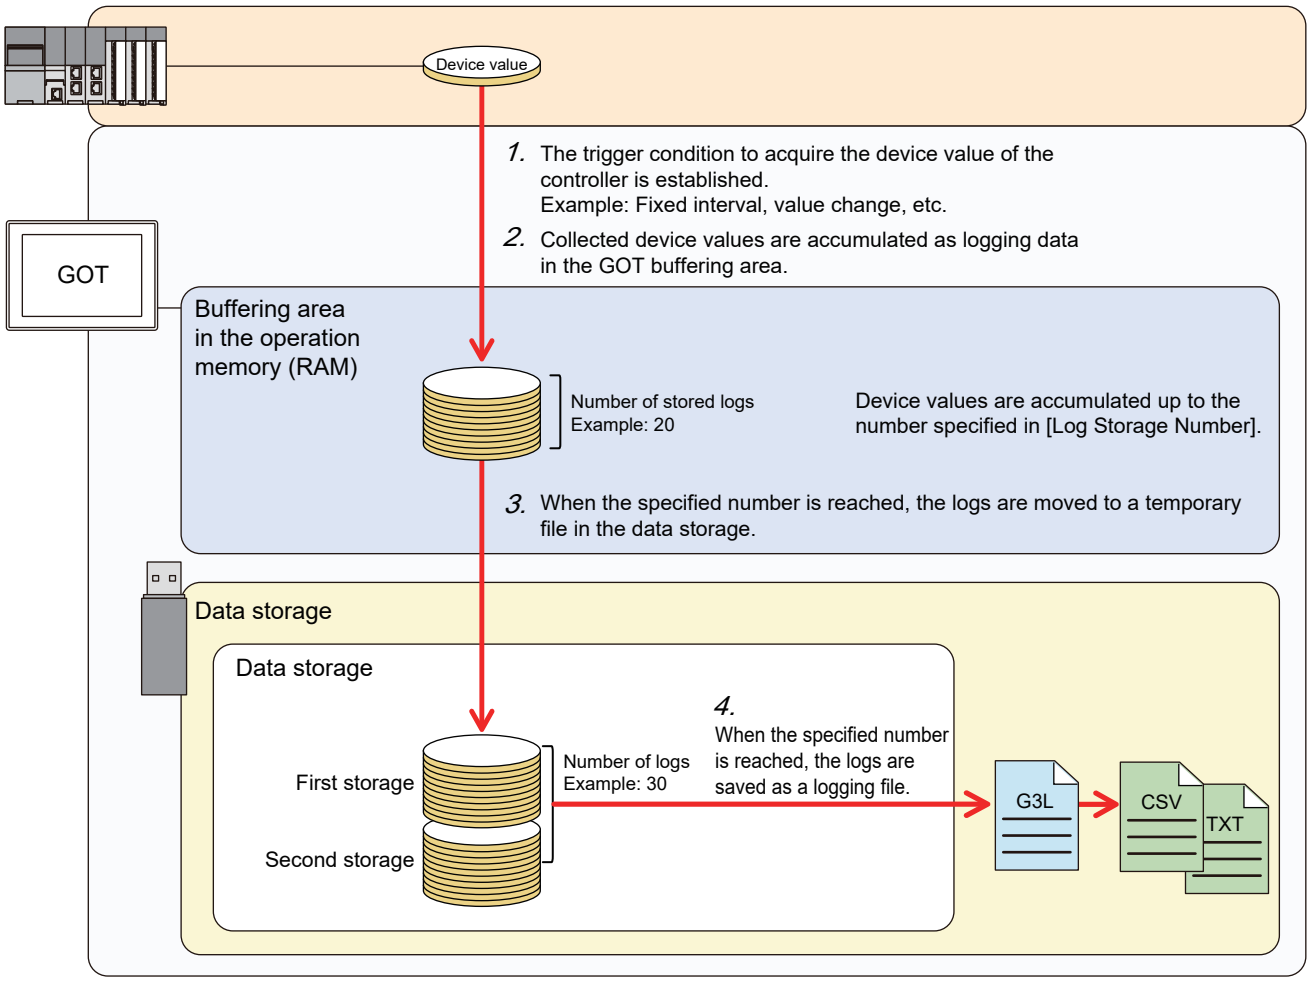
65.3 Basic flow of data collection and storage

This section explains the basic flow of collecting device values from the controller and saving the collected data as a logging file.



1. Start of device value collection

When the condition for device value collection (trigger condition) is satisfied, the GOT starts collecting device values from the controller.

2. Temporary storage to the buffering area

The collected device values are accumulated as logging data in the buffering area in the operation memory (RAM) of the GOT.

3. Move to the temporary file

When the number of logs in the buffering area reaches the set [Log Storage Number] (full state), they are moved to the temporary file in the data storage installed on the GOT.

At this time, the logs are deleted from the buffering area.

4. Saving as a logging file

When the number of logs accumulated in the temporary file reaches the set [Number of logs to be stored in 1 logging file], the data is saved as a single logging file.

At this time, an additional CSV file or Unicode text file can also be created and saved.

Repeating the steps 1 to 4 accumulates logging files and text data (CSV, Unicode text) in the data storage.

Point

The figure in this section shows the behavior when detailed settings are configured.
In the default settings, [Log Storage Number] and [Number of logs to be stored in 1 logging file] are set to the same values. Therefore, one logging file is created each time the buffering area becomes full.
In the detailed settings, you can individually set [Log Storage Number] and [Number of logs to be stored in 1 logging file], and specify various triggers and devices described later to enable flexible data saving.

65.4 How to save logging data (logging mode)

The GOT provides the following two logging modes for saving logging data.
Since up to 60 logging settings can be configured per project, you can specify the logging mode for each logging setting according to your application.

Logging mode	Description
☞ Page 2201 File save mode	This mode saves the collected logging data as a logging file in the data storage installed on the GOT. Long-term storage of large volumes of logging data is possible. Both real-time and previously accumulated logging data are displayed in the trend graph and the historical data list display. When using file save mode, a data storage is required.
☞ Page 2205 Buffer historical mode	This mode stores logging data only in the buffering area. This mode is useful to save large volumes of logging data, or to perform high-speed logging of device values from the controller and check them in real time on the historical trend graph or historical data list display on the GOT screen.

Specify the logging mode for [How to store logging data] in the [Logging] dialog.
☞ Page 2228 [Logging] dialog

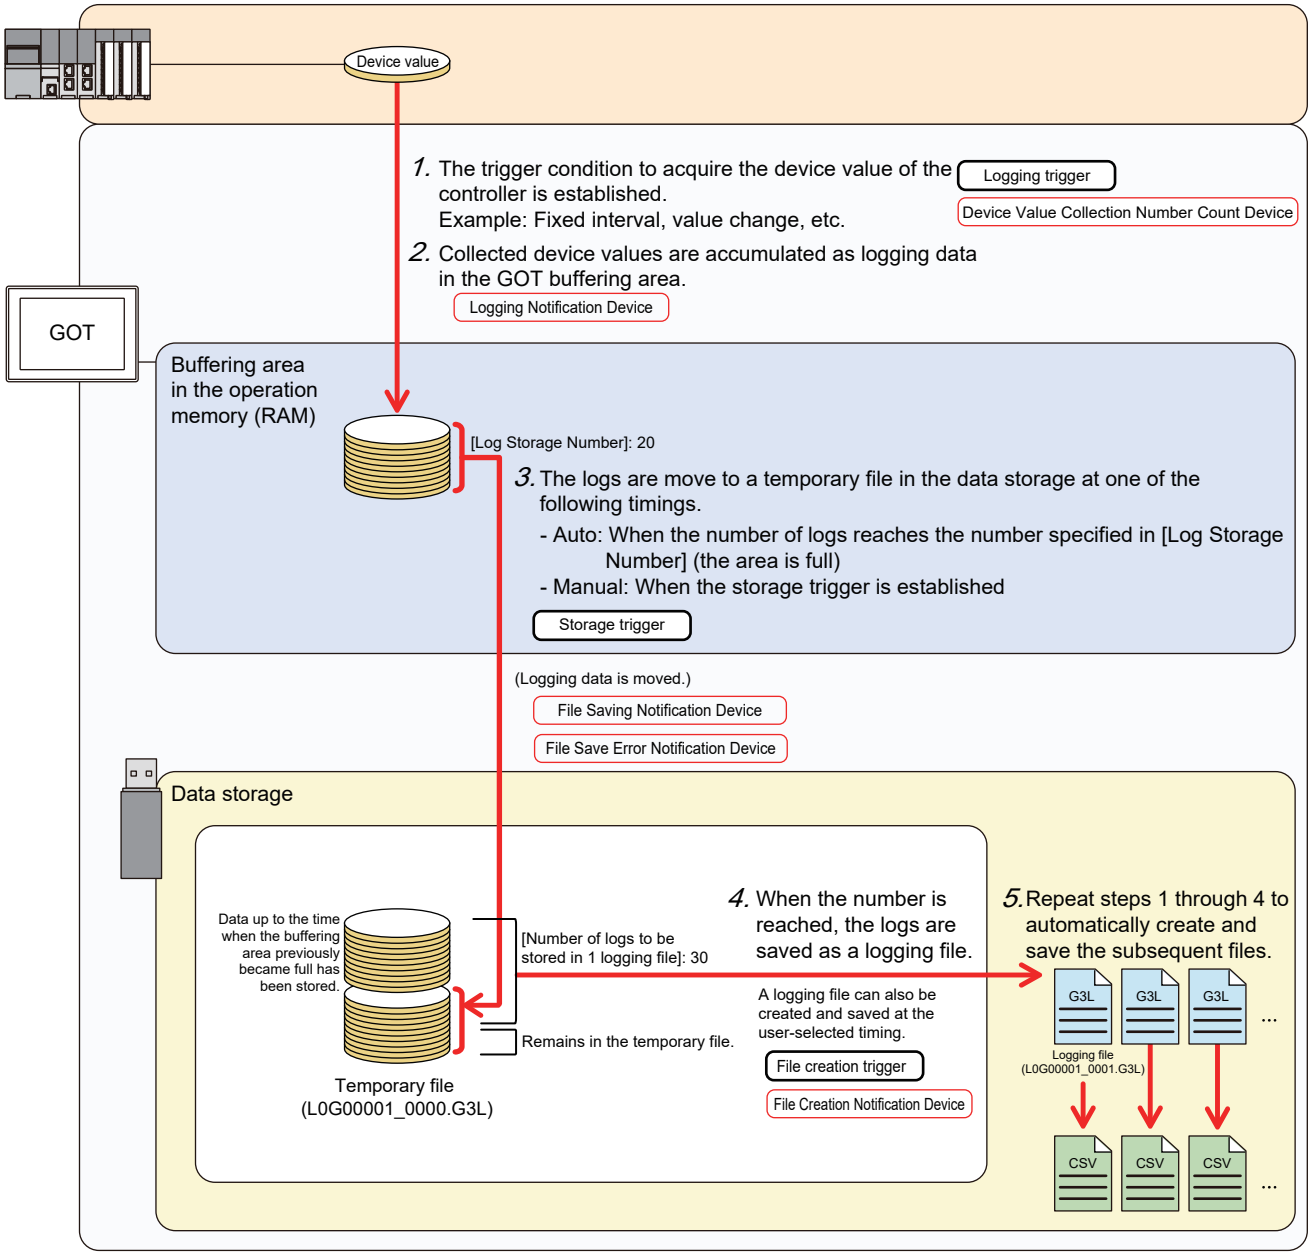
65.4.1 File save mode

The following example shows the operation of file save mode.

Ex.

When [Log Storage Number] is 20

When [Number of logs to be stored in 1 logging file] is 30



1. Start of device value collection

When the device value collection condition (logging trigger) is satisfied, the GOT starts collecting device values from the controller.

Trigger and device	Description	Setting item in the [Logging] dialog ☞ Page 2228 [Logging] dialog
Logging trigger	Condition for starting device value collection from the controller ☞ Page 2214 Logging trigger	[When to collect device values]
Device Value Collection Number Count Device	You can check the device value collection count since the GOT started. ☞ Page 2217 Device Value Collection Number Count Device	[Device Value Collection Number Count Device]

2. Temporary storage to the buffer area

The collected device values are accumulated as logging data in the buffering area in the operation memory (RAM) of the GOT.

Device	Description	Setting item in the [Logging] dialog ☞ Page 2228 [Logging] dialog
Logging Notification Device	You can check that device data is being collected in the buffering area. ☞ Page 2217 Logging Notification Device	[Logging Notification Device]

3. Move to the temporary file

When one of the following requirements is satisfied, the logging data in the buffering ring area is moved to the temporary file in the data storage installed on the GOT and deleted from the buffering area.

Requirements	Description
The number of logs in the buffering area reaches [Log Storage Number] (full state).	When the number of logs collected in the buffering area reaches [20] set to [Log Storage Number] in the [Logging] dialog, the logs are moved to the temporary file (file number 0000) in the data storage. If the buffering area is full and 20 logs are already in the temporary file, the new logs are added to the existing ones.
The storage trigger is established.	When the storage trigger is established, the logging data in the buffering area is moved to the temporary file (file number 0000) in the data storage. Regardless of [Log Storage Number], the data can be moved to the temporary file at use-specified timings.

The following trigger and devices can be used.

Trigger and device	Description	Setting item in the [Logging] dialog ☞ Page 2228 [Logging] dialog
Storage trigger	☞ Page 2216 Storage trigger	[When to store logs to the temporary file]
File Saving Notification Device	You can check that the logging data stored in the buffering area is being written to the temporary file. ☞ Page 2219 File Saving Notification Device	[File Saving Notification Device]
File Save Error Notification Device	You can check for errors while writing to the temporary file. ☞ Page 2220 File Save Error Notification Device	[File Save Error Notification Device]

Precautions

- Powering off, restarting, or resetting the GOT will delete the logging data in the buffering area.

If the data needs to be retained, use the storage trigger to store the logging data.

- If no data storage is installed, logging is paused when the number of logs reaches [Log Storage Number].

4. Saving as a logging file

Set the number of logs stored in one logging file by [Number of logs to be stored in 1 logging file] in the [Logging] dialog.

When the logging data accumulated in the temporary file reaches [30] set to [Number of logs to be stored in 1 logging file], the data is saved to a logging file.

When the settings for creating a CSV file or a Unicode text file are configured, the corresponding file is created at the time a logging file is created.

While the logging data is being saved to a file (including a text file), logging is paused.

Trigger and device	Description	Setting item in the [Logging] dialog ☞ Page 2228 [Logging] dialog
File creation trigger	Use this to create and save a logging file even though the number of logs in the temporary file is below the specified value. When the file creation trigger is used, the logging data in the buffering area is also saved to the file in addition to the logging data in the temporary file (the data is deleted from the buffering area). ☞ Page 2217 File creation trigger	[Create a logging file at any desired time]
File Creation Notification Device	When this device is used with the file creation trigger, you can check whether the logging data in the temporary file is being saved to a file (whether logging is paused). ☞ Page 2220 File Creation Notification Device	[File Creation Notification Device]

After the logging file is saved, the logging data stored in the temporary file is automatically deleted, and logging resumes.

Any logging data not saved to a logging file remains in the temporary file.

5. Automatic logging file creation

By repeating the operations in steps 1 to 4, the next logging file is automatically created and saved.

When the number of logging files exceeds the maximum number specified in the settings, the oldest logging file is overwritten.

Even when the file creation trigger is used, logging data is automatically saved to a logging file once [Number of logs to be stored in 1 logging file] is satisfied.

When the settings for creating a CSV file or a Unicode text file are configured, the corresponding file is created at the time one logging file is created.

Precautions

■When a data storage is not installed

If no data storage is installed, writing of the logging data stored in the buffer area to the temporary file fails, and the [File Save Error Notification Device] turns on.

Logging is performed up to the specified log storage count. After that, logging is paused and device values are not collected until writing to the temporary file succeeds.

When a data storage is installed, writing to the temporary file and logging resume.

■Data storage size

Use a data storage with a capacity larger than the size of the logging files to be saved.

If the data storage becomes full before the specified number of saved files is reached, the logging file is not overwritten, and the logging is paused.

For information on the logging file size, refer to the following.

☞ Page 3673 Logging

To receive a notification when the data storage becomes full, use system signal 2-2 or system signal 2-3.

■To maintain file access performance

It is recommended to format the data storage before using it.

The number of files stored in the data storage must be less than 500, including logging files, CSV files, and Unicode text files.

If 500 or more files are stored, file access performance may be lowered.

Repeated writing or deleting of data may degrade access performance, regardless of the number of files.

In such a case, format the data storage.

■Clearing logging data in the buffering area

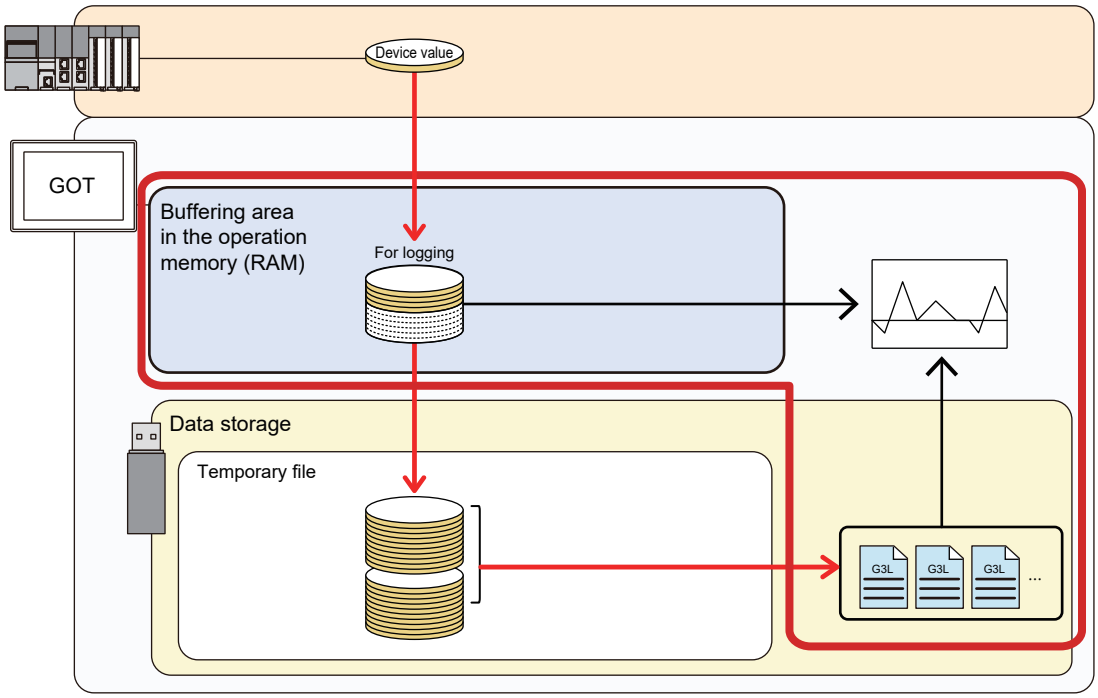
In file save mode, no device is provided for deleting logging data from the buffering area.

To delete target logging data from the buffering area, use [Data mng.] - [NVRAM management] in the utility.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

Data used by the historical trend graph and the historical data list display

When linking data with the historical trend graph and the historical data list display, these objects display the logging data in the buffering area and the data in the logging file.



Using the nonvolatile RAM power-failure backup function

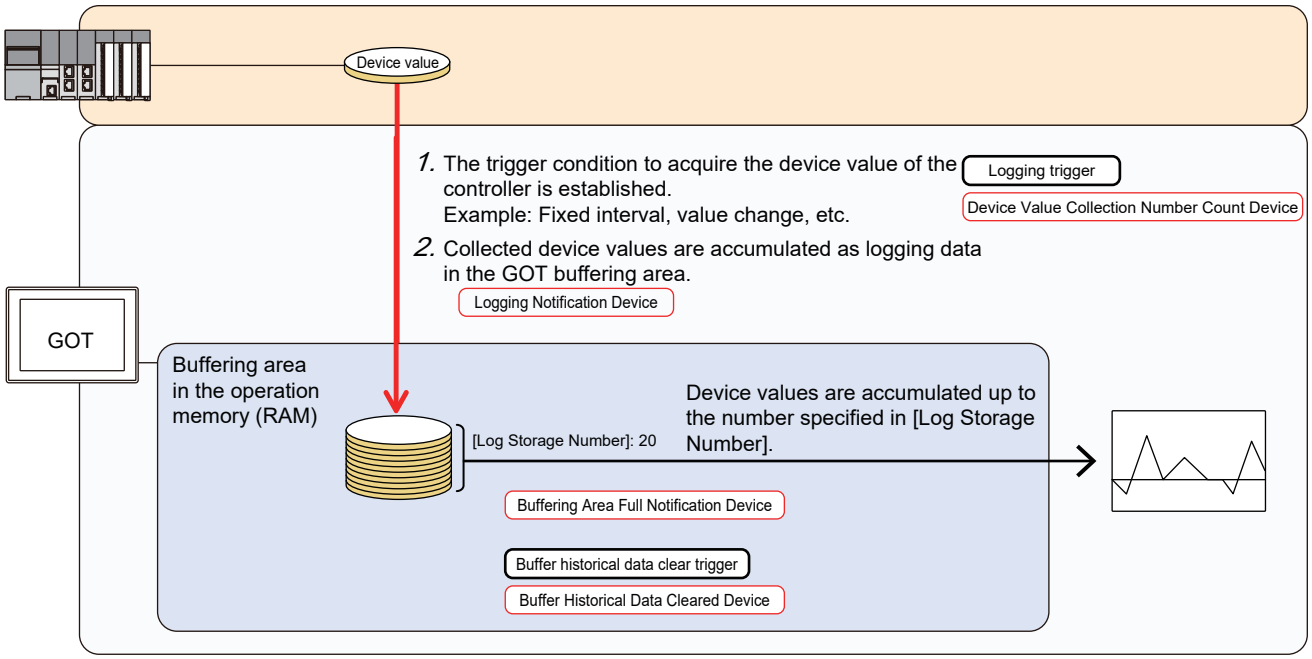
GT37 SoftGOT3000

Powering off, restarting, or resetting the GOT will delete the logging data in the buffering area.
To retain the logging data in the buffering area, enable the setting to save it to the nonvolatile RAM user area.
The data saved in the nonvolatile RAM user area is retained even if the GOT is powered off (power-failure backup).
If logging data exists in the nonvolatile RAM user area, it is automatically restored when the GOT is powered on.
Up to 20 logging settings with nonvolatile RAM power-failure backup enabled can be set per project.
The timing for saving data to the nonvolatile RAM user area cannot be set.

For the specifications of the nonvolatile RAM user area and operations performed on it, refer to the following.
☞ Page 3679 Specifications and operations of the nonvolatile RAM user area

65.4.2 Buffer historical mode

The flow of data in buffer historical mode is as follows:



1. Start of device value collection

When the device value collection condition (logging trigger) is satisfied, the GOT starts collecting device values from the controller.

Trigger and device	Description	Setting item in the [Logging] dialog ☞ Page 2228 [Logging] dialog
Logging trigger	Condition for starting device value collection from the controller ☞ Page 2214 Logging trigger	[When to collect device values]
Device Value Collection Number Count Device	You can check the device value collection count since the GOT started. ☞ Page 2217 Device Value Collection Number Count Device	[Device Value Collection Number Count Device]

2. Temporary storage to the buffer area

The collected device values are accumulated as logging data in the buffering area in the operation memory (RAM) of the GOT.

Device	Description	Setting item in the [Logging] dialog ☞ Page 2228 [Logging] dialog
Logging Notification Device	You can check that device data is being collected in the buffering area. ☞ Page 2217 Logging Notification Device	[Logging Notification Device]

The number of logs that can be accumulated in the buffering area is the number specified in [Log Storage Number] in the [Logging] dialog.

Select one of the two operations below for adding data when [Log Storage Number] is reached (the buffering area is full).

- Delete the oldest data in sequence and store the new data.
- Do not add new data.

Buffering area full notification

When the logging data in the buffering area reaches [Log Storage Number] set in the [Logging] dialog, you can use [Buffering Area Full Notification Device] to receive a notification.

Device	Description	Setting item in the [Logging] dialog ☞ Page 2228 [Logging] dialog
Buffering Area Full Notification Device	Notifies that the buffering area becomes full. Specify the number of logs before full to receive an advance notification. ☞ Page 2219 Buffering Area Full Notification Device	[Buffering Area Full Notification Device]

Complete deletion of logging data in the buffering area

By specifying the buffer historical data clear trigger, all logging data accumulated in the buffering area can be deleted.
After all historical data is deleted, a notification can be issued using the Buffer Historical Data Cleared device.
☞ Page 2219 When the logging trigger type is [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling]
While the buffering area is being cleared, the historical trend graph and the historical data list display are not updated.

Device	Description	Setting item in the [Logging] dialog ☞ Page 2228 [Logging] dialog
Buffer historical data clear trigger	☞ Page 2216 Buffer historical data clear trigger	[Delete all the histories]
Buffer Historical Data Cleared Device	Notifies that the clearing of the buffering area is completed. ☞ Page 2219 Buffer Historical Data Cleared Device	[Notify when all the histories are deleted]

Data used by the historical trend graph and the historical data list display

In buffer historical mode, only the logging data in the buffering area can be displayed on the historical trend graph and in the historical data list display.
Even if a logging file is created in the data storage, the data in the logging file cannot be displayed on the historical trend graph and in the historical data list display.
To display past logging data, use file save mode.

Using the nonvolatile RAM power-failure backup function

GT37 SoftGOT3000

Powering off, restarting, or resetting the GOT will delete the logging data in the buffering area.
To retain the logging data in the buffering area, enable the setting to save it to the nonvolatile RAM user area.
The data saved in the nonvolatile RAM user area is retained even if the GOT is powered off (power-failure backup).
If logging data exists in the nonvolatile RAM user area, it is automatically restored when the GOT is powered on.
Up to 20 logging settings with nonvolatile RAM power-failure backup enabled can be set per project.
The timing for saving data to the nonvolatile RAM user area cannot be set.

For the specifications of the nonvolatile RAM user area and operations performed on it, refer to the following.
☞ Page 3679 Specifications and operations of the nonvolatile RAM user area

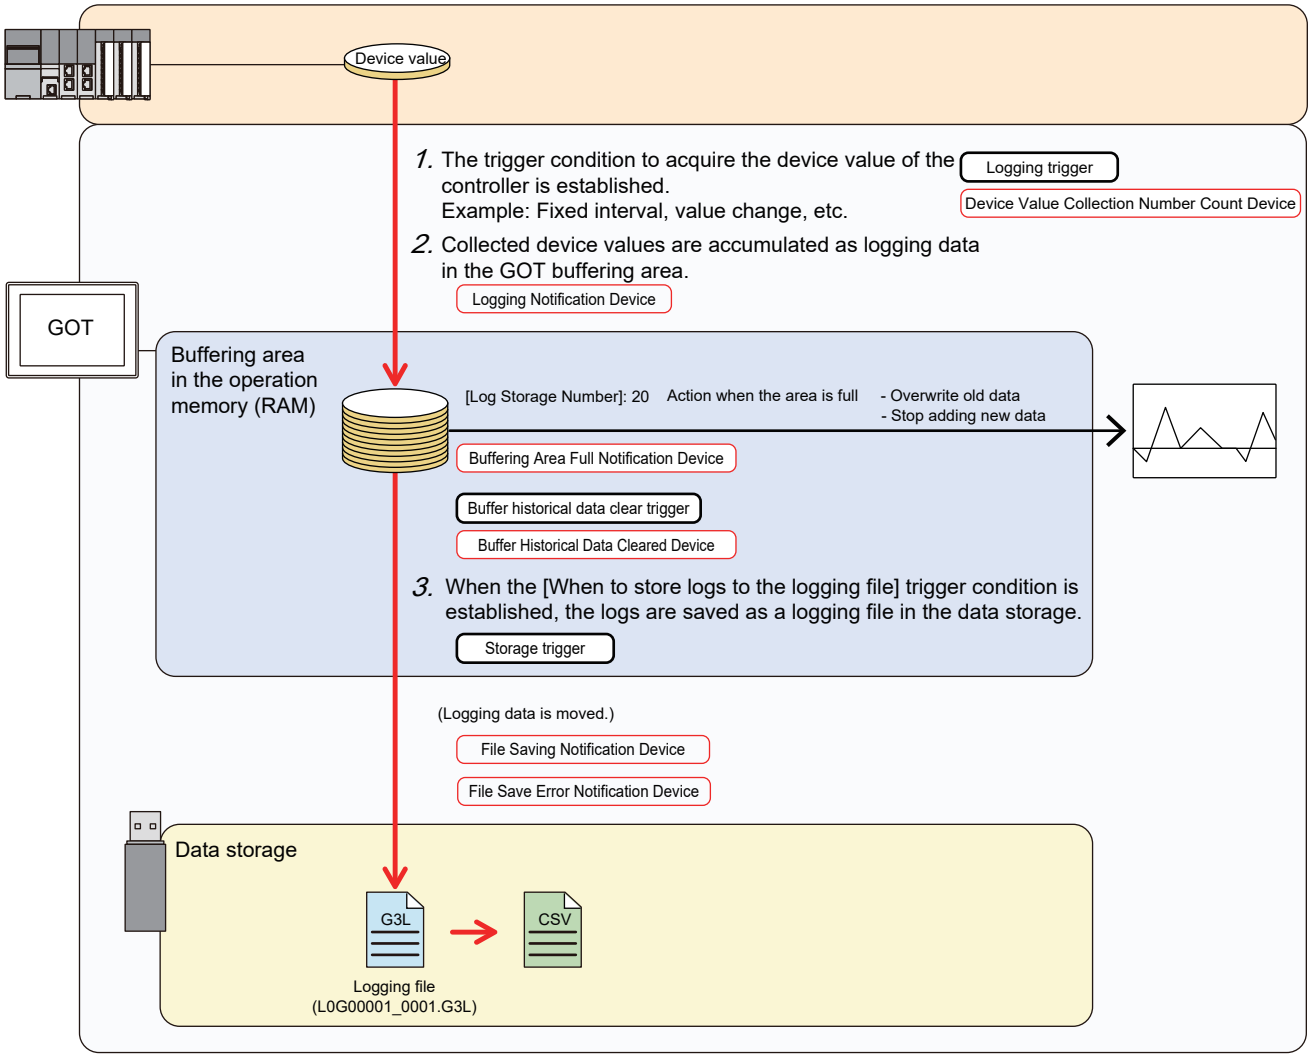
Saving to the data storage

Saving the logging data in the buffering area to the data storage as a logging file is also possible.
Use this function in the following cases.

- When checking past logging data
- When retaining data in preparation for a power failure

When logging data is saved in the data storage, the GOT reads the data from the data storage into the buffering area and restores it automatically at power-on.

The operation flow for saving to the data storage is as follows:



1. Start of device value collection

☞ Page 2205 Buffer historical mode

2. Temporary storage to the buffer area

☞ Page 2205 Buffer historical mode

3. Saving as a logging file

When the [When to store logs to the logging file] condition (storage trigger) in the [Logging] dialog is satisfied, the logging data in the buffering area is saved to the data storage as a logging file.
At this time, the logs are deleted from the buffering area.

Trigger and device	Description	Setting item in the [Logging] dialog ☞ Page 2228 [Logging] dialog
Storage trigger	☞ Page 2216 Storage trigger	[When to store logs to the logging file]

Trigger and device	Description	Setting item in the [Logging] dialog ☞ Page 2228 [Logging] dialog
File Saving Notification Device	You can check that the logging data saved in the buffering area is being written to the logging file. ☞ Page 2219 File Saving Notification Device	[File Saving Notification Device]
File Save Error Notification Device	You can check for errors while writing to the logging file. ☞ Page 2220 File Save Error Notification Device	[File Save Error Notification Device]

In buffer historical mode, only one logging file can be created, and it is overwritten each time the storage trigger is established. To prevent overwriting, move the logging file regularly.

When the settings for creating a CSV file or a Unicode text file are configured, the corresponding text data is created at the time a logging file is created.

Each time the logging file is overwritten, the CSV or Unicode text file is also overwritten.

■Restoring logging data from a data storage

When using the logging file saved in the data storage for restoration, install a data storage on the GOT before powering on the GOT.

If you install the data storage after powering on the GOT, the data in the data storage cannot be restored.

If you install the data storage after powering on the GOT and save logging data, the logging data in the data storage is overwritten.

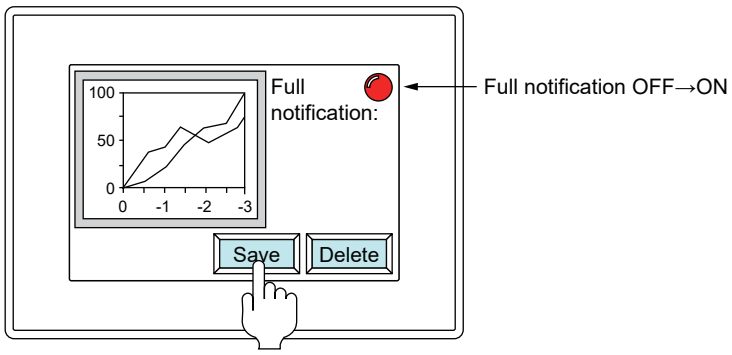
When saving to the data storage and power-failure backup of the nonvolatile RAM user area are both enabled, the data in the nonvolatile RAM user area takes priority during restoration. Only when the data is unavailable, the logging data in the data storage is restored.

Usage examples for devices and triggers

The following device and triggers can be used together to implement the example below.

- Buffering Area Full Notification Device
- Storage trigger
- Buffer historical data clear trigger

Set [Remaining Number to Notify that Buffering Area is Full] to receive a notification before the buffering area becomes full. When the full notification turns on, operate the switch to either save the logging data in the buffering area to the data storage or delete it.



65.4.3 Guidelines for logging mode selection

The following differences exist between file save mode and buffer historical mode.

Use the logging mode that suits your purpose.

Item	Logging mode	
	File save mode	Buffer historical mode
Application	To save large amount of logging data Displaying data from the past up to the present	High-speed logging High-speed display of the historical trend graph and the historical data list display Real-time monitoring
Location where the collected data is saved	Saves data temporarily in the buffering area, then saves it to the data storage.	Saves data only temporarily in the buffering area, in principle. Depending on the settings, saving to data storage is also possible.
Operation when the buffering area becomes full	Moves the logging data in the buffering area to the data storage and saves it as a logging file.	Select either of the following. • Do not add the new data. • Delete the old data.
Saved-file format	Binary file (*.G3L) (Depending on the settings) Unicode text file or CSV file	Binary file (*.G3L) (Depending on the settings) Unicode text file or CSV file
Number of log files that can be created	Multiple (max. 9999)	One
Timing of logging file creation	• When the logging data in the buffering area reaches the log storage count • When the file creation trigger is established	• When the storage trigger is established
Uses of the logging data in a data storage	To display the collected data	Power-failure backup for the buffering area
Data displayed on the historical trend graph and in the historical data list display	Logging data in the buffering area (real-time data) and in the logging file (past data)	Logging data in the buffering area (real-time data)

65.5 Specifications of the logging

GT37 SoftGOT3000

The following shows the specifications of the logging.

☞ Page 2210 Management of logging setting
☞ Page 2212 Size of the buffering area
☞ Page 2212 Logging file name
☞ Page 2213 Control triggers and notification devices used for logging

65.5.1 Management of logging setting

GT37 SoftGOT3000

The logging settings consist of the target devices for data collection, triggers for collection and storage, logging mode, data storage destination, and other related settings.

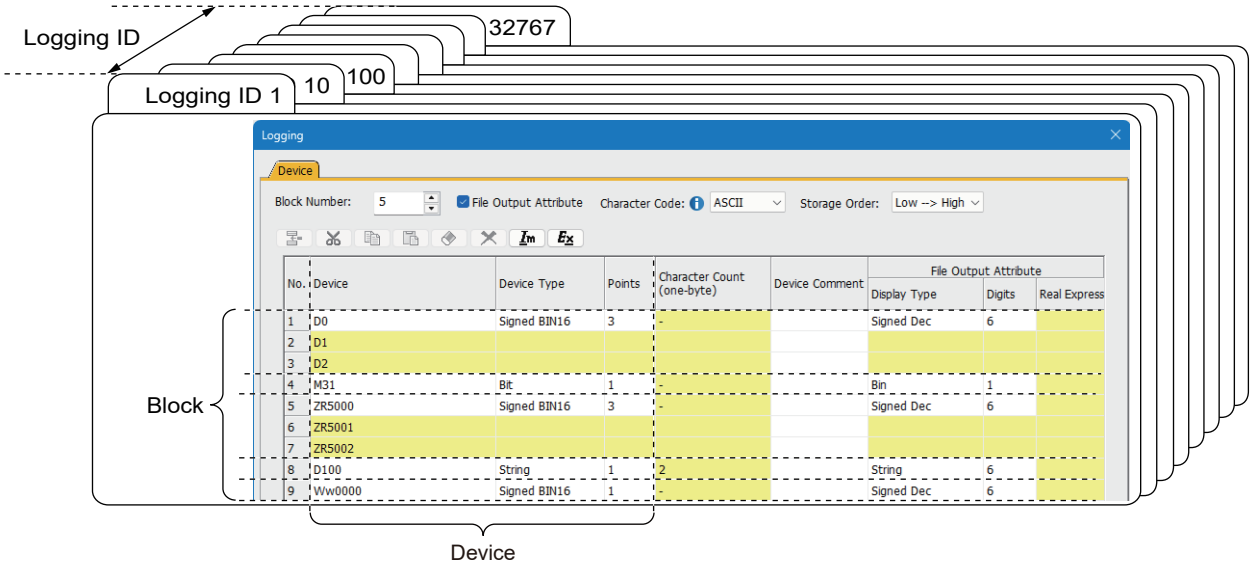
Each logging setting is assigned an ID (logging ID) for identification, which is used to specify the logging data to display in objects such as the historical data list display.

The following shows the setting ranges for the logging settings.

Item	Setting range
Number of logging settings per project	Max. 60
Configurable range for logging ID	1 to 32767

Configure the logging settings in the [Logging] dialog.

☞ Page 2228 [Logging] dialog



For details on blocks and devices that constitute one logging setting, refer to the following.

Item	Upper limit	Reference
Block	Up to 250 per logging setting	☞ Page 2211 Blocks and devices
Device	• Total of 250 points per logging setting • Up to 250 points per block	

Precautions

■Setting value of logging setting

The set size of an object cannot exceed the user area of the GOT.

Depending on the combination of the settings, not all the setting values (such as the number of devices) can be set to their maximum values.

Set the setting values within the capacity of the available user area for the GOT.

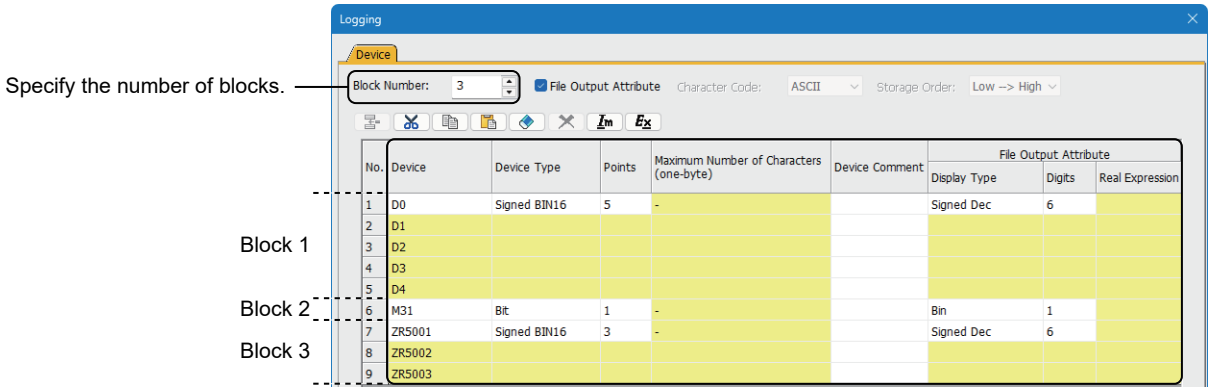
Blocks and devices

A block is a unit for specifying the target devices for logging data collection. Configure the target devices for logging data collection, device type, points, and other settings for each block. To set consecutive devices, specify the start device and set the number of consecutive devices from the start device to [Points]. The set number of devices starting from the start device are the target devices for logging data collection. To set non-consecutive devices, delimit them by blocks and specify only one device per block. Set the number of delimiters to [Block Number], and set the device for each block.

Mixing blocks of consecutive and non-consecutive devices enables the use of both word and bit devices.

Ex.

Example settings for mixing bit devices, word devices (signed BIN16 and signed BIN32), and strings



Block	[Device]	[Device Type]	[Points]
Block 1	Five consecutive devices (D0 to D4, starting from [D0]) are the target devices for collection.	[Signed BIN16]	5
Block 2	Only [M31] is the target device for collection.	[Bit]	1
Block 3	Three consecutive devices (ZR5001 to ZR5003, starting from [ZR5001]) are the target devices for collection.	[String]	3

■How to calculate the number of device points

For bit devices, each device is counted as one point.

Only one device (fixed) can be set in a block.

For word devices, the calculation varies depending on the device length.

When the device length is 8-bit or 16-bit, one device counts as one point. When the device length is 32-bit, one device counts as two points. When the device length is 64-bit, one device counts as four points.

When multiple blocks exist, the number of devices that can be set is the total number of devices in all blocks.

Ex.

Block 1: 30 devices, Block 2: 70 devices, Block 3: 120 devices

The number of devices that can be set is 30 + 70 + 120 = 220 devices.

Precautions

■When setting a string-type label or tag for the logging device

Set [Device Type] to [String].

■Character code when a string-type label or tag is set for the device whose [Device Type] is set to [String]

If you set a string-type label or tag for the device whose [Device Type] is set to [String], set the character code according to the type of the label or tag.

- Global label: ASCII code, Unicode, or Shift JIS code
- AB native tag: ASCII code
- OMRON NJ/NX tag: Unicode
- OPC UA tag: Unicode

■Relation between device comments and their setting sizes

Device comments affect the size of the logging settings and the file size.

If device comments are set for each device, the setting size and file size will increase.

65.5.2 Size of the buffering area

The size of the buffering area used for logging data varies depending on [Log Storage Number] in the [Logging] dialog (up to 32767).

Increasing the set value of [Log Storage Number] decreases the available space in the user area.

Set [Log Storage Number] according to the capacity of the user area.

☞ Page 2228 [Logging] dialog

65.5.3 Logging file name

In file save mode, the logging file name is the specified file name with an appended number.

When the number of logging files exceeds the value set in [Number of logs to be stored in 1 logging file], the file numbering returns to 0001 and the existing file is overwritten.

To prevent overwriting, move the files in the data storage to another location.

In buffer historical mode, the file name consists only of the specified file name. No number is appended.

Precautions

In file save mode, the management file is saved in the background when the logging file is saved.

Do not delete the management file and the temporary file.

If either of the following is deleted, logging is not executed normally.

Ex.

For the logging file [LOG00001_****.G3L] (* indicates a number)

- Management file

File without a number in its name

Example: [LOG00001.G3L]

- Temporary file

File with the number 0000 in its name

Example: [LOG00001_0000.G3L]

65.5.4 Control triggers and notification devices used for logging

The following shows the control triggers and notification devices used for logging.

Available types vary depending on the logging mode.

○ Available, —: Unavailable

Trigger and device	Logging mode	
	File save mode	Buffer historical mode
Logging trigger	○ Applies to the trigger set for [When to collect device values].	
Device Value Collection Number Count device	○ The device set for [Device Value Collection Number Count Device]	
Logging Notification device	○ The device set for [Logging Notification Device]	
Buffering Area Full Notification device	—	○ The device set for [Buffering Area Full Notification Device]
Buffer historical data clear trigger	—	○ Applies to the trigger set for [Delete all the histories].
Buffer Historical Data Cleared device	—	○ The device set for [Notify when all the histories are deleted]
Storage trigger	○ Applies to the trigger set for [When to store logs to the temporary file].	○ Applies to the trigger set for [When to store logs to the logging file]
File Saving Notification device	○ The device set for [File Saving Notification Device]	
File Save Error Notification device	○ The device set for [File Save Error Notification Device]	
File creation trigger	○ Applies to the trigger set for [Create a logging file at any desired time].	—
File Creation Notification device	○ [File Creation Notification Device]	—

For the specifications of each trigger and device, refer to the following.

☞ Page 2214 Control triggers used for logging

☞ Page 2217 Notification devices used for logging

For information on trigger and device operation and their timing of use in each logging mode, refer to the following.

☞ Page 2201 File save mode

☞ Page 2205 Buffer historical mode

65.6 Control triggers used for logging

This section explains the control triggers used for logging.

☞ Page 2214 Logging trigger
☞ Page 2216 Buffer historical data clear trigger
☞ Page 2216 Storage trigger
☞ Page 2217 File creation trigger

65.6.1 Logging trigger

A logging trigger is a condition for starting device value collection from the controller.
The configurable trigger types include bit-rise and sampling.

☞ Page 980 Trigger types of the functions running in the background

Basic operations

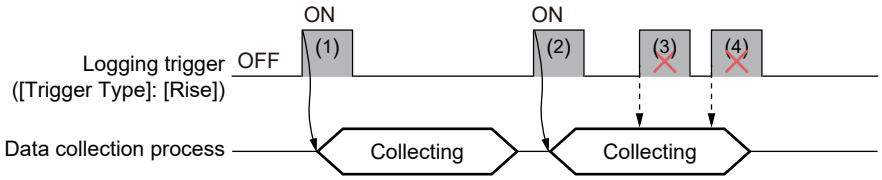
When the configured trigger condition is satisfied, data collection starts. Even if the logging trigger is established again during data collection, a new collection is not performed. After the current data collection is completed, data collection starts again when the logging trigger is next established.

Ex.

When the trigger type is set to [Rise]

After the data collection triggered by logging trigger (1) is completed, logging trigger (2) is established, and thus data collection is executed.

However, because triggers (3) and (4) are established during data collection for (2), data collection for (3) and (4) is not executed.



To ensure data collection reliably through logging, use [Logging Notification Device].

When the trigger type is [Rise] or [Fall], establish a handshaking between the [Logging Notification Device] and the logging trigger to ensure data collection by logging.

☞ Page 2217 Related devices

■If device values cannot be collected as configured

In the following cases, device values may not be collected at the configured cycle or when the logging trigger is established.

• There are a large number of collection target devices.

Communication between the GOT and the controller may take too long, causing data collection to fail to complete within the cycle.

• The logging trigger cycle is short.

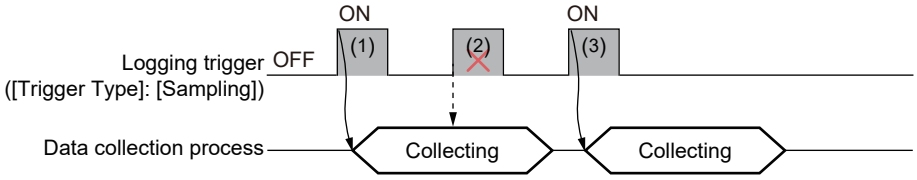
After the previous logging operation, communication processing may not finish before the next logging operation (the trigger is established during device value collection).

Ex.

The logging trigger cycle is short.

Because the logging trigger cycle is too short, device values cannot be collected when logging trigger (2) is established.

Device values are collected when logging trigger (3) is next established.

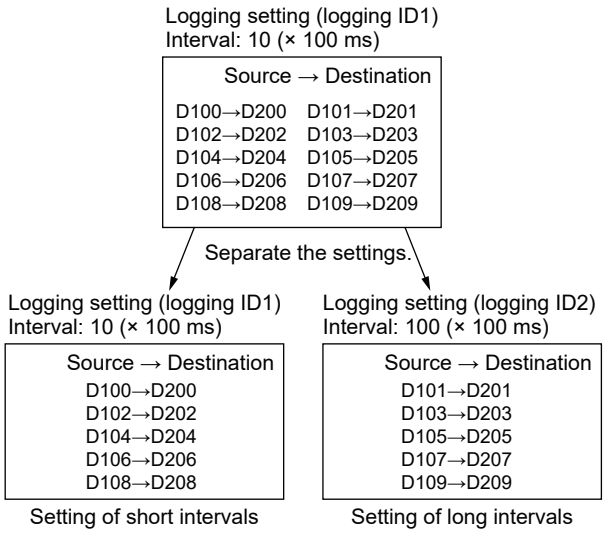


Take one of the following countermeasures against the above situations.

- If the baud rate can be changed, increase the baud rate in the detailed settings of the controller.
- Split the logging settings to reduce the number of device points per setting.
- If the trigger type is [Sampling], set a longer cycle.

For example, split one logging setting into items that require logging at a short cycle and items that accept logging at a longer cycle, as shown below.

By splitting the setting, the trigger condition can be satisfied when logging is not being performed.



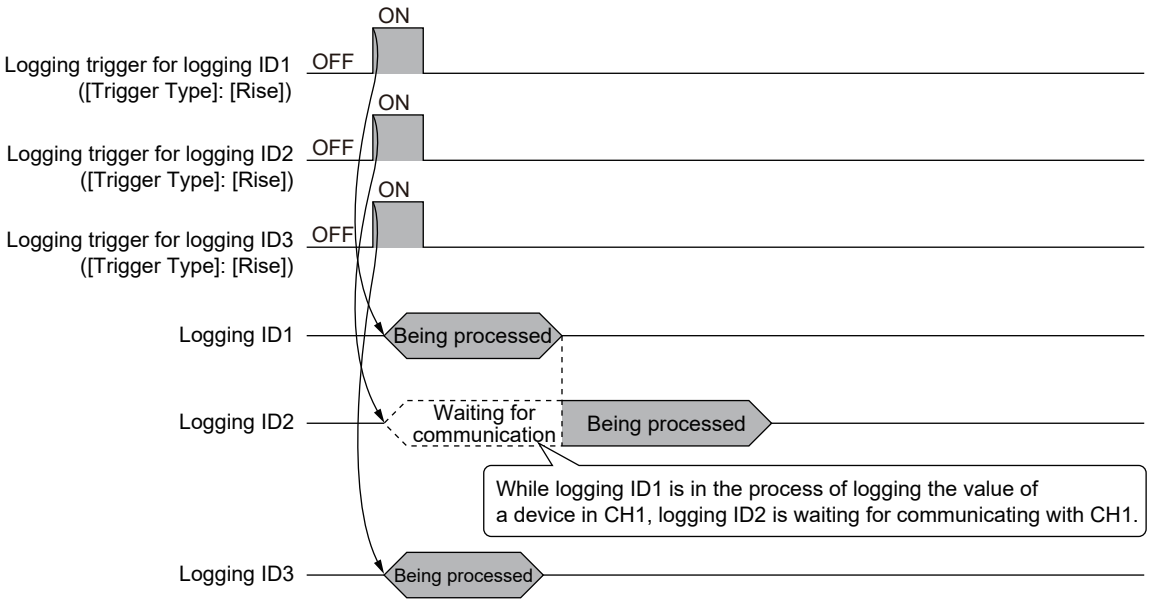
Operation when multiple logging triggers are established

If the conditions of multiple logging triggers are satisfied simultaneously, device data logs are taken in parallel.

Ex.

When the logging trigger conditions of logging ID No. 1 to 3 are satisfied simultaneously

- Logging ID No. 1 and 2: A device of channel No. 1 is set as the logging target.
- Logging ID No. 3: A device of channel No. 2 is set as the logging target.



The device data logs of the same channel are taken one by one, and therefore a waiting time occurs, causing a longer logging time.

Setting procedure

Set the logging trigger for [When to collect device values] in the [Logging] dialog.

☞ Page 2228 [Logging] dialog

Related devices

The following devices are related to the logging trigger.

☞ Page 2217 Device Value Collection Number Count Device

☞ Page 2217 Logging Notification Device

65.6.2 Buffer historical data clear trigger

The buffer historical data clear trigger can be used only in buffer historical mode.

For each logging setting, this trigger clears the logging data in the buffering area used by the corresponding logging.

Use this trigger to delete the logging data in the buffering area before it becomes full.

When the buffer historical data clear trigger turns on, the number of logs counted in the buffering area is cleared.

Setting procedure

To specify the buffer historical data clear trigger, set [Delete all the histories] in the [Logging] dialog.

☞ Page 2228 [Logging] dialog

Related devices

The following devices are related to the logging trigger.

☞ Page 2219 Buffering Area Full Notification Device

☞ Page 2219 Buffer Historical Data Cleared Device

65.6.3 Storage trigger

The storage trigger can be used in file save mode and buffer historical mode.

This function specifies the timing for saving the logging data in the buffering area.

The save destination of the logging data varies depending on the logging mode.

• In file save mode

When the storage trigger is established, the logging data in the buffering area is moved to the temporary file.

☞ Page 2201 File save mode

• In buffer historical mode

When the storage trigger is established, the data in the buffering area is saved to a logging file.

☞ Page 2207 Saving to the data storage

Precautions

While the logging data is being saved as a result of the storage trigger, logging is paused.

When configuring the storage trigger settings, consider the logging trigger cycle and the log storage count.

Setting procedure

Set the storage trigger using the following items in the [Logging] dialog.

☞ Page 2228 [Logging] dialog

• In file save mode

[When to store logs to the temporary file]

• In buffer historical mode

[When to store logs to the logging file]

Related devices

The following devices are related to the storage trigger.

☞ Page 2219 File Saving Notification Device

☞ Page 2220 File Save Error Notification Device

65.6.4 File creation trigger

The file creation trigger can be used only in file save mode.

This function specifies the timing for saving the logging data stored in the temporary file as a logging file.

☞ Page 2201 File save mode

Precautions

While the logging data is being saved after the file creation trigger is established, logging is paused.

When configuring the file creation trigger settings, consider the logging trigger cycle and the log storage count.

Setting procedure

To specify the file creation trigger, select [Create a logging file at any desired time] in the [Logging] dialog.

☞ Page 2228 [Logging] dialog

Related devices

The following devices are related to the file creation trigger.

☞ Page 2220 File Creation Notification Device

65.7 Notification devices used for logging

Processing statuses such as logging data collection and file saving can be output to the specified device.

Configure each notification device for each logging setting.

☞ Page 2217 Device Value Collection Number Count Device
☞ Page 2217 Logging Notification Device
☞ Page 2219 Buffering Area Full Notification Device
☞ Page 2219 Buffer Historical Data Cleared Device
☞ Page 2219 File Saving Notification Device
☞ Page 2220 File Save Error Notification Device
☞ Page 2220 File Creation Notification Device

65.7.1 Device Value Collection Number Count Device

This device notifies the device value collection count since the GOT started for each logging ID.

You can check that device values are collected normally by checking that the logging counter value is updated.

The count cycles through 0 to 65535 (for unsigned 16-bit binary).

The count is cleared when the GOT is powered off, reset, or restarted.

65.7.2 Logging Notification Device

This device notifies that one device data item is being collected in the buffering area.

The operation varies depending on the logging trigger type. When the trigger type is [Rise] or [Fall], establish a handshake between the Logging Notification device and the logging trigger to ensure data collection by logging.

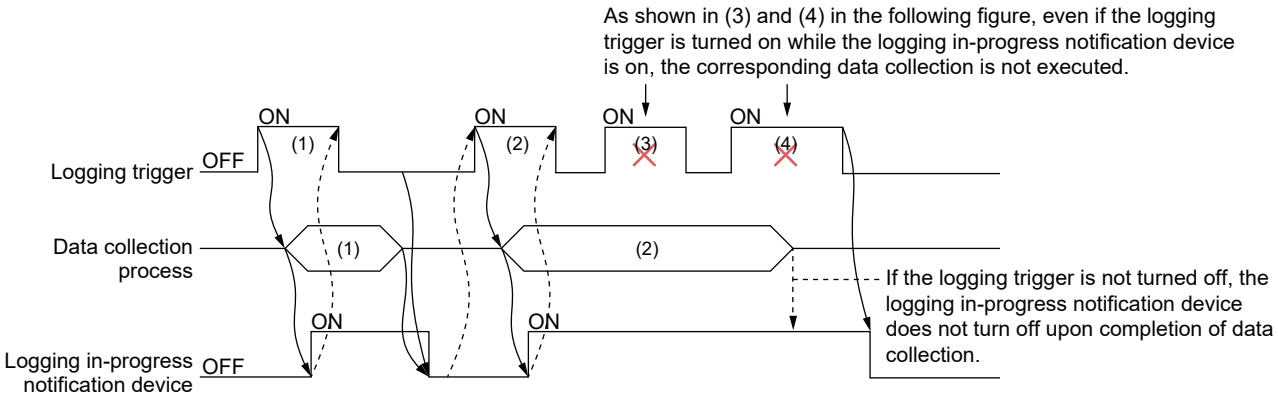
☞ Page 2218 When the logging trigger type is [Rise] or [Fall]
☞ Page 2218 When the logging trigger type is [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling]

When the logging trigger type is [Rise] or [Fall]

When the logging trigger turns on and device data collection starts, the Logging Notification device turns on.
When the logging trigger turns off and the processing is completed, the Logging Notification device turns off.
To ensure data collection by establishing a handshake, the following operations are required.

- Check that the Logging Notification device turns on, and then turn off the logging trigger.
- While the Logging Notification device is off, turn on the next logging trigger.

Ex.
When the trigger type is set to [Rise]

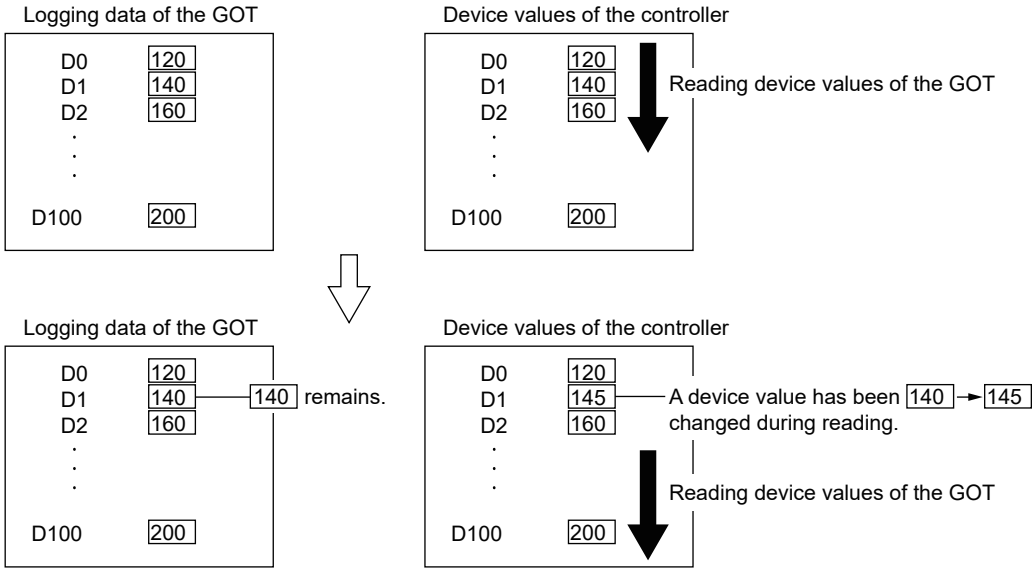


When the logging trigger type is [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling]

When the logging trigger turns on and device data collection starts, the Logging Notification device turns on.
When the processing is completed, the Logging Notification device turns off.
If the trigger interval is set to a high speed (for example, 100 msec), the Logging Notification device may not provide notification at each logging depending on the communication performance.

Precautions

If the number of target devices of logging is large, the device values in the controller may be inconsistent with the collected device values.



In this case, set an interlock to prevent the device values in the controller from being changed until logging by the GOT is completed.
The logging status can be check by [Logging Notification Device].
☞ Page 2228 [Logging] dialog

65.7.3 Buffering Area Full Notification Device

Use this device in the buffer historical mode.
This device notifies that the buffering area becomes full.

65.7.4 Buffer Historical Data Cleared Device

Use this device in the buffer historical mode.
Turning on the buffer historical data clear trigger starts clearing the logging data in the buffering area. The Buffer Historical Data Cleared device notifies the completion of clearing the data.
To specify the Buffer Historical Data Cleared device, set [Notify when all the histories are deleted] in the [Logging] dialog.

65.7.5 File Saving Notification Device

This device notifies that the logging data in the buffering area is being written to a file.
The save destination varies depending on the logging mode.
In file save mode, the device notifies that the logging data in the buffering area is being written to the temporary file.
In buffer historical mode, the device notifies that the logging data in the buffering area is being written to a logging file.
This device is used together with the storage trigger and operates differently depending on the storage trigger type.
When the storage trigger type is [Rise] or [Fall], establish a handshake between the File Saving Notification device and the storage trigger to ensure writing.
☞ Page 2219 When the storage trigger type is set to [Rise] or [Fall]
☞ Page 2219 When the storage trigger type is set to [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling]

When the storage trigger type is set to [Rise] or [Fall]

When the storage trigger turns on and writing starts, the File Saving Notification device turns on.
When the storage trigger turns off and the writing is completed, the File Saving Notification device turns off.
To ensure data collection by establishing a handshake, the following operations are required.

- Check that the File Saving Notification device turns on, then turn off the storage trigger.
- Turn on the storage trigger when the File Saving Notification device is off.

When the File Saving Notification device is on, writing does not occur even when the storage trigger is turned on.
The relationship among the storage trigger, writing, and the File Saving Notification device is the same as that among the storage trigger, writing, and the Logging Notification device.
For details, refer to the following.
☞ Page 2217 Logging Notification Device

When the storage trigger type is set to [Rise/Fall], [Sampling], [ON Sampling], or [OFF Sampling]

When the storage trigger turns on and writing starts, the File Saving Notification device turns on.
When the processing is completed, the File Saving Notification device turns off.

65.7.6 File Save Error Notification Device

This device notifies that an error has occurred while the logging data stored in the buffering area is being saved to the temporary file or a logging file.
If this device is turned on, check the following.

- The SD card cover of the GOT is closed.
- The SD card access switch of the GOT is turned on.
- The data storage works normally.

The user needs to turn off this device.

Precautions

When you open the SD card cover or turn off the SD card access switch, the files are saved automatically.
Before removing the SD card, make sure that the file saving is complete by checking one of the following conditions.

- The Drive Status Notification signal (system signal 2-2.b0, b1) is turned off.
- The SD card access LED is turned off.

☞ Page 2228 [Logging] dialog
The save process may take a few minutes to complete.

65.7.7 File Creation Notification Device

This device is used in combination with the file creation trigger in file save mode.
This device notifies that the logging data in the temporary file and in the buffering area is being saved to a file.
When the file creation trigger turns on and logging file saving starts, the File Creation Notification device turns on.
When the file creation trigger is off and the logging file saving is completed, the File Creation Notification device turns off.
In the following cases, data is not saved to a logging file when the file creation trigger turns on.

- When the device data is being read: The File Creation Notification device does not turn on until one logging cycle's worth of device data has been collected.
- When the File Creation Notification device is on

For the file save operation when the file creation trigger is used, refer to the following.
☞ Page 2217 Logging Notification Device
Note that when the File Creation Notification device is on, data collection does not occur even when the trigger device turns on.

65.8 How to use the logging

GT37 SoftGOT3000

☞ Page 2221 Output settings for logging data
☞ Page 2222 Operations on logging files
☞ Page 2223 Converting a logging file to a CSV file or a Unicode text file

65.8.1 Output settings for logging data

Configure the output settings for logging data using the following steps.

1. Select [Common] → [Logging] from the GT Designer3 menu.

The [Logging List] dialog appears.

2. Create, edit, or delete logging output settings in the [Logging List] dialog.

For details, refer to the following.

☞ Page 2227 [Logging List] dialog

65.8.2 Operations on logging files

GT37 SoftGOT3000

You can manipulate the logging files in the GOT using the utility.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Operation	Description
Creating a folder	Creates a folder where logging files are stored. You can manage folders by production line or product type.
Deleting a folder	Deletes a folder where logging files are stored.
Copying a file	Copies a logging file. Perform this operation to back up a logging file.
Deleting a file	Deletes a logging file.
Renaming a file	Renames a logging file.
Moving a file	Moves a logging file to another folder. Perform this operation to back up a logging file.
Converting a binary file (*.G3L) into a Unicode text file or CSV file	Converts the binary file (*.G3L) into a Unicode text file or CSV file.

65.8.3 Converting a logging file to a CSV file or a Unicode text file

Converting a logging file to a CSV file or a Unicode text file enables its use on a personal computer.

Conversion method	Description
Additional output when outputting to a logging file (.G3L)	Depending on the logging settings, additional output to a CSV file or a Unicode text file is possible when outputting the logging data from the buffer area to a logging file (*.G3L). Configure the [Output additional file] settings in the [Logging] dialog. ☞ Page 2228 [Logging] dialog
In the utility	Convert the file format on the GOT using the [Logging Information] screen. Convert files one by one. ☞ Page 2223 Conversion in the utility
On a personal computer (GT Designer3)	Convert a file on a personal computer. Multiple files can be converted at a time. Since the file is converted with GT Designer3, no processing load is put on the GOT. ☞ Page 2223 Conversion in GT Designer3

Point

While file saving is in progress according to the logging settings, logging is paused.
To reduce the duration of paused logging, do not perform additional output to a CSV or Unicode text file when outputting a logging file (*.G3L); instead, convert the file later.

Conversion in the utility

Using the utility to perform conversion will delete the logging data in the buffering area.
If the logging data needs to be retained, use the file creation trigger or storage trigger to store the data beforehand.

1. Start the GOT utility and touch the [Data mng.] tab.

2. Touch [Logging information] to display the [Logging information] screen.

3. Select the file to be converted and click either of the following buttons.

• [G3L→CSV] button

Converts the logging file (.G3L) to a CSV file.

• [G3L→TXT] button

Converts the logging file (.G3L) to a Unicode text file.

4. Select the output destination folder and click the [OK] button.

The converted file is stored in the specified folder.

5. Store the converted Unicode text file or CSV file on a personal computer using either of the following methods.

• Transferring with GT Designer3

Select [Communication] → [Read from GOT] from the menu to transfer a file to the personal computer.

• Storing in the data storage

Save the logging file to the data storage and read the data on the personal computer.

Conversion in GT Designer3

The following shows the conversion procedure in GT Designer3.

1. Transfer the logging file (*.G3L) to the personal computer using either of the following methods.

• Transferring with GT Designer3

Select [Communication] → [Read from GOT] from the menu to transfer a file to the personal computer.

☞ Page 441 Reading the data from the GOT

• Storing in the data storage

Save the logging file to the data storage and read the data on the personal computer.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

2. Select [Tools] → [Resource Data Conversion] → [Logging File] from the GT Designer3 menu.

The [Logging File Conversion] dialog appears.

3. Configure each setting and click the [Convert] button.

☞ Page 2240 [Logging File Conversion] dialog

When the logging file is output with the information protection function enabled, the [Encryption Password Entry] dialog appears. Enter the encryption password accordingly.

☞ Page 3068 [File Protection]

Precautions for conversion

■Character code and conversion destination file

If a device comment or logging name contains any character other than ASCII and Shift JIS characters, convert the relevant file as shown below.

- Convert the file to Unicode text format.
- Turn on the Character Code for CSV Conversion signal (GS522.b2), and convert the file to CSV format.

■Editing a CSV file or Unicode text file

For the precautions for using a CSV file or Unicode text file, refer to the following.

☞ Page 3668 Precautions for using CSV file

☞ Page 3669 Precautions for using Unicode text file

■Opening a CSV file with Microsoft Excel

When you open a Unicode text file or CSV file created through the logging function with Microsoft Excel, the standard style of Microsoft Excel is applied.

Depending on the setting, data of logging date and others may be displayed in a style different from the actual setting.

If the displayed data is different from the actual style, open the Unicode text file or CSV file with a text editor to check the style output by the GOT.

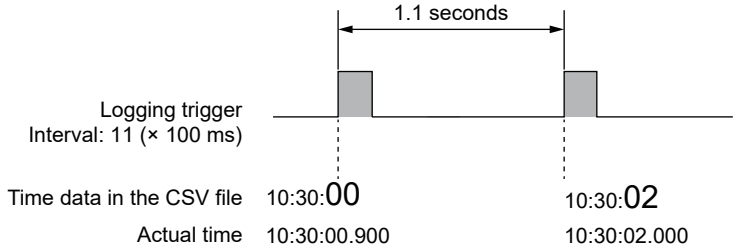
■Time data in a CSV file and the interval for a logging trigger

After a logging file (*.G3L) is converted to a CSV file, the time data will be displayed with an accuracy of seconds.

If the logging trigger interval is not set to less than 10 (× 100 ms), a time lag may occur between the collection interval and the time data in the CSV file.

Ex.

When the interval for the logging trigger is set to 11 (× 100 ms)



Logging data format

The following shows the format used when converting logging data from a binary file (*.G3L) to a Unicode text file or a CSV file.

	A	B	C	D	E	F
1	:GT3K_LOG	0				
2	:LOGGING_ID	1				
3	:LOGGING_NAME	Logging_1				
4	:SERIAL_ID	2				
5	:DEVICE_NUM	5				
6	:RECORD_NUM	56				
7	:DATE_ORDER	YYYY/MM/DD hh:mm:ss				
8	:LOCAL_TIME	UTC+09:00				
9	:TIME_INF_ORDER	L				
10	:DEV_COMMENT	Line_A	Line_B	Line_B	FLG	NAME
11	:DISP_TYPE	BIN16	BIN16	BIN16	BIT	STRING
12	:DEV_SIZE	1	1	1	1	5
13	2024/9/19 10:52	100	50	300	1	PRO1
14	2024/9/19 10:52	100	50	300	1	PRO1
15	2024/9/19 10:52	100	50	300	1	PRO1
16	2024/9/19 10:52	100	50	300	1	PRO1
17	2024/9/19 10:52	100	50	300	1	PRO1
18	2024/9/19 10:52	100	50	300	1	PRO1
19	2024/9/19 10:52	100	50	300	1	PRO1
20	2024/9/19 10:52	100	50	300	1	PRO1
21	2024/9/19 10:52	100	50	300	1	PRO1
22	2024/9/19 10:53	100	50	300	1	PRO1
23	2024/9/19 10:53	100	50	300	1	PRO1

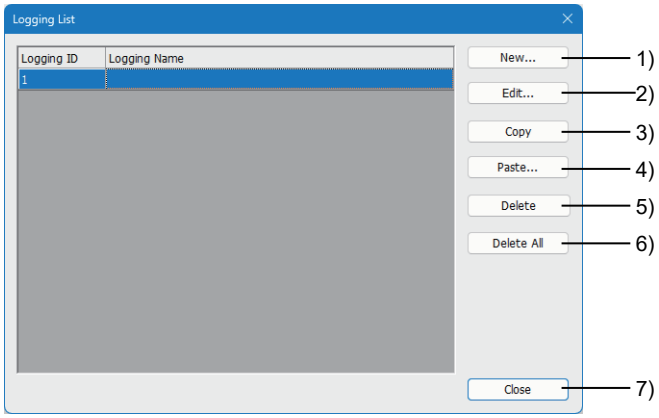
Item		Description
1)	Logging ID	Displays the logging ID.
2)	Logging name	Displays the logging name.
3)	Serial number	Displays a number 0001 to 9999 attached to the end of the file name.
4)	Number of set devices	Displays the number of collection target devices.
5)	Number of logs	Displays the number of logs.
6)	Order of date and time	Displays the order of dates.
7)	Time zone	Displays the difference from UTC.
8)	Time information	Displays the information on the time data. • L: Local time
9)	Device comment	Displays device comments.
10)	Device type	Displays device types. • [BIT]: Bit • [BIN8]: Signed 8-bit binary • [BIN8_Unsigned]: Unsigned 8-bit binary • [BIN16]: Signed 16-bit binary • [BIN16_Unsigned]: Unsigned 16-bit binary • [BIN32]: Signed 32-bit binary • [BIN32_Unsigned]: Unsigned 32-bit binary • [BIN64]: Signed 64-bit binary • [BIN64_Unsigned]: Unsigned 64-bit binary • [BCD16]: BCD16 • [BCD32]: BCD32 • [BCD64]: BCD64 • [REAL]: Real numbers (32 bits) • [REAL64]: Real numbers (64 bits) • [STRING]: Character string

Item		Description
11)	Display type	Displays the display formats. • [BIT]: Bit • [DEC]: Signed decimal • [UNSIGNED_DEC]: Unsigned decimal • [REAL_FLOAT]: Real number (exponential expression) • [REAL_FIX]: Real number (fixed-point number) • [ASC]: ASCII • [UNI]: Unicode • [SJIS]: Shift JIS • [KS]: KS (Korean) • [GB]: GB (Simplified Chinese) • [BIG5]: BIG5 (Traditional Chinese) • [BIN]: Binary number • [OCT]: Octal number • [HEX]: Hexadecimal number
12)	Device size	Displays the device size (unit: byte). • 1: Bit device or word device (16 bits) • 2: Word device (32 bits) • 4: Word device (64 bits) • 1 to 250: Character string
13)	Time data	Displays the time when the device value is collected.
14)	Logging data	Displays the collected device values. It will be blank if a communication timeout occurs or the values are outside the device range. If the device values cannot be collected when the logging trigger condition is satisfied, the display depends on whether the missing logging data detection function is enabled or disabled. • Disabled: Previously collected values • Enabled: [-] (Hyphen) For the missing information, refer to the following. ☞ Page 2232 Missing logging data detection function

65.9 [Logging List] dialog

GT37 SoftGOT3000

The [Logging List] dialog lists the currently created logging settings.
Create, edit, or delete logging settings in this dialog.
This dialog is displayed by selecting [Common] → [Logging] from menu.



Item		Description
1)	[New] button	Creates a logging setting. Clicking this button displays the [Logging] dialog. ☞ Page 2228 [Logging] dialog
2)	[Edit] button	Changes a selected logging setting. Clicking this button displays the [Logging] dialog. ☞ Page 2228 [Logging] dialog
3)	[Copy] button	Copies a selected logging setting.
4)	[Paste] button	Pastes the copied logging setting to the list. Click to display the [Copy Logging Setting] dialog and set [Destination ID].
5)	[Delete] button	Deletes a selected logging setting.
6)	[Delete All] button	Deletes all the logging settings.
7)	[Close] button	Closes the [Logging List] dialog.

65.10 [Logging] dialog

In the [Logging] dialog, you will configure the settings such as the logging mode, logging trigger, processing in the buffering area, and processing in data storage.

The [Logging] dialog provides default and detailed settings. In the default settings, [Log Storage Number] is fixed at [100], allowing you to configure the settings without considering the temporary file.

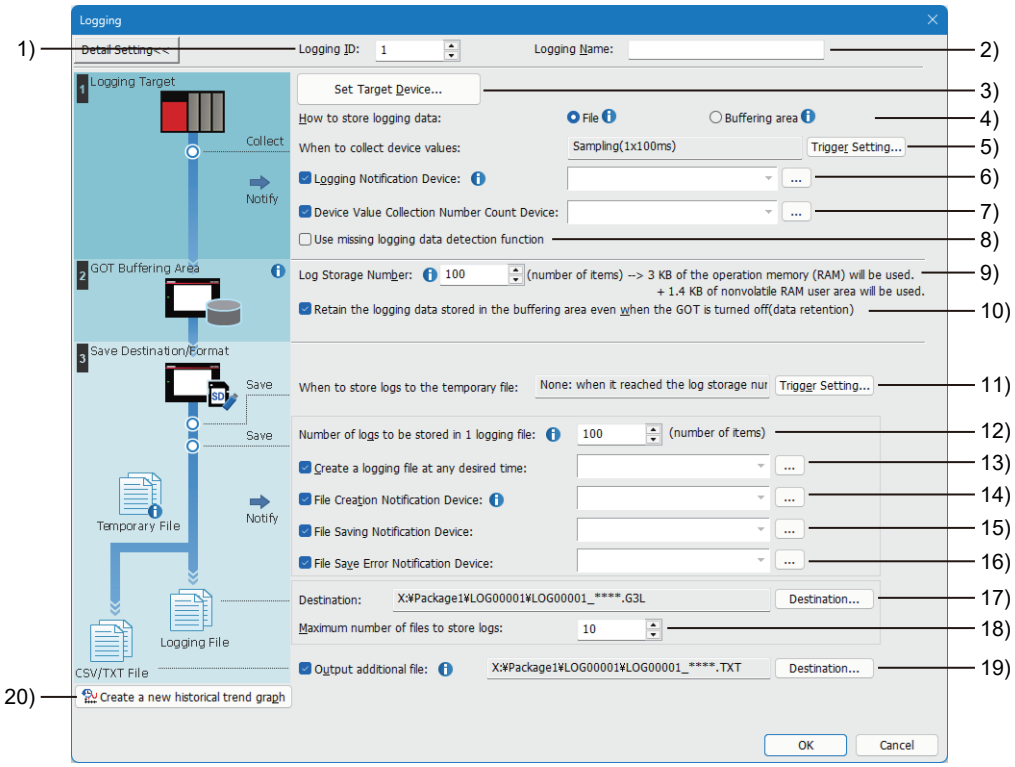
In the detailed settings, flexible data saving is enabled using various triggers and devices.

Click the [Detail Setting] button in the upper left of the dialog to display the detailed setting items.

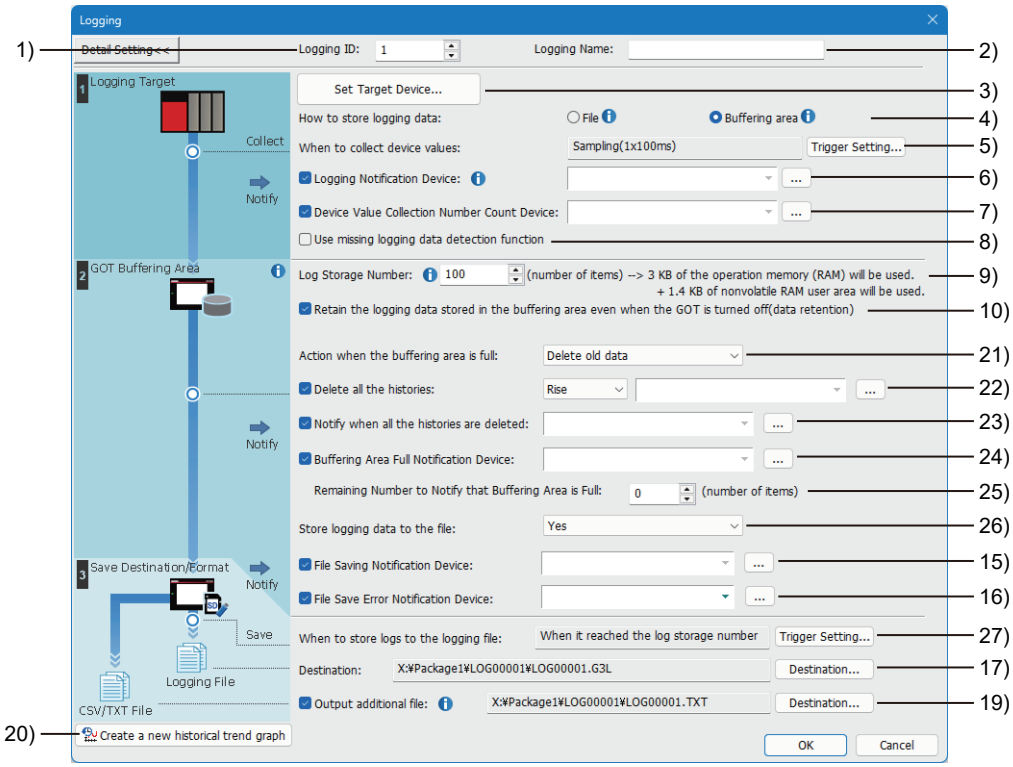
This section uses the detailed settings screen.

The setting items vary depending on the logging mode specified for [How to store logging data].

- When [How to store logging data] is set to [File]



• When [How to store logging data] is set to [Buffering area]



Item		Description
1)	[Logging ID]	Set the number to identify the logging setting. The setting range is [1] to [32767]. The logging ID is also used to specify display targets in the graph when a historical trend graph or historical data list display is used. ☞ Page 2210 Management of logging setting
2)	[Logging Name]	Set a logging name. Up to 32 characters can be set. The set logging name is displayed in a Unicode text file and CSV file.
3)	[Set Target Device] button	Set the device to be collected. ☞ Page 2234 [Device] tab
4)	[How to store logging data]	Select the logging mode. For details on the logging mode, refer to the following. • [File] ☞ Page 2201 File save mode • [Buffering area] ☞ Page 2205 Buffer historical mode
5)	[When to collect device values]	When setting the conditions for device value collection, select this item and click the [Trigger Setting] button to display the [Trigger Setting] dialog and set the trigger conditions. ☞ Page 980 Trigger types of the functions running in the background
6)	[Logging Notification Device]	Set the device to notify that device values from the controller are being collected in the buffering area. ☞ Page 2217 Logging Notification Device
7)	[Device Value Collection Number Count Device]	Set the device to notify the device value collection count since the GOT started. ☞ Page 2217 Device Value Collection Number Count Device
8)	[Use missing logging data detection function]	Select this item when using the missing logging data detection function. ☞ Page 2232 Missing logging data detection function
9)	[Log Storage Number]	Set the number of logging data points temporarily saved in the buffering area. The setting range is [1] to [32767]. The [Log Storage Number] setting greatly affects the logging file saving frequency and the time required to save the file. For details, refer to the following. ☞ Page 2233 Logging file saving and save processing time
10)	[Retain the logging data stored in the buffering area even when the GOT is turned off(data retention)]	Select this item to store the logging data in the buffering area in the nonvolatile RAM user area. Up to 20 logging settings with nonvolatile RAM power-failure backup enabled can be configured per project. For file save mode, refer to the following. ☞ Page 2204 Using the nonvolatile RAM power-failure backup function For buffer historical mode, refer to the following. ☞ Page 2206 Using the nonvolatile RAM power-failure backup function
11)	[When to store logs to the temporary file]	Specify the timing (storage trigger condition) for saving the data in the buffering area to the temporary file. Click the [Trigger Setting] button to display the [Trigger Setting] dialog and specify the trigger. If you select any item other than [When it reached the log storage number], set the trigger. ☞ Page 980 Trigger types of the functions running in the background
12)	[Number of logs to be stored in 1 logging file]	Set the number of logs to be stored in a single logging file. The setting range is [1] to [65500]. This item must be equal to or larger than [Log Storage Number].
13)	[Create a logging file at any desired time]	Set the file creation trigger to start saving logging data to a file at an intended timing. ☞ Page 2217 File creation trigger
14)	[File Creation Notification Device]	Set this item when [Create a logging file at any desired time] is selected. Set the device to notify that the data in the buffering area is being saved to a logging file. ☞ Page 2220 File Creation Notification Device
15)	[File Saving Notification Device]	Set the device to notify that the logging data stored in the buffering area is being written to the temporary file or a logging file. ☞ Page 2219 File Saving Notification Device
16)	[File Save Error Notification Device]	Set the device to notify that an error has occurred while the logging data stored in the buffering area is being written to the temporary file or a logging file. ☞ Page 2220 File Save Error Notification Device
17)	[Destination]	Click the [Destination] button to display the [Destination] dialog and set the save destination for the logging file (*.G3L). ☞ Page 2238 [Destination] dialog (for saving a logging file)
18)	[Maximum number of files to store logs]	This item appears only when [File] is selected. Set the maximum number of logging files (*.G3L) to be saved (up to 9999). The number of files stored in one data storage must be less than 500, including logging files, CSV files, and Unicode text files. If 500 or more files are stored, file access performance may be lowered.

Item		Description
19)	[Output additional file]	Select this item to output a Unicode text file or a CSV file when saving the logging file. When this item is selected, click the [Destination] button to display the [Destination] dialog and set the output file type and the save destination. ☞ Page 2239 [Destination] dialog (for saving a CSV or TXT file) If you select this item and use any characters other than ASCII and Shift JIS characters in device comments or logging names, output the file as shown below. • Output to a Unicode text file. • Turn on the Character Code for CSV Conversion signal (GS522.b2), then output to a CSV file.
20)	[Create a new historical trend graph] button	Create a new historical trend graph on which the collected logging data is to be displayed. ☞ Page 2196 Data visualization Click to display the [Screen Selection] dialog and set the screen on which to place the historical trend graph. ☞ Page 2239 [Screen Selection] dialog
21)	[Action when the buffering area is full]	Appears when [Buffering area] is selected. Select an action when the number of logging data points stored in the buffering area reaches [Log Storage Number]. • [Delete old data] Deletes the oldest logging data and adds new logging data. • [Add no item] Device values are not collected even if a new logging trigger condition is satisfied.
22)	[Delete all the histories]	Appears when [Buffering area] is selected. Set the trigger device to delete the logging data stored in the buffering area. ☞ Page 2205 Buffer historical mode
23)	[Notify when all the histories are deleted]	Appears when [Buffering area] is selected. Set the device to notify that all logging data in the buffering area has been deleted by the [Delete all the histories] setting. ☞ Page 2219 Buffer Historical Data Cleared Device
24)	[Buffering Area Full Notification Device]	Appears when [Buffering area] is selected. Set the device to notify that the available space in the buffering area for saving logging data falls below the setting of [Remaining Number to Notify that Buffering Area is Full]. In [Remaining Number to Notify that Buffering Area is Full], set the timing (the number of currently available logging data points that can be saved: 0 to 255) to notify that the available space in the buffering area is low. If the number of currently available logging data points falls below this setting, [Buffering Area Full Notification Device] turns on. ☞ Page 2205 Buffer historical mode
25)	[Remaining Number to Notify that Buffering Area is Full]	Set the number of remaining data points to notify that the buffering area is full before it becomes full.
26)	[Store logging data to the file]	Appears when [Buffering area] is selected. Set whether to save the logging data in the buffering area as a logging file. • [No] The logging data in the buffering area is not saved as a logging file. The data is not saved to a file, and the logging does not pause. Select [No] for the high-speed logging. • [Yes] Saves the logging data in the buffering area as a logging file at user-specified timings. The logging data stored in the logging file can be read and restored when the GOT is powered on. • [Yes (auto backup when saving)] Saves the logging data in the buffering area as a logging file at user-specified timings. At that time, the logging file before overwriting is automatically saved as a backup file. If the logging file becomes corrupted and a backup file is available, the backup file is read when GOT is powered on. The automatically saved backup file is the original file with its filename extension changed to [.bak]. Example) LOG00001.G3L → LOG00001.bak
27)	[When to store logs to the logging file]	Appears when [Buffering area] is selected. Click the [Trigger Setting] button to display the [Trigger Setting] dialog specify the conditions for saving the logging data in the buffering area to a logging file (storage trigger). For details, refer to the following. ☞ Page 980 Trigger types of the functions running in the background

Missing logging data detection function

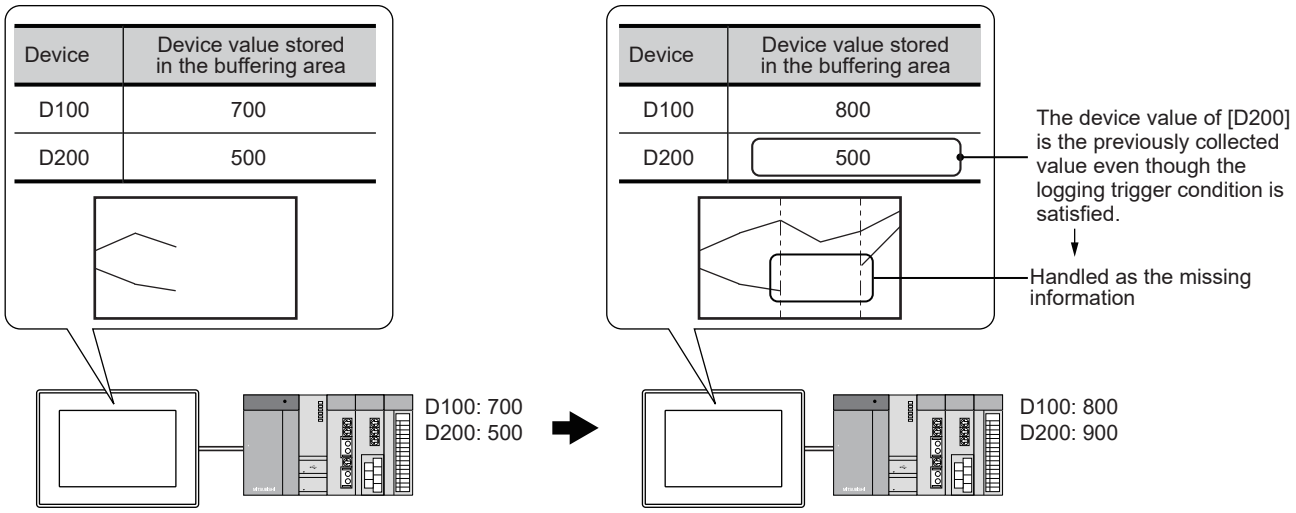
GT37 SoftGOT3000

After the previous logging operation, if communication processing with the controller does not finish before the next logging operation, device values may not be collected even if the logging trigger is established.
In this state, communication is normal, but the device values cannot be updated in time because the logging trigger cycle is too short (e.g. 0.1 s).
In this case, the previously collected device values are stored in the buffering area and output to a logging file.
When the missing logging data detection function is enabled, device values that cannot be collected due to unfinished communication processing are treated as missing, and hyphens (-) are output to the logging file.
The missing information is not displayed on the historical trend graph.

Ex.
When [500] is previously collected in device D200, and the device value cannot be collected when the logging trigger condition is satisfied

Missing logging data detection function	Device value stored in the buffering area		Value output to a logging file
	Previously collected	Uncollected when the logging trigger condition is satisfied	
Disabled	500	500 (Previously collected value)	500 (Previously collected value)
Enabled	500	500 (Previously collected value)	- (Hyphen)

The following shows an example of processing when the missing logging data detection function is enabled.



If the device values cannot be collected when the logging trigger condition is satisfied, refer to the following.
☞ Page 2214 Basic operations
You can enable or disable the missing logging data detection function for each logging setting.
For the setting method, refer to the following.
☞ Page 2228 [Logging] dialog

Precautions

Regardless of whether the missing logging data detection function is used, device values are not recorded when a communication timeout has occurred.
This also applies if a single logging setting (a single logging ID) is used for logging the device values of multiple connected controllers.
Device values of the controllers communicating with the GOT are recorded. When a communication timeout (timeout error) occurs, device values of the relevant controller are not recorded.
When a logging file (*.G3L) is converted to a CSV file, the unrecorded values are left blank.

Logging file saving and save processing time

The setting of [Log Storage Number] determines the frequency and time required for saving data to a file.
When the set value of [Log Storage Number] is large, data saving occurs infrequently, requiring a long time.
When the set value of [Log Storage Number] is small, data saving occurs frequently, requiring a short time.
The following shows the relationship between the logging trigger, log storage count, and file saving frequency.

Logging trigger ([When to collect device values])	[Log Storage Number]		
	1	100	10000
Time interval: 10 (× 100 ms)	Saving every 1 sec	Saving every 100 sec	Saving every 10000 sec
Time interval: 1000 (× 100 ms)	Saving every 100 sec	Saving every 10000 sec	Saving every 1000000 sec

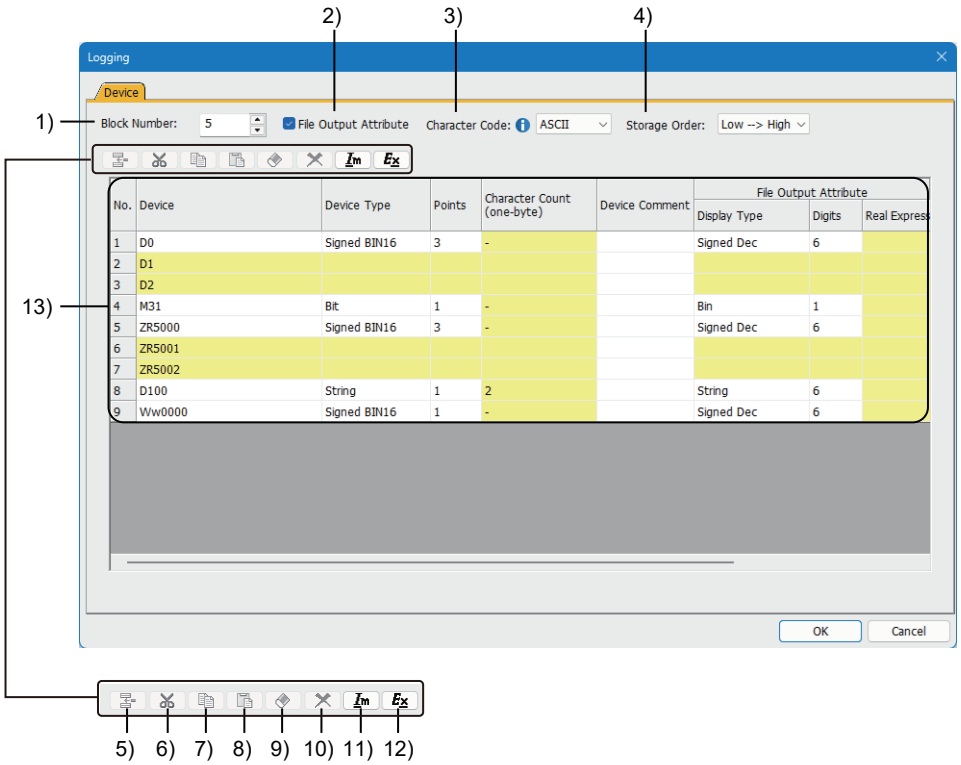
Since device value collection is paused while the logging file is being saved, device values may not be collected normally.
Depending on the settings such as the logging trigger, [Log Storage Number] needs to be adjusted.

Point

To collect device values in short intervals, set a larger number in [Log Storage Number].

65.10.1 [Device] tab

Set the device to be collected.



Item		Description
1)	[Block Number]	Set the number of blocks of the logging setting. ☞ Page 2210 Management of logging setting The setting range is [1] to [250].
2)	[File Output Attribute]	This item can be set only when [File] is selected for [How to store logging data] in the [Logging] dialog. Select this item to change the style of the device value that is to be output to a Unicode text file or CSV file. Select this item to add [File Output Attribute] setting columns to the device list. This setting is available only when [How to store logging data] is set to [File].
3)	[Character Code]	Select a character code. For precautions when selecting [Unicode] for [Character Code], refer to the following. ☞ Page 2236 Selecting Unicode for the character code of the device to be collected
4)	[Storage Order]	Select the order in which character codes are stored.
5)	[Insert Block] button	Inserts a block. Select a column when inserting a block.
6)	[Cut] button	Cuts a selected item. This operation can also be performed from the right-click menu.
7)	[Copy] button	Copies a selected item. This operation can also be performed from the right-click menu.
8)	[Paste] button	Pastes a selected item. This operation can also be performed from the right-click menu.
9)	[Clear] button	Clears the device comment when [Device Comment] is being selected. Returns the number of displayed digits to the initial value when [Digits] is being selected.
10)	[Delete] button	Deletes a selected line setting.
11)	[Import] button	Imports the setting edited in a Unicode text file or CSV file to GT Designer3.
12)	[Export] button	Saves the setting in the [Device] tab with a Unicode text or CSV file. You can edit the exported file in spreadsheet software and others. The edited file can be imported with GT Designer3. When importing or exporting files in the multiple-language input environment, use Unicode text files. The characters of multiple languages can be imported or exported normally by using Unicode text files.

Item			Description
13)	Device list	[Device]	Set the devices from which data is collected by the logging trigger. ☞ Page 834 How to set devices, labels, and tags
		[Device Type]	Select the data type of the device.
		[Points]	Set the number of devices to be collected in block units. Devices starting from the start device are set sequentially for the set number. The maximum number of devices that can be set depends on the setting of [Device Type]. • [Bit]: [1] • [Signed BIN16], [Unsigned BIN16], [Signed BIN8], [Unsigned BIN8] [BCD16], or [String]: [1] to [250] • [Signed BIN32], [Unsigned BIN32], [BCD32], or [Real(32bit)]: [1] to [125] • [Signed BIN64], [Unsigned BIN64], [BCD64], or [Real(64bit)]: [1] to [62]
		[Character Count (one-byte)] ([Character Count] when [Unicode] is selected for [Character Code])	Maximum number of characters to be collected. This item is displayed when [String] is selected for [Device Type]. The settings of [Points] and [Character Code] determine the setting value. • When [Unicode] is selected for [Character Code] The maximum number of characters equals the value in [Points]. • When an item other than [Unicode] is selected The maximum number of characters equals the value in [Points] multiplied by 2. A two-byte character is counted as two characters.
		[Device Comment]	Set a device comment. Up to 32 characters can be set. A set device comment is displayed in a Unicode text file and CSV file. Adjust the column width to display the entire device comment.
		[File Output Attribute]	Set the style of the device value that is to be output to a Unicode text file or CSV file. When [File Output Attribute] to the right of [Block Number] is selected, the corresponding setting items are displayed. For details, refer to the next page.

Settings for [File Output Attribute]

When [File Output Attribute] is selected, also configure the following settings.

Item	Description
[Display Type]	Select the data display type. The setting range depends on the setting of [Device Type]. ☞ Page 2236 Relationship between the settings of [Device Type], [Display Type], and [Digits]
[Display Digits]	Set the number of the digits displayed. The setting range differs depending on the setting of [Display Type]. If the number of the digits of a collected value exceeds the number of set digits, the value is output intact. When [Display Type] is set to [String], if a collected character string contains a null character in the range of the set number of digits, the characters preceding the null character are displayed. When the number of characters collected is less than that of the set digits, spaces are added. ☞ Page 2236 Relationship between the settings of [Device Type], [Display Type], and [Digits]
[Real Expression]	Select the expression type of the real number. Set this item when [Real] is selected for [Display Type]. Example) When the device stores 123.4567 and [Decimal Point] is set to 3 Display using [Exponential Expression]: 1.235E+002 (The value in the exponential expression is rounded off to the third decimal place.) Display using [Fixed Decimal]: 123.457 (The value is rounded off to the third decimal place.) When [Device Type] is set to an item other than [Real], [Real Expression] is fixed to [Fixed Decimal]. The value set for [Decimal Point] is handled as the number of decimal places. Example) When the device stores 12345 and [Decimal Point] is set to 2 Device value output to a file: 123.45 (The last two digits of the value are handled as the decimal places.)
[Decimal Point]	Set the number of digits of decimal numbers. Set this item when [Real] is selected for [Display Type]. The setting range is [0] digits to [30] digits.
[Fill with 0]	Select this item to display 0 before the device value. When the collected device value is 125 and [Digits] is 6, 000125 is displayed with this item selected.

Selecting Unicode for the character code of the device to be collected

When [Character Code] is set to [Unicode] for a target device, if you specify the device for a text display, text input, or text print object, configure the settings in the object setting dialog as shown below.

■When [Storage Order] is set to [Low→High] in the [Logging] dialog

1. Select [Unicode] for [Character Code] in the [Device/Style] tab or in the [Text Print] dialog.
2. Select [High→Low] in the [Extended] tab or in the [Text Print] dialog.

■When [Storage Order] is set to [High→Low] in the [Logging] dialog

1. Select [Unicode] for [Character Code] in the [Device/Style] tab or in the [Text Print] dialog.
2. Deselect [Display in order of High→Low] in the [Extended] tab or in the [Text Print] dialog.

Relationship between the settings of [Device Type], [Display Type], and [Digits]

The selectable items for [Display Type] vary depending on the setting of [Device Type].
The setting range of [Digits] also varies depending on the setting of [Display Type].

[Device Type]	[Display Type]	Setting range for [Digits][*1]
[Bit]	[Bin]	[1]
	[Bit]	[3]
[Signed BIN16]	[Signed Dec]	[1] to [21]
	[Hex]	[4]
	[Octal]	[6]
	[Bin]	[16]
	[Real]	[1] to [32]
[Unsigned BIN16]	[Unsigned Dec]	[1] to [21]
	[Hex]	[4]
	[Octal]	[6]
	[Bin]	[16]
	[Real]	[1] to [32]
[Signed BIN32]	[Signed Dec]	[1] to [21]
	[Hex]	[8]
	[Octal]	[11]
	[Bin]	[32]
	[Real]	[1] to [32]
[Unsigned BIN32]	[Unsigned Dec]	[1] to [21]
	[Hex]	[8]
	[Octal]	[11]
	[Bin]	[32]
	[Real]	[1] to [32]
[Signed BIN64]	[Signed Dec]	[1] to [21]
	[Hex]	[16]
	[Real]	[1] to [32]
[Unsigned BIN64]	[Unsigned Dec]	[1] to [21]
	[Hex]	[16]
	[Real]	[1] to [32]
[Signed BIN8]	[Signed Dec]	[1] to [21]
	[Hex]	[2]
	[Octal]	[3]
	[Bin]	[8]
	[Real]	[1] to [32]

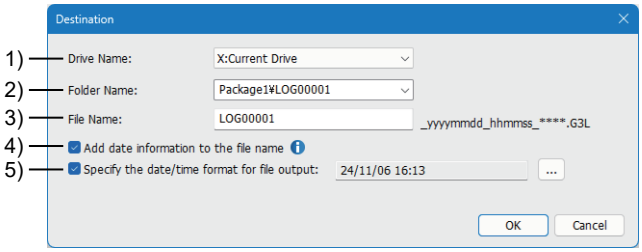
[Device Type]	[Display Type]	Setting range for [Digits]*1
[Unsigned BIN8]	[Unsigned Dec]	[1] to [21]
	[Hex]	[2]
	[Octal]	[3]
	[Bin]	[8]
	[Real]	[1] to [32]
[BCD16]	[Unsigned Dec]	[1] to [21]
	[Real]	[1] to [32]
[BCD32]	[Unsigned Dec]	[1] to [21]
	[Real]	[1] to [32]
[BCD64]	[Unsigned Dec]	[1] to [21]
	[Real]	[1] to [32]
[Real(32bit)]	[Real]	[1] to [32]
[Real(64bit)]	[Real]	[1] to [32]
[String]	[String]	[1] to [500]

*1 When [Real Expression] is set to [Fixed Decimal], the value set for [Digits] is handled as the number of digits of the integer portion. The sum of the values set for [Digits] and [Decimal Point] must be 30 or less.

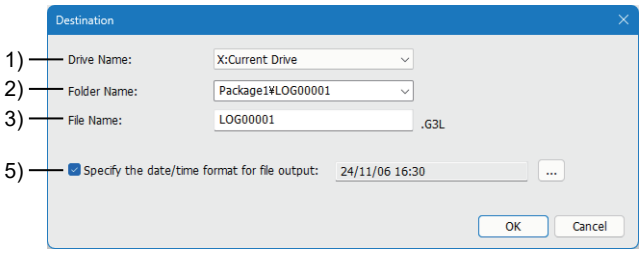
65.10.2 [Destination] dialog (for saving a logging file)

Set the save destination for logging files (*.G3L).

- When [How to store logging data] is set to [File]



- When [How to store logging data] is set to [Buffering area]



Item		Description
1)	[Drive Name]	Select a destination drive. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
2)	[Folder Name]	Set the name of the folder where files are stored. In the default setting, [Package Folder Name] selected from [Common] → [GOT Type Setting] is set as the folder name. ☞ Page 84 Restrictions for folder names and file names used in GOT
3)	[File Name]	Set the name of the files to be saved. In the default setting, LOG☐ is set for the file name (☐ indicates the logging ID). ☞ Page 84 Restrictions for folder names and file names used in GOT
4)	[Add date information to the file name]	Adds the date (year, month, and day) and time (hour, minute, and second) to the file name when the file is saved. The date and time information of the first event in the logging file is used.
5)	[Specify the date/time format for file output]	Set the format of the date and time displayed in a Unicode text file or CSV file. Click the [...] button to specify the date and time format in the [Date/Time Setting] dialog. ☞ Page 3684 [Date/Time Setting] dialog (screen)

Precautions

When configuring multiple logging settings, do not set the same name for both folders and files.

If the same name is used, logging is not executed normally.

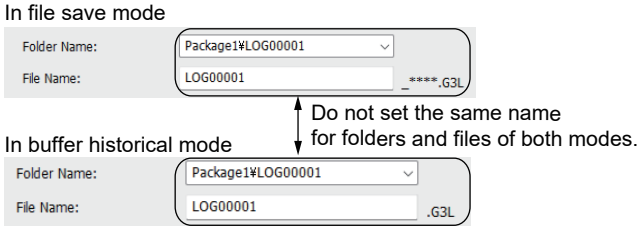
Special care is required when file save mode and buffer historical mode are used together.

In file save mode, the management file is saved in the background when the logging file is saved.

For example, when the logging file [LOG00001_****.G3L] (* indicates a number) is saved, the management file [LOG00001.G3L] is saved simultaneously.

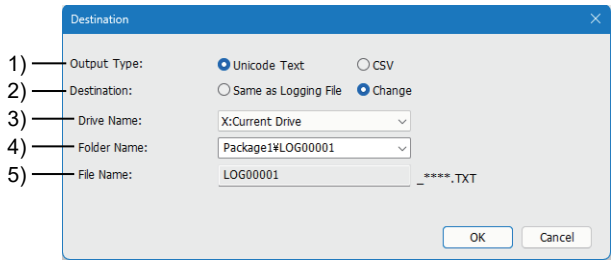
If the file name in buffer historical mode is [LOG00001.G3L], logging is not executed normally due to the duplicated file name.

To check duplication, select [Debug/Check] → [Data Check] from the menu.



65.10.3 [Destination] dialog (for saving a CSV or TXT file)

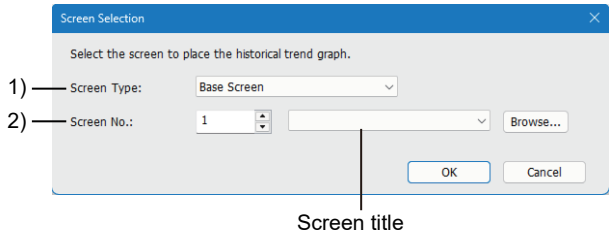
Set the save destination for the Unicode text file or CSV file.



Item		Description
1)	[Output Type]	Select the file format to be additionally output. When an additional file is output, the duration of logging interruption may be longer.
2)	[Destination]	Select the save destination folder for the additionally output file. If you select [Change], set the [Drive Name] and [Folder Name] for the save destination.
3)	[Drive Name]	Select a destination drive. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
4)	[Folder Name]	Set the name of the folder where files are stored. In the default setting, [Package Folder Name] selected from [Common] → [GOT Type Setting] is set as the folder name. ☞ Page 84 Restrictions for folder names and file names used in GOT
5)	[File Name]	Displays the name of the logging file.

65.10.4 [Screen Selection] dialog

Select the screen in which a historical trend graph is placed.

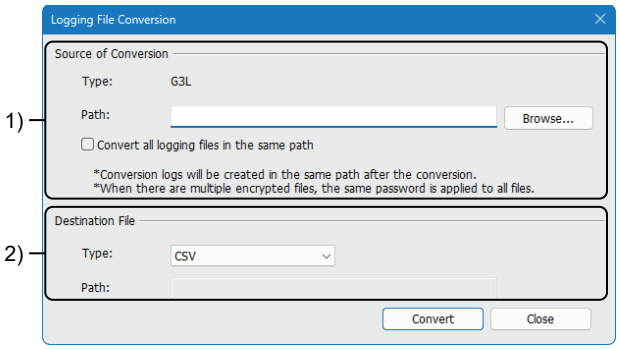


Item		Description
1)	[Screen Type]	Select the type of the screen in which a historical trend graph is placed.
2)	[Screen No.]	Set the number of the screen in which a historical trend graph is placed. The setting range is [0] to [32767]. A target screen is selectable from among screen titles as well. To place a historical trend graph on a new screen, select [A new screen will be created.] for the screen title. Clicking the [Browse] button allows you to check the screen image to be selected in the [Screen Image List] dialog. ☞ Page 3683 [Image List] dialog (screen)

65.11 [Logging File Conversion] dialog

This dialog is used to convert a logging file (*.G3L) to a Unicode text file or a CSV file.

Select [Tools] → [Resource Data Conversion] → [Logging File] from the GT Designer3 menu to display the dialog.



Item			Description
1)	[Source of Conversion]	[Type]	Displays the file type of the conversion source file.
		[Path]	Specify a path of the conversion source file.
		[Convert all logging files in the same path]	Select this item to set all logging files (*.G3L) in the same path as conversion targets. When conversion is executed with this item selected, a conversion log (.log) containing the conversion results is automatically created in the specified path. File name example) G3LtoCSV_20260113103901.log You can check the full path of the converted files, the conversion results (OK, NG), or the creation date of files in the conversion log.
2)	[Destination File]	[Type]	Select a file type of a file to be created after the conversion.
		[Path]	Displays the path of a file to be saved at the destination, which is the same path as the one of the conversion source file.

65.12 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the logging function as required. The following shows the functions that are available by configuring the relevant settings.

65.12.1 GOT internal devices

☞ Page 3581 GOT special register (GS)

Function	Setting item
Saving the data in the buffering area to data storage (Forcefully Save Buffered Data signal)*1	GS520.b0
Changing the character code to Unicode when a binary file is converted to CSV format	GS522.b2

*1 If the setting for saving the logging data in the buffering area to the data storage is not configured (if [Store logging data to the file] in the logging setting is set to [No]), the data cannot be saved to the data storage.

PART 11 Recipe

66 Writing or reading values to multiple devices ([Recipe])

66 Writing or reading values to multiple devices ([Recipe])

GT37 SoftGOT3000

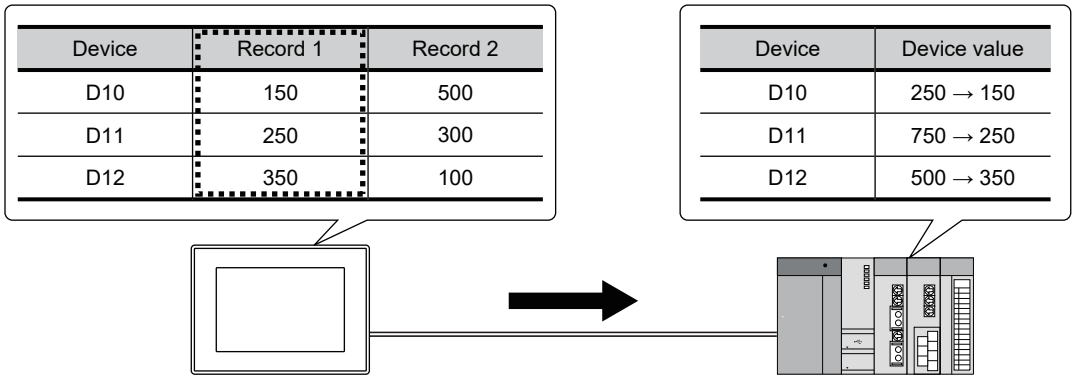
☞ Page 2244 Overview of the recipe function
☞ Page 2246 Specifications of the recipe
☞ Page 2255 How to use the recipe
☞ Page 2301 Control and notification with devices
☞ Page 2309 [Recipe Common Setting] dialog
☞ Page 2310 [Recipe List] dialog
☞ Page 2311 [Recipe] dialog
☞ Page 2321 [Recipe File Conversion] dialog
☞ Page 2322 Relevant settings

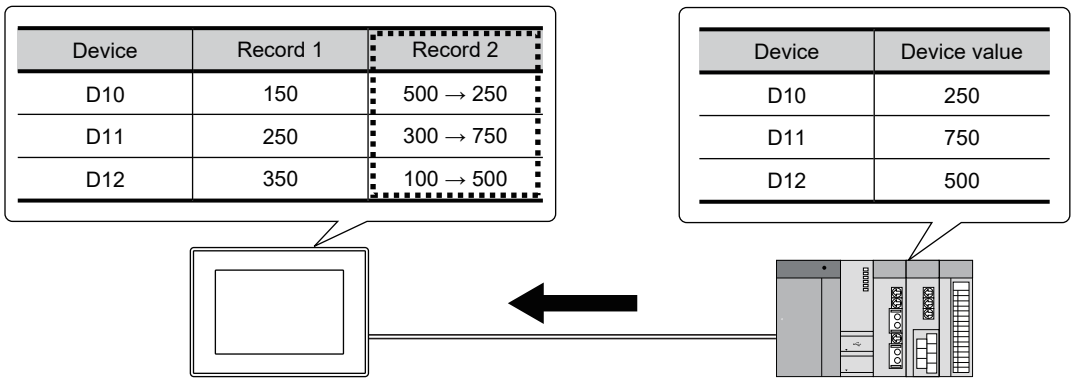
66.1 Overview of the recipe function

GT37 SoftGOT3000

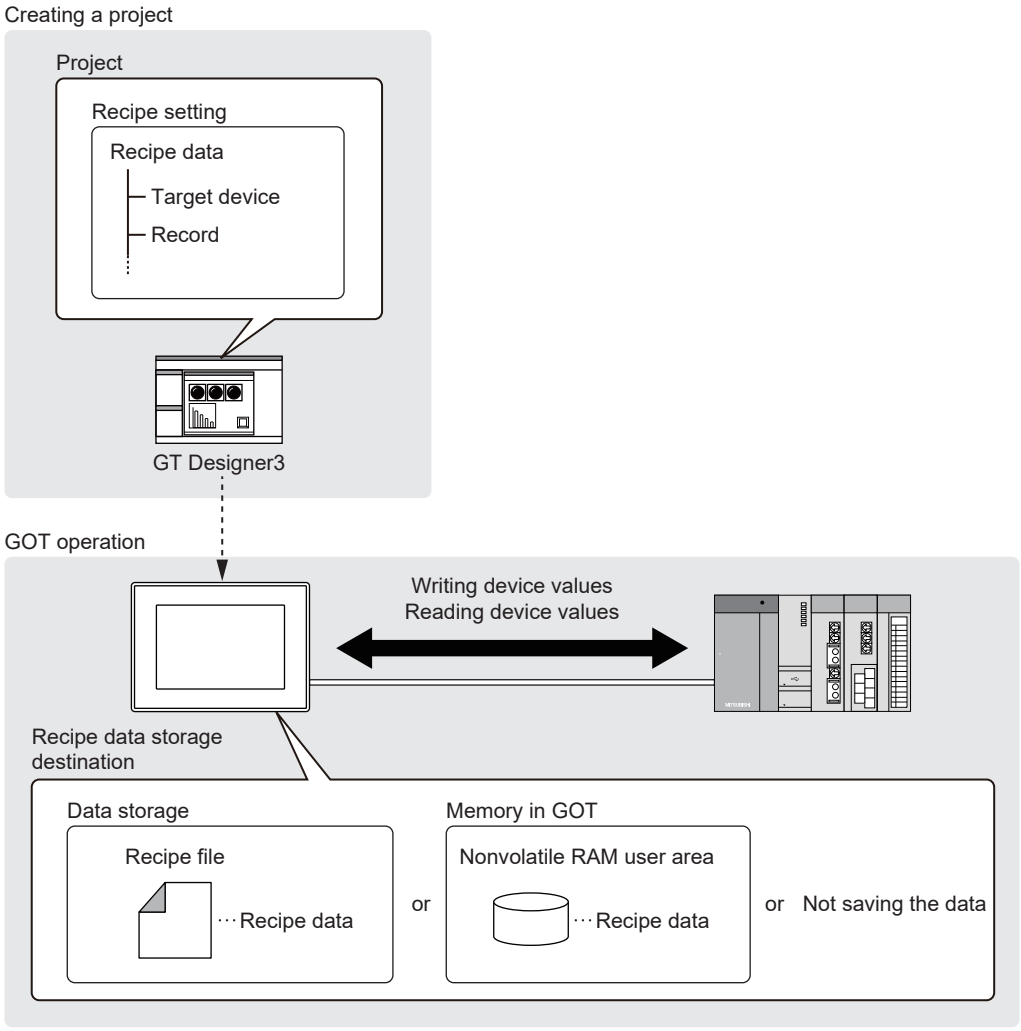
The recipe function collectively writes or reads values to or from multiple devices.

Function	Operation
Writing device values	Preset values are written to multiple devices. You can set multiple combinations of device values (records) to be written. Example) Writing the values of record 1
Reading device values	Values are read from multiple devices. The read values are saved as the values of a record in a data storage or the nonvolatile RAM user area. Example) Saving the read device values in record 2





The following shows the outline of operation from creating project with GT Designer3 to operating the GOT, and the terms of the recipe function.



Term	Description
Recipe setting	Setting configured with GT Designer3 for the recipe function. A recipe setting consists of target devices, combinations of values to be written (records), trigger devices, and other fields. ☞ Page 2246 Contents of a recipe setting
Recipe data	Data such as target devices, records, and device comments based on a recipe setting. The records in the recipe data are subjected to reading and writing. You can save the recipe data into a data storage or the nonvolatile RAM user area. ☞ Page 2249 Recipe data
Recipe file	A recipe file contains recipe data. A recipe file is created when the recipe data is stored in the GOT data storage. The records in the recipe file are subjected to reading and writing, and the contents of the file are editable. Set whether to use the recipe file per recipe setting. ☞ Page 2250 Specifications of the recipe file

66.2 Specifications of the recipe

GT37 SoftGOT3000

☞ Page 2246 Contents of a recipe setting
☞ Page 2249 Recipe data
☞ Page 2250 Specifications of the recipe file
☞ Page 2254 Specifications of saving recipe data into the nonvolatile RAM user area

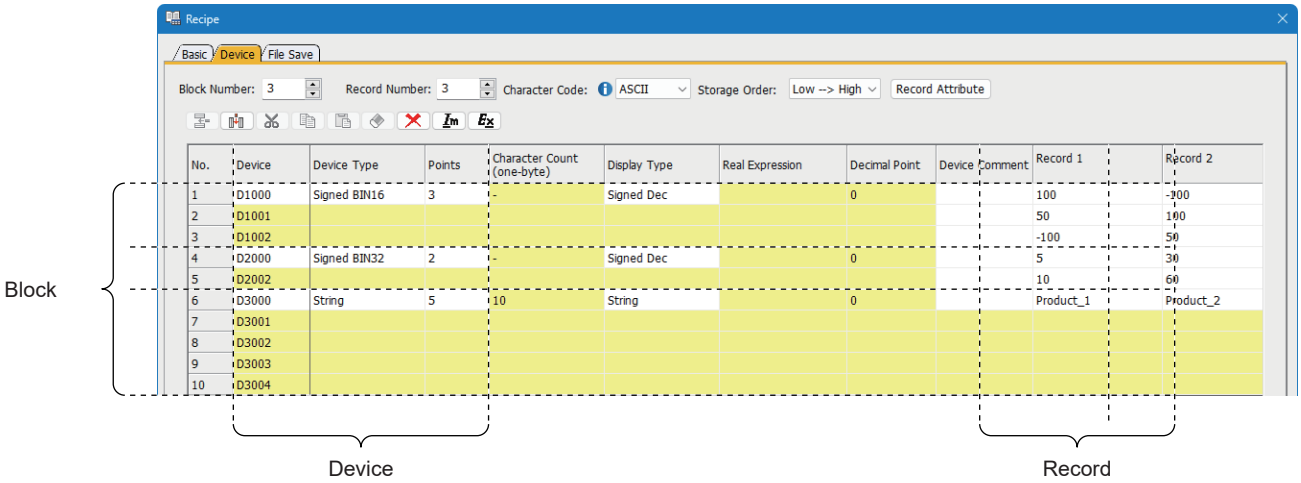
66.2.1 Contents of a recipe setting

GT37 SoftGOT3000

A recipe setting consists of target devices, combinations of values to be written (records), trigger devices, and other fields.
Device values are read or written in units of recipe settings.
Each recipe setting has a recipe number used to specify the recipe data to be written or read.
The following shows the setting range of recipe setting.

Item	Setting range
Number of recipe settings per project	Up to 2500 settings
Setting range of recipe No.	1 to 32767

Set recipe settings in the [Recipe] dialog.
☞ Page 2311 [Recipe] dialog



For details on blocks, devices, and records that configure a recipe setting, refer to the following.

Item		Upper limit	Reference
Block		Up to 2048 per recipe setting	☞ Page 2247 Block
Device	256 records or less	• 65536 per recipe setting • 32768 per block (up to 2048 when [Device Type] is [Text])	
	257 records or more	• 8192 per recipe setting • 8192 per block (up to 2048 when [Device Type] is [Text])	
Record		Up to 2000 per recipe setting	☞ Page 2248 Record

Precautions

■Project size and recipe setting

The project size (ROM or RAM) must be equal to or smaller than the capacity of the GOT storage memory (ROM) or operation memory (RAM).

Depending on the recipe setting (including the number of records, number of target devices, and record initial values) and other function settings, setting items may not be set up to each upper limit due to the project size.

Block

Target devices are set in units of blocks.

Set target devices, device types, and number of devices by block.

To set consecutive devices, specify the start device and set the number of consecutive devices from the start device to [Points].

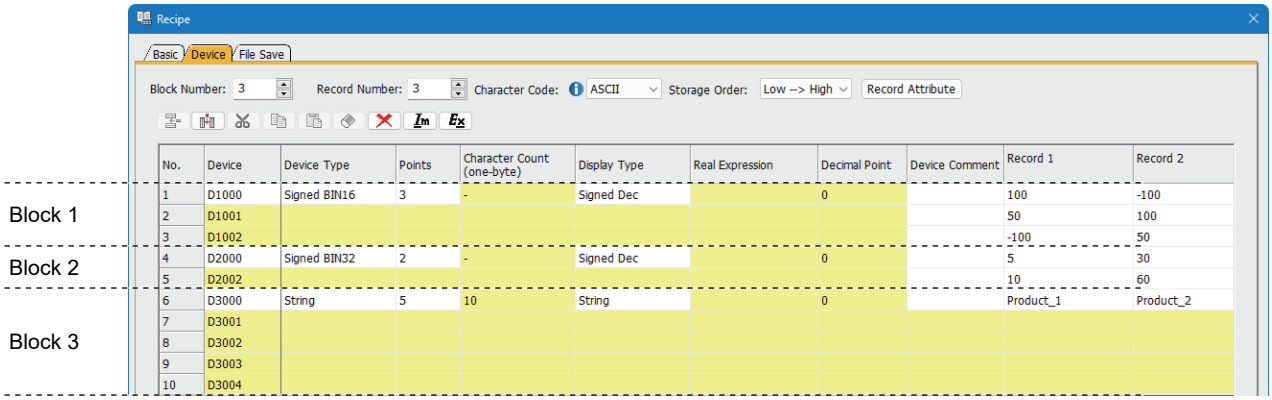
The set number of devices starting from the start device are the recipe target devices.

To set non-consecutive devices, delimit devices by blocks.

Set the number of delimiters to [Block Number], and set devices for each block.

Ex.

Example of block settings



No.	Device	Device Type	Points	Character Count (one-byte)	Display Type	Real Expression	Decimal Point	Device Comment	Record 1	Record 2
1	D1000	Signed BIN16	3	-	Signed Dec		0		100	-100
2	D1001								50	100
3	D1002								-100	50
4	D2000	Signed BIN32	2	-	Signed Dec		0		5	30
5	D2002								10	60
6	D3000	String	5	10	String		0		Product_1	Product_2
7	D3001									
8	D3002									
9	D3003									
10	D3004									

Block	[Device]	[Device Type]	[Points]
Block 1	[D1000] Three consecutive devices (D1000 to D1002) are set as target devices.	[Signed BIN16]	3
Block 2	[D2000] Two consecutive devices (D2000 to D2003) are set as target devices.	[Signed BIN32]	2
Block 3	[D3000] Five consecutive devices (D3000 to D3004) are set as target devices.	[String]	5

Record

Values of target devices are managed in units of records.

Each record has a record number used to specify the record to be written or read.

Record number is indicated as record n (n = 1, 2...).

Ex.

Record 1 = Record number 1

Record 2 = Record number 2

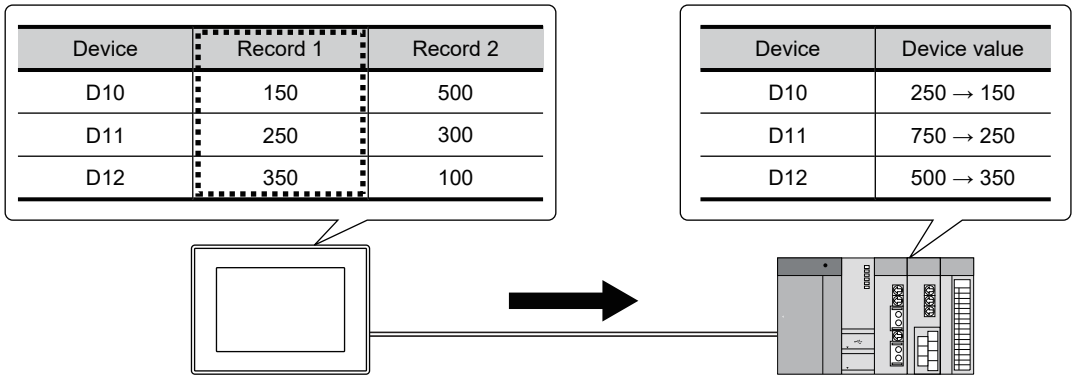
■When writing device values

Specify values to be written to devices in units of records.

One record can be specified for one write.

Ex.

Writing the values of record 1



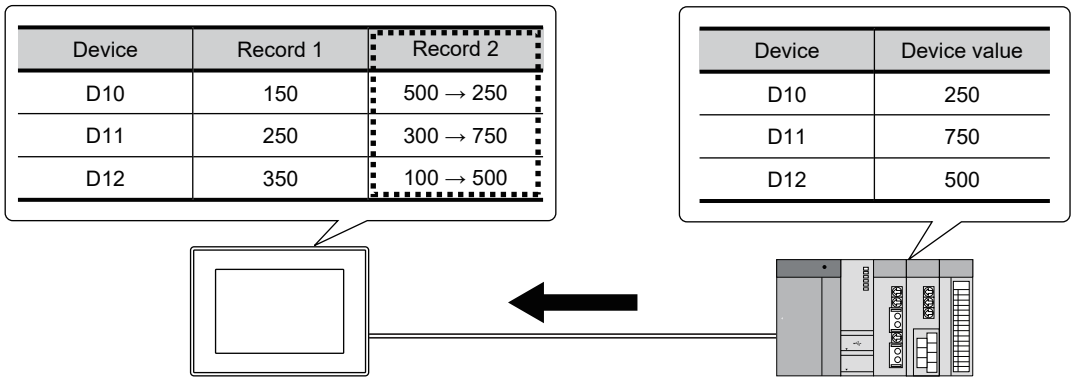
■When reading device values

The values read from devices are saved as one record.

One record can be specified for one read.

Ex.

Saving the read device values in record 2



66.2.2 Recipe data

GT37 SoftGOT3000

The recipe data includes the target devices, records, and device comments of a recipe setting.

The records in the recipe data are subjected to reading and writing.

You can save the recipe data into a data storage or the nonvolatile RAM user area.

Set the save destination in the [Recipe] dialog ([Basic] tab).

☞ Page 2311 [Basic] tab

The recipe data is handled differently depending on the save destination setting.

[Recipe Data Save Location] setting	Handling of recipe data
[Data Storage (Recipe File)(read and write)]	The recipe data is saved to a recipe file in the data storage of the GOT. The records in the recipe file are subjected to reading and writing. To edit the recipe data, transfer the recipe file to a personal computer. For the specifications of the recipe file, refer to the following. ☞ Page 2250 Specifications of the recipe file For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
[Embedded Memory in GOT (read and write)]	The recipe data is saved to the nonvolatile RAM user area of the GOT. No recipe file is created. The records of the recipe data in the nonvolatile RAM user area are subjected to reading and writing. The nonvolatile RAM user area space is limited. Only the following fields are saved accordingly. For the other fields, the recipe settings in the project are used. • Record name • Record attribute • Values of the record To use device comments or other fields, or large amounts of recipe data, save the recipe data to a recipe file in the data storage. For details on the nonvolatile RAM user area, refer to the following. ☞ Page 2254 Specifications of saving recipe data into the nonvolatile RAM user area
[Not save (record value write only)]	The recipe data is not saved. No recipe file is created. The records in a recipe setting in the project are subjected to writing. Reading of device values is not available. Select not to save the recipe data for write operations only.

PART 11

66.2.3 Specifications of the recipe file

GT37 SoftGOT3000

☞ Page 2250 Recipe file
☞ Page 2251 Recipe file format
☞ Page 2252 Configuration of the recipe file

Recipe file

A recipe file contains recipe data.
The records in the recipe file are subjected to reading and writing, and the contents of the file are editable.
Set whether to use the recipe file per recipe setting.
To use a recipe file, set [Recipe Data Save Location] to [Data Storage (Recipe File)(read and write)] in the [Recipe] dialog ([Basic] tab).
☞ Page 2311 [Basic] tab
A recipe file is automatically created when all of the following conditions are satisfied at writing or reading.

- [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)] in the [Recipe] dialog.
- Writing or reading is caused by the trigger device (external control device or trigger device per recipe setting).
- No recipe file exists.

Precautions

■Influence by recipe file size

A large recipe file requires more space in a data storage, takes a long writing or reading time, and influences others.
The following shows methods to reduce the size of a recipe file.

- Reduce the number of characters in device comments.
- Reduce the number of digits of the record initial values.
- Exclude device comments from the conversion target.

■Changing the recipe setting after its recipe file is created

When a recipe file is used, device values are written to or read from the recipe file.
In the save destination, if another recipe file already exists, changes made in GT Designer3 are not applied to the recipe file and the writing or reading of device values.
Remove the recipe file from the save destination, and then write or read device values.

■Recipe file created when a recipe process error occurs

Even if a recipe process error occurs, a recipe file may still be created.
Change the setting in GT Designer3 to remove error causes, and then create a recipe file again.

■Changing the save destination or file name of a recipe file

If you change the save destination or name of a recipe file used, also change the save destination and file name of the corresponding recipe setting.

■To maintain file access performance

It is recommended to format the data storage before using it.
The number of files to be stored in a folder should be less than 500.
If 500 or more files are stored in a folder, file access performance may be lowered.
Repeated writing or deleting of data may lower access performance, regardless of the number of files.
In such a case, format the data storage.

Recipe file format

The following file formats are available for recipe files.

Select a file format in the [Basic] tab in the [Recipe] dialog.

☞ Page 2311 [Basic] tab

File format	Extension	Description
Binary format	*.G3P	A binary file (*.G3P) is used as a recipe file. One file is created for one recipe setting. To edit such a recipe file on a personal computer, convert it to CSV or Unicode text format. In this case, unlike a recipe file originally in CSV or Unicode text format, the file still contains multiple records after its format is converted.
CSV format	*.CSV	A recipe file created in CSV format (*.CSV) is used intact. To edit such a file on a personal computer, the file format conversion is not required. One recipe file contains one record only. Recipe files are created for each record. The record number is added to the end of the file name. Example) Recipe file with record number 3: ARP00001_0003.CSV
Unicode text format	*.TXT	A recipe file in Unicode text format (*.TXT) is used intact. To edit such a file on a personal computer, the file format conversion is not required. One recipe file contains one record only. Recipe files are created for each record. The record number is added to the end of the file name. Example) Recipe file with record number 3: ARP00001_0003.TXT

Point

For the precautions for editing a CSV file or Unicode text file on a personal computer, refer to the following.

☞ Page 3668 Precautions for using CSV file

☞ Page 3669 Precautions for using Unicode text file

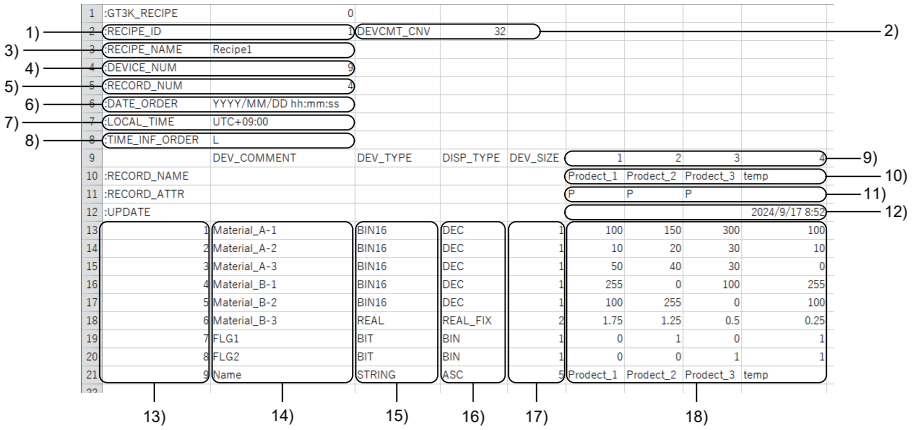
Configuration of the recipe file

The following shows the configuration of a recipe file in CSV or Unicode text format.

To edit a binary recipe file (*.G3P) on a personal computer, convert the format to CSV or Unicode text format.

Only the following items can be edited.

- Record name
- Record attribute
- Record
- Device comment (when edit is allowed in the recipe setting)



Item		Description
1)	Recipe No.	Recipe number of a source recipe setting
2)	Number of characters in the device comment to be converted	Number of characters in a target device comment when the recipe file is converted from CSV or Unicode text format to binary format (*.G3P). This item is output when [Include device comments in conversion target] is selected in the [Basic] tab in the [Recipe] dialog.
3)	Recipe name	Name of a source recipe setting
4)	Total number of devices	Total number of devices in a source recipe setting
5)	Number of records	Number of records in a source recipe setting
6)	Order of date and time	Order of date and time output when the records are updated
7)	Time zone	Difference between Greenwich Mean Time and local time
8)	Time information	Information on time data • L: Local time
9)	Record No.	Record number of each record
10)	Record name	Each record name Up to 32 characters can be set.
11)	Record attribute	Record attribute of each record. The following shows selectable items. • Blank column: Device values can be changed. • P: Device values cannot be changed. • N: No device value
12)	Record update time	Time when the device values of a read record are updated
13)	Line number	Line number of each line
14)	Device comment	Comment for the device in each line. Up to 32 characters can be set. For a binary recipe file (*.G3P), set the number of characters that is applied when the file format is converted to the CSV or Unicode text format, the file is edited, and the file format is converted back to the binary format (*.G3P) to [Maximum number of characters] in the [Recipe] dialog ([Basic] tab). Characters exceeding the maximum number of characters cannot be applied to a reverse-converted recipe file.

Item		Description
15)	Device type	Type of the device in each line • [BIT]: Bit • [BIN8]: Signed 8-bit binary • [BIN8_Unsigned]: Unsigned 8-bit binary • [BIN16]: Signed 16-bit binary • [BIN16_Unsigned]: Unsigned 16-bit binary • [BIN32]: Signed 32-bit binary • [BIN32_Unsigned]: Unsigned 32-bit binary • [BIN64]: Signed 64-bit binary • [BIN64_Unsigned]: Unsigned 64-bit binary • [BCD16]: 16-bit binary-coded decimal • [BCD32]: 32-bit binary-coded decimal • [BCD64]: 64-bit binary-coded decimal • [REAL]: Real number (32-bit) • [REAL64]: Real number (64-bit) • [STRING]: Character string
16)	Display type	Display format of the device in each line • [BIT]: Bit • [DEC]: Signed decimal • [REAL_FLOAT]: Real number (exponential expression) • [REAL_FIX]: Real number (fixed-point number) • [ASC]: ASCII • [UNI]: Unicode • [SJIS]: Shift JIS code • [KS]: KS (Korean) • [GB]: GB (Simplified Chinese) • [BIG5]: Big5 (Traditional Chinese) • [BIN]: Binary number • [OCT]: Octal number • [HEX]: Hexadecimal number
17)	Number of devices	Number of devices in each line
18)	Record	Device values of each record. Edit the value according to the device type. Multiple records are managed in a recipe file, which is converted from binary format (*.G3P). Only one record is managed in a recipe file, which is originally created in CSV or Unicode text format.

66.2.4 Specifications of saving recipe data into the nonvolatile RAM user area

GT37 SoftGOT3000

You can save recipe data into the nonvolatile RAM user area.
Values are readable from the target devices of a controller into the RAM user area instead of a data storage.
For the specifications of the nonvolatile RAM user area and operations performed on it, refer to the following.
☞ Page 3679 Specifications and operations of the nonvolatile RAM user area

Although a recipe file is not created, data can be imported and exported between the recipe data stored in the non-volatile RAM user area and the recipe file stored in the data storage.
☞ Page 2273 Exporting/importing recipe data

Precautions

■Fields to be imported

If you import data from a recipe file using a special function switch (Recipe Data Operation) or external control device, only the following items are imported.

- Record name
- Record attribute
- Values of the record

To use device comments or other fields, save the recipe data to a recipe file in the data storage.

66.3 How to use the recipe

GT37 SoftGOT3000

☞ Page 2256 Recipe setting procedure

66.3.3 Writing device values

GT37 SoftGOT3000

The following writing methods are available when the GOT writes the values of a record into the target devices of a controller.

Writing methods		Description
With a device	External control device (trigger device common in a project)	Specify a recipe number and a record number with applicable devices to write the values of the record into the target devices of a controller. The trigger device is shared among all the recipe settings in one project. The trigger condition is satisfied only by turning on the trigger device. For the setting and operating procedures, refer to the following. ☞ Page 2259 Writing device values with an external control device (trigger device common in a project)
	Trigger device of each recipe setting	Specify a record number with an applicable device to write the values of the record into the target devices of a controller. When the recipe setting has only one record, the record number does not need to be specified. Up to two trigger devices can be set. The following setting can be configured: Device values are written only when both of the trigger conditions are satisfied. Each trigger condition is satisfied by turning on or off a trigger device. For the setting and operating procedures, refer to the following. ☞ Page 2261 Writing device values with a trigger device of each recipe setting
With a recipe display (record list) object on the monitor screen		Use a key code switch to write a record selected on the recipe display (record list). This method requires the applicable key code switch. For the setting and operating procedures, refer to the following. ☞ Page 1552 How to use the recipe display (record list)

For precautions for writing device values, refer to the following.

☞ Page 2262 Precautions for writing

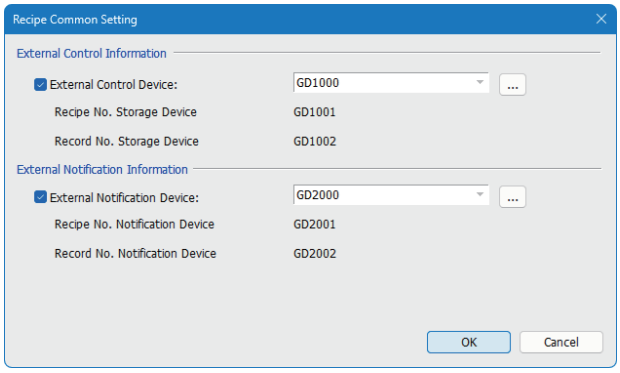
Writing device values with an external control device (trigger device common in a project)

GT37 SoftGOT3000

■Settings in GT Designer3

1. Select [Common] → [Recipe] → [Recipe Common Setting] from the menu to display the [Recipe Common Setting] dialog.

☞ Page 2309 [Recipe Common Setting] dialog



2. Select [External Control Device], set a device, and click the [OK] button.

Consecutive devices, starting from the device set in [External Control Device], are automatically set in [Recipe No. Storage Device] and [Record No. Storage Device].

Bit 0 of the device set in [External Control Device] is the write trigger device common in a project.

☞ Page 2302 Functions of the external control device

■Operation on the GOT

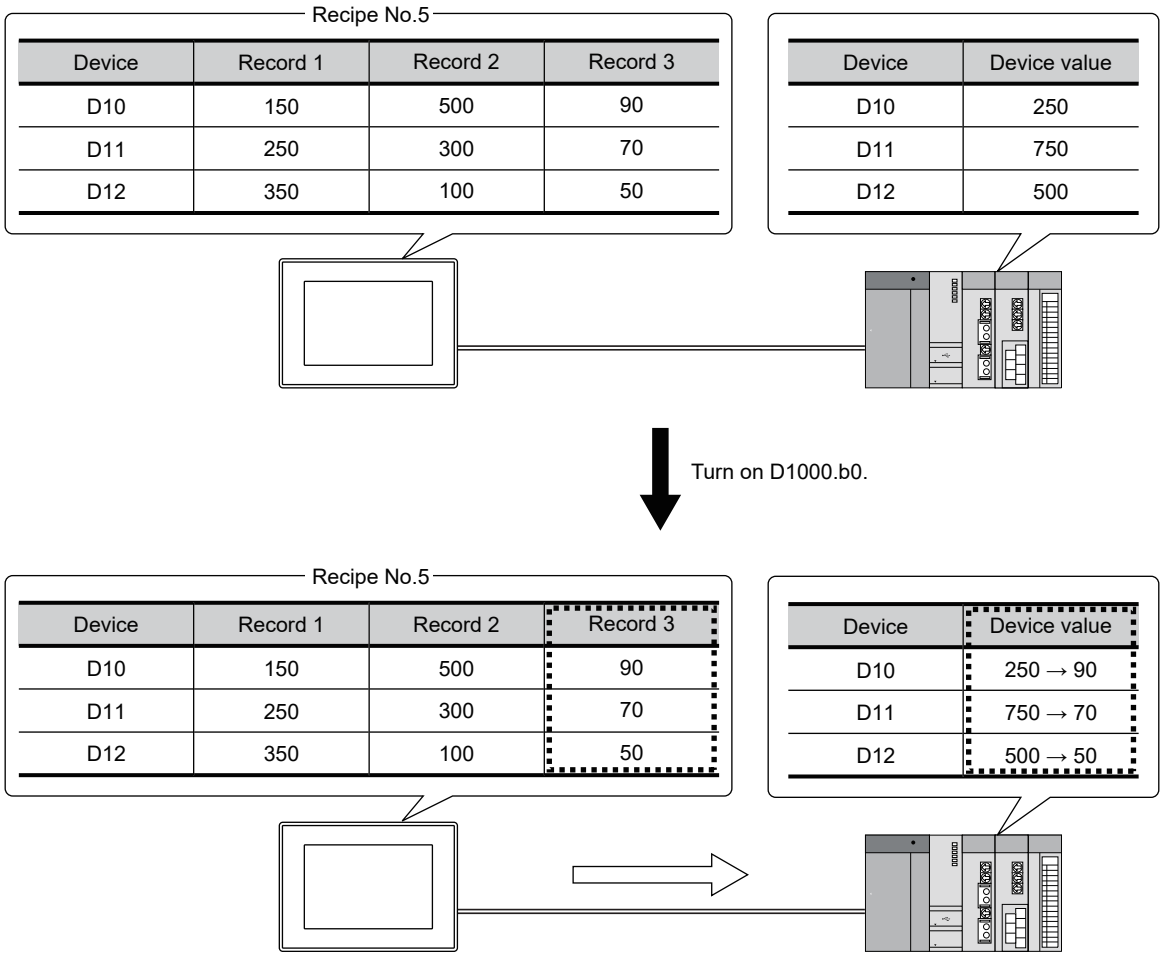
Input values into the Recipe No. Storage device and the Record No. Storage device respectively, and then satisfy the condition of the write trigger.

The values of the specified record will be written into the target devices.

Ex.

Writing record 3 on recipe No. 5

- [External Control Device]: D1000
- [Recipe No. Storage Device]: D1001 = 5
- [Record No. Storage Device]: D1002 = 3



Point

For the operating specifications of the devices to control the recipe function, refer to the following.

☞ Page 2301 Control devices

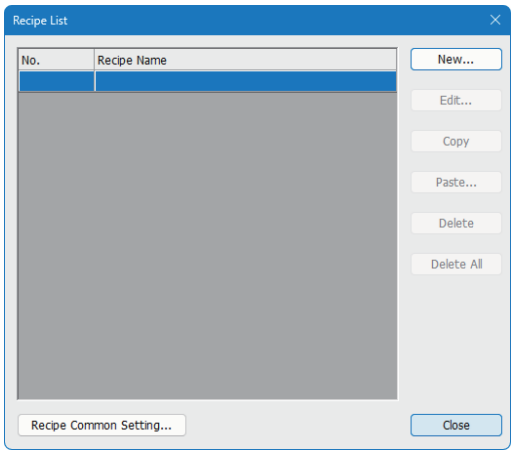
Writing device values with a trigger device of each recipe setting

GT37 SoftGOT3000

■Settings in GT Designer3

1. Select [Common] → [Recipe] → [Recipe] from the menu to display the [Recipe List] dialog.

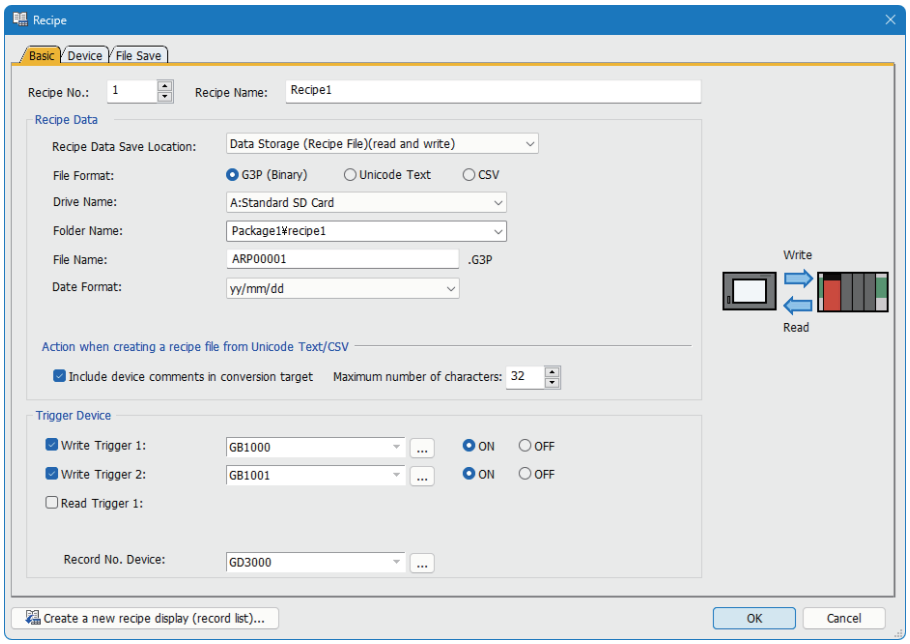
☞ Page 2310 [Recipe List] dialog



2. Perform either of the following operations to display the [Recipe] dialog.

- Click the [New] button.
- Select a recipe setting and click the [Edit] button.

☞ Page 2311 [Recipe] dialog



3. Set the following items in the [Basic] tab, and click the [OK] button.

Setting	Description
[Recipe Data Save Location]	Set the save destination of the recipe data. ☞ Page 2249 Recipe data
[Write Trigger 1]	Select this item to set a device and its trigger condition (ON or OFF).
[Write Trigger 2]	Set this item as required.
[Record No. Device]	Set a device. When the number of records is one, record 1 is always specified, and thus no setting is required.

■Operation on the GOT

Input a value into the Record No. device, and then satisfy the condition of the write trigger.
The values of the specified record will be written into the target devices.

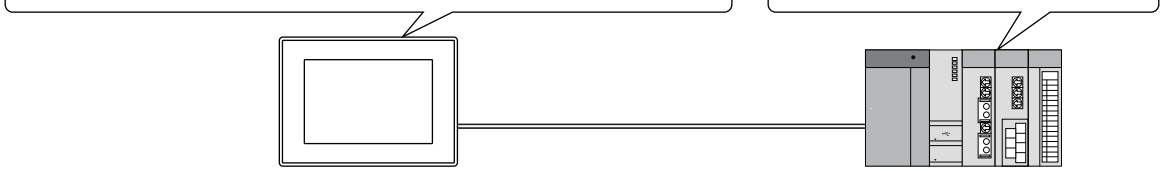
Ex.
Writing record 2 on recipe No. 3

- [Write Trigger 1] of recipe No. 3: X1000 (Trigger condition: ON)
- [Record No. Device] of recipe No. 3: D1100 = 2

Recipe No.3

Device	Record 1	Record 2	Record 3
D10	150	500	90
D11	250	300	70
D12	350	100	50

Device	Device value
D10	250
D11	750
D12	500

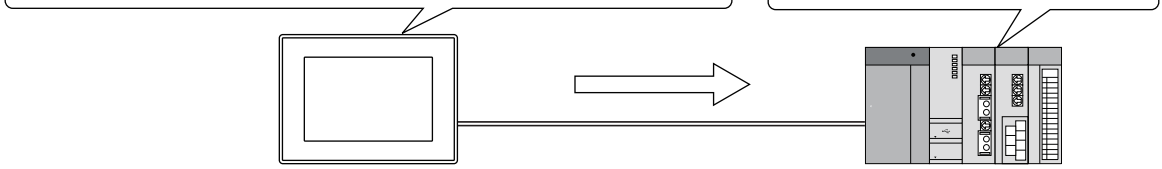


Turn on X1000.

Recipe No.3

Device	Record 1	Record 2	Record 3
D10	150	500	90
D11	250	300	70
D12	350	100	50

Device	Device value
D10	250 → 500
D11	750 → 300
D12	500 → 100



Point

For the operating specifications of the devices to control the recipe function, refer to the following.
☞ Page 2301 Control devices

Precautions for writing

■When writing cannot be executed

In the save destination, if a recipe file with the same name is already created for another recipe setting, writing device values cannot be executed.
Delete the recipe file from the save destination, and then write device values.

66.3.4 Reading device values

GT37 SoftGOT3000

The following reading methods are available when the GOT reads values from the target devices of a controller into a record.

Reading methods		Description
With a device	External control device (trigger device common in a project)	Specify a recipe number and a record number with applicable devices to read values from the target devices of a controller into the record. The trigger device is shared among all the recipe settings in one project. The trigger condition is satisfied only by turning on the trigger device. For the setting and operating procedures, refer to the following. ☞ Page 2263 Reading with an external control device (trigger device common in a project)
	Trigger device of each recipe setting	Specify a record number with an applicable device to read values from the target devices of a controller into the record. When the recipe setting has only one record, the record number does not need to be specified. Up to two trigger devices can be set. The following setting can be configured: Device values are read only when both of the trigger conditions are satisfied. Each trigger condition is satisfied by turning on or off a trigger device. For the setting and operating procedures, refer to the following. ☞ Page 2265 Reading device values with a trigger device of each recipe setting
With a recipe display (record list) object on the monitor screen		Use a key code switch to read a record selected on the recipe display (record list). This method requires the applicable key code switch. For the setting and operating procedures, refer to the following. ☞ Page 1552 How to use the recipe display (record list)

For precautions for reading device values, refer to the following.

☞ Page 2267 Precautions for reading

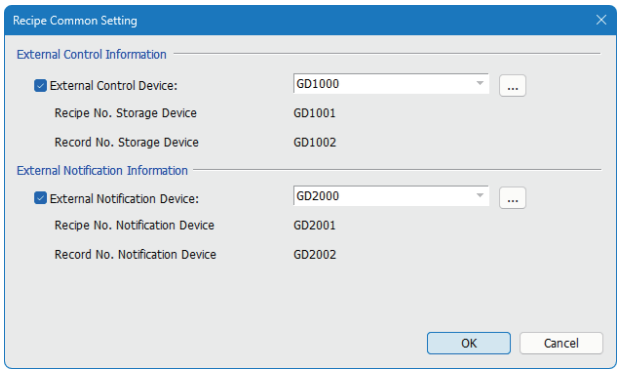
Reading with an external control device (trigger device common in a project)

GT37 SoftGOT3000

■Settings in GT Designer3

1. Select [Common] → [Recipe] → [Recipe Common Setting] from the menu to display the [Recipe Common Setting] dialog.

☞ Page 2309 [Recipe Common Setting] dialog



2. Select [External Control Device], set a device, and click the [OK] button.

Consecutive devices, starting from the device set in [External Control Device], are automatically set in [Recipe No. Storage Device] and [Record No. Storage Device].

Bit 1 of the device set in [External Control Device] is the read trigger device common in a project.

☞ Page 2302 Functions of the external control device

■Operation on the GOT

Input values into the Recipe No. Storage device and the Recipe No. Storage device respectively.

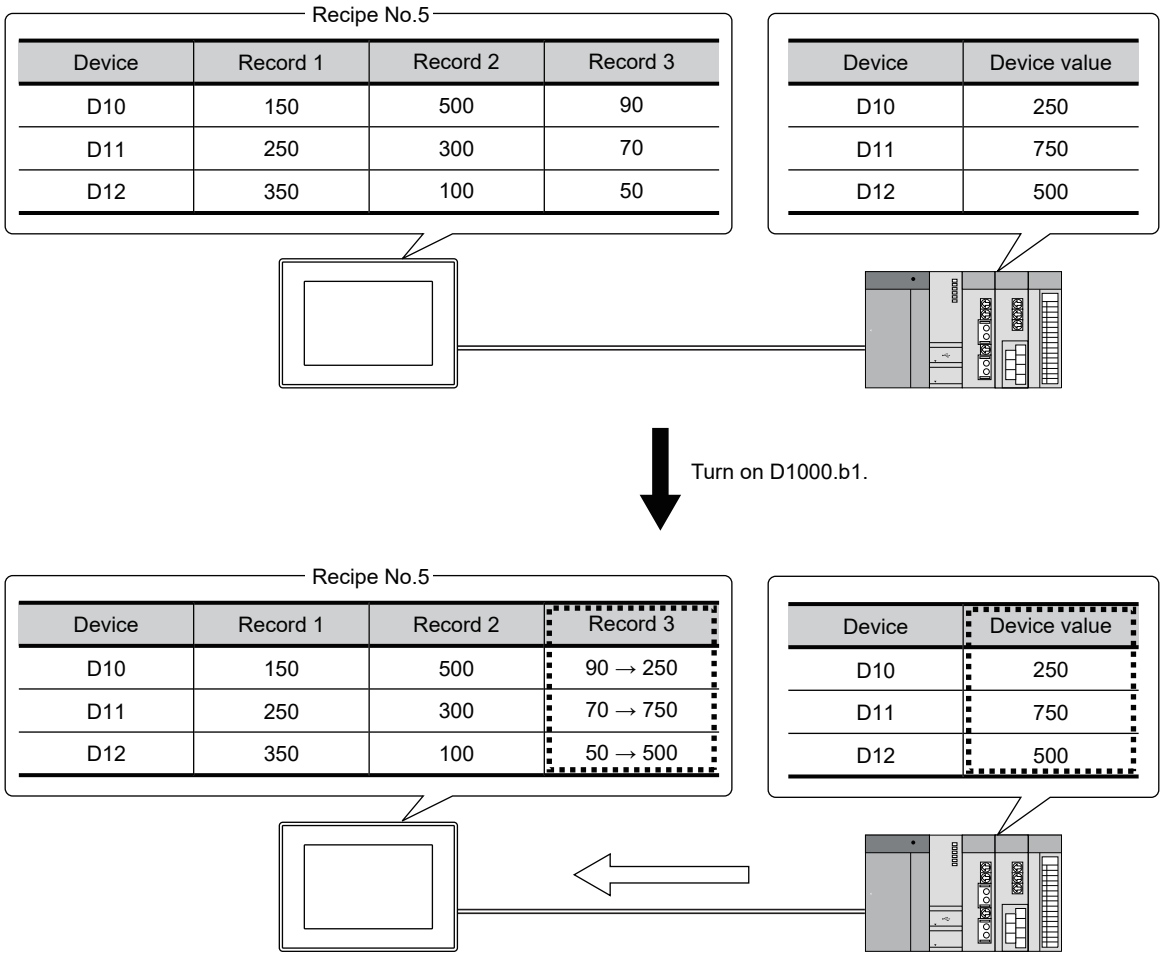
Then, satisfy the condition of the read trigger.

The values of the specified record will be overwritten with the values read from the target devices.

Ex.

Reading device values and overwriting record 3 on recipe No. 5

- [External Control Device]: D1000
- [Recipe No. Storage Device]: D1001 = 5
- [Record No. Storage Device]: D1002 = 3



Point

For the operating specifications of the devices to control the recipe function, refer to the following.

☞ Page 2301 Control devices

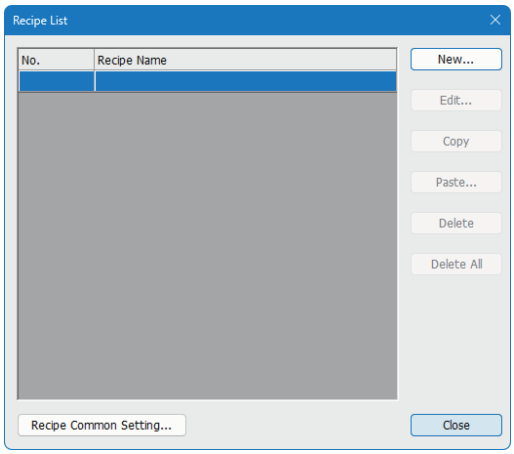
Reading device values with a trigger device of each recipe setting

GT37 SoftGOT3000

■Settings in GT Designer3

1. Select [Common] → [Recipe] → [Recipe] from the menu to display the [Recipe List] dialog.

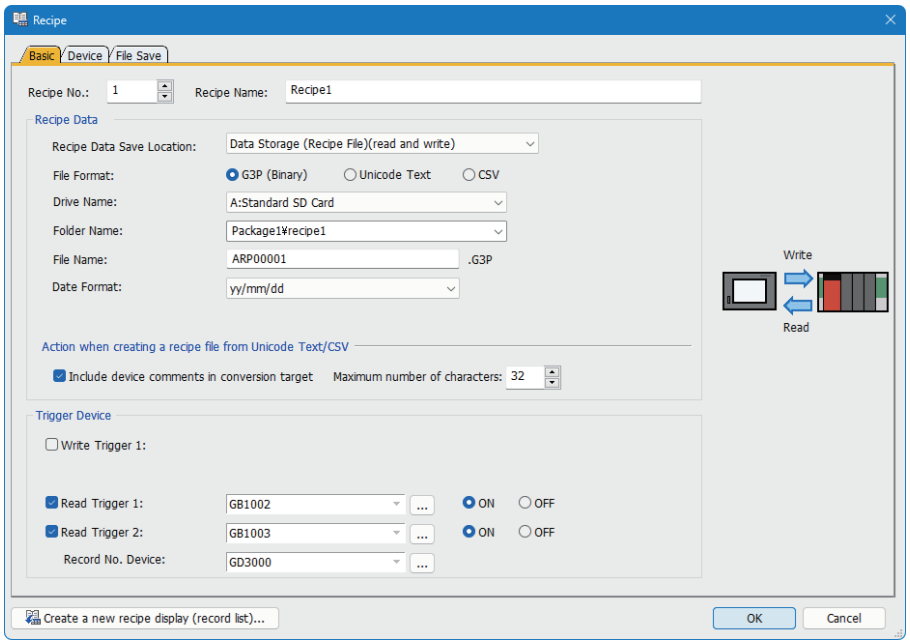
☞ Page 2310 [Recipe List] dialog



2. Perform either of the following operations to display the [Recipe] dialog.

- Click the [New] button.
- Select a recipe setting and click the [Edit] button.

☞ Page 2311 [Recipe] dialog



3. Set the following items in the [Basic] tab, and click the [OK] button.

Item	Description
[Recipe Data Save Location]	Set the save destination of the recipe data. ☞ Page 2249 Recipe data
[Read Trigger 1]	Select this item to set a device and its trigger condition (ON or OFF).
[Read Trigger 2]	Set this item as required.
[Record No. Device]	Set a device. When the number of records is one, record 1 is always specified, and thus no setting is required.

■Operation on the GOT

Input a value into the Record No. device.

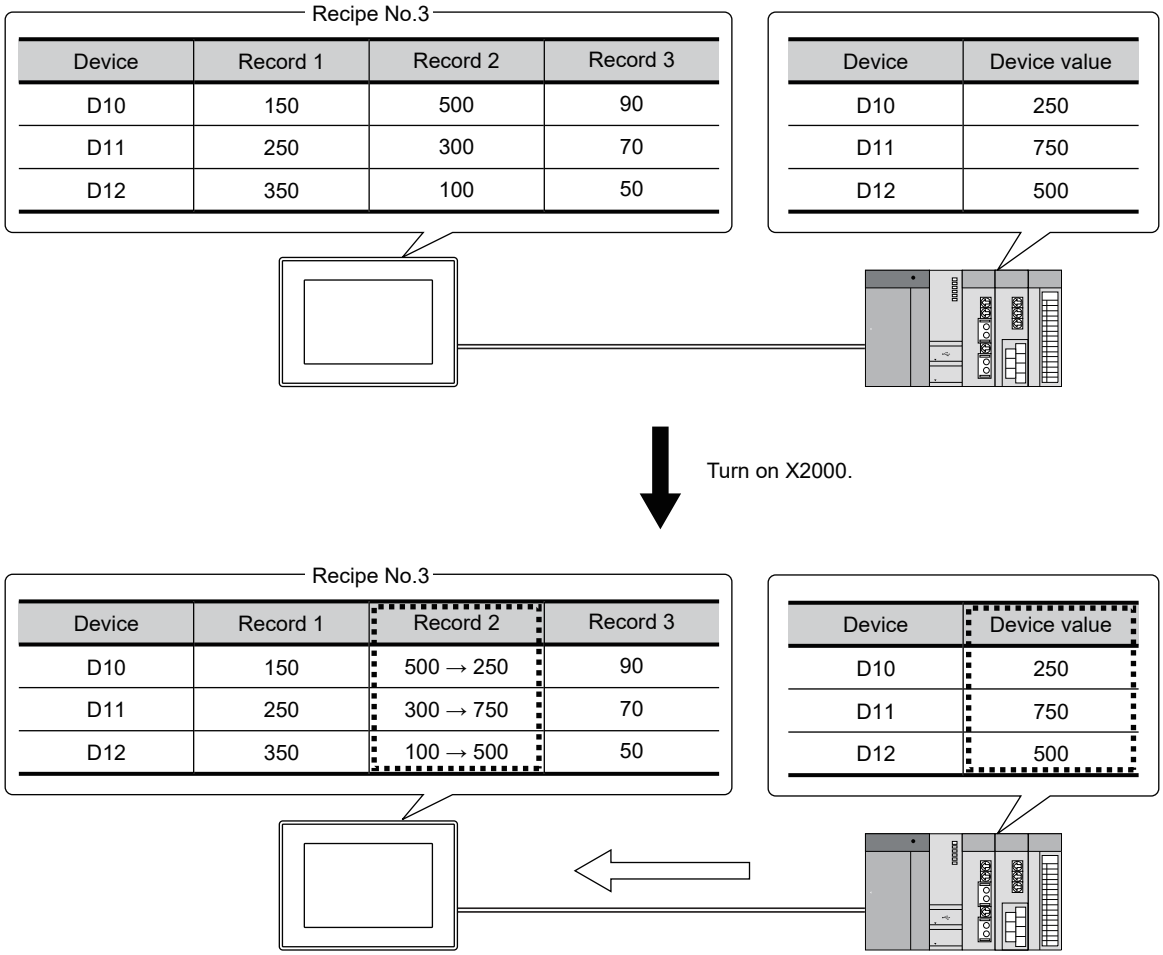
Then, satisfy the condition of the read trigger.

The values of the specified record will be overwritten with the values read from the target devices.

Ex.

Reading device values and overwriting record 2 on recipe No. 3

- [Read Trigger 1] of recipe No. 3: X2000 (Trigger condition: ON)
- [Record No. Device] of recipe No. 3: D1100 = 2



Point

For the operating specifications of the devices to control the recipe function, refer to the following.

☞ Page 2301 Control devices

Precautions for reading

■Reflecting the device values of a record to the project

The project holds the initial device values of records in a recipe setting.

Even if you change a device value of a record on the GOT, the change is not reflected to the project.

To reflect the value changed on the GOT to the project, use GT Designer3 to import the recipe file from the GOT to the project.

☞ Page 441 Reading the data from the GOT

☞ Page 2314 [Device] tab

■When reading cannot be executed

In the save destination, if a recipe file with the same name is already created for another recipe setting, reading device values cannot be executed.

Delete the recipe file from the save destination, then read device values.

66.3.5 Transferring recipe files to edit

GT37 SoftGOT3000

You can transfer recipe files to a personal computer to edit, and then transfer them back to the GOT to use.

The editing method depends on the recipe file format.

File format	Extension	Editing method
Binary format	*.G3P	To edit a recipe file on a personal computer, the file format needs to be converted to the CSV or Unicode text format. After editing the recipe file, convert the file format back to binary format (*.G3P) and use the file on the GOT. ☞ Page 2269 Converting a recipe file
CSV format	*.CSV	For a recipe file in CSV or Unicode text format, edit the file on a personal computer directly. For the precautions for using a CSV file or Unicode text file, refer to the following. ☞ Page 3668 Precautions for using CSV file ☞ Page 3669 Precautions for using Unicode text file
Unicode text format	*.TXT	

The following shows how to transfer a recipe file between the GOT and a personal computer.

☞ Page 2268 Transfer using a data storage

☞ Page 2268 Direct transfer between a personal computer and the GOT

For GT SoftGOT3000, you can manipulate the recipe files stored in virtual drives by using Windows Explorer or others.

For the structure of GT SoftGOT3000 virtual drives, refer to the following.

☞ Page 83 Drive configuration and capacity of GT SoftGOT3000

Point

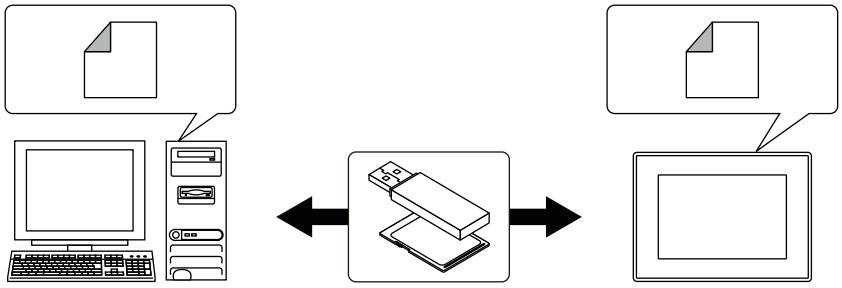
If the save destination of the recipe data is set to the nonvolatile RAM user area, no recipe file will be created. To edit the recipe data stored in the nonvolatile RAM user area on a personal computer, export the data to a recipe file.

☞ Page 2273 Exporting/importing recipe data

Transfer using a data storage

GT37 SoftGOT3000

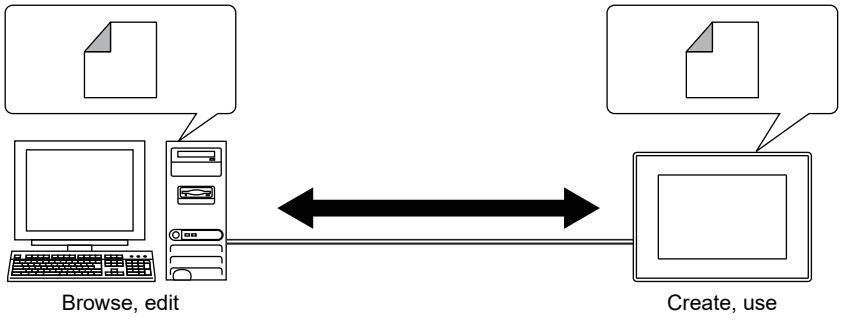
Install a data storage that contains a recipe file to a personal computer, and read the file.
Then, install the data storage that contains the edited recipe file to the GOT to use the file.



Direct transfer between a personal computer and the GOT

GT37 SoftGOT3000

Connect a personal computer and the GOT to transfer recipe files between them.



For information on how to connect the personal computer with the GOT, refer to the following.

☞ Page 420 Connecting a personal computer to the GOT

For the settings to write or read resource data, refer to the following.

☞ Page 465 [GOT Write] tab
☞ Page 472 [GOT Read] tab

66.3.6 Converting a recipe file

GT37 SoftGOT3000

The following methods are available for recipe file conversion.

Conversion method		Description
With a device	External control device (trigger device common in a project)	Use a trigger device to convert a recipe file on the GOT. Convert files one by one. The behavior when the trigger condition is satisfied varies depending on the recipe data save destination setting. ☞ Page 2269 Conversion with an external control device (trigger device common in a project)
In the utility		Convert a recipe file on the [Recipe information] screen on the GOT. Convert files one by one. The recipe data stored in the nonvolatile RAM user area cannot be converted. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
On a personal computer (GT Designer3)		Convert a recipe file on a personal computer. Multiple files can be converted at a time. Since the file is converted with GT Designer3, no processing load is put on the GOT. ☞ Page 2272 Conversion in GT Designer3

For precautions for recipe file conversion, refer to the following.

☞ Page 2272 Precautions for conversion

Conversion with an external control device (trigger device common in a project)

GT37 SoftGOT3000

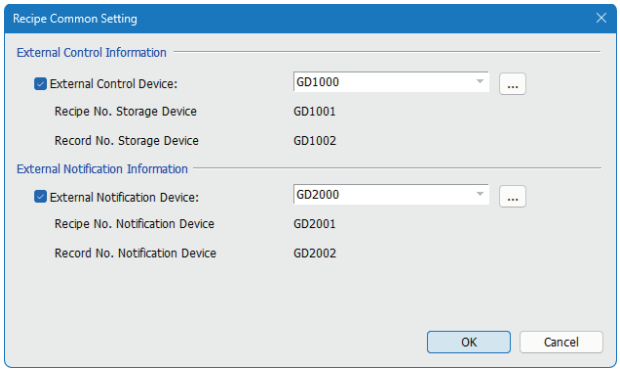
■Settings in GT Designer3

Set a trigger device used for conversion in the common setting.

Set the file format and save destination of conversion destination files for each recipe setting.

1. Select [Common] → [Recipe] → [Recipe Common Setting] from the menu to display the [Recipe Common Setting] dialog.

☞ Page 2309 [Recipe Common Setting] dialog



2. Select [External Control Device], set a device, and click the [OK] button.

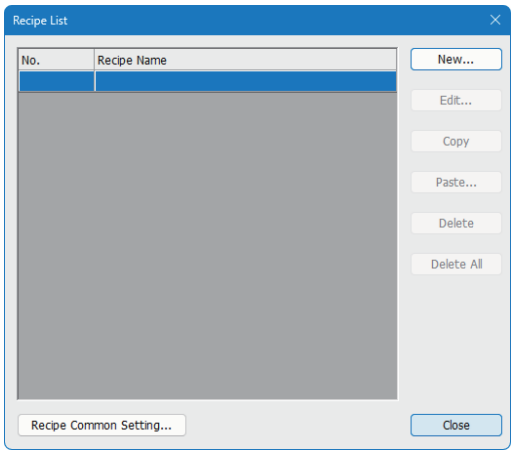
Consecutive devices, starting from the device set in [External Control Device], are automatically set in [Recipe No. Storage Device] and [Record No. Storage Device].

Bit 8 of the device set in [External Control Device] is set as the Convert Recipe File signal, and bit 9 is set as the Reverse-convert Recipe File signal.

☞ Page 2302 Functions of the external control device

3. Select [Common] → [Recipe] → [Recipe] from the menu to display the [Recipe List] dialog.

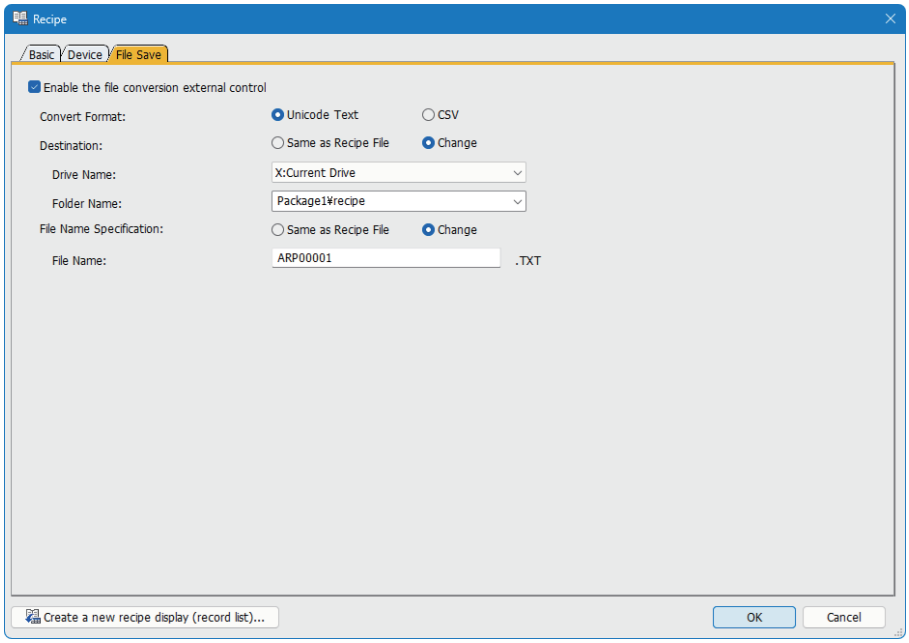
☞ Page 2310 [Recipe List] dialog



4. Perform either of the following operations to display the [Recipe] dialog.

- Click the [New] button.
- Select a recipe setting and click the [Edit] button.

☞ Page 2311 [Recipe] dialog



5. Set the following items in the [File Save] tab, and click the [OK] button.

Item	Description
[Enable the file conversion external control]	Select this item.
[Convert Format]	Select the file format to which a recipe file is converted.
[Destination]	Set this item as required.
[File Name Specification]	Set this item as required.

■Conversion operation (Recipe data save destination: data storage (recipe file))

Enter the recipe number of the recipe file to be converted in the Recipe No. Storage device.

When the trigger conditions are satisfied, the process is executed.

The trigger depends on the process to be executed.

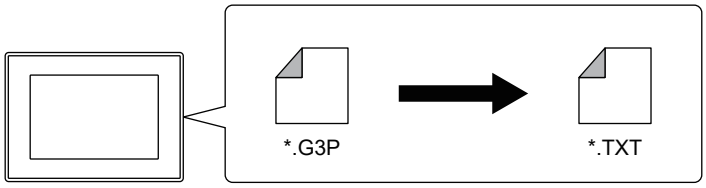
Process to be executed	Trigger
Conversion from the binary format (*.G3P) to the set file format	Turn on the Convert Recipe File signal (bit 8 of the external control device).
Conversion from the set file format to the binary format (*.G3P)	Turn on the Reverse-convert Recipe File signal (bit 9 of the external control device).

The conversion source file remains intact.

Ex.

Converting a recipe file (*.G3P) of recipe No. 5 to a Unicode text format file (*.TXT)

- [External Control Device]: D1000
- [Recipe No. Storage Device]: D1001 = 5



Turn on the Convert Recipe File signal (D1000.b8).

Point

For the operating specifications of the devices to control the recipe function, refer to the following.

☞ Page 2301 Control devices

■Conversion operation (Recipe data save destination: nonvolatile RAM user area)

Input the recipe number of the import or export source file into the Recipe No. Storage device.

When the trigger conditions are satisfied, the process is executed.

The trigger depends on the process to be executed.

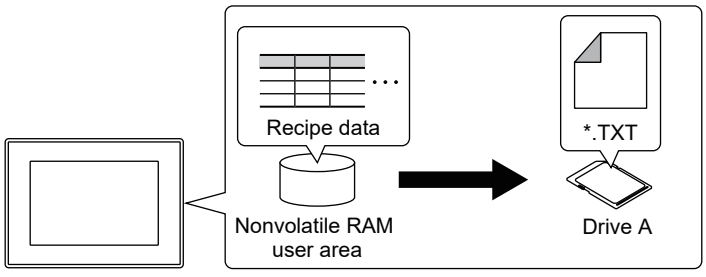
Process to be executed	Trigger
Export from the nonvolatile RAM user area to a recipe file	Turn on the Convert Recipe File signal (bit 8 of the external control device).
Import from a recipe file to the nonvolatile RAM user area	Turn on the Reverse-convert Recipe File signal (bit 9 of the external control device).

After an export operation, the source data remains in the Nonvolatile RAM user area.

Ex.

Exporting the data of recipe No. 5 from the nonvolatile RAM user area to a Unicode text file (*.TXT)

- [External Control Device]: D1000
- [Recipe No. Storage Device]: D1001 = 5



Turn on the Convert Recipe File signal (D1000.b8).

Point

For the operating specifications of the devices to control the recipe function, refer to the following.

☞ Page 2301 Control devices

Conversion in GT Designer3

GT37 SoftGOT3000

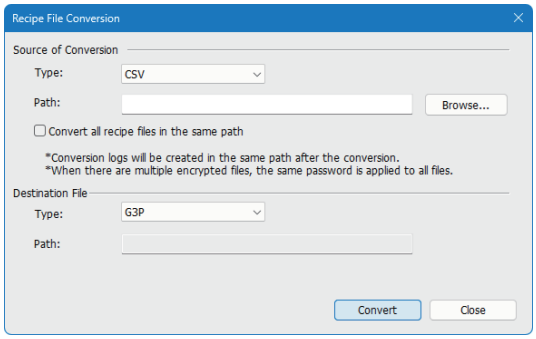
1. Transfer a recipe file to a personal computer from the GOT with one of the following methods.

- Transfer a recipe file with a data storage.
- Transfer a recipe file by connecting the personal computer with the GOT.

☞ Page 441 Reading the data from the GOT

2. Click [Tools] → [Resource Data Conversion] → [Recipe File] from the menu to display the [Recipe File Conversion] dialog.

☞ Page 2321 [Recipe File Conversion] dialog



3. Set the following items, and click the [Convert] button. The converted recipe file is stored in the destination set in [Path] of [Destination File].

The conversion source file remains intact.

Item		Description
[Source of Conversion]	[Type]	Select the file format of the conversion source file.
	[Path]	Set the storage location of the conversion source file.
[Destination File]	[Type]	Select the file format of the conversion destination file.
	[Path]	Set the storage location of the conversion destination file.

Precautions for conversion

■Character code and conversion destination file

If a device comment or record name contains any character other than ASCII and Shift JIS characters, convert the relevant file as shown below.

- Convert the file to Unicode text format.
- Convert the file to a CSV file by turning on GS522.b2.

When using GS522.b2, note the following.

☞ Page 3648 GOT special register (GS)

Precaution	Description
When using a CSV file as a recipe file	Use either of the following combinations. Otherwise, the relevant file is unreadable. • If a CSV file has been created while GS522.b2 is on, make sure that GS522.b2 is on when the file is used. • If a CSV file has been created while GS522.b2 is off, make sure that GS522.b2 is off when the file is used.
When converting a CSV file to a binary file	Use either of the following combinations for conversion. Otherwise, the relevant file cannot be converted. • If a binary file has been converted to a CSV file while GS522.b2 is on, make sure that GS522.b2 is on when the CSV file is converted to a binary file. • If a binary file has been converted to a CSV file while GS522.b2 is off, make sure that GS522.b2 is off when the CSV file is converted to a binary file.

66.3.7 Exporting/importing recipe data

GT37 SoftGOT3000

The recipe data stored in a recipe file or the nonvolatile RAM user area can be exported or imported.

Recipe data save destination	Export/import operation
[Data Storage (Recipe File)(read and write)]	The contents (recipe data) of a recipe file created in the data storage can be exported as a different recipe file. The exported recipe file can be edited and imported to reflect edits to the recipe file in the data storage.
[Embedded Memory in GOT (read and write)]	The recipe data saved in the nonvolatile RAM user area can be exported as a recipe file. The exported recipe file can be edited and imported to reflect edits to the recipe data in the nonvolatile RAM user area.

The following methods are available for exporting or importing recipe files.

Recipe data save destination	Operation method		Description
When [Data Storage (Recipe File)(read and write)] is set	With a special function switch (Recipe data operation)	Export	☞ Page 2274 When the save destination is set to the data storage (recipe file)
		Import	☞ Page 2276 When the save destination is set to the data storage (recipe file)
When [Embedded Memory in GOT (read and write)] is set	With a special function switch (Recipe data operation)	Export	☞ Page 2275 When the save destination is set to the nonvolatile RAM user area
		Import	☞ Page 2277 When the save destination is set to the nonvolatile RAM user area
	With a device	Export	☞ Page 2269 Conversion with an external control device (trigger device common in a project)
		Import	

For transfer or conversion of exported recipe files, refer to the following.

☞ Page 2267 Transferring recipe files to edit

☞ Page 2269 Converting a recipe file

Exporting a recipe file by using a special function switch (Recipe data operation)

GT37 SoftGOT3000

The behavior of the special function switch (Recipe data operation) varies depending on the recipe data save destination setting.

☞ Page 2274 When the save destination is set to the data storage (recipe file)
☞ Page 2275 When the save destination is set to the nonvolatile RAM user area

For the settings of the special function switch (Recipe data operation), refer to the following.

☞ Page 1246 Settings for [Recipe Data Operation]

■When the save destination is set to the data storage (recipe file)

This operation is available for a recipe file in the binary format (*.G3P) only.

When you touch a special function switch ([Switch Action]: [Recipe Data Operation]), the recipe data of the specified recipe number is saved to a specified folder as a recipe file.

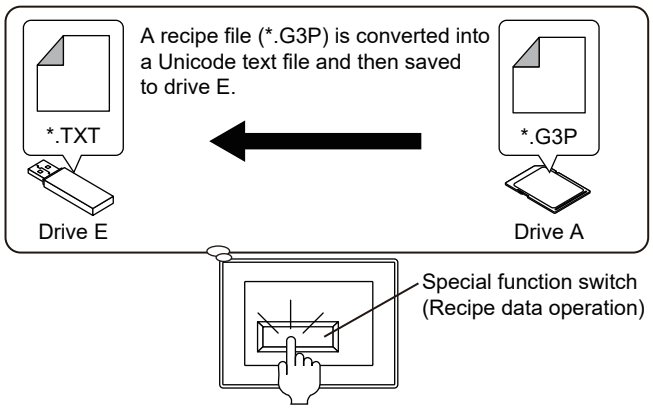
The export destination file must be in the binary format (*.G3P), CSV format (*.CSV), or Unicode text format (*.TXT).

When you specify the CSV format (*.CSV) or Unicode text format (*.TXT) for the export destination file, the export source file is converted to a specified file format and then saved on the GOT.

When you specify the binary format (*.G3P), the file is saved without conversion.

Ex.

When exporting a recipe file (*.G3P) in drive A to drive E



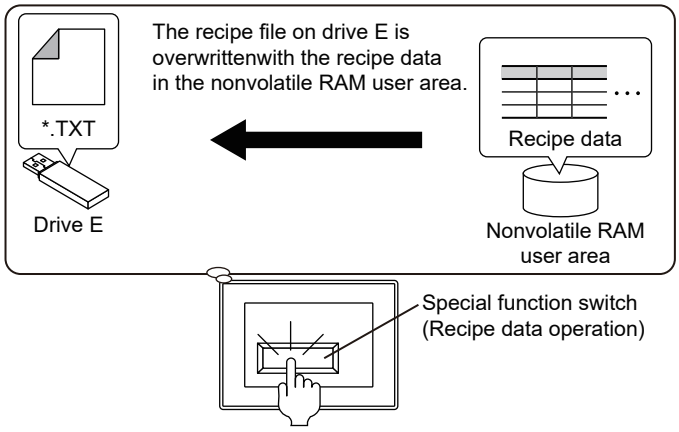
■When the save destination is set to the nonvolatile RAM user area

When you touch a special function switch ([Switch Action]: [Recipe Data Operation]), the recipe data in the nonvolatile RAM user area is saved to a recipe file in a specified folder.

The export destination file must be in the binary format (*.G3P), CSV format (*.CSV), or Unicode text format (*.TXT).

Ex.

When exporting the recipe data in the nonvolatile RAM user area to a recipe file (*.TXT) in drive E



Importing a recipe file by using a special function switch (Recipe data operation)

GT37 SoftGOT3000

The behavior of the special function switch (Recipe data operation) varies depending on the recipe data save destination setting.

☞ Page 2276 When the save destination is set to the data storage (recipe file)
☞ Page 2277 When the save destination is set to the nonvolatile RAM user area

For the settings of the special function switch (Recipe data operation), refer to the following.

☞ Page 1246 Settings for [Recipe Data Operation]

■When the save destination is set to the data storage (recipe file)

This operation is available for a recipe file in the binary format (*.G3P) only.

When you touch a special function switch ([Switch Action]: [Recipe Data Operation]), the recipe file (*.G3P) having the specified recipe number is overwritten with the data from the import source file.

The import source file must be in the binary format (*.G3P), CSV format (*.CSV), or Unicode text format (*.TXT).

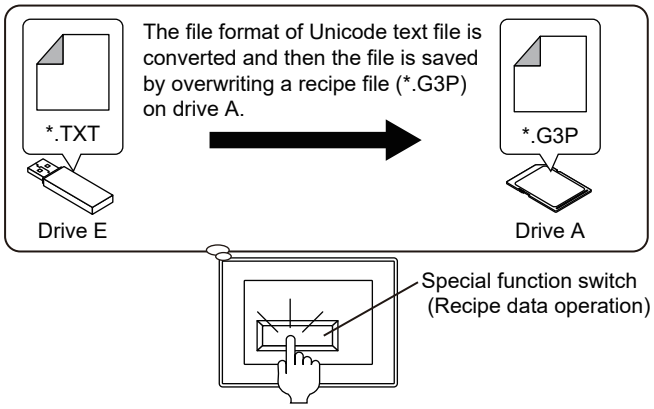
When you use an import source file in the CSV format (*.CSV) or Unicode text format (*.TXT), the file is converted to the binary format and then saved on the GOT.

(The conversion source file is not deleted.)

When you use an import source recipe file in the binary format (*.G3P), the file is saved without conversion.

Ex.

When importing a Unicode text file in drive E to a recipe file (*.G3P) in drive A



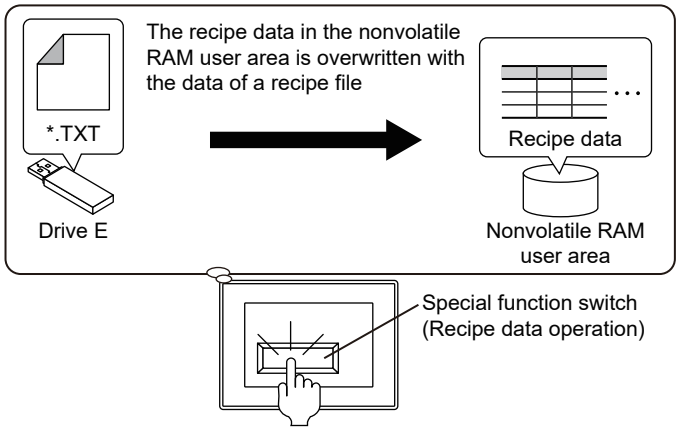
■When the save destination is set to the nonvolatile RAM user area

When you touch a special function switch ([Switch Action]: [Recipe Data Operation]), the recipe data in the nonvolatile RAM user area is overwritten with the data from the import source file.

The import source file must be in the binary format (*.G3P), CSV format (*.CSV), or Unicode text format (*.TXT).

Ex.

When importing a Unicode text file in drive E to the recipe data in the nonvolatile RAM user area



66.3.8 Operations with the recipe display (record list)

GT37 SoftGOT3000

The recipe display (record list) object lists the records of a recipe on the GOT.
The following operations are available on the object by using applicable key code switches.

Operation	Description
Renaming a record	Rename a record.
Read record	Read a record from the PLC.
Write record	Write a record to the PLC.
Verifying a record	Verify the device values of a record against those of the PLC.
Deleting a record	Delete a record.

For operating the recipe display (record list), refer to the following.
☞ Page 1550 Placing a recipe display (record list)
For information on how to link the recipe function with the recipe display (record list) by using GOT special registers, refer to the following.
☞ Page 2296 Link with the recipe display (record list) by using GOT special registers

66.3.9 Operations with the utility

GT37 SoftGOT3000

The following operations are available on the [Recipe information] screen in the utility.

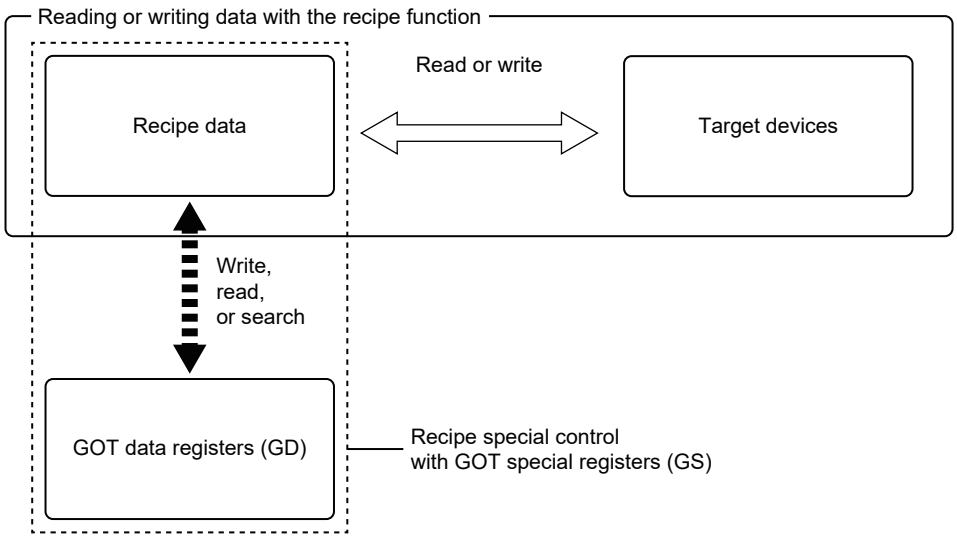
Operation	Description
Copying a file	Copies a recipe file.
Creating a folder	Creates a folder.
Renaming a file	Renames a recipe file.
Delete	Deletes a recipe file.
Moving a file	Moves a recipe file.

For operations on the [Recipe information] screen, refer to the following.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

66.3.10 Operations with GOT special registers (recipe special control)

GT37 SoftGOT3000

With the specific GOT special registers (GS), you can read a record from recipe data into GOT data registers (GD) or overwrite the values of a record with those of GDs.
This function is referred to as the recipe special control.
The recipe special control also enables you to check or edit the recipe data without routing a PLC.



The following lists the actions of the recipe special control.

Action		Description
Resetting notification devices		Reset the Recipe Special Control Result device (GS1011) and the Recipe Special Control No. device (GS1012) to 0. ☞ Page 2283 Resetting notification devices
Reading	Reading a record (in whole)	Read a record from the recipe data by specifying a record number. The read record will be stored into the specified GOT data registers (GD). ☞ Page 2283 Reading a record (in whole)
	Reading a record (in part)	Read part of the data in a record from the recipe data by specifying a record number and row. The read record will be stored into the specified GOT data registers (GD). ☞ Page 2284 Reading a record (in part)
	Reading device comments	This action is available when the save destination of the recipe data is set to the data storage (recipe file). Read the device comments from the recipe data. The read device comments will be stored into the specified GOT data registers (GD). ☞ Page 2285 Reading device comments
Writing	Writing a record (in whole)	Overwrite a record in the recipe data with the values of GOT data registers (GD) by specifying a record number. ☞ Page 2286 Writing a record (in whole)
	Writing a record (in part)	Overwrite a record in the recipe data with the values of GOT data registers (GD) by specifying a record number and target rows. ☞ Page 2287 Writing a record (in part)
	Writing device comments	This action is available when the save destination of the recipe data is set to the data storage (recipe file). Overwrite the device comments in the recipe data with the values of GOT data registers (GD). ☞ Page 2288 Writing device comments
Outputting recipe information		Output the following recipe information of a specified recipe setting: recipe No., recipe file format, recipe name, numbers of records, blocks, and rows, and total number of devices. ☞ Page 2289 Outputting recipe information
Searching	Performing a search by record name	Search recipe data for a record by record name. The record number of the matching record is stored in the Recipe Special Control No. device (GS1012). ☞ Page 2290 Performing a search by record name

For the list of GOT special registers (GS) used for the recipe special control, refer to the following.
☞ Page 2281 GOT special registers (GS) used for the recipe special control

Recipe data targeted for the recipe special control

The recipe special control is usable only for the recipe data saved in a data storage or the nonvolatile RAM user area.
To use the function, select either of the following for [Recipe Data Save Location] in the [Recipe] dialog ([Basic] tab).
☞ Page 2311 [Basic] tab

- [Data Storage (Recipe File)(read and write)]
- [Embedded Memory in GOT (read and write)]

Execution timing of the recipe special control

Execute the recipe special control when no recipe process is performed by the recipe function.

Precautions when using a text display or text input object

Under the recipe special control, recipe names, record names, or device comments are stored in Unicode.
They are stored starting from the least significant bit.
When a device storing the above data is used in a text display or text input object, configure the following settings in the setting dialog of the object.

- Select [Unicode] for [Character Code] in the [Device/Style] tab.
- Select [Display in order of High → Low] in the [Extended] tab.

GOT special registers (GS) used for the recipe special control

You can use the Recipe Special Control Action device (GS1801) to specify the control action, and turn on the Execute Special Control signal (GS1800.b2) to execute the control.

For some actions, you must preset values in GS1802 to GS1808 and the GOT data registers (GD).

The following lists the GOT special registers (GS) used for the recipe special control.

☞ Page 2281 Read device list

☞ Page 2282 Write device list

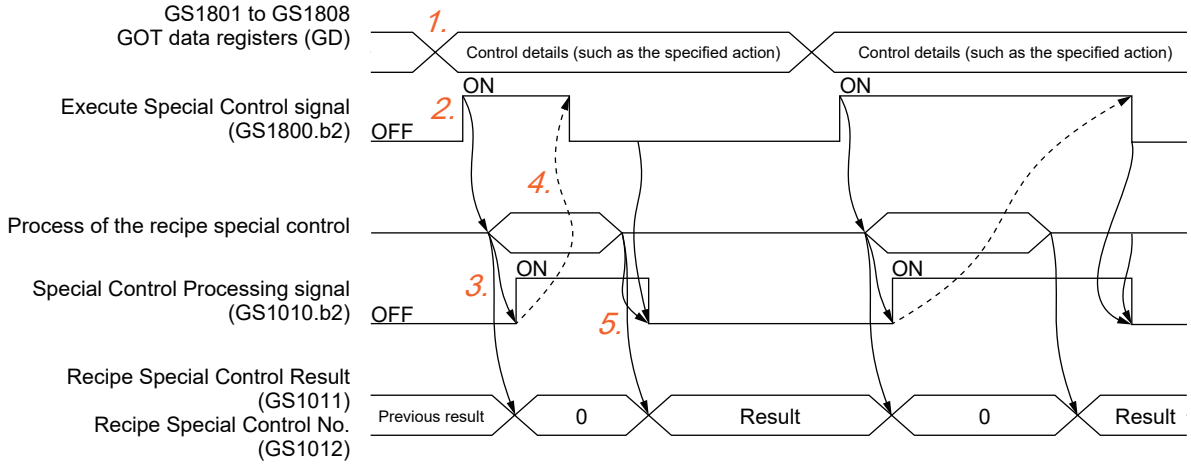
■Read device list

Device		Name	Function
GS1800	b0 to b1	Use prohibited	—
	b2	Execute Special Control Trigger signal	When this signal is turned on, the recipe special control is executed. Set the control details with GS1801 to GS1808. Execute the recipe special control when no recipe process is performed by the recipe function.
	b3 to b13	Use prohibited	—
	b14	Clear Touch Switch Operation Status Information signal	Not used
	b15	Use prohibited	—
GS1801		Recipe Special Control Action	Specify the control action. The action varies with the stored value. • 0: Resets the Recipe Special Control Result device (GS1011) and the Recipe Special Control No. device (GS1012) to 0. • 1: Reads a record from the target recipe data into GOT data registers (GD). • 2: Overwrites the values of a record in the target recipe data with the values of GOT data registers (GD). • 4: Outputs recipe information to GOT data registers (GD). • 5: Searches the target recipe data based on the values of GOT data registers (GD).
GS1802	b0	Control Record Information signal	When this signal is turned on, record information (record No., record attribute, and record name) is set as the control target.
	b1	Control Date of Update signal	When this signal is turned on, the update date and time of a record is set as the control target.
	b2	Control Record Data signal	When this signal is turned on, the device values of a record are set as the control target.
	b3	Control Device Comment signal	When this signal is turned on, device comments are set as the control target.
	b4 to b15	Use prohibited	—
GS1803		Recipe Special Control Start GD Device No.	Specify the start device number of the GOT internal devices (GD) to be used. The data type must be unsigned 16-bit binary.
GS1805		Recipe Special Control Recipe No.	Specify the recipe number of a target recipe setting.
GS1806		Recipe Special Control Record No.	Specify the record number of a target record.
GS1807		Recipe Special Control Row No.	Specify the start row of a record as necessary. Subtract 1 from a target row number, and then set the result. Example 1) To specify row number 1, set 0. Example 2) To specify row number 65536, set 65535.
GS1808		Recipe Special Control Points	Specify the number of target rows of a record as necessary. Starting from the row specified with GS1807, the specified number of rows are targeted for the recipe special control.

■Write device list

Device		Name	Function
GS1010	b0	Import-in-progress signal	Not used
	b1	Export-in-progress signal	Not used
	b2	Special Control Processing signal	Turns on when the recipe special control is executed. Turns off after the control is complete and the Execute Special Control signal (GS1800.b2) is turned off.
	b3 to b13	Use prohibited	—
	b14	Touch Switch Operation Completed signal	Not used
	b15	Touch Switch Operation Error signal	Not used
GS1011		Recipe Special Control Result	Stores the result of the recipe special control. • 0: Normal completion • Value other than 0: Error For details on errors, refer to the following. ☞ Page 2295 Error code list This device is reset to 0 upon turn-on of the Execute Special Control signal (GS1800.b2).
GS1012		Recipe Special Control No.	Stores a record number as the search result. This device is reset to 0 upon turn-on of the Execute Special Control signal (GS1800.b2).

To notify the completion of the recipe special control, check that the Special Control Processing signal (GS1010.b2) is on, and then turn off the Execute Special Control signal (GS1800.b2) to turn off GS1010.b2.



1. Preset values in GS1801 to GS1808 and the GOT data registers (GD) as necessary.

2. Turn on the Execute Special Control signal (GS1800.b2).

3. The recipe special control starts, and the Special Control Processing signal (GS1010.b2) turns on.

The Recipe Special Control Result device (GS1011) and the Recipe Special Control No. device (GS1012) are reset to 0.

4. Check that GS1010.b2 is on, and then turn off GS1800.b2 by using trigger actions or other methods.

5. Upon completion of the recipe special control, GS1010.b2 turns off.

GS1011 stores the result of the control.

If you execute the recipe special control to search for a record, GS1012 stores the search result.

Resetting notification devices

You can reset the Recipe Special Control Result device (GS1011) and the Recipe Special Control No. device (GS1012) to 0.
Set the Recipe Special Control Action device (GS1801) to 0, and then turn on the Execute Special Control signal (GS1800.b2).

Reading a record (in whole)

You can read the record information, date of update, and device values of a target record.
Set GS1801 to GS1808 as shown below, and then turn on the Execute Special Control signal (GS1800.b2).

Device		Set value	Function
GS1801		1	The device value must be set as shown on the left. to specify this action.
GS1802	b0	0, 1	When this bit is turned on, record information (record No., record attribute, and record name) is set to be read. (The record attribute refers to the settings of [Not to set the device value] and [Not to overwrite the device value in a recipe file].) Set this bit as necessary. You can set this bit together with GS1802.b1 and GS1802.b2.
	b1	0, 1	When this bit is turned on, the update date and time of a target record is set to be read. Set this bit as necessary. You can set this bit together with GS1802.b0 and GS1802.b2.
	b2	0, 1	When this bit is turned on, the device values of a target record are set to be read. Set this bit as necessary. You can set this bit together with GS1802.b0 and GS1802.b1.
	b3	0	The device value must be set as shown on the left.
GS1803		0 to 65535	Specify the start device number of the GOT internal devices (GD) that store the read data. Reserve the GOT internal devices (GD) according to the size of data to be read. • Record information: 34 word devices required • Date of update: 4 word devices required • Device values of a record: The required number of word devices varies with the device types and number of devices that are targeted for the control. For the specifications of storing data and each data size, refer to the following. ☞ Page 2291 Record information ☞ Page 2291 Date of update ☞ Page 2292 Device values of a record ☞ Page 2293 Reading record information, date of update, and device values of a target record simultaneously
GS1805		1 to 32767	Specify the recipe number of a target recipe setting.
GS1806		1 to 2000	Specify the record number of a target record.
GS1807		0	The device value must be set as shown on the left.
GS1808		0	The device value must be set as shown on the left. When this device stores 0, all the device values of a target record are read to the GOT data registers (GD).

When the save destination of the recipe data is set to the data storage (recipe file), the operation is as follows: if no recipe file exists in the data storage, a recipe file will be created automatically and the special recipe control will start.
If the recipe file format is set to [CSV] or [Unicode Text], the created file contains the specified record only.
After the control is complete, the Recipe Special Control Result device (GS1011) stores 0.
Stores a value other than 0 if an error occurs.
For the error codes and corrective actions, refer to the following.
☞ Page 2295 Error code list

Reading a record (in part)

You can read the record information, date of update, and device values of a target record.

The values in the specified rows of the record are read.

Set GS1801 to GS1808 as shown below, and then turn on the Execute Special Control signal (GS1800.b2).

Device		Set value	Function
GS1801		1	The device value must be set as shown on the left. to specify this action.
GS1802	b0	0, 1	When this bit is turned on, record information (record No., record attribute, and record name) is set to be read. (The record attribute refers to the settings of [Not to set the device value] and [Not to overwrite the device value in a recipe file].) Set this bit as necessary. You can set this bit together with GS1802.b1 and GS1802.b2.
	b1	0, 1	When this bit is turned on, the update date and time of a target record is set to be read. Set this bit as necessary. You can set this bit together with GS1802.b0 and GS1802.b2.
	b2	1	The device value must be set as shown on the left. When this bit is turned on, the device values of a target record are set to be read. You can set this bit together with GS1802.b0 and GS1802.b1.
	b3	0	The device value must be set as shown on the left.
GS1803		0 to 65535	Specify the start device number of the GOT internal devices (GD) that store the read data. Reserve the GOT internal devices (GD) according to the size of data to be read. • Record information: 34 word devices required • Date of update: 4 word devices required • Device values of a record: The required number of word devices varies with the device types and number of devices that are targeted for the control. For the specifications of storing data and each data size, refer to the following. ☞ Page 2291 Record information ☞ Page 2291 Date of update ☞ Page 2292 Device values of a record ☞ Page 2293 Reading record information, date of update, and device values of a target record simultaneously
GS1805		1 to 32767	Specify the recipe number of a target recipe setting.
GS1806		1 to 2000	Specify the record number of a target record.
GS1807		0 to 65535	Specify the start row to be read. Subtract 1 from a target row number, and then set the result.
GS1808		1 to 65535	Set the number of rows to be read.

When the save destination of the recipe data is set to the data storage (recipe file), the operation is as follows: if no recipe file exists in the data storage, a recipe file will be created automatically and the special recipe control will start.

If the recipe file format is set to [CSV] or [Unicode Text], the created file contains the specified record only.

After the control is complete, the Recipe Special Control Result device (GS1011) stores 0.

Stores a value other than 0 if an error occurs.

For the error codes and corrective actions, refer to the following.

☞ Page 2295 Error code list

Reading device comments

You can read device comments.

This operation is available when the save destination of the recipe data is set to the data storage (recipe file).

Note that device comments must be read independently of the other data (such as record information).

If the target recipe file is in the binary format (*.G3P), the device comments are read from the file.

If the target recipe file is in the CSV or Unicode text format (*.CSV or *.TXT), the device comments are read from the corresponding recipe setting in the project.

Set GS1801 to GS1808 as shown below, and then turn on the Execute Special Control signal (GS1800.b2).

Device		Set value	Function
GS1801		1	The device value must be set as shown on the left. to specify this action.
GS1802	b0	0	The device value must be set as shown on the left.
	b1	0	The device value must be set as shown on the left.
	b2	0	The device value must be set as shown on the left.
	b3	1	The device value must be set as shown on the left. When this bit is turned on, device comments are set to be read. You cannot set this bit together with GS1802.b0, GS1802.b1, and GS1802.b2.
GS1803		0 to 65535	Specify the start device number of the GOT internal devices (GD) that store the read data. Reserve the GOT internal devices (GD) according to the size of data to be read. • Device comment: 32 word devices × specified number of rows For the specifications of storing data and each data size, refer to the following. ☞ Page 2293 Device comment
GS1805		1 to 32767	Specify the recipe number of a target recipe setting.
GS1806		1 to 2000	Specify the record number of a target record.
GS1807		0 to 65535	Specify the start row to be read. Subtract 1 from a target row number, and then set the result.
GS1808		1 to 65535	Set the number of rows to be read.

If you execute the recipe special control for a recipe setting without the corresponding recipe file, a recipe file is created automatically and then the control starts. (Only when the recipe file format is set to [G3P (Binary)])

After the control is complete, the Recipe Special Control Result device (GS1011) stores 0.

Stores a value other than 0 if an error occurs.

For the error codes and corrective actions, refer to the following.

☞ Page 2295 Error code list

Writing a record (in whole)

You can overwrite record information (record name only) and device values of a target record.

Store the write source data in GOT data registers (GD).

Set GS1801 to GS1808 as shown below, and then turn on the Execute Special Control signal (GS1800.b2).

Device		Set value	Function
GS1801		2	The device value must be set as shown on the left. to specify this action.
GS1802	b0	0, 1	When this bit is turned on, record information (record name only) is set to be overwritten. Set this bit as necessary. You can set this bit together with GS1802.b1 and GS1802.b2.
	b1	0, 1	This bit is disabled because the date of update cannot be overwritten.
	b2	0, 1	When this bit is turned on, the device values of a target record are set to be overwritten. Set this bit as necessary. You can set this bit together with GS1802.b0 and GS1802.b1.
	b3	0	The device value must be set as shown on the left.
GS1803		0 to 65535	Specify the start device number of the GOT data registers (GD) that store the write source data. Store the write source data in the GOT data registers (GD) according to the specifications of storing data. • Record information: 34 word devices required • Date of update: 4 word devices required • Device values of a record: The required number of word devices varies with the device types and number of devices that are targeted for the control. For the specifications of storing data and each data size, refer to the following. ☞ Page 2291 Record information ☞ Page 2291 Date of update ☞ Page 2292 Device values of a record ☞ Page 2293 Reading record information, date of update, and device values of a target record simultaneously
GS1805		1 to 32767	Specify the recipe number of a target recipe setting.
GS1806		1 to 2000	Specify the record number of a target record.
GS1807		0	The device value must be set as shown on the left.
GS1808		0	The device value must be set as shown on the left. When this device stores 0, all the device values of a target record are overwritten.

When the save destination of the recipe data is set to the data storage (recipe file), the operation is as follows: if no recipe file exists in the data storage, a recipe file will be created automatically and the special recipe control will start.

If the recipe file format is set to [CSV] or [Unicode Text], the created file contains the specified record only.

The date and time at which the device values of a record are overwritten is stored as the update date and time of the record.

If [Not to overwrite the device value in a recipe file] is selected in the record attribute setting, overwriting the device values results in an error. (If both record information and device values are set to be overwritten, record information is also not overwritten.)

After the control is complete, the Recipe Special Control Result device (GS1011) stores 0.

Stores a value other than 0 if an error occurs.

For the error codes and corrective actions, refer to the following.

☞ Page 2295 Error code list

Writing a record (in part)

You can overwrite record information (record name only) and device values of a target record.
The values in the specified rows of the record are written.
Store the write source data in GOT data registers (GD).
Set GS1801 to GS1808 as shown below, and then turn on the Execute Special Control signal (GS1800.b2).

Device		Set value	Function
GS1801		2	The device value must be set as shown on the left. to specify this action.
GS1802	b0	0, 1	When this bit is turned on, record information (record name only) is set to be overwritten. Set this bit as necessary. You can set this bit together with GS1802.b1 and GS1802.b2.
	b1	0, 1	This bit is disabled because the date of update cannot be overwritten.
	b2	1	The device value must be set as shown on the left. When this bit is turned on, the device values of a target record are set to be overwritten. You can set this bit together with GS1802.b0 and GS1802.b1.
	b3	0	The device value must be set as shown on the left.
GS1803		0 to 65535	Specify the start device number of the GOT data registers (GD) that store the write source data. Store the write source data in the GOT data registers (GD) according to the specifications of storing data. • Record information: 34 word devices required • Date of update: 4 word devices required • Device values of a record: The required number of word devices varies with the device types and number of devices that are targeted for the control. For the specifications of storing data and each data size, refer to the following. ☞ Page 2291 Record information ☞ Page 2291 Date of update ☞ Page 2292 Device values of a record ☞ Page 2293 Reading record information, date of update, and device values of a target record simultaneously
GS1805		1 to 32767	Specify the recipe number of a target recipe setting.
GS1806		1 to 2000	Specify the record number of a target record.
GS1807		0 to 65535	Specify the start row to be written. Subtract 1 from a target row number, and then set the result.
GS1808		1 to 65535	Set the number of rows to be written.

When the save destination of the recipe data is set to the data storage (recipe file), the operation is as follows: if no recipe file exists in the data storage, a recipe file will be created automatically and the special recipe control will start.
If the recipe file format is set to [CSV] or [Unicode Text], the created file contains the specified record only.
The date and time at which the device values of a record are overwritten is stored as the update date and time of the record.
If [Not to set the device value] is selected in the record attribute setting, the device values in the unspecified rows are overwritten with 0.
If [Not to overwrite the device value in a recipe file] is selected in the record attribute setting, overwriting the device values results in an error. (If both record information and device values are set to be overwritten, record information is also not overwritten.)
After the control is complete, the Recipe Special Control Result device (GS1011) stores 0.
Stores a value other than 0 if an error occurs.
For the error codes and corrective actions, refer to the following.
☞ Page 2295 Error code list

Writing device comments

You can overwrite device comments.

This operation is available when the save destination of the recipe data is set to the data storage (recipe file).

Note that device comments must be overwritten independently of the other data (such as record information).

To overwrite device comments, satisfy all the following conditions.

- A binary recipe file (*.G3P) is used.
- [Include device comments in conversion target] is selected when a recipe file in the CSV or Unicode text format is converted back to the binary format.

Store the write source data in GOT data registers (GD).

Set GS1801 to GS1808 as shown below, and then turn on the Execute Special Control signal (GS1800.b2).

Device		Set value	Function
GS1801		2	The device value must be set as shown on the left. to specify this action.
GS1802	b0	0	The device value must be set as shown on the left.
	b1	0	The device value must be set as shown on the left.
	b2	0	The device value must be set as shown on the left.
	b3	1	The device value must be set as shown on the left. When this bit is turned on, device comments are set to be overwritten. You cannot set this bit together with GS1802.b0, GS1802.b1, and GS1802.b2.
GS1803		0 to 65535	Specify the start device number of the GOT data registers (GD) that store the write source data. Store the write source data in the GOT data registers (GD) according to the specifications of storing data. • Device comment: 32 word devices × specified number of rows For the specifications of storing data and each data size, refer to the following. ☞ Page 2293 Device comment
GS1805		1 to 32767	Specify the recipe number of a target recipe setting.
GS1806		1 to 2000	Specify the record number of a target record.
GS1807		0 to 65535	Specify the start row to be written. Subtract 1 from a target row number, and then set the result.
GS1808		1 to 65535	Set the number of rows to be written.

If you execute the recipe special control for a recipe setting without the corresponding recipe file, a recipe file is created automatically and then the control starts. (Only when the recipe file format is set to [G3P (Binary))

After the control is complete, the Recipe Special Control Result device (GS1011) stores 0.

Stores a value other than 0 if an error occurs.

For the error codes and corrective actions, refer to the following.

☞ Page 2295 Error code list

Outputting recipe information

You can output information on the specified recipe setting.

Set GS1801 to GS1808 as shown below, and then turn on the Execute Special Control signal (GS1800.b2).

Device	Set value	Function
GS1801	4	The device value must be set as shown on the left. to specify this action.
GS1803	0 to 65535	Specify the start device number of the GOT internal devices (GD) that store the read data. Reserve the GOT internal devices (GD) according to the size of data to be read. • Record information: 40 word devices required For the specifications of storing data and each data size, refer to the following. ☞ Page 2294 Recipe information
GS1805	1 to 32767	Specify the recipe number of a target recipe setting.
GS1806	0	The device value must be set as shown on the left.
GS1807	0	The device value must be set as shown on the left.
GS1808	0	The device value must be set as shown on the left.

After the control is complete, the Recipe Special Control Result device (GS1011) stores 0.

Stores a value other than 0 if an error occurs.

For the error codes and corrective actions, refer to the following.

☞ Page 2295 Error code list

Performing a search by record name

You can search for a record that has the specified record name.

When the target recipe files are in the CSV or Unicode text format (*.CSV or *.TXT), each file contains one record only. Each time the recipe file corresponding to a record is not found, the specified recipe setting in the project is searched.

Set GS1801 to GS1808 as shown below, and then turn on the Execute Special Control signal (GS1800.b2).

Device		Set value	Function
GS1801		5	The device value must be set as shown on the left. to specify this action.
GS1802	b0	1	The device value must be set as shown on the left. When this bit is turned on, a record having the specified record name is searched for.
	b1	0	The device value must be set as shown on the left.
	b2	0	The device value must be set as shown on the left.
	b3	0	The device value must be set as shown on the left.
GS1803		0 to 65535	Specify the start device number of the GOT data registers (GD) that store the record name for search. Store the name in the GOT data registers (GD) according to the specifications of storing data. • Record name for search: 32 word devices required For the specifications of storing data and each data size, refer to the following. ☞ Page 2294 Record name for search
GS1805		1 to 32767	Specify the recipe number of a target recipe setting.
GS1806		0 to 2000	Specify the record number of a record from which a search starts. The search is performed in ascending order of the record numbers. When this device stores 0, the search starts from record No.1.
GS1807		0	The device value must be set as shown on the left.
GS1808		0	The device value must be set as shown on the left.

When the save destination of the recipe data is set to the data storage (recipe file), the operation is as follows: if no recipe file exists in the data storage, a recipe file will be created automatically and the special recipe control will start.

(Only when the recipe file format is set to [G3P (Binary))

Upon completion of the control, the Recipe Special Control Result device (GS1011) and the Recipe Special Control No. device (GS1012) store a value according to the search result.

- If the matching record is found, GS1011 stores 1, and GS1012 stores the record number.
- If no matching record is found, GS1011 and GS1012 each store 0.

If an error occurs, GS1011 stores a value other than 0 and 1.

For the error codes and corrective actions, refer to the following.

☞ Page 2295 Error code list

If a recipe file in the CSV or Unicode text format (*.CSV or *.TXT) causes an error during a search, the Recipe Special Control No. device (GS1012) stores the record number of the recipe file.

If the error has been caused by any other reason, GS1012 stores 0.

Specifications of storing data in GOT data registers (GD)

When you execute the recipe special control to read data, the GOT data registers (GD) store the read data as shown below.
Store the write source data to the GOT data registers (GD) in the same manner.

☞ Page 2291 Record information
☞ Page 2291 Date of update
☞ Page 2292 Device values of a record
☞ Page 2293 Reading record information, date of update, and device values of a target record simultaneously
☞ Page 2293 Device comment
☞ Page 2294 Recipe information
☞ Page 2294 Record name for search

■Record information

To store record information, reserve 34 word devices.

Ex.
Start device: GD1000

GD1000	Record No.
GD1001	Record attribute
GD1002	Record name
⋮	
GD1033	

} 34 word devices

Order	Stored data	Details
Start device	Record No.	This device is disabled and skipped at the time of writing data.
2nd device	Record attribute	• b0: With or without initial device values (0: With, 1: Without) • b1: Writable or write-protect (0: Writable, 1: Write-protect) • b2 to b15: Use prohibited This device is disabled and skipped at the time of writing data.
3rd device to the 33rd device	Record name	The data is stored in Unicode. If a record name has less than 32 characters, the name is stored with a termination character (0) appended. If a record name has 32 characters, the name is stored with no termination character appended.

■Date of update

To store the date of update, reserve four word devices.

Ex.
Start device: GD1000

GD1000	Month and year
GD1001	Day and hour
GD1002	Minute and second
GD1003	Day of the week

} 4 word devices

Order	Stored data	Details
Start device	Month and year	• b8 to b15: Year (Data type: BCD) • b0 to b7: Month (Data type: BCD) This device is disabled and skipped at the time of writing data.
2nd device	Date and hour	• b8 to b15: Date (Data type: BCD) • b0 to b7: Hour (Data type: BCD) This device is disabled and skipped at the time of writing data.
3rd device	Minute and second	• b8 to b15: Minute (Data type: BCD) • b0 to b7: Second (Data type: BCD) This device is disabled and skipped at the time of writing data.
4th device	Day of the week	• b8 to b15: Use prohibited • b0 to b7: Day of the week (0: Sunday, 1: Monday, 2: Tuesday, 3: Wednesday, 4: Thursday, 5: Friday, 6: Saturday) This device is disabled and skipped at the time of writing data.

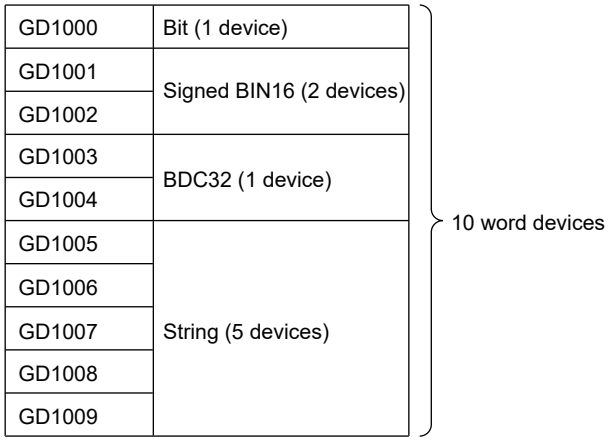
■Device values of a record

For storing the device values of a record, the required number of word devices varies with the device types and number of devices in the record.

The device values of a record are stored in the order specified in the recipe setting.

Ex.

Start device: GD1000, Bit: 1 device, Signed BIN16: 2 devices, BCD32: 1 device, String: 5 devices



Device type	Required number of word devices	Details
Bit	1	Only the value of bit 0 is applied.
Signed 8-bit binary	1	—
Unsigned 8-bit binary	1	—
Signed 16-bit binary	1	—
Unsigned 16-bit binary	1	—
Signed 32-bit binary	2	—
Unsigned 32-bit binary	2	—
Signed 64-bit binary	4	—
Unsigned 64-bit binary	4	—
16-bit binary-coded decimal	1	—
32-bit binary-coded decimal	2	—
64-bit binary-coded decimal	4	—
Real number (32-bit)	2	—
Real number (64-bit)	4	—
String	Specified number of devices	The specified number of word devices are used. Data is stored in the specified character code.

■Reading record information, date of update, and device values of a target record simultaneously

The record information, date of update, and device values are stored in that order.

Ex.

Reading record information, date of update, and device values of a record with the start device GD1000

Record information	GD1000	Record No.	34 word devices
	GD1001	Record attribute	
	GD1002	Record name	
	⋮		
	GD1033		
Date of update	GD1034	Month and year	4 word devices
	GD1035	Day and hour	
	GD1036	Minute and second	
	GD1037	Day of the week	
Device values of a record	GD1038	Bit (1 device)	10 word devices
	GD1039	Signed BIN16 (2 devices)	
	GD1040		
	GD1041	BDC32 (1 device)	
	GD1042		
	GD1043	String (5 devices)	
	GD1044		
	GD1045		
	GD1046		
	GD1047		

■Device comment

To store one device comment, reserve 32 word devices. For two or more device comments, multiply 32 word devices by the specified number of rows.

Ex.

Start device: GD1000, specified number of rows: 5

GD1000	Device comment (1st row)	160 word devices
⋮		
GD1031		
⋮	⋮	
GD1128	Device comment (5th row)	
⋮		
GD1159		

Order	Stored data	Details
Start device to the 32nd device	Device comment	Storing one device comment requires 32 word devices.

The data is stored in Unicode.

■Recipe information

To store recipe information, reserve 40 word devices.

Ex.

Start device: GD1000

GD1000	Recipe No.	40 words
GD1001	File format	
GD1002	Recipe name	
⋮		
GD1033		
GD1034	Number of records	
GD1035	Number of blocks	
GD1036	Number of rows	
GD1037		
GD1038	Total number of devices	
GD1039		

Order	Stored data	Details
Start device	Recipe No.	—
2nd device	File format	Recipe file format • 0: Does not use a recipe file. • 1: Binary format (*.G3P) • 2: CSV format (*.CSV) • 3: Unicode text format (*.TXT)
3rd device to the 34th device	Recipe name	The data is stored in Unicode. If a record name has less than 32 characters, the name is stored with a termination character (0) appended. If a record name has 32 characters, the name is stored with no termination character appended.
35th device	Number of records	—
36th device	Number of blocks	—
37th and 38th devices	Number of rows	Number of rows of the recipe setting
39th and 40th devices	Total number of devices	Total number of devices of the recipe setting

■Record name for search

To store a record name for search, reserve 32 word devices.

Ex.

Start device: GD1000

GD1000	Record name for search	32 word devices
⋮		
GD1031		

Order	Stored data	Details
Start device to the 32nd device	Record name for search	The data is stored in Unicode. The stored record name (including the termination character (0)) is used as the search criterion.

Error code list

The following lists the error codes that are stored in the Recipe Special Control Result device (GS1011) and the corrective actions.

Error code	Cause and corrective action
-1	Any of the set values in GS1801 to GS1808 is incorrect. Correct the set values.
322	The specified device number is outside the device range for GOT data registers (GD). Specify a device number within the device range.
345	A binary-to-BCD conversion error occurred. Make sure that the data types of the target device values are the same as the device types set in the recipe setting.
575	Device comments cannot be overwritten because the recipe file is not in the binary format (*.G3P) or [Include device comments in conversion target] is not selected in the [Recipe] dialog ([Basic] tab). Select [Include device comments in conversion target] in the recipe setting in the project.
576	The specified row number is nonexistent. Specify an existent row number.
581	An invalid recipe file exists. Delete the invalid recipe file.
582	Creating a recipe file has failed. Check that the following conditions are satisfied, and then execute the recipe special control again. • A data storage is installed on the GOT. • The SD card cover is closed. • The SD card access switch is turned on. • The installed data storage has enough free space.
583	Writing data to the target recipe file has failed. Check that the following conditions are satisfied, and then execute the recipe special control again. • The data storage is not write-protected. • The recipe file is not write-protected.
584	Writing data to the target recipe file has failed. Do not remove the data storage during the recipe special control. For saving recipe data to the nonvolatile RAM user area, consult your local sales office.
585	Reading data from the target recipe file has failed. Do not remove the data storage during the recipe special control. For saving recipe data to the nonvolatile RAM user area, consult your local sales office.
586	The specified recipe number is nonexistent. Specify an existent recipe number.
587	The specified record number is nonexistent. Specify an existent record number.
588	The target record cannot be overwritten because the record is write-protected. Disable the write protection for the target record in the recipe setting in the project, or specify another writable record.
589	The recipe special control cannot be executed because the target recipe setting is set not to use a recipe file. Execute the recipe special control for a recipe setting that is set to use a recipe file.
591	The contents of the target recipe file do not match the source recipe setting. Correct the recipe setting in the project, and then write the data to the GOT again.

66.3.11 Link with the recipe display (record list) by using GOT special registers

GT37 SoftGOT3000

The following GOT special registers store information of the recipe display (record list).

GOT special register (GS)	Description
GS1013	Stores the recipe number for the records displayed on the recipe display (record list).
GS1014	Stores the record number selected on the recipe display (record list).

With GS1013 and GS1014, you can specify a recipe number and a record number on the recipe display (record list), and perform operations such as the following.

- Write the values of GS1013 and GS1014 to the PLC CPU devices (Recipe No. Storage device and Record No. Storage device specified in the recipe common setting), and run a sequence program to turn on the trigger device of the target recipe process.
- Write the values of GS1013 and GS1014 to the GOT special registers (GS1805 and GS1806), and turn on the trigger device of the recipe special control.

For the recipe common setting, refer to the following.

☞ Page 2309 [Recipe Common Setting] dialog

For the recipe special control, refer to the following.

☞ Page 2279 Operations with GOT special registers (recipe special control)

Application example

Execute the recipe special control to read the device values of the record selected on the recipe display (record list), and display the read values on numerical display objects.

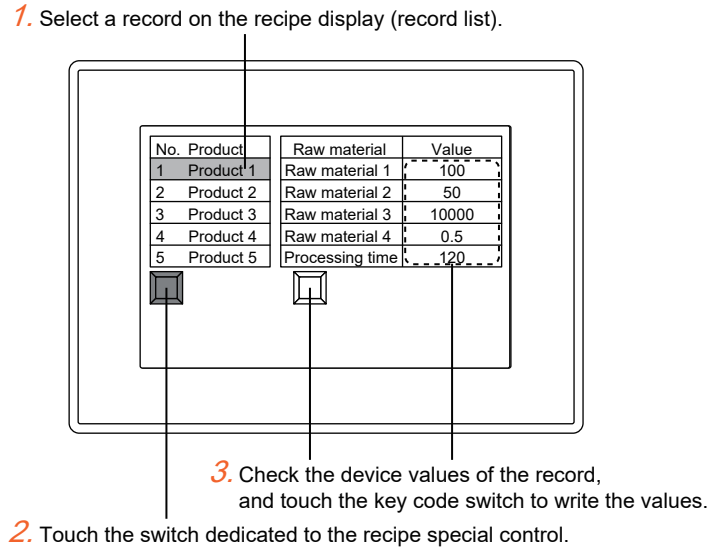
Check the values on numerical display objects, and write the values to target devices.

■Settings in GT Designer3

Place the following objects on the screen.

Object	Description
Switch	Inputs data to the GOT special registers (GS1801 to GS1803, GS1807, and GS1808), and executes the recipe special control. Set the following actions to run in top-to-bottom order as shown below. • [Word Set]: Write 1 to GS1801. • [Word Set]: Write the start device number of GOT data registers (GD) to GS1803. (The start device number is user-configurable, and the GD devices store the device values of a record.) • [Word Set]: Write the value of GS1013 to GS1805. • [Word Set]: Write the value of GS1014 to GS1806. • [Word Set]: Write 0 to GS1807. • [Word Set]: Write 0 to GS1808. • [Bit Set]: Turn on GS1802.b2. • [Bit Reset]: Turn off GS1802.b0. • [Bit Reset]: Turn off GS1802.b1. • [Bit Reset]: Turn off GS1802.b3. • [Bit Momentary]: Turn on GS1800.b2 while the switch is being touched.
Key code switch	Writes the device values of a record to target devices. Use the applicable key code switch that is placed automatically upon placement of the recipe display (record list). When placing the applicable key code switch manually, configure the following settings. • Select [Recipe Display (Record List)] for [Key Code Type]. • Select [Load record] for [Action].
Numerical display	Displays a device value of the record that has been read by the recipe special control. Place numerical displays corresponding to the number of target devices. Set the numerical displays according to the types of devices in the record.
Recipe display (record list)	On this object, select a recipe number and a record number that are targeted for the recipe special control. In [Recipe No.], specify a target recipe number.

■Operation on the GOT



1. On the recipe display (record list), select a record to write its device values to target devices.
2. Touch the switch dedicated to the recipe special control to display the device values of the selected record on the numerical displays.
3. Check the displayed values, and touch the applicable key code switch to write the values to target devices.

66.3.12 Using a GOT2000 recipe file (*.G2P)

GT37 SoftGOT3000

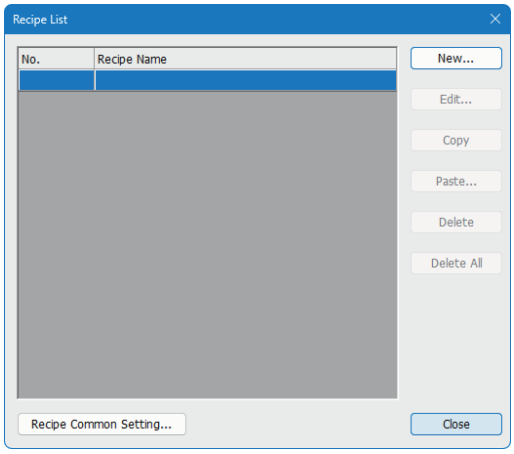
You can use a GOT2000 recipe file (*.G2P) to create a GOT3000 recipe file (*.G3P).

Settings in GT Designer3

Set the following with GT Designer3 (GOT3000) according to the recipe file (*.G2P) used.

1. Select [Common] → [Recipe] → [Recipe] from the menu to display the [Recipe List] dialog.

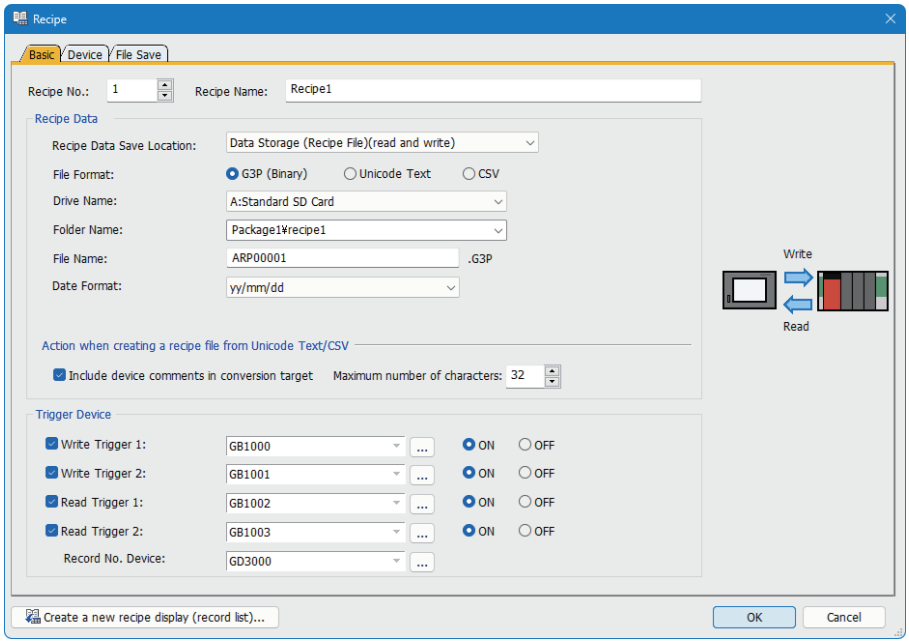
☞ Page 2310 [Recipe List] dialog



2. Perform either of the following operations to display the [Recipe] dialog.

- Click the [New] button.
- Select a recipe setting and click the [Edit] button.

☞ Page 2311 [Recipe] dialog



3. Set the following items in the [Basic] tab.

Item	Description
[Recipe Data Save Location]	Select [Data Storage (Recipe File)(read and write)].
[File Format]	Select [G3P (Binary)].
[File Name]	Enter the same file name as the recipe file (*.G2P) used.
[Include device comments in conversion target]	Set this item as required. • Selected: The device comments of a recipe file (*.G2P) are used. • Deselected: The device comments set in the [Devices] tab are used.

4. Set the following items in the [Device] tab according to the recipe file (*.G2P) used, and click the [OK] button.

- [Block Number]
- [Record Number]
- [Device Type] of each block
- [Points] of each block

Preparation on a personal computer

Store the recipe file (*.G2P) in the location, which is set in [Folder Name] in the [Basic] tab of the [Recipe] dialog.

Do not store a recipe file (*.G3P) in the same location.

If a recipe file (*.G3P) has already existed, another recipe file (*.G3P) is not created.

Operation on the GOT

When writing or reading with a trigger device (external control device or trigger device of each recipe setting) is executed, a GOT3000 recipe file (*.G3P) is created based on a recipe file (*.G2P).

The recipe file (*.G2P) remains intact.

The following settings of the recipe file (*.G2P) are applied to the created recipe file (*.G3P).

Item to be applied	Remarks
Number of blocks	—
Number of records	—
Device type	—
Points	—
Device comment	The device comments of a recipe file (*.G2P) are applied when [Include device comments in conversion target] is selected in the [Recipe] dialog ([Basic] tab). ☞ Page 2311 [Basic] tab
Record name	—
Record update time	If no time zone is specified, the time difference from UTC is none. ☞ Page 642 [Local Time] tab
Record attribute	—
Device values of a record	—

Precautions for using an advanced recipe file

■When the settings of a recipe file (*.G2P) are not applied

In the following cases, a recipe file (*.G3P) is created during GOT operation based on a recipe setting in GT Designer3 (GOT3000) instead of a recipe file (*.G2P).

- The recipe file (*.G2P) to be used is not stored in the location, which is set in [Folder Name] in the [Recipe] dialog ([Basic] tab).
- The recipe settings in GT Designer3 (GOT3000) are inconsistent with those of the recipe file (*.G2P) to be used.
- The recipe file to be used is corrupted.

■Applying the recipe file (*.G3P) created based on a recipe file (*.G2P)

The recipe file (*.G3P) can be used with GOT3000 only.

It cannot be used as GOT2000 recipe file (*.G2P).

■Saving recipe data into the nonvolatile RAM user area

You cannot save a recipe file (*.G2P) directly into the nonvolatile RAM user area.

Create a recipe file (*.G3P) based on a recipe file (*.G2P), and then import data from the created file to the nonvolatile RAM user area.

For information on how to import data from a recipe file (*.G3P) to the nonvolatile RAM user area, refer to the following.

☞ Page 2269 Converting a recipe file

66.4 Control and notification with devices

GT37 SoftGOT3000

For the recipe function, devices are used to control or notify the following operations.

- Writing and reading device values and converting files
- Notifying the status of processing such as writing and reading device values and converting files

☞ Page 2301 Control devices
☞ Page 2305 Notification devices

66.4.1 Control devices

The following shows the devices used to write or read device values or convert files.

○: Available, —: Not available

Control devices	Control details			Description
	Writing device values	Reading device values	Converting a recipe file	
External control device (trigger device common in a project)	○	○	○	This device is shared among all the recipe settings in one project. Set this device in [External Control Device] in the [Recipe Common Setting] dialog. ☞ Page 2309 [Recipe Common Setting] dialog Each bit of the device set as the external control device is used as the write or read trigger device. For the function of each bit, refer to the following. ☞ Page 2302 Functions of the external control device
Trigger device of each recipe setting	○	○	—	The trigger device to be set for each recipe setting. Set this device in the [Basic] tab in the [Recipe Settings] dialog. ☞ Page 2311 [Basic] tab

Point

To control operations without using devices, refer to the following.

☞ Page 2259 Writing device values
☞ Page 2263 Reading device values
☞ Page 2269 Converting a recipe file

☞ Page 2302 Functions of the external control device
☞ Page 2303 Priority when multiple trigger conditions are satisfied simultaneously
☞ Page 2304 Trigger judgment when the same trigger condition is repeatedly satisfied
☞ Page 2304 Timing to change the writing or reading target after a trigger condition is satisfied
☞ Page 2304 When a trigger condition is satisfied while the [Recipe information] screen is being displayed

Functions of the external control device

The following table lists the functions of each bit of the device set in [External Control Device].

When a bit device is set, a function is assigned to each of the 16 bits starting from the top.

Bit number	Signal name	Function	
b0	Recipe-shared Trigger Write signal	When this signal turns on, values are written to the target devices by using the recipe setting and record specified with [Recipe No. Storage Device] and [Record No. Storage Device].	
b1	Recipe-shared Trigger Read signal	When this signal turns on, values are read from the target devices by using the recipe setting and record specified with [Recipe No. Storage Device] and [Record No. Storage Device].	
b2 to b7	Use prohibited	—	
b8	Convert Recipe File signal	The operation varies depending on the recipe data save destination setting.	
		For the data storage (recipe file)	When this bit turns on, the recipe file (*.G3P) corresponding to the recipe data specified with [Recipe No. Storage Device] is converted to a CSV or Unicode text file. Set the file format of the conversion destination file in the [File Save] tab in the [Recipe] dialog. If a recipe file having the same name exists, the recipe file is overwritten.
		For the nonvolatile RAM user area	When this bit turns on, the recipe data specified with [Recipe No. Storage Device] is exported to a recipe file. Set the file format of the export destination file in the [File Save] tab in the [Recipe] dialog. If a recipe file having the same name exists, the recipe file is overwritten.
b9	Reverse-convert Recipe File signal	The operation varies depending on the recipe data save destination setting.	
		For the data storage (recipe file)	When this bit turns on, the recipe file (CSV or Unicode text format) corresponding to the recipe data specified with [Recipe No. Storage Device] is converted to a binary file (*.G3P). Set the file format of the conversion source file in the [File Save] tab in the [Recipe] dialog. If a recipe file having the same name exists, the recipe file is overwritten.
		For the nonvolatile RAM user area	When this bit turns on, the recipe data specified with [Recipe No. Storage Device] is imported from the relevant recipe file to the nonvolatile RAM user area. Set the import source file in the [File Save] tab in the [Recipe] dialog.
b10 to b14	Use prohibited	—	
b15	Clear Recipe Processing Error signal	When this signal turns on, the Recipe Processing Error Notification signal (External notification device.b15) turns off.	

Priority when multiple trigger conditions are satisfied simultaneously

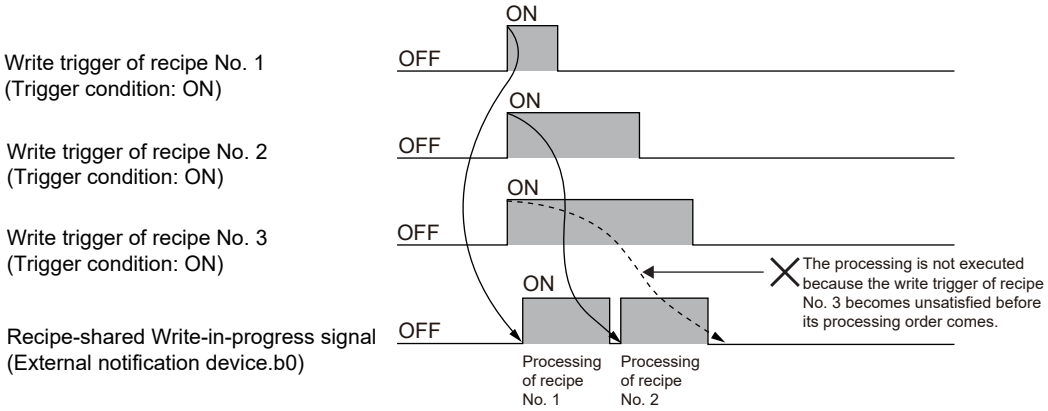
When trigger conditions for writing, reading, and file conversion are satisfied simultaneously, the processes are executed in the following order.

Priority	Trigger device		
High ↕ Low	Trigger device of each recipe setting	Recipe No. 1	Read trigger device
			Write trigger device
		:	:
		Recipe No. 32767	Read trigger device
			Write trigger device
	External control device (trigger device common in a project)	Read trigger device	
		Write trigger device	
		Trigger File Conversion device	

If a satisfied trigger condition becomes unsatisfied before the processing order comes, the process is not executed.

Ex.

When the trigger condition becomes unsatisfied before the writing process of recipe No. 3 is executed



■How to make sure that the processing for the simultaneously-satisfied triggers are executed

To make sure that the processing for the simultaneously-satisfied triggers are executed, set the trigger devices for each recipe setting as follows.

Multiple recipes can be processed sequentially by turning on and off one device.

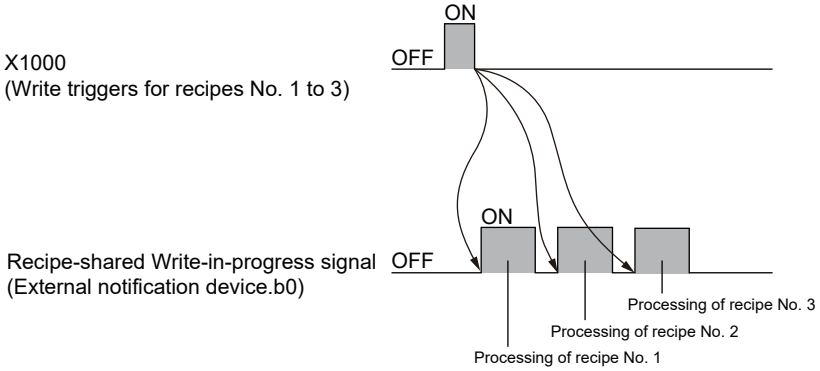
- Set the conditions to satisfy the trigger devices to "OFF". (A trigger condition is satisfied when a device turns off.)
- Set the same device as the trigger devices of multiple recipe settings.

☞ Page 2311 [Basic] tab

Ex.

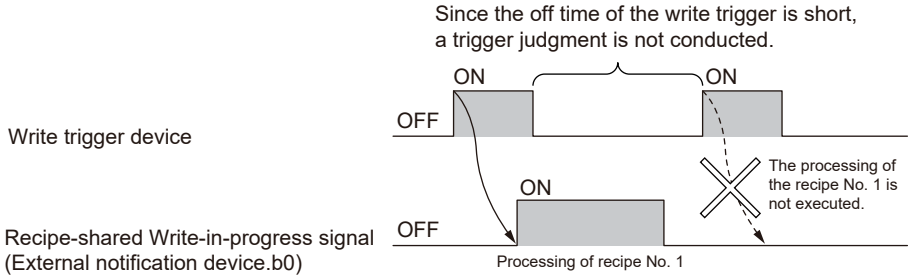
Executing the writing processes of recipe No. 1 to 3 sequentially

- [Write Trigger 1] of recipe No. 1 to 3: X1000
- Trigger condition of [Write Trigger 1] of recipe No. 1 to 3: [OFF]



Trigger judgment when the same trigger condition is repeatedly satisfied

A trigger judgment is conducted each and every time a trigger condition is satisfied.
When the state of a trigger condition changes from satisfied to unsatisfied to satisfied, a trigger judgment is conducted again.
When the time while the trigger condition is not satisfied is too short, the trigger cannot be detected as its condition is not satisfied. Therefore, the recipe may not be processed.



Timing to change the writing or reading target after a trigger condition is satisfied

Before changing the writing or reading target (such as the recipe number and the record number), confirm that the writing or reading process are complete with the following signals.

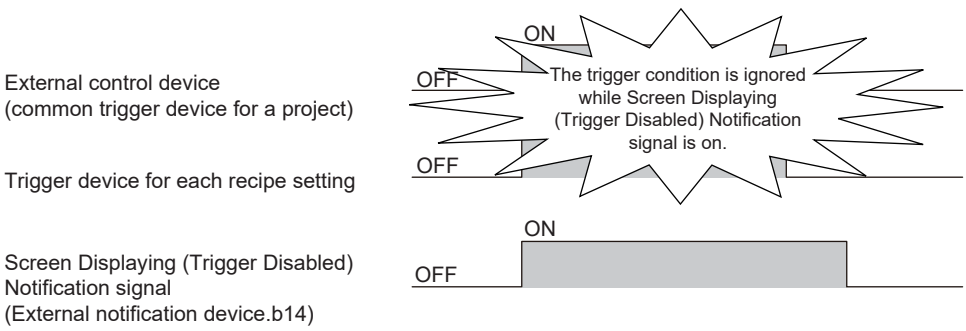
- For the writing process: Recipe-shared Write Completed signal (External notification device.b4)
- For the reading process: Recipe-shared Read Completed signal (External notification device.b5)

If you change the target before the corresponding signal turns on, a next writing or reading process may not be executed properly.

When a trigger condition is satisfied while the [Recipe information] screen is being displayed

The trigger devices for writing, reading, and file conversion are ignored while the [Recipe information] screen is being displayed.
You can check the display status of the [Recipe information] screen with Screen Displaying (Trigger Disabled) Notification signal (External notification device.b14).

☞ Page 2305 Functions of the external notification device



66.4.2 Notification devices

The following shows the devices used to notify the status of processing such as writing or reading of device values and file conversion.

Notification devices	Description
External notification device	This device is shared among all the recipe settings in one project. Set this device in [External Notification Device] in the [Recipe Common Setting] dialog. ☞ Page 2309 [Recipe Common Setting] dialog Each bit of the device set as the external notification device is used as the write or read processing status notification signal. For the function of each bit, refer to the following. ☞ Page 2305 Functions of the external notification device
System information	Notifies that the writing or reading process started by the following trigger devices is in progress. • Recipe-shared Trigger Write signal (External control device.b0) • Recipe-shared Trigger Read signal (External control device.b1) • Write trigger device of each recipe setting • Write trigger device of each recipe setting For details on the system information, refer to the following. ☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

☞ Page 2305 Functions of the external notification device
☞ Page 2307 Operation example of the external notification device
☞ Page 2308 Difference between the external notification device and system information
☞ Page 2308 Handshake by the notification signal

Functions of the external notification device

The following table lists the functions of each bit of the device set in [External Notification Device].

When a bit device is set, a function is assigned to each of the 16 bits starting from the top.

For the operation example of each bit, refer to the following.

☞ Page 2307 Operation example of the external notification device

For a handshake established using the notification signal, refer to the following.

☞ Page 2308 Handshake by the notification signal

Bit number	Signal name	Function
b0	Recipe-shared Write-in-progress signal	Turns on while the Recipe-shared Trigger Write signal (External control device.b0) is on or values are being written with the write trigger device of each recipe setting. Turns off when all of the following conditions are satisfied. • The writing process is complete. • The Recipe-shared Trigger Write signal (External control device.b0) is off, or the write trigger condition of each recipe setting is not satisfied.
b1	Recipe-shared Read-in-progress signal	Turns on when the Recipe-shared Trigger Read signal (External control device.b1) is on or values are being read with the read trigger device of each recipe setting. Turns off when all of the following conditions are satisfied. • The reading processing is complete. • The Recipe-shared Trigger Read signal (External control device.b1) is off, or the read trigger condition of each recipe setting is not satisfied.
b2 to b3	Use prohibited	—
b4	Recipe-shared Write Completed signal	Turns on when the Recipe-shared Trigger Write signal (External control device.b0) is on, or the writing process with the write trigger device of each recipe setting is complete. Turns off when a next writing or reading process starts.
b5	Recipe-shared Read Completed signal	Turns on when the Recipe-shared Trigger Read signal (External control device.b1) is on, or the reading process with the read trigger device of each recipe setting is complete. Turns off when a next writing or reading process starts.
b6 to b7	Use prohibited	—
b8	Recipe File Converting Notification signal	Turns on when the file conversion is started by the Convert Recipe File signal (External control device.b8). Turns off when all of the following conditions are satisfied. • The file conversion is complete. • The Convert Recipe File signal (External control device.b8) is off.

Bit number	Signal name	Function
b9	Recipe File Reverse-converting Notification signal	Turns on when the file conversion is started by the Reverse-convert Recipe File signal (External control device.b9). Turns off when all of the following conditions are satisfied. • The file reverse conversion is complete. • The Reverse-convert Recipe File signal (External control device.b9) is off.
b10	Recipe File Conversion Error Notification signal	Turns on at the end of the file conversion started by the Convert Recipe File signal (External control device.b8), if an error occurs during the conversion and the target file is not converted properly. Turns off when a next conversion of a recipe file starts.
b11	Recipe File Reverse-conversion Error Notification signal	Turns on at the end of the file conversion started by the Reverse-convert Recipe File signal (External control device.b9), if an error occurs during the conversion and the target file is not converted properly. Turns off when a next reverse conversion of a recipe file starts.
b12	Recipe Processing (Trigger Disabled) Notification signal	Turns on during either of the following processing and notifies that the operations (including file conversion) from external control devices cannot be performed. • Recipe processing (including reading of recipe information for display) from the recipe display (record list) • Import/export of a recipe file using a special function switch Turns off when the above processing is completed.
b13	Recipe File Reverse-conversion Warning Error Notification signal	Turns on at the end of the file conversion started by the Reverse-convert Recipe File signal (External control device.b9), if any of the following mismatches is found between the recipe setting and the target recipe file at the conversion. • Recipe setting [Include device comments in conversion target] is not selected in the [Basic] tab in the [Recipe] dialog. ☞ Page 2311 [Basic] tab • Recipe file [DEVCMT_CNV] (number of characters in the device comment to be converted) is input in the edited recipe file. ☞ Page 2252 Configuration of the recipe file Turns off when a next reverse conversion of a recipe file starts.
b14	Screen Displaying (Trigger Disabled) Notification signal	Turns on while the [Recipe information] screen is being displayed and notifies that the operations (including file conversion) from external control devices cannot be performed. Turns off when the [Recipe Information] screen disappears.
b15	Recipe Processing Error Notification signal	Turns on if an error occurs during the recipe process (such as writing or reading) started by an external control device and the process is performed improperly. A system alarm occurs when this signal turns on. Check the message and remove error causes. After the error causes are removed, even if this signal is on, the recipe process (writing or reading) can be performed. One of the following operations turns off this signal. • Turn on the Clear Recipe Processing Error signal (External control device.b15). • Start another process with the external control device.

Operation example of the external notification device

The following shows the ON/OFF timing of each signal.

Ex.

Behavior of the signal at writing

Status	Behavior
When the process ends successfully	When the process ends abnormally	
Difference between the external notification device and system information

The following shows differences between the external notification device and system signal, both of which notify the recipe processing status.

To establish a handshake, use the external notification device.

☞ Page 2308 Handshake by the notification signal

■External notification device

Signal	Condition for the signal to be turned on	Condition for the signal to be turned off
Recipe-shared Write-in-progress signal (External notification device.b0)	Turns on during the writing process started by the following trigger devices. • Recipe-shared Trigger Write signal (External control device.b0) • Write trigger device of each recipe setting	Turns off when all of the following conditions are satisfied. • The writing process is complete. • The Recipe-shared Trigger Write signal (External control device.b0) is off, or the write trigger condition of each recipe setting is not satisfied.
Recipe-shared Read-in-progress signal (External notification device.b1)	Turns on during the reading process started by the following trigger devices. • Recipe-shared Trigger Read signal (External control device.b1) • Write trigger device of each recipe setting	Turns off when all of the following conditions are satisfied. • The reading processing is complete. • The Recipe-shared Trigger Read signal (External control device.b1) is off, or the read trigger condition of each recipe setting is not satisfied.

■System information

Signal	Condition for the signal to be turned on	Condition for the signal to be turned off
System signal 2-1.b10	Turns on during the writing or reading process started by the following trigger devices. • Recipe-shared Trigger Write signal (External control device.b0) • Recipe-shared Trigger Read signal (External control device.b1) • Write trigger device of each recipe setting • Write trigger device of each recipe setting	Turns off when the writing or reading process is complete, regardless of the status of the trigger device.

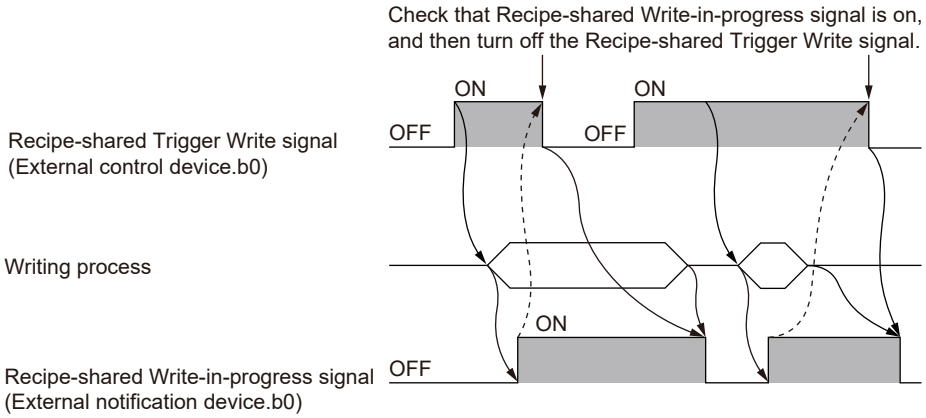
Handshake by the notification signal

To ensure that a process is performed, use the notification signal to establish a handshake.

Ex.

Handshake established by the Recipe-shared Write-in-progress signal (External notification device.b0)

Confirm that the Recipe-shared Write-in-progress signal (External notification device.b0) is on. Then, turn off the Recipe-shared Trigger Write signal (External control device.b0) to ensure that the writing process is performed.

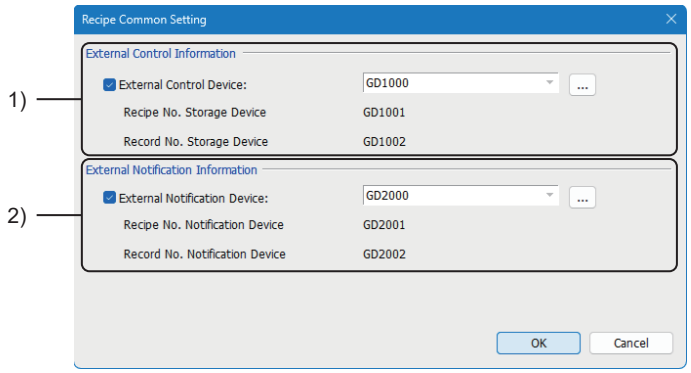


66.5 [Recipe Common Setting] dialog

GT37 SoftGOT3000

Set devices for controlling the recipe function.

Select [Common] → [Recipe] → [Recipe Common Setting] from the menu to display the following dialog.



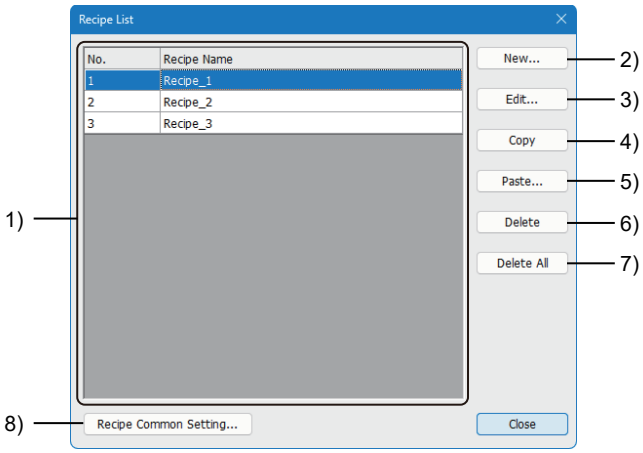
Item			Description
1)	[External Control Information]	—	Enable the device setting to control the writing and reading processes. This setting is common to all the recipe settings in a project.
		[External Control Device]	Controls the writing and reading of device values, and the file format conversion. You can specify a word device or word-specified bit device. The device set in [External Notification Device] cannot be set here. ☞ Page 2302 Functions of the external control device
		[Recipe No. Storage Device]	Specifies the target recipe number when the device set in [External Control Device] controls the writing and reading of device values and the file conversion. One of the consecutive devices starting from the device set in [External Control Device] is set automatically.
		[Record No. Storage Device]	Specifies the target record number when the device set in [External Control Device] controls the writing and reading of device values and the file conversion. One of the consecutive devices starting from the device set in [External Control Device] is set automatically.
2)	[External Notification Information]	—	Enable the device setting to output the execution status of a recipe, including a recipe process error.
		[External Notification Device]	Notifies the execution status of writing or reading device values. You can specify a word device or word-specified bit device. The device set in [External Control Device] cannot be set here. ☞ Page 2305 Functions of the external notification device
		[Recipe No. Notification Device]	Stores the recipe number of a recipe being processed by the trigger device. One of the consecutive devices starting from the device set in [External Notification Device] is set automatically.
		[Record No. Notification Device]	Stores the record number of a recipe being processed by the trigger device. One of the consecutive devices starting from the device set in [External Notification Device] is set automatically.

66.6 [Recipe List] dialog

GT37 SoftGOT3000

Displays the list of the recipe settings and manages the settings.

Select [Common] → [Recipe] → [Recipe] from the menu to display the following dialog.



Item			Description
1)	Recipe setting list	—	List of recipe settings in a project
		[No.]	Recipe number of each recipe setting
		[Recipe Name]	Recipe name of each recipe setting
2)	[New] button		Displays the [Recipe] dialog. Create a recipe setting. ☞ Page 2311 [Recipe] dialog
3)	[Edit] button		Displays the [Recipe] dialog. to edit a recipe setting selected in the recipe setting list. ☞ Page 2311 [Recipe] dialog
4)	[Copy] button		Copies a recipe setting selected in the recipe setting list.
5)	[Paste] button		Displays the [Copy Recipe Setting] dialog. Create a recipe setting by using a copied recipe setting.  Set the recipe number of a recipe setting, which is created by using a copied recipe setting. The setting range is [1] to [32767].
6)	[Delete] button]		Deletes a recipe setting selected in the recipe setting list.
7)	[Delete All] button		Deletes all the recipe settings.
8)	[Recipe Common Setting] button		Displays the [Recipe Common Setting] dialog. ☞ Page 2309 [Recipe Common Setting] dialog

66.7 [Recipe] dialog

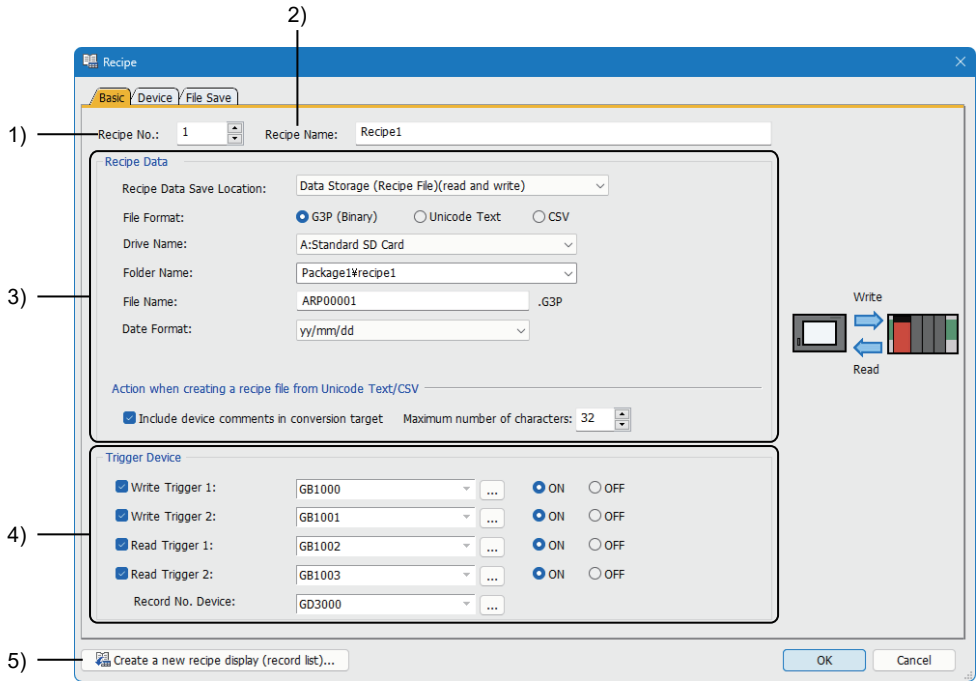
GT37 SoftGOT3000

☞ Page 2311 [Basic] tab
☞ Page 2314 [Device] tab
☞ Page 2320 [File Save] tab

66.7.1 [Basic] tab

GT37 SoftGOT3000

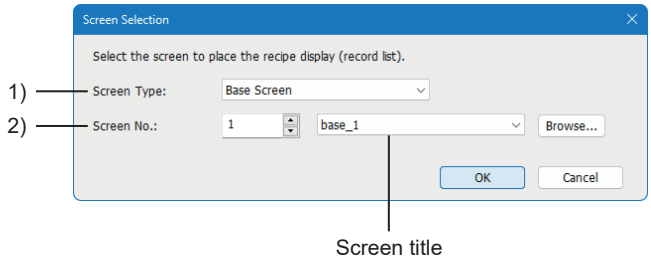
Configure the recipe file setting and set the write and read trigger devices.



Item		Description
1)	[Recipe No.]	Set the recipe number of a recipe setting. The setting range is [1] to [32767]. ☞ Page 2246 Contents of a recipe setting
2)	[Recipe Name]	Set the name of a recipe setting. Up to 32 characters can be set.

Item			Description
3)	[Recipe Data]	—	Configure the settings to save recipe data. ☞ Page 2250 Specifications of the recipe file
		[Recipe Data Save Location]	Set the destination to save recipe data. The recipe data is handled differently depending on the save destination setting. For details, refer to the following. ☞ Page 2249 Recipe data
		[File Format]	Set this item when [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)]. Select a file format of the recipe file. ☞ Page 2251 Recipe file format
		[Drive Name]	Set this item when [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)]. Select a drive at which a recipe file is located on the GOT.
		[Folder Name]	Set this item when [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)]. Specify a folder to which a recipe file is saved on the GOT. For the restrictions on the folder name used in the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT When [File Format] is set to [Unicode Text] or [CSV], recipe files are created for each record. It is recommended to specify different folders to save each recipe file.
			Do not specify the same save destination on the GOT for recipe files and for files of other functions (such as the alarm function). Only recipe files can be displayed or operated on the [Recipe information] screen in the utility. When a recipe file and a file of other functions are stored in the same folder, the folder cannot be deleted on the [Recipe information] screen.
		[File Name]	Set this item when [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)]. Set the name of a recipe file. For the restrictions of the file name used in the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
		[Date Format]	Set this item when [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)] or [Embedded Memory in GOT (read and write)]. Select a date format in which the record update date is displayed.
		[Include device comments in conversion target]	Set this item when [File Format] is set to [G3P (Binary)]. Enables editing of device comments when a binary recipe file (*.G3P) is converted to a Unicode text or CSV file. Includes device comments in the conversion target when a recipe file is converted back to a binary file (*.G3P).
		[Maximum number of characters]	Set this item when [Include device comments in conversion target] is selected. Set the number of conversion target characters in a device comment when a recipe file is converted back to a binary file (*.G3P). The setting range is [1] to [32].
4)	[Trigger Device]	—	Set the write and read trigger devices. ☞ Page 834 How to set devices, labels, and tags The set trigger device can be used only in the recipe setting being edited. For the trigger device types, refer to the following. ☞ Page 2301 Control and notification with devices
		[Write Trigger 1] [Write Trigger 2]	Set a device to be written and a trigger condition (ON, OFF). Set [Write Trigger 2] to execute the writing when two conditions are satisfied. In that case, device values are written only when the trigger conditions of both the trigger device 1 and 2 are satisfied.
		[Read Trigger 1] [Read Trigger 2]	Set a device to be read and a trigger condition (ON, OFF). Set [Read Trigger 2] to execute the reading when two conditions are satisfied. In that case, device values are read only when the trigger conditions of both the trigger device 1 and 2 are satisfied.
		[Record No. Device]	Set a device that specifies the target record number when the trigger device of each recipe setting starts the writing or reading process. When the number of records is one, record 1 is always specified, and thus no setting is required.
5)	[Create a new recipe display (record list)] button		This item is not displayed when the [Recipe] dialog is called up from the [Recipe Display (Record List)] dialog. Displays the [Screen Selection] dialog. Select a screen to place a recipe display (record list). ☞ Page 2313 [Screen Selection] dialog

[Screen Selection] dialog

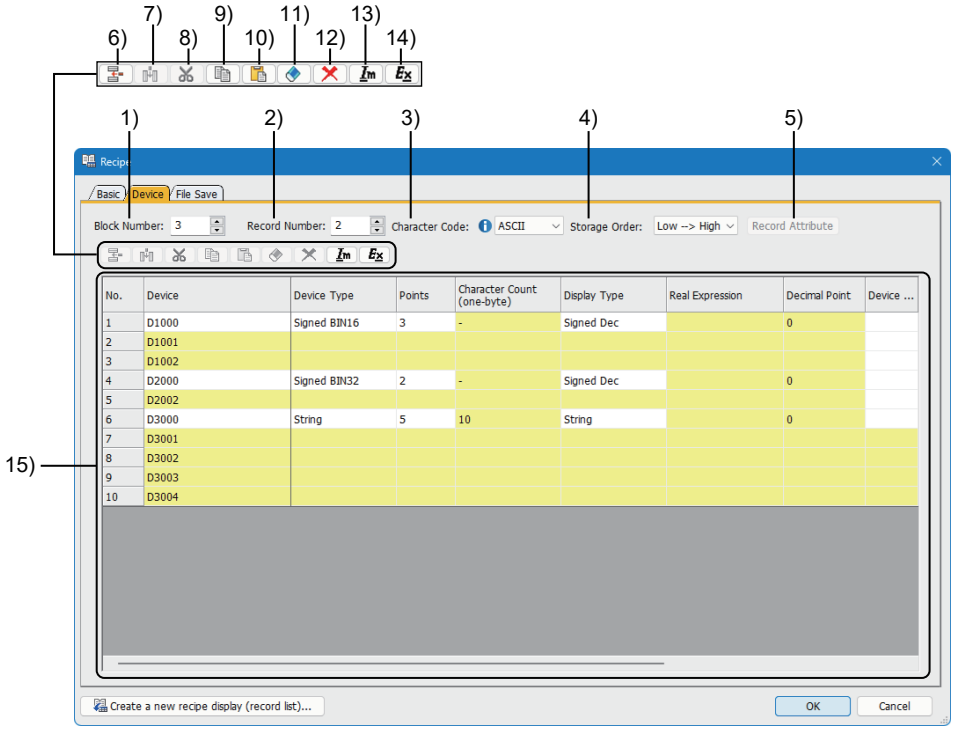


Item		Description
1)	[Screen Type]	Select the type of a screen to place a recipe display (record list).
2)	[Screen No.]	Select the screen number of a screen to place a recipe display (record list). The setting range is [0] to [32767]. A target screen is selectable from among screen titles as well. To place a recipe display (record list) on a new screen, select [A new screen will be created.] for the screen title. Click the [Browse] button to select a screen in thumbnail view in the [Screen Image List] dialog. ☞ Page 3683 [Image List] dialog (screen)

66.7.2 [Device] tab

GT37 SoftGOT3000

Set the target devices and the initial values of records.



Item		Description
1)	[Block Number]	Set the number of blocks of the recipe setting. The setting range is [1] to [2048]. ☞ Page 2247 Block
		To specify the number of target devices more than the number of blocks, set consecutive devices in blocks. Depending on the number of blocks and the setting of [Points], specifying the number of target devices up to its upper limit may be unavailable. Example) When 2048 is set in [Block Number] and 1 is set in [Points] of all the blocks According to the upper limit of the number of blocks, up to 2048 devices can be set.
		When a large number of blocks are set in a recipe setting, processing time for writing and reading may increase. To shorten the processing time, reduce the number of blocks.
2)	[Record Number]	Set the number of records of the recipe setting. The setting range is [1] to [2000]. ☞ Page 2248 Record The number of records in a recipe is not user-changeable on the GOT. If you perform record reading, preset several blank records that have no name and device value. Doing so enables you to add new records on the GOT by overwriting the blank records.

Blank record with no name and device value

Recipe No. 1

Device	Record 1	Record 2	Record 3	Record 4
	Product A	Product B		
D300	76	74		
D301	7	8		
D302	17	18		
D303	0	0		

Record No.

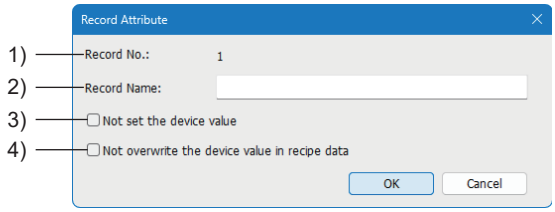
Record name

Item		Description	
3)	[Character Code]	Set this item when [String] is selected for [Device Type] in a block. Select the character code to be applied to the value of devices whose [Device Type] is set to [String]. If you set a string-type label or tag for the device whose [Device Type] is set to [String], set the character code according to the type of the label or tag. • Global label: [ASCII], [Unicode], or [S-JIS] • AB native tag: [ASCII] • OMRON NJ/NX tag: Unicode • OPC UA tag: Unicode	
		When [Character Code] is set to [Unicode] for a recipe target device, if you specify the device for a text display or text input object, the following settings need to be configured in the object setting dialog.	
		When [Storage Order] is set to [Low→High] in the [Recipe] dialog	• Select [Unicode] for [Character Code] in the [Device/Style] tab. • Select [Display in order of High -> Low] in the [Extended] tab.
		When [Storage Order] is set to [High→Low] in the [Recipe] dialog	• Select [Unicode] for [Character Code] in the [Device/Style] tab. • Deselect [Display in order of High -> Low] in the [Extended] tab.
4)	[Storage Order]	Set this item when [String] is selected for [Device Type] in a block. Select an order in which data is stored to the devices whose [Device Type] is set to [String].	
5)	[Record Attribute] button	Displays the [Record Attribute] dialog. Set the attribute of the record selected in the target device list. You can select multiple records by drugging on the record title column. ☞ Page 2318 [Record Attribute] dialog	
6)	[Insert Block] button	Inserts a block above the block selected in the target device list.	
7)	[Insert Record] button	Inserts a record in the left of the record selected in the target device list.	
8)	[Cut] button	Cuts an editable cell selected in the target device list.	
9)	[Copy] button	Copies an editable cell selected in the target device list.	
10)	[Paste] button	Pastes the cut or copied data in the selected cell.	
11)	[Clear] button	Clears data of a cell or record selected in the target device list.	
12)	[Delete] button	Deletes a block or record selected in the target device list.	
13)	[Import] button	Imports a recipe setting file which is exported with GT Designer3, and overwrites the existing setting in the [Device] tab. Files of recipe settings or advanced recipe settings exported with the following software can also be imported. • GT Designer3 Version1(GOT2000) • GT Designer3 Version1(GOT1000) • GT Designer2 Version2 Recipe files created on the GOT cannot be imported.	

Item		Description
14)	[Export] button	Saves the setting in the [Device] tab with a Unicode text or CSV file. You can edit the exported file in spreadsheet software and others. The edited file can be imported with GT Designer3. The following shows the file format of the exported file.  When importing or exporting files in the multiple-language input environment, use Unicode text files. The characters of multiple languages can be imported or exported normally by using Unicode text files.

Item			Description	
15)	Target device list	—	Lists the target devices and records set in blocks.	
		[Device]	Set the devices from which values are read or to which values are written. ☞ Page 834 How to set devices, labels, and tags	
		[Device Type]	Select the data type of devices in each block. When setting a string-type label or tag for the recipe target device, select [String].	
		[Points]	Set the number of target devices set in each block. Devices starting from the start device are set sequentially for the set number. The maximum number of devices that can be set depends on the setting of [Device Type].	
			[Bit]	[1]
			[Signed BIN16] [Unsigned BIN16] [Signed BIN8] [Unsigned BIN8] [BCD16]	256 records or less: [1] device to [32768] devices 257 records or more: [1] device to [8192] devices
			[Signed BIN32] [Unsigned BIN32] [BCD32] [Real(32bit)]	256 records or less: [1] device to [16384] devices 257 records or more: [1] device to [4096] devices
			[Signed BIN64] [Unsigned BIN64] [BCD64] [Real(64bit)]	256 records or less: [1] to [8192] 257 records or more: [1] to [2048]
			[String]	[1] to [2048]
		[Character Count (one-byte)] ([Character Count] when [Unicode] is selected for [Character Code])	Maximum number of characters to be collected. This item is displayed when [String] is selected for [Device Type]. The settings of [Points] and [Character Code] determine the setting value.	
			When [Unicode] is selected for [Character Code] The maximum number of characters equals the value in [Points].	
			When an item other than [Unicode] is selected The maximum number of characters equals the value in [Points] multiplied by 2. A two-byte character is counted as two characters.	
		[Display Type]	Select the display type of a device when its data is output into a CSV or Unicode text file. The setting range depends on the setting of [Device Type]. ☞ Page 2318 Relationship between the record setting range and [Device Type] and [Display Type]	
		[Real Expression]	Select the expression type of the real number. Set this item when [Real] is selected for [Display Type]. Example) When 12345 is set as the record value and 3 is set in [Decimal Point] • Display in [Exponential Expression]: 1.235E+004 • Display in [Fixed Decimal]: 12345.000	
		[Decimal Point]	Set the number of digits of decimal numbers. Set this item when [Real] is selected for [Display Type]. The setting range is [0] digits to [32] digits.	
		[Device Comment]	Set the comment for a target device. Up to 32 characters can be set.	
		Record	Combinations of device values specified at writing or reading Set values are the initial values of a record. The setting range of the record initial value depends on [Device Type] and [Display Type]. ☞ Page 2318 Relationship between the record setting range and [Device Type] and [Display Type]	
			The device values displayed in the records are adjusted according to the settings of [Display Type], [Real Expression], and [Decimal Point]. The values may differ when the settings in the [Device] tab are exported.	
			Record columns are created corresponding to the setting of [Record Number]. ☞ Page 2248 Record	
			Click a column header of the table to display the [Edit] button on the header. Click the [Edit] button to display the [Record Attribute] dialog, and set the attributes of the relevant record. ☞ Page 2318 [Record Attribute] dialog	

[Record Attribute] dialog



Item		Description
1)	[Record No.]	Record number of a selected record This item is not displayed when multiple records are selected.
2)	[Record Name]	Set the record name. Up to 32 characters can be set.
3)	[Not set the device value]	Set no initial value for a record. A record without values cannot be used for writing. Set a value by reading device values or editing the recipe file.
4)	[Not overwrite the device value in recipe data]	Protects the record from being overwritten. Device values cannot be written to a record, which is protected from being overwritten.

Relationship between the record setting range and [Device Type] and [Display Type]

The selectable items for [Display Type] vary depending on the setting of [Device Type].

The device value range that can be set for records depends on the setting of [Display Type].

[Device Type]	[Display Type]	Range of device values
[Bit]	[Bin]	0, 1
	[Bit]	
[Signed BIN8]	[Signed Dec]	-128 to 127
	[Hex]	00 to FF
	[Octal]	000 to 377
	[Bin]	00000000 to 11111111
	[Real]	-128 to 127
[Unsigned BIN8]	[Unsigned Dec]	0 to 255
	[Hex]	00 to FF
	[Octal]	000 to 377
	[Bin]	00000000 to 11111111
	[Real]	0 to 255
[Signed BIN16]	[Signed Dec]	-32768 to 32767
	[Hex]	0000 to FFFF
	[Octal]	000000 to 177777
	[Bin]	0000000000000000 to 1111111111111111
	[Real]	-32768 to 32767
[Unsigned BIN16]	[Unsigned Dec]	0 to 65535
	[Hex]	0000 to FFFF
	[Octal]	000000 to 177777
	[Bin]	0 to 1111111111111111
	[Real]	0 to 65535
[Signed BIN32]	[Signed Dec]	-2147483648 to 2147483647
	[Hex]	00000000 to FFFFFFFF
	[Octal]	00000000000 to 37777777777
	[Bin]	00000000000000000000000000000000 to 11111111111111111111111111111111
	[Real]	-2147483648 to 2147483647

[Device Type]	[Display Type]	Range of device values	
[Unsigned BIN32]	[Unsigned Dec]	0 to 4294967295	
	[Hex]	00000000 to FFFFFFFF	
	[Octal]	00000000000 to 37777777777	
	[Bin]	0 to 11111111111111111111111111111111	
	[Real]	0 to 4294967295	
[Signed BIN64]	[Signed Dec]	-9223372036854775808 to 9223372036854775807	
	[Hex]	0000000000000000 to FFFFFFFFFFFFFFFF	
	[Real]	-9223372036854775808 to 9223372036854775807	
[Unsigned BIN64]	[Unsigned Dec]	0 to 18446744073709551615	
	[Hex]	0000000000000000 to FFFFFFFFFFFFFFFF	
	[Real]	0 to 18446744073709551615	
[BCD16]	[Unsigned Dec]	0 to 9999	
	[Real]		
[BCD32]	[Unsigned Dec]	0 to 99999999	
	[Real]		
[BCD64]	[Unsigned Dec]	0 to 9999999999999999	
	[Real]		
[Real(32bit)]	[Real]	0, ±(1.17550e-38 to 3.40282e+38) Number of significant digits: 6 digits	
[Real(64bit)]	[Real]	0, ±(2.2250738585073e-308 to 1.7976931348623e+308) Number of significant digits: 14 digits	
[String]	[String]	The settings of [Points] and [Character Code] determine the setting value.	
		When [ASCII] is selected for [Character Code]	The maximum number of characters equals the value in [Points] multiplied by 2. A two-byte character is counted as two characters.
		When an item other than [ASCII] is selected for [Character Code]	The maximum number of characters equals the value in [Points].

66.7.3 [File Save] tab

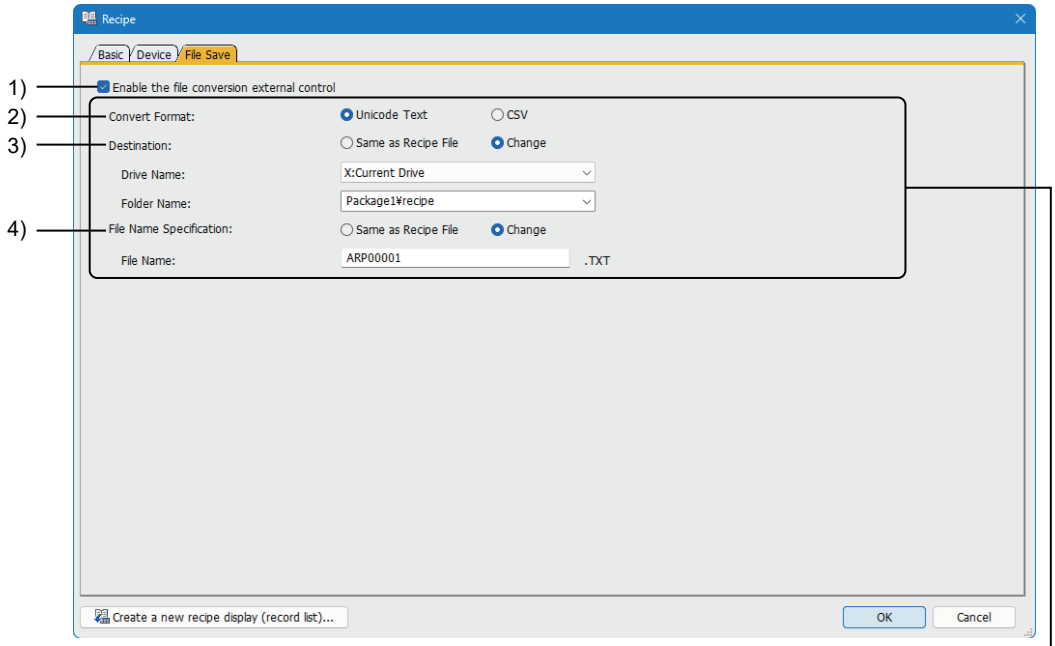
GT37 SoftGOT3000

Configure the settings to convert a recipe file (*.G3P) or to import or export the recipe data of the nonvolatile RAM user area.
For details, refer to the following.

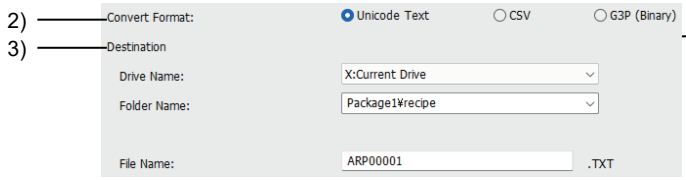
☞ Page 2269 Converting a recipe file

The [File Save] tab does not appear when the following settings are made in the [Basic] tab.

- [Recipe Data Save Location] is set to [Not save (record value write only)].
- [File Format] is set to [Unicode Text] or [CSV].



When [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)]



When [Recipe Data Save Location] is set to [Embedded Memory in GOT (read and write)]

Item		Description
1)	[Enable the file conversion external control]	Allows the file conversion to be controlled by an external control device. ☞ Page 2302 Functions of the external control device Select this item to configure the settings on the [File Save] tab.
2)	[Convert Format]	Select the file format after the conversion.
3)	[Destination]	If the save destination of recipe data is set to the data storage (recipe file), set the destination path of the conversion destination file. To change the destination from the one where a recipe file is saved, select [Change] and set [Drive Name] and [Folder Name]. If the save destination of recipe data is set to the nonvolatile RAM user area, set the destination path of the export destination file or import source file. Set [Drive Name], [Folder Name], and [File Name]. For the restrictions on the folder name and the file name used on the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
4)	[File Name Specification]	If the save destination of recipe data is set to the data storage (recipe file), set the name of the conversion destination file. To change the file name from the one of the recipe file, select [Change] and set [File Name].

66.8 [Recipe File Conversion] dialog

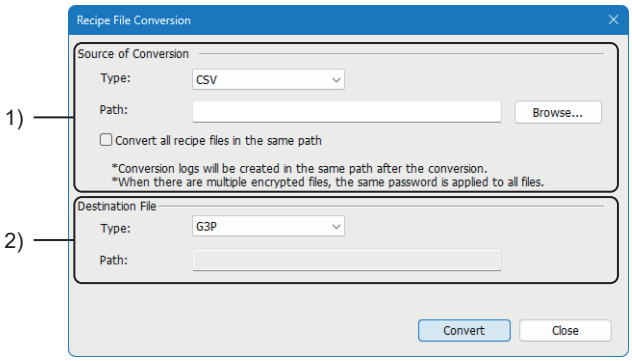
GT37 SoftGOT3000

Convert the file format of a recipe file.

Select [Tools] → [Resource Data Conversion] → [Recipe File] from the menu to display the following dialog.

When the information protection function is enabled, a dialog to enter a password is displayed during file conversion.

☞ Page 3065 Protecting the files in the GOT (Information protection function)



Item			Description
1)	[Source of Conversion]	[Type]	Select a file type of the conversion source file.
		[Path]	Specify a path of the conversion source file.
		[Convert all recipe files in the same path]	Converts the recipe files, which are in a format selected for [Type], in a specified path. A conversion log is created in the specified path. The full path of the conversion destination files, the conversion results (OK or NG), and the creation date of files are output to the conversion log. C:¥recipe¥ARP00001.txt OK 20240917092625 C:¥recipe¥ARP00002.txt OK 20240917092625 C:¥recipe¥ARP00003.txt OK 20240917092625
2)	[Destination File]	[Type]	Select a file type of a file to be created after the conversion.
		[Path]	Displays the path of a file to be saved at the destination, which is the same path as the one of the conversion source file.

66.9 Relevant settings

GT37 SoftGOT3000

Set the relevant settings other than the specific settings for the recipe function as required.
The following shows the functions that are available by configuring the relevant settings.

66.9.1 GOT environmental settings (System information)

GT37 SoftGOT3000

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Notifies that recipe processing (writing or reading) is in progress.*1	[System Signal 2-1] System signal 2-1.b10

*1 The signals available to notify the recipe process status include external notification devices.
For the differences between the external notification device and system information, refer to the following.
☞ Page 2308 Difference between the external notification device and system information

66.9.2 GOT internal device

GT37 SoftGOT3000

☞ Page 3581 GOT special register (GS)

Function	Setting item
Turning on when a recipe file is imported with an applicable special function switch	GS1010.b0
Turning on when a recipe file is exported with an applicable special function switch	GS1010.b1
Turning on when the recipe special control is executed	GS1010.b2
Turning on after a recipe file is successfully imported or exported with an applicable special function switch	GS1010.b14
Turning on when a recipe file is unsuccessfully imported or exported with an applicable special function switch	GS1010.b15
Notifying the result of the recipe special control	GS1011
Notifying the search result of the recipe special control	GS1012
Changing the character code to Unicode at the following timing • When a binary file is converted to CSV format • When data is written to or read from a recipe file in CSV format	GS522.b2
Executing the recipe special control	GS1800.b2
Turning off the Touch Switch Operation Completed signal (GS1010.b14) and the Touch Switch Operation Error signal (GS1010.b15) of the Recipe Status device	GS1800.b14
Specifying the action of the recipe special control	GS1801
Specifying the target of the recipe special control	GS1802
Specifying the start device number of the GOT data registers (GD) that are used for the recipe special control	GS1803
Specifying the target recipe setting for the recipe special control	GS1805
Specifying the target record for the recipe special control	GS1806
Specifying the target start row for the recipe special control	GS1807
Specifying the number of target rows (starting from the specified start row) for the recipe special control	GS1808

PART 12 Script

67 Controlling operations with scripts ([Script])

68 Project script, screen script, script part, and script block

69 Object script

67 Controlling operations with scripts ([Script])

GT37 SoftGOT3000

☞ Page 2326 Overview of the script function
☞ Page 2327 Features of the script function
☞ Page 2329 Script types

PART 12

67.1 Overview of the script function

GT37 SoftGOT3000

Scripts allow you to control the GOT display with the GOT's original programs.
By controlling the GOT display with scripts in the GOT, you can significantly reduce the load for the display of the system (controllers).

Precautions

■Applicable range of the scripts

Since this function is designed to control the GOT display, do not use it for machine control that requires precise time management.
When changing the data in the PLC through the GOT, create an interlock circuit using a sequence program to ensure the whole system can always operate safely.
The following periods may vary depending on projects.

- The period between when the trigger device condition of the script is satisfied and when the script is actually executed
- Processing time of the script

67.2 Features of the script function

GT37 SoftGOT3000

67.2.1 Easy system maintenance

With scripts, the controllers can be programmed to handle machine control only, so the system maintenance becomes much easier.

67.2.2 Various screen controls available together with the GOT

Using scripts enables the following operations that could not be achieved by the GOT alone.

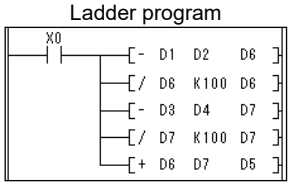
Operations together with other object functions

- The status of multiple bit devices can be indicated by one lamp.
- A specific part can be displayed if any of the bit devices is on, and hidden if all of them are off.
- When a numerical value is input, the part which indicates that it has already been input is pasted next to the then input numerical display frame.
- One touch switch can perform multiple operations corresponding to the status in multiple situations.
- The error handling screen appears automatically upon the detection of an error. (The GOT Error Code device of the system information stores the error code upon its detection.)

Processing complicated arithmetic operations

- Polynomial operations can be expressed simply in a line, which are difficult for ladder programs to express.

Ladder program



Script

```
[w:D5]=([w:D1]-[w:D2])/100+([w:D3]-[w:D4])/100;
```

- In addition to four arithmetic operations, scripts can be used for various application arithmetic operation functions such as trigonometric and exponential functions.

No limit on application

- You can obtain a target date using an entered date and interval (number of days in between).

What is the date after 345 days from May 20, 2012?→ April 30, 2013

- You can obtain the corresponding day of the week from an entered date.

What day of the week was February 21, 1961?→ Tuesday

67.2.3 Simple programming language

Scripts are in a language similar to C language, so you can easily make a program with elementary programming knowledge.

67.2.4 Programming using a commercially available text editor

Commercially-available text editors (such as the Microsoft® Windows® standard memo pad and Wordpad) which you may use every day can be used for programming, so you can improve program productivity.

PART 12

67.2.5 Operating conditions settable for each script

Various conditions can be set as triggers for a script, so script execution can be scheduled.
In addition to the above conditions, the execution of an object script can be tied to an input to the object, display on the object, or a touch on a touch switch.

67.2.6 A wide variety of the debug functions

Since scripts and C language are similar, you can simulate the scripts by making minor corrections using a general C language compiler or debugger.
Complicated scripts including many control statements can be debugged easily by using them.
Placing objects such as numerical displays and lamps for test operation is useful for debugging using the GOT.
By using them, you can check conditional branches in a script.
By monitoring the GOT special register (GS), error information and scripts in execution can be easily checked.

67.2.7 Syntax check of the created scripts

You can check the syntax of a created script in GT Designer3 before running the script on the GOT, improving programming efficiency.

67.2.8 Converting the script language of SCHNEIDER EJH software

You can convert the D-Scripts or Global D-Scripts of SCHNEIDER EJH software so that the scripts run on the GOT.
To convert the script language, use GT Converter2.
For details on the data to be converted and the conversion method, refer to the following.
📖 GT Converter2 Version3 Operating Manual for GT Works3

67.3 Script types

GT37 SoftGOT3000

The following five types of scripts are supported.

Type	Description
Project script	Project scripts are set and operate for the whole project. For details on project scripts, refer to the following. ☞ Page 2330 Project script, screen script, script part, and script block
Screen script	Screen scripts are set and operate for each base screen and window screen (superimpose windows and overlap windows). For details on screen scripts, refer to the following. ☞ Page 2330 Project script, screen script, script part, and script block
Script part	A script parts object is placed on a base screen or a window screen (superimpose window or overlap window), and the script set for the object runs. For details on script parts, refer to the following. ☞ Page 2330 Project script, screen script, script part, and script block
Script block	Script blocks are operated by calling them from a project script or screen script as a subroutine. For details on script blocks, refer to the following. ☞ Page 2330 Project script, screen script, script part, and script block
Object script	Object scripts are set and operate for the following objects. • Touch switch ([Switch] only) • [Bit Lamp] • [Word Lamp] • [Numerical Display] • [Numerical Input] • [Text Display] • [Text Input] • [Date Display] • [Time Display] • [Bit Comment] • [Word Comment] • [Bit Parts] • [Word Parts] • [Fixed Parts] • [Frame Animation] • [Line Graph] • [Trend Graph] • [Bar Graph] • [Bar(Rectangle)] • [Pie(Circle)] • [Scatter Graph] • [Historical Trend Graph] • [Graphical Meter] • [Level] • [Panelmeter] For details on object scripts, refer to the following. ☞ Page 2447 Object script

☞ Page 2434 Troubleshooting

68.1 Overview of the script function

GT37 SoftGOT3000

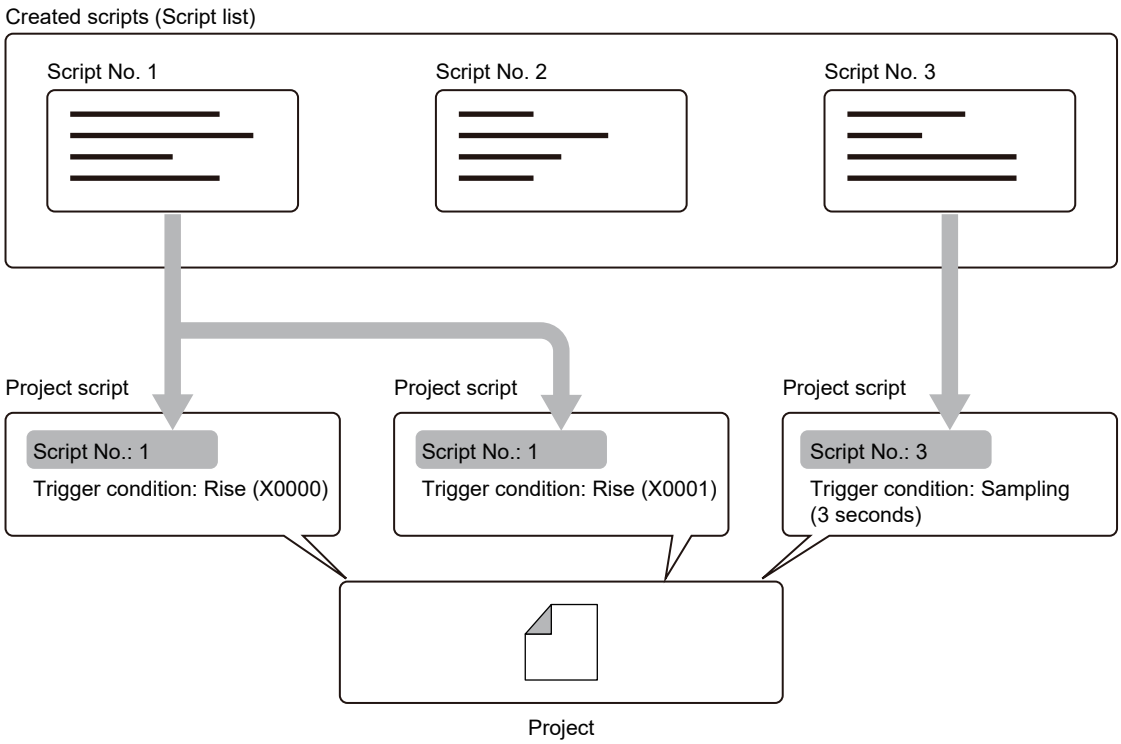
68.1.1 Overview of a project script

Set a project script for the current project.

If the trigger condition of the script is satisfied, the script runs.

A created script can be specified in a project script setting or a screen script setting.

If you edit the script, the edit will affect the project script setting or screen script setting.



Precautions

The monitor device of a project script is always operating.

Note that displaying the monitor screen may take long when the number of monitor devices is large.

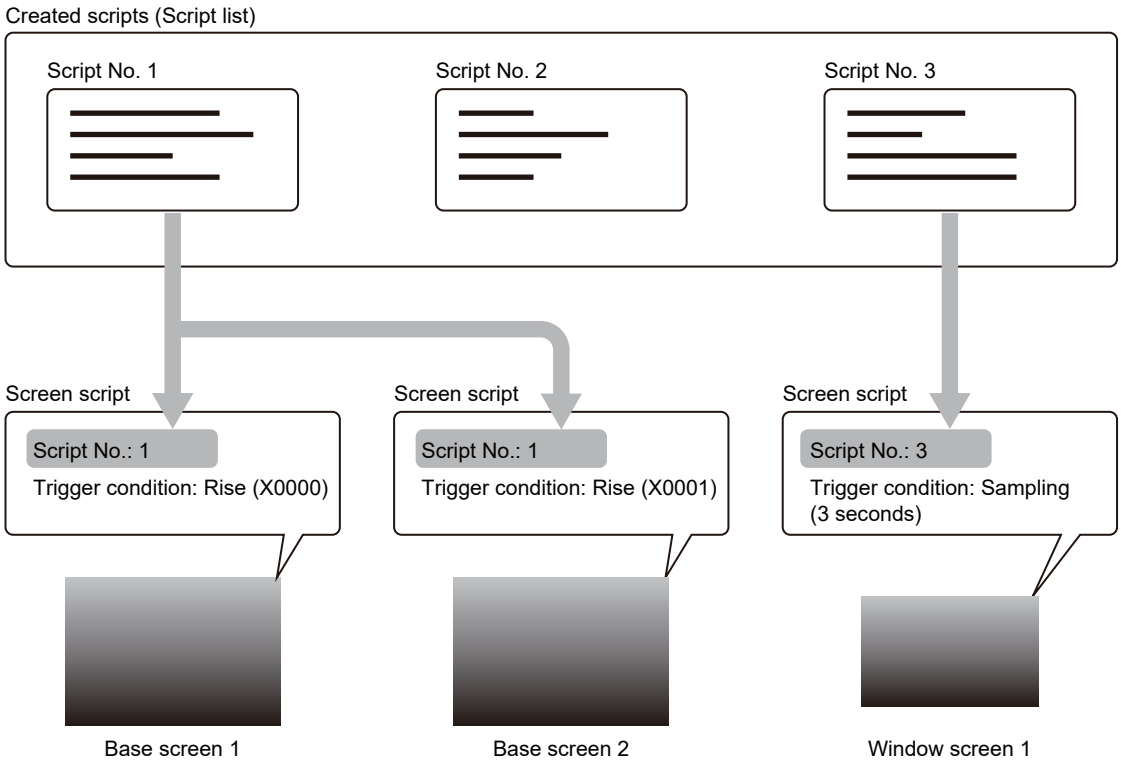
68.1.2 Overview of a screen script

Set a screen script for the user-specified screen.

While the GOT displays the screen, if the trigger condition of the script is satisfied, the script runs.

A created script can be specified in a project script setting or a screen script setting.

If you edit the script, the edit will affect the project script setting or screen script setting.



68.1.3 Overview of a script part

Place a script parts object on a screen to create a script.

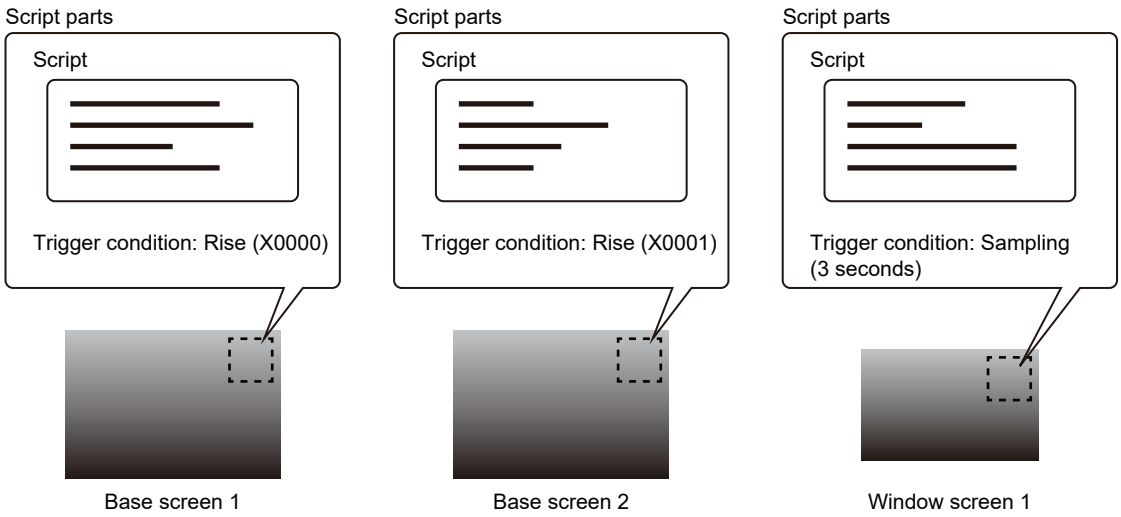
While the GOT displays the screen having a script parts object, if the trigger condition of the created script is satisfied, the script runs.

Each script parts object has its own scripts.

If you edit a script of a script parts object, the edit will not affect the other script parts objects.

The following object manipulations are supported.

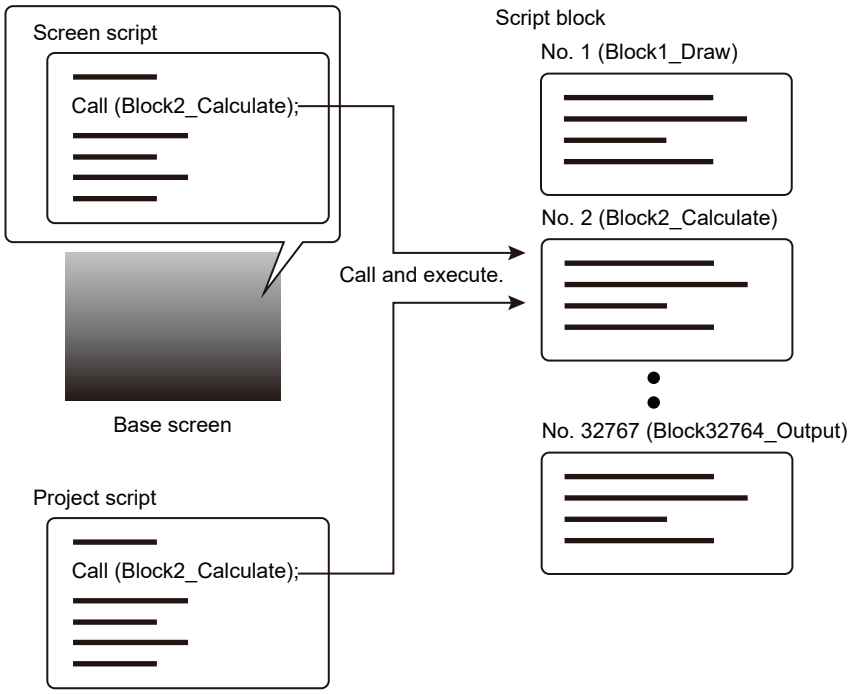
- Copying to another screen
- Grouping
- Registering to the library
- Adding to a template



A script parts object is visible only on the screen editor of GT Designer3.
The object is invisible on the GOT screen.

68.1.4 Overview of a script block

A script block is a script that is called as a subroutine from another script.
The script is executed when it is called from a project script or screen script with a call statement.
Using it to execute the same processing in multiple scripts allows you to reduce the number of steps in the script.



68.2 Specifications of the script

GT37 SoftGOT3000

☞ Page 2334 Specifications related to a script setting
☞ Page 2334 Specifications related to the behavior of a script
☞ Page 2335 Control structures for scripts
☞ Page 2352 Available data and how to express the data

68.2.1 Specifications related to a script setting

A script setting consists of a script trigger condition and a script.
The setting target, and the maximum numbers of script settings and scripts vary depending on the script type.

Script type	Setting target	Maximum number of script settings	Maximum number of scripts
Project script	Project	256	32767 (in both the project script settings and the screen script settings)
Screen script	• Base screen • Window screen (superimpose window or overlap window)	256 per screen (The script settings for called screens are included.)	
Script part		Maximum number of script parts objects: 32 per screen Maximum number of script settings: 16 per object	16 per object
Script block	• Project script • Screen script	256	256 per project

68.2.2 Specifications related to the behavior of a script

The following shows the specifications related to the behavior of a script.

Script type	Execution condition	Number of executable scripts
Project script	The trigger condition of a script is satisfied.	256
Screen script	The trigger condition of a script is satisfied while the GOT displays the screen for which the script is set.	256 per screen (in both the screen script settings and the script settings of script parts objects)
Script part		
Script block	It is called from a project script or screen script with a call statement.	256

Specifications of a screen script and script part

The following shows the behavior of a script when the set overlay screen function or a parts display object displays the screen for which the script is set.

Function	Behavior
Set overlay screen	If the set overlay screen function calls a screen for which a screen script or script part is set, the script or script part runs.
Parts display	If a parts display object displays a screen for which a screen script or a script part is set, the script does not run.

68.2.3 Control structures for scripts

The following explains the control structures for scripts.

Program scripts using the following commands (including control statements, operators, and functions).

You can describe nests (hierarchy) for if, while, and switch statements.

End a script using a return statement.

Control statement

Control statements are used to execute the conditional branches and repetitions.

Control statement	Description	
if	Syntax	if (conditional expression) {statements}
	Function	Performs a conditional control. The if statement evaluates (conditional expression). If the expression is true (other than 0), {statements} is executed. The if statement is a fundamental conditional control and used to execute specified processing when a value satisfies a condition or to alter the flow of program execution.
if to else	Syntax	if (conditional expression) {statements 1} else {statements 2}
	Function	Performs a conditional control. The if statement evaluates (conditional expression). If the expression is true (other than 0), {statements 1} is executed. If the expression is false (0), {statements 2} is executed. The if statement is a fundamental conditional control and used to execute specified processing when a value satisfies a condition or to alter the flow of program execution.
while break	Syntax	while (continuous conditional expression) {statements}
	Function	Evaluates (continuous conditional expression). As long as the expression is true (other than 0), {statements} is repeatedly executed. In the following cases, the iterative loop is terminated. • When (continuous conditional expression) is false (0) • When {statements} includes the break statement The while statement is used to execute processing repeatedly until a target condition is satisfied. (For example, repeating the processing until a device value becomes 0) If a condition is always evaluated to true (other than 0), an infinite loop is created. Use the temporary device area or a GOT internal device as the write destination.

switch
case
default
break
	Syntax	switch (target)
		{
		case constant: statements; break;
		case constant: statements; break;
		default: statements;
		}

	Function	Determines the result of the expression indicated by switch and branches the processing using a case statement and default statement. In the following cases, the statements that follow a case statement and the default statement are executed. • When (target) matches a specified constant • When (target) does not match any constant that case statements have and when there is the default statement In the following cases, the switch body {} is terminated. • When there is a break statement in the script • When there is no case statement or default statement that has the constant that matches (target) The break statement and default statement are not required in the control statement. The switch statement is used when various processing are required according to the value of a variable.
call	Syntax	call (<script block name>)
	Function	Calls and executes the script block specified in <script block name>.
return	Syntax	return;
	Function	Terminates the script. A single script can have multiple return statements.
;	Syntax	;
	Function	Indicates the end of a line. It must be put at the end of each line.

Operator (logic)

Logical operators are used to determine whether conditions in expressions, such as an if statement, are true or false.

Operator	Description	
&&	Syntax	if ((relevant expression) && (relevant expression) {·····}
	Function	If both of (relevant expression) are true, the result has 1. If either of (relevant expression) is false, the result has 0. (Logical AND operator)
||	Syntax	if ((relevant expression) || (relevant expression)) {·····}
	Function	If either of (relevant expression) is true, the result has 1. If both of (relevant expression) are false, the result has 0. (Logical OR operator)
!	Syntax	if (! (relevant expression)) {·····}
	Function	If (relevant expression) is 0, the result has 1. Otherwise, the result has 0. (Logical NOT operator)

Operator (relation)

Relational operators are used to determine the size of two values in expressions, such as an if statement.

Operator	Description	
<	Syntax	<target 1> < <target 2>
	Function	<target 1> is less than <target 2>. (Left-inequality operator)
<=	Syntax	<target 1> <= <target 2>
	Function	<target 1> is less than or equal to <target 2>. (Equivalence left-inequality operator)
>	Syntax	<target 1> > <target 2>
	Function	<target 1> is greater than <target 2>. (Right-inequality operator)
>=	Syntax	<target 1> >= <target 2>
	Function	<target 1> is greater than or equal to <target 2>. (Equivalence right-inequality operator)
!=	Syntax	<target 1> != <target 2>
	Function	<target 1> and <target 2> are not equal. (Inequality operator)
==	Syntax	<target 1> == <target 2>
	Function	<target 1> and <target 2> are equal. (Equality operator)

Operator (arithmetic)

Arithmetic operators are used for four arithmetic operations.

Operator	Description	
+	Syntax	<target> + <factor>
	Function	Adds <factor> to <target>. (Addition operator)
-	Syntax	<target> - <factor>
	Function	Subtracts <factor> from <target>. (Subtraction operator)
*	Syntax	<target> * <factor>
	Function	Multiplies <target> by <factor>. (Multiplication operator)
/	Syntax	<target> / <factor>
	Function	Divides <target> by <factor>. (Division operator) When <factor> is 0, the script operation stops.
%	Syntax	<target> % <factor>
	Function	Finds the remainder dividing <target> by <factor>. (Remainder operator) When <factor> is 0, the script operation stops.

Operator (bit device)

Bit device operators are used for bit device logical operations, alternations, and shift operations.

Operator	Description	
&	Syntax	<target> & <factor>
	Function	Finds the logical product (AND) of <target> and <factor>. (Bit accumulation operator)
|	Syntax	<target> | <factor>
	Function	Finds the logical add (OR) of <target> and <factor>. (Bit addition operator)
~	Syntax	~<bit>
	Function	Negates (alternates) <bit>. (Complement operator)
^	Syntax	<target> ^ <factor>
	Function	Finds the exclusive logical add (XOR) of <target> and <factor>. (Bit difference operator)
<<	Syntax	<target> << <factor>
	Function	Shifts <target> left by the number of bits specified by <factor>. (Left-shift operator)
>>	Syntax	<target> >> <factor>
	Function	Shifts <target> right by the number of bits specified by <factor>. (Right-shift operator)

Precautions

If you perform a bitwise operation on the device with a signed data type, an unexpected value may result.
Set an unsigned data type for the target device of a bitwise operation.

Operator (assignment)

Assignment operators are symbols used to assign device values.

Operator	Description	
=	Syntax	<device> = <target>
	Function	Stores <target> in <device>. (Assignment operator)

Variables

Variables are used to represent devices in scripts.

Variable	Description	
Device and temporary device area	Syntax	[w:GD150]
	Function	Indicates a PLC CPU device, a GOT internal device, or a temporary device area. For devices and temporary device areas, refer to the following. ☞ Page 2352 Available data and how to express the data

Functions (device operation)

Device operation functions are used to turn on, turn off, and alternate bit devices.

Function	Description	
set	Syntax	set (<bit device>)
	Function	Turns on <bit device>.
	Example	set([b:M0001]);
rst	Syntax	rst (<bit device>)
	Function	Turns off <bit device>.
	Example	rst([b:M0001]);
alt	Syntax	alt (<bit device>)
	Function	Inverts <bit device>.
	Example	alt([b:M0001]);

Functions (consecutive device operation)

Consecutive device operation functions are used to transfer device values to another device at a time.

These functions cannot be used in object scripts.

For the data type of arguments, refer to the following.

☞ Page 2359 Data type setting and function definition

Function	Description	
bmov	Syntax	bmov (<word device 1>, (word device 2>, <integer>)
	Function	Batch-transfers the data in the devices in the contiguous sequence, the first area of which is <word device 1>, to the devices in the contiguous sequence, the first area of which is <word device 2>. The number of the devices in the contiguous sequence is specified by <integer>.
	Data type of arguments	<word device 1>, <word device 2>: Specified data format*1 <integer>: long
	Example	bmov([w:D100],[w:D500],10);
fmov	Syntax	fmov (<word device 1>, (word device 2>, <integer>)
	Function	Transfers the data in <word device 1> to the devices in the contiguous sequence, the first area of which is <word device 2>. The number of the devices in the contiguous sequence is specified by <integer>.
	Data type of arguments	<word device 1>, <word device 2>: Specified data format*1 <integer>: long
	Example	fmov([w:D100],[w:D500],10);

*1 Set the same data type for the word device 1 and word device 2.

■Data type

When using bmov or fmov, use the same data type for <word device 1> and <word device 2>.

Otherwise, an error occurs during the syntax check.

☞ Page 2375 Data type conversion function

Functions (application arithmetic operation)

Application arithmetic operation functions are used for advanced calculations such as trigonometric functions, logarithms, exponents, and square roots.

For the data type of arguments and return values, refer to the following.

☞ Page 2359 Data type setting and function definition

Function	Description	
sin	Syntax	sin (<word device or constant>)
	Function	Calculates the sine of a specified <word device or constant>. (Sine) Specify <word device or constant> in radian.
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	sin([w:D100]);
cos	Syntax	cos (<word device or constant>)
	Function	Calculates the cosine of a specified <word device or constant>. (Cosine) Specify <word device or constant> in radian.
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	cos([w:D100]);

Function	Description	
tan	Syntax	tan (<word device or constant>)
	Function	Calculates the tangent of a specified <word device or constant>. (Tangent) Specify <word device or constant> in radian.
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	tan([w:D100]);
asin	Syntax	asin (<word device or constant>)
	Function	Calculates the arc sine of <word device or constant>. (Arc sine) Specify <word device or constant> in radian.
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	asin([w:D100]);
acos	Syntax	acos (<word device or constant>)
	Function	Calculates the arc cosine of <word device or constant>. (Arc cosine) Specify <word device or constant> in radian.
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	acos([w:D100]);
atan	Syntax	atan (<word device or constant>)
	Function	Calculates the arc tangent of <word device or constant>. (Arc tangent) Specify <word device or constant> in radian.
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	atan([w:D100]);
abs	Syntax	abs (<word device or constant>)
	Function	Calculates the absolute value of <word device or constant>. (Absolute value)
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	abs([w:D100]);
log	Syntax	log (<word device or constant>)
	Function	Calculates the base-e logarithm <natural logarithm> of <word device or constant>.
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	log([w:D100]);

Function	Description	
log10	Syntax	log10 (<word device or constant>)
	Function	Calculates the base-10 logarithm (common logarithm) of <word device or constant>. (Common logarithm)
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	log10([w:D100]);
exp	Syntax	exp (<word device or constant>)
	Function	Calculates the value of e raised to the power of <word device or constant>. (Exponent)
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	exp([w:D100]);
ldexp	Syntax	ldexp (<word device 1 or constant 1>, <word device 2 or constant 2>)
	Function	Calculates <word device 1 or constant 1> multiplied by (2 raised to the power of <word device 2 or constant 2>). (Exponent of product)
	Data type of arguments	<word device 1 or constant 1>: double <word device 2 or constant 2>: long
	Return value	double
	Example	ldexp([w:D100], [w:D101]);
sqrt	Syntax	sqrt (<word device or constant>)
	Function	Calculates the square root of <word device or constant>. (Square root)
	Data type of arguments	<word device or constant>: double
	Return value	double
	Example	sqrt([w:D100]);

Functions (file operation)

File operation functions are used for operations such as new file creation, file name change, movement, and deletion.

For the arguments used for the file operation function, refer to the following.

☞ Page 2357 Arguments for the file operation function and string operation function and how to express them

For the data type of arguments and return values, refer to the following.

☞ Page 2359 Data type setting and function definition

Function	Description	
file_getlist	Syntax	file_getlist (<folder name>, <file name>, <storage device>, <offset>, <number of files>, <maximum number of characters>)
	Function	Obtains the file list. Extracts file names equivalent to the number of characters specified by <maximum number of characters>, and stores the file names in <storage device> and the following devices in the contiguous sequence. The number of files specified by <number of files> is read from the xth file (x is specified by <offset>) counted from the first specified by <folder name> and <file name>.
	Data type of arguments	<folder name>, <file name>, <storage device>, <offset>, <number of files>, <maximum number of characters>: long
	Return value	long Normal: Number of obtained files When a specified file is nonexistent or the value of <offset> is larger than the number of existing files: 0 Error: -1
	Example	[s16:D500] = file_getlist("X:\\Package1\\", "*.DAT", [w:D100], 3, 2, 8);

Function	Description	
file_getfolderlist	Syntax	file_getfolderlist (<folder name 1>, <folder name 2>, <storage device>, <offset>, <number of folders>, <maximum number of characters>)
	Function	Obtains the folder list. In a folder specified by <folder name 1> and <folder name 2>, obtains characters of the name of the <offset>th and subsequent folders. Then, stores the obtained characters in <storage device> and subsequent devices. The number of obtained characters is specified by the <maximum number of characters>, and that of target folders is specified by <number of folders>.
	Data type of arguments	<folder name 1>, <folder name 2>, <offset>, <number of folders>, <maximum number of characters>: long <storage device>: Signed 32-bit binary
	Return value	long Normal: Number of obtained folders When a specified folder is nonexistent or the value of <offset> is larger than the number of existing folders: 0 Error: -1
	Example	[s16:D500] = file_getfolderlist("X:\\Package1\\", "", [w:D100], 6, 2, 8);
file_read*2	Syntax	file_read (<folder name>, <file name>, <storage device>, <offset>, <number of read bytes>)
	Function	Reads data from a file. Reads data of the file specified by <folder name> and <file name>, and stores the data in <storage device> and the following devices in the contiguous sequence. The number of bytes specified by <number of read bytes> is read from the xth byte (x is specified by <offset>).
	Data type of arguments	<folder name>, <file name>, <storage device>, <offset>, <number of read bytes>: long
	Return value	long Normal: Size of read data (bytes) When <number of read bytes> is 0 or <offset> is greater than the file size: 0 Error: -1
	Example	[s16:D500] = file_read("X:\\Package1\\", "ARP00001.DAT", [w:D100], 4, 16);
file_lineread*2	Syntax	file_lineread (<folder name>, <file name>, <storage device>, <offset>, <maximum number of read bytes>)
	Function	Reads only one line of data from a file. This function is for an ASCII or Shift-JIS file. Reads 1-line data starting from the <offset>th byte from a file specified by <folder name> and <file name>, and stores the data in <storage device> and subsequent devices. Data size that can be read at a time is within <maximum number of read bytes>.
	Data type of arguments	<folder name>, <file name>, <storage device>, <offset>, <maximum number of read bytes>: long
	Return value	long Normal: Size of read data (bytes)*1 When <number of read bytes> is 0 or <offset> is greater than the file size: 0 Error: -1
	Example	[s16:D200] = file_lineread("X:\\Package1\\", "ARP00001.CSV", [w:D300], 0, 32);
file_unilineread*2	Syntax	file_unilineread (<folder name>, <file name>, <storage device>, <offset>, <maximum number of read bytes>)
	Function	Reads only one line of data from a file. This function is for a Unicode file. Reads 1-line data starting from the <offset>th byte from a file specified by <folder name> and <file name>, and stores the data in <storage device> and subsequent devices. Data size that can be read at a time is within <maximum number of read bytes>.
	Data type of arguments	<folder name>, <file name>, <storage device>, <offset>, <maximum number of read bytes>: long
	Return value	long Normal: Size of read data (bytes)*1 When <number of read bytes> is 0 or <offset> is greater than the file size: 0 Error: -1
	Example	[s16:D200] = file_unilineread("X:\\Package1\\", "ARP00001.txt", [w:D300], 0, 32);

Function	Description	
file_write[*2]	Syntax	file_write (<folder name>, <file name>, <storage device>, <offset>, <number of write bytes>, <mode>)
	Function	Writes data to the file. Writes data in a manner specified by <mode>. • New: 0 Creates the file specified by <folder name> and <file name> to which device data is written. The number of bytes specified by <number of write bytes> of the device data in <storage device> and the following devices in the contiguous sequence is written. When the file that <file name> specifies already exists, the file is deleted and a new file is created. • Addition: 1 Adds data equivalent to the number of bytes specified by <number of write bytes> in <storage device> and the following devices in the contiguous sequence to the end of the file specified by <folder name> and <file name>. When <file name> specifies a file that does not exist, a new file is created. • Overwrite: 2 Overwrites a position in the file specified by <folder name> and <file name> with the device data equivalent to the number of bytes specified by <number of write bytes> in <storage device> and the following devices in the contiguous sequence. The position in the file is specified by <offset>.
	Data type of arguments	<folder name>, <file name>, <storage device>, <offset>, <number of write bytes>, <mode>: long
	Return value	long Normal: Size of written data (bytes) Error: -1
	Example	[s16:D500] = file_write("X:\\Package1\\", "ARP00001.DAT", [w:D100], 4, 16, 2);
file_rename	Syntax	file_rename (<folder name>, <file name>, <new file name>)
	Function	Renames the file. Changes <file name> of the file specified by <folder name> and the <file name> to <new file name>.
	Data type of arguments	<folder name>, <file name>, <new file name>: long
	Return value	long Normal: 0 Error: -1
	Example	[s16:D500] = file_rename("X:\\Package1\\", "ARP00001.DAT", "DATA1201.DAT");
file_delete	Syntax	file_delete (<folder name>, <file name>)
	Function	Deletes the file. Deletes a specified <file name> in <folder name>.
	Data type of arguments	<folder name>, <file name>: long
	Return value	long Normal: 0 Error: -1
	Example	[s16:D500] = file_delete("X:\\Package1\\", "ARP00001.DAT");
file_copy	Syntax	file_copy (<copy source folder name>, <copy source file name>, <copy destination folder name>, <copy destination file name>, <copy mode>)
	Function	Copies the file. Copies the file specified by <copy source folder name> and <copy source file name> into the folder specified by <copy destination folder name> changing the file name to <copy destination file name>. With <copy mode>, whether or not write protection is imposed can be specified. • Overwrite prohibited: 0 • Overwrite allowed: 1 When <copy destination folder name> specifies a folder that does not exist, a new folder is created and the file is pasted. A file with the length of 0 byte is copied.
	Data type of arguments	<copy source folder name>, <copy source file name>, <copy destination folder name>, <copy destination file name>, <copy mode>: long
	Return value	long Normal: 0 Error: -1
	Example	[s16:D500] = file_copy("X:\\Package1\\", "ARP00001.DAT", "B:\\backup\\", "", 1);

Function	Description	
file_xcopy	Syntax	file_xcopy (<copy source folder name 1>, <copy source folder name 2>, <copy destination folder name 1>, <copy destination folder name 2>, <copy mode>)
	Function	Copies the folder. Copies the folders specified by <copy source folder name 1> and <copy source folder name 2> to the folders specified by <copy destination folder name 1> and <copy destination folder name 2>. With <copy mode>, whether or not write protection is imposed and sub folders are set as the target for a copy can be specified. • Overwrite prohibited, subfolders not copied: 0 • Overwrite allowed, subfolders not copied: 1 • Overwrite prohibited, subfolders copied: 2 • Overwrite allowed, subfolders copied: 3
	Data type of arguments	<copy source folder name 1>, <copy source folder name 2>, <copy destination folder name 1>, <copy destination folder name 2>, <copy mode>: long
	Return value	long Normal: 0 Error: -1
	Example	[s16:D500] = file_xcopy("X:\\Package1\\", "sample1", "B:\\backup\\", "sample1", 1);
#pragma folder_name_length	Syntax	#pragma folder_name_length (<maximum number of folder name characters>)
	Function	Declares the maximum number of characters in a folder name within the range of 1 to 78. Use this declaration statement to specify a folder name with a device. If a folder name is directly specified by character strings, this function is invalid. Up to 12 characters can be used for a folder name when this declaration statement is not used. The declaration statement is declared only once before the body of the script. Declarations in the calling source do not apply to script blocks. To apply a declaration to a script block, the declaration must be made within the script block to be called. Additionally, declarations in a script block do not apply to the calling source script.
	Example	#pragma folder_name_length(14)
#pragma file_name_length	Syntax	#pragma file_name_length (<maximum number of file name characters>)
	Function	Declares the maximum number of characters in a file name within the range of 1 to 78. Use this declaration statement to specify a file name with a device. If a file name is directly specified by character strings, this function is invalid. Up to 12 characters can be used for a file name when this declaration statement is not used. The declaration statement is declared only once before the body of the script. Declarations in the calling source do not apply to script blocks. To apply a declaration to a script block, the declaration must be made within the script block to be called. Additionally, declarations in a script block do not apply to the calling source script.
	Example	#pragma file_name_length(12)
#pragma use_character_code unicode	Syntax	#pragma use_character_code unicode
	Function	Declares that the characters of the folder name and file name specified in a file operation function are used as Unicode characters. The characters of the folder name and file name, which are obtained using "file_getlist" or "file_getfolderlist", are encoded in Unicode. When this declaration statement is not used, the characters of the folder name and file name are encoded in ASCII. The declaration statement is declared only once before the body of the script. Declarations in the calling source do not apply to script blocks. To apply a declaration to a script block, the declaration must be made within the script block to be called. Additionally, declarations in a script block do not apply to the calling source script.
	Example	#pragma use_character_code unicode

*1 The data which is read does not contain line feed codes but the return value contains the number of bytes containing line feed codes.

*2 Specify a data storage order (from higher-order bytes or from lower-order bytes) in GT Designer3 or with GS390.

Setting method	Description
Setting in GT Designer3	Set [File/Text Handling Function Storage Order] on the [Option] tab in the [Script] dialog. ☞ Page 2410 [Option] tab
Setting with GS390	Specify a data storage order with the value of GS390. • 0 or 3 or more: Data is stored in the order specified in GT Designer3. • 1: Data is stored from lower-order bytes. • 2: Data is stored from higher-order bytes.

■Devices used for arguments

If a controller device is used for any of the following arguments, a function using the argument takes a long time to execute. Therefore, using a GOT internal device is recommended.

- <folder name>
- <folder name 1>
- <folder name 2>
- <file name>
- <storage device>
- <new file name>
- <copy source folder name>
- <copy source folder name 1>
- <copy source folder name 2>
- <copy source file name>
- <copy destination folder name>
- <copy destination folder name 1>
- <copy destination folder name 2>
- <copy destination file name>

■Order of storing data in arguments

The [File/Text Handling Function Storage Order] setting is not applied to some arguments.
When the setting is not applied, the argument storage order is fixed to [Low→High].
☞ Page 2410 [Option] tab

Argument to which the [File/Text Handling Function Storage Order] setting is applied	Argument to which the [File/Text Handling Function Storage Order] setting is not applied
<storage device> for the following functions • file_read • file_write • file_lineread • file_unilineread	Arguments other than <storage device> for the following functions • file_read • file_write • file_lineread • file_unilineread All arguments for the following functions • file_getlist • file_getfolderlist • file_rename • file_delete • file_copy • file_xcopy

When [High→Low] is selected for [File/Text Handling Function Storage Order] and a string operation function and a file operation function are used together, the resulting operation may not be as intended depending on whether the setting for [File/Text Handling Function Storage Order] is applied or not.
Although a 32-bit data type such as signed 32-bit binary can be specified for the device specified in the argument, the storage order setting operates in 16-bit units.
When specifying the storage order, it is recommended that you specify a 16-bit data type such as signed 16-bit binary data.

■Data type

When using the file operation functions, do not specify BCD for the data type of the storage devices.
Doing so may disable detection of abnormality in the script.

■Data type for [w:device]

The data type for [w:device] is set to the one specified in the [Script Edit] dialog.
When using [w:device] for the file operation functions, do not specify BCD for the data type of the storage devices.

■Character code for the file line read function (file_lineread, file_unilineread)

When using file_lineread or file_unilineread, pay attention to the supported character codes (ASCII, Unicode).
If a character with an unsupported character code is read, the function handles it as a supported character code, resulting in incorrect output.

■Operations while files are read or written

The following file operation functions cannot be executed while the target file is accessed by other functions.
Execute the functions after the access to the target file from the other functions is complete.

File status	File operation function that cannot be executed
Being written from another function	• file_read • file_write • file_lineread • file_unilineread • file_rename • file_delete • file_copy • file_xcopy
Being read to another function	• file_write • file_rename • file_delete • file_copy*1 • file_xcopy*1

*1 This function cannot be executed while the copy destination file is being read.

■Influences on other functions

When the size of the files handled by the file operation function is large or the number of files is large, the following functions may delay the processing.

- Trigger action
- Time action
- Clock control
- Update of system information
- Update of GOT special register (GS)
- Screen save
- Object for which the trigger type of the display condition is set to [Sampling]
- Data saving by buffering and file access control (GS520)
- Delay of touch switch
- Clock display update of utility

■Overwritten file of the file write function (file_write)

Overwriting when <mode> for file_write is 1 or 2 is recommended only for files created by the file operation function.
If a file other than the above is overwritten, the file may be broken.

■Argument for the file rename function (file_rename)

When the full path to a file to be renamed is specified in <folder name>, do not leave <file name> blank.
Otherwise, the file name is not renamed correctly.

Ex.

When specifying the full path to a file in <folder name> without setting <file name>
[s16:D500] = file_rename("A:\\Package1\\ARP00001.DAT", "", "DATA-15-JAN-08.DAT"); //Renames file name.
The file name with the folder name is renamed from "A:\Package1\ARP00001.DAT" to "A:\Package1\ARP00001.DATDATA-15-JAN-08.DAT".

When specifying the full path to a file in <file name>, specify the full path to the file in <renamed file name> also.
Otherwise, the path is changed together with the change of the file name.
Therefore, the file is not moved in the intended location.

Ex.

When specifying the full path to a file in <file name> without setting <folder name>
[s16:D500] = file_rename("", "A:\\Package1\\ARP00001.DAT", "DATA-15-JAN-08.DAT"); //Renames file name.
The file name is renamed from "A:\Package1\ARP00001.DAT" to "A:\DATA-15-JAN-008.DAT".

■Argument for the file copy function (file_copy)

If there is no folder specified in <copy destination folder name>, create a folder when copying the file.
Make sure to add "\\" at the end of <copy destination folder name>.
Otherwise, the file is renamed to the folder name specified in <copy destination folder name> and copied.

Ex.

When there is no folder specified in <copy destination folder name> and "\\" is not added at the end of <copy destination folder name>
[s16:D200] = file_copy("A:\\Package1\\ARP00001.DAT", "B:\\backup", "", 1); //Copies file.
If no backup folder exists in the drive B, "ARP00001.DAT" is renamed to backup and copied in "B:\\".

Do not create any folder in the same name as that of the file specified in <copy source file name> in the copy destination drive.
Otherwise, the file cannot be copied correctly.

■Operation of the folder copy function (file_xcopy)

If an error occurs during the copying process, copying files stops.
The files copied before interruption are correctly copied.
Do not create any folder in the same name as that of the file specified in <copy source file name> in the copy destination drive.
Otherwise, the file cannot be copied correctly.

■Maximum number of characters in the folder or file name

When specifying the folder and file names with devices, keep the maximum number of characters that are specified by the declaration statement (#pragma folder_name_length, #pragma file_name_length) to a minimum.

When specifying the folder and file names with devices, the GOT reads as many devices as the number of the characters specified in the declaration statement.

If the values specified in the functions exceed the actual number of the file and folder name characters, the GOT reads unnecessary devices.

Reading unnecessary data results in an excessive load on the communication process, so such an operation as updating a screen or executing a script may take longer time.

Ex.

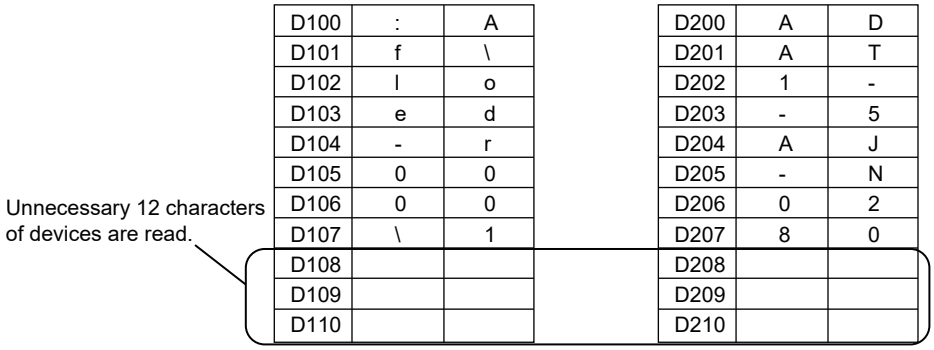
When the maximum number of characters in a file name is set to 22 and the number of characters in the actual file name is 16

D100 to D110: Holds the folder name "A:\folder-00001\".

D200 to D210: Holds the file name "DATA-15-JAN-2008".

GD100: Storage device

```
#pragma folder_name_length(22)                          //Limits the maximum folder name length to 22 characters.
#pragma file_name_length(22)                            //Limits the maximum file name length to 22 characters.
[s16:D500]=file_read([w:D100],[w:D200],[w:GD100],0,16); //Reads the 16-byte data from the specified file.
```



D100	:	A		D200	A	D
D101	f	\		D201	A	T
D102	l	o		D202	1	-
D103	e	d		D203	-	5
D104	-	r		D204	A	J
D105	0	0		D205	-	N
D106	0	0		D206	0	2
D107	\	1		D207	8	0
D108				D208		
D109				D209		
D110				D210		

Functions (string operation)

The string operation functions are used to partially read strings stored in the devices or convert strings of different character codes and write them to the devices.

By using a file operation function together with a string operation function, you can read data from a CSV file or Unicode text file, or edit the file.

For the arguments available to the string operation functions, refer to the following.

☞ Page 2357 Arguments for the file operation function and string operation function and how to express them

For the data type of arguments and return values, refer to the following.

☞ Page 2350 Devices used for arguments

Function	Description	
str_scanf	Syntax	str_scanf (<input string storage device>, <input byte count>, <offset>, <format>, <input value storage device>, <input value storage device>, ...)
	Function	Use this function to read data from an ASCII or Shift JIS string. Stores the character string equivalent to <input byte count> extending from the xth byte (x is specified by <offset>) of <input string storage device> in <input value storage device> in the format specified by <format>. Up to 10 pieces of data can be read.
	Data type of arguments	<input string storage device>, <input byte count>, <offset>: long <format>: Character string <input value storage device>, ...: Changes the specified data type to the device type.
	Return value	long Normal: Number of the pieces of read data Error: -1
	Example	[s16:D500] = str_scanf([w:D100], 32, 0, "%d,%4x", [w:D200], [w:D204]);

Function	Description	
str_printf	Syntax	str_printf (<output string storage device>, <output byte count>, <format>, <output value storage device>, <output value storage device>, ...)
	Function	Use this function to write a device value in ASCII or Shift JIS code. Writes the value of <output value storage device> equivalent to <output byte count>, starting from the first byte of <output string storage device> in <format>. A null is appended to a string, and therefore specify "the number of characters + 1" for <output byte count>. Up to 10 pieces of data can be written.
	Data type of arguments	<output string storage device>, <output byte count>: long <format>: Character string <output value storage device>, ...: Changes the device value to the specified data type.
	Return value	long Normal: Data length of the written string (bytes) Error: -1
	Example	[s16:D500] = str_printf([w:D100], 18, "%04d,%4x,%4.2f\r\n", [s16:D200], [s16:D300], [flt:D400]);
str_strlen	Syntax	str_strlen (<input string storage device>, <input byte count>)
	Function	Use this function to obtain the data length of an ASCII or Shift JIS string. Obtains the data length of characters from the first byte of <input string storage device> to the byte specified by <input byte count>.
	Data type of arguments	<input string storage device>, <input byte count>: long
	Return value	long Normal: Data length of the string (bytes) Error: -1
	Example	[s16:D500] = str_strlen([w:D100], 10);
str_strmid	Syntax	str_strmid (<input string storage device>, <output string storage device>, <offset>, <string length>)
	Function	Use this function to read a part of an ASCII or Shift JIS string and write the read data to a device. Stores the character string equivalent to <string length> extending from the xth byte (x is specified by <offset>) of <input string storage device> in <output string storage device>.
	Data type of arguments	<input string storage device>, <output string storage device>, <offset>, <string length>: long
	Return value	long Normal: Data length of the read string (bytes) Error: -1
	Example	[s16:D500] = str_strmid([w:D100], [w:D200], 5, 7);
str_uniscanf	Syntax	str_uniscanf (<input string storage device>, <input byte count>, <offset>, <format>, <input value storage device>, <input value storage device>, ...)
	Function	Use this function to read data from a Unicode string. Stores the character string equivalent to <input byte count> extending from the xth byte (x is specified by <offset>) of <input string storage device> in <input value storage device> in the format specified by <format>. Up to 10 pieces of data can be read.
	Data type of arguments	<input string storage device>, <input byte count>, <offset>: long <format>: Character string <input value storage device>, ...: Changes the specified data type to the device type.
	Return value	long Normal: Number of the pieces of read data Error: -1
	Example	[s16:D500] = str_uniscanf([w:D100], 32, 0, "%d%5s", [s16:D200], [w:D300]);
str_uniprintf	Syntax	str_printf (<output string storage device>, <output byte count>, <format>, <output value storage device>, <output value storage device>, ...)
	Function	Use this function to write a device value in Unicode. Writes the value of <output value storage device> equivalent to <output byte count>, starting from the first byte of <output string storage device> in <format>. A null is appended to a string, and therefore specify "the number of characters + 2" for <output byte count>. Up to 10 pieces of data can be written.
	Data type of arguments	<output string storage device>, <output byte count>: long <format>: Character string <output value storage device>, ...: Changes the device value to the specified data type.
	Return value	long Normal: Data length of the written string (bytes) Error: -1
	Example	[s16:GD400] = str_uniprintf([w:GD100], 32, "%04d?t%5s\r\n", [s16:GD200], [w:GD300]);

Function	Description	
str_unistrlen	Syntax	str_unistrlen (<input string storage device>, <input byte count>)
	Function	Use this function to obtain the data length of a Unicode string. Obtains the data length of characters from the first byte of <input string storage device> to the byte specified by <input byte count>.
	Data type of arguments	<input string storage device>, <input byte count>: long
	Return value	long Normal: Data length of the string (bytes) Error: -1
	Example	[s16:GD200] = str_unistrlen([w:GD100], 20);
str_unistrmid	Syntax	str_unistrmid (<input string storage device>, <output string storage device>, <offset>, <string length>)
	Function	Use this function to read a part of a Unicode string and write it to a device. Stores the character string equivalent to <string length> extending from the xth byte (x is specified by <offset>) of <input string storage device> in <output string storage device>.
	Data type of arguments	<input string storage device>, <output string storage device>, <offset>, <string length>: long
	Return value	long Normal: Data length of the read string (bytes) Error: -1
	Example	[s16:GD400] = str_unistrmid([w:GD100], [w:GD200], 10, 5);
str_lc2uni	Syntax	str_lc2uni (<local code type>, <original string storage device>, <destination string storage device>, <input byte count>, <output byte count>)
	Function	Use this function to encode characters in a local code to characters in Unicode. Reads characters from a string in <local code type> in <original string storage device> and subsequent devices. The number of read characters is specified by <input byte count>. The following shows the setting of <local code>. • 0: Depends on the system language. (ASCII for English, Shift JIS for other languages): 0 • SJIS: 1 • ASCII: 2 • GB: 3 • KS: 4 • Big5: 5 Encodes the read characters to Unicode, and writes the Unicode characters to <destination string storage device> and subsequent devices. The number of written characters is specified by <output byte count>. A character that cannot be encoded is replaced with a space.
	Data type of arguments	<local code type>, <conversion source string storage device>, <conversion destination string storage device>, <input byte count>, <output byte count>: long
	Return value	long Normal: Data length of the written string (bytes) Error: -1
	Example	[s16:GD300] = str_lc2uni(1, [w:GD100], [w:GD200], 6, 12);
str_uni2lc	Syntax	str_uni2lc (<local code type>, <original string storage device>, <destination string storage device>, <input byte count>, <output byte count>)
	Function	Use this function to encode characters in Unicode to characters in a local code. Reads characters from a Unicode string in <original string storage device> and subsequent devices. The number of read characters is specified by <input byte count>. The read Unicode characters are encoded to a character code specified in <local code type>, and the encoded characters are written to <destination string storage device> and subsequent devices. The number of written characters is specified by <output byte count>. A character that cannot be encoded is replaced with a space.
	Data type of arguments	<local code type>, <conversion source string storage device>, <conversion destination string storage device>, <input byte count>, <output byte count>: long
	Return value	long Normal: Data length of the written string (bytes) Error: -1
	Example	[s16:GD300] = str_uni2lc(3, [w:GD100], [w:GD200], 12, 6);

■Devices used for arguments

If a controller device is used for any of the following arguments, a function using the argument takes a long time to execute. Therefore, using a GOT internal device is recommended.

- <input string storage device>
- <output string storage device>
- <input value storage device>
- <output value storage device>
- <original string storage device>
- <destination string storage device>

■Order of storing data in arguments

The [File/Text Handling Function Storage Order] setting is not applied to some arguments.
When the setting is not applied, the argument storage order is fixed to [Low→High].
☞ Page 2410 [Option] tab

Argument to which the [File/Text Handling Function Storage Order] setting is applied	Argument to which the [File/Text Handling Function Storage Order] setting is not applied
• <input string storage device> • <output string storage device>	• Arguments other than <input string storage device> and <output string storage device>

When [High→Low] is selected for [File/Text Handling Function Storage Order] and a string operation function and a file operation function are used together, the resulting operation may not be as intended depending on whether the setting for [File/Text Handling Function Storage Order] is applied or not.

Although a 32-bit data type such as signed 32-bit binary can be specified for the device specified in the argument, the storage order setting operates in 16-bit units.
When specifying the storage order, it is recommended that you specify a 16-bit data type such as signed 16-bit binary data.

■Character code for string operation function

When using string operation functions, pay attention to the supported character codes (ASCII, Shift JIS, Unicode).
If a character with an unsupported character code is read, the function handles it as a supported character code, resulting in incorrect output.

■Return value when an error occurs

If an error occurs when data in a device set as an argument is being read or written, execution of the script is aborted. Therefore, no return value is stored in the device for storing the return value.

Others

Constants, symbols, and declaration statements used to write scripts

Item	Description	
Constant	Syntax	1234
	Function	Constant (decimal number, hexadecimal number, BCD, real number, character string) For details on the constants, refer to the following. ☞ Page 2352 Available constants and how to express the constants
#pragma use_ptmp_length	Syntax	#pragma use_ptmp_length (<points to be used>)
	Function	It can only be used with script parts. Declare the number of script parts temporary device areas (PTMP) ranging from 1 to 32768. If not declared, the number is 1024. (PTMP0 to PTMP1023) The declaration statement is declared before the body of the script. When multiple numbers are declared in a script part, the maximum number is applied. When a value out of the range is set in <maximum number of areas>, the declaration becomes disabled. (1024, PTMP0 to PTMP1023)
	Example	#pragma use_ptmp_length (32768)
Local Symbol Definition	Syntax	#defsym <symbol name> <symbol definition>
	Function	Defines <symbol name>. Replaces the contents of <symbol name> in a script with those of <symbol definition> while the script is running. Even if a same-name symbol of the following types already exists in the script, the symbol name will be replaced with the symbol definition by #defsym. • Script symbol • Script parts symbol • Object script symbol The set symbol definition is effective from the definition line to the end of the script.
	Example	#defsym XYZ 10
Comment	Syntax	//(comment)
	Function	A comment can be described in (comment).

Precautions

In a syntax check, whether the number of PTMPs falls within the following range is checked regardless of the setting of #pragma use_ptmp_length.

• 32768 (PTMP0 to PTMP32767)

Even if the number of PTMPs is invalid according to the above setting, no error will occur during the syntax check.

You must check that the number of PTMPs is within the valid range.

68.2.4 Available data and how to express the data

The following describes available data used for project scripts and screen scripts and how to express them.

Data type of scripts

The following data types are provided for scripts.

- [Signed BIN16]
- [Unsigned BIN16]
- [Signed BIN32]
- [Unsigned BIN32]
- [Signed BIN64]
- [Unsigned BIN64]
- [BCD16]
- [BCD32]
- [BCD64]
- [Real(32bit)]
- [Real(64bit)]

The data types are fixed for each script.

To operate different types of data, using the integer-real number conversion function enables you to handle integral device values as real numbers for each script.

☞ Page 2373 Integer-real number conversion function

Select a data type when creating a monitor screen with GT Designer3.

Precautions

The data type for [w:device] is set to the one specified in the [Script Edit] dialog.

The following example shows an error that occurs in the syntax check when using [w:device].

Ex.

When setting [Signed BIN16] for the data type in the [Script Edit] dialog

bmov([w:GD200],[flt:GD201],10);

Since the data type for GD200 is signed 16-bit binary while the data type for GD201 is real number, an error occurs in the syntax check.

☞ Page 2375 Data type conversion function

Available constants and how to express the constants

The following four constants are provided for scripts.

Constant	Expression example	Description method
Decimal number	32-bit (positive): 124 64-bit (negative): -124LL	Describe the constant using 0 to 9 and add minus (-) at the beginning if the number is negative. When the data type is 64-bit, add "LL" after the constant.
Hexadecimal number	32-bit: 0xFF12 64-bit: 0xFF12LL	Describe the constant using 0 to 9 and A to F and add "0x" at the beginning. When the data type is 64-bit, add "LL" after the constant.
BCD	32-bit: 344 64-bit: 344LL	Describe the constant using 0 to 9. When the data type is 64-bit, add "LL" after the constant.
Real number	32-bit, positive real number: 32.124 64-bit, negative real number (exponential expression): -3.2124e + 10LF	Describe the constant using 0 to 9 and a decimal point (.) and add minus (-) at the beginning if the number is negative. When it is represented as an exponent, add "e" or "E" after the mantissa part. When the data type is 64-bit, add "LF" after the constant.

However, available constants and the data range are determined according to the data type of each script as shown below.

Data type	Available constant	Available data range
Signed 16-bit binary	Decimal number	-32768 to 32767
	Hexadecimal number	0 to FFFF
Unsigned 16-bit binary	Decimal number	0 to 65535
	Hexadecimal number	0 to FFFF

Data type	Available constant	Available data range
Signed 32-bit binary	Decimal number	-2147483648 to 2147483647
	Hexadecimal number	0 to FFFFFFFF
Unsigned 32-bit binary	Decimal number	0 to 4294967295
	Hexadecimal number	0 to FFFFFFFF
Signed 64-bit binary*4	Decimal number	-9223372036854775808 to 9223372036854775807
	Hexadecimal number	0 to FFFFFFFFFFFFFFFF
Unsigned 64-bit binary*4	Decimal number	0 to 18446744073709551615
	Hexadecimal number	0 to FFFFFFFFFFFFFFFF
BCD16	BCD	0 to 9999
BCD32	BCD	0 to 99999999
BCD64	BCD	0 to 9999999999999999
Real number (32 bits)*1	Real number	0, ±1.17550e-38 to 3.40282e+38*2
Real number (64 bits)*1	Real number	0, ±2.2250738585073e-308 to 1.7976931348623e+308*3

*1 When a value exceeding the number of digits to which a real number is accurate is set, the set value and the operating value differ. For a real number, set the number of digits not exceeding the number of digits to which the real number is accurate.
*2 The real number precision is given to 6-digit.
*3 The real number precision is given to 14-digit.
*4 When there are real numbers (32 bits or 64 bits) in the expression of a single, if, switch, or while statement, the precision is reduced to 14 digits, which is the precision of real numbers (64 bits).

Available devices and how to express the devices

Scripts use the same devices as the ones used by other monitor functions.

Expressions of devices differ according to the device type and whether a station is specified or not.

Devices which can be monitored by the GOT depend on the device to be monitored.

☞ Page 3128 Device range and settings of Mitsubishi Electric equipment

☞ Page 3487 Device range and settings of each controller

To readily specify a device in the device setting screen, use the input navigation in the [Edit Script (script name)] dialog.

☞ Page 2415 [Edit Script(script name)] dialog

Device type		Statement example	Expression example	Model
Word device	Data type specified in the script	[w: Device No.]	[w:D100]	GT37 SoftGOT3000

*1 The available data range for the offset device number is 16 bits (-32768 to 32767).

*2 If a data type other than [w:] is specified for the offset device No., the offset can be used within the range appropriate for the data type.
*3 To specify the host station or all stations, specification of a network number and station number can be omitted.
