Engineering Software

GT Designer3 (GOT3000) Screen Design Manual

-SW1DND-GTWK3-E

Safety precautions

Always read the precautions before using this product.

Also read this manual and the relevant manuals mentioned in this manual carefully, and use the product properly while paying full attention to safety.

Note that the precautions in this manual apply only to this product.

The safety precautions are divided into the following levels: ⚠ WARNING and ⚠ CAUTION.

⚠ **WARNING**	**Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.**
⚠ **CAUTION**	**Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage.**

Note that failure to observe ⚠ CAUTION may lead to a serious accident depending on the circumstances.

Make sure to observe both warnings and cautions to ensure personal safety.

Ensure that this manual is easily accessible to all users of this product.

[Design precautions]

⚠WARNING

- To maintain the security (availability, integrity, and confidentiality) of the GOT and the system against unauthorized access, DoS[*1] attacks, computer viruses, and other cyberattacks from unreliable networks and devices via network, take appropriate measures such as firewalls, virtual private networks (VPNs), and antivirus solutions.
  Mitsubishi Electric shall have no responsibility or liability for any problems involving GOT trouble and system trouble by unauthorized access, DoS attacks, computer viruses, and other cyberattacks.
  *1 DoS: A denial-of-service (DoS) attack disrupts services by overloading systems or exploiting vulnerabilities, resulting in a denial-of-service (DoS) state.
- Check our website for vulnerability periodically, and update the software if any vulnerabilities are found.

[Design precautions]

⚠CAUTION

- When the GOT connects to an Ethernet network, the IP address setting is restricted according to the system configuration.
  When a GOT1000 series model is on an Ethernet network, do not set the IP address 192.168.0.18 for the GOT and the controller on this network.
  Doing so may cause IP address duplication at the GOT startup, adversely affecting the communication of the device with the IP address 192.168.0.18.
  The operation at IP address duplication depends on the devices and the system.
- When using the Ethernet interfaces, set an IP address for each interface to access a different network.

[Input operation precautions]

⚠WARNING

- Thoroughly read the manual to fully understand the operating procedures before performing input operations on a user-created screen (such as turning a bit device on or off, changing the current value of a word device, changing the set or current value of a timer or counter, or changing the current value of a buffer memory or parameter).
  During the input operation, never change the data of the devices which are used to perform significant operation for the system.
  Doing so may cause an accident due to an incorrect output or malfunction.

[Precautions for use of the data storage]

⚠WARNING

- If the SD card in drive A of the GOT is removed while the GOT is accessing it, the GOT may stop processing for about 20 seconds.
  During this stop, you cannot operate the GOT, and the functions running in the background, including the screen refresh, alarm, logging, and script, also stop.
  This stop may affect the system operation, causing an accident.
  Before removing the SD card, check that the SD card access LED is off.

[Precautions for use of the data storage]

⚠CAUTION

- If you remove the data storage from the GOT while the GOT is accessing it, the data storage or files may get damaged.
  Before removing the data storage, check the SD card access LED, relevant system signal, or others to make sure that the data storage is not being accessed.
  If the data storage is damaged, the GOT may not function properly.

[Remote control precautions]

⚠WARNING

- Remote control is available through a network by using GOT functions, including the VNC server function and the GOT Mobile function.
  If these functions are used to perform remote control of control equipment, the field operator may not notice the remote control, possibly leading to an accident.
  In addition, a communication delay or interruption may occur depending on the network environment, and remote control of control equipment cannot be performed normally in some cases.
  Before using the above functions to perform remote control, fully grasp the circumstances of the field site and ensure safety.
- When operating the server (GOT) of the GOT Mobile function to disconnect a client, notify the operator of the client about the disconnection beforehand.
  Not doing so may cause an accident.

Product application

(1) Mitsubishi graphic operation terminal ("the PRODUCT") shall be used in conditions;
i) where any problem, fault or failure occurring in the PRODUCT, if any, shall not lead to any major or serious accident;
and
ii) where the backup and fail-safe function are systematically or automatically provided outside of the PRODUCT for the case of any problem, fault or failure occurring in the PRODUCT.

(2) The PRODUCT has been designed and manufactured for the purpose of being used in general industries.
MITSUBISHI ELECTRIC SHALL HAVE NO RESPONSIBILITY OR LIABILITY (INCLUDING, BUT NOT LIMITED TO ANY AND ALL RESPONSIBILITY OR LIABILITY BASED ON CONTRACT, WARRANTY, TORT, PRODUCT LIABILITY) FOR ANY INJURY OR DEATH TO PERSONS OR LOSS OR DAMAGE TO PROPERTY CAUSED BY the PRODUCT THAT ARE OPERATED OR USED IN APPLICATION NOT INTENDED OR EXCLUDED BY INSTRUCTIONS, PRECAUTIONS, OR WARNING CONTAINED IN MITSUBISHI ELECTRIC USER'S, INSTRUCTION AND/OR SAFETY MANUALS, TECHNICAL BULLETINS AND GUIDELINES FOR the PRODUCT. ("Prohibited Application")
- Nuclear Power Plants and any other power plants operated by Power companies, and/or any other cases in which the public could be affected if any problem or fault occurs in the PRODUCT.
- Railway companies or Public service purposes, and/or any other cases in which establishment of a special quality assurance system is required by the Purchaser or End User.
- Aircraft or Aerospace, Medical applications, Train equipment, transport equipment such as Elevator and Escalator, Incineration and Fuel devices, Vehicles, Manned transportation, Equipment for Recreation and Amusement, and Safety devices, handling of Nuclear or Hazardous Materials or Chemicals, Mining and Drilling, and/or other applications where there is a significant risk of injury to the public or property.

Notwithstanding the above restrictions, Mitsubishi Electric may in its sole discretion, authorize use of the PRODUCT in one or more of the Prohibited Applications, provided that the usage of the PRODUCT is limited only for the specific applications agreed to by Mitsubishi Electric and provided further that no special quality assurance or fail-safe, redundant or other safety features which exceed the general specifications of the PRODUCTs are required. For details, please contact the Mitsubishi Electric representative in your region.

(3) Mitsubishi Electric shall have no responsibility or liability for any problems involving graphic operation terminal trouble and system trouble caused by DoS attacks, unauthorized access, computer viruses, and other cyberattacks.

Introduction

Thank you for choosing Mitsubishi Electric Graphic Operation Terminal (GOT).
Before using the product, read this manual carefully and make sure you understand the functions and performance of the GOT for correct use.

CONTENTS

Safety precautions . . . 1
Product application . . . 4
Introduction . . . 5
Relevant manuals . . . 26
Abbreviations, generic terms, and model icons . . . 27

PART 1 Search by purpose

CHAPTER 1 Useful information 31

1.1 Finding the reference manual . . . 31
1.2 Searching for functions . . . 37

PART 2 Steps to operate the GOT

CHAPTER 2 Procedure before operation 48

2.1 Procedure before operating the GOT . . . 49
2.2 Procedure before operating GT SoftGOT3000 . . . 51

PART 3 Specifications and screen layout of GT Designer3

CHAPTER 3 Specifications 53

3.1 Operating environment . . . 54
3.2 Model . . . 55

CHAPTER 4 Basic knowledge required for screen design 56

4.1 BootOS, CoreOS and package data . . . 57
4.2 Screen types and specifications . . . 58
4.3 Specifications of displayable characters . . . 74
4.4 Character codes supported by the GOT . . . 80
4.5 Drive configuration and capacity of the GOT . . . 81
4.6 Restrictions for folder names and file names used in GOT . . . 84

CHAPTER 5 Screen layout and basic operations 85

5.1 Startup and exit . . . 86
5.2 Switching the display language . . . 88
5.3 Screen layout . . . 91
5.4 Checking and editing settings of screens and objects . . . 126
5.5 Searching for and editing settings of projects . . . 130
5.6 Customizing GT Designer3 . . . 188

PART 4 Creating a project, simulation, and data transfer

CHAPTER 6 Project creation and operations 207

6.1 Creating a project 208
6.2 Basic operations of a project 216
6.3 Utilizing other project data 226
6.4 Verifying a project 245
6.5 Creating a screen 263
6.6 Basic operations of a screen 284
6.7 Basic operations of a screen editor 293
6.8 Setting a screen design 306
6.9 Changing screen property 313
6.10 Managing the created screen 334
6.11 Viewing the image of the created screen 336
6.12 Performing a data check 343
6.13 Checking data size 349

CHAPTER 7 Simulation 351

7.1 Specifications 352
7.2 Connecting 367
7.3 Simulation procedure 375
7.4 Screen layout of GT Simulator3 379
7.5 Connection and environment settings in GT Simulator3 381
7.6 Basic operations of GT Simulator3 392
7.7 Useful functions of GT Simulator3 393
7.8 Troubleshooting 407

CHAPTER 8 Transferring data to the GOT 408

8.1 Function overview 409
8.2 Specifications of data transfer function 410
8.3 Setting procedure for using the data transfer function 414
8.4 Transferred data and GOT storage destination 415
8.5 Route for the data transfer 418
8.6 Connecting a personal computer to the GOT 420
8.7 Configuring the settings for communication between the personal computer and the GOT 434
8.8 Setting the data to be transferred (application selection) 435
8.9 Writing data to the GOT 437
8.10 Reading the data from the GOT 441
8.11 Verifying with the project data in the GOT 443
8.12 Transferring data via a data storage 445
8.13 Setting dialogs related to data transfer 450
8.14 Troubleshooting 484

PART 5 Common settings

CHAPTER 9 Changing the GOT type of the project 493

9.1 Specifications of the GOT type change 493
9.2 Operating the monitor screen of the GOT using gestures (gesture function) 502
9.3 Expanding the base screen size 510

9.4 [Type Setting] dialog . . . 519
9.5 [Output] window . . . 528

CHAPTER 10 Setting the GOT basic operations ([GOT Environmental Setting]) 529

10.1 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window]) . . . 530
10.2 Setting for switching the language displayed on the GOT ([Language Switching]) . . . 546
10.3 Setting dialog windows of the GOT ([Dialog Window]) . . . 552
10.4 Setting key windows of the GOT ([Key Window]) . . . 558
10.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information]) . . . 576
10.6 Restricting GOT operations and data transfers ([Security]) . . . 598
10.7 Protecting files and communication data ([Information Protection Function]) . . . 599
10.8 Configuring the settings for creating the GOT operation history ([Operation Log]) . . . 600
10.9 Configuring the settings for retaining GOT internal device data at power failure ([Internal Device Retention]) . . . 601
10.10 Configuring the settings for converting a text into kanji or Simplified Chinese characters in the GOT ([Kana-Kanji/Pinyin Conversion]) . . . 604

CHAPTER 11 Configuring the GT SoftGOT3000 settings ([SoftGOT Setting]) 612

11.1 [MELSOFT GT Designer3 (GOT3000) (SoftGOT Setting)] dialog . . . 613

CHAPTER 12 Configuring the utility settings ([GOT Setup]) 614

12.1 Configuring the settings for the display on the GOT ([Display Setting/Language Setting]) . . . 616
12.2 Setting the identification information to the GOT ([GOT ID]) . . . 620
12.3 Configuring the settings for the touch operation on the GOT ([Operation Setting/Utility Call Key]) . . . 626
12.4 Disabling the USB interface on the GOT front face ([USB Common Setting]) . . . 629
12.5 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host]) . . . 630
12.6 Setting the GOT time setting method ([Time Setting]) . . . 635
12.7 Setting the FA transparent function ([Transparent Mode Setting]) . . . 643
12.8 Configuring the settings for the GOT internal device monitor ([GOT Internal Device Monitor]) . . . 644
12.9 Setting a screen to be displayed on the GOT at startup ([Startup Logo]) . . . 645
12.10 Configuring the external display output settings ([Digital Image Output]) . . . 647
12.11 Configuring the settings for the SoftGOT-GOT link function ([SoftGOT-GOT Link]) . . . 648
12.12 Configuring the settings for the VNC server function ([VNC Server]) . . . 649
12.13 Configuring the settings for the sequence program monitor ([Sequence Program Monitor]) . . . 650
12.14 Configuring the settings for the backup/restoration function ([Backup/Restoration]) . . . 652
12.15 Configuring the settings for the system launcher function ([System Launcher]) . . . 655
12.16 Configuring the settings for the iQSS utility function ([iQSS Utility]) . . . 656
12.17 Configuring the settings for the GOT contactless tag ([Contactless Tag]) . . . 667
12.18 Setting the VPN connection function of the GOT ([VPN Connection]) . . . 671
12.19 Setting the web browser function ([Web Browser]) . . . 691

CHAPTER 13 Setting the GOT Ethernet interface ([GOT Ethernet Setting]) 713

13.1 Setting the GOT IP address . . . 714
13.2 Configuring the settings common to Ethernet interfaces . . . 717
13.3 Setting the IP filter . . . 719

CHAPTER 14 Configuring the communication method between the GOT and the controller ([Controller Setting]) 726

14.1 Setting channels . . . 727

14.2 Setting the routing information 740
14.3 Configuring the setting of the MELSEC redundant function 744
14.4 Configuring settings for switching the target station number for monitoring 747
14.5 Configuring the settings for switching the monitoring target buffer memory unit number 755

CHAPTER 15 Setting the interaction function for equipment on Ethernet ([GOT Network Interaction]) 762

15.1 Specifications of the GOT network interaction function 763
15.2 How to use the GOT network interaction function 766
15.3 Precautions 771
15.4 [GOT Network Interaction] dialog 772

CHAPTER 16 Checking the interface settings of the GOT ([I/F Communication Setting]) 773

16.1 How to use the I/F communication setting 773
16.2 [I/F Communication Setting] dialog 774

CHAPTER 17 Comment setting ([Comment]) 776

17.1 Specifications of comments 777
17.2 How to use comment 780
17.3 Setting comments 788

CHAPTER 18 Registering parts ([Parts]) 812

18.1 Outline of parts 812
18.2 Specifications of parts 814
18.3 How to use parts ([Parts]) 816
18.4 [Parts Image List] window 830
18.5 [Parts Setting] dialog 831

PART 6 Basic settings and edits

CHAPTER 19 Device, label, and tag settings 833

19.1 How to set devices, labels, and tags 834
19.2 Settable devices in GT Designer3 854
19.3 Labels and Tags Usable in GT Designer3 858
19.4 How to set labels (GT Designer3) 867
19.5 How to set global labels 896
19.6 How to set OMRON NJ/NX tags 921
19.7 Using RSLogix 5000 tags 931
19.8 How to set AB native tags 936
19.9 How to set OPC UA tags 944
19.10 How to Set Device Comments or Device Definitions 954
19.11 Offset 963

CHAPTER 20 Trigger type settings 968

20.1 Trigger types settable for the object display condition 969
20.2 Trigger types settable for the object operating condition 976
20.3 Trigger types of the functions running in the background 980

CHAPTER 21 Color settings 988
21.1 Color settings 988
21.2 Color palette. 989

PART 7 Settings for figures and objects

CHAPTER 22 Basics of figures and objects 995
22.1 List of figures and objects 996
22.2 Placing figures and objects 1001
22.3 Selecting figures and objects on the screen editor 1003
22.4 Moving a figure or an object. 1006
22.5 Resizing 1007
22.6 Changing the settings. 1014
22.7 Operation with the [Edit] menu 1015
22.8 Settings common to figures and objects 1032
22.9 Settings common to figures. 1034
22.10 Settings common to objects 1037
22.11 Superimposition of figures and objects 1055

CHAPTER 23 Using the data registered in the library 1061
23.1 Specifications of the library 1062
23.2 How to use the library. 1067
23.3 [Library] window 1085

CHAPTER 24 Efficient Drawing with Templates 1092
24.1 Specifications of the template 1093
24.2 How to use the template. 1096
24.3 [Edit Template Attribute] dialog 1111
24.4 [Register to Template] dialog 1117
24.5 [Property] window (when the template property is displayed) 1118

CHAPTER 25 Managing figures and objects by category 1121
25.1 Specifications of the category 1122
25.2 How to use the category. 1123
25.3 [Category List] window. 1128

CHAPTER 26 Figures 1131
26.1 Drawing a text figure. 1132
26.2 Drawing a logo text figure 1135
26.3 Drawing a Line. 1141
26.4 Drawing a Line Freeform 1145
26.5 Drawing a Rectangle. 1149
26.6 Drawing a Polygon 1153
26.7 Drawing a Circle 1157
26.8 Drawing an Arc or a Sector 1161
26.9 Drawing a Table. 1163
26.10 Drawing a Scale. 1167
26.11 Drawing a Piping 1169
26.12 Filling the framed area of the figure 1173

26.13 Pasting an image file 1177
26.14 Pasting DXF Data 1184
26.15 Pasting IGES Data 1187

CHAPTER 27 Placing a touch switch 1191

27.1 Overview of a touch switch 1192
27.2 How to use touch switch 1195
27.3 Specifications of touch switch 1197
27.4 Setting touch switches 1198
27.5 [Switch] dialog 1199
27.6 [Bit Switch] dialog 1215
27.7 [Word Switch] dialog 1217
27.8 [Go To Screen Switch] dialog 1220
27.9 [Change Station No. Switch] dialog 1227
27.10 [Special Function Switch] dialog 1230
27.11 [Key Window Display Switch] dialog 1249
27.12 [Key Code Switch] dialog 1251
27.13 Settings common to touch switches 1257
27.14 Relevant settings 1273

CHAPTER 28 Placing a lamp 1276

28.1 Overview of lamps 1277
28.2 Specifications of Lamps 1278
28.3 How to use the lamp 1279
28.4 [Bit Lamp] dialog 1282
28.5 [Word Lamp] dialog 1292
28.6 [Lamp Area] dialog 1304

CHAPTER 29 Placing a numerical display or numerical input object 1305

29.1 Overview of the numerical display and numerical input objects 1306
29.2 How to use the numerical display and numerical input objects 1308
29.3 Specifications of the numerical display and numerical input objects 1314
29.4 Configuring the settings for a numerical display or numerical input object 1316
29.5 [Numerical Display] dialog 1317
29.6 [Numerical Input] dialog 1328
29.7 Relevant settings 1342

CHAPTER 30 Placing a text display or text input object 1345

30.1 Overview of the text display and text input objects 1346
30.2 How to use the text display and text input objects 1348
30.3 Specifications of the text display and text input objects 1352
30.4 Configuring the settings for a text display or text input object 1356
30.5 [Text Display] dialog 1357
30.6 [Text Input] dialog 1362
30.7 Relevant settings 1370

CHAPTER 31 Placing a date display or time display 1373

31.1 Specifications of the date display and time display 1374
31.2 How to use the date display and time display 1375
31.3 [Date Display] dialog 1376

31.4 [Time Display] dialog 1381

CHAPTER 32 Placing a comment display 1386

32.1 Specifications of the comment display 1387
32.2 How to use the comment display 1388
32.3 [Bit Comment Display] dialog 1390
32.4 [Word Comment Display] dialog 1400
32.5 [Simple Comment Display] dialog 1413

CHAPTER 33 Placing a parts display 1416

33.1 How to switch parts 1416
33.2 Specifications of the parts display 1417
33.3 How to use the parts display 1420
33.4 [Bit Parts Display] dialog 1436
33.5 [Word Parts Display] dialog 1449
33.6 [Fixed Parts Display] dialog 1464
33.7 Relevant settings 1476

CHAPTER 34 Placing a frame animation 1477

34.1 Overview of the frame animation 1478
34.2 How to use the frame animation 1479
34.3 Specifications of the frame animation 1481
34.4 Configuring the frame animation settings 1484
34.5 [Frame Animation] dialog 1486

CHAPTER 35 Placing a historical data list display 1495

35.1 Specifications of the historical data list display 1495
35.2 How to use the historical data list display 1498
35.3 [Historical Data List Display] dialog 1504

CHAPTER 36 Placing an alarm display 1518

CHAPTER 37 Placing a simple alarm display 1519

37.1 Specifications of the simple alarm display 1520
37.2 How to use the simple alarm display 1521
37.3 [Simple Alarm Display] dialog 1533
37.4 Relevant settings 1541

CHAPTER 38 Placing a system alarm display 1542

38.1 Specifications of the system alarm display 1543
38.2 How to use the system alarm display 1545
38.3 [System Alarm Display] dialog 1547
38.4 Relevant settings 1549

CHAPTER 39 Placing a recipe display (record list) 1550

39.1 Specifications of the recipe display (record list) 1551
39.2 How to use the recipe display (record list) 1552
39.3 [Recipe Display (Record List)] dialog 1563
39.4 Relevant settings 1576

CHAPTER 40 Placing a line graph 1577
40.1 Overview of the line graph 1578
40.2 How to use the line graph 1580
40.3 Specifications of the line graph 1582
40.4 Setting a line graph 1583
40.5 [Line Graph] dialog 1584
CHAPTER 41 Placing a trend graph 1594
41.1 Overview of the trend graph 1594
41.2 Specifications of the trend graph 1595
41.3 How to use the trend graph 1596
41.4 [Trend Graph] dialog 1605
41.5 Relevant settings 1623
CHAPTER 42 Placing a bar graph 1624
42.1 Overview of the bar graph 1625
42.2 How to use the bar graph 1626
42.3 Specifications of the bar graph 1628
42.4 Setting a bar graph 1630
42.5 [Bar Graph] dialog 1631
CHAPTER 43 Placing a bar graph 1640
43.1 Specifications of the bar graph 1641
43.2 How to use the bar graph 1642
43.3 [Bar(Rectangle)] dialog 1645
CHAPTER 44 Placing a pie graph 1655
44.1 Specifications of the pie graph 1656
44.2 How to use the pie graph 1657
44.3 [Pie(Circle)] dialog 1660
CHAPTER 45 Placing a scatter graph 1669
45.1 Overview of the scatter graph 1669
45.2 Specifications of the scatter graph 1671
45.3 How to use the scatter graph 1672
45.4 [Scatter Graph] dialog 1680
CHAPTER 46 Placing a historical trend graph 1693
46.1 Overview of the historical trend graph 1693
46.2 Specifications of the historical trend graph 1693
46.3 How to use the historical graph 1702
46.4 [Historical Trend Graph] dialog 1710
46.5 Relevant settings 1729
CHAPTER 47 Placing a graphical meter 1730
47.1 Overview of the graphical meter 1731
47.2 How to use the graphical meter 1732
47.3 Specifications of the graphical meter 1734
47.4 Setting the graphical meter 1737
47.5 Resizing the graphical meter 1738

47.6 Editing the areas of the graphical meter 1739
47.7 [Graphical Meter] dialog 1742

CHAPTER 48 Placing a level object 1761

48.1 Overview of the level object 1761
48.2 Specifications of the level object 1762
48.3 How to use the level object 1763
48.4 [Level] dialog 1771

CHAPTER 49 Placing a panel meter 1778

49.1 Overview of the panel meter 1778
49.2 How to use the panel meter 1779
49.3 Specifications of the panel meter 1780
49.4 Setting a panel meter 1782
49.5 [Panelmeter] dialog 1783

CHAPTER 50 Placing a slider 1797

50.1 Overview of the slider 1797
50.2 How to use the slider 1799
50.3 Specifications of the slider 1800
50.4 Setting the slider 1801
50.5 [Slider] dialog 1802

CHAPTER 51 Placing a document display 1809

51.1 Overview of the document display 1810
51.2 Specifications of the document display 1811
51.3 Preparation for using Document Converter 1814
51.4 How to use the document display (for PDF files) 1819
51.5 How to use the document display (for Document Converter output files) 1821
51.6 Placing a document display 1825
51.7 Operating the document display 1827
51.8 [Document Display] dialog 1837
51.9 Relevant settings 1843

CHAPTER 52 Placing a digital image display object 1844

52.1 Overview of the digital image display object 1845
52.2 Specifications of the digital image display object 1847
52.3 How to use the digital image display object 1855
52.4 [Digital Image Display] dialog 1859
52.5 Relevant settings 1863

CHAPTER 53 Placing a script parts object 1864

CHAPTER 54 Placing a screen on another screen 1865

54.1 Overview of the set overlay screen object 1866
54.2 Specifications of the set overlay screen object 1868
54.3 How to use the set overlay screen object 1873
54.4 [Set Overlay Screen] dialog 1876
54.5 Relevant settings 1877

CHAPTER 55 Configuring an animation route 1878
55.1 Overview of the animation route 1879
55.2 Animation route specifications 1880
55.3 Configuring an animation route 1881
55.4 [Animation Route] dialog 1882

CHAPTER 56 Specifying the display position of a window screen 1883
56.1 Overview of the window position object 1884
56.2 Specifications of the window position 1885
56.3 How to use the window position 1886

CHAPTER 57 Placing an object to display the input information 1887
57.1 Overview of the object to display the input information 1888
57.2 Specifications of key window objects 1889
57.3 Placing the key window object 1890
57.4 [Input Value Area Setting] dialog 1891
57.5 [Input Range Area Setting] dialog 1892
57.6 [Input Maximum Value Area Setting] dialog 1893
57.7 [Input Minimum Value Area Setting] dialog 1894
57.8 [Previous Value Area Setting] dialog 1895

CHAPTER 58 Placing a hyperlink on a mobile screen 1896
58.1 Overview of the hyperlink 1897
58.2 Specifications of the hyperlink object 1899
58.3 How to use the hyperlink object 1900
58.4 [Hyperlink] dialog 1901

PART 8 Operation log

CHAPTER 59 Configuring the settings for collecting the GOT operation history ([Operation Log]) 1909
59.1 Overview of operation logs 1910
59.2 Specifications of the operation log 1911
59.3 Log details by operation 1927
59.4 How to use operation logs 2003
59.5 Recording the operator name as the character string stored in the device 2011
59.6 [Operation Log] 2013
59.7 [Operation Log File Conversion] dialog 2019
59.8 Relevant settings 2020

PART 9 Alarm

CHAPTER 60 Collecting alarms by monitoring devices 2022
60.1 Overview of the user alarm monitoring 2023
60.2 Specifications of the user alarm monitoring 2024
60.3 Procedure for setting the user alarm monitoring 2033
60.4 Power failure backup by storing the user alarm 2034
60.5 Converting alarm log files 2038

60.6 [Alarm Common Setting] dialog . . . 2043
60.7 [User Alarm Observation List] dialog . . . 2044
60.8 [User Alarm Observation] dialog . . . 2045
60.9 [Alarm File Conversion] dialog . . . 2072
60.10 Relevant settings . . . 2073

CHAPTER 61 Collecting alarms by monitoring the system 2075

61.1 Overview of system alarm monitoring . . . 2076
61.2 Specifications of the system alarm monitoring . . . 2077
61.3 Procedure for setting the system alarm monitoring . . . 2084
61.4 Recovery from alarms . . . 2085
61.5 Deleting alarm data . . . 2088
61.6 Power failure backup by storing the user alarm . . . 2089
61.7 Converting alarm log files . . . 2093
61.8 [System Alarm Observation] dialog . . . 2097
61.9 Relevant settings . . . 2103

CHAPTER 62 Enabling the popup display for when an alarm occurs 2105

62.1 Overview of the alarm popup display . . . 2106
62.2 How to use the alarm popup display . . . 2107
62.3 Specifications of the alarm popup display . . . 2114
62.4 Setting the alarm popup display . . . 2116
62.5 [Alarm Popup Display] dialog . . . 2118
62.6 Relevant settings . . . 2131

CHAPTER 63 Viewing alarm events (Alarm display) 2132

63.1 Overview of the alarm display . . . 2133
63.2 How to use the alarm display . . . 2134
63.3 Specifications of the alarm display . . . 2139
63.4 Configuring the settings for an alarm display . . . 2140
63.5 Key code switches for operating alarm displays . . . 2141
63.6 [Alarm Display(User)] dialog . . . 2144
63.7 [Alarm Display(System)] dialog . . . 2164
63.8 Relevant settings . . . 2178

CHAPTER 64 Sending an e-mail from the GOT when an alarm occurs (mail send function) 2179

64.1 Overview of the mail send function . . . 2179
64.2 Specifications of the mail send function . . . 2180
64.3 How to use the mail send function . . . 2183
64.4 [Mailing] . . . 2186
64.5 Mail send function application example . . . 2188
64.6 Relevant settings . . . 2189
64.7 Troubleshooting . . . 2190

PART 10 Logging

CHAPTER 65 Collecting device data ([Logging]) 2194

65.1 Overview of the logging function . . . 2195

65.2 Useful information 2197
65.3 Basic flow of data collection and storage 2198
65.4 How to save logging data (logging mode) 2200
65.5 Specifications of the logging 2210
65.6 Control triggers used for logging 2214
65.7 Notification devices used for logging 2217
65.8 How to use the logging 2221
65.9 [Logging List] dialog 2227
65.10 [Logging] dialog 2228
65.11 [Logging File Conversion] dialog 2240
65.12 Relevant settings 2241

PART 11 Recipe

CHAPTER 66 Writing or reading values to multiple devices ([Recipe]) 2243

66.1 Overview of the recipe function 2244
66.2 Specifications of the recipe 2246
66.3 How to use the recipe 2255
66.4 Control and notification with devices 2301
66.5 [Recipe Common Setting] dialog 2309
66.6 [Recipe List] dialog 2310
66.7 [Recipe] dialog 2311
66.8 [Recipe File Conversion] dialog 2321
66.9 Relevant settings 2322

PART 12 Script

CHAPTER 67 Controlling operations with scripts ([Script]) 2325

67.1 Overview of the script function 2326
67.2 Features of the script function 2327
67.3 Script types 2329

CHAPTER 68 Project script, screen script, script part, and script block 2330

68.1 Overview of the script function 2331
68.2 Specifications of the script 2334
68.3 How to use a script 2377
68.4 Program example 2387
68.5 [Script] dialog 2403
68.6 [Script Edit] dialog (for project scripts and screen scripts) 2412
68.7 [Edit Script(script name)] dialog 2415
68.8 [Script File List] dialog 2417
68.9 [Script Symbol] dialog 2421
68.10 [Script Parts] dialog 2424
68.11 [Script Edit] dialog (for script parts) 2428
68.12 Relevant settings 2431
68.13 Troubleshooting 2434

CHAPTER 69 Object script 2447
69.1 Overview of the object script 2447
69.2 Specifications of the object script 2447
69.3 How to use object scripts 2463
69.4 Program example 2468
69.5 [Object Script Symbol] dialog 2472
69.6 How to set object scripts 2475
69.7 Relevant settings 2482
69.8 Troubleshooting 2484

PART 13 Device data transfer

CHAPTER 70 Transferring data between devices ([Device Data Transfer]) 2498
70.1 Overview of the device data transfer function 2499
70.2 Specifications of device data transfer 2500
70.3 How to use device data transfer 2505
70.4 [Device Data Transfer List] dialog 2514
70.5 [Device Data Transfer] dialog 2515
70.6 Relevant settings 2519

PART 14 Trigger action

CHAPTER 71 Operating a device as a trigger ([Trigger Action]) 2521
71.1 Overview of the trigger action function 2521
71.2 Specifications of trigger action 2522
71.3 How to use trigger action 2524
71.4 [Trigger Action] dialog 2528
71.5 [Trigger/Action] dialog 2530
71.6 [Sound Setting] dialog 2539

PART 15 Time action

CHAPTER 72 Operating the set time as a trigger ([Time Action]) 2541
72.1 Overview of the time action function 2541
72.2 Specifications of the time action 2543
72.3 How to use the time action 2543
72.4 [Time Action List] dialog 2549
72.5 [Time Action Attribute] dialog 2551

PART 16 Hard copy

CHAPTER 73 Capturing the operating screen of the GOT ([Hard Copy]) 2554
73.1 Overview of the hard copy function 2554
73.2 Specifications of the hard copy 2555
73.3 How to use the hard copy function 2558
73.4 [Hard Copy] dialog 2559
73.5 Relevant settings 2562

PART 17 Barcode function

CHAPTER 74 Using a barcode reader with the GOT (barcode function) 2564

74.1 Overview of the barcode function 2565
74.2 Specifications of the barcode function 2566
74.3 Basic use of the barcode function 2568
74.4 Advanced use of the barcode function 2570
74.5 [Bar Code] dialog 2572
74.6 System information settings 2578
74.7 Action of the barcode function 2579
74.8 Relevant settings 2586

PART 18 RFID function

CHAPTER 75 Using an RFID with the GOT (RFID function) 2588

75.1 Overview of the RFID function 2589
75.2 Specifications of the RFID function 2590
75.3 Basic use of the RFID function 2592
75.4 Advanced use of the RFID function 2593
75.5 [RFID] dialog 2595
75.6 System information settings 2598
75.7 Action of an RFID 2599
75.8 Relevant settings 2611

PART 19 Remote personal computer operation (Ethernet) function

CHAPTER 76 Operating a personal computer by using the GOT (remote personal computer operation function (Ethernet)) 2613

76.1 Overview of the remote personal computer operation function (Ethernet) 2614
76.2 Specifications of the remote personal computer operation function (Ethernet) 2615
76.3 How to use the remote personal computer operation function (Ethernet) 2619
76.4 [PC Remote Operation] dialog 2622
76.5 Personal computer settings 2623
76.6 Remote personal computer screen 2633
76.7 Relevant settings 2636

PART 20 VNC server function

CHAPTER 77 Viewing the GOT from a personal computer (VNC server function) 2638

77.1 Overview of the VNC server function 2638
77.2 Specifications of the VNC server function 2639
77.3 How to use the VNC server function 2647
77.4 [VNC Server] dialog 2650
77.5 Personal computer setting 2652
77.6 Relevant settings 2658

PART 21 Digital image input function

CHAPTER 78 Displaying and recording an image from a camera or video device on the GOT (digital image input/recording function) 2661

78.1 Displaying and recording an image from a camera on the GOT . . . 2661
78.2 Displaying the PC image on the GOT . . . 2679
78.3 [Digital Image Input/Recording] dialog . . . 2688

PART 22 Video output function

CHAPTER 79 Displaying the GOT screen on an external display (video output function) 2698

79.1 Overview of the video output function . . . 2698
79.2 Specifications of the video output function . . . 2700
79.3 How to use the video output function . . . 2704
79.4 Relevant settings . . . 2705

PART 23 Sound output function

CHAPTER 80 Outputting sound with the GOT (sound output function) 2707

80.1 Overview of the sound output function . . . 2707
80.2 Specifications of the sound output function . . . 2708
80.3 How to use the sound output function . . . 2712
80.4 Registration of the speech synthesis license . . . 2714
80.5 [Sound File List] dialog . . . 2715
80.6 [Create New Sound File] or [Edit Sound File] dialog . . . 2717
80.7 [Touch Key Sound Setting] dialog . . . 2719
80.8 Relevant settings . . . 2720

PART 24 External I/O function, operation panel function

CHAPTER 81 Using an external I/O device on the GOT (External I/O function and operation panel function) 2722

81.1 Overview of the external I/O function and the operation panel function . . . 2723
81.2 Specifications of the external I/O function and the operation panel function . . . 2724
81.3 How to use the external I/O function and the operation panel function . . . 2726
81.4 [External I/O / Operation Panel] dialog . . . 2730
81.5 [Action/Key Code Setting] dialog . . . 2732
81.6 Relevant settings . . . 2734

PART 25 GOT Mobile function

CHAPTER 82 Monitoring a controller from tablets or other devices (GOT Mobile function) 2736

82.1 Overview of the GOT Mobile function . . . 2736
82.2 Specifications of the GOT Mobile function . . . 2739

82.3 System configuration of the GOT Mobile function 2766
82.4 Settings and connection method of the GOT Mobile function 2769
82.5 ANDON function 2812
82.6 [GOT Mobile Setting] window 2817
82.7 Mobile screen properties 2831
82.8 Relevant settings 2833
82.9 Troubleshooting 2834

PART 26 OPC UA server function

CHAPTER 83 Monitoring controllers through the GOT (OPC UA server function) 2839

83.1 Overview of the OPC UA server function 2840
83.2 OPC UA server function specifications 2841
83.3 OPC UA tag specifications 2843
83.4 System configuration of the OPC UA server function 2851
83.5 OPC UA server function setting methods 2852
83.6 [OPC UA Server Settings] window 2856
83.7 [OPC UA Tag Setting] window 2860
83.8 Relevant settings 2866
83.9 Troubleshooting 2866

PART 27 Controller monitoring function

CHAPTER 84 Monitoring a controller through the GOT (server/client function) 2868

84.1 Overview of the server/client function 2869
84.2 Specifications of the server/client function 2872
84.3 How to use the gateway devices 2875
84.4 How to use the server/client function 2879
84.5 [Gateway Communication Setting] 2883
84.6 [Gateway-Server] 2884
84.7 [Gateway Client] 2885
84.8 Server/client function application examples 2886
84.9 Using the server/client function efficiently 2891
84.10 Precautions 2894
84.11 Relevant settings 2898
84.12 Troubleshooting 2899

PART 28 File transfer function

CHAPTER 85 Transferring files between the GOT and peripheral devices (FTP server function) 2904

85.1 Overview of the FTP server function 2905
85.2 Specifications of the FTP server function 2906
85.3 How to use the FTP server function 2910
85.4 [FTP Server] 2913
85.5 Procedures of the FTP server function 2915
85.6 Relevant settings 2924

85.7 Troubleshooting 2925

CHAPTER 86 Transferring files between the GOT and peripheral devices (file transfer function (FTP transfer)) 2929

86.1 Overview of the file transfer function (FTP transfer) 2930
86.2 Specifications of the file transfer function (FTP transfer) 2932
86.3 How to use the file transfer function (FTP transfer) 2935
86.4 [File Transfer] (FTP transfer) 2938
86.5 Operation of the file transfer function (FTP transfer) 2948
86.6 Precautions 2954
86.7 Relevant settings 2956
86.8 Troubleshooting 2957

CHAPTER 87 Transferring files between the GOT drives (file transfer function (GOT internal transfer)) 2960

87.1 Overview of the file transfer function (GOT internal transfer) 2960
87.2 Specifications of the file transfer function (GOT internal transfer) 2961
87.3 How to use the file transfer function (GOT internal transfer) 2962
87.4 [File Transfer] (GOT internal transfer) 2963
87.5 Operation of the file transfer function (GOT internal transfer) 2967
87.6 Precautions 2970
87.7 Relevant settings 2970
87.8 Troubleshooting 2970

PART 29 Security settings

CHAPTER 88 Protecting a project by registering users (Project security) 2972

88.1 Overview of the project security 2972
88.2 Specifications of the project security 2974
88.3 How to use the project security 2980
88.4 [User Addition] dialog 2984
88.5 [User Management] dialog 2985
88.6 [Setup Access Authority] dialog 2987
88.7 [Change Password] dialog 2988

CHAPTER 89 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2)) 2989

89.1 Specifications of the operator authentication (Mode 2) 2991
89.2 How to set the operator authentication (Mode 2) 3002
89.3 Registering or editing an operator or group 3003
89.4 Editing an operator on a personal computer 3004
89.5 Common settings relevant to authentication (Operator authentication setting) 3032
89.6 Login 3034
89.7 Logout 3034
89.8 [Security] ([Screen Security] tab) (Mode 2) 3035
89.9 Relevant settings 3037

CHAPTER 90 Restricting display and operation on the GOT (Screen security) 3038
90.1 Restricting display and operation on the GOT with level authentication 3039
90.2 Restricting display and operation on the GOT with operator authentication (mode 1) 3042
90.3 [Security] ([Screen Security] tab) (Mode 1) 3053

CHAPTER 91 Configuring the security settings for operations in the utility (Functional operation security) 3057
91.1 Operations restricted by functional operation security 3057
91.2 Settings for the functional operation security 3057
91.3 [Security] ([Functional Operation Security] tab) 3058

CHAPTER 92 Configuring the security setting for transferring data (Data transfer security) 3062
92.1 Settings for the data transfer security 3064
92.2 [Security] ([Data Transfer Security] tab) 3064

CHAPTER 93 Protecting the files in the GOT (Information protection function) 3065
93.1 File tampering check function 3065
93.2 Confidentiality protection function 3066
93.3 How to set the information protection function 3067
93.4 [File Protection] 3068

CHAPTER 94 Encrypting communication data (Encrypted communication function) 3069
94.1 Specifications of the encrypted communication function 3070
94.2 Target functions for encrypted communication and required settings 3072
94.3 Creating and managing the certificate 3076
94.4 [Certificate] 3078

PART 30 Troubleshooting

CHAPTER 95 Checking the causes and corrective actions for errors (GOT diagnostics) 3080
95.1 Overview of GOT diagnostics 3080
95.2 Specifications of the GOT diagnostics 3081
95.3 Displaying GOT error information 3083
95.4 Saving the contents of the error list to a file 3085
95.5 Monitoring GOT internal devices 3086
95.6 [GOT Diagnostics] dialog 3089

CHAPTER 96 Reproducing GOT operations offline (GOT offline monitor) 3091
96.1 Outline of the GOT offline monitor 3092
96.2 Specifications of the GOT offline monitor 3095
96.3 Procedure for using the GOT offline monitor 3105
96.4 Screen layout of the GOT offline monitor 3106
96.5 Connection and environmental settings for the GOT offline monitor 3108
96.6 Basic operations of the GOT offline monitor 3112
96.7 Useful functions of the GOT offline monitor 3114
96.8 How to use a Resource File Viewer module 3117

PART 31 Device range and settings

CHAPTER 97 Device range and settings of Mitsubishi Electric equipment 3128

97.1 Device setting dialog (Mitsubishi Electric equipment) 3129
97.2 [MELSEC MX Controller] 3137
97.3 [MELSEC iQ-R, RnMT/NC/RT, CR800-D] 3165
97.4 [MELSEC iQ-L] 3253
97.5 [MELSEC iQ-F] 3265
97.6 [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700] 3279
97.7 [MELSEC-L] 3297
97.8 [MELSEC-A] 3312
97.9 [MELSEC-FX] 3316
97.10 [MELIPC] 3324
97.11 [MELSERVO-J3-*A] 3325
97.12 [MELSERVO-J3-*T] 3338
97.13 [MELSERVO-J4-*A, -JE-*A] 3353
97.14 [MELSERVO-J4-*A-RJ] 3374
97.15 [MELSERVO-JE-*C] 3399
97.16 [MELSERVO-J5(W)-*G(-RJ), -JET-*G] 3418
97.17 [FREQROL 700/800, Sensorless Servo] 3457
97.18 [FREQROL 800/E700NE(Batch monitor)] 3465

CHAPTER 98 Device range and settings of each controller 3487

98.1 AZBIL equipment ([Azbil SDC/DMC]) 3488
98.2 OMRON equipment ([OMRON SYSMAC]) 3490
98.3 OMRON equipment ([OMRON NJ/NX]) 3494
98.4 OMRON equipment ([OMRON Digital Temperature Controller]) 3495
98.5 KEYENCE equipment ([KEYENCE KV-700/1000/3000/5000/7000/8000]) 3501
98.6 FUJI equipment ([FUJI MICREX-SX SPH]) 3507
98.7 YASKAWA equipment ([YASKAWA MP2000]) 3510
98.8 YASKAWA equipment ([YASKAWA MP3000]) 3513
98.9 YASKAWA equipment ([YASKAWA Robot Controller]) 3516
98.10 YOKOGAWA equipment ([YOKOGAWA FA-M3]) 3523
98.11 ALLEN-BRADLEY equipment ([AB MicroLogix]) 3528
98.12 ALLEN-BRADLEY equipment ([AB Control/CompactLogix]) 3534
98.13 ALLEN-BRADLEY equipment ([AB Control/CompactLogix(Tag)]) 3538
98.14 LS ELECTRIC equipment ([LS ELECTRIC XGK]) 3539
98.15 SIEMENS equipment ([SIEMENS OP(Ethernet)]) 3543
98.16 CLPA ([CC-Link IE Field Network Basic]) 3552
98.17 CLPA ([SLMP]) 3556
98.18 MODBUS ([MODBUS Server(GOT:Client)]) 3562
98.19 MODBUS ([MODBUS Client(GOT:Server)]) 3569
98.20 OPC([OPC UA]) 3573
98.21 Microcomputer ([Computer]) 3574

Appendices 3577

Appendix 1 GOT internal devices 3577
Appendix 2 Precautions for using CSV file 3668
Appendix 3 Precautions for using Unicode text file 3669

Appendix 4 Specifications of resource data 3670
Appendix 5 Specifications and operations of the nonvolatile RAM user area 3679
Appendix 6 Common dialog 3683
Appendix 7 License registration method 3686
Appendix 8 Open source software 3688
Appendix 9 Functions that require upgrading the versions of BootOS and CoreOS 3732
Revisions 3734
Warranty 3735

Copyrights 3737

Relevant manuals

Point

e-Manual refers to the Mitsubishi Electric FA electronic book manuals that can be browsed using a dedicated tool.

e-Manual has the following features:

- Required information can be cross-searched in multiple manuals.
- Other manuals can be accessed from the links in the manual.
- Hardware specifications of each part can be found from the product figures.
- Pages that users often browse can be bookmarked.
- Sample programs can be copied to the engineering tool.

GOT1000 series	GOT1000 series	—	—

GOT units and option units

Abbreviations and generic terms		Description
Extension interface converter unit		This unit connects the extension unit of the GOT2000 series and GOT1000 series to the GOT3000 series.
Extension unit	Communication unit	A unit, such as the serial communication unit or CC-Link IE TSN communication unit, installed on the GOT to enable communication with other devices
	Option unit	A unit, such as an external I/O unit, installed on the GOT to provide specific functions
Option		Options, such as SD cards, batteries, and protective sheets, installed on the GOT for use

Software

■Software related to GOT

Abbreviations and generic terms	Description
GT Works3	Software that comprehensively supports screen design for the GOT
GT Works3 Version1	
GT Designer3	Screen design software for the GOT3000 series, GOT2000 series, and GOT1000 series
GT Designer3 (GOT3000)	Screen design software for the GOT3000 series
Speech synthesis license	License to use the speech synthesis function
VNC server function license	License to use the VNC server function with the GOT3000
VPN function license	License to use the VPN function with the GOT3000
License for the remote personal computer operation function (Ethernet)	License to use the remote personal computer operation function (Ethernet) in the GOT3000
Multimedia function license	License to perform the following with the GOT3000 • Use a network camera. • Record or play images taken by a network camera or web camera.
License for GT SoftGOT3000	License to use GT SoftGOT3000
GOT Mobile function license for GOT3000	License to use the GOT Mobile function with the GOT3000
GOT Mobile function license for GT SoftGOT3000	License to use the GOT Mobile function with GT SoftGOT3000
GENESIS64 Advanced	GENESIS64 server application (GEN64-APP)
GENESIS64 Basic SCADA	GENESIS64 server application (GEN64-BASIC)
GENESIS64	Generic term of GENESIS64 Advanced and GENESIS64 Basic SCADA
GT Simulator3	Screen simulator GT Simulator3 for the GOT3000 series
GT SoftGOT3000	Software that performs the same functions as the GOT3000 on a personal computer or panel computer
GT OPC UA Client	OPC UA server connection setting software

■Software related to iQ Works

Abbreviations and generic terms	Description
iQ Works	iQ Platform compatible engineering environment MELSOFT iQ Works
MELSOFT Navigator	Integrated development environment software included in the iQ Platform-compatible engineering environment, MELSOFT iQ Works
MELSOFT iQ AppPortal	Integrated application management software

■Other software

Abbreviations and generic terms		Description
GX Works3		Programmable controller engineering software
GX Works2		
Controller simulator	GX Simulator3	Simulation function of GX Works3
	GX Simulator2	Simulation function of GX Works2
	GX Simulator	Ladder logic test tool function software package
GX Developer		Programmable controller programming software
GX LogViewer		Dedicated logging data viewer
MI Configurator		Configuration and monitor tool for Mitsubishi Electric industrial computers
PX Developer		FBD software package for process control
MT Works2		Motion controller engineering software
MT Developer		Integrated start-up support software for motion controller Q series
CW Configurator		Setting/monitoring tools for the C Controller module and MELSECWinCPU
MR Configurator2		Servo configuration software
MR Configurator		Servo configuration software
FR Configurator2		Inverter setup software
FR Configurator		Inverter setup software
NC Configurator2		CNC parameter setting support software
NC Configurator		CNC parameter setting support tool
FX Configurator-FP		Parameter setting, monitoring, and testing software
FX Configurator-EN-L		FX3U-ENET-L type Ethernet module setting software
RT ToolBox3		Robot program creation software
RT ToolBox2		Robot program creation software
MX Component		Communication library
MX Sheet		Communication support software package
CPU Module Logging Configuration Tool		CPU Module Logging Configuration Tool

1.1 Finding the reference manual

This section describes the main GOT manuals and their contents.
The following abbreviations are used for the manual names.

Manual name	Abbreviation	Main contents
GT Designer3 (GOT3000) Screen Design Manual	GTD	• Screen operation with GT Designer3 • Settings of the functions that run on the GOT • Functions enabled by connecting the GOT and controllers
GOT3000 Series User's Manual (Hardware)	HW	• GOT hardware specifications • How to connect cables to and install units on the GOT
GOT3000 Series User's Manual (Utility & Maintenance Functions)	UT	• How to operate the utility • How to use dedicated screens such as a sequence program monitor • System alarms and corrective actions
GOT3000 Series User's Manual (Connection)	Connection	• Devices connectable with the GOT • System configuration • Communication settings • FA transparent function (reading and writing programs between a personal computer and a controller via the GOT)
GT SoftGOT3000 User's Manual	SGT	• How to operate GT SoftGOT3000

The following contents and their reference manuals are shown below.

☞ Page 32 Operations related to package data, BootOS, and CoreOS (data transfer)
☞ Page 32 How to protect the GOT and data
☞ Page 32 Operating the GOT using gestures
☞ Page 33 How to use GOT peripherals
☞ Page 34 Settings that can be changed in the utility or in GT Designer3
☞ Page 36 Devices, labels, and tags that can be monitored with the GOT
☞ Page 36 Drive configuration and capacity of the GOT
☞ Page 36 Differences between GT SoftGOT3000 functions and other functions

1.2.1 Security function

☞ Page 39 Security mode
☞ Page 40 Security function list

This section describes the security functions of the GOT and GT Designer3.

Precautions

■Taking security measures

The security functions of the GOT and GT Designer3 serve as a method to prevent unauthorized access from external devices, which could lead to the destruction of programs or data. However, these functions do not provide complete protection against unauthorized access.

To maintain the security (availability, integrity, and confidentiality) of GOT3000 and the system against unauthorized access from external devices, DoS attacks, computer viruses, and other cyberattacks, also take additional measures, such as firewalls, virtual private networks (VPNs), and antivirus solutions.

Mitsubishi Electric shall have no responsibility or liability for GOT3000 troubles and system troubles caused by unauthorized access from external devices, DoS attacks, computer virus, and other cyberattacks.

Security mode

There are two security modes: Mode 1 and mode 2.

The available security functions differ depending on the security mode.

Security mode	Description
Mode 1	The security functions compatible with the GOT2000 series can be used.
Mode 2	More robust security functions than mode 1 can be used.

When a new project is created, mode 2 is set by default.

The security mode can be set only in the [Type Setting] dialog ([Security Setting]).

☞ Page 526 [Security Setting]

■Differences by security mode

The availability and operation of the following functions vary depending on the security mode.

Function	Mode 1	Mode 2
Operator authentication	Only user-created screens are protected.	All operations on the GOT are protected.
Screen security	Select an authentication method from the following options: • Not used • Level authentication • Operator authentication	Only operator authentication is available. This function cannot be disabled.
Functional operation security	Restricts the display of the screen used to start the utility or to configure parameter settings.	Restricts the display of the screen used to configure parameter settings.
		Starting the utility is restricted by operator authentication. To determine whether the utility can be started for each operator, change the operation authority setting in the [Operator authentication management] screen in the utility. ☞ Page 3003 Registering or editing an operator or group
Data transfer security	Set a password for data transfers.	This function is disabled. Operator authentication is used for data transfer.
Operation log function	Records information on the items added to the operation log target list as an operation log.	Records the following information as operation logs: • Information on the items added to the operation log target list • Security information
Project security (when opening a project with GT SoftGOT3000)	Authenticates users.	This function is disabled. Authentication when opening a project with GT SoftGOT3000 is performed by operator authentication.

For information on security modes and the corresponding security functions, refer to the following.

☞ Page 40 Security function list

■Change of the security mode

When the package data is written, the GOT runs in the security mode set for the package data.

When the security mode is changed, the operator management information stored on the GOT is deleted.

Security function list

The following shows security modes and the corresponding security functions.

☞ Page 40 GOT (excluding GT SoftGOT3000) security function list

☞ Page 42 GT SoftGOT3000 security function list

■GOT (excluding GT SoftGOT3000) security function list

○: Supported

—: Unsupported

Function		Description	Mode 1	Mode 2
Security function setting function		Specifies the security mode of the GOT. ☞ Page 39 Security mode	○	○
Operator authentication (mode 2)		Registers operators to the GOT, thereby restricting the operation of GOT screens and access from external devices. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2))	—	○
Mobile code execution control function		Disables JavaScript in the web browser function. ☞ Page 708 Disabling JavaScript (Mobile code execution control function)	○	○
Firmware update function		Updates the firmware of the GOT (CoreOS, BootOS, and system applications). ☞ Page 408 Transferring data to the GOT	○	○
Operation setting function		Prompts the GOT to perform a specific operation and notifies the error status using a buzzer when an error occurs on the GOT. The user does not need to configure the setting for this function.	○	○
Port forced close function	Default open port use/ nonuse setting function	Sets whether to open or close the GOT ports that are open by default. Configure the setting in the utility or in GT Designer3. ☞ Page 717 Configuring the settings common to Ethernet interfaces 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)	○	○
	USB host/device disable function	Disables the USB interface on the GOT front face. Configure the setting in the utility or in GT Designer3. ☞ Page 629 Disabling the USB interface on the GOT front face ([USB Common Setting]) 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)	○	○
External device input data verification function		Verifies whether the data input from an external device is consistent with the specifications. The user does not need to configure the setting for this function.	○	○
Initialize all data function		Deletes all data on the GOT. This function can be used to securely dispose of the GOT. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)	○	○
Information protection function		Performs the following: • File tampering check function: Checks if the files on the GOT have been tampered with. • Security protection function: Encrypts the security information of the GOT. ☞ Page 3065 Protecting the files in the GOT (Information protection function)	○	○
Encrypted communication function		Encrypts communication data when the GOT communicates with an external device. ☞ Page 3069 Encrypting communication data (Encrypted communication function)	○	○
IP filter function		Uses IP addresses to restrict devices that can communicate with the GOT via Ethernet. When connecting the GOT to Ethernet, using an IP filter is recommended. ☞ Page 719 Setting the IP filter	○	○
Operation log function	Mode 1	Records the operations of the GOT and system as history. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])	○	—
	Mode 2	Records the security functions of the GOT and system operations chronologically. For information on the operation log, refer to the following. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log]) For the system alarm monitoring function, refer to the following. ☞ Page 2075 Collecting alarms by monitoring the system	—	○

Function		Description	Mode 1	Mode 2
Restriction function against DoS attacks		Restricts the bandwidth of networks used by the GOT. This function prevents network traffic and CPU load from increasing due to operational errors, etc., which may affect necessary functions. The user does not need to configure the setting for this function.	○	○
GOT data package acquisition function		Backs up the GOT data to the data storage. The backup data can be restored using the restore function. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)	○	○
Restore function		Restores the data backed up using the GOT data package acquisition function to the GOT via data transfer. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)	○	○
Screen security	Mode 1	Restricts operators who can display and operate screens by setting security levels for screens and objects. Select level authentication or operator authentication (mode 1) for the authentication method. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)	○	—
	Mode 2	Restricts operators who can display and operate screens by setting security levels for screens and objects. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2))	—	○
Functional operation security	Mode 1	Restricts the display of the screen used to start the utility or to configure parameter settings. ☞ Page 3057 Configuring the security settings for operations in the utility (Functional operation security)	○	—
	Mode 2	Restricts the display of the screen used to configure parameter settings. ☞ Page 3057 Configuring the security settings for operations in the utility (Functional operation security)	—	○
Data transfer security		Restricts data transfer between a personal computer and the GOT. ☞ Page 3062 Configuring the security setting for transferring data (Data transfer security)	○	—
Security control via Ethernet		Performs the following: • Prohibits or permits operations via the Ethernet port. • Notifies when a prohibited operation is performed via the Ethernet port. ☞ Page 3601 Invalid Access from Ethernet Port 1, Invalid Access from Ethernet Port 2 (GS254) ☞ Page 3641 Ethernet Port 1 Access Control, Ethernet Port 2 Access Control (GS454)	○	○
System screen operation restriction function		Restricts screen operations in the [Data mng.] tab of the utility. ☞ Page 3654 System Screen Operation Restriction (GS622) ☞ Page 3654 Specify Drive to Prohibit Write Operation (System Screen) (GS623) ☞ Page 3655 Specify Drive to Hide (System Screen) (GS624)	○	○
USB device communication disable function		Controls communications with GT Designer3 or Data Transfer Tool through the front USB interface (host/device) of the GOT. ☞ Page 629 Disabling the USB interface on the GOT front face ([USB Common Setting]) 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)	○	○
SD card access control signal		Controls the SD card access switch ON/OFF. ☞ Page 3660 SD Card Access Switch Status Control (GS1820)	○	○
Project security		Restricts the project from being displayed or edited in GT Designer3. ☞ Page 2972 Protecting a project by registering users (Project security)	○	○

■GT SoftGOT3000 security function list

○: Supported

—: Unsupported

Function		Description	Mode 1	Mode 2
Security function setting function		Specifies the security mode of the GOT. ☞ Page 39 Security mode	○	○
Operator authentication (mode 2)		Registers operators to the GOT, thereby restricting the operation of GOT screens and access from external devices. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2))	—	○
Mobile code execution control function		Restricts the execution of mobile code. Windows functions are used for the restriction.	○	○
Operation setting function		Prompts the GOT to perform a specific operation and notifies the error status in a dialog when an error occurs on the GOT. The user does not need to configure the setting for this function.	○	○
External device input data verification function		Verifies whether the data input from an external device is consistent with the specifications. The user does not need to configure the setting for this function.	○	○
Initialize all data function		Deletes non-deletable data by uninstalling GT SoftGOT3000. Execute this function from the GT SoftGOT3000 menu. 📖GT SoftGOT3000 User's Manual	○	○
Information protection function		Performs the following: • File tampering check function: Checks if the files on the GOT have been tampered with. • Security protection function: Encrypts the security information of the GOT. ☞ Page 3065 Protecting the files in the GOT (Information protection function)	○	○
Encrypted communication function		Encrypts communication data when the GOT communicates with an external device. ☞ Page 3069 Encrypting communication data (Encrypted communication function)	○	○
IP filter function		Uses IP addresses to restrict devices that can communicate with the GOT via Ethernet. Use the function of Windows or an external operating environment. When connecting GT SoftGOT3000 to Ethernet, it is recommended to use an IP filter.	○	○
Operation log function	Mode 1	Records the operations of the GOT and system as history. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])	○	—
	Mode 2	Records the security functions of the GOT and system operations chronologically. For information on the operation log, refer to the following. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log]) For the system alarm monitoring function, refer to the following. ☞ Page 2075 Collecting alarms by monitoring the system	—	○
Restriction function against DoS attacks		Restricts the bandwidth of networks used by the GOT. This function prevents network traffic and CPU load from increasing due to operational errors, etc., which may affect necessary functions. Use the function of Windows or an external operating environment. The user does not need to configure the setting for this function.	○	○
Screen security	Mode 1	Restricts operators who can display and operate screens by setting security levels for screens and objects. Select level authentication or operator authentication (mode 1) for the authentication method. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)	○	—
	Mode 2	Restricts operators who can display and operate screens by setting security levels for screens and objects. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2))	—	○
Functional operation security		Restricts the utility from being started. ☞ Page 3057 Configuring the security settings for operations in the utility (Functional operation security)	○	—

Function	Description	Mode 1	Mode 2
System screen operation restriction function	Restricts screen operations in the [Data mng.] tab of the utility. ☞ Page 3654 System Screen Operation Restriction (GS622) ☞ Page 3654 Specify Drive to Prohibit Write Operation (System Screen) (GS623) ☞ Page 3655 Specify Drive to Hide (System Screen) (GS624)	○	○
Project security	Restricts the project from being displayed or edited in GT Designer3. ☞ Page 2972 Protecting a project by registering users (Project security)	○	○

1.2.2 Remote GOT operation functions

☞ Page 44 Remote GOT operation function list
☞ Page 45 Differences between functions

The following shows the remote GOT operation functions.

Remote GOT operation function list

Function	Description
SoftGOT-GOT link function	With the SoftGOT-GOT link function, both GT SoftGOT3000 and the GOT hold the project data and monitor the controller. Since GT SoftGOT3000 displays the GOT screen on the personal computer, the processing load on the GOT is reduced. By using the internal device as the screen switching device, GT SoftGOT3000 and the GOT can display different screens.  The GOT and GT SoftGOT3000 operate independently; therefore, there may be differences in the collected data, such as alarm data and logging data, between the GOT and the personal computer. You cannot use the extended functions unsupported by GT SoftGOT3000 together with the SoftGOT-GOT link function. For details on the SoftGOT-GOT link function, refer to the following. 📖GT SoftGOT3000 User's Manual
VNC server function	The VNC server function displays the GOT screen on the remote screen of a personal computer. You can view the data collected by the GOT, including alarm data and logging data, on a personal computer in real time. Dedicated screens for add-on functions can also be operated on a personal computer (VNC client).  Since the VNC server function increases the processing load on the GOT, the GOT may delay displaying a screen or collecting data, including alarm data and logging data. The GOT may also delay its response to operations from the VNC client (personal computer). Set the load balance between processing of the VNC server function and processing of the other functions on the GOT as necessary. The processing load balance can be set in the [VNC Server] dialog or using GS1798. ☞ Page 2638 Viewing the GOT from a personal computer (VNC server function)

Function	Description
GOT Mobile function	With the GOT Mobile function, an information device, such as a tablet, displays mobile screens that are stored on the server (GOT). Considering one browser as one client, the GOT can access up to five clients while GT SoftGOT3000 can access up to 15 clients simultaneously. Each client can display different mobile screens. The information device does not store project data and resource data. The server (GOT) stores the data for management.  No functions incompatible with the GOT Mobile function, such as objects that cannot be placed on mobile screens, can be used. For details on the GOT Mobile function, refer to the following. ☞ Page 2736 Monitoring a controller from tablets or other devices (GOT Mobile function)

Differences between functions

Item	Function		
	SoftGOT-GOT link function	VNC server function	GOT Mobile function
Terminal to be used	Personal computer with GT SoftGOT3000 installed	Information device (such as a tablet and personal computer) on which an applicable VNC client is installed	Information device (such as a tablet and personal computer) on which an applicable browser is installed
Number of terminals connectable to one GOT	One GT SoftGOT3000 module is connectable. Up to seven GT SoftGOT3000 modules are connectable when the GOT network interaction function is enabled.	One VNC client is connectable.	Considering one browser as one client, the number of connectable clients is as follows: GOT (excluding GT SoftGOT3000): 5 clients GT SoftGOT3000: 15 clients
Required number of licenses	One license is required per personal computer.	One license is required per GOT.	One license is required per GOT.
Screen display contents	The GOT and GT SoftGOT3000 can display different screens.	The GOT and the remote screen on the personal computer display the same screen.	The GOT and each client display different screens. (The clients display dedicated mobile screens.)
Screen with exclusive authorization control enabled	All screens	All screens	Screen with exclusive authorization control enabled (settable for each screen)
Creation of screens for the terminal (project data setting)	Not needed	Not needed	Mobile screens must be created.
Project data storage destination	Both the GOT and GT SoftGOT3000 hold the project data. GT SoftGOT3000 reads the project data from the GOT.	GOT only	GOT or GT SoftGOT3000
Resource data storage destination	When the project data is read, the resource data is also read into GT SoftGOT3000. Afterward, both the GOT and GT SoftGOT3000 hold the resource data.	GOT only	GOT or GT SoftGOT3000
Support for add-on functions for terminals	Limited For the functions that can and cannot be used with GT SoftGOT3000, refer to the following. GT SoftGOT3000 User's Manual	Not limited	Limited ☞ Page 2748 Add-on function

1.2.3 Data collection functions

The following shows the data collection functions.

Collection target		Function and reference
GOT operation log		Collects information on the operation of the GOT such as the date and time and operator. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])
Alarm	User-defined alarms	☞ Page 46 User-defined alarm collection function
	System alarms	☞ Page 46 System alarm collection function
Device value		Collects the values of the specified device. ☞ Page 2194 Collecting device data ([Logging])

User-defined alarm collection function

The following functions collect user-defined alarms.

- User alarm monitoring
- Simple alarm display

Item	Function	
	User alarm monitoring	Simple alarm display
Function type	Functions running in the background	Object function
Alarm collection specifications	Collects alarms regardless of the screen being displayed.	Collects alarms only while the screen with the simple alarm display is displayed.
Alarm history accumulation	Supported. File save is supported.	Unsupported
Power-failure backup	Supported.	Unsupported
Alarm hierarchization	Supported.	Unsupported
Alarm display method	Uses the alarm popup display or alarm display (user) to display alarms. ☞ Page 2105 Enabling the popup display for when an alarm occurs ☞ Page 2132 Viewing alarm events (Alarm display)	Displays alarms on the simple alarm display placed on the screen.
Reference	☞ Page 2022 Collecting alarms by monitoring devices	☞ Page 1519 Placing a simple alarm display

System alarm collection function

The following functions collect system alarms.

- System alarm monitoring
- System alarm display

Item	Function	
	System alarm monitoring	System alarm display
Function type	Functions running in the background	Object function
Alarm collection specifications	Collects alarms regardless of the screen being displayed.	Collects alarms regardless of the screen being displayed.
Alarm history accumulation	Supported. File save is supported.	Unsupported
Power-failure backup	Supported.	Unsupported
Specification of the alarm type of alarms to be collected	Supported.	Unsupported
Alarm display method	Uses the alarm popup display or alarm display (system) to display alarms. ☞ Page 2105 Enabling the popup display for when an alarm occurs ☞ Page 2132 Viewing alarm events (Alarm display)	Displays alarms on the system alarm display placed on the screen.
Reference	☞ Page 2075 Collecting alarms by monitoring the system	☞ Page 1542 Placing a system alarm display

PART 2 Steps to operate the GOT

2 Procedure before operation

GT37 SoftGOT3000

This section explains the general procedure before operation.
The procedure before operation differs between GT SoftGOT3000 and the other GOTs.
The procedure also differs depending on the security mode set for the project.
For the procedure before operating a GOT other than GT SoftGOT3000 and the differences depending on the security mode, refer to the following.
☞ Page 49 Procedure before operating the GOT
For the procedure before operating GT SoftGOT3000 and the differences depending on the security mode, refer to the following.
☞ Page 51 Procedure before operating GT SoftGOT3000

What is the security mode?

The GOT's security function has two security modes.

Security mode	Description
Mode 1	The security functions compatible with the GOT2000 series can be used.
Mode 2 (default)	More robust security functions than mode 1 can be used.

Security mode settings can be configured only with GT Designer3.
For details, refer to the following.
☞ Page 493 Changing the GOT type of the project

2.1 Procedure before operating the GOT

GT37 SoftGOT3000

This section explains the procedure before operating the GOT and the manuals describing the details.
The procedure before operation differs depending on the security mode.
The necessity of each step is shown below.
○: Required, △: Optional, —: Not required

Step		Security mode		Reference
		Mode 1	Mode 2	
1	Install GT Designer3 on the personal computer.	○	○	📖GT Works3 Version1 Installation Instructions
2	Create a project with GT Designer3.	○	○	☞ Page 207 Project creation and operations
	Set the Ethernet interface of the GOT when connecting the GOT and the controller via Ethernet.	△	△	☞ Page 713 Setting the GOT Ethernet interface ([GOT Ethernet Setting])
	Configure the settings to connect the GOT and controllers.	○	○	📖GOT3000 Series User's Manual (Connection)
3	Install the battery (sold separately) in the GOT.	△*1	○	📖GOT3000 Series User's Manual (Hardware)
4	Install the extension unit and options on the GOT.	△	△	📖GOT3000 Series User's Manual (Hardware)
5	Install the GOT on the control panel.	○	○	📖GOT3000 Series User's Manual (Hardware)
6	Provide wiring to the power supply section of the GOT.	○	○	📖GOT3000 Series User's Manual (Hardware)
7	Turn on the GOT. The GOT includes a preinstalled demo screen project at the time of factory shipment. After the GOT is started and the initial settings are configured, the demo screen is displayed.	○	○	—
8	Write the project created with GT Designer3 to the GOT.*2	○	○	☞ Page 408 Transferring data to the GOT
	Enter the password when the file protection function is enabled.	△	△	☞ Page 3065 Protecting the files in the GOT (Information protection function)
	If the security mode set for the project is mode 2, register the information of the operator with administrator privileges in the GOT.	—	○	☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2))
9	Turn off the GOT and connect the GOT and the controller.	○	○	📖GOT3000 Series User's Manual (Connection)
10	Turn on the GOT and the controller to start monitoring. You can check whether the GOT is monitoring normally.	○	○	☞ Page 50 How to check whether the GOT is operating correctly

*1 Install a battery to retain the clock data even when the GOT is powered off.
*2 When a project is written to the GOT, the demo screen project is overwritten.

How to check whether the GOT is operating correctly

The following methods can be used to check for any issues with the operation of the project written to the GOT or the communication status with the controller.

Check	Method
Check whether the GOT recognizes the controller.	This can be checked on the [Communication setting] screen of the utility. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
Check if an error (system alarm) has occurred in the GOT, controller, or network.	When an error occurs in the GOT, controller, or network, the GOT outputs a system alarm (error code and error message). The system alarm can be checked on the [System alarm] of the utility. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
Check that the settings enable the GOT to communicate with the controller correctly and that the connection cable is connected properly.	This can be checked on the [I/O check] of the utility. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

2.2 Procedure before operating GT SoftGOT3000

GT37 SoftGOT3000

This section explains the procedure before operating GT SoftGOT3000 and the manuals describing the details.
The procedure before operation differs depending on the security mode.
The necessity of each step is shown below.
○: Required, △: Optional, —: Not required

Step		Security mode		Reference
		Mode 1	Mode 2	
1	Install GT SoftGOT3000 on the personal computer.	○	○	GT Works3 Version1 Installation Instructions
	When creating a project, install GT Designer3 on the personal computer.	○	○	GT Works3 Version1 Installation Instructions
2	Start GT SoftGOT3000 and register the GT SoftGOT3000 license.	○	○	GT SoftGOT3000 User's Manual
	When starting GT SoftGOT3000 for the first time, set a password for the GT SoftGOT3000 application log file.	○	○	GT SoftGOT3000 User's Manual
3	Create a project with GT Designer3.	○	○	☞ Page 207 Project creation and operations ☞ Page 493 Changing the GOT type of the project
	Configure the settings to connect GT SoftGOT3000 and the controller.	○	○	GOT3000 Series User's Manual (Connection)
4	Connect the personal computer with GT SoftGOT3000 installed to the controller.	○	○	GOT3000 Series User's Manual (Connection)
5	Open the project in GT SoftGOT3000.	○	○	GT SoftGOT3000 User's Manual
	Enter the password when the file protection function is enabled.	△	△	☞ Page 3065 Protecting the files in the GOT (Information protection function) GT SoftGOT3000 User's Manual
	When the security mode set for the project is mode 2, register the information of the operator with administrator privileges to GT SoftGOT3000.	—	○	☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2)) GT SoftGOT3000 User's Manual
6	Perform monitoring with GT SoftGOT3000 using the project.	○	○	GT SoftGOT3000 User's Manual
	The following shows how to check if GT SoftGOT3000 is monitoring correctly. • When an error occurs, the details of the error can be checked on the [System alarm] screen of the utility.	○	○	GOT3000 Series User's Manual (Utility & Maintenance Functions)

PART 3 Specifications and screen layout of GT Designer3

3 Specifications

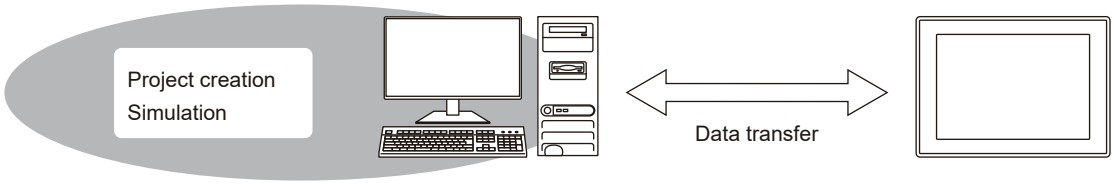
4 Basic knowledge required for screen design

5 Screen layout and basic operations

3 Specifications

GT37 SoftGOT3000

GT Designer3 is software used to create screens for GOT3000 series, GOT2000 series, and GOT1000 series.
This software enables you to create and simulate a project, and transfer data between the GOT and a personal computer.

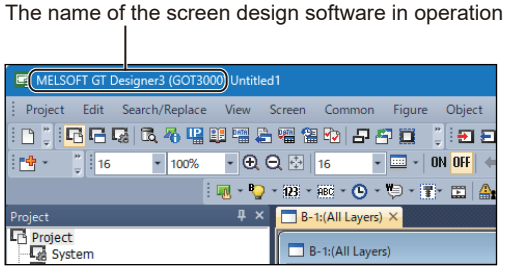


GT Designer3 consists of three screen design software modules as shown below.

- GT Designer3 (GOT3000): Screen design software module for GOT3000 series
- GT Designer3 (GOT2000): Screen design software module for GOT2000 series
- GT Designer3 (GOT1000): Screen design software module for GOT1000 series

When a project that cannot be edited with the current screen design software is operated, the compatible screen design software will start.
The title bar indicates the screen design software module in use.

The name of the screen design software in operation is displayed.



Each screen design software module has own Help.
To display Help for the screen design software module in use, press the [F1] key or use the menu.

Project creation

GT Designer3 manages the data used to operate the GOT for each project.
Set screens to be displayed on the GOT and functions which operate with the GOT for the created project.
☞ Page 207 Project creation and operations

Simulation

In GT Designer3, you can launch GT Simulator3 (3000) to simulate the project data being edited and check the operation on the GOT.
☞ Page 351 Simulation

Data transfer

Created projects and the data required for operating the GOT are written into the GOT from GT Designer3.
The resource data stored in the GOT can be read from the GOT to GT Designer3.
For the data transfer between GT Designer3 and the GOT, use a communication cable, network, or the data storage.
☞ Page 408 Transferring data to the GOT

3.1 Operating environment

GT37 SoftGOT3000

The following shows the operating environment for GT Designer3.

Item	Description
Model	Personal computer that Windows runs on
OS*1*2*3*4*5*6	• Microsoft Windows 11 Education (64-bit)*7 • Microsoft Windows 11 Enterprise (64-bit)*7 • Microsoft Windows 11 Pro (64-bit)*7 • Microsoft Windows 11 Home (64-bit)*7
CPU	Intel Core i3 (8th generation) or later
Memory	8 GB or more recommended
Display	9-inch or larger display with FWXGA (1366 × 768 dots) or higher resolution
Hard disk space	• For installation: 5 GB or more recommended • For execution: 512 MB or more recommended
Display color	High Color (16 bits) or higher

*1 For installation, administrator privileges are required.
For startup, the standard user or administrator account is required.
If another MELSOFT product is running with administrator privileges, also start GT Designer3 with administrator privileges.
If you change any setting of the personal computer while GT Designer3 is running, the change will not be applied to GT Designer3.

*2 The following functions are not supported.
Application start in Windows compatibility mode
Fast user switching
Changing your desktop themes (fonts)
Remote desktop
Setting the size of text and illustrations on the screen to any size other than [Small-100%]

*3 The touch feature is not supported.

*4 Operation in a virtual environment such as Hyper-V is not supported.

*5 Tablet mode is not supported.

*6 Unified Write Filter is not supported.

*7 Use the same language version of Windows OS as that of GT Designer3.
Example: When using the Japanese version of GT Designer3, use the Japanese version of Windows OS.

3.2 Model

GT37 SoftGOT3000

GT Designer3 is compatible with the following GOTs.

GOT	GOT type	Model
GT37	GT37**-FH (1920x1080)	GT3715-FHCBD
	GT37**-WX (1280x800)	GT3712-WXCBD
	GT37**-X (1024x768)	GT3715-XRBA GT3715-XRBD GT3712-XRBA GT3712-XRBD GT3710-XRBA GT3710-XRBD GT3708-XRBA GT3708-XRBD
GT SoftGOT3000	GT SoftGOT3000	GT SoftGOT3000

4 Basic knowledge required for screen design

☞ Page 57 BootOS, CoreOS and package data
☞ Page 58 Screen types and specifications
☞ Page 74 Specifications of displayable characters
☞ Page 80 Character codes supported by the GOT
☞ Page 81 Drive configuration and capacity of the GOT
☞ Page 84 Restrictions for folder names and file names used in GOT

4.1 BootOS, CoreOS and package data

GT37 SoftGOT3000

Data required to activate the GOT are shown below.

4.1.1 BootOS and CoreOS

The BootOS and the CoreOS are necessary to activate the GOT.

They are installed on the GOT by factory default.

To use additional functions, upgrading the BootOS and the CoreOS are required.

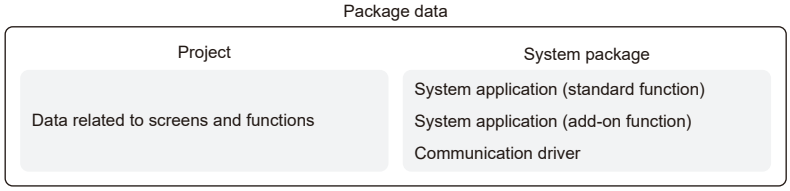
For the additional functions, refer to the following.

☞ Page 3732 Functions that require upgrading the versions of BootOS and CoreOS

4.1.2 Package data

The package data consists of a project and a series of system packages required to run the project.

GT Designer3 is used to create projects and write the projects to the GOT as package data.



Data included in the package data	Description	
Project	Data related screens and functions created by user using GT Designer3.	
System package	Programs and data of the system required to operate the GOT	
	System application (standard function)	Application required to operate the GOT or display the utility
	System application (add-on function)	Application required to use some functions such as the VPN connection function and GOT Mobile function
	Communication driver	Driver required for communication between the GOT and the controller

4.1.3 Package data and project file formats

Created project is saved as package data or a project in a file with one of the following extensions.

Perform manipulations (such as copy, move, and rename) on a file by using Windows Explorer or others.

Extension	Description	Model
*.GTY	File format of a single file containing projects only.	GT37 SoftGOT3000
*.GTYS	File format of a single file containing a project and the related system package. Since the versions of the project and system package are fixed, if you have transferred the file to the GOT with an older version of GT Designer3, the relevant functions are usable without being downgraded. This provides convenience when you save a project as complete data. Data can be transferred to the GOT by using Data Transfer Tool without GT Designer3.	
*.GTYP	File format used to execute a project on the GT SoftGOT3000 module. Only *.GTYP projects can be opened with GT SoftGOT3000.	GT37 SoftGOT3000
*.G3	File format used to save the project on the GOT or data storage.	GT37 SoftGOT3000

4.2 Screen types and specifications

GT37 SoftGOT3000

☞ Page 58 Screen type
☞ Page 62 Specifications of base screens
☞ Page 62 Specifications of window screens
☞ Page 65 Layer
☞ Page 68 Stacking order of the screens on the GOT
☞ Page 72 Coordinate
☞ Page 73 Functions that can be set on a screen

4.2.1 Screen type

GT37 SoftGOT3000

The following screens can be created with GT Designer3.

☞ Page 58 Base screen
☞ Page 58 Window screen
☞ Page 61 Mobile screen

Base screen

Basic screen that always appears on the GOT.

You can create multiple base screens and switch between them as needed.

The base screen to be displayed is controlled by a screen switching device.

When a value is stored to the screen switching device of the base screen, the screen is switched to the screen with the screen number corresponding to the stored value.

For details on base screen specifications, refer to the following.

☞ Page 62 Specifications of base screens

For information on how to create a base screen, refer to the following.

☞ Page 264 Creating a base screen

Window screen

Displayed as part of a base screen or used to display a popped window.

The following methods are available to display a window screen on the GOT.

☞ Page 59 Superimpose window
☞ Page 59 Overlap window
☞ Page 60 Key window
☞ Page 60 Dialog window

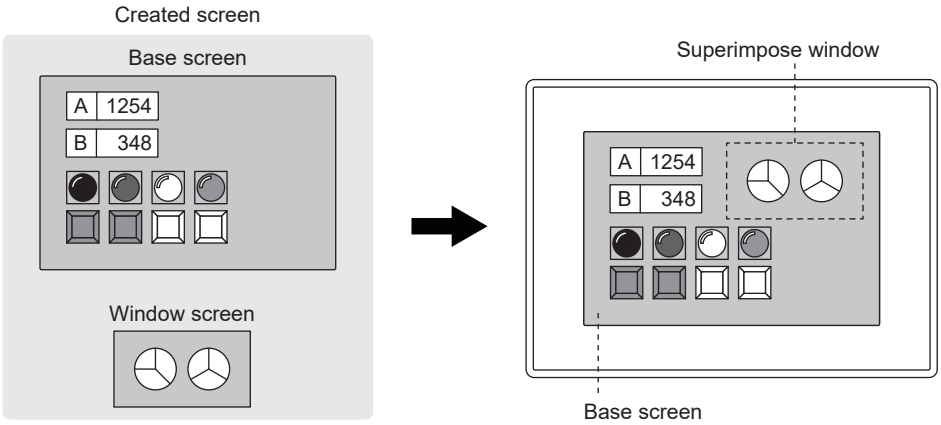
For information on how to create a window screen, refer to the following.

☞ Page 265 Creating a window screen

■Superimpose window

Window to be superimposed on a base screen and displayed as part of the base screen.

Up to two superimpose windows (superimpose window 1 and 2) can be displayed simultaneously.



For the specifications of window screens displayed as superimpose windows, refer to the following.

☞ Page 62 Specifications of superimpose windows

To display a superimpose window, set the following.

Setting	Reference
Setting a screen switching device for the superimpose window	☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])
Placing a window position object on the base screen	☞ Page 1883 Specifying the display position of a window screen

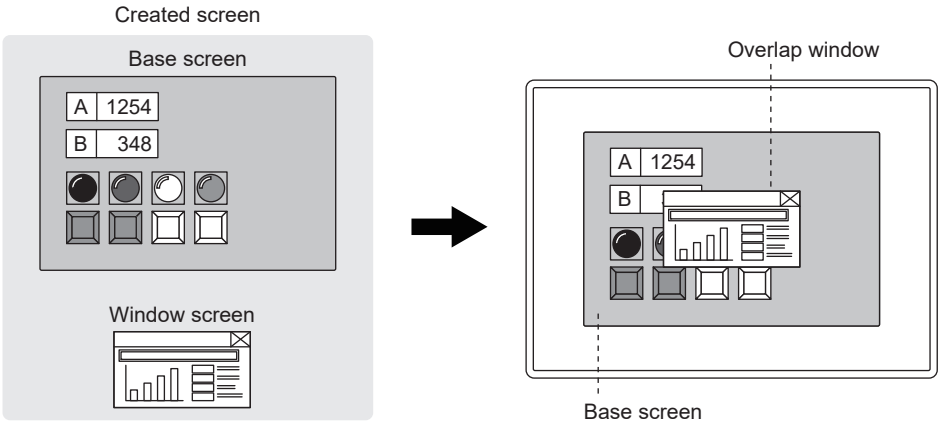
When a value is stored to the screen switching device of the superimpose window, the window screen with the screen number corresponding to the stored value is displayed at the position of the window position object.

■Overlap window

Window to pop up on a base screen.

Up to five overlap windows (overlap windows 1 to 5) can be displayed simultaneously.

The window is movable by using a touch operation or a display position specification device.



For the specifications of window screens displayed as overlap windows, refer to the following.

☞ Page 63 Specifications of overlap windows and key windows

To display overlap windows, set the following.

Setting	Reference
Setting screen switching devices for the overlap windows	☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])
Placing a window position object on the base screen	☞ Page 1883 Specifying the display position of a window screen

When a value is stored to the screen switching device of the overlap window, the window screen with the screen number corresponding to the stored value is displayed at the window position object.

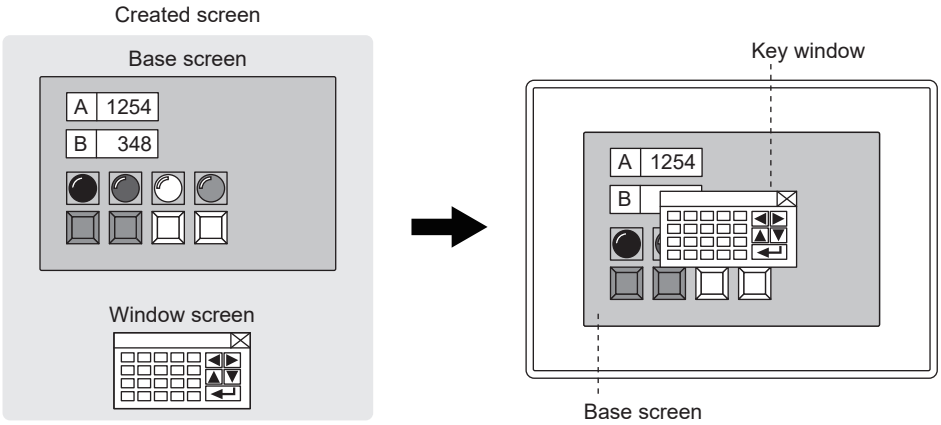
■Key window

Window used to enter a values or text.

The window pops up on the base screen when a numerical input object or text input object is touched.

The window is movable by a touch operation.

The GOT standard key window and the user-created key window are available.



For the specifications of a window screen displayed as a key window, refer to the following.

☞ Page 63 Specifications of overlap windows and key windows

For the settings to display a key window, refer to the following.

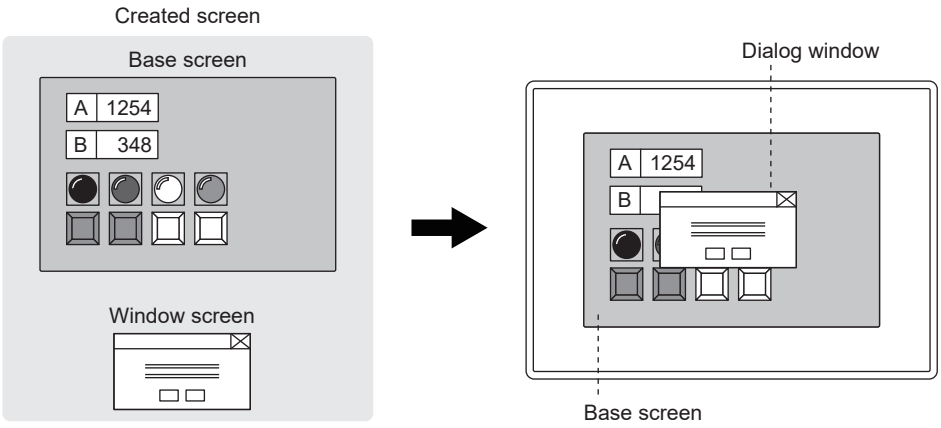
☞ Page 565 How to use key windows

■Dialog window

Window to be displayed, showing information such as errors and warnings.

While a dialog window is displayed, the other screens are inoperable.

Ready-made system dialogs and user-created dialogs are available.



For the specifications of a window screen displayed as a dialog window, refer to the following.

☞ Page 64 Specifications of dialog windows

For the settings to display a dialog window, refer to the following.

☞ Page 555 How to use dialog windows

Mobile screen

A screen displayed on the client (tablet or other information devices) when the GOT Mobile function is used.

The screen is not displayed on the server (GOT) screen.

For details on mobile screen, refer to the following.

☞ Page 2753 Mobile screen

4.2.2 Specifications of base screens

GT37 SoftGOT3000

GOT type	Screen size (width × height) (dots)		Registrable number of screen	Registrable screen number
	Base screen size expansion disabled	Base screen size expansion enabled*1*2		
GT37**-FH (1920 × 1080)	Horizontal display: 1920 × 1080 Vertical display: 1080 × 1920	Horizontal display: 1920 × 1080 to 3000 × 3000 Vertical display: 1080 × 1920 to 3000 × 3000	9999	0 to 32767

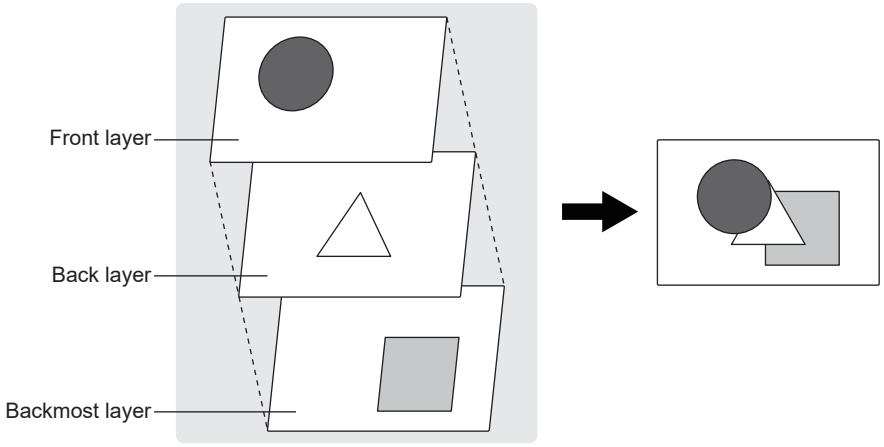
4.2.4 Layer

GT37 SoftGOT3000

A base screen and a window screen created with GT Designer3 consists of three layers: a front layer, a back layer, and a backmost layer.

Each layer allows different items to be placed.



Display order	Layer type	Description	Item that can be placed
3	Front layer	The front layer is like a transparent sheet displayed in the foreground. When a transparent color is set, the figures and objects placed on the front layer becomes transparent. ☞ Page 67 Transparency of the front layer Through the parts without figures or objects, the back layer and the backmost layer can be seen.	Figure (processed as an object) Object
2	Back layer	The back layer is like a transparent sheet displayed behind the other screens. Through the parts other than figures and objects, the backmost layer can be seen.	Figure (processed as an object) Object
1	Backmost layer	Displayed behind the other screens.	Figure

Layers may be disabled depending on how the screen is displayed on the GOT.

☞ Page 66 Layers on each screen

Layers on each screen

In GT Designer3, layers are enabled when a base screen or window screen is edited.

Layers are handled differently depending on how the created screen is displayed on the GOT.

○: The stacking order of figures and objects placed on separate layers is valid.

×: The layers are combined into one layer on the GOT, and the stacking order between the layers is not guaranteed.

Screen type	Display on the GOT	Handling of layers	Remarks
Base screen	Base screen	○	—
	Called screen*1	○	Each layer of a called screen is combined with the corresponding layer of the basic screen. ☞ Page 69 Layer and screen combinations
Window screen	Superimpose window	○	Each layer of a superimpose window is combined with the corresponding layer of the base screen. ☞ Page 69 Layer and screen combinations
	Overlap window	○	—
	Key window	○	—
	Dialog window	×	—
	Called screen*1	○	Each layer of a called screen is combined with the corresponding layer of the basic screen. ☞ Page 69 Layer and screen combinations

*1 A called screen is displayed on a basic screen (base screen or window screen on which the called screen is to be placed) by setting the set overlay screen function.
A base screen or window screen is called on a basic screen, and the screens are displayed as a single screen.
☞ Page 1865 Placing a screen on another screen

Display status of layers and the layer on which figures and objects are placed

The display status of layers can be switched during screen editing in GT Designer3.

☞ Page 301 Switching the layer display

The display status affects the layer on which figures and objects are placed.

The display status of the layer may also be changed.

Item	Effect of the display status of the layer	
Figure	Regardless of the display status of the layer, figures are placed on the layer at the rearmost position. When the rearmost layer is hidden, the layer becomes visible only on the screen where figures are placed.	
Object	When all of the following conditions are satisfied • Either the front or the back layer is hidden. • The layer set as the initial value for the object to be placed is hidden.	The object is placed on the displayed layer.
	When a default value is set for the object to be placed	The layer set as the default value becomes visible and the object is placed. For information on the default value, refer to the following. ☞ Page 203 Customizing the default value
	When the front and back layers are hidden	The layer set as the initial or default value for the object becomes visible and the object is placed.

Transparency of the front layer

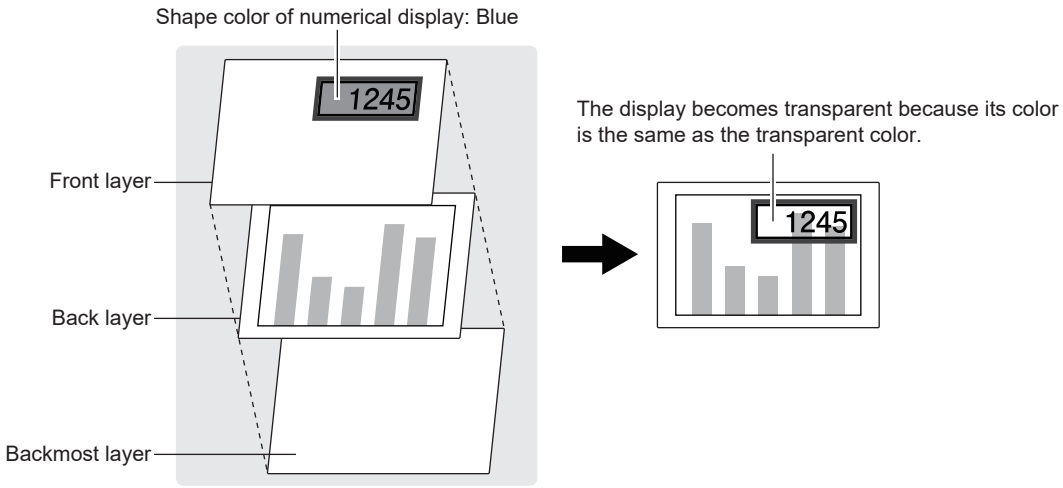
When [Enable the antialiasing] is not selected in the [Type Setting] dialog ([Basic Setting]), a transparent color can be set for the front layer.

The parts of the figures and objects placed on the front layer that have the same color as the transparent color become transparent, and the back layer and backmost layer are seen through the parts.

Ex.

When [Front Layer Transparent Color] of the base screen and the shape color of numerical display placed on the front layer are the same

[Front Layer Transparent Color] of the base screen: Blue



■Transparent color setting

A transparent color is set per screen.

Select [Front Layer Transparent Color] in the property of the base screen or window screen to enable this setting.

☞ Page 314 [Basic] tab

☞ Page 323 [Basic] tab

When a window screen is displayed as the following screen on the GOT, the transparent color will be as follows.

Display on the GOT	Transparent color
Superimpose window	The transparent color set to each screen is disabled, and the transparent color of the base screen is enabled.
Dialog window	The layers are combined into one layer on the GOT, and the transparent color is disabled.
Called screen*1	The transparent color set to each screen is disabled, and the transparent color of the basic screen is enabled.

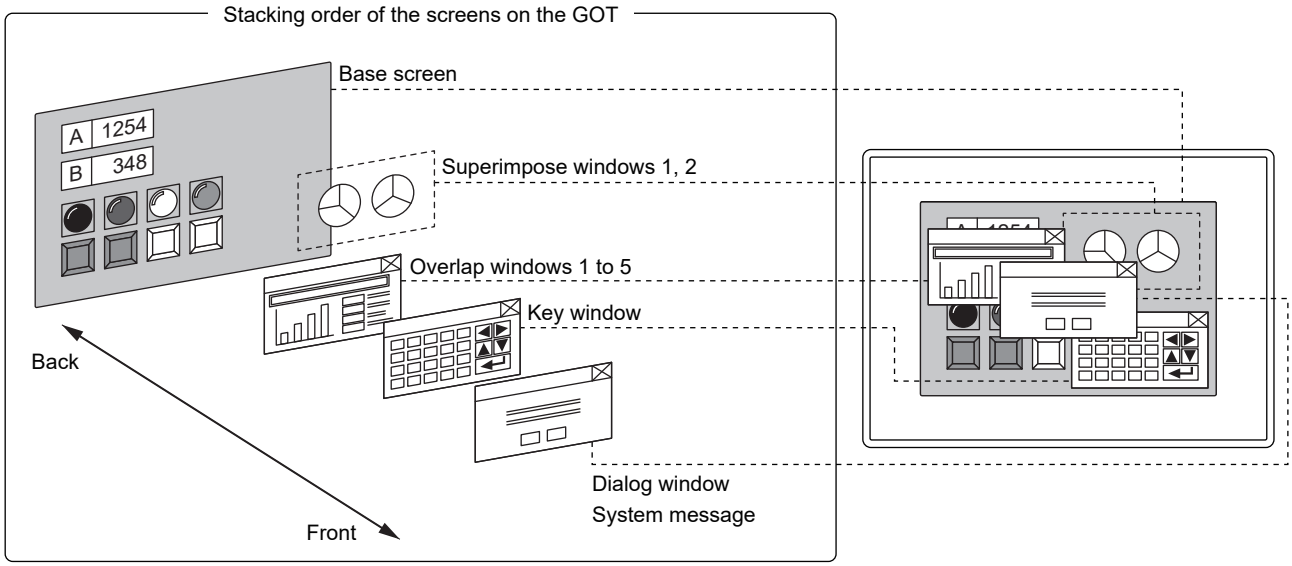
*1 A called screen is displayed on a basic screen (base screen or window screen on which the called screen is to be placed) by setting the set overlay screen function.
A base screen or window screen is called on a basic screen, and the screens are displayed as a single screen.
☞ Page 1865 Placing a screen on another screen

4.2.5 Stacking order of the screens on the GOT

GT37 SoftGOT3000

The screens created with GT Designer3 are displayed in the following order on the GOT.

Display order	Screen type	Description
6	Dialog window	The dialog window is displayed above the other screens.
5	Key window	The dialog window is displayed above the other screens. ☞ Page 71 Display and operation of the area where an overlap window and a key window overlap with each other
4	Overlap windows 1 to 5	The overlap window is displayed above a base screen. ☞ Page 71 Display and operation of the area where an overlap window and a key window overlap with each other When multiple overlap windows are displayed, the last-displayed one or the last-operated one is displayed above the other overlap windows. The stacking order of overlap windows is settable in the [Environmental Setting] window ([Screen Switching/Window]) as well. ☞ Page 542 [Screen Switching/Window]
3	Superimpose window 2	The superimpose window is displayed as a part of a base screen since the window is superimposed on the base screen. ☞ Page 69 Layer and screen combinations
2	Superimpose window 1	
1	Base screen	Displayed behind the other screens.



The stacking order of figures and objects is consistent with the stacking order of the screens on which the figures and objects are placed.

Layer and screen combinations

In the following combinations, each layer of a screen is combined with the corresponding layer of the other screen.

Screen combination	Description
Displaying a superimpose window on a base screen	The superimpose window is combined with the base screen and displayed as part of the base screen.
Displaying a called screen on a basic screen	A called screen is displayed on a basic screen (base screen or window screen on which the called screen is to be placed) by setting the set overlay screen function. A base screen or window screen is called on a basic screen, and the screens are displayed as a single screen. ☞ Page 1865 Placing a screen on another screen The stacking order of a basic screen and called screen varies by the settings of [Overlay Screen Positioning] in the [Environmental Setting] window ([Screen Switching/Window]). ☞ Page 542 [Screen Switching/Window]

☞ Page 69 Stacking order of screens on each layer
☞ Page 70 Screen combination example

Point

Overlapped objects on each combined layer may not appear or operate normally.
Do not overlap the objects placed on the same layer.
Some objects can appear and operate normally even on the same layer.
For the objects that can be overlapped even on the same layer, refer to the following.
☞ Page 1056 Operations of the superimposed objects

■Stacking order of screens on each layer

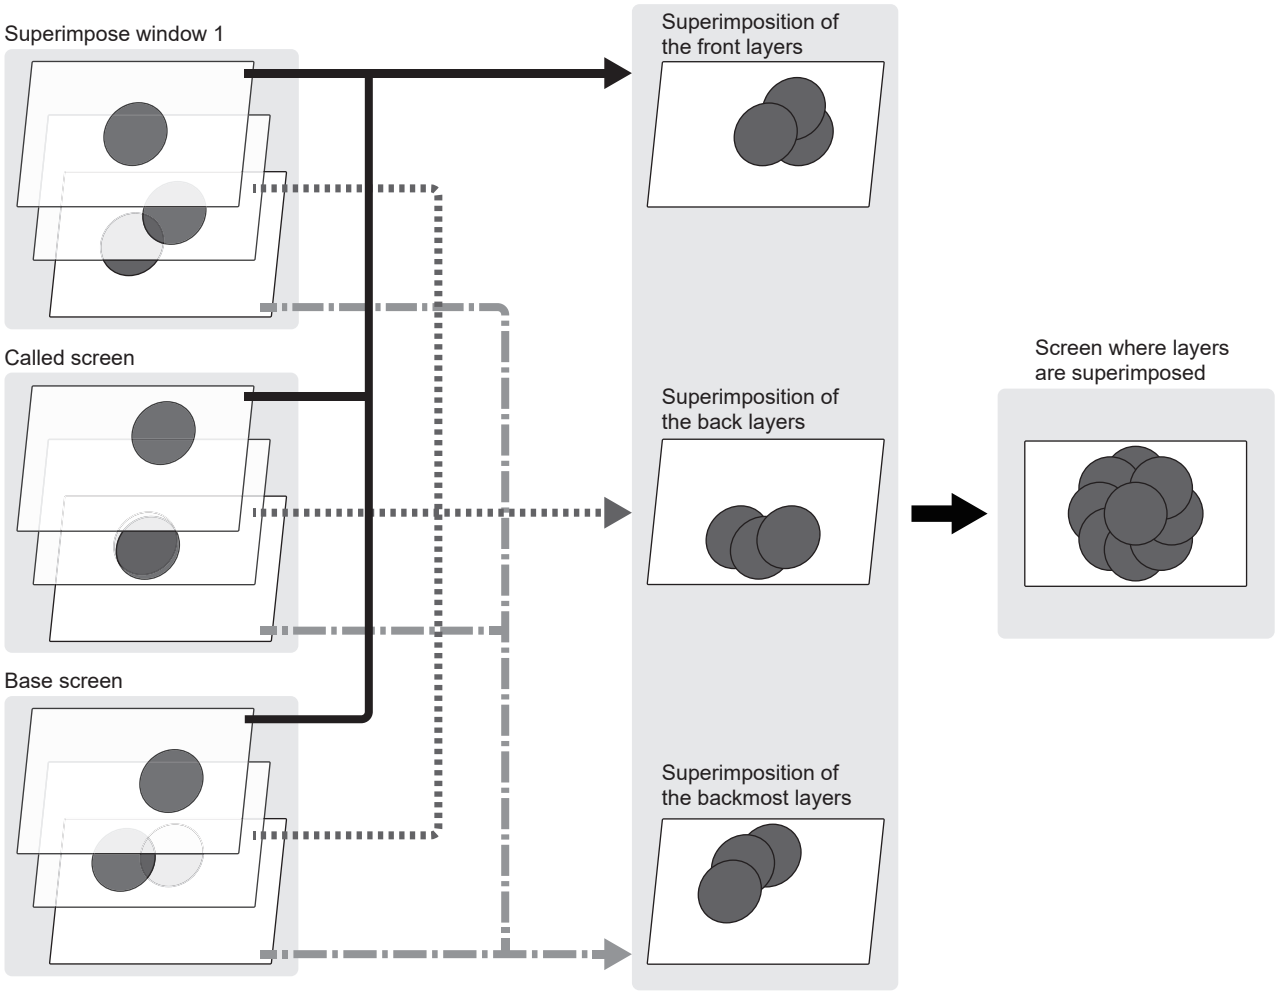
The following shows the stacking order of screens on each layer.

Layer	Stacking order of screens	
	When [On top of the reference screen] is selected for [Overlay Screen Positioning]	When [Under the reference screen] is selected for [Overlay Screen Positioning]
Front layer	Superimpose window 2	Superimpose window 2
	Superimpose window 1	Superimpose window 1
	Called screen	Basic screen (screen on which the set overlay screen is placed)
	Basic screen (screen on which the set overlay screen is placed)	Called screen
Back layer	Superimpose window 2	Superimpose window 2
	Superimpose window 1	Superimpose window 1
	Called screen	Basic screen (screen on which the set overlay screen is placed)
	Basic screen (screen on which the set overlay screen is placed)	Called screen
Backmost layer	Superimpose window 2	Superimpose window 2
	Superimpose window 1	Superimpose window 1
	Called screen	Basic screen (screen on which the set overlay screen is placed)
	Basic screen (screen on which the set overlay screen is placed)	Called screen

■Screen combination example

The following shows examples of combinations using the following settings.

- Base screen: One called screen and superimpose window 1 are displayed.
- [Overlay Screen Positioning] in the [Environmental Setting] window ([Screen Switching/Window]): [On top of the reference screen] is selected.



Display and operation of the area where an overlap window and a key window overlap with each other

■Display and operation of the area where windows overlap with each other

When hidden behind the windows, the figures and objects are not displayed, and input objects do not work.

To check or operate the figures and objects behind the windows, close or move the windows.

■Area where touch operation is invalid

When the title bar is displayed, touches are invalid in some areas around the window.

Such areas are 16 to 25 dots, depending on the screen size and resolution of the GOT.

Title bar display	Operation
Displayed	The area around the window is invalid even when touched. In the area around the [×], touch of the [×] button is valid. In the area where windows overlap with each other, above-mentioned 16 dots are the areas where touches are invalid. Not displayed	Touches are valid in all areas.

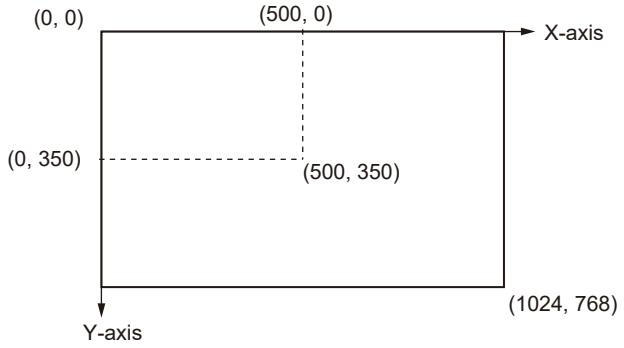
4.2.6 Coordinate

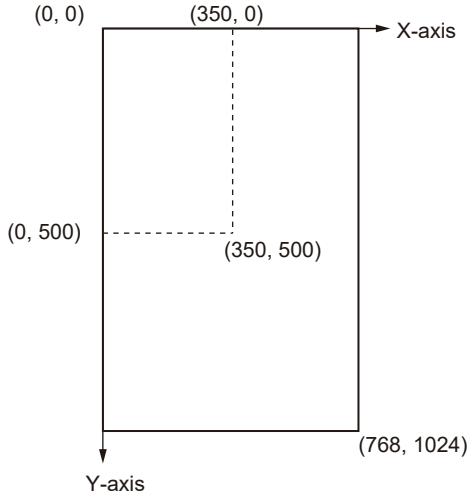
GT37 SoftGOT3000

The horizontal direction on the screen is regarded as the X coordinate, and the vertical direction the Y coordinate. The coordinate (X, Y) indicates the distance from the origin (0, 0) at the top-left of the screen.
The coordinates are specified in units of dots.

Ex.
When GT37-X (1024 × 768) is installed horizontally



Ex.
When GT37-X (1024 × 768) is installed vertically



The following can be checked by using the status bar on GT Designer3.

- Coordinates of the mouse pointer on the screen editor
- Coordinates of the figure or object selected on the screen editor

☞ Page 125 Status bar

The position of the figure or object selected on the screen editor can be changed by specifying coordinates on the property sheet.

☞ Page 126 Checking and editing settings of screens and objects

4.2.7 Functions that can be set on a screen

GT37 SoftGOT3000

To display texts, images, and touch switches for operation on a screen, use figures or objects.

Some functions do not appear on the screen but run in the background of the GOT.

☞ Page 73 Figure
☞ Page 73 Object
☞ Page 73 Functions running in the background on the GOT

Figure

Figures are a function placed on the screen and used to display texts and images.

It is suitable for displaying texts that do not change dynamically.

For the type of figures, refer to the following.

☞ Page 996 List of figures

Object

Objects are a function placed on the screen and used for the following purposes.

- Displaying texts or images on the screen and switching between them dynamically according to the change of the device value
- Operating touch a switch or input object to change the device value or display a window

The maximum number of objects on one screen depends on the screen type.

Screen type	Number of objects that can be set on one screen
Base screen	Up to 1024 objects can be placed. Objects placed after the 1025th object are not displayed on the GOT.
Window screen	Up to 512 objects can be placed. Objects placed after the 513th object are not displayed on the GOT.
Mobile screen	☞ Page 2753 Mobile screen

For the object types and the number of settings per object, refer to the following.

☞ Page 997 List of objects

Point

If many objects are placed on a screen, refreshing the GOT screen may be delayed.

Functions running in the background on the GOT

Some functions run when a specific screen is displayed.

Unlike figures and objects, on-screen placement does not apply to such functions.

The following table shows the functions that can be set on a screen and are performed in the background of the GOT.

Function running in the background	Description
Notifying the detected alarm in a popup window	☞ Page 2105 Enabling the popup display for when an alarm occurs
Writing a device value or executing a sound output triggered by change of the device value or by a cycle	☞ Page 2521 Operating a device as a trigger ([Trigger Action])
Executing a script	☞ Page 2330 Project script, screen script, script part, and script block

4.3 Specifications of displayable characters

GT37 SoftGOT3000

☞ Page 74 Font type
☞ Page 76 KANJI region
☞ Page 77 How to display characters on the GOT
☞ Page 79 Display language in the utility

4.3.1 Font type

GT37 SoftGOT3000

The following table lists the fonts available in GT Designer3.
Available fonts differ depending on the figures and objects.
Check the available fonts in the setting of each figure and object.

Classification	Font	Image	Displayable characters
UD font	UD Gothic*1		Fonts designed for easy reading. Unicode 2.1 characters can be displayed. Unicode surrogate pairs (character code: 0xD800 to 0xDBFF and 0xDC00 and 0xDFFF) are not supported. Thai is supported. For text display and text input, character codes can be specified as well as fonts. When the Shift JIS code is specified, only JIS level 1 and level 2 characters can be displayed on the GOT.
	UD Mincho*1		
	UDP Gothic*1		
	UDP Mincho*1		
	7-segment font		A font designed for easy reading. Numbers and some symbols can be displayed.
Windows font	TrueType font and OpenType font displayable on a personal computer		The TrueType font and OpenType font of Windows installed to a personal computer. Vertical fonts are unavailable. Unicode surrogate pairs (character code: 0xD800 to 0xDBFF and 0xDC00 and 0xDFFF) are not supported. Displayable characters, fonts, and character pitches differ depending on Windows fonts used.

*1 When placing figures and objects that display text on the screen, ensure they fit within the screen display area of the screen editor. If they extend beyond the temporary area, the text may be displayed incorrectly due to insufficient memory in the GOT.
☞ Page 293 Basic operations of a screen editor

Detailed font specifications

Font type	Font size	Character pitch*1	Character effect	KANJI region specification*2	Legible font*3
UD Gothic	Displayed in the size of 8 to 540 dots for the vertical and horizontal size. Specify 8 to 540 dots (in units of one dot) for the vertical size. Specify the horizontal size (font width) as a magnification of the vertical size.	Fixed	Bold*4 Shadow Engrave	Supported	Supported
UD Mincho		Fixed	Bold*4 Shadow Engrave	Supported	Supported
UDP Gothic		Proportional	Bold*4 Shadow Engrave	Supported	Supported
UDP Mincho		Proportional	Bold*4 Shadow Engrave	Supported	Supported
7-segment font	Displayed in the size of 8 to 540 dots for the vertical and horizontal size. Specify 8 to 540 dots (in units of one dot) for the vertical size. The horizontal size (font width) is half the vertical size.	Fixed	—	Not supported	Not supported
Windows font	Displayed in the size of 8 to 540 dots for the vertical and horizontal size. Specify 8 to 540 dots (in units of one dot) for the vertical size. Specify the horizontal size (font width) as a magnification of the vertical size.	Proportional	Bold*4 Shadow Engrave Italic*5 Underline*5*6	Not supported	Not supported

*1 A character pitch refers to the character width.
A proportional font is a font type that has different character widths for each character.

*2 For KANJI regions, refer to the following.
☞ Page 76 KANJI region

*3 0 (zero) and I can be changed to an easily-distinguishable font.
☞ Page 525 [Language and Font Setting]

*4 When setting a large font to bold, the text may look overlapped.

*5 Not available when Windows fonts are used for comment groups.

*6 When setting an underline for Windows font characters, the underline may not appear.

Precautions

When using the Windows fonts, note the following.

■Opening a created project on another computer

When Windows font used in the project has not been installed to the personal computer, and if a set text is changed, a different font is applied.

If the computer to open the project does not have the used Windows font, install the font to the computer.

■Using a Windows font that is installed while GT Designer3 is running

When using Windows fonts installed when operating GT Designer3, re-install GT Designer3.

■Effects of selecting [Enable the antialiasing to smooth jagged text edges]

Item	Description
Display of strings in GT Designer3	When antialiasing is enabled, the top of characters not included in European fonts may be cut off when certain European Windows fonts are used.
Data size of Windows fonts	When antialiasing is enabled, the data size becomes eight times larger than when it is disabled.
Character width of Windows fonts	When antialiasing is enabled, the character width increases compared to when it is disabled, which may cause characters to appear partially cut off.
Screen differential transfer	When only some screen data in the package data is transferred to the GOT, there may be a mix of screens with antialiasing enabled and screens with antialiasing disabled for Windows fonts.

4.3.2 KANJI region

GT37 SoftGOT3000

KANJI region refers to where Chinese characters are used (such as Japan and China).
Some Chinese characters, even with the same character code, look different depending on the region where Chinese characters are used.
In GT Designer3, the KANJI region can be specified for each figure or object to display characters in the font of the specified region (language).
Whether or not the KANJI region can be specified depends on the font.
☞ Page 75 Detailed font specifications
Available Chinese characters are Unicode Unified CJK Ideographs.
Unified CJK Ideographs are Chinese characters that consist of Chinese (Simplified), Chinese (Traditional), Japanese, and Korean, all of which are standardized in Unicode.
GT Designer3 supports the following KANJI regions.

KANJI region	Language	Available Chinese characters	Image
Japan	Japanese	Chinese characters included in the Shift JIS codes	
China	Chinese (Simplified)	Chinese characters included in the GB18030-2022 code set.	
	Chinese (Traditional)	Chinese characters included in the Big5 codes	

Multiple types of Chinese characters can be displayed as follows.
- Chinese characters in multiple KANJI regions can be displayed on one screen.
- The font of the displayed comment can be switched for each KANJI region by using the language switching function.

When Chinese characters in multiple KANJI regions are supported, install required fonts to the GOT.
☞ Page 77 How to display characters on the GOT

Precautions

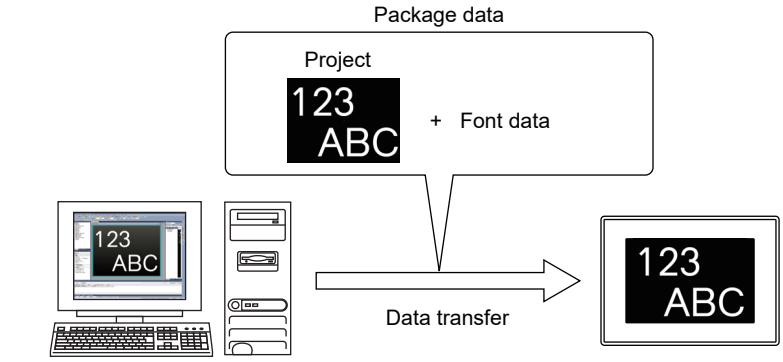
■Chinese characters which cannot be displayed with a specified KANJI region

If a specified KANJI region does not have Chinese character to be displayed, the character is displayed in Chinese character of another KANJI region that has the corresponding Chinese character.
The system finds the alternative KANJI region in order of Japanese, Chinese (Simplified), and Chinese (Traditional).

4.3.3 How to display characters on the GOT

GT37 SoftGOT3000

To display the text set in GT Designer3 on the GOT, write the font data to the GOT together with the project (screen data).
For GT SoftGOT3000, the font data is included in the GT SoftGOT3000 execution file (*.GTYP).



The font data is a system application and is automatically selected according to the font settings when the package data is transferred to the GOT.
The font data types are the system font and the add-on font.

Type of font data		Conditions for writing to the GOT
System font	UD system font	Automatically selected according to the settings for [Standard Language] and [Standard Style] in the [Environmental Setting] dialog ([Language and Font Setting]). ☞ Page 77 [Standard Language] and [Standard Style] in the [Environmental Setting] dialog ([Language and Font Setting])
	UD font (7-segment font)	Automatically selected if there are places where [7-Segment Font] is selected for [Font] for figures or objects.
Add-on font		Additionally required when displaying characters that are not included in the system font. Automatically selected according to the settings of [Font] and [KANJI Region] for figures or objects. ☞ Page 78 [Font] and [KANJI Region] for figures or objects ☞ Page 78 Other settings

You can check which font data was selected in the [Application Selection] dialog.
☞ Page 435 Setting the data to be transferred (application selection)

[Standard Language] and [Standard Style] in the [Environmental Setting] dialog ([Language and Font Setting])

Set a font used in the GOT as standard.
☞ Page 525 [Language and Font Setting]
One of the UD system fonts is selected to write to the GOT according to the settings.

Applicable UD system fonts	Settings in the [Type Setting] dialog ([Language and Font Setting])	
	[Standard Language]	[Standard Style]
[Japanese (Gothic)]	[Japanese] [English]	[Gothic]
[Japanese (Mincho)]		[Mincho]
[Chinese (Simplified) (Gothic)]	[Chinese (Simplified)]	[Gothic]
[Chinese (Simplified) (Mincho)]		[Mincho]
[Chinese (Traditional) (Gothic)]	[Chinese (Traditional)]	[Gothic]
[Chinese (Traditional) (Mincho)]		[Mincho]
[Korean (Hangul) (Gothic)]	[Korean (Hangul)]	[Gothic]
[Korean (Hangul) (Mincho)]		[Mincho]

[Font] and [KANJI Region] for figures or objects

Specify a font and KANJI region for each figure or object.

Add-on fonts are selected according to settings if any character that is not included in the fonts or KANJI regions set in the GOT as standard are set.

Applicable add-on fonts	Settings in the [Type Setting] dialog ([Language and Font Setting])		Settings for figures or objects	
	[Standard Language]	[Standard Style]	[Font]	[KANJI Region]
[Japanese (Gothic)]	[Japanese]	[Mincho]	Select either of the following items for at least one of the font settings. • [UD Gothic] • [UDP Gothic]	—
	Other than [Japanese]	—		Select the following item for at least one of the font settings. • [Japan]
[Japanese (Mincho)]	[Japanese]	[Gothic]	Select either of the following items for at least one of the font settings. • [UD Mincho] • [UDP Mincho]	—
	Other than [Japanese]	—		Select the following item for at least one of the font settings. • [Japan]
[Chinese (Simplified) (Gothic)]	[Chinese (Simplified)]	[Mincho]	Select either of the following items for at least one of the font settings. • [UD Gothic] • [UDP Gothic]	—
	Other than [Chinese (Simplified)]	—		Select the following item for at least one of the font settings. • [China(GB)]
[Chinese (Simplified) (Mincho)]	[Chinese (Simplified)]	[Gothic]	Select either of the following items for at least one of the font settings. • [UD Mincho] • [UDP Mincho]	—
	Other than [Chinese (Simplified)]	—		Select the following item for at least one of the font settings. • [China(GB)]
[Chinese (Traditional) (Gothic)]	[Chinese (Traditional)]	[Mincho]	Select either of the following items for at least one of the font settings. • [UD Gothic] • [UDP Gothic]	—
	Other than [Chinese (Traditional)]	—		Select the following item for at least one of the font settings. • [China(Big5)]
[Chinese (Traditional) (Mincho)]	[Chinese (Traditional)]	[Gothic]	Select either of the following items for at least one of the font settings. • [UD Mincho] • [UDP Mincho]	—
	Other than [Chinese (Traditional)]	—		Select the following item for at least one of the font settings. • [China(Big5)]

Other settings

The corresponding add-on font is selected if a different language from [Standard Language] in the [Environmental Setting] dialog ([Language and Font Setting]) is selected.

Setting	Reference
[System Language] in the [GOT Setup] window ([Display Setting/Language Setting])	☞ Page 618 [Display Setting/Language Setting]
[Fixed Language] in the [Alarm Common Setting] dialog	☞ Page 2043 [Alarm Common Setting] dialog
[Section Title] in the [Mail Send Detail Setting] dialog	☞ Page 2051 [Mail Send Detail Setting] dialog

4.3.4 Display language in the utility

GT37 SoftGOT3000

To switch the display language in the utility, the GOT requires the font data of the target language.
For GT SoftGOT3000, the font data is included in the GT SoftGOT3000 execution file (*.GTYP).
The following shows the relationship between the language displayed in the utility and the font data required for the GOT (excluding GT SoftGOT3000).

Display language in the utility	Required font data
Japanese	One of the following font data items is required. • [Standard Function] → [UD System Font] → [Japanese (Gothic)] • [Standard Function] → [UD System Font] → [Japanese (Mincho)] • [Add-on Function] → [Add-on Font] → [UD Add-on Font] → [Japanese (Gothic)] • [Add-on Function] → [Add-on Font] → [UD Add-on Font] → [Japanese (Mincho)]
English	The language can be selected regardless of the font data installed on the GOT.
Chinese (Simplified)	One of the following font data items is required. • [Standard Function] → [UD System Font] → [Chinese (Simplified) (Gothic)] • [Standard Function] → [UD System Font] → [Chinese (Simplified) (Mincho)] • [Add-on Function] → [Add-on Font] → [UD Add-on Font] → [Chinese (Simplified) (Gothic)] • [Add-on Function]→ [Add-on Font]→ [UD Add-on Font] → [Chinese (Simplified) (Mincho)]
Chinese (Traditional)	One of the following font data items is required. • [Standard Function] → [UD System Font] → [Chinese (Traditional) (Gothic)] • [Standard Function] → [UD System Font] → [Chinese (Traditional) (Mincho)] • [Add-on Function] → [Add-on Font] → [UD Add-on Font] → [Chinese (Traditional) (Gothic)] • [Add-on Function] → [Add-on Font] → [UD Add-on Font] → [Chinese (Traditional) (Mincho)]
Korean	The language can be selected regardless of the font data installed on the GOT.

Font data is one of the system applications.
For information on how to add a system application to be installed on the GOT, refer to the following.
☞ Page 435 Setting the data to be transferred (application selection)

4.4 Character codes supported by the GOT

GT37 SoftGOT3000

The GOT supports the following character codes.

Character code	Remarks
ASCII	—
Unicode	UTF-16 is supported. If any Unicode data other than UTF-16 data is used, the GOT converts the character code to UTF-16. There are restrictions depending on the data used.
Shift JIS	—
GB	GB18030-2022 is supported.
Big5	—
KS	—

4.5 Drive configuration and capacity of the GOT

GT37 SoftGOT3000

This section describes the GOT drives specified as transfer destinations of projects or storage destinations of resource data.

☞ Page 81 Drive configuration and capacity of GT37
☞ Page 83 Drive configuration and capacity of GT SoftGOT3000

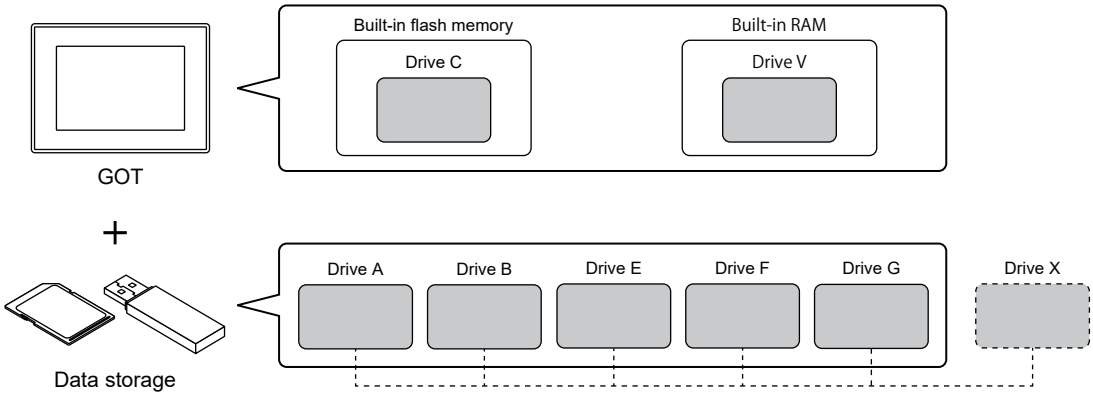
4.5.1 Drive configuration and capacity of GT37

GT37 SoftGOT3000

Built-in flash memory and data storages mounted to a built-in interface are used as drives.

For specifications of built-in interface and available data storages, refer to the following.

GOT3000 Series User's Manual (Hardware)



Drive	Name	Capacity	Conditions for use	Specification as a storage destination	
				Project System application (add-on function)	Resource data
A	Standard SD card	Depends on the data storage used.	Insert an SD card to the SD card interface of the GOT.*1	Available	Available
B	USB drive*2	Depends on the data storage used.	Install a data storage on the USB interface of the GOT.*1	Available	Available
C	Built-in flash memory	User area: 256 MB	No condition	Available	Not available
E	USB drive*2	Depends on the data storage used.	Install a data storage on the USB interface of the GOT.*1	Available	Available
F	USB drive*2				
G	USB drive*2				
V*3	Built-in RAM (user work memory area)	16 MB	Select [Enable the automatic update of image files] in the [Parts Setting] dialog ☞ Page 831 [Parts Setting] dialog	Not available	Not available
X	Current drive	A drive that is running a project. If the project is running from drive C, the current drive refers to drive A. By specifying a current drive, the same drive as the project storage destination can be specified. The drive specifications are consistent with the drive that is running a project.			

*1 For details on data storage specifications, refer to the following.
☞ Page 82 Specifications of available data storages

*2 For details on USB drive specifications, refer to the following.
☞ Page 82 USB drive specifications

*3 Drive V is the area where image files written using the FTP server function are stored.
The image files on this drive can only be used to automatically switch the image of a parts display object.
☞ Page 1416 Placing a parts display

Specifications of available data storages

Data storages with 2 TB or less can be used.

Before using data storages, format them with the following file systems.

Data storage	Compatible file system
2 GB or more	FAT32
Less than 2 GB	FAT16

Formatting can also be performed using the GOT utility or GT Designer3.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

☞ Page 472 [GOT Read] tab

USB drive specifications

Drive letters (characters for identifying the drives) are assigned to the data storages mounted to the USB interface of the GOT in the order they are mounted.

Multiple data storages can be mounted to a single USB interface using a USB hub or card reader.

Up to four USB drives can be assigned to all the USB interfaces.

The assignment order of drive letters differs depending on whether the data storage is mounted to the front USB (device/host) or the rear USB (host).

Built-in interface of the GOT	Order of drive letter assignment	
	First drive detected	Second and subsequent drives detected
Front USB interface (device/host)	E	F→G→B
Rear USB interface (host)	B	F→G→E

When assigning user-selected drives to data storages, mount the data storages in order of assignment.

4.5.2 Drive configuration and capacity of GT SoftGOT3000

GT37 SoftGOT3000

Specify a folder in the personal computer as a virtual drive and use the folder as a drive.

Multiple GT SoftGOT3000 modules can be started, and a module number is assigned to each activated window.

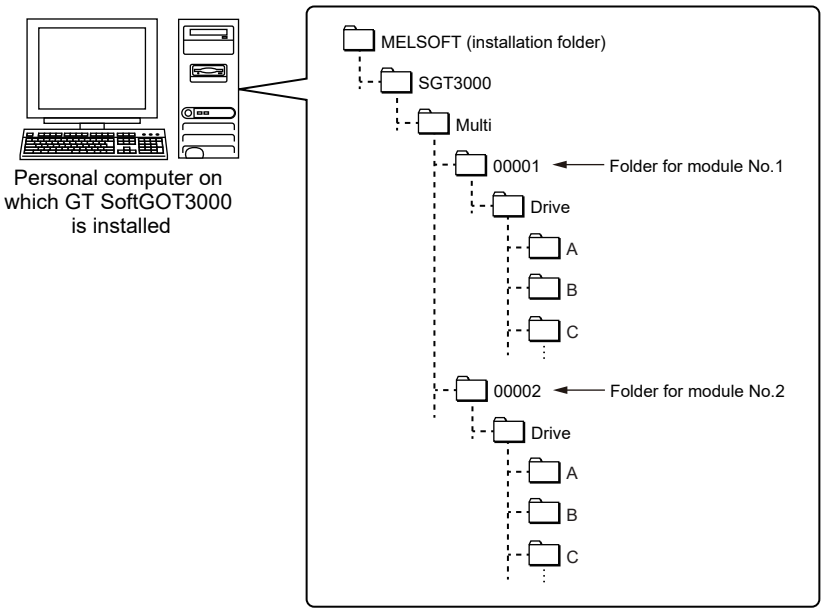
Virtual drives are created for each GOT.

For information on how to set virtual drives, refer to the following.

GT SoftGOT3000 User's Manual

In GT SoftGOT3000, open the project to be used and start monitoring.

Data of the opened project is stored to drive C.



Virtual drive	Name	Capacity	Conditions for use	Specification as a storage destination
				Resource data
A	—	Depends on the personal computer hard disk.	No condition	Available
B	—	Depends on the personal computer hard disk.	No condition	Available
C	—	Depends on the personal computer hard disk.	No condition	Not available
E	—	Depends on the personal computer hard disk.	No condition	Available
F	—	Depends on the personal computer hard disk.	No condition	
G	—	Depends on the personal computer hard disk.	No condition	
V*1	—	Depends on the personal computer hard disk.	Select [Enable the automatic update of image files] in the [Parts Setting] dialog ☞ Page 831 [Parts Setting] dialog	Not available
X	Current drive	A drive that is running a project. If the project is running from drive C, the current drive refers to drive A. By specifying a current drive, the same drive as the project storage destination can be specified. The drive specifications are consistent with the drive that is running a project.		

*1 Drive V is the area where image files written using the FTP server function are stored.
The image files on this drive can only be used to automatically switch the image of a parts display object.
☞ Page 1416 Placing a parts display

4.6 Restrictions for folder names and file names used in GOT

GT37 SoftGOT3000

Item	Description	Remarks
Usable characters	One-byte alphanumeric and symbols	The following symbols cannot be used. • " • * • / • : (Usable only for indicating a drive name) • < • > • ? • \ (Usable only for the folder name separator) • | • One-byte space
		The following texts (case-insensitive) cannot be used as a folder name or file name. However, the following characters can be used when they are included in those names. • COM0 to COM9 • LPT0 to LPT9 • AUX • CON • NUL • PRN • CLOCK$
		Do not use the following items because they are hidden in the GOT utility. • Folders and files whose names start with G1, G2, or G3 • A folder named SYSLOG • Files with .INI or .G3G extensions
	Any characters specified in Unicode	Surrogate pairs (character code: 0xD800 to 0xDBFF and 0xDC00 and 0xDFFF) are not supported.
		Characters specified in Unicode cannot be used in a name of the folder to store package data ([Package Folder Name]). ☞ Page 519 [Basic Setting]
Maximum number of characters	78 (Any character type)	Set a folder name and file name so that the total number of characters used for the path is 78 or less. Example) Path of the CSV file to be stored to drive A  When setting the folder name, enter \ between folder names. \ is counted as a character. Up to 20 hierarchy levels are functional in a folder.

5 Screen layout and basic operations

5.1 Startup and exit

GT37 SoftGOT3000

☞ Page 86 Starting GT Designer3
☞ Page 87 Exiting GT Designer3

5.1.1 Starting GT Designer3

Operating procedure

The following shows how to start GT Designer3 using the Windows 11 operating environment as an example.

1. From the Windows start menu, select [All] → [MELSOFT] → [GT Designer3] to start GT Designer3.
2. Select [GOT3000] in the series selection dialog.
3. Select an operation in the [Select Project] dialog.

☞ Page 86 [Select Project] dialog

■Starting multiple GT Designer3 modules

You can edit data among GT Designer3 modules, such as copying and pasting.
Copying and pasting data between GT Designer3 modules of different series are unavailable.

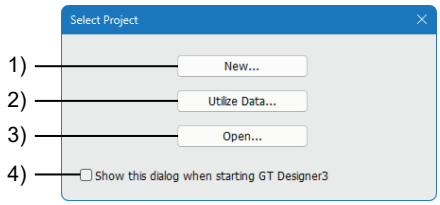
Point

GT Designer3 consists of three screen design software modules as shown below.

- GT Designer3 (GOT3000): Screen design software module for GOT3000 series
- GT Designer3 (GOT2000): Screen design software module for GOT2000 series
- GT Designer3 (GOT1000): Screen design software module for GOT1000 series

When a project that cannot be edited with the current screen design software is operated, the compatible screen design software will start.

[Select Project] dialog



Item		Description
1)	[New] button	Creates a new project. ☞ Page 208 Creating a project
2)	[Utilize Data] button	Utilizes an existing project to create a new project. ☞ Page 211 Utilizing a project
3)	[Open] button	Opens a saved project. ☞ Page 216 Opening a project
4)	[Show this dialog when starting GT Designer3]	Displays the [Select Project] dialog at startup of GT Designer3. Whether to display or hide the [Select Project] dialog at startup of GT Designer3 is settable on the [Operation] tab in the [Option] dialog as well. ☞ Page 197 Customizing the operation

5.1.2 Exiting GT Designer3

Operating procedure

To exit GT Designer3, perform one of the following operations.

- Select [Project] → [Exit] from the menu.
- Click the [×] button on the title bar of GT Designer3.

5.2 Switching the display language

GT37 SoftGOT3000

By switching the display language of GT Designer3, you can use GT Designer3 in multiple languages on one personal computer.

Operating procedure

The following shows how to switch the display language.

1. Select [View] → [Switch Display Language] from the menu to display the [Switch Display Language] dialog.
☞ Page 90 [Switch Display Language] dialog
2. Select a language to be switched to in [Display Language], and click the [OK] button.
3. Exit GT Designer3.
4. Start GT Designer3 again to switch the display language.

The language of Help is also switched according to the display language.
If you need the latest Help, consult your local sales office.

5.2.1 Specifications of the display language switching

Languages supported by the personal computer OS

When the personal computer OS does not support a language to be switched to, the screen layout collapses and the characters become garbled in GT Designer3.
Install a language pack or others on the personal computer as needed.

Items to which the display language switching is not applied

The display language switching is not applied to the following items.

Item	Display specifications
Some right-click context menu items	The display language depends on the OS language.
Setting items and buttons in some dialogs	The display language depends on the OS language.
Manuals	The display language depends on the language version of the manual installed.

Display language for importing files

After exporting a file using the following functions, you cannot import the file to GT Designer3 whose display language is different.

- Label group
- Comment group
- User alarm monitoring
- Logging
- Recipe
- Device data transfer

File format of exported files

When display languages differ between GT Designer3 and the OS, export files in the Unicode text format.
Do not select CSV format, or the files may not be exported properly.

Copying the settings between GT Designer3 modules whose display languages are different

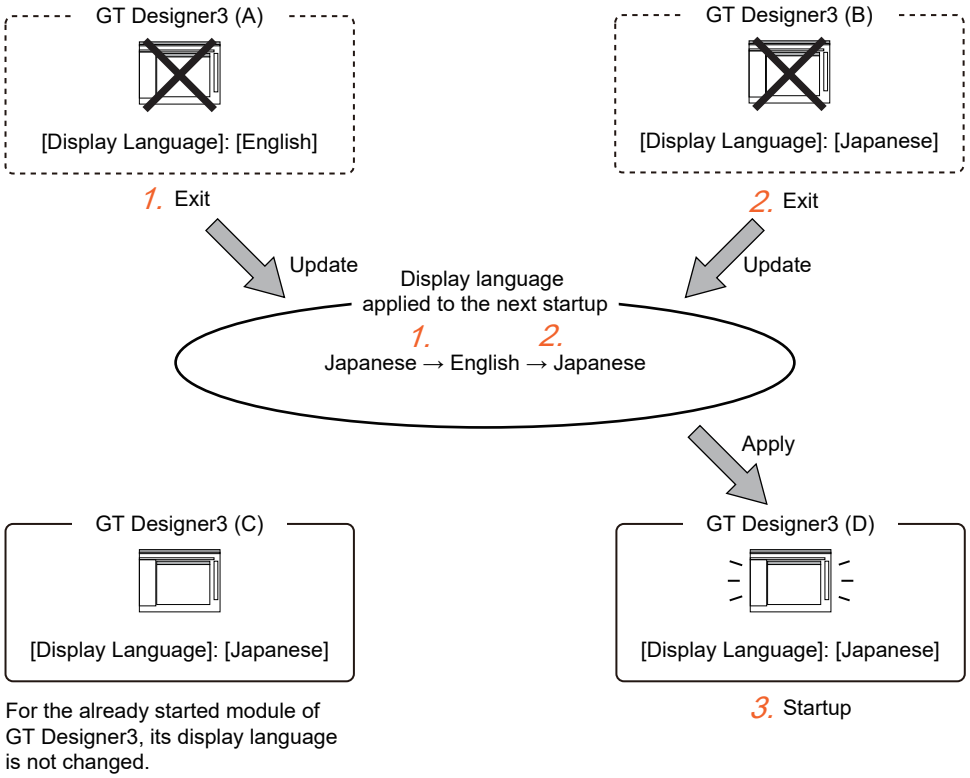
When starting multiple GT Designer3 modules, you cannot copy the following items between the modules whose display languages are different.

- Label group
- Search result list in the data browser

Operation when multiple modules of GT Designer3 are started

The display language is shared among all modules of GT Designer3.
When GT Designer3 is exited, the display language will be updated at the next startup according to the [Display Language] setting in GT Designer3.
The display language of the last exited GT Designer3 is applied when you newly start a GT Designer3 module.

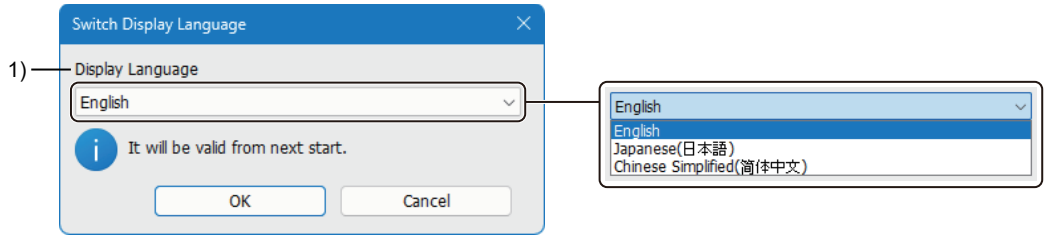
Ex.
When exiting GT Designer3 (A) ([Display Language]: [English]), and then exiting GT Designer3 (B) ([Display Language]: [Japanese])
Japanese is applied as the display language when GT Designer3 (D) is newly started.



For the already started module of GT Designer3, its display language is not changed.

5.2.2 [Switch Display Language] dialog

GT37 SoftGOT3000

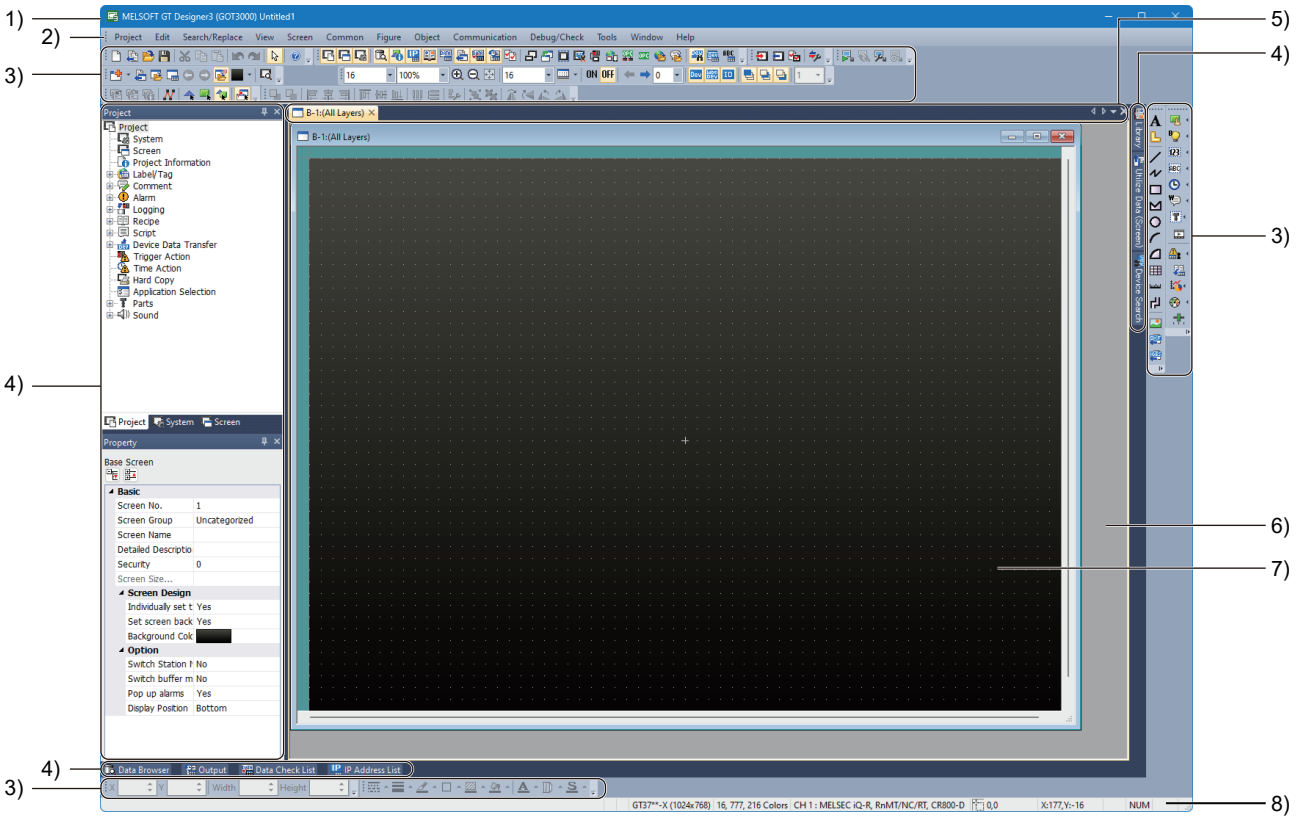


Item		Description
1)	[Display Language]	Select a language to be switched to.

5.3 Screen layout

GT37 SoftGOT3000

The following shows the screen layout of GT Designer3.



Item		Description
1)	Title bar	Displays the software module name and the file name with a full path.
2)	Menu bar	GT Designer3 is operable with the pull-down menus. ☞ Page 93 Menu bar
3)	Toolbar	GT Designer3 is operable with the buttons. ☞ Page 104 Toolbars and shortcut keys
4)	Docking window	A window that can be docked with the screen of GT Designer3. The docking location is customizable. ☞ Page 194 Customizing a docking window For the docking window types, refer to the following. ☞ Page 92 List of docking windows
5)	Editor tab	Displays the tabs of the windows and screen editors which are displayed on the work window. ☞ Page 114 Editor tab, work window
6)	Work window	Displays screen editors, the [Environmental Setting] window, the [GOT Setup] window, and other windows. ☞ Page 114 Editor tab, work window
7)	Screen editor	Create a screen to be displayed on the GOT by placing figures and objects on the screen editor. ☞ Page 263 Creating a screen
8)	Status bar	Displays the following contents according to the position of the mouse cursor, selected figure, or object. • Description of the item under the mouse cursor • GOT type, color settings, and controller settings in the current project • Coordinates of the selected figure or object • Auto save function enabled state

List of docking windows

Item	Description
[Utilize Data (Screen)] window	Search other projects for a screen that can be utilized. ☞ Page 211 Utilizing a project
[Project] window	Lists the settings of the whole project. ☞ Page 116 [Project] window
[System] window	Lists settings, such as the GOT type setting, environmental setting, and controller setting. ☞ Page 118 [System] window
[Screen] window	Lists the created base screens, window screens, and mobile screens. You can create or edit a base screen, window screen, or mobile screen. ☞ Page 122 [Screen] window
[Property] window	Lists the settings of a selected screen, figure, or object. You can edit the settings without opening the setting dialog of a figure, object and others. ☞ Page 126 Checking and editing settings of screens and objects
[Library] window	Lists the figures and objects registered in the library. You can utilize, create, or edit a figure or object in the library. ☞ Page 1061 Using the data registered in the library
[Device Search] window	Search the project for matching devices, labels, or tags. ☞ Page 130 Searching for a device (Device search)
[Data Browser] window	Lists the settings in the project. You can search for the setting of a figure or object and edit it. ☞ Page 167 Searching for and editing a specific setting (Data Browser)
[Data Check List] window	Lists data check results. ☞ Page 344 [Data Check List] window
[Output] window	Lists the history of changes when a project is converted due to GOT type change or other reasons. ☞ Page 528 [Output] window
[Controller Type List] window	Lists the controllers set for each channel. ☞ Page 739 [Controller Type List] window
[Data View] window	Lists the figures and objects on the screen editor. You can select a figure or object in the [Data View] window. ☞ Page 1005 [Data View] window
[Screen Image List] window	Displays the icons of base screens, window screens, and mobile screens. You can create or edit a base screen, window screen, or mobile screen. ☞ Page 335 [Screen Image List] window
[Category List] window	Lists categories, and their figures and objects. You can change a category, or collectively change the devices or other settings by category. ☞ Page 1128 [Category List] window
[Parts Image List] window	Lists the icons of registered parts. You can create or edit a part. ☞ Page 830 [Parts Image List] window
[IP Address List] window	Lists the IP addresses registered in the project. ☞ Page 183 Checking the IP addresses in the list (IP address list)

5.3.1 Menu bar

The following shows the GT Designer3 menu configurations.

The menus unavailable for the GOT type are not displayed.

[Project]

Menu			Description
[New]			Creates a new project.
[Utilize Data]			Searches for a project that can be utilized.
[Open]			Opens a saved project.
[Close]			Closes the current project.
[Save]			Saves the current project over itself.
[Save As]			Saves the current project as a new name.
[Verify]			Verifies the current project against a saved project.
[Project Information]			Set a project title and a creator's name.
[Utilize Project]			Utilizes data of saved projects.
[Import Other Data]	[Device Comment/Device Definition]		Reads device comments.
	[Label/Tag/Ethernet Setting]		Reads the label, tag, and Ethernet settings.
	[Profile (CSP+)]	[Label (GT Designer3) Auto Registration]	Registers the labels (GT Designer3) created from profile data automatically.
[Save Package Data]			Saves the project in the package data format (*.GTYS).
[Security]	[User Management]		Manage the user information registered with the project.
	[Setup Access Authority]		Set the access authority of each access level.
	[Change Password]		Change the password of the logged-in user.
[Recent Projects]			Lists up to five recently-used projects.
[Start GT Designer3 (GOT2000)]			Starts GT Designer3 (GOT2000).
[Start GT Designer3 (GOT1000)]			Starts GT Designer3 (GOT1000).
[Exit]			Exits GT Designer3.

[Edit]

Menu		Description
[Undo]		Cancels the last operation.
[Redo]		Redoes the operation that has been undone by the [Undo] command.
[Cut]		Cuts the selected item.
[Copy]		Copies the selected item.
[Paste]		Pastes a copied or cut target to a selected area.
[Duplicate]		Pastes a copy of a figure or object selected on the screen editor.
[Consecutive Copy]		Pastes multiple copies of a figure or object selected on the screen editor.
[Select All]		Selects all figures and objects placed on the screen editor.
[Delete]		Deletes the selected item.
[Object of Selection]	[Figure]	Changes the target for selecting on the screen editor.
	[Object]	
	[Figure + Object]	
	[Overlay Screen]	Enables or disables selection of set overlay screens.
[Group]		Groups selected figures and objects.
[Ungroup]		Cancels the grouping of a selected group.
[Stacking Order]	[Move to the Front of Front Layer]	Changes the stacking order of the selected figures and objects.
	[Move to the Back of Back Layer]	
	[Move to the Front of Layer]	
	[Move to the Back of Layer]	
	[Move to the Front]	
	[Move to the Back]	
[Align]	[Left]	Aligns the positions of multiple selected figures, objects, template information, and groups.
	[Center (Horizontal)]	
	[Right]	
	[Top]	
	[Center (Vertical)]	
	[Bottom]	
	[Align Sideways]	
	[Align Lengthways]	
	[Custom]	
[Rotate/Flip]	[Flip Vertical]	Rotates or flips a selected figure.
	[Flip Horizontal]	
	[Rotate Left]	
	[Rotate Right]	
[Edit Vertices]		Switches between changing and fixing the positions of the vertexes of a figure.
[Edit Objects with Fixed Frame Width]	[Always Fix the Width]	Fixes or does not fix the frame width of the object shape when the object is resized.
	[Collective Edit]	Changes the shape frame widths of all objects that satisfy the frame width fixing conditions. After the change, the frame widths become fixed.
[Edit Touch Area]	[Manual Edit]	Enables or disables separately setting the touch area and display area of a touch switch.
	[Self-adjust]	Matches the touch area of a selected touch switch with the displayed area.
	[Constant Self-adjust]	Enables or disables automatic adjustment so that the touch area of a touch switch is always aligned with the display area.
[Adjust Direct Text Size]		Enables or disables change of the text size according to the scaling of the object size.
[Template Registration]	[Register to Template]	Adds a selected figure or object to a template.
	[Deregister from Template]	Deletes a selected figure or object from the template list.
[Edit Template Attribute]		Edits the template attribute of a selected template.
[Set to Default]		Sets the settings configured for the selected figure or object as defaults.
[Add to Category]	[Switch]	Changes the category of a selected figure or object.
	[Lamp]	
	[Other]	
	[User-defined Category]	

Menu	Description
[Shape Change]	Changes the shape of a selected object.
[Change Text]	Changes the text of the selected figure or object.
[Display Template Property]	Displays the settings of a selected template.
[Open Setting Dialog]	Displays the setting dialog of a selected figure or an object.

[Search/Replace]

Menu		Description
[Device Search]		Search the project for matching devices, labels, or tags.
[Device List]	[Screen]	Lists the devices used in the project.
	[Project]	
	[Script Text]	
[Text List]		Lists the strings used in the project.
[Batch Edit]	[Device]	Changes the device settings in the project collectively.
	[Unit No./Axis No.]	Changes the unit numbers and axis numbers in the project collectively.
	[Network]	Changes the network settings in the project collectively.
	[CH No.]	Changes the channel number settings in the project collectively.
	[Color]	Changes the color settings in the project collectively.
	[Figure]	Changes the shape settings in the project collectively.
[Data Browser]		Displays the [Data Browser] window.
[IP Address List]		Displays the [IP Address List] window.

[View]

Menu		Description
[Preview]		Displays a preview of the current screen.
[Window Preview]	[Apply to all base screens]	Switches between applying settings in the [Window Preview] dialog to all base screens and configuring the settings for each base screen.
	[Apply to all mobile screens]	Switches between applying settings in the [Window Preview] dialog to all mobile screens and configuring the settings for each mobile screen.
	[Overlap Window1]	Displays a preview of overlap window 1.
	[Overlap Window2]	Displays a preview of overlap window 2.
	[Overlap Window3]	Displays a preview of overlap window 3.
	[Overlap Window4]	Displays a preview of overlap window 4.
	[Overlap Window5]	Displays a preview of overlap window 5.
	[Superimpose Window1]	Displays a preview of superimpose window 1.
	[Superimpose Window2]	Displays a preview of superimpose window 2.
	[Key Window]	Displays a preview of the key window.
	[Dialog Window]	Displays a preview of the dialog window.
	[PC Remote Operation]	Displays a preview of the remote personal computer screen.
	[Web Browser]	Displays a preview of the web browser window.
	[Custom]	Sets a window screen to be displayed.
[Switch ON/OFF Display]		Switches the display status of objects on screen editors between ON and OFF.
[State No.]	[Previous State]	Switches the states of objects to be displayed on screen editors in descending order.
	[Next State]	Switches the states of objects to be displayed on screen editors in ascending order.
[Redisplay]		Redisplays a selected screen editor.

Menu		Description
[Toolbar]	[Main]	Displays or hides the [Main] toolbar.
	[Window Display]	Displays or hides the [Window Display] toolbar.
	[View]	Displays or hides the [View] toolbar.
	[Screen]	Displays or hides the [Screen] toolbar.

[Screen]

Menu		Description
[New]	[Base Screen]	Create a base screen.
	[Window Screen]	Create a window screen.
	[Mobile Screen]	Create a mobile screen.
[Utilize Data]		Search other projects for a screen that can be utilized.
[Open]		Open a selected window.
[Close]		Closes the current screen.
[Close All]		Closes all windows.
[Copy]		Copy a selected window.
[Delete]		Delete a selected window.
[Screen Design]		Displays the [Screen Design] dialog.
[Screen Image List]		Displays the [Screen Image List] window.
[Previous Screen]		Opens a screen whose screen number is one smaller than that of the current screen.
[Next Screen]		Opens a screen whose screen number is one greater than that of the current screen.
[Open Closed Screens]		Sets or cancels the closed screen as the target for the operation of [Previous Screen] or [Next Screen].
[Screen Script]		Set screen scripts.
[Screen Trigger Action]		Set screen trigger actions.
[Resize Screen]		Resizes the following screens. • Base screen (when the base screen size expansion is enabled) • Window screen • Mobile screen This item is enabled when all of the following conditions are satisfied. • [Expand base screen sizes] is selected in the [Type Setting] dialog ([Basic Setting]) (for the base screen only). • Screen size editing is allowed for the logged-in operator's access level (project security function).

Menu	Description
[Copy Screen Image to the Clipboard]	Captures the current screen image.
[Screen Property]	Configure the settings for the screen being edited in the screen properties.

[Common]

Menu			Description
[GOT Type Setting]			Change the GOT model setting of the project.
[GOT Environmental Setting]	[Screen Switching/Windows]		Configure the screen switching settings.
	[Language Switching]		Configure the language switching settings.
	[Dialog Window]		Configure the system message dialog window settings.
	[Key Window]		Configure the project-wide key window settings.
	[System Information]		Set devices that handle the system information.
	[Security]		Set a password for operating the GOT and reading the data from the GOT.
	[Information Protection Function]		Configure the settings for file protection and certificates in the GOT.
	[Operation Log]		Configure the settings for collecting operation history events of the GOT.
	[Internal Device Retention]		Configure the settings for retaining the GOT internal device values.
	[Kana-Kanji/Pinyin Conversion]		Configure the settings for Kana-Kanji or Pinyin conversion.
[SoftGOT Setting]			Configure the GT SoftGOT3000 settings.
[GOT Setup]	[Basic Setting]	[Display Setting/Language Setting]	Configure the GOT display settings.
		[GOT ID]	Set unique information to the GOT.
		[Operation Setting/Utility Call Key]	Set a buzzer sound and the utility call key for the GOT.
		[USB Common Setting]	Configure the GOT USB interface settings.
		[USB Host]	Configure the settings for using a mouse and keyboard on the GOT.
		[Time Setting]	Set the GOT time setting method.
		[Transparent Mode Setting]	Set the target channel for the FA transparent function.
		[GOT Internal Device Monitor]	Configure the GOT internal device monitor settings for the GOT diagnostics.
		[Startup Logo]	Configure the startup logo settings.
		[Digital Image Output]	Set the target (screen image) to be output from the GOT to an external display.
	[Add-on Setting]	[SoftGOT-GOT Link]	Configure the SoftGOT-GOT link function settings.
		[VNC Server]	Configure the VNC server function settings.
		[Sequence Program Monitor]	Configure the sequence program monitor settings.
		[Backup/Restoration]	Configure the backup/restoration function settings.
		[System Launcher]	Configure the system launcher settings.
		[iQSS Utility]	Configure the iQSS utility settings.
		[Contactless Tag]	Configure the contactless tag settings.
		[VPN Connection]	Configure the VPN connection settings.
		[Web Browser]	Configure the settings for displaying a web browser on the GOT.
[GOT Ethernet Setting]	[GOT IP Address Setting]		Set the IP address of the GOT.
	[GOT Ethernet Common Setting]		Configure the GOT Ethernet setting.
	[IP filter Setting]		Configure the IP filter setting.
[VPN Connection]			Configure the VPN connection settings.
[Controller Setting]			Configure the settings for communicating with controllers.

Menu		Description
[Peripheral Setting]	[PC (Data Transfer)]	Set the interface for connecting GT Designer3 (personal computer) with the GOT.
	[Bar Code]	Configure the settings for using a barcode reader on the GOT.
	[RFID]	Configure the settings for using a RFID controller on the GOT.
	[PC Remote Operation]	Configure the settings for operating the personal computer from the GOT.
	[VNC Server]	Configure the VNC server function settings.
	[Digital Image Input/Recording]	Configure the settings for displaying or recording images from a web camera or other devices on the GOT.
	[Web Browser]	Configure the optional settings for the web browser function.
	[External I/O / Operation Panel]	Configure the settings for using an external I/O device or operation panel with the GOT.
[GOT Network Interaction]		Configure the settings for controlling pieces of equipment on the same network to prevent simultaneous operations.
[GOT Mobile Setting]		Configure the settings for using the GOT as the server in the GOT Mobile function.
[OPC UA Server Setting]	[OPC UA Server Setting]	Configure the settings for using the GOT as an OPC UA server.
	[OPC UA Tag Setting]	Create an OPC UA tag.
[I/F Communication Setting]		Lists the interface settings of the GOT.
[Label]	[Open]	Lists label groups.
	[New Label Group]	Create a label group.
	[Label Group Property]	Change the number and title of a label group.
[Comment]	[Open]	Lists comment groups.
	[New Comment Group]	Create a comment group.
	[Comment Group Property]	Change the number and title of a comment group.
	[New Row]	Create a row at the bottom of the comment group being edited.
	[Insert Row]	Insert a new row into a comment group being edited.
	[Insert Column]	Insert a new column into a comment group being edited.
	[Import]	Imports a comment group from a file.
	[Export]	Outputs a comment group to a file.
	[Search]	Searches a comment group for a comment.
	[Jump]	Displays the row of a specified comment number.
	[Attribute Setting]	Changes the attribute of a selected row.
	[Attribute Display/Non-Display]	Displays or hides the attribute of a comment group.
[Alarm]	[Alarm Common Setting]	Set devices that convert alarm files.
	[User Alarm Observation]	Configure the settings for collecting alarms by monitoring target devices.
	[System Alarm Observation]	Configure the settings for collecting alarms by monitoring the system.
	[Alarm Popup Display]	Configure the settings for displaying collected alarms in a popup window when the alarms are collected.
[Logging]		Set control devices for the recipe function.
[Recipe]	[Recipe Common Setting]	Configures the settings for executing batch write or batch read on multiple devices.
	[Recipe]	
[Script]	[Script]	Set scripts.
	[Script List]	Lists the scripts.
	[Script Symbol]	Set script symbols.
	[Object Script Symbol]	Set object script symbols.
[Device Data Transfer]		Configure the settings for transferring data between devices.
[Trigger Action]		Set actions triggered by devices or sampling.
[Time Action]		Set actions triggered by time.
[Hard Copy]		Captures the active screen on the GOT.
[Application Selection]		Select system applications to be written to the GOT.
[Parts]	[Parts Image List]	Lists the icons of the parts.
	[Parts Setting]	Configure the part settings.
	[New]	Create a part.

Menu		Description
[Sound]	[Sound File List]	Lists the sound files to register or edit the files.
	[Touch Key Sound Setting]	Configure the setting to use a specified sound file for the touch key sound.

[Figure]

Menu	Description
[Text]	Draw a text figure.
[Logo Text]	Draw a logo text figure.
[Line]	Draw a line.
[Line Freeform]	Draw a freeform line.
[Rectangle]	Draw a rectangle.
[Polygon]	Draw a polygon.
[Circle]	Draw a circle.
[Arc]	Draw an arc.
[Sector]	Draw a sector.
[Table]	Draw a table.
[Scale]	Draw a scale.
[Piping]	Draw a piping.
[Paint]	Fills the framed area of the figure on the screen.
[Import Image Data]	Imports an image file into the screen.
[Import DXF Data]	Imports a DXF data into the screen.
[Import IGES Data]	Imports an IGES data into the screen.

[Object]

Menu		Description
[Select Library]	[Library List]	Displays the [Library] window.
	[My Library]	Displays the [My Library] tree in the [Library] window.
	[My Favorites]	Displays the [My Favorites] tree in the [Library] window.
[Switch]	[Switch]	Place a touch switch with multiple functions.
	[Bit Switch]	Place a touch switch to switch ON/OFF of a bit device.
	[Word Switch]	Place a touch switch to change the value of a word device.
	[Go To Screen Switch]	Place a touch switch to switch a screen.
	[Change Station No. Switch]	Place a touch switch to switch the station number of the GOT monitoring target.
	[Special Function Switch]	Place a touch switch to display the utility or the screen for a monitor function.
	[Key Window Display Switch]	Place a touch switch to display a key window.
	[Key Code Switch]	Place a touch switch to enter a key code.
[Lamp]	[Bit Lamp]	Place a lamp controlled by a bit device.
	[Word Lamp]	Place a lamp controlled by a word device.
	[Lamp Area]	Place a lamp area controlled by a bit device.
[Numerical Display/Input]	[Numerical Display]	Place an object to display a device value (numerical value).
	[Numerical Input]	Place an object to input a device value (numerical value).
[Text Display/Input]	[Text Display]	Place an object to display a device value (text).
	[Text Input]	Place an object to input a device value (text).
[Date/Time Display]	[Date Display]	Place an object to display the date.
	[Time Display]	Place an object to display the time.
[Comment Display]	[Bit Comment]	Place an object to display a comment. A bit device controls the displayed comment.
	[Word Comment]	Place an object to display a comment. A word device controls the displayed comment.
	[Simple Comment]	Place an object to display a comment. The displayed comment is fixed.

Menu		Description
[Parts Display]	[Bit Parts]	Place an object to display a part. A bit device controls the displayed parts.
	[Word Parts]	Place an object to display a part. A word device controls the displayed parts.
	[Fixed Parts]	Place an object to display a part. The displayed part is fixed.
[Frame Animation]		Place an object to display frame-by-frame videos.
[Historical Data List Display]		Place an object to display the history of device values collected by the logging function.
[Alarm Display]	[Alarm Display (User)]	Place an object to display the alarms collected through user alarm monitoring.
	[Alarm Display (System)]	Place an object to display the alarms collected through system alarm monitoring.
	[Simple Alarm Display]	Place an object to display the alarms collected by monitoring devices. Set the alarms to be monitored by object.
	[System Alarm Display]	Place an object to display the alarms collected by monitoring the system. Set the alarms to be monitored by object.
[Recipe Display (Record List)]		Place an object to list the records of a recipe. This object must be used in combination with the recipe function.
[Graph]	[Line Graph]	Place an object to display device values in line graph.
	[Trend Graph]	Place an object to display device values in chronological order in graph.
	[Bar Graph]	Place an object to display device values in bar graph.
	[Bar(Rectangle)]	Place an object to display the ratio of each device value to the total device values in bar graph.
	[Pie(Circle)]	Place an object to display the ratio of each device value to the total device values in pie graph.
	[Scatter Graph]	Place an object to display two device values as a point in scatter graph by assigning the two devices to the X and Y coordinates respectively.
	[Historical Trend Graph]	Place an object to display the device values collected by the logging function in chronological order in graph.
[Graphical Meter]	[Sector Meter]	Place an object to display a device value on a sector meter.
	[Semicircle Meter]	Place an object to display a device value on a semicircle meter.
	[Bar (Vertical) Meter]	Place an object to display a device value on a vertical bar meter.
	[Bar (Horizontal) Meter]	Place an object to display a device value on a horizontal bar meter.
[Meter]	[Level]	Place an object to display a device value by filling the specified area.
	[Panelmeter]	Place an object to display a device value on a meter.
[Slider]		Place an object to specify a device value (numeric value) by sliding the knob along the bar.
[Document Display]		Place an object to display a document on a screen.
[Digital Image Display]	[Camera/PC Image Display]	Place an object to display the images sent from the personal computer or other devices on the GOT.
	[File Playback]	Place an object to play a video file.
[Script Parts]		Place an object to create a script.
[Set Overlay Screen]		Place an object to overlay a called screen on a base screen.
[Animation Route]		Set a route through which an object travels.
[Window Position]	[Overlap1]	Place an object to specify the display position of overlap window 1.
	[Overlap2]	Place an object to specify the display position of overlap window 2.
	[Overlap3]	Place an object to specify the display position of overlap window 3.
	[Overlap4]	Place an object to specify the display position of overlap window 4.
	[Overlap5]	Place an object to specify the display position of overlap window 5.
	[Superimpose1]	Place an object to specify the display position of superimpose window 1.
	[Superimpose2]	Place an object to specify the display position of superimpose window 2.
	[Key Window]	Place an object to specify the display position of the key window.
[Key Window Object]	[Input Value Area Setting]	Place an object to display the value being input.
	[Input Range Area Setting]	Place an object to display the range of values that can be input.
	[Input Maximum Value Area Setting]	Place an object to display the maximum value that can be input.
	[Input Minimum Value Area Setting]	Place an object to display the minimum value that can be input.
	[Previous Value Area Setting]	Place an object to display the value that is input previously.
	[Project Setting]	Configure the project-wide key window settings.

Menu	Description
[Hyperlink]	Place an object to access a website or a file in the GOT public folder, or make a phone call.
[My Favorites]	Displays objects registered in [My Favorites] in the library.

[Communication]

Menu	Description
[Write to GOT]	Writes data from the personal computer (GT Designer3) to the GOT.
[Read from GOT]	Reads data from the GOT to the personal computer (GT Designer3).
[Verify GOT]	Compares the current project with the project in the GOT.
[Communication Configuration]	Sets the method of the communication between the personal computer (GT Designer3) and the GOT.
[Batch Write to multiple GOTs]	Writes data from a personal computer (GT Designer3) to multiple GOTs.
[Write to Memory Card]	Writes data to data storage.
[CSP+ for iQSS Data Write]	Writes iQSS data (CSP+) to data storage.

[Debug/Check]

Menu		Description
[Simulator]	[Activate]	Simulates the current project.
	[Update]	
	[Set]	
	[Exit]	
[Data Check]	[Check]	Checks if no error exists in the project.
	[Item Setting]	Sets the targets for the data check function.
[Label Check]		Checks the set label (GT Designer3) for errors.
[Data Size]	[Screen]	Displays the data size of the screen and the project.
	[Project]	
[GOT Offline Monitor]	[Activate]	Connect to the GX Works3 offline monitor on the personal computer to monitor the project running on the GOT.
	[Setting]	
	[Exit]	
[GOT Diagnostics]		Displays the causes and corrective actions for GOT errors.

[Tools]

Menu		Description
[Resource Data Conversion]	[Operation Log File]	Converts the file format of the operation log file.
	[Alarm File]	Converts the file format of the alarm file.
	[Logging File]	Converts the file format of the logging file.
	[Recipe File]	Converts the file format of the recipe file.
[Default Setting]	[Edit]	Sets the preset values of figures and objects.
	[Export]	Exports the preset values of figures and objects.
	[Import]	Imports the preset values of figures and objects.
[Customize]		Customize the toolbars. ☞ Page 188 Customizing the toolbar
[Option]		Customizes operations and displayed contents of GT Designer3.

[Window]

Menu	Description
[Cascade]	Aligns the screen editors and screens in the work window.
[Vertical]	
[Horizontal]	
[Align Icons]	Aligns minimized screens.
[Close All Windows]	Closes all screens in the work window.
List of open screens	Up to nine screens being opened on the work window are displayed in the pull-down menu.
[Other Windows]	Select a screen to be operated on the [Window Selection] dialog.

[Help]

Menu	Description
[GT Designer3 (GOT3000) Help]	Displays Help.
[Manual List]	Lists the manuals.
[Connection to MITSUBISHI ELECTRIC FA Global Website]	Connects to the MITSUBISHI ELECTRIC FA Global Website.
[About GT Designer3]	Displays the version of GT Designer3. ☞ Page 103 [About GT Designer3] dialog

■[About GT Designer3] dialog

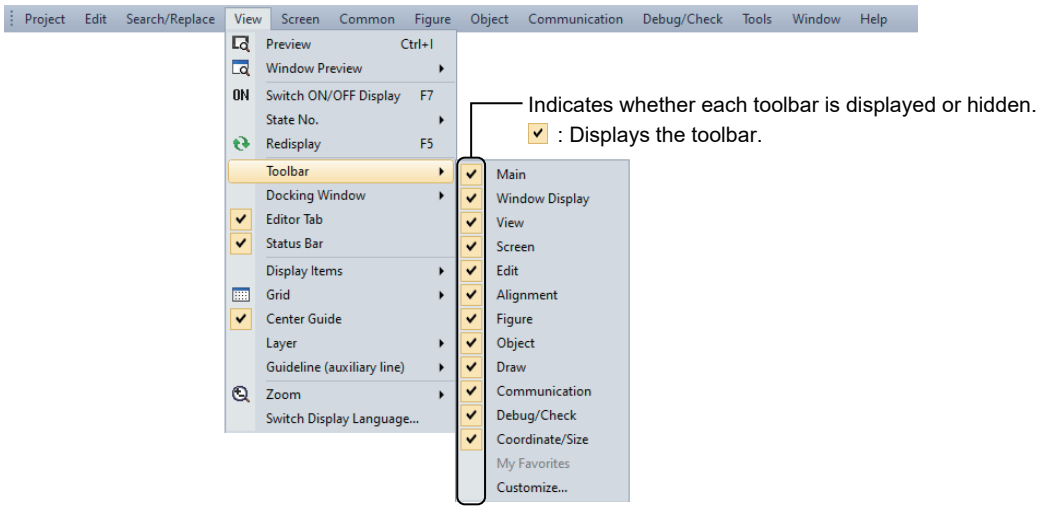
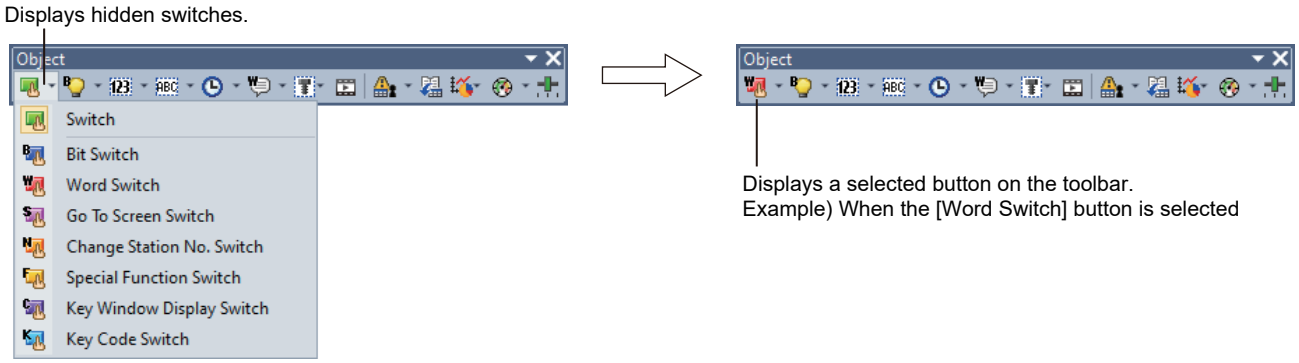
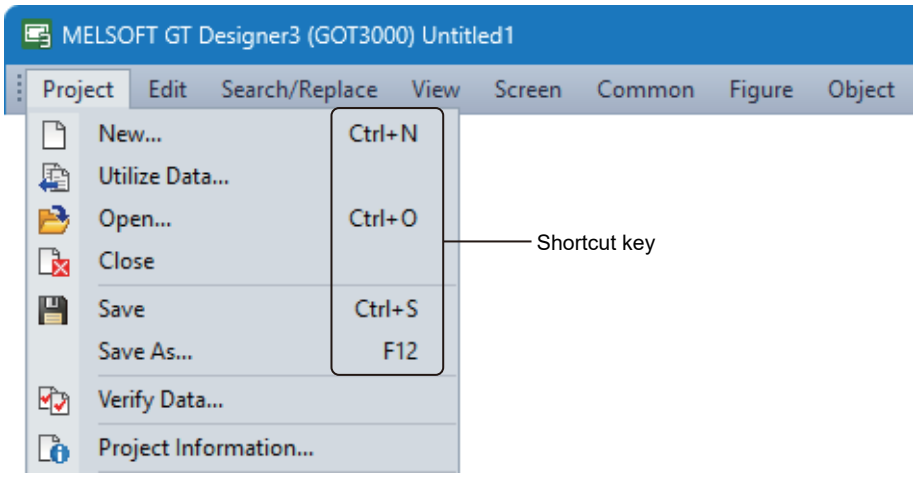
You can select whether to display or hide each toolbar on the [View] menu.



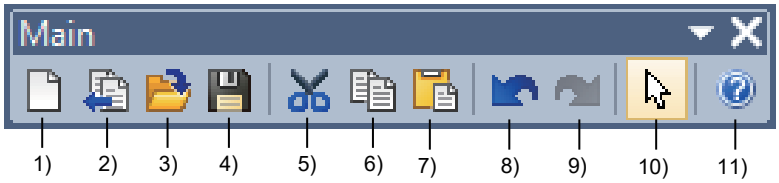
Some buttons may not be displayed on the toolbar.
Select a hidden button to display it on the toolbar.



Shortcut keys are displayed on each menu.

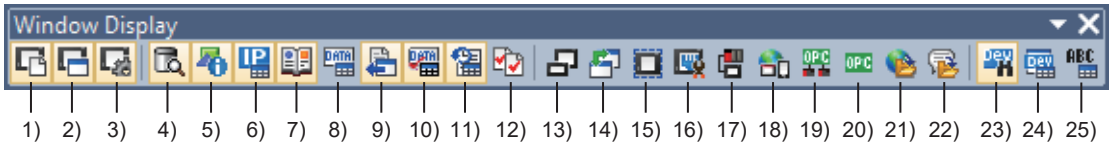


[Main]



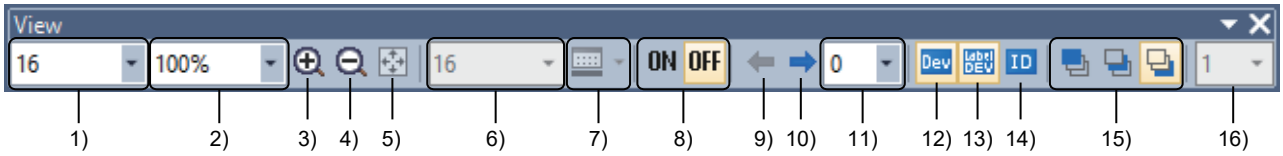
Item		Description	Shortcut key
1)	[New] button	Creates a new project.	Ctrl + N
2)	[Utilize Data] button	Searches for a project that can be utilized.	—
3)	[Open] button	Opens a saved project.	Ctrl + O
4)	[Save] button	Saves the current project over itself.	Ctrl + S
5)	[Cut] button	Cuts the selected item.	Ctrl + X
6)	[Copy] button	Copies the selected item.	Ctrl + C
7)	[Paste] button	Pastes a copied or cut target to a selected area.	Ctrl + V
8)	[Undo] button	Cancels the last operation.	Ctrl + Z
9)	[Redo] button	Redoes the operation that has been undone by the [Undo] command.	Ctrl + Y
10)	[Figure or Object Selection] button	Enables the mouse pointer to select a figure or object.	—
11)	[GT Designer3 Help] button	Displays GT Designer3 Help.	F1

[Window Display]



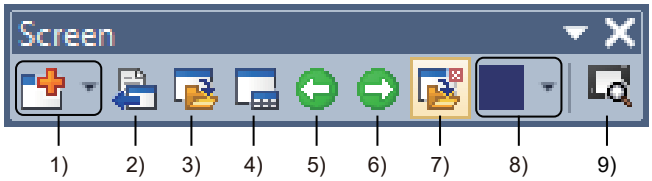
Item		Description	Shortcut key
1)	[Docking Window: Project Tree] button	Displays or hides the [Project] window.	Alt + O
2)	[Docking Window: Screen Tree] button	Displays or hides the [Screen] window.	—
3)	[Docking Window: System Tree] button	Displays or hides the [System] window.	—
4)	[Docking Window: Data Browser] button	Displays or hides the [Data Browser] window.	Ctrl + E
5)	[Docking Window: Property Sheet] button	Displays or hides the [Property] window.	Alt + 1
6)	[Docking Window: IP Address List] button	Displays or hides the [IP Address List] window.	—
7)	[Docking Window: Library List] button	Displays or hides the [Library] window.	F9
8)	[Docking Window: Data View] button	Displays or hides the [Data View] window.	—
9)	[Docking Window: Utilize Creation (Screen)] button	Displays or hides the [Utilize Creation (Screen)] window.	—
10)	[Docking Window: Data Check List] button	Displays or hides the [Data Check List] window.	—
11)	[Docking Window: Output] button	Displays or hides the [Output] window.	—
12)	[Docking Window: Verify Result] button	Displays or hides the [Verify Result] window.	—
13)	[GOT Type Setting] button	Displays the [GOT Type Setting] dialog.	—
14)	[GOT Environmental Setting: Screen Switching/Window] button	Displays the [Environmental Setting] window.	—
15)	[GOT Setup: Basic Setting: Display Setting/Language Setting] button	Displays the [GOT Setup] window.	—
16)	[GOT Ethernet Setting] button	Displays the [GOT Ethernet Setting] window.	—
17)	[Controller Setting] button	Displays the [Controller Setting] window.	—
18)	[GOT Mobile Setting] button	Displays the [GOT Mobile Setting] window.	—
19)	[OPC UA Server Setting:OPC UA Server Setting] button	Displays the [OPC UA Server Setting] window.	—
20)	[OPC UA Server Setting:OPC UA Tag Setting] button	Displays the [OPC UA Tag Setting] window.	—
21)	[Label: Open] button	Displays the [Label Group List] dialog.	—
22)	[Comment: Open] button	Displays the [Open Comment Group] dialog.	—
23)	[Docking Window: Device Search] button	Displays or hides the [Device Search] window.	Ctrl + F
24)	[Device List: Screen] button	Displays the [Device List] window.	—
25)	[Text List] button	Displays the [Text List] window.	—

[View]



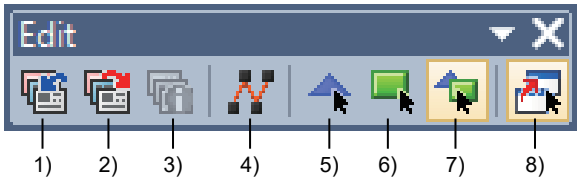
Item		Description	Shortcut key
1)	[Snap]	Sets the travel distance of a figure and an object on the screen editor.	—
2)	[Zoom]	Sets the magnification of the screen editor.	—
3)	[Zoom in] button	Increases the magnification of the screen editor in increments of 10%.	Ctrl + +
4)	[Zoom out] button	Reduces the magnification of the screen editor by 10%.	Ctrl + -
5)	[Whole Screen] button	Resizes the screen display area of the screen editor according to the editor window size. This item is unavailable when [All Screens] is selected in [Zoom] on the [View] menu.	—
6)	[Grid Interval]	Sets the distance between the lines of the grid on the screen editor.	—
7)	[Grid Color]	Sets the grid color of the screen editor.	—
8)	[ON] button [OFF] button	Switches the display status of objects on screen editors between ON and OFF.	F7 (The display can be off with F8 as well.)
9)	[Previous State] button	Switches the states of objects to be displayed on screen editors in descending order.	—
10)	[Next State] button	Switches the states of objects to be displayed on screen editors in ascending order.	—
11)	[State No.]	Switches the states of objects to be displayed on screen editors by selecting the state No.	—
12)	[Display Items: Device] button	Displays or hides the specified devices on screen editors.	—
13)	[Display Items: Device of Label] button	Displays or hides the devices that are assigned to the labels (GT Designer3) on screen editors.	—
14)	[Display Items: Object ID] button	Displays or hides object IDs on screen editors.	—
15)	[Layer: Front] button [Layer: Back] button [Layer: Backmost] button	Displays or hides each layer.	—
16)	[Language Switching Preview Column No.]	Sets a comment column number to be displayed on the screen editor. The setting range is [1] to [30].	—

[Screen]



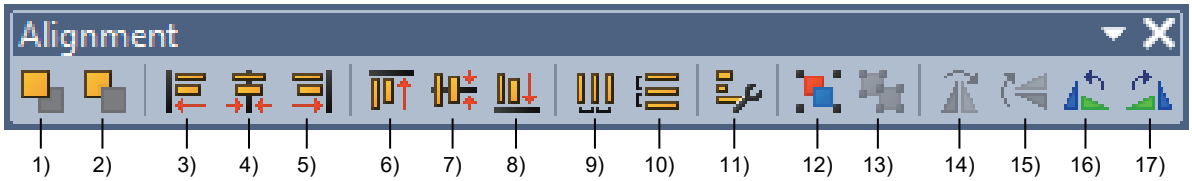
Item			Description	Shortcut key
1)	[New] button	[Base Screen]	Creates a base screen.	—
		[Window Screen]	Creates a window screen.	—
		[Mobile Screen]	Creates a mobile screen.	—
2)	[Utilize Data] button		Search other projects for a screen that can be utilized.	—
3)	[Open] button		Open a selected window.	—
4)	[Screen Image List] button		Displays the [Screen Image List] window.	—
5)	[Previous Screen] button		Opens a screen whose screen number is one smaller than that of the current screen.	Ctrl + Alt + P
6)	[Next Screen] button		Opens a screen whose screen number is one greater than that of the current screen.	Ctrl + Alt + N
7)	[Open Closed Screens] button		Sets or cancels the closed screen as the target for the operation of [Previous Screen] or [Next Screen].	—
8)	[Screen Background Color] button		Select a background color, gradient, and pattern for the screen.	—
9)	[Preview] button		Displays a preview of the current screen.	Ctrl + I

[Edit]



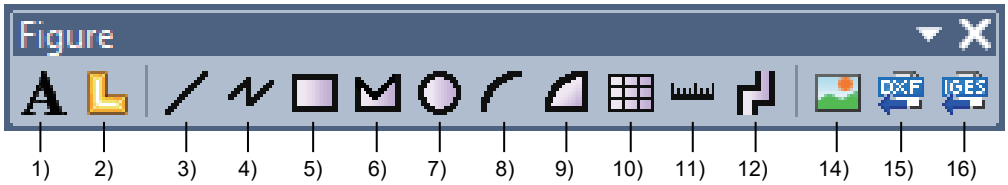
Item		Description
1)	[Template Registration: Register to Template] button	Register the selected figure or object to the template.
2)	[Template Registration: Deresigter from Template] button	Deletes a selected figure or object from the template list.
3)	[Edit Template Attribute] button	Edits the template attribute of selected template information.
4)	[Edit Vertices] button	Switches between changing and fixing the positions of the vertexes of a figure.
5)	[Object of Selection: Figure] button	Enables selection of figures only.
6)	[Object of Selection: Object] button	Enables selection of objects only.
7)	[Object of Selection: Figure + Object] button	Enables selection of figures and objects.
8)	[Object of Selection: Overlay Screen] button	Enables or disables selection of set overlay screens on the screen editor.

[Align]



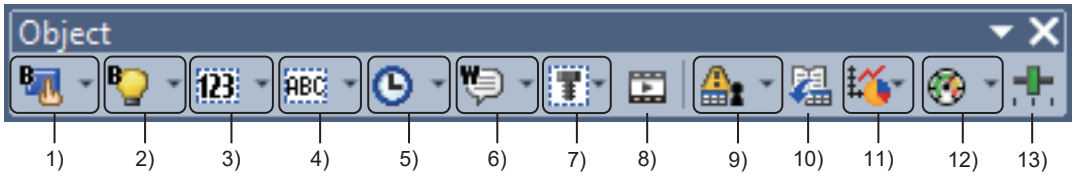
Item		Description	Shortcut key
1)	[Stacking Order: Move to the Front] button	Moves a selected figure or object to the front.	—
2)	[Stacking Order: Move to the Back] button	Moves a selected figure or object to the back.	—
3)	[Align: Left] button	Aligns selected figures, objects, template information, and groups with the leftmost item.	—
4)	[Align: Center (Horizontal)] button	Aligns selected figures, objects, template information, and groups horizontally to the center.	—
5)	[Align: Right] button	Aligns selected figures, objects, template information, and groups with the rightmost item.	—
6)	[Align: Top] button	Aligns selected figures, objects, template information, and groups with the topmost item.	—
7)	[Align: Center (Vertical)] button	Aligns selected figures, objects, template information, and groups vertically to the center.	—
8)	[Align: Bottom] button	Aligns selected figures, objects, template information, and groups with the bottom item.	—
9)	[Align: Align Sideways] button	Aligns selected figures, objects, template information, and groups horizontally with even spacing.	—
10)	[Align: Align Lengthways] button	Aligns selected figures, objects, template information, and groups vertically with even spacing.	—
11)	[Align: Custom] button	Displays the [Align] dialog.	—
12)	[Group] button	Groups selected figures and objects.	Ctrl + G
13)	[Ungroup] button	Cancels the grouping of selected figures and objects.	Ctrl + U
14)	[Rotate/Flip: Flip Horizontal] button	Flips a selected figure horizontally.	Ctrl + H
15)	[Rotate/Flip: Flip Vertical] button	Flips a selected figure vertically.	Ctrl + J
16)	[Rotate/Flip: Rotate Left] button	Rotates a selected figure 90 degrees counterclockwise.	Ctrl + L
17)	[Rotate/Flip: Rotate Right] button	Rotates a selected figure 90 decrees clockwise.	Ctrl + R

[Figure]



Item		Description
1)	[Text] button	Draw a text figure.
2)	[Logo Text] button	Draw a logo text figure.
3)	[Line] button	Draw a line.
4)	[Line Freeform] button	Draw a freeform line.
5)	[Rectangle] button	Draw a rectangle.
6)	[Polygon] button	Draw a polygon.
7)	[Circle] button	Draw a circle.
8)	[Arc] button	Draw an arc.
9)	[Sector] button	Draw a sector.
10)	[Table] button	Draw a table.
11)	[Scale] button	Draw a scale.
12)	[Piping] button	Draw a piping.
13)	[Paint] button	Fills the framed area of the figure on the screen.
14)	[Import Image Data] button	Imports an image file into the screen.
15)	[Import DXF Data] button	Imports a DXF data into the screen.
16)	[Import IGES Data] button	Imports an IGES data into the screen.

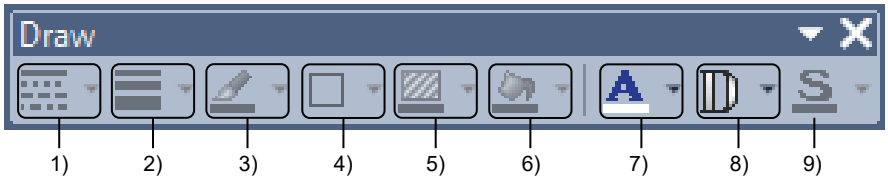
[Object]



Item			Description
1)	[Switch] button	[Switch] button	Place a touch switch with multiple functions.
		[Bit Switch] button	Place a touch switch to switch ON/OFF of a bit device.
		[Word Switch] button	Place a touch switch to change the value of a word device.
		[Go To Screen Switch] button	Place a touch switch to switch a screen.
		[Change Station No. Switch] button	Place a touch switch to switch the station number of the GOT monitoring target.
		[Special Function Switch] button	Place a touch switch to display the utility or the screen for a monitor function.
		[Key Window Display Switch] button	Place a touch switch to display a key window.
		[Key Code Switch] button	Place a touch switch to enter a key code.
2)	[Lamp] button	[Bit Lamp]	Place a lamp controlled by a bit device.
		[Word Lamp]	Place a lamp controlled by a word device.
		[Lamp Area]	Place a lamp area controlled by a bit device.
3)	[Numerical Display/ Input] button	[Numerical Display]	Place an object to display a device value (numerical value).
		[Numerical Input]	Place an object to input a device value (numerical value).
4)	[ASCII Display/Input] button	[Text Display]	Place an object to display a device value (text).
		[Text Input]	Place an object to input a device value (text).
5)	[Date/Time Display] button	[Date Display]	Place an object to display the date.
		[Time Display]	Place an object to display the time.
6)	[Comment Display] button	[Bit Comment]	Place an object to display a comment. A bit device controls the displayed comment.
		[Word Comment]	Place an object to display a comment. A word device controls the displayed comment.
		[Simple Comment]	Place an object to display a comment. The displayed comment is fixed.
7)	[Parts Display] button	[Bit Parts]	Place an object to display a part. A bit device controls the displayed parts.
		[Word Parts]	Place an object to display a part. A word device controls the displayed parts.
		[Fixed Parts]	Place an object to display a part. The displayed part is fixed.
8)	[Frame Animation] button		Place an object to play a video frame by frame.
9)	[Alarm Display] button	[Alarm Display (User)]	Place an object to display the alarms collected through user alarm monitoring.
		[Alarm Display (System)]	Place an object to display the alarms collected through system alarm monitoring.
		[Simple Alarm Display]	Place an object to display the alarms collected by monitoring devices. Set the alarms to be monitored by object.
		[System Alarm Display]	Place an object to display the alarms collected by monitoring the system. Set the alarms to be monitored by object.
10)	[Recipe Display (Record List)] button		Place an object to list the records of a recipe. This object must be used in combination with the recipe function.

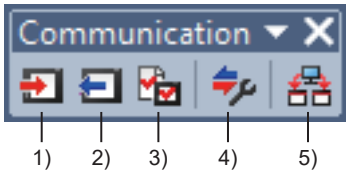
Item			Description
11)	[Graph] button	[Line Graph]	Place an object to display device values in line graph.
		[Trend Graph]	Place an object to display device values in chronological order in graph.
		[Bar Graph]	Place an object to display device values in bar graph.
		[Statistics Bar Graph]	Place an object to display the ratio of each device value to the total device values in bar graph.
		[Pie(Circle)]	Place an object to display the ratio of each device value to the total device values in pie graph.
		[Graph]	Place an object to display two device values as a point in scatter graph by assigning the two devices to the X and Y coordinates respectively.
		[Historical Trend Graph]	Place an object to display the device values collected by the logging function in chronological order in graph.
12)	[Graphical Meter] button	[Sector Meter]	Place an object to display a device value on a sector meter.
		[Semicircle Meter]	Place an object to display a device value on a semicircle meter.
		[Bar (Vertical) Meter]	Place an object to display a device value on a vertical bar meter.
		[Bar (Horizontal) Meter]	Place an object to display a device value on a horizontal bar meter.
13)	[Slider] button		Place an object to specify a device value (numeric value) by sliding the knob along the bar.

[Draw Figure]



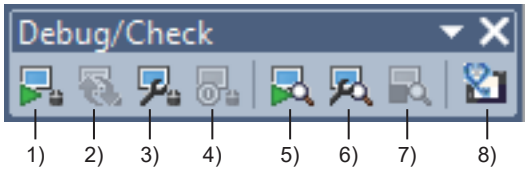
Item		Description
1)	[Line Style] button	Sets the line type of a selected figure.
2)	[Line Width] button	Sets the line width of a selected figure.
3)	[Line Color] button	Sets the line color of a selected figure.
4)	[Pattern] button	Sets the pattern of a selected figure.
5)	[Shape Color] button	Sets the pattern color of a selected figure.
6)	[Background Color] button	Sets the pattern background color of a selected figure.
7)	[Text Color] button	Set the text color.
8)	[Style] button	Set a character effect.
9)	[Text Solid Color] button	Set a shadow color for a text.

[Communication]



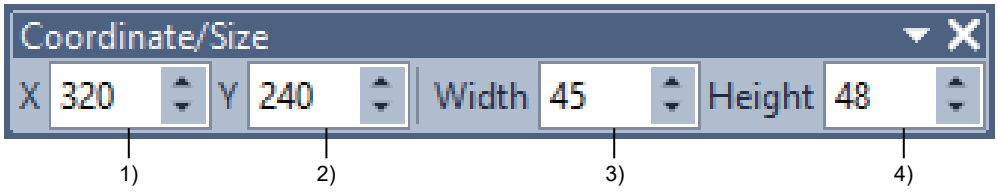
Item		Description	Shortcut key
1)	[Write to GOT] button	Writes data from the personal computer (GT Designer3) to the GOT.	Shift + F11
2)	[Read from GOT] button	Reads data from the GOT to the personal computer (GT Designer3).	—
3)	[Verification with GOT] button	Compares the current project with the project in the GOT.	—
4)	[Communication Configuration] button	Sets the method of the communication between the personal computer (GT Designer3) and the GOT.	—
5)	[Batch Write to multiple GOTs]	Writes data from a personal computer (GT Designer3) to multiple GOTs.	—

[Debug/Check]



Item		Description	Shortcut key
1)	[Simulator: Start] button	Starts GT Simulator3 and executes a simulation.	Ctrl + F10
2)	[Simulator: Update] button	Updates the project being simulated with the current project.	Alt + F10
3)	[Simulator: Setting] button	Configure the connection and other settings for GT Simulator3.	—
4)	[Simulator: End] button	Exits GT Simulator3.	—
5)	[GOT Offline Monitor: Activate] button	Activates the GOT offline monitor.	Ctrl + F12
6)	[GOT Offline Monitor: Set] button	Configure the connection and other settings for the GOT offline monitor.	—
7)	[GOT Offline Monitor: Exit] button	Exits the GOT offline monitor.	—
8)	[GOT Diagnostics]	Displays the causes and corrective actions for GOT errors.	—

[Coordinate/Size]



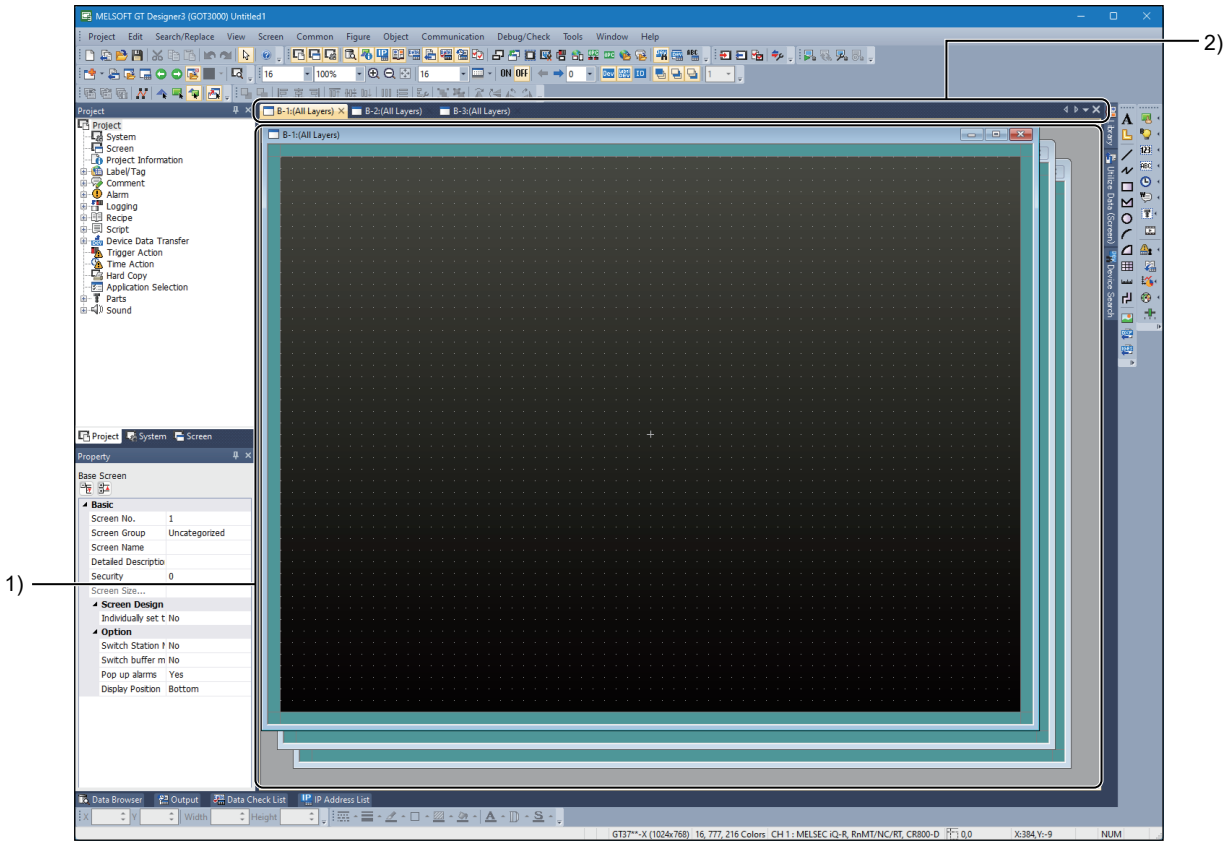
Item		Description
1)	[X]	Sets the X coordinate of the upper left vertex of a selected figure or object in dots.
2)	[Y]	Sets the Y coordinate of the upper left vertex of a selected figure or object in dots.
3)	[Width]	Sets the width of a selected figure or object in dots.
4)	[Height]	Sets the height of a selected figure or object in dots.

[My Favorites]

Displays figures and objects registered in the favorite of the [Library] window.

5.3.3 Editor tab, work window

The following shows what are displayed in the editor tab and work window.



Item		Description
1)	Work window	Area where screen editors and other windows are displayed. The following shows the screens to be displayed in the work window. • Screen editor • [Environmental Setting] window • [GOT Setup] window • [Controller Setting] window • [Comment List] window • [Device List] window • [Text List] window

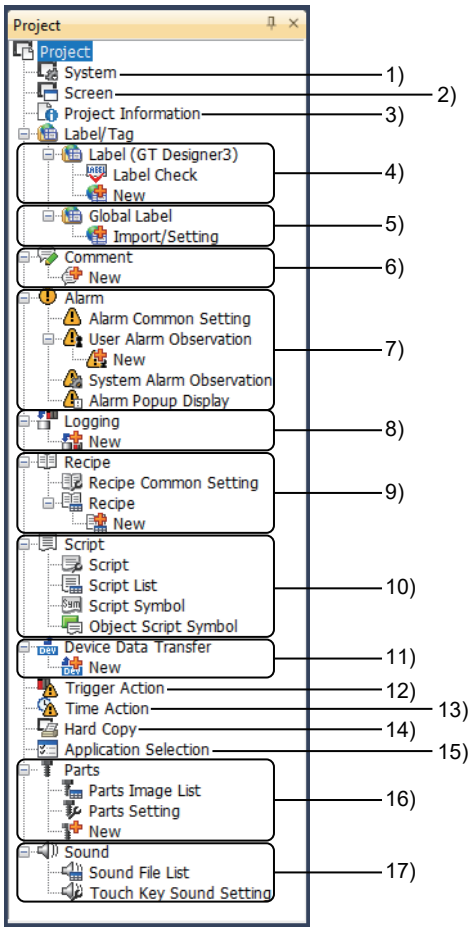
Item		Description
2)	Editor tab	Displays the tabs of the windows and screen editors which are displayed on the work window. When a tab is selected, the corresponding window is displayed in the topmost position in the work window. To switch between displaying and hiding the editor tab, select [Display] → [Editor tab] from the menu.  • Scroll button Scrolls the position of a selected tab sideways. The button can be used when tabs are too many to be displayed in the editor tab. • Pull-down menu button Displays the list of screen editors and windows being displayed in the work window. This button displays a screen editor or window selected from the pull-down menu in the topmost position. • Close button Closes a selected tab.  Right-click a tab to display menus to operate the tab. • [Close this Tab] Closes the right-clicked tab. • [Close All Tab on the Left] Closes all the tabs on the left side of the right-clicked tab. • [Close All Tab on the Right] Closes all the tabs on the right side of the right-clicked tab. • [Close All Other] Closes all the tabs except the right-clicked tab. • [Close All] Closes all the displayed tabs.

5.3.4 [Project] window

The [Project] window lists the settings of the whole project.

Double-click an item to display the setting dialog.

The menus unavailable for the GOT type are not displayed.

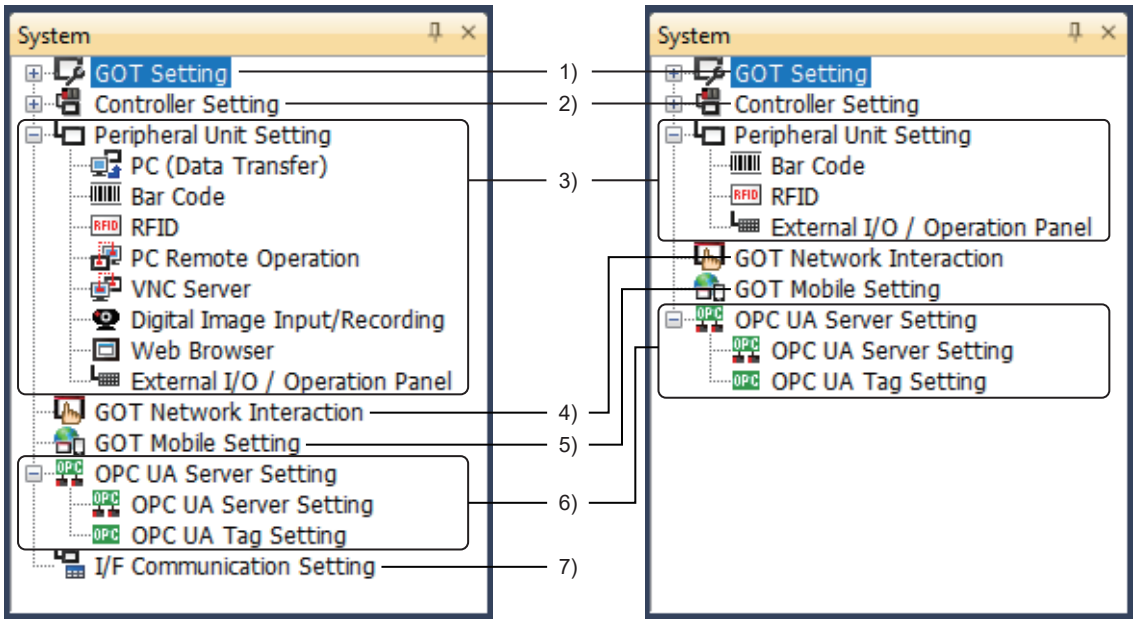


Item			Description
1)	[System]		Displays the [System] window. ☞ Page 118 [System] window
2)	[Screen]		Displays the [Screen] window. ☞ Page 122 [Screen] window
3)	[Project Information]		Set a project title and a creator's name.
4)	[Label (GT Designer3)]	—	Lists the set label groups. Each one can be copied and pasted with the [Edit] menu.
		[Label Check]	Updates labels (GT Designer3) and checks them.
		[New]	Create a label group.
5)	[Global Label] [OMRON NJ/NX Tag] [RSLogix 5000 Tag] [AB Native Tag] [OPC UA Tag]	—	Lists the imported labels and tags. Each item appears when the controller settings corresponding to the label or tag are configured in the [Controller Setting] window. ☞ Page 729 [Controller Setting]
		[Import/Setting]	Displays the [Label/Tag/Ethernet Setting List] dialog. ☞ Page 860 [Label/Tag/Ethernet Setting List] dialog
6)	[Comment]	—	Lists the set comment groups. Each one can be copied and pasted with the [Edit] menu.
		[New]	Create a comment group.

Item			Description
7)	[Alarm]	[Alarm Common Setting]	Set devices that convert alarm files.
		[User Alarm Observation]	Lists the configured settings for user alarm monitoring. Each one can be copied and pasted with the [Edit] menu. Double-click [New] to configure the settings for collecting alarms by monitoring devices.
		[System Alarm Observation]	Configure the settings for collecting alarms by monitoring the system.
		[Alarm Popup Display]	Configure the settings for displaying collected alarms in a popup window when the alarms are collected.
8)	[Logging]	—	Lists the set logging settings. Each one can be copied and pasted with the [Edit] menu.
		[New]	Configure the settings for collecting device values.
9)	[Recipe]	[Recipe Common Setting]	Set control devices for the recipe function.
		[Recipe]	Lists the set recipe settings. Each one can be copied and pasted with the [Edit] menu. Double-click [New] to configure the settings for executing batch write or batch read on multiple devices.
10)	[Script]	[Script]	Set scripts.
		[Script List]	Lists the scripts.
		[Script Symbol]	Set script symbols.
		[Object Script Symbol]	Set object script symbols.
11)	[Device Data Transfer]	—	Lists the set device data transfer settings. Each one can be copied and pasted with the [Edit] menu.
		[New]	Configure the settings for transferring data between devices.
12)	[Trigger Action]		Set actions triggered by devices or sampling.
13)	[Time Action]		Set actions triggered by time.
14)	[Hard Copy]		Configure the settings for capturing the active screen on the GOT.
15)	[Application Selection]		Select system applications to be written to the GOT.
16)	[Parts]	[Parts Image List]	Lists the part images. Each one can be copied and pasted with the [Edit] menu.
		[Parts Setting]	Configure the part settings.
		[New]	Create a part.
17)	[Sound]	[Sound File List]	Lists the sound files to register or edit the files.
		[Touch Key Sound Setting]	Configure the setting to use a specified sound file for the touch key sound.

5.3.5 [System] window

The [System] window lists settings, such as the GOT type setting, environmental setting, and controller setting.
Double-click an item to display the setting dialog.
The menus unavailable for the GOT type are not displayed.

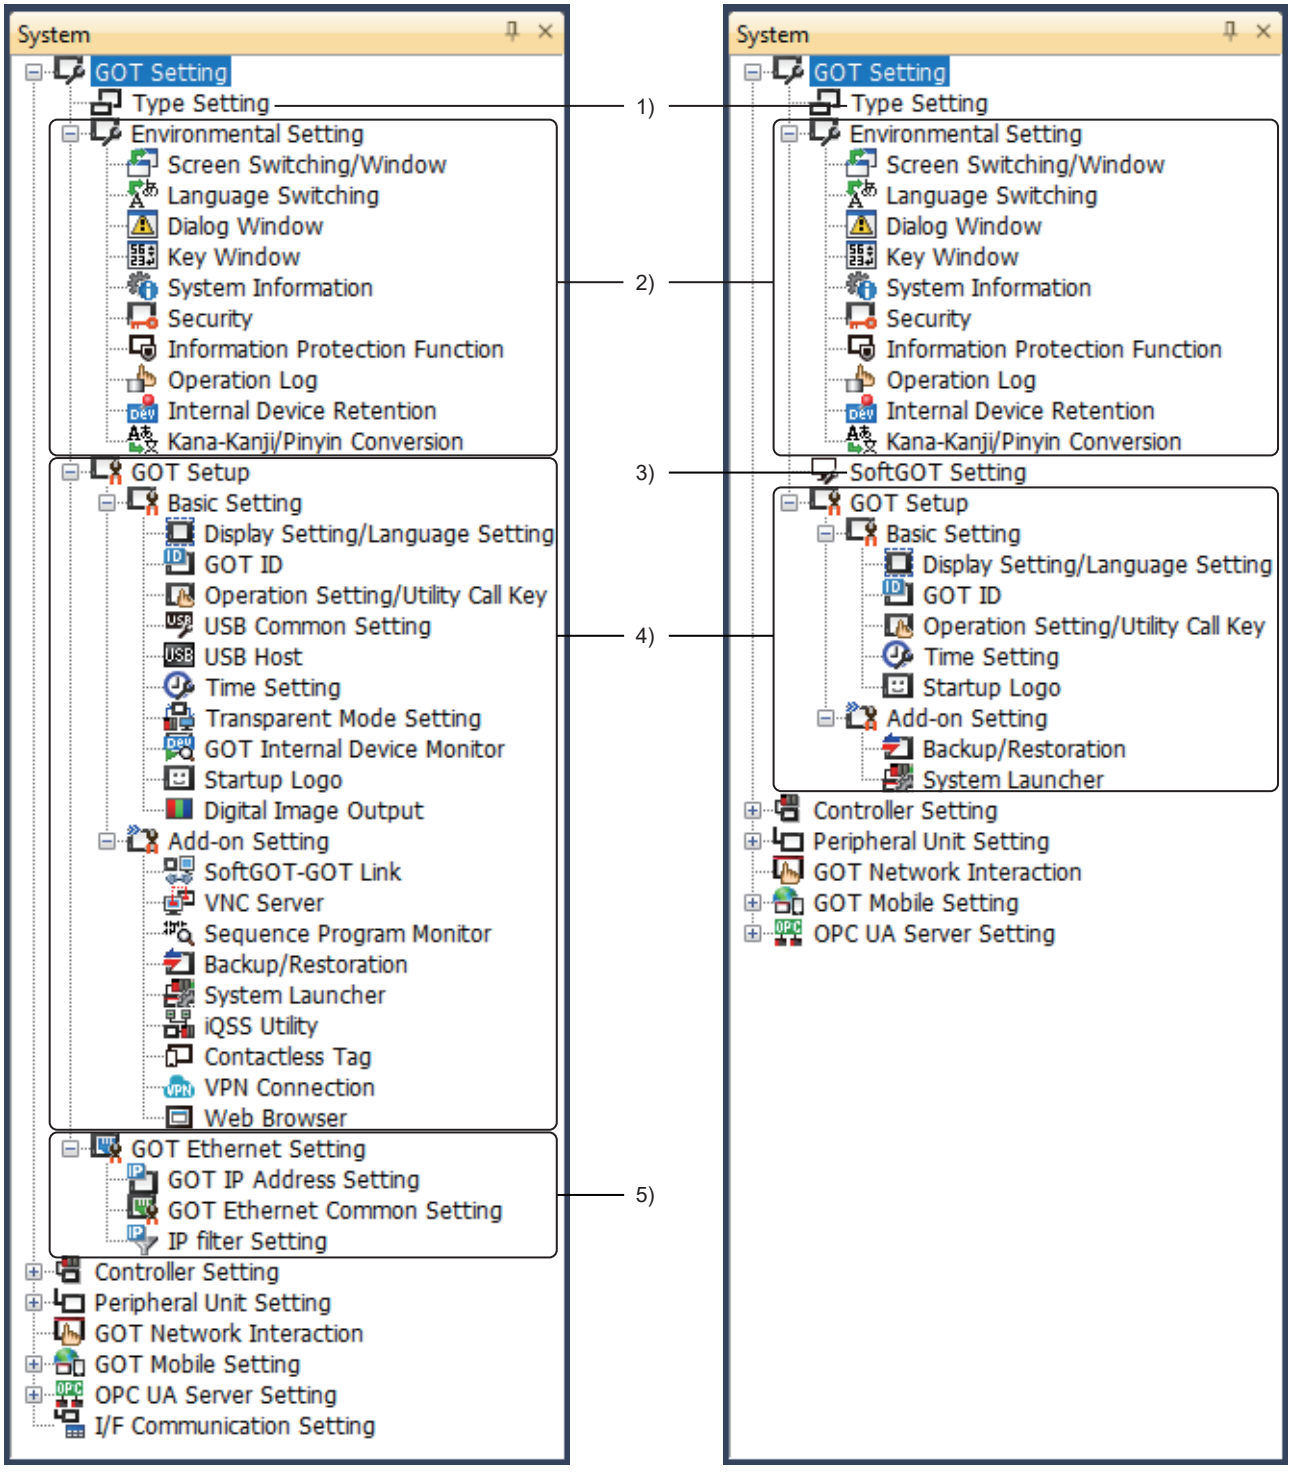


GOT (excluding GT SoftGOT3000)

GT SoftGOT3000

Item			Description
1)	[GOT Setting]		☞ Page 119 [GOT Setting]
2)	[Controller Setting]		☞ Page 121 [Controller Setting]
3)	[Peripheral Unit Setting]	[PC (Data Transfer)]	Set the interface for connecting GT Designer3 (personal computer) with the GOT.
		[Bar Code]	Configure the settings for using a barcode reader on the GOT.
		[RFID]	Configure the settings for using a RFID controller on the GOT.
		[PC Remote Operation]	Configure the settings for operating the personal computer from the GOT.
		[VNC Server]	Configure the settings for viewing the GOT display contents from the personal computer.
		[Digital Image Input/ Recording]	Configure the settings for displaying or recording images from a web camera or other devices on the GOT.
		[Web Browser]	Configure the optional settings for the web browser function.
		[External I/O / Operation Panel]	Configure the settings for using an external I/O device or operation panel with the GOT.
4)	[GOT Network Interaction]		Configure the settings for controlling pieces of equipment on the same network to prevent simultaneous operations.
5)	[GOT Mobile Setting]		Configure the settings for using the GOT as the server in the GOT Mobile function.
6)	[OPC UA Server Setting]	[OPC UA Server Setting]	Configure the settings for using the GOT as an OPC UA server.
		[OPC UA Tag Setting]	Create an OPC UA tag.
7)	[I/F Communication Setting]		Lists the interface settings of the GOT.

[GOT Setting]



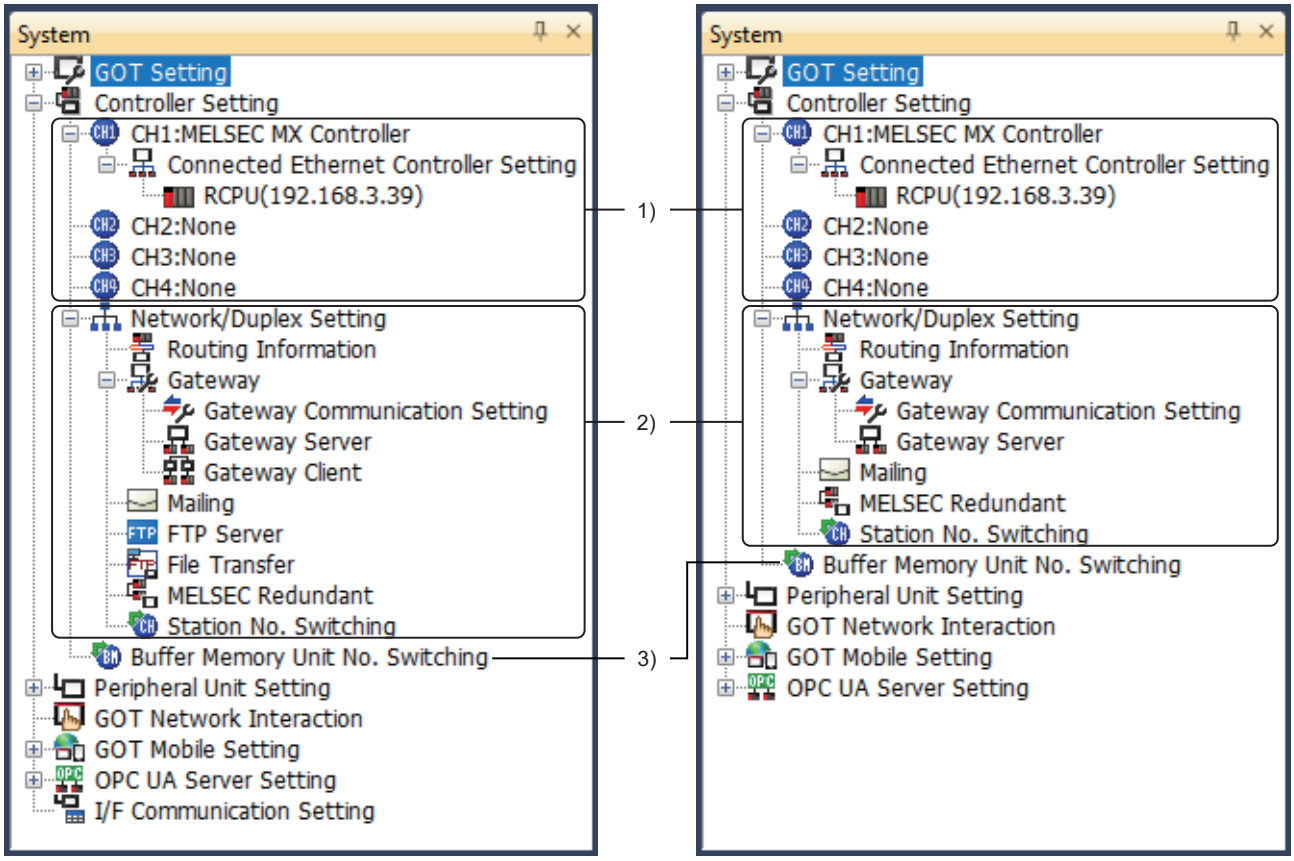
GOT (excluding GT SoftGOT3000)

GT SoftGOT3000

Item		Description
1)	[Type Setting]	Change the GOT model setting of the project.

Item				Description
2)	[Environmental Setting]	[Screen Switching/Windows]		Configure the screen switching settings.
		[Language Switching]		Configure the language switching settings.
		[Dialog Window]		Configure the system message dialog window settings.
		[Key Window]		Configure the project-wide key window settings.
		[System Information]		Set devices that handle the system information.
		[Security]		Configure the security settings for the GOT operations.
		[Information Protection Function]		Configure the settings for file protection and certificates in the GOT.
		[Operation Log]		Configure the settings for collecting operation history events of the GOT.
		[Internal Device Retention]		Configure the settings for retaining the GOT internal device values.
		[Kana-Kanji/Pinyin Conversion]		Configure the settings for Kana-Kanji or Pinyin conversion.
3)	[SoftGOT Setting]			Configure the GT SoftGOT3000 settings.
4)	[GOT Setup]	[Basic Setting]	[Display Setting/Language Setting]	Configure the GOT display settings.
			[GOT ID]	Set unique information to the GOT.
			[Operation Setting/Utility Call Key]	Set a buzzer sound and the utility call key for the GOT.
			[USB Common Setting]	Configure the GOT USB interface settings.
			[USB Host]	Configure the settings for using a mouse and keyboard on the GOT.
			[Time Setting]	Set the GOT time setting method.
			[Transparent Mode Setting]	Set the target channel for the FA transparent function.
			[GOT Internal Device Monitor]	Configure the GOT internal device monitor settings for the GOT diagnostics.
			[Startup Logo]	Set the initial screen displayed at the GOT startup.
			[Digital Image Output]	Set the target (screen image) to be output from the GOT to an external display.
		[Add-on Setting]	[SoftGOT-GOT Link]	Configure the SoftGOT-GOT link function settings.
			[VNC Server]	Configure the VNC server function settings.
			[Sequence Program Monitor]	Configure the sequence program monitor settings.
			[Backup/Restoration]	Configure the backup/restoration function settings.
			[System Launcher]	Configure the system launcher settings.
			[iQSS Utility]	Configure the iQSS utility settings.
			[Contactless Tag]	Configure the contactless tag settings.
			[VPN Connection]	Configure the VPN connection settings.
			[Web Browser]	Configure the web browser settings.
5)	[GOT Ethernet Setting]	[GOT IP Address Setting]		Set the IP address of the GOT.
		[GOT Ethernet Common Setting]		Configure the GOT Ethernet setting.
		[IP filter Setting]		Configure the IP filter setting.

[Controller Setting]



GOT (excluding GT SoftGOT3000)

GT SoftGOT3000

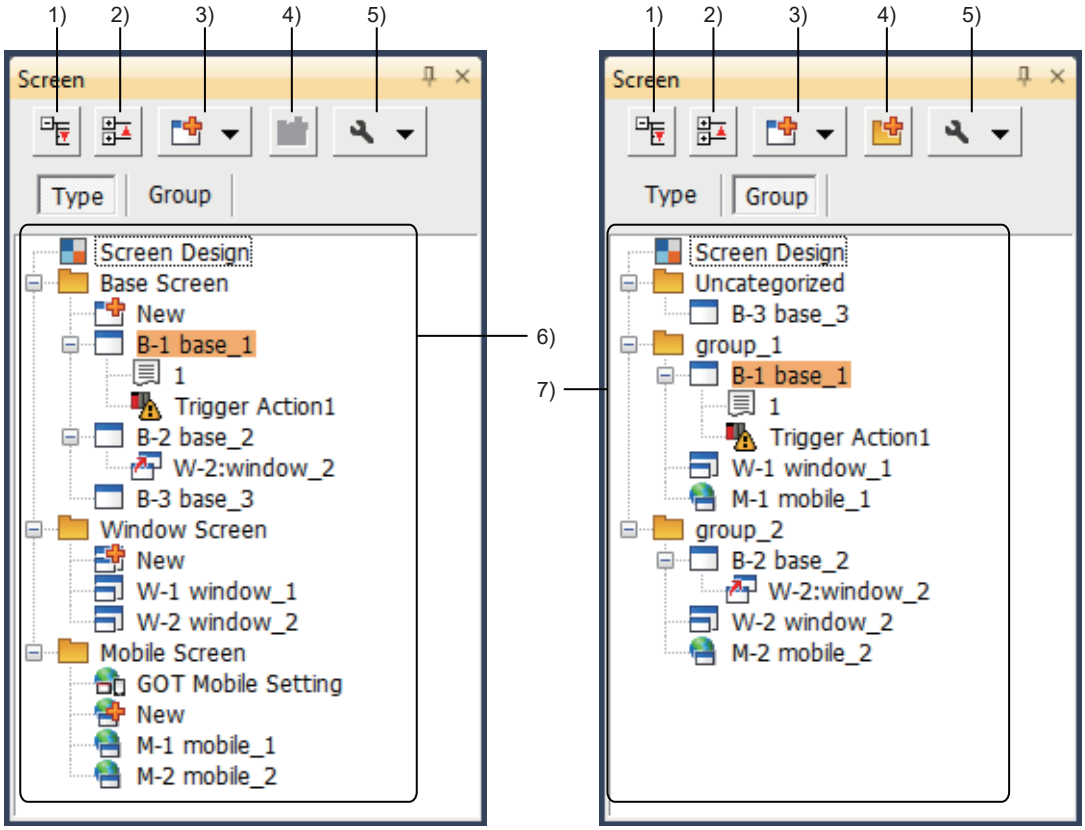
Item				Description
1)	Channel settings			Configure the settings for communicating with controllers.
2)	[Network/Duplex Setting]	[Routing Information]		Configure the settings for monitoring other networks.
		[Gateway]	[Gateway Communication Setting]	Configure the communication settings for the server/client function.
			[Gateway Server]	Configure the server function settings.
			[Gateway Client]	Configure the client function settings.
		[Mail Send]		Configure the mail send function settings.
		[FTP Server]		Configure the FTP server function settings.
		[File Transfer]		Configure the file transfer function settings (FTP transfer or GOT internal transfer).
		[MELSEC Redundant]		Configure the settings for monitoring the MELSEC redundant system.
		[Station No. Switching]		Configure the settings for switching the station number of the monitoring target.
3)	[Buffer Memory Unit No. Switching]			Configure the settings for switching the buffer memory unit No. of the monitoring target.

5.3.6 [Screen] window

The [Screen] window lists the created base screens, window screens, and mobile screens.

Double-click an item to display the setting dialog.

The menus unavailable for the GOT type are not displayed.



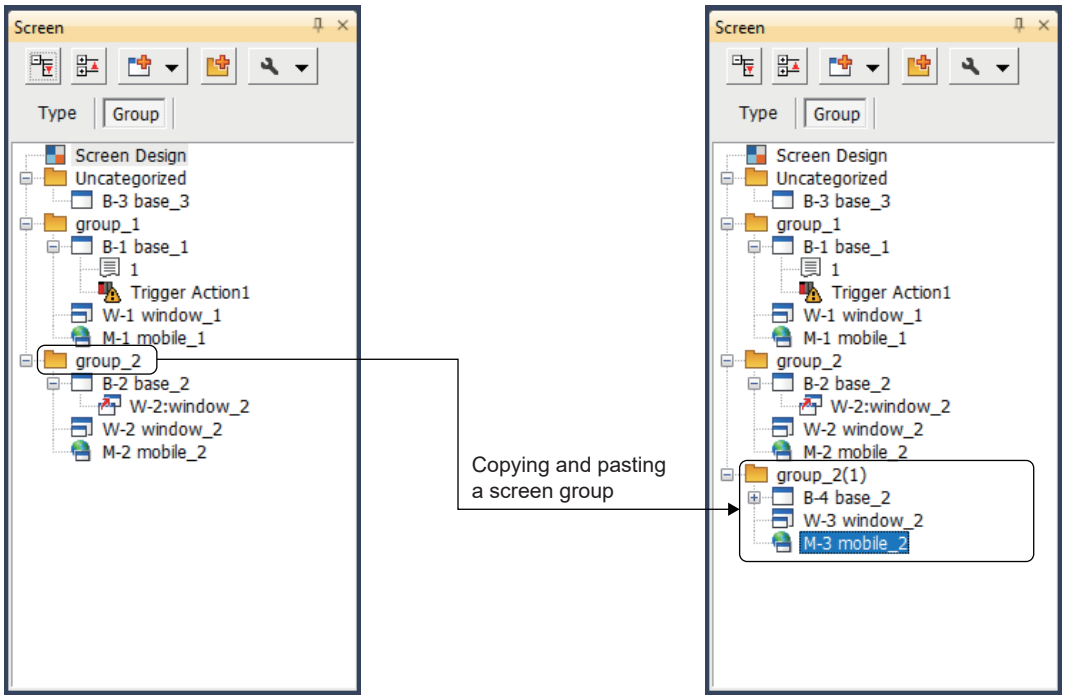
[Type] tab [Group] tab

Item			Description
1)	[Unfold All] button		Expands the tree.
2)	[Fold All] button		Collapses the tree.
3)	[New Screen] button		Creates a base screen, window screen, or mobile screen.
4)	[New Screen Group] button		Creates a screen group in the [Group] tab. Up to 10000 screen groups can be created. (The default screen group [Uncategorized] is not counted as a screen group.) However, if there are 256 empty screen groups, no more screen group can be created. Up to 100 characters can be set for a screen group name. The characters are case-sensitive. The following characters cannot be used. • , / • Control characters (Unicode: U+0000 to U+001F (C0 control code), U+007F (delete character), U+0080 to U+009F (C1 control code))
5)	[Display Option] button	[Set Overlay Screen]	Displays or hides the hierarchy of set overlay screens in the tree.
		[Screen Script]	Displays or hides the screen script settings in the tree.
		[Screen Trigger Action]	Displays or hides the screen trigger action settings in the tree.

Item		Description
6)	[Base Screen] [Window Screen] [Mobile Screen]	Lists the created base screens, window screens, and mobile screens. If there items are enabled using the [Display Option] button, the set overlay screen objects, scripts, and trigger actions set for each screen are also displayed in the tree. Double-click [New] to create a new screen. Copying and pasting are available from the right-click context menu. For details, refer to the following. ☞ Page 124 Copying and pasting a screen or screen group If screen display and editing are prohibited by project security, the list is displayed as shown below. Edit-disabled screen  Display-disabled screen
7)	Screen group	Lists the created base screens, window screens, and mobile screens by screen group. For details on a screen group, refer to the following. ☞ Page 125 Operating a screen group You can select a screen or screen group, and copy and paste it from the right-click context menu. For details, refer to the following. ☞ Page 124 Copying and pasting a screen or screen group If screen display and editing are prohibited by project security, the list is displayed as shown below. Display-disabled screen  Edit-disabled screen

Copying and pasting a screen or screen group

A screen or screen group can be duplicated by copying and pasting from the right-click context menu in the [Screen] window.
Empty screen groups cannot be copied.



The specifications of pasting differ depending on the copy source and destination.

Copy source screen or screen group	Copy destination	Specifications of pasting
One screen	In the tree on the [Type] tab	Pasting can be performed in the tree of the same screen type. When pasting is performed, the screen properties are displayed. Set [Screen No.] of the pasted screen.
	In the tree on the [Group] tab	Pasting can be performed in any group. When pasting is performed, the screen properties are not displayed. The screen number is set to the largest number used + 1.
Multiple screens of the same screen type	In the tree on the [Type] tab	Pasting can be performed in the tree of the same screen type. When pasting is performed, the screen properties are displayed. Set [Screen No.] of the pasted screen.
	In the tree on the [Group] tab	Pasting can be performed in any group. When pasting is performed, the screen properties are not displayed. The first screen number is set to the largest number used + 1, and the subsequent screen numbers are set with the same order and interval as those of the copy source screen numbers.
Multiple screens of different screen types	In the tree on the [Type] tab	Pasting cannot be performed.
	In the tree on the [Group] tab	Pasting can be performed in any group. When pasting is performed, the screen properties are not displayed. The first screen number is set to the largest number used + 1, and the subsequent screen numbers are set with the same order and interval as those of the copy source screen numbers.
Screen group	In the tree on the [Type] tab	Pasting cannot be performed.
	In the tree on the [Group] tab	Pasting can be performed as a new screen group. The screen group name is the title of the copy source screen group with a sequential number appended to the end of the title. The first screen number is set to the largest number used + 1, and the subsequent screen numbers are set with the same order and interval as those of the copy source screen numbers.

Operating a screen group

Screens can be grouped by purpose.

Creating a screen group of the screens and settings to be utilized enables utilization easy when you create another project.

The following shows grouping methods.

One screen can belong to one group.

■Moving a screen among screen groups

1. Select an intended screen and perform one of the following operations to change the screen group to which the selected screen belongs.

Multiple screens can be selected and moved together.

- Dragging a screen to the move destination screen group
- Selecting [Move Screen Group] from the right-click menu, then selecting the move destination screen group in the [Move Screen Group] dialog, and clicking the [OK] button

■Deleting a screen group

When a created screen group is deleted, the screen group and the screens within are deleted.

Multiple screen groups can be selected and deleted together.

The screen group registered by default ([Uncategorized]) cannot be deleted.

1. Select an intended screen group and click the [Delete] button from the right-click context menu.
2. Click [Yes] in the confirmation dialog to delete the selected screen group and the screens within.

5.3.7 Status bar

Displays the following contents according to the position of the mouse cursor, selected figure, or object.

- Description of the item under the mouse cursor
- GOT type, color settings, and controller settings in the current project
- Coordinates of the selected figure or object
- Auto save function enabled state

To display or hide the status bar, select [Display] → [Status bar] from the menu.

When a global label is used and a change in the label is detected, an icon appears to notify the change.

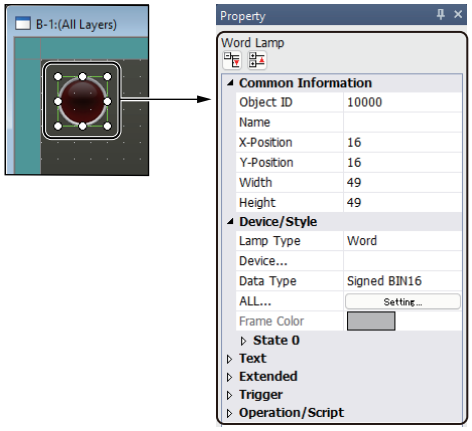
☞ Page 907 Updating the imported global labels

5.4 Checking and editing settings of screens and objects

GT37 SoftGOT3000

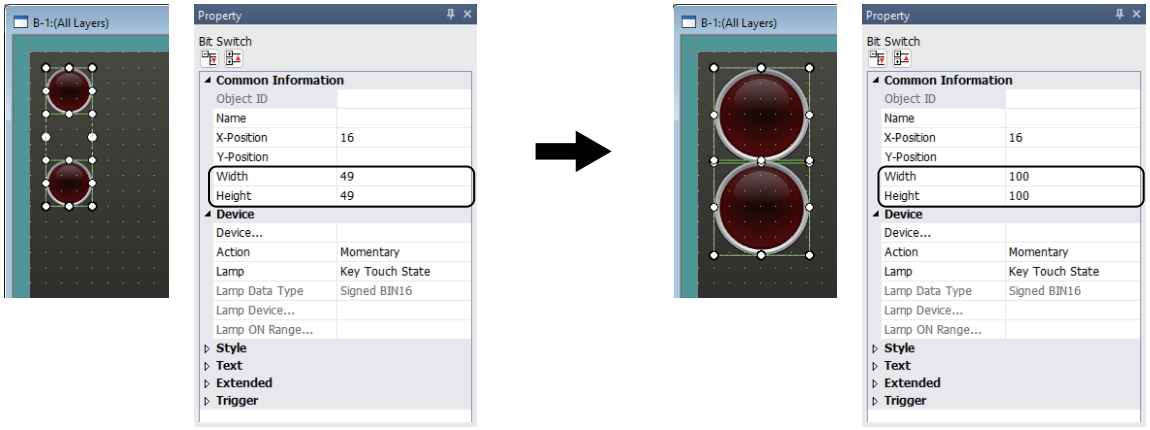
The attributes and set values of a selected screen, figure, or object are listed.
Settings can be checked or changed without opening the setting dialog.

Ex.
Selecting a word lamp



Set values can be changed collectively by selecting multiple figures or objects on the same screen.

Ex.
Collectively changing the width and height of bit switches



☞ Page 127 Specifications of the property sheet
☞ Page 128 How to use the property sheet
☞ Page 129 [Property] window

5.4.1 Specifications of the property sheet

Display targets in the [Property] window

The following shows the display targets whose attributes can be listed in the [Property] window.

- Base screen
- Window screen
- Mobile screen
- Figure
- Object
- Template

Display when multiple figures and objects are selected

When multiple figures and objects on the same screen are selected, the attribute list is displayed as follows.

■If a figure is included in the selection

The attribute list is displayed on the basis of the attributes of the figure in the backmost layer.

■If no figure is included in the selection

The attribute list is displayed on the basis of the attributes of the object of the smallest object ID number.

Display when a grouped figure or object is selected

When a grouped figure or object is selected, the attribute list is displayed as follows.

■When a group is selected

The properties of the group are displayed.

■When one of the figures and objects in a group is selected

The properties of the selected figure or object are displayed.

■When multiple figures and objects in a group are selected

The display is the same as when multiple ungrouped figures and objects are selected.

For details, refer to the following.

☞ Page 127 Display when multiple figures and objects are selected

Batch change of attributes

You can select multiple figures and objects on the same screen and perform a batch change of the attributes.

The batch change is applicable to the attributes that are common to the selected figures or objects.

If the set values of the attributes common to the selected figures and objects differ, the fields of the set values are displayed blank.

The attributes that cannot be changed are displayed with in gray.

A batch change result is reflected in all the selected figures and objects.

To avoid an unintentional change, select only the targets that need the change.

Width and height of a figure or object

The following shows the setting ranges of the width and height of a figure or object.

Item	Setting range
[Width]	[1] to [2000]
[Height]	[1] to [1600]

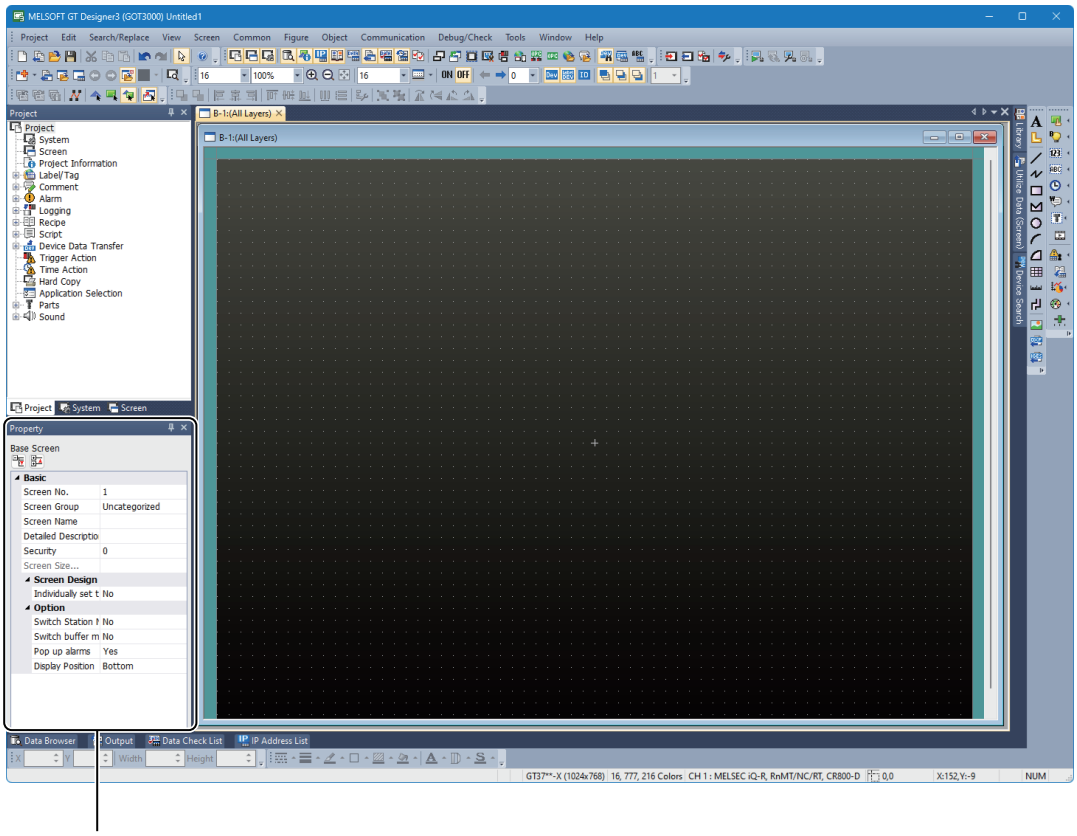
In the [Property] window, the width and height of a grouping of figures or objects are not user-changeable.

5.4.2 How to use the property sheet

1. Click [View] → [Docking Window] → [Propertysheet] from the menu to display the [Property] window.

The [Property] window is docked with GT Designer3 by default.

☞ Page 129 [Property] window



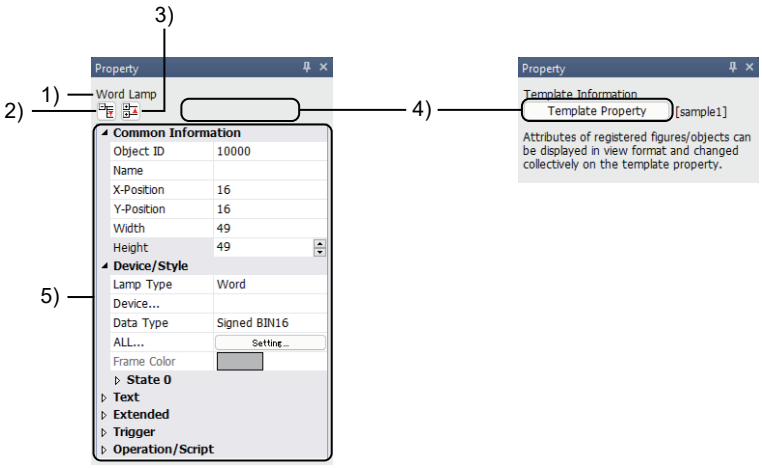
2. Select the target screen, figure, or object to display the attributes of the target in the [Property] window.

3. To change an attribute, change the set value in the attribute list of the [Property] window.

The method of setting each attribute is the same as that applied to each setting dialog.

5.4.3 [Property] window

GT37 SoftGOT3000



Item		Description
1)	Display target	Displays the target that gets its attributes displayed in the [Property] window.
2)	[Unfold All] button	Expands all attribute items.
3)	[Fold All] button	Collapses all attribute items.
4)	[Template Property] button	Appears when a template information box is selected. Switches the [Property] window to the one for template attributes. ☞ Page 1118 [Property] window (when the template property is displayed)
5)	Attribute list	Lists the attributes the target has had. The contents displayed depend on the selected item. • For a base screen, window screen, or mobile screen The same contents as those in the [Basic] tab in the screen properties are displayed. • Figures and objects The coordinates (X, Y), size (width, height), and the same contents as those in each setting dialog are displayed. • Templates The template attributes are displayed. ☞ Page 1118 [Property] window (when the template property is displayed)

PART 3

5.5 Searching for and editing settings of projects

GT37 SoftGOT3000

☞ Page 130 Searching for a device (Device search)
☞ Page 136 Listing devices (Device list)
☞ Page 143 Listing strings (Text list)
☞ Page 147 Changing the set values collectively (Batch Edit)
☞ Page 167 Searching for and editing a specific setting (Data Browser)
☞ Page 183 Checking the IP addresses in the list (IP address list)

5.5.1 Searching for a device (Device search)

Search the current project for devices, labels, or tags.

You can perform a keyword search, identify which functions use the found devices, and change the related settings.

☞ Page 131 How to use the device search
☞ Page 133 [Device Search] window

How to use the device search

☞ Page 131 Searching the project for matching devices
☞ Page 132 Changing or deleting the settings related to a found device
☞ Page 132 Exporting the search result list data

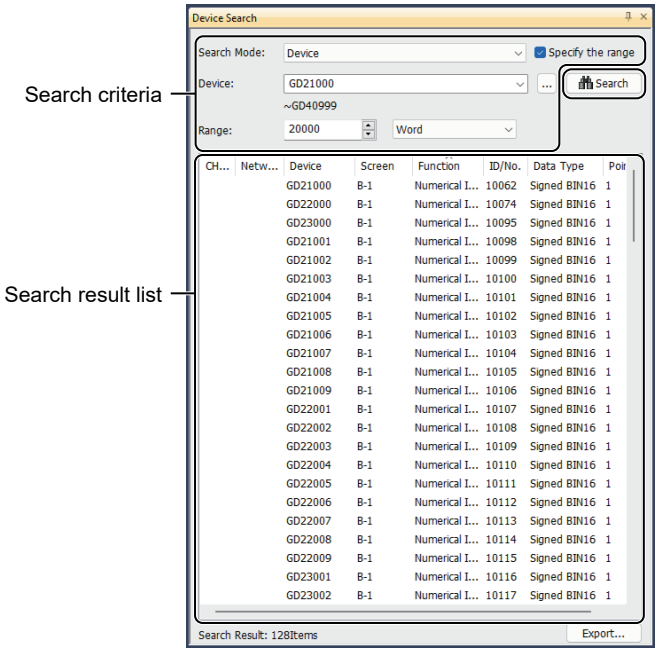
■Searching the project for matching devices

1. Perform one of the following operations to display the [Device Search] window.

- Pressing Ctrl + F keys
- Clicking [Search/Replace] → [Device Search] from the menu
- Clicking [View] → [Docking Window] → [Device Search] from the menu
- Clicking the [Device Search] button on the toolbar
- Selecting [Device Search] from the right-click context menu

☞ Page 133 [Device Search] window

2. Set the search criteria and click the [Search] button to display the found devices, labels, or tags in the search result list. When [Search Mode] is set to [Keyword (Label/Tag)], [Keyword (Label)], or [Keyword (Device)], if [Keyword] is left blank, clicking the [Search] button lists all the devices, labels, or tags used in the project.



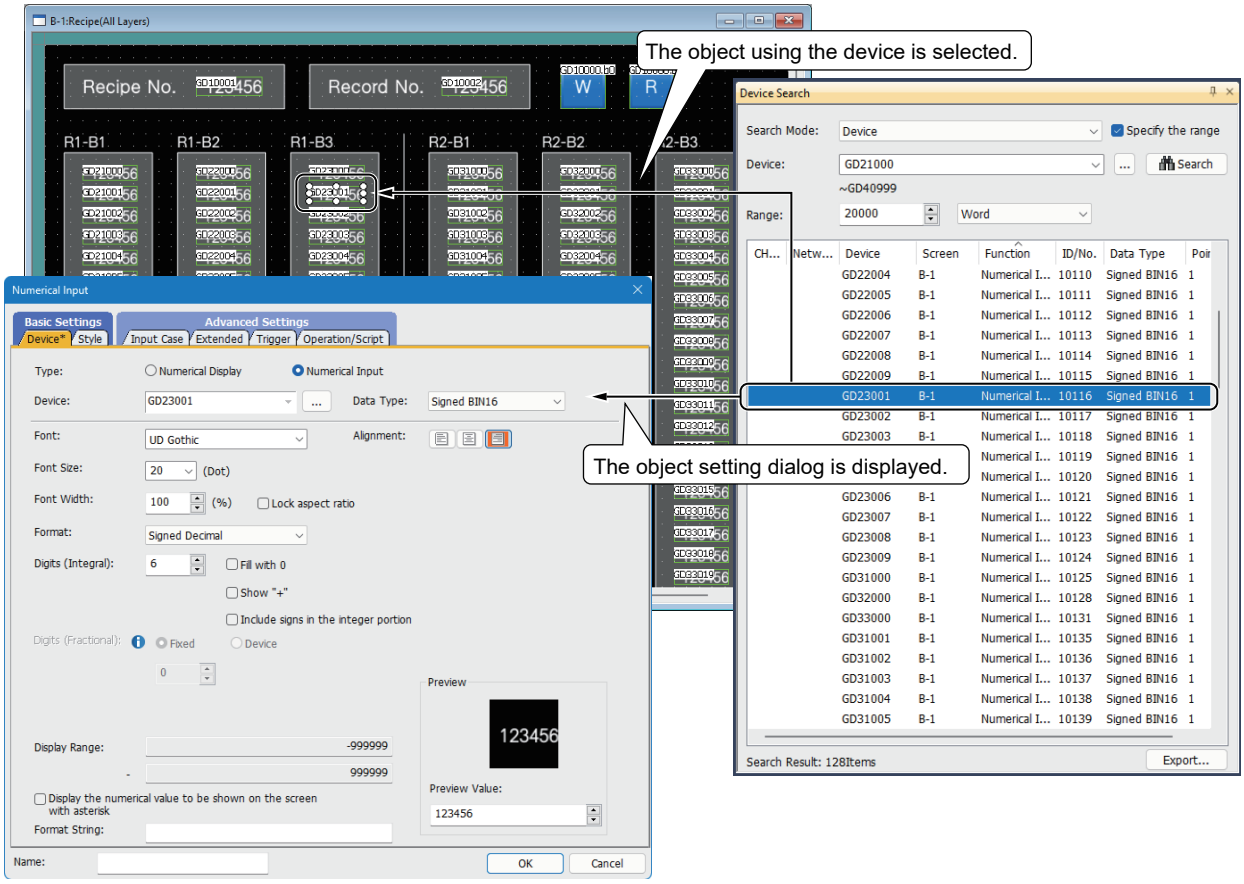
■Changing or deleting the settings related to a found device

1. Search for devices in the [Device Search] window.

☞ Page 131 Searching the project for matching devices

2. Double-click a found device in the search result list to display the setting dialog for the figure, object, or common setting where the device is specified.

Change or delete settings as necessary.



3. Click the [Search] button again to apply setting changes to the search result list.

■Exporting the search result list data

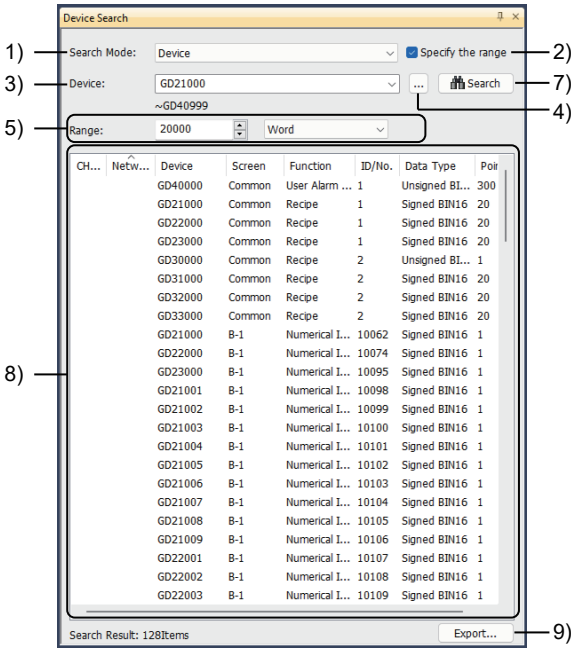
1. Search for devices in the [Device Search] window.

☞ Page 131 Searching the project for matching devices

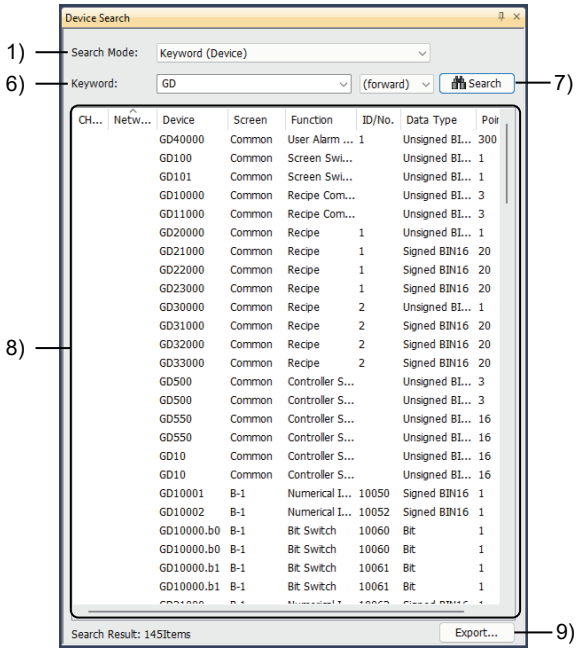
2. Click the [Export] button to display the [Save As] dialog.
3. Set [File name] and [Save as type] and click the [Save] button to export the search result list.

[Device Search] window

GT37 SoftGOT3000



When [Search Mode] is set to [Device]



When [Search Mode] is set to any other than [Device]

Item		Description
1)	[Search Mode]	Select a search mode. The following shows selectable items. • [Device] Searches for the device that matches the specified device, channel number, and network setting. If one of consecutive devices is specified, the start device of the consecutive devices is searched for. Among the devices of non-Mitsubishi Electric equipment, some bit devices and word devices are used for the same purpose, but have different device names. When [Search Mode] is set to [Device], the search result list will display the specified device and other devices that are used for the same purpose as the specified device. To find the specified device only, select [Keyword (Device)] for [Search Mode]. • [Keyword (Label/Tag)] Searches for labels and tags containing the specified keyword. • [Keyword (Label)] Searches for labels containing the specified keyword. • [Keyword (Device)] Searches for devices containing the specified keyword.
2)	[Specify the range]	This item appears when [Search Mode] is set to [Device]. Enables the setting to specify the scope of a search.
3)	[Device]	This item appears when [Search Mode] is set to [Device]. Specify a device, channel number, and network setting. If you specify no channel number and network setting, channel No. 1 and 0-FF (host station) are assumed. The search result list will display the device matching the specified conditions or the start device of consecutive devices containing the matching device. The device, channel number, and network setting are settable in the [Setting] dialog alternatively.

Item		Description
4)	[...] button	This item appears when [Search Mode] is set to [Device]. Displays the [Setting] dialog. Specify a device, channel number, and network setting. If you specify no channel number and network setting, channel No. 1 and 0-FF (host station) are assumed.  • [Device Type] Select the data type of a device. • [Device] Specify a device, channel number, and network setting. ☞ Page 834 How to set devices, labels, and tags
5)	[Range]	This item appears when [Specify the range] is selected. Specify the number of devices and the device type.  The consecutive devices starting from the specified device are searched for. The maximum number of devices varies depending on the device name.
6)	[Keyword]	This item appears when [Search Mode] is set to [Keyword (Label/Tag)], [Keyword (Label)], or [Keyword (Device)]. Specify a search keyword. The labels, tags, or devices containing the specified keyword will be listed in the search result list. To specify multiple keywords, enter a one-byte space between them.
7)	[Search] button	Performs a search. The hits will be listed in the search result list. If two or more objects and figures are selected on the screen editor, the devices, labels, or tags specified for the objects and figures will be searched. In this case, the title bar of the window displays [selected range].

Item			Description
8)	Search result list	—	Lists the search results. Right-click the column header of the list to select columns to be displayed.
		[Label/Tag], [Label]	Labels or tags that contain the string specified with [Keyword]
		[Device]	• When [Search Mode] is set to [Device] Device matching the specified device, channel number and network setting, or the start device of consecutive devices containing the matching device Devices used on the display-prohibited screens and scripts in a project protected with project security are not displayed. The devices assigned to script symbols are not displayed. • When [Search Mode] is set to [Keyword (Label/Tag)] or [Keyword (Label)] Devices assigned to the found labels or tags • When [Search Mode] is set to [Keyword (Device)] Devices that contain the string specified with [Keyword]
		[CH No.]	Channel numbers specified for the devices listed
		[Network]	Network numbers, station numbers, and CPU numbers that are specified for the devices listed Example) When network No. 1, station No. 2, and CPU No. 3 are set 		[Screen]	Locations where the devices listed are set "n" represents a screen number. • [Common]: Common setting • [B-n]: Base screen • [W-n]: Window screen • [M-n]: Mobile screen
		[Function]	Functions that use the devices listed
		[ID/No.]	Object IDs of the objects where the devices listed are set, or setting numbers of the functions where the devices listed are set
		[Data Type]	Data type of the devices
		[Points]	Number of consecutive devices
9)	[Export] button		Saves the search result list as a CSV or Unicode text file.

■Mouse and keyboard operations

The following shows the mouse and keyboard operations for the search result list in the [Device Search] window.

Operation	Action
↑ ↓	Moves the cursor.
Enter	Moves the cursor down one row.
Home Ctrl + ↑	Moves the cursor to the top row.
Enter Ctrl + ↓	Moves the cursor to the bottom row.
PgUp	Moves the cursor from the row with the cursor to the corresponding row up one page.
PgDown	Moves the cursor from the row with the cursor to the corresponding row down one page.
Click	Select the figure or object where the selected device is set, on the screen editor.
Double click	Open the setting dialog for the figure, object, or common setting where the selected device is set.

5.5.2 Listing devices (Device list)

The devices and labels used in the project are displayed in a list.

You can narrow your search, jump to the location where a selected device is used, and export the device list.

☞ Page 136 How to use the device list
☞ Page 139 [Device List] window
☞ Page 142 Details of the exported file

How to use the device list

☞ Page 136 Listing the devices used in the project
☞ Page 137 Searching for a device or jumping to the location where a selected device is used
☞ Page 138 Exporting the device list

■Listing the devices used in the project

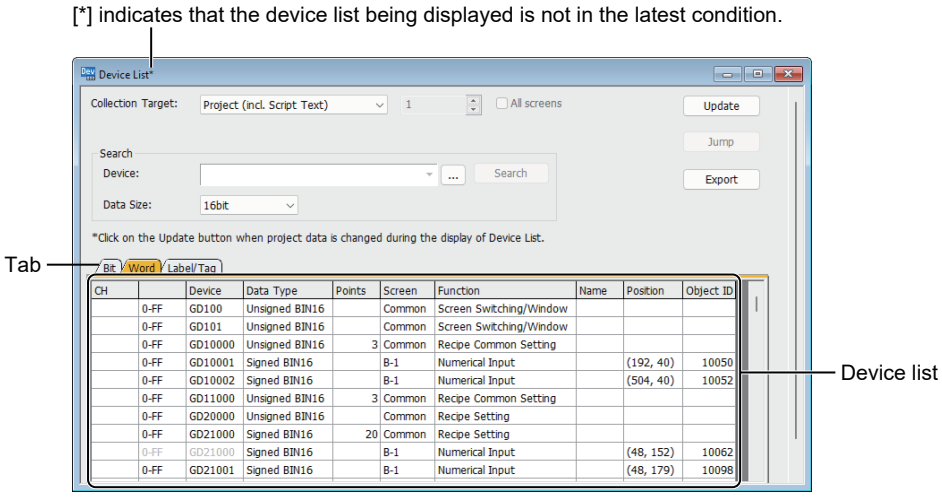
1. Select [Search/Replace] → [Device List] from the menu, then select either of the following items to display the [Device List] window.

☞ Page 139 [Device List] window

- [Screen]: Displays the [Device List] window and sets the currently selected screen editor as the target for collecting devices.
- [Project]: Displays the [Device List] window and sets the whole project (including script texts) as the target for collecting devices.
- [Script Text]: Displays the [Device List] window and sets all script text as the target for collecting devices.

2. After selecting any item for [Collection Target], click the [Update] button to update the device list.

To switch the display of bit devices, word devices, labels, and others, switch the tabs.



CH		Device	Data Type	Points	Screen	Function	Name	Position	Object ID
	0-FF	GD100	Unsigned BIN16		Common	Screen Switching/Window			
	0-FF	GD101	Unsigned BIN16		Common	Screen Switching/Window			
	0-FF	GD10000	Unsigned BIN16	3	Common	Recipe Common Setting			
	0-FF	GD10001	Signed BIN16		B-1	Numerical Input		(192, 40)	10050
	0-FF	GD10002	Signed BIN16		B-1	Numerical Input		(504, 40)	10052
	0-FF	GD11000	Unsigned BIN16	3	Common	Recipe Common Setting			
	0-FF	GD20000	Unsigned BIN16		Common	Recipe Setting			
	0-FF	GD21000	Signed BIN16	20	Common	Recipe Setting			
	0-FF	GD21000	Signed BIN16		B-1	Numerical Input		(48, 152)	10062
	0-FF	GD21001	Signed BIN16		B-1	Numerical Input		(48, 179)	10098

Even though any device setting is changed while the [Device List] window is displayed, the device list is not automatically updated.

If the device list being displayed is not in the latest condition, [*] is displayed in the title bar.

Click the [Update] button to update the list.

Precautions

The gateway device (EG) is not displayed in the [Device List] window.

■Searching for a device or jumping to the location where a selected device is used

1. Display the [Device List] window.

☞ Page 136 Listing the devices used in the project

2. Select a target that includes the device to be searched for [Collection Target] and click the [Update] button.

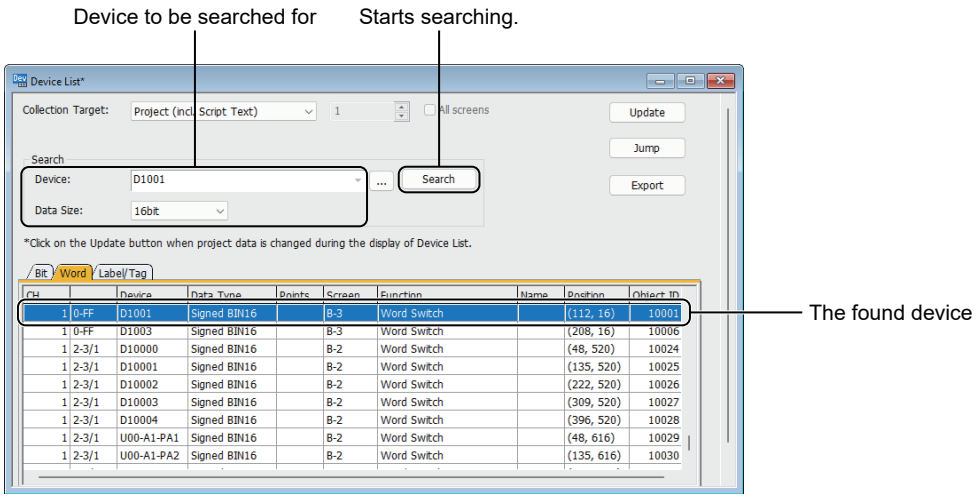
3. Switch between the tabs according to the deice or label to be searched for.

- [Bit] tab: Displays bit devices.
- [Word] tab: Displays word devices.
- [Label/Tag] tab: Displays labels or tags.

4. Set a device or label to be searched for and click the [Search] button.

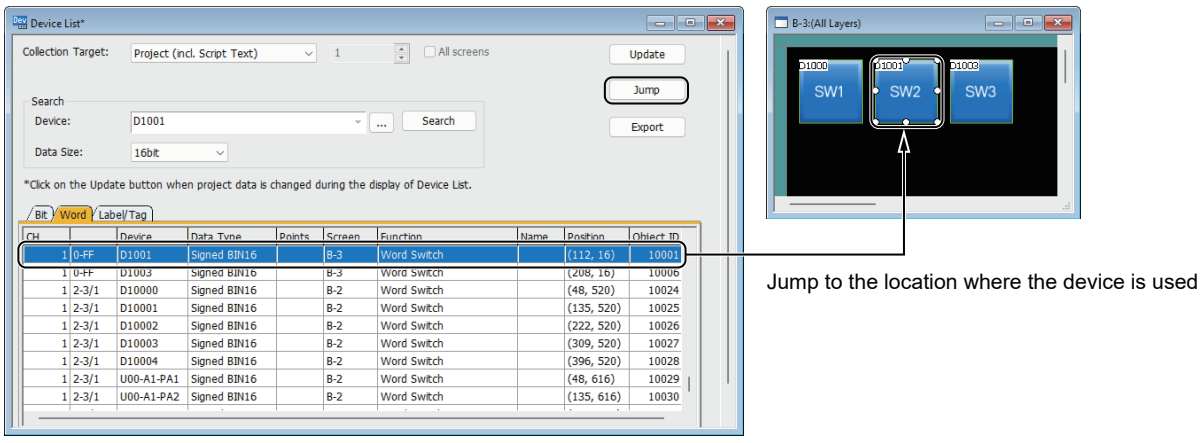
- [Bit] tab: Set [Device].
- [Word] tab: Set [Device] and [Data Size].
- [Label/Tag] tab: Set [Label/Tag Name] or [Label Name].

5. The corresponding device is selected in the device list.



6. If you select a device in the device list and click the [Jump] button, a figure or an object for which the selected device is used is selected on the screen editor.

If any device which has been used for something other than figures and objects is selected, the [Jump] button is disabled.



■Exporting the device list

1. Display the [Device List] window.

☞ Page 136 Listing the devices used in the project

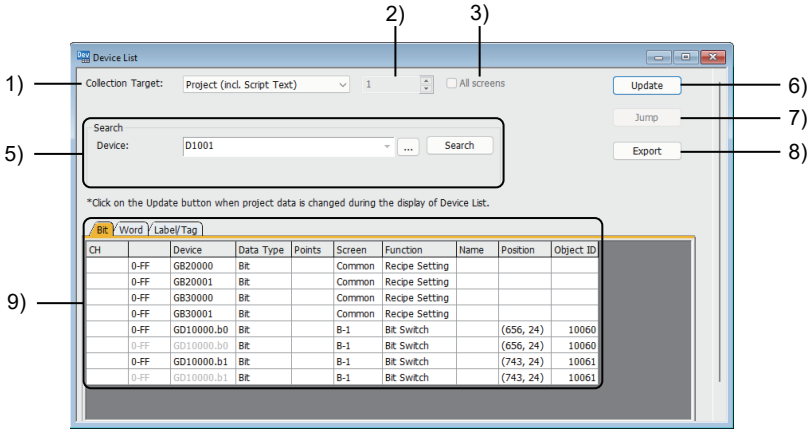
2. Click the [Export] button to display the [Save As] dialog.

3. Set [File name] and [Save as type] and click the [Save] button to export the device list.

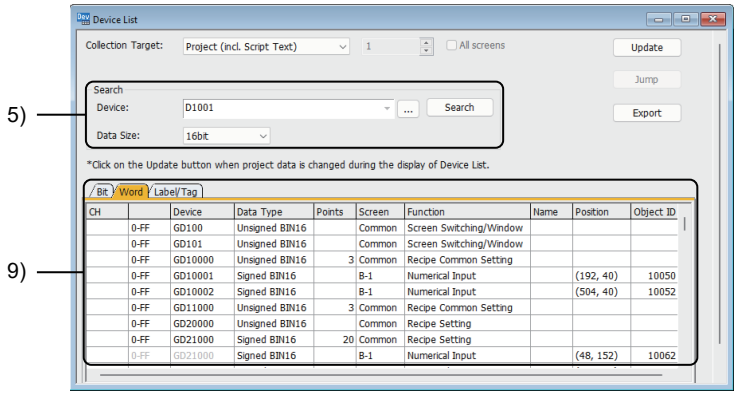
☞ Page 142 Details of the exported file

[Device List] window

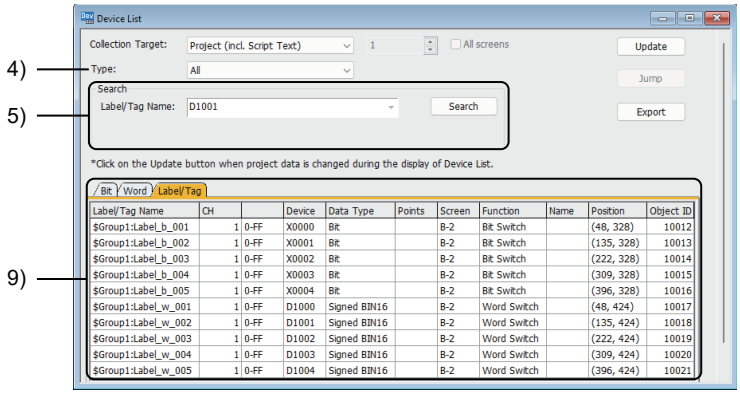
GT37 SoftGOT3000



When the [Bit] tab is selected



When the [Word] tab is selected



When the [Label/Tag] tab is selected

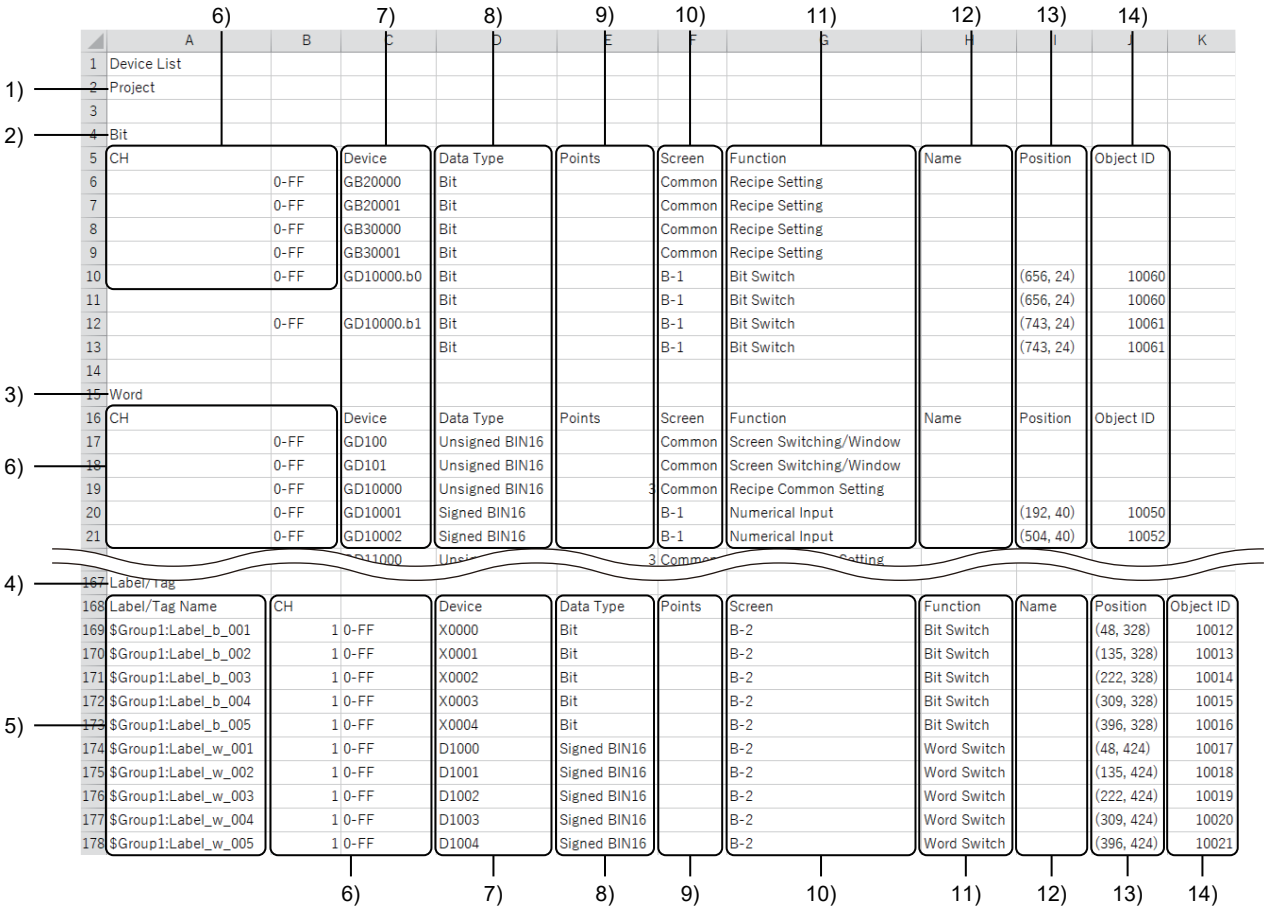
Item		Description
1)	[Collection Target]	Select a target to be displayed in the device list. After changing any device setting, click the [Update] button to update the device list.
2)	Target screen number	When [Base Screen], [Window Screen], or [Mobile Screen] is selected for [Collection Target], set the screen number to be searched for. The range to be selected is [0] to [32767].
3)	[All screens]	When [Base Screen], [Window Screen], or [Mobile Screen] is selected for [Collection Target], all the screens selected for [Collection Target] are targeted for collection. When this item is selected, the target screen number is invalid.
4)	[Type]	Select the type of the labels or tags displayed in the device list.

Item			Description
5)	[Search]	—	Set search conditions.
		[Device]	Set a device to be searched for.
		[Data Bit]	This item is displayed when the [Word] tab is selected. Set a data size of the device to be searched for.
		[Label/Tag Name]	This item is displayed when the [Label/Tag] tab or the [Label] tab is selected. Set the label name or tag name to be searched for.
		[...] button	Displays the device setting dialog when the [Bit] tab or the [Word] tab is selected. When the [Label/Tag] tab or the [Label] tab is selected, the dialog to appear varies with the selection for [Type] as shown below. • When [Label (GT Designer3)] is selected for [Type], the [Select Label (GT Designer3)] dialog appears. ☞ Page 838 [Select Label (GT Designer3)] dialog • When [Global Label] is selected for [Type], the [Select Global Label] dialog appears. ☞ Page 839 [Select Global Label] dialog • When [OMRON NJ/NX Tag] is selected for [Type], the [Select OMRON NJ/NX Tag] dialog appears. ☞ Page 840 [Select OMRON NJ/NX Tag] dialog • When [AB Native Tag] is selected for [Type], the [Select AB Native Tag] dialog appears. ☞ Page 841 [Select AB Native Tag] dialog • When [OPC UA Tag] is selected for [Type], the [Select OPC UA Tag] dialog appears. ☞ Page 842 [Select OPC UA Tag] dialog
		[Search] button	Starts searching.
6)	[Update] button		Updates the device list. If the device list being displayed is not in the latest condition, [*] is displayed in the title bar of the [Device List] window.
7)	[Jump] button		Displays a figure or object for which the device selected in the device list is used. If any device which is used for something other than figures and objects is selected, the [Jump] button is disabled.
8)	[Export] button		Saves the device list as a CSV file or Unicode text file. Set [File name] and [Save as type] in the displayed dialog and click the [Save] button. ☞ Page 142 Details of the exported file

Item			Description
9)	Device list	—	The list of the devices used in the project. Devices used on the display-prohibited screens and scripts in a project protected with project security are not displayed in the device list. Each tab displays different contents. Switch the following tabs according to the contents to be checked. • [Bit] tab: Displays the list of bit devices. • [Word] tab: Displays the list of word devices. • [Label/Tag] tab: Displays the list of labels or tags.
		[Label/Tag Name]	This item is displayed in the [Label/Tag] tab. Label name or tag name.
		[CH], network No., station number, CPU No.	Channel Nos., network Nos., station numbers, and CPU Nos. Example) Device of channel No. 2, network No. 1, station number 2, and CPU No. 3  If the same device continues, the one in the second row or later is displayed in gray.
		[Device]	Devices If the same device continues, the one in the second row or later is displayed in gray.
		[Data Type]	Data type of the devices
		[Points]	Number of devices which are consecutively set
		[Screen]	Screens for which the devices are used • [Common]: Common setting • [B-n]: Base screen "n" represents a screen number. • [W-n]: Window screen "n" represents a screen number. • [M-n]: Mobile screen "n" represents a screen number.
		[Function]	Function names for which the devices are used
		[Name]	Names of figures and objects
		[Position]	Coordinates where the figures and objects are placed
		[Object ID]	Object IDs of the figures and objects

Details of the exported file

The following shows the details of the exported file of the device list.



Item		Description
1)	Collection target	Setting of the collection target
2)	[Bit]	Details of the [Bit] tab
3)	[Word]	Details of the [Word] tab
4)	[Label/Tag]	Details of the [Label/Tag] tab
5)	[Label/Tag Name]	Label name or tag name.
6)	[CH], network No., station number, CPU No.	Channel Nos., network Nos., station numbers, and CPU Nos. If the same device continues, the one in the second row or later is blank.
7)	[Device]	Devices If the same device continues, the one in the second row or later is displayed in gray.
8)	[Data Type]	Data type of the devices
9)	[Points]	Number of devices which are consecutively set
10)	[Screen]	Screens for which the devices are used • [Common]: Common setting • [B-n]: Base screen "n" represents a screen number. • [W-n]: Window screen "n" represents a screen number. • [M-n]: Mobile screen "n" represents a screen number.
11)	[Function]	Function names for which the devices are used
12)	[Name]	Names of figures and objects
13)	[Position]	Coordinates where the figures and objects are placed
14)	[Object ID]	Object IDs of the figures and objects

5.5.3 Listing strings (Text list)

Lists the strings used in the project.

You can narrow your search, and jump to the location where a selected text is used.

☞ Page 143 How to use the text list

☞ Page 145 [Text List] window

How to use the text list

☞ Page 143 Listing the strings used in the project

☞ Page 144 Searching for a text or jumping to a text

■Listing the strings used in the project

1. Select [Search/Replace] → [Text List] from the menu to display the [Text List] window.

☞ Page 145 [Text List] window

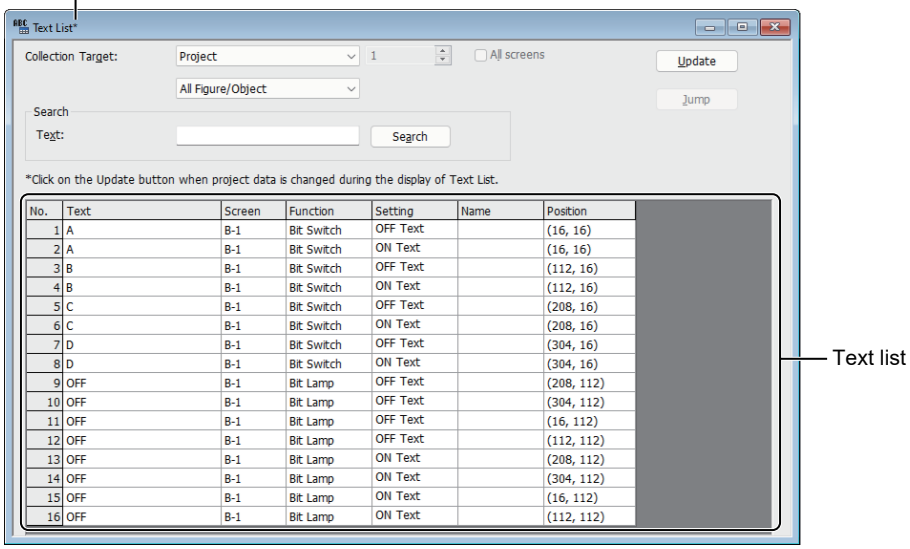
2. After selecting any item for [Collection Target], click the [Update] button to update the text list.

Even though any text setting is changed while the [Text List] window is displayed, the text list is not automatically updated.

If the text list being displayed is not in the latest condition, [*] is displayed in the title bar.

Click the [Update] button to update the list.

[*] indicates that the text list being displayed is not in the latest condition.



No.	Text	Screen	Function	Setting	Name	Position
1	A	B-1	Bit Switch	OFF Text		(16, 16)
2	A	B-1	Bit Switch	ON Text		(16, 16)
3	B	B-1	Bit Switch	OFF Text		(112, 16)
4	B	B-1	Bit Switch	ON Text		(112, 16)
5	C	B-1	Bit Switch	OFF Text		(208, 16)
6	C	B-1	Bit Switch	ON Text		(208, 16)
7	D	B-1	Bit Switch	OFF Text		(304, 16)
8	D	B-1	Bit Switch	ON Text		(304, 16)
9	OFF	B-1	Bit Lamp	OFF Text		(208, 112)
10	OFF	B-1	Bit Lamp	OFF Text		(304, 112)
11	OFF	B-1	Bit Lamp	OFF Text		(16, 112)
12	OFF	B-1	Bit Lamp	OFF Text		(112, 112)
13	OFF	B-1	Bit Lamp	ON Text		(208, 112)
14	OFF	B-1	Bit Lamp	ON Text		(304, 112)
15	OFF	B-1	Bit Lamp	ON Text		(16, 112)
16	OFF	B-1	Bit Lamp	ON Text		(112, 112)

■Searching for a text or jumping to a text

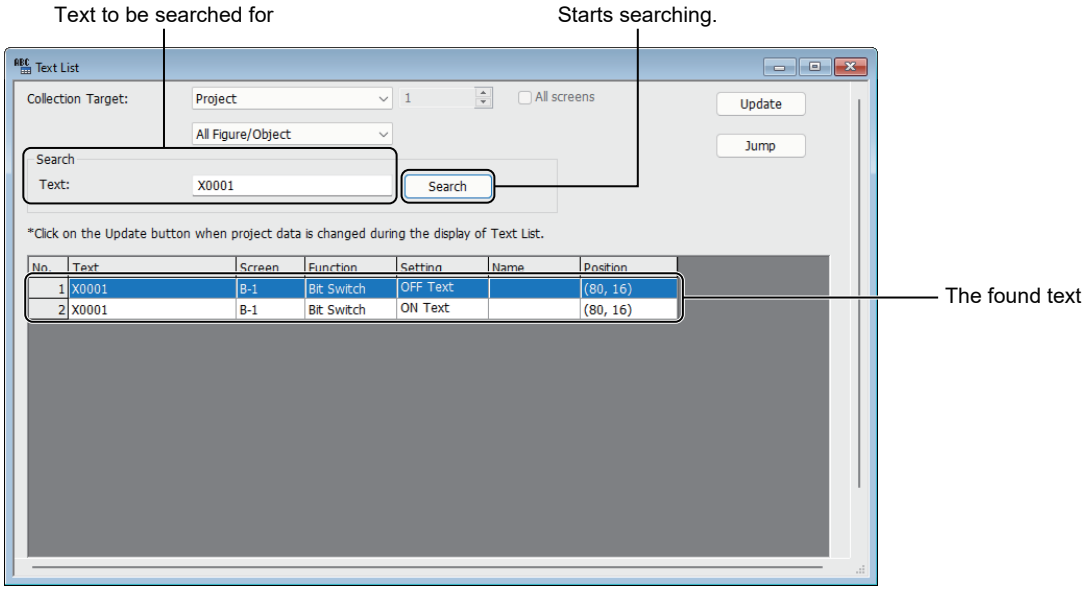
1. Display the [Text List] window.

☞ Page 143 Listing the strings used in the project

2. Select a target that includes the text to be searched for [Collection Target] and click the [Update] button.

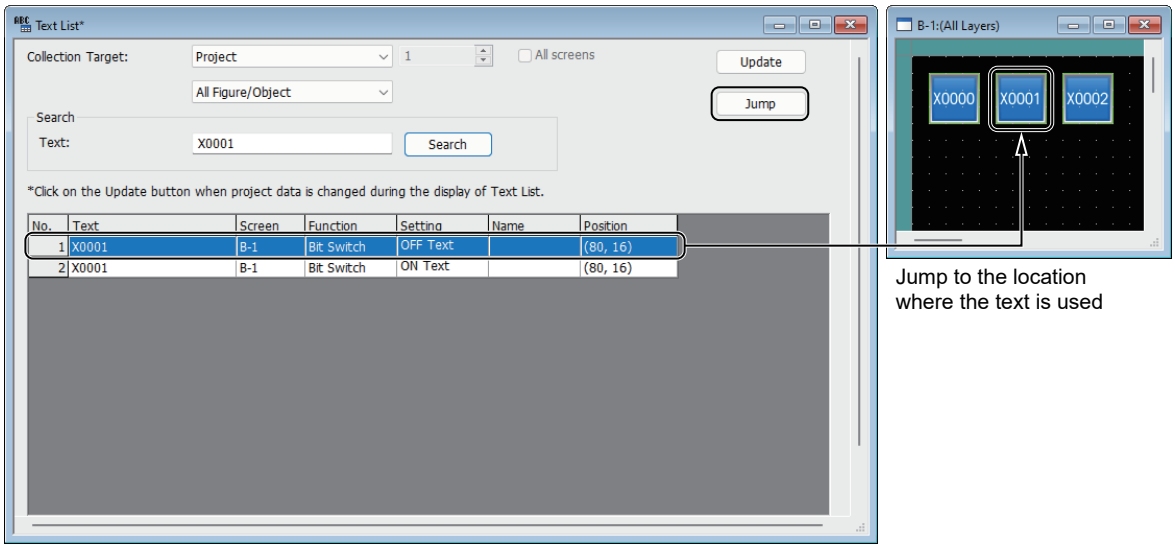
3. Set the text to be searched for in [Text] and click the [Search] button.

The corresponding text is displayed in the text list.



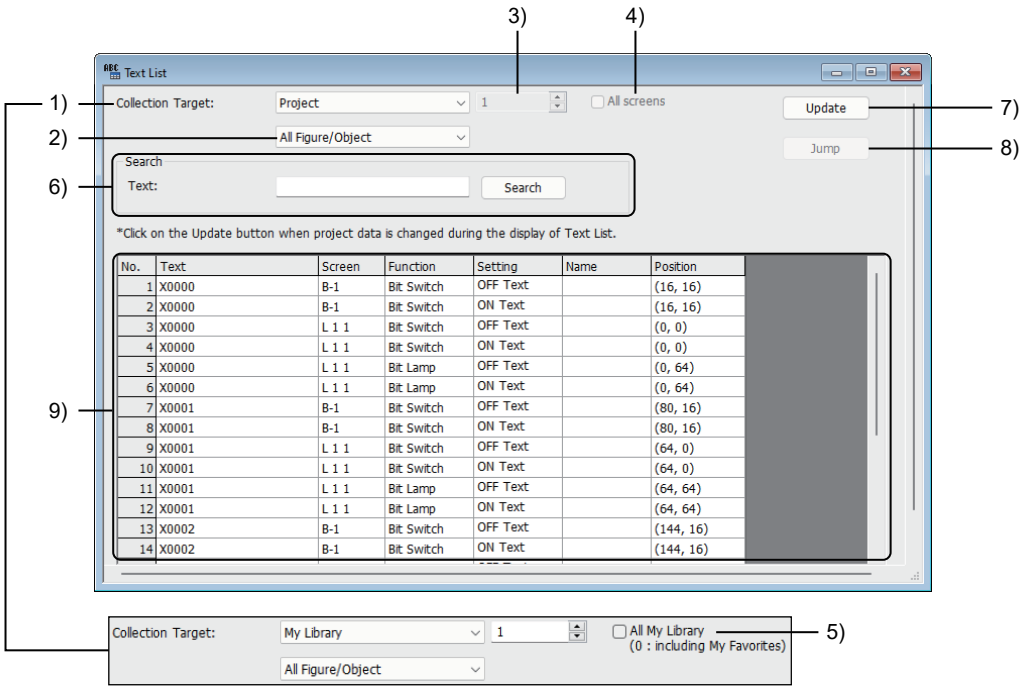
4. If you select a text in the text list and click the [Jump] button, a figure or an object for which the selected text is used is used on the screen editor.

If any text which is used for something other than figures and objects is selected, the [Jump] button is disabled.



[Text List] window

GT37 SoftGOT3000



Item			Description
1)	[Collection Target]		Select a target to be displayed in the text list. After changing any text setting, click the [Update] button to update the text list.
2)	Additional condition		Select an additional condition to narrow the collection target.
3)	Target number		Depending on the selection for [Collection Target], the setting item differs. • [Base Screen], [Window Screen], or [Mobile Screen] Set the collection target screen number. The setting range is [0] to [32767]. • [Parts] Set the collection target parts number. The setting range is [1] to [32767]. • [My Library] Set the collection target library folder number. The setting range is [0] to [512].
4)	[All screens]		Depending on the selection for [Collection Target], the setting item differs. When this item is selected, the target number is invalid. • [Base Screen], [Window Screen], or [Mobile Screen] Sets all screens with the screen type selected in [Collection Target] as the collection target. • [Parts] Sets all parts as the collection target.
5)	[All My Library]		Sets all library folders as the collection target.
6)	[Search]	—	Set search conditions.
		[Text]	Set the text to be searched for.
		[Search] button	Starts searching.
7)	[Update] button		Updates the text list. If the text list being displayed is not in the latest condition, [*] is displayed in the title bar of the [Text List] window.
8)	[Jump] button		Displays the location where the text selected in the text list is used.

Item			Description
9)	Text list	—	Lists the text used in the project. Texts used on the display-prohibited screens in a project protected with project security are not displayed in the text list. Dragging each column enables changing the width of column.
		[Text]	Texts.
		[Screen]	The screens for which the texts are used. • [B-n]: Base screen "n" represents a screen number. • [W-n]: Window screen "n" represents a screen number. • [M-n]: Mobile screen "n" represents a screen number. • [P-n]: Part "n" represents a screen number. • [L x n], [L x-y n]: Folder of the my library "x" represents the folder number one level below My Library, "y" represents the folder number two levels below My Library, and "n" represents the data number.
		[Function]	Function names for which the texts are used
		[Setting]	Settings for which the texts are used
		[Name]	Names which are set for the figures and objects
		[Position]	Coordinates where the figures and objects are placed

5.5.4 Changing the set values collectively (Batch Edit)

☞ Page 148 How to use the Batch Edit
☞ Page 155 [Device Batch Edit] dialog
☞ Page 157 [Unit No./Axis No. Batch Edit] dialog
☞ Page 159 [Network Batch Edit] dialog
☞ Page 161 [CH No. Batch Edit] dialog
☞ Page 163 [Color Batch Edit] dialog
☞ Page 165 [Shape Batch Edit] dialog

The settings including the device settings and the figure settings can be changed collectively.

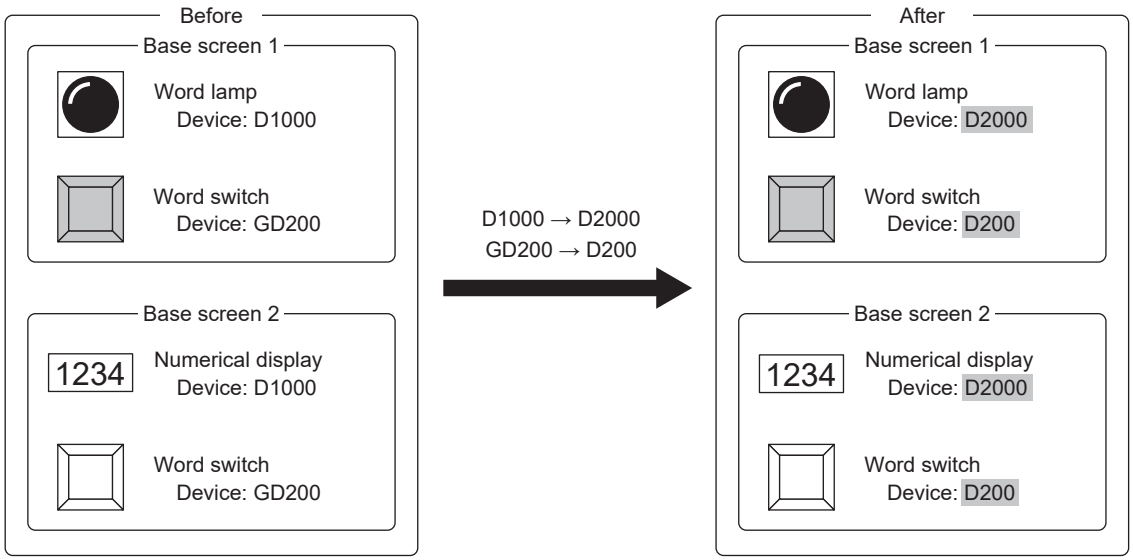
The following shows the settings which can be changed collectively.

- Device, label, OMRON NJ/NX tag, AB native tag, or OPC UA tag
- Unit No. and axis No.
- Network setting (Network No., station number, and CPU No.)
- Channel No.
- Color of a figure or object
- Shape of a touch switch or lamp

The settings of different figures and objects can be changed collectively.

Ex.

Changing devices collectively



How to use the Batch Edit

☞ Page 148 Changing devices collectively
☞ Page 150 Changing unit numbers and axis numbers collectively
☞ Page 151 Changing the network settings collectively
☞ Page 152 Changing channel numbers collectively
☞ Page 153 Changing the colors of figures and objects collectively
☞ Page 154 Changing the shapes of touch switches and lamps collectively

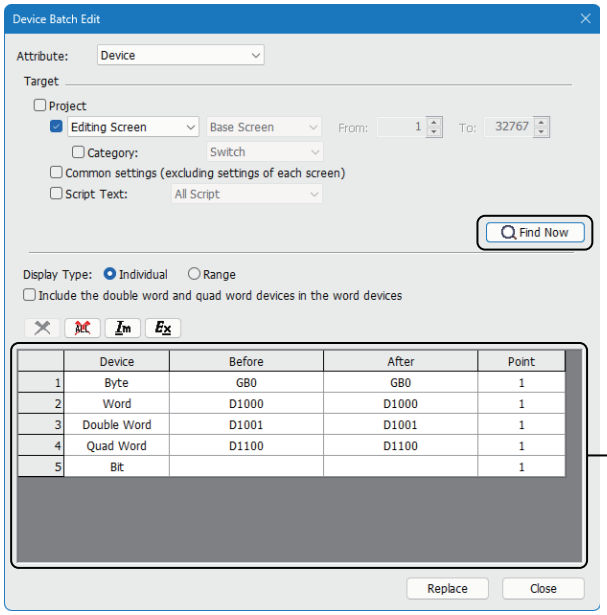
■Changing devices collectively

1. Select [Search/Replace] → [Batch Edit] → [Device] from the menu to display the [Device Batch Edit] dialog.

If you have selected figures and objects on the screen editor before selecting the menu, the [Device Batch Edit] dialog displays the settings of the selected figures and objects in the search result list.

☞ Page 155 [Device Batch Edit] dialog

2. Set [Target] and [Display Type] and click the [Find Now] button to list search results.



3. In the search result list, double-click a cell in the [After] column, and set a new value.

☞ Page 834 How to set devices, labels, and tags

4. Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

Precautions

Item	Description
Changing devices into different device types	The devices for which the settable device types are fixed (including bit devices and word devices) cannot be changed into different device types.
Changing consecutive devices	The start device of consecutive devices cannot be changed to a device which is out of the device range.
Changing a device of the object for which the offset function is enabled	The device of the object for which the offset function is enabled cannot be changed to a bit device specified as a word device.
Changing to labels (GT Designer3)	For collectively changing to labels (GT Designer3), the data type consistency check is not performed automatically between the labels (GT Designer3) and the objects or others where the labels (GT Designer3) are used. It is recommended to check the data type consistency by comparing the contents between the device list on GT Designer3 and the labels (GT Designer3) exported with GT Designer3. Note that change to the labels (GT Designer3) unregistered in label groups is not available.
Changing to global labels	For collectively changing to global labels, the data type consistency check is not performed automatically between the global labels and the objects or others where the global labels are used. It is recommended to check the data type consistency by comparing the contents between the device list on GT Designer3 and the global labels exported with GX Works3.
Changing to OMRON NJ/NX tags	For collectively changing to OMRON NJ/NX tags, the data type consistency check is not performed automatically between the OMRON NJ/NX tags and the objects or others where the tags are used. It is recommended to check the data type consistency by comparing the contents between the device list on GT Designer3 and the OMRON NJ/NX tags exported from Sysmac Studio.
Changing to AB native tags	For collectively changing to AB native tags, the data type consistency check is not performed automatically between the AB native tags and the objects or others where the AB native tags are used. It is recommended to check the data type consistency by comparing the contents between the device list on GT Designer3 and the AB native tags exported from RSLogix 5000.
Changing to OPC UA tags	For collectively changing to OPC UA tags, the data type consistency check is not performed automatically between the OPC UA tags and the objects or others where the OPC UA tags are used. It is recommended to check the data type consistency by comparing the device list in GT Designer3 with the tag information in GT OPC UA Client.
Collectively changing double-word devices	Double-word devices are collectively changed in units of two words. When the start device number is an even number, only the devices whose device number is an even number are changed collectively. When the start device number is an odd number, only the devices whose device number is an odd number are changed collectively. Example) For five double-word devices (D0 to D9), D0, D2, D4, D6, and D8 are changed collectively. D1, D3, D5, D7, and D9 are not changed. To collectively change word and double-word devices, select [Include the double word and quad word devices in the word devices] in the [Device Batch Edit] dialog.
Collectively changing quad word devices	Quad word devices are collectively changed in units of four words. Example) For five quad word devices (D0 to D19), D0, D4, D8, D12, and D16 are changed collectively. The other devices are not changed collectively. To collectively change word and quad word devices, select [Include the double word and quad word devices in the word devices] in the [Device Batch Edit] dialog.
Collectively changing the string-type labels and tags	When the string-type and non-string type devices, labels, and tags are set as the batch change targets, the string-type labels and tags cannot be changed collectively.
Collectively changing the string-type labels and tags	In the [Device Batch Edit] dialog, when values are directly entered in [Before] and [After] without using the [Find Now] button or the values are imported, the data is handled as signed 16-bit binary data. String-type labels and tags cannot be set in these cases. Even though the [Find Now] button is used, if string-type data and non-string type data both exist, string-type labels and tags may not be selected.

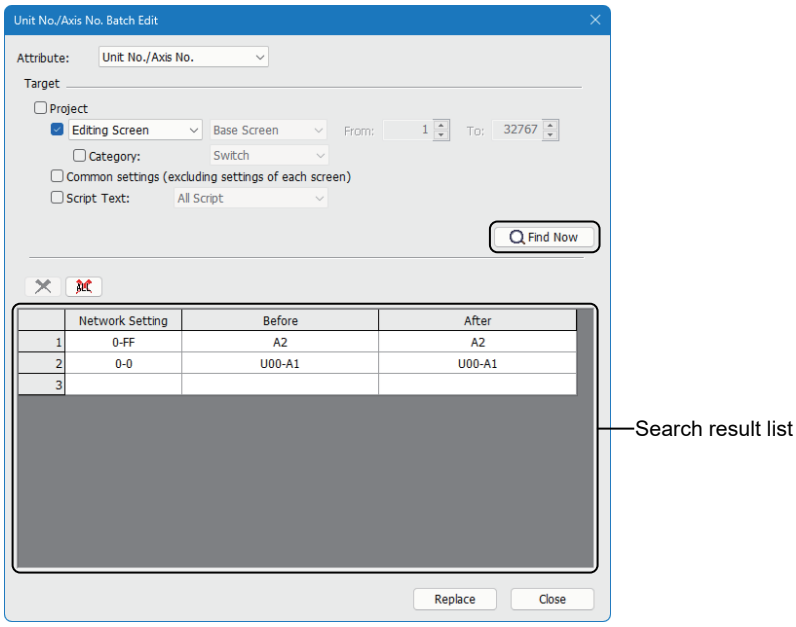
■Changing unit numbers and axis numbers collectively

1. Select [Search/Replace] → [Batch Edit] → [Unit No./Axis No.] from the menu to display the [Unit No./Axis No. Batch Edit] dialog.

If you have selected figures and objects on the screen editor before selecting the menu, the [Unit No./Axis No. Batch Edit] dialog displays the settings of the selected figures and objects in the search result list.

☞ Page 157 [Unit No./Axis No. Batch Edit] dialog

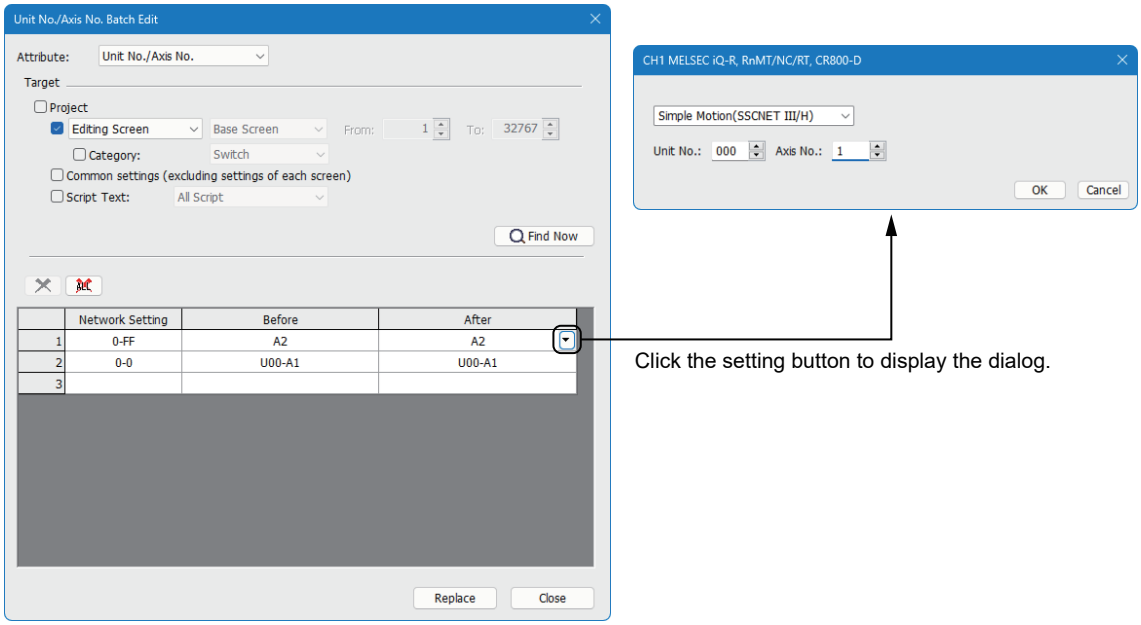
2. Set [Target] and click the [Find Now] button to display the found settings in the search result list.



3. In the search result list, click a cell in the [After] column to display the setting button.

4. Click the setting button to display the unit No./axis No. setting dialog.

Set a value to be applied after the batch change, and click the [OK] button.



5. Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

Precautions

Item	Description
Unit numbers and axis numbers not applicable to the batch change	For the global labels imported from Motion Control Setting Function, the unit numbers and axis numbers are not changed collectively.

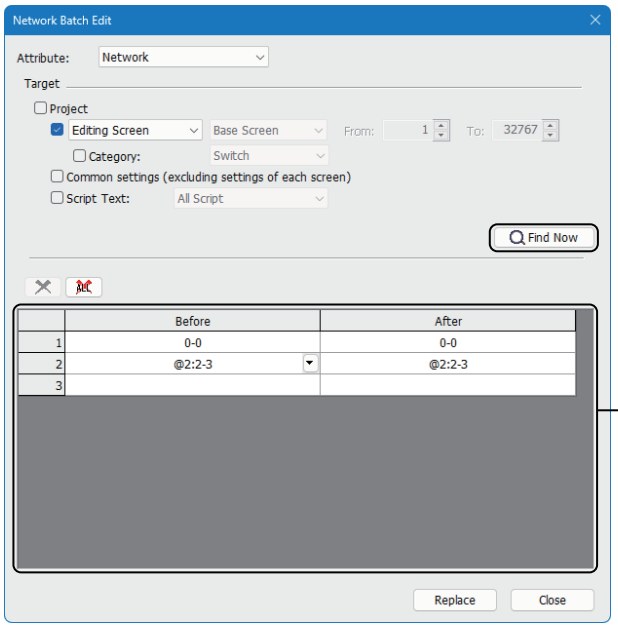
■Changing the network settings collectively

1. Select [Search/Replace] → [Batch Edit] → [Network] from the menu to display the [Network Batch Edit] dialog.

If you have selected figures and objects on the screen editor before selecting the menu, the [Network Batch Edit] dialog display the settings of the selected figures and objects in the search result list.

☞ Page 159 [Network Batch Edit] dialog

2. Set [Target] and click the [Find Now] button to display the found settings in the search result list.

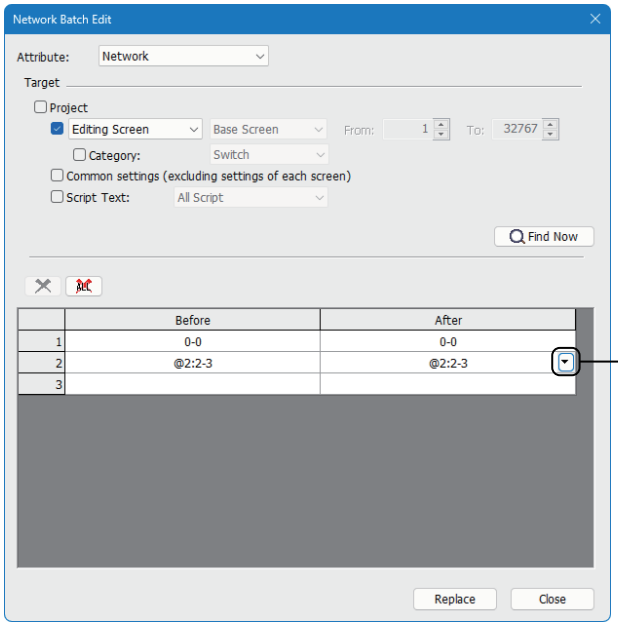


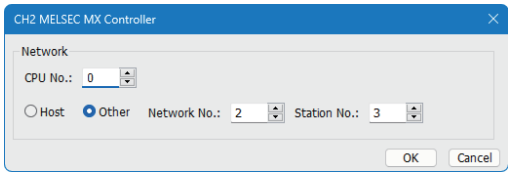
Search result list

3. In the search result list, click a cell in the [After] column to display the setting button.

4. Click the setting button to display the network setting dialog.

Set a value to be applied after the batch change, and click the [OK] button.





Click the setting button to display the dialog.

5. Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

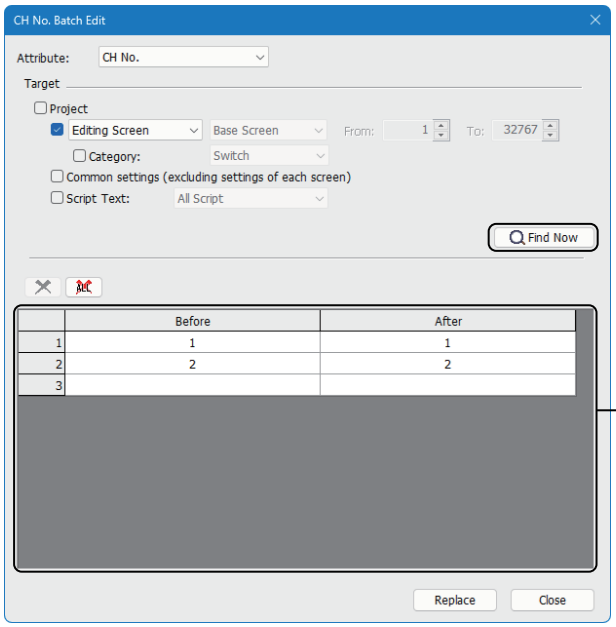
■Changing channel numbers collectively

1. Select [Search/Replace] → [Batch Edit] → [CH No.] from the menu to display the [CH No. Batch Edit] dialog.

If you have selected figures and objects on the screen editor before selecting the menu, the [CH No. Batch Edit] dialog displays the settings of the selected figures and objects in the search result list.

☞ Page 161 [CH No. Batch Edit] dialog

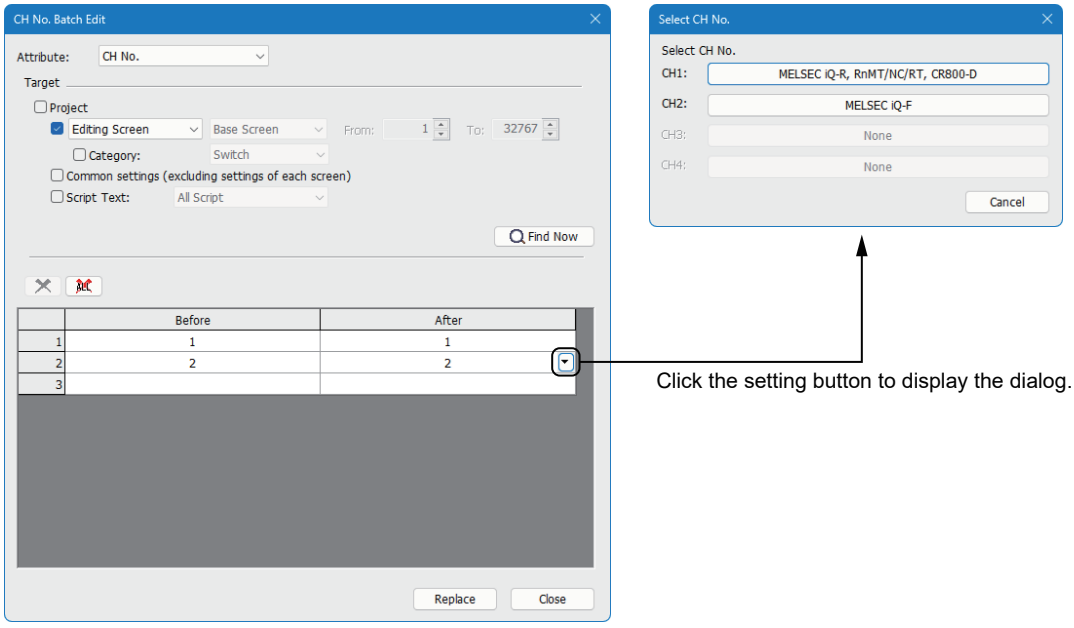
2. Set [Target] and click the [Find Now] button to display the found settings in the search result list.



3. In the search result list, click a cell in the [After] column to display the setting button.

4. Click the setting button to display the [Select CH No.] dialog.

Select a channel No. after the batch change and click the [OK] button.



5. Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

Precautions

Item	Description
Confirmation after the batch change	If a device that does not exist in the after the batch change is set for a channel number, the device is displayed as [??] after the batch change. After changing channel numbers in a batch, check that all the devices set in the project are not displayed as [??].

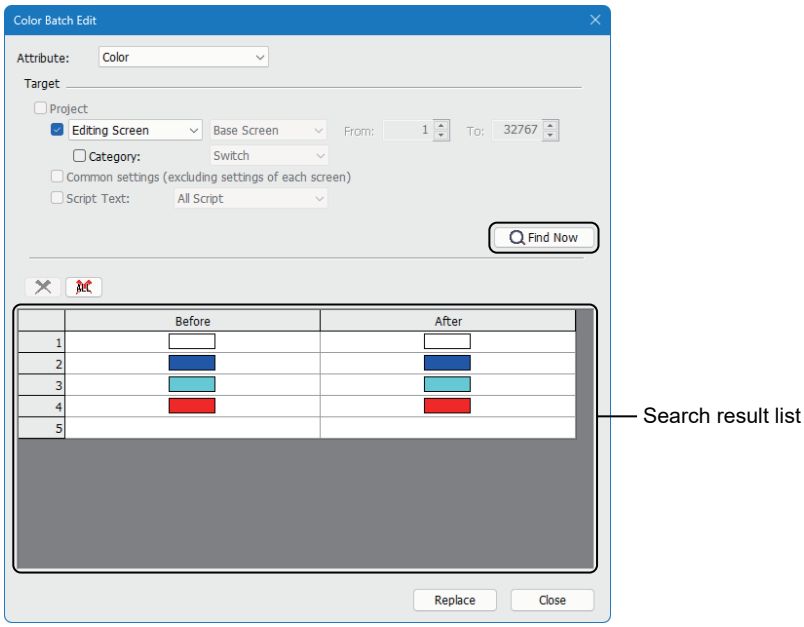
■Changing the colors of figures and objects collectively

1. Select [Search/Replace] → [Batch Edit] → [Color] from the menu to display the [Color Batch Edit] dialog.

If you have selected figures and objects on the screen editor before selecting the menu, the [Color Batch Edit] dialog displays the settings of the selected figures and objects in the search result list.

☞ Page 163 [Color Batch Edit] dialog

2. Set [Target] and click the [Find Now] button to display the found settings in the search result list.

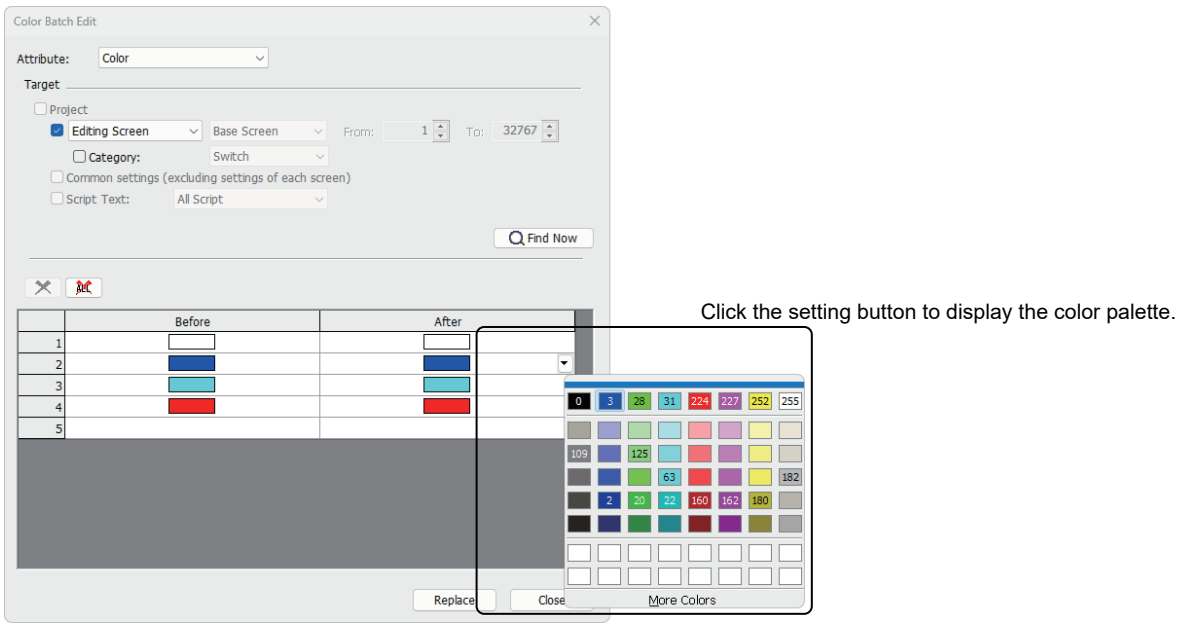


3. In the search result list, click a cell in the [After] column to display the setting button.

4. Click the setting button to display the color palette.

Set a color after the batch change.

☞ Page 988 Color settings



5. Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

Precautions

Item	Description
Colors not applicable to the bath change	When you select a shape in a given color from the system library for an object, the object is excluded from the target of the color batch change.

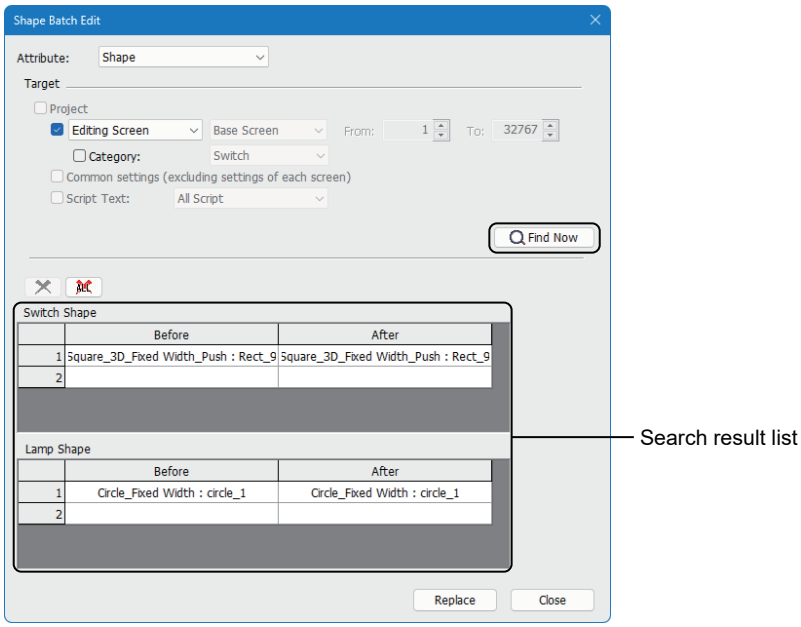
■Changing the shapes of touch switches and lamps collectively

1. Select [Search/Replace] → [Batch Edit] → [Shape] from the menu to display the [Shape Batch Edit] dialog.

If you have selected figures and objects on the screen editor before selecting the menu, the [Shape Batch Edit] dialog displays the settings of the selected figures and objects in the search result list.

☞ Page 165 [Shape Batch Edit] dialog

2. Set [Target] and click the [Find Now] button to display the found settings in the search result list.

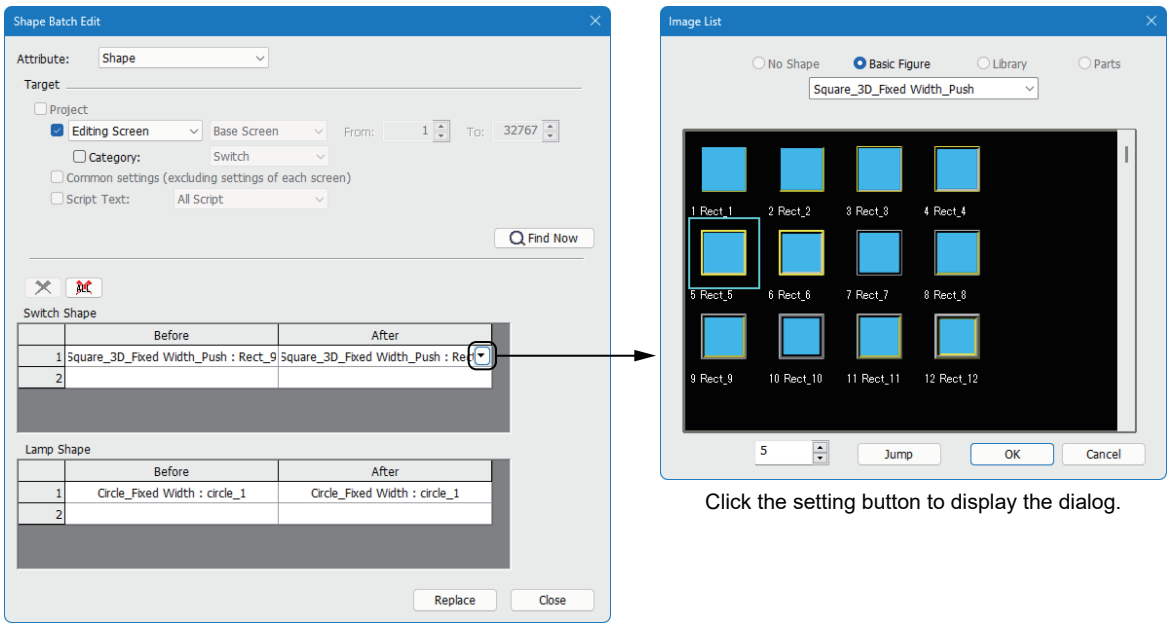


3. In the search result list, click a cell in the [After] column to display the setting button.

4. Click the setting button to display the [Image List] dialog.

The image types of figures ([Basic Figure], [Library] and [Parts]) cannot be changed.

Select a figure after the batch change and click the [OK] button.

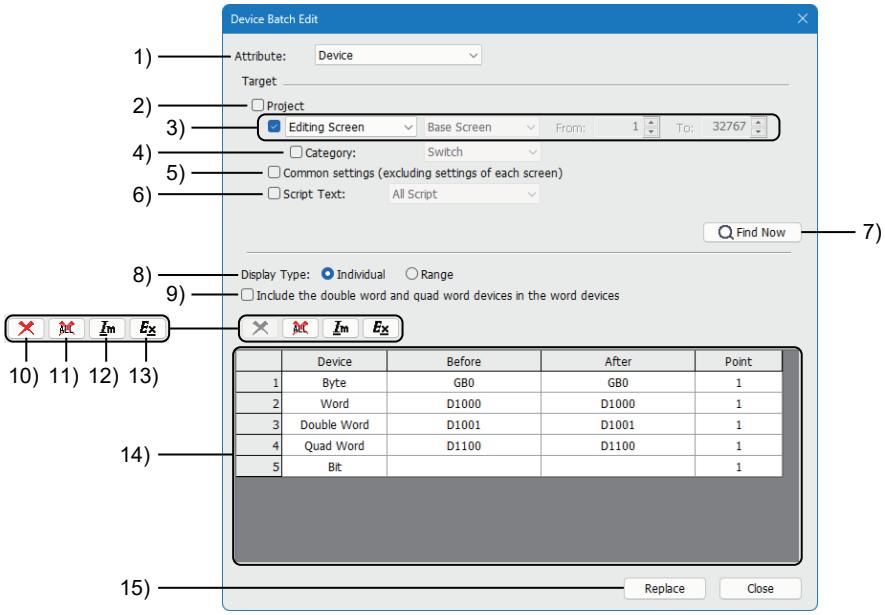


Click the setting button to display the dialog.

5. Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

[Device Batch Edit] dialog

GT37 SoftGOT3000



Item		Description
1)	[Attribute]	Select an attribute to change in a batch. The dialog to be displayed differs depending on the selected item. ☞ Page 155 [Device Batch Edit] dialog ☞ Page 157 [Unit No./Axis No. Batch Edit] dialog ☞ Page 159 [Network Batch Edit] dialog ☞ Page 161 [CH No. Batch Edit] dialog ☞ Page 163 [Color Batch Edit] dialog ☞ Page 165 [Shape Batch Edit] dialog
2)	[Project]	Searches the whole project.
3)	Search target screens	The specified screens are searched. The following shows selectable items. • [All screens] Searches all screens. • [Editing screen] Sets the screen editor displayed at the topmost position as the search target. • [Screen range] Searches the screens of the specified type and screen numbers.  Select the type of the screens to be searched for. Set the range of the screens to be searched for to [From] and [To] with screen numbers. The setting range is [0] to [32767]. • [Selected area] Searches the figures and objects selected on the screen editor before the [Device Batch Edit] dialog is opened. This item is enabled only when figures and objects have been selected on the screen editor.
4)	[Category]	Searching is performed in the set category. ☞ Page 1121 Managing figures and objects by category
5)	[Common settings (excluding settings of each screen)]	Searches the common settings.
6)	[Script Text]	Searches the scripts of the specified type.
7)	[Find Now] button	Conducts a search based on the setting of [Target]. Search results are displayed in the search result list.

Item			Description
8)	[Display Type]		Select the display type of the search results. • [Individual] Lists devices individually. • [Range] Lists devices collectively by device type.
9)	[Include the double word and quad word devices in the word devices]		Displays double-word and quad word devices in word devices, which are collectively changed in word units.
10)	[Delete] button		Clears all the contents in the search result list.
11)	[Clear] button		Clears all the contents in the search result list.
12)	[Import] button		Reads the device batch change settings from a Unicode text file or CSV file.
13)	[Export] button		Saves the device batch change settings to a Unicode text file or CSV file. ☞ Page 156 Details of the exported file For the precautions for using a Unicode text file or CSV file, refer to the following. ☞ Page 3668 Precautions for using CSV file ☞ Page 3669 Precautions for using Unicode text file
14)	Search result list	—	Shows the search results. Display-prohibited screens and scripts in a project protected with project security are not displayed in the search result list. Double-clicking each cell enables changing the settings. You can also directly set [Device], [Before], [After], and [Point] without a search to execute the batch change.
		[Device]	Device types ([Bit], [Byte], [Word], [Double Word], [Quad Word])
		[Before]	Setting values of the found settings
		[After]	Set a device applied after the batch change. The setting values before the batch change are displayed in the [After] column right after the searching. Double-clicking each cell of the [After] column enables changing the devices. If you change a device in the [After] column and then change the setting of [Display Type], the last-minute device change is discarded. ☞ Page 834 How to set devices, labels, and tags
		[Point]	Number of devices which are consecutively set In a row where a label or tag is set in [Before] or [After], [Points] is fixed to [1], and the cell color of [Points] changes to gray.
15)	[Replace] button		Executes the batch change with the settings in the search result list.

■Details of the exported file

The following shows the details of the exported file of the search results.

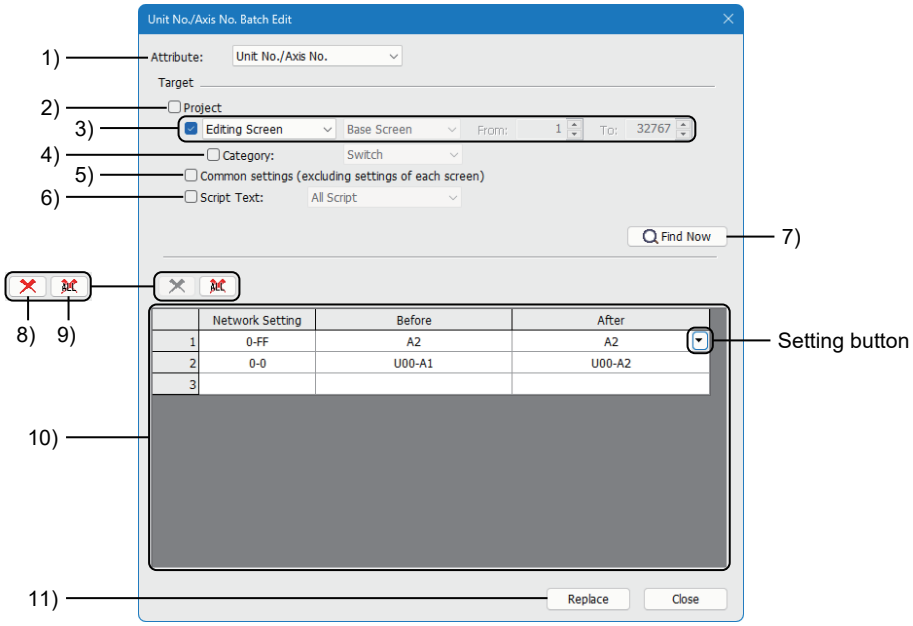
	A	B	C	D
1	Device Batch Edit			
2				
3	Device	Before	After	Point
4	Byte	GB0	GB0	1
5	Word	D1000	D1000	1
6	Double Word	D1001	D1001	1
7	Quad Word	D1100	D1100	1

1) 2) 3) 4)

Item		Description
1)	[Device]	Device types.
2)	[Before]	Devices before the change.
3)	[After]	Devices after the change. When [Range] is selected for [Display Type], only the start device is exported.
4)	[Point]	Number of devices.

[Unit No./Axis No. Batch Edit] dialog

GT37 SoftGOT3000



Item		Description
1)	[Attribute]	Select an attribute to change in a batch. The dialog to be displayed differs depending on the selected item. ☞ Page 155 [Device Batch Edit] dialog ☞ Page 157 [Unit No./Axis No. Batch Edit] dialog ☞ Page 159 [Network Batch Edit] dialog ☞ Page 161 [CH No. Batch Edit] dialog ☞ Page 163 [Color Batch Edit] dialog ☞ Page 165 [Shape Batch Edit] dialog

5.5.5 Searching for and editing a specific setting (Data Browser)

The common setting, figures, and objects set in the project are displayed in a list.
You can narrow the targets displayed in the list by specifying conditions with keywords.
You can change the settings separately or collectively in the [Data Browser] window.

☞ Page 167 How to use the data browser
☞ Page 175 [Data Browser] window
☞ Page 179 [Display Setting] dialog
☞ Page 181 [Display Setting List] dialog
☞ Page 182 [Text Replacement] dialog
☞ Page 182 Details of the exported file

How to use the data browser

☞ Page 167 Displaying the [Data Browser] window
☞ Page 168 Displaying the settings in the project
☞ Page 169 Changing the items and ranges to be displayed in the data browser (registering a preset)
☞ Page 170 Editing a preset
☞ Page 170 Deleting a preset
☞ Page 171 Changing the settings displayed in the data browser separately
☞ Page 172 Changing the settings displayed in the data browser collectively
☞ Page 173 Exporting the data collected in the data browser
☞ Page 173 Operations not restored by [Undo]
☞ Page 173 The settings which cannot be edited while the corresponding screen is closed
☞ Page 173 Projects protected with project security
☞ Page 174 Editing of [Range Setting] and [Input Range Setting]

■Displaying the [Data Browser] window

Perform either of the following operations to display the [Data Browser] window.

- Clicking [Search/Replace] → [Data Browser] from the menu
- Clicking [View] → [Docking Window] → [Data Browser] from the menu

☞ Page 175 [Data Browser] window

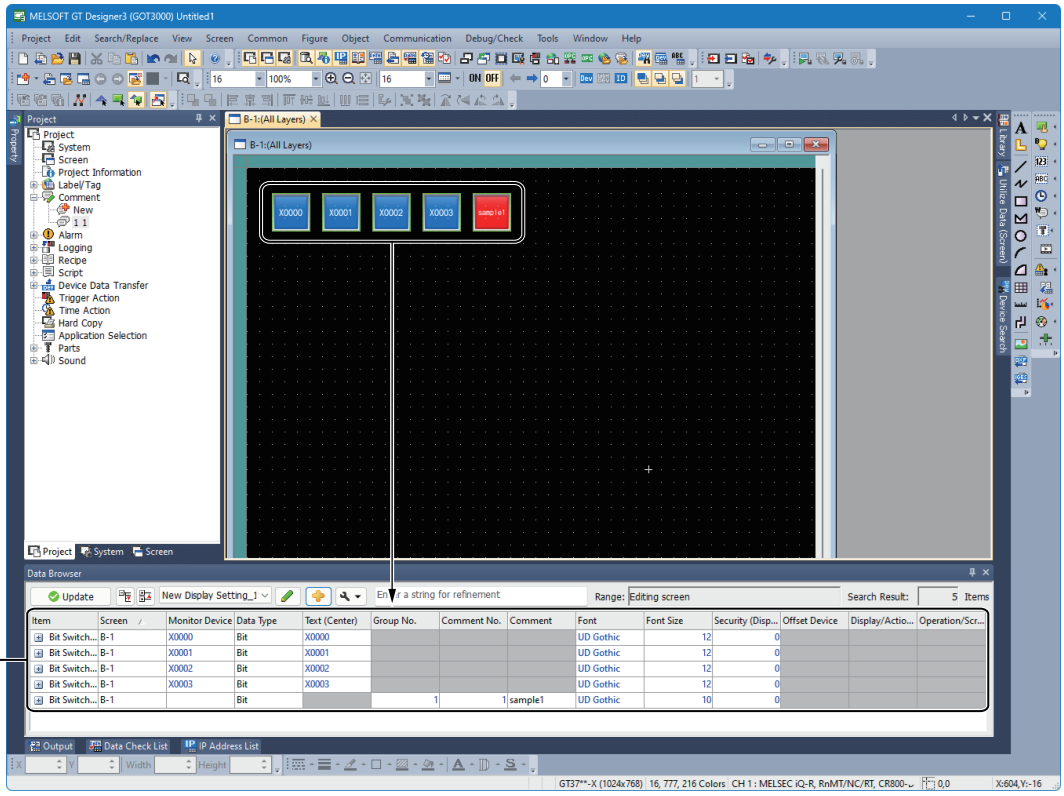
■Displaying the settings in the project

The search result list in the [Data Browser] window displays the search results according to the setting of the search range.

Ex.

When [Editing screen] is selected for [Range]

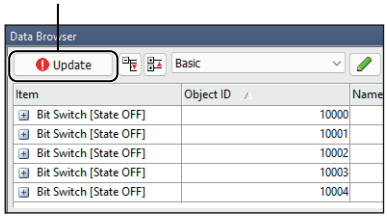
When the [Data Browser] window is displayed, the settings of the screen editor displayed at the topmost position are displayed.



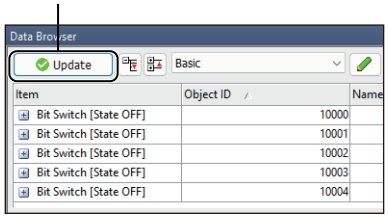
If any setting in the project is changed while the [Data Browser] window is displayed, the search result list is not automatically updated.

Click the [Update] button to refresh the contents of the search result list.

When the search result list is not in the latest condition



When the search result list is in the latest condition



To change the targets or items displayed in the [Data Browser] window, refer to the following.

☞ Page 169 Changing the items and ranges to be displayed in the data browser (registering a preset)

■Changing the items and ranges to be displayed in the data browser (registering a preset)

Register a combination of the items and ranges to be displayed in the data browser as a preset.

Select the registered preset of the display settings from the pull-down menu, and the items and ranges displayed in the data browser will change.

1. Register a new preset.

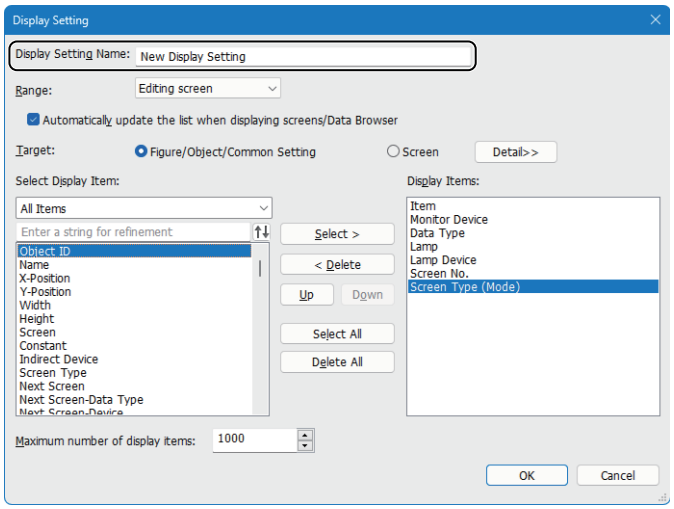
Perform one of the following operations to display the [Display Setting] dialog.

- Click the [Add] button in the [Data Browser] window.
- Click [Option] → [Display Setting List] button in the [Data Browser] window, and then click the [Add] button in the [Display Setting List] dialog.

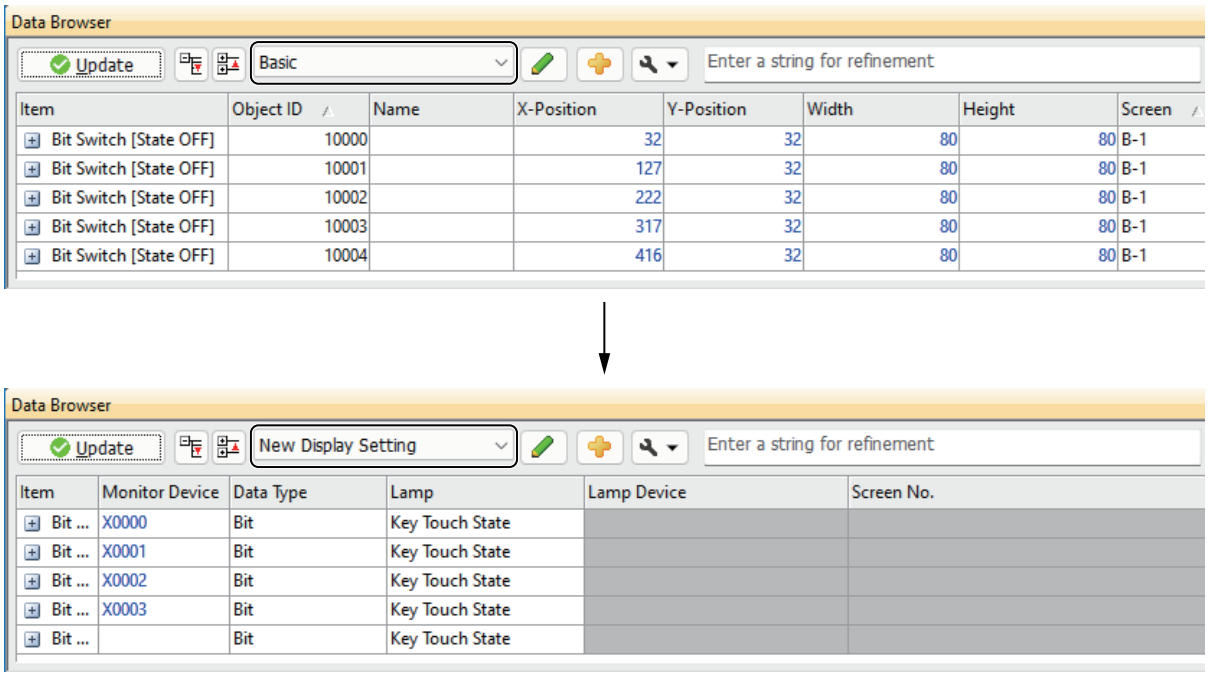
2. Select the items and ranges to be displayed in the data browser.

☞ Page 179 [Display Setting] dialog

Click the [OK] button to register the preset with the name set for [Display Setting Name].



3. Select the preset of the display settings registered in Step 2 from the pull-down menu, and the items and ranges displayed in the data browser will change.



■Editing a preset

Edit the settings of a registered preset.

The settings of the presets registered as initial settings can also be edited.

To restore the initial settings after editing, refer to the following.

☞ Page 176 Presets registered as initial settings

1. In the [Data Browser] window, click [Option] → [Display Setting List] from the menu to display the [Display Setting List] dialog.

☞ Page 181 [Display Setting List] dialog

2. Select a preset and click the [Edit] button to display the [Display Setting] dialog.

☞ Page 179 [Display Setting] dialog

3. Edit the settings and click the [OK] button to apply the new settings to the preset.

■Deleting a preset

Delete a registered preset.

The presets registered as initial settings can also be deleted.

To restore the initial settings after deletion, refer to the following.

☞ Page 176 Presets registered as initial settings

1. In the [Data Browser] window, click [Option] → [Display Setting List] from the menu to display the [Display Setting List] dialog.

☞ Page 181 [Display Setting List] dialog

2. Select an intended preset and click the [Delete] button to delete the preset.

■Changing the settings displayed in the data browser separately

1. The text color of each cell in the search result list indicates whether you can edit the cell or not in the [Data Browser] window.

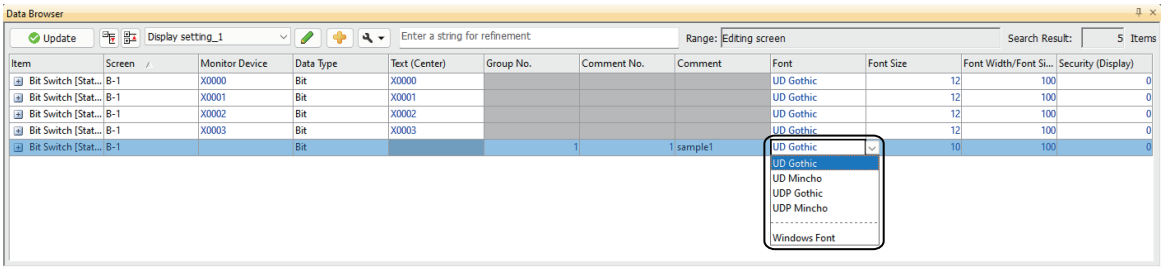
Double-click a cell whose text color is blue and edit the setting.

Text color	Description
Blue	The setting can be edited in the [Data Browser] window. Double-click each cell to edit the setting.
Black	The setting cannot be edited in the [Data Browser] window. Double-click each cell to display the setting dialog.

The setting method differs depending on the setting to be edited.

Ex.

Changing a font



For mouse and keyboard operations, refer to the following.

☞ Page 177 Operations for the list display

☞ Page 178 Operations when a cell is edited

■Changing the settings displayed in the data browser collectively

1. Select the rows intended for the batch change in the search result list.

Multiple rows can be selected by either of the following methods.

- Shift + Click

Selects the rows from the row with the cursor to the row where the mouse is clicked.

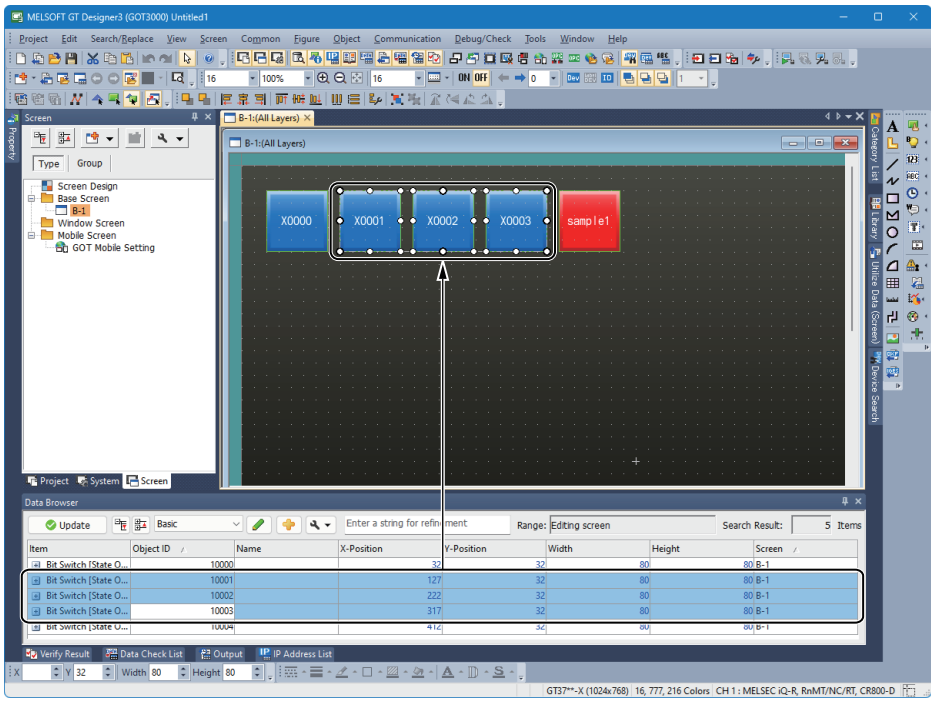
- Ctrl + Click

Selects or deselects a row.

- Shift + ↑, Shift + ↓

Moves the cursor while keeping the row with the cursor selected.

The destination row of the cursor is also selected.



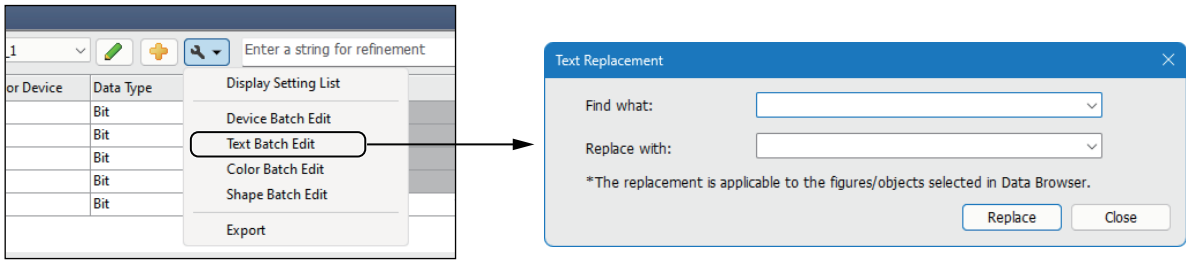
The figures and objects corresponding to the rows selected in the search result list are selected on the screen editor.

2. Click the [Option] button, and select [Device Batch Edit], [Text Batch Edit], [Color Batch Edit], or [Shape Batch Edit] from the pull-down menu.

A dialog appears to prompt the batch change of each setting.

Ex.

Selecting [Text Batch Edit] from the menu



3. Set each item in the displayed dialog and click the [Replace] button to execute the batch change with the configured settings.

- [Device Batch Edit] dialog

☞ Page 155 [Device Batch Edit] dialog

- [Text Replacement] dialog

☞ Page 182 [Text Replacement] dialog

- [Color Batch Edit] dialog

☞ Page 163 [Color Batch Edit] dialog

- [Shape Batch Edit] dialog

☞ Page 165 [Shape Batch Edit] dialog

4. Click the [Close] button to close the batch edit dialog.

5. Click the [Update] button to refresh the contents of the search result list.

■Exporting the data collected in the data browser

1. Click the [Option] button and select [Export] from the pull-down menu.

The [Save As] dialog appears.

2. Set [File name] and [Save as type] and click the [Save] button to export the search result list.

☞ Page 182 Details of the exported file

■Operations not restored by [Undo]

The settings changed by the following operations cannot be restored even [Edit] → [Undo] is selected from the menu.

Before changing the settings, check the contents to be changed.

- Changing the settings with the Text Batch Edit, Device Batch Edit, or Color Batch Edit
- Changing the settings of the figures and objects placed on a screen editor which is not opened
- Changing the common settings or screen settings

■The settings which cannot be edited while the corresponding screen is closed

Some settings (including the settings of X-coordinates, Y-coordinates, and logo texts) cannot be edited while the corresponding screens are closed.

If you change those settings in the [Data Browser] window, open a screen on which the figures and objects to be edited are placed.

■Projects protected with project security

When editing the project is prohibited, the settings cannot be changed in the [Data Browser] window.

The settings for display-disabled screens and scripts are not displayed in the [Data Browser] window.

Although the settings for edit-disabled screens and scripts are displayed in the [Data Browser] window, the settings cannot be changed and deleted.

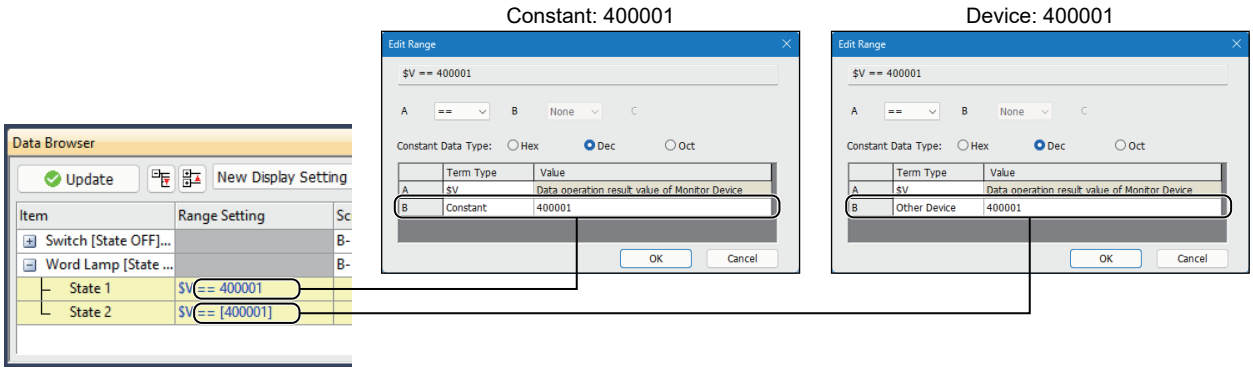
■Editing of [Range Setting] and [Input Range Setting]

When you directly enter a device name for [Range Setting] or [Input Range Setting] with numbers only, enclose the numbers in square brackets.

If not, the device will not be recognized as a device.

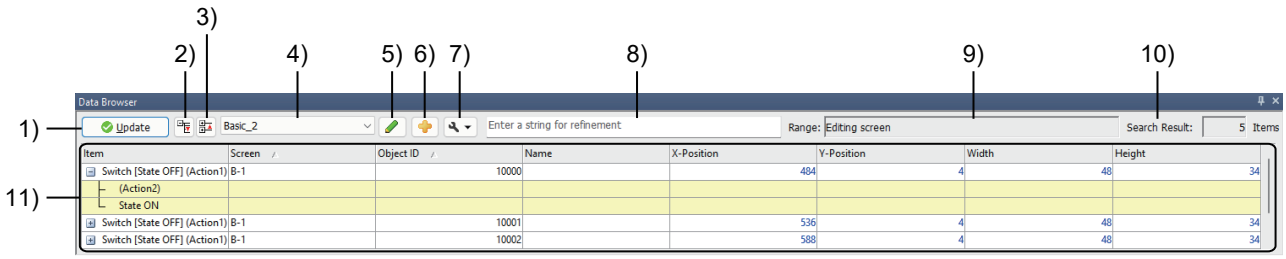
Ex.

Specifying the device [400001] of the MODBUS equipment for [Range Setting]



[Data Browser] window

GT37 SoftGOT3000



Item			Description
1)	[Update] button		Updates the search result list. The display of the [Update] button differs depending on the status of the search result list. When the search result list is not in the latest condition  When the search result list is in the latest condition
2)	[Unfold All] button		Expands all the trees in the [Type] column.
3)	[Fold All] button		Collapses all the trees in the [Type] column.
4)	Preset for display settings		Selecting a registered preset from the pull-down menu changes the items and ranges displayed in the result list. You can add presets to the preregistered presets [Basic], [Device], [Text], [Color], and [Screen]. ☞ Page 169 Changing the items and ranges to be displayed in the data browser (registering a preset) For information on the settings of presets registered as initial settings, refer to the following. ☞ Page 176 Presets registered as initial settings

■Operations for the list display

The following table shows how to operate the search result list in the [Data Browser] window with the mouse or keyboard.

Operation	Action
↑ ↓ → ←	Moves the cursor.
Shift + ↑ ↓ → ←	Moves the cursor while keeping the cell with the cursor selected. The cell to which the cursor is moved is also selected.
+ (Numeric keypad)	Expands the row under the cursor.
- (Numeric keypad)	Collapses the row under the cursor.
Shift + + (Numeric keypad) Shift + , (comma)	Expands the tree.
Shift + - (Numeric keypad) Shift + . (Period)	Collapses the tree.
Home	Moves the cursor to the cell in the top row.
End	Moves the cursor to the cell in the bottom row.
PgUp	Moves the cursor from the cell with the cursor to the corresponding cell up one page.
PgDown	Moves the cursor from the cell with the cursor to the corresponding cell down one page.
Shift + Home	Selects the cells from the cell with the cursor to the cell in the top row.
Shift + End	Selects the cells from the cell with the cursor to the cell in the bottom row.
Shift + PgUp	Selects the cells from the cell with the cursor to the corresponding cell up one page.
Shift + PgDown	Selects the cells from the cell with the cursor to the corresponding cell down one page.
Shift + Click	Selects the cells from the cell with the cursor to the cell where the mouse is clicked.
Ctrl + Space Ctrl + Click	Selects or deselects a row.
Tab	Moves the cursor to the right cell.
Shift + Tab	Moves the cursor to the left cell.
Enter	Moves the cursor down one row.
Alt + Enter F3	Displays the setting dialog for the figure or object corresponding to the row with the cursor.
Ctrl + C	Copies the figure or object corresponding to the row selected with the cursor when a cell in the [Type] column is selected. When multiple cells are selected, only the figures and objects placed on the same screen editor are copied. Copies the setting value in the cell selected with the cursor when a cell in a column other than the [Type] column is selected. When multiple cells are selected, the setting values of all the selected cells are copied.
Ctrl + X	Cuts the figure or object corresponding to the row with the cursor.
Ctrl + V	Pastes the copied figure or object to the screen editor when a cell in the [Type] column is copied. Pastes the text into the cell selected with the cursor when a cell in a column other than the [Type] column is copied. The value which is out of the setting range cannot be pasted.
Ctrl + D	Pastes a copy of the figure or object corresponding to the row with the cursor on the screen editor.
Ctrl + A	Selects all the figures and objects placed on the screen editor displayed at the topmost position.
Ctrl + U	Cancels the grouping of the figures and objects corresponding to the rows with the cursor.
Delete	Clears the value of the cell with the cursor only when the cell allows direct editing. Clearing the items for which numerical values are set makes the setting values to zero.
Back space	Enables editing of the cell with the cursor. Clears the setting value and enables editing when the cell allows direct editing. ☞ Page 178 Operations when a cell is edited
Character keys	Enables editing when the cell with the cursor allows direct editing. ☞ Page 178 Operations when a cell is edited
F2	Enables editing of the cell with the cursor. You can edit only the cells whose text color is blue. ☞ Page 178 Operations when a cell is edited
Double click	Enables editing of the cells whose text color is blue. For the other cells, the setting dialog for the figure or object corresponding to the cell is displayed. ☞ Page 178 Operations when a cell is edited
Drag	Selects multiple cells.

■Operations when a cell is edited

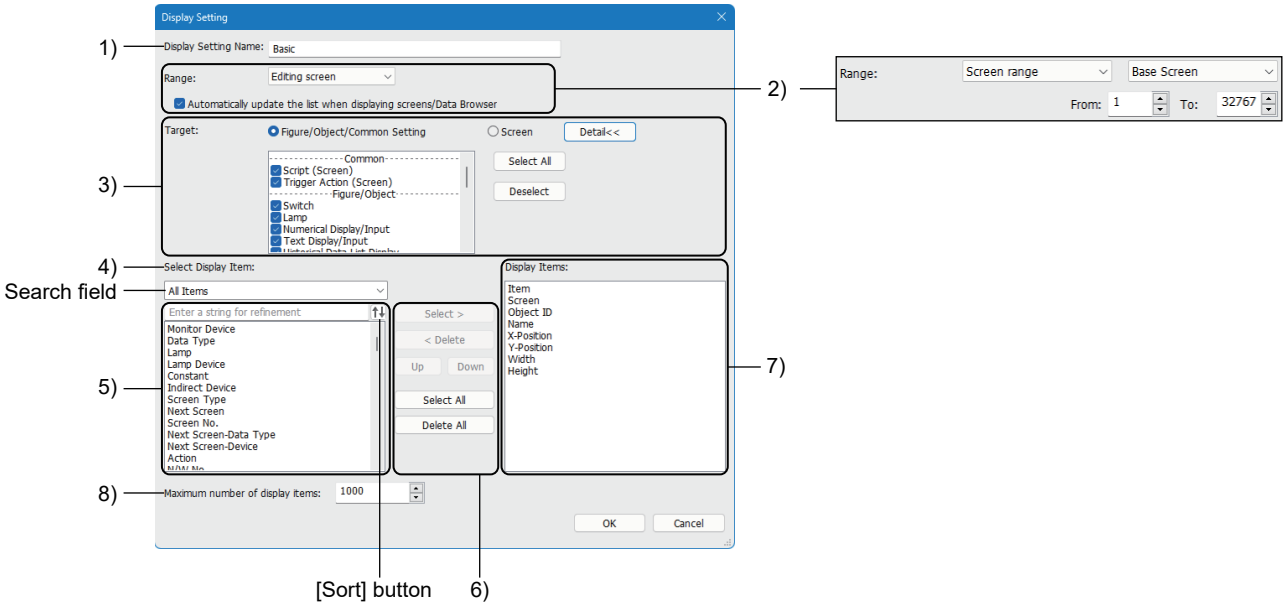
The following table shows the keyboard operation for when a cell in the search result list is edited.

Operation	Action
Enter	Confirms and ends the edit.
Esc	Discards and ends the edit.
Tab	Confirms the edit and moves the cursor to the right cell.
Shift + Tab	Confirms the edit and moves the cursor to the left cell.
Alt + Enter	Inserts a line feed when text is input.

[Display Setting] dialog

GT37 SoftGOT3000

Configure the settings to narrow down the items and ranges to be displayed in the search result list in the [Data Browser] window.



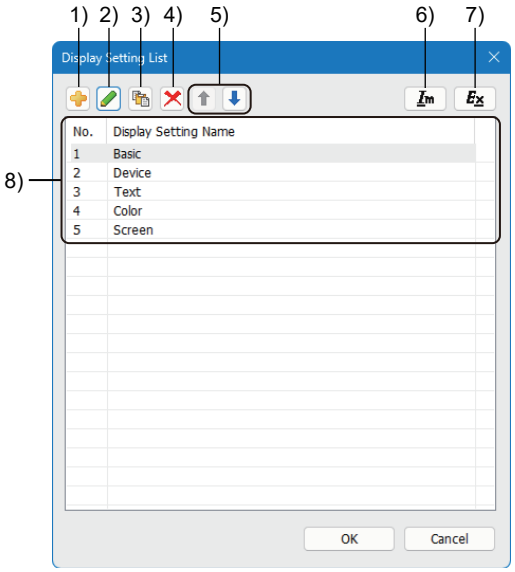
Item			Description
1)	[Display Setting Name]		Set a name used to narrow down the items and ranges to be displayed in the search result list in the [Data Browser] window. Up to 100 characters can be set. The set name is added to the preset for display settings in the [Data Browser] window.
2)	[Range]	—	Selects the range to be displayed in the [Data Browser] window. The following shows selectable items.
		[All screens]	Displays the settings included in all screens.
		[Editing screen]	Displays the settings included in the screen editor displayed in the foreground. When [Automatically update the list when displaying screens/Data Browser] is selected, the displayed contents in the [Data Browser] window are updated when one of the following operations is performed. • Displaying or switching a screen editor • Displaying the hidden [Data Browser] window (auto-hiding function enabled)
		[Screen range]	Displays the settings included in the specified screen.  Select the type of the display target screens. Set the range of displayed screens to [From] and [To] with screen numbers. The setting range is [0] to [32767].
3)	[Target]		Set the display target in the [Data Browser] window. Click the [Detail >>] button to display details of the display target. Select the settings to be displayed.
4)	[Select Display Item]		Narrow down the items listed in the display item options.
5)	Display item options		Options of the items displayed in the search result list Select an item and click the [Select] button to move the item to [Display Items]. To narrow down the list, enter a string in the search field. To sort the list in ascending or descending order, click the [Sort] button.

Item			Description
6)	Operation buttons	[Select] button	Moves the item selected in the display item options to [Display Items].
		[Delete] button	Moves the item selected in [Display Items] to the display item options.
		[Up] button, [Down] button	Move the item selected in [Display Items] up or down.
		[Select All] button	Moves all the items in the display item options to [Display Items].
		[Delete All] button	Moves all the items other than [Type] in [Display Items] to the display item options.
7)	[Display Items]		Items to be displayed in the search result list Select an item and click the [Delete] button to move the item to the display item options. The items in the search result list are displayed in the order set for [Display Items].  Select an item and click the [Up] or [Down] button to move the item up or down.
8)	[Maximum number of display items]		Sets the maximum number of data to be displayed in the search result list. The setting range is [1] to [10000].

[Display Setting List] dialog

GT37 SoftGOT3000

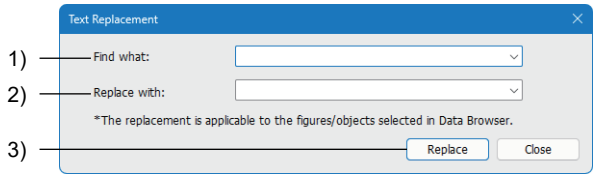
Manage the presets created in the [Display Setting] dialog.



Item		Description
1)	[Add] button	Create a new preset in the [Display Setting] dialog. Up to 32 presets can be created. ☞ Page 179 [Display Setting] dialog
2)	[Edit] button	Edit a preset in the [Display Setting] dialog. ☞ Page 179 [Display Setting] dialog
3)	[Duplicate] button	Duplicate the selected preset in the bottom of the list.
4)	[Delete] button	Deletes the selected preset.
5)	[Up] button [Down] button	Move the selected preset up or down.
6)	[Im] button	Import the preset list. The imported preset list replaces the current preset list. The file format of importable files is the format (*.gtdbr) of the file that lists the display settings in the data browser.
7)	[Ex] button	Export the preset list. The file format of exportable files is the format (*.gtdbr) of the file that lists the display settings in the data browser.
8)	Preset list	Lists the registered presets.

[Text Replacement] dialog

GT37 SoftGOT3000



Item		Description
1)	[Find what]	Set a text before the replacement. Up to 512 characters can be set. The characters are case-sensitive.
2)	[Replace with]	Set a text after the replacement. Up to 512 characters can be set. The characters are case-sensitive.
3)	[Replace] button	The text set in [Find what] is replaced with the text set in [Replace with].

3)	Item	Item set in the [Display Item Setting]

5.5.6 Checking the IP addresses in the list (IP address list)

The IP addresses registered in the project are displayed in the list.

You can narrow your search, or jump to an IP address setting window.

☞ Page 183 IP addresses to be displayed
☞ Page 184 How to use the IP address list
☞ Page 186 [IP Address List] window
☞ Page 187 [Display Item Setting] dialog (IP address list)

IP addresses to be displayed

The IP addresses are displayed in the IP address list depending on the settings as shown below.

Display target setting			Remarks
[GOT Setup] window	[Adjust] tab of [Time Setting]		—
	[VPN Connection]		—
	[Web Browser]	[HTTPS Server]	—
		[HTTP Server]	—
[GOT Ethernet Setting] window	[GOT IP Address Setting]	[Port 1] tab	—
		[Port 2] tab	—
	[GOT Ethernet Common Setting]	[Preferred Server]	These items are displayed when either [Preferred Server] or [Alternate Server] is set to a value other than [0.0.0.0].
		[Alternate Server]	
[Controller Setting] window	Channel settings (CH1 to CH4)	IP address of the device registered in [Connected Ethernet Controller Setting]	—
		[IP Address] of [Detail Setting]	This item is displayed when the communication driver is [CC-Link IE TSN].
	[Gateway Client]		—
	[Mail Send]	[SMTP Server]	—
		[POP3 Server]	—
	[File Transfer]	[Destination FTP Server Setting]	—
[Digital Image Input/Recording] dialog	[Ethernet] tab	[IP Address] in the [Network Camera List] dialog (CH1 to CH4)	—
[GOT Network Interaction] dialog	[IP Address]		—
[OPC UA Server Setting] dialog	[Communication Setting] tab		This item is displayed when [Port No.] is included in the items displayed in the [IP Address List] window. Only the port number is displayed in the [IP Address List] window.
[Communication Setting] dialog	[IP Address] for [PLC side I/F]		—

How to use the IP address list

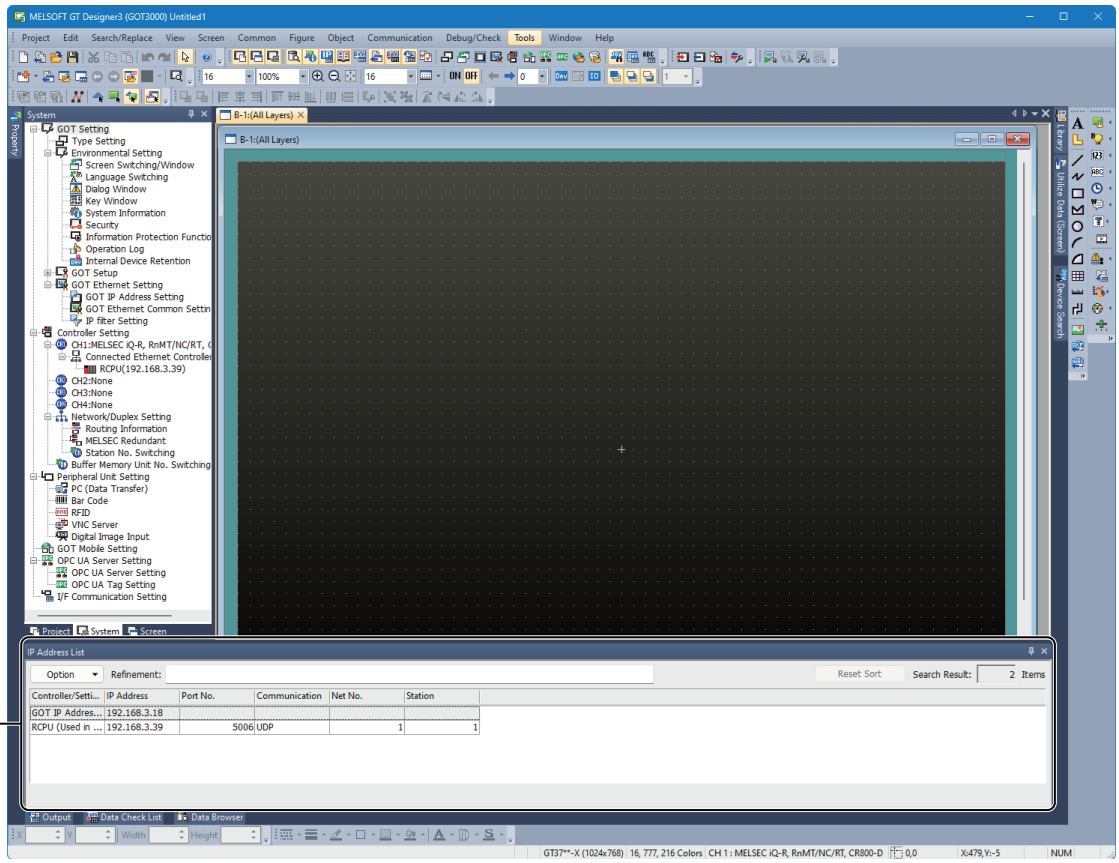
☞ Page 184 Displaying the IP addresses registered in a project
☞ Page 185 Changing the items to be displayed in the IP address list
☞ Page 185 Changing an IP address displayed in the IP address list
☞ Page 185 Exporting the search results displayed in the IP address list

■Displaying the IP addresses registered in a project

Perform one of the following operations to display the [IP Address List] window.

- Select [Search/Replace] → [IP Address List] from the menu.
- Select [View] → [Docking Window] → [IP Address List] from the menu.
- Click the [IP Address List] button on the toolbar.

☞ Page 186 [IP Address List] window

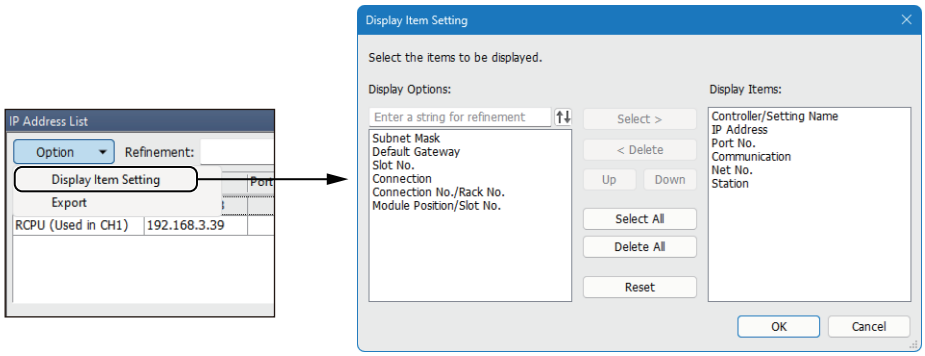


The search result list in the [IP Address List] window displays the search results according to the items selected for display.
For selecting the items to be displayed, refer to the following.

☞ Page 185 Changing the items to be displayed in the IP address list

■Changing the items to be displayed in the IP address list

1. Click the [Option] button in the [IP Address List] window and select [Display Item Setting] from the pull-down menu to display the [Display Item Setting] dialog.



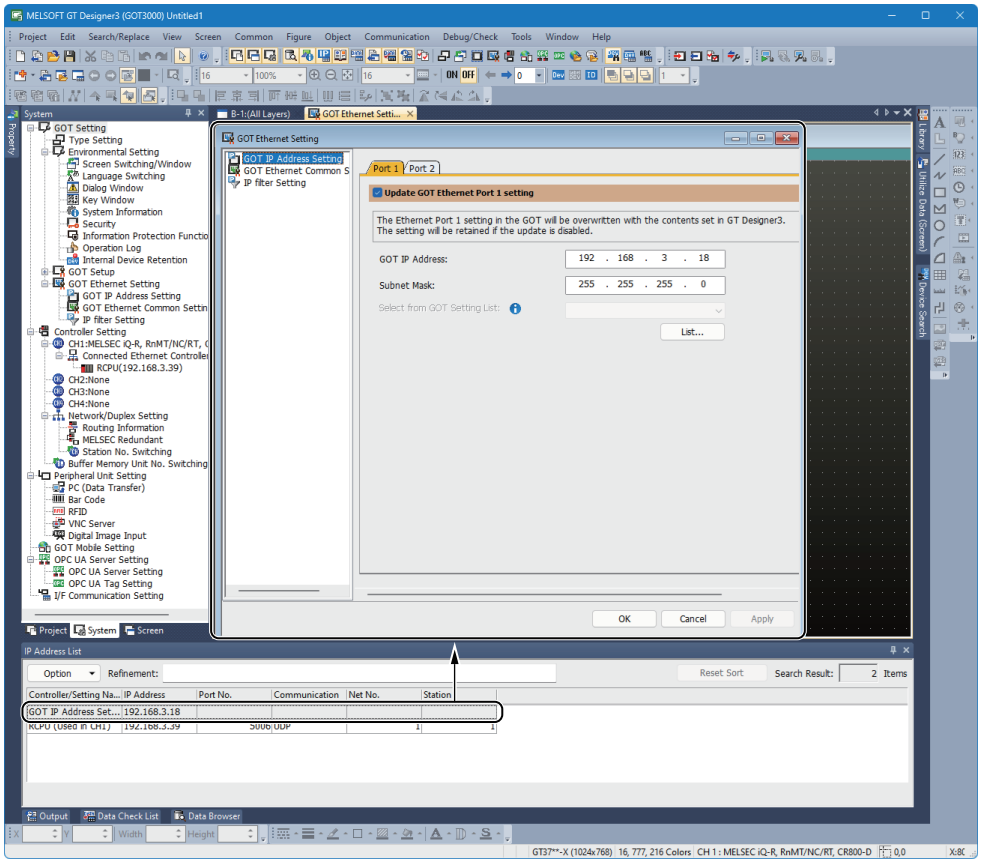
2. Select the items to be displayed in the [IP Address List] window, and specify their display order.

For details on the operation buttons, refer to the following.

☞ Page 187 [Display Item Setting] dialog (IP address list)

■Changing an IP address displayed in the IP address list

1. Double-click the row of the IP address to be changed in the search result list in the [IP Address List] window to display its setting window.



2. Edit the setting and click the [OK] button to apply the new setting.

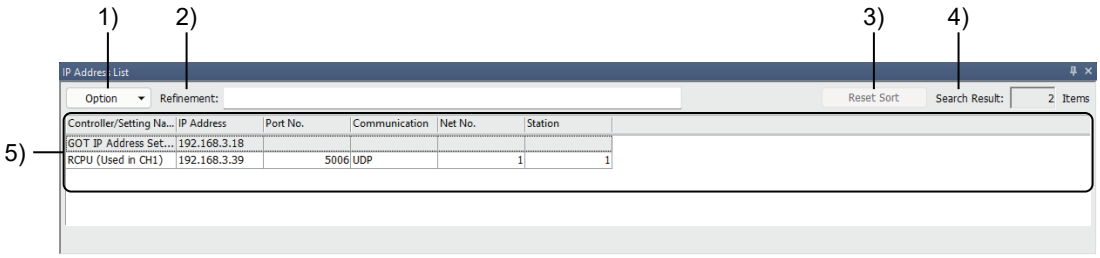
■Exporting the search results displayed in the IP address list

1. Click the [Option] button and select [Export] from the pull-down menu to display the [Save As] dialog.

2. Set [File name] and [Save as type] and click the [Save] button to export the search result list.

[IP Address List] window

GT37 SoftGOT3000



Item			Description
1)	[Option] button	—	Select a setting item from the pull-down menu.
		[Display Item Setting]	Displays the [Display Item Setting] dialog. Select the items to be displayed in the search result list. ☞ Page 187 [Display Item Setting] dialog (IP address list)
		[Export]	Saves the search result list as a CSV file or a Unicode text file. Set [File name] and [Save as type] in the displayed dialog and click the [Save] button to export the search result list. When the IP address is duplicated in a project, a symbol indicating duplication is output to the right of the IP address.
2)	[Refinement]		Narrows the displayed contents of the search result list by keywords. Up to 128 characters can be set. To narrow the contents using multiple keywords, separate each keyword with one-byte spaces.
3)	[Reset Sort]		Changes the sorting order of [Controller/Setting Name] to the order of GT Designer3 menus.
4)	[Search Result]		Displays the number of the items displayed in the search result list.
5)	Search result list		Displays the search result. Click an item name to enable sorting. If the IP address is duplicated in a project, the target cell turns yellow and a symbol indicating duplication appears to the right of the IP address. Display when duplication occurs  However, if the IP address is duplicated with one that is not included as a target in the IP address list, the IP address is not displayed as described above. ☞ Page 183 IP addresses to be displayed

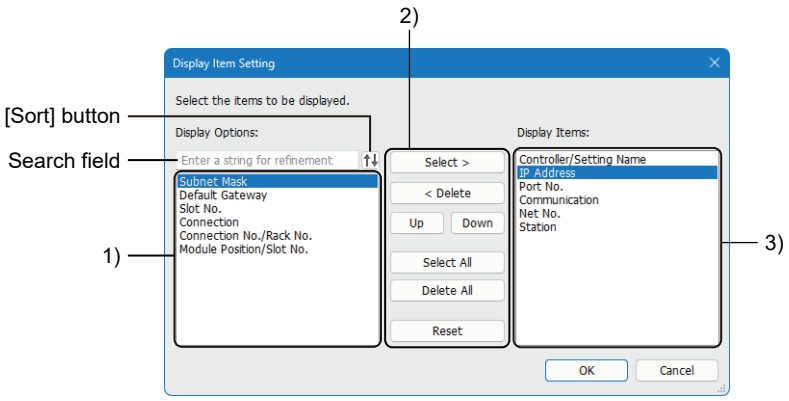
■Mouse and keyboard operations

The following shows the mouse and keyboard operations for the search result list in the [IP Address List] window.

Operation	Action
↑ ↓ → ←	Moves the cursor.
Home	Moves the cursor to the cell in the top row.
End	Moves the cursor to the cell in the bottom row.
PgUp	Moves the cursor from the cell with the cursor to the corresponding cell up one page.
PgDown	Moves the cursor from the cell with the cursor to the corresponding cell down one page.
Enter	Moves the cursor down one row.
Ctrl + Space	Selects or deselects a row.
Double click	Displays the setting window corresponding to the row with the cursor.
Alt + Enter	
F3	

■[Display Item Setting] dialog (IP address list)

GT37 SoftGOT3000



Item			Description
1)	[Display Options]		Options of the items displayed in the search result list Select an item and click the [Select] button to move the item to [Display Items]. To narrow down the list, enter a string in the search field. To sort the list in ascending or descending order, click the [Sort] button.
2)	Operation buttons	[Select] button	Moves the item selected in [Display Options] to [Display Items].
		[Delete] button	Moves the item selected in [Display Items] to [Display Options].
		[Up] button [Down] button	Move the item selected in [Display Items] up or down.
		[Select All] button	Moves all the items in [Display Options] to [Display Items].
		[Delete All] button	Moves all the items other than [Controller/Setting Name] in [Display Items] to [Display Options].
		[Reset] button	Restores the items in [Display Items] to the default ones.
3)	[Display Items]		Items to be displayed in the search result list If any item is selected and the [Delete] button is clicked, the selected item is moved to [Display Options]. The items in the search result list are displayed in the order set for [Display Items].  Select an item and click the [Up] or [Down] button to move the item up or down.

PART 3

5.6 Customizing GT Designer3

GT37 SoftGOT3000

☞ Page 188 Customizing the toolbar
☞ Page 194 Customizing a docking window
☞ Page 197 Customizing the operation
☞ Page 199 Customizing the settings related to editing operations
☞ Page 201 Customizing the display
☞ Page 203 Customizing the default value

5.6.1 Customizing the toolbar

The position of the toolbars for GT Designer3 can be changed and a toolbar can be created in collecting frequently used functions.

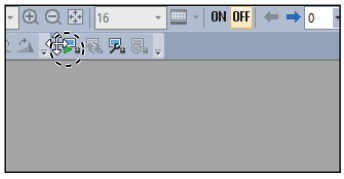
☞ Page 188 Changing the position of toolbars
☞ Page 189 Adding/deleting buttons to/from a toolbar
☞ Page 190 Resetting toolbars
☞ Page 190 Creating a toolbar
☞ Page 191 Deleting a toolbar
☞ Page 192 [Customize] dialog

For details on toolbar types and the method of switching between displaying and hiding toolbars, refer to the following.

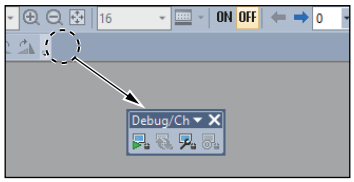
☞ Page 104 Toolbars and shortcut keys

Changing the position of toolbars

1. When the mouse cursor is moved over the left end of the toolbar to move, the shape of the mouse cursor changes as shown below.



2. Drag the toolbar to the destination while holding it clicked. The toolbar moves.



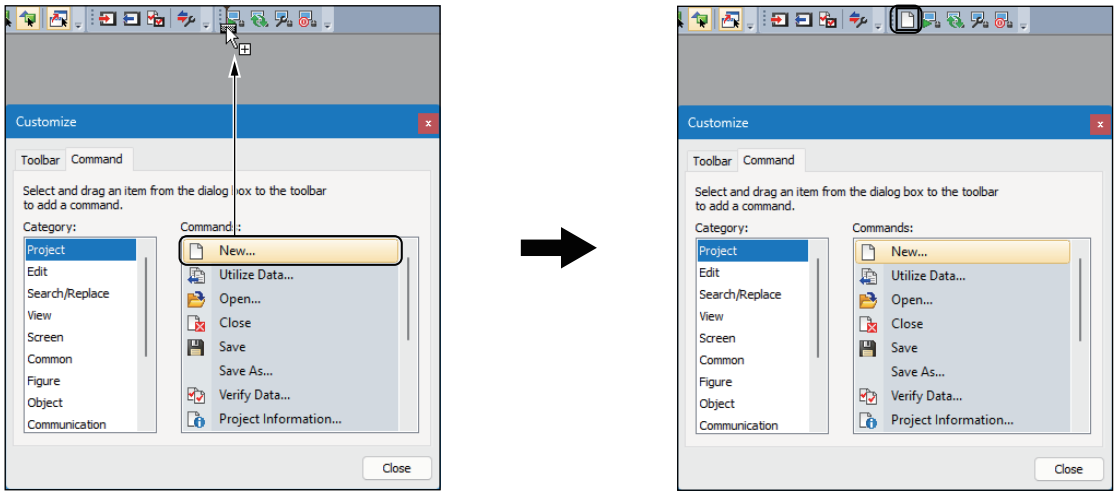
Adding/deleting buttons to/from a toolbar

☞ Page 189 Adding buttons
☞ Page 189 Deleting buttons

■Adding buttons

1. Select [Tools] → [Customize] from the menu to display the [Customize] dialog.
2. Select [Category] in the [Command] tab and drag the command to add from [Command] to the toolbar to which the corresponding button is added.

The button corresponding to the dragged command is added.



☞ Page 193 [Command] tab

3. When completed, close the [Customize] dialog.

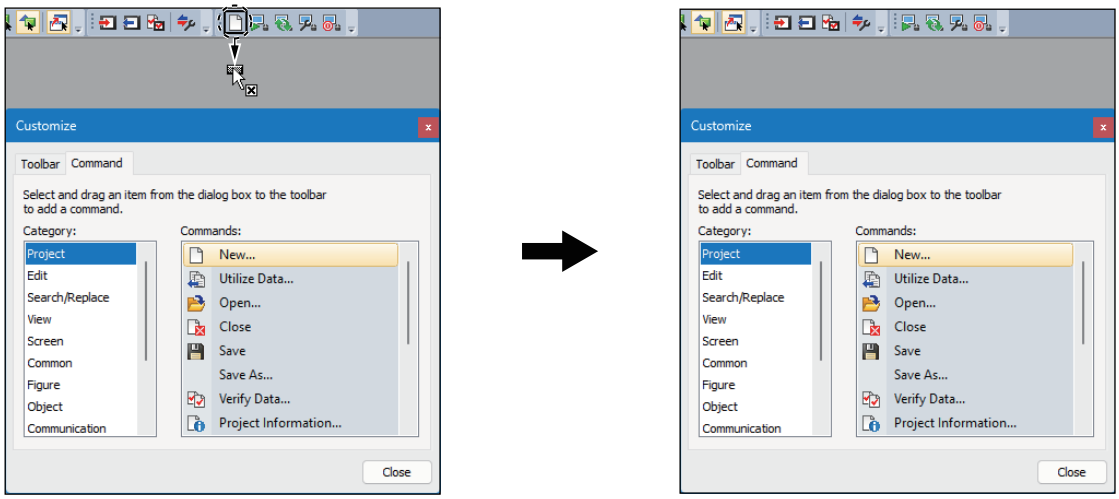
Changes made to the default toolbars can be reset in the [Toolbar] tab.

☞ Page 192 [Toolbar] tab

■Deleting buttons

1. Select [Tools] → [Customize] from the menu to display the [Customize] dialog.
2. While the [Customize] dialog is displayed, drag out of the toolbar the button to delete from the toolbar.

The dragged button is deleted.

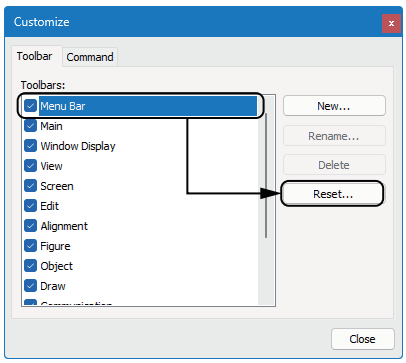


3. When completed, close the [Customize] dialog.

Resetting toolbars

1. Select [Tools] → [Customize] from the menu to display the [Customize] dialog.
2. Select the toolbar to reset in the [Toolbar] tab and click the [Reset] button to reset the toolbar.

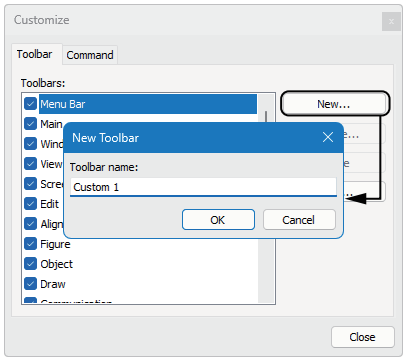
Only the default toolbars can be reset.



3. When completed, close the [Customize] dialog.

Creating a toolbar

1. Select [Tools] → [Customize] from the menu to display the [Customize] dialog.
2. Click the [New] button in the [Toolbar] tab to display the [New Toolbar] dialog.



3. Set [Toolbar name] and click the [OK] button to create a new toolbar.

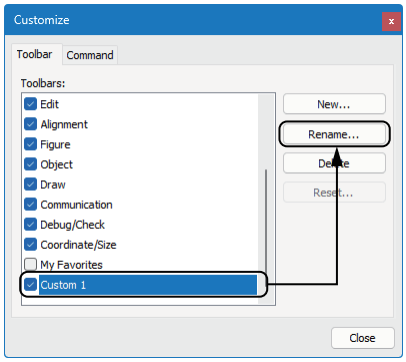
Add buttons in the [Command] tab.

☞ Page 189 Adding buttons

Deleting a toolbar

The following describes how to delete a user-created toolbar.

1. Select [Tools] → [Customize] from the menu to display the [Customize] dialog.
2. Select an intended toolbar in the [Toolbar] tab, and click the [Delete] button to delete the toolbar.



3. When completed, close the [Customize] dialog.

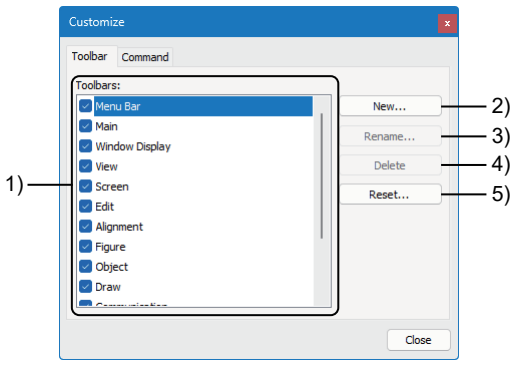
[Customize] dialog

GT37 SoftGOT3000

☞ Page 192 [Toolbar] tab
☞ Page 193 [Command] tab

■[Toolbar] tab

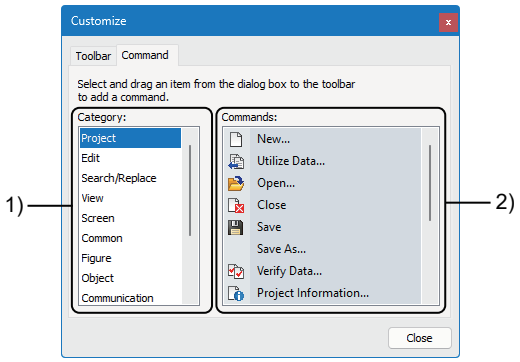
GT37 SoftGOT3000



Item		Description
1)	[Toolbars]	Lists the toolbars. Switches between displaying and hiding each toolbar.
2)	[New] button	Displays the [New Toolbar] dialog. Creates a new toolbar.  Set a name for the toolbar to be created for [Toolbar name]. Up to 255 characters can be entered.
3)	[Rename] button	Displays the [Rename Toolbar] dialog. Rename the toolbar selected in [Toolbars]. The default toolbars cannot be renamed.  Set a new name for [Toolbar name]. Up to 255 characters can be entered.
4)	[Delete] button	Deletes the toolbar selected in the [Toolbars]. The default toolbars cannot be deleted.
5)	[Reset] button	Resets the contents of the toolbar selected in [Toolbars] to the initial status. Only the default toolbars can be reset.

■[Command] tab

GT37 SoftGOT3000



Item		Description
1)	[Category]	Lists the categories of commands. Switches the contents displayed in [Commands].
2)	[Commands]	Display the commands to add to the toolbars. Drag a command to a toolbar to add a button in the toolbar.

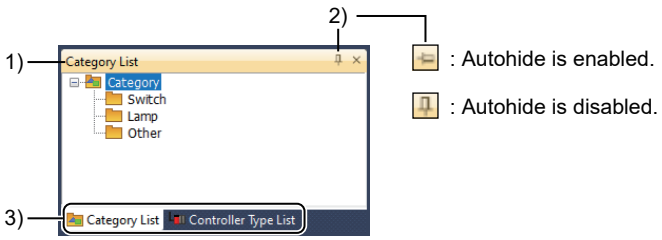
5.6.2 Customizing a docking window

You can reposition a docking window or combine multiple docking windows into a single window.
Docking windows can be displayed or hidden as required.
Customized docking windows are saved and retained for the next startup.
☞ Page 194 Screen layout of the docking windows
☞ Page 195 Changing the position of docking windows
For details on docking window types, and the method of switching between displaying and hiding the docking windows, refer to the following.
☞ Page 91 Screen layout
☞ Page 104 Toolbars and shortcut keys

Screen layout of the docking windows

The following shows the screen layout common to the docking windows.

Ex.
[Category List] window



Item		Description
1)	Title bar	Displays the title of the docking window. Drag this bar to display the docking guide on the screen. ☞ Page 195 Docking
2)	Autohide button	The contents of the docking window are displayed only when the mouse cursor is moved over the title bar of the docking window. 3)	Docking tabs	Switches docking windows. The tabs are displayed when docking windows are docked. To extract a docking window from the dock window, drag the corresponding tab out of the dock window.

Changing the position of docking windows

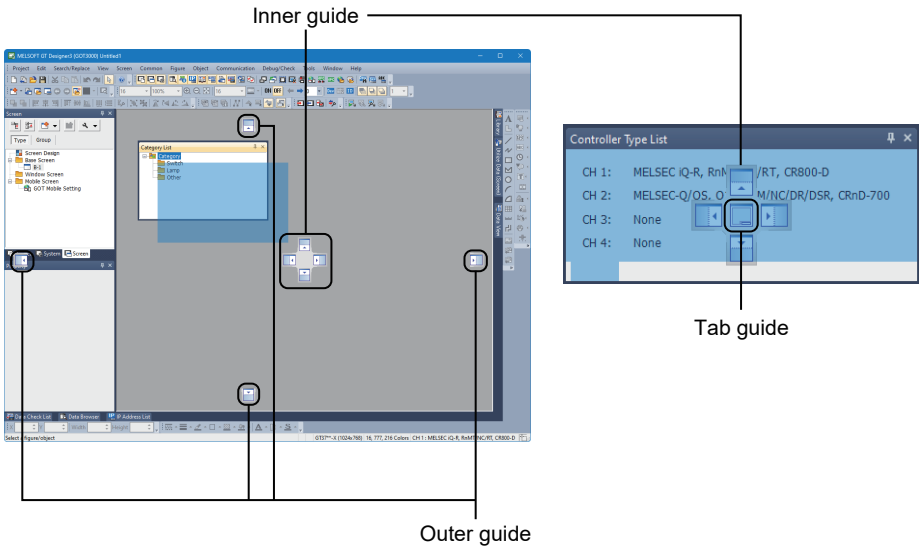
☞ Page 195 Docking
☞ Page 196 Extracting docking windows from a dock window

■Docking

Ex.

Docking the [Category List] window with the main screen

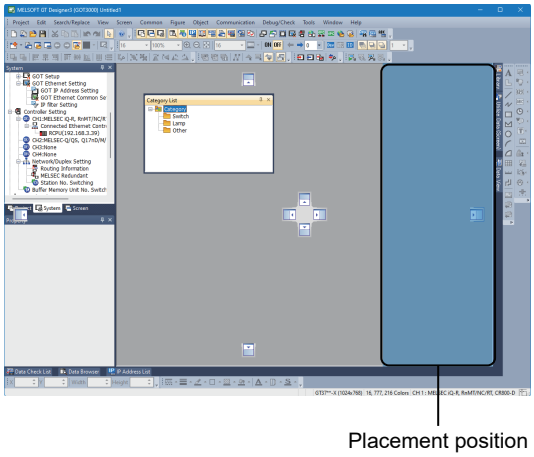
1. Drag the title bar of the docking window to dock over the main screen to display the docking guides.



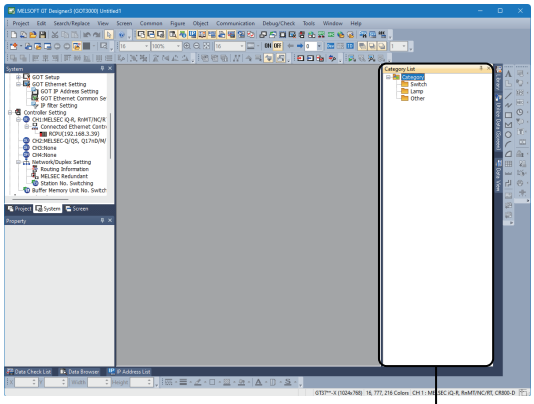
The following shows the types of the docking guides.

Type	Description
Inner guide (Right/Left/Up/Down)	Docks the window in a position nearer to the center than where the other docking windows have been already docked.
Tab guide	Appears in the center of the inner guide when the docking window is dragged over another docking window. Docks the docking window with another docking window.
Outer guide (Right/Left/Up/Down)	Docks the window in a position farther from the center than where the other docking windows have been already docked.

2. Move the mouse cursor over a docking guide while dragging the docking window over to display the indication of the position where the docking window is placed when it is docked.



3. Drop the window while the mouse cursor is on the docking guide to dock the docking window.

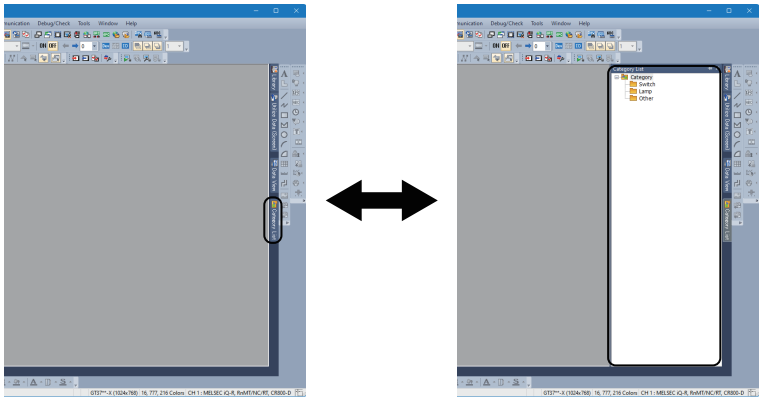


A docking window has been docked.

4. Enable autohide with the autohide button to display the tab of the docking window.

☞ Page 194 Screen layout of the docking windows

Place the mouse cursor over the tab to display the docking window.



To change the size of the docking window, place the mouse cursor over and drag the docking window frame.

■Extracting docking windows from a dock window

1. Disable autohide of the docking window with the autohide button.

☞ Page 194 Screen layout of the docking windows

2. Drag the corresponding tab or the title bar out of the dock window to extract the docking window from the dock window.

Double-clicking the title bar or the tab also extracts the window.

5.6.3 Customizing the operation

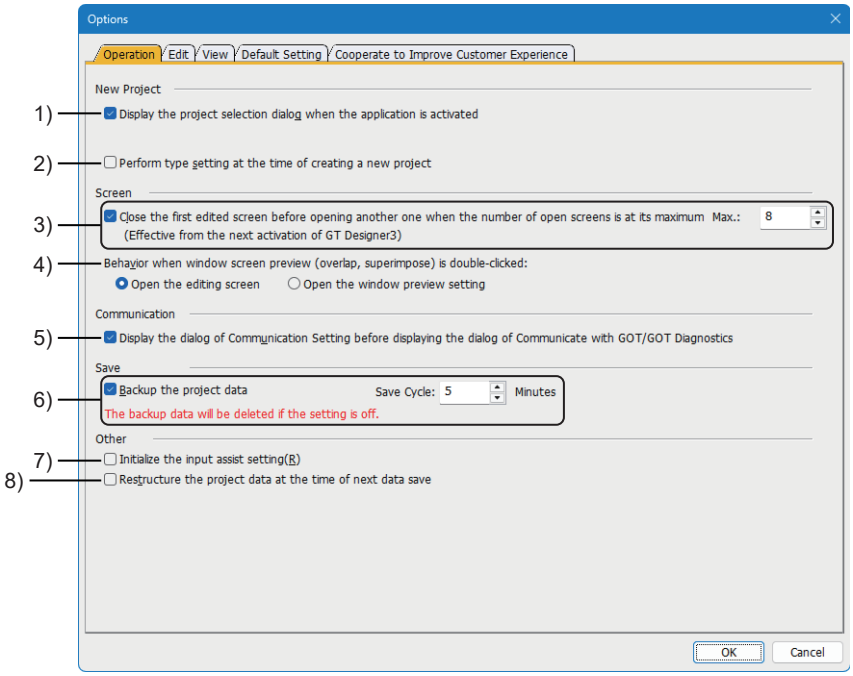
You can customize settings related to the operations of GT Designer3.

1. Select [Tools] → [Option] from the menu to display the [Options] dialog.
2. Change the settings of the [Operation] tab and click the [OK] button to get the settings reflected.

☞ Page 197 [Options] dialog ([Operation] tab)

[Options] dialog ([Operation] tab)

GT37 SoftGOT3000



Item			Description
1)	[Display the project selection dialog when the application is activated]		Displays the [Select Project] dialog at the startup of GT Designer3. ☞ Page 86 Starting GT Designer3
2)	[Perform type setting at the time of creating a new project]		Displays the [Type Setting] dialog when a project is created.
3)	[Close the first edited screen before opening another one when the number of open screens is at its maximum]	—	Closes the first-opened screen when a new editor is opened after the number of screen editors being opened reaches its maximum. The setting is enabled at the next start-up of GT Designer3.
		[Max]	Set the maximum number of screens which can be opened. The setting range is [1] to [25].
4)	[Behavior when window screen preview (overlap, superimpose) is double-clicked]		Select the behavior when the window position object for an overlap window or superimpose window is doubled-clicked on the base screen. If a window screen preview is not displayed for the placed window position object, double-clicking the object displays the [Window Preview] dialog regardless of what is selected. The [Window Preview] dialog is displayed by one of the following operations as well. • Select [Display] → [Window Preview] → [Setting] from the menu. • Right-click a window position object on a base screen, and select [Setting]. • Select a window position object on a base screen, and press the Alt + Enter keys simultaneously.
5)	[Display the dialog of Communication Setting before displaying the dialog of Communicate with GOT/GOT Diagnostics]		Displays the [Communication Setting] dialog before displaying the [Communicate with GOT] dialog or the [GOT Diagnostics] dialog.

Item			Description
6)	[Backup the project data]	—	Saves the backup data of the current project automatically. The following projects are saved automatically. • A project which has never been saved • Project data (*.GTY) • Package data (*.GTYS) • GT SoftGOT3000 execution file (*.GTYP) If GT Designer3 unexpectedly exits while a project is being edited, the project can be restored from the backup data at the next startup of the software.
		[Save Cycle]	Set a time interval to save the backup data of a project automatically. The setting range is [5] minutes to [720] minutes. If GT Designer3 unexpectedly exits before the first backup data is generated, the project is not restored at the next startup of the software.
7)	[Initialize the input assist setting]		Select this item and click the [OK] button to reset the settings in the [Input Assist Setting] dialog to their defaults. After the settings are reset to their defaults, [Initialize the input assist setting] is automatically deselected.
8)	[Restructure the project data at the time of next data save]		Deletes unnecessary data from a project to reduce the project size when the project is saved. After the project is saved, this item is automatically deselected. Therefore, this setting is not maintained after the project is saved. When restructuring the project, note the following. • The verification results of the project before and after a restructuring may have inconsistencies. • If the personal computer, which the project is saved and restructured in, does not have Windows fonts used in the project, each Windows font is changed to the default font of each object. • When the restructured project is written to the GOT again, all the screen data are rewritten.

5.6.4 Customizing the settings related to editing operations

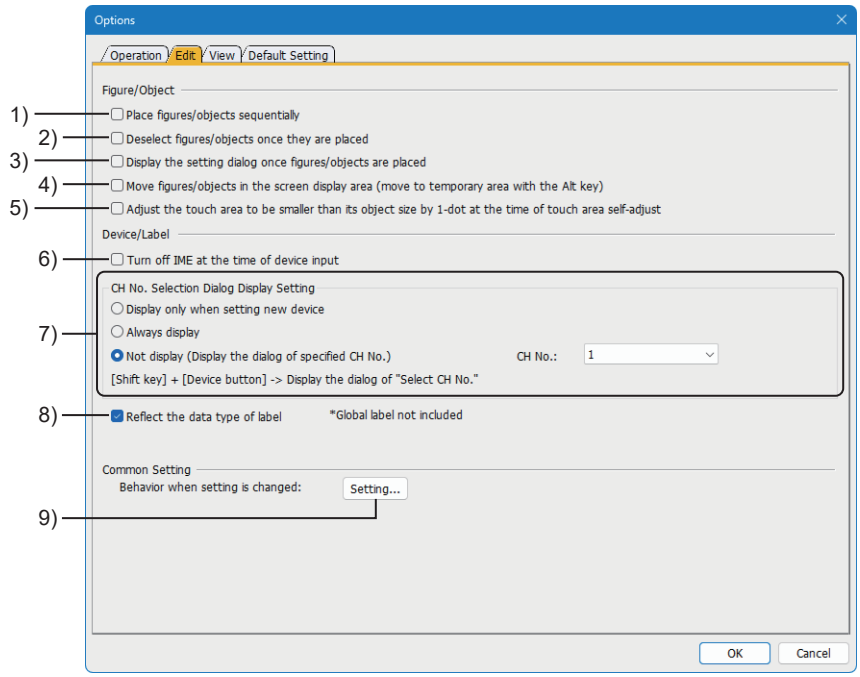
Customize the settings related to editing operations on GT Designer3.

1. Select [Tools] → [Option] from the menu to display the [Options] dialog.
2. Customize the settings on the [Edit] tab and click the [OK] button to apply changes.

☞ Page 199 [Options] dialog ([Edit] tab)

[Options] dialog ([Edit] tab)

GT37 SoftGOT3000

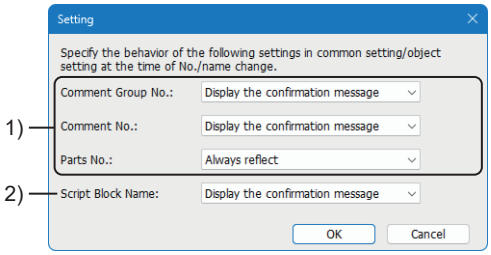


Item		Description
1)	[Place figures/objects sequentially]	Retains the control of the arrangement mode after a figure or an object is placed. The same figure or object can be placed repeatedly without selecting it from the menu. Right-click or press the Esc key to cancel placement mode.
2)	[Deselect figures/objects once they are placed]	Deselects figures and objects after they are placed.
3)	[Display the setting dialog once figures/objects are placed]	Displays the setting dialog automatically every time a figure or an object is placed.
4)	[Move figures/objects in the screen display area (move to temporary area with the Alt key)]	Limits the area where figures and objects can be placed to the screen display area on the screen editor. You can also place a figure or object in the temporary area by holding down the Alt key while manipulating it.
5)	[Adjust the touch area to be smaller than its object size by 1-dot at the time of touch area self-adjust]	Reduces the touch area to be inside the object area at the time of the touch area self-adjustment. The edge of the touch area becomes 1 dot away from the edge of the object area. For the touch area self-adjustment, refer to the following. ☞ Page 1030 Adjusting the touch area of an object (size, position)
6)	[Turn off IME at the time of device input]	Switches keyboard input to one-byte character input to specify a device.

Item			Description
7)	[CH No. Selection Dialog Display Setting]	—	Select whether to display or hide the [Select CH No.] dialog at the device setting. The [Select CH No.] dialog is displayed when two or more channels are set. ☞ Page 835 Setting a device in the device setting dialog The following shows selectable items. • [Display only when setting new device] Displays the [Select CH No.] dialog only when a device is newly set. • [Always display] Always displays the [Select CH No.] dialog at the device setting. • [Not display (Display the dialog of specified CH No.)] Does not display the [Select CH No.] dialog at the device setting. Displays the device setting dialog of the channel set for [CH No.].
		[CH No.]	Set these items when [Not display (Display the dialog of specified CH No.)] is selected. The following shows selectable items. • [Label (GT Designer3)]: Displays the [Select Label (GT Designer3)] dialog. • [Global Label]: Displays the [Select Global Label] dialog. • [1], [2], [3], [4]: Displays the device setting dialog of a set channel. • [Latest]: Displays the device setting dialog of the same channel as that of the latest device setting.
8)	[Reflect the data type of label]		Applies the data type of the label to the data type of objects and others when a label (GT Designer3) is set to the devices of objects and others.
9)	[Setting] button		Displays the [Setting] dialog. Select whether to reflect a number change to the related common settings and object settings. ☞ Page 200 [Setting] dialog (for customizing the settings related to editing operations)

■[Setting] dialog (for customizing the settings related to editing operations)

GT37 SoftGOT3000



Item		Description
1)	[Comment Group No.] [Comment No.] [Parts No.]	If a number is changed for items such as a comment group registered in the project, select whether to reflect the number change to the related common settings or objects. The following shows selectable items. • [Always reflect] Reflects the number change to the related common settings or objects. • [Not reflect] Does not reflect the number change to the related common settings or objects. • [Display the confirmation message] Displays a confirmation dialog with each number change. Select whether to reflect the number change to the related common settings or objects.
2)	[Script Block Name]	If a script block name registered in the project is changed, select whether to reflect the name change to the related project script and screen script. The following shows selectable items. • [Always reflect] Reflects the script block name change to the related project script and screen script. • [Not reflect] Does not reflect the script block name change to the related project script and screen script. • [Display the confirmation message] Displays a confirmation dialog with each name change. Select whether to reflect the script block name change to the related project script and screen script.

5.6.5 Customizing the display

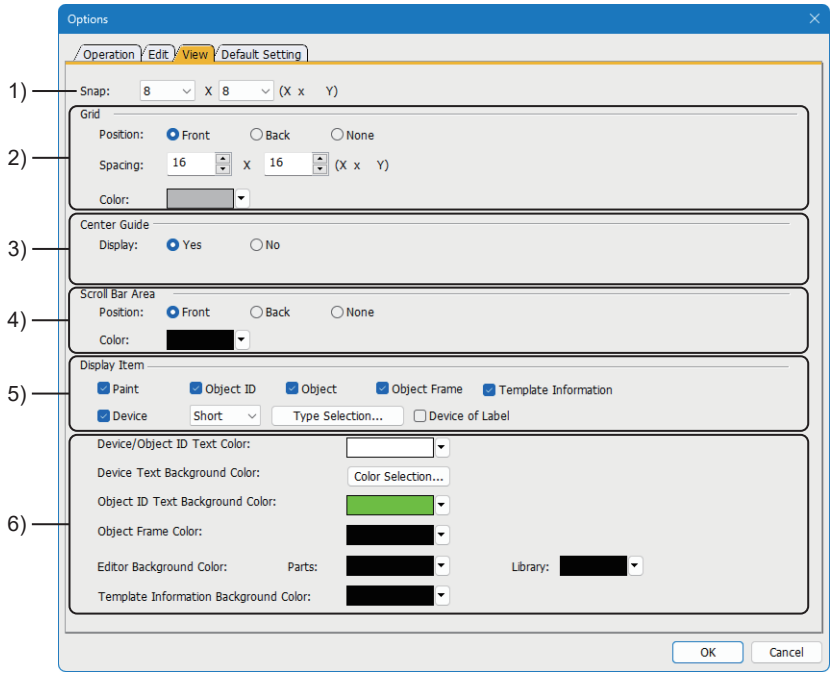
You can customize the settings related to the display of GT Designer3.

1. Select [Tools] → [Option] from the menu to display the [Options] dialog.
2. Change the setting of the [View] tab and click the [OK] button to get the setting reflected.

☞ Page 201 [Options] dialog ([View] tab)

[Options] dialog ([View] tab)

GT37 SoftGOT3000

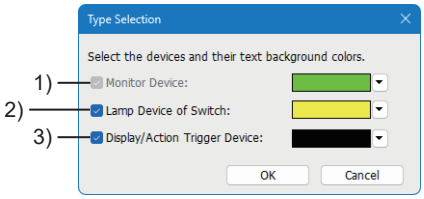


Item			Description
1)	[Snap]		Select the interval (in dots) between figures and objects when they are placed or moved on the screen editor.
2)	[Grid]	—	Set the position and the distance between the lines of the grid on the screen editor. The grid is set not for each project but for GT Designer3. The customized grid is enabled regardless of the project to be opened.
		[Position]	Select the display position of the grid.
		[Spacing]	Set the grid spacing (in dots). The setting range is [2] dots to [64] dots.
		[Color]	Select a grid color. ☞ Page 988 Color settings
3)	[Center Guide]		Select whether to display or hide the guidelines that indicate the center of the screen display area.
4)	[Scroll Bar Area]	—	This item is available when [Expand base screen sizes] is selected in [Basic Setting] in the [Type Setting] dialog. Set the display position and color of the following items on the screen editors for the expanded base screens. • Solid lines representing the scroll bar areas • Dotted lines representing partitions for GOT screens This item is not settable if the scroll bars are set to be hidden on the expanded base screens. For details on the base screen size expansion, refer to the following. ☞ Page 300 Displaying the scroll bar areas for editing the expanded base screens
		[Position]	Select the display position of the lines.
		[Color]	Select the color of the lines. ☞ Page 988 Color settings

Item			Description
5)	[Display Item]	—	Set the information to be displayed on the screen editor.
		[Paint]	Displays a color on the area to be filled.
		[Object ID]	Displays the object ID numbers on the objects.
		[Object]	Displays the objects on the screen editor.
		[Object Frame]	Displays the object frames on the screen editor.
		[Template Information]	Displays the template Information on the screen editor.
		[Device]	Displays the set devices on the objects. The display type can be selected. The following shows selectable items. • [Short]: Displays only the devices. (For labels (GT Designer3): Displays label names only.) • [Full]: Displays the channel numbers, network numbers, station numbers, CPU numbers, and devices. (For labels (GT Designer3): Displays label group names and label names.) Click the [Type Selection] button to display the [Type Selection] dialog. Whether to display or hide the devices other than monitor devices and display colors can be set. ☞ Page 202 [Type Selection] dialog
		[Device of Label]	Displays the devices assigned to the label (GT Designer3) on the objects.
6)	Color setting	—	Set a text color and background color. ☞ Page 988 Color settings
		[Device/Object ID Text Color]	Select the text color of the devices and object ID numbers displayed on the objects.
		[Device Text Background Color]	Select the text background color of the devices displayed on the objects. Click the [Color Selection] button to display the [Type Selection] dialog. Whether to display or hide the devices other than monitor devices and display colors can be set. ☞ Page 202 [Type Selection] dialog
		[Object ID Text Background Color]	Select the text background color of the object ID numbers displayed on the objects.
		[Object Frame Color]	Select the display color of the object frames.
		[Editor Background Color]	• [Parts] Select the background color of the parts editor. • [Library] Select the background color of the library editor.
		[Template Information Background Color]	Select the background color of the template information.

■[Type Selection] dialog

GT37 SoftGOT3000



Item		Description
1)	[Monitor Device]	Displays the monitor devices on the objects. This item cannot be deselected. Select the text background color of the devices.
2)	[Lamp Device of Switch]	Displays the devices set for the lamp function of touch switches. Select the text background color of the devices.
3)	[Display/Action Trigger Device]	Displays the devices set as display conditions or operating conditions. Select the text background color of the devices.

5.6.6 Customizing the default value

Default value refers to the initial value that is specified for a figure or object.

You can design a screen efficiently by specifying a frequently used value as a default value.

☞ Page 203 How to customize a default value

☞ Page 205 [Option] dialog ([Default Setting] tab)

How to customize a default value

☞ Page 203 Changing a default value in the [Option] dialog

☞ Page 204 Setting the user-specified value of a figure or object as the default value

☞ Page 204 Resetting the user-specified default value to the factory default value

☞ Page 204 Exporting the default values

☞ Page 204 Importing the default values

■Changing a default value in the [Option] dialog

1. Perform one of the following operations to display the [Option] dialog.

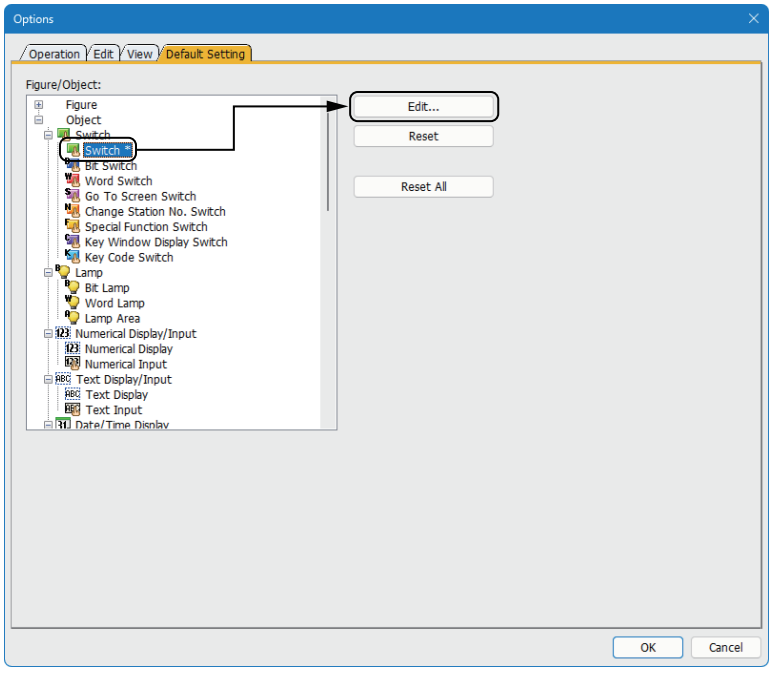
- Select [Tools] → [Default Setting] → [Edit] from the menu.
- Select [Tools] → [Option] from the menu.

2. Select a target figure or object in [Figure/Object] on the [Default Setting] tab, and click the [Edit] button.

☞ Page 205 [Option] dialog ([Default Setting] tab)

Ex.

Specifying the default value of the switch



3. The setting dialog for the selected figure or object appears.

Specify a new default value, and click the [OK] button.

4. In the [Option] dialog, click the [OK] button to apply the change.

■Setting the user-specified value of a figure or object as the default value

The following shows how to set the user-specified value of a figure or object as the default value.

1. Place a figure or an object on the screen editor, and change the set value in the setting dialog or others.

☞ Page 1001 Placing figures and objects

2. Select the figure or object, and select [Edit] → [Set to Default] from the menu to set the new value as the default value.

■Resetting the user-specified default value to the factory default value

1. Perform one of the following operations to display the [Option] dialog.

- Select [Tools] → [Default Setting] → [Edit] from the menu.
- Select [Tools] → [Option] from the menu.

2. Perform one of the following operations.

- Resetting the user-specified default value to the factory default value by figure or object

In the [Default Setting] tab, select a target figure or object in [Figure/Object], and click the [Reset] button.

- Resetting the user-specified default values of all figures and objects to the factory default values

Click the [Reset All] button in the [Default Setting] tab.

3. In the [Option] dialog, click the [OK] button to apply the change.

■Exporting the default values

1. Select [Tools] → [Default Setting] → [Export] from the menu to display the [Save As] dialog.

2. Set [File name] and click the [Save] button to export the default value settings.

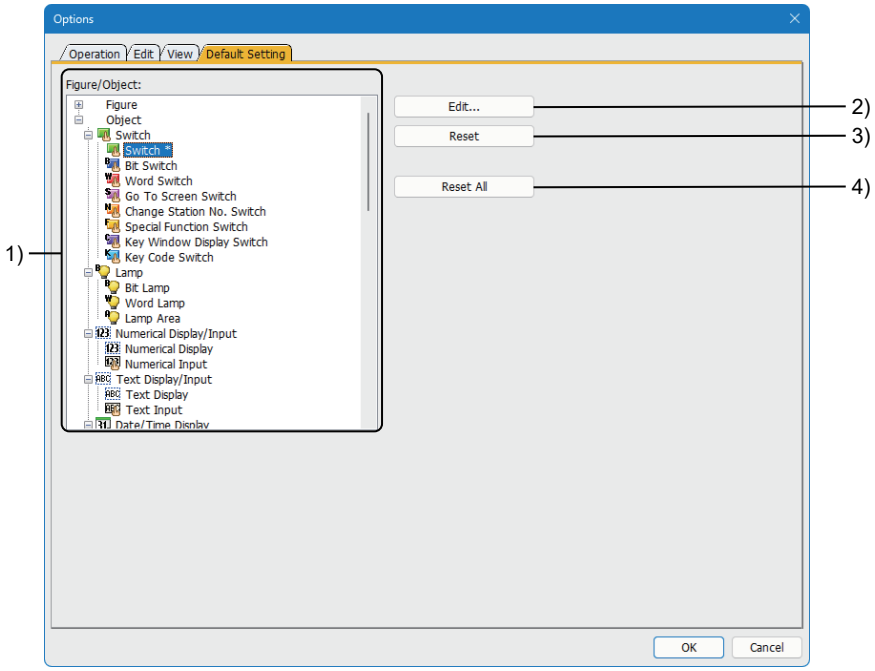
■Importing the default values

1. Select [Tools] → [Default Setting] → [Import] from the menu to display the [Open Default Setting File] dialog.

2. Set [File name] and click the [Open] button to import the default value settings.

[Option] dialog ([Default Setting] tab)

GT37 SoftGOT3000



Item		Description
1)	[Figure/Object]	Lists figures and objects. For the items of figures and objects that have got the default values changed, [*] is displayed to the right of the names. When an item is double-clicked, the setting dialog is displayed as it is displayed when the [Edit] button is clicked.
2)	[Edit] button	Displays the setting dialog of the figure/object selected in [Figure/Object]. The items for which no default value can be set are displayed in gray. After changing settings, click the [OK] button to change the default value.
3)	[Reset] button	Resets the default value of the figure/object selected in [Figure/Object] to the initial value.
4)	[Reset All] button	Resets the default value of all the figures and objects to the initial values.

PART 4 Creating a project, simulation, and data transfer

6 Project creation and operations

7 Simulation

8 Transferring data to the GOT

6 Project creation and operations

6.1 Creating a project

GT37 SoftGOT3000

☞ Page 208 Creating a new project
☞ Page 211 Utilizing a project

6.1.1 Creating a new project

GT37 SoftGOT3000

To create a project, the following settings are required.

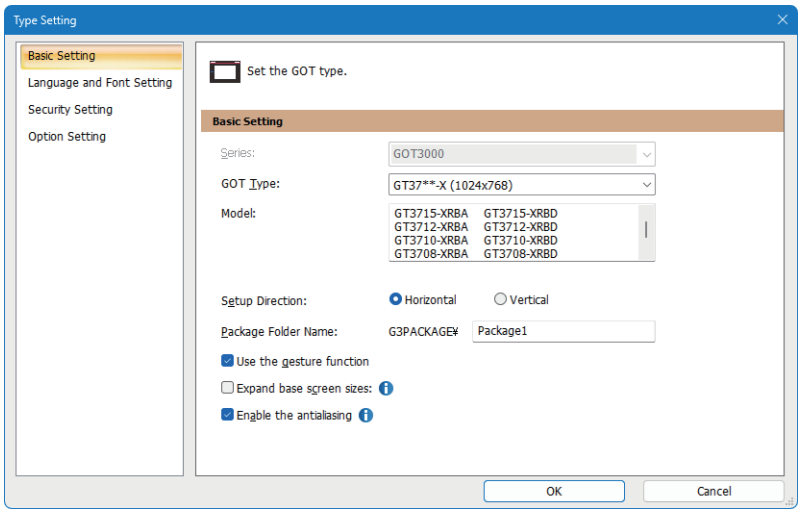
- [Type Setting] dialog: Set a GOT to be used for the project.
- [Controller Setting] window: Configure the settings relevant to communications between the GOT and the controller.
- [Environmental Setting] window ([Screen Switching/Window]): Configure the settings to display screens on the GOT.

1. Either of the following operations displays the [Type Setting] dialog.

- Click the [New] button in the [Select Project] dialog.
- Select [Project] → [New] from the menu.

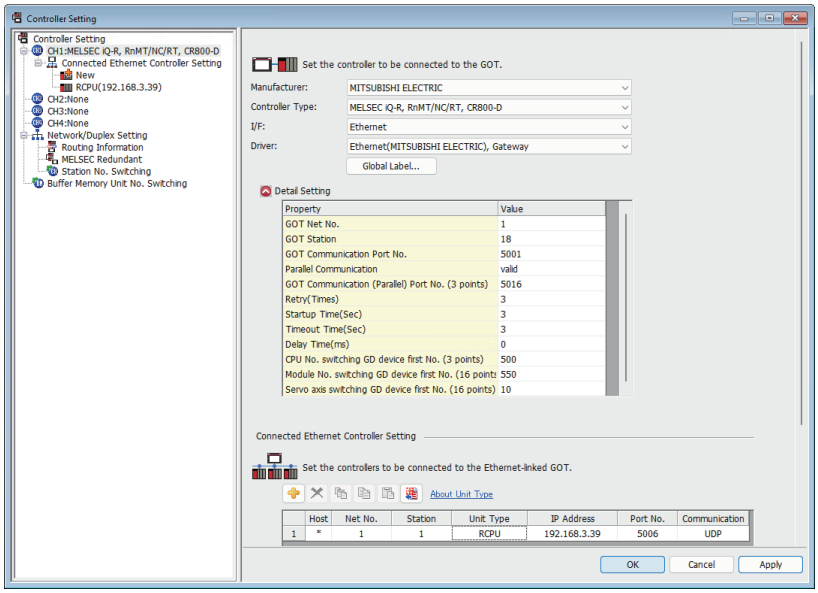
2. Configure the settings, and click the [OK] button. A project is created and the [Controller Setting] window appears.

☞ Page 519 [Type Setting] dialog



3. Select the manufacturer, model, GOT interface, and communication driver for the controller to be connected then click the [OK] button.

☞ Page 729 [Controller Setting]



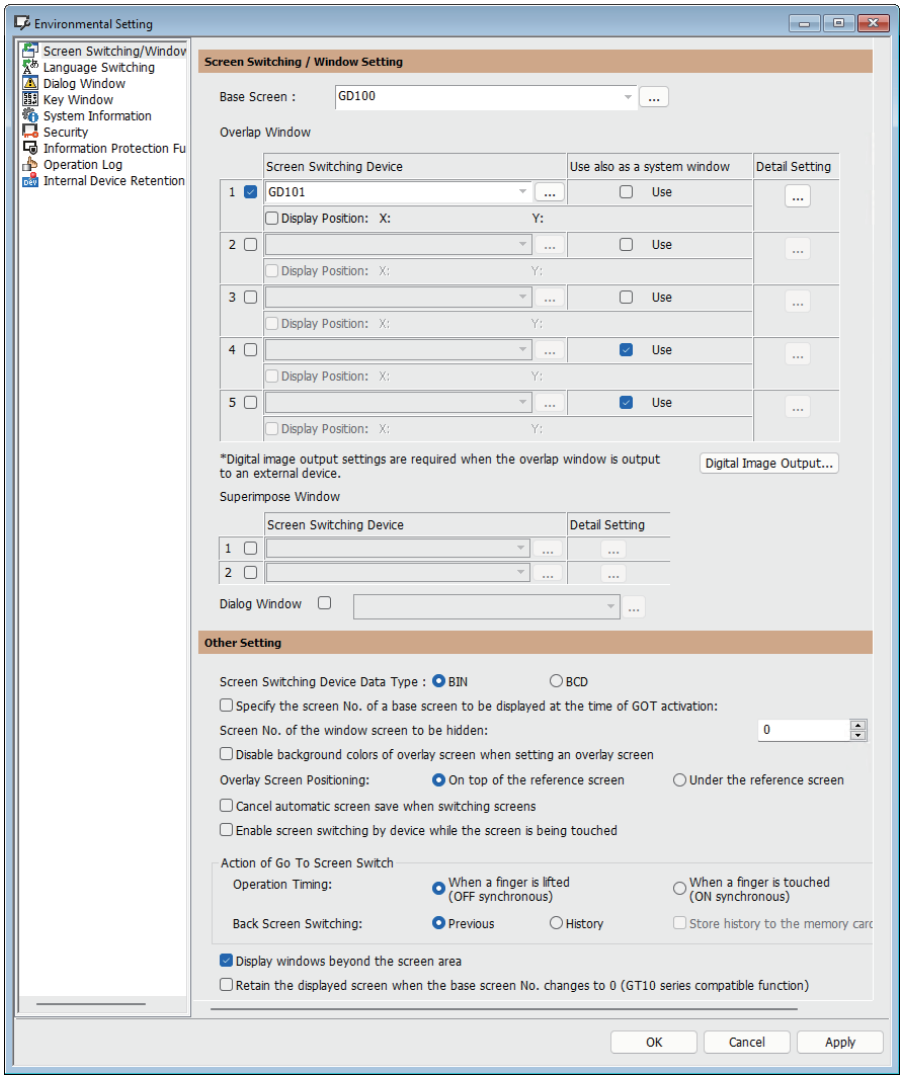
4. Select [Common] → [GOT Environmental Setting] → [Screen Switching/Windows] from the menu to display the [Screen Switching/Window] of the [Environmental Setting] window.

5. Set screen switching devices for the base screen and other necessary windows then click the [OK] button.

☞ Page 542 [Screen Switching/Window]

The creation of a project is complete.

Create screens and configure function settings as necessary.



Point

If [Perform type setting at the time of creating a new project] is deselected in the [Operation] tab in the [Options] dialog, a project is created without displaying the [Type Setting] dialog and [Controller Setting] window.

The settings of the last edited project will be applied for the newly created project.

☞ Page 197 [Options] dialog ([Operation] tab)

6.1.2 Utilizing a project

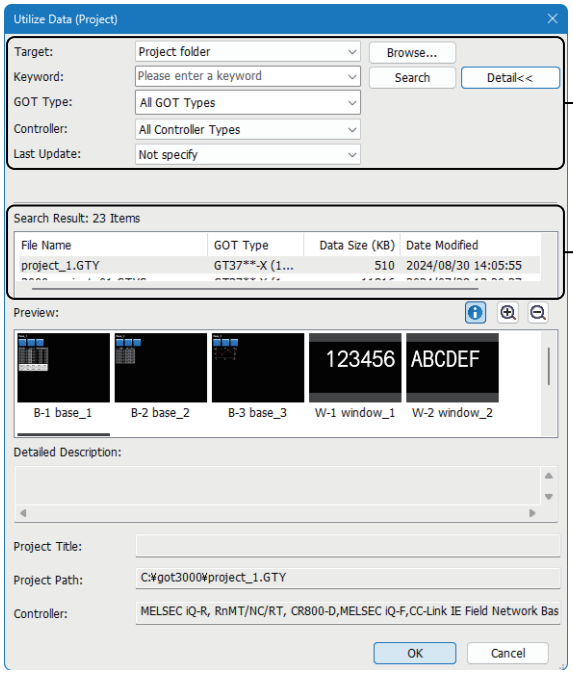
GT37 SoftGOT3000

Edit an existing project to create a project.

The project to be utilized can be searched by a keyword, the GOT type, or other criteria.

You can find utilizable data efficiently without the knowledge of the settings in the sample or existing projects.

This is helpful to determine an existing project to be copied to create a project by copying.



Search criteria

Utilizable data narrowed by search criteria

Point

If you know the settings in a project to be utilized, you can specify the necessary data to be read into the project being edited.

☞ Page 226 Utilizing other project data

☞ Page 212 Specifications of project utilization

☞ Page 213 Utilizing a project

☞ Page 214 [Utilize Data (Project)] dialog and [Search] dialog

Specifications of project utilization

GT37 SoftGOT3000

■Utilizable project formats

The following shows the utilizable project formats.

GOT	Project format
GOT3000 series	• *.GTY • *.GTYS • *.GTYP If a project is saved without deselecting [Include projects for the function of Utilize Data] in the [Project Information] dialog, the project is not utilizable.

■Settings to be changed when utilized

Item	Specifications
GOT type	Utilized data are converted according to the GOT type set for the destination project. Functions that does not correspond to the GOT type of the destination project are not eliminated.
Controller setting	When [Retain the CH No.] is selected in the [Utilize] dialog ([Controller Setting]), the devices set for the objects on the utilized screens will be changed as shown below. • The device name is changed according to the controller setting in the destination project. • The device to which the controller setting in the destination project does not correspond is changed to [??] (except the devices in the script data) Check and change the device settings.
Comment group	If the Windows fonts used for comment groups are not installed on the personal computer, the comments are displayed in different fonts. To display the comments in the specified Windows fonts, make sure that the fonts are installed on the personal computer before utilizing the project.

■Utilizing a project protected with project security

When project security is set in the search target project, user authentication is conducted.

When project security is set in the project that is being edited, the search target project that can be authenticated is automatically authenticated by the logged-in user name and password.

Only authenticated projects are displayed in the search result list.

In the following cases, the project is not displayed in the search result list and cannot be utilized.

- Authentication of the project has failed.
- Display of the project is prohibited with access privileges of an authenticated user.
- The project includes a screen whose display is prohibited with access privileges of an authenticated user.

If you preview the screen, a dummy screen appears.

☞ Page 2972 Protecting a project by registering users (Project security)

■Utilizing a project with the information protection function set

If a password is set by the information protection function for the search target project, password authentication is performed.

Only authenticated projects are displayed in the search result list.

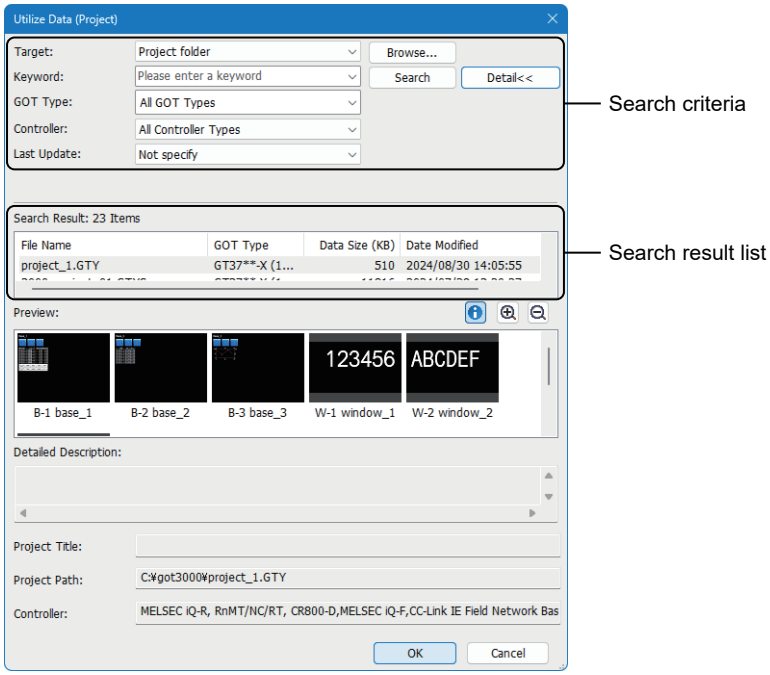
☞ Page 3065 Protecting the files in the GOT (Information protection function)

Utilizing a project

GT37 SoftGOT3000

1. Select [Project] → [Utilize Data] from the menu to display the [Utilize Data (Project)] dialog.
2. Set the search criteria and click the [Search] button to list the search results.

☞ Page 214 [Utilize Data (Project)] dialog and [Search] dialog



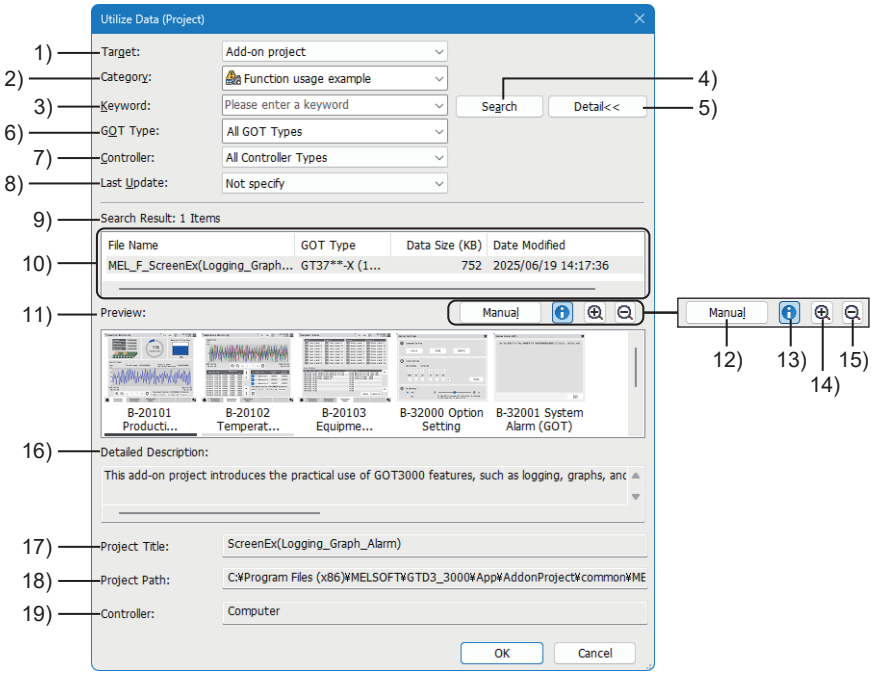
3. Select a project to be utilized and click the [OK] button to create a new project based on the selected project.

[Utilize Data (Project)] dialog and [Search] dialog

GT37 SoftGOT3000

The dialog name varies with the display method.

- The [Utilize Data (Project)] dialog is displayed by selecting [Project] → [Utilize Data] from the menu.
- The [Search] dialog is displayed from the [Utilize Project] dialog.



Item		Description
1)	[Target]	Select a search target.
		The search target for [Recently edited project] is up to five recently edited projects.
		The search target for [Project folder] is the projects in up to the third folder within the specified folder. Up to 200 projects are searched. Click the [Browse] button to specify a folder.
2)	[Category]	This item appears when [Target] is set to [Add-on project]. Select the project type.
3)	[Keyword]	Set a search keyword for the project file name or project title. Two-byte and one-byte characters are distinguished. Specifying keywords delimited with one-byte or two-byte spaces enables you to narrow the scope of a search to the projects containing the keywords. Adding "!" before keywords can search the projects on which the specified keywords are not included. Up to the last five searches are saved.
4)	[Search] button	Conducts a search.
5)	[Detail >>] button [Detail <<] button	Displays or hides the following setting items. • [GOT Type] • [Controller] • [Last Update] Even though the above setting items are not displayed, they can be included in the targets for a search.
6)	[GOT Type]	Select the type of GOTs for the project to be searched.
7)	[Controller]	Select the controller type for the project to be searched. The selectable items are the same as those for [Controller Type] in each channel setting in the [Controller Setting] window. ☞ Page 729 [Controller Setting]
8)	[Last Update]	Select the last update of the project to be searched.
9)	[Search Result]	Number of found projects.
10)	Search result list	Lists found projects.
11)	[Preview]	Displays the images of the screens used in the project selected in the search result list. Immediately after the project is read from the GOT, the screen images set in the project are not displayed. To display the screen images set in the project, open the project read from the GOT, and save the project again.

Item		Description
12)	[Manual] button	This item appears when an add-on project is selected in the search result list. Use this button to display the manual (PDF) for the add-on project.
13)	[Information] button	Displays or hides the following items. • [Detailed Description] • [Project Title] • [Project Path] • [Controller]
14)	[Zoom in] button	Zoom in the display of [Preview].
15)	[Zoom out] button	Zoom out the display of [Preview].
16)	[Detailed Description]	Detail description of the project selected in the search result list.
17)	[Project Title]	Title of the project selected in the search result list.
18)	[Project Path]	Save folder path of the project selected in the search result list.
19)	[Controller]	Controller type specified in the project that is selected in the search result list.

6.2 Basic operations of a project

GT37 SoftGOT3000

☞ Page 216 Opening a project
☞ Page 221 Closing a project
☞ Page 221 Saving a Project
☞ Page 224 Deleting a project
☞ Page 224 Giving a title to a project

6.2.1 Opening a project

☞ Page 217 Opening a GOT3000 project
☞ Page 218 Opening a GOT2000 project
☞ Page 219 Opening a GOT1000 project
☞ Page 220 Opening a GOT900 project
☞ Page 220 [Open Project] dialog

Opening a GOT3000 project

In GT Designer3, you can open a project in any of the following formats.

- *.GTY
- *.GTYS
- *.GTYP
- *.G3

1. Select [Project] → [Open] from the menu to display the [Open Project] dialog.

☞ Page 220 [Open Project] dialog

2. In the [Open Project] dialog, select the project , and then click the [Open] button to open the project.

Point

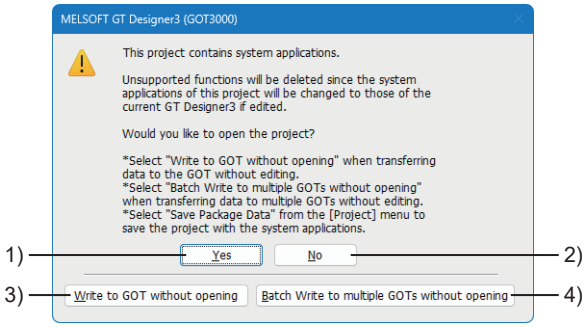
When a project protected with project security is opened, user authentication is performed.

☞ Page 2972 Protecting a project by registering users (Project security)

When a project with a password set by the information protection function is opened, password authentication is performed.

☞ Page 3065 Protecting the files in the GOT (Information protection function)

When the package data (*.GTYS) is opened, the following dialog appears.



Item		Description
1)	[Yes]	Opens the project.
2)	[No]	Stops opening the project and displays the [Select Project] dialog.
3)	[Write to GOT without opening] button	Transfers the package data to the GOT without opening it. The [Communication Configuration] dialog or [Communicate with GOT] dialog ([GOT Write] tab) appears. ☞ Page 451 [Communication Configuration] dialog ☞ Page 465 [GOT Write] tab
4)	[Batch Write to multiple GOTs without opening] button	Transfers the package data to multiple GOTs without opening it. Use this button to display the [Batch Write to multiple GOTs] dialog. ☞ Page 476 [Batch Write to multiple GOTs] dialog

Point

When opening the package data (*.GTYS), select whether to open the data in GT Designer3 or transfer the data to the GOT without opening.

If you open the package data and save it, the system applications and communication drivers of the data will be updated to the version supported by GT Designer3 in use.

The settings of the functions that are not supported by GT Designer3 will be deleted.

PART 4

Opening a GOT2000 project

In GT Designer3, you can open a project in any of the following formats.

The operation differs depending on the extension of the project to be opened.

Extension	Reference
*.GTX *.GTXS *.G2	☞ Page 218 When opening a GOT2000 project (*.GTX, *.G2), GT SoftGOT3000 execution file (*.GTXS)
*.GTCNV	☞ Page 219 When opening a GOT2000 project (*.GTCNV)

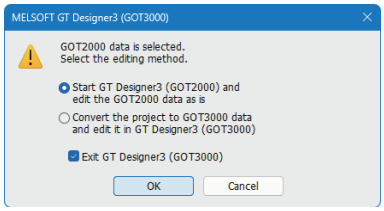
■When opening a GOT2000 project (*.GTX, *.G2), GT SoftGOT3000 execution file (*.GTXS)

There are two alternatives: convert the project into the GOT3000 equivalent, or start GT Designer3 (GOT2000) and edit the project as a GOT2000 project.

1. Select [Project] → [Open] from the menu to display the [Open Project] dialog.

☞ Page 220 [Open Project] dialog

2. In the [Open Project] dialog, select a project and click the [Open] button to display the following dialog.

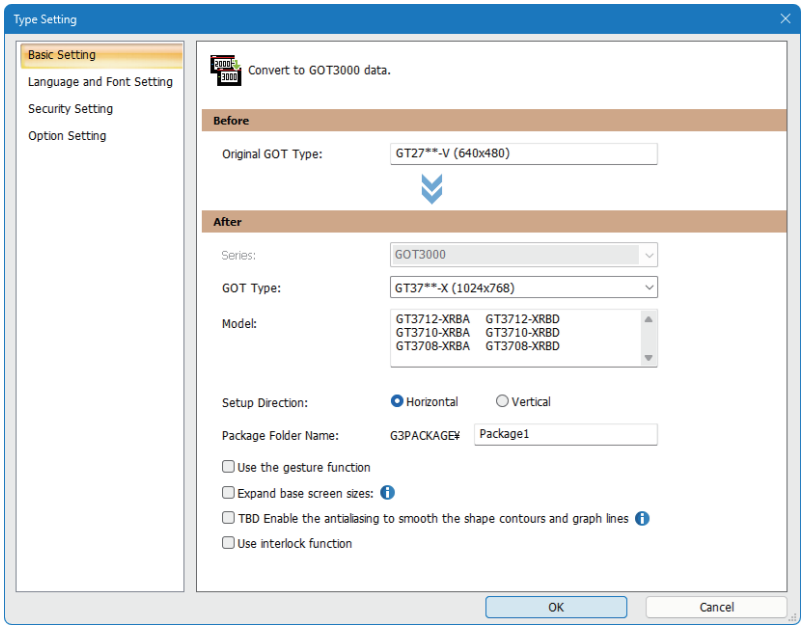


3. Select the editing method of the project and click the [OK] button.

Setting item	Description
[Start GT Designer3 (GOT2000) and edit the GOT2000 data as is]	Starts GT Designer3 (GOT2000) and opens the project.
[Convert the project to GOT3000 data and edit it in GT Designer3 (GOT3000)]	Converts the project into the GOT3000 equivalent. The [Type Setting] dialog appears. Proceed to Step 4.

4. Set the GOT type after the conversion, and click the [OK] button.

☞ Page 519 [Type Setting] dialog



The converted project opens, and the conversion results are listed in the [Output] window.

☞ Page 528 [Output] window

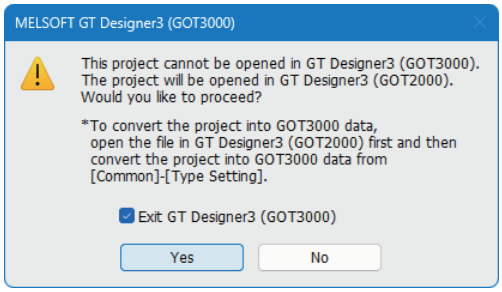
■When opening a GOT2000 project (*.GTCNV)

Start GT Designer3 (GOT2000), and open a project.

1. Select [Project] → [Open] from the menu to display the [Open Project] dialog.

☞ Page 220 [Open Project] dialog

2. In the [Open Project] dialog, select a project and click the [Open] button to display the following dialog.



3. Click the [Yes] button to switch the screen design software to GT Designer3 (GOT2000).

Opening a GOT1000 project

For a project in any of the following formats, start GT Designer3 (GOT1000) and open the project.

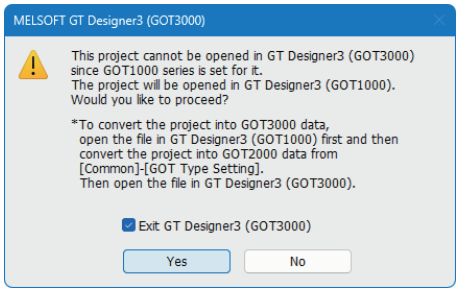
- *.GTW
- *.GTE
- *.G1

To convert the project into the GOT3000 equivalent, convert the project into the GOT2000 equivalent in advance.

1. Select [Project] → [Open] from the menu to display the [Open Project] dialog.

☞ Page 220 [Open Project] dialog

2. In the [Open Project] dialog, select a project and click the [Open] button to display the following dialog.



3. Click the [Yes] button to switch the screen design software to GT Designer3 (GOT1000).

Opening a GOT900 project

For a project in any of the following formats, start GT Designer3 (GOT1000) and convert the project into the GOT1000 equivalent.

• *.GTD

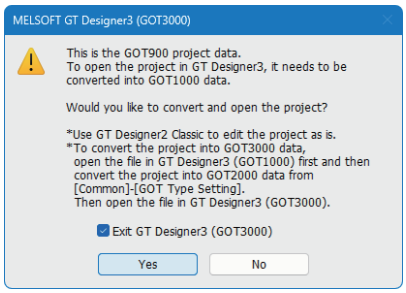
To edit the project as a GOT900 project, use GT Designer2 Classic.

To convert the project into the GOT3000 equivalent, convert the project into the GOT2000 equivalent in advance.

1. Select [Project] → [Open] from the menu to display the [Open Project] dialog.

☞ Page 220 [Open Project] dialog

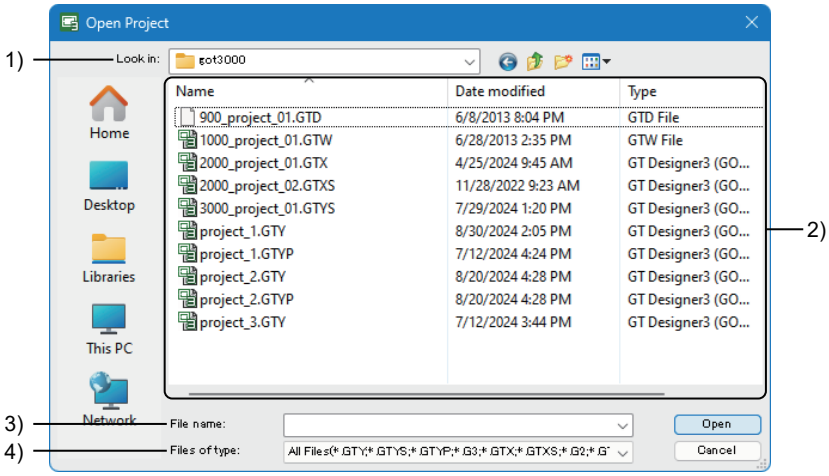
2. In the [Open Project] dialog, select a project and click the [Open] button to display the following dialog.



3. Click the [Yes] button to switch the screen design software to GT Designer3 (GOT1000).

Convert the project into the GOT1000 equivalent by using GT Designer3 (GOT1000).

[Open Project] dialog



Item		Description
1)	[Look in]	Select a location where the project has been saved.
2)	File list	Lists the files saved in the location specified in [Look in].
3)	[File name]	Input the file name of the project to be opened. Click the [Open] button to open the project having the input file name.
4)	[Files of type]	Select the file type of the files to be displayed in the file list.

6.2.2 Closing a project

Select [Project] → [Close] from the menu to close the open project.

6.2.3 Saving a Project

GT Designer3 saves a project as a file with one of the following extensions.

Extension	Description	Model
*.GTY	File format of a single file containing projects only.	GT37 SoftGOT3000
*.GTYS	File format of a single file containing a project and the related system package. Since the versions of the project and system package are fixed, if you have transferred the file to the GOT with an older version of GT Designer3, the relevant functions are usable without being downgraded. This provides convenience when you save a project as complete data. Data can be transferred to the GOT by using Data Transfer Tool without GT Designer3.	
*.GTYP	File format used to execute a project on the GT SoftGOT3000 module. Only *.GTYP projects can be opened with GT SoftGOT3000.	GT37 SoftGOT3000

☞ Page 222 Naming and saving the project as project data (*.GTY) or a GT SoftGOT3000 execution file (*.GTYP)
☞ Page 223 Naming and saving the project as package data (*.GTYS)
☞ Page 224 Overwriting a project

Naming and saving the project as project data (*.GTY) or a GT SoftGOT3000 execution file (*.GTYP)

GT37 SoftGOT3000

1. Select [Project] → [Save As] from the menu to display the [Save As Project] dialog.

☞ Page 222 [Save As Project] dialog

2. Click the [Save] button after the required settings to save the project.

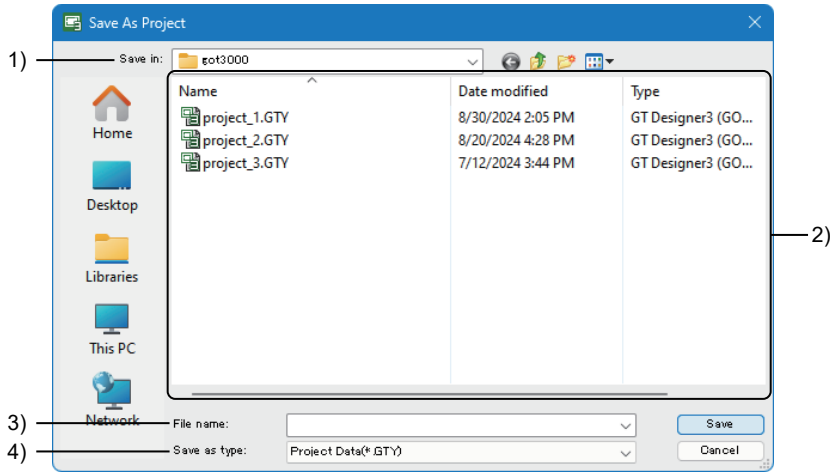
In the [GOT Environmental Setting] window ([Information Protection Function]), when [Use file protection function] in the [File Protection] tab is selected, the [Project Data Password Registration] dialog appears.

Set a password for the project data.

☞ Page 3068 [File Protection]

■[Save As Project] dialog

GT37 SoftGOT3000



Item		Description
1)	[Save in]	Select the destination to save the project. Do not save the project in the following path. • <Installation path>\GTD3_3000\App • <Installation path>\GTD3
2)	File list	Lists files in the destination to save the project.
3)	[File name]	Set a file name of the project to be saved. Click the [Save] button to save the project with the set file name.
4)	[Save as type]	Refers to the type of the file to be saved.

Naming and saving the project as package data (*.GTYS)

GT37 SoftGOT3000

Save a single file of package data containing a project and the related system package.

1. Select [Project] → [Save Package Data] from the menu to display the [Save As Package] dialog.

☞ Page 223 [Save As Package] dialog

2. Set [File name] and click the [Save] button to save the package data.

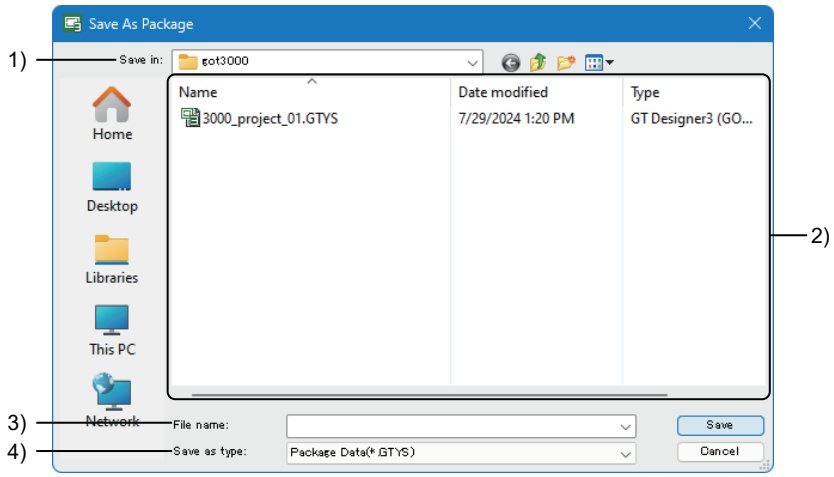
In the [GOT Environmental Setting] window ([Information Protection Function]), when [Use file protection function] in the [File Protection] tab is selected, the [Project Data Password Registration] dialog appears.

Set a password for the project data.

☞ Page 3068 [File Protection]

■[Save As Package] dialog

GT37 SoftGOT3000



Item		Description
1)	[Save in]	Select the destination to save the package data. Do not save the project in the following path. • <Installation path>\GTD3_3000\App • <Installation path>\GTD3
2)	File list	Lists files in the destination to save the package data.
3)	[File name]	Set a file name of the package data to be saved. Click the [Save] button to save the package data with the set file name.
4)	[Save as type]	Refers to the type of the file to be saved. The setting is fixed to [Package Data(*.GTYS)].

Overwriting a project

GT37 SoftGOT3000

Select [Project] → [Save] from the menu to save a project by overwriting.

However, when the currently edited project is in any of the following conditions, the [Save As Project] dialog is displayed.

- A project which has never been saved
- Project data (*.G3)
- Package data (*.GTYS)
- A GOT2000 project that is opened after converted to the GOT3000 equivalent

6.2.4 Deleting a project

Delete files of the project using Windows Explorer or other methods.

6.2.5 Giving a title to a project

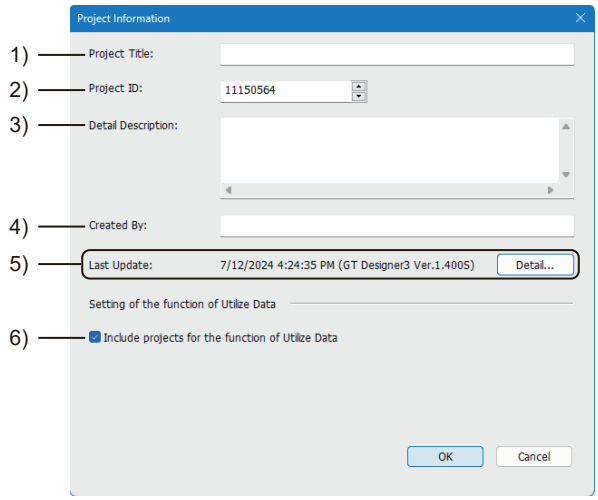
GT37 SoftGOT3000

Set a title, a creator's name, and other information for a project.

1. Select [Project] → [Project Information] from the menu to display the [Project Information] dialog.
2. Set each item, and then click the [OK] button to complete the settings.

[Project Information] dialog

GT37 SoftGOT3000

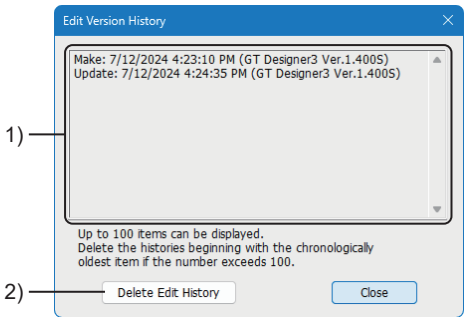


Item		Description
1)	[Project Title]	Set a title for the project. Up to 32 characters can be set. The project title is used as the search target for creating a project by utilizing another project.
2)	[Project ID]	Set a project ID. A project ID is automatically given to the project when a project is created.
3)	[Detail Description]	Set text information for the project. Up to 512 characters can be set. A line feed is counted as two characters.
4)	[Created By]	Set the creator's name of the project. Up to 64 characters can be set.
5)	[Last Update]	Displays the latest date and time at which the project was saved and the GT Designer3 version. Click the [Detail] button to display the [Edit Version History] dialog. ☞ Page 225 [Edit Version History] dialog

Item		Description
6)	[Include projects for the function of Utilize Data]	Enables the following. • The current project is included in the search targets for creating a project based on another project. • The display of screen images in the [Screen Image List] window or [Image List] dialog (screen) is sped up.

■[Edit Version History] dialog

GT37 SoftGOT3000

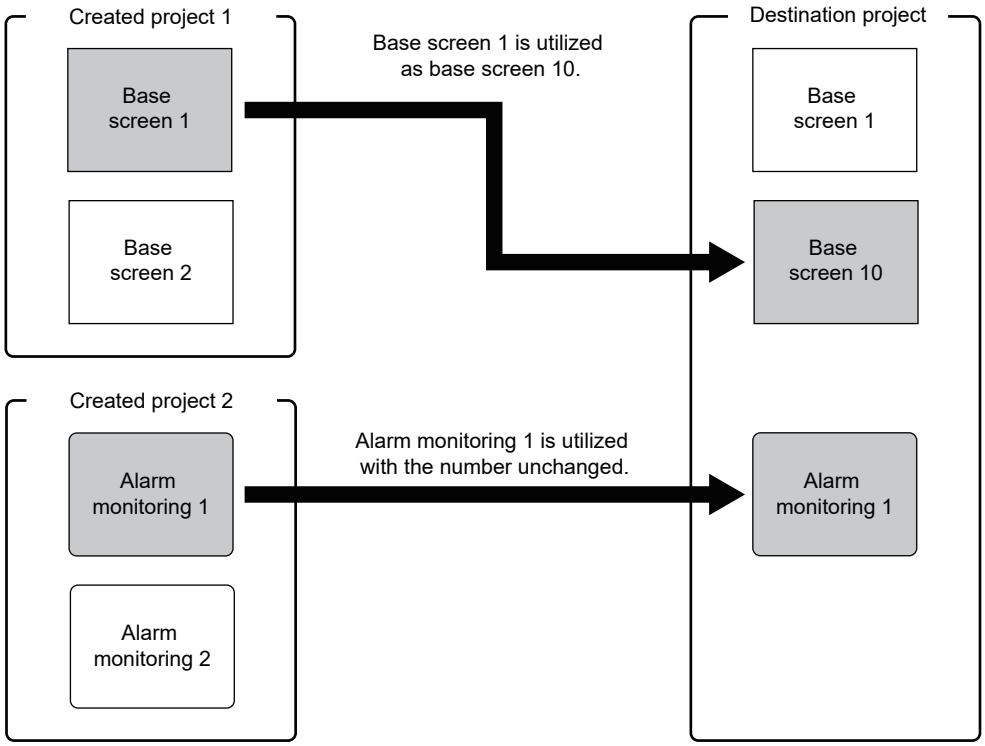


Item		Description
1)	Edit history	The edit history of the project is displayed.
2)	[Delete Edit History] button	Deletes the edit history.

6.3 Utilizing other project data

GT37 SoftGOT3000

The settings for screens and functions can be read from a specified project (source) into the project (destination) being edited. You can create a project efficiently by utilizing data of an existing project.



☞ Page 227 Specifications of the project utilization
☞ Page 229 Reading the settings of another project
☞ Page 234 [Utilize Project] dialog

6.3.1 Specifications of the project utilization

GT37 SoftGOT3000

☞ Page 227 Utilizable project formats
☞ Page 227 Utilizable data

Utilizable project formats

The following shows the utilizable project formats.

GOT	Project format
GOT3000 series	*.GTY *.GTYS *.GTYP

Utilizable data

Select data to utilize from [Source Project] of the [Utilize Project] dialog.

☞ Page 236 [Source Project] tree

Settings to be changed when utilized

Item	Specifications
GOT type	Utilized data are converted according to the GOT type set for the destination project. Functions that does not correspond to the GOT type of the destination project are not eliminated.
Controller setting	Utilized data are converted according to the controller type set for the destination project. According to the combination of the settings for the source project and those for the destination project, the devices set for utilized data are changed as described below. • The device name is changed according to the controller setting in the destination project. • The device to which the controller setting in the destination project does not correspond is changed to [??] (except the devices in the script data) Check and change the device settings.
Base screen	The window preview settings for the source project will be migrated to the destination project if [Apply to all base screens] is deselected in the [Window Preview] dialog in the destination project. If [Apply to all base screens] is selected in the destination project, the window preview settings of the destination project will be applied.
Comment group	If the Windows fonts used for comment groups are not installed on the personal computer, the comments are displayed in different fonts. To display the comments in the specified Windows fonts, make sure that the fonts are installed on the personal computer before utilizing the project.
Script	Even if the controller settings for the source project and destination project are different, the devices in script data are not automatically changed. Check and change the device settings.
Category	Categories cannot be utilized. When the categories set for figures and objects do not exist in the destination project, the categories are changed to [None] in utilization. Before utilizing, add categories that exist in the source project into the destination project.

■Utilizing the project edited with a different version of GT Designer3

When the version of GT Designer3 being used is older than that used to edit the source project, the functions unsupported by GT Designer3 being used are not utilized.

Utilizing a project protected with the security

■Utilizing a project protected with project security

If project security is set for the source project, user authentication is performed.

Only authenticated projects can be utilized.

In the following cases, the project cannot be opened and utilized.

- Authentication of the project has failed.
- Display of the project is prohibited with access privileges of an authenticated user.

The screens whose display is prohibited with access privileges of an authenticated user are not displayed in the source project's tree structure and cannot be utilized.

☞ Page 2972 Protecting a project by registering users (Project security)

■Utilizing a project with the information protection function set

If a password is set by the information protection function for the source project, password authentication is performed.

Only authenticated projects can be utilized.

☞ Page 3065 Protecting the files in the GOT (Information protection function)

6.3.2 Reading the settings of another project

GT37 SoftGOT3000

Before reading the settings of another project, close the following windows.

- [Environmental Setting] window
- [GOT Setup] window
- [Controller Setting] window

When the [Utilize Project] dialog is displayed while the above windows are open, the settings for the windows cannot be utilized.

1. Select [Project] → [Utilize Project] from the menu to display the [Utilize Project] dialog.

☞ Page 234 [Utilize Project] dialog

2. Perform one of the following operations in the [Utilize Project] dialog to display the setting tree of the source project.

- Click the [Browse] button to display the [Open Project] dialog, select the source project, and click the [Open] button.
- Click the [Search] button to display the [Search] dialog, and perform a search for the source project.
- Enter the path to the [Source Project], and press the Tab key.

Point

If project security is set for the source project, user authentication is performed.

☞ Page 2972 Protecting a project by registering users (Project security)

If a password is set by the information protection function for the source project, password authentication is performed.

☞ Page 3065 Protecting the files in the GOT (Information protection function)

3. Select the settings to be utilized in the setting tree.

If you select the settings for which numbers are set, the numbers set in [Destination] are enabled.

For the settings of the numbers used by the destination project, refer to the following.

☞ Page 230 Utilizing settings without changing the numbers set in the source project

☞ Page 231 Specifying a start number in utilizing settings for the source destination with their order and differences retained

☞ Page 232 Specifying a number for each setting to be utilized

4. Click the [Utilize] button to read the selected settings into the destination project.

If there is data that can be reused from another project, proceed to step 2.

When you have completed the utilization, close the [Utilize Project] dialog.

Utilizing settings without changing the numbers set in the source project

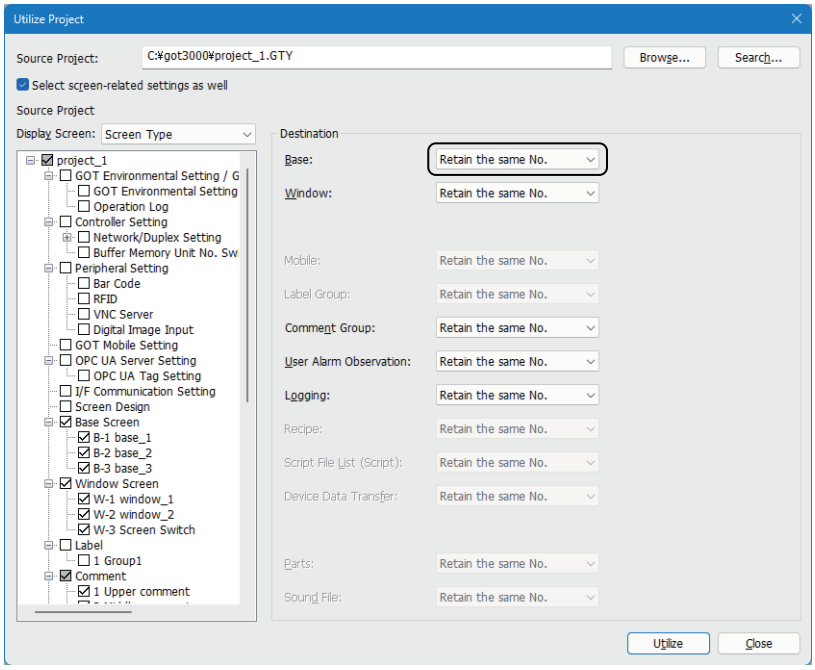
GT37 SoftGOT3000

The following shows the procedure for utilizing settings for a source project as those for a destination project without changing the associated numbers that have been set in the source project.

1. In [Destination] of the [Utilize Project] dialog, select [Retain the same No.].

☞ Page 234 [Utilize Project] dialog

Example) Utilizing a base screen



2. Click the [Utilize] button to read the settings selected in the [Source Project] tree into the destination project.
3. When you have completed the utilization, close the [Utilize Project] dialog.

Specifying a start number in utilizing settings for the source destination with their order and differences retained

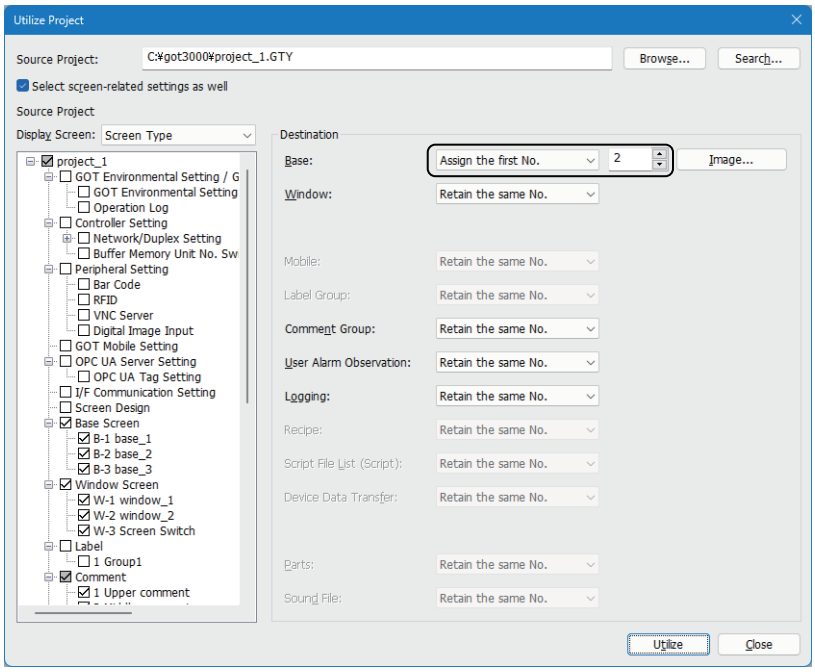
GT37 SoftGOT3000

The following shows the procedure for specifying a start number in utilizing settings for a source project as those for a destination project with their order and differences retained.

1. Select [Assign the first No.] in [Destination] of the [Utilize Project] dialog and set a start number.

☞ Page 234 [Utilize Project] dialog

Example) Utilizing a base screen



2. Click the [Utilize] button to read the settings selected in the [Source Project] tree into the destination project.

3. When you have completed the utilization, close the [Utilize Project] dialog.

Specifying a number for each setting to be utilized

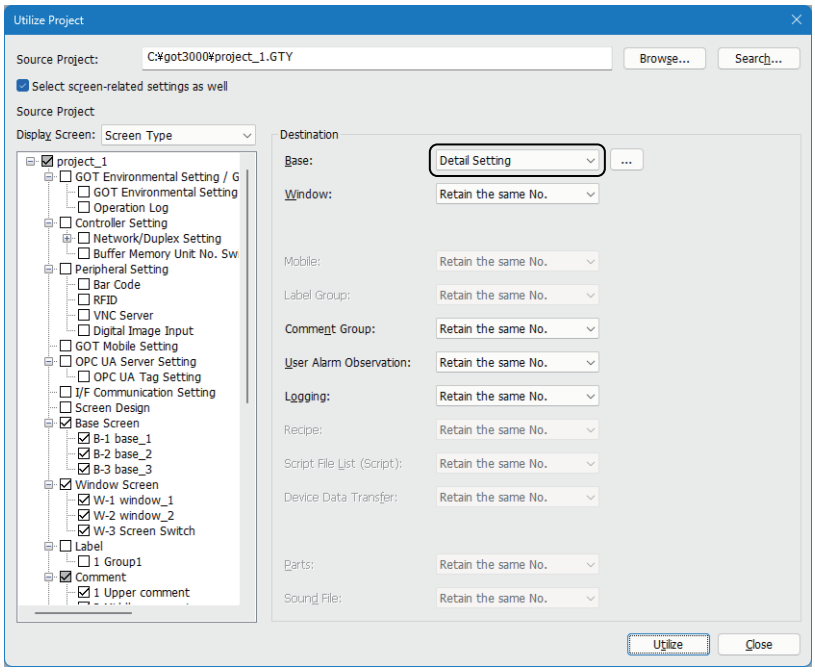
GT37 SoftGOT3000

The following shows how to specify a number for each setting to be utilized. The specified numbers are used in the destination project.

1. Select [Detail Setting] in [Destination] of the [Utilize Project] dialog and click the [...] button to display the [Detail Setting] dialog.

☞ Page 234 [Utilize Project] dialog

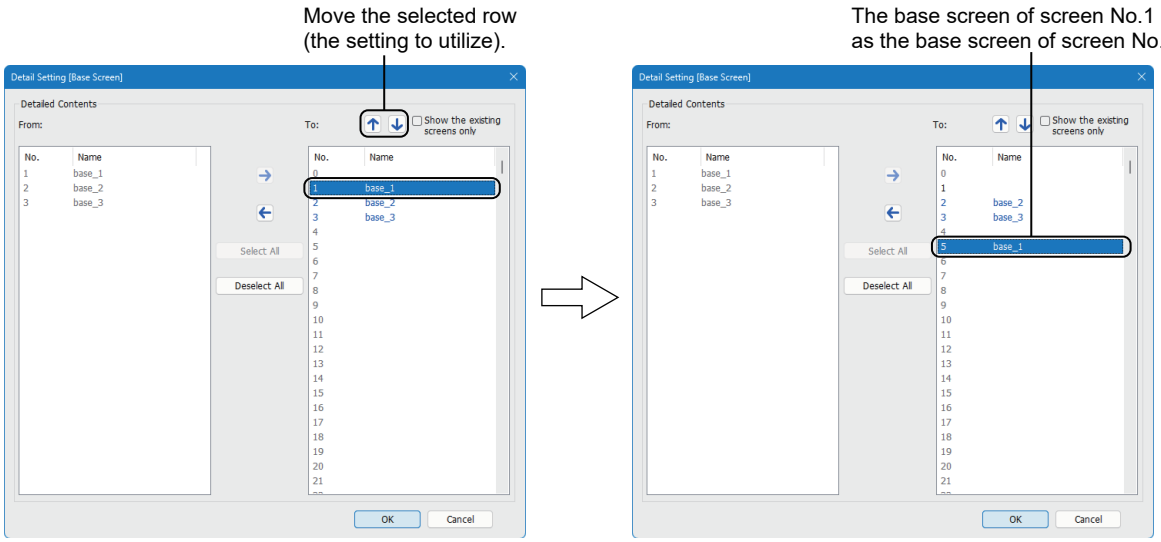
Example) Utilizing a base screen



2. In [Destination], select the setting to be utilized (the row with blue text).

Move the row you have selected with the [↑] or [↓] button into the row corresponding to the number used by the destination project.

Example) Utilizing a base screen of screen No.1 as that of screen No.5



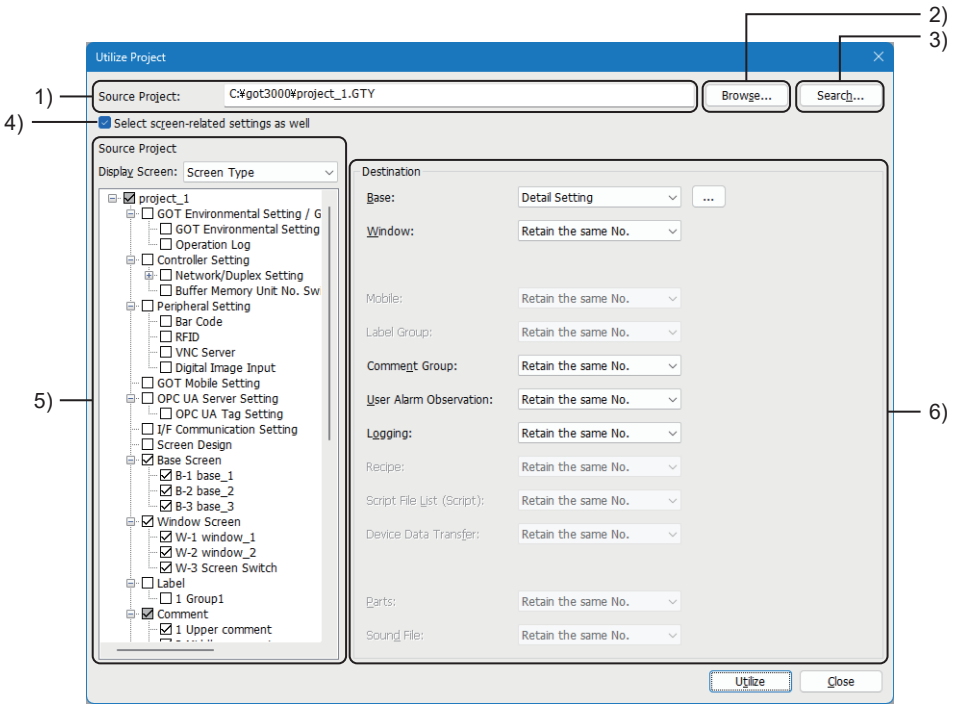
☞ Page 243 [Detail Setting] dialog

3. When you have completed the setting, click the [OK] button.

4. Click the [Utilize] button in the [Utilize Project] dialog to read the settings selected in the [Source Project] tree into the destination project.
5. When you have completed the utilization, close the [Utilize Project] dialog.

6.3.3 [Utilize Project] dialog

GT37 SoftGOT3000



Item			Description
1)	[Source Project]		Set the path to the source project.
2)	[Browse] button		Displays the [Open Project] dialog. Set the path to the source project.
3)	[Search] button		Displays the [Search] dialog. Searches for a project that can be utilized. ☞ Page 214 [Utilize Data (Project)] dialog and [Search] dialog
4)	[Select screen-related settings as well]		When items are selected in the [Source Project] tree, the relevant settings are also selected. Example) If a base screen for which a screen script has been set is selected, the script is also selected.
5)	[Source Project]	—	When a path is set for [Source Project], the utilizable source project settings are displayed in the tree structure. Select the settings to utilize. ☞ Page 236 [Source Project] tree The settings nonexistent in the source project or destination project are not displayed in the tree structure. When the following items are selected, the related settings in [Destination] become available to specify numbers or utilization methods. • [Base Screen] • [Window Screen] • [Mobile Screen] • [Label Group] • [Comment] • [User Alarm Observation] • [Logging] • [Recipe] • [Script] • [Device Data Transfer] • [Parts] • [Sound Files]
		[Display Screen]	Switches between the view modes of the screens in the tree. Even after the view mode is switched, the selected items in the tree remain selected.

Item		Description
6)	[Destination]	In each setting, specify a number to be used in the destination project or a utilization method.
		[Assign the first No.] specifies a start number in utilizing settings for the source project as those for the destination project with their order and differences retained. ☞ Page 242 [Assign the first No.] details
		[Detail Setting] specifies numbers setting by setting in utilization, which are used by the destination project. Click the [...] button to display the [Detail Setting] dialog. ☞ Page 243 [Detail Setting] dialog

■[GOT Environmental Setting / GOT Setup / GOT Ethernet Setting]

[Source Project]	Utilizable data	Model
[GOT Environmental Setting / GOT Setup / GOT Ethernet Setting]	Utilizes the following settings. • [Environmental Setting] window (except the setting for [Operation Log]) • [GOT Setup] window • [GOT Ethernet Setting] window	GT37 SoftGOT3000
[CSP+ for iQSS Data Write]	Utilizes the settings for [iQSS Utility] in the [GOT Setup] window.	GT37 SoftGOT3000
[Operation Log]	Utilizes the settings for [Operation Log] in the [Environmental Setting] window.	GT37 SoftGOT3000

■[SoftGOT Setting]

GT37 SoftGOT3000

Utilizes the settings in the [MELSOFT GT Designer3 (GOT3000) (SoftGOT Setting)] dialog.

■[Controller Setting]

Utilizes the settings for [Gateway Communication Setting] if the settings exist in the source project.

[Source Project]			Utilizable data	Model
[Network/Duplex Setting]	[Routing Information]		Utilizes the settings for [Routing Information] in the [Controller Setting] window.	GT37 SoftGOT3000
	[Gateway]	[Gateway Server]	Utilizes the settings for [Getaway Server] in the [Controller Setting] window.	GT37 SoftGOT3000
		[Gateway Client]	Utilizes the settings for [Gateway Client] in the [Controller Setting] window.	GT37 SoftGOT3000
	[Mail Send]		Utilizes the settings for [Mail Send] in the [Controller Setting] window.	GT37 SoftGOT3000
	[FTP Server]		Utilizes the setting for [FTP Server] in the [Controller Setting] window.	GT37 SoftGOT3000
	[File Transfer]		Utilizes the settings for [File Transfer] in the [Controller Setting] window.	
	[MELSEC Redundant]		Utilizes the settings for [MELSEC Redundant] in the [Controller Setting] window. The MELSEC redundant setting is not migrated if the corresponding channel is not set in the destination project.	GT37 SoftGOT3000
	[Station No. Switching]		Utilizes the settings for [Station No. Switching] in the [Controller Setting] window.	
[Buffer Memory Unit No. Switching]			Utilizes the settings for [Buffer Memory Unit No. Switching] in the [Controller Setting] window.	GT37 SoftGOT3000

■[Peripheral Setting]

[Source Project]	Utilizable data	Model
[Bar Code]	Utilizes the settings in the [Bar Code] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize the settings in [I/F Communication Setting].	GT37 SoftGOT3000
[RFID]	Utilizes the settings in the [RFID] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize the settings in [I/F Communication Setting].	
[PC Remote Operation]	Utilizes the settings in the [PC Remote Operation] dialog. To utilize the setting for [Destination I/F], utilize the settings in [I/F Communication Setting].	GT37 SoftGOT3000
[VNC Server]	Utilizes the settings in the [VNC Server] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize the settings in [I/F Communication Setting].	GT37 SoftGOT3000
[Digital Image Input/Recording]	Utilizes the settings in the [Digital Image Input/Recording] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize the settings in [I/F Communication Setting].	

[Source Project]	Utilizable data	Model
[Web Browser]	Utilizes the settings in the [Web Browser] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize the settings in [I/F Communication Setting].	GT37 SoftGOT3000
[External I/O / Operation Panel]	Utilizes the settings in the [External I/O / Operation Panel] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize the settings in [I/F Communication Setting].	GT37 SoftGOT3000

■[GOT Network Interaction]

GT37 SoftGOT3000

Utilizes the settings in the [GOT Network Interaction] dialog.

■[GOT Mobile Setting]

GT37 SoftGOT3000

Utilizes the settings in the [GOT Mobile Setting] window.

■[OPC UA Server Setting]

GT37 SoftGOT3000

Utilizes the following settings.

Setting to be utilized	Requirements
[OPC UA Server Setting]	None
[OPC UA Tag Setting]	None

■[I/F Communication Setting]

GT37 SoftGOT3000

Utilizes the following settings.

Setting to be utilized	Requirements
Interface setting for each channel	The same channel No. set for the source project must be enabled for the destination project.
The setting for [Destination I/F] in the setting for each peripheral device	None

■[Screen Design]

GT37 SoftGOT3000

Utilizes the settings in the [Screen Design] dialog.

■[Base Screen]

GT37 SoftGOT3000

This item appears when [Screen Type] is selected for [Display Screen].
Utilizes base screens.
Screens to be utilized can be selected individually.
The following settings for the screens to be utilized are also utilized.

Setting to be utilized	Requirements
Screen trigger action	None
Project script setting	A project script is utilized when the following item is selected in the [Script Edit] dialog. • [Include this script in a screen-related setting when utilizing project/screen]
Screen script setting	None
Script symbol	None

When utilized by the destination project, script data are associated with an existing script number + 1.
To specify a script number to be used in utilization by the destination project, select [Script].

■[Window Screen]

GT37 SoftGOT3000

This item appears when [Screen Type] is selected for [Display Screen].
Utilizes window screens.
Screens to be utilized can be selected individually.
The following settings for the screens to be utilized are also utilized.

Setting to be utilized	Requirements
Screen trigger action	None
Project script setting	A project script is utilized when the following item is selected in the [Script Edit] dialog. • [Include this script in a screen-related setting when utilizing project/screen]
Screen script setting	None
Script symbol	None

When utilized by the destination project, script data are associated with an existing script number + 1.
To specify a script number to be used in utilization by the destination project, select [Script].

■[Mobile Screen]

GT37 SoftGOT3000

This item appears when [Screen Type] is selected for [Display Screen].
Utilizes mobile screens.
Screens to be utilized can be selected individually.

■Screen group

GT37 SoftGOT3000

This item appears when [Screen Group] is selected for [Display Screen].

Utilizes the screen group that includes the utilization target screen.

[Source Project]	Utilizable data	Model
[Uncategorized]	Utilizes unclassified screens.	GT37 SoftGOT3000
Registered screen group	Utilizes the screens registered in the screen group.	

The following settings for the screens to be utilized are also utilized.

Setting to be utilized	Requirements
Screen trigger action	None
Project script setting	A project script is utilized when the following item is selected in the [Script Edit] dialog. • [Include this script in a screen-related setting when utilizing project/screen]
Screen script setting	None
Script symbol	None

■[Label]

GT37 SoftGOT3000

Utilizes the relevant label groups.

Label groups to be utilized can be selected individually.

■[Comment]

GT37 SoftGOT3000

Utilizes comment groups.

Comment groups to be utilized can be selected individually.

■[Alarm]

[Source Project]		Utilizable data	Model
[Alarm Common Setting]		Utilizes the settings in the [Alarm Common Setting] dialog.	GT37 SoftGOT3000
[User Alarm Observation]	Registered user alarm monitoring settings	Utilizes the user alarm monitoring settings. You can select individual user alarm monitoring settings to be utilized.	
[System Alarm Observation]		Utilizes the settings in the [System Alarm Observation] dialog.	
[Alarm Popup Display]		Utilizes the settings in the [Alarm Popup Display] dialog.	

■[Logging]

[Source Project]	Utilizable data	Model
Registered logging settings	Utilizes logging settings. Logging settings to be utilized can be selected individually.	GT37 SoftGOT3000

■[Recipe]

[Source Project]		Utilizable data	Model
[Recipe Common Setting]		Utilizes the settings in the [Recipe Common Setting] dialog.	GT37 SoftGOT3000
[Recipe]	Registered recipe settings	Utilizes recipe settings. Recipe settings to be utilized can be selected individually.	

■[Script]

[Source Project]		Utilizable data	Model
[Script (Project, Symbol)]		Utilizes the following settings. • Project script setting • Script symbol The script of a utilized project script setting is executed after the script of an existing project script setting in the destination project is executed.	GT37 SoftGOT3000
[Script File List (Script)]	Registered script text	Utilizes scripts. Scripts to be utilized can be selected individually.	
[Script File List (Script Block)]	Registered script block text	Utilizes script blocks. Script blocks to be utilized can be selected individually.	
[Object Script Symbol]		Utilizes the settings in the [Object Script Symbol] dialog.	

■[Device Data Transfer]

GT37 SoftGOT3000

Utilizes device data transfer settings.

Device data transfer settings to be utilized can be selected individually.

■[Trigger Action (Project)]

GT37 SoftGOT3000

Utilizes the settings for the trigger actions commonly used in a project.

To utilize the settings for the trigger actions of individual screens, utilize the screen for which the required trigger actions have been set.

■[Time Action]

GT37 SoftGOT3000

Utilizes the settings for the time action.

■[Hard Copy]

GT37 SoftGOT3000

Utilizes the settings in the [Hard Copy] dialog.

■[Parts]

[Source Project]	Utilizable data	Model
[Parts Setting]	Utilizes the settings in the [Parts Setting] dialog.	GT37 SoftGOT3000
Registered parts	Utilizes parts. Parts to be utilized can be selected individually.	

■[Sound Files]

[Source Project]	Utilizable data	Model
[Touch Key Sound Setting]	Utilizes the settings in the [Touch Key Sound Setting] dialog.	GT37 SoftGOT3000
Registered sound files	Utilizes sound files. Sound files to be utilized can be selected individually.	

[Assign the first No.] details

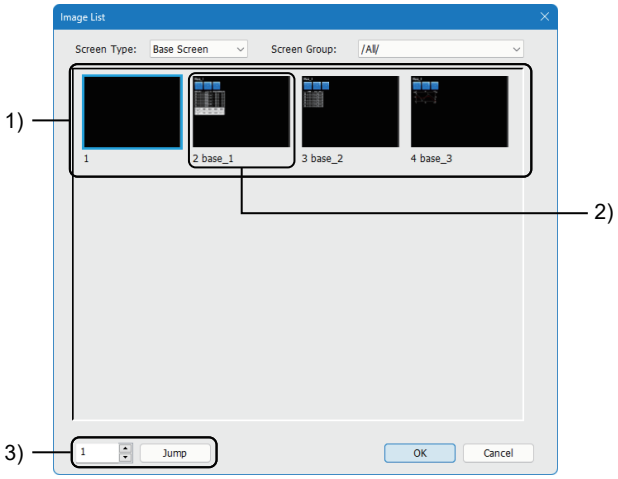
GT37 SoftGOT3000

The setting range for the first number depends on the item.

Item	Setting range	Remarks
[Base Screen]	0 to 32767	Click the [Image] button to display the [Image List] dialog (screen) dialog. The images of the screens existing in the project being edited can be checked. ☞ Page 3683 [Image List] dialog (screen)
[Window Screen]	0 to 32767	
[Mobile Screen]	0 to 32767	
[Label Group]	1 to 200	If the start number that is set is used in the destination project, the name of the setting is displayed. Example) If comment group No.1 has been used  The name of comment group No.1 is displayed.
[Comment Group]	1 to 500	
[User Alarm Observation]	1 to 32767	
[Logging]	1 to 32767	
[Recipe]	1 to 32767	
[Script File List (Script)]	1 to 32767	—
[Script File List (Script Block)]	1 to 32767	—
[Device Data Transfer]	1 to 255	If the start number that is set is used in the destination project, the name of the setting is displayed.
[Parts]	1 to 32767	Click the [Image] button to display the [Image List] dialog (parts). The images of the parts registered in the project being edited can be checked. ☞ Page 242 [Image List] dialog (parts)
[Sound File]	1 to 500	Click the [Browse] button to display the [Sound File List] dialog. The sound files registered in the project being edited can be checked. When the dialog is displayed from the [Utilize Project] dialog, sound files are not registered and deleted. ☞ Page 2715 [Sound File List] dialog

■[Image List] dialog (parts)

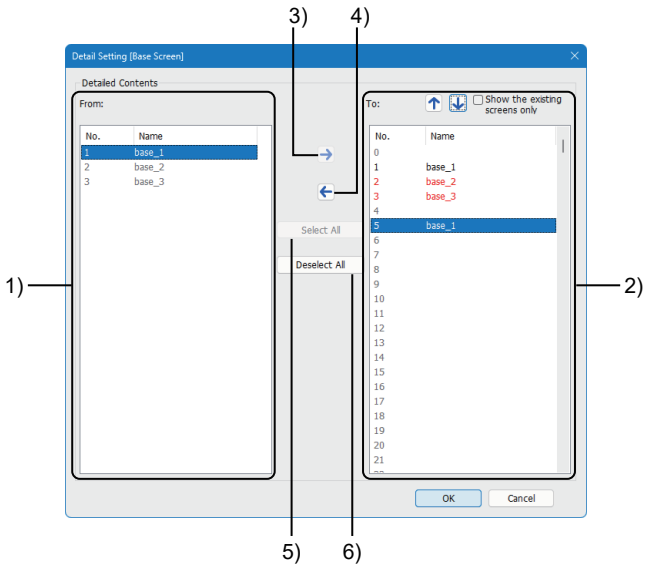
GT37 SoftGOT3000



Item		Description
1)	Image type	Select the type of the images to be displayed in the parts image list.
2)	Parts image list	Display the images of parts.
3)	Jump	Set a part number and click the [Jump] button to display the images of the specified part on the parts image list.

[Detail Setting] dialog

GT37 SoftGOT3000



Item			Description
1)	[From]	—	Lists the settings utilizable from the source project. For mouse and keyboard operations, refer to the following. ☞ Page 244 Mouse and keyboard operations The text color of a setting represents the status of the setting. • Black Setting that is not added to [To]. To utilize a setting in the destination project, add the setting to [To] with the [→] button. • Gray Setting added to [To].
		[No.]	Number of each setting in the source project.
		[Name]	Name of each setting in the source project.
2)	[To]	—	Lists the settings in the destination project. The number of each setting in the destination project can be changed with the [↑] button or the [↓] button. For mouse and keyboard operations, refer to the following. ☞ Page 244 Mouse and keyboard operations • Black Setting existing in the destination project. • Blue Setting added from [From]. • Red Duplicate setting number in the destination project.
		[↑] button [↓] button	Moves the setting selected in [To] up or down.
		[Skip blank rows]	Only displays the rows where a setting is present.
		[No.]	Number of each setting in the destination project.
		[Name]	Name of each setting in the destination project.
3)	[→] button		Adds the setting selected in [From] to the row selected in [To]. If no row has been preselected in [To], the [Destination Data No. Specification] dialog appears.  • [Destination Data No.] Specify a setting number to be assigned in the destination project. The setting range varies depending on the setting to be utilized.
4)	[←] button		Deletes the setting selected in [To].

Item		Description
5)	[Select All] button	Adds all the settings listed in [From] to [To]. The settings are added to the selected row and subsequent rows in [To]. If no row has been preselected in [To], each setting is added with its setting number unchanged.
6)	[Deselect All] button	Deletes all the added settings from [To].

■Mouse and keyboard operations

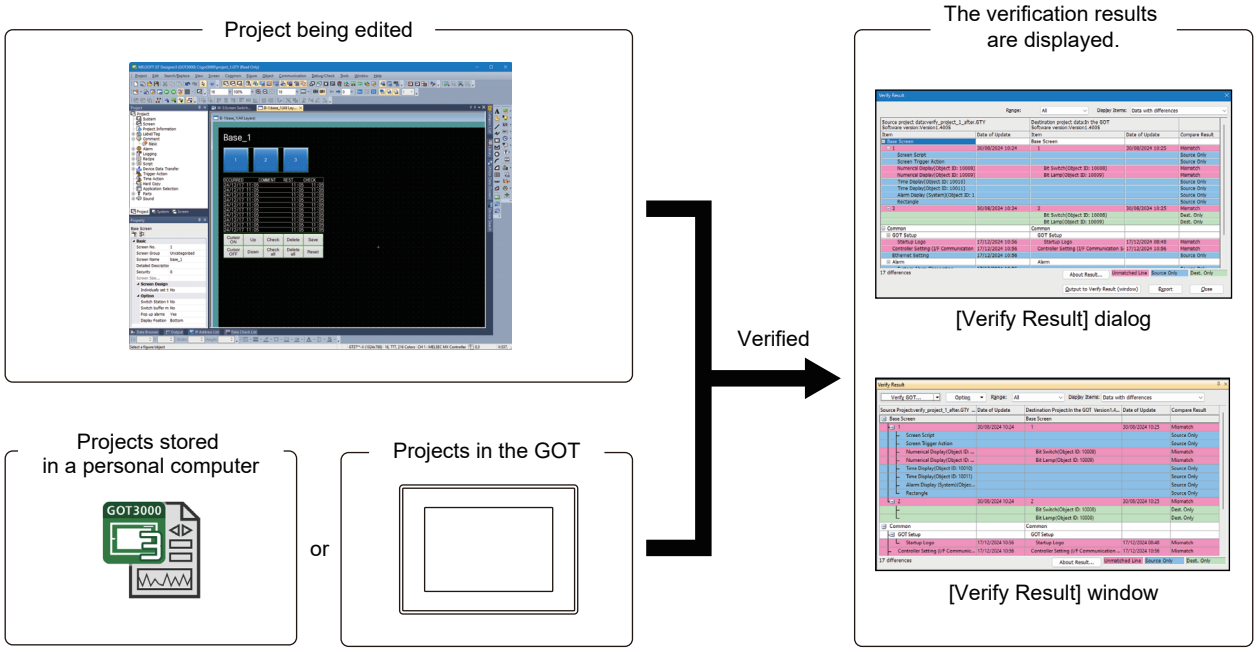
The following shows operating [From] and [To] with a mouse and keyboard.

Operation	[From]	[To]
↑ ↓	Moves the cursor.	
Shift + ↑ Shift + ↓	Moves the row while selecting the row where the cursor is positioned. The destination row of the cursor is also selected.	—
Home	Moves the cursor to the top row.	
End	Moves the cursor to the bottom row.	
PgUp	Moves the cursor from the row with the cursor to the corresponding row up one page.	
PgDown	Moves the cursor from the row with the cursor to the corresponding row down one page.	
Shift + Home	Selects the rows from the row where the cursor is positioned to the top row.	—
Shift + End	Selects the rows from the row where the cursor is positioned to the bottom row.	—
Shift + PgUp	Selects the rows from the row where the cursor is positioned to the corresponding row up one page.	—
Shift + PgDown	Selects the rows from the row where the cursor is positioned to the corresponding row down one page.	—
Shift + Click	Selects the rows from the row with the cursor to the row where the mouse is clicked.	—
Ctrl + Space	Selects or deselects a row.	Selects or deselects a row.
Ctrl + Click		—

6.4 Verifying a project

GT37 SoftGOT3000

Verify a project being edited in GT Designer3 against another project.
Differences can be checked by screen or by object.



☞ Page 246 Specification of verification
☞ Page 248 Verifying a project
☞ Page 249 [Verify Project] dialog
☞ Page 250 [Verify Result] window
☞ Page 261 [Verify Result] dialog
☞ Page 262 Details of the exported file

6.4.1 Specification of verification

GT37 SoftGOT3000

☞ Page 246 Verifiable projects
☞ Page 246 Verification method
☞ Page 247 Verifying against a project edited by GT Designer3 of another version
☞ Page 247 Verifying the current project against the project stored in the GOT after writing package data to multiple GOTs in one go
☞ Page 247 Verifying against a project for which security is set

Verifiable projects

GT37 SoftGOT3000

Verification is available for the following projects.

- Projects stored in a personal computer
- Projects in the GOT

■Verifying against a stored project in a personal computer

GT37 SoftGOT3000

The following shows the verifiable project formats.

GOT	Project format
GOT3000 series	• *.GTY • *.GTYS • *.GTYP • *.G3

Verification is unavailable between the projects that specify different GOT types.
If the verification target is the package data (*.GTYS), the system application is not verified.

■Verifying against a project in the GOT

GT37 SoftGOT3000

Verification against a project is available by establishing communications with the GOT3000 series.
Verification is unavailable between the projects that specify different GOT types.

Verification method

GT37 SoftGOT3000

The following shows the methods of verifying a project.

Verification method	Description
Data check	This method verifies settings.
Time stamp check	This method verifies time stamps of files. This method can be selected only for verifying against a project in GOT.

The following shows the verification target items of each method.

☞ Page 251 Verification items for data check
☞ Page 259 Verification items for time stamp check

Verifying against a project edited by GT Designer3 of another version

GT37 SoftGOT3000

If the version of GT Designer3 used to edit the verification target project and that being used for the project being edited are different, the verification results may be different from those obtained when the version is the same.

Verifying the current project against the project stored in the GOT after writing package data to multiple GOTs in one go

GT37 SoftGOT3000

When you write package data to multiple GOTs in one go, the individual identification information and the communication interface setting data are not written.

Accordingly, inconsistencies in the following settings may be detected as a result of the verification.

- [Individual Identification Information]
- [Controller Setting (I/F Communication Setting)]

Verifying against a project for which security is set

GT37 SoftGOT3000

■Verifying against a project protected with project security

If project security has been set for the verification target project, user authentication is performed.

Only authenticated projects can be verified.

If display-disabled screens or scripts exist in the project being edited or the verification target project, verification of the project is unavailable.

☞ Page 2972 Protecting a project by registering users (Project security)

■Verifying against a project with the information protection function set

If a password is set by the information protection function for the verification target project, password authentication is performed.

Only authenticated projects can be verified.

☞ Page 3065 Protecting the files in the GOT (Information protection function)

6.4.2 Verifying a project

GT37 SoftGOT3000

☞ Page 248 Verifying against a stored project in a personal computer
☞ Page 248 Verifying against a project in the GOT

Verifying against a stored project in a personal computer

GT37 SoftGOT3000

1. Perform one of the following operations to display the [Verify Project] dialog.

☞ Page 249 [Verify Project] dialog

- Select [Project] → [Verify Data] from the menu.
- In the [Verify Result] window, click the [Verify Project] button and select [Verify Project] from the pull-down menu.

2. Set [Target Project] and click the [Verify] button to display the verification results in the [Verify Result] window.

If different versions of GT Designer3 are used for the project being edited and the verification target project, a dialog appears, confirming that a verification is executed according to the version of GT Designer3 used for the project being edited.
Click [Yes] button to execute the verification.

Point

If security is set for the verification target project, user authentication is performed.

☞ Page 2972 Protecting a project by registering users (Project security)

If a password is set by the information protection function for the verification target, password authentication is performed.

☞ Page 3065 Protecting the files in the GOT (Information protection function)

3. Check the verification results in the [Verify Result] window.

☞ Page 250 [Verify Result] window

Verifying against a project in the GOT

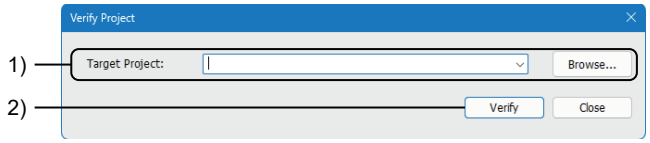
GT37 SoftGOT3000

For information on how to verify the project being edited against a project in GOT, refer to the following.

☞ Page 443 Verifying with the project data in the GOT

6.4.3 [Verify Project] dialog

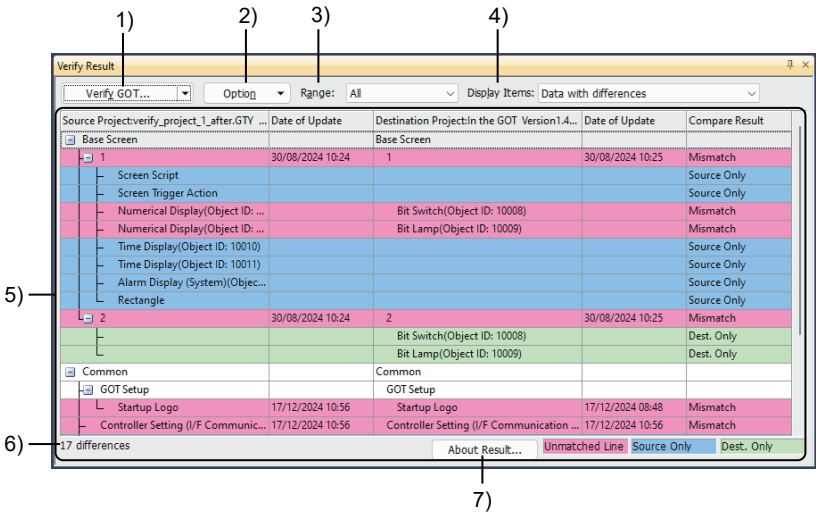
GT37 SoftGOT3000



Item		Description
1)	[Target Project]	Set the project being edited and the verification target project. The path can be set from the [Browse] button.
2)	[Verify] button	Starts verification and displays the [Verify Result] window. The verification results can be checked. ☞ Page 250 [Verify Result] window

6.4.4 [Verify Result] window

GT37 SoftGOT3000



Item			Description
1)	Verification start button	—	Starts verification. Select a verification method from the pull-down menu.
		[Verify Project]	Verifies the project being edited against a project saved in the personal computer.
		[Verify GOT]	Displays the [GOT Verification] tab of the [Communicate with GOT] dialog. ☞ Page 475 [GOT Verification] tab In the dialog, verify the project being edited against a project saved in the GOT.
2)	[Option] button	—	Select an item from the pull-down menu to operate the [Verify Result] window.
		[Export]	Saves the verification results as a Unicode text file. Set [File name] and click the [Save] button in the displayed dialog. ☞ Page 262 Details of the exported file
3)	[Range]		Narrow the displayed contents of the verification results by selecting a verification item.
4)	[Display Items]		Narrow the displayed contents of the verification results by selecting the type of differences.
5)	Verification results	—	Displays the results of verification. In each row, the target item for verification is shown. The item that has been set for neither the project being edited nor the verification target project is not displayed. The verified items differ depending on the verification method. (For the verification against a project stored in a personal computer, the verification method available is only the data check.) ☞ Page 251 Verification items for data check ☞ Page 259 Verification items for time stamp check The background color of a row varies according to the type of the difference. • Blue: The item exists only in the verification source project. • Green: The item exists only in the verification target project. • Red: The item exists in both projects and the data are not matched. Double-click an item in the verification source project to select the corresponding object or others, or display the corresponding dialog. For the behavior of double-clicking an item, refer to the following. ☞ Page 251 Verification items for data check Right-click a row and select [Open the Setting dialog] from the menu to display the corresponding setting dialog. This function is not available to the row indicating an order mismatch and the data existing only in the verification target project. The verification results are retained even if you close the [Verify Result] window. To delete the verification results, close the project or convert the GOT type set in the project.
		[Source Project]	Displays the information of the project being edited.
		[Destination Project]	Displays the information of the verification target project.
		[Compare Result]	Displays the presence/absence and the type of differences.

Item		Description
6)	Number of differences	This item appears when any difference exists. When the verification method is set to the data check, the item (screen number or title) immediately below the [Base Screen], [Window Screen], or [Mobile Screen] row is not counted.
7)	[About Result] button	Displays Help.

Verification items for data check

GT37 SoftGOT3000

The following shows the items to be verified by the data check.

In the [Verify Result] window, double-clicking an item in the verification source project selects the corresponding object or others, or displays the corresponding dialog.

■[Screen Design]

GT37 SoftGOT3000

Double-click this item to display the [Screen Design] dialog.

■[Base Screen]

Verifies the base screens that exist in a project by screen No.

Also verifies the following items set in each screen.

[Item]	Remarks	Model
[Screen Property]	Double-clicking this item displays the corresponding screen and the [Base Screen Property] dialog.	GT37 SoftGOT3000
[Screen Script]	Double-clicking this item displays the [Screen] tab of the [Script] dialog.	
[Screen Trigger Action]	Double-clicking this item displays the [Screen] tab of the [Trigger Action] dialog.	
Figure/object type name (Object ID) (Name)	The figures or objects having the same object ID are verified. The figure IDs are controlled internally and cannot be checked. When you cut or copy a figure and then paste it to the location where the original figure has been placed, if the original and pasted figures have different IDs, the figures are handled as different data. The name appears when it is set for a figure or object. Double-clicking this item selects the corresponding figure or object on the screen editor.	
[(Unmatched figure/object stacking order)]	The placement orders of figures or objects, and the states of grouping are verified. This item appears when the numbers of placed figures or objects are the same. The verification starts from the rearmost figure or object. Double-clicking this item selects a figure or object in which the first placement order difference is detected. When the placement order of a figure or object is directly changed, double-clicking this item may select any figure or object whose placement order is affected by the change. The placement order also differs when figures or objects are grouped.	

■[Window Screen]

Verifies the window screens that exist in a project by screen No.

Also verifies the following items set in each screen.

[Item]	Remarks	Model
[Screen Property]	Double-clicking this item displays the corresponding screen and the [Window Screen Property] dialog.	GT37 SoftGOT3000
[Screen Script]	Double-clicking this item displays the [Screen] tab of the [Script] dialog.	
[Screen Trigger Action]	Double-clicking this item displays the [Screen] tab of the [Trigger Action] dialog.	
Figure/object type name (Object ID) (Name)	The figures or objects having the same object ID are verified. The figure IDs are controlled internally and cannot be checked. When you cut or copy a figure and then paste it to the location where the original figure has been placed, if the original and pasted figures have different IDs, the figures are handled as different data. The name appears when it is set for a figure or object. Double-clicking this item selects the corresponding figure or object on the screen editor.	
[(Unmatched figure/object stacking order)]	The placement orders of figures or objects, and the states of grouping are verified. This item appears when the numbers of placed figures or objects are the same. The verification starts from the rearmost figure or object. Double-clicking this item selects a figure or object in which the first placement order difference is detected. When the placement order of a figure or object is directly changed, double-clicking this item may select any figure or object whose placement order is affected by the change. The placement order also differs when figures or objects are grouped.	

■[Mobile Screen]

Verifies the mobile screens that exist in a project by screen No.

Also verifies the following items set in each screen.

[Item]	Remarks	Model
[Screen Property]	Double-clicking this item displays the corresponding screen and the [Mobile Screen Property] dialog.	GT37 SoftGOT3000
Figure/object type name (Object ID) (Name)	The figures or objects having the same object ID are verified. The figure IDs are controlled internally and cannot be checked. When you cut or copy a figure and then paste it to the location where the original figure has been placed, if the original and pasted figures have different IDs, the figures are handled as different data. The name appears when it is set for a figure or object. Double-clicking this item selects the corresponding figure or object on the screen editor.	
[(Unmatched figure/object stacking order)]	The placement orders of figures or objects, and the states of grouping are verified. This item appears when the numbers of placed figures or objects are the same. The verification starts from the rearmost figure or object. Double-clicking this item selects a figure or object in which the first placement order difference is detected. When the placement order of a figure or object is directly changed, double-clicking this item may select any figure or object whose placement order is affected by the change. The placement order also differs when figures or objects are grouped.	

■[Common]

[Item]		Remarks	Model
[GOT Type Setting]		Double-clicking this item displays the [Type Setting] dialog.	GT37 SoftGOT3000

[Parts]	[Parts Setting]	Double-clicking this item displays the [Parts Setting] dialog.	GT37 SoftGOT3000
	[Parts]	The data is verified by registered part. Double-clicking this item displays the parts editor for the corresponding part.	GT37 SoftGOT3000
[Sound]	[Touch Key Sound Setting]	Double-clicking this item displays the [Touch Key Sound Setting] dialog.	GT37 SoftGOT3000
	[Sound Files]	The data is verified by registered sound file. Double-clicking this item displays the [Sound File List] dialog.	
[Project Information]		The latest update date and the edit version history are not included in the verification targets. Double-clicking this item displays the [Project Information] dialog.	GT37 SoftGOT3000

■[Individual Identification Information]

GT37 SoftGOT3000

Double-clicking this item displays the [Standard Port] tab of the [GOT Ethernet Setting] window ([GOT IP Address Setting]).
The following pieces of information are included in the individual identification information.

- [GOT ID]
- [GOT Net No.]
- [GOT Station]
- [GOT IP Address]
- [Subnet Mask]
- [Default Gateway]
- [Peripheral S/W Communication Port No.]
- [Transparent Port No.]
- [IP Filter Setting]

■[Communication Configuration/GOT Setting List]

GT37 SoftGOT3000

Double-clicking this item displays the [Communication Configuration] dialog.

Verification items for time stamp check

The following shows the items to be verified by the time stamp check.

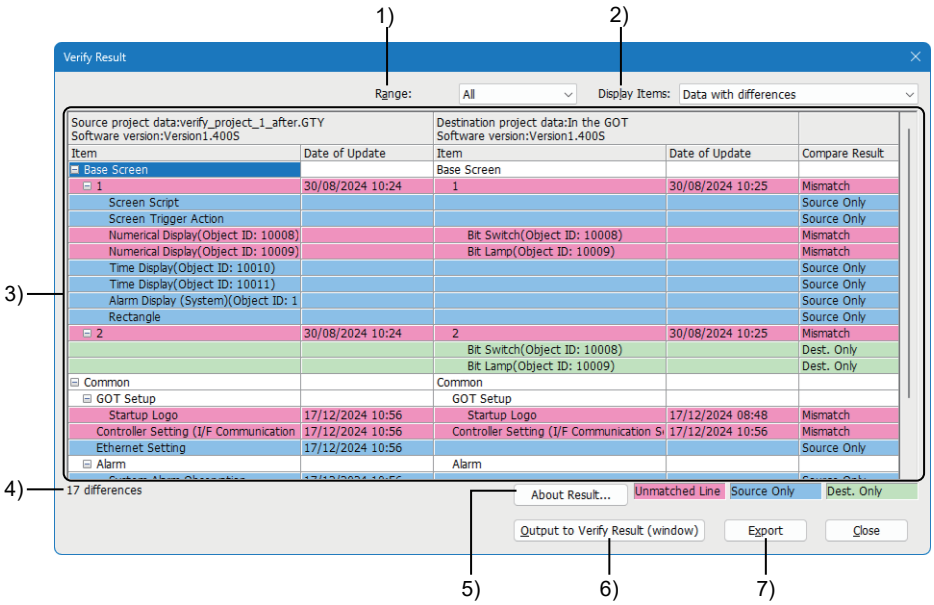
The time stamp check does not support displaying a setting dialog from a verification result.

[Item]		Remarks	Model
[Base Screen]		Verifies the base screens that exist in a project by screen No.	GT37 SoftGOT3000
[Window Screen]		Verifies the window screens that exist in a project by screen No.	GT37 SoftGOT3000
[Mobile Screen]		Verifies the mobile screens that exist in a project by screen No.	GT37 SoftGOT3000
[Common]		The following settings are also verified. • [Project Information] (except the last update date and the edit history) • [Screen Design] • [OPC UA Server Setting]	GT37 SoftGOT3000
[GOT Setup]		—	GT37 SoftGOT3000
[Startup Logo]		—	GT37 SoftGOT3000
[Controller Setting (I/F Communication Setting)]		—	GT37 SoftGOT3000
[Ethernet Setting]		—	GT37 SoftGOT3000
[Comment]		The data is verified by comment group No.	GT37 SoftGOT3000
[Recipe]	[Recipe Common Setting]	—	GT37 SoftGOT3000
	[Recipe]	The data is verified by recipe No.	GT37 SoftGOT3000
[Device Data Transfer]		—	GT37 SoftGOT3000

[Item]	Remarks	Model
[Application Selection]	—	GT37 SoftGOT3000
[Parts]	—	GT37 SoftGOT3000
[Sound]	—	GT37 SoftGOT3000
[Individual Identification Information]	—	GT37 SoftGOT3000
[Communication Configuration/GOT Setting List]	—	GT37 SoftGOT3000
[Label] (label (GT Designer3))	—	GT37 SoftGOT3000

6.4.5 [Verify Result] dialog

GT37 SoftGOT3000

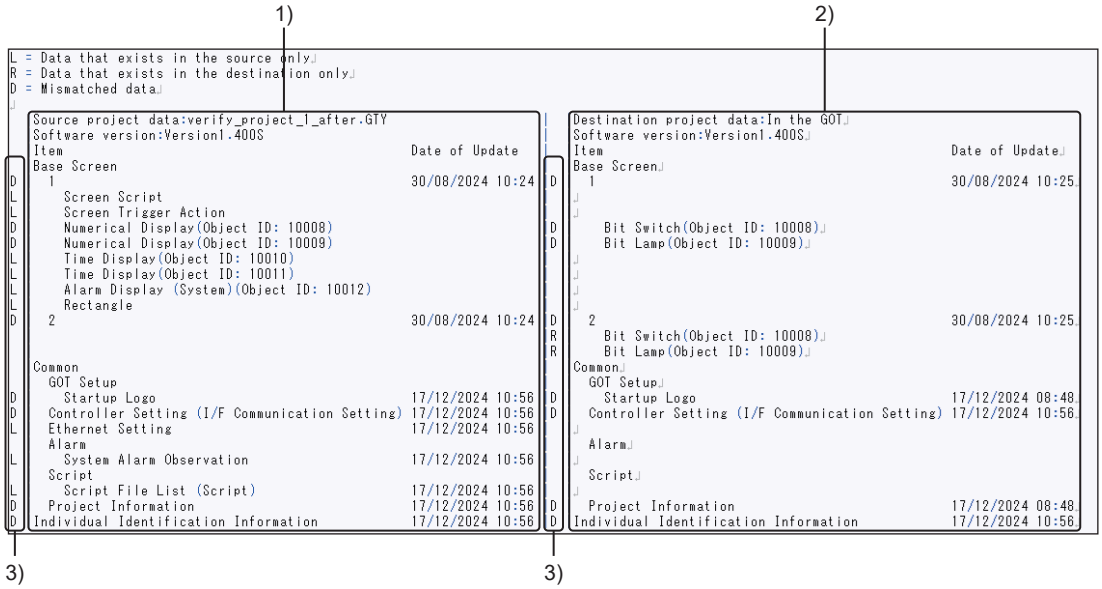


Item			Description
1)	[Range]		Narrow the displayed contents of the verification results by selecting a verification item.
2)	[Display Items]		Narrow the displayed contents of the verification results by selecting the type of differences.
3)	Verification results	—	Displays the results of verification. In each row, the target item for verification is shown. The item that has been set for neither the project being edited nor the verification target project is not displayed. The verified items differ depending on the verification method. (For the verification against a project stored in a personal computer, the verification method available is only the data check.) ☞ Page 251 Verification items for data check ☞ Page 259 Verification items for time stamp check The background color of a row varies according to the type of the difference. • Blue: The item exists only in the verification source project. • Green: The item exists only in the verification target project. • Red: The item exists in both projects and the data are not matched.
		[Source project data]	Displays the information of the project being edited.
		[Destination project data]	Displays the information of the verification target project.
		[Compare Result]	Displays the presence/absence and the type of differences.
4)	Number of differences		This item appears when any difference exists. When the verification method is set to the data check, the item (screen number or title) immediately below the [Base Screen], [Window Screen], or [Mobile Screen] row is not counted.
5)	[About Result] button		Displays Help.
6)	[Output to Verify Result (window)] button		This item appears only when the verification method is set to the data check. Displays the verification results in the [Verify Result] window. The settings of [Range] and [Display Items] are retained. Even if the [Verify Result] dialog is closed, you can check the verification results. ☞ Page 250 [Verify Result] window
7)	[Export] button		Saves the verification results as a Unicode text file. Set [File name] and click the [Save] button in the displayed dialog. ☞ Page 262 Details of the exported file

6.4.6 Details of the exported file

GT37 SoftGOT3000

The following shows the details of the exported file of verification results.



Item		Description
1)	[Source project data]	Displays the information of the project being edited. In each row, the target item for verification is shown.
2)	[Destination project data]	Displays the information of the verification target project. In each row, the target item for verification is shown.
3)	Types of differences	Displays the types of differences. • [L]: The item exists only in the verification source project. • [R]: The item exists only in the verification target project. • [D]: The item has a difference in its data.

6.5 Creating a screen

GT37 SoftGOT3000

The following shows how to create a screen.

Method	Description
Creating a new screen	Create a new screen. ☞ Page 264 Creating a base screen ☞ Page 265 Creating a window screen For information on how to create a mobile screen, refer to the following. ☞ Page 2800 Creating a mobile screen
Utilizing a screen	Read the screen data of another project to the project being edited. The screen data to be read can be searched by a keyword or other criteria. This is helpful to determine an existing screen to be copied to create a screen by copying. ☞ Page 266 Utilizing a screen
Utilizing screen data of another project	Read the specified screen data of another project to the project being edited. This is helpful when the settings of the project to be utilized are recognized. ☞ Page 226 Utilizing other project data
Copying a screen	Copy an existing screen. ☞ Page 290 Copying a screen

Point

If a login user has access on which project editing is banned, the user cannot create any screen.

☞ Page 2972 Protecting a project by registering users (Project security)

6.5.1 Creating a new screen

GT37 SoftGOT3000

☞ Page 264 Creating a base screen

☞ Page 265 Creating a window screen

PART 4

Creating a base screen

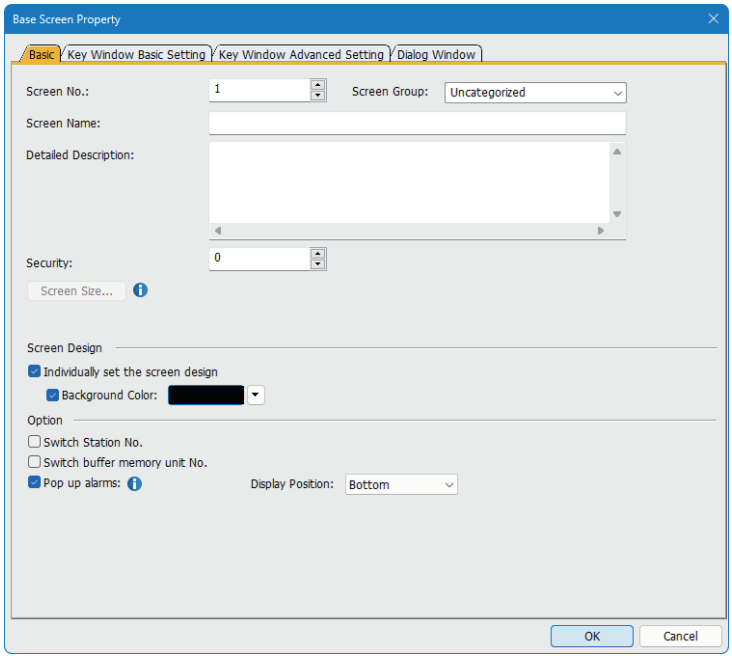
GT37 SoftGOT3000

For details on the screen sizes and registrable number of screens, refer to the following.

☞ Page 62 Specifications of base screens

1. Perform either of the following operations to display the [Base Screen Property] dialog.

- Select [Screen] → [New] → [Base Screen] from the menu.
- In the [Screen] window, click the [New Screen] button and select [Base Screen] from the pull-down menu.



2. Configure the settings, and click the [OK] button.

☞ Page 313 Base screen properties

3. A base screen is created and a screen editor appears on the work window.

Point

By enabling the base screen size expansion, you can create base screens that are larger than the GOT screen.

☞ Page 510 Expanding the base screen size

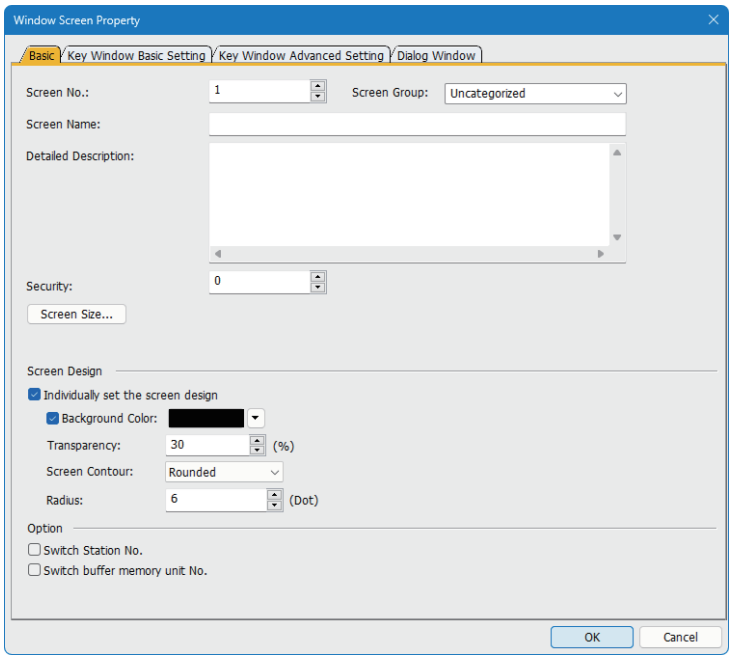
Creating a window screen

GT37 SoftGOT3000

The setting range for the window screen size depends on the display method of the window screen on the GOT.
For details on the screen sizes and registrable number of screens, refer to the following.
☞ Page 62 Specifications of base screens

1. Perform either of the following operations to display the [Window Screen Property] dialog.

- Select [Screen] → [New] → [Window Screen] from the menu.
- In the [Screen] window, click the [New Screen] button and select [Window Screen] from the pull-down menu.



2. Configure the settings, and click the [OK] button.
☞ Page 323 Window screen properties

3. A window screen is created and a screen editor appears on the work window.

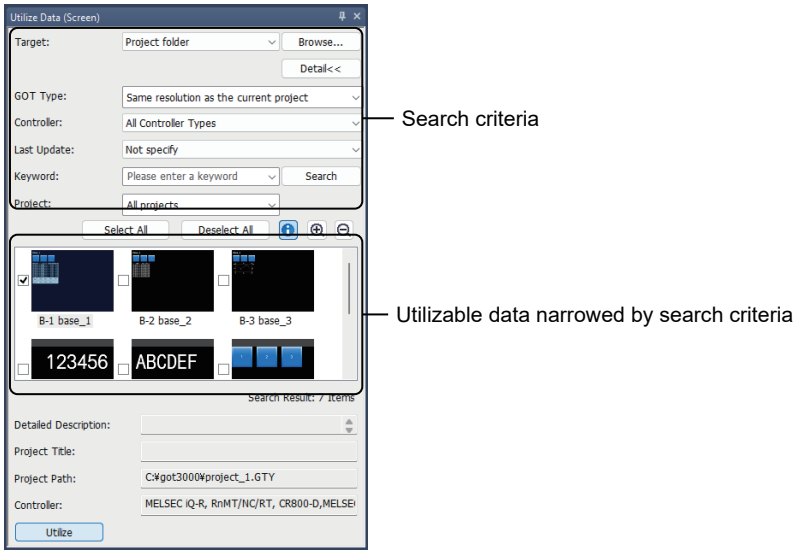
6.5.2 Utilizing a screen

GT37 SoftGOT3000

Read the screen data of another project to the project being edited.

The screen data to be read can be searched by a keyword or other criteria.

This is helpful to determine an existing screen to be copied to create a screen by copying.



Point

If you know the settings in a project to be utilized, you can specify the screens to be utilized and read the screen data to the project being edited.

☞ Page 226 Utilizing other project data

☞ Page 267 Specifications of screen utilization
☞ Page 268 Utilizing a screen
☞ Page 272 [Utilize Data (Screen)] window
☞ Page 274 [Utilize] dialog

Specifications of screen utilization

GT37 SoftGOT3000

■Utilizable project formats

The following shows the utilizable project formats.

GOT	Project format
GOT3000 series	• *.GTY • *.GTYS • *.GTYP If a project is saved without deselecting [Include projects for the function of Utilize Data] in the [Project Information] dialog, the project is not utilizable.

■Settings to be changed when utilized

Item	Specifications
GOT type	Utilized data are converted according to the GOT type set for the destination project. Functions that does not correspond to the GOT type of the destination project are not eliminated.
Controller setting	When [Retain the CH No.] is selected in the [Utilize] dialog ([Controller Setting]), the devices set for the objects on the utilized screens will be changed as shown below. • The device name is changed according to the controller setting in the destination project. • The device to which the controller setting in the destination project does not correspond is changed to [??] (except the devices in the script data) Check and change the device settings.
	If you use GT Designer3 version earlier than the version of GT Designer3 that has been used to create the source project, you cannot utilize the settings of controllers unsupported.
Base screen	The window preview settings for the source project will be migrated to the destination project if [Apply to all base screens] is deselected in the [Window Preview] dialog in the destination project. If [Apply to all base screens] is selected in the destination project, the window preview settings of the destination project will be applied.
Comment group	If the Windows fonts used for comment groups are not installed on the personal computer, the comments are displayed in different fonts. To display the comments in the specified Windows fonts, make sure that the fonts are installed on the personal computer before utilizing the project.

■Utilizing a project protected with project security

When project security is set in the search target project, user authentication is conducted.

When project security is set in the project that is being edited, the search target project that can be authenticated is automatically authenticated by the logged-in user name and password.

Only the screens of authenticated projects are displayed in the search result list.

In the following cases, the screen is not displayed in the search result list and cannot be utilized.

- Authentication of the project has failed.
- Display of the project is prohibited with access privileges of an authenticated user.

For screens whose display is prohibited with access privileges of an authenticated user, dummy screens are displayed in the search result list and cannot be utilized.

☞ Page 2972 Protecting a project by registering users (Project security)

■Utilizing a project with the information protection function set

If a password is set by the information protection function for the search target project, password authentication is performed.

Only the screens of authenticated projects are displayed in the search result list.

☞ Page 3065 Protecting the files in the GOT (Information protection function)

Utilizing a screen

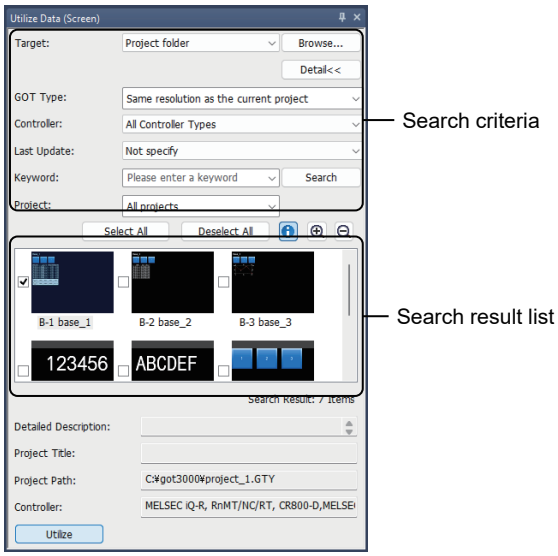
GT37 SoftGOT3000

1. Select [Screen] → [Utilize Data] from the menu to display the [Utilize Data (Screen)] window.

Point

The [Utilize Data (Screen)] window is one of the docking windows. It is docked with other windows in GT Designer3 by default.
For the operations of the docking windows, refer to the following.
☞ Page 194 Screen layout of the docking windows

2. Set the search criteria and click the [Search] button to list the search results.
☞ Page 272 [Utilize Data (Screen)] window

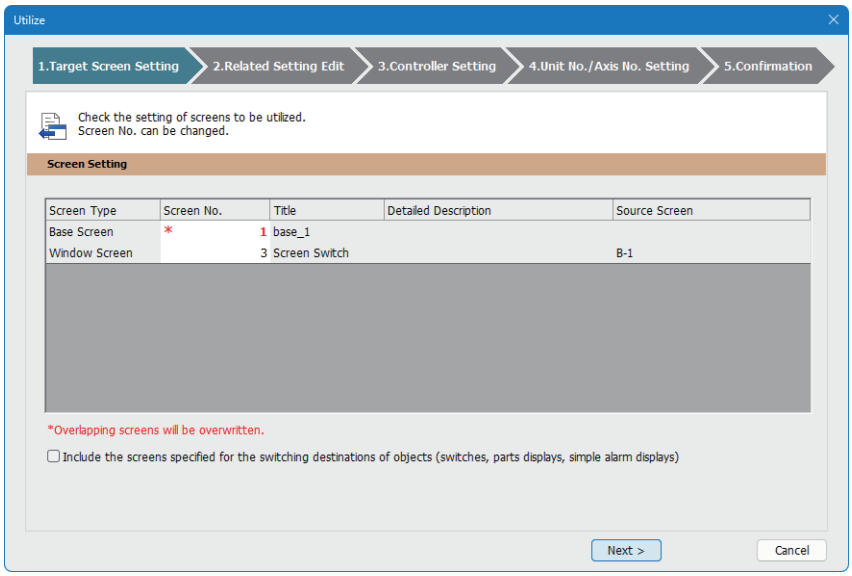


3. Select the screen to be utilized and perform one of the following operations to display the [Utilize] dialog.
☞ Page 274 [Utilize] dialog

- Click the [Utilize] button.
- Drag a target screen to the work window from the search result list.

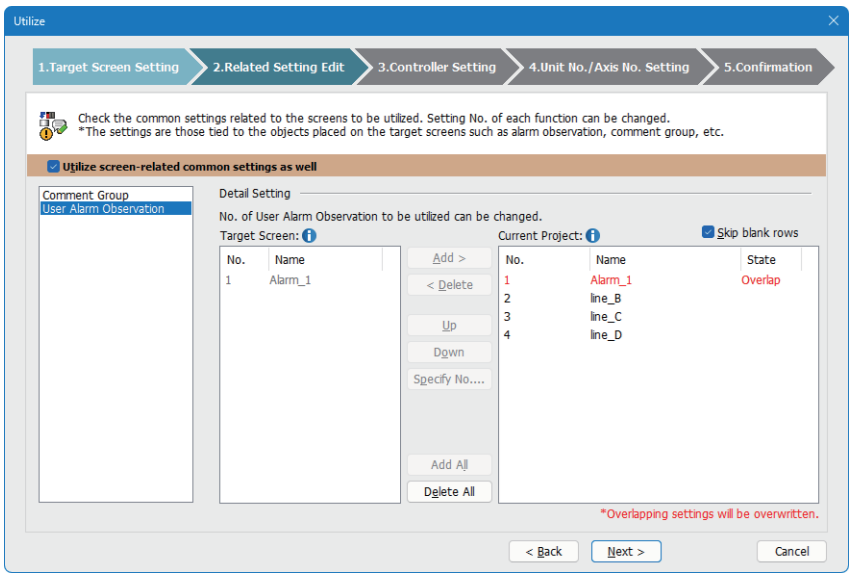
4. Set a screen number to be assigned in the destination project, and click the [Next] button.

☞ Page 275 [Target Screen Setting]



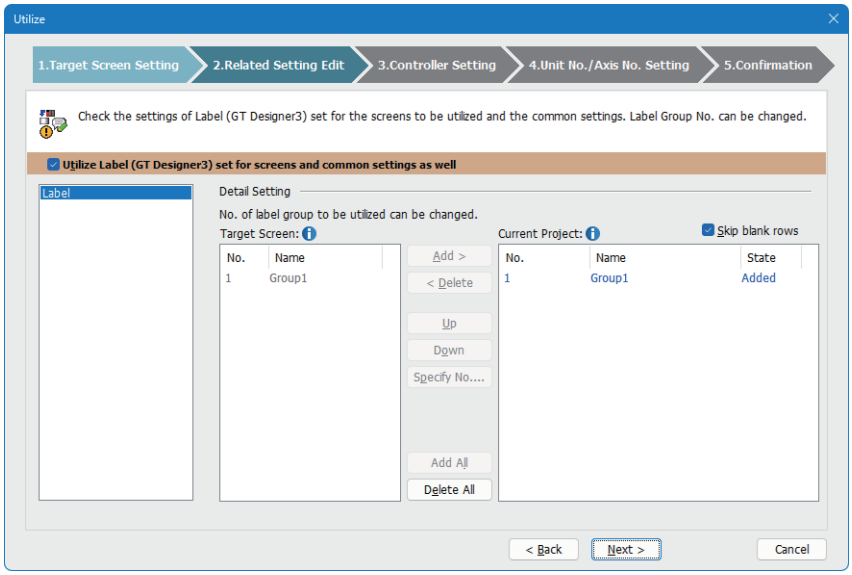
5. Set whether to utilize the settings related to the target screen, assign the setting numbers, and click the [Next] button.

☞ Page 278 [Related Setting Edit]



6. If labels (GT Designer3) are used in the target screen and the settings related to the screen, set whether to utilize the relevant label groups, assign label group numbers, and click the [Next] button.

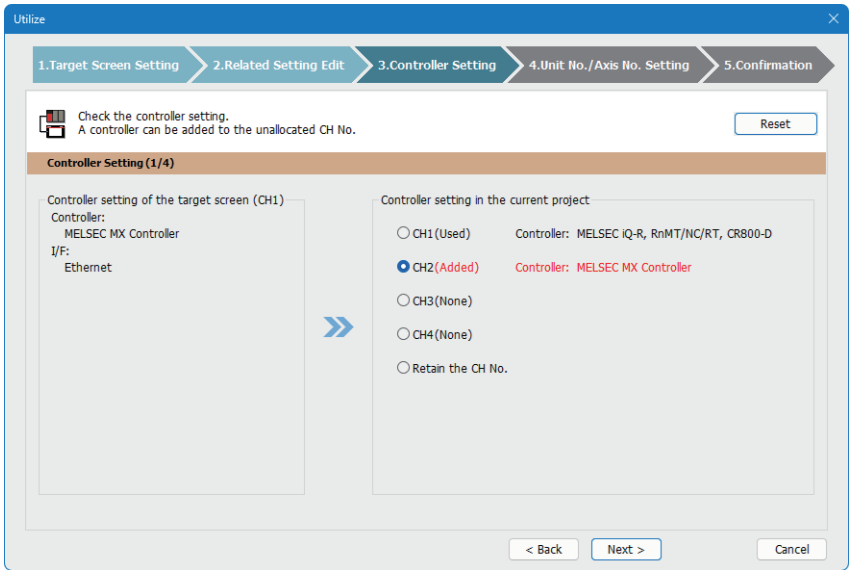
☞ Page 278 [Related Setting Edit]



7. Select a channel for each controller type to be used in the destination project, and click the [Next] button.

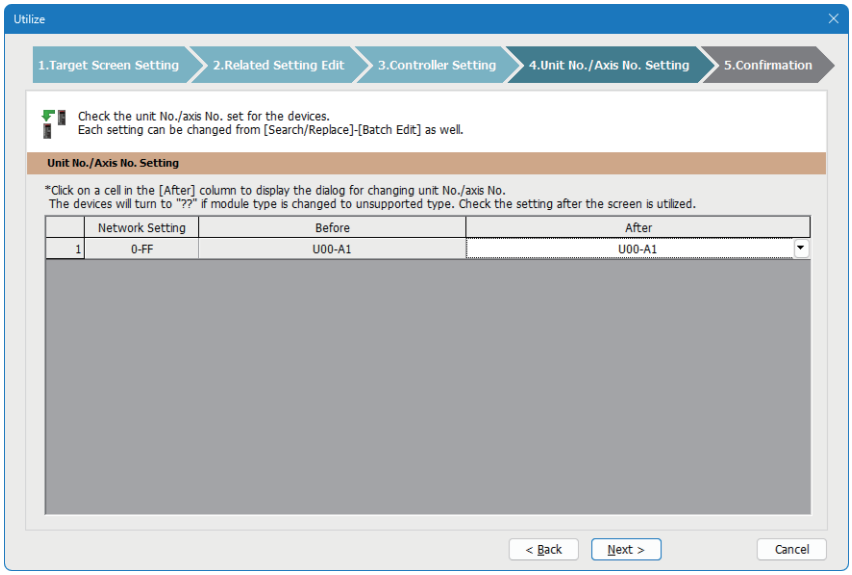
☞ Page 281 [Controller Setting]

If multiple channels are used in the source project, this step is repeated for each additional channel.



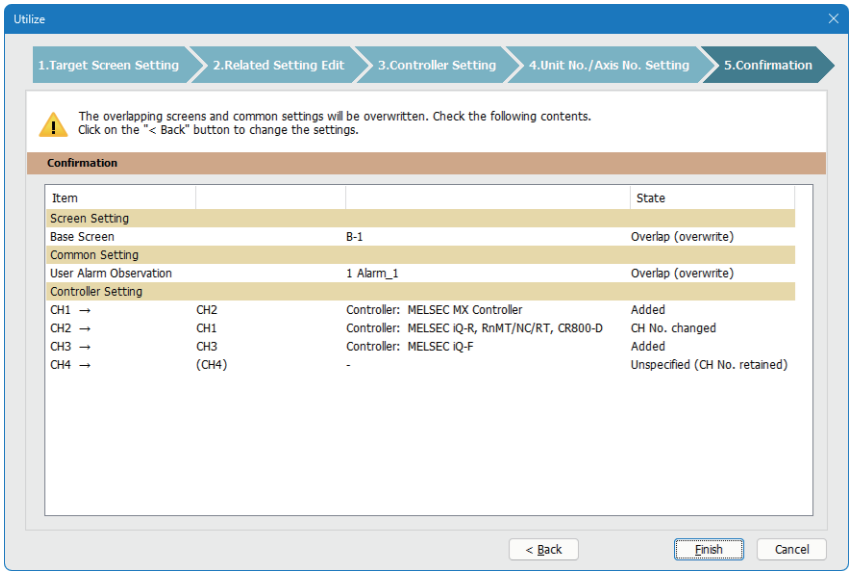
8. If necessary, change the unit number and axis number specified for an applicable device used in the target screen, and click the [Next] button.

☞ Page 282 [Unit No./Axis No. Setting]



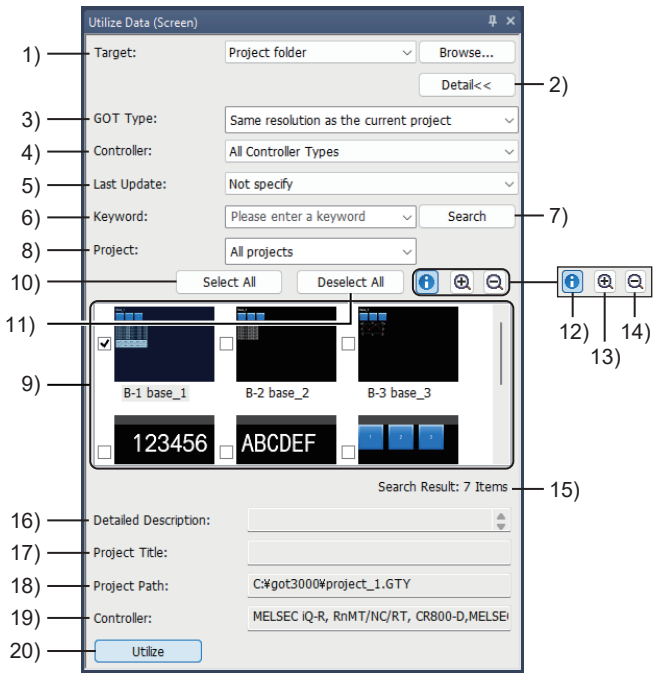
9. Confirm the displayed contents and click the [Finish] button to execute the screen utilization.

☞ Page 283 [Confirmation]



[Utilize Data (Screen)] window

GT37 SoftGOT3000



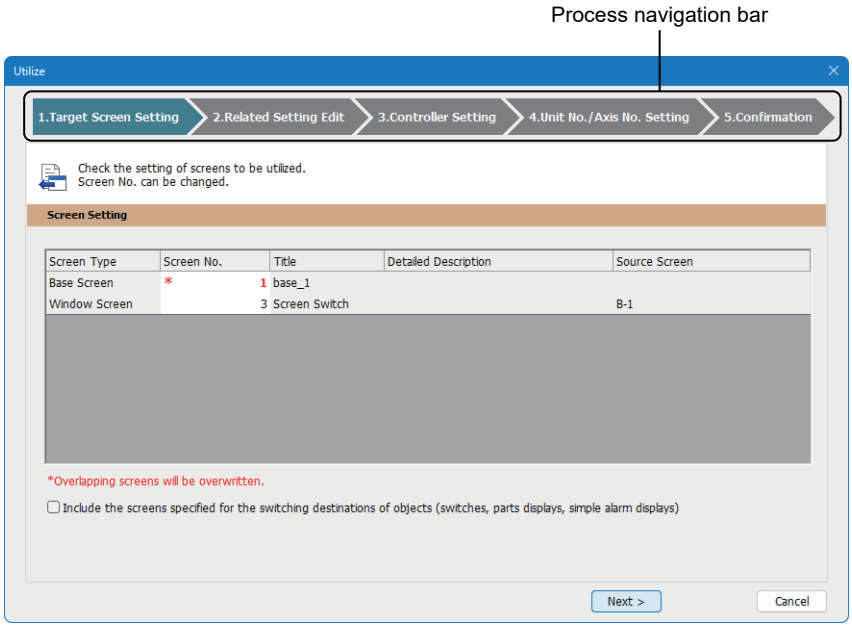
Item		Description
1)	[Target]	Select a search target.
		The search target for [Recently edited project] is up to five recently edited projects.
		The search target for [Project folder] is the projects in up to the third folder within the specified folder. Up to 200 projects are searched. Click the [Browse] button to specify a folder.
2)	[Detail >>] button [Detail <<] button	Displays or hides the following setting items. • [GOT Type] • [Controller] • [Last Update] Even though the above setting items are not displayed, they can be included in the targets for a search.
3)	[GOT Type]	Select the type of GOTs for the project to be searched.
4)	[Controller]	Select the controller type for the project to be searched. The selectable items are the same as those for [Controller Type] in each channel setting in the [Controller Setting] window. ☞ Page 729 [Controller Setting]
5)	[Last Update]	Select the last update of the project to be searched.
6)	[Keyword]	Specify a search keyword. Set a search keyword for the project file name or screen title. Two-byte and one-byte characters are distinguished. Specifying keywords delimited with one-byte or two-byte spaces enables you to narrow the scope of a search to the projects containing the keywords. Up to the last five searches are saved.
7)	[Search] button	Conducts a search.
8)	[Project]	Select a project, narrowing down the thumbnails of found screens in the search result list.
9)	Search result list	Thumbnails of found screens. Multiple screens are selectable from within the same project. Immediately after the project is read from the GOT, the screen images set in the project are not displayed. To display the screen images set in the project, open the project read from the GOT, and save the project again.
10)	[Select All] button	Selects all the screens in the project which includes the screen selected in the search result list.
11)	[Deselect All] button	Deselects all the screens selected in the search result list.

Item		Description
12)	[Information] button	Displays or hides the following items. • [Detailed Description] • [Project Title] • [Project Path] • [Controller]
13)	[Zoom in] button	Zoom in the display of search result list.
14)	[Zoom out] button	Zoom out the display of search result list.
15)	[Search Result]	Number of found screens.
16)	[Detailed Description]	Detail description of the screen selected in the search result list.
17)	[Project Title]	Title of the project including the screen selected in the search result list.
18)	[Project Path]	Save folder path of the project including the screen selected in the search result list.
19)	[Controller]	Controller type specified in the project that contains the screen selected in the search result list.
20)	[Utilize] button	Displays the [Utilize] dialog. ☞ Page 274 [Utilize] dialog

[Utilize] dialog

GT37 SoftGOT3000

Configure the settings to utilize a screen.



In the process navigation bar, the color of each step represents the status of the step.

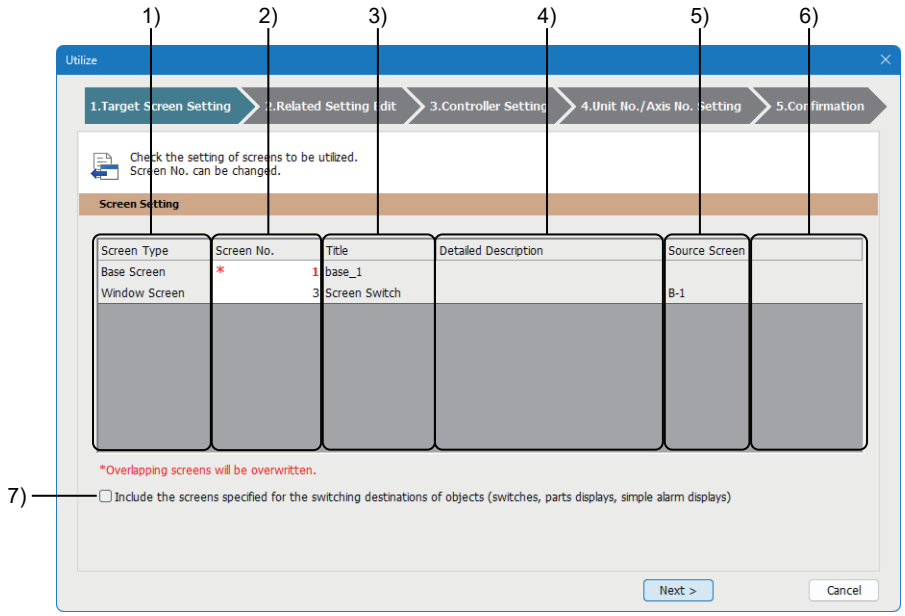
Display image	Status
	Active
	Done
	Undone

☞ Page 275 [Target Screen Setting]
☞ Page 278 [Related Setting Edit]
☞ Page 281 [Controller Setting]
☞ Page 282 [Unit No./Axis No. Setting]
☞ Page 283 [Confirmation]

■[Target Screen Setting]

GT37 SoftGOT3000

Set the screen number of a screen to be utilized in the destination project.



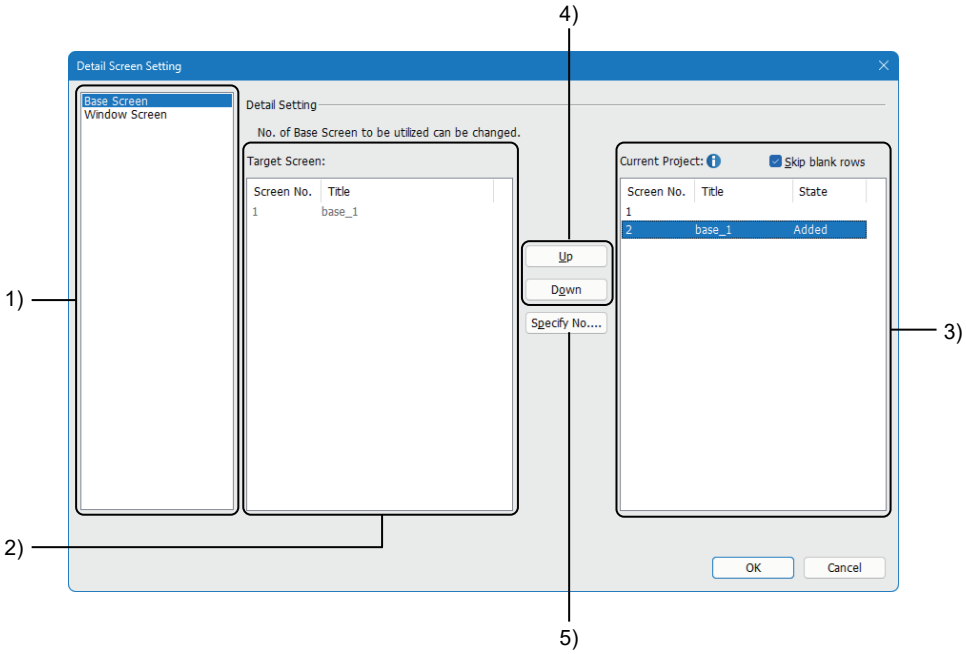
Item		Description
1)	[Screen Type]	Type of the screen to be utilized
2)	[Screen No.]	Set a screen number for each screen to be utilized in the destination project. Change the screen number as necessary. The screen number is displayed in red if it is used in the destination project. Click the [...] button to display the [Detail Screen Setting] dialog. ☞ Page 276 [Detail Screen Setting] dialog In the [Detailed Screen Settings] dialog, you can set screen numbers while checking the listed screens of the source project and destination project.
3)	[Title]	Title of the screen to be utilized
4)	[Detailed Description]	Detail description of the screen to be utilized
5)	[Source Screen]	If a target screen is specified as a called screen for the set overlay screen function, the screen number of the calling screen is displayed.
6)	[Previous Screen]	If a target screen is specified as the screen to be switched to in a touch switch setting, the screen number of the switched screen is displayed.
7)	[Include the screens specified for the switching destinations of objects (switches, parts displays, simple alarm displays)]	Utilizes the screen that is specified as the screen to be switched to in the setting of a touch switch, parts display, or simple alarm display.

■[Detail Screen Setting] dialog

GT37 SoftGOT3000

Set a screen number for each screen to be utilized in the destination project.

To display this dialog, click the [...] button for the intended row in the column of [Screen No.] in the [Utilize] dialog ([Target Screen Setting]).



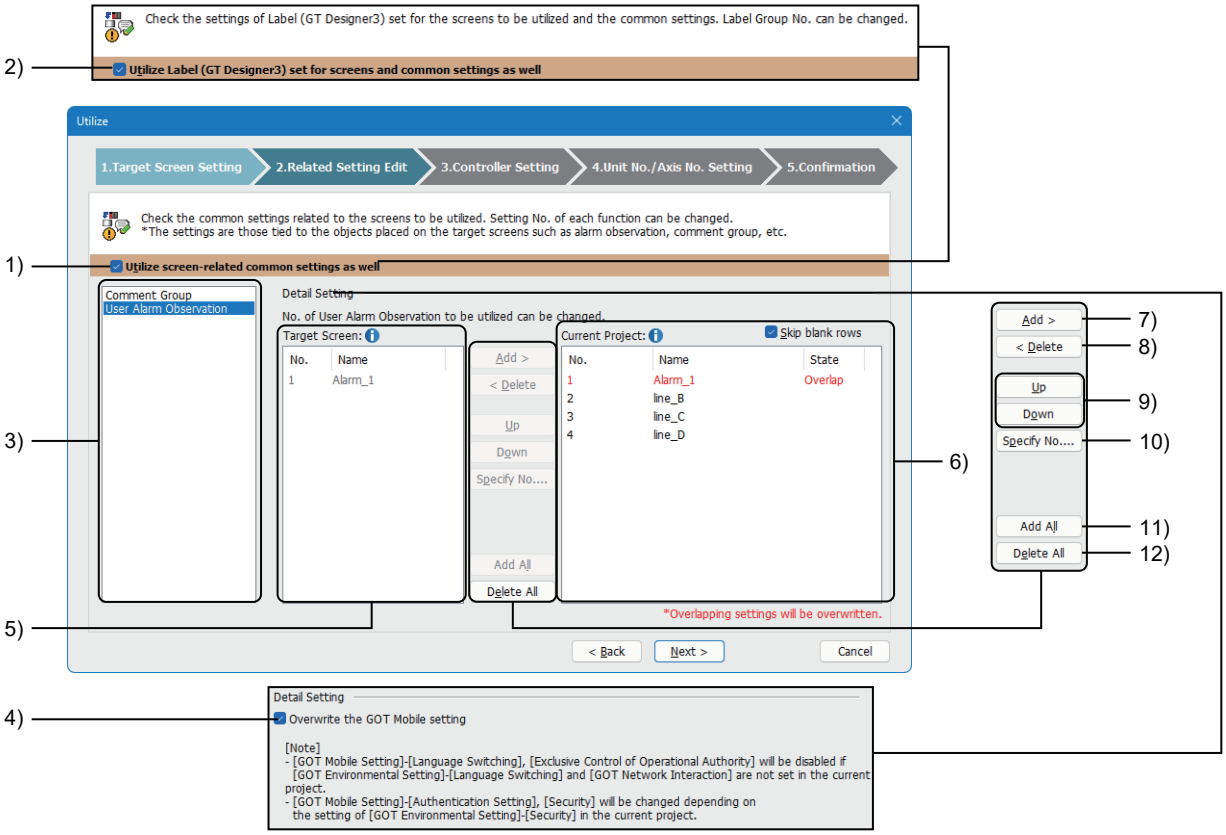
Item			Description
1)	Screen type		The screen types of target screens are listed. • [Base Screen] • [Window Screen] • [Mobile Screen]
2)	[Target Screen]	—	Lists the utilizable screens.
		[Screen No.]	Screen number of each screen in the source project.
		[Title]	Title of each screen in the source project.
3)	[Current Project]	—	Lists the settings in the destination project. In the destination project, the assigned number is user-changeable with the [Up] button or the [Down] button. The text color of a screen setting represents the assignment status of the setting. • Black Screen setting existing in the destination project. • Blue Screen setting added from [Target Screen]. • Red Duplicate screen number in the destination project.
		[Skip blank rows]	Only displays the rows where a screen setting is present.
		[Screen No.]	Screen number of each screen in the destination project.
		[Title]	Title of each screen in the destination project.
		[State]	Assignment status of each screen setting. • [Added]: Screen setting added from [Target Screen] • [Overlap]: Duplicate screen number in the destination project
4)	[Up] button [Down] button		Moves the screen setting selected in [Current Project] up or down.

Item		Description
5)	[Specify No.] button	Displays the [Destination Data No. Specification] dialog. Change the screen number of the screen selected in [Current Project].  Set the screen number of a screen to be utilized in the destination project. The setting range is [0] to [32767].

■[Related Setting Edit]

GT37 SoftGOT3000

Set whether to utilize the settings related to the screen to be utilized, and assign setting numbers.



When [GOT Mobile Setting] is selected in the setting list

Item			Description
1)	[Utilize screen-related common settings as well]		Utilizes the settings related to the target screen.
2)	[Utilize Label (GT Designer3) set for screens and common settings as well]		This item appears when labels (GT Designer3) are used in the target screen and the settings related to the screen. Utilizes the relevant label groups. For information on how to display this item, refer to the following. ☞ Page 268 Utilizing a screen
3)	Setting list		Lists the settings related to the target screen. Only applicable items are displayed.
4)	[Overwrite the GOT Mobile setting]		This item is displayed when [GOT Mobile Setting] is selected in the setting list. Utilizes the settings for the GOT Mobile function.
5)	[Target Screen]	—	Lists the utilizable settings. The text color of a setting represents the status of the setting. • Black Setting that is not added to [Current Project]. To utilize a setting in the destination project, add the setting to [Current Project] with the [Add] button. • Gray Setting added to [Current Project].
		[No.]	Number of each setting in the source project.
		[Name]	Name of each setting in the source project.

Item			Description
6)	[Current Project]	—	Lists the settings in the destination project. In the destination project, the assigned number is user-changeable with the [Up] button or the [Down] button. For mouse and keyboard operations, refer to the following. ☞ Page 280 Mouse and keyboard operations The text color of a setting represents the status of the setting. • Black Setting existing in the destination project. • Blue Setting added from [Target Screen]. • Red Duplicate setting number in the destination project.
		[Skip blank rows]	Only displays the rows where a setting is present.
		[No.]	Number of each setting in the destination project.
		[Name]	Name of each setting in the destination project.
		[State]	Assignment status of each setting. • [Added]: Setting added from [Target Screen] • [Overlap]: Duplicate setting number in the destination project
7)	[Add] button		Adds the setting selected in [Target Screen] to the row selected in [Current Project]. If no row has been preselected in [Current Project], the [Destination Data No. Specification] dialog appears. Specify a setting number to be assigned in the destination project.
8)	[Delete] button		Deletes the setting selected in [Current Project].
9)	[Up] button [Down] button		Moves the setting selected in [Current Project] up or down.
10)	[Specify No.] button		Displays the [Destination Data No. Specification] dialog. Change the setting number of the setting selected in [Current Project].  Specify a setting number to be assigned in the destination project. The setting range varies depending on the setting to be utilized.
11)	[Add All] button		Adds all the settings listed in [Target Screen] to [Current Project]. The settings are added to the selected row and subsequent rows in [Current Project]. If no row has been preselected in [Current Project], each setting is added with its setting number unchanged.
12)	[Delete All] button		Deletes all the added settings from [Current Project].

■Mouse and keyboard operations

The following shows the mouse and keyboard operations in [Target Screen] and [Current Project].

Operation	[Target Screen]	[Current Project]
↑ ↓	Moves the cursor.	
Shift + ↑ Shift + ↓	Moves the row while selecting the row where the cursor is positioned. The destination row of the cursor is also selected.	—
Home	Moves the cursor to the top row.	
End	Moves the cursor to the bottom row.	
PgUp	Moves the cursor from the row with the cursor to the corresponding row up one page.

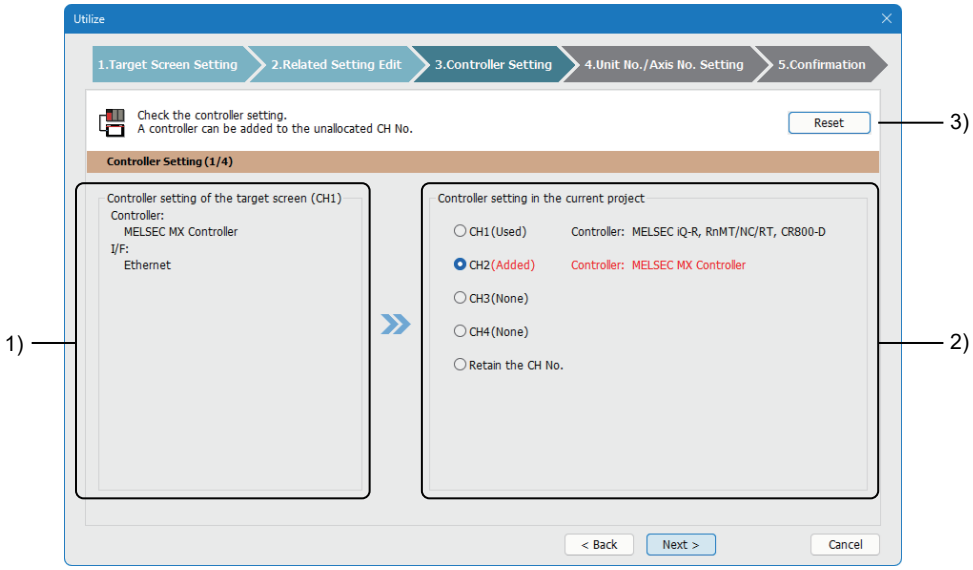
■[Controller Setting]

GT37 SoftGOT3000

Select a channel for each controller type to be used in the destination project.



Item		Description
1)	[Controller setting of the target screen]	Controller settings in the source project.
2)	[Controller setting in the current project]	Controller settings in the destination project. Select a channel for the controller type displayed in [Controller setting of the target screen]. Unavailable items are grayed out. You can select the channel used for a different controller type in the destination project. In this case, the channel number and controller type specified in the destination project will be applied. Check the device setting after the utilization.
		When [Controller Type] of the source project is [GT SoftGOT3000], only the [Controller Type] setting in the [Controller Setting] window is utilized. For other settings (such as [I/F]), check the settings for each channel in the [Controller Setting] window after utilization. ☞ Page 729 [Controller Setting]
3)	[Reset] button	Resets the settings in [Controller setting in the current project] for all channels.

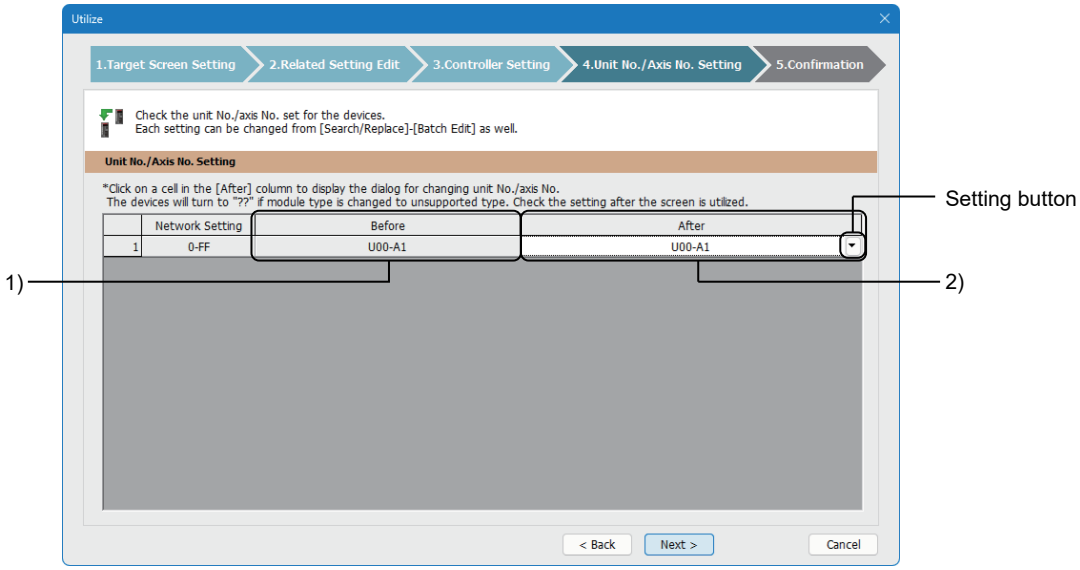
■[Unit No./Axis No. Setting]

GT37 SoftGOT3000

If necessary, change the unit number and the axis number (axis designation) set to an applicable device used in the target screens.

The settings are configurable in the [Unit No./Axis No. Batch Edit] dialog as well.

☞ Page 157 [Unit No./Axis No. Batch Edit] dialog



Item		Description
1)	[Before]	Unit number and axis number (axis designation) set to each applicable device used in the target screens.
2)	[After]	If necessary, change the unit number and axis number (axis designation) to be used in the destination project. Click the setting button to display the unit No./axis No. setting dialog. The setting items vary according to the selected module.  • Unit Select a module to be routed to. • [Unit No.] Specify a unit number. • [Axis No.] Specify an axis number. • [Axis Designation] Specify an axis.

■[Confirmation]

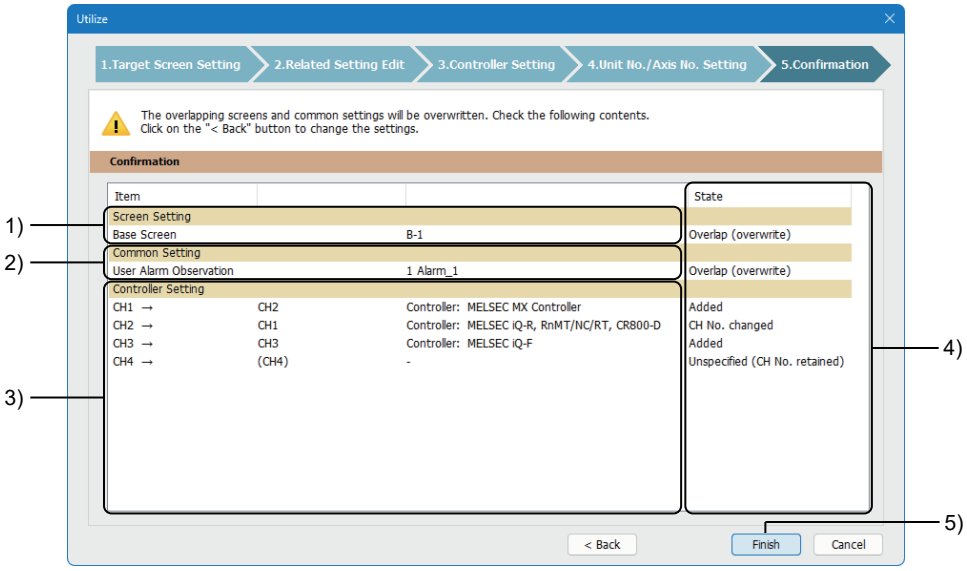
GT37 SoftGOT3000

The following set contents are displayed.

- Duplicate screen number or setting number
- Controller setting

Confirm the set contents, and execute the screen utilization.

To change the settings, go back to the relevant step with the [Back] button or the process navigation bar.



Item		Description
1)	[Screen Setting]	If a duplicate screen number exists in the destination project, the screen type and screen number are displayed. ☞ Page 275 [Target Screen Setting]
2)	[Common Setting]	If a duplicate setting number exists in the destination project, the setting type and setting number are displayed. ☞ Page 278 [Related Setting Edit]
3)	[Controller Setting]	Settings made in [Controller Setting].
4)	[State]	Assignment status of each setting. • [Overlap (overwrite)] A duplicate screen number or setting number exists in the destination project. If you click the [Finish] button without resolving of the duplication, the existing setting is overwritten. • [CH No./controller change] The channel number and controller type are changed to the ones specified in the destination project. • [Controller changed] The controller type is changed to the one specified in the destination project. • [CH No. changed] The channel number is changed to the one specified in the destination project. • [Unchanged] The channel number and controller type remain unchanged. • [New] The controller settings are assigned to an unused channel in the destination project. • [Unspecified (CH No. retained)] The channel number remains unchanged, and the controller type is changed to the one specified in the destination project.
5)	[Finish] button	Executes the screen utilization. If a label (GT Designer3) error occurs after the screen utilization, the [Label Check] dialog will appear. Correct the setting of the relevant label (GT Designer3). ☞ Page 883 Checking for errors in the label (GT Designer3) If you select a channel being used in the destination project, check the device settings after the screen utilization.

☞ Page 285 Opening a screen from the [Screen] window
☞ Page 286 Opening a screen from the [Screen Image List] window
☞ Page 286 Opening a screen from the menu
☞ Page 288 [Open Screen] dialog

Point

- Up to 25 screens can be opened. A number smaller than 25 can be set as the maximum number of screens that can be opened.

☞ Page 197 [Options] dialog ([Operation] tab)

- When project security is set for each screen, displaying or editing screens is disabled according to the access level set for each screen.

☞ Page 2972 Protecting a project by registering users (Project security)

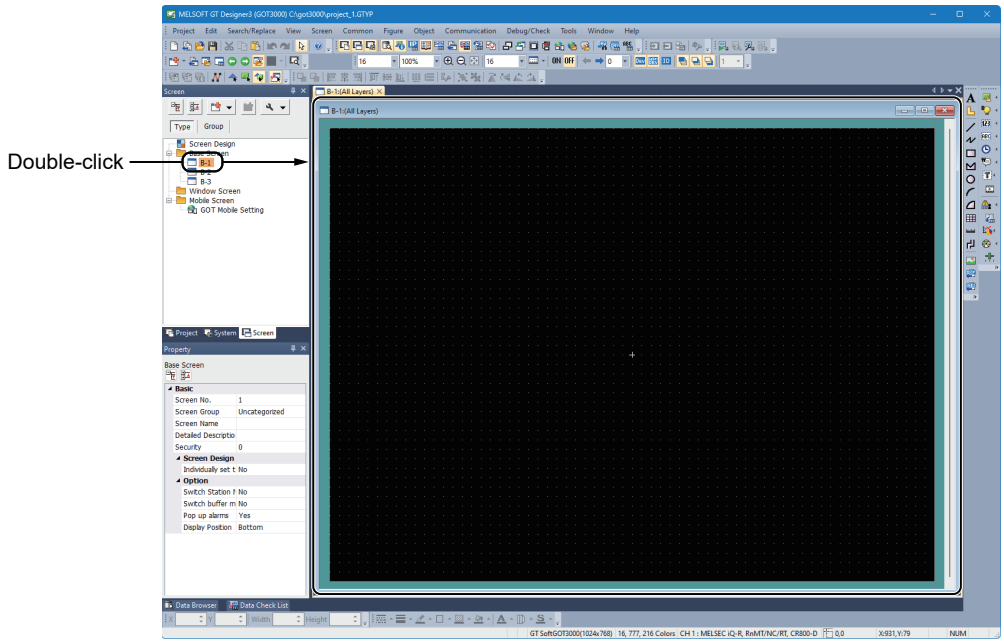
Opening a screen from the [Screen] window

GT37 SoftGOT3000

☞ Page 285 Opening screens one by one
☞ Page 285 Opening multiple screens simultaneously

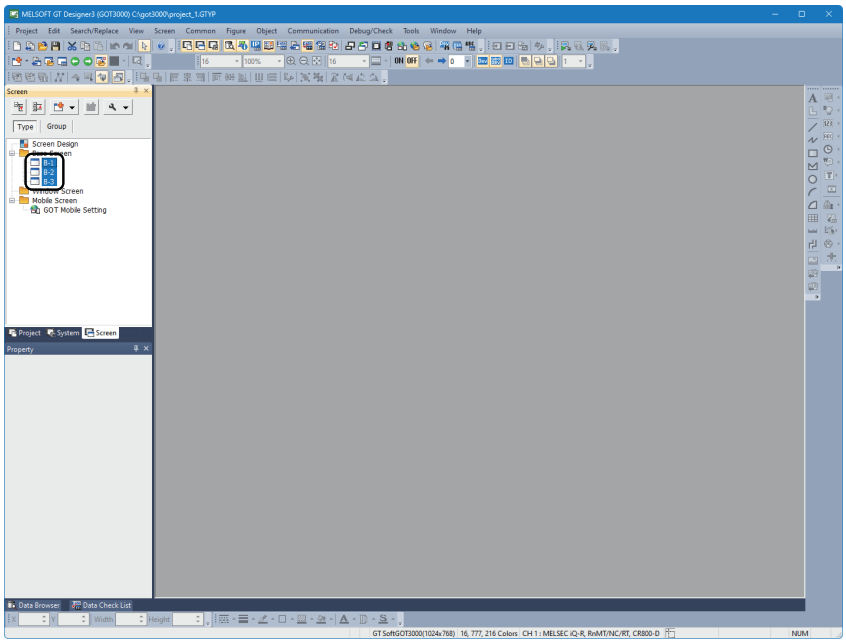
■Opening screens one by one

Double-click the screen to be opened on the [Screen] window to display a screen editor on the work window.



■Opening multiple screens simultaneously

1. Select multiple screens to be opened while pressing the Ctrl or Shift key.



2. Either of the following operations displays a screen editor on the work window.

- Press the Enter key.
- Right-click on the selected screen and select [Open] from the menu.

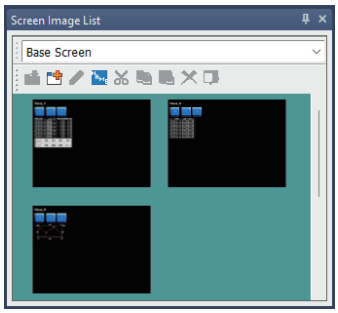
Opening a screen from the [Screen Image List] window

GT37 SoftGOT3000

Base screens, window screens, and mobile screens are displayable from the [Screen Image List] window.

1. Select [View] → [Docking Window] → [Screen Image List] from the menu to display the [Screen Image List] window.

☞ Page 335 [Screen Image List] window



2. Double-click the image of a screen to be opened to display a screen editor on the work window.

Opening a screen from the menu

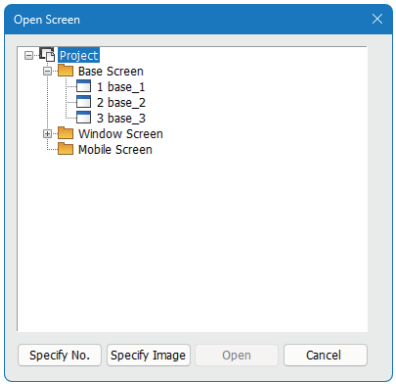
GT37 SoftGOT3000

☞ Page 286 Opening a screen specifying the screen number
☞ Page 287 Opening a screen checking the corresponding screen image

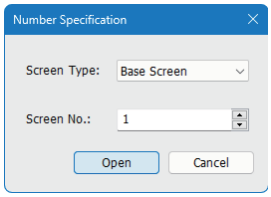
■Opening a screen specifying the screen number

1. Select [Screen] → [Open] from the menu to display the [Open Screen] dialog.

☞ Page 288 [Open Screen] dialog



2. Click the [Number Specification] button to display the [Number Specification] dialog.

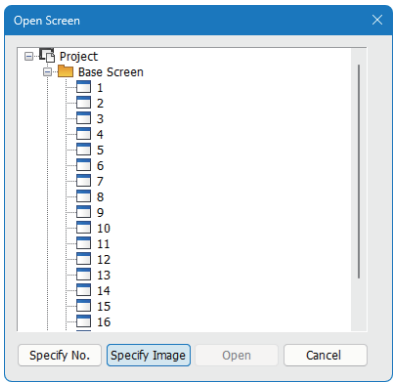


3. Set [Screen Type] and [Screen No.] then click the [Open] button to display a screen editor on the work window.

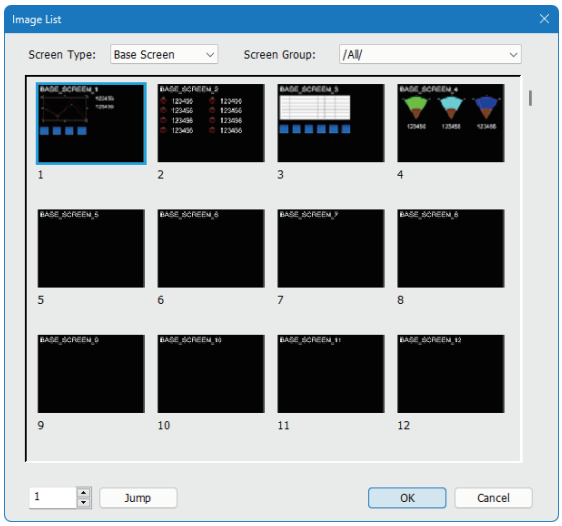
■Opening a screen checking the corresponding screen image

1. Select [Screen] → [Open] from the menu to display the [Open Screen] dialog.

☞ Page 288 [Open Screen] dialog



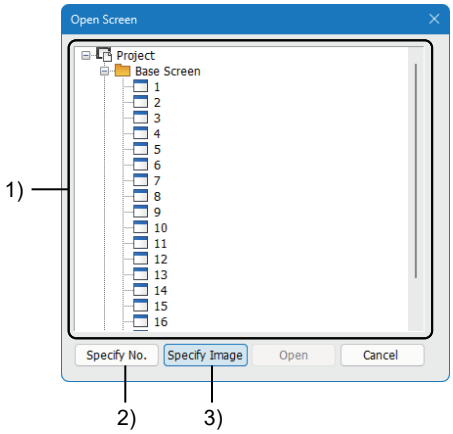
2. Click the [Specify Image] button to display the [Image List] dialog (screen).



3. Select a screen and click the [OK] button to display a screen editor on the work window.

[Open Screen] dialog

GT37 SoftGOT3000



Item		Description
1)	List of screens	Lists the created base screens, window screens, and mobile screens.

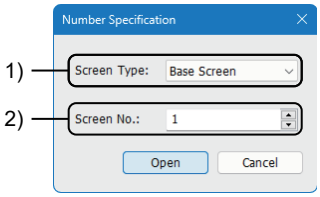
3)	[Specify Image] button	Displays the [Image List] dialog (screen). You can open a screen by selecting the corresponding screen image. ☞ Page 3683 [Image List] dialog (screen)

■[Number Specification] dialog

GT37 SoftGOT3000



Item		Description
1)	[Screen Type]	Select the type of a screen to be opened.
2)	[Screen No.]	Set the screen number of a screen to be opened.

6.6.2 Closing a screen

GT37 SoftGOT3000

Closing a single screen

Either of the following operations closes a screen being edited.

- Select [Screen] → [Close] from the menu.
- Click the [×] button on the title bar on the screen editor.

Closing all screens

Select [Screen] → [Close All] from the menu to close all screens.

6.6.3 Copying a screen

GT37 SoftGOT3000

☞ Page 290 Specifications of screen copy
☞ Page 290 Copying a screen
☞ Page 291 [Copy Screen] dialog

Point

For information on how to copy a base screen or window screen to create a mobile screen, refer to the following.

☞ Page 2800 Creating a mobile screen

Specifications of screen copy

GT37 SoftGOT3000

■Setting of the screen trigger action and screen script

When the trigger action or script is set to the screen to be copied, the setting of the trigger action or script is also copied.

■Projects protected with project security

For operating the project for which project security is set, refer to the following.

☞ Page 2972 Protecting a project by registering users (Project security)

Copying a screen

GT37 SoftGOT3000

Screens can be copied from the [Screen] window, [Screen Image List] window, and menu.

For the operation of the [Screen] window and [Screen Image List] window, refer to the following.

☞ Page 122 [Screen] window
☞ Page 335 [Screen Image List] window

The following shows how to copy screens from the menu.

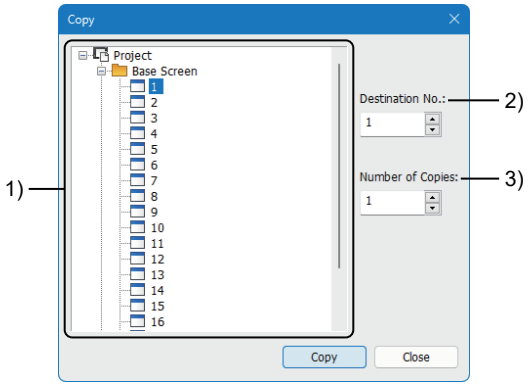
1. Select [Screen] → [Copy] from the menu to display the [Copy] dialog.

☞ Page 291 [Copy Screen] dialog

2. Select the screen to be copied in the screen list and set [Destination No.] and [Number of Copy].
3. Click the [Copy] button to create a screen.

[Copy Screen] dialog

GT37 SoftGOT3000



Item		Description
1)	List of screens	List of the created screens Select a screen to be copied. Use the Ctrl key or Shift key to select up to 25 screens of the same type.
2)	[Destination No.]	Set the screen number of the screen to be created. The setting range is [0] to [32767].
3)	[Number of Copies]	Set the number of copies. The setting range is [1] to [100]. The screen numbers after the second copied screen are set sequentially from the number set in [Destination No.]. If you copy the screens exceeding the number of the maximum number of the screen setting or range of the screen number, the screens cannot be copied.

6.6.4 Deleting a screen

GT37 SoftGOT3000

☞ Page 292 Specifications of screen deletion
☞ Page 292 Deleting a screen
☞ Page 292 [Delete Screen] dialog

Specifications of screen deletion

GT37 SoftGOT3000

■Projects protected with project security

When the display or editing of a screen is disabled by the project security, the screen image is not listed in the [Delete Screen] dialog.

Deleting a screen

GT37 SoftGOT3000

Screens can be deleted from the [Screen] window, [Screen Image List] window, and the menu.
For the operation of the [Screen] window and [Screen Image List] window, refer to the following.

☞ Page 122 [Screen] window
☞ Page 335 [Screen Image List] window

The following shows how to delete screens from the menu.

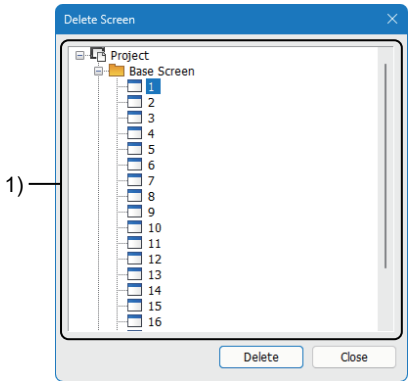
1. Select [Screen] → [Delete] from the menu to display the [Delete Screen] dialog.

☞ Page 292 [Delete Screen] dialog

2. Select the screen to be deleted in the screen list and click the [Delete] button to delete the screen.

[Delete Screen] dialog

GT37 SoftGOT3000

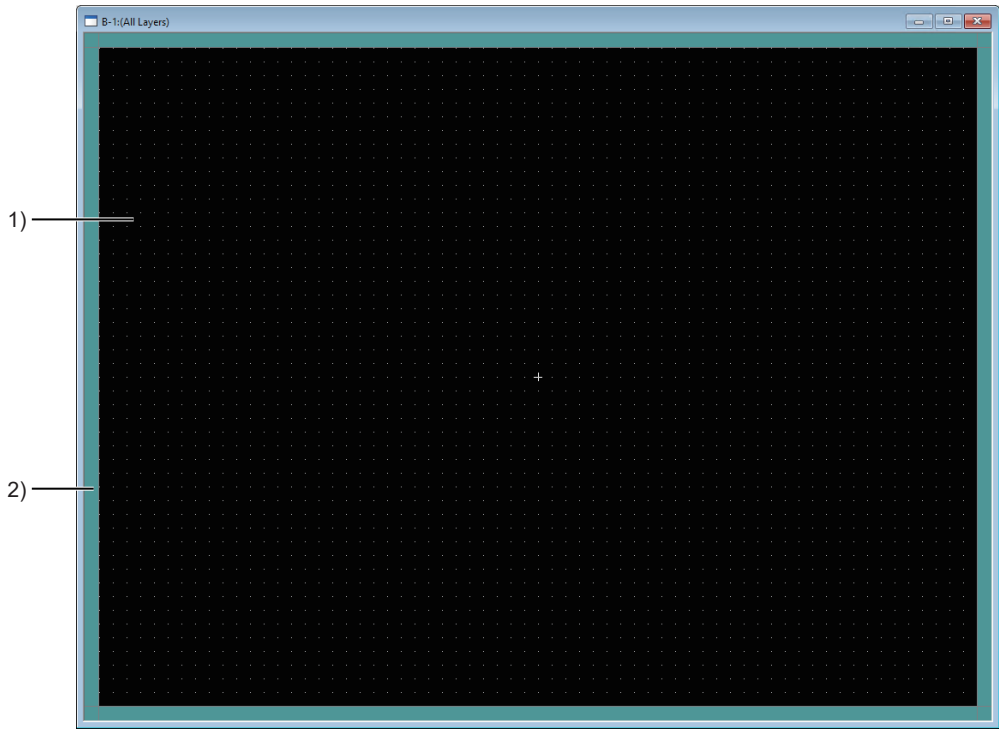


Item		Description
1)	List of screens	List of the created screens Select a screen to be deleted. Use the Ctrl key or Shift key to select multiple screens of the same type.

6.7 Basic operations of a screen editor

GT37 SoftGOT3000

The following shows the layout of the screen editor.



Item		Description
1)	Screen display area	This area is displayed on the GOT. Figures and objects can be arranged on this area. The [+] sign indicates the center of the screen. On an expanded base screen with its base point at the upper left corner, this sign indicates the center of the GOT screen.
2)	Temporary area	This area is not displayed on the GOT. Figures and objects can be temporarily arranged on this area. The data size of a screen includes the size of the figures and objects arranged on the temporary area. Before writing package data to the GOT, delete the figures and objects on the temporary area. The size of the temporary area is -1000 to 5000 for both X and Y coordinates. 
*1 Varies by GOT type.

For information on how to arrange and set figures and objects, refer to the following.

☞ Page 995 Basics of figures and objects

For the operations of the screen editor, refer to the following.

☞ Page 295 Selecting a screen editor to be edited
☞ Page 296 Switching the display status of objects to be displayed on the screen editor
☞ Page 296 Redisplaying a selected screen editor
☞ Page 297 Setting information to be displayed on the screen editor
☞ Page 299 Displaying the grid
☞ Page 300 Displaying the scroll bar areas for editing the expanded base screens
☞ Page 301 Switching the layer display
☞ Page 302 Displaying guidelines
☞ Page 304 Scaling the size of items on the screen editor
☞ Page 305 Cascading or arranging open screen editors
☞ Page 305 Copying the image of a screen editor to the clip board

Display of a figure or object on the border between the screen display area and the temporary area

Figures and objects appear on the GOT when all the following conditions are satisfied.

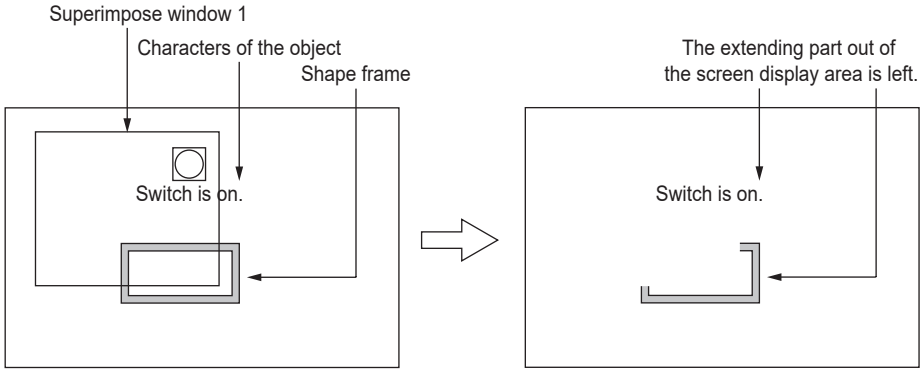
Condition	Remarks
A part of the object is included in the screen display area.	If only the frame of a figure is included in the screen display area, the figure is ineffective. Ineffective figures and objects are not displayed on the GOT, and the actions set to the figures and objects such as data operations and scripts are not executed.  On the screen editor of GT Designer3, [×] is displayed in the upper right corner of invalid objects. However, If the upper-left coordinates of the object are negative values, [×] is not displayed in the upper-right corner of the object.
The upper-left coordinates of the object are not negative values.	If the upper-left coordinates of the object are negative, the following operations cannot be performed. • Saving as package data • Saving as a GT SoftGOT3000 execution file • Data transfer to/from the GOT • Writing to a memory card • Starting or updating GT Simulator3

How a superimpose window is displayed

When a window, on which an arranged figure or object extends to the temporary area, is displayed as a superimpose window on the GOT, the extending part is displayed on the GOT.

When the superimpose window is hidden, the extending part is left on the base screen.

Switching the base screen updates the screen to remove the left extending part.



When the superimpose window is displayed. When the superimpose window is hidden.

6.7.1 Selecting a screen editor to be edited

GT37 SoftGOT3000

To select a screen editor to be edited, click any part of the screen editor displayed on the work window.

The selected screen editor is displayed at the topmost position.

When multiple screen editors are displayed, the followings are more useful.

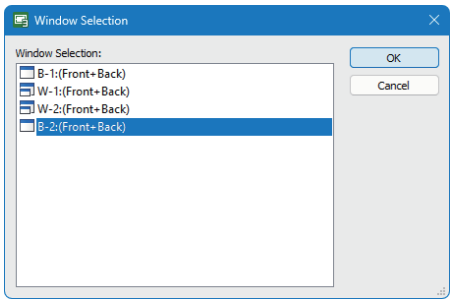
Selecting a screen editor with the editor tab

Select a screen editor with the editor tab to display the selected editor at the topmost position.

☞ Page 114 Editor tab, work window

Selecting a screen editor in the [Window Selection] dialog

1. Select [Window] → [Select Windows] from the menu to display the [Window Selection] dialog.



2. Select a screen editor to be edited and click the [OK] button to display the selected editor at the topmost position.

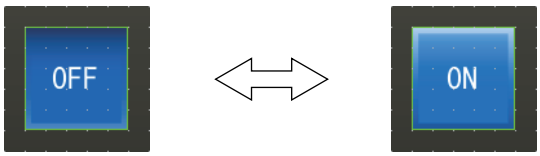
6.7.2 Switching the display status of objects to be displayed on the screen editor

GT37 SoftGOT3000

Switching the display status between ON and OFF

Select [View] → [Switch ON/OFF Display] from the menu to switch between on and off the display status of the objects on the screen editor.

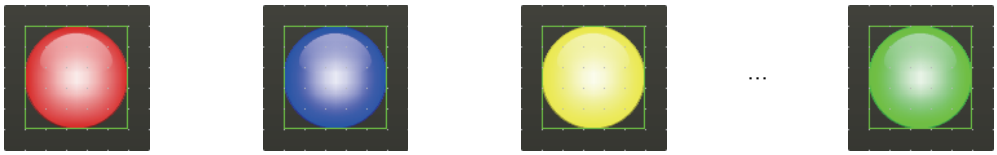
If a condition is set to an object, the image of the object switches between OFF with the condition No.0 and ON with the condition No.1.



Switching the display status by specifying the state No.

Select [View] → [State No.] → [Previous State] or [Next State] from the menu to switch between displaying and hiding the objects on the screen editor according to the state No.

If the display status of an object is switched between ON and OFF, the display of the object switches between OFF with state No.0 and ON with state No.1 or more.



State No.0 State No.1 State No.2 State No.63

6.7.3 Redisplaying a selected screen editor

GT37 SoftGOT3000

In some cases such as when an object placed on a paint is moved, a part of the figure may be left unpainted.

To display the screen correctly, redisplay the screen editor.

1. Select a screen editor to be redisplayed.
2. Select [View] → [Redisplay] from the menu to redisplay the contents of the selected screen editor.

6.7.4 Setting information to be displayed on the screen editor

GT37 SoftGOT3000

The following shows how to set information to be displayed on the screen editor.

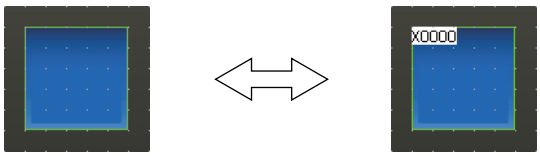
☞ Page 297 [Device]
☞ Page 297 [Device of Label]
☞ Page 297 [Object ID]
☞ Page 298 [Paint]
☞ Page 298 [Object]
☞ Page 298 [Object Frame]
☞ Page 298 [Template Information]
☞ Page 298 [Touch Area]
☞ Page 299 [Frame]

Point

Select [View] → [Display Items] → [Option] from the menu to display the [Option] dialog.
In this dialog, you can configure the settings displayed on the screen editor.
☞ Page 201 [Options] dialog ([View] tab)

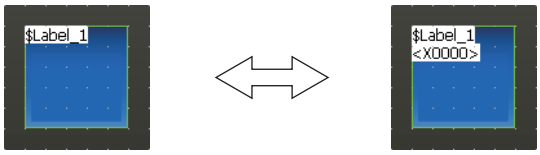
[Device]

Select [View] → [Display Items] → [Device] from the menu to display or hide devices on the screen editor.



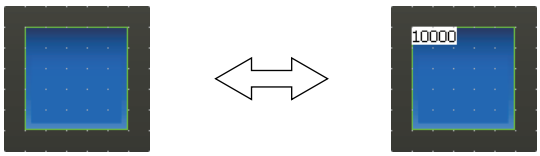
[Device of Label]

Select [View] → [Display Items] → [Device of Label] from the menu to display or hide the devices assigned to the labels (GT Designer3) on the screen editor.



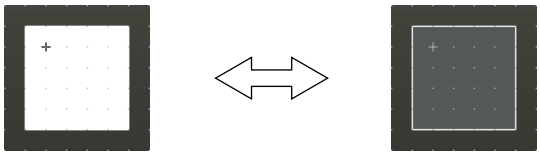
[Object ID]

Select [View] → [Display Items] → [Object ID] from the menu to display or hide object IDs on the screen editor.
The object ID is displayed only for objects.



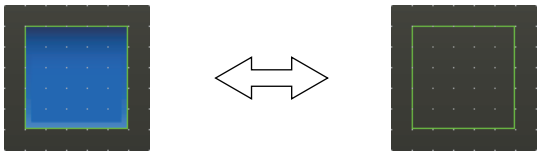
[Paint]

Select [View] → [Display Items] → [Paint] from the menu to display or hide paints on the screen editor.



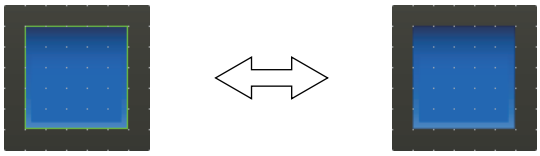
[Object]

Select [View] → [Display Items] → [Object] from the menu to display or hide objects on the screen editor.



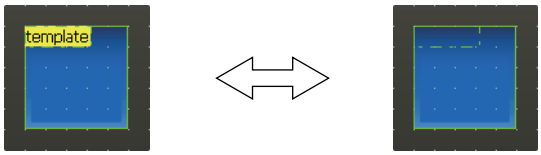
[Object Frame]

Select [View] → [Display Items] → [Object Frame] from the menu to display or hide object frames on the screen editor.



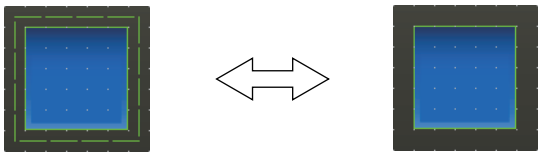
[Template Information]

Select [View] → [Display Items] → [Template Information] from the menu to display or hide the template information on the screen editor.



[Touch Area]

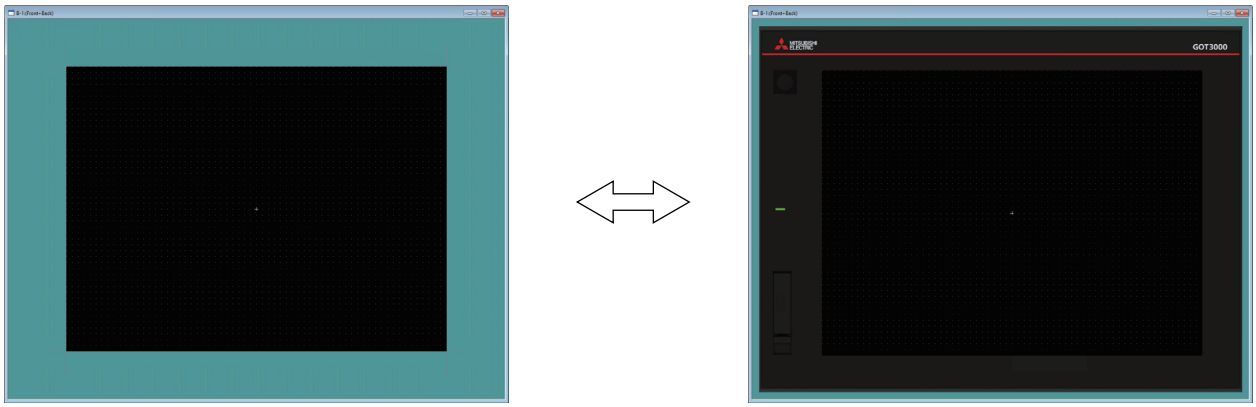
Select [View] → [Display Items] → [Touch Area] from the menu to display or hide the touch area on the screen editor.



[Frame]

The item is not displayed for expanded base screens.

Select [View] → [Display Items] → [Frame] from the menu to display or hide the GOT frame on the screen editor.

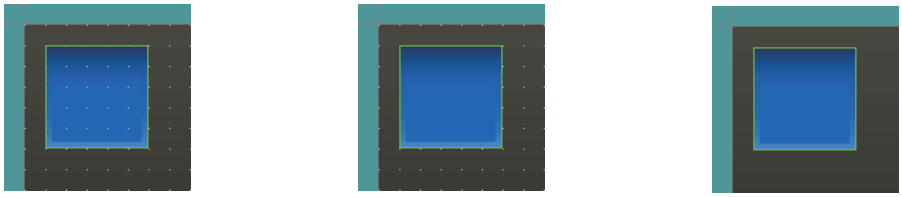


6.7.5 Displaying the grid

GT37 SoftGOT3000

You can display the screen editor with equally-spaced points (a grid) which give an indication to arrange figures and objects.

Select [View] → [Grid] → [Front], [Back], or [None] from the menu to display or hide the grid on the screen editor.



[Front] [Back] [None]

6.7.6 Displaying the scroll bar areas for editing the expanded base screens

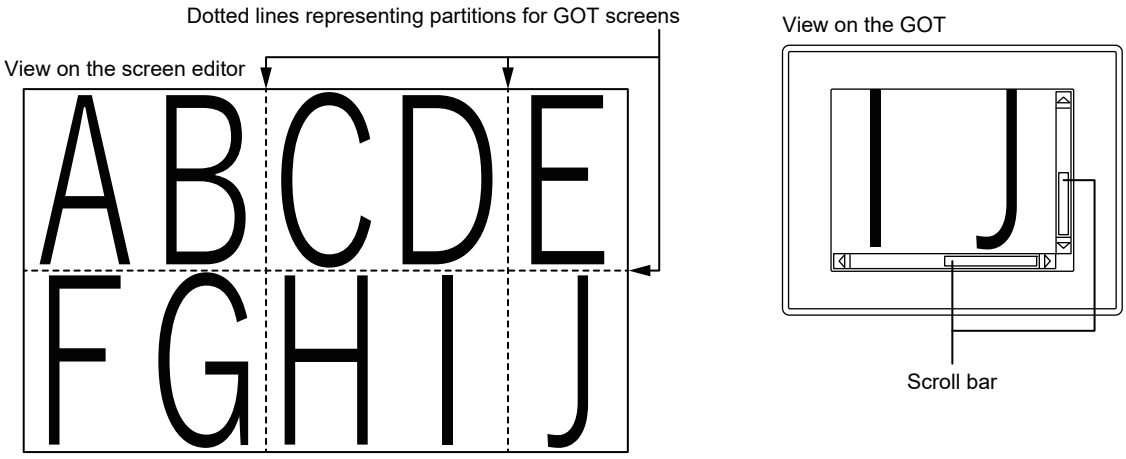
GT37 SoftGOT3000

The following lines are displayable on screen editors.

Line type	Description
Solid line	Appears when either the vertical or horizontal size of the base screen is larger than the vertical or horizontal size of the GOT screen. Represents the areas of the scroll bars to appear on the GOT. Appears 40 dots from the right or bottom edge of the screen display area. Place figures and objects so that they do not overlap the scroll bar areas.
Broken line	Represents a partition for one GOT screen. Represents partitions for multiple GOT screens. The lines are usable as guidelines to specify the size of a base screen to an integral multiple of the GOT screen size.

Example) Displaying an expanded base screen (2560 × 1536) on GT37-X (1024 × 768)

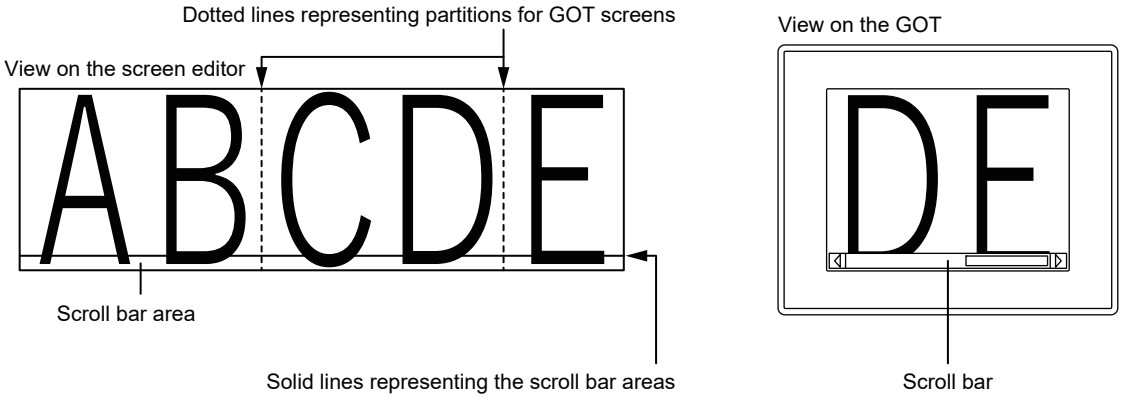
The scroll bar areas are not displayed because the base screen is vertically and horizontally expanded.



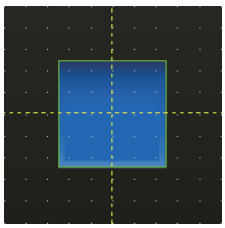
Example) Displaying an expanded base screen (2560 × 768) on GT37-X (1024 × 768)

A solid line representing the scroll bar area is displayed in the lower part of the base screen because the screen is horizontally expanded.

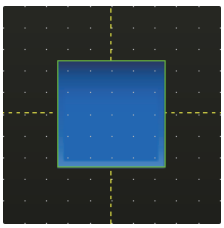
A scroll bar appears in the scroll bar area when the base screen is displayed on the GOT.



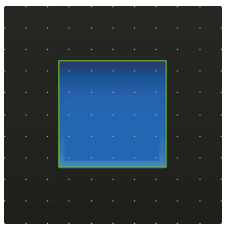
Select [View] → [Scroll Bar Area] → [Front], [Back], or [None] from the menu to display or hide the polyline on the screen editor.



[Front]



[Back]



[None]

In the following cases, no scroll bar is displayed on the GOT, and no lines representing the scroll bar areas and partitions for GOT screens are displayed on the screen editors.

- The base screen is smaller than the GOT screen.
- The scroll bars are set to be hidden.

For details on the base screen size expansion, refer to the following.

☞ Page 510 Expanding the base screen size

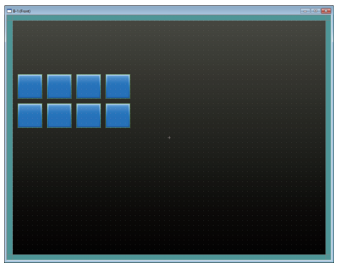
6.7.7 Switching the layer display

GT37 SoftGOT3000

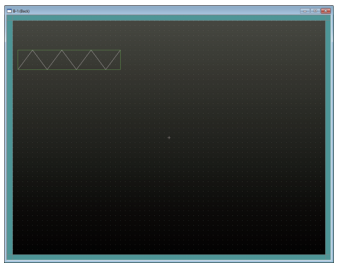
Select [View] → [Layer] → [All screens] from the menu to switch between all screen editors and individual screen editor as the target for the layer switching.

Select [View] → [Layer] → [Front], [Back], or [Backmost] from the menu to switch the display status of each layer.

Select [View] → [Layer] → [All Layers] from the menu to display all layers.



[Front]



[Back]

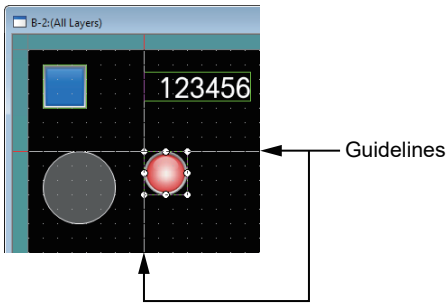
[Backmost]

[All Layers]

6.7.8 Displaying guidelines

GT37 SoftGOT3000

When moving a figure or object, you can display guidelines to indicate a position relation between other figures and objects.



Point

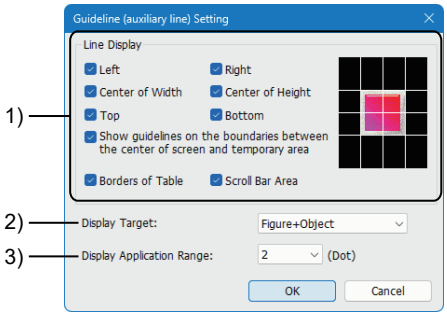
- When figures and objects are grouped together, guidelines are displayed for the group.
- Within the touch area of a touch switch and when operations are performed with a keyboard, guidelines are not displayed.

Select [View] → [Guideline (auxiliary line)] from the menu and then select one of the following items to change the display of guidelines.

Menu	Description
[Display]	Displays or hides guidelines.
[Figure]	Displays guidelines in relation to existing figures.
[Object]	Displays guidelines in relation to existing objects.
[Figure + Object]	Displays guidelines in relation to existing figures and objects.
[Same Type]	Displays guidelines in relation to the same type of existing figures or objects as those being moved.
[Custom]	[Displays the Guidelines (auxiliary line)] dialog. You can customize guidelines such as where they are displayed. ☞ Page 303 [Guidelines (auxiliary line) setting] dialog

[Guidelines (auxiliary line) setting] dialog

GT37 SoftGOT3000



Item			Description
1)	[Line Display]	—	Set where to display guidelines.
		[Left] [Right] [Center of Width] [Center of Height] [Top] [Bottom]	Set the position of guidelines displayed on a figure or an object being moved. Select each item to display the image of corresponding guideline in the [Guidelines (auxiliary line)] dialog.
		[Show guidelines on the boundaries between the center of screen and temporary area]	Displays the guidelines at the center of the screen ([+]) and the boundary between the screen display area and the temporary area.
		[Borders of Table]	Displays the guidelines for table borders.
		[Scroll Bar Area]	Displays the guidelines for the following items on the expanded base screens. • Solid lines representing the scroll bar areas • Dotted lines representing partitions for GOT screens
2)	[Display Target]		Select targets for guidelines.
3)	[Display Application Range]		A figure or object can be automatically in alignment with an existing figure or object. Select the distance (in dot) between a figure/object to be moved and existing figures/objects. Moving an existing figure or object while pressing the Alt key disables the setting for [Display Application Range]. Example) Correcting the vertical position when selecting [8] for [Display Application Range] Drag the figure or object, which should be vertically aligned, within 8 dots from the target for the alignment. Doing so horizontally aligns the figure or object being moved with the target figure or object.  Before correction (away more than 8 dots) After correction (moved within 8 dots)

PART 4

6.7.9 Scaling the size of items on the screen editor

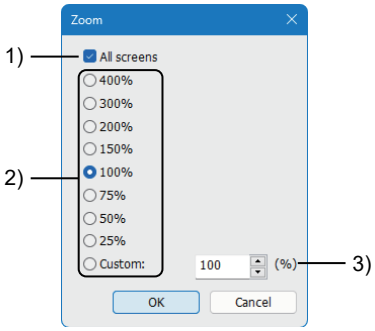
GT37 SoftGOT3000

Select [View] → [Zoom] from the menu and then select one of the following items to change the display magnification of the screen editor.

Menu	Description
[All Screens]	Applies a specified display magnification to all screen editors.
[400%] [300%] [200%] [150%] [100%] [75%] [50%] [25%]	Changes the display magnification of the screen editor to the selected magnification.
[Custom]	Displays the [Zoom] dialog. The display magnification of the screen editor is customizable. ☞ Page 304 [Zoom] dialog
[Whole Screen]	Resizes the screen display area of the screen editor according to the editor window size. This item is not selectable when [All Screens] is selected.

[Zoom] dialog

GT37 SoftGOT3000

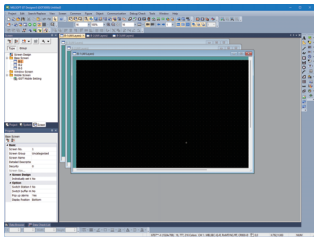


Item		Description
1)	[All Screens]	Applies a specified display magnification to all screen editors.
2)	Display magnification	Select the display magnification of a selected screen editor.
3)	Custom magnification	Specify the display magnification in units of 1%. The setting range is [25] to [400].

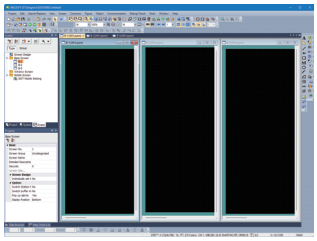
6.7.10 Cascading or arranging open screen editors

GT37 SoftGOT3000

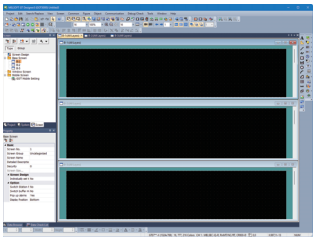
Select [Window] → [Cascade], [Arrange Sideways], or [Arrange Lengthways] from the menu to cascade or arrange the screen editors and windows in the work window.



[Cascade]



[Arrange Sideways]



[Arrange Lengthways]

6.7.11 Copying the image of a screen editor to the clip board

GT37 SoftGOT3000

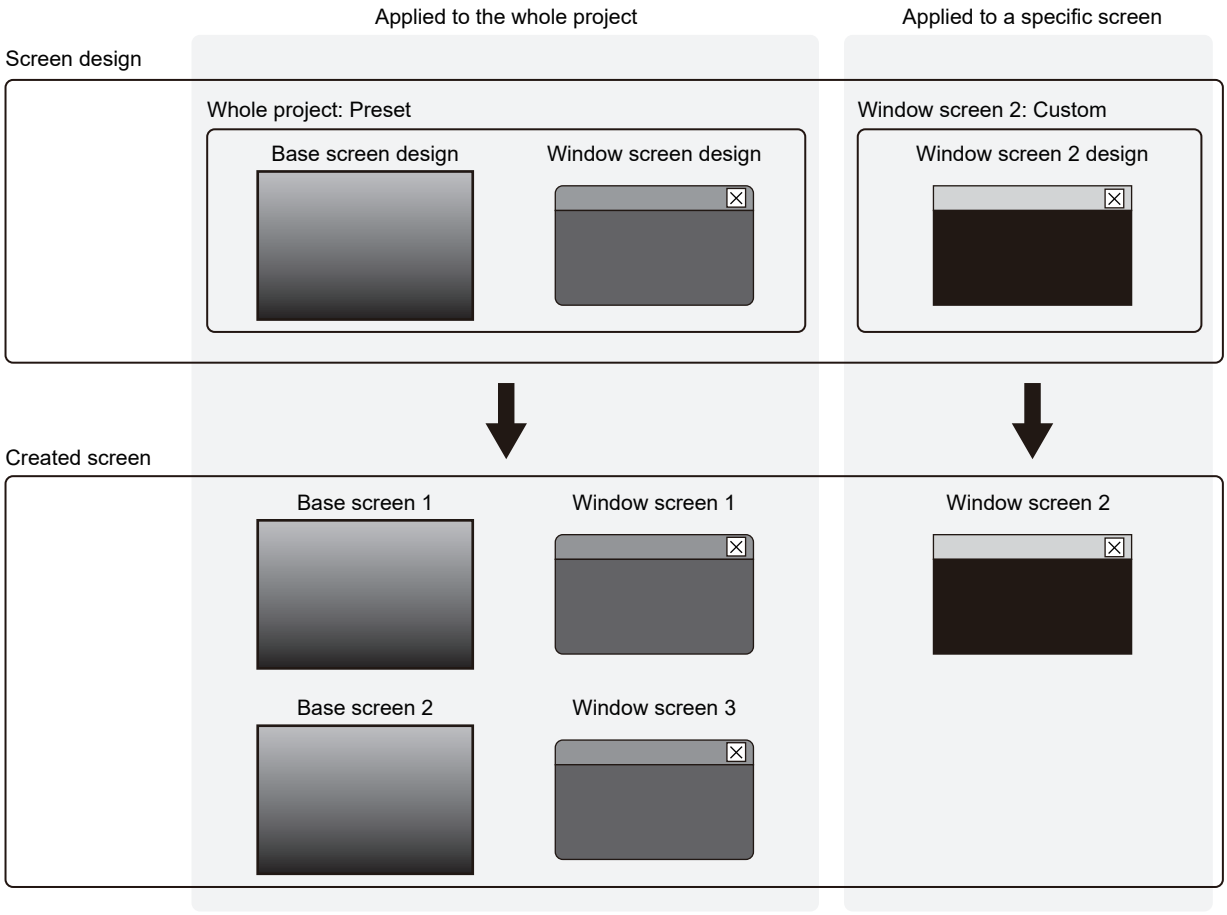
Select [Screen] → [Copy Screen Image to the Clip Board] from the menu to copy the image of the active screen editor to the clip board.

Only the image within the screen display area is copied.

6.8 Setting a screen design

GT37 SoftGOT3000

Set a background color and a shape of the windows displayed on the GOT.
Selecting a registered (preset) setting enables a batch change of all the screen designs.
Part of a preset design can be customized.
Individual screen design can also be changed.



The screen design setting is applied to the following screens.

- Base screen
- Window screen
- Mobile screen

The following shows how to select a screen design.

☞ Page 307 Changing the designs of all the screens
☞ Page 308 Changing a specified screen design

Point

If editing of a project is prohibited by project security, the following operations are not available.

- Changing a screen design in the [Screen Design] dialog
- Pasting a copied screen design

6.8.1 Changing the designs of all the screens

GT37 SoftGOT3000

Change the designs of all the screens registered in the project collectively.

1. Select [Screen] → [Screen Design] from the menu to display the [Screen Design] dialog ([Preset]).

☞ Page 310 [Screen Design] dialog

2. Selecting a design from the design list switches the display of the open screen.

Click the [OK] button to apply the new setting.

3. Perform either of the following operations according to your purpose.

Purpose	Operation
Using a preset design	Click the [OK] button to apply the selected design to the screen.
Customizing a preset design	Select [Custom] in the [Screen Design] dialog. The preset settings are applied. Proceed to Step 4.

4. Changing each setting switches the display of the open screen.

Click the [OK] button to apply the new setting.

☞ Page 312 [Custom]

5. Click the [OK] button to apply the new design to the screen.

PART 4

6.8.2 Changing a specified screen design

GT37 SoftGOT3000

Change the screen design individually by screen.

Change the screen properties of each screen.

For the screen properties of each screen, refer to the following.

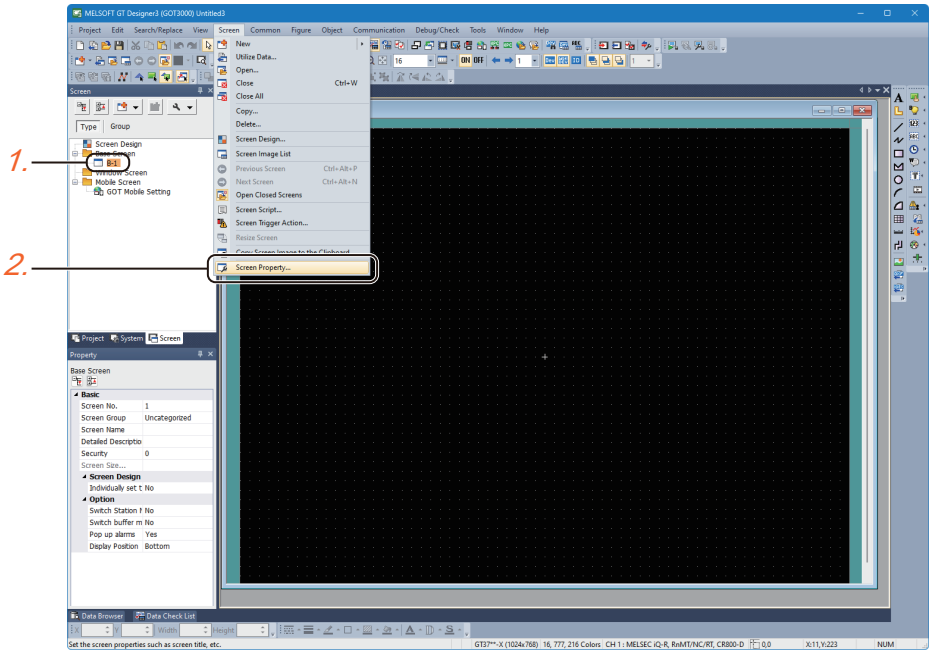
☞ Page 313 Base screen properties

☞ Page 323 Window screen properties

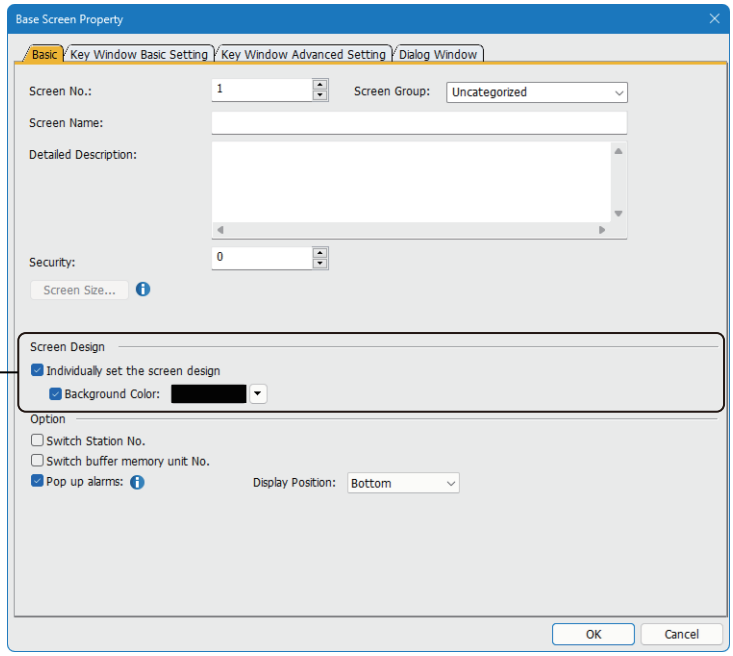
☞ Page 2831 Mobile screen properties

The following shows the procedure for setting an individual screen design for base screen 1 as an example.

1. Select base screen 1.
2. Select [Screen] → [Screen Property] from the menu to display the [Base Screen Property] dialog.



3. Select [Individually set the screen design] to enable the individual screen design setting.
4. Change each setting for [Screen Design] and click the [OK] button to apply the new design to the screen.



[Screen Design]

PART 4

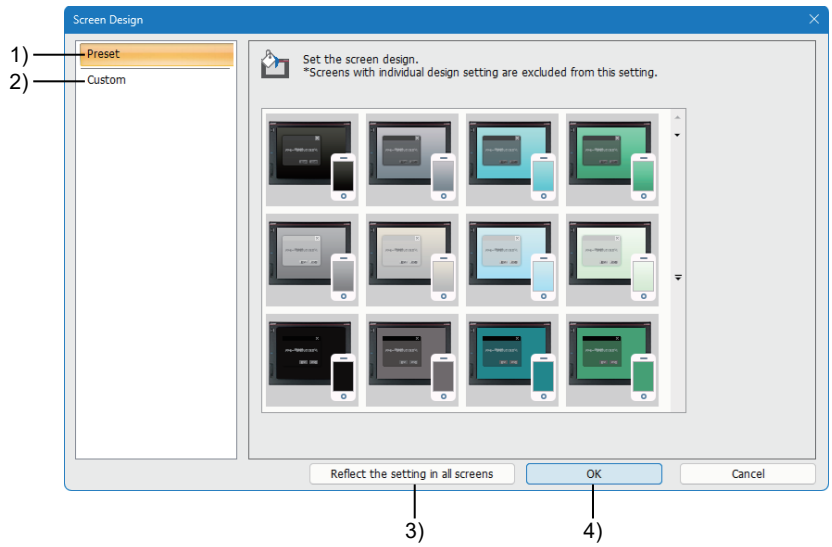
6.8.3 [Screen Design] dialog

GT37 SoftGOT3000

Select [Screen] → [Screen Design] from the menu to display the [Screen Design] dialog.

The screen design setting is saved when the project is saved.

The saved screen design setting is retained upon exit from GT Designer3 and applied at the next GT Designer3 startup.

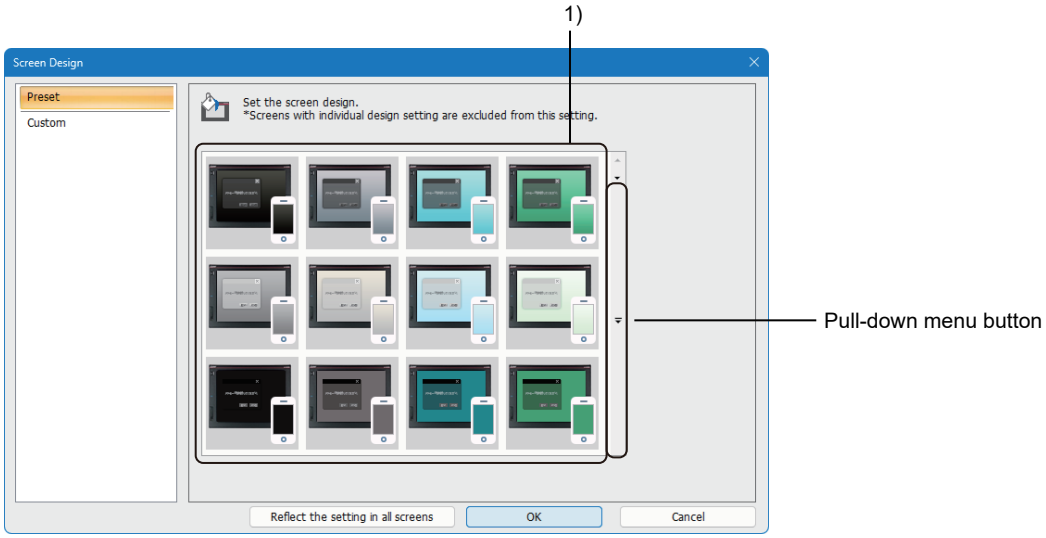


Item		Description
1)	[Preset]	Displays screen designs. Select a design. ☞ Page 311 [Preset]
2)	[Custom]	Displays customizable settings for base screens, window screens, and mobile screens. Customize the settings of the screen design selected from the pre-installed screen designs. ☞ Page 312 [Custom]
3)	[Reflect the setting in all screens] button	Applies the set design to all screens. The design is also applied to a screen for which [Individually set the screen design] is selected in the [Screen Property] dialog. Upon the application of the design, [Individually set the screen design] is deselected in the [Screen Property] dialog. After clicking this button, you cannot restore the screens to their former design. The specified design is not applied to the screens satisfying all the following conditions. • Editing a screen is prohibited by project security. • [Individually set the screen design] is selected in the [Screen Property] dialog.
4)	[OK] button	Applies the set design to all screens. The design is not applied to a screen for which [Individually set the screen design] is selected in the [Screen Property] dialog.

Point

As the screen display method differs between the GOT and a personal computer, a screen with a gradient background may look different on the GOT.

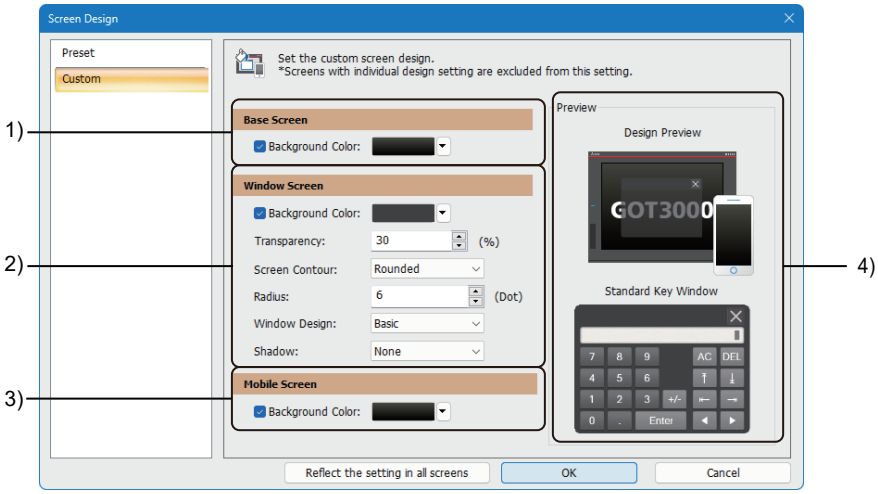
[Preset]



Item		Description
1)	Design list	Select a screen design. Click the pull-down menu button to display all designs. The selectable designs differ depending on the selection for [Graphics Setting] in the [Type Setting] dialog. ☞ Page 519 [Type Setting] dialog

[Custom]

Customize the background color, transparency, and other settings based on the screen design setting selected in [Preset]. When you select a screen design in [Preset] while changing the settings in [Custom], the changes in [Custom] are canceled and the screen design selected in [Preset] is set.



Item			Description
1)	[Base Screen]		Select a background color for base screens. For instruction on the color setting, refer to the following. ☞ Page 988 Color settings
2)	[Window Screen]	—	Set a design for window screens.
		[Background Color]	Select a background color. For instruction on the color setting, refer to the following. ☞ Page 988 Color settings
		[Transparency]	Set the transparency of the window screen. The setting range is [0]% to [100]%.
		[Screen Contour]	Set the contours of the window screen.
		[Radius]	When [Rounded] is selected for [Screen Contour], set the circle radius. The setting range is [0] to [599]. The radius may be adjusted automatically depending on the size of the window screen.
		[Window Design]	Set a design for the title bar of window screens and the standard key window.
		[Shadow]	Set a shadow to window screens and the standard key window.
3)	[Mobile Screen]		Select a background color for mobile screens. For instruction on the color setting, refer to the following. ☞ Page 988 Color settings
4)	[Preview]		Previews a base screen, window screen, mobile screen, and standard key window.

6.9 Changing screen property

GT37 SoftGOT3000

You can change the screen properties including the screen number, background color, and the key window setting that can be enabled per screen.

☞ Page 313 Base screen properties
☞ Page 323 Window screen properties

For information on how to set the mobile screen properties, refer to the following.

☞ Page 2831 Mobile screen properties

6.9.1 Base screen properties

GT37 SoftGOT3000

1. Perform either of the following operations to select a base screen for changing its properties.

- Clicking any part of the screen editor
- Selecting a screen in the [Screen] window (If you select multiple screens with the Ctrl key or Shift key, you can change the screen properties at a time.)

☞ Page 122 [Screen] window

2. Select [Screen] → [Screen Property] from the menu to display the [Base Screen Property] dialog.

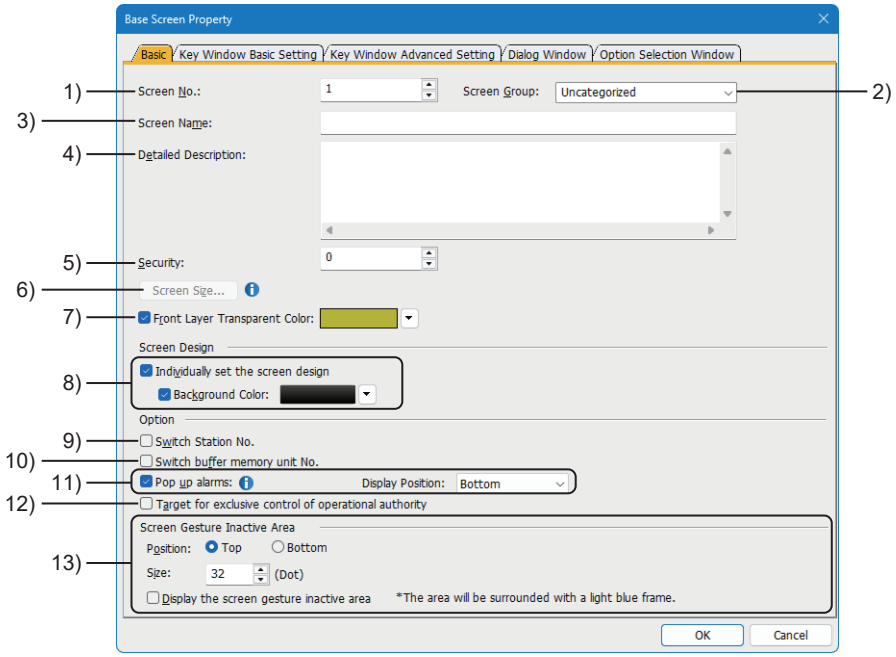
☞ Page 314 [Basic] tab
☞ Page 316 [Key Window Basic Setting] tab
☞ Page 319 [Key Window Advanced Setting] tab
☞ Page 321 [Dialog Window] tab
☞ Page 322 [Option Selection Window] tab

3. Configure the settings and click the [OK] button to apply the setting changes.

When you select multiple screens in the [Screen] tree, the settings are applied to all the selected screens.

[Basic] tab

GT37 SoftGOT3000

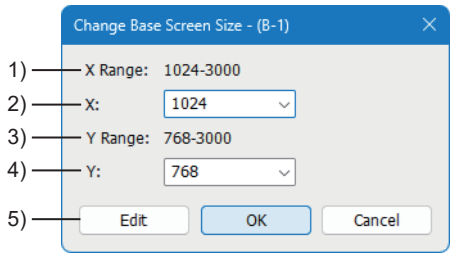


Item			Description
1)	[Screen No.]		Set a screen number. The setting range is [0] to [32767]. If this dialog is displayed with multiple screens selected, the value cannot be changed.
2)	[Screen Group]		Set a screen group. Up to 100 characters can be set.
3)	[Screen Name]		Set a title for the screen. Up to 100 characters can be set.
4)	[Detailed Description]		Set the explanation of the screen. Up to 512 characters can be set. A line feed is counted as two characters.
5)	[Security]		Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2)) ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
6)	[Screen Size] button		This item is available when [Expand base screen sizes] is selected in [Basic Setting] in the [Type Setting] dialog. The [Change Base Screen Size] dialog appears. You can enter values to change the base screen size. ☞ Page 315 [Change Base Screen Size] dialog
7)	[Front Layer Transparent Color]		This item appears only when [Enable the antialiasing] is deselected in the [Type Setting] dialog ([Basic Setting]). Set the transparent color of the objects on the front layer. The parts of the objects whose colors are set to the transparent color become transparent, and the back layer can be seen through them.
8)	[Individually set the screen design]	—	Enables the individual screen design (including the background color), instead of the design selected in the [Screen Design] dialog.
		[Background Color]	Select a background color. For instruction on the color setting, refer to the following. ☞ Page 988 Color settings
9)	[Switch Station No.]		Enables station No. switching by screen. ☞ Page 747 Configuring settings for switching the target station number for monitoring

Item			Description
10)	[Switch buffer memory unit No.]		Enables buffer memory unit No. switching by screen. ☞ Page 755 Configuring the settings for switching the monitoring target buffer memory unit number
11)	[Pop up alarms]	—	An alarm pops up when an alarm occurs. Configure the following settings additionally. • User alarm settings or system alarm settings ☞ Page 2045 [User Alarm Observation] dialog ☞ Page 2097 [System Alarm Observation] dialog • Alarm popup display settings ☞ Page 2118 [Alarm Popup Display] dialog
		[Display Position]	Select the position to display an alarm to be popped up.
12)	[Target for exclusive control of operational authority]		Enables the authorization control for the base screen. ☞ Page 762 Setting the interaction function for equipment on Ethernet ([GOT Network Interaction])
13)	[Screen Gesture Inactive Area]	—	Available for GT37-W. This item is not available when [Expand base screen sizes] is selected in the [Type Setting] dialog ([Basic Setting]). Set an area (screen gesture inactive area) where object operations are enabled even in the screen gesture mode. ☞ Page 502 Zooming and scrolling the monitor screen of the GOT (screen gesture function)
		[Position]	Select a position to arrange the screen gesture inactive area.
		[Size]	Set the height of the screen gesture inactive area. The setting range is [16] dots to [100] dots.
		[Display the screen gesture inactive area]	Displays the frame indicating the screen gesture inactive area on the screen editor. Place the switch for switching to the screen gesture mode in the screen gesture inactive area. ☞ Page 502 Zooming and scrolling the monitor screen of the GOT (screen gesture function)

■[Change Base Screen Size] dialog

GT37 SoftGOT3000



Item		Description
1)	[X Range]	Setting range of the horizontal size
2)	[X]	Set the horizontal size (dot).
3)	[Y Range]	Setting range of the vertical size
4)	[Y]	Set the vertical size (dot).

Item		Description
5)	[Edit] button	This button is not displayed when the screen is newly created. Changes the size of window screens on the screen editor. Drag the handles to change the screen size.  Change the screen size and click any part other than the handles to confirm the change.

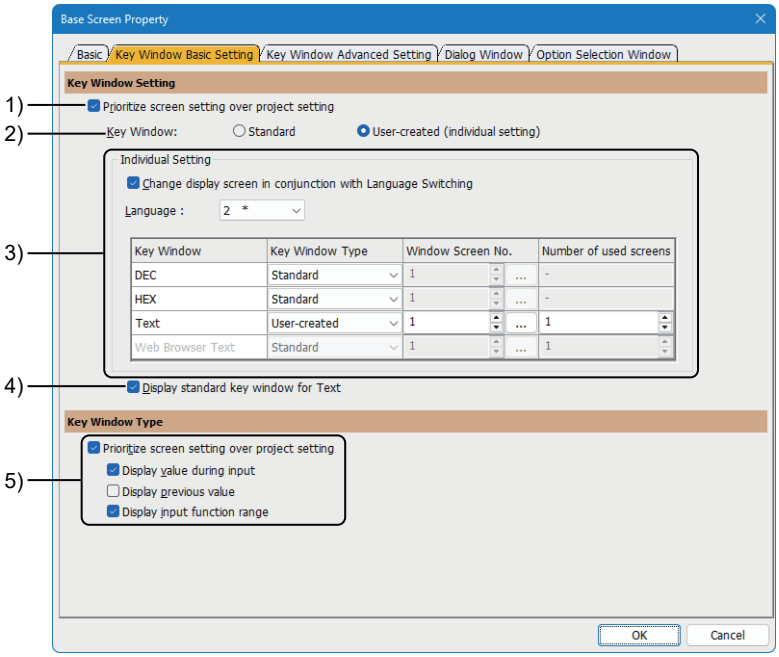
[Key Window Basic Setting] tab

GT37 SoftGOT3000

The following shows the basic settings of key windows for each screen.

To configure project-by-project settings, use the [Environmental Setting] window.

☞ Page 570 [Basic] tab



Item		Description
1)	[Prioritize screen setting over project setting]	Enables the individual settings in [Key Window Setting], instead of the settings in the [Environmental Setting] window.
2)	[Key Window]	Select the type of a key window to be used. If you select [User-created (individual setting)], set a key window to be used for each input target (decimal, hexadecimal, character string, and Web browser character string) in [Individual Setting].

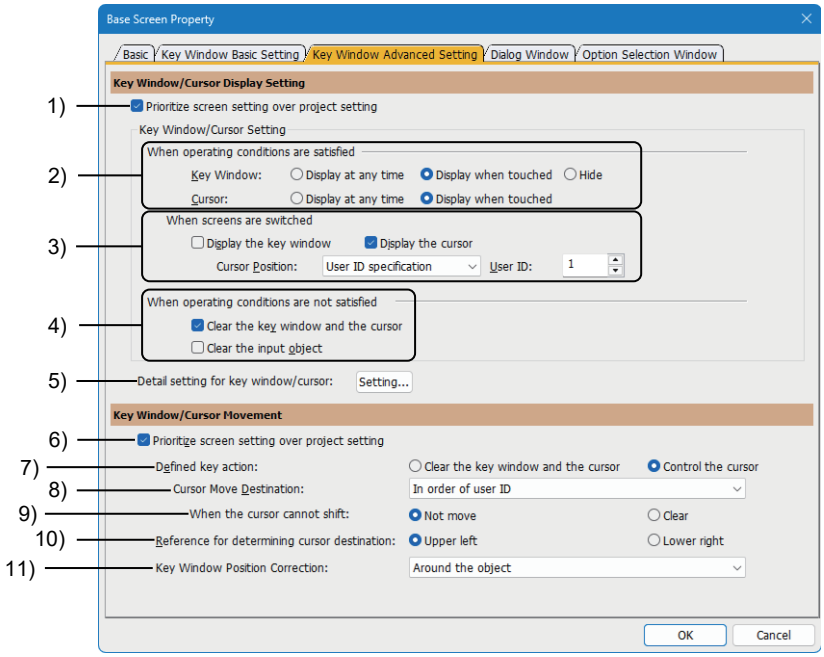
Item			Description
3)	[Individual Setting]	—	Set the key window to be used for each input target. This item is enabled when [User-created (individual setting)] is selected in [Key Window Setting].
		[Change display screen in conjunction with Language Switching]	Enable the settings for switching the key windows to be displayed in conjunction with the value (1 to 30) of the language switching device. For the language switching device, refer to the following. ☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching]) For each of the values (1 to 30) of [Language], set a key window to be used. Select a value in [Language], and set a key window to be used for each input target (decimal, hexadecimal, character string, and Web browser character string). If you change the default value, [*] is added to the selected value. For each value of the language switching device, you can set a key window to be used. If you select [User-created] in [Key Window Type], [*] is added to the value of the selected range. Example) If you select [2] in [Language] and change the key window type from the default [*] is added to the value.  The default setting has been changed.
		[Key Window]	The use of each key window [Web Browser Text] cannot be set in the screen property settings. The setting can be configured only in the [Environmental Setting] window ([Key Window]). ☞ Page 570 [Key Window] [Web Browser Text] is not displayed in GT SoftGOT3000.
		[Key Window Type]	Select the type of key windows according to their uses. If you select [User-created], select the window screen to be used as a user-created key window in [Window Screen No.].
		[Window Screen No.]	Set the number of the window screen to be displayed as a user-created key window. The setting range is [1] to [32767]. Click the [...] button to display the [Image List] dialog (screen). You can check the image on the screen when selecting a window screen. ☞ Page 3683 [Image List] dialog (screen)
		[Number of used screens]	This item is settable for [Text] and [Web Browser Text] only. Set the number of key windows used for text input. With the window screen set in [Window Screen No.] as the first on the list, window screens are used for the set number as key windows. To switch key windows, arrange key code switches to which the following operations are set. • [Switch window screens for ASCII (to the next)] • [Switch window screens for ASCII (to the previous)] • [Switch window screens for ASCII (screen no. specification)] ☞ Page 1251 [Key Code Switch] dialog
4)	[Display standard key window for Text]		Set whether to display or hide the standard key window for character string. Clear this checkbox if the standard key window for character string is not necessary because character strings are input from the key code switch on the screen.

Item			Description
5)	[Prioritize screen setting over project setting]	—	Enables the individual settings in [Key Window Type], instead of the settings in the [Environmental Setting] window.
		[Display value during input]	Displays the value being input in the key window. To display the value in the user-created key window, arrange the input value area setting on the window screen. ☞ Page 1887 Placing an object to display the input information
		[Display previous value]	Displays the previous value in the key window. To display the previous value in the user-created key window, arrange the previous value area setting on the window screen. ☞ Page 1887 Placing an object to display the input information
		[Display input function range]	Displays the valid input range in the key window. To display the valid input range in the user-created key window, arrange the input range area setting on the window screen. ☞ Page 1887 Placing an object to display the input information

[Key Window Advanced Setting] tab

GT37 SoftGOT3000

The following shows the advanced settings of key windows for each screen.
To configure project-by-project settings, use the [Environmental Setting] window.
☞ Page 572 [Advanced Setting] tab



Item			Description
1)	[Prioritize screen setting over project setting]		Enables the individual settings in [Key Window/Cursor Display Setting], instead of the settings in the [Environmental Setting] window.
2)	[When operating conditions are satisfied]	—	Configure the display settings of the key window and cursor for when the operating conditions of the objects for input are satisfied.
		[Key Window]	Configure the display settings of the key window for when the operating conditions of the objects for input are satisfied.
		[Cursor]	Configure the display settings of the cursor for when the operating conditions of the object for input are satisfied.
3)	[When screens are switched]	—	Configure the display settings of the key window and cursor to switch screens for when the operating conditions of the object for input are satisfied.
		[Display the key window]	Displays a key window when the screen is switched.
		[Display the cursor]	Displays a cursor when the screen is switched. Set the position to display the cursor in [Cursor Position].
		[Cursor Position]	Select the position to display the cursor when the screen is switched.
		[User ID]	Sets the user ID of the object on which the cursor is displayed. The setting range is [1] to [65535].
4)	[When operating conditions are not satisfied]	—	Configure the display settings of the key window and cursor for when the operating conditions of the objects for input are not satisfied.
		[Clear the key window and the cursor]	Deletes the key window and cursor when the operating conditions of the objects for input are not satisfied.
		[Clear the input object]	Deletes the key window, the cursor, and the objects for input when the operating conditions of the objects for input are not satisfied.
5)	[Detail setting for key window/cursor]		Click the [Setting] button to display the [Display Detail Setting] dialog. ☞ Page 574 [Display Detail Setting] dialog
6)	[Prioritize screen setting over project setting]		Enables the settings in [Key Window/Cursor Movement], instead of the settings in the [Environmental Setting] window.
7)	[Defined key action]		Select the action of the key window and cursor when the enter key is touched.

Item			Description
8)	[Cursor Move Destination]	—	Select a position to move the cursor. The following shows selectable items.
		[Same operation as the right arrow key]	Moves the cursor using the specified coordinate point of the active object as a reference. Specify the reference coordinates with [Reference for determining cursor destination]. The cursor moves as shown below. 		[Same operation as the down arrow key]	Moves the cursor using the specified coordinate point of the active object as a reference. Specify the reference coordinates with [Reference for determining cursor destination]. The cursor moves as shown below. 		[In order of user ID]	Moves the cursor to the object that has the same user ID number as the move destination ID number of the active object. If the destination object is hidden due to unsatisfied conditions, the cursor does not move. To control the cursor movement, set [User ID] and [Move Destination ID] of the relevant objects. 		[Subsequently valid user ID]	Moves the cursor to the object that has the same user ID number as the move destination ID number of the active object. If the destination object is hidden due to unsatisfied conditions, the cursor moves to the object specified with [Move Destination ID] of the hidden destination object. To control the cursor movement, set [User ID] and [Move Destination ID] of the relevant objects. 		[Not move]	Does not move the cursor even after the entry is confirmed.

Item		Description
9)	[When the cursor cannot shift]	This item is displayed when [Cursor Move Destination] is set to [In order of user ID] or [Subsequently valid user ID]. Select how the cursor moves when no destination object exists.
10)	[Reference for determining cursor destination]	Select the standard to determine a position to move the cursor.
11)	[Key Window Position Correction]	Select an action of the key window when it overlaps the input target object. When [To the four corners of the screen] is selected, the key window is displayed in one of the four corners so that it will not overlap the input target object. If the key window inevitably overlaps the input target object, it is displayed in the lower right of the screen.

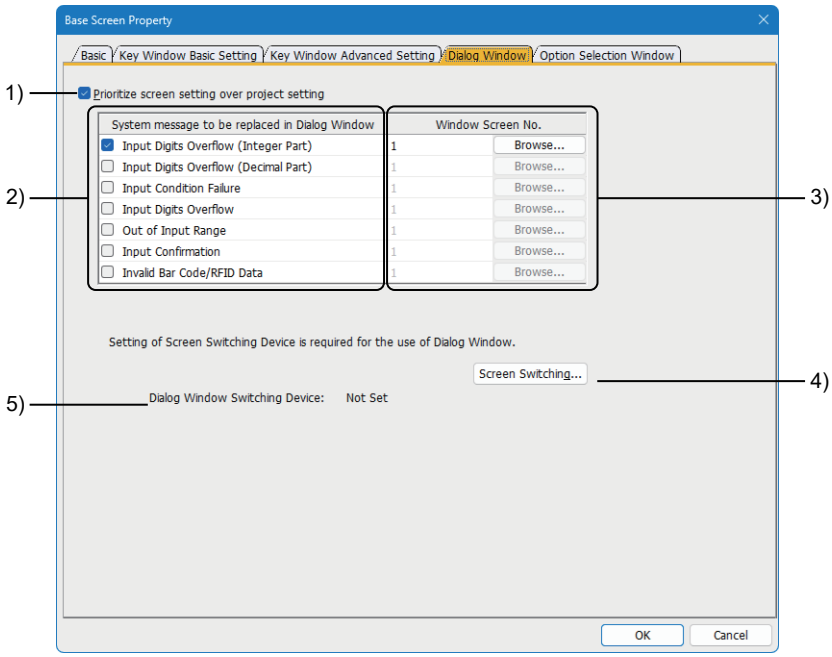
[Dialog Window] tab

GT37 SoftGOT3000

The following shows the settings of the dialog window for each screen.

To configure project-by-project settings, use the [Environmental Setting] window.

☞ Page 557 [Dialog Window]

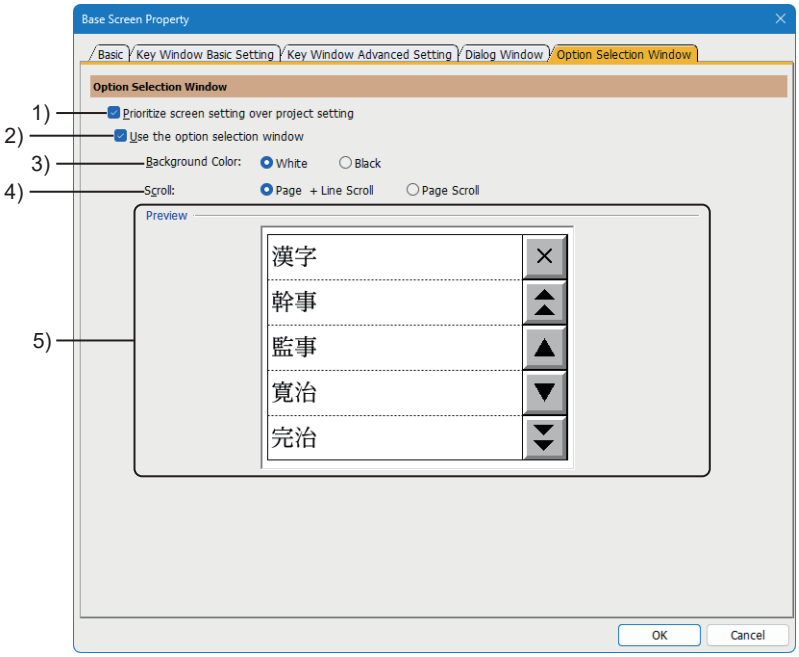


Item		Description
1)	[Prioritize screen setting over project setting]	Prioritizes the settings in the dialog window of the [Base Screen Property] dialog over the project-by-project settings in the [Environmental Setting] window.
2)	[System message to be replaced in Dialog Window]	Select a system message to be replaced by the dialog window. Replaces the selected system message with the window screen set in [Window Screen No.]. For the system messages of each item, refer to the following. ☞ Page 555 How to use dialog windows
3)	[Window Screen No.]	Set a screen number of the window screen to be displayed instead of the system message. The setting range is [0] to [32767]. Click the [Browse] button to display the [Image List] dialog (screen). You can check the image on the screen when selecting a window screen. ☞ Page 3683 [Image List] dialog (screen)
4)	[Screen Switching] button	Displays the [Environmental Setting] window. ☞ Page 557 [Dialog Window]
5)	[Dialog Window Switching Device]	The currently set screen switching device for a dialog window

[Option Selection Window] tab

GT37 SoftGOT3000

Displays the settings in the option selection window for screen-by-screen Kana-Kanji or Pinyin conversion.
To configure project-by-project settings, use the [Environmental Setting] window.
☞ Page 610 [Kana-Kanji/Pinyin Conversion]



Item		Description
1)	[Prioritize screen setting over project setting]	Prioritizes the settings in [Option Selection Window] of the [Base Screen Property] dialog over the project-by-project settings in the [Environmental Setting] window.
2)	[Use the option selection window]	Select this item to display the option selection window for Kana-Kanji or Pinyin conversion.
3)	[Background Color]	Select the background color for the option selection window.
4)	[Scroll]	Select the keys to be displayed on the option selection window. • [Page + Line Scroll]: Displays the keys for scrolling by page or by line. • [Page Scroll]: Displays the keys for scrolling by page.
5)	[Preview]	Displays a preview of the option selection window with the [Background Color] and [Scroll] settings applied.

6.9.2 Window screen properties

GT37 SoftGOT3000

1. Perform either of the following operations to select a window screen for changing its properties.

- Clicking any part of the screen editor
- Selecting a screen in the [Screen] window (If you select multiple screens with the Ctrl key or Shift key, you can change the screen properties at a time.)

☞ Page 122 [Screen] window

2. Select [Screen] → [Screen Property] from the menu to display the [Window Screen Property] dialog.

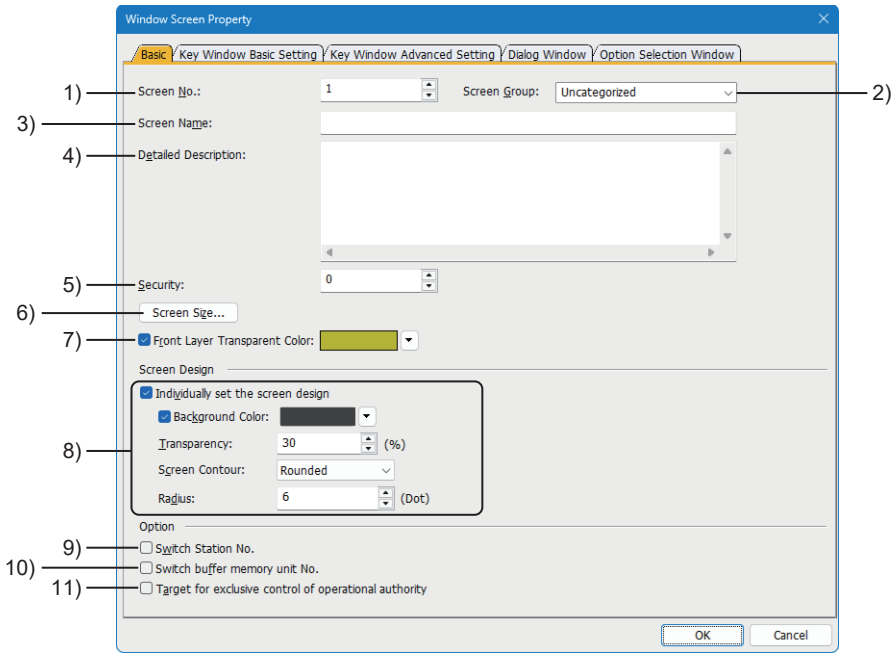
☞ Page 326 [Key Window Basic Setting] tab
☞ Page 329 [Key Window Advanced Setting] tab
☞ Page 332 [Dialog Window] tab
☞ Page 333 [Option Selection Window] tab

3. Configure the settings and click the [OK] button to apply the setting changes.

When you select multiple screens in the [Screen] tree, the settings are applied to all the selected screens.

[Basic] tab

GT37 SoftGOT3000

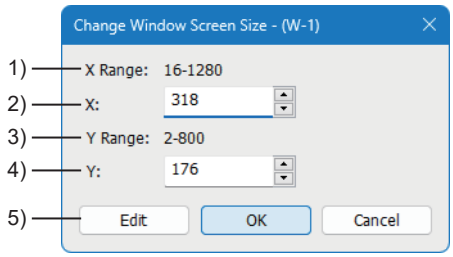


Item		Description
1)	[Screen No.]	Set a screen number. The setting range is [0] to [32767]. If this dialog is displayed with multiple screens selected, the value cannot be changed.
2)	[Screen Group]	Set a screen group. Up to 100 characters can be set.
3)	[Screen Name]	Set a title for the screen. Up to 100 characters can be set.
4)	[Detailed Description]	Set the explanation of the screen. Up to 512 characters can be set. A line feed is counted as two characters.

Item			Description
5)	[Security]		Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2)) ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
6)	[Screen Size] button		Displays the [Change Window Size] dialog. Specify a numerical value to change the size of the window screen. ☞ Page 325 [Change Window Size] dialog
7)	[Front Layer Transparent Color]		This item appears only when [Enable the antialiasing] is deselected in the [Type Setting] dialog ([Basic Setting]). Set the transparent color of the objects on the front layer. The parts of the objects whose colors are set to the transparent color become transparent, and the back layer can be seen through them.
8)	[Individually set the screen design]	—	Enables the individual screen design (including the background color), instead of the design selected in the [Screen Design] dialog.
		[Background Color]	Select a background color. For instruction on the color setting, refer to the following. ☞ Page 988 Color settings For a window screen, if [Screen Contour] is set to [Rounded], the gradient area of the window screen varies depending on whether its title bar is displayed. Position the window screen on the screen editor of the base screen, and check the window screen image in the [Screen Preview] window. ☞ Page 336 Displaying a preview
		[Transparency]	Set the transparency of the window screen. The setting range is [0]% to [100]%.
		[Screen Contour]	Set the contours of the window screen.
		[Radius]	When [Rounded] is selected for [Screen Contour], set the circle radius. The following shows the setting range. [0] dots to (n - 1) / 2 dots n: Window screen height or width, whichever is smaller (dots) The fractional portion of the result is rounded off.
9)	[Switch Station No.]		Enables station No. switching by screen. ☞ Page 747 Configuring settings for switching the target station number for monitoring
10)	[Switch buffer memory unit No.]		Enables buffer memory unit No. switching by screen. ☞ Page 755 Configuring the settings for switching the monitoring target buffer memory unit number
11)	[Target for exclusive control of operational authority]		Enables the authorization control for the window screen. ☞ Page 762 Setting the interaction function for equipment on Ethernet ([GOT Network Interaction])

■[Change Window Size] dialog

GT37 SoftGOT3000



Item		Description
1)	[X Range]	Setting range of the horizontal size
2)	[X]	Set the horizontal size (dot).
3)	[Y Range]	Setting range of the vertical size
4)	[Y]	Set the vertical size (dot).
5)	[Edit] button	This button is not displayed when the screen is newly created. Changes the size of window screens on the screen editor. Drag the handles to change the screen size.  Change the screen size and click any part other than the handles to confirm the change.

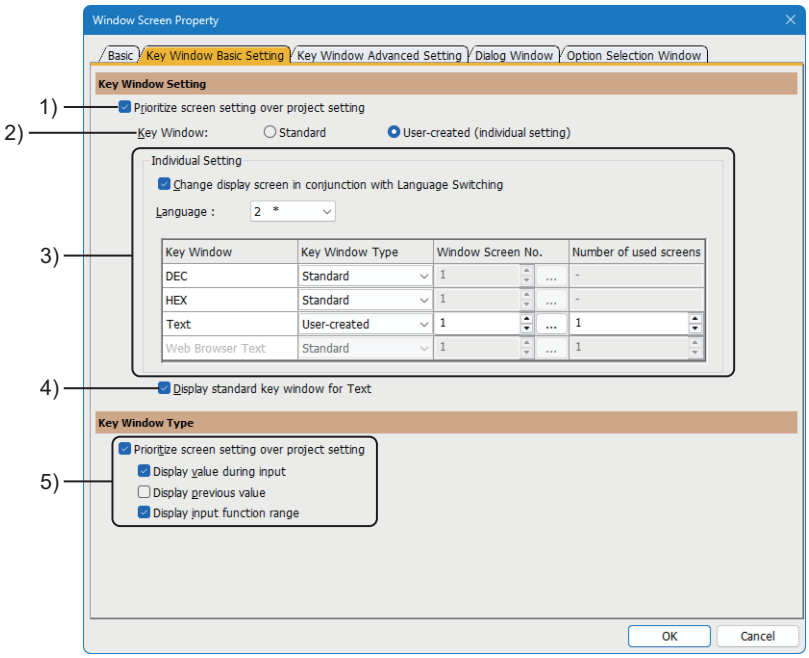
[Key Window Basic Setting] tab

GT37 SoftGOT3000

The following shows the basic settings of key windows for each screen.

To configure project-by-project settings, use the [Environmental Setting] window.

☞ Page 570 [Basic] tab



Item		Description
1)	[Prioritize screen setting over project setting]	Enables the individual settings in [Key Window Setting], instead of the settings in the [Environmental Setting] window.
2)	[Key Window]	Select the type of a key window to be used. If you select [User-created (individual setting)], set a key window to be used for each input target (decimal, hexadecimal, character string, and Web browser character string) in [Individual Setting].

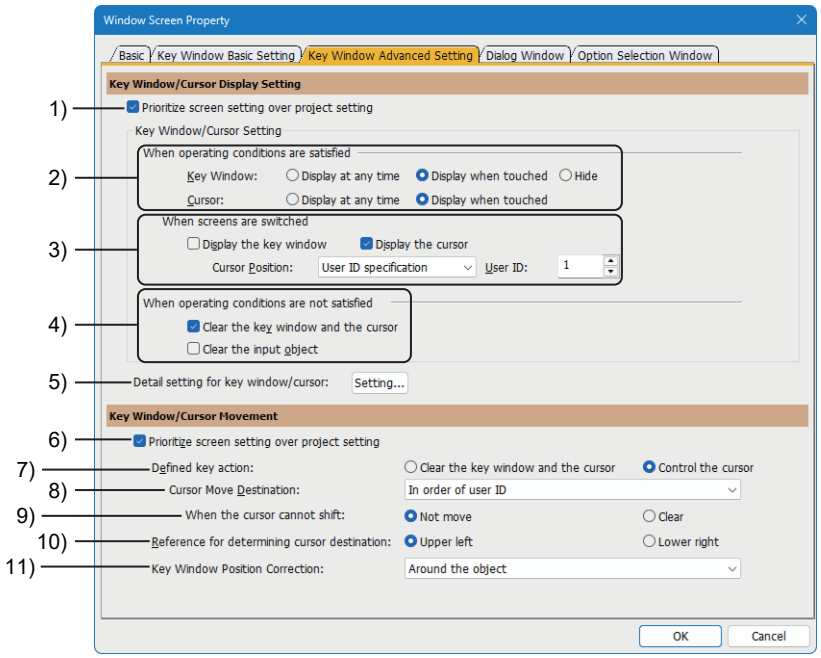
Item			Description
3)	[Individual Setting]	—	Set the key window to be used for each input target. This item is enabled when [User-created (individual setting)] is selected in [Key Window Setting].
		[Change display screen in conjunction with Language Switching]	Enable the settings for switching the key windows to be displayed in conjunction with the value (1 to 30) of the language switching device. For the language switching device, refer to the following. ☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching]) For each of the values (1 to 30) of [Language], set a key window to be used. Select a value in [Language], and set a key window to be used for each input target (decimal, hexadecimal, character string, and Web browser character string). If you change the default value, [*] is added to the selected value. For each value of the language switching device, you can set a key window to be used. If you select [User-created] in [Key Window Type], [*] is added to the value of the selected range. Example) If you select [2] in [Language] and change the key window type from the default [*] is added to the value.  The default setting has been changed.
		[Key Window]	The use of each key window [Web Browser Text] cannot be set in the screen property settings. The setting can be configured only in the [Environmental Setting] window ([Key Window]). ☞ Page 570 [Key Window] [Web Browser Text] is not displayed in GT SoftGOT3000.
		[Key Window Type]	Select the type of key windows according to their uses. If you select [User-created], select the window screen to be used as a user-created key window in [Window Screen No.].
		[Window Screen No.]	Set the number of the window screen to be displayed as a user-created key window. The setting range is [1] to [32767]. Click the [...] button to display the [Image List] dialog (screen). You can check the image on the screen when selecting a window screen. ☞ Page 3683 [Image List] dialog (screen)
		[Number of used screens]	This item is settable for [Text] and [Web Browser Text] only. Set the number of key windows used for text input. With the window screen set in [Window Screen No.] as the first on the list, window screens are used for the set number as key windows. To switch key windows, arrange key code switches to which the following operations are set. • [Switch window screens for ASCII (to the next)] • [Switch window screens for ASCII (to the previous)] • [Switch window screens for ASCII (screen no. specification)] ☞ Page 1251 [Key Code Switch] dialog
4)	[Display standard key window for Text]		Set whether to display or hide the standard key window for character string. Clear this checkbox if the standard key window for character string is not necessary because character strings are input from the key code switch on the screen.

Item			Description
5)	[Prioritize screen setting over project setting]	—	Enables the individual settings in [Key Window Type], instead of the settings in the [Environmental Setting] window.
		[Display value during input]	Displays the value being input in the key window. To display the value in the user-created key window, arrange the input value area setting on the window screen. ☞ Page 1887 Placing an object to display the input information
		[Display previous value]	Displays the previous value in the key window. To display the previous value in the user-created key window, arrange the previous value area setting on the window screen. ☞ Page 1887 Placing an object to display the input information
		[Display input function range]	Displays the valid input range in the key window. To display the valid input range in the user-created key window, arrange the input range area setting on the window screen. ☞ Page 1887 Placing an object to display the input information

[Key Window Advanced Setting] tab

GT37 SoftGOT3000

The following shows the advanced settings of key windows for each screen.
To configure project-by-project settings, use the [Environmental Setting] window.
☞ Page 572 [Advanced Setting] tab



Item			Description
1)	[Prioritize screen setting over project setting]		Enables the individual settings in [Key Window/Cursor Display Setting], instead of the settings in the [Environmental Setting] window.
2)	[When operating conditions are satisfied]	—	Configure the display settings of the key window and cursor for when the operating conditions of the objects for input are satisfied.
		[Key Window]	Configure the display settings of the key window for when the operating conditions of the objects for input are satisfied.
		[Cursor]	Configure the display settings of the cursor for when the operating conditions of the object for input are satisfied.
3)	[When screens are switched]	—	Configure the display settings of the key window and cursor to switch screens for when the operating conditions of the object for input are satisfied.
		[Display the key window]	Displays a key window when the screen is switched.
		[Display the cursor]	Displays a cursor when the screen is switched. Set the position to display the cursor in [Cursor Position].
		[Cursor Position]	Select the position to display the cursor when the screen is switched.
		[User ID]	Sets the user ID of the object on which the cursor is displayed. The setting range is [1] to [65535].
4)	[When operating conditions are not satisfied]	—	Configure the display settings of the key window and cursor for when the operating conditions of the objects for input are not satisfied.
		[Clear the key window and the cursor]	Deletes the key window and cursor when the operating conditions of the objects for input are not satisfied.
		[Clear the input object]	Deletes the key window, the cursor, and the objects for input when the operating conditions of the objects for input are not satisfied.
5)	[Detail setting for key window/cursor]		Click the [Setting] button to display the [Display Detail Setting] dialog. ☞ Page 574 [Display Detail Setting] dialog
6)	[Prioritize screen setting over project setting]		Enables the settings in [Key Window/Cursor Movement], instead of the settings in the [Environmental Setting] window.
7)	[Defined key action]		Select the action of the key window and cursor when the enter key is touched.

Item			Description
8)	[Cursor Move Destination]	—	Select a position to move the cursor. The following shows selectable items.
		[Same operation as the right arrow key]	Moves the cursor using the specified coordinate point of the active object as a reference. Specify the reference coordinates with [Reference for determining cursor destination]. The cursor moves as shown below. 		[Same operation as the down arrow key]	Moves the cursor using the specified coordinate point of the active object as a reference. Specify the reference coordinates with [Reference for determining cursor destination]. The cursor moves as shown below. 		[In order of user ID]	Moves the cursor to the object that has the same user ID number as the move destination ID number of the active object. If the destination object is hidden due to unsatisfied conditions, the cursor does not move. To control the cursor movement, set [User ID] and [Move Destination ID] of the relevant objects. 		[Subsequently valid user ID]	Moves the cursor to the object that has the same user ID number as the move destination ID number of the active object. If the destination object is hidden due to unsatisfied conditions, the cursor moves to the object specified with [Move Destination ID] of the hidden destination object. To control the cursor movement, set [User ID] and [Move Destination ID] of the relevant objects. 		[Not move]	Does not move the cursor even after the entry is confirmed.

Item		Description
9)	[When the cursor cannot shift]	This item is displayed when [Cursor Move Destination] is set to [In order of user ID] or [Subsequently valid user ID]. Select how the cursor moves when no destination object exists.
10)	[Reference for determining cursor destination]	Select the standard to determine a position to move the cursor.
11)	[Key Window Position Correction]	Select an action of the key window when it overlaps the input target object. When [To the four corners of the screen] is selected, the key window is displayed in one of the four corners so that it will not overlap the input target object. If the key window inevitably overlaps the input target object, it is displayed in the lower right of the screen.

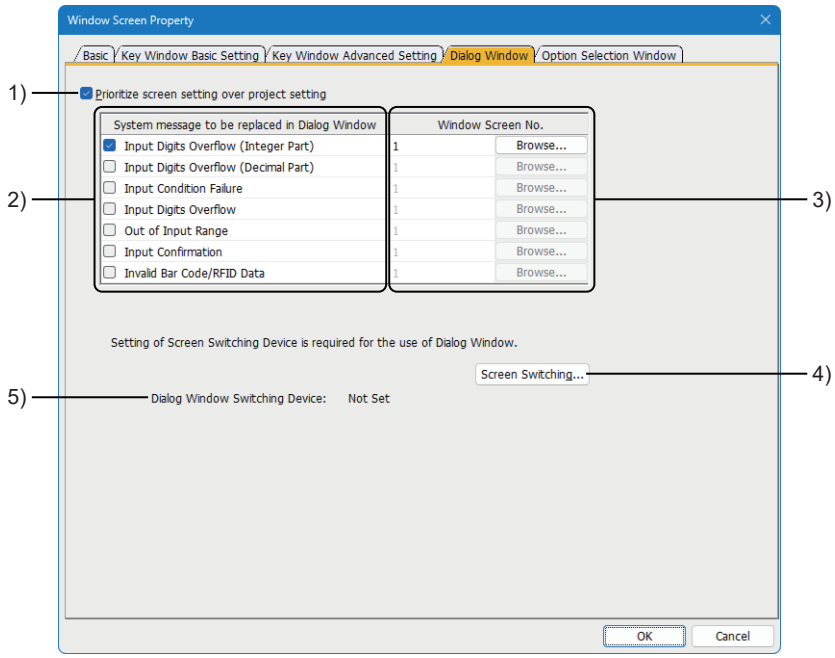
[Dialog Window] tab

GT37 SoftGOT3000

The following shows the settings of the dialog window for each screen.

To configure project-by-project settings, use the [Environmental Setting] window.

☞ Page 557 [Dialog Window]



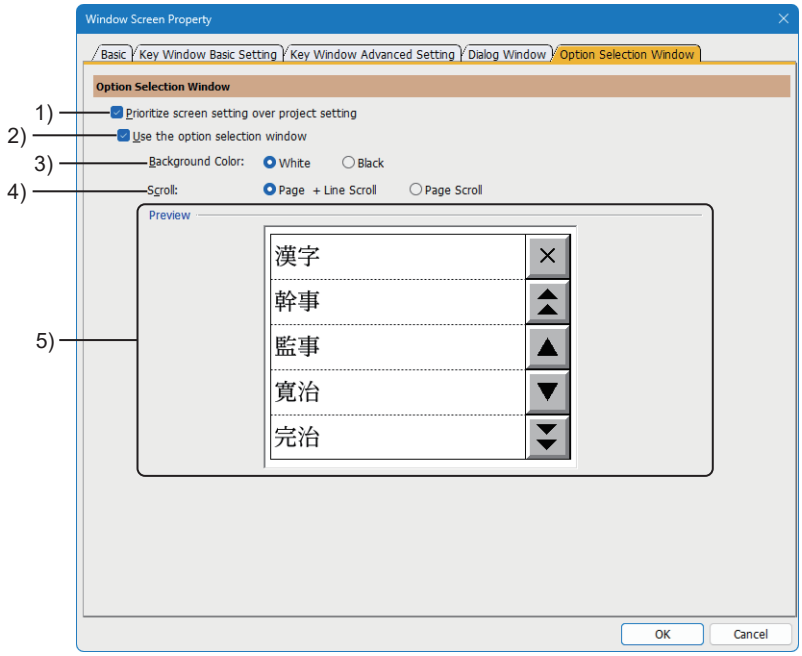
Item		Description
1)	[Prioritize screen setting over project setting]	Prioritizes the settings in the dialog window of the [Window Screen Property] dialog over the project-by-project settings in the [Environmental Setting] window.
2)	[System message to be replaced in Dialog Window]	Select a system message to be replaced by the dialog window. Replaces the selected system message with the window screen set in [Window Screen No.]. For the system messages of each item, refer to the following. ☞ Page 555 How to use dialog windows
3)	[Window Screen No.]	Set a screen number of the window screen to be displayed instead of the system message. The setting range is [0] to [32767]. Click the [Browse] button to display the [Image List] dialog (screen). You can check the image on the screen when selecting a window screen. ☞ Page 3683 [Image List] dialog (screen)
4)	[Screen Switching] button	Displays the [Environmental Setting] window. ☞ Page 557 [Dialog Window]
5)	[Dialog Window Switching Device]	The currently set screen switching device for a dialog window

[Option Selection Window] tab

Displays the settings in the option selection window for screen-by-screen Kana-Kanji or Pinyin conversion.

To configure project-by-project settings, use the [Environmental Setting] window.

☞ Page 610 [Kana-Kanji/Pinyin Conversion]



Item		Description
1)	[Prioritize screen setting over project setting]	Prioritizes the settings in [Option Selection Window] of the [Screen Property] dialog over the project-by-project settings in the [Environmental Setting] window.
2)	[Use the option selection window]	Select this item to display the option selection window for Kana-Kanji or Pinyin conversion.
3)	[Background Color]	Select the background color for the option selection window.
4)	[Scroll]	Select the keys to be displayed on the option selection window. • [Page + Line Scroll]: Displays the keys for scrolling by page or by line. • [Page Scroll]: Displays the keys for scrolling by page.
5)	[Preview]	Displays a preview of the option selection window with the [Background Color] and [Scroll] settings applied.

6.10 Managing the created screen

GT37 SoftGOT3000

The created screen is displayed on the [Screen] window and [Screen Image List] window.
You can copy or delete the screen on each window.

Window	Description
[Screen] window	Displays the screen view tree with the screen number and title of the created screens. Whether the script and trigger action is set for each screen can be displayed. ☞ Page 122 [Screen] window
[Screen Image List] window	Displays the icons of created base screens, window screens, and mobile screens. ☞ Page 335 [Screen Image List] window

6.10.1 [Screen Image List] window

GT37 SoftGOT3000

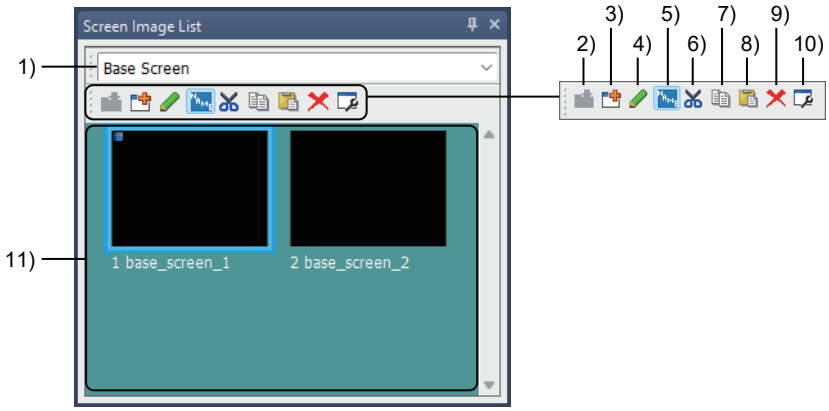
Either of the following operations displays the [Screen Image List] window.

- Select [View] → [Docking Window] → [Screen Image List] from the menu.
- Select [Screen] → [Screen Image List] from the menu.

Point

To speed up the display of screen images, select [Include projects for the function of Utilize Data] in the [Project information] dialog.

☞ Page 224 [Project Information] dialog



Item		Description
1)	Screen type	Select the type of the screen to be displayed in the screen image list.
2)	[Register] button	Creates a new screen utilizing the figure or object selected on the screen editor.
3)	[New] button	Creates a new screen of the type selected in the screen types.
4)	[Edit] button	Opens the screen selected in the screen image list.
5)	[Name] button	Switches between displaying and hiding screen numbers and titles in the screen image list.
6)	[Cut] button	Cuts the screen selected in the screen image list.
7)	[Copy] button	Copies the screen selected in the screen image list.
8)	[Paste] button	Pastes the screen cut or copied in the screen image list. The screen appears after the paste.
9)	[Delete] button	Deletes the screen selected in the screen image list.
10)	[Property] button	Displays the screen properties of the screen selected in the screen image list.
11)	Screen image list	Lists the images of the created screens. When the display or edit of a screen is disabled by project security, the screen image is displayed as shown below. 
6.11 Viewing the image of the created screen

GT37 SoftGOT3000

☞ Page 336 Displaying a preview
☞ Page 340 Displaying the preview of a window screen on the screen editor

6.11.1 Displaying a preview

GT37 SoftGOT3000

1. Select the screen editor of the base screen or window screen to display the preview.

☞ Page 295 Selecting a screen editor to be edited

2. Select [View] → [Preview] from the menu to display the [Screen Preview] window.

Edit the screen editor to apply the edit contents to the [Screen Preview] window.

☞ Page 337 [Screen preview] window

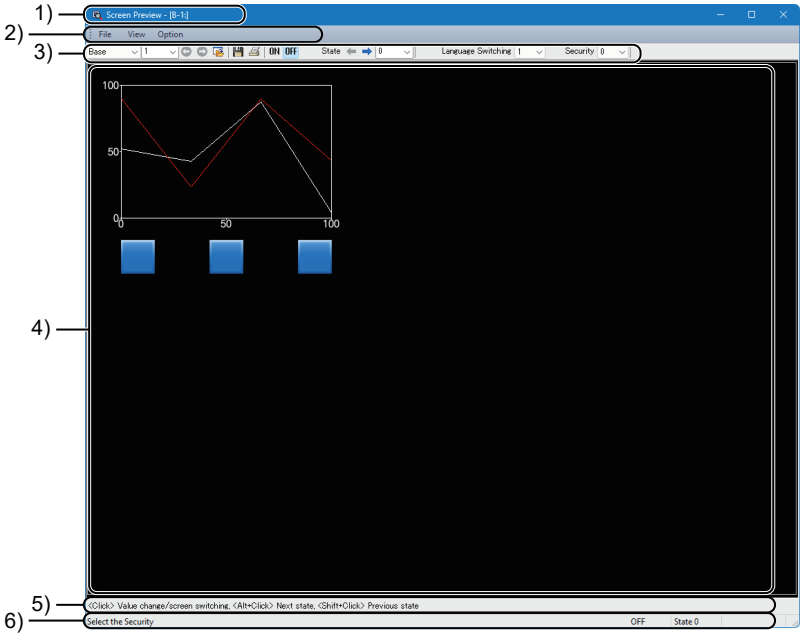
Point

The following items are not displayed in the [Screen Preview] window.

- Frame animation
- Animation route

[Screen preview] window

GT37 SoftGOT3000



Item		Description
1)	Title bar	Screen number and title of the previewed screen
2)	Menu bar	Operate the [Screen Preview] window from the pull-down menu. ☞ Page 338 [File] menu ☞ Page 338 [Display] menu ☞ Page 338 [Option] menu
3)	Toolbar	Use the buttons and other items to operate the [Screen Preview] window. ☞ Page 339 Toolbar
4)	Display section	Displays the preview of the screen editor. The scroll bars appear on the expanded base screens. Each time you click the superimposed part of objects while holding down the Ctrl key, the selected object is shifted in order from the topmost object. Right-click the display section to display the menu. The available items are the same as those in [Display] in the menu. ☞ Page 338 [Display] menu Click a Go To Screen switch for which an option other than [Fixed] is selected in [Next Station] to display the [Screen No. Specification] dialog. In this dialog, you can set the destination screen number. ☞ Page 339 [Screen No. Specification] dialog Click the numerical display, numerical input, text display, or text input to display the [Preview Value] dialog. ☞ Page 339 [Preview Value] dialog
5)	Description bar	Displays the operation description of the [Screen Preview] window.
6)	Status bar	The following are displayed according to the position of the mouse cursor and setting of the preview. • Type and condition of an object which the mouse cursor is pointed to • Condition in preview • Number of colors being previewed

PART 4

■[File] menu

Item	Description
[Save]	Saves the image of the display section in the BMP format. Shortcut key: Ctrl + Shift + S
[Print]	Prints the image of the display section.
[Printer Settings]	Sets the printer for printing.
[Output in reverse]	Switches between reversing the color and leaving the color unreversed when an image is output to a printer or file.
[Fill Black at Text BG]	Outputs an image with the text in white and background in black to a printer or file.
[Dithering]	Outputs an image with the intermediated color added to the two-tone monochrome to a printer or file.
[Copy Screen Image to the Clipboard]	Captures the image of the display section.
[Close]	Closes the [Screen Preview] window.

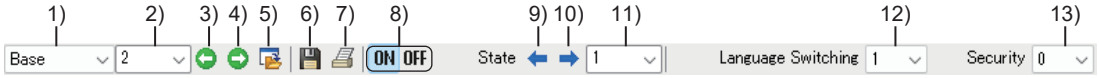
■[Display] menu

Item	Description
[Menu and Title]	Switches between displaying and hiding the menu bar and title bar.
[Toolbar]	Switches between displaying and hiding the toolbar.
[Status Bar]	Displays or hides the status bar.
[Description Bar]	Switches between displaying and hiding the description bar.
[Next Screen]	Switches to a screen whose screen number is one greater than that of the currently displayed screen.
[Previous Screen]	Switches to a screen whose screen number is one smaller than that of the currently displayed screen.
[Use Preview No.]	Switches between enabling and disabling the preview number as the column No. of the comment group.
[ON Image]	Switches between on and off of the object to be displayed.
[Next State]	Switches the states of objects to be displayed on screen editors in ascending order.
[Previous State]	Switches the states of objects to be displayed on screen editors in descending order.
[Overlap1]	Switches between displaying and hiding the overlap window 1.
[Overlap2]	Switches between displaying and hiding the overlap window 2.
[Overlap3]	Switches between displaying and hiding the overlap window 3.
[Overlap4]	Switches between displaying and hiding the overlap window 4.
[Overlap5]	Switches between displaying and hiding the overlap window 5.
[Superimpose1]	Switches between displaying and hiding the superimpose window 1.
[Superimpose2]	Switches between displaying and hiding the superimpose window 2.
[Key Window]	Switches between displaying and hiding the key window.
[Dialog Window]	Switches between displaying and hiding the dialog window.
[PC Remote Operation]	Displays or hides the remote screen.
[Web Browser]	Switches between displaying and hiding the web browser window.
[Show the entire base screen]	Switches between the view modes of the expanded base screens. The following shows the view modes. • The area of the base screen for the GOT to display • The entire expanded base screen
[Show the Screen Only]	Deletes the menu bar and other bars to display only the image of the display section. Double-clicking the display section also switches the display. Shortcut key: Shift + F4

■[Option] menu

Item	Description
[Open the editing screen in conjunction with Screen Preview]	Switches between displaying and hiding the screen editor of the screen displayed on the [Screen Preview] window.
[Display the frame around the selected item]	Switches between displaying and hiding the frame of the target which mouse cursor is pointed to.

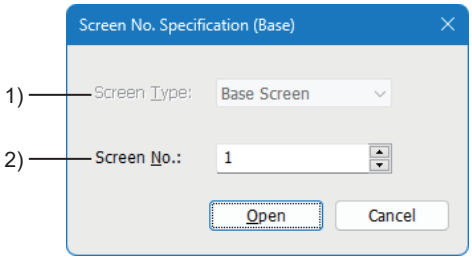
■Toolbar



Item		Description
1)	[Screen Type]	Select the type of the screen to be displayed.
2)	[Screen No.]	Select the screen number of the screen to be displayed.
3)	[Previous Screen]	Switches to a screen whose screen number is one smaller than that of the currently displayed screen.
4)	[Next Screen]	Switches to a screen whose screen number is one greater than that of the currently displayed screen.
5)	[Open Editing Screen]	Displays the screen editor of the screen displayed on the [Screen Preview] window.
6)	[Save]	Saves the image of the display section in the BMP format.
7)	[Print]	Prints the image of the display section.
8)	[ON] [OFF]	Switches between on and off of the object to be displayed.
9)	[Previous State]	Switches the states of objects to be displayed on screen editors in descending order.
10)	[Next State]	Switches the states of objects to be displayed on screen editors in ascending order.
11)	[State No.]	Switches the states of objects to be displayed on screen editors by selecting the state No.
12)	[Language Switching]	Select the column No. for a comment group to be displayed.
13)	[Security]	Select the security level. Only the objects which can be displayed in the selected security level are displayed.

■[Screen No. Specification] dialog

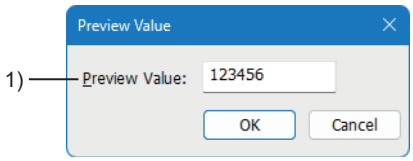
GT37 SoftGOT3000



Item		Description
1)	[Screen Type]	Displays the screen type.
2)	[Screen No.]	Set the destination screen number. The setting range is [0] to [32767].

■[Preview Value] dialog

GT37 SoftGOT3000



Item		Description
1)	[Preview Value]	Set the value to be displayed.

6.11.2 Displaying the preview of a window screen on the screen editor

GT37 SoftGOT3000

When arranging a window position object on the screen editor, you can display the preview of the window screen.

1. Select [View] → [Window Preview] → [Custom] from the menu to display the [Window Preview] dialog.

☞ Page 341 [Window Preview] dialog

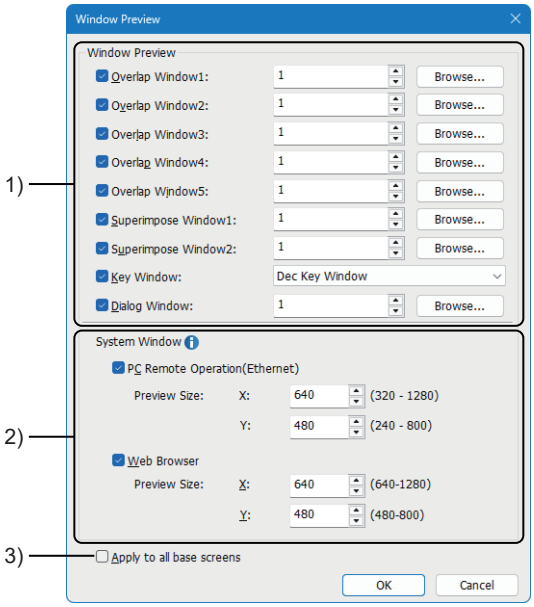
2. Set the window screen to be displayed in the preview of each screen. Then click the [OK] button.

Point

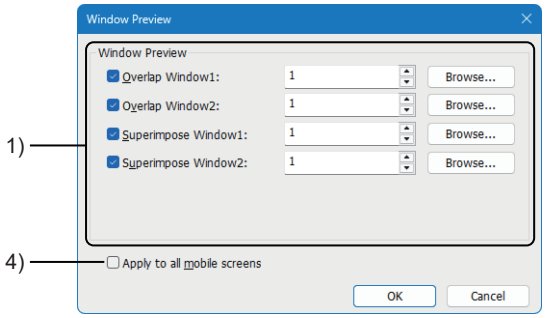
When a window screen is previewed on a mobile device, if the window screen is set to preview another window screen, that window screen will not be previewed.

[Window Preview] dialog

GT37 SoftGOT3000



Base screen



Mobile screen

Item			Description
1)	[Window Preview]	—	Set the window screens, such as an overlap window, to be displayed on the screen editor. Set the screen number of window screens to be displayed. The setting range is [0] to [32767]. Click the [Browse] button to display the [Image List] dialog (screen). You can check the image on the screen when selecting a window screen. ☞ Page 3683 [Image List] dialog (screen)
		[Overlap Window1]	Displays a preview of overlap window 1.
		[Overlap Window2]	Displays a preview of overlap window 2.
		[Overlap Window3]	Displays a preview of overlap window 3.
		[Overlap Window4]	Displays a preview of overlap window 4.
		[Overlap Window5]	Displays a preview of overlap window 5.
		[Superimpose Window1]	Displays a preview of superimpose window 1.
		[Superimpose Window2]	Displays a preview of superimpose window 2.
		[Key Window]	Displays a preview of the key window. Select a standard key window to be displayed. Not available for mobile screens. The size of the displayed standard key window reflects the setting for [Standard Key Window Size] in the [GOT Setup] window ([Display Setting/Language Setting]). ☞ Page 618 [Display Setting/Language Setting]
		[Dialog Window]	Displays a preview of the dialog window. Not available for mobile screens.

Item			Description
2)	[System Window]	—	Displays a preview of the system window. The preview replaces and displays the preview of the overlap window used as the system window. Example) Using overlap window 4 as a system window When a window position object for overlap window 4 is placed, a preview of the window such as a web browser window is displayed.
		[PC Remote Operation (Ethernet)]	Enabled when selecting [Use PC Remote Operation (Ethernet)] in the [PC Remote Operation] dialog. ☞ Page 2622 [PC Remote Operation] dialog Displays a preview of the remote screen. Set the window size using [Preview Size]. The width setting range is from [640] dots to the horizontal resolution of the GOT. The height setting range is from [480] dots to the vertical resolution of the GOT. The window size set for the special function switch is applied to the size of the remote screen displayed by touching the special function switch on the [Screen Preview] window.
		[Web Browser]	Displays a preview of the web browser window. Set the window size using [Preview Size]. The width setting range is from [640] dots to the horizontal resolution of the GOT. The height setting range is from [480] dots to the vertical resolution of the GOT. The window size set for the special function switch is applied to the size of the web browser window displayed by touching the special function switch on the [Screen Preview] window.
3)	[Apply to all base screens]		Applies the settings in the [Window Preview] dialog to all the base screens.
4)	[Apply to all mobile screens]		Applies the settings in the [Window Preview] dialog to all the mobile screens.

6.12 Performing a data check

GT37 SoftGOT3000

Check if there is any invalid device, setting that exceeds the upper limit, or other incorrectness in the project.

6.12.1 Narrowing down the items to be checked

All items are to be checked by default.

Narrow down the items to be checked according to the following procedure.

1. Perform either of the following operations to display the [Check Item Setting] dialog.
- Select [Debug/Check] → [Data Check] → [Item Setting] from the menu.
- Click the [Option] button in [Data Check List] to select [Check Item Setting] from the pull-down menu.

☞ Page 345 [Check Item Setting] dialog

2. Change the setting, and click the [OK] button.

6.12.2 Executing a data check

Select [Debug/Check] → [Data Check] → [Check] from the menu to display the check results in the [Data Check List] window.

☞ Page 344 [Data Check List] window

6.12.3 Exporting the check result

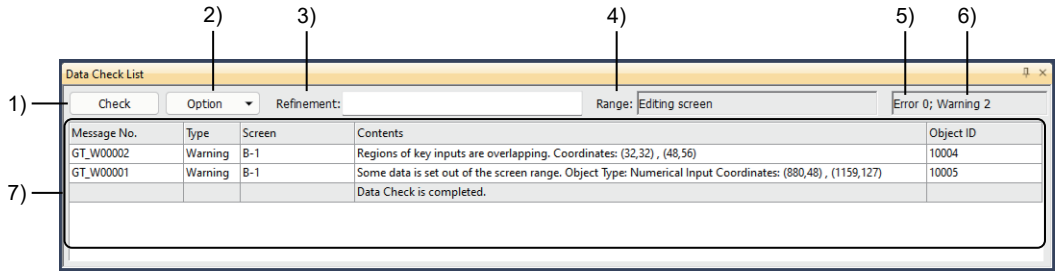
You can export the check result in a CSV format or Unicode text format.

1. Click the [Option] button in the [Data Check List] window and select [Export] from the pull-down menu to display the [Save As] dialog.
2. Set [File name] and [Files of type] and click the [OK] button to export the check result.

☞ Page 348 Details of the exported file

6.12.4 [Data Check List] window

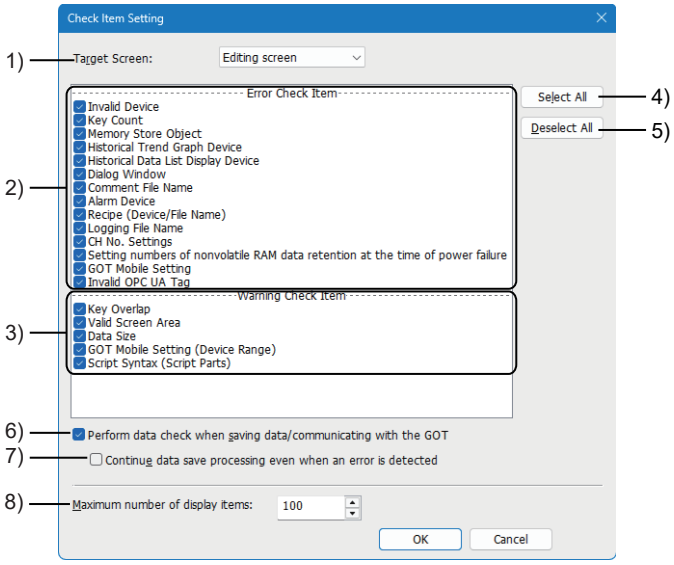
GT37 SoftGOT3000



Item			Description
1)	[Check] button		Checks the items selected in the [Check Item Setting] dialog.
2)	[Option] button	—	Operates the [Data Check List] window from the pull-down menu.
		[Check Item Setting]	Displays the [Check Item Setting] dialog. In this dialog, you can set the check target and check item. ☞ Page 345 [Check Item Setting] dialog
		[Export]	Exports the check result as a CSV file or Unicode text file. Set [File name] and [Files of type] in the displayed dialog and click the [Save] button. ☞ Page 348 Details of the exported file
3)	[Refinement]		Narrow the displayed contents of the check result by keywords. Up to 128 characters can be set. To narrow the contents using multiple keywords, separate each keyword with one-byte spaces.
4)	[Range]		Range selected in [Object No.] of the [Check Item] dialog
5)	Number of errors		Number of settings which do not perform operation
6)	Number of warnings		Number of settings which cause unintentional operation
7)	List of check results	—	Displays the check result. Double-click a result to jump to the position which causes an error or warning.
		[Message No.]	Message No. of an error or warning
		[Type]	Type of a detected event • [Error]: Setting which does not perform operation • [Warning]: Setting which causes unintentional operation
		[Screen]	Screen with the cause of an error or warning • [B-n]: Base screen ("n" represents the screen number.) • [W-n]: Window screen ("n" represents the screen number.) • [M-n]: Mobile screen ("n" represents the screen number.)
		[Contents]	Message which shows the description of an error or warning
		[Object ID]	Object ID of the cause of an error or warning

6.12.5 [Check Item Setting] dialog

GT37 SoftGOT3000



Item		Description
1)	[Target Screen]	Select the check target. Regardless of the selected items, the common settings are checked.
2)	[Error Check Item]	Items for checking whether any setting which does not perform operation exists Select the items to check. ☞ Page 346 Details of [Error Check Item]
3)	[Warning Check Item]	Items for checking that any setting which causes unintentional operation does not exist. Select the items to check. ☞ Page 347 Details of [Warning Check Item]
4)	[Select All] button	Selects all the items in the check item.
5)	[Deselect All] button	Deselects all the items in the check item.
6)	[Perform data check when saving data/communicating with the GOT]	Performs a data check when a project is saved and package data is transferred.
7)	[Continue data save processing even when an error is detected]	Saves a project even if an error is found when the project is saved.
8)	[Maximum number of display items]	Set the maximum number of errors and warnings displayed in the [Data Check List] window. The setting range is [1] to [1000].

Details of [Error Check Item]

GT37 SoftGOT3000

Item	Description
Invalid device	Checks that any device for which [??] is set does not exist.
[Key Count]	Checks whether more than 1000 touch switches are placed on one screen.
[Memory Store Object]	Checks whether more than 16 scatter graphs (when [Store Memory] is set) are placed on one screen.
[Historical Trend Graph Device]	Checks whether a mismatch exists in the logging setting and device setting in the historical trend graph.
[Historical Data List Display Device]	Checks whether a mismatch exists in the following settings. • Logging setting and device setting in the historical data list display • Device format in the historical data list display and device display
[Dialog Window]	Checks the properties of the base screens and window screens or the settings of [Dialog Window] in the [Environmental Setting] window, regarding the following. • Checks whether the screen number of a window screen which does not exist is set to a dialog window. • Checks whether the screen size of the window screen is 320 × 240 or more.
[Comment File Name]	Checks the comment group settings for duplicate comment text file paths. For comment text files, refer to the following. ☞ Page 785 Import/Export
[Alarm Device]	Checks that the alarm device and alarm range are set correctly in the user alarm monitoring settings.
[Recipe (Device/Alarm name)]	Checks the following for the setting in the [Recipe Common Setting] dialog and [Recipe] dialog. • Checks that the common control device and external notification device are not duplicated with the screen switching device or station No. switching device. • Checks that the recipe files (file path) in each recipe setting are not duplicated.
[Logging File Name]	Checks that the settings(file path) of the destination to save files in each logging setting are not duplicated.
[CH No. Settings]	Checks that any channel which is not used is not set to the following settings. • [CH No. for Station No. Switching] in [Station No. Switching] in the [Controller Setting] window • [Adjust CH No.] in the [Adjust] tab in [Time Setting] in the [GOT Setup] window • [Broadcast CH No.] in the [Broadcast] tab in [Time Setting] in the [GOT Setup] window • [Controller CH No.] in [Transparent Mode Setting] in the [GOT Setup] window
[Setting numbers of nonvolatile RAM data retention at the time of power failure]	Checks the following. • Checks that the nonvolatile RAM power-failure backup function is enabled for less than 10 logging settings. • Checks that the nonvolatile RAM power-failure backup function is enabled for less than 20 logging settings.
[GOT Mobile Setting]	Checks the following. • Checks that GOT Mobile devices (VGB and VGD) are only specified in the mobile screens and in the [GOT Mobile Setting] window. • Checks that specified GOT Mobile devices (VGB and VGD) are within the setting ranges. • Checks that [Use GOT Mobile function] is selected when a mobile screen is used. • When [Action] is set to [Auto Connection of GOT Mobile Function] for [Contactless Tag] in the [GOT Setup] window, checks that [Use GOT Mobile function] is selected in the [GOT Mobile Setting] window.
[Invalid OPC UA Tag]	Checks that no invalid OPC UA tag is set in device settings.

Details of [Warning Check Item]

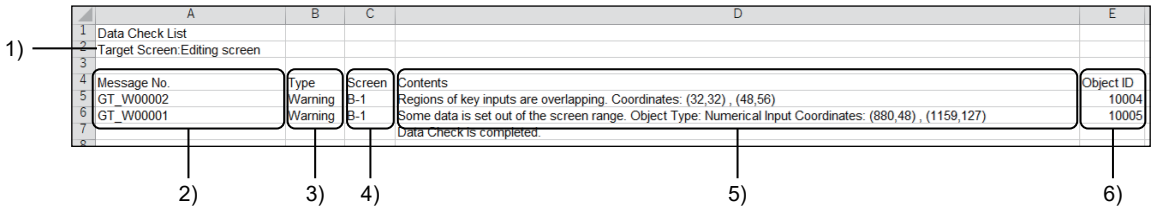
GT37 SoftGOT3000

Item	Description
[Valid Screen Area]	Checks that objects are not arranged out of the screen display area.
[Data Size]	Checks the following. • Checks that the ROM data size in a project does not exceed the ROM size of the GOT. • Checks that the RAM data size in a project does not exceed the RAM size of the GOT. • Checks that the total data size in the nonvolatile RAM user area used for alarm monitoring, logging, and recipe function does not exceed 500 KB.
[GOT Mobile Setting (device range)]	Checks that the GOT internal devices (GB and GD) assigned to GOT Mobile devices (VGB and VGD) are not specified for other settings.
[Key Overlap]	Checks whether the following objects are overlapped. • Touch switch • Numerical input • Text input • Historical data list (when [Single Touch Operation] is set) • Trend graph (when [Single Touch Operation] is set) • Historical trend graph (when [Single Touch Operation] is set) • Alarm display • Simple alarm display (when [Operation] is selected in [Touch Mode]) • Slider • Recipe display (record list) Objects in the temporary area are not checked. The overlap of an object on a screen opened using the set overlay screen and an object on the basic screen is not checked.
[Script Syntax (Script Parts)]	Checks the script parts for possible errors in their scripts.

6.12.6 Details of the exported file

GT37 SoftGOT3000

The following shows the details of the exported file of a check result.



Item		Description
1)	[Target Screen]	Target screens which are selected in [Target screen] of the [Check Item Setting] dialog
2)	[Message No.]	Message No. of a detected error or warning
3)	[Type]	Type of a detected event • [Error]: Setting which does not perform operation • [Warning]: Setting which causes unintentional operation
4)	[Screen]	Screen with the cause of a detected error or warning • [B-n]: Base screen ("n" represents the screen number.) • [W-n]: Window screen ("n" represents the screen number.) • [M-n]: Mobile screen ("n" represents the screen number.)
5)	[Contents]	Message which shows the description of a detected error or warning
6)	[Object ID]	Object ID of the cause of a detected error or warning

6.13 Checking data size

GT37 SoftGOT3000

The data size of created screens or projects can be checked.
For the relationship between the GOT storage memory (ROM)/operation memory (RAM) and the data to be transferred, refer to the following.
☞ Page 415 Storage and expansion destination memories of transferred data

6.13.1 Checking the data size of a screen

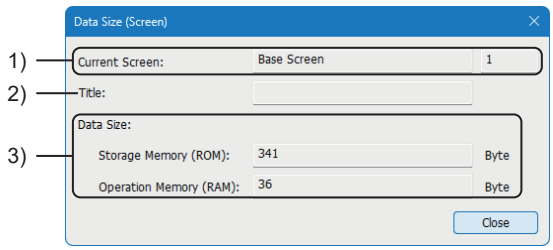
GT37 SoftGOT3000

1. Select the screen to check the data size.
2. Select [Debug/Check] → [Data Size] → [Screen] from the menu to display the [Data Size (Screen)] dialog.

Check the data size.
☞ Page 349 [Data Size (Screen)] dialog

[Data Size (Screen)] dialog

GT37 SoftGOT3000



Item			Description
1)	[Current Screen]		Displays the type of the screen being edited and the associated number.
2)	[Title]		Displays the title of the screen being edited.
3)	[Data Size]	—	Displays the data size of the screen.
		[Storage Memory (ROM)]	Displays the data size of the screen saved in the GOT storage memory (ROM).
		[Operation Memory (RAM)]	Displays the data size of the screen expanded in the GOT operation memory (RAM).

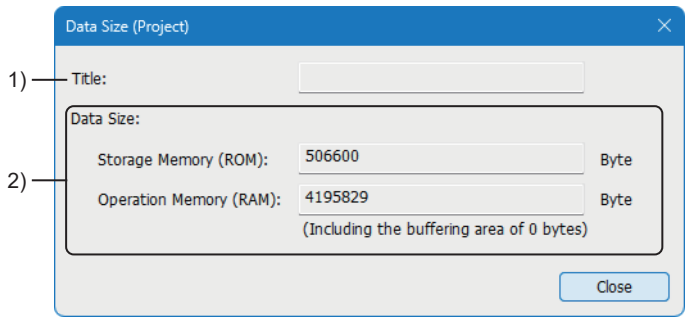
6.13.2 Checking data size of project

GT37 SoftGOT3000

Select [Debug/Check] → [Data Size] → [Project] from the menu to display the [Data Size (Project)] dialog.
Check the data size.
☞ Page 350 [Data Size (Project)] dialog

[Data Size (Project)] dialog

GT37 SoftGOT3000



Item			Description
1)	[Title]		Displays the title of the project.
2)	[Data Size]	—	Displays the data size of the project.
		[Storage Memory (ROM)]	Displays the data size of the screen saved in the GOT storage memory (ROM).
		[Operation Memory (RAM)]	Displays the data size of the screen expanded in the GOT operation memory (RAM).

7 Simulation

GT37 SoftGOT3000

In GT Designer3 (3000), you can launch GT Simulator3 (3000) (hereafter GT Simulator3) to simulate the project data being edited and check the operation on the GOT.

☞ Page 352 Specifications
☞ Page 367 Connecting
☞ Page 375 Simulation procedure
☞ Page 379 Screen layout of GT Simulator3
☞ Page 381 Connection and environment settings in GT Simulator3
☞ Page 392 Basic operations of GT Simulator3
☞ Page 393 Useful functions of GT Simulator3
☞ Page 407 Troubleshooting

7.1 Specifications

GT37 SoftGOT3000

☞ Page 352 Operating environment
☞ Page 352 Simulation-supported GOTs
☞ Page 353 Monitoring-supported controllers
☞ Page 359 Monitoring-supported channels
☞ Page 359 Device range for monitoring
☞ Page 360 Simulation-supported/unsupported functions
☞ Page 365 Destination to save data
☞ Page 366 Clock specifications
☞ Page 366 Precautions

7.1.1 Operating environment

A network adapter is required for personal computers and other devices that operate GT Simulator3.
The other requirements are the same as those for the operating environment of GT Designer3.
For information on the operating environment of GT Designer3, refer to the following.
☞ Page 54 Operating environment

7.1.2 Simulation-supported GOTs

The following shows the GOTs compatible with simulation with GT Simulator3.

Name	Resolution (dot)	Display color
GT37**-FH	1920×1080	16 million colors
GT37**-WX	1280×800	
GT37**-X	1024 × 768	
GT SoftGOT3000	640 × 480 to 1920 × 1200 (1200 × 1920)	16 million colors

Precautions

The display on GT Simulator3 may differ from that on the GOT.
Check the actual display on the GOT.

7.1.3 Monitoring-supported controllers

☞ Page 353 Controller simulator
☞ Page 358 Mitsubishi Electric products

Point

For the devices that can be monitored with GT Simulator3, refer to the following.

☞ Page 359 Device range for monitoring

Precautions

When non-Mitsubishi Electric controller is selected for CH1 in [Controller Setting], the simulator menu is not displayed in GT Designer3.

Controller simulator

GT Simulator3 can be connected to controller simulators to monitor virtual controllers.

In this section, controller simulator refers to the following software applications.

The supported software version differs depending on the controller simulator to be connected.

Controller simulator to be connected	Supported software version
GX Simulator3	GX Works3 1.105K or later
GX Simulator2	GX Works2 1.621X or later
MT Simulator2	MT Works2 1.189X or later
MELSOFT Mirror	MELSOFT Mirror 1.000A or later

■Combinations of monitoring-supported controller simulators and PLCs

The following shows combinations of controller simulators and PLCs that can be connected from GT Simulator.

Use the latest version of the controller simulator.

Series name	Model	GX Works3 (GX Simulator3)	GX Works2 (GX Simulator2)	MT Simulator2	MELSOFT Mirror
MELSEC MX Controller	MXR300-16	○*1	—*6	—	—
	MXR300-32	○*1	—*6	—	—

*1 Simulation with GT Simulator3 is not supported for projects created in GX Works3 when the applicable PLC is specified.
Create a project for the MELSEC iQ-R series (general CPU) in GX Works3, and perform a simulation with GT Simulator3.

*2 When using the redundant function module (R6RFM), create a project for the MELSEC iQ-R series (general CPU) in GX Works3 and perform a simulation with GT Simulator3.

*3 Simulation with GT Simulator3 is not supported for projects created in GX Works2 when the applicable PLC is specified.
Create a project for the MELSEC-Q series in GX Works2, and perform a simulation with GT Simulator3.

*4 To monitor the module, a SIL2 function module and a redundant function module are required.

*5 Simulation with GT Simulator3 is not supported for projects created in GX Works2 when the applicable PLC is specified.
Create a project for the Q03UDCPU in GX Works2, and perform a simulation with GT Simulator3.

*6 In GX Works2, a project cannot be created when the applicable PLC is specified.
Create a project for the MELSEC-Q in GX Works2, and perform a simulation with GT Simulator3.

Mitsubishi Electric products

The following shows Mitsubishi Electric products that can be monitored with GT Simulator3.

Type		Model			
MELSEC MX Controller		MXF100-8-N32	MXF100-8-P32	MXF100-16-N32	MXF100-16-P32

*1 The MELSEC redundant system is configurable by mounting the redundant function module (R6RFM).
*2 To monitor the module, a SIL2 function module and a redundant function module are required.
*3 The multiple CPU system cannot be monitored.
*4 The model can be connected only to the PLC CPU area (CPU No. 1).
*5 Monitor the module via a MELSEC iQ-R in the multiple CPU system.
*6 Monitor the module via a MELSEC-Q in the multiple CPU system.
*7 Perform a simulation as the MELSEC iQ-R series (general CPU).
*8 Perform a simulation as the MELSEC-Q series.

7.1.4 Monitoring-supported channels

If the project data supports multiple channels, only channel 1 can be monitored.

The other channels are ignored.

To monitor a device on a channel other than channel 1, select [Search/Replace] → [Batch Edit] → [CH No.] from the menu and set channel 1 for the debug target channel in GT Designer3.

Ex.

When channel 1 and 2 are used and channel 2 is to be monitored

1. Change channel 1 to channel 3 in a batch.
2. Change channel 2 to channel 1 in a batch.

For the batch edit of the channels, refer to the following.

☞ Page 147 Changing the set values collectively (Batch Edit)

7.1.5 Device range for monitoring

☞ Page 359 When connected to the controller simulator
☞ Page 359 When connected to Mitsubishi Electric products

When connected to the controller simulator

The devices that can be monitored with GT Simulator3 when the GOT is connected to the controller simulator are shown below.

For the PLCs that can be monitored with GT Simulator3, refer to the following.

☞ Page 353 Monitoring-supported controllers

■Mitsubishi Electric products

Devices that satisfy all of the following conditions can be monitored.

Condition	Reference
Devices supported by the controller simulator	📖GX Works3 Operating Manual 📖GX Works2 Version □ Operating Manual (Common) 📖MT Developer2 Help
Devices that can be monitored by the GOT (The timer setting (TS) and counter setting (CS) of the Mitsubishi Electric PLC are excluded.)	☞ Page 3128 Device range and settings of Mitsubishi Electric equipment

When connected to Mitsubishi Electric products

GT Simulator3 can monitor the devices that are monitored by the GOT.

For the devices that can be monitored with the GOT, refer to the following.

☞ Page 3128 Device range and settings of Mitsubishi Electric equipment

For the PLC CPUs that can be monitored with GT Simulator3, refer to the following.

☞ Page 353 Monitoring-supported controllers

7.1.6 Simulation-supported/unsupported functions

GT37 SoftGOT3000

The following shows the functions that are compatible and incompatible with simulation with GT Simulator3.

☞ Page 360 Figures and objects
☞ Page 361 Functions running in the background
☞ Page 361 Functions used with peripheral devices
☞ Page 362 Common functions for screen display/control and other relevant/extended functions
☞ Page 363 Utility function

Figures and objects

○: Supported, —: Unsupported

Function	Simulation support	
	GT37	GT SoftGOT3000
Figure	○	○
Logo text	○	○
Touch switch	○	○
Lamp	○	○
Numerical display	○	○
Numerical input	○	○
Text display	○	○
Text input	○	○
Key window	○	○
Date display, time display	○	○
Comment display	○	○
Parts display	○	○
Historical data list display	○	○
Simple alarm display	○	○
System alarm display	○	○
Alarm display (user)	○	○
Alarm display (system)	○	○
Recipe display (record list)	○	○
Line graph	○	○
Trend graph	○	○
Bar graph	○	○
Band graph	○	○
Pie graph	○	○
Scatter graph	○	○
Historical trend graph	○	○
Graphical meter	○	○
Level	○	○
Panel meter	○	○
Slider	○	○
Document display	○	○
Script parts	○	○
Frame animation	○	○
Hyperlink	—	—

Precautions

- When [Real] is set for [Format] in [Numerical Display], if the specified device stores an invalid value, GT Simulator3 displays that value (the GOT displays [non]).

Functions running in the background

○: Supported, —: Unsupported

Function	Simulation support	
	GT37	GT SoftGOT3000
Logging	○	○
Operation log	○	○
Recipe	○	○
Device data transfer	○	○
Trigger action	○	○
Time action	○	○
System information	○	○
Hard copy	○	○
Project/screen script	○	○
Object script	○	○

Precautions

• The following hard copy functions do not support simulation.

◇[Invert]

◇[Writing Notification Device]

◇[Take a hard copy of a screen other than the displayed monitor screen]

◇Output to a PDF file

◇System information about the hard copy function

• The data cannot be output directly using the hard copy function or other methods.

Data will be output to a file (TXT, CSV, or BMP format) on the hard disk of the personal computer. Output the file to a printer.

☞ Page 365 For functions involving data saving into a data storage

• The system alarm is not displayed when the hard copy is executed.

Functions used with peripheral devices

○: Supported, —: Unsupported

Function	Simulation support	
	GT37	GT SoftGOT3000
Barcode function	—	—
RFID function	—	—
GOT Mobile function	—	—
Remote personal computer operation function (Ethernet)	—	—
VNC server function	—	—
Digital image input/recording function	—	—
Video output function	—	—
Sound output function	○	○
External I/O function	—	—
Operation panel function	—	○
Server function, client function	—	—
Mail send function	—	—
FTP server function	—	—
File transfer function (FTP transfer)	—	—
File transfer function (GOT internal transfer)	—	—
USB mouse/keyboard function	○	○
Web browser function	—	—
Contactless tag function	—	—
OPC UA server function	—	—
VPN connection function	—	—

Precautions

• The sound output function is executed with the sound function (sound card) or speaker of the personal computer.
If the personal computer to be used cannot output sound, the sound output function is unavailable.
• If you mute GT Simulator3 in Windows sound settings, GT Simulator3 is automatically unmuted at its startup.
However, if you mute all sounds on Windows, GT Simulator3 remains mute.

Common functions for screen display/control and other relevant/extended functions

○: Supported, —: Unsupported

Function	Simulation support	
	GT37	GT SoftGOT3000
Base screen	○	○
Overlap window	○	○
Superimpose window	○	○
Dialog window	○	○
Mobile screen	—	—
Key window	○	○

SoftGOT-GOT link	—	—
Backup/restoration	—	—
GOT network interaction function	—	—
Transition to the utility	○	○
Level authentication	○	○
Operator authentication (mode 1)*1	○	○
Device monitor	—	—
Sequence program monitor	—	—
iQSS utility	—	—

*1 In GT Simulator3, operation is fixed to that in security mode 1 regardless of the project data settings.

Precautions

• If you forget the administrator password for operator authentication, delete the operator management information file (OPEPASSINF.G3G) and register all operator management information again.
If you select [Delete operator information at the time of initial simulation] in [Environment Setup] ([Action Setup]) and start GT Simulator3, the operator management information file (OPEPASSINF.G3G) is deleted and a new file is created.

*1 [Delete all labels] and [Sort out labels] are supported.

*2 [Initialize all] and [Initialize selected area] are supported.

7.1.7 Destination to save data

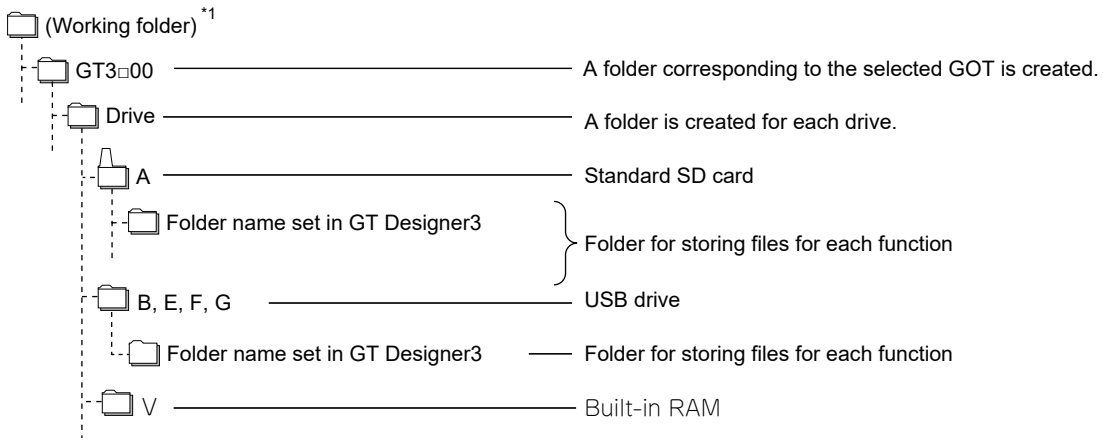
GT Simulator3 uses the folders on the hard drive of the personal computer as virtual drives.

☞ Page 365 For functions involving data saving into a data storage
☞ Page 366 For functions requiring the user to save data into a data storage
☞ Page 366 Working folder

For functions involving data saving into a data storage

When a data storage is specified to save files for functions including object functions and add-on functions, data is saved onto the hard drive of the personal computer.

Files of functions are stored in the following folders.



The drive unavailable to the simulation target GOT is not usable.

*1 For the working folder, refer to the following.
☞ Page 366 Working folder

Precautions

To store image files in drive V and use them for parts displays, satisfy all the following conditions.

- Store the image files directly under drive V using the FTP server function or other Windows-supported functions.
- Use IMG1.jpg, IMG2.jpg, IMG3.jpg, and IMG4.jpg only for the file name and extension.
- Do not store any file other than IMG1.jpg, IMG2.jpg, IMG3.jpg, and IMG4.jpg.
- Limit the total file size to less than 8 MB.

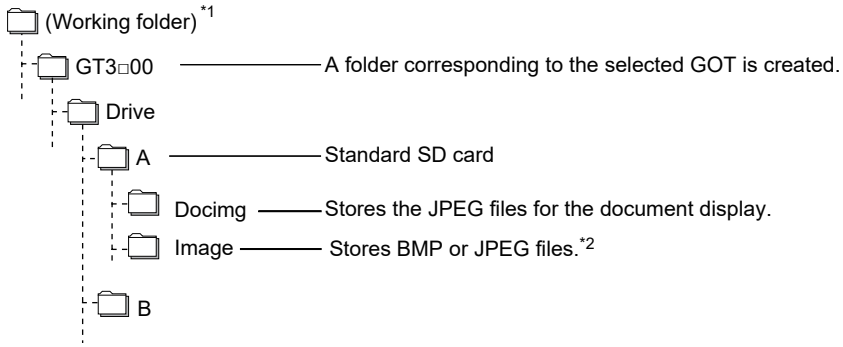
The files in drive V are deleted when a simulation is started, refreshed, or ended.

For functions requiring the user to save data into a data storage

When registering BMP files, JPEG files, or PNG files used as parts or data for document display, save them in the hard disk of the personal computer.

Store each data in the following (user-created) folders.

The drive to be used depends on the specifications and settings of the object.



*1 For the working folder, refer to the following.
☞ Page 366 Working folder

*2 You can change the file name.
For instructions on how to use BMP files or JPEG files, refer to the following.
☞ Page 816 How to use parts ([Parts])

Working folder

The working folder is located below.

```

7.1.8 Clock specifications

The clock display during simulation with GT Simulator3 uses the data of the personal computer (the GOT reads the clock data from the PLC CPU).

[Adjust for daylight saving time automatically] on the personal computer is not applicable. Do not enable this setting.

7.1.9 Precautions

The following shows the precautions for using GT Simulator3.

Screen save function

The screen is displayed even in screen save mode during simulation with GT Simulator3.

When the Forced Screen Saver Enable signal (System signal 1-1.b1) is turned on, the GOT enters screen save mode and key input is disabled.

When the Forced Screen Saver Enable signal (System signal 1-1.b1) is turned off, key input is enabled.

If you perform input operation with the mouse or keyboard or others in screen save mode, the first input will cancel the mode.

For details on the system signal, refer to the following.

☞ Page 577 System signal 1-1

The automatic screen save function is not available.

When using project data that involve file saving

Make sure that your personal computer has enough hard disk space, and delete output files as necessary.

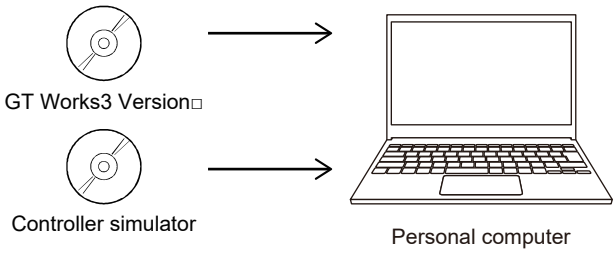
The output files will not be deleted automatically even upon exit from GT Simulator3.

7.2 Connecting

GT37 SoftGOT3000

☞ Page 367 Connecting with the controller simulators
☞ Page 368 Connecting with Mitsubishi Electric products

7.2.1 Connecting with the controller simulators



Install a controller simulator to be connected.

Controller simulator to be connected	Required software
GX Simulator3	GX Works3 For the installation method, refer to the following. GX Works3 Installation Instructions
GX Simulator2	GX Works2 For the installation method, refer to the following. GX Works2 Installation Instructions
MT Simulator2	GX Works2 MT Developer2 GT Simulator3 monitors MT Simulator2 as another module of one station of GX Simulator2. To monitor MT Simulator2, GX Simulator2 is also required. For the installation method, refer to the following. GX Works2 Installation Instructions MELSOFT MT Works2 Installation Instructions
MELSOFT Mirror	MELSOFT Mirror

7.2.2 Connecting with Mitsubishi Electric products

GT37 SoftGOT3000

☞ Page 368 Connecting with MELSEC MX Controller
☞ Page 369 Connecting with MELSEC iQ-R or Motion CPU (MELSEC iQ-R series)
☞ Page 369 Connecting with MELSEC iQ-F series
☞ Page 370 Connecting with MELSEC iQ- L series
☞ Page 370 Connecting with MELSEC-Q series or Motion CPU (MELSEC-Q series)

7.3 Simulation procedure

GT37 SoftGOT3000

Simulate the project data being edited in GT Designer3.

☞ Page 375 Connecting with a controller simulator to perform a simulation

☞ Page 378 Connecting with the PLC CPU to perform a simulation

Simulators of different series can be used simultaneously.

7.3.1 Connecting with a controller simulator to perform a simulation

Simulation is executed differently depending on the controller simulator to be connected.

☞ Page 375 When using GX Simulator3

☞ Page 376 When using GX Simulator2 or MT Simulator2

☞ Page 377 When using MELSOFT Mirror

When using GX Simulator3

During the simulation in GT Simulator3, GX Simulator3 is automatically started with the default project, even if the project data of GX Works is not specified.

To perform a simulation on the created GX Works3 project, specify the GX Works3 project file to be used for simulation in [Connection] in GT Simulator3 in advance, and start GX Simulator3 before performing the simulation with GT Simulator3.

For details on GX Simulator3, refer to the following.

GX Works3 Operating Manual

1. Open a project in GT Designer3, and select [Debug/Check] → [Simulator] → [Setting] from the menu.

The [MELSOFT GT Simulator3(3000)] dialog appears.

2. Configure each setting in [Connection].

Setting item	Description
[I/F]	Select [MELSOFT Simulator3].
[Simulator]	Select [GX Simulator3].
[GX Simulator3 Settings]	Configure each setting. When performing a simulation for the project created with GX Works3, specify the GX Works3 project file to be used for simulation with [Project Name]. When the project file is specified, start GX Simulator3 before step 4. If no project is set, GX Simulator3 will start with the default project. ☞ Page 381 Connection and environment settings in GT Simulator3

3. Click the [OK] button in the [MELSOFT GT Simulator3(3000)] dialog.

4. Select [Debug/Check] → [Simulator] → [Activate] from the GT Designer3 menu.

GT Simulator3 starts.

GX Simulator3 starts automatically with the project specified in step 2 and starts a simulation.

When you start GX Simulator3 from GT Simulator3, changes to whether [The window is automatically closed when the operation is completed successfully.] is selected in the [Write to PLC] dialog are not saved.

To retain the selected/deselected status, start GX Simulator3 from GX Works3 and change the setting in the [Write to PLC] dialog.

5. Debug the project in GT Simulator3.

☞ Page 392 Basic operations of GT Simulator3

☞ Page 393 Useful functions of GT Simulator3

6. Correct the project data in GT Designer3 as necessary.

7. When you corrected the project data, select [Debug/Check] → [Simulator] → [Update] from the menu.

The updates are reflected in GT Simulator3.

8. Select [Debug/Check] → [Simulator] → [Exit] from the GT Designer3 menu.

GT Simulator3 exits.

When using GX Simulator2 or MT Simulator2

Perform the following procedure while the GX Simulator2 or MT Simulator2 module of the project specified in step 2 is not running in other applications.

1. Open a project in GT Designer3, and select [Debug/Check] → [Simulator] → [Setting] from the menu.

The [MELSOFT GT Simulator3(3000)] dialog appears.

2. Configure each setting in [Connection].

Setting item	Description
[I/F]	Select [MELSOFT Simulator3].
[Simulator]	Select [GX Simulator2/MT Simulator2].
[GX Simulator2 Settings] [MT Simulator2 Settings]	Configure each setting as necessary. Specify the project to be used for simulation for [Project Name]. ☞ Page 381 Connection and environment settings in GT Simulator3

3. Click the [OK] button in the [MELSOFT GT Simulator3(3000)] dialog.

4. Open project data with GX Works2, and start GX Simulator2.

Also to monitor MT Simulator2, GX Simulator2 must be running.

For details on GX Simulator2, refer to the following.

📖GX Works2 Version1 Operating Manual (Common)

5. Select [Debug/Check] → [Simulator] → [Activate] from the GT Designer3 menu.

GT Simulator3 starts and begins a simulation.

When MT Simulator2 is used, the simulator starts automatically with the project specified in step 2.

6. Debug the project in GT Simulator3.

☞ Page 392 Basic operations of GT Simulator3

☞ Page 393 Useful functions of GT Simulator3

7. Correct the project data in GT Designer3 as necessary.

8. When you corrected the project data, select [Debug/Check] → [Simulator] → [Update] from the menu.

The updates are reflected in GT Simulator3.

9. Select [Debug/Check] → [Simulator] → [Exit] from the GT Designer3 menu.

GT Simulator3 exits.

When using MELSOFT Mirror

1. Start MELSOFT Mirror.

2. Open a project in GT Designer3, and select [Debug/Check] → [Simulator] → [Setting] from the menu.

The [MELSOFT GT Simulator3(3000)] dialog appears.

3. Configure each setting in [Connection].

Setting item	Description
[I/F]	Select [MELSOFT Simulator3].
[Simulator]	Select [MELSOFT Mirror].
[Connection Destination Setting] [Monitor Target Setting] [Detail]	Configure each setting as necessary. ☞ Page 381 Connection and environment settings in GT Simulator3

4. Click the [OK] button in the [MELSOFT GT Simulator3(3000)] dialog.

5. Select [Debug/Check] → [Simulator] → [Activate] from the GT Designer3 menu.

GT Simulator3 starts and begins a simulation.

6. Debug the project in GT Simulator3.

☞ Page 392 Basic operations of GT Simulator3

☞ Page 393 Useful functions of GT Simulator3

7. Correct the project data in GT Designer3 as necessary.

8. When you corrected the project data, select [Debug/Check] → [Simulator] → [Update] from the menu.

The updates are reflected in GT Simulator3.

9. Select [Debug/Check] → [Simulator] → [Exit] from the GT Designer3 menu.

GT Simulator3 exits.

7.3.2 Connecting with the PLC CPU to perform a simulation

The following shows the steps to connect with the PLC CPU and perform a simulation.

1. Connect the personal computer and the PLC CPU.

2. Open a project in GT Designer3, and select [Debug/Check] → [Simulator] → [Setting] from the menu.

The [MELSOFT GT Simulator3(3000)] dialog appears.

3. Configure the basic settings in GT Simulator3 and click the [OK] button.

☞ Page 381 Connection and environment settings in GT Simulator3

4. Power on the PLC CPU.

5. Select [Debug/Check] → [Simulator] → [Activate] from the GT Designer3 menu.

A simulation starts with GT Simulator3.

6. Debug the project in GT Simulator3.

☞ Page 392 Basic operations of GT Simulator3
☞ Page 393 Useful functions of GT Simulator3

7. Correct the project data in GT Designer3 as necessary.

8. When you corrected the project data, select [Debug/Check] → [Simulator] → [Update] from the menu.

The updates are reflected in GT Simulator3.

9. Select [Debug/Check] → [Simulator] → [Exit] from the GT Designer3 menu.

GT Simulator3 exits.

Point

When [USB] is selected for [Connection Method]

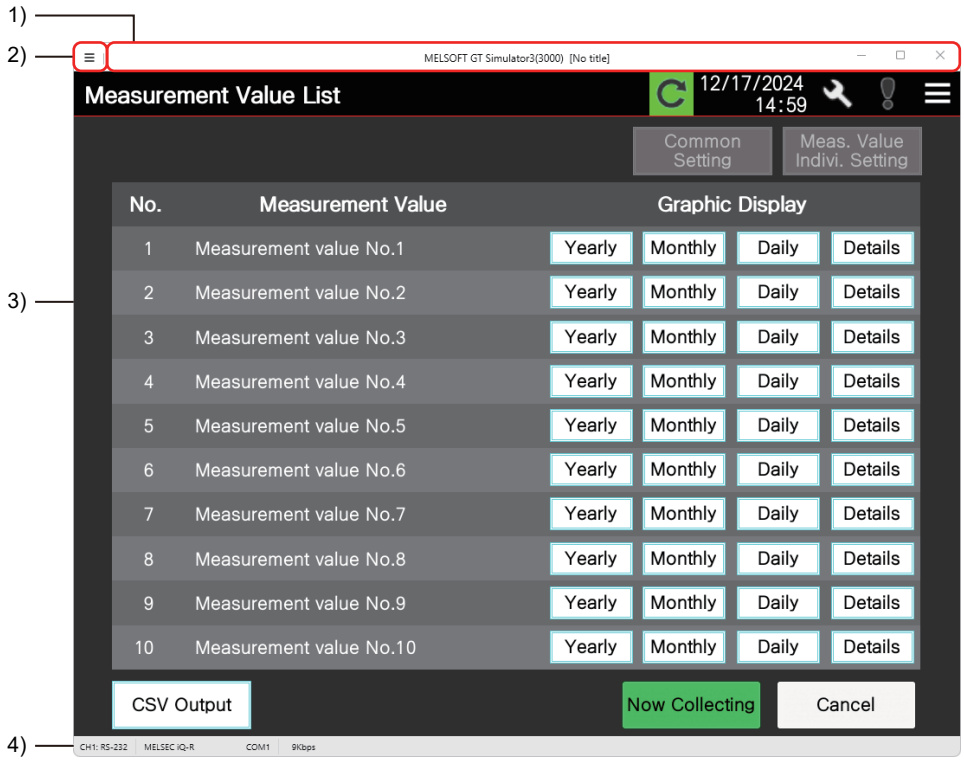
The setting of [Connection] is not retained after GT Designer3 is exited.

The next time you start GT Designer3, set [Connection] according to the connection type.

7.4 Screen layout of GT Simulator3

GT37 SoftGOT3000

This section describes the screen layout.



Item		Description
1)	Title bar	Displays the software name and the project name. The icons to minimize, maximize, and close the screen are also displayed. Select [Debug/Check] → [Simulator] → [Setting] from the GT Designer3 menu to display the [Environment] dialog ([Display]). In [Items displayed in the title bar], select the items to be displayed on the title bar.
2)	Menu button	Clicking this button displays the GT Simulator3 operation menu. ☞ Page 380 Menu
3)	Screen for simulation	Displays the contents of the simulation.
4)	Status bar	Displays the status of GT Simulator3 and the settings in [Controller Setting] (channel number, interface, and model).

7.4.1 Menu

The following shows the menu structure.

Menu items except [Project] can also be executed from the right-click context menu on the simulation screen.

Menu		Description	Shortcut key
[Project]	[Snap Shot]	Saves a screen as a file. (BMP format and JPEG format) ☞ Page 393 Taking snap shots	Ctrl + H
	[Printer Settings]	Set a printer. ☞ Page 394 Configuring the printer settings	—
	[Page Settings]	Adjusts the page layout for printing. ☞ Page 394 Page settings	—
	[Print Preview]	Displays a print preview. ☞ Page 394 Previewing print image	—
	[Print]	Outputs the contents of the settings of the project into a file. ☞ Page 394 Printing	Ctrl + P
[Display]	[Scroll Bar]	Switches display or non-display of a scroll bar. ☞ Page 395 Displaying scroll bars	—
	[Full Screen Mode]	Sets and cancels the full screen mode. ☞ Page 396 Displaying the screen in full screen mode	Alt + F9
[Tool]	[Start or Stop Device Monitor]	Starts or ends the device monitor. ☞ Page 397 Using the device monitor	—
	[Resource Data]	Refer to resource data. ☞ Page 404 Opening resource data files	Ctrl + R
	[Keyboard Input]	Enables or disables the keyboard input. ☞ Page 395 Operating the numerical input or text input with a keyboard	—
[Diagnostics]	[GOT Diagnostics]	Executes GOT diagnostics. ☞ Page 404 Checking the causes and corrective actions for errors (GOT diagnostics)	—

	[Connection to MITSUBISHI ELECTRIC FA Global Website]	Connects to the MITSUBISHI ELECTRIC FA Global Website.	—
[Exit]		Exits GT Simulator3.	Alt + F4

7.5 Connection and environment settings in GT Simulator3

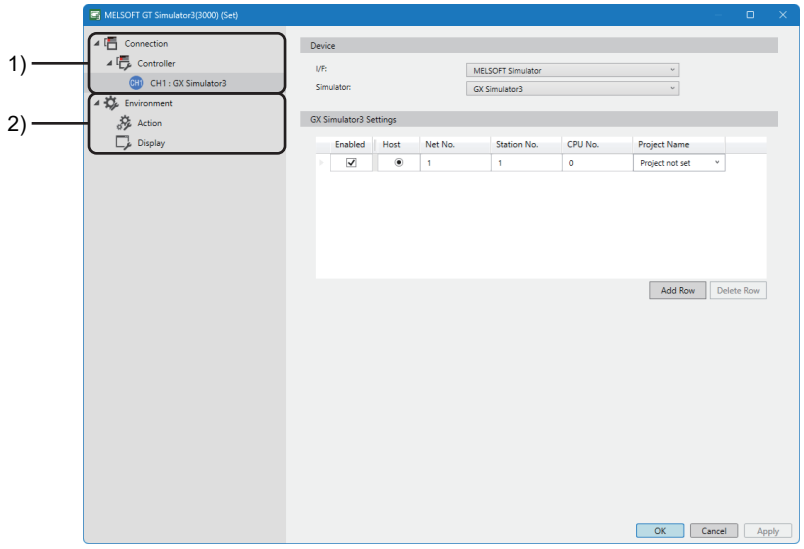
GT37 SoftGOT3000

Before using GT Simulator3, configure the connection and environment settings.

1. Select [Debug/Check] → [Simulator] → [Set] from the GT Designer3 menu.

The setting dialog appears.

2. Select the setting category from the setting tree on the left.



Setting		Description
1)	☞ Page 382 [Connection]	Configure the settings for connection with the target controller for simulation.
2)	☞ Page 390 [Environment]	Configure the operation settings and screen display settings to execute GT Simulator3.

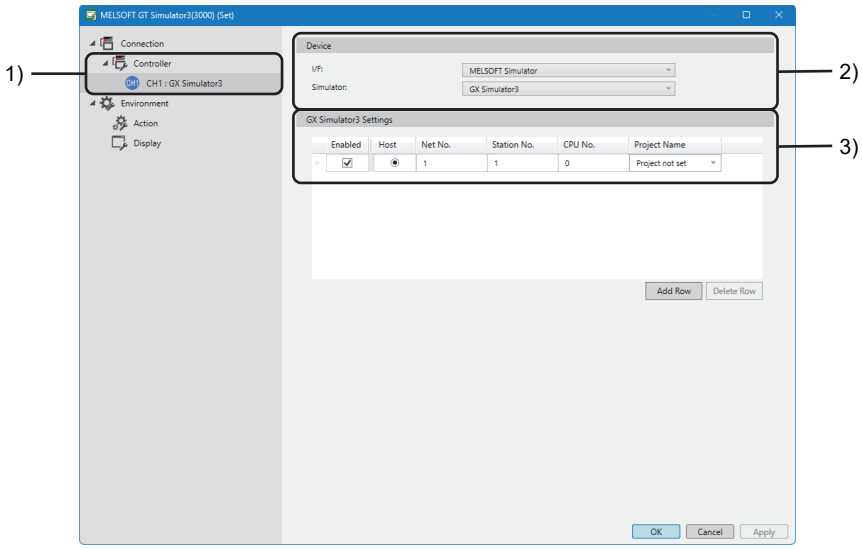
3. Click the [Apply] button to save the settings.

Click the [OK] button to save the settings and close the screen.

PART 4

7.5.1 [Connection]

Configure the settings for connection with the target controller for simulation.



Item			Description
1)	[Controller]		Select the target channel to configure the settings.
2)	[Device]	[I/F]	Specify the method of connection with the controller. • [RS-232] Select this option when connecting with a Mitsubishi Electric PLC via RS-232. • [MELSOFT Simulator] Select this option when connecting with the controller simulator. • [USB] Select this option when connecting with a Mitsubishi Electric PLC via USB. For the settings for [I/F] corresponding to the controller setting in GT Designer3, refer to the following. ☞ Page 383 Settings for [I/F] and the corresponding controller settings in GT Designer3
3)	Advanced settings		Configure the advanced settings according to the settings in [Device]. For details, refer to the following. ☞ Page 384 Advanced settings

Settings for [I/F] and the corresponding controller settings in GT Designer3

The following shows the settings for [I/F] in the simulator and the corresponding controller settings in GT Designer3.

Precautions

If the controller setting of the project data and the controller setting (model) of the simulator are different, the simulation does not start and an error occurs.

Advanced settings

The advanced settings differ depending on the settings in [Device].

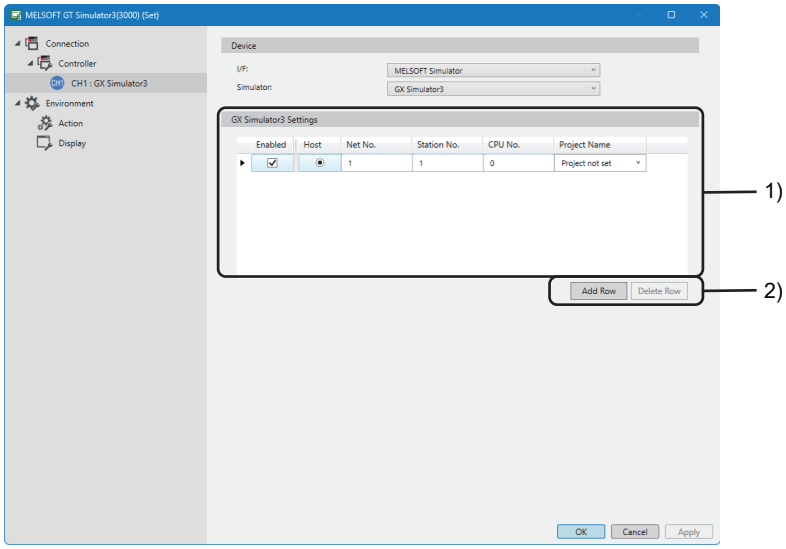
☞ Page 384 Settings when [GX Simulator3] is selected
☞ Page 385 Settings when [GX Simulator2/MT Simulator2] is selected
☞ Page 387 Settings when [MELSOFT Mirror] is selected
☞ Page 388 Settings when [RS-232] is selected
☞ Page 389 Settings when [USB] is selected

■Settings when [GX Simulator3] is selected

When you select [GX Simulator3] for [Simulator] under [Device], configure the settings for connection with GX Simulator3 to be monitored.

Multiple GX Simulator3 modules can be started simultaneously and each of these modules can be treated as a different station or module.

When connection with GX Simulator3 is established, dynamic global labels can be simulated.



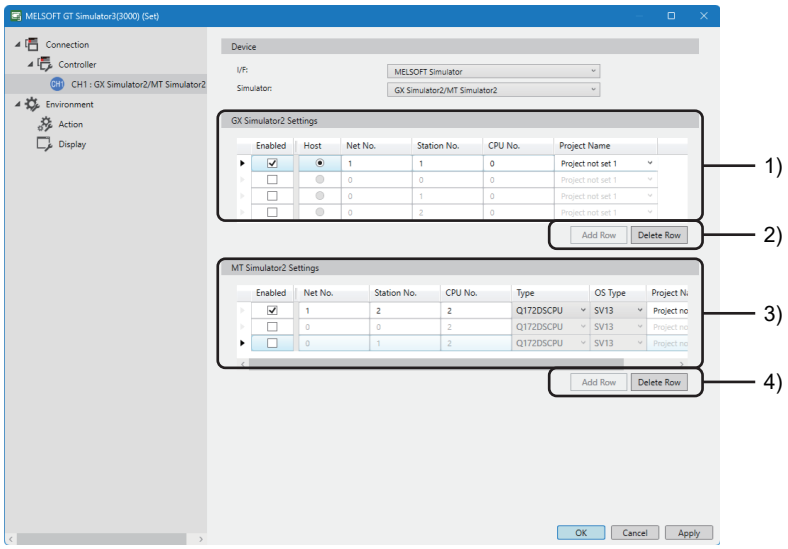
Item			Description
1)	[GX Simulator3 Settings]	-	Set the controller simulator to be monitored. Match the settings with those of [Network] of the device set in the project. When the GOT monitors the device of the host station, the device set in the project does not have the network number and station number settings. [0-FF] is set internally for the device. Set values corresponding to the host station (0-FF) to [Net No.] and [Station No.] according to the system configuration of the monitoring target. For a connection without a network such as serial connection, set [0] to [Net No.] and [255] to [Station No.]. If the following conditions are both satisfied, no applicable station for monitoring exists. The GOT monitors the host station. • A device of other stations is set in the project. • No controller simulator on other stations is set in GT Simulator3.
		Checkbox	Select this to enable the settings.
		[Host]	Set a simulator as the host station.
		[Net No.]	Set a network number. The setting range is [0] to [239].
		[Station No.]	Set a station number. The setting range is [0] to [255].
		[CPU No.]	Set a CPU number. The setting range is [0] to [4].
		[Project Name]	When performing a simulation for the project created with GX Works3, specify the GX Works3 project file to be used for simulation. Specify a project that does not generate errors when starting a simulation with GX Works3. If you set no project, start GX Simulator3 with the default project provided in the GX Simulator3 installation folder "\App\GSS3(3000)".

Item		Description
2)	[Add Row] button	Adds a row for configuring settings. Up to 32 rows can be added.
	[Delete Row] button	Deletes the selected setting row.

■Settings when [GX Simulator2/MT Simulator2] is selected

When you select [GX Simulator2/MT Simulator2] for [Simulator] under [Device], configure the settings for connection with GX Simulator2/MT Simulator2 to be monitored.

Connection with up to four GX Simulator2 modules is possible, and each of these modules can be handled as a different station or module. Connection with up to three MT Simulator2 modules is possible, each of them is handled as a module of one station of GX Simulator2.

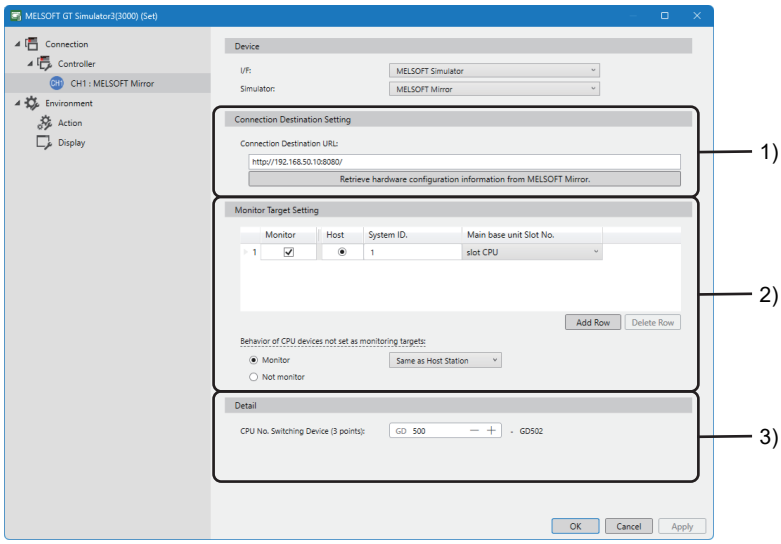


Item			Description
1)	[GX Simulator2 Settings]	-	Set the connection method for GX Simulator2. Set the controller simulator to be monitored. Match the settings with those of [Network] of the device set in the project. When the GOT monitors the device of the host station, the device set in the project does not have the network number and station number settings. [0-FF] is set internally for the device. Set values corresponding to the host station (0-FF) to [Net No.] and [Station No.] according to the system configuration of the monitoring target. For a connection without a network such as serial connection, set [0] to [Net No.] and [255] to [Station No.]. If the following conditions are both satisfied, no applicable station for monitoring exists. The GOT monitors the host station. • A device of other stations is set in the project. • No controller simulator on other stations is set in GT Simulator3.
		Checkbox	Select this to enable the settings.
		[Host]	Set a simulator as the host station.
		[Net No.]	Set a network number. The setting range is [0] to [239].
		[Station No.]	Set a station number. The setting range is [0] to [255].
		[CPU No.]	Set a CPU number. The setting range is [0] to [4].
		[Project Name]	Set the project name for GX Simulator2. The following shows the available project formats. • Workspace format project (*.gd2) • Single file format project (*.GXW)
2)	[Add Row] button		Adds a row for configuring settings. Up to 4 rows can be added.
	[Delete Row] button		Deletes the selected setting row.

Item			Description
3)	[MT Simulator2 Settings]	-	Set the connection method for MT Simulator2. Set the controller simulator to be monitored. Match the settings with those of [Network] of the device set in the project. When the GOT monitors the device of the host station, the device set in the project does not have the network number and station number settings. [0-FF] is set internally for the device. Set values corresponding to the host station (0-FF) to [Net No.] and [Station No.] according to the system configuration of the monitoring target. For a connection without a network such as serial connection, set [0] to [Net No.] and [255] to [Station No.]. If the following conditions are both satisfied, no applicable station for monitoring exists. The GOT monitors the host station. • A device of other stations is set in the project. • No controller simulator on other stations is set in GT Simulator3.
		Checkbox	Select this to enable the settings.
		[Net No.]	Set a network number. The setting range is [0] to [239].
		[Station No.]	Set a station number. The setting range is [0] to [255].
		[CPU No.]	Set a CPU number. The setting range is [2] to [4].
		[Type]	Select the model.
		[OS Type]	Select the OS type.
		[Project Name]	Set the project name for MT Simulator2. The following shows the available project formats. • Workspace format project (*.mt2) • Single file format project (*.MTW)
4)	[Add Row] button		Adds a row for configuring settings. Up to 3 rows can be added.
	[Delete Row] button		Deletes the selected setting row.

■Settings when [MELSOFT Mirror] is selected

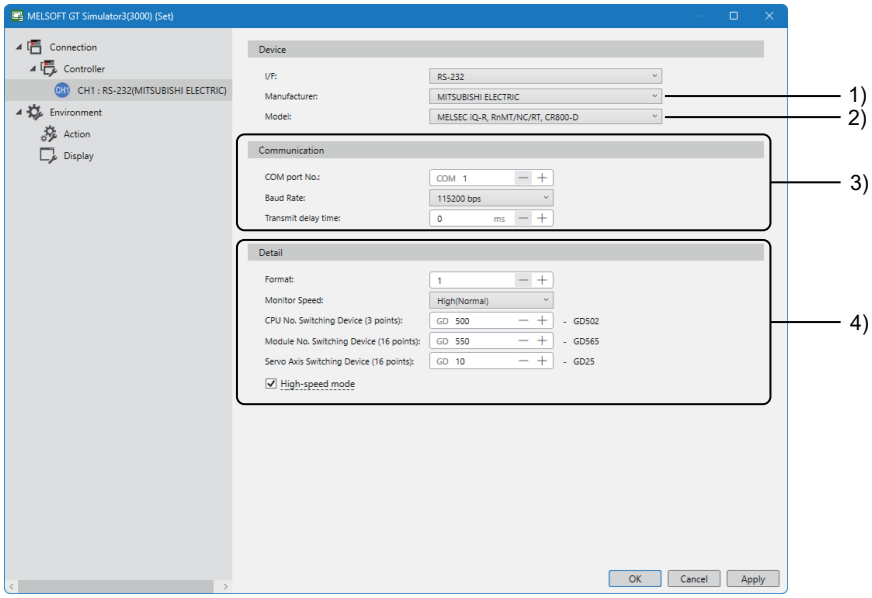
When you select [MELSOFT Mirror] for [Simulator] under [Device], configure the settings for connection with MELSOFT Mirror to be monitored.



Item			Description
1)	[Connection Destination Setting]	[Connection Destination URL]	Specify the URL for connection with the MELSOFT Mirror server. Specify the URL with one-byte alphanumerics and symbols within 2083 characters.
		[Retrieve hardware configuration information from MELSOFT Mirror.]	Acquires the hardware configuration being simulated in MELSOFT Mirror. When this button is pressed, the hardware configuration information of MELSOFT Mirror is displayed in the detail setting table for [Monitor Target Setting].
2)	[Monitor Target Setting]	Detail setting table	Configure the monitoring target settings. • No. Displays the item number. • [Monitor] Select the checkbox when monitoring the network information. • [Host] Select a host station. Only one station can be set. • [System ID.] Set the system ID of the system to be simulated. The setting range is [1] to [59]. • [Main base unit Slot No.] Set the slot number of the CPU module which is set to the main base unit of the system to be simulated with MELSOFT Mirror. The setting range is [slot CPU] or [slot I/O 0] to [slot I/O 6].
		[Add Row] button	Adds a row for configuring settings. Up to 64 rows can be added.
		[Delete Row] button	Deletes the selected setting row.
		[Behavior of CPU devices not set as monitoring targets]	Set the behavior of the CPU devices not targeted for monitoring. • [Monitor] All the CPU devices not targeted for monitoring are monitored. [Same as Host Station] is automatically set and displayed in the same way as the devices of the monitored host station. • [Not monitor] The CPU devices not targeted for monitoring are not monitored.
3)	[Detail]	[CPU No. Switching Device (3 points)]	Set the start device number of the GOT data registers (GD) that specifies the CPU number. The setting range is [0] to [65520]. Specify the value of [CPU No. switching GD device first No. (3 points)] set in the [Controller Setting] window in GT Designer3. If you set a different number, the simulation is not performed properly.

■Settings when [RS-232] is selected

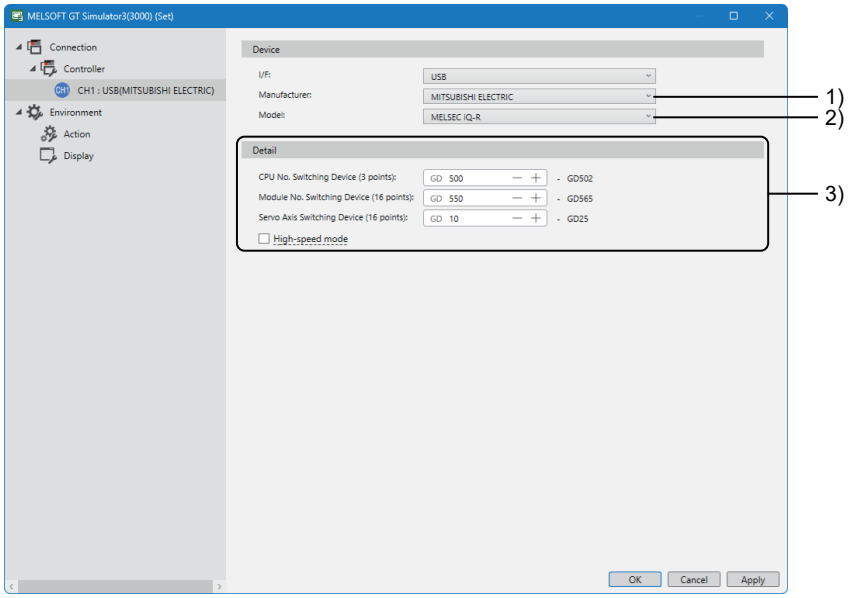
When setting [RS-232] for [I/F] under [Device], configure the settings for connection with the controller.



Item			Description
1)	[Manufacturer]		Fixed to [MITSUBISHI ELECTRIC].
2)	[Model]		Select the model of the controller to be monitored.
3)	[Communication]	-	Configure the settings for connection with the controller.
		[COM Port No.]	Specify the COM port number. The selectable range is [COM1] to [COM63].
		[Baud Rate]	Select a communication baud rate.
		[Transmit delay time]	Set the transmission delay time. The selectable range is [0] to [300].
4)	[Detail]	-	Configure the settings for connection with the controller.
		[Format]	Specify the communication format. The selectable range is [1] to [2].
		[Monitor Speed]	Specify the monitoring speed.
		[CPU No. Switching Device (3 points)]	When you select [MELSEC-FX] in the [Controller Type], this item is not displayed. Set the start device number of the GD devices that specifies the CPU number. Specify the value of [CPU No. switching GD device first No. (3 points)] set in the [Controller Setting] window in GT Designer3. If you set a different number, the simulation is not performed properly.
		[Module No. Switching Device (16 points)]	When you select [MELSEC-FX] in the [Controller Type], this item is not displayed. Set the start device number of the GD devices that specifies the module number. Specify the value of [Module No. switching GD device first No. (16 points)] set in the [Controller Setting] window in GT Designer3. If you set a different number, the simulation is not performed properly.
		[Servo Axis Switching Device (16 points)]	When you select [MELSEC-FX] in the [Controller Type], this item is not displayed. Set the start device number of the GD devices that specifies the axis number. Specify the value of [Servo axis switching GD device first No. (16 points)] set in the [Controller Setting] window in GT Designer3. If you set a different number, the simulation is not performed properly.
		[High-speed mode]	When you select [MELSEC-A] in the [Controller Type], this item is not displayed. Configure this setting to speed up communication using the entry monitor. When using high-speed mode, the continuous simulation time is approximately two hours.

■Settings when [USB] is selected

When setting [USB] for [I/F] under [Device], configure the settings for connection with the controller.



Item			Description
1)	[Manufacturer]		Fixed to [MITSUBISHI ELECTRIC].
2)	[Model]		Select the model of the controller to be monitored.
3)	[Detail]	-	Configure the settings for connection with the controller. The setting items displayed in [Detail Setting] differ depending on the selection for [Type].
		[CPU No. Switching Device (3 points)]	Configure this setting when selecting [MELSEC iQ-R] or [MELSEC-Q] for [Type]. Set the start device number of the GOT data registers (GD) that specifies the CPU number. The setting range is [0] to [65520]. Specify the value of [CPU No. switching GD device first No. (3 points)] set in the [Controller Setting] window in GT Designer3. If you set a different number, the simulation is not performed properly.
		[Module No. Switching Device (16 points)]	Configure this setting when selecting [MELSEC iQ-R] or [MELSEC iQ-F] for [Type]. Set the start device number of the GOT data registers (GD) to specify the module number. The setting range is [0] to [65520]. Specify the value of [Module No. switching GD device first No. (16 points)] set in the [Controller Setting] window in GT Designer3. If you set a different number, the simulation is not performed properly.
		[Servo Axis Switching Device (16 points)]	Configure this setting when selecting [MELSEC iQ-R] or [MELSEC iQ-F] for [Type]. Set the start device number of the GOT data registers (GD) that specifies the axis number. The setting range is [0] to [65520]. Specify the value of [Servo axis switching GD device first No. (16 points)] set in the [Controller Setting] window in GT Designer3. If you set a different number, the simulation is not performed properly.
		[High-speed mode]	Select this option when using the high-speed mode. In the high-speed mode, the continuous simulation time is two hours.

Precautions

- When connection is established between GT Simulator3 and the controller via USB, connecting another MELSOFT product via USB may cause a communication error.

In this case, monitor that MELSOFT product via a different route or stop the monitoring.

- If the USB cable is connected/disconnected or the controller is reset or turned on/off frequently during communication, a communication timeout (system alarm 402) may occur and may not be reset.

Connect/disconnect the USB cable or reset or turn on/off the controller before starting the monitoring with GX Simulator.

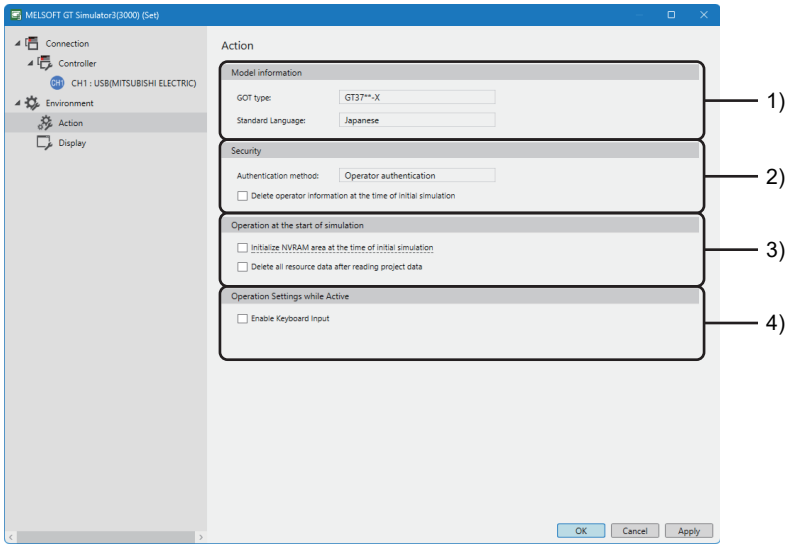
If the communication error is not reset, disconnect the USB cable, wait at least 5 seconds, and then connect the cable again. Even after this operation, an error may occur at the first communication. However, communication can be performed normally from the second attempt onwards.

7.5.2 [Environment]

Configure the operation settings and screen display settings to execute GT Simulator3.

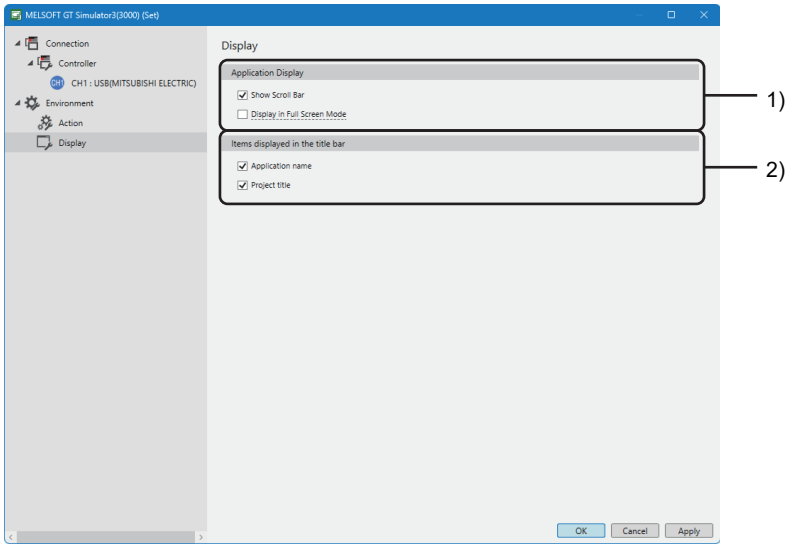
☞ Page 390 [Action]
☞ Page 391 [Display]

[Action]



Item			Description
1)	[Model information]	[GOT Type]	Displays the GOT model to be simulated.
		[Standard Language]	Displays the standard language.
2)	[Security]	[Authentication method]	Displays the authentication method.
		[Delete operator information at the time of initial simulation]	Select this option to delete the operator information when a simulation starts.
3)	[Operation at the start of simulation]	[Initialize NVRAM area at the time of initial simulation]	Select this option to initialize the nonvolatile RAM area when a simulation starts. The following functions save data to the nonvolatile RAM area. • User alarm monitoring • System alarm monitoring • Logging • Recipe • Internal device retention
		[Delete all resource data after reading project data]	Select this option to delete all the user data in the working folder when a simulation starts. Hierarchies under folders A, B, E, F, and G found in "Users\(User name)\AppData\Local\MITSUBISHI\GSS3_3000" When this setting is enabled, system alarms can be prevented when there is inconsistency between the recipe file or alarm data in the working folder and the recipe settings or alarm history settings of the screen data that has been read.
4)	[Operation Settings while Active]	[Enable Keyboard Input]	Select this option to enable keyboard input during simulation.

[Display]



Item			Description
1)	[Application Display]	[Show Scroll Bar]	Select this option to display scroll bars on the simulator screen.
		[Display in Full Screen Mode]	Select this option to execute the full screen display (with the title bar and status bar hidden) when starting the simulator.
2)	[Items displayed in the title bar]		Select the options to be displayed in the title bar.

7.6 Basic operations of GT Simulator3

GT37 SoftGOT3000

☞ Page 392 Operating on the simulation screen
☞ Page 392 Updating the project to be simulated
☞ Page 392 Exiting GT Simulator3
☞ Page 392 Switching the display language of GT Simulator3

7.6.1 Operating on the simulation screen

In GT Simulator3, use the mouse instead of touching the screen.
The input range is narrower than that of the GOT. Check the input by buzzer.

7.6.2 Updating the project to be simulated

If a project is edited in GT Designer3 during simulation, the editing can be reflected to the simulation data.
You can update GT Simulator3 project data by selecting [Debug/Check] → [Simulator] → [Update] from the GT Designer3 menu.

7.6.3 Exiting GT Simulator3

One of the following operations exits GT Simulator3.

- Select [Debug/Check] → [Exit] from the GT Designer3 menu.
- Select [Exit] from the GT Simulator3 menu.
- Right-click on the GT Simulator3 screen and select [Exit] from the menu.
- Click the [×] button on the title bar.

GX Simulator3, which is automatically started when GT Simulator3 is started, automatically exits.

7.6.4 Switching the display language of GT Simulator3

The display language of GT Simulator3 is switched according to that of GT Designer3.
The following shows how to switch the display language.

1. Exit GT Simulator3.
2. Switch the display language of GT Designer3.

For information on how to switch the display language of GT Designer3 and precautions, refer to the following.
☞ Page 88 Switching the display language
Start GT Simulator3 again to switch the display language.
In the following cases, the display language of GT Simulator3 is not switched.

- GT Simulator3 is not exited before the display language of GT Designer3 is switched.
- After the display language of GT Designer3 is switched, GT Simulator3 is started before GT Designer3 is exited.

7.7 Useful functions of GT Simulator3

GT37 SoftGOT3000

☞ Page 393 Taking snap shots
☞ Page 394 Printing the screen
☞ Page 395 Operating the numerical input or text input with a keyboard
☞ Page 397 Using the device monitor
☞ Page 404 Opening resource data files
☞ Page 395 Displaying scroll bars
☞ Page 396 Displaying the screen in full screen mode

7.7.1 Taking snap shots

Save the screen image as a BMP (24-bit BMP) or JPEG format file.

1. Select [Project] → [Snap Shot] from the menu or press Ctrl + H.
2. When the [Save As] dialog appears, select the save destination folder, enter a file name, select a file type, and click the [Save] button.

7.7.2 Printing the screen

Output a screen image to a printer.

☞ Page 394 Configuring the printer settings
☞ Page 394 Page settings
☞ Page 394 Previewing print image
☞ Page 394 Printing

Configuring the printer settings

Set the printer to be used, paper, and print orientation.

1. Select [Project] → [Print Setup] from the menu.

The [Print] dialog of Windows is displayed.

2. Configure the printer settings (printer, paper size, print orientation, etc.), and click the [OK] button.

Precautions

Printer settings are retained for each simulator model (or for each monitored GOT model for the GOT offline monitor). However, when you perform one of the following operations, the printer selected for [Set as default printer] in Windows is specified.

- Deleting the selected printer
- Selecting a printer whose name contains 31 characters or more

Depending on the printer used, some print settings are not retained.

Page settings

Set the printing margins.

1. Select [Project] → [Page Setup] from the menu.

Displays the page settings dialog.

2. Set the top, bottom, left, and right margins and click the [OK] button.

Previewing print image

The print preview allows you to preview the print image on the screen.

1. Select [Project] → [Print Preview] from the menu.

The print preview screen appears.

Precautions

- The print preview of the simulator screen may look smaller than the actual simulator screen (or monitor screen for the GOT offline monitor) depending on the paper type, paper size, and screen resolution.

Therefore, what is printed may not match the print preview.

Check what has been printed.

- To preview the print image at 100% magnification, adjust the paper type and size so that the simulator screen can be displayed at 100% magnification.

Printing

1. Select [Project] → [Print] from the menu or press Ctrl + P.

The [Print] dialog of Windows is displayed.

2. Click the [OK] button to start printing.

7.7.3 Operating the numerical input or text input with a keyboard

Numerical input and text input can be operated with the personal computer keyboard.

Data can be entered without creating a touch switch for numerical or text input in the project data.

Perform one of the following operations to enable or disable the keyboard input.

- Select [Debug/Check] → [Simulator] → [Setting] from the GT Designer3 menu, and select [Action] then select [Enable Keyboard Input] in the displayed dialog.
- Select [Tool] → [Keyboard Input] and select the checkbox.
- Select [Tool] → [Keyboard Input] from the right-click menu and select the checkbox.

The following shows how to operate the numerical input or text input with a keyboard.

Keyboard operation	GOT key code (hexadecimal)	Operation on the numerical input	Operation on the text input
Back space	0008	Deletes the character immediately before the cursor.	
Enter *1	000D	Writes to a device, displays the cursor, moves the cursor, or closes the key window.	
Esc	001B	Cancels the entry.	
- (Hyphen)	002D	Reverses the sign of the value.	—
. (Period)	002E	Enters a decimal point.	—
[0] to [9]	0030 to 0039	Enters a numeric character.	Enters an ASCII or Unicode 2.1-compatible character.
[A] to [Z], [a] to [z]	0041 to 005A, 0061 to 007A	Enters a numeric character in hexadecimal ([A] to [F], [a] to [f]).	
Symbol keys	Character codes (ASCII)	—	
Enters text (such as hiragana or kanji characters).	Character codes (Unicode)	—	
→, ←, ↑, ↓	0080, 0081, 0082, 0083	Moves the cursor	
Home	0084	—	Kana-Kanji/Pinyin conversion
PgUp	0085	—	Selects the previous candidate.
PgDown	0086	—	Selects the next candidate.
End	0087	—	Confirms the entry. When a group of characters is converted, the next group of characters is selected.
Delete	0088	Deletes all the entered characters.	
Ctrl + ←, Ctrl + →	0090, 0091	Moves the cursor on the target object.	
Ctrl + ↑, Ctrl + ↓	FFFA, FFFB	Increments or decrements the value.	—

*1 The operation on the target object varies depending on the setting in the [Environmental Setting] window ([Key Windows]).
For details, refer to the following.
☞ Page 558 Setting key windows of the GOT ([Key Window])

7.7.4 Displaying scroll bars

1. Perform one of the following operations.

- Select [Display] → [Scroll bar] from the menu.
- Right-click the mouse and select [Scroll bar] from the menu.

A scroll bar appears.

Precautions

When resolutions of the GOT model to be simulated are lower than the window size, the scroll bar is not displayed.

Point

Scrolling is possible with the mouse wheel.

The vertical scroll is prioritized.

The cursor keys, PgDown key, and PgUp key on the keyboard cannot be used to scroll.

7.7.5 Displaying the screen in full screen mode

You can hide the title bar and status bar and perform monitoring at the resolution size set in the project data.

☞ Page 396 Executing the full screen display
☞ Page 396 Canceling the full screen display

Executing the full screen display

1. Perform one of the following operations.

- Press Alt + F9.
- Select the [Display] → [Full-screen display] from the menu.
- Right-click the mouse and select [Full-screen display] from the menu.

The confirmation dialog for switching the full screen display appears.

2. Click the [Yes] button.

The full screen display is executed.

Point

When you select [Debug/Check] → [Simulator] → [Setting] from the GT Designer3 menu, and select [Display in Full Screen Mode] under [Display] in the displayed settings dialog, GT Simulator3 will start in full-screen mode by default.

Canceling the full screen display

1. Perform one of the following operations.

- Press Alt + F9.
- Right-click the mouse and select [Full-screen display] from the menu.

A dialog appears to confirm the end of the full screen display.

2. Click the [Yes] button.

The full screen display is canceled.

Precautions

- To perform any operation other than [Exit] during the full screen display, cancel the full screen display.
- If full screen display is executed when the resolution of the personal computer display does not match that of the project data, the simulation screen (or monitor screen for the GOT offline monitor) will be locked to the upper-left corner and cannot be moved.

7.7.6 Using the device monitor

The device monitor function monitors the devices of the controller during simulation.
Internal devices that are not set on the GOT screen and any devices of the controller can be monitored.
Manage monitored devices using the free registration list function.
By registering an internal device in the free registration list, you can check the current value of the device.
You can also change the device value by rewriting it in the free registration list.
This enables you to efficiently check the operation of the project when the device value changes.
Multiple free registration lists can be created to suit your needs for each project, screen (base or window), or device to be monitored (such as X devices and GD devices).
The free registration list includes import and export functions, allowing you to use spreadsheet software or other tools to register and edit devices.

☞ Page 397 Specifications of the device monitor
☞ Page 398 Starting and ending the device monitor
☞ Page 398 Checking and changing the device value in the free registration list
☞ Page 398 Creating a free registration list
☞ Page 401 [Device Monitor] window

Specifications of the device monitor

■Starting the device monitor

- When connection is established between GT Simulator3 and a controller simulator or Mitsubishi Electric equipment, you can start the device monitor during simulation only.
- Only one device monitor can be started.

One device monitor from each of the GOT1000 series, GOT2000 series, and GOT3000 series can be started simultaneously.

■Devices that can be monitored

The device monitor function monitors GOT internal devices and controller devices.
For the devices that can be monitored with GT Simulator3, refer to the following.

☞ Page 359 Device range for monitoring

■Specifications of the free registration list

When you create free registration lists, they are retained after GT Simulator3 exits.
Up to 32 free registration lists can be created.
Up to 32 characters are available for a free registration list name.
The following characters cannot be used in a free registration list name.
\ / : ; * ? " < > | .
Up to 6 free registration windows can be open simultaneously.
Up to 256 devices are registrable in one free registration list.

■Precautions

- An increase in the number of monitored devices causes monitoring performance degradation in GT Simulator3.

■Restrictions

- Label/tag communication is not supported.
- Communication using the label of GT Designer3 (3000) is not supported.
- Communication is not supported when the CPU number and the module number are indirectly specified.

Starting and ending the device monitor

■Starting the device monitor

While GT Simulator3 is performing a simulation, perform one of the following operations to start the device monitor.

- Select [Tool] → [Start or Stop Device Monitor] from the GT Simulator3 menu.
- Select [Tool] → [Start or Stop Device Monitor] from the GT Simulator3 right-click menu.

■Ending the device monitor

Perform one of the following operations to end the device monitor.

- Select [File] → [Exit] from the device monitor menu.
- Click the [×] button on the title bar of the device monitor.
- Press Alt + F4 on the device monitor.
- Select [Tool] → [Start or Stop Device Monitor] from the GT Simulator3 menu.
- Select [Tool] → [Start or Stop Device Monitor] from the GT Simulator3 right-click menu.
- Exit GT Simulator3.

Checking and changing the device value in the free registration list

By registering a device in the free registration list and starting monitoring, you can check the current value of the device on the screen.

1. Creates a free registration list.

☞ Page 398 Creating a free registration list

2. If [Monitoring] is not displayed in the title bar of the [Device Monitor] window, perform one of the following operations.

- Select [Online] → [Start] from the menu.
- Click the [Start the communication] button on the toolbar of the device monitor.

Device monitoring begins and the device value is displayed in the [Current Value] field.

When you change the value in the [Current Value] field, the new value is immediately stored in the device.

Creating a free registration list

You can create a free registration list by either registering a device or importing an already-exported file containing existing free registration lists.

☞ Page 398 Creating a new list
☞ Page 399 Exporting a free registration list
☞ Page 399 Importing existing free registration lists
☞ Page 400 Free registration list format
☞ Page 400 Editing the free registration list
☞ Page 400 Deleting the free registration list

■Creating a new list

To create a new free registration list, follow the steps below.

1. Open the free registration window by either of the following methods.

- Select [Window] → [New Free Registration List] from the menu.
- Double-click [New] under [Free Reg] in the [Project] window.

2. Register a device in the free registration window.

☞ Page 403 Free registration window

Operation	Description
Changing the name of a free registration list	Select the free registration list to be renamed, and click or press F2 on the keyboard to enable editing.
Deleting a device	Select the device to be deleted and press Delete on the keyboard to delete the device.

■Exporting a free registration list

Export a free registration list in CSV or Unicode text format.

There are two export methods: exporting free registration lists individually or exporting all the free registration lists.

1. To export one free registration list, select the list to be exported in the [Project] window.

To export all lists, select [Free Reg] at the top of the tree.

2. Perform one of the following operations.

- Select [File] → [Export Free Registration List] from the menu.
- Click the [Ex] button in the [Project] window.
- Right-click the free registration list to be exported, and select [Export] from the menu.

The [Save As] dialog or the file format selection dialog appears.

3. Perform either of the following operations.

Dialog	Operation
[Save As]	Set [File Name] and [File Type] and click the [Save] button.
File format selection	Select the file format of the output file and click the [OK] button. When the [Browse For Folder] dialog appears, select the export destination folder and click the [OK] button.

The free registration lists are exported.

The exported free registration lists are editable with spreadsheet software or others.

For the free registration list format, refer to the following.

☞ Page 400 Free registration list format

Precautions

When using a character not included in ASCII and Shift JIS codes, use Unicode text format for the file format.

If CSV format is used, characters not included in ASCII and Shift JIS codes are not output correctly.

■Importing existing free registration lists

Import the file created with the existing free registration lists that have been exported.

Multiple free registration lists can be imported individually or collectively.

When importing multiple files, you can import CSV and Unicode text files together.

Files exported with GT Simulator (2000) can also be imported to GT Simulator (3000).

To import free registration lists, follow the steps below.

1. Export free registration lists.

☞ Page 399 Exporting a free registration list

2. Perform one of the following operations in the [Project] window.

Purpose	Operation
Creating one free registration list	Select [New].
Creating multiple free registration lists	Select [Free Reg] at the top of the tree.
Overwriting an existing free registration list	Select the free registration list to be overwritten.

3. Perform one of the following operations to open the [Open] dialog.

- Select [File] → [Import Free Registration List] from the menu.
- Click the [Im] button in the [Project] window.
- Right-click the selected list and select [Import] from the menu.

4. Select the file to be imported and click the [Open] button.

The free registration lists are imported.

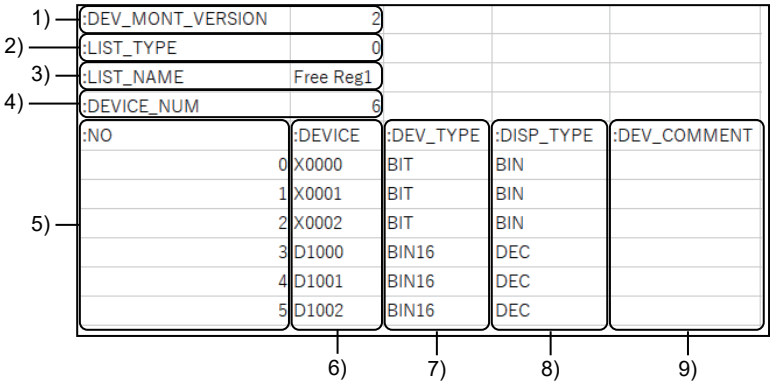
■Free registration list format

The following shows the layout of an exported free registration list.

For the precautions for using CSV files and Unicode text files, refer to the following.

☞ Page 3668 Precautions for using CSV file

☞ Page 3669 Precautions for using Unicode text file



Item		Description
1)	Version	Version of the free registration list.
2)	List type	Type of a list. • 0: Free registration list
3)	List name	Name of the free registration list. For the name specifications, refer to the following. ☞ Page 397 Specifications of the free registration list
4)	Number of devices	Number of the registered devices. Up to 256 devices are registrable in one free registration list.
5)	No.	Serial numbers of the registered devices.
6)	Device	Registered device.
7)	Data type	Data type of a device • BIT: [Bit] • BIN8: [Byte [Signed]] • BIN8_Unsigned: [Byte [Unsigned]/Bit String [8-bit]] • BIN16: [Word [Signed]] • BIN16_Unsigned: [Word [Unsigned]/Bit String [16-bit]] • BIN32: [Double Word [Signed]] • BIN32_Unsigned: [Double Word [Unsigned]/Bit String [32-bit]] • BIN64: [Quad Word [Signed]] • BIN64_Unsigned: [Quad Word [Unsigned]/Bit String[64-bit]]
8)	Display format	Display format of a device. • BIN: [Binary] • OCT: [Octal] • DEC: [Decimal] • HEX: [Hexadecimal]
9)	Comment	Comment set for a device. Up to 255 characters can be set for one comment. Tab characters and line feed codes cannot be entered.

■Editing the free registration list

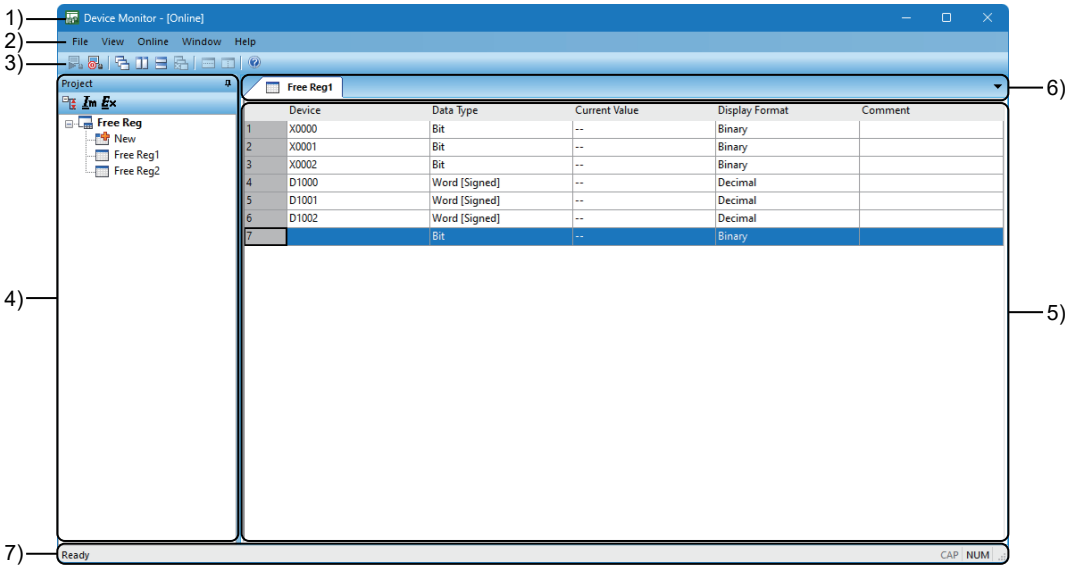
Double-click the free registration list to be edited under [Free Reg] in the [Project] window.

Edit the device list displayed in the free registration window as necessary.

■Deleting the free registration list

Select the free registration list to be deleted in the [Project] window, and press Delete on the keyboard or right-click the list and select [Delete] from the menu.

[Device Monitor] window



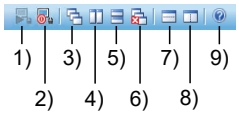
Item		Description
1)	Title bar	Displays the device monitor operation status. • [Monitoring] Communication with the controller is in progress. • [Stopped] Communication with the controller is stopped.
2)	Menu bar	Displays the operation menu. ☞ Page 402 Menu bar
3)	Toolbar	Displays operation buttons. ☞ Page 403 Toolbar
4)	[Project] window	Displays the free registration list in a tree view. Expand all button, collapse all button  • [New] Creates a free registration list. Clicking this button creates a new free registration tab in the work window. Up to 32 lists can be created. ☞ Page 403 Free registration window • Expand all button, collapse all button Expands or collapses all items in the tree. • [Im] button Imports the free registration list in CSV or Unicode text format. For the steps to import the free registration list, refer to the following. ☞ Page 399 Importing existing free registration lists • [Ex] button Exports the free registration list file in CSV or Unicode text format. For the steps to export the free registration list, refer to the following. ☞ Page 399 Exporting a free registration list
5)	Work window	An area in which the free registration window appears. ☞ Page 403 Free registration window Up to six lists can be opened simultaneously. If seven or more lists are opened, the first opened free registration list will close.

Item		Description
6)	Editor tab	Displays the tabs corresponding to the windows opened in the work window. To bring an open window to the foreground in the work window, select its tab. Pull-down menu button • Pull-down menu button Lists the open windows in the work window. To bring an open window to the foreground in the work window, select it from the pull-down menu.
7)	Status bar	Displays the description of a selected menu. The statuses of the CapsLock and NumLock keys on Windows are also displayed. Gray indicates the disabled state, while black indicates the enabled state.

■Menu bar

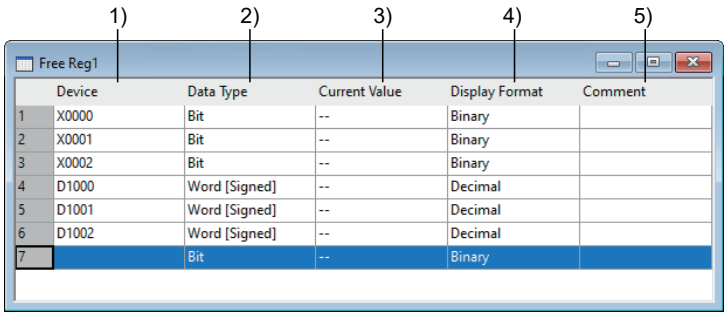
Menu		Description	Shortcut key
[File]	[Import Free Registration List]	Imports the free registration list in CSV or Unicode text format. For the steps to import the free registration list, refer to the following. ☞ Page 399 Importing existing free registration lists	Alt + I
	[Export Free Registration List]	Exports the free registration list file in CSV or Unicode text format. For the steps to export the free registration list, refer to the following. ☞ Page 399 Exporting a free registration list	Alt + E
	[Stop Device Monitor]	Ends the device monitor.	Alt + F4
[Display]	[Toolbar]	Displays or hides the toolbar.	—
	[Status Bar]	Displays or hides the status bar.	—
[Online]	[Start]	Starts the device monitor.	F3
	[Stop]	Stops the device monitor.	Alt + F3
[Window]	[New Free Registration List]	Creates a free registration list.	—
	[Cascade]	Displays open windows in a stack in the work window.	—
	[Arrange Sideways]	Tiles open windows side by side in the work window.	—
	[Arrange Lengthways]	Tiles open windows horizontally in the work window.	—
	[Close Inactive Windows]	Closes all open windows except the selected one in the work window.	—
	[New Horizontal Tab Group]	Splits the work window into panes horizontally. Puts the free registration window corresponding to a selected tab in a pane immediately underneath the current pane. Tabs are movable between the editor tabs of panes.	—
	[New Vertical Tab Group]	Splits the work window into panes vertically. Puts the free registration window corresponding to a selected tab in the immediately right pane. Tabs are movable between the editor tabs of panes.	—
[Help]	[GT Designer3 Help]	Displays GT Designer3 Help.	F1

■Toolbar



Item		Description
1)	[Start the communication] button	Starts the device monitor.
2)	[Stop the communication] button	Stops the device monitor.
3)	[Display all open windows in a stack (cascade)] button	Displays open windows in a stack in the work window.
4)	[Display all open windows in a horizontal direction] button	Tiles open windows side by side in the work window.
5)	[Display all open windows in a vertical direction] button	Tiles open windows horizontally in the work window.
6)	[Close all the inactive windows] button	Closes all open windows except the selected one in the work window.
7)	[Create a new horizontal tab group] button	Splits the work window into panes horizontally. Puts the free registration window corresponding to a selected tab in a pane immediately underneath the current pane. Tabs are movable between the editor tabs of panes.
8)	[Create a new vertical tab group] button	Splits the work window into panes vertically. Puts the free registration window corresponding to a selected tab in the immediately right pane. Tabs are movable between the editor tabs of panes.
9)	[Display GT Designer3 Help] button	Displays GT Designer3 Help.

■Free registration window



Item		Description
1)	[Device]	Set a device to be monitored. Up to 256 items (rows) can be registered per list. ☞ Page 834 How to set devices, labels, and tags
2)	[Data Type]	Select the data type of a device.
3)	[Current Value]	Displays the current value of a device. The set value is changeable. If a communication error occurs, [--] is displayed. The setting range of [Current Value] depends on the device.
4)	[Display Format]	Select the display format of a device.
5)	[Comment]	Set a comment for a device. Up to 255 characters can be set for one comment.

7.7.7 Opening resource data files

Open resource data files collected by the simulator and saved on the personal computer (such as alarm log files, recipe files, data log files, and operation log files, with extensions .csv, .txt, .bmp, and .jpg).

1. Perform one of the following operations to display the [Refer To Resource Data] dialog.

- Select [Tool] → [Resource Data] from the menu.
- Select [Tool] → [Resource Data] from the right-click menu.
- Press Ctrl + R.

2. Select the file to be referenced in the [Refer To Resource Data] dialog, and click the [Open] button.

The selected resource data is displayed.

7.7.8 Checking the causes and corrective actions for errors (GOT diagnostics)

GOT diagnostics is a function that obtains error information during simulation and displays the error details, causes, and corrective actions on the screen. The function enables efficient debugging during simulation.

Errors identified through GOT diagnostics

GOT diagnostics addresses the following errors.

Error monitored by GOT diagnostics	Description
System alarm	• GOT error • CPU error • Network error When GOT diagnosis is started, the most recent CPU error, GOT error, and network error are displayed respectively from the currently occurring alarms.
Script error	• Project script • Screen script • Object script Script parts are not covered by GOT diagnostics.

Displaying GOT error information

The following shows the procedure for executing GOT diagnostics and displaying GOT error information on the screen.

1. Click [Diagnostics] → [GOT Diagnostics] from the menu.

The GOT diagnostic window is displayed.

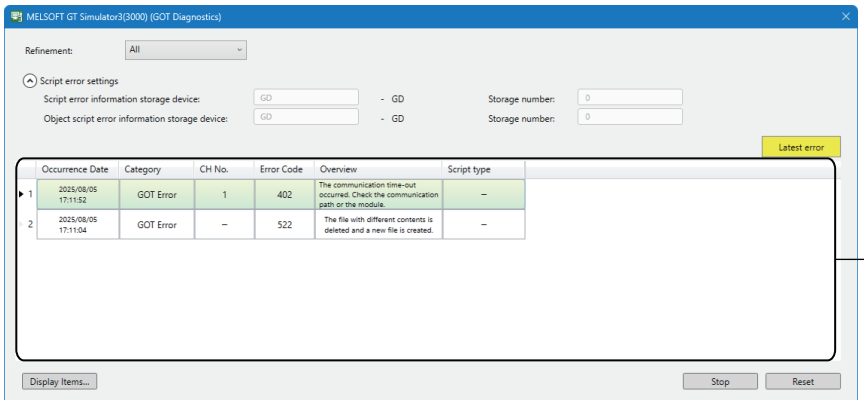
☞ Page 405 GOT diagnostics window

2. If necessary, use the [Refinement] field to narrow down the types of errors to be displayed on the screen.

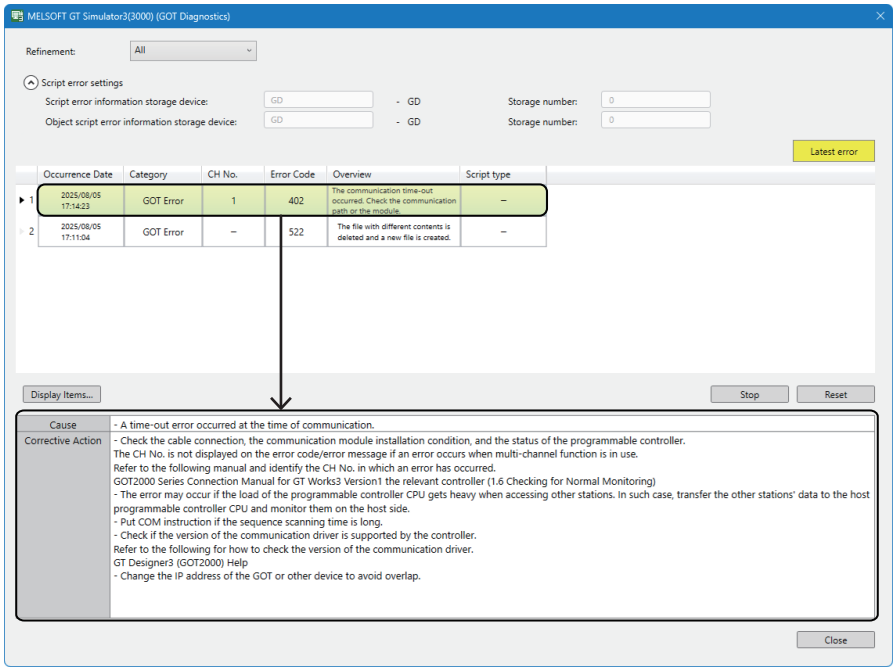
3. Click the [Start] button.

The occurring errors are displayed in a list.

The errors are displayed in order of occurrence date and time.



4. Click an error in the error list to display its causes and corrective actions.



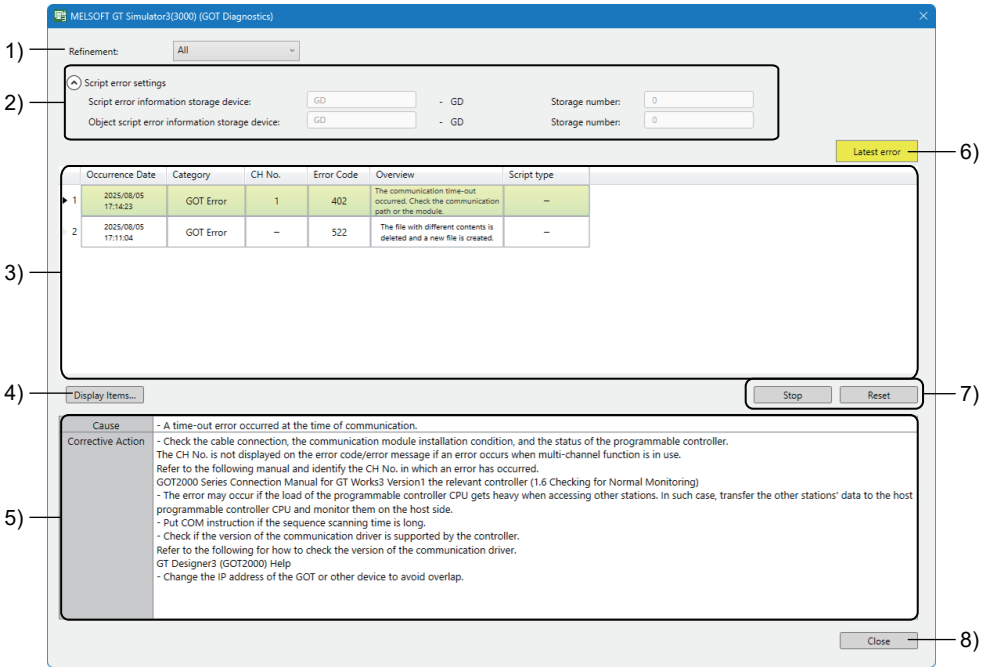
5. After the error is resolved, click the [Reset] button to clear the error details.

Errors resolved during monitoring will remain on the screen until they are reset.

Click the [Reset] button to obtain the latest error information and display it on the screen.

GOT diagnostics window

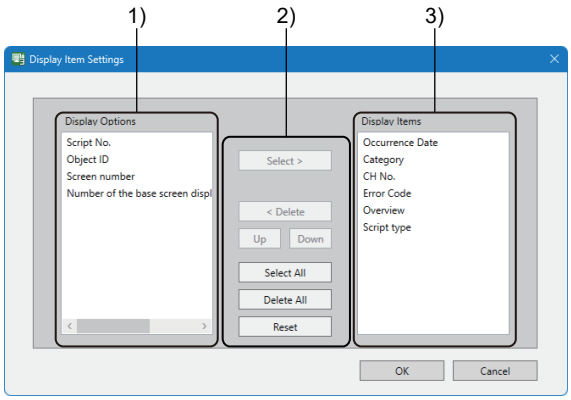
Select [Diagnostics] → [GOT Diagnostics] from the menu to display the window.



Item			Description
1)	[Refinement]		Select the category of errors to be displayed in the error list.
2)	[Script error settings]	[Script error information storage device]	Specify the device that stores script error information. Specify the number of script error information items to be stored in the [Storage number] field.
		[Object script error information storage device]	Specify the device that stores object script error information. Specify the number of object script error information items to be stored in the [Storage number] field.

Item		Description
3)	Error list	Lists the errors currently occurring on the connected GOT. Errors are displayed in reverse chronological order. If the number of errors exceeds the maximum number of displayed errors, earlier errors are not displayed. For the system alarm (GOT error), script error, and object script error, correct an error and click the [Reset] button to delete the error from the error list. For the precautions on the system alarm, refer to the following. ☞ Page 1543 Specifications of the system alarm display
4)	[Display Items]	Click to display the [Display Item Settings] and set the items to be displayed in the error list. ☞ Page 406 [Display Item Setting] dialog
5)	[Cause] [Corrective Action]	Displays the cause of the selected error and its solution in the error list.
6)	[Latest error]	Obtains the latest error information.
7)	[Start] button [Stop] button	Starts or stops obtaining error information.
	[Reset] button	Resets error data in the GOT, and updates the error list. Corrected system alarms (GOT errors) and script errors are deleted from the error list. Others remain in the list.
8)	[Close] button	Closes the window.

■[Display Item Setting] dialog



Item			Description
1)	[Display Options]		Options of the items displayed in the search result list Select an item and click the [Select] button to move the item to [Display Items].
2)	Operation buttons	[Select] button	Moves the item selected in [Display Options] to [Display Items].
		[Delete] button	Moves the item selected in [Display Items] to [Display Options].
		[Up] button [Down] button	Moves the item selected in [Display Items] up or down.
		[Select All] button	Moves all the items in [Display Options] to [Display Items].
		[Delete All] button	Moves all the items other than [Controller/Setting Name] in [Display Items] to [Display Options].
		[Reset] button	Restores the items in [Display Items] to the default ones.
3)	[Display Items]		Items to be displayed in the search result list If any item is selected and the [Delete] button is clicked, the selected item is moved to [Display Options]. The top-to-bottom order in [Display Items] corresponds to the left-to-right order in the search results list. Select an item and click the [Up] or [Down] button to move the item up or down.

7.8 Troubleshooting

GT37 SoftGOT3000

Error message	Cause	Solution
Exit MELSOFT GT Simulator3(3000) before you logoff or exit Windows.	Windows was logged off or exited before GT Simulator3 (3000).	Exit GT Simulator3 (3000), and then log off or exit Windows.
Cannot terminate Simulate. Close the simulate screen and retry.	• Dialogs, messages, or pint previews are displayed. Waiting for completion of internal process.	• Close all dialogs, messages, and print previews that are being displayed. • Retry stopping after a while.
MELSOFT GT Simulator3(3000) is not installed properly. Please do the following. • After restarting the personal computer, restart MELSOFT GT Simulator3(3000). • Uninstall MELSOFT GT Simulator3(3000), and then reinstall it.	• Configuring the execution environment for GT Simulator3 (3000) has failed. • GT Simulator3 (3000) is not installed properly.	• Restart the personal computer, and then restart GT Simulator3 (3000). • Uninstall GT Simulator3 (3000) and install it again.
GOT type of the project data is different from the one specified in MELSOFT GT Simulator3(3000). [Project data settings] GOT type: GT**-*	The GOT type set in the project differs from the GOT type set in GT Simulator3 (3000).	Match the GOT type set in the project and the GOT type set in GT Simulator3 (3000).
Reading has failed. Check the following and retry. • The project data size and data count • Available disk space • Access privileges to the project file • The project data is invalid or does not exist • The project password is invalid or not entered	-	• Reduce the project data size to 256 MB or less. • Increase free space on the hard disk. • Check the access privilege for a file. • Check the settings in GT Designer3 (GOT3000). • Use the project data that is not damaged. • Check that the project data exists. • In the password entry dialog, enter the correct password and click the [OK] button.
The GOT type (resolution) of the project data is different from the setting in MELSOFT GT Simulator3(3000). [Project data settings] GOT type: GT**-*(***x***) [MELSOFT GT Simulator3(3000) settings] Resolution: ****x**** If the resolution differs between the project data being monitored and the project data you are trying to open, please exit MELSOFT GT Simulator3 (3000) and reopen the project data.	The GOT type (resolution) set in the project differs from the setting in GT Simulator3 (3000).	Match the GOT type (resolution) set in the project and the resolution set in GT Simulator3 (3000).
Failed to delete resource data. • Close resource data if it is open. • Check the file access privileges.	• The file is in use. • Access to the file is disabled.	• Check if the file is opened by another application. • Check the access privilege for a file.
Cannot set up the operating environment. Insufficient disk space or memory may be the cause. Please do the following and retry. • Exit unnecessary applications. • Increase the free space of the hard disk. • Restart the personal computer.	Error code [0x1103] • The available space of the memory or hard disk is not sufficient. • An application was closed incorrectly. • Incorrect processing is activated. Error code [0x1502] Mutex creation failed.	Error code [0x1103] • Exit unnecessary applications. • Increase free space on the hard disk. • Restart the application. • After restarting the personal computer, restart the application. Error code [0x1502] After restarting the personal computer, restart the application.
Failed to set up an operating environment. Check the following and retry the operation. • Free disk space. • Access privileges to the environment file. • Validity of environment files (invalid files or files not found).	• Increase the available space in the device where the application runs. You do not have access privileges to the environment file. The environment file does not exist or is in an invalid state. The MAC address does not exist.	• Increase the available space in the device where the application runs. • Check the access privilege for a file. • Reinstall the application. • Check if the network adapter exists.

8 Transferring data to the GOT

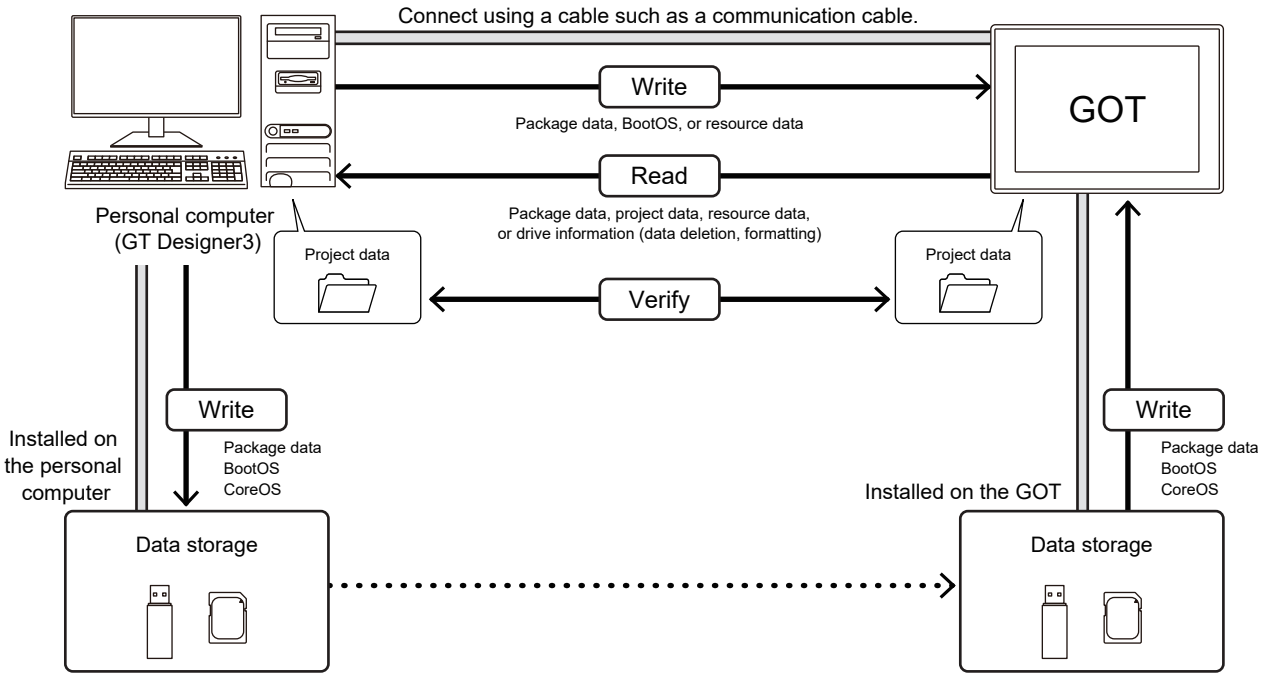
GT37 SoftGOT3000

☞ Page 409 Function overview
☞ Page 410 Specifications of data transfer function
☞ Page 414 Setting procedure for using the data transfer function
☞ Page 415 Transferred data and GOT storage destination
☞ Page 418 Route for the data transfer
☞ Page 420 Connecting a personal computer to the GOT
☞ Page 434 Configuring the settings for communication between the personal computer and the GOT
☞ Page 435 Setting the data to be transferred (application selection)
☞ Page 437 Writing data to the GOT
☞ Page 441 Reading the data from the GOT
☞ Page 443 Verifying with the project data in the GOT
☞ Page 445 Transferring data via a data storage
☞ Page 450 Setting dialogs related to data transfer
☞ Page 484 Troubleshooting

8.1 Function overview

GT37 SoftGOT3000

Package data, BootOS, CoreOS, and resource data can be written/installed to the GOT from a personal computer on which GT Designer3 is installed, and package data and resource data in the GOT can be read to the personal computer.
This function is referred to as the data transfer function.
The project data in the personal computer and the one in the GOT can be verified to check the differences.
In this chapter, "personal computer" means the one on which GT Designer3 is installed.



Data transfer mainly consists of the following functions.

Write

Connect the personal computer to the GOT and establish communication or use a data storage to write data from the personal computer to the GOT.
The data that can be transferred is different between the data transfer using communication and that using a data storage. For details, refer to the next section.
☞ Page 410 Types of the data that can be transferred
The batch writing function is also available for writing the same package data to multiple GOTs connected via Ethernet.
When transferring package data using a data storage, you can specify whether to write the package data stored in the data storage to the GOT or let the GOT use the package data stored in the data storage as is.

Read

Connect the personal computer to the GOT and establish communication to read the project data or resource data written to the GOT to the personal computer.
The read function contains functions such as acquiring the folder structure or file information in the GOT drive to delete the project data or resource data in the drive and formatting the data storage in the GOT.

Verification

Connect the personal computer to the GOT and establish communication to verify the project data being edited in GT Designer3 and the project data written to the GOT.
Differences can be checked for each screen and object.
The data is verified based on the data or the modified date.

8.2 Specifications of data transfer function

GT37 SoftGOT3000

This section explains the specifications of the data transfer function.

☞ Page 410 Types of the data that can be transferred
☞ Page 411 Operation related to the security mode
☞ Page 411 Encrypted communication
☞ Page 412 File protection
☞ Page 413 Precautions

8.2.1 Types of the data that can be transferred

GT37 SoftGOT3000

The following shows the data that can be transferred by the data transfer function.

○: Available, —: Not available

Data	Write	Read	Timing example for transferring data
BootOS	○	—	• When upgrading the version of the BootOS or CoreOS ☞ Page 3732 Functions that require upgrading the versions of BootOS and CoreOS
CoreOS	○	—	
Package data	○	○	• When using the GOT for the first time • When modifying or changing the project data (only differential writing is available) • When changing the system application used • When changing the method of communication with the PLC • When using special data such as intelligent module monitor data
Project data (independent)	—	○	• When saving the project written in the GOT to the personal computer
Resource data	○*1	○	• When modifying the recipe file or image file • When checking the control data (such as an alarm log file, logging file, and operation log file)
Drive information Use status of each drive in the GOT	—	○	• When deleting data from the GOT • When formatting the data storage in the GOT

*1 Files of 0 MB or more than 256 MB cannot be written to the GOT.
For the route for data transfer supported by each data, refer to the following.
☞ Page 419 Transferred data and supported routes for data transfer

8.2.2 Operation related to the security mode

The following shows the operation of the data transfer function related to the security mode.
For the security mode, refer to the following.
☞ Page 38 Security function

When performing data transfer operation for a GOT in security mode 2

When any of the following operations is performed for a project of the GOT in security mode 2, operator authentication is required. This displays the [Operator] dialog.
When the [Operator Authentication] dialog appears, enter the operator name and password to perform authentication.

Operation	Operation dialog
Writing data to the GOT	☞ Page 465 [GOT Write] tab ☞ Page 476 [Batch Write to multiple GOTs] dialog
Reading data from the GOT	☞ Page 472 [GOT Read] tab
Verifying with the project data in the GOT	☞ Page 475 [GOT Verification] tab
Acquiring the GOT information	☞ Page 465 [GOT Write] tab ☞ Page 472 [GOT Read] tab ☞ Page 475 [GOT Verification] tab ☞ Page 469 [GOT Information - Detail] dialog
Acquiring the drive information	☞ Page 470 [Select Resource Data] dialog ☞ Page 472 [GOT Read] tab ☞ Page 474 [Path Setting] dialog
Deleting the drive data, formatting the drive	☞ Page 472 [GOT Read] tab
Communication test	☞ Page 451 [Communication Configuration] dialog ☞ Page 476 [Batch Write to multiple GOTs] dialog

When the security mode of the GOT is changed to mode 1

When the following operation is performed, the security mode of the GOT is changed from mode 2 to mode 1.

- Write project data for which [Security Mode] is set to [Mode 1] in [Security setting] of [GOT Type Setting].

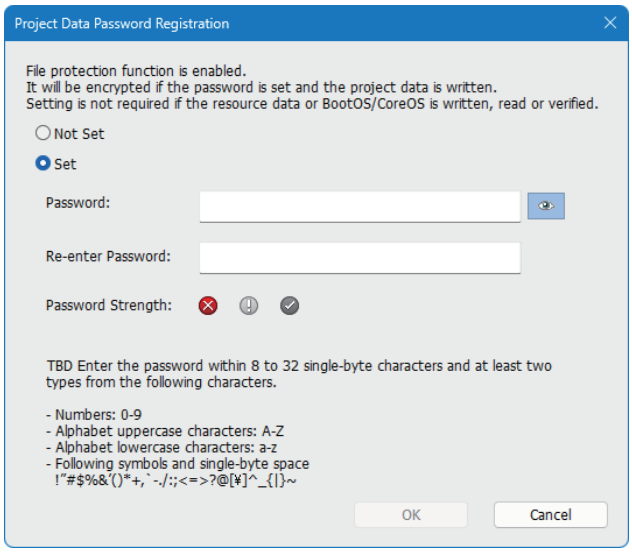
8.2.3 Encrypted communication

When the personal computer and GOT are directly connected by Ethernet, communication data can be encrypted when transferred.
To encrypt the communication, set [Encryption Communication Port No.] to open in the [GOT Ethernet Setting] window, and select [Perform encryption communication] in the [Communication Configuration] or [Batch Write to multiple GOTs] dialog.
☞ Page 717 [GOT Ethernet Common Setting]
☞ Page 451 [Communication Configuration] dialog
☞ Page 476 [Batch Write to multiple GOTs] dialog
☞ Page 3069 Encrypting communication data (Encrypted communication function)

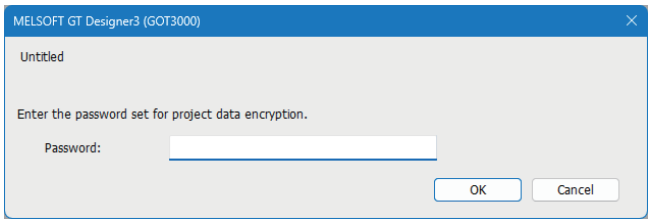
8.2.4 File protection

To enhance the confidentiality of project data, you can set a password for project data with the file protection function.
In the GOT, the project data is encrypted using the set password.
To enable file protection, configure the setting in [Information Protection Function] - [File Protection] in the [Environmental Setting] window.
☞ Page 3068 [File Protection]
When the file protection function is enabled, performing one of the following data transfer operations displays the [Project Data Password Registration] dialog, allowing you to register a password.

- Open the project data (GTY) and select [Communication] → [Write to GOT], [Read from GOT], [Verify GOT], [Batch Write to multiple GOTs], or [Write to Memory Card].
- Click the [OK] button in the [Communication Configuration] dialog when [Display the dialog of [Communication Configuration] the next time as well] is selected in the [Communication Configuration] dialog.



When the project data for which a password is set is read from the GOT or verified with the GOT, the following dialog appears and a password is requested.



Precautions

The following operations cannot be performed with GT Designer3 for project data projected by file protection and not started on the GOT.

- Drive information acquisition
- Package data writing (differential writing in synchronous mode)
- Package or project data reading
- Verification with the GOT

8.2.5 Precautions

Opening the port for communication with peripheral software products

When using the data transfer function, set [Peripheral S/W Communication Port No.] to open in the [GOT Ethernet Setting] window.

Transferring data while the FA transparent function is used

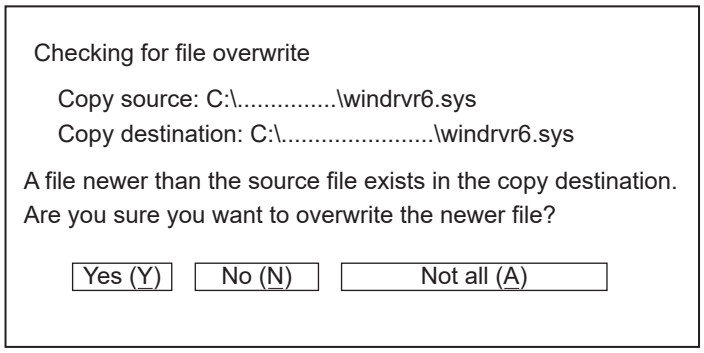
If another MELSOFT application is communicating with the connected GOT using the FA transparent function, data may not be transferred.
To transfer data, make sure that the FA transparent function is not in use.

Power saving function of the personal computer

To transfer data by connecting to the GOT, disable the power saving function of the personal computer and Windows.
For details on power saving function settings related to security mode, refer to the manual of the personal computer or Windows Help.

USB driver of other products

When the USB driver of other products is installed, the confirmation message for overwriting the USB driver file (windrvr6.sys) may appear.
If a new file already exists, click the [No] button and do not overwrite the file.
When the file is overwritten, the USB communication of GT Designer3 and the GOT may not be properly executed.



Communication error by the firewall

The setting of the communication port of the personal computer may cause a communication error, such as timeout error.
When the port for the Ethernet communication is blocked by the firewall, a communication error occurs.
Disable the firewall or set the port to be opened.
For details on checking or setting the communication port, refer to Windows Help.

Transferring data while firmware update is in progress

While firmware update of the communication unit mounted on the GOT is in progress, transferring data is not available.
To transfer data, make sure that firmware update is not executed.

PART 4

8.3 Setting procedure for using the data transfer function

To use the data transfer function, connect the GOT and personal computer and configure the connection setting in advance. The following shows the setting procedure for using the data transfer function.

Setting procedure	Reference
Checking the data storage destination of the GOT	☞ Page 415 Transferred data and GOT storage destination
Determining the route for data transfer between the personal computer and the GOT	☞ Page 418 Route for the data transfer
Connecting the personal computer and GOT	☞ Page 420 Connecting a personal computer to the GOT
Configuring communication setting between the personal computer and the GOT	☞ Page 434 Configuring the settings for communication between the personal computer and the GOT
Data transfer operation	Perform one of the following operations according to your purpose. ☞ Page 437 Writing data to the GOT ☞ Page 441 Reading the data from the GOT ☞ Page 443 Verifying with the project data in the GOT ☞ Page 445 Transferring data via a data storage

8.4 Transferred data and GOT storage destination

GT37 SoftGOT3000

When transferring data to the GOT from the personal computer, consider the size of the data to be transferred and the memory of the GOT.

This section describes the following.

☞ Page 415 Storage and expansion destination memories of transferred data
☞ Page 416 Checking method of data size
☞ Page 417 How to reduce the size of the package data

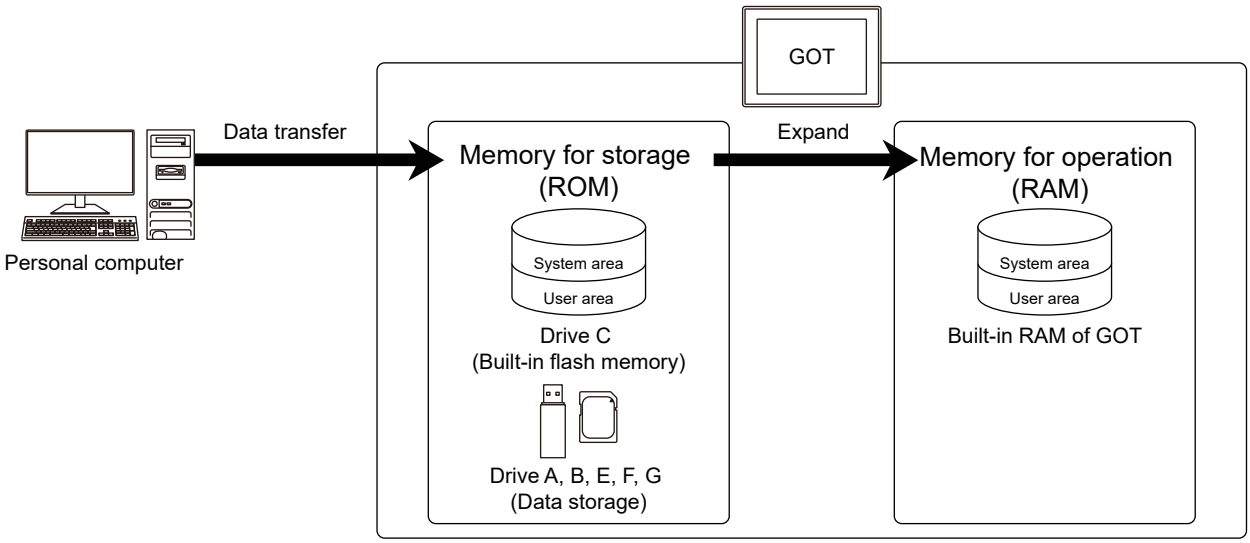
8.4.1 Storage and expansion destination memories of transferred data

The GOT has a storage memory (ROM) and operation memory (RAM).

The GOT stores the written data in the storage memory (ROM) first, and then expands it to the operation memory (RAM) when operating it.

The drive corresponding to the storage memory (ROM) is shown in the figure below.

The operation memory (RAM) is the built-in RAM of the GOT.



The storage destination and expansion destination differ depending on the type of the transferred data.

Some of the transferred data is stored in the storage memory (ROM) with compressed. When the data is expanded to the operation memory (RAM), the data size increases.

Transferred data type	Storage destination		Expansion destination	
	Storage memory (ROM)	Size	Operation memory (RAM)	Size
BootOS	System area of drive C (built-in flash memory) The size of data to be stored in the system area is unnecessary to be considered.		System area of built-in RAM The size of data to be stored in the system area is unnecessary to be considered.	
Package data	• User area on drive C (built-in flash memory)*1	256 MB	User area in built-in RAM*2	768 MB
Package data Resource data	• Drive A • Drive B • Drive E • Drive F • Drive G	Depends on the data storage.		

*1 Some standard system applications included in the package are stored in the system area.

*2 The following system application is expanded to the system area of the built-in RAM. Considering the data size is unnecessary.

Data type	Data stored in the system area of the built-in RAM
System application (standard function)	Standard system application
	UD system font, 7-segment font

For the available drives by GOT model, refer to the following.

☞ Page 81 Drive configuration and capacity of GT37

Precautions

- If the GOT is powered off while data is being written to the storage memory (ROM), the data may be corrupted and the GOT may become inoperable.
- The size of the package data must be less than the free space size of the storage memory (ROM) or the operation memory (RAM).

8.4.2 Checking method of data size

You can check the size of data such as package data and free space size of the storage destination drive in each dialog.

Check target	Dialog for checking
Screen Project data	[Data Size (Screen)] dialog [Data Size (Project)] dialog Display method: Select [Tools] → [Debug/Check] → [Data Size] from the menu. ☞ Page 349 Checking data size
Package data	[Write Option] dialog Display method: Click the [Write Option] button in the [GOT Write] tab in the [Communicate with GOT] dialog. ☞ Page 467 [Write Option] dialog
Storage designation drive	[GOT Write] tab in the [Communicate with GOT] dialog ☞ Page 465 [GOT Write] tab
	[GOT Information - Detail] dialog Display method: Click the [Detail] button in the [Communicate with GOT] dialog. ☞ Page 469 [GOT Information - Detail] dialog

8.4.3 How to reduce the size of the package data

Reduce the size of the package data by one of the following methods when the size of the package data exceeds the free space size of the storage memory (ROM) or the operation memory (RAM).

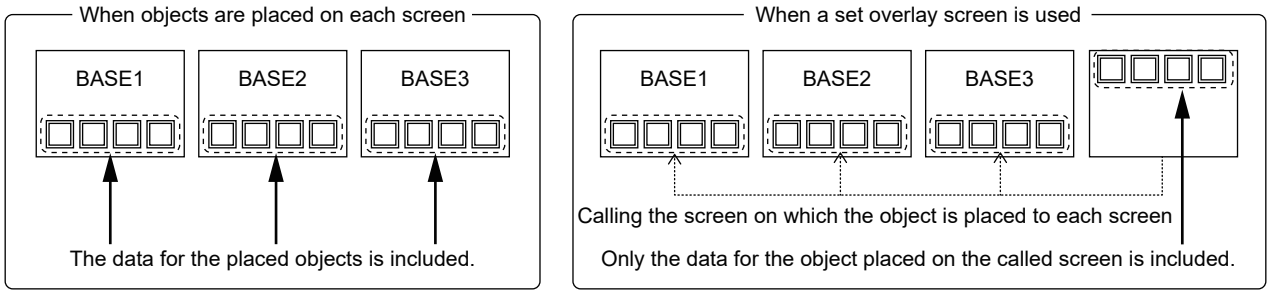
☞ Page 417 Deleting figures and objects in the project
☞ Page 417 Not writing unnecessary screens or settings
☞ Page 417 Not writing unnecessary system applications

Deleting figures and objects in the project

Reduce the number of figures and objects placed on screens in the project data.

When you placing the same object on multiple screens, reduce the capacity of the data by using the set overlay screen.

☞ Page 1865 Placing a screen on another screen



Not writing unnecessary screens or settings

When the package data is written to the GOT, the size can be reduced by selecting [Select] for [Write Mode] in the [Write Option] dialog and clearing checkboxes of unnecessary screens and settings.

☞ Page 467 [Write Option] dialog

Not writing unnecessary system applications

When the package data is written to the GOT, data size can be reduced by deselecting the checkboxes of unnecessary system applications (add-on functions) in the [Application Selection] dialog.

☞ Page 458 [Application Selection] dialog

For system application (add-on function) data sizes, refer to the following.

☞ Page 459 System application (add-on function) list

8.5 Route for the data transfer

GT37 SoftGOT3000

The following table lists the routes for the data transfer.

Route for data transfer	Description	
Transferring data using communication	Connect the personal computer to the GOT, establish communication, and transfer the package data, BootOS, and resource data.	
	Connecting a personal computer and the GOT directly	Connect the personal computer to the GOT directly via USB or Ethernet to establish communication. ☞ Page 421 Connecting a personal computer and the GOT directly 	Connecting to the GOT via a PLC	The personal computer communicates with the GOT via a PLC that is connected to the same Ethernet network, CC-Link IE TSN, or CC-Link IE Field Network as the GOT. ☞ Page 424 Connecting to the GOT via a PLC The communication available between the personal computer and the PLC is as follows.  The personal computer can communicate with the GOT over multiple networks through multiple PLCs as well. Connection can be established to the GOT on the eighth network from the personal computer at a maximum. For details, refer to the following. ☞ Page 425 Maximum network system and networks that can be routed
Transferring data using a data storage	The package data, BootOS, or CoreOS is written/stored to the data storage such as a USB memory and an SD card installed to the personal computer. ☞ Page 445 Transferring data via a data storage Then, install the data storage to the GOT to use.  Use the utility to read the data from the GOT using the data storage.	

8.5.1 Transferred data and supported routes for data transfer

Available routes for data transfer differ depending on the type of the transferred data.

○: Available, —: Not available

Data type	Route for data transfer using communication		Using data storage
	Direct connection to the GOT	Connection via a PLC	
CoreOS	—	—	○
BootOS	Connection using a USB cable only	—	○
Package data	○	○	○
Project data (independent)	○	○	—
Resource data	○	○	—
Drive information Use status of each drive in the GOT	○	○	—

PART 4

8.6 Connecting a personal computer to the GOT

GT37 SoftGOT3000

This section explains the connection method between the personal computer and the GOT when data is transferred using communication.

Supported route for data transfer	
Connecting a personal computer and the GOT directly	Connect the personal computer to the GOT directly via USB or Ethernet to establish communication.  ☞ Page 421 Connection using a USB cable ☞ Page 422 Connection using an Ethernet cable
Connection via a PLC	The personal computer communicates with the GOT via a PLC that is connected to the same Ethernet network, CC-Link IE TSN, or CC-Link IE Field Network as the GOT. When data is transferred by Ethernet, direct connection using an Ethernet cable and connection via a hub are available.  ☞ Page 431 Connection using an RS-232 cable ☞ Page 431 Connection using a USB cable ☞ Page 432 Direct connection using an Ethernet cable ☞ Page 433 Ethernet connection via a hub

For the route for data transfer supported by the transferred data, refer to the following.

☞ Page 419 Transferred data and supported routes for data transfer

When accessing a GOT in a remote area from the personal computer, you can perform the communication safely by using the VPN connection function.

☞ Page 671 Setting the VPN connection function of the GOT ([VPN Connection])

Precautions for the data transfer by Ethernet

■ Advance preparation for the data transfer

For the data transfer by Ethernet, configure the following settings to the GOT in advance to enable the communication by Ethernet.

- Writing of the system application (basic function and communication driver)
- Communication settings

For information on how to check the settings, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Advance notification for the writing of the package data

When the package data is written by Ethernet, set a rule in advance, such as notifying the operator of the change of the package data.

When the package data is changed without a notice, the operation of the GOT may be affected.

■ Securing a recovering method

Changing the communication settings when the project data is written may disable the communication with GT Designer3.

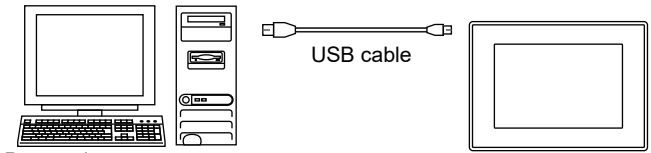
Save the data for recovering to the data storage or perform other methods, so that the GOT can recover.

8.6.1 Connecting a personal computer and the GOT directly

This section explains the data transfer by directly connecting the personal computer and the GOT with a cable.
The GOT can be connected to a personal computer directly using a USB cable or by Ethernet.
☞ Page 421 Connection using a USB cable
☞ Page 422 Connection using an Ethernet cable
To write package data to multiple GOTs in one go, connect a personal computer and the GOTs via Ethernet.

Connection using a USB cable

Connect the personal computer and the GOT directly using a USB cable.



The supported USB cables are as follows.

Cable type	Connector
USB cable	Personal computer⇔GOT USB Type-C⇔USB Type-C
	Personal computer⇔GOT USB Type-A⇔USB Type-C

Precautions

To transfer the data by connecting the personal computer and the GOT using a USB cable, do not set the resume function, suspending function, power saving function, or standby mode of the personal computer.
For details on resumption, suspension, power-saving, and standby settings, refer to the manual of the personal computer or Windows Help.
If the USB cable is removed or the GOT is reset or powered off/on, the communication may not be recovered from an error.
In this case, perform either of the following operations.

- Check if the personal computer recognizes a USB.

Check that [MITSUBISHI GOT3000 USB Controller] is displayed in [Universal Serial Bus Controllers] in Device Manager.

- Restart the GOT.

Remove the USB cable from the GOT and power off the GOT.
After the GOT is powered off, restart the GOT and connect a cable to communicate again.

Connection using an Ethernet cable

Connect the personal computer and the GOT using an Ethernet cable.

To connect by Ethernet, connect the personal computer and the GOT to the same network.

Data transfer to the second and subsequent GOTs connected through the first GOT is not supported.

When a single GOT and a single personal computer are directly connected using an Ethernet cable, they can be connected without setting the IP address.

This function is referred to as [Easy Connection].

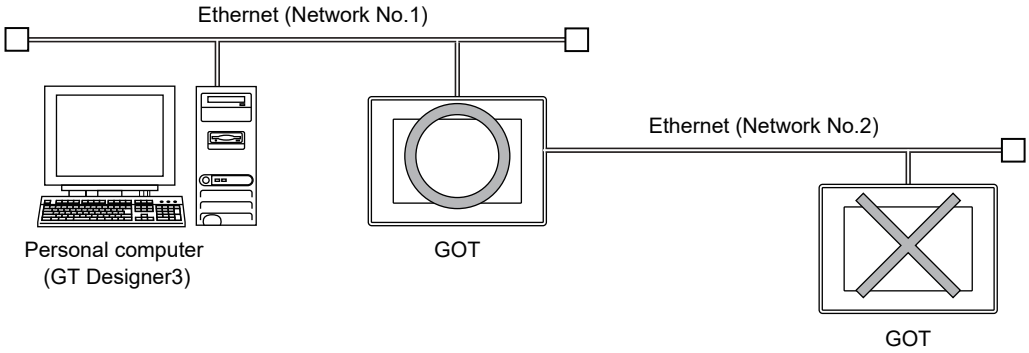
For details, refer to the following.

☞ Page 423 Easy connection

When accessing a GOT in a remote area from the personal computer, you can perform the communication safely by using the VPN connection function.

For the VPN connection function, refer to the following.

☞ Page 671 Setting the VPN connection function of the GOT ([VPN Connection])



The supported Ethernet cables are as follows.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The following values are set for the Ethernet settings including the IP address and subnet mask of the GOT as default settings at shipment.

- Ethernet standard port 1: 192.168.3.18
- Subnet mask: 255.255.255.0

If the personal computer can access the network group set in the GOT by default, reading/writing data from/to the GOT with the factory settings is available by connecting the personal computer to the GOT.

If there are multiple GOTs whose factory settings remain unchanged, a connection to the GOTs is not available due to IP address duplication.

Set different IP addresses.

■Easy connection

[Easy Connection] is a function that allows connection without setting the IP address when a single GOT and a single personal computer are directly connected using an Ethernet cable.

It can be used only when the built-in Ethernet port 1 of the GOT is used.

Even if built-in Ethernet port 1 is disabled ([0.0.0.0] is specified for the IP address), the easy connection is available.

To prevent unauthorized connections by prohibiting the use of the easy connection, close the port used for the easy connection.

The port open/close settings can be configured in [GOT Ethernet Common Setting].

☞ Page 717 [GOT Ethernet Common Setting]

Precautions

- When one of the following connection routes is used, easy connection is not available.

◇Connection using a hub

◇Connection to LAN line

- The easy connection is not available for the GOT for which the IP filter is set.
- When the settings of the personal computer or GOT meet one of the following conditions, the easy connection may not be available.

◇In the network connection setting of the personal computer, two or more Ethernet ports are enabled.

In this case, review the settings of the personal computer so that only the Ethernet port to be used for the easy connection is enabled and the other Ethernet ports are disabled.

◇In the IP address setting of the GOT, all bits corresponding to the zeros in the subnet mask of the personal computer are on or off.

◇In the IP address setting of the GOT, all bits corresponding to the host address of each class in the IP address of the personal computer are on or off.

- The easy connection does not support encrypted communication.

Even when the setting is configured to perform encrypted communication, data is communicated in plain text with the easy connection.

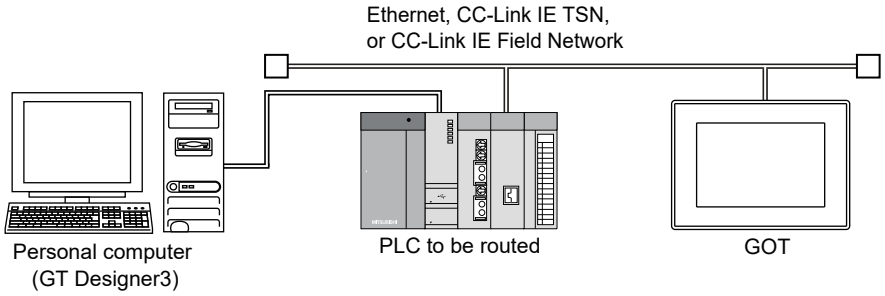
8.6.2 Connecting to the GOT via a PLC

The personal computer and the GOT are connected through a PLC that is connected to the same Ethernet network, CC-Link IE TSN, or CC-Link IE Field Network as the GOT.

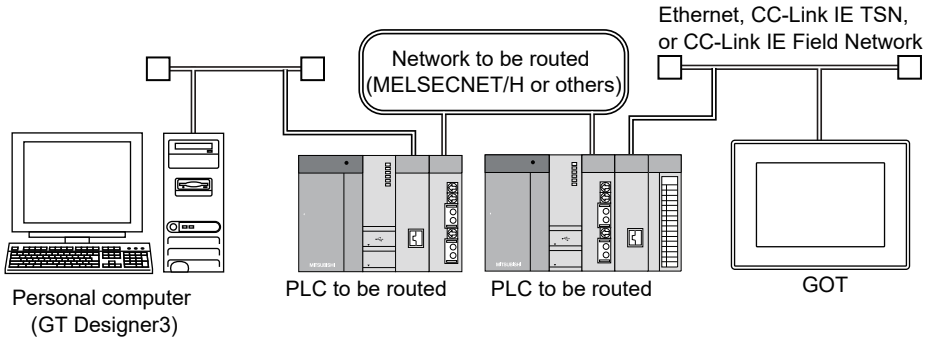
The personal computer can communicate with the GOT over multiple networks through multiple PLCs as well.

Communication with the GOT through a PLC requires routing parameter settings.

- Example of communication via a PLC



- Example of communication via the network



Precautions

■Transferring BootOS or CoreOS

BootOS and CoreOS cannot be transferred through data transfer via a PLC.

To install the BootOS to the GOT, connect the personal computer and the GOT using a USB cable or use the data storage.

To install CoreOS on the GOT, use a data storage.

☞ Page 421 Connection using a USB cable

☞ Page 448 Installing BootOS or CoreOS on the GOT

■Remote password of the PLC to be routed

When the remote password is set for the PLC to be routed, the setting must be canceled at the communication with the GOT.

When the dialog requiring you to enter the remote password appears, input the remote password of the PLC to be routed.

■Communication error when the PLC is not connected

If the GOT is not connected to a PLC with the connection setting to the PLC, the GOT fails to communicate with the PLC and retries the communication.

When the following operations are performed in GT Designer3 with this status, a communication error (error No. 8011000a) may occur.

- Writing package data
- Deleting the system application, the advanced application, the project data, and the resource data
- Drive format

For solutions, refer to the following.

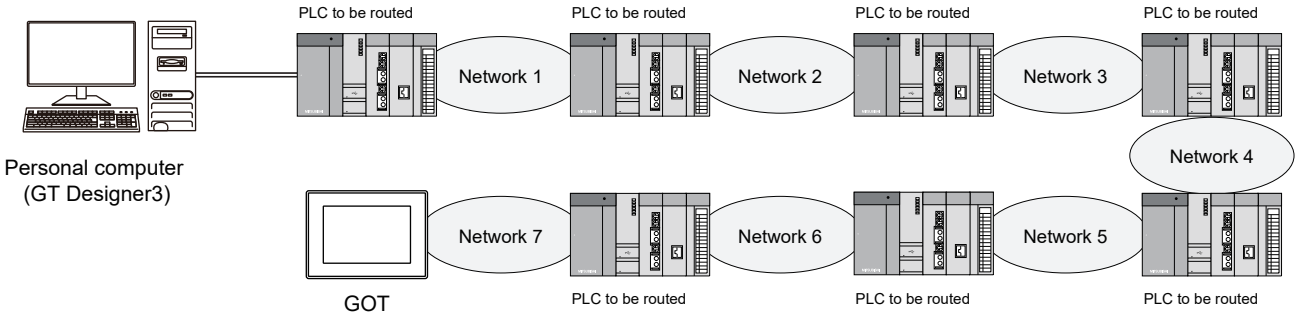
☞ Page 484 Troubleshooting

PLCs and networks to be routed

The following shows the maximum network system and connection types supported by PLCs to be routed when the personal computer and the GOT are connected via the PLCs.

■Maximum network system and networks that can be routed

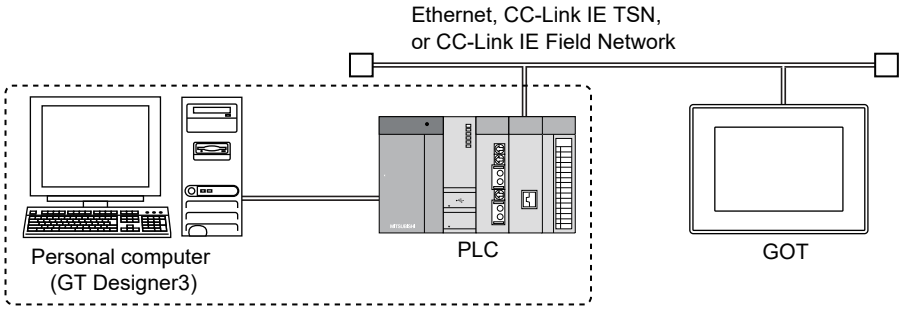
When the personal computer and the GOT are not directly connected but connected through PLCs, communication can be performed to the GOT on the eighth network (seven PLCs to be routed) from the personal computer at a maximum.



Route	Connection type
Personal computer - PLC	The following connection types are supported. • Connection using an RS-232 cable ☞ Page 431 Connection using an RS-232 cable • Connection using a USB cable ☞ Page 431 Connection using a USB cable • Ethernet connection ☞ Page 432 Direct connection using an Ethernet cable ☞ Page 433 Ethernet connection via a hub
	The supported connection types depend on the type of the PLC to be routed. For details, refer to the following. ☞ Page 426 Connection type between the personal computer and a PLC
Network 1 to 6	• MELSECNET/10 • MELSECNET/H • CC-Link IE TSN • CC-Link IE Controller Network • CC-Link IE Field Network • Ethernet
Network 7	• CC-Link IE TSN • CC-Link IE Field Network • Ethernet
	The supported networks depend on the type of the PLC to be routed. For details, refer to the following. ☞ Page 428 Connection type between a PLC and the GOT

■Connection type between the personal computer and a PLC

The following shows the applicable PLCs and the connection type between the personal computer and the PLC.



○: Available, —: Not available

Applicable PLC		Connection type between the personal computer and a PLC		
		Connection using an RS-232 cable	Connection using a USB cable	Connection using an Ethernet cable
MELSEC iQ-R series	R00CPU R01CPU R02CPU R04CPU R08CPU R16CPU R32CPU R120CPU	—	○	○
	R08PCPU R16PCPU R32PCPU R120PCPU	—	○	○
	R08SFCPU R16SFCPU R32SFCPU R120SFCPU	—	○	○

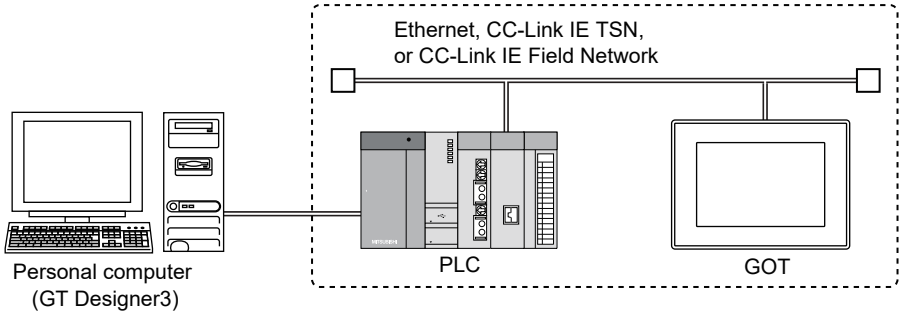
CC-Link IE Field Network head module	RJ72GF15-T2 LJ72GF15-T2	—	○	—

*1 Since the CPU has no Ethernet port, it cannot be connected with an Ethernet cable.
Use an Ethernet module and a hub to connect the CPU.
*2 Connect the CPU via a QCPU in the multiple CPU system.
*3 An adapter (L6ADP-R2 or L6ADP-R4) is required.
*4 Use port P1 and P2 of the network part. (The ports must be enabled for Ethernet connection.)
*5 Use the Ethernet module in the multiple CPU system.

■Connection type between a PLC and the GOT

The following shows the applicable PLCs and the connection type between the GOT and the PLC.



○: Available, —: Not available

Applicable PLC		Connection type between the GOT and a PLC			
		Ethernet connection		CC-Link IE TSN connection	CC-Link IE Field Network connection
		PLC side: Built-in Ethernet port	PLC side: Ethernet module		
MELSEC iQ-R series	R00CPU R01CPU R02CPU	○*6	○	○	○
	R04CPU R08CPU R16CPU R32CPU R120CPU	○*7	○	○	○

	Q12DCCPU-V Q24DHCCPU-V Q24DHCCPU-LS Q24DHCCPU-VG Q26DHCCPU-LS	—	○	—	○*4

Applicable PLC		Connection type between the GOT and a PLC			
		Ethernet connection		CC-Link IE TSN connection	CC-Link IE Field Network connection
		PLC side: Built-in Ethernet port	PLC side: Ethernet module		
MELSEC-L series	L02CPU L06CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT L02SCPU-P	—	○	—	○*5
CC-Link IE Field Network remote head module	RJ72GF15-T2 LJ72GF15-T2	—	—	—	○
CC-Link IE Field Network Ethernet adapter module	NZ2GF-ETB	—	—	—	○

*1 Use port P1 and P2 of the network part. (The ports must be enabled for Ethernet connection.)

*2 Use the Ethernet module in the multiple CPU system.

*3 For the conditions and settings to establish connection through the Ethernet port built in the QnUD(P)VCPU, refer to the following.
☞ Page 432 Settings required for connection through the built-in Ethernet port of the QnUD(P)VCPU

*4 For Q12DCCPU-V (Basic mode), the serial number must start with 12042 or later.
For Q12DCCPU-V (Extended mode), the serial number must start with 15102 or later.

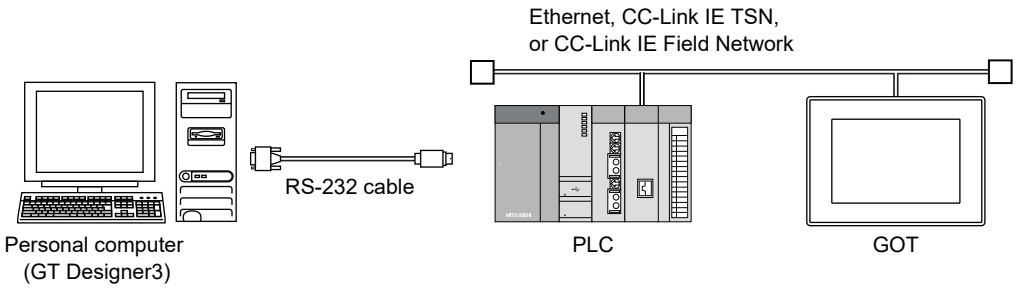
*5 Use a PLC CPU having a serial number starting with 13012 or later.
Use GT Works2 with version 1.50C or later.

*6 Use a PLC CPU with firmware version 08 or later.

*7 Use a PLC CPU with firmware version 40 or later.

Connection using an RS-232 cable

Connect the personal computer and a PLC with an RS-232 cable to communicate with the GOT via the PLC.



Use the following cable to connect a personal computer with a PLC.

PLC to be routed	Cable type	Cable model
MELSEC-Q series	RS-232 cable	GT01-C30R2-6P (3 m)
MELSEC-L series		

- For the PLCs connectable to the personal computer, refer to the following.

☞ Page 426 Connection type between the personal computer and a PLC

- For the connection type between a PLC and the GOT, refer to the following.

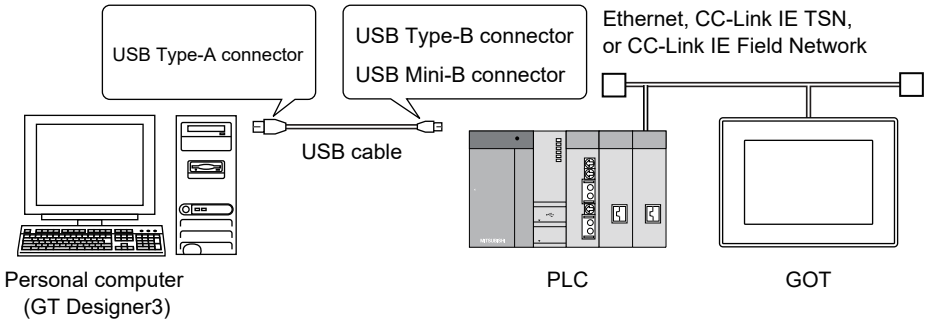
☞ Page 428 Connection type between a PLC and the GOT

- For the position of the RS-232 port of the PLC, refer to the following.

📖User's Manual of the PLC used

Connection using a USB cable

Connect the personal computer and a PLC with a USB cable to communicate with the GOT via the PLC.



Use the following cable to connect a personal computer with a PLC.

PLC to be routed		Cable type	Connector
MELSEC iQ-R series		USB cable	USB Type-A⇔USB Mini-B
MELSEC-Q series	High Performance model QCPU	USB cable	USB Type-A⇔USB Type-B
	Universal model QCPU	USB cable	USB Type-A⇔USB Mini-B
MELSEC-L series		USB cable	USB Type-A⇔USB Mini-B

- For the PLCs connectable to the personal computer, refer to the following.

☞ Page 426 Connection type between the personal computer and a PLC

- For the connection type between a PLC and the GOT, refer to the following.

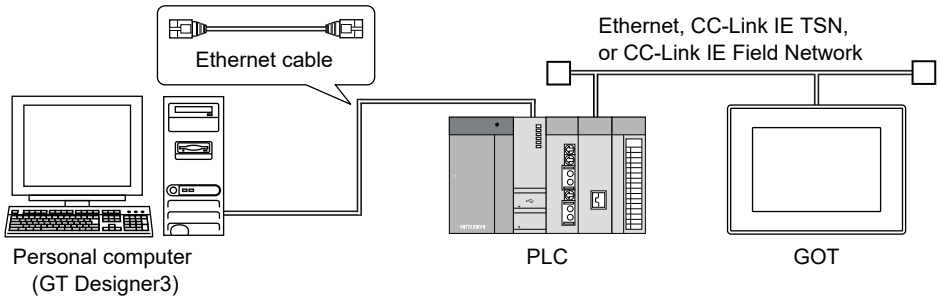
☞ Page 428 Connection type between a PLC and the GOT

- For the position of the USB port of the PLC, refer to the following.

📖User's Manual of the PLC used

Direct connection using an Ethernet cable

Connect the Ethernet port of the personal computer and the Ethernet port built in the PLC to be routed using an Ethernet cable.



Use the following cable to connect the personal computer and the PLC.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

- For the position of the Ethernet port of the PLC, refer to the following.

📖User's Manual of the PLC used

- For the PLCs connectable to the personal computer, refer to the following.

☞ Page 426 Connection type between the personal computer and a PLC

- For the connection type between a PLC and the GOT, refer to the following.

☞ Page 428 Connection type between a PLC and the GOT

- To establish connection through the Ethernet port built in the QnUD(P)VCPU, configure the MELSOFT connection extended setting.

☞ Page 432 Settings required for connection through the built-in Ethernet port of the QnUD(P)VCPU

- To establish connection through the Ethernet port built in the RCPU, enable communication based on the network number and station number.

☞ Page 432 Settings required for connection through the built-in Ethernet port of the RCPU

■Settings required for connection through the built-in Ethernet port of the QnUD(P)VCPU

Configure the settings on the PLC and GOT sides as shown below.

Required setting	Description	Requirements
PLC side setting	On GX Works2, configure the MELSOFT connection extended setting and write the parameter to the PLC. For the MELSOFT connection extended setting, refer to the following. 📖QnUCPU User's Manual (Communication via Built-in Ethernet Port)	Use the QnUD(P)VCPU and GX Works2 that satisfy the following requirements. • QnUD(P)VCPU: The serial number contains 17052 or later in the first 5 digits. • GX Works2: Version 1.535H or later
GOT side settings	In GT Designer3, register the QnUD(P)VCPU in [Connected Ethernet Controller Setting] and write the package data to the GOT. Set [Net No.], [Station], and [Port No.] as shown below. • [Net No.]: [Network No.] set in the MELSOFT connection extended setting on GX Works2 • [Station]: [Station No.] set in the MELSOFT connection extended setting on GX Works2 • [Port No.]: 5001 For [Connected Ethernet Controller Setting], refer to the following. ☞ Page 729 [Controller Setting]	-

■Settings required for connection through the built-in Ethernet port of the RCPU

Configure the settings on the PLC and GOT sides as shown below.

Required setting	Description	Requirements
PLC side setting	In GX Works3, set [Communications by Network No./Station No.] to [Enable], set the network number and station number, and then write the parameter to the PLC. For [Communications by Network No./Station No.], refer to the following. 📖MELSEC iQ-R Ethernet User's Manual (Application)	For the firmware version of the applicable RCPU, refer to the following. ☞ Page 425 PLCs and networks to be routed

Required setting	Description	Requirements
GOT side settings	In GT Designer3, register the RCPU in [Connected Ethernet Controller Setting] and write the package data to the GOT. Set [Net No.], [Station], and [Port No.] as shown below. • [Net No.]: [Network No.] set on GX Works3 • [Station No.]: [Station No.] set on GX Works3 • [Port No.]: 5001 For [Connected Ethernet Controller Setting], refer to the following. ☞ Page 729 [Controller Setting]	-

Ethernet connection via a hub

Use a hub to connect the personal computer and the PLC on the same Ethernet network, and communicate with the GOT via the PLC.

Connect the Ethernet cable for the PLC to the Ethernet port of the PLC or to the Ethernet interface module.

For the PLCs connectable to the personal computer, refer to the following.

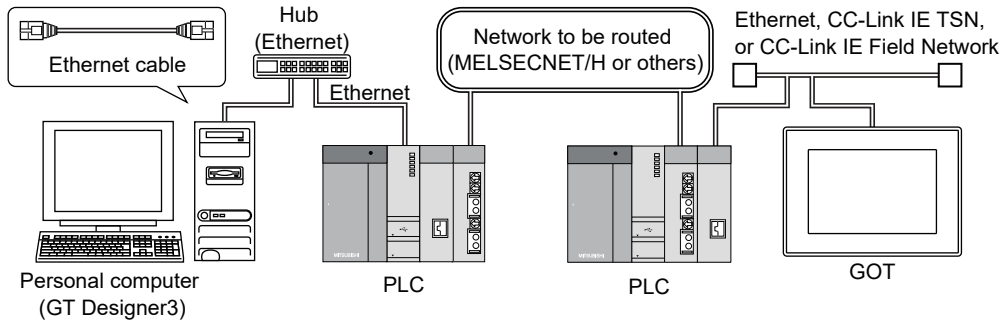
☞ Page 426 Connection type between the personal computer and a PLC

For the connection type between a PLC and the GOT, refer to the following.

☞ Page 428 Connection type between a PLC and the GOT

Ex.

Ethernet port of the PLC



The supported Ethernet cables are as follows.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

To establish connection through the Ethernet port built in the QnUD(P)VCPU, configure the MELSOFT connection extended setting.

☞ Page 432 Settings required for connection through the built-in Ethernet port of the QnUD(P)VCPU

To establish connection through the Ethernet port built in the RCPU, enable communication based on the network number and station number.

☞ Page 432 Settings required for connection through the built-in Ethernet port of the RCPU

Precautions

For transferring data to the GOT via an RCPU and RJ71EN71, the GOT is connectable to Ethernet ports (P1 and P2) of the RJ71EN71.

If you set the same network number for both Ethernet ports (P1 and P2) of the RJ71EN71, connect the GOT to Ethernet port P1.

An error occurs if all the following conditions are satisfied.

- Both Ethernet ports (P1 and P2) of the RJ71EN71 are in use.
- The same network number is set for both Ethernet ports (P1 and P2).
- The GOT (data transfer destination) is connected to Ethernet port P2 of the RJ71EN71.

8.7 Configuring the settings for communication between the personal computer and the GOT

After configuring connection between the personal computer and the GOT, configure communication between them.

1. Select [Common] → [Peripheral Setting] → [PC (Data Transfer)] from the menu to display the [PC (Data Transfer)] dialog.
2. Configure the settings in the [PC (Data Transfer)] dialog.

For the setting items, refer to the following.

☞ Page 450 [PC (Data Transfer)] dialog

3. Select [Communication] → [Communication Configuration] from the menu to display the [Communication Configuration] dialog.

The dialog can be displayed by clicking the [Communication Configuration] button in the [Communicate with GOT] dialog as well.

4. Configure the settings in the [Communication Configuration] dialog.

For the setting items, refer to the following.

☞ Page 451 [Communication Configuration] dialog

5. Click the [Test] button to check that the communication with the GOT can be normally performed.
6. Click the [OK] button.

The communication settings are saved.

Point

The [Communication Configuration] dialog appears when one of the following operations is performed.

- Select [Communication] → [Write to GOT] from the menu.
- Select [Communication] → [Read from GOT] from the menu.
- Select [Communication] → [Verify GOT] from the menu.

To display the [Communicate with GOT] dialog without displaying the [Communication Configuration] dialog, deselect [Display the dialog of [Communication Configuration] the next time as well] in the [Communication Configuration] dialog.

If this item is deselected, the [Communication Configuration] dialog and this item do not appear from the next time.

To display the [Communication Configuration] dialog again, select [Display the dialog of Communication Setting before displaying the dialog of Communicate with GOT/GOT Diagnostics] in the [Option] dialog.

8.8 Setting the data to be transferred (application selection)

GT37 SoftGOT3000

Before writing package data to the GOT, set the data to be included in the package data.
This function is referred to as [Application Selection].
The GOT automatically selects the system applications, communication drivers, and special data required for the project and incorporates them into the package data.
System applications, communication drivers, and special data for functions not set in the project are not incorporated into the package data automatically. Add the data manually if necessary.
Conversely, to reduce the size of the package data, you can set unnecessary functions to be excluded from the package data.
☞ Page 435 Specifications of the application setting
☞ Page 436 Setting applications used

PART 4

8.8.1 Specifications of the application setting

☞ Page 435 Writing data the user can select
☞ Page 435 Method to hold the data when the project is saved

Writing data the user can select

In [Application Selection], the following data can be set.
- System application (add-on function)
- Communication driver
- Special data

Method to hold the data when the project is saved

The information of the writing data which the user has selected manually is held in the project when the project is saved.
The method to hold the data depends on the saving format.

Saving format of project data	Method to hold transfer data	
	Manual selection status	System application
A single file format project (GTYS, G3)	Held	The data is saved to the package data with the project data. When the project is edited after the [Application Selection] dialog is closed and functions with a settable number limit are set exceeding the allowed limit, only the data for the number of settable functions is saved in the priority order of the automatic selection → manual selection. When the number of functions exceeds the limit only by the automatic selection, system applications up to the limit starting from the top in the tree are saved in the package data.
A single file format project (GTY)	Held	The data is not saved to the package data.

8.8.2 Setting applications used

Select the writing data by the following procedure.

1. Perform one of the following operations to display the [Application Selection] dialog.

- Select [Common] → [Application Selection] from the menu.
- Double-click [Application Selection] in the project tree.
- Click the [Application Selection] button in the [Write Option] dialog.

2. Switch the tab in the [Application Selection] dialog and select the data to be included in the package according to your purpose.

☞ Page 458 [Application Selection] dialog

3. Click the [OK] button.

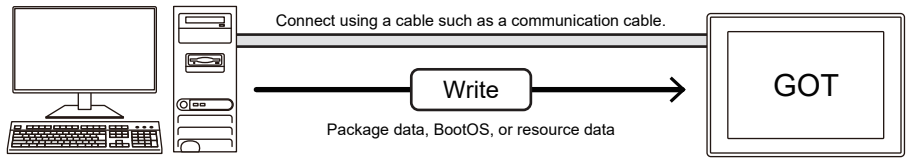
Settings of the applications used are saved in the project.

8.9 Writing data to the GOT

GT37 SoftGOT3000

The following shows the function for writing data to the GOT from the personal computer using communication.

☞ Page 437 Specifications of data writing
☞ Page 439 Writing data to a single GOT
☞ Page 440 Writing package data to multiple GOTs in a batch



Personal computer
(GT Designer3)

- For the settings and others required before writing data, refer to the following.

☞ Page 414 Setting procedure for using the data transfer function

- For the instruction on how to write data to the GOT using a data storage, refer to the following.

☞ Page 445 Transferring data via a data storage

To start up the package data from a data storage directly, use a data storage.

8.9.1 Specifications of data writing

The following shows the specifications of data writing to the GOT.

Individual writing and batch writing

There are two methods for writing data: one for writing to each GOT individually, and another for writing to multiple GOTs in a batch.

The following types of data can be written.

Writing method	Target data	Details
Individual writing	• BootOS • Package data • Resource data	The BootOS can be installed only when the personal computer and the GOT are directly connected by using a USB cable.
Batch writing	• Package data	GOTs directly connected via Ethernet are subject to batch writing. GOTs connected via a PLC do not support batch writing. Batch writing is not available for GOTs whose types differ from the one set in the project of the package data.

CoreOS can only be installed using a data storage.

☞ Page 445 Transferring data via a data storage

Package data write mode

The following two modes are available for writing package data to each GOT individually.

When writing package data to multiple GOTs in a batch, the mode is fixed to [Synchronized].

Mode	Description
Synchronized	When package data having the same package folder name or project ID as the package data in the GOT is written, only the different data is written. From the data in the GOT, system applications not used in the project data and project data are deleted. When package data having a different package folder name or project ID from the package data in the GOT is written, all the data in the GOT is deleted before the package data is written.
Select	Only the data selected in the package data tree in the [Write Option] dialog is written. When package data having a different package folder name or project ID from the package data in the GOT is written, all the data in the GOT is deleted before the package data is written.

Set the write mode in the [Write Option] dialog.

☞ Page 467 [Write Option] dialog

Operation related to the security mode

The following shows the operation of the data transfer function related to the security mode.

■When writing package data in security mode 2 to a GOT in security mode 1

When package data in security mode 2 is written to a GOT with project data in security mode 1 and without the operator management information file, the [Register New Operator] screen appears to prompt a new operator registration.

In this case, set an operator name and password and click the [OK] button.

The group of the registered operator is Administrators.

When the operator is registered, the security mode is changed to mode 2.

■When writing data to a GOT in security mode 2

When writing package data to a single GOT or performing batch writing to multiple GOTs, the behavior of operator authentication differs as follows when the security mode of the destination GOT is set to mode 2.

Writing method	Description
Writing to a single GOT	Operator authentication is performed when data is written. If operator authentication fails, a message is displayed and the writing process is canceled.
Batch writing to multiple GOTs	Authentication is performed using the operator authentication information set in the [Batch Write to multiple GOTs] dialog. Batch writing is available only for the GOTs for which operator authentication has been successful. If operator authentication fails, a write error occurs.

When the security mode of the destination GOT is mode 2, operator authentication works as follows.

- Operator authentication is performed when data is written.
- If operator authentication fails, a message is displayed and the writing process is canceled.

When installing BootOS or CoreOS, the operator to be authenticated must have the authority to install BootOS or CoreOS.

Encrypted communication

When the personal computer and GOT are directly connected by Ethernet, communication data can be encrypted when transferred.

To encrypt the communication, set [Encryption Communication Port No.] to open in the [GOT Ethernet Setting] window, and select [Perform encryption communication] in the [Communication Configuration] or [Batch Write to multiple GOTs] dialog.

☞ Page 717 [GOT Ethernet Common Setting]
☞ Page 451 [Communication Configuration] dialog
☞ Page 476 [Batch Write to multiple GOTs] dialog
☞ Page 3069 Encrypting communication data (Encrypted communication function)

File protection

To enhance the confidentiality of project data, you can set a password for project data with the file protection function.

To enable file protection, select [Information Protection Function] - [File Protection] tab in the [Environmental Setting] window, select [Use file protection function], and set a file protection password in the [Project Data Password Registration] dialog that appears when writing data.

☞ Page 3068 [File Protection]
☞ Page 451 [Communication Configuration] dialog

8.9.2 Writing data to a single GOT

This section explains how to write data to a single connected GOT using communication.
When installing the BootOS, connect to the GOT directly by USB connection.
For functions that require upgrading BootOS and CoreOS versions, refer to the following.
☞ Page 3732 Functions that require upgrading the versions of BootOS and CoreOS
For the writable data, refer to the following.
☞ Page 410 Types of the data that can be transferred
For project data where the file protection function is enabled but not started, differential writing of the package data cannot be performed.
Write data by the following procedure.

1. Perform either of the following operations.

Data to be written	Operation
Package data	Perform either of the following operations. • Open the project data (GTY) to be written and select [Communication] → [Write to GOT] from the menu. • In the [MELSOFT GT Designer3] dialog displayed when the package data (GTYS) is opened, click the [Write to GOT without opening] button.
BootOS Resource data	Select [Communication] → [Write to GOT] from the menu.

Depending on the setting, the displayed dialog differs as follows.

Displayed dialog	Next step
[Communication Configuration] dialog	Proceed to Step 2.
[Communicate with GOT] dialog	Proceed to Step 4.
[Project Data Password Registration] dialog	Displayed when the file protection function is enabled. Set a file protection password as necessary. Proceed to Step 4.

2. Configure settings in the [Communication Configuration] dialog.
For the setting items, refer to the following.
☞ Page 451 [Communication Configuration] dialog

3. Click the [OK] button in the [Communication Configuration] dialog.
When the file protection function is enabled, the [Project Data Password Registration] dialog appears. Set a file protection password as necessary.
The [Communicate with GOT] dialog appears.

4. Click the [GOT Write] tab in the [Communicate with GOT] dialog and configure settings.
For the setting items, refer to the following.
☞ Page 465 [GOT Write] tab

5. Check the size of the data to be transferred with [Data Size], and make sure that the destination drive has enough free space for storing the data.
For the storage destination of each data, refer to the following.
☞ Page 415 Transferred data and GOT storage destination

6. Click the [GOT Write] button.
If data transfer security has been set for the destination GOT, the dialog for entering the data transfer password appears.
Enter the data transfer password.
The data is written to the GOT.
For resource data, the [Resource Data Write Result] dialog appears after it is written.
☞ Page 471 [Resource Data Write Result] dialog

Precautions

• If the writing of the package data is canceled during the process, the data in the GOT may become corrupt.
In this case, write the package data again.

• A large number of folders or files in the data storage may decrease file access performance, resulting in a much longer communication time than usual or a communication timeout.

Reduce the number of folders or files in the data storage as necessary.

8.9.3 Writing package data to multiple GOTs in a batch

You can write the same package data to multiple GOTs connected via Ethernet in a batch.

Batch writing is not available for GOTs connected via a PLC.

When sharing projects between multiple GOTs, project data can be updated efficiently.

Perform the following operation to write package data to multiple GOTs in a batch.

1. Perform either of the following operations to display the [Batch Write to multiple GOTs] dialog.

• Open the project data (GTY) to be written and select [Communication] → [Batch Write to multiple GOTs] from the menu. In the [MELSOFT GT Designer3] dialog displayed when the package data (GTYS) is opened, click the [Batch Write to multiple GOTs without opening] button.

When the file protection function is enabled, the [Project Data Password Registration] dialog appears. Set a file protection password as necessary.

2. Configure each setting in the [Batch Write to multiple GOTs] dialog, and click the [OK] button.

For the setting items, refer to the following.

☞ Page 476 [Batch Write to multiple GOTs] dialog

3. Click the [GOT Write] button.

Package data writing starts and the [Communication Status] dialog appears.

The confirmation dialog before writing is not displayed.

When the writing is completed, the write result is displayed in the [Communication Status] dialog.

☞ Page 480 [Communication Status] dialog

Precautions

• When writing package data to multiple GOTs in a batch, the write mode is fixed to [Synchronize].

• Batch writing cannot be performed on GOTs that do not match the type set in the package data to be written.

• The following settings cannot be written to multiple GOTs in a batch.

If package data reflecting these setting changes is written to GOTs, differences will be detected during verification.

Data excluded from batch writing	Reference for details
Setting for [GOT ID] in the [GOT Setup] window	☞ Page 623 [GOT ID]
Settings in the [I/F Communication Setting] dialog	☞ Page 774 [I/F Communication Setting] dialog
Settings in the [GOT Ethernet Setting] window	☞ Page 713 Setting the GOT Ethernet interface ([GOT Ethernet Setting])
Individual identification information such as the GOT IP address and the GOT station number	☞ Page 251 Verification items for data check

• Since individual identification information and the settings of the connected device are not transferred, communication may fail if package data containing these setting changes is transferred.

• If the writing of the package data is canceled during the process, the data in the GOT may become corrupted.

In this case, write the package data again.

• The settings in the [Batch Write to multiple GOTs] dialog opened using the [Batch Write to multiple GOTs without opening] button are not retained.

• A large number of folders or files in the data storage may decrease file access performance, resulting in a much longer communication time than usual or a communication timeout.

Reduce the number of folders or files in the data storage as necessary.

• When the project data is encrypted by registering a project password, the following cases result in a write error.

◇The package data to be written is not encrypted, and the project data in the destination GOT is encrypted.

◇The package data to be written is encrypted, and the project data in the destination GOT is not encrypted.

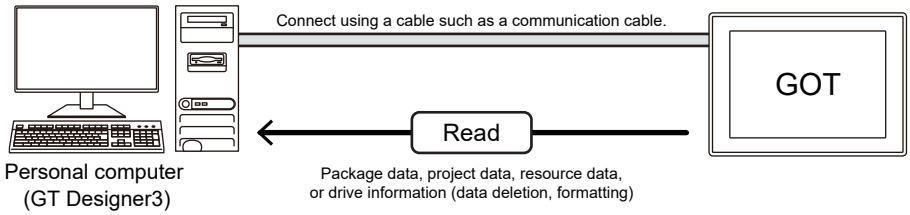
◇Both the package data to be written and the project data in the destination GOT are encrypted, but the passwords used for encryption are different.

8.10 Reading the data from the GOT

GT37 SoftGOT3000

The following shows the function for reading data from the GOT to the personal computer using communication.
The read function contains functions such as acquiring the folder structure or file information in the GOT drive to delete the project data or resource data in the drive and formatting the data storage in the GOT.

☞ Page 441 Specifications of data reading
☞ Page 442 Reading the data from the GOT



- For the settings and others required before reading data, refer to the following.

☞ Page 414 Setting procedure for using the data transfer function

8.10.1 Specifications of data reading

The following shows the specifications of data reading from the GOT.

Reading data and reading methods

Depending on the data read from the GOT, the reading method differs, such as storing it in a folder in the personal computer and opening it in GT Designer3. The following table lists the available reading method for each data.

Reading data	Reading methods
Package data	Storing the data in a folder in the personal computer
Project data	Storing the data in a folder in the personal computer Reading the data to GT Designer3 to open
Resource data	Storing the data in a folder in the personal computer
Drive information	Displaying the drive information in the [GOT Read] dialog of GT Designer3 Data in a drive in the GOT can be deleted or formatted.

Operation related to the security mode

When the security mode of the read source GOT is mode 2, operator authentication is performed when data is read.

Encrypted communication

When the personal computer and GOT are directly connected by Ethernet, communication data can be encrypted when transferred.
To encrypt the communication, open [Encryption Communication Port No.] in the [GOT Ethernet Setting] window and select [Perform encryption communication] in the [Communication Configuration] dialog.

☞ Page 717 [GOT Ethernet Common Setting]
☞ Page 451 [Communication Configuration] dialog

8.10.2 Reading the data from the GOT

Project or package data where the file protection function is enabled but not started cannot be read.
Read data by the following procedure.

1. Select [Communication] → [Read from GOT] from the menu.

If the [Communication Configuration] dialog appears, proceed to Step 2.
If the [Communicate with GOT] dialog appears, perform the operation from Step 4.

2. Configure settings in the [Communication Configuration] dialog.

For the setting items, refer to the following.
☞ Page 451 [Communication Configuration] dialog

3. Click the [OK] button in the [Communication Configuration] dialog.

The [Communicate with GOT] dialog appears.

4. Click the [GOT Read] tab in the [Communicate with GOT] dialog and configure settings.

For the setting items, refer to the following.
☞ Page 472 [GOT Read] tab

5. To read package data, project data, or resource data, click the [GOT Read] button.

- When data transfer security is set for the connected GOT

The dialog for entering the data transfer password appears. Enter the data transfer password.

- When a file protection password is set for the project data to be read

The dialog for entering the password appears. Enter the file protection password.

- When project security is set for the project data to be read

The user authentication dialog appears. Enter the user name and password.
The data is read from the GOT.

Precautions

- If the GOT type of the GOT from which data is read is not supported and the system version of GT Designer3 is earlier than that of the project to be read from the GOT, the data cannot be read as project data to GT Designer3.

In such a case, read it after changing [Read Data] in the [GOT Read] tab to [Package Data].

- When the project data is saved to the personal computer directly at the reading from the GOT, the project data is not the target to search for the utilize data.

When the utilize data is used, open the project in GT Designer3 and save the project again after reading.

- A large number of folders or files in the data storage may decrease file access performance, resulting in a much longer communication time than usual or a communication timeout.

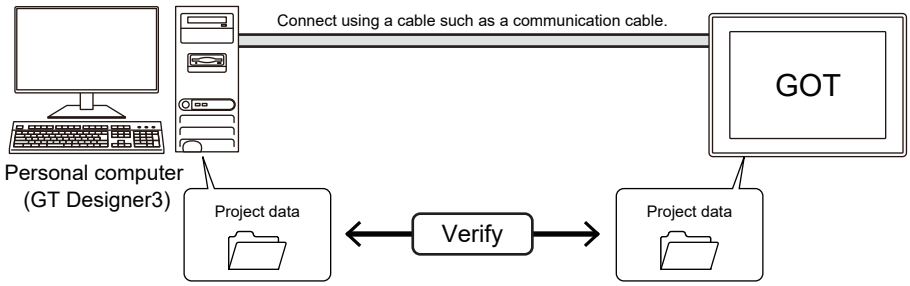
Reduce the number of folders or files in the data storage as necessary.

8.11 Verifying with the project data in the GOT

GT37 SoftGOT3000

You can verify the project data currently being edited in GT Designer3 with the project data written to the connected GOT to check the difference information.

☞ Page 443 Specification of verification
☞ Page 444 Verifying with the project data in the GOT



- For the settings and others required before verifying data, refer to the following.

☞ Page 414 Setting procedure for using the data transfer function

- For verification of the project data being edited in GT Designer3 and other project data saved in the personal computer, refer to the following.

☞ Page 245 Verifying a project

8.11.1 Specification of verification

The following shows the specifications of verification with the project data in the connected GOT.

Data verification method

Verify the data by either of the following methods.

Verification method	Description
Data check	The data is verified by setting.
Time stamp check	The data is verified by time stamps of files.

Operation related to the security mode

When the security mode of the connected GOT is mode 2, operator authentication is performed when data is verified.

Encrypted communication

When the personal computer and GOT are directly connected by Ethernet, communication data can be encrypted when transferred.

To encrypt the communication, open [Encryption Communication Port No.] in the [GOT Ethernet Setting] window and select [Perform encryption communication] in the [Communication Configuration] dialog.

☞ Page 717 [GOT Ethernet Common Setting]
☞ Page 451 [Communication Configuration] dialog

8.11.2 Verifying with the project data in the GOT

Project data where the file protection function is enabled but not started cannot be verified.

Verify with the project data in the GOT by the following procedure.

1. Open the project data in GT Designer3 and select [Communication] → [Verify GOT] from the menu.

If the [Communication Configuration] dialog appears, proceed to Step 2.

If the [Communicate with GOT] dialog appears, perform the operation from Step 4.

2. Configure settings in the [Communication Configuration] dialog.

For the setting items, refer to the following.

☞ Page 451 [Communication Configuration] dialog

3. Click the [OK] button in the [Communication Configuration] dialog.

The [Communicate with GOT] dialog appears.

4. Click the [GOT Verification] tab in the [Communicate with GOT] dialog and configure settings.

For the setting items, refer to the following.

☞ Page 475 [GOT Verification] tab

5. Click the [GOT Verification] button.

• When data transfer security is set for the connected GOT

The dialog for entering the data transfer password appears. Enter the data transfer password.

• When a file protection password is set for the project data to be verified

The dialog for entering the password appears. Enter the file protection password.

• When project security is set for the project data in the GOT to be verified

The user authentication dialog appears. Enter the user name and password.

Data is verified.

When the verification is completed, the verification results are shown in the [Verify Result] dialog.

☞ Page 261 [Verify Result] dialog

8.12 Transferring data via a data storage

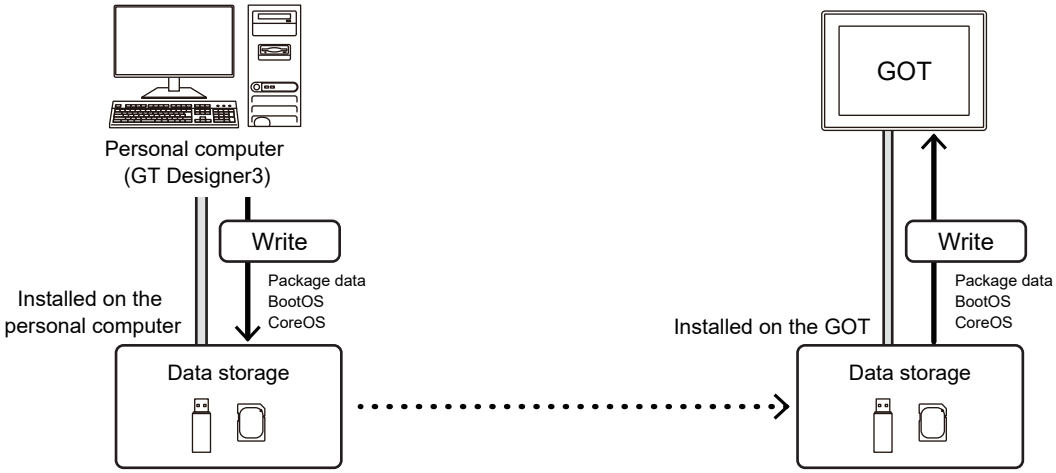
GT37 SoftGOT3000

You can copy data such as package data, BootOS, and CoreOS to a data storage such as an SD card and USB memory from the personal computer once, and then write/install the data from the data storage to the GOT.

☞ Page 446 Transferring the package data to the GOT

☞ Page 448 Installing BootOS or CoreOS on the GOT

When configuring settings for writing package data to a data storage, you can specify whether to write the package data in the data storage to the GOT or let the GOT use the package data stored in the data storage as is.



For the available data storage, refer to the following Technical Bulletin.

List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)

For functions that require upgrading BootOS and CoreOS versions, refer to the following.

☞ Page 3732 Functions that require upgrading the versions of BootOS and CoreOS

8.12.1 Transferring the package data to the GOT

Transfer the package data from the personal computer to the GOT using a data storage by either of the following methods.

Operation	Description
☞ Page 446 Writing a package data into the GOT	Use this method to start up the package data from the built-in flash memory of the GOT.
☞ Page 447 Starting up the package data from a data storage	Use this method to start up the package data directly from a data storage instead of the built-in flash memory of the GOT. Preparing multiple data storages in which different projects are written allows you to switch projects by replacing the data storage.

Before writing the package data, check the data size of the package data to be transferred and the available space of the destination drive.

For how to check the available space of the destination drive, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

When the package data is transferred to the GOT via a data storage, it is verified against the package data already written to the GOT. Only the differing data is written.

The data in the GOT which is not related to the package is deleted.

Set the data to be included in the package data in advance as necessary.

☞ Page 435 Setting the data to be transferred (application selection)

Writing a package data into the GOT

The following shows the procedure for writing package data to the GOT using a data storage.

1. Install a data storage to the personal computer.

2. Start GT Designer3 and open the project data to be written.

3. Select [Communication] → [Write to Memory Card] from the menu.

When the file protection function is enabled, the [Project Data Password Registration] dialog appears. Set a file protection password as necessary.

The [Communicate with Memory Card] dialog appears.

☞ Page 482 [Communicate with Memory Card] dialog

4. Click the [Package Data Write] tab and configure settings.

At this time, set the following items without fail.

Setting item	Description
[Destination Memory Card]	Select the drive name of the data storage to which the package data is written.
[GOT Startup Method]	Select [Start after installing on the specific drive].
[Install Destination Drive]	Select the destination drive of the GOT to which the data is written.

5. Click the [Memory Card Write] button.

6. After the data is written to the data storage, remove the data storage from the personal computer.

7. Install the data storage that has been removed from the personal computer to the GOT.

For information on how to install each data storage, refer to the following.

📖GOT3000 Series User's Manual (Hardware)

8. While pressing the S.MODE switch, power on the GOT.

The package data is written to the GOT.

9. After the package data is written, touch the screen to restart the GOT.

Starting up the package data from a data storage

Start up the GOT from a data storage instead of the built-in flash memory of the GOT by the following procedure.

1. Install a data storage to the personal computer.
2. Start GT Designer3 and open the project data to be written.
3. Select [Communication] → [Write to Memory Card] from the menu.

When the file protection function is enabled, the [Project Data Password Registration] dialog appears. Set a file protection password as necessary.

The [Communicate with Memory Card] dialog appears.

☞ Page 482 [Communicate with Memory Card] dialog

4. Click the [Package Data Write] tab and configure settings.

At this time, set the following items.

Setting item	Description
[Destination Memory Card]	Select the drive name of the data storage to which the package data is written.
[GOT Startup Method]	Select [Directly from the memory card].

5. Click the [Memory Card Write] button.
6. After the data is written to the data storage, remove the data storage from the personal computer.
7. Install the data storage that has been removed from the personal computer to the GOT.

For information on how to install each data storage, refer to the following.

GOT3000 Series User's Manual (Hardware)

8. Power on the GOT.

8.12.2 Installing BootOS or CoreOS on the GOT

Use a data storage to install BootOS or CoreOS on the GOT.
For functions that require upgrading BootOS and CoreOS versions, refer to the following.
☞ Page 3732 Functions that require upgrading the versions of BootOS and CoreOS
When the security mode of the GOT is mode 2, authentication is performed by the operator authentication function. If the authentication succeeds and the operator has the authority to install BootOS and CoreOS, the data can be installed on the GOT.
Even when the security mode of the GOT is mode 2, operator authentication is not performed if CoreOS is installed with the setting to delete package data on drive C.
Before installing BootOS or CoreOS, check the data size of Boot OS or CoreOS and the available space of the data storage.

Installing BootOS to the GOT

The following shows the procedure for installing BootOS to the GOT.

1. Install the data storage to the personal computer, and start GT Designer3.
2. Select [Communication] → [Write to Memory Card] from the menu.

The [Communicate with Memory Card] dialog appears.
☞ Page 482 [Communicate with Memory Card] dialog

3. In the [BootOS/CoreOS Write] tab, select [BootOS] for [Write Data], and configure other settings as needed.
4. Click the [Memory Card Write] button.

The data is written to the data storage.

5. After the data is written to the data storage, remove the data storage from the personal computer.
6. Install the data storage that has been removed from the personal computer to the GOT.

For information on how to install each data storage, refer to the following.
GOT3000 Series User's Manual (Hardware)

7. While pressing the S.MODE switch, power on the GOT.

BootOS is installed on the GOT.

8. When the BootOS installation is complete, power off the GOT.
9. Remove the data storage from the GOT.
10. Power the GOT back on and install the required package data on the GOT.

If the installation process fails, the recovery function returns BootOS to the factory state.
If an error occurs at the recovery, contact the manufacturer for repair.

Installing CoreOS on the GOT

When CoreOS is installed, BootOS is also installed at the same time.
CoreOS can only be installed on the standard SD card (drive A of the GOT).
The following shows the procedure for installing CoreOS on the GOT.

1. Insert the SD card into the personal computer and start GT Designer3.
2. Select [Communication] → [Write to Memory Card] from the menu.

The [Communicate with Memory Card] dialog appears.
☞ Page 482 [Communicate with Memory Card] dialog

3. In the [BootOS/CoreOS Write] tab, select [CoreOS] for [Write Data], and configure other settings as needed.
4. Click the [Memory Card Write] button.

The data is installed on the SD card.

5. When the installation on the SD card is complete, remove the SD card from the personal computer.

6. Insert the SD card removed from the personal computer into the GOT.

For information on how to insert an SD card, refer to the following.

GOT3000 Series User's Manual (Hardware)

7. Power on the GOT.

A confirmation message for installing CoreOS appears.

8. To install CoreOS, touch the screen for two seconds or longer.

To abort the CoreOS installation, power off the GOT.

When the CoreOS installation is complete, a completion message appears.

9. Remove the SD card from the GOT.

10. Touch the screen to restart the GOT.

11. Install the required package data on the GOT.

If the installation processing fails, BootOS and CoreOS are reset to the factory defaults by the recovery function.

If an error occurs at the recovery, contact the manufacturer for repair.

8.13 Setting dialogs related to data transfer

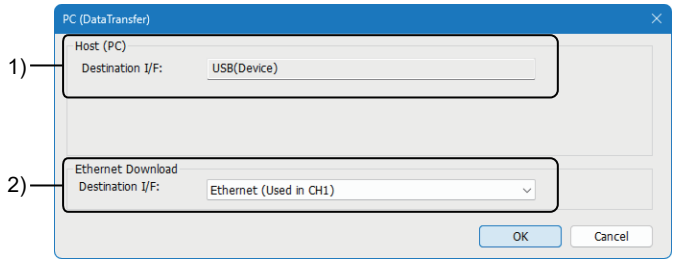
GT37 SoftGOT3000

☞ Page 450 [PC (Data Transfer)] dialog
☞ Page 451 [Communication Configuration] dialog
☞ Page 458 [Application Selection] dialog
☞ Page 465 [Communicate with GOT] dialog
☞ Page 476 [Batch Write to multiple GOTs] dialog
☞ Page 482 [Communicate with Memory Card] dialog

8.13.1 [PC (Data Transfer)] dialog

Set the communication interface to be used for the data transfer between the personal computer and the GOT.

This dialog can be displayed by selecting [Common] → [Peripheral Setting] → [PC (Data Transfer)] from the menu.



Item			Description
1)	[Host (PC)]	[Destination I/F]	A connection destination interface for direct connection using a USB cable.
2)	[Ethernet Download]	[Destination I/F]	A connection destination interface for connection via Ethernet. Set the connection destination interface for Ethernet download. • [Ethernet] Connects to the Ethernet interface of the GOT. If it is already used for another setting, the channel that uses it is also displayed. • [Not connected] Does not use an Ethernet interface of the GOT.

8.13.2 [Communication Configuration] dialog

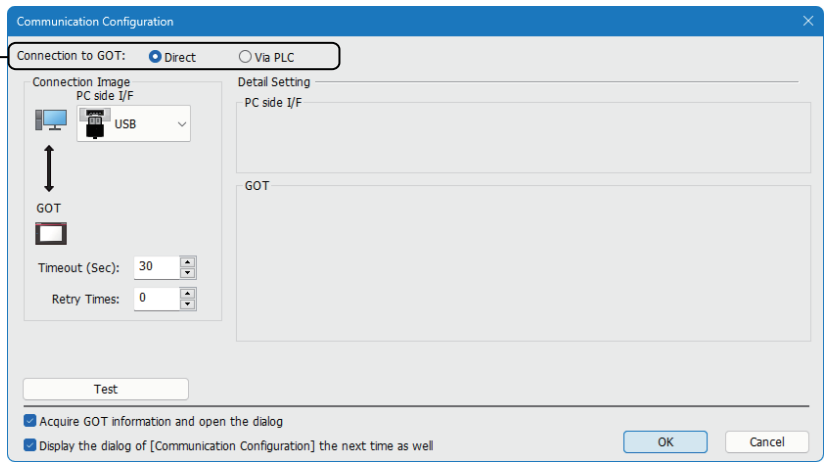
Configure the settings for communication between the personal computer and the GOT such as connection method and connection interface between the personal computer and the GOT.

This dialog can be displayed by selecting [Communication] → [Communication Configuration] from the menu.

The settings differ according to the connection method of the personal computer and the GOT.

Connection method	Setting
Connecting the personal computer to GOT directly	Select [Direct] for [Connection to GOT] in the [Communication Configuration] dialog. ☞ Page 452 Connecting to the GOT directly
Connecting the personal computer to the GOT via a PLC	Select [Via PLC] for [Connection to GOT] in the [Communication Configuration] dialog. ☞ Page 454 Connecting to the GOT via a PLC

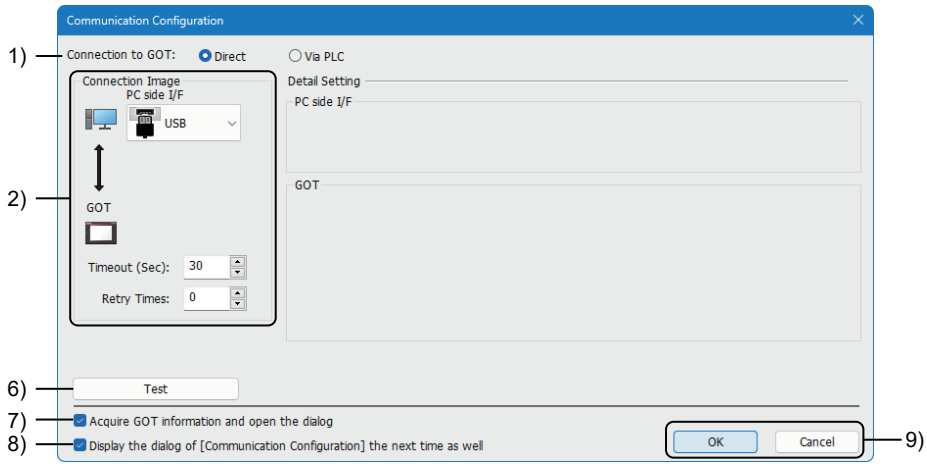
[Connection to GOT]



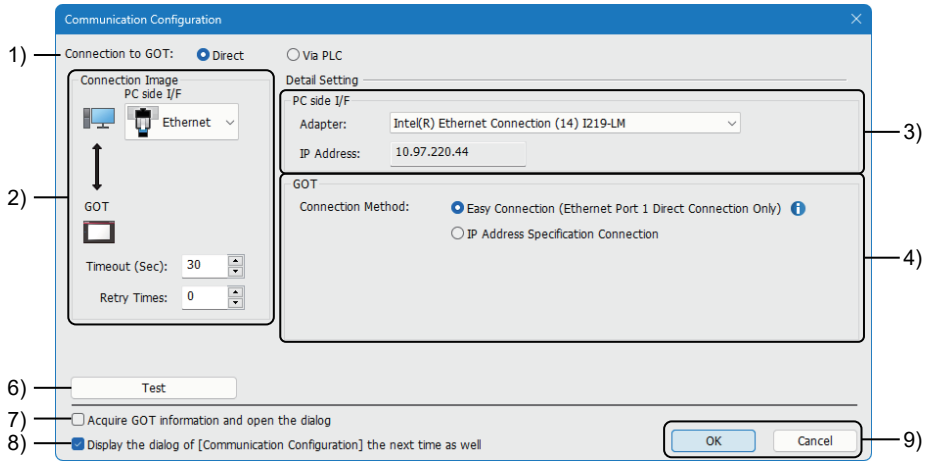
Connecting to the GOT directly

The following shows the setting windows for directly connecting the personal computer to the GOT via USB or Ethernet. The setting items differ depending on the selection for [PC side I/F] in [Connection Image] in the [Communication Configuration] dialog.

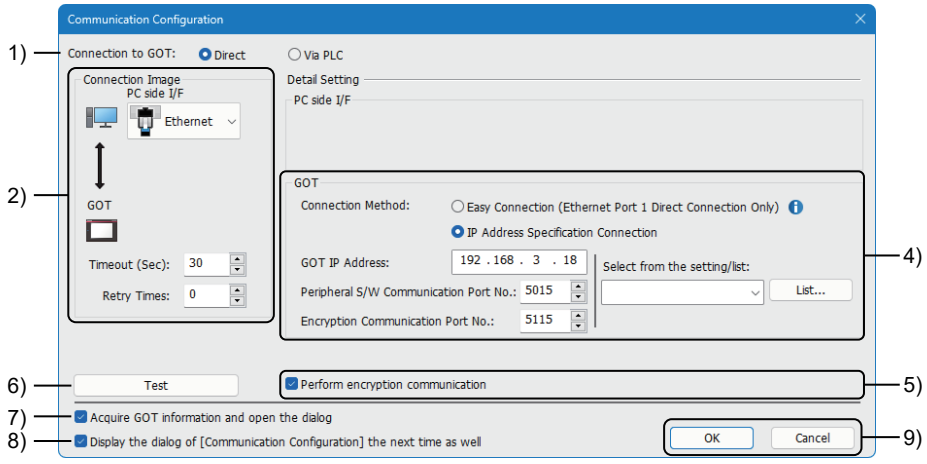
- When [USB] is selected



- When [Ethernet] is selected (easy connection to the GOT)



- When [Ethernet] is selected (specifying the GOT with the IP address)



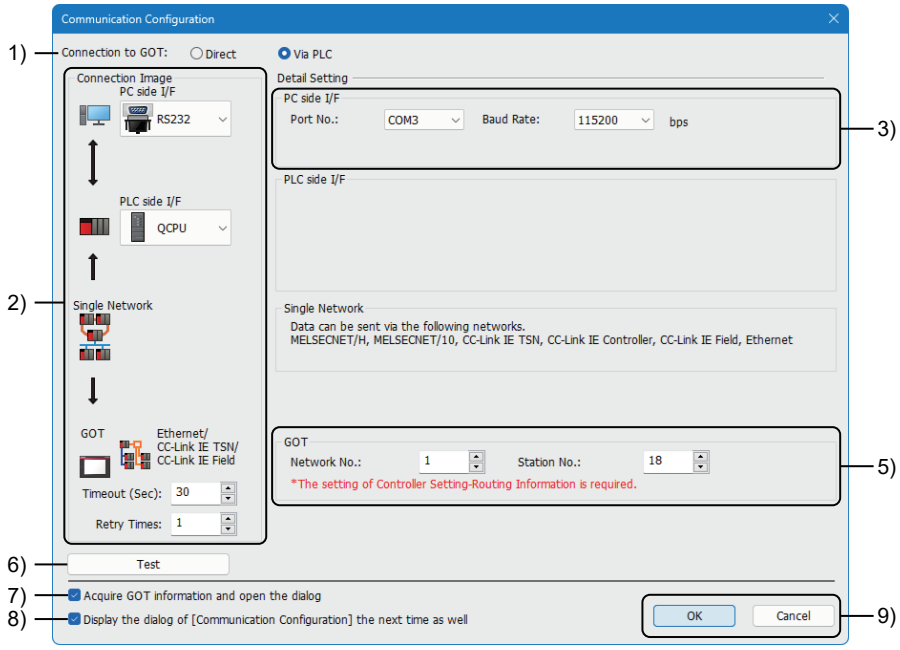
Item			Description
1)	[Connection to GOT]		Select the connection method of the personal computer and the GOT. When connecting to the GOT directly, select [Direct].
2)	[Connection Image]	-	Set the interface to be used for the connection between the personal computer and the GOT.
		[PC side I/F]	Select the type of the interface of the personal computer.
		[Timeout (Sec)]	Set the time period for the communication between the personal computer and the GOT to time out. The setting range is [1] to [9999] seconds. Setting a value of less than [30] seconds may result in a communication error. Set the value to [30] seconds or more.
		[Retry Times]	Set the number of retries to be performed when a communication error occurs. The setting range is [0] time to [5] times.
3)	[PC side I/F]	-	Set the adapter used in the personal computer and the IP address when [Ethernet] is selected for [PC side I/F] and [Easy Connection] is selected for [Connection Method] of [GOT].
		[Adapter]	Select the Ethernet adapter of the personal computer. If acquisition of the information has failed, [Not specified] is displayed. In this case, check the connection status with the Ethernet adapter.
		[IP Address]	The IP address assigned to the adapter selected in [Adapter] is displayed.
4)	[GOT]	[Connection Method]	Set this item when [Ethernet] is selected for [PC side I/F]. If you select [IP Address Specification Connection], set the following items. Set [GOT IP Address] and [Peripheral S/W Communication Port No.] manually, or select information from the registered GOT information.
		[GOT IP Address]	Set the IP address of the GOT. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
		[Peripheral S/W Communication Port No.]	Set the port number used for the communication with GT Designer3. Enter the port number set in [Peripheral S/W Communication Port No.] in [GOT Ethernet Common Setting].
		[Encryption Communication Port No.]	Specify the port number used for the encrypted communication between GT Designer3 and the GOT. Enter the port number set in [Encryption Communication Port No.] in [GOT Ethernet Common Setting].
		[Select from setting/list]	Select the information of the connected GOT from the registered GOT information. [Project] in the list displays the GOT IP address of each tab in [GOT IP Address Setting] in the [GOT Ethernet Setting] window. [GOT Setting List] displays the GOT IP address set in the [GOT Setting List] dialog displayed by clicking the [View] button.
		[List] button	Opens the [GOT Setting List] dialog. Set GOT names and IP addresses to be options of [Select from the setting/list]. ☞ Page 624 [GOT Setting List] dialog
5)	[Perform encryption communication]		Set this item when [Ethernet] is selected for [PC side I/F] and [IP Address Specification Connection] is selected for [Connection Method]. Select it when GT Designer3 and GOT perform encrypted communication. If it is not selected, all data including security information is communicated in plain text.
6)	[Test] button		Executes a communication test between the personal computer and the GOT.
7)	[Acquire GOT information and open the dialog]		Select this item to display the [Communicate with GOT] dialog after acquiring the GOT identification information from the GOT. For details on the GOT identification information, refer to the following. ☞ Page 620 Setting the identification information to the GOT ([GOT ID])
8)	[Display the dialog of [Communication Configuration] the next time as well]		Select this item to display the [Communication Configuration] dialog before the [Communicate with GOT] dialog appears. If this item is deselected, the [Communication Configuration] dialog and this item do not appear from the next time. To display the [Communication Configuration] dialog again, select [Display the dialog of Communication Setting before displaying the dialog of Communicate with GOT/GOT Diagnostics] in the [Operation] tab of the [Option] dialog. ☞ Page 197 [Options] dialog ([Operation] tab)
9)	[OK] button		Applies the changed settings. The settings are not applied without clicking the [OK] button. The saved settings are held until next time they are changed.
	[Cancel] button		Discards the changed settings and closes the [Communication Configuration] dialog.

Connecting to the GOT via a PLC

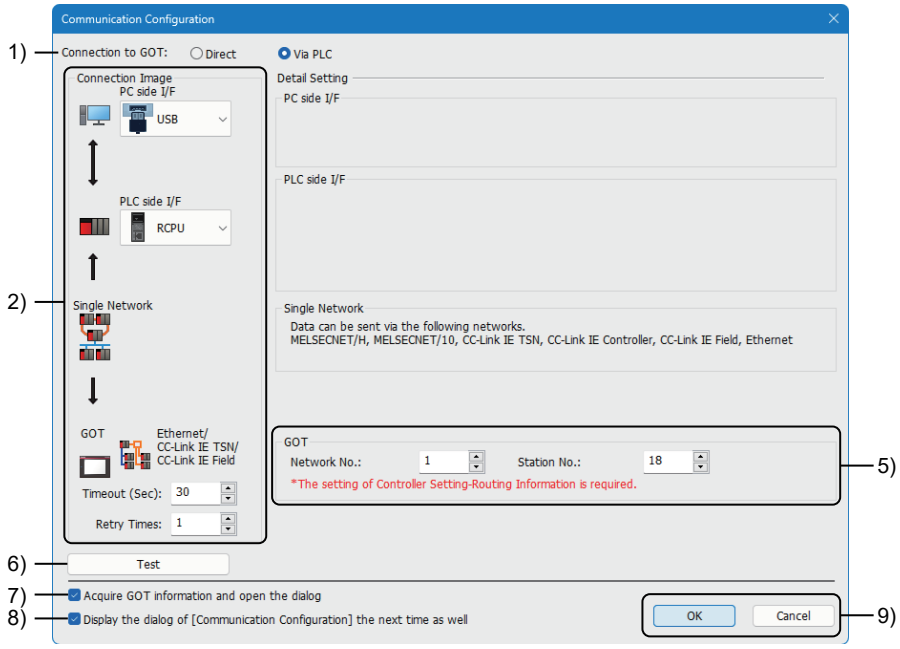
The following shows the setting windows for connecting the personal computer to the GOT via a PLC.
To configure the settings, the connection setting information of the PLC to be routed is required.
Check it in advance referring to the following manual.
GOT3000 Series User's Manual (Connection)

The setting items differ depending on the selection for [PC side I/F] in [Connection Image] in the [Communication Configuration] dialog.
In addition, the setting items differ depending on whether the connected PLC is a CPU module or an Ethernet interface module even if [Ethernet] is selected for [PC side I/F].

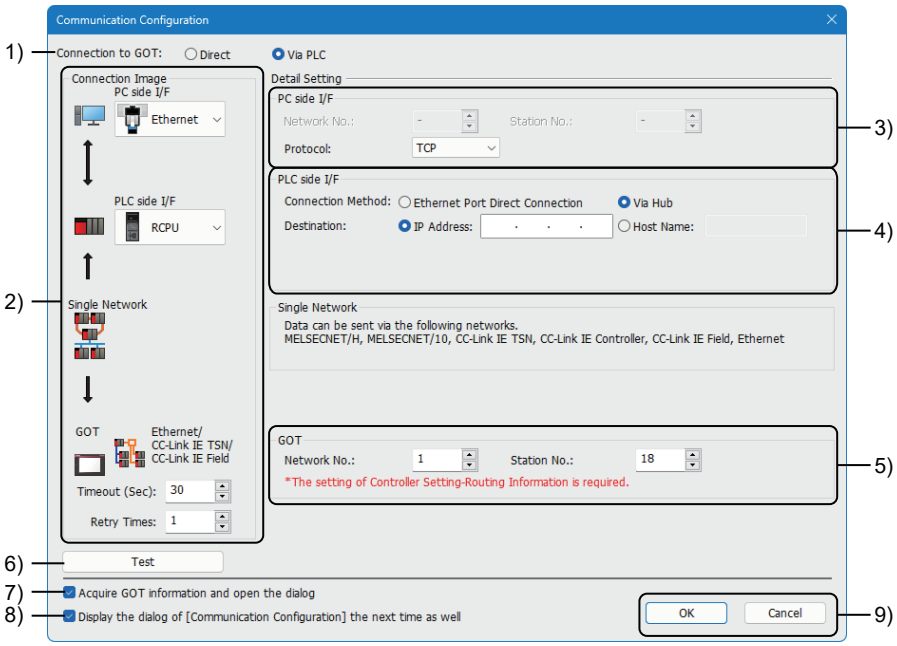
- When [RS232] is selected



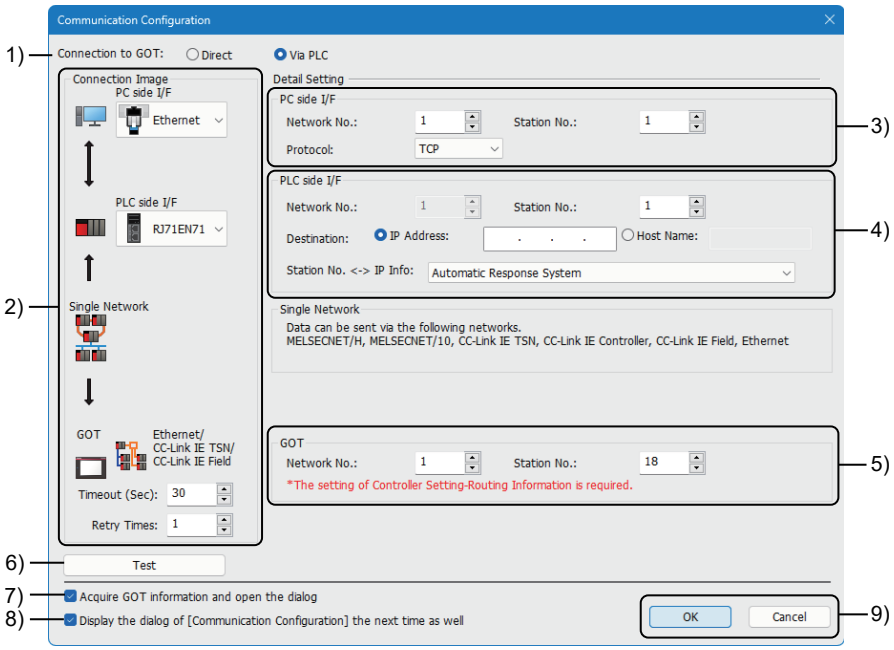
- When [USB] is selected



• When [Ethernet] is selected (CPU module connection)



• When [Ethernet] is selected (Ethernet interface module connection)



Item			Description
1)	[Connection to GOT]		Select the connection method of the personal computer and the GOT. Select [Via PLC] when the connection is established via a PLC.
2)	[Connection Image]	-	Set the interface to be used or the device to be routed for the connection of the personal computer and the GOT.
		[PC side I/F]	Select the type of the interface of the personal computer.
		[PLC side I/F]	Select the CPU module to be routed or the Ethernet interface module. [RCPU] is not selectable when [RS232] is selected for [PC side I/F]. To use port CPU P1 of the RnENCPU, select [RCPU]. To use port P1 of the RnENCPU, select [RJ71EN71]. Port P2 does not support the Ethernet connection.
		[Ethernet/CC-Link IE TSN/ CC-Link IE Field]	Network to be routed to the GOT.
		[Timeout (Sec)]	Set the timeout period for communication between the personal computer and the GOT. The setting range is [1] to [9999] seconds. Setting a value of less than [30] seconds may result in a communication error. Set the value to [30] seconds or more.
		[Retry Times]	Set the number of retries to be performed when a communication error occurs. The setting range is [0] time to [5] times.
3)	[PC side I/F]	[Port No.]	Set the communication port of the personal computer to perform the encrypted communication. The setting range depends on the personal computer to be used.
		[Baud Rate]	Set the transmission speed between the personal computer and the PLC when [RS232] is selected for [PC side I/F].
		[Network No.]	Set this item when [Ethernet] is selected for [PC side I/F] and [RJ71EN71], [QJ71E71], or [LJ71E71] is selected for [PLC side I/F]. Set the network number of the Ethernet network to which the personal computer is connected. The setting range is [1] to [239].
		[Station No.]	Set this item when [Ethernet] is selected for [PC side I/F] and [RJ71EN71], [QJ71E71], or [LJ71E71] is selected for [PLC side I/F]. Set the station number of the personal computer. To connect the personal computer with the Ethernet interface module, set the station number which does not overlap with other station numbers in the same network. The following shows the setting range. • When [PLC side I/F] is set to [RJ71EN71]: [1] to [120] • When [PLC side I/F] is set to [QJ71E71] or [LJ71E71]: [1] to [64]
		[Protocol]	Select the communication protocol to be used for the communication between the personal computer and the PLC when [Ethernet] is selected for [PC side I/F].

Item			Description
4)	[PLC side I/F]	-	Set the following items when [Ethernet] is selected for [PC side I/F].
		[Connection Method]	Set this item when [RCPU], [QCPU], or [LCPU] is selected for [PLC side I/F]. Select the connecting method of the personal computer and the PLC.
		[Network No.]	Displays the network number of the PC side I/F when [RJ71EN71], [QJ71E71], or [LJ71E71] is selected for [PLC side I/F].
		[Station No.]	Set the station number of the PLC when [RJ71EN71], [QJ71E71], or [LJ71E71] is selected for [PLC side I/F]. The following shows the setting range. • When [PLC side I/F] is set to [RJ71EN71]: [1] to [120] • When [PLC side I/F] is set to [QJ71E71] or [LJ71E71]: [1] to [64]
		[Destination]	Set the IP address or host name of the connected PLC when either of the following conditions is met. • When [RCPU], [QCPU], or [LCPU] is selected for [PLC side I/F] and [Via Hub] is selected for [Connection Method] • When [RJ71EN71], [QJ71E71], or [LJ71E71] is selected for [PLC side I/F] Set the following. • [IP Address] Specify the destination PLC by the IP address. After selecting, set the IP address of the destination PLC. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255]. • [Host Name] Specify the host name by the destination PLC. Up to 64 characters can be set for the host name. A one-byte character is counted as one character, and a two-byte character is counted as two characters.
		[Station No.<->IP Info]	Set this item when [RJ71EN71], [QJ71E71], or [LJ71E71] is selected for [PLC side I/F]. When the PLC connected to the GOT communicates with a PLC of another station, select the method to acquire the network number the station number, and the IP address of the PLC of another station. Select the item according to the network parameter of the destination PLC.
5)	[GOT]	[Network No.]	Set the network number of the network to which the GOT is connected. The setting range is [1] to [239].
		[Station No.]	Set the GOT's station number. The setting range is [1] to [64].
6)	[Test] button		Executes a communication test between the personal computer and the GOT.
7)	[Acquire GOT information and open the dialog]		After the GOT identification information is acquired from the GOT, the [Communicate with GOT] dialog is opened. For details on the GOT identification information, refer to the following. ☞ Page 620 Setting the identification information to the GOT ([GOT ID])
8)	[Display the dialog of [Communication Configuration] the next time as well]		Displays the [Communication Configuration] dialog before displaying the [Communicate with GOT] dialog. If this item is deselected, the [Communication Configuration] dialog and this item do not appear from the next time. To display the [Communication Configuration] dialog again, select [Display the dialog of Communication Setting before displaying the dialog of Communicate with GOT/GOT Diagnostics] in the [Operation] tab of the [Option] dialog. ☞ Page 197 [Options] dialog ([Operation] tab)
9)	[OK] button		Applies the changed settings. The settings are not applied without clicking the [OK] button. The saved settings are held until next time they are changed.
	[Cancel] button		Discards the changed settings and closes the [Communication Configuration] dialog.

8.13.3 [Application Selection] dialog

This dialog is used to select system applications (add-on functions) and communication drivers to be included in the package data.

The dialog can be displayed by selecting [Common] → [Application Selection] from the menu.

When this dialog is opened for the first time, data required for the project data is automatically selected.

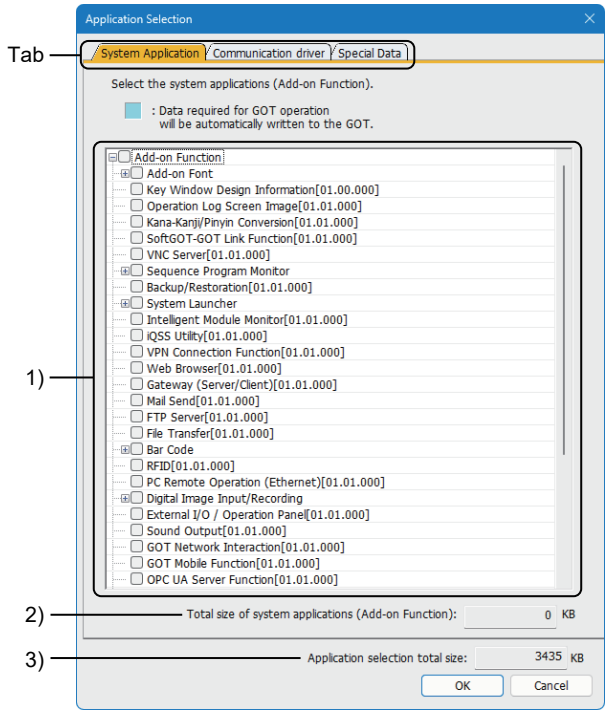
The [Application Settings] dialog provides three tabs, each corresponding to a different data type.

Switch the tabs according to your purpose.

Tab	Purpose
☞ Page 458 [System Application] tab	Select the system applications (add-on functions) to be included in the package data.
☞ Page 462 [Communication Driver] tab	Select the communication drivers to be included in the package data.
☞ Page 464 [Special Data] tab	Select the special data to be included in the package data.

[System Application] tab

Select the system applications (add-on functions) to be included in the package data.



Item		Description
1)	[Add-on Function] tree	Lists the system applications (add-on functions) that can be written to the GOT in a tree view. For list of functions and sizes of system applications, refer to the following. ☞ Page 459 System application (add-on function) list The application selected in the tree is written to the GOT regardless of whether to use or not use the function. The application required for the GOT operation is displayed in light-blue. The selection of the application displayed in light-blue cannot be canceled.
2)	[Total size of system applications (Add-on Function)]	Displays the total size of the system applications (add-on functions) selected in the tree.
3)	[Application selection total size]	Displays the total size of all data selected in the [System Application] tab, the [Communication driver] tab, and the [Special Data] tab.

■System application (add-on function) list

The following table lists the system applications (add-on functions).

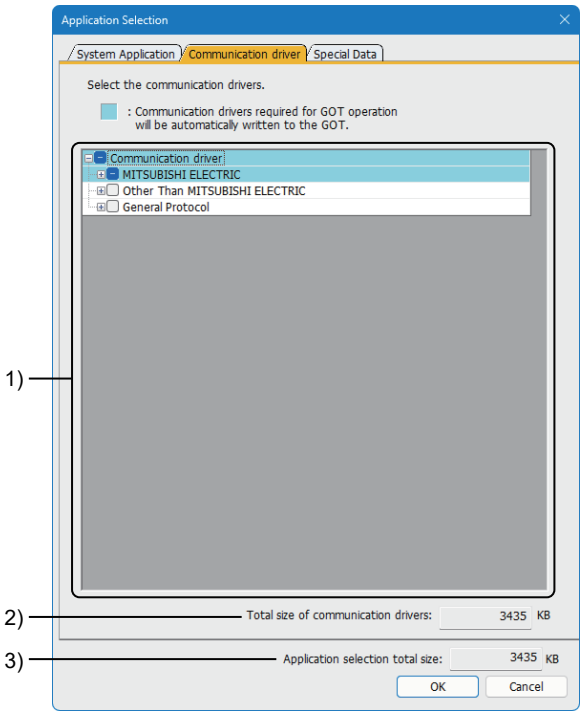
System application (add-on function)			Automatic selection condition	Occupied memory size (KB)	
				Built-in flash memory (ROM)	Built-in RAM of GOT
[Add-on Font]	[UD Add-on Font]	[Japanese (Gothic)]	Select language from [GOT Setup] - [Basic Setting] - [Display Setting/Language Setting] - [System Language]. For the add-on fonts to be used, refer to the following. ☞ Page 77 How to display characters on the GOT In the following settings, if the language differs from [Standard Language] in [Type Setting] - [Language and Font Setting], the corresponding add-on font for that language will be selected. • [User Alarm Observation] - [Device] - [Additional Setting] - [Mail Send Detail Setting] - [Section Title] • [Alarm Common Setting] - [Fixed language]	2867	3961
		[Japanese (Mincho)]		5802	8023
		[English (Gothic)]		724	1448
		[English (Mincho)]		1146	2233
		[Chinese (Simplified) (Gothic)]		2417	3357
		[Chinese (Simplified) (Mincho)]		2499	3762
		[Chinese (Traditional) (Gothic)]		1158	1635
		[Chinese (Traditional) (Mincho)]		1322	1821
		[Korean (Hangul) (Gothic)]		366	949
		[Korean (Hangul) (Mincho)]		396	913
[Key Window Design Information]			Any option other than [Classic] is selected for [Window Design] in [Screen Design] - [Custom].	2215	4810
Operation log screen image			[Display the screen image when using operation logs] is selected in [GOT Environmental Setting] - [Operation Log] - [Basic].	56	268
[Kana-Kanji/Pinyin Conversion]			When any of the following conditions are satisfied • [Kana-Kanji/Pinyin Conversion] is selected in the [Extended] tab in the [Text Input] dialog • [Use the option selection window] is selected in [GOT Environmental Setting] - [Kana-Kanji/Pinyin Conversion]. • [Use the option selection window] is selected in [Base Screen Property] - [Option Selection Window]. • [Use the option selection window] is selected in [Window Screen Property] - [Option Selection Window]. • [Use Kana-Kanji/Pinyin Conversion] is selected in [Peripheral Setting] - [Web Browser]. • When both of the following conditions are satisfied ◇[Standard Language] is selected in [GOT Type Setting] - [Language and Font Setting]. ◇[Use the search/bookmark function] is selected in [Document Display].	1083	2065
[SoftGOT-GOT Link Function]			[Update the SoftGOT-GOT link function setting] is selected in [GOT Setup] - [Add-on Setting] - [SoftGOT-GOT Link].	110	730
[VNC Server]			[Update the VNC server function setting] or [Use VNC Server] is selected in [GOT Setup] - [Add-on Setting] - [VNC Server].	684	19250
[Sequence Program Monitor]	[Sequence Program Monitor (iQ-R/iQ-L Ladder)]		[Use sequence program monitor in MELSEC iQ-R/MELSEC iQ-L series] is selected in [GOT Setup] - [Add-on Setting] - [Sequence Program Monitor], or [Sequence Program Monitor (iQ-R/iQ-L Ladder)] is selected in [Special Function Switch] - [Switch Action].	14962	48969
	[Sequence Program Monitor (iQ-F Ladder)]		[Use sequence program monitor in MELSEC iQ-F series] is selected in [GOT Setup] - [Add-on Setting] - [Sequence Program Monitor], or [Sequence Program Monitor (iQ-F Ladder)] is selected in [Special Function Switch] - [Switch Action].	19914	53073
	[Sequence Program Monitor (Q/L Ladder)]		[Use sequence program monitor in MELSEC-Q/MELSEC-L series] is selected in [GOT Setup] - [Add-on Setting] - [Sequence Program Monitor], or [Sequence Program Monitor (Q/L Ladder)] is selected in [Special Function Switch] - [Switch Action].	19914	53073

System application (add-on function)		Automatic selection condition	Occupied memory size (KB)	
			Built-in flash memory (ROM)	Built-in RAM of GOT
[Backup/Restoration]		[Update the backup/restoration save setting] is selected in [GOT Setup] - [Add-on Setting] - [Backup/Restoration], or [Backup/Restoration] is selected in [Special Function Switch] - [Switch Action].	865	4970
[System Launcher]	[System Launcher (Basic)]	When any of the following conditions are satisfied • [Update the setting of system launcher function] is selected in [GOT Setup] - [Add-on Setting] - [System Launcher]. • [System Launcher] is selected in [Special Function Switch] - [Switch Action]. • [R Motion Monitor] is selected in [Special Function Switch] - [Switch Action]. • [Intelligent Module Monitor] is selected.	2580	6764
[Intelligent Module Monitor]		[Use intelligent module monitor] is selected in [GOT Setup] - [Add-on Setting] - [System Launcher].	2935	9762
[iQSS Utility]		When any of the following conditions are satisfied • [Update the iQSS utility setting] is selected in [GOT Setup] - [Add-on Setting] - [iQSS Utility]. • [iQSS Utility] is selected in [Special Function Switch] - [Switch Action]. • One or more models are selected as write targets in [CSP+ for iQSS Data Write].	1622	3243
[VPN connection function]		[Update the VPN connection function] or [Use VPN] is selected in [VPN Connection] under [Add-on Setting] in the [GOT Setup] window.	1024	4096
[Web Browser]		[Web Browser] is selected for [Switch Action] of [Special Function Switch].	116409	394250
[Gateway (Server/Client)]		At least one configured row is found in [EG Device Layout] in [Controller Setting] - [Gateway Server], or it is present in the GOT list for server function in [Controller Setting] - [Gateway Client].	98	1954
[Mail Send]		[Use the function of Mail] is selected in [Controller Setting] - [Mailing].	712	2048
[FTP Server]		[Use the function of FTP Server] is selected in [Controller Setting] - [FTP Server].	98	1954
[File Transfer]		One or more settings exist in [Destination FTP Server Setting] or [File Transfer Setting] in [Controller Setting] - [File Transfer].	50	2500
[Bar Code]	[Bar Code (Serial)]	When either of the following conditions is satisfied • Any option other than [Not connected] is selected in [Peripheral Setting] - [Bar Code] - [Serial] - [Destination I/F]. • [Use Serial Bar Code] is selected in the window displayed by selecting [Peripheral Setting] - [Bar Code] - [Serial]. • [Bar Code] is selected for [Driver] in the [I/F Communication Setting] window.	48	120
	[Bar Code (USB)]	[Use USB Bar Code] is selected in the [USB] tab of the window displayed by selecting [Peripheral Setting] - [Bar Code].	15	30
[RFID]		[Use RFID] is selected in the window displayed by selecting [Peripheral Setting] - [RFID], or [RFID] is selected for [Driver] in the [I/F Communication Setting] window.	48	120
[PC Remote Operation (Ethernet)]		[Use PC Remote Operation (Ethernet)] is selected in [Peripheral Setting] - [PC Remote Operation], or [PC Remote Operation (Ethernet)] is selected in [Special Function Switch] - [Switch Action].	411	17662

System application (add-on function)		Automatic selection condition	Occupied memory size (KB)	
			Built-in flash memory (ROM)	Built-in RAM of GOT
[Digital Image Input/ Recording]	[Digital Image Input(For USB Input)]	[WEB Camera] is selected in [Peripheral Setting] - [Digital Image Input/Recording] - [Input Device], or [PC Image] is selected in [Peripheral Setting] - [Digital Image Input/ Recording], or [WEB Camera] is selected in [Peripheral Setting] - [Digital Image Input/Recording].	106	61677
	[Digital Image Input (Extended)]	[Network Camera] is selected in [Peripheral Setting] - [Digital Image Input/Recording] - [Input Device], or [Network Camera] is selected in [Peripheral Setting] - [Digital Image Input/ Recording].	388	29587
	[Digital Image Recording/Playback]	[Digital Image Recording] is selected in [Peripheral Setting] - [Digital Image Input/Recording] - [Operation Mode].	348	132143
[External I/O / Operation Panel]		Any option other than [Not connected] is selected in [Peripheral Setting] - [External I/O / Operation Panel] - [Destination I/F], or [Use Operation Panel] is selected in [Peripheral Setting] - [External I/O / Operation Panel], or [External I/O / Operation Panel] is selected in [I/F Communication Setting] - [Extend Unit] - [Driver].	80	100
[Sound Output]		At least one sound file has been created in [Sound File List].	20	64
[GOT Network Interaction]		[Use GOT network interaction function] is selected in [GOT Network Interaction].	140	280
[GOT Mobile Function]		[Use GOT Mobile function] is selected in [Basic Setting] in the [GOT Mobile Setting] window.	5140	14356
[OPC UA Server Function]		At least one tag is set in [OPC UA Tag Setting] in the [OPC UA Server Setting] window.	1931	83359
[Device Data Transfer]		At least one setting is configured in the [Device Data Transfer] window.	50	200
[Hard Copy PDF Output]		When either of the following conditions is satisfied • [File] is selected in [Hard Copy] - [Destination], and [Fixed] is selected in [Hard Copy] - [Style], and [PDF] is selected for the file type in [Hard Copy]. • [Device] is selected in [Hard Copy] - [Style] and [Output PDF file] is selected in [Hard Copy].	160	40960
[R Motion Monitor]		[R Motion Monitor] is selected in [Special Function Switch] - [Switch Action].	3565	12071
[CC-Link IE TSN/CC-Link IE Field Network diagnostics]		[CC-Link IE TSN/CC-Link IE Field Network diagnostics] is selected in [Special Function Switch] - [Switch Action].	2580	6964
[Recipe Display (Record List)]		The recipe display (record list) is placed on at least one screen.	10000	10000
[Document Display]	[Document Display (Document Converter)]	[Document Converter Output File] is selected for [Document Type] of [Document Display].	200	20000
	[Document Display (PDF)]	[File] is selected in [Hard Copy] - [Destination], and [Fixed] is selected in [Hard Copy] - [Style], and [PDF] is selected for the file type in [Hard Copy]. Alternatively, [Output PDF file] is selected in [Hard Copy].	5120	40960
	[PDF Search/Bookmark Function]	[PDF file] is selected in [Document Display] - [Document Type], and [Use the search/bookmark function] is selected in [Document Display].	5353	41865
[GOT Platform Library]		When any of the following system applications are on • [Sequence Program Monitor (iQ-R/iQ-L Ladder)] • [Sequence Program Monitor (iQ-F Ladder)] • [Sequence Program Monitor (Q/L Ladder)]	200	200
[GOT Function Expansion Library]		When any of the following system applications are on • [Sequence Program Monitor (iQ-R/iQ-L Ladder)] • [Sequence Program Monitor (iQ-F Ladder)] • [Sequence Program Monitor (Q/L Ladder)]	6724	29620
[GOT Function Expansion Library (Add / MELSEC iQ-R / MELSEC iQ-L)]		[Sequence Program Monitor (iQ-R/iQ-L Ladder)] is selected.	5145	4297
[GOT Function Expansion Library (Add / MELSEC iQ-F)]		[Sequence Program Monitor (iQ-F Ladder)] is selected.	5145	4297

[Communication Driver] tab

Select the communication drivers to be included in the package data.



Item		Description
1)	[Communication driver] tree	Lists the communication drivers which can be installed to the GOT. For the list of communication drivers and their sizes, refer to the following. ☞ Page 463 Communication driver list The communication driver required for the GOT operation is displayed in light-blue. The selection of the communication driver displayed in light-blue cannot be canceled. You can select up to four communication drivers to be added.
2)	[Total size of communication drivers]	Displays the total size of the communication drivers selected in the tree.
3)	[Application selection total size]	Displays the total size of all data selected in the [System Application] tab, the [Communication driver] tab, and the [Special Data] tab.

■Communication driver list

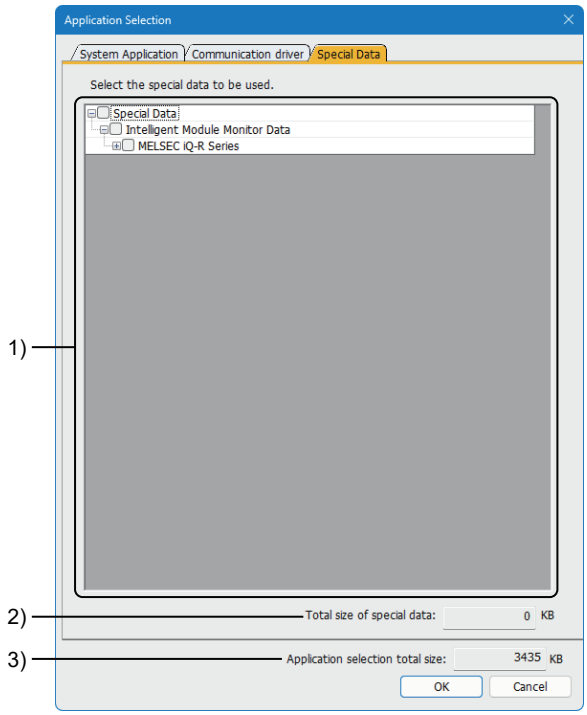
The following table lists the communication drivers.

According to the option selected for [Driver] in the [Controller Setting] window, the applicable communication driver is automatically selected.

Communication driver		Occupied memory size (KB)	
		Built-in flash memory (ROM)	Built-in RAM of GOT
[MITSUBISHI ELECTRIC]	[Bus(Q)]	2590	3275
	[MELSECNET/H]	2595	3695
	[CC-Link IE TSN]	2445	3245
	[CC-Link IE TSN (Built-in Ethernet)]	2385	2705
	[CC-Link IE Controller Network]	2610	3365
	[CC-Link IE Field Network]	2630	3610
	[CC-Link Ver.2(ID)]	2715	3275
	[Ethernet(MITSUBISHI ELECTRIC), Gateway]	3435	4850
	[Ethernet(FX), Gateway]	620	1350
	[Ethernet(MELSERVO), Gateway]	450	775
	[Ethernet(FREQROL(Batch monitor)), Gateway]	390	660
	[Serial (MELSEC)]	2800	3480
	[Serial (MELSERVO)]	760	850
	[MELSEC-FX]	597	1525
	[FREQROL 700/800, Sensorless Servo]	305	349
	[FREQROL(Batch Monitor Support)]	285	585
[Other Than MITSUBISHI ELECTRIC]	[Ethernet(OMRON), Gateway]	180	375
	[Ethernet(OMRON NJ/NX), Gateway]	215	571
	[Ethernet(KEYENCE), Gateway]	465	365
	[Ethernet(FUJI), Gateway]	245	220
	[Ethernet(YASKAWA),Gateway]	375	385
	[Ethernet(YASKAWA MP3000),Gateway]	34	37
	[Ethernet(YASKAWA High Speed Ethernet Server), Gateway]	175	305
	[Ethernet(YOKOGAWA), Gateway]	285	330
	[Ethernet(AB MicroLogix), Gateway]	295	260
	[Ethernet(AB), Gateway]	43	49
	[Ethernet(AB Tag), Gateway]	245	610
	[Ethernet(LS ELECTRIC XGK), Gateway]	240	365
	[Ethernet(SIEMENS OP), Gateway]	302	482
	[Azbil SDC/DMC]	410	316
	[OMRON Digital Temperature Controller]	345	415
[General Protocol]	[Ethernet(CC-Link IE Field Network Basic)]	212	327
	[Ethernet(SLMP), Gateway]	310	745
	[MODBUS/RTU Client]	277	417
	[MODBUS/TCP Client, Gateway]	227	427
	[MODBUS/RTU Server]	330	1000
	[MODBUS/TCP Server, Gateway]	255	960
	[OPC UA Client]	1410	27495
	[Serial (MICROCOMPUTER)]	160	431
	[Ethernet(Computer)]	285	455

[Special Data] tab

Select the special data to be included in the package data.



Item		Description
1)	[Special Data] tree	Displays the list of special data that can be written to the GOT. For the list of special data, refer to the following page.
2)	[Total size of special data]	The total size of the special data selected in the tree is displayed.
3)	[Application selection total size]	Displays the total size of all data selected in the [System Application] tab, the [Communication driver] tab, and the [Special Data] tab.

■Special data list

The following lists special data.

Special data		Occupied memory size (KB)	
		Built-in flash memory (ROM)	Built-in RAM of GOT
[Intelligent Module Monitor Data]	[MELSEC iQ-R Series]	2586	2586

8.13.4 [Communicate with GOT] dialog

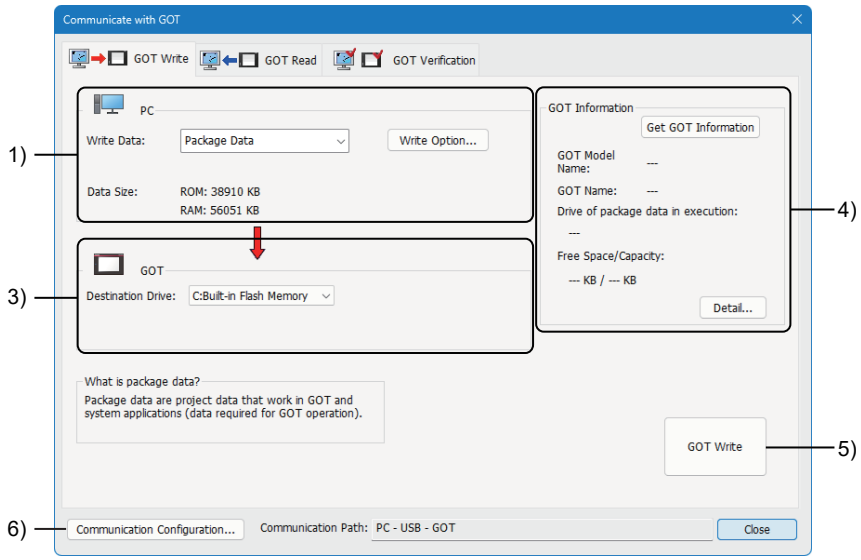
In this dialog, you can read/write data from/to the GOT and verify with the project data in the GOT.
The [Communicate with GOT] dialog has the following three tabs for each function.
Switch the tabs according to your purpose.

Tab	Purpose
☞ Page 465 [GOT Write] tab	Install the package data, BootOS, or resource data on the GOT from the personal computer.
☞ Page 472 [GOT Read] tab	Read the package data, project data, or resource data from the GOT. The drive information of the GOT is acquired and the data can be deleted or the drive can be formatted.
☞ Page 475 [GOT Verification] tab	Verify with the project data in the connected GOT.

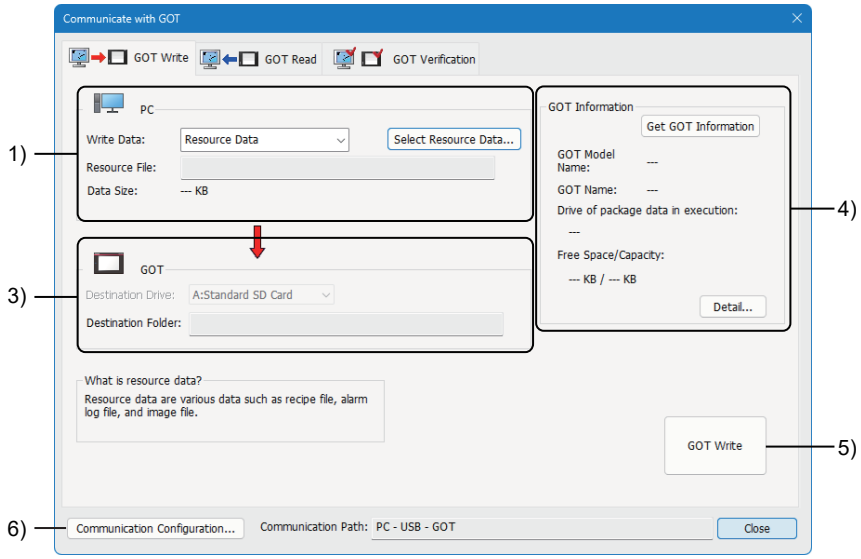
[GOT Write] tab

This is the setting screen for writing data from a personal computer to the GOT. The format varies according to the data to be written.

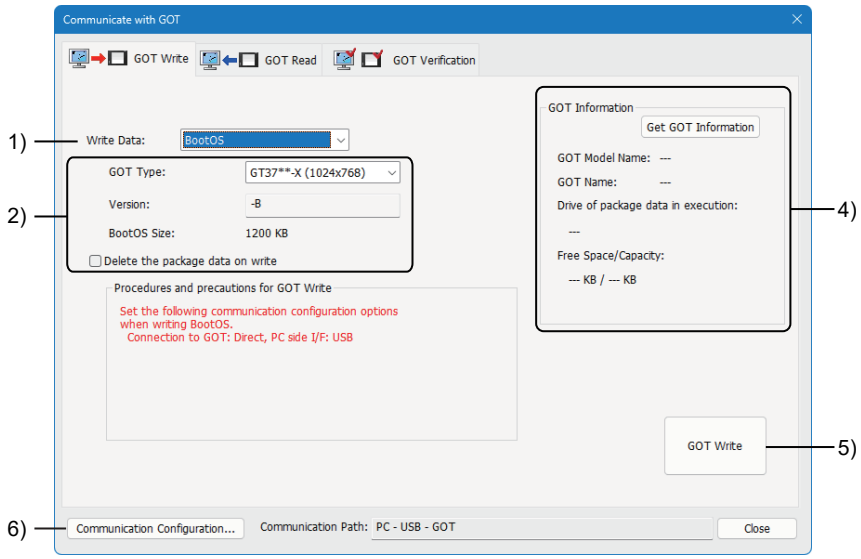
• For package data



• For resource data



• For BootOS

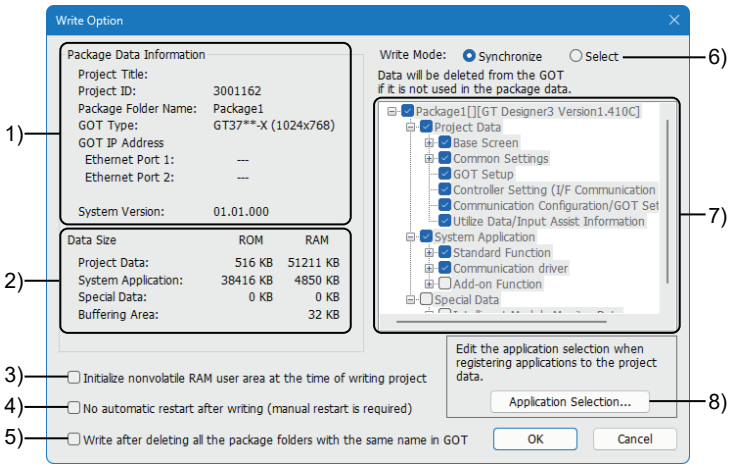


Item			Description
1)	[PC]	[Write Data]	Set the data to be written to the GOT.
		[Write Option] button	Only when [Package Data] is selected for [Write Data], check the package data information, select the data to be included in the package data, set whether to initialize the nonvolatile RAM user area of the GOT or not and whether to restart the GOT after the data is written, select the write mode, and configure the other settings in the [Write Option] dialog. ☞ Page 467 [Write Option] dialog
		[Select Resource Data] button	Only when [Resource Data] is selected for [Write Data], set the resource data to be written to the GOT and the write destination drive in the [Select Resource Data] dialog. ☞ Page 470 [Select Resource Data] dialog For the writable resource data, refer to the following. ☞ Page 410 Types of the data that can be transferred
		[Resource File]	Displays the resource file selected in the [Select Resource Data] dialog.
		[Data Size]	Displays the size of the data to be written to the GOT when [Package Data] or [Resource Data] is selected for [Write Data].
2)	[GOT Type]		Select the GOT type when [BootOS] is selected for [Write Data].
	[Version]		Displays the version of the BootOS to be installed to the GOT when [BootOS] is selected for [Write Data].
	[BootOS Size]		Displays the data size of BootOS to be installed on the GOT when [BootOS] is selected for [Write Data].
	[Delete the package data on write]		Configure this setting when [BootOS] is selected for [Write Data]. Select this item to delete the package data in the GOT when installing BootOS on the GOT.
3)	[GOT]	[Destination Drive]	For package data, select the write destination drive of the package data. For resource data, the write destination drive of the resource data selected in the [Select Resource Data] dialog is displayed.
		[Destination Folder]	Displays the write destination folder of the resource data selected in the [Select Resource Data] dialog.
4)	[GOT Information]	[Get GOT information] button	Acquires the following GOT information from the connected GOT and displays the information on the screen. • [GOT Model Name] Model name of the connected GOT [-] is displayed when the type of the GOT is not supported by GT Designer3. • [GOT Name] Name of the connected GOT • [Drive of package data in execution] Drive that stores the package data being used in the connected GOT • [Free Space/Capacity] Free space and capacity of the drive selected for [Destination Drive]
		[Detail] button	This button is displayed when [Package Data] or [Resource Data] is selected for [Write Data]. In the [GOT Information - Detail] dialog, you can check the size of the storage memory (ROM) and operation memory (RAM) for each drive of the GOT. ☞ Page 469 [GOT Information - Detail] dialog

Item		Description
5)	[GOT Write] button	Writes the data to the target GOT. For BootOS, this button becomes active only when the GOT is connected directly via USB. For resource data, the [Resource Data Write Result] dialog appears after the data is written.
6)	[Communication Configuration] button	Displays the [Communication Configuration] dialog. Configure the communication settings between the personal computer and the GOT. ☞ Page 451 [Communication Configuration] dialog

■[Write Option] dialog

In this dialog, you can check the package data information, set the write mode, select the data to be included in the package data, set whether to initialize the nonvolatile RAM user area of the GOT or not and whether to restart the GOT after the data is written, and configure the other settings.



Item			Description
1)	[Package Data Information]	[Project Title]	Title of the project
		[Project ID]	ID of the project
		[Package Folder Name]	Name of the folder that stores the package data
		[GOT Type]	GOT type of the project
		[GOT IP Address]	GOT IP address for the GOT Ethernet port If the Ethernet port is not supported by [GOT Type] or [Update GOT Ethernet Port setting] is not selected in the setting tab for the target port of [GOT IP Address Setting] in the [GOT Ethernet Setting] window, [---] is displayed.
		[System Version]	System application version in the package data
2)	[Data Size]	[Project Data]	Project data size (ROM and RAM)
		[System Application]	Size of the system applications included in the package data (ROM and RAM)
		[Special Data]	Size of the special data included in the package data
		[Buffering Area]	Size of the buffering area in the operation memory (RAM)
3)	[Initialize nonvolatile RAM user area at the time of writing project]		This item is not displayed in the [Write Option] dialog opened from the [Communicate with Memory Card] dialog. Select this item to initialize the nonvolatile RAM user area when the package data is written to the GOT.
4)	[No automatic restart after writing (manual restart is required)]		This item is not displayed in the [Write Option] dialog opened from the [Communicate with Memory Card] dialog. Select this item not to restart the GOT automatically after the package data is written to the GOT. When this item is selected, the GOT needs to be restarted manually after writing.
5)	[Write after deleting all the package folders with the same name in GOT]		This item is not displayed in the [Write Option] dialog opened from the [Communicate with Memory Card] dialog. Select this item to delete all data in the package folder with the same name (if it exists in the GOT) before writing the data.

Item		Description
6)	[Write Mode]	Select the write mode of the package data. For differences among the modes, refer to the following. ☞Page 437 Package data write mode The write mode is fixed to [Synchronize] in the following cases. • When the [Write Option] dialog is displayed from the [Communicate with Memory Card] dialog • When writing a package data (GTYS format file) to the GOT without opening it • When global labels or AB native tags are set in the common settings or object settings • When a label group is created • When a mobile screen is created • [Use GOT Mobile function] is selected in [Basic Setting] in the [GOT Mobile Setting] window. • When the project data is encrypted by entering a password in the [Project Data Password Registration] dialog
7)	Package data tree	The data included in the package data is displayed in the tree. When [Selection] is selected for [Write Mode], the data can be added or deleted.
8)	[Application Selection] button	This button is displayed only when [Synchronize] is selected for [Write Mode]. In the [Application Selection] dialog displayed by clicking the button, select the data to be included in the package data. The following shows the settable data. • System application (add-on function) • Communication driver • Special data For details, refer to the following. ☞Page 458 [Application Selection] dialog

Precautions

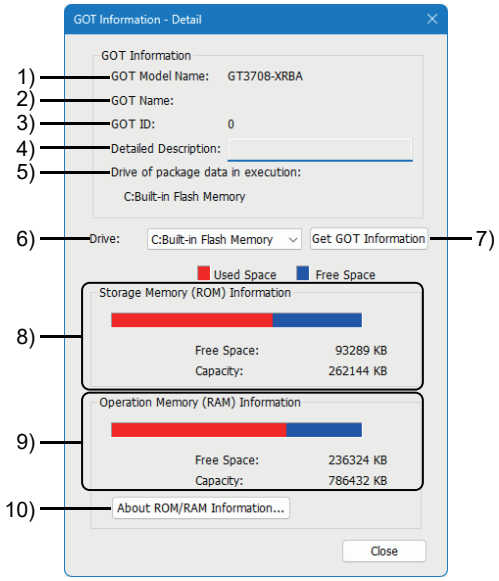
■Operation when [Utilize Data/Input Assist Information] is not selected

If a package whose [Utilize Data/Input Assist Information] is not selected in the package tree is read from the GOT, the following operation is performed.

- If the data has never been opened after being read, the project data is not eligible for the data utilization.
- The accumulated input assist information returns to the initial status.
- The first performance of the device list is decreased.

■[GOT Information - Detail] dialog

This dialog displays the detail information such as the model, drive information, and memory capacity of the connected GOT.

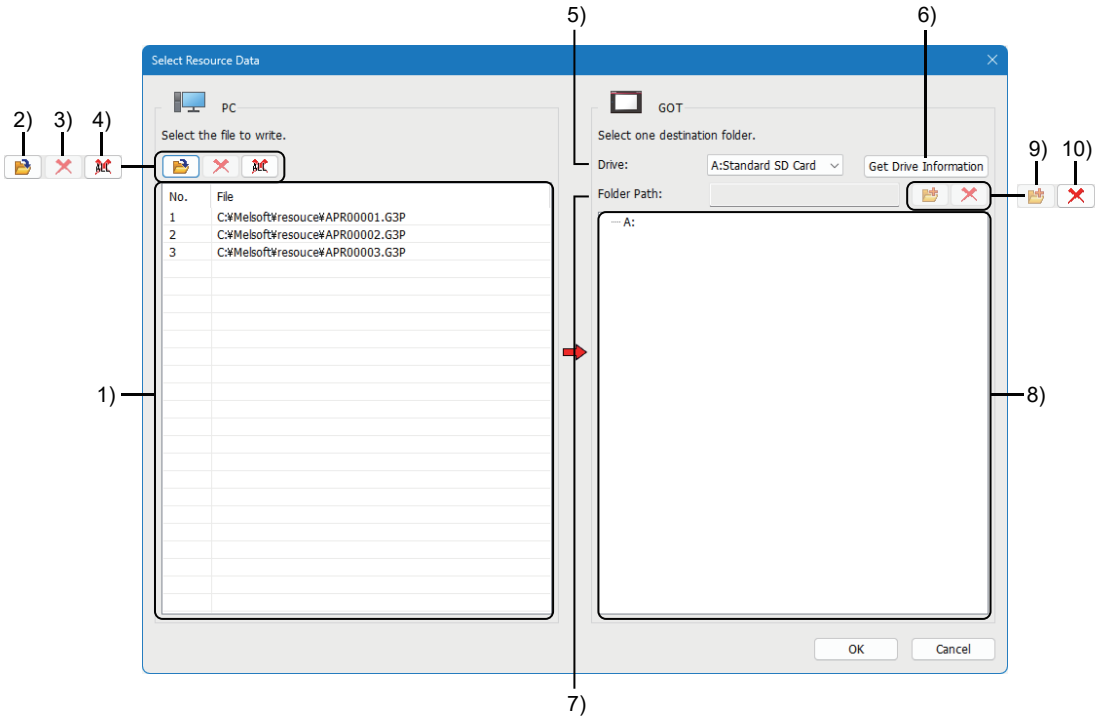


Item		Description
1)	[GOT Model Name]	Model name of the GOT
2)	[GOT Name]	Name to identify the GOT
3)	[GOT ID]	ID number to identify the GOT
4)	[Detailed Description]	Detailed description for the GOT
5)	[Drive of package data in execution]	Drive that stores the package data being used in the GOT
6)	[Drive]	Select the GOT drive whose detailed information is to be displayed.
7)	[Get GOT information] button	Acquires the GOT information from the GOT, including the GOT model and the free space of the specified drive, and displays it on the screen. When the GOT information is acquired from the GOT in security mode 2, operation authentication is performed. When [Perform encryption communication] is selected in the [Communication Configuration] dialog, the GOT information is acquired using encrypted communication.
8)	[Storage Memory (ROM) Information]	Free space and capacity of the GOT storage memory (ROM)
9)	[Operation Memory (RAM) Information]	Free space and capacity of the GOT operation memory (RAM)
10)	[About ROM/RAM Information] button	Displays explanations of ROM and RAM in the GOT.

■[Select Resource Data] dialog

In this dialog, set the resource data to be written to the GOT and the write destination drive.

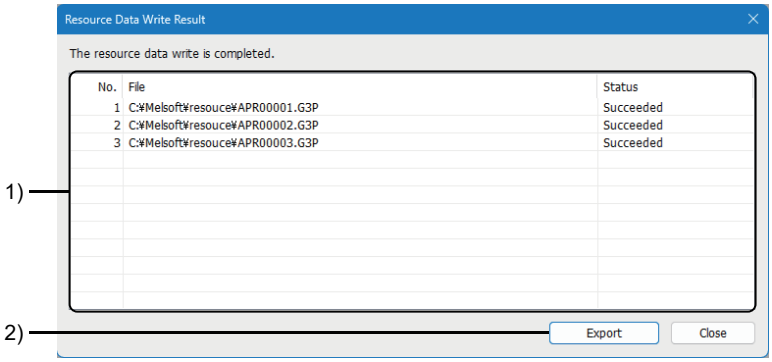
Multiple resource data files can be selected.



Item		Description
1)	Write target list	Set the resource data file to be written to the GOT. Multiple resource data files can be set.
2)	[Add File] button	Opens the [Open] dialog where you can select the resource data file to be written to the GOT. In the [Open] dialog, multiple files can be selected.
3)	[Delete] button	Deletes a selected resource data file from the write target list.
4)	[Delete All] button	Deletes all resource data files from the write target list.
5)	[Drive]	Select the destination drive to which the resource data is written. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
6)	[Get Drive Information] button	Acquires the information on the folders and resource data in the GOT and displays it in the drive information tree. If you click the [Get Drive Information] button after a new folder is created, the created folder is deleted.
7)	[Folder Path]	Path to the write destination folder for the resource data The path to the folder selected in the drive information tree is displayed.
8)	Drive information tree	Displays the structure of the folders and files in the drive selected in [Drive]. Items enclosed in [ ] are folders. Select the write destination folder.
9)	[New Folder] button	Adds a new folder under the drive or folder selected in the drive information tree. The new folder name is displayed in red. The new folder is created upon completion of resource data writing.
10)	[Delete] button	Deletes a newly-added folder that is selected in the drive information tree.

■[Resource Data Write Result] dialog

This dialog appears after resource data writing is performed. It displays the results of resource data writing.



Item			Description
1)	Write result list	-	Result of resource data writing
		[No.]	File number
		[File]	Resource data file
		[Status]	Displays whether the write result is [Succeeded] or [Failed].
2)	[Export] button		Displays the [Save As] dialog. Save the write result to a file.

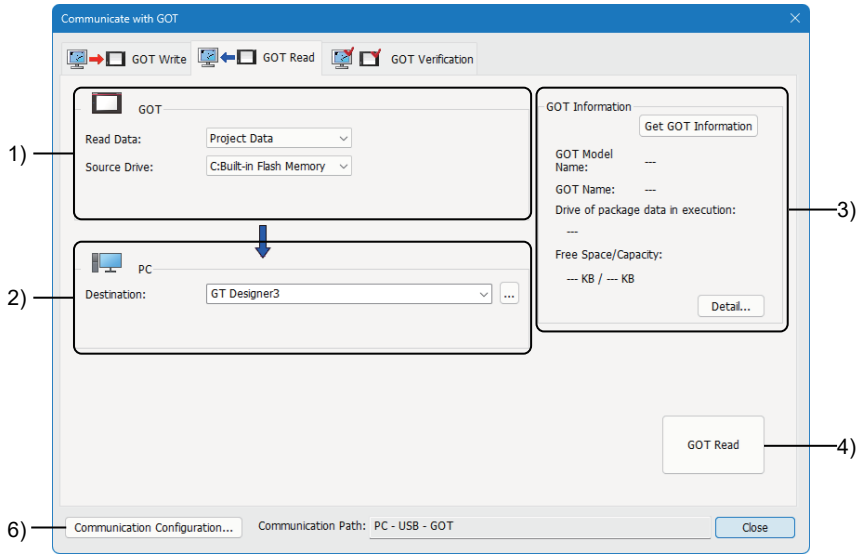
[GOT Read] tab

This is the setting screen for reading the project data, package data, and resource data from the connected GOT to the personal computer.

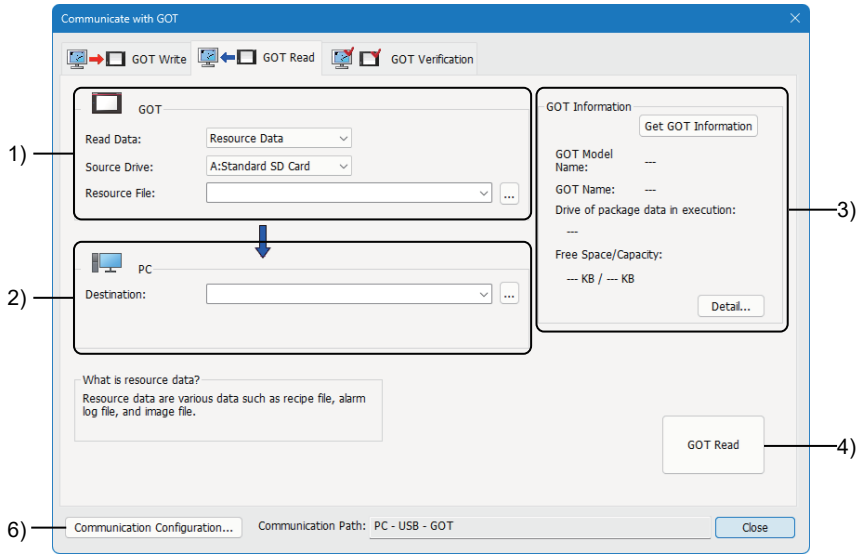
The drive information of the GOT can be read, and folders and data in the GOT can be deleted.

The setting items differ depending on the data to be read.

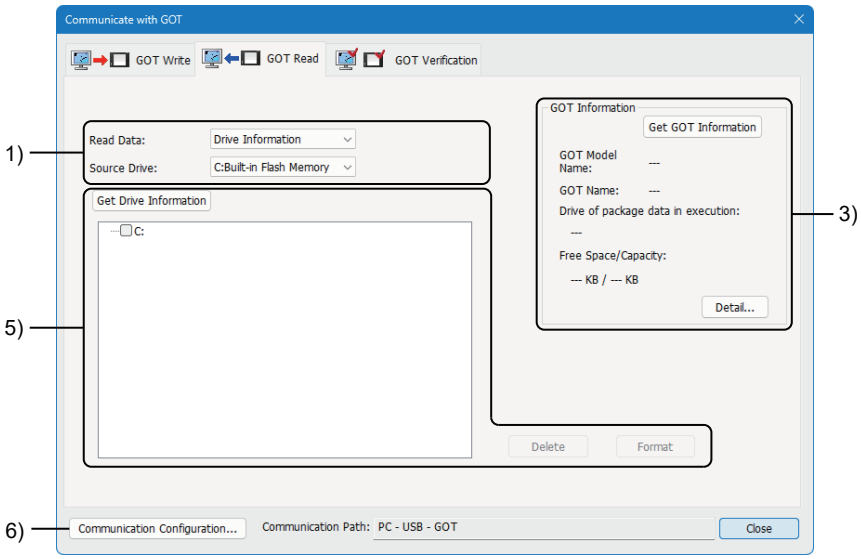
- For project data or package data



- For resource data



• For drive information

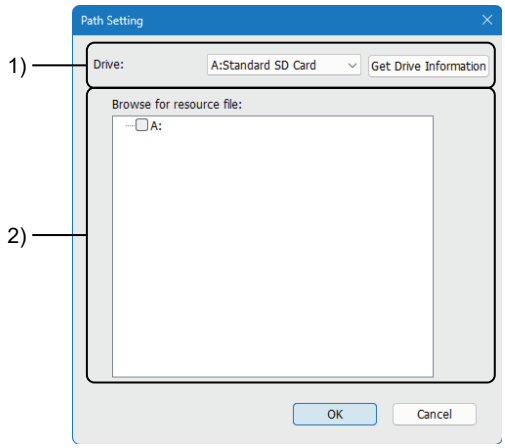


Item			Description
1)	[GOT]	[Read Data]	Set the type of the data to be read from the GOT.
		[Source Drive]	Select the source drive from which the data is read. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
		[Resource File]	Set the save path and file name of the resource data when [Resource Data] is selected for [Read Data]. Set them in the [Path Setting] dialog displayed by clicking the [...] button. ☞ Page 474 [Path Setting] dialog
2)	[PC]	[Destination]	Set the destination of the data read from the GOT.
			For package data or project data, specify whether to open the project data with GT Designer3 or save it as a file in the personal computer. • [GT Designer3] The read project is opened in GT Designer3. The project cannot be selected when the package data is read. • Saving as a file Click the [...] button to display the dialog to save data as a file with a name. In the displayed dialog, select the destination folder to save the read data, enter the file name, and save the data.
			For resource data, set the path for the destination of the resource data read from the GOT. Click the [...] button to display the [Browse For Folder] dialog. You can specify the destination folder to save the read resource data in the displayed dialog as well.
3)	[GOT Information]	[Get GOT information] button	Acquires the following GOT information from the connected GOT and displays the information on the screen. • [GOT Model Name] Model name of the connected GOT [-] is displayed when the type of the GOT is not supported by GT Designer3. • [GOT Name] Name of the connected GOT • [Drive of package data in execution] Drive that stores the package data being used in the connected GOT • [Free Space/Capacity] Free space and capacity of the drive selected for [Source Drive]
		[Detail] button	In the [GOT Information - Detail] dialog, you can check the size of the storage memory (ROM) and operation memory (RAM) for each drive of the GOT. ☞ Page 469 [GOT Information - Detail] dialog
4)	[GOT Read] button		Starts the data reading from the GOT.

Item		Description
5)	[Get Drive Information] button	This button is displayed when [Drive Information] is selected for [Read Data]. Acquires the drive information of the drive selected in [Source Drive] and displays it in the drive information tree.
	Drive information tree	This button is displayed when [Drive Information] is selected for [Read Data]. The file configuration of the read source drive is displayed in the tree. For an encrypted package that is not started, only the package name is displayed. • [Delete] button Collectively deletes the folders and files selected in the tree. Individually deleting the folder or file is not available. • [Format] button Formats the drive selected in [Source Drive]. Drive C cannot be formatted.
6)	[Communication Configuration] button	Displays the [Communication Configuration] dialog. Configure the communication settings between the personal computer and the GOT. ☞ Page 462 [Communication Driver] tab

■[Path Setting] dialog

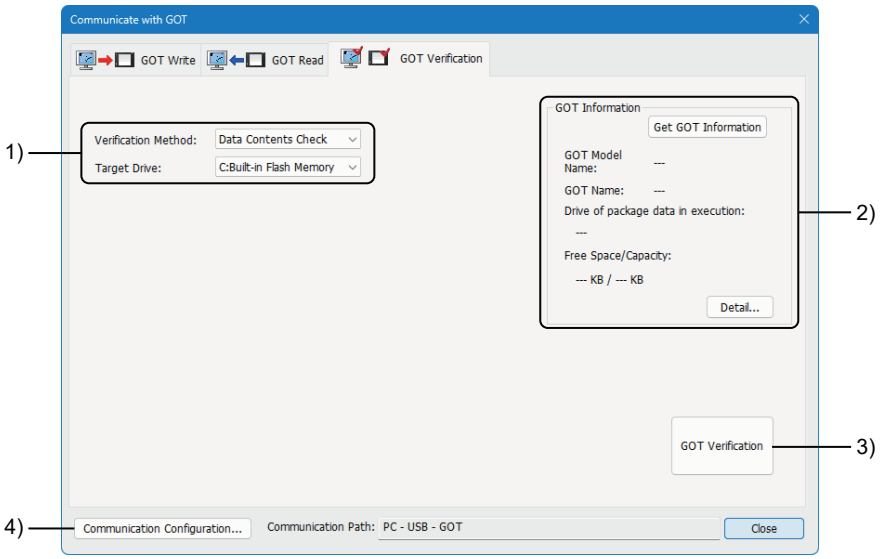
Set the source drive and resource file when [Resource Data] is selected for [Read Data].



Item		Description
1)	[Drive]	Select the read source drive.
	[Get Drive Information] button	Acquires the file information of the source drive and displays it in the tree under [Browse for resource file].
2)	[Browse for resource file]	The file configuration of the read source drive is displayed in the tree. Select the resource file to be read from the tree.

[GOT Verification] tab

This tab is for configuring settings to compare the project data currently being opened in GT Designer3 with the one written to the connected GOT.



Item			Description
1)	[Verification Method]		Select the method to verify the project. • [Data Contents Check] The verification is performed according to the description of the project. • [Time Stamp Check] The verification is performed according to the time stamp of the project data.
	[Target Drive]		Select the drive of the GOT which stores the project data to be verified. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
2)	[GOT Information]	[Get GOT information] button	Acquires the following GOT information from the connected GOT and displays the information on the screen. • [GOT Model Name] Model name of the connected GOT [-] is displayed when the type of the GOT is not supported by GT Designer3. • [GOT Name] Name of the connected GOT • [Drive of package data in execution] Drive that stores the package data being used in the connected GOT • [Free Space/Capacity] Free space and capacity of the drive selected for [Target Drive]
		[Detail] button	In the [GOT Information - Detail] dialog, you can check the size of the storage memory (ROM) and operation memory (RAM) for each drive of the GOT. ☞ Page 469 [GOT Information - Detail] dialog
3)	[GOT Verification] button		Starts the verification with the GOT. For how to check the verification results, refer to the following. ☞ Page 250 [Verify Result] window
4)	[Communication Configuration] button		Displays the [Communication Configuration] dialog. Configure the communication settings between the personal computer and the GOT. ☞ Page 451 [Communication Configuration] dialog

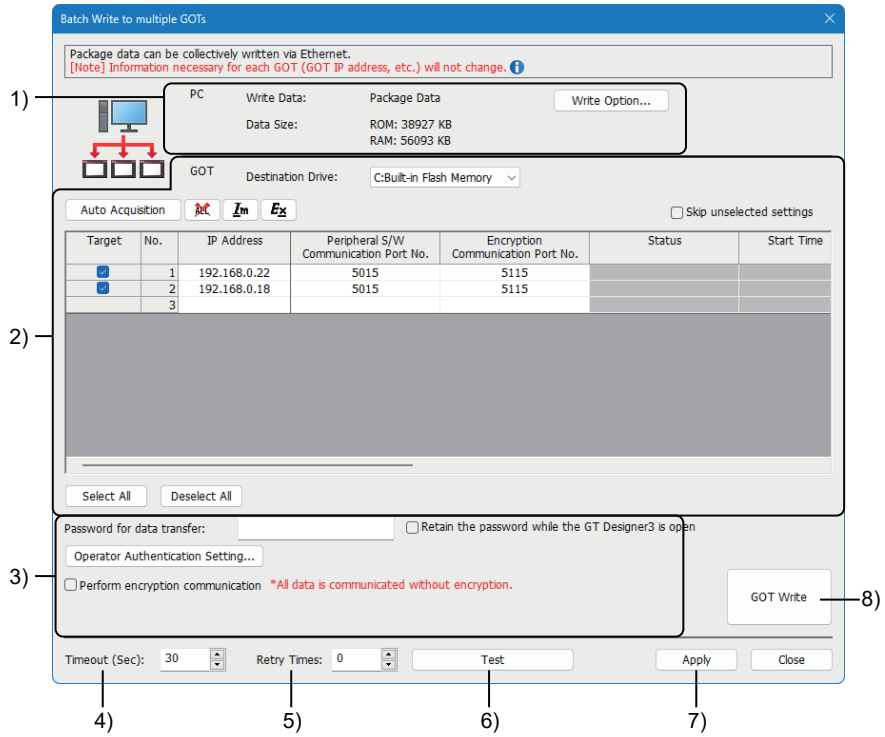
Precautions

If an error occurs during communication when the GOT is connected via a PLC and [RS232] is specified for [PC side I/F], increase the number of retries.

8.13.5 [Batch Write to multiple GOTs] dialog

Configure the settings to write the same package data to multiple GOTs in batch.

This dialog can be displayed by selecting [Communication] → [Batch Write to multiple GOTs] from the menu.



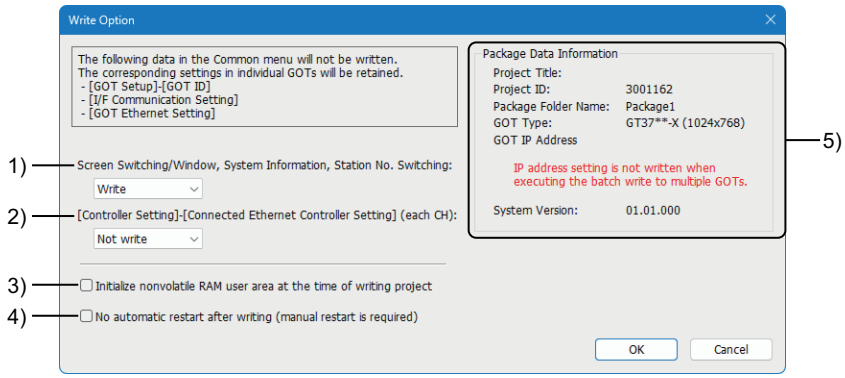
Item			Description
1)	[PC]	[Write Data]	Displays the type of the data to be written. It is fixed to [Package Data].
		[Data Size]	Data size of the package data.
		[Write Option] button	The [Write Option] dialog appears. Check the package data information, select the data to be included in the package data, set whether to initialize the nonvolatile RAM user area of the GOT and whether to restart the GOT after the data is written, and configure the other settings in the [Write Option] dialog. ☞ Page 467 [Write Option] dialog If you change the default settings for the following items in the [Write Options] dialog, an asterisk (*) is added to the button notation and the button text changes to pink. • [Screen Switching/Window, System Information, Station No. Switching] • [[Connected Ethernet Controller Setting] in the [Controller Setting] window (per channel)]

Item			Description
2)	[GOT]	[Destination Drive]	Select the drive where the package data will be written. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
	List of write destination GOTs	-	Set the write destination GOT by either of the following methods. • Click the [Auto Acquisition] button to acquire the information of the GOTs on the same network. • Enter the [IP Address] directly. Copying and pasting are available from the right-click menu in the write destination GOT list. You can also paste data edited in spreadsheet software or other applications. • Click the import button to import the file containing the GOT settings.
		[Auto Acquisition] button	Automatically acquires the GOT identification information, including the GOT IP address, and displays it on the screen. Any information entered before the button is pressed will be deleted. If the GOT type does not match the package data, [Unmatched GOT type] is displayed in the [Status] field.
		Delete All button	Deletes all rows.
		Import button	Imports the communication target setting, IP address, port number for communication with peripheral software, and port number for encrypted communication. The following file formats can be imported. • CSV file (.csv) • Unicode text file (*.txt) For information on importable file formats, refer to the following. ☞ Page 481 File format
		Export button	Exports the information displayed on the screen, including communication target setting, IP address, port number for communication with peripheral software, and other GOT information. The following file formats can be exported. • CSV file (.csv) • Unicode text file (*.txt)
		[Skip unselected settings]	Displays only the rows selected in the [Target] checkbox.
		[Target]	Select the write target GOT. This item is not settable for the GOT whose type is different from the one set in the project of the package data to be written.
		[No.]	Number for each GOT in the list. The number ranges from [1] to [256].
		[IP Address]	Set the IP address of the GOT. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
		[Peripheral S/W Communication Port No.]	Set the port number used for the communication with GT Designer3. Enter the port number set in [Peripheral S/W Communication Port No.] in [GOT Ethernet Common Setting]. The setting range is [1024] to [65534].
		[Encryption Communication Port No.]	Specify the port number used for the encrypted communication between GT Designer3 and the GOT. Enter the port number set in [Encryption Communication Port No.] in [GOT Ethernet Common Setting].
		[Status]	Displays the communication result.
		[Start Time]	Displays the start date and time of a communication test or data write to the GOT.
		[End Time]	Displays the end date and time of a communication test or data write to the GOT.
		[GOT ID]	ID number to identify the GOT
		[GOT Name]	Name to identify the GOT
		[GOT Type]	Displays the GOT type.
		[I/F]	Displays the interface type for each GOT IP address.
		[Select All] button	Selects all [Target] checkboxes.
		[Deselect All] button	Deselects all [Target] checkboxes.

Item			Description
3)	Authentication information	[Password for data transfer]	If data transfer security is set for the destination GOT, enter the data transfer password. If the entered password differs from the one set in the destination GOT, data cannot be written to the GOT. In this case, enter the password which is set on the destination GOT and perform the writing again.
		[Retain the password while the GT Designer3 is open]	Retains the data transfer password while GT Designer3 is running. As a result, password entry is not required for the next data write. The following operations clear the retained password. • Exit GT Designer3. • Change the data transfer security password of the GOT and establish communication with the GOT.
		[Operator Authentication Setting]	If the security mode of the write target GOT is mode 2, enter the operator name and password for operator authentication. When writing package data in security mode 2 to a GOT in security mode 1, a new operator must be registered. For details, refer to the following. ☞ Page 438 When writing package data in security mode 2 to a GOT in security mode 1
		[Perform encryption communication]	Performs encrypted communication.
4)	[Timeout (Sec)]		Set the time period for the communication between the personal computer and the GOT to time out. The setting range is [1] to [9999] seconds. Setting a value of less than [30] seconds may result in a communication error. Set the value to [30] seconds or more.
5)	[Retry Times]		Set the number of retries to be performed when a communication error occurs. The setting range is [0] time to [5] times.
6)	[Test] button		Executes a communication test between the personal computer and the GOT.
7)	[Apply] button		Confirms the new settings, and saves them in the current project. This item is displayed only when this dialog has been brought up from the [Communication] menu. The following shows the settings to be saved. • [Destination Drive] • [Skip unselected settings] • [Target] • [No.] • [IP Address] • [Peripheral S/W Communication Port No.] • [Encryption Communication Port No.] • [GOT ID] • [GOT Name] • [GOT Type] • [I/F] • [Perform encryption communication] • [Timeout (Sec)] • [Retry Times]
8)	[GOT Write] button		Writes the data to the target GOT.

[Write Option] dialog (for writing data to multiple GOTs in one go)

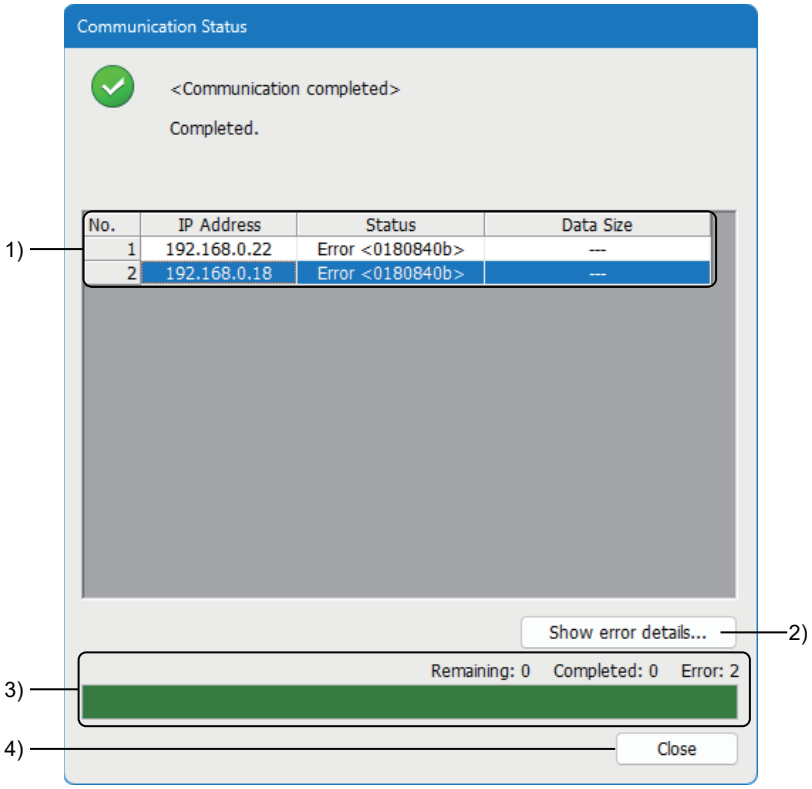
In this dialog, you can check the package data information, set whether to write common settings, set whether to initialize the GOT's nonvolatile RAM user area, and set the behavior or the GOT restart after writing.



Item			Description
1)	[Screen Switching/Window, System Information, Station No. Switching]		Set whether to write the following settings from the package data to the connected GOT. If [Not write] is selected, the settings of each connected GOT will be retained. • [Screen Switching/Windows] in the [Environmental Setting] window • [System Information] in the [Environmental Setting] window • [Station No. Switching] in the [Controller Setting] window If [Not write] is selected and the following conditions are satisfied, a write error occurs. • Global labels, labels (GT Designer3), OMRON NJ/NX tags, or AB native tags are set. • A label group is created. • The [Batch Write to Multiple GOTs] dialog is opened without opening the package data.
2)	[Connected Ethernet Controller Setting] in the [Controller Setting] window (per channel)		Set whether to write [Connected Ethernet Controller Setting] in the [Controller Setting] window to the connected GOT. If [Not write] is selected, the settings of each connected GOT will be retained.
3)	[Initialize nonvolatile RAM user area at the time of writing project]		Select this item to initialize the nonvolatile RAM user area when the package data is written to the GOT. If the GOT is started with BootOS, initialization does not occur even if installation is executed with this item selected.
4)	[No automatic restart after writing (manual restart is required)]		The GOT does not restart automatically after the package data is written to the GOT. When this item is selected, the GOT needs to be restarted manually after writing. If the GOT is started with BootOS, automatic restart occurs even if installation is executed with this item selected.
5)	[Package Data Information]	[Project Title]	Title of the project
		[Project ID]	ID number of the project
		[Package Folder Name]	Name of the folder that stores the package data
		[GOT Type]	GOT type of the project
		[System Version]	System application version in the package data

[Communication Status] dialog

This dialog displays the communication status or the results when a communication test or batch writing of package data is executed for multiple GOTs.



Item			Description
1)	Communication status list	-	Lists the IP addresses and communication status of target GOTs.
		[No.]	Displays the number for each GOT.
		[IP Address]	Displays the IP address of each GOT.
		[Status]	Displays the communication status or result.
		[Data Size]	Displays the transferred data size and/or the total data size. The data size is displayed according to [Status] as shown below. • Writing in progress: Transferred data size and total data size • [Completed]: Total data size • [Waiting]: - • [Error]: - For communication tests, the data size is not displayed.
2)	[Show error details] button		Displays the details of an error in the GOT selected in the communication status list.
3)	Progress bar		Shows the overall communication progress.
4)	[Cancel] button		Cancels communication with the GOTs being in the waiting status. The communication in progress cannot be canceled. The data in the GOTs in the completion status cannot be reset to the state before the data write.
	[Close] button		This item is displayed upon completion of communication. Closes the [Communication Status] dialog, and updates [Start Time], [End Time], and [Status] in the [Batch Write to multiple GOTs] dialog.

File format

The following shows the file format used for import and export.

Target	No.	IP Addres	Peripheral	Encryptior	Status	Start Time	End Time	GOT ID	GOT Nam	GOT Type	I/F
TRUE	1	192.168.0.	5015	5115	Error <0180840b>	5/8/2025 17:31	5/8/2025 17:32				
TRUE	2	192.168.0.	5015	5115	Error <0180840b>	5/8/2025 17:31	5/8/2025 17:33				

CSV files only support the languages supported by the OS.

For imports, some items are not imported but must still be included in the file.

○: Import target

—: Not import target

Import target	Item name	Item name in GT Designer3	Description	Double quotation marks ("") required for Unicode text files
○	Target	Communication target	Stores TRUE or FALSE (whether the item is a communication target).	—
—	No.	No.	Stores the GOT number (1 to 256).	—
○	IP Address	IP address	Stores the IP address of the GOT.	○
○	Peripheral S/W Communication Port No.	Port number for communication with peripheral software	Stores the port number of the GOT for communication with peripheral software.	○
○	Encryption Communication Port No.	Port number for encrypted communication	Stores the port number of the GOT for encrypted communication.	○
—	Status	Status	Stores the status (communication result).	—
—	Start Time	Start time	Stores the start date and time of a communication test or data write to the GOT.	○
—	End Time	End time	Stores the end date and time of a communication test or data write to the GOT.	○
—	GOT ID	GOT ID	Stores the GOT ID.	○
—	GOT Name	GOT name	Stores the GOT name.	○
—	GOT Type	GOT type	Stores the GOT type.	○
—	I/F	I/F	Stores the type of the connection interface.	—

8.13.6 [Communicate with Memory Card] dialog

In this dialog, set the information to be written to the data storage and the destination to write the data.

This dialog can be displayed by selecting [Communication] → [Write to Memory Card] from the menu.

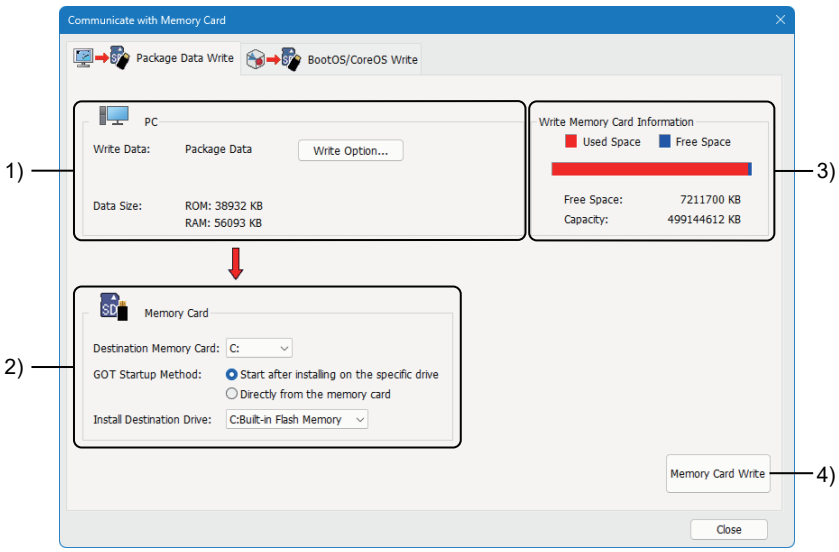
The [Communicate with Memory Card] dialog has the following two tabs for each function.

Switch the tabs according to your purpose.

Tab	Purpose
☞ Page 482 [Package Data Write] tab	Write package data to a data storage.
☞ Page 483 [BootOS/CoreOS Write] tab	Store BootOS or CoreOS + BootOS to a data storage.

[Package Data Write] tab

Write package data to a data storage.



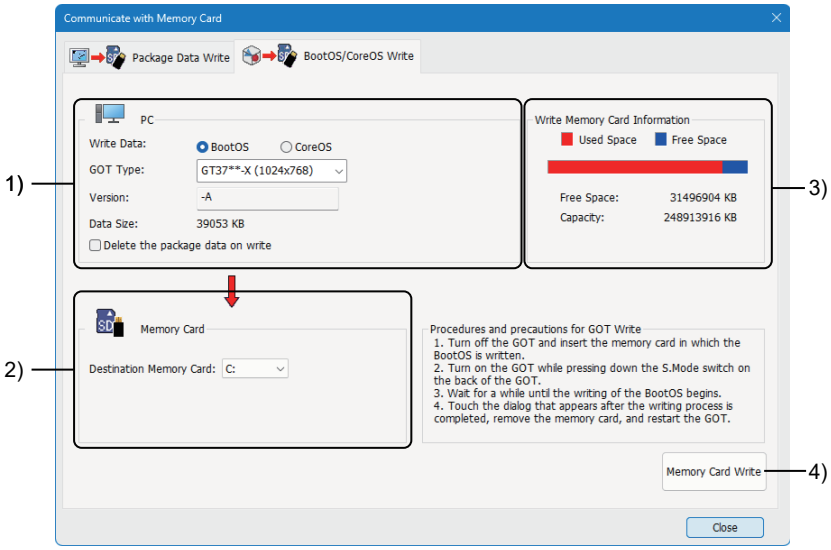
Item			Description
1)	[PC]	[Write Data]	Displays the type of the data to be written to the GOT. It is fixed to [Package Data].
		[Write Option] button	Check the package data information, select the data to be included in the package data, set the write mode, and others in the dialog displayed by clicking this button. ☞ Page 467 [Write Option] dialog
		[Data Size]	Displays the data size of the package data.
2)	[Memory Card]	[Destination Memory Card]	Select the drive of the destination data storage. The drive which is displayed in [Hard Disk Drive] or [Device with Removable Storage] of Windows can be used in [My Computer]. The available drives depend on the personal computer.
		[GOT Startup Method]	Select the startup operation of the GOT.
		[Install Destination Drive]	Select the destination drive of the GOT to which the package data is written when [Start after installing on the specific drive] is selected for [GOT Startup Method]. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
3)	[Write Memory Card Information]		Information of destination data storage capacity.
4)	[Memory Card Write] button		Writes the package data to the data storage.

[BootOS/CoreOS Write] tab

Install BootOS only, or both CoreOS and BootOS on the data storage.

For functions that require upgrading BootOS and CoreOS versions, refer to the following.

☞ Page 3732 Functions that require upgrading the versions of BootOS and CoreOS



Item			Description
1)	[PC]	[Write Data]	Select the type of the data to be stored. When [CoreOS] is selected, BootOS is also installed.
		[GOT Type]	Select the GOT type for BootOS or CoreOS.
		[Version]	Version of BootOS or CoreOS
		[Data Size]	Data size of BootOS or CoreOS
		[Delete the package data on write]	Select this item to delete the package data in the GOT when installing BootOS or CoreOS on the GOT. When this item is deselected, only BootOS or CoreOS is updated.
2)	[Memory Card]	[Destination Memory Card]	Select the drive of the destination data storage. The drive which is displayed in [Hard Disk Drive] or [Device with Removable Storage] of Windows can be used in [My Computer]. The available drive depends on the personal computer.
3)	[Write Memory Card Information]		Information of destination data storage capacity.
4)	[Memory Card Write] button		Stores BootOS or CoreOS to the data storage.

8.14 Troubleshooting

When an error occurs during the data transfer, check the following items.
If an error occurs after the following actions are taken or an error which is not described in the following list occurs, consult a service representative.
Errors whose error codes start with [801f] are returned from hardware (such as CPUs, network modules, and GOTs).
Refer to the manual of each device to take the corrective action.

Error code	Error message	Description	Solution
80100005	An error occurred. The file in the p.c. cannot be written.	Failed to write to the file in the personal computer.	Check that the drive to which the file is written can be written or has enough available space in the disk capacity.
80110003	An error occurred. Please check Port No.	The set port number is out of the range.	Check the port number.
80110004	An error occurred. Time out error	Communication time error	Check the communication cable and the power of the device.
80110006	An error occurred. The GOT is being accessed by another application.	The GOT is being accessed by another application.	Wait until another application ends.
80110007	An error occurred. Quality of communication signal error. Please check communication settings.	Error by the quality of the communication line	Decrease the baud rate and perform the communication.
80110008	An error occurred. Please check Baud rate.	The controller does not support the set baud rate.	Check the baud rate which the controller supports.
80110015	An error occurred. Please enter the correct remote password.	Remote password specification error.	Specify the correct remote password.
80112401	An error occurred. Unable to communicate with GOT via Ethernet. The possible causes are shown below. (1) Basic system application is not written in the GOT (2) The GOT is not turned on (3) Communication Settings are not properly set (4) GOT IP address is not properly set (5) Incorrect wiring	The GOT does not exist on the network.	Check the following. • The basic system application is written to the GOT. • The GOT is powered on. • The communication settings are set correctly. • [GOT IP Address] is set correctly in the [Communication Configuration] dialog. • The wiring is correct.
80112402	An error occurred. Unable to communicate with GOT via Ethernet. The possible causes are shown below. (1) The GOT is communicating with another computer (2) GOT IP address is not properly set (3) GOT Port No. is not properly set	Socket line open error (Failed to generate a socket.)	Check the following. • The GOT is not communicating with another computer. • The communication target is not the network device excluding the GOT. • [Peripheral S/W Communication Port No.] in the [Communication Configuration] dialog matches with the port number set to the GOT.
80112405	An error occurred. Please check if both GOT and PC are properly connected together via Ethernet cabling.	Network error	Check the GOT is connected to the network correctly.
80112406	An error occurred. Unable to communicate with GOT via Ethernet. The possible causes are shown below. (1) The GOT is communicating via USB/ RS232 (2) The GOT is not turned on	The connecting socket is disconnected forcibly.	Check the following. • The GOT is not communicating using the USB or RS-232. • The GOT is powered on.
801fa000	An error occurred. Routing parameter is insufficient in the GOT of the relay station. Please set routing parameter for the GOT.	The routing parameter set for the relay station (GOT) is incorrect.	Check the routing parameter setting of the relay station.
801fa080	An error occurred. Information is insufficient in the GOT of the relay station Ethernet setting. Please set the Ethernet setting of the GOT.	The Ethernet setting configured for the relay station (GOT) is incorrect.	Check the routing parameter and the IP address.

Error code	Error message	Description	Solution
801fa200	An error occurred. Communication driver is not booted in the GOT of the relay station. Please check the GOT setting.	The possible causes are as follows. • No communication driver is installed on the GOT. • The package data is corrupt. • The communication driver does not support the relay function.	Install the package data on the GOT again.
801fa303	An error occurred. GOT restricts the communication with Ethernet. Unable to communicate with GOT via Ethernet.	Communication via an Ethernet network is not allowed.	Clear the Ethernet Access Control (GS454).
801fa304	An error occurred. The basic system application to be written is not valid for the H/W version of the GOT. Please prepare the new drawing software.	The hardware versions of BootOS and GOT do not match.	Install BootOS from the appropriate version of GT Designer3.
801fa305	An error occurred. SD card cannot be accessed. The possible causes are shown below. • SD card cover of the GOT is open. • SD card access switch of the GOT is turned off.	The possible causes are as follows. • The SD card cover is open. • The SD card access switch is turned off.	Close the SD card cover of the GOT. Turn on the SD card access switch of the GOT.
801fa306	An error occurred. Project data, system application, and resource data cannot be written/deleted since the write-protect switch is activated. Please deactivate the write-protect switch.	The write protection switch of the data storage is on.	Cancel the write protection switch of the data storage.
801fa309	An error occurred. The package data/resource data cannot be written due to the shortage of free space on the drive.	The available space of the drive is not sufficient.	Acquire the free space by deleting unnecessary files or others. Or, reduce the size of the package data or resource data to be written.
801fa30b	An error occurred. Selected Drive cannot be accessed.	The specified drive does not exist.	Check the specified drive.
801fa30c 801fa30d	An error occurred. The following drive is not mounted. X: XXXXXXXXX Check the drive.	The data storage is not connected to the specified drive.	Check the data storage is connected correctly to the specified drive.
801fa311	An error occurred. The specified file cannot be found. Update the information. (Click on the "Get Drive Information" button.)	The specified file does not exist.	Check if the specified file name is correct.
801fa314 801fa315	An error occurred. The specified drive cannot be formatted.	The drive is used for the GOT direct startup and therefore cannot be formatted.	Select a drive that is not used for the GOT direct startup.
801fa31f	An error occurred. The password for data transfer is wrong.	An authentication error occurred due to an incorrect password.	Specify the correct password.
801fa32f	An error occurred. This function cannot be executed since the GOT does not support data write of the selected resource data. The possible causes are shown below. • The resource data that the destination GOT does not support is selected. • Version of the basic system application in the GOT does not support data write of the selected resource data.	The write destination GOT does not support the file format of the selected resource data. Or, the target GOT has an older version of the standard system application, and therefore the resource data file cannot be written.	Delete the unsupported resource data file from the write target list. Or, install the latest version of GT Designer3, and then write the package data to the GOT.
801fa330	An error occurred. Failed to access the file. Perform the following operations. • Reduce the number of files in the destination. • Check if the selected file in the GOT exists. • Check if the selected file in the GOT can be overwritten.	The number of files and folders has exceeded the storage limit for the root directory of the FAT16 formatted data storage on the write destination drive.	Reduce the number of the files and folders in the data storage on the write destination drive.
		The selected file is nonexistent or write-protected in the GOT.	Check the following. • The selected file exists. • The selected file is not write-protected.
801fa331	An error occurred. Communication error	This occurs when the GOT is unable to perform the GOT diagnostics (for example, when there is an IP address conflict).	—

Error code	Error message	Description	Solution
801fa332	An error occurred. Communication with the GOT is disconnected during monitoring. Check the state of the GOT and retry.	The GOT lost communication while monitoring (for example, if you changed the GOT setting in the utility).	Wait for a while and then start monitoring again.
801fa338	An error occurred. The password does not meet password requirements. Check the password.	A password strength error.	Specify a password that meets the requirements.
801fa33a	An error occurred. The operator name or password is invalid. Check the operator name or password.	The entered operator name or password does not exist in the GOT3000 operator information.	Specify a registered operator name and password.
801fa33b	An error occurred. The new password is the same as the previous one. Specify a different password.	The new password exists in the password history.	Specify a different password.
801fa33c	An error occurred. The new password is the same as the current one. Specify a different password.	The new password is the same as the current one.	Specify a different password.
801fa33d	An error occurred. The password of the authenticated operator needs to be changed for the following reasons: • Password expired • [Change password at next login] enabled Write from [Communication] -> [Write to GOT] or change the password in the GOT.	A password change is required for one of the following reasons. • The password has expired. • [Change password at next login] is enabled.	Change the password when writing to the GOT or during operator authentication on the GOT.
801fa33f	An error occurred. The operator has been set to a locked state due to exceed the specified number of consecutive failures. Please consult the administrator to unlock.	The number of the predetermined operator lock count has been exceeded.	Unlock the operator account in the utility.
801fa340	An error occurred. An invalid login operation was found sequentially. Run after a while.	An unauthorized login has been attempted.	Log in with the correct password after the login block time has elapsed.
801fa341	An error occurred. Incorrect login operation is detected sequentially for operator in a locked state. Please consult the administrator to unlock.	The number of predetermined operator lock count has been exceeded and an unauthorized login has been attempted.	Unlock the operator account in the utility.
801fa342	An error occurred. The operator is in a locked state. Please consult the administrator to unlock.	A locked operator attempted to log in.	Unlock the operator account in the utility.
801fa343	An error occurred. The operator is invalid. Please consult the administrator to unlock.	A disabled operator attempted to log in.	Edit the user information of the operator in the utility.
801fa344	An error occurred. Exceed the maximum number of operators that can log in simultaneously. Please wait for other operators to log out.	The number of simultaneous logins has been exceeded.	Log in after another operator logs out.
801fa345	An error occurred. Only Administrators or operators that in the user-defined groups with operational privileges can perform this function. Please use an administrator or an operator that in the user-defined group with operational privileges to log in.	The operator does not have operation rights.	Log in as an administrator or an operator in the user-defined group with operation rights.
801fa346	An error occurred. The operator has been logged out due to exceed the automatic logout time. Please log in again.	A timeout has occurred.	Retry the login.
801fa347	An error occurred. The operation was operated by an unauthenticated operator. Please log in.	A logged out operator attempted operation.	Log in.

Error code	Error message	Description	Solution
801fa348	An error occurred. An logged operator is editing. Run after a while.	An error occurred during editing.	—
801fa349	An error occurred. Operator authentication failed. Please contact the administrator.	An unknown error occurred during operator authentication.	—
801fa413	An error occurred. Failed to access the file. Perform the following operations. • Delete the files with their paths exceeding 78 characters from the target drive. • Delete the files with their sizes greater than or equal to 2GB. If the problem persists, restart the GOT.	An internal error of the file access library	—
801fc202 801fc205	An error occurred. Please confirm whether a remote password is set in the relay station. It is not possible to establish communication when a remote password is set in the relay station.	When the GOT accesses another station, the remote password authentication fails.	Do not set a remote password in the relay station and other stations, or exclude the GOT from the remote password authentication.
80110009	An error occurred. Communication error The possible causes are shown below. • The communication port settings are incorrect. • The cable is disconnected or broken. • The GOT is turned off. • The communication setting of each controller or routing parameter setting is incorrect. • Dialog window is displayed in the GOT. • Remote password is set for unsupported PLC/unit. • It is not connected with GOT3000. • The time set for "Timeout (Sec)" is short. • The connection configuration is incorrect.	Packet send error	Check the line is connected.
8011000a		Communication time error	Check the GOT operates normally and perform the communication again.
80112208		USB line error (Cable is disconnected halfway.)	Check the USB cable connected to the GOT.
80112403		Socket line close error	Perform the communication again.
80112501		Easysocket generate error	Check the following. • Easysocket is installed. • The GOT is in communication process of another connection type. • The GOT is connected correctly.
801fa302		The GOT is processing data and no interrupt is available.	After the GOT completes the current process, perform the operation again.
801fa307		The specified file is read-only.	Check the destination data storage.
801fa30f		The specified path does not exist.	Check the specified path is correct.
801fa310		The specified path is incorrect.	Check the input path. • The reserved word is not used. • A dot is not used at the top. • A dot is not used at the end. • The path and the file name are not too long.
a	An error occurred. The software installation file is damaged or incomplete. Please reinstall.	Failed to generate the object of EZSocket.	Reinstall GT Designer3.
c9	Memory Card error Failed to create the folder. Check if the destination memory card exists.	Folder creating error	Check the destination data storage.
ca	Memory Card error Failed to delete the folder.	Folder deleting error	Check either of the following operations. • The specified folder exists. • The specified folder is not read-only.
cc	Memory Card error Failed to copy the file. The capacity of the destination memory card is full. Reduce the capacity. *The specified drive may be write protected.	File copy error	Check the following. • Capacity of the data storage • Access privilege of the destination drive When the user account control is valid, set a destination drive other than drive C.
dc	Memory Card error Failed to delete the file.	File deleting error	Check either of the following operations. • The specified file exists. • The specified file is not read-only.

Error code	Error message	Description	Solution
132	An error occurred. The BootOS cannot be written if its version is older than the one of the BootOS written in the GOT. Version of the BootOS in the GOT: BB Version of the BootOS to be written: AA	A later version of BootOS is already installed on the GOT.	Install the BootOS version that is newer than the one installed on the GOT.
133	An error occurred. The GOT type is different or unsupported.	The GOT type acquired from the GOT and the one of the package data do not match. Or, the type of the GOT to communicate with is not supported.	Check the project and the GOT type of the destination GOT.
134	An error occurred. Package data is not written. Write the package data.	BootOS was started during the following process. • Installing BootOS • Writing the package data • Writing or acquiring the GOT identification information • Performing the processing other than writing or acquiring of the security	Write the package data again.
13a	An error occurred. Functions to be written and already written functions conflict with each other. Selected function: %s Written function: %s *Select "Synchronize" for Write Mode in the dialog of Write Option or delete the package data from the drive information in the [GOT Read] tab, and then write the package data.	Since the function which is written and the one which is already written are competing, the system application cannot be written.	Write the package data after performing either of the following operations. • Selecting [Synchronize] in [Write Mode] of [Write Option] • Deleting the package data in [Drive Information] of [GOT Read]
13d	An error occurred. There are more than 4 communication drivers that are already written in the GOT and those to be written. (Up to 4 communication drivers can be written in GOT.) Delete the already written communication drivers and write the items again. *Select "Synchronize" for Write Mode in the dialog of Write Option or delete the package data from the drive information in the [GOT Read] tab, and then write the package data.	Four communication drivers have already been installed on the GOT. Therefore, the communication driver cannot be installed.	Write the package data after performing either of the following operations. • Selecting [Synchronize] in [Write Mode] of [Write Option] • Deleting the package data in [Drive Information] of [GOT Read]
190	An error occurred. The package data in the memory card is directly started. The following operations cannot be performed. • Deleting the package data during direct startup • Formatting the startup drive • Writing another package data to the drive of package data in execution • Writing package data to the destination other than the drive of package data in execution *Take out the memory card from the GOT to perform these operations.	When the package data is started from a data storage directly, the following operations cannot be performed. • Deleting the package data during direct startup • Formatting the startup drive • Writing another package data to the startup drive • Writing package data to a drive other than the startup drive	Do not perform the following operations. • Deleting the package data during direct startup • Formatting the startup drive • Writing another package data to the startup drive • Writing package data to a drive other than the startup drive
191	An error occurred. Failed to create the file.	Failed to create a file when the resource data is read.	Check the destination file is not read only.
192	An error occurred. Failed to create the folder.	Failed to create a folder when the resource data is read.	Check the destination file is not read only.
193	An error occurred. The processing is not properly completed since the data may be broken.	The data is corrupted. Or, the data could not be converted for writing during batch writing to multiple GOTs.	Recovery may be possible if you retry after reinstalling GT Designer3. However, recovery is not possible if the data in the saved file is corrupted.
194	An error occurred. The processing is not properly completed since the file may be broken.	The data is corrupted.	Recovery may be possible if you retry after reinstalling GT Designer3. However, recovery is not possible if the data in the saved file is corrupted.

Error code	Error message	Description	Solution
195	An error occurred. The package data to be written is insufficient. Change the write mode to "Synchronize" and retry.	The basic system application is not included in the package data.	Add the basic system application and the project data in the package data.
196	An error occurred. The system major version of the package data in the GOT is different from the one of the package data to be written. The project data and special data will be deleted since they do not work properly if the major versions are different. Package data without project data and basic system application cannot be written.	This error occurs when the package data is written without selecting the project data in the [Write Option] dialog, the same package data exists in the GOT, and the system application of the different major version is written.	Write the package data after performing either of the following operations. • Selecting [Synchronize] in [Write Mode] of [Write Option] • Deleting the package data in [Drive Information] of [GOT Read]
197	An error occurred. Multiple package data are written in the drive. In the current software, data cannot be written to the drive where multiple package data exist. Please update the software version.	Multiple package data exist in the destination drive of the package data.	Write the package data from GT Designer3 of the latest version or write the package data to other drives.
198	An error occurred. There is no package data in the specified drive.	The package data does not exist in the specified drive.	Specify the drive in which the package data is stored.
199	An error occurred. The package data cannot be written with the write mode "Select" since project security is set for the project. Change the write mode to "Synchronize" and retry.	The package data with the project security is written to the GOT. Therefore, the data cannot be written by setting [Write Mode] to [Selection] in the [Write Option] dialog.	Write the data by setting [Write Mode] to [Synchronize] in the [Write Option] dialog.
19a	An error occurred. Unsupported GOT security is set. Please update the software version.	The GOT does not support the security setting to be written.	Install the latest version of GT Designer3, and then write the package data to the GOT.
19e	An error occurred. The write processing cannot be executed since the setting to restrict write from GT Designer3 of the older versions is in effect. Check the version of GT Designer3 in which the editing is executed.	The setting, which restricts writing data from earlier versions of GT Designer3, is enabled on the GOT. The GT Designer3 version is old.	Install the latest version of GT Designer3, and then perform the operation again.
1a2	An error occurred. This function cannot be executed since the GOT does not support GOT diagnostics function. The possible cause is shown below. • Version of the basic system application in the GOT does not support GOT diagnostics function.	An old version of GT Designer3 was used.	Install the latest version of GT Designer3, and then write the package data to the GOT.
1a3	An error occurred. There is unsupported error information in the GOT. Please update the software version.	The system alarm format has been changed.	Install the latest version of GT Designer3, and then perform the operation again.
1a6	An error occurred. FA transparent function is used in other MELSOFT applications for the GOT. Terminate the function and retry.	Another MELSOFT application is using the FA transparent function, and therefore the following processes cannot be executed. • Writing package data • Installing BootOS • Deleting package data • Formatting a drive • Starting monitoring of GOT diagnostics	Wait 30 seconds after the application ends the FA transparent function, and then execute the process again.
1a9	An error occurred. The resource file that does not exist is specified. Check the file to be written.	The selected resource data file is nonexistent.	Check that the file exists.
1b0	An error occurred. The resource file that cannot be read is specified. Check the file to be written.	Another software application is using the selected resource data file, and therefore the file cannot be opened.	Check that the file is not being used by the other software applications.

Error code	Error message	Description	Solution
1b1	An error occurred. Memory capacity in the PC is insufficient. Check the size of the resource file to be written.	The personal computer does not have enough memory, and therefore the selected resource data file cannot be opened.	Perform the following operations on the personal computer to free up the hard disk space and memory, and then write the resource data file. • Exit unnecessary applications. • Delete unnecessary files.
1b4	An error occurred. The following function to be written conflicts with the function that is already written in the GOT. Key Window Design Information *Select "Synchronize" for Write Mode in the dialog of Write Option or delete the package data from the drive information in the [GOT Read] tab, and then write the package data.	The system application cannot be written because the application conflicts with the existing one in the GOT.	Write the package data after performing either of the following operations. • Selecting [Synchronize] in [Write Mode] of [Write Option] • Deleting the package data in [Drive Information] of [GOT Read]
1b5	An error occurred. The package data cannot be written since the communication via Ethernet will be disabled if it is written in the following cases. Write the package data from [Communication] -> [Write to GOT]. • Package data does not exist on the destination • The package folder is different from the one of the package data on the destination drive • The project ID is different from the one of the package data on the destination drive • The major version of the system application is different from the one of the package data on the destination drive • Security key is set for the destination package data • Free space of the destination drive is insufficient	During batch writing to multiple GOTs, some necessary settings for the GOT (such as individual identification information and controller settings) are not transferred. In the following cases, writing is aborted because the post-write data is incomplete. • Package data does not exist on the destination • The package folder is different from the one of the package data on the destination drive • The project ID is different from the one of the package data on the destination drive • The major version of the system application is different from the one of the package data on the destination drive • Security key is set for the write target package data • Security key is set for the destination package data • Free space of the destination drive is insufficient	Install via memory card, or write the package data to the GOT using [Write to GOT] in the [Communication] menu.
1b6	An error occurred. The package data cannot be written since the data in the GOT contains the following settings. • Global label • Label (GT Designer3) • OMRON NJ/NX Tag • AB Native Tag *Change the setting of "Screen Switching/Window, System Information, Station No. Switching" to "Write" in the dialog of Write Option, and then write the package data.	If screen switching/window, system information, and station switching are not written, the writing process will be interrupted if the following settings are present in the GOT. • Global label • Label (GT Designer3) • OMRON NJ/NX Tag • AB Native Tag	Display [Write Option] in the [Batch Write to multiple GOTs] dialog, set [Write] for [Screen Switching/Window, System Information, Station No. Switching], and write the package data.
1bd	An error occurred. Functions to be written and already written functions conflict with each other. Either Kana-kanji conversion or Pinyin conversion can be written depending on the conversion method. *Select "Synchronize" for Write Mode in the dialog of Write Option or delete the package data from the drive information in the [GOT Read] tab, and then write the package data.	The system application cannot be written because it conflicts with an existing function that has already been written.	Select "Synchronize" for [Write Mode] in [Write Option], or delete the package data from [Drive Information] in [GOT Read], and then write the package data.
200	An error occurred. The data to be retrieved was created by a software version newer than the current one, or it was created with an unsupported GOT type. Read again after changing "Read Data" to "Package Data".	Appears in the following cases. • When project data whose major version of the GT Designer3 system is earlier than the major version of the GOT is read • When project data of an unsupported GOT type is read	Read the package data after performing either of the following operations. • Change [Read Data] to [Package Data]. • Install the latest GT Designer3.

Error code	Error message	Description	Solution
201	An error occurred. Unsupported functions have been set up in the package data of the GOT. Please update the software version.	Appears when write, read, or verification is executed to the GOT for which an unsupported function is set.	Install the latest version of GT Designer3, and then perform the operation again.
202	An error occurred. The package data information cannot be acquired. The possible causes are shown below. • There is an encrypted project data that is not activated. • The package data is broken.	Appears when a drive containing encrypted project data that has not been started is specified, and read or verification is executed.	Specify a drive that does not contain encrypted project data that has not been started, and execute read or verification.
203	An error occurred. The data cannot be written with the write mode "Select" since different package data has been written. *Select "Synchronize" for Write Mode in the dialog of Write Option or delete the package data from the drive information in the [GOT Read] tab, and then write the package data.	The data cannot be written with the write mode set to "Select" because different project data is already written to the GOT.	Write the package data after performing either of the following operations. • Selecting [Synchronize] in [Write Mode] of [Write Option] • Deleting the package data in [Drive Information] of [GOT Read]
205	An error occurred. An unsupported security mode has been set. Please update the software to the latest version.	An unsupported security mode has been set.	Install the latest version of GT Designer3 and retry.
206	An error occurred. Encryption communication cannot be performed. The possible causes are shown below. • The Encryption Communication Port No. settings are incorrect. • The Encryption Communication Port for GOT Ethernet Common Setting has been closed.	Encrypted communication cannot be performed.	Perform one of the following operations and retry. • Check the encrypted communication port number setting. • Check that the encrypted communication port in the GOT Ethernet common settings is open.
208	An error occurred. The package data cannot be written. Possible causes are shown below. • The package data that is different from the one to be written is written. • The encryption settings are different between the package data to be written and the package data written to the GOT.	—	Perform one of the following operations. • Write the same package data as the one already written. • Write the package data encrypted with the same encryption password as the one used for the package data already written. • Perform writing to each GOT, not batch writing to multiple GOTs.
20a	An error occurred. The security mode cannot be changed to Mode 2 since the operator name and password of the new operator to be registered are not set. Write the package data after entering the operator name and password from [Operator Authentication Setting].	The error has occurred because all of the following conditions are satisfied. • The security mode of the package data to be written is mode 2. • The security mode of the write destination GOT3000 is mode 1. • [Operator Name (Register New Operator)] and [Password (Register New Operator)] are left blank in the [Operator Authentication Setting] dialog.	Perform either of the following operations and retry writing. • Set the security mode of the package data to be written to mode 1. • Enter [Operator Name (Register New Operator)] and [Password (Register New Operator)] in the [Operator Authentication Setting] dialog.
	An error occurred. The security mode cannot be changed to mode 2 because the name and password of the new operator to be registered are not specified. Specify the operator name and password to write the package data.	The error has occurred because all of the following conditions are satisfied. • The security mode of the package data to be written is mode 2. • The security mode of the write destination GOT3000 is mode 1. • The operator name and password of the new operator to be registered have not been specified.	Perform either of the following operations and retry writing. • Set the security mode of the package data to be written to mode 1. • Specify the name and password of the new operator to be registered.

PART 5 Common settings

9 Changing the GOT type of the project

10 Setting the GOT basic operations ([GOT Environmental Setting])

11 Configuring the GT SoftGOT3000 settings ([SoftGOT Setting])

12 Configuring the utility settings ([GOT Setup])

13 Setting the GOT Ethernet interface ([GOT Ethernet Setting])

14 Configuring the communication method between the GOT and the controller ([Controller Setting])

15 Setting the interaction function for equipment on Ethernet ([GOT Network Interaction])

16 Checking the interface settings of the GOT ([I/F Communication Setting])

17 Comment setting ([Comment])

18 Registering parts ([Parts])

9 Changing the GOT type of the project

☞ Page 493 Specifications of the GOT type change
☞ Page 502 Operating the monitor screen of the GOT using gestures (gesture function)
☞ Page 510 Expanding the base screen size
☞ Page 519 [Type Setting] dialog
☞ Page 528 [Output] window

9.1 Specifications of the GOT type change

GT37 SoftGOT3000

The available functions depend on the GOT model.
Thus, set the GOT type of the project according to the GOT model.
If you change the GOT type in the [Type Setting] dialog, some settings may be deleted or changed, or the shape and shape frame settings may be changed.

☞ Page 493 Settings to be held when the GOT type is changed
☞ Page 493 Settings to be deleted when the GOT type is changed
☞ Page 494 Settings to be changed when the GOT type is changed
☞ Page 495 Settings that cannot be restored after the GOT type change
☞ Page 495 Changing the GOT type while GT Simulator3 is running
☞ Page 495 Resizing the screens, figures, and objects

9.1.1 Settings to be held when the GOT type is changed

The setting of the changed GOT that is available in the newly set GOT is held after the GOT type change.

Screen size

When the GOT type is changed to one with the same screen resolution, the screens are not resized.
The figures and objects on the screens are also not resized.

Channel No. setting

When the GOT type after the change has the same channel No. and interface as those of the GOT type before the change, the channel No. is assigned to the same interface before the change.

Library

The user-created library is not changed.
The parts and templates in the library can be used in the newly set GOT.
However, the library data containing figures or objects incompatible with the new GOT is not displayed on the library image list.

9.1.2 Settings to be deleted when the GOT type is changed

Functions, settings, or screens that the newly set GOT does not have are deleted.

9.1.3 Settings to be changed when the GOT type is changed

If the originally-selected GOT does not support some settings of the newly-selected GOT, the default values are applied according to the other related settings of the newly-selected GOT.
For some of the unsupported settings, the default values may not be applied depending on the combination of the originally-selected GOT and the newly-selected GOT.

Screen size

Screen type	Description
Original-size base screen	When the GOT type is changed to one with a different screen resolution, the base screens are resized to the screen size of the newly-selected GOT. Select whether to reposition and resize the figures and objects on the screens. For information on how the screen data is converted, refer to the following. ☞ Page 495 Resizing the screens, figures, and objects
Expanded base screen	Select whether to resize the screens. For information on how the screen data is converted, refer to the following. ☞ Page 495 Resizing the screens, figures, and objects
Window screen	

Channel No. setting

When the newly set GOT does not have the channel No. that the changed GOT has, the default value is set in the channel No.
When a channel No. with the default value is already used in another interface, the channel No. is set to 0.
When the newly set GOT does not have the communication driver set for the channels of the changed GOT, the default communication driver is set.

Device settings

The incompatible device range with the newly set GOT is shown as [??] in GT Designer3.
In this case, set the device again.
The devices with device types (BCD, real number) that the newly set GOT does not support are deleted.

Project security

When the project security is set, the following user cannot change the GOT type.

- Users who are restricted to edit the project by the project security
- Users who are restricted to display or edit a screen

Image data (BMP)

Item	Description
Changing 16-tone monochrome to 256 or 65536 colors	When the GOT type is changed, the number of bits per pixel of 16-tone monochrome image data cannot be held. The image data is converted to the image data with either 8 bits or 16 bits. Thus, the data size of the image data is increased.
Restriction due to the arrangement method	When using image data of BMP files (256 colors), use the same method to display all the image data. The color of the image data of BMP files (256 colors) may be changed depending on the arrangement method at the GOT type change. • Importing the BMP file by selecting [Figure] → [Import Image Data] from the menu The image data is displayed in 8-bit color. • Copying the BMP file to the clipboard and pasting it on the screen The image data is displayed in 16-bit color.

Startup logo setting

When the screen size of the newly set GOT does not correspond to that of the changed GOT, the size of the startup logo may be changed.
When the screen size has been changed, set the startup logo again.

Public folder of the GOT Mobile function

If you change the setting of [Package Folder Name] in the [Type Setting] dialog, the path to the public folder of the GOT Mobile function is automatically changed accordingly.

With the change of the package folder name, if the path to a file in the public folder contains more than 78 characters, the file becomes inaccessible.

For details on the public folder in the GOT Mobile function, refer to the following.

☞ Page 2760 Public folder

Specifying key codes

Key codes with functions that are not supported by the GOT after conversion may become unusable after conversion.

9.1.4 Settings that cannot be restored after the GOT type change

The settings that have been changed through the GOT type change cannot be restored.

The operation history of [Undo] is deleted at the GOT type change.

Saving the project before the GOT type change is recommended.

9.1.5 Changing the GOT type while GT Simulator3 is running

If the GOT type or standard language is changed, the running GT Simulator3 will exit.

9.1.6 Resizing the screens, figures, and objects

In the [Type Setting] dialog, change the GOT type to one with a different screen resolution and click the [OK] button to display the dialog prompting you to specify the method of changing the figures and objects on the screens.

How the screen data is converted depends on the types of the base screens before the GOT type change and the method of changing the figures and objects on the screens.

For more details, refer to the following.

☞ Page 497 How the original-size base screen data is converted

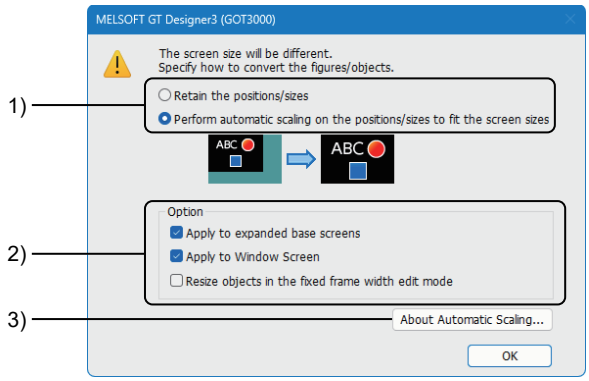
☞ Page 498 How the expanded base screen data is converted (when enabling the base screen size expansion for the newly-selected GOT)

☞ Page 499 How the expanded base screen data is converted (when disabling the base screen size expansion for the newly-selected GOT)

☞ Page 500 How the window screen data is converted

☞ Page 501 How the figures and objects are changed

☞ Page 501 GOT2000 project data



Item			Description
1)	Method of changing the figures and objects		Select whether to reposition and resize the figures and objects according to the screen size of the newly-selected GOT. The following shows selectable items. • [Retain the positions/sizes] Resizes the screens, and does not reposition and resize the figures and objects on the screens. If the screen size of the newly-selected GOT is smaller than the screen size of the originally-selected GOT, some of the figures and objects may enter the temporary area. In this case, move such figures and objects to the screen display area. If the screen size of the newly-selected GOT is larger than the screen size of the originally-selected GOT, click the [OK] button to display the following dialog. Select where to place the figures and objects on the base screens after the GOT type change.  Position of the figures and objects • [Perform automatic scaling on the positions/sizes to fit the screen sizes] Automatically repositions and rescales the figures and objects according to the new screen size. The rescaling specifications vary depending on the figure or object. ☞ How the figures and objects are changed The setting of [Resize objects in the fixed frame width edit mode] determines whether to fix the object shape frame widths after the GOT type change.
2)	[Option]	—	This item appears when [Perform automatic scaling on the positions/sizes to fit the screen sizes] is selected as the method of changing the figures and objects.
		[Apply to expanded base screens]	This item is displayed when the base screen size expansion is available for both the originally-selected GOT and newly-selected GOT. Resizes the figures and objects on the expanded base screens. Resizes the expanded base screens. For information on how the expanded base screen data is converted, refer to the following. ☞ Page 498 How the expanded base screen data is converted (when enabling the base screen size expansion for the newly-selected GOT) ☞ Page 499 How the expanded base screen data is converted (when disabling the base screen size expansion for the newly-selected GOT)
		[Apply to Window Screen]	Resizes the figures and objects on the window screens. Resizes the window screens. For information on how the window screen data is converted, refer to the following. ☞ Page 500 How the window screen data is converted
		[Resize objects in the fixed frame width edit mode]	Resizes the applicable objects with their shape frame widths fixed. The objects must satisfy the frame width fixing conditions. For the frame width fixing conditions, refer to the following. ☞ Page 1027 Switching between fixing or not fixing the frame width of an object shape The shape frame widths are fixed after the GOT type change.
3)	[About Automatic Scaling] button		This item appears when [Perform automatic scaling on the positions/sizes to fit the screen sizes] is selected as the method of changing the figures and objects. Displays precautions for the automatic scaling.

How the original-size base screen data is converted

The original-size base screen data is converted as shown below.

Method of changing the figures and objects	Conversion specifications
[Retain the positions/sizes]	The base screens are resized to the screen size of the newly-selected GOT. The figures and objects on the screens are not repositioned and resized. Example) Changing the GOT type with a resolution of 1024 × 768 to the GOT type with a resolution of 1920 × 1080 Base screen (1024 × 768) Base screen (1920 × 1080)  Original screen size (1024 × 768)
[Perform automatic scaling on the positions/ sizes to fit the screen sizes]	The base screens are resized to the screen size of the newly-selected GOT. The figures and objects on the screens are repositioned and resized in proportion to the screen resolution of the originally-selected GOT. Example) Changing the GOT type with a resolution of 1024 × 768 to the GOT type with a resolution of 1920 × 1080 Base screen (1024 × 768) Base screen (1920 × 1080)  Original screen size (1024 × 768)

How the expanded base screen data is converted (when enabling the base screen size expansion for the newly-selected GOT)

If you enable the base screen size expansion for the newly-selected GOT, the expanded base screen data will be converted as shown below.

Method of changing the figures and objects	[Apply to expanded base screens]	Conversion specifications
[Retain the positions/ sizes]	—	The screens are not resized, and the figures and objects on the screens are not repositioned and resized. Example) Changing the GOT type with a resolution of 1024 × 768 to the GOT type with a resolution of 1920 × 1080  Note that only the screens are resized under the following condition. • The vertical or horizontal size of the screens is smaller than the vertical or horizontal screen size of the newly-selected GOT. The screens are resized to the screen size of the newly-selected GOT.
[Perform automatic scaling on the positions/ sizes to fit the screen sizes]	Selected	The base screens are resized and the figures and objects on the screens are repositioned and resized in proportion to the screen resolution of the originally-selected GOT. The base screen expanded to an integral multiple of the original size is resized proportionally. Example) Changing the GOT type with a resolution of 1024 × 768 to the GOT type with a resolution of 1920 × 1080  Note that the specifications vary under the following conditions. • Even after the screens are resized in proportion to the screen resolution of the originally-selected GOT, the vertical or horizontal size of the screens is smaller than the vertical or horizontal screen size of the newly-selected GOT. The screens are resized to the screen size of the newly-selected GOT. The figures and objects on the screens are repositioned and resized based on the ratio of the base screen sizes before and after the GOT type change. • Even after the screens are resized in proportion to the screen resolution of the originally-selected GOT, the vertical or horizontal size of the screens exceeds 3000 dots. The screens are not resized, and the figures and objects on the screens are not repositioned and resized.
	Deselected	The screens are not resized, and the figures and objects on the screens are not repositioned and resized. Example) Changing the GOT type with a resolution of 1024 × 768 to the GOT type with a resolution of 1920 × 1080  Note that the screens are resized and the figures and objects on the screens are repositioned and resized under the following condition. • The vertical or horizontal size of the screens is smaller than the vertical or horizontal screen size of the newly-selected GOT. The screens are resized to the screen size of the newly-selected GOT. The figures and objects on the screens are repositioned and resized based on the ratio of the base screen sizes before and after the GOT type change.

How the expanded base screen data is converted (when disabling the base screen size expansion for the newly-selected GOT)

If you disable the base screen size expansion for the newly-selected GOT, the expanded base screen data will be converted as shown below.

Method of changing the figures and objects	Conversion specifications
[Retain the positions/sizes]	The base screens are resized to the screen size of the newly-selected GOT. The figures and objects on the screens are not repositioned and resized. Example) Changing the GOT type with a resolution of 1024 × 768 to the GOT type with a resolution of 1920 × 1080 [Perform automatic scaling on the positions/ sizes to fit the screen sizes]	The base screens are resized to the screen size of the newly-selected GOT. The figures and objects on the screens are repositioned and resized based on the ratio of the base screen sizes before and after the GOT type change. Example) Changing the GOT type with a resolution of 1024 × 768 to the GOT type with a resolution of 1920 × 1080 
How the window screen data is converted

The window screen data is converted as shown below.

Method of changing the figures and objects	[Apply to Window Screen]	Conversion specifications
[Retain the positions/ sizes]	—	The screens are not resized, and the figures and objects on the screens are not repositioned and resized. Example) Changing the GOT type with a resolution of 1024 × 768 to the GOT type with a resolution of 1920 × 1080  Note that only the screens are resized under the following condition. • The vertical or horizontal size of the screens is larger than the vertical or horizontal screen size of the newly-selected GOT. The screens are resized to the screen size of the newly-selected GOT.
[Perform automatic scaling on the positions/ sizes to fit the screen sizes]	Selected	The window screens are resized and the figures and objects on the screens are repositioned and resized in proportion to the screen resolution of the originally-selected GOT. Example) Changing the GOT type with a resolution of 1024 × 768 to the GOT type with a resolution of 1920 × 1080 	Deselected	The screens are not resized, and the figures and objects on the screens are not repositioned and resized. Example) Changing the GOT type with a resolution of 1024 × 768 to the GOT type with a resolution of 1920 × 1080  Note that the screens are resized and the figures and objects on the screens are repositioned and resized under the following condition. • The vertical or horizontal size of the screens is larger than the vertical or horizontal screen size of the newly-selected GOT. The screens are resized to the screen size of the newly-selected GOT. The figures and objects on the screens are repositioned and resized based on the ratio of the base screen sizes before and after the GOT type change.

How the figures and objects are changed

The figures and objects are repositioned and resized based on the ratio of the base screen sizes before and after the GOT type change.

How the figures and objects are changed depends on them.

○: Changed, ×: Not changed

Function	Specifications	
	Size	Other than size
Figure	○	The setting of [Font Size] for the text and logo text is changed.
Touch switch	○	The setting of [Font Size] is also changed. When [Adjust Font Size] is enabled, [Minimum Font Size] is also changed.
Lamp	○	The setting of [Font Size] is also changed. When [Adjust Font Size] of the bit lamp or word lamp is enabled, [Minimum Font Size] is also changed.
Numerical display Numerical input	○	The setting of [Font Size] is changed according to the object size.
Text display Text input	○	The setting of [Font Size] is changed according to the object size.
Date display Time display	○	The setting of [Font Size] is changed according to the object size.
Comment display	○	The setting of [Font Size] is also changed.
Parts display	○	When [Move Way] is set to any other than [Line], the object size is not changed.
Frame animation	○	—
Historical data list display	○	The setting of [Font Size] is also changed.
Alarm display	○	The setting of [Font Size] is also changed.
Recipe display (record list)	○	The setting of [Font Size] and the scroll bar width are changed.
Graph	○	The setting of [Font Size] is not changed.
Graphical meter	○	The setting of [Font Size] on the [Text] tab is also changed. When [Adjust Font Size] is enabled, [Minimum Font Size] is also changed. The setting of [Font Size] on the [Scale] tab is not changed.
Meter	○	The setting of [Font Size] for the panel meter is also changed. The setting of [Font Size] for the scale is not changed.
Slider	○	The setting of [Font Size] is not changed.

■When [Lock aspect ratio] is selected

The font size of figures and objects with [Lock aspect ratio] selected in their setting dialogs is changed while maintaining the aspect ratio.

GOT2000 project data

When GOT2000 project data is opened, the data can be converted to GOT3000 project data.

Precautions

When converting GOT2000 project data to GOT3000 project data, a coordinate position error may occur for figures and objects.

If you convert GOT2000 project data to GOT3000 project data, check if any of the following applied to parts movement settings.

- [Center] is set for [Alignment].
- [Position] or [Point] is selected for [Move Way].
- [Line] or [Circle] is set for [Move Way], and the start point is placed at a coordinate smaller than half of the part size.

9.2 Operating the monitor screen of the GOT using gestures (gesture function)

GT37 SoftGOT3000

☞ Page 502 Zooming and scrolling the monitor screen of the GOT (screen gesture function)
☞ Page 507 Operating objects with gestures (object gesture function)
☞ Page 509 How to set the gesture function

Use gestures such as pinch-in and pinch-out to operate the monitor screen of the GOT.

The following functions are available to operate the monitor screen using gestures.

Function	Description
Screen gesture function	Available for GT37-W. Zoom and scroll the screen while the user-created screen on the GOT is displayed. ☞ Page 502 Zooming and scrolling the monitor screen of the GOT (screen gesture function)
Object gesture function	Use gestures such as flicks to scroll, zoom in on, or zoom out of an object. ☞ Page 507 Operating objects with gestures (object gesture function)

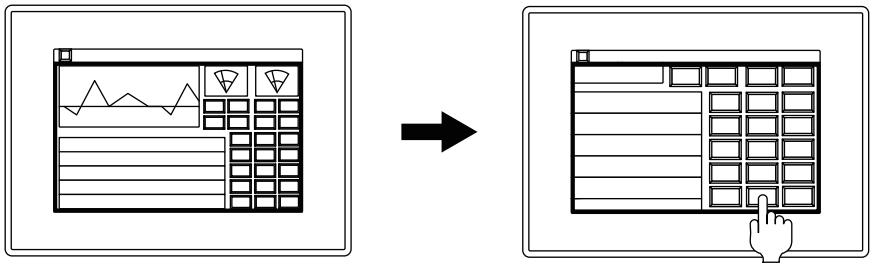
9.2.1 Zooming and scrolling the monitor screen of the GOT (screen gesture function)

☞ Page 503 Specification of the screen gesture function
☞ Page 505 How to use the screen gesture function (setting with GT Designer3)
☞ Page 506 How to use the screen gesture function (operating with the GOT)

Available for GT37-W.

Zoom and scroll the screen while the user-created screen on the GOT is displayed.

Even on a screen with many objects, zooming the screen can prevent incorrect operations.



Zoom and scroll the screen after switching to screen gesture mode.

Operations on objects are disabled except in certain areas of the screen during screen gesture mode.

Specification of the screen gesture function

☞ Page 503 Screen gesture mode
☞ Page 503 Screens applicable to screen gesture mode
☞ Page 504 Screen display during screen gesture mode
☞ Page 504 Effect on other functions during screen gesture mode

■Screen gesture mode

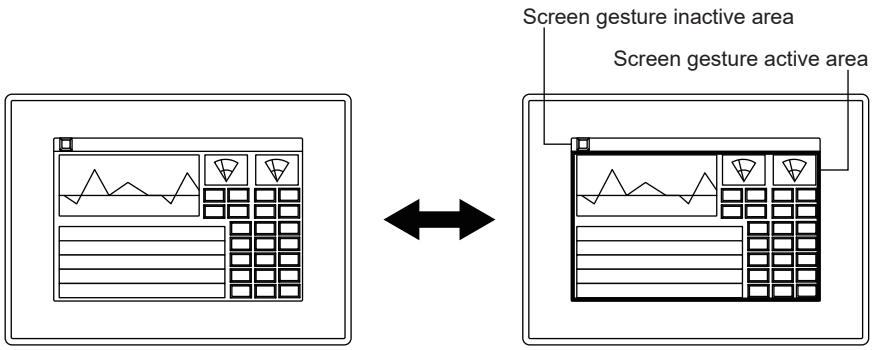
Screen gesture mode allows you to zoom and scroll the monitor screen of the GOT.

Use a mode-switching switch to change the mode.

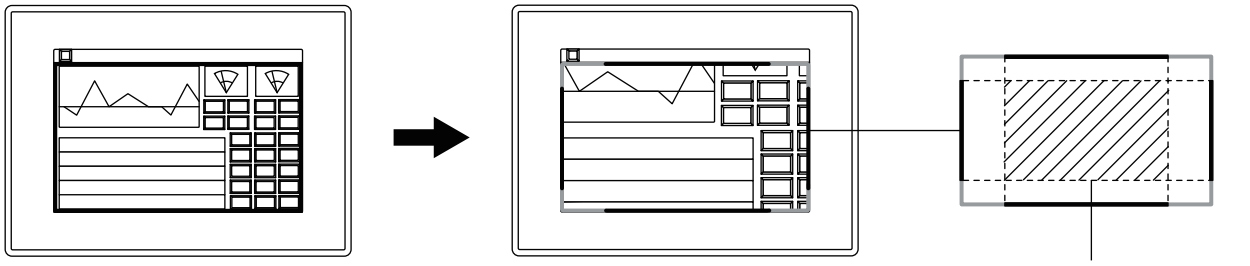
☞ Page 505 Arranging the switch for switching to screen gesture mode

Zooming and scrolling can be performed only in the screen gesture active area.

Switching to screen gesture mode displays the frame indicating the screen gesture active area.



The frame colors indicate which section of the enlarged screen is displayed.



Function	Description
Screen gesture active area	This area allows zooming and scrolling. Operations on objects in the screen gesture active area are disabled. The status of zooming and scrolling during screen gesture mode is kept even after the mode is canceled. The status of zooming or scrolling is reset when the screen is switched.
Screen gesture inactive area	The area in which operating objects is enabled even during screen gesture mode. Zooming and scrolling the screen are not available in this area. The height of the area is 32 dots from the top edge of the screen by default. The height and position of the area are user-changeable. To operate an object during screen gesture mode, place the object in the screen gesture inactive area. For information on how to set the screen gesture inactive area, refer to the following. ☞ Page 314 [Basic] tab

■Screens applicable to screen gesture mode

The following shows the applicable screens to screen gesture mode.

- Base screen
- Superimpose window (only when it is displayed on the base screen)
- Called screen (only when displayed on the base screen)

When a mode-switching switch placed on an overlap window or key window is touched, the mode switches to screen gesture mode for the currently displayed base screen.

The availability of the screen gesture function is set for each project.

■Screen display during screen gesture mode

Screen	Description
Base screen	Switching to screen gesture mode displays the frame indicating the screen gesture active area. If the value of the screen switching device changes during operations such as pinch-in or flick, the screen is switched after the finger is released from the screen of the GOT. Screen switching cancels screen gesture mode and resets the status of zooming or scrolling.
Superimpose window Called screen	The superimpose window and the called screen are applied as part of the base screen of the destination display. When the base screen on the destination display is zoomed or scrolled, the status of zooming or scrolling is applied to the superimpose window and the called screen. Even though the superimpose window is switched, the status of zooming or scrolling is kept.
Overlap window	Switching to screen gesture mode hides the overlap window. Canceling screen gesture mode redisplays the screen at the original position. The status of zooming or scrolling is not applied to the overlap window. The status of zooming or scrolling is also not applied to the display position specification device of the overlap window.
Key window	Switching to screen gesture mode hides the key window. Canceling screen gesture mode does not redisplay the key window.

■Effect on other functions during screen gesture mode

Function	Effect	
Numerical input Text input	Numerical inputs and text inputs placed in the screen gesture inactive area do not allow input during screen gesture mode. If the mode is switched to screen gesture mode during input, the content being input is canceled.	
Digital image display object	The input image is not displayed during screen gesture mode. When screen gesture mode is canceled, the input image is displayed at the size adjusted by the zoom in and zoom out operations. If the digital image display object overlaps the screen gesture inactive area, the input image is not displayed.	
Functions that display popups	Popup displays that appear during the alarm popup display, VNC server, or other functions also appear during screen gesture mode. The display position can also be switched by touching the left edge of the popup display. The display position is corrected to avoid overlapping the screen gesture inactive area. Example) Screen gesture inactive area set on the top edge of the screen  	
Hard copy	When a hard copy is performed with the GOT screen zoomed or scrolled, the zoomed or scrolled screen image is output.	
VNC server function	While a VNC client (such as a personal computer) is communicating with a VNC server (GOT), when the client obtains authorization of the VNC server function, screen gesture mode is canceled and the zoomed or scrolled screen is reset. While the VNC client has the authorization, the GOT is not switched to screen gesture mode.	
Digital image input function	The image input from the external device is not displayed during screen gesture mode. To display the image, cancel screen gesture mode. Zooming and scrolling are not applied.	
Operation log	The operation log includes switching to and cancelling screen gesture mode. The operation log does not include the operations during screen gesture mode.	
GOT internal device to notify the touch status of the GOT	The following shows the action of the GOT internal device to notify the touch status of the GOT while the screen gesture function is used.	
	Touch Status External Notification (X-coordinate) (GS654) Touch Status External Notification (Y-coordinate) (GS655)	Inoperable during screen gesture mode. Cancel the screen gesture mode and touch the screen gesture active area of the zoomed or scrolled screen to notify the coordinates applied to the screen.
	Touch Status External Notification (Touch Status) (GS656)	Inoperable during screen gesture mode.
Screen save	Screen gesture mode is retained even if the GOT transitions to the screen saver state during screen gesture mode.	
Mouse operation	Pinch-in and pinch-out zooming cannot be performed with the mouse.	

How to use the screen gesture function (setting with GT Designer3)

For information on the setting to enable the screen gesture function, refer to the following.

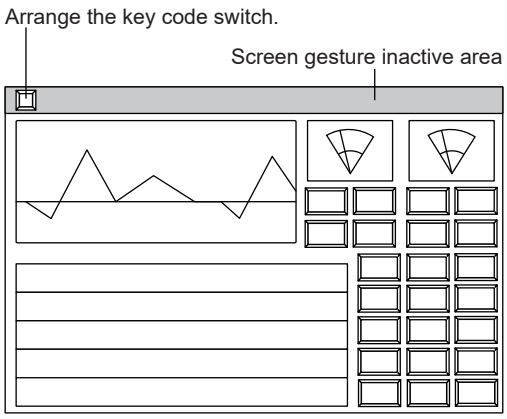
☞ Page 509 How to set the gesture function

■Arranging the switch for switching to screen gesture mode

Point

During screen gesture mode, the objects in the screen gesture active area are inoperative.
If a switch for enabling/disabling screen gesture mode is placed in the screen gesture active area, you cannot disable screen gesture mode with the switch.
Place the switch in the screen gesture inactive area.

1. Select [Object] → [Switch] → [Key Code Switch] from the menu to place the key code switch in the screen gesture inactive area of the screen where the screen gesture function is used.



The position and size of the screen gesture inactive area are settable in the [Screen Gesture Inactive Area] of the [Base Screen Property] dialog ([Basic] tab).
To display the frame of the screen gesture inactive area on the screen editor, select [Display the screen gesture inactive area].

☞ Page 314 [Basic] tab

2. Double-click the placed key code switch to display the setting dialog.

☞ Page 1251 [Key Code Switch] dialog

3. Configure the following settings in the [Key Code] tab and click the [OK] button to complete the settings.

- Select [Screen Gesture] for [Key Code Type].
- Select [Screen gesture mode switching] for [Code Setting].

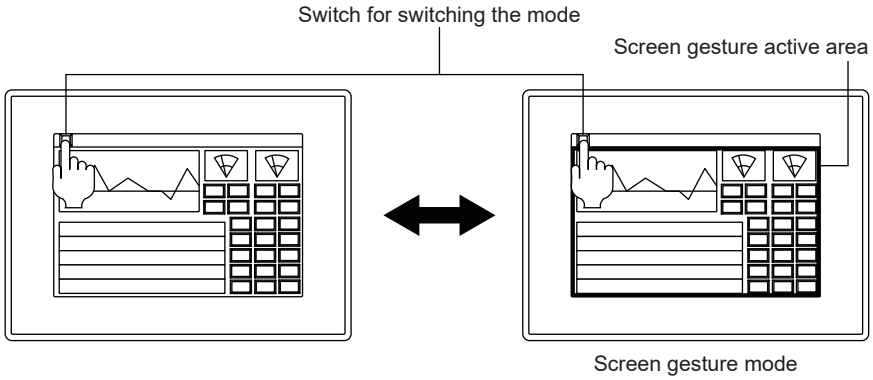
How to use the screen gesture function (operating with the GOT)

☞ Page 506 Switching to screen gesture mode
☞ Page 506 Canceling screen gesture mode
☞ Page 506 Zooming the GOT screen
☞ Page 506 Scrolling the screen of the GOT

■Switching to screen gesture mode

Touch the mode-switching key code switch to switch to screen gesture mode.

Switching to screen gesture mode displays the frame indicating the screen gesture active area.



For information on how to set the mode-switching key code switch, refer to the following.

☞ Page 505 Arranging the switch for switching to screen gesture mode

■Canceling screen gesture mode

Touch the mode-switching key code switch during screen gesture mode to cancel screen gesture mode.

Screen gesture mode is also canceled in the following cases.

- Displaying the utility
- Switching the screen (the value of the screen switching device is changed.)
- Displaying the system dialog

■Zooming the GOT screen

Pinch the screen in or out to enlarge or reduce the screen.

Zooming out is available only for the enlarged screen.

Operation	Description
Zoom out (pinch-in)	Touch two points on the GOT screen to define the center of the area to be zoomed out. Slide your fingers inward toward the center of two points to zoom out the screen from that center. The screen cannot be zoomed out smaller than the original size. Display update of the object is canceled during the operation.
Zoom in (pinch-out)	Touch two points on the GOT screen to define the center of the area to be zoomed in. Slide your fingers outward from the center of two points to zoom in the screen from that center. The screen can be zoomed in up to four times the size of the original screen. Zooming in may cause the screen to become blurry. Display update of the object is canceled during the operation.
Return to the full scale display	Touch the key code switch having the following settings to return the GOT screen to the actual size (100%) and to cancel screen gesture mode. • Select [Screen Gesture] for [Key Code Type]. • [Full scale display (100%)] is selected in [Code Setting].

When the base screen size extension is enabled, the screen gesture function cannot be used to zoom in or out.

■Scrolling the screen of the GOT

Flick or slide the GOT screen to scroll.

Operation	Description
Flick	Flick the screen to scroll the screen.
Slide	Move your finger while touching the screen to scroll.

9.2.2 Operating objects with gestures (object gesture function)

☞ Page 507 Objects operated by using gestures
☞ Page 507 How to use the object gesture function (setting with GT Designer3)
☞ Page 507 How to use the object gesture function (operation with the GOT)
☞ Page 508 Relevant settings

Use gestures such as flicks to scroll, zoom in on, or zoom out of an object.

Objects operated by using gestures

The following shows the objects operable with the object gesture function.

- Historical data list display
- Alarm display (user)
- Alarm display (system)
- Simple alarm display
- Historical trend graph
- Document display
- Digital image display object

Enabling the object gesture function does not affect the touch operation of the applicable objects.

The single touch operation setting of each object determines the operation when the object is touched, such as displaying the cursor.

How to use the object gesture function (setting with GT Designer3)

For information on the setting to enable the object gesture function, refer to the following.

☞ Page 509 How to set the gesture function

■Setting to operate the digital image display object with gestures

To operate the digital image display object with gestures, configure the following setting in the [Digital Image Display] dialog.

Item		Setting
[Digital Image Setting] tab	[Touch Mode]	Select [Gesture Operation]. ☞ Page 1859 [Digital Image Setting] tab

How to use the object gesture function (operation with the GOT)

☞ Page 507 Operating the historical data list display, alarm display (user), alarm display (system), or simple alarm display
☞ Page 508 Operating the historical trend graph
☞ Page 508 Operating the document display
☞ Page 508 Operating the digital image display object

■Operating the historical data list display, alarm display (user), alarm display (system), or simple alarm display

Function	Operation
Scroll	Flick or slide the object up or down to scroll the displayed contents vertically. With a flick operation, the contents scroll half a page. With a slide operation, the contents scroll according to the amount slid. When an alarm display (user) or alarm display (system) is slid, the contents may scroll less than the amount the object is slid.

■Operating the historical trend graph

Function	Operation	
Scroll	Flick or slide the object to scroll the displayed contents. With a flick operation, the contents scroll half a page. With a slide operation, the contents scroll according to the amount slid. The direction of the flick or slide operation depends on the setting of [Direction] for the historical trend graph.	
	When [Direction] is [Right] or [Left]	Flick or slide the object left or right to scroll the displayed contents horizontally.
	When [Direction] is [Up] or [Down]	Flick or slide the object up or down to scroll the displayed contents vertically.
Zooming in and out time axis	Pinch in or out the object to zoom out or in the time axis. The details of pinch-out and pinch-in operations are settable in [Magnification for scaling operation] in the [Historical Trend Graph] dialog ([Extended] tab). ☞ Page 1721 [Extended] tab The magnification factor for a pinch-in or pinch-out operation is selectable from among 2-fold, 4-fold, and 8-fold. You can enlarge the time axis until the graph displays two points. The scope of reducing the time axis varies with the setting of [Shrink the graph to be less than its full scale]. When [Shrink the graph to be less than its full scale] is selected, the time axis can be reduced to a magnification of 1/128. When [Shrink the graph to be less than its full scale] is deselected, the time axis can be reduced to the original magnification.	

■Operating the document display

Function	Operation	
Scroll	Flick or slide your finger on the document display to scroll the document. The document display can be scrolled in eight directions as follows. 	
Next page Previous page	Flick the display with the edge of the document displayed to change the page.	
	When displaying the upper end of the document	Flick the page downward to change to the previous page. (Previous page)
	When displaying the bottom end of the document	Flick the page upward to change to the next page. (Next page)
	When displaying the left end of the document	Flick the page rightward to change to the previous page. (Previous page)
	When displaying the right end of the document	Flick the page leftward to change to the next page. (Next page)
Zooming in and out	Pinch in or out to increase or decrease the document size. The display magnification can be adjusted freely in the range of 25% to 400%, using the large image's original size as the reference.	

■Operating the digital image display object

Function	Operation
Scrolling the displayed image	To scroll the displayed image, slide your finger across the digital image display object.
Zooming in and out the displayed image	To zoom in or out the displayed image to an intended size (25% to 400%), pinch in or out on the digital image display object.

Relevant settings

Configure the relevant settings other than the specific settings for the object gesture function as required.

The following shows the functions that are available by configuring the relevant settings.

■GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Disabling the object gesture function	GS1794.b0
Disabling the single touch operation of the object	GS1794.b1

9.2.3 How to set the gesture function

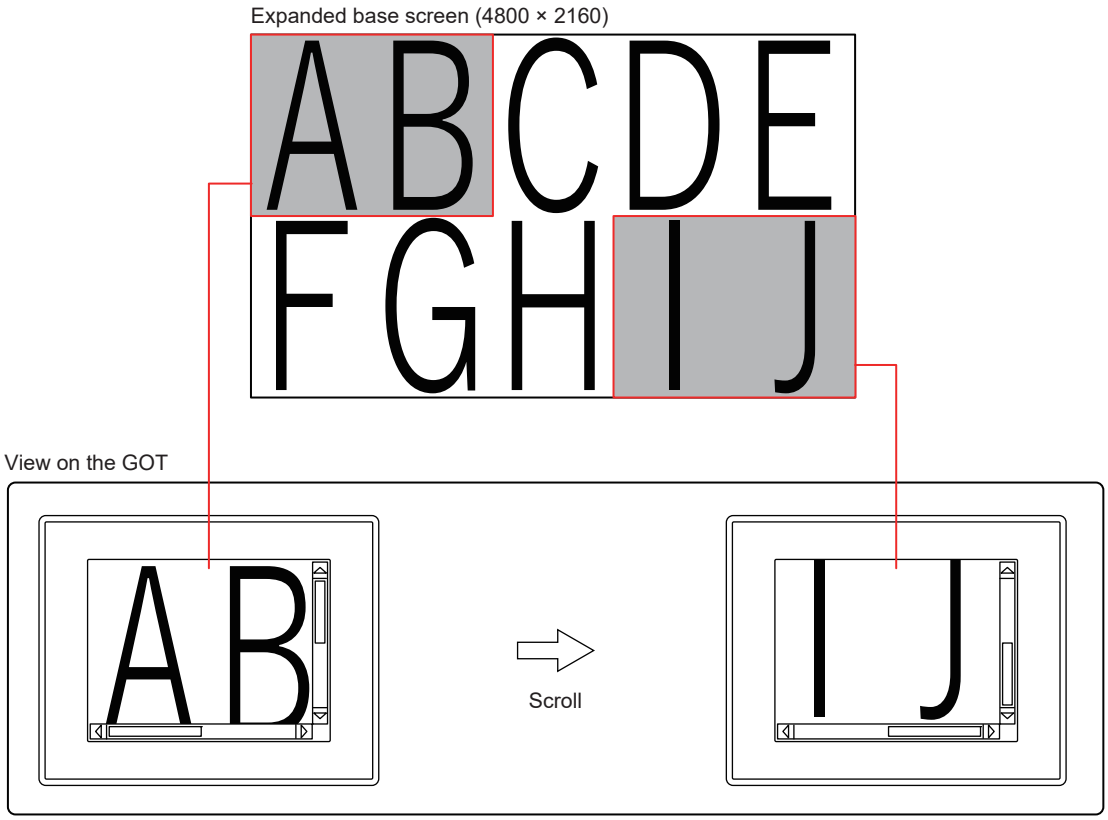
To enable the gesture function, select [Use gesture function] in the [Type Setting] dialog ([Basic Settings]).
This item is selected by default.
☞ Page 519 [Basic Setting]

9.3 Expanding the base screen size

GT37 SoftGOT3000

Create a base screen that is larger than the GOT screen.
You can scroll the screen by using swipe gestures or the scroll bars.

Ex.
Displaying an expanded base screen (4800 × 2160) on the GOT with a resolution of 1920 × 1080



☞ Page 511 Settings of the base screen size expansion
☞ Page 511 Screen editors for editing the expanded base screens
☞ Page 513 Operation of the GOT displaying an expanded base screen
☞ Page 516 Scrolling the expanded base screens
☞ Page 518 Settings relevant to the base screen size expansion

9.3.1 Settings of the base screen size expansion

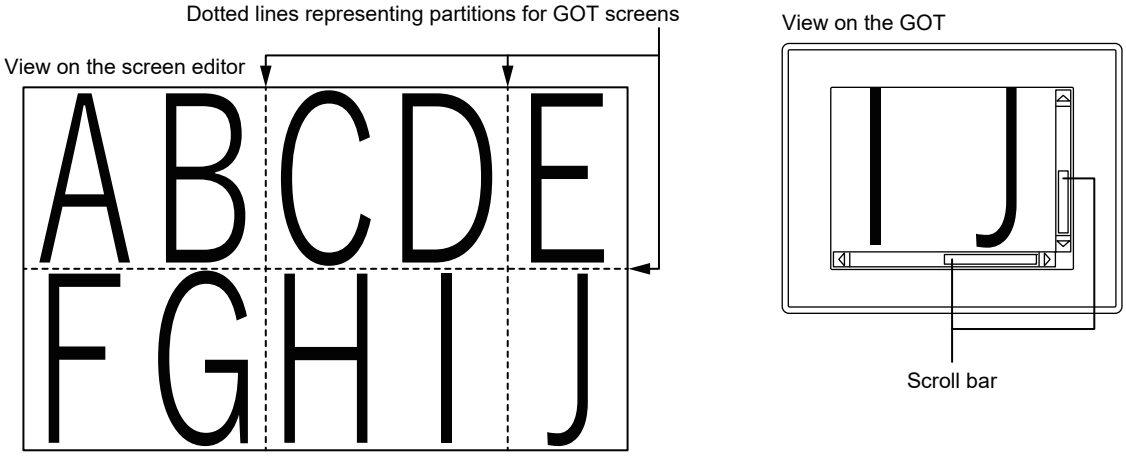
To enable the base screen size expansion, select [Expand base screen sizes] in [Basic Setting] in the [Type Setting] dialog.
☞ Page 519 [Basic Setting]
To change the size of each base screen, open the [Base Screen Property] dialog ([Basic] tab).
☞ Page 314 [Basic] tab
To change the size of multiple base screens at once, select base screens in the [Screen] window and display the [Base Screen Property] dialog.
☞ Page 122 [Screen] window

9.3.2 Screen editors for editing the expanded base screens

When you edit an expanded base screen, the following lines appear on the screen editor.
The lines are invisible on the GOT.

Line type	Description
Solid line	Appears when either the vertical or horizontal size of the base screen is larger than the vertical or horizontal size of the GOT screen. Represents the areas of the scroll bars to appear on the GOT. Appears 40 dots from the right or bottom edge of the screen display area. Place figures and objects so that they do not overlap the scroll bar areas.
Broken line	Represents a partition for one GOT screen. Represents partitions for multiple GOT screens. The lines are usable as guidelines to specify the size of a base screen to an integral multiple of the GOT screen size.

Ex.
Displaying an expanded base screen (2560 × 1536) on the GOT with a resolution of 1024 × 768
The scroll bar areas are not displayed because the base screen is vertically and horizontally expanded.

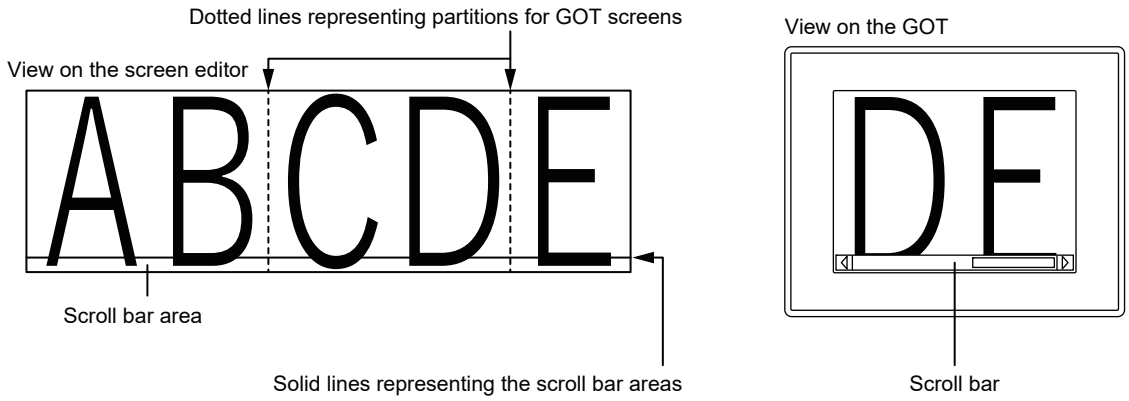


Ex.

Displaying an expanded base screen (2560 × 768) on the GOT with a resolution of 1024 × 768

A solid line representing the scroll bar area is displayed in the lower part of the base screen because the screen is horizontally expanded.

A scroll bar appears in the scroll bar area when the base screen is displayed on the GOT.



Whether to display the lines and the color of the lines are selectable.

☞ Page 300 Displaying the scroll bar areas for editing the expanded base screens

☞ Page 201 Customizing the display

The scroll bars are viewable in the screen preview.

☞ Page 336 Displaying a preview

The design of the scroll bars depends on the screen design selected.

☞ Page 310 [Screen Design] dialog

In the following cases, no scroll bar is displayed on the GOT, and no lines representing the scroll bar areas and partitions for GOT screens are displayed on the screen editors.

- The base screen is smaller than the GOT screen.
- The scroll bars are set to be hidden.

9.3.3 Operation of the GOT displaying an expanded base screen

Refreshing the display of the objects while the screen is being scrolled

The display of the objects are refreshed while the screen is being scrolled.

Operating an object while the screen is being scrolled

While scrolling the screen, you cannot operate the objects on the screen.

You also cannot scroll the screen while operating any of the objects.

Movements of the windows while the screen is being scrolled

The following shows how the windows move while the screen is being scrolled.

Window type	Operation
Superimpose window	The window as well as the figures and objects on the screen move along the screen while the screen is being scrolled. Example) When displaying superimpose window 1 View on the screen editor  View on the GOT Other windows	The window keeps its current position on the GOT screen while the screen is being scrolled. Example) When displaying overlap window 1 View on the screen editor  View on the GOT 
Specifying the display positions of the overlap windows and key windows

When [Display windows beyond the screen area] is selected in the [Environmental Setting] window ([Screen Switching/Window]), specify the display positions of the overlap windows and key windows so that the windows will be displayed within the GOT screen.

☞ Page 542 [Screen Switching/Window]

The overlap windows and key windows outside the GOT screen cannot be displayed on the GOT even the GOT screen is scrolled.

The following shows how to specify the display positions of the overlap windows and key windows.

Window type	Method
Overlap window	Place a window position object on the screen. ☞ Page 1883 Specifying the display position of a window screen
	Specify the overlap window display position with a display position specification device. Select [Display Position] in [Screen Switching/Window] of the [Environmental Setting] window to enable the display position specification device setting. ☞ Page 542 [Screen Switching/Window]
Key window	Place a window position object on the screen. ☞ Page 1883 Specifying the display position of a window screen
	Configure either of the following settings to display a key window near an object. • In the [Environmental Setting] window ([Key Window]), [Key Window Position Correction] is set to [Around the object] on the [Advanced Setting] tab. ☞ Page 572 [Advanced Setting] tab • In the [Base Screen Property] dialog, [Key Window Position Correction] is set to [Around the object] on the [Key Window Advanced Setting] tab. ☞ Page 319 [Key Window Advanced Setting] tab
	Specify the display position of a key window with the key window display switch. ☞ Page 1249 [Key Input] tab

Switching the current screen to an expanded base screen

When the current screen switches to an expanded base screen, the upper-left corner of the expanded base screen appears on the GOT.

To specify any other area of the base screen to appear on the GOT, use GS635.b0, GS636, and GS637.

☞ Page 3581 GOT special register (GS)

The position of the area displayed before screen switching is retained.

The position will be cleared if the following events occur.

- The GOT is turned off.
- The GOT is restarted by writing project data to the GOT.

Size of images displayable on the expanded base screens

The size of images displayable on the GOT screen depends on the image file format.

Image file format	Displayable size on the GOT screen
BMP*1 JPEG PNG	Up to the size of the GOT screen
BMP*2	Up to 6000 dots × 6000 dots

*1 For using a BMP file stored in the data storage as a part

*2 For pasting an image on a screen editor or parts editor in GT Designer3

Precautions

If the GOT displays the following images (including parts, frame animations, and logo texts), screen refresh may be delayed.

- Images (JPEG, PNG, SVG, APNG, or GIF) that are larger than the size of the GOT screen
- Two or more images (JPEG, PNG, SVG, APNG, or GIF) that are almost the same size as the GOT screen
- Large images (JPEG, PNG, SVG, APNG, or GIF) that are displayed on the parts display objects

Setting a shape for an object

When an object filled with a pattern is placed on an expanded base screen, the start point of the pattern may be different from the start point of the pattern of the object placed on an unexpanded base screen.
Note that the screen tends to flicker while scrolled.

Calling the expanded base screens using the set overlay screen function

When you use the set overlay screen function, you can call the expanded base screens.
The screen size settings of the calling base screen are applied to the expanded base screens called.
You can scroll the called screens within the calling base screen.

Object scripts

Object scripts run even when the objects that correspond to the scripts are hidden from view on the GOT.
The free figure drawing function draws figures even in the hidden area of the expanded base screens.

Functions that use popup displays

When a popup display overlaps the scroll bar at the bottom edge of the GOT screen, switch the position of the popup display by touching the popup display.
The following shows the functions that use popup displays.

- SoftGOT-GOT link function
- GOT network interaction function
- Alarm popup display
- VNC server function

In the [Alarm Popup Display] dialog, if you set [Display Position Switching] to [None] on the [Basic] tab, you cannot switch the position of the popup display.
It is recommended to select [Switch] for [Display Position Switching].
☞ Page 2119 [Basic] tab

Screenshots captured by using the hard copy function

The hard copy function captures only the area of the expanded base screen currently displayed on the GOT.
The scroll bars and navigation window are captured in screenshots.

Screen image display for the operation log information

If you select the log event that a user has operated any object on the expanded base screen, the image window for the event will not display the image of the entire base screen.
The window displays the image of the area which is centered around the object. The area fits with the GOT screen.

9.3.4 Scrolling the expanded base screens

To scroll the expanded base screens on the GOT, perform the following operations.

- Swiping the GOT screen
- Using the scroll bars
- Using the navigation window

Swiping the GOT screen

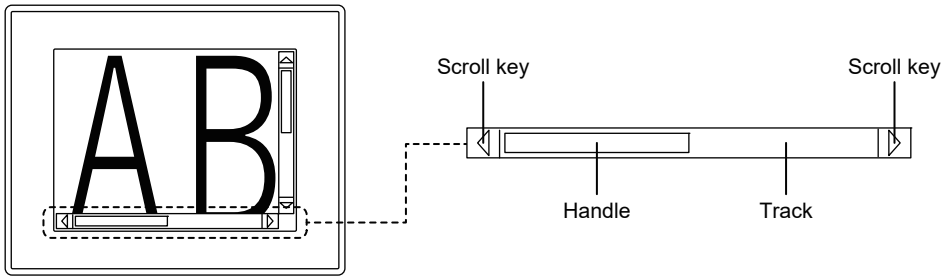
Swipe somewhere on the GOT screen where no object is displayed to scroll the base screen.

To avoid an unintended object operation by swiping on the GOT screen, turn on GS635.b1 to disable swiping to scroll the screen.

Using the scroll bars

Touch the scroll keys or drag the handle to scroll the screen.

The scroll bars are displayed at the right and bottom edges of the GOT screen.



Item	Description
Handle	Drag the handle to scroll the screen.
Track	Touch somewhere on the track to scroll the screen one page.
Scroll key	Touch the scroll key to scroll the screen one dot.

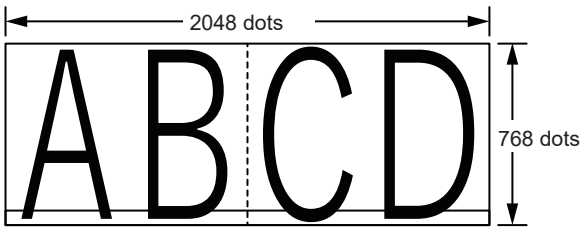
Each scroll bar is displayed when the vertical or horizontal size of the base screen is larger than the vertical or horizontal size of the GOT screen.

Ex.

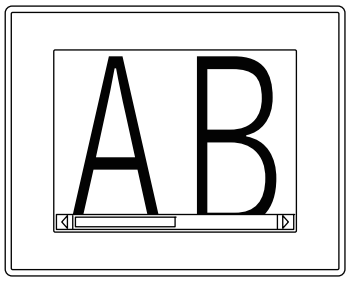
Displaying an expanded base screen (2048 × 768) on the GOT with a resolution of 1024 × 768

A scroll bar is displayed only at the bottom edge of the GOT screen.

View on the screen editor



View on the GOT



Whether to display the scroll bars is selectable.

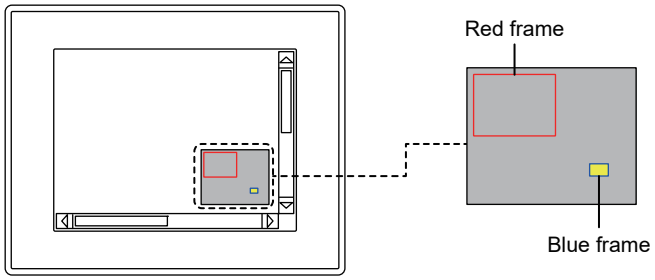
☞ Page 524 [Display Setting] dialog (Base screen size expansion)

Using the navigation window

The navigation window shows your current location within the base screen.

The window is semi-transparent and one-ninth the size of the GOT screen.

Touch or swipe anywhere in the window to bring that point to the center of the GOT screen.



The following items appear in the window.

Item	Description
Red frame	Indicates the area of the base screen currently displayed on the GOT.
Blue frame (The area enclosed in the frame blinks in yellow.)	Indicates the position of the object where the cursor is located. The frame appears when the cursor moves to any object that is hidden from view.

■Display timing and position of the navigation window

You can specify the display timing and position of the navigation window.

☞ Page 524 [Display Setting] dialog (Base screen size expansion)

When the cursor moves to any object that is hidden from view, the navigation window appears for two seconds, regardless of the display timing setting.

■Placing objects and the navigation window

Objects behind the navigation window are displayed but inoperable.

When placing an object to be operated on a base screen, make one of the following settings.

- Position the object so that it will not be overlapped by the navigation window.
- Select [While swiping/touching the screen] or [Not display] for [Display Timing].

For setting the timing to display the navigation window, refer to the following.

☞ Page 524 [Display Setting] dialog (Base screen size expansion)

■Displaying the navigation window and the comment window

The navigation window cannot be displayed simultaneously with the comment window for the following functions.

- Alarm display (user)
- Simple alarm display

If the navigation window is set to always be displayed, the comment window will not appear.

■Displayed navigation window while a switch is being touched

Although [While swiping/touching the screen] is set for the display timing of the navigation window, the window remains displayed while a switch is being touched.

During the time, the displayed objects are not refreshed.

9.3.5 Settings relevant to the base screen size expansion

Set the relevant settings other than the specific settings for the base screen size expansion as required.
The following shows the functions that are available by configuring the relevant settings.

GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Specifying the upper-left coordinates of the area of the expanded base screen to be displayed on the GOT	GS635.b0 GS636 GS637
Disabling swiping to scroll the screen	GS635.b1
Notifying the upper-left coordinates of the area of the expanded base screen currently displayed on the GOT	GS696 GS697

9.4 [Type Setting] dialog

GT37 SoftGOT3000

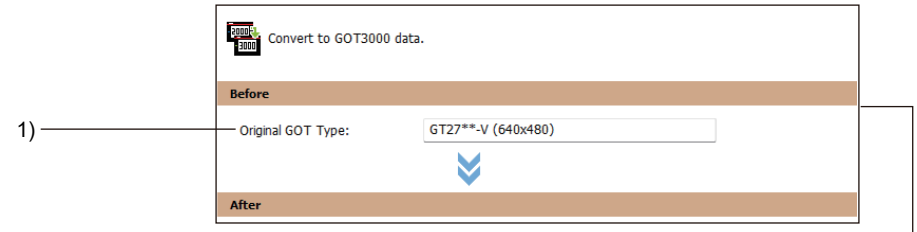
In the [Type Setting] dialog, set the model of the GOT to be used and the standard font.

Select [Common] → [GOT Type Setting] from the menu to display this dialog.

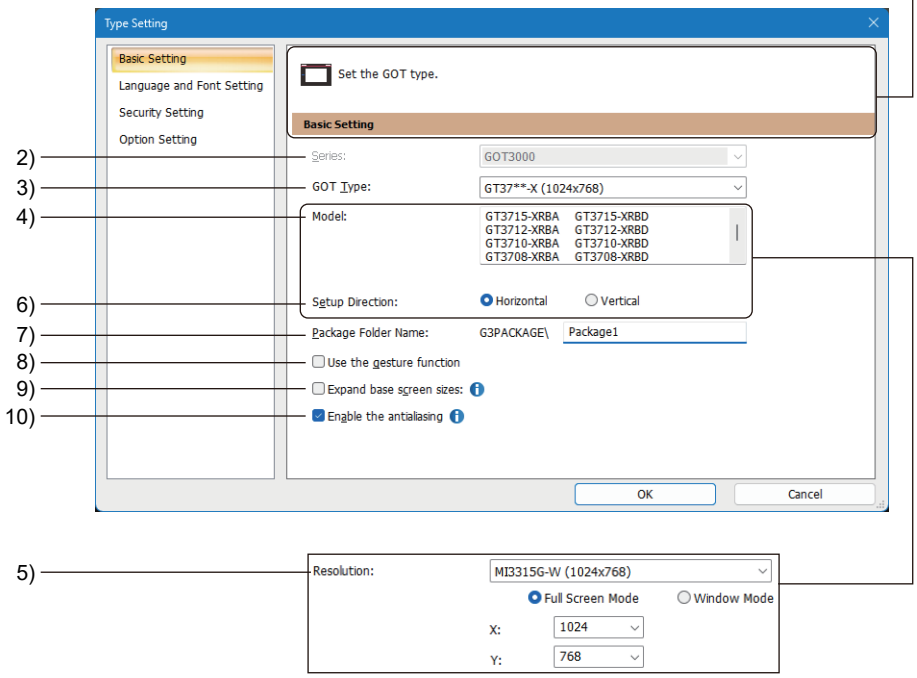
☞ Page 519 [Basic Setting]
☞ Page 525 [Language and Font Setting]
☞ Page 526 [Security Setting]
☞ Page 527 [Option Setting]

9.4.1 [Basic Setting]

GT37 SoftGOT3000



When GOT2000 data is converted to GOT3000 data



For GT SoftGOT3000

Item		Description	
1)	[Original GOT Type]	Displays the GOT type before the type is changed. This item is displayed only when a GOT2000 project is converted to a GOT3000 project.	
2)	[Series]	The setting depends on when to display the [Type Setting] dialog.	
		When creating a new project	Select the GOT series. When [GOT2000] is selected, GT Designer3 (GOT2000) will start. When [GOT1000] is selected, GT Designer3 (GOT1000) will start.
		When editing a project	The setting is fixed to [GOT3000].
3)	[GOT Type]	Set the GOT type. When this item has been changed, the confirmation dialog for the change appears. ☞ Page 495 Resizing the screens, figures, and objects	

PART 5

Item		Description
4)	[Model]	Displays the models applicable to the GOT type selected for [Type].
5)	[Resolution]	Select the screen resolution of GT SoftGOT3000. When selecting [MI3315G-W (1024x768) or [MI3321G-W (1920x1080)], select [Full Screen Mode] or [Window Mode]. To customize the resolution, set a value for [X] and [Y]. The maximum size is [1920] × [1200] or [1200] × [1920]. When [X] or [Y] is set, [Resolution] is set to [Custom].
6)	[Setup Direction]	Set the installation orientation of the GOT. Some operations of the GOT differ according to the GOT installation orientation. ☞ Page 521 Operation of the GOT when installed vertically
7)	[Package Folder Name]	Set the name of the folder that stores the package data. Use up to 32 alphanumeric characters and symbols for the folder name. For the character strings available and unavailable for folder names, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT This item is required for project creation. Always set this item.
8)	[Use the gesture function]	Only available to GT37. Enables the gesture function to operate the GOT. ☞ Page 502 Operating the monitor screen of the GOT using gestures (gesture function)
9)	[Expand base screen sizes]	Only available to GT37. Enables you to set a larger base screen by setting higher resolution than the original GOT resolution. For details on the base screen size expansion, refer to the following. ☞ Page 510 Expanding the base screen size Click the [Display Setting] button to display the [Display Setting] dialog. Configure the settings for displaying the scroll bars and navigation window on the GOT. ☞ Page 524 [Display Setting] dialog (Base screen size expansion) When this item is enabled, the paint cannot be placed on the screen and on-screen parts. ☞ Page 1173 Filling the framed area of the figure
10)	[Enable the antialiasing]	Enables antialiasing (processing to smooth out jagged edges of figures and graph lines). ☞ Page 522 Effect of the setting for [Enable the antialiasing]
		Enabling antialiasing allows for faster draw processing and enhances visual quality compared to when it is disabled. It is recommended to enable this setting.

Operation of the GOT when installed vertically

When [Vertical] is selected, the screen is rotated 90 degrees counterclockwise and treated as a vertically long screen.
The origin is at the top left, with the horizontal axis as the X axis, and the vertical axis as the Y axis.
When you install the GOT vertically, the GOT operates as follows.

Item	Operation at GOT vertical installation
Utility	The contents appear according to the vertical installation.
Monitor screen, data screen, or other screens called up from the utility	The contents appear according to the vertical installation.
User-created screen	The screen created according to the vertical installation is displayed. The key window and dialog window on the user-created screen are also displayed according to the vertical installation.
Startup logo	The startup logo appears according to the vertical installation.
Utility call key	The key is positioned according to the vertical installation. When the key is set to the upper left corner, the key is positioned on the upper left corner according to the vertical installation.
VNC server function	The contents appear on the VNC client according to the vertical installation.
Digital image input function	The video window does not rotate and appears horizontally. For the video window, the width and height of the display size and clip area are specified according to the horizontal installation. The video window display position is specified with the coordinates of the window upper left corner. The origin (0, 0) is on the GOT upper left corner according to the vertical installation.
Video output function	The contents appear on the external display according to the vertical installation. If you set vertical installation for the GOT and create a screen, use the display vertically.
Popup window	The popup window appears according to the vertical installation. However, the popup window does not support the scrolling display. When text extends off the screen, you cannot check the portions of text lying offscreen.
Hard copy	Capturing images is performed according to the vertical installation.
USB mouse	The mouse pointer is displayed according to the vertical installation.
Touch Status External Notification (X-coordinate) (GS654) Touch Status External Notification (Y-coordinate) (GS655)	The coordinates are notified by using the upper left corner as the origin (0, 0) according to the vertical installation.

Effect of the setting for [Enable the antialiasing]

The following shows the items affected by the setting for [Enable the antialiasing].

The following shows the items affected by the setting for [Enable the antialiasing].

■Screen

Item		Setting for [Enable the antialiasing]	
		Selected	Deselected
Base screen	[Front Layer Transparent Color] of the [Base Screen Property] dialog ([Basic] tab) ☞ Page 314 [Basic] tab	Not settable	Settable
Window screen	[Front Layer Transparent Color] of the [Window Screen Property] dialog ([Basic] tab) ☞ Page 323 [Basic] tab	Not settable	Settable

■Figure

Item	Setting for [Enable the antialiasing]	
	Selected	Deselected
Text (when the UD font is set)	Antialiasing is applied when the figure is displayed on the GOT. Antialiasing is not applied when the figure is displayed on the screen editor of GT Designer3.	
Logo text (when the UD font is set)		
Line	Antialiasing is applied when the figure is displayed on the GOT. Antialiasing is not applied when the figure is displayed on the screen editor of GT Designer3.	Antialiasing is not applied.
Freeform line		
Rectangle		
Polygon		
Circle	Antialiasing is applied when the figure is displayed on the GOT. Antialiasing is not applied when the figure is displayed on the screen editor of GT Designer3.	Antialiasing is not applied. In GT SoftGOT3000 and GT Simulator3, line display disturbances may occur.
Arc		
Sector		
Scale	Antialiasing is applied when the figure is displayed on the GOT. Antialiasing is not applied when the figure is displayed on the screen editor of GT Designer3.	Antialiasing is not applied.
Piping		
Paint ☞ Page 1173 Filling the framed area of the figure	Unusable The paint already placed on the screen is deleted.	Usable

■Object

Item		Setting for [Enable the antialiasing]	
		Selected	Deselected
Common among objects	Character string of the UD font	Antialiasing is applied when the figure is displayed on the GOT. Antialiasing is not applied when the figure is displayed on the screen editor of GT Designer3.	
	Basic shapes displayed on the object	Antialiasing is applied when the figure is displayed on the GOT. Antialiasing is not applied when the figure is displayed on the screen editor of GT Designer3.	Antialiasing is not applied.
Touch switch	[Reverse Switch Area] on the [Style] tab ☞ Page 1257 [Style] tab	Not settable	Settable
Numerical display Numerical input	[Display Mode] on the [Extended] tab ☞ Page 1323 [Extended] tab ☞ Page 1335 [Extended] tab	[Display Mode] is not displayed, and the operation when selecting [Transparent] is applied.	Settable

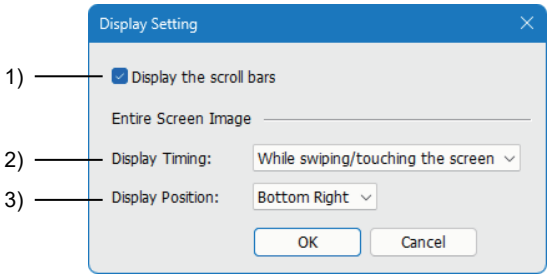
	[Rotate the object itself] on the [Animation] tab (when [Circle] is selected for [Move Way]) ☞ Page 1469 [Animation] tab	Settable	Not settable
Line graph	Graph line	Antialiasing is applied when the figure is displayed on the GOT. Antialiasing is not applied when the figure is displayed on the screen editor of GT Designer3.	Antialiasing is not applied.
Trend graph	Graph line (excluding straight lines)		
Pie graph	Contour Boundary line		
Scatter graph	Graph line		
Historical trend graph	Graph line (excluding straight lines)		
Panel meter	Needle (excluding when [Needle Shape] is [Straight Line]) Meter frame Meter panel Core		
Object script	Figure drawn with a free figure drawing function (other than the d_line, d_textout, and d_commentout functions)		

[Display Setting] dialog (Base screen size expansion)

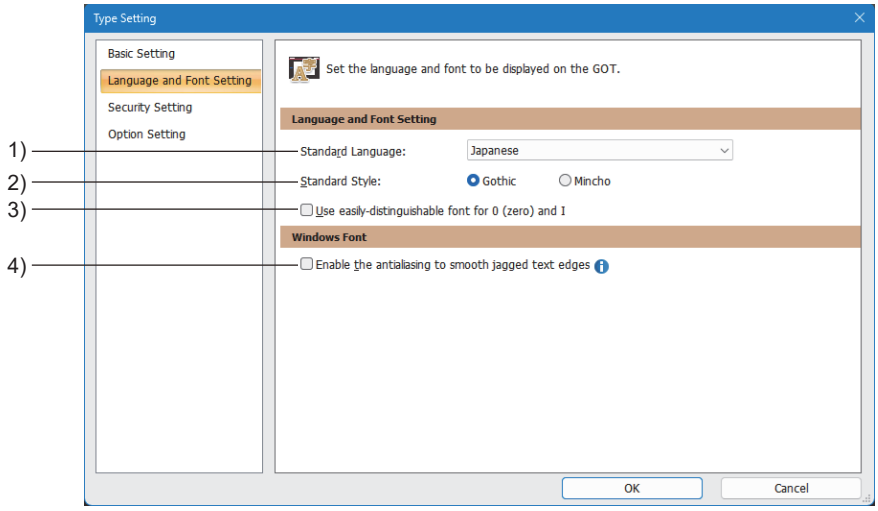
GT37 SoftGOT3000



Item		Description	
1)	[Display the scroll bars]	Displays the scroll bars on the expanded base screens. Deselecting this item hides the scroll bars and the following items on the screen editors. • Solid lines representing the scroll bar areas • Dotted lines representing partitions for GOT screens	
2)	[Display Timing]	Select the timing for displaying the navigation window. The navigation window shows your current location within the base screen. The window is semi-transparent and one-ninth the size of the GOT screen. For details on the window, refer to the following. ☞ Page 510 Expanding the base screen size	
		[Always]	Always displays the navigation window.
		[While swiping/touching the screen]	Displays the navigation window when you touch somewhere on the screen where no object is displayed or the scroll bars. The window will be hidden one second after you release your finger from the GOT screen.
		[Not display]	Does not display the navigation window.
3)	[Display Position]	Set this item when [Display Timing] is set to [Always] or [While swiping/touching the screen]. Select the display position of the navigation window.	

9.4.2 [Language and Font Setting]

GT37 SoftGOT3000



Item		Description
1)	[Standard Language]	Select the language used in the whole project. The fonts to be written to the GOT differ depending on the combination of the settings for [Standard Language] and [Standard Style]. ☞ Page 77 How to display characters on the GOT
2)	[Standard Style]	Select a typeface for the font used in the whole project. The fonts to be written to the GOT differ depending on the combination of the settings for [Standard Language] and [Standard Style]. ☞ Page 77 How to display characters on the GOT
3)	[Use easily-distinguishable font for 0 (zero) and I]	Use a font having the slashed zero and the crossbar I. ☞ Page 74 Font type
4)	[Enable the antialiasing to smooth jagged text edges]	Enable anti-aliasing (smoothing jagged edges) for Windows font.

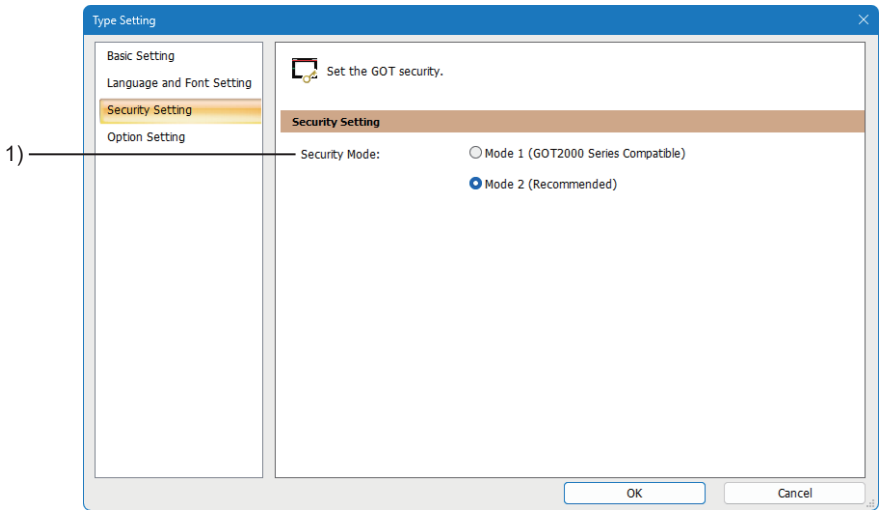
Precautions

If the [Enable the antialiasing to smooth jagged text edges] setting is enabled, the top edge of the text may be truncated on some Windows fonts.

9.4.3 [Security Setting]

GT37 SoftGOT3000

Set the security mode.

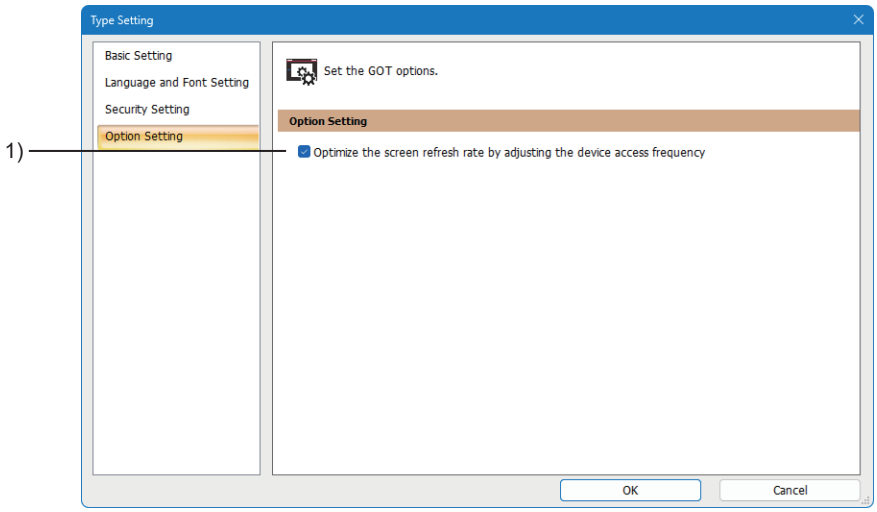


Item		Description
1)	[Security Mode]	Select the security mode. Use in mode 2 is recommended. (Default) If you use the GOT2000 series-compatible security function, select mode 1. For information on the differences between security modes, refer to the following. ☞ Page 39 Security mode

9.4.4 [Option Setting]

Configure the setting related to optimizing the screen update frequency.

GT37 SoftGOT3000



Item		Description
1)	[Optimize the screen refresh rate by adjusting the device access frequency]	Controls the priority of communication processing and optimizes screen refresh frequency based on the access frequency of each monitored device. Deselecting this item disables the function.

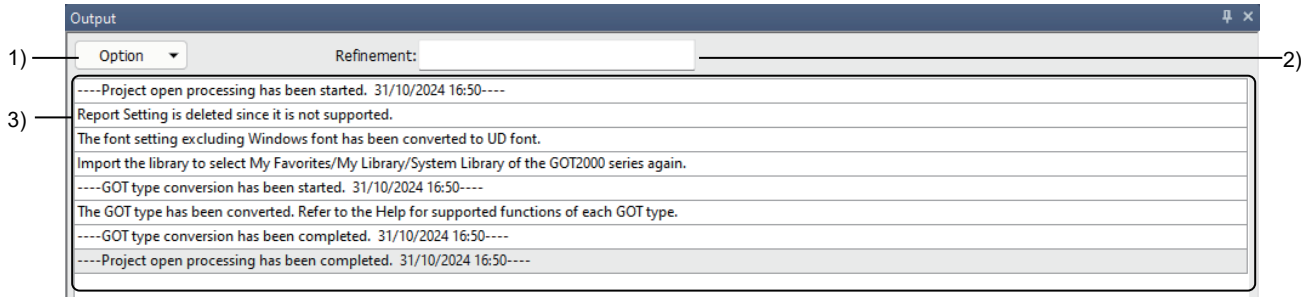
9.5 [Output] window

GT37 SoftGOT3000

This window displays operation histories that significantly affect the project in a list.

This window appears at the GOT type change.

To display this window manually, select [View] → [Docking Window] → [Output] from the menu.



Item			Description
1)	[Option] button	—	Displays the option operations for the history list.
		Export	Exports the history list as a CSV file or Unicode text file. After clicking the item, specify the storage folder, file name, and file type.
2)	[Refinement]		Use this field to refine the messages displayed on the history list by keywords.
3)	History list		Displays the history of operations that significantly affect the project, such as the GOT type change or import of other projects, in a list.

10 Setting the GOT basic operations ([GOT Environmental Setting])

GT37 SoftGOT3000

☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])
☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching])
☞ Page 552 Setting dialog windows of the GOT ([Dialog Window])
☞ Page 558 Setting key windows of the GOT ([Key Window])
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])
☞ Page 598 Restricting GOT operations and data transfers ([Security])
☞ Page 599 Protecting files and communication data ([Information Protection Function])
☞ Page 600 Configuring the settings for creating the GOT operation history ([Operation Log])
☞ Page 601 Configuring the settings for retaining GOT internal device data at power failure ([Internal Device Retention])
☞ Page 604 Configuring the settings for converting a text into kanji or Simplified Chinese characters in the GOT ([Kana-Kanji/Pinyin Conversion])

10.1 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])

GT37 SoftGOT3000

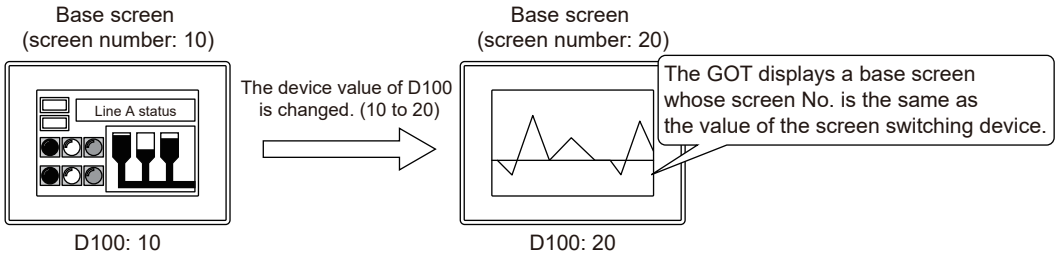
☞ Page 531 Specifications of the screen switching
☞ Page 534 How to use the screen switching
☞ Page 541 Moving an overlap window
☞ Page 542 [Screen Switching/Window]

The GOT displays or switches the screens with screen switching devices.

The screens to be displayed on the GOT are switched by changing a value (screen number) of the screen switching device.

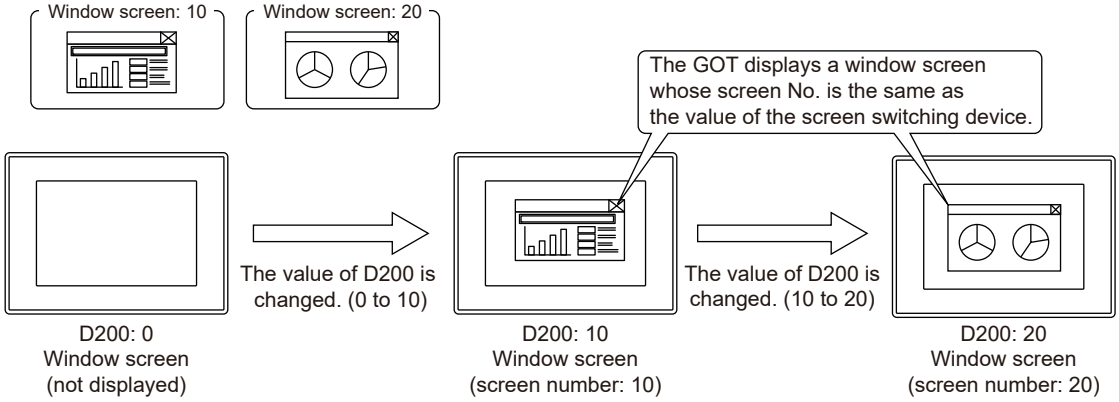
Ex.

Setting D100 for the screen switching device of a base screen



Ex.

Setting D200 for the screen switching device of the overlap window 1



Precautions

Use the device which is set for the screen switching device carefully.

A careless writing to the device may cause unexpected screen switching.

10.1.1 Specifications of the screen switching

GT37 SoftGOT3000

☞ Page 531 Target screens of the screen switching device
☞ Page 531 Screen switching of base screens
☞ Page 533 Screen switching of overlap windows and superimpose windows
☞ Page 533 Screen switching of dialog windows

Target screens of the screen switching device

Set a screen switching device for each of the following screens.

- Base screen
- Overlap windows 1 to 5
- Superimpose windows 1 and 2
- Dialog window
- Mobile screen

For switching mobile screens, refer to the following.

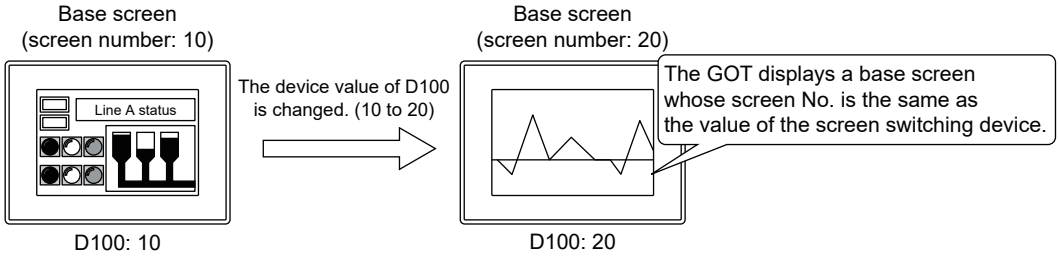
☞ Page 2736 Monitoring a controller from tablets or other devices (GOT Mobile function)

Screen switching of base screens

The GOT displays a base screen whose screen number is the same as the value of the screen switching device.

Ex.

Storing 20 in the screen switching device (D100) while displaying the base screen with the screen No. 10



■When 0 is stored in a screen switching device

When the screen switching device stores 0, the response differs depending on the setting of [Retain the displayed screen when the base screen No. changes to 0 (GT10 series compatible function)] in the [Environmental Setting] window.

☞ Page 542 [Screen Switching/Window]

Setting	Operation when 0 is stored in a screen switching device
Deselected	The GOT displays the base screen with the smallest screen number. Example) Storing 0 in the screen switching device (D100) when the smallest screen No. is 1 Selected	The base screen is not switched. Example) Storing 0 in the screen switching device (D100) while the GOT displays the base screen with the screen No.10 
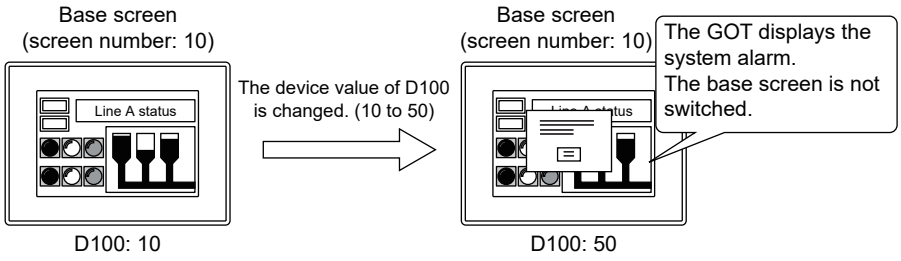
■If a nonexistent screen number is stored in the screen switching device

If a nonexistent screen number is stored in the screen switching device, system alarm 310 is displayed.

In that case, the screen is not switched.

Ex.

Storing screen No. 50 of a nonexistent base screen in the screen switching device (D100)

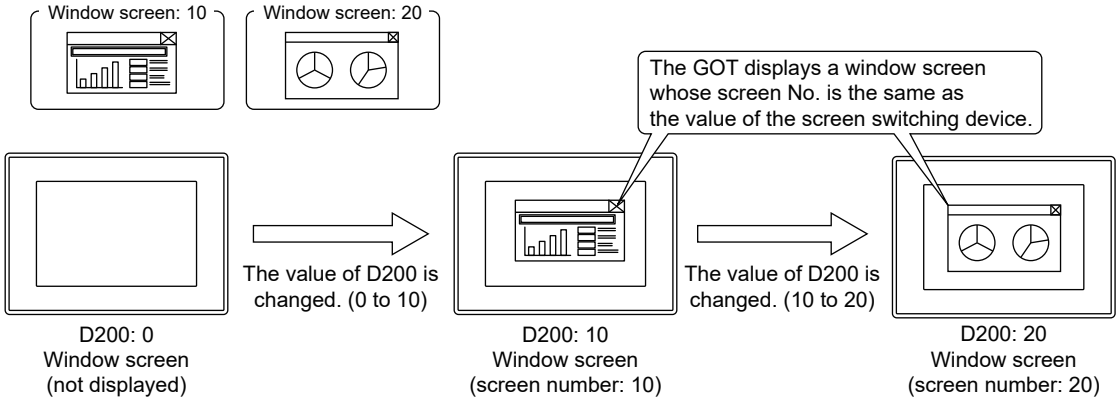


Screen switching of overlap windows and superimpose windows

The GOT displays the window screen whose screen number is the same as the value of the screen switching device as an overlap window or a superimpose window.

Ex.

Setting D100 for the screen switching device of an overlap window



■Closing screens

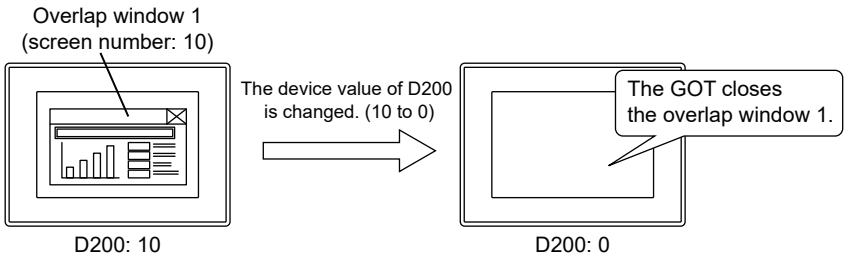
When the screen switching device stores the value set to [Screen No. of the window screen to be hidden] in [Environment Setting] dialog, the GOT closes the target overlap window or superimpose window.

☞ Page 542 [Screen Switching/Window]

Ex.

Storing 0 in the screen switching device (D200) while displaying the overlap window 1

- [Screen No. of the window screen to be hidden]: 0



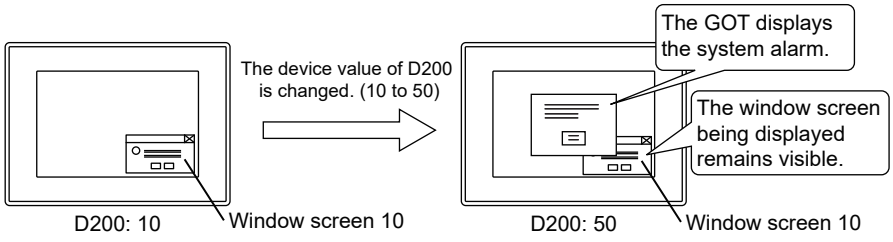
■If a nonexistent screen number is stored in the screen switching device

If a nonexistent screen number is stored in the screen switching device, system alarm 310 is displayed.

In that case, the screen is not switched and the window which has been displayed remains displayed.

Ex.

Storing screen No. 50 of a nonexistent window screen in the screen switching device (D200)



Screen switching of dialog windows

For details on dialog windows, refer to the following.

☞ Page 552 Setting dialog windows of the GOT ([Dialog Window])

10.1.2 How to use the screen switching

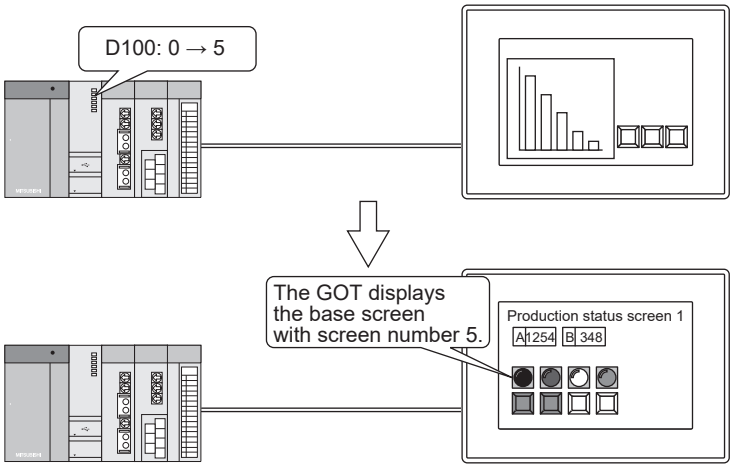
GT37 SoftGOT3000

☞ Page 534 Switching screens with the screen switching device
☞ Page 534 Switching screens with touch switches (Go To Screen switch)
☞ Page 535 Selecting a screen switching device
☞ Page 535 Display position of an overlap window or a superimpose window
☞ Page 536 Using an overlap window as the system window
☞ Page 537 Displaying an overlap window off-screen
☞ Page 538 Specifying the stacking order of overlap windows
☞ Page 539 Disabling the touch operation on the screens that are behind an overlap window
☞ Page 540 Changing the action of the system window when the base screen is switched

Switching screens with the screen switching device

When a screen number is stored in the screen switching device, the corresponding screen is displayed on the GOT.

Ex.
Storing 5 in the screen switching device (D100)



Set the screen switching device in the [Screen Switching/Window] dialog.

☞ Page 542 [Screen Switching/Window]

Switching screens with touch switches (Go To Screen switch)

The screen is switched to another screen when you touch the Go To Screen switch placed on the screen.

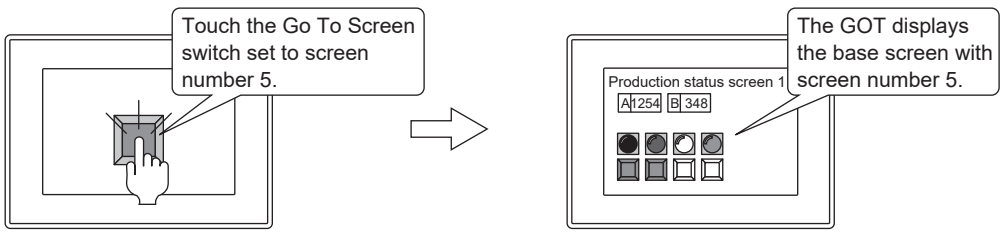
The destination screen depends on the setting of the touch switch.

For information on how to set the Go To Screen switch, refer to the following.

☞ Page 1220 [Go To Screen Switch] dialog

■Switching screens by specifying a screen number

The screen can be switched to the base screen or the window screen which is set for the touch switch.



■Switching screens according to the hierarchy or history of the screens

The screens can be switched according to the operation (hierarchy mode, historical mode) which is set for the touch switch.

Setting	Operation
Hierarchy mode	This mode is for returning to a screen in the upper hierarchy according to the screen hierarchy based on the relation between a source screen and a destination screen. Historical mode	This mode is for returning to the previously displayed screen according to the history of the screen switching. 
Selecting a screen switching device

To select a device used as the screen switching device, refer to the following depending on the method of screen switching.

Device	Description
GOT internal device	Recommended for performing the screen switching by touch switches. To control the screen switching by a controller, you need to use scripts or the device data transfer.
Controller device	Recommended for controlling the screen switching by a controller. You can also switch the screens with touch switches.

Display position of an overlap window or a superimpose window

You can specify the display position of an overlap window or a superimpose window by setting [Window Position] on a base screen.

For information on how to set [Window Position], refer to the following.

☞ Page 1883 Specifying the display position of a window screen

On the base screen having no [Window Position] setting, the display position of a window screen is as follows.

- A window screen initially appears in the center of the GOT screen.
- When a window screen was displayed previously, the window screen appears at the previously displayed position.

When you switch a base screen on which a window screen is being displayed, note the following: even if you configure different [Window Position] settings on the destination base screen, the window screen remains in the same position after the base screen switching.

Using an overlap window as the system window

Window screens used for system applications, including Web browser windows, are called system windows.
Displaying such a system window requires the following overlap window as a resource.

- Overlap window for which no screen switching device is set
- Overlap window for which [Use also as a system window] is set

Settings to be assigned to system window resources are configurable in the [Environmental Setting] window ([Screen Switching/Window]).

☞ Page 542 [Screen Switching/Window]

When the system window is not used, you can also display a window screen as usual with an overlap window assigned to a resource.
If the system window is called while a window screen is displayed with the overlap window, the GOT closes that window screen and opens that system window.
After the system window is closed, the window screen whose screen No. is the same as the value of the screen switching device is displayed again.

Precautions

The number of system windows that can be started cannot exceed that of overlap windows that can be used as resources. Set as many such overlap windows as the number of system windows to be used.

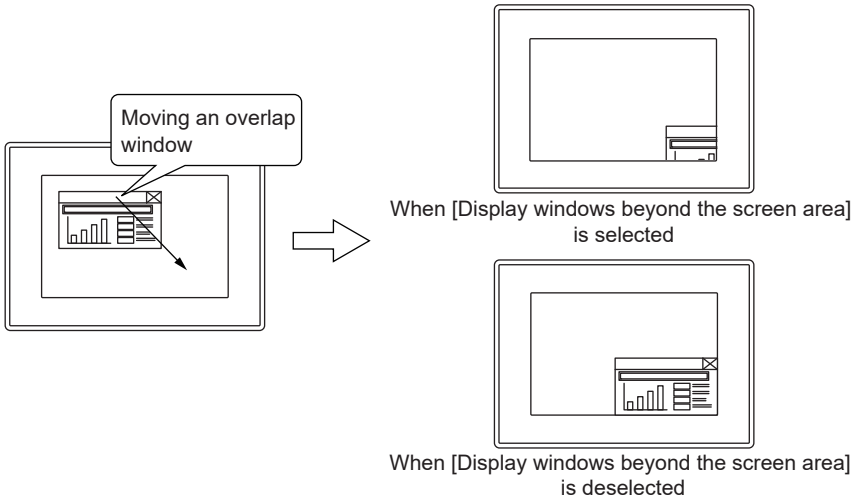
Displaying an overlap window off-screen

To display an overlap window off the GOT screen, select [Display windows beyond the screen area] in the [Screen Switching/Window] dialog.

Note that dialog windows cannot be displayed off the GOT screen.

The overlap window can be displayed off the right side or the bottom of the screen.

☞ Page 542 [Screen Switching/Window]



This setting also allows the following windows to be displayed off the GOT screen.

- Key window
- Comment window
- Screen image display in the utility (operation log information)
- Web browser window

Specifying the stacking order of overlap windows

To specify the stacking order of overlap windows, set [Specify the display order] in the detail setting for each overlap window.

The detail setting for the overlap window is configurable in the [Environmental Setting] window ([Screen Switching/Window]).

☞ Page 542 [Screen Switching/Window]

The stacking order number for an overlap window is settable ranging from 1 (the most front face) to 5 (the most rear face).

The same stacking order number is settable for multiple overlap windows.

When an overlap window is used as a system window, the user-specified stacking order number is invalid.

When you specify the stacking order number for some overlap windows, all overlap windows are classified into groups below.

- User-specified stacking order group (Overlap windows having a user-specified stacking order number)
- Non-user-specified stacking order group (Overlap windows having no user-specified stacking order number)
- Group of overlap windows used as system windows

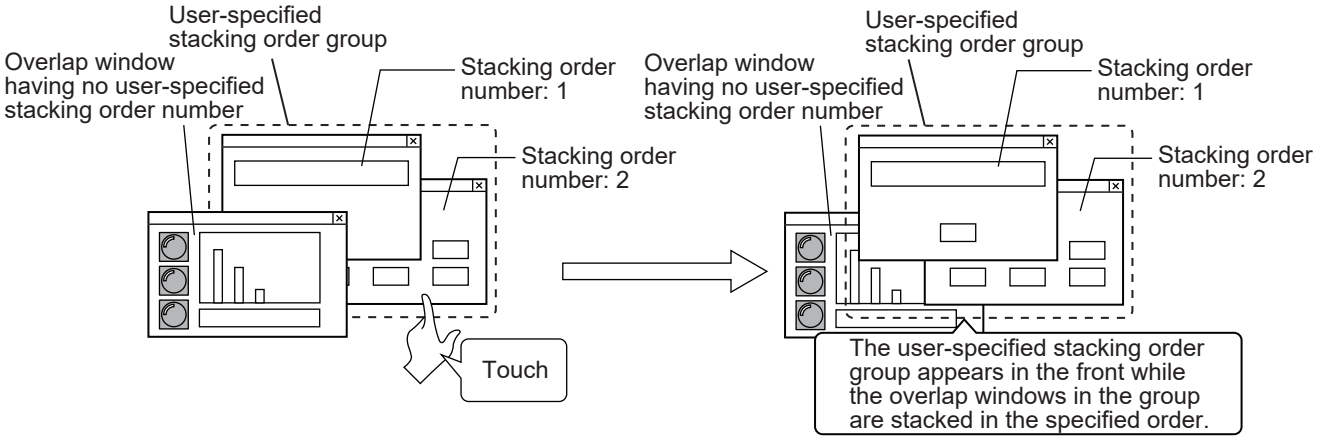
Within the user-specified stacking order group, the overlap windows always appear in the specified stacking order.

Within the other groups, the stacking order of the overlap windows varies with the user operation or GOT behavior.

The following shows examples where the overlap windows in the multiple groups are displayed.

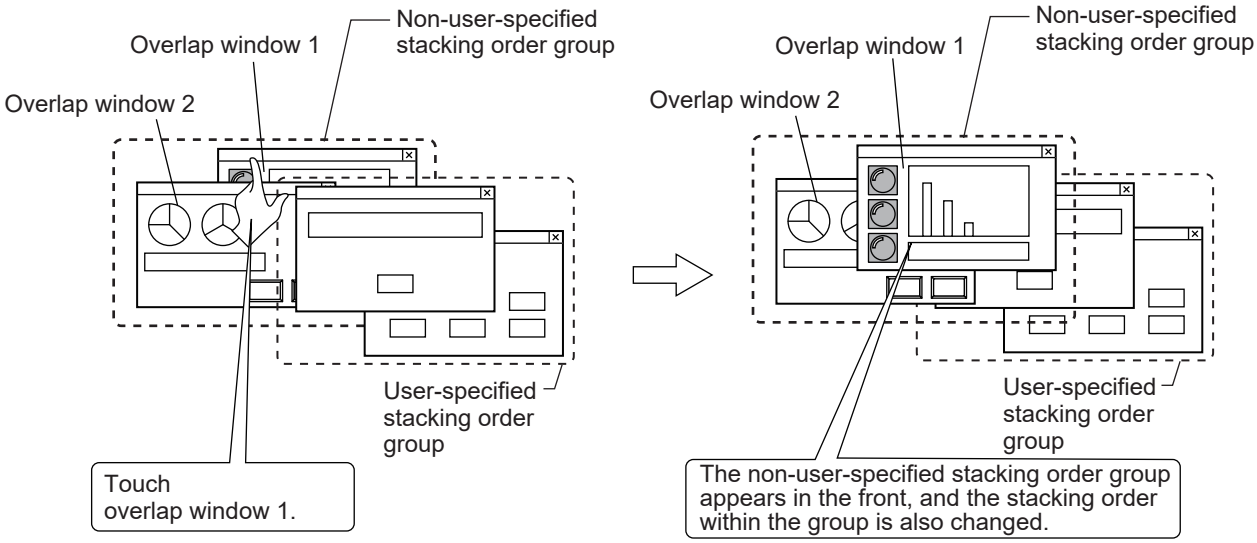
Ex.

When touching an overlap window having a user-specified stacking order number



Ex.

When touching an overlap window having no user-specified stacking order number



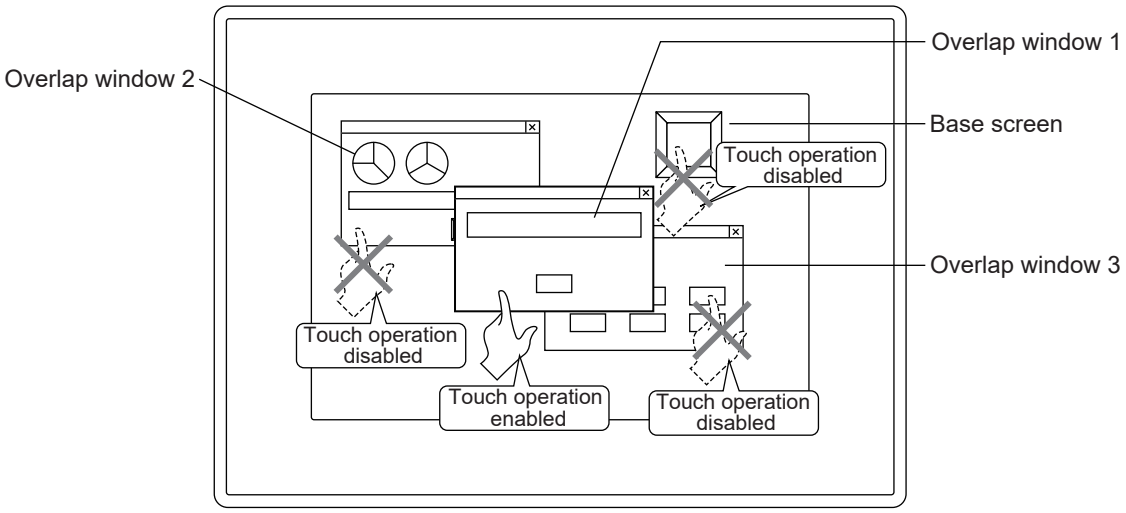
Disabling the touch operation on the screens that are behind an overlap window

To disable the touch operation on the screens that are behind an overlap window, select [Disable the touch operation of a screen on the back] in the detail setting for the overlap window. The overlap window appears in the front, regardless of the stacking order number setting.

While this overlap window is being displayed, the touch operation is disabled in the area outside the window.

Ex.

When disabling the touch operation on the screens that are behind the overlap window 1



The detail setting for the overlap window is configurable in the [Environmental Setting] window ([Screen Switching/Window]).

☞ Page 542 [Screen Switching/Window]

A bit device is usable to enable or disable the touch operation.

When this bit device control is enabled, the touch operation of screens behind this screen is disabled only while the relevant bit device is on.

Changing the action of the system window when the base screen is switched

Use GS522.b7 to set the action of the system window displayed when the base screen is switched.

For system windows, refer to the following.

☞ Page 536 Using an overlap window as the system window

Item	Operation
When GS522.b7 is on	The displayed system window is closed when the base screen is switched. When GS522.b7 is off	The displayed system window is not closed when the base screen is switched. 
10.1.3 Moving an overlap window

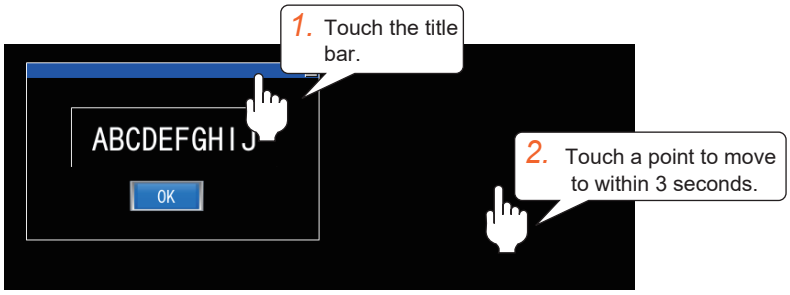
GT37 SoftGOT3000

The following shows how to move an overlap window which is displayed on the GOT.

Moving the window with touch operations

Touch the title bar of an overlap window, and then touch the position to move the window to within three seconds.

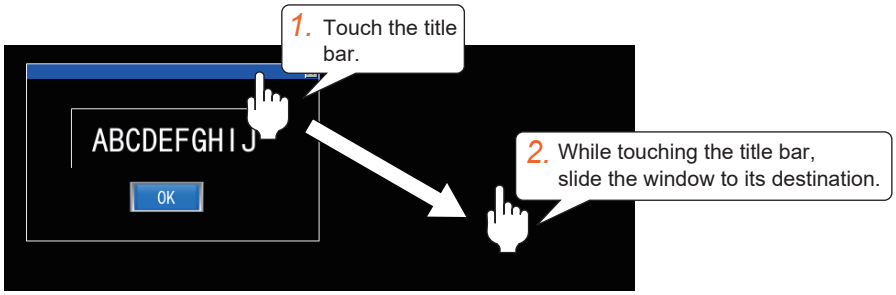
To enable this operation, the setting for displaying title bars must be configured.



Moving the window with a slide operation

While touching the title bar of an overlap window, slide the window to its destination.

To enable this operation, the setting for displaying title bars must be configured.



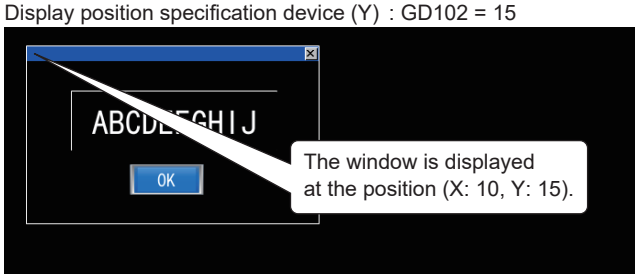
Moving the window with devices

Set the coordinates of a position to move the window for the display position specification device (X and Y).

To enable this operation, the setting of the display position specification device must be configured.

☞ Page 542 [Screen Switching/Window]

Screen switching device : GD100 = 1
Display position specification device (X) : GD101 = 10
Display position specification device (Y) : GD102 = 15



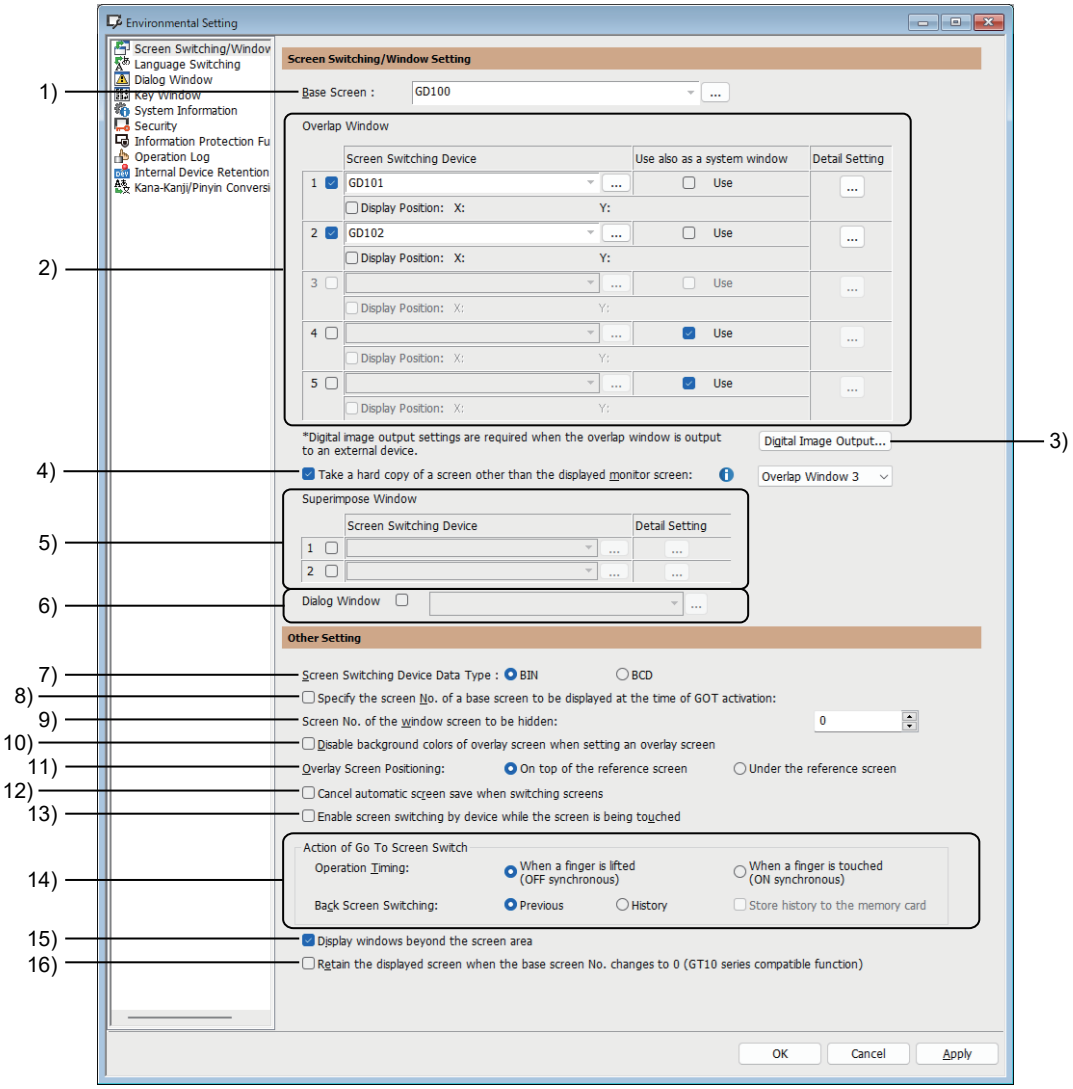
PART 5

10.1.4 [Screen Switching/Window]

GT37 SoftGOT3000

Set the screen switching and the display method of window screens.

Select [Common] → [GOT Environmental Setting] → [Screen Switching/Windows] from the menu to display this dialog.



Item		Description
1)	Screen switching device for a base screen	Set a screen switching device (word device) for a base screen. The bit device cannot be specified as the word device. ☞ Page 834 How to set devices, labels, and tags

Item			Description
2)	Settings for overlap window	—	Set whether to use overlap windows 1 to 5, the screen switching devices, and the display method of those windows. The overlap window which you selected becomes available. You cannot set the overlap window selected for [Take a hard copy of a screen other than the displayed monitor screen].
		[Screen Switching Device]	Set screen switching devices (word device) for overlap windows 1 to 5. The bit device cannot be specified as the word device. ☞ Page 834 How to set devices, labels, and tags
		[Display Position]	Specify the display positions of overlap windows 1 to 5 with devices. A display position specification device is automatically assigned to each overlap window when you select this item. The device numbers of the display position specification devices for the X and Y coordinates are specified as follows: The horizontal coordinate (X coordinate) is the screen switching device + 1, and the vertical coordinate (Y coordinate) is the screen switching device + 2. Specify the display positions of overlap windows 1 to 5 as follows.  If a value which cannot be displayed on the GOT is stored to the display position specification device, the display position is adjusted automatically. The adjusted display position is not reflected to the device value. 		[Use also as a system window]	Allows to use an overlap window as the system window. ☞ Page 536 Using an overlap window as the system window
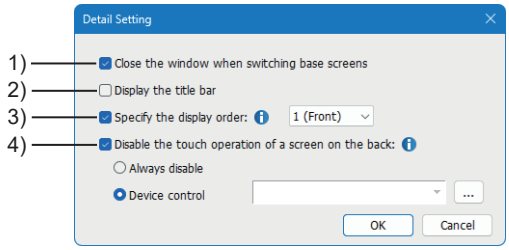
		[Detail Setting]	Displays the [Detail Setting] dialog. ☞ Page 545 [Detail Setting] dialog (overlap window)
3)	[Digital Image Output] button		The [GOT Setup] window ([Digital Image Output]) appears. Set the window to be output to an external device. ☞ Page 647 [Digital Image Output]
4)	[Take a hard copy of a screen other than the displayed monitor screen]		Set the overlap window to be used for the hard copy function processing. Overlap windows 1 to 5 whose use is deselected are settable. When selected, the window cannot be used to specify the display position or as a system window. For details on the hard copy function, refer to the following. ☞ Page 2554 Capturing the operating screen of the GOT ([Hard Copy])
5)	Setting of superimpose window	—	Set whether to use superimpose windows 1 and 2 and the screen switching device. The superimpose window which you selected becomes available.
		[Screen Switching Device]	Set screen switching devices (word device) for superimpose windows 1 and 2. The bit device cannot be specified as the word device. ☞ Page 834 How to set devices, labels, and tags
		[Detail Setting]	Displays the [Detail Setting] dialog.  If you select the checkbox, the superimpose window is closed when the base screen is switched.

Item			Description
6)	[Dialog Window]		When you select the checkbox, the dialog window becomes available. Set a screen switching device (word device) for the dialog window. The bit device cannot be specified as the word device. ☞ Page 834 How to set devices, labels, and tags
7)	[Screen Switching Device Data Type]		Set the data type of the screen switching device.
8)	[Specify the screen No. of a base screen to be displayed at the time of GOT activation]		Set a screen number of the base screen to be displayed on the GOT at startup.
9)	[Screen No. of the window screen to be hidden]		Set a screen number for closing a displayed overlap window or superimpose window.
10)	[Disable background colors of overlay screen when setting an overlay screen]		Disables the background color of the called screen.
11)	[Overlay Screen Positioning]		Set whether to place the called screen above or below the base screen.
12)	[Cancel automatic screen save when switching screens]		Cancels the screen saver state in the following cases. • Switching the base screen • Displaying, hiding, or switching an overlap window • Displaying, hiding, or switching a superimpose window • Displaying or hiding a dialog window • Displaying or hiding a video window • Displaying or hiding a popup display
13)	[Enable screen switching by device while the screen is being touched]		Enables screen switching by using the screen switching devices while the screen is being touched.
14)	[Action of Go To Screen Switch]	[Operation Timing]	Set the timing to operate the Go To Screen switch. Select [When a finger is lifted (OFF synchronous)] to switch screens at the timing when you release your finger from the switch. Select [When a finger is touched (ON synchronous)] to switch screens when you touch the switch.
		[Back Screen Switching]	Set the operation when [Back (Previous/History)] is selected for [Next Screen] in the setting of the Go To Screen switch. Select [Previous] to perform the screen switching in hierarchy mode. Select [History] to perform the screen switching in historical mode. ☞ Page 535 Switching screens according to the hierarchy or history of the screens
		[Store history to the memory card]	Stores the history of the screen switching in a data storage. This item can be selected if [History] is selected for [Back Screen Switching].
15)	[Display windows beyond the screen area]		Enables overlap windows and key windows to be displayed off the GOT screen. ☞ Page 537 Displaying an overlap window off-screen ☞ Page 566 Displaying a key window off-screen
			You can move an overlap window off the GOT screen by specifying coordinates off the GOT screen with the display position specification device. The overlap window that was moved outside the GOT screen cannot be moved by the touch operation. To move the window back into view, specify the window coordinates within the screen area with display position specification devices.
16)	[Retain the displayed screen when the base screen No. changes to 0 (GT10 series compatible function)]		When the screen switching device stores 0, the currently displayed base screen is not switched. However, if the base screen with the screen No. 0 exists, the current screen is switched to the base screen with the screen No. 0. If this item is not selected, the GOT switches to the base screen with the smallest screen number. ☞ Page 531 Screen switching of base screens

[Detail Setting] dialog (overlap window)



Item		Description
1)	[Close the window when switching base screens]	Closes the overlap window when the base screen is switched.
2)	[Display the title bar]	Displays a title bar on the overlap window.
3)	[Specify the display order]	Select a stacking order number for the overlap window. For details on the stacking order, refer to the following. ☞ Page 538 Specifying the stacking order of overlap windows
4)	[Disable the touch operation of a screen on the back]	Displays the overlap window in the front regardless of the setting of [Specify the display order], and disables the touch operation on the screens behind the overlap window. Select this item, and then select a condition for disabling the touch operation. • [Always disable]: Always disables the touch operation. • [Device control]: Uses a specified bit device to enable or disable the touch operation. For details, refer to the following. ☞ Page 539 Disabling the touch operation on the screens that are behind an overlap window

Precautions

To configure the following settings, make sure to arrange the Go To Screen switch for closing the window screen, in the overlap window.

- Select [Disable the touch operation of a screen on the back]
- Do not select [Display the title bar]

If the touch operation of the screen behind the overlap window with no title bar is disabled, you cannot close the overlap window.

☞ Page 1220 [Go To Screen Switch] dialog

10.2 Setting for switching the language displayed on the GOT ([Language Switching])

GT37 SoftGOT3000

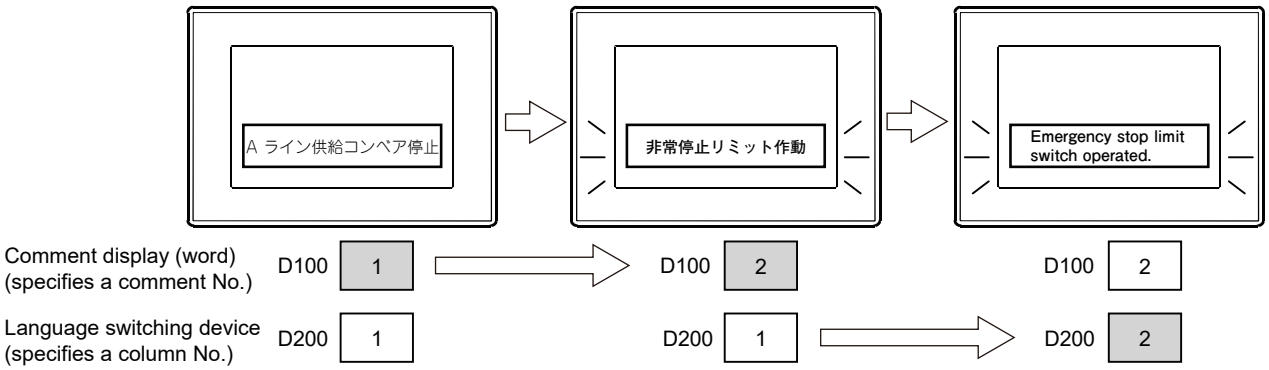
☞ Page 547 Specifications of the language switching
☞ Page 549 How to use the language switching
☞ Page 551 [Language Switching]

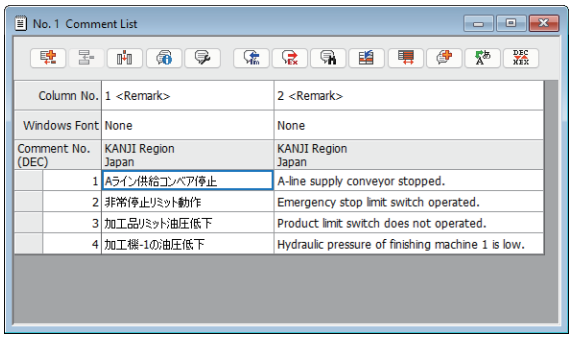
The GOT switches comments displayed on the object according to a value (column number of the comment group) in the language switching device.

If messages of Japanese, English, Chinese, and other languages are registered in each column of the comment group, the language of the comment displayed can be switched.

For information on how to register comments, refer to the following.

☞ Page 780 How to use comment

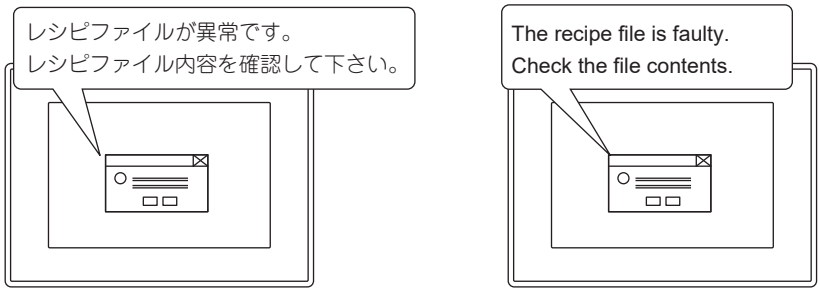




On the other hand, the system language used in the utility screen and others is switched by the system language switching device.

The system language can be switched to the language compatible with the language ID according to the value stored to the system language switching device (language ID).

System language switching device: GD100
Language ID = 1: Japanese, 2: English



GD100 = 1 GD100 = 2

10.2.1 Specifications of the language switching

GT37 SoftGOT3000

☞ Page 547 Language switching device
☞ Page 547 System language switching device
☞ Page 548 Area setting
☞ Page 548 Effect of language switching or system language switching on objects

Language switching device

The language switching device is used to switch the comment column of the comment group.
A language switching device can be set per project.
Store the column number of the comment group to the language switching device to switch the comment column to be displayed.
For comment settings, refer to the following.
☞ Page 776 Comment setting ([Comment])
For the setting of the language switching device, refer to the following.
☞ Page 551 [Language Switching]

System language switching device

The system language switching device is used to switch the system language used for the utility, system alarm, and others.
A system language switching device can be set per project.
A language ID is assigned to each language.
Store the language ID to the system language switching device to switch the system language.
language IDs are assigned as shown below.

Language ID	Compatible language
1	Japanese
2	English
3	Chinese (Simplified)
4	Chinese (Traditional)
5	Korean

When a value other than the one above is stored to the system language switching device, the system language set in the utility is set.
For the setting of system language switching, refer to the following.
☞ Page 551 [Language Switching]

Precautions

When the system language is switched while a dialog window is displayed, the system language is switched after the dialog window is closed and the screen returns to the user-created screen.

Area setting

The formats of a sorting order of the date, decimal marker, and others which differ depending on areas can be switched associating with language switching.

This setting is applied to all the objects on the user screen.

However, this setting is not applied to the system screens, such as the utility screen and the system application screen.

■Date

Select [yy/mm/dd], [mm/dd/yy], or [dd/mm/yy] for a sorting order of the date.

■Decimal marker

Select [, (comma)] or [. (period)] for a decimal marker.

Effect of language switching or system language switching on objects

Language switching or system language switching switches screens.

Therefore, the operations of the following objects are affected at language switching.

Target	Effect
Parts display	When [Locus] is selected for [Display Mode], the locus is deleted.
Scatter graph	When settings such as memory storage are not configured, the previously collected data of the occurrence time or others is deleted. To store the previously collected data at language switching, set each object to store the memory. ☞ Page 1687 [Extended] tab
Historical data list display Alarm display (user) Alarm display (system) Simple alarm display	When the display is scrolled, the display returns to the top after language switching.
Object during input	When data is being input to objects, the cursor is deleted and the input is canceled.
Display trigger of objects	When the display trigger condition of objects is not satisfied before language switching, the description displayed on objects is deleted.

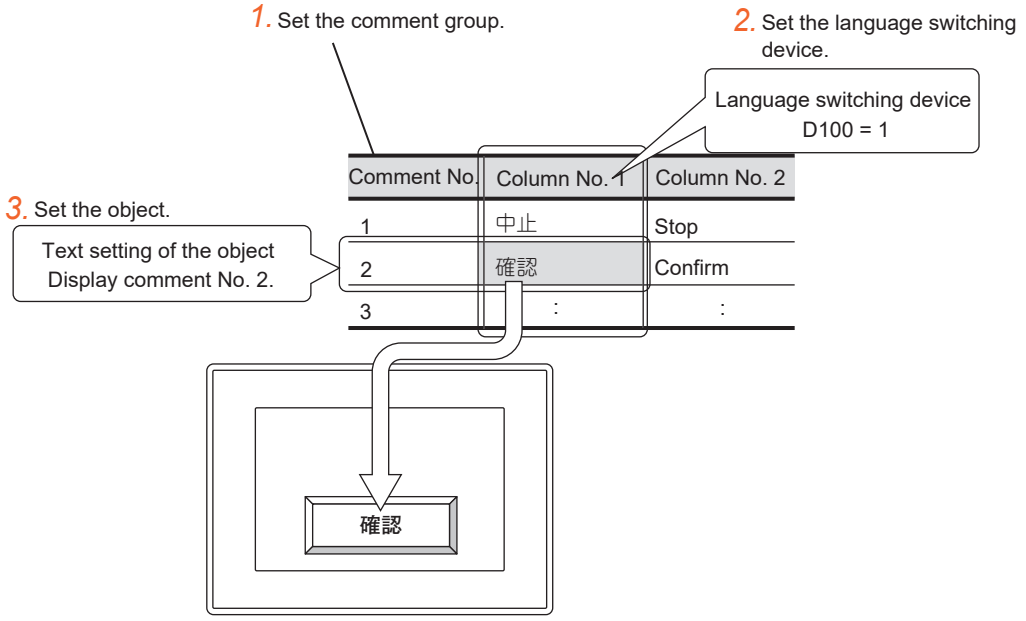
10.2.2 How to use the language switching

GT37 SoftGOT3000

Switching the language of the comment to be displayed on the object (switching the comment column)

Switch the comment column to switch the language of the comment to be displayed on the object.
Store the column No. to the language switching device to switch the comment column.

■Setting procedure



1. Set the comment group.

Set multiple comment columns in the comment group.

☞ Page 780 How to use comment

2. Set the language switching device.

☞ Page 551 [Language Switching]

3. Configure the setting of each object on the screen for displaying character strings set as a comment text.

☞ Page 1191 Placing a touch switch
☞ Page 1276 Placing a lamp
☞ Page 1386 Placing a comment display
☞ Page 1495 Placing a historical data list display
☞ Page 1519 Placing a simple alarm display
☞ Page 2132 Viewing alarm events (Alarm display)

■Operation on the GOT

Store the value of the column No. to the language switching device by a touch switch or a numerical input.
Storing the value switches the language of the comment to be displayed on the object.
When the value of the language switching device is out of the range (0, 31 or larger) or a nonexistent column No. is specified, a comment is not displayed.
However, when [Alternative Display (when the language switching device value is out of the range (other than 1-30) or comment column No. does not exist)] is set, the column No. set previously is displayed.

Switching the system language on the user-created screen

The system language is used on the screen other than the user-created screen, such as the utility screen and system alarm.
To change the system language on the user-created screen, use the system language switching device.
Store the value of the language ID to the system language switching device to switch the system language.
You can also change the system language on the utility screen of the GOT.
For information on how to change the system language on the utility screen, refer to the following.
📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Setting procedure

1. Enable language switching to set the system language switching device.
☞ Page 551 [Language Switching]

2. Place an object such as a numerical input or a word switch for storing the language ID to the system language device.

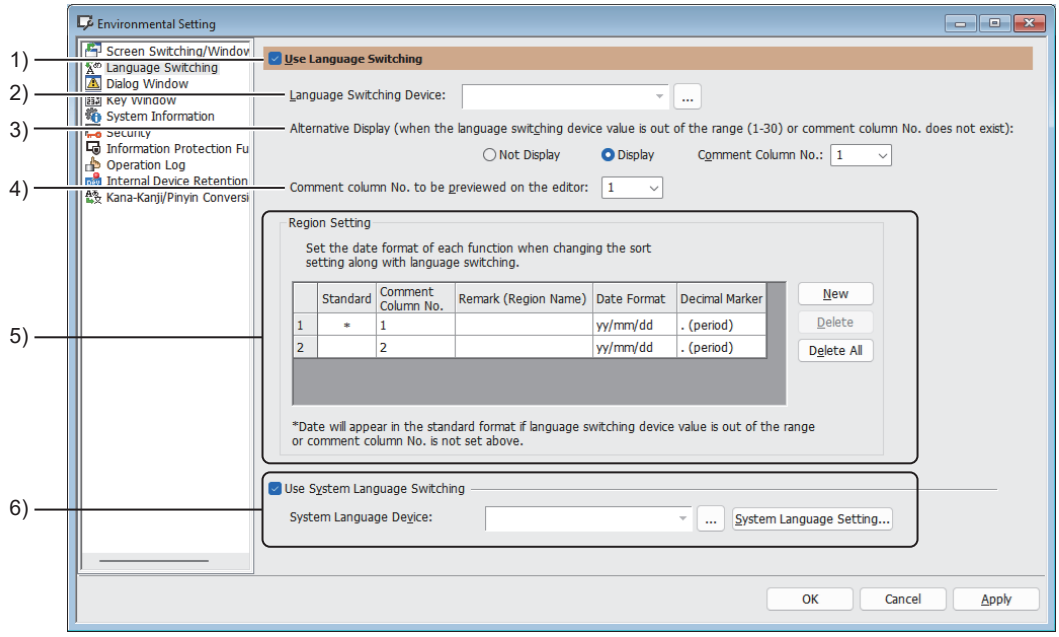
■Operation on the GOT

Input the value of the language ID to the language switching device by a touch switch or a numerical input.
Inputting the value switches the system language to the language which is compatible with the language ID.
For the specifications of the language ID, refer to the following.
☞ Page 547 System language switching device
The system language can be switched by the system language switching device only on the user-created screen.
The system language cannot be switched by the system language switching device while the system window, utility screen, add-on function screen, or other screens are displayed.
Switch the system language by the device after closing all the screens above.

10.2.3 [Language Switching]

GT37 SoftGOT3000

In [Language Switching], the language switching device and the system language switching device are set.
Select [Common] → [GOT Environmental Setting] → [Language Switching] from the menu to display this window.



Item			Description
1)	[Use Language Switching]		Select this item to enable language switching.
2)	[Language Switching Device]		Set the language switching device (word device). The bit device cannot be specified as the word device. Data type is signed 16-bit binary.
3)	[Alternative Display (when the language switching device value is out of the range (1-30) or comment column No. does not exist)]		When the comment column No. which matches with the value of the language switching device does not exist in the comment group, select whether to display a comment. If you select [Display], set the comment column number to be displayed to [Comment Column No.]. The setting range is [1] to [30]. If you set a nonexistent comment column No., a comment is not displayed.
4)	[Comment column No. to be previewed on the editor]		Set the comment column No. to be used for a preview display on the screen editor.
5)	[Region Setting]	—	Set the formats of a sorting order of the date, decimal marker, and others which differ depending on areas.
		[Standard]	The row with [*] is the default value of the area setting.
		[Comment Column No.]	Set the comment column No. which the area setting is applied to. The setting range is [1] to [30].
		[Remark (Region Name)]	Set the remarks such as the area setting name. Up to 32 characters can be set.
		[Date Format]	Select a sorting order of the date.
		[Decimal Marker]	Select a symbol to be used as a decimal marker.
		[New] button	Adds a new area setting.
		[Delete] button	Deletes a selected area setting.
		[Delete All] button	Deletes all the area settings.
6)	[Use System Language Switching]	—	Select this item to enable system language switching. Set the system language switching device.
		[System Language Device]	Set the system language switching device (word device). The bit device cannot be specified as the word device. Data type is signed 16-bit binary.
		[System Language Setting] button	Displays the settings of the language ID to be used for system language switching. The system language setting can be displayed only when [Language Setting] is set in the GOT setup. ☞ Page 618 [Display Setting/Language Setting]

10.3 Setting dialog windows of the GOT ([Dialog Window])

GT37 SoftGOT3000

☞ Page 553 Specifications of dialog windows
☞ Page 555 How to use dialog windows
☞ Page 557 [Dialog Window]

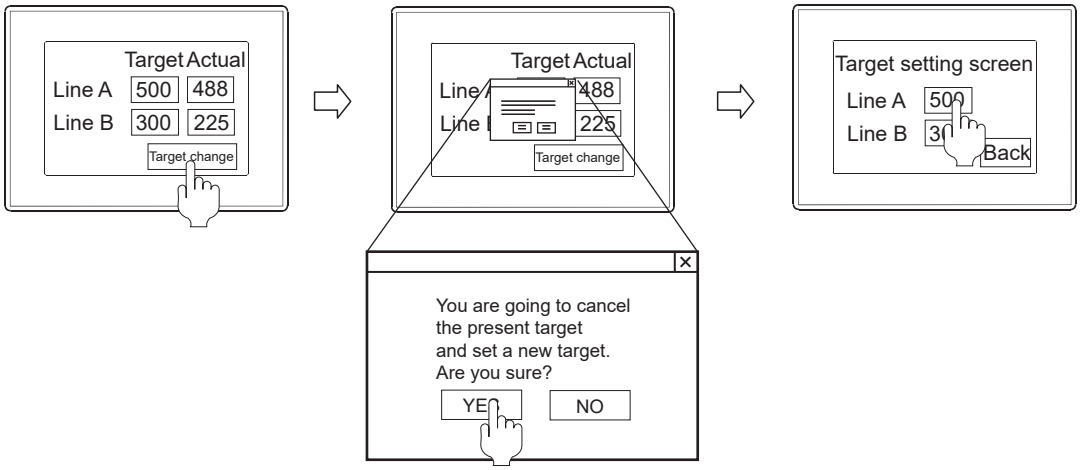
You can create and replace system messages displayed on the GOT using the created dialog windows.

Ex.

Displaying a created dialog window as a new message

By creating a dialog window for an error or warning as a system, the GOT can display the dialog window as a system message.

You can set a window that does not display the next screen without an answer to the message or a window that is for confirmation for the information.



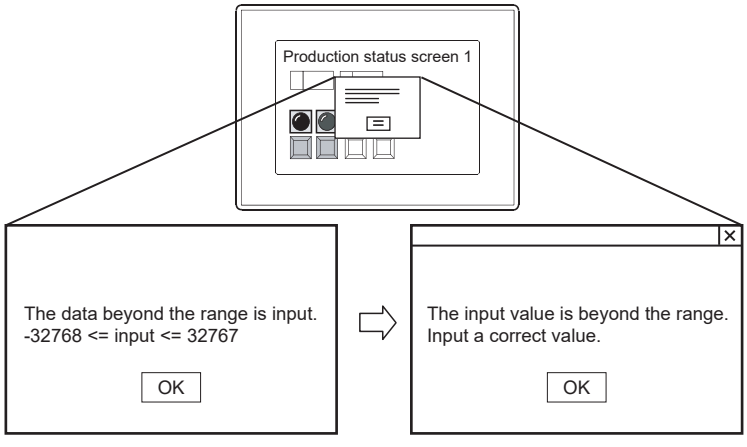
A dialog window such as one guiding a user to confirm the operation can be displayed.

Ex.

Displaying a created dialog window instead of the system message of the GOT

You can replace the system message displayed by the GOT with the created dialog window.

The GOT can display more specific and system-matched messages.



System message displayed on the GOT

Changed to the dialog window created by a user

10.3.1 Specifications of dialog windows

GT37 SoftGOT3000

☞ Page 553 Available screen size and number of screens
☞ Page 553 Available figures and objects
☞ Page 553 Superimposition of objects
☞ Page 553 Layer setting
☞ Page 553 Functions that do not operate
☞ Page 553 Screen switching while a dialog window is displayed
☞ Page 554 Communication with GT Designer3 while a dialog window is displayed
☞ Page 554 Priority between the displayed dialog window and a newly generated system message
☞ Page 554 Dialog window replacement setting on superimpose windows or called screens

Available screen size and number of screens

For the specifications of dialog windows as window screens, refer to the following.

☞ Page 58 Screen types and specifications

Available figures and objects

You can place all the figures and objects placeable on the window screen.

Some restrictions are placed on the use of the following objects.

Object	Restriction
Numerical input Text input	The input operation is not available.
Recipe display (record list)	Not displayed.
Key window object	The key window object is displayed only on the dialog window that appears, replacing any of the following system messages. • [Input data error, too many integer places] • [Input data error, too many decimal places] • [Input data error, number too large/small] • [Input data error, out of range] For the system message replacement display, refer to the following. ☞ Page 555 Displaying a created dialog window instead of the system message of the GOT

Superimposition of objects

The superimposition of objects is not available.

Layer setting

The front layer and the back layer are combined on the GOT.

The set object stacking order may be invalid.

Functions that do not operate

The following functions do not operate in the dialog window.

- Screen script
- Trigger action

Screen switching while a dialog window is displayed

The screen is not switched while a dialog window is displayed.

If you have attempted to switch the screen, the screen switching is valid after the dialog window is closed.

Communication with GT Designer3 while a dialog window is displayed

While a dialog window is displayed, communication between the GOT and GT Designer3 may not be established.
If communication between the GOT and GT Designer3 is not established, close the dialog window.

Priority between the displayed dialog window and a newly generated system message

A system message and a dialog window cannot be displayed together.
If you have attempted to display a dialog window together with a system message, the system message has the priority.

■When a user-created system message is generated while a dialog window is displayed

The displayed dialog window remains.
The newly generated system message is not displayed.

■When a system message of the GOT is generated

The displayed dialog window is closed, and 0 is stored in the screen switching device for the dialog window.
Then, the newly generated system message is displayed.
If a button is arranged on the displayed dialog window, the following processing is executed before the window is closed.

- For the dialog window with only a [OK] button, the processing is the same as when the [OK] button is pressed.
- For the dialog window with a cancel button, the processing is the same as when the [Cancel] button is pressed.

Dialog window replacement setting on superimpose windows or called screens

On the screen displayed as a superimpose window or called screen of the set overlay screen, screen-based dialog window replacement setting is invalid.
The dialog window replacement setting of the displayed base screen is valid.

10.3.2 How to use dialog windows

GT37 SoftGOT3000

☞ Page 555 Displaying a created dialog window as a new message
☞ Page 555 Displaying a created dialog window instead of the system message of the GOT
☞ Page 556 Setting procedure

To use a dialog window, set a screen switching device for the dialog window.

For information on how to set the screen switching devices, refer to the following.

☞ Page 542 [Screen Switching/Window]

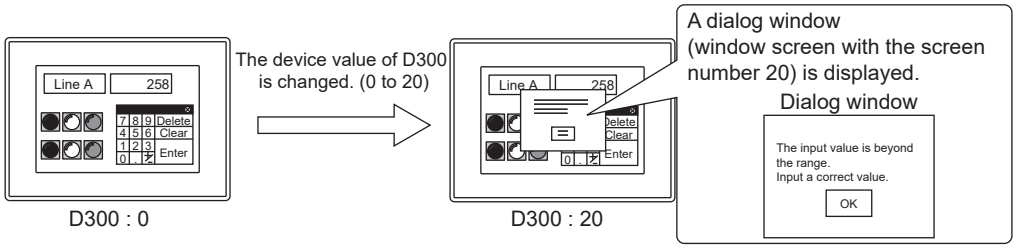
Displaying a created dialog window as a new message

Storing the screen number of the created dialog window to the screen switching device enables the display of the dialog window.

Storing 0 to the screen switching device closes the displayed dialog window.

Ex.

Storing the screen number 20 of the window screen to the screen switching device (D300) for the dialog window



Displaying a created dialog window instead of the system message of the GOT

A created dialog window can be displayed instead of the system message of the GOT.

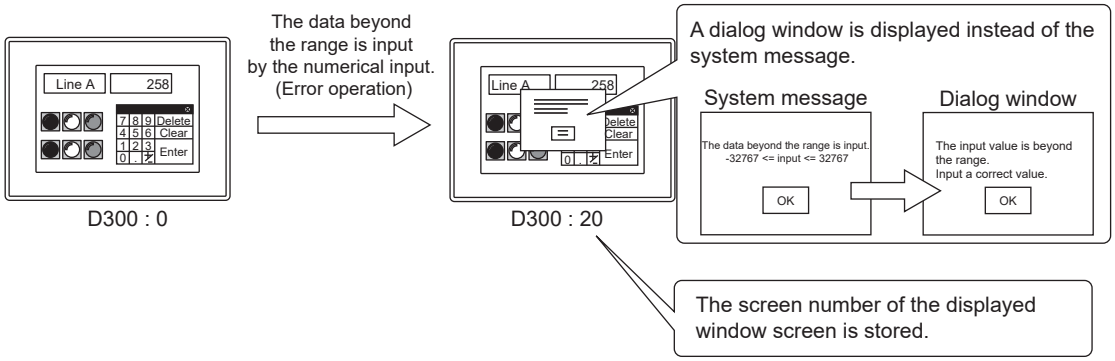
This is called the system message replacement display.

Storing 0 to the screen switching device closes the displayed dialog window.

Ex.

Displaying the window screen with the screen number 20 instead of the system message at an error operation

(Screen switching device (dialog window): D300)



The following table lists the system messages available for the replacement display.

System message to be replaced	Setting item of the [Environmental Setting] window	Unit of setting
[Communication error. Refer to System Alarm in Utility Menu.]	[Communication Circuit Check Demand]	By project
[Input data error, too many integer places.]*1	[Input Digits Overflow (Integer Part)]	By project By screen
[Input data error, too many decimal places.]*1	[Input Digits Overflow (Decimal Part)]	By project By screen

System message to be replaced	Setting item of the [Environmental Setting] window	Unit of setting
[Interlock not set.]	[Input Condition Failure]	By project By screen
[Input data error, number too large/small.]	[Input Digits Overflow]	By project By screen
[Input data error, out of range.]	[Out of Input Range]	By project By screen
[Do you want to change?]	[Input Confirmation]	By project By screen
[Barcode/RFID data is invalid.]	[Invalid Bar Code/RFID Data]	By project By screen

*1 Available only when the data type of the monitor device is real number.

Configure the setting for replacing a system message in the [Environmental Setting] window.

☞ Page 557 [Dialog Window]

Setting procedure

1. Set a screen switching device.

☞ Page 542 [Screen Switching/Window]

2. Create a window screen to be displayed as a dialog window.

For the creation procedure, refer to the following.

☞ Page 263 Creating a screen

3. Configure the setting of the dialog window in the [Environmental Setting] window when replacing a system message with the window.

For the setting procedure, refer to the following.

☞ Page 557 [Dialog Window]

Precautions

Configure the setting for closing the dialog window.

If the dialog window is not closed, monitor screens or utility screens cannot be displayed.

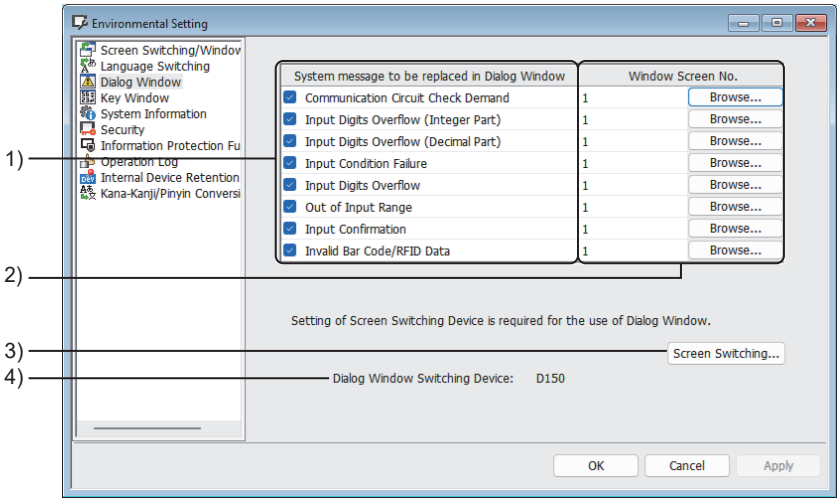
The setting includes: arranging a touch switch for closing the window, script that writes 0 to the screen switching device, and a sequence program.

10.3.3 [Dialog Window]

GT37 SoftGOT3000

In [Dialog Window], set the display method of the dialog window.

Select [Common] → [GOT Environmental Setting] → [Dialog Window] from the menu to display this window.



Item		Description
1)	[System message to be replaced in Dialog Window]	Select a system message to be replaced by the dialog window. Replaces the selected system message with the window screen set in [Window Screen No.]. For the system messages of each item, refer to the following. ☞ Page 555 Displaying a created dialog window instead of the system message of the GOT
2)	[Window Screen No.]	Set a screen number of the window screen to be displayed instead of the system message. The setting range is [0] to [32767]. When [0] is set, either system message or dialog window is not displayed.
3)	[Screen Switching] button	Displays the setting screen for the screen switching devices. ☞ Page 542 [Screen Switching/Window]
4)	[Dialog Window Switching Device]	Displays the currently set screen switching device for a dialog window.

10.4 Setting key windows of the GOT ([Key Window])

GT37 SoftGOT3000

☞ Page 558 Specifications of the standard key window
☞ Page 563 Specifications of the user-created key window
☞ Page 564 Common specifications of the standard key window and user-created key window
☞ Page 565 How to use key windows
☞ Page 570 [Key Window]
☞ Page 575 Relevant settings

The key window is a window for inputting numerical values and characters which are used for objects including numerical input and text input.

The key window has two types: GOT default key window (standard key window) and key window created by the user (user-created key window).

10.4.1 Specifications of the standard key window

GT37 SoftGOT3000

The standard key window is a GOT default window for inputting numerical values and characters.

The standard key window automatically appears according to the input area format (hexadecimal, decimal, octal, binary, or text).

☞ Page 559 Key window for numerical values
☞ Page 560 Key window for inputting characters (Alphabet or kana mode)

The design of the standard key window varies depending on the design selected in the [Screen Design] dialog.

☞ Page 310 [Screen Design] dialog

Point

The standard key window size can be selected from [Standard] and [Large].

The setting can be configured using the utility or [Common].

☞ Page 618 [Display Setting/Language Setting]

For the GOT with XGA resolution, [Standard] is selected by default.

When using the standard key window with GT3708-X, it is recommended to change the standard key window size to [Large] to ensure operability.

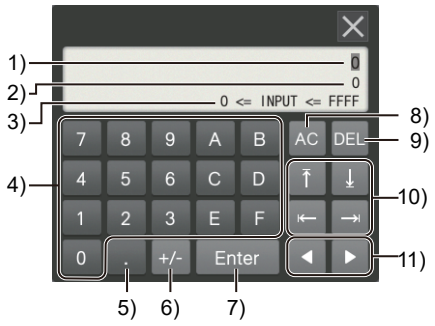
GOT3000 Series User's Manual (Utility & Maintenance Functions)

Key window for numerical values

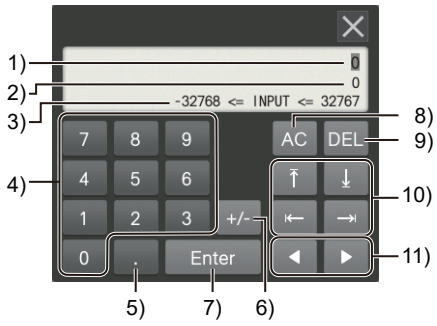
Item	Description
Hexadecimal	The key window for inputting hexadecimal values is displayed.
Decimal	The key window for inputting decimal values is displayed.
Octal	While GS450.b7 is on, the key window for inputting octal values is displayed. While GS450.b7 is off, the key window for inputting hexadecimal values is displayed. After the key window is displayed, turning on or off GS450.b7 does not change the key window type.
Binary	While GS450.b6 is on, the key window for inputting binary values is displayed. While GS450.b6 is off, the key window for inputting hexadecimal values is displayed. After the key window is displayed, turning on or off GS450.b6 does not change the key window type.

Ex.

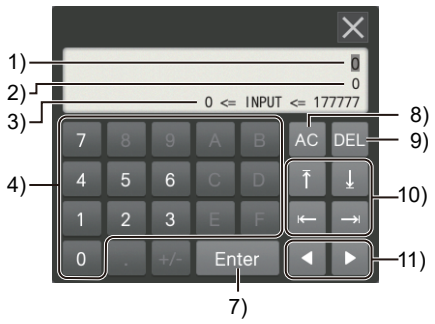
When the design is set to [Basic-Black]



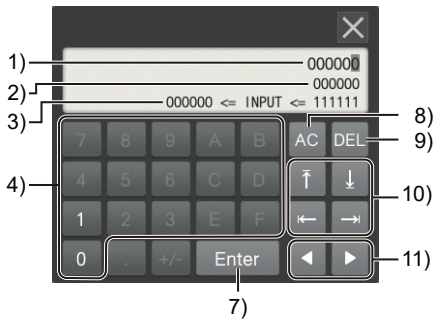
Key window for inputting hexadecimal values



Key window for inputting decimal values



Key window for inputting octal values



Key window for inputting binary values

Item		Description
1)	Input value display	Displays the input value.
2)	Current value display	Displays the current value of the device.
3)	Input range display	Displays the valid input range. The displayed input range depends on the number of displayed digits which is set for the numerical input. The following shows the meaning of displayed symbols. • [INPUT]: Value to be input • [<]: The left side value is smaller than the right side value. • [<=]: The left side value is equal to or smaller than the right side value. • [==]: The left side value is equal to the right side value. • [!=]: The left side value is not equal to the right side value.
4)	Numeric keys	Input numerical values.
5)	[.] key	Inputs a decimal point.
6)	[+/-] key	Switches the input value between + and -.
7)	[Enter] key (confirm key)	Writes the input value to the device.
8)	[AC] key	Deletes the input value.
9)	[DEL] key	Deletes the least significant digit in the character string.
10)	Cursor keys (screen)	Move the input cursor in the screen.
11)	Cursor keys (object)	Move the cursor in the currently input object.

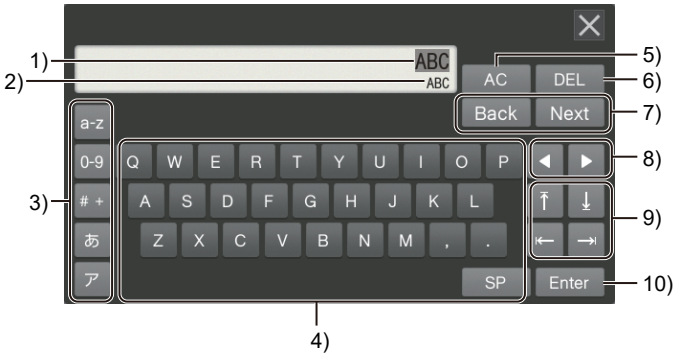
Key window for inputting characters (Alphabet or kana mode)

To switch the character type used in the key window, use the sequential or direct character type switching keys.

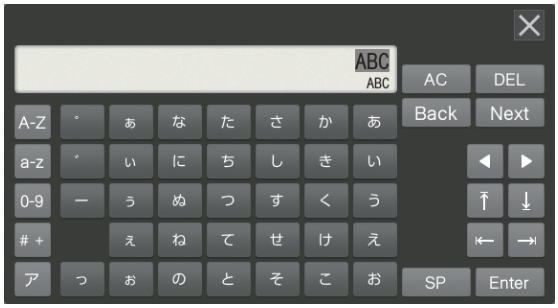
In the input area of an object, characters are displayed in a character code specified in the setting dialog of the object.

Ex.

When the design is set to [Basic-Black]



Key window in alphabet mode



Key window in kana mode

Item		Description
1)	Input value display	Displays the input value.
2)	Current value display	Displays the current value of the device.
3)	Keys for switching character types directly	Switch the character types of the key window directly. The keys for switching to hiragana or katakana appear only when the system language is Japanese. A-Z — Displays the keyboard for uppercase letters. a-z — Displays the keyboard for lowercase letters. 0-9 — Displays the keyboard for numeric characters. # + — Displays the keyboard for symbols. あ — Displays the keyboard for hiragana. ア — Displays the keyboard for katakana.
4)	Character keys	Use the keys to input characters to objects. The displayed keys depend on the character types of the key window.
5)	[AC] key	Deletes the input character string.
6)	[DEL] key	Deletes a character to the right of the cursor.

Item		Description
7)	Keys for switching character types sequentially	Switch the character types of the key window sequentially. Since all hiragana characters or katakana characters are too many to be displayed on one key window, the characters are separately listed in two windows (first half and latter half). Use the keys for switching character types sequentially to switch the display between the first half and latter half. 8)	Cursor keys (object)	Move the cursor in the currently input object.
9)	Cursor keys (screen)	Move the input cursor in the screen.
10)	[Enter] key (confirm key)	Writes the input characters to the device.

Key window for text (key window that supports Kana-Kanji/Pinyin conversion)

The key window can be used when all the following conditions are satisfied.

- [Kana-Kanji/Pinyin Conversion] is selected in the [Text Input] dialog.
- The system language and Character Code Control are set.

☞ Page 605 Conditions that enable Kana-Kanji conversion

☞ Page 605 Conditions that enable Pinyin conversion

- Switch to Key Window capable of Kana-Kanji Conversion (GS467.b1) is turned on.

☞ Page 3645 Monitor Common Control 2 (GS467)

Kana-Kanji conversion and Pinyin conversion cannot be used simultaneously.

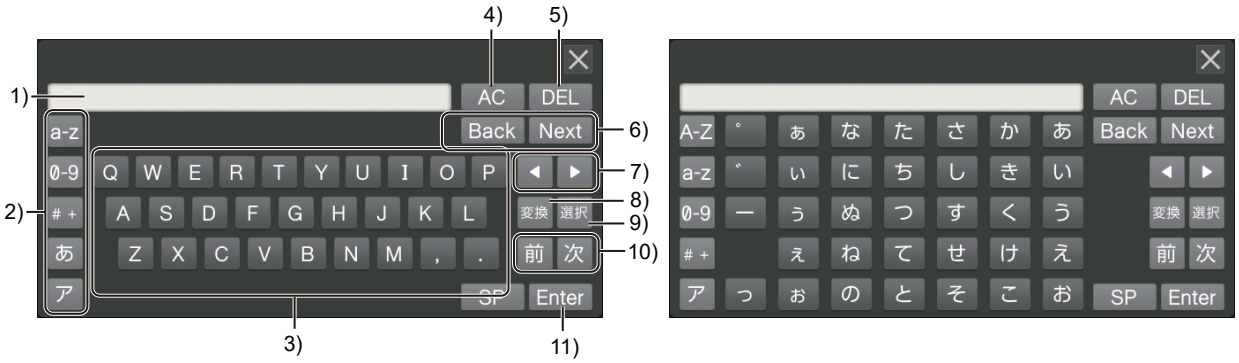
Set a conversion method in the [Kana-Kanji/Pinyin Conversion] window in the [Environmental Setting] dialog.

☞ Page 610 [Kana-Kanji/Pinyin Conversion]

You can switch the character types of the key window using keys for switching character types sequentially or keys for switching character types directly.

Ex.

When the design is set to [Basic-Black]



Key window in alphabet mode

Key window in kana mode

Item		Description
1)	Input value display	Displays the input value.
2)	Keys for switching character types directly	Switch the character types of the key window directly.
3)	Character keys	Use the keys to input characters to objects. The displayed keys depend on the character types of the key window.
4)	[AC] key	Deletes the input character string.
5)	[DEL] key	Deletes a character to the right of the cursor.
6)	Keys for switching character types sequentially	Switch the character types of the key window sequentially. Since all hiragana characters or katakana characters are too many to be displayed on one key window, the characters are separately listed in two windows (first half and latter half). Use the keys for switching character types sequentially to switch the display between the first half and latter half.
7)	Cursor keys	The behavior differs depending on the status of the character string. • The character string is not converted. The keys move the cursor. • The character string is converted. The keys change the range of the phrases to be converted.
8)	Convert key	Converts the input character string. If you touch this key during the conversion, the conversion is undone.
9)	Select key	Confirms the entry. When you convert multiple phrases, confirm each group.
10)	Previous key or Next key	Converts each phrase during input. If you touch this key during the conversion, another option will be displayed.
11)	[Enter] key (confirm key)	Writes the input characters to the device.

10.4.2 Specifications of the user-created key window

GT37 SoftGOT3000

The user-created key window is a window for inputting numerical values and characters which is created by the user.
Assign the window screen created by the user as a key window.
The key window automatically appears according to the display type of the input area (hexadecimal, decimal, octal, binary, or character string).

☞ Page 563 Available screen size and number of screens
☞ Page 563 Key window types
☞ Page 563 Available figures and objects
☞ Page 563 Superimposition of objects and layer setting
☞ Page 563 Functions that do not operate

Available screen size and number of screens

For the specifications of the user-created key window, refer to the following.

☞ Page 63 Specifications of overlap windows and key windows

Key window types

The available key window types are the key window for decimal numbers, key window for hexadecimal numbers, and key window for character strings.

Point

For the numerical input when the display type is binary or octal, the key window for hexadecimal numbers is displayed.
If the hexadecimal key window is displayed while GS450.b6 is on, only binary values can be input.
If the hexadecimal key window is displayed while GS450.b7 is on, only octal values can be input.

☞ Page 3640 Monitor Common Control (GS450)

Available figures and objects

You can place all the figures and objects placeable on the window screen.
Some restrictions are placed on the use of the following objects.

Object	Restriction
Numerical input Text input	The input operation is not available.
Special function switch	Inoperable when [Key Windows] is selected for [Switch Action].

For the key window objects used to display the value being entered or others in the key window, refer to the following.

☞ Page 1887 Placing an object to display the input information

Superimposition of objects and layer setting

The superimposition of objects is available on the key window.
The layer setting is also available.

Functions that do not operate

The following functions do not operate in the key window.

- Screen script
- Trigger action

10.4.3 Common specifications of the standard key window and user-created key window

GT37 SoftGOT3000

Display position of the key window

The key window is displayed on the bottom right of the input object by default.

For information on how to set [Window Position], refer to the following.

☞ Page 1883 Specifying the display position of a window screen

Key window action

You can set the following key window actions for each project or screen.

- Actions of the cursor and key window when the operating condition is satisfied, the operating condition is not satisfied, and the screen is switched
- Display method of the cursor input area
- Display method and clear method of the key window

For information on how to configure the setting for each project, refer to the following.

☞ Page 572 [Advanced Setting] tab

For information on how to configure the setting for each screen, refer to the following.

Screen type	Reference
Base screen	☞ Page 319 [Key Window Advanced Setting] tab
Window screen	☞ Page 329 [Key Window Advanced Setting] tab

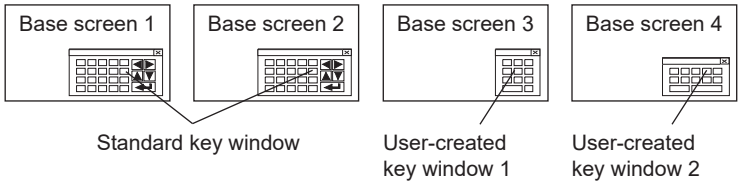
10.4.4 How to use key windows

GT37 SoftGOT3000

☞ Page 565 How to display key windows
☞ Page 566 How to operate key windows
☞ Page 566 Displaying a key window off-screen
☞ Page 567 How to move key windows
☞ Page 568 How to create a user-created key window

How to display key windows

The key window appears when you touch an object such as numerical input and text input, which requires data input.
The key window type is automatically determined according to the input area display format.
☞ Page 558 Specifications of the standard key window
☞ Page 563 Specifications of the user-created key window
You can change the type of the key window to be displayed for each project or screen.
Create multiple key windows and set an appropriate key window for each screen.



For the settings of the key window displayed for each project, refer to the following.
☞ Page 570 [Key Window]
For the settings of the key window displayed for each screen, refer to the following.
☞ Page 313 Changing screen property

Precautions

To input a value using key windows, a cursor must be displayed at the input target object.
When a key window is displayed, if the cursor is not displayed at the input target object, the following do not appear in the displayed key window.

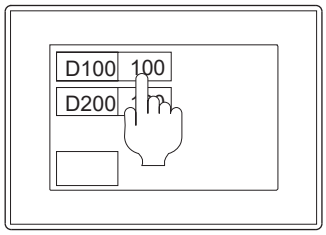
- Values that have been input
- Input range
- Previous value

In addition, even if the operating condition which has been satisfied changes while a key window is displayed, the key window being displayed is not switched to another key window.
Even if the operating conditions for all the input objects become unsatisfied, the key window remains displayed.

How to operate key windows

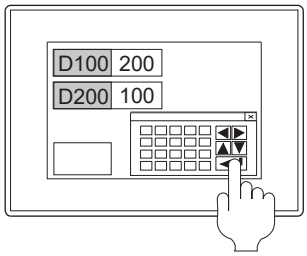
The following shows the basic operations.

1. Touch an object to which data is to be input.

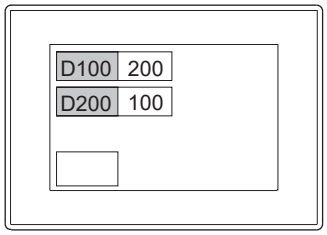


2. When the key window appears, input a numerical value or character string.

Then, touch the [Enter] button to write the numerical value or character string to the device.



3. The input data is applied to the object and the key window closes.

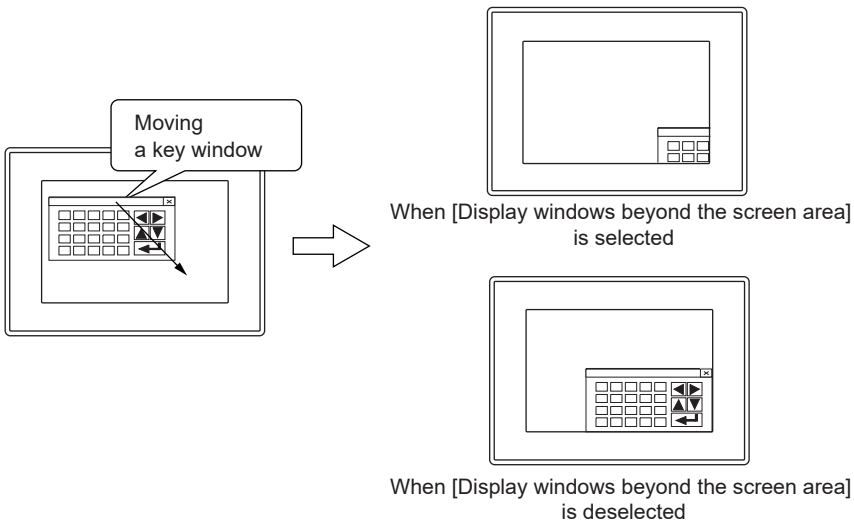


Displaying a key window off-screen

To display a key window off the GOT screen, select [Display windows beyond the screen area] in the [Screen Switching/Window] dialog.

The key window can be displayed off the right side or the bottom of the screen.

☞ Page 542 [Screen Switching/Window]



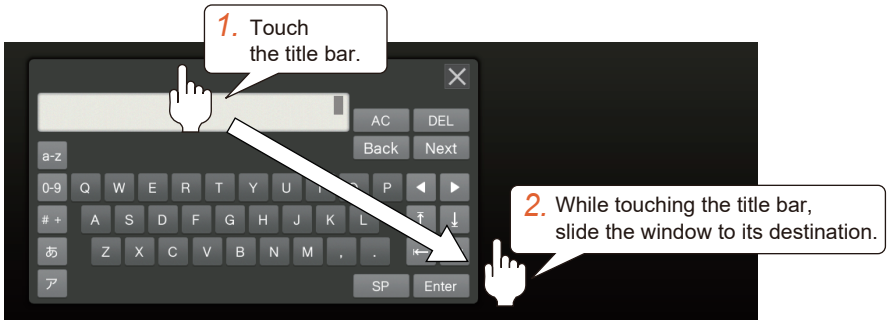
How to move key windows

■Moving the window with touch operations

Touch the title bar of a key window, and then touch the position to move the window to within three seconds.

■Moving the window with a slide operation

While touching the title bar of a key window, slide the window to its destination.



PART 5

How to create a user-created key window

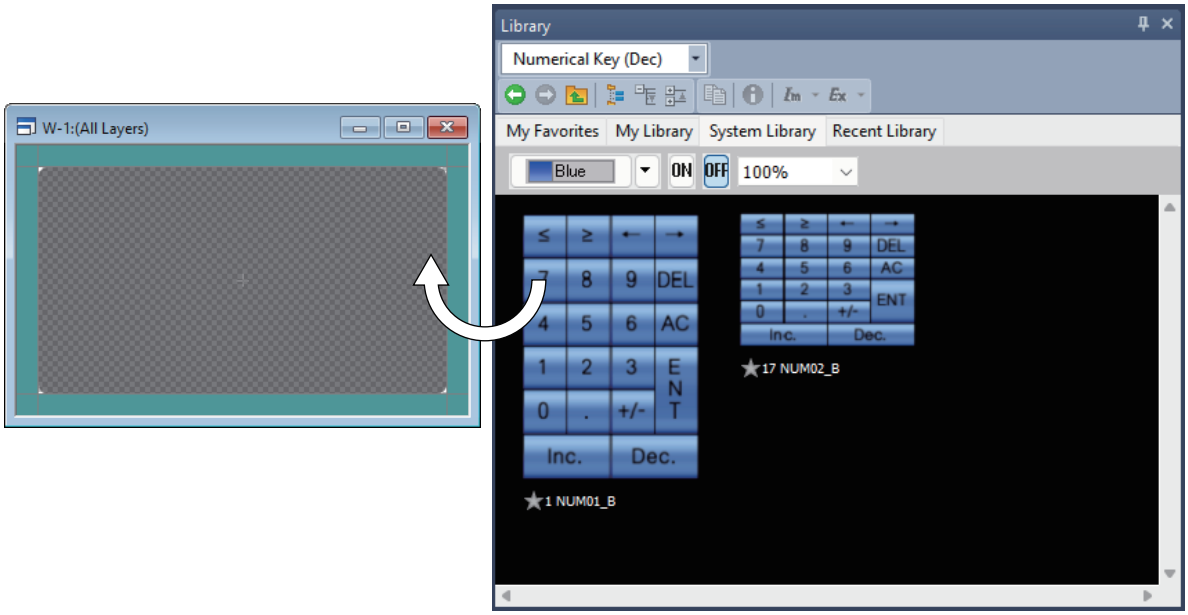
■Outline procedure of creation

1. Select [Screen] → [New] → [Window Screen] from the menu to create a window screen.

☞ Page 265 Creating a window screen

2. According to the application of the key window, place key code switches to which key codes are set, key window objects, and other objects and figures.

You can create a key window easily by using the buttons for numerical input and text input which are registered in the library.



Various types of touch switches are registered in the library.

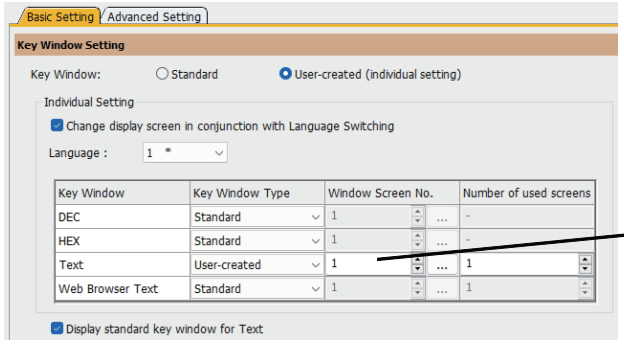
For information on how to use the library, refer to the following.

☞ Page 1067 How to use the library

3. Configure the setting to use the created window screen as a key window.

As appropriate, set also how to display the key window and the action of the cursor.

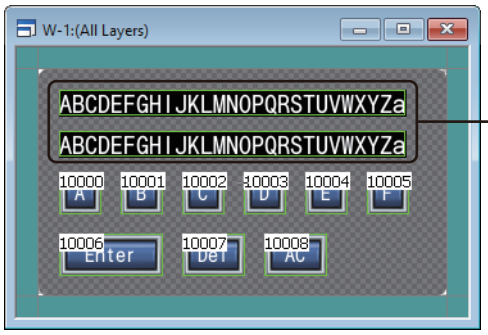
☞ Page 570 [Key Window]



Select a window screen used as a key window.

4. To display the input value and input range, configure the settings such as the display format and display position.

☞ Page 1887 Placing an object to display the input information



Configure the settings such as the display position and the number of displayed digits for the input value.

5. Check the display image on GT Designer3.

☞ Page 336 Displaying a preview

■Buzzer setting

You can set whether to sound the buzzer when moving the window on GT Designer3 or in the GOT utility.

For the setting in GT Designer3, refer to the following.

☞ Page 626 Setting targets in [Operation Setting/Utility Call Key]

For the setting on the GOT utility, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

10.4.5 [Key Window]

GT37 SoftGOT3000

In [Key Window], set how to display the key window for each project.

Select [Common] → [GOT Environmental Setting] → [Key Window] from the menu to display this window.

☞ Page 570 [Basic] tab

☞ Page 572 [Advanced Setting] tab

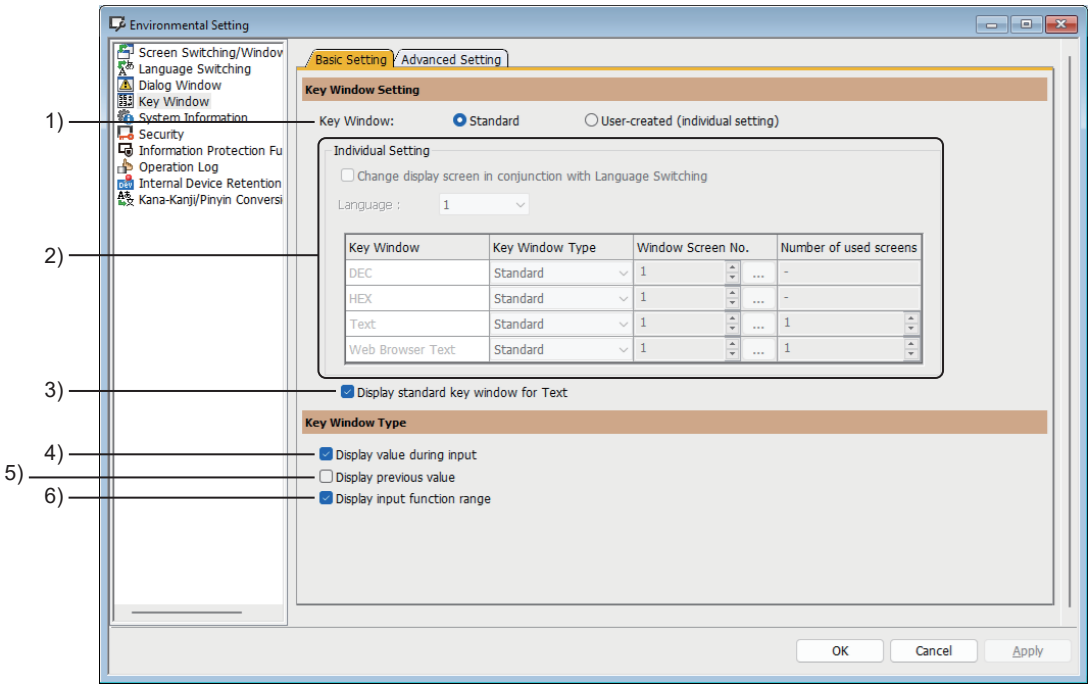
For information on how to display the key window for each screen, refer to the following.

☞ Page 313 Base screen properties

☞ Page 323 Window screen properties

[Basic] tab

GT37 SoftGOT3000

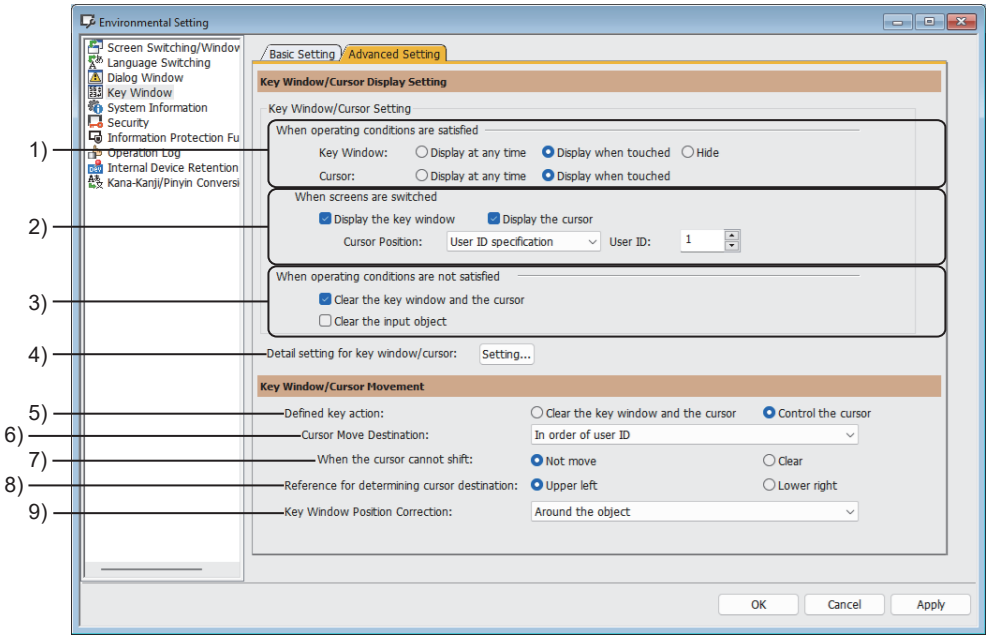


Item		Description
1)	[Key Window]	Select the type of a key window to be used. If you select [User-created (individual setting)], set a key window to be used for each input target (decimal, hexadecimal, character string, and Web browser character string) in [Individual Setting].

Item			Description
2)	[Individual Setting]	—	Set the key window to be used for each input target. This item is enabled when [User-created (individual setting)] is selected in [Key Window Setting].
		[Change display screen in conjunction with Language Switching]	Enable the settings for switching the key windows to be displayed in conjunction with the value (1 to 30) of the language switching device. For the language switching device, refer to the following. ☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching]) For each of the values (1 to 30) of [Language], set a key window to be used. Select a value in [Language], and set a key window to be used for each input target (decimal, hexadecimal, character string, and Web browser character string). If you change the default value, [*] is added to the selected value. For each value of the language switching device, you can set a key window to be used. If you select [User-created] in [Key Window Type], [*] is added to the value of the selected range. Example) If you select [2] in [Language] and change the key window type from the default [*] is added to the value.  The default setting has been changed.
		[Key Window]	The use of each key window [Web Browser Text] is not displayed in GT SoftGOT3000.
		[Key Window Type]	Select the type of key windows according to their uses. If you select [User-created], select the window screen to be used as a user-created key window in [Window Screen No.].
		[Window Screen No.]	Set the number of the window screen to be displayed as a user-created key window. The setting range is [1] to [32767]. Click the [...] button to display the [Screen Image List] dialog. You can check the image on the screen when selecting a window screen. ☞ Page 3683 [Image List] dialog (screen)
		[Number of used screens]	This item is settable for [Text] and [Web Browser Text] only. Set the number of key windows used for text input. With the window screen set in [Window Screen No.] as the first on the list, window screens are used for the set number as key windows. To switch key windows, arrange key code switches to which the following operations are set. • [Switch window screens for ASCII (to the next)] • [Switch window screens for ASCII (to the previous)] • [Switch window screens for ASCII (screen no. specification)] ☞ Page 1251 [Key Code Switch] dialog
3)	[Display standard key window for Text]		Set whether to display or hide the standard key window for character string. Clear this checkbox if the standard key window for character string is not necessary because character strings are input from the key code switch on the screen.
4)	[Display value during input]		Displays the value being input in the key window. To display the value in the user-created key window, arrange the input value area setting on the window screen. ☞ Page 1887 Placing an object to display the input information
5)	[Display previous value]		Displays the previous value in the key window. To display the previous value in the user-created key window, arrange the previous value area setting on the window screen. ☞ Page 1887 Placing an object to display the input information
6)	[Display input function range]		Displays the valid input range in the key window. To display the valid input range in the user-created key window, arrange the input range area setting on the window screen. ☞ Page 1887 Placing an object to display the input information

[Advanced Setting] tab

GT37 SoftGOT3000



Item			Description
1)	[When operating conditions are satisfied]	—	Configure the display settings of the key window and cursor for when the operating conditions of the objects for input are satisfied.
		[Key Window]	Configure the display settings of the key window for when the operating conditions of the objects for input are satisfied.
		[Cursor]	Configure the display settings of the cursor for when the operating conditions of the object for input are satisfied.
2)	[When screens are switched]	—	Configure the display settings of the key window and cursor to switch screens for when the operating conditions of the object for input are satisfied.
		[Display the key window]	Displays a key window when the screen is switched.
		[Display the cursor]	Displays a cursor when the screen is switched. Set the position to display the cursor in [Cursor Position].
		[Cursor Position]	Select the position to display the cursor when the screen is switched.
		[User ID]	Sets the user ID of the object on which the cursor is displayed. The setting range is [1] to [65535].
3)	[When operating conditions are not satisfied]	—	Configure the display settings of the key window and cursor for when the operating conditions of the objects for input are not satisfied.
		[Clear the key window and the cursor]	Deletes the key window and cursor when the operating conditions of the objects for input are not satisfied.
		[Clear the input object]	Deletes the key window, the cursor, and the objects for input when the operating conditions of the objects for input are not satisfied.
4)	[Detail setting for key window/cursor]		Click the [Setting] button to display the [Display Detail Setting] dialog. ☞ Page 574 [Display Detail Setting] dialog
5)	[Defined key action]		Select the action of the key window and cursor when the enter key is touched.

Item			Description
6)	[Cursor Move Destination]	—	Select a position to move the cursor. The following shows selectable items.
		[Same operation as the right arrow key]	Moves the cursor using the specified coordinate point of the active object as a reference. Specify the reference coordinates with [Reference for determining cursor destination]. The cursor moves as shown below. 		[Same operation as the down arrow key]	Moves the cursor using the specified coordinate point of the active object as a reference. Specify the reference coordinates with [Reference for determining cursor destination]. The cursor moves as shown below. 		[In order of user ID]	Moves the cursor to the object that has the same user ID number as the move destination ID number of the active object. If the destination object is hidden due to unsatisfied conditions, the cursor does not move. To control the cursor movement, set [User ID] and [Move Destination ID] of the relevant objects. 		[Subsequently valid user ID]	Moves the cursor to the object that has the same user ID number as the move destination ID number of the active object. If the destination object is hidden due to unsatisfied conditions, the cursor moves to the object specified with [Move Destination ID] of the hidden destination object. To control the cursor movement, set [User ID] and [Move Destination ID] of the relevant objects. 		[Not move]	Does not move the cursor even after the entry is confirmed.
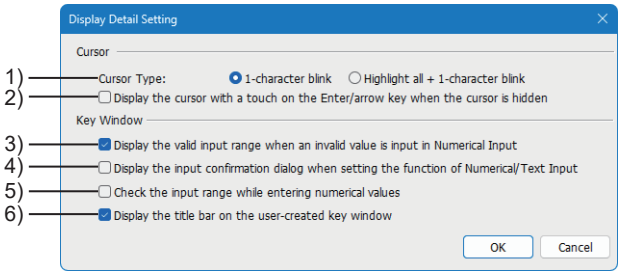
7)	[When the cursor cannot shift]		This item is displayed when [Cursor Move Destination] is set to [In order of user ID] or [Subsequently valid user ID]. Select how the cursor moves when no destination object exists.
8)	[Reference for determining cursor destination]		Select the standard to determine a position to move the cursor.

Item		Description
9)	[Key Window Position Correction]	Select an action of the key window when it overlaps the input target object. When [To the four corners of the screen] is selected, the key window is displayed in one of the four corners so that it will not overlap the input target object. If the key window inevitably overlaps the input target object, it is displayed in the lower right of the screen.

■[Display Detail Setting] dialog

GT37 SoftGOT3000



Item		Description
1)	[Cursor Type]	Select the action of the cursor to be displayed on the input area.
2)	[Display the cursor with a touch on the Enter/arrow key when the cursor is hidden]	Displays the cursor when the enter key or an arrow key is touched while the cursor is hidden.
3)	[Display the valid input range when an invalid value is input in Numerical Input]	Displays the dialog indicating the valid input range when an invalid value is input in numerical input.
4)	[Display the input confirmation dialog when setting the function of Numerical/Text Input]	Displays the confirmation dialog when numerical values or text are input.
5)	[Check the input range while entering numerical values]	This item is enabled only when an input range is set. The error message is displayed when a value out of the setting range is being entered. ☞ Page 1334 [Input case] tab
6)	[Display the title bar on the user-created key window]	Displays the title bar of a user-created key window. If the checkbox is cleared, you cannot close the key window with the [×] button because the button is hidden. Configure one of the following settings to close the key window. • Place a key code switch for which [key Code Type] is set to [Numerical/Text Input] and [Action] is set to [Cancel]. • Select [Clear the key window and the cursor] for [Defined key action] in the [Environmental Setting] window ([Advanced Setting] tab).

10.4.6 Relevant settings

GT37 SoftGOT3000

Set the relevant settings other than the specific settings for the key window as required.

The following shows the functions that are available by configuring the relevant settings.

☞ Page 575 GOT environmental settings (System information)

☞ Page 575 GOT internal devices

GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] window.

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Disabling touch operations and inputs from external devices (System signal 1-1.b9)	[System Signal 1-1]
Notifying whether a key code is entered from an input object (touch switch, numerical input, or text input) (System signal 2-1.b3)	[System Signal 2-1]
Notifying that the input is determined (System signal 2-1.b4)	[System Signal 2-1]
Notifying that a key window is displayed (System signal 2-1.b11)	[System Signal 2-1]
Notifying the user ID of the numerical input to which an input is confirmed	[Numeric Value Input Number]
Notifying the key code which is set for the touched key	[Key Code Input]
Notifying the value before the change (32 bits)	[Previous Numeric Value Input(32bit)]
Notifying the fixed input value (32 bits)	[Current Numeric Value Input(32bit)]

GOT internal devices

☞ Page 3581 GOT special register (GS)

Function	Setting item
Displaying the dialog for confirming the input contents when an input is fixed for numerical input and text input	GS450.b0
Displaying the dialog for notifying that an input value is outside the range when the value is input for numerical input	GS450.b1
Forcibly closing a key window when the input condition (the trigger condition or security level for the object) is not satisfied during numerical value or text input	GS450.b5
Displaying the binary key window when the display format of the numerical input is binary	GS450.b6
Displaying the octal key window when the display format of the numerical input is octal	GS450.b7

10.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

GT37 SoftGOT3000

☞ Page 577 Specifications of the system information (read device)
☞ Page 580 Specifications of the system information (write device)
☞ Page 589 How to use the system information
☞ Page 594 [System Information]
☞ Page 597 Relevant settings

By setting devices that store the system information, you can control the GOT operations (closing a screen, disabling key input) from a controller and notify the GOT status to a controller.

The two types of devices that store system information are shown below.

Type	Description
Read device	This device controls the GOT operations by writing values from a controller to the read device for controlling the GOT operations. The read device is monitored at the monitoring cycle of the GOT. The read device value needs to be held for the interval of GOT monitoring cycle or longer. Example) Turning the GOT to screen saver mode forcibly by a controller • System signal 1-1: D10 Write device	By writing a value to the write device for notifying the GOT status, the GOT notifies the GOT status itself to a controller. The write device is updated when the GOT operation status has changed. Example) Notifying the base screen number currently displayed on the GOT to a controller • On-screen base screen number: D20 
Precautions

■Writing data to the system information device (write device)

Do not write data to a device set as a write device for the system information.

Depending on the operation on the GOT and the GOT internal status, the value of a write device may be overwritten with data retained in the GOT.

10.5.1 Specifications of the system information (read device)

GT37 SoftGOT3000

The system information is stored in devices assigned to each system information.

☞ Page 577 System signal 1-1
☞ Page 579 System signal 1-2
☞ Page 579 External I/O function, output information

System signal 1-1

This signal controls the GOT from a controller.

The following shows the control details of each bit.

Bit	Signal name	Description	Model
b0	Automatic Screen Saver Disable signal	Turning on this signal disables the screen saver function.	GT37 SoftGOT3000
b1	Forced Screen Saver Enable signal	Turning on this signal forcibly turns the GOT into screen saver mode. Turning off this signal displays the screen again.	
b2	Forced Screen Saver Touch-Cancel signal	Turning on this signal cancels the screen saver when the screen is touched even during forced screen saving. The operation condition of the Forced Screen Saver Enable signal (System signal 1-1.b1) varies according to on or off of this signal. • ON: Operates at the rising. • OFF: Operates during on.	
b3	Key Code Read Complete signal	Turning on this signal notifies that the reading of input key code has completed to the GOT. Turning on this signal turns off the Key Input signal (System signal 2-1.b3). ☞ Page 581 System signal 2-1	
b4	Numeric Value Input Read Complete signal	Turning on this signal notifies the GOT that reading the input value of a numerical input object has completed. Turning on this signal turns off the Numeric Value Input signal (System signal 2-1.b4), and 0 is stored in the numerical value input number. For details, refer to the following. ☞ Page 590 Checking the confirmation timing of numerical input To use this signal for text input, configure either of the following settings. • Selecting [Output object ID of Text Input to the system information device] in the [Environmental Setting] window ([System Information]) ☞ Page 594 [System Information] • Turning on GS450.b2 ☞ Page 3640 Monitor Common Control (GS450)	
b5	Barcode Input Disable signal (CH8)	Turning on this signal disables the barcode function for channel No. 8.	GT37 SoftGOT3000
b6	External Device I/O Complete signal (CH8)	Turning on this signal notifies the GOT that reading data from the device, which the barcode or the RFID input data is stored in, is completed. Turning on this signal turns off the External Device Input signal (CH8) (System signal 2-1.b6). ☞ Page 581 System signal 2-1	GT37 SoftGOT3000
b7	—	Use prohibited	—
b8	Buzzer Three-shot Output signal	Turning on this signal sounds the buzzer three times. Set the buzzer length in the utility. The buzzer is sounded even when [Buzzer] is set to [None] in the [GOT Setup] window ([Operation Setting/Utility Call Key]). ☞ Page 618 [Display Setting/Language Setting]	GT37 SoftGOT3000
b9	Disable Touch Operation signal	Turning on this signal disables touch operations and inputs from external devices.	
b10 to b12	—	Use prohibited	—

Bit	Signal name	Description	Model
b13	GOT Error Reset signal	Turning on this signal processes the followings. • Storing 0 to the GOT error code (Write device) ☞ Page 585 GOT error code • Turning off the GOT Error Detection signal (System signal 2-1.b13) ☞ Page 581 System signal 2-1 • Clearing system alarm messages	GT37 SoftGOT3000
b14	Buzzer Output signal	While turning on this signal, the buzzer is sounded. The buzzer is sounded even when [Buzzer] is set to [None] in the [GOT Setup] window ([Operation Setting/Utility Call Key]).	
b15	Buzzer One-shot Output signal	Turning on this signal sounds the buzzer once. Set the buzzer length in the utility. The buzzer is sounded even when [Buzzer] is set to [None] in the [GOT Setup] window ([Operation Setting/Utility Call Key]).	

■Screen control of the screen in the screen saver mode

The following shows the priority of the screen save status control.

Priority	System information and function	System information condition	Screen saving status
High ↕ Low	Forced Screen Saver Touch-Cancel signal (System signal 1-1.b2)	ON	Screen saver disabled
	Forced Screen Saver Enable signal (System signal 1-1.b1)	ON	Screen saver enabled
	Automatic Screen Saver Disable signal (System signal 1-1.b0)	ON	Screen saver disabled
	Screen saver function by the utility setting	—	Screen saver enabled
	Displaying user-created screens or the utility screen	—	Screen saver disabled

■Relationship between the screen saver function and the Disable Touch Operation signal

The following shows the relationship between the screen saver function and the Disable Touch Operation signal.

Forced Screen Saver Touch-Cancel signal (System signal 1-1.b2)	Forced Screen Saver Enable signal (System signal 1-1.b1)	Disable Touch Operation signal (System signal 1-1.b9)	Screen saver function by the utility setting	Screen status
ON	ON	ON	ON, OFF	The GOT enters screen saver mode. Touching the screen cancels the screen saver mode. The screen does not respond to a touch operation even after the screen saver mode has been canceled.
		OFF		The GOT enters screen saver mode. Touching the screen cancels the screen saver mode. The screen responds to a touch operation after the screen saver mode has been canceled.
OFF		ON, OFF		The GOT enters screen saver mode. Touching the screen does not cancel the screen saver mode.
	OFF	ON		The GOT does not enter screen saver mode. The screen does not respond to a touch operation.
		OFF	ON	The GOT enters screen saver mode. Touching the screen cancels the screen saver mode. The screen responds to a touch operation after the screen saver mode has been canceled.
			OFF	The GOT does not enter screen saver mode. The screen responds to a touch operation.

System signal 1-2

This signal controls the GOT from a controller.

The following shows the control details of each bit.

Bit	Signal name	Description	Model
b0	File Access Error Reset signal	Turning on this signal resets all the File Access Error signals (System signals 2-2.b7 to b9 and extended drive information.b2, b5, and b8) in the drive A, B, E, F, and G. While this signal is on, the File Access Error Reset signal does not turn on. ☞ Page 583 System signal 2-2 ☞ Page 585 Extended drive information	GT37 SoftGOT3000
b1	RFID Request signal (CH8)	By turning on this signal, the GOT requests to read the data with channel No. 8.	
b2	Barcode Input Disable signal (CH5)	Turning on this signal disables the barcode function for channel No. 5.	
b3	External Device I/O Complete signal (CH5)	Turning on this signal turns off the External Device Input signal (CH5) (System signal 2-3.b0). ☞ Page 584 System signal 2-3	
b4	RFID Request signal (CH5)	By turning on this signal, the GOT requests to read the data with channel No. 5.	GT37 SoftGOT3000
b5	Barcode Input Disable signal (CH6)	Turning on this signal disables the barcode function for channel No. 6.	
b6	External Device I/O Complete signal (CH6)	Turning on this signal turns off the External Device Input signal (CH6) (System signal 2-3.b1). ☞ Page 584 System signal 2-3	
b7	RFID Request signal (CH6)	By turning on this signal, the GOT requests to read the data with channel No. 6.	
b8	Barcode Input Disable signal (CH7)	Turning on this signal disables the barcode function for channel No. 7.	
b9	External Device I/O Complete signal (CH7)	Turning on this signal turns off the External Device Input signal (CH7) (System signal 2-3.b2). ☞ Page 584 System signal 2-3	
b10	RFID Request signal (CH7)	By turning on this signal, the GOT requests to read the data with channel No. 7.	
b11	Enable Serial RFID Control During External Authentication signal	When this bit is turned on, the operator authentication data read by an RFID controller (serial connection) can be saved into devices.	GT37 SoftGOT3000
b12 to b15	—	Use prohibited	—

External I/O function, output information

Use the external I/O function for the external output.

The following shows the control details of each bit.

Bit	Signal name	Description	Model
b0 to b15	Output signal Y0 to YF	Write the information for outputting to the external device, such as a lamp or relay. These signals are enabled only when an external I/O unit (extension unit) is used.	GT37 SoftGOT3000

10.5.2 Specifications of the system information (write device)

GT37 SoftGOT3000

The system information is stored in devices assigned to each system information.

☞ Page 581 System signal 2-1
☞ Page 583 System signal 2-2
☞ Page 584 System signal 2-3

☞ Page 588 Current numeric value input (64 bits)

System signal 2-1

This signal notifies various notifications from the GOT to a controller or the user.

The following shows the notification details of each bit.

Bit	Signal name	Description	Model
b0	Screen Saving signal	Turns on while the GOT is in screen saver mode.	GT37 SoftGOT3000
b1	GOT Ready signal	Shows the GOT status when the GOT is powered on. • ON: Normal • OFF: Abnormal If this signal does not turn on by resetting the GOT, the hardware error may occur in the GOT. Consult your local Mitsubishi service center or representative.	
b2	—	Use prohibited	—
b3	Key Input signal	Shows whether a key code is entered from an input object (touch switch, numerical input, or text input). • ON: The key is input. • OFF: The key is not input. This signal turns off when the Key Code Read Complete signal (System signal 1-1.b3) turns on. ☞ Page 577 System signal 1-1	GT37 SoftGOT3000
b4	Numeric Value Input signal	Turns on when a value is input to the numerical input and the value is confirmed. Turning on the Numeric Value Input Read Complete signal (System signal 1-1.b4) turns off this signal. ☞ Page 577 System signal 1-1 This signal does not function when a value is input to the numerical input for which a user ID is not set. To use this signal for text input, configure either of the following settings. • Selecting [Output object ID of Text Input to the system information device] in the [Environmental Setting] window ([System Information]) ☞ Page 594 [System Information] • Turning on GS450.b2 ☞ Page 3640 Monitor Common Control (GS450)	
b5	Human Sensor Detection signal	Available for GT3712-X and GT3715-X. Turns on when the human sensor detects human motion. This signal turns on for approx. 60 seconds after GOT startup due to the sensor's characteristic.	GT37 SoftGOT3000
b6	External Device Input signal (CH8)	Available when channel No. 8 is used for the barcode function. Turns on when the data read by the barcode reader is stored in the specified device.	GT37 SoftGOT3000
		Available when channel No. 8 is used for the RFID function. Turns on when the data read by the RFID reader/writer is stored in the specified device when the dedicated protocol is used. Turns on when the data transfer to the RFID controller is completed when the nonprocedural protocol is used. Turns off when the External Device I/O Complete signal (CH8) (System signal 1-1.b6) turns on.	GT37 SoftGOT3000
b7	Hard Copy Output signal	Turns on during output by the hard copy function.	GT37 SoftGOT3000
b8 to b9	—	Use prohibited	—
b10	Recipe Processing signal	Turns on during recipe process (Write/Read operation).	GT37 SoftGOT3000
b11	Key Window Output signal	Turns on while the key window is displayed.	
b12	Hardcopy Sub-signal	Enabled when [Delete the file with the smallest number and create another file when the capacity of the destination is exceeded] is selected in the [Hard Copy] dialog. ☞ Page 2559 [Hard Copy] dialog Turns on when the number of screen data files (file number) stored in a data storage by using the hard copy function is 9900 to 9999.	GT37 SoftGOT3000

Bit	Signal name	Description	Model
b13	GOT Error Detection signal	Turns on when an error occurs in the GOT. When this signal is turned on, check the GOT error code and eliminate the cause. After eliminating the cause, turn on the GOT Error Reset signal (System signal 1-1.b13). ☞ Page 577 System signal 1-1 ☞ Page 585 GOT error code ☞ Page 585 GOT error code 2	GT37 SoftGOT3000
b14	Numeric Value Error Detection signal	Turns on when a value exceeding the input range is stored in the write destination device of the numerical input. (This signal is checked when screens are switched.) When no input range formula is preset to the numerical input, detection is not performed.	
b15	—	Use prohibited	—

System signal 2-2

This signal notifies various notifications from the GOT to a controller or the user.

The following shows the notification details of each bit.

Bit	Signal name	Description	Model
b0	Drive A File Accessing signal	Turns on while a file in the drive A is open or while a folder or file is operated.	GT37 SoftGOT3000
b1	Drive B File Accessing signal	Turns on while a file in drive B is open or a folder or file in drive B is manipulated.	
b2	Drive C File Accessing signal	Turns on while a file in drive C is open or a folder or file in drive C is manipulated.	
b3	—	Use prohibited	—
b4	Drive A Full signal	Turns on when the free space of drive A is less than 1 kilobyte.	GT37 SoftGOT3000
b5	Drive B Full signal	Turns on when the free space of drive B is less than 1 kilobyte.	
b6	—	Use prohibited	—
b7	Drive A File Access Error signal	Turns on when an error occurs while a file in drive A is being accessed.	GT37 SoftGOT3000
b8	Drive B File Access Error signal	Turns on when an error occurs while a file in drive B is being accessed.	
b9 to b10	—	Use prohibited	—
b11	Cursor Displaying signal	Turns on during displaying the numerical input or text input cursor.	GT37 SoftGOT3000
b12	Built-in Battery Voltage Drop signal	Turns on when a voltage drop of the GOT built-in battery is detected. If a power failure occurs after this bit turns on, the clock data is held within the data retention period. Replace the battery immediately.	GT37 SoftGOT3000
b13	—	Use prohibited	—
b14	Liquid Crystal Backlight Brightness Decrease/Failure Detection signal	Turns on when a decrease in brightness or a failure of the liquid crystal backlight is detected.	GT37 SoftGOT3000
b15	—	Use prohibited	—

System signal 2-3

This signal notifies various notifications from the GOT to a controller or the user.

The following shows the notification details of each bit.

Bit	Signal name	Description	Model
b0	External Device Input signal (CH5)	Available when channel No. 5 is used for the barcode function. Turns on when the data read by the barcode reader is stored in the specified device.	GT37 SoftGOT3000
		Available when channel No. 5 is used for the RFID function. Turns on when the data read by the RFID reader/writer is stored in the specified device when the dedicated protocol is used. Turns on when the data transfer to the RFID controller is completed when the nonprocedural protocol is used. Turns off when the External Device I/O Complete signal (CH6) (System signal 1-2.b3) turns on. ☞ Page 579 System signal 1-2	
b1	External Device Input signal (CH6)	Available when channel No. 6 is used for the barcode function. Turns on when the data read by the barcode reader is stored in the specified device.	GT37 SoftGOT3000
		Available when channel No. 6 is used for the RFID function. Turns on when the data read by the RFID reader/writer is stored in the specified device when the dedicated protocol is used. Turns on when the data transfer to the RFID controller is completed when the nonprocedural protocol is used. Turns off when the External Device I/O Complete signal (CH6) (System signal 1-2.b6) turns on. ☞ Page 579 System signal 1-2	
b2	External Device Input signal (CH7)	Available when channel No. 7 is used for the barcode function. Turns on when the data read by the barcode reader is stored in the specified device.	
		Available when channel No. 7 is used for the RFID function. Turns on when the data read by the RFID reader/writer is stored in the specified device when the dedicated protocol is used. Turns on when the data transfer to the RFID controller is completed when the nonprocedural protocol is used. Turns off when the External Device I/O Complete signal (CH7) (System signal 1-2.b9) turns on. ☞ Page 579 System signal 1-2	
b3 to b15	—	Use prohibited	—

Numeric value input number

This signal stores the user ID number of a numerical input object when a value input to the object is confirmed.

To clear the stored user ID, turn on the Numeric Value Input Read Complete signal (System signal 1-1.b4).

For details, refer to the following.

☞ Page 590 Checking the confirmation timing of numerical input

To use this signal for text input, configure either of the following settings.

- Selecting [Output object ID of Text Input to the system information device] in the [Environmental Setting] window ([System Information])

☞ Page 594 [System Information]

- Turning on GS450.b2

☞ Page 3640 Monitor Common Control (GS450)

Previous numeric value input (32 bits)

When a value is input in the numerical input, the value before the change (32 bits) is stored.
When the data type of the numerical input is 64 bits, the value of the lower 32 bits is stored.
Only the numerical input to which the user ID is set is effective.

Current numeric value input (32 bits)

The input value (32 bits) determined in the numerical input.
When the data type of the numerical input is 64 bits, the value of the lower 32 bits is stored.
Only the numerical input to which the user ID is set is effective.

GOT error code

The error code of errors occurred in the GOT is stored.
For details on errors, refer to the following.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

GOT error code 2

The classification code of errors occurred in the GOT is stored.
The upper 8 bits store ASCII code G (identification code indicating a GOT error).
The lower 8 bits store values indicating a classification code.

Ex.
For the GOT error (G01) related to the communication and controllers, 4701h is stored.
For details on errors, refer to the following.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

Extended drive information

This signal notifies the usage status of the extended drive information.
The following shows the notification details of each bit.

Bit	Signal name	Description
b0	Drive E File Accessing signal	Turns on while a folder or a file in drive E is manipulated.
b1	Drive E Full signal	Turns on when the free space of drive E is less than 1 kilobyte.
b2	Drive E File Access Error signal	Turns on when an error occurs while a file in drive E is being accessed.
b3	Drive F File Accessing signal	Turns on while a folder or a file in drive F is manipulated.
b4	Drive F Full signal	Turns on when the free space of drive F is less than 1 kilobyte.
b5	Drive F File Access Error signal	Turns on when an error occurs while a file in drive F is being accessed.
b6	Drive G File Accessing signal	Turns on while a folder or a file in drive G is manipulated.
b7	Drive G Full signal	Turns on when the free space of drive G is less than 1 kilobyte.
b8	Drive G File Access Error signal	Turns on when an error occurs while a file in drive G is being accessed.
b9 to b15	—	Use prohibited

Drive Empty Capacity Information

The free space information of each drive is stored.
The value is stored in two word devices.
The unit of the stored value can be specified by using the Unit of Drive Free Space device (GS466).
☞ Page 3645 Unit of Drive Free Space (GS466)
For the available drives by GOT model, refer to the following.
☞ Page 81 Drive configuration and capacity of the GOT

On-screen base screen number

The base screen number being displayed is stored.

The following shows the screen number to be stored.

Display status	Base screen No. 0	Data type of the screen switching device	
		BIN	BCD
Displaying other than user-created screens (such as the utility)	Not existent	-1	Stores the number of the user-created base screen previously displayed.
	Existent	-2	
Screen switching	Not existent	0*1	0*1
	Existent	-1*1	9999*1*2
Displaying base screen	Not existent	1 to 32767	1 to 9999
	Existent	0 to 32767	0 to 9999

*1 When you select [Retain the screen number of on-screen] in the [Environmental Setting] window, the screen number of the screen displayed before the screen switching is stored.
☞ Page 594 [System Information]

*2 If the base screen number is also 9999, the GOT cannot distinguish base screen No. 9999 from the device value (9999) during screen switching.

On-screen window 1 to 5 screen number

The screen number of the window screen being displayed as an overlap window 1 to 5 is stored.

The following shows the screen number to be stored.

Display status	Data type of the screen switching device	
	BIN	BCD
Not displayed or during screen switching	When you select [Retain the screen number of on-screen] in the [Environmental Setting] window, the screen number of the screen displayed before the screen switching is stored. ☞ Page 594 [System Information] For other than the above, the value set to [Screen No. of the window screen to be hidden] in the [Environmental Setting] window is stored. ☞ Page 542 [Screen Switching/Window]	
Displaying base screen	0 to 32767	1 to 9999

Current cursor display object ID

The object ID of the object on which the numerical input or text input is currently displayed is stored.

By setting any of the followings, 0 is stored.

- No object that requires the cursor is displayed on the displayed screen.
- A cursor is not displayed when the screen is switched.

To store 0 when the cursor is deleted, set either of the following.

- Selecting [Clear the cursor information when deleting the cursor] in the [Environmental Setting] window ([System Information])

☞ Page 594 [System Information]

- Turning on GS450.b3

☞ Page 3640 Monitor Common Control (GS450)

Previous cursor display object ID

The object ID of the object on which the numerical input or text input is previously displayed is stored.

By setting any of the followings, 0 is stored.

- No object that requires the cursor is displayed on the displayed screen.
- A cursor is not displayed when the screen is switched.

To store 0 when the cursor is deleted, set either of the following.

- Selecting [Clear the cursor information when deleting the cursor] in the [Environmental Setting] window ([System Information])

☞ Page 594 [System Information]

- Turning on GS450.b3

☞ Page 3640 Monitor Common Control (GS450)

Current cursor display user ID

This signal stores the user ID number of a numerical input object with the cursor being displayed.

To use this signal for text input, configure either of the following settings.

- Selecting [Output object ID of Text Input to the system information device] in the [Environmental Setting] window ([System Information])
- Turning on GS450.b2

The user ID of the object on which the numerical input or text input is currently displayed is stored.

To store 0 when the cursor is deleted, set either of the following.

- Selecting [Clear the cursor information when deleting the cursor] in the [Environmental Setting] window ([System Information])

☞ Page 594 [System Information]

- Turning on GS450.b3

☞ Page 3640 Monitor Common Control (GS450)

Previous cursor display user ID

This signal stores the user ID number of a numerical input object with the cursor displayed previously.

To use this signal for text input, configure either of the following settings.

- Selecting [Output object ID of Text Input to the system information device] in the [Environmental Setting] window ([System Information])
- Turning on GS450.b2

The user ID of the object on which the numerical input or text input is previously displayed is stored.

To store 0 when the cursor is deleted, set either of the following.

- Selecting [Clear the cursor information when deleting the cursor] in the [Environmental Setting] window ([System Information])

☞ Page 594 [System Information]

- Turning on GS450.b3

☞ Page 3640 Monitor Common Control (GS450)

Key code input

When inputting values with the input key (touch switch, numerical input, or text input), the specified key code is stored.

When a key code is stored, the Key Input signal (System signal 2-1.b3) is turned on.

☞ Page 581 System signal 2-1

External I/O function, input information 1

Use the external I/O function for the external input.

The following shows the notification details of each bit.

Bit	Signal name	Description	Model
b0 to b7	Input signal X0 to X7	Input data is written. An external input can take up to three seconds to write data. For avoiding the delay time, use GOT internal devices (GB10 to GB25, GB30 to GB37, GB50 to GB57). ☞ Page 3577 GOT bit register (GB)	GT37 SoftGOT3000
b8	Power supply signal	Turns on when the power is not supplied to an external I/O device.	
b9 to b15	—	Use prohibited	—

External I/O function, input information 2

Use the external I/O function for the external input.

The following shows the notification details of each bit.

Bit	Signal name	Description	Model
b0 to b7	Input signal X8 to XF	Input data is written. An external input can take up to three seconds to write data. For avoiding the delay time, use GOT internal devices (GB10 to GB25, GB30 to GB37, GB50 to GB57). ☞ Page 3577 GOT bit register (GB)	GT37 SoftGOT3000
b8 to b15	—	Use prohibited	—

Previous numeric value input (64 bits)

When a value is input in the numerical input, the value before the change (64 bits) is stored.

Only the numerical input to which the user ID is set is effective.

Current numeric value input (64 bits)

The input value (64 bits) confirmed with the numerical input is stored.

Only the numerical input to which the user ID is set is effective.

10.5.3 How to use the system information

GT37 SoftGOT3000

Use the system information by assigning word devices to each signal.

Setting the read device and write device is required.

For information on how to set the devices, refer to the following.

☞ Page 594 [System Information]

The following shows application examples of the system information.

☞ Page 589 Checking the errors occurred in the GOT
☞ Page 590 Checking the entered key code
☞ Page 590 Checking the confirmation timing of numerical input
☞ Page 591 Checking the cursor display position
☞ Page 591 Deleting the user ID and object ID stored when the cursor is deleted
☞ Page 592 Controlling the screen

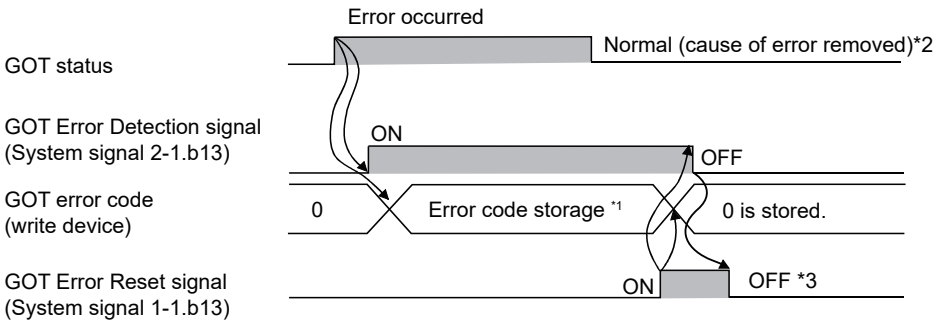
Checking the errors occurred in the GOT

The error codes of errors occurred in the GOT can be confirmed.

The error codes ranging from 300 to 699 are displayed.

For details on the error codes, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)



*1 When multiple errors occur simultaneously, the latest error code is stored.

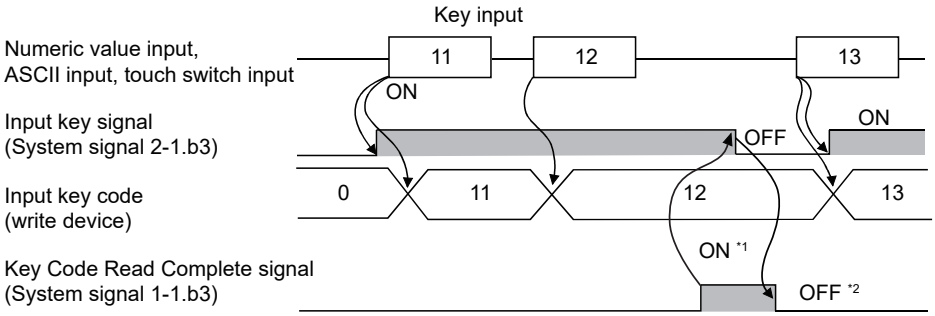
*2 The GOT error code (write device) is not cleared automatically even if the error cause is removed.
Clear the error code by using the GOT Error Reset signal (System signal 1-1.b13).

*3 Check that the GOT Error Detection signal (System signal 2-1.b13) turns off, then turn off the GOT Error Reset signal (System signal 1-1.b13).
If the GOT Error Reset signal (System signal 1-1.b13) remains on, the GOT error code (write device) is reset in the next error occurrence.

PART 5

Checking the entered key code

The entered key code can be checked by input key (touch switch, numerical input, or text input).

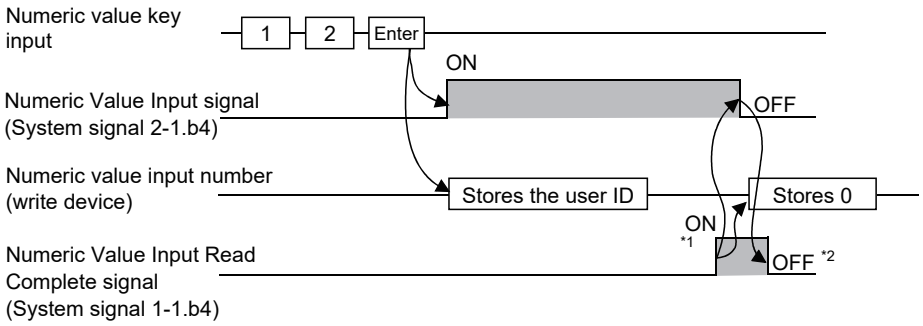


*1 When key entry is completed, the stored key code is held.
When the Key Code Read Complete signal (System signal 1-1.b3) turns on, the Input Key signal (System signal 2-1.b3) turns off.

*2 Check that the Input Key signal (System signal 2-1.b3) turns off, then turn off the Key Code Read Complete signal (System signal 1-1.b3).
If the Key Code Read Complete signal (System signal 1-1.b3) remains on, the stored key code is reset at the next key input.

Checking the confirmation timing of numerical input

The timing for which the input value was determined with the numerical input function can be checked with the user ID written in the numerical input number.



*1 After the numeric value input determination, the stored user ID is held.
The Numeric Value Input signal is cleared when the Numeric Value Input Read Complete signal (System signal 1-1.b4) turns on.

*2 Check that the Numeric Value Input signal (write device) turns off, then turn off the Numeric Value Input Read Complete signal (System signal 1-1.b4).
If the Numeric Value Input Read Complete signal (System signal 1-1.b4) remains on, the user ID cannot be stored or the Numeric Value Input signal cannot be turned on at the next value input and determination.

Checking the cursor display position

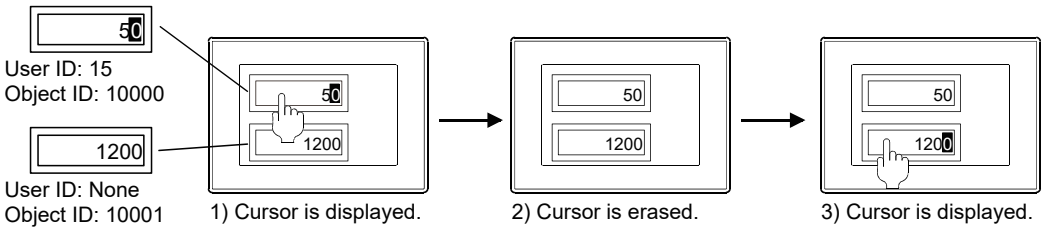
The cursor display position can be checked by writing the information of the object (numerical input and text input) in which a cursor is displayed to the device.

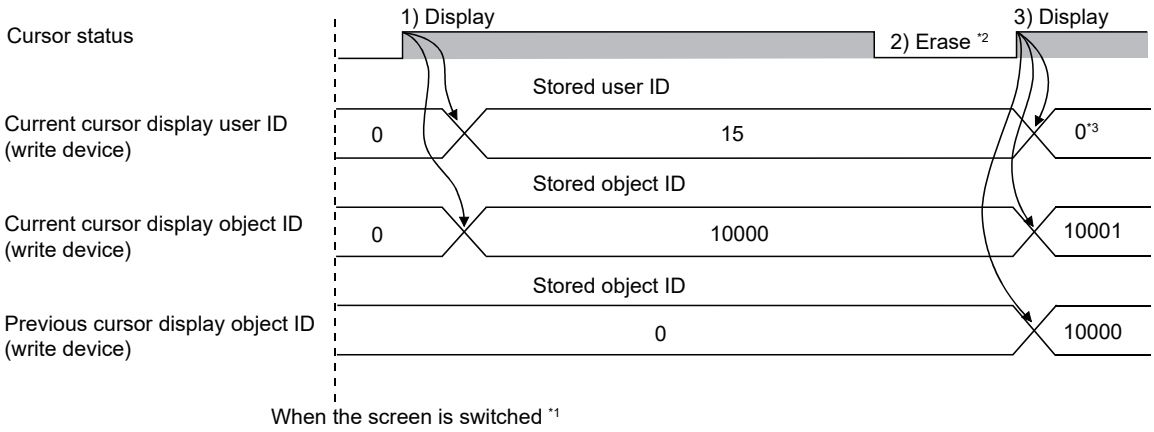
The following shows the object information to be written.

Information	Description
User ID	Set any ID for an object. Set the user ID in the setting dialog of each object.
Object ID	The ID is set automatically when an object is set with GT Designer3.

Ex.

Operation example when the cursor is displayed





*1 If a cursor is not displayed when the screen is switched, 0 is stored.

*2 The stored user ID and object ID are held even when a cursor is erased.

*3 If a cursor is displayed at the object (numeric input, text input) for which a user ID is not set, the cursor position numeric value input is 0.

*4 The current cursor display user ID and previous cursor display user ID operate with the text input when the GOT internal device GS450.b2 turns on.

Deleting the user ID and object ID stored when the cursor is deleted

To store 0 when the cursor is deleted, set either of the following.

- Selecting [Clear the cursor information when deleting the cursor] in the [Environmental Setting] window ([System Information])

☞ Page 594 [System Information]

- Turning on GS450.b3

☞ Page 3640 Monitor Common Control (GS450)

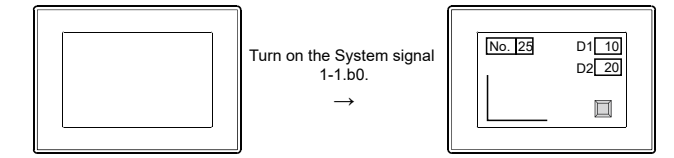
Controlling the screen

☞ Page 592 Disabling the screen saver function
☞ Page 592 Erasing the screen
☞ Page 593 Display control by human sensor
☞ Page 593 Canceling the screen saver mode only when human movement is detected

■Disabling the screen saver function

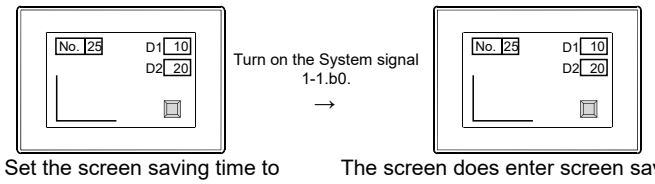
The screen saver function, which is set with the GOT utility, is designed to turn off the screen display if the GOT is not touched within a specified time. This function prevents the screen performance from deteriorating over its operable life.
By turning on the Automatic Screen Saver Disable signal in the system information, the system information function set with the utility (setup) can be disabled.

Ex.
Displaying the monitor screen erased by the automatic screen saver function



The screen is not displayed. The screens is displayed.

Ex.
Preventing the screen saver function from starting after the set time elapses



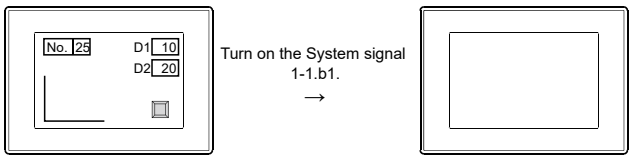
Set the screen saving time to 30 minutes.

The screen does enter screen saver mode after 30 minutes.
(The set time is disabled, and the screen remains displayed.)

■Erasing the screen

By turning on the Forced Screen Saver Enable signal, the monitor screen can be erased.
While this bit is on, the monitor screen is not displayed even when the GOT screen is touched.

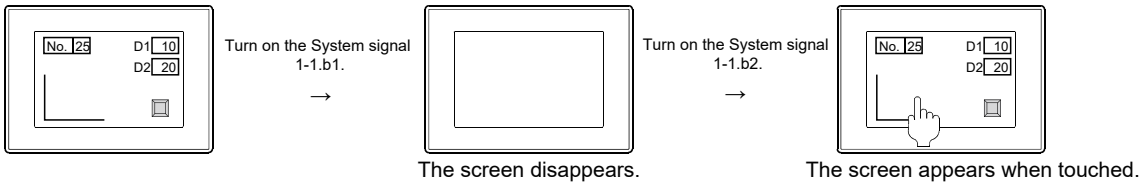
Ex.
Erasing the displayed monitor screen



The screen disappears.

In addition, the monitor screen can be displayed by turning on the Forced Screen Saver Touch-Cancel signal and touching the screen to cancel the forced screen saver function started with the Forced Screen Saver Enable signal.

Ex.
Displaying the monitor screen that is forcibly erased



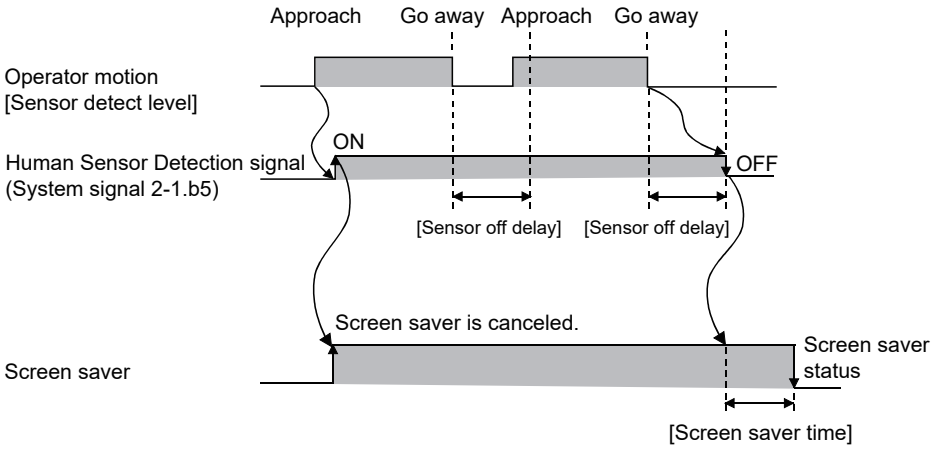
The screen disappears. The screen appears when touched.

■Display control by human sensor

Available for GT3712-X and GT3715-X.

The human sensor is a function that cancels the screen saver mode without touching the GOT.

When an operator approaches the GOT, the screen saver mode can be canceled.



When there is no operator motion around the GOT for the time set in [Sensor off delay], the Human Sensor Detection signal (System signal 2-1.b5) turns off.

When the time set in [Screen save time] elapses after the Human Sensor Detection signal turns off, the GOT enters screen saver mode.

Configure the human sensor settings (including [Motion Sensor Sensitivity] and [Sensor off delay]) in the GOT utility.

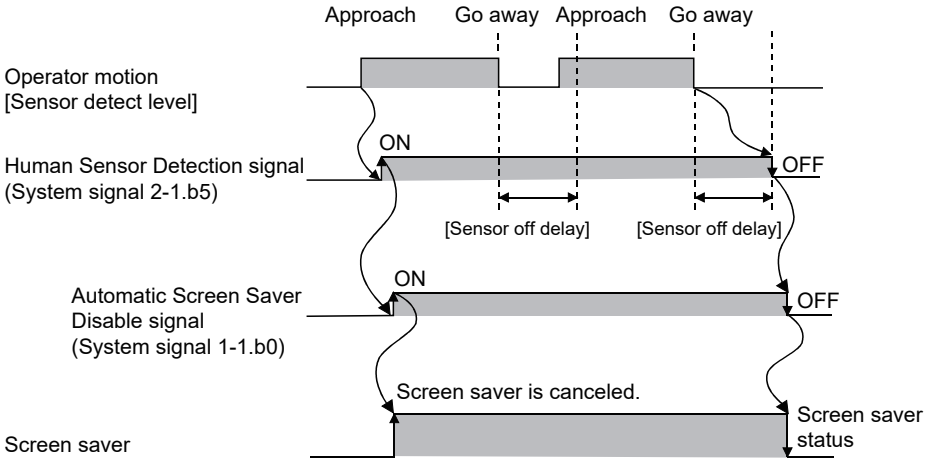
For details on the utility settings, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Canceling the screen saver mode only when human movement is detected

Available for GT3712-X and GT3715-X.

The screen saver mode can be canceled only when a human movement is detected by disabling cancellation by touch or externally.



To control the screen saver mode, use a sequence program to link the Human Sensor Detection signal with the Automatic Screen Saver Disable signal.

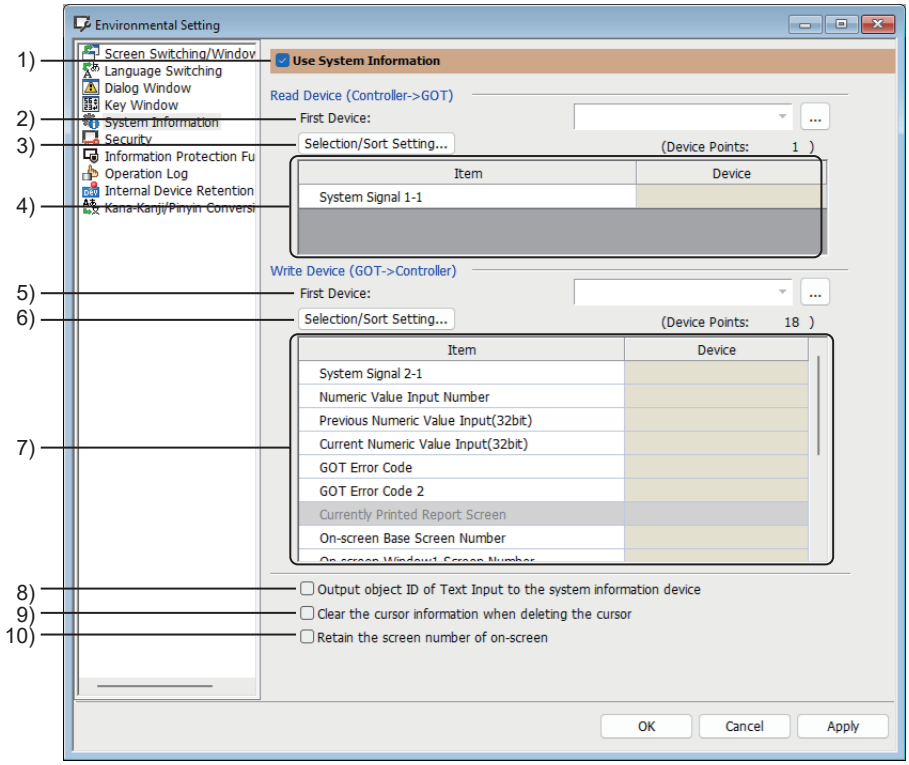
With this setting, the GOT enters screen saver mode after the human sensor OFF delay time elapses, regardless of the screen saving time.

10.5.4 [System Information]

GT37 SoftGOT3000

With [System Information], set the validity for each system information.

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display this window.



Item		Description
1)	[Use System Information]	Select this item to enable the system information.
2)	[First Device] (Read)	Set a read device where the system information (read) is stored. A word device can be set. Up to contiguous 3 points of devices from the set device are used for the read device.
3)	[Selection/Sort Setting] button	Displays the [Selection/Sort Setting] dialog. Set the system information and order of the read device to be enabled. ☞ Page 596 [Selection/Sort Setting] dialog
4)	Selected item list (read device)	Displays the enabled system information and the read device assigned to each system information in a list.
5)	[First Device] (Write)	Set a write device where the system information (write) is stored. A word device can be set. Up to contiguous 39 points of devices from the set device are used for the write device.
6)	[Selection/Sort Setting] button	Displays the [Selection/Sort Setting] dialog. Set the system information and order of the write device to be enabled. ☞ Page 596 [Selection/Sort Setting] dialog
7)	Selected item list (write device)	Displays the enabled system information and the write device assigned to each system information in a list.
8)	[Output object ID of Text Input to the system information device]	Outputs the object ID number of a text input object to the following system information devices when data is input to the object. • Numeric Value Input Read Complete signal (System signal 1-1.b4) • Numeric Value Input signal (System signal 2-1.b4) • Numeric value input number • Current cursor display user ID • Previous cursor display user ID
9)	[Clear the cursor information when deleting the cursor]	Stores 0 in the following devices when the cursor is deleted. • Current cursor display object ID • Previous cursor display object ID • Current cursor display user ID • Previous cursor display user ID

Item		Description
10)	[Retain the screen number of on-screen]	Holds the following device values while the screens are switched. (0 is not stored.) • On-screen base screen number • On-screen window 1 screen number • On-screen window 2 screen number • On-screen window 3 screen number • On-screen window 4 screen number • On-screen window 5 screen number

Precautions

■Using a special register of the PLC

Do not use a special register of the PLC as a read device or write device of the system information.

The special register is an internal register whose specification is defined in the PLC.

If the special register is used, the PLC or the GOT may not operate correctly.

■When using global labels for the system information (write device)

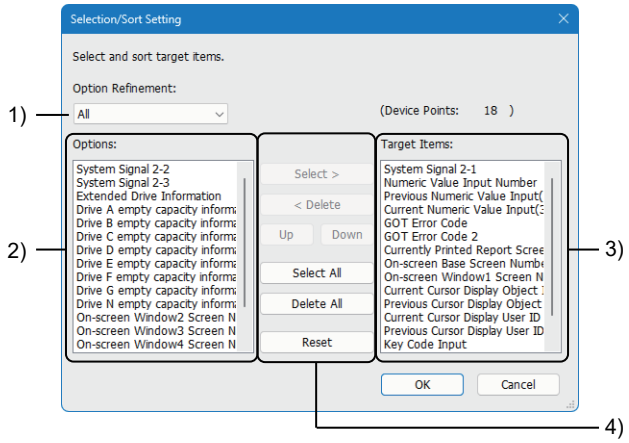
When using global labels for the system information (write device), set the array-type global labels.

If a primitive data type global label is set, system alarm 315 occurs.

[Selection/Sort Setting] dialog

GT37 SoftGOT3000

In the [Selection/Sort Setting] dialog, set items to be enabled and the order of devices.
Display this window from the [Environmental Setting] window ([System Information]).



Item			Description
1)	[Option Refinement]		Narrows down the items displayed in [Options]. This item is displayed only when a write device is set.
2)	[Options]		Items to be disabled with the system information are displayed in a list. Click the buttons on the window to move the item to [Target Items].
3)	[Target Items]		Items to be enabled with the system information are displayed in a list. Contiguous devices are assigned to the items in the list from the top. By clicking the buttons on the window, items can be moved to [Options] or the order of the display can be changed.
4)	Operation buttons	[Select] button	Selects, deletes, or changes the order of the display. Moves an item selected in [Options] to [Target Items].
		[Delete] button	Moves an item selected in [Target Items] to [Options].
		[Up] button	Moves up an item selected in the target items.
		[Down] button	Moves down an item selected in the target items.
		[Select All] button	Moves all items displayed in [Options] to [Target Items].
		[Delete All] button	Moves all items displayed in [Target Items] to [Options]. However, the System signal 1-1 (read device) and the System signal 2-1 (write device) are not moved.
		[Reset] button	Resets [Options] and [Target Items] to the initial status.

10.5.5 Relevant settings

GT37 SoftGOT3000

Set the relevant settings other than the specific settings for the system information as required.
The following shows the functions that are available by configuring the relevant settings.

GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Specifying the unit of the drive free space	GS466

PART 5

10.6 Restricting GOT operations and data transfers ([Security])

GT37 SoftGOT3000

For the functions to be set in the [Environmental Setting] window ([Security]), refer to the following.

☞ Page 3038 Restricting display and operation on the GOT (Screen security)
☞ Page 3057 Configuring the security settings for operations in the utility (Functional operation security)
☞ Page 3062 Configuring the security setting for transferring data (Data transfer security)

10.7 Protecting files and communication data ([Information Protection Function])

GT37 SoftGOT3000

For the functions to be set in the [Environmental Setting] window ([Information Protection Function]), refer to the following.

☞ Page 3065 Protecting the files in the GOT (Information protection function)
☞ Page 3069 Encrypting communication data (Encrypted communication function)

PART 5

10.8 Configuring the settings for creating the GOT operation history ([Operation Log])

GT37 SoftGOT3000

For the functions to be set in the [Environmental Setting] window ([Operation Log]), refer to the following.

☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])

10.9 Configuring the settings for retaining GOT internal device data at power failure ([Internal Device Retention])

GT37 SoftGOT3000

☞ Page 601 Specifications of the internal device retention
☞ Page 602 How to use the internal device retention function
☞ Page 603 [Internal Device Retention]

The GOT internal device values are saved to the built-in memory (nonvolatile RAM) of the GOT.

The GOT retains the device values monitored before power-off of the GOT, and monitors the retained values again upon power-on of the GOT.

For the specifications of the nonvolatile RAM, refer to the following.

☞ Page 3679 Specifications and operations of the nonvolatile RAM user area

GT SoftGOT3000 saves device values when GT SoftGOT3000 exits.

10.9.1 Specifications of the internal device retention

GT37 SoftGOT3000

Devices used for the internal device retention

The following shows the devices used for the internal device retention and device range.

Device	Range
GOT bit register (GB)	GB64 to GB65535
GOT data register (GD)	GD0 to GD65535

PART 5

10.9.2 How to use the internal device retention function

GT37 SoftGOT3000

How to set the internal device retention function

Configure the settings to enable the internal device retention function according to the following procedure.

Operating procedure

1. Select [Common] → [GOT Environmental Setting] → [Internal Device Retention] from the menu to display the [Environmental Setting] window ([Internal Device Retention]).

☞ Page 603 [Internal Device Retention]

2. Specify the start device of consecutive devices and the number of devices for saving their data to the built-in memory (nonvolatile RAM), and click the [OK] button.
3. Write package data to the GOT.

For the communication method with the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

For GT SoftGOT3000, the timing for saving device values is settable.

GT SoftGOT3000 User's Manual

Deleting the device values in the built-in memory (nonvolatile RAM)

The device values saved in the built-in memory (nonvolatile RAM) will be deleted in the following cases.

- The project is written with [Initialize nonvolatile RAM user area at the time of writing project] selected in the [Write Option] dialog.
- The built-in memory (nonvolatile RAM) is initialized using [NVRAM management] of the utility.
- Any setting in the [Environmental Setting] window ([Internal Device Retention]) is changed, and then the project data is written to the GOT.
- Project data having a different project ID is written to the GOT.

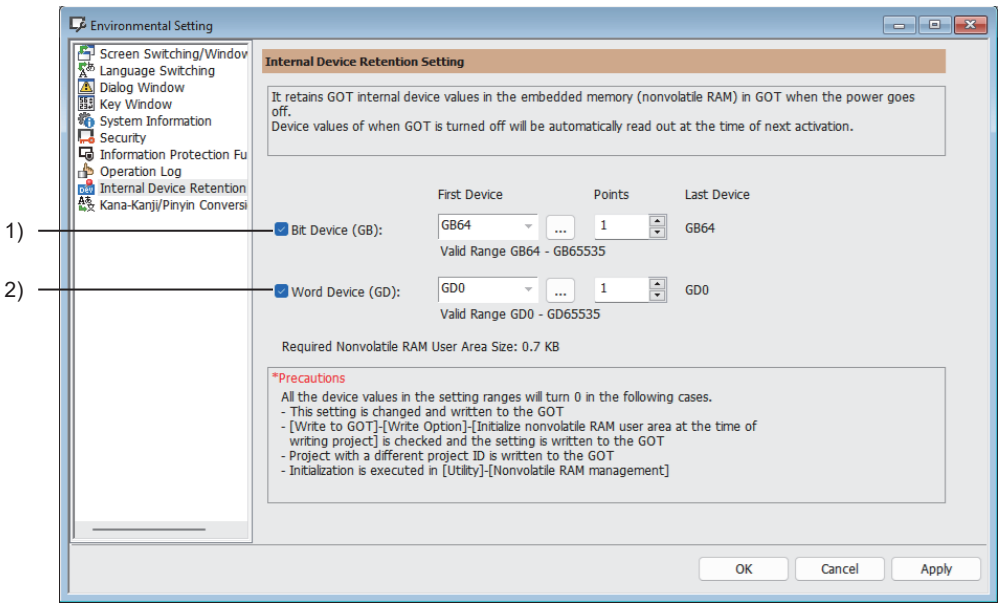
For settings to delete the device values in the built-in memory (nonvolatile RAM) in GT SoftGOT3000, refer to the following.

GT SoftGOT3000 User's Manual

10.9.3 [Internal Device Retention]

GT37 SoftGOT3000

Set the ranges of devices to save their data to the built-in memory (nonvolatile RAM) in [Internal Device Retention].
To display the following window, select [Common] → [GOT Environmental Setting] → [Internal Device Retention] from the menu.



Item			Description
1)	[Bit Device (GB)]	—	Saves the values of GOT bit registers (GB) to the built-in memory (nonvolatile RAM).
		[First Device]	Specify the start device of GOT bit registers (GB).
		[Points]	Specify the number of GOT bit registers (GB).
2)	[Word Device (GD)]	—	Saves the values of GOT data registers (GD) to the built-in memory (nonvolatile RAM).
		[First Device]	Specify the start device of GOT data registers (GD).
		[Points]	Specify the number of GOT data registers (GD).

PART 5

10.10 Configuring the settings for converting a text into kanji or Simplified Chinese characters in the GOT ([Kana-Kanji/Pinyin Conversion])

GT37 SoftGOT3000

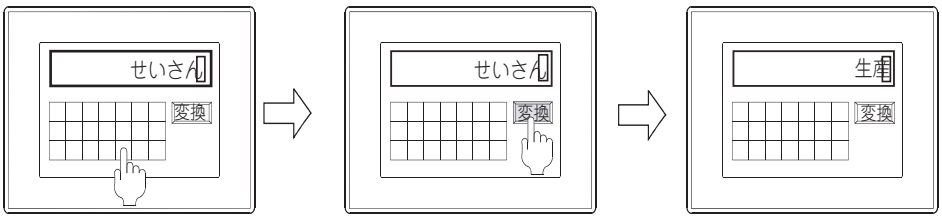
☞ Page 605 Specifications of Kana-Kanji/Pinyin conversion
☞ Page 609 Settings required for Kana-Kanji/Pinyin conversion
☞ Page 610 [Kana-Kanji/Pinyin Conversion]
☞ Page 611 Relevant settings

A text entered with a text input object can be converted into kanji or Simplified Chinese characters.
The following shows the conversion methods.

- Kana-Kanji conversion: Hiragana to kanji
- Pinyin conversion: Pinyin (lowercase alphabetic characters) to Simplified Chinese

Use a touch switch for which key codes for Kana-Kanji/Pinyin conversion are set or a keyboard for Kana-Kanji/Pinyin conversion to convert a text.

Ex.
Converting hiragana characters into kanji characters



Input the hiragana characters by ASCII input.

Touch the [Conversion] switch.

The hiragana characters are converted into the kanji characters.

Precautions

When using Kana-Kanji conversion or Pinyin conversion, data entry to a text input object using a USB keyboard is not available.
Use the key window displayed on the GOT screen for input.

10.10.1 Specifications of Kana-Kanji/Pinyin conversion

GT37 SoftGOT3000

☞ Page 605 Conditions that enable Kana-Kanji conversion
☞ Page 605 Conditions that enable Pinyin conversion
☞ Page 606 Input mode
☞ Page 606 Conversion method
☞ Page 606 Number of characters that can be input and converted at once
☞ Page 606 Supported Kanji
☞ Page 607 Learning conversion results
☞ Page 607 Operation switch
☞ Page 608 Option selection window

PART 5

Conditions that enable Kana-Kanji conversion

Kana-Kanji conversion is enabled by text input that satisfies all the following conditions.

- Selecting [Kana-Kanji/Pinyin Conversion] in the [Extended] tab in the [Text Input] dialog
- Selecting [Kana-Kanji] for [Conversion Method] in [Kana-Kanji/Pinyin Conversion] in the [GOT Environmental Setting] dialog
- Setting the character code and system language

The following shows the combinations of character codes and system languages that are available for Kana-Kanji conversion.

Value in Text Code Format Control (GS456)*1	GOT system language	[Character Code] in the [Device/Style] tab in the [Text Input] dialog*2
0	Japanese	[System Language Link] [Unicode] [S-JIS]
1	• Japanese • English • Chinese (Simplified) • Chinese (Traditional) • Korean	

*1 It changes the character code used for text input.
☞ Page 3643 Text Code Format Control (GS456)

*2 When the character code other than [System Language Link], [Unicode], or [S-JIS] is set, Kana-Kanji conversion is enabled. However, the GOT cannot display the converted characters correctly.

Conditions that enable Pinyin conversion

Pinyin conversion is enabled by text input that satisfies all the following conditions.

- Selecting [Kana-Kanji/Pinyin Conversion] in the [Extended] tab in the [Text Input] dialog
- Selecting [Pinyin Simplified Characters] for [Conversion Method] in [Kana-Kanji/Pinyin Conversion] in the [GOT Environmental Setting] dialog
- Setting the character code and system language

The following shows the combinations of character codes and system languages that are available for Pinyin conversion.

Value in Text Code Format Control (GS456)*1	GOT system language	[Character Code] in the [Device/Style] tab in the [Text Input] dialog*2
0	Chinese (Simplified)	[System Language Link] [Unicode] [GB]
3	• Japanese • English • Chinese (Simplified) • Chinese (Traditional) • Korean	

*1 It changes the character code used for text input.
☞ Page 3643 Text Code Format Control (GS456)

*2 When the character code other than [System Language Link], [Unicode], or [GB] is set, Pinyin conversion is enabled. However, the GOT cannot display the converted characters correctly.

Input mode

Hiragana-input is supported.

Input texts on objects by using the touch switch (key code switch).

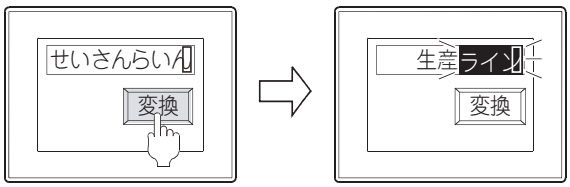
Conversion method

Consecutive phrases can be converted.

Characters are converted when the input characters match the dictionary data completely.

Ex.

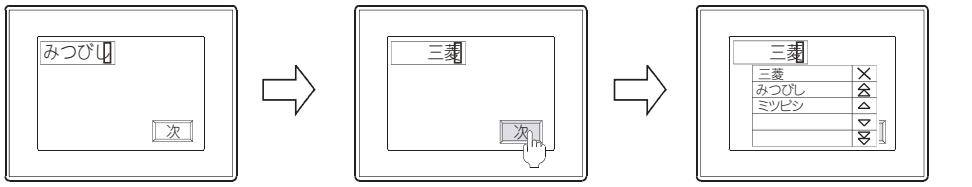
Example) Entering [せいさんらいん] and converting it using Kana-Kanji conversion



Touch the 変換 switch.

Convert "せいさん" and "らいん" separately.

For the first conversion attempt, a single option is displayed. If a second attempt is made, an option selection window appears, showing additional options.



When the Conversion switch is touched once, one conversion option is displayed.

When the switch is touched again, the option selection window is displayed.

Precautions

The four tones are not supported.

Uppercase alphabetic characters cannot be converted into Simplified Chinese characters.

Number of characters that can be input and converted at once

Up to 40 two-byte characters (80 bytes) can be input.

Up to 20 two-byte characters (40 bytes) can be converted.

Precautions

Do not exceed the number of input digits set in the text input.

Otherwise, determining the characters and writing to a device cannot be executed.

Supported Kanji

• Kana-Kanji conversion

Kanji characters classified in the JIS Level-1 and Level-2 Kanji sets are supported.

• Pinyin conversion

GB2312 Chinese characters are supported.

Learning conversion results

The GOT learns Kana-Kanji conversion results and Pinyin conversion results.

No setting is required for the GOT to learn conversion results.

The GOT holds the learning result until powered off or reset.

Up to 20 two-byte characters (40 bytes) can be learned.

Up to 1000 words can be learned.

Operation switch

The touch switch used for Kana-Kanji/Pinyin conversion operates when key codes are assigned.

When creating a key window by the user, use the following key codes.

Item	Key code	Application and operation
Hiragana characters	Shift JIS code	Used for hiragana-input.
Cursor key (left)	0091h	Moves the cursor. • During input, the cursor is shifted left by one character.  • During conversion, the selected phrase is shortened. Cursor key (right)	0090h	Moves the cursor. • During input, the cursor is shifted right by one character.  • During conversion, the selected phrase is extended.  During conversion, touch this key and then enter a sonant mark or p-sound mark to input the mark as one character. [DEL] key	0008h	Deletes characters. • During input, the right-most character is deleted.  • During conversion, the conversion is undone. [CLR] key	0088h	Clears characters. • During input, all the characters are cleared.  • During conversion, only the characters being converted are cleared. Kanji/Simplified Chinese character conversion key	0084h	Converts characters. • During input, the characters are converted. • During conversion, the conversion is undone.

Item	Key code	Application and operation
Option key ([The former candidate] or [The next candidate])	0085h or 0086h	Displays the options. • When this key is touched first, the next option will be displayed. • When this key is touched again, the option selection window will be displayed. [>>] key	0087h	Selects the next phrase during conversion. • When a single phrase is converted, the input characters are determined.  • When consecutive phrases are converted, the next phrase is selected. [<<] key	0089h	Selects the previous phrase during conversion. • When a single phrase is converted, the conversion is undone. • When consecutive phrases are converted, the previous phrase is selected. [Enter] key	000Dh	Writes characters to the device. • During input and conversion, the displayed characters are determined. • After the conversion, the characters are input to the device.

Option selection window

The option selection window displays multiple conversion options in a list at the conversion.

The background color and the scroll button can be selected.

The background color can be selected from [White] or [Black].

The scroll button can be selected from [Page + Line Scroll] or [Page Scroll].

Background color: [White]

Scroll: [Page + Line Scroll]

Background color: [Black]

Scroll: [Page Scroll]

10.10.2 Settings required for Kana-Kanji/Pinyin conversion

GT37 SoftGOT3000

The following settings are required to use Kana-Kanji/Pinyin conversion.

☞ Page 609 Setting a key window
☞ Page 609 Setting an object

Setting a key window

Perform one of the following operations to set a key window.

• Using a key window for text (key window that supports Kana-Kanji/Pinyin conversion)

When GS467.b1 is on, the key window displayed at a touch of an text input object is switched to a key window that supports Kana-Kanji/Pinyin conversion.

Set a bit switch or other objects and turn on GS467.b1.

☞ Page 562 Key window for text (key window that supports Kana-Kanji/Pinyin conversion)

• Using a user-created key window

Create a key window for Kana-Kanji/Pinyin conversion.

KANA key and conversion keys registered in the library can be used.

☞ Page 563 Specifications of the user-created key window
☞ Page 1061 Using the data registered in the library

Use either of the following methods when using the option selection window as well.

• Setting by the project

Select [Common] → [GOT Environmental Setting] → [Kana-Kanji/Pinyin Conversion] from the menu to display the [Kana-Kanji/Pinyin Conversion] window, and select [Use the option selection window].

☞ Page 610 [Kana-Kanji/Pinyin Conversion]

• Setting by screen

Select [Screen] → [Screen Property] from the menu to display the setting dialog, and select [Use the option selection window] in the [Option Selection Window] tab.

☞ Page 313 Changing screen property

Setting an object

Configure the settings to enable Kana-Kanji/Pinyin conversion for a text input object placed on the screen.

☞ Page 1365 [Extended] tab

Setting a system application

Kana-Kanji/Pinyin conversion does not work if the system application (add-on function) for [Kana-Kanji/Pinyin conversion] is not installed on the GOT.

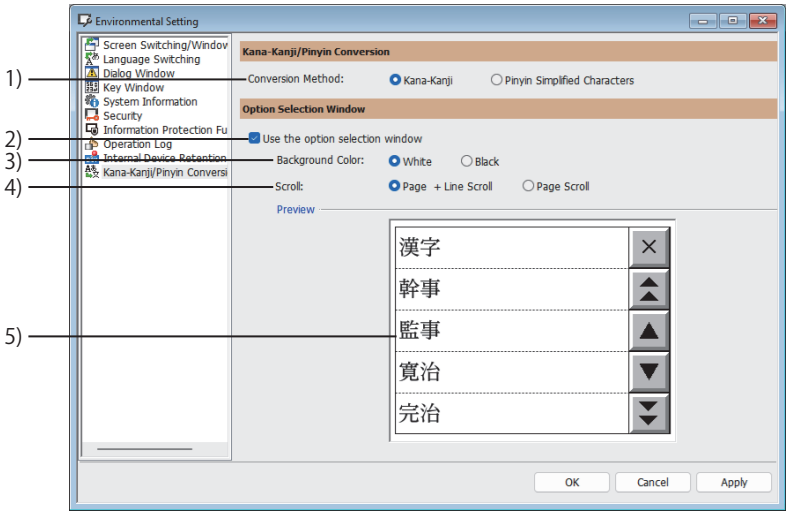
☞ Page 458 [Application Selection] dialog

10.10.3 [Kana-Kanji/Pinyin Conversion]

GT37 SoftGOT3000

Set how to display the option selection window in [Kana-Kanji/Pinyin Conversion].

Select [Common] → [GOT Environmental Setting] → [Kana-Kanji/Pinyin Conversion] from the menu to display the window.



Item		Description
1)	[Conversion Method]	Select a conversion method.
2)	[Use the option selection window]	Select this item to display the option selection window at Kana-Kanji conversion or Pinyin conversion.
3)	[Background Color]	Select the background color of the option selection window.
4)	[Scroll]	Select the keys to be displayed on the option selection window. • [Page + Line Scroll]: Displays the keys for scrolling by page or by line. • [Page Scroll]: Displays the keys for scrolling by page.
5)	[Preview]	Displays the preview of the option selection window which the settings of [Background Color] and [Scroll] are reflected.

10.10.4 Relevant settings

GT37 SoftGOT3000

GOT internal device

Set the relevant settings other than the specific settings for the Kana-Kanji/Pinyin conversion as required.

The following shows the function that is available by configuring the relevant settings.

☞ Page 3581 GOT special register (GS)

Function	Setting item
Switching a key window for text input to a key window that supports Kana-Kanji conversion or Pinyin conversion	GS467.b1

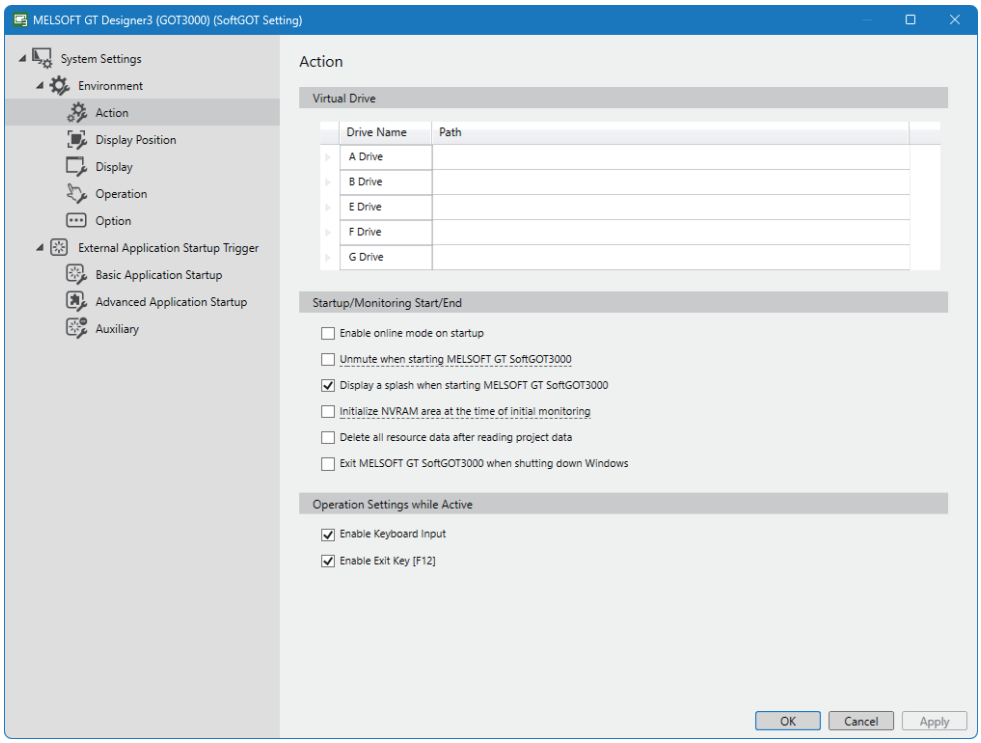
PART 5

11 Configuring the GT SoftGOT3000 settings ([SoftGOT Setting])

Configure the GT SoftGOT3000 settings in GT Designer3.
The settings are saved in the project (GT SoftGOT3000 execution file (*.GTYP)) and applied to the GT SoftGOT3000 module where the project is opened.

11.1 [MELSOFT GT Designer3 (GOT3000) (SoftGOT Setting)] dialog

Select [Common] → [SoftGOT Setting] from the menu to display this dialog.



The dialog can also be displayed from GT SoftGOT3000, but the dialog titles and displayed items may be different between GT Designer3 and GT SoftGOT3000.

For details on each item, refer to the [Set] dialog in the following manual.

📖GT SoftGOT3000 User's Manual

The following shows the differences in displayed items between GT Designer3 and GT SoftGOT3000.

○: Displayed

—: Not displayed

Tree item			Display availability	
			GT Designer3	GT SoftGOT3000

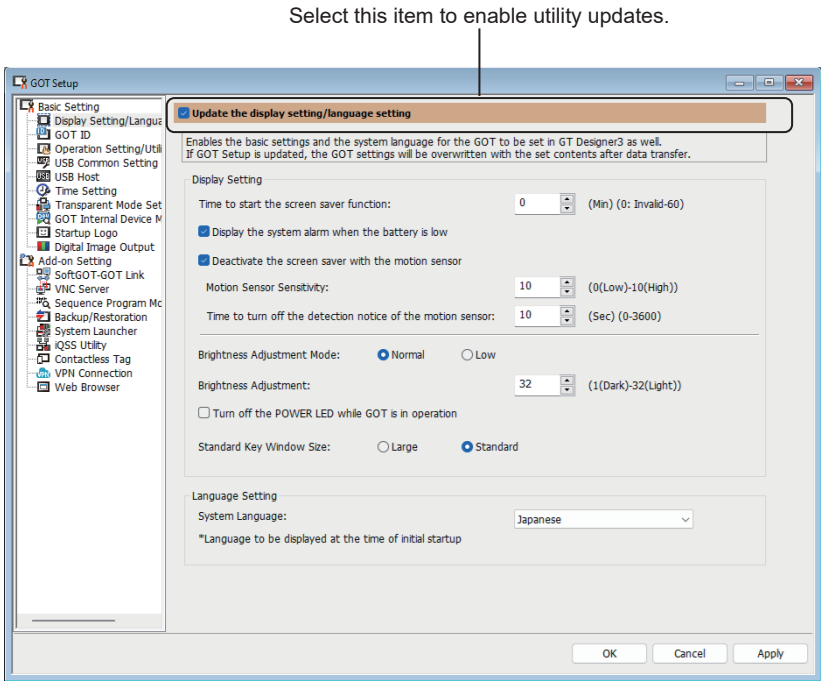
☞ Page 691 Setting the web browser function ([Web Browser])

Relationship between [GOT Setup] and the utility

You can update the GOT utility settings with the settings in GT Designer3 by enabling the settings in the [GOT Setup] window.
Each setting screen in the [GOT Setup] window provides the settings to enable the GT Designer3 settings.

Ex.

[Display Setting/Language Setting] in the [GOT Setup] window



The utility settings are handled as follows when you write or read package data.

Item	Handling of settings	
	Settings with update enabled	Settings with updates disabled
Writing the package data to the GOT	The utility settings are updated with the GT Designer3 settings.	The utility settings will not be updated because the settings in GT Designer3 are disabled. The GOT operates according to its utility settings.
Reading the package data from the GOT	The settings are read from the utility. If any changes are made to the utility settings after the package data is written, the updated package data is read.	The utility settings are not read because the settings in GT Designer3 are disabled. Any changes to the utility settings are not applied to the read package data.

For the utility, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

12.1 Configuring the settings for the display on the GOT ([Display Setting/Language Setting])

GT37 SoftGOT3000

☞ Page 616 Setting targets in [Display Setting/Language Setting]
☞ Page 618 [Display Setting/Language Setting]

In [Display Setting/Language Setting], configure settings for the GOT display and the system language.

12.1.1 Setting targets in [Display Setting/Language Setting]

GT37 SoftGOT3000

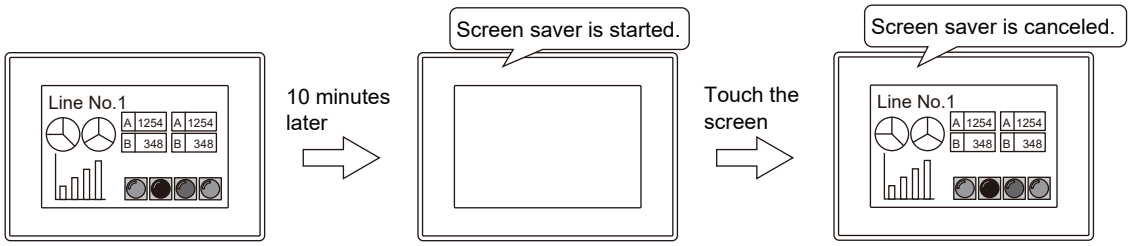
Screen saver

The screen saver function is designed to turn off the screen display if the screen is not touched within a specified time.

The screen saver mode can be canceled by the screen touch operation, the human sensor, and the system information.

Ex.

When the time to the screen saver is set to 10 minutes



For information on how to control the screen saver function with the system information, refer to the following.

☞ Page 592 Controlling the screen

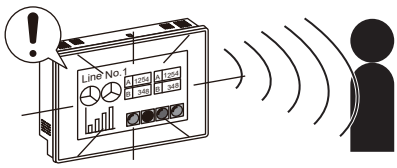
Human sensor

Available for GT3712-X and GT3715-X.

The human sensor detects human approach.

Use the human sensor to release the screen saver mode.

By approaching the GOT, the screen saver mode can be canceled.



Cancels the screen saver mode by detecting human approach

The human sensor operation can be controlled with the system information as well.

For information on how to control the human sensor with the system information, refer to the following.

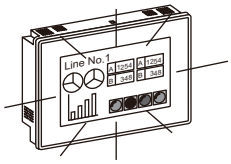
☞ Page 592 Controlling the screen

Brightness adjustment mode

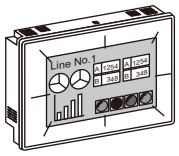
You can change the brightness adjustment mode of the backlight.

Select [Normal] or [Low] for the brightness adjustment mode.

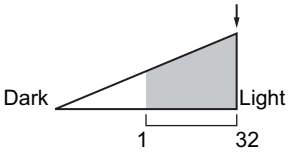
To reduce the luminous intensity of the GOT screen, select [Low] instead of [Normal] for [Brightness Adjustment Mode].

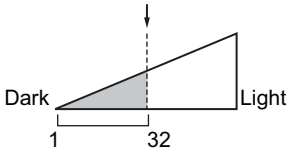


Brightness adjustment mode: [Normal]
Brightness adjustment: [32]



Brightness adjustment mode: [Low]
Brightness adjustment: [32]



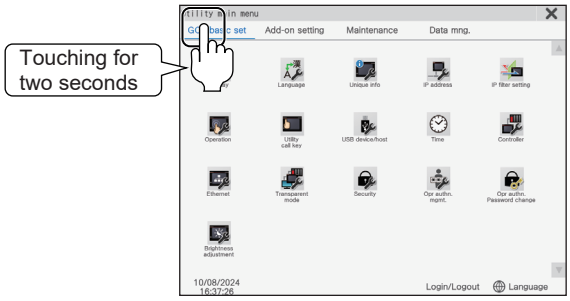


■Temporarily switching the brightness adjustment mode to the [Normal] mode in the utility screen

In the [Low] mode, touching the left edge of the utility main menu screen for two seconds enters the [Normal] mode temporarily.

The brightness adjustment mode returns to the original mode at the following timing.

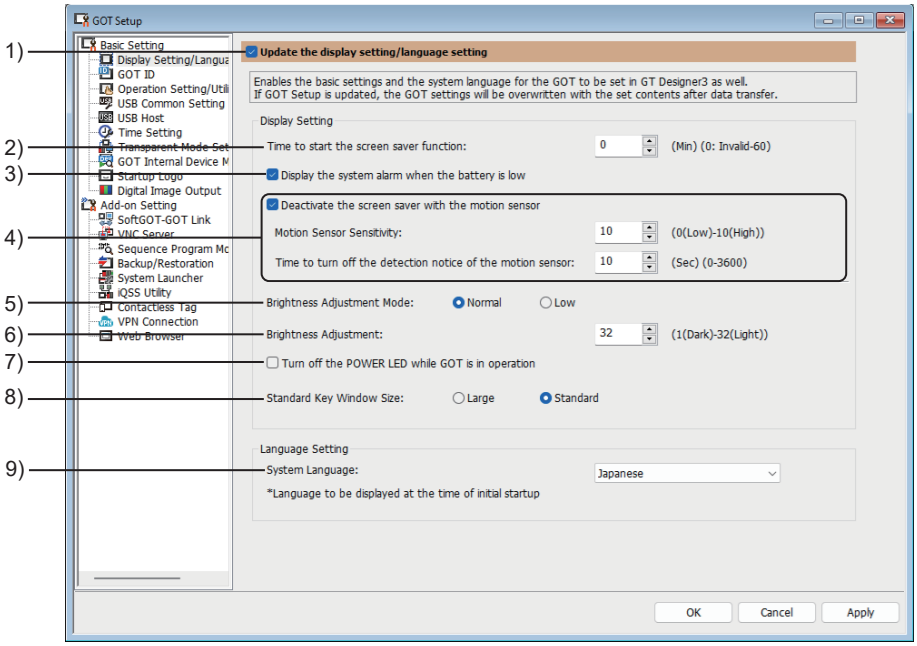
- When the screen is switched to a monitor screen
- When the setting of [Brightness adjust] or [Brightness adjustment] is changed in the utility (The screen is displayed using the set value of [Brightness adjust] and [Brightness adjustment].)



12.1.2 [Display Setting/Language Setting]

GT37 SoftGOT3000

In [Display Setting/Language Setting], configure settings for the GOT display and the system language.
Select [Common] → [GOT Setup] → [Basic Setting] → [Display Setting/Language Setting] from the menu to display this window.



Item			Description
1)	[Update the display setting/language setting]		Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. Select this item to configure the settings in [Display Setting/Language Setting]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Time to start the screen saver function]		Not available for GT SoftGOT3000. Set the time to the screen saver. ☞ Page 616 Screen saver
3)	[Display the system alarm when the battery is low]		Not available for GT SoftGOT3000. Select this item to display the system alarm when the battery voltage is low.
4)	[Deactivate the screen saver with the motion sensor]	—	Available for GT3712-X and GT3715-X. If a model other than the above is used, this setting is not applied. Cancels the screen saver mode when the human sensor detects the human motion. Select this item to set the sensor detection level and the time to turn off the Human Sensor Detection signal. ☞ Page 616 Human sensor
		[Motion Sensor Sensitivity]	Set the human sensor detection level.
		[Time to turn off the detection notice of the motion sensor]	Set the time from when the human sensor stops detecting the human motion to when the Human Sensor Detection signal turns off.
5)	[Brightness Adjustment Mode]		Not available for GT SoftGOT3000. Select the brightness adjustment mode of the backlight. ☞ Page 617 Brightness adjustment mode
			In [Low] mode, the GOT cannot detect the backlight failure. To detect the backlight failure, set the brightness adjustment mode to [Standard].
			In [Low] mode, the screen may flicker, or the screen display may turn off. If you do not use the GOT in a dark place, set the brightness adjustment mode to [Normal].
6)	[Brightness Adjustment]		Not available for GT SoftGOT3000. Set the intensity of the backlight.
7)	[Turn off the POWER LED while GOT is in operation]		Not available for GT SoftGOT3000. The power LED turns off even when the GOT is operating. Even if this item is selected, the power LED remains on until the startup logo appears after the GOT starts up to check the operation.
8)	[Standard Key Window Size]		Select the size of the standard key window.

Item		Description
9)	[System Language]	At the initial startup of the GOT, select the language to be used for the utility and the system message.

Point

When the GOT model GT3708-X is selected, it is recommended to change the [Standard Key Window Size] setting to [Large] to ensure operability.

12.2 Setting the identification information to the GOT ([GOT ID])

GT37 SoftGOT3000

☞ Page 620 GOT identification information
☞ Page 621 How to use the identification information
☞ Page 623 [GOT ID]

In [GOT ID], set the information such as the GOT ID, GOT name, and Ethernet interface.

12.2.1 GOT identification information

GT37 SoftGOT3000

The GOT identification information below is used to identify the GOT.

Item	Overview
GOT ID	ID number to identify the GOT
GOT name	Name to identify the GOT. Use as the identification information when obtaining the GOT list by the network.
Detailed description	Detailed description for the GOT. Describe the supplemental information of the GOT.
Ethernet interface setting at the GOT side	The communication interface setting at the GOT side for using the Ethernet connection.

Set the identification information for each GOT.

Up to 256 pieces of GOT identification information can be stored for a project.

12.2.2 How to use the identification information

GT37 SoftGOT3000

The following shows the usages of the GOT identification information.

☞ Page 621 Performing various operations in each GOT in one project
☞ Page 622 Switching the destination GOT for writing the package data

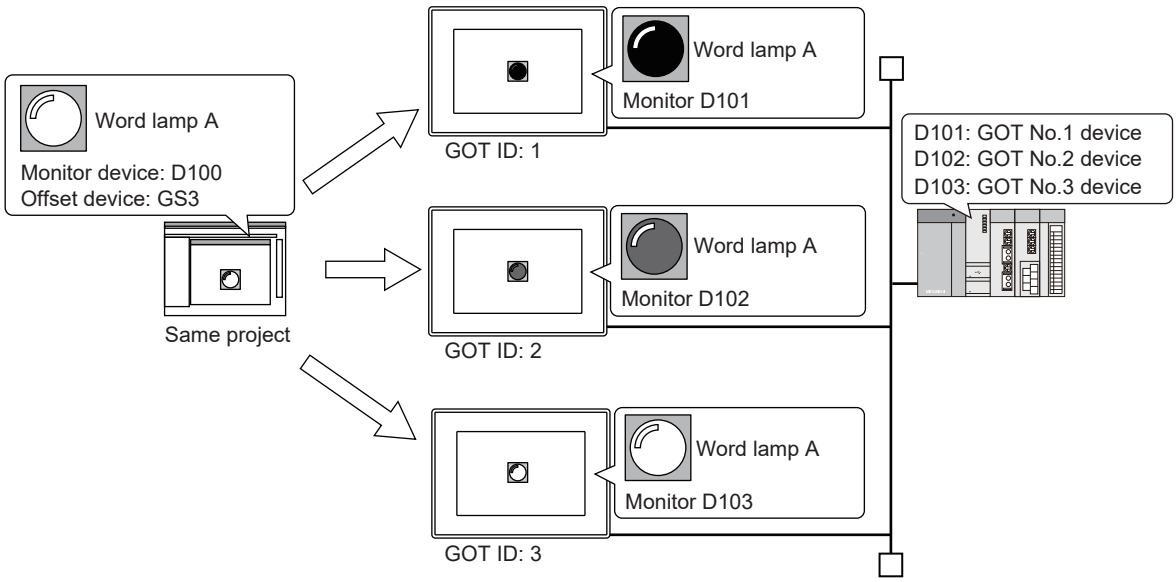
Performing various operations in each GOT in one project

The GOT ID is stored in the GOT special register (GS3).

Using the GOT special register (GS3) allows object operations and script controls to have difference even when the same project is written to multiple GOTs.

Ex.

Writing the same project to three GOTs with different GOT IDs



PART 5

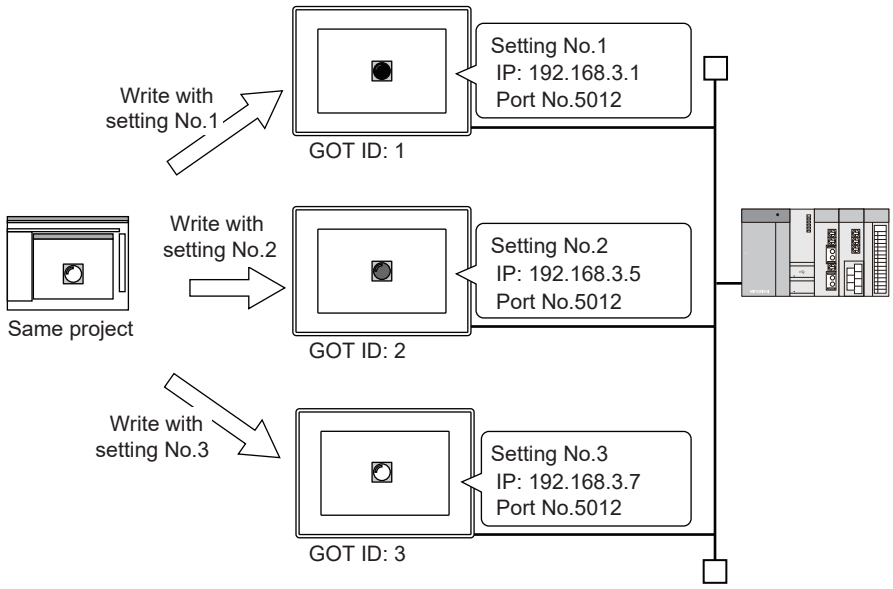
Switching the destination GOT for writing the package data

The Ethernet setting can be stored for each GOT ID.

This enables the Ethernet interface setting to be switched when the destination GOT for writing package data is switched.

Use this function to switch the communication setting in a system where multiple GOTs which use the same project exist.

If the communication setting switching is unnecessary, preparing multiple settings is unnecessary.



Precautions

■Ethernet interface settings which are not included in the GOT identification information

The following settings are not included the GOT identification information.

- Number of retry
- Startup time
- Communication timeout time
- Send delay time

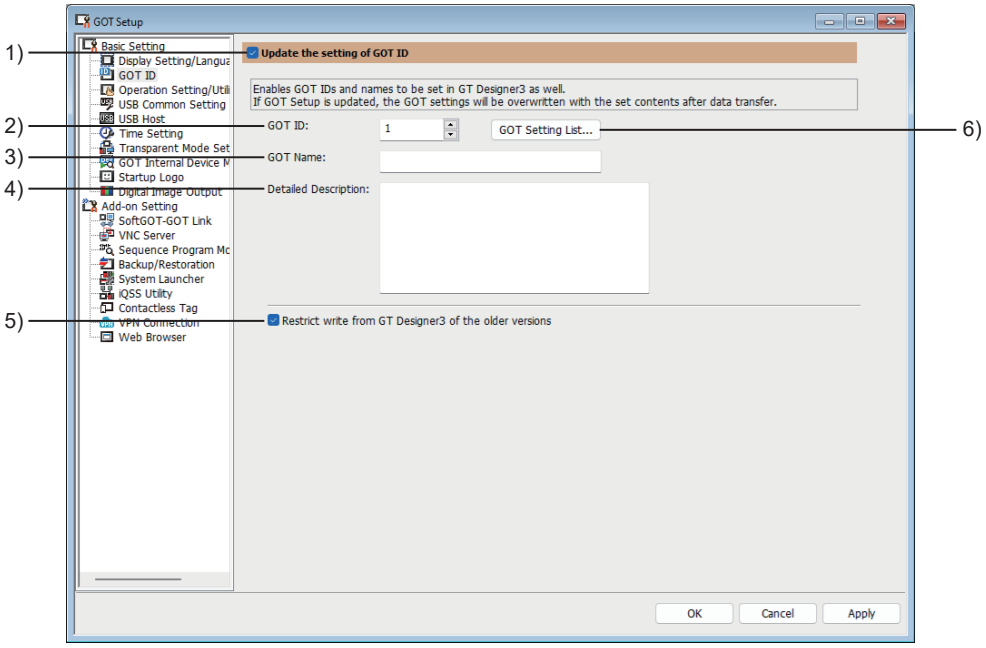
These settings cannot be changed by the GOT ID No. switching.

12.2.3 [GOT ID]

GT37 SoftGOT3000

In [GOT ID], set the GOT ID and GOT name.

Select [Common] → [GOT Setup] → [Basic Setting] → [GOT ID] from the menu to display this window.



Item		Description
1)	[Update the setting of GOT ID]	Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. Select this item to configure the settings in [GOT ID].
2)	[GOT ID]	Set an ID number to identify the GOT. The setting range is [1] to [32767].
3)	[GOT Name]	Set a name to identify the GOT. Up to 32 characters can be set.
4)	[Detailed Description]	Set a description about the GOT. Up to 512 characters can be set. The line feed cannot be used.
5)	[Restrict write from GT Designer3 of the older versions]	Data writing from GT Designer3 is restricted if its version is older than the one used to write the package data.
6)	[GOT Setting List] button	Not available for GT SoftGOT3000. Displays the [GOT Setting List] dialog. In the [GOT Setting List] dialog, you can set the GOT information which have been previously registered by selecting from a list. ☞ Page 624 [GOT Setting List] dialog

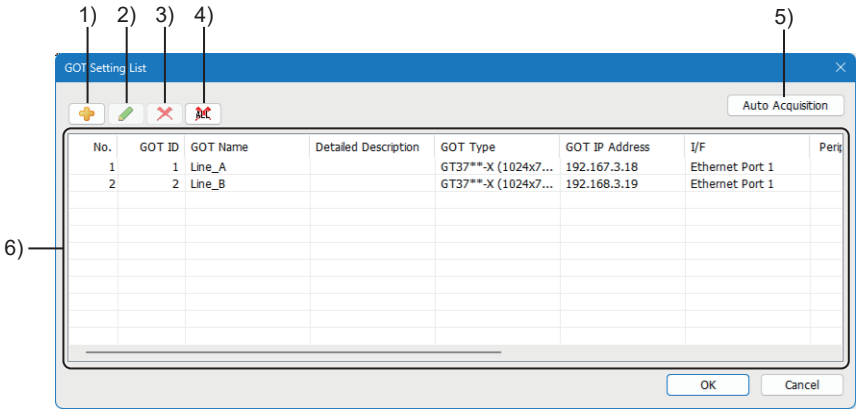
[GOT Setting List] dialog

GT37 SoftGOT3000

In the [GOT Setting List] dialog, add or edit the GOT identification information.

Up to 256 GOT identification information settings can be stored.

Select one from the GOT identification information list and click the [OK] button. The selected information is set to the [GOT Setup] window ([GOT ID]).

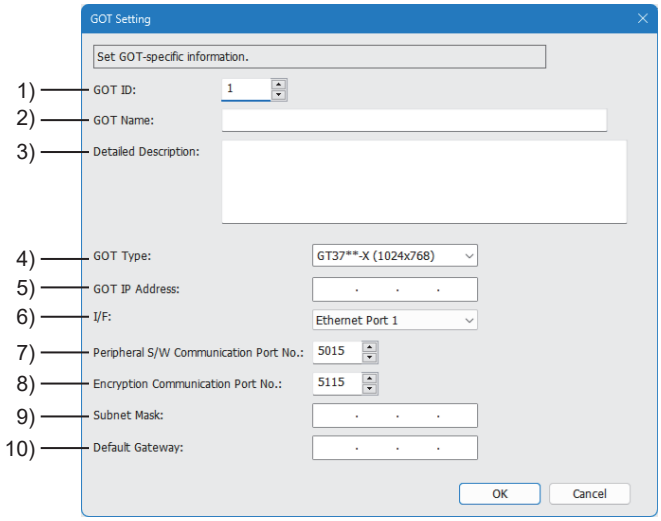


Item		Description
1)	[Add] button	Adds new GOT individual information to the list. Enter the GOT individual information in the [GOT Setting] dialog. ☞ Page 625 [GOT Setting] dialog
2)	[Edit] button	Edits the GOT identification information that is being selected in the GOT identification information list. Enter the GOT individual information in the [GOT Setting] dialog. ☞ Page 625 [GOT Setting] dialog
3)	[Delete] button	Deletes the GOT identification information that is being selected in the GOT setting list.
4)	[Delete All] button	Deletes all GOT identification information registered to the project.
5)	[Auto Acquisition] button	Click the [Auto Acquisition] button to acquire the GOT identification information.
6)	GOT identification information list	A list of the GOT identification information saved in the project.

■[GOT Setting] dialog

GT37 SoftGOT3000

In the [GOT Setting] dialog, edit the GOT identification information to be registered to the project.



Item		Description
1)	[GOT ID]	Set an ID number to identify the GOT. The setting range is [0] to [32767]. If 0 is set, the GOT ID is not used.
2)	[GOT Name]	Set a name to identify the GOT. Up to 32 characters can be set.
3)	[Detailed Description]	Set a description about the GOT. Up to 512 characters can be set. The line feed cannot be inserted into the description.
4)	[GOT Type]	Set the GOT type. GT SoftGOT3000 is not displayed. For the correspondence between the GOT types and GOT models, refer to the following. ☞ Page 55 Model
5)	[GOT IP Address]	Set the IP address of the GOT. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
6)	[I/F]	Set the interface for the GOT IP address.
7)	[Peripheral S/W Communication Port No.]	Set the port No. used for the communication with GT Designer3. The setting range is [1024] to [65534]. Do not set the port number used for the other settings. To change the number, it is recommended to use a number in the 50000s or higher.
8)	[Encryption Communication Port No.]	Set the port number used for the encrypted communication with GT Designer3. The setting range is [1024] to [65534]. Do not set the port number used for the other settings. To change the number, it is recommended to use a number in the 50000s or higher.
9)	[Subnet Mask]	Set the subnet mask for the GOT. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
10)	[Default Gateway]	Set the default gateway. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].

12.3 Configuring the settings for the touch operation on the GOT ([Operation Setting/ Utility Call Key])

GT37 SoftGOT3000

☞ Page 626 Setting targets in [Operation Setting/Utility Call Key]
☞ Page 627 [Operation Setting/Utility Call Key]

In [Operation Setting/Utility Call Key], configure settings for the GOT operations and the utility call key.

12.3.1 Setting targets in [Operation Setting/Utility Call Key]

GT37 SoftGOT3000

Buzzer sound

GT37 SoftGOT3000

A buzzer that sounds when the touch panel is touched.

Set no sound, the short sound, or the long sound as the buzzer sound.

In addition, the pitch of the buzzer can be changed. (Not available for GT SoftGOT3000.)

Key sensitivity

GT37 SoftGOT3000

Sensitivity of the touch panel.

The touch detection speed of the touch panel (sensitivity) and the pressing pressure that is required to detect the touch operation (pressing pressure) can be changed in this setting.

Utility call key

GT37 SoftGOT3000

A key that calls the utility screen from the monitor screen.

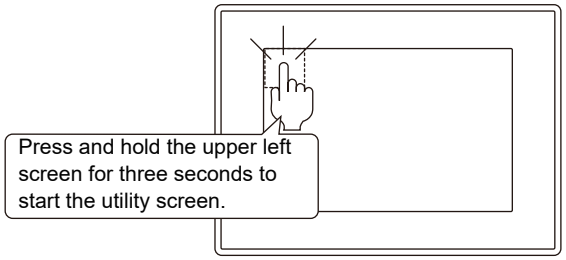
Arrange the utility call key one of the four corners.

The utility key is not displayed on the screen.

To activate the utility call key, press the utility call key for a certain period.

Change the depression length for the utility call key activation in this setting.

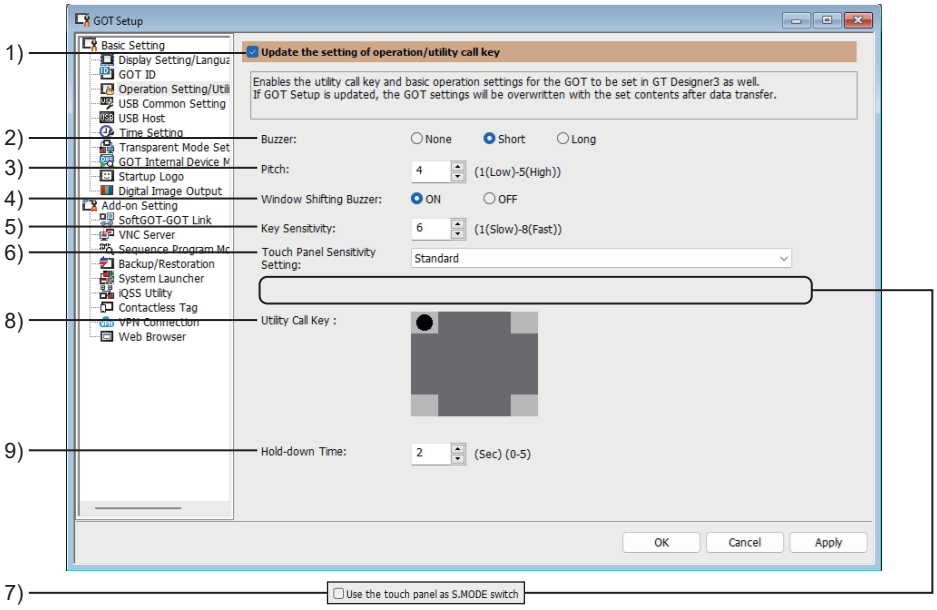
• Utility call key: Arranged on the upper left
• Depression length: Three seconds



12.3.2 [Operation Setting/Utility Call Key]

GT37 SoftGOT3000

In [Operation Setting/Utility Call Key], configure settings for the GOT operations and the utility call key.
Select [Common] → [GOT Setup] → [Basic Setting] → [Update the setting of operation/utility call key] from the menu to display this window.



Item		Description
1)	[Update the setting of operation/utility call key]	Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. Select this item to configure the settings in [Operation Setting/Utility Call Key]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Buzzer]	Select the buzzer sound for the touch operations of objects and buttons.
3)	[Pitch]	Not available for GT SoftGOT3000. Set the pitch of the buzzer sound for the touch operations of objects and buttons.
4)	[Window Shifting Buzzer]	Select whether to sound or not the buzzer when moving the window screen.
5)	[Key Sensitivity]	Not available for GT SoftGOT3000. Set the speed for the utility call key to detect the touch operation of the touch panel.
6)	[Touch Panel Sensitivity Setting]	Available for GT37-W. Set the sensitivity of the touch panel.
7)	[Use the touch panel as S.MODE switch]	Available for GT37-X. The GOT touch panel operates as an equivalent to the S.MODE switch. The S.MODE switch can be used without opening the control panel. For the S.MODE switch, refer to the following. ☞ Page 628 Functions of the S.MODE switch

Item		Description
8)	[Utility call key]	Select the position to arrange the key (utility call key) that calls the utility screen from the monitor screen. The squares on the four corners indicate the positions where the utility call key can be arranged. The black circle indicates the position of the utility call key. Click one of the squares on the four corners to select the position of the utility call key.  Click any corner square to change the position of the black circle. To disable the utility call key, click the black circle.  Click the black circle to deselect the square.
9)	[Hold-down Time]	Not available for GT SoftGOT3000. Set the depression length from you touch the utility call key to when the utility call key starts function.

Functions of the S.MODE switch

The S.MODE switch is used for the following applications.

When the touch panel is used as an S.MODE switch, applications it supports differ from those supported by the S.MODE switch on the GOT rear face.

Application	Availability	
	Touch panel S.MODE switch	GOT rear face S.MODE switch
By powering on the GOT while pressing the S.MODE switch, the GOT enters system installation mode. If the data storage contains the BootOS or package data, installation is started.	Available However, installation of the BootOS is not available.	Available
After powering on the GOT, pressing the S.MODE switch immediately after [Booting] appears in the upper left displays the utility on the screen.	Available	Available

12.4 Disabling the USB interface on the GOT front face ([USB Common Setting])

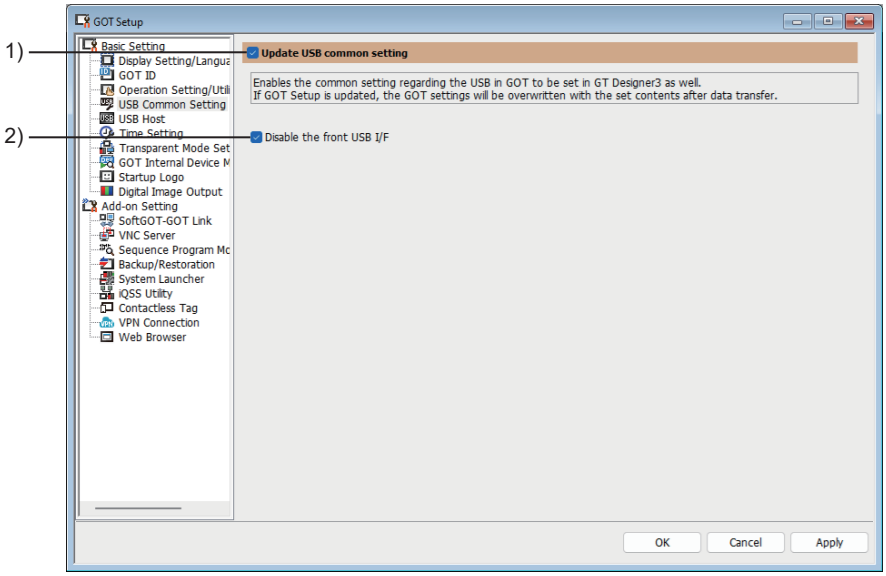
GT37 SoftGOT3000

Disable the USB interface on the GOT front face.

12.4.1 [USB Common Setting]

In [USB Common Setting], disable the USB interface on the GOT front face.

Select [Common] → [GOT Setup] → [Basic Setting] → [USB Common Setting] from the menu to display this window.



Item		Description
1)	[Update USB common setting]	Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. Select this item to configure the settings in [USB Common Setting]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Disable the front USB I/F]	Disable the USB interface (host and device) on the GOT front face.

12.5 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host])

GT37 SoftGOT3000

☞ Page 630 Using a USB mouse
☞ Page 631 Using a USB keyboard
☞ Page 633 Using multiple USB devices together
☞ Page 634 [USB Host]

The GOT responds to the input from the USB mouse and keyboard connected to the USB interface (host). (USB mouse function, USB keyboard function)

In [USB Host], enable or disable the USB mouse and USB keyboard connected to the GOT.

12.5.1 Using a USB mouse

When you connect a USB mouse to the USB interface (host) of the GOT, a mouse cursor is displayed on the GOT.

You can perform touch operations with a left click.

Precautions

■Touch operation during clicking

Do not touch the GOT screen while you are clicking the USB mouse.

The GOT recognizes the operation as 2-point press.

■Canceling the screen saver mode with a USB mouse

Moving the mouse cursor or a left click cancels the screen saver mode.

It is recommended that you cancel the screen saver mode by moving the mouse cursor.

Moving the mouse cursor while left-clicking may cause screen touches after the screen saver mode is canceled and result in malfunction.

Applicable USB mouse

A two-button mouse is applicable.

A wheeled mouse and a mouse with more than two buttons can be used as a two-button mouse.

Wheels or special buttons on the mouse cannot be used.

Some GOT models do not support mice equipped with special function.

Screens that are not operable with a USB mouse

The following screens are not operable with a USB mouse.

- Touch panel calibration screen of the utility
- Touch panel check screen

12.5.2 Using a USB keyboard

You can use a USB keyboard by connecting it to the USB interface (host) of the GOT.
When you connect a USB barcode reader or an RFID controller to the USB interface (host) of the GOT, the device will be handled as a USB keyboard.
The GOT receives inputs from a USB keyboard as key codes.

Precautions

■Precautions on the USB keyboard

The kana input with a USB keyboard is unavailable.
To enter hiragana or Pinyin characters and convert the entry into kanji or Simplified Chinese characters using Kana-Kanji/Pinyin conversion, use the key window displayed on the GOT screen.

■Precautions on the RFID controller

The RFID function is not available for the RFID controller connected to the USB interface (host) of the GOT.
Use the RFID controller that can be connected to the RS-232/422/485 interface of the GOT for the RFID function.

Applicable USB keyboard

The following keyboards can be used.

- Japanese 106 keyboard
- English 101 keyboard

Forward-compatible keyboards, including Japanese 109 keyboard or English 104 keyboard, are also available.
However, the keys which do not exist on Japanese 106 keyboard and English 101 keyboard are not available.
Some GOT models do not support keyboards equipped with special function such as the hub function.

Applicable USB barcode reader and RFID controller

USB barcode readers and RFID controllers must satisfy the following requirements.

- Equipped with a USB keyboard (HID) interface
- Compliant with USB standards

For the USB barcode readers and RFID controllers applicable to the USB mouse/keyboard function, refer to the following Technical Bulletin.
📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)
Key codes that can be input from a USB barcode reader or an RFID controller are the same as those of a USB keyboard.

Operations corresponding to the USB keyboard inputs

The following shows the operations corresponding to the USB keyboard inputs.

Operation	Description
Operations on the numerical input or text input	Corresponds to the operations with key codes such as numerical input, text input, and cursor movement. For the key code of the GOT corresponding to each key on the USB keyboard, refer to the following. ☞ Page 632 Correspondence between the USB keyboard and GOT key codes
Screen operations for the utility and monitor functions	Corresponds to the screen operations for the utility and monitor functions. You can input the ID and a password on the authentication screen.
Operations on the dialog window	Corresponds to the key operations on the dialog window. For the key on the USB keyboard corresponding to each key on the dialog window, refer to the following. ☞ Page 632 Correspondence between the USB keyboard and dialog window

■Correspondence between the USB keyboard and GOT key codes

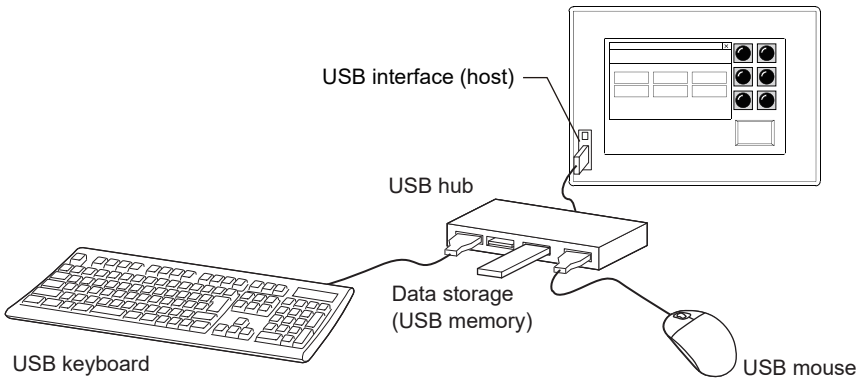
Key on the USB keyboard	GOT key code (HEX)	Action
Back space	0008	Delete the character on the cursor.
Enter	000D	Write the entry to a specified device, display the cursor on the target object, move the cursor to a different object, or close the key window. The operations of the key window and cursor after the inputs are confirmed vary depending on the setting in the [Environment Settings] window ([Key Window]). ☞ Page 570 [Key Window]
Esc	001B	Cancel the entry.
- (Hyphen)	002D	Reverse the sign of the value (for the numerical input only).
. (Period)	002E	Enter a decimal point (for the numerical input only).
0 to 9	0030 to 0039	Enter a numeric character (for the numerical input only).
A to F	0041 to 0046	
Character keys and symbol keys	Key codes corresponding to the characters and symbols	Enter a character. (ASCII-compatible) Kana input is not supported.
→	0080	Moves the cursor
←	0081	
↑	0082	
↓	0083	
Delete	0088	Deletes all the entered characters.
Ctrl + →	0090	Moves cursor within object Lengthens or shortens a segment during conversion to Kanji or Simplified Chinese characters.
Ctrl + ←	0091	
Ctrl + ↑	FFFA	Increment
Ctrl + ↓	FFFB	Decrement

■Correspondence between the USB keyboard and dialog window

Key on the dialog window	Key on the USB keyboard	Key code of USB barcode reader and RFID controller
[OK] key [Confirm] key [Yes] key	Y Shift + Y Enter	59h(Y) 79h(y) 0Dh(Enter)
[Cancel] key [Stop] key [No] key	N Shift + N Esc	4Eh(N) 6Eh(n) 1Bh(Esc)

12.5.3 Using multiple USB devices together

You can use USB devices such as a USB mouse and USB memory simultaneously via a USB hub connected to the USB interface (host) of the GOT.



Item	Specifications
Number of USB devices that can be used	A total of 12 devices (excluding USB hubs) • Up to 4 USB devices (mouse, keyboard, etc.) assignable to GOT drives and channels • Up to 4 USB devices (memory) assignable to GOT drives • Up to four USB devices (audio, web camera, etc.) assignable to channels A total of 900 mA is allowed for USB devices connected to the front USB interface (USB Type-C) and the rear USB interface (USB Type-A).
Applicable USB hub	Up to 4 devices connected in cascade

For the specifications of the USB interface such as USB standards, refer to the following.

GOT3000 Series User's Manual (Hardware)

Precautions

The USB interface of the GOT does not support simultaneous use of the device and host.

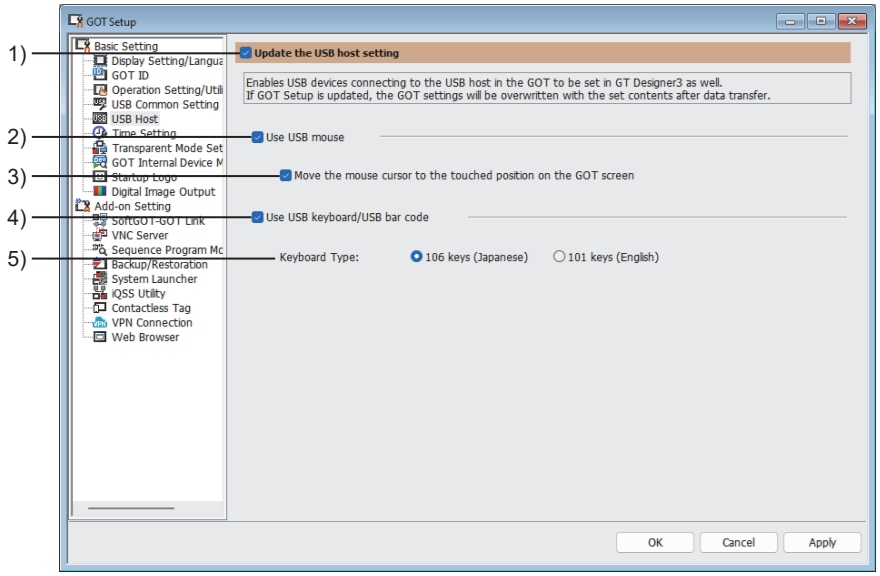
When a USB device (excluding a hub) is connected to the USB interface, the action (host or device) is switched.

12.5.4 [USB Host]

GT37 SoftGOT3000

In [USB Host], set USB devices to be connected to the GOT.

Select [Common] → [GOT Setup] → [Basic Setting] → [USB Host] from the menu to display this window.



Item		Description
1)	[Update the USB host setting]	Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. Select this item to configure the settings in [USB Host]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Use USB mouse]	Enables a USB mouse connected to the USB interface (host) of the GOT.
3)	[Move the mouse cursor to the touched position on the GOT screen]	Select this item to move the mouse cursor to a position you touch.
4)	[Use USB keyboard/USB bar code]	Enables a USB keyboard, USB barcode reader, or RFID controller connected to the USB interface (host) of the GOT.
5)	[Keyboard Type]	Select the type of a USB keyboard to be used. Make sure that the setting is consistent with the type of the USB keyboard to be used. Otherwise, some characters cannot be input correctly.

12.6 Setting the GOT time setting method ([Time Setting])

GT37 SoftGOT3000

☞ Page 636 Clock synchronization method
☞ Page 637 Controllers available for the time setting function and the time notification function
☞ Page 638 Changing the current time with the GOT special register (GS)
☞ Page 639 [Time Setting]

In [Time Setting], the setting method for the clock data between the GOT and the controller is set.

GT SoftGOT3000 uses the clock of the personal computer.

When setting the clock synchronization in GT SoftGOT3000, note the following.

Precautions

■Time setting function on GT SoftGOT3000

The time on the personal computer is changed when the time setting function is performed.

In the following cases, do not use the time setting function because the clock data will not be synchronized between the personal computer and the controller.

- The user who has started GT SoftGOT3000 does not have the authority to change the system time.
- The clock of the personal computer is synchronized with an Internet time server.
- Sortware that periodically adjusts the clock of the personal computer is used.

■Personal computer time zone when using GT SoftGOT3000

Set the same time zone for the personal computer and controller.

Otherwise, a time difference occurs.

■Setting change in the utility

You cannot use GT SoftGOT3000 to change the clock synchronization method in the utility.

Set the clock synchronization method in GT Designer3.

PART 5

12.6.1 Clock synchronization method

GT37 SoftGOT3000

The following shows the clock synchronization method on the GOT.

Clock synchronization method	Description
Time setting function	Acquire the clock data of the controller or the SNTP server and change the clock data of the GOT. GT SoftGOT3000 cannot acquire the clock data from the SNTP server.  At startup, the GOT clock data is synchronized with the clock data of the controller or SNTP server. Since the GOT does not need to hold the clock data while the power is off, a built-in battery is not required. If the GOT needs to hold the clock data at startup, install a battery. To set the time of the GOT using the controller, the settings of the GOT must be adjusted to the time zone schedule of the controller. To set the controller clock data of the controller, refer to the manual of the controller you use.
Time notification function	Notify the clock data of the GOT to the controller to change that of the controller.  At the timing of the trigger, set the clock data of the controller to that of the GOT. Since the GOT must hold the clock data while the power is off, a built-in battery is required.*1 Set the clock data of the GOT in the utility.
	After the time notification function is performed, the target controller acts differently depending on its system configuration (such as the multiple CPU system). For example, the target controller CPU may notify the obtained time data to another CPU. For the controller action, refer to the manual of the controller used.
Using the time setting function and the time notification function together	The time setting function acquires the clock data of the target controller or the SNTP server, and the time setting function changes the clock data of the other controllers. 
*1 The battery is sold separately.
To use the time notification function, purchase the battery, establish connection, and configure the setting.
For information on how to connect the battery, refer to the following manual.
GOT3000 Series User's Manual (Hardware)

12.6.2 Controllers available for the time setting function and the time notification function

GT37 SoftGOT3000

GOTs other than GT SoftGOT3000 perform the time setting function or the time notification function to the controllers equipped with a clock.

For controllers equipped with a clock, refer to the following.

GOT3000 Series User's Manual (Connection)

For the controllers subjected to the time setting function and the time notification function by GT SoftGOT3000, refer to the following.

GT SoftGOT3000 User's Manual

Time setting function and time notification function for network-connected controllers

When the GOT and controllers are connected using any of the following connection types, only the controller of the host station or master station (specified control station) is targeted for the time setting function and the time notification function.

Connection type	Target of time setting function and time notification function
Ethernet connection	Host station
CC-Link IE TSN connection*1*2*3	Network (communication unit)
CC-Link IE Field Network connection*1	Master station (specified control station)

*1 When this station is disconnected, the GOT cannot perform the time setting function or the time notification function on the station.

*2 After the time distribution from the master station, the time is set in the GOT.
For the time distribution from the master station, refer to the following.
MELSEC iQ-R CC-Link IE TSN User's Manual (Application)

*3 The time notification function is not supported.

PART 5

12.6.3 Changing the current time with the GOT special register (GS)

GT37 SoftGOT3000

Changing the current time of the GOT

GT37 SoftGOT3000

When GS512.b0 is turned on, the current time of the GOT is changed to the time specified with GS513 to GS516.

☞ Page 3647 Time Change Information (GS512)

☞ Page 3647 Changed Time (GS513 to GS516)

Function	Setting item	Bit	Description
Time Change signal	GS512	b0	A trigger device to change the current time Changes the clock data of the GOT to the data of the change time (GS513 to GS516) when the bit is turned on.
Change time	GS513	b8 to b15	Two lower digits of year (data type: BCD)
		b0 to b7	Month (data type: BCD)
	GS514	b8 to b15	Day (data type: BCD)
		b0 to b7	Hour (data type: BCD)
	GS515	b8 to b15	Minute (data type: BCD)
		b0 to b7	Second (data type: BCD)
	GS516	b8 to b15	Use prohibited
		b0 to b7	Day (0: Sunday, 1: Monday, 2: Tuesday, 3: Wednesday, 4: Thursday, 5: Friday, 6: Saturday)

Checking the current time of the GOT

GT37 SoftGOT3000

The GOT writes the clock data (current time) into the following devices.

☞ Page 3607 Present Time (GS650 to GS653)

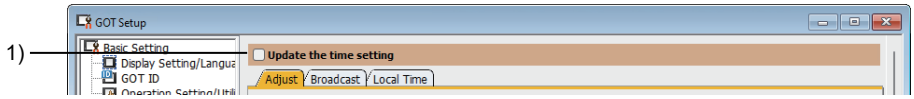
Function	Setting item	Bit	Description
Current time	GS650	b8 to b15	Two lower digits of year (data type: BCD)
		b0 to b7	Month (data type: BCD)
	GS651	b8 to b15	Day (data type: BCD)
		b0 to b7	Hour (data type: BCD)
	GS652	b8 to b15	Minute (data type: BCD)
		b0 to b7	Second (data type: BCD)
	GS653	b8 to b15	Use prohibited
		b0 to b7	Day (0: Sunday, 1: Monday, 2: Tuesday, 3: Wednesday, 4: Thursday, 5: Friday, 6: Saturday)

12.6.4 [Time Setting]

GT37 SoftGOT3000

In [Time Setting], the setting method for the clock data of the GOT is set.

Select [Common] → [GOT Setup] → [Basic Setting] → [Time Setting] from the menu to display this window.



Item		Description
1)	[Update the time setting]	Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. Select this item to configure the settings in [Time Setting]. When a project is read from the GOT, the setting changed in the utility is applied. ☞ Page 640 [Adjust] tab ☞ Page 641 [Broadcast] tab ☞ Page 642 [Local Time] tab

Precautions

■Time setting function and time notification function for the same controller

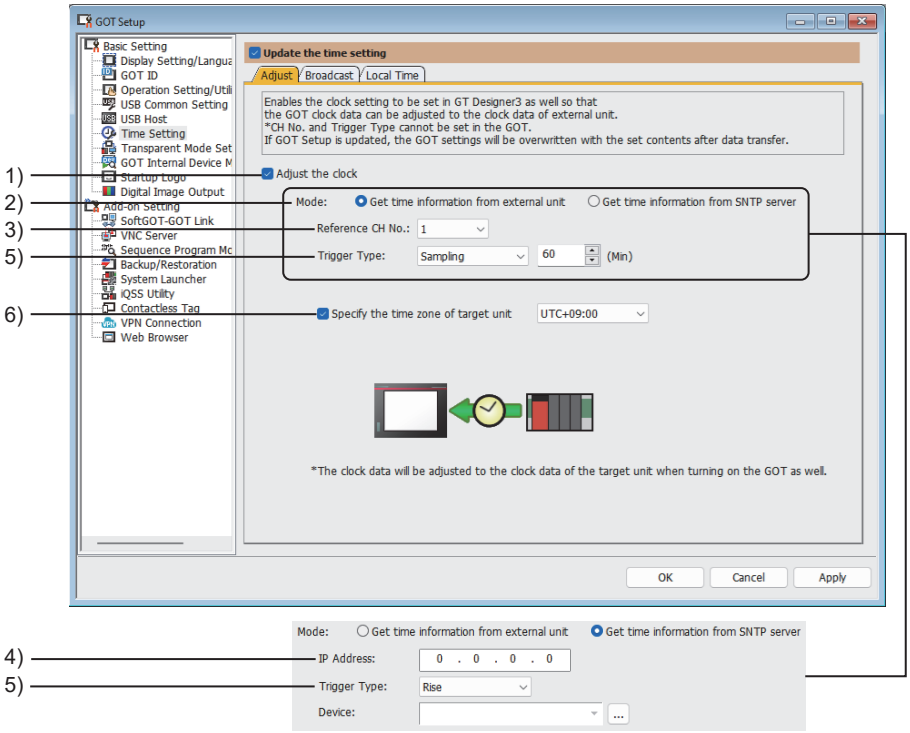
When executing both the time setting function and the time notification function for the same controller, configure different trigger type settings for each of them to separate their execution timing.

Otherwise, clock data may be delayed.

PART 5

[Adjust] tab

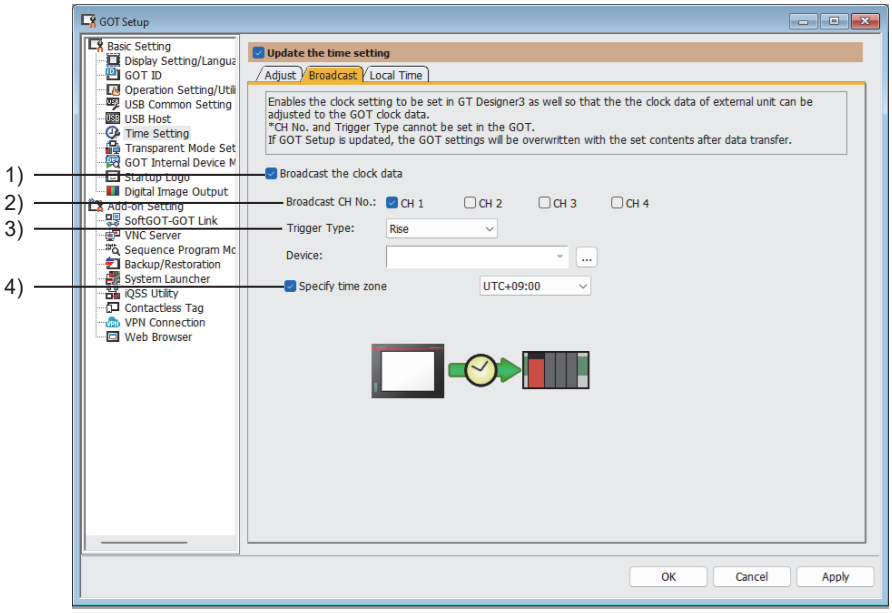
GT37 SoftGOT3000



Item		Description
1)	[Adjust the clock]	Select this item to use the time setting function. Select this item to set how to acquire the clock data.
2)	[Mode]	Set the destination device of the clock data and how to acquire the clock data. In GT SoftGOT3000, this item is not displayed and [Get time information from external unit] is selected. When [Get time information from external unit] is selected, set [Reference CH No.] and [Trigger Type]. When [Get time information from SNTP server] is selected, set [IP Address] and [Trigger Type] of the destination.
		When [Get time information from SNTP server] is selected, enable the Ethernet interface of the GOT in the [I/F Communication Setting] dialog or other setting dialogs. The clock data is acquired via Ethernet. If no Ethernet interface is usable, the clock data cannot be acquired. ☞ Page 773 How to use the I/F communication setting
3)	[Reference CH No.]	This item is settable when [Mode] is set to [Get time information from external unit]. Set the channel No. to connect the device from which the clock data is acquired.
4)	[IP Address]	This item is settable when [Mode] is set to [Get time information from SNTP server]. Set the IP address of the SNTP server from which the clock data is acquired. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
5)	[Trigger Type]	Set the trigger to acquire the clock data. When [Rise] or [Fall] is selected, set the trigger device. When [Sampling] is selected, set the cycle in the range from [1] minute to [1440] minutes.
6)	[Specify the time zone of target unit]	Not available for GT SoftGOT3000. Select this item to set the time zone of the destination device of the clock data. When [Custom] is selected, the time difference with UTC can be set by 15 minutes.

[Broadcast] tab

GT37 SoftGOT3000



Item		Description
1)	[Broadcast the clock data]	Select this item to use the time notification function. Select this item to set how to notify the clock data.
2)	[Broadcast CH No.]	Set the channel No. to connect the destination device of the clock data.
3)	[Trigger Type]	Set the trigger to notify the clock data. When [Rise] or [Fall] is selected, set the trigger device. When [Sampling] is selected, set the cycle in the range from [1] minute to [1440] minutes.
4)	[Specify time zone]	Not available for GT SoftGOT3000. Select this item to set the time zone of the destination device of the clock data. When [Custom] is selected, the time difference with UTC can be set by 15 minutes.

[Local Time] tab

GT37 SoftGOT3000

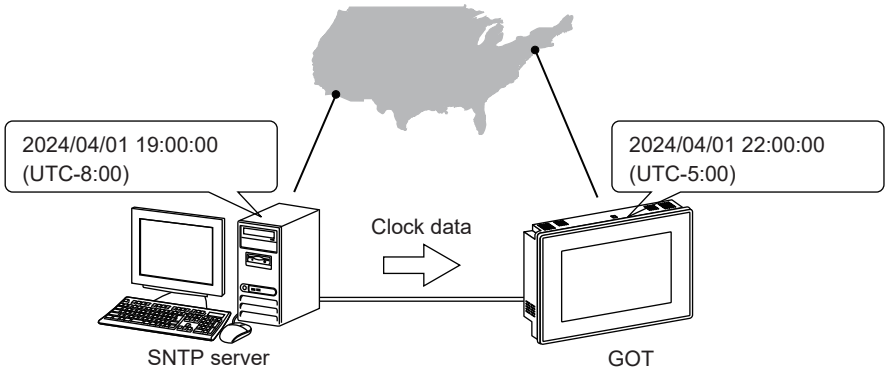
Set the time difference from UTC and perform the time setting according to the local time in the region where the GOT is installed.

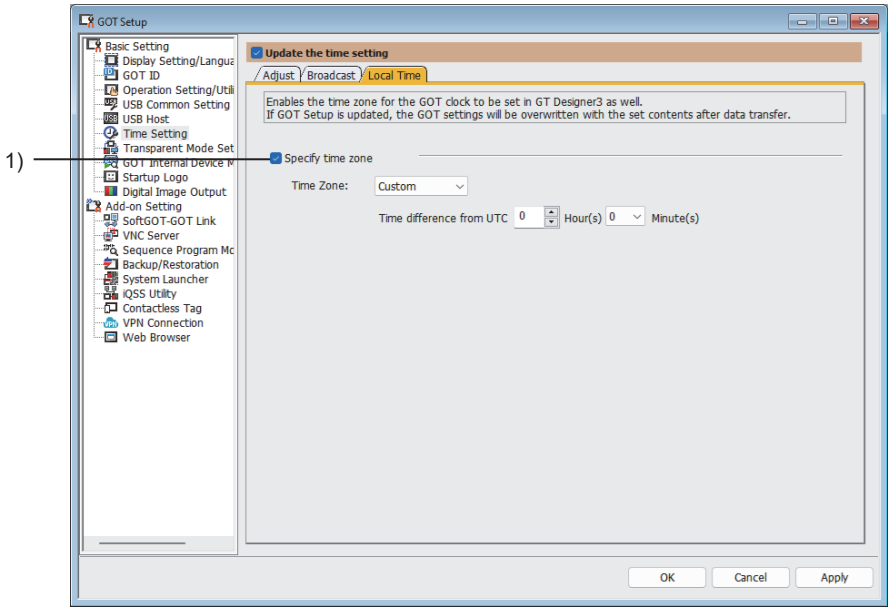
This setting enables the time setting among countries or regions in different time zones.

Daylight saving time setting is not supported.

Ex.

When the time zone of the region where the GOT is installed is UTC-5:00, select [UTC-5:00] for [Time Zone] to set the clock in the GOT to the local time.





Item		Description
1)	[Specify time zone]	Select this item to set the time zone. When [Custom] is selected, the time difference with UTC can be set by 15 minutes.

12.7 Setting the FA transparent function ([Transparent Mode Setting])

GT37 SoftGOT3000

In [Transparent Mode Setting], set a channel number used for the FA transparent function when using the multi-channel function.

The FA transparent function transfers data between a personal computer and controllers through the GOT.

You can select only one channel of the GOT for data transfer.

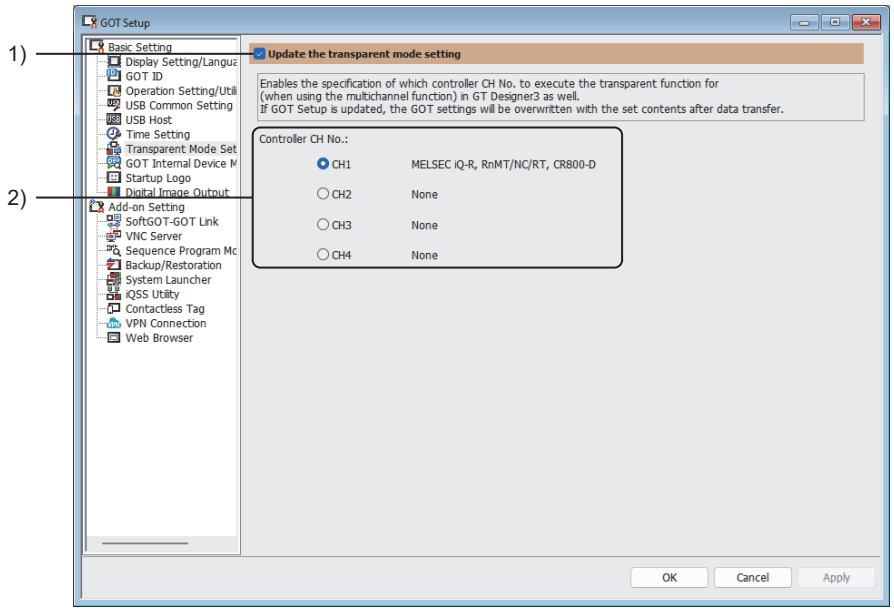
For details on the FA transparent function, refer to the following.

GOT3000 Series User's Manual (Connection)

12.7.1 [Transparent Mode Setting]

In [Transparent Mode Setting], set a channel number used for the FA transparent function when using the multi-channel function.

Select [Common] → [GOT Setup] → [Basic Setting] → [Transparent Mode Setting] from the menu to display this window.



Item		Description
1)	[Update the transparent mode setting]	Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. Select this item to configure the settings in [Transparent Mode Setting]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Controller CH No.]	Select a channel number used for the FA transparent function.

12.8 Configuring the settings for the GOT internal device monitor ([GOT Internal Device Monitor])

GT37 SoftGOT3000

☞ Page 644 [GOT Internal Device Monitor]

In [GOT Internal Device Monitor], configure the settings of the GOT internal device monitor.

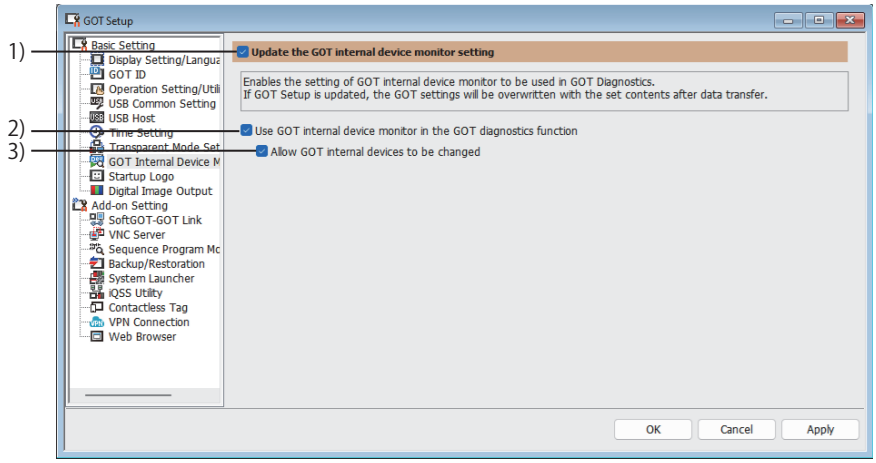
For details on the GOT internal device monitor of the GOT diagnostics function, refer to the following.

☞ Page 3080 Checking the causes and corrective actions for errors (GOT diagnostics)

12.8.1 [GOT Internal Device Monitor]

In [GOT Internal Device Monitor], configure the settings of the GOT internal device monitor.

Select [Common] → [GOT Setup] → [Basic Setting] → [GOT Internal Device Monitor] from the menu to display the following window.



Item		Description
1)	[Update the GOT internal device monitor setting]	Overwrites the settings of the GOT with the settings of GT Designer3 when package data is written to the GOT. Select this item to enable the settings in [GOT Internal Device Monitor]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Use GOT internal device monitor in the GOT diagnostics function]	Allows GT Designer3 to monitor the GOT internal devices when the GOT diagnostics runs.
3)	[Allow GOT internal devices to be changed]	Allows GT Designer3 to change the values of the GOT internal devices when the GOT diagnostics runs.

12.9 Setting a screen to be displayed on the GOT at startup ([Startup Logo])

GT37 SoftGOT3000

☞ Page 645 Specifications of the startup logo
☞ Page 646 [Startup Logo]

In [Startup Logo], set an image (startup logo) to be displayed at GOT startup.
Any user-selected image or pre-installed startup logo in the GOT can be displayed as a startup logo.

12.9.1 Specifications of the startup logo

GT37 SoftGOT3000

Item	Specifications
Number of settings	1 setting per project
Display position	Center of the screen
Image that can be used as the startup logo	The following file formats are supported. • BMP format: *.bmp • JPEG format: *.jpg, *.jpeg, *.jpe When the resolution is higher than that of the GOT, the GOT displays only the part that lies within the screen by using the center of the image as the reference.

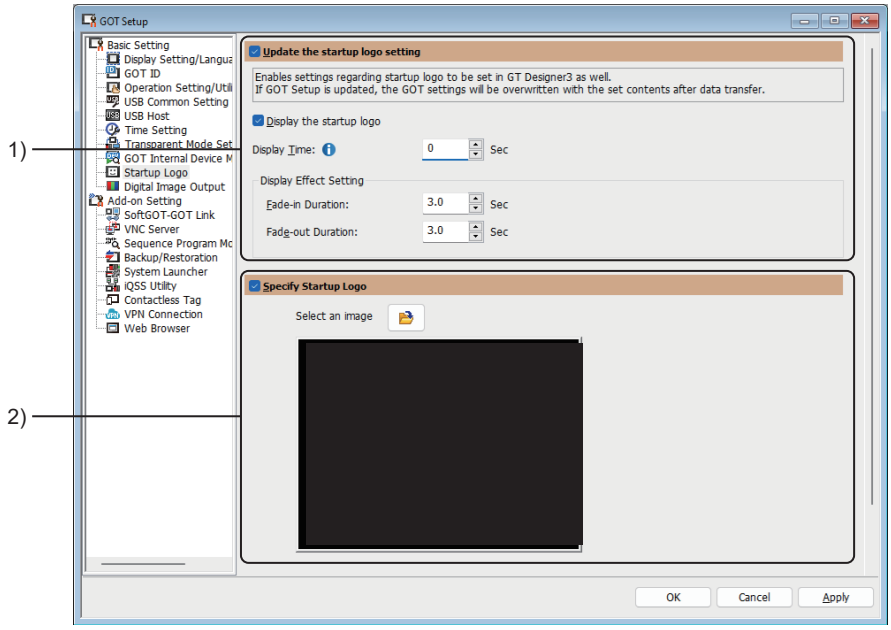
PART 5

12.9.2 [Startup Logo]

GT37 SoftGOT3000

In [Startup Logo], set an image (startup logo) to be displayed at GOT startup.

Select [Common] → [GOT Setup] → [Basic Setting] → [Startup Logo] from the menu to display this window.



Item			Description
1)	[Update the startup logo setting]	—	Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. Select this item to configure the settings in [Update the startup logo setting]. When a project is read from the GOT, the setting changed in the utility is applied.
		[Display the startup logo]	Displays the logo at GOT startup. Specify the image to be displayed as the startup logo in [Display the startup logo]. If no image is specified, the pre-installed startup logo is displayed.
		[Display Time]	Set the period of time for displaying the startup logo. The setting range is [0] seconds to [60] seconds. If the time required for the startup processing is longer than the time set in [Display Time], the startup logo is displayed even during the startup processing.
		[Fade-in Duration]	Set the fade-in and fade-out effects for the startup logo. The setting range is [0.0] seconds to [10.0] seconds. [Fade-in Duration] and [Fade-out Duration] are not included in [Display Time]. Setting this item will slow down startup because the total time the startup logo is displayed is the sum of [Fade-in Duration], [Display Time], and [Fade-out Duration].
		[Fade-out Duration]	
2)	[Specify Startup Logo]	—	Set an image file to be used as the startup logo.
		[Select an image] button	Displays the [Open] dialog. Select an image file to be used as the startup logo. The preview of the selected image file is displayed. If the specified image cannot be displayed, the pre-installed startup logo is displayed.

Precautions

■Precautions for utilizing a project

When you utilize a project where the GOT installation orientation is set to [Vertical], set the startup logo again.

Otherwise, the utilized startup logo is rotated and appears in the destination project.

12.10 Configuring the external display output settings ([Digital Image Output])

GT37 SoftGOT3000

☞ Page 647 [Digital Image Output]

In [Digital Image Output], set the screen image to be output to an external display using the image output function.

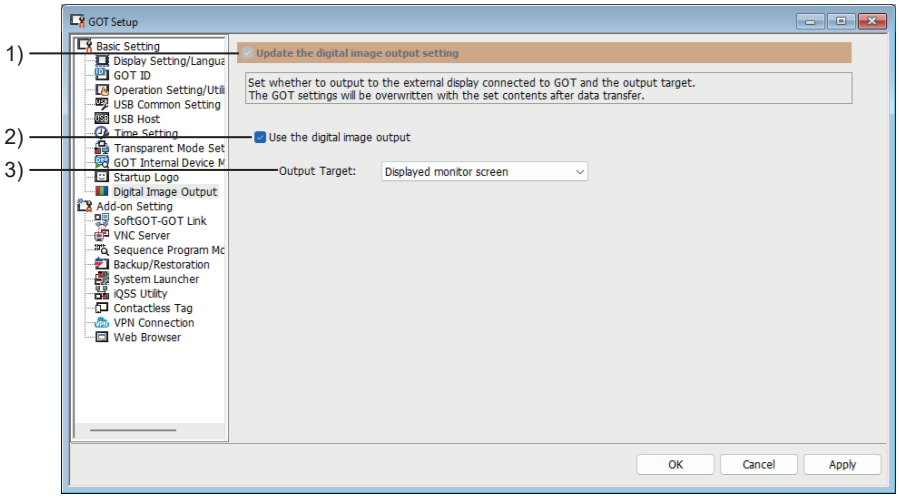
For details on the video output function, refer to the following.

☞ Page 2698 Displaying the GOT screen on an external display (video output function)

12.10.1 [Digital Image Output]

In [Digital Image Output], set the screen image to be output to an external display using the image output function.

Select [Common] → [GOT Setup] → [Basic Setting] → [Digital Image Output] from the menu to display this window.



Item		Description
1)	[Update the digital image output setting]	This item is already selected but cannot be deselected. Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Use the digital image output]	Enables the GOT screen output to an external display.
3)	[Output Target]	Select the screen to be output to an external display.

PART 5

12.11 Configuring the settings for the SoftGOT-GOT link function ([SoftGOT-GOT Link])

GT37 SoftGOT3000

☞ Page 648 [SoftGOT-GOT Link]

In [SoftGOT-GOT Link], configure the settings for the authorization of the SoftGOT-GOT link function and others.

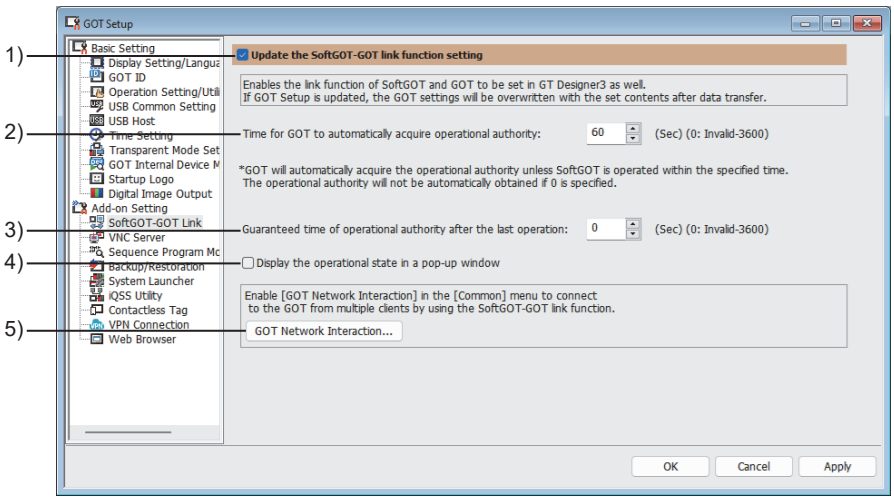
For details on the SoftGOT-GOT link function, refer to the following.

GT SoftGOT3000 User's Manual

12.11.1 [SoftGOT-GOT Link]

In [SoftGOT-GOT Link], configure the settings for the authorization of the SoftGOT-GOT link function and others.

Select [Common] → [GOT Setup] → [Add-on Setting] → [SoftGOT-GOT Link] from the menu to display this window.



Item		Description
1)	[Update the SoftGOT-GOT link function setting]	Overwrites the settings of the GOT with the settings of GT Designer3 when package data is written to the GOT. Select this item to configure the settings in [SoftGOT-GOT Link]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Time for GOT to automatically acquire operational authority]	Set a period of time for the GOT to obtain the operation after GT SoftGOT3000 obtains the operation right and is then operated. The setting range is [0] (Invalid), or [1] to [3600] seconds.
3)	[Guaranteed time of operational authority after the last operation]	Set a period of time for the GOT or GT SoftGOT3000 to retain the operation right after either one obtains the operation right and is then operated. The setting range is [0] (Invalid), or [1] to [3600] seconds. This setting is disabled when GS447.b1 is turned on. When [Use GOT network interaction function] is selected in the [GOT Network Interaction] dialog, the authorization guarantee time set for the GOT network interaction function is prioritized.
4)	[Display the operational state in a pop-up window]	When the GT SoftGOT3000 or the GOT does not have the operation right, information about the device with the operation right will pop up.
5)	[GOT Network Interaction] button	Displays the [GOT Network Interaction] dialog.

12.12 Configuring the settings for the VNC server function ([VNC Server])

GT37 SoftGOT3000

☞ Page 649 [VNC Server]

In [VNC Server], configure the settings for the authorization of the VNC server function.

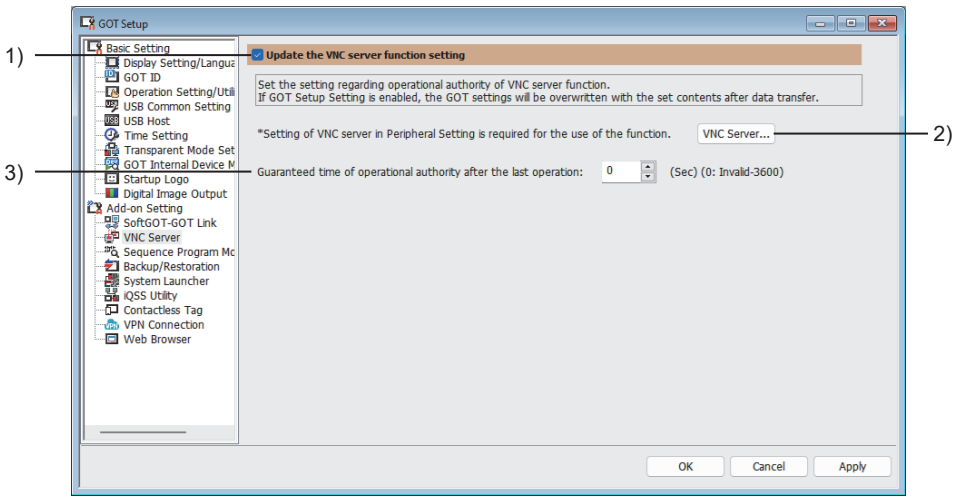
For details on the VNC server function, refer to the following.

☞ Page 2638 Viewing the GOT from a personal computer (VNC server function)

12.12.1 [VNC Server]

In [VNC Server], configure the settings for the authorization of the VNC server function.

Select [Common] → [GOT Setup] → [Add-on Setting] → [VNC Server] from the menu to display this window.



Item		Description
1)	[Update the VNC server function setting]	Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. Select this item to configure the settings in [VNC Server]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[VNC Server] button	Set how to connect the VNC server. Click this button to display the [VNC Server] dialog. ☞ Page 2650 [VNC Server] dialog
3)	[Guaranteed time of operational authority after the last operation]	Set the time to retain the authorization after the VNC server (GOT) or the VNC client (personal computer) obtains the authorization and then the VNC server (GOT) or the VNC client (personal computer) is operated. This setting is disabled when GS1792.b8 is turned on. When [Use GOT network interaction function] is selected in the [GOT Network Interaction] dialog, the authorization guarantee time set for the GOT network interaction function is prioritized.

12.13 Configuring the settings for the sequence program monitor ([Sequence Program Monitor])

GT37 SoftGOT3000

☞ Page 651 [Sequence Program Monitor]

In [Sequence Program Monitor], configure the settings for reading sequence programs and displaying comments on the sequence program monitor.

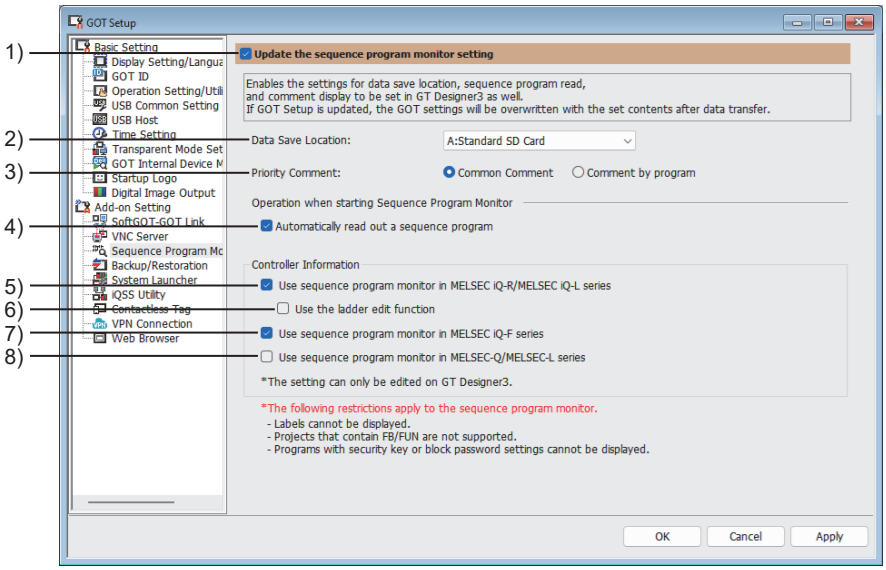
For details on the sequence program monitor, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

12.13.1 [Sequence Program Monitor]

In [Sequence Program Monitor], configure the settings for reading sequence programs and displaying comments on the sequence program monitor.

Select [Common] → [GOT Setup] → [Add-on Setting] → [Sequence Program Monitor] from the menu to display this window.



Item		Description
1)	[Update the sequence program monitor setting]	Overwrites the settings of the GOT with the settings of GT Designer3 when package data is written to the GOT. Select this item to configure the settings in [Sequence Program Monitor]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Data Save Location]	Select a destination to save the data of the sequence program monitor. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
3)	[Priority Comment]	Select the priority comment when a common comment and each program comment are set for the same device in the sequence program.
4)	[Automatically read out a sequence program]	Automatically reads a sequence program from the controller at the sequence program monitor startup.
5)	[Use sequence program monitor in MELSEC iQ-R/MELSEC iQ-L series]	Enables the sequence program monitor (iQ-R/iQ-L ladder). Select this item to incorporate a system application (add-on function) of [Sequence Program Monitor (iQ-R/iQ-L Ladder)] into the package data.
6)	[Use the ladder edit function]	Enables the ladder edit function in the sequence program monitor (iQ-R/iQ-L ladder).
7)	[Use sequence program monitor in MELSEC iQ-F series]	Allows the use of the sequence program monitor (iQ-F ladder). Select this item to incorporate a system application (add-on function) of [Sequence Program Monitor (iQ-F Ladder)] into the package data. The ladder edit function is also usable.
8)	[Use sequence program monitor in MELSEC Q/MELSEC L series]	Allows the use of the sequence program monitor (Q/L ladder). Select this item to incorporate a system application (add-on function) of [Sequence Program Monitor (Q/L Ladder)] into the package data. The ladder edit function is also usable.

12.14 Configuring the settings for the backup/restoration function ([Backup/Restoration])

GT37 SoftGOT3000

☞ Page 652 [Backup/Restoration]
☞ Page 653 [Trigger Setting] dialog
☞ Page 654 [Device List] dialog (trigger device, process notification device)
☞ Page 654 Relevant settings

In [Backup/Restoration], set the destination for saving backup data and configure the trigger backup settings.

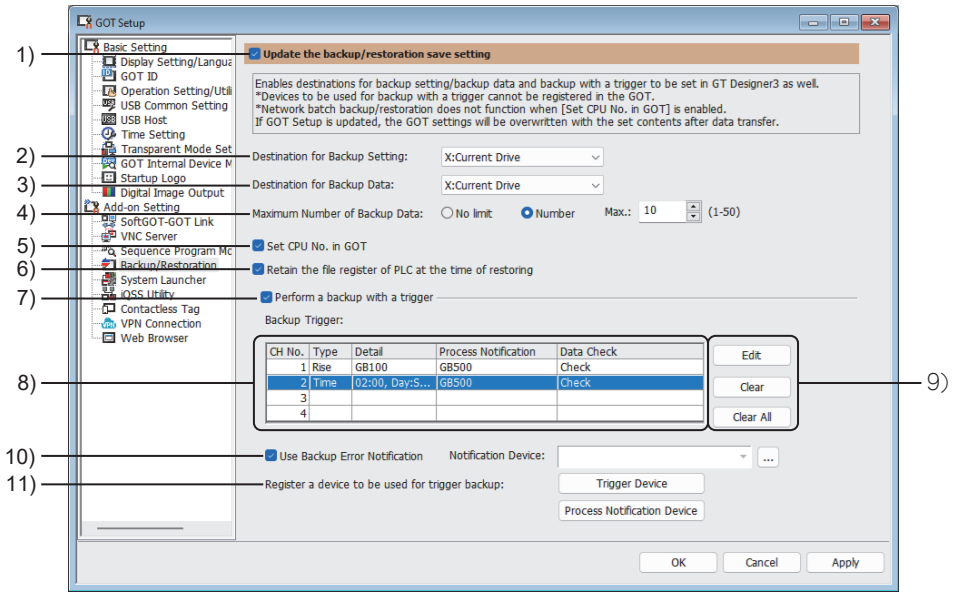
For details on the backup/restoration function, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

12.14.1 [Backup/Restoration]

In [Backup/Restoration], set the destination for saving backup data and configure the trigger backup settings.

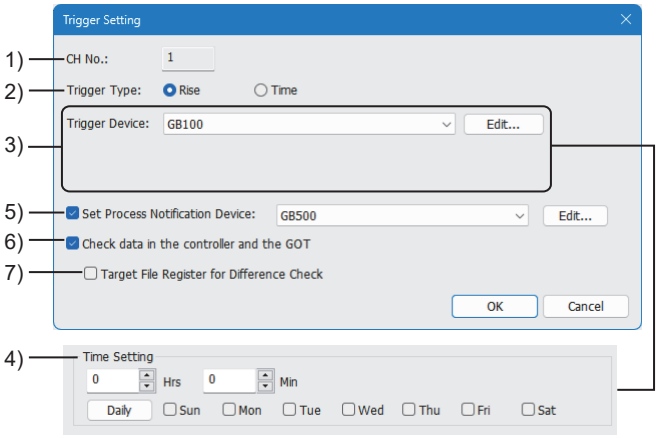
Select [Common] → [GOT Setup] → [Add-on Setting] → [Backup/Restoration] from the menu to display this window.



Item		Description
1)	[Update the backup/restore save setting]	Overwrites the settings of the GOT with the settings of GT Designer3 when package data is written to the GOT. Select this item to configure the settings in [Backup/Restoration]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Destination for Backup Setting]	Select a destination to save the backup setting. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
3)	[Destination for Backup Data]	Select a destination to save the backup data. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
4)	[Maximum Number of Backup Data]	Select the maximum number of saved backup data. • [No limit]: Saves as much backup data as possible to the drive selected in [Destination for Backup Data]. • [Number]: Saves data up to the specified number of data sets. After selecting this item, set the maximum number of saved backup data. The setting range is [1] to [50].
5)	[Set CPU No. in GOT]	Select this item to set the CPU number of the PLC which executes a backup.
6)	[Retain the file register of PLC at the time of restoring]	Retains the file registers of a PLC at restoration.
7)	[Perform a backup with a trigger]	Select this item to execute a backup by a trigger you set. After selecting this item, set the backup trigger from the list of backup triggers.

Item			Description
8)	List of backup trigger settings		Lists the backup trigger settings. • [CH No.]: Channel number for which the backup trigger setting is used • [Type]: Trigger type • [Detail]: Details of the setting • [Process Notification]: Backup process notification device • [Data Check]: Indicates if the data check after the backup is performed or not.
9)	Operation button of backup trigger settings	—	The following buttons edit the list of backup trigger settings.
		[Edit] button	The [Trigger Setting] dialog appears. ☞ Page 653 [Trigger Setting] dialog
		[Clear] button	Deletes the selected backup trigger setting.
		[Clear All] button	Deletes all the backup trigger settings.
10)	[Use Backup Error Notification]		Stores the channel number of the backup trigger in the notification device if an error occurs during the backup. After selecting this item, set [Notification Device]. A word device can be used for the notification device.
11)	[Register a device to be used for trigger backup]	—	Register the devices used for the trigger backup. Up to 10 devices can be registered for each trigger device and process notification device.
		[Trigger Device] button	Displays the [Device List (Trigger Device)] dialog. Register bit devices used for the trigger device. ☞ Page 654 [Device List] dialog (trigger device, process notification device)
		[Process Notification Device] button	Displays the [Device List (Process Notification Device)] dialog. Register bit devices used for the process notification device. ☞ Page 654 [Device List] dialog (trigger device, process notification device)

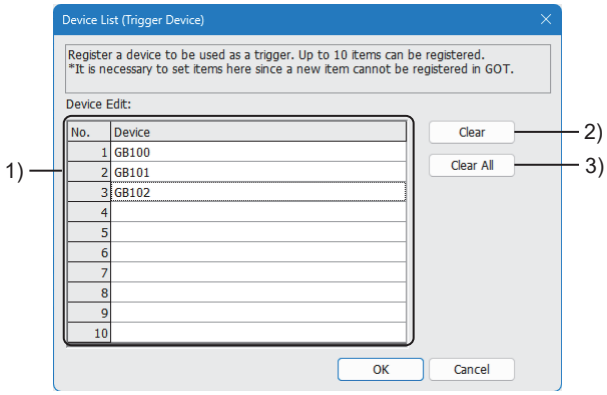
12.14.2 [Trigger Setting] dialog



Item			Description
1)	[CH No.]		Channel number for which the backup trigger setting is used.
2)	[Trigger Type]		Select a trigger type to execute the backup.
3)	[Trigger Device]	—	Select a trigger device from the devices set in the [Device List (Trigger Device)] dialog. This item is displayed when [Rise] is selected in [Trigger Type].
		[Trigger Device] button	Displays the [Device List (Trigger Device)] dialog. Register bit devices used for the trigger device. ☞ Page 654 [Device List] dialog (trigger device, process notification device)
4)	[Time Setting]	—	Set the time and day to take the backup. This item is displayed when [Time] is selected in [Trigger Type].
		[Daily] button	Selects all the days.
5)	[Set Process Notification Device]	—	Select a device to notify a backup is in process. Select a process notification device from the devices set in the [Device List (Process Notification Device)] dialog.
		[Edit] button	Displays the [Device List (Process Notification Device)] dialog. Register bit devices used for the process notification device. ☞ Page 654 [Device List] dialog (trigger device, process notification device)
6)	[Check data in the controller and the GOT]		Select this item to check the data in the controller and backup data in the GOT when a backup is executed.

Item		Description
7)	[Target File Register for Difference Check]	Select this item to check if the file register is changed when a backup is executed. If the file register is changed as a result of the check, a backup is executed. This item can be selected when [Check data in the controller and the GOT] is selected.

12.14.3 [Device List] dialog (trigger device, process notification device)



Item		Description
1)	Device list	Lists the trigger devices or process notification devices. Click the [Device] field to display the [...] button. Set the trigger device or process notification device. The bit device is available.
2)	[Clear] button	Deletes the selected device.
3)	[Clear All] button	Deletes all the devices.

12.14.4 Relevant settings

Configure the relevant settings in addition to the specific settings for the backup/restoration function as required.
The following shows the functions that are available by configuring the relevant settings.

GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Executing the GOT data package acquisition when the trigger backup is complete	GS522.b6

12.15 Configuring the settings for the system launcher function ([System Launcher])

GT37 SoftGOT3000

☞ Page 655 [System Launcher]

In [System Launcher], configure the settings of the system launcher function.

For details on the system launcher function and the system launcher (servo network) function, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Point

Installing system applications (add-on functions)

To use various monitor functions from the system configuration screen, install the system applications (add-on functions) required for the system launcher function and also for the monitor function to the GOT.

Otherwise, monitor functions cannot be invoked from the system configuration screen of the system launcher.

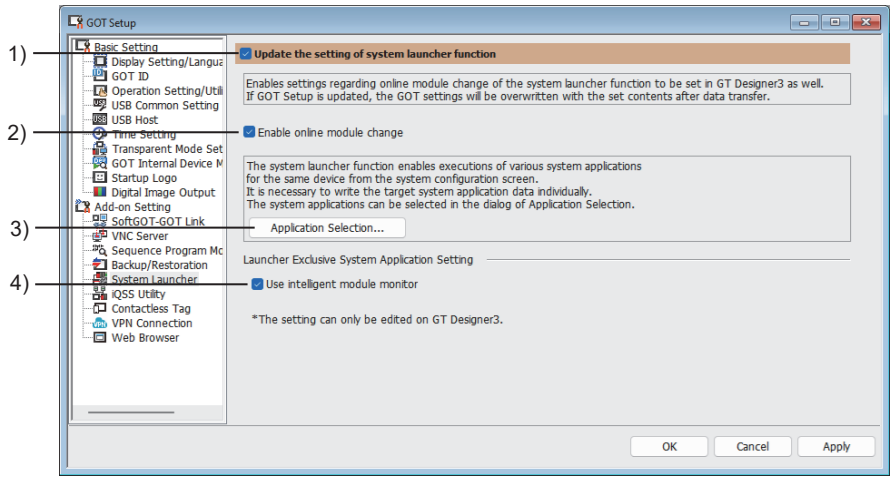
For details, refer to the following.

☞ Page 458 [Application Selection] dialog

12.15.1 [System Launcher]

In [System Launcher], configure the settings of the system launcher function.

Select [Common] → [GOT Setup] → [Add-on Setting] → [System Launcher] from the menu to display the following window.



Item		Description
1)	[Update the setting of system launcher function]	Overwrites the settings of the GOT with the settings of GT Designer3 when package data is written to the GOT. Enables the setting items in [System Launcher] to be set. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Enable online module change]	Enables the online module change for PLCs by operating the GOT.
3)	[Application Selection] button	Displays the [Application Selection] dialog. Select a system application to be added to package data. ☞ Page 458 [Application Selection] dialog
4)	[Use intelligent module monitor]	Enables the intelligent module monitor function.

12.16 Configuring the settings for the iQSS utility function ([iQSS Utility])

GT37 SoftGOT3000

☞ Page 656 [iQSS Utility]
☞ Page 657 [CSP+ for iQSS Data Write] dialog
☞ Page 658 Equipment compatible with the iQSS utility

In [iQSS Utility], configure the settings of the storage location for iQSS data (CSP+).

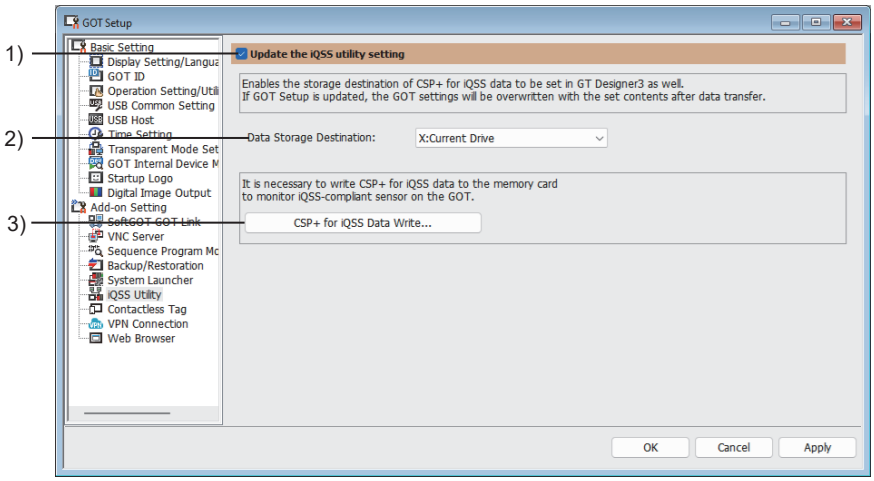
For details on the iQSS utility, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

12.16.1 [iQSS Utility]

In [iQSS Utility], specify iQSS data (CSP+) to be written to a data storage, and select a drive of the GOT as the storage location.

Select [Common] → [GOT Setup] → [Add-on Setting] → [iQSS Utility] from the menu to display the following window.

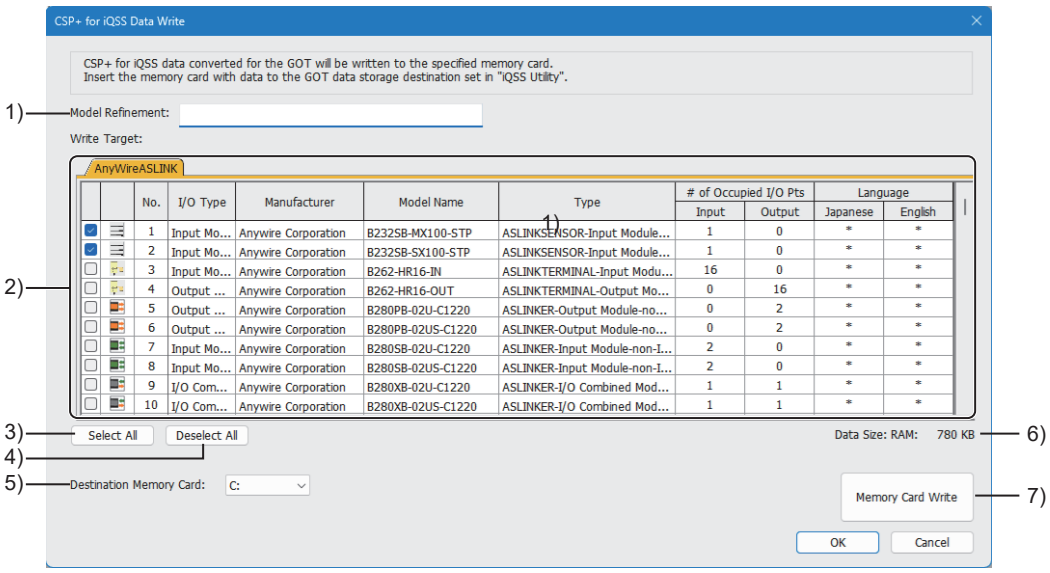


Item		Description
1)	[Update the iQSS utility setting]	Overwrites the settings of the GOT with the settings of GT Designer3 when package data is written to the GOT. Enables the setting items in [iQSS Utility] to be set. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Data Storage Destination]	Select a drive at which iQSS data (CSP+) is located. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
3)	[CSP+ for iQSS Data Write] button	Write iQSS data (CSP+) to a data storage installed on the personal computer. Click this button to display the [CSP+ for iQSS Data Write] dialog. ☞ Page 657 [CSP+ for iQSS Data Write] dialog

12.16.2 [CSP+ for iQSS Data Write] dialog

Write iQSS data (CSP+) to a data storage installed on the personal computer.

Select [Communication] → [CSP+ for iQSS Data Write] from the menu to display the following dialog.



Item			Description
1)	[Model Refinement]		Narrows down iQSS data (CSP+) in [Write Target] by the entered model name. Up to 48 characters can be set. Numeric characters, A to Z, a to z, a one-byte space, and the following symbols are available. !#$%&()+,-=@[\]^_`{} The entered characters are case-insensitive.
2)	[Write Target]	—	Lists iQSS data (CSP+) to be written to a data storage. All pieces of iQSS data (CSP+) are arranged in tabs by network type. Use the checkbox to select the iQSS data (CSP+) to be written to a data storage. For equipment compatible with the iQSS utility, refer to the following. ☞ Page 658 Equipment compatible with the iQSS utility
		[No.]	iQSS data (CSP+) number
		[I/O Type]	Input/output type of the target equipment
		[Manufacturer]	Manufacturer of the target equipment
		[Model Name]	Model of the target equipment
		[Type]	Type of the target equipment
		[# of Occupied I/O]	• [Input] Number of inputs for the target equipment • [Output] Number of outputs for the target equipment
		[Language]	Displays an asterisk (*) when this version of data exists. • [Japanese] Indicates the presence or absence of the Japanese version of iQSS data (CSP+). • [English] Indicates the presence or absence of the English version of iQSS data (CSP+).
3)	[Select All] button		Selects all pieces of iQSS data (CSP+) in [Write Target].
4)	[Delete All] button		Deselects all pieces of iQSS data (CSP+) in [Write Target].
5)	[Destination Memory Card]		Select a drive (data storage) to which iQSS data (CSP+) is written. The selectable drives depend on the personal computer.
6)	[Data Size]		Displays the space of the operation memory (RAM) that is required to store the iQSS data (CSP+) selected in [Write Target]. For the available space in the GOT user area, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
7)	[Memory Card Write] button		Writes data listed in [Write Target] to a data storage.

12.17 Configuring the settings for the GOT contactless tag ([Contactless Tag])

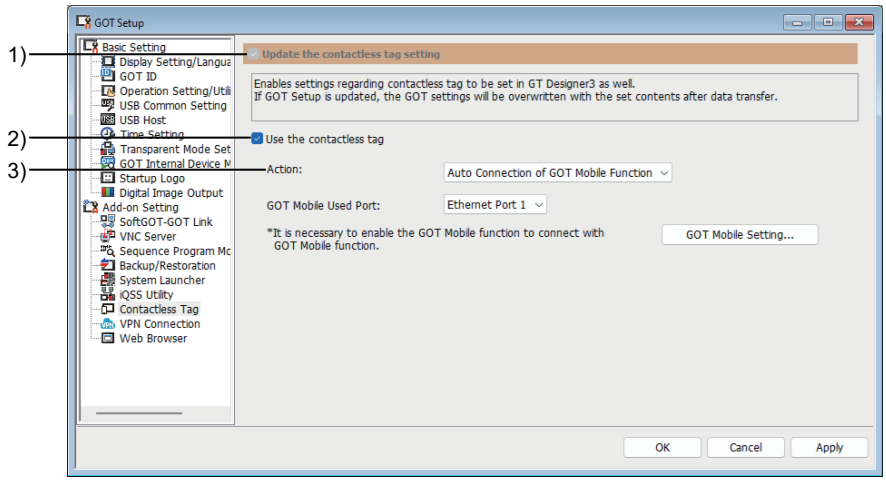
GT37 SoftGOT3000

In [Contactless Tag], enable or disable the built-in contactless tag in the GOT and configure the settings for the operation. When the contactless tag is enabled, you can perform the preset action by holding the device over the GOT's contactless tag.

12.17.1 [Contactless Tag]

In [Contactless Tag], enable or disable the built-in contactless tag in the GOT and configure the settings for the operation.

Select [Common] → [GOT Setup] → [Add-on Setting] → [Contactless Tag] from the menu to display this window.

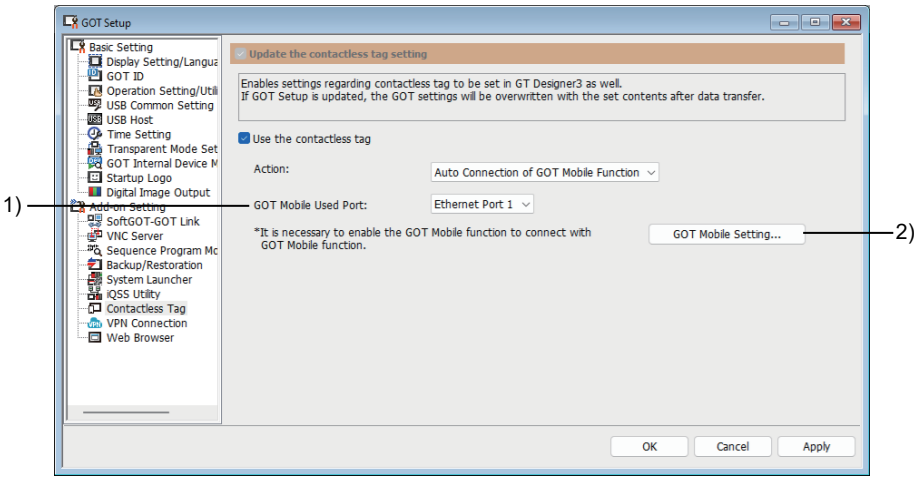


Item			Description
1)	[Update the contactless tag setting]		This item is already selected but cannot be deselected. Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Use the contactless tag]		Enables the contactless tag embedded in the GOT.
3)	[Action]	—	Select an action for the contactless tag and configure the settings required for the selected action.
		[Auto Connection of GOT Mobile Function]	Connects the client with the server (GOT) automatically using the contactless tag. ☞ Page 668 [Auto Connection of GOT Mobile Function]
		[Acquire Phone Number]	Acquires the set phone number using the contactless tag. ☞ Page 668 [Acquire Phone Number]
		[Acquire URL]	Acquires the set URL using the contactless tag. ☞ Page 669 [Acquire URL]
		[Acquire SMS Send]	Acquires the set SMS sending setup using the contactless tag. ☞ Page 669 [Acquire SMS Send]
		[Acquire Mail Send]	Acquires the set e-mail sending setup using the contactless tag. ☞ Page 670 [Acquire Mail Send]
		[Acquire String]	Acquires the set character string using the contactless tag. ☞ Page 670 [Acquire String]

[Auto Connection of GOT Mobile Function]

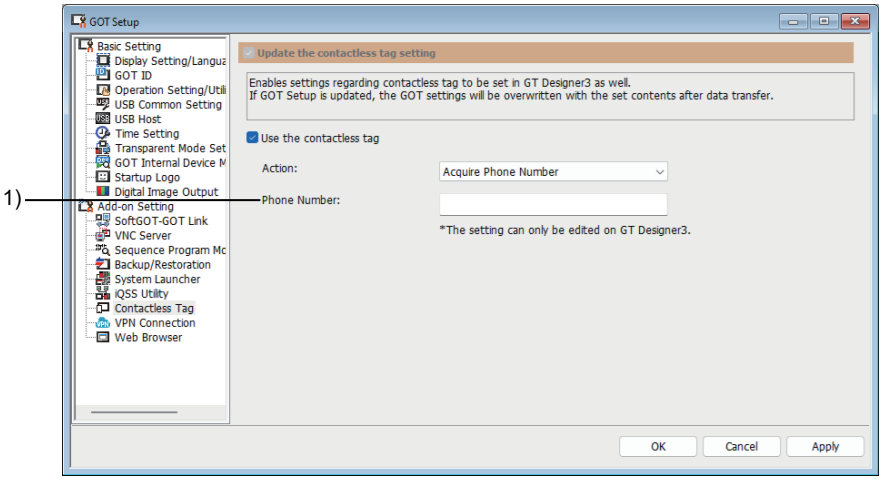
For details on the GOT Mobile function, refer to the following.

☞ Page 2736 Monitoring a controller from tablets or other devices (GOT Mobile function)



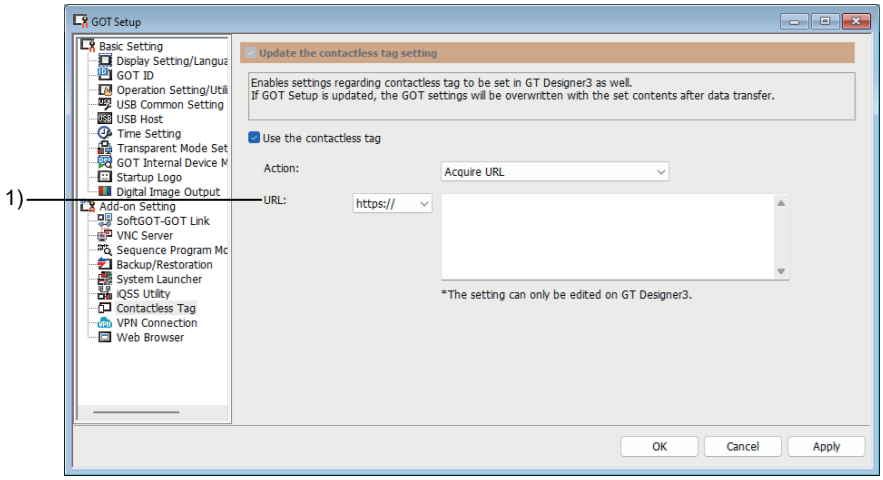
Item		Description
1)	[GOT Mobile Used Port]	Select the GOT's Ethernet port used for connection between the server (GOT) and the client of the GOT Mobile function.
2)	[GOT Mobile Setting] button	Displays the [GOT Mobile Setting] window. ☞ Page 2817 [GOT Mobile Setting] window

[Acquire Phone Number]



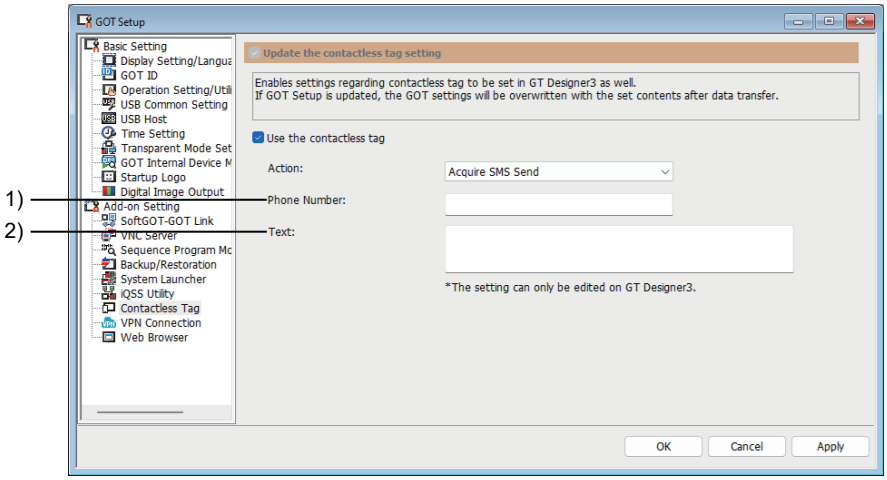
Item		Description
1)	[Phone Number]	Set a phone number. Up to 15 characters can be entered.

[Acquire URL]



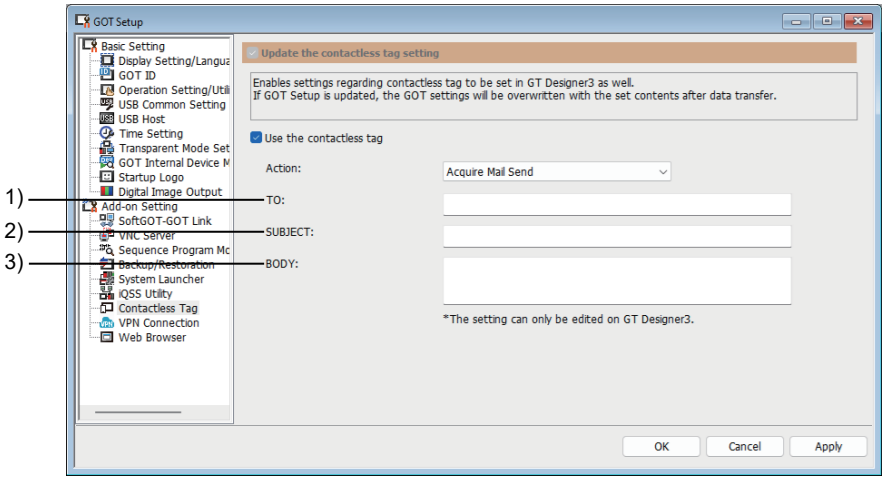
Item		Description
1)	[URL]	Set a URL. Up to 400 characters can be entered.

[Acquire SMS Send]



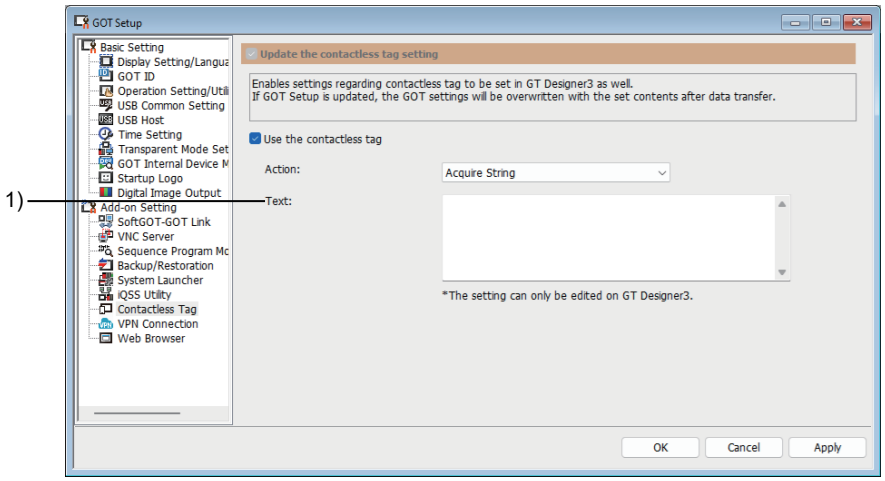
Item		Description
1)	[Phone Number]	Set a phone number. Only one-byte numeric input is allowed.
2)	[String]	Enter text. Up to 100 characters can be entered.

[Acquire Mail Send]



Item		Description
1)	[TO]	Enter the address. Up to 100 characters can be entered.
2)	[SUBJECT]	Enter the subject. Up to 50 characters can be entered.
3)	[BODY]	Enter the text body. Up to 180 characters can be entered.

[Acquire String]



Item		Description
1)	[String]	Enter text. Up to 500 characters can be entered.

12.18 Setting the VPN connection function of the GOT ([VPN Connection])

GT37 SoftGOT3000

☞ Page 671 Overview of the VPN connection function
☞ Page 673 Specifications of the VPN connection function
☞ Page 674 How to set the VPN connection function
☞ Page 689 [VPN Connection]
☞ Page 690 Relevant settings
☞ Page 690 Troubleshooting

In [VPN Connection], configure the relevant settings for the VPN function of the GOT.

12.18.1 Overview of the VPN connection function

GT37 SoftGOT3000

This function establishes VPN connections using the software VPN embedded in the GOT without using a VPN router. You can establish safe communications between each terminal (such as a personal computer or a tablet) and the GOT through a cloud server.

The following functions are protected by the VPN connection function.

- Communication between GT Designer3 and the GOT
- FA transparent function
- VNC server function
- GOT Mobile function
- OPC UA server function

The VPN connection function uses the following licenses.

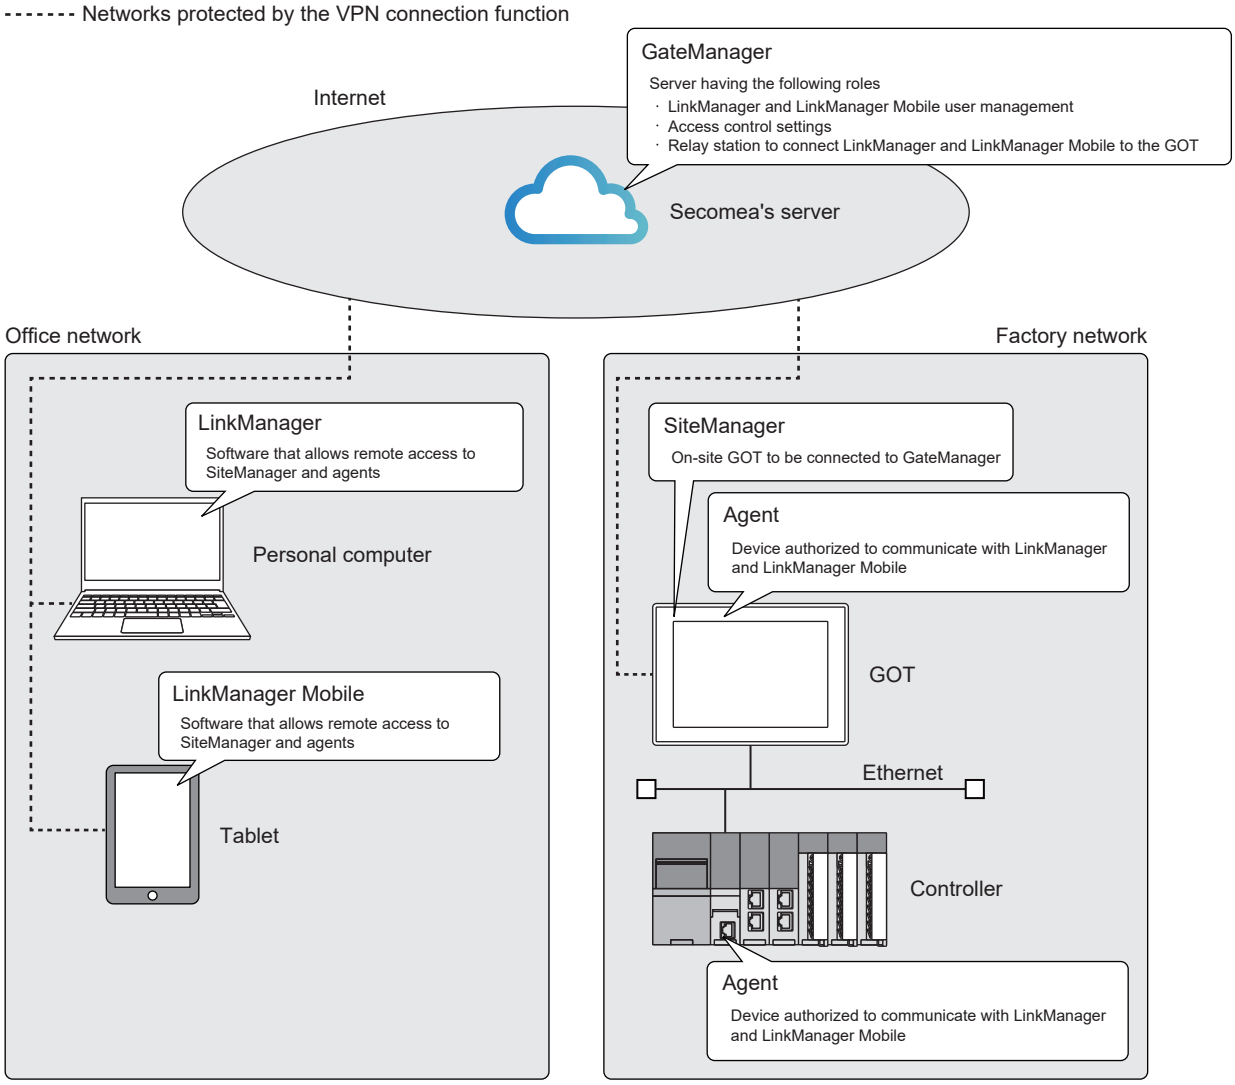
License	Description
VPN connection function license	The license to be registered to the GOT to use the VPN connection function.
SiteManager license	The license required to use Secomea products. To use the VPN connection function, a contract through a Secomea partner is required. For information on Secomea partners, refer to the following. https://secomea.com/partners/ Note that the above website may be changed without notification.

PART 5

Functionality and software relationships and terminology

The following shows an example of network configuration for accessing the GOT installed in the factory from a personal computer in a remote office.

LinkManager installed on a personal computer communicates with the GOT (SiteManager) through GateManager (Secomea's server).



Item	Description
GateManager	Secomea's server on the cloud. Users do not need to prepare their own servers. Access the server via a web browser and configure the settings to manage users and access authority of LinkManager and LinkManager Mobile. The server also acts as a relay station to connect LinkManager and LinkManager Mobile to the GOT.
LinkManager	Software that allows remote access to SiteManager and agents. In this section, this is the generic term for the following software products. • LinkManager: Software that runs on the personal computer to be connected to the GOT • LinkManager Mobile: LinkManager software for smartphones and tablets
SiteManager	On-site GOT to be connected to GateManager. The GOT using the VPN connection function requires the software SiteManager Embedded to communicate with GateManager. SiteManager Embedded is included in the system application (add-on function) of the VPN connection function.
Agent	Generic term for devices (GOT and controllers connected to the GOT) authorized by SiteManager to communicate with LinkManager and LinkManager Mobile.

12.18.2 Specifications of the VPN connection function

GT37 SoftGOT3000

☞ Page 673 Recommended LinkManager installations
☞ Page 673 Type of SiteManager license
☞ Page 673 Required system application (add-on function)
☞ Page 673 Connection/disconnection record (operation log)

Recommended LinkManager installations

Up to four devices are recommended.

Type of SiteManager license

The applicable communication route varies depending on the type of SiteManager license purchased from Secomea.

Applicable: ○

Not applicable: —

Communication route	Type of license	
	SiteManager Embedded-Basic	SiteManager Embedded-Extend5 SiteManager Embedded-Extend10
Between LinkManager and the GOT	○	○
Between LinkManager and the controller via the GOT	—	○
Between LinkManager and the controller via the GOT using the GOT FA transparent function	○	○

Required system application (add-on function)

To use the VPN connection function, [VPN Connection Function] must be selected from the system applications (add-on functions).

Configuring one of the following settings in the [GOT Setup] window ([VPN Connection]) incorporates the application into the package data automatically.

- Select [Update the VPN connection function].
- Select [Use VPN].

Connection/disconnection record (operation log)

Connections and disconnections of the GOT from Link Manager are recorded in the operation log.

However, those from LinkManager Mobile are not recorded.

12.18.3 How to set the VPN connection function

GT37 SoftGOT3000

Configuring all the following settings allows you to remotely access the GOT from terminals.

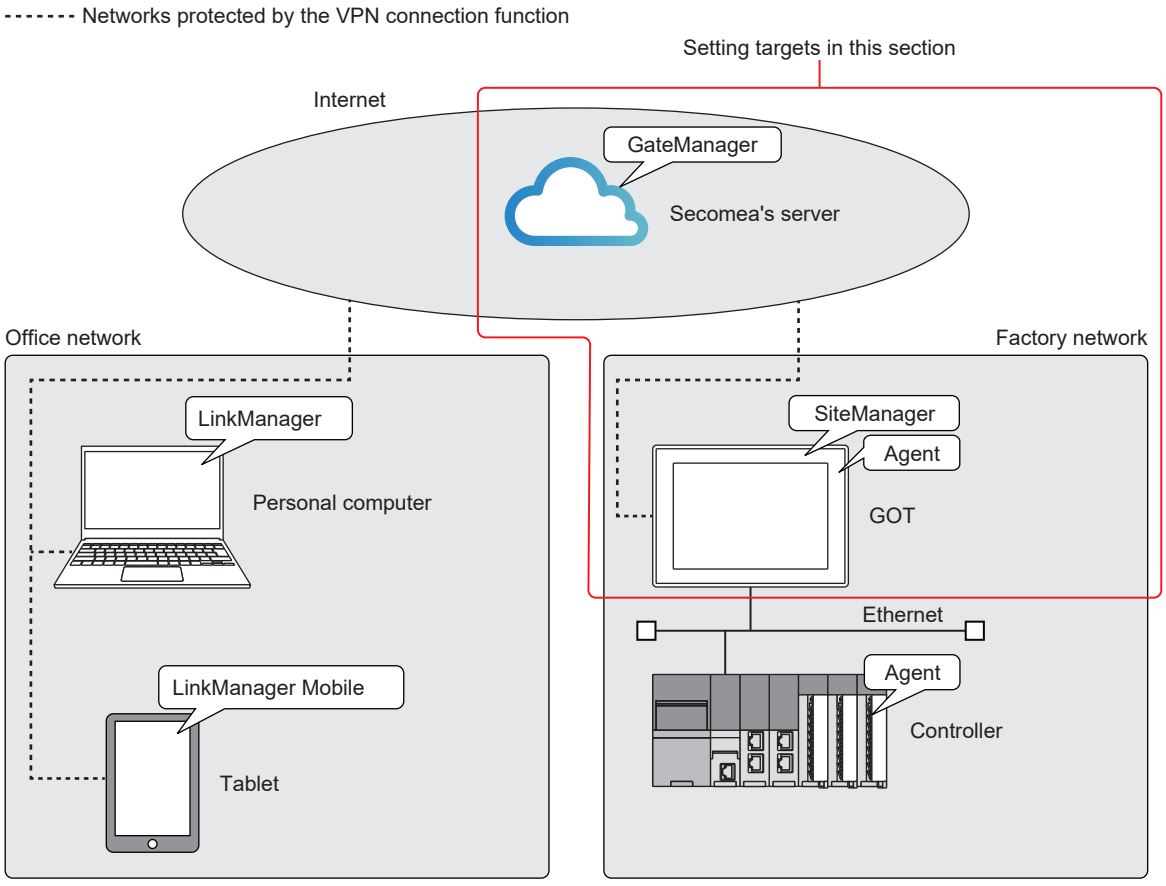
☞ Page 674 Connecting SiteManager (GOT) and GateManager
☞ Page 679 Connecting LinkManager and GateManager
☞ Page 685 Setting the agents to be accessed from LinkManager

Point

To use the VPN connection function, the VPN connection function license must be registered on the GOT.
Even if the VPN connection function license is not registered, you can try the VPN connection function after starting the GOT, until the connection time between SiteManager (GOT) and GateManager reaches 30 minutes.
If the VPN connection function license is registered during the trial period, the function remains in trial mode until the GOT (SiteManager) is stopped and reconnected.
After 30 minutes, the connection is forcibly disconnected, even if the GOT is in operation.
Before incorporating the GOT into your product, register the VPN connection function license to the GOT.

Connecting SiteManager (GOT) and GateManager

☞ Page 675 Registering a VPN connection function license to the GOT
☞ Page 675 Settings on SiteManager (GOT)
☞ Page 676 Logging in to GateManager
☞ Page 678 SiteManager license assignment in GateManager



■Registering a VPN connection function license to the GOT

Request a VPN connection function license, and register the license to the GOT.

For the registration method, refer to the following.

☞ Page 3686 License registration method

■Settings on SiteManager (GOT)

Configure the settings to allow SiteManager (GOT) to connect to GateManager in GT Designer3.

Operating procedure

1. Select [Common] → [GOT Setup] → [Add-on Setting] → [VPN Connection] from the menu to display the [GOT Setup] window ([VPN Connection]).

☞ Page 689 [VPN Connection]

2. Select [Update the VPN connection function] and [Use VPN], and configure each setting.
3. Click the [OK] button to complete the VPN connection function settings.
4. Place objects such as a bit switch and bit lamp for monitoring the following GOT special registers that notifies and controls the VPN connection function.

GOT special register	Description
GS2051.b0	Notifies users of the connection status between SiteManager (GOT) and GateManager. It is turned off while the connection is stopped. It is turned on during connection. Place an object such as a bit lamp for checking the ON/OFF state. ☞ Page 1276 Placing a lamp The connection status can also be checked on the [VPN connection function] screen in the utility.
GS2051.b1	Notifies users of the operation status of the VPN connection function in SiteManager (GOT). It is turned off while the operation is stopped. It is turned on during operation. Place an object such as a bit lamp for checking the ON/OFF state. ☞ Page 1276 Placing a lamp The operation status can also be checked on the [VPN connection function] screen in the utility.
GS2565.b0	Controls the connection between SiteManager (GOT) and GateManager. Turning on this register starts connection between SiteManager (GOT) and GateManager. Turning off this register stops connection between SiteManager (GOT) and GateManager. Place an object such as a bit switch for controlling the ON/OFF status. ☞ Page 1191 Placing a touch switch

5. Write package data into the GOT to restart the GOT.

☞ Page 408 Transferring data to the GOT

6. Turn on GS2565.b0 using an object such as a touch switch to start connecting to GateManager.
7. Check the connection status between SiteManager (GOT) and GateManager and operation status of the VPN connection function in SiteManager (GOT) by checking either of the following item.

- Status of GS2051.b0 and GS2051.b1 set for the objects such as bit lamps
- [VPN connection function] screen in the utility

Point

The settings in the [GOT Setup] window ([VPN Connection]) can also be configured in the utility.

Even if the settings are changed during VPN connection, the VPN connection continues with the settings before the change.

To apply the new settings, stop the VPN connection once and start it again.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Logging in to GateManager

Log in to GateManager from the personal computer and open the management screen.

Specifications and functions of Secomea's products may be changed without notification.

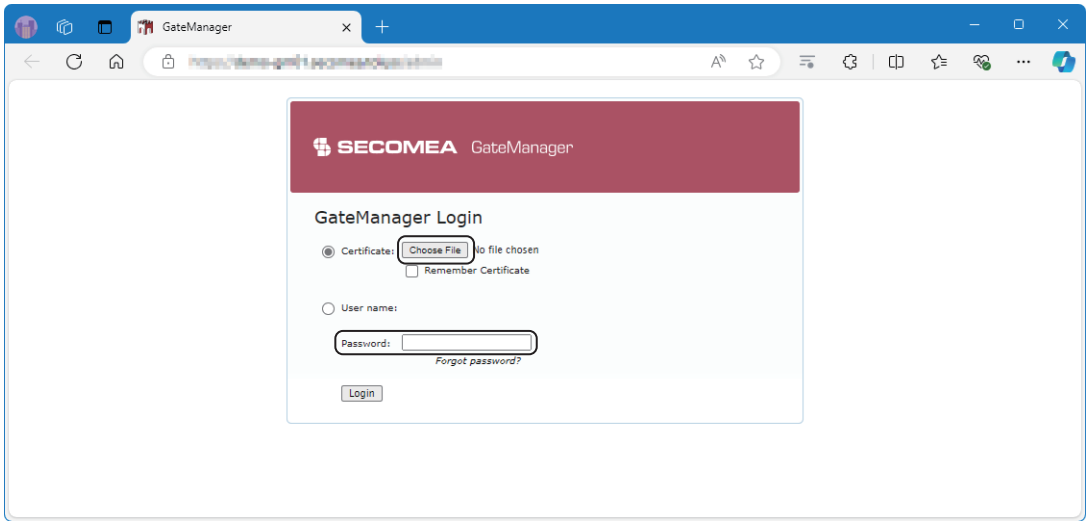
For the latest information, contact Secomea.

Operating procedure

1. Click the URL link found in the e-mail from Secomea to open the GateManager login screen.

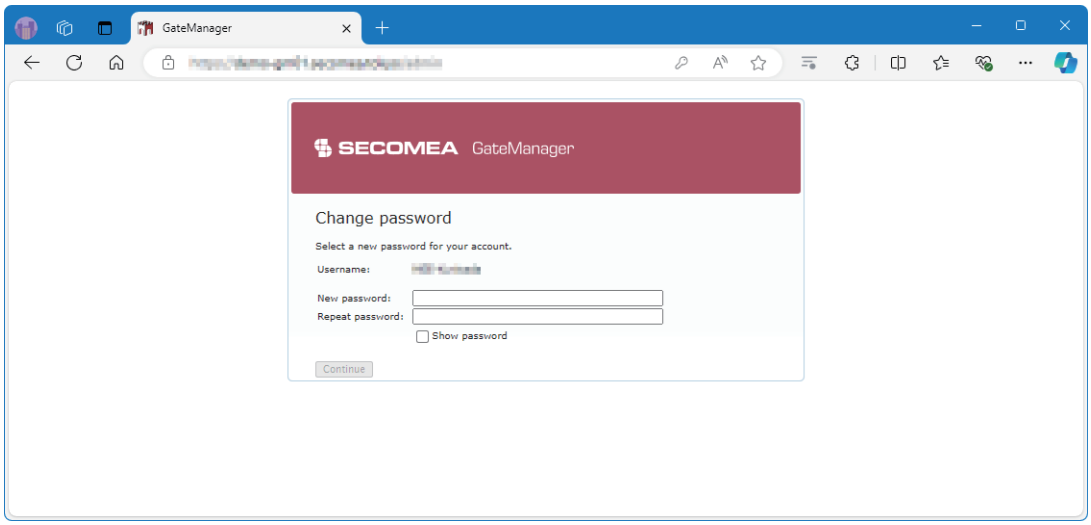
2. After performing the following operations, click the [Login] button.

- Click the [Choose File] button, and then specify the certificate for login (*.gmc) attached to the e-mail.
- Enter the password indicated in the body of the e-mail.

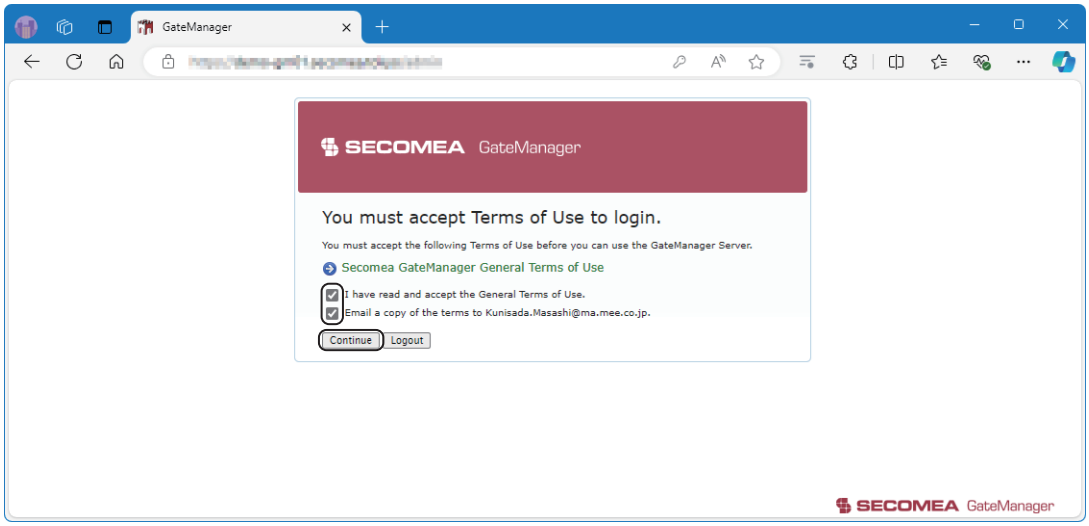


3. When logging in for the first time, you must change the password and accept the terms of use.

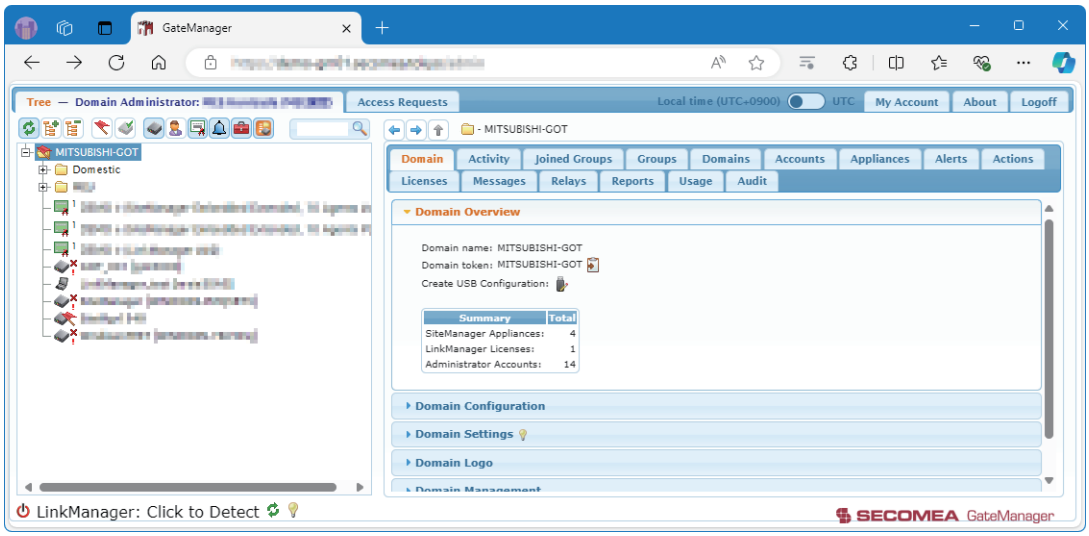
Enter a new password to be used for the next and subsequent logins, and then click the [Continue] button.



4. Only when logging in for the first time, you will be asked to agree to the license agreement as shown below.
Select the upper checkbox and click the [Continue] button.
(If you wish to receive the contents of the license agreement by e-mail, check the lower checkbox as well.)



When you log in, the GateManager management screen appears.



■SiteManager license assignment in GateManager

To establish connection between GateManager and SiteManager (GOT), assign the SiteManager license to SiteManager (GOT).

The number of assignable licenses differs depending on the type of the SiteManager license you purchased.

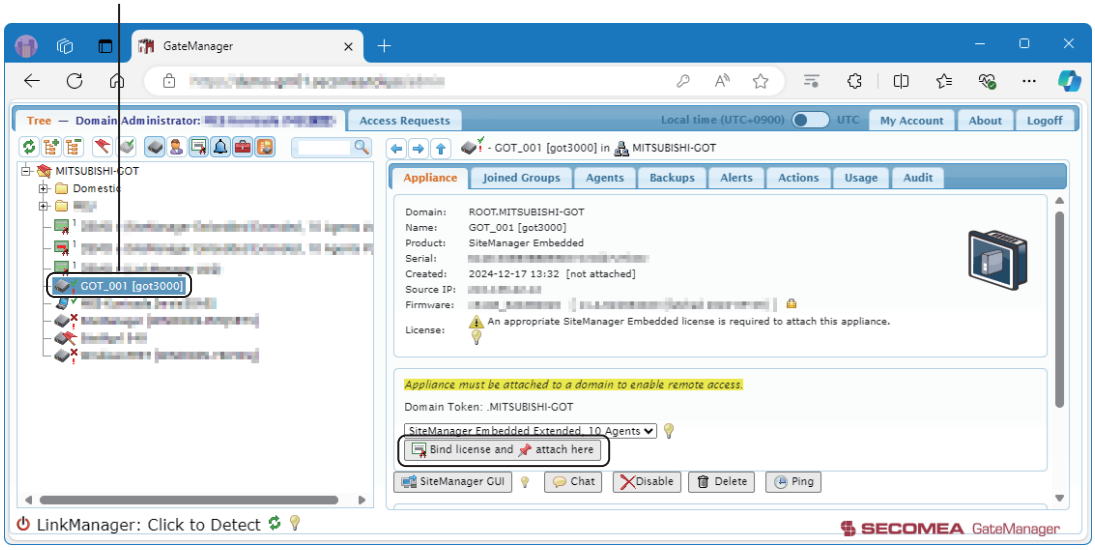
Specifications and functions of Secomea's products may be changed without notification.

For the latest information, contact Secomea.

Operating procedure

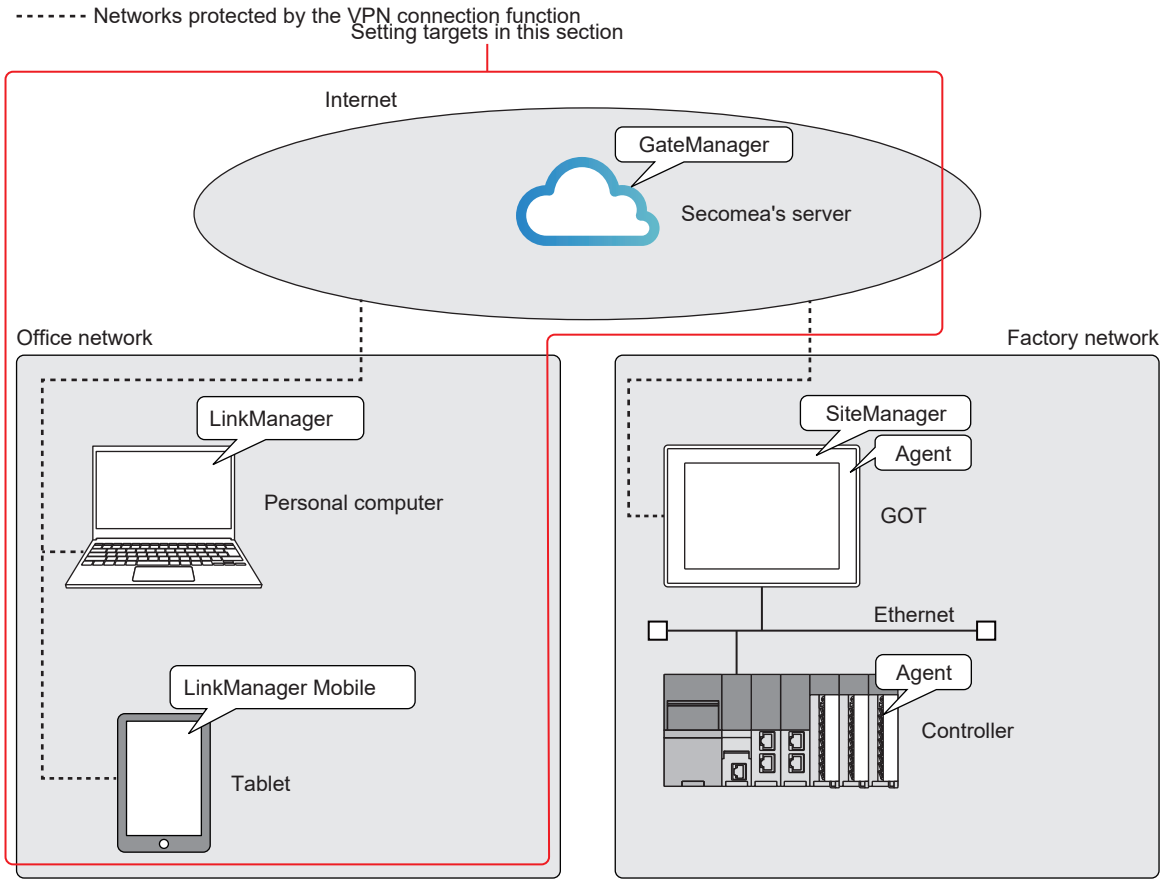
1. In the GateManager management screen, select SiteManager to assign the SiteManager license.
2. Click the [Bind license and attach here] button to assign the SiteManager license and establish the connection between GateManager and SiteManager (GOT).

Select SiteManager to which the SiteManager license is to be assigned.



Connecting LinkManager and GateManager

☞ Page 680 Creating a LinkManager account
☞ Page 681 Logging in to LinkManager
☞ Page 683 Installing LinkManager application



Specifications and functions of Secomea's products may be changed without notification.
For the latest information, contact Secomea.

■Creating a LinkManager account

In the GateManager management screen, create a LinkManager account.

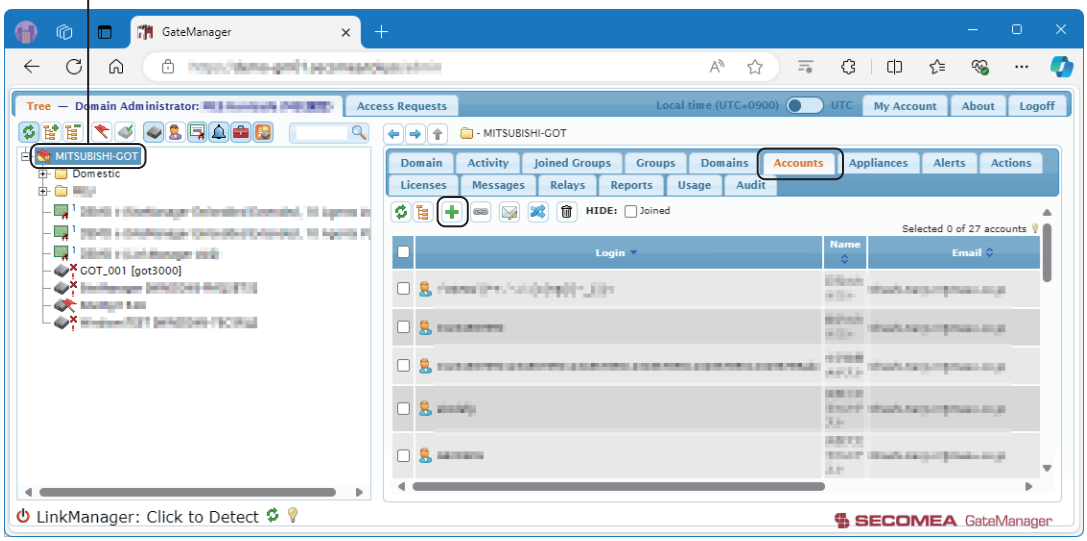
For information on how to log in to GateManager, refer to the following.

☞ Page 676 Logging in to GateManager

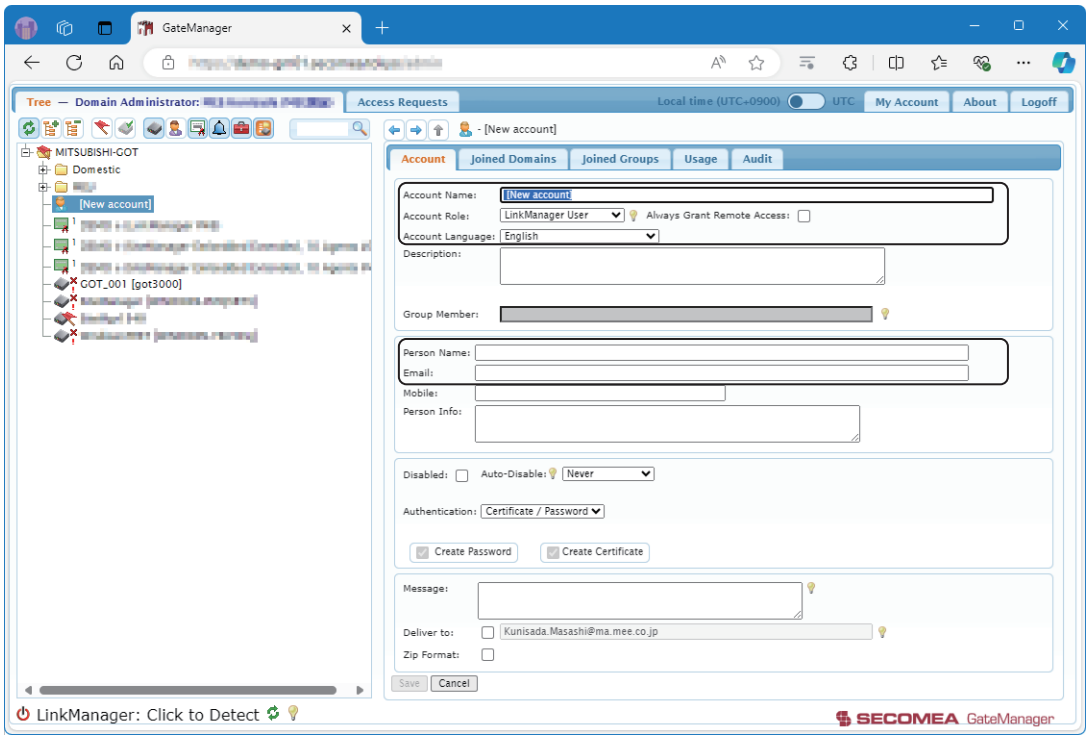
Operating procedure

1. In the GateManager management screen, select a folder and click the [+] button in the [Accounts] tab.

Select a folder.



2. Configure the following settings in the displayed pane, and click the [Save] button.



Item	Description
[Account Name]	User name to be displayed on the GOT
[Account Role]	Type of account
[Account Language]	Language to be used
[Person Name]	Name to be displayed with parentheses following the user name
[Email]	E-mail address You will receive information to log in to the LinkManager management screen.

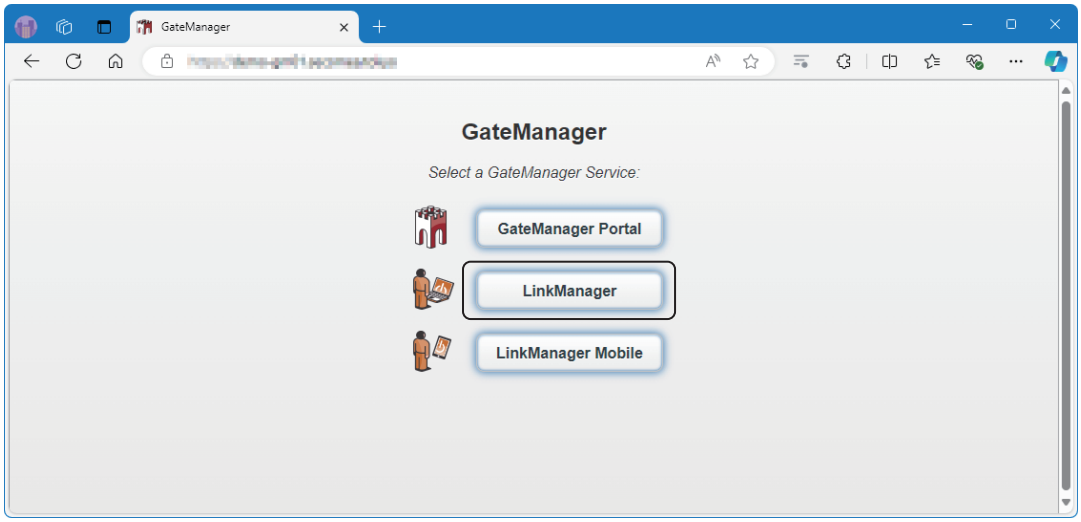
A LinkManager account is created. You will receive information to log in to the LinkManager management screen from Secomea.

■Logging in to LinkManager

Log in to LinkManager from the personal computer and open the management screen.

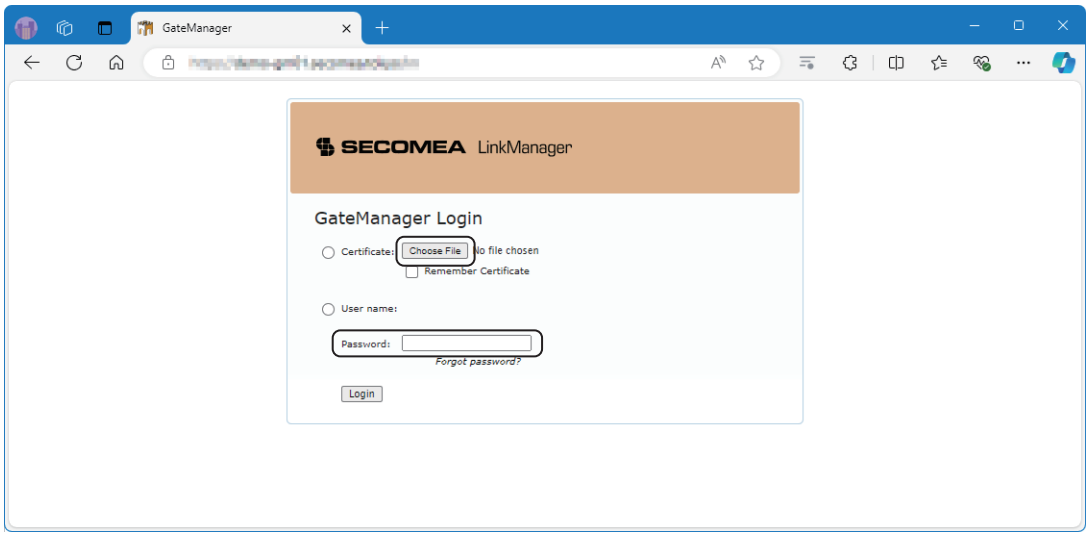
Operating procedure

1. Click the URL link in the e-mail sent from Secomea to the LinkManager account to open the GateManager landing page.
2. Click [LinkManager] to open the LinkManager login screen.



3. After performing the following operations, click the [Login] button.

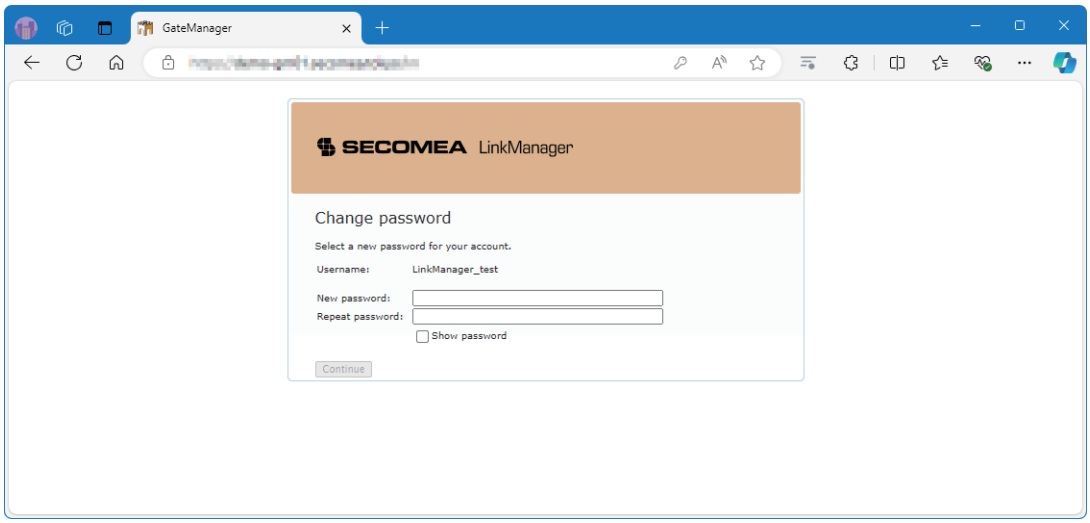
- Click the [Choose File] button, and then specify the certificate for login (*.gml) attached to the e-mail.
- Enter the password indicated in the body of the e-mail.



PART 5

4. When logging in for the first time, you must change the password and accept the terms of use.

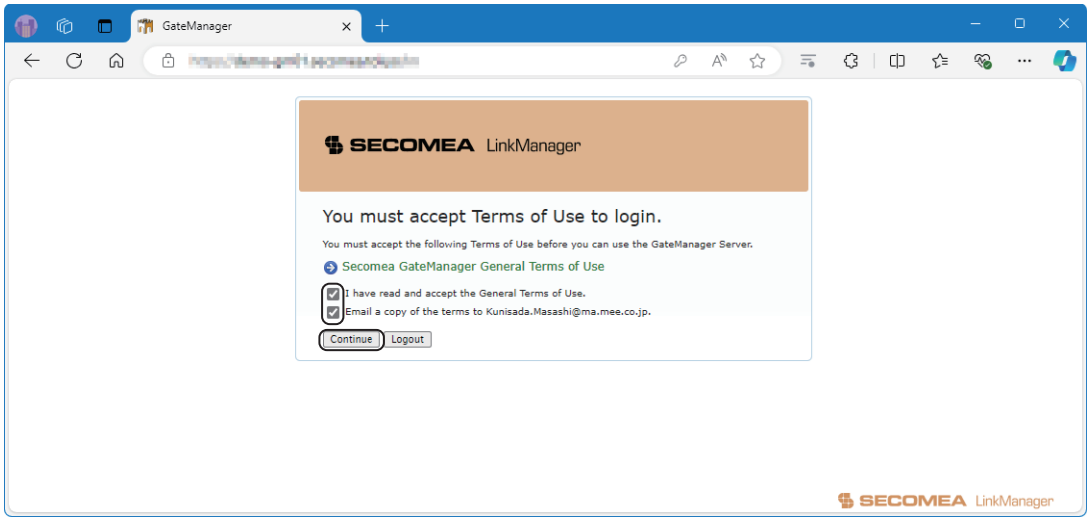
Enter a new password to be used for the next and subsequent logins, and then click the [Continue] button.



5. Only when logging in for the first time, you will be asked to agree to the license agreement as shown below.

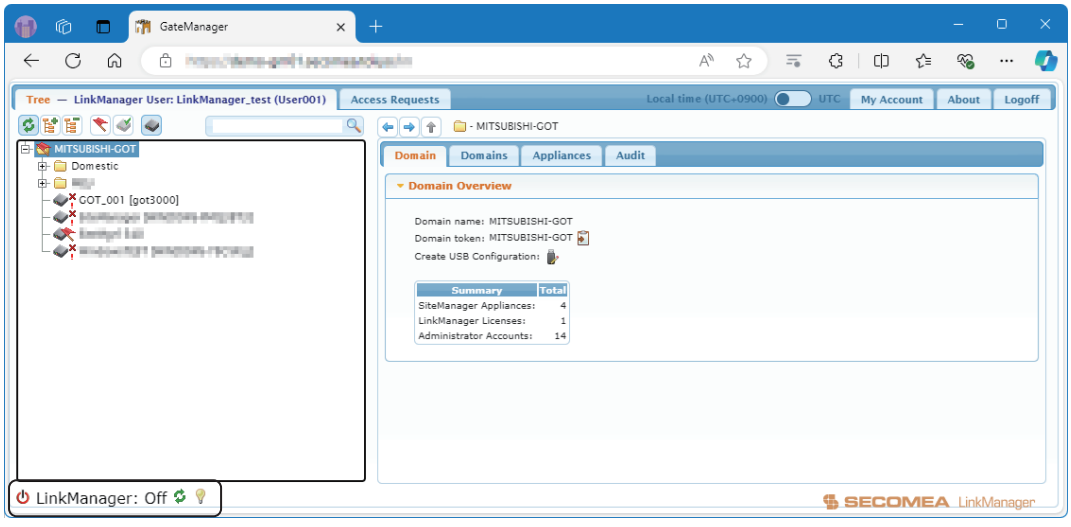
Select the upper checkbox and click the [Continue] button.

(If you wish to receive the contents of the license agreement by e-mail, check the lower checkbox as well.)



When you log in, the LinkManager management screen appears.

Since LinkManager is not installed on the personal computer at this time, [LinkManager: Off] is displayed in the lower left corner of the management screen.

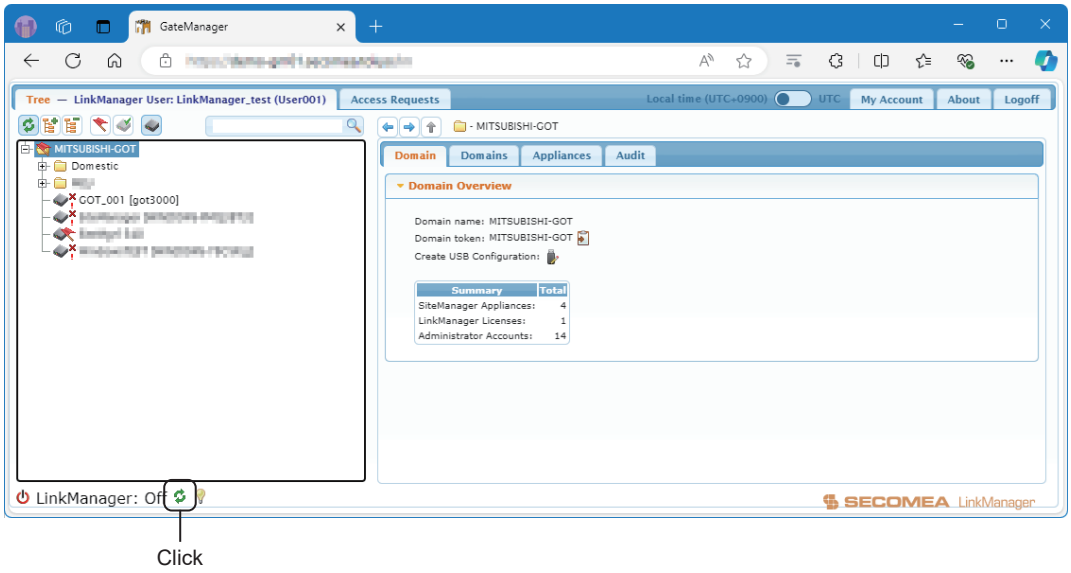


■Installing LinkManager application

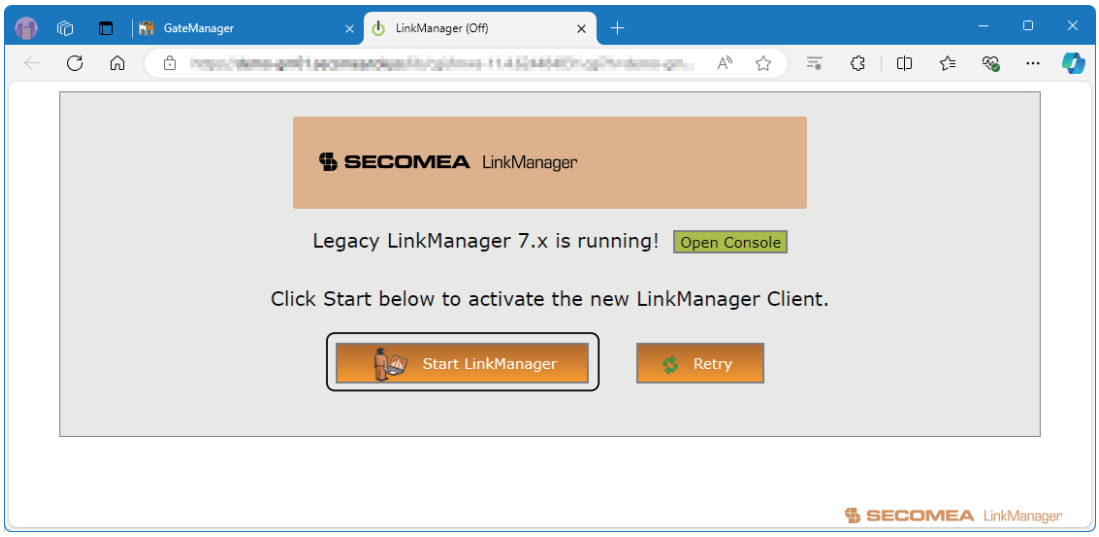
Install LinkManager on the personal computer.

Operating procedure

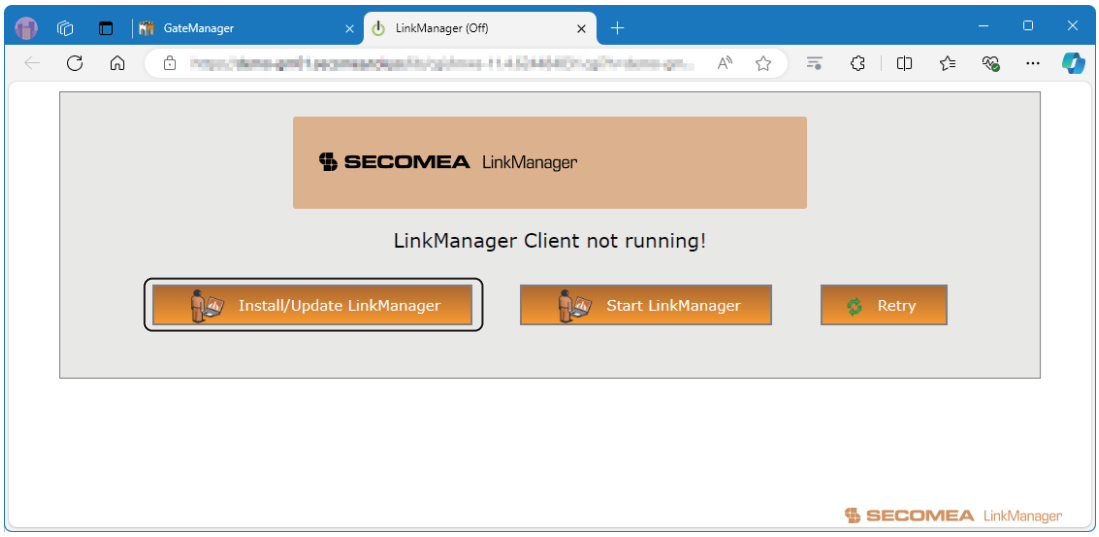
1. Click the following icon in the LinkManager management screen.



2. Click the [Start LinkManager] button.

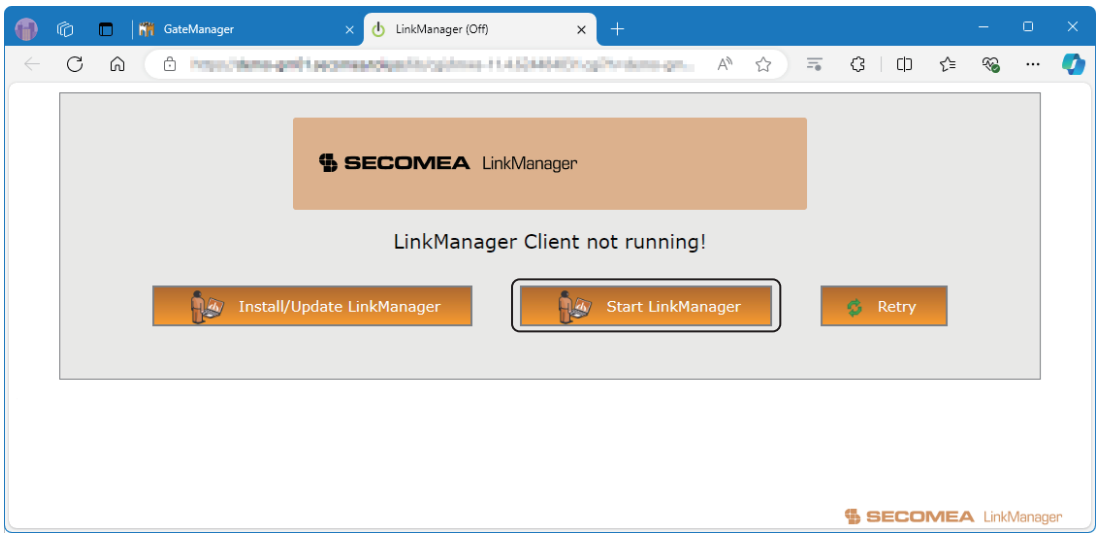


3. Click the [Install LinkManager] button to download the LinkManager application (*.exe).
Do not close the LinkManager management screen.

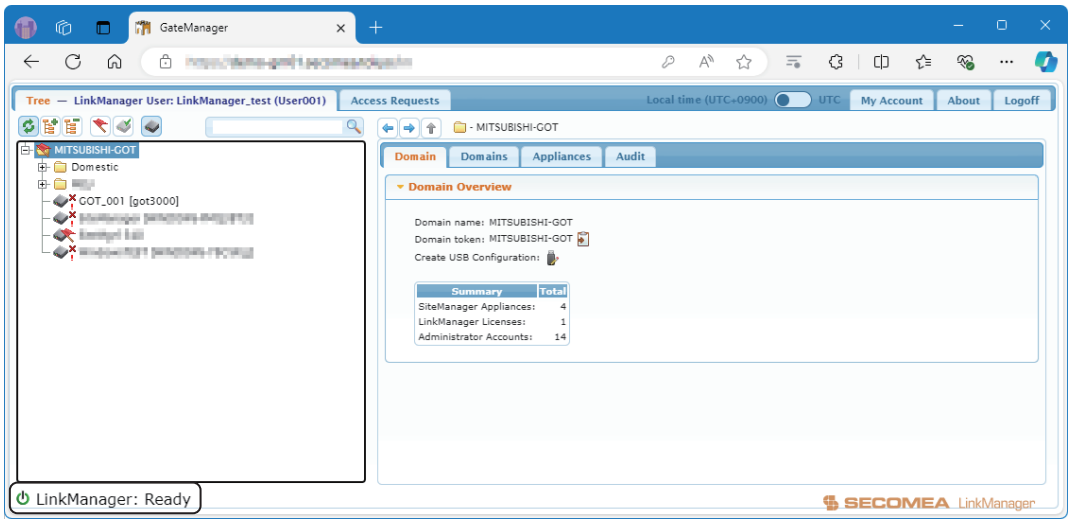


4. Open the downloaded file to display the installation screen.
Follow the instructions on the screen to install the application.

5. After installation, click the [Start LinkManager] button to start LinkManager.



[LinkManager: Off] displayed in the lower left corner of the LinkManager management screen will change to [LinkManager: Ready].

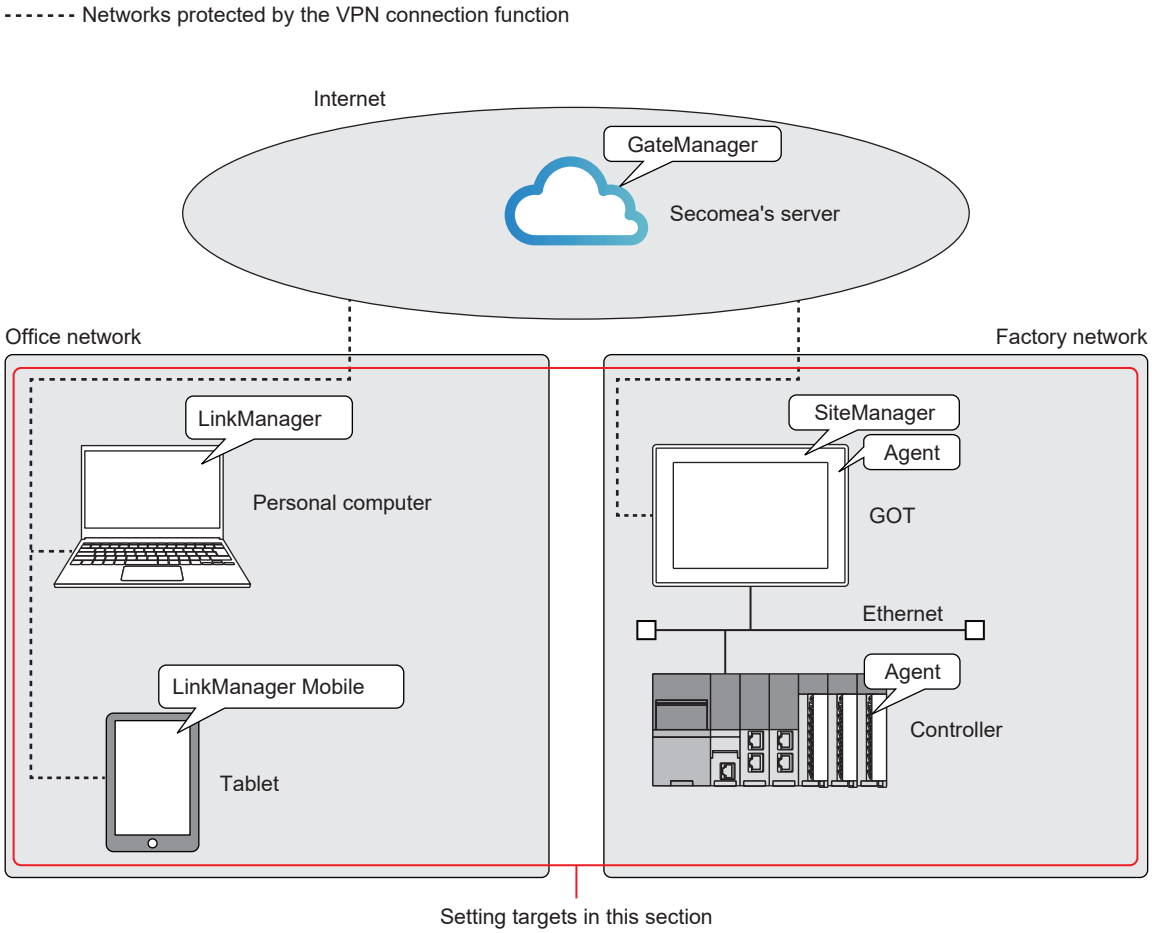


The LinkManager icon is displayed in the task tray.

Setting the agents to be accessed from LinkManager

Register the devices (agents) you want to remotely access from the terminal such as a personal computer or tablet.
Register the GOT as an agent as well.
To establish communications between LinkManager and an agent, enable the communications in SiteManager.
You can configure the agent settings from the GateManager site or LinkManager site.
The following describes the setting procedure from the LinkManager site.

☞ Page 686 Registering an agent
☞ Page 688 Connecting LinkManager and an agent



Specifications and functions of Secomea's products may be changed without notification.
For the latest information, contact Secomea.

Point

If the agent settings are changed during VPN connection, the new settings are immediately applied.

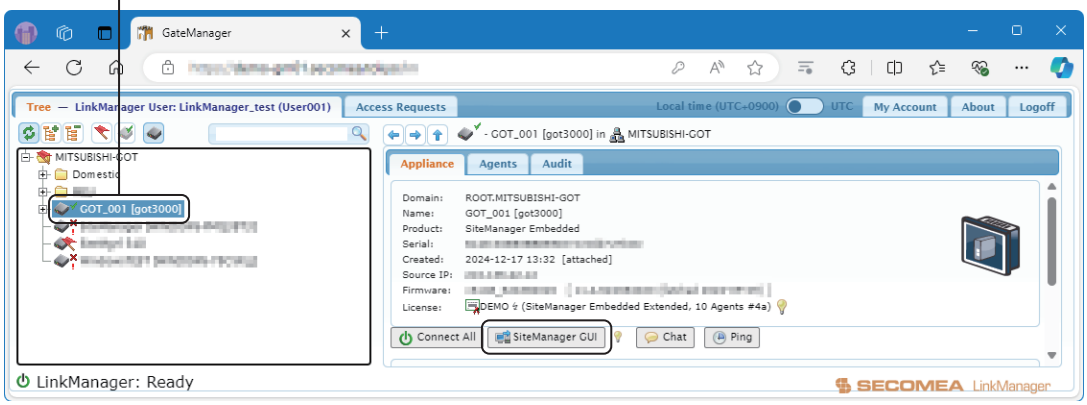
■Registering an agent

The following provides an example for changing the default agent settings.

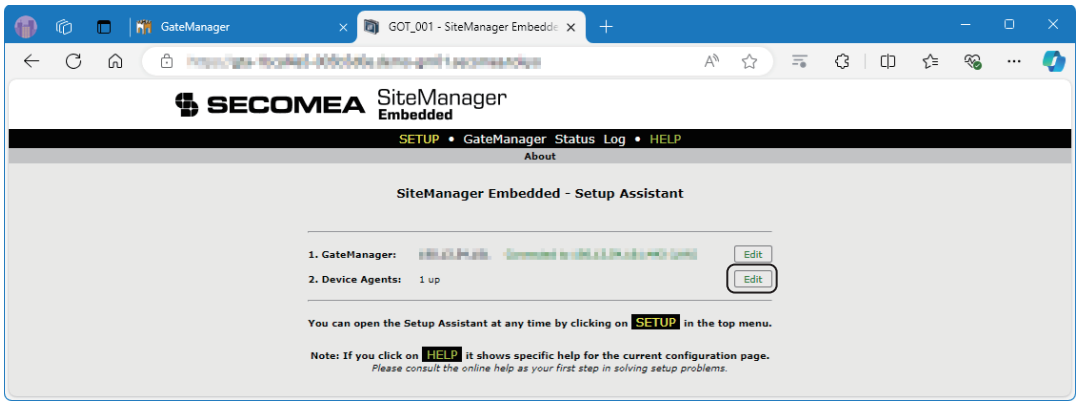
Operating procedure

1. In the LinkManager management screen, select SiteManager for which you want to change the settings, and click the [SiteManager GUI] button.

Select SiteManager whose settings are to be changed.

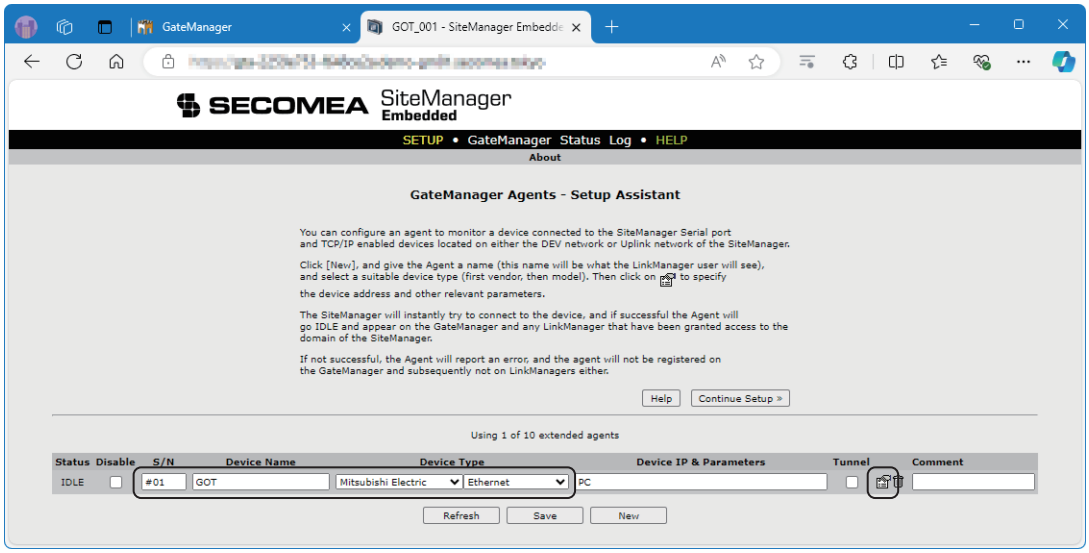


2. Click the [Edit] button shown below.

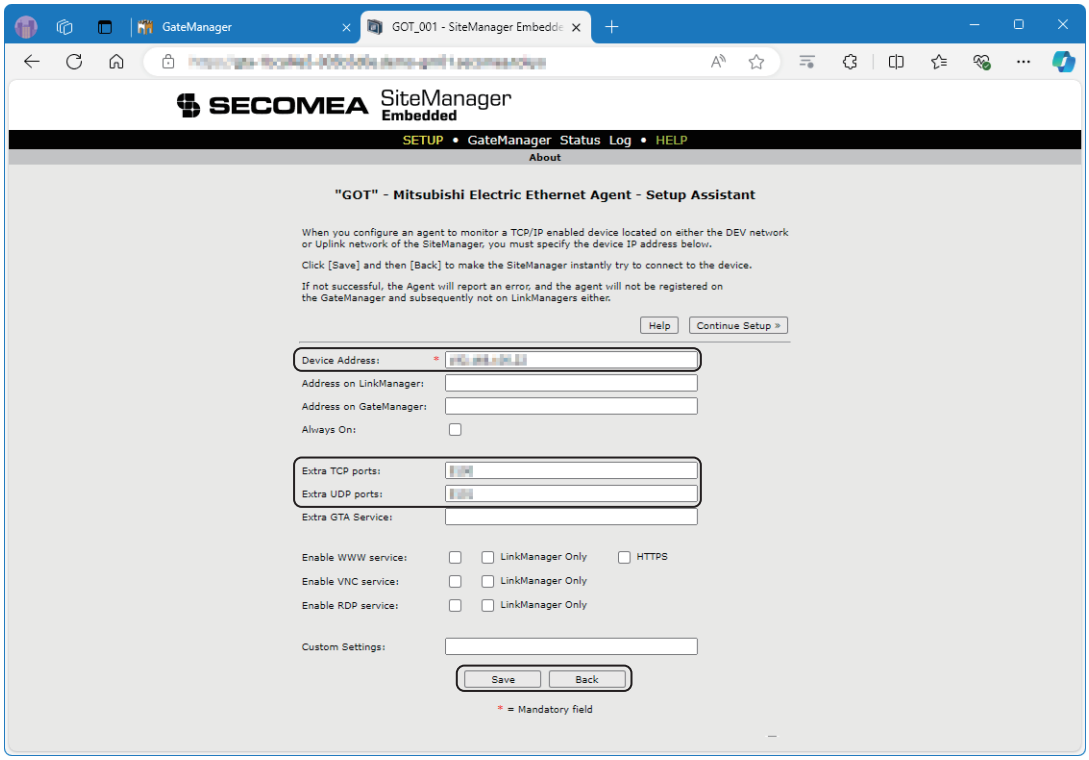


3. Enter each setting item.

Click the icon shown below to display the detail setting screen.

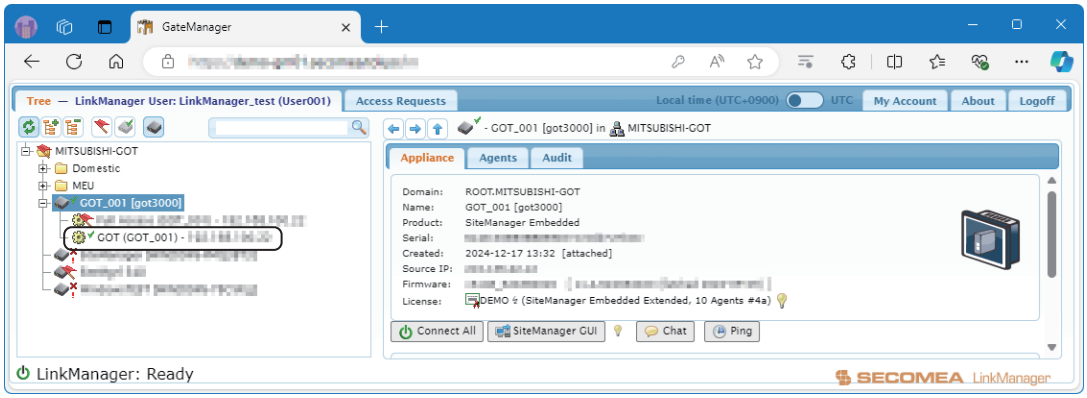


4. Set the following items and click the [Save] button. Then, click the [Back] button.



Item	Description
[Device Address]	Set the IP address of the device to enable its communication.
[Extra TCP ports]	Set the TCP port number of the device to enable its communication.
[Extra UDP ports]	Set the UDP port number of the device to enable its communication.

Update the LinkManager management screen to update the agent information according to the settings.



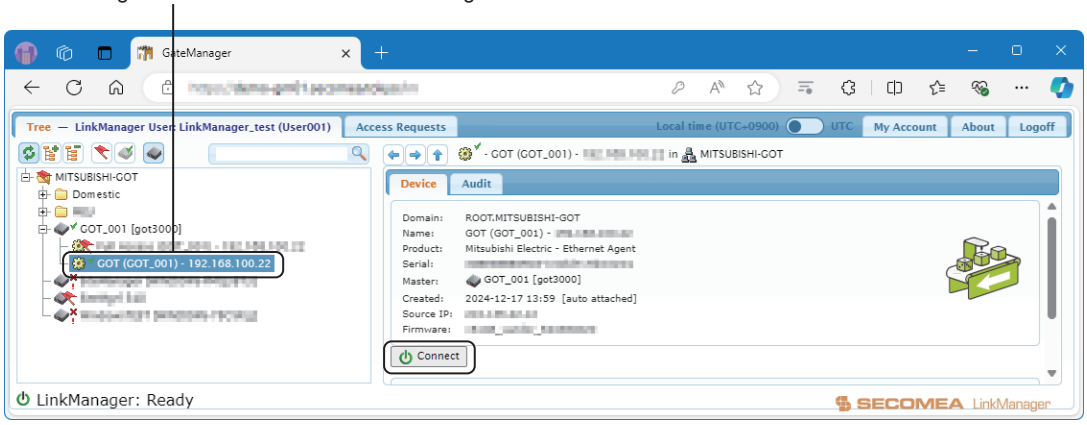
■Connecting LinkManager and an agent

Start communications between LinkManager and an agent.

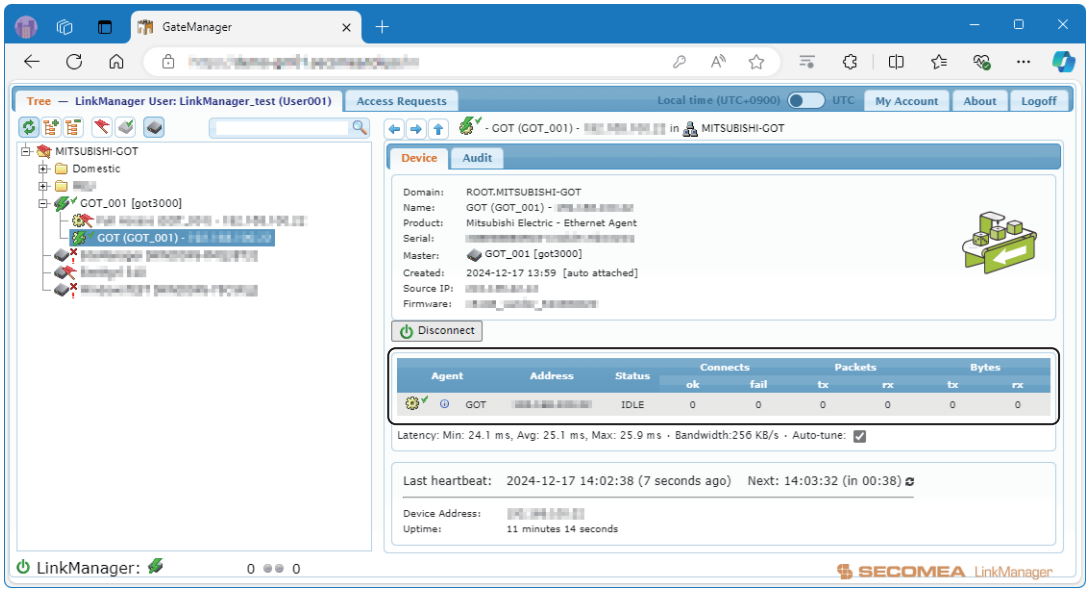
Operating procedure

In the LinkManager management screen, select the agent to be connected from LinkManager, and click the [Connect] button.

Select the agent to be connected from LinkManager.



LinkManager and the agent start communicating with each other, and information on the communications is displayed in the screen of the LinkManager site.

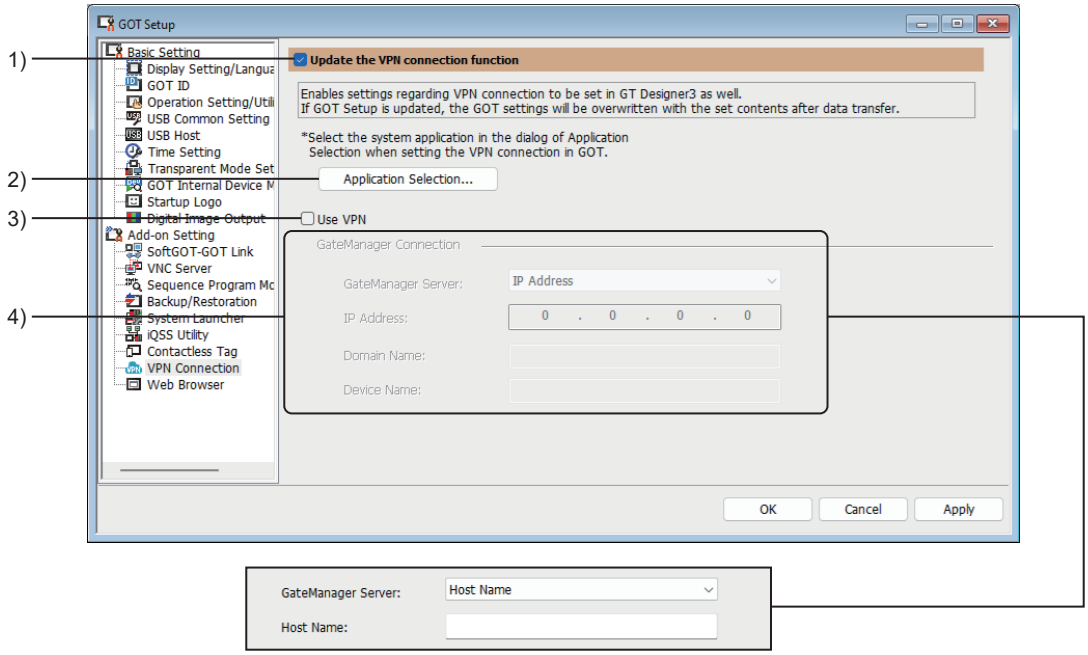


12.18.4 [VPN Connection]

GT37 SoftGOT3000

Configure the settings of GateManager to which SiteManager (GOT) is connected.

Select [Common] → [GOT Setup] → [Add-on Setting] → [VPN Connection] from the menu to display this window.



When [Host Name] is selected for [GateManager Server]

Item			Description
1)	[Update the VPN connection function]		Updates the setting data in the GOT with the ones set on GT Designer3 when package data is written. Select this item to configure the settings in [VPN Connection]. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Application Selection] button		Displays the [Application Selection] dialog. ☞ Page 458 [Application Selection] dialog To use the VPN connection function, select [VPN Connection Function] on the [System Application] tab. When [Use VPN] is selected, this setting is not required because the system application of the VPN connection is incorporated in the package data automatically.
3)	[Use VPN]		Enables the VPN connection function.
4)	[GateManager Connection]	[GateManager Server]	Select how to specify the GateManager server.
		[IP Address]	This item is displayed when [IP Address] is selected for [GateManager Server]. Specify the GateManager server with the IP address. The setting range is [0.0.0.0] to [255.255.255.255].
		[Host Name]	This item is displayed when [Host Name] is selected for [GateManager Server]. Specify the GateManager server with the host name. Up to 127 characters can be set. One-byte alphanumeric characters, hyphens (-), and periods (.) can be used.
		[Domain Name]	Set the domain name of the GateManager server. Up to 127 characters can be set. One-byte alphanumeric characters, hyphens (-), and periods (.) can be used.
		[Device Name]	Set the name of the device used to display the SiteManager (GOT) name in the GateManager site. Up to 127 characters can be set. One-byte alphanumeric characters, one-byte spaces, and the following symbols can be used. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [¥] ^ _ { | } ~ A one-byte space cannot be used at the start or end of the device name. A one-byte space can be used between characters. Two or more one-byte spaces cannot be used consecutively.

12.18.5 Relevant settings

GT37 SoftGOT3000

The VPN connection function has other relevant settings besides the specific settings.
The following shows the functions that are available by configuring the relevant settings.

GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Notifying users of the connection status between SiteManager (GOT) and GateManager.	GS2051.b0
Notifying users of the operation status of the VPN connection function in SiteManager (GOT).	GS2051.b1
Starting or stopping the connection between SiteManager (GOT) and GateManager.	GS2565.b0

12.18.6 Troubleshooting

GT37 SoftGOT3000

Issue	Possible cause	Solution
The VPN connection cannot be established.	The VPN connection is invalid.	• Check that the network cables are connected. • Check that the router or any other repeater is powered on.
	The settings of the VPN connection function are incorrect.	Check the VPN connection settings. ☞ Page 674 How to set the VPN connection function
	The access is blocked by firewall or security software.	Check that the use of the IP address and port number to be used for VPN connection is allowed.
The communication speed is low.	More than the recommended number of terminals (such as personal computers and tablets) are connected.	Keep the number of connected terminals within the recommended number. ☞ Page 673 Recommended LinkManager installations
	Access is concentrated.	Connect again after a while.
	Continuous long-term use of the terminal (such as a personal computer or a tablet) or router has decreased its processing capacity.	Restart the terminal or router continuously used for a long time.
	Your ISP (Internet Service Provider) restricts your Internet bandwidth or speed.	Check with your ISP (Internet Service Provider).
	The network of your plan is slow.	Review your Internet plan.
	The maximum transmission unit (MTU) of data that the device can transmit at one time is inappropriate.	Check the MTU value and change it to the appropriate value.

12.19 Setting the web browser function ([Web Browser])

GT37 SoftGOT3000

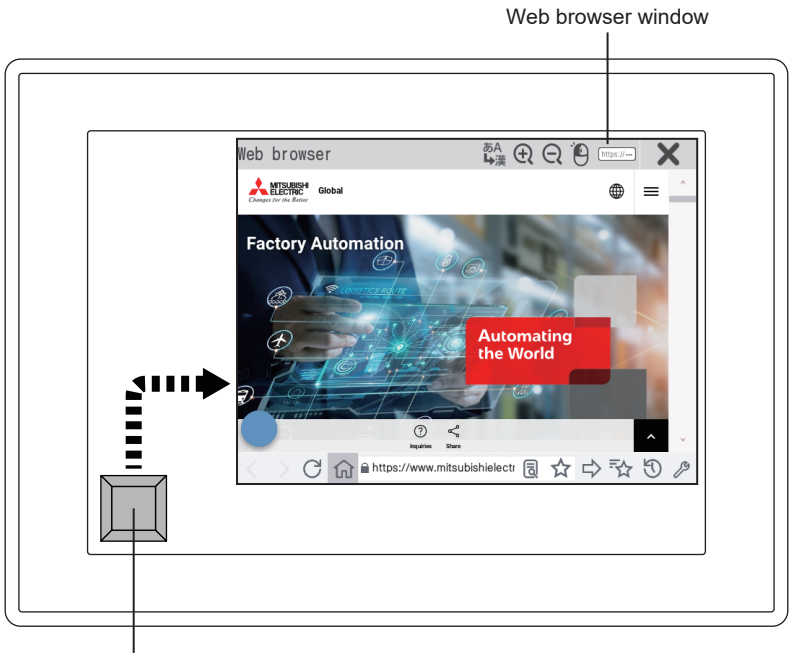
☞ Page 692 Overview of the web browser function
☞ Page 693 Specifications of the web browser function
☞ Page 698 How to set the web browser function
☞ Page 701 Launching or exiting a web browser window
☞ Page 702 Operation on the web browser window
☞ Page 707 Operation control on the web browser window
☞ Page 709 [Web Browser]
☞ Page 710 [Web Browser] dialog (peripheral setting)
☞ Page 711 Relevant settings
☞ Page 711 Troubleshooting

In [Web Browser], configure the settings of the web browser function.

12.19.1 Overview of the web browser function

GT37 SoftGOT3000

The web browser function launches a web browser on the GOT.
This function allows you to launch a web browser window to display websites, access the devices equipped with the web server function, and use web applications.



Precautions

■Access to websites

Ensure that you trust the website before visiting it.

■Difference between the web browser window and standard web browsers

The website displayed in the web browser window may look different from the one displayed in browsers on your personal computer.

12.19.2 Specifications of the web browser function

GT37 SoftGOT3000

☞ Page 693 Specifications of the web browser window
☞ Page 697 Encrypted communication
☞ Page 697 Required system application (add-on function)
☞ Page 697 Resource for the system window

Specifications of the web browser window

Item	Specifications	Remarks
Display language	Japanese English Chinese (Simplified) Chinese (Traditional) Korean	The display language can be switched by setting the system language. Any unsupported HTML element or text will be displayed in English regardless of the system language setting.
Maximum number of web browser windows that can be launched	1	—
Supported contents	• HTML (except for video playback) • CSS • JavaScript	For the actions not supported by the web browser window, refer to the following. ☞ Page 693 Actions not supported by the web browser window For the detailed specifications of the web browser window, refer to the following. ☞ Page 694 Detailed specifications of the web browser window
Text input method	• Text input key window • USB keyboard	The text input key window has two types: the standard key window and user-created key window. For the text input key window setting, refer to the following. ☞ Page 698 How to set the web browser function
		For the USB keyboard, refer to the following. ☞ Page 630 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host]) When text is input using a USB keyboard, the buzzer is not output.
Security specifications	SRI (Subresource Integrity) is supported.	If an integrity attribute is specified for HTML, SRI checks that the external reference files have not been manipulated.

■Actions not supported by the web browser window

Item	Description
Downloading files	Files cannot be downloaded from the Internet or a web server to the GOT drive.
Uploading files	Files cannot be uploaded from the GOT drive to the Internet or a web server.
Displaying HTML files saved using a character code other than UTF-8	If the character code of the HTML file is not set using a <meta> element, it is decoded as UTF-8. Therefore, characters in HTML files saved with a character code other than UTF-8 become garbled. To avoid garbled characters, perform any of the following. • Saving HTML files as UTF-8 • Setting the character code of the HTML file using a <meta> element in the <head> element
	When setting the character code of the HTML file using a <meta> element, set it in the first 1024 bytes of the HTML file. The following shows examples for setting the character code to UTF-8. Example 1) <head> <meta charset="utf-8"/> </head> Example 2) <head> <meta http-equiv="content-type" content="text/html; charset=utf-8"/> </head>
Executing or displaying content	The following content cannot be executed or displayed. • Content using Java Applet • Content using ActiveX controls or scripts (such as VBScript and Jscript)
Selecting, copying, and pasting text	Not available
Displaying tabs	Not available
Changing mouse cursor display	Even if the mouse cursor is hovered over a specific element on a web page, the mouse cursor display does not change in the web browser window.

Item	Description
Displaying tooltips	Tooltips, which usually appear when the mouse cursor is hovered over an element on a web page, may not be displayed. Tooltips are not displayed for the following element and attribute. • Tooltip display by the <title> element of SVG • Tooltip display by the title attribute of HTML (in HTML elements, all the elements that support the title attribute)

Precautions

■Precautions for system language switching

If the system language is switched after a web browser is launched, some text will not change in conjunction with system language.

Switch the system language before launching the web browser, or restart the web browser after switching the system language.

Encrypted communication

The web browser function supports encrypted communications.

Server authentication is performed using a certificate issued by the certificate authority to allow access to the web server that supports https.

The certificate issued by the certificate authority is transferred to the GOT when [Web Browser] of the system application (add-on function) is written.

☞ Page 3069 Encrypting communication data (Encrypted communication function)

Required system application (add-on function)

To use the web browser function, [Web Browser] must be selected from the system applications (add-on functions).

Placing a special function switch with the following setting in the screen incorporates the application into the package data automatically.

- Select [Web Browser] for [Switch Action] in the [Special Function Switch] dialog ([SP Function] tab).

Resource for the system window

The web browser function displays web browser windows as system windows.

Use an overlap window as a resource to display a system window.

For the resource of the system window, refer to the following.

☞ Page 536 Using an overlap window as the system window

12.19.3 How to set the web browser function

GT37 SoftGOT3000

Configure all of the following settings to use the web browser function.

Setting	Description
GOT Ethernet setting	Configure the settings to connect the GOT to Ethernet. ☞ Page 713 Setting the GOT Ethernet interface ([GOT Ethernet Setting]) In the following cases, configure the DNS server settings in the GOT. • The host name is used to access a web server. • The host name is used to access a proxy server. ☞ Page 717 Configuring the settings common to Ethernet interfaces
Special function switch setting	Place a special function switch to launch the web browser window. For information on how to place a special function switch, refer to the following. ☞ Page 1198 Setting touch switches Select [Web Browser] for [Switch Action] in the [Special Function Switch] dialog ([SP Function] tab). ☞ Page 1230 [SP Function] tab

Configure the following settings as necessary.

Setting	Description
System window setting	Set the overlap windows to be used as resources for web browser windows (system windows). The overlap windows 4 and 5 are set to be used as resources by default. ☞ Page 542 [Screen Switching/Window]
Text input key window setting	Set the key window to input text in the web browser window. The standard key window is set to be used by default. The following operations are not supported by the standard key window. Use a user-created key window. • Input of characters not supported by the GOT (such as Cyrillic characters) • Input of line feeds To use a user-created key window, configure all of the following settings in the [Basic Setting] tab of the [Environmental Setting] window ([Key Window]). • Select [User-created (individual setting)] in [Key Window]. • Change [Key Window Type] of [Web Browser Text] to [User-created] and set [Window Screen No.]. This setting can be configured only for each project, not for each screen (screen property). For information on how to create a user-created key window, refer to the following. ☞ Page 568 How to create a user-created key window For details on the settings to use Kana-Kanji/Pinyin conversion, refer to the following. ☞ Page 604 Configuring the settings for converting a text into kanji or Simplified Chinese characters in the GOT ([Kana-Kanji/Pinyin Conversion]) ☞ Page 710 [Web Browser] dialog (peripheral setting) The option selection window settings can be configured only for each project, not for each screen (screen property).
	To insert a line feed to enter the text in two or more lines in the web browser window, place key code switches in the user-created key window, and set the following items in the [Key Code Switch] dialog ([Key Code] tab). • Select [Numerical/Text Input] for [Key Code Type]. • Set the key code to [000A]. ☞ Page 1251 [Key Code Switch] dialog
	For the specifications of the key window in the web browser function, refer to the following. ☞ Page 699 Specifications of the key window in the web browser function
Additional setting of the operation memory	Configure the relevant settings for the operation memory to be used in the web browser function. If the operation memory is insufficient, some content may not be displayed. ☞ Page 709 [Web Browser]
Web browser setting	Configure the following settings to be used in the web browser function. • Setting to enable image display • Setting to enable alarm popup display • Setting to enable cookies • Setting to enable histories • Proxy server settings • Website settings • Setting to enable Kana-Kanji/Pinyin conversion • Resource file settings ☞ Page 709 [Web Browser] ☞ Page 710 [Web Browser] dialog (peripheral setting)

Specifications of the key window in the web browser function

■Specifications of the standard key window in the web browser function

Some specifications of the standard key window in the web browser function differ from those of the standard key window for inputting numerical values and other data in the GOT.

The following table lists the specifications that differ.

Specification with different actions		Action
Key	[AC] key	This key is equivalent to the Back space key in a web browser on your personal computer. It deletes the character on the left of the cursor.
	[DEL] key	This key is equivalent to the Delete key in a web browser on your personal computer. It deletes the character on the right of the cursor.
	Cursor keys (screen)	The keys do not operate. (The cursor keys (object), which move the cursor right or left inside objects, can operate.)
Settings not applied		The following settings in the [Environmental Setting] window (the [Basic Setting] tab of [Key Window]) or in the [Key Window Basic Setting] tab of the screen properties are not applied to the standard key window in the web browser function. • [Display value during input] • [Display previous value] • [Display input function range]

For the specifications of the standard key window for inputting numerical values and others in the GOT, refer to the following.

☞ Page 558 Specifications of the standard key window

■Objects that operate in the user-created key window

The following objects operate in the user-created key window.

Object	Remarks
Touch switch	Only the touch switches whose [Key Code Type] is [Numerical/Text Input]] will operate. ☞ Page 1251 [Key Code] tab
	For the touch switches displayed in the user-created key window, the following settings are disabled. • [Lamp(Timing to change shape/text)] • [Comment] of [Text Type] • [Use offset] • [Operation Log Target] • [Control displaying/hiding] • [Trigger] • [Use Object Script] The behavior when [Only if conditions are met] is selected for [Buzzer] is the same as that of [Always].
Key window object	☞ Page 1887 Placing an object to display the input information

PART 5

Specifications for excluded host names in Proxy server settings

Domain names or parts of IP addresses can be specified as excluded host names using wild cards (asterisks: *).
If a host name is incorrectly specified with wild cards, the excluded host name setting will be invalid.
The following shows the conditions for specifying names with wild cards.

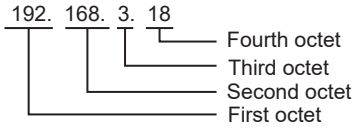
IP address format

- You can specify the numerical values of the first to fourth octets using wild cards.
- Multiple octets can be specified using wild cards.

Example) 192.*.*.*

- You cannot omit the periods that separate the octets.

Example) 192.*



Domain name format

- You can specify a domain-level group of characters in deep hierarchies using a wild card.

Example) *.example.co.jp, *.co.jp

- You cannot use a wild card to include the top and the second level domains.

Example) *.jp

- You cannot use wild cards for two or more domains.

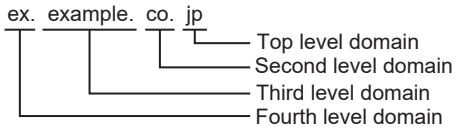
Example) *.*.co.jp

- You cannot use a wild card as a part of any domain.

Example) *ple.co.jp

- You cannot use a wild card as the middle part of a domain.

Example) ex.*.co.jp



12.19.4 Launching or exiting a web browser window

Operation	Description
Launch	Touch a special function switch to launch the web browser window. For information on how to set a special function switch, refer to the following. ☞ Page 698 How to set the web browser function
Exit	Touch the exit button in the upper right corner of the web browser window. ☞ Page 702 Operation on the web browser window

Precautions

■Precautions for turning on the GOT

After the GOT is turned on, the processing to enable launch of a web browser window takes approximately 30 seconds.
If a web browser window is launched before the processing is completed, any screen operation will not be available until the processing is completed.

■Precautions for using a web browser window for a long period of time

If a web browser window is used for an extended period, it may relaunch due to an error.
If the window is relaunched, the URL that was accessed when it was first opened is reloaded.

If a web browser window is used for an extended period, it may stop due to an error.
If the web browser stops, an error notification dialog is displayed and GS2065.b15 is turned on.
If the web browser window stops, you need to restart the GOT to use it again.
The following methods can restart the GOT:

- Power off → on the GOT.
- Turn on GS639.b15.

Prepare a script to turn on GS639.b15 when GS2065.b15 is turned on to restart the GOT automatically when the web browser window stops.
For details on the GOT special registers, refer to the following.
☞ Page 3581 GOT special register (GS)

To ensure stable use of the web browser window, it is recommended to restart the GOT periodically (every 24 hours is recommended).

■Precautions for exiting a web browser window

When a web browser window is closed, the exiting processing may take some time.
If the exiting processing is not completed within five seconds, the web browser window is closed, and the exiting processing continues in the background.
If a web browser window is launched before the exiting processing is completed, a dialog to notify you that the exiting processing is in progress.
Close the dialog and launch the web browser window again.

12.19.5 Operation on the web browser window

GT37 SoftGOT3000

Touch the special function switch to launch the web browser window.

The URL displayed in the launched web browser window and the window size are determined by the settings of the special function switch.

The following shows the displayed contents in the web browser window and how to operate the window.

Item			Description
1)	Application tool bar	—			Title bar	Displays the text set in [Window Title] with the special function switch.
		Enable Kana-Kanji/Pinyin conversion button	Appears when [Use Kana-Kanji/Pinyin Conversion] is selected in the [Web Browser] dialog (peripheral setting). Switch the key window for the web browser to the key window for Kana-Kanji/Pinyin conversion.
		Zoom in button Zoom out button	Changes the display magnification of the screen. The change is applied to the contents displayed in the web browser screen. Display of some contents are not changed even if the display magnification is changed. They can be hidden by turning on GS2562.b3 before launching the web browser window.
		Click switching button	Activates the right-click mode. In the right-click mode, touch operation behaves as right-click only once. The right-click mode is deactivated after the touch operation (right-click). Use this mode when displaying the content that supports right-click. It can be hidden by turning on GS2562.b2 before launching the web browser window.
		Browser toolbar display switching button	Displays or hides the browser toolbar. It can be hidden by turning on GS2562.b0 before launching the web browser window.
		Exit button	Closes the web browser window.
2)	Content display area		Displays the content. When the content is larger than the content display area, horizontal and vertical scroll bars are displayed.

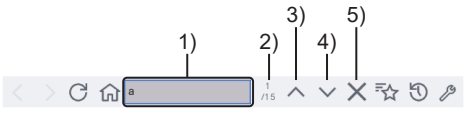
Item			Description
3)	Browser toolbar	—	 Indicates the progress of processing by a bar while a page is being loaded. It can be hidden by turning on GS2562.b1. (You can also display or hide the tool bar after launching the web browser window.)
		Back button	Returns to the previous page. Disabled if the browsing history does not exist or the history saving is disabled.
		Forward button	Moves to the page that had been displayed before the back button was clicked. Disabled if the browsing history does not exist or the history saving is disabled.
		Update button	Updates a page. This button becomes the cancel button while the page is being refreshed.
		Website button	Moves the web browser window to the startup page. If a website URL is configured, moves to that specific URL.
		Address bar	Displays the URL. During https communications, an icon is displayed at the beginning of the URL. Touch the address bar to display the text input key window for web browsers. Up to 8192 characters can be entered in UTF-16 code units.
		Search button	Searches for the text in the page. The browser toolbar enters the search mode. ☞ Page 703 Browser toolbar (search mode)
		Bookmark button	Opens the dialog to confirm bookmarking of the page. If the displayed page is already bookmarked, a dialog appears to confirm the deletion of the bookmark. ☞ Page 704 Dialog to confirm bookmarking
		Move button	Moves to the URL page displayed in the address bar.
		Bookmark management button	Displays a list of bookmarks in the bookmark management screen. ☞ Page 704 Bookmark management screen
		History management button	Displays the list of browsing history in the history management screen. ☞ Page 705 History management screen
		Setting button	Displays the browser settings screen. ☞ Page 705 Browser settings screen

Browser toolbar (search mode)

Click the search button on the browser toolbar to search for the text within the page.

When you enter a keyword as the search text, the search results in the page are highlighted in yellow.

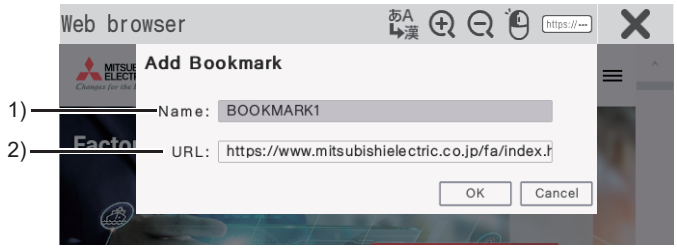
The text focused by the back button or forward button is highlighted in orange.



Item		Description
1)	Search text	Enter the text to be searched for.
2)	Current focus position/Number of hits	Displays the current focus position relative to the total number of hits in the page.
3)	Back button	Moves the focus to the previous hit.
4)	Forward button	Moves the focus to the next hit.
5)	Exit button	Exits the search mode.

Dialog to confirm bookmarking

Touch the bookmark button on the browser toolbar to bookmark the displayed page.



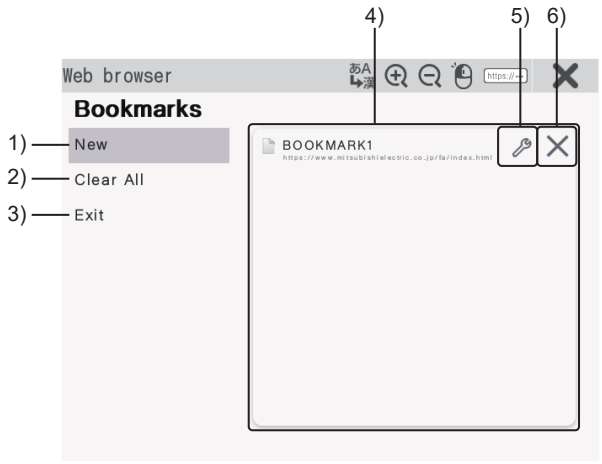
Item		Description
1)	[Name]	Specify the title for the bookmark. The allowable number of characters for the title depends on the text used. If a title longer than the limit is registered, the extra characters will be removed.
2)	[URL]	Specifies the URL to bookmark.

Bookmark management screen

Touching the bookmark management button on the browser toolbar to check the registered bookmarks.

Up to 32 bookmarks are retained, and older bookmarks are deleted when the number exceeds 32.

Bookmarks are saved in the folder specified in the [Web Browser] dialog (peripheral setting).



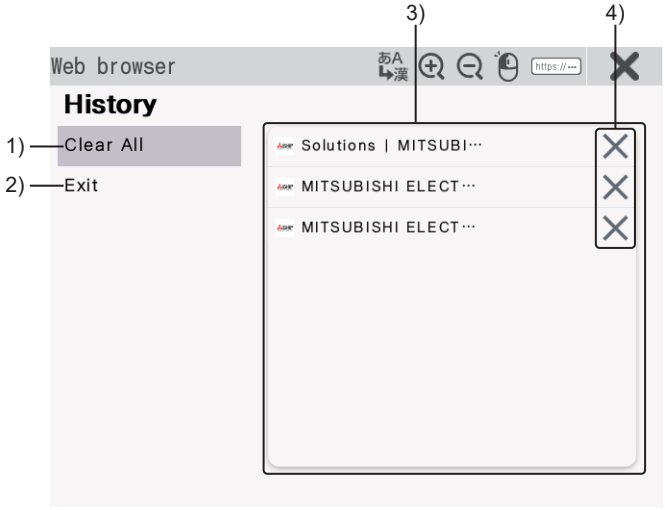
Item		Description
1)	[New] button	Displays the dialog to confirm bookmarking of the page.
2)	[Clear All] button	Deletes all bookmarks.
3)	[Exit] button	Exits the bookmark management screen.
4)	Bookmark list	List of bookmarks. They are displayed in the order of creation. Touch a bookmark to browse the page.
5)	Edit button	Displays the edit dialog.
6)	Delete button	Deletes the bookmark.

History management screen

Click the history management button on the browser toolbar to see the history of pages you have visited.

It retains up to 50 records. If the number of records exceeds 50, the oldest records are deleted.

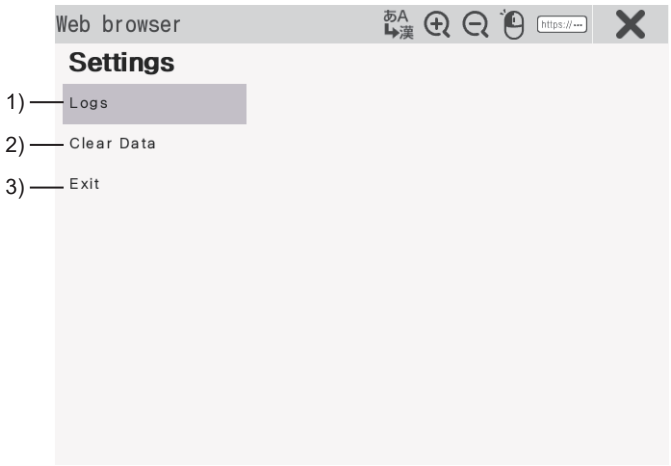
Records are saved in the folder specified in the [Web Browser] dialog (peripheral setting).



Item		Description
1)	[Clear All] button	Deletes all the history records.
2)	[Exit] button	Exits the history management screen.
3)	History list	Lists the history records. The browsing history is displayed from newest to oldest. Touch a history record to browse the page again.
4)	Delete button	Deletes the history.

Browser settings screen

Click the setting button on the browser toolbar to see the browser settings.

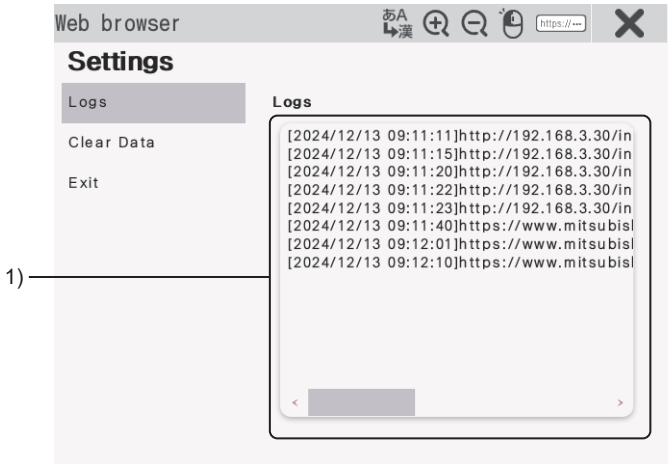


Item		Description
1)	[Logs] button	Displays the log of the web browser function. This button is displayed if GS2562.b14 is on when the web browser is launched. ☞ Page 706 Log display
2)	[Clear Data] button	Displays the data clear. ☞ Page 706 Data clear
3)	[Exit] button	Closes the browser settings screen and returns to the previous screen.

■Log display

To display this screen, GS2562.b14 must be on when the web browser is launched.

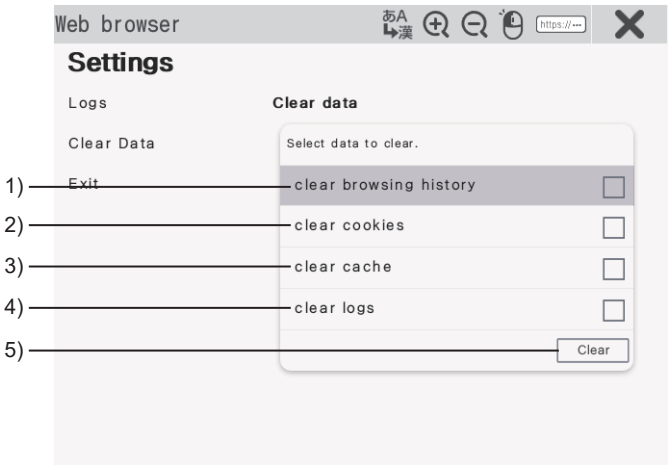
This screen displays information for webpage designers.



Item		Description
1)	Log list	Displays the logs stored at the time this screen is displayed. It retains up to 100 logs. If the number of logs exceeds 100, the oldest logs are discarded.

■Data clear

Touch the [Clear Data] button on the browser settings screen to display this screen.



Item		Description
1)	[clear browsing history]	Allows the history to be deleted.
2)	[clear cookies]	Allows cookies to be deleted.
3)	[clear cache]	Allows cache to be deleted.
4)	[clear logs]	Logs are the target for deletion. This item is displayed if GS2562.b14 is on when the web browser is launched.
5)	[Clear] button	Deletes the selected item(s).

12.19.6 Operation control on the web browser window

GT37 SoftGOT3000

☞ Page 707 Website to be displayed when the web browser window is launched
☞ Page 707 Specifying the display mode of the web browser window
☞ Page 708 Specifying the behavior when the special function switch is clicked after the web browser window is launched
☞ Page 708 Disabling JavaScript (Mobile code execution control function)

Website to be displayed when the web browser window is launched

Specify the URL of the website to be displayed when the web browser window is launched with the special function switch for startup.

Set it in [Specification] under [URL at Startup].

☞ Page 1233 [Web Browser] setting

Specifying the display mode of the web browser window

The web browser window is displayed in the window display mode or full screen mode.

Use GS2562.b10 to switch between the display modes.

The web browser window can be displayed in the full screen mode by turning on GS2562.b10 before launching the web browser window.

GS2562.b10	Display mode	Description
OFF	Window display mode	Displays the web browser window as a window on the base screen. ON	Full screen mode	Displays the web browser window on the entire base screen. In the full screen mode, the utility call key does not function. 
Specifying the behavior when the special function switch is clicked after the web browser window is launched

Use GS2562.b11 to switch the behavior when the special function switch is clicked after the web browser window is launched.
You can also switch the behavior after launching the web browser window.

GS2562.b11	Behavior
OFF	Displays the dialog notifying you that the web browser window cannot be launched.
ON	Closes the displayed web browser window. A new web browser window is launched according to the setting of the special function switch you clicked.

Disabling JavaScript (Mobile code execution control function)

Use GS2562.b12 to enable or disable JavaScript.
JavaScript is disabled by turning on GS2562.b12 before launching the web browser window.

GS2562.b12	Behavior
OFF	Enables JavaScript.
ON	Disables JavaScript.

Precautions

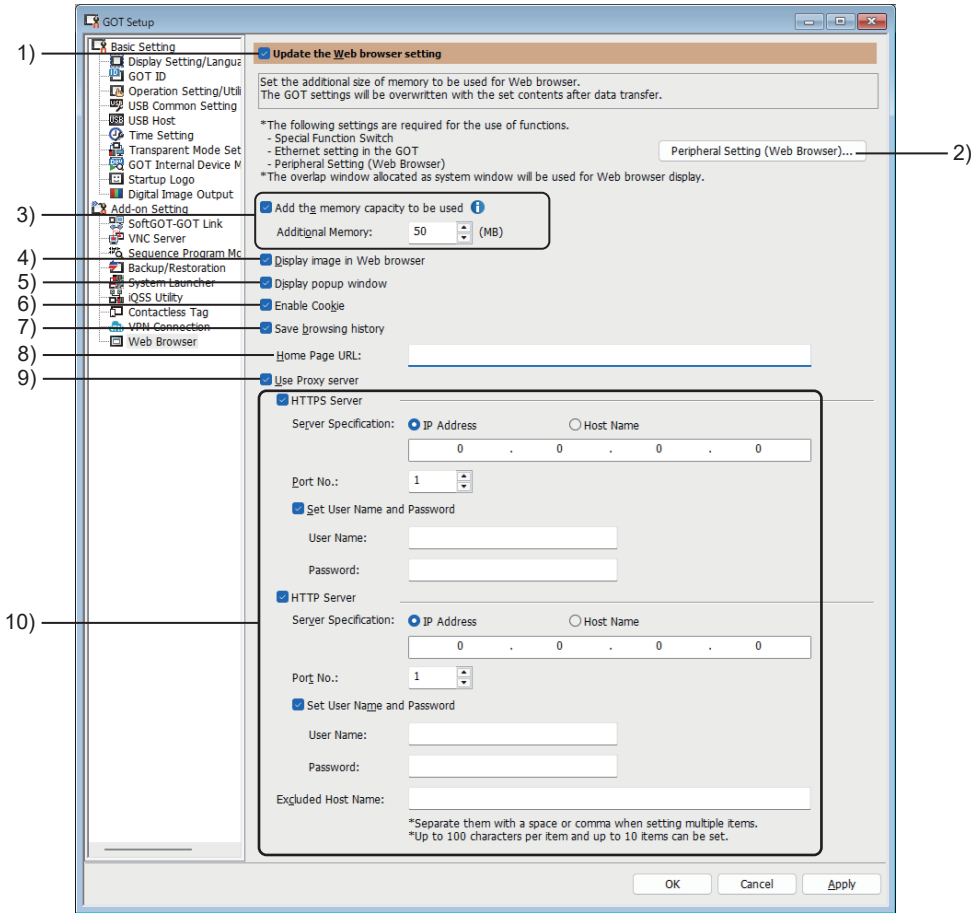
The mobile code execution control function prevents JavaScript from being executed.
This function does not determine if the JavaScript code is malicious.

12.19.7 [Web Browser]

GT37 SoftGOT3000

Configure the settings to use the web browser function.

Select [Common] → [GOT Setup] → [Add-on Setting] → [Web Browser] from the menu to display this window.

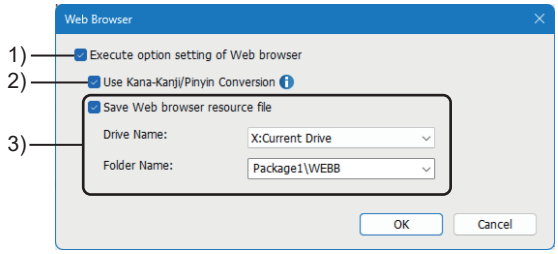


Item		Description
1)	[Update the Web browser setting]	Configure the web browser settings.
2)	[Peripheral Setting (Web Browser)]	Opens the [Web Browser] dialog (peripheral setting). ☞ Page 710 [Web Browser] dialog (peripheral setting)
3)	[Add the memory capacity to be used]	Add the operation memory to be used in the web browser function. If the operation memory is insufficient, some content may not be displayed. The setting range is [1] MB to [100] MB.
4)	[Display image in Web browser]	Enables the display of images in the web browser. If you access the image file URL directly, the image will be displayed regardless of the setting.
5)	[Display popup window]	Enables the display of popup windows in the web browser. When disabled, popup windows will be blocked except for those initiated by user actions such as touch, mouse, and keyboard operations.
6)	[Enable Cookie]	Enables saving and reading cookies. For information on the save destination setting, refer to the following. ☞ Page 710 [Web Browser] dialog (peripheral setting)
7)	[Save browsing history]	Enables saving of browsing history. For information on the save destination setting, refer to the following. ☞ Page 710 [Web Browser] dialog (peripheral setting)
8)	[Home Page URL]	Set the URL that is displayed when you touch the website button. Up to 512 characters can be set. The input URL must start with http:// or https://. If the URL does not start with http:// or https://, it is considered a format error and the website is not displayed.

Item			Description
9)	[Use Proxy server]		Enables connections via a proxy server. The following authentication methods are supported. • Basic authentication • Digest authentication
10)	[HTTPS Server] [HTTP Server]	—	Enables server settings.
		[Server Specification]	Set either of the following. • IP address: The setting range is [0].[0].[0].[0] to [255].[255].[255].[255]. • Host name: Up to 100 characters, alphanumeric characters and symbols (including hyphen (-) and period (.)), can be entered.
		[Port No.]	Set the port number used for the communication with the proxy server. The setting range is [1] to [65535].
		[Set User Name and Password]	Enables user name and password settings for proxy authentication.
		[User Name]	Set a user name for proxy authentication. Up to 32 characters can be entered.
		[Password]	Set a password for proxy authentication. Up to 32 characters can be entered.
		[Excluded Host Name]	Specify the host names or IP addresses of web servers that can be accessed without using a proxy server. You can enter up to ten options, with a maximum of 100 characters for each. Use a comma (,) or space as the delimiter. Domain names or parts of IP addresses can be specified as excluded host names using wild cards (asterisks: *). For details, refer to the following. ☞ Page 700 Specifications for excluded host names in Proxy server settings

12.19.8 [Web Browser] dialog (peripheral setting)

GT37 SoftGOT3000



Item			Description
1)	[Execute option setting of Web browser]		Enables the optional settings for web browsers.
2)	[Use Kana-Kanji/Pinyin Conversion]		Enables switching to the key window for Kana-Kanji/Pinyin conversion.
3)	[Save Web browser resource file]	—	Enables the saving of the resource file. When the saving is enabled, historical or other data can be retained even if the GOT is turned off.
		[Drive Name]	Select the save destination folder for the resource file. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
		[Folder Name]	Specify a folder to save the resource file. You can enter up to 60 characters, including the drive name.

12.19.9 Relevant settings

GT37 SoftGOT3000

The web browser function has other relevant settings besides the specific settings.
The following shows the functions that are available by configuring the relevant settings.

GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Hides the browser toolbar display switching button.	GS2562.b0
Hides the browser toolbar.	GS2562.b1
Hides the click switching button.	GS2562.b2
Hides the zoom in button and zoom out button.	GS2562.b3
Displays the web browser window in the full screen mode.	GS2562.b10
Closes the displayed web browser window and launches a new web browser window when the special function switch is clicked with the web browser window launched.	GS2562.b11
Disables JavaScript.	GS2562.b12
Enables switching to the screen that displays logs for webpage designers.	GS2562.b14
Saves the display history of pages containing <iframe> elements, and enables page switching with the back or forward button on the browser toolbar.	GS2562.b15

12.19.10 Troubleshooting

GT37 SoftGOT3000

Issue	Possible cause	Solution
An abnormal URL format error screen is displayed.	The entered URL does not start with http:// or https://.	Add http:// or https:// to the beginning.
A URL acquisition error screen is displayed.	Acquisition of the URL at startup failed.	• Check the URL setting. • Change the method of specifying the URL from device specification to another option. ☞ Page 1233 [Web Browser] setting
Nothing is displayed in the web browser.	The network connection is invalid.	• Check that the network cables are connected. • Check that the router is powered on.
	The access is blocked by firewall or security software.	Check that the use of the IP address and port number to be used for the network connection is allowed.
The communication speed is low.	Access is concentrated.	Connect again after a while.
	Continuous long-term use of the personal computer or router has decreased its processing capacity.	Restart the personal computer or router continuously used for a long time.
	Your ISP (Internet Service Provider) restricts your Internet bandwidth or speed.	Check with your ISP (Internet Service Provider).
	The network of your plan is slow.	Review your Internet plan.
The web browser function does not work properly.	The content is not supported by the web browser function.	Display the content that is supported by the web browser function. ☞ Page 693 Specifications of the web browser window
	Cache is corrupted.	Clear cache in the browser settings screen (data clear). ☞ Page 706 Data clear
The connection error window (Error Has Occurred) is displayed.	The URL to be accessed does not exist.	Reload the file or back to the previous page in the connection error window.
	There is no response from the URL to be accessed.	
	Connection to the proxy server failed due to network issues.	Check the network environment.

PART 5

Issue	Possible cause	Solution
A security warning dialog (Security Warning) is displayed. (When an SSL authentication error has occurred)	The URL was accessed in the following state. • There is no certificate. • The certificate is expired. • There is a problem with the self-signed certificate.	Click the [Cancel] button in the security warning dialog. (Recommended) When the [Proceed] button is clicked, you will be redirected to the website but with the following problems. • The website fails to provide encrypted communication. • The website is not displayed correctly.
		Verify that a certificate is installed, and check its expiration date.
An error dialog indicating that an attempt was made to display unsupported content (MIME Type Not Supported) is displayed.	An attempt was made to display content that cannot be displayed.	Do not display unsupported content. ☞ Page 693 Specifications of the web browser window
The following message is displayed in the notification dialog. [Web browser function has stopped due to an error. Please restart the GOT to use web browser function again.]	An error occurred, and the web browser cannot continue.	To use the web browser function again, restart the GOT. ☞ Page 701 Precautions for using a web browser window for a long period of time
GS2065.b15 turns on.		

13 Setting the GOT Ethernet interface ([GOT Ethernet Setting])

GT37 SoftGOT3000

☞ Page 714 Setting the GOT IP address
☞ Page 717 Configuring the settings common to Ethernet interfaces
☞ Page 719 Setting the IP filter

PART 5

13.1 Setting the GOT IP address

GT37 SoftGOT3000

Set an IP address and a subnet mask for each Ethernet interface of the GOT.
For setting the default gateway, refer to the following.
☞ Page 717 Configuring the settings common to Ethernet interfaces
For the specifications of the GOT interface, refer to the following.
GOT3000 Series User's Manual (Hardware)

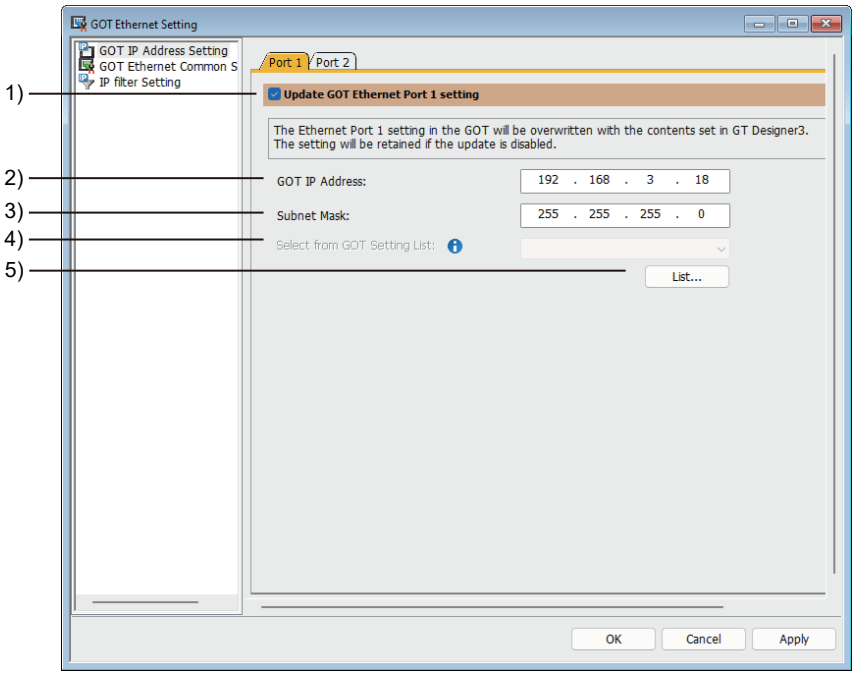
13.1.1 [GOT IP Address Setting]

GT37 SoftGOT3000

In [GOT IP Address Setting], set an IP address and a subnet mask for each Ethernet interface.
Select [Common] → [GOT Ethernet Setting] → [GOT IP Address Setting] from the menu to display this window.
Switch between the tabs according to the Ethernet port to be set.
☞ Page 715 [Port 1] tab
☞ Page 716 [Port 2] tab

[Port 1] tab

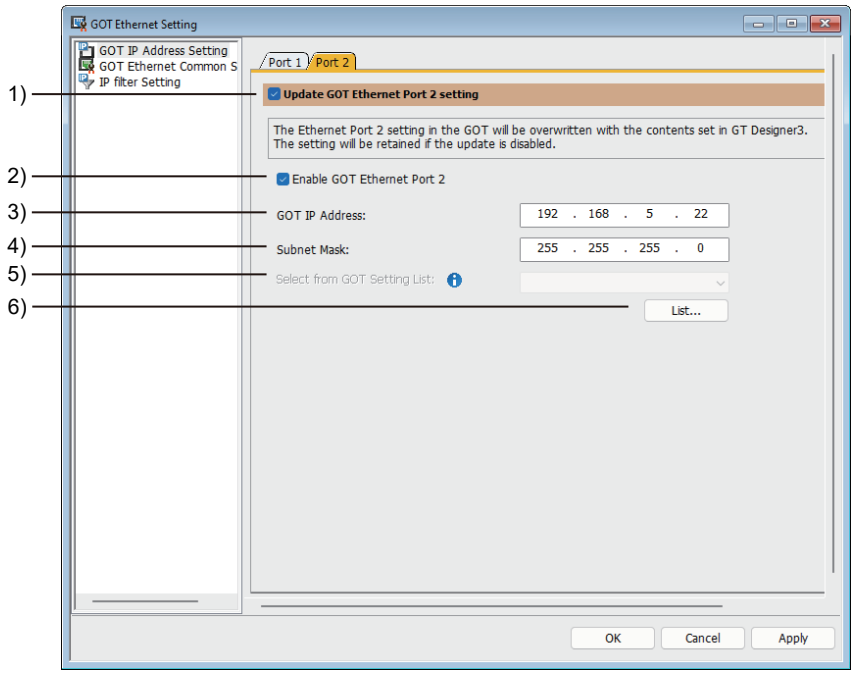
Set an IP address and a subnet mask for Ethernet port 1.



Item		Description
1)	[Update GOT Ethernet Port 1 setting]	Overwrites the settings of the GOT with the settings of GT Designer3 when package data is written to the GOT. Select this item to configure the settings on the [Port 1] tab. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[GOT IP Address]	Set an IP address for Ethernet port 1. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255]. The same network is inaccessible through Ethernet port 1 and Ethernet port 2. Set an IP address for each interface to access a different network.
3)	[Subnet Mask]	Set a subnet mask for Ethernet port 1. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
4)	[Select from GOT Setting List]	Select the GOT Ethernet setting to be used among the settings registered in the [GOT Setting List] dialog.
5)	[List] button	Displays the [GOT Setting List] dialog. For details on the settings, refer to the following. ☞ Page 624 [GOT Setting List] dialog

[Port 2] tab

Set an IP address and a subnet mask for Ethernet port 2.



Item		Description
1)	[Update GOT Ethernet Port 2 setting]	Overwrites the settings of the GOT with the settings of GT Designer3 when package data is written to the GOT. Select this item to configure the settings on the [Port 2] tab. When a project is read from the GOT, the setting changed in the utility is applied.
2)	[Enable GOT Ethernet Port 2]	Enables Ethernet port 2.
3)	[GOT IP Address]	Set the IP address for Ethernet port 2. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255]. The same network is inaccessible through Ethernet port 1 and Ethernet port 2. Set an IP address for each interface to access a different network.
4)	[Subnet Mask]	Set a subnet mask for Ethernet port 2. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
5)	[Select from GOT Setting List]	Select the GOT Ethernet setting to be used among the settings registered in the [GOT Setting List] dialog.
6)	[List] button	Displays the [GOT Setting List] dialog. For details on the settings, refer to the following. ☞ Page 624 [GOT Setting List] dialog

13.2 Configuring the settings common to Ethernet interfaces

GT37 SoftGOT3000

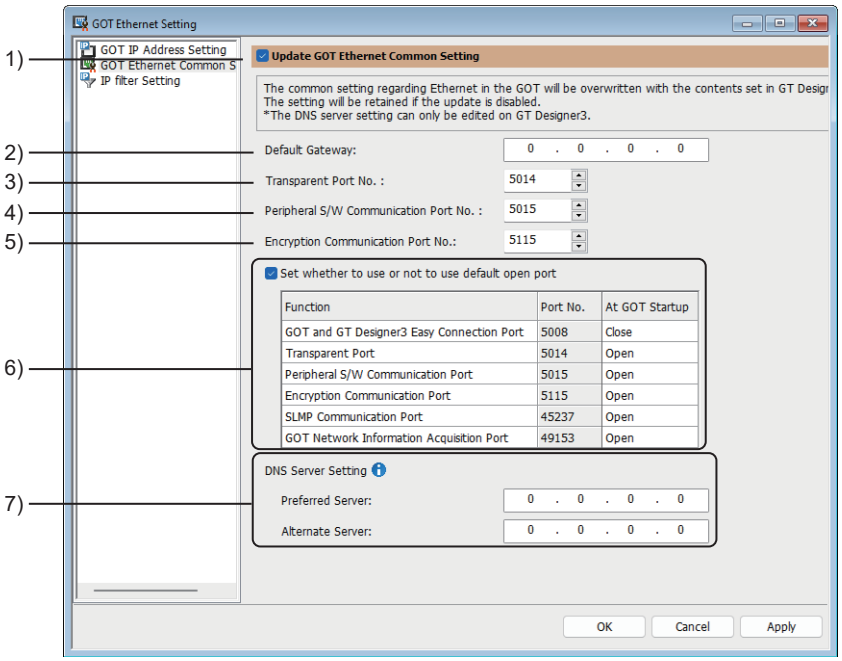
Set the default gateway and other common items for Ethernet interfaces.

13.2.1 [GOT Ethernet Common Setting]

GT37 SoftGOT3000

In [GOT Ethernet Common Setting], set the default gateway and other common items for Ethernet interfaces.

Select [Common] → [GOT Ethernet Setting] → [GOT Ethernet Common Setting] from the menu to display this window.



Item		Description
1)	[Update GOT Ethernet Common Setting]	When this item is selected, the settings of the GOT will be overwritten with the settings of GT Designer3 when package data is written to the GOT. If this item is deselected, the settings will not be overwritten. The Ethernet-related common settings of the GOT will be held. The settings for [DNS Server Setting] can be changed only in GT Designer3.
2)	[Default Gateway]	Set the default gateway. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
3)	[Transparent Port No.]*1	Use this port number for the FA transparent function. This setting is common to Ethernet port 1 and Ethernet port 2. The setting range is [1024] to [65534]. Do not set the port number used for the other settings. Duplication of the port number disables communication. To change the number, it is recommended to use a number in the 50000s or higher.
4)	[Peripheral S/W Communication Port No.]*1	Set the port number used for communications with GT Designer3 or Data Transfer Tool. This setting is common to Ethernet port 1 and Ethernet port 2. The setting range is [1024] to [65534]. Do not set the port number used for the other settings. Duplication of the port number disables communication. To change the number, it is recommended to use a number in the 50000s or higher.

Item			Description
5)	[Encryption Communication Port No.]		Set the port number used for encrypted communications with GT Designer3 or Data Transfer Tool . This setting is common to Ethernet port 1 and Ethernet port 2. The setting range is [1024] to [65534]. Do not set the port number used for the other settings. Duplication of the port number disables communication. To change the number, it is recommended to use a number in the 50000s or higher.
6)	[Set whether to use or not to use default open port]*1		Set whether to open or close the ports that are open by default. (Default open port use/nonuse setting function) Select whether to open or close the port used for each function at GOT startup.
7)	[DNS Server Setting]	—	Set a DNS server. Configure the settings when accessing with the host name. If both [Preferred Server] and [Alternate Server] are set to [0.0.0.0], the DNS server settings are disabled.
		[Preferred Server]	Set an IP address for the preferred server. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
		[Alternate Server]	Set an IP address for the alternate server. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].

*1 The port number and the default open port setting can also be changed in the utility.
Open the port to be used. The port number must be the same between GT Designer3 and the GOT.
If the port is closed or the port number is not the same, communications with the GOT is not possible.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

Precautions

■Taking security measures except the open port use/nonuse setting function

The default open port use/nonuse setting function is one method of preventing unauthorized access from external devices such as destruction of programs or data. The function does not prevent unauthorized access completely.
To maintain the security (availability, integrity, and confidentiality) of GOT3000 and the system against unauthorized access from external devices, DoS attacks, computer viruses, and other cyberattacks, take appropriate measures in addition to this function, such as firewalls, virtual private networks (VPNs), and antivirus solutions.
Mitsubishi Electric shall have no responsibility or liability for GOT3000 troubles and system troubles caused by unauthorized access from external devices, DoS attacks, computer virus, and other cyberattacks.

■Reserved port number settings

Numbers below 50000 contains reserved port numbers.
Do not use these numbers when changing from default settings.
When converting a GOT2000 project to a GOT3000 project, ensure that the port number is not already in use.

13.3 Setting the IP filter

GT37 SoftGOT3000

☞ Page 720 Filtering method
☞ Page 722 Filtering list
☞ Page 723 [IP filter Setting]

The IP filter allows or blocks access via an Ethernet network from IP addresses in the filtering list.
When connecting the GOT to Ethernet, it is recommended to use an IP filter.

Precautions

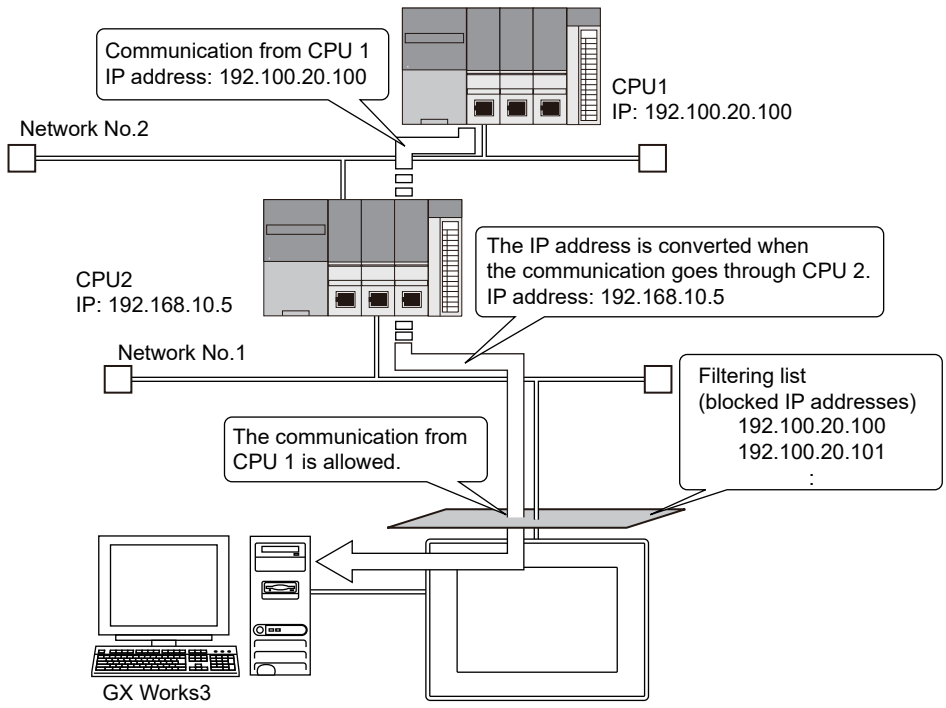
■Taking security measures except the IP filter

The IP filter function is one method of preventing unauthorized access from external devices such as destruction of programs or data. The function does not prevent unauthorized access completely.
To maintain the security (availability, integrity, and confidentiality) of GOT3000 and the system against unauthorized access from external devices, DoS attacks, computer viruses, and other cyberattacks, take appropriate measures in addition to this function, such as firewalls, virtual private networks (VPNs), and antivirus solutions.
Mitsubishi Electric shall have no responsibility or liability for GOT3000 troubles and system troubles caused by unauthorized access from external devices, DoS attacks, computer virus, and other cyberattacks.

■Filtering in communication via network equipment

A source IP address may be converted depending on the network route, such as via a router having the IP address conversion function or via a PLC CPU by using the FA transparent function.
When a controller communicates with the GOT via network equipment whose IP address is unlisted in the filtering list, even if the controller IP address is in the filtering list, the IP filter is not applied.
For network configurations in which a source IP address may be changed, set the filtering list in consideration of routed system equipment.

Ex.
When CPU 1 accesses GX Works3 via CPU 2 on a different network and then via the GOT using the FA transparent function



13.3.1 Filtering method

GT37 SoftGOT3000

The GOT filters access from IP addresses in the filtering list by the following filtering methods.

☞ Page 720 Transmission

☞ Page 721 Blocking

The filtering method is settable in [IP Filter Setting] on GT Designer3 or the GOT utility.

☞ Page 723 [IP filter Setting]

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

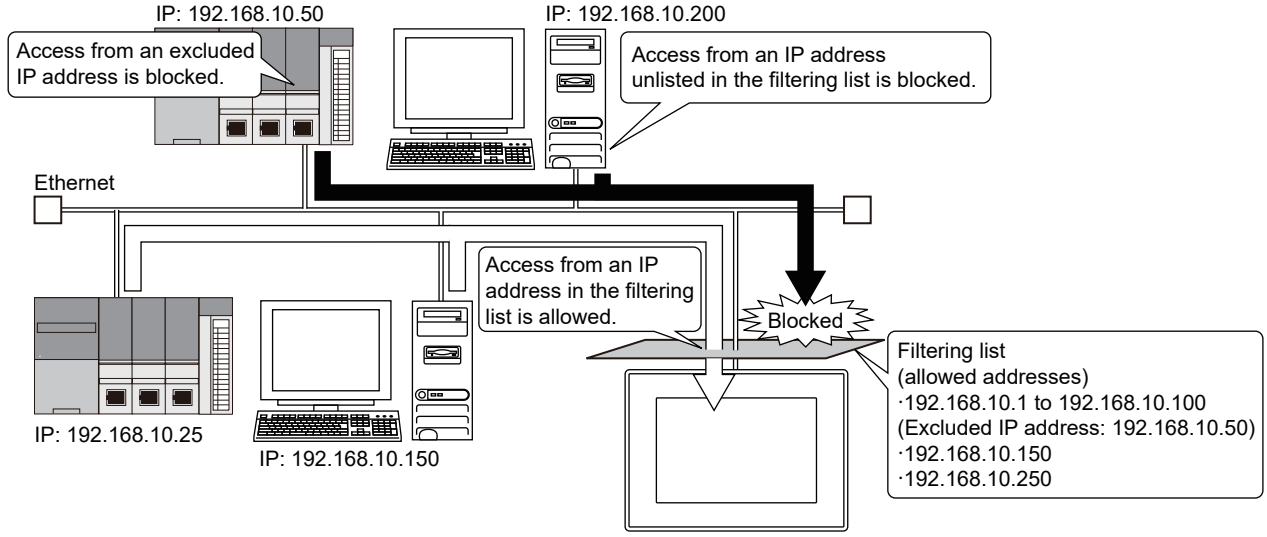
Transmission

The GOT allows access from IP addresses in the filtering list.

The GOT blocks access from IP addresses unlisted in the filtering list.

Excluded IP addresses are settable in the filtering list.

The GOT blocks access from the excluded IP addresses.



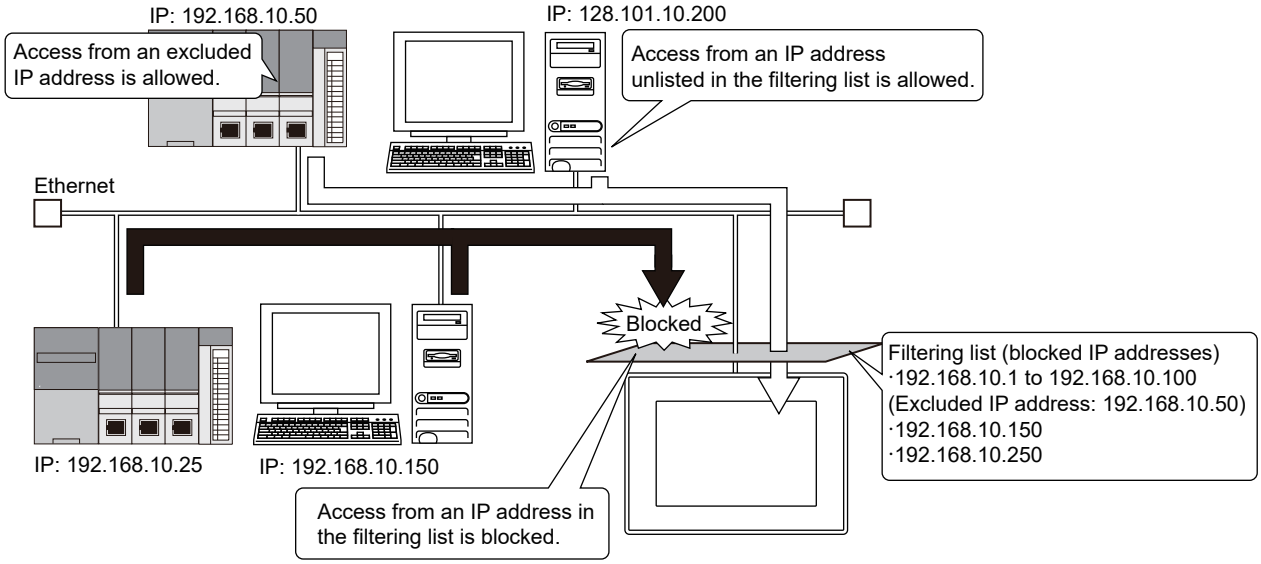
Blocking

The GOT blocks access from IP addresses in the filtering list.

The GOT allows access from IP addresses unlisted in the filtering list.

Excluded IP addresses are settable in the filtering list.

The GOT allows access from the excluded IP addresses.



13.3.2 Filtering list

GT37 SoftGOT3000

The filtering list contains IP addresses to be filtered.

The filtering list is settable in [IP Filter Setting] on GT Designer3 or the GOT utility.

☞ Page 723 [IP filter Setting]

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Specifying the IP address range

You can set the range of IP addresses to be registered in the filtering list.

To set the range of IP addresses, the start IP address and the end IP address must belong to the same subnet.

To set the range of IP addresses belonging to different subnets, group IP addresses by subnet for registration.

The following shows an example where the fourth octet of IP addresses indicates a subnet.

Ex.

Possible settings

- First setting: Start IP address 192.168.3.5, end IP address 192.168.3.255
- Second setting: Start IP address 192.168.4.1, end IP address 192.168.4.20

Ex.

Impossible settings

- First setting: Start IP address 192.168.3.100, end IP address 192.168.3.20
- Second setting: None

Priority of the IP filter settings

When the IP address ranges overlap in the filtering list, the GOT prioritizes the range that has been set earlier.

If an excluded IP address overlaps with an IP address in the already-specified IP address range, the excluded IP address becomes invalid.

Ex.

When the filtering method is blocking

- First setting: 192.168.3.10 to 192.168.3.100, excluded: 192.168.3.90
- Second setting: 192.168.3.80 to 192.168.3.240, excluded: 192.168.3.85

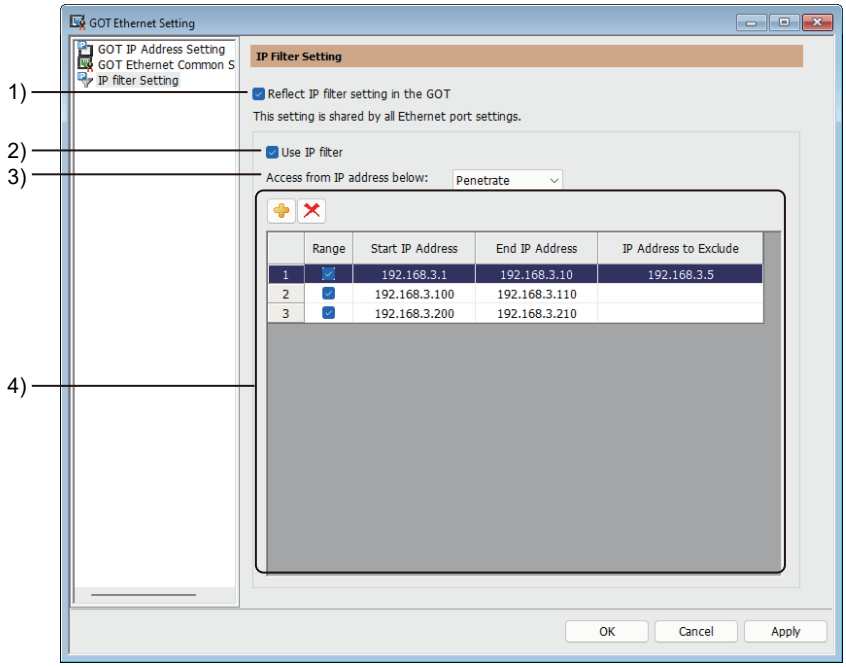
IP address 192.168.3.85 is blocked.

13.3.3 [IP filter Setting]

GT37 SoftGOT3000

In [IP Filter Setting], set the filtering method and the filtering list.

Select [Common] → [GOT Ethernet Setting] → [IP filter Setting] from the menu to display this window.



Item		Description
1)	[Reflect IP filter setting in the GOT]	Reflects the IP filter setting to the GOT.
2)	[Use IP filter]	Enables the IP filter.
3)	[Access from IP address below]	Select whether to transmit or block access from the IP addresses specified in the filtering list. ☞ Page 720 Filtering method

PART 5

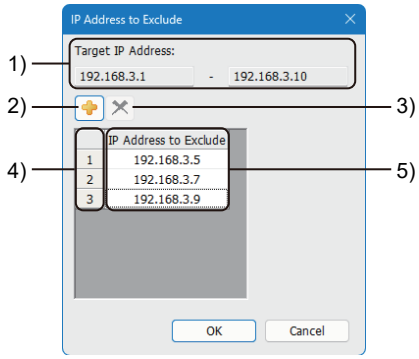
Item			Description
4)	Filtering list	—	Lists IP address ranges to which the IP filter is applied. Up to 32 IP address ranges can be registered.  For details on the filtering list, refer to the following. ☞ Page 722 Filtering list
		[Add] button	Adds an IP filter setting in the bottom of the list.
		[Delete] button	Deletes a selected IP filter setting.
		No.	IP filter setting number Clicking an IP filter setting number selects the row. Hold down the Ctrl key and click a setting number to select or deselect the row while the other rows remain selected or deselected. Select the first row in the range, hold down the Shift key, and click a setting number to select the last row in the range.
		[Range]	Enables the registration of IP addresses by specifying a range. To register IP addresses one by one, clear this item.
		[Start IP Address]	Set the start IP address of the IP address range.
		[End IP Address]	This item is settable only when [Range] is selected. Set the end IP address of the IP address range.
		[IP Address to Exclude]	Set IP addresses excluded from being filtered. Click the [...] button to display the [IP Address to Exclude] dialog. ☞ Page 725 [IP Address to Exclude] dialog

[IP Address to Exclude] dialog

GT37 SoftGOT3000

Set the IP addresses excluded from the IP address range.

Up to 32 IP addresses can be registered for each IP address range.



Item		Description
1)	[Target IP Address]	Displays the IP address range to which the IP filter is applied.
2)	[Add] button	Adds an excluded IP address in the bottom of the list.
3)	[Delete] button	Deletes a selected excluded IP address.
4)	No.	Excluded IP address setting number Clicking an excluded IP address setting number selects the row. Hold down the Ctrl key and click a setting number to select or deselect the row while the other rows remain selected or deselected. Select the first row in the range, hold down the Shift key, and click a setting number to select the last row in the range.
5)	[IP Address to Exclude]	Lists the IP addresses excluded from being filtered.

14 Configuring the communication method between the GOT and the controller ([Controller Setting])

GT37 SoftGOT3000

☞ Page 727 Setting channels
☞ Page 740 Setting the routing information
☞ Page 744 Configuring the setting of the MELSEC redundant function
☞ Page 747 Configuring settings for switching the target station number for monitoring
☞ Page 755 Configuring the settings for switching the monitoring target buffer memory unit number

14.1 Setting channels

GT37 SoftGOT3000

☞ Page 727 How to set channels
☞ Page 729 [Controller Setting]
☞ Page 739 [Controller Type List] window

Set the channel used for the connection between the GOT and controllers.

Setting the communication interface and driver to be used for each channel in a single GOT enables communications with multiple controllers.

Communications with multiple channels (up to four channels) is called the multi-channel function.

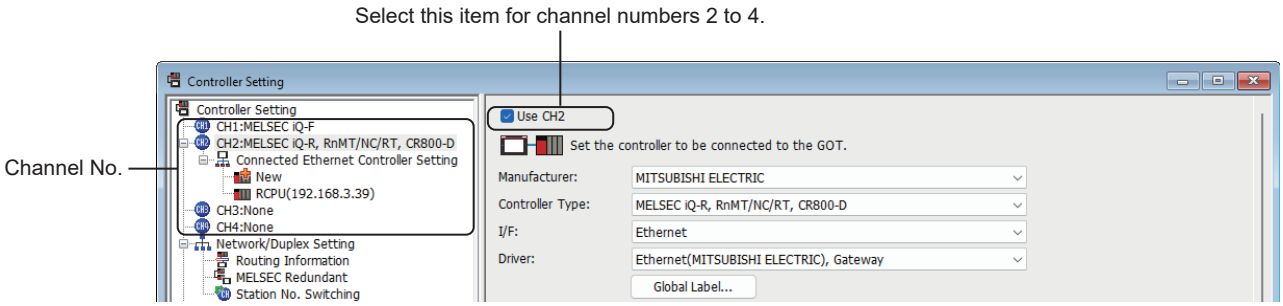
For details on the multi-channel function, refer to the following.

☞ GOT3000 Series User's Manual (Connection)

14.1.1 How to set channels

Operating procedure

1. Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
2. Select a channel number to be used from the controller setting tree.



3. Configure the communication settings for each channel.

☞ Page 729 [Controller Setting]

The settings need to be configured according to the connection type between the GOT and the controller.

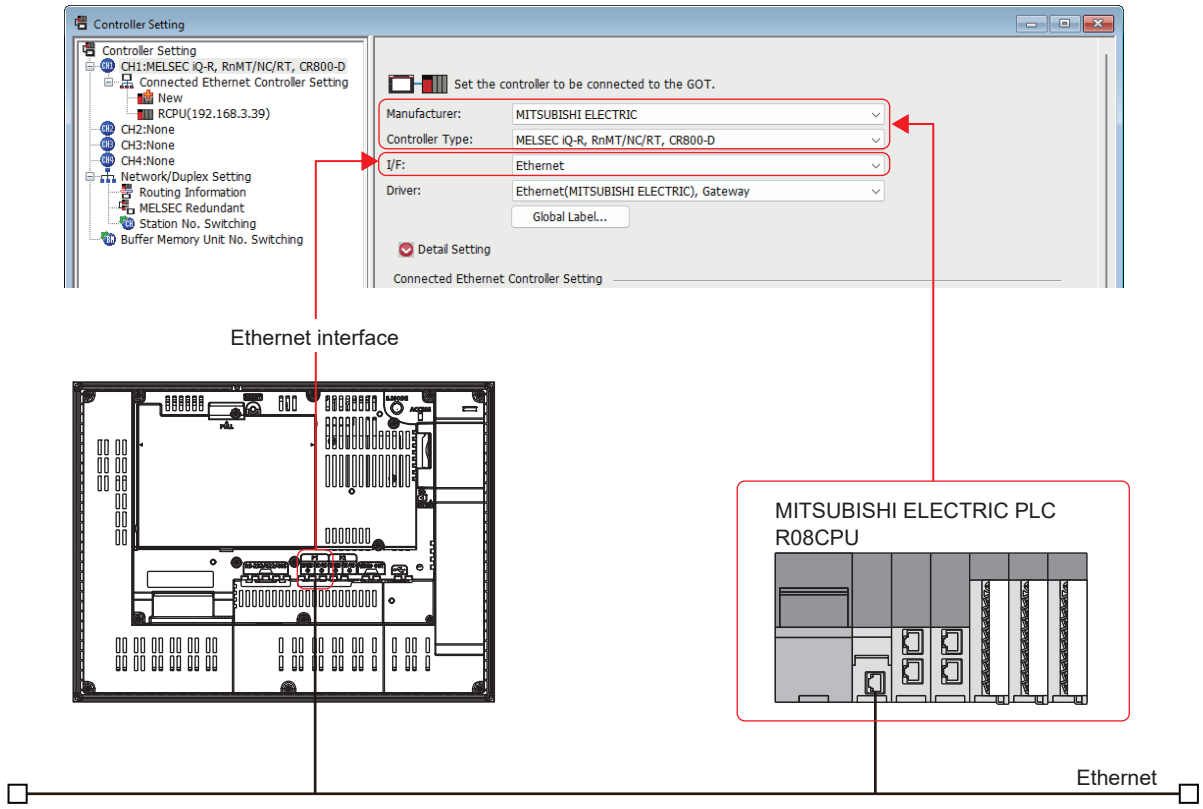
For details on the settings for each connection type, refer to the following.

GOT3000 Series User's Manual (Connection)

PART 5

Ex.

Connection to a Mitsubishi Electric PLC through the Ethernet interface of GT3712-X using channel 1



Precautions

■Changing the channel after the device setting

Do not change the channel to an unused one in the controller setting after the device setting.

If the channel is changed to an unused one, the device of the unused channel must be set again.

■Communication settings with devices on different network segments

When communicating with devices on different network segments via Ethernet, set a different channel for each network segment.

If devices on different network segments are accessed using a single channel, a communication timeout on any of the networks will disable communications with devices on the other networks.

14.1.2 [Controller Setting]

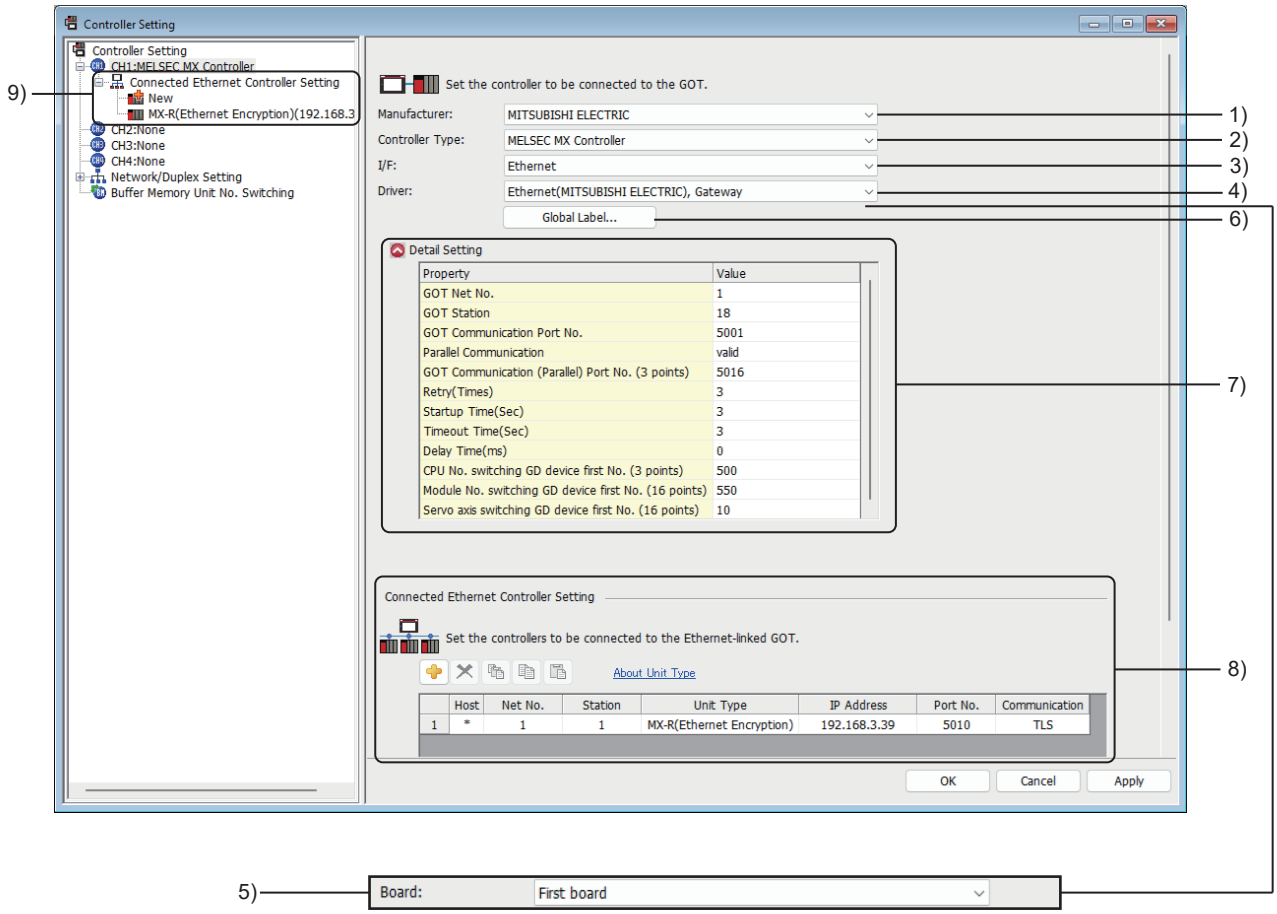
GT37 SoftGOT3000

The settings in this window depend on the conditions, such as the controller model, communication interface, and communication driver used.

The settings need to be configured according to the connection type between the GOT and the controller.

For details on the settings for each connection type, refer to the following.

GOT3000 Series User's Manual (Connection)



Item		Description
1)	[Manufacturer]	Select the manufacturer of the controller connected to the GOT.
2)	[Controller Type]	Select the model of the controller connected to the GOT.
3)	[I/F]	Select the communication interface of the GOT.
4)	[Driver]	Appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F]. Select the communication driver to be written to the GOT.
5)	[Board]	Appears when GT SoftGOT3000 is selected in the [Type Setting] dialog and [CC-Link IE Field Network Interface Board] is selected for [I/F]. Select the board to be used.

Item			Description
6)	Label/tag setting button	—	Imports labels or tags. ☞ Page 858 Labels and Tags Usable in GT Designer3
		[Global Label] button	Appears when one of the following items is selected for [Controller Type]. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELIPC] The [Label/Tag/Ethernet Setting List] dialog and the [Add Global Label/Ethernet Setting] dialog are displayed. ☞ Page 862 [Add Global Label/Ethernet Setting] dialog or [Edit Global Label/Ethernet Setting] dialog

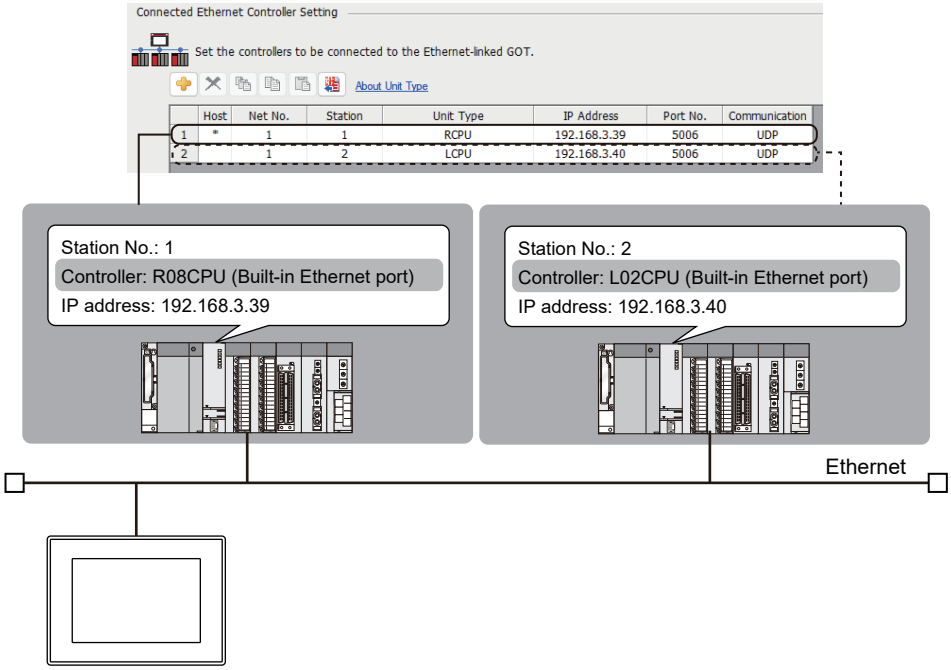
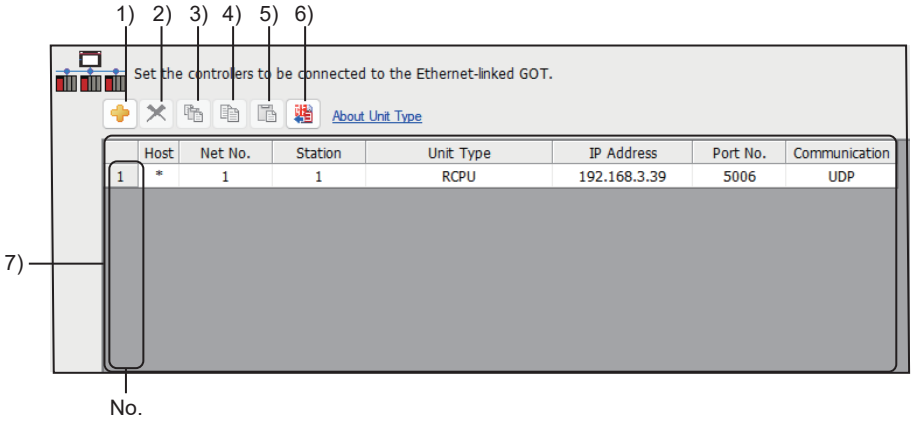
		[OPC UA Tag] button	Appears when the following item is selected for [Controller Type]. • [OPC UA] The [Label/Tag/Ethernet Setting List] dialog and the [Add OPC UA Tag] dialog are displayed. ☞ Page 866 [Add OPC UA Tag] dialog or [Edit OPC UA Tag] dialog
7)	[Detail Setting]		Set the connection details, such as the baud rate of the communication driver and the data length. To display or hide the setting items, click the button at the left of [Detail Setting].
8)	[Connected Ethernet Controller Setting]		Appears when [Ethernet] is selected for [I/F]. (It may not appear depending on [Driver].) Register the controller to be connected to the GOT via Ethernet. ☞ Page 731 [Connected Ethernet Controller Setting]
9)	[Connected Ethernet Controller Setting]		Appears for the channel for which [Ethernet] is selected for [I/F]. Indicates the Ethernet equipment registered to each channel. Double-click [New] to add a new Ethernet setting row to the bottom of the list in [Connected Ethernet Controller Setting].

[Connected Ethernet Controller Setting]

In the [Controller Setting] window, if you select an Ethernet interface, [Connected Ethernet Controller Setting] appears.
Register the controller to be connected to the GOT via Ethernet.



The following shows the items displayed in [Connected Ethernet Controller Setting].



Item		Description
1)	[Add] button	Adds a new Ethernet setting row to the bottom of the list.
2)	[Delete] button	Deletes a selected Ethernet setting.
3)	[Duplicate] button	Duplicates a selected Ethernet setting below the bottom row of the list.
4)	[Copy] button	Copies a selected Ethernet setting.
5)	[Paste] button	Pastes a copied Ethernet setting.
6)	[Import from GX Works3 Project] button	Imports the Ethernet settings from the GX Works3 project and register them in [Connected Ethernet Controller Setting]. The [Label/Tag/Ethernet Setting List] dialog and the [Add Global Label/Ethernet Setting] dialog are displayed. ☞ Page 862 [Add Global Label/Ethernet Setting] dialog or [Edit Global Label/Ethernet Setting] dialog

Item			Description
7)	List of controllers connected via Ethernet	—	Lists the controllers connected with the GOT via Ethernet. Displayed items differ depending on the settings for [Manufacturer] or [Controller Type]. The following shows the displayed items regardless of the settings for [Manufacturer] or [Controller Type].
		No.	Ethernet setting number. Clicking an Ethernet setting number selects the row. Hold down the Ctrl key and click a setting number to select or deselect the row while the other rows remain selected or deselected. Select the first row in the range, hold down the Shift key, and click a setting number to select the last row in the range.
		[Host]	Select a host station. Asterisk (*) is displayed with the selected Ethernet setting.
		[Net No.]	Set the network number of the destination Ethernet module.
		[Station]	Select the station number of the destination Ethernet module.
		[Unit Type]	Select the type of the destination Ethernet module. The selectable items for [Unit Type] vary according to the selection for [Controller Type] and [Driver]. For the selectable items for [Unit Type], refer to the following. ☞ Page 732 Selectable items for [Unit Type] For the correspondence between the selectable items for [Unit Type] and the controllers or communication modules, refer to the following. ☞ Page 735 Correspondence between the selection for [Unit Type] and the equipment connected via Ethernet
		[IP Address]	Set the IP address of the controller. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
		[Port No.]	Set the port number of the destination Ethernet module.
		[Communication]	Select a communication protocol. Each communication protocol has the following setting upper limit. • TCP (including TLS): Up to 128 in total for all channels • UDP (including DTLS): Up to 128 in total for all channels • Mixture of TCP (including TLS) and UDP (including DTLS) on the same channel: Up to 128 per channel

Selectable items for [Unit Type]

The selectable items for [Unit Type] in [Connected Ethernet Controller Setting] vary according to the selection for [Controller Type].

☞ Page 733 Selectable items for connection to Mitsubishi Electric equipment

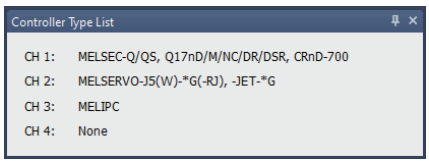
	SIMATIC S7-200		[S7-200 OP]
SLMP-compatible device			[SLMP]
MODBUS equipment			To connect a controller under the following conditions, select [MODBUS/TCP]. • The unit ID is fixed to 255 (for connecting with the GOT as the host station). • The unit ID is not fixed. To connect a controller of another station, whose unit ID is fixed to 255, with the GOT, select [MODBUS/TCP(unit ID fixed)].

14.1.3 [Controller Type List] window

GT37 SoftGOT3000

The window displayed to confirm the controllers of each channel.

Select [View] → [Docking Window] → [Controller Type List] from the menu to display this window.



14.2 Setting the routing information

GT37 SoftGOT3000

☞ Page 742 Setting condition of the routing information
☞ Page 742 How to set the routing information
☞ Page 743 [Routing Information]

When the following connection types are used between the GOT and the connected controller, devices on other networks can be monitored.

- Ethernet connection
- MELSECNET/H connection
- CC-Link IE TSN connection
- CC-Link IE Controller Network connection
- CC-Link IE Field Network connection
- SLMP connection
- MODBUS/TCP connection

To monitor devices on other networks, routing information settings are required for the GOT, relay device (relay station), and the devices to be monitored.

Routing information	Description
Destination network	Network number of the network to which the monitored device is connected
Relay network	Network number of the network to which the relay device (relay station) is connected
Relay station	Station number of the relay device

If communications are performed within the host network, routing information settings are not required.

Set the routing information for the GOT in GT Designer3.

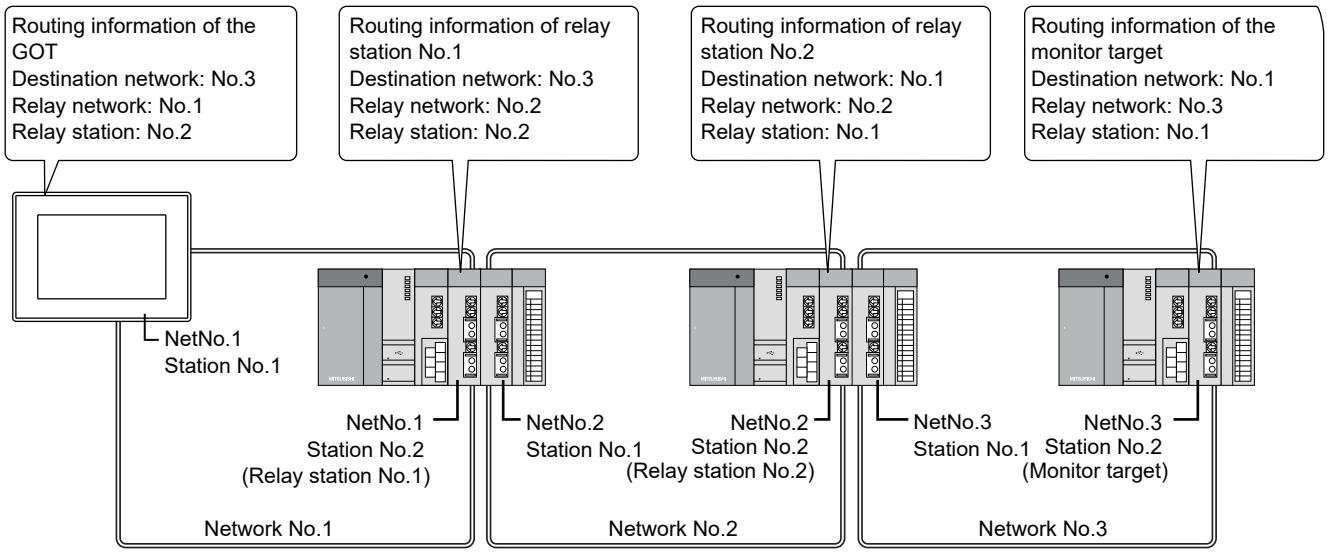
Set the routing information for the relay station using the relay device's setting software.

For details on the routing parameters, refer to the following.

Relay station device		Reference manual
MELSEC MX Controller (MX-R series)		📖Manual for the MELSEC MX Controller
MELSEC MX Controller (MX-F series)		
RCPU		📖MELSEC iQ-R CPU Module User's Manual (Application)
Other than RCPU	Ethernet connection	📖MELSEC-Q/L Ethernet Interface Module User's Manual (Application)
	MELSECNET/H connection	📖Q corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)
	CC-Link IE Controller Network connection	📖MELSEC-Q CC-Link IE Controller Network Reference Manual
	CC-Link IE Field Network connection	📖MELSEC-Q CC-Link IE Field Network Master/Local Module User's Manual
SLMP server device		📖Manual for the SLMP-compatible device used
MODBUS equipment		📖Manual for the MODBUS equipment used

Ex.

Communicating with a device on network 3 from network 1 to which the GOT is connected, via network 2



Routing information of relay station 2 and the monitored device is required for the response from the monitored device to the GOT.

PART 5

14.2.1 Setting condition of the routing information

The routing information can be set when one of the following items is selected for [Controller Type] in the [Controller Setting] window.

☞ Page 729 [Controller Setting]

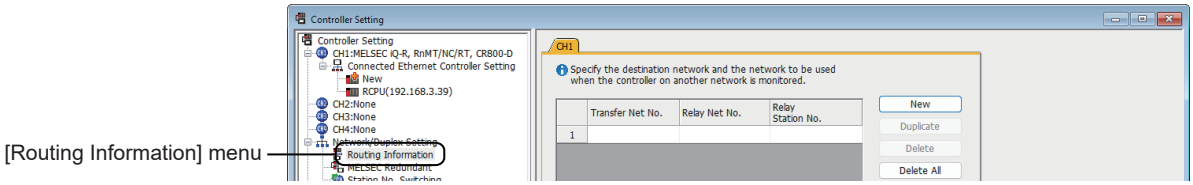
- [MELSEC MX Controller]
- [MELSEC iQ-R, RnMT/NC/RT, CR800-D]
- [MELSEC iQ-F]
- [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
- [MELSEC-L]
- [MELSEC-A]
- [MELIPC]
- [SLMP]
- [MODBUS Server (GOT: Client)]

14.2.2 How to set the routing information

1. Select [Common] → [Controller Setting] from the menu.

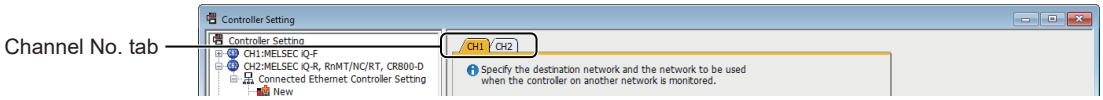
2. The [Controller Setting] window appears.

Select the [Routing Information] menu from the controller setting tree.



3. Configure the routing information setting for each channel.

Select the tab of the channel for which the routing information is set.



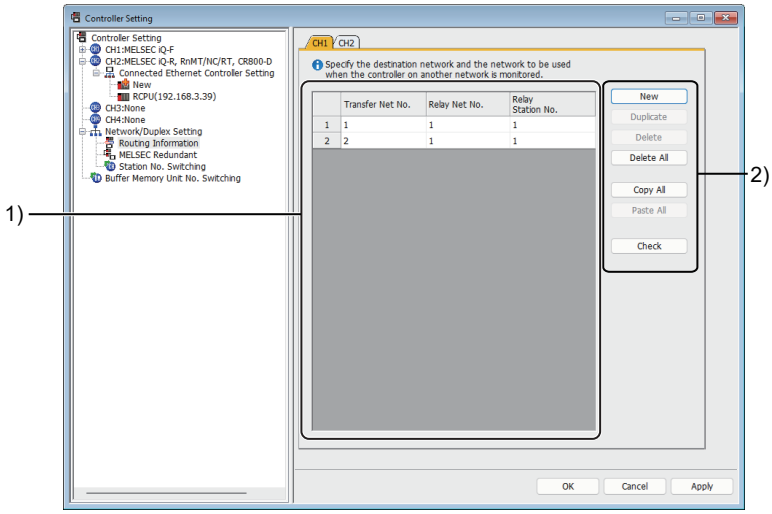
Select this item to set the routing information.

☞ Page 743 [Routing Information]

14.2.3 [Routing Information]

GT37 SoftGOT3000

In [Routing Information], set the destination network and specify the network and controller though which data is transferred. Up to 64 sets of routing information can be registered.



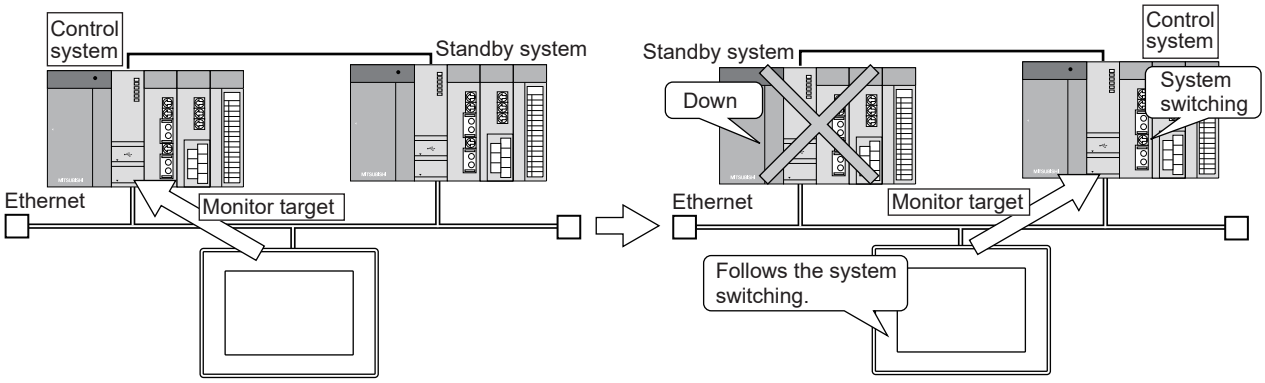
Item			Description
1)	List of routing information settings	—	Lists the routing information settings registered in the project. Each setting can be edited in the list.
		[Transfer Net No.]	Set the network number of the destination network. The setting range is [1] to [239].
		[Relay Net No.]	Set the network number of the relay network. The setting range is [1] to [239].
		[Relay Station No.]	Set the station number of the relay station. The setting range depends on [Controller Type] selected for each channel. • [SLMP]: [0] to [120], [125] • [MODBUS Server (GOT: Client)]: [0] to [247] • Other than the above: [1] to [120]
2)	Buttons for the routing information setting	—	Use the following buttons to add, copy, and delete the routing information setting in the list.
		[New]	Adds a new routing information setting row to the bottom of the list.
		[Duplicate]	Duplicates a selected routing information setting below the bottom row of the list.
		[Delete]	Deletes a selected routing information setting.
		[Delete All]	Deletes all the routing information settings.
		[Copy All]	Copies all the routing information settings in the list of the selected tab. Use this button to utilize the settings for other channels.
		[Paste All]	Pastes the copied settings to the list. The existing settings are overwritten.
		[Check]	Checks if the routing information setting has any error. The following show the points to be checked. • Non-entered items • Setting range • Duplication of the destination network numbers

14.3 Configuring the setting of the MELSEC redundant function

GT37 SoftGOT3000

☞ Page 744 Setting condition of the MELSEC redundant function
☞ Page 745 How to set the MELSEC redundant function
☞ Page 746 [MELSEC Redundant]

You can monitor the redundant system on the GOT by specifying the control system and the standby system.
If the redundant system is the target station, specifying the control system as the target CPU enables consecutive monitoring even when the system is switched from the control system to the standby system.
For details on the redundant system, refer to the following.
📖GOT3000 Series User's Manual (Connection)



14.3.1 Setting condition of the MELSEC redundant function

The MELSEC redundant function is available when one of the following items is selected for [Controller Type] in the [Controller Setting] window.

☞ Page 729 [Controller Setting]

- [MELSEC MX Controller]
- [MELSEC iQ-R, RnMT/NC/RT, CR800-D]
- [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
- [MELIPC]

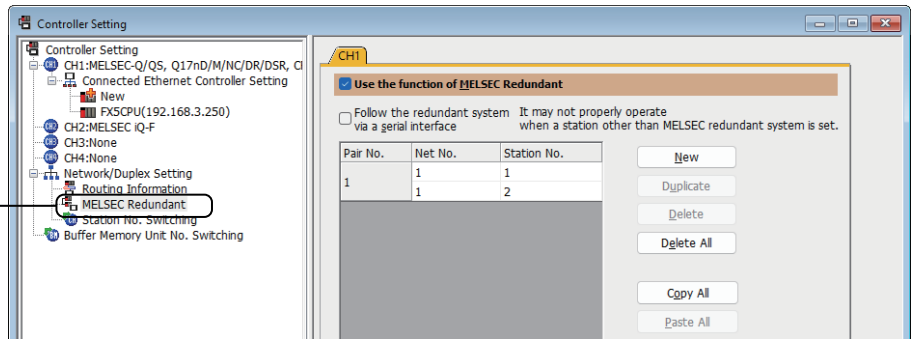
14.3.2 How to set the MELSEC redundant function

1. Select [Common] → [Controller Setting] from the menu.

2. The [Controller Setting] window appears.

Select [MELSEC Redundant] from the setting tree.

[MELSEC Redundant] menu

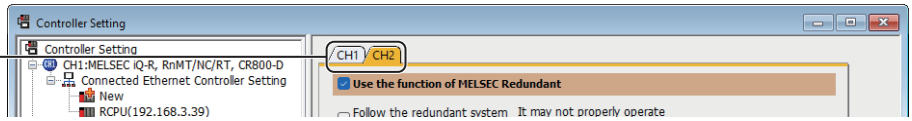


3. Configure the MELSEC redundant setting by channel.

Select the target channel tab, and configure the MELSEC redundant setting.

☞ Page 746 [MELSEC Redundant]

Channel No. tab



Point

When setting the device to be monitored by objects, you can select the control system or the standby system. For the device format for monitoring the standby system, refer to the following.

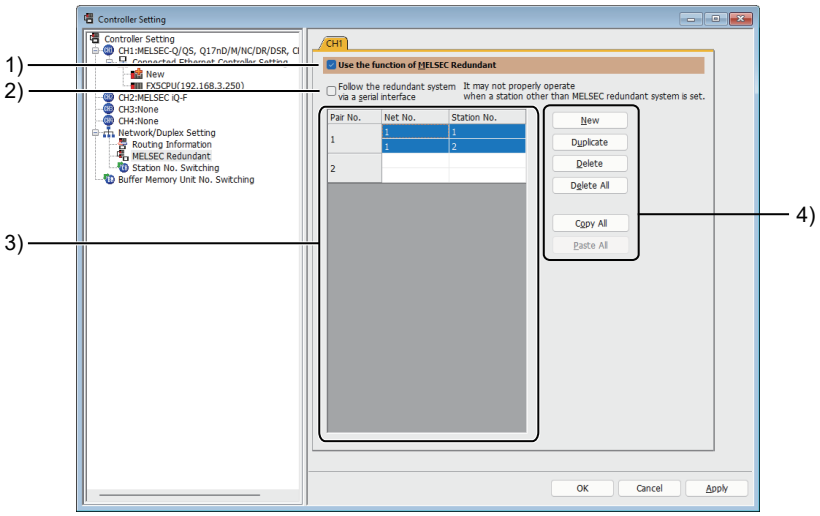
☞ Page 849 Formats of devices, labels, and tags

PART 5

14.3.3 [MELSEC Redundant]

GT37 SoftGOT3000

Set a pair of control and standby systems.



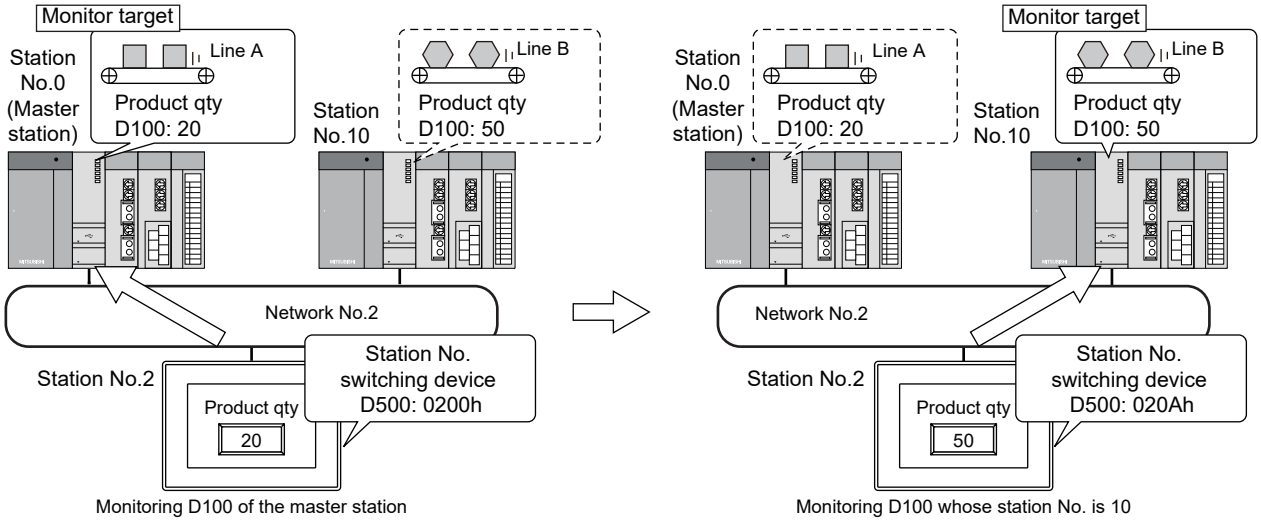
Item			Description
1)	[Use the function of MELSEC Redundant]		Enables the MELSEC redundant function. Select this item to configure the settings in [MELSEC Redundant].
2)	[Follow the redundant system via a serial interface]		Automatically switches the monitoring target upon system switching if the redundant system is connected to the GOT by the serial connection.
3)	MELSEC redundant setting list	—	Lists the MELSEC redundant settings registered in the project. Each setting can be edited in the list.
		[Pair No.]	Pair number of the MELSEC redundant setting The numbers are assigned automatically starting from 1. Setting [Pair No.] is not required to monitor the redundant system that is connected to the GOT by the CC-Link connection (intelligent device station).
		[Net No.]	Set the network numbers for each pair number. The upper row is for the setting of the first redundant CPU. The setting range is [1] to [239]. The lower row is for the setting of the second redundant CPU. The network number of the second redundant CPU is the same as that of the first CPU.
		[Station No.]	Set the station numbers of the redundant CPUs for each pair number. The upper row is for the setting of the first redundant CPU. The lower row is for the setting of the second redundant CPU. The setting range is [0] to [120].
4)	Operation buttons for the MELSEC redundant setting list	—	Add, copy, and delete a MELSEC redundant setting in the list.
		[New] button	Adds a new pair number setting row to the bottom of the list.
		[Duplicate] button	Duplicates a selected pair number setting below the bottom row of the list.
		[Delete] button	Deletes the selected pair number setting.
		[Delete All] button	Deletes all the pair number settings.
		[Copy All] button	Copies all the pair number settings in the list of the selected tab. Use this button to utilize the settings for other channels.
		[Paste All] button	Pastes the copied settings to the list. The existing settings are overwritten.

14.4 Configuring settings for switching the target station number for monitoring

GT37 SoftGOT3000

☞ Page 748 Specifications of the station number switching setting
☞ Page 751 How to switch the station numbers
☞ Page 752 How to configure the station number switching settings
☞ Page 753 [Station No. Switching]
☞ Page 754 Relevant settings

Screen number switching can be used to switch the network number and the station number of the monitored station.
When multiple devices executing the same control are connected on the network, the devices can be monitored on a single monitor screen.
Since the number of objects to be set can be reduced, you can save the built-in memory of the GOT.
Station number switching is performed by changing the value of the station number switching device.
This can also be performed by touching the Change Station No. switch to which the switching destination is set.



Switching between network numbers and station numbers is available within the monitoring range of the GOT.

14.4.1 Specifications of the station number switching setting

☞ Page 748 Specifications of the station number switching device
☞ Page 748 Communication drivers supporting station number switching
☞ Page 749 Functions supporting station number switching
☞ Page 750 Effect of station number switching

Specifications of the station number switching device

The data type of the station number switching device is unsigned 16-bit binary.
The higher and lower bits of the device store the network number and station number to be switched to.

Upper (b15 to b8)	Lower (b7 to b0)
Network No.	Station No.

The following shows examples of switching destinations and device values.

Switching details	Hexadecimal value stored in the station number switching device
Switches to the specified network number and station number	Example) When switching to station number 18 on network number 1 0112h
Switches to the station number set for each object (Same as when station number switching is not performed)	00FEh
Switches to the host station (connection destination)	00FFh

Communication drivers supporting station number switching

The following lists the communication drivers that allow station number switching.
If one controller can be connected to one GOT, station number switching cannot be used even though any of the following drivers is set.
○: Effective, —: Ineffective

Manufacturer Communication protocol	Communication driver	Target for switching	
		Network No.	Station No.
MITSUBISHI ELECTRIC	[Ethernet(MITSUBISHI ELECTRIC), Gateway]	○	○
	[CC-Link IE TSN (built-in Ethernet)]	—	○
	[CC-Link IE TSN]	—	○
	[CC-Link IE Field Network]	—	○
	[Ethernet(FX), Gateway]	○	○
	[Ethernet(MELSERVO), Gateway]	—	○
	[Ethernet(FREQROL(Batch monitor)), Gateway]	○	○
ALLEN-BRADLEY	[Ethernet(AB Tag), Gateway]	—	—
SIEMENS	[Ethernet(SIEMENS OP), Gateway]	—	○

Precautions

Functions that do not support station number switching operate with the device of the station number set for each function.
Note that if an object that supports station number switching and an object that does not support station number switching are placed on the same screen, the monitoring target station number will vary depending on the object when screen switching is performed.

Effect of station number switching

■Redrawing of objects

All the objects on the screen will be redrawn when the station number is switched.
Thus, the display speed of the object may become slow temporarily.

14.4.2 How to switch the station numbers

Switch the station numbers with either of the following methods.

Method	Description
Station number switching with the station number switching device	Station number switching is executed by storing the value indicating the switching destination in the station number switching device. For the value stored in the station number switching device, refer to the following. ☞ Page 748 Specifications of the station number switching device
Station number switching with the Change Station No. switch	Touching the Change Station No. switch executes station number switching. In this case, the setting of the station number switching device is required. For the Change Station No. switch settings, refer to the following. ☞ Page 1227 [Change Station No. Switch] dialog

Precautions

■Station number switching while a dialog window is displayed

The dialog window operates according to the value of the station number switching device which is set when the dialog window is displayed.

If the value of station number switching device is changed while the dialog window is displayed, the display and operation of the object on the dialog window are not changed.

14.4.3 How to configure the station number switching settings

The following settings are required for station number switching.

Setting		Description
Screen properties		Settings need to be configured in the screen property for the screen where station number switching is performed.
[Controller Setting] window	Set the station number switching device.	Set the station number switching device for each project or screen type.
	Set the channel subject to station number switching.	Set whether to enable or disable station number switching for each channel.

Set the Change Station No. switch as necessary.

☞ Page 1227 [Change Station No. Switch] dialog

Operating procedure

1. Select [Switch Station No.] in the screen property for each screen where station number switching is performed.

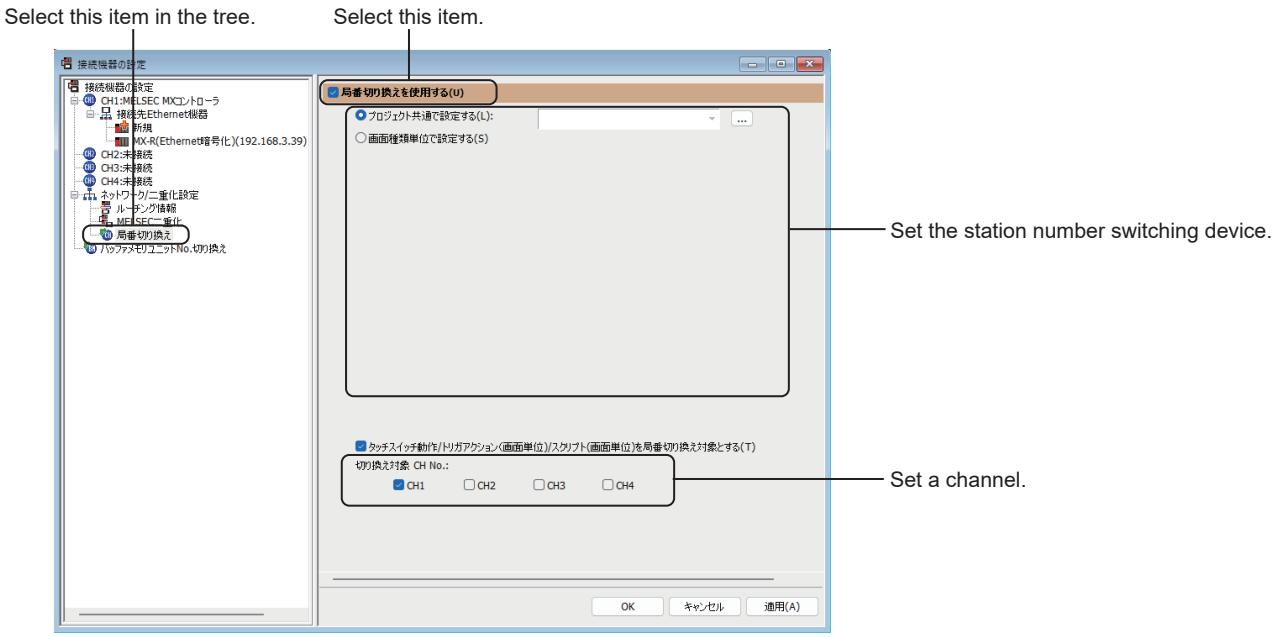
Screen type	Reference
Base screen properties	☞ Page 314 [Basic] tab
Window screen properties	☞ Page 323 [Basic] tab

2. Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.

3. Select the [Station No. Switching] menu from the controller setting tree.

Select [Use Station No. Switching], and then set the station number switching device and the channel for which station number switching is enabled.

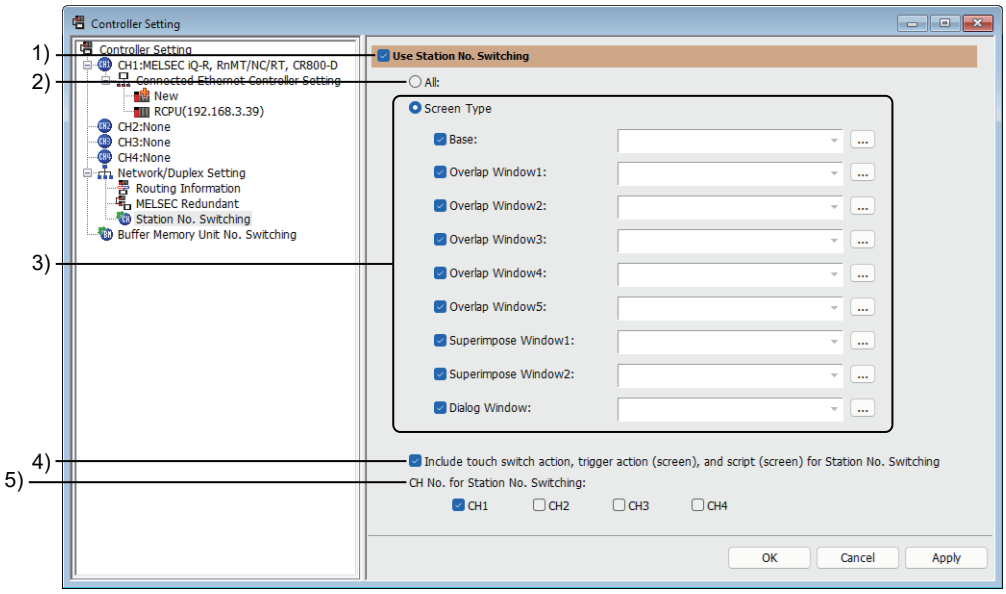
☞ Page 753 [Station No. Switching]



14.4.4 [Station No. Switching]

GT37 SoftGOT3000

Set the station number switching device.



Item		Description
1)	[Use Station No. Switching]	Enable the station number switching. Select this item to configure each setting in [Station No. Switching].
2)	[All]	Station number switching is executed across the whole project. Select this item, and then set the station number switching device (word device). The bit device cannot be specified as the word device. Data type: Unsigned 16-bit binary ☞ Page 834 How to set devices, labels, and tags
3)	[Screen Type]	Enables station number switching by screen type. Select this item, then select the screen type for which station number switching is performed, and then set the station number switching device (word device). The bit device cannot be specified as the word device. Data type: Unsigned 16-bit binary ☞ Page 834 How to set devices, labels, and tags
4)	[Include touch switch action, trigger action (screen), and script (screen) for Station No. Switching]	Sets the devices of touch switches, trigger actions (per screen), and screen scripts as the target of station number switching. For details, refer to the following. ☞ Page 749 Functions supporting station number switching
5)	[CH No. for Station No. Switching]	Select the channel number for which station number switching is executed.

Point

When a GOT internal register (GD) is set as the station number switching device, the GOT starts monitoring station number 0 on network number 0 immediately after power-on until the value of the station number switching device (GD) is set.
In this case, a system alarm due to the communication timeout may occur depending on the connection type.
To avoid a system alarm, create an initially-displayed screen with no object, and set the station number switching device (GD) and its value on the screen.

14.4.5 Relevant settings

Configure the relevant settings other than the specific settings for the station number switching function as required.
The following shows the functions that are available by configuring the relevant settings.

Screen properties

Select the screen editor on which settings are configured, and select [Screen] → [Screen Property] from the menu to display the screen properties.

Screen type	Reference
Base screen properties	☞ Page 314 [Basic] tab
Window screen properties	☞ Page 323 [Basic] tab

The following shows the settings relevant to station number switching.

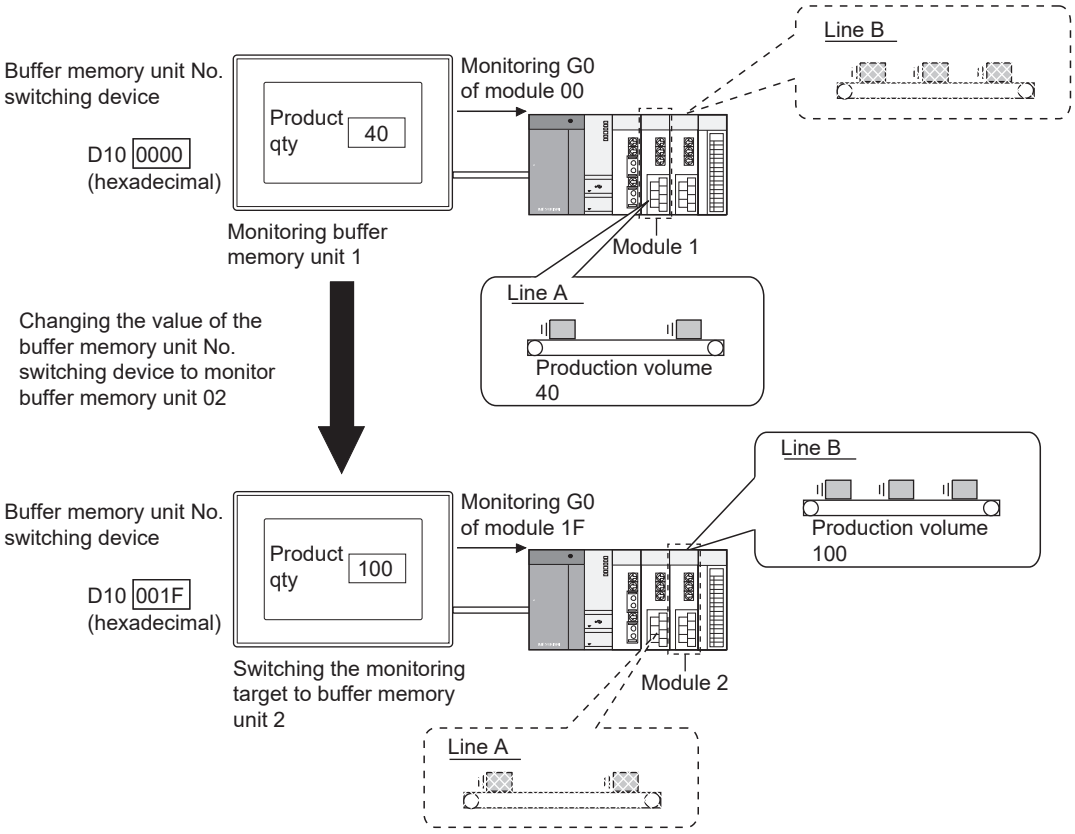
Function	Setting item
Setting whether to execute the station number switching or not for each screen	Select [Switch Station No.] from in the [Basic] tab

14.5 Configuring the settings for switching the monitoring target buffer memory unit number

GT37 SoftGOT3000

☞ Page 756 Specifications of buffer memory unit number switching
☞ Page 758 How to switch buffer memory unit numbers
☞ Page 759 How to configure the settings for buffer memory unit number switching
☞ Page 760 [Buffer Memory Unit No. Switching]
☞ Page 761 Relevant settings

Buffer memory unit number switching can be used to switch the buffer memory unit number of the monitored unit.
When multiple devices executing the same control are connected on the network, the devices can be monitored on a single monitor screen.
Since the number of objects to be set can be reduced, you can save the built-in memory of the GOT.
Buffer memory unit number switching is performed by changing the value of the buffer memory unit number switching device.



Switch between buffer memory unit numbers within the monitoring range of the GOT.

14.5.1 Specifications of buffer memory unit number switching

☞ Page 756 Target for buffer memory unit number switching
☞ Page 756 Functions supporting buffer memory unit number switching
☞ Page 757 Effect of buffer memory unit number switching

Target for buffer memory unit number switching

Buffer memory unit number switching can be performed when one of the following is selected for [Controller Type] in the [Controller Setting] window, and the buffer memory is set as the device to be monitored by objects or others.

- [MELSEC MX Controller]
- [MELSEC iQ-R, RnMT/NC/RT, CR800-D]
- [MELSEC iQ-L]
- [MELSEC iQ-F]
- [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
- [MELSEC-L]
- [MELSEC-A]
- [MELIPC]

Effect of buffer memory unit number switching

■Redrawing of objects

All the objects on the screen will be redrawn when the buffer memory unit number is switched.

14.5.2 How to switch buffer memory unit numbers

Buffer memory unit number switching is executed by storing a value indicating the switching destination in the buffer memory unit number switching device.

Precautions

■If the buffer memory unit number is not switched

In the following cases, buffer memory unit number switching is not executed. The buffer memory unit number set for each object will be monitored.

If the buffer memory unit number is not switched	Remarks
The buffer memory unit number of the switching destination is other than 0x00 to 0xFF.	—
The device cannot be monitored due to a communication error such as disconnection.	During GOT operation, if a communication error occurs due to a disconnection or other reasons, the buffer memory unit number monitored before the error will be monitored.

■Buffer memory unit number switching while a dialog window is displayed

The dialog window operates according to the value of the buffer memory unit number switching device which is set when the dialog window is displayed.

Even if the value of the buffer memory unit number switching device is changed while the dialog window is displayed, the display and operation of the objects on the dialog window will not change.

Judgment of communication status

When you attempt to switch the buffer memory unit number to a nonexistent one, the switching is not executed and the buffer memory unit number switching device stores -1.

This enables you to judge the communication status (normal or abnormal) of the buffer memory unit.

When you monitor a buffer memory that always stores a value other than -1, if the buffer memory stores -1, the communication status is abnormal.

When a value other than -1 is stored, the communication status is normal.

Ex.

For G0 (the unit setting for basic parameter 1) of RD75, the device ranges from 0 to 3. If G0 stores -1, the communication status is abnormal.

14.5.3 How to configure the settings for buffer memory unit number switching

The following settings are required to perform buffer memory unit number switching.

Setting	Description
Screen properties	Settings need to be configured in the screen property for the screen where buffer memory unit number switching is performed.
[Controller Setting] window	Set the buffer memory unit number switching device for each project or screen type.

Operating procedure

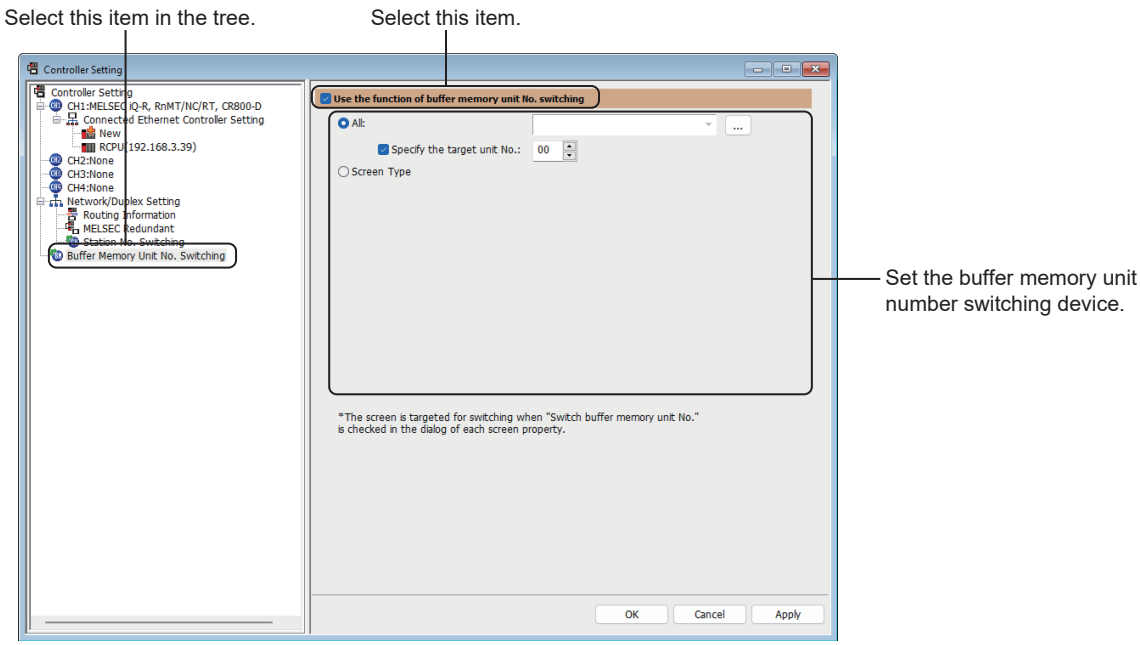
1. Select [Switch buffer memory unit No.] in the screen property for each screen where buffer memory unit number switching is performed.

Screen type	Reference
Base screen properties	☞ Page 314 [Basic] tab
Window screen properties	☞ Page 323 [Basic] tab

2. Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.

3. Select the [Buffer Memory Unit No. Switching] menu from the controller setting tree.

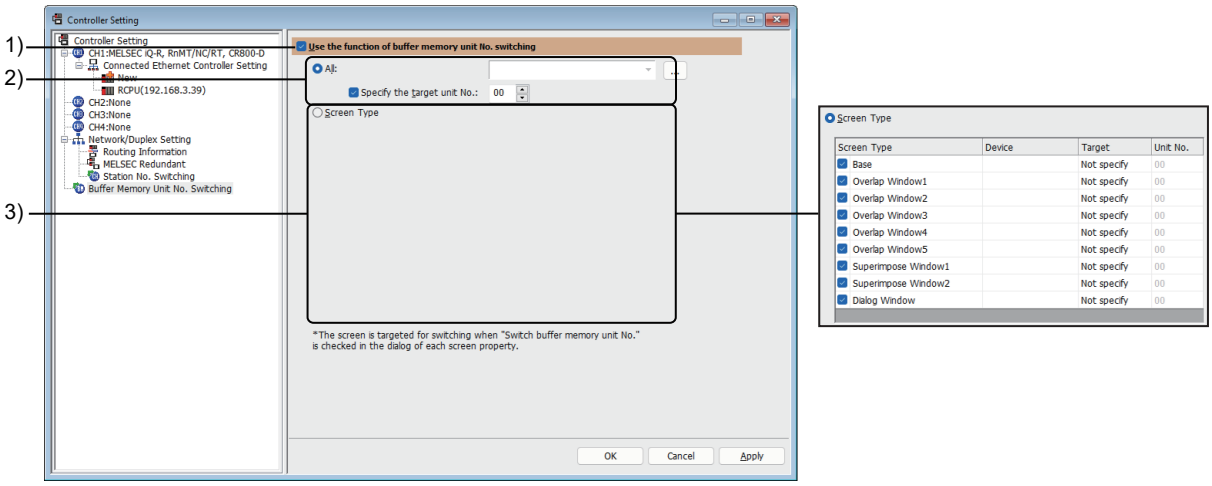
Select [Use the function of buffer memory unit No. switching], and then set the buffer memory unit number switching device.
☞ Page 760 [Buffer Memory Unit No. Switching]



14.5.4 [Buffer Memory Unit No. Switching]

GT37 SoftGOT3000

Set the buffer memory unit number switching device.



Item			Description
1)	[Use the function of buffer memory unit No. switching]		Enables the buffer memory unit number switching. Select this item to configure each setting in [Buffer Memory Unit No. Switching].
2)	[All]	—	Buffer memory unit number switching is executed across the whole project. Select this item, and then set the buffer memory unit number switching device (word device). The bit device cannot be specified as the word device. Data type: Unsigned 16-bit binary ☞ Page 834 How to set devices, labels, and tags
		[Specify the target unit No.]	Set the buffer memory unit number to be switched. Only the specified buffer memory unit number is subject to switching. Example) When [00] is set to [Specify the target unit No.] Only the devices with unit numbers set to [00] are subject to buffer memory unit number switching. Value of the buffer memory unit number switching device: 0000 → 001F Monitor device of numerical display: AU00-G100 → U1F-G100 Monitor device of numerical display: BU01-G100 → U01-G100
3)	[Screen Type]	—	Enables buffer memory unit number switching by screen type. Select this item, then select the screen type for which buffer memory unit number switching is performed, and then set the buffer memory unit number switching device and others.
		[Screen Type]	Select a screen in which the buffer memory unit number switching is performed.
		[Device]	Set the buffer memory unit number switching device (word device). The bit device cannot be specified as the word device. Data type: Unsigned 16-bit binary ☞ Page 834 How to set devices, labels, and tags
		[Target]	Set whether to specify the selected screen as the switching target. Select this item, and then set the buffer memory unit number to be switched to [Unit No.]. Example) When [00] is set to [Unit No.] Only the devices with unit numbers set to [00] are subject to buffer memory unit number switching. Value of the buffer memory unit number switching device: 0000 → 001F Monitor device of numerical display: AU00-G100 → U1F-G100 Monitor device of numerical display: BU01-G100 → U01-G100

14.5.5 Relevant settings

Configure the relevant settings other than the specific settings for the buffer memory unit number switching function as required.
The following shows the functions that are available by configuring the relevant settings.

Screen properties

Select the screen editor on which settings are configured, and select [Screen] → [Screen Property] from the menu to display the screen properties.

Screen type	Reference
Base screen properties	☞ Page 314 [Basic] tab
Window screen properties	☞ Page 323 [Basic] tab

The following shows the settings relevant to buffer memory unit number switching.

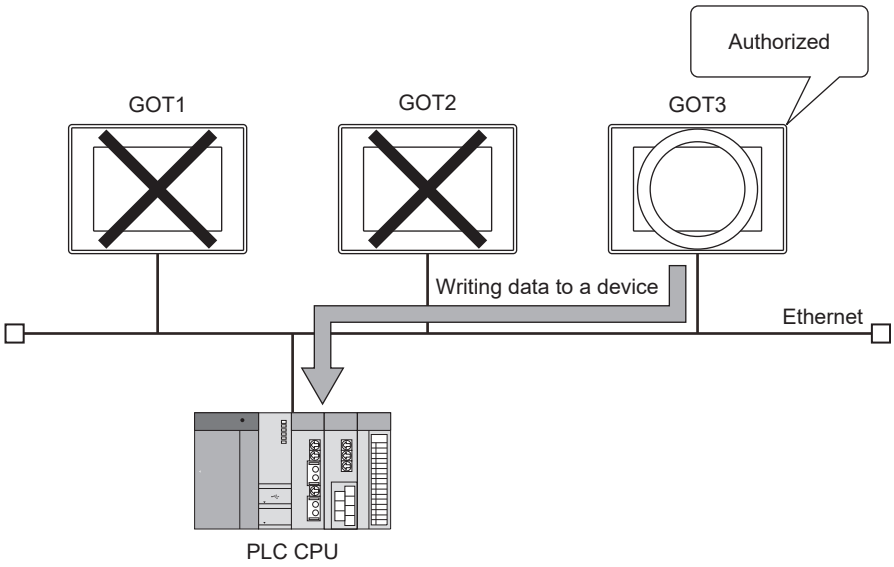
Function	Setting item
Setting whether to execute the buffer memory unit number switching by screen	[Switch buffer memory unit No.] on the [Basic] tab

15 Setting the interaction function for equipment on Ethernet ([GOT Network Interaction])

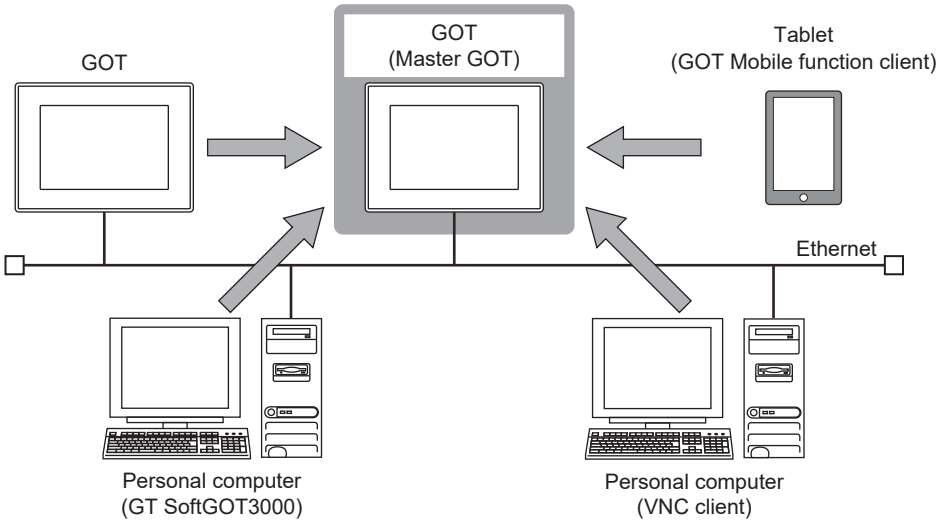
GT37 SoftGOT3000

☞ Page 763 Specifications of the GOT network interaction function
☞ Page 766 How to use the GOT network interaction function
☞ Page 771 Precautions
☞ Page 772 [GOT Network Interaction] dialog

The GOT network interaction function controls authorization (to give the operation right) among devices on the same network to prevent simultaneous operations.



In the group of devices, a GOT is specified as the master GOT to control the operation right.
The other devices in the group communicate with the master GOT to obtain the operation right.



15.1 Specifications of the GOT network interaction function

GT37 SoftGOT3000

☞ Page 763 Target equipment
☞ Page 763 Authorization control scope
☞ Page 764 Target screens
☞ Page 764 Influences on other functions
☞ Page 765 Required system application (add-on function)

Target equipment

The following two equipment types are applicable for authorization control using the GOT network interaction function.

- Master GOT: Equipment that controls the operation right.
- Operator device: Equipment that requests and obtains the operation right from the master GOT.

The recommended number of operator devices is as follows.

- When the master GOT is a GOT: Up to 7 operator devices per 1 master GOT
- When the master GOT is GT SoftGOT3000: Up to 15 operator devices per 1 master GOT

The following shows the applicable equipment types.

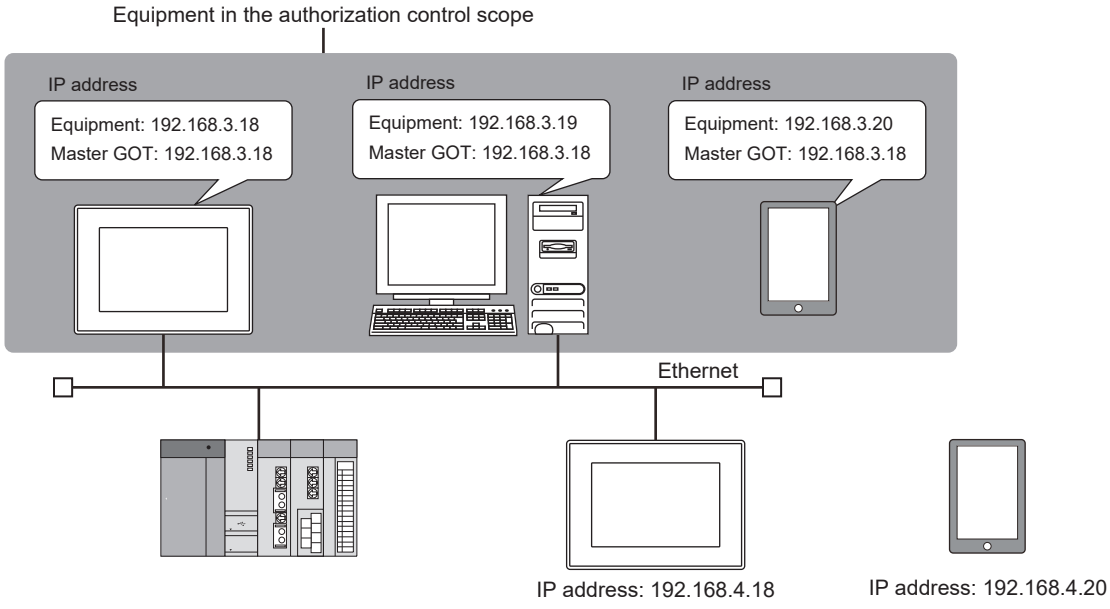
○: Applicable, —: Not applicable

GOT	Operator device	Master GOT
GT37	○	○
GT SoftGOT3000	○	○
GT SoftGOT3000 (when the SoftGOT-GOT link function is used)	○	—
VNC client (VNC server function)	○	—
Client (GOT Mobile function)	○	—

Authorization control scope

Authorization control is enabled for the devices that satisfy the following conditions.

- Same subnet
- Same master GOT



Target screens

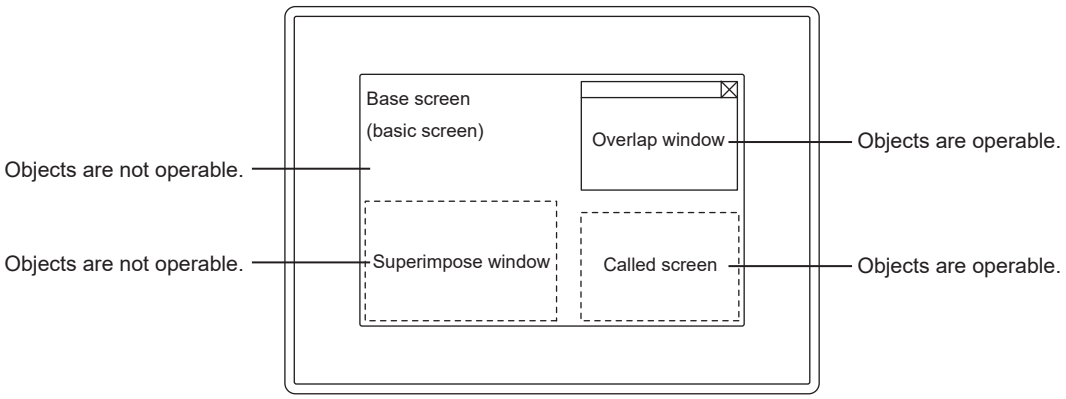
Whether the operation right is required to operate objects is set on a screen-by-screen basis.
The following shows the target screens for authorization control.

- Base screen
- Window screen (when displayed as a superimpose window or overlap window)
- Mobile screen

When authorization control is enabled on a screen, objects on the screen can be operated only when the operation right is obtained.
Otherwise, the screen is displayed, but the objects on the screen are not operable.
Screens for which authorization control is disabled or utility call keys can be displayed and operated regardless of the operation right status.
If authorization control is enabled on some screens and disabled on others, the operation right settings vary for each screen.

Ex.
Availability of operation when the operation right is not obtained

- Base screen (Basic screen of the set overlay screen function): Authorization control is enabled.
- Superimpose window: Authorization control is enabled.
- Overlap window: Authorization control is disabled.
- Called screen (Screen called from the base screen): Authorization control is disabled.



Influences on other functions

Enabling the GOT network interaction function influences other functions as follows.

Function	Influence
SoftGOT-GOT link function	Authorization control of the SoftGOT-GOT link function becomes disabled, and authorization control of the GOT network interaction function becomes enabled. Multiple GT SoftGOT3000 modules are connectable to one GOT. However, only one GT SoftGOT3000 module can be connected to the same GOT from one personal computer. The popup display on the screen will be changed to the popup display of the GOT network interaction function. GT SoftGOT3000 User's Manual
VNC server function	Even though the GOT network interaction function is enabled, authorization control of the VNC server function remains active. To operate a screen with authorization control enabled on the VNC server or VNC client, both the operation rights for the GOT network interaction function and the VNC server function are required. (When you perform operations on the VNC client, the VNC server obtains the operation right for the GOT network interaction function.) The popup display on the screen of the VNC server or VNC client will be changed to the popup display of the GOT network interaction function. ☞ Page 2638 Viewing the GOT from a personal computer (VNC server function)
GOT Mobile function	To operate a screen with authorization control enabled on the client, the operation right for the GOT network interaction function is required. ☞ 82 Monitoring a controller from tablets or other devices (GOT Mobile function)

Required system application (add-on function)

Not available for GT SoftGOT3000.

To use the GOT network interaction function, [GOT Network Interaction] must be selected from the system applications (add-on functions).

Selecting [Use GOT network interaction function] in the [GOT Network Interaction] dialog incorporates the application into package data automatically.

☞ Page 772 [GOT Network Interaction] dialog

15.2 How to use the GOT network interaction function

GT37 SoftGOT3000

☞ Page 766 Settings in GT Designer3
☞ Page 766 Settings in GT SoftGOT3000
☞ Page 766 Operation on target equipment
☞ Page 769 Control and status notification with devices

Settings in GT Designer3

Configure the following setting in all the projects of the GOTs that are under control of the GOT network interaction function.

1. Select [Common] → [GOT Network Interaction] from the menu to display the [GOT Network Interaction] dialog.

☞ Page 772 [GOT Network Interaction] dialog

2. Set the following items, and click the [OK] button.

- Select [Use GOT network interaction function].
- Set the IP address of the master GOT in [IP address].

Set the following items if necessary.

- [Port No.]
- [Guaranteed time of operational authority after the last operation]
- [Specify the home screen No.]

3. To enable authorization control for a screen, select [Target for exclusive control of operational authority] in the [Basic] tab in the [Screen Property] dialog.

☞ Page 313 Changing screen property

To collectively enable or disable authorization control for all the base screens and window screens, configure the setting in the [GOT Network Interaction] dialog.

To collectively enable or disable authorization control for all the mobile screens, configure the setting in [Exclusive Control of Operational Authority] in the [GOT Mobile Setting] window.

Settings in GT SoftGOT3000

To use GT SoftGOT3000 as the master GOT, configure the following settings in GT SoftGOT3000.

1. Select [Online] → [Communication Setup] from the menu.

2. In the [GOT Network Interaction Function] tab in the [Communication Setup] dialog, configure the following settings.

Select [Control authorization using GT SoftGOT3000 (this module)].

[IP address]: Set the IP address of GT SoftGOT3000 (master GOT).

[Port No.]: Set the port number of GT SoftGOT3000 (master GOT).

For details, refer to the following.

GT SoftGOT3000 User's Manual

Operation on target equipment

When switching a screen on target equipment to another screen with authorization control enabled, the equipment will obtain the operation right automatically and display a popup display.

On the popup display, you can check the operation right status, and manually obtain or release the operation right.

For details on operations and the differences by equipment, refer to the following.

☞ Page 767 Obtaining the operation right
☞ Page 767 Releasing the operation right
☞ Page 768 Operation on the popup display

The operation right status of the target equipment can be checked using GOT internal devices as well.
GOT internal devices can also be used to prevent the equipment from obtaining the operation right.
☞ Page 769 Control and status notification with devices

■Obtaining the operation right

When switching a screen to another screen with authorization control enabled, the equipment will obtain the operation right automatically.
The screen is switched regardless of whether the equipment obtains the operation right.
To manually obtain the operation right, touch the status icon on the popup display.
To obtain the operation right for the VNC server function on the VNC server or VNC client, touch the message display area on the popup display.
☞ Page 768 Operation on the popup display
When the set overlay screen function is used, the behavior differs depending on the setting of the destination basic screen.

Setting of the destination basic screen	Acquisition of the operation right
Authorization control is enabled.	The applicable equipment obtains the operation right at screen switching. Automatic acquisition of the operation right can be disabled. ☞ Page 770 Control with devices
Authorization control is disabled.	The applicable equipment does not obtain the operation right at screen switching.

For details on the set overlay screen function, refer to the following.
☞ Page 1865 Placing a screen on another screen

■Releasing the operation right

When switching to a screen with authorization control disabled while holding the operation right, the equipment automatically releases the operation right. (Note that the operation right is not released when the destination screen contains a called screen with authorization control enabled such as for the set overlay screen function.)
When another equipment tries to obtain the operation right, the operation right will be released even if the equipment is displaying a screen with authorization control enabled.
However, if the authorization guarantee time is set, the operation right is not released until the set time elapses from the last operation.
To manually release the operation right, perform the operation on the popup display.
☞ Page 768 Operation on the popup display

On the master GOT, you can also release the operation right from the equipment using GOT internal devices.
☞ Page 770 Control with devices

The operation right is not released even if the GOT transitions to the screen saver state.

■Operation on the popup display

On the target equipment, you can check the operation right status, and manually obtain or release the operation on the popup display.

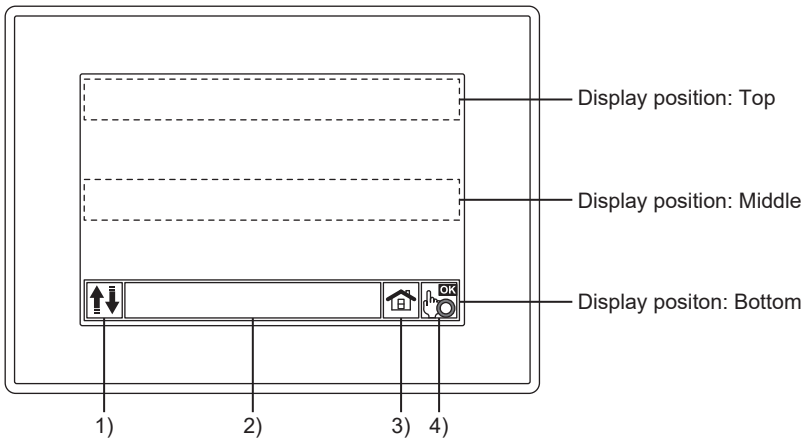
The conditions for the popup display to appear differ depending on the target equipment.

Target equipment	Display condition
GT37 (other than the VNC server)	The popup display appears when a screen is switched to another screen with authorization control enabled.
GT SoftGOT3000	
GOT Mobile function client	
GOT (VNC server)	• When authorization control of the VNC server function is enabled The popup display always appears on the screen. For the VNC client started with the exclusive password for monitoring, the popup display appears when a screen is switched to another screen with authorization control enabled. • When authorization control of the VNC server function is disabled The popup display appears when a screen is switched to another screen with authorization control enabled.
VNC client	

The operation right is not required to perform operations on the popup display.

Ex.

Popup display on the GOT



1) Display position switching button

Switches the position of the popup display. (Top, middle, bottom)

2) Message display area

Displays information including the operation right status.

On the VNC server or VNC client, touching the message display area obtains the operation right for the VNC server function. If you do so on the screen with authorization control enabled, the operation right for the GOT network interaction function is obtained together with the one for the VNC server function.

The format of the IP address displayed in the message differs according to the equipment type.

Type	Format	Example
GT37	(IP address):g(GOT ID)	192.168.3.18:g1
GT SoftGOT3000	(IP address):s(Module No.)	192.168.3.19:s1
VNC client*1	(IP address):v1	192.168.3.20:v1
GOT Mobile function client	(IP address):m(Client No.)	192.168.3.21:m1

*1 The IP address of the VNC server is displayed.

3) Home screen button

Switches to the home screen.

The home screen differs depending on the target equipment.

Equipment other than the GOT Mobile function client

Base screen specified in [Specify the home screen No.] in the [GOT Network Interaction] dialog

GOT Mobile function client

Mobile screen specified in [Specify the home screen No.] of [Exclusive Control of Operational Authority] in the [GOT Mobile Setting] window

If no screen is set as the home screen, touching this button displays the lowest numbered screen.

4) Status icon

Indicates the status of the target equipment.

Touching a status icon obtains or releases the authorization.

This action is not available if the GOT Mobile function client is authenticated by using a guest operator account.

The type of the target equipment determines the icon to be displayed.

Equipment	When displaying a screen with authorization control disabled	When displaying a screen with authorization control enabled		
		Operation right not obtained	Operation right obtained	Operation right being obtained
Equipment other than the VNC server and VNC client	-			
VNC server, VNC client (Authorization control for the VNC server function is disabled.)*1				
VNC server, VNC client (Authorization control for the VNC server function is enabled and the VNC server has the operation right.)				
VNC server, VNC client (Authorization control for the VNC server function is enabled and the VNC client has the operation right.)				

*1 For the VNC client started with the exclusive password for monitoring, the icon when authorization control for the VNC server function is disabled appears.

Control and status notification with devices

When using the devices for control and notification of the GOT network interaction function, you can prevent equipment from obtaining the operation right and check the operation right status.

The type of the target equipment determines the devices to be used.

Target equipment	Devices for control and status notification
GOT	GOT internal devices ☞ Page 3581 GOT special register (GS)
GOT Mobile function client	Devices that are set in [Operational Authority Status Control Device] and [Operational Authority Status Notification Device] of [Exclusive Control of Operational Authority] in the [GOT Mobile Setting] window ☞ Page 2817 [GOT Mobile Setting] window

■Control with devices

The following shows how to control the operation of the GOT network interaction function with devices.

Target equipment	Control details	Operation	
		Equipment other than the GOT Mobile function client	GOT Mobile function client
All	Disables automatic acquisition of the operation right when switching to a screen with authorization control enabled.	Turn on GS1795.b0.	Turn on b0 of [Operational Authority Status Control Device].
Master GOT	Prevents devices except the master GOT from obtaining the operation right.	Turn on GS1796.b0.	-
	Disables the authorization guarantee time.	Turn on GS1796.b1.	-
	Prevents all devices including the master GOT from obtaining the operation right.	Turn on GS1796.b2.	-

To ignore the authorization guarantee time and forcibly release the operation right from the target device, perform the following operation on the master GOT: Turn on GS1796.b1 to disable the authorization guarantee time, and then turn on GS1796.b0 or GS1796.b2.

■Status notification with devices

The following shows how to check the status of the GOT network interaction function with devices.

Target equipment	Notification details	Operation	
		Equipment other than the GOT Mobile function client	GOT Mobile function client
All	Notifies that the equipment obtains the operation right.	GS1460.b0 turns on.	The b0 of [Operational Authority Status Notification Device] turns on.
	Notifies that a screen requiring the operation right is being displayed.	GS1460.b1 turns on.	The b1 of [Operational Authority Status Notification Device] turns on.
Equipment other than the GOT Mobile function client	Notifies the IP address of the master GOT when the equipment obtains the operation right.	GS1461 and GS1462 store the data.	-
	Notifies the time (second) elapsed since the equipment obtained the operation right.	GS1463 stores the data.	-
	Notifies the remaining authorization guarantee time (second).	GS1464 stores the data.	-
Master GOT	Notifies that certain equipment holds the operation right.	GS1465.b0 turns on.	-
	Notifies that equipment except the master GOT is prevented from obtaining the operation right (GS1796.b0 is on).	GS1465.b1 turns on.	-
	Notifies that obtaining the operation right is prohibited (GS1796.b2 is on).	GS1465.b2 turns on.	-
	Notifies the IP address of the equipment that holds the operation right.	GS1466 and GS1467 store the data.	-
	Notifies the type of the equipment that holds the operation right.	GS1468 stores the data. • 0: GOT • 1: GT SoftGOT3000 • 2: GOT Mobile function client	-
	Notifies the identification information on the equipment that holds the operation right.	GS1469 stores the data. • GOT: GOT ID number • GT SoftGOT3000: Module number • GOT Mobile function client: Client number	-
	Notifies the time (second) elapsed since the equipment obtained the operation right.	GS1470 stores the data.	-

15.3 Precautions

GT37 SoftGOT3000

Precautions for drawing

■Specifying the master GOT

Set the same master GOT IP address in the projects of the GOTs that are in the same authorization control group.

If you set different IP addresses, the exclusive authorization control is not available.

■Setting the home screen

When setting a screen as the home screen, make sure that authorization control is disabled in the screen.

This avoids a state where the operation right cannot be obtained, which would result in the equipment being inoperable.

Precautions for use

■Master GOT startup timing

Start the master GOT earlier than other equipment.

No equipment can obtain the operation right before the master GOT is started.

■Restrictions on the alarm popup display

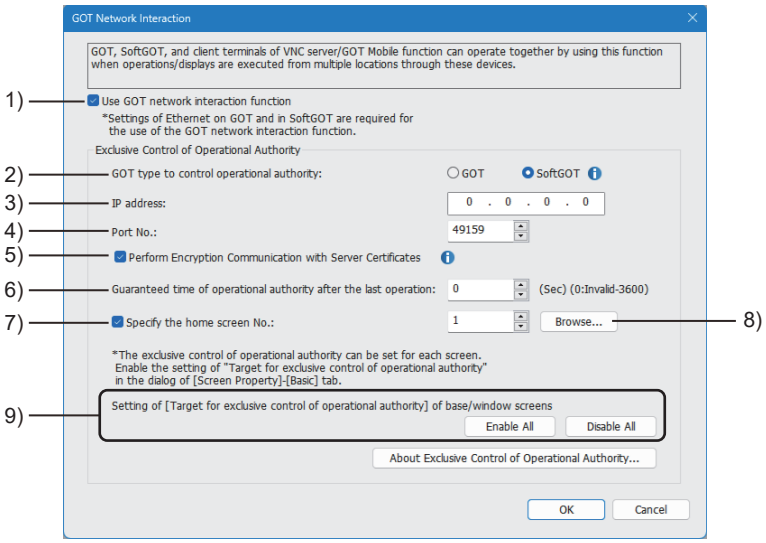
While the popup display of the GOT network interaction function is being displayed, the alarm popup display is disabled.

PART 5

15.4 [GOT Network Interaction] dialog

GT37 SoftGOT3000

In the [GOT Network Interaction] dialog, configure the settings for the GOT network interaction function.
Select [Common] → [GOT Network Interaction] from the menu to display this dialog.



Item		Description
1)	[Use GOT network interaction function]	Enables the GOT network interaction function.
2)	[GOT type to control operational authority]	Set the type of the master GOT. When selecting [SoftGOT], configure the settings for the GOT network interaction function in GT SoftGOT3000. For details, refer to the following. GT SoftGOT3000 User's Manual
3)	[IP address]	Set the IP address of the master GOT.
4)	[Port No.]	Set the port number of the master GOT. The setting range depends on the model set for [GOT type to control operational authority]. • [GOT]: Fixed to 49159 (49201 when encrypted communication is set) • [SoftGOT]: [1024] to [65534]
5)	[Perform Encryption Communication with Server Certificates]	Enable the encrypted communication with a server certificate. For details, refer to the following. ☞ Page 3078 [Certificate]
6)	[Guaranteed time of operational authority after the last operation]	Set a period of time to retain the operation right after certain equipment obtains the operation right and then the equipment is operated. The setting range is [0] (Invalid), or [1] to [3600] seconds. This setting is disabled when GS1796.b1 is turned on.
7)	[Specify the home screen No.]	Set a base screen as the home screen. On the popup display of the GOT network interaction function, touching the home screen button displays the set base screen. Make sure that the authorization control is disabled in the set base screen.
8)	[Browse] button	Displays the [Image List] dialog. ☞ Page 3683 [Image List] dialog (screen)
9)	[Setting of [Target for exclusive control of operational authority] of base/window screens]	• [Enable All] button: Selects [Target for exclusive control of operational authority] for all the base screens and window screens. • [Disable All] button: Clears [Target for exclusive control of operational authority] for all the base screens and window screens.

16 Checking the interface settings of the GOT ([I/F Communication Setting])

GT37 SoftGOT3000

☞ Page 773 How to use the I/F communication setting
☞ Page 774 [I/F Communication Setting] dialog

In the [I/F Communication Setting] dialog, check or edit the settings related to the communication interface of the GOT.

16.1 How to use the I/F communication setting

Operating procedure

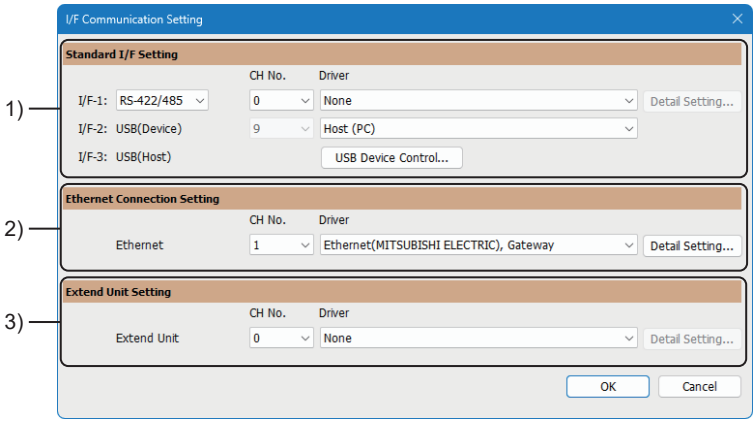
Select [Common] → [I/F Communication Setting] from the menu to display the [I/F Communication Setting] dialog.
Check or edit the settings related to each communication interface.

☞ Page 774 [I/F Communication Setting] dialog

16.2 [I/F Communication Setting] dialog

GT37 SoftGOT3000

Check or edit the settings related to the communication interface of the GOT that have been configured on other screens.



Item			Description
1)	[Standard I/F Setting]	—	Indicates the use status of the RS-232, RS-422/485, and USB communication interfaces of the GOT.
		[I/F-1]	Indicates the use status of the RS-232 or RS-422/485 interfaces. The interface type (RS-232 or RS-422/485) can be changed.
		[I/F-2]	Indicates the use status of the USB (device) interface.
		[I/F-3]	Clicking the [USB Device Control] button displays the [USB Device Control] dialog. You can check the settings of the device using the USB (host) in the dialog.
		[CH No.]	The channel number assigned to each interface. • [0]: Not used • [1] to [4]: Used for communications with the controllers set to channel numbers 1 to 4 in the [Controller Setting] window. • [5] to [8]: Used for the barcode function and the RFID function. • [9]: Used for data transfer to/from the host (personal computer).
		[Driver]	The communication driver set for each interface. The required communication driver differs depending on the controller and connection type. 📖GOT3000 Series User's Manual (Connection)
		[Detail Setting] button	Displays the [Detail Setting] dialog. Set the connection details, such as the number of retries and the communication timeout period. ☞ Page 775 [Detail Setting] dialog
2)	[Ethernet Connection Setting]	—	Indicates the use status of the Ethernet interface.
		[CH No.]	The channel number assigned to the Ethernet interface. • [0]: Not used • [1] to [4]: Used for communications with the controllers set to channel numbers 1 to 4 in the [Controller Setting] window. • [9]: Used for data transfer to/from the personal computer. • [A]: Used for the gateway function. • [Multi]: Used for communications with multiple devices.
		[Driver]	The communication driver set for the Ethernet interface. The required communication driver differs depending on the controller and connection type. 📖GOT3000 Series User's Manual (Connection)
		[Detail Setting] button	Displays the [Detail Setting] dialog when [Ch No.] is [1] to [4]. Set the connection details, such as the number of retries and the communication timeout period. ☞ Page 775 [Detail Setting] dialog
			Displays the [Ethernet Multi Connection] dialog when [CH No.] is [Multi]. Set the communication driver for each channel.

Item			Description
3)	[Extend Unit Setting]	—	Indicates the use status of the extension unit.
		[CH No.]	The channel number assigned to each interface. • [0]: Not used • [1] to [4]: Used for communications with the controllers set to channel numbers 1 to 4 in the [Controller Setting] window. • [5] to [8]: Used for the barcode function and the RFID function. • [A]: Used for the external I/O function and the operation panel function.
		[Driver]	The communication driver set for each interface. The required communication driver differs depending on the controller and connection type. 📖GOT3000 Series User's Manual (Connection)
		[Detail Setting] button	Displays the [Detail Setting] dialog. Set the connection details, such as the number of retries and the communication timeout period. ☞ Page 775 [Detail Setting] dialog

16.2.1 [Detail Setting] dialog

GT37 SoftGOT3000

The settings in this dialog vary depending on the controller type, communication interface, communication driver, and other setting items.

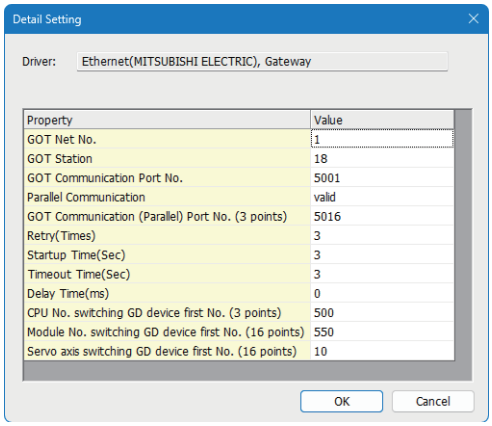
The settings need to be configured according to the connection type between the GOT and the controller.

For details on the settings for each connection type, refer to the following.

📖GOT3000 Series User's Manual (Connection)

Ex.

When [Driver] is set to [Ethernet(MITSUBISHI ELECTRIC), Gateway]



PART 5

17 Comment setting ([Comment])

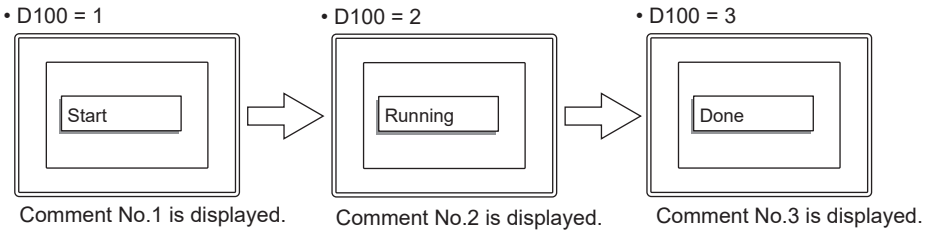
GT37 SoftGOT3000

Comments are the character strings registered to the project by a user.
Comments can be used for displaying the character strings with each object.
Comments are used for displaying the same character string with multiple objects or for displaying messages which are changed by the device value.
Comments supporting multiple languages can be displayed with the language switching device.

Ex.
Changing the message that appears on a comment display object according to the value of D100.

Comment group No.1

Comment No.	Column No.1
1	Start
2	Running
3	Done
⋮	⋮



☞ Page 777 Specifications of comments
☞ Page 780 How to use comment
☞ Page 788 Setting comments

17.1 Specifications of comments

GT37 SoftGOT3000

☞ Page 777 Number of comments
☞ Page 777 Number of characters
☞ Page 777 Applicable functions
☞ Page 778 Applicable font
☞ Page 779 Display attributes
☞ Page 779 Files that can be imported or exported

17.1.1 Number of comments

Item	Description
Maximum number of comment groups for a project	500
Maximum number of comments for a comment group	32767
Maximum number of comment columns for a comment group	30

17.1.2 Number of characters

Item	Description
Comment group title	Up to 32 characters
Comment	Up to 1024 characters

17.1.3 Applicable functions

- Touch switch
- Lamp
- Comment display
- Historical data list display
- Alarm display (user)
- Simple alarm display (Windows fonts not supported)
- Alarm popup display
- Recipe display (record list) (Windows fonts not supported)
- Graphical meter
- Document display
- Hyperlink

17.1.4 Applicable font

For information on comment compatible fonts and KANJI regions, refer to the following.

☞ Page 74 Specifications of displayable characters

Precautions

■Project data size

When comments in Windows fonts are registered to comment groups, the project data size becomes large.

To reduce the project data size, configure the following settings.

- Separate comment groups into two types: group with the Windows font setting and group without the Windows font setting.
- Set the same font size for the objects that display the same comment.
- Set the same text style for the objects that display the same comment.

■Comment exceeding the display range in length

If a Windows font is used for a comment exceeding the display range, the comment may not be displayed correctly.

Set the comment within the display range.

■Display for a comment group of more than 128 MB

If the data size of a comment group exceeds 128 MB, some comments in Windows fonts are not displayed properly.

Make sure that the data size of a comment group is 128 MB or less.

17.1.5 Display attributes

The display attributes are settable for each comment.

The display attributes valid for displaying a comment vary with the object.

Object name	Text color	Blink	Character effect	Shadow color	Inversion
Touch switch	Selectable	Nonexistent	Selectable	Selectable	Nonexistent
Lamp	Selectable	Nonexistent	Selectable	Selectable	Nonexistent
Comment display	Selectable	Selectable	Selectable	Selectable	Selectable
Historical data list display	Object setting	Nonexistent	Object setting	Object setting	Nonexistent
Alarm display (user), simple alarm display	Object setting	Nonexistent	Object setting	Object setting	Nonexistent
Alarm popup display	Varying with the condition	Nonexistent	Object setting	Object setting	Nonexistent
Recipe display (record list)	Object setting	Nonexistent	Object setting	Object setting	Nonexistent
Graphical meter	Selectable	Nonexistent	Object setting	Object setting	Nonexistent
Document display	Nonexistent	Nonexistent	Nonexistent	Nonexistent	Nonexistent
Hyperlink	Selectable	Nonexistent	Selectable	Selectable	Nonexistent

The following explains the details of each display attribute shown in the above table.

Selectable

You can select the display attribute in the object setting or the one in the comment group setting.

To use the display attribute in the object setting, select [Change Attribute of Comment Setting] in the object setting.

To use the display attribute in the comment group setting, deselect this item.

Nonexistent

The relevant display attribute is nonexistent for the object.

Accordingly, the display attribute in the comment group setting is invalid.

Object setting

The display attribute in the object setting is used.

Accordingly, the display attribute in the comment group setting is invalid.

Varying with the condition

When [Comment Color (System Alarm: Fixed)] is selected for [Switching Type] in [Alarm Text Color Switching] in the object setting, the display attribute in the comment group setting is used.

☞ Page 2118 [Alarm Popup Display] dialog

When any other item is selected for [Switching Type], the display attribute in the object setting is used.

17.1.6 Files that can be imported or exported

Unicode text files and CSV files can be used.

17.2 How to use comment

GT37 SoftGOT3000

Register comments to a comment group.
Create comment groups according to the usage of the comments and register the comments.
If you set multiple comment columns in a comment group, the comments prepared in multiple languages can be switched with language switching devices.
Device comments created in GX Works3, GX Works2, GX Developer and MT Developer2 can also be registered in comment groups.
For information on how to register comments to a comment group, refer to the following.
☞ Page 959 [Device Comment / Device Definition List] dialog

17.2.1 Using comments

The following shows how to use comments.

1. Create a comment group according to the usage of the comments.
☞ Page 797 Creating a new comment group

2. Open the comment group and register comments.
☞ Page 789 Opening comment groups
☞ Page 799 Creating a new row
☞ Page 800 Inserting a row
☞ Page 801 Inserting a column

3. Set the comments for each object.
☞ Page 1191 Placing a touch switch
☞ Page 1276 Placing a lamp
☞ Page 1386 Placing a comment display
☞ Page 1495 Placing a historical data list display
☞ Page 1518 Placing an alarm display
☞ Page 1519 Placing a simple alarm display

17.2.2 Comment group

A comment group is a group of comments.

To register the comments, create a comment group in a project.

Multiple comment groups can be created in a project.

If multiple comment groups are created, the comment groups can be used according to the purpose.

Ex.

Specify a comment group number with a device then change the type of comment to be displayed.

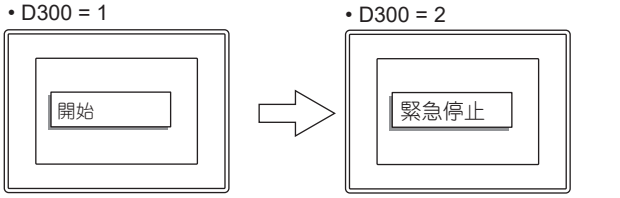
Comment group No.1: Comment for normal messages

Comment No.	Column No.1	Column No.2
1	開始	Start
2	実行中	Running
3	完了	Done
⋮	⋮	⋮

Comment group No.2: Comment for error messages

Comment No.	Column No.1	Column No.2
1	緊急停止	Emergency stop
2	通信エラー	Communication error
3	異物混入	Contamination
⋮	⋮	⋮

Comment group No.: Specified with D300



Comment for normal messages (Comment group No.1) is displayed.

Comment for error messages (Comment group No.2) is displayed.

PART 5

17.2.3 Displaying multi-language comments (Language switching device)

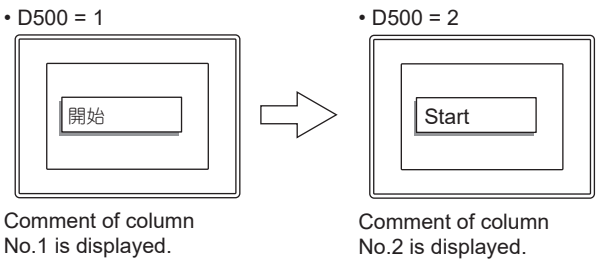
If you set multiple comment columns in a comment group, the comments can be registered in multiple languages for one comment number.
The comments registered in multiple languages can be switched by switching the comment column to be displayed with the language switching devices.

Ex.
Switching comments with the language switching device.

Comment group No.1

Comment No.	Column No.1	Column No.2
1	開始	Start
2	実行中	Running
3	完了	Done
⋮	⋮	⋮

Comment No. to be displayed: 1
Language switching device: D500



Comment group which does not operate with language switching devices

If a comment group which does not operate with a language switching device is required, configure the following settings in the language switching device settings.

- Select [Display] for [Alternative Display (when the language switching device value is out of the range (1-30) or comment column No. does not exist)].
- Set [1] for [Comment Column No.].

When the above settings are configured, the comment for column No.1 is always displayed regardless of the value of the language switching device if the comment group only contains column No.1.

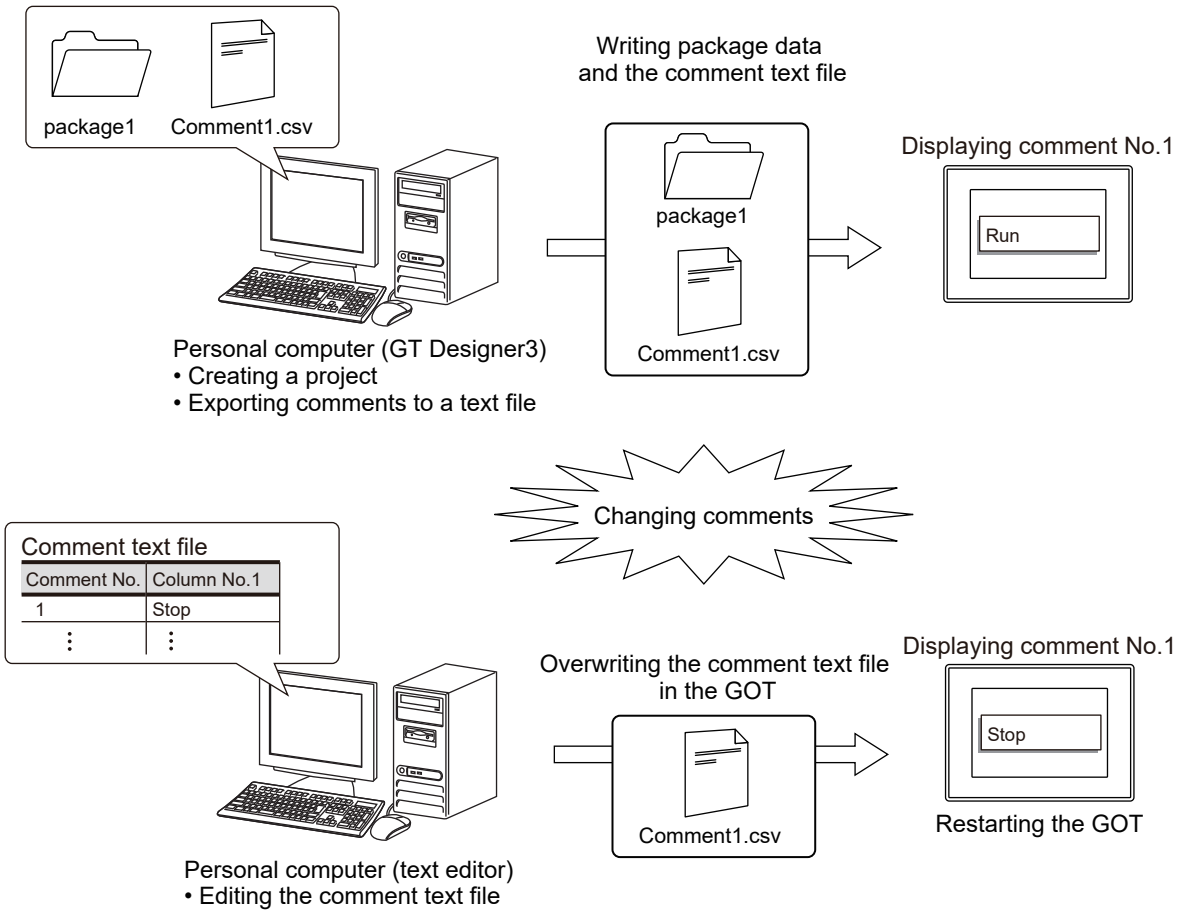
☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching])

Font restrictions

If a Windows font is not specified in the [Comment Group Property] dialog and a Windows font is set on the object side, comments are displayed in the UDP font.

17.2.4 Displaying the comments of a text file

The GOT can display comments by reading a comment text file from the installed data storage.
After you change a comment, overwrite the comment text file in the data storage and restart the GOT to display the new comment.



To display the comments of a text file, configure the relevant settings in the project.
Configure the settings by comment group.

Procedure for displaying the comments of a text file

Configure the following settings for a comment group from which comments are exported to a text file.

Operating procedure

1. In the [Comment Group Property] dialog, configure the settings as shown below.

- Select [Read comment data from the memory card].
- Click the [File Access] button to display the [File Access] dialog, and set the save destination and file name of a text file.

☞ Page 797 [Comment Group Property] dialog

2. Export a target comment group to the text file.

Set the [File name] in the [Save As] dialog as the same [File name] set in the [Destination] dialog.

☞ Page 804 Exporting comments

3. Save the text file exported in step 2 to the folder specified in the [Destination] dialog.
4. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 437 Writing data to the GOT

If the text file is saved after package data has been written to the GOT, restart the GOT.

Procedure for reflecting comment changes

Operating procedure

1. Edit a comment text file with a text editor, and overwrite the text file in the data storage with the edited one.
2. Restart the GOT.

Font restrictions

Windows fonts are not supported.

Even if a Windows font is specified in the object setting dialog, comments are displayed in UDP Gothic on the GOT.

If the UDP Gothic font data does not exist, comments are displayed in UDP Mincho.

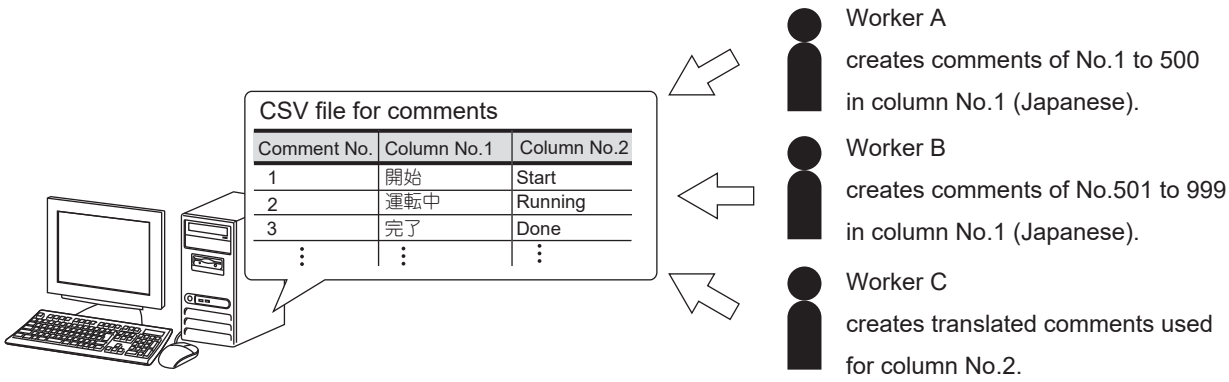
Influence on the GOT startup time

When this function is used, the GOT reads a comment text file at startup, resulting in a longer startup time.

To minimize the increase of the startup time, enable this function only for the comment group in which comments may be changed.

17.2.5 Import/Export

Comments can be imported or exported with a personal computer.
Available text files are Unicode text file and CSV file.
If you need to set a large amount of comments, working hours required to create the comments can be shortened by importing the text files for comments created by multiple persons.
To create a new text file for comments, using a text file exported from a comment group is recommended.
For the precautions for using a Unicode text file or CSV file, refer to the following.
☞ Page 3668 Precautions for using CSV file
☞ Page 3669 Precautions for using Unicode text file



The format of the text files for comments is common for both Unicode text files and CSV files.
However, use the following delimiters for each item.

- Unicode text file: Tab (\t)
- CSV file: Comma (,)

Point

Files exported from GT Designer3 (GOT2000) can also be imported.

Precautions

■Importing the exported comments to GT Designer3 whose display language is different

If you export comments to a file with a GT Designer3 module, the file cannot be imported to another GT Designer3 module that uses a different display language.

■Overwriting comments when importing a text file for comments

When a text file for comments is imported, comments in the file are used to overwrite the comment group in the import destination.
Before importing comments, check the comment group in the import destination and comments in the text file to be imported.
For details, refer to the following.
☞ Page 802 Importing comments

■Exporting multi-language comments

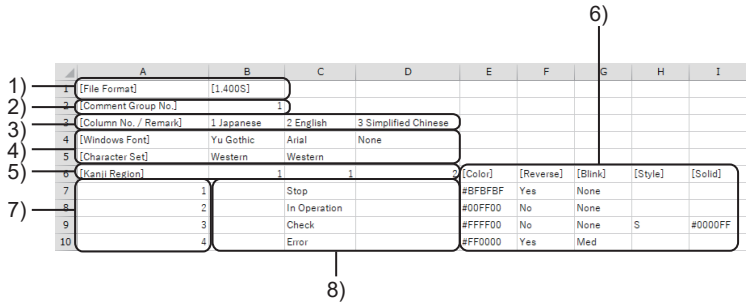
A comment group for which multiple languages including Chinese are used may not be saved in a CSV file properly.
Export a comment group including multiple languages in the Unicode text file format.

17.2.6 Formatting an exported file

The format of the exported file is shown below.

Ex.

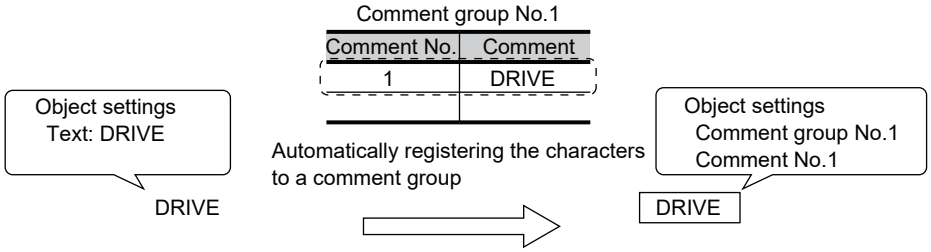
Example of a CSV file



Item			Description
1)	[File Format]		The format version of the exported files.
2)	[Comment Group No.]		Set a comment group number. The setting range is 1 to 500.
3)	[Column No. / Remark]		Set the column numbers and remarks for the comment column. Separate the column numbers and remarks with a one-byte space. The setting range of the column numbers is 1 to 30. Up to 32 characters can be set as remarks.
4)	[Windows Font], [Character Set]		Displays the Windows fonts that are selected in the [Comment Group Property] dialog. Displays the character sets that are specified for the selected Windows fonts. For details on the setting, refer to the following. ☞ Page 797 [Comment Group Property] dialog Even if Windows fonts are set for the comments of a text file, the GOT displays the comments in standard fonts.
5)	[Kanji Region]		Set a KANJI region for each comment column. The target comment column of the KANJI region is the comment column specified under these items. The following shows the settings for each KANJI region. • 1: Japan • 2: China(GB)-Mincho • 3: China(Big5)-Gothic
6)	Character property	—	Set character properties for each comment. Input a property name to the first row, then input each setting in the subsequent rows.
		[Color]	Set the comment text color with a hexadecimal color code. The setting range is #000000 to #FFFFFF.
		[Reverse]	Set whether to reverse the characters or not. The following shows the setting range. • Yes: Reversed • No: Not reversed
		[Blink]	Set a blink style of characters. The following shows the setting range. • None: Not blinking • Low: Blinking at a low speed • Med: Blinking at a medium speed • High: Blinking at a high speed
		[Style]	Set the text style. The following shows the setting range. • Blank: Standard • B: Bold • S: Shadow • R: Embossed
		[Solid]	Set the color of the shade when the character effect is shadow or engrave. The setting range is the same as the character colors.
7)	Comment number		Set a comment number for the comment. The setting range is 1 to 32767 (decimal) or 0x0001 to 0x7FFF (hexadecimal).
8)	Comment		Input text for the comment. Up to 1024 characters can be set.

17.2.7 Comment registration using the characters of the text figure

In the text figure setting, you can register the characters entered in the [Text] field to a comment group, and convert the text figure to a simple comment display object.



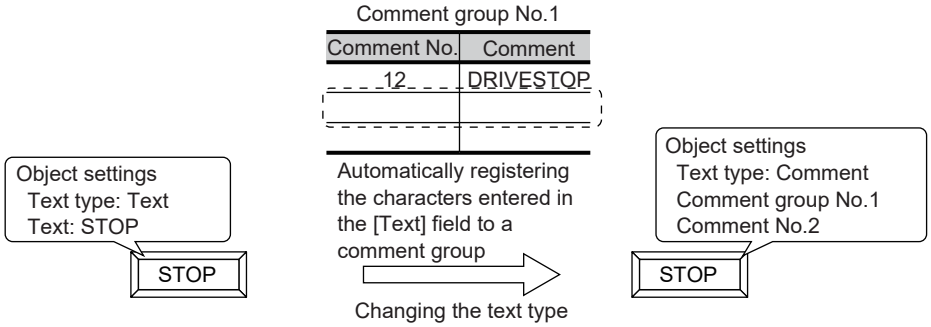
Converting the text figure to a simple comment display object

For the registration method, refer to the following.

☞ Page 810 Registering the characters of a text figure to a comment group

17.2.8 Comment registration using the text type [Text]

In the object setting, you can register the characters entered in the [Text] field to a comment group by changing the text type from [Text] to [Comment].



Changing the text type

For the registration method, refer to the following.

☞ Page 811 Registering the characters in the [Text] field to a comment group

17.3.1 Opening comment groups

GT37 SoftGOT3000

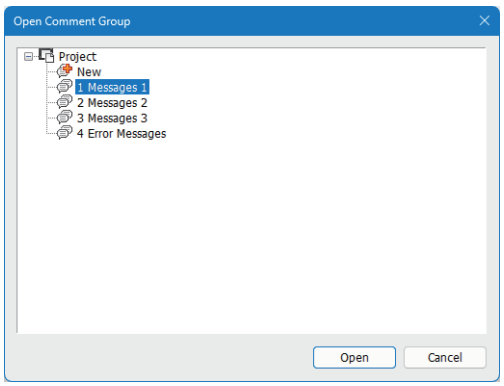
Opening comment groups from the menu

The following shows the procedure to open existing comment groups.

Operating procedure

1. Select [Common] → [Comment] → [Open] from the menu to open the [Open Comment Group] dialog.

☞ Page 790 [Open Comment Group] dialog



2. Select the target comment group and click the [Open] button.

☞ Page 791 [Comment List] window

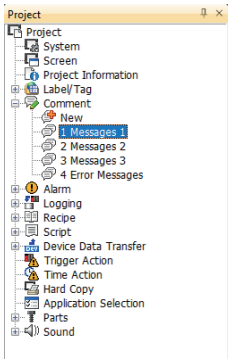
Opening comment groups from the project tree

The following shows a procedure to open existing comment groups in the project tree.

Operating procedure

1. Open [Comment] in the project tree.

☞ Page 116 [Project] window



2. Open comment groups using either of the following operations.

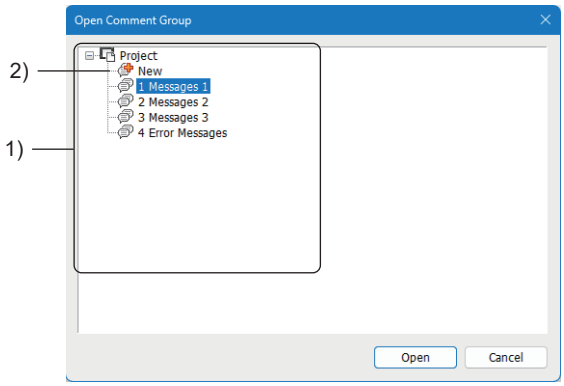
- Double-click a comment group.
- Right-click a comment group then select [Open].

☞ Page 791 [Comment List] window

[Open Comment Group] dialog

GT37 SoftGOT3000

The [Open Comment Group] dialog lists all the comment groups registered in the project.
In this dialog, you can create new comment groups and edit existing comment groups.
Select [Common] → [Comment] → [Open] from the menu to display the dialog.



Item		Description
1)	Comment group list	The list of comment groups registered to the project. Double-click a comment group or select a comment group then click the [Open] button to display the [Comment List] window. To open the [Comment List] window of multiple comment groups with a single operation, click the [Open] button while selecting multiple comment groups (up to 10). ☞ Page 791 [Comment List] window
2)	[New]	Creates a new comment group. After clicking the [New] button, create a new comment group in the displayed dialog. ☞ Page 797 [Comment Group Property] dialog Up to 10 [Comment List] windows can be displayed simultaneously. When the 11th window opens, the first-edited (oldest in the edit history) [Comment List] window closes automatically.

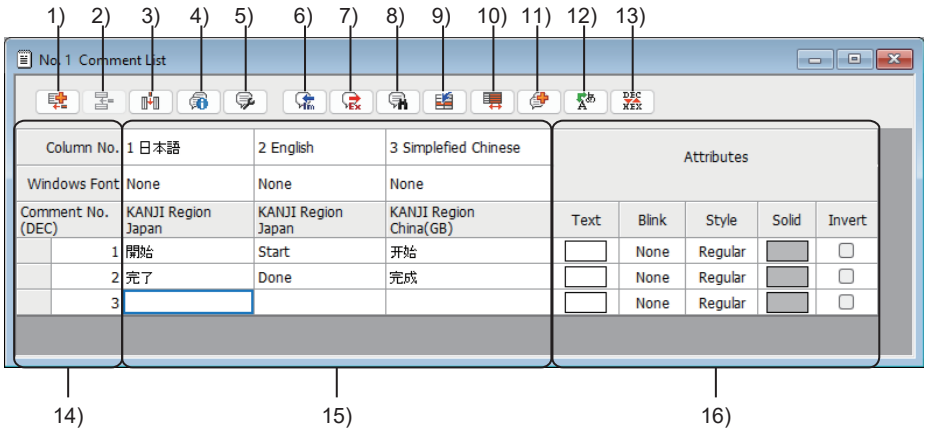
[Comment List] window

GT37 SoftGOT3000

The [Comment List] window displays the list of the comments registered to a comment group.

☞ Page 791 Setting items in the [Comment List] window
☞ Page 795 Items in the right-click menu
☞ Page 796 Mouse and keyboard operations

■Setting items in the [Comment List] window



Item		Description
1)	[New] button	Creates a new comment. A new comment is added to below the bottom row of the comment list. ☞ Page 797 Creating a new comment group
2)	[Insert Row] button	Inserts a row in the comment list. If multiple rows are selected in the comment list, the same number of new rows are inserted above the selected ones. When a row is inserted between consecutive comment numbers, all rows after the inserted row are renumbered. ☞ Page 800 Inserting a row
3)	[Insert Column] button	Inserts a column in the comment column. If multiple columns are selected in the comment list, the same number of new columns are inserted to the left of the selected ones. When a column is inserted between consecutive column numbers, all columns to the right of the inserted column are renumbered. ☞ Page 801 Inserting a column
4)	[Comment Group Property] button	Check or change the detail of the comment group including the comment name and KANJI region. ☞ Page 797 [Comment Group Property] dialog

Item		Description
5)	[Attribute Setting] button	Set the character property of comments. ☞ Page 807 Changing properties  • [Text Color] Set the character color. • [Blink] Set the blinking speed of characters. The following shows selectable items. • [None] • [Low] • [Medium] • [High] • [Style] Select a character effect. The following shows selectable items. • [Standard] • [Bold] • [Solid] • [Raised] • [Solid Color] Select the shadow color of characters when [Solid] or [Raised] is selected for [Style]. • [Invert] Highlights characters. This item can be selected only when [Regular] is selected for [Style].
6)	[Import] button	Imports comments from a Unicode text file or a CSV file. After clicking the button, select a file to import in the displayed dialog. ☞ Page 802 Importing comments
7)	[Export] button	Exports a comment group into a Unicode text file or a CSV file. After clicking the button, select a file to export in the displayed dialog. ☞ Page 804 Exporting comments
8)	[Search] button	Searches a comment. ☞ Page 806 Comment searching  • [Search String] Input a character string to search information. • [Direction] Select the search direction. • [Search Next] button Searches the next option. • [Close] button Closes the [Search] dialog.
9)	[Jump] button	Jumps to the specified comment number. ☞ Page 806 Jumping to the specified comment  • [Jump] Set a target comment number. • [Jump] button Displays the comment number which is specified in [Jump]. • [Close] button Closes the [Jump] dialog.
10)	[Display/Hide Attribute] button	Displays/hides the character property setting field. ☞ Page 809 Displaying/hiding attributes

Item			Description
11)	[New Group] button		Creates a new comment group. ☞ Page 797 [Comment Group Property] dialog
12)	[Language Switching] button		Configures the language switching settings. After clicking the button, configure the language switching settings in the [Environmental Setting] window. ☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching])
13)	[Comment No. Notation Switching] button		Switches the comment number notation of the comment No. field between decimal and hexadecimal.
14)	Comment No. field		The field to display and change the comment numbers. Comment numbers are always displayed in ascending order. Comment numbers are assigned automatically when a new comment is created. The comment numbers can be changed by double-clicking a comment number cell. Clicking a cell to the left of a comment number selects the row. To select multiple rows, perform one of the following operations. • Hold down the [Ctrl] key and click a target cell. To deselect a selected row, perform the same operation. • Select the first row in the range, hold down the [Shift] key, and click a target cell to select the last row in the range. • Click the first cell and drag to the last cell in the range.
15)	Comment field	—	The field to display and edit text of comments. 		Column No. and remarks	Column number and remarks of a comment column. Click a target cell to edit its contents.
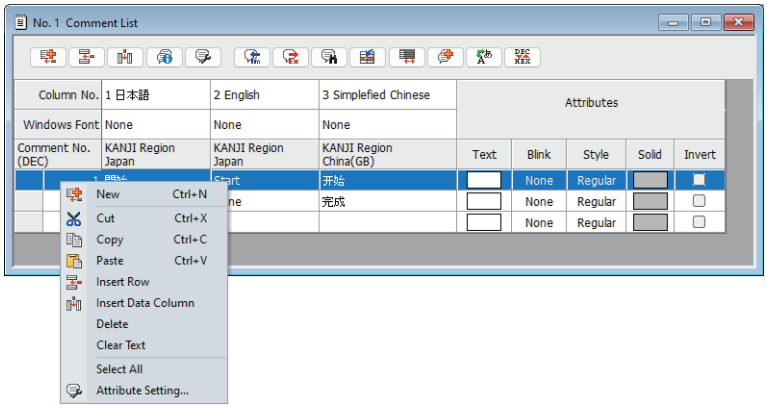
		Windows Font	This item is displayed when [Read comment data from the memory card] is deselected in the [Comment Group Property] dialog. Displays the Windows fonts that are selected in the [Comment Group Property] dialog. Click a Windows font cell to select the column. To select multiple columns, perform one of the following operations. • Click a Windows font cell to select the first column in the range, hold down the [Shift] key, and click another Windows font cell to select the last column in the range. • Click a Windows font cell and drag to the last cell in the range. To change the set Windows fonts, double-click a Windows font cell to display the [Comment Group Property] dialog. ☞ Page 797 [Comment Group Property] dialog
		KANJI region	KANJI region of a comment column The KANJI region is changeable in the [Comment Group Property] dialog. ☞ Page 797 [Comment Group Property] dialog Click a KANJI region cell to select the column. To select multiple columns, perform one of the following operations. • Click a KANJI region cell to select the first column in the range, hold down the [Shift] key, and click another KANJI region cell to select the last column in the range. • Click a KANJI region cell and drag to the last cell in the range.
		Comment	Set the comment corresponding to a comment number. Double-click a target cell to edit its comment.

Item			Description
16)	Character property setting field	—	The field to display and set the character property of comments. Available character properties differ depending on the object types. For the difference among the object types, refer to the following. ☞ Page 779 Display attributes
		Text color	Set the character color. Select a color from the color palette.
		Blink	Set the blinking speed of characters. The following shows selectable items. • [None] • [Low] • [Medium] • [High]
		Character effect	Select a character effect. The following shows selectable items. • [Standard] • [Bold] • [Solid] • [Raised]
		Shadow color	Select the shadow color of characters when [Solid] or [Raised] is selected for [Style]. Select a color from the color palette.
		Inversion	Select this item to highlight the characters. This item can be selected only when [Regular] is selected for [Style].

■Items in the right-click menu

The [Comment List] window can be edited with the right-click menu.



Item	Description
[New Row]	Creates a new comment. A new comment is added to below the bottom row of the comment list.
[Cut]	Cuts a selected row, column, or cell.
[Copy]	Copies a selected row, column, or cell.
[Paste]	• When the copy source is the comment list: Pastes rows, columns, and cells cut and copied from the comment list. • When the copy source is Excel: Pastes columns and cells cut and copied from Excel. If the number of columns to be pasted exceeds the number of columns in the comment list, new columns are added to the comment list.
[Insert Row]	Inserts a row in the comment list. If multiple rows are selected in the comment list, the same number of new rows are inserted above the selected ones. When a row is inserted between consecutive comment numbers, all rows after the inserted row are renumbered.
[Insert Column]	Inserts a column in the comment list. If multiple columns are selected in the comment list, the same number of new columns are inserted to the left of the selected ones. When a column is inserted between consecutive column numbers, all columns to the right of the inserted column are renumbered.
[Delete]	Deletes a selected row, column, or cell.
[Clear Text]	Deletes the character strings set in a selected row or column.
[Select All]	Selects all the comments in the comment list.

Item	Description
[Attribute Setting]	Set the character property of comments.  • [Text Color] Set the character color. • [Blink] Set the blinking speed of characters. The following shows selectable items. • [None] • [Low] • [Medium] • [High] • [Style] Select a character effect. The following shows selectable items. • [Standard] • [Bold] • [Solid] • [Raised] • [Solid Color] Select the shadow color of characters when [Solid] or [Raised] is selected for [Style]. • [Invert] Highlights characters. This item can be set only when [Regular] is selected for [Style].

■Mouse and keyboard operations

The following shows how to manipulate the cells in the [Comment List] window with a mouse and keyboard.

You can select, copy, cut, or paste the cells in the comment No. field and the comment field.

Operation	Action
Arrow (Up/Down/Left/Right)	Move the cell pointer.
[Shift] + Arrow (Up/Down/Left/Right)	Extend the selection of cells. Select the first cell, hold down the [Shift] key and press an arrow key to extend the selection.
[Shift] + Click	Select a range of cells. Select the first cell in the range, hold down the [Shift] key and click the last cell in the range.
[Ctrl] + [C]	Copy the contents of a selected cell. When multiple cells are selected, the contents of all the selected cells are copied.
[Ctrl] + [X]	Cut the contents of a selected cell.
[Ctrl] + [V]	Paste the contents of the clipboard to a selected cell.

17.3.2 Creating a new comment group

GT37 SoftGOT3000

The following shows how to create a comment group.

Operating procedure

1. Open the [Comment Group Property] dialog by either of the following operations.

- Select [Common] → [Comment] → [Open] from the menu to open the [Open Comment Group] dialog and double-click the [New] button.

☞ Page 790 [Open Comment Group] dialog

- Double-click the [New] button under [Comment] in the project tree in the [Project] window.

☞ Page 116 [Project] window

- Right-click [Comment] of the project tree and selecting [New Comment Group] from the menu.

☞ Page 116 [Project] window

2. Set the created comment group in the [Comment Group Property] dialog.

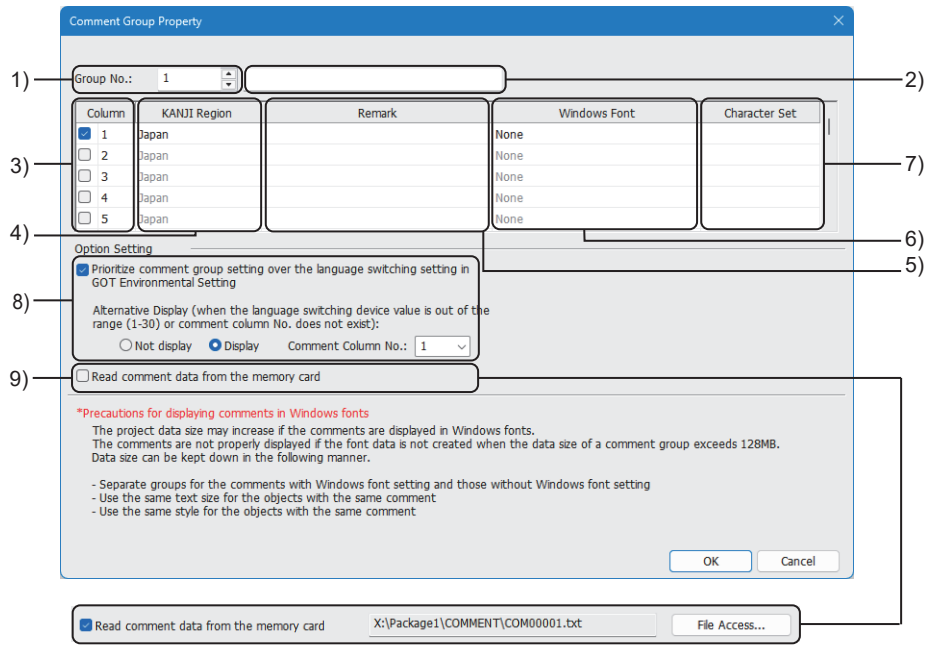
☞ Page 797 [Comment Group Property] dialog

[Comment Group Property] dialog

GT37 SoftGOT3000

Create a new comment group in the [Comment Group Property] dialog.

Select [Common] → [Comment] → [New Comment Group] from the menu to display the dialog.



Item		Description
1)	[Group No.]	Set a comment group number.
2)	Title	Set a title of the comment group. Up to 32 characters can be set.
3)	[Column]	Set column numbers to be used in the comment group. Select column numbers to be used.
4)	[KANJI Region]	Set a KANJI region for each comment column. The following shows selectable items. • [Japan] • [China(GB)-Mincho] • [China(Big5)-Gothic]

PART 5

Item			Description
5)	[Remark]		Set remarks for each comment column. Up to 32 characters can be set.
6)	[Windows Font]		This item is displayed when [Read comment data from the memory card] is deselected. Select a Windows font for each comment column.
7)	[Character Set]		This item is displayed when [Read comment data from the memory card] is deselected. Select a character set for each selected Windows font. The selectable character sets vary with the selected Windows font.
8)	[Prioritize comment group setting over the language switching setting in GOT Environmental Setting]	—	Set whether to prioritize the setting in this dialog over the settings of the language switching of the GOT environmental settings. This item can be set only when the language switching device is set in the GOT environmental settings.
		[Alternative Display (when the language switching device value is out of the range (1-30) or comment column No. does not exist)]	Set the display method of the comment columns for when the column number of the comment column specified by the language switching device does not exist. The following shows selectable items. • [Not display] Comments are not displayed. • [Display] The comment of the specified column number is displayed. After selecting this item, set the column number of the column to be displayed. When [Read comment data from the memory card] is selected, the comment column number specified in [Language Switching] in the GOT environmental settings is applied.
9)	[Read comment data from the memory card]		Displays comments by reading a comment text file from the data storage installed on the GOT. Click the [File Access] button to display the [File Access] dialog.  Set the save destination and file name of a text file. • [Drive Name] Select a drive to which the text file is saved. The following shows selectable items. • [A:Standard SD Card] • [B:USB Drive] • [E:USB Drive] • [F:USB Drive] • [G:USB Drive] • [X:Current Drive] For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT • [Folder Name] Specify the name of the folder to which the text file is saved. For the restrictions on the folder name used on the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT • [File Name] Specify the name of the text file to be saved. The text file can be saved as a Unicode text (*.TXT) or CSV (*.CSV) file. For the restrictions of the file name used in the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT

17.3.3 Creating a new row

GT37 SoftGOT3000

Create a new comment row in the [Comment List] window or the project tree.

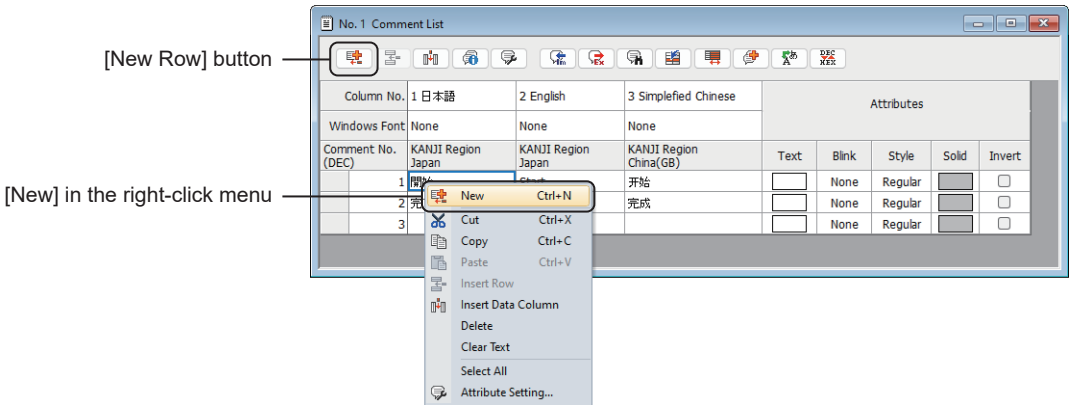
The number which is one plus the largest comment number in the comment groups is assigned to the comment number of a new comment.

The largest settable comment number is 32767 (or 7FFF in hexadecimal).

If 32767 (or 7FFF in hexadecimal) is already used, the smallest unused number in the comment group is assigned to the new comment.

1. Create a new comment row using either of the following operations.

• In the [Comment List] window, click the [New Row] button or select [New] from the right-click menu.



• In the project tree, select a comment group and select [Add Comment Row] in the right-click menu.

A new row is created in the comment list.

17.3.4 Inserting a row

GT37 SoftGOT3000

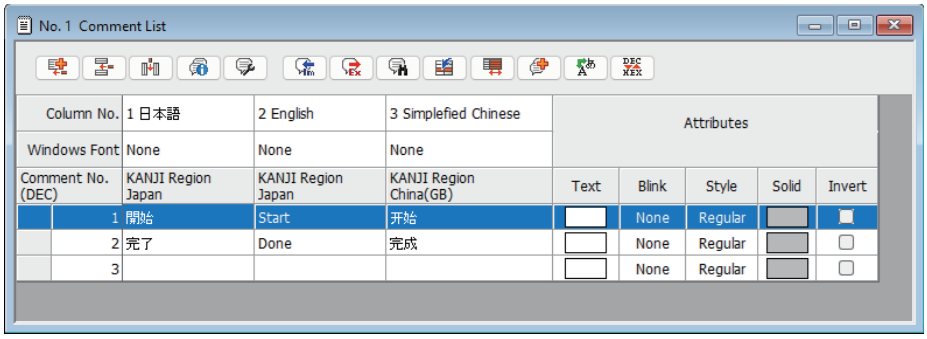
Insert a row in the [Comment List] window.

If multiple rows are selected in the comment list, the same number of new rows are inserted above the selected ones.

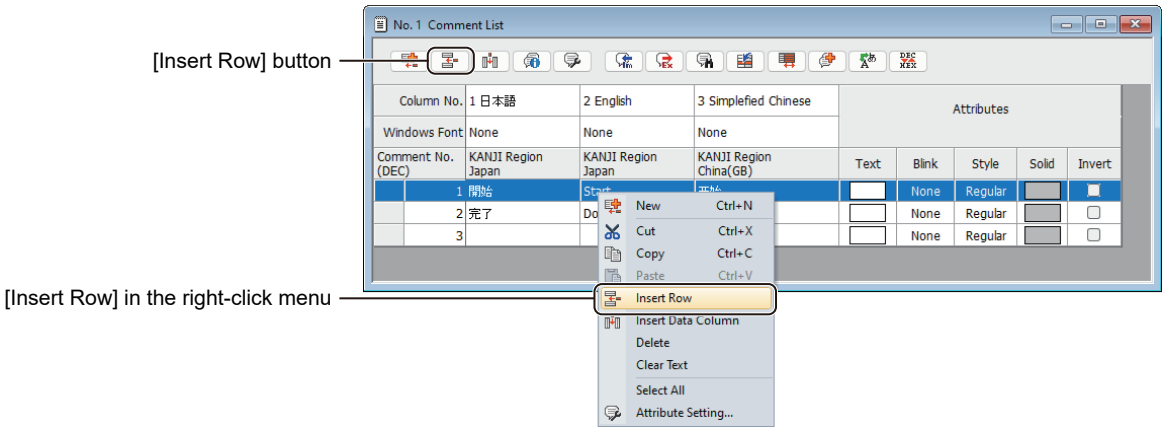
When a row is inserted between consecutive comment numbers, all rows after the inserted row are renumbered.

Operating procedure

1. Select a place to insert a row in the [Comment List] window.



2. Click the [Insert Row] button, or select [Insert Row] from the right-click menu.



3. A row is inserted above the selected row.

17.3.5 Inserting a column

GT37 SoftGOT3000

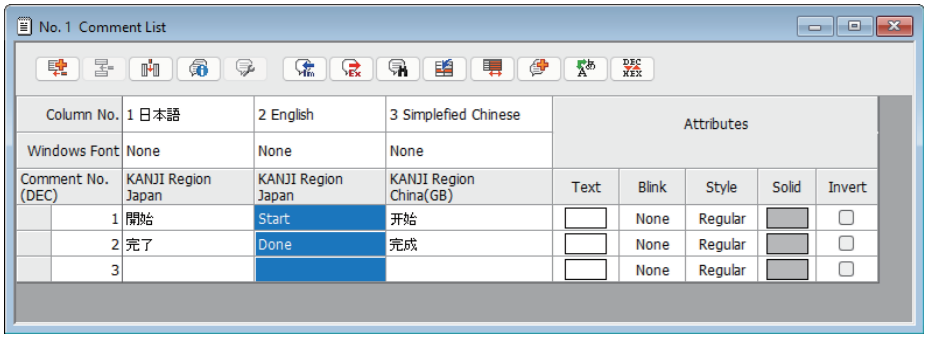
Insert a column in the [Comment List] window.

If multiple columns are selected in the comment list, the same number of new columns are inserted to the left of the selected ones.

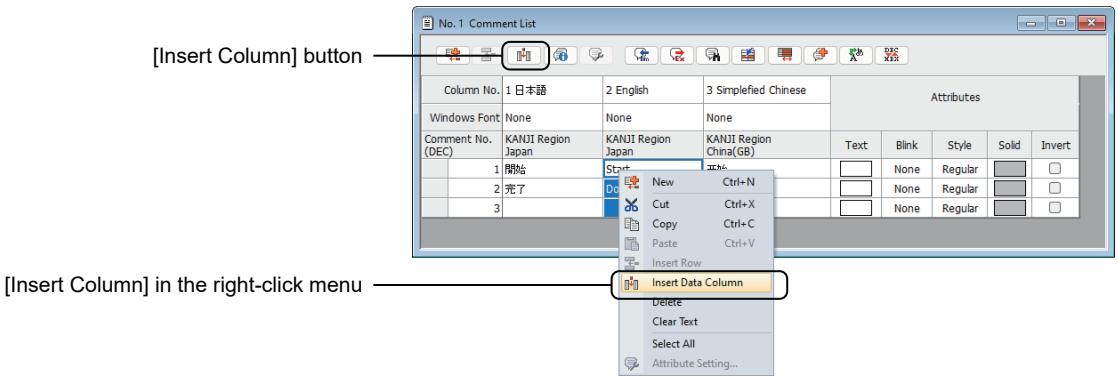
When a column is inserted between consecutive column numbers, all columns to the right of the inserted column are renumbered.

Operating procedure

1. Select a place to insert a column in the [Comment List] window.



2. Click the [Insert Column] button, or select [Insert Column] from the right-click menu.



3. A column is inserted to the left side of the selected column.

17.3.6 Importing comments

GT37 SoftGOT3000

Comments in a comment group can be set in the dialog. Also, comments can be registered or changed by importing a user-created comment text file.

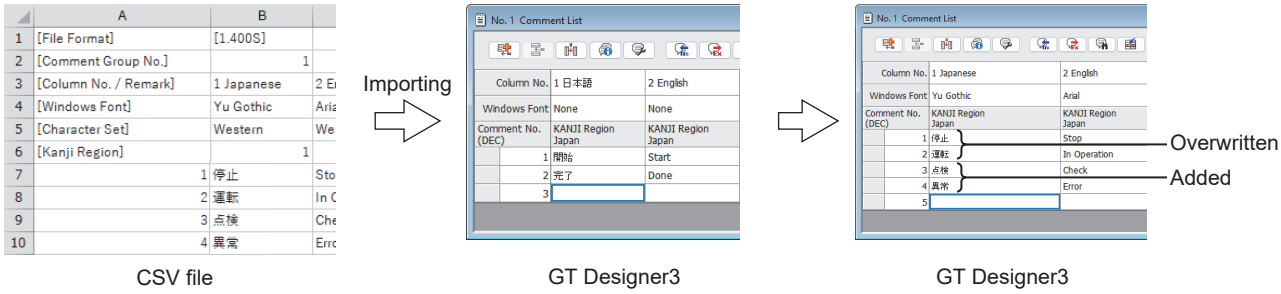
For information on how to create a comment text file and its format, refer to the following.

☞ Page 785 Import/Export

Adding or overwriting comments when importing comments from a file

The comment numbers of the comments in the file to be imported and the comment numbers of the registered comments are compared.

- If the comment numbers are different each other, the comments in the file are added to the registered comments.
- If the comment numbers are the same, the registered comments are overwritten with the comments in the file.



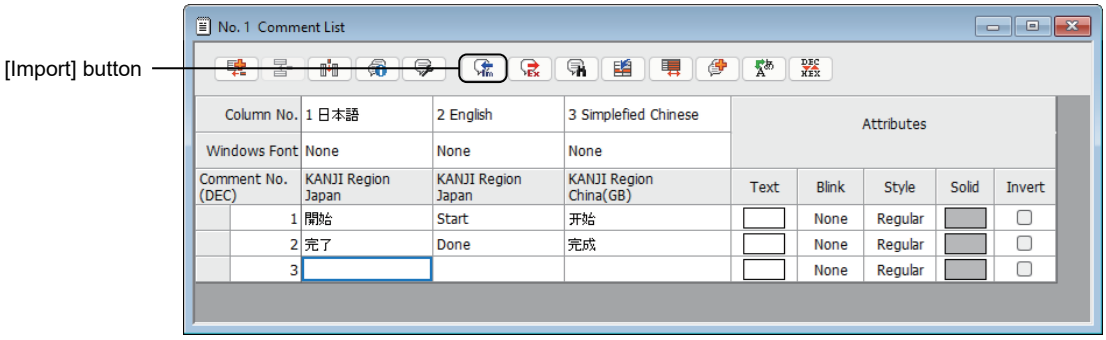
CSV file GT Designer3 GT Designer3

Setting procedure

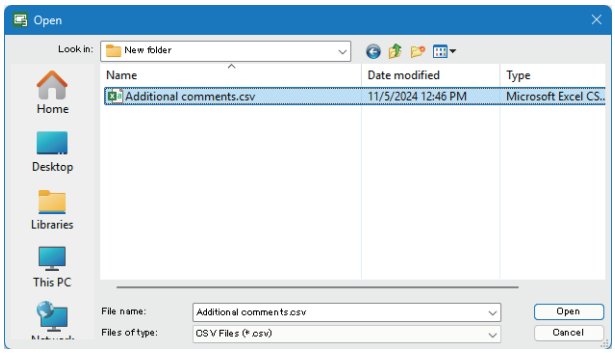
Import comments in the [Comment List] window.

Operating procedure

1. Click the [Import] button, or select [Common] → [Comment] → [Import] from the menu.

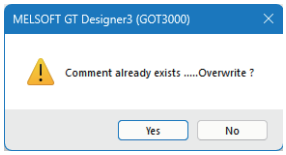


2. Select a file to be imported.



3. The following dialog appears.

Click the [Yes] button to import the comments in a text file.



17.3.7 Exporting comments

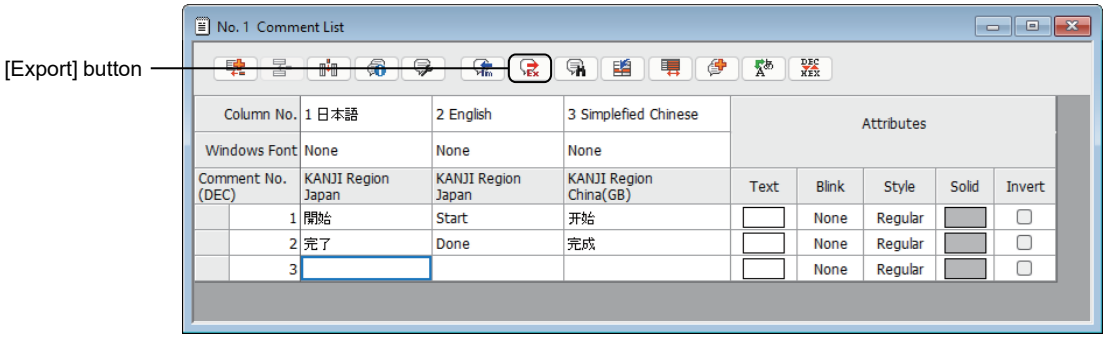
GT37 SoftGOT3000

The registered comments in a comment group can be exported as a Unicode text file (*.TXT) or a CSV file (*.CSV).
You can view or edit the exported file with the text editor, spreadsheet software, or other tools.
To export comments, open the [Comment List] window and export comments, or export comments in the project tree.
For the format of text files for comments, refer to the following.
☞ Page 785 Import/Export

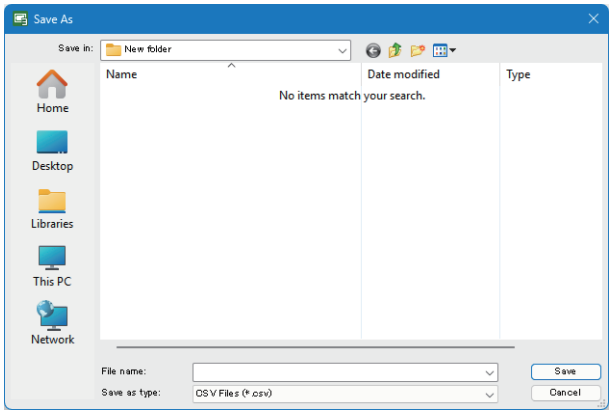
Exporting comments from the [Comment List] window

Operating procedure

1. Click the [Export] button, or select [Common] → [Comment] → [Export] from the menu.



2. Set [File name] and [Save as type] to save the file.



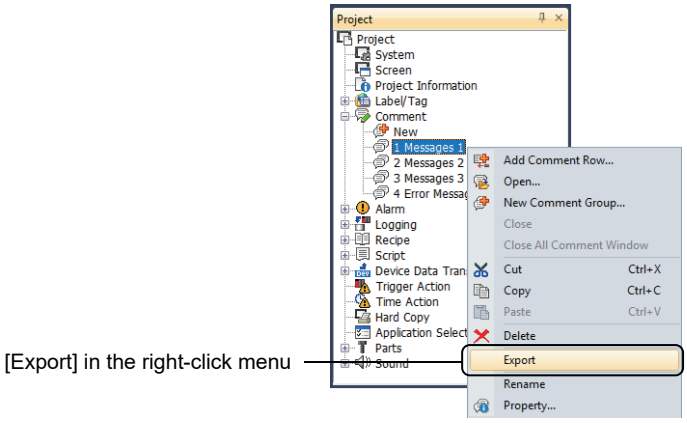
3. The comment group is exported.

Exporting from the project tree

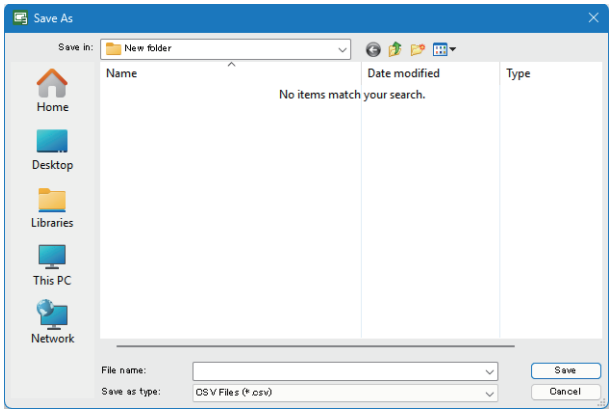
Operating procedure

1. Select a comment group in the project tree and select [Export] in the right-click menu.

☞ Page 116 [Project] window



2. Set [File name] and [Save as type] to save the file.



3. The comment group is exported.

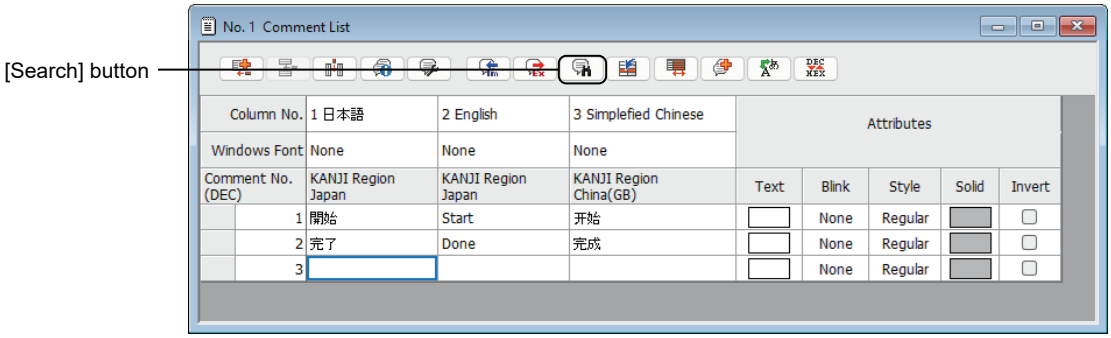
17.3.8 Comment searching

GT37 SoftGOT3000

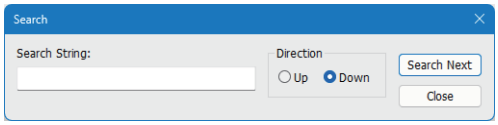
Search for a comment in the [Comment List] window.

Operating procedure

1. Click the [Search] button.



2. Search for a comment in the [Search] dialog.



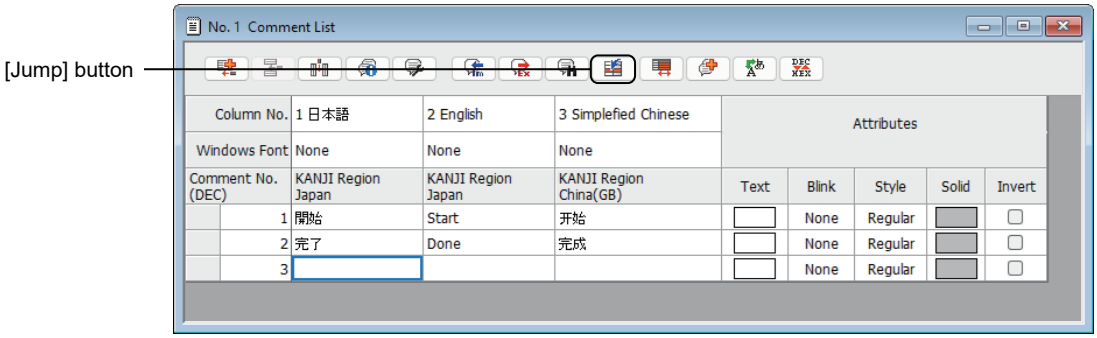
17.3.9 Jumping to the specified comment

GT37 SoftGOT3000

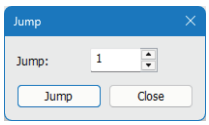
Jump to the specified comment from the [Comment List] window.

Operating procedure

1. Click the [Jump] button.



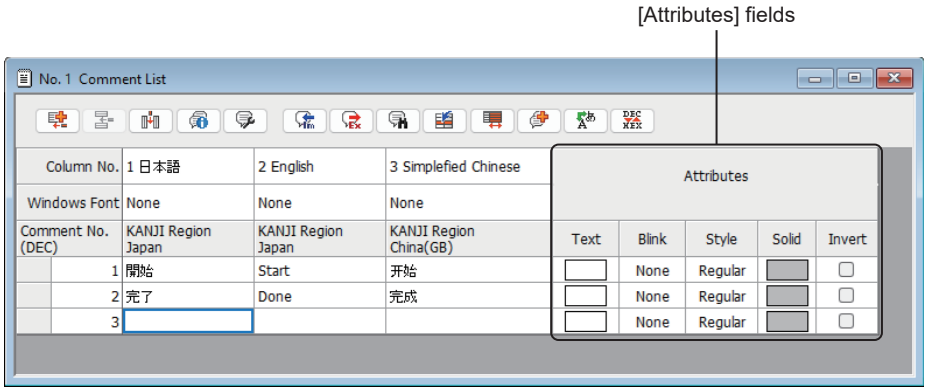
2. Set a target to jump in the [Jump] dialog and click the [Jump] button.



17.3.10 Changing properties

GT37 SoftGOT3000

Change the character property of a comment in the [Comment List] window.
Edit the character property in the [Character Property] field.



The following shows the methods of the batch editing for the character property of multiple comments.

- Changing the character property of an entire column in the [Comment List] window

☞ Page 807 Changing the character property of an entire column in the [Comment List] window

- Using the [Attribute Setting] dialog

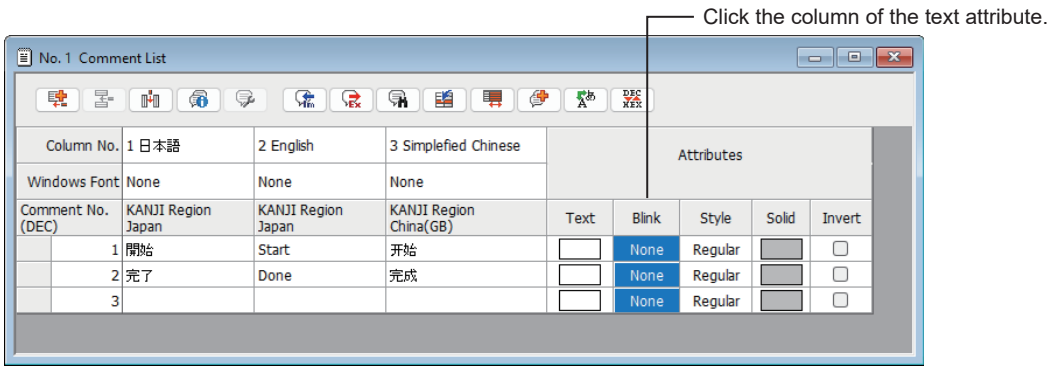
☞ Page 808 Using the [Attribute Setting] dialog

Changing the character property of an entire column in the [Comment List] window

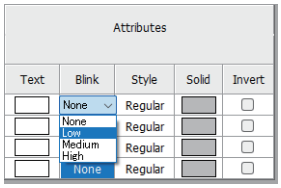
GT37 SoftGOT3000

Operating procedure

1. Click an entire column of the character property to be changed.



2. Click an option of the property to edit the character property in batch.



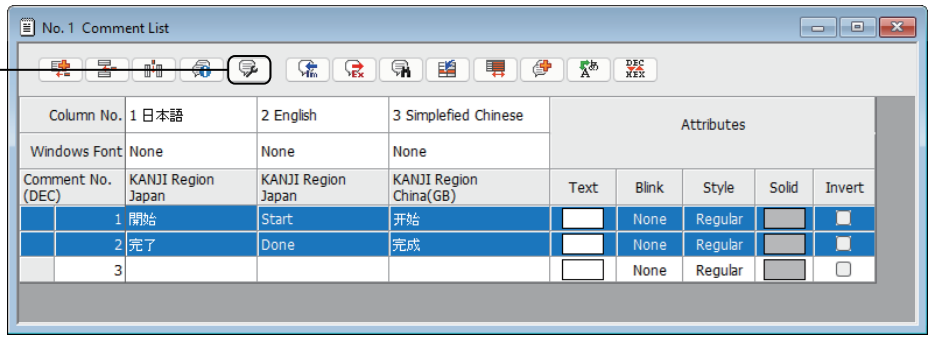
Using the [Attribute Setting] dialog

GT37 SoftGOT3000

Operating procedure

1. Select a comment to change the character property in the [Comment List] window then click the [Attribute Setting] button.

[Attribute Setting] button



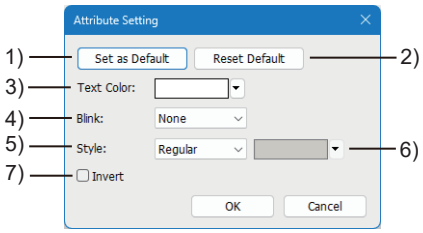
2. Change the character property of the comment in the [Attribute Setting] dialog.

☞ Page 808 [Attribute Setting] dialog

[Attribute Setting] dialog

GT37 SoftGOT3000

Change the character property of the comment in the [Attribute Setting] dialog.



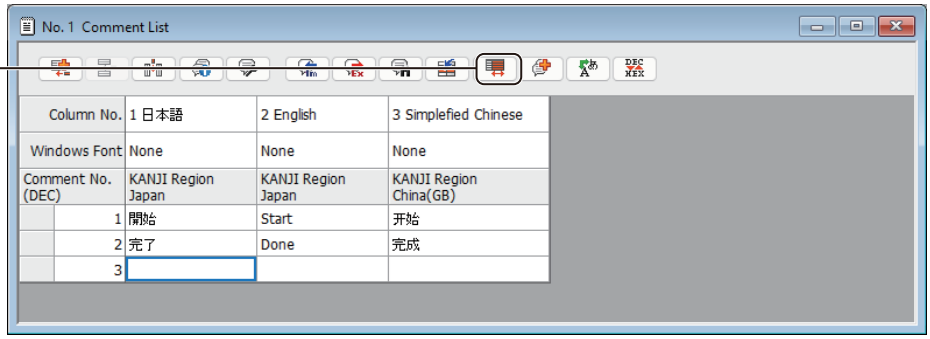
Item		Description
1)	[Set as Default] button	Sets the input setting in this dialog as the default value. ☞ Page 203 Customizing the default value
2)	[Reset Default] button	Resets the input setting in this dialog to the initial value.
3)	[Text Color]	Set the character color.
4)	[Blink]	Set the blinking speed of characters. The following shows selectable items. • [None] • [Low] • [Medium] • [High]
5)	[Style]	Select a character effect. The following shows selectable items. • [Standard] • [Bold] • [Solid] • [Raised]
6)	[Solid Color]	Select the shadow color of characters when [Solid] or [Raised] is selected for [Style].
7)	[Invert]	Highlights characters. This item can be selected only when [Regular] is selected for [Style].

17.3.11 Displaying/hiding attributes

GT37 SoftGOT3000

Text attributes can be displayed or hidden in the [Comment List] window.
Display or hide text attributes using the [Display/Hide Attribute] button.

[Display/Hide Attribute] button



PART 5

17.3.12 Registering characters of a text figure, touch switch, or other attribute to a comment group

GT37 SoftGOT3000

☞ Page 810 Registering the characters of a text figure to a comment group
☞ Page 811 Registering the characters in the [Text] field to a comment group

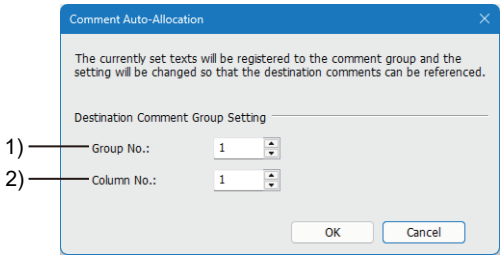
Registering the characters of a text figure to a comment group

In the text figure setting, you can register the characters entered in the [Text] field to a comment group, and convert the text figure to a simple comment display object.

Operating procedure

1. Open the text figure setting dialog, and click the [Convert to Comment Display] button.

2. In the [Comment Auto-Allocation] dialog,
set [Group No.] and [Column No.] of the comment group.
Characters cannot be registered to a comment group where identical characters already exist.



Item		Description
1)	[Group No.]	Set the number of the comment group where the characters are to be registered.
2)	[Column No.]	Set the column number of the comment group where the characters are to be registered.

3. Click the [OK] button to register the characters to the comment group and covert the text figure to a simple comment display object.

In the [Simple Comment Display] dialog, click the [OK] button to execute the conversion, or the [Cancel] button to cancel the conversion. However, registering the characters to the comment group is not canceled.

Registering the characters in the [Text] field to a comment group

For the following objects, when entering characters in the [Text] field, you can register the characters to a comment group by changing the text type from [Text] to [Comment], and enable the registered comment to be referred.

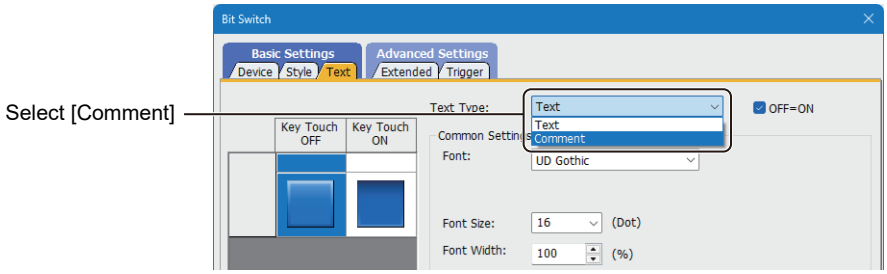
- Touch switch
- Lamp

The following shows the registration procedure for a bit switch as an example.

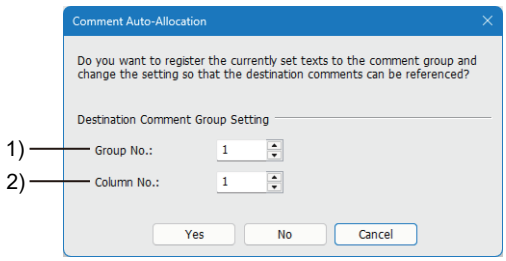
Operating procedure

1. Open the object setting dialog, and select the [Text] tab.

2. Select [Text] in [Text Type].



3. In the [Comment Auto-Allocation] dialog,
set [Group No.] and [Column No.] of the comment group.
Characters cannot be registered to a comment group where identical characters already exist.



Item		Description
1)	[Group No.]	Set the number of the comment group where the characters are to be registered.
2)	[Column No.]	Set the column number of the comment group where the characters are to be registered.

4. To register the characters to the comment group, click [Yes] button.
To not to register the characters to the comment group, click [No] button.
To cancel converting the text type to [Comment], click [Cancel] button.

18 Registering parts ([Parts])

GT37 SoftGOT3000

☞ Page 812 Outline of parts
☞ Page 814 Specifications of parts
☞ Page 816 How to use parts ([Parts])
☞ Page 830 [Parts Image List] window
☞ Page 831 [Parts Setting] dialog

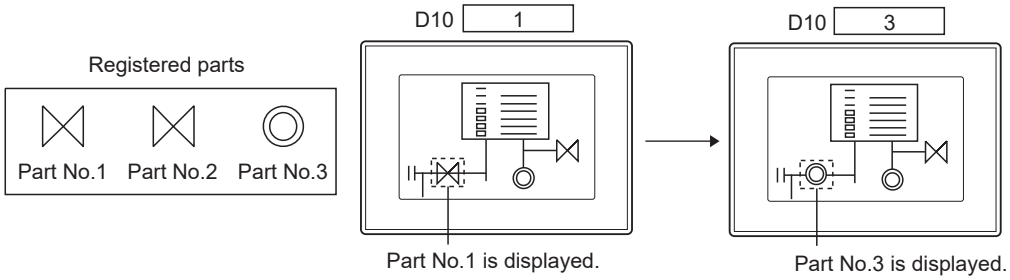
18.1 Outline of parts

GT37 SoftGOT3000

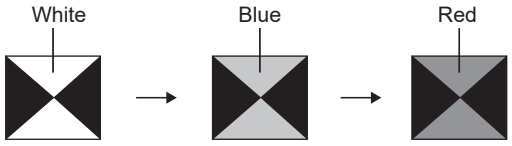
Groups of figures can be registered as parts.
Each of the registered parts can be set as a shape to each object.
The parts can also be placed directly on the screen as a figure.
Objects for which parts can be used depends on the figures registered as parts.

18.1.1 Displaying parts using a parts display object

By setting parts to a parts display object, you can switch displayed parts or display the movements of parts.



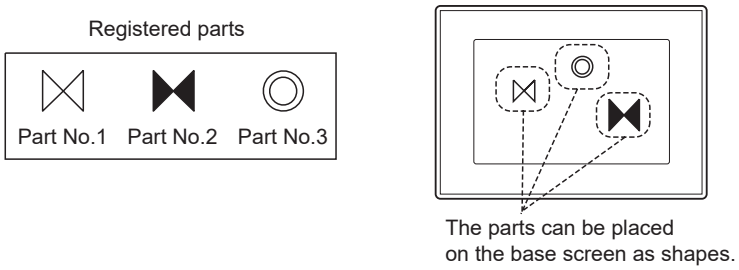
If displaying a part as a mark, you can change the white-colored area of the part to other colors.



The display color of the white space can be changed.

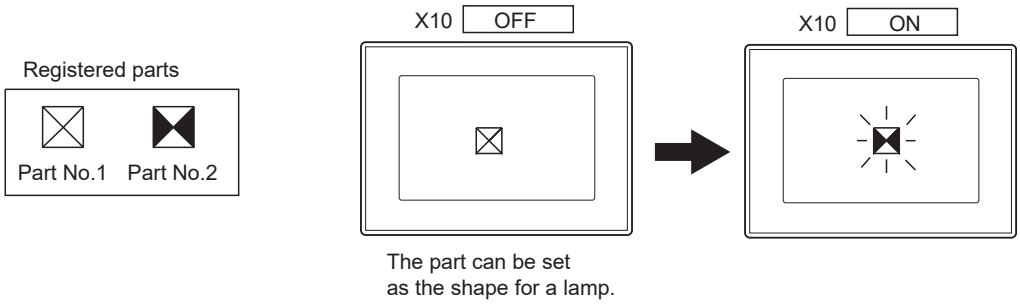
18.1.2 Using a part as a figure

Parts can be placed on the screen as they are.



18.1.3 Using a part as the shapes for objects

Parts can be set as the shapes for objects including switches or lamps.



18.2 Specifications of parts

GT37 SoftGOT3000

18.2.1 Number of registerable parts per project

Up to 32767 parts can be registered per project.

18.2.2 Figures placeable per part

Up to 10000 figures can be placed per part.

The volume of the data used for the part is the total volume of the data of the figures placed to the part.

The following figures can be placed to a part.

- Basic figure: Line, freeform line, rectangle, polygon, circle, arc, sector, scale, piping, and paint

☞ Page 1141 Drawing a Line
☞ Page 1145 Drawing a Line Freeform
☞ Page 1149 Drawing a Rectangle
☞ Page 1153 Drawing a Polygon
☞ Page 1157 Drawing a Circle
☞ Page 1161 Drawing an Arc or a Sector
☞ Page 1167 Drawing a Scale
☞ Page 1169 Drawing a Piping
☞ Page 1173 Filling the framed area of the figure

- Character string: Text and logo text

☞ Page 1132 Drawing a text figure
☞ Page 1135 Drawing a logo text figure

- Image: BMP file, JPEG file, and PNG file

☞ Page 1177 Pasting an image file

18.2.3 Size of figures that can be registered as parts

Figures up to 6000 dots × 6000 dots can be registered as parts.

Figures that have a horizontal or vertical size exceeding the size stated above cannot be registered.

Precautions

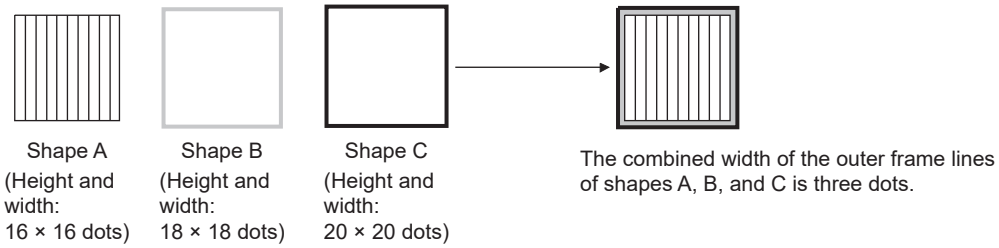
■Line width of outer frame

Draw the external frame of the figure with one dot of the line width to register as a part.

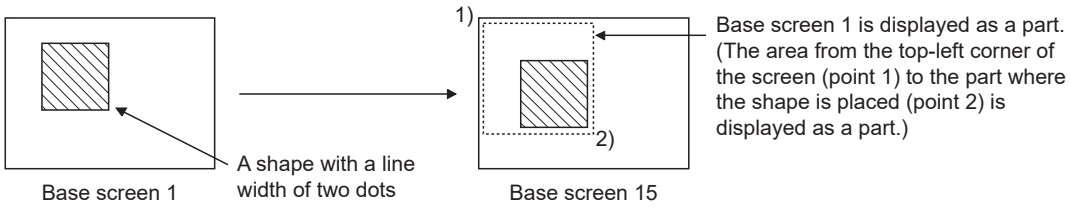
The outer frame line with the width of two or more dots may not be displayed correctly.

To display the outer frame line with the width of two or more dots, perform either of the following operations.

- Drawing the outer frame line in combination with figures that have one-dot line width



- Setting a figure with an outer frame of two or more dots on the unused base screen and displaying the base screen as a part in the parts display object

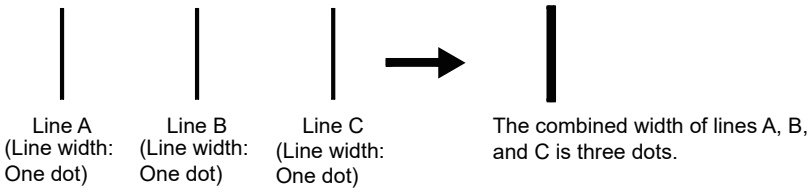


■Line width of line (excluding slant lines)

A line (excluding slant lines) that has the width of two to seven dots and has been registered as a part may not be displayed correctly.

To display the line with the width of two or more dots, perform either of the following operations.

- Draw a line using a rectangle (color filled).
- Draw a line by combining other lines that have a width of one dot.



18.3 How to use parts ([Parts])

GT37 SoftGOT3000

☞ Page 817 Registering parts
☞ Page 820 Copying parts
☞ Page 822 Deleting parts
☞ Page 824 Editing parts
☞ Page 826 Changing part names and numbers
☞ Page 827 Using the image file stored in the data storage as a part

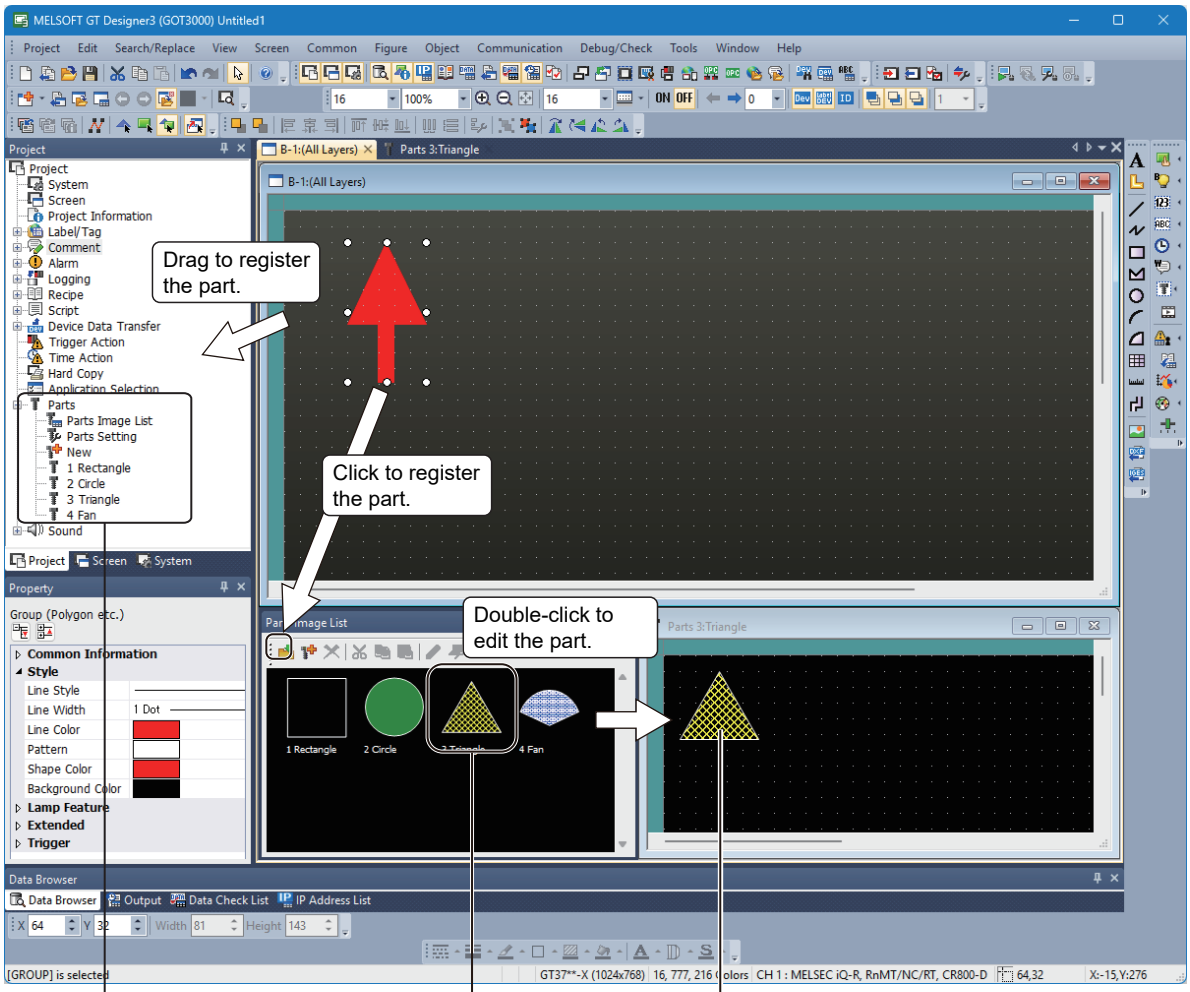
Select a part in the [Parts Image List] window or in the project tree to create, edit, or delete a part or change the property of a part.

For information on how to and display the [Parts Image List] window, refer to the following.

☞ Page 830 [Parts Image List] window

For information on how to display the project tree, refer to the following.

☞ Page 116 [Project] window



18.3.1 Registering parts

GT37 SoftGOT3000

Parts can be registered in either of the following two methods: You can register a figure on the screen editor or you can newly create a part to register it.

☞ Page 817 Registering a figure on the screen editor
☞ Page 818 Creating a new part

Registering a figure on the screen editor

GT37 SoftGOT3000

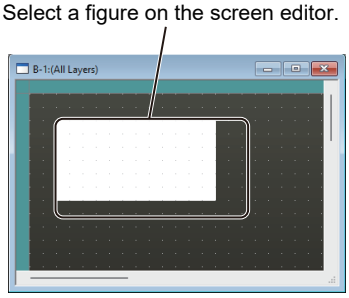
■Registering a figure in the [Parts Image List] window

Operating procedure

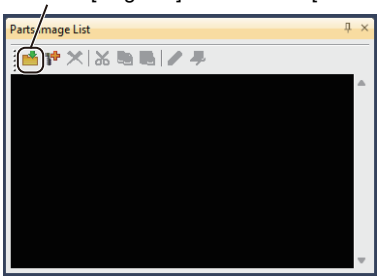
1. To register a figure on the screen editor as a part, select the figure and perform either of the following operations.

- Click the [Register] button in the [Parts Image List] window.
- Select [Register] then right-click to display [Register to Parts] from the menu.

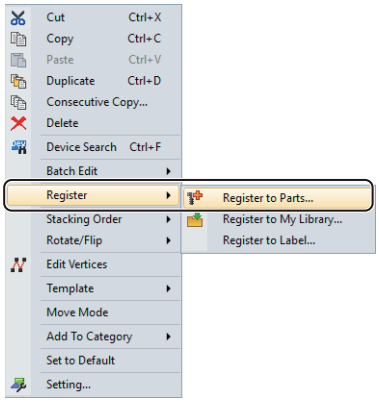
Select a figure on the screen editor.



Click the [Register] button in the [Parts Image List] window.



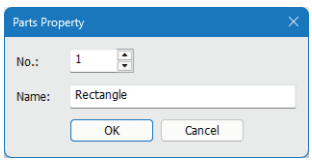
Select [Register to Parts] in the right-click menu.



2. The [Parts Property] dialog appears.

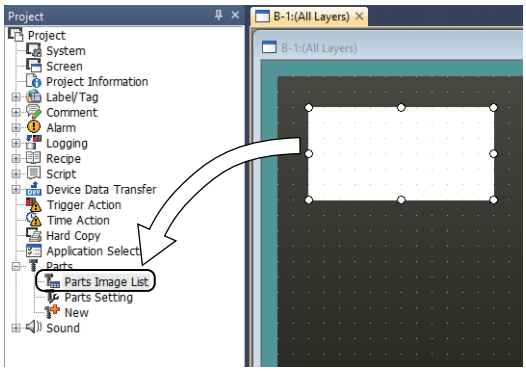
Set [Number] and [Name] then click the [OK] button.

The part is registered in the project data.



■Registering a figure as a part from the project tree

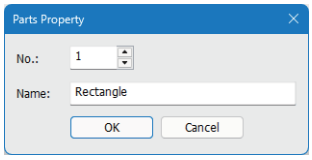
1. Drag the figure to be registered as a part onto the project tree.



2. The [Parts Property] dialog appears.

Set [Number] and [Name] then click the [OK] button.

The part is registered in the project data.



Creating a new part

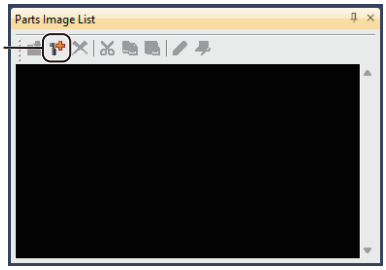
GT37 SoftGOT3000

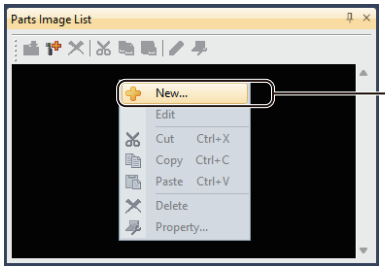
Operating procedure

1. Select [Common] → [Parts] → [New] from the menu or perform either of the following operations in the [Parts Image List] window.

- Click the [New] button.
- Select [New] in the right-click menu.

Click the [New] button.



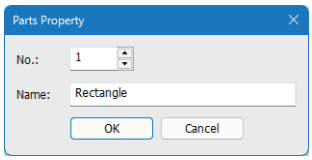


Select [New] in the right-click menu.

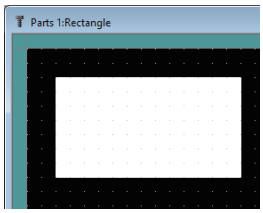
2. The [Parts Property] dialog appears.

Set [Number] and [Name] then click the [OK] button.

The part is registered in the project data.



3. Draw a figure to be registered as a part on the parts editor.
After drawing the figure, close the parts editor.



Precautions

When registering parts that are registered as symbols, note the following.

- Do not use a BMP, JPEG, or PNG files as the color of the figure cannot be changed.
- Draw the parts of the figure, of which the color can be changed, in white.

18.3.2 Copying parts

GT37 SoftGOT3000

Copying parts in the [Parts Image List] window

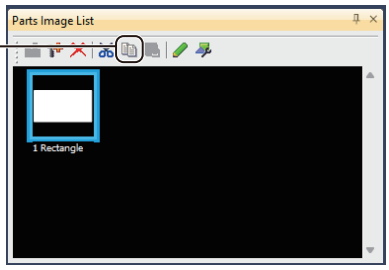
Operating procedure

1. Select a part to be copied in the [Parts Image List] window.

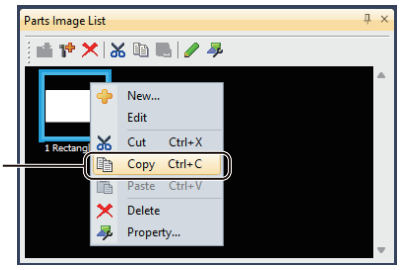
After selecting the part, perform either of the following operations.

- Click the [Copy] button.
- Select [Copy] in the right-click menu.

Click the [Copy] button.



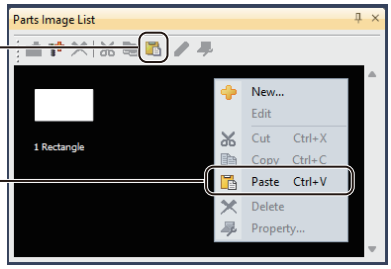
Select [Copy] in the right-click menu.



2. Click the [Paste] button or right-click a part to select [Paste] from the menu.

Click the [Paste] button.

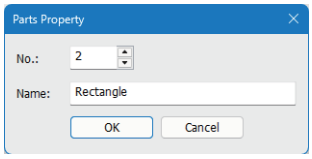
Select [Paste] in the right-click menu.



3. The [Parts Property] dialog appears.

Set [Number] and [Name] then click the [OK] button.

The part is registered in the project data.

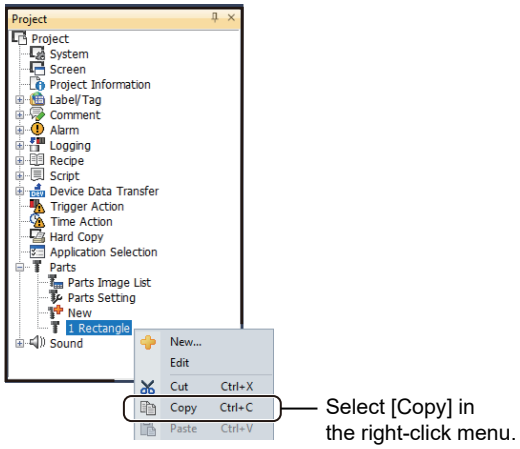


Copying a part in the project tree

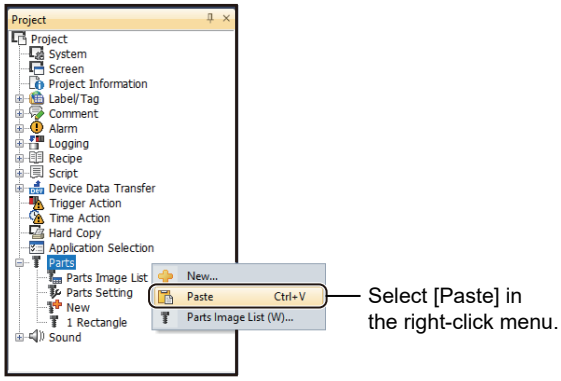
Operating procedure

1. Select a part to be copied in the project tree.

Right-click the selected part to select [Copy] from the menu.



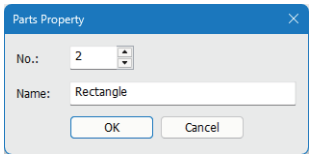
2. Right-click [Parts] to select [Paste].



3. The [Parts Property] dialog appears.

Set [Number] and [Name] then click the [OK] button.

The part is registered in the project data.



18.3.3 Deleting parts

GT37 SoftGOT3000

Deleting parts in the [Parts Image List] window

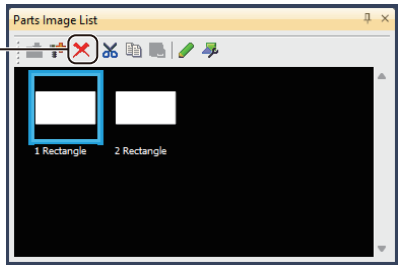
Operating procedure

1. Select a part to be deleted in the [Parts Image List] window.

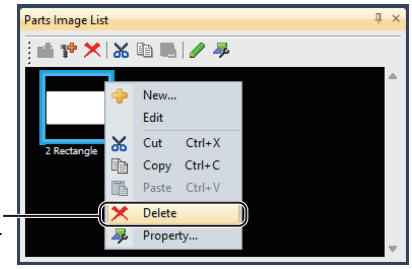
After selecting the part, perform either of the following operations.

- Click the [Delete] button.
- Select [Delete] in the right-click menu.

Click the [Delete] button.



Select [Delete] in the right-click menu.



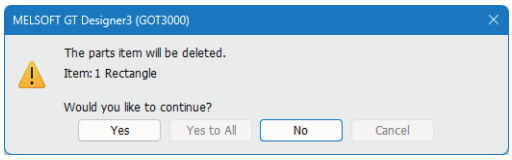
2. The confirmation dialog appears.

Click the [Yes] button to delete the part displayed on the confirmation dialog.

Click the [Delete All] button to delete all the selected parts.

Click the [No] button to cancel the deletion of the part displayed on the confirmation dialog.

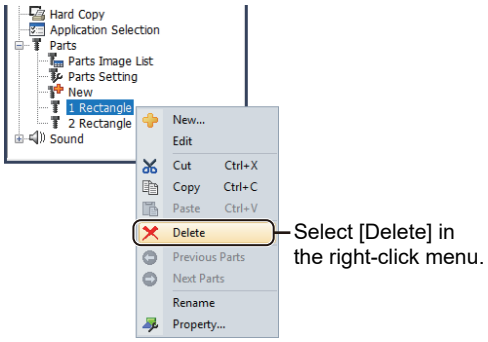
Click the [Cancel] button to cancel the deletion of all the selected parts.



Deleting a part in the project tree

1. Select a part to be deleted in the project tree.

Right-click the selected part to select [Delete] from the menu.



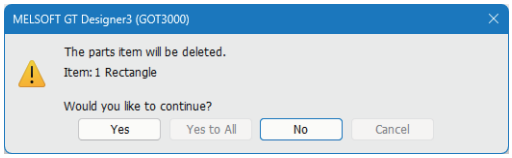
2. The confirmation dialog appears.

Click the [Yes] button to delete the part displayed on the confirmation dialog.

Click the [Delete All] button to delete all the selected parts.

Click the [No] button to cancel the deletion of the part displayed on the confirmation dialog.

Click the [Cancel] button to cancel the deletion of all the selected parts.



PART 5

18.3.4 Editing parts

GT37 SoftGOT3000

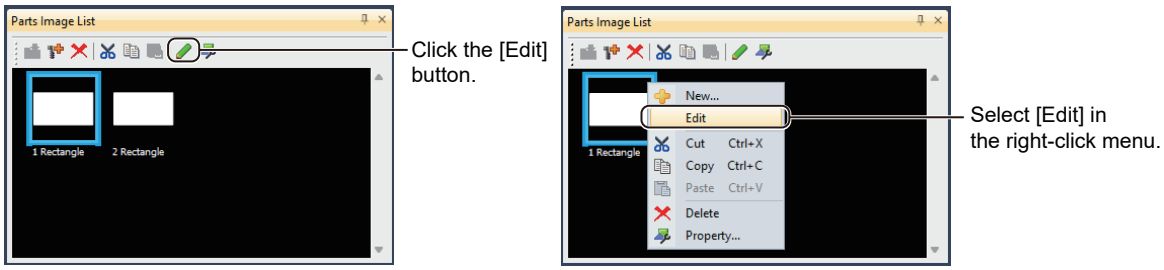
Editing parts from the [Parts Image List] window

Operating procedure

1. Select a part to be edited in the [Parts Image List] window.

After selecting the part, perform either of the following operations.

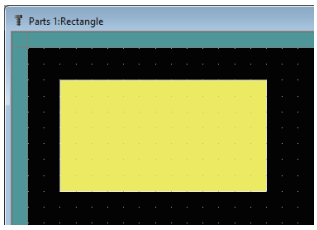
- Click the [Edit] button.
- Select [Edit] in the right-click menu.



2. The parts editor appears.

Edit the selected part.

After editing the part, close the parts editor.

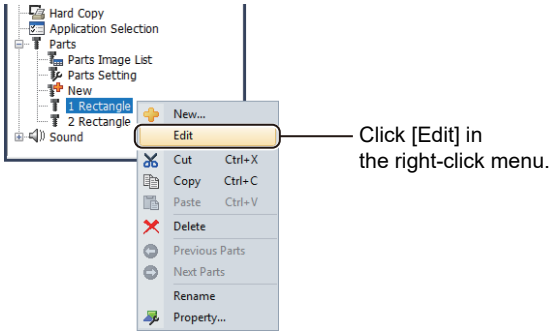


Editing a part from the project tree

Operating procedure

1. Select a part to be edited in the project tree.

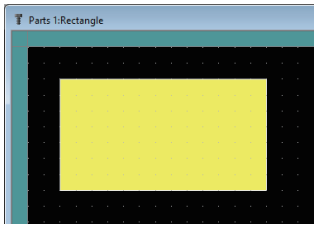
Right-click the selected part to select [Edit] from the menu.



2. The parts editor appears.

Edit the selected part.

After editing the part, close the parts editor.



PART 5

18.3.5 Changing part names and numbers

GT37 SoftGOT3000

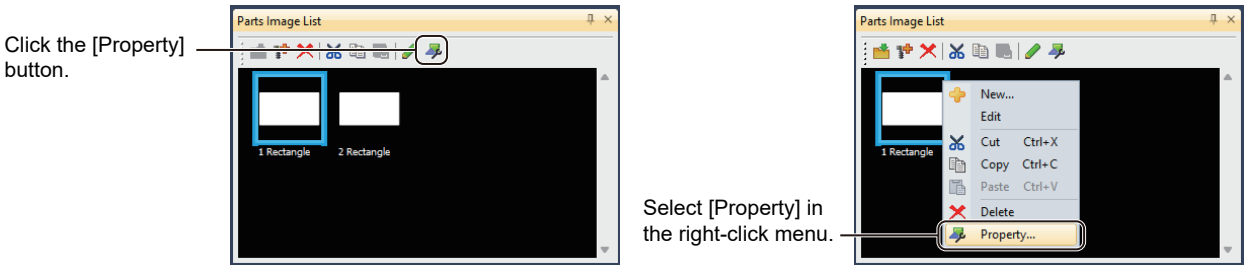
Changing part names and numbers from the [Parts Image List] window

Operating procedure

1. Select a part whose number or name is to be changed in the [Parts Image List] window.

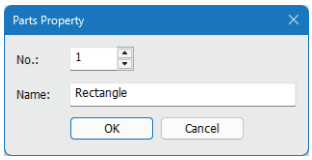
After selecting the part, perform either of the following operations.

- Click the [Property] button.
- Select [Property] in the right-click menu.



2. The [Parts Property] dialog appears.

After changing [Number] or [Name], click the [OK] button to apply the change.

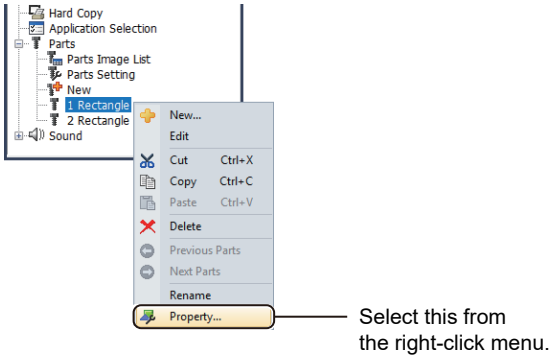


Changing part names and numbers in the project tree

Operating procedure

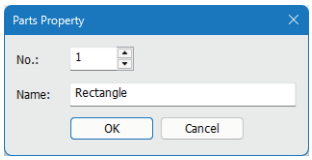
1. Select a part whose number or name is to be changed in the project tree.

Right-click the selected part to select [Property] from the menu.



2. The [Parts Property] dialog appears.

After changing [Number] or [Name], click the [OK] button to apply the change.

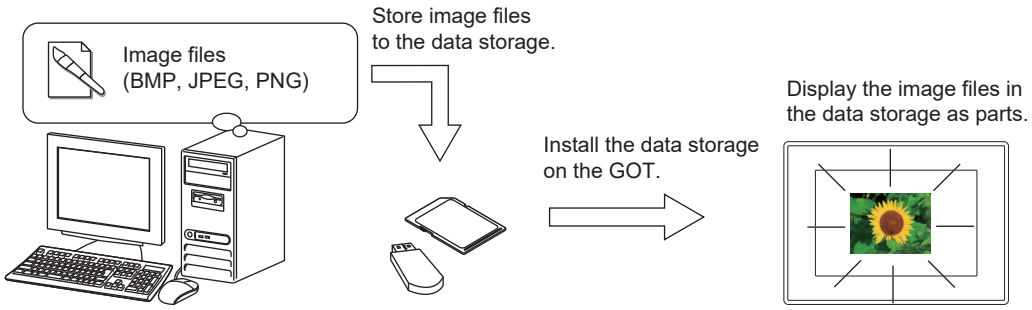


18.3.6 Using the image file stored in the data storage as a part

GT37 SoftGOT3000

The image file stored in the data storage can be used to display parts.

Storing parts in the data storage reduces the size of the project data.



The following two methods are provided to use an image file in the data storage as a part.

☞ Page 828 Specifying an image file from an object

☞ Page 829 Specifying an image file in the project

Precautions

The image of the parts displayed on the GOT will be displayed as the same size as the image on the data storage.

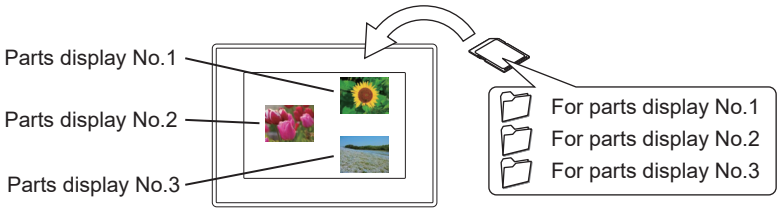
Images larger than the GOT display cannot be displayed.

Store part image files on the data storage as image sizes that are the same or smaller than the GOT display.

Specifying an image file from an object

Select the part image files on the data storage and set them in the parts display object settings.

Prepare one folder for each object to save image files separately per object.



Item	Description
Folder name	Specified in the settings of the parts display object.
File name	Specified in the settings of the parts display object.
Available drives	Drive A, drive B, drive E, drive F, drive G, and drive X (current drive)
Setting range	Object units
Maximum number of parts	Max. 65536 parts

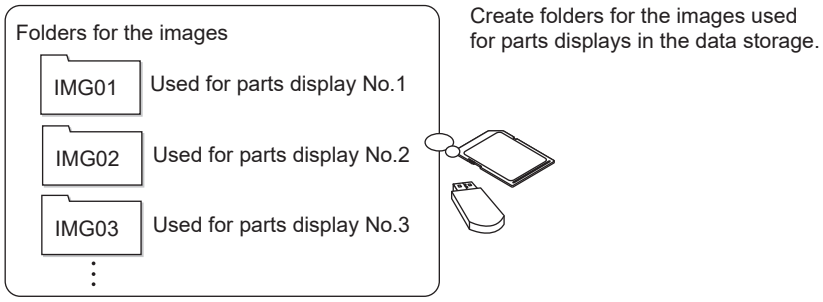
The following shows the procedure to register image files.

Operating procedure

1. Create a folder in the data storage to store image files.

Create one folder per parts display object.

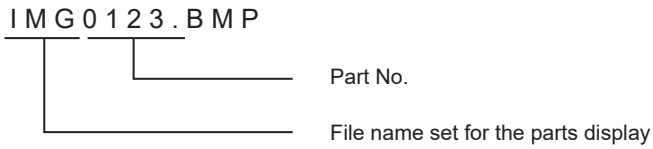
The folder name must be the same as the name set for the parts display object.



2. Store an image file to be used as a part to the created folder.

The file name must be the same as the name set for the parts display object.

Example) File name: IMG, parts number.: 0123, number of digits: 4



Parts number is assigned according to [Digits] set for the parts display object.

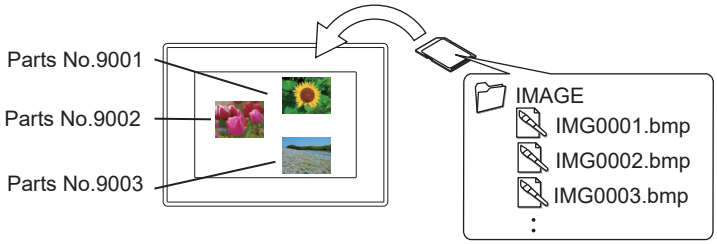
- Five digits: 00001 to 65535
- Four digits: 0001 to 9999
- Three digits: 001 to 999
- Two digits: 01 to 99
- One digit: 1 to 9

Specifying an image file in the project

Use parts number 9001 or later number as the numbers dedicated for image-file parts.

In this case, store image files in one folder.

The file name and the folder name are fixed.



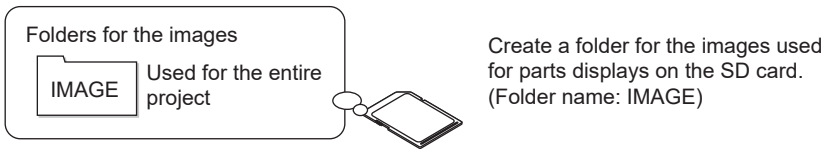
Item	Description
Folder name	IMAGE (fixed)
File name	IMG + 0 + rightmost three digits of the parts number
Available drives	Drive A
Setting range	By project
Maximum number of parts	Max. 999 parts

The following shows the procedure to register image files.

Operating procedure

1. Create a folder name it as IMAGE in the SD-card.

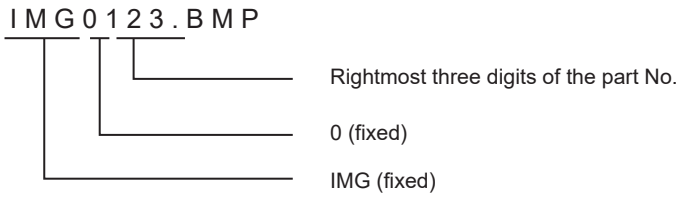
If any name other than IMAGE is used for the folder, the image cannot be displayed using the parts display object.



2. Store image files to be used as parts in the IMAGE folder in the SD-card.

Set each file name as follows.

Example) Parts number: 9123

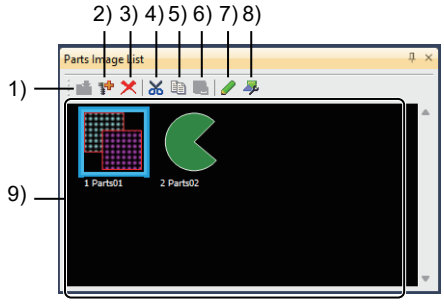


PART 5

18.4 [Parts Image List] window

GT37 SoftGOT3000

Displays the list of parts registered in GT Designer3. You can register, edit, or delete parts in the [Parts Image List] window.
Select [Common] → [Parts] → [Parts Image List] from the menu to display this dialog.



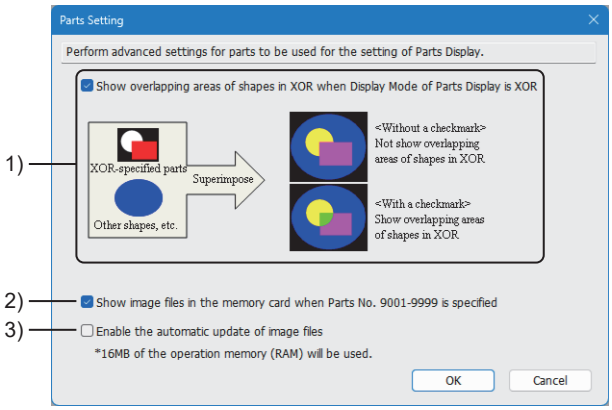
Item		Description
1)	[Register] button	Registers a selected figure as a part.
2)	[New Register] button	Registers a new part.
3)	[Delete] button	Deletes a selected part.
4)	[Cut] button	Cuts a selected part.
5)	[Copy] button	Copies a selected part.
6)	[Paste] button	Pastes a copied or cut part to a selected area.
7)	[Edit] button	Edits a selected part on the parts editor.
8)	[Property] button	Changes the number or name of a selected part.
9)	Parts image list	Displays the list of the thumbnails, numbers, and names of the registered parts.

18.5 [Parts Setting] dialog

GT37 SoftGOT3000

Set the display method of the parts using the parts display object.

Select [Common] → [Parts] → [Parts Setting] from the menu to display the [Parts Setting] dialog.



Item		Description
1)	[Show overlapping areas of shapes in XOR when Display Mode of Parts Display is XOR]	When the display mode of the parts display object (excluding fixed parts) is set to [XOR], XOR synthesis is performed on all grouped figures at once. This item appears when [Enable the antialiasing] is deselected in [Basic Setting] in the [Type Setting] dialog. ☞ Page 519 [Basic Setting]
2)	[Show image files in the memory card when Parts No. 9001-9999 is specified]	Specify a BMP file, JPEG file, or PNG file stored on the data storage to display the image as a part using a parts display object.
3)	[Enable the automatic update of image files]	Select the checkbox to update the image file automatically.

PART 6 Basic settings and edits

19 Device, label, and tag settings

20 Trigger type settings

21 Color settings

19 Device, label, and tag settings

GT37 SoftGOT3000

☞ Page 834 How to set devices, labels, and tags
☞ Page 854 Settable devices in GT Designer3
☞ Page 858 Labels and Tags Usable in GT Designer3
☞ Page 867 How to set labels (GT Designer3)

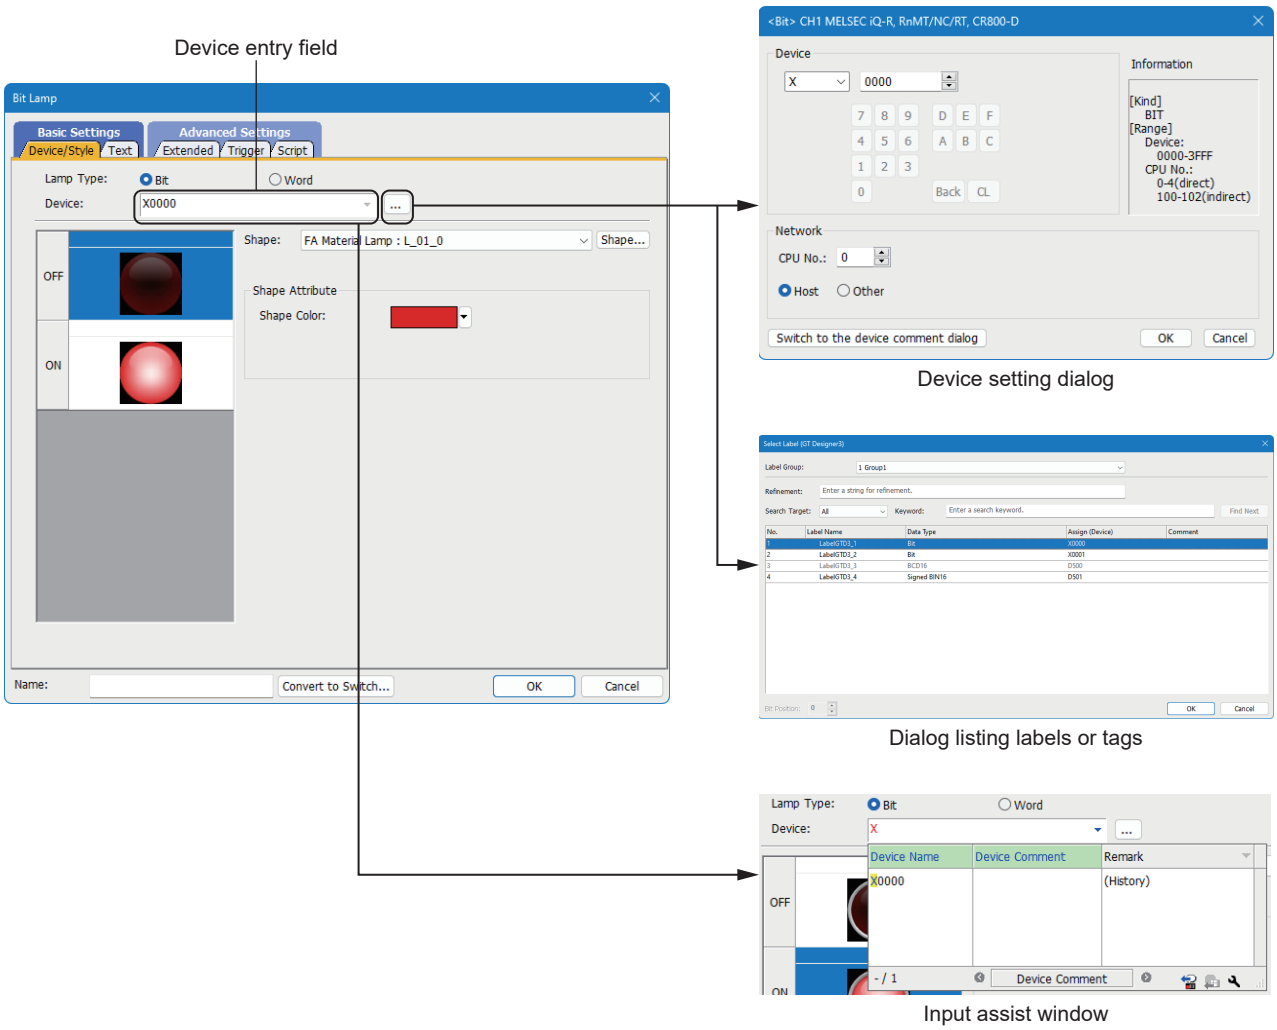
19.1 How to set devices, labels, and tags

GT37 SoftGOT3000

This section describes how to set a device, label, or tag in the device entry field in the setting dialog.

Ex.
Setting a monitor device for a bit lamp



○: Available, —: Not available

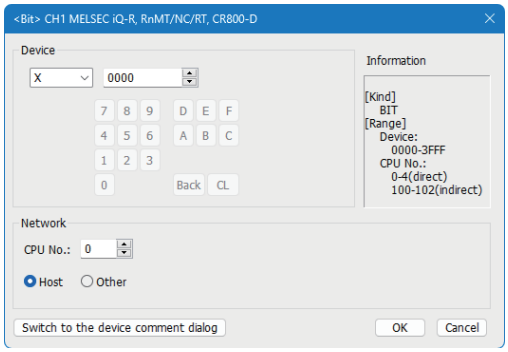
Setting method	Setting target		Description
	Device	Label Tag	
Setting a device in the device setting dialog	○	—	Set a device in the device setting dialog that appears when the [...] button in the dialog is clicked. A device name and a device number can be set directly. ☞ Page 835 Setting a device in the device setting dialog
Selecting a label or tag from the list	—	○	Set a label or tag by selecting it in the dialog that lists registered labels and tags. The dialog that lists the labels and tags differs depending on the tag type or label type. ☞ Page 837 Selecting a label or tag from the list
Selecting from utilizable data (input assist)	○	○	Enter characters in the device entry field in the setting dialog to display utilizable data in the input assist window. You can set a device, label, or tag simply by selecting it from the utilizable data. ☞ Page 843 Selecting from utilizable data (input assist)
Directly entering data in the device entry field	○	○	Enter a device, label, or tag in the device entry field directly in the setting dialog. The entry must be performed according to the specified format. ☞ Page 849 Directly entering data in the device entry field

19.1.1 Setting a device in the device setting dialog

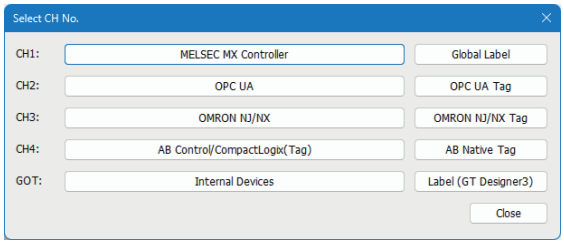
GT37 SoftGOT3000

Display the device setting dialog from the setting dialog of an object, and set a device.
The following shows an example of setting a monitor device for bit lamp.

1. In the [Bit Lamp] dialog, click the [...] button for [Device] in the [Device/Style] tab.
Either of the following dialogs appears.



Device setting dialog



[Select CH No.] dialog

Dialog	Description
Device setting dialog	Appears in the following cases. • When using only one channel for connection between the GOT and controllers • When editing a device that has been set
[Select CH No.] dialog	Appears when all the following conditions are satisfied. • Multiple channels are used in the [Controller Setting] window. • No device is set. To edit the device that has been set, display this dialog by holding down the Shift key and clicking the [...] button. Select a channel of the controller whose device is to be set. ☞ Page 836 [Select CH No.] dialog When a channel is selected, the device setting dialog appears.

Point

The behavior when a device is set can be set with [CH No. Selection Dialog Display Setting] in the [Option] dialog ([Edit] tab).
☞ Page 199 [Options] dialog ([Edit] tab)

2. Set a device in the device setting dialog.
The following shows the displayed device setting dialog and settable devices.

Item		Description
Device setting dialog		Depends on the selection for [Controller Type] in the [Controller Setting] window.
Settable device	Device range	For the device setting dialog and settable device range for each controller, refer to the following. ☞ Page 3577 GOT internal devices ☞ Page 3128 Device range and settings of Mitsubishi Electric equipment ☞ Page 3487 Device range and settings of each controller
	Data type	Set a device supported by the data type. The data type is displayed in the title bar of the device setting dialog. Example) When the data type is [Signed BIN16] Data type  For the devices supported by each data type, refer to the following. ☞ Page 857 Data type of devices

PART 6

Point

For the monitoring targets when "0" or "FF" is set to the network number and station number for network connection, refer to the following.

☞ Page 852 Device setting for network connection

3. Click the [OK] button in the device setting dialog.

The dialog closes, and the set device is entered in the device entry field in the [Device/Style] tab.

4. Click the [OK] button in the [Bit Lamp] dialog.

The device setting is completed.

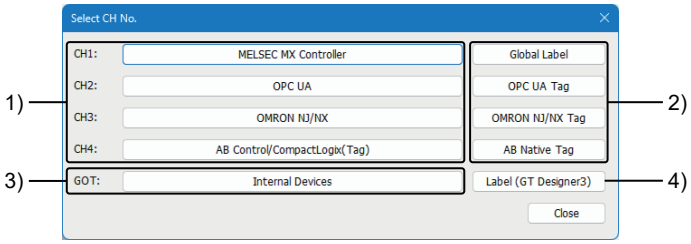
Point

Once set, the device is displayed in the input assist window as a history.

☞ Page 843 Selecting from utilizable data (input assist)

[Select CH No.] dialog

GT37 SoftGOT3000



Item		Description
1)	Controller device setting	Select a channel of the controller whose device is to be set. Each channel button displays [Controller Type] selected in the [Controller Setting] window. Clicking each channel button displays the corresponding device setting dialog.
2)	Label/tag button	This is enabled when you configure the settings to enable labels or tags for each channel and import data. Clicking the label/tag button for each channel displays the corresponding setting dialog. ☞ Page 839 [Select Global Label] dialog ☞ Page 840 [Select OMRON NJ/NX Tag] dialog ☞ Page 841 [Select AB Native Tag] dialog ☞ Page 842 [Select OPC UA Tag] dialog
3)	GOT internal device setting	Set a GOT internal device. Clicking the [Internal Devices] button displays the device setting dialog.
4)	[Label (GT Designer3)] button	Set a label (GT Designer3). Clicking this button displays the [Select Label (GT Designer3)] dialog. ☞ Page 838 [Select Label (GT Designer3)] dialog

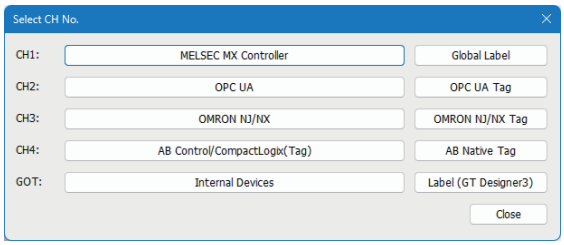
19.1.2 Selecting a label or tag from the list

GT37 SoftGOT3000

Set a label or tag by selecting it in the dialog that lists registered labels and tags.
The following shows an example of setting a monitor device for bit lamp.

1. In the [Bit Lamp] dialog, hold down the Shift key and click the [...] button for [Device] in the [Device/Style] tab to display the [Select CH No.] dialog.

☞ Page 836 [Select CH No.] dialog



Point

The behavior when a device is set can be set with [CH No. Selection Dialog Display Setting] in the [Option] dialog ([Edit] tab).

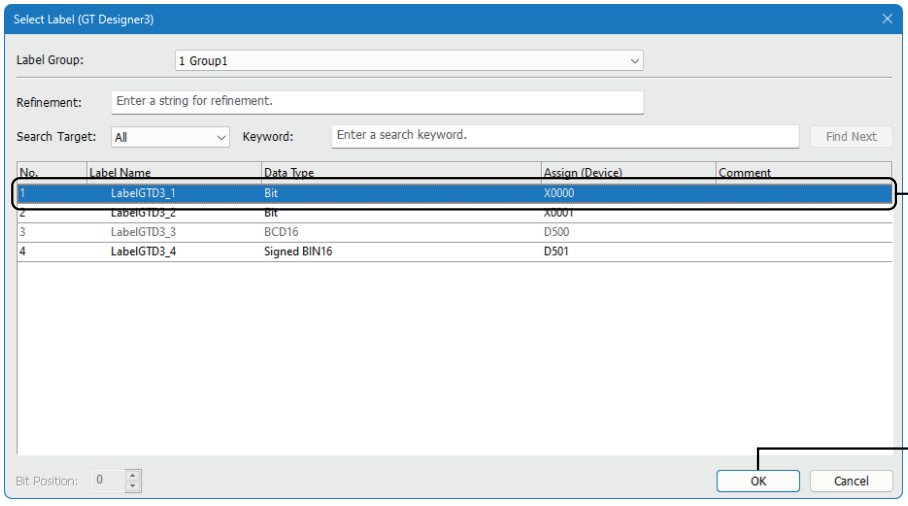
☞ Page 199 [Options] dialog ([Edit] tab)

2. Click the button of the label or tag to be specified in the device setting to display the label or tag selection dialog.

Button	Displayed dialog
[Label (GT Designer3)] button	☞ Page 838 [Select Label (GT Designer3)] dialog
[Global Label] button	☞ Page 839 [Select Global Label] dialog
[OMRON NJ/NX Tag] button	☞ Page 840 [Select OMRON NJ/NX Tag] dialog
[AB Native Tag] button	☞ Page 841 [Select AB Native Tag] dialog
[OPC UA Tag] button	☞ Page 842 [Select OPC UA Tag] dialog

3. Select a label or tag in the displayed dialog and click the [OK] button to set the label or tag for [Device].

Example) When specifying a label (GT Designer3)



Select a label (GT Designer3).

Click the button.

4. Click the [OK] button to close the label or tag selection dialog, and the set label or tag is entered in the device entry field in the [Device/Style] tab.

PART 6

5. Click the [OK] button in the [Bit Lamp] dialog.

The device setting is completed.

Point

Once set, the label or tag is displayed in the input assist window as a history.

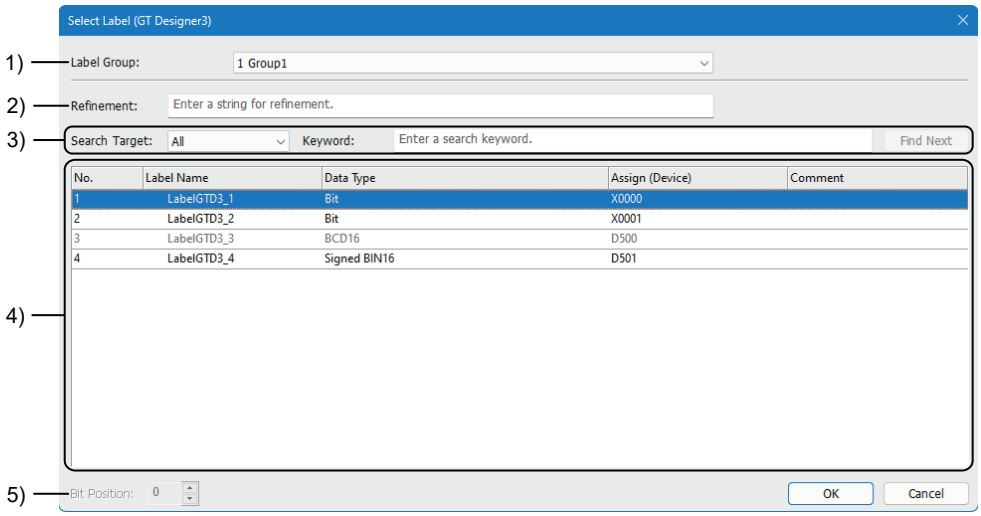
☞ Page 843 Selecting from utilizable data (input assist)

[Select Label (GT Designer3)] dialog

GT37 SoftGOT3000

You can select a label (GT Designer3) from the label list and set the label in the device setting of an object or others.

To display this dialog, click the [Label (GT Designer3)] button in the [Select CH No.] dialog.



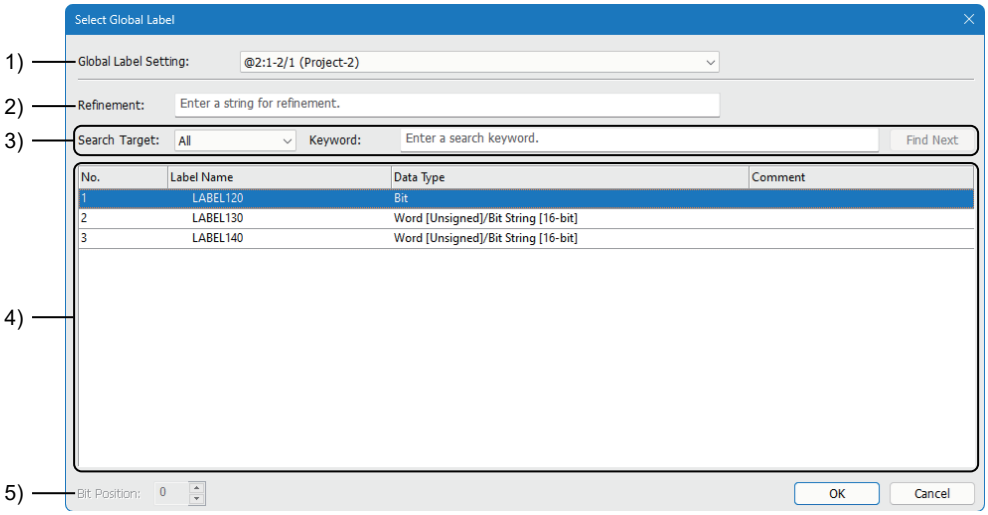
Item			Description
1)	[Label Group]		Select a label group to be displayed in the label (GT Designer3) list.
2)	[Refinement]		Enter characters to narrow down the labels (GT Designer3) in the label list. Only the labels (GT Designer3) narrowed down by the entered characters are displayed in the label list. Up to 32 characters can be set. The entered characters are case-insensitive.
3)	Search		Search the label (GT Designer3) list for a label by the specified keyword. Set [Search Target] and enter a search keyword in [Keyword]. Click the [Find Next] button to search for a label (GT Designer3) by the search keyword. Up to 32 characters can be set in [Keyword]. The entered characters are case-insensitive.
4)	Label (GT Designer3) list	—	Lists the labels (GT Designer3) of the label group selected in [Label Group]. Select a label (GT Designer3) from the list and click the [OK] button to set the label for [Device]. The data type of an object or others automatically changes according to the data type of the label (GT Designer3) that is set.
		[No.]	Number of a label (GT Designer3).
		[Label Name]	Name of the label (GT Designer3).
		[Data Type]	Data type of a label (GT Designer3).
		[Assign (Device)]	Device assigned to the label (GT Designer3).
		[Comment]	Comment set for a label (GT Designer3).
5)	[Bit Position]		Set the bit position of a label (GT Designer3). The setting range is [0] to [15]. If you use the [Device List] window or the [Edit Script (script name)] dialog to display the [Select Label (GT Designer3)] dialog, [Bit Position] is not settable.

[Select Global Label] dialog

GT37 SoftGOT3000

You can select a global label from the label list and set the label in the device setting of an object or others in the [Select Global Label] dialog.

To display this dialog, click the [Global Label] button in the [Select CH No.] dialog.



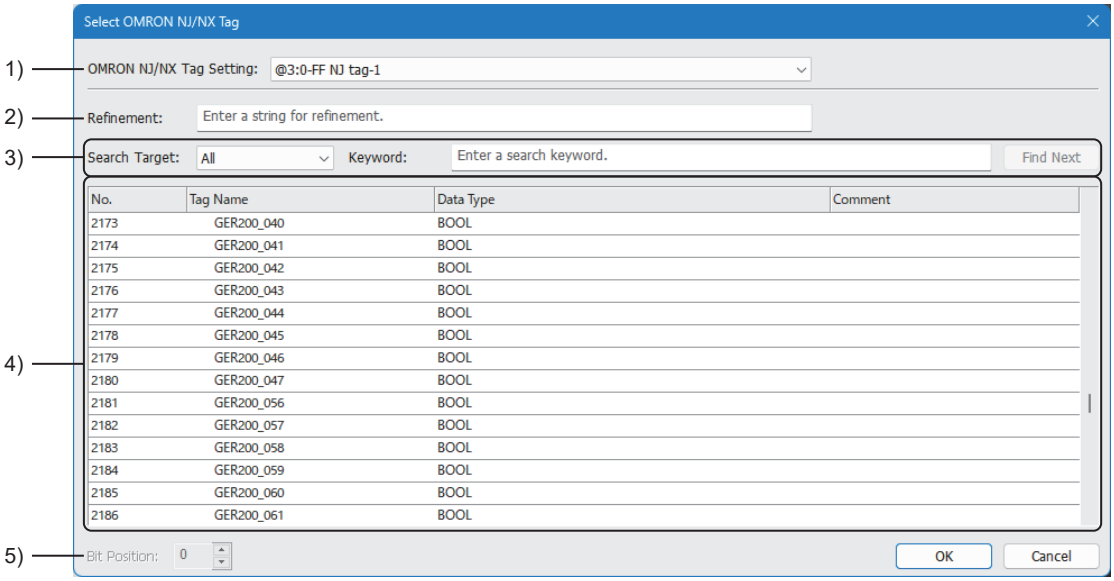
Item			Description
1)	[Global Label Setting]		Select a combination of the channel number, network setting, module number, and data name of the imported global labels.
2)	[Refinement]		Enter characters to narrow down the global labels in the label list. Only the global labels narrowed down by the entered characters are displayed in the label list. Up to 32 characters can be set. The entered characters are case-insensitive.
3)	Search		Search the global label list for a label by the specified keyword. Set [Search Target] and enter a search keyword in [Keyword]. Click the [Find Next] button to search for a global label by the search keyword. Up to 32 characters can be set in [Keyword]. The entered characters are case-insensitive.
4)	Global label list	—	Lists global labels. Select a global label from the list and click the [OK] button to set the label for [Device]. The [OK] button is enabled only when a global label corresponding to the data type of the setting target item is selected.
		[No.]	Number of a global label
		[Label Name]	Name of a global label
		[Data Type]	Data type of a global label
		[Comment]	Comment set for a global label
5)	[Bit Position]		Set the bit position of a global label. The setting range is [0] to [15]. If you use the [Device List] window to display the [Select Global Label] dialog, [Bit Position] is not settable.

[Select OMRON NJ/NX Tag] dialog

GT37 SoftGOT3000

In the [Select OMRON NJ/NX Tag] dialog, select an OMRON NJ/NX tag from the tag list to set the tag in the device setting of an object or others.

To display this dialog, click the [OMRON NJ/NX Tag] button in the [Select CH No.] dialog.

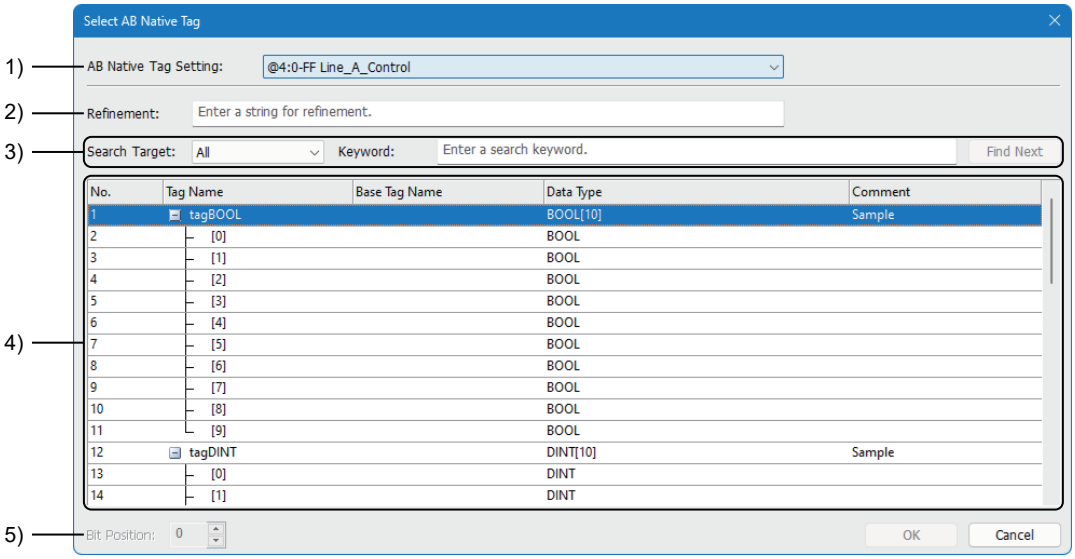


Item			Description
1)	[OMRON NJ/NX Tag Setting]		Select a combination of the channel number, network setting, and data name of the imported OMRON NJ/NX tags.
2)	[Refinement]		Enter characters to narrow down the OMRON NJ/NX tags in the tag list. Only the OMRON NJ/NX tags narrowed down by the entered characters are displayed in the tag list. Up to 32 characters can be set. The entered characters are case-insensitive.
3)	Search		Search the OMRON NJ/NX tag list for a tag by the specified keyword. Set [Search Target] and enter a search keyword in [Keyword]. Click the [Find Next] button to search for the next occurrence of the keyword. Up to 32 characters can be set in [Keyword]. The entered characters are case-insensitive.
4)	OMRON NJ/NX tag list	—	Lists the OMRON NJ/NX tags. Select an OMRON NJ/NX tag from the tag list and click the [OK] button to set the tag in [Device].
		[No.]	Number of an OMRON NJ/NX tag
		[Tag Name]	Name of an OMRON NJ/NX tag
		[Data Type]	Data type of an OMRON NJ/NX tag
		[Comment]	Comment set for an OMRON NJ/NX tag
5)	[Bit Position]		Set the bit position of an OMRON NJ/NX tag. The setting range is [0] to [15]. If the [Select OMRON NJ/NX Tag] dialog has been brought up from the [Device List] dialog, [Bit Position] is not settable.

[Select AB Native Tag] dialog

GT37 SoftGOT3000

Select an AB native tag from the list to set the tag in the device setting of an object or others.
To display this dialog, click the [AB Native Tag] button in the [Select CH No.] dialog.



Item			Description
1)	[AB Native Tag Setting]		Select a combination of the channel number, network setting, and data name of the imported AB native tags.
2)	[Refinement]		Enter characters to narrow down the AB native tags in the tag list. Only the AB native tags narrowed down by the entered characters are displayed in the tag list. Up to 32 characters can be set. The entered characters are case-insensitive.
3)	Search		Search the AB native tag list for a tag by the specified keyword. Set [Search Target] and enter a search keyword in [Keyword]. Click the [Find Next] button to search for the next occurrence of the keyword. Up to 32 characters can be set in [Keyword]. The entered characters are case-insensitive.
4)	AB native tag list	[No.]	AB native tags are listed. Select an AB native tag from the list and click the [OK] button to set the tag for [Device]. Number of an AB native tag. The [OK] button is enabled only when an AB native tag corresponding to the data type of the setting target item is selected.
		[Tag Name]	Name of an AB native tag
		[Base Tag Name]	Base tag name of an AB native tag
		[Data Type]	Data type of an AB native tag
		[Comment]	Comment set for an AB native tag
5)	[Bit Position]		Set the bit position of an AB native tag. The setting range varies with the data type. • Word type: [0] to [15] • Double-word type: [0] to [31] If the [Select AB Native Tag] dialog has been brought up from the [Device List] dialog, [Bit Position] is not settable.

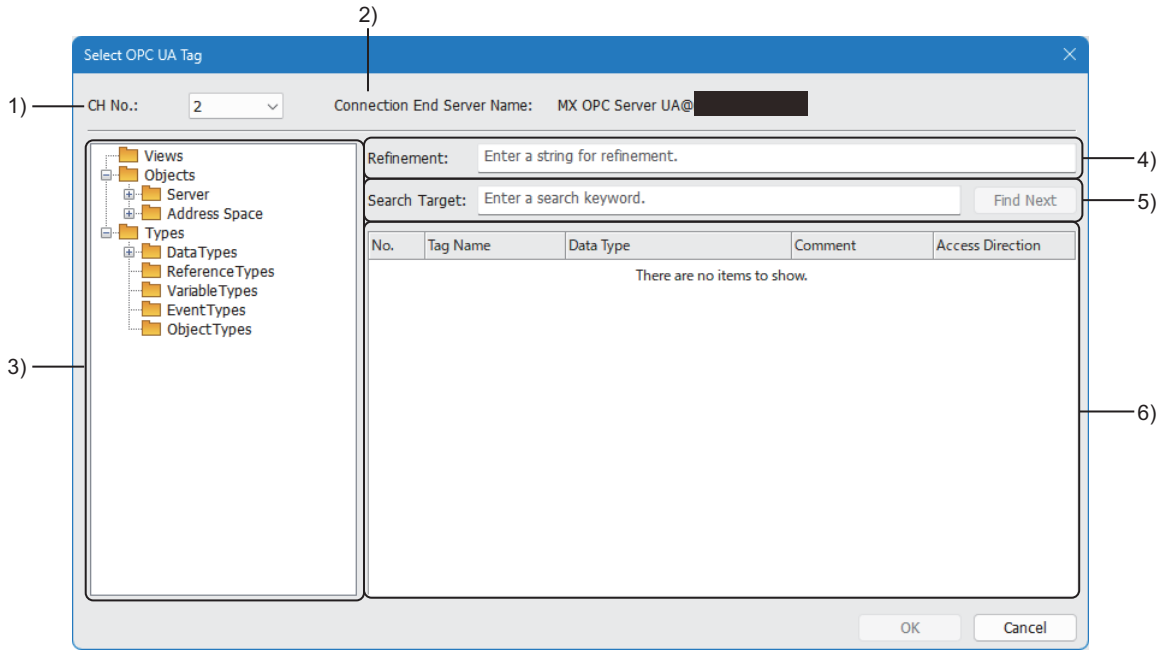
[Select OPC UA Tag] dialog

GT37 SoftGOT3000

Select an OPC UA tag from the list to set the tag in the device setting of an object or others.

To display this dialog, click the [OPC UA Tag] button in the [Select CH No.] dialog.

When OPC UA is set on multiple channels, the OPC UA tag selection dialog can be displayed from each channel.



Item		Description
1)	[CH No.]	Select a channel for connecting to an OPC UA server.
2)	[Connection End Server Name]	Displays the name of the OPC UA server corresponding to the channel selected for [CH No.].
3)	Tag information tree	Displays the tag information corresponding to the channel selected for [CH No.].
4)	[Refinement]	Enter a string to display tags with names containing the entered string in the OPC UA tag list. Tags are narrowed down as a string is entered. [Tag Name], [Data Type], [Comment], and [Access Direction] are searched. Up to 64 characters can be entered. The entered characters are case-insensitive.
5)	[Search Target]	Enter a keyword and click the [Find Next] button to search for the OPC UA tags containing the keyword. You can perform a search in the list after tags are narrowed down with [Refinement]. Up to 64 characters can be entered. The entered characters are case-insensitive.
6)	OPC UA tag list	OPC UA tags in the folder (group or structure) selected in the tag information tree. Select an OPC UA tag and click the [OK] button to set the tag as a device.

19.1.3 Selecting from utilizable data (input assist)

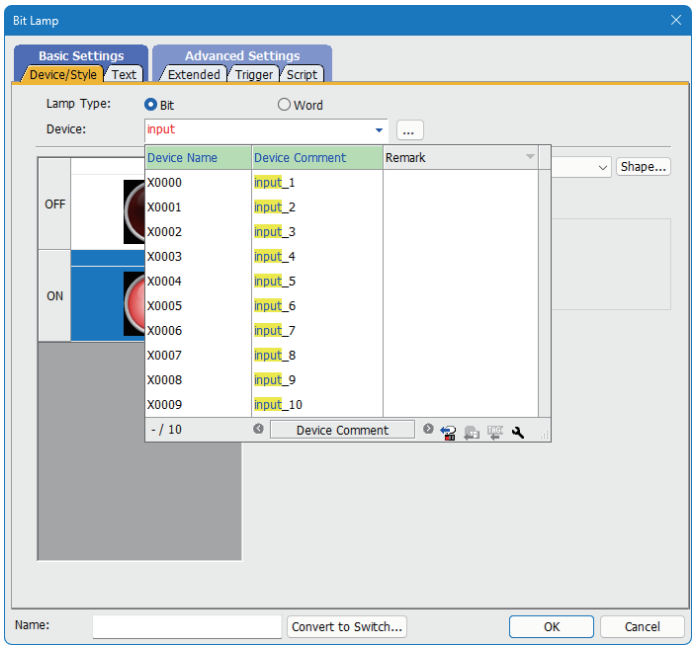
GT37 SoftGOT3000

☞ Page 844 Specifications of the input assist
☞ Page 845 Preparations for the input assist
☞ Page 845 Selecting a device or label from utilizable data
☞ Page 846 Input assist window

When you enter a keyword in the device entry field, utilizable data searched from device comments and label names is displayed.

Select a device or label from the data.

By using certain keywords in device comments and label names, you can display intended devices and labels as utilizable data.



Specifications of the input assist

GT37 SoftGOT3000

■Display target items of the input assist and preparations for display

The input assist displays utilizable data for the following items.

Search target	Description	Preparation to display utilizable data
Device	The device names and the device numbers are searched. Device representation may be different between the GOT and controllers. Use device representation of the GOT for a search. ☞ Page 3128 Device range and settings of Mitsubishi Electric equipment ☞ Page 3487 Device range and settings of each controller	Not required
Device comment	The device comments are searched.	Import device comments. ☞ Page 954 How to Set Device Comments or Device Definitions
Device definition	The following device definitions are searched. • Device definitions of the GOT special registers (GS) • Device definitions of the MITSUBISHI ELECTRIC PLCs (special relays and special registers) • Device definitions of the MITSUBISHI ELECTRIC servo amplifiers • Device definitions of the MITSUBISHI ELECTRIC inverters For device definitions of the GOT special registers (GS), refer to the following. ☞ Page 3581 GOT special register (GS)	The device definitions of the host station (0-FF) are automatically imported according to the setting for [Controller Type] in the [Controller Setting] window. To display the device definitions of the specified station as utilizable data, import the device definitions. ☞ Page 954 How to Set Device Comments or Device Definitions
Label (GT Designer3)	The labels (GT Designer3) are searched.	Register labels (GT Designer3). ☞ Page 867 How to set labels (GT Designer3)
Global label	The global labels are searched. Only the global labels corresponding to the data type of the setting target item are displayed as utilizable data.	Import global labels. ☞ Page 896 How to set global labels
OMRON NJ/NX tag	The OMRON NJ/NX tags are searched.	Import OMRON NJ/NX tags. ☞ Page 921 How to set OMRON NJ/NX tags
AB native tag	The AB native tags are searched. Only the AB native tags corresponding to the data type of the setting target item are displayed as utilizable data.	Import AB native tags. ☞ Page 936 How to set AB native tags
OPC UA tag	The OPC UA tags are searched.	Import OPC UA tags. ☞ Page 944 How to set OPC UA tags

■Search symbols

The following shows the symbols that enable special searches when the symbols are used with keywords.

Search symbol	Remarks
@	Specify a channel number in the form of @n. ("n" represents a number.) You can search the devices of the specified channel. Example) @2 represents channel number 2.
One-byte space	Enables a search with multiple keywords by delimiting the keywords with one-byte spaces.
"	Enables a search with keywords containing @ or one-byte spaces by enclosing the keywords. Example) Inputting "@" enables a search for device comments containing @.

Preparations for the input assist

GT37 SoftGOT3000

For preparation for displaying utilizable data, refer to the following.

☞ Page 844 Display target items of the input assist and preparations for display

Selecting a device or label from utilizable data

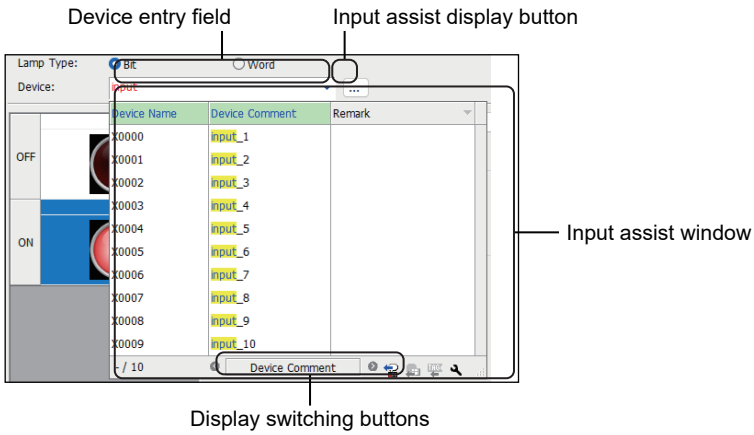
GT37 SoftGOT3000

1. Open the setting dialog of an object or others and perform either of the following operations in the device entry field to display the input assist window.

- Entering a search keyword in the device entry field
- Clicking the input assist display button in the device entry field

The items (device comments, labels, or others) displayed in the input assist window can be switched with the display switching button.

☞ Page 846 Input assist window



Limiting the items displayed in the input assist window or sorting by multiple criteria can be performed in the [Input Assist Setting] dialog.

☞ Page 848 [Input Assist Setting] dialog

2. Perform either of the following operations to set a device in the device entry field.

- Clicking the device to be set
- Selecting the device to be set with up and down arrow keys on the keyboard, and pressing the Enter key or the Tab key

Point

Using @ or one-byte spaces enables a search for a device with a channel specified or a search with multiple keywords.

☞ Page 844 Search symbols

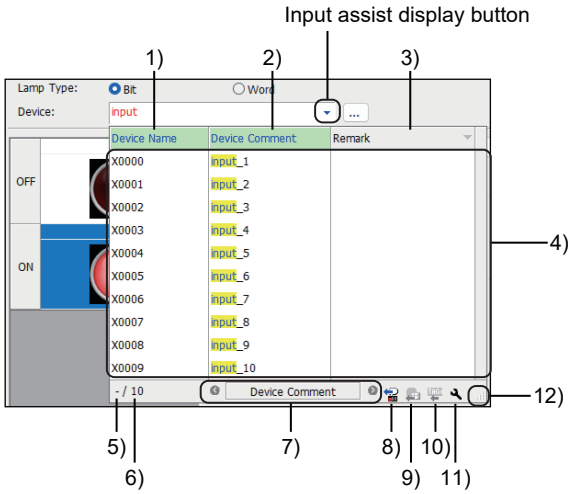
Input assist window

GT37 SoftGOT3000

Select a device or label from utilizable data.

This dialog is displayed by either of the following operations.

- Entering a search keyword in the device entry field
- Clicking the input assist display button in the device entry field



Item		Description
1)	[Device Name] [Label Name] [Tag Name]	Switch the ascending order, descending order, no sort in order every clicking the mouse. The name changes according to the contents of the displayed item.
2)	[Device Comment] [Device Definition] [Comment]	Switch the ascending order, descending order, no sort in order every clicking the mouse. The name changes according to the contents of the displayed item. The items are not displayed when [Show the device comment/definition settings] is deselected in the [Input Assist Setting] dialog.
3)	[Remark]	Switch the ascending order, descending order, no sort in order every clicking the mouse. [(History)] is displayed in the devices saved in the setting history.
4)	Utilizable data list	Searched devices. Select a row to select the device. The displayed contents can be scrolled with a mouse or keyboard. The column width can be changed with a mouse.
5)	Selected device	Position (row) of the device with the cursor in the utilizable data list. The device is displayed during cursor operation with a keyboard.
6)	Number of utilizable data items	Number of utilizable data items displayed in the utilizable data list. The number of utilizable data items changes when the utilizable data list is scrolled.
7)	Display switching buttons	Switches the items displayed in the utilizable data list. The text on the center button indicates the type of the data displayed in the utilizable data list. Switching is performed also by using the Ctrl + ← keys or Ctrl + → keys of the keyboard.
8)	[Device Comment / Device Definition List] button	The [Device Comment / Device Definition List] dialog appears. Import the device comment and the device definition. ☞ Page 959 [Device Comment / Device Definition List] dialog
9)	[Global Label List] button	Displays the [Label/Tag/Ethernet Setting List] dialog. Import global labels. ☞ Page 860 [Label/Tag/Ethernet Setting List] dialog
10)	Tag list button	The button name varies depending on the tag displayed in the utilizable data list. Displays the [Label/Tag/Ethernet Setting List] dialog. • [OMRON NJ/NX Tag List] button: Imports OMRON NJ/NX tags. • [AB Native Tag List] button: Imports AB native tags. • [OPC UA Tag List] button: Imports OPC UA tags. ☞ Page 860 [Label/Tag/Ethernet Setting List] dialog
11)	[Input Assist Setting] button	Displays the [Input Assist Setting] dialog. Enable or disable the input assist or select the search target. ☞ Page 848 [Input Assist Setting] dialog

Item		Description
12)	Resizing a figure or object	To change the size of the input assist window, move the mouse pointer to the lower right corner of the window where the pointer becomes a double-headed arrow, and drag the pointer.

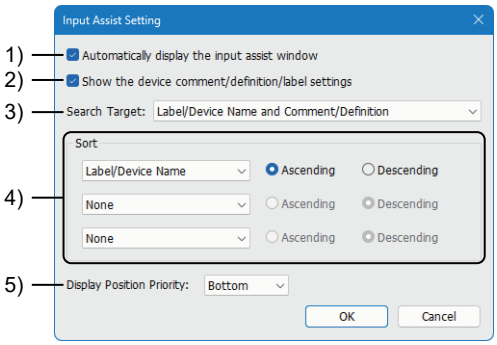
■[Input Assist Setting] dialog

GT37 SoftGOT3000

Set the items to be displayed in the input assist window and sorting order of utilizable data.

This dialog is displayed by either of the following operations.

Operation method	Operation screen
Clicking the [Input Assist Setting] button in the input assist window	 [Input Assist Setting] button
Right-clicking the device entry field, and selecting [Input Assist Setting] from the menu	 Right-click menu



Item		Description
1)	[Automatically display the input assist window]	Automatically displays the input assist window when a keyword is entered in the device entry field in the object setting dialog and others. Even though this item is deselected, you can display the input assist window by the following operation. Click 2)	[Show the device comment/definition/label settings] [Show the device comment/definition/label/tag settings]	Displays the device comments, device definitions, and others as utilizable data in the input assist window. Deselect this item to display only the device setting history in the input assist window.
3)	[Search Target]	Select a search target.
4)	[Sort]	Set the sorting order of the utilizable data list of the input assist window. Up to three conditions for sorting order can be set and their priority is high from the top. Select [Ascending] and [Descending] for each condition.
5)	[Display Position Priority]	Select the display position of the input assist window against the device entry field.

19.1.4 Directly entering data in the device entry field

GT37 SoftGOT3000

☞ Page 849 Formats of devices, labels, and tags
☞ Page 852 Device setting for network connection

Directly enter a device, label, or tag in the device entry field.
Entry must be performed according to the specified format.

Formats of devices, labels, and tags

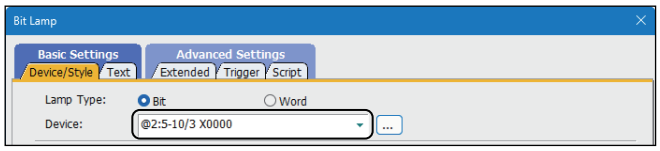
The following shows how to format devices, labels, and tags in setting dialogs and scripts.

☞ Page 849 Formats in setting dialogs
☞ Page 851 Formats in scripts

■Formats in setting dialogs

The following shows the formats in the setting dialog of an object or others.

Ex.
Channel number 2, network number 5, station number 10, CPU number 3, and device X0000



Device, label, or tag	Format
Device	(Channel):(Network setting) (Device)
Label (GT Designer3)	$(Group name):(Label name)
Global label	For setting the global labels imported with GX Works3 or MT Developer2 (Channel):(Network setting)::(Label name)
	For setting the global labels imported with Motion Control Setting Function (Channel):(Network setting)::U (Module No.)-(Label name)
OMRON NJ/NX tag	(Channel):(Network setting)::(Tag name)
AB native tag	(Channel):(Network setting)::(Tag name)
OPC UA tag	(Channel)&(Tag name)

The formats in [Device] include the following elements.

Element	Description	
Channel	Format	@(Channel No.)
	Example	Example) Channel number 2 @2
	Description	Channel for communicating with a controller. To specify channel number 1, "@1:" can be omitted. If no network setting exists, the colon (:) after "(Channel)" is not required.

Element	Description		
Network setting	Format	(Network No.)-(Station No.)/(CPU No.)-(Redundant system)	
	Example	Example) Network No. 5, station No. 10, CPU No. 3, and standby system 5-10/3-S	
	Description	Setting for specifying a network-connected controller. Enter the following elements as necessary.	
		Network No., station No.	To specify the host station or all stations, "(Network No.)-(Station No.)" can be omitted. However, enter 0-0 to specify all stations for monitoring MODBUS salve equipment. If no network number and station number exist, "(Network No.)-(Station No.)" is not required. For the monitoring targets when "0" or "FF" is set to the network number and station number for network connection, refer to the following. ☞ Page 852 Device setting for network connection
		CPU No.	To specify a CPU number, "(Network No.)-(Station No.)" cannot be omitted. If no CPU number exists or you specify CPU number 0, "/(CPU No.)" is not required.
		Redundant system	To monitor the standby system in a redundant system, enter S. To monitor the control system in a redundant system or monitor a non-redundant system, "-(Redundant system)" is not required.
			If you deselect [Use the function of MELSEC Redundant] in the [Controller Setting] window ([MELSEC Redundant]), the specified device is still marked with [-S] that identifies the standby system. ☞ Page 746 [MELSEC Redundant] To perform batch deletion of [-S], use the [Network Batch Edit] dialog or other methods. ☞ Page 159 [Network Batch Edit] dialog
Group name	Format	$(Group name)	
	Example	Example) Group name: LG1 $LG1	
	Description	Label group of labels (GT Designer3)	
Module number	Format	U(Module No.)	
	Example	Example) Module number: A1 UA1	
	Description	Set this element to import global labels with Motion Control Setting Function.	
Device	Format	(Device name)(Device No.).b(Bit position)	
	Example	Example) Bit 15 of D1000 D1000.b15	
	Description	Device name and device number. When inserting "(Device)" immediately after "(Network setting)", add a one-byte space between them. To specify a bit of a word device, enter ".b(Bit position)". Some devices require other elements. For the formats of such devices, refer to the following. ☞ Page 3128 Device range and settings of Mitsubishi Electric equipment ☞ Page 3487 Device range and settings of each controller	
Label name Tag name	Format	(Label name or tag name).b(Bit position)	
	Example	Example) Bit 15 of a global label named global_label_001 global_label_001.b15	
	Description	Label name or tag name. To specify a bit of a word device, enter ".b(Bit position)". The format varies according to the types of labels or tags. For details, refer to the following. ☞ Page 867 How to set labels (GT Designer3) ☞ Page 896 How to set global labels ☞ Page 921 How to set OMRON NJ/NX tags ☞ Page 936 How to set AB native tags ☞ Page 944 How to set OPC UA tags	

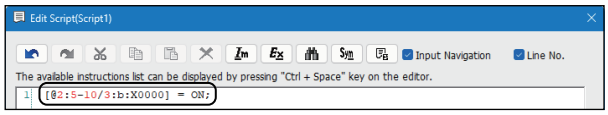
■Formats in scripts

The formats in setting dialogs and scripts are different.

The following shows the formats in scripts.

Ex.

Channel number 2, network number 5, station number 10, CPU number 3, and device X0000



Device, label, or tag	Format
Device	[(Channel):(Network setting):(Data type):(Device)]
Label (GT Designer3)	[<$:(Group name):(Label name)>]
Global label	For setting the global labels imported with GX Works3 or MT Developer2 [(Channel):(Network setting):(Data type)::(Label name)]
	For setting the global labels imported with Motion Control Setting Function [(Channel):(Network setting):(Data type)::U (Module No.)-(Label name)]
OMRON NJ/NX tag	[(Channel):(Network setting):(Data type)::(Tag name)]
AB native tag	[(Channel):(Network setting):(Data type)::(Tag name)]
OPC UA tag	[(Channel):(Data type)::&(Tag name)]

The formats of channel, network setting, module number, device, label name, and tag name are the same as the formats of the elements in [Device] in setting dialogs.

☞ Page 849 Formats in setting dialogs

"(Data type)" is required in scripts.

For its format, refer to the following.

☞ Page 2353 Available devices and how to express the devices

Device setting for network connection

The following shows the monitored stations when "0" or "FF" is specified for the network number and station number of the device.

■MELSECNET/H connection

Specified value		Monitored station		Remarks
Network No.	Station No.	Network No.	Station No.	
0 (Own network)	0	Own network	Control station	-
	FF (host station)	Own network	Host station (GOT)	Link devices and GOT internal devices can be monitored but the others (transient devices) cannot be monitored.
	Same as the GOT	Monitoring unavailable	Monitoring unavailable	-
	Other than the above	Own network	As specified	-
Same as the GOT	0	As specified	Control station	-
	FF (host station)	Monitoring unavailable	Monitoring unavailable	-
	Same as the GOT	Monitoring unavailable	Monitoring unavailable	-
	Other than the above	As specified	As specified	-
Other than the above (Other network)	0	As specified	Control station	-
	FF (host station)	Monitoring unavailable	Monitoring unavailable	-
	Other than the above	As specified	As specified	-

■CC-Link IE TSN connection

Specified value		Monitored station		Remarks
Network No.	Station No.	Network No.	Station No.	
0 (Own network)	0	Monitoring unavailable	Monitoring unavailable	—
	FF	Own network	Host station (GOT)	Link devices can be monitored but the others (transient devices) cannot be monitored.
	Same as the GOT	Monitoring unavailable	Monitoring unavailable	—
	Other than the above	Monitoring unavailable	Monitoring unavailable	—
Same as the GOT	0	As specified	Master station	—
	FF	Monitoring unavailable	Monitoring unavailable	—
	Same as the GOT	Monitoring unavailable	Monitoring unavailable	—
	Other than the above	As specified	As specified	—
Other than the above (Other network)	0	As specified	Master station	—
	FF	Monitoring unavailable	Monitoring unavailable	—
	Other than the above	As specified	As specified	—

■CC-Link IE Controller Network connection

Specified value		Monitored station		Remarks
Network No.	Station No.	Network No.	Station No.	
0 (Own network)	0	Own network	Control station	-
	FF (host station)	Own network	Host station (GOT)	Link devices and GOT internal devices can be monitored but the others (transient devices) cannot be monitored.

19.2 Settable devices in GT Designer3

GT37 SoftGOT3000

☞ Page 854 Available devices and setting ranges
☞ Page 857 Data type of devices

19.2.1 Available devices and setting ranges

The following shows the devices that can be set in GT Designer3.

☞ Page 854 GOT internal devices (GB, GD, and GS)
☞ Page 855 SoftGOT3000 internal devices (SGB and SGD)
☞ Page 855 GOT Mobile devices (VGB, VGD)
☞ Page 856 Controller device

Point

Labels or tags can be set in the device setting in GT Designer3.
Labels and tags are used to manage devices by label names or tag names. This is enabled by assigning labels or tags with usage names or function names to the devices.
For labels and tags usable in GT Designer3, refer to the following.
☞ Page 858 Labels and Tags Usable in GT Designer3

GOT internal devices (GB, GD, and GS)

GT37 SoftGOT3000

GOT internal devices refer to the devices that the GOT has in itself.
These devices are usable for any connection type, but they cannot be controlled by the sequence program of a controller.
If the GOT is powered off or reset, the GOT internal devices store 0.
The GOT internal device includes the GOT bit register, GOT data register, and GOT special register.

Device	Setting range	Device number representation	Description
GOT bit register (GB)	GB0 to GB65535	Decimal	Can be used as bit devices. This device is usable without connection through a controller as shown below. • Work area for the script function • Barcode storage area This device cannot be used as a 64-bit device.
GOT data register (GD)	GD0 to GD65535		Can be used as word devices. This device is usable without connection through a controller as shown below. • Screen switching device • Work area for the script function • Barcode storage area This device cannot be used as an 8-bit device.
GOT special register (GS)	GS0 to GS3071		Special register that the GOT has in itself The registers store internal information, communication status, and error information of the GOT. Monitoring the GOT special registers allows you to check the GOT information and control the GOT. This device cannot be used as an 8-bit or a 64-bit device.

The GOT internal devices have the area where functions are assigned or use prohibited areas used by the system.
For details on the device functions and use-prohibited devices, refer to the following.
☞ Page 3577 GOT internal devices

SoftGOT3000 internal devices (SGB and SGD)

GT37 SoftGOT3000

SoftGOT3000 internal devices refer to data storage areas used by GT SoftGOT3000.
SoftGOT3000 internal devices are usable for any connection type, but they cannot be controlled by the sequence program of a controller.
When you exit GT SoftGOT3000, these devices are reset to 0.
The SoftGOT3000 internal devices are classified into two types: SoftGOT bit registers and SoftGOT data registers.

Device	Setting range	Device number representation	Description
SoftGOT bit register (SGB)	SGB0 to SGB65535	Decimal	Can be used as bit devices. This device is usable without connection through a controller as shown below. • Screen switching device • Work area for the script function • Barcode storage area
SoftGOT data register (SGD)	SGD0 to SGD65535		Can be used as word devices. This device is usable without connection through a controller as shown below. • Screen switching device • Work area for the script function • Barcode storage area

The SoftGOT3000 internal devices are also usable to monitor the data collected by the data collector of Edgecross.
To monitor the collected data, assign the data to SoftGOT3000 internal devices in the Edgecross interaction function setting in GT SoftGOT3000.
For the Edgecross interaction function setting, refer to the following.
GT SoftGOT3000 Operating Manual

GOT Mobile devices (VGB, VGD)

GT37 SoftGOT3000

The GOT Mobile devices are virtual devices usable for a client.
Assign GOT internal devices (GB and GD) to GOT Mobile devices for a client. The GOT Mobile devices are used as internal devices for the client.
Multiple clients are controllable individually by assigning different GOT internal devices for each client.
The virtual devices are not initialized at the start of monitoring a mobile screen. Therefore, the devices hold the values that are stored immediately before the monitoring.

Device	Setting range	Device number representation
GOT Mobile bit register (VGB)	VGB0 to VGB32767	Decimal
GOT Mobile data register (VGD)	VGD0 to VGD32767	

Controller device

GT37 SoftGOT3000

The controller device refers to the data storage area in a controller.
The GOT can monitor the controller devices.
The setting range and device number representation vary with the controller.
☞ Page 3128 Device range and settings of Mitsubishi Electric equipment
☞ Page 3487 Device range and settings of each controller

Precautions

The range of the devices that the GOT can monitor and the range of the devices that the controller has may be different.
GT Designer3 does not automatically check if a device set in the settings of an object or others exists in the controller being monitored.
To check if such device exists in the controller being monitored by the GOT, use one of the following methods.

Method	Description
Checking when setting the controllers	For the types and the ranges of the devices available for the controllers, refer to the following. GOT3000 Series User's Manual (Connection)
Checking when drawing	For the types and the ranges of the devices that can be set in GT Designer3 projects, refer to the following. ☞ Page 3128 Device range and settings of Mitsubishi Electric equipment ☞ Page 3487 Device range and settings of each controller
Monitoring with the GOT	When you attempt to monitor devices that the controller does not have, system alarm 322 occurs. You can check the system alarm by placing a system alarm display object on the screen or by using the utility. ☞ Page 1542 Placing a system alarm display ☞ Page 2132 Viewing alarm events (Alarm display) GOT3000 Series User's Manual (Utility & Maintenance Functions)

19.2.2 Data type of devices

The following data types are supported.

Each data type supports different data range and different devices.

Data type	Data length	Data range	Supported device
Bit	1 bit	0, 1	• Bit device • Bit-specified word device
Signed 8-bit binary	8-bit	-128 to 127	• Byte device • Byte-specified bit device
Unsigned 8-bit binary	8-bit	0 to 255	
Signed 16-bit binary	16-bit	-32768 to 32767	• Word device • Word-specified bit devices
Unsigned 16-bit binary	16-bit	0 to 65535	
Signed 32-bit binary	32-bit	-2147483648 to 2147483647	• Double-word device • Double-word-specified bit device • Double-word-specified word device
Unsigned 32-bit binary	32-bit	0 to 4294967295	
Signed 64-bit binary	64-bit	-9223372036854775808 to 9223372036854775807	Quad-word-specified word device
Unsigned 64-bit binary	64-bit	0 to 18446744073709551615	
16-bit binary-coded decimal	16-bit	0 to 9999	• Word device • Word-specified bit devices
32-bit binary-coded decimal	32-bit	0 to 99999999	• Double-word device • Double-word-specified bit device • Double-word-specified word device
64-bit binary-coded decimal	64-bit	0 to 9999999999999999	Quad-word-specified word device
Real number (32-bit)*1	32-bit	±(0, 1.17550E-38 to 3.40282E+38) Real number precision: 6 digits	• Double-word device • Double-word-specified bit device • Double-word-specified word device
Real number (64-bit)*1	64-bit	±(0, 2.2250738585073e-308 to 1.7976931348623e+308) Real number precision: 14 digits	Quad-word-specified word device

*1 When a value exceeding the number of digits to which a real number is accurate is set, the set value and the operating value differ. For a real number, set the number of digits not exceeding the number of digits to which the real number is accurate.

19.3 Labels and Tags Usable in GT Designer3

GT37 SoftGOT3000

☞ Page 858 Types of labels and tags usable in GT Designer3
☞ Page 860 [Label/Tag/Ethernet Setting List] dialog

Labels and tags are used to manage devices by label names or tag names. This is enabled by assigning labels or tags with usage names or function names to the devices.

You can set labels or tags to in the device setting in GT Designer3.

19.3.1 Types of labels and tags usable in GT Designer3

GT37 SoftGOT3000

In GT Designer3, you can create labels used in GT Designer3 projects, or import labels or tags of controllers and set them in the device setting.

The following shows the labels and tags usable in GT Designer3.

Labels or tags created in GT Designer3

Type	Description	Model
Label (GT Designer3)	This label is used only in GT Designer3 projects without sharing label information with controllers. ☞ Page 867 How to set labels (GT Designer3)	GT37 SoftGOT3000
OPC UA tag	Tags that the OPC UA server (GOT) has. The OPC UA client can access the controllers to which the GOT is connected through the OPC UA tag of the OPC UA server (GOT). ☞ Page 2839 Monitoring controllers through the GOT (OPC UA server function)	GT37 SoftGOT3000

Labels or tags created in the controller

Type	Software used for setting	Description	Model
Global label	GX Works3 MT Developer2 Motion Control Setting Function	Labels to be set with the software of the controller. You can import global labels and set them in the device setting in GT Designer3. Even if you change the devices assigned to the global labels in the controller, the GOT obtains the information from the controller and monitors the new devices. ☞ Page 896 How to set global labels	GT37 SoftGOT3000
OMRON NJ/NX tag	OMRON programming software	Tags to be set with the OMRON programming software. You can import OMRON NJ/NX tags and set them in the device setting in GT Designer3. ☞ Page 921 How to set OMRON NJ/NX tags	GT37 SoftGOT3000
RSLogix 5000 tag	ALLEN-BRADLEY programming software	Tags to be set with the ALLEN-BRADLEY programming software. You can import RSLogix 5000 tags and set them in the device setting in GT Designer3. ☞ Page 931 Using RSLogix 5000 tags	GT37 SoftGOT3000
AB native tag	ALLEN-BRADLEY programming software	Tags to be set with the ALLEN-BRADLEY programming software. You can import AB native tags and set them in the device setting in GT Designer3. ☞ Page 936 How to set AB native tags	GT37 SoftGOT3000
OPC UA tag	OPC UA server	Tags to be set with the OPC UA server function. You can import OPC UA tags and set them in the device setting in GT Designer3. ☞ Page 944 How to set OPC UA tags	GT37 SoftGOT3000

19.3.2 [Label/Tag/Ethernet Setting List] dialog

GT37 SoftGOT3000

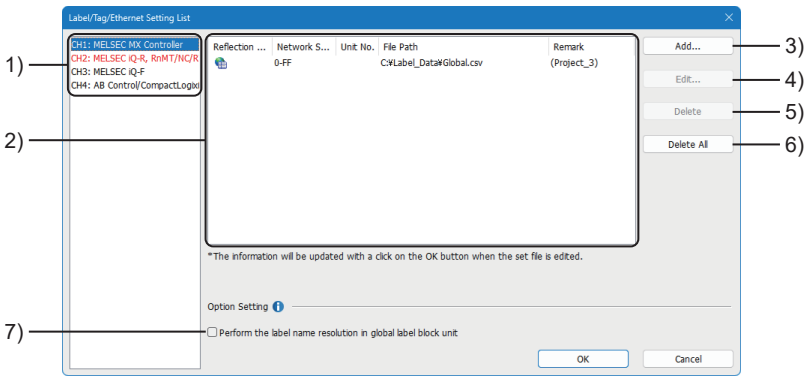
This dialog is used to import or delete the following items.

Item	Description
Label Tag	Import the labels or tags created in the controller. For labels and tags that can be imported or deleted, refer to the following. ☞ Page 859 Labels or tags created in the controller
Ethernet settings	Import the Ethernet settings from a GX Works3 project and applies them in [Connected Ethernet Controller Setting].

Window

This dialog is displayed by either of the following operations.

- Select [Project] → [Import Other Data] → [Label/Tag/Ethernet Setting] from the menu.
- Double-click [Import/Setting] under [Label/Tag] in the [Project] window.



Item		Description
1)	Channel list	List of each channel and the communication setting that has been set. When you select a channel, the contents displayed in the label/tag/Ethernet setting list will change according to the settings of the selected channel. When this dialog is opened, if any label, tag, or Ethernet setting requires updating due to changes such as updates to the previously imported file, the text of the corresponding channel turns red.
2)	Label/tag/Ethernet setting list	In the channel list, when you select a channel for which communication setting relevant to labels or tags are configured, the import settings of the labels or tags are displayed. When this dialog is opened, if there is no previously imported file in the specified path, the text of the corresponding row turns red. When a global label is set, the type of the imported settings is displayed as an icon in the [Reflection Function] column. 
Item		Description	
3)	[Add] button	Imports labels or tags. The displayed dialog depends on the communication setting of the selected channel.	
		When selecting a channel that supports global labels or Ethernet settings	When one of the following is selected for [Controller Type] in the [Controller Setting] window, and a channel whose [Driver] is [Ethernet(MITSUBISHI ELECTRIC), Gateway] is selected in the channel list, the [Add Global Label/Ethernet Setting] dialog appears. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELSEC iQ-F] • [MELIPC] ☞ Page 862 [Add Global Label/Ethernet Setting] dialog or [Edit Global Label/Ethernet Setting] dialog Up to 500 files can be imported.
		When selecting a channel that supports the following tags • OMRON NJ/NX tag • RSLogix 5000 tag • AB native tag • OPC UA tag	When a channel is selected in the channel list, with the following selected for [Controller Type] in the [Controller Setting] window, the dialog for adding the tag corresponding to the selected channel appears. • [OMRON NJ/NX] ☞ Page 864 [Add OMRON NJ/NX Tag] dialog or [Edit OMRON NJ/NX Tag] dialog • [AB Control/CompactLogix] ☞ Page 865 [Add RSLogix 5000 Tag] dialog or [Edit RSLogix 5000 Tag] dialog • [AB Control/CompactLogix(Tag)] ☞ Page 865 [Add AB Native Tag] dialog or [Edit AB Native Tag] dialog • [OPC UA] ☞ Page 866 [Add OPC UA Tag] dialog or [Edit OPC UA Tag] dialog Up to 128 files can be imported.
4)	[Edit] button	Edit the import settings of the label or tag selected in the label/tag/Ethernet setting list. The displayed dialog depends on the communication setting of the selected channel.	
		When selecting a channel that supports global labels or Ethernet settings	When one of the following is selected for [Controller Type] in the [Controller Setting] window, and a channel whose [Driver] is [Ethernet(MITSUBISHI ELECTRIC), Gateway] is selected in the channel list, the [Edit Global Label/Ethernet Setting] dialog appears. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELSEC iQ-F] • [MELIPC] ☞ Page 862 [Add Global Label/Ethernet Setting] dialog or [Edit Global Label/Ethernet Setting] dialog
		When selecting a channel that supports the following tags • OMRON NJ/NX tag • RSLogix 5000 tag • AB native tag • OPC UA tag	When a channel is selected in the channel list, with the following selected for [Controller Type] in the [Controller Setting] window, the dialog for editing the tag corresponding to the selected channel appears. • [OMRON NJ/NX] ☞ Page 864 [Add OMRON NJ/NX Tag] dialog or [Edit OMRON NJ/NX Tag] dialog • [AB Control/CompactLogix] ☞ Page 865 [Add RSLogix 5000 Tag] dialog or [Edit RSLogix 5000 Tag] dialog • [AB Control/CompactLogix(Tag)] ☞ Page 865 [Add AB Native Tag] dialog or [Edit AB Native Tag] dialog • [OPC UA] ☞ Page 866 [Add OPC UA Tag] dialog or [Edit OPC UA Tag] dialog
5)	[Delete] button	Deletes the settings selected in the label/tag/Ethernet setting list. When the imported setting is deleted and the [OK] button is clicked in a channel that supports global labels or Ethernet settings, related data is treated as follows: • The global labels imported from the deleted setting are deleted as well. • The connected Ethernet controller settings imported from the deleted setting are retained.	
6)	[Delete All] button	Deletes all the settings displayed in the label/tag/Ethernet setting list. When the imported setting is deleted and the [OK] button is clicked in a channel that supports global labels or Ethernet settings, related data is treated as follows: • The global labels imported from the deleted setting are deleted as well. • The connected Ethernet controller settings imported from the deleted setting are retained.	
7)	[Perform the label name resolution in global label block unit]	This item is enabled when you select a channel that uses global labels in the channel list. Perform the label name resolution by the split method. The label name resolution is performed only on the global label block containing an updated label. For details, refer to the following. ☞ Page 909 Obtaining label information from the controller during GOT operation (label name resolution)	

[Add Global Label/Ethernet Setting] dialog or [Edit Global Label/Ethernet Setting] dialog

GT37 SoftGOT3000

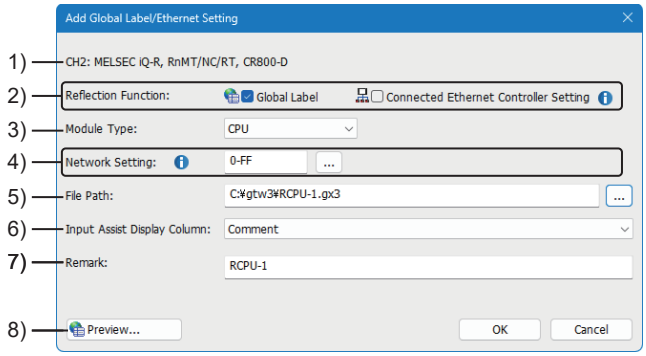
This dialog is used to import or delete the following items.

Item	Description
Global label	Import the settings of the controller that uses global labels from the specified file. For the importable file formats and required version of GX Works3, refer to the following. ☞ Page 898 Importable files in GT Designer3
Ethernet settings	Import the Ethernet settings from a GX Works3 project (*.gx3) and apply them in [Connected Ethernet Controller Setting]. GX Works3 Ver.101F or later is required for import. Only *.gx3 files can be imported.

The dialog name varies by how to display the dialog.

Use one of the following methods to display this dialog.

- In the [Label/Tag/Ethernet Setting List], select a channel that supports global labels and click the [Add] or [Edit] button.
- Click the [Global Label] button in the [Controller Setting] window.
- Click the [Import from GX Works3 Project] button in the [Controller Setting] window.



Item		Description
1)	Communication setting	Channel number and the communication setting

Item			Description
2)	[Reflection Function]	—	Select the settings to be imported.
		[Global Label]	This item is enabled for the channel for which one of the following items is selected for [Controller Type] in the [Controller Setting] window. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELIPC] Selecting this item enables the following setting items. • [Module Type] • [Network Setting] • [Input Assist Display Column] • [Data Name] • [Preview] button (when the path to a GX Works3 project (*.gx3) is specified in [File Path]) Import global labels from the specified file. If the [OK] button is clicked after the import with this item cleared, the imported global labels are deleted.
		[Connected Ethernet Controller Setting]	This item is enabled when one of the following is selected for [Controller Type] in the [Controller Setting] window, and a channel whose [Driver] is [Ethernet(MITSUBISHI ELECTRIC), Gateway] is selected in the channel list. • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-F] Import the Ethernet settings from a GX Works3 project and applies them in [Connected Ethernet Controller Setting]. ☞ Page 731 [Connected Ethernet Controller Setting] If the [OK] button is clicked after the import with this item cleared, the connected Ethernet controller settings imported are retained. The following module parameter settings are imported from the GX Works3 project. • [IP Address] • [Network No.] • [Station No.] • [External Device Configuration] (the setting of [MELSOFT Connection Module] for [Model Name] in the detailed settings) When [Communications by Network No./Station No.] is set to [Disable] in the GX Works3 project, only the IP address is imported. [Unit Type] in [Connected Ethernet Controller Setting] is set according to the GX Works3 project. If the module configuration diagram is not set, the GX Works3 project cannot be imported. Import attempts fail.
3)	[Module Type]		This item is enabled for the channel for which [Connected Ethernet Controller Setting] is deselected and one of the following items is selected for [Controller Type] in the [Controller Setting] window. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELIPC] When specifying a project or a CSV file exported with GX Works3 or MT Developer2 in [File Path]: Select [CPU]. When specifying a CSV file exported with Motion Control Setting Function in [File Path]: Select [Motion Module].
4)	[Network Setting]	—	This item is enabled for the channel for which one of the following items is selected for [Controller Type] in the [Controller Setting] window. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELIPC] Set the network setting for the PLC having the global label setting.
		[Unit No.]	This item appears when [Motion Module] is selected for [Module Type]. Set this item when specifying a CSV file exported with Motion Control Setting Function in [File Path]. Set the second and third values of the start I/O number of the connected Motion module. Example) When the start I/O number is 0FE0, set FE to [Unit No.].
5)	[File Path]		Specify the path to the file to be imported. If GX Works3 project data with security settings configured is specified, user or project authentication may be required. Enter the user name and password in the displayed dialog to perform authentication.

Item		Description
6)	[Input Assist Display Column]	This item is enabled for the channel for which one of the following items is selected for [Controller Type] in the [Controller Setting] window. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELIPC] For the comment set in the global label, specify the column of the comment to be displayed in the input assist. If a project is specified in [File Path], the settable comments are fixed.
7)	[Data Name]	This item is enabled for the channel for which one of the following items is selected for [Controller Type] in the [Controller Setting] window. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELIPC] Set the data name to be displayed in the [Label/Tag/Ethernet Setting List] dialog.
8)	[Preview] button	This item is enabled for the channel for which [CPU] is selected for [Module Type] and one of the following items is selected for [Controller Type] in the [Controller Setting] window. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELIPC] This item appears only when a project is specified in [File Path]. Displays the [Global Label Preview] dialog showing the details of target global labels. The global label that cannot be imported is highlighted in gray. The displayed project is not editable.

■Updating global labels and Ethernet settings

When any of the imported global labels or Ethernet settings is updated, an icon appears in the status bar to notify you of the update.

☞ Page 907 Updating the imported global labels

[Add OMRON NJ/NX Tag] dialog or [Edit OMRON NJ/NX Tag] dialog

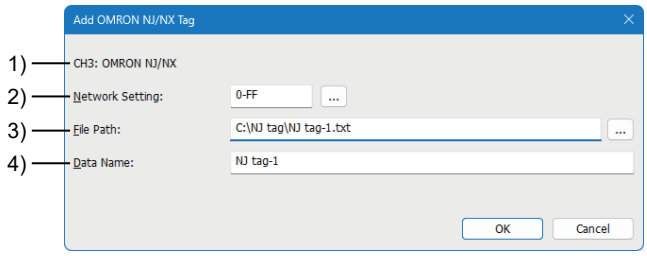
GT37 SoftGOT3000

Configure the settings for the controller that uses OMRON NJ/NX tags or specify a file to be imported.

The dialog name varies by how to display the dialog.

Use one of the following methods to display this dialog.

- In the [Label/Tag/Ethernet Setting List] dialog, select a channel that supports OMRON NJ/NX tags and click the [Add] or [Edit] button.
- Click the [AB Native Tag] button in the [Controller Setting] window.



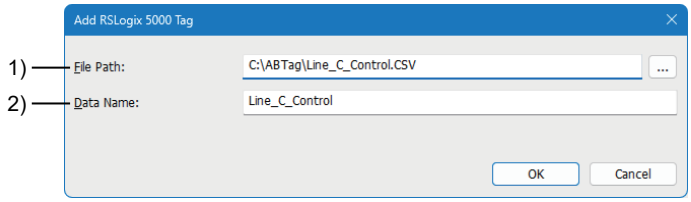
Item		Description
1)	Communication setting	Channel number and the communication setting
2)	[Network Setting]	Specify the network of the PLC having the OMRON NJ/NX tag setting.
3)	[File Path]	Specify the path to a Unicode text file of OMRON NJ/NX tags.
4)	[Data Name]	Set the data name to be displayed in the [OMRON NJ/NX Tag List] dialog. If this field is left blank, the file name specified with the file path is automatically entered.

[Add RSLogix 5000 Tag] dialog or [Edit RSLogix 5000 Tag] dialog

GT37 SoftGOT3000

Specify the file path and data name of the RSLogix 5000 tag to be used.
The dialog name varies by how to display the dialog.
Use one of the following methods to display this dialog.

- In the [Label/Tag/Ethernet Setting List] dialog, select a channel that supports RSLogix 5000 tags and click the [Add] or [Edit] button.
- Click the [RSLogix 5000 Tag] button in the [Controller Setting] window.



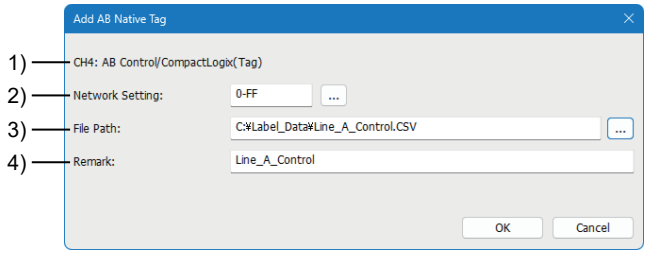
Item		Description
1)	[File Path]	Set the path of the RSLogix 5000 tag file to be added.
2)	[Data Name]	Set the data name of the RSLogix 5000 tag file to be added. The setting cannot be changed in the [Edit RSLogix 5000 Tag] dialog.

[Add AB Native Tag] dialog or [Edit AB Native Tag] dialog

GT37 SoftGOT3000

Configure the settings for the controller that uses AB native tags or specify a file to be imported.
The dialog name varies by how to display the dialog.
Use one of the following methods to display this dialog.

- In the [Label/Tag/Ethernet Setting List], select a channel that supports AB native tags and click the [Add] or [Edit] button.
- Click the [AB Native Tag] button in the [Controller Setting] window.



Item		Description
1)	Communication setting	Channel number and the communication setting
2)	[Network Setting]	Specify the network for the PLC that uses AB native tags.
3)	[File Path]	Specify the path to the file to be imported.
4)	[Data Name]	Set the data name to be displayed in GT Designer3. The setting cannot be changed in the [Edit AB Native Tag] dialog.

[Add OPC UA Tag] dialog or [Edit OPC UA Tag] dialog

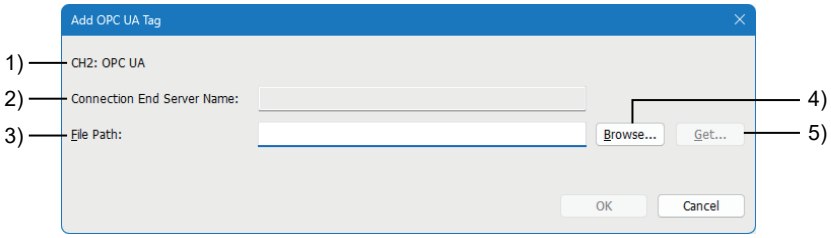
GT37 SoftGOT3000

Configure the settings for the controller that uses OPC UA tags or specify a file to be imported.

The dialog name varies by how to display the dialog.

Use one of the following methods to display this dialog.

- In the [Label/Tag/Ethernet Setting List] dialog, select a channel that supports OPC UA tags and click the [Add] or [Edit] button.
- Click the [OPC UA Tag] button in the [Controller Setting] window.



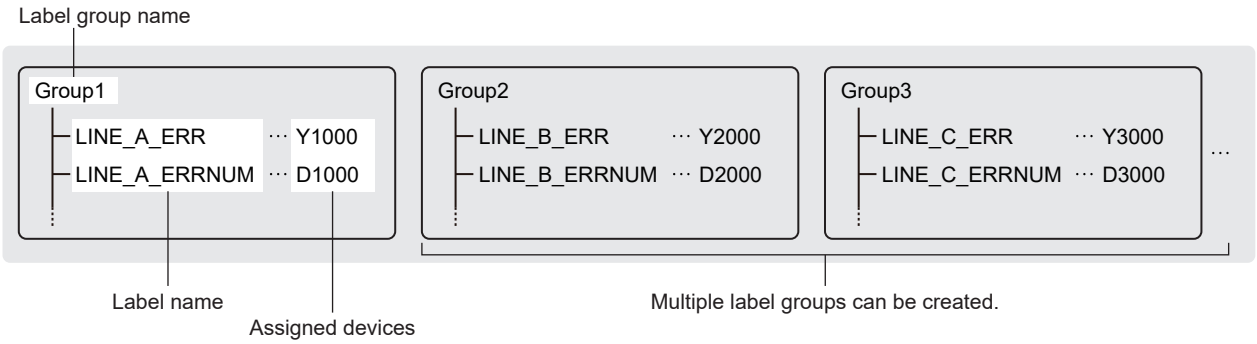
Item		Description
1)	Communication setting	Channel number and the communication setting
2)	[Connection End Server Name]	Displays the name of the OPC UA server to be connected when a tag information file is selected.
3)	[File Path]	Displays the path to the tag information file to be imported.
4)	[Browse] button	Displays the [Browse] dialog. Select a tag information file to be imported.
5)	[Get] button	Starts GT OPC UA Client and obtains tag information from an OPC UA server. The manual of the OPC UA client used

19.4 How to set labels (GT Designer3)

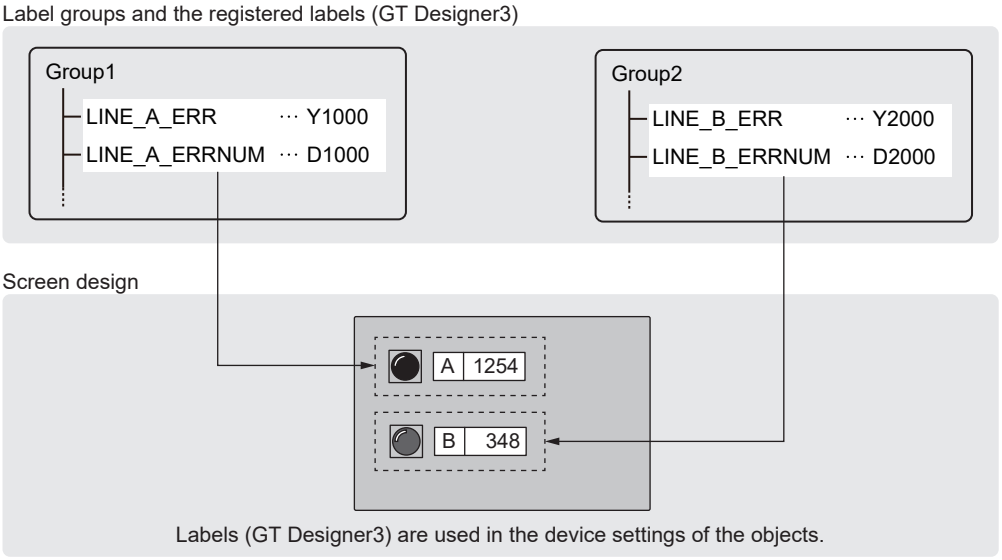
GT37 SoftGOT3000

☞ Page 868 Specifications of the label (GT Designer3)
☞ Page 872 Procedure to use the label (GT Designer3)
☞ Page 873 Registering or editing the label (GT Designer3)
☞ Page 874 Importing the label (GT Designer3)
☞ Page 881 Setting a label (GT Designer3) in the device setting
☞ Page 883 Checking for errors in the label (GT Designer3)
☞ Page 885 [Label Group List] dialog
☞ Page 887 [Label Group] window
☞ Page 892 [Register to Label] dialog
☞ Page 893 [Project Specification] dialog

A label (GT Designer3) is a character string with a device assigned and usable only in GT Designer3 projects.
The label (GT Designer3) enables you to create project without paying attention to the actual devices.
To use labels (GT Designer3), a label group must be created in advance.
For the created label group, register the label names of the labels (GT Designer3) and the devices to be assigned.



When you set a registered label (GT Designer3) in the device setting of an object or others, the GOT monitors the value of the device assigned to the label (GT Designer3).



19.4.1 Specifications of the label (GT Designer3)

GT37 SoftGOT3000

☞ Page 868 Assignable devices
☞ Page 868 Using different types of labels or tags together
☞ Page 868 Label group
☞ Page 868 Number of registrable labels
☞ Page 868 Label name
☞ Page 869 Data type of the label (GT Designer3)
☞ Page 869 Array-type label (GT Designer3)
☞ Page 869 Export and import specifications

Assignable devices

You can assign devices of the following controllers to the labels (GT Designer3).

- Devices of Mitsubishi Electric products
- Devices of non-Mitsubishi Electric products
- GOT internal devices

You can set the labels (GT Designer3) without devices assigned on GT Designer3. However, if you write a project having such settings to the GOT, the GOT does not operate correctly.

For details on the controller devices, refer to the following.

☞ Page 3577 GOT internal devices
☞ Page 3128 Device range and settings of Mitsubishi Electric equipment
☞ Page 3487 Device range and settings of each controller

Using different types of labels or tags together

The label (GT Designer3) can be used together with other labels and tags.

Label group

A label group is used to classify labels (GT Designer3).

All labels (GT Designer3) are registered in label groups.

Up to 200 label groups can be set for one project.

The numbers or names of the label groups cannot overlap each other.

Set a unique number and name to all label groups.

Number of registrable labels

Up to 20480 labels (GT Designer3) can be registered in one project.

Up to 10000 labels (GT Designer3) can be registered in one label group.

Label name

A label name must satisfy the following requirements.

Otherwise, the label (GT Designer3) cannot be set in GT Designer3.

- A label group contains no labels with the same names.
- Up to 256 characters are used for a label name.
- The following one-byte symbols are not used.

/ \ * ? < > | " : [ ] ; , = + % ' ^ @ { } . ! # $ & ~ ` ( ) -

Data type of the label (GT Designer3)

The following data types are settable for the label (GT Designer3).

Data type of the label (GT Designer3)	Bit-specified word device	Remarks
[Bit]	Not applicable	—
[Signed BIN16]	Applicable	The bit specification is not available when a device incapable of being bit-specified is assigned to the label (GT Designer3).
[Unsigned BIN16]	Applicable	
[Signed BIN32]	Not applicable	—
[Unsigned BIN32]	Not applicable	—
[Signed BIN64]	Not applicable	—
[Unsigned BIN64]	Not applicable	—
[Signed BIN8]	Not applicable	—
[Unsigned BIN8]	Not applicable	—
[BCD16]	Not applicable	—
[BCD32]	Not applicable	—
[BCD64]	Not applicable	—
[Real(32bit)]	Not applicable	—
[Real(64bit)]	Not applicable	—

Array-type label (GT Designer3)

The array must satisfy the following requirements.

- One-, two-, or three-dimensional array
- (Number of elements in the first dimension) × (Number of elements in the second dimension) × (Number of elements in the third dimension) is 2147483648 or less.

Export and import specifications

☞ Page 869 Importable labels as the label (GT Designer3)
☞ Page 869 Supported file format
☞ Page 870 Structure of the exported file of a label group

■Importable labels as the label (GT Designer3)

The following labels can be imported as the label (GT Designer3).

- Label (GT Designer3)
- Global labels created with GX Works3, GX Works2, or MT Developer2 (except structure-type global labels)

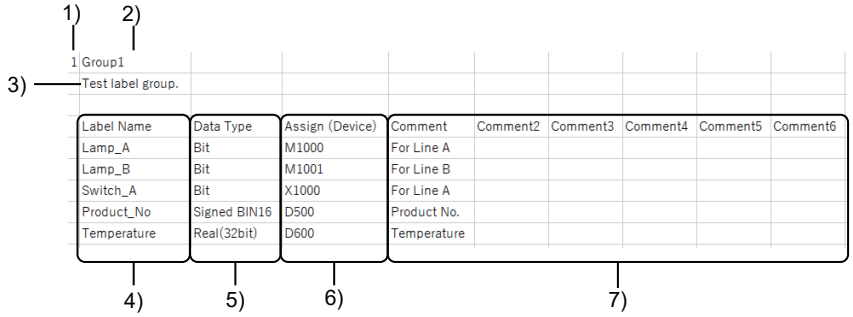
■Supported file format

The label (GT Designer3) supports export and import of files in the following formats.

Operation type	File format	Remarks
Export	• CSV file • Unicode text file	For the configuration of the exported file, refer to the following. ☞ Page 870 Structure of the exported file of a label group
Import	• CSV file • Unicode text file • GX Works3 project (*.gx3)	To import a GX Works3 project (*.gx3), GX Works3 is required on the personal computer. The required GX Works3 version depends on the setting of the project to be imported. • Uncompressed project: Version 1.040S or later • Compressed project: Version 1.050C or later • Project data with security version 2: Version 1.096A or later 📖GX Works3 Operating Manual

■Structure of the exported file of a label group

The following shows the exported file configuration of a label group.



Item		Description
1)	Label group number	Group number of the label group. The setting range is [1] to [200].
2)	Label group name	Name of the label group. Up to 32 characters can be set.
3)	Detailed description	Detailed description of the label group. Up to 512 characters can be set. A line feed is counted as two characters.
4)	[Label Name]	Name of the label (GT Designer3). Up to 256 characters can be set.
5)	[Data Type]	Data type of the label (GT Designer3), and array elements The array elements are displayed only when the array setting is configured. Example) When the data type is bit and array elements are set in three dimensions  The following shows selectable items for the data type. • [Bit] • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [Signed BIN8] • [Unsigned BIN8] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)] The setting range of array elements is [-2147483648] to [2147483647]. (Number of elements in the first dimension) × (Number of elements in the second dimension) × (Number of elements in the third dimension) must be 2147483648 or less.
6)	[Assign (Device)]	Device assigned to the label (GT Designer3). An invalid device is displayed as [??].
7)	Comment	Comment set for a label (GT Designer3). There are 16 columns. Up to 1024 characters can be set.

Influences of the label (GT Designer3) on operations

■Specifications for data transfer to the GOT

When you set the label (GT Designer3) in the package data and write the data to the GOT, [Write Mode] is not selectable in the [Write Option] dialog.

In this case, [Write Mode] is fixed to [Synchronize].

☞ Page 467 [Write Option] dialog

■Consecutive copy of an object with a label (GT Designer3) set

When you perform the consecutive copy of an object with the array-type label (GT Designer3) set, the array subscripts are incremented.

When you perform the consecutive copy of the label other than the array-type label (GT Designer3), the same label (GT Designer3) is set.

19.4.2 Procedure to use the label (GT Designer3)

GT37 SoftGOT3000

The following shows the procedure from registering a label (GT Designer3) to setting it in the device setting in GT Designer3.

1. Create a label group to which the label (GT Designer3) is registered.

☞ Page 873 Creating a label group

2. Register labels (GT Designer3) to the label group.

☞ Page 873 Registering or editing the label (GT Designer3)

Labels (GT Designer3) can be imported from a file that is exported from a different project.

☞ Page 875 Exporting or importing a label group

3. Set a registered label (GT Designer3) in the device setting of an object or others.

☞ Page 881 Setting a label (GT Designer3) in the device setting

The label (GT Designer3) setting is completed.

Point

For information on the specifications of assignable devices or others, refer to the following.

☞ Page 868 Specifications of the label (GT Designer3)

To check for any errors in the setting of the label (GT Designer3), refer to the following.

☞ Page 883 Checking for errors in the label (GT Designer3)

19.4.3 Registering or editing the label (GT Designer3)

GT37 SoftGOT3000

Register labels (GT Designer3) in a label group.

Create a label group in advance, and register the labels (GT Designer3).

Creating a label group

The following shows the procedure for creating a label group.

1. Perform one of the following operations to open the [Label Group Property] dialog.

Operation method	Description
Operating with the menu	Select [Common] → [Label] → [Open] from the menu to display the [Label Group List] dialog, and click the [New] button. ☞ Page 885 [Label Group List] dialog
Operating with the tree in the [Project] window	Double-click [New] under [Label (GT Designer3)]. ☞ Page 116 [Project] window
	Select [New Label Group] from the right-click context menu of the label (GT Designer3). ☞ Page 116 [Project] window

2. In the [Label Group Property] dialog, set the label group.

☞ Page 886 [Label Group Property] dialog

3. Click the [OK] button. The label group is created and the [Label Group] window appears.

The label group creation is completed.

☞ Page 873 Registering or editing the label (GT Designer3)

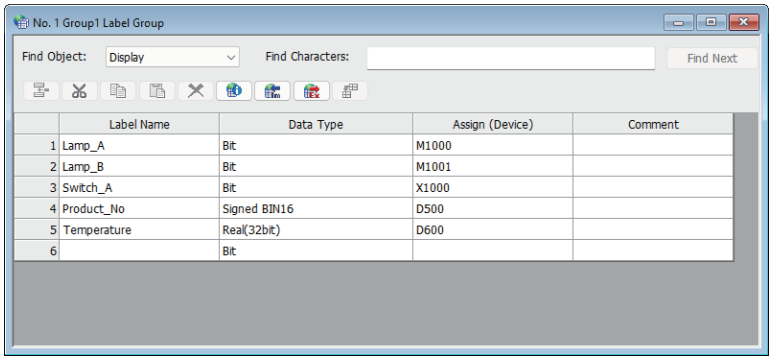
Registering or editing the label (GT Designer3)

1. Open the [Label Group] window using either of the following methods.

Operation method	Description
Operating with the menu	Select [Common] → [Label] → [Open] from the menu to display the [Label Group List] dialog, select the target label group, and click the [Edit] button. ☞ Page 885 [Label Group List] dialog
Operating with the tree in the [Project] window	Right-click the label group to be edited from the label groups displayed under [Label (GT Designer3)], and select [Open] from the menu. ☞ Page 116 [Project] window

2. Register, edit, or delete the label (GT Designer3) in the [Label Group] window.

☞ Page 887 [Label Group] window



For information on how to use imported labels (GT Designer3) for device settings, refer to the following.

☞ Page 881 Setting a label (GT Designer3) in the device setting

PART 6

19.4.4 Importing the label (GT Designer3)

GT37 SoftGOT3000

The label (GT Designer3) can be imported from a different project or others.

Import method	Description
Exporting or importing the label (GT Designer3)	Created labels (GT Designer3) can be exported. You can use the label (GT Designer3) in a different project by using an exported file or by importing a GX Works3 project. ☞ Page 875 Exporting or importing a label group
Utilizing the label (GT Designer3) from a different project	When a screen is created by utilizing screen data from a different project, the label groups set in the source screen are selectable. For information on how to create a screen by utilizing screen data from a different project, refer to the following. ☞ Page 226 Utilizing other project data
Register the label (GT Designer3) from a template	When pasting a template with the label (GT Designer3) set from the library or others, you can register the label (GT Designer3) set in the template to the destination project. ☞ Page 876 Register the label (GT Designer3) from a template
Registering the label (GT Designer3) from an object	When starting multiple GT Designer3 modules and copying an object between projects, you can register the label (GT Designer3) set to the object to the destination project. ☞ Page 877 Registering the (GT Designer3) from a copied object
Registering the labels (GT Designer3) from profile data	Register the labels (GT Designer3) created from the profile (CSP+) data that is stored in the personal computer. As label groups and labels (GT Designer3) are created automatically in the registration process, you do not need to perform these tasks manually. ☞ Page 878 Registering the labels (GT Designer3) from profile data

Exporting or importing a label group

GT37 SoftGOT3000

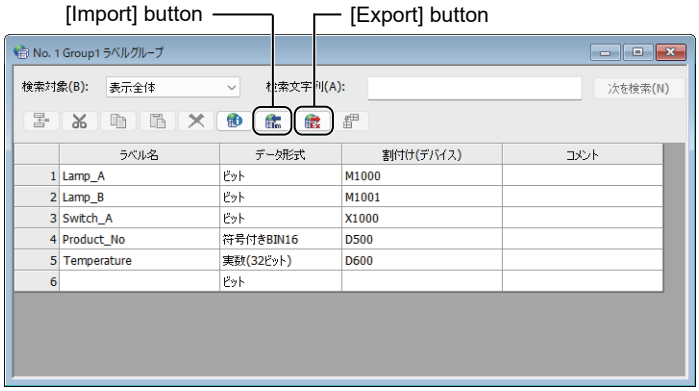
For the specifications and conditions of the files that support export and import of the label (GT Designer3), refer to the following.

☞ Page 869 Export and import specifications

1. Open the [Label Group] window using either of the following methods.

Operation method	Description
Operating with the menu	Select [Common] → [Label] → [Open] from the menu to display the [Label Group List] dialog, select the target label group, and click the [Edit] button. ☞ Page 885 [Label Group List] dialog
Operating with the tree in the [Project] window	Right-click the label group to be edited from the label groups displayed under [Label (GT Designer3)], and select [Open] from the menu. ☞ Page 116 [Project] window

2. Click the [Export] or [Import] button depending on your intention.



3. In the displayed dialog, perform import or export operation.

Operation type	Operation	Remarks	
Export	In the [Save As] dialog, set [Save in], [File Name], and [Save as type], and click the [Save] button.	—	
Import	Select the file to be imported in the [Import Label] dialog, and click the [OK] button. ☞ Page 890 [Import Label] dialog	If [Access from External Device] is enabled for the global labels to be imported, a confirmation dialog appears upon clicking the [OK] button in the [Add Global Label/Ethernet Setting] dialog. The following shows each behavior when each button is clicked in the confirmation dialog.	
		[Yes] button	Disables [Access from External Device] and performs import operation.
		[No] button	Displays the [Label/Tag/Ethernet Setting List] dialog. The access from external devices remains enabled, and you cannot import the labels as the labels (GT Designer3). To import the labels as global labels, perform the operation in the [Label/Tag/Ethernet Setting List] dialog. ☞ Page 860 [Label/Tag/Ethernet Setting List] dialog
		[Cancel] button	Returns to the [Label Group] window.

For information on how to use imported labels (GT Designer3) for device settings, refer to the following.

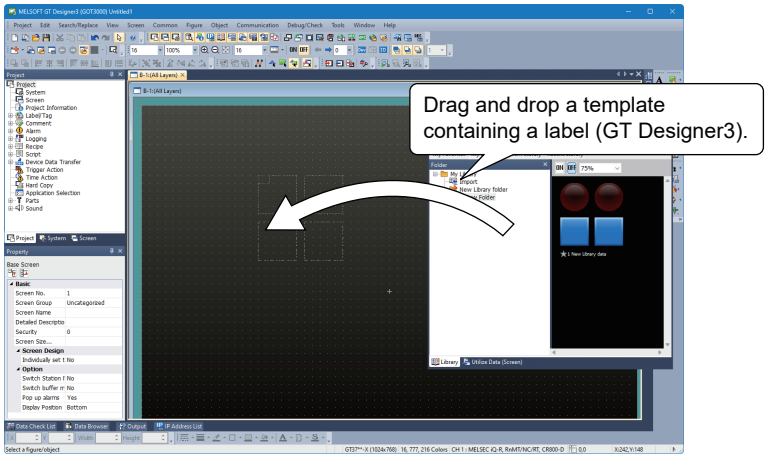
☞ Page 881 Setting a label (GT Designer3) in the device setting

Register the label (GT Designer3) from a template

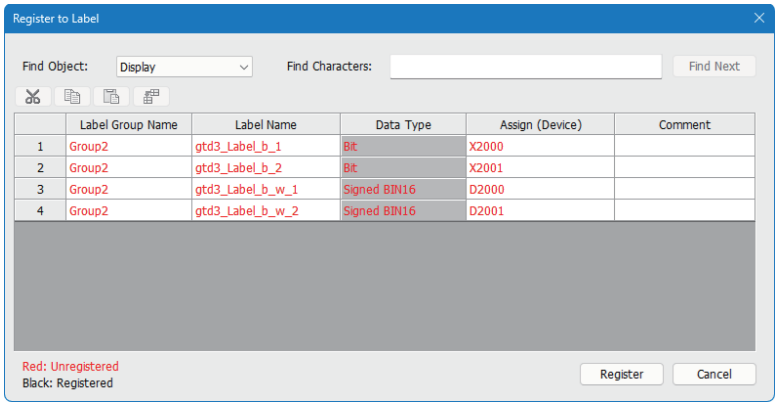
GT37 SoftGOT3000

When pasting a template with the label (GT Designer3) set from the library or others, you can register the label (GT Designer3) set in the template to the destination project.

1. Drag and drop a template containing a label (GT Designer3) from the library or others to the screen editor.



2. When the template is pasted, the [Register to Label] dialog appears.
Register the label (GT Designer3).
☞ Page 892 [Register to Label] dialog



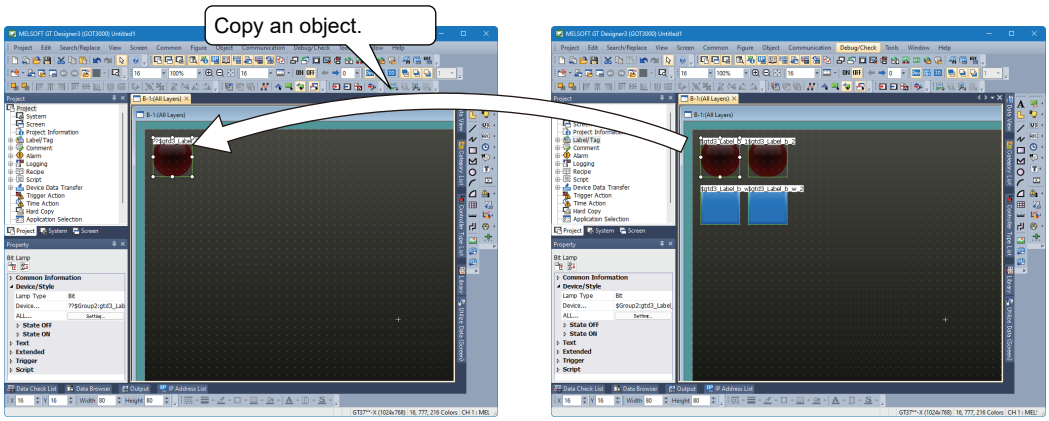
If a label (GT Designer3) registered in the copy destination project has the same label group and label name, but has a different assigned device and comment, the following occurs.
Another label is registered under the same label name with a consecutive number appended.

Registering the (GT Designer3) from a copied object

GT37 SoftGOT3000

When starting multiple GT Designer3 modules and copying an object between projects, you can register the label (GT Designer3) set to the object to the destination project.

1. Open a copy source project and a copy destination project on different GT Designer3 modules.
2. Copy an object with a label set in the source project, and paste the object in the destination project.



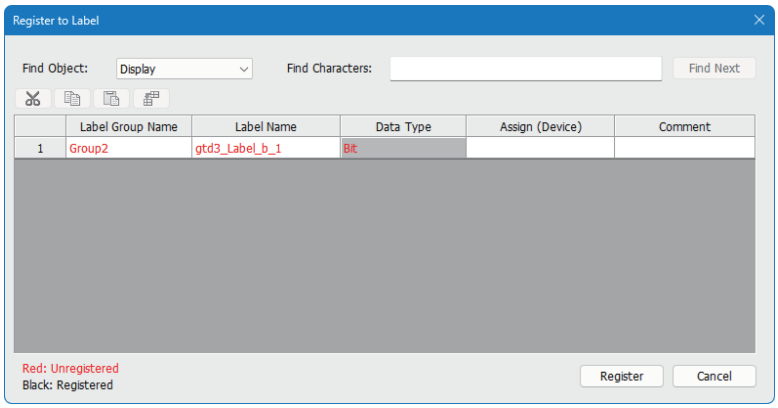
Copy destination project

Copy source project

When some labels (GT Designer3) listed have the same label group name and label name, but have different assigned devices and comments in the copy destination project, registration is not made. The labels are handled as the existing labels. (The rest of the procedure is unnecessary.)

3. Select the pasted object and select [Register] → [Register to Label] from the right-click menu.
4. Register the label (GT Designer3) in the [Register to Label] dialog.

☞ Page 892 [Register to Label] dialog



Registering the labels (GT Designer3) from profile data

GT37 SoftGOT3000

Register the labels (GT Designer3) created from the profile (CSP+) data that is stored in the personal computer.
As label groups and labels (GT Designer3) are created automatically in the registration process, you do not need to perform these tasks manually.

☞ Page 878 Conditions to register the labels (GT Designer3) created from profile data
☞ Page 878 Specifications of the labels (GT Designer3) created from profile data
☞ Page 879 Registering the labels (GT Designer3) from profile data

■Conditions to register the labels (GT Designer3) created from profile data

The labels (GT Designer3) created from profile data is registrable if all the following conditions are satisfied.

Item		Condition
GX Works3	GX Works3 version	GX Works3 version 1.045X or later is installed.
	Profile registration	The personal computer has the profile data from which labels (GT Designer3) are created. For information on how to register a profile, refer to the following. 📖Help for MELSOFT Navigator 📖GX Works3 Operating Manual
	Profile language	The profile language is English or the same as the language version of GT Designer3.
	Network of the project	The CC-Link IE Field Network is specified in the target GX Works3 project.
GT Designer3	Controller setting	In the [Controller Setting] window, [Controller Type] is set to one of the following items. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELIPC]

■Specifications of the labels (GT Designer3) created from profile data

For the basic specifications of labels (GT Designer3), refer to the following.

☞ Page 868 Specifications of the label (GT Designer3)

Item	Specifications
Label group number	Label groups are numbered in descending order, starting from 200. If any label group number already exists, the number is skipped.
Label group name	A label group is named using the equipment name selected in the list of network-connected equipment. ☞ Page 895 [I/O Information Specification] If a same-name label group already exists, an underscore character (_) and a number will be appended. The following characters will be deleted from the equipment name to be a label group name. • Numbers prefixed to the equipment name • Symbols unavailable for a label name • Excess characters when the maximum length of a label group name is exceeded
Data types to be registered	☞ Page 879 Data types to be registered

■Data types to be registered

The following shows the correspondences between the data types used in profile data and the ones of labels (GT Designer3) to be registered.

Data type used in profile data	Data type of the label (GT Designer3)
BOOL BIN1	Bit
BIN2 to BIN16	Unsigned 16-bit binary
BIN32	Unsigned 32-bit binary
BYTE WORD BIT_STRING2 to BIT_STRING15	Unsigned 16-bit binary
DWORD	Unsigned 32-bit binary
INT2 to 16	Signed 16-bit binary
INT32	Signed 32-bit binary
UINT2 to 16	Unsigned 16-bit binary
UINT32	Unsigned 32-bit binary
BCD4 8-bit binary-coded decimal BCD12 16-bit binary-coded decimal	16-bit binary-coded decimal
32-bit binary-coded decimal	32-bit binary-coded decimal
STRUCT	Unsigned 16-bit binary

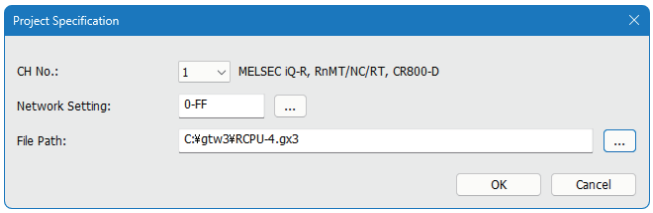
■Registering the labels (GT Designer3) from profile data

GT37 SoftGOT3000

1. Select [Project] → [Import Other Data] → [Profile (CSP+)] → [Label (GT Designer3) Auto Registration] from the menu to display the [Project Specification] dialog.

Specify the path to an applicable GX Works3 project.

☞ Page 893 [Project Specification] dialog

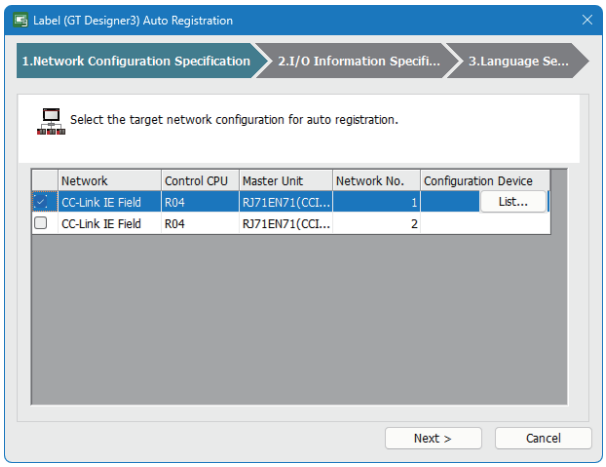


2. Click the [OK] button to display the [Label (GT Designer3) Auto Registration] dialog.

☞ Page 894 [Label (GT Designer3) Auto Registration] dialog

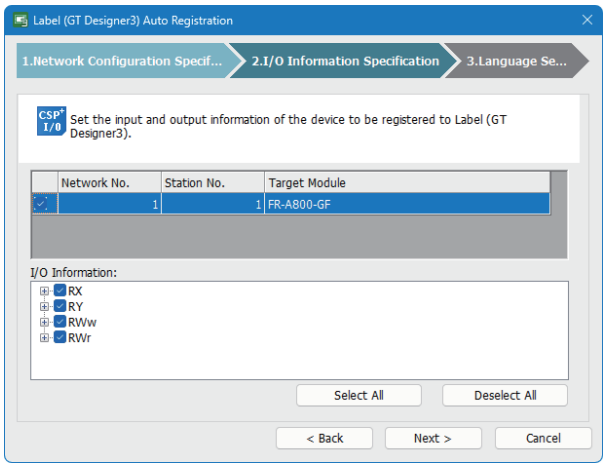
3. Select a target network, and click the [Next] button.

☞ Page 894 [Network Configuration Specification]



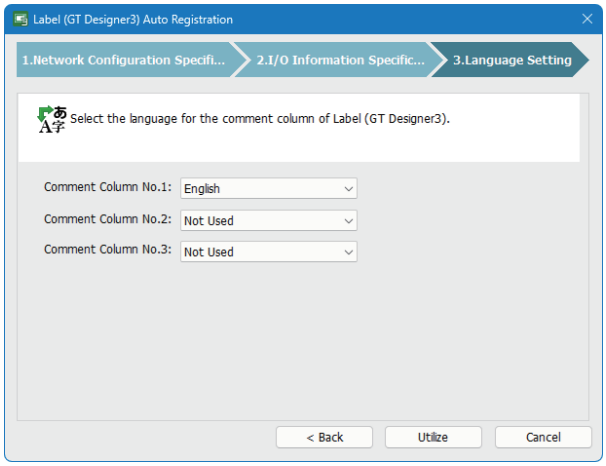
4. Select the link devices that labels (GT Designer3) are based on, and click the [Next] button.

☞ Page 895 [I/O Information Specification]



5. Select a language for the comments to be used for labels (GT Designer3), and click the [Utilize] button to register labels (GT Designer3).

☞ Page 895 [Language Setting]



19.4.5 Setting a label (GT Designer3) in the device setting

GT37 SoftGOT3000

The following entry methods are available.

Entry method	Description
Directly entering a label name	☞ Page 881 Directly entering a label name
Selecting from the list	Display the [Select Label (GT Designer3)] dialog, and select one of the registered labels (GT Designer3) from the list. ☞ Page 837 Selecting a label or tag from the list
Selecting from utilizable data (input assist)	Enter characters in the device entry field in the setting dialog to display utilizable data in the input assist window. You can set a device, label, or tag simply by selecting it from the utilizable data. ☞ Page 843 Selecting from utilizable data (input assist)

For precautions when setting a label (GT Designer3) in the device setting, refer to the following.

☞ Page 882 Precautions when setting a label (GT Designer3)

Point

When you set the label (GT Designer3) in the device setting of an object or others, the data type of the object or others automatically changes according to the data type of the label (GT Designer3).

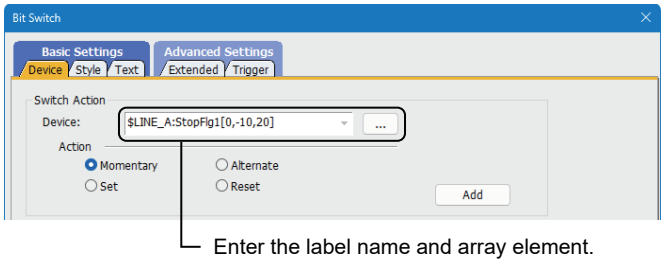
You can enable or disable automatic change by selecting or deselecting [Reflect the data type of label] in the [Options] dialog ([Edit] tab).

☞ Page 199 Customizing the settings related to editing operations

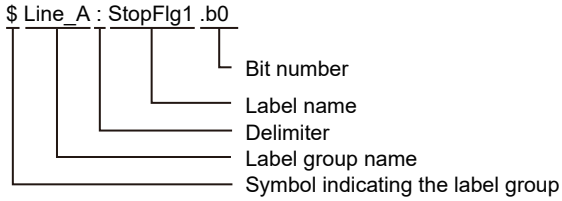
Directly entering a label name

In the setting dialog of an object or others, enter the name of a label (GT Designer3) directly in the text box of [Device].

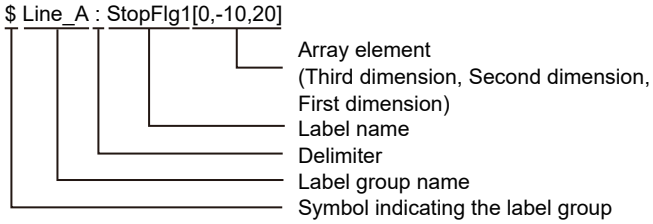
- At the beginning of the name, enter a symbol "$" indicating the label group.
- Between the label group name and the label name, enter a delimiter ":".
- To specify a bit of the label (GT Designer3) to which a word device is assigned, append a bit number (b0 to b15) to the label name.
- To enter an array element, enclose the subscripts of the element in a square bracket ([]).
- For a multidimensional array, enter a comma (,) to separate the subscripts in each dimension.



• Label name



• Array



Precautions when setting a label (GT Designer3)

■Checking the data type of the label (GT Designer3)

After setting a label (GT Designer3) in the device setting of an object or others, performing one of the following changes results in data type inconsistency.

- Changing the data type of the label (GT Designer3)
- Manually changing the data type of an object or others

If you perform one of the above, ensure that the data types are consistent between the label (GT Designer3) and an object or others.

To check the data types, it is recommended to compare the exported CSV file of a label group with the CSV file exported from [Device List].

☞ Page 136 Listing devices (Device list)
☞ Page 875 Exporting or importing a label group

■When setting an unregistered label (GT Designer3) in the device setting

When you set an unregistered label (GT Designer3) in the device setting for an object, after registering the label in the [Label Group] window, close the screen on which the object is placed.

If you edit the label name and the label group name without closing the screen after the registration, the changes are not reflected to the object.

■When using a label (GT Designer3) to specify consecutive devices

When you use a label (GT Designer3) to specify consecutive devices, the consecutive devices, beginning with the device assigned to the label, must be within the device range.

Otherwise, you cannot set the label (GT Designer3) to specify the consecutive devices in the device setting.

You also cannot use an unregistered label (GT Designer3) to specify consecutive devices.

19.4.6 Checking for errors in the label (GT Designer3)

GT37 SoftGOT3000

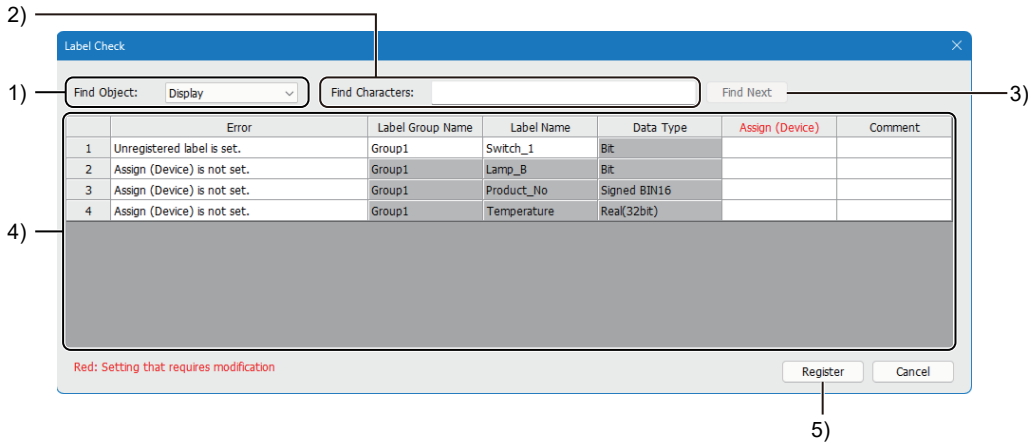
The label check function checks for errors in the set labels (GT Designer3) and corrects the errors.

Perform one of the following operations to execute the label check.

Operation method	Description
Operating with the menu	Select [Debug/Check] → [Label Check] from the menu.
Operating with the tree in the [Project] window	Double-click [Label Check] under [Label (GT Designer3)]. ☞ Page 116 [Project] window

If there is an error, the [Label Check] dialog appears.

In the [Label Check] dialog, correct the errors.



Item			Description
1)	[Find Object]		Select the target to be searched in the label check error list.
2)	[Find Characters]		Set a character string to be searched for. The search string is case-insensitive.
3)	[Find Next]		Searches the list by the settings of [Find Object] and [Find Characters].
4)	Label check error list	—	Lists errors detected by the label check. You can correct each item in the list.
		[Error]	Description of the detected error. ☞ Page 884 Error messages, causes, and corrective actions
		[Label Group Name]	Name of the label group to which the label (GT Designer3) belongs.
		[Label Name]	Name of the label (GT Designer3). Up to 256 characters can be set.
		[Data Type]	Data type of the label (GT Designer3), and array elements The array elements are displayed only when the array setting is configured. Example) When the data type is bit and array elements are set in three dimensions 		[Assign (Device)]	Device assigned to the label (GT Designer3). An invalid device is displayed as [??].
		[Comment]	Comment set for the label (GT Designer3) where an error occurs. The comment is displayed according to the setting of [Input Assist Display] in the [Label Group Property] dialog. ☞ Page 886 [Label Group Property] dialog Up to 1024 characters can be set.
5)	[Register] button		Registers the label (GT Designer3) in the label group.

Error messages, causes, and corrective actions

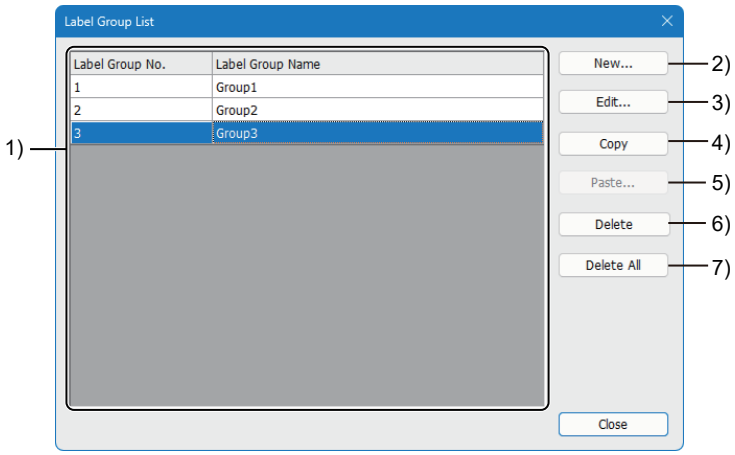
The following lists messages, causes, and corrective actions for errors detected by the label check.

Error message	Cause	Corrective action
Unregistered label is set.	A label (GT Designer3) unregistered in the label group is set.	Resister the label (GT Designer3) in the label group.
		Delete the label (GT Designer3) if unnecessary. ☞ Page 887 [Label Group] window
The array element count is invalid. Register the label as a new label or check the setting on the Device List, etc. and change the setting.	After an array-type label (GT Designer3) was set for an object or others, the array setting of the label was changed in the label list.	Register the relevant label (GT Designer3) in the label group as a new one.
		Correct the array setting of the relevant label (GT Designer3).
		Delete the label (GT Designer3) if unnecessary. ☞ Page 887 [Label Group] window
Assign (Device) is not set.	A label (GT Designer3) without a device assigned is set.	Assign a device to the label (GT Designer3). ☞ Page 887 [Label Group] window
Data Type or Assign (Device) is invalid.	A device of a channel No. that cannot be set is assigned to a label (GT Designer3).	Assign a valid device to the label (GT Designer3). ☞ Page 887 [Label Group] window
	A device that cannot be monitored by the GOT is assigned to a label (GT Designer3).	

19.4.7 [Label Group List] dialog

GT37 SoftGOT3000

Create, edit, or delete a label group.



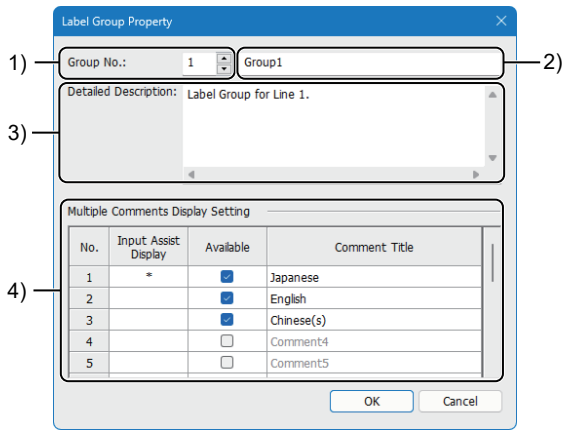
Item		Description
1)	Label group list	Lists label groups registered in the project.
2)	[New] button	Displays the [Label Group Property] dialog to create a label group. ☞ Page 886 [Label Group Property] dialog
3)	[Edit] button	Displays the [Label Group] window to edit the label group setting and labels (GT Designer3). ☞ Page 887 [Label Group] window
4)	[Copy] button	Copies the selected label group.
5)	[Paste] button	Pastes a copied label group in the label group list.  • [Destination No.]: Set the number of the label group to be pasted. • Label group name: Set the name of the label group to be pasted.
6)	[Delete] button	Deletes the selected label group.
7)	[Delete All] button	Deletes all the label groups in the label group list.

PART 6

[Label Group Property] dialog

GT37 SoftGOT3000

Create or delete a label group.

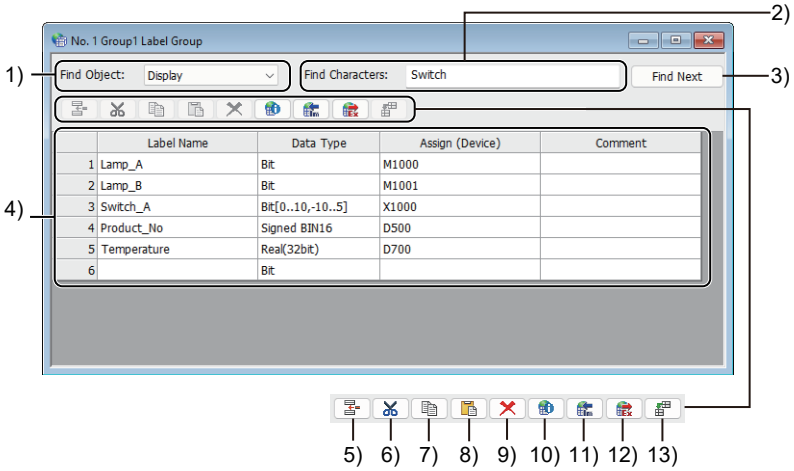


Item			Description
1)	[Group No.]		Set the group number of the label group. The setting range is [1] to [200].
2)	Label group name		Set the name of the label group. Up to 32 characters can be set.
			If you change the label group name, the change is not reflected to the script text containing the label (GT Designer3). When using a label (GT Designer3) in the script text, also check the script text when changing the label (GT Designer3) settings.
3)	[Detailed Description]		Set the detailed description of the label group. Up to 512 characters can be set. A line feed is counted as two characters.
4)	[Multiple Comments Display Setting]	[Input Assist Display]	Set comments for the label group. Up to 16 comments can be set. The set comments can be used for the input assist. Select comments to be displayed in the input assist.
		[Available]	Enables the comment title input.
		[Comment Title]	Set remarks for the comment. Up to 32 characters can be set.

19.4.8 [Label Group] window

GT37 SoftGOT3000

Create, edit, or delete a label (GT Designer3) in a label group.
The label group setting is also changeable.



Item		Description
1)	[Find Object]	Select the target to be searched in the label (GT Designer3) list.
2)	[Find Characters]	Set a character string to be searched for. The search string is case-insensitive.
3)	[Find Next] button	Searches the list by the settings of [Find Object] and [Find Characters].

Item			Description
4)	Label (GT Designer3) list	—	Lists labels (GT Designer3) that belong to the label group.
		[Label Name]	Name of the label (GT Designer3). Up to 256 characters can be set. Click [Label Name] to select the column. To select multiple cells in the same column, perform one of the following operations. • Drag the target cells. • Select the first cell in the range, hold down the Shift key and click the last cell in the range. • Select the first cell, hold down the Shift key and press an arrow key to extend the selection.
			If you change the label name, the change is not reflected to the script text containing the label (GT Designer3). When using a label (GT Designer3) in the script text, also check the script text when changing the label (GT Designer3) settings.
		[Data Type]	Data type of the label (GT Designer3), and array elements Click a target cell and then click the [...] button to display the [Data Type Selection] dialog. ☞ Page 889 [Data Type Selection] dialog The array elements are displayed only when the array setting is configured. Example) When the data type is bit and array elements are set in three dimensions 		[Assign (Device)]	Device assigned to the label (GT Designer3). An invalid device is displayed as [??]. Click [Assign (Device)] to select the column. To select multiple cells in the same column, perform one of the following operations. • Drag the target cells. • Select the first cell in the range, hold down the Shift key and click the last cell in the range. • Select the first cell, hold down the Shift key and press an arrow key to extend the selection.
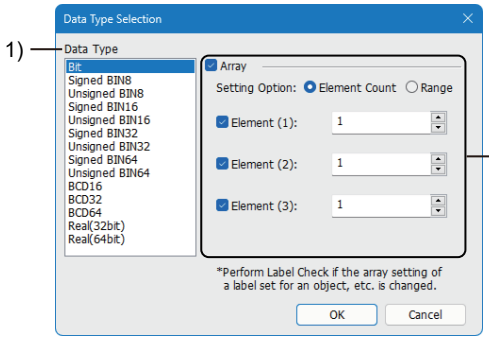
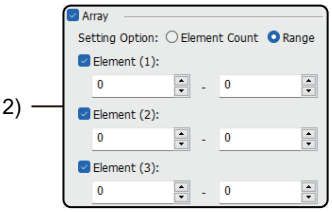
		[Comment] [Comment2] to [Comment16]	Comment for the label (GT Designer3). Up to 1024 characters can be set. Click [Comment] or [Comment2] to [Comment16] to select the corresponding column. To select multiple cells in the same column, perform one of the following operations. • Drag the target cells. • Select the first cell in the range, hold down the Shift key and click the last cell in the range. • Select the first cell, hold down the Shift key and press an arrow key to extend the selection.
5)	[Insert Row] button		Inserts a row above the selected row in the label (GT Designer3) list.
6)	[Cut] button		Cuts the row, column, or cell selected in the label (GT Designer3) list. Note that a cell in the [Data Type] column cannot be cut alone. You can paste the cut data on another text editing application (such as Microsoft Excel and Notepad).
7)	[Copy] button		Copies the row, column, or cell selected in the label (GT Designer3) list. You can paste the copied data on another text editing application (such as Microsoft Excel and Notepad).
8)	[Paste] button		Pastes the copied row, column, or cell to the location specified in the label (GT Designer3) list. You can also copy or cut data that is created with a text editing application (such as Microsoft Excel and Notepad), and paste the data to the label (GT Designer3) list. However, you cannot paste data to multiple columns at once.
9)	[Delete] button		Deletes the row, column, or cell selected in the label (GT Designer3) list. Note that a cell in the [Data Type] column cannot be deleted alone.
10)	[Label Group Property] button		Displays the [Label Group Property] dialog to change the label group setting. ☞ Page 886 [Label Group Property] dialog
11)	[Import] button		Imports labels (GT Designer3) in the label group being edited. Set the file to be imported in the [Import Label] dialog. ☞ Page 890 [Import Label] dialog
12)	[Export] button		Exports labels (GT Designer3) registered in the label group being edited. Set the file to be exported in the [Save As] dialog.
13)	[Batch Edit] button		Displays the [Batch Edit] dialog to collectively change the label group, channel, or network settings of rows selected in the label (GT Designer3) list. ☞ Page 891 [Batch Edit] dialog (label (GT Designer3))

[Data Type Selection] dialog

GT37 SoftGOT3000



When [Setting Option] is set to [Element Count]

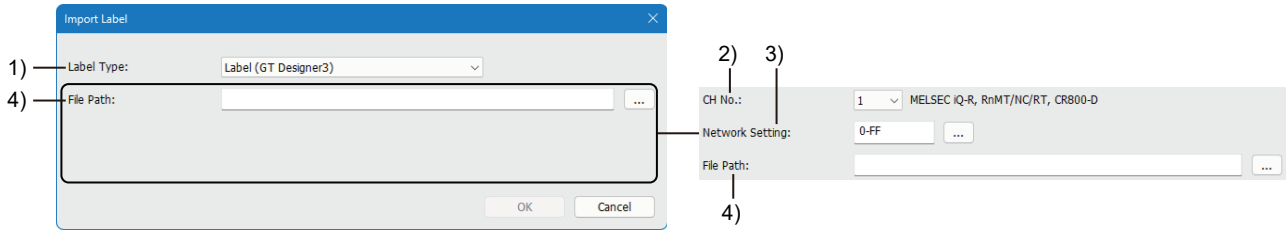


When [Setting Option] is set to [Range]

Item			Description
1)	[Data Type]		Select the data type of the label (GT Designer3). For the available data types, refer to the following. ☞ Page 869 Data type of the label (GT Designer3)
2)	[Array]	—	Set the array for the label (GT Designer3).
		[Setting Option]	Select the method of specifying the array.
		[Element (1)] [Element (2)] [Element (3)]	When [Element Count] is selected for [Setting Option], the number of array elements in each dimension is settable. (The smallest subscript for each dimensions is always 0.) The setting range is [1] to [2147483648]. (Number of elements in the first dimension) × (Number of elements in the second dimension) × (Number of elements in the third dimension) must be 2147483648 or less.
		[Element (1)] [Element (2)] [Element (3)]	When [Range] is selected for [Setting Option], the lower and upper bounds of each dimension are settable. The setting range is [-2147483648] to [2147483647]. (Number of elements in the first dimension) × (Number of elements in the second dimension) × (Number of elements in the third dimension) must be 2147483648 or less.

[Import Label] dialog

GT37 SoftGOT3000



When [Label Type] is set to [Label (GT Designer3)]

When [Label Type] is set to [Global Label (GX Works2)], [Global Label (GX Works3)], or [Label (MT Developer2)]

Item		Description
1)	[Label Type]	Select the type of labels to be imported. The setting of [Controller Type] in the [Controller Setting] window determines the selectable items. ☞ Page 890 Selectable items for [Label Type]
2)	[CH No.]	This item is settable when [Label Type] is set to [Global Label (GX Works2)], [Global Label (GX Works3)], or [Label (MT Developer2)]. Select the channel number of the controller that uses labels (GT Designer3) or global labels.
3)	[Network Setting]	This item is settable when [Label Type] is set to [Global Label (GX Works2)], [Global Label (GX Works3)], or [Label (MT Developer2)]. Set the network for the controller that uses labels (GT Designer3) or global labels.
4)	[File Path]	Specify the path to a CSV file, Unicode text file, or GX Works3 project.

■Selectable items for [Label Type]

The setting of [Controller Type] in the [Controller Setting] window determines the selectable items.

○: Selectable ×: Not selectable

[Controller Type]	[Label Type]			
	[Label (GT Designer3)]	[Global Label (GX Works2)]	[Global Label (GX Works3)]	[Label (MT Developer2)]
[MELSEC MX Controller]	○	×	○	×
[MELSEC iQ-R, RnMT/NC/RT, CR800-D]	○	×	○	○
[MELSEC iQ-L]	○	×	○	×
[MELSEC iQ-F]	○	×	○	×
[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]	○	○	×	○
[MELSEC-L]	○	○	×	×
[MELSEC-A]	○	○	×	×
[MELSEC-FX]	○	○	×	×
[MELIPC]	○	×	○	○

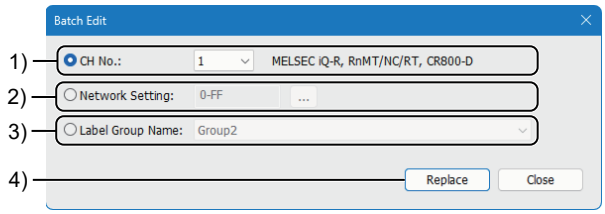
[Batch Edit] dialog (label (GT Designer3))

GT37 SoftGOT3000

Collectively change the settings of the labels (GT Designer3) selected in the label (GT Designer3) list in the [Label Group] window or the [Register to Label] dialog.

For details on the batch edit dialog for OPC UA tags in the [OPC UA Tag Setting] window, refer to the following.

☞ Page 2865 [Batch Edit] dialog (OPC UA tag)

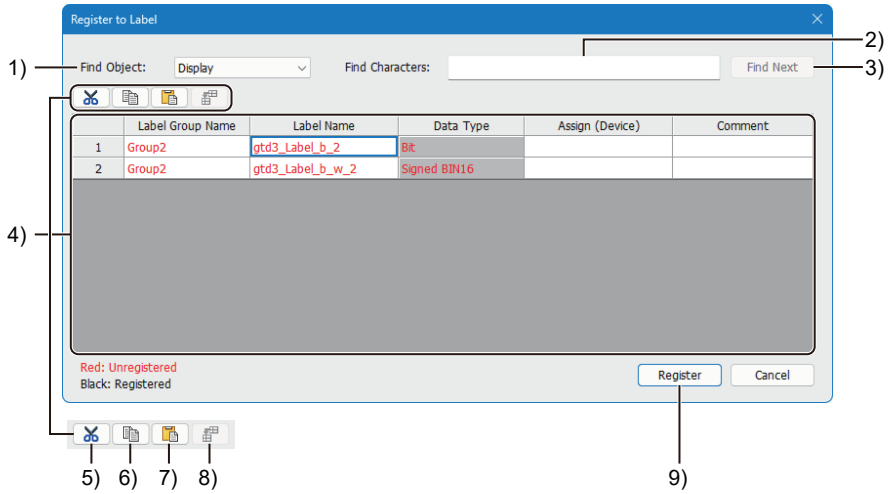


Item		Description
1)	[CH No.]	This item cannot be set in the following cases. • No devices are assigned to all the selected labels (GT Designer3). • GOT internal devices are assigned to all the selected labels (GT Designer3). The channel numbers of the labels (GT Designer3) are changed collectively. Select the channel number to be changed to.
2)	[Network Setting]	This item cannot be set in the following cases. • Devices of different controllers are assigned to the selected labels (GT Designer3). • No devices are assigned to all the selected labels (GT Designer3). • GOT internal devices are assigned to all the selected labels (GT Designer3). The network settings of the labels (GT Designer3) are changed collectively. Click [...] and configure the network setting in the [Network Setting] dialog. The settings differ depending on the controller. Refer to the descriptions of the device setting dialog for each controller. ☞ Page 3128 Device range and settings of Mitsubishi Electric equipment ☞ Page 3487 Device range and settings of each controller
3)	[Label Group Name]	This item can be set only when this dialog is opened in the [Register to Label] dialog. The label group names of the labels (GT Designer3) are changed collectively. Select a label group name.
4)	[Replace] button	Collectively reflects the setting changes made in this dialog to the labels (GT Designer3) selected in the [Label Group] window or the [Register to Label] dialog.

19.4.9 [Register to Label] dialog

GT37 SoftGOT3000

The labels (GT Designer3) set for an object and others are listed. Register unregistered labels (GT Designer3) in label groups.



Item			Description
1)	[Find Object]		Select the target to be searched in the label (GT Designer3) list.
2)	[Find Characters]		Set a character string to be searched for. The search string is case-insensitive.
3)	[Find Next]		Searches the list by the settings of [Find Object] and [Find Characters].
4)	Label (GT Designer3) list	—	Lists the labels (GT Designer3) set in the project. The names of labels (GT Designer3) unregistered in label groups are shown in red.
		[Label Group Name]	Name of the label group. Up to 32 characters can be set.
		[Label Name]	Name of the label (GT Designer3). Up to 256 characters can be set.
		[Data Type]	Data type of the label (GT Designer3), and array elements The array elements are displayed only when the array setting is configured. Example) When the data type is bit and array elements are set in three dimensions 		[Assign (Device)]	Device assigned to the label (GT Designer3). An invalid device is displayed as [??].
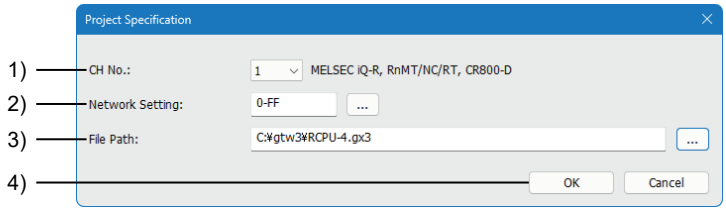
		[Comment]	Comment for the label (GT Designer3). The comment is displayed according to the setting of [Input Assist Display] in the [Label Group Property] dialog. ☞ Page 886 [Label Group Property] dialog Up to 1024 characters can be set.
5)	[Cut] button		Cuts the row selected in the label (GT Designer3) list.
6)	[Copy] button		Copies the row selected in the label (GT Designer3) list.
7)	[Paste] button		Pastes a copied row in the label (GT Designer3) list.
8)	[Batch Edit] button		Displays the [Batch Edit] dialog to collectively change the label group, channel, or network settings of rows selected in the label (GT Designer3) list. ☞ Page 891 [Batch Edit] dialog (label (GT Designer3))
9)	[Register] button		Registers the label (GT Designer3) in the label group.

19.4.10 [Project Specification] dialog

GT37 SoftGOT3000

Select a GX Works3 project that uses profile data and register the label (GT Designer3).

Select [Project] → [Import Other Data] → [Profile (CSP+)] → [Label (GT Designer3) Auto Registration] from the menu to display the [Project Specification] dialog.



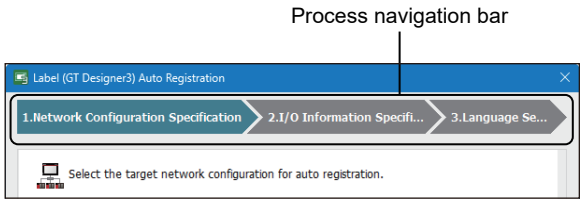
Item		Description
1)	[CH No.]	Select a channel number used to connect the controller that is specified in the target GX Works3 project. Channels are selectable if one of the following controller types is selected in the [Controller Setting] window. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELIPC]
2)	[Network Setting]	Specify the network of the controller that is set in the target GX Works3 project.
3)	[File Path]	Specify the path to the target GX Works3 project.
4)	[OK] button	Confirms the entries, and displays the [Label (GT Designer3) Auto Registration] dialog. ☞ Page 894 [Label (GT Designer3) Auto Registration] dialog

PART 6

[Label (GT Designer3) Auto Registration] dialog

GT37 SoftGOT3000

In the [Project Specification] dialog, click the [OK] button to display the [Label (GT Designer3) Auto Registration] dialog. Configure the settings to register labels (GT Designer3).



In the process navigation bar, the color of each step represents the status of the step.

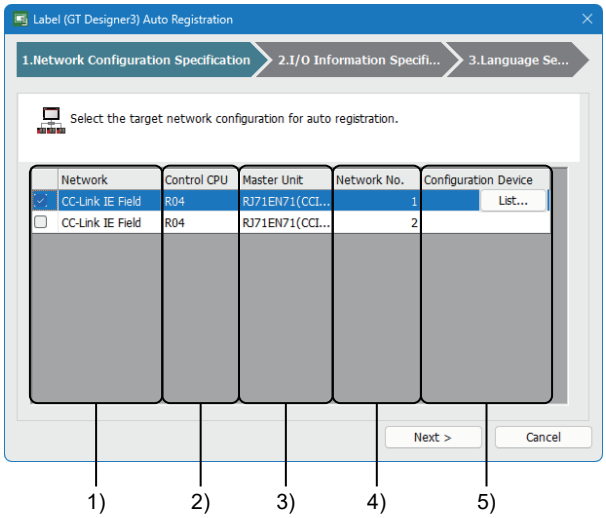
Display image	Status
2.I/O Information Specification	Active
2.I/O Information Specific...	Done
2.I/O Information Specifi...	Undone

☞ Page 894 [Network Configuration Specification]
☞ Page 895 [I/O Information Specification]
☞ Page 895 [Language Setting]

■[Network Configuration Specification]

GT37 SoftGOT3000

Select a target network from the list.

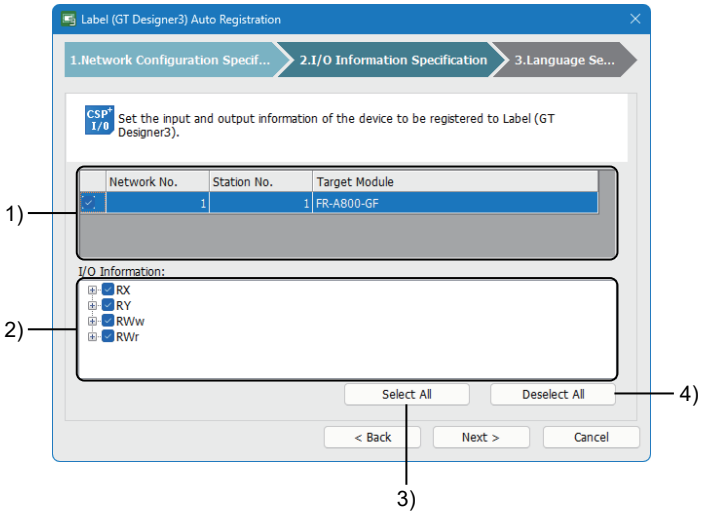


Item		Description
1)	[Network]	Type of a network. Each row displays a network configuration. Select a target network.
2)	[Control CPU]	Model of the PLC CPU on the master station.
3)	[Master Unit]	Model of a module on the master station.
4)	[Network No.]	Number of a network.
5)	[Configuration Device]	Select a row to display the [List] button. Click the [List] button to display the [Configuration Device List] dialog where you can check the equipment on the relevant network.

■[I/O Information Specification]

GT37 SoftGOT3000

Select the link devices that labels (GT Designer3) are based on.

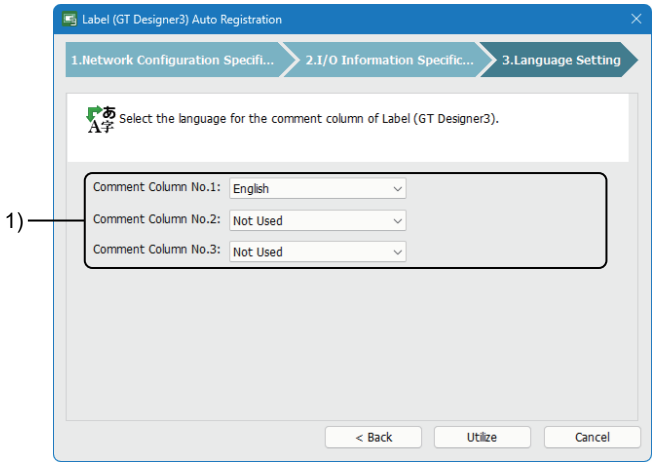


Item		Description
1)	List of network-connected equipment	Lists the equipment on the network that has been selected in [Network Configuration Specification]. Equipment with its profile unregistered is not listed. Select equipment to display its link devices in [I/O Information].
2)	[I/O Information]	Link devices set for the selected equipment. Select the link devices that labels (GT Designer3) are based on.
3)	[Select All] button	Selects all items in [I/O Information].
4)	[Deselect All] button	Deselects all items in [I/O Information].

■[Language Setting]

GT37 SoftGOT3000

Select a language for the comments to be used for labels (GT Designer3).



Item		Description
1)	[Comment Column No.1] [Comment Column No.2] [Comment Column No.3]	Select a language for the comments to be used. The comments are used from the profile data in the selected language. If you select the language of an unregistered profile or [Not Used], the relevant comment column will be blank.

19.5 How to set global labels

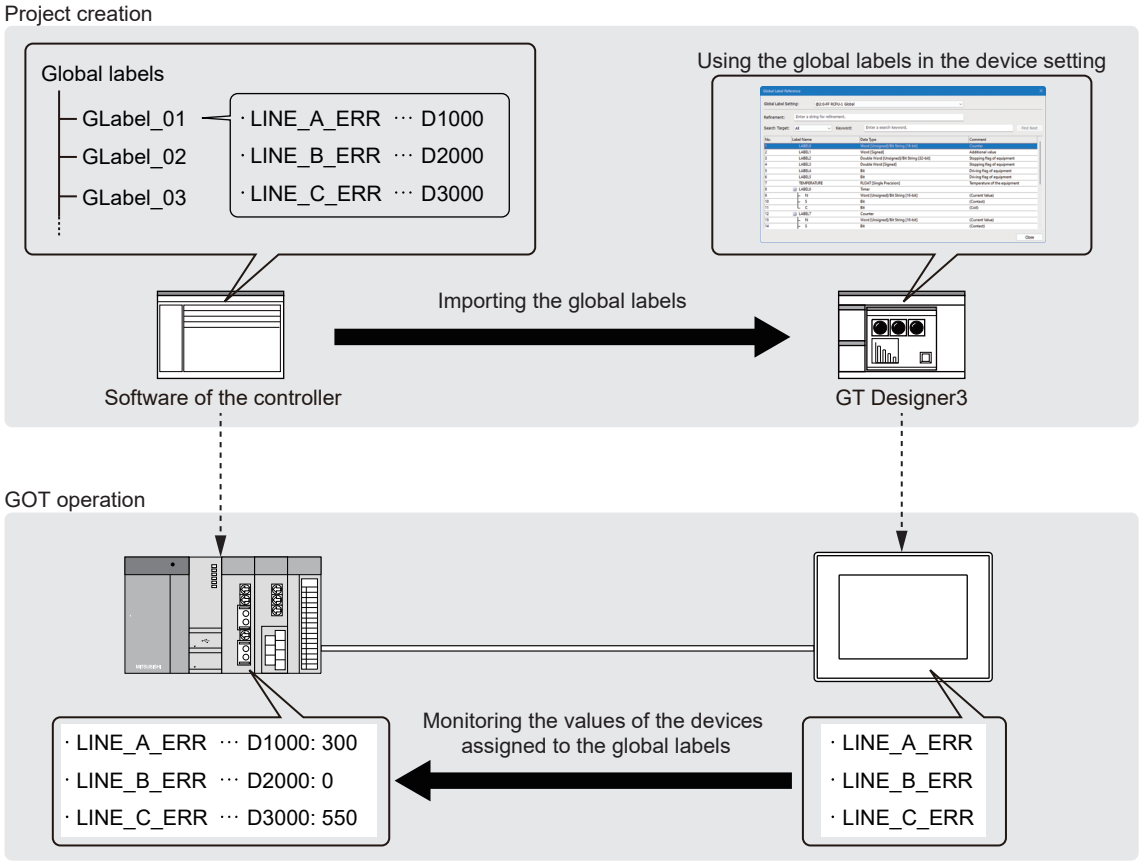
GT37 SoftGOT3000

☞ Page 898 Specifications of global labels usable in GT Designer3
☞ Page 902 Procedure to use global labels in GT Designer3
☞ Page 903 Importing global labels
☞ Page 904 Setting a global label in the device setting
☞ Page 907 Updating the imported global labels
☞ Page 909 Obtaining label information from the controller during GOT operation (label name resolution)
☞ Page 920 [Global Label Reference] dialog

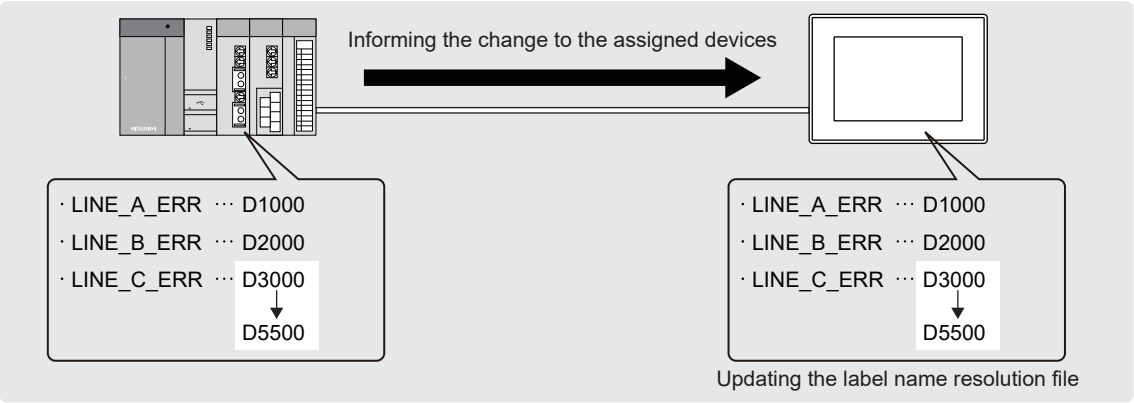
You can set global labels in the device setting of an object or others by importing the global labels set with GX Works3 or Motion Control Setting Function in GT Designer3.

Using global labels enables you to create project without paying attention to the actual devices.

The GOT monitors the values of the devices assigned to the global labels.



When the package data in which global labels are used is written, the GOT holds information (label name resolution file) that correlates global label names with device names used in the controller.
At startup or upon detecting the label update in the controller, the GOT obtains information from the controller and updates the label name resolution file.
This function is referred to as the label name resolution.
☞ Page 909 Obtaining label information from the controller during GOT operation (label name resolution)



19.5.1 Specifications of global labels usable in GT Designer3

GT37 SoftGOT3000

☞ Page 898 Importable files in GT Designer3
☞ Page 899 Global labels usable in GT Designer3
☞ Page 901 Specifications of the offset setting for global labels
☞ Page 901 Functions not supporting global labels
☞ Page 901 Specifications for data transfer to the GOT

Importable files in GT Designer3

You can set the global labels that are set in the following controllers in the device setting in GT Designer3.

Equipment	Remarks
RCPU	The GOT cannot monitor the global labels of R00CPU, R01CPU, and R02CPU that do not support the settings to permit access their labels from external devices.
Motion CPU (MELSEC iQ-R series)	—
Motion module	—
LHCPU	—

The following shows the software products used to set global labels and file formats of the files importable in GT Designer3.

Software	Extension	Remarks
GX Works3	*.gx3	To import a GX Works3 project (*.gx3), GX Works3 is required on the personal computer. The required GX Works3 version depends on the setting of the project to be imported. • Uncompressed project: Version 1.040S or later • Compressed project: Version 1.050C or later • Project data with security version 2: Version 1.096A or later 📖GX Works3 Operating Manual
	*.csv	CSV file to which label data is exported with GX Works3. 📖GX Works3 Operating Manual Save CSV files of structure-type global labels to the same folder.
MT Developer2	*.csv	CSV file to which label data is exported with MT Developer2. 📖MT Developer2 Help Save CSV files of structure-type global labels to the same folder.
Motion Control Setting Function	*.csv	CSV file to which label data is exported with Motion Control Setting Function. Use Motion Control Setting Function version 1.005F or later. 📖Motion Control Setting Function Save CSV files of structure-type global labels to the same folder.

Global labels usable in GT Designer3

The following shows the conditions for global labels settable in the device setting in GT Designer3.

☞ Page 899 Setting for access from external devices
☞ Page 899 Class
☞ Page 899 Global label name
☞ Page 900 Data type of global label
☞ Page 900 Array-type global label
☞ Page 900 Global label handled as a special structure

■Setting for access from external devices

Among the global labels set with the software of the controller, the ones with [Access from External Device] selected are usable in GT Designer3.

All the global labels set with Motion Control Setting Function are usable because the software has no settings to control access from external devices.

■Class

Global labels of the following classes are usable.

- VAR_GLOBAL
- VAR_GLOBAL_RETAIN

■Global label name

You can use global labels whose label names satisfy the following conditions.

Item	Description
Number of characters	Up to 256 characters. Up to 300 characters can be used for the label name of a structure.
First character	Begins with a character or an underscore (_). The label name of a structure can begin with a number.
Line terminator	No ASCII line terminator is used. • LF(\n, line feed) • CR(\r, carriage return) • CR followed immediately by LF (\r\n)
Invalid symbol	The following space symbols are not used. • ASCII code: SP (space), VT (\v, vertical tabulation), HT (\t, horizontal tabulation), and FF (\f, form feed) • Unicode: two-byte space (\u3000)
	The following one-byte symbols are not used. / \ * ? < > | " : [ ] ; , = + % ' ^ @ { } . ! # $ & ~ ` ( ) -
Invalid character string	No device name, identifier of files, or instruction of sequence programs is used as a global label name. 📖GX Works3 Operating Manual
	No reserved character is used. 📖GX Works3 Operating Manual

■Data type of global label

The following shows the usable primitive data type global labels.

○: Available, —: Not available

Data type of the controller's software			Data type or device type in GT Designer3	Bit-specified word device
Bit		BOOL	Bit	—
Word [Signed]		INT	Signed 16-bit binary	○
			16-bit binary-coded decimal	—
Word [Unsigned] Bit string [16-bit]]		WORD	Unsigned 16-bit binary	○
Double-word [Signed]		DINT	Signed 32-bit binary	—
			32-bit binary-coded decimal	—
Double-word [Unsigned] Bit string [32-bit]]		DWORD	Unsigned 32-bit binary	—
Single-precision real number		REAL	Real number (32-bit)	—
Double-precision real number		LREAL	Real number (64-bit)	—
Timer	Contact	TIMER	Bit	—
	Coil	TIMER	Bit	—
	Current value	TIMER	Unsigned 16-bit binary	—
Retentive timer	Contact	RETENTIVETIMER	Bit	—
	Coil	RETENTIVETIMER	Bit	—
	Current value	RETENTIVETIMER	Unsigned 16-bit binary	—
Counter	Contact	COUNTER	Bit	—
	Coil	COUNTER	Bit	—
	Current value	COUNTER	Unsigned 16-bit binary	—
Long timer	Contact	LTIMER	Bit	—
	Coil	LTIMER	Bit	—
	Current value	LTIMER	Unsigned 32-bit binary	—
Long retentive timer	Contact	LRETENTIVETIMER	Bit	—
	Coil	LRETENTIVETIMER	Bit	—
	Current value	LRETENTIVETIMER	Unsigned 32-bit binary	—
Long counter	Contact	LCOUNTER	Bit	—
	Coil	LCOUNTER	Bit	—
	Current value	LCOUNTER	Unsigned 32-bit binary	—
String		STRING	Unsigned 16-bit binary or string	—
String [Unicode]		WSTRING		—

■Array-type global label

You can use array-type global labels that satisfy the following conditions.

- One-, two-, or three-dimensional array
- For the undefined labels: the subscript for each dimension as shown below

Array	Subscript range
One-dimensional array	-2147483648 to 2147483647
Two-dimensional array	-268435456 to 268435455
Three-dimensional array	-262144 to 262143

■Global label handled as a special structure

GT Designer3 handles the following data types of global labels as special structures.

Although GX Works3 or MT Developer2 handles such a label as one, GT Designer3 handles the label as multiple labels.

Data type of global label		Notation in GX Works3 and MT Developer2	Notation in GT Designer3
Timer Counter Retentive timer Long timer Long counter Long retentive timer	Contact	Global label name	Global label name.S
	Coil	Global label name	Global label name.C
	Current value	Global label name	Global label name.N

Specifications of the offset setting for global labels

■Available data types for the offset setting

The following shows the data types of global labels available for the offset setting.

- Bit
- Word [Signed]
- Word [Unsigned]/Bit string [16-bit]]
- Double-word [Signed]
- Double-word [Unsigned]/Bit string [32-bit]]
- Single-precision real number
- Double-precision real number

■Offset setting item

The offset setting is applied to array element numbers.

For an array of structures, the offset setting is not applied to the element numbers.

For an array of members of a structure, the offset setting is applied to the element numbers.

Ex.

Offset setting for a three-dimensional array

When the global label set in GT Works3 is aaa[0..9,0..9,0..9]

- First dimension: The start element number is 0, and the number of elements is 10.
- Second dimension: The start element number is 0, and the number of elements is 10.
- Third dimension: The start element number is 0, and the number of elements is 10.

Global label set for an object or others	Offset device value	Offset result
aaa[0.0.1]	8	aaa[0.0.9]
	12	aaa[0.1.3]
	150	aaa[1.5.1]
	352	aaa[3.5.3]
	1100	A system alarm occurs due to invalid array subscripts.

Ex.

Offset setting for a structure

Global label set for an object or others	Applicability of the offset setting
aaa[0].bbb	The offset setting is not applied to arrays of structures.
aaa.bbb[0]	The offset setting applies to arrays of structure members.

Functions not supporting global labels

Global labels are not available for the following functions.

Functions not supporting global labels	Remarks
Station number switching	Station number switching is not available for the GOT to monitor the station that uses global labels. Do not use global labels for the station requiring station number switching.
Indirect specification of a CPU number	—
Indirect specification of a module number	—

Specifications for data transfer to the GOT

When you set global labels in the package data and write the data to the GOT, [Write Mode] is not selectable in the [Write Option] dialog.

In this case, [Write Mode] is fixed to [Synchronize].

☞ Page 467 [Write Option] dialog

19.5.2 Procedure to use global labels in GT Designer3

GT37 SoftGOT3000

The following shows the procedure from importing global labels to setting them in the device setting in GT Designer3.

1. Prepare a file in GT Designer3 with the software of the controller.

The operation depends on the file to be prepared.

Software	Extension	Operation	Reference
GX Works3	*.gx3	Compile the project in which global labels are set.	📖GX Works3 Operating Manual
	*.csv	Compile the project in which global labels are set, and export the global labels to a CSV file. When using structure-type global labels, export the structures to a CSV file separately from the global labels.	
MT Developer2	*.csv		📖MT Developer2 Help
Motion Control Setting Function	*.csv		📖Motion Control Setting Function

Using the global labels without compilation may cause inconsistency in the global label settings between the GOT and the controller.

2. Import the global labels in GT Designer3.

☞ Page 903 Importing global labels

3. Set the imported global labels in the device setting of an object or others.

☞ Page 904 Setting a global label in the device setting

The global label setting is completed.

Precautions when setting a global label with the software of the controller

■Global label assigned with a device out of the device range

When data is written to the global label that is assigned with a device out of the device range, a system alarm occurs.

Assign a device within the device range to the global label.

■Device assigned to a global label

The monitoring speed may decrease depending on whether data types are consistent between the monitored global label and the device assigned to the label.

For an array-type global label, assigning a device to an element of the array as shown below may improve the monitoring performance.

- When the data type of the global label is bit, assign a bit device to the label.
- When the data type of the global label is not bit, assign a word device to the label.

19.5.3 Importing global labels

GT37 SoftGOT3000

Import global labels from a file.

For the specifications and conditions of the files importable in GT Designer3, refer to the following.

☞ Page 898 Importable files in GT Designer3

1. Perform either of the following operations to display the [Label/Tag/Ethernet Setting List] dialog.

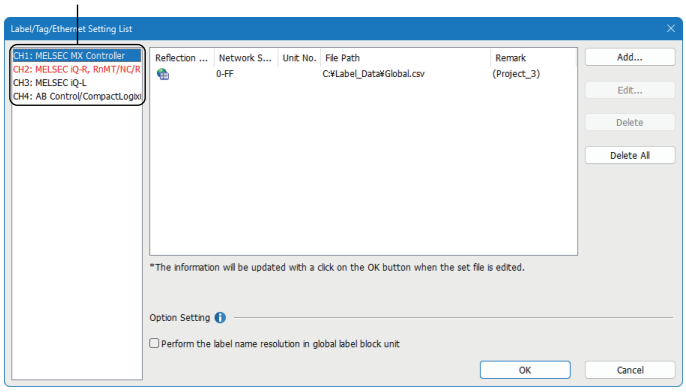
- Select [Project] → [Import Other Data] → [Label/Tag/Ethernet Setting] from the menu.
- In the [Project] window, click [Label/Tag] → [Global Label], and double-click [Import/Setting].

2. Select a channel to establish communication with the controller that uses global labels.

The channel that supports importing global labels is the one in which one of the following items is selected for [Controller Type] in the [Controller Setting] window.

- [MELSEC MX Controller]
- [MELSEC iQ-R, RnMT/NC/RT, CR800-D]
- [MELSEC iQ-L]
- [MELIPC]

Select a channel.



3. Click the [Add] button to display the [Add Global Label/Ethernet Setting] dialog.

☞ Page 862 [Add Global Label/Ethernet Setting] dialog or [Edit Global Label/Ethernet Setting] dialog

4. Set the network setting and the file to be imported, and click the [OK] button.

Global labels are imported in the project.

If GX Works3 project data with security settings configured is specified during the import of global labels, user or project authentication may be required.

Enter the user name and password in the displayed dialog to perform authentication.

Precautions

■Restriction by the project security

Users who are prohibited from editing by project-wide security cannot import global labels.

For the project security, refer to the following.

☞ Page 2972 Protecting a project by registering users (Project security)

19.5.4 Setting a global label in the device setting

GT37 SoftGOT3000

The following entry methods are available.

Entry method	Description
Directly entering a global label name	☞ Page 904 Directly entering a global label name
Selecting from the list	Display the [Select Global Label] dialog, and select one of the registered global labels from the list. ☞ Page 837 Selecting a label or tag from the list
Selecting from utilizable data (input assist)	Enter characters in the device entry field in the setting dialog to display utilizable data in the input assist window. You can set a global label simply by selecting it from the utilizable data. ☞ Page 843 Selecting from utilizable data (input assist)

For precautions when setting a global label in the device setting, refer to the following.

☞ Page 906 Precautions when setting a global label

Directly entering a global label name

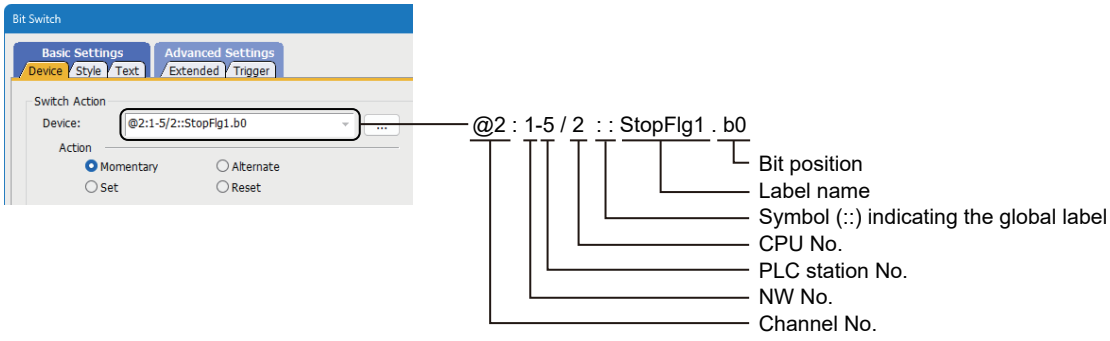
Enter a global label name in the text box of [Device] in the setting dialog.

For the global label formats, refer to the following.

☞ Page 849 Formats in setting dialogs

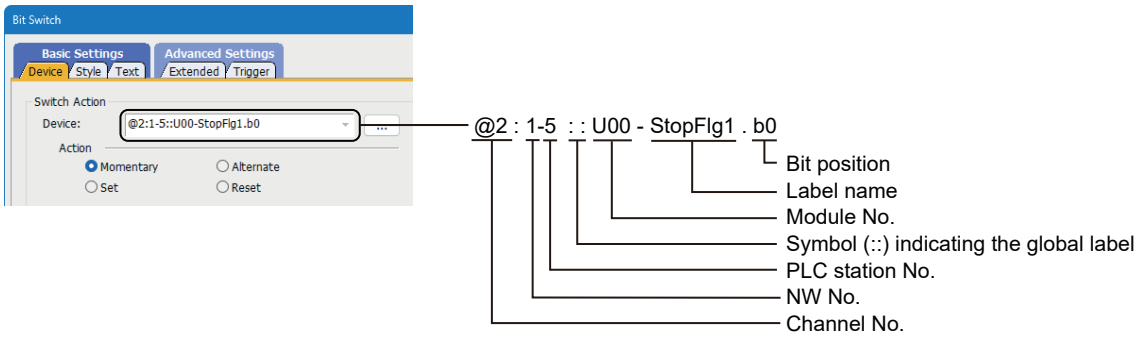
Ex.

When setting a global label of GX Works3 or MT Developer2



Ex.

When setting a global label of Motion Control Setting Function

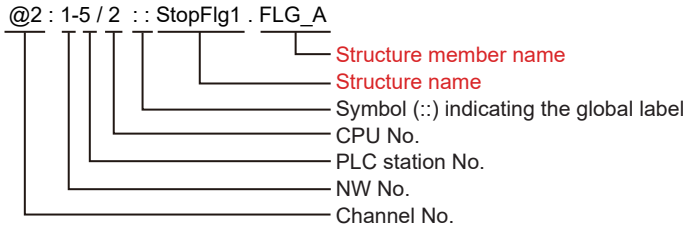


■Directly entering a structure-type global label

For a structure-type global label, add a period (.) and a member name after the structure name.

Ex.

When setting a structure-type global label of GX Works3 or MT Developer2

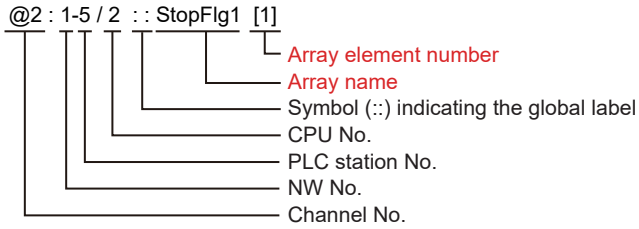


■Directly entering an array-type global label

For an array-type global label, add an element number surrounded by square brackets ([ ]) after the array name.

Ex.

When setting an array-type global label of GX Works3 or MT Developer2



Precautions

Precautions	Description
Data type verification	When you enter the global label name directly, the data type consistency check between the global label and the object or others is not performed automatically. The data types may be inconsistent between the global label and the object or others.
Global label of the string type or Unicode string type	To directly enter a string type or Unicode string type global label name, import the global label in advance. If not, the data type cannot be recognized as string or Unicode string, and a system alarm occurs.

Precautions when setting a global label

■Checking the data type of a global label

After setting a global label in the device setting of an object or others, performing one of the following changes results in data type inconsistency.

- Changing the data type of the global label
- Manually changing the data type of an object or others

If you perform one of the above, ensure that the data types are consistent between the global label and an object or others.
To check the data types, it is recommended to compare the CSV file of global labels with the CSV file exported from [Device List] of GT Designer3.

■Using a global label for the setting that requires multiple devices

To set a global label for the setting that requires consecutive or separate devices, use a global label whose data type is as follows.

- Array
- Bit-specified word device
- String
- String [Unicode]

For the required number of devices, the array-type global label with insufficient number of elements cannot be used.

■Number of characters to be displayed

When you use a global label whose data type is string or Unicode string, set the number of characters to be displayed according to the number of characters set with GX Works3.

■Settings for functions that use global labels

When using string type or Unicode string type global labels, you need to configure settings for some functions.

Function	Data type	Setting	Reference
Text display Text input	String	Deselect [Display in order of High → Low] in the [Extended] tab.	☞ Page 1345 Placing a text display or text input object
	String [Unicode]	Select [Display in order of High → Low] in the [Extended] tab.	
Logging Recipe	String	Select [High → Low] for [Storage Order] in the [Device] tab.	☞ Page 2194 Collecting device data ([Logging]) ☞ Page 2243 Writing or reading values to multiple devices ([Recipe])
	String [Unicode]	Select [Low → High] for [Storage Order] in the [Device] tab.	

■Monitor speed setting

To read or write 235 two-byte characters or more, select [High(Normal)] or [Middle] for [Monitor Speed] in [Detail Setting] in the [Controller Setting] window.
If you select [Low] for [Monitor Speed], a system alarm occurs when the data is read or written.
☞]Page 729 [Controller Setting]

■Global label for a Motion module

If the data type of an array-type global label is specified as bit, a system alarm occurs.
Specify any data type other than bit.

■Data types of global labels and consecutive/random device setting

To monitor a primitive data type global label, use the random device setting.
To use the consecutive device setting, set an array-type global label.

19.5.5 Updating the imported global labels

GT37 SoftGOT3000

GT Designer3 can detect changes to the file that is specified when global labels are imported.
If the project or CSV file has been changed, update the global labels to operate the labels properly.

☞ Page 907 Changes to the file to be detected
☞ Page 907 Timing to check for and notify of changes
☞ Page 908 Change notification and update method

Changes to the file to be detected

GT Designer3 detects the following changes to the imported file.

- Time stamp
- Renaming
- Deletion
- Move

Timing to check for and notify of changes

When any of the following operations is performed, changes to the file are checked.

- Opening a project
- Displaying the [Label/Tag/Ethernet Setting List] dialog
- Displaying the [Global Label Reference] dialog
- Displaying the [Select Global Label] dialog
- Clicking the [OK] button in the [Type Setting] dialog
- Clicking the [OK] button or [Apply] button in the [Controller Setting] window
- Clicking the [Finish] button in the [Utilize] dialog to utilize a screen with new controllers
- Selecting [Communication] → [Write to GOT] or [Write to Memory Card] from the menu

When a change to the file is detected, the change is notified.

Change notification and update method

When a change to the file is detected, the change is notified by the following methods.

Location of notification	Description
Status bar	The label/Ethernet setting change notification icon appears in the status bar.  Label/Ethernet setting change notification icon
[Select Global Label] dialog [Global Label Reference] dialog	When the dialog is displayed, the message is displayed at the bottom of the dialog. Example) The [Select Global Label] dialog  Message displayed when there is a change

To update the global labels, open the [Label/Tag/Ethernet Setting List] dialog, and click the [OK] button to close the dialog.

The [Label/Tag/Ethernet Setting List] dialog is opened by one of the following operations.

- Right-click the label/Ethernet setting change notification icon, and click [Update global label/Ethernet setting data].
- Select [Project] → [Import Other Data] → [Label/Tag/Ethernet Setting] from the menu.
- Double-click [Import/Setting] under [Label/Tag] in the [Project] window.

19.5.6 Obtaining label information from the controller during GOT operation (label name resolution)

GT37 SoftGOT3000

The label name resolution obtains the devices assigned to global labels from controllers.

The following changes in the controller require the GOT to update label information.

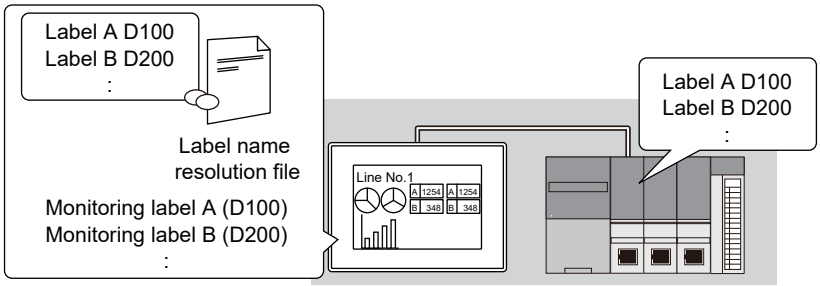
Change in the controller	Required operation in the GOT
A device assigned to a global label is changed.	The GOT performs the label name resolution, obtains the assigned device information, and changes the device to be monitored. The GOT performs the label name resolution at startup or upon detecting global label update in the controller. For the timing of the label name resolution, refer to the following. ☞ Page 914 Execution timing of the label name resolution
A global label is deleted.	Delete the label from the GOT project as well. The corresponding global label can be searched by using the device search or in the device list. ☞ Page 130 Searching for and editing settings of projects Write the changed project to the GOT.
A global label is renamed.	Reflect the renaming to the GOT project. The corresponding global label can be searched by using the device search or in the device list. ☞ Page 130 Searching for and editing settings of projects Write the changed project to the GOT.

The obtained device information is recorded in a label name resolution file.

Point

The label name resolution file is used to correlate global label names used in the project with device names used in the controller.

Referring to the label name resolution file, the GOT identifies the devices assigned to the global labels.



The label name resolution file is created for each channel in the project startup drive at the timing such as the first execution of the label name resolution.

Using the GOT utility, you can delete the label name resolution file.

For the deletion method, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

☞ Page 910 Label name resolution methods
☞ Page 914 Execution timing of the label name resolution
☞ Page 914 Label name resolution performed automatically
☞ Page 916 Manually performing the label name resolution
☞ Page 917 GOT operation during the label name resolution
☞ Page 918 Precautions for the label name resolution

Label name resolution methods

Select one of the following methods to resolve label names.

☞ Page 910 Batch method

☞ Page 912 Split method

To switch between the above methods, set [Perform the label name resolution in global label block unit] in the [Label/Tag/Ethernet Setting List] dialog.

☞ Page 860 [Label/Tag/Ethernet Setting List] dialog

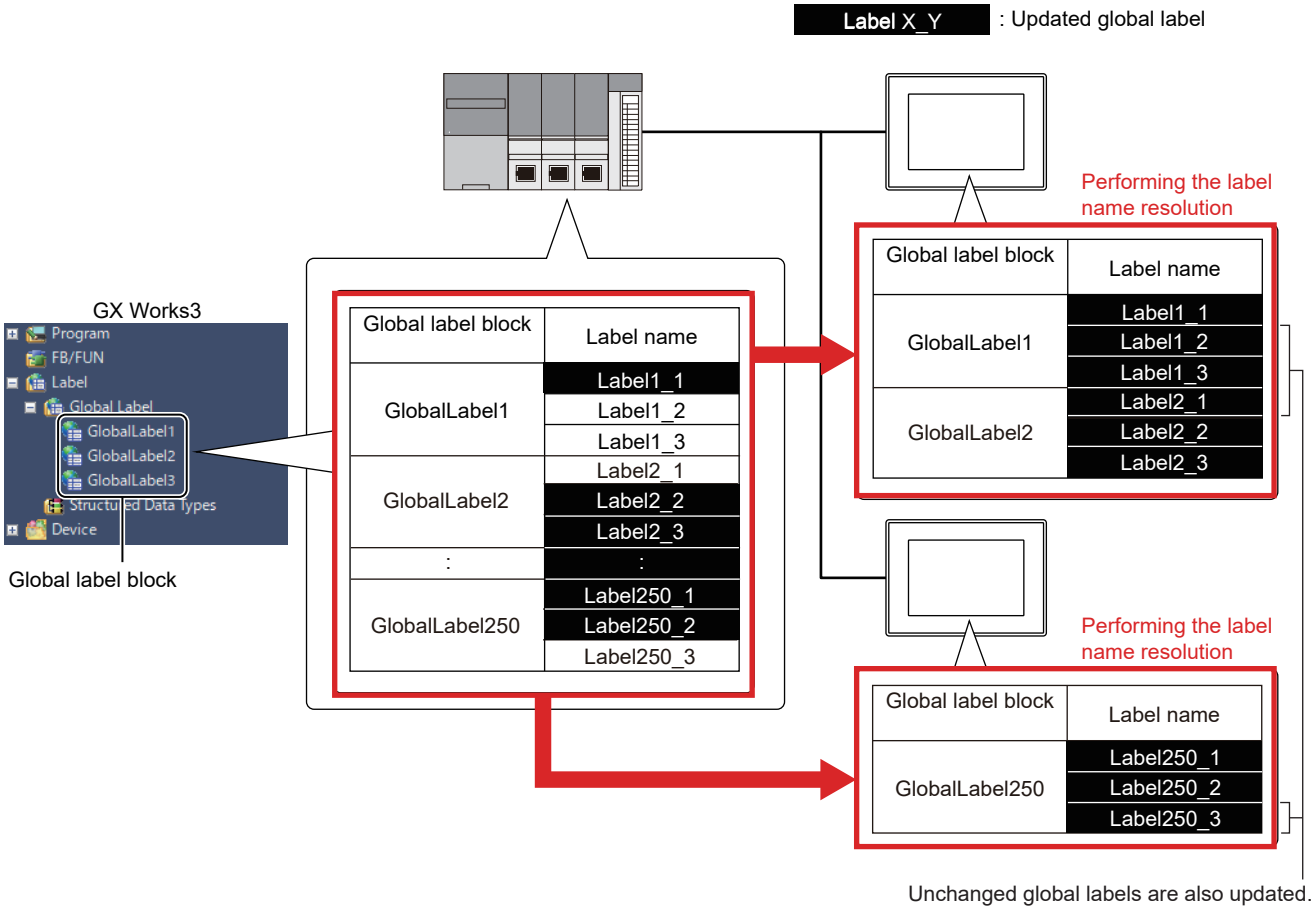
Batch method

When a global label in a GX Works3 project is updated, the GOT performs the label name resolution on all the global labels in the project.

This method is recommended for use when only one global label block exists in the project or many global label blocks are targeted for the label name resolution.

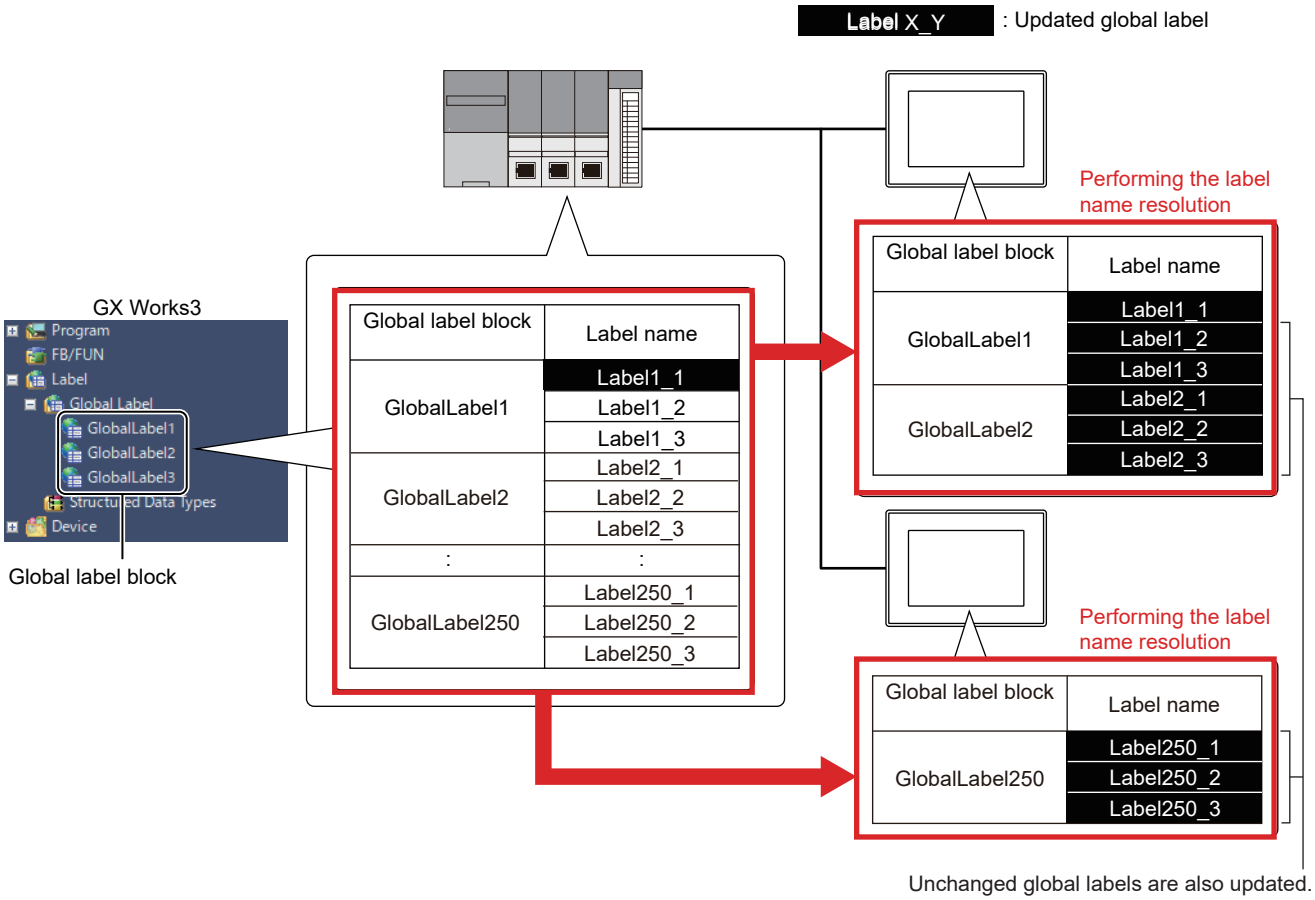
Ex.

When many global label blocks are targeted for the label name resolution, the batch method takes less time to complete the resolution as compared with the split method.



Ex.

When a few global label blocks are targeted for the label name resolution, the batch method takes more time to complete the resolution as compared with the split method.



Split method

When a global label is updated, the GOT performs the label name resolution only on the global label block containing the updated label.

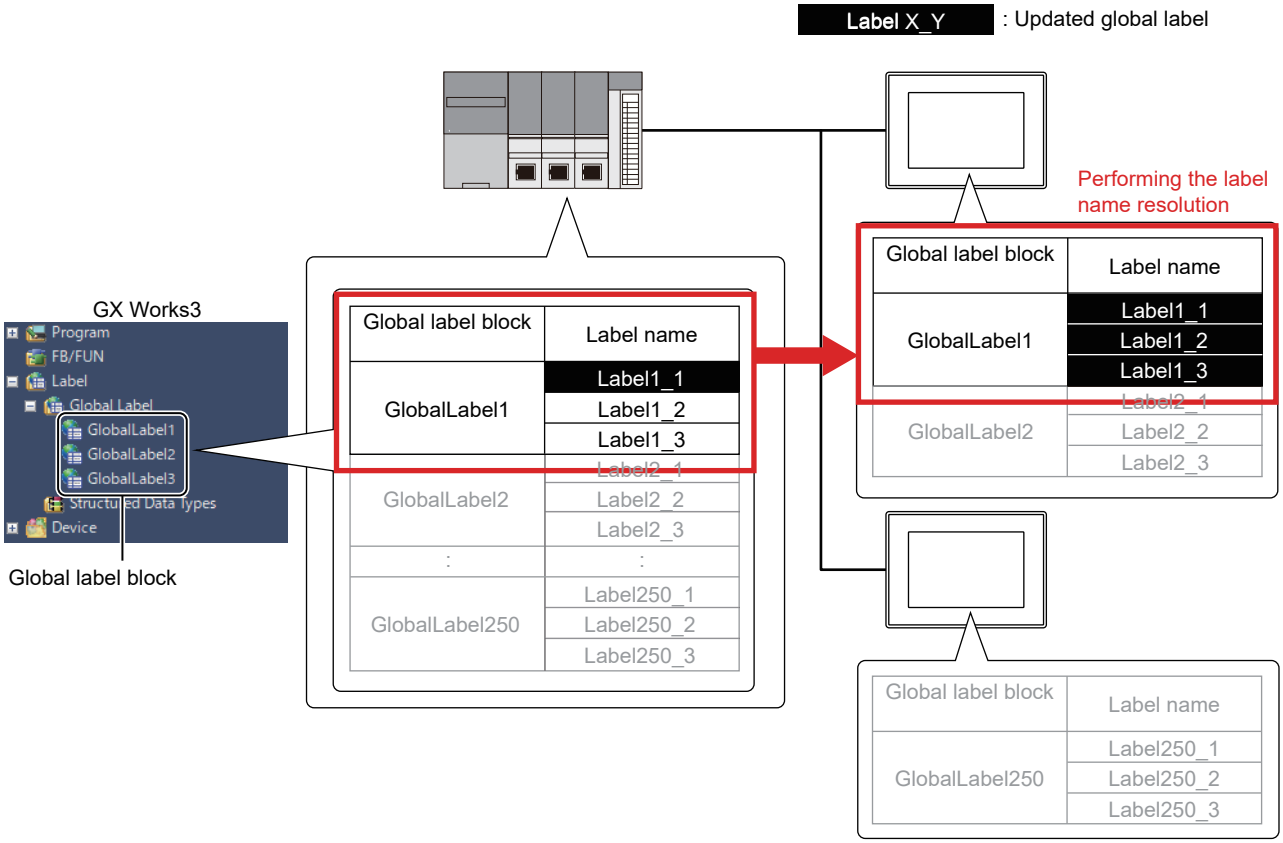
This method is recommended for use when a few global label blocks are targeted for the label name resolution.

☞ Page 912 Operation example of the split method
☞ Page 913 Application criteria for the split method
☞ Page 914 Global labels targeted for the label name resolution

■Operation example of the split method

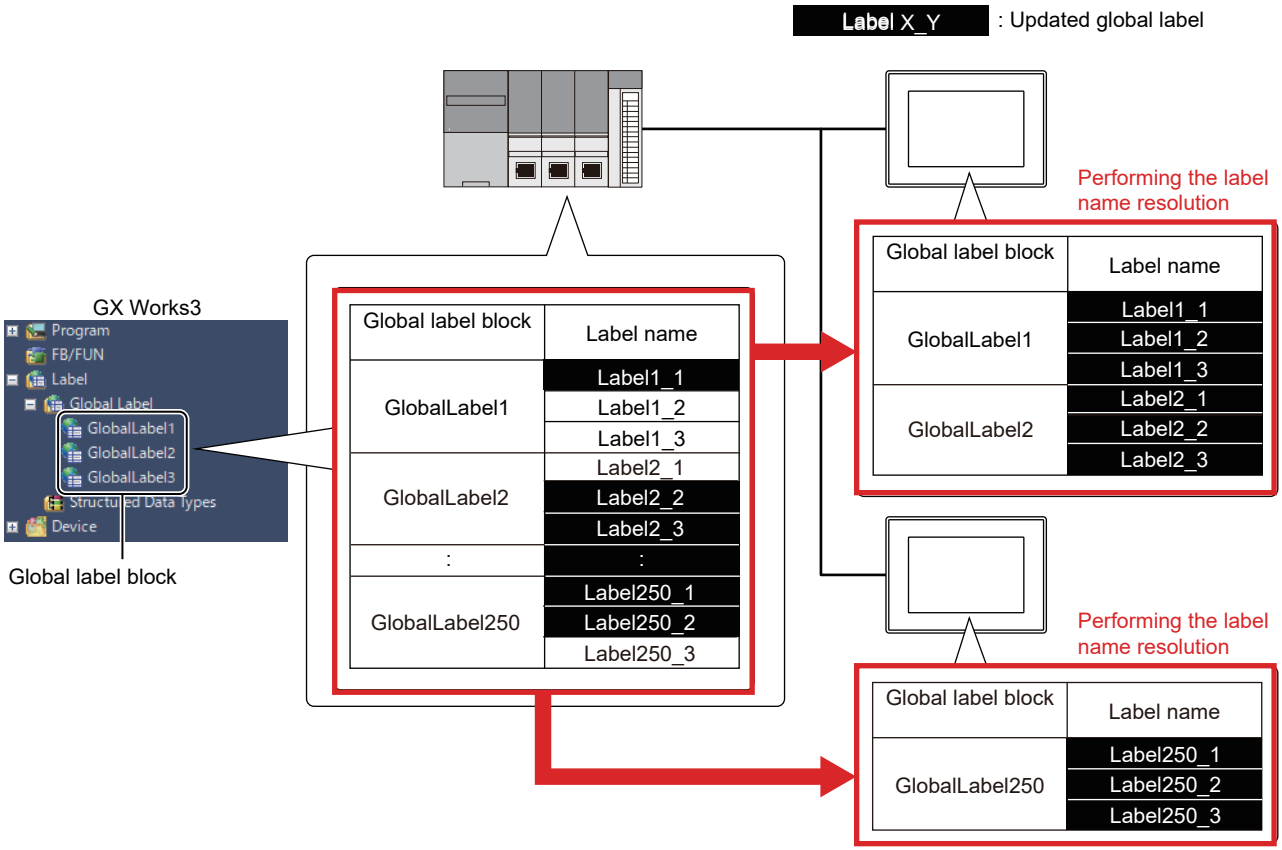
Ex.

When a few global label blocks are targeted for the label name resolution, the split method takes less time to complete the resolution as compared with the batch method.



Ex.

When many global label blocks are targeted for the label name resolution, the split method takes more time to complete the resolution as compared with the batch method.



■Application criteria for the split method

The split method is usable when one of the following PLC CPUs is connected to the GOT.

If the firmware of the connected PLC CPU does not support the split method, regardless of the setting of [Perform the label name resolution in global label block unit], the GOT will perform the label name resolution by the batch method.

Model	Firmware version
R04CPU R08CPU R16CPU R32CPU R120CPU R04ENCPU R08ENCPU R16ENCPU R32ENCPU R120ENCPU	Version 40 or later
R08PCPU R16PCPU R32PCPU R120PCPU	Version 28 or later
R08SFCPU R16SFCPU R32SFCPU R120SFCPU	Version 16 or later
L04HCPU L08HCPU L16HCPU L32HCPU	All versions

■Global labels targeted for the label name resolution

The global labels targeted for the label name resolution vary depending on the conditions under which operations are performed on GX Works3.

If all the following conditions are satisfied, the GOT performs the label name resolution only on the global label block containing the updated label.

Otherwise, the GOT performs the label name resolution on all the global labels in the project.

- The project is kept open between the instant when it is written to a PLC with [Write to PLC] and the instant when it is rewritten to the PLC with [Online Program Change].
- A global label is added to or changed in an existing global label block.

Execution timing of the label name resolution

The label name resolution is automatically or manually performed.

Execution timing		Reference
Automatic	At GOT startup (at GOT powered on, restart by reset, or project rerun)	☞ Page 914 At GOT startup (at GOT powered on, restart by reset, or project rerun)
	When the GOT detects global label update in the controller	☞ Page 915 When the GOT detects global label update in the controller
Manual	When the Start Label Name Resolution signal (GS1880.b1) turns on	☞ Page 916 Manually performing the label name resolution

Label name resolution performed automatically

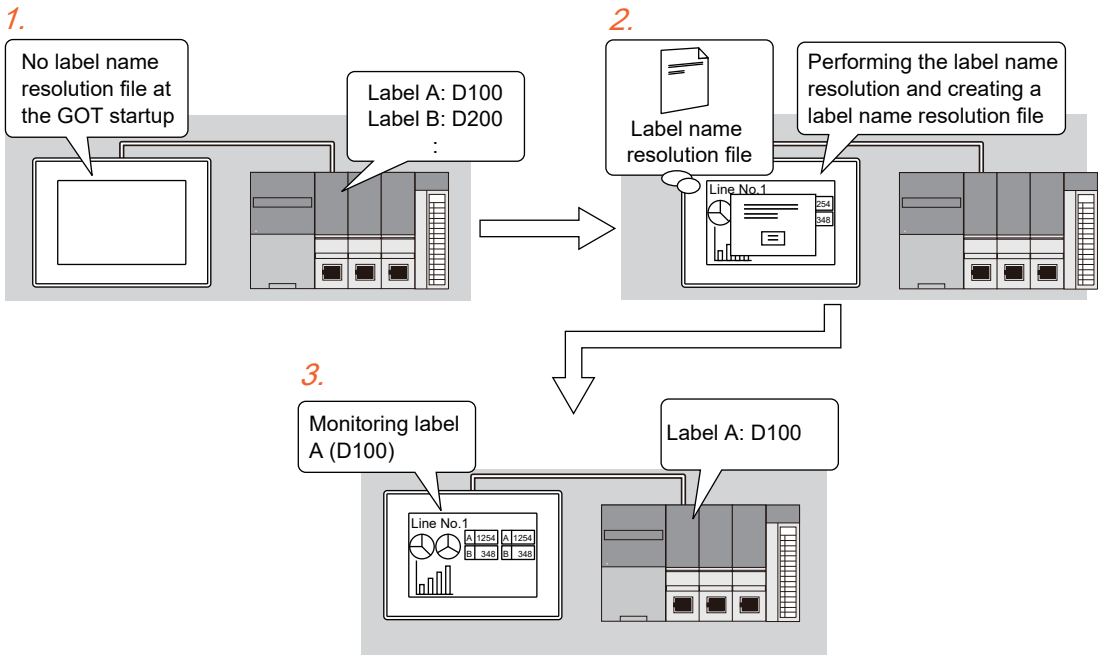
The GOT performs the label name resolution automatically at the following timing.

☞ Page 914 At GOT startup (at GOT powered on, restart by reset, or project rerun)
☞ Page 915 When the GOT detects global label update in the controller

■At GOT startup (at GOT powered on, restart by reset, or project rerun)

Ex.

When no label name resolution file exists at GOT startup



1. The GOT checks if a label name resolution file exists at startup.

2. If no label name resolution file exists, the GOT performs the label name resolution on all the global labels used in the project and creates a label name resolution file.

If a label name resolution file exists, the GOT performs the label name resolution on the unresolved global labels in the file.

3. After the label name resolution ends, the GOT starts device monitoring on all the channels.

The GOT stops device monitoring on the channel where the resolution is canceled or not performed.

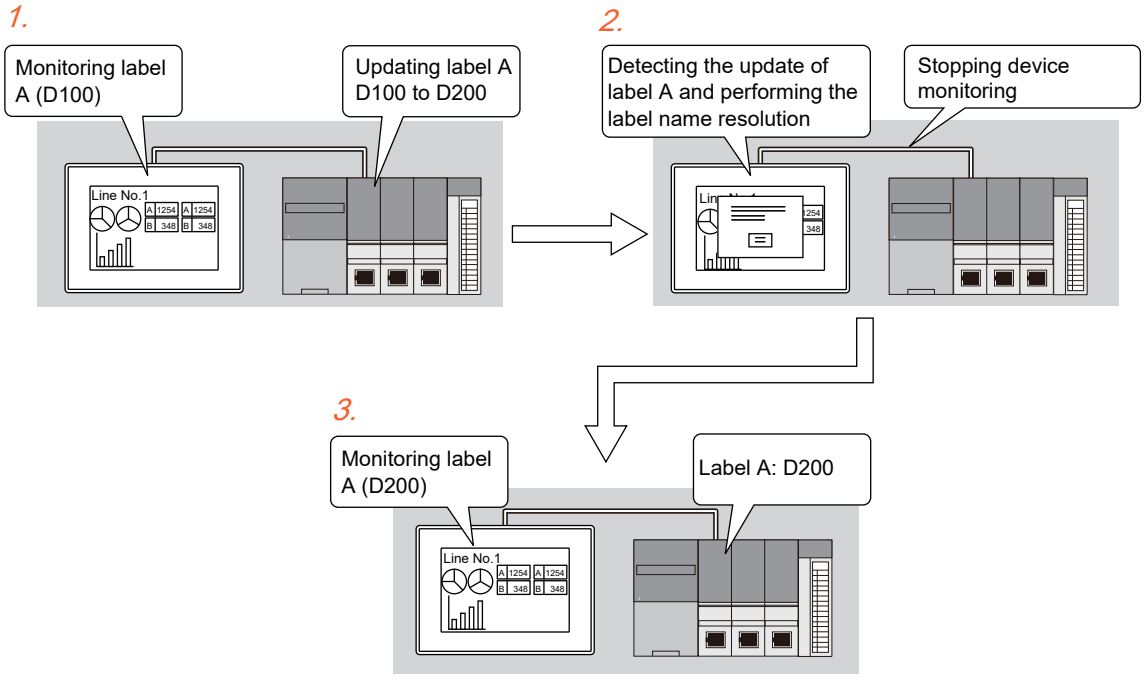
The GOT cannot monitor the global label that has an error occurred during the resolution.

Accordingly, the object that uses this global label cannot appear on the GOT.

For the resolution results, check the Label Name Resolution Status (Common, CH1 to CH4) (GS1080, GS1081 to GS1084).

☞ Page 3615 Label Name Resolution Status (Common, CH1 to CH4) (GS1080, GS1081 to GS1084)

■When the GOT detects global label update in the controller



1. The device assigned to the monitored global label is updated from D100 to D200.

2. Upon detecting the global label update on a station, the GOT stops the device update on the station and displays a system alarm.

After the label update completes on the PLC side, the GOT performs the label name resolution on the station.

3. After the label name resolution ends, the GOT restarts device monitoring.

The GOT cannot monitor the global label that has an error occurred during the resolution.

Accordingly, the object that uses this global label cannot appear on the GOT.

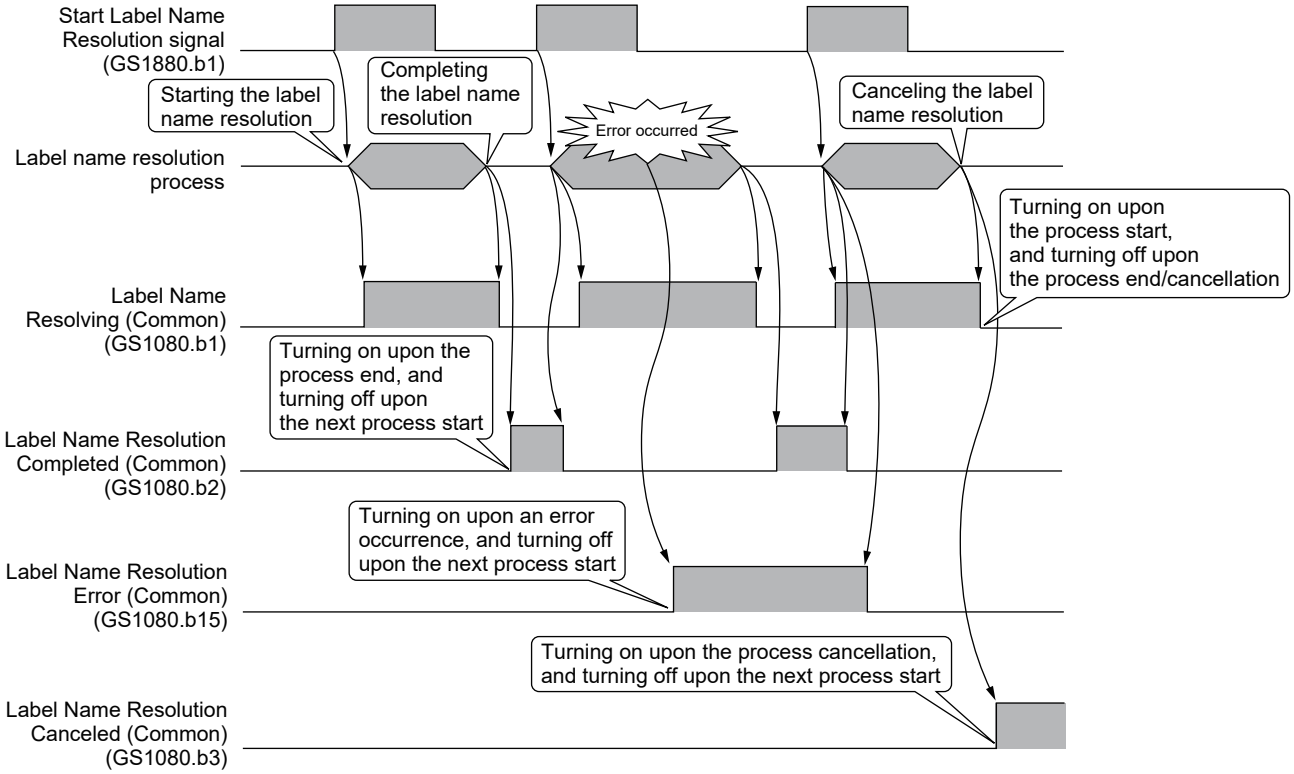
For the resolution results, check the Label Name Resolution Status (Common, CH1 to CH4) (GS1080, GS1081 to GS1084).

☞ Page 3615 Label Name Resolution Status (Common, CH1 to CH4) (GS1080, GS1081 to GS1084)

Manually performing the label name resolution

Turing on the Start Label Name Resolution signal (GS1880.b1) performs the label name resolution.

To monitor the status of the label name resolution, use the Label Name Resolution Status (Common, CH1 to CH4) (GS1080, GS1081 to GS1084) simultaneously.



For details on the Label Name Resolution Control (GS1880) and the Label Name Resolution Status (Common, CH1 to CH4) (GS1080, GS1081 to GS1084), refer to the following.

☞ Page 3615 Label Name Resolution Status (Common, CH1 to CH4) (GS1080, GS1081 to GS1084)

☞ Page 3660 Label Name Resolution Control (GS1880)

GOT operation during the label name resolution

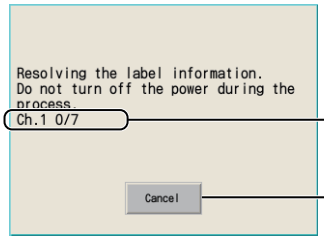
The GOT performs the label name resolution for the global labels monitored on the channel.

The operation differs depending on the timing of the label name resolution.

Execution timing		Operation
Automatic	At GOT startup (at GOT powered on, restart by reset, or project rerun)	Displays the dialog notifying the processing status during the label name resolution. ☞ Page 917 Dialog displayed during the label name resolution at GOT startup Stops the monitoring of the devices on the channel where the label name resolution is to be performed.
	When the GOT detects global label update in the controller	Displays no dialog during the label name resolution. Monitoring of the devices is not canceled.
Manual	When the Start Label Name Resolution signal (GS1880.b1) turns on	Displays no dialog during the label name resolution. Monitoring of the devices is canceled on all channels.

■Dialog displayed during the label name resolution at GOT startup

The following dialog appears during the resolution.



Item		Description
1)	Number of resolved label names Number of errors	The number of resolved label names by channel is displayed. The number of errors is displayed after the number of resolved label names. If an error occurs during the label name resolution, a system alarm occurs after the resolution ends. Check the system alarm for details on the error. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions) The GOT cannot monitor the global label that has an error occurred during the resolution. Accordingly, the object that uses this global label cannot appear on the GOT.
2)	[Cancel] button	Cancels the label name resolution. After the cancellation, monitoring starts on the channels where the label name resolution has ended. (Monitoring is unavailable on stations where label names are unresolved.) When the label name resolution is canceled on a channel, bit 0 of the corresponding Channel Shutdown Control (CH1 to CH4) (GS539, GS549, GS559, GS569) turns on and the GOT stops monitoring. Objects that use global labels that cannot be monitored do not appear on the GOT. To display such objects, the label name resolution must be performed again and completed. Turning off bit 0 of the Channel Shutdown Control (CH1 to CH4) (GS539, GS549, GS559, GS569) restarts the label name resolution on the corresponding channel. ☞ Page 3651 Channel Shutdown Control Information (CH1 to CH4) (GS539, GS549, GS559, GS569)

Precautions for the label name resolution

■Differences of whether a label name resolution file exists

In the following cases, the GOT performs the label name resolution on all global labels.
Therefore, the label name resolution may take longer time to complete.

- The GOT has no label name resolution file.
- The GOT has the label name resolution file in which all label names are unresolved.
- The GOT has the label name resolution file that is not created by using the global labels in the project.

■Size of a label name resolution file

Using the split method results in a larger label name resolution file as compared with using the batch method.
Reserve enough free space to store the file, and then perform the label name resolution.

■Communication timeout during the label name resolution

When the controller communication times out during the label name resolution, the resolution is skipped.
The global labels used for the skipped station are counted as the resolved labels.

■Screen switching during the label name resolution

The GOT stops device monitoring on a channel where the label name resolution is being performed.
Therefore, when you switch the screen during the resolution, objects using the devices of the channel cannot appear on the destination screen.

■Device update during the label name resolution

The GOT stops the device update on a station where the label name resolution is being performed.
When you monitor the station by using object functions, functions running on the GOT background, or others, the latest device values are not reflected until the resolution process ends.

■Global labels using a data type of structure

When a structure-type global label has a structure-type member, if you manually assign devices to the child members of the structure-type member, the GOT will fail to perform the label name resolution on these child members.

System error 328 occurs.

To solve the above problem, take one of the following corrective actions.

- Perform operations so that the devices are automatically assigned to the members.
- Directly set the manually assigned devices as monitor devices.

The following shows an example where the GOT cannot resolve some label names.

Ex.

When ST_B is set as the data type of Struct_B that is a member of ST_A in GT Works3

If devices are manually assigned to the labels in ST_B, the GOT cannot resolve these label names.

Structure A			Structure B			[Device] (Manually assigned)	Availability of the label name resolution
Structure name	[Label Name] (Name of a member)	[Data Type] (Data type of a member)	Structure name	[Label Name] (Name of a member)	[Data Type] (Data type of a member)		
ST_A	LabelA_1	[Word [Signed]]	—	—	—	D10	Available
	LabelA_2	[Word [Signed]]	—	—	—	D20	Available
	Struct_B	ST_B(Structure B)	ST_B	LabelA_1	[Word [Signed]]	D100	Not available
				LabelA_2	[Word [Signed]]	D200	Not available

■Corrective action for unresolved label names

The following shows the conditions resulting in unresolved label names.

- The label name resolution is executed during the PLC initial processing.
- The relevant labels are nonexistent on the PLC side.

In both cases, system alarm 328 occurs.

To identify the exact condition resulting in unresolved label names, turn on GS1880.b2 and GS1880.b1 to execute the label name resolution.

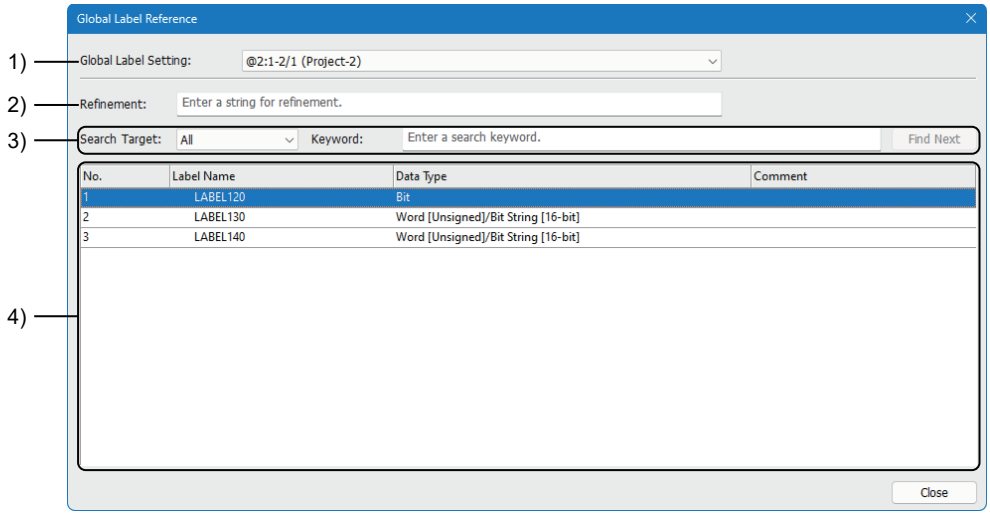
Condition resulting in unresolved label names	Label name resolution result		Corrective action
	When GS1880.b2 is off	When GS1880.b2 is on	
The label name resolution is executed during the PLC initial processing.	Unresolved label names are existent. System error 328 occurs.	The unresolved label names have been resolved. No system alarm occurs.	Change the title display time of the GOT so as to execute the label name resolution after the PLC initial processing. ☞ Page 618 [Display Setting/ Language Setting]
The relevant labels are nonexistent on the PLC side.		Unresolved label names are existent. System error 328 occurs.	Correct the label settings.

19.5.7 [Global Label Reference] dialog

GT37 SoftGOT3000

The [Global Label Reference] dialog lists the global labels imported to GT Designer3.

To display this dialog, double-click a target global label, or right-click the label and select [Open] from the right-click context menu in the [Project] window.



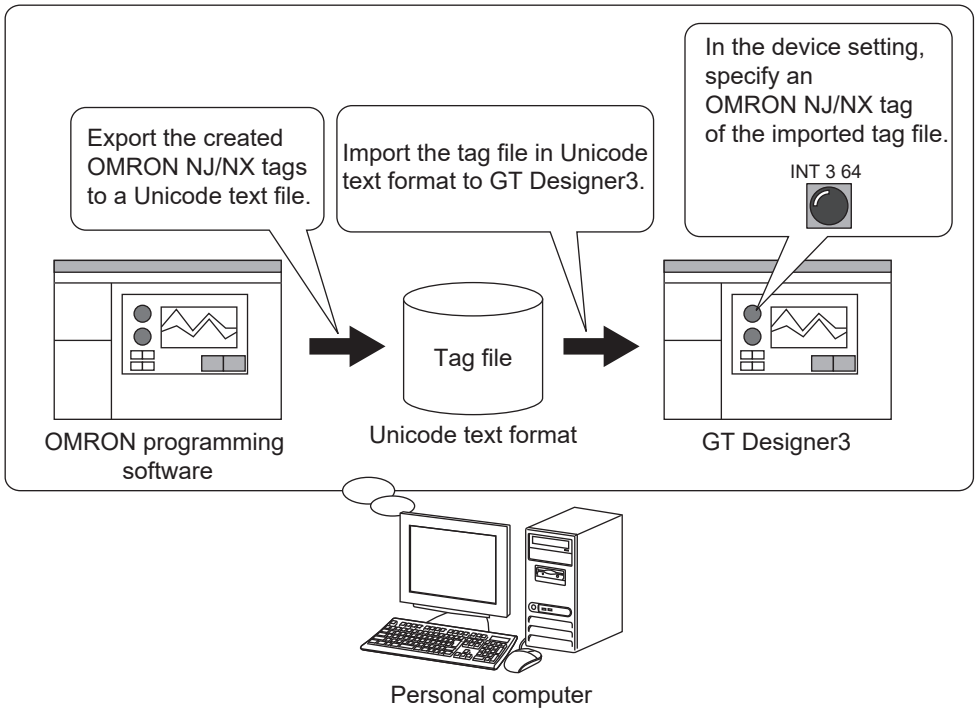
Item			Description
1)	[Global Label Setting]		Select a combination of the channel number, network setting, module number, and data name of the imported global labels.
2)	[Refinement]		Enter characters to narrow down the global labels in the label list. Only the global labels narrowed down by the entered characters are displayed in the label list. Up to 32 characters can be set. The entered characters are case-insensitive.
3)	Search		Search the global label list for a label by the specified keyword. Set [Search Target] and enter a search keyword in [Keyword]. Click the [Find Next] button to search for a global label by the search keyword. Up to 32 characters can be set in [Keyword]. The entered characters are case-insensitive.
4)	Global label list	—	Lists global labels.
		[No.]	Number of a global label
		[Label Name]	Name of a global label
		[Data Type]	Data type of a global label
		[Comment]	Comment set for a global label

19.6 How to set OMRON NJ/NX tags

GT37 SoftGOT3000

☞ Page 922 Usable OMRON NJ/NX tags
☞ Page 923 Requirements for OMRON NJ/NX tags
☞ Page 926 Offset setting for OMRON NJ/NX tags
☞ Page 927 Importing a tag file
☞ Page 928 Setting an OMRON NJ/NX tag
☞ Page 929 Precautions for OMRON NJ/NX tags

You can import the OMRON NJ/NX tags created with OMRON programming software to GT Designer3.
The imported OMRON NJ/NX tags are usable in the device setting.
Using OMRON NJ/NX tags enables you to create project data without paying attention to the actual devices.



PART 6

19.6.1 Usable OMRON NJ/NX tags

GT37 SoftGOT3000

☞ Page 922 Supported PLCs
☞ Page 922 Supported software
☞ Page 922 Tag file format
☞ Page 922 Importable pieces of data

You can import the OMRON NJ/NX tags created with OMRON programming software to GT Designer3.
The imported OMRON NJ/NX tags are usable for the channel whose [Controller Type] is set to [OMRON NJ/NX] in the controller setting.
For the above channel, only OMRON NJ/NX tags and GOT internal devices are usable in the device setting.

Supported PLCs

You can import the tag files created for the following PLCs to GT Designer3.

PLC type		Model
OMRON PLC	NJ series	NJ501-1500, NJ501-1400, NJ501-1300, NJ501-1520, NJ501-1420, NJ501-1320, NJ501-1340, NJ301-1200, NJ301-1100, NJ101-1000, NJ101-9000, NJ101-1020, NJ101-9020
	NX series	NX1P2-1140DT, NX1P2-1140DT1, NX1P2-1040DT, NX1P2-1040DT1, NX1P2-9024DT, NX1P2-9024DT1, NX701-1700, NX701-1600, NX502-1700, NX502-1600, NX502-1500, NX502-1400, NX502-1300, NX102-1200, NX102-1100, NX102-1000, NX102-9000

Supported software

GT Designer3 can import tag files created with the following programming software.

Manufacturer	Software
OMRON Corporation	Sysmac Studio

Tag file format

Create tag files in Unicode text format.
You cannot import the tag files in any other file format to GT Designer3.

Importable pieces of data

Importable pieces of data is 204800 per tag file.

19.6.2 Requirements for OMRON NJ/NX tags

GT37 SoftGOT3000

☞ Page 923 Tag name and structure name
☞ Page 923 Data type
☞ Page 924 Using an OMRON NJ/NX tag for the setting that requires multiple devices
☞ Page 925 Structure-type OMRON NJ/NX tags
☞ Page 925 Union-type OMRON NJ/NX tags
☞ Page 925 Enumeration-type OMRON NJ/NX tags
☞ Page 925 Array-type OMRON NJ/NX tags

Tag name and structure name

A tag name or structure name must satisfy the following requirements.

- A name consists of alphanumeric characters (A to Z, a to z, and 0 to 9), one-byte katakana, multibyte characters, and underscores (_).
- The length of a tag name is 127 bytes or less.
- Up to 300 characters can be set for a structure name.

However, the names containing the following combinations of characters are unusable.

- A name begins with a number (0 to 9).
- A name begins or ends with a space.

Data type

The following shows the usable data types.

○: Available, —: Not available

Data type of OMRON NJ/NX tag	Device data type or device type on GT Designer3	Bit-specified word device
BOOL	Bit	—
BYTE	Signed 8-bit binary	—
	Unsigned 8-bit binary	—
WORD	Signed 16-bit binary	○

Using an OMRON NJ/NX tag for the setting that requires multiple devices

To set an OMRON NJ/NX tag for the setting that requires consecutive or separate devices, use an OMRON NJ/NX tag whose data type is as follows.

- Structure
- String
- Array
- Bit-specified word device

Structure-type OMRON NJ/NX tags

Structure-type tags composed of members of the following data types can be used.

- Boolean
- Bit string
- Integer
- Real
- String
- Array specification
- Enumeration

Directly entering an enumeration-type tag name allows you to read the tag value.

Select [Signed BIN32], [Unsigned BIN32], [BCD32], or [Real(32bit)] for the data type and device type.

☞ Page 928 Directly entering a tag name

Union-type OMRON NJ/NX tags

Union-type tags composed of members of the following data types can be used.

- Boolean
- Bit string

Enumeration-type OMRON NJ/NX tags

Directly entering a tag name allows you to read the tag value.

Select [Signed BIN32], [Unsigned BIN32], [BCD32], or [Real(32bit)] for the data type and device type.

☞ Page 928 Directly entering a tag name

Array-type OMRON NJ/NX tags

An array must satisfy the following requirements.

- One-, two-, or three-dimensional array
- Any data type other than string
- For the undefined tags: the subscript for each dimension as shown below

Array	Subscript range
One-dimensional array	0 to 65535
Two-dimensional array	0 to 65535
Three-dimensional array	0 to 65535

19.6.3 Offset setting for OMRON NJ/NX tags

GT37 SoftGOT3000

The offset setting is applied to array element numbers.

Ex.

Offset setting for an OMRON NJ/NX tag in Tag[4,4,4]

OMRON NJ/NX tag set for an object or others	Offset device value	Offset result
Tag[0,1,1]	2	Tag[0,1,3]
	-1	Tag[0,1,0]
	5	Tag[0,2,1] (As the row number of the element tag is changed, a system alarm occurs if Tag[4,4,4] has not been imported.)
	119	A system alarm occurs due to invalid array subscripts.

For the tags of a structure, if the structure is set as an array element, the offset setting is not applied to the tags.

For the array-type tags of a structure, the offset setting is applied to the tags.

Ex.

Offset setting for the OMRON NJ/NX tags of a structure

OMRON NJ/NX tag set for an object or others	Offset result
STRUCT01[1].INT01	The offset setting is not applied to arrays of structures.
STRUCT01.INT02[1]	The offset setting applies to arrays of structure members.

19.6.4 Importing a tag file

GT37 SoftGOT3000

The following shows the procedure for importing a tag file to GT Designer3.

Operating procedure

1. Perform either of the following operations to display the [Label/Tag/Ethernet Setting List] dialog.

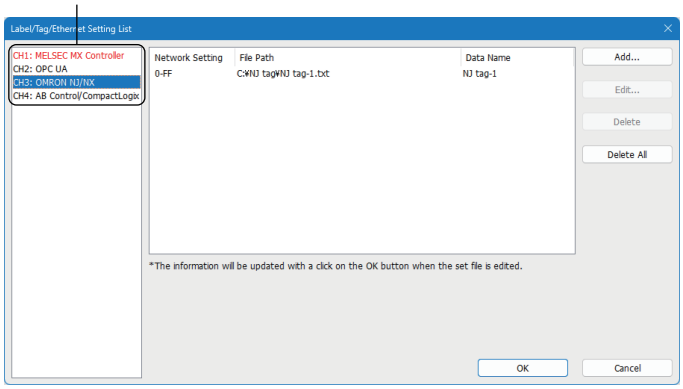
- Select [Project] → [Import Other Data] → [Label/Tag/Ethernet Setting] from the menu.
- Double-click [Import/Setting] under [Label/Tag] → [OMRON NJ/NX Tag] in the [Project] window.

2. Select a channel to establish communication with the controller that uses OMRON NJ/NX tags.

The channel that supports importing OMRON NJ/NX tags is the one in which the following item is selected for [Controller Type] in the [Controller Setting] window.

- [OMRON NJ/NX]

Select a channel.



3. Click the [Add] button to display the [Add OMRON NJ/NX Tag] dialog.

Page 864 [Add OMRON NJ/NX Tag] dialog or [Edit OMRON NJ/NX Tag] dialog

4. Set the network setting and the file to be imported, and click the [OK] button.

OMRON NJ/NX tags are imported to the project.

19.6.5 Setting an OMRON NJ/NX tag

GT37 SoftGOT3000

The following setting methods are available.

Entry method	Description
Directly entering a tag name	☞ Page 928 Directly entering a tag name
Selecting a tag from the tag list	Display the [Select OMRON NJ/NX Tag] dialog, and select one of the registered OMRON NJ/NX tags from the list. ☞ Page 837 Selecting a label or tag from the list
Selecting from utilizable data (input assist)	Enter characters in the device entry field in the setting dialog to display utilizable data in the input assist window. You can set an OMRON NJ/NX tag by selecting it from the utilizable data. ☞ Page 843 Selecting from utilizable data (input assist)

Point

Checking the data type of an OMRON NJ/NX tag

If you change the data type of an object or others, the data types may be inconsistent between the set OMRON NJ/NX tag and the object or others.

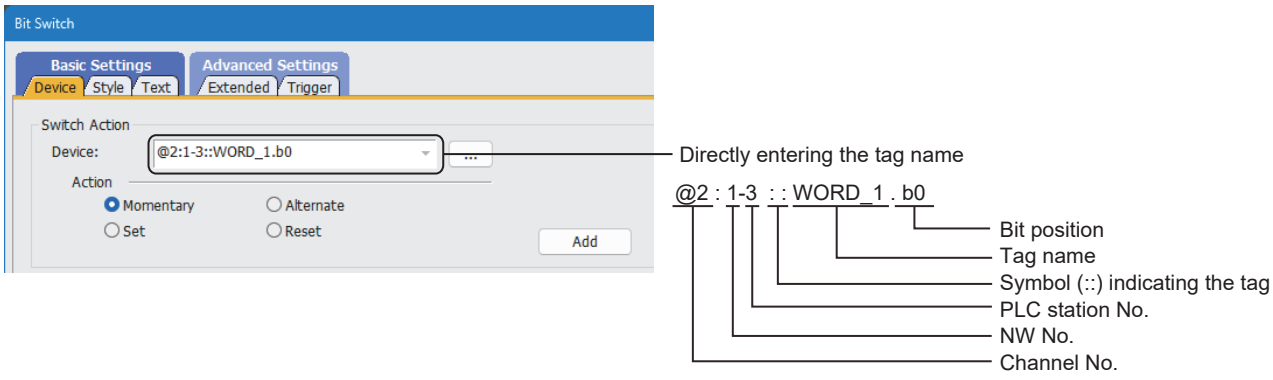
After setting an OMRON NJ/NX tag, check if the data types are consistent between the tag and the object or others.

To check the data type consistency, it is recommended to compare the used tag file with the file exported from [Device List] of GT Designer3.

Directly entering a tag name

Enter an OMRON NJ/NX tag name directly in the textbox of [Device] in the setting dialog of an object or others.

At the beginning of the tag name, add a "::" symbol indicating the tag.



When you enter the tag name directly, the data type consistency check between the OMRON NJ/NX tag and the object or others is not performed automatically.

The data types may be inconsistent between the OMRON NJ/NX tag and the object or others.

19.6.6 Precautions for OMRON NJ/NX tags

GT37 SoftGOT3000

OMRON NJ/NX tag name

When you use multiple OMRON NJ/NX tags whose names are long, the monitoring process may take a longer time.

Tag settings in a project read from the GOT

When a project containing OMRON NJ/NX tags is read from the GOT, check the tags in the [OMRON NJ/NX Tag List] dialog.
If a tag file is displayed in red, import the tag file again.

Directly entering an OMRON NJ/NX tag name

For a string-type OMRON NJ/NX tag, import the tag and enter the tag name to specify it.
If you do not import the tag before setting it, the data type cannot be recognized as string, and a system alarm occurs.

Importing an identically-named OMRON NJ/NX tag of a different data type

After an OMRON NJ/NX tag is set in the project, if you import an identically-named OMRON NJ/NX tag of a different data type, the set tag may be displayed as [??].
If [??] is displayed, set the relevant OMRON NJ/NX tag again.

Setting the object or function that uses an OMRON NJ/NX tag

Configure the following settings for the object or function that uses a string-type OMRON NJ/NX tag.
Text display object, text input object
Select [Display in order of High -> Low] in the [Extended] tab.
Text print object
Select [Display in order of High -> Low].
Recipe function, logging function
Select [Low-->High] for [Storage Order] in the [Device] tab.

Character code

The GOT uses UTF-16 encoding, and the OMRON NJ or NX series uses UTF-8 encoding.
When you use a string-type OMRON NJ/NX tag, perform encoding conversion (between UTF-16 and UTF-8) and then write or read the tag.
The string length in bytes varies with the encoding format.

- UTF-16

One character takes two bytes.

- UTF-8

One character takes one to three bytes.
A null (one byte) is appended to a string.
As the length of a string in UTF-16 differs from that of the string in UTF-8, an OMRON NJ/NX tag may not be written or read properly.
Set the number of characters to be displayed and the number of bytes for a string-type OMRON NJ/NX tag with consideration of the string length difference between UTF-16 and UTF-8.

Startup time setting

If data is written to or read from an OMRON NJ/NX tag immediately after the OMRON NJ or NX series is turned on, a system alarm may occur.

In such a case, specify a longer time after which the GOT start communicating with the OMRON NJ or NX series by setting [Startup Time(Sec)] of the [Detail Setting] dialog in the controller setting.

☞ Page 775 [Detail Setting] dialog

Station No. switching while an OMRON NJ/NX tag is being used

The station No. switching is not available to the station using an OMRON NJ/NX tag.

Do not use an OMRON NJ/NX tag for the station requiring the station No. switching.

Number of characters of the comment set for an OMRON NJ/NX tag

For an OMRON NJ/NX tag, set a comment in 1024 characters or less.

The 1025th and subsequent characters are not displayed in GT Designer3.

Bit specification of a word device assigned to an OMRON NJ/NX tag

The GOT reads the value of the device in word units, then writes a value to the device in bit units.

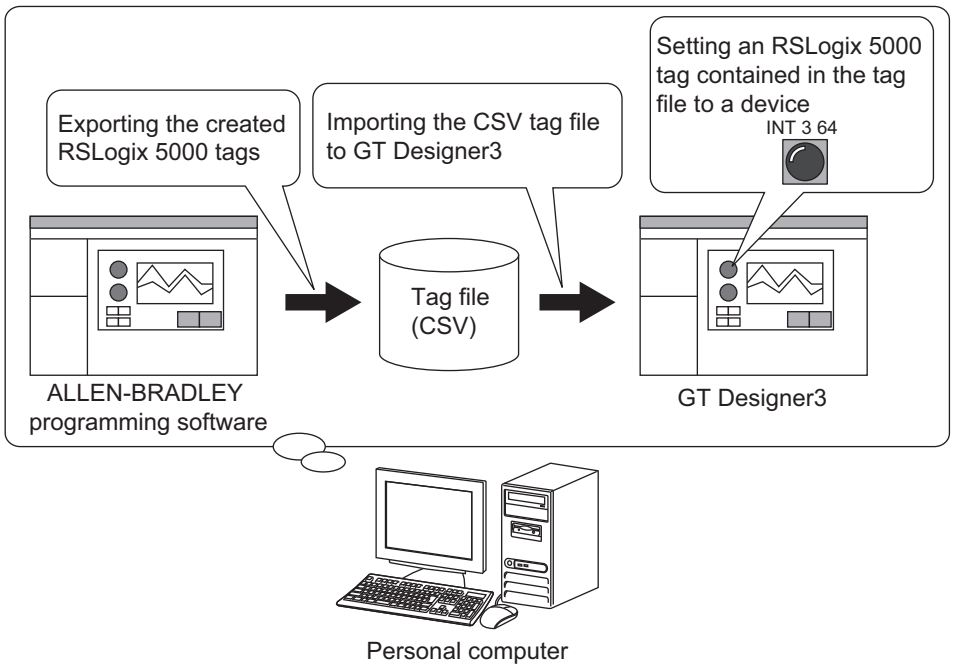
Do not change the device value with a sequence program until the GOT completes writing a value to the device.

19.7 Using RSLogix 5000 tags

GT37 SoftGOT3000

☞ Page 932 Importing a tag file
☞ Page 934 Referring to RSLogix 5000 tags

You can import RSLogix 5000 tags, which are created with ALLEN-BRADLEY programming software, to GT Designer3.
The imported RSLogix 5000 tags are usable in the device setting.



19.7.1 Importing a tag file

GT37 SoftGOT3000

The following shows the procedure for importing a tag file to GT Designer3.

Operating procedure

1. Perform either of the following operations to display the [Label/Tag/Ethernet Setting List] dialog.

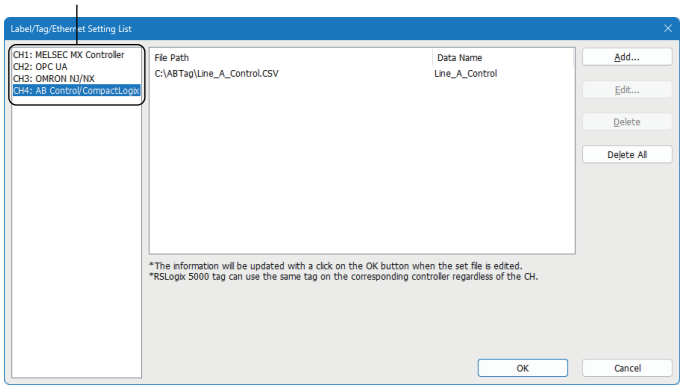
- Select [Project] → [Import Other Data] → [Label/Tag/Ethernet Setting] from the menu.
- Double-click [Import/Setting] under [Label/Tag] → [RSLogix 5000 Tag] in the [Project] window.

2. Select a channel to establish communication with the controller that uses RSLogix 5000 tags.

The channel that supports importing RSLogix 5000 tags is the one in which the following item is selected for [Controller Type] in the [Controller Setting] window.

- [AB Control/CompactLogix]

Select a channel.



3. Click the [Add] button to display the [Add RSLogix 5000 Tag] dialog.

☞ Page 865 [Add RSLogix 5000 Tag] dialog or [Edit RSLogix 5000 Tag] dialog

4. Set the network setting and the file to be imported, and click the [OK] button.

RSLogix 5000 tags are imported to the project.

Specifications of the tag file

■Supported PLCs

GT Designer3 can import tag files created with the following programming software.

PLC type		Model
ALLEN-BRADLEY PLC	ControlLogix series	1756-L, 1756-L1M1, 1756-L1M2, 1756-L1M3, 1756-L61, 1756-L62, 1756-L63, 1756-L64, 1756-L55M12, 1756-L55M13, 1756-L55M14, 1756-L55M16, 1756-L55M22, 1756-L55M23, 1756-L55M24
	CompactLogix series	1769-L31, 1769-L32E, 1769-L32C, 1769-L35E, 1769-L35CR

■Supported software

You can import tag files, which are created with the following programming software, to GT Designer3.

Manufacturer	Software
Rockwell Automation, Inc. (ALLEN-BRADLEY)	RSLogix 5000

■Supported tag

You can import only controller tags with GT Designer3.

Program tags cannot be imported.

Requirements for creating tag files

The following explains the requirements for creating tag files with RSLogix 5000.

■Tag mapping

Map the created RSLogix 5000 tags.

Tags without mapping cannot be set in devices using GT Designer3.

■Tag file format

Create tag files in the CSV format.

GT Designer3 cannot import tag files in formats other than the CSV format.

■Composition of tag files

To import tag files to GT Designer3, the following settings are required.

Set the following fields with RSLogix 5000.

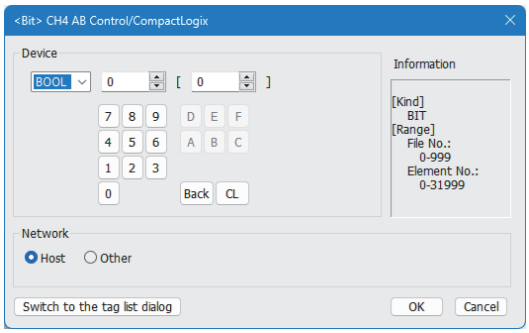
Field	Description	Input example
TYPE	Set the type of the target records. Set the type TAG: the tag type that can be read to GT Designer3 is only the type TAG.	TAG
SCOPE	Leave blank.	-
NAME	Set a tag name. The setting range is 0 to 40 character (s).	tagBOOL
DESCRIPTION	Set the comment of the tag in ASCII characters. The setting range is 0 to 120 character (s).	$0050$004C$0043
DATATYPE	Set the data type and the element number. The setting range of the element number depends on the data type. • INT, DINT, REAL: The setting range is [0] to [1000]. • BOOL: The setting range is [32] to [32000]. The element number must be set in multiples of 32.	BOOL[32]
SPECIFIER	Leave blank.	-
ATTRIBUTES	Set the attribute. RADIX PLCMappingFile or PLC2Mapping can be selected. If this field is PLCMappingFile, set the file number. The setting range of the file number is 0 to 999. 	(PLCMappingFile := 100)

19.7.2 Referring to RSLogix 5000 tags

GT37 SoftGOT3000

The following shows the procedure for setting imported tags into devices.

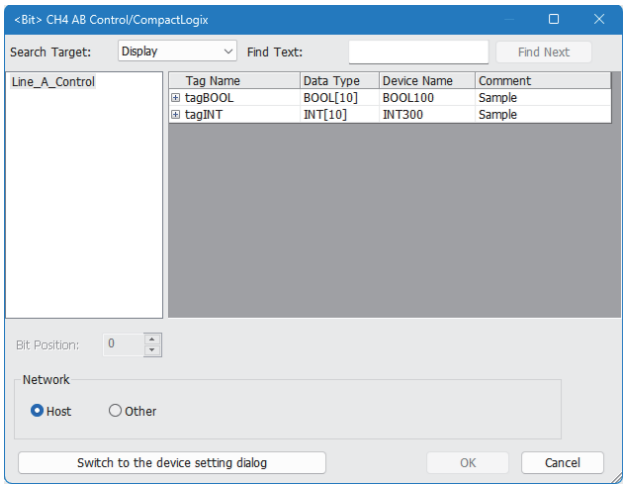
1. Click the [Switch to the tag list dialog] button from the device setting dialog.



2. The tag list dialog (RSLogix 5000 tag) appears.

Set the RSLogix 5000 tag to be used.

☞ Page 935 Tag list dialog (RSLogix 5000 tag)

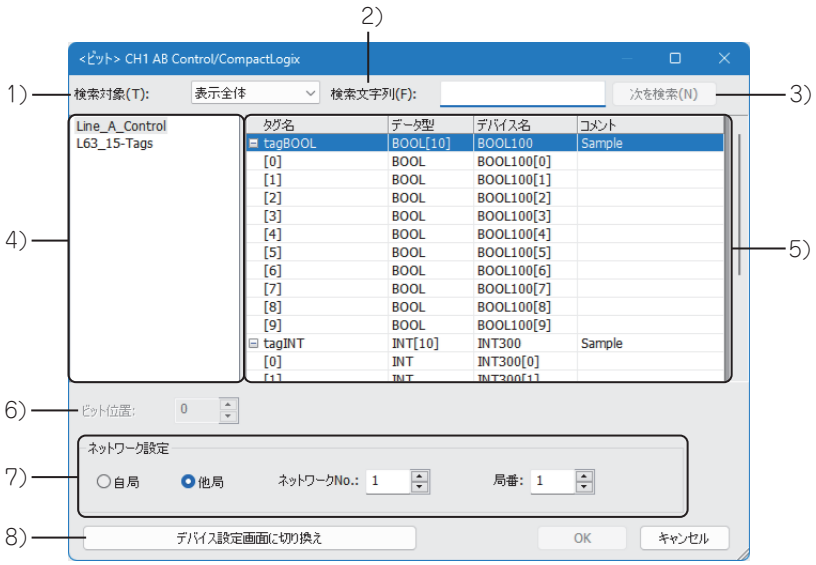


3. Click the [OK] button to complete the RSLogix 5000 tag setting.

19.7.3 Tag list dialog (RSLogix 5000 tag)

GT37 SoftGOT3000

Click the [Switch to the tag list dialog] button in the device setting dialog to display the tag list dialog.



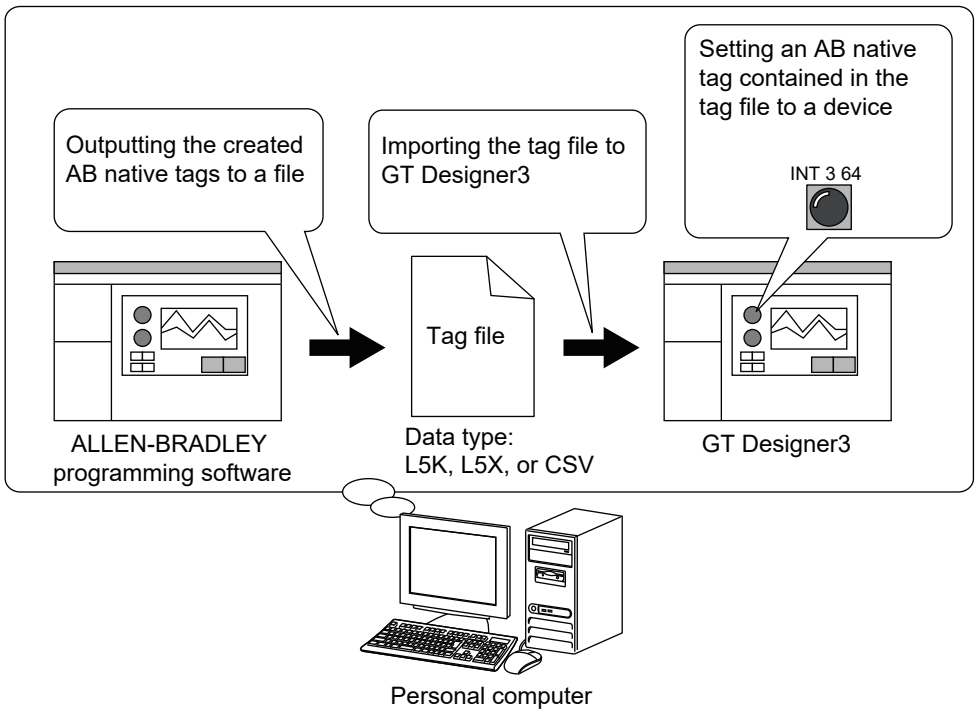
Item		Description
1)	[Find Object]	Select the target item for searching in the tag view.
2)	[Find Characters]	Set a character string to be searched for. The search string is case-insensitive.
3)	[Find Next] button	Searches by the settings in [Search Target] and [Find Text].
4)	Tag file list	The tag files which have been imported to GT Designer3 appear in a list.
5)	Tag list	Displays the contents of the tag file selected in the list.
6)	[Bit Position]	Set a bit position. The setting range is [0] to [15].
7)	[Network Setting]	Set the station No. of the destination controller for monitoring. [Host] or [Other] can be set. When selecting [Other], set [Network No.] and [Station No.].
8)	[Switch to the device setting dialog] button	Switches to the device setting dialog.

19.8 How to set AB native tags

GT37 SoftGOT3000

☞ Page 937 Specifications of AB native tags usable in GT Designer3
☞ Page 940 Procedure to use AB native tags in GT Designer3
☞ Page 941 Importing a tag file
☞ Page 942 Setting an AB native tag in the device setting

You can import AB native tags, which are created with ALLEN-BRADLEY programming software, to GT Designer3.
The imported AB native tags can be set in the device setting.
Using AB native tags enables you to create project without paying attention to the actual devices.



19.8.1 Specifications of AB native tags usable in GT Designer3

GT37 SoftGOT3000

☞ Page 937 Importable files in GT Designer3
☞ Page 937 AB native tags usable in GT Designer3
☞ Page 939 Function unsupported by the AB native tag
☞ Page 939 Specifications for data transfer to the GOT

Importable files in GT Designer3

You can import the tag files created for the following PLCs to GT Designer3.

PLC type		Model
ALLEN-BRADLEY PLC	ControlLogix 5000 series	1756-L, 1756-L1M1, 1756-L1M2, 1756-L1M3, 1756-L55M12, 1756-L55M13, 1756-L55M14, 1756-L55M16, 1756-L55M22, 1756-L55M23, 1756-L55M24, 1756-L61, 1756-L62, 1756-L63, 1756-L64, 1756-L72S, 1794-L33, 1794-L34
	ControlLogix 5000 series	1756-L81E, 1756-L82E, 1756-L83E, 1756-L84E, 1756-L85E
	CompactLogix series	1769-L32E, 1769-L35E

The following shows the software products used to set AB native tags and file formats of the files importable in GT Designer3.

Manufacturer	Software	Extension	Software version
Rockwell Automation, Inc. (ALLEN-BRADLEY)	RSLogix 5000	*.L5K	10, 11, 12, 13, 15, 20, 32
		*.L5X	20, 32
		*.CSV	13 or later

When importing AB native tags that include the following, import a tag file with an extension *.L5K or *.L5X.

- Alias tags that refer to structure-type tags
- Structure-type AB native tags

AB native tags usable in GT Designer3

☞ Page 937 External access
☞ Page 937 Scope
☞ Page 938 Tag name and structure name
☞ Page 938 Tag type
☞ Page 938 Data type
☞ Page 939 Constant value
☞ Page 939 Structure-type AB native tags
☞ Page 939 Array-type AB native tags

■External access

To use AB native tags, select an item other than [None] for the external access.

■Scope

The AB native tags must be defined as follows.

Scope	Description
Controller (global data)	Controller tags. Direct access to the tags is available. The tags are not output to the [SCOPE] column of a CSV file.

PART 6

■Tag name and structure name

A tag name or structure name must satisfy the following requirements.

- A name consists of one-byte alphanumeric characters (A to Z, a to z, 0 to 9) and underscores (_).
- A name begins with a one-byte alphanumeric character (A to Z, a to z) or an underscore (_).
- Up to 40 characters are used for a tag name. (Up to 300 characters can be used for a tag name of a structure.)
- Underscores (_) are not used successively in a name.
- A tag name does not end in an underscore (_).

■Tag type

The following tag types can be used.

- Alias tag
- Base tag
- Produced tag
- Consumed tag

For details, refer to the following.

📖ALLEN-BRADLEY programming software manual

■Data type

The following shows the usable data types.

○: Available, —: Not available

Data type of AB native tag	Device data type or device type on GT Designer3	Bit-specified word device
BOOL	Bit	—
SINT	Signed 8-bit binary	—
	Unsigned 8-bit binary	
INT	Signed 16-bit binary	○
	Unsigned 16-bit binary	
	16-bit binary-coded decimal	—
DINT	Signed 32-bit binary	○
	Unsigned 32-bit binary	
	32-bit binary-coded decimal	—
	Real number (32-bit)	
LINT	Signed 64-bit binary	—
	Unsigned 64-bit binary	
	64-bit binary-coded decimal	
	Real number (64-bit)	
REAL	Signed 32-bit binary	○
	Unsigned 32-bit binary	
	32-bit binary-coded decimal	—
	Real number (32-bit)	
USINT*1	Signed 32-bit binary	—
	Unsigned 32-bit binary	
UINT*1	Signed 16-bit binary	○
	Unsigned 16-bit binary	
	16-bit binary-coded decimal	—
UDINT*1	Signed 32-bit binary	○
	Unsigned 32-bit binary	
	32-bit binary-coded decimal	—
	Real number (32-bit)	
ULINT*1	Signed 64-bit binary	—
	Unsigned 64-bit binary	
	64-bit binary-coded decimal	
	Real number (64-bit)	

Data type of AB native tag	Device data type or device type on GT Designer3	Bit-specified word device
LREAL*1	Signed 64-bit binary	—
	Unsigned 64-bit binary	
	64-bit binary-coded decimal	
	Real number (64-bit)	

*1 Only available to ControlLogix 5580 series.

■Constant value

The AB native tags specified as constants (True) are not usable.

■Structure-type AB native tags

Item	Specifications
Data type	The data type of a structure must be as follows. • String • Predefined data type • Module-defined data type • User-defined data type
Hierarchy of a structure	GT Designer3 supports import of a structure of 15 levels or less. Tag files that contain a structure of 16 levels or more are not imported.
Data type of the structure when it is imported from a CSV file	When a CSV file is imported, the data type of the structure differs depending on the data type name of the structure. • When the data type name contains the word "STRING": String-type structure • When the data type name does not contain the word "STRING": Non-string type structure

■Array-type AB native tags

An array must satisfy the following requirements.

- One-, two-, or three-dimensional array
- For the BOOL data type: One-dimensional array (However, for the BOOL undefined tags, one-, two-, or three-dimensional arrays are usable.)
- For the undefined tags: the subscript for each dimension as shown below

Array	Subscript range
One-dimensional array	0 to 2147483647
Two-dimensional array	0 to 268435455
Three-dimensional array	0 to 262143

Function unsupported by the AB native tag

AB native tags do not support the following functions.

Function unsupported by the AB native tag	Remarks
Station number switching	Station number switching is not available for the GOT to monitor the station that uses AB native tags. Do not use AB native tags for the station requiring station number switching.
Offset	—

Specifications for data transfer to the GOT

When you set AB native tags in the package data and write the data to the GOT, [Write Mode] is not selectable in the [Write Option] dialog.

In this case, [Write Mode] is fixed to [Synchronize].

☞ Page 467 [Write Option] dialog

19.8.2 Procedure to use AB native tags in GT Designer3

GT37 SoftGOT3000

The following shows the procedure from importing AB native tags to setting them in the device setting in GT Designer3.

1. Prepare a file in GT Designer3 with ALLEN-BRADLEY programming software.

For the specifications of the files importable in GT Designer3, refer to the following.

☞ Page 937 Importable files in GT Designer3

For information on how to operate the ALLEN-BRADLEY programming software, refer to the following.

📖ALLEN-BRADLEY programming software manual

2. Import the tag file in GT Designer3.

☞ Page 941 Importing a tag file

3. Set the imported AB native tags in the device setting of an object or others.

☞ Page 942 Setting an AB native tag in the device setting

The AB native tag setting is completed.

Precautions when setting an AB native tag with ALLEN-BRADLEY programming software

■Number of characters of the comment set for an AB native tag

Set the comment in 1024 characters or less for an AB native tag.

The 1025th and subsequent characters are not displayed in GT Designer3.

■AB native tag name

When you use multiple AB native tags whose names are long, the monitoring process may take a longer time.

19.8.3 Importing a tag file

GT37 SoftGOT3000

The following shows the procedure for importing a tag file to GT Designer3.

1. Perform either of the following operations to display the [Label/Tag/Ethernet Setting List] dialog.

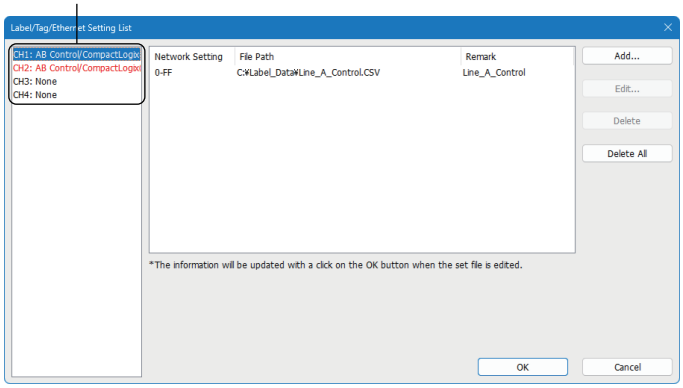
- Select [Project] → [Import Other Data] → [Label/Tag/Ethernet Setting] from the menu.
- In the [Project] window, click [Label/Tag] → [AB Native Tag], and double-click [Import/Setting].

2. Select a channel to establish communication with the controller that uses AB native tags.

The channel that supports importing AB native tags is the one in which the following item is selected for [Controller Type] in the [Controller Setting] window.

- [AB Control/CompactLogix(Tag)

Select a channel.



3. Click the [Add] button to display the [Add AB Native Tag] dialog.

☞ Page 865 [Add AB Native Tag] dialog or [Edit AB Native Tag] dialog

4. Set the network setting and the file to be imported, and click the [OK] button.

AB native tags are imported to the project.

Precautions

■Importing an edited tag file

If you edit the tag file outputted with ALLEN-BRADLEY programming software before importing it in GT Designer3, the tag file may be imported improperly.

■Restriction by the project security

Users who are prohibited from editing by project-wide security cannot import tag files.

For the project security, refer to the following.

☞ Page 2972 Protecting a project by registering users (Project security)

19.8.4 Setting an AB native tag in the device setting

GT37 SoftGOT3000

The following entry methods are available.

Entry method	Description
Directly entering a tag name	☞ Page 942 Directly entering a tag name
Selecting a tag from the tag list	Display the [Select AB Native Tag] dialog, and select one of the registered AB native tags from the list. ☞ Page 837 Selecting a label or tag from the list
Selecting from utilizable data (input assist)	Enter characters in the device entry field in the setting dialog to display utilizable data in the input assist window. You can set an AB native tag simply by selecting it from the utilizable data. ☞ Page 843 Selecting from utilizable data (input assist)

For precautions when setting an AB native tag in the device setting, refer to the following.

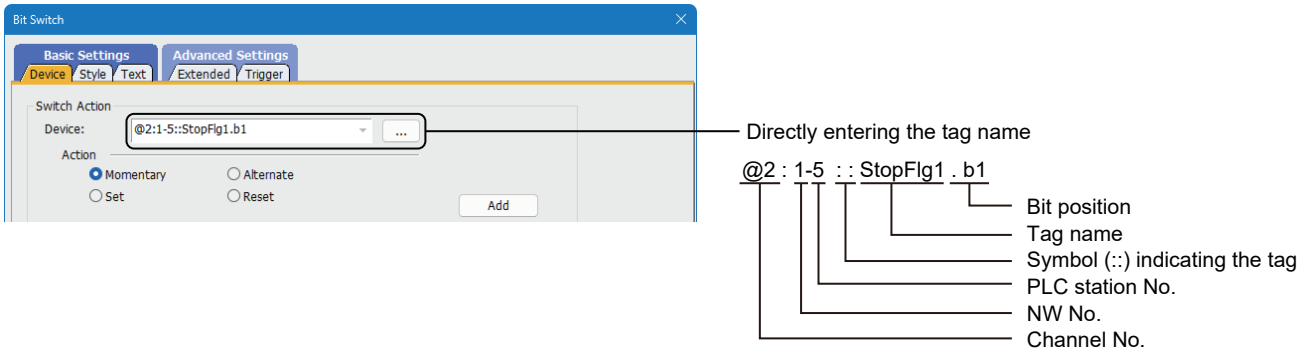
☞ Page 943 Precautions when setting an AB native tag

Directly entering a tag name

Enter an AB native tag name directly in the text box of [Device] in the setting dialog.

At the beginning of the tag name, add a "::" symbol indicating the tag.

When specifying a tag which has not been imported with bit position, available bit positions are b0 to b15.



Precautions

■Data type verification

When you enter the tag name directly, the data type consistency check between the AB native tag and the object or others is not performed automatically.

The data types may be inconsistent between the AB native tag and the object or others.

■String-type AB native tag

When the data type of an AB native tag is string, import the tag and then set the tag by entering its name.

If you do not import the tag before setting it, the data type cannot be recognized as string, and a system alarm occurs.

Precautions when setting an AB native tag

■Checking the data type of the AB native tag

After setting an AB native tag in the device setting of an object or others, performing one of the following changes results in data type inconsistency.

- Changing the data type of the AB native tag
- Manually changing the data type of an object or others

If you perform one of the above, ensure that the data types are consistent between the AB native tag and an object or others. To check the data type, it is recommended to compare the tag file created with RSLogix 5000 with the CSV file exported from [Device List] of GT Designer3.

■Using an AB native tag for the setting that requires multiple devices

To set an AB native tag for the setting that requires consecutive or separate devices, use an AB native tag whose data type is as follows.

- Structure
- String
- Array
- Bit-specified word device

■Unusable AB native tags

The string-type AB native tags of a structure are unusable on the GOT.

■Number of characters when a string-type AB native tag is used

Set an even number of characters to be stored.

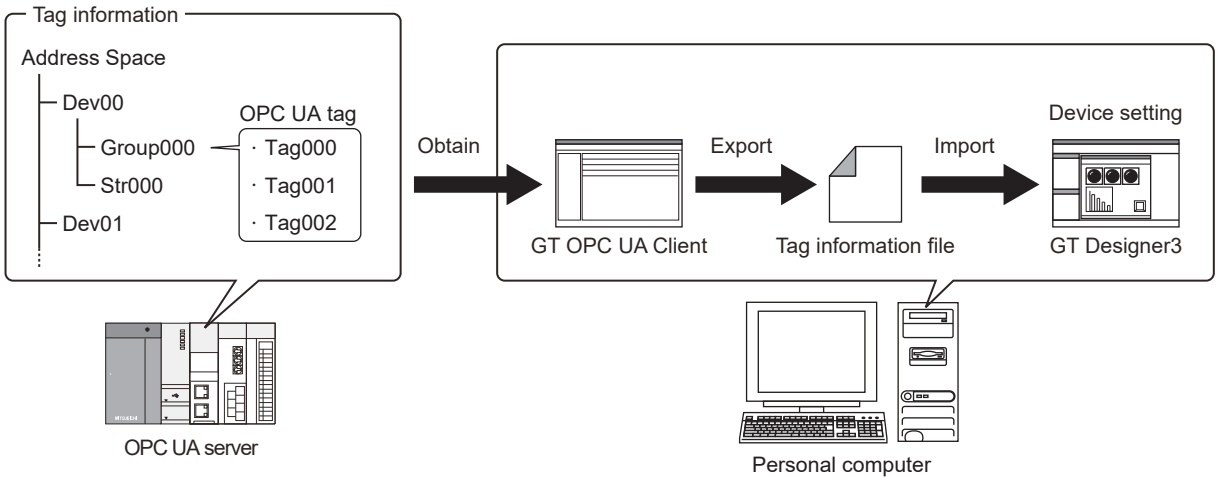
If you set an odd number of characters, some characters may not be monitored.

19.9 How to set OPC UA tags

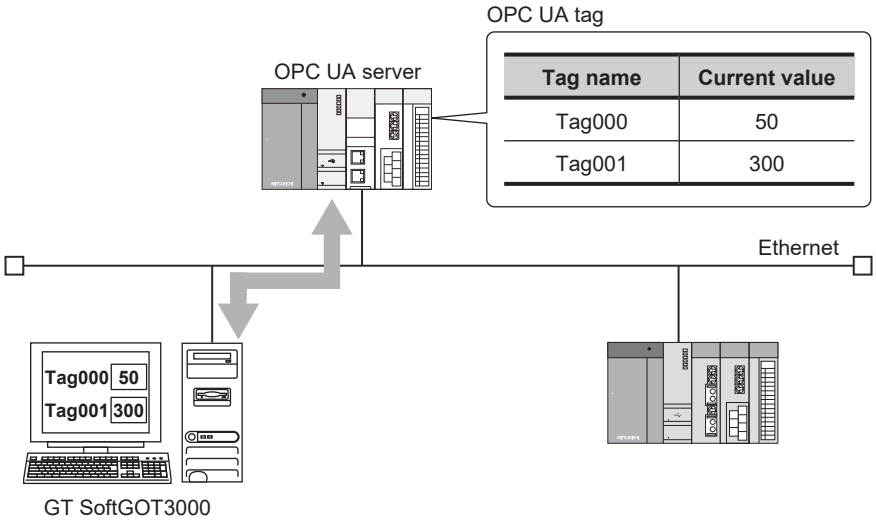
GT37 SoftGOT3000

☞ Page 945 Usable OPC UA tags
☞ Page 950 Importing a tag information file
☞ Page 951 Setting an OPC UA tag
☞ Page 952 Precautions for OPC UA tags

You can specify the OPC UA tags of an OPC UA server in device settings in GT Designer3.
To do this, import the tag information of the OPC UA server to GT Designer3.



The GOT monitors the OPC UA tags of an OPC UA server by using a project in which the tags are set.
For the OPC UA client connection, refer to the following.
📖The manual of the OPC UA client used



19.9.1 Usable OPC UA tags

GT37 SoftGOT3000

The following shows the specifications of tag information files that can be imported and the specifications of usable OPC UA tags.

☞ Page 945 Importable tag information files
☞ Page 945 Characters in the tag names of OPC UA tags
☞ Page 946 Display of OPC UA tags in GT Designer3
☞ Page 946 Supported data types of OPC UA tags
☞ Page 947 Structure
☞ Page 948 Array
☞ Page 949 Offset setting for OPC UA tags

Importable tag information files

Item	Specifications
File format	Tag information file (*.gtuc)
Maximum number of tag information files	One tag information file is imported for each channel. A tag information file is imported for a channel for which [Controller Type] is set to [OPC UA] in the [Controller Setting] window.
Maximum number of OPC UA tags	20480 in one tag information file

Characters in the tag names of OPC UA tags

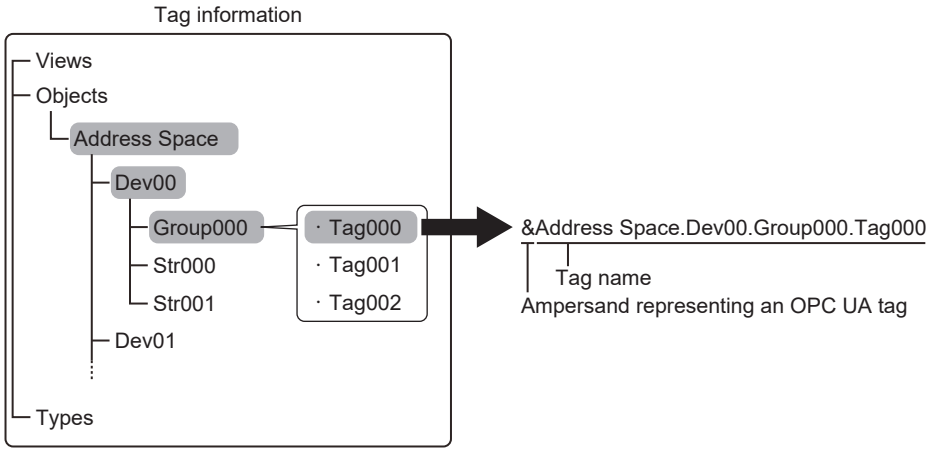
OPC UA tags with the following characters in their names will not be imported.

- " & ( ) . ; { }
- // (Double slash)
- U+0000 to U+001F (C0 control code)
- U+007F (Delete character)
- U+0080 to U+009F (C1 control code)
- One-byte space at the start or end of a tag name
- Two-byte space at the start or end of a tag name

An OPC UA server, GT Designer3, and the GOT use different encoding formats for tag names.
For precautions for encoding formats, refer to the following.
☞ Page 953 Encoding formats used
Case sensitivity differs between an OPC UA server and GT Designer3.
For precautions for case sensitivity, refer to the following.
☞ Page 953 Case sensitivity of tag names

Display of OPC UA tags in GT Designer3

The imported tag information and OPC UA tags are displayed in GT Designer3 as shown below.



In GT Designer3, a tag name includes the names of parent folders (groups and structures) of the tag.

The tag name does not include the folder names "Views", "Objects", and "Types".

The folder names within a tag name are separated by a period (.).

If a tag name includes 532 or more characters (excluding the ampersand), the tag will not be imported.

For arrays, if a tag name includes 553 or more characters including element numbers (excluding the ampersand), the tag will not be imported.

☞ Page 948 Array

Supported data types of OPC UA tags

The following shows the data types of OPC UA tags supported by GT Designer3.

In GT Designer3, select the data types or device types that correspond to the data types of OPC UA tags.

Only the following types of OPC UA tags will be imported to GT Designer3.

Supported data type of OPC UA tags	Data type or device type selectable in GT Designer3	Remarks
Boolean	Bit	The word specification of bit devices is not available.
Int16	Signed 16-bit binary	The bit specification of word devices is not available.
	Unsigned 16-bit binary	
	16-bit binary-coded decimal	
UInt16	Signed 16-bit binary	The bit specification of word devices is not available.
	Unsigned 16-bit binary	
	16-bit binary-coded decimal	
Int32	Signed 32-bit binary	The bit specification of word devices is not available.
	Unsigned 32-bit binary	
	32-bit binary-coded decimal	
	Real	
UInt32	Signed 32-bit binary	The bit specification of word devices is not available.
	Unsigned 32-bit binary	
	32-bit binary-coded decimal	
	Real	
Float	Signed 32-bit binary	The bit specification of word devices is not available.
	Unsigned 32-bit binary	
	32-bit binary-coded decimal	
	Real	
String*1	String	The bit specification of word devices is not available.

*1 An OPC UA server, GT Designer3, and the GOT use different encoding formats for string data.

For precautions for encoding formats, refer to the following.

☞ Page 953 Encoding formats used

For settings requiring consecutive devices or devices that store string data, use the following types of OPC UA tags.

Item	Settable OPC UA tag
Consecutive devices	Use array-type OPC UA tags. Make sure that as many array elements as the required number of consecutive devices are set on an OPC UA server. For precautions for writing data to arrays, refer to the following. ☞ Page 952 Writing data to arrays
Devices that store string data	Use string-type OPC UA tags. Make sure that a data length equivalent to the required number of devices is set for the OPC UA tags on an OPC UA server.

Structure

You can specify the members of a structure in device settings.

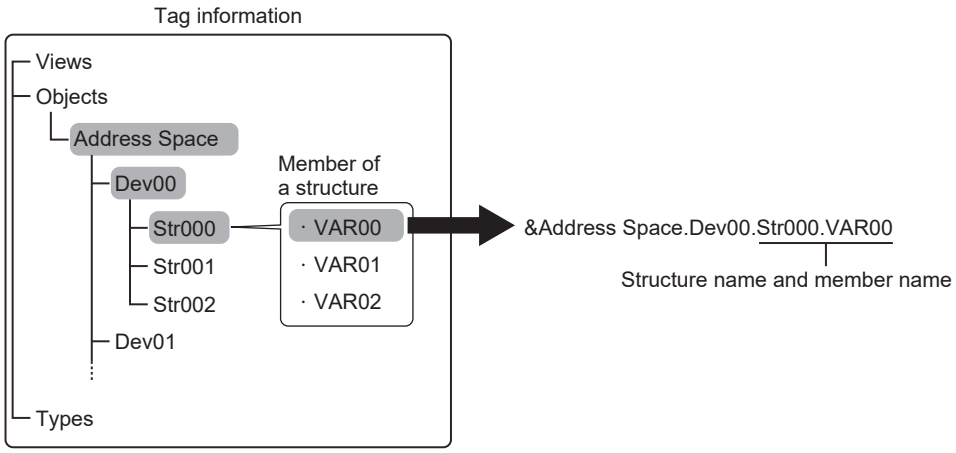
The supported data types of members are the same as the supported data types of usable OPC UA tags.

☞ Page 946 Supported data types of OPC UA tags

A member of a structure is displayed in GT Designer3 as shown below.

Ex.

Display of the VAR00 member of the Str000 structure



The structure name and member name within a tag name are separated by a period (.).

Array

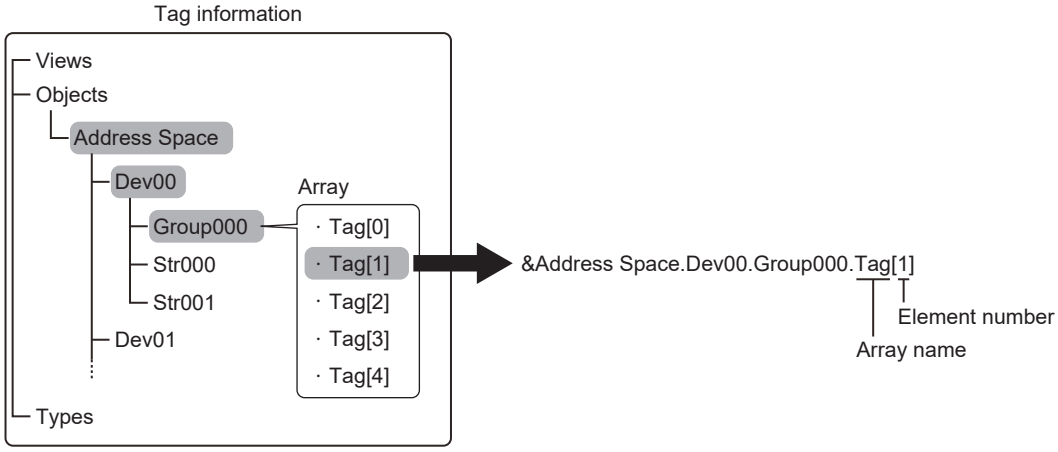
An array must satisfy the following requirements.

Item	Specifications
Number of dimensions	3 or less Tag[0..3,0..5,0..10] Third dimension Second dimension First dimension
Maximum number of elements	65536 regardless of the number of dimensions
Data type	Other than string among the data types of OPC UA tags usable in GT Designer3 ☞ Page 946 Supported data types of OPC UA tags

An array is displayed in GT Designer3 as shown below.

Ex.

Display of array Tag [1]



Regardless of the start element number of an array set on an OPC UA server, GT Designer3 assumes the start element number to be zero.

For precautions for element numbers, refer to the following.

☞ Page 952 Start element number of an array

Offset setting for OPC UA tags

The offset setting is applied to array element numbers.

Ex.

Offset setting for a three-dimensional array

For Tag[0..4,0..4,0..4] set on an OPC UA server

- First dimension: The start element number is 0, and the number of elements is 5.
- Second dimension: The start element number is 0, and the number of elements is 5.
- Third dimension: The start element number is 0, and the number of elements is 5.

OPC UA tag set for an object or others	Offset device value	Offset result
Tag[0,1,1]	2	Tag[0,1,3]
	-1	Tag[0,1,0]
	5	Tag[0,2,1]
	119	A system alarm occurs due to invalid array subscripts.

For an array of structures, the offset setting is not applied to the element numbers.

For an array of members of a structure, the offset setting is applied to the element numbers.

Ex.

Offset setting for a structure

OPC UA tag set for an object or others	Applicability of the offset setting
Str[1].VAR01	The offset setting is not applied to arrays of structures.
Str.VAR01[1]	The offset setting applies to arrays of structure members.

19.9.2 Importing a tag information file

GT37 SoftGOT3000

The following shows the procedure for importing a tag file to GT Designer3.

Operating procedure

1. Perform either of the following operations to display the [Label/Tag/Ethernet Setting List] dialog.

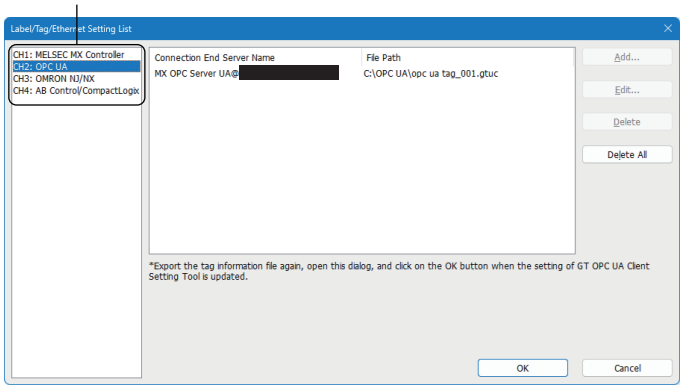
- Select [Project] → [Import Other Data] → [Label/Tag/Ethernet Setting] from the menu.
- Double-click [Import/Setting] under [Label/Tag] → [OPC UA Tag] in the [Project] window.

2. Select a channel to establish communication with the controller that uses OPC UA tags.

The channel that supports importing OPC UA tags is the one in which the following item is selected for [Controller Type] in the [Controller Setting] window.

- [OPC UA]

Select a channel.



3. Click the [Add] button to display the [Add OPC UA Tag] dialog.

Page 866 [Add OPC UA Tag] dialog or [Edit OPC UA Tag] dialog

4. Set the network setting and the file to be imported, and click the [OK] button.

OPC UA tags are imported to the project.

19.9.3 Setting an OPC UA tag

GT37 SoftGOT3000

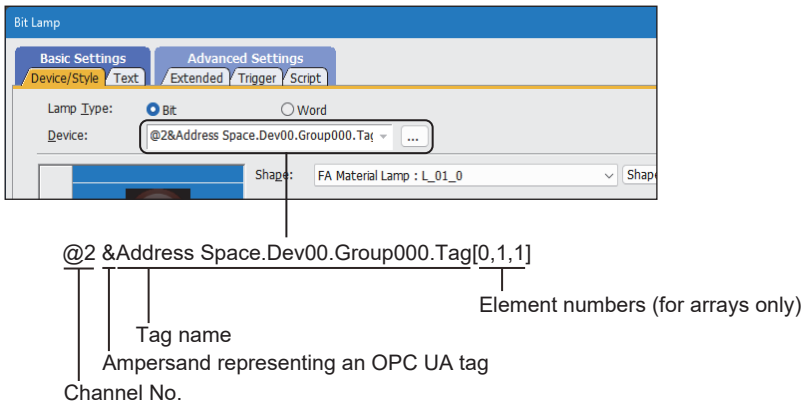
The following setting methods are available.

Entry method	Description
Directly entering a tag name	☞ Page 951 Directly entering a tag name
Selecting a tag from the tag list	Display the [Select OPC UA Tag] dialog, and select one of the registered OPC UA tags from the list. ☞ Page 837 Selecting a label or tag from the list
Selecting from utilizable data (input assist)	Enter characters in the device entry field in the setting dialog to display utilizable data in the input assist window. You can set an OPC UA tag by selecting it from the utilizable data. ☞ Page 843 Selecting from utilizable data (input assist)

Directly entering a tag name

Enter an OPC UA tag name directly in the textbox of [Device] in the setting dialog of an object or others.

Prepend one ampersand (&), which represents an OPC UA tag, to the tag name.



For information on how tag names are displayed in GT Designer3, refer to the following.

☞ Page 946 Display of OPC UA tags in GT Designer3

19.9.4 Precautions for OPC UA tags

GT37 SoftGOT3000

Changing channel settings

If you change the settings of the channel for connecting to an OPC UA server in the [Controller Setting] window, the tag information for the channel will be deleted.

Importing a tag information file if an OPC UA tag is set

After you specify an OPC UA tag as a device, if you import a same-name OPC UA tag of a different data type, the specified tag may be displayed as [??].
If [??] is displayed, specify the relevant OPC UA tag again.

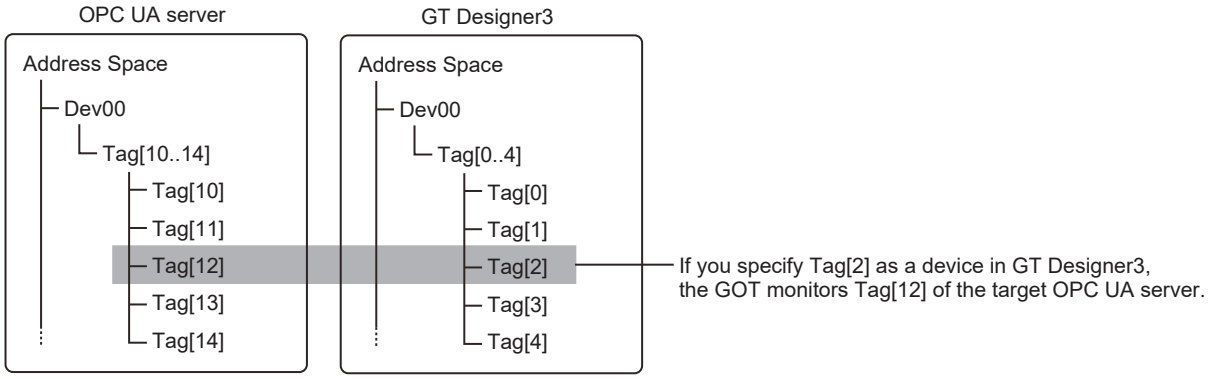
Checking the data types of OPC UA tags

If you change the data type of an object or others, the data types may be inconsistent between the specified OPC UA tag and the object or others.
Check that the data types are consistent between the tag and the object or others.
To check the data type consistency, it is recommended to compare the tag information in GT OPC UA Client and the file exported from [Device List] of GT Designer3.

Start element number of an array

Regardless of the start element number of an array set on an OPC UA server, GT Designer3 assumes the start element number to be zero.
However, the GOT monitors the array with the start element number set on the OPC UA server.

Ex.
Monitoring a one-dimensional array with 5 elements, starting with element number 10
To monitor Tag[12] of the OPC UA server, specify Tag[2] as a device in GT Designer3.



Writing data to arrays

Data is written to the arrays set as consecutive devices only when all the following conditions are satisfied.

- Array element number 0 is set for the start device of consecutive devices.
- The number of array elements set on an OPC UA server equals to the number of consecutive devices set in GT Designer3.

Encoding formats used

An OPC UA server, GT Designer3, and the GOT use different encoding formats.

- OPC UA server: UTF-8
- GT Designer3 and GT SoftGOT3000: UTF-16

Therefore, GT Designer3 and the GOT convert the encoding format of tag names and string data.

The following shows how the data is converted.

Type, software	Tag name	String data
GT Designer3	Changes the encoding format to UTF-16 when importing a tag information file. Does not import OPC UA tags with invalid characters in their names.	-
GOT	Changes the encoding format when accessing an OPC UA tag. (UTF-8←→UTF-16) If invalid characters are included, a system alarm occurs.	Changes the encoding format when accessing an OPC UA tag. (UTF-8←→UTF-16) Converts invalid characters to one-byte spaces (0x20).

Case sensitivity of tag names

Tag names are case-insensitive in GT Designer3.

If tag names are case-sensitive on an OPC UA server, tag names may be duplicated when OPC UA tags are imported to GT Designer3.

Duplicate tags will not be imported.

Data storage order settings when string-type OPC UA tags are set

Configure the following settings for functions that use string-type OPC UA tags.

- Text display object, text input object

Select [Display in order of High -> Low] in the [Extended] tab.

- Text print object

Select [Display in order of High -> Low].

- Recipe function, logging function

Select [Low-->High] for [Storage Order] in the [Device] tab.

19.10 How to Set Device Comments or Device Definitions

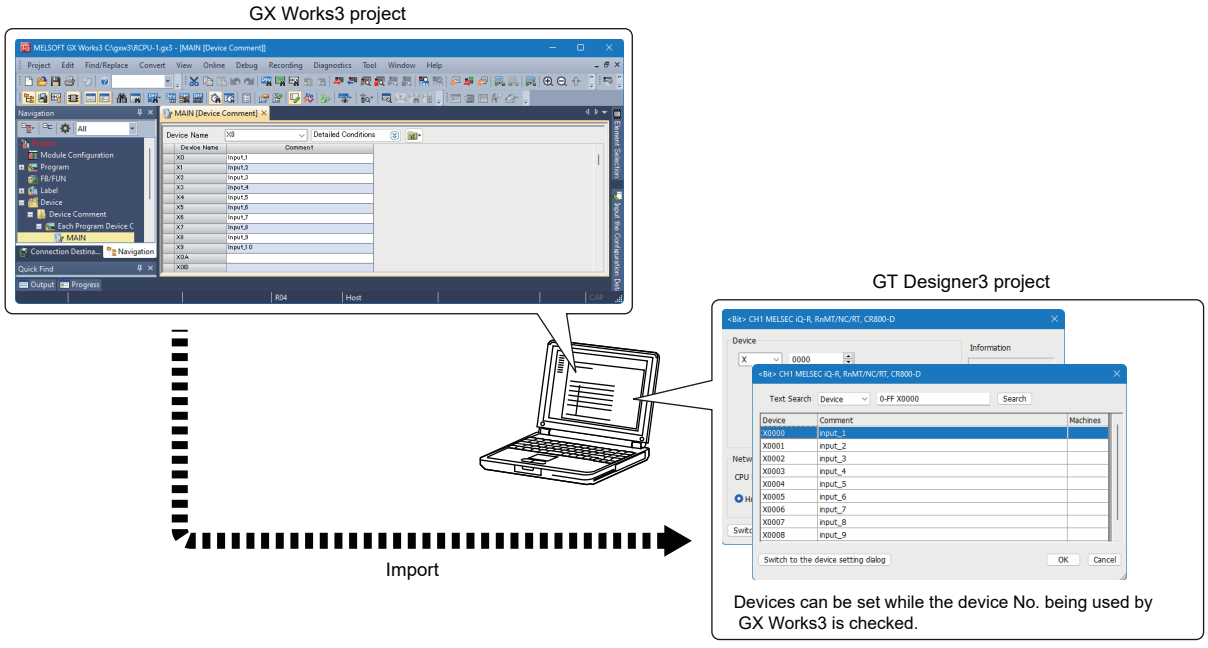
GT37 SoftGOT3000

☞ Page 955 Specifications of the usable device comments in GT Designer3
☞ Page 956 Specifications of the device definitions usable in GT Designer3
☞ Page 957 Importing device comments or device definitions
☞ Page 958 Setting a device by referring to the device comment or device definitions
☞ Page 959 [Device Comment / Device Definition List] dialog
☞ Page 961 Device comment setting dialog
☞ Page 962 Device definition setting dialog

You can retrieve the following device comments or device definitions in the device setting in GT Designer3.

Reference	Description
Device comment	You can set a device by referring to device comments of a MITSUBISHI ELECTRIC PLC or MELIPC. The device comments to be referred to are enabled when the file set with software of the controller is imported to each station connected to the GOT. For the device comments usable in GT Designer3, refer to the following. ☞ Page 955 Specifications of the usable device comments in GT Designer3
Device definition	You can set a device by referring to device definitions of a MITSUBISHI ELECTRIC servo amplifier, inverter, or others. The device definitions to be referred to are enabled when the device definitions are imported to each station connected to the GOT. (Import the device definitions of GT Designer3.) For the device definitions usable in GT Designer3, refer to the following. ☞ Page 956 Specifications of the device definitions usable in GT Designer3

When you set devices, checking the details of the devices used in a sequence program or others helps avoid specifying incorrect device numbers.



19.10.1 Specifications of the usable device comments in GT Designer3

Device comment files importable in GT Designer3

The following shows the software products used to set device comments and file formats of the files importable in GT Designer3.

Software	Extension	Remarks
GX Works3	*.csv	CSV file of the device comments exported with GX Works3 GX Works3 Operating Manual
GX Works2	*.csv	CSV file of the device comments exported with GX Works2 GX Works2 Version 1 Operating Manual (Common)
GX Developer	*.wcd	Device comment file created with GX Developer. The file with the extension of .wcd is created in the GX Developer project. Only a file with the extension of .wcd is required for import in GT Designer3.
MT Developer2	*.csv	CSV file of the device comments exported with MT Developer2 MT Developer2 Help

Importable files depend on the setting of [Controller Type] for each channel in the [Controller Setting] window.

☞ Page 729 [Controller Setting]

The following shows the selectable items for [Controller Type] that support import of device comments.

○: Available, —: Not available

Selectable items for [Controller Type]	Device comment			
	GX Works3	GX Works2	GX Developer	MT Developer2
[MELSEC MX Controller]	○	—	—	—
[MELSEC iQ-R, RnMT/NC/RT, CR800-D]	○	—	—	○
[MELSEC iQ-L]	○	—	—	—
[MELSEC iQ-F]	○	—	—	—
[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]	—	○	○	—
[MELSEC-L]	—	○	○	—
[MELSEC-A]	—	○	○	—
[MELSEC-FX]	—	○	○	—
[MELIPC]	○	—	—	○

Maximum number of importable device comments from a file

Up to 32767 device comments can be imported from one file.

The device comments in the 3rd to 32770th rows in the file are imported.

19.10.2 Specifications of the device definitions usable in GT Designer3

The usable device definitions depend on the setting for [Controller Type] in the [Controller Setting] window.

☞ Page 729 [Controller Setting]

The device definitions of the host station (0-FF or 0-0) are automatically imported according to the setting for [Controller Type].

Automatically imported device definitions are not displayed in the [Device Comment / Device Definition List] dialog.

The following shows the selectable items for [Controller Type] that support import of device definitions.

○: Available, —: Not available

Selectable items for [Controller Type]	Automatic import of device definitions	Manual import of device definitions
[MELSEC MX Controller]	○	—
[MELSEC iQ-R, RnMT/NC/RT, CR800-D]	○	—
[MELSEC iQ-L]	○	—
[MELSEC iQ-F]	○	—
[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]	○	—
[MELSEC-L]	○	—
[MELSEC-A]	○	—
[MELSEC-FX]	○	—
[MELIPC]	○	—
[MELSERVO-JE-*C]	○	○
[MELSERVO-J5(W)-*G(-RJ), -JET-*G]	○	○
[FREQROL 800/E700NE(Batch monitor)]	○ The device definitions of FR-A800-E are imported.	○

19.10.3 Importing device comments or device definitions

GT37 SoftGOT3000

To retrieve device comments or device definitions in the device setting, import them to GT Designer3.
The information on the imported device comments or device definitions is saved in the project.

1. Select [Project] → [Import Other Data] → [Device Comment/Device Definition] from the menu to display the [Device Comment / Device Definition List] dialog.
2. Set the device comments or device definitions to be used.

☞ Page 959 [Device Comment / Device Definition List] dialog

3. Click the [OK] button to complete the import.

Precautions

■Restriction by the project security

Users who are prohibited from editing by project-wide security cannot import device comments, device definitions, and tag files.
For the project security, refer to the following.

☞ Page 2972 Protecting a project by registering users (Project security)

■When editing an imported device comment

If a device comment file is edited, the device comments imported in GT Designer3 are not automatically updated.
To apply the editing of the device comments in GT Designer3, open the [Device Comment / Device Definition List] dialog and click the [OK] button.

☞ Page 959 [Device Comment / Device Definition List] dialog

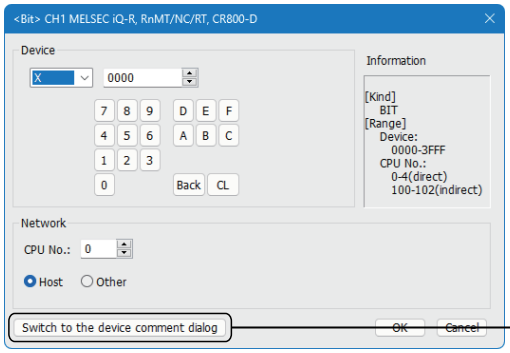
19.10.4 Setting a device by referring to the device comment or device definitions

GT37 SoftGOT3000

☞ Page 958 Setting a device by referring to the setting dialog
☞ Page 958 Using the input assist

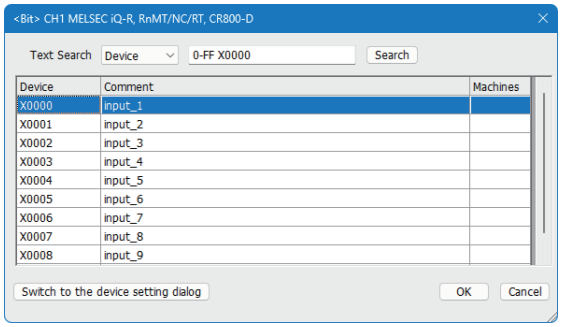
Setting a device by referring to the setting dialog

1. In the device setting dialog, click the [Switch to the device comment dialog] button or [Switch to the device define dialog] button to display the device comment or device definition setting dialog.



2. Search for the device to be used.

☞ Page 961 Device comment setting dialog
☞ Page 962 Device definition setting dialog



3. Select the device and click the [OK] button to complete the device setting.

Using the input assist

Search the device comments or device definitions for a device without opening the setting dialog for device comments or device definitions, and set the device.

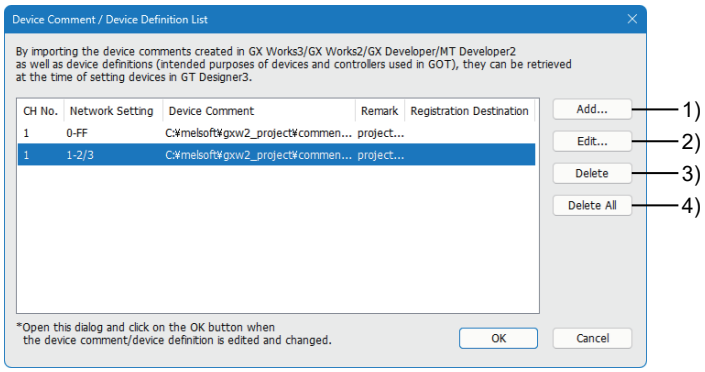
For information on how to use the input assist, refer to the following.

☞ Page 843 Selecting from utilizable data (input assist)

19.10.5 [Device Comment / Device Definition List] dialog

GT37 SoftGOT3000

Select [Project] → [Import Other Data] → [Device Comment/Device Definition] from the menu to display the setting dialog.



Device definitions describe the uses of servo amplifier devices and inverter devices.

For the correspondences between the devices used in the GOT and the data of a servo amplifier or inverter, refer to the following.

☞ Page 3128 Device range and settings of Mitsubishi Electric equipment

Item		Description
1)	[Add] button	Displays the [Add Device Comment / Device Definition] dialog. Add the device comments or device definitions to be retrieved. ☞ Page 960 [Add Device Comment / Device Definition] dialog or [Edit Device Comment / Device Definition] dialog
2)	[Edit] button	Displays the [Edit Device Comment / Device Definition] dialog. Edit the settings to import the device comments or device definitions of the selected controller. ☞ Page 960 [Add Device Comment / Device Definition] dialog or [Edit Device Comment / Device Definition] dialog
3)	[Delete] button	Deletes the selected device comment or device definition.
4)	[Delete All] button	Deletes all device comments or device definitions.

Point

If there is a channel with a Mitsubishi Electric servo amplifier or Mitsubishi Electric inverter selected for [Controller Type] in the controller settings, a device definition with [0-0] set for [Network Setting] is automatically added.

The device definitions can be retrieved in the device definition setting dialog or by the input assist, but cannot be updated and deleted because they are not displayed in the list in the [Device Comment / Device Definition List] dialog.

Precautions

■Influences of changing the GOT type

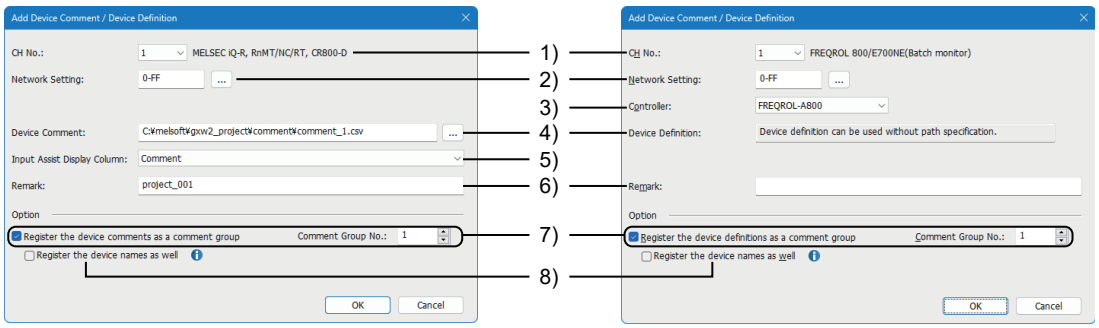
After the GOT type is changed, if the channel number set in the [Device Comment / Device Definition List] dialog cannot be used by the newly set GOT type, the device comments and device definitions of the channel number are deleted.

■Influences of changing the controller type

If the controller type is changed, the device comments and device definitions of the channel number for which the previous model is set are deleted.

[Add Device Comment / Device Definition] dialog or [Edit Device Comment / Device Definition] dialog

GT37 SoftGOT3000



Adding device comments

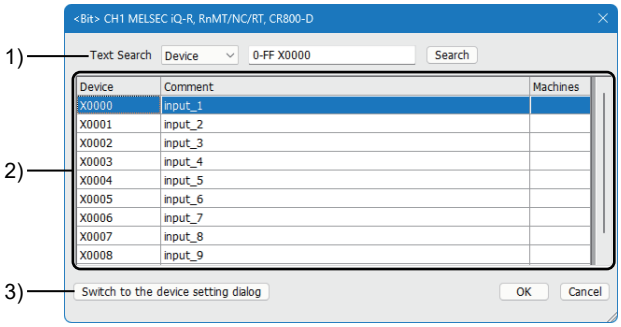
Adding device definitions

Item		Description
1)	[CH No.]	Select the channel number of the controller having the device comments or device definitions to be added.
2)	[Network Setting]	Specify the network of the controller having the device comments or device definitions to be added.
3)	[Controller]	Set this item only for connection to an inverter. Select the controller having the device comments or device definitions to be added.
4)	[Device Comment] [Device Definition]	Set the file necessary to use the device comments. For the specifications of the files importable in GT Designer3, refer to the following. ☞ Page 955 Device comment files importable in GT Designer3 If a MITSUBISHI ELECTRIC servo amplifier or inverter is selected with [CH No.], this setting is unnecessary.
5)	[Input Assist Display Column]	Specify the column of the device comment to be displayed in the input assist. This item is enabled for the channel for which one of the following items is selected for [Controller Type] in the [Controller Setting] window. • [MELSEC MX Controller] • [MELSEC iQ-R, RnMT/NC/RT, CR800-D] • [MELSEC iQ-L] • [MELSEC iQ-F] • [MELIPC]
6)	[Remark]	Set remarks to be displayed in the [Device Comment / Device Definition List] dialog. Up to 200 characters can be set. When the device comments of GX Works2 are imported, the project name of GX Works2 is set.
7)	[Register the device comments as a comment group] [Register the device definitions as a comment group]	Registers the imported device comments or device definitions as a comment group. Set the destination comment group number in [Comment Group No.]. The setting range is [1] to [500]. The data of [Remark] is set to the comment group name. Up to 32 characters can be used for the comment group name, and the 33rd or later characters are not used.
8)	[Register the device names as well]	Registers the device names to the comment group, together with the device comments or the device definitions. The device names are added to column number 30 in the comment group where the device comments are registered.

19.10.6 Device comment setting dialog

GT37 SoftGOT3000

In the device setting dialog, click the [Switch to the device comment dialog] button to display the device comment setting dialog.



Item		Description
1)	[Text Search]	Select the range (category) of the character string and type the character string to search the target device comment. Up to 32 characters can be set.
2)	Device comment list	Displays the device comments that match the search criteria.
3)	[Switch to the device setting dialog] button	Switches the display to the device setting dialog.

Point

If any of the following items has been selected for [Controller Type] in the [Controller Setting] dialog, the buffer memory cannot be searched in the dialog for selecting device comments.

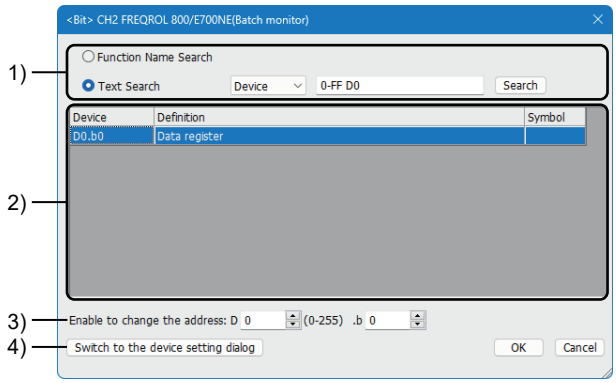
- [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
- [MELSEC-L]
- [MELSEC-FX]

PART 6

19.10.7 Device definition setting dialog

GT37 SoftGOT3000

In the device setting dialog, click the [Switch to the device define dialog] button to display the device definition setting dialog.



Item			Description
1)	Search method	—	Select the method of searching.
		[Function Name Search]	Select a function to search the target device. Depending on the controller, the setting range differs.
		[Text Search]	Select the range (category) of the character string and type the character string to search the target device comment. Up to 32 characters can be set.
2)	Device definition list		Displays the device definitions that match the search criteria.
3)	Changing the address		The device number or axis number of each set device definition is changeable. This item appears when [Controller Type] is set to one of the following items in the [Controller Setting] window and the selected device definition is available. • [MELSERVO-J5(W)-*G(-RJ), -JET-*G] • [FREQROL 800/E700NE(Batch monitor)] The setting range differs depending on the device.
4)	[Switch to the device setting dialog] button		Switches the display to the device setting dialog.

19.11 Offset

GT37 SoftGOT3000

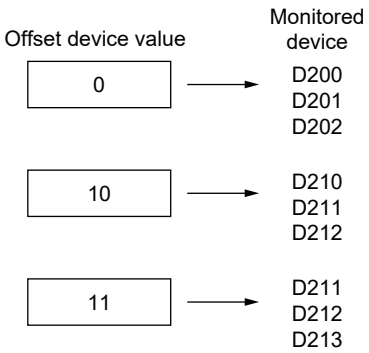
☞ Page 964 Offset specifications
☞ Page 966 Application examples
☞ Page 967 Precautions for the offset

The offset is a function that dynamically changes the device to be monitored during GOT operation.
Multiple target devices for monitoring can be switched according to a single device setting.
The device set for the offset is hereinafter referred to as the offset device.

Ex.

Monitoring the statuses of multiple devices by switching between the devices with a single device
Add offset device values to the devices set in the setting of each object.
Changing an offset device value switches the devices to be monitored by the object.

- Devices set for each object D200, D201, D202
- Offset device D100



19.11.1 Offset specifications

GT37 SoftGOT3000

Functions for which the offset can be set

The following functions allow the offset setting.

For the contents in the setting dialog and the offset target items, refer to the reference for each function.

Function	Reference	Remarks
Touch switch	☞ Page 1191 Placing a touch switch	The offset device value is added to the device number of the device set in [Action List]. The offset setting is available for bit and word switches.
		For the following touch switches, the offset setting is available for the lamp function as well. • Switch • Bit switch • Word switch • Go To Screen switch • Change station No. switch • Key window display switch
Bit lamp Word lamp	☞ Page 1276 Placing a lamp	The offset device value is added to the device number set in [Device] in the [Device/Style] tab.
Numerical display Numerical input	☞ Page 1305 Placing a numerical display or numerical input object	—
Text display Text input	☞ Page 1345 Placing a text display or text input object	—
Bit comment display Word comment display	☞ Page 1386 Placing a comment display	—
Bit parts display Word parts display	☞ Page 1416 Placing a parts display	—
Simple alarm display	☞ Page 1519 Placing a simple alarm display	—
Line graph	☞ Page 1577 Placing a line graph	—
Trend graph	☞ Page 1594 Placing a trend graph	—
Bar graph	☞ Page 1624 Placing a bar graph	—
Band graph	☞ Page 1640 Placing a bar graph	—
Pie graph	☞ Page 1655 Placing a pie graph	—
Scatter graph	☞ Page 1669 Placing a scatter graph	—
Graphical meter	☞ Page 1730 Placing a graphical meter	—
Level	☞ Page 1761 Placing a level object	—
Panel meter	☞ Page 1778 Placing a panel meter	—
Slider	☞ Page 1797 Placing a slider	—
Script	☞ Page 2330 Project script, screen script, script part, and script block ☞ Page 2447 Object script	—
Trigger action	☞ Page 2521 Operating a device as a trigger ([Trigger Action])	If the trigger action is executed in the device value sampling cycle, the cycle in which the offset device value changes must be longer than the cycle in which the trigger action is executed. Example) Sampling cycle (7 s) of the offset device value > Sampling cycle of the trigger action (5 s)
		If using the trigger action, do not place objects for which the offset is specified on the monitor screen. Monitoring of the device for executing the trigger action slows down.

Offset result by data type

The offset result depends on the data type and data length of the device that has been set.

Ex.

When the offset device value is 20, the offset result is as follows.

Data type	Offset result by data length				
	Bit Example) M0	Byte Example) HD100*1	Word Example) D100	Double-word Example) DD100*1	Quad-word Example) QD100*1
Bit	M20	—	D120.b0	DD120.b0	—
Byte (8-bit)	M160 (M160 to M167)	HD120	—	—	—
Word (16-bit)	M320 (M320 to M335)	HD120 (HD120, HD121)	D120	—	—
Double-word (32-bit)	M320 (M320 to M351)	HD120 (HD120 to HD123)	D120 (D120, D121)	DD120	—
Quad-word (64-bit)	—	HD120 (HD120 to HD127)	D120 (D120 to D123)	DD120 (DD120, DD121)	QD120

*1 This is a non-existent device used to indicate the offset result for each data length.

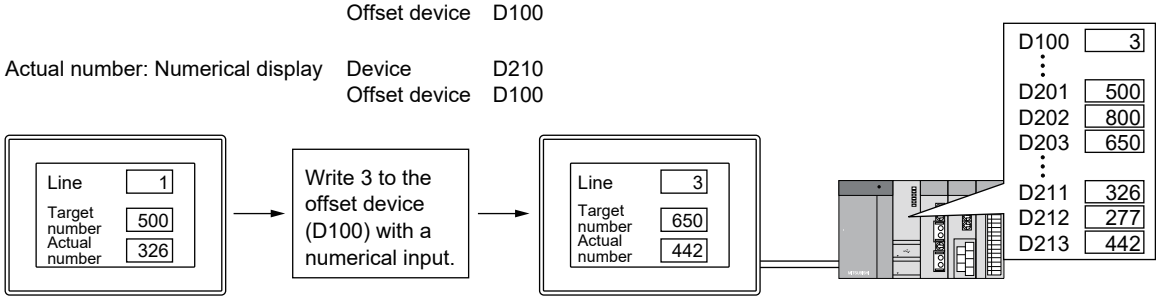
19.11.2 Application examples

GT37 SoftGOT3000

Switching and monitoring multiple line statuses with a single numerical display

☞ Page 1305 Placing a numerical display or numerical input object

Line: Numerical display	Device	D100
Target number: Numerical display	Device	D200
	Offset device	D100
Actual number: Numerical display	Device	D210
	Offset device	D100



"Target number" monitors D201.
(D200 + 1 = D201)
"Actual number" monitors D211.
(D210 + 1 = D211)

"Target number" monitors D203.
(D200 + 3 = D203)
"Actual number" monitors D213.
(D210 + 3 = D213)

Displaying multiple comments by switching them with a single device

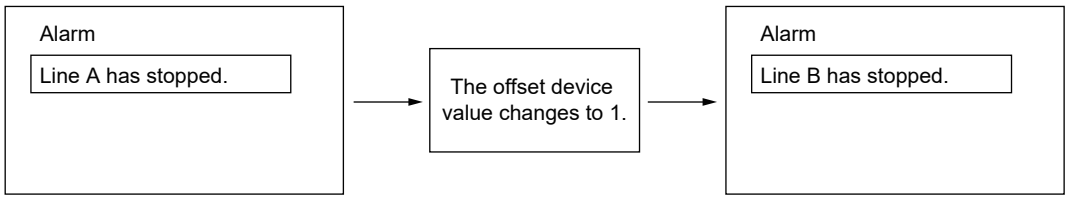
The offset device value is added to the comment number of comments set for a simple alarm display.
To display multiple comments using a simple alarm display in the usual way, you have to set the same number of bit devices with that of comments to be displayed. If the offset is used, multiple comments can be displayed by switching them with a single device.

☞ Page 1519 Placing a simple alarm display

■Offsetting display settings

The offset device value is added to the number associated with the comment to be displayed.

First comment No. : 1
Comment No. offset device : D200



D200 0
Comment 1 is displayed when an alarm occurs.
(First comment No.1 + 0 = 1)

D200 1
Comment 2 is displayed when an alarm occurs.
(First comment No.1 + 1 = 2)

■Offsetting detail display settings

The offset device value is added to the number of the comment (comment window), window screen, and base screen to be displayed as detail displays.

Detail display : Comment window
First comment No. : 1
Comment No. offset device : D200

19.11.3 Precautions for the offset

GT37 SoftGOT3000

Changing the offset value

Monitor devices are read every time the offset value changes.

Frequent changes of the offset value may cause slower monitor speeds.

When the device number is out of the range after the offset

When the device number is out of the range after the offset, monitoring and writing are not performed.

The error can be displayed if a simple alarm display is set.

If multiple devices are monitored in a single graph display, the display depends on the setting of the devices being monitored.

Function	Display method	
Trend graph Line graph Bar graph Band graph Pie graph	When consecutive devices are set	The previous display is held.
	When devices are set randomly	The previous display is held only when the device number is out of the range. Otherwise, the display reflects the offset devices being monitored.
Scatter graph	When consecutive devices are set	The previous display is held.
	When devices are set randomly	The previous display is held.

20 Trigger type settings

GT37 SoftGOT3000

The conditions to run functions such as objects are called trigger types.
The following shows the settings in which a trigger type is to be selected.

Setting having trigger type selection		Description	Reference
Object	Display condition	The display condition is used to set whether to refresh the object display. When the condition is satisfied, the object is refreshed according to the value in the monitored device. When the condition is not satisfied, object refresh is stopped. Example) Displaying the production volume on the numerical display only for the operating line • Bit device that turns on while line 1 is operating: M11 • Bit device that turns on while line 2 is operating: M12 • Bit device that turns on while line 3 is operating: M13 • Numerical display (production volume of line 1): [Trigger Type] = [ON], [Trigger Device] = M11 • Numerical display (production volume of line 2): [Trigger Type] = [ON], [Trigger Device] = M12 • Numerical display (production volume of line 3): [Trigger Type] = [ON], [Trigger Device] = M13  M11: ON → Line 1 is updated. M12: ON → Line 2 is updated. M13: OFF → Hidden M11: ON → Line 1 is updated. M12: OFF → Hidden M13: ON → Line 3 is updated.	☞ Page 969 Trigger types settable for the object display condition
	Operating condition	The operating condition is used to set whether to enable/disable inputs using an object. When the condition of the set trigger type is satisfied, the object is refreshed according to the value in the monitored device and input operation using the object is enabled. When the condition is not satisfied, object refresh and input operation are stopped. Example) Setting a device for interlock to a touch switch • Bit device that turns on when the line is ready to operate: M10 • Touch switch to start operation: [Trigger Type] = [ON], [Trigger Device] = M10  When touched, the operation does not start because the condition is not satisfied. When touched, the operation starts because the condition is satisfied.	☞ Page 976 Trigger types settable for the object operating condition
Functions running in the background		For the functions such as logging and trigger actions running in the background, the execution is controlled.	☞ Page 980 Trigger types of the functions running in the background

20.1 Trigger types settable for the object display condition

GT37 SoftGOT3000

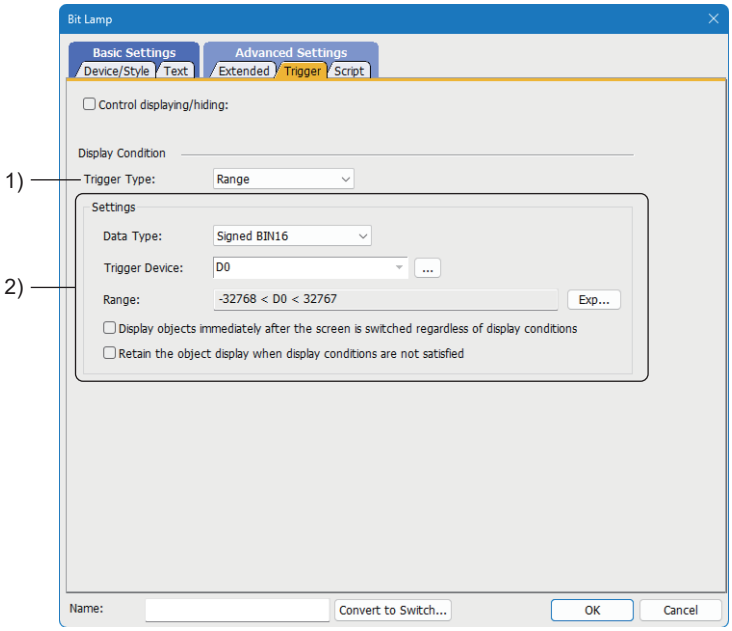
The display condition is used to set whether to refresh the object display.

- When the condition is satisfied: The object is refreshed according to the value in the monitored device.
- When the condition is not satisfied: Object refresh is stopped.

Set the condition to refresh the object display with [Trigger Type].

Ex.

[Trigger] tab in the [Bit Lamp] dialog



Item		Description
1)	[Trigger Type]	Select the condition to refresh the object display. ☞ Page 970 Specifications of the trigger types The settable trigger types depend on the object. ☞ Page 975 Objects and trigger types applicable to the display condition setting
2)	[Settings]	The setting items differ depending on the setting of [Trigger Type].

PART 6

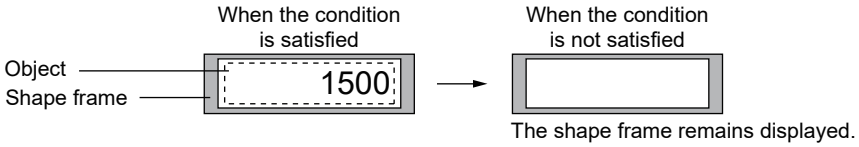
20.1.1 Specifications of the trigger types

The following shows the trigger types settable for the display condition.

[Trigger Type]	Description	Actions for when the condition is satisfied
[Ordinary]	The condition is always satisfied.	The device is monitored and the object display is refreshed. The frequency of refresh varies depending on conditions such as other functions being processed simultaneously.
[ON]*1	The condition is satisfied while the trigger device (bit device) is on. 	The device is monitored and the object display is refreshed. The frequency of refresh varies depending on conditions such as other functions being processed simultaneously. ☞ Page 972 [ON], [OFF]
[OFF]*1	The condition is satisfied while the trigger device (bit device) is off. 	
[Rise]	The condition is satisfied when the trigger device (bit device) is switched from off to on. 	The device is monitored and the object display is refreshed when the condition is satisfied. Other than when the condition is satisfied, the object display is retained. ☞ Page 972 [Rise], [Fall], [Rise/Fall]
[Fall]	The condition is satisfied when the trigger device (bit device) is switched from on to off. 	
[Rise/Fall]	The condition is satisfied when the trigger device (bit device) is switched to on or off. 	
[Sampling]	The condition is first satisfied when the cycle count starts, and thereafter, the condition is satisfied repeatedly at the specified cycle. 	When the condition is satisfied, the object is refreshed. ☞ Page 972 [Sampling]

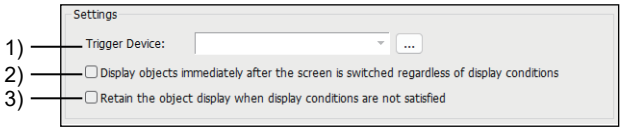
[Trigger Type]	Description	Actions for when the condition is satisfied
[Range]	The condition is satisfied while the value in the trigger device (word device) is within the set range. Example) • [Data Type]: Unsigned 16-bit binary • [Trigger Device]: D1000 • [Range]: 0 < D1000 < 100 	The device is monitored and the object display is refreshed. The frequency of refresh varies depending on conditions such as other functions being processed simultaneously. ☞ Page 973 [Range]
[Bit Trigger]*1	The condition is satisfied when the statuses of two to eight trigger devices (bit devices) match with the conditions (AND or OR). Example) • [Number of Bits]: 3 • [Trigger]: [AND] • [Device]: [Continuous] • Trigger device (1st): X0000 (The condition is satisfied in the ON state.) • Trigger device (2nd): X0001 (The condition is satisfied in the ON state.) • Trigger device (3rd): X0002 (The condition is satisfied in the ON state.) 	The device is monitored and the object display is refreshed. The frequency of refresh varies depending on conditions such as other functions being processed simultaneously. ☞ Page 973 [Bit Trigger]
[ON Sampling]	While the trigger device (bit device) is on, the condition is first satisfied when the cycle count starts, and thereafter, the condition is repeatedly satisfied at the specified cycle. The cycle base point is when switching of the trigger device from off to on is detected. 	The device is monitored and the object display is refreshed when the condition is satisfied. ☞ Page 974 [ON Sampling], [OFF Sampling]
[OFF Sampling]	While the trigger device (bit device) is off, the condition is first satisfied when the cycle count starts, and thereafter, the condition is repeatedly satisfied at the specified cycle. The cycle base point is when switching of the trigger device from on to off is detected. 	

*1 When a shape frame is set to the object, only the shape frame is left and displayed when the object is deleted.



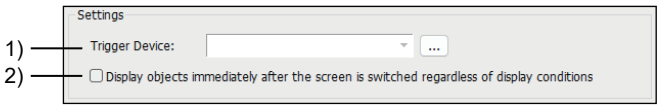
20.1.2 Settings by trigger type

[ON], [OFF]



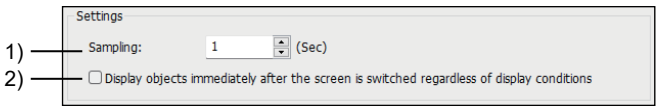
Item		Description
1)	[Trigger Device]	Set a trigger device (bit device). ☞ Page 834 How to set devices, labels, and tags
2)	[Display objects immediately after the screen is switched regardless of display conditions]	The device is monitored and the object display is refreshed immediately after the screen with the object is displayed even though the display condition is not satisfied.
3)	[Retain the object display when display conditions are not satisfied]	The object display is retained even after the display condition becomes unsatisfied.

[Rise], [Fall], [Rise/Fall]



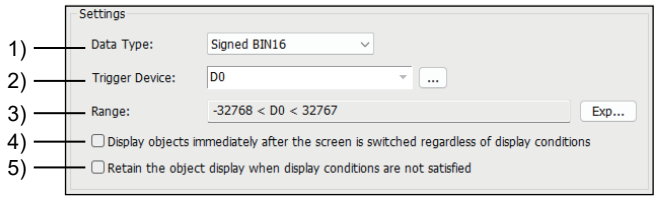
Item		Description
1)	[Trigger Device]	Set a trigger device (bit device). ☞ Page 834 How to set devices, labels, and tags
2)	[Display objects immediately after the screen is switched regardless of display conditions]	The device is monitored and the object display is refreshed immediately after the screen with the object is displayed even though the display condition is not satisfied.

[Sampling]



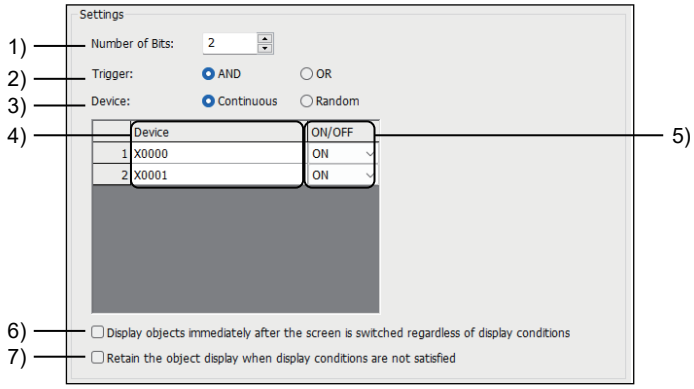
Item		Description
1)	[Sampling]	Set the cycle time to monitor the device and refresh the object. The setting range is [1] second to [3600] seconds.
2)	[Display objects immediately after the screen is switched regardless of display conditions]	The device is monitored and the object display is refreshed immediately after the screen with the object is displayed even though the display condition is not satisfied.

[Range]



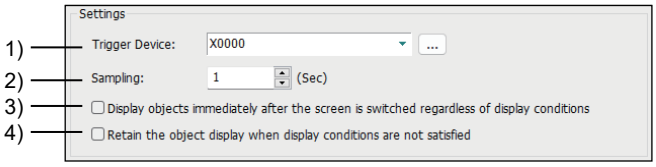
Item		Description
1)	[Data Type]	Select the data type of the trigger device.
2)	[Trigger Device]	Set a trigger device (word device). ☞ Page 834 How to set devices, labels, and tags
3)	[Range]	Range of the device value within which the condition is satisfied. Click the [Range] button, and set the range in the [Edit Range] dialog. ☞ Page 1043 [Edit Range] dialog
4)	[Display objects immediately after the screen is switched regardless of display conditions]	The device is monitored and the object display is refreshed immediately after the screen with the object is displayed even though the display condition is not satisfied.
5)	[Retain the object display when display conditions are not satisfied]	The object display is retained even after the display condition becomes unsatisfied.

[Bit Trigger]



Item		Description
1)	[Number of Bits]	Set the number of trigger devices (bit devices). The setting range is [2] to [8].
2)	[Trigger]	Select trigger conditions of multiple bits. The following shows selectable items. • [AND]: The condition is satisfied when all the [ON/OFF] conditions set to individual devices are satisfied. • [OR]: The condition is satisfied when one or more of the [ON/OFF] conditions set to individual devices are satisfied.
3)	[Device]	Select how to set the multiple devices. Select [Continuous] to set consecutive bit devices as trigger devices. Select [Random] to set non-consecutive bit devices as trigger devices.
4)	[Device]	Set a trigger device (bit device). ☞ Page 834 How to set devices, labels, and tags When selecting [Continuous] for [Device], set the start device of consecutive devices. When selecting [Random] for [Device], set devices one by one.
5)	[ON/OFF]	For each trigger device, set whether the condition is satisfied in the ON or OFF state.
6)	[Display objects immediately after the screen is switched regardless of display conditions]	The device is monitored and the object display is refreshed immediately after the screen with the object is displayed even though the display condition is not satisfied.
7)	[Retain the object display when display conditions are not satisfied]	The object display is retained even after the display condition becomes unsatisfied.

[ON Sampling], [OFF Sampling]



Item		Description
1)	[Trigger Device]	Set a trigger device (bit device). ☞ Page 834 How to set devices, labels, and tags
2)	[Sampling]	Set a cycle at which the device is monitored. The setting range is [1] second to [3600] seconds.
3)	[Display objects immediately after the screen is switched regardless of display conditions]	The device is monitored and the object display is refreshed immediately after the screen with the object is displayed even though the display condition is not satisfied.
4)	[Retain the object display when display conditions are not satisfied]	The object display is retained even after the display condition becomes unsatisfied.

20.1.3 Objects and trigger types applicable to the display condition setting

The following shows the objects having the display condition setting.

The settable trigger types depend on the object.

○: Available, —: Not available

20.2 Trigger types settable for the object operating condition

GT37 SoftGOT3000

The operating condition is used to set whether to enable/disable inputs using an object.

- When the condition is satisfied: The object is refreshed according to the value in the monitored device and input operation using the object is enabled.
- When the condition is not satisfied: Object refresh is stopped and input operation is disabled.

Set the condition to enable/disable inputs by touching a touch switch or using a numerical input object with [Trigger Type].

Point

When the operating condition is not satisfied, the behavior of the key window and cursor for numerical input and text input can be set with [When operating conditions are not satisfied] in one of the following screens.

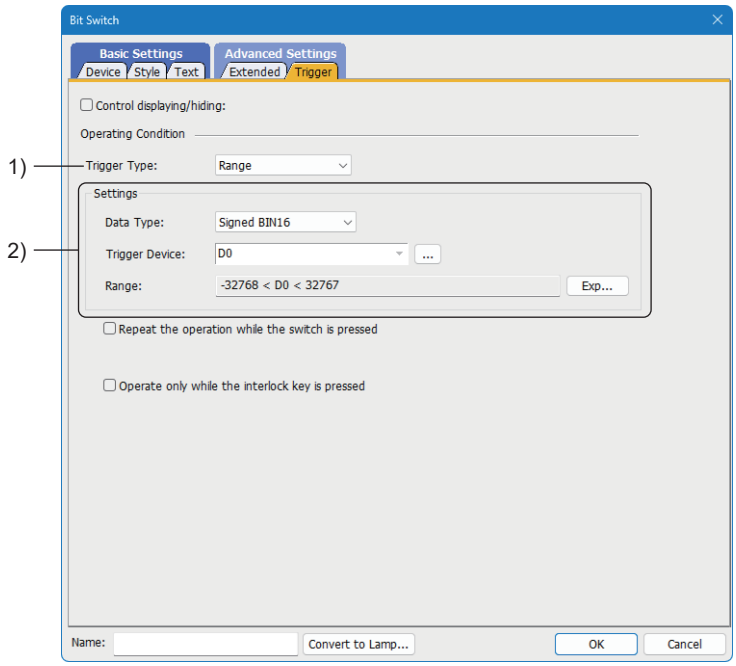
- [Advanced Setting] tab in the [Environmental Setting] window ([Key Window])
- [Key Window Advanced Setting] tab in the [Base Screen Property] dialog
- [Key Window Advanced Setting] tab in the [Window Screen Property] dialog

For details, refer to the following.

☞ Page 572 [Advanced Setting] tab
☞ Page 319 [Key Window Advanced Setting] tab
☞ Page 329 [Key Window Advanced Setting] tab

Ex.

[Trigger] tab in the [Bit Switch] dialog



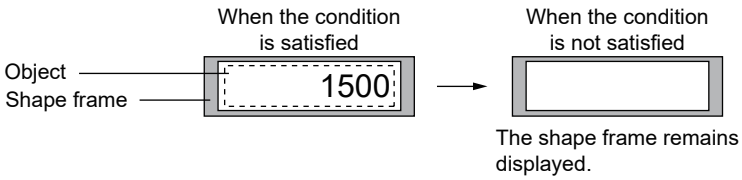
Item		Description
1)	[Trigger Type]	Select the condition to enable/disable inputs using an object. ☞ Page 977 Specifications of the trigger types
2)	[Settings]	The setting items differ depending on the setting of [Trigger Type].

20.2.1 Specifications of the trigger types

The following shows the trigger types settable for the operating condition.

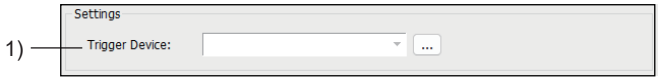
[Trigger Type]	Description	Actions for when the condition is satisfied
[Ordinary]	The condition is always satisfied.	Input using an object is enabled.
[ON]*1	The condition is satisfied while the trigger device (bit device) is on. 	Input using an object is enabled. ☞ Page 978 [ON], [OFF]
[OFF]*1	The condition is satisfied while the trigger device (bit device) is off. 	
[Range]	The condition is satisfied while the value in the trigger device (word device) is within the set range. Example) • [Data Type]: Unsigned 16-bit binary • [Trigger Device]: D1000 • [Range]: 0 < D1000 < 100 	Input using an object is enabled. ☞ Page 978 [Range]
[Bit Trigger]*1	The condition is satisfied when the statuses of two to eight trigger devices (bit devices) match with the conditions (AND or OR). Example) • [Number of Bits]: 3 • [Trigger]: [AND] • [Device]: [Continuous] • Trigger device (1st): X0000 (The condition is satisfied in the ON state.) • Trigger device (2nd): X0001 (The condition is satisfied in the ON state.) • Trigger device (3rd): X0002 (The condition is satisfied in the ON state.) 	Input using an object is enabled. ☞ Page 978 [Bit Trigger]

*1 When a shape frame is set to the object, only the shape frame is left and displayed when the object is deleted.



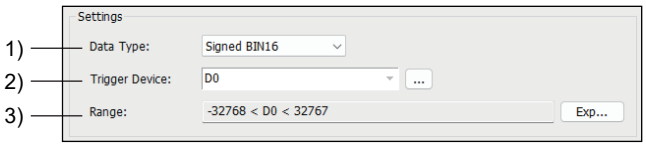
20.2.2 Settings by trigger type

[ON], [OFF]



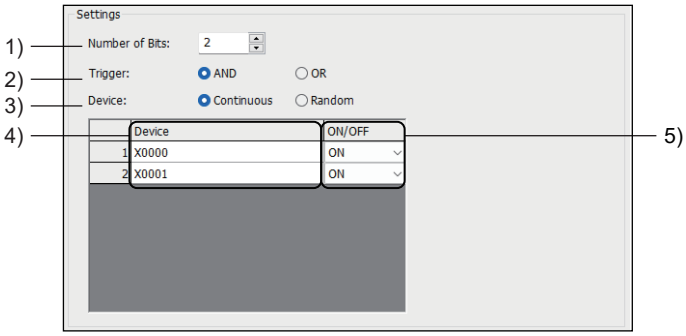
Item		Description
1)	[Trigger Device]	Set a trigger device (bit device). ☞ Page 834 How to set devices, labels, and tags

[Range]



Item		Description
1)	[Data Type]	Select the data type of the trigger device.
2)	[Trigger Device]	Set a trigger device (word device). ☞ Page 834 How to set devices, labels, and tags
3)	[Range]	Range of the device value within which the condition is satisfied. Click the [Range] button, and set the range in the [Edit Range] dialog. ☞ Page 1043 [Edit Range] dialog

[Bit Trigger]



Item		Description
1)	[Number of Bits]	Set the number of trigger devices (bit devices). The setting range is [2] to [8].
2)	[Trigger]	Select trigger conditions of multiple bits. The following shows selectable items. • [AND]: The condition is satisfied when all the [ON/OFF] conditions set to individual devices are satisfied. • [OR]: The condition is satisfied when one or more of the [ON/OFF] conditions set to individual devices are satisfied.
3)	[Device]	Select how to set the multiple devices. Select [Continuous] to set consecutive bit devices as trigger devices. Select [Random] to set non-consecutive bit devices as trigger devices.
4)	[Device]	Set a trigger device (bit device). ☞ Page 834 How to set devices, labels, and tags When selecting [Continuous] for [Device], set the start device of consecutive devices. When selecting [Random] for [Device], set devices one by one.
5)	[ON/OFF]	For each trigger device, set whether the condition is satisfied in the ON or OFF state.

20.2.3 Objects and trigger types applicable to the operating condition setting

The following shows the objects having the operating condition setting.

○: Available, —: Not available

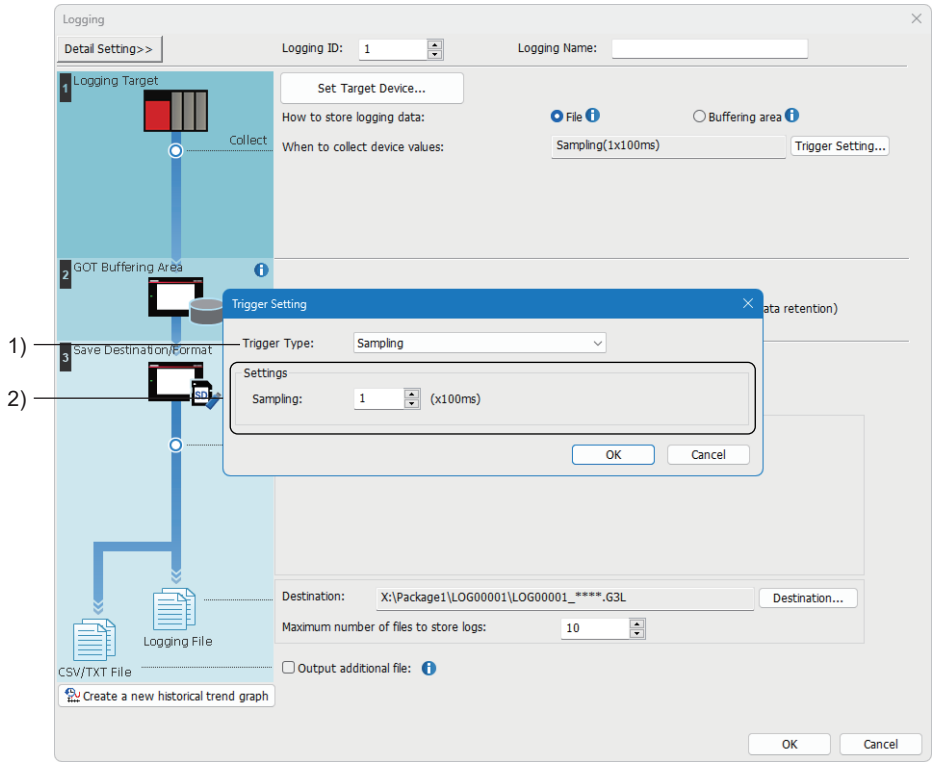
Object	Trigger type			
	Ordinary	ON OFF	Range	Bit Trigger
Touch switch	○	○	○	○
Numerical input	○	○	○	○
Text input	○	○	○	○
Slider	○	○	○	○

20.3 Trigger types of the functions running in the background

GT37 SoftGOT3000

Set a trigger type as the condition to execute functions such as logging and trigger actions running in the background.
Set the condition to control the functions with [Trigger Type].

Ex.
[Trigger Setting] displayed from the [Logging] dialog



Item		Description
1)	[Trigger Type]	Select the function execution condition. ☞ Page 981 Specifications of the trigger types The settable trigger types depend on the function. ☞ Page 986 Functions running in the background and trigger types
2)	[Settings]	The setting items differ depending on the setting of [Trigger Type].

20.3.1 Specifications of the trigger types

The following shows the trigger types settable for the function execution condition.

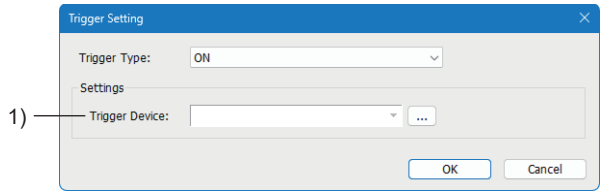
[Trigger Type]	Description	Actions for when the condition is satisfied
[Ordinary]	The condition is always satisfied.	The function is executed repeatedly. The execution cycle varies depending on conditions such as other functions being processed simultaneously.
[When it reached the log storage number]	This item is settable as the storage trigger for the logging function. The condition is satisfied when the number of stored logs has reached the upper limit.	The data in the buffering area is saved to a logging file.
[ON]	The condition is satisfied while the trigger device (bit device) is on. 	While the condition is satisfied, the function is executed repeatedly. The execution cycle varies depending on conditions such as other functions being processed simultaneously. ☞ Page 984 [ON], [OFF], [Rise], [Fall], [Rise/Fall]
[OFF]	The condition is satisfied while the trigger device (bit device) is off. 	
[Rise]	The condition is satisfied when the trigger device (bit device) is switched from off to on. 	When the condition is satisfied, the function is executed. ☞ Page 984 [ON], [OFF], [Rise], [Fall], [Rise/Fall]
[Fall]	The condition is satisfied when the trigger device (bit device) is switched from on to off. 	
[Rise/Fall]	The condition is satisfied when the trigger device (bit device) is switched to on or off. 	
[Sampling]	The condition is first satisfied when the cycle count starts, and thereafter, the condition is satisfied repeatedly at the specified cycle. 	When the condition is satisfied, the function is executed. ☞ Page 984 [Sampling]

[Trigger Type]	Description	Actions for when the condition is satisfied
[Range]	The condition is satisfied while the value in the trigger device (word device) is within the set range. Example) • [Data Type]: Unsigned 16-bit binary • [Trigger Device]: D1000 • [Range]: 0 < D1000 < 100 	While the condition is satisfied, the function is executed repeatedly. The execution cycle varies depending on conditions such as other functions being processed simultaneously. ☞ Page 984 [Range]
[Bit Trigger]	The condition is satisfied when the statuses of two to eight trigger devices (bit devices) match with the conditions (AND or OR). Example) • [Number of Bits]: 3 • [Trigger]: [AND] • [Device]: [Continuous] • Trigger device (1st): X0000 (The condition is satisfied in the ON state.) • Trigger device (2nd): X0001 (The condition is satisfied in the ON state.) • Trigger device (3rd): X0002 (The condition is satisfied in the ON state.) 	While the condition is satisfied, the function is executed repeatedly. The execution cycle varies depending on conditions such as other functions being processed simultaneously. ☞ Page 985 [Bit Trigger]
[ON Sampling]	While the trigger device (bit device) is on, the condition is first satisfied when the cycle count starts, and thereafter, the condition is repeatedly satisfied at the specified cycle. The cycle base point is when switching of the trigger device from off to on is detected. 	When the condition is satisfied, the function is executed. ☞ Page 985 [ON Sampling], [OFF Sampling]
[OFF Sampling]	While the trigger device (bit device) is off, the condition is first satisfied when the cycle count starts, and thereafter, the condition is repeatedly satisfied at the specified cycle. The cycle base point is when switching of the trigger device from on to off is detected. 	
[When closing a screen]	This item is settable for the screen script execution condition. The condition is satisfied when the screen with a screen script set is closed.	The screen script is executed.

[Trigger Type]	Description		Actions for when the condition is satisfied
[Device Writing]	This item is settable for the object script (touch switch) execution condition. When a touch switch with [Bit] or [Word] set for the switch action is touched, the condition is satisfied.		When the condition is satisfied, the function is executed.
[View Change]	The condition is satisfied when the object display is changed.		When the condition is satisfied, the function is executed.
[Synchronize Display Trigger]	The condition is satisfied when the condition of the trigger type set as the object display condition is satisfied.		When the condition is satisfied, the function is executed.
[Key Code Input]	The condition is satisfied when a key code is input to an object. The following shows the applicable key codes.		When the condition is satisfied, the function is executed.
	Numerical input	• 0008h: [Delete one rightmost and shift one to right] • 0088h: [Delete value being input] • 002Dh: ["+/-"(Reverse),"-"(Minus, Hyphen)] • 002Eh: ["."(Dot, Period)] • ASCII code • Shift JIS kanji code	
	Text input	• 0008h: [Delete one rightmost and shift one to right] • 0088h: [Delete value being input] • ASCII code • Shift JIS kanji code • GB code • KS code • Big5 code • Unicode	
[Input Fixation]	When the input value is input, and the input is confirmed with key code 000Dh ([Write to the device and move the cursor]), the condition is satisfied. If the input value is not input, the condition is not satisfied.		When the condition is satisfied, the function is executed.

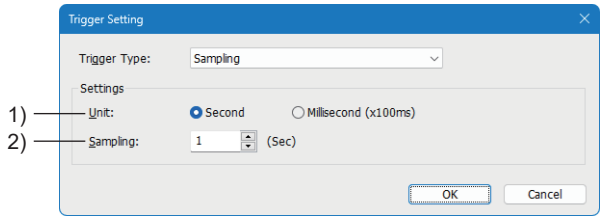
20.3.2 Settings by trigger type

[ON], [OFF], [Rise], [Fall], [Rise/Fall]



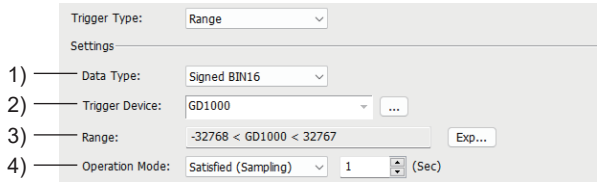
Item		Description
1)	[Trigger Device]	Set a trigger device (bit device). ☞ Page 834 How to set devices, labels, and tags

[Sampling]



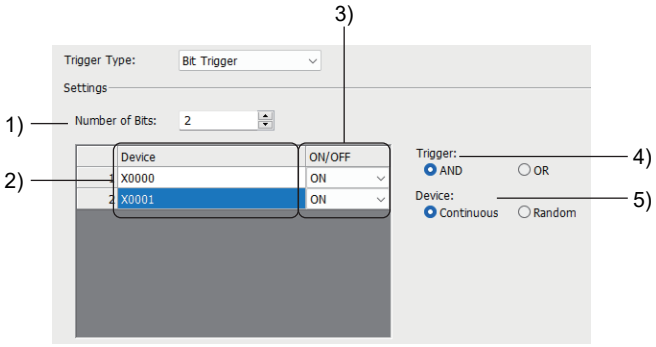
Item		Description	
1)	[Unit]	This item appears when the [Trigger Setting] dialog is opened from the [Edit Script] dialog. Select the unit of the cycle time to execute the script.	
2)	[Sampling]	Set the cycle time to execute the function. The setting range depends on the function.	
		Script	When [Second] is selected for [Unit]: [1] second to [3600] seconds When [Millisecond (x100ms)] is selected for [Unit]: [1] × 100 ms to [600] × 100 ms
		Logging (logging trigger)	[1] x 100 ms to [36000] x 100 ms
		Logging (storage trigger)	[1] minute to [1440] minutes

[Range]



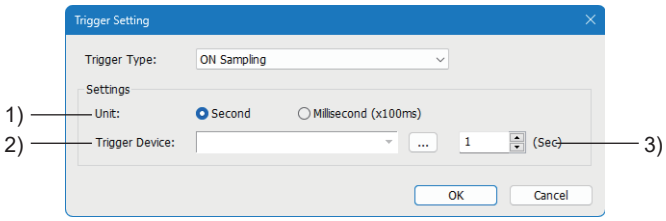
Item		Description
1)	[Data Type]	Select the data type of the trigger device.
2)	[Trigger Device]	Set a trigger device (word device). ☞ Page 834 How to set devices, labels, and tags
3)	[Range]	Range of the device value within which the condition is satisfied. Click the [Range] button, and set the range in the [Edit Range] dialog. ☞ Page 1043 [Edit Range] dialog
4)	[Operation Mode]	This item appears when condition 1 is set in the [Trigger/Action] dialog of the trigger action. Select an operation mode of when the condition is satisfied. To execute the function repeatedly while the condition is satisfied, select [Satisfied]. To execute the function in the specified cycle while the condition is satisfied, select [Satisfied (Sampling)]. The setting range for the cycle time is [1] (second) to [3600] (seconds).

[Bit Trigger]



Item		Description
1)	[Number of Bits]	Set the number of trigger devices (bit devices). The setting range is [2] to [8].
2)	[Device]	Set a trigger device (bit device). ☞ Page 834 How to set devices, labels, and tags When selecting [Continuous] for [Device], set the start device of consecutive devices. When selecting [Random] for [Device], set devices one by one.
3)	[ON/OFF]	For each trigger device, set whether the condition is satisfied in the ON or OFF state.
4)	[Trigger]	Select trigger conditions of multiple bits. The following shows selectable items. • [AND]: The condition is satisfied when all the [ON/OFF] conditions set to individual devices are satisfied. • [OR]: The condition is satisfied when one or more of the [ON/OFF] conditions set to individual devices are satisfied.
5)	[Device]	Select how to set the multiple devices. Select [Continuous] to set consecutive bit devices as trigger devices. Select [Random] to set non-consecutive bit devices as trigger devices.

[ON Sampling], [OFF Sampling]



Item		Description	
1)	[Unit]	This item appears when the [Trigger Setting] dialog is opened from the [Edit Script] dialog. Select the unit of the cycle time to execute the script.	
2)	[Trigger Device]	Set a trigger device (bit device). ☞ Page 834 How to set devices, labels, and tags	
3)	Cycle time	Set the cycle time to execute the function. The setting range depends on the function.	
		Script	When [Second] is selected for [Unit]: [1] second to [3600] seconds When [Millisecond (x100ms)] is selected for [Unit]: [1] × 100 ms to [600] × 100 ms
		Logging (logging trigger)	[1] x 100 ms to [36000] x 100 ms
		Logging (storage trigger)	[1] minute to [1440] minutes

21 Color settings

GT37 SoftGOT3000

Set colors for objects, figures, and characters.

GT Designer3 provides 16.77 million of colors that can be set.

☞ Page 988 Color settings

☞ Page 989 Color palette

21.1 Color settings

GT37 SoftGOT3000

Click the display area or the button to set a color in the setting dialog to display the color palette.

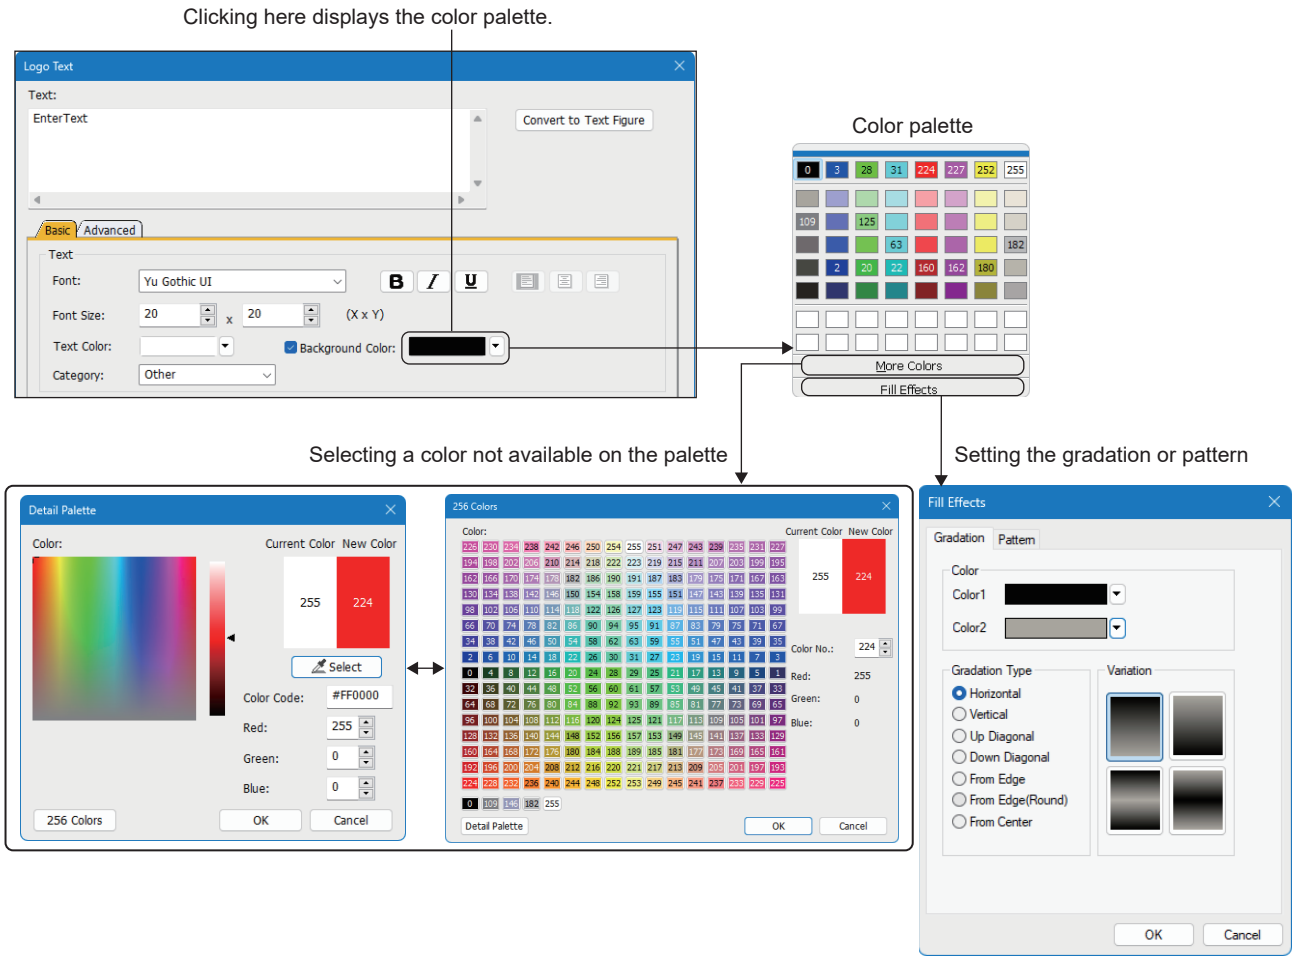
Select a color from the color palette.

☞ Page 989 Color palette

If the intended color is not displayed on the color palette, click the [More Color] button on the palette to open the dialog, and select the color.

For the background color of the screen or logo text, the gradation or pattern can be set.

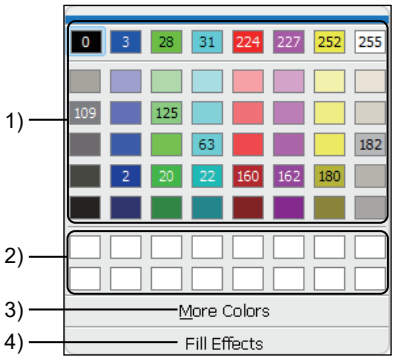
☞ Page 992 [Fill Effects] dialog



21.2 Color palette

GT37 SoftGOT3000

Select a color from the basic colors or recently used colors.



Item		Description
1)	Basic colors	Select a color to be displayed.
2)	Recently used colors	Select a color to be displayed. When you specify a color in the dialog displayed with the [More Color] button, the color is added to the color palette. The colors existing in the palette will not be added as a new one.
3)	[More Color] button	Displays the [Detail Palette] dialog. ☞ Page 990 [Detail Palette] dialog
4)	[Fill Effects] button	This button appears only for the background color in the following dialogs. • Screen Property • [Screen Design] dialog • [Logo Text] dialog Displays the [Fill Effects] dialog. Set the gradation or pattern. ☞ Page 992 [Fill Effects] dialog

PART 6

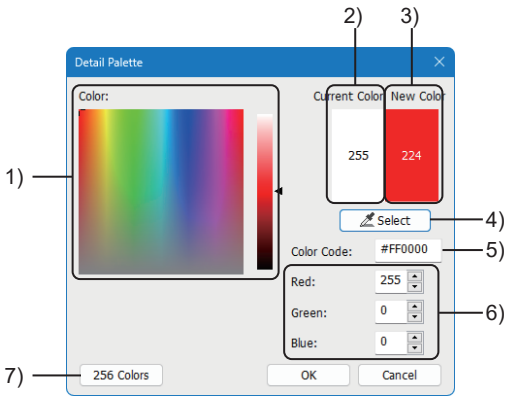
21.2.1 [Detail Palette] dialog

GT37 SoftGOT3000

Select a color from the 16.77 million colors.

To display this dialog, perform either of the following operations.

- Click the [More Colors] button on the color palette.
- Click the [Detail Palette] button in the [256 Colors] dialog.



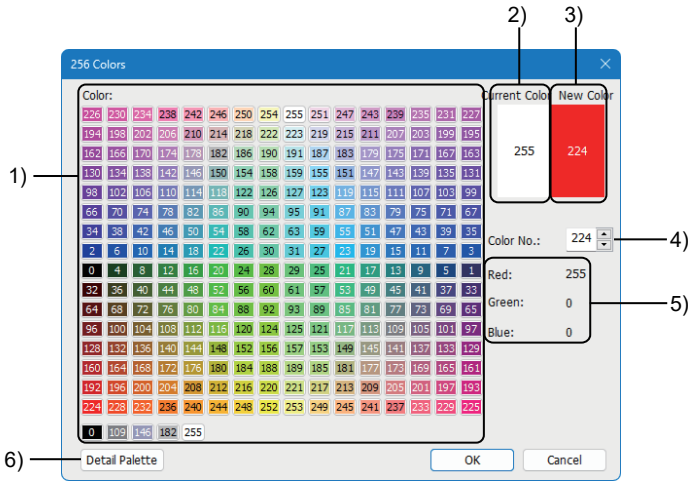
Item			Description
1)	[Color]		Select a color to be displayed.
2)	[Current Color]		Displays the currently set color.
3)	[New Color]		Displays the color set in the following setting items. • [Color] • [Select] button • [Color Code] • RGB value
4)	[Select] button		Changes the shape of the mouse cursor to a dropper and displays the color of the clicked position in [New Color]. When you move the mouse cursor with the display of the dropper, the color on which the cursor is placed is displayed in [New Color].
5)	[Color Code]		Specify a color code to set the color to be displayed. The setting range is [#000000] to [#FFFFFF]. The color code consists of the following elements. #00FF00 Value of blue (hexadecimal) Value of green (hexadecimal) Value of red (hexadecimal) Symbol for color codes
6)	RGB value	—	Set a color to be displayed with three colors: red, green, and blue.
		[Red]	Set the value for red. The setting range is [0] to [255].
		[Green]	Set the value for green. The setting range is [0] to [255].
		[Blue]	Set the value for blue. The setting range is [0] to [255].
7)	[256 Colors] button		Switches the dialog to the [256 Colors] dialog. If a color which cannot be displayed with 256 colors is set, the color is changed to an approximate color in 256 colors when the dialog is switched to the [256 Colors] dialog.

21.2.2 [256 Colors] dialog

GT37 SoftGOT3000

Select a color from the 256 colors.

This dialog is displayed by clicking the [256 Colors] button in the [Detail Palette] dialog.



Item		Description
1)	[Color]	Select a color to be displayed.
2)	[Current Color]	Displays the currently set color.
3)	[New Color]	Displays the color set in the following setting items. • [Color] • [Color No.]
4)	[Color No.]	Specify a color to be displayed with its number from 256 colors. The setting range is [0] to [255].
5)	RGB value	Indicates the numerical values of red, green, and blue for the selected color.
6)	[Detail Palette] button	Switches the dialog to the [Detail Palette] dialog.

21.2.3 [Fill Effects] dialog

GT37 SoftGOT3000

Set the fill effects, such as the gradation or pattern.

To apply the setting configured on a tab, click the [OK] button on the tab.

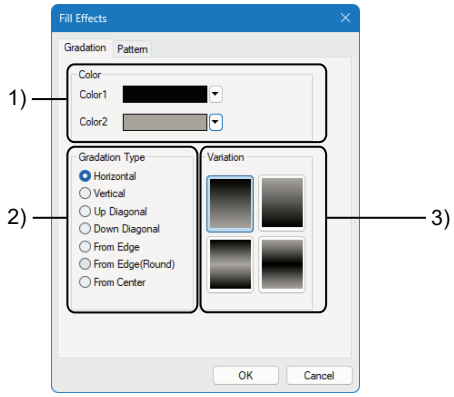
The gradation and pattern cannot be set at the same time.

This dialog is displayed by clicking the [Fill Effects] button on the color palette.

☞ Page 992 [Gradation] tab

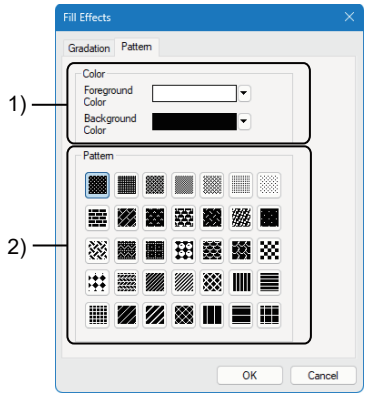
☞ Page 992 [Pattern] tab

[Gradation] tab



Item		Description
1)	[Color]	Select two gradient colors. ☞ Page 989 Color palette
2)	[Gradation Type]	Select a gradation type. The selectable items vary by the setting target item (background color of the logo text or background color of the screen).
3)	[Variation]	Select a gradient to be applied. The displayed gradients vary depending on the setting of [Gradation Type].

[Pattern] tab



Item			Description
1)	[Color]	—	Select a foreground color and a background color for the pattern.
		[Foreground Color]	Pattern foreground color. ☞ Page 989 Color palette
		[Background Color]	Pattern background color. ☞ Page 989 Color palette
2)	[Pattern]		Select a pattern.

22.1.1 List of figures

GT37 SoftGOT3000

Figure	Description	Reference
Text	Draw a text figure.	☞ Page 1132 Drawing a text figure
Logo text	Draws text with an outline or gradient.	☞ Page 1135 Drawing a logo text figure
Line	Draws a line.	☞ Page 1141 Drawing a Line
Line freeform	Draws a freeform line with connected vertices.	☞ Page 1145 Drawing a Line Freeform
Rectangle	Draws a rectangle or square.	☞ Page 1149 Drawing a Rectangle
Polygon	Draws a polygon.	☞ Page 1153 Drawing a Polygon
Circle	Draws a circle.	☞ Page 1157 Drawing a Circle
Arc	Draws an arc.	☞ Page 1161 Drawing an Arc or a Sector
Sector	Draws a sector.	
Table	Draws a table.	☞ Page 1163 Drawing a Table
Scale	Draws a scale.	☞ Page 1167 Drawing a Scale
Piping	Draws a piping.	☞ Page 1169 Drawing a Piping
Paint	Fills the area or figure enclosed by lines with the specified color.	☞ Page 1173 Filling the framed area of the figure
Import Image Data	Import an image file to GT Designer3, and paste it on the screen.	☞ Page 1177 Pasting an image file
Import DXF Data	Import the data of the DXF file (AutoCAD Data Exchange Format file) to GT Designer3, convert the data into the figure data of GT Designer3, and paste it on the screen.	☞ Page 1184 Pasting DXF Data
Import IGES Data	Import IGES data (Data Exchange Format among CADs) to GT Designer3, convert the data into the figure data of GT Designer3, and paste it on the screen.	☞ Page 1187 Pasting IGES Data

22.1.2 List of objects

GT37 SoftGOT3000

The following shows the list of objects.

The maximum number of objects on one screen depends on the object.

Object		Function and reference	Maximum settable value	Model
Touch switch	Switch Bit switch Word switch Go to screen switch Change station No. switch Special function switch Key window display switch Key code switch	Executes the set action when touched. ☞ Page 1191 Placing a touch switch	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen	GT37 SoftGOT3000
Lamp	Bit lamp Word lamp Lamp area	Controls the lamp illumination with a device. ☞ Page 1276 Placing a lamp	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen Figures with the lamp attribute are included.	GT37 SoftGOT3000
Numerical display, numerical input	Numerical display Numerical input	Displays the device value as a numerical value. A numerical input can also be used for writing to devices. ☞ Page 1305 Placing a numerical display or numerical input object	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen	GT37 SoftGOT3000
Text display, text input	Text display Text input	Displays the device value as a text string. A text input can also be used for writing to devices. ☞ Page 1345 Placing a text display or text input object	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen	GT37 SoftGOT3000
Date display, time display	Date display Time display	Displays the date and time. ☞ Page 1373 Placing a date display or time display	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen	GT37 SoftGOT3000
Comment display	Bit comment Word comment Simple comment	Controls the comment to be displayed with a device. ☞ Page 1386 Placing a comment display	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen	GT37 SoftGOT3000
Parts display	Bit parts Word parts Fixed parts	Controls the part to be displayed with a device. ☞ Page 1416 Placing a parts display	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen	GT37 SoftGOT3000
Frame animation		Plays a video frame by frame. ☞ Page 1477 Placing a frame animation	Up to 32 objects per screen being displayed (including the base screen, window screen, set overlay screen, and window screen output for digital image display)	GT37 SoftGOT3000
Historical data list display		Collects multiple word device values and displays the values in chronological order. The logging setting is required to collect device values. ☞ Page 1495 Placing a historical data list display	8 objects per screen	GT37 SoftGOT3000

PART 7

Object		Function and reference	Maximum settable value	Model
Alarm display	Alarm display (user)	Displays the detected user alarms. The user alarm observation settings need to be configured. ☞ Page 2132 Viewing alarm events (Alarm display)	25 objects per screen 33 objects per screen (total number of alarm displays (user) and simple alarm displays)	GT37 SoftGOT3000
	Alarm display (system)	Displays the detected system alarms. The system alarm observation settings need to be configured. ☞ Page 2132 Viewing alarm events (Alarm display)	8 objects per screen	
	Simple alarm display	Displays the detected user alarms. Set the alarms to be detected for each simple alarm display. ☞ Page 1519 Placing a simple alarm display	24 objects per screen 33 objects per screen (total number of alarm displays (user) and simple alarm displays)	
	System alarm display	Displays the detected system alarms. Set the alarms to be detected for each simple alarm display. ☞ Page 1542 Placing a system alarm display	1 object per screen	
Recipe display (record list)		Displays the recipe records. ☞ Page 1550 Placing a recipe display (record list)	1 object per screen	GT37 SoftGOT3000
Graph	Line graph	Displays the current values of multiple word devices in a line graph. ☞ Page 1577 Placing a line graph	32 objects per screen	GT37 SoftGOT3000
	Trend graph	Collects multiple word device values and displays the values in chronological order in a graph. ☞ Page 1594 Placing a trend graph	32 objects per screen (total number of trend graphs and historical trend graphs)	
	Bar graph	Displays the current values of multiple word devices in a bar graph. ☞ Page 1624 Placing a bar graph	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen 256 objects per project when [Collect data only when trigger conditions are satisfied] is set	
	Band graph	Displays the ratio of the current values of multiple devices in a band graph. ☞ Page 1640 Placing a bar graph	32 objects per screen	
	Pie graph	Displays the ratio of the current values of multiple devices in a pie graph. ☞ Page 1655 Placing a pie graph		
	Scatter graph	Displays the values of two word devices as a data point along the X and Y axes. ☞ Page 1669 Placing a scatter graph	24 objects per screen 16 objects per project when [Store Memory] is set 256 objects per project when [Collect data only when trigger conditions are satisfied] is set	
	Historical trend graph	Collects multiple word device values and displays the values in chronological order in a graph. The logging setting is required to collect device values. ☞ Page 1693 Placing a historical trend graph	32 objects per screen (total number of trend graphs and historical trend graphs)	
Graphical meter		Displays the device value on a meter. ☞ Page 1730 Placing a graphical meter	32 objects per screen	GT37 SoftGOT3000

Object		Function and reference	Maximum settable value	Model
Meter	Level	Monitors the value of a word device, and indicates the value relative to the set upper and lower limits by filling the corresponding area with the user-selected color. ☞ Page 1761 Placing a level object	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen	GT37 SoftGOT3000
	Panel meter	Displays the device value on a meter. This function monitors the word device value and indicates the value relative to the set upper and lower limit values with a needle. ☞ Page 1778 Placing a panel meter	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen	
Slider		Specifies a device value (numeric value) by sliding the knob along the bar. ☞ Page 1797 Placing a slider	• Base screen: 1024 objects per screen • Window screen: 512 objects per screen	GT37 SoftGOT3000
Document display		Displays documents created on a personal computer (such as Microsoft Word and Microsoft Excel). ☞ Page 1809 Placing a document display	1 object per screen	GT37 SoftGOT3000
Digital image display	Camera/PC image display	Displays images entered on the GOT. ☞ Page 1844 Placing a digital image display object	4 objects per screen	GT37 SoftGOT3000
	File playback			
Script parts		Sets the script for the screen. When the condition is satisfied while the placed screen is displayed, the script will run. ☞ Page 1864 Placing a script parts object	32 objects per screen	GT37 SoftGOT3000
Set overlay screen		Calls a base screen or window screen on a basic screen, and displays them as a single screen. ☞ Page 1865 Placing a screen on another screen	2047 objects per screen	GT37 SoftGOT3000
Animation route		Sets the animation route along which the object moves. ☞ Page 1878 Configuring an animation route	30 objects per screen	GT37 SoftGOT3000
Window position	Overlap1	Sets the position of a window screen to be displayed on a base screen or mobile screen. ☞ Page 1883 Specifying the display position of a window screen	1 object per screen	GT37 SoftGOT3000
	Overlap2		1 object per screen	
	Overlap3		1 object per screen	
	Overlap4		1 object per screen	
	Overlap5		1 object per screen	
	Superimpose1		1 object per screen	
	Superimpose2		1 object per screen	
	Key window		1 object per screen	
Key window object	Input value area setting	Displays the relevant information when a numerical value or text is input to an object by using a key window. ☞ Page 1887 Placing an object to display the input information	1 object per screen	GT37 SoftGOT3000
	Input range area setting		1 object per screen	
	Input maximum value area setting		1 object per screen	
	Input minimum value area setting		1 object per screen	
	Previous value area setting		1 object per screen	

Object	Function and reference	Maximum settable value	Model
Hyperlink	Performs the following operations on the GOT Mobile function client on a mobile screen. • Opening a website • Referring to a file in the public folder • Making a phone call ☞ Page 1896 Placing a hyperlink on a mobile screen	1024 objects per screen	GT37 SoftGOT3000

22.2 Placing figures and objects

GT37 SoftGOT3000

☞ Page 1001 Placing from the menu or toolbar
☞ Page 1002 Placing from the library or parts

22.2.1 Placing from the menu or toolbar

Operating procedure

1. Perform either of the following operations to change the shape of mouse cursor to + that allows you to place the selected figure or object.

Operation	Details
Selecting from the menu	Select a figure or an object to be placed from [Figure] or [Object] in the menu bar. ☞ Page 100 [Figure] ☞ Page 100 [Object] Selecting from the tool bars	Select a figure or an object to be placed from the buttons in the toolbars. ☞ Page 110 [Figure] ☞ Page 111 [Object] 
2. Perform one of the following operations by moving the cursor to place a figure or an object.

Target	Operation			Remarks
Figure	The operation depends on the figure to be placed. For how to place each figure, refer to the following. ☞ Page 1131 Figures			—
Object	Placing an object in its default size	Operation with a mouse	Click the mouse button to complete the placement.	—
		Operation with a keyboard	Press the Enter key twice to complete the placement.	
	Placing an object resized from its default size	Operation with a mouse	Click and hold the mouse button at the start point, and drag the pointer to the end point. Release the mouse button to complete the placement.	The following objects cannot be resized. • Script parts • Set overlay screen • Window position
		Operation with a keyboard	Press the Enter key once at the start point and move the cursor key to the end point. Press the Enter key to complete the placement.	

Double-click the figure or object to display the setting dialog and configure the settings such as the device to be monitored. For details on the setting dialog, refer to each function.

PART 7

Point

To change the operation performed when figures and objects are placed, set the following items on the [Edit] tab in the [Options] dialog.

- [Place figures/objects sequentially]
- [Deselect figures/objects once they are placed]
- [Display the setting dialog once figures/objects are placed]
- [Move figures/objects in the screen display area (move to temporary area with the Alt key)]

For how to display the [Option] dialog and for the operations with the above setting items, refer to the following.

☞ Page 199 [Options] dialog ([Edit] tab)

22.2.2 Placing from the library or parts

Figures and objects registered in the library or parts can be placed on the screen.

For details on each function, refer to the following.

Function	Details
Library	Select a figure or an object in the [Library] window and click the screen editor to place it. The library is a collection of preconfigured figures and objects. You can use the registered figures and objects to speed up screen creation. The library stores the figures and objects registered in GT Designer3. The figures and objects configured by the user are registrable. ☞ Page 995 Basics of figures and objects
Parts	Select a part in the [Parts Image List] window and click the screen editor to place it. Refers to the figures registered by the user. The registered figures are used for the following applications. • Displayed with the parts display • Placed on the screen as figures • Displayed as object shapes ☞ Page 812 Registering parts ([Parts])

22.3 Selecting figures and objects on the screen editor

GT37 SoftGOT3000

To select a figure or an object placed on the screen editor, perform either of the following operations.

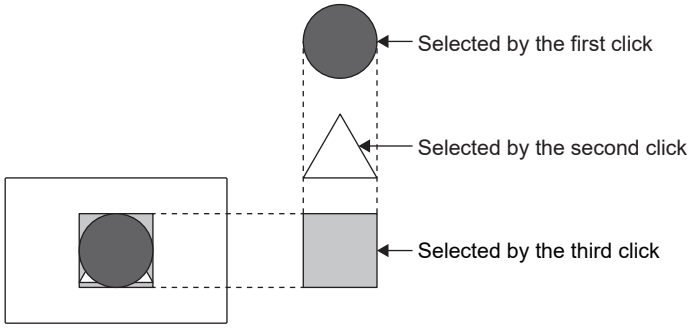
Operation	Details
Selecting on the screen editor	Click a figure or an object on the screen editor to select it.
Selecting from the list	Click the list of figures and objects displayed in the following windows to select the figures and objects on the screen editor. ☞ Page 1005 [Data View] window ☞ Page 175 [Data Browser] window

☞ Page 1003 Selecting one of the overlapped figures and objects
☞ Page 1004 Selecting multiple figures and objects

22.3.1 Selecting one of the overlapped figures and objects

Selecting on the screen editor

Click the overlapped part of a figure or object while pressing the Ctrl key.
Even if completely overlapped, the hidden figures or objects can be selected.
Each click selects the next figure or object.



Selecting from the list

You can select figures and objects from the list in the [Data View] window or [Data Browser] window regardless of the overlap status.

Point

On the screen editor or in the [Data View]window, you can select one of the following items.

- [Figure]
- [Object]
- [Figure + Object]

The settings can be changed from the [Edit] menu or [Edit] toolbar.

☞ Page 94 [Edit]
☞ Page 108 [Edit]

PART 7

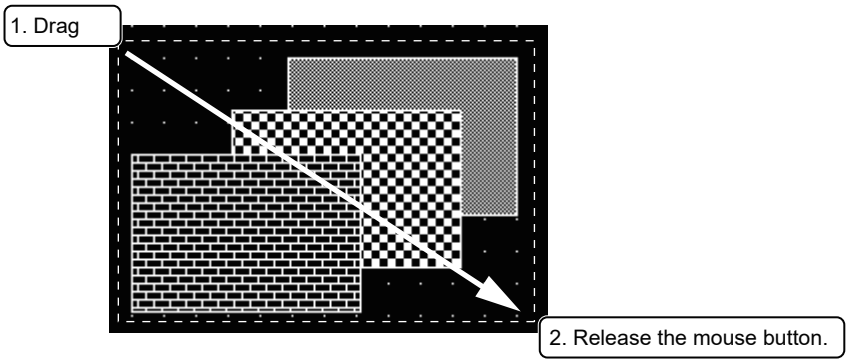
22.3.2 Selecting multiple figures and objects

Selecting on the screen editor

■Mouse drag operation

Drag to take the figures and objects in the square area.

When the mouse button is released, all the figures and objects in the area are selected.



■Keyboard + mouse operation

Click the figures and objects to be selected while pressing the Shift key.

To deselect them, click the figures and objects to be deselected while pressing the Shift key.

Selecting from the list

Perform the following operations in the [Data View] window or [Data Browser] window.

The figures and objects selected in the window are selected on the screen editor.

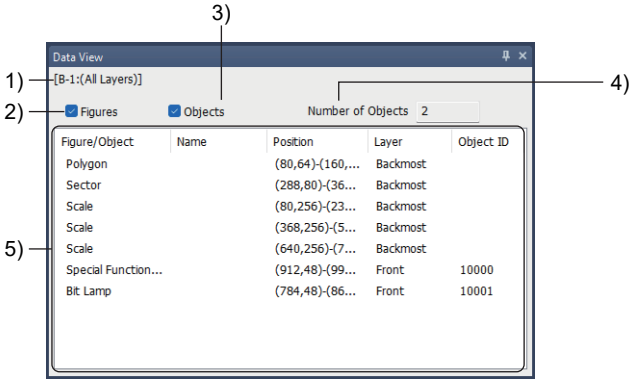
- Ctrl + click: Selects or deselects a row.
- Shift + click: Selects the rows from the row where the cursor is placed to the row where the mouse is clicked.
- Ctrl + ↑, Ctrl + ↓: Moves the cursor while selecting the row where the cursor is placed.

22.3.3 [Data View] window

GT37 SoftGOT3000

This window lists the figures and objects placed on the screen editor.

Select [View] → [Docking Window] → [Data View] from the menu to display this window.



Item			Description
1)	Screen information		Displays the information on the screen editor being edited as shown below. [B-3:LINE_C(Front)] The layer being displayed Title Screen type - screen number
2)	[Figures]		Displays or hides the figures in the data view.
3)	[Objects]		Displays or hides the objects in the data view.
4)	[Number of Objects]		Displays the number of objects placed in the displayed layer. The number is displayed regardless of the [Objects] setting. The figures processed as objects are also counted as objects.
5)	Data view	—	Lists the figures and objects on the screen editor being edited. To change the items to be displayed, configure the [Figures] and [Objects] settings.
		[Figure/Object]	Displays the names of the figures and objects. For the grouped figures and objects, [Gn] is displayed at the beginning of the names. (n= 1, 2.)
		[Name]	Displays the set names if they have been set for [Name] of the figures and objects.
		[Position]	Displays the coordinates of the positions of the figures and objects.
		[Layer]	Displays the layers in which the figures and objects are placed.
		[Object ID]	Displays the object ID numbers which are set for the objects. The ID is also displayed for the figures processed as objects.

PART 7

22.4 Moving a figure or an object

GT37 SoftGOT3000

To move a figure or an object, perform one of the following operations.

Operation	Details
Dragging on the screen editor	Drag a figure or an object.
Operating with a keyboard	Select a figure or an object and press the following keys. • ↓ • ← • → • ↑
Changing in the [Property] window	Select a figure or an object and change [X-Position] and [Y-Position] in the [Property] window. For how to use the [Property] window, refer to the following. ☞ Page 126 Checking and editing settings of screens and objects

Guidelines can be displayed to indicate the positional relationship between the item to be moved and the other figures and objects.

☞ Page 302 Displaying guidelines

22.5 Resizing

GT37 SoftGOT3000

This section describes how to resize a figure or an object on the screen editor.

☞ Page 1007 Resizing a figure or an object
☞ Page 1009 Impact of object resizing

22.5.1 Resizing a figure or an object

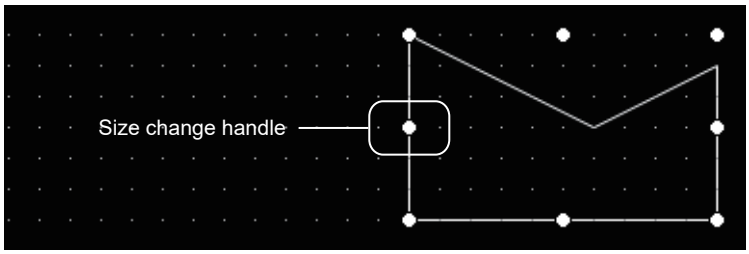
To resize a figure or an object, perform either of the following operations.

Operation	Details
Operating the handle on the screen editor	Drag the handle displayed on the selected figure or object. ☞ Page 1008 Operating the handle on the screen editor
Changing in the [Property] window	Select a figure or an object and change [Width] and [Height] in the [Property] window. For how to use the [Property] window, refer to the following. ☞ Page 126 Checking and editing settings of screens and objects

PART 7

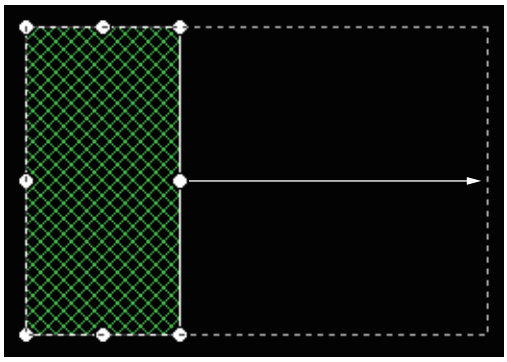
Operating the handle on the screen editor

1. Select the figure or object to be resized to display the size change handles.

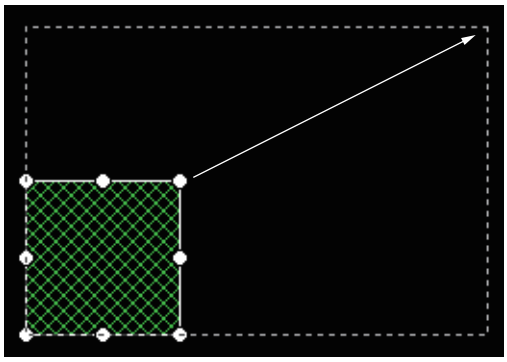


2. Drag one of the size change handles.

Release the mouse button to complete the resizing.



Example) Size change in the horizontal direction



Example) Size change in the vertical and horizontal directions from the corner base

Multiple figures and objects can be selected and resized together.

The following operations can be performed by using a mouse and keyboard keys together.

Operation	Description
Dragging a handle while pressing the Ctrl key	The figure or object can be resized symmetrically about its center. Dragging a handle while pressing the Shift key	Resizing is possible with the aspect ratio maintained. Dragging handles while pressing the Ctrl key and the Shift key	The figure or object can be resized symmetrically about its center while keeping the aspect ratio. Dragging a handle while pressing the Alt key	The [Snap] setting in the [Option] dialog becomes invalid and the sizes can be changed in dots.

Guidelines can be displayed to indicate the positional relationship with other placed figures and objects as a guide for resizing.

☞ Page 302 Displaying guidelines

22.5.2 Impact of object resizing

☞ Page 1009 Font size
☞ Page 1012 Object shape
☞ Page 1013 Touch area

Font size

The impact on the font size of the text to be displayed on objects depends on each object.

Pattern		Target	Operation
Pattern whose font size is changed		Numerical display Numerical input Text display Text input Date display Time display Historical data list display Alarm display (user) Alarm display (system) Recipe display (record list)	The font size is changed to the largest size that will fit within the object area. Example) When resizing a numerical display Pattern whose operation differs depending on the setting	Selecting [Text] for [Text Type]	Touch switch Bit lamp Word lamp Panel meter*1 Graphical meter Hyperlink	The operation depends on the setting of [Adjust Direct Text Size]. ☞ Page 1031 Switching between resizing and not resizing the string (text) as the object is resized
	Selecting [Comment] for [Text Type]	Touch switch Bit lamp Word lamp Comment display*2 Historical data list display*3 Alarm display (user)*3 Alarm display (system)*3 Recipe display (record list)*3 Graphical meter Hyperlink	The operation differs depending on the settings of each object. ☞ Page 1010 Font size of the comment
Pattern whose font size is not changed		This pattern applies to the values on the scale displayed on the following objects. Line graph Trend graph Bar graph Band graph Pie graph Scatter graph Historical trend graph Graphical meter Panel meter Slider	The font size is not changed even if the object size is changed. To change the font size, do so in the setting dialog of each object.

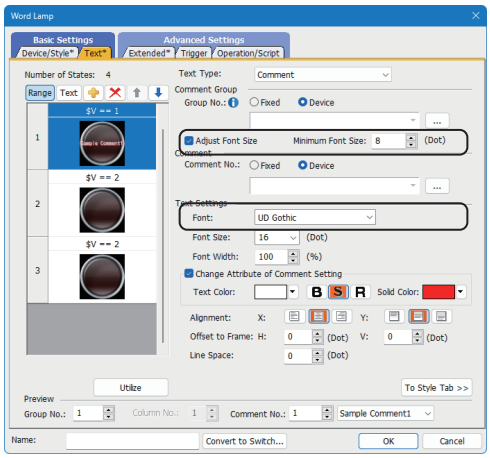
*1 As the setting is fixed to text, the setting of [Text Type] is not displayed.
*2 As the setting is fixed to comment, the setting of [Text Type] is not displayed.
*3 The font size of the title is changed (when a comment is specified).

■Font size of the comment

The font size of the object that meets all the following conditions is changed when the object size is changed.

Ex.

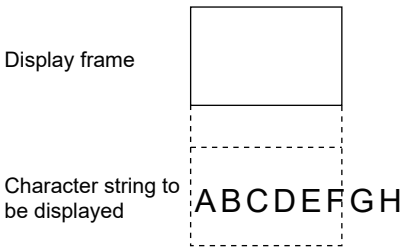
For a word lamp



Condition	Description
[Font] setting	One of the following fonts (UD fonts) is selected. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho] • [7-Segment Font]
[Adjust Font Size] setting	[Adjust Font Size] is selected. The value set to [Minimum Font Size] is the lower limit when the font size is changed.

The font size is changed with [Font Size] as the upper limit and [Minimum Font Size] as the lower limit.
The following shows the operational differences depending on the setting of [Adjust Font Size].

Ex.
If the text with the [Font Size] extends beyond the display frame of the object



[Font] setting	[Adjust Font Size] setting	
	Selected	**Deselected**
UD font	The font is resized automatically to fit in the display frame.  If the text even with the [Minimum Font Size] extends beyond the display frame, the extended part is not displayed. If a character straddles the frame, the character is not displayed. The text is displayed left aligned. 	The portion of the character string that has been extending off the frame starts a new line to fit in the display frame.  After the text wraps to the next line, if a part of the text still extends off the display frame, the part is not displayed. If a character straddles the frame, the character is not displayed.
Windows font	The text is displayed with the [Minimum Font Size]. If the text even with the [Minimum Font Size] extends beyond the display frame, the extended part is not displayed. If a character straddles the frame, only the part of the character within the frame is displayed. The text alignment is not changed.  	Even if the text extends off the display frame, the text does not wrap to the next line. If a character straddles the frame, only the part of the character within the frame is displayed.

Object shape

The shapes displayed for objects are called object shapes.

☞ Page 1044 Object shape

The object shape is resized as the object is resized.

The resize behavior of the shape frame width varies according to the shape type and the frame width fixing setting.

<table>
<tr><th colspan="2">Shape type</th><th colspan="2">Resize behavior of the shape frame width</th></tr>
<tr><td rowspan="3">Library</td><td rowspan="3">System Library</td><td colspan="2">The resize behavior of the frame width varies according to the frame width fixing setting.
☞ Page 1027 Switching between fixing or not fixing the frame width of an object shape</td></tr>
<tr><td>When the frame width fixing setting is enabled</td><td>For the object shape to which the setting is applicable, resizing the object does not change the frame width.

For the object shape to which the setting is inapplicable, resizing the object resizes the frame width.</td></tr>
<tr><td>When the frame width fixing setting is disabled</td><td>Resizing an object resizes the frame width.
 </td></tr>
<tr><td>My Library</td><td colspan="2">Resizing an object resizes the frame width.</td></tr>
<tr><td colspan="2" rowspan="3">Basic Figure</td><td colspan="2">The resize behavior of the frame width varies according to the shape state.
For the shape with a fixed frame width, the shape name includes [Fixed Width].
  </td></tr>
<tr><td>When the shape frame width is fixed</td><td>Resizing an object does not change the frame width.
 </td></tr>
<tr><td>When the shape frame width is not fixed</td><td>Resizing an object resizes the frame width.
 </td></tr>
</table>

Touch area

The touch area is the area of an object used for input, such as a touch switch or a numeric input.

The touch area is resized as the object is resized.

When you set a shape for an object, resizing the object may make the touch area and object area different-sized and misaligned.

In such a case, perform one of the following operations to adjust the touch area and object area.

Adjustment method	Operation
Centering the touch area in the object area	Right-click the object and select [Centering] from the right-click menu. The touch area is centered in the shape. Adjusting the touch area and object area separately	Select [Edit] → [Edit Touch Area] → [Manual Edit] from the menu. ☞ Page 1030 Adjusting the touch area manually Matching the touch area of the touch switch with the object area	This operation is only supported by the touch switch. Select the touch switch, and then select [Edit] → [Edit Touch Area] → [Self-adjust] from the menu. ☞ Page 1030 Adjusting the touch area of the touch switch automatically Always adjusting the touch area and object area automatically	Select [Edit] → [Edit Touch Area] → [Constant Self-adjust] from the menu. ☞ Page 1031 Adjusting the touch area of the touch switch automatically

PART 7

22.6 Changing the settings

GT37 SoftGOT3000

To change the settings of figures and objects, perform either of the following operations.

Operation	Details
Changing in the setting dialog	Perform one of the following operations to change the settings in the displayed setting dialog. • Double-click a figure or object. • Select the intended item on the screen editor, and select [Edit] → [Setting] from the menu. • Double-click the intended item for setting change in the [Data Browser] window. • Double-click the intended item for setting change in the [Data View] window. For details on the setting dialog, refer to each function.
Changing in the [Property] window	Select a figure or an object and change the settings displayed in the [Property] window. For how to use the [Property] window, refer to the following. ☞ Page 126 Checking and editing settings of screens and objects

22.7 Operation with the [Edit] menu

GT37 SoftGOT3000

The following table shows the operations which can be performed on figures and objects with the [Edit] menu.

Menu	Description
[Undo]	☞ Page 1016 Canceling the last operation or redoing the canceled operation
[Redo]	
[Cut]	☞ Page 1016 Copying or cutting a figure or object and pasting it
[Copy]	
[Paste]	
[Duplicate]	Copies and pastes the selected item at a time. Select an item and select [Edit] → [Duplicate] from the menu. You cannot change the intervals for pasting figures or objects.
[Consecutive Copy]	☞ Page 1017 Pasting multiple copies of a figure or object
[Select All]	Selects all the data placed or set on the selected screen editor or window.
[Delete]	Deletes the selected item.
[Object of Selection]	☞ Page 1020 Changing the selectable items on the screen editor
[Group]	☞ Page 1021 Grouping two or more figures and objects or ungrouping them
[Ungroup]	
[Stacking Order]	☞ Page 1022 Changing the stacking order of figures and objects
[Align]	☞ Page 1023 Aligning figures and objects
[Rotate/Flip]	☞ Page 1025 Rotating or flipping a figure
[Edit Vertices]	☞ Page 1026 Editing vertices to change the shape of a figure
[Edit Objects with Fixed Frame Width]	☞ Page 1027 Switching between fixing or not fixing the frame width of an object shape
[Edit Touch Area]	☞ Page 1030 Adjusting the touch area of an object (size, position)
[Adjust Direct Text Size]	☞ Page 1031 Switching between resizing and not resizing the string (text) as the object is resized
[Template Registration]	☞ Page 1092 Efficient Drawing with Templates
[Set to Default]	☞ Page 203 Customizing the default value
[Add to Category]	☞ Page 1121 Managing figures and objects by category
[Shape Change]	☞ Page 1045 How to set the object shape
[Setting]	☞ Page 1014 Changing the settings

22.7.1 Canceling the last operation or redoing the canceled operation

[Undo] and [Redo] are available only on the screen editors and the data view.

Operation	Details
Canceling the last operation	Select [Edit] → [Undo] from the menu.
Redoing the canceled operation	Select [Edit] → [Redo] from the menu.

History retention specifications

Item		Description
Number of storable operations		There is no limit to the number of storable operations to the operation histories.
Unit of the operation histories		The operation history is held per screen. Therefore, when creating multiple screens, display a screen to which you want to redo operations and perform [Undo] or [Redo].
Timing when the operation history is deleted	Deletion of the operation histories of both [Undo] and [Redo]	• Closing a project • Deleting or cutting the target screen • Pasting a copied or cut screen to a selected area • Changing the controller type • Executing the [Collective Edit] command on the [Edit Objects with Fixed Frame Width] submenu • Changing the GOT type
	Deletion of the operation history of [Redo] only	• Performing other editing operations (such as placing an object) when [Redo] is available

22.7.2 Copying or cutting a figure or object and pasting it

You can cut or copy a selected item and paste it to an intended location.

The operation is possible even if multiple items are selected.

Operation	Details
Cut	Select an intended item, and select [Edit] → [Cut] from the menu.
Copy	Select an intended item, and select [Edit] → [Copy] from the menu.
Paste	Select the destination screen and select [Edit] → [Paste] from the menu.

Precautions

If the controller settings differ between in the copy source project and the copy destination project, the set devices may be displayed as [??].

Check if the pasted device has no problem and set the device again as required.

Holding the cut or copied data

The cut or copied data is overwritten when a new data is cut or copied.

The last cut or copied data is deleted when the cut or copy source project is closed.

Data copy between screen design software modules

The data cut and copied in a GT Designer3 (GOT3000) module can be pasted to other running modules of GT Designer3.

Copying and pasting between the following conventional products is unavailable.

- GT Designer3 (GOT2000)
- GT Designer3 (GOT1000)

22.7.3 Pasting multiple copies of a figure or object

Copies and pastes a selected figure or object at a time based on the settings.

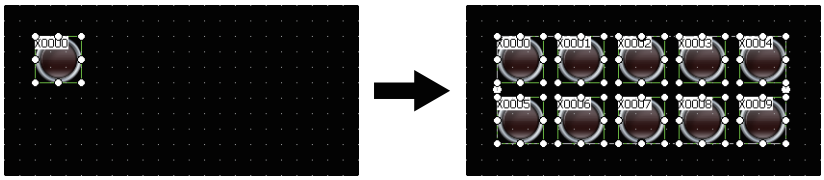
1. Select the item to be copied on the screen editor.

Multiple items can also be selected and copied.

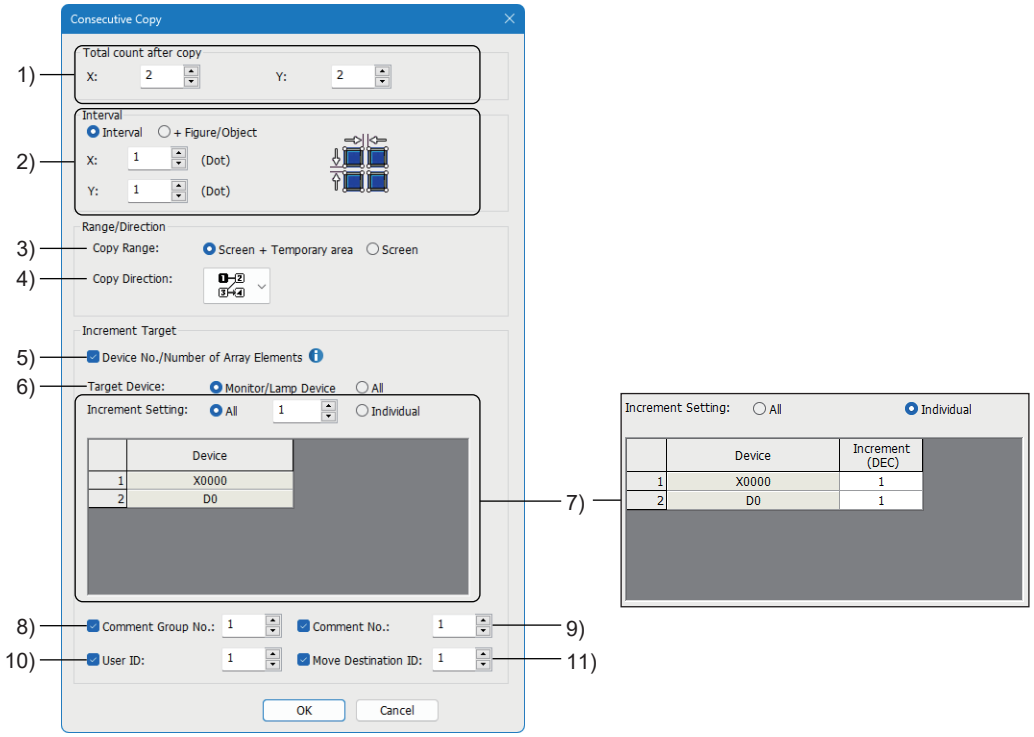
2. Select [Edit] → [Consecutive Copy] from the menu to display the [Consecutive Copy] dialog.

☞ Page 1017 [Consecutive Copy] dialog

3. Configure the settings and click the [OK] button to paste the target item according to the settings.



[Consecutive Copy] dialog



Item			Description
1)	[Total count after copy]	—	Set the number of figures or objects to be pasted. Example) · [X]: 3 · [Y]: 2 · [Copy Direction]: 		[X]	Set the number of figures or objects to be horizontally pasted. The setting range is [1] to [100].
		[Y]	Set the number of figures or objects to be vertically pasted. The setting range is [1] to [100].

Item		Description	
2)	[Interval]	Set an interval between figures or objects to be pasted. The setting ranges of [X] and [Y] differ depending on the selected item.	
		When [Interval] is selected	The setting range for [X Position] and [Y Position] is [0] to [300]. Example) · [X]: 5 · [Y]: 3 · [Copy Direction]: For one figure  For multiple figures 		When [+ Figure/Object] is selected	The following shows the setting range. • [X Position]: [0] to [300] + Horizontal size of the item to be copied (dots) • [Y Position]: [0] to [300] + Vertical size of the item to be copied (dots) Example) · [X]: 10 · [Y]: 15 · [Copy Direction]: For one figure  For multiple figures 3)	[Copy Range]	Set an area of the screen editor where figures or objects can be pasted.	
4)	[Copy Direction]	Set a direction in which figures or objects are pasted.	
5)	[Device No./Number of Array Elements]	Select this item to increment the device number of the device set to a figure or object. The array subscripts of the array-type label and tag are incremented. When you perform the consecutive copy of the label and tag other than the array-type labels and tags, the same label and tag are set.	
6)	[Target Device]	Set the target device for increment.	
7)	[Increment Setting]	Select whether to set the increment count of the device number collectively or individually for the continuous copy target device. The setting range of the increment count is [-10000] to [10000].	
8)	[Comment Group No.]	Select this item to increment the comment group number set to an object. The setting range of the increment count is [-100] to [100].	
9)	[Comment No.]	Select this item to increment the comment number set to an object. The setting range of the increment count is [-10000] to [10000]. When an object with comment number set to 0 is copied by using the consecutive copy function, the comment number is not incremented.	

Item		Description
10)	[User ID]	Select this item to increment the user ID set to an object. The setting range of the increment count is [-10000] to [10000].
11)	[Move Destination ID]	Select this item to increment the move destination ID set to an object. The setting range of the increment count is [-10000] to [10000].

22.7.4 Changing the selectable items on the screen editor

Change the selectable items on the screen editor.

This setting is applied to the entire project.

☞ Page 1020 Switching the selectable items (figures or objects)

☞ Page 1020 Switching whether to make the overlay screen selectable

☞ Page 1020 Operation when a new figure, object, or called screen is placed

Switching the selectable items (figures or objects)

Change the selectable on the screen editor.

Operation	Details
Limiting the selectable items to figures	Select [Edit] → [Object of Selection] → [Figure] from the menu.
Limiting the selectable items to objects	Select [Edit] → [Object of Selection] → [Object] from the menu.
Not limiting the selectable items	Select [Edit] → [Object of Selection] → [Figure + Object] from the menu.

You can select grouped figures or objects when the selected target is included in the group.

Ex.

When [Figure] is selected for [Object of Selection]

- Group of figures only: Selectable
- Group of figures and objects: Selectable
- Group of objects only: Selectable

Switching whether to make the overlay screen selectable

Select [Edit] → [Object of Selection] → [Overlay Screen] from the menu.

Operation when a new figure, object, or called screen is placed

You can newly place a figure, an object, or a called screen regardless of the selection of [Object of Selection].

When the figure, object, or called screen that was newly placed is out of the selection target, the setting of [Object of Selection] is changed to include it to the selection target.

Ex.

When an object is placed while [Object of Selection] is set to [Figure], the setting of [Object of Selection] is changed to [Figure + Object].

22.7.5 Grouping two or more figures and objects or ungrouping them

Groups multiple figures and objects into one.

Groups are treated as figures.

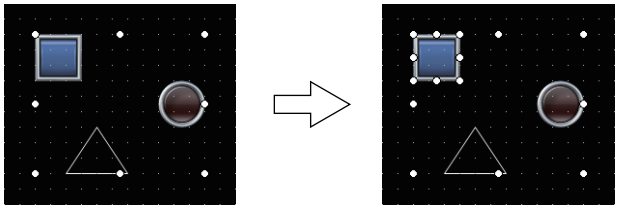
Operation	Details
Grouping	Select figures and objects to be grouped and select [Edit] → [Group] from the menu.
Ungrouping	Select the intended group and select [Edit] → [Ungroup] from the menu.

Operations for the group

Operation	Details
Changing the settings	Select a group to display the setting items in the [Property] window. You can change the setting items common to all the figures and objects in the group in the [Property] window. The changed setting is applied to all the figures and objects in the group. For how to use the [Property] window, refer to the following. ☞ Page 126 Checking and editing settings of screens and objects
Changing the coordinates	When you select a grouping of figures or objects, the [Coordinate/Size] toolbar and the [Property] window display the coordinates of the upper-left corner of the grouping. If you change the coordinates, the figures and objects in the grouping move accordingly while their intervals remain unchanged.
Changing the size (width and height)	When you select a grouping of figures and objects, the [Coordinate/Size] toolbar and the [Property] window display the width and height of the grouping. The width and height are not changeable in the above toolbar and window. To change the size of the grouping, use the size change handle on the screen editor.

Changing the settings of individual figures and objects in a grouping

While a group is selected, select a figure or object displayed in the group to display the handle around the selected figure or object.



To change the settings for grouped figures and objects individually, perform the following operations.

Operation	Details
Changing in the setting dialog	Perform one of the following operations to change the settings in the displayed setting dialog. • Double-click the item intended for setting change while selecting the group. • Select the item intended for setting change while selecting the group, and select [Edit] → [Setting] from the menu. • Double-click the intended item for setting change in the [Data Browser] window. • Double-click the intended item for setting change in the [Data View] window. For details on the setting dialog, refer to each function.
Changing in the [Property] window	Select the item intended for setting change while selecting the group, and change the settings displayed in the [Property] window. For how to use the [Property] window, refer to the following. ☞ Page 126 Checking and editing settings of screens and objects

For a grouping of groups, you can also change the settings by using the same procedure.

Operations that cannot be performed individually for grouped figures and objects

When operating grouped figures or objects individually, you cannot perform the following operations.

- Move
- Resize
- Change touch area
- Delete

22.7.6 Changing the stacking order of figures and objects

To change the stacking order, select a figure or object and perform the following operations.

The menu depends on the selected item.

Operation		Details
Change across layers	Moving to the foreground in the front layer	Select [Edit] → [Stacking Order] → [Move to the Front of Front Layer] from the menu. The menu is not displayed when the selected item includes a figure (excluding figures processed as objects) or has template attributes.
	Moving to the background in the back layer	Select [Edit] → [Stacking Order] → [Move to the Back of Back Layer] from the menu. The menu is not displayed when the selected item includes a figure (excluding figures processed as objects) or has template attributes.
Change in the same layer	Moving to the foreground	Select [Edit] → [Stacking Order] → [Move to the Front of Layer] from the menu.
	Moving to the background	Select [Edit] → [Stacking Order] → [Move to the Back of Layer] from the menu.
	Moving to the front of the target item	Select [Edit] → [Stacking Order] → [Move to the Front]] from the menu.
	Moving to the back of the target item	Select [Edit] → [Stacking Order] → [Move to the Back] from the menu.

For the layers, refer to the following.

☞ Page 65 Layer

22.7.7 Aligning figures and objects

Align the multiple selected figures and objects.

When you click one of the selected figures or objects, it is enclosed in a red frame and anchored.

Click the figure or object again to cancel the anchoring.

The alignment of figures and objects varies depending on whether a figure or object is anchored.

Anchoring	Description
Anchored	Figures and objects are aligned to the edge or center of the anchored figure or object. Example) Left alignment with a lamp object anchored Not anchored	The selected figures and objects are aligned to the edge or center of the entire object. Example) Left alignment without anchoring 
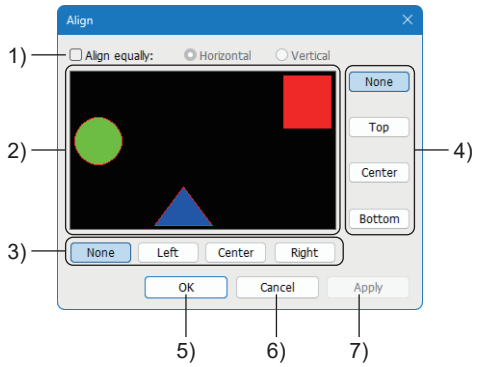
The following lists the alignment operations.

Operation		Details
Horizontal alignment	Left alignment	Select [Edit] → [Align] → [Left] from the menu.
	Centered	Select [Edit] → [Align] → [Center (Horizontal)] from the menu.
	Right alignment	Select [Edit] → [Align] → [Right] from the menu.
	Justified	Select [Edit] → [Align] → [Align Sideways] from the menu. This item is enabled when three or more figures or objects are selected.
Vertical alignment	Top aligned	Select [Edit] → [Align] → [Top] from the menu.
	Centered	Select [Edit] → [Align] → [Center (Vertical)] from the menu.
	Bottom aligned	Select [Edit] → [Align] → [Bottom] from the menu.
	Justified	Select [Edit] → [Align] → [Align Lengthways] from the menu. This item is enabled when three or more figures or objects are selected.
Alignment with multiple conditions		Select [Edit] → [Stacking Order] → [Custom] from the menu. ☞ Page 1024 [Align] dialog

[Align] dialog

Set the alignment method.



Item		Description
1)	[Align equally]	Aligns figures and objects evenly and horizontally or vertically. This item is enabled when three or more figures or objects are selected.
2)	Preview	Previews the settings configured in this dialog.
3)	Horizontal alignment	Sets the horizontal alignment position. • [None] button: Not aligned • [Left] button: Left aligned • [Center] button: Centered • [Right] button: Right aligned
4)	Vertical alignment	Sets the vertical alignment position. • [None] button: Not aligned • [Top] button: Top aligned • [Center] button: Centered • [Bottom] button: Bottom aligned
5)	[OK] button	Applies the settings and closes the dialog.
6)	[Cancel] button	Discards the settings and closes the dialog.
7)	[Apply] button	Applies the settings. This dialog is not closed.

22.7.8 Rotating or flipping a figure

Select a figure to be rotated or flipped, and perform any of the following operations.

Operation	Details	Remarks
Vertical flip	Select [Edit] → [Rotate/Flip] → [Flip Vertical] from the menu.	The following figures can be flipped. • Logo text • Line • Line freeform • Polygon • Arc • Sector • Scale • Piping
Horizontal flip	Select [Edit] → [Rotate/Flip] → [Flip Horizontal] from the menu.	
90-degree rotation to the left	Select [Edit] → [Rotate/Flip] → [Rotate Left] from the menu.	—
90-degree rotation to the right	Select [Edit] → [Rotate/Flip] → [Rotate Right] from the menu.	

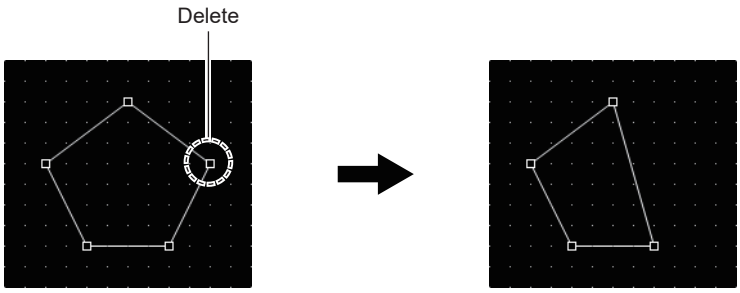
When multiple figures are selected, rotation or flip is applied to each figure.
For grouped figures, rotation or flip is applied to the entire group as a single figure.

Precautions

When [Move figures/objects in the screen display area (move to temporary area with the Alt key)] is selected in the [Options] dialog ([Edit] tab), the figure cannot be rotated if it extends into the temporary area.
For the [Options] dialog ([Edit] tab), refer to the following.
☞ Page 199 [Options] dialog ([Edit] tab)

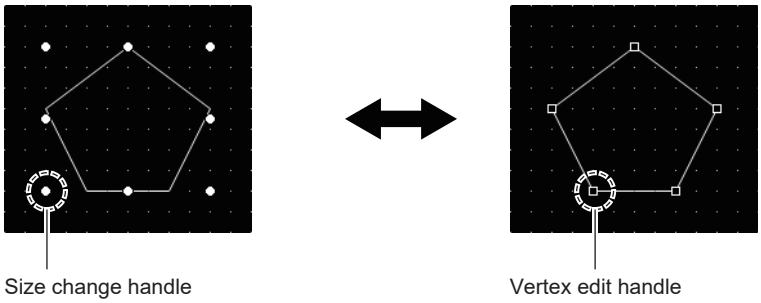
22.7.9 Editing vertices to change the shape of a figure

Change the shape of a figure by moving, adding, or deleting vertices.



To edit vertices, change the handles to vertex edit handles.

Select [Edit] → [Edit Vertex] from the menu to change the handles to vertex edit handles.



Applicable figures

The following figures allow vertex editing.

- Line freeform
- Polygon
- Piping

Grouped figures do not allow vertex editing.

Vertex editing methods

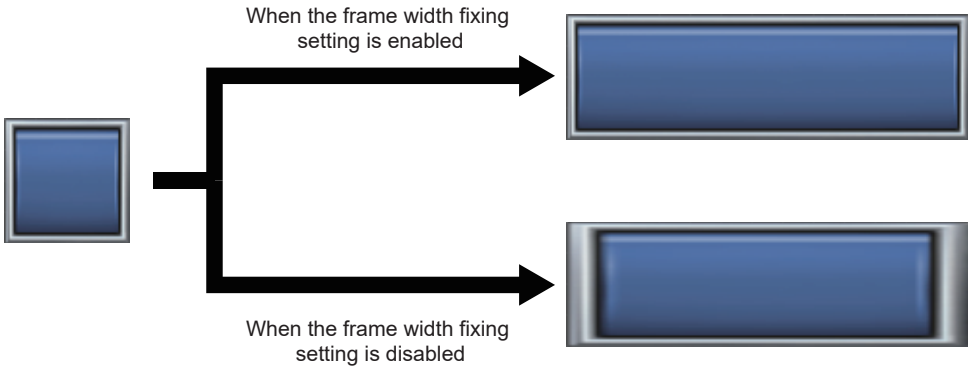
The following shows the vertex editing methods.

Operation	Details
Moving a vertex	Drag a vertex.
Adding a vertex	Click the line of a figure.
	While pressing the Shift key, click and drag a line of the figure to the position where a vertex is to be added.
	Right-click the line of a figure and select [Add Vertices] from the menu.
Deleting a vertex	While pressing the Ctrl key, click the vertex to be deleted.
	Right-click the line of a figure and select [Delete Vertices] from the menu.

22.7.10 Switching between fixing or not fixing the frame width of an object shape

The frame width fixing setting determines whether the frame width of the object shape is fixed when the object is resized.
When the frame width fixing setting is enabled, resizing an object does not change the frame width.
This setting is applied to the entire project.

Ex.
When an object is enlarged



Precautions

Even when the frame width fixing setting is enabled, if you reduce the object size (width or height) to less than its shape frame width, the frame width is reduced as well.

Switching between enabling or disabling frame width fixing

Select [Edit] → [Edit Objects with Fixed Frame Width] → [Always Fix the Width] from the menu to enable or disable frame width fixing.

Editing a frame width collectively

Select [Edit] → [Edit Objects with Fixed Frame Width] → [Collective Edit] from the menu to enable frame width fixing and edit the frame width of all objects in the project.

Target of the frame width fixing setting

The objects that satisfy all the following conditions are the target of the frame width fixing setting.

Condition	Details
The object allows the fame width fixing.	☞ Page 1028 Objects that allow frame width fixing
An object shape that allows frame width fixing is set.	The frame width fixing setting is applied to shapes that satisfy all of the following conditions. • Registered in the System Library • Raster format (registered in the yellow folder in the library tree area) • [Shape] is set to other than [None]. [Shape] can be checked in the [Library data Property] dialog. ☞ Page 1085 [Library] window

■Objects that allow frame width fixing

The following shows the objects that allow frame width fixing.

○: Available, ×: Not available

Object		Applicability	Remarks
Touch switch	Switch	○	—
	Bit switch	○	—
	Word switch	○	—

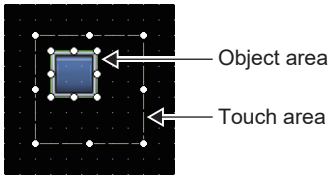
	Input minimum value area setting	×	No shape setting.
	Previous value area setting	×	No shape setting.
Hyperlink		○	—

22.7.11 Adjusting the touch area of an object (size, position)

☞ Page 1030 Adjusting the touch area manually
☞ Page 1030 Adjusting the touch area of the touch switch automatically

Adjusting the touch area manually

To enable or disable the manual adjustment, select [Edit] → [Edit Touch Area] → [Edit Manually] from the menu.
Enabling the manual adjustment of the touch area allows you to adjust the object area and the touch area separately.



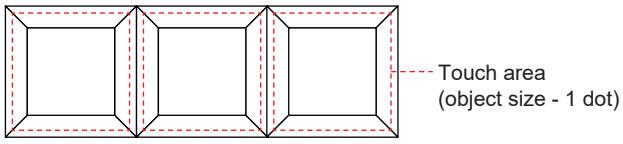
Adjusting the touch area of the touch switch automatically

If you perform the automatic adjustment of the touch area, the touch area will be adjusted according to the object area of the touch switch.
The following table shows how to adjust the touch area automatically.

Operation	Details
Selecting the intended item and performing automatic adjustment	Select the touch switch whose touch area is to be automatically adjusted, and select [Edit] → [Edit Touch Area] → [Self-adjust] from the menu.
Switching whether to always enable automatic adjustment	Select [Edit] → [Edit Touch Area] → [Constant Self-adjust] from the menu. Once the automatic adjustment is always enabled, the touch area will be automatically adjusted for the touch switch placed on the screen editor. Automatic adjustment is also performed at the following timing. • Moving the touch switch • Placing the touch switch

Point

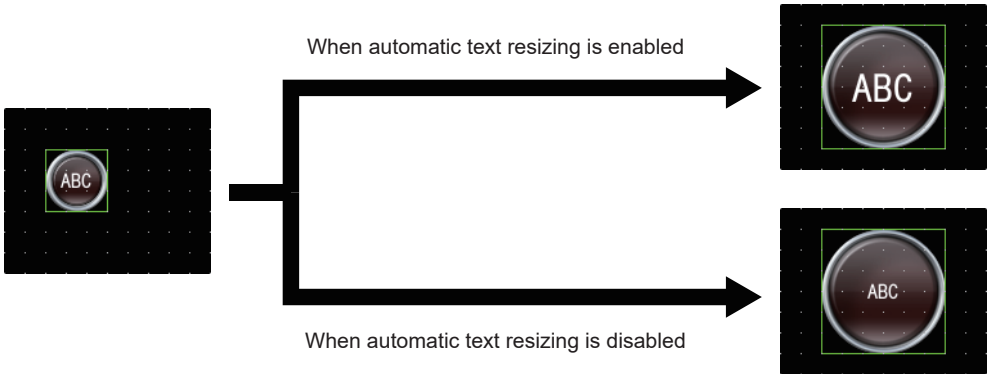
When [Adjust the touch area to be smaller than its object size by 1-dot at the time of touch area self-adjust] is selected on the [Edit] tab in the [Options] dialog, the touch area is reduced to be inside the object area. The edge of the touch area becomes 1 dot away from the edge of the object area.
This setting helps prevent unintended touches when objects are adjacent to each other.



For the [Options] dialog ([Edit] tab), refer to the following.
☞ Page 199 [Options] dialog ([Edit] tab)

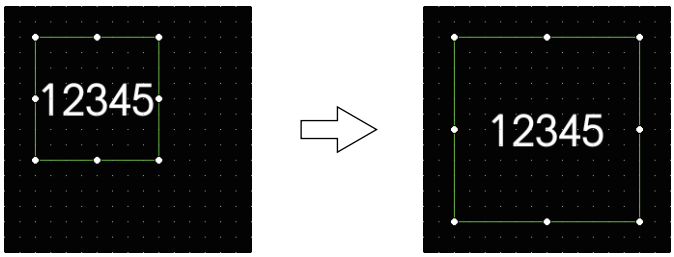
22.7.12 Switching between resizing and not resizing the string (text) as the object is resized

To enable or disable automatic resizing of the string, select [Edit] → [Adjust Direct Text Size] from the menu.
When the setting is enabled and the object for which the direct text has been set is scaled, the text will be scaled according to the size of the object.

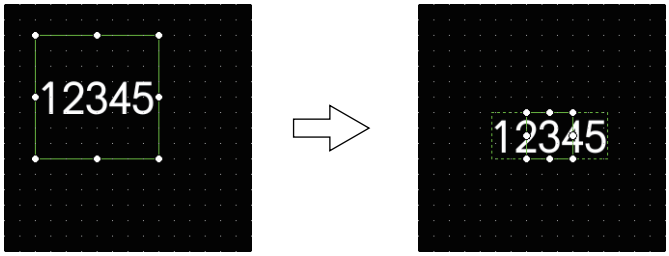


When the objects are scaled beyond the maximum or minimum size of texts, the texts hold the maximum or minimum size.
Objects can be scaled regardless of the maximum or minimum size of the texts.

Ex.
When the object is enlarged beyond the maximum size of the text, only the object is enlarged while the text is kept at the maximum size.



Ex.
When the object size is reduced beyond the minimum size of the text, the text is kept at the minimum size and only the object size is reduced.
The text is displayed beyond the object.



Applicable objects

The following shows the objects that allow automatic resizing of the text string.

- Touch switch
- Lamp
- Graphical meter
- Panel meter
- Hyperlink

22.8 Settings common to figures and objects

GT37 SoftGOT3000

The following shows the settings common to figures and objects.

☞ Page 1032 Attributes
☞ Page 1033 Direct editing of character string

22.8.1 Attributes

This section describes the attributes that figures and objects have as common information.

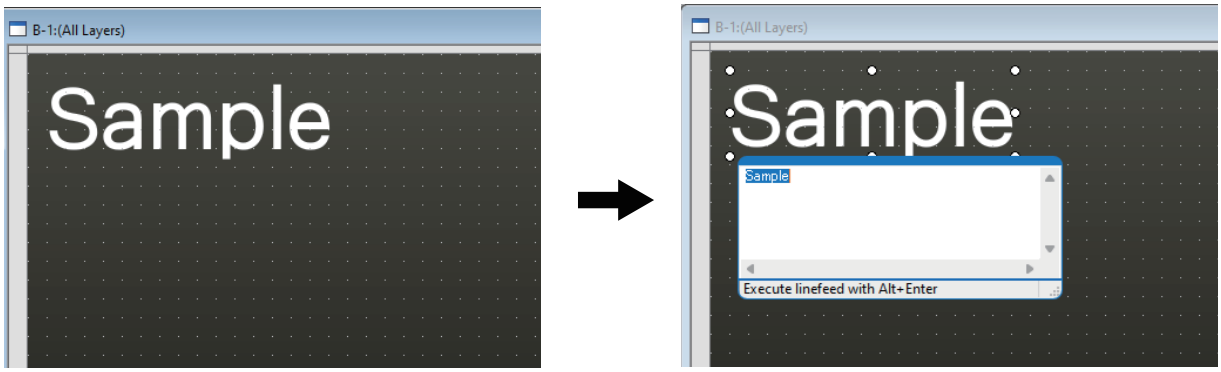
You can check the common information of the figures and objects selected on the screen editor in the [Property] window.

☞ Page 126 Checking and editing settings of screens and objects

Setting item	Description
[Object ID]	The number assigned to each figure and object on the screen editor. A unique number is assigned to each item in the order they are placed on the screen. The user cannot change this number. It is displayed on the figures processed as objects or objects on the screen editor. It is displayed in the [Data Browser] window and [Property] window, and can be used to identify figures and objects.
[Name]	Set a name for the figure or object. It is displayed in the data browser or in the operation log, and can be used to identify figures and objects. Up to 100 characters can be set. The name can be edited in the setting dialog of each figure or object.
[X Position]	The upper left X coordinate of a figure or an object. It is the start point of the X-coordinate for a line or freeform line. The setting range is [-1000] dots to [4999] dots.
[Y Position]	The upper left Y coordinate of a figure or an object. It is the start point of the Y-coordinate for a line or freeform line. The setting range is [-1000] dots to [4999] dots.
[Width]	The width of a figure or an object. The setting range is [1] dots to [6000] dots. The setting range varies by the type and position of the figure or object.
[Height]	The height of a figure or an object. The setting range is [1] dots to [6000] dots. The setting range varies by the type and position of the figure or object.

22.8.2 Direct editing of character string

To display the text edit dialog, select an object or figure that supports text input and press the F2 key.
In the text edit dialog, you can only edit the character string.



Perform one of the following operations to confirm the change and close the dialog.

- Click outside the dialog.
- Press the enter key.
- Press the tab key.
- Cancel operation (Esc key or Alt + F4 keys)

PART 7

22.9 Settings common to figures

GT37 SoftGOT3000

The following shows the settings common only to figures.

☞ Page 1034 Antialiasing
☞ Page 1035 Processing a figure as an object
☞ Page 1036 Lamp attribute

22.9.1 Antialiasing

Antialiasing smooths out jagged edges of figures and graph lines.

The following table shows the figures to which antialiasing is applied.

Figure	Conditions under which antialiasing is applied
Text	One of the following items is selected for [Font]. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho] • [7-Segment Font]
Line	[Enable the antialiasing] is selected in [Basic Setting] in the [Type Setting] dialog. When the line width is set to 1 dot, antialiasing is not applied. ☞ Page 519 [Basic Setting]
Line freeform	
Rectangle	
Polygon	
Circle	
Arc	
Sector	
Scale	
Piping	

22.9.2 Processing a figure as an object

When you select one of the following items in the setting dialog of a figure, the figure is processed as an object.

Setting item	Condition for processing a figure as an object	Remarks
[Use lamp attribute]	Select this item.	For the lamp attribute, refer to the following. ☞ Page 1036 Lamp attribute
[Layer]	Select [Front] or [Back].	For the layers, refer to the following. ☞ Page 65 Layer
[Control displaying/hiding]	Select this item.	—

The figures processed as objects are handled as follows.

Item		Description
Handling on the screen editor		The following items are displayed for a figure processed as an object. • An area that indicates the outline of an object (object area) • Object ID • Object frame
Handling in each window	[Device Search] window	[(Object)] is appended to the end of the figure name.
	[Data Browser] window	
	[Property window	
	[Category List] window	
	[Data View] window	[(Object)] is appended to the end of the figure name. The figures processed as objects are counted in [Number of Objects].
Change in the figure setting dialog		[Backmost] can no longer be selected for [Layer]. If the figure is processed as an object using a setting other than [Layer], the [Layer] setting changes from [Backmost] to [Back].

22.9.3 Lamp attribute

The lamp attribute is a function to switch colors by turning on or off a bit device similarly to a lamp object.

Figures that support the lamp attribute

The following shows the figures that support the lamp attribute.

Figure	Reference
Line	☞ Page 1141 Drawing a Line
Line freeform	☞ Page 1145 Drawing a Line Freeform
Rectangle	☞ Page 1149 Drawing a Rectangle
Polygon	☞ Page 1153 Drawing a Polygon
Circle	☞ Page 1157 Drawing a Circle
Piping	☞ Page 1169 Drawing a Piping

Lamp attribute setting

To use the lamp attribute, configure the following settings in the setting dialog of each figure.

- Select [Use lamp attribute], and set the control bit device.
- Configure the display settings for when the control bit device is ON for each item in [Lamp Attribute (Device: ON)].

Handling of figures with the lamp attribute

■Processing figures as objects

Figures with the lamp attribute are processed as objects.

For processing of figures as objects, refer to the following.

☞ Page 1035 Processing a figure as an object

■Maximum number of figures per screen

Figures with the lamp attribute are counted as lamp objects.

For the maximum number of lamps per screen, refer to the following.

☞ Page 997 List of objects

22.10 Settings common to objects

GT37 SoftGOT3000

The following shows the settings common only to objects.

☞ Page 1038 Control with conditions
☞ Page 1044 Object shape
☞ Page 1049 Data operation

PART 7

22.10.1 Control with conditions

GT37 SoftGOT3000

Objects can be used to perform the following controls by setting conditions.

- Switching the shape or text displayed on the object
- Switching the operation (destination screen or destination station number) when the touch switch is touched
- Limiting the range of values that can be entered using the numerical input

The following shows the objects that support control with conditions and the control methods.

Object		Target of control	Control method
Touch switch	Switch	Shape Text	☞ Page 1039 Control by the key touch state and the ON and OFF states of the lamp
	Bit switch		
	Word switch		
	Go to screen switch	Shape Text	☞ Page 1039 Control by the key touch state and the ON and OFF states of the lamp
		Destination screen	☞ Page 1041 Control with multiple conditions
	Change station No. switch	Shape Text	☞ Page 1039 Control by the key touch state and the ON and OFF states of the lamp
		Destination station number	☞ Page 1041 Control with multiple conditions
	Special function switch	Shape Text	☞ Page 1039 Control by the key touch state and the ON and OFF states of the lamp
	Key window display switch		
	Key code switch		
Lamp	Bit lamp	Shape Text	☞ Page 1040 Control with a bit device
	Word lamp		☞ Page 1041 Control with multiple conditions
Numerical display		Frame color Shape color Blink Numerical value color	☞ Page 1041 Control with multiple conditions
Numerical input		Frame color Shape color Blink Numerical value color Input range	☞ Page 1041 Control with multiple conditions
Comment display	Bit comment	Shape color Comment	☞ Page 1040 Control with a bit device
	Word comment		☞ Page 1041 Control with multiple conditions
Parts display	Bit parts	Parts	☞ Page 1040 Control with a bit device
	Word parts		☞ Page 1041 Control with multiple conditions
Scatter graph		Type of points or lines Size of points or lines Color of points or lines	Select either of the following. ☞ Page 1040 Control with a bit device ☞ Page 1041 Control with multiple conditions
Level		Level color Pattern Background color	☞ Page 1041 Control with multiple conditions
Panel meter		Needle color Fill color Background color	☞ Page 1041 Control with multiple conditions
Slider		Knob	The object can be controlled by the key touch state. ☞ Page 1797 Placing a slider
Frame animation		Shape	Use either of the following. • Cycle specification • Frame No. specification For details, refer to the following. ☞ Page 1477 Placing a frame animation

Control by the key touch state and the ON and OFF states of the lamp

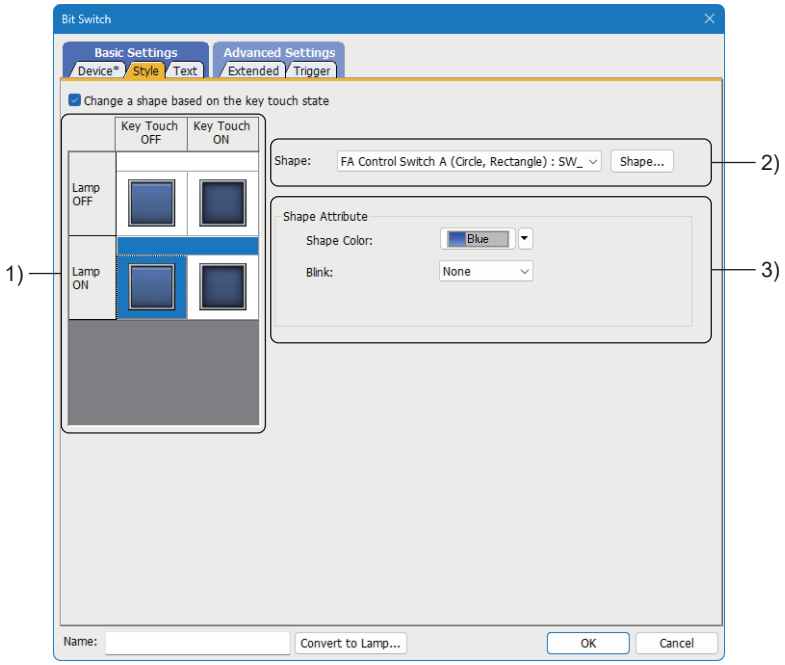
Use either or both of the following items as conditions to set the display when each condition is satisfied.

- Key touch status
- ON and OFF states of the lamp

In addition, the displayed contents can be set under the following conditions.

- When the object is touched twice (between the first touch and second touch)
- When the touch switch does not function (when the operating condition of the touch switch is unsatisfied)

The following shows the setting items for a bit switch as an example.



Item		Description
1)	Preview list	The list of conditions. Set the display to be applied when each condition is satisfied in [Shape Attribute].
2)	[Shape]	The outline of the touch switch. This setting is applied to all the conditions.
3)	[Shape Attribute]	Set the color of the shape to be applied when each condition is satisfied. Select the condition to be set in the preview list and change the settings. The settable items depend on the shape type.

The setting items depend on the touch switch.

For the setting of each touch switch, refer to the following.

☞ Page 1198 Setting touch switches

PART 7

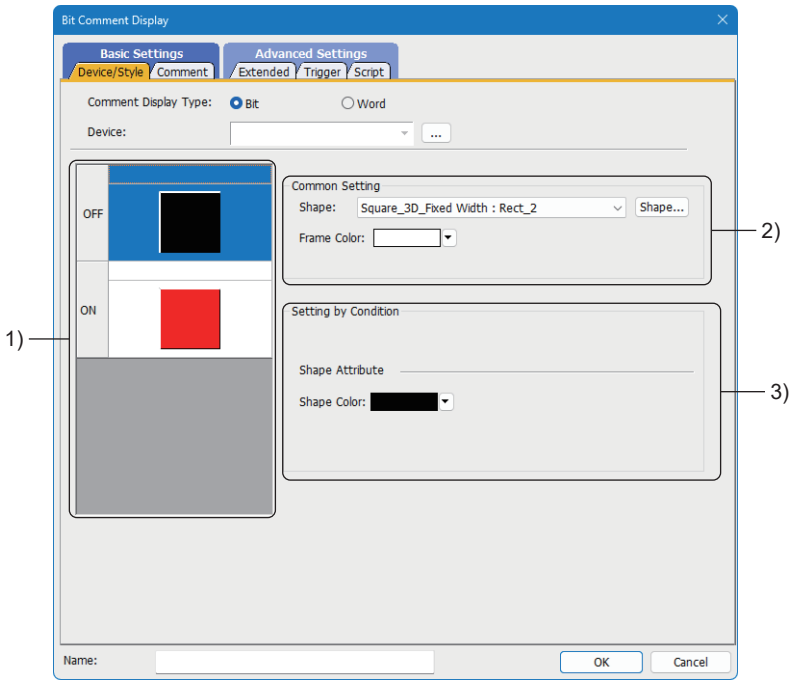
Control with a bit device

For each of the ON and OFF states of the bit device, set the display and operation when the condition is satisfied.

The setting items depend on the object.

Check the setting items in the setting dialog of each object.

The following shows the setting items for a bit comment display as an example.



Item		Description
1)	Preview list	The list of conditions. Set the contents to be applied when each condition is satisfied in [Setting by Condition].
2)	[Common Setting]	The setting applied to all the conditions.
3)	[Setting by Condition]	The setting applied when each condition is satisfied. Select the condition to be set in the preview list and change the settings. The settable items depend on the object type.

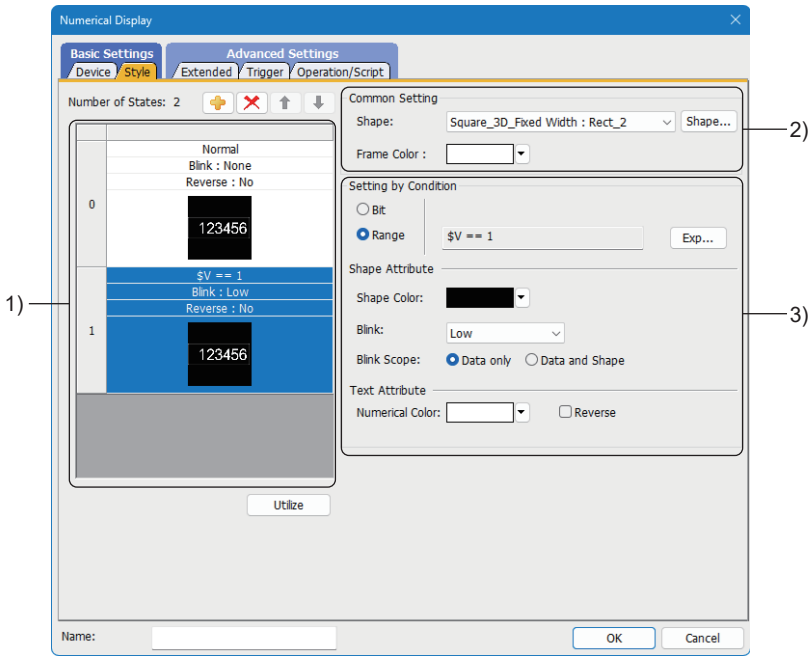
Control with multiple conditions

For each condition, set the applicable range and display and operation when the condition is satisfied.

The setting items depend on the object.

Check the setting items in the setting dialog of each object.

The following the setting items for a numerical display as an example.



Item		Description	
1)	Preview list	The list of conditions. Selecting a condition from the list displays the settings to be applied when the condition is satisfied in [Setting by Condition]. Up to 64 conditions can be set. The following shows the available conditions.	
		Condition 0	A condition that must be set. This condition is applied when none of the other conditions are satisfied.
		Condition 1 to condition 63	Conditions that are set by the user. The applicable range of each condition is set by the ON/OFF state of the bit device or by the conditional expression using a word device.  If applicable ranges of multiple conditions overlap, the condition with smallest number is prioritized. Example) If condition 1 and condition 2 are satisfied simultaneously When the range expressions for condition 1 and condition 2 are as follows, condition 1 is applied when D100 = 80. • Range expression of condition 1: 50 < = D100 • Range expression of condition 2: 0 < = D100
2)	[Common Setting]	The setting applied to all the conditions.	

Item		Description	
3)	[Setting by Condition]	The applicable range of each setting and the setting applied when each condition is satisfied. Select the scope of application from [Bit] or [Range].	
		[Bit]	Uses the ON/OFF state of the bit device as the applicable range of the condition. Configure the following settings. • Bit device for control • Applicable condition (when the bit device for control is on or off)
		[Range]	Sets the conditional expression using a word device as the applicable range of the condition. Click the [Range] button, and set the conditional expression in the [Edit Range] dialog. ☞ Page 1043 [Edit Range] dialog

Ex.

Display the production volume in the numerical display and change the shape color according to the number of defective products.

- Device to store the production volume: D500
- Device to store the number of defective products: D100

Configure the following settings in the [Numerical Display] dialog.

Tab	Setting item		Setting
[Device] tab	[Device]		D500
[Style] tab	Condition	0	Shape Color: White Range expression: — Numerical Color: Black
		1	Shape Color: Gray Range expression: 5 < = D100 < = 9 Numerical Color: Black
		2	Shape Color: Black Range expression: 10 < = D100 Numerical Color: White

When the value of D100 changes, the shape color changes as shown below.

D500 = 50
D100 = 0

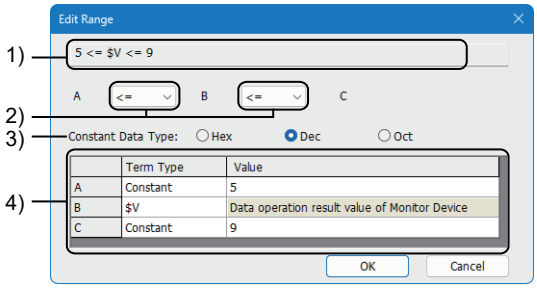
D500 = 150
D100 = 7

D500 = 200
D100 = 12

■[Edit Range] dialog

GT37 SoftGOT3000

Set a conditional expression as the applicable range of the condition to display the object or execute the function.
This dialog appears when the [Range] button is clicked in the setting dialog of the object or others.
The setting items to be displayed depend on how the [Edit Range] dialog is displayed.



Item			Description	
1)	Conditional expression		The conditional expression you set.	
2)	Relational operators		Select relational operators used in the range expression.	
3)	[Constant Data Type]		Select the data type when [Constant] is selected for [Term Type] of the range expression setting. This item is available if other than [Real] is set for [Data Type] when setting [Range] of [Trigger Type].	
4)	Range expression setting	[Term Type]	Select the type and value of each side (A to C) of the range expression. Set at least one of [$V], [$W], [$$], monitor device, and [Other Device] in the range expression. The following shows selectable items.	
			[Constant]	Operates with constants.
			[$V]	Operates with the value read from the monitored device and displayed on the object. The data type is that of the monitored device.
			[$W]	Operates with the value written to the monitored device when the enter key is touched. The data type is that of the monitored device.
			[$$]	Operates with the value read from the monitored device. The data type is that of the monitored device.
			Monitor device	Operates with the value read from the device that is set to control the display condition or operating condition. The data type is that of the device that is set to control the display condition or operating condition.
			[Other Device]	Operates the value of a word device. The data type is the same as that of the monitored device.
		[Value]	Select the value of each side (A to C) of the range expression. Depending on the [Term Type], the setting item differs.	
			[Constant]	Set a numerical value. The setting range depends on the data type of the monitored device. ☞ Page 857 Data type of devices
			[$V] [$W] [$$] Monitor device	The target device for monitoring is set.
			[Other Device]	Set a device. ☞ Page 834 How to set devices, labels, and tags

Precautions

■Conditional expression whose data type is a real number

For a device whose [Data Type] is [Real], the GOT and a controller handle the device value a little differently.
If you set a precise input condition using [==] or [!=], the input range may not be checked properly.
When checking the input range with such a device, do not use [==] and [!=] to set the input condition.
For the data type specifications, refer to the following.
☞ Page 857 Data type of devices

PART 7

22.10.2 Object shape

GT37 SoftGOT3000

Setting shapes for objects spruces up the displays of the objects.

The shapes displayed for objects are called object shapes.

Some objects display a shape as an outline and others as a frame.

Type	Image	Target object
Object that displays a shape as an outline	Example) Touch switch 	Touch switch Lamp (bit lamp, word lamp) Parts display Slider Graphical meter Frame animation
Object that displays a shape as a frame	Example) Numerical display  Without a frame  With a frame	Numerical display Numerical input Text display Text input Date display Time display Comment display Alarm display Simple alarm display System alarm display Historical data list Recipe display (record list) Panel meter Line graph Bar graph Band graph Pie graph Scatter graph Trend graph Historical trend graph

Object shapes can be switched for each condition.

☞ Page 1038 Control with conditions

Precautions

■When using a PNG file that includes a semi-transparent area (α channel) as the object shape

The display of the semi-transparent area depends on the layer on which the object is placed and the transparent color setting for the front layer.

☞ Page 1177 Transparent and semi-transparent areas (α channel) of a PNG file

How to set the object shape

The following shows how to set the object shape of a bit switch as an example.

Operating procedure

1. Perform either of the following operations to display the [Image List] dialog.

- Click the [Shape] button in the [Style tab] in the [Bit Switch] dialog
- Select the bit switch on the screen editor, and select [Edit] → [Shape Change] from the menu

☞ Page 1045 [Image List] dialog (shape)

2. In the [Image List] dialog, select a shape to be displayed for each condition and click the [OK] button.

3. Click the [OK] button in the [Bit Switch] dialog.

The object shape setting is completed.

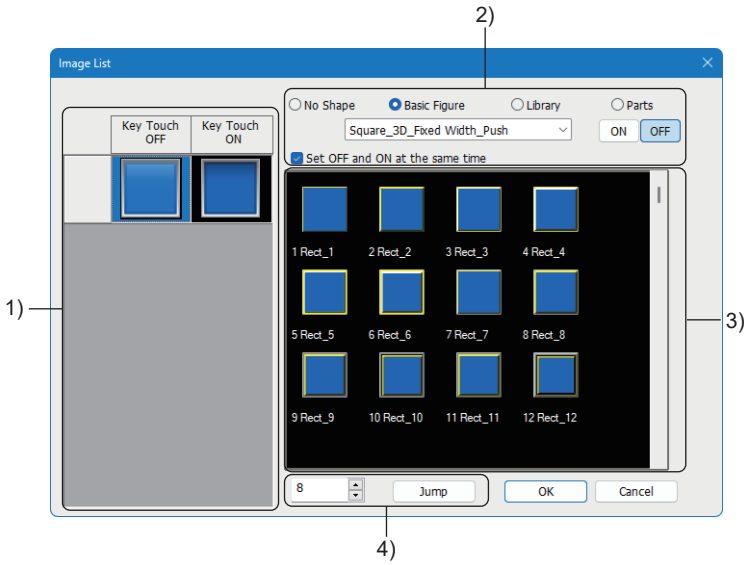
[Image List] dialog (shape)

Set the object shape.

The setting items depend on the object.

Ex.

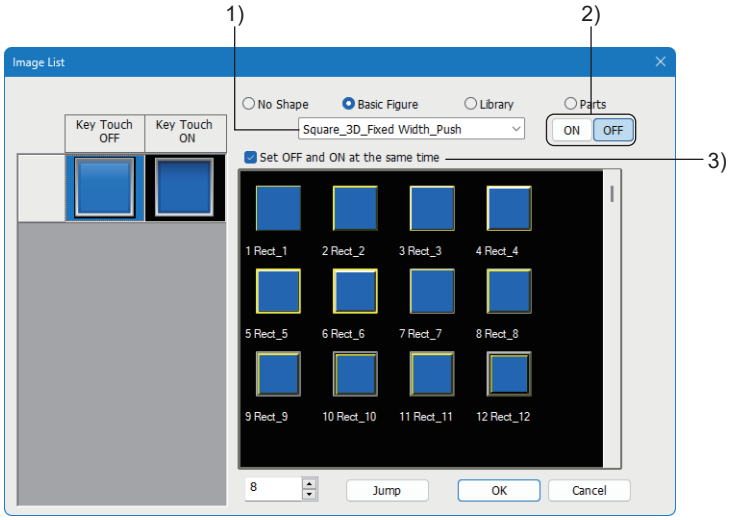
For a bit switch



Item		Description	
1)	Image preview	The image of the shapes to be displayed for each condition. For objects whose shapes are set as frames, no image is displayed. Select a condition in the image preview and select a shape in the shape image list to change the shape for the selected condition.	
2)	Image types	Select the image type of the shapes. The image type cannot be switched for each condition. This item is not displayed for objects whose image types of shapes cannot be changed. The setting items differ depending on the selected image type.	
		When [No Shape] or [None] is selected	The object shape is not set.
		When [Basic Figure] is selected	Select an object shape from the basic shapes. ☞ Page 1047 [Basic Figure]
		When [Library] is selected	Select an object shape from the shapes registered in the library. ☞ Page 1048 [Library]
		When [Parts] is selected	Select an object shape from the shapes registered as parts by the user. For how to register a part, refer to the following. ☞ Page 812 Registering parts ([Parts])
3)	Shape image list	Select an object shape.	

Item		Description
4)	[Jump] button	Specify a number from the shape image list and click the [Jump] button to select the shape associated with that number. This button does not appear when [My Favorites] is selected in [Library].

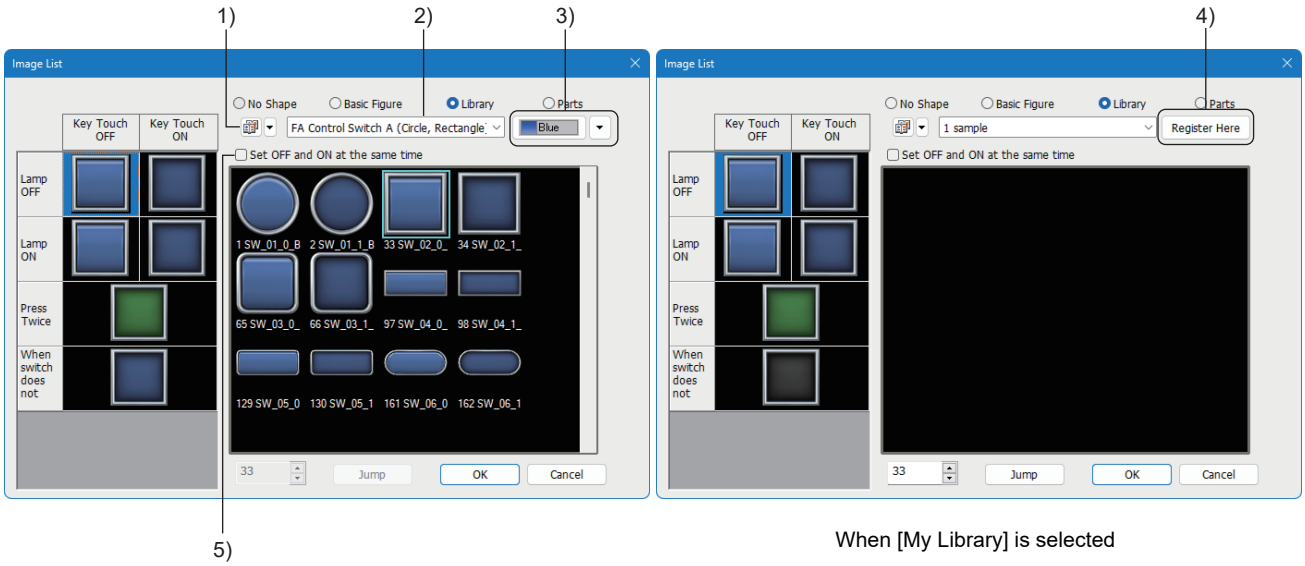
■[Basic Figure]



Item		Description
1)	Basic shape list	Selecting a shape type displays shapes in the shape image list.
2)	Display switching buttons	These are displayed for touch switches, bit lamps, and sliders. The shapes in the shape image list can be switched between those for the ON and OFF states.
3)	[Set OFF and ON at the same time] [Set every state at the same time]	The setting depends on the object. Selecting this item sets the same shape for all the conditions.

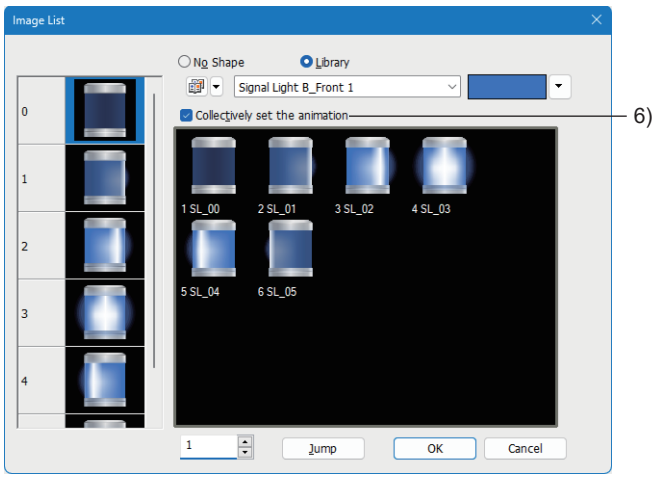
■[Library]

Ex.
For a bit switch



When [My Library] is selected

Ex.
For a frame animation



Item		Description
1)	Library theme button	Select a theme to be displayed in the library folder list. When [My Favorites] or [My Library] is selected, a shape can be selected from the ones registered to the library by users. For registration to a library, refer to the following. ☞ Page 1068 Registering data in the library
2)	Library folder list	Selecting a library folder displays shapes in the shape image list.
3)	Color category button	Narrows down the shapes displayed in the shape image list by the selected color.
4)	[Register Here] button	This button is displayed when [My Library] is selected in the library folder list. The shape selected in the image preview or the shape image list is registered to My Library.
5)	[Set OFF and ON at the same time] [Set every state at the same time]	The setting depends on the object. Selecting this item sets the same shape for all the conditions.
6)	[Collectively set the animation]	This item is displayed only for frame animations. When "shape" is set to any condition, the shapes registered in the library folder are also set to the other conditions collectively. The shapes are set to conditions in order, starting from condition 0, based on the registration numbers of the shapes in the library folder or the numbers of the filter results. If there are more conditions than shapes or filter results, any excess conditions do not have an associated shape.

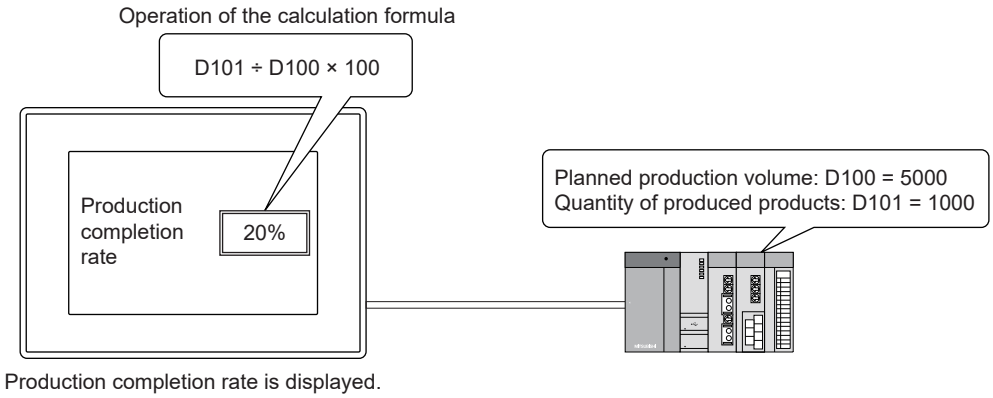
22.10.3 Data operation

Device values handled by objects can be operated.

Ex.

A device value monitored with a numerical display is operated, and the operated value is displayed.

Monitored device of the numerical display: D101



☞ Page 1049 Operation type
☞ Page 1051 Objects to which the data operation is applicable
☞ Page 1052 Order of the operating processes
☞ Page 1053 How to set the data operation
☞ Page 1054 [Edit Data Expression] dialog

Operation type

Data are operated and determined in bitwise operation.

The bitwise operation is the function that operates each bit of the value of a word device.

The following shows the settable operation types.

☞ Page 1049 Mask processing
☞ Page 1050 Shift processing
☞ Page 1050 Operating expression

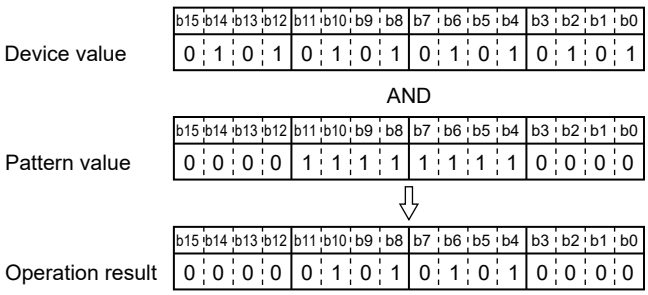
■Mask processing

A logical operation is performed on the value of a word device using a set pattern value.

Mask type	Description
Logical AND	If the corresponding bits of a device value and a pattern value are both 1, the result is 1. Otherwise the result is 0.
Logical OR	If the corresponding bits of a device value and a pattern value are both 0, the result is 0. Otherwise the result is 1.
Exclusive OR	If the corresponding bits of a device value and a pattern value are equal, the result is 0, otherwise 1.

Ex.

When using the logical AND



■Shift processing

The value of a word device is operated by shifting each bit to right or left.

The operation result depends on the data type of the monitored device.

Data type of the monitored device	Operation result
Signed	If a device of a signed data type is monitored, an arithmetic sift operation is performed. Example) Shifting signed 16-bit binary data to the right by 4 bits • Device value: -10000 (decimal) • Operation result: -625 (decimal) Unsigned	Example) Shifting unsigned 16-bit binary data to the right by 4 bits • Device value: 10000 (decimal) • Operation result: 625 (decimal) 
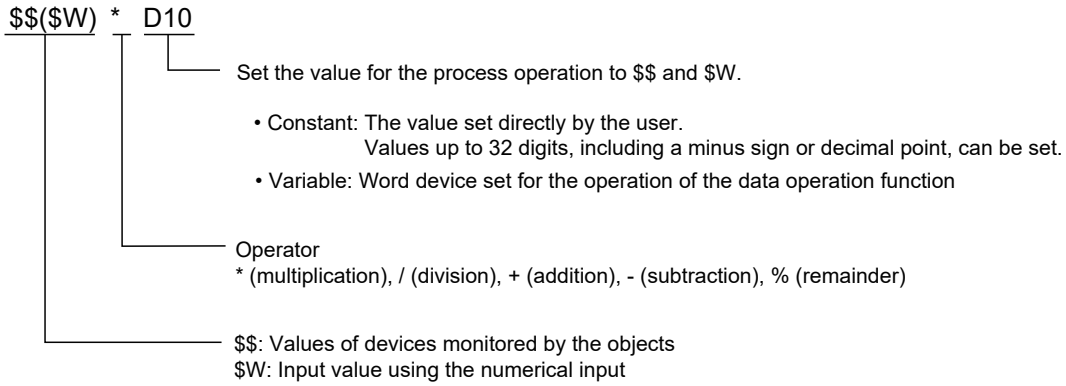
■Operating expression

The value of a word device is operated by applying an operating expression.

The following shows an example of the operating expression.

Ex.

When [Style] is [A.B]



Objects to which the data operation is applicable

The following shows the objects to which the data operation is applicable.

Object		Data operation setting tab	Order of the operating processes
Lamp	Word lamp	☞ Page 1301 [Operation/Script] tab	☞ Page 1052 Order when refreshing the display of an object
Numerical display		☞ Page 1325 [Operation/Script] tab	
Numerical input		☞ Page 1338 [Operation/Script] tab	☞ Page 1052 Order when inputting data in an object
Comment display	Word comment	☞ Page 1410 [Operation/Script] tab	☞ Page 1052 Order when refreshing the display of an object
Parts display	Word parts	☞ Page 1461 [Operation/Script] tab	
Frame animation		☞ Page 1492 [Script] and [Operation/Script] tabs	
Historical data list display		☞ Page 1517 [Trigger] tab	
Graph	Line graph	☞ Page 1591 [Operation/Script] tab	
	Trend graph	☞ Page 1606 [Data] tab ☞ Page 1620 [Operation/Script] tab	
	Bar graph	☞ Page 1637 [Operation/Script] tab	
	Band graph	☞ Page 1652 [Operation/Script] tab	
	Pie graph	☞ Page 1666 [Operation/Script] tab	
	Scatter graph	☞ Page 1690 [Operation/Script] tab	
	Historical trend graph	☞ Page 1710 [Data] tab ☞ Page 1726 [Operation/Script] tab	
Graphical meter		☞ Page 1758 [Operation/Script] tab	
Meter	Level	☞ Page 1775 [Operation/Script] tab	
	Panel meter	☞ Page 1793 [Operation/Script] tab	
Slider		☞ Page 1808 [Operation] tab	☞ Page 1052 Order when inputting data in an object

Order of the operating processes

The order of the operating processes is different between when refreshing the display of an object and when inputting data in an object.

☞ Page 1052 Order when refreshing the display of an object
☞ Page 1052 Order when inputting data in an object

■Order when refreshing the display of an object

The operating processes are performed in the following order for the value read from the monitored device ($$).

Order	Operating process	Remarks
1	Mask processing	—
2	Shift processing	—
3	Data operation by using the expression	For a numerical input and slider, the operation is performed by using the expression for writing.

The display of an object is refreshed with the value after the operating processes.

■Order when inputting data in an object

For a numerical input and slider, the operating processes are performed in the following order for the input value ($W).

Order	Process	Remarks
1	Data operation by using the expression	The operation is performed by using the expression for monitoring.
2	Shift processing	—
3	Mask processing	—

■Processing order when input and display operations are set

After the operating process at the time of input, the operating process for refreshing the object display is performed using the value read from the monitored device ($$).

The following shows the order of the operating processes in an input object, taking a numerical input as an example.

Ex.

When the following operating processes are enabled in a numerical input

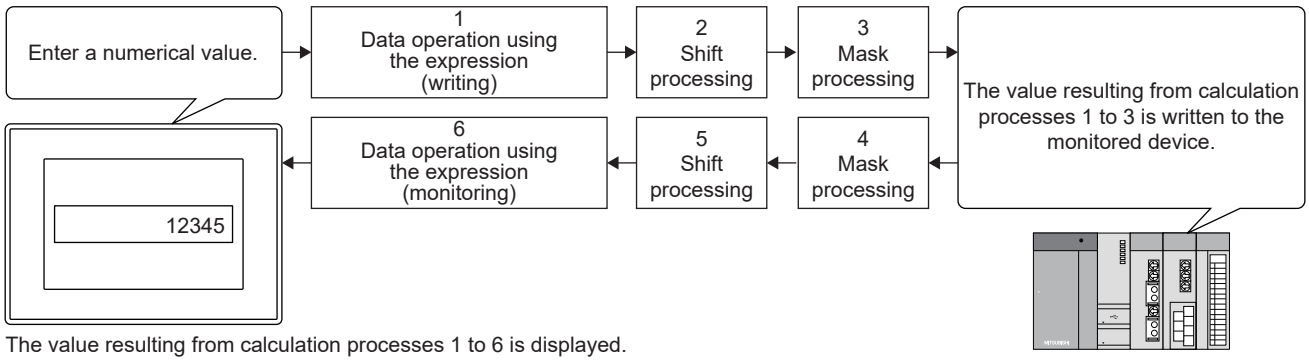
- Mask processing
- Shift processing
- Data operation (monitoring)
- Data operation (writing)

The operating processes are performed in the following order.

Order	Operating process		Description
1	Operating process when inputting data in an object	Data operation by using the expression	Performs the operation by using the expression of the data operation (writing).
2		Shift processing	Shifts the value in the set direction.
3		Mask processing	Masks the value with a set pattern.
4	Operating process when refreshing the display of an object	Mask processing	Masks the value with a set pattern.
5		Shift processing	Shifts the value in the opposite direction of the input.
6		Data operation by using the expression	Performs the operation by using the expression of the data operation (monitoring).

For the monitored device of a numerical input, the value to which operating processes 1 to 3 are applied is written.

For the numerical input, the value to which operating processes 1 to 6 are applied is displayed.



The value resulting from calculation processes 1 to 6 is displayed.

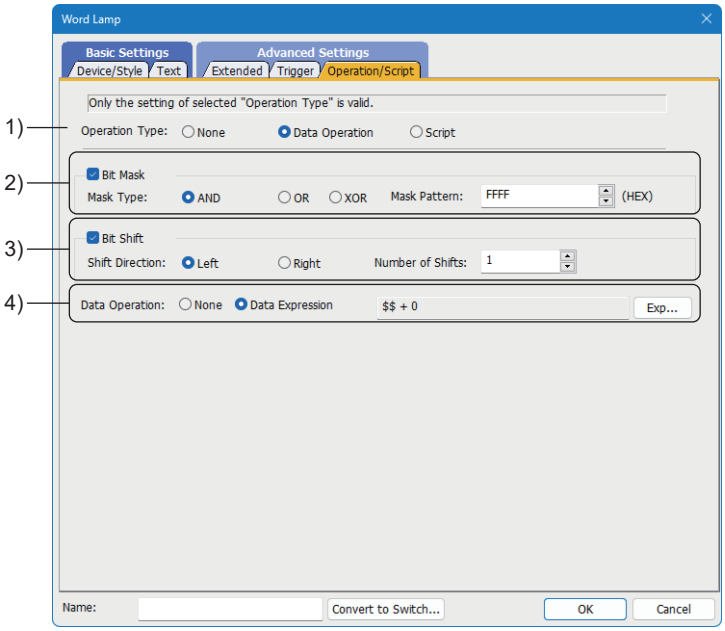
How to set the data operation

Set the operating process.

The setting items depend on the object.

Check the setting items in the setting dialog of each object.

The following shows the setting items using a word lamp as an example.



Item		Description
1)	[Operation Type]	Select [Data Operation].
2)	[Bit Mask]	Select this item to set the mask processing. Set [Mask Type] and [Pattern] (hexadecimal). ☞ Page 1049 Mask processing The setting range of [Pattern] depends on the data type of the monitored device. ☞ Page 857 Data type of devices
3)	[Bit Shift]	Select this item to set the shift processing. Set [Shift Direction] and [Number of Shifts] (number of bits to be shifted). ☞ Page 1050 Shift processing
4)	[Data Operation]	Select [Data Expression] to set an expression. ☞ Page 1050 Operating expression Click the [Exp] button to set an expression in the [Edit Data Expression] dialog. ☞ Page 1054 [Edit Data Expression] dialog

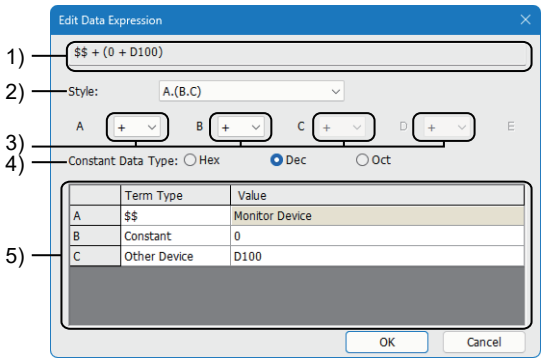
[Edit Data Expression] dialog

GT37 SoftGOT3000

Displayed when the [Exp] button in [Data Expression] is clicked.

Depending on the type of the object, the setting items in the setting dialog differ.

Refer to the setting items explained in this section that are provided for the object to be used.

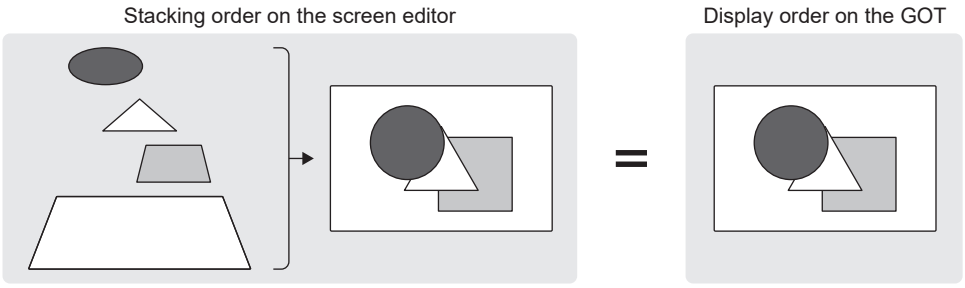


Item			Description	
1)	Operating expression		Displays a set operating expression.	
2)	[Style]		Select the format of the expression. Example) For [A.(B.C)]  	
3)	Operators		Select operators. If [%] is selected, the left side is divided by the right side, and the operation result is the remainder. Example) 100 % 3 = 1(100 ÷ 3 = 33 and the remainder is 1)	
4)	[Constant Data Type]		Select the data type when [Constant] is selected for [Term Type] of the range expression setting.	
5)	Range expression setting	[Term Type]	Select the type and value of each side (A to E) of the range expression. Set at least one of [$W], [$$], and [Other Device] in the range expression. The following shows selectable items.	
			[Constant]	Operates with constants.
			[$W]	Operates with the value written to the monitored device when the enter key is touched. The data type is that of the monitored device.
			[$$]	Operates with the value read from the monitored device. The data type is that of the monitored device.
			[Other Device]	Operates the value of a word device. The data type is the same as that of the monitored device.
		[Value]	Select the value of each side (A to E) of the range expression. Depending on the [Term Type], the setting item differs.	
			[Constant]	Set a numerical value. The setting range depends on the data type of the monitored device. ☞ Page 857 Data type of devices
			[$W] [$$]	The target device for monitoring is set.
			[Other Device]	Set a device. ☞ Page 834 How to set devices, labels, and tags

22.11 Superimposition of figures and objects

GT37 SoftGOT3000

Figures and objects can be placed in superimposition on the screen.
The superimposition order of figures and objects placed on the screen editor is ensured when the screen is displayed on the GOT.



☞ Page 1055 Changing the superimposition order
☞ Page 1056 Operations of the superimposed objects
☞ Page 1057 Touch switch superimposition specifications

22.11.1 Changing the superimposition order

To change the superimposition order of figures and objects, perform either of the following operations.

Operation	Details
Changing the superimposition order by selecting the target	Change the order from the [Edit] menu. ☞ Page 1022 Changing the stacking order of figures and objects
Changing the layer for placement	Change the layer in each setting dialog of the figure or object. Select the destination layer for [Layer] in the [Extended] tab.

By separating the layers, the following processes can be performed.

- Placing a figure in front of an object
- Setting a transparent color to the front layer to display the back layer and backmost layer through the front layer

For the layers, refer to the following.

☞ Page 65 Layer

PART 7

22.11.2 Operations of the superimposed objects

Certain objects can be displayed and operate normally even when they are superimposed in the same layer.
The following lists the objects that can be superimposed in the same layer.

Combination	Reference
Superimposition of touch switches	☞ Page 1057 Touch switch superimposition specifications
Numerical input and text input	The numerical input and text input can be superimposed. They also can be superimposed on a touch switch. When superimposed on a touch switch, the numerical input and text input are also counted as touch switches. ☞ Page 1058 Superimposition of touch switches The cursor and key window are displayed for the last operated numerical input or text input.
Level and numerical display, numerical input, and comment display	When a label and a numerical display, numerical input, and comment display are superimposed, a numerical value or text can be displayed in the level area. When the level fill and the numerical value or text are superimposed, the color of the value or text can be inverted.  For superimposition of levels, refer to the following. ☞ Page 1761 Placing a level object
Superimposition of parts displays	Two or more parts can be displayed in superimposition. Select [Overwrite] for [Display Mode] of parts displays. ☞ Page 1416 Placing a parts display Parts display A: Displays part No.1 when M10 rises. Parts display B: Displays part No.2 when M20 rises. Parts display C: Displays part No.3 when M30 rises. Three parts displays are superimposed. 
Precautions

■Placing objects displayed at the forefront of the layer

The figures and objects with the following settings are always displayed at the forefront of the layer.

Figures and objects	Setting
Alarm display (user)	Select an item other than [Fixed] for [Display Type] in the [Alarm Setting] tab.
Alarm display (system)	
Scatter graph	Select [Store Memory] in the [Extended] tab.
Figures drawn by the free figure drawing function of the object scripts	Set the script in each object.

To superimpose the objects of each type listed above, place them in the separate layers.

22.11.3 Touch switch superimposition specifications

☞ Page 1057 Superimposition of touch switches and other objects
☞ Page 1058 Superimposition of touch switches

Superimposition of touch switches and other objects

Touch switches without figures and texts can be used in superimposition with the other objects.
With the following settings, no shapes or text are set for the touch switches.

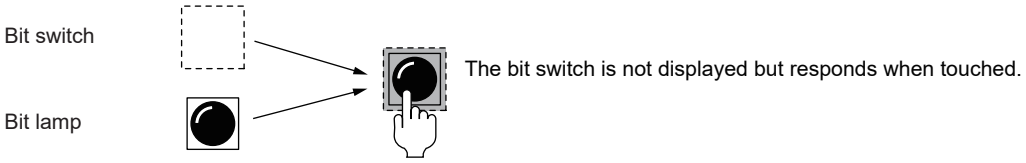
Setting	Description
[Style] tab	• [None] is selected for [Shape] • [Reverse Switch Area] is not selected.
[Text] tab	[Text] is selected for [Text Type] and no string is input for [Text].

For how to set touch switches, refer to the following.

☞ Page 1191 Placing a touch switch

Ex.

When superimposing a bit switch and a bit lamp for which no shapes or text are set



Precautions

■Superimposition with a numerical display and text display

Place on a different layer from the layer of the touch switch.

■Superimposition with an alarm display (user) or alarm display (system)

When an item other than [None] is selected for [Touch Mode] in the [Alarm Setting] tab in the setting dialog of the alarm display (user) or alarm display (system), superimposition with touch switches is not possible.

PART 7

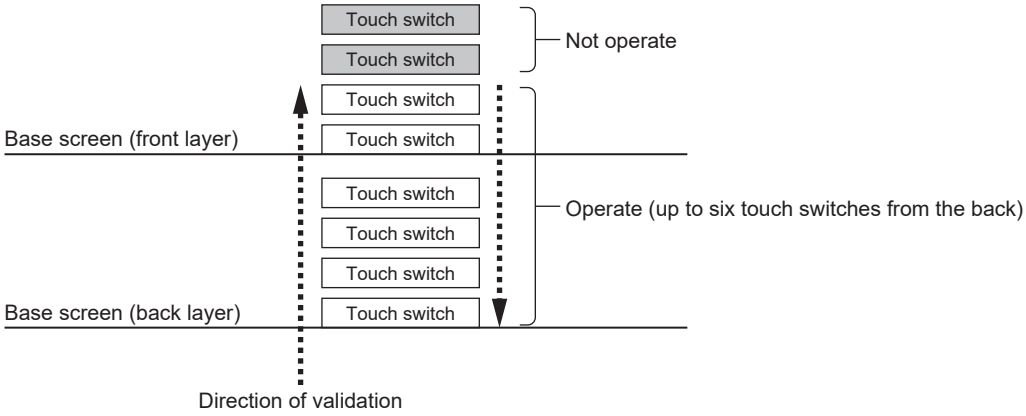
Superimposition of touch switches

Up to six superimposed touch switches can operate on the front layer and back layer.

This also applies to the case when multiple actions are set for each touch switch.

The order in which the actions are determined to be valid is different from the order in which they are performed.

- Order of validation judgment: From back to front
- Order of actions when a touch switch is touched: From front to back



☞ Page 1059 Superimposition of touch switches placed on different screens

☞ Page 1060 Operation example

Precautions

Precautions	Description
Superimposition of touch switches for which the simultaneous press is disabled	A touch switch for which [Simultaneous Press] is selected in the [Extended] tab in the setting dialog does not operate when superimposed with other touch switches. For the following touch switches, [Simultaneous Press] is selected. • Switch ([SP Function] is set for its action.) • Special function switch
Superimposition of key code switches	Superimposed key code switches with individual key code settings may interrupt operation depending on the key code type.

■Superimposition of touch switches placed on different screens

When the touch switches placed on different screens are superimposed by the following methods, they will also operate.

- Displaying a superimpose window on a base screen
- Displaying a called screen on a screen

Up to six touch switches can operate per screen type.

When a superimpose window or called screen is displayed on a screen, the operation is as follows.

Item	Specifications
When a superimpose window is displayed	The superimpose window is displayed as part of the base screen since the window is superimposed on the base screen. ☞ Page 59 Superimpose window The maximum number of operable touch switches depends on the number of displayed superimpose windows. • When one superimpose window is displayed: Up to seven touch switches (At least one touch switch on the superimpose window operates.) • When two superimpose windows are displayed: Up to eight touch switches (At least one touch switch on each superimpose window 1 and 2 operates.) The actions of touch switches are determined to be valid or not in the following order, regardless of the order in which the superimpose windows are displayed. 1st: Base screen 2nd: Superimpose window 1 3rd: Superimpose window 2
When the called screen is displayed	A called screen is displayed on the basic screen (screen on which the called screen is placed) with the set overlay screen function. Calls a base screen or window screen on a basic screen, and displays them as a single screen. ☞ Page 1865 Placing a screen on another screen Superimposed touch switches can operate on a maximum of 99 called screens. The superimposition order of the basic screen and called screen depends on the settings of [Overlay Screen Positioning] in the [Environmental Setting] window ([Screen Switching/Window]). ☞ Page 542 [Screen Switching/Window] Since the validation judgment of touch switches is performed in order from the back layer, the order in which their actions become valid changes depending on the display order of the basic screen and called screen.  The number (1 to 99) of the called screen is the order in which the screen is called.

■Operation example

The following shows operation examples (pattern A to E) when touch switches on each screen are superimposed with the following setting.

- Base screen: Three called screens are displayed.
- Superimpose window 1: Three called screens are displayed.
- Superimpose window 2: Three called screens are displayed.
- [Overlay Screen Positioning] in the [Environmental Setting] window ([Screen Switching/Window]): [On top of the reference screen] is selected.

(n) ... Operative touch switch ("n" indicates the operation order)
× ... Inoperative touch switch

			Pattern A	Pattern B	Pattern C	Pattern D	Pattern E
Superimpose window 2	Front layer	Called screen 3				×	×
		Called screen 2				×	×
		Called screen 1				×	×
		Basic screen				×	×
	Back layer	Called screen 3				×	×
		Called screen 2				×	×
		Called screen 1				×	×
		Basic screen				(1)	(1)
Superimpose window 1	Front layer	Called screen 3		×		×	×
		Called screen 2				×	×
		Called screen 1		×		×	(2)
		Basic screen		(1)	×	×	(3)
	Back layer	Called screen 3			×	×	(4)
		Called screen 2			(1)	×	(5)
		Called screen 1			(2)	×	(6)
		Basic screen			(3)	(2)	(7)
Base screen	Front layer	Called screen 3	×			×	
		Called screen 2		×		×	
		Called screen 1	(1)	(2)		(3)	
		Basic screen	(2)	(3)	(4)	(4)	
	Back layer	Called screen 3	(3)	(4)		(5)	
		Called screen 2	(4)	(5)	(5)	(6)	
		Called screen 1	(5)	(6)	(6)	(7)	
		Basic screen	(6)	(7)	(7)	(8)	

Pattern	Operation
Pattern A	Up to six touch switches can operate since only the base screen is displayed. Six touch switches on the base screen operate.
Pattern B	Since the touch switches placed on superimpose window 1 are superimposed, up to seven touch switches can operate. The number of touch switches that can operate is as follows. • Base screen: Six touch switches (Up to six touch switches can operate per screen type.) • Superimpose window 1: One touch switch (At least one touch switch on the superimpose window operates.)
Pattern C	Since the touch switches placed on superimpose window 1 are superimposed, up to seven touch switches can operate. The number of touch switches that can operate is as follows. • Base screen: Four touch switches • Superimpose window 1: Three touch switches
Pattern D	Since the touch switches placed on superimpose window 1 and 2 are superimposed, up to eight touch switches can operate. The number of touch switches that can operate is as follows. • Base screen: Six touch switches (Up to six touch switches can operate per screen type.) • Superimpose window 1: One touch switch (At least one touch switch on the superimpose window operates.) • Superimpose window 2: One touch switch (At least one touch switch on the superimpose window operates.)
Pattern E	Since the touch switches placed on superimpose window 1 and 2 are superimposed, up to eight touch switches can operate. The number of touch switches that can operate is as follows. • Superimpose window 1: Six touch switches (Up to six touch switches can operate on one screen type.) • Superimpose window 2: One touch switch (At least one touch switch on the superimpose window operates.)

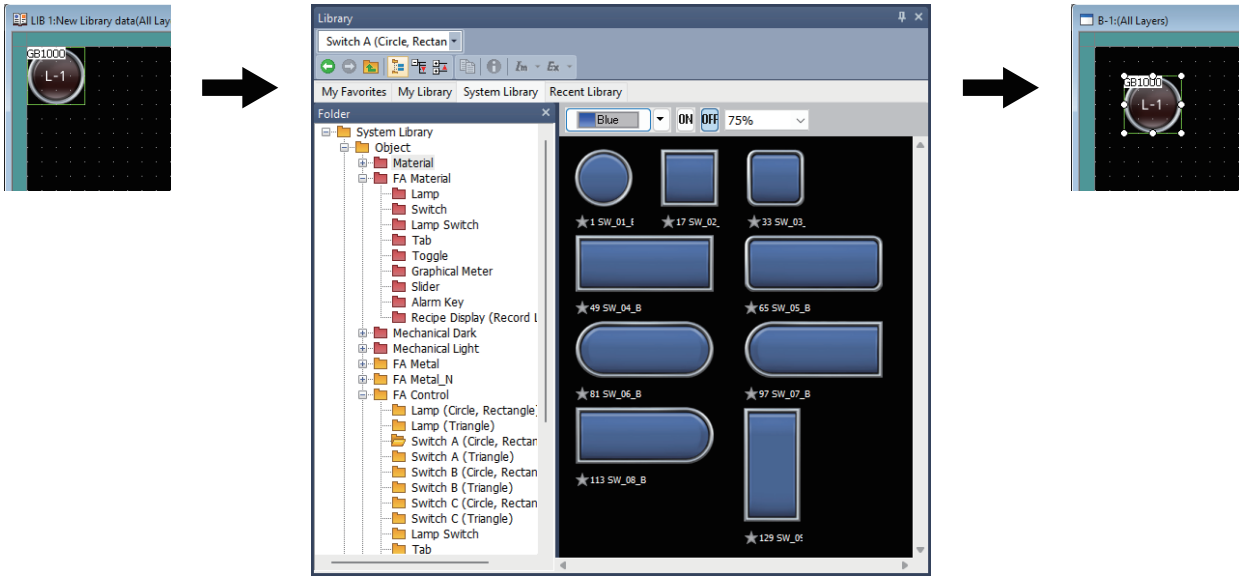
23 Using the data registered in the library

GT37 SoftGOT3000

The library is a collection of preconfigured figures and objects.
You can use the registered figures and objects to speed up screen creation.
The library consists of the preregistered System Library and My Library for registering user-configured figures and objects.

Register

Place it on the screen editor.



[Library] window

☞ Page 1062 Specifications of the library
☞ Page 1067 How to use the library
☞ Page 1085 [Library] window

23.1 Specifications of the library

GT37 SoftGOT3000

☞ Page 1062 Library data types
☞ Page 1063 Library classifications
☞ Page 1064 Specifications of My Library

23.1.1 Library data types

The following shows the types of data that can be registered in the library.

Type	Description
Figure	The figures drawn by the user are registrable. Raster and vector format shapes are registered in the System Library. The user cannot register vector format shapes.
Object	The objects configured by the user are registrable. However, the following objects are not registrable. • Set overlay screen • Animation route • Window position • Key window object
Template	User-created templates are registrable. For details on the templates, refer to the following. ☞ Page 1092 Efficient Drawing with Templates
Image file	Image files can be registered as figures. The files in the following formats can be registered. • BMP format: *.bmp • JPEG format: *.jpg, *.jpeg, *.jpe • PNG format: *.png
Video file	Videos used for frame animation can be registered as figures. The files in the following formats can be registered. • Animation PNG format: *.png, *.apng • GIF format: *.gif

23.1.2 Library classifications

The following shows the library classifications.

Library	Description	
[System Library]	The library data is supplied with GT Designer3. The icon images differ depending on the format of the registered shapes. ☞ Page 1087 Library tree area The System Library consists of the following library folders.	
	[Object] folder	Object data and other data are registered. The lower-level library folders are divided by design and data type.
	[Image] folder	Image data is registered. The lower-level library folders are divided by design and data type.
[My Library]	User-created figures and objects are registered. This is saved for each user logged in to Windows. It is available for exporting or importing registered data. You can create library folders in the [My Library] folder and categorize the folders by use.  ☞ Page 1064 Specifications of My Library	

23.1.3 Specifications of My Library

☞ Page 1064 Specifications of library folders and library data
☞ Page 1065 Export specifications
☞ Page 1066 Import specifications

Specifications of library folders and library data

The following shows the specifications of library folders and library data to be registered in My Library.

Item		Description
Library folder	Hierarchy	Up to two levels can be created under the [My Library] folder (route folder). The first level can store only either library folders or library data.
	Creation quantity	Up to 512 folders can be created in the first and second levels together.
	Folder number and name	Library folders can be numbered from 1 to 512. A folder names can be up to 128 characters. Library folder numbers and names are displayed in the [Library] window in the following formats. ☞ Page 1085 [Library] window First-level library folder  Second-level library folder Library data	Registration quantity	Up to 512 pieces of data can be registered in one library folder.

Export specifications

Exported data (My Library file) can be imported and used by other users or with other personal computers.

For the export operation, refer to the following.

☞ Page 1075 Exporting the library data

■File format for export

The following shows the file formats of library data for export.

- My Library file: *.my3
- My Favorites file: *.csv, *.txt

■File structure for export

The hierarchy of the library folder to be exported determines the structure of the exported file.

Example of library folder structure	Structure of the exported file
When exporting a first-level library folder 	The export target file is exported as a My Library file (*.my3). When exporting a second-level library folder 	A folder with the first-level folder number is created at the export destination. The export target file is exported as a My Library file (*.my3) in the created folder. When exporting all of My Library and My Favorites 	A [MyLibrary] folder is created at the export destination. Export is performed maintaining the folder structure of My Library. My Favorites registration information is exported as MyFavorites.csv. 
PART 7

Import specifications

The following shows the importable file formats.

Item	Extension	Remarks
My Library file	• *.my3 • *.my2	*.my3 represents a file exported with GT Designer3 (GOT3000). *. my2 represents a file exported with GT Designer3 (GOT2000).
System Library file	• *.sy3	—
Image file	• *.bmp • *.jpg • *.jpeg • *.jpe • *.png	—
Video file	• *.png • *.apng • *.gif	A library folder with the same name as the video file is created and the file is imported as frame-by-frame image data.
My Favorites file	• *.csv • *.txt	—

For the import operation, refer to the following.

☞ Page 1078 Importing data to the library

23.2 How to use the library

GT37 SoftGOT3000

The following shows the operations for the libraries.

The available operations are different between My Library and System Library.

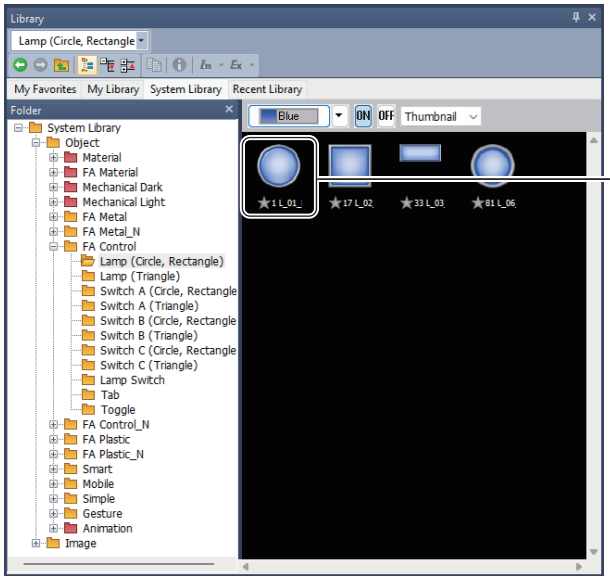
○: Available, —: Not available

Operation	Operation target	
	My Library	System Library
☞ Page 1067 Placing library data on the screen editor	○	○
☞ Page 1068 Registering data in the library	○	—
☞ Page 1071 Copying the library data	○	—*1
☞ Page 1072 Deleting the library data	○	—
☞ Page 1073 Opening the library editor to edit the library data	○	—
☞ Page 1074 Renumbering and renaming the library data	○	—
☞ Page 1074 Registering library data in My Favorites	○	○
☞ Page 1075 Exporting the library data	○	—
☞ Page 1078 Importing data to the library	○	—

*1 Data can be copied but cannot be pasted.

23.2.1 Placing library data on the screen editor

1. Select the library data to be placed on the screen editor from the library.



2. Click the intended position to place the library data on the screen editor.

Click and drag to resize and paste the library data.

Point

The library data registered in [My Favorites] can also be placed from the My Favorites tool bar.

Precautions

■Objects with device, label, or tag settings

If the controller setting does not support the device, label, or tag set to the object to be placed, the device setting of the placed object will be [??].

Change the device setting.

23.2.2 Registering data in the library

☞ Page 1068 Creating new library data
☞ Page 1069 Registering a figure or object on the screen editor in the library
☞ Page 1069 Registering a figure used as an object in the library

To register an image file or video file in the library, the file must be imported.

For the import operation, refer to the following.

☞ Page 1078 Importing data to the library

Creating new library data

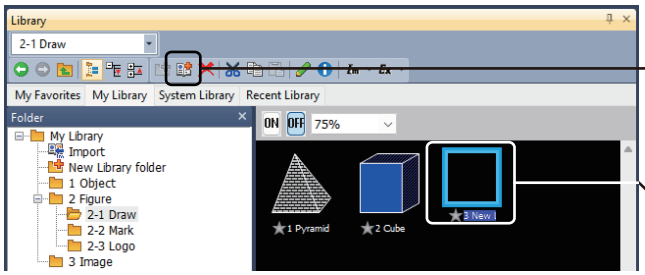
1. Select the [My Library] tab in the [Library] window.

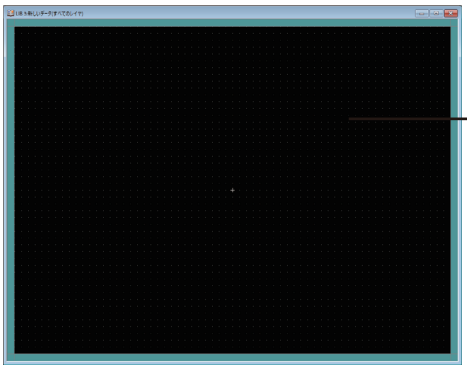
☞ Page 1085 [Library] window

2. Double-click the library folder for storing library data in the library tree area.

To create a new library folder, click the [Create Library Folder] button.

3. Click the [Create New Library Data] button to create library data in the library data area and display the library editor.





4. Place figures and objects on the library editor.

5. After editing, close the library editor.

6. Edit the number and name of the library data.

☞ Page 1074 Renumbering and renaming the library data

The library data creation is completed.

Registering a figure or object on the screen editor in the library

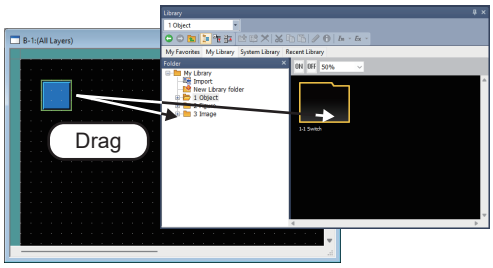
1. Select the [My Library] tab in the [Library] window.

☞ Page 1085 [Library] window

2. Double-click the library folder for registering library data in the library tree area.

To create a new library folder, click the [Create Library Folder] button.

3. Drag a figure or object on the screen editor to the library tree area or library data area.



4. Release the mouse button to display the [Library data Property] dialog.

☞ Page 1091 [Library data Property] dialog

5. Enter [Number] and [Name], and click the [OK] button.

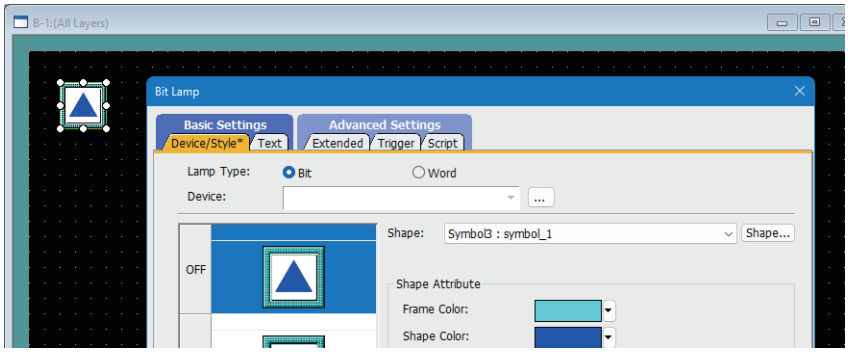
The registration to the library is completed.

Point

Right-clicking a figure or object on the screen editor and selecting [Register] → [Register to My Library] from the menu is also available for registering the figure or object to the library.

Registering a figure used as an object in the library

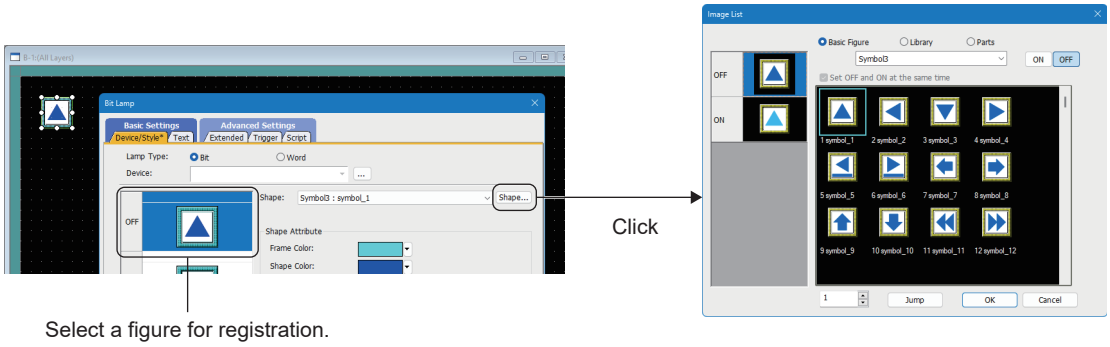
1. Display the object setting dialog.



2. Select a figure from the preview list and click the [Figure] button.

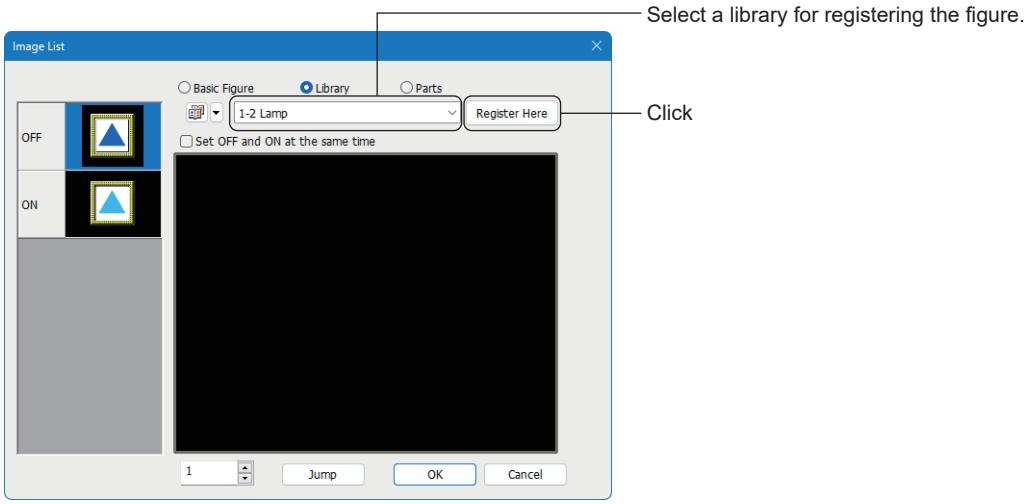
The [Image List] dialog is displayed.

☞ Page 1045 [Image List] dialog (shape)



PART 7

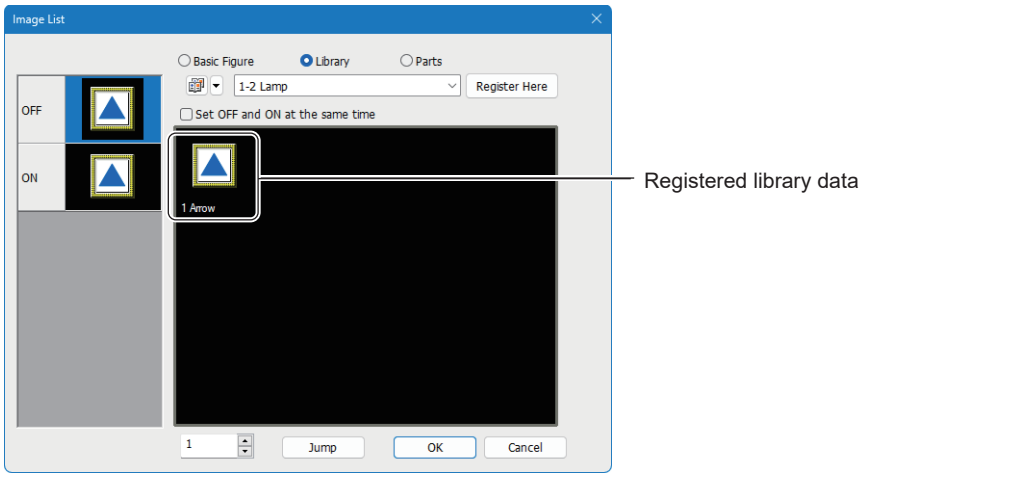
3. In the list of library folders, select the library folder for registering the library data from My Library, and click the [Register Here] button.



4. Enter [Number] and [Name] in the displayed [Library data Property] dialog, and click the [OK] button.

☞ Page 1091 [Library data Property] dialog

The registration to the library is completed.

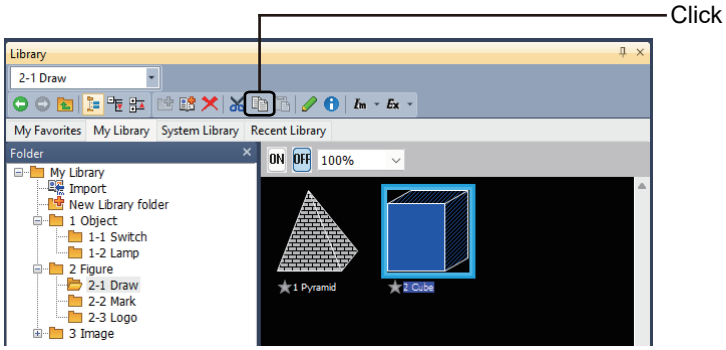


23.2.3 Copying the library data

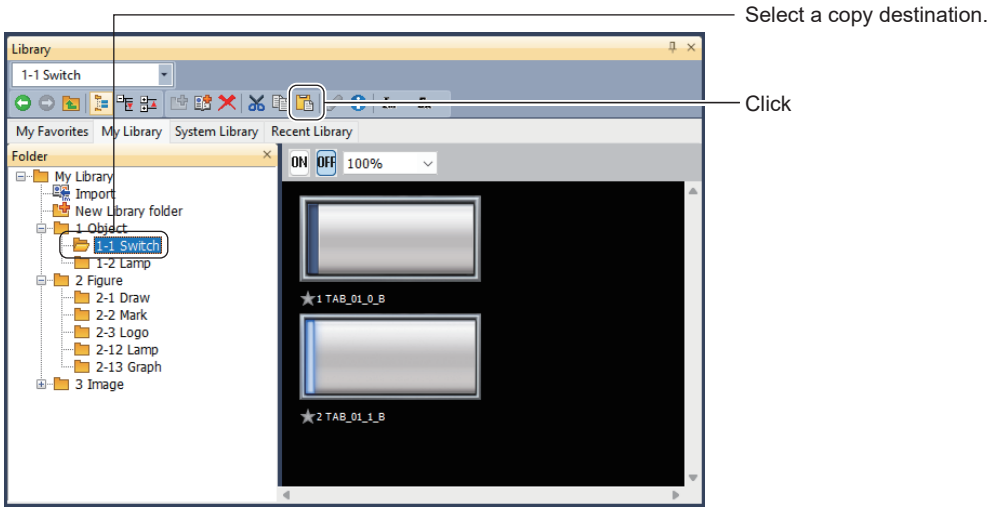
1. Select the [My Library] tab or [System Library] tab in the [Library] window.

☞ Page 1085 [Library] window

2. Select the library folder or library data to be copied, and click the [Copy] button.

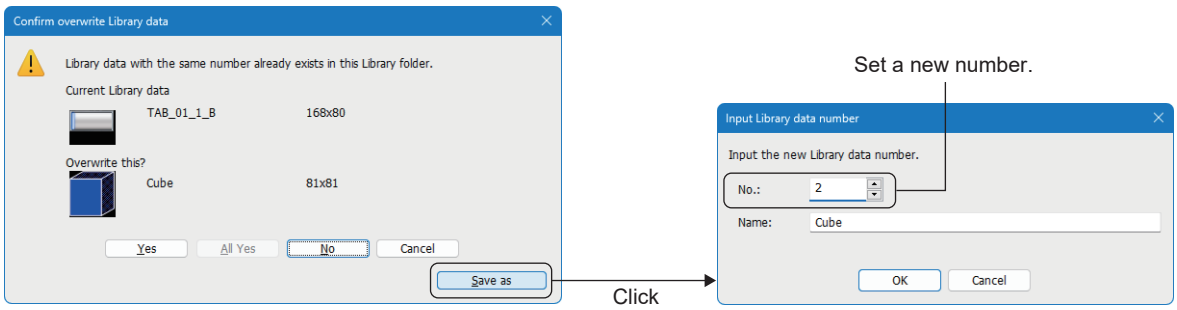


3. Select the [My Library] tab in the [Library] window, select the copy destination library folder, and click the [Paste] button.



4. If library data having the same number as the copy source library data exists, the [Overwriting the Library Data Confirmation] dialog is displayed.

- To overwrite the library data, click the [Yes] button.
- To overwrite all the library data, click the [All Yes] button.
- To not to overwrite the library data, click the [Save as Different Number] button and set a new number.
- To cancel pasting, click the [No] button.
- To cancel the pasting of all the data, click the [Cancel] button.

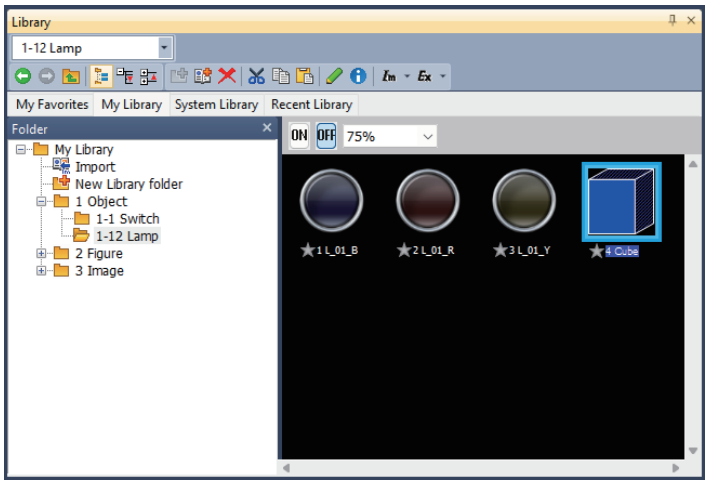


23.2.4 Deleting the library data

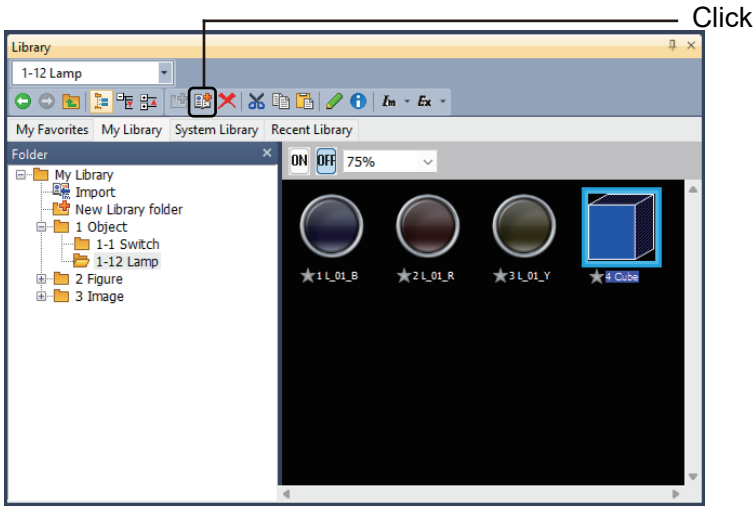
1. Select the [My Library] tab in the [Library] window.

☞ Page 1085 [Library] window

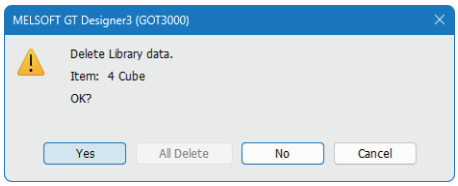
2. Select a library folder or a library data to be deleted from the library.



3. Click the [Delete] button.



4. Click the [Yes] button in the displayed dialog to delete the selected library folder or library data.



Point

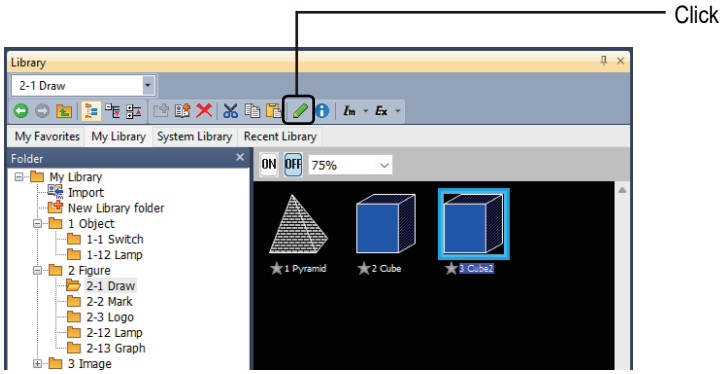
Note that deleting the library folder deletes all the library data sets registered in the library folder as well.

23.2.5 Opening the library editor to edit the library data

1. Select the [My Library] tab in the [Library] window.

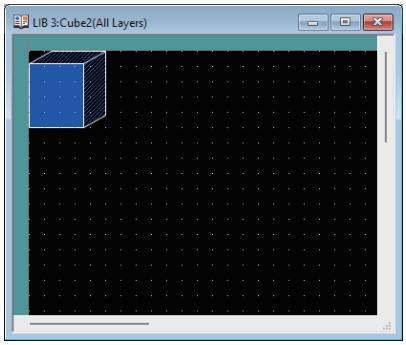
☞ Page 1085 [Library] window

2. Select the library data to be edited in the library data area, and click the [Edit] button.



3. Edit the library data on the displayed library editor.

The edited contents are reflected to the library data immediately.



To cancel the wrong edited contents, click the [Undo] button before closing the library editor.

The edited contents are determined after the library editor is closed.

4. After editing, close the library editor.

The library data creation is completed.

Point

The following copied data can be pasted onto the library editor.

- Figures and objects on the screen editor
- Library data registered in the System Library or My Library

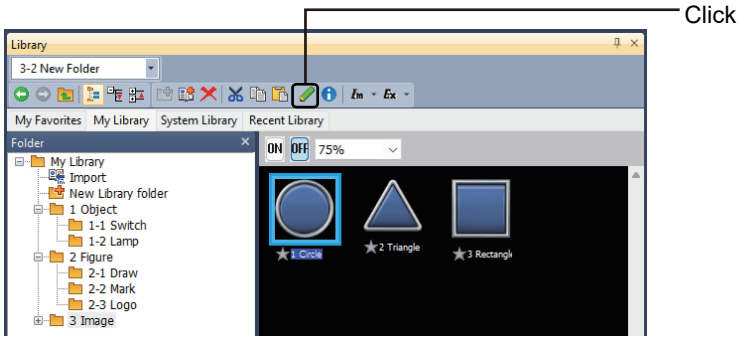
PART 7

23.2.6 Renumbering and renaming the library data

1. Select the [My Library] tab in the [Library] window.

☞ Page 1085 [Library] window

2. Select the library data for changing its attributes, and click the [Property] button.



3. Enter [Number] and [Name] in the displayed [Library data Property] dialog, and click the [OK] button.

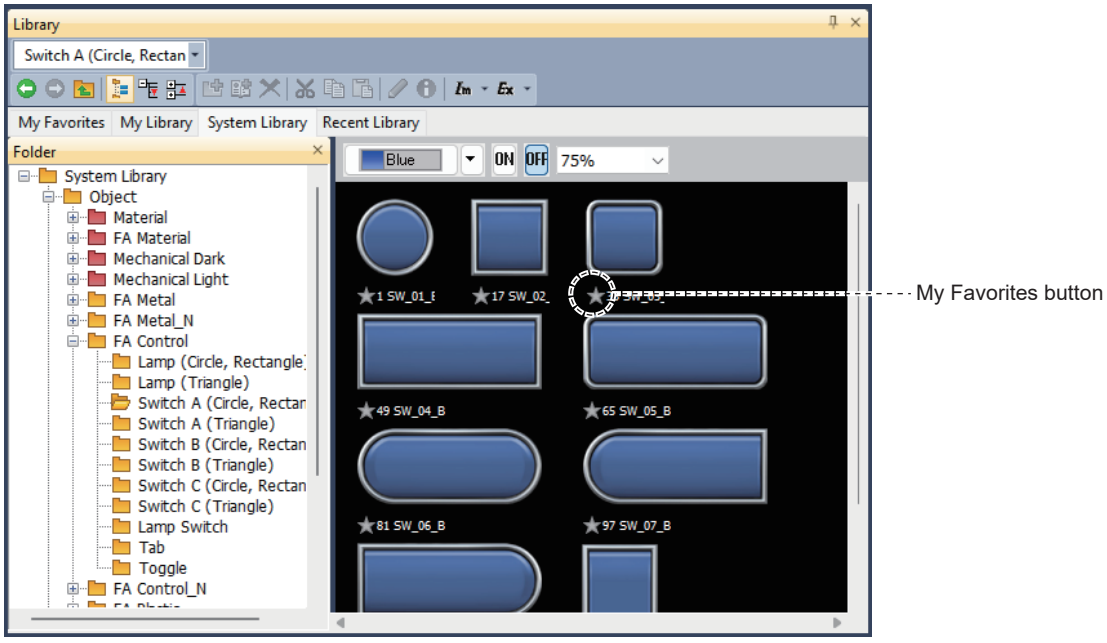
☞ Page 1091 [Library data Property] dialog

The renumbering and renaming are completed.

23.2.7 Registering library data in My Favorites

When library data is registered in My Favorites, the data is displayed in the [My Favorites] tab in the [Library] window.
To register to or deregister from My Favorites, use the My Favorites button displayed in the library data area in the [Library] window.

☞ Page 1089 Library data area



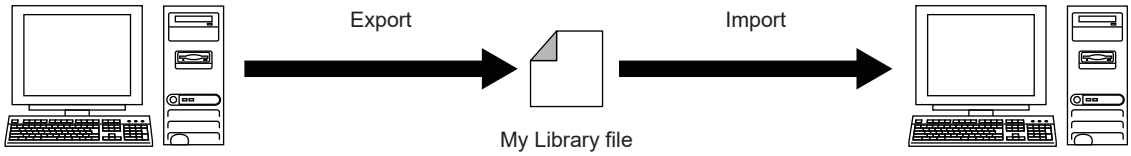
23.2.8 Exporting the library data

My Library is exported by folder or in a batch.

Exported data (My Library file) can be imported and used by other users or with other personal computers.

For the export specifications, refer to the following.

☞ Page 1065 Export specifications



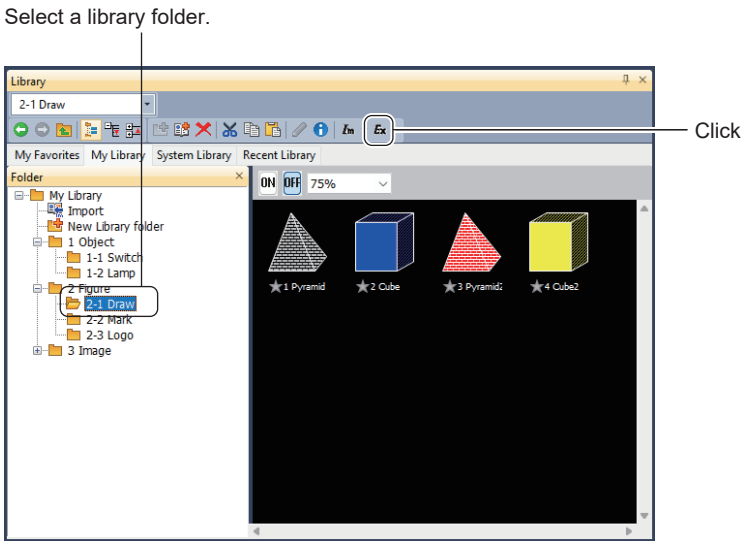
☞ Page 1076 Exporting a specified library folder
☞ Page 1077 Exporting My Favorites
☞ Page 1077 Exporting My Library and My Favorites in a batch

Exporting a specified library folder

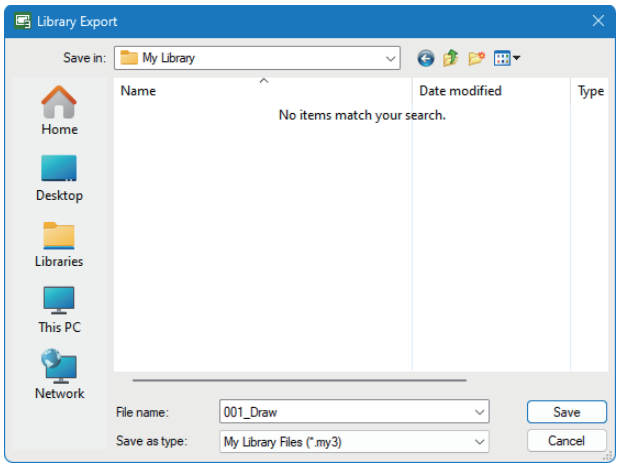
1. Select the [My Library] tab in the [Library] window.

☞ Page 1085 [Library] window

2. Select a library folder to be exported in the library tree area, and click the [Export] button on the edit bar.



3. Set [Save in] and [File name] in the displayed [Export Destination Specification] dialog, and click the [Save] button.



The export is completed.

The contents of the specified library folder determine the structure of the exported file.

☞ Page 1065 Export specifications

Exporting My Favorites

Only My Favorites registration information is exported.

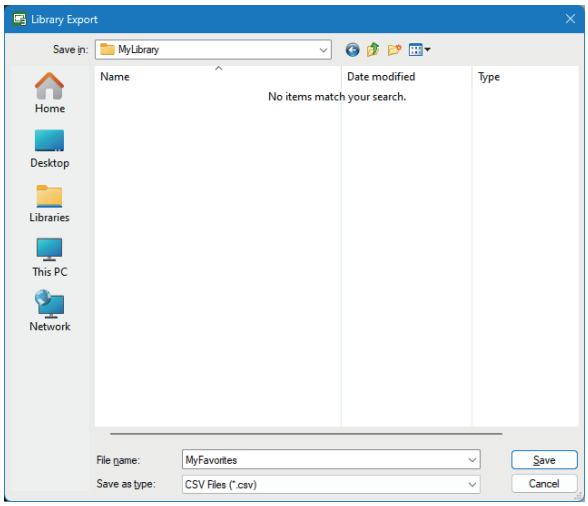
For My Favorites, not the library data itself but My Favorites registration information is exported.

1. Select the [My Favorites] tab in the [Library] window.

☞ Page 1085 [Library] window

2. Click the [Export] button on the edit bar.

3. Set [Save in], [File name], and [Save as type] (extension) in the displayed [Export Destination Specification] dialog, and click the [Save] button.



The export is completed.

Exporting My Library and My Favorites in a batch

Export all the library folders in My Library and My Favorites in a batch.

For My Favorites, not the library data itself but My Favorites registration information is exported.

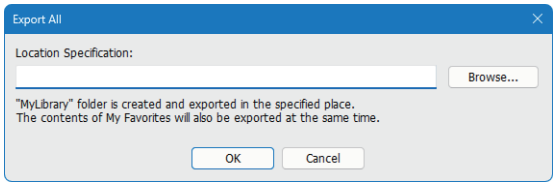
1. Select [Export] and click the [Export All] button on the edit bar in the [Library] window.

☞ Page 1085 [Library] window

2. Set the export destination in the displayed [Export All] dialog.

If the library has already been saved in the specified location, the data is overwritten.

To not to overwrite the data, specify a different location.



3. Click the [OK] button to create [MyLibrary] folder in the specified location and export My Library and My Favorites to the folder.

The export is completed.

Precautions

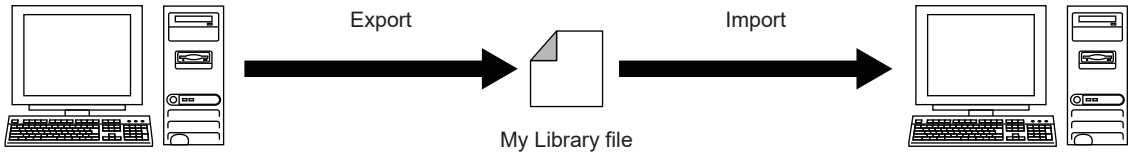
Do not manipulate such as add, delete, and rename the [MyLibrary] folder and the files in the library folder.

Doing so may disable proper import of the library.

23.2.9 Importing data to the library

Importable data includes exported data (My Library file) by other users or with other personal computers and image files.
My Library is imported by file or in a batch.
For the import specifications, refer to the following.

☞ Page 1066 Import specifications



☞ Page 1079 Importing library data or My Favorites registration information
☞ Page 1080 Importing My Library and My Favorites of GT Designer3 (GOT2000)
☞ Page 1081 Importing an image file
☞ Page 1083 Importing a video file
☞ Page 1084 Importing My Library and My Favorites in a batch
☞ Page 1084 Importing a System Library file

Precautions

- When My Favorites registration information is imported, if the corresponding library data does not exist, the information is discarded.
- If the name of the imported file contains invalid characters, those characters are replaced with underscores "_" during the import.
- If the name of library data or folder exceeds 128 characters, the excess characters are discarded.

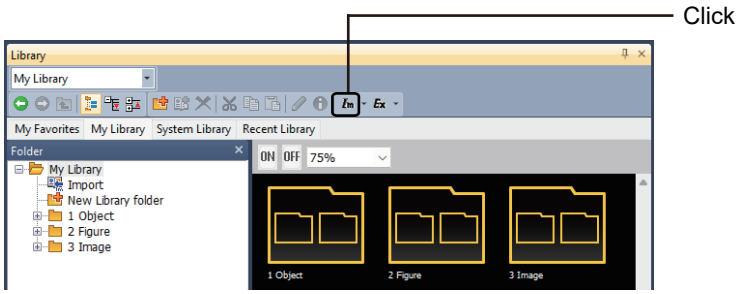
Importing library data or My Favorites registration information

1. Select the tab in the [Library] window according to the file to be imported as shown below.

- When importing the My Library file: [My Library] tab
- When importing My Favorites registration information: [My Favorites] tab

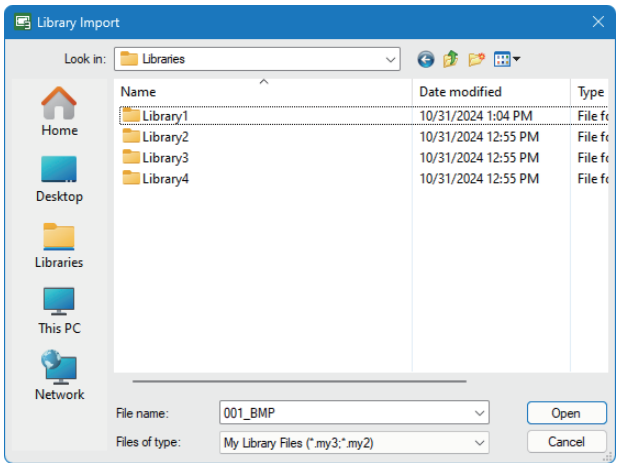
☞ Page 1085 [Library] window

2. Click the [Import] button on the edit bar.



3. Select either of the following for [Files of type] in the displayed [Import Library] dialog.

- When importing the My Library file: [My Library File (*.my3;*.my2)]
- When importing My Favorites registration information: [My Favorites File (*.csv;*.txt)]



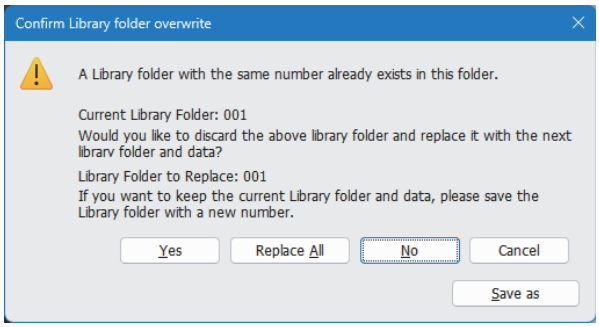
PART 7

4. Select a file to be imported and click the [Open] button.

The import is completed.

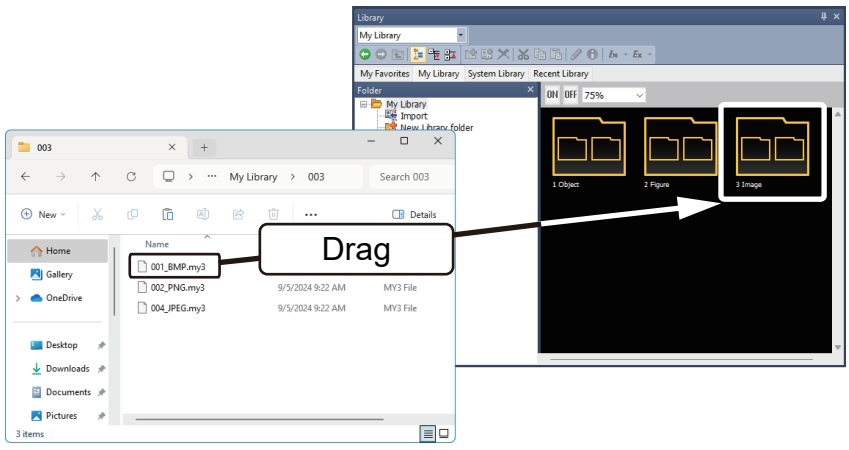
However, if a library folder having the same number as the imported library exists, [Overwriting the Library Folder Confirmation] dialog is displayed.

Click one of the buttons.



Button	Action
[Yes] button	The library folder is overwritten.
[Replace All] button	Even if a library folder with the same number exists in subsequent levels, all files are overwritten without displaying a confirmation message.
[No] button	Import is not performed, and the library folder is not overwritten.
[Cancel] button	When multiple library folders are imported, all the subsequent imports are aborted.
[Save as] button	The import target library folder is renumbered. Set the library folder number in the [Input Library folder number] dialog. 
Point

You can also drag the My Library file to import.



Importing My Library and My Favorites of GT Designer3 (GOT2000)

To import the data from My Library and My Favorites in GT Designer3 (GOT2000), follow the steps below.

1. In GT Designer3 (GOT2000), select [Save My library] and save My library and Favorites data.

2. For further steps, refer to the following.

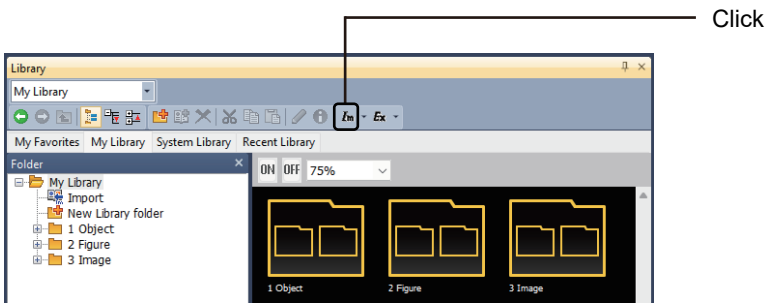
☞ Page 1084 Importing My Library and My Favorites in a batch

Importing an image file

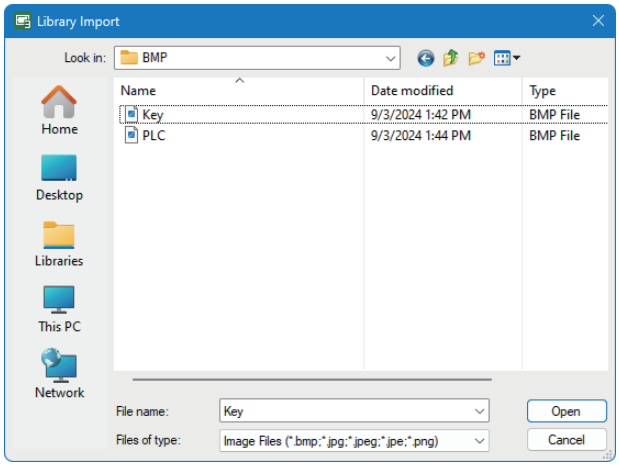
1. Select the [My Library] tab in the [Library] window.

☞ Page 1085 [Library] window

2. Click the [Import] button on the edit bar.



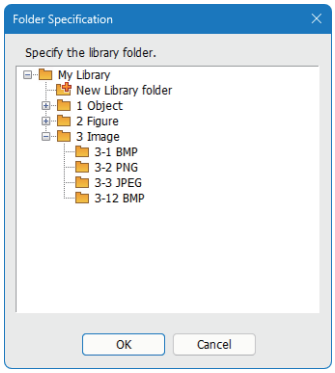
3. Select [Image File (*.bmp;*.jpg;*.jpeg;*.jpe;*.png)] for [Files of type] in the displayed [Library Import] dialog.



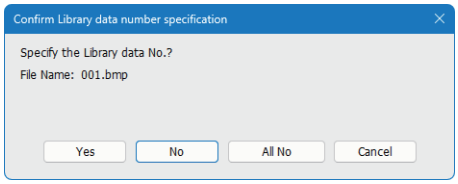
4. Select a file to be imported and click the [Open] button.

Specifying multiple files is also available.

5. In the displayed [Folder Specification] dialog, select a library folder for saving the file, and click the [OK] button.



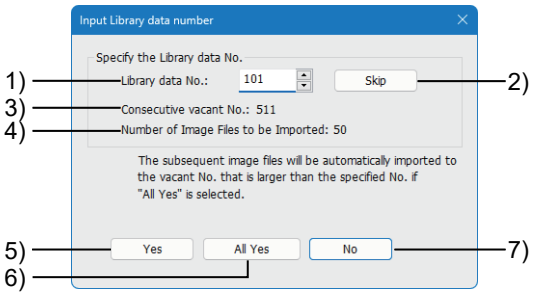
6. Select one of the buttons in the displayed [Confirm Library data number specification] dialog.



Button	Action
[Yes] button	Specify a library data number. Set a library data number in the [Input Library data number] dialog. ☞ Page 1082 [Input Library data number] dialog
[No] button	Sets an unused library data number and imports the file. When multiple files are selected, the [Confirm Library data number specification] dialog appears repeatedly for each file.
[All No] button	Sets unused library data numbers and imports all files.
[Cancel] button	Aborts the import and closes the dialog.

■[Input Library data number] dialog

Specify the library data number for the file to be imported.



Item		Description
1)	[Library data No.]	Set a library data number. The smallest vacant number is displayed by default. The setting range is [1] to [512].
2)	[Skip] button	Switches the library data number to the start number of the subsequent consecutive vacant numbers. 3)	[Consecutive vacant No.]	Displays the number of consecutive vacant numbers, beginning with the current library data number.
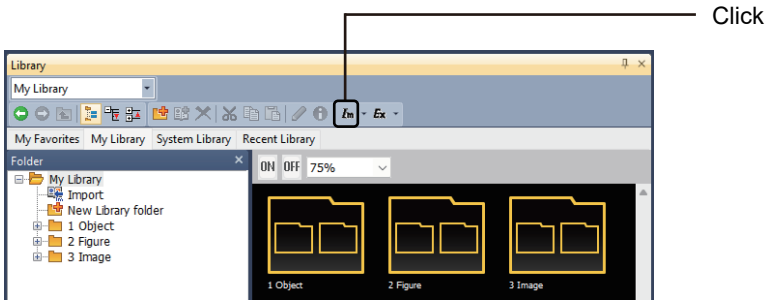
4)	[Number of Image Files to be Imported]	Displays the number of files to be imported.
5)	[Yes] button	Saves the file with the vacant number specified in [Library data No.].
6)	[All Yes] button	Saves the files with the consecutive vacant numbers, starting from the number specified in [Library data No.]. When the number of files to be imported exceeds that of the current consecutive vacant numbers, the subsequent vacant numbers are used to save all the files. When [Library data No.] is set to 513 or larger, even if consecutive vacant numbers starting with a number less than 513 exist, the import process is stopped.
7)	[No] button	Returns to the [Confirm Library data number specification] dialog.

Importing a video file

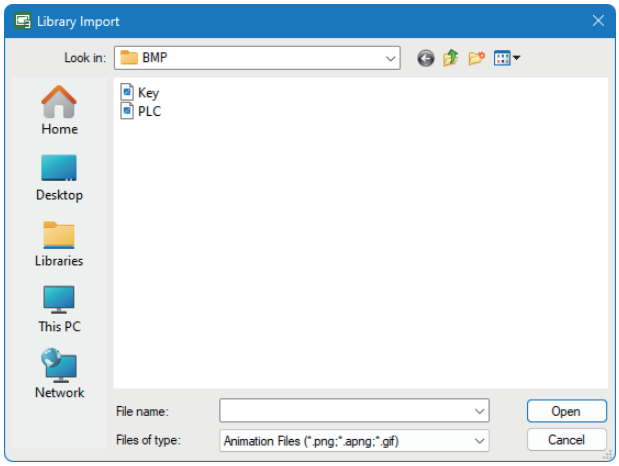
1. Select the [My Library] tab in the [Library] window.

☞ Page 1085 [Library] window

2. Click the [Import] button on the edit bar.



3. Select [Animation Files (*.png;*.apng;*.gif)] for [Files of type] in the displayed [Library Import] dialog.



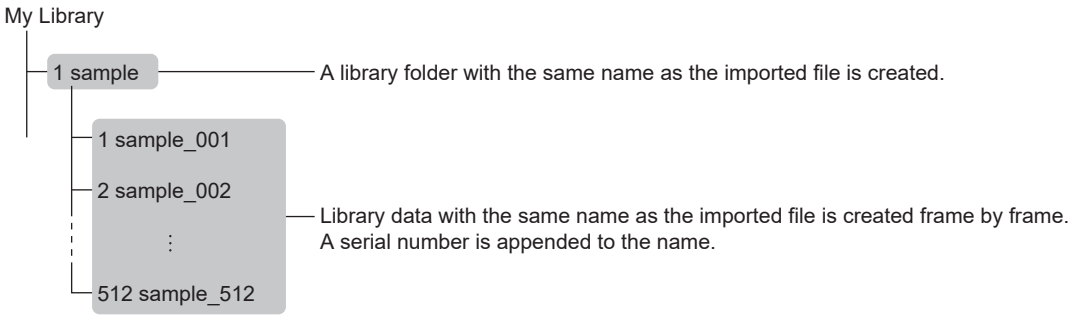
4. Select a file to be imported.

Specifying multiple files is also available.

5. Click the [Open] button to create a library folder and import the frame-by-frame image data as library data to the folder.

Ex.

When importing sample.gif



Importing My Library and My Favorites in a batch

Import the exported My Library and My Favorites in a batch.

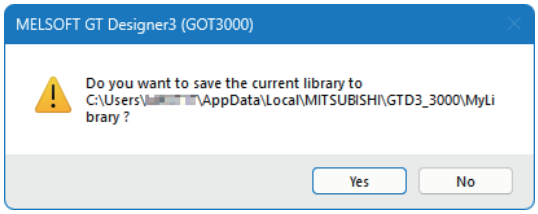
My Library and My Favorites folders before the import are retained.

1. Select [Import] and click the [Import All] button on the edit bar in the [Library] window.

☞ Page 1085 [Library] window

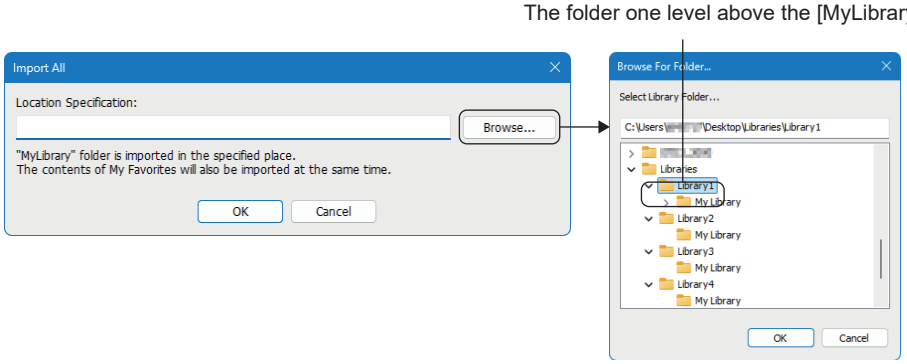
When the library is being edited, the dialog for confirming whether to save the library is displayed.

Click the [Yes] button to save the library, click the [No] button not to save the library.



2. Click the [Browse] button in the displayed [Import All] dialog, and specify the storage destination of the [MyLibrary] folder to be imported.

Specify the folder (the folder one level above the [MyLibrary] folder) where the library to be read is saved.



3. Click the [OK] button to import My Library and My Favorites.

The import is completed.

Importing a System Library file

1. Select the [System Library] tab in the [Library] window.

2. Click the [Import] button on the edit bar or the [Import] button in the library tree area.

☞ Page 1085 [Library] window

3. Select [System Library File (*.sy3)] for [Files of type] in the displayed [Import Library] dialog.

4. Select a library file, and click the [Open] button.

The System Library file is imported.

The import is completed.

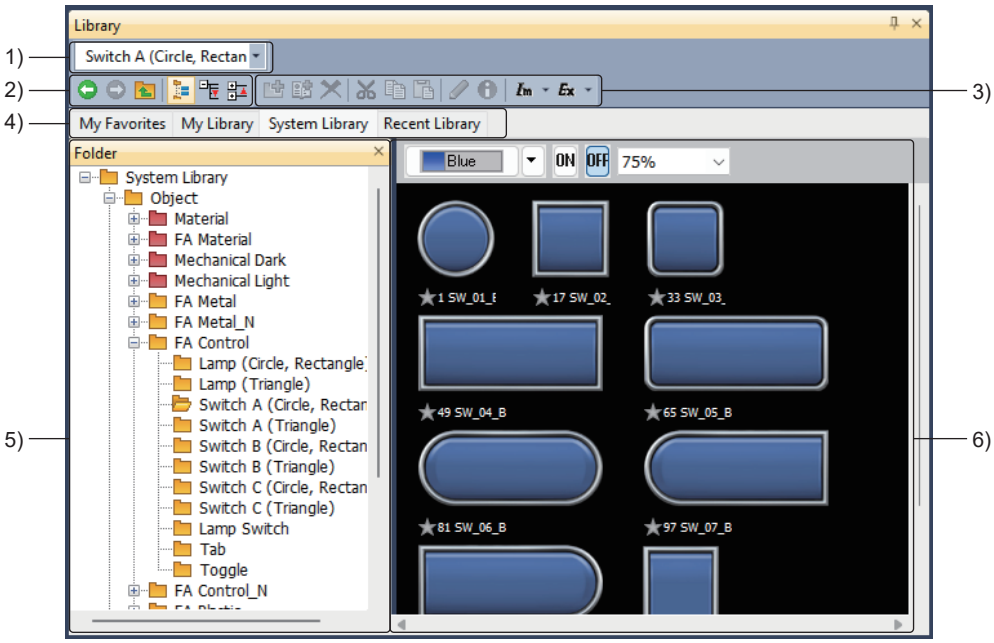
Point

You can also import a System Library file by dragging it to a location in the library list.

23.3 [Library] window

GT37 SoftGOT3000

Select [View] → [Docking Window] → [Library List] from the menu to display the [Library] window.



Item			Description
1)	Display bar	—	Performs display-related operations for the library tree area and library data area.
		[Library folder]	When a library folder is selected, the registered data is displayed in the library data area.
2)	Move bar	—	Performs move-related operations for library folders. 		[Back] button	Moves to the previous library folder.
		[Forward] button	Moves to the next library folder.
		[Up One Level] button	Moves to a one level higher library folder.
		[Tree View] button	Switches display or non-display of a library tree.
		[Unfold All] button	Expands the library tree entirely.
		[Fold All] button	Collapses the library tree entirely.

PART 7

Item				Description
3)	Edit bar	—		Performs edit-related operations for library data. The displayed contents vary by the selected tab. 		[Create Library Folder] button		Creates a library folder.
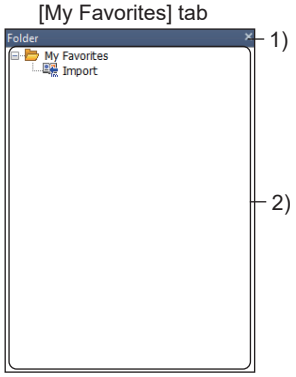
		[Create New Library Data] button		Creates library data.
		[Delete] button		Deletes the selected library folder or library data. Deregisters My Favorites registration information of the library data when [My Favorites] tab is selected.
		[Cut] button		Cuts the selected library folder or library data.
		[Copy] button		Copies the selected library folder or library data.
		[Paste] button		Pastes the copied library folder or library data.
		[Edit] button		Edits the selected library data.
		[Property] button		Displays the [Library folder Property] dialog or [Library data Property] dialog. You can renumber or rename the library folder or library data in the [My Library] tab. ☞ Page 1091 [Library folder Property] dialog ☞ Page 1091 [Library data Property] dialog
		[Import] button	[Import]	Imports the library folders or My Favorites.
			[Import All]	Imports My Library and My Favorites from the specified [MyLibrary] folder. Specify the [MyLibrary] folder to be imported in the displayed [Import All] dialog.
		[Export] button	[Export]	Exports the selected library folder.
			[Export All]	Exports all of My Library and My Favorites. Specify the export destination in the displayed [Export All] dialog. A [MyLibrary] folder is created at the export destination. My Library is exported maintaining the tree hierarchy. My Favorites is exported as MyFavorites.csv.
4)	Tab area	—		Switches between the display of the library tree area and the display of the library data area.
		[My Favorites] tab		Displays the library data registered in My Favorites.
		[My Library] tab		Displays the library data registered in My Library. The user can register library data in My Library.
		[System Library] tab		Displays the library data preregistered in the System Library.
		[Recent Library] tab		Displays up to 10 pieces of most recently used library data.
5)	Library tree area			Displays library folder structure in a tree view. ☞ Page 1087 Library tree area
6)	Library data area			Displays the library data registered in the library folder which is selected in the library tree area. ☞ Page 1089 Library data area

23.3.1 Library tree area

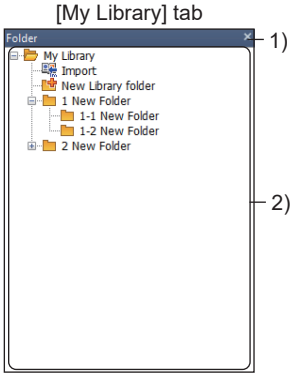
Displays library folder structure in a tree view.

Switch between tabs in the tab area to change items to be displayed.

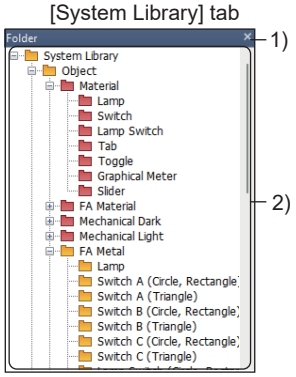
[My Favorites] tab



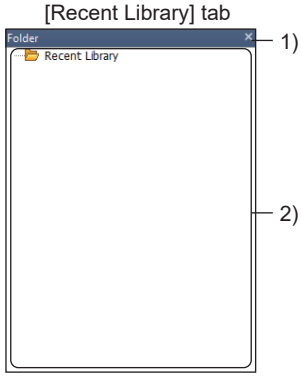
[My Library] tab



[System Library] tab



[Recent Library] tab



Item			Description
1)	[Close] button		Closes the library tree area. You can also show or hide the library tree area by using the [Tree View] button on the move bar.
2)	Tree	—	Double-clicking a displayed library folder displays the registered library data in the library data area. Right-click the library folder and select an operation from the menu. The operations for the library folders can be performed by using the edit bar and right-click menu of each folder. ☞ Page 1088 Operations from the right-click menu For the specifications such as the levels in the My Library hierarchy and creation quantity, refer to the following. ☞ Page 1064 Specifications of My Library The icon images differ depending on the format of the registered shapes. 		[Import]	This item is displayed in the [My Favorites] or [My Library] tab. Imports data to the library.
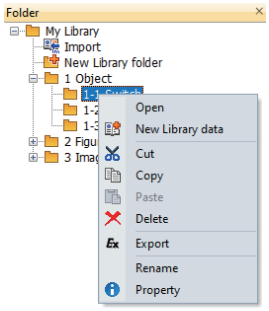
		[Create Folder]	This item is displayed in the [My Library] tab. Creates a library folder.

Operations from the right-click menu

The displayed menu depends on the selected tab and the right-clicked library folder.

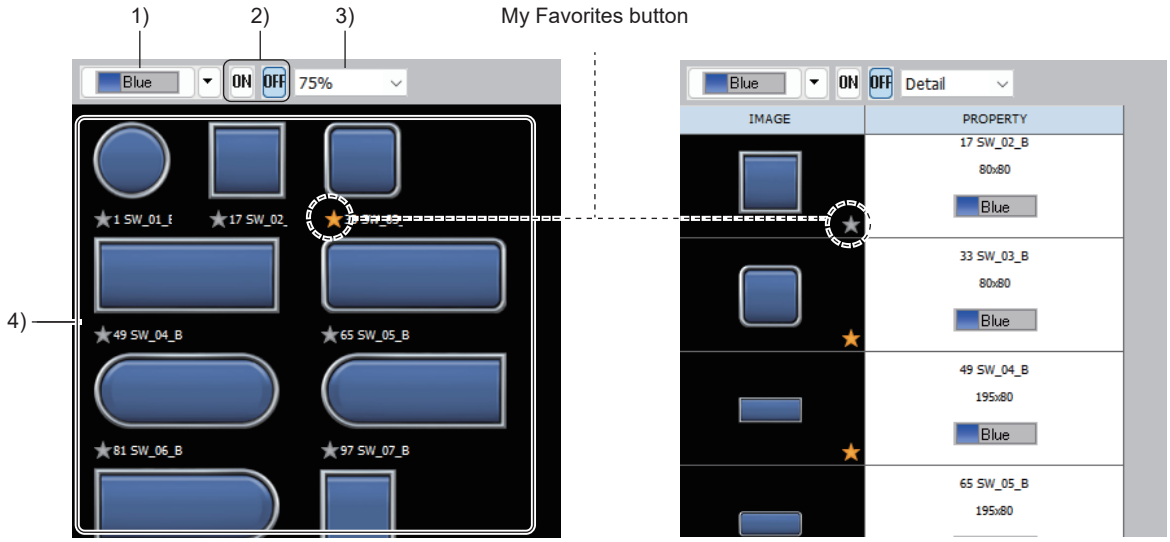


Menu	Description
[All reduce]	Collapses all the levels of library folders displayed in the library tree. Subfolders are folded.
[Fold]	Folds the one hierarchy of library folder displayed in the library tree. Subfolders are not folded.
[Unfold All]	Displays all levels of contents in the library folder in the library tree.
[Unfold]	Displays the one hierarchy of contents in the library folder to the library data area.
[Open]	Displays the contents in the library folder to the library data area.
[Create Library Data]	Creates library data in the [My Library] folder.
[Create Library Folder]	Creates a library folder in the [My Library] folder. A vacant number is assigned to the created library folder automatically, and the folder name is [New Folder].
[Cut]	Cuts a library folder.
[Copy]	Copies a library folder.
[Paste]	Pastes a library folder.
[Delete]	Deletes a library folder.
[Export]	Exports a library folder.
[Rename]	Changes the number and name of the library folder.
[Property]	Displays the [Library folder Property] dialog. (The number and name of the library folder can be changed.) ☞ Page 1091 [Library folder Property] dialog

23.3.2 Library data area

Data in the library folder is displayed.

The setting items vary depending on the selected tab.

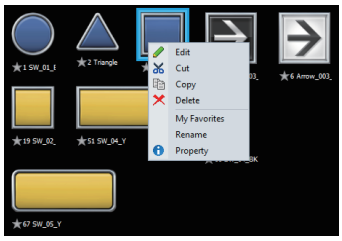


When [Detail] is selected

Item			Description
1)	Color settings	—	The displayed button varies by the data displayed in the library data area.
		Color category button	Narrows down the shapes displayed in the library data area by the selected color.
		Shape color button	Changes the color of the shapes displayed in the library data area.
2)	[ON] button [OFF] button		Switches display or non-display of figures displayed on the library data area.
3)	Display setting		Switches the display magnification and display format of shapes displayed in the library data area. Selecting [Thumbnail] displays the library data in a certain size. Selecting [Detail] displays the library data and the properties.
4)	Library data area		Displays the library folder or library data. Clicking the My Favorites button switches the My Favorites registration status of the library data. The library data registered in My Favorites is displayed in the [My Favorites] tab. The My Favorites button does not appear when the [My Favorites] tab is selected. The operations for the library data can be performed by using the edit bar and from the right-click menu of each library data. ☞ Page 1090 Operations from the right-click menu

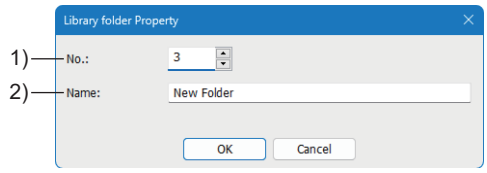
Operations from the right-click menu

The displayed menu depends on the selected tab and the right-clicked item.



Menu	Description
[Open]	Displays the contents in the library folder to the library data area.
[Create Library Data]	Creates library data in the [My Library] folder.
[Create Library Folder]	Creates a library folder in the [My Library] folder. A vacant number is assigned to the created library folder automatically, and the folder name is [New Folder].
[Edit]	Edits the right-clicked library data.
[Cut]	Cuts the right-clicked item.
[Copy]	Copies the right-clicked item.
[Paste]	Pastes the copied item in the [My Library] folder.
[Delete]	Deletes the right-clicked item.
[Export]	Exports a library folder.
[My Favorites]	Switches the My Favorites registration status of the library data. The library data registered in My Favorites is displayed in the [My Favorites] tab.
[Rename]	Changes the number and name of the library folder.
[Property]	Displays the [Library folder Property] dialog or [Library data Property] dialog. You can renumber or rename the library folder or library data in the [My Library] tab. ☞ Page 1091 [Library folder Property] dialog ☞ Page 1091 [Library data Property] dialog

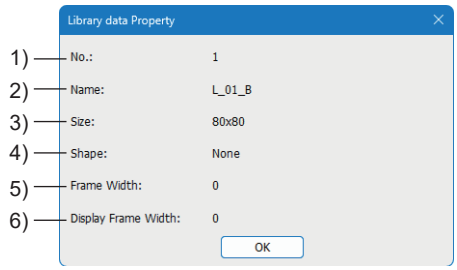
23.3.3 [Library folder Property] dialog



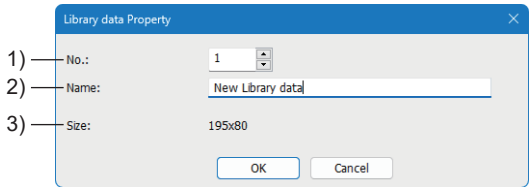
Item		Description
1)	[No.]	Number of the library folder. The setting range is [1] to [512].
2)	[Name]	Name of the library folder. Up to 128 characters can be set.

23.3.4 [Library data Property] dialog

The displayed contents depend on whether the library data is registered in the System Library or in My Library.



System library



My Library

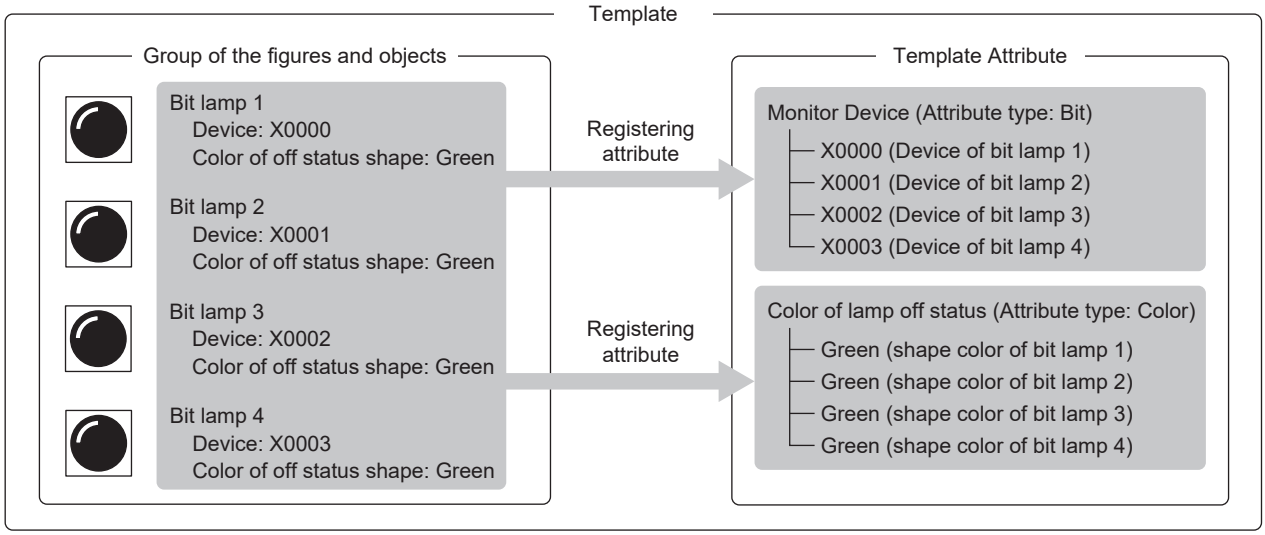
Item		Description
1)	[No.]	Number of the library folder. You can change the library data in My Library. The setting range is [1] to [512].
2)	[Name]	Name of the library folder. You can change the library data in My Library. Up to 128 characters can be set.
3)	[Size]	Size of the library data.
4)	[Shape]	Shape of the library data.
5)	[Frame Width]	Frame width of the library data.
6)	[Display Frame Width]	Display frame width of the library data.

24 Efficient Drawing with Templates

GT37 SoftGOT3000

Templates are the combination of the following group and information.

- Group of the figures and objects on the screen editor
- The attribute information for the above group (template attribute)



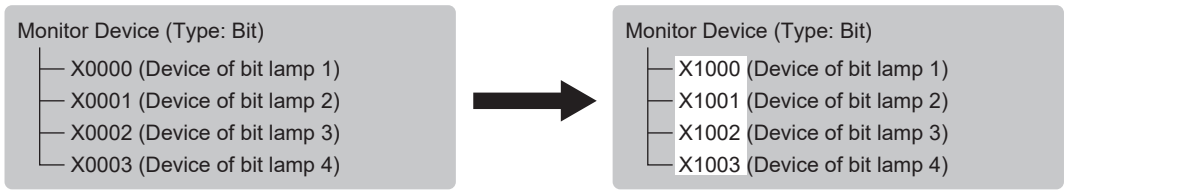
For the attributes registered into template attributes, the set values can be batch changed.

Because the attributes of figures and object do not need changing separately, drawing data can be utilized efficiently.

If created templates are registered in the library, they can be utilized in creating another screen.

Ex.

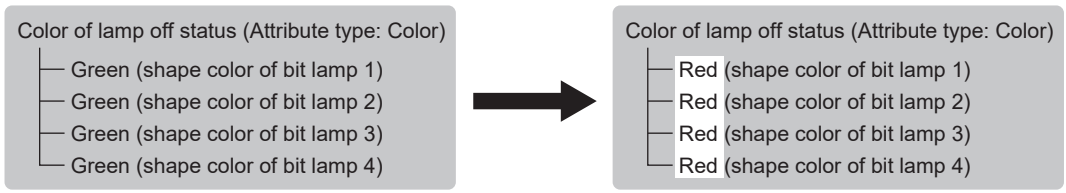
Batch changing successive devices by changing the first device with the difference between any two of successive device numbers retained



The difference between any two of successive device numbers is retained.

Ex.

Batch changing the color



The colors of all the lamps are changed to red.

☞ Page 1093 Specifications of the template
☞ Page 1096 How to use the template
☞ Page 1111 [Edit Template Attribute] dialog
☞ Page 1117 [Register to Template] dialog
☞ Page 1118 [Property] window (when the template property is displayed)

24.1 Specifications of the template

GT37 SoftGOT3000

☞ Page 1093 Figures and objects that can be registered in a template
☞ Page 1093 Template attributes and the types of attributes that can be registered
☞ Page 1094 Displaying templates on the screen editor
☞ Page 1095 Individual operations for figures and objects registered in a template

24.1.1 Figures and objects that can be registered in a template

The figures and objects on the same screen editor can be registered in a template.
Figures and objects that have been registered in a template cannot be registered in another template.

24.1.2 Template attributes and the types of attributes that can be registered

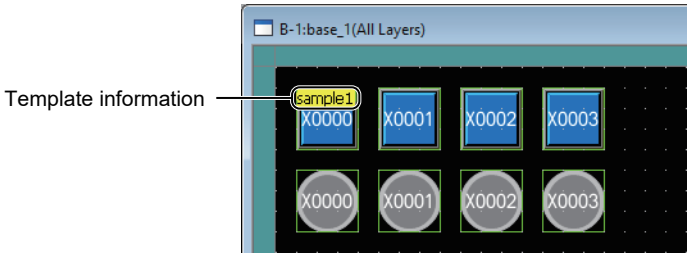
Up to 255 template attributes can be possessed by a single template.
The following shows the types of the attributes that can be registered as template attributes.

- Bit (device)
- Word (device)
- Numerical value
- Character string
- Color
- Figure
- Font
- Font size

PART 7

24.1.3 Displaying templates on the screen editor

When a template is placed on the screen editor, a template information box that indicates the existence of the template is shown.



The template information box displays the template's name.

The information boxes can be used to rearrange the figures and objects registered in the template and to open the editor screen for the template.

Displaying template information boxes

Template information boxes are displayed only on the screen editor of GT Designer3.

The boxes are not displayed in the [Screen Preview] window and [Data View] window of GT Designer3, and on the GOT display screen.

Display settings for template information boxes

Display/hide template information boxes and change their background colors in the [View] tab of the [Options] tab.

The text of the template name is displayed in the color set for [Device/Object ID Text Color].

☞ Page 201 Customizing the display

Operations on template information boxes

Operation	Details
Move	Template information boxes can be moved as in the case of figures and objects. To move a template information box simultaneously with registered figures and objects, select them together. When a template information box is double-clicked, all the registered figures and objects are selected.
Cut Copy Paste Replicate Consecutive copy	The figures and objects registered in the template are also processed.
Alignment	Available
Rotation Inversion Part registration	Not available

24.1.4 Individual operations for figures and objects registered in a template

Operation	Details
Copy Paste Replicate Consecutive copy	On figures and objects registered in a template, a copy and paste, replication, and consecutive copy operation can be performed. However, replicated figures and objects are not automatically registered into the template.
Cut Delete Drag onto another screen	The target figure or object is deleted from the template.
Grouping	Only template information boxes and figures and objects registered in the same template can be grouped.  Figures and objects that have been registered in the same template can be grouped. For the grouping method, refer to the following. ☞ Page 1021 Grouping two or more figures and objects or ungrouping them
Setting change	The following describes the operations performed when the settings for figures and objects that have been registered in a template are changed individually in the setting dialog. • When an attribute is added due to a change of the setting, the attribute is not automatically registered into the template attribute. • When an attribute that has been registered in a template attribute is deleted due to a change of the setting, it is also deleted from the template attribute. • After the setting is changed, if the change is canceled with [Undo], the registration status of the template attribute returns to the previous.

24.2 How to use the template

GT37 SoftGOT3000

☞ Page 1096 Creating screens using templates
☞ Page 1104 Creating and editing templates
☞ Page 1110 Registering templates in the library
☞ Page 1110 Canceling template settings

24.2.1 Creating screens using templates

☞ Page 1096 Before utilizing templates
☞ Page 1097 Utilizing templates of the library
☞ Page 1099 Checking the attributes of the figures and objects in templates
☞ Page 1100 Batch changing the set values for attributes
☞ Page 1103 Changing by attribute

Before utilizing templates

Certain templates require settings necessary for the project in which the templates are utilized, such as the controller setting and Go To Screen switch setting.
Check the settings of the template to be utilized and set necessary items for the project.
The following shows the required settings for the project in which templates are utilized.

■Controller setting

Before pasting templates, set the items in the [Controller Setting] dialog.
☞ Page 729 [Controller Setting]
If the settings for a pasted template are not supported by the set controller, the device settings are changed as described below.
When setting a controller that does not support the settings for the template, check and change the device settings.

- The devices are changed to the equivalents supported by the controller.
- The devices not supported by the set controller (because the equivalents do not exist or they are outside the acceptable setting range) are changed to [??].

■Common setting

When utilizing templates in which user alarm displays and historical trend graphs are used, set necessary common setting items, such as user alarm observation and logging.

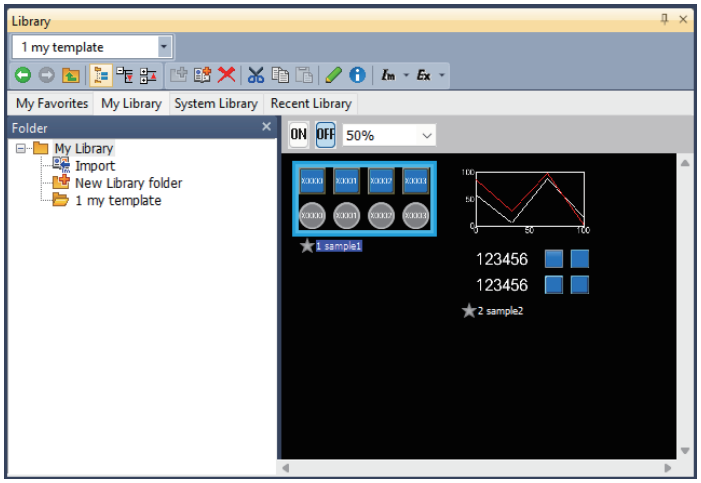
■Go To Screen switch setting

After pasting on a base screen a template in which a Go To Screen switch is placed, check and change [Screen No.] of the switch in consideration of the base screen No.
☞ Page 1220 [Next Screen] tab

Utilizing templates of the library

1. Select [View] → [Docking Window] → [Library List] or [Library List (Template)] from the menu to display the [Library] window.
2. Click the template to utilize, in the [Library] window.

☞ Page 1085 [Library] window



In My Library, you cannot check if the library data include the template.

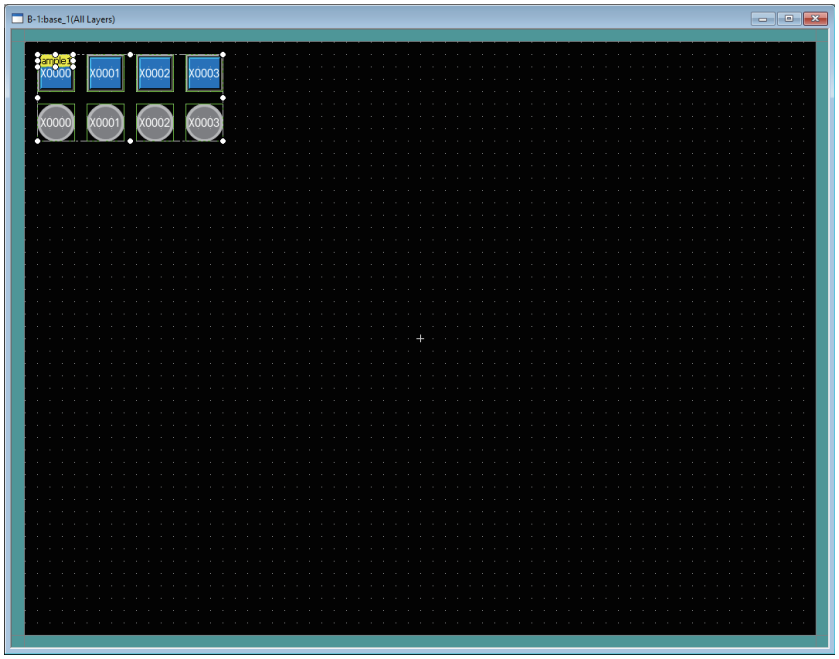
Paste the template on the screen editor to check if the template information box is displayed.

☞ Page 1094 Displaying templates on the screen editor

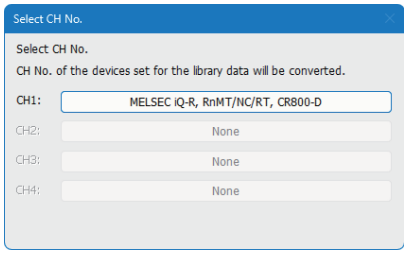
3. Click the screen editor to paste the template.

To change the sizes or positions of individual figures and objects, cancel the grouping.

Even if the grouping is canceled, the registration of the figures and objects in the template is not canceled.



For certain templates, the [Select CH No.] dialog is displayed when the templates are pasted.



Select the channel of the controller to monitor.

The controller devices that have been set for the template are changed as described below according to the controller on the selected channel.

When selecting the channel of a controller that does not support the settings for the template, check and change the device settings.

- The devices are changed to the equivalents supported by the controller on the selected channel.
- The devices not supported by the controller on the selected channel (because the equivalents do not exist or they are outside the acceptable setting range) are changed to [??].

Precautions

The [Select CH No.] dialog is displayed only when the templates in the System Library are utilized.

The dialog is not displayed when the templates registered in My Library are utilized. Also, device conversion according to the controller setting is not carried out.

Checking the attributes of the figures and objects in templates

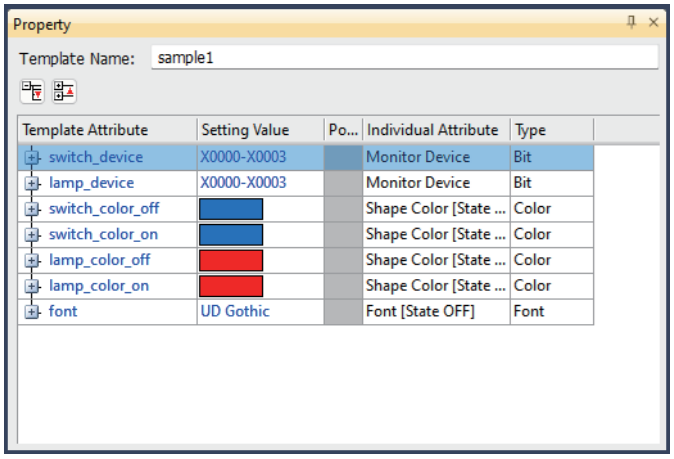
The following procedure shows how to check the set values for the attributes of the figures and objects in a template.

1. Perform one of the following operations to display the details of the settings for the template in the [Property] window.

- Double-click the template information box on the screen editor or in the [Data Browser] window.
- Right-click the template information box on the screen editor and select [Template] → [Display Template Property] from the menu.
- On the screen editor or in the [Data Browser] window, select a figure or object that has been registered in the template and click the [Template Property] button displayed in the [Property] window.

2. Check the set values for attributes in the [Property] window.

☞ Page 1118 [Property] window (when the template property is displayed)



For the procedure for changing the set values, refer to the following.

☞ Page 1100 Batch changing the set values for attributes

☞ Page 1103 Changing by attribute

Batch changing the set values for attributes

The following shows the procedure for changing the set values for attributes in the [Property] window.

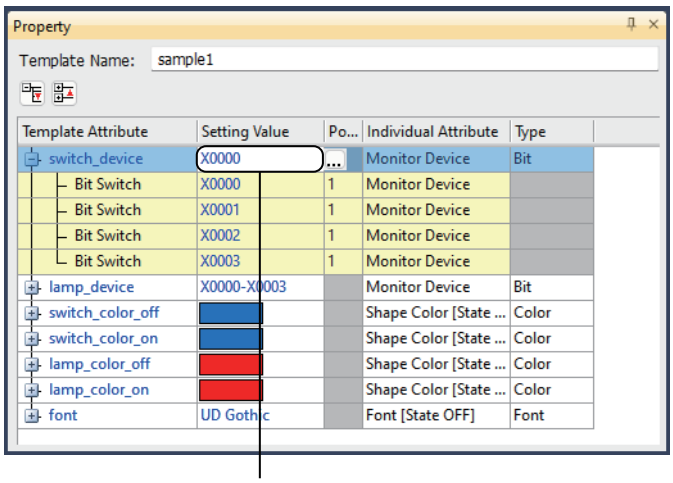
Ex.

When the template attribute is "Bit" and the same device is set for multiple registered attributes

1. Display the details of the template with the [Property] window.

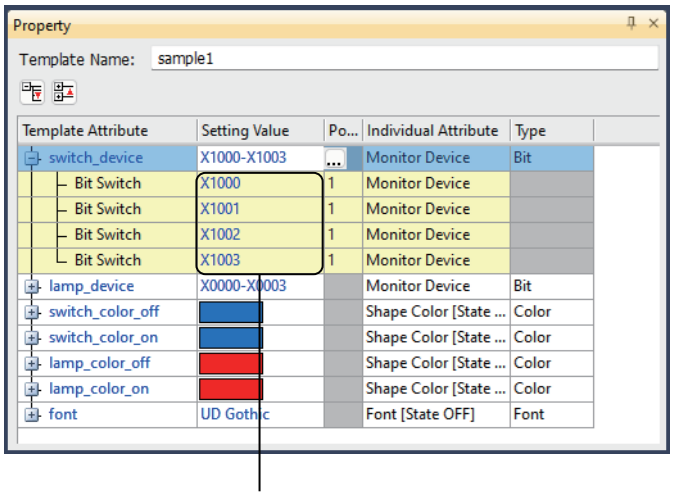
☞ Page 1099 Checking the attributes of the figures and objects in templates

2. Change the set value for the attribute in the target template attribute row.



Change the start device from X0000 to X1000.

3. The set values for the registered attributes in the template attribute are changed.



The set value for each attribute is changed according to the start device.

When a setting falls out of the input range as a result of the batch change, it causes an error.

If a set value falls out of the input range, the set values in the corresponding figure/object attribute row and the successive rows below are not changed.

The following describes the specifications of the batch change for each attribute.

☞ Page 1101 Bit, word

☞ Page 1101 Numerical value

☞ Page 1102 Character string

☞ Page 1102 Color

☞ Page 1102 Figures, fonts, font sizes

■Bit, word

By changing the start device of the set values for attributes, the set values for the attributes below the start device can be batch changed. The difference between any two of successive device numbers is not changed.

Before

Template Attribute	Set value
Monitor device	X0000 to X001F
Bit lamp	X0000
Bit lamp	X0001
⋮	⋮
Bit lamp	X001F

Change the start device from X0000 to X1000.

After

Template Attribute	Set value
Monitor device	X1000 to X101F
Bit lamp	X1000
Bit lamp	X1001
⋮	⋮
Bit lamp	X101F

The set values are changed but the difference between any two of successive device numbers is not changed.

The device names can also be changed collectively.

Before

Template Attribute	Set value
Monitor device	X0000 to X001F
Bit lamp	X0000
Bit lamp	X0001
⋮	⋮
Bit lamp	X001F

Change the start device's name from X to Y.

After

Template Attribute	Set value
Monitor device	Y0000 to Y001F
Bit lamp	Y0000
Bit lamp	Y0001
⋮	⋮
Bit lamp	Y001F

The device name is changed.

Batch change is enabled when the following conditions are satisfied.

- Devices that have the same channel No., network No., station No., CPU No., and block No. are set for all the attributes.
- Devices that have the same name are set for all the attributes.

Even if the data types of the attributes are different, batch change is enabled.

To change the set values for all the attributes to the same device, change the set values for the attributes individually.

☞ Page 1103 Changing by attribute

■Numerical value

By changing the smallest of the set values for the attributes, the set values for the attributes can be batch changed. The difference between any two of successive set values is not changed.

Before

Template Attribute	Set value
Screen No.	1 to 60
Go To Screen switch	1
Go To Screen switch	10
⋮	⋮
Go To Screen switch	60

Change the smallest value from 1 to 100.

After

Template Attribute	Set value
Screen No.	100 to 159
Go To Screen switch	100
Go To Screen switch	109
⋮	⋮
Go To Screen switch	159

The set values are changed but the difference between any two of successive set values is not changed.

To change the set values for all the attributes to the same value, change the set values for the attributes individually.

☞ Page 1103 Changing by attribute

■Character string

The set values for all the attributes can be batch changed to the same character string.

Before

Template Attribute	Set value
Switch name	
Bit Switch	Switch 1
Bit Switch	Switch 2
⋮	⋮
Bit Switch	Switch 10

Type SWITCH as a set value in the template attribute row.

After

Template Attribute	Set value
Switch name	SWITCH
Bit Switch	SWITCH
Bit Switch	SWITCH
⋮	⋮
Bit Switch	SWITCH

The set values of all the attributes are changed.

The maximum number of characters that can be typed in a single template attribute row is the same as the upper limit of the widest of all the acceptable input ranges for the registered attributes.
However, the maximum number of characters for each attribute is within the acceptable input range for each attribute.

■Color

The set values for all the attributes can be batch changed to the same color.

Before

Template Attribute	Set value
Off color (each screen)	Red
Go To Screen switch	Red
Go To Screen switch	Red
⋮	⋮
Go To Screen switch	Red

Change the set value for the template attribute row from red to blue.

After

Template Attribute	Set value
Off color (each screen)	Blue
Go To Screen switch	Blue
Go To Screen switch	Blue
⋮	⋮
Go To Screen switch	Blue

The set values of all the attributes are changed.

For the following attributes, different ways of setting colors are had. Hence if the attributes are mixed in the same template attribute, the colors are not batch changed.

- Text color of switches and lamps
- Color of the switches with their figures from the System Library (color switching)
- Color of logo texts (color fill effect)

■Figures, fonts, font sizes

The set values for all the attributes can be batch changed to the same.
Example) When the type is font size

Before

Template Attribute	Set value
Font size	
Bit Switch	0.5 × 0.5 (width × length)
Bit Switch	1 × 1 (width × length)
⋮	⋮
Bit Switch	6 × 6 (width × length)

Change the set value for the template attribute row to 2 × 2 (width × length).

After

Template Attribute	Set value
Font size	2 × 2 (width × length)
Bit Switch	2 × 2 (width × length)
Bit Switch	2 × 2 (width × length)
⋮	⋮
Bit Switch	2 × 2 (width × length)

The set values of all the attributes are changed.

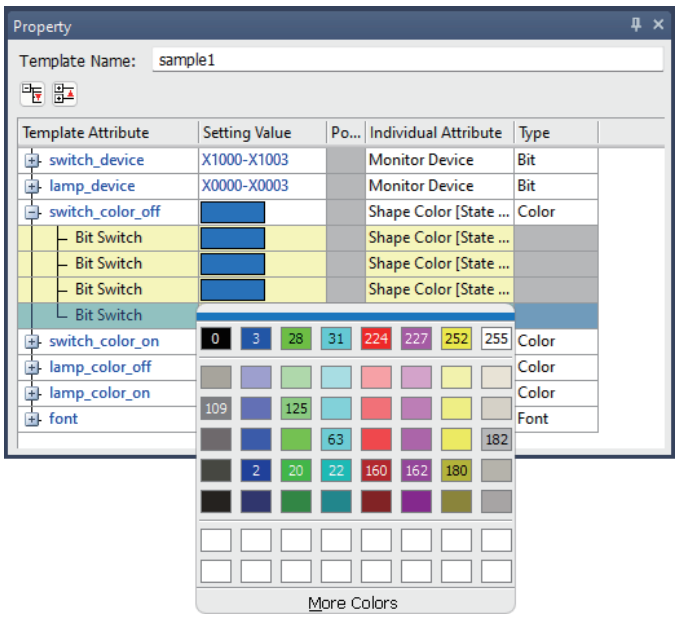
If the acceptable setting range for each attribute is the same, the sizes are batch changed.

Changing by attribute

1. Display the details of the template with the [Property] window.

☞ Page 1099 Checking the attributes of the figures and objects in templates

2. When the setting in a figure/object attribute row is changed, the set value for the attribute is changed.



If the model is a figure, the set value can be changed in the [Image List] dialog.

☞ Page 988 Color settings

PART 7

24.2.2 Creating and editing templates

☞ Page 1104 Creating templates and registering figures and objects into the templates
☞ Page 1105 Registering figures and objects into an existing template
☞ Page 1105 Deleting figures and objects from a template
☞ Page 1106 Creating template attributes
☞ Page 1107 Deleting template attributes
☞ Page 1108 Registering attributes into template attributes
☞ Page 1109 Deleting attributes from the template attributes

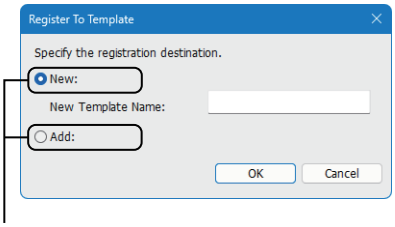
Creating templates and registering figures and objects into the templates

1. On the screen editor, select the figure or object to register in a template.

2. Perform either of the following operations to display the [Register to Template] dialog.

- Select [Edit] → [Template Registration] → [Register to Template] from the menu.
- Right-click the figure or object and select [Template] → [Register to Template] from the menu.

3. Select [New] and set [New Template Name].



These items are not displayed if there is no template on the screen editor.

4. Click the [OK] button to display the [Edit Template Attribute] dialog.

☞ Page 1111 [Edit Template Attribute] dialog

5. Edit the template attribute then click the [OK] button to complete registering into the template.

When a new template is created, template attributes are displayed on the screen editor.

For the procedure for editing template attributes in the [Edit Template Attribute] dialog, refer to the following.

☞ Page 1106 Creating template attributes
☞ Page 1107 Deleting template attributes
☞ Page 1108 Registering attributes into template attributes
☞ Page 1109 Deleting attributes from the template attributes

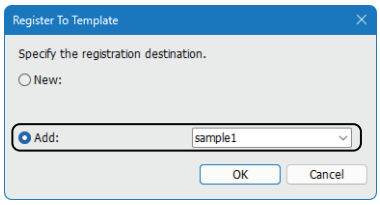
Registering figures and objects into an existing template

1. On the screen editor, select the figure or object to register in a template.

2. Perform either of the following operations to display the [Register to Template] dialog.

- Select [Edit] → [Template Registration] → [Register to Template] from the menu.
- Right-click the figure or object and select [Template] → [Register to Template] from the menu.

3. Select [Add] then select the target template for registering.



4. Click the [OK] button to display the [Edit Template Attribute] dialog.

☞ Page 1111 [Edit Template Attribute] dialog

5. Edit the template attribute then click the [OK] button to complete registering into the template.

For the procedure for editing template attributes in the [Edit Template Attribute] dialog, refer to the following.

☞ Page 1106 Creating template attributes
☞ Page 1107 Deleting template attributes
☞ Page 1108 Registering attributes into template attributes
☞ Page 1109 Deleting attributes from the template attributes

Deleting figures and objects from a template

1. On the screen editor, select the figure or object to delete from the template.

2. Perform either of the following operations to delete the figure or object from the template.

- Select [Edit] → [Template Registration] → [Deregister from Template] from the menu.
- Right-click the figure or object and select [Template] → [Deregister from Template] from the menu.

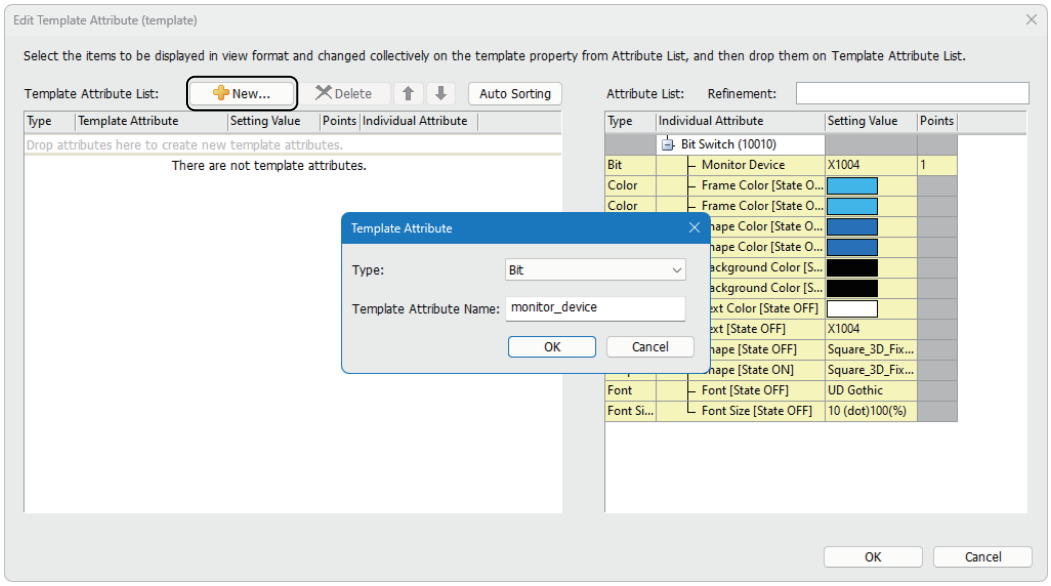
Creating template attributes

1. Perform either of the following operations to display the [Edit Template Attribute] dialog.

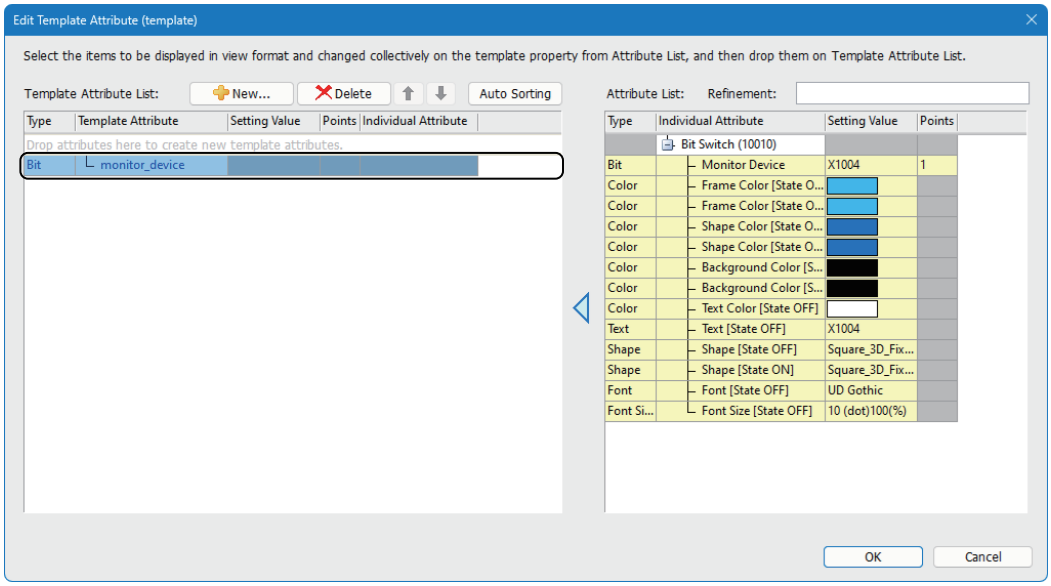
- Select the template information box or a figure/object and select [Edit] → [Edit Template Attribute] from the menu.
- Right-click the template information box or the figure/object and select [Template] → [Edit Template Attribute] from the menu.

☞ Page 1111 [Edit Template Attribute] dialog

2. Click the [New] button to display the [Template Attribute] dialog.



3. Set [Type] and [Template Attribute Name] and click the [OK] button. The template attribute is created.



When the [Auto Sorting] button is clicked, the attributes in [Attribute List] are classified according to their types and are automatically registered in the automatically created corresponding template attributes.

Only the attributes in [Attribute List] are registered in the automatically created template attributes.

The target attributes for the automatic creation can be operated using [Refinement].

For the procedure for registering attributes in template attributes, refer to the following.

☞ Page 1108 Registering attributes into template attributes

Deleting template attributes

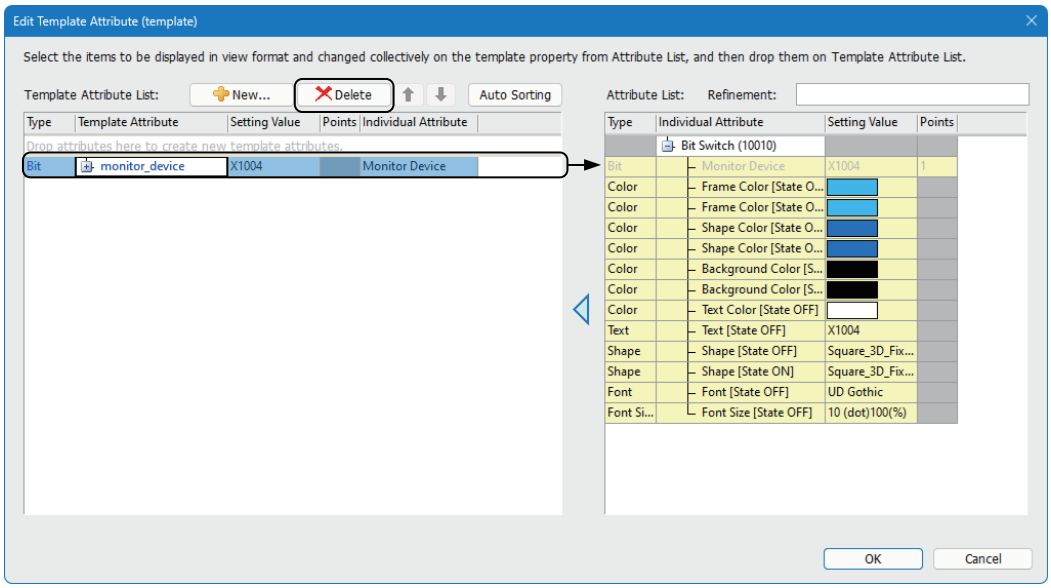
1. Perform either of the following operations to display the [Edit Template Attribute] dialog.

- Select the template information box or a figure/object and select [Edit] → [Edit Template Attribute] from the menu.
- Right-click the template information box or the figure/object and select [Template] → [Edit Template Attribute] from the menu.

☞ Page 1111 [Edit Template Attribute] dialog

2. Perform either of the following operations to delete the template attribute.

- Drag the template attribute to delete from [Template Attribute List] to [Attribute List].
- Select the template attribute row to delete in [Template Attribute List] and click the [Delete] button.



The attributes that have been registered in the template attribute are also deleted.

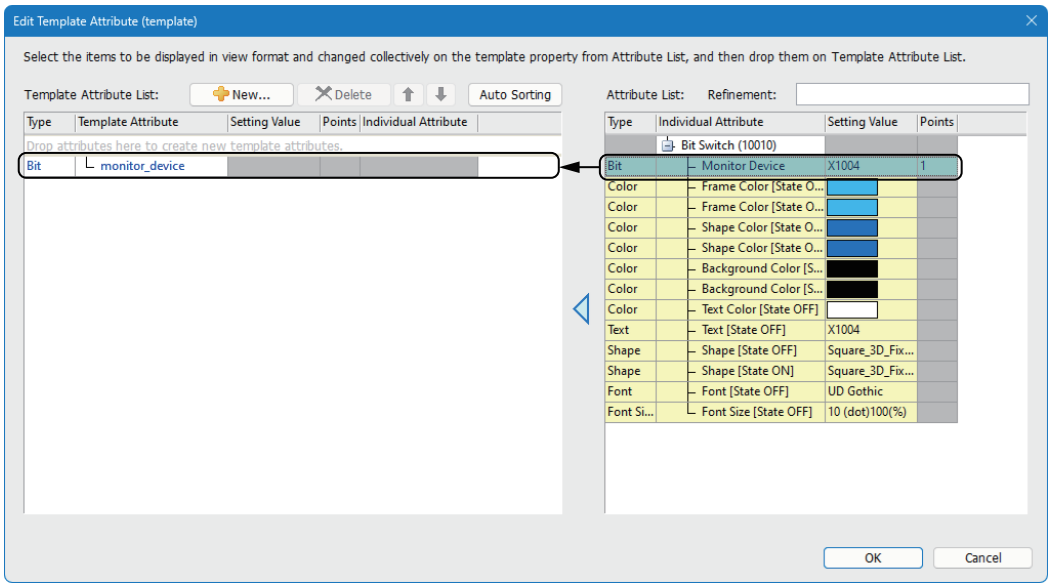
Registering attributes into template attributes

1. Perform either of the following operations to display the [Edit Template Attribute] dialog.

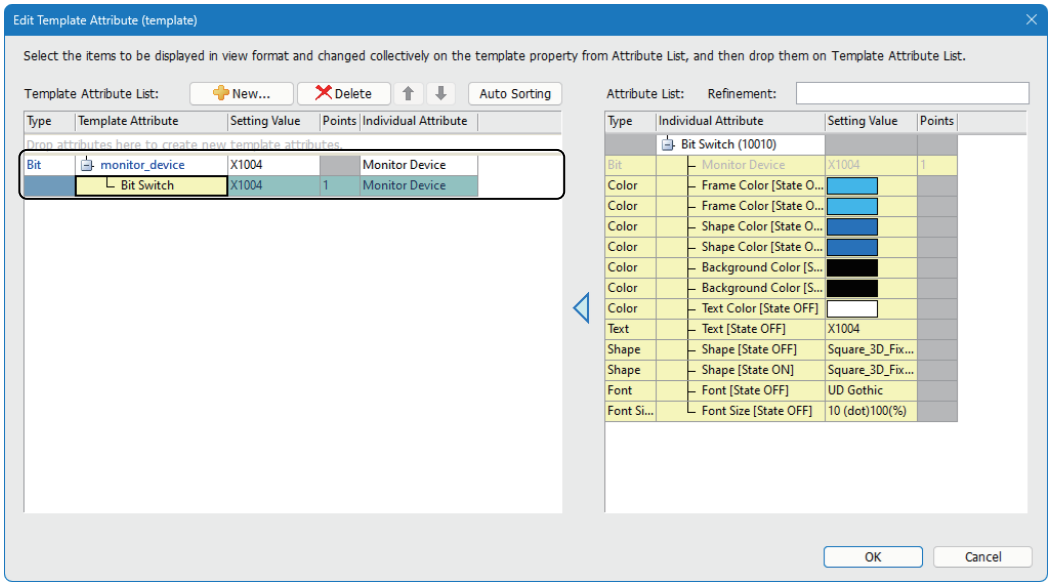
- Select the template information box or a figure/object and select [Edit] → [Edit Template Attribute] from the menu.
- Right-click the template information box or the figure/object and select [Template] → [Edit Template Attribute] from the menu.

☞ Page 1111 [Edit Template Attribute] dialog

2. Drag the target attribute from [Attribute List] into a template attribute row in [Template Attribute List].



3. The dragged attribute is registered in the template attribute.



Deleting attributes from the template attributes

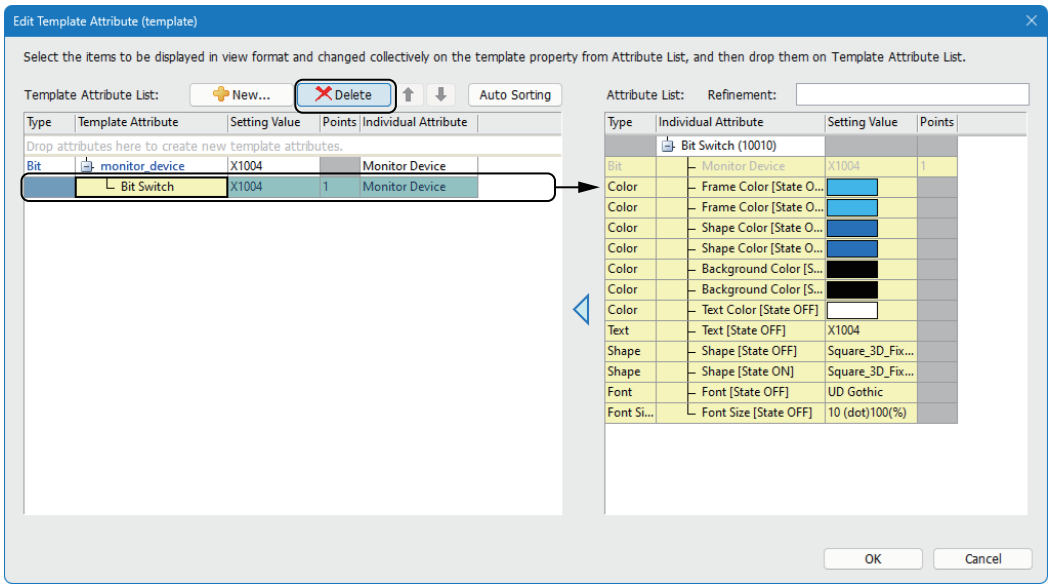
1. Perform either of the following operations to display the [Edit Template Attribute] dialog.

- Select the template information box or a figure/object and select [Edit] → [Edit Template Attribute] from the menu.
- Right-click the template information box or the figure/object and select [Template] → [Edit Template Attribute] from the menu.

☞ Page 1111 [Edit Template Attribute] dialog

2. Perform either of the following operations to delete the target attribute from the template attribute.

- Drag the attribute to delete from [Template Attribute List] to [Attribute List].
- Select the attribute row to delete in [Template Attribute List] and click the [Delete] button.



24.2.3 Registering templates in the library

1. Select [View] → [Docking Window] → [Library List] from the menu to display the [Library] window.

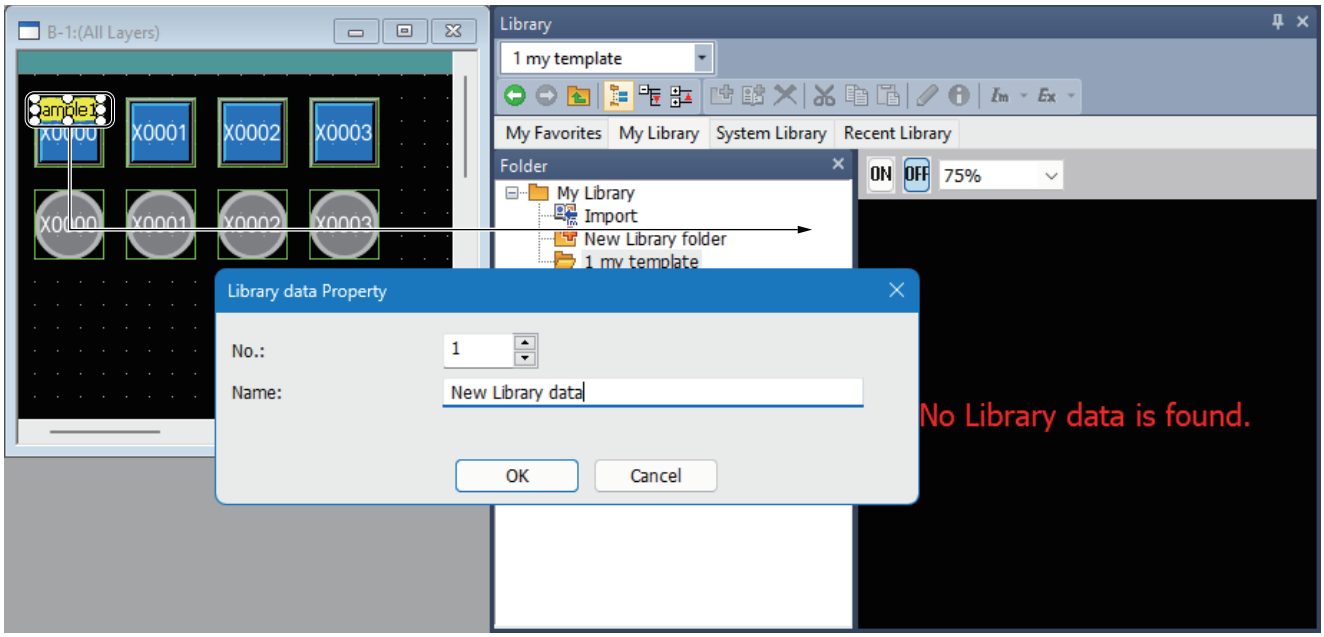
☞ Page 1085 [Library] window

2. Select the [My Library] tab.

3. Double-click the library folder for storing templates in the library tree area.

To create a new library folder, click the [Create Library Folder] button.

4. Drag into the [Library] window the template information box of the target template for registering into the library. The [Library data Property] dialog appears.



5. In the [Library data Property] dialog, set [No.] and [Name], then click the [OK] button. The template is registered in the library.

Precautions

For cases where 10000 or more figures have been registered in a template, when the project is transferred to the GOT or data storage, the 10000th and those registered later are deleted from the template.

The project saved in the GOT or data storage is different from the one designed before the transfer. Exercise care when reading the project saved after the transfer.

24.2.4 Canceling template settings

1. In the screen editor, select the template information box to delete.

Figures and objects selected together with the box are deleted simultaneously with the template.

When the template information box is double-clicked, all the registered figures and objects are selected.

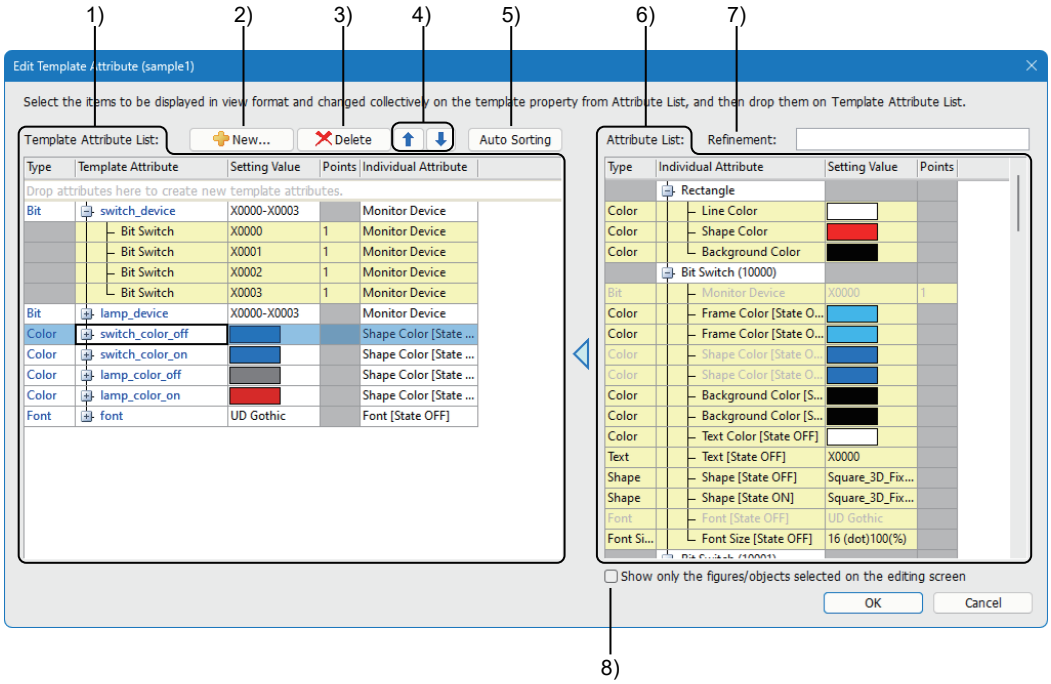
2. Perform either of the following operations to delete the target template setting.

- Select [Edit] → [Delete] from the menu.
- Right-click the template information box and select the [Delete] menu.

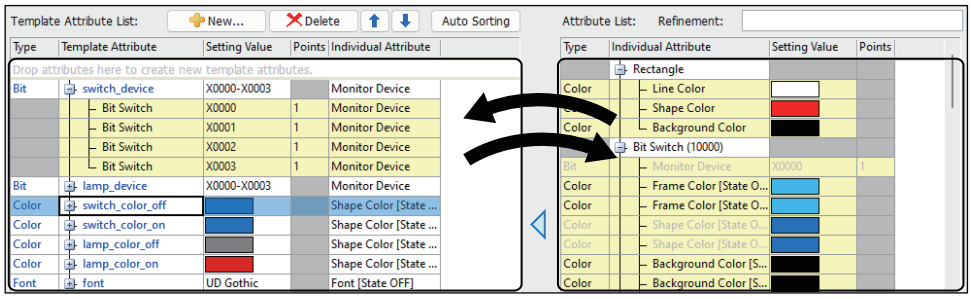
24.3 [Edit Template Attribute] dialog

GT37 SoftGOT3000

Edit the template attributes.



Attributes can be dragged between [Template Attribute List] and [Attribute List] to register into/delete from the template attributes.



For mouse and keyboard operations, refer to the following.

☞ Page 1115 Mouse and keyboard operations

<table>
<tr><th colspan="3">Item</th><th colspan="2">Description</th></tr>

</table>

24.3.1 Mouse and keyboard operations

☞ Page 1115 Operations for the lists on display
☞ Page 1116 Operations when a cell is edited

Operations for the lists on display

The following table describes the mouse and keyboard operations for [Template Attribute List] and [Attribute List] in the [Edit Template Attribute] dialog.

Operation	[Template Attribute List]	[Attribute List]
↑ ↓	Moves the cursor.	Moves the focus upward or downward.
←		Collapses the tree when a figure/object row is selected. If the tree has been folded, moves the focus upward. Moves the focus up to the figure/object row when an attribute row is selected.
→		Expands the tree when a figure/object row is selected. If the tree has been unfolded, moves the focus downward. Moves the focus down when an attribute row is selected.
Shift + ↑ Shift + ↓	Moves the cursor while selecting the row where the cursor is positioned. The destination row of the cursor is also selected.	Moves the focus while selecting the row where the focus is positioned. The destination row of the cursor is also selected.
+ (Numeric keypad)	Expands the template attribute row under the cursor.	
- (Numeric keypad)	Collapses the template attribute row under the cursor.	
Shift + + (Numeric keypad) Ctrl + .	Expands all the trees.	
Shift + - (Numeric keypad) Ctrl + .	Collapses all the trees.	
Home	Moves the cursor to the top row.	Selects the top row.
End	Moves the cursor to the bottom row.	Selects the bottom row.
PgUp	Moves the cursor up one page.	Moves the focus from the row where the focus is positioned to the corresponding row up one page.
PgDown	Moves the cursor down one page.	Moves the focus from the row where the focus is positioned to the corresponding row down one page.
Shift + Home	Selects the rows from the row where the cursor is positioned to the top row.	Selects the rows from the row where the focus is positioned to the top row.
Shift + End	Selects the rows from the row where the cursor is positioned to the bottom row.	Selects the rows from the row where the focus is positioned to the bottom row.
Shift + PgUp	Selects the rows from the row where the cursor is positioned to the corresponding row up one page.	Selects the rows from the row where the focus is positioned to the corresponding row up one page.
Shift + PgDown	Selects the rows from the row where the cursor is positioned to the corresponding row down one page.	Selects the rows from the row where the focus is positioned to the corresponding row down one page.
Shift + click	Selects the rows from the row where the cursor is positioned to the row where the mouse is clicked.	Selects the rows from the row where the focus is positioned to the row where the mouse is clicked.
Ctrl + Space	Selects or deselects a row.	
Ctrl + click		
F2 Double-click	Enables editing of the cell where the cursor is positioned. The target columns for editing are [Type] and [Template Attribute] in a template attribute row. ☞ Page 1116 Operations when a cell is edited	—
Drag	Deletes an attribute from the template attribute by dragging from [Template Attribute List] to [Attribute List].	Registers an attribute to the template attribute by dragging from [Attribute List] to [Template Attribute List].

Operations when a cell is edited

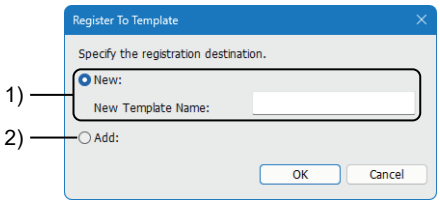
The following table lists the keyboard operations for editing cells in [Template Attribute List].

Operation	[Template Attribute List]
Enter	Confirms and ends the edit.
Esc	Discards and ends the edit.

24.4 [Register to Template] dialog

GT37 SoftGOT3000

Select the template for registering a figure or object.



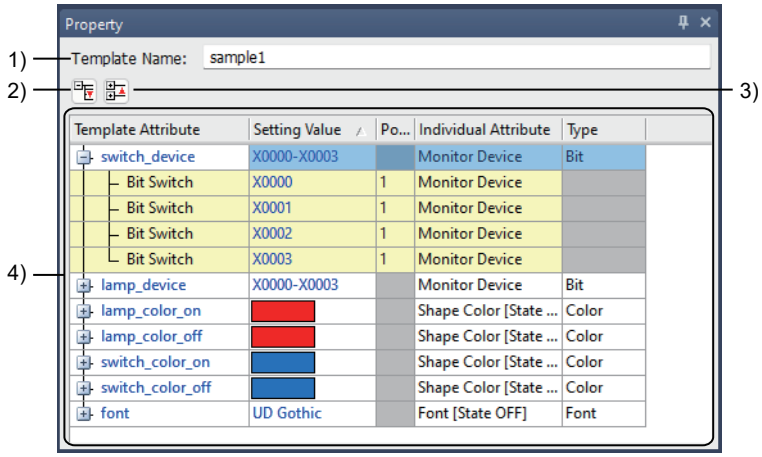
Item			Description
1)	[New]	—	Newly creates a template into which figures and objects are registered.
		[New Template Name]	Set the name of the template to create. Up to 128 characters can be set.
2)	[Add]		Specifies an existing template as the target for registration. Select the target template.

PART 7

24.5 [Property] window (when the template property is displayed)

GT37 SoftGOT3000

The following describes the screen layout shown when the template setting is displayed in the [Property] window.



Item		Description
1)	[Template Name]	Displays the template name. The name can be changed. Up to 128 characters can be set.
2)	[Unfold All] button	Expands all template attribute items.
3)	[Fold All] button	Collapses all template attribute items.

Item			Description	
4)	Template attribute list	—	Lists template attributes. The set values for attributes can be batch changed by template attribute. ☞ Page 1100 Batch changing the set values for attributes For mouse and keyboard operations, refer to the following. ☞ Page 1120 Mouse and keyboard operations The relation between a template attribute and the registered attributes is shown in a tree.  The figure/object attribute rows (attributes of the figures and objects registered to the template attributes) are displayed under the template attribute row. Clicking the top row sorts the results by item. When a figure/object attribute row is selected, handles appear on the figure/object having the corresponding attribute on the screen editor. The handles indicate the corresponding figure/object.  When a figure/object attribute row is double-clicked, the setting dialog of the corresponding figure/object is displayed.	
		[Template Attribute]	Each row displays different contents.	
			Template attribute row	Displays the names of the template attributes. To change the settings, double-click them. Up to 128 characters can be set.
			Figure/object attribute row	Displays the types of the figures or names of the objects. For the attributes of objects for which [Name] is not set, the types are displayed instead of the names.
		[Setting Value]	Each row displays different contents.	
			Template attribute row	Displays the background color of set values in white when the conditions for batch change are satisfied. Displays the background color of set values in gray when the conditions for batch change are not satisfied. For the conditions for batch change and the procedure for the change, refer to the following. ☞ Page 1100 Batch changing the set values for attributes
			Figure/object attribute row	Displays the set values for figures and objects.
		[Points]	Each [Type] displays different contents.	
			[Bit] [Word]	Displays the number of consecutive devices.
			[Number] having the consecutive or random setting	Displays the number of consecutive values.
		[Individual Attribute]	Each row displays different contents.	
			Template attribute row	Displays the names of the attributes that have been registered in the template attribute. Additionally, conditions are displayed if set. For a script part, the attribute name and execution order number of each script are displayed.
			Figure/object attribute row	Displays the names of the figure/object attributes. Additionally, conditions are displayed if set. For a script part, the attribute name and execution order number of each script are displayed.
		[Type]	Displays the types of the template attributes.	

24.5.1 Mouse and keyboard operations

☞ Page 1120 Operations for the lists on display
☞ Page 1120 Operations when a cell is edited

Operations for the lists on display

The following table shows how to operate the template attribute list in the [Property] window with the mouse or keyboard.

Operation	Action
↑/↓/←/→	Moves the cursor.
Shift + ↑/↓	Moves the cursor while selecting the row where the cursor is positioned. The destination row of the cursor is also selected.
+ (Numeric keypad)	Expands the template attribute row under the cursor.
- (Numeric keypad)	Collapses the template attribute row under the cursor.
Shift + + (Numeric keypad)	Expands all the trees.
Shift + - (Numeric keypad)	Collapses all the trees.
Home	Moves the cursor to the top row.
End	Moves the cursor to the bottom row.
PgUp	Moves the cursor up one page.
PgDown	Moves the cursor down one page.
Shift + Home	Selects the rows from the row where the cursor is positioned to the top row.
Shift + End	Selects the rows from the row where the cursor is positioned to the bottom row.
Shift + PgUp	Selects the rows from the row where the cursor is positioned to the corresponding row up one page.
Shift + PgDown	Selects the rows from the row where the cursor is positioned to the corresponding row down one page.
Shift + click	Selects the rows from the row where the cursor is positioned to the row where the mouse is clicked.
Ctrl + Space	Selects or deselects a row.
Ctrl + click	
Tab	Moves the cursor to the right cell.
Shift + Tab	Moves the cursor to the left cell.
Enter	Move the cursor down one row.
Alt + Enter	Displays the setting dialog for the figure/object corresponding to the figure/object attribute row where the cursor is positioned.
Ctrl + C	Copies the set value in the cell of [Template Attribute] where the cursor is positioned as a character string when the template attribute row is selected. Copies the cell of [Setting Value] where the cursor is positioned when a figure/object attribute row is selected.
Ctrl + V	Pastes a character string in the cell of [Template Attribute] being edited when the template attribute row is selected. Pastes in the cell of [Setting Value] where the cursor is positioned when a figure/object attribute row is selected.
F2	Enables editing of the cell where the cursor is positioned. The target columns for editing are [Template Attribute] (template attribute rows only) and [Setting Value]. ☞ Page 1120 Operations when a cell is edited
Double-click	[Template Attribute] (template attribute row only): Double-clicking the [Setting Value] column enables editing of the cells. Double-clicking any columns other than the above will display the setting dialog of the figure/object having attributes. ☞ Page 1120 Operations when a cell is edited

Operations when a cell is edited

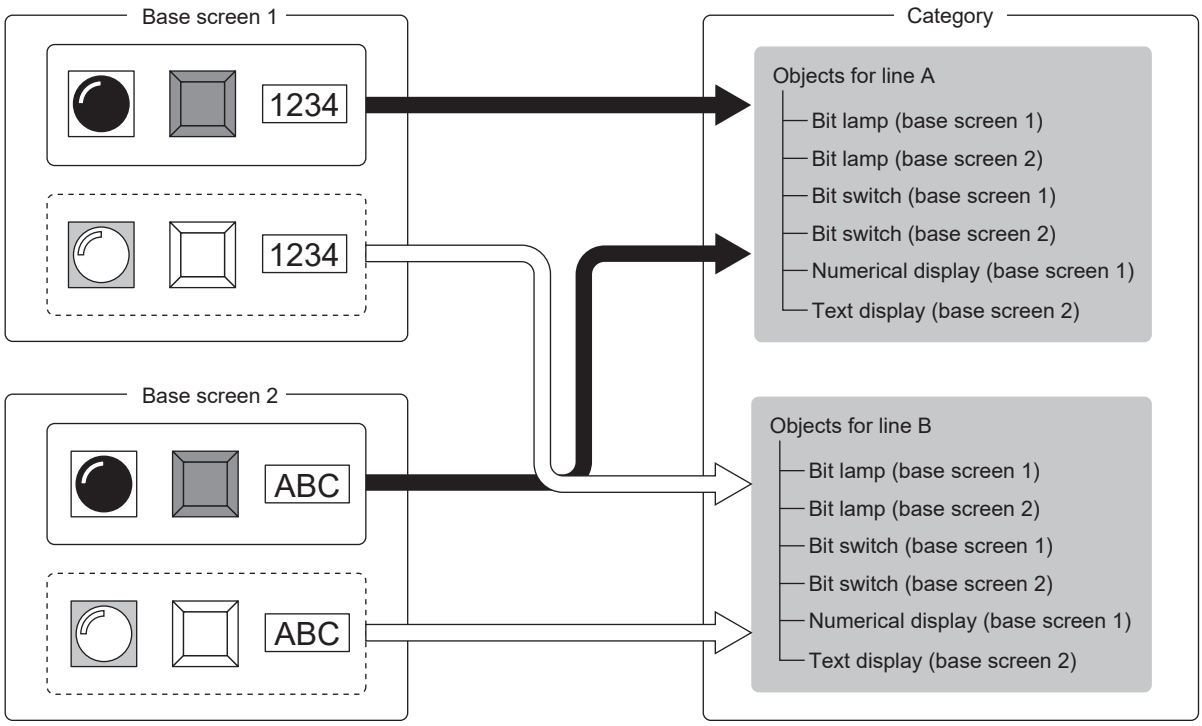
The following table lists the keyboard operations for editing cells in [Template Attribute List].

Operation	Action
Enter	Confirms and ends the edit.
Esc	Discards and ends the edit.
Tab	Confirms the edit and moves the cursor to the right cell.
Shift + Tab	Confirms the edit and moves the cursor to the left cell.
Alt + Enter	Inserts a line feed when text is input.

25 Managing figures and objects by category

GT37 SoftGOT3000

Figures and objects can be managed by grouping them into categories according to the usage.



The following operations are available for figures and objects set in the same category.

- Device batch edit
- Unit No./axis No. batch edit
- Network batch edit
- CH No. batch edit
- Color batch edit
- Shape batch edit

☞ Page 1122 Specifications of the category
☞ Page 1123 How to use the category
☞ Page 1128 [Category List] window

PART 7

25.1 Specifications of the category

GT37 SoftGOT3000

☞ Page 1122 Category type
☞ Page 1122 Registering into categories
☞ Page 1122 Manipulation of the project for which project security is set

25.1.1 Category type

[Switch], [Lamp], and [Other] are provided as default categories.

Categories can be created by the user.

25.1.2 Registering into categories

Figures and objects placed on the following screens can be registered into categories.

- Base screen
- Window screen
- Mobile Screen

Each figure and object can be registered to one category.

One figure/object cannot be registered to multiple categories.

When figures and objects are placed on the screen editor, they are registered to the default categories as described below.

- Switch: Registered to [Switch].
- Lamp: Registered to [Lamp].
- Other than the above: Registered to [Other].

25.1.3 Manipulation of the project for which project security is set

If a login user does not have access to edit projects, the user cannot create or change any categories.

25.2 How to use the category

GT37 SoftGOT3000

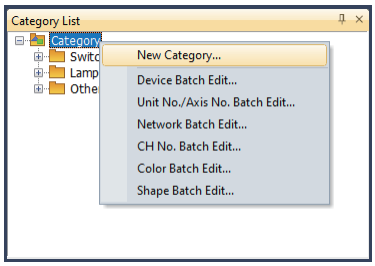
☞ Page 1123 Creating a category
☞ Page 1124 Changing the registered destination category of figures and objects
☞ Page 1126 Batch changing the settings by category

25.2.1 Creating a category

1. Select [View] → [Docking Window] → [Category List] from the menu to display the [Category List] window.

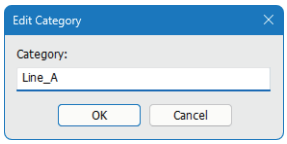
☞ Page 1128 [Category List] window

2. Right-click any one of the categories and select [New Category] from the menu to display the [Edit Category] dialog.

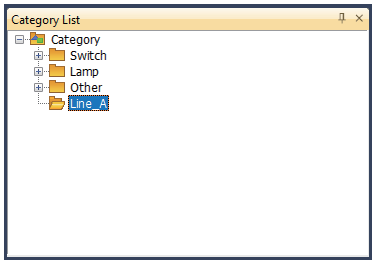


3. Set the name of a new category.

Up to 32 characters can be set.



4. Click the [OK] button to create the category.



For how to change the category of figures and objects, refer to the following.

☞ Page 1124 Changing the registered destination category of figures and objects

25.2.2 Changing the registered destination category of figures and objects

☞ Page 1124 Changing in the [Category List] window
☞ Page 1124 Changing from the menu
☞ Page 1125 Changing in the setting dialog of figure or object

Changing in the [Category List] window

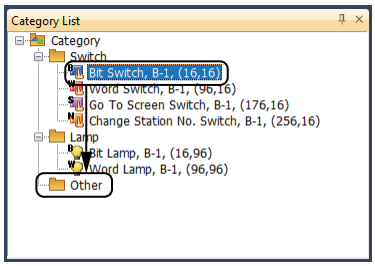
1. Select [View] → [Docking Window] → [Category List] from the menu to display the [Category List] window.

☞ Page 1128 [Category List] window

Figures and objects placed on the open screen are displayed in the tree of each category.
Figures and objects in a closed screen are not displayed in the [Category List] window.

☞ Page 284 Opening a screen

2. Drag the target figure or object into the destination category. The category is changed.



Changing from the menu

Select the target figure or object for placing into another category on the screen editor, then select [Edit] → [Add to Category] from the menu, and then select one of the following categories.

Menu	Action
[Switch]	Changes the registered destination category to [Switch].
[Lamp]	Changes the registered destination category to [Other].
[Other]	Changes the registered destination category to [Other].
[User-defined Category]	Change or create a category. Displays the [Add to Category] dialog.  Select a registered category and click the [OK] button to change the category. If [None] is selected, the figure or object is not registered to any categories. If a nonexistent category is set, the category is newly created and the target is registered. Up to 32 characters can be set.

Changing in the setting dialog of figure or object

1. On the screen editor, double-click the target figure or object for placing into another category to display the setting dialog.
2. Set the registered destination category for [Category] and click the [OK] button to change the category of the figure or object.

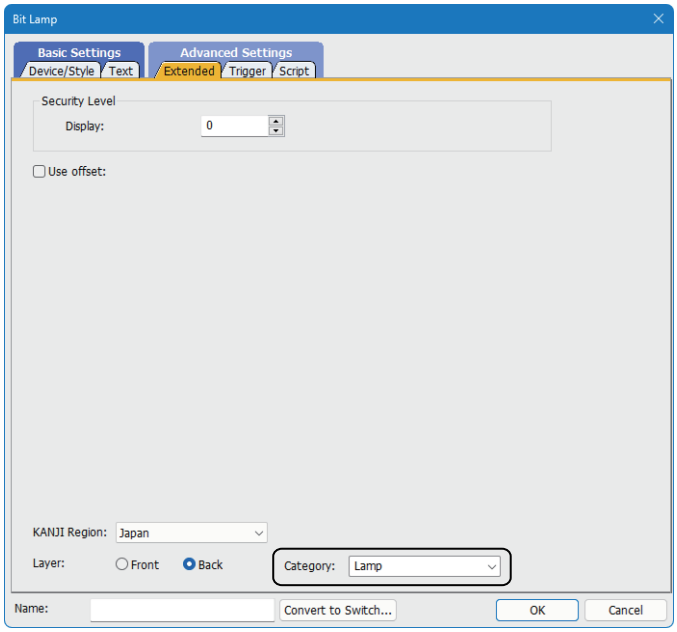
If [None] is selected, the figure or object is not registered to any categories.

If a nonexistent category is set, the category is newly created and the target is registered.

Up to 32 characters can be set.

Ex.

Setting dialog of a bit lamp



PART 7

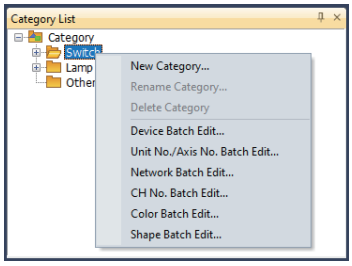
25.2.3 Batch changing the settings by category

1. Select [View] → [Docking Window] → [Category List] from the menu to display the [Category List] window.

☞ Page 1128 [Category List] window

2. Right-click any one of the categories and select the following menus according to the target settings for batch change.

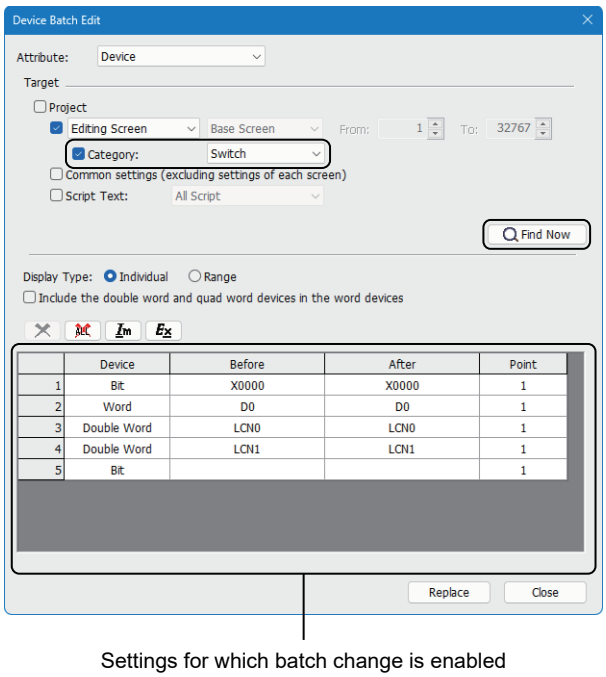
The setting dialog which is corresponding to the selected menu is displayed.



Menu	Action	Reference
[Device Batch Edit]	Change the devices in a batch.	☞ Page 155 [Device Batch Edit] dialog
[Unit No./Axis No. Batch Edit]	Change the unit numbers and axis numbers in a batch.	☞ Page 157 [Unit No./Axis No. Batch Edit] dialog
[Network Batch Edit]	Change the network settings in a batch, such as the network number, station number, and CPU number.	☞ Page 159 [Network Batch Edit] dialog
[CH No. Batch Edit]	Change the channel numbers in a batch.	☞ Page 161 [CH No. Batch Edit] dialog
[Color Batch Edit]	Change the colors in a batch.	☞ Page 163 [Color Batch Edit] dialog
[Shape Batch Edit]	Change the shapes of touch switches and lamps in a batch.	☞ Page 165 [Shape Batch Edit] dialog

3. Select the search target in [Category] and click the [Find Now] button to display the settings for which batch change is enabled.

Example) [Device Batch Edit] dialog



Settings for which batch change is enabled

4. Change the settings in [After] and click the [Replace] button to apply the settings collectively.

Precautions

■ Figures and objects not displayed in the [Category List] window

Figures and objects in a closed screen are not displayed in the [Category List] window.

However, figures and objects that have been registered in categories are identified as the targets for batch change even if the figures and objects are not displayed in the [Category List] window.

■Precautions for batch change

Refer to the following for other precautions related to batch change.

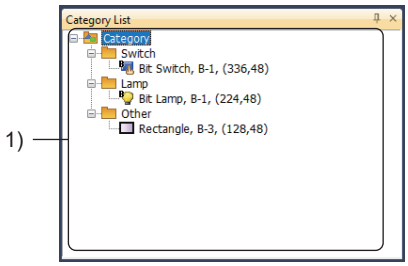
☞ Page 147 Changing the set values collectively (Batch Edit)

PART 7

25.3 [Category List] window

GT37 SoftGOT3000

Add or change a category.

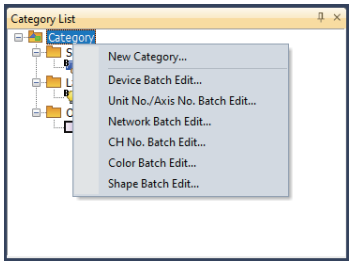


Item		Description
1)	Category list	Lists the categories in the project. [Switch], [Lamp], and [Other] are default categories. Figures and objects placed on the open screen are displayed in the tree of each category. Figures and objects in a closed screen are not displayed in the [Category List] window.  A category of figures and objects can be changed by dragging them to another category. Right-click a category, a figure, or an object to display a menu for operating a category. ☞ Page 1129 Operations from the right-click menu

25.3.1 Operations from the right-click menu

☞ Page 1129 Right-click menu of category
☞ Page 1130 Right-click menu of a figure or an object

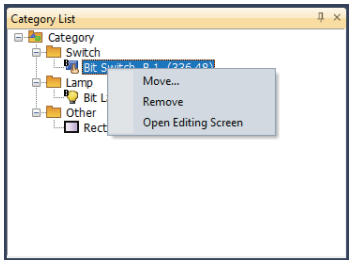
Right-click menu of category



Menu	Description
[New Category]	Displays the [Edit Category] dialog. Create a new category.  Set a category's name. Up to 32 characters can be set.
[Rename Category]	Displays the [Edit Category] dialog. Change the name of the right-clicked category. The names of [Switch], [Lamp], [Other] cannot be changed.  Set a category's name. Up to 32 characters can be set.
[Delete Category]	Deletes the right-clicked category. The registered figures, objects are deleted from the category. [Switch], [Lamp], [Other] cannot be deleted.
[Device Batch Edit]	Displays the [Device Batch Edit] dialog. Change the devices in a batch. ☞ Page 155 [Device Batch Edit] dialog
[Unit No./Axis No. Batch Edit]	Displays the [Unit No./Axis No. Batch Edit] dialog. Change the unit numbers and axis numbers in a batch. ☞ Page 157 [Unit No./Axis No. Batch Edit] dialog
[Network Batch Edit]	Displays the [Network Batch Edit] dialog. Change the network settings in a batch, such as the network number, station number, and CPU number. ☞ Page 159 [Network Batch Edit] dialog
[CH No. Batch Edit]	Displays the [CH No. Batch Edit] dialog. Change the channel numbers in a batch. ☞ Page 161 [CH No. Batch Edit] dialog
[Color Batch Edit]	Displays the [Color Batch Edit] dialog. Change the colors in a batch. ☞ Page 163 [Color Batch Edit] dialog
[Shape Batch Edit]	Displays the [Shape Batch Edit] dialog. Change the shapes of touch switches and lamps in a batch. ☞ Page 165 [Shape Batch Edit] dialog

PART 7

Right-click menu of a figure or an object



Menu	Description
[Move]	Displays the [Move to Category] dialog. Change the registered destination category of the right-clicked figure or object.  Selecting a registered category changes the category. If [None] is selected, the figure or object is not registered to any categories. If a nonexistent category is set, the category is newly created and the target is registered. Up to 32 characters can be set.
[Remove]	Deletes the right-clicked figure or object from the category.
[Open Editing Screen]	Selects the right-clicked figure or object on the screen editor.

26.1 Drawing a text figure

GT37 SoftGOT3000

Draw a text figure.

Operating procedure

1. Select [Figure] → [Text] from the menu.
2. Click the position where text starts.

A text is placed on the screen.

3. Double-click the text to display the [Text] dialog.

☞ Page 1133 [Text] dialog

4. Set a text to be displayed and a font, and click the [OK] button.

The text setting is completed.

For the settings and editing operations common to figures, refer to the following.

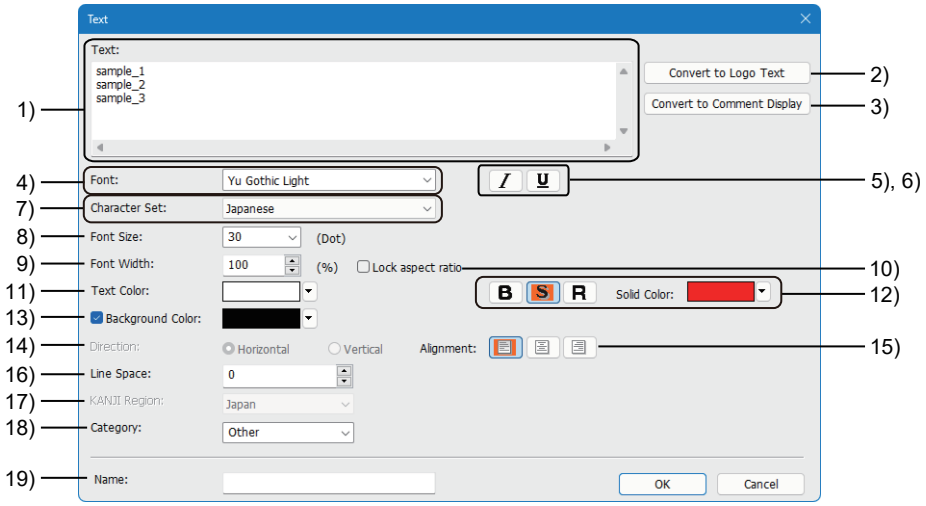
☞ Page 988 Color settings

26.1.1 [Text] dialog

GT37 SoftGOT3000

For mobile screens, some setting items are not available.

☞ Page 2742 Usable functions



Item		Description
1)	[Text]	Set the text to be displayed. The input text is displayed on the screen.  [Text] dialog  Screen Up to 512 characters can be set. A line feed is counted as two characters.
2)	[Convert to Logo Text] button	Converts the text figure to a logo text figure. The [Text] dialog changes to the [Logo Text] dialog. ☞ Page 1136 [Logo Text] dialog If an unusable font is set for the logo text, it is converted to a usable one.
3)	[Convert to Comment Display] button	Registers the entered text to a comment group and converts the text figure to a simple comment display object. For the conversion method, refer to the following. ☞ Page 810 Registering characters of a text figure, touch switch, or other attribute to a comment group
4)	[Font]	Select a font. ☞ Page 74 Specifications of displayable characters
5)	[Italic] button	Italicizes the text. This item is displayed when a Windows font is selected for [Font].
6)	[Underline] button	Underlines the text. This item is displayed when a Windows font is selected for [Font].
7)	[Character Set]	Set the language. This item is displayed when a Windows font is selected for [Font].
8)	[Font Size]	Set a vertical text size. The setting range is [8] dots to [540] dots.
9)	[Font Width]	Set a horizontal text size. The horizontal size is specified with the magnification relative to [Font Size] (vertical text size). The setting range is [6]% to [1600]%.
10)	[Lock aspect ratio]	The aspect ratio of the text is retained when you resize the text by manipulating a handle on the screen editor.
11)	[Text Color]	Select a text color. For details on the color, refer to the following. ☞ Page 988 Color settings

Item		Description
12)	Text style	Set a text style. Only one of the styles ([Bold], [Solid], or [Raised]) is settable.  • [Bold] button: Displays the text in bold. • [Solid] button: Displays the text with a shadow. • [Raised] button: Displays the text embossed. • [Solid Color]: When [Solid] or [Raised] is selected as the text style, set the color of the shadow.
13)	[Background Color]	Fills the background of the text with the specified color. If [Background Color] and a character effect ([Bold], [Solid], or [Raised]) are set at the same time, the text may extend off the left or top edge.
14)	[Direction]	Select the direction of the text. This item is enabled when one of the following options is selected for [Font]. • [UD Gothic] • [UD Mincho]
15)	[Alignment]	Set the horizontal position (left-aligned, centered, or right-aligned) of the text. This item is applied when the text is entered in two or more lines. 16)	[Line Space]	Set the space between lines. The setting range is [0] dots to [128] dots.
17)	[KANJI Region]	Select the KANJI region. ☞ Page 76 KANJI region This item is enabled when one of the following options is selected for [Font]. • [UD Gothic] • [UD Mincho] • [UDP Gothic] • [UDP Mincho]
18)	[Category]	Select the category to which the figure belongs. ☞ Page 1121 Managing figures and objects by category
19)	[Name]	Set the figure name. The name is displayed in places such as the data browser and property sheet. Up to 100 characters can be set.

26.1.2 Similar functions

The following shows other functions that display text on the GOT.

Applicable function	Description
Logo text	Draws text with an outline or gradient. The logo text is effective to make the text highly visible. ☞ Page 1135 Drawing a logo text figure The logo text can be converted from the text in the [Text] dialog.
Text display	Uses the values stored in the word device as the text code to display the text on the object. ☞ Page 1345 Placing a text display or text input object
Comment display	Displays a registered text (comment). To display a text, register the text as a comment group in the project. This function is useful in the following cases. • Displaying the same text on multiple objects • Switching the text according to the change of the device value ☞ Page 1386 Placing a comment display

26.2 Drawing a logo text figure

GT37 SoftGOT3000

Draws text with an outline or gradient.

Operating procedure

1. Select [Figure] → [Logo Text] from the menu.
2. Click the position where text starts.

A logo text is placed on the screen.

3. Double-click the logo text to display the [Logo Text] dialog.

☞ Page 1136 [Logo Text] dialog

4. Set a text to be displayed and a font, and click the [OK] button.

The logo text setting is completed.

For the settings and editing operations common to figures, refer to the following.

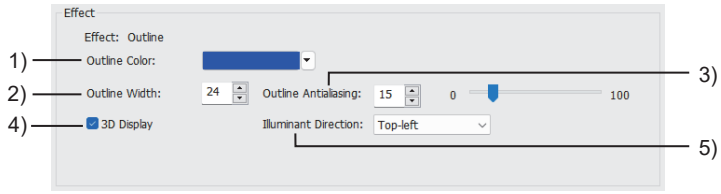
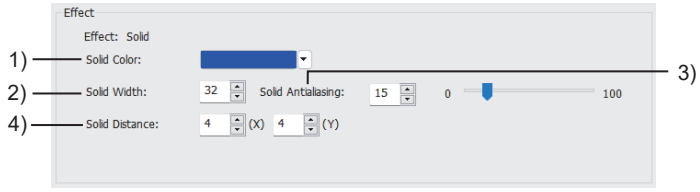
■[Outline]



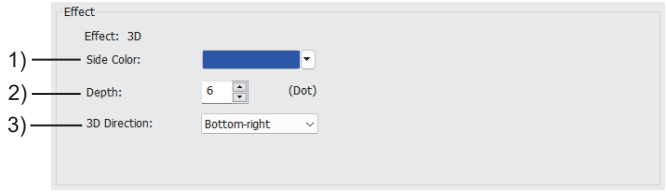
Item		Description
1)	[Outline Color]	Select the color of the outline. For details on the color, refer to the following. ☞ Page 988 Color settings When [Fill Effects] is selected in the color palette, the text can be displayed with gradation or pattern.
2)	[Outline Width]	Set the width of the outline. The setting range is [0] dots to [100] dots.
3)	[Outline Antialiasing]	Set the value of the anti-aliasing (which eliminates the aliasing of pixels) for the outline. The setting range is [0] dots to [100] dots.
4)	[3D Display]	Highlights the logo text so that it appears three-dimensional.
5)	[Illuminant Direction]	Select a direction of illuminant that highlights the text.

■[Solid]



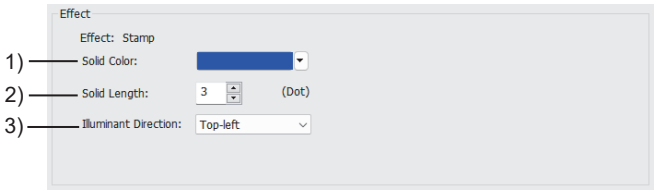
Item		Description
1)	[Solid Color]	Set the color of the shadow. For details on the color, refer to the following. ☞ Page 988 Color settings When [Fill Effects] is selected in the color palette, the text can be displayed with gradation or pattern.
2)	[Solid Width]	Set the width of the shade. The setting range is [0] dots to [100] dots.
3)	[Solid Antialiasing]	Set the value of the anti-aliasing (which eliminates the aliasing of pixels) for the shade. The setting range is [0] dots to [100] dots.
4)	[Solid Distance]	Set the gap between the text and the shade in the X-axis and Y-axis directions. The setting range is [-20] dots to [20] dots.

■[3D]



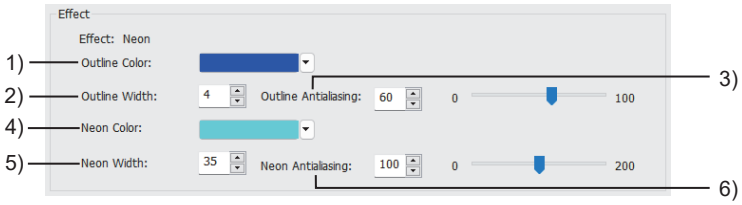
Item		Description
1)	[Side Color]	Set the color of the sides of the three-dimensional text. For details on the color, refer to the following. ☞ Page 988 Color settings When [Fill Effects] is selected in the color palette, the text can be displayed with gradation or pattern.
2)	[Depth]	Set the width of the sides of the three-dimensional text. The setting range is [0] dots to [20] dots.
3)	[3D Direction]	Select the direction in which the sides of the three dimensions extend.

■[Stamp]



Item		Description
1)	[Solid Color]	Set the color of the shadow. For details on the color, refer to the following. ☞ Page 988 Color settings When [Fill Effects] is selected in the color palette, the text can be displayed with gradation or pattern.
2)	[Solid Length]	Set the length of the shade. The setting range is [0] dots to [20] dots.
3)	[Illuminant Direction]	Select a direction in which the text is illuminated.

■[Neon]



Item		Description
1)	[Outline Color]	Select the color of the outline. For details on the color, refer to the following. ☞ Page 988 Color settings When [Fill Effects] is selected in the color palette, the text can be displayed with gradation or pattern.
2)	[Outline Width]	Set the width of the outline. The setting range is [0] dots to [100] dots.
3)	[Outline Antialiasing]	Set the value of the anti-aliasing (which eliminates the aliasing of pixels) for the outline. The setting range is [0] dots to [100] dots.
4)	[Neon Color]	Set the color of the radiant light around the outline. For details on the color, refer to the following. ☞ Page 988 Color settings When [Fill Effects] is selected in the color palette, the text can be displayed with gradation or pattern.
5)	[Neon Width]	Select the width of the neon. The setting range is [0] dots to [100] dots.
6)	[Neon Antialiasing]	Set the value of the anti-aliasing (which eliminates the aliasing of pixels) for the neon. The setting range is [0] dots to [200] dots.

26.3 Drawing a Line

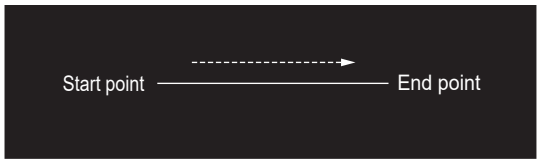
GT37 SoftGOT3000

Draw a line.

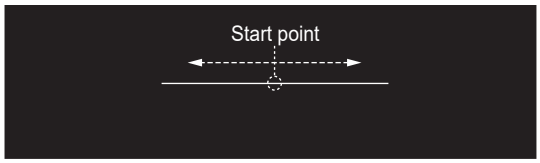
Operating procedure

1. Select [Figure] → [Line] from the menu.
2. Click and hold the mouse button at the start point, and drag the pointer to the end point on the screen editor.

Release the mouse button to complete the placement.



Holding down the Shift key and drag enables drawing of a line in 45-degree increments.
Holding down the Ctrl key and drag enables drawing of a line with the start point as the center.



3. Double-click the placed line to display the [Line] dialog.

☞ Page 1142 [Line] dialog

4. Set a width, color, and others, and click the [OK] button.

The line setting is completed.
For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

PART 7

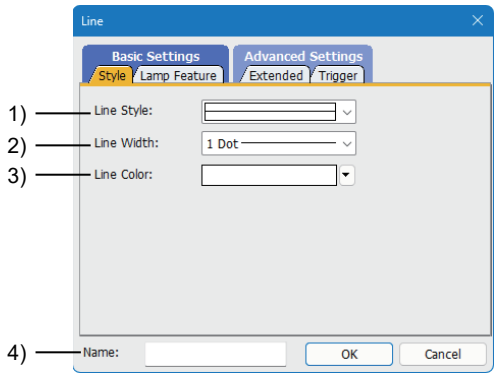
26.3.1 [Line] dialog

GT37 SoftGOT3000

☞ Page 1142 [Style] tab
☞ Page 1143 [Lamp Feature] tab
☞ Page 1143 [Extended] tab
☞ Page 1144 [Trigger] tab

[Style] tab

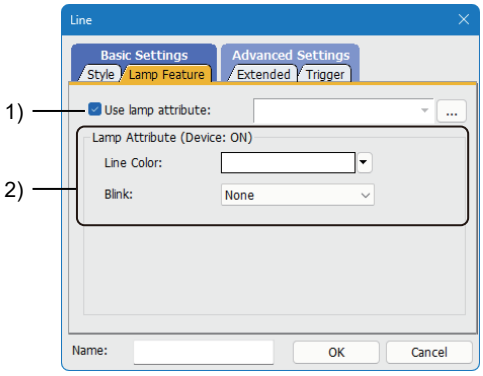
GT37 SoftGOT3000



Item		Description
1)	[Line Style]	Select the style of the line.
2)	[Line Width]	Select the width of the line.
3)	[Line Color]	Select the color of the line. For details on the color, refer to the following. ☞ Page 988 Color settings
4)	[Name]	Set the figure name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

[Lamp Feature] tab

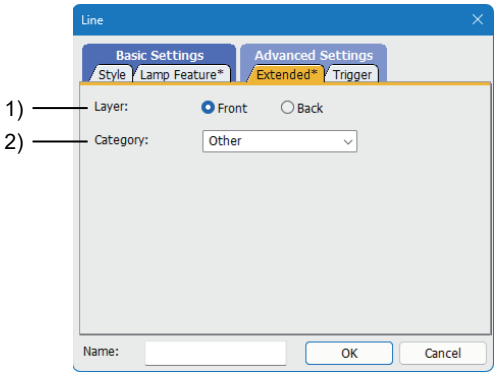
GT37 SoftGOT3000



Item			Description
1)	[Use lamp attribute]		Enables color switching similar to the color switching of a lamp by turning the bit device on or off. ☞ Page 1036 Lamp attribute Set a bit device for control.
			When this item is selected, the figure is processed as an object. ☞ Page 1035 Processing a figure as an object
2)	[Lamp Attribute (Device: ON)]	—	Set the attribute of when the bit device is on.
		[Line Color]	Select the color of the line.
		[Blink]	Select the blinking speed.

[Extended] tab

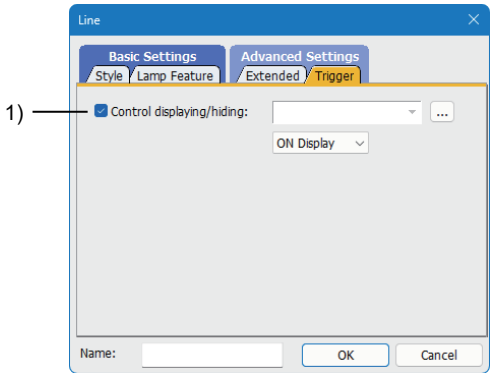
GT37 SoftGOT3000



Item		Description
1)	[Layer]	Select the layer on which the figure is to be placed. ☞ Page 65 Layer
		If either of the following settings is configured, [Backmost] does not appear. • [Use lamp attribute] is selected in the [Lamp Feature] tab • [Control displaying/hiding] is selected in the [Trigger] tab
		When [Front] or [Back] is selected, the figure is processed as an object. ☞ Page 1035 Processing a figure as an object
2)	[Category]	Select the category to which the figure belongs. ☞ Page 1092 Efficient Drawing with Templates

[Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the figure only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off

26.4 Drawing a Line Freeform

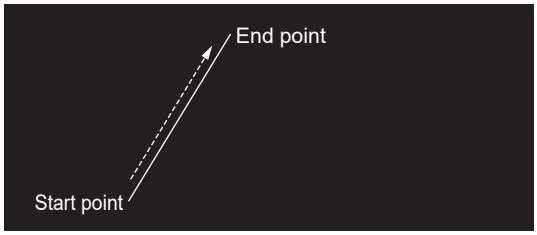
GT37 SoftGOT3000

Draws a freeform line with connected vertices.

Operating procedure

1. Select [Figure] → [Line Freeform] from the menu.
2. Click and hold the mouse button at the start point, and drag the pointer to the end point of the first line on the screen editor.

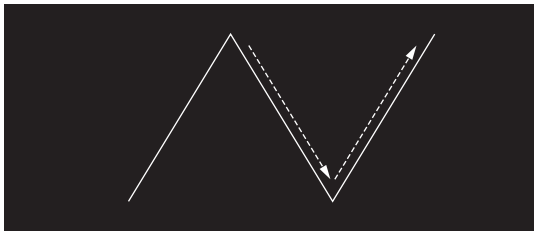
Release the mouse button to determine the drawing of the first line.



Holding down the Shift key and drag enables drawing of a line in 45-degree increments.

3. Move the mouse pointer to the end point of the next line and click the end point.

Repeat this as necessary.



Clicking the Back space key allows reposition of the immediately preceding vertex.

4. Double-click the last vertex to complete the placement.
5. Double-click the placed freeform line to display the [Line Freeform] dialog.

☞ Page 1146 [Line Freeform] dialog

6. Set a width, color, and others, and click the [OK] button.

The freeform line setting is completed.

For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

Point

After a figure is placed, vertices can be moved, added, or deleted.

Select [Edit] → [Edit Vertices] from the menu to switch the handles to the vertex editing handles.

For how to edit vertices, refer to the following.

☞ Page 1026 Editing vertices to change the shape of a figure

GT37 SoftGOT3000

Item		Description
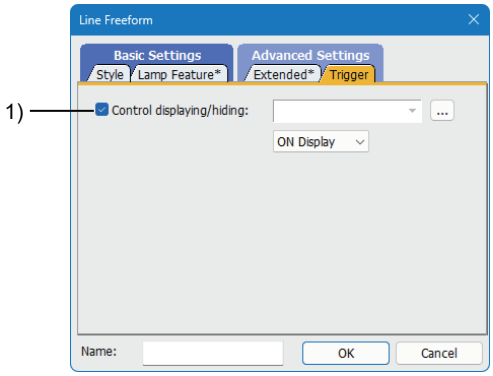
1)	[Layer]	Select the layer on which the figure is to be placed. ☞ Page 65 Layer
		If either of the following settings is configured, [Backmost] does not appear. • [Use lamp attribute] is selected in the [Lamp Feature] tab • [Control displaying/hiding] is selected in the [Trigger] tab
		When [Front] or [Back] is selected, the figure is processed as an object. ☞ Page 1035 Processing a figure as an object
2)	[Category]	Select the category to which the figure belongs. ☞ Page 1121 Managing figures and objects by category

PART 7

[Trigger] tab

GT37 SoftGOT3000



Item		Description
1)	[Control displaying/hiding]	Enables the setting to display the figure only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off

26.5 Drawing a Rectangle

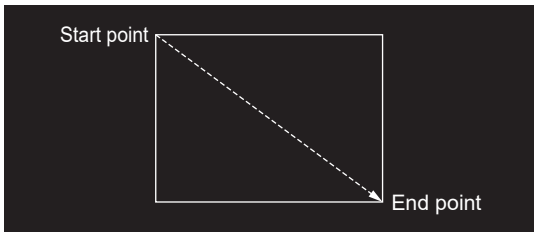
GT37 SoftGOT3000

Draw a rectangle and square.

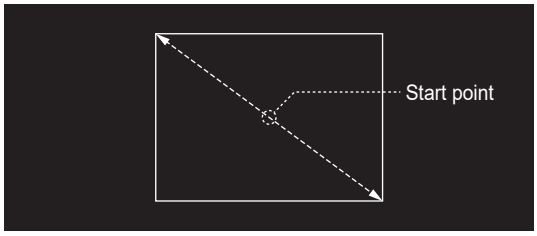
Operating procedure

1. Select [Figure] → [Rectangle] from the menu.

2. Click and hold the mouse button at the start point, and drag the pointer to the end point on the screen editor.
Release the mouse button to complete the placement.



Holding down the Shift key and drag enables drawing of a square.
Holding down the Ctrl key and drag enables drawing of a rectangle with the start point as the center.



3. Double-click the placed rectangle to display the [Rectangle] dialog.
☞ Page 1150 [Rectangle] dialog

4. Set a width, color, and others, and click the [OK] button.
The rectangle setting is completed.
For the settings and editing operations common to figures, refer to the following.
☞ Page 988 Color settings

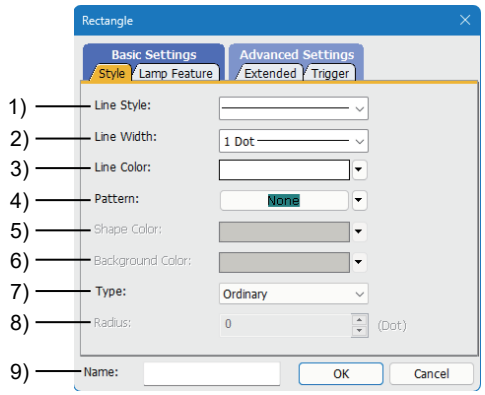
[Style] tab

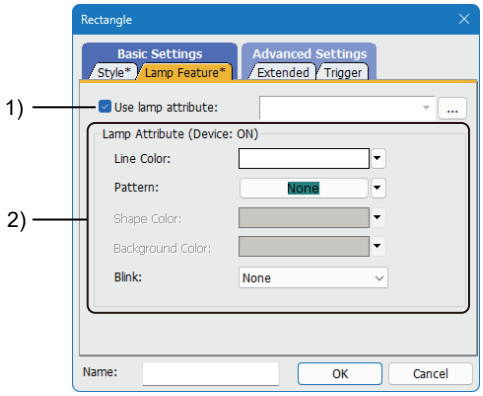
GT37 SoftGOT3000



Item		Description
1)	[Line Style]	Select the style of the frame.
2)	[Line Width]	Select the width of the frame.
3)	[Line Color]	Select the color of the frame. For details on the color, refer to the following. ☞ Page 988 Color settings
4)	[Pattern]	Select a fill pattern for the frame inside. To display the frame only without filling, select [None].
5)	[Shape Color]	This item is enabled when [None] is not selected for [Pattern]. Select a pattern color.
6)	[Background Color]	This item is enabled when [None] is not selected for [Pattern]. Select a background color.
7)	[Type]	Select a corner shape. For [Rounded], when the value other than [1 Dot] is selected for [Line Width], the line style is automatically changed to the straight line. For [Rounded], when the style other than the straight line is selected for [Line Style], the line width is automatically changed to [1 Dot].
8)	[Radius]	Set the radius of the corner. This item is enabled when [Rounded] or [Octagonal] is selected for [Type]. The radius can be set from [0] dot. The maximum value is the value calculated by dividing either of the vertical and horizontal sides of a rectangle, whichever is shorter, by 2. The value is rounded down after the decimal point. (Unit: dot)
9)	[Name]	Set the figure name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

[Lamp Feature] tab

GT37 SoftGOT3000



Item			Description
1)	[Use lamp attribute]		Enables color switching similar to the color switching of a lamp by turning the bit device on or off. ☞ Page 1036 Lamp attribute Set a bit device for control.

1)	[Control displaying/hiding]	Enables the setting to display the figure only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off

26.6 Drawing a Polygon

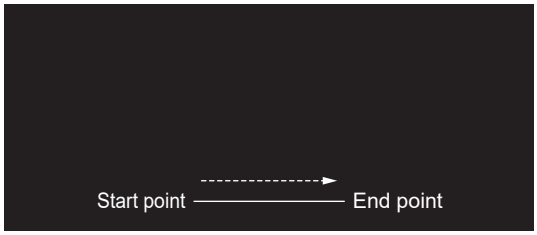
GT37 SoftGOT3000

Draw a polygon.

Operating procedure

1. Select [Figure] → [Polygon] from the menu.
2. Click and hold the mouse button at the start point, and drag the pointer to the end point of the first side on the screen editor.

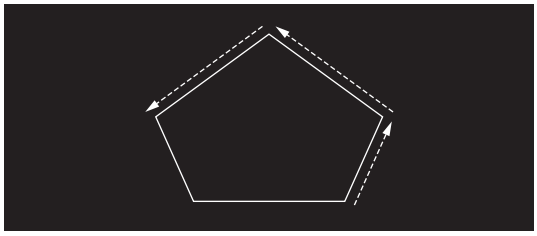
Release the mouse button to determine the drawing of the first side.



Holding down the Shift key and drag enables drawing of a line in 45-degree increments.

3. Move the mouse pointer to the end point of the next side and click the end point.

Repeat this as necessary.



Clicking the Back space key allows reposition of the immediately preceding vertex.

4. Double-click the last vertex to complete the placement.
5. Double-click the placed polygon to display the [Polygon] dialog.

☞ Page 1154 [Polygon] dialog

6. Set a width, color, and others, and click the [OK] button.

The polygon setting is completed.

For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

Point

After a figure is placed, vertices can be moved, added, or deleted.

Select [Edit] → [Edit Vertices] from the menu to switch the handles to the vertex editing handles.

For how to edit vertices, refer to the following.

☞ Page 1026 Editing vertices to change the shape of a figure

1)	[Control displaying/hiding]	Enables the setting to display the figure only when requirements are met. Set the following as requirements. • Bit device for control • When to display: When the bit device for control is on or off

26.8 Drawing an Arc or a Sector

GT37 SoftGOT3000

Draw an arc or a sector.

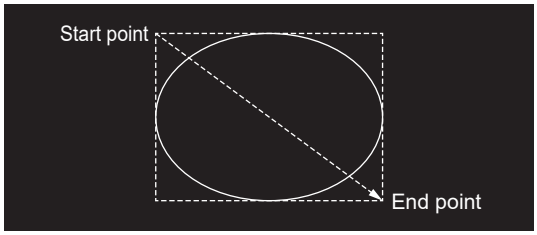
Operating procedure

1. Perform either of the following operations according to the figure to be drawn.

- When drawing an arc: Select [Figure] → [Arc] from the menu.
- When drawing a sector: Select [Figure] → [Sector] from the menu.

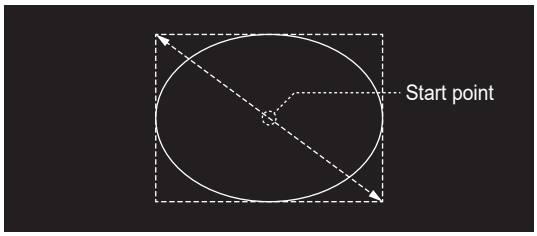
2. Click and hold the mouse button at the start point, and drag the pointer to the end point on the screen editor.

Release the mouse button to complete the placement.



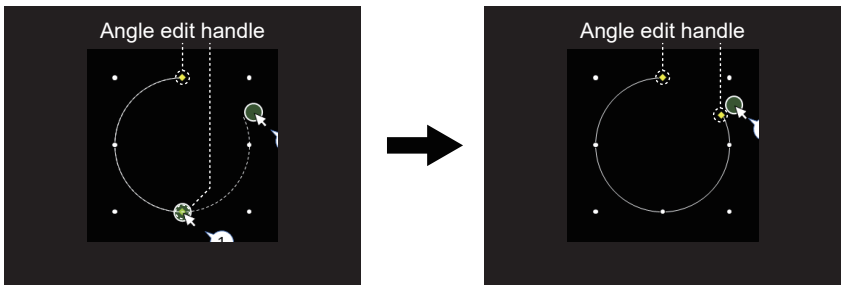
Holding down the Shift key and drag enables drawing of a perfect circle.

Holding down the Ctrl key and drag enables drawing of a circle with the start point as the center.



3. Select the placed arc or sector to display the angle edit handles.

Drag an angle edit handle to adjust the start and end angles.



4. Double-click the placed arc or sector to display the [Arc/Sector] dialog.

☞ Page 1162 [Arc/Sector] dialog

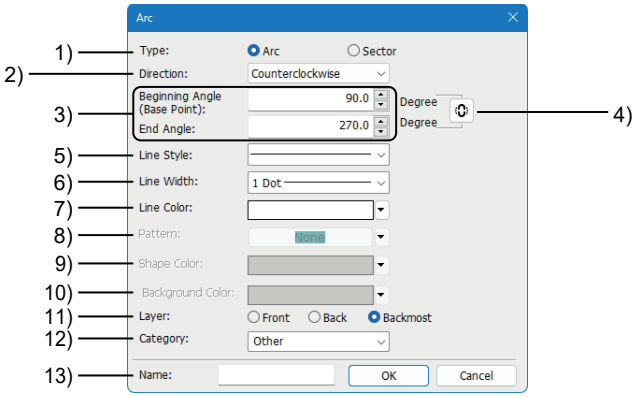
5. Set a width, color, and others, and click the [OK] button.

The arc or sector setting is completed.

For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

26.8.1 [Arc/Sector] dialog



Item		Description
1)	[Type]	Select the type of the figure to be drawn.
2)	[Direction]	Select the direction in which the arc or sector is drawn from the start angle to the end angle.
3)	[Beginning Angle (Base Point)] [End Angle]	Set angles to define the arc or sector shape. The setting range is [0.0] degrees to [359.9] degrees.
4)	[Fix central angle] button	Link [Beginning Angle (Base Point)] and [End Angle] to maintain the center angle when this setting is enabled.
5)	[Line Style]	Select the style of the frame.
6)	[Line Width]	Select the width of the frame.
7)	[Line Color]	Select the color of the frame. For details on the color, refer to the following. ☞ Page 988 Color settings
8)	[Pattern]	Select a fill pattern for the frame inside. To display the frame only without filling, select [None].
9)	[Shape Color]	This item is enabled when [None] is not selected for [Pattern]. Select a pattern color.
10)	[Background Color]	This item is enabled when [None] is not selected for [Pattern]. Select a background color.
11)	[Layer]	Select the layer on which the figure is to be placed. ☞ Page 65 Layer
		When [Front] or [Back] is selected, the figure is processed as an object. ☞ Page 1035 Processing a figure as an object
12)	[Category]	Select the category to which the figure belongs. ☞ Page 1121 Managing figures and objects by category
13)	[Name]	Set the figure name. The name is displayed in places such as the data browser and property sheet. Up to 100 characters can be set.

26.9 Drawing a Table

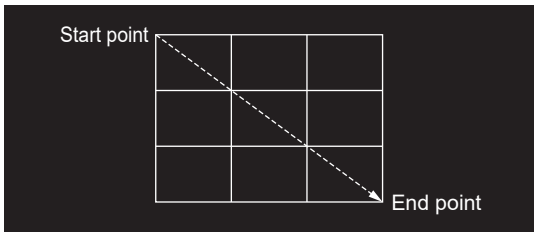
GT37 SoftGOT3000

Draw a table.

Displayed items

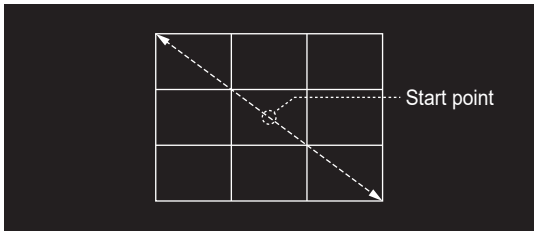
1. Select [Figure] → [Table] from the menu.
2. Click and hold the mouse button at the start point, and drag the pointer to the end point on the screen editor.

Release the mouse button to complete the placement.



Holding down the Shift key and drag enables drawing of a square table.

Holding down the Ctrl key and drag enables drawing of a table with the start point as the center.



3. Double-click the placed table to display the [Table] dialog.

☞ Page 1164 [Table] dialog

4. Set the number of rows and columns, and click the [OK] button.
5. Drag a border to edit the row height or column width as necessary.

When a border is dragged, the behavior differs depending on the setting of [Interval] in the [Table] dialog.

☞ Page 1165 Editing a table on the screen editor

The table setting is completed.

For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

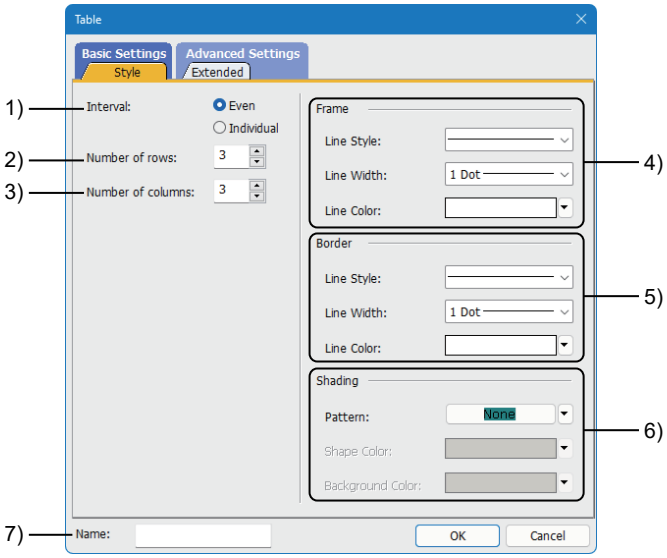
26.9.1 [Table] dialog

GT37 SoftGOT3000

☞ Page 1164 [Style] tab
☞ Page 1166 [Extended] tab

[Style] tab

GT37 SoftGOT3000



Item			Description
1)	[Interval]		Select the row height and column width. When a border of the table is dragged, the behavior differs depending on the setting. ☞ Page 1165 Editing a table on the screen editor
2)	[Number of rows]		Set the number of rows. The setting range depends on the setting of [Interval] or the table height. • When [Interval] is set to [Even] (table height is 31 dots or more): [1] row to [30] rows • When [Interval] is set to [Even] (table height is 30 dots or less): [1] row to the table height - 1 row • When [Interval] is set to [Individual]: [1] row to [30] rows
3)	[Number of columns]		Set the number of columns. The setting range depends on the setting of [Interval] or the table width. • When [Interval] is set to [Even] (table width is 31 dots or more): [1] column to [30] columns • When [Interval] is set to [Even] (table width is 30 dots or less): [1] column to the table width - 1 column • When [Interval] is set to [Individual]: [1] column to [30] columns
4)	[Frame]	[Line Style]	Select the style of the frame.
		[Line Width]	Select the width of the frame.
		[Line Color]	Select the color of the frame. For details on the color, refer to the following. ☞ Page 988 Color settings
5)	[Border]	[Line Style]	Select the style of the border.
		[Line Width]	Select the width of the border.
		[Line Color]	Select the color of the border. For details on the color, refer to the following. ☞ Page 988 Color settings

Item			Description
6)	[Shading]	[Pattern]	Select a fill pattern for the frame inside. To display the frame only without filling, select [None].
		[Shape Color]	This item is enabled when [None] is not selected for [Pattern]. Select a pattern color.
		[Background Color]	This item is enabled when [None] is not selected for [Pattern]. Select a background color.
7)	[Name]		Set the figure name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

■Editing a table on the screen editor

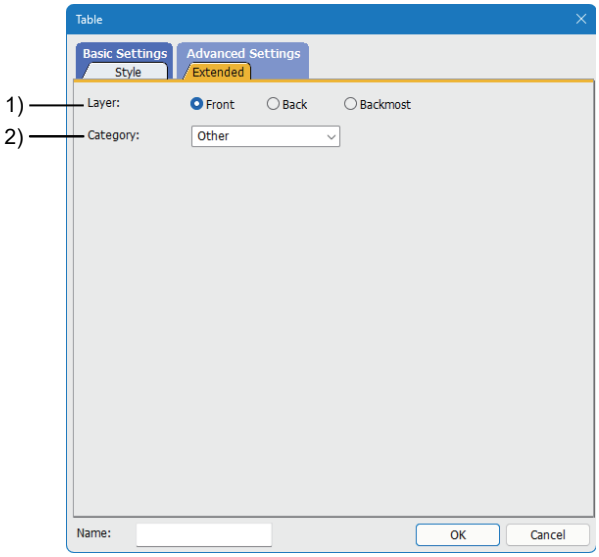
The row height or column width of a table selected on the screen editor can be edited by dragging of a handle or a border.

The behavior at dragging depends on the setting of [Interval] in the [Table] dialog.

Setting of [Interval]	Behavior at dragging
[Even]	The rows and columns are evenly distributed. Dragging a handle on the table frame or a border automatically resizes rows and/or columns and distributes them evenly according to the table size.  Drag the handle to the right.
[Individual]	The row height and column width can be set individually. Dragging a handle on the table frame resizes the table with the locations of borders unchanged.  Drag the handle to the right. Dragging a border only moves this border.  Drag the border to the right.

[Extended] tab

GT37 SoftGOT3000



Item		Description
1)	[Layer]	Select the layer on which the figure is to be placed. ☞ Page 65 Layer
		When [Front] or [Back] is selected, the figure is processed as an object. ☞ Page 1035 Processing a figure as an object
2)	[Category]	Select the category to which the figure belongs. ☞ Page 1121 Managing figures and objects by category

26.10 Drawing a Scale

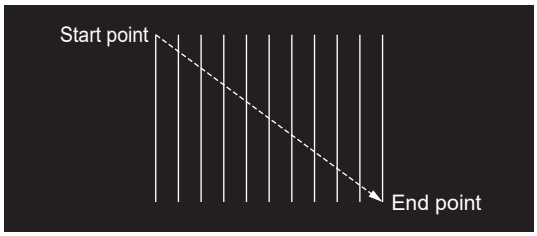
GT37 SoftGOT3000

Draw a scale.

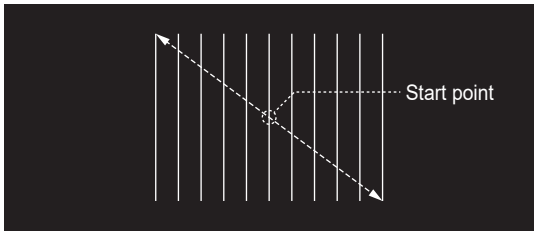
Operating procedure

1. Select [Figure] → [Scale] from the menu.
2. Click and hold the mouse button at the start point, and drag the pointer to the end point on the screen editor.

Release the mouse button to complete the placement.



Holding down the Shift key and drag enables drawing of a vertically and horizontally symmetrical scale.
Holding down the Ctrl key and drag enables drawing of a scale with the start point as the center.



3. Double-click the placed scale to display the [Scale] dialog.

☞ Page 1168 [Scale] dialog

4. Set a width, color, and others, and click the [OK] button.

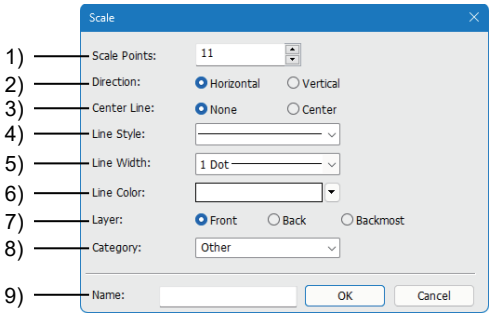
The scale setting is completed.
For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

PART 7

26.10.1 [Scale] dialog

GT37 SoftGOT3000



Item		Description
1)	[Scale Points]	Set the number of scale marks. The setting range is [2] to [255].
2)	[Direction]	Select the direction of the scale.
3)	[Center Line]	Select the center line which passes vertically through the scale.
4)	[Line Style]	Select the style of the line.
5)	[Line Width]	Select the width of the line.
6)	[Line Color]	Select the color of the line. For details on the color, refer to the following. ☞ Page 988 Color settings
7)	[Layer]	Select the layer on which the figure is to be placed. ☞ Page 65 Layer
		When [Front] or [Back] is selected, the figure is processed as an object. ☞ Page 1035 Processing a figure as an object
8)	[Category]	Select the category to which the figure belongs. ☞ Page 1121 Managing figures and objects by category
9)	[Name]	Set the figure name. The name is displayed in places such as the data browser and property sheet. Up to 100 characters can be set.

26.11 Drawing a Piping

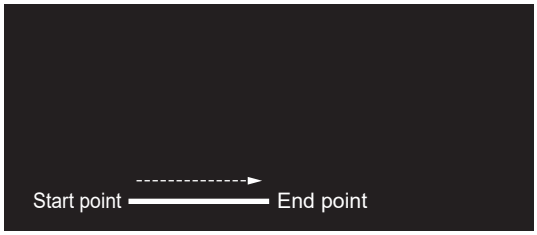
GT37 SoftGOT3000

Draw a piping.

Operating procedure

1. Select [Figure] → [Piping] from the menu.
2. Click and hold the mouse button at the start point, and drag the pointer to the end point of the first line on the screen editor.

Release the mouse button to determine the drawing of the first line.

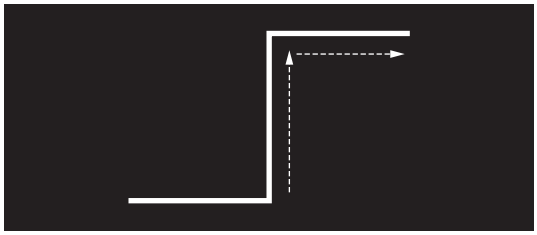


Holding down the Shift key and drag enables drawing of a line in 45-degree increments.

3. Move the mouse pointer to the end point of the next line and click the end point.

Repeat this as necessary.

When 100 vertices are drawn, the drawing automatically ends.



Clicking the Back space key allows reposition of the immediately preceding vertex.

4. Double-click the last vertex to complete the placement.
5. Double-click the placed piping to display the [Piping] dialog.

☞ Page 1170 [Piping] dialog

6. Set a width, color, and others, and click the [OK] button.

The piping setting is completed.

For the settings and editing operations common to figures, refer to the following.

☞ Page 988 Color settings

Point

After a figure is placed, vertices can be moved, added, or deleted.

Select [Edit] → [Edit Vertices] from the menu to switch the handles to the vertex editing handles.

For how to edit vertices, refer to the following.

☞ Page 1026 Editing vertices to change the shape of a figure

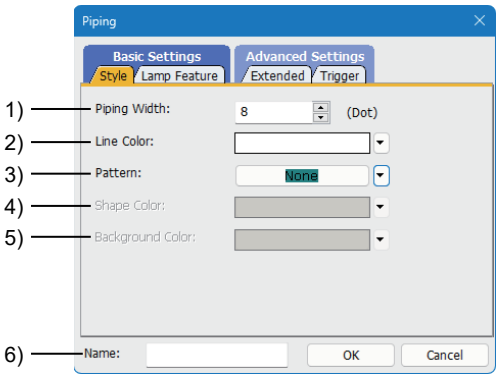
[Style] tab

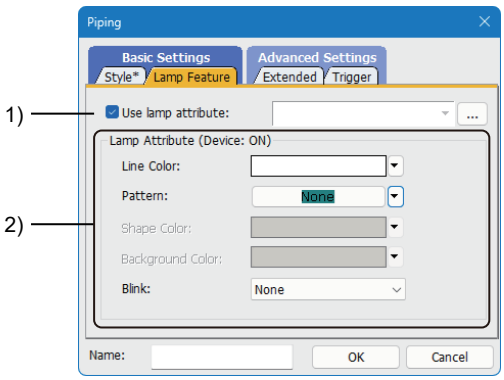
GT37 SoftGOT3000



Item		Description
1)	[Piping Width]	Set the width of the piping. The setting range is [3] dots to [100] dots.
2)	[Line Color]	Select the color of the frame. For details on the color, refer to the following. ☞ Page 988 Color settings
3)	[Pattern]	Select a fill pattern for the frame inside. To display the frame only without filling, select [None].
4)	[Shape Color]	This item is enabled when [None] is not selected for [Pattern]. Select a pattern color.
5)	[Background Color]	This item is enabled when [None] is not selected for [Pattern]. Select a background color.
6)	[Name]	Set the figure name. The name is displayed in places such as the data browser and property sheet. The setting can also be changed in other tabs. Up to 100 characters can be set.

[Lamp Feature] tab

GT37 SoftGOT3000



Item			Description
1)	[Use lamp attribute]		Enables color switching similar to the color switching of a lamp by turning the bit device on or off. ☞ Page 1036 Lamp attribute Set a bit device for control.
			When this item is selected, the figure is processed as an object. ☞ Page 1035 Processing a figure as an object
2)	[Lamp Attribute (Device: ON)]	—	Set the attribute of when the bit device is on.
		[Line Color]	Select the color of the frame. For details on the color, refer to the following. ☞ Page 988 Color settings
		[Pattern]	Select a fill pattern for the frame inside. To display the frame only without filling, select [None].
		[Shape Color]	This item is enabled when [None] is not selected for [Pattern]. Select a pattern color.
		[Background Color]	This item is enabled when [None] is not selected for [Pattern]. Select a background color.
		[Blink]	Select the blinking speed.

[Extended] tab
