However, enter 0-0 to specify all stations for monitoring MODBUS salve equipment.
*4 Even if the target PLC is the host station (0-FF), station specification must be performed.
*5 For details on the offset devices, refer to the following.
☞ Page 963 Offset
*6 Can be set only when an ER device is used.
*7 The start I/O No. can be specified only when a BM device is used.
*8 The unit No. can be specified only when a G device is used.
*9 The SFC block No. can be specified only when a BLS device is used.
*10 The axis No. can be specified only when a device of the servo amplifier is used.
The unit No. can be specified only when the target device is monitored through a simple motion module.
*11 When specifying both a channel No. and a station number, specify the channel No. first. (Example: [@3:0-FF:w:D100])
*12 When specifying a device of channel No.1, specification of the channel No. (@channel No.:) can be omitted.
([@1:w:D100] can also be expressed as [w:D100] by omitting "@1:" part.)
*13 Settable only when an RCPU model is set in the [Controller Setting] window.
☞ Page 729 [Controller Setting]
*14 Settable only when a label (GT Designer3) is registered.
☞ Page 867 How to set labels (GT Designer3)
*15 Settable only when [AB Control/CompactLogix(Tag)] is set for the controller type in the [Controller Setting] window.
☞ Page 729 [Controller Setting]
*16 For the global label created by the Motion Control Setting Function, specify the module number.
Specify the second and third digit values of the start I/O number of the connected Motion module.
Example) When the start I/O number is 0FE0, set FE to module number.
*17 Settable only when [OMRON NJ/NX] is set for the controller type in the [Controller Setting] window.
☞ Page 729 [Controller Setting]
*18 Settable only when [OPC UA] is set for the controller type in the [Controller Setting] window.
☞ Page 729 [Controller Setting]

Precautions

Do not write a script that causes an operation result which exceeds the allowable range of a device value.
Script operation is processed internally in double-precision real numbers.
Therefore, when a judgment is made using an if statement and others, the result of the judgment may differ depending on the operation methods.

Ex.
Judgment of difference between GD100 and D100 using an if statement (in the case of 16-bit signed binary)
For GD100: -32758, D100: 32767
• When operation is executed in an evaluation expression

```
if(([w:GD100]-[w:D100])>=10){ //If the difference between GD100 and D100 is 10 or larger,
[w:D200]=0; //Writes 0 to D200.
}
```

The calculation result of "GD100 - D100" (-32758 - 32767) is -65525, thus the condition is not satisfied.
• When processing the script after assignment

```
[w:GD200]=[w:GD100]-[w:D100]; //Assigns the value of "GD100 - D100" to GD200.
if([w:GD200]>=10){ //When the value of GD200 is 10 or larger,
[w:D200]=0; //Writes 0 to D200.
}
```

When -65525; the calculation result of "GD100 - D100" (-32758 - 32767) is assigned to GD200 as 16-bit signed binary data, GD200 becomes 10, so the condition is satisfied.
(Since a value out of the range that can be handled by a variable (device) is assigned as the result of an operation, the result differs from the result obtained above.)

Arguments for the file operation function and string operation function and how to express them

The following shows available arguments for the file operation function and string operation function.

Argument	Expression example	Available data range
Folder name[*1] Folder name 1[*1] Folder name 2[*1] Copy source folder name[*1] Copy source folder name 1[*1] Copy source folder name 2[*1] Copy destination folder name[*1] Copy destination folder name 1[*1] Copy destination folder name 2[*1]	For specifying with character strings: "X:\\Package1\\" For specifying with devices: [w:D0001]	The following drives can be specified. A, B, E, F, G, X The total number of the characters of a folder name and a file name must be 78 or less. This specification is also applied to a case where multiple arguments are used to specify a folder name or file name. ☞ Page 2359 Folder name delimiter (\) An argument can be specified using a device. ☞ Page 2353 Available devices and how to express the devices
File name[*1] Copy source file name[*1] Copy destination file name[*1]	For specifying with character strings: "FILE00001.CSV" For specifying with devices: [w:D0001]	
New file name[*1]	For specifying with character strings: "FILE00001.BAK" For specifying with devices: [w:D0001]	
Storage device[*1]	[w:GD200]	For applicable devices, refer to the following. ☞ Page 2353 Available devices and how to express the devices Bit devices and the word specification of bit devices cannot be used.
Number of folders Number of files	1	The setting range is 1 to 32. An argument can be specified using a device. ☞ Page 2353 Available devices and how to express the devices
Offset	0	The offset is the argument which represents the storage location of the target data in a folder or file. Specify it with a fixed value or a device. The storage location of the target data is counted starting with 0. • For the file operation function 16 bits: 0 to 65535 32 bits: 0 to 2147483647 When the offset is used for the file name obtaining function (file_getlist), only 16 bits can be specified. When the file write function (file_write) is used, the offset is available only when <mode> is 2 (overwrite). For a mode other than overwrite, set 0 for the offset. • For the string operation function (str_scanf, str_strmid) 0 to 255 • For the string operation function (str_uniscanf, str_unistrmid) 0 to 510 When using Unicode, make sure to set an even number. ☞ Page 2353 Available devices and how to express the devices
Maximum number of characters	8	The setting range is 1 to 78. An argument can be specified using a device. ☞ Page 2353 Available devices and how to express the devices
Number of read bytes Number of write bytes	For specifying with character strings: 32 For specifying with devices: [w:GD200]	The setting range is 1 to 2048. An argument can be specified using a device. ☞ Page 2353 Available devices and how to express the devices
Input byte count String length Output byte count	For specifying with character strings: 32 For specifying with devices: [w:GD200]	• For str_scanf, str_printf, str_strlen, str_strmid, and str_lc2uni 1 to 256 • For str_uniscanf, str_uniprintf, str_unistrlen, str_unistrmid, and str_uni2lc 2 to 512 Make sure to set an even number. An argument can be specified using a device. ☞ Page 2353 Available devices and how to express the devices

Argument	Expression example	Available data range
Maximum number of read bytes	256	The setting range is 1 to 256. Set an even number in "file_unilineread". An argument can be specified using a device. ☞ Page 2353 Available devices and how to express the devices
Mode	0	The following shows the setting range. • 0: New • 1: Addition • 2: Overwrite For operations of the file write function (file_write) for each mode, refer to the following. ☞ Page 2340 Functions (file operation) An argument can be specified using a device. ☞ Page 2353 Available devices and how to express the devices
Copy mode	For specifying with character strings: 3 For specifying with devices: [w:D0001]	The setting range is 0 to 3. Each bit of the setting value determines the copy mode. • Bit 0 0: Prohibits overwriting a file. 1: Allows overwriting a file. • Bit 1 0: Does not copy subfolders. 1: Copies subfolders. • Bit 2 to 15: Use prohibited An argument can be specified using a device. ☞ Page 2353 Available devices and how to express the devices
Maximum number of folder name characters	12	The setting range is 1 to 78.
Maximum number of file name characters	12	The setting range is 1 to 78.
Input string storage device*1 Output string storage device*1	[w:GD200]	For applicable devices, refer to the following. ☞ Page 2353 Available devices and how to express the devices
Format	For specifying with character strings: "%d,%5s" For specifying with comments: cmt(1,3)	Specify a format using format specifiers and escape sequences. • For specifying with character strings: Number of characters: 256 characters or less Number of format specifiers: 10 or less Enclose a format specifier in double quotation marks. ☞ Page 2361 Format specifier ☞ Page 2365 Escape sequence • For specifying with comments: cmt (comment group, comment No.) Comment group: 1 to 255 Comment No.: 1 to 32767 Only the comments registered in the comment group can be used. ☞ Page 2360 Specifying a format with comments
Input value storage device*1 Output value storage device*1	[w:GD200]	For applicable devices, refer to the following. ☞ Page 2353 Available devices and how to express the devices
Local code type	1	The following shows the setting range. • 0: Depends on the system language. (ASCII for English, Shift JIS for other languages) • 1: SJIS • 2: ASCII • 3: GB • 4: KS • 5: Big5
Conversion source string storage device*1 Conversion destination string storage device*1	[w:GD200]	For applicable devices, refer to the following. ☞ Page 2353 Available devices and how to express the devices

*1 An error occurs if a primitive data type label is set.
When using a label, set an array-type or structure-array-type label.

■Data type setting and function definition

To use an argument, refer to the data type of the set device and convert the argument data type to the function definition type.

To assign a return value, convert the operation result obtained in the function definition type to the data type of the set device.

To use the argument or return value as the type of the function definition, set the following data types.

- long: Signed 32-bit binary
- double: Real number (64 bits)

■Folder name delimiter (\)

To specify a folder name with character strings, use \\ in a path as a delimiter.

In the file operation function, the first \ is recognized as a control character.

Therefore, unless the delimiter is used as \\, the path is not correctly specified and an error occurs.

Ex.

A:\Package1\(actual path) → A:\\Package1\\(path used as an argument)

To specify a folder name with devices, do not use \\ as a delimiter.

The path is not correctly specified and an error occurs.

■Restrictions for folder names and file names

For the character strings available and unavailable for folder names and file names, refer to the following.

☞ Page 84 Restrictions for folder names and file names used in GOT

Precautions

Only ASCII code is applicable to the screens for file manipulations in the utility.

A file name, which is not encoded in ASCII, is displayed incorrectly in the utility.

■Specifying the folder name and file name with the wild card

A wildcard is a symbol that represents any string of characters when part of a folder name or file name is unknown.

The part specified by wild cards can be any character strings.

A wild card can be used for the following arguments to specify the folder name or file name.

- <folder name>, <file name> of the file name obtaining function (file_getlist)
- <folder name 1> of the obtain folder name function (file_getfolderlist)

The following shows the specifications of the wild cards.

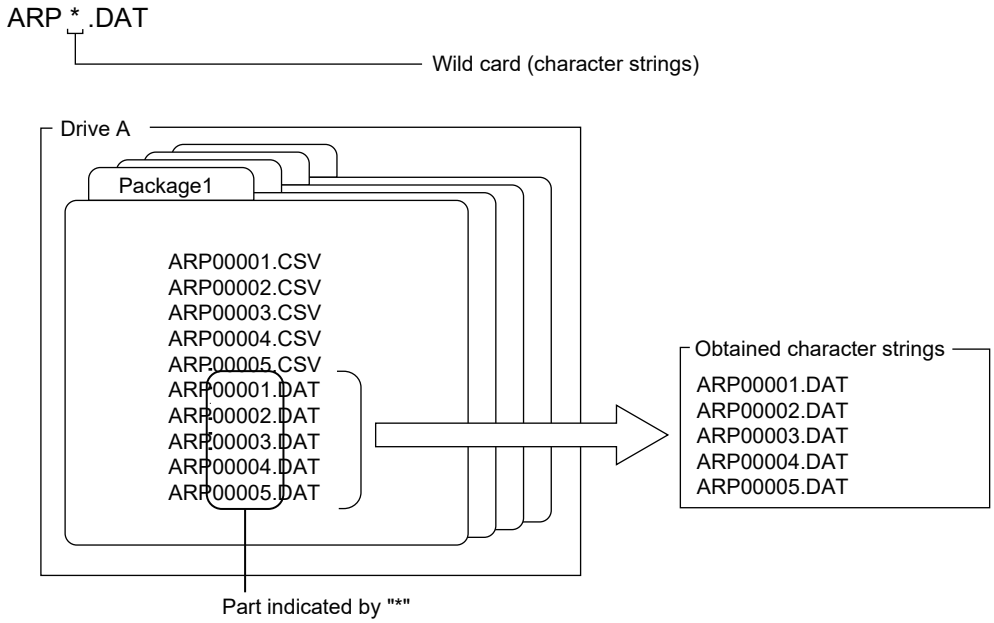
Specifications	Example of valid use	Example of invalid use
Only [*] can be used as the wild card.	ARP*.DAT	ARP?????.DAT
Only one [*] can be used in an argument. However, you can use [*.*] as an exception.	*.DAT	ARP012*0.*
You can use [*] only immediately before [.] (period) for the file name.	ARP*.DAT	ARP*01.DAT
When [*] is used in the extension part of the file name of the script, the extension must consist of the wild card only.	ARP00001.*	ARP00001.*AT

The following shows application examples of wild cards.

Ex.

For obtaining the file whose name starts with ARP and ends with .DAT from the folder A:\\Package1\\

[s16:D500] = file_getlist("A:\\Package1\\", "ARP*.DAT", [w:GD100], 0, 5, 12); //Obtains file name.



■Specifying a format with comments

Only the comments registered in the comment group can be used.

Do not enter a line feed in the format.

The description after a line feed is not reflected in the format.

■Format specifier

Determines the data type for reading and writing.

The form of a format specifier differs according to the function used.

Target function	Format of the format specifier	Description example
String input function (str_scanf, str_uniscanf)	% + flag + field width + type specifier	%*c%5d (Skipping one character and reading the data (field width: 5) in decimal number)
String output function (str_printf, str_uniprintf)	% + flag + field width + precision specification + type specifier	%-5.4f (Writing the data (field width: 5) in fixed-point numbers of four digits after the decimal point and left-aligning the numbers)

Describe one format specifier for one data.

The number of format specifiers must be the same as the number of devices, which are the storage locations of read or written data.

The following describes the content to be described in each format.

• Flag

The flag is the processing to be executed when the data is written.

Add a flag after % as required.

Target function	Flag	Expression	Description example	Description
String input function (str_scanf, str_uniscanf)	Skip	*	%*d	Skips the specified type data. The number of the skipped data is not added to the number of the read data (return value). (Description example: when decimal data is skipped)
String output function (str_printf, str_uniprintf)	Left alignment	-	%-d	Left-aligns character strings when a field width is specified. If the number of characters in the written data is smaller than the field width, blanks are stored in the remaining digits. (Description example: when decimal data is written and left-aligned)
	Plus sign (+) addition	+	%+d	Adds a plus sign before a positive numerical value and writes the data. (Description example: when decimal data is written after a plus sign is added to the data)
	Blank addition	Blank	% d	Adds a blank before a positive numerical value and writes the data. (Description example: when decimal data is written after a blank is added to the data)
	Zero padding	0	%05d	Right-aligns numerical values, adds a zero to blank spaces, and writes the data when a field width is specified. (Description example: when decimal data of 5 digits is written after a zero is added to the data)
	Prefix addition	#	%#5x	Adds 0, 0x, or 0X as a prefix when octal or hexadecimal numbers are written. (Description example: when hexadecimal data is written after 0x is added as a prefix to the data)

• Field width

The field width is the maximum number of characters for the character string to be read or written.

Specify the field width with positive integers.

Add a field width before a specifier as required.

If the data exceeding the field width is attempted to be read with the string input function (str_scanf, str_uniscanf), the excess portion of the data cannot be read.

In addition, if characters exceeding the field width are attempted to be written with the string output function (str_printf, str_uniprintf), an overflow occurs and a value of -1 (error) is returned.

• Precision specification

Specify precision specification with 0, positive integers, and "." (period).

The effect of precision specification differs depending on the type specifier to be used.

If precision specification is not added, the default value is applied.

Add a precision specification after the field width as required.

Target function	Type specifier	Effect of the precision specification	Default value
String output function (str_printf, str_uniprintf)	c	The precision specification is invalid.	None
	s	Specifies the maximum number of characters to be output. The characters which exceed the value of precision specification are not output. Example) Outputting a string of 26 alphabetic characters (A to Z) • %s (default value): Outputting 8 characters (A to H) • %.10s (10 characters specified): Outputting 10 characters (A to J)	8
	d, u, o, x, X	Specifies the minimum value of the number of digits to be written. If the number of digits in an argument is smaller than the specified value, Null or zero is input into the remaining digits. (Whether either one is input into the digits differs depending on the flag to be specified.) If the number of digits exceeds the value of precision specification, the value is not rounded down.	1
	f*1	Specifies the number of digits after the decimal point of decimal numbers. When the decimal point is displayed, integers are displayed. The value is rounded down until the value becomes an appropriate number of digits.	6
	e, E*1	Specifies the number of digits to be output after the decimal point of decimal numbers. Up to 39 digits can be specified for precision. The last number of the data to be output is rounded down.	
	g, G	Specifies the maximum value of the number of significant digits to be written. Up to 14 digits can be specified for precision.	

*1 The values after the decimal point are not output in the following cases.
When 0 is set for the precision specification
When a period (.) is set without specifying subsequent numerical values

• Type specifier

Specify the data type for the character string to be read and written.

Target function	Specifier	Description
String input function (str_scanf, str_uniscanf)	c	Reads one character.
	s	Reads character strings.
	d	Reads integers in decimal numbers.
	lld	Reads 64-bit integers in decimal numbers.
	u	Reads unsigned integers in decimal numbers.
	llu	Reads unsigned 64-bit integers in decimal numbers.
	o	Reads integers in octal numbers.
	llo	Reads 64-bit integers in octal numbers.
	x	Reads integers in hexadecimal numbers.
	llx	Reads 64-bit integers in hexadecimal numbers.
	f	Reads real numbers (32 bits).
	lf	Reads real numbers (64 bits).
	[...]	Reads the characters specified with square brackets.*1 Reading is stopped at the time of reading characters which are not specified with the brackets. Example) If %[ABC] is set for a format specifier and the character string CBAGAB is read, the result is CBA. If ^ is added to the character string in square brackets, characters other than the specified ones are read. Reading is stopped at the time of reading the character string specified with square brackets. Example) If %[^ABC] is set for a format specifier and the character string DEFADE is read, the result is DEF.
	%	Skips a percent sign (%).

Target function	Specifier	Description
String output function (str_printf, str_uniprintf)	c	Writes one character.
	s	Writes character strings.
	d	Writes integers as signed decimal numbers.
	lld	Writes 64-bit integers as signed decimal numbers.
	u	Writes integers in unsigned decimal numbers.
	llu	Writes 64-bit integers in unsigned decimal numbers.
	o	Writes integers in octal numbers.
	llo	Writes 64-bit integers in octal numbers.
	x, X	Writes integers in hexadecimal numbers. When X is used, alphabets in the data are capitalized.
	llx, llX	Writes 64-bit integers in hexadecimal numbers. When X is used, alphabets in the data are capitalized.
	f	Writes real numbers in real number form. Example) 123.456
	e, E	Writes real numbers in exponential form. The exponents are displayed with three digits. Example) 12345.6e-002 When E is used, alphabets in the data are capitalized.
	g, G	Writes real numbers in an optimal form. If an exponent is either of the following, real numbers are written in exponential form. • Value less than -4 • Value larger than the precision value specified with the precision specification For an exponent other than the above, real numbers are written in real number form. When G is used, alphabets in the data are capitalized.
	%	Writes a percent sign (%). Specifying the corresponding device is not required. Even though a field width and a flag are specified, they are invalid.

*1 The following cannot be read.
[ ](square brackets)(Example: %[[ ], %[^]])
Range specification using "-" (hyphen) (Example: %[a-z], %[^0-9])
Characters other than ASCII (Example: %[?], %[^?])

Precautions

• Specifying a format with comments

Comments consist of the Unicode text.

When specifying the format with a comment, do not use a character that cannot be converted from the Unicode text to the ASCII characters.

If such characters are used, they are replaced with blanks.

• Data delimiter of a CSV file

When reading/writing data in a CSV file, indicate a delimiter with the format specifier.

Ex.

When reading obtained numerical values from a CSV file

If delimited by a blank: 123 456 can be read with the syntax %d%d.

If delimited by a comma: 123,456 can be read with the syntax %d,%d can read.

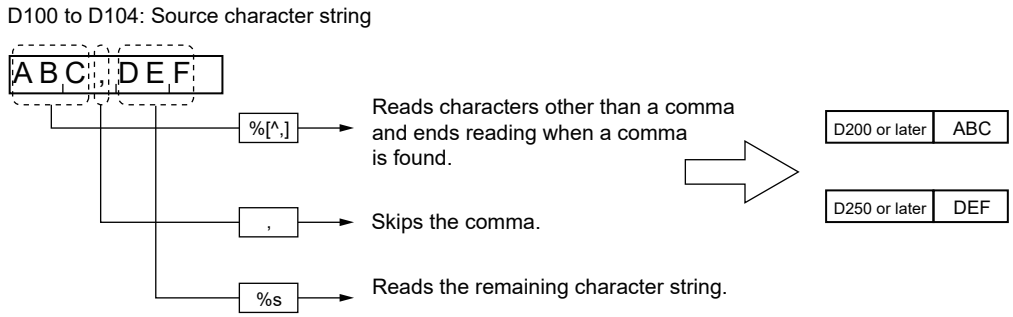
(The first "%d" is used to enter 123, the comma (,) is skipped, and the second "%d" is used to enter 456.)

• Character string delimiters

When a character string is read using "%s", a comma is not recognized as a delimiter but as a part of the string.
Therefore, the string with a comma for a delimiter is read as one data including the comma.
To read the character string as the data that is delimited by a comma, use "%[^,]" to read characters other than the comma, and then skip the delimiter with the comma.

Ex.

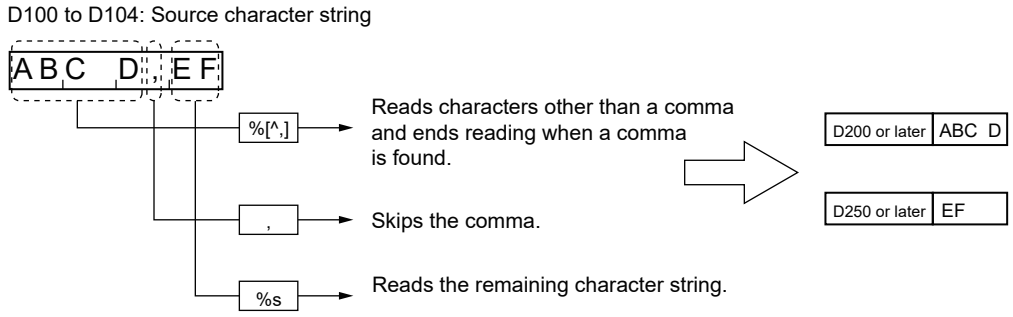
When reading the character string ABC,DEF with "%s"
GD100 to D108: Holds the character string ABC,DEF.
GD200: Input value storage device 1
GD250: Input value storage device 2
[s16:GD500]=str_scanf([w:GD100],7,0,"%[^,],%s",GD200,GD250); //Reads the 7-byte character string.



Blanks are recognized as delimiters. Therefore, if a character string including blanks is read, it is read as multiple data.
To read a character string with blanks as one data, use "%[^,]" to read characters other than a comma, then skip a delimiter with the comma.

Ex.

When reading the character string ABC D,EFG in the above script



• Number of significant digits for the single precision real number

The maximum number of significant digits for the single precision real number is six.
If the precision with six digits or more is set for the format specifier, the result may be incorrect.
In addition, when a value equal to or more than 256 is specified for the field width or precision specification, it is corrected to 255.
This is because the maximum number of output bytes that can be specified as a single-precision real number is up to 256, which is 255 if NULL at the end is excluded.

• Differences in the written result between the GOT and GT SoftGOT3000 or GT Simulator3

Some of the processing differs between the GOT and GT SoftGOT3000 or GT Simulator3.
If single precision real numbers more than the number of significant digits (six digits) are written, the results may differ.

• When writing a character string with "%s"

Starting from the device to be written, a number of devices corresponding to that of characters are used.
Reserve the writable device area in advance.

■Escape sequence

Skips or writes control symbols.

Available escape sequences differ depending on the function used.

Target function	Escape sequence	Description
String input function (str_scanf, str_uniscanf)	\n	Skips a line feed (LF).
	\t	Skips a tab.
	\\	Skips a backslash (\).
	\?	Skips a question mark (?).
	\'	Skips a single quotation mark (').
	\"	Skips a double quotation mark (").
String output function (str_printf, str_uniprintf)	\n	Writes a line feed (LF).
	\r	Writes a carriage return (CR).
	\t	Writes a tab.
	\\	Writes a backslash (\).
	\?	Writes a question mark (?).
	\'	Writes a single quotation mark (').
	\"	Writes a double quotation mark (").

Available temporary device areas and how to express the temporary device areas

Temporary device areas are usable in a script in addition to controller devices.

They are variables used when there is a delay in writing to the controller devices or when a device areas are required for operations, repetitive processing, and others.

Data is written to the specified temporary device areas in real time during script execution.

The GOT does not need to communicate with a controller when using temporary device areas, reducing communication load.

■Temporary device areas and their uses

The following types of temporary device areas are supported.

Type	Specifications
Temporary device area (TMP)	A TMP is a global variable that is accessible by multiple scripts. It can be used in the following scripts. • Project script • Screen script • Script part • Script block • Object script For details, refer to the following. ☞ Page 2366 Specifications of a temporary device area (TMP)
Script parts temporary device area (PTMP)	A PTMP is a local variable that is accessible by the scripts of each script parts object. PTMPs can be specified in the scripts of the object or as the trigger devices to run the scripts. For details, refer to the following. ☞ Page 2367 Specifications of a script parts temporary device area (PTMP)

Use temporary device areas in the following cases.

Application	Description

To prevent an assignment delay	If a controller device is specified as the write destination in a script, the operation result will be written to the device when the script ends, resulting in an assignment delay.
	If a temporary device area is specified instead, the result will be written to the area in real time without delay.
	Example) If you manipulate a bit device, and then use the bit device in a conditional formula
	`if(...) {`
	`  alt([b:TMP0001.03]);  //Invert TMP0001.03`
	`}`
	`if([b:TMP0001.03] == ON) {  //A branch is executed based on the status of TMP0001.03`
	`...`
	`} else {`
	`  ...`
	`}`
	For details on the assignment delay, refer to the following.
	☞ Page 2368 Assignment delay

Application	Description
As the write destination device of a while statement	A device causing an assignment delay cannot be used as the write destination device of a while statement. Use a temporary device area that does not cause an assignment delay or a GOT internal device accordingly.

■Specifications of a temporary device area (TMP)

The following shows the specifications of a temporary device area (TMP).

Item	Specifications
Size	One TMP is 64 bits long. If a TMP is used as a bit device, it is handled as 16 bits long. The settable bit range is 0 to 15.
Initial value	A TMP stores 0 when the GOT is powered on.
Maximum number of the areas	1024 (TMP0 to TMP1023)
Expression example	• To handle TMP0001 as a word device [w:TMP0001] • To handle bit 1 of TMP1023 as a bit device [b:TMP1023.01]

Project scripts, screen scripts, script parts, and script blocks use common TMPs.

Object scripts use different TMPs.

Accordingly, object scripts and the other types of scripts cannot exchange data using their TMPs.

To exchange data, use the GOT internal devices (GD or GB).

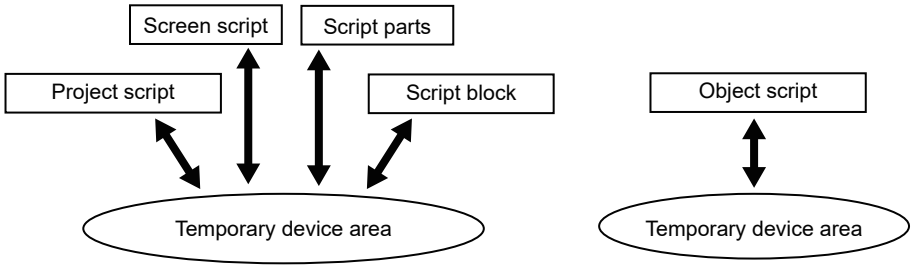


Figure conceptualizing the access to each TMP with the same number

To access the same TMP from multiple scripts, set the same data type for the scripts and the same representation for the TMP in the scripts.

Otherwise, the stored value may be rendered invalid in the following uses.

Invalid use	Example

Scripts with different data types access the same TMP.	Script A (unsigned 16-bit binary) writes a value to TMP0000, and then script B (unsigned 32-bit binary) reads the value from TMP0000.
	Script A ([Data Type]: [Unsigned BIN16])
	[w:TMP0000] = 0x1234; //Write a value to TMP0000 as unsigned 16-bit binary data.
	Script B ([Data Type]: [Unsigned BIN32])
	[w:GD0000] = [w:TMP0000]) //Read the value from TMP0000 as unsigned 32-bit binary data.

The representation of a TMP at reading differs from the one at writing.	Script A writes a hexadecimal value to TMP0000 represented as a word device, and then script B reads the value from TMP0000 represented as a bit device.
	[w:TMP0000] = 0x3; //Write a value to TMP0000 represented as a word device.
	if([b:TMP0000.b0] == ON) {... //Read the value from TMP0000 represented as a bit device.

■Specifications of a script parts temporary device area (PTMP)

The following shows the specifications of a script parts temporary device area (PTMP).

Item	Specifications
Size	One PTMP is 32 bits long. If a PTMP is used as a bit device, it is handled as 16 bits long. The settable bit range is 0 to 15.
Initial value	A PTMP is reset to 0 at screen switching. The value stored during script execution is retained until the next screen switching.
Maximum number of the areas	Using #pragma use_ptmp_length, you can specify the maximum number of PTMPs ranging from 1 to 32768. The default is set as shown below. 1024 (PTMP0 to PTMP1023)
Expression example	• To handle PTMP0001 as a word device [w:PTMP0001] • To handle bit 1 of PTMP1023 as a bit device [b:PTMP1023.01]

Each script parts object uses its own PTMPs.

The scripts of a script parts object can exchange data each other using their common PTMPs.

Script parts objects cannot exchange data each other using their PTMPs.

To exchange data, use the GOT internal devices (GD or GB) or temporary device areas (TMPs).

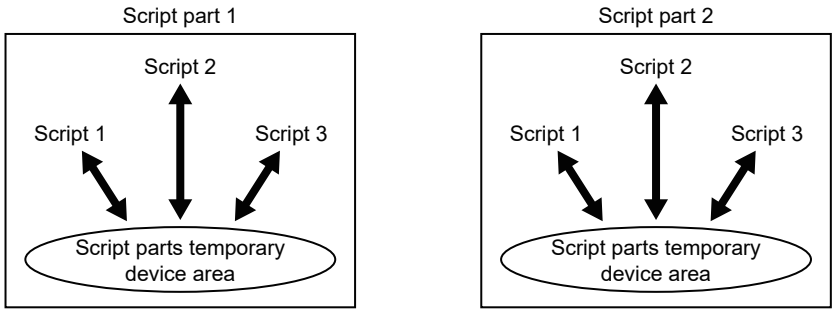

Figure conceptualizing the access to each PTMP with the same number

Precautions

When you use PTMPs, the size of the user area to be used depends on the number of the PTMPs.

Set the minimum number of PTMPs.

■Assignment delay

Depending on devices where you write the operation result of scripts, some time (called assignment delay) is needed for writing the result to the device when the operation of a script is complete.

The following shows whether each device needs assignment delay or not.

Synchronized: The result is written in synchronization with the script. Delay: Assignment delay occurs.

Device and temporary device area	Script
Controller device	Delay
GB	Synchronized
GD	
GS	
TMP	

If you perform an assignment as shown in the following example, an assignment delay leads to an unexpected operation result.

To reduce the frequency of communication with the PLC CPU to lower the influence on the monitoring process, describe the script such as assignment delay workarounds 1 and 2.

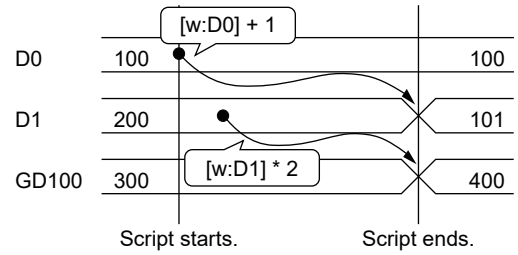
Ex.

Assignment using PLC CPU devices (assignment delay example)

In the following example, due to an assignment delay, after the script ends, the operation result of the first line (D0+1) is reflected to D1.

Therefore, the operation result of the first line is not reflected to that of the second line (D1*2).

```
[w:D1]=[w:D0]+1;       //Assign the result of the operation D0 + 1 to D1.
[w:GD100]=[w:D1]*2;  //Assign the result of the operation D1*2 to GD100.
```



Ex.

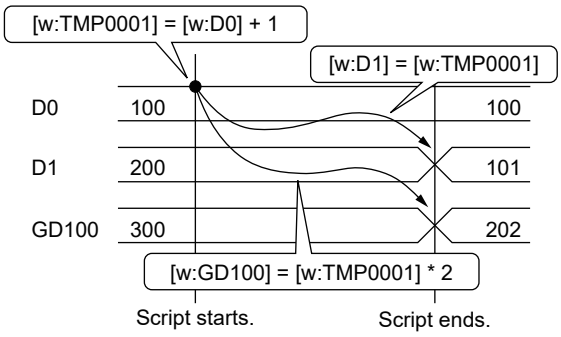
Assignment using a temporary device area (assignment delay workaround 1)

Using a temporary device area for the script avoids an assignment delay.

For details on temporary device areas, refer to the following.

☞ Page 2365 Temporary device areas and their uses

```
[w:TMP0001]=[w:D0]+1;       //Assign the result of the operation D0 + 1 to TMP0001.
[w:D1]=[w:TMP0001];         //Assign the value of TMP0001 to D1.
[w:GD100]=[w:TMP0001]*2;  //Assign the result of the operation TMP0001*2 to GD100.
```



Ex.

Assignment using GOT internal devices (GD, GB) (assignment delay workaround 2)

The processing timing with GOT internal devices (GD and GB) is the same as one with temporary device areas. Therefore, you can avoid assignment delays.

```
[w:GD10]=[w:D0]+1;       //Assign the result of the operation D0 + 1 to GD10.
[w:D1]=[w:GD10];         //Assign GD10 to D1.
[w:GD100]=[w:GD10]*2;  //Assign the result of the operation GD10*2 to GD100.
```

How to express bit devices (system define)

The following expressions can be used for bit devices.

■If a relevant expression for bit devices is processed

Device values which are normally expressed with 1 or 0 can be expressed with on and off.

if([b:X100]==1){[w:D0]=100;} //If X100 is on, D0 is 100.

↓

if([b:X100]==ON){[w:D0]=100;} //If X100 is on, D0 is 100.

■If assignment processing of bit devices is processed

Device values which are normally expressed with the set statement, the rst statement, 1, or 0 can be expressed with on or off.

set([b:X100]); //X100 turns on.

[b:X100]=1; //X100 turns on.

↓

[b:X100]=ON; //X100 turns on.

Substituting devices and constants by the user-defined character strings

The devices and constants in a script are substitutable by the user-defined character strings.

Define character strings as symbols for devices and constants. You can check for duplicate devices and constants, and apply changes of devices and constants to the script without editing the script directly.

Ex.

When substituting the device [b:X1000] by the character string "ERROR_CHECK"

if(ERROR_CHECK == 1) {[w:D0] = 100;} // Write 100 to D0 if ERROR_CHECK ([b:X1000]) turns on.

The following types of symbols are supported.

Symbol	Description
Script symbol	It can be used in the following scripts. • Project script • Screen script • Script block For instruction on setting a script symbol, refer to the following. ☞ Page 2407 [Script Symbol] tab
Script parts symbol	It can only be used with script parts. Each script parts object has its own script parts symbols. For instruction on setting a script parts symbol, refer to the following. ☞ Page 2407 [Script Symbol] tab
Object script symbol	Object script symbols are usable in object scripts only. For instruction on setting an object script symbol, refer to the following. ☞ Page 2421 [Script Symbol] dialog
Local symbol	Local symbols are usable in all types of scripts. They are valid only in the script where they are defined. For the local symbols, refer to the following. ☞ Page 2351 Others

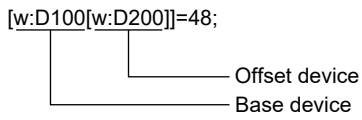
Offset device specification

The offset device can be specified.

■Format

Ex.

When D200 is 5, 48 is stored in D105.



■Available devices

• Base device

Controller devices, GOT internal devices, and temporary device areas can be specified.

Word devices and bit devices can be used.

• Offset device

Controller devices, GOT internal devices, and temporary device areas can be specified.

Only word devices can be used.

Bit devices can be specified as word devices.

In that case, specify a device with a multiple of 16.

The device cannot be used when the data type is 8 bits or 64 bits.

Ex.

Changing parameters according to the operation mode

D10: For switching the operation mode

D100 to D109: For storing parameter values

GD500: Base device

TMP100: Offset device

· Script 1 (specifies a parameter value.)

```
[w:GD500]=10; //Parameter value of operation mode 1
[w:GD501]=11;
[w:GD502]=12;
:
[w:GD600]=20; //Parameter value of operation mode 2
[w:GD601]=21;
[w:GD602]=22;
:
[w:GD700]=30; //Parameter value of operation mode 3
[w:GD701]=31;
[w:GD702]=32;
```

· Script 2 (determines an offset value according to the device value for switching the operation mode.)

```
switch( [w: D10] ){
case 1: //If D10 is 1, the offset value is 0.
[w:TMP100]=0;
break;
case 2: //If D10 is 2, the offset value is 100.
[w:TMP100]=100;
break;
case 3: //If D10 is 3, the offset value is 200.
[w:TMP100]=200;
break;
}
```

· Script 3 (writes parameters according to the offset value.)
bmov([w:GD500[w:TMP100]],[w:D100],10); //Writes the device value of [GD500 + value of TMP100] to the devices from D100 to D109.
If script 2 and 3 are processed simultaneously or as one script, the scripts do not operate properly due to the switching delay of offsets.

■Data type of offset devices

The data type of offset devices is converted into signed 16-bit binary data regardless of [Data Type] set in [Edit Script].
Example) [w:GD100] = [w:D1000[s32:GD1000]];
1) If 65535 is set to GD1000 (signed 32-bit binary), the equation "65535 (signed 32-bit binary) = -1 (signed 16-bit binary)" is satisfied and the value in D999 is assigned to GD100.
2) If 65537 is set to GD1000 (signed 32-bit binary), the equation "65537 (signed 32-bit binary) = 1 (signed 16-bit binary)" is satisfied and the value in D1001 is assigned to GD100.
Example) [w:GD100] = [w:D1000[d32:GD1000]];
If 10 is set to GD1000 (signed 32-bit binary), the equation "10 (signed 32-bit binary) = 16 (signed 16-bit binary)" is satisfied and the value in D1016 is assigned to GD100.
Example) [w:GD100] = [w:D1000[flt:GD1000]];
1) If 65535.0 is set to GD1000 (real number), the equation "65535.0 (real number) = -1 (signed 16-bit binary)" is satisfied and the value in D999 is assigned to GD100.
2) If 65537.0 is set to GD1000 (real number), the equation "65537.0 (real number) = 1 (signed 16-bit binary)" is satisfied and the value in D1001 is assigned to GD100.

■Assignment delay when an offset is specified

• When reading values from devices

If you specify an offset in a script when devices of controllers are used as base devices, assignment delays may occur and the script may not operate correctly even if the values of offset devices are changed.

Ex.

When specifying a target device for reading with an offset device does not work correctly (when R200 = 10)
In the following case, the value of the offset device (TMP0000) is the value before assignment. The value of R110 cannot be referenced.

```
[w:TMP0000]=[w:R200];
[w:TMP0001]=[w:R100[w:TMP0000]];    The value of R110 cannot be referred to at this timing.
     Base device ──┘          └─ Offset device
```

If the "value of R100 + offset device value before assignment" is outside the range of the base device (R), an error other than an assignment delay occurs.
To avoid assignment delays, use temporary device areas or GOT internal devices (GD, GB) for both base devices and offset devices.

Ex.

Assignment delay workaround using temporary device areas (when R200 = 10)
By assigning the values of R devices to the temporary device areas in advance, the operation not available in the above example becomes available.
In the following example, the range of the offset device (R200) is 0 to 10, and the values of 11 devices counted from the base device (R100) are assigned to the temporary device areas.
The number of devices to be assigned to the temporary device areas must be changed according to the range of offset device values.

```
[w:TMP0100]=[w:R100];
[w:TMP0101]=[w:R101];
     :
[w:TMP0109]=[w:R109];
[w:TMP0110]=[w:R110];
[w:TMP0000]=[w:R200];
[w:TMP0001]=[w:TMP0100[w:TMP0000]];    The value of R110 can be referred to at this timing.
```

• When writing values to devices

When writing values to devices, there are no specific restrictions applied when reading values from devices. (Refer to the following example (Enabled).)

Ex.

Specifying a target device for writing with an offset device (Enabled)

```
[w:TMP0000]=10;
[w:R100[w:TMP0000]]=[w:TMP0001];    The value can be assigned to R110 at this timing.
Base device ┘          └ Offset device
```

However, when controller devices are used as base devices, you cannot assign values repeatedly by switching values of offset devices in a while statement as shown in the following example (Disabled).

Ex.

Specifying a target device for writing with an offset device in a while statement (Disabled)

```
[w:TMP0000]=10;
while([w:TMP0000]<20){
[w:R100[w:TMP0000]]=[w:TMP0001];          An error occurs.
[w:TMP0000]=[w:TMP0000]+2;
}
```

To assign values repeatedly by switching offset device values in a while statement, assign R devices to the temporary device areas in advance, and write the values last assigned to the temporary device areas to R devices as shown in the following example (Workaround).

Ex.

Specifying a target device for writing with an offset device in a while statement (Workaround)

```
[w:TMP0110]=[w:R110];
      :
[w:TMP0119]=[w:R119];
[w:TMP0000]=10;
while([w:TMP0000]<20){
[w:TMP0100[w:TMP0000]]=[w:TMP0001];        No error occurs.
[w:TMP0000]=[w:TMP0000]+2;
}
[w:R110]=[w:TMP0110];
      :
[w:R119]=[w:TMP0119];
```

Integer-real number conversion function

Although the device data type is selected for each script, using the integer-real number conversion function enables you to use 16-bit integral device values as real numbers for operation. (and vice versa)

The integer-real number conversion function is available only for GOT internal devices (GD).

To convert the value of a controller device, transfer the value to the GOT internal device (GD) using bmov.

When real numbers are converted into integers, the value after the decimal point is rounded down. (1.53→1)

If the real number is out of the range, an error occurs before the value after the decimal point is rounded down and the real number is not converted.

■Conversion method

The integer-real number conversion is executed using the GOT internal device (GD) as the target to be converted.

Execute the integer-real number conversion by specifying the following GOT special registers (GS).

Up to 4096 points can be converted at once.

For details on the GOT special register (GS), refer to the following.

☞ Page 3581 GOT special register (GS)

• Read device

Device	Function	Description
GS460	Conversion Start Indication	Specifies the conversion start and the conversion method with each bit. b0: Unsigned 16-bit binary data is converted into real numbers. b1: Signed 16-bit binary data is converted into real numbers. b2 and b3: Use prohibited b4: Real numbers are converted into unsigned 16-bit binary data. b5: Real numbers are converted into signed 16-bit binary data. b6 to b14: Use prohibited b15: This bit is turned on when conversion is executed.
GS461	Number of Conversion Devices	Specifies the number of devices to be converted. The setting range is 1 to 4096.
GS462	Conversion Source Head Device No.	Specifies the start device No. of the GOT internal device (GD) where the value before conversion is stored.
GS463	Conversion Destination Head Device No.	Specifies the start device No. of the GOT internal device (GD) where the conversion result is to be stored.
GS464	Storage Error Value	Specifies the device value to be stored in the conversion destination device when a conversion error occurs. (Using this device for error recognition may be useful.)

Turn off the Conversion Start Indication (GS460) after completion of conversion.

If the Conversion Start Indication is executed when it is on, the device value is not converted.

• Write device

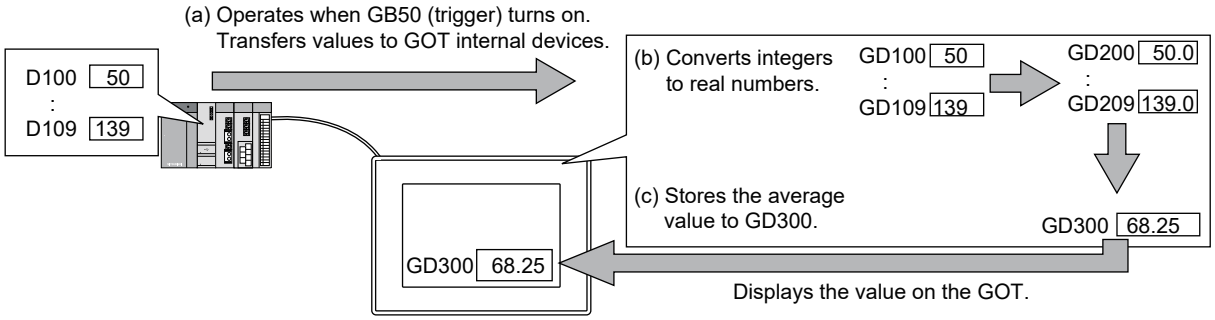
Device	Function	Description
GS260	Status	Stores the conversion completion notification and an error occurrence in each bit. If the Conversion Start Indication (GS460.b15) is turned off (0), each bit becomes 0. b0 to b13: Use prohibited b14: This bit turns on when an error occurs during conversion in the GOT. (An error code is stored in GS261.) b15: This bit turns on when conversion is finished in the GOT.
GS261	Error code*1	Stores an error which has occurred at conversion. When conversion is finished properly, 0 is stored in this device.

*1 The following shows the error codes to be stored in GS261.

Error code	Description	Remarks
1	The Conversion Start Indication is not initialized.	Conversion processing is not executed.
2	The setting of the Conversion Start Indication is incorrectly configured.	
3	The number of devices is out of range.	
4	The device is out of range.	
5	The conversion souse and destination are the same.	
6	Not used	-
7	Conversion error (such as an overflow)	Conversion processing continues.

Ex.

The average value of the data (signed 16-bit binary) stored in controller devices is displayed on the GOT in real numbers.



• Script 1 (conversion start processing)

Transfers the controller device values (D100 to D109) to the GOT internal devices (GD100 to GD109) and then converts integer numbers to real numbers.

Script 2 is started after the conversion is started.

· Data type: Signed 16-bit binary

· Trigger: Rise of GB50

```
bmov([w:D100],[w:GD100],10);
[w:GS461]=10; //Number of devices to be converted
[w:GS462]=100; //Conversion source head device No.
[w:GS463]=200; //Conversion destination head device No.
[w:GS460]=0x8002; //Starts conversion.
set([b:GB100]); //Launches script 2.
```

• Script 2 (conversion completion monitor processing)

Waits for completion of the conversion from integral numbers to real numbers.

When no error occurs after completion of the conversion, the Conversion Start Indication device is cleared at the same time of starting script 3.

· Data type: Signed 16-bit binary

· Trigger: While GB100 is on

```
if([b:GS260.15]==1)
{ //Conversion is complete.
if([b:GS260.14]==0)
{
set([b:GB101]); //Conversion is complete and the status is normal. (Launches script 3.)
}
[w:GS460]=0; //Clears the conversion start trigger.
rst([b:GB100]); //Clears the script 2 trigger.
}
```

• Script 3 (Average calculation processing)

Calculates the average value of GD200 to GD218 converted into real numbers and stores the average value in GD300.

• Data type: Real number

• Trigger: Rise of GB101

```
[w:TMP001]=0;
[w:TMP001]=[w:TMP001]+[w:GD200];
[w:TMP001]=[w:TMP001]+[w:GD202];
[w:TMP001]=[w:TMP001]+[w:GD204];
[w:TMP001]=[w:TMP001]+[w:GD206];
[w:TMP001]=[w:TMP001]+[w:GD208];
[w:TMP001]=[w:TMP001]+[w:GD210];
[w:TMP001]=[w:TMP001]+[w:GD212];
```

[w:TMP001]=[w:TMP001]+[w:GD214];
[w:TMP001]=[w:TMP001]+[w:GD216];
[w:TMP001]=[w:TMP001]+[w:GD218];
[w:GD300]=[w:TMP001]/10; //Stores the average in GD300 (real number).
rst([b:GB101]); //Clears the script 3 trigger.

Data type conversion function

Using this function makes calculating integral device values as real numbers much easier than using the integer-real number conversion function.
The values of word devices can be converted into a specified data type for reading or writing.
Specify the data type when reading or writing the device values.
The following shows the list of the data types which can be specified with the data type conversion function.

Data type after conversion	Statement example	Expression example	
Signed 8-bit binary	[s8:device]	[s8:GB50]=[s16:D100];	Refers to the values in D100 and D101 as signed 16-bit binary data, converts the values into unsigned 8-bit binary data, and assigns the data to GB50 to GB81.
Unsigned 8-bit binary	[u8:device]	[u8:GB50]=[s16:D100];	Refers to the values in D100 and D101 as signed 16-bit binary data, converts the values into unsigned 8-bit binary data, and assigns the data to GB50 to GB81.
Signed 16-bit binary	[s16:device]	[s16:D0]=[w:GD0];	Refers to the value in GD0 as the data type set in [Data Type], converts the value into signed 16-bit binary data, and assigns the data to D0.
Unsigned 16-bit binary	[u16:device]	[w:GD0]=[u16:D0];	Refers to the value in D0 as unsigned 16-bit binary data, converts the value into the data type set in [Data Type], and assigns the data to GD0.
Signed 32-bit binary	[s32:device]	if([s32:D0]<0){	Refers to the values in D0 and D1 as signed 32-bit binary data and compares the data with 0.
Unsigned 32-bit binary	[u32:device]	[u32:GD10]=[w:GD0]*[w:GD1];	Refers to the values in GD0 and GD1 as the data type set in [Data Type], converts the operation results into unsigned 32-bit binary data, and assigns the results to GD10 and GD11.
Signed 64-bit binary	[s64:device]	[s64:W12]=[w:D100];	Refers to the values in D100 to D103 as the data type set in [Data Type], converts the values into signed 64-bit binary data, and assigns the data to W12 to W15.
Unsigned 64-bit binary	[u64:device]	[u64:D100]=[s64:D40];	Refers to the values in D40 and D43 as signed 64-bit binary data, converts the values into unsigned 64-bit binary data, and assigns the data to D100 to D103.
BCD16	[d16:device]	[d16:GD0]=[w:D0]&0x000F;	Refers to the value in D0 as the data type set in [Data Type], converts the operation result into BCD16 data, and assigns the result to GD0.
BCD32	[d32:device]	[w:GD0]=[d32:D0];	Refers to the value in D0 and D1 as the BCD32 data, converts the values into the data type set in [Data Type], and assigns the values to GD0.
BCD64	[d64:device]	[d64:D10]=[flt64:D30];	Refers to the values in D30 to D33 as the real numbers (64 bits), converts the values into the BCD64 data, and assigns the values to D10 to D13.
Real number (32 bits)	[flt:device]	[flt:D100]=log([w:D200]);	Refers to the value in D200 as the data type set in [Data Type], converts the operation result into real numbers (32 bits), and assigns the result to D100 and D101.
Real number (64 bits)	[flt64:device]	[flt64:D10]=[u64:D30];	Refers to the values in D30 to D33 as unsigned 64-bit binary data, converts the values into real numbers (64 bits), and assigns the values to D10 to D13.

The following shows application examples of the data type conversion function.

Ex.
If signed 16-bit binary is set for [Data Type] and the average value of the device values is assigned as a real number (32 bits)
[flt:D10]=([w:D20]+[w:D30]+[w:D40]+[w:D50]+[w:D60])/5;

Ex.
If the device value (32-bit real number) is rounded down and written to the signed 32-bit binary format
[s32:D100]=[flt:D200];

Ex.

If the device value (32-bit real number) is rounded off and written to the signed 32-bit binary format

[s32:D100]=[flt:D200]+0.5;

Precautions

When converting the data type of a device value to a different data type, note the following.

- When the data type is converted from a real data type to an integer data type, the values after the decimal point are omitted.
- If a device value after conversion exceeds the setting range of the data type, do not convert the value.
- If a device value is negative, do not convert the data type to an unsigned data type.

68.3 How to use a script

GT37 SoftGOT3000

☞ Page 2377 Setting procedure
☞ Page 2380 Operation
☞ Page 2384 Load reduction on bmov processing

This section explains how to use a project script, screen script, script part, or script block.

68.3.1 Setting procedure

The following shows the procedure for setting a script.

Procedure for setting a project script or screen script

1. Configure the script settings with GT Designer3, such as the data type and trigger type.

☞ Page 2403 [Script] dialog

2. Edit a script with the script editor.

When you have edited a script with a commercially available text editor, import a locally saved text file.

☞ Page 2415 [Edit Script(script name)] dialog

3. Check the syntax of the script with GT Designer3.

☞ Page 2415 [Edit Script(script name)] dialog

If an error is detected, return to step 1 and correct the script.

A general C language compiler is also usable to simulate the operation.

☞ Page 2434 Simulation using a general C language compiler or debugger

4. Write the project from the personal computer to the GOT with GT Designer3.

☞ Page 408 Transferring data to the GOT

5. Start monitoring.

6. Monitor the device values using the monitor function of the software in the controller to check the operation status of the script.

If the script runs properly, the creation of the script is complete.

When the script does not run properly, return to step 1 and correct the script.

Procedure for setting a script part

When you place a script parts object on the screen editor, make sure that the object overlaps the screen display area 1 dot or more.

Otherwise, the script set for the object does not run.

1. Select [Object] → [Script Parts] from the menu.
2. Click the position to place a script parts object.
3. Double-click the script parts object to display the [Script Parts] dialog.

☞ Page 2424 [Script Parts] dialog

4. On the [Script Setting] tab, set a trigger type and a script.
5. Check the syntax of the script with GT Designer3.

☞ Page 2415 [Edit Script(script name)] dialog
☞ Page 2428 [Script Edit] dialog (for script parts)

If an error is detected, return to step 4 and correct the script.

A general C language compiler is also usable to simulate the operation.

☞ Page 2434 Simulation using a general C language compiler or debugger

6. Write the project from the personal computer to the GOT with GT Designer3.

☞ Page 408 Transferring data to the GOT

7. Start monitoring.
8. Monitor the device values using the monitor function of the software in the controller to check the operation status of the script.

If the script runs properly, the creation of the script is complete.

When the script does not run properly, return to step 4 and correct the script.

Precautions

If an overlap window, superimpose window, and the set overlay screen function call a screen having a script parts object, the script of the script parts object runs only when the screen is called up for the first time.

The script does not run in the other locations even after you close the screen where the script has run.

In the above state, if the screen is called up again in any of these locations, the script will run on the newly displayed screen.

Procedure for setting a script block

A script block is called from a project script or screen script with a call statement and executed.

Incorporate the call processing by the call statement in the project script and screen script in advance.

1. To display the [Script File List] dialog, select [Common] → [Script] → [Script File List] from the menu.

☞ Page 2417 [Script File List] dialog

2. Click the [Script Block] tab to display.

☞ Page 2419 [Script Block] tab

3. Click the [Add] button to add a script to the script list.

☞ Page 2419 [Script Block] tab

4. Click the [Script Edit] button to display the [Edit Script(script name)] dialog.

☞ Page 2419 [Script Block] tab

5. Edit a script with the script editor.

When you have edited a script with a commercially available text editor, import a text file.

☞ Page 2415 [Edit Script(script name)] dialog

6. Check the syntax of the script with GT Designer3.

☞ Page 2415 [Edit Script(script name)] dialog

If an error is detected, return to step 5 and correct the script.

A general C language compiler is also usable to simulate the operation.

☞ Page 2434 Simulation using a general C language compiler or debugger

7. Write the project from the personal computer to the GOT with GT Designer3.

☞ Page 408 Transferring data to the GOT

8. Start monitoring.

9. Monitor the device values using the following method and check the operation status of the script.

- GOT internal device

Monitor the device values using the GOT internal device monitor.

☞ Page 3577 GOT internal devices

- Controller device

Monitor the device values using the monitor function of the software in the controller.

If the script runs properly, the creation of the script is complete.

When the script does not run properly, return to step 5 and correct the script.

68.3.2 Operation

The following shows the operation of a project script, screen script, script part, or script block.

Operating condition

A project script, a screen script, or the script of a script parts object runs when its trigger condition is satisfied, and the result is written to a target PLC CPU.

The following shows the selectable trigger types.

- [Ordinary]
- [ON]
- [OFF]
- [Rise]
- [Fall]
- [Rise/Fall]
- [ON Sampling]
- [OFF Sampling]
- [Sampling] (Unit: second)
- [When closing a screen] (for screen scripts and script parts)

The script block is called by a project or screen script with a call statement to execute the script and write the results to the PLC CPU.

Precautions

When the trigger type is [Sampling], [ON Sampling], or [OFF Sampling], note the following.

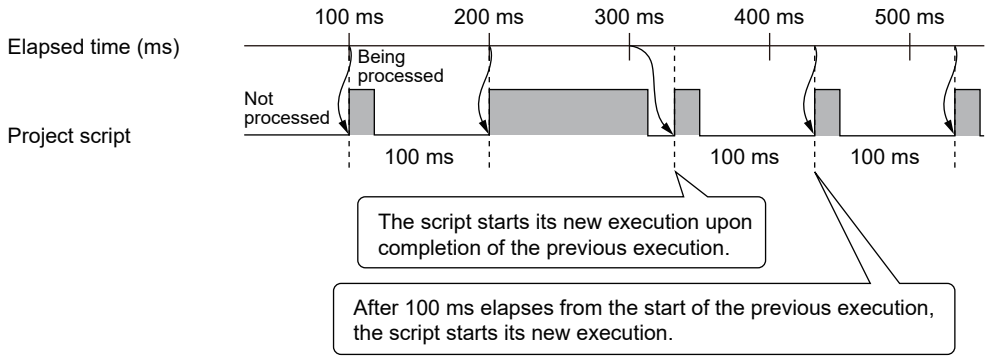
- If a script does not complete within the set cycle time

If a script does not complete within the set cycle time, its subsequent execution is delayed until the current execution completes.

After the set cycle time elapses from the start of the delayed execution, the script starts its new execution.

Ex.

Executing a project script for which [Trigger Type] is set to [Sampling] and [Sampling] is set to 1 (×100 ms)



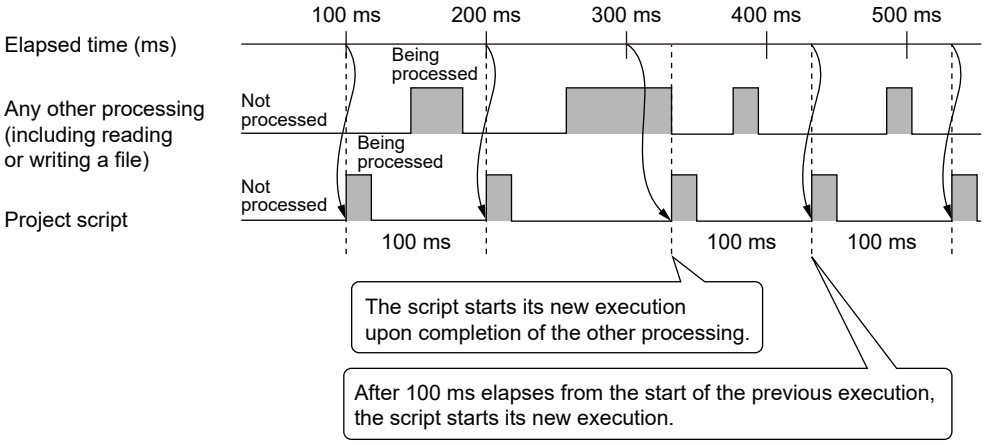
• If the trigger condition for a script is satisfied while any processing other than the script is in progress

If the trigger condition for a script is satisfied while any processing other than the script (including reading or writing a file and updating a screen) is in progress, the script execution is delayed until the processing completes.

After the set cycle time elapses from the start of the delayed execution, the script starts its new execution.

Ex.

Executing a project script for which [Trigger Type] is set to [Sampling] and [Sampling] is set to 1 (×100 ms)



• If the scripts running periodically are set for multiple screens to be displayed simultaneously

When these screens are displayed simultaneously, the scripts may fail to run at short time intervals, such as every 100 ms. In such a case, set a longer cycle time.

Execution unit

Project scripts, screen scripts, and the scripts of a script parts object run one by one.

Even if the trigger conditions of multiple scripts are satisfied, the scripts do not run simultaneously.

Execution order

The GOT check whether the trigger conditions of project scripts, screen scripts, and scripts of script parts objects are satisfied in top-to-bottom order as shown in the table below.

Depending on when the trigger device status is refreshed, the scripts may not run in the specified order even though the same trigger device is set for the scripts.

To control the execution order of scripts, establish a handshake between the scripts.

Priority order of screens	Priority order of scripts	Hierarchical order of the set overlay screen function	Execution order specified in GT Designer3	Number of executable scripts
—	Project script	—	1→2→...	256
Base screen	Screen script	Basic screen	1→2→...	256

		⋮	⋮	
		32 script parts objects on the called screens of the 16th layer	Script parts object 1: 1 → 2 → ... ⋮ Script parts object 32: 1 → 2 → ...	

Precautions

If screen switching is executed while a screen script or the script of a script parts object is running, the target screen will not be switched until the script ends.
If screen switching is executed while a project script is running, the script will temporarily stop running until the target screen is switched.

Execution status

A project script, a screen script, or the script of a script parts object is processed according to the script status.

Script status	Processing
Waiting for turn	• Waits for the processing turn according to the execution order. • When the turn has come, the script enters the "Waiting for execution" status.
Waiting for execution	• The processing differs depending on the operating condition. Satisfied: The script enters the "Execution" status. Not satisfied: The script enters the "Waiting for turn" status, and the next script enters the "Waiting for execution" status.
Execution	• When the script has ended, the processing result is written to the PLC CPU and the script enters the "Waiting for turn" status. The next script enters the "Waiting for execution" status. • If an error occurs, the script enters the "Stop" status and the next script enters the "Waiting for execution" status. • When a screen is switched while screen scripts are used, the next script does not enter the "Waiting for execution" status until all the scripts set in the screen have been executed.
Stop	• The "Stop" status is held until the error history is cleared.

Interruption

In any of the following cases, the corresponding script being processed stops and an error occurs.

- In division, when the divisor becomes 0 and the calculation becomes zero division
- When [BCD16], [BCD32], or [BCD64] is selected as the script data type but the monitor device value cannot be handled as BCD
- When [BCD16], [BCD32], or [BCD64] is selected as the script data type but the operation result is out of the BCD range
- When a controller device is specified as the write destination device of a while statement

For the available data type and data range, refer to the following.
☞ Page 2352 Available data and how to express the data
For details on the while statement, refer to the following.
☞ Page 2335 Control statement
For troubleshooting when the script processing is interrupted, refer to the following.
☞ Page 2439 Script execution errors and their corrective actions on the GOT

Precautions

In the following cases, you may get an unexpected result of processing.

- When a format other than [BCD16], [BCD32], or [BCD64] is selected as the script data type but a constant out of the selected format range is included
- When [Unsigned BIN16] or [Unsigned BIN32] is selected as the script data type but a negative constant is included
- When a format other than [Real(32bit)] or [Real(64bit)] is selected as the script data type but a decimal is used as a constant

For details on data types, refer to the following.
☞ Page 2352 Available data and how to express the data

68.3.3 Load reduction on bmov processing

For project scripts or screen scripts, using many bmov commands to read device values from the controller and to store them in the GOT internal devices may slow the performance of the GOT display refresh or the reaction of the touch switch input. This section explains how to make the GOT monitor operate at a higher speed by reducing the frequency of the communication with controllers by bmov.

How to read device values from controllers without bmov

The GOT can read device values with device data transfer instead of bmov.
With device data transfer, the GOT communicates with controllers only when trigger conditions are satisfied. Therefore, the GOT has no communication loads by always monitoring the device used for the script function.
For details on device data transfer, refer to the following.
☞ Page 2498 Transferring data between devices ([Device Data Transfer])

How to reduce the communication time when using bmov

When controller devices are handled in a bmov, if, or switch statement, communication with the controller is performed every time a device value is read.
To reduce the communication time, it is recommended that you read a batch of values from the source devices temporarily into a temporary device area.
Take measures as follows.

• If device values are read from controllers in divided blocks

Change the script into the one that reads values temporarily into the temporary device area at a time, then divides them again, and then transfers them to the GOT internal devices.
☞ Page 2385 Reading device values into a temporary device area at a time

• If the GOT reads device values in a controller according to each operating condition of an if or switch statement

Read the values temporarily into the temporary device area before the if or switch statement is executed.
Then, change the script into the one that transfers the values from the temporary device area to the GOT internal devices by dividing the values into groups according to the condition of if or switch statement.
☞ Page 2386 Reading bmov commands in a script at a time

■Reading device values into a temporary device area at a time

This solution saves the communication time by reducing the frequency of communication between the GOT internal memory and the controller from three times to once.

When data are transferred from a temporary device area to GOT internal devices (such as GD), the internal memory does not communicate with controllers.

The internal memory is used for communication processing.

It is a system area, and the user is not permitted to access to the area.

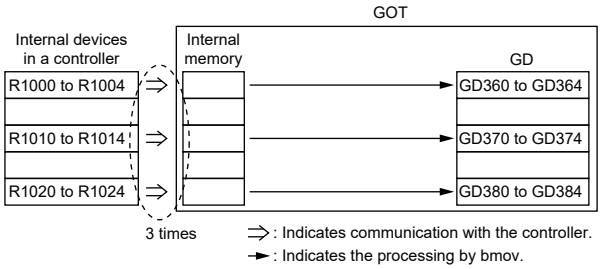
Before applying remedy

• Processing outline

Device values are transferred from R1000 to R1004, R1010 to R1014 and R1020 to R1024 into GD360 to GD364, GD370 to GD374 and GD380 to GD384 respectively.

• Script description

```
bmov([w:R1000],[w:GD360],5);
bmov([w:R1010],[w:GD370],5);
bmov([w:R1020],[w:GD380],5);
```



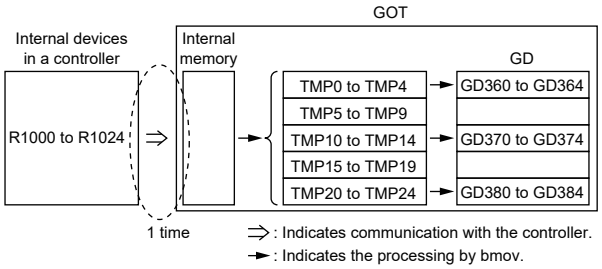
After applying remedy

• Processing outline

Device values are transferred from R1000 to R1024 into TMP0 to TMP24 in the GOT first, then transferred again from TMP0 to TMP24 into GD360 to GD364, GD370 to GD374 and GD380 to GD384 respectively.

• Script description

```
bmov([w:R1000],[w:TMP0],25);
bmov([w:TMP0],[w:GD360],5);
bmov([w:TMP10],[w:GD370],5);
bmov([w:TMP20],[w:GD380],5);
```



■Reading bmov commands in a script at a time

This solution saves the communication time by reducing the frequency of communication between the GOT internal memory and the controller from 10 times to once.

(When internal devices in a controller are read in an if or switch statement, the internal memory communicates with the controller regardless of the operating condition. When data are transferred from a temporary device area to GOT internal devices (such as GD), the internal memory does not communicate with controllers.)

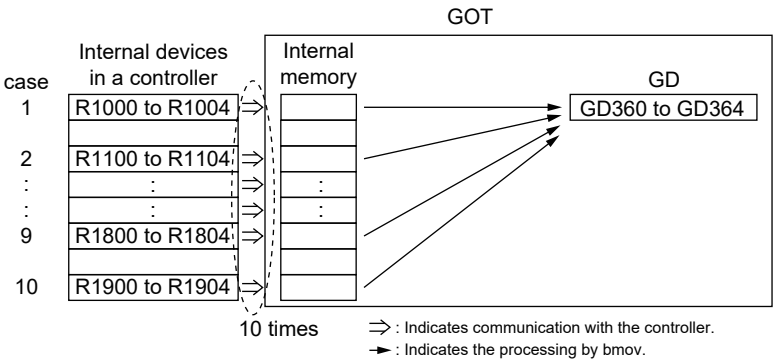
Before applying remedy

• Processing outline

Device values are transferred from R1000 to R1004, ⋯ and R1900 to R1904 into GD360 to GD364 according to the case statements.

• Script description

```
switch([w:D1000]){
case 1:
bmov([w:R1000],[w:GD360],5);
break;
case 2:
bmov([w:R1100],[w:GD360],5);
break;
:
case 9:
bmov([w:R1800],[w:GD360],5);
break;
case 10:
bmov([w:R1900],[w:GD360],5);
break;
}
rst([b:GB1000]);
```



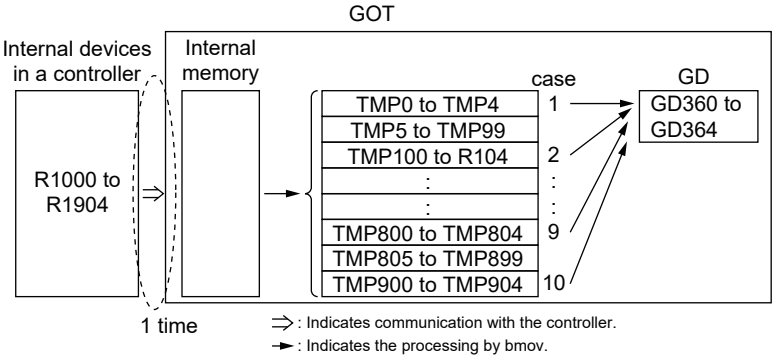
After applying remedy

• Processing outline

Device values are transferred from R1000 to R1904 into TMP0 to TMP904 in the GOT at a time, then transferred again from TMP0 to TMP904 into GD360 to GD364 according to the case statements.

• Script description

```
bmov([w:R1000],[w:TMP0],905);
switch([w:D1000]){
case 1:
bmov([w:TMP0],[w:GD360],5);
break;
case 2:
bmov([w:TMP100],[w:GD360],5);
break;
:
case 9:
bmov([w:TMP800],[w:GD360],5);
break;
case 10:
bmov([w:TMP900],[w:GD360],5);
break;
}
rst([b:GB1000]);
```



68.4 Program example

GT37 SoftGOT3000

☞ Page 2387 Switches with the interlock function
☞ Page 2388 Lamps which change display objects according to multiple conditions
☞ Page 2390 Password entry screen with time limit function
☞ Page 2392 GOT operation check (watchdog) on a PLC
☞ Page 2393 Selecting data and swapping between upper and lower data
☞ Page 2394 Data type conversion
☞ Page 2395 File operation
☞ Page 2400 Character string operation

The following shows the examples of project scripts, screen scripts, and the scripts of script parts objects.

68.4.1 Switches with the interlock function

GT37 SoftGOT3000

Operation

When the ready switch and the run/stop switch turn on, the running lamp turns on.

The system operation is controlled associating with the running lamp.

Screen image	Operation of each object
	Running lamp: Displays the operation status of the system. Ready switch: Operates as an interlock of the [Run/Stop] switch. Run/Stop switch: Switches the operation status of the system (running or stop).

Monitor screen setting

Object name	Type	Setting item	Setting
Running lamp	Bit lamp	Monitor device	M0003 (System operation control device)
Ready switch	Bit switch	Monitor device	M0001
		Operation setting	Bit set
Run/Stop switch	Bit switch	Monitor device	M0002
		Operation setting	Bit set

Program example

Item	Description	
Data type	Signed 16-bit binary	
Trigger type	Ordinary	

Script	if ([b:M0001]&&[b:M0002]){
	set([b:M0003]);
	}else{
	rst([b:M0003]);
	rst([b:M0002]);
	}
		//When both the ready switch and the run/stop switch turn on,
		//the running lamp turns on and the system operation starts.
		//If not,
		//the running lamp turns off and the system stops and
		//the run/stop switch is reset.

68.4.2 Lamps which change display objects according to multiple conditions

GT37 SoftGOT3000

Operation

The operations of three lines are controlled by the switches, and the control statuses of each line are indicated by one lamp.

Screen image	Operation of each object
	Control status lamp: The lamp color and the comment change according to the operation status of each line. Line 1 to Line 3 switch: Control the operations of line 1 to line 3. Stop all lines switch: Stops all the lines.

Monitor screen setting

Object name	Type	Setting item	Setting
Control status lamp	Word lamp	Monitor device	D10
Control status lamp	Word lamp	Style, text	Display range: $V==0 Lamp color: 182 Text: All lines stop
			Display range: $V==1 Lamp color: 3 Text: Line 1 running
			Display range: $V==2 Lamp color: 224 Text: Line 2 running
			Display range: $V==3 Lamp color: 227 Text: Line 3 running
			Display range: $V==4 Lamp color: 28 Text: Line1 and 2 running
			Display range: $V==5 Lamp color: 31 Text: Line1 and 3 running
			Display range: $V==6 Lamp color: 252 Text: Line2 and 3 running
			Display range: $V==7 Lamp color: 162 Text: Line1, 2 and 3 running
Line 1 switch	Bit switch	Monitor device	X1
		Operation setting	Bit alternate
Line 2 switch	Bit switch	Monitor device	X2
		Operation setting	Bit alternate
Line 3 switch	Bit switch	Monitor device	X3
		Operation setting	Bit alternate
Stop all lines switch	Bit switch	Monitor device	X0
		Operation setting	Bit set

Program example

Item	Description	
Data type	Signed 16-bit binary	
Trigger type	Ordinary	

Script	if(([b:X1]==OFF)&&([b:X2]==OFF)&&([b:X3]==OFF)){
	[w:D10]=0;
	}
	if(([b:X1]==ON)&&([b:X2]==OFF)&&([b:X3]==OFF)){
	[w:D10]=1;
	}
	if(([b:X1]==OFF)&&([b:X2]==ON)&&([b:X3]==OFF)){
	[w:D10]=2;
	}
	if(([b:X1]==OFF)&&([b:X2]==OFF)&&([b:X3]==ON)){
	[w:D10]=3;
	}
	if(([b:X1]==ON)&&([b:X2]==ON)&&([b:X3]==OFF)){
	[w:D10]=4;
	}
	if(([b:X1]==ON)&&([b:X2]==OFF)&&([b:X3]==ON)){
	[w:D10]=5;
	}
	if(([b:X1]==OFF)&&([b:X2]==ON)&&([b:X3]==ON)){
	[w:D10]=6;
	}
	if(([b:X1]==ON)&&([b:X2]==ON)&&([b:X3]==ON)){
	[w:D10]=7;
	}
	if ([b:X0]==ON){
	rst([b:X1]);
	rst([b:X2]);
	rst([b:X3]);
	rst([b:X0]);
	}
		//When line 1, 2, and 3 are off,
		//0 is stored in D10.
		//When line 1 is on and line 2 and 3 are off,
		//1 is stored in D10.
		//When line 2 is on and line 1 and 3 are off,
		//2 is stored in D10.
		//When line 3 is on and line 1 and 2 are off,
		//3 is stored in D10.
		//When line 1 and 2 are on and line 3 is off,
		//4 is stored in D10.
		//When line 1 and 3 are on and line 2 is off,
		//5 is stored in D10.
		//When line 2 and 3 are on and line 1 is off,
		//6 is stored in D10.
		//When line 1, 2, and 3 are on,
		//7 is stored in D10.
		//When the Stop all lines switch is turned on,
		//line 1 is turned off.
		//line 2 is turned off.
		//line 3 is turned off.
		//The Stop all lines switch is turned off.

68.4.3 Password entry screen with time limit function

GT37 SoftGOT3000

Operation

The password entry screen is displayed. If the correct password is not entered within 10 seconds, the screen returns to the previous screen.

Screen image	Operation of each object
 Manager screen (base screen 5) appears.	Manager button: Displays the password entry screen (base screen 4). Password entry: Displays the password entered using 0 to 9 switches. 0 to 9 switch: Inputs a value. Clear switch: Clears the input value. Confirm switch: Confirms the input value.

Monitor screen setting

Object name	Type	Setting item	Setting
Manager button	Go To Screen switch	Operation setting	Base screen switching 4
Password entry	Numerical input	Monitor device	D10
1 switch	Key code switch	Operation setting	Key code [0031h]
2 switch	Key code switch	Operation setting	Key code [0032h]
3 switch	Key code switch	Operation setting	Key code [0033h]
4 switch	Key code switch	Operation setting	Key code [0034h]
5 switch	Key code switch	Operation setting	Key code [0035h]
6 switch	Key code switch	Operation setting	Key code [0036h]
7 switch	Key code switch	Operation setting	Key code [0037h]
8 switch	Key code switch	Operation setting	Key code [0038h]
9 switch	Key code switch	Operation setting	Key code [0039h]
0 switch	Key code switch	Operation setting	Key code [0030h]
Clear switch	Key code switch	Operation setting	Key code [0088h]
Confirm switch	Key code switch	Operation setting	Key code [000Dh]

Program example

This program example uses the GOT special registers (GS devices).

In the GOT special registers, the GOT internal information, the communication status, and the error information of the scripts are stored.

Associating the GOT special registers with scripts enables various operations.

For details on the GOT special register, refer to the following.

☞ Page 3581 GOT special register (GS)

Item	Description	
Data type	Signed 16-bit binary	
Trigger type	Ordinary	

Script	if([b:GS1.01]==ON){
	[w:TMP0001]=[w:GS7];}
	if([w:D10]==3238){
	[w:D0]=5;
	[w:D10]=0; }
	if([w:GS7]-[w:TMP0001]>=10){
	[w:D0]=3; }
		//Only when the screen switches to the password entry screen,
		//TMP0001 is input to GS7.
		//When the correct password (3238) is entered,
		//the manager screen (base screen 5) appears.
		//Clear password
		//When 10 seconds or longer have passed after the password entry screen appears,
		//the screen with the manager switch (base screen 3) appears.

68.4.4 GOT operation check (watchdog) on a PLC

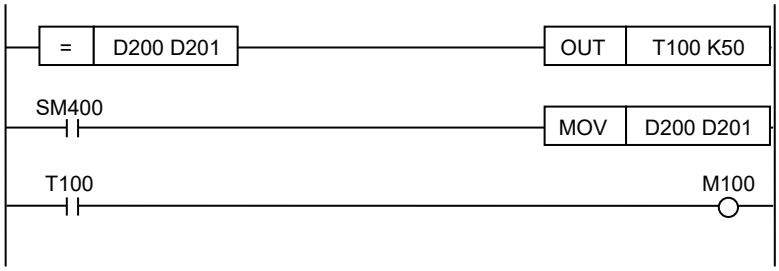
GT37 SoftGOT3000

Write data from the GOT to the device (D200) of the PLC at regular intervals.
This enables the PLC to check whether the GOT is operating normally.
For example, if you configure a setting so that the indicator light is lit on the GOT screen when the value in D200 does not change, the GOT visually notifies that it operates abnormally.

Devices and ladder diagrams of the PLC

The following shows the devices and the ladder diagrams to be used in the PLC.

Description	Device
Write destination device from GOT	D200
Written device from the GOT change confirmation device	D201
Timeout timer	T100
Processing start trigger	M100
Always ON	SM400



Program example

Item	Description
Trigger type	Cycle (1 second)
Script	[u16:D200] = [u16:D200] + 1;

68.4.5 Selecting data and swapping between upper and lower data

GT37 SoftGOT3000

The GOT selects higher-order bits or lower-order bits of 16 or 32 bit data or swap the data.

The following shows program examples and the results using a script.

Trigger types are user-selected.

(1) Selecting higher-order bits of 8-bit data

The GOT selects the higher-order 8 bits of the 16-bit data stored in D300 and stores the data in D350.

```
[u16:D350] = ([u16:D300] & 0xFF00) >> 8;
```

(2) Selecting lower-order bits of 8-bit data

The GOT selects the lower-order 8 bits of the 16-bit data stored in D300 and stores the data in D351.

```
[u16:D351] = [u16:D300] & 0x00FF;
```

(3) Swapping data between higher-order bits and lower-order bits of 16-bit data

The GOT swaps data between higher-order 8 bits and lower-order 8 bits of the 16-bit data stored in D300 and stores the data in D352.

```
[u16:D352] = (([u16:D300] & 0x00FF) << 8) | (([u16:D300] & 0xFF00) >> 8);
```

(4) Swapping data between higher-order bits and lower-order bits of 32-bit data

The GOT swaps data between higher-order 16 bits and lower-order 16 bits of the 32-bit data stored in D400 and stores the data in D450.

```
[u32:D450] = (([u32:D400] & 0x0000FFFF) << 16) | (([u32:D400] & 0xFFFF0000) >> 16);
```

Specify [u16] or [u32] so that the data type is unsigned.

Specify the unsigned data type for a script when specifying [w].

Examples of the result using a script

Description		Device	Example of stored data
16-bit source data storage destination device		D300	0x1234
(1)	Higher-order bit data storage destination device	D350	0x12
(2)	Lower-order bit data storage destination device	D351	0x34
(3)	Higher/lower bit data swap storage destination device	D352	0x3412
32-bit source data storage destination device		D400	0x12345678
(4)	Higher/lower bit data swap storage destination device	D450	0x56781234

PART 12

68.4.6 Data type conversion

GT37 SoftGOT3000

Convert decimal data into BCD data or BCD data into decimal.

The following shows program examples and the results using a script.

Trigger types are user-selected.

(1) Converting decimal data into BCD data

The GOT converts decimal data stored in D300 into BCD data and stores the data in D350.

```
if( [u16:D300] < 10000 ) {
    [d16:D350] = [u16:D300];
}
```

If 5 digits of data or more is stored in D300, set the storage destination to 32 bits instead of using an if statement as follows.

```
[d32:D350] = [u16:D300];
```

(2) Converting BCD data into decimal data

The GOT converts BCD data stored in D400 into decimal data and stores the data in D450.

```
[[u16:D450] = [d16:D400];
```

Examples of the result using a script

Description		Device	Example of stored data
Decimal data storage destination device		D300	1234
(1)	Converted BCD data storage destination device	D350	0x1234
BCD data storage destination device		D400	0x1234
(2)	Converted decimal data storage destination device	D450	1234

68.4.7 File operation

GT37 SoftGOT3000

The following shows file operation examples using the file operation functions.

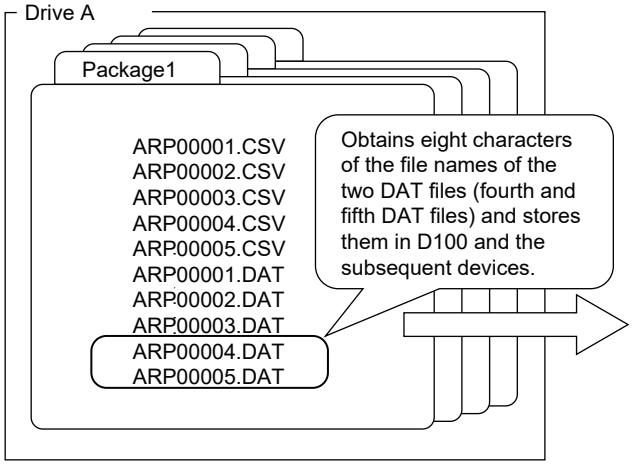
Obtaining a file name

To obtain a file name, use the file name obtaining function (file_getlist).

Ex.

To obtain the file names of the two DAT files from the fourth DAT file in the Package1 folder on drive A and store eight characters of each file name in D100 and subsequent devices

```
//(Without using the declare function, #pragma use_character_code unicode)
[s16:D500] = file_getlist("A:\\Package1\\", "*.DAT", [w:D100], 3, 2, 8); //Obtain a file name.
```



Storage device

D100	R	A
D101	0	P
D102	0	0
D103	4	0
D104	\0	\0
D105	R	A
D106	0	P
D107	0	0
D108	5	0
D109	\0	\0

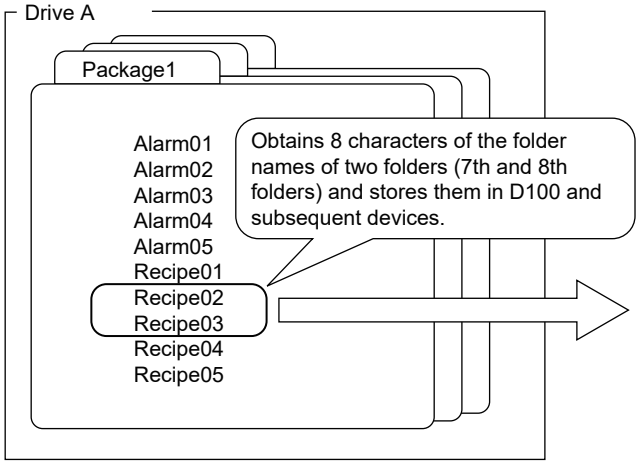
Obtaining a folder name

To obtain a folder name, use the obtain folder name function (file_getfolderlist).

Ex.

To obtain eight characters of the name of the seventh and eighth folders each in the Package1 folder on drive A and to store the characters in D100 and subsequent devices

```
//(Without using the declare function, #pragma use_character_code unicode)
[s16:D500] = file_getfolderlist("A:\\Package1\\", "",[w:D100],6,2,8); // Obtain a folder name.
```



Storage device

D100	e	R
D101	i	c
D102	e	p
D103	2	0
D104	\0	\0
D105	e	R
D106	i	c
D107	e	p
D108	3	0
D109	\0	\0

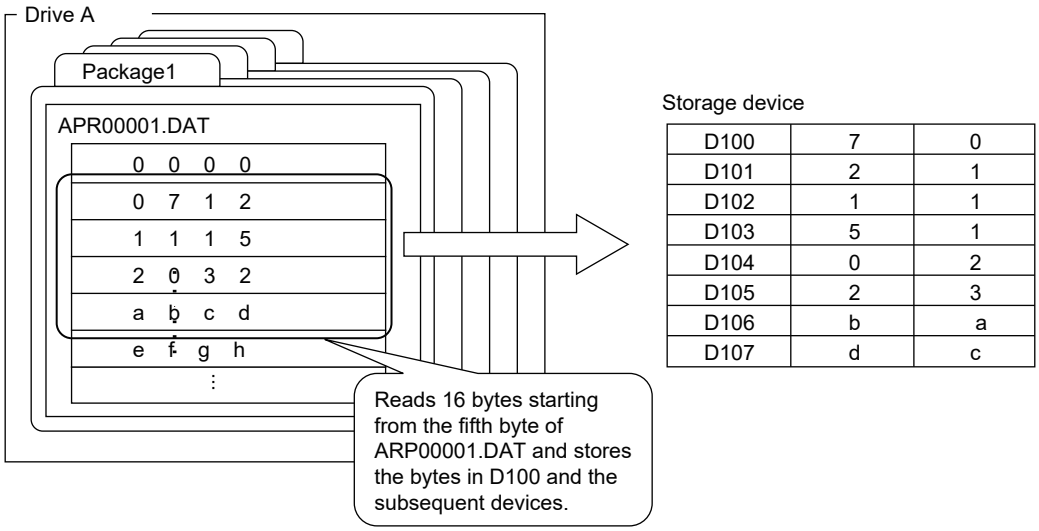
Reading data from a file

To read data from a file, use the file read function (file_read).

Ex.

To read 16 bytes from the fifth byte of ARP00001.DAT in the Package1 folder on drive A and store the bytes in D100 and subsequent devices

```
[s16:D500] = file_read("A:\\Package1\\", "ARP00001.DAT", [w:D100], 4, 16); //Reads file.
```



Storage device

D100	7	0
D101	2	1
D102	1	1
D103	5	1
D104	0	2
D105	2	3
D106	b	a
D107	d	c

Reading data for only one line from a file

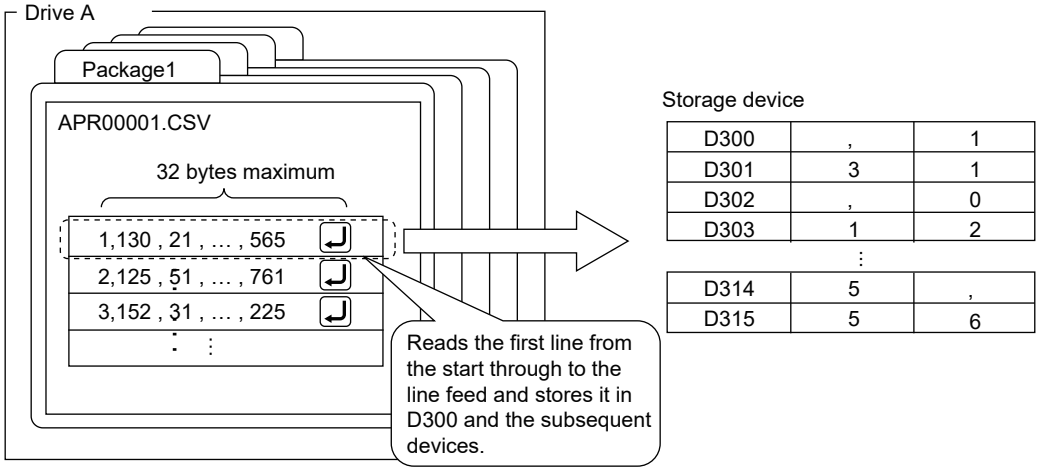
To read data for only one line from a file, use the file line read function (file_lineread, file_unilineread).

Ex.

To read the first line of ARP00001.CSV in the Package1 folder on drive A and store it in D300 and subsequent devices

- Length of one line: Up to 32 bytes
- D200: Return value (number of read bytes)
- D300: Device storing the read data

```
[s16:D200] = file_lineread("A:\\Package1\\","ARP00001.CSV",[w:D300],0,32); //Read one line.
```



Storage device

D300	,	1
D301	3	1
D302	,	0
D303	1	2
⋮		
D314	5	,
D315	5	6

By adding the number of read bytes stored in the return value to the offset, the second or later lines can be read consecutively.

Ex.

Reading data from the second and subsequent lines

```
[s16:D400] = [s16:D400] + [s16:D200]; //Add the number of read bytes to the offset.
[s16:D200] = file_lineread("A:\\Package1\\","ARP00001.CSV",[w:D300],[s16:D400],256);
```

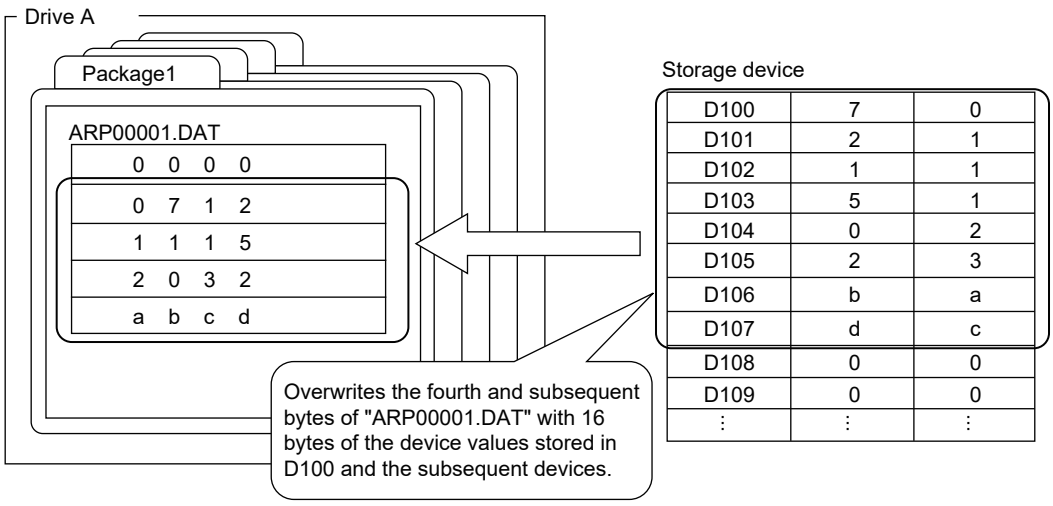
Writing data to a file

To write data to a file, use the file write function (file_write).

Ex.

To overwrite the bytes from the fourth byte of ARP00001.DAT in the Package1 folder on drive A with 16 bytes of the device value stored in D100 and subsequent devices

```
[s16:D500] = file_write("A:\\Package1\\", "ARP00001.DAT", [w:D100], 4, 16, 2); //Write file.
```



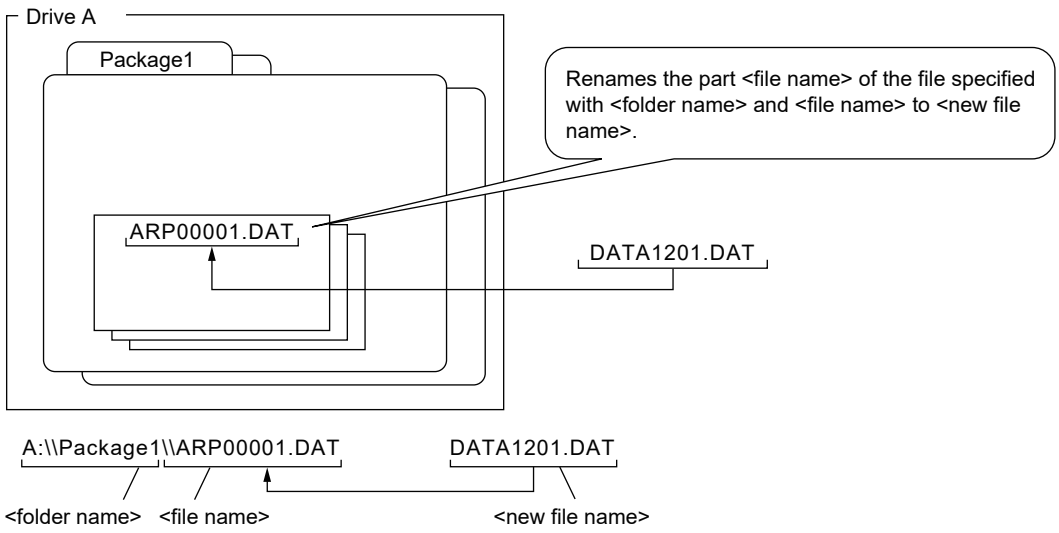
Renaming a file

To rename the file, use the file rename function (file_rename).

Ex.

To rename ARP00001.DAT in the Package1 folder on drive A to DATA1201.DAT

```
[s16:D500] = file_rename("A:\\Package1\\", "ARP00001.DAT", "DATA1201.DAT"); //Rename file.
```



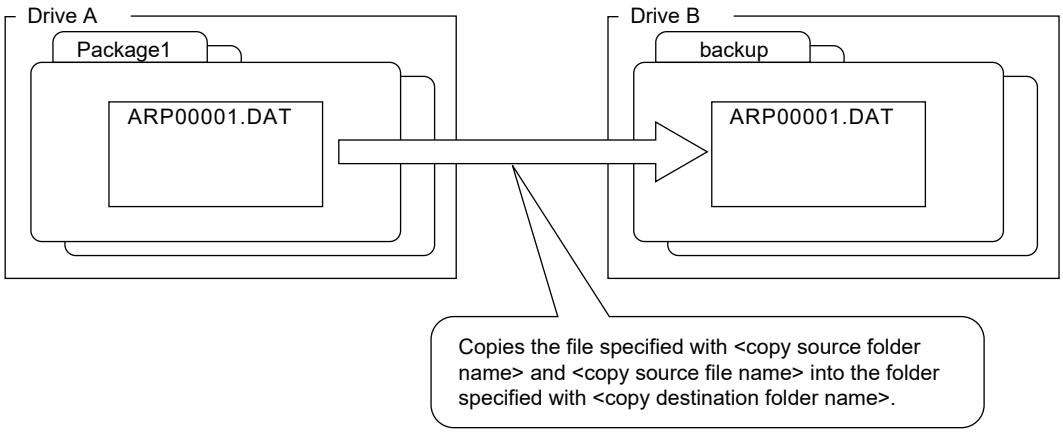
Copying a file

To copy the file, use the file copy function (file_copy).

Ex.

To copy ARP00001.DAT in the Package1 folder on drive A to the backup folder on drive B

```
[s16:D500] = file_copy("A:\\Package1\\", "ARP00001.DAT", "B:\\backup\\", "", 1); //Copy file.
```



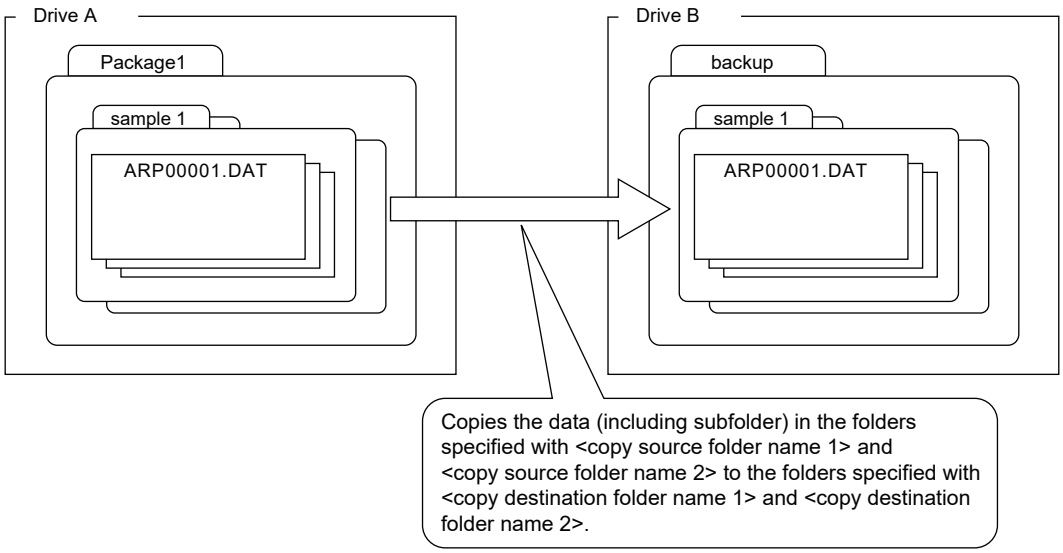
Copying a folder

To copy the folder, use the folder copy function (file_xcopy).

Ex.

To copy the data (including subfolders) in the Package1 folder on drive A to the backup folder on drive B

```
[s16:D500] = file_xcopy("A:\\Package1\\", "sample1", "B:\\backup\\", "sample1", 1); //Copy folder.
```



Specifying the number of characters in the folder or file name at file reading

Use the following declaration statements to specify the number of characters in the folder or file name at file reading.

- #pragma folder_name_length
- #pragma file_name_length

Ex.

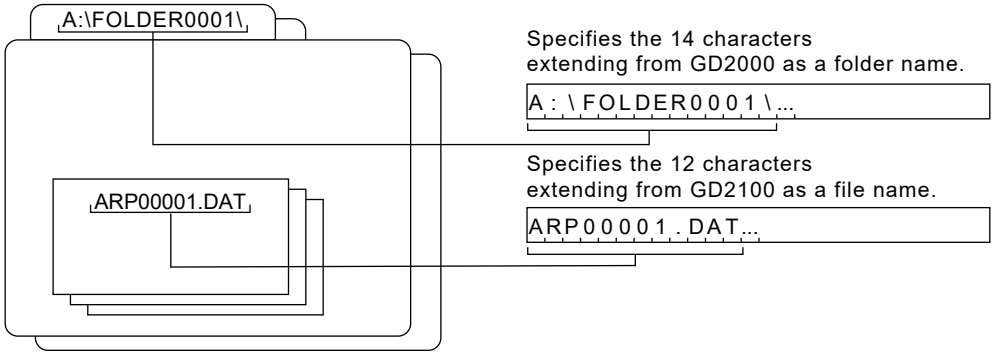
To limit the folder name to 14 characters and file name to 12 characters at file reading

GD2000 to GD2006: Store folder name A: \FOLDER0001\.

GD2100 to GD2105: Store file name ARP00001.DAT.

GD3000 to GD3015: Store the data read from a file.

```
#pragma folder_name_length(14) //Limit the folder name length to 14 characters.
#pragma file_name_length(12) //Limit the file name length to 12 characters.
[s16:D500]=file_read([w:GD2000],[w:GD2100],[w:GD3000],0,32);//Read 32 characters from the start of file name GD2100.
```



Obtaining a file name in Unicode

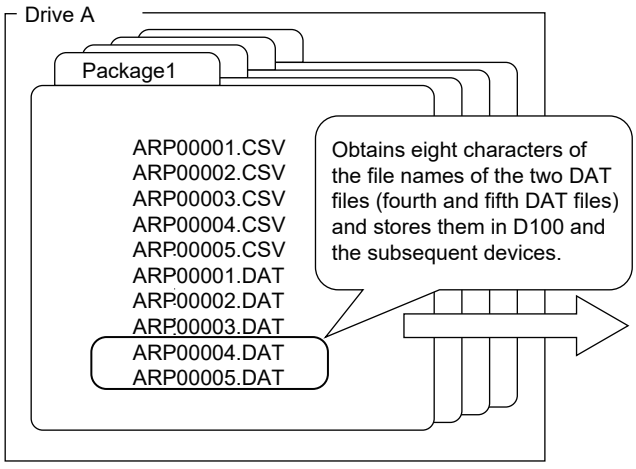
To obtain a file name in Unicode, use the following declaration statement.

- #pragma use_character_code unicode

Ex.

To specify a file name in Unicode at file reading

```
#pragma use_character_code unicode
[s16:D500] = file_getlist("A:\\Package1\\", "*.DAT", [w:D100], 3, 2, 8); //Obtain a file name.
```



Storage device

D100	A
D101	R
D102	P
D103	0
D104	0
D105	0
D106	0
D107	4
D108	\0
D109	A
D110	R
D111	P

D117	\0

68.4.8 Character string operation

GT37 SoftGOT3000

The following shows examples of operating the character string using the string operation functions.

Reading the specified data from a string

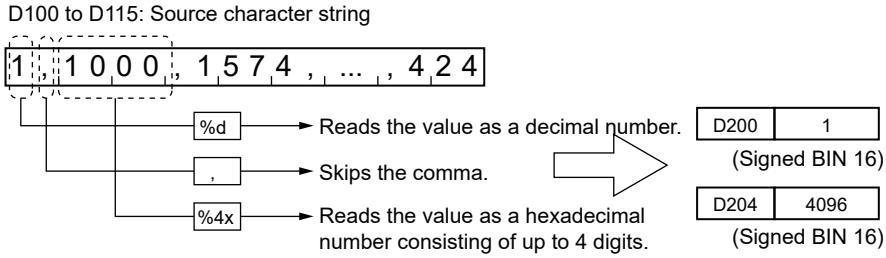
To read the specified data from a string, use the string input function (str_scanf, str_uniscanf).

Ex.

To read the first two fields from one line stored in D100 and subsequent devices

- D500: Return value
- D100: Input string storage device (read one-line data)
- D200: Input value storage device (first field)
- D204: Input value storage device (second field

```
[s16:D500] = str_scanf([w:D100], 32, 0, "%d,%4x", [w:D200], [w:D204]); //Obtain two data sets.
```



Writing the specified data into a string

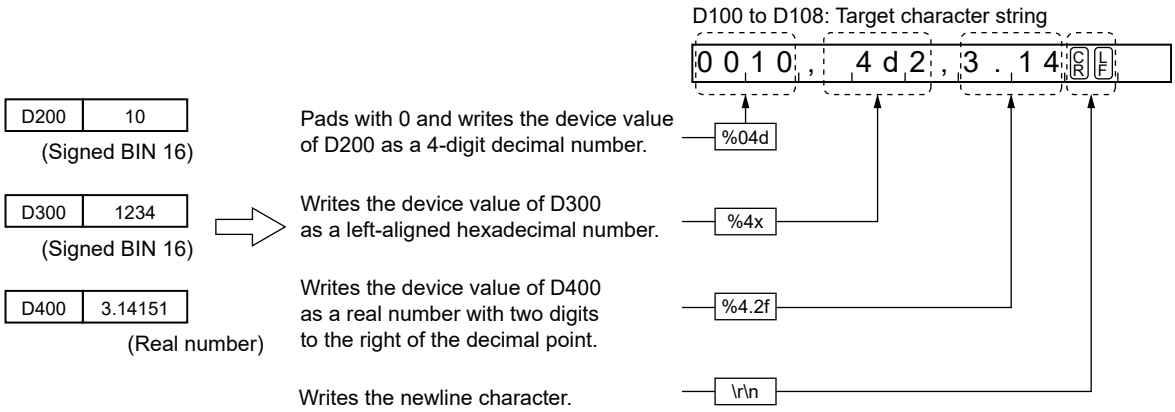
To write the specified data into a string, use the string output function (str_printf, str_uniprintf).

Ex.

To write three data sets stored in D200, D300, and D400 to one character string stored in D100 and subsequent devices

- D500: Return value
- D100: Output string storage device (target character string
- D200: Output value storage device (data to be written to the first field)
- D300: Output value storage device (data to be written to the second field)
- D400: Output value storage device (data to be written to the third field)

```
[s16:D500] = str_printf([w:D100],18,"%04d,%4x,%4.2f\r\n",[s16:D200],[s16:D300],[flt:D400]); //Write three data sets.
```



Data length of the specified string

To obtain the data length of the specified string, use the string length acquisition function (str_strlen, str_unistrlen).

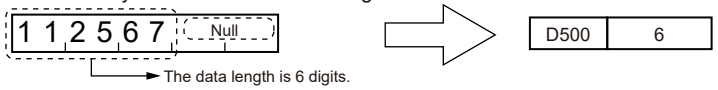
Ex.

Obtaining the data length of characters from the 1st byte of D100 to the 10th byte

- D500: Return value (data length)
- D100: Input string storage device

```
[s16:D500] = str_strlen([w:D100],10); //Obtain data length of D100.
```

Obtains the stored data length.
D100 to D104: 10 bytes of the character string



Stores the obtained data length to the return value.

D500	6

Reading a part of the string

To read a part of the string, use the partial string acquisition function (str_strmid, str_unistrmid).

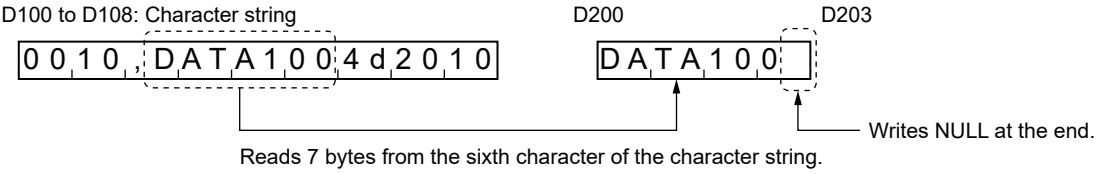
Ex.

To read 7 bytes from the sixth character of the string stored in D100 and subsequent devices and store the bytes in D200

- D500: Return value (read data amount)
- D100: Input string storage device (source character string)
- D200: Output string storage device (read data)

```
[s16:D500] = str_strmid([w:D100], [w:D200], 5, 7); //Obtain a part of the string of D100.
```

D100 to D108: Character string



Converting the character code into Unicode

To convert the character code from a local code to Unicode, use the convert character code function (local code → Unicode)(str_lc2uni).

Ex.

To read six characters (6-byte data) from an ASCII string stored in D100 and subsequent devices, encode the characters to Unicode, and write the six Unicode characters (12-byte data) to D200 and subsequent devices

- Order of storing data: Lower → higher

```
[s16:D500] = str_lc2uni(2, [w:D100], [w:D200], 6, 12); // Convert a character code.
```

D100	A	D
D101	A	T
D102	\0	1

D200	D
D201	A
D202	T
D203	A
D204	1
D205	\0

Converting the character code into a local code

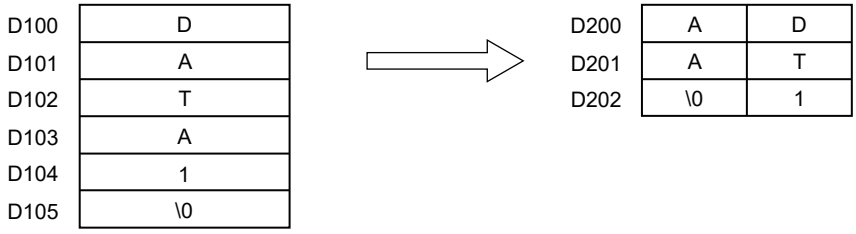
To convert the character code from Unicode to a local code, use the convert character code function (Unicode → local code)(str_uni2lc).

Ex.

To read six characters (12-byte data) from a Unicode string stored in D100 and subsequent devices, encode the characters to ASCII, and writes the six ASCII characters (6-byte data) to D200 and subsequent devices

- Order of storing data: Lower → higher

```
[s16:D500] = str_uni2lc(2, [w:D100], [w:D200], 12, 6); // Convert a character code.
```



68.5 [Script] dialog

GT37 SoftGOT3000

This dialog is used for setting a project script or screen script.

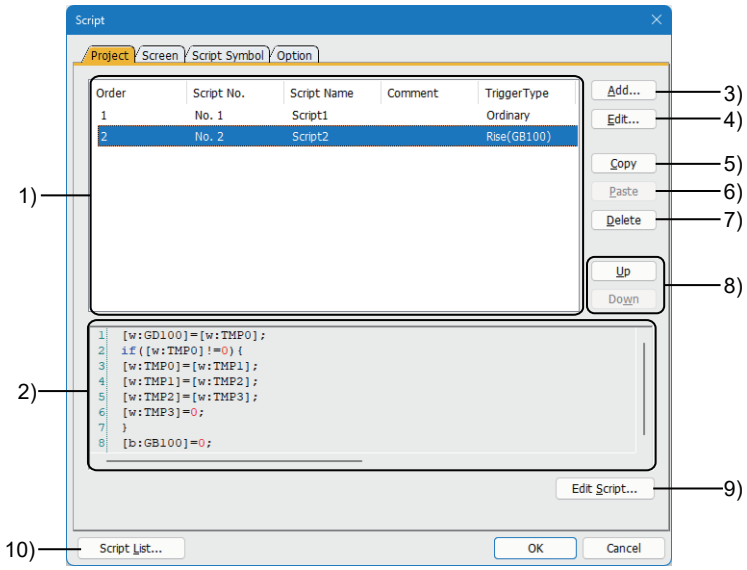
Select [Common] → [Script] → [Script] from the menu to display the setting dialog.

☞ Page 2403 [Project] tab
☞ Page 2405 [Screen] tab
☞ Page 2407 [Script Symbol] tab
☞ Page 2410 [Option] tab

68.5.1 [Project] tab

GT37 SoftGOT3000

Set the project scripts which operate to the whole project.

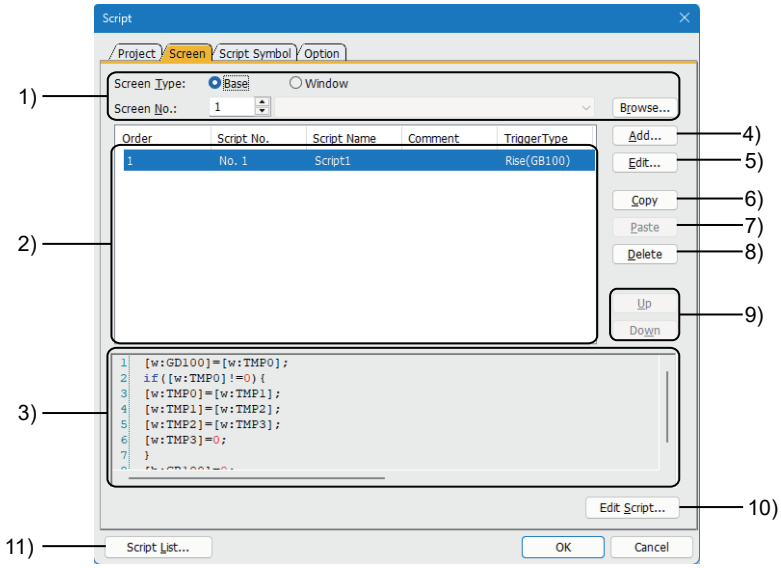


Item		Description
1)	Script setting list	Lists the script settings. The script of the selected script No. is displayed in the space below the script setting list.
2)	Script preview	Displays the content of the script selected in the script setting list.
3)	[Add] button	Add a new script setting to the list. Click this button to display the [Script Edit] dialog. ☞ Page 2412 [Script Edit] dialog (for project scripts and screen scripts) The execution order of the scripts is set according to the order in which the scripts are added.
4)	[Edit] button	Edit the selected script setting. Click this button to display the [Script Edit] dialog. ☞ Page 2412 [Script Edit] dialog (for project scripts and screen scripts)
5)	[Copy] button	Copies the selected script setting.

Item		Description
6)	[Paste] button	Pastes the copied script setting to the last line of the list. Click the [Paste] button to display the dialog for selecting the method to paste the script. The pasting method differs depending on the [Yes] or [No] button. [Yes] button: Copies the source script. [No] button: Refers to the same script as that of the copy source. Select the [Yes] button to display the following dialog.  • [Script No.] Set the script No. for the script to be registered. (Default: The minimum number of the non-registered script No.) After registered, the script is reflected to the script list. ☞ Page 2417 [Script File List] dialog • [Script Name] Set the name of the script to be registered. The setting range is 1 character to 32 characters. However, the following symbols cannot be entered. • " * / \ : < > ? |
7)	[Delete] button	Deletes the selected script setting.
8)	[Up] button, [Down] button	Changes the execution order of the selected script setting.
9)	[Edit Script] button	Edit the selected project script in the [Script Edit] dialog. ☞ Page 2415 [Edit Script(script name)] dialog
10)	[Script List] button	Displays the list of the registered scripts. You can register scripts additionally and edit and delete the scripts in the list. ☞ Page 2417 [Script File List] dialog

68.5.2 [Screen] tab

GT37 SoftGOT3000



Item		Description
1)	[Screen Type]	Select the screen ([Base] or [Windows]) in which the script setting operates and the screen number. The setting range is [0] to [32767]. The screen number can be selected with the screen title. Click the [Browse] button to display the [Image List] dialog. ☞ Page 3683 [Image List] dialog (screen)
2)	Script setting list	Displays the list of script settings. The script of the selected script No. is displayed in the space below the script setting list.
3)	Script preview	Displays the content of the script selected in the script setting list.
4)	[Add] button	Add a new script setting to the list. Click this button to display the [Script Edit] dialog. ☞ Page 2412 [Script Edit] dialog (for project scripts and screen scripts) The execution order of the scripts is set according to the order in which the scripts are added.
5)	[Edit] button	Edit the selected script setting. Click this button to display the [Script Edit] dialog. ☞ Page 2412 [Script Edit] dialog (for project scripts and screen scripts)
6)	[Copy] button	Copies the selected script setting.
7)	[Paste] button	Pastes the copied script setting to the last line of the list. Click the [Paste] button to display the dialog for selecting the method to paste the script. The pasting method differs depending on the [Yes] or [No] button. [Yes] button: Copies the source script. Select the [Yes] button to display the following dialog.  • [Script No.] Set the script No. for the script to be registered. (Default: The minimum number of the non-registered script No.) After registered, the script is reflected to the script list. ☞ • [Script Name] Set the name of the script to be registered. The setting range is 1 character to 32 characters. However, the following symbols cannot be entered. • " * / \ : < > ? | [No] button: Refers to the same script as that of the copy source.

Item		Description
8)	[Delete] button	Deletes the selected script setting.
9)	[Up] button, [Down] button	Changes the execution order of the selected script setting.
10)	[Edit Script] button	Edit the selected project script with the editor selected in [Script Editor Selection] in the [Option] tab. ☞ Page 2410 [Option] tab ☞ Page 2412 [Script Edit] dialog (for project scripts and screen scripts)
11)	[Script List] button	Displays the list of the registered scripts. You can register scripts additionally and edit the scripts in the list. ☞ Page 2417 [Script File List] dialog

68.5.3 [Script Symbol] tab

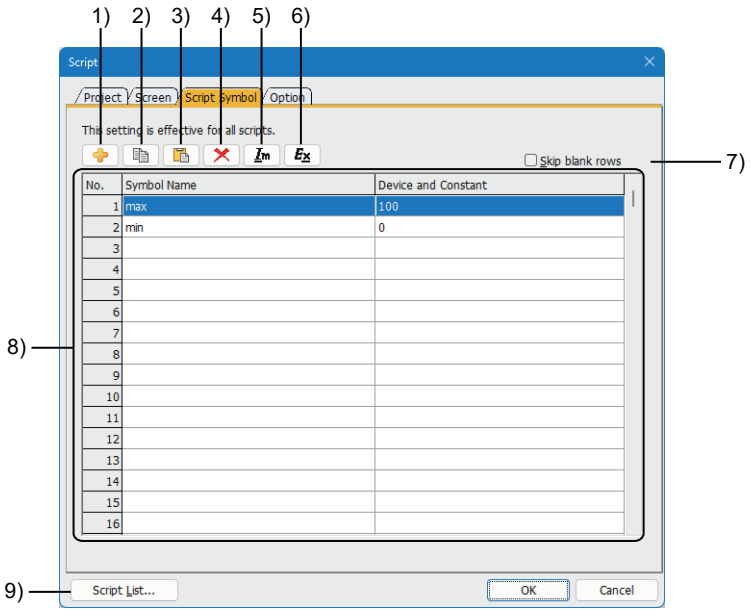
GT37 SoftGOT3000

Register character strings as script symbols.

Devices and constants in a script can be substituted by the registered character strings.

The set script symbols are usable in all project scripts, screen scripts, and script blocks.

It may take a long time to select communication in GT Designer3 or save projects due to this setting.



Item		Description
1)	[Add] button	Displays the [Add Script Symbol] dialog.  • [No.] Set a number for the script symbol to be added. The setting range is [1] to [10000]. • [Symbol Name] Set a character string to be described in a script. Up to 32 alphanumeric characters and symbols can be entered. However, the symbol # is not usable. • [Device and Constant] Set a device or constant for the symbol name. Up to 32 alphanumeric characters and symbols can be entered.
2)	[Copy] button	Copies the setting from the row selected in the script symbol list. Multiple rows can be copied at once. When [Skip blank rows] is selected, the settings in the hidden rows are also copied. The copied settings can be pasted to another script symbol setting dialog.

Item			Description
3)	[Paste] button		Pastes the copied setting to the selected row. When [Skip blank rows] is selected, the [Paste Symbol] dialog is displayed.  When pasting a setting to one row  When pasting settings to multiple rows • [Symbol No.] Set a symbol number for the destination row. The setting range is [1] to [10000]. • [First Symbol No.] Set a symbol number for the first destination row. The setting range is [1] to [10000].
4)	[Delete] button		Deletes the setting from the selected row. You can delete the settings from multiple rows at one time.
5)	[Import] button		Displays the [Open] dialog. Read the script symbol settings from a Unicode text file or CSV file.
6)	[Export] button		Displays the [Save As] dialog. Save the script symbol settings to a Unicode text file or CSV file. If multi-language characters are used in the settings, use the Unicode text file format. For the precautions for using a Unicode text file or CSV file, refer to the following. ☞ Page 3668 Precautions for using CSV file ☞ Page 3669 Precautions for using Unicode text file
7)	[Skip blank rows]		Displays only the rows in which script symbols have been registered.
8)	Script symbol list	[No.]	Lists the registered script symbols. [Symbol Name] and [Device and Constant] are editable. It is a row number. Clicking a row number selects the relevant row. The following operations can be performed on the selected row. • Copy: Ctrl + C • Paste: Ctrl + V • Delete: Delete
		[Symbol Name]	Set a character string to be described in a script. Up to 32 characters can be entered. However, the symbol # is not usable.
		[Device and Constant]	Set a device or constant for the symbol name. Up to 32 characters can be entered.
9)	[Script List] button		Displays the [Script List] dialog. Displays the list of the registered scripts. You can register scripts additionally and edit the scripts in the list. ☞ Page 2417 [Script File List] dialog

Point

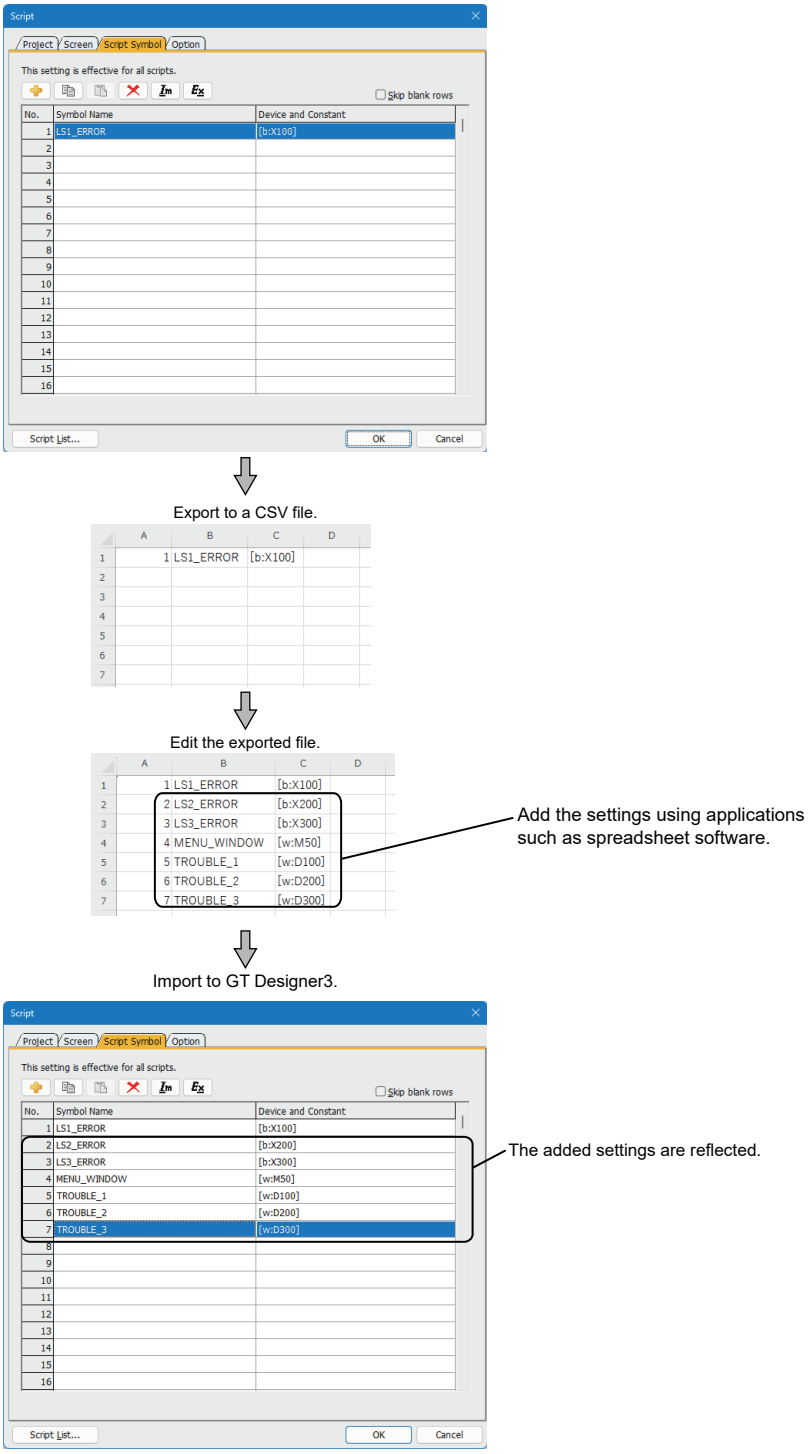
Editing method of scripts

You can edit scripts in the exported Unicode text file or CSV file using spreadsheet software and other software.

The edited Unicode text file or CSV file can be imported and read to GT Designer3.

Editing the exported file

Example) When script settings are exported into and imported from a CSV file



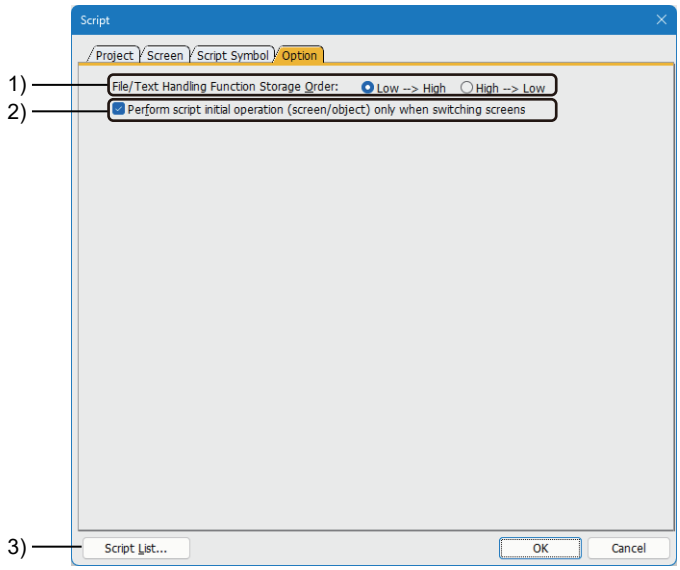
When 0 is set at the beginning of the symbol name, device, or constant, 0 at the beginning may be deleted depending on the function of the application for editing files (spreadsheet software and other software).

Pay attention to the above for editing exported files.

68.5.4 [Option] tab

GT37 SoftGOT3000

Set the data storage order of devices and processing at screen switching.



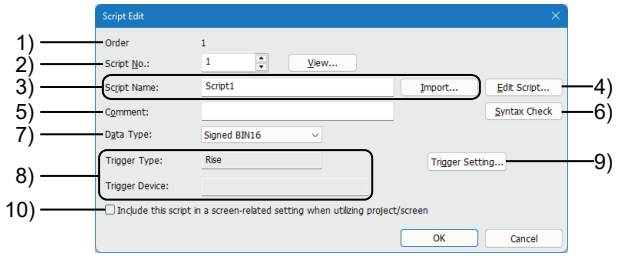
Item		Description
1)	[File/Text Handling Function Storage Order]	Select the order of data storage when using the file operation function or string operation function. • [Low-->High]: Select this item to store data in the order of lower to upper data. • [High-->Low]: Select this item to store data in the order of upper to lower data.

Item			Description
2)	[Perform script initial operation (screen/object) only when switching screens]	Selected	Enables the initial operation of the screen script or the object script upon screen switching only. The screen scripts and object scripts, which the following trigger type is set in, are executed upon screen switching. • [Rise] Executes the script when the trigger device turns on after screen switching or other processes. • [Fall] Executes the script when the trigger device turns off after screen switching or other processes. • [Rise/Fall] Executes the script when the trigger device turns on or off after screen switching or other processes. Example) When a screen script ([Trigger Type]: [Rise], [Trigger Device]: X1000) is set for base screen 2 After base screen 1 is switched to base screen 2, if the trigger device (X1000) turns on, the screen script set for base screen 2 is executed.  The setting determines the process that triggers the initial operation of the script as shown below. • Screen switching The scripts, which are set for the screen displayed after screen switching, are executed.
		Deselected	• Screen switching The scripts, which are set for the screen displayed after screen switching, are executed. • Security switching • Language switching • System language switching • Station number switching When the station number switching devices are set by screen type, the scripts that are set for the screens of the target screen type are executed. • Offset switching Only the screen scripts are executed. On a screen having a script setting, when offset switching occurs in any device of the screen, the script is executed. • Buffer memory unit No. switching • When object script "redraw_screen()" is executed You can disable the initial operation of the scripts by using the GOT internal devices. • Project script and screen script: GS386 • Object script: GS389 ☞ Page 3623 List of read devices
3)	[Script List] button		Displays the [Script List] dialog. Displays the list of the registered scripts. You can register scripts additionally and edit the scripts in the list. ☞ Page 2417 [Script File List] dialog

68.6 [Script Edit] dialog (for project scripts and screen scripts)

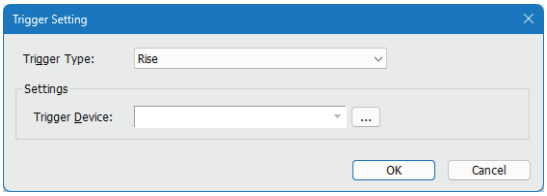
GT37 SoftGOT3000

This dialog is used for setting a project script or screen script.
For each script setting, set a trigger condition and a script.

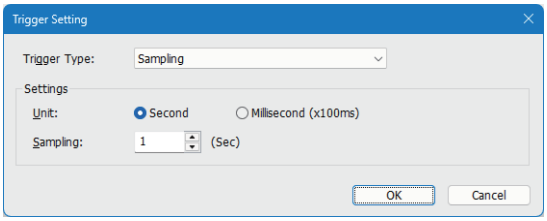


Item		Description
1)	[Order]	Displays the execution order of the script being edited.
2)	[Script No.]	Set the registration number of the script that is to be executed by the script being edited. Click the [View] button to check the registration number of other scripts. ☞ Page 2417 [Script File List] dialog
3)	[Script Name]	Set the name of the script to be executed. The following symbols cannot be entered into [Script Name]. • " * / \ : < > ? | Click the [Import] button to read the script edited in the text file format to GT Designer3. When a script file is imported, the file name excluding the extension (.TXT) is displayed at [Script Name].
4)	[Edit Script] button	Edit the script selected in [File Name] or [Script Name] with the script editor. ☞ Page 2415 [Edit Script(script name)] dialog
5)	[Comment]	Set the comment (note) of the script being edited. Up to 200 characters can be set.
6)	[Syntax Check] button	Checks the syntax of the script selected in [File Name] or [Script Name]. The available device type and device range are also checked. ☞ Page 2436 Messages to be displayed at the syntax check
7)	[Data Type]	Select the data type of the script to be executed. The following shows selectable items. • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
8)	[Trigger Type], [Trigger Device]	Displays the operating condition and trigger device of the script which are set in the [Trigger Setting] dialog.

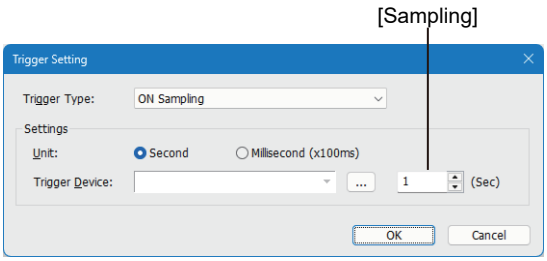
Item		Description
9)	[Trigger Setting] button	Click the [Trigger Setting] button to display the [Trigger Setting] dialog. ☞ Page 968 Trigger type settings



When [Trigger Type] is set to [Rise]



When [Trigger Type] is set to [Sampling]



When [Trigger Type] is set to [ON Sampling]

• [Trigger Type]
Select the operating condition of the script.
The following shows selectable items.
[Ordinary]
[ON]
[OFF]
[Rise]
[Fall]
[Rise/Fall]
[Sampling]
[ON Sampling]
[OFF Sampling]
[When closing a screen] (Available to the screen script only)
• [Trigger Device]
Set this item when [Trigger Type] is set to [ON], [OFF], [Rise], [Fall], [Rise/Fall], [ON Sampling], or [OFF Sampling].
Set a trigger device to execute the script.
• [Unit]
Set this item when [Trigger Type] is set to [Sampling], [ON Sampling], or [OFF Sampling].
Select the unit of the cycle time to execute the script.
The following shows selectable items.
[Second]
[Millisecond (x100ms)]
• [Sampling]
Set this item when [Trigger Type] is set to [Sampling], [ON Sampling], or [OFF Sampling].
Set the cycle time to execute the script.
The setting range depends on the setting of [Unit].
When [Unit] is set to [Second], the setting range is [1] second to [3600] seconds.
When [Unit] is set to [Millisecond (x100ms)], the setting range is [1] × 100 ms to [600] × 100 ms.
The counting of the cycle time starts when the trigger condition is satisfied.
When the satisfied trigger condition becomes unsatisfied, the count of the cycle time is reset.
Example) When [Trigger Type] is set to [ON Sampling] and the cycle time is set to 10 seconds
After the trigger device has been on for 10 seconds, the script runs.
If the trigger device turns off before a lapse of 10 seconds, the script does not run.

Item		Description
10)	[Include this script in a screen-related setting when utilizing project/screen]	This item is displayed only when this dialog has been brought up from the [Project] tab of the [Script] dialog. Utilizes this script as a screen-related setting when the project or screen utilization is executed.

68.6.1 Behavior of the script for which [Trigger Type] is set to [When closing a screen]

Such a script runs immediately before the relevant screen is switched or closed.

The screen will not be switched until the script execution is complete.

If an error or a timeout occurs during script execution, the screen is switched upon the occurrence of the event.

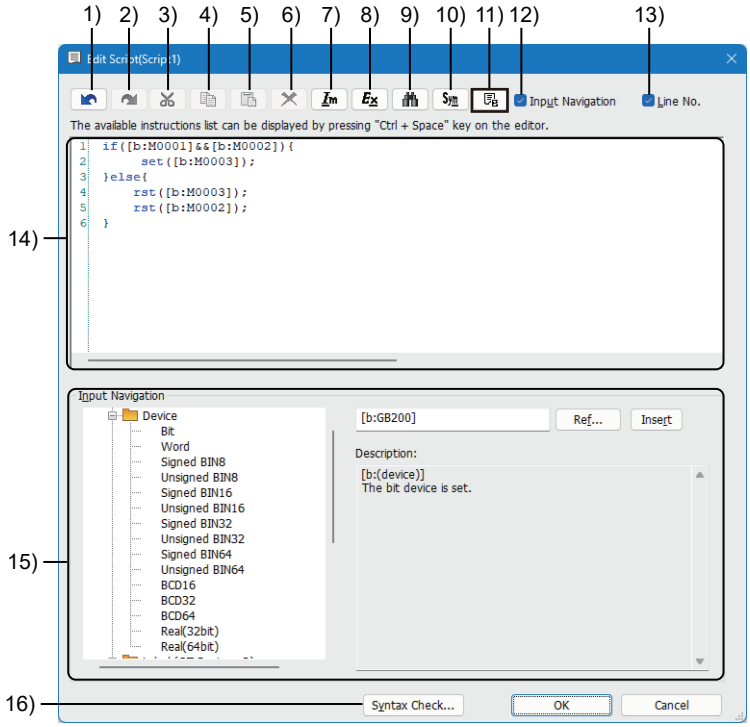
When [Trigger Type] is set to [When closing a screen], take the following precautions.

Item	Description
Response speed for screen switching	Depending on the controller device used in the script, there may be a delay in response when switching screens.
Restrictions during script execution	When a trigger type other than [When closing a screen] is set for a script, the script does not run if its trigger condition is satisfied during the execution of another script whose trigger type is [When closing a screen]. The GOT can accept inputs from a touch switch or others.
State of not notifying of an error	An error is not notified in the state where the communication is unestablished for reasons such as a cable disconnection or screen switching.

68.7 [Edit Script(script name)] dialog

GT37 SoftGOT3000

This dialog is used for setting a project script, screen script, script part, script block, or object script.
Edit, import, or export a script.



Item		Description
1)	[Undo] button	Returns the editing operation of the script to the previous step.
2)	[Redo] button	Redoes the returned operation.
3)	[Cut] button	Cuts the selected character strings.
4)	[Copy] button	Copies the selected character strings.
5)	[Paste] button	Pastes the copied or cut character strings.
6)	[Delete] button	Deletes the selected character strings.
7)	[Import] button	Displays the [Open] dialog. Read a script from a text file.
8)	[Export] button	Displays the [Save As] dialog. Save the script in the script edit area to a text file. If the script contains multi-language characters, use the Unicode text file format. For the precautions for using a Unicode text file, refer to the following. ☞ Page 3669 Precautions for using Unicode text file
9)	[Search] button	Displays the [Search] dialog. Input the text to be searched and select the search direction ([Up], [Down]). Then click the [Search Next] button to search the input text.
10)	[Symbol] button	Displays the dialog for selecting a script symbol to be inserted. The script symbol is inserted into the cursor position in the script edit area.*1
11)	[Script Block] button	Displays the [Script List] dialog. Set the script block in the [Script Block] tab. ☞ Page 2419 [Script Block] tab
12)	[Input Navigation]	Displays [Input Navigation] in the dialog.
13)	[Line No.]	Displays line numbers in the script edit area.
14)	Script edit area	Area to edit a script. The following editing operations can be performed. • Cutting and pasting the selected character string by drag and drop motion • Copying and pasting the character strings selected while the [Ctrl] key is being pressed by drag and drop motion

Item			Description
15)	[Input Navigation]	Input navigation tree	Insert a device or function to the script. Select an item from the input navigation tree to display its expression in the input area. Click the [Insert] button to insert the entry in the input area into the cursor position in the script edit area.  Select a device or function to be inserted. The expression of the selected item appears in the input area.
		Input area	Make an entry to be inserted to the script.
		[Ref] button	This item appears when a device, label, tag, or script block is selected in the input navigation tree. When a device, label, or tag is selected, the setting dialog is displayed. The settings made in the dialog is reflected to the input area. To display the [Select CH No.] dialog, hold down the Shift key and click the [Ref] button. To specify a channel, label, or tag, bring up the relevant setting dialog from the [Select CH No.] dialog. ☞ Page 835 Setting a device in the device setting dialog When a script block is selected, the [Script File List] dialog is displayed. Select a script block from the list and click the [Insert] button to insert the script block name in the call statement in the input area. ☞ Page 2417 [Script File List] dialog
		[Insert] button	Inserts the entry in the input area into the cursor position in the script edit area.
		[Description]	Describes the expression and function of the item selected in the input navigation tree.
16)	[Syntax Check] button		Checks the syntax of the script being edited. The available device type and device range are also checked. ☞ Page 2436 Messages to be displayed at the syntax check

*1 The dialog to appear varies depending on the type of the script being edited.

Script	Reference
Project script	☞ Page 2421 [Script Symbol] dialog
Screen script	
Script block	
Script part	☞ Page 2426 [Script Parts Symbol] tab
Object script	☞ Page 2472 [Object Script Symbol] dialog

68.8 [Script File List] dialog

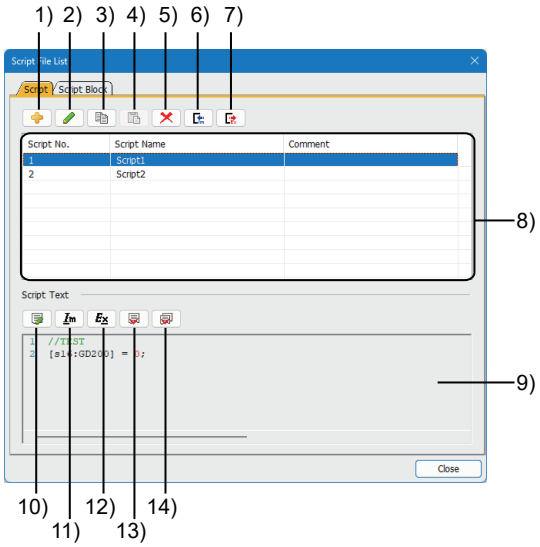
GT37 SoftGOT3000

This dialog is used for setting a project script or screen script.
Select [Common] → [Script] → [Script File List] from the menu to display the setting dialog.
Register scripts additionally and edit and delete the scripts in the list of the registered scripts.

Precautions

When a syntax check is done from the [Script File List] dialog, the data type is regarded as [Signed BIN16].
When executing a syntax check using a data type other than [Signed BIN16], first set a desired data type in the [Edit Script] dialog, then execute the syntax check from the script editor.

68.8.1 [Script] tab



Item		Description
1)	[Add] button	Adds a new script to the script list. ☞ Page 2418 [Script Setting] dialog
2)	[Edit] button	Edit the setting of the script selected in the script list. ☞ Page 2418 [Script Setting] dialog
3)	[Copy] button	Copies the script selected in the script list.
4)	[Paste] button	Pastes the copied script to the script list. ☞ Page 2418 [Script Setting] dialog
5)	[Delete] button	Deletes the script selected in the script list.
6)	[Import All] button	Imports all the text files stored in the specified location. The file name without the extension becomes the script name. If the same script name exists in the script list, the existing script name is overwritten. 
Item		Description
7)	[Export All] button	Exports all the scripts registered in the script list as text files. The exported text files are stored in the "Script" folder, which is created in a specified location. 8)	Script list	Displays the list of the registered scripts. The following operations can be performed on the selected row. • Copy: Ctrl + C • Paste: Ctrl + V • Delete: Delete
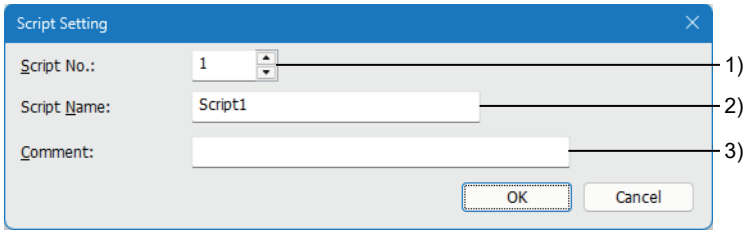
9)	Script preview	Displays the content of the script selected in the script list.
10)	[Edit Script] button	Edit the script selected in the script list with the script editor. ☞ Page 2415 [Edit Script(script name)] dialog
11)	[Import] button	Imports the script in the specified text file and overwrites the script selected in the script list. The file name without the extension becomes the script name.
12)	[Export] button	Exports the script selected in the script list as a text file to a specified location.
13)	[Syntax Check] button	Checks the script syntax of the selected script. If an error is detected, the relevant line number and error details are displayed. The available device type and device range are also checked. ☞ Page 2436 Messages to be displayed at the syntax check
14)	[Check All] button	Checks the script syntax of all the registered scripts. If an error is detected, the relevant line number and error details are displayed. The available device type and device range are also checked. ☞ Page 2436 Messages to be displayed at the syntax check

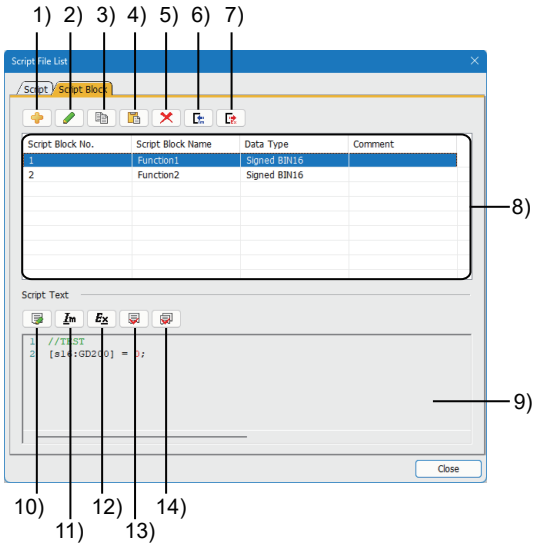
[Script Setting] dialog

Set the No., name, and comment of the script selected in the script list.



Item		Description
1)	[Script No.]	Set the script No. The setting range is [1] to [32767].
2)	[Script Name]	Up to 32 characters can be set for a script name. The following symbols cannot be entered. • " * / \ : < > ? |
3)	[Comment]	Up to 200 characters can be entered for a comment.

68.8.2 [Script Block] tab



Item		Description
1)	[Add] button	Adds a new script to the script block list. ☞ Page 2418 [Script Setting] dialog
2)	[Edit] button	Edit the setting of the script selected in the script block list. ☞ Page 2418 [Script Setting] dialog
3)	[Copy] button	Copies the script selected in the script block list.
4)	[Paste] button	Pastes the copied script to the script block list. ☞ Page 2418 [Script Setting] dialog
5)	[Delete] button	Deletes the script selected in the script block list.
6)	[Import All] button	Imports all the text files stored in the specified location. The file name without the extension becomes the script block name. If the same script block name exists in the script block list, the existing script block name is overwritten. 7)	[Export All] button	Exports all the scripts registered in the script block list as text files. The exported text files are stored in the "scriptBlock" folder, which is created in a specified location. 8)	Script block list	Displays the list of the registered script blocks. The following shows the display items. • Script block No. • Script block name • Data type • Comment The following operations can be performed on the selected row. • Copy: Ctrl + C • Paste: Ctrl + V • Delete: Delete
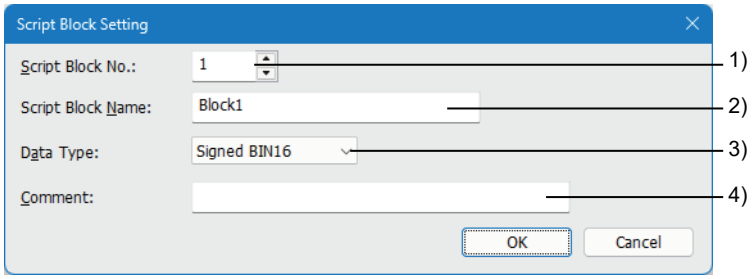
9)	Script preview	Displays the content of the script selected in the script block list.
10)	[Edit Script] button	Edit the script selected in the script block list with the script editor. ☞ Page 2415 [Edit Script(script name)] dialog

Item		Description
11)	[Import] button	Imports the script in the specified text file and overwrites the script selected in the script block list. The file name without the extension becomes the script block name.
12)	[Export] button	Exports the script selected in the script block list as a text file to a specified location.
13)	[Syntax Check] button	Checks the script syntax of the selected script block. If an error is detected, the relevant line number and error details are displayed. The available device type and device range are also checked. ☞ Page 2436 Messages to be displayed at the syntax check
14)	[Check All] button	Checks the script syntax of all the registered script blocks. If an error is detected, the relevant line number and error details are displayed. The available device type and device range are also checked. ☞ Page 2436 Messages to be displayed at the syntax check

[Script Block Setting] dialog

Set the No., name, and comment of the script selected in the script list.



Item		Description
1)	[Script Block No.]	Set the script block No. The setting range is [1] to [32767].
2)	[Script Block Name]	Up to 32 characters can be set for a script block name. The following symbols cannot be entered. • ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ { | } ~
3)	[Data Type]	Set the data type of the script block. The following shows the setting range. • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
4)	[Comment]	Up to 200 characters can be entered for a comment.

68.9 [Script Symbol] dialog

GT37 SoftGOT3000

This dialog is used for setting a project script or screen script.

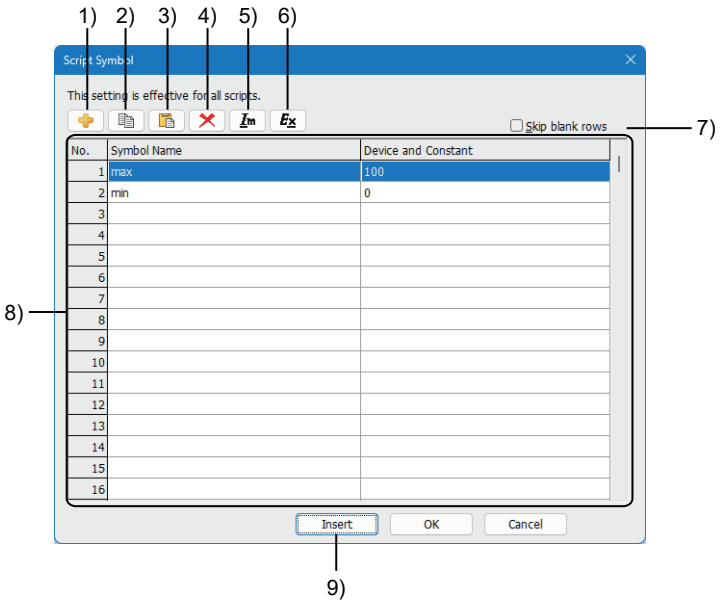
Select [Common] → [Script] → [Script Symbol] from the menu to display the setting dialog.

Register character strings as script symbols.

Devices and constants in a script can be substituted by the registered character strings.

The set script symbols are usable in project scripts and screen scripts.

It may take a long time to select communication in GT Designer3 or save projects due to this setting.



Item		Description
1)	[Add] button	Displays the [Add Script Symbol] dialog.  • [No.] Set a number for the script symbol to be added. The setting range is [1] to [10000]. • [Symbol Name] Set a character string to be described in a script. Up to 32 characters can be entered. However, the following symbol names cannot be set. Symbol name containing "#" Same symbol name as another script symbol • [Device and Constant] Set a device or constant for the symbol name. Up to 32 characters can be entered.
2)	[Copy] button	Copies the setting from the row selected in the script symbol list. Multiple rows can be copied at once. When [Skip blank rows] is selected, the settings in the hidden rows are also copied. The copied settings can be pasted to another script symbol setting dialog.

Item			Description
3)	[Paste] button		Pastes the copied setting to the selected row. When [Skip blank rows] is selected, the [Paste Symbol] dialog is displayed.  When pasting a setting to one row  When pasting settings to multiple rows • [Symbol No.] Set a symbol number for the destination row. The setting range is [1] to [10000]. • [First Symbol No.] Set a symbol number for the first destination row. The setting range is [1] to [10000].
4)	[Delete] button		Deletes the setting from the selected row. You can delete the settings from multiple rows at one time.
5)	[Import] button		Displays the [Open] dialog. Read the script symbol settings from a Unicode text file or CSV file.
6)	[Export] button		Displays the [Save As] dialog. Save the script symbol settings to a Unicode text file or CSV file. If multi-language characters are used in the settings, use the Unicode text file format. For the precautions for using a Unicode text file or CSV file, refer to the following. ☞ Page 3668 Precautions for using CSV file ☞ Page 3669 Precautions for using Unicode text file
7)	[Skip blank rows]		Displays only the rows in which script symbols have been registered.
8)	Script symbol list	[No.]	Lists the registered script symbols. [Symbol Name] and [Device and Constant] are editable. [No.] is a row number. Clicking a row number selects the relevant row. The following operations can be performed on the selected row. • Copy: Ctrl + C • Paste: Ctrl + V • Delete: Delete
		[Symbol Name]	Set a character string to be described in a script. Up to 32 characters can be entered. However, the following symbol names cannot be set. Symbol name containing "#" Same symbol name as another script symbol
		[Device and Constant]	Set a device or constant for the symbol name. Up to 32 characters can be entered.
9)	[Insert] button		This item appears when this dialog is brought up from the [Edit Script(script name)] dialog. Inserts the selected script symbol into the script edit area in the [Edit Script(script name)] dialog.

Point

Editing method of scripts

You can edit scripts in the exported Unicode text file or CSV file using spreadsheet software and other software.

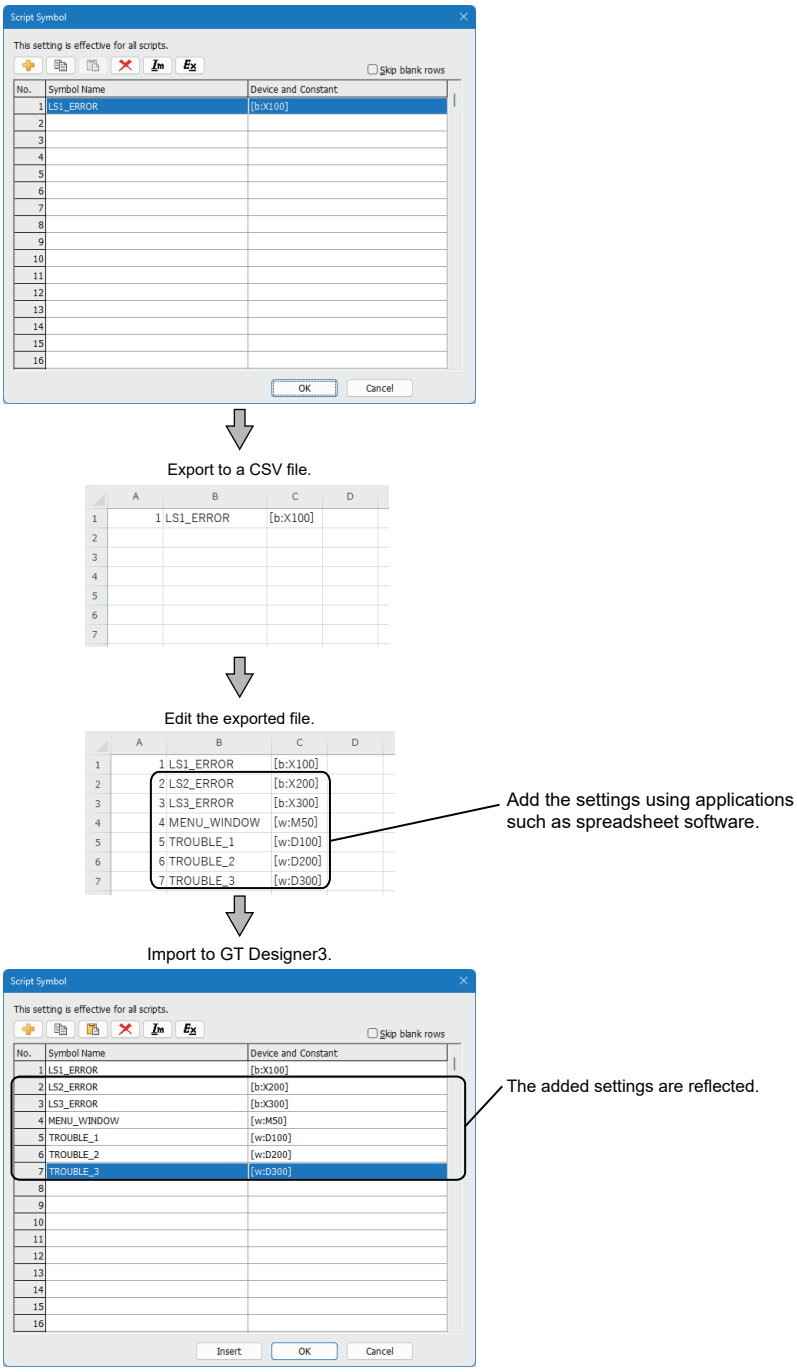
The edited Unicode text file or CSV file can be imported and read to GT Designer3.

Editing the exported file

When 0 is set at the beginning of the symbol name, device, or constant, 0 at the beginning may be deleted depending on the function of the application for editing files (spreadsheet software and other software).

Pay attention to the above for editing exported files.

Example) When script settings are exported into and imported from a CSV file



68.10 [Script Parts] dialog

GT37 SoftGOT3000

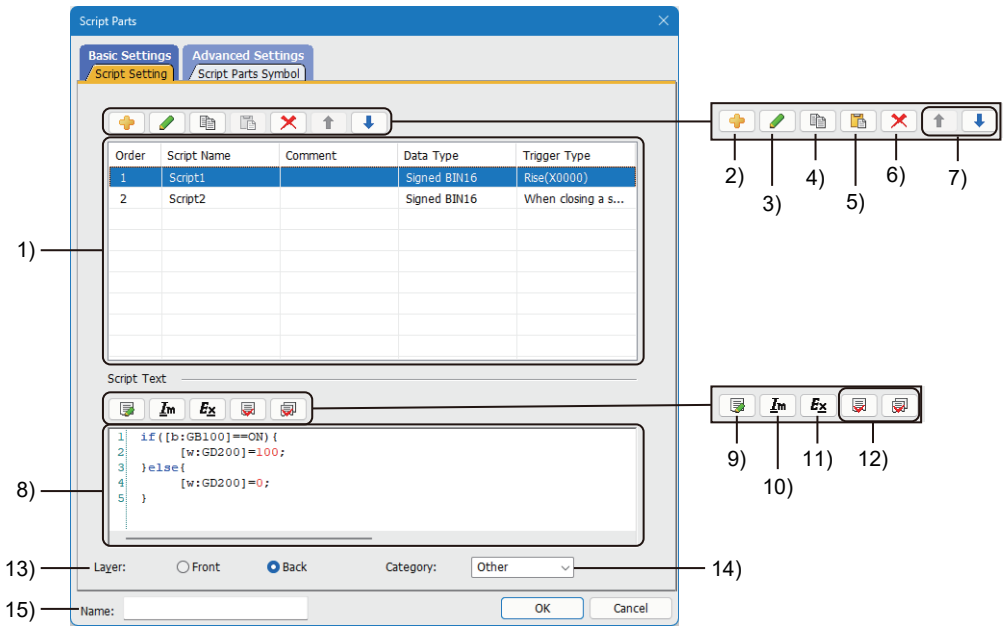
This dialog is used for setting a script part.

1. Select [Object] → [Script Parts] from the menu.
2. Click the position to place a script parts object.
3. Double-click the script parts object to display the setting dialog.

☞ Page 2424 [Script Setting] tab
☞ Page 2426 [Script Parts Symbol] tab

68.10.1 [Script Setting] tab

Set a script trigger condition and a script.



Item		Description
1)	Script setting list	Lists the scripts set for the current script parts object.
2)	[Add] button	Displays the [Script Edit] dialog. Add a new script setting to the list. ☞ Page 2428 [Script Edit] dialog (for script parts)
3)	[Edit] button	Displays the [Script Edit] dialog. Edit the selected script setting. ☞ Page 2428 [Script Edit] dialog (for script parts)
4)	[Copy] button	Copies the selected script setting.
5)	[Paste] button	Pastes the copied script setting to the last line of the list.
6)	[Delete] button	Deletes the selected script setting.
7)	[Up] button, [Down] button	Changes the execution order of the selected script setting.
8)	Script preview	Displays a preview of the script set for the selected script setting.
9)	[Edit Script] button	Displays the [Edit Script(script name)] dialog. Edit the script. ☞ Page 2428 [Script Edit] dialog (for script parts)
10)	[Import] button	Displays the [Open] dialog. Read a script from a text file. The name of the read text file is set as the script name.
11)	[Export] button	Displays the [Save As] dialog. Save the previewed script to a text file.

Item		Description
12)	[Syntax Check] button, [Check All] button	Performs a syntax check on the previewed script or all the scripts set for the script parts object. If an error is detected, the relevant line number and error details are displayed. The available device type and device range are also checked. ☞ Page 2436 Messages to be displayed at the syntax check
13)	[Layer]	Select the layer to arrange the object on. The following shows selectable items. • [Front] • [Back]
14)	[Category]	Select the category to assign the object. ☞ Page 1121 Managing figures and objects by category
15)	[Name]	Set the object name. The name is displayed in the [Data View] window, property sheet, and others. The name can also be changed in other tabs. Up to 100 characters can be entered.

68.10.2 [Script Parts Symbol] tab

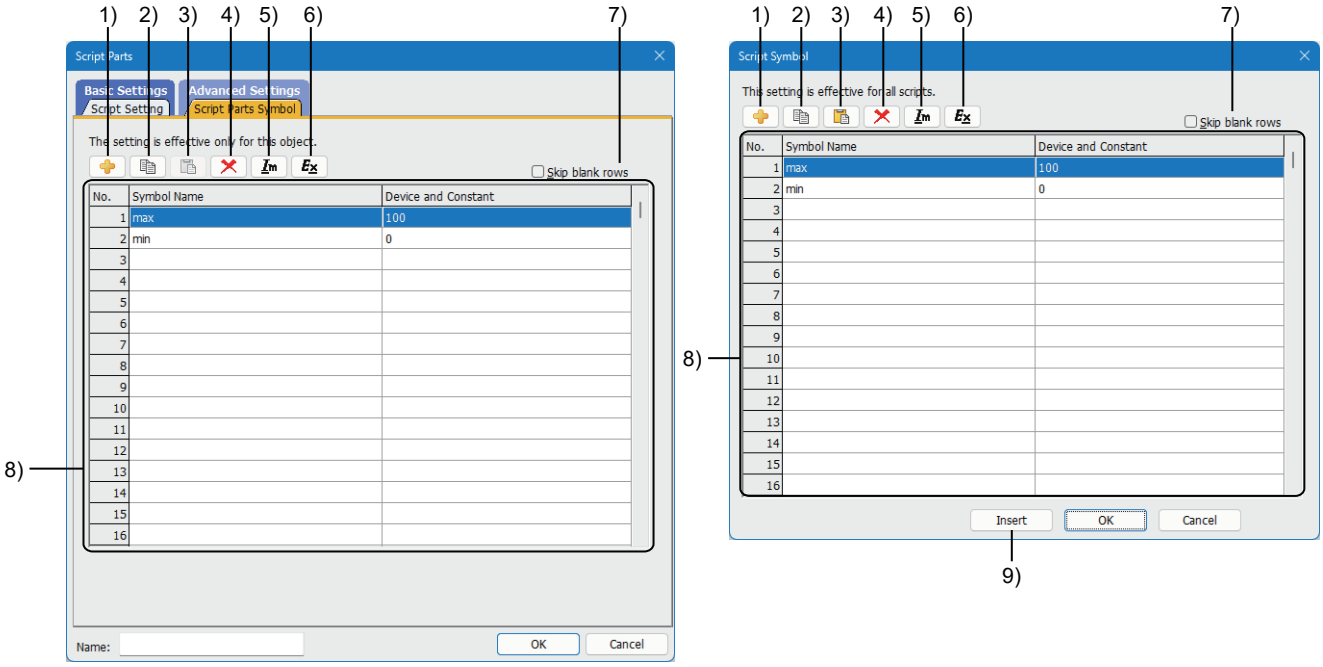
Register character strings as script parts symbols.

Devices and constants in a script can be substituted by the registered character strings.

The set script parts symbols are usable only in the scripts of the current script parts object.

It may take a long time to select communication in GT Designer3 or save projects due to this setting.

Display the [Script Parts Symbol] dialog from the [Edit Script(script name)] dialog.

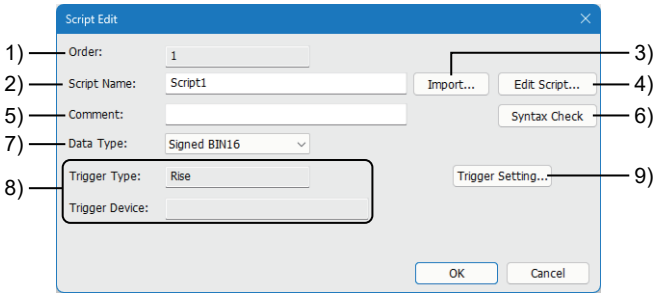


Item		Description
1)	[Add] button	This button is available when [Skip blank rows] is selected. Displays the [Add Script Parts Symbol] dialog.  • [No.] Set a number for the script symbol to be added. The setting range is [1] to [10000]. • [Symbol Name] Set a character string to be described in a script. Up to 32 characters can be entered. However, the following symbol names cannot be set. Symbol name containing "#" Same symbol name as another script symbol • [Device and Constant] Set a device or constant for the symbol name. Up to 32 characters can be entered.
2)	[Copy] button	Copies the setting from the row selected in the script symbol list. Multiple rows can be copied at once. When [Skip blank rows] is selected, the settings in the hidden rows are also copied. The copied settings can be pasted to another script symbol setting dialog.

Item			Description
3)	[Paste] button		Pastes the copied setting to the selected row. When [Skip blank rows] is selected, the [Paste Symbol] dialog is displayed.  When pasting a setting to one row  When pasting settings to multiple rows • [Symbol No.] Set a symbol number for the destination row. The setting range is [1] to [10000]. • [First Symbol No.] Set a symbol number for the first destination row. The setting range is [1] to [10000].
4)	[Delete] button		Deletes the setting from the selected row. You can delete the settings from multiple rows at one time.
5)	[Import] button		Displays the [Open] dialog. Read the script symbol settings from a Unicode text file or CSV file.
6)	[Export] button		Displays the [Save As] dialog. Save the script symbol settings to a Unicode text file or CSV file. If multi-language characters are used in the settings, use the Unicode text file format. For the precautions for using a Unicode text file or CSV file, refer to the following. ☞ Page 3668 Precautions for using CSV file ☞ Page 3669 Precautions for using Unicode text file
7)	[Skip blank rows]		Displays only the rows in which script symbols have been registered.
8)	Script symbol list	[No.]	Lists the registered script symbols. [Symbol Name] and [Device and Constant] are editable. [No.] is a row number. Clicking a row number selects the relevant row. The following operations can be performed on the selected row. • Copy: Ctrl + C • Paste: Ctrl + V • Delete: Delete
		[Symbol Name]	Set a character string to be described in a script. Up to 32 characters can be entered. However, the following symbol names cannot be set. Symbol name containing "#" Same symbol name as another script symbol
		[Device and Constant]	Set a device or constant for the symbol name. Up to 32 characters can be entered.
9)	[Insert] button		Inserts the selected script symbol into the script edit area in the [Edit Script(script name)] dialog.

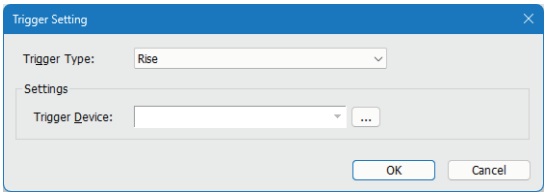
68.11 [Script Edit] dialog (for script parts)

This dialog is used for setting a script part.

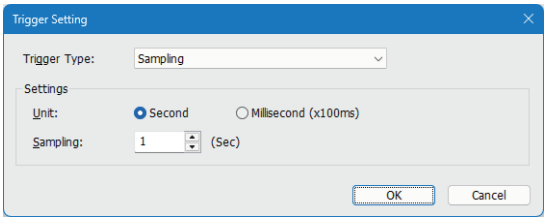


Item		Description
1)	[Order]	Execution order of the current script.
2)	[Script Name]	Name of the current script. The following symbols cannot be entered into [Script Name]. • " * / \ : < > ? |
3)	[Import] button	Displays the [Open] dialog. Read a script from a text file. The name of the read text file is set as the script name.
4)	[Edit Script] button	Displays the [Edit Script(script name)] dialog. Edit the script. ☞ Page 2415 [Edit Script(script name)] dialog
5)	[Comment]	Set the comment (note) of the script being edited. Up to 32 characters can be set.
6)	[Syntax Check] button	Checks the syntax of the script for possible errors. The available device type and device range are also checked. ☞ Page 2436 Messages to be displayed at the syntax check
7)	[Data Type]	Select the data type of the script to be executed. The following shows selectable items. • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
8)	[Trigger Type], [Trigger Device]	Displays the script trigger type or trigger device set in the [Trigger Setting] dialog.

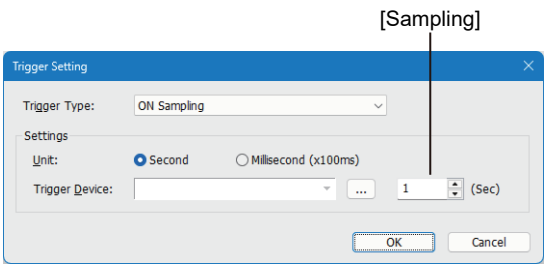
Item		Description
9)	[Trigger Setting] button	Displays the [Trigger Setting] dialog. Set a script trigger condition.



When [Trigger Type] is set to [Rise]



When [Trigger Type] is set to [Sampling]



When [Trigger Type] is set to [ON Sampling]

• [Trigger Type]
Select the operating condition of the script.
The following shows selectable items.
[Ordinary]
[ON]
[OFF]
[Rise]
[Fall]
[Rise/Fall]
[Sampling]
[ON Sampling]
[OFF Sampling]
[When closing a screen]
• [Trigger Device]
Set this item when [Trigger Type] is set to [ON], [OFF], [Rise], [Fall], [Rise/Fall], [ON Sampling], or [OFF Sampling].
Set a trigger device to execute the script.
• [Unit]
Set this item when [Trigger Type] is set to [Sampling], [ON Sampling], or [OFF Sampling].
Select the unit of the cycle time to execute the script.
The following shows selectable items.
[Second]
[Millisecond (x100ms)]
• [Sampling]
Set this item when [Trigger Type] is set to [Sampling], [ON Sampling], or [OFF Sampling].
Set the cycle time to execute the script.
The setting range depends on the setting of [Unit].
When [Unit] is set to [Second], the setting range is [1] second to [3600] seconds.
When [Unit] is set to [Millisecond (x100ms)], the setting range is [1] × 100 ms to [600] × 100 ms.
The counting of the cycle time starts when the trigger condition is satisfied.
When the satisfied trigger condition becomes unsatisfied, the count of the cycle time is reset.
Example) When [Trigger Type] is set to [ON Sampling] and the cycle time is set to 10 seconds
After the trigger device has been on for 10 seconds, the script runs.
If the trigger device turns off before a lapse of 10 seconds, the script does not run.

68.11.1 Behavior of the script for which [Trigger Type] is set to [When closing a screen]

Such a script runs immediately before the relevant screen is switched or closed.

The screen will not be switched until the script execution is complete.

If an error or a timeout occurs during script execution, the screen is switched upon the occurrence of the event.

When [Trigger Type] is set to [When closing a screen], take the following precautions.

Item	Description
Response speed for screen switching	Depending on the controller device used in the script, there may be a delay in response when switching screens.
Restrictions during script execution	When a trigger type other than [When closing a screen] is set for a script, the script does not run if its trigger condition is satisfied during the execution of another script whose trigger type is [When closing a screen]. The GOT can accept inputs from a touch switch or others.
	If a script is executed with [When closing a screen] set as the trigger type while communication is not established, no retry will be performed because the screen has already switched at the next execution cycle.
State of not notifying of an error	An error is not notified in the state where the communication is unestablished for reasons including a cable disconnection or screen switching.

68.12 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for project scripts, screen scripts, and script parts as required.

The following shows the functions that are available by configuring the relevant settings.

68.12.1 GOT internal device

☞ Page 3581 GOT special register (GS)

○: Applicable, -: Not applicable

Function	GOT special register (GS)	Project script	Screen script	Script part	Script block
Notifying that a script error has occurred.	GS14.b0	○	○	○	○
Notifying that a BCD error has occurred.	GS14.b7	○	○	○	○
Notifying that a zero division error has occurred.	GS14.b8	○	○	○	○
Notifying that a communication error (including access to an invalid device) has occurred.	GS14.b12	○	○	○	○
Storing the start device number of the devices where the latest error record is stored. The devices range from GS16 to GS47.	GS15	○	○	-	○
Storing the script error records (including script numbers and error codes).	GS16 to GS47	○	○	-	○
Storing the device number of the device where the latest script execution record is stored. The device is in the range of GS49 to GS79.	GS48	○	○	-	○
Storing the script numbers of the executed scripts.	GS49 to GS79	○	○	-	○
Notifying that a file operation function is being executed.	GS154.b0	○	○	○	○
Notifying that a file operation function error has occurred.	GS154.b15	○	○	○	○
Storing a number showing the GOT data registers (GD) where the latest error record is stored. The GD devices are specified with GS392 and GS394.	GS157	○	○	○	○
Storing a number showing the GOT data registers (GD) where the latest script execution record is stored. The GD devices are specified with GS396 and GS398.	GS158	○	○	○	○
Notifying occurrence of an error while the integer-real number conversion is processed.	GS260.b14	○	○	○	○
Notifying the completion of the integer-real number conversion.	GS260.b15	○	○	○	○
Storing the error code of an error that occurred while the integer-real number conversion is processed.	GS261	○	○	○	○
Clearing script error records as shown below. • GS14.b0, b7, b8, and b12 store 0. • GS15 stores -1. • GS16 to GS47 store 0.	GS384.b0	○	○	○	○
Re-executing the script aborted due to an error.	GS384.b1	○	○	○	○
Setting the monitoring time for one script.	GS385	○	○	○	○
Controlling whether to run a script upon screen switching or other applicable processes. The applicable script trigger types are as follows. • [Rise] • [Fall] • [Rise/Fall]	GS386	○	○	○	○
Specifying a data storage order when a file operation function is used.	GS390	○	○	○	○
Storing the detailed script error records.	GS392 GS394 GS395	○	○	○	○

Function	GOT special register (GS)	Project script	Screen script	Script part	Script block
Storing the detailed script execution records.	GS396 GS398 GS399	○	○	○	○
Executing an integer-real number conversion.	GS460 GS461 GS462 GS463 GS464	○	○	○	○

Precautions

While the GOT displays a screen in which no script is set, the following operations are not available.

- Clearing script error data or executing a script stopped due to an error by using the Script Common Control (GS384)

☞ Page 3631 Script Common Control (GS384)

Perform the above operations while the GOT displays a screen in which a script is set.

Monitoring time setting

Specify the monitoring time of a script with GS385.

If a script does not end after a lapse of the specified monitoring time, the script is aborted.

The setting range is 1 second to 300 seconds. (Units of 1 second)

If the set value falls outside this range, 10 seconds are assumed.

If error code 15 is output during script execution, specify a longer monitoring time with GS385.

Precautions

For functions that take a long time to process, such as the folder copy function (file_xcopy), processing may not complete and timeout may not occur even after the monitoring time has elapsed.

In such cases, take a sufficiently long script monitoring time or divide the process into as small units as possible.

Initial operation setting

Use GS386 to set whether to run a script upon screen switching or other applicable processes.

When GS386 stores 0: Runs the script upon an applicable process.

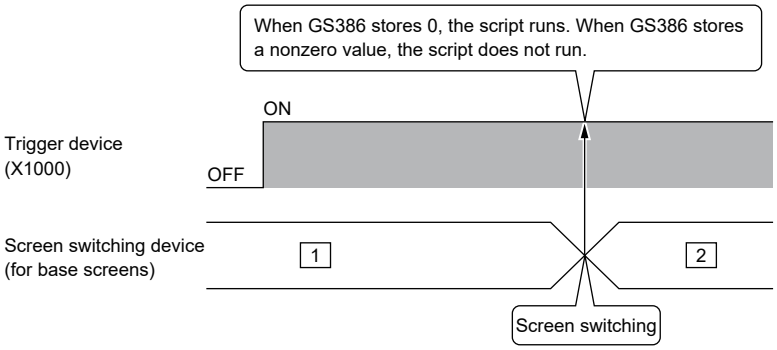
When GS386 stores a nonzero value: Does not run the script upon an applicable process.

This setting is applied to the project scripts, screen scripts, and script parts where the following trigger types are set.

Trigger type	When running a script upon an applicable process
[Rise]	When the trigger device is on, the script runs upon screen switching or other applicable processes.
[Fall]	When the trigger device is off, the script runs upon screen switching or other applicable processes.
[Rise/Fall]	When the trigger device is on or off, the script runs upon screen switching or other applicable processes.

Ex.

When a screen script ([Trigger Type]: [Rise], [Trigger Device]: X1000) is set for base screen 2



The following shows the processes upon which a script runs.

Script type	Process	Remarks
Project script	When the GOT is powered on or when the GOT returns from offline	—
Screen script Script part	Screen switching	The scripts, which are set for the screen displayed after screen switching, are executed.
	Security switching*1	—
	Language switching*1	—
	System language switching*1	—
	Station number switching*1	When the station number switching devices are set by screen type, the scripts that are set for the screens of the target screen type are executed.
	Offset switching*1	On a screen having a script setting, when offset switching occurs in any device of the screen, the script is executed.
	Buffer memory unit No. switching*1	—
	When the object script "redraw_screen()" is executed*1	—

*1 When [Perform script initial operation (screen/object) only when switching screens] is deselected on the [Option] tab in the [Script] dialog, the script runs upon the process.

☞ Page 2410 [Option] tab

68.13 Troubleshooting

GT37 SoftGOT3000

Scripts do not display error messages when an error occurs. Stopping the script where an error has occurred prevents other scripts and monitor functions from stopping. Therefore, every script must be debugged following the procedures as shown below.

68.13.1 Simulation using a general C language compiler or debugger

Since scripts and C language are similar, you can simulate the scripts by making minor corrections using a general C language compiler or debugger.
Complicated scripts including many control statements can be debugged easily by using them.
The following shows the procedure to simulate scripts using a general C language compiler or debugger.

1. Change a script file for GOTs (extension.txt) into a C language source file (extension.c).

• Change of the file extension: text1.txt → text1.c

2. Open the C language source file in a commercially-available text editor and create a frame with "main(){}".
Describe "#include<stdio.h>" at the beginning.

• Additional description of "main" and "include"

```
Additional description→ #include<stdio.h>
Additional description→ main(){
                          [w:TMP0001]=0;
                          while([w:TMP0000]<[w:D100]){
                            if(!(([w:TMP0000]-1900)%4)){
                              [w:TMP0001]=[w:TMP0001]+1;
                           ••• (Omitted) •••
                        [w:TMP0010]=[w:TMP0002]+[w:TMP0003]+[w:TMP0004]-1;
                        [w:D200] = [w:TMP0010]%7;
Additional description→ }
```

3. Change the description method of devices (variables) from the one for scripts to the one for C language.
Using the following definitions to change the variables into the one for C language enables you to smoothly restore them into the GOT scripts.
Using the batch replacement function of a commercially-available text editor may be useful for the change as well.
Definition 1 [w: → _w
Definition 2 [b: → _b
Definition 3] → __

• Change of the description method of devices (variables)

```
                        #include<stdio.h>
                        main(){
Description change→      _wTMP0001__=0;
Description change→      while(_wTMP0000__<_wD100__){
Description change→          if(!((_wTMP0000__-1900)%4)){
Description change→          _wTMP0001__=_wTMP0001__+1;
                          ••• (Omitted) •••
Description change→     _wTMP0010__=_wTMP0002__+_wTMP0003__+_wTMP0004__-1;
Description change→     _wD200__ = _wTMP0010__%7;
                        }
```

4. For C language, variables to be used must be defined in advance.

Since only one data type can be set for one script, the same variable type of C language must be set for all the variables.
The following shows the data type of scripts.
If [BCD16], [BCD32], or [BCD64] is selected as the script data type, you cannot perform a simulation using the general C language compiler or debugger.

Data type of scripts	Variable type
Signed 16-bit binary	short
Unsigned 16-bit binary	unsigned short
Signed 32-bit binary	long
Unsigned 32-bit binary	unsigned long
Signed 64-bit binary	long long
Unsigned 64-bit binary	unsigned long long
BCD16	-
BCD32	
BCD64	
Real number (32 bits)	float
Real number (64 bits)	double

- Variable definition (auto variable declaration)

Description change→
Addition →
Addition →
Addition →
Addition →
	#include<stdio.h>
	void main(void){
	  unsigned short _wTMP0000__;
	  unsigned short _wTMP0001__;
	  unsigned short _wTMP0002__;
	  unsigned short _wD100__;
	  ••• (Omitted) •••
	_wTMP0001__=0;
	  while(_wTMP0000__<_wD100__){
	  if(!((_wTMP0000__-1900)%4)){
	  _wTMP0001__=_wTMP0001__+1;
	  ••• (Omitted) •••
	_wTMP0010__=_wTMP0002__+_wTMP0003__+_wTMP0004__-1;
	_wD200__ = _wTMP0010__%7;
	}

5. Perform a simulation with the general C language compiler or debugger.

The step run, variable watch, and other functions specific to the debugger can be used.
After completion of debugging, perform Step 1 to 4 in reverse order to restore the data into the GOT script file.

Precautions

- If [BCD16], [BCD32], or [BCD64] is selected as the script data type, you cannot perform a simulation using the general C language compiler or debugger.
- Since the set, rst, alt, bmov, and fmov statements are dedicated for scripts, you cannot perform a simulation using a general C language compiler or debugger.

Use assignment of 1 or 0 instead of the set or rst statement.

- When you use the system define (ON, OFF description) of the GOT as they are, the define for it must be added to the C language source file.
- The assignment delay which occurs when a script is executed on the GOT does not occur during a simulation using a general C language compiler or debugger.

Therefore, when performing a simulation, take a possibility of occurrence of assignment delays into consideration.

- By applying the measures above, a new program created using C language then debugged can be used as a GOT script.
- Offset device specification cannot be made in the above debugging process.

If you debug the offset specified device, it is necessary to set the corresponding device in advance.

68.13.2 Messages to be displayed at the syntax check

Dialog to be displayed at the syntax check

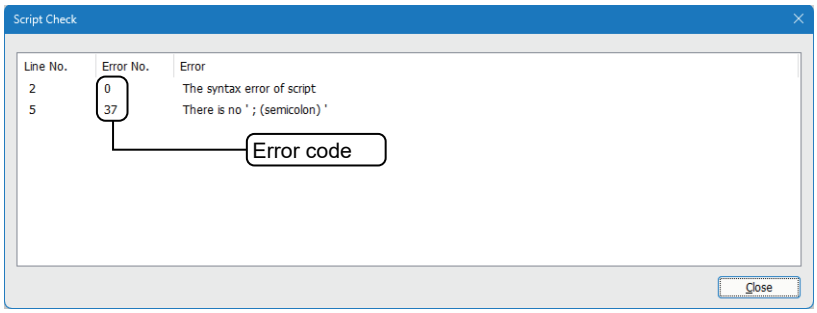
When you execute a syntax check, the [Script Check] dialog appears to display the error codes of the errors detected in a script.

For details on the error codes, refer to the following.

☞ Page 2436 List of syntax error codes

Ex.

When executing a syntax check on a project script



Some errors cannot be detected by the syntax check.

If any error which cannot be detected by the syntax check exists in the script, the error is detected when the script is executed on the GOT.

For the errors for the execution of a script and the corrective action on the GOT, refer to the following.

☞ Page 2439 Script execution errors and their corrective actions on the GOT

List of syntax error codes

The [Script Check] dialog displays the error codes listed below.

Error code*1	Description
0	The syntax error of script
1	The odd number address is set to the address
2	Extended file register (ER) setting error (inter-block settings)
3	Address is only a multiple of 16
4*2	Out of the range of device No. (displayed in HEX. Number)
5*2	Out of the range of device No. (displayed in DEC. Number)
6	Out of the range of device No. (displayed in OCT. Number address)
7	The setting is not executed with the multiple of 16 when specifying the bit device word
8	The setting is not within the range of 0 to 15 when specifying word device bit
9	The set device is out of the range or does not exist
11	Illegal address
14	Access to the device disabling word accessibility by using bit
15	Access to the device disabling bit accessibility by using bit
16	Octal device are set with odd number
17	The setting is not executed with the multiple of 16 when specifying the bit device word
20	The specified CPU does not exist
21	The specified Word type does not exist
22	A CPU not included with network settings has been specified
24	2 byte code cannot be used
25	No expression exist between {and}
26	There are a lot of expression or control structure
27	There are a lot of expression or control structure
28	case outside of switch
29	"Default" exist although there is no switch statement

Error code[*1]	Description
30	There are multiple "default" settings in switch
31	There are too many switch "case" statements
32	There are too many "switch break" statements
33	Too many nest of switch
34	System memory is insufficient
35	Parenthesis nest is deep
36	Syntax error
37	There is no ' ; (semicolon) '
38	There are invalid characters
39	File input is not specified
40	The specified input file does not exist
41	The nest of if/while is deep
45	The CPU incompatible with multi-CPU is specified as multi-CPU
46	The multi-specified station No. is incorrect
47	Network in GOT internal devices
48	Set network in GOT internal devices
101	No closed parenthesis
111	The bit device is specified for the device with indirect specification
112	The controller type of channel "n" is not specified or does not exist.[*3]
113	Channel number error
114	Common device cannot use channel
115	The read only variable is written
116	The write only variable is read
117	The read only property is written
118	The write only property is read
119	Unterminated string
120	There is EOF in string
121	The string is too long
122	Unicode translation error
124	Cannot use word type cast
125	There are invalid variables
126	There are invalid properties
127	There are invalid functions
128	There are invalid device type
129	Unterminated label
130	There is EOF in label
131	The label is too long
132	An unavailable label is set
133	The device of label is invalid
134	The device of label is not set
135	Label conversion error
136	Data types of the 1st argument and 2nd one are not equal in bmov/fmov
137	value out of range
138	can't use #pragma except in script head
139	#pragma folder_name_length redeclared
140	#pragma file_name_length redeclared
141	Bit device word cannot be used
142	Word device bit cannot be used
143	The format is invalid
144	The number of format designators is out of the valid range
145	The argument count is wrong
147	#pragma use_ptmp_length redeclared
148	PTMP cannot be used except for script parts

Error code[*1]	Description
149	An unavailable script block name is set
201	The device code is unknown
202	The device No. is beyond the valid range
203	Device No. + Device Points are beyond the valid range
204	The network No./Station No./CPU No. are beyond the valid range
205	The device name is invalid
206	The device No. notation is invalid
207	The address No. is invalid (not in even number or multiples of 8/16)
208	The device type is invalid
209	The GOT series is unknown
301	The GOT type does not support global labels/tags
302	The controller on channel "n" cannot use global labels/tags.[*3]
303	The global label/tag/label (GT Designer3) is too long
304	An invalid character is used for the global label/tag/label (GT Designer3)
305	Global label/tag/label (GT Designer3) syntax error
306	The global label/tag that is not array type is used for the continuous device setting
307	An unregistered OPC UA tag is set

*1 If the station number setting of the device is incorrect, the same error may be displayed twice.

*2 For devices in which decimal numbers and hexadecimal numbers are used for device numbers (including a coil (MB) of YASKAWA PLC CP-9200SH), error code 4 occurs if a number outside the address range is specified.

*3 The letter "n" indicates a channel number.

68.13.3 Script execution errors and their corrective actions on the GOT

The following shows how to check the errors and their error codes on the GOT.

Item	Description
Checking for the occurrence of an error	Check for the occurrence of the following errors. • Script error • BCD error • Zero division error • Communication error (including access to an invalid device) • File operation function error The following script types are supported: project script, screen script, and script part. ☞ Page 2440 Checking for the occurrence of an error
Checking an error record	Check the following information of an error. • Script number • Error code The following script types are supported: project script and screen script. ☞ Page 2440 Checking an error record
Checking a detailed error record	Check the following information of an error. • Error code • Script type • Screen number • Script number or object ID • Execution order number • Screen type • Number of the displayed base screen The following script types are supported: project script, screen script, and script part. ☞ Page 2441 Checking a detailed error record
Clearing error records	Turn on GS384.b0 to clear the script error records as shown below. • GS14.b0, b7, b8, and b12 store 0. • GS15 stores -1. • GS16 to GS47 store 0. The following script types are supported: project script, screen script, and script part.
Re-executing the script aborted due to an error	Turn on GS384.b1 to re-execute the script aborted due to an error. The following script types are supported: project script, screen script, and script part.

To check device values, use objects (including a numerical display and lamp).

Precautions

If an error occurs in the script block, the error is the call source script error.

Checking for the occurrence of an error

The following script types are supported: project script, screen script, and script part.

The following GOT internal devices notify the error status.

GOT internal devices		Description
GS14	b0	Turns on when a script error occurs.
	b7	Turns on when a BCD error occurs.
	b8	Turns on when a zero division error occurs.
	b12	Turns on when a communication error (including access to an invalid device) occurs.
GS154	b15	Turns on when a file operation function error occurs. Turns off when the subsequent file operation function is properly completed.

To reset each bit of GS14, turn on GS384.b0.

Checking an error record

The following script types are supported: project script and screen script.

When an error occurs, the error record is stored into the devices ranging from GS16 to GS47.

GS15 stores the start device number of the devices where the latest error record is stored.

To clear error records, turn on GS384.b0.

The following shows the operation of the relevant GOT internal devices.

GOT internal devices	Description
GS15	Stores the start device number of the devices where the latest error record is stored. The devices range from GS16 to GS47. The value of GS15 changes as follows each time an error occurs. -1 → 16 → 18 → 20 → 22 → ... → 46 (The next loop will start from 16.) Example) Relationship between the value of GS15 and the storage location of the latest error record • When GS15 stores 16, the latest error record is stored in GS16 and GS17. • When GS15 stores 46, the latest error record is stored in GS46 and GS47. Turning on GS384.b0 resets GS15 to -1.
GS16 to GS47	Stores the following information when a script error occurs. • Script number • Error code Two word devices are used for one error.  If the number of errors is 17 or more, the error records are overwritten starting from the oldest one.

Checking a detailed error record

The following script types are supported: project script, screen script, and script part.

The specified GOT data registers (GD) store error records.

These GD devices are specified with the following GOT special registers (GS).

- GS392: Specify the start device number of the GD devices to store error records.
- GS394: Specify the maximum number of error records.

Ex.

When GS392 (start device number) stores 1000, and GS394 (number of error records) stores 5

GD1000 to GD1007	··· 1st error record
GD1008 to GD1015	··· 2nd error record
GD1016 to GD1023	··· 3rd error record
GD1024 to GD1031	··· 4th error record
GD1032 to GD1039	··· 5th error record

Eight word devices are used for one error.

For details on an error record, refer to the following.

☞ Page 2442 Details on an error record

To start storing error records, turn on GS395.b0.

You can identify the devices storing the latest error record based on the values of GS392 and GS157.

The following shows the operation of the relevant GOT internal devices.

- Write device

GOT internal devices	Description
GS157	Stores a number showing the devices where the latest error record is stored. Data type: Signed binary Initial value: -1 Calculate the start device number of the devices storing the latest error record by using the following expression. • GS392 + (GS157 × 8) Example) When GS392 stores 1000, and GS157 stores 5 1000 + (5 × 8) = 1040 In this case, GD1040 to GD1047 (eight GD devices) store the latest error record.

- Read device

GOT internal devices		Description
GS392		Specify the start device number of the GD devices to store error records. Data type: Unsigned binary
GS394		Specify the maximum number of error records. Data type: Unsigned binary The setting range is 0 to 5000. If the device stores 0, no error record will be stored. If the device stores 5001 or more, up to 5000 records will be stored. GS395.b1 specifies the operation to be performed when the number of errors has exceeded the maximum number of error records.
GS395	b0	When this bit is turned on, storing error records starts. When this bit is turned off, storing error records ends.
	b1	Specifies the operation to be performed when the number of errors has exceeded the maximum number of error records specified with GS394. When this bit is turned on, storing error records stops. When this bit is turned off, storing error records continues by overwriting the oldest record.
	b8	When this bit is turned on, the project script error records are not stored.
	b9	When this bit is turned on, the screen script error records are not stored.
	b10	When this bit is turned on, the script error records of script parts objects are not stored.
	b11	When this bit is turned on, the records of warnings (that do not abort a script) are not stored.

Details on an error record

The following shows an example of how an error record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Error code	Error code of an error. For the error details and corrective actions, refer to the following. ☞ Page 2442 List of script execution error codes
GD1001	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 1: Project script • 2: Screen script (set for a base screen) • 3: Screen script (set for a window screen) • 4: Script part
GD1002	Screen number	Number of the screen for which the script is set. The device stores 0 for a project script.
GD1003	Script number or object ID	The device stores a script number or object ID according to the script type. • For project scripts and screen scripts: script number • For script parts: object ID
GD1004	Execution order number	Script execution order number specified in GT Designer3 The device stores any of the following values according to the script type. • For project scripts: 1 to 256 • For screen scripts: 1 to 256 (per screen) • For script parts: 1 to 16 (per script parts object)
GD1005	Screen type	Type of the screen for which the script is set. The device stores any of the following values according to the screen type. • 200: Base screen • 210: Superimpose window 1 • 220: Superimpose window 2 • 310: Overlap window 1 • 320: Overlap window 2 • 330: Overlap window 3 • 340: Overlap window 4 • 350: Overlap window 5 If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. • When a base screen is called, 1 is added. • When a window screen is called, 2 is added. Example) When a window screen is called from overlap window 3 330 + 2 = 332 The device stores 0 for a project script.
GD1006	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1007	Use prohibited	The device stores 0.

List of script execution error codes

Error code	Description	Corrective action
1	Initialization of project script failed.*2	• Reduce the number of monitor devices in scripts. • Reduce the number of project scripts to be executed.
2	Initialization of screen script (base screen) failed.*1*2	• Reduce the number of monitor devices in scripts and base screens. • Reduce the number of screen scripts (base screen) to be executed.
3	Initialization of screen script (superimpose window 1) failed.*1*2	• Reduce the number of monitor devices in scripts and superimpose window 1. • Reduce the number of screen scripts (superimpose window 1) to be executed.
4	Initialization of screen script (overlap window 1) failed.*1*2	• Reduce the number of monitor devices in scripts and overlap window 1. • Reduce the number of screen scripts (overlap window 1) to be executed.
5	Initialization of screen script (overlap window 2) failed.*1*2	• Reduce the number of monitor devices in scripts and overlap window 2. • Reduce the number of screen scripts (overlap window 2) to be executed.
6	An error occurred in reading data from the device that always collects the data.	Correct the description of the device whose data is out of the specified device range.
7	The number of scripts to be executed exceeded the limit. And some scripts were left unexecuted.	• Change the number of scripts to be executed in one project to 256 or less. • Change the number of scripts to be executed in one screen to 256 or less.

Error code	Description	Corrective action
8	When [BCD16], [BCD32], or [BCD64] was selected as the script data type, the monitor device value could not be handled as BCD.	• Check whether the device to be monitored is correct. • Check the processing for the device which could not be handled as BCD, and correct the script and sequence program.
9	When [BCD16], [BCD32], or [BCD64] was selected as the script data type, the operation result was out of the BCD data range.	Correct the processing for the device that is not in the BCD data range.
10	The numerator was divided by the denominator of 0.	Check the factor that caused zero division in the script, and correct the script.
11	Writing to a device failed.	Correct the device description in the relevant script.
12	Reservation of an internal area for writing to a device failed.	Reduce the number of devices to be written in the script.
13	The while statement includes the description of a device that causes an assignment delay.	Replace the device causing an assignment delay in the while statement with the temporary device area or a GOT internal device.
14	The expression was too complicated to process.	Simplify or divide the operation expression in the script.
15	A script did not end within the script monitoring time.	• Check whether the script has gone into an endless loop. • Increase the value of the Script Monitoring Time (GS385).
16	Access to the GOT internal device failed, resulting in an error (out of the specified device range).	• Check the processing for the GOT internal device, and correct the script and sequence program. • Correct the description of the relevant script.
18	The number of consecutive devices handled by the FMOV or BMOV function exceeded the maximum as shown below. • Maximum number of word devices: 32766 • Maximum number of double-word devices: 16383 • Maximum number of quad-word devices: 8191	Reduce the number of consecutive devices handled by the FMOV or BMOV function.
19	Initialization of screen script (superimpose window 2) failed.*1*2	• Reduce the number of monitor devices in scripts and superimpose window 2. • Reduce the number of screen scripts (superimpose window 2) to be executed.
20	The GOT failed to access a temporary device area because the area is invalid.	Correct the descriptions of temporary device areas in the relevant script.
21	An 8-bit or 64-bit device is specified for an indirect device.	Correct the indirect device description in the relevant script.
22	Temporary device areas for 32-bit data are used for the script of 64-bit data.	Correct the common settings of the relevant script.
23	The GOT failed to access a script parts temporary device area because the area is invalid.	Correct the descriptions of script parts temporary device areas in the relevant script.
24*3	The GOT failed to execute a file operation function because the function has invalid arguments (such as invalid path or value).	• Check that all arguments are valid. • Correct the folder and file names. • Check that the specified offset value, number of write bytes, or number of read bytes does not cause the storage device and file size to be invalid.
25*3	The GOT failed to write data because the data storage has insufficient free space.	Check the free space of the data storage.
26*3	The GOT failed to access the file because no data storage is installed or the SD card cover is open.	• Check that a data storage is installed on the GOT. • Check that the SD card cover is closed. • Check that the SD card access switch is turned on.
27*3	The GOT failed to write the data because the data storage is write-protected, the specified file is a read-only file, or a file in the same name as the folder name in the path of the copy destination exists.	• Check if the data storage is not write-protected. • Check if the specified file is not a read-only file. • Check if a file in the same name as the folder name in the path of the copy destination does not exist.
28*3	The GOT failed to access the file because the data storage is not formatted or is faulty.	• Check if the data storage is formatted. • Check if the data storage is not broken.
29*3	The GOT failed to access the file because the specified file is used for the other functions.	Check if the file which is being used by the file operation function is not used by other functions at the execution of the file operation function.
30*3	The GOT stopped copying the file because a file in the same name as the copy source file exists in the copy destination folder.	• Check if the copy destination folder has no file in the name which is the same as the copy source file. • If the copy mode is write protection, disable write protection.
31*3	The GOT failed to execute the string operation function because arguments in the function specify invalid character strings.	• Correct the format. • Check if the arguments are not out of the available range for specifying.
32	A 64-bit operation overflow has occurred.	Check the description of the relevant script and correct it.

Error code	Description	Corrective action
35	Initialization of screen script (overlap window 3) failed.*1*2	• Reduce the number of monitor devices in scripts and overlap window 3. • Reduce the number of screen scripts (overlap window 3) to be executed.
36	Initialization of screen script (overlap window 4) failed.*1*2	• Reduce the number of monitor devices in scripts and overlap window 4. • Reduce the number of screen scripts (overlap window 4) to be executed.
37	Initialization of screen script (overlap window 5) failed.*1*2	• Reduce the number of monitor devices in scripts and overlap window 5. • Reduce the number of screen scripts (overlap window 5) to be executed.
40	The script specified by a subroutine call (call statement) could not be found.	Check that the number specified by the call statement and the script block number match.
42	There is a function description that cannot be used in a script executed by a subroutine call (call statement).	Check that screen scripts and project scripts are not using functions that cannot be used.

*1 Script parts in the screen are also included in the causes of the error.

*2 Because the error is for each screen, "0" is stored in the script No. of GS16 to GS47 (script error data).
If an error occurs when initializing a script part, no error record is stored in GS16 to GS47 (script error data).

*3 Since it is a warning error, the script does not stop.

68.13.4 How to check a script execution record

The following shows how to check a script execution record on the GOT.

Item	Description
Checking the execution status of a file operation function	Check whether the file operation function is being executed. While a file operation function is being executed, GS154.b0 is on. After the execution is complete, GS154.b0 turns off. The following script types are supported: project script, screen script, and script part.
Checking a script execution record	Check the script number of an executed script. The following script types are supported: project script and screen script. ☞ Page 2444 Checking a script execution record
Checking a detailed script execution record	Check the following information on an executed script. • Script type • Screen number • Script number or object ID • Execution order number • Screen type • Number of the displayed base screen The following script types are supported: project script, screen script, and script part. ☞ Page 2445 Checking a detailed script execution record

To check device values, use the device monitor function or objects (including a numerical display and lamp).

Checking a script execution record

The following script types are supported: project script and screen script.

When a script runs, the script number is stored into the device in the range of GS49 to GS79.

GS48 stores the device number of the device where the latest script execution record is stored.

The following shows the operation of the relevant GOT internal devices.

GOT internal devices	Description
GS48	Stores the device number of the device where the latest script execution record is stored. The device is in the range of GS49 to GS79. The value of GS48 changes as follows each time a script is executed. -149 → 50 → 51 → 52 → ... → 79 (The next loop will start from 49.)
GS49 to GS79	Store the script numbers of the executed scripts. One word device is used for one script. If the number of the executed scripts is 32 or more, the script execution records are overwritten starting from the oldest one.

Checking a detailed script execution record

The following script types are supported: project script, screen script, and script part.

The specified GOT data registers (GD) store script execution records.

These GD devices are specified with the following GOT special registers (GS).

- GS396: Specify the start device number of the GD devices to store script execution records.
- GS398: Specify the maximum number of script execution records.

Ex.

When GS396 (start device number) stores 1000, and GS398 (number of execution records) stores 5

GD1000 to GD1007	··· 1st execution record
GD1008 to GD1015	··· 2nd execution record
GD1016 to GD1023	··· 3rd execution record
GD1024 to GD1031	··· 4th execution record
GD1032 to GD1039	··· 5th execution record

Eight word devices are used for one script execution record.

For details on a script execution record, refer to the following.

☞ Page 2446 Details on a script execution record

To start storing script execution records, turn on GS399.b0.

You can identify the devices storing the latest script execution record based on the values of GS396 and GS158.

The following shows the operation of the relevant GOT internal devices.

- Write device

GOT internal devices	Description
GS158	Stores a number showing the devices where the latest script execution record is stored. Data type: Signed binary Initial value: -1 Calculate the start device number of the devices storing the latest script execution record by using the following expression. • GS396 + (GS158 × 8) Example) When GS396 stores 1000, and GS158 stores 5 1000 + (5 × 8) = 1040 In this case, GD1040 to GD1047 (eight GD devices) store the latest script execution record.

- Read device

GOT internal devices		Description
GS396		Specify the start device number of the GD devices to store script execution records. Data type: Unsigned binary
GS398		Specify the maximum number of script execution records. Data type: Unsigned binary The setting range is 0 to 5000. If the device stores 0, no script execution record will be stored. If the device stores 5001 or more, up to 5000 records will be stored. GS399.b1 specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records.
GS399	b0	When this bit is turned on, storing script execution records starts. When this bit is turned off, storing script execution records ends.
	b1	Specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records specified with GS398. When this bit is turned on, storing script execution records stops. When this bit is turned off, storing script execution records continues by overwriting the oldest record.
	b8	When this bit is turned on, the project script execution records are not stored.
	b9	When this bit is turned on, the screen script execution records are not stored.
	b10	When this bit is turned on, the script execution records of script parts objects are not stored.

Precautions

If the range specified by GS396 (Start GD device for script event notification) and GS398 (Number of script event outputs) exceeds the device range in the GOT data register (GD), the execution records are stored with the number of outputs within the device range.

Ex.

When storing 20 execution records from GD65455 (when GS396 is "65455" and GS398 is "20")

In 80 devices from GD65455 to GD65535, 10 execution records are stored.

Details on a script execution record

The following shows an example of how a script execution record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 1: Project script • 2: Screen script (set for a base screen) • 3: Screen script (set for a window screen) • 4: Script part
GD1001	Screen number	Number of the screen for which the script is set. The device stores 0 for a project script.
GD1002	Script number or object ID	The device stores a script number or object ID according to the script type. • For project scripts and screen scripts: script number • For script parts: object ID
GD1003	Execution order number	Script execution order number specified in GT Designer3 The device stores any of the following values according to the script type. • For project scripts: 1 to 256 • For screen scripts: 1 to 256 (per screen) • For script parts: 1 to 16 (per script parts object)
GD1004	Screen type	Type of the screen for which the script is set. The device stores any of the following values according to the screen type. • 200: Base screen • 210: Superimpose window 1 • 220: Superimpose window 2 • 310: Overlap window 1 • 320: Overlap window 2 • 330: Overlap window 3 • 340: Overlap window 4 • 350: Overlap window 5 If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. • When a base screen is called, 1 is added. • When a window screen is called, 2 is added. Example) When a window screen is called from overlap window 3 330 + 2 = 332 The device stores 0 for a project script.
GD1005	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1006	Use prohibited	The device stores 0.
GD1007	Use prohibited	The device stores 0.

69 Object script

☞ Page 2484 Troubleshooting

PART 12

69.1 Overview of the object script

GT37 SoftGOT3000

Object scripts are settable by object.
If the trigger condition for an object script is satisfied while the relevant object is being displayed, the script runs.

69.2 Specifications of the object script

GT37 SoftGOT3000

69.2.1 Target objects of the object script

Object scripts are set and operate for the following objects.

- Touch switch ([Switch] only)
- [Bit Lamp]
- [Word Lamp]
- [Numerical Display]
- [Numerical Input]
- [Text Display]
- [Text Input]
- [Date Display]
- [Time Display]
- [Comment Display]
- [Parts Display]
- [Frame Animation]
- [Line Graph]
- [Trend Graph]
- [Bar Graph]
- [Bar(Rectangle)]
- [Pie(Circle)]
- [Scatter Graph]
- [Historical Trend Graph]
- [Graphical Meter]
- [Level]
- [Panelmeter]

69.2.2 Object script type

The following three types of object scripts are provided.

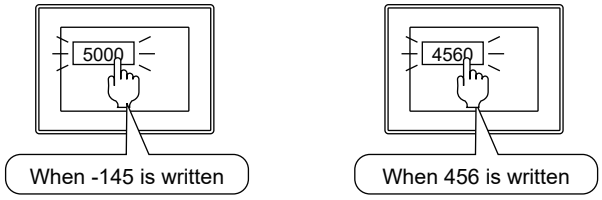
Input object script

Scripts that are executed for objects that input numerical values.

Ex.

☞ Page 2468 Data operation by a numerical input script

Changes the value to be written to a device according to the input value.



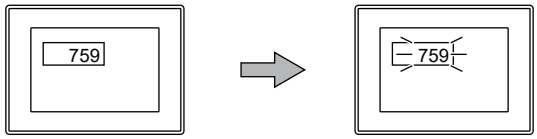
Display object script

Scripts that are executed for objects that display texts and lamps.

Ex.

☞ Page 2468 To start blinking after set time

Changes the color of numerical display and makes the value blink if it has not changed for 5 seconds.
(Notifies that a device value update has stopped.)



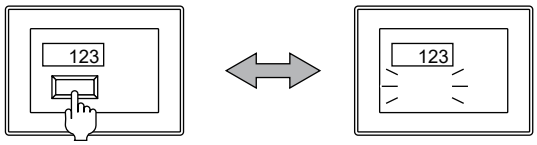
Switch object script

Scripts that are executed for touch switches ([Switch] only).

Ex.

☞ Page 2469 Showing and hiding objects for input and touch operations

Displays or hides a touch switch so that the switch can be touched only when a touch operation is necessary.



69.2.3 The GOT condition under which object scripts can be executed

Object scripts can be executed when all the following conditions are satisfied.

- The screen where the target object is placed has been displayed.
- The target object has been displayed or in operation.
- The target object has no limit on its operations by the security function.

69.2.4 Operating conditions of object scripts

Scripts are executed when the operating conditions set for each script are satisfied. The execution is also tied to: Input to the object, the display on the object, and a touch operation on a touch switch.

☞ Page 2464 Operating condition

69.2.5 Number of object script settings

For a single object for numerical input and character string input, both an input object script and a display object script can be set.

For a single object for other than numerical input and character string input, either an input object script or a display object script can be set.

Note that it takes longer time than usual for the monitor screen to display when the number of monitor devices in the object script is large.

69.2.6 Control structure of object scripts

For object scripts, the control structure of project scripts and screen scripts and the control structure described in this section are available.

However, the following control structure is not available.

Classification	Name
Contiguous device operation function	bmov
	fmov

For the control structure of project scripts and screen scripts, refer to the following.

☞ Page 2335 Control structures for scripts

Object internal variables (input object script)

These variables process the monitor device values and input values in input object scripts.

Variable	Description	
$$	Statement example	[w:D100] = $$;
	Function	Referred to for the script to process a monitor device value. Each time it is referred to in an object script, the latest value is obtained. Values cannot be assigned.
	Data type	Data type of the device to be monitored by objects
$K	Statement example	[w:D100] = $K;
	Function	Referred to for the script to process the latest key code input from a touch key. It obtains the key code equivalent to one ASCII or Shift JIS character. Assigned when a key code is written to the object. If this variable is referred to when no key code has been input, 0xFFFF is obtained.
	Data type	Unsigned 16-bit binary

$W	Statement example	[w:D100] = $W; // Example of reference
		$W = [w:D100] + $W; // Example of substitution

	Function	Referred to for the script to process the value input by the determination key of a touch key. Assigned when a value is written to the object. If this variable is referred to when no value has been input by the determination key, 0 is obtained.
	Data type	Data type of the device to be monitored by objects

Available object internal variables for input object scripts differ depending on the combination of objects and trigger types used.

The following shows available object internal variables.

RW: Reference or substitution is possible, R: Reference is possible, W: Substitution is possible, —: Use prohibited

Object	Trigger type	Variable			
		$$	$K	$W	$V
Numerical input	Ordinary, ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling	R	—	—	—
	When a key code is input	R	RW	—	—
	When the input is confirmed	R	—	RW	—
Text input	Ordinary, ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling	—	—	—	—
	When a key code is input	—	RW	—	—
	When the input is confirmed	—	—	—	—

Object internal variables (display object script)

These variables process the monitor device values in display object scripts.

Variable	Description	
$$	Statement example	[w:D100] = $$
	Function	Referred to for the script to process a monitor device value. Values cannot be assigned.
	Data type	Data type of the device to be monitored by objects
$V	Statement example	$V = [w:D100] + $$; // Offsets the displayed value.
	Function	Reference is unavailable. Assigned when the value displayed on the object is changed for another one. The initial value is the monitor device value ($$).
	Data type	Data type of the device to be monitored by objects

Available object internal variables for display object scripts differ depending on the combination of objects and trigger types used.

The following shows available object internal variables.

RW: Reference or substitution is possible, R: Reference is possible, W: Substitution is possible, —: Use prohibited

Object	Trigger type	Variable			
		$$	$K	$W	$V
Numerical display, numerical input, comment display*1, parts display*1, frame animation, level	Ordinary, Synchronize Display Trigger	R	—	—	W
	ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling	R	—	—	—
	When the view changes	R	—	—	R
Lamp*1, panel meter, graphical meter	Ordinary	R	—	—	W
	ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling	R	—	—	—
	When the view changes	R	—	—	R
Text display, text input, date display, time display, line graph, trend graph, bar graph, band graph, pie graph, scatter graph, historical trend graph	Ordinary, ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling, View Change, Synchronize Display Trigger*2	—			

*1 When the device type set to the object is bit data type, reference of $$ and substitution to $V are not available.

*2 [Trigger Type] cannot be set to [Synchronize Display Trigger] if the object is for date display or time display.

Object internal variables (switch object script)

These variables process the monitor device values in switch object scripts.

Variable	Description	
$W	Statement example	$W = [w:D100]
	Function	Reference is unavailable. Assigned when a value processed in the script is used in writing with the touch switch.
	Data type	Data type of the device to be monitored by objects

Available object internal variables for switch object scripts differ depending on the combination of objects and trigger types used.

The following shows available object internal variables.

RW: Reference or substitution is possible, R: Reference is possible, W: Substitution is possible, —: Use prohibited

Object	Trigger type	Variable			
		$$	$K	$W	$V
Touch switch ([Switch] only)	Ordinary, ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling, Device Writing	—	—	W	—

Point

Using object internal variables that cannot be checked by the syntax check

In the syntax check, object internal variables in the following uses are not checked.

- In referring to an object internal variable that cannot be referred to
- In assigning a value to an object internal variable to which no value can be assigned

Use object internal variables correctly when creating scripts.

Object property

These variables change the property values of objects.

For the correspondence between the read/write operation and object properties, refer to the following.

☞ [Script] tab in the setting dialog for each object

For the timing of the screen reflecting after the settings of object properties, refer to the following.

☞ Page 2456 Timing at which the setting change of an object property is reflected

Changes of object properties are retained until the GOT is powered on/powered off/reset, the package data are written, or screen switching is performed.

The following shows the list of the object properties.

Property	Description	
active	Statement example	my.active = 1;
	Target object	Switch, lamp, numerical display, numerical input, text display, text input, date display, time display, comment display, parts display, frame animation, line graph, trend graph, bar graph, band graph, pie graph, scatter graph, level object, panel meter, graphical meter
	Function	Specifies whether to update the object itself or not. 1: Updates the object itself. 0: Does not update the object itself. The object is not updated even if the display condition is satisfied. When "0" is specified after the screen being switched and before the object being displayed subsequently on the screen, the object itself is not displayed. However, drawing by the free figure drawing function is possible.
x	Statement example	my.x = 0;
	Target object	Switch, lamp, numerical display, numerical input, text display, text input, date display, time display, comment display, parts display, frame animation, line graph, trend graph, bar graph, band graph, pie graph, scatter graph, level object, panel meter, graphical meter
	Function	Specifies in dots the X coordinate to which the object itself moves. The setting range is 0 to 32767. The left end of the screen is 0. For parts display, this property is enabled only when [Line] is selected for [Move Way] in the [Animation] tab. When the specified coordinate is outside the screen area, the object does not move.
y	Statement example	my.y = 0;
	Target object	Switch, lamp, numerical display, numerical input, text display, text input, date display, time display, comment display, parts display, frame animation, line graph, trend graph, bar graph, band graph, pie graph, scatter graph, level object, panel meter, graphical meter
	Function	Specifies in dots the Y coordinate to which the object itself moves. The setting range is 0 to 32767. The upper end of the screen is 0. For parts display, this property is enabled only when [Line] is selected for [Move Way] in the [Animation] tab. When the specified coordinate is outside the screen area, the object does not move.
width	Statement example	[w:D100] = my.width;
	Target object	Switch, lamp, numerical display, numerical input, text display, text input, date display, time display, comment display, parts display, frame animation, line graph, trend graph, bar graph, band graph, pie graph, scatter graph, level object, panel meter, graphical meter
	Function	Obtains the width of the object frame.
height	Statement example	[w:D100] = my.height;
	Target object	Switch, lamp, numerical display, numerical input, text display, text input, date display, time display, comment display, parts display, frame animation, line graph, trend graph, bar graph, band graph, pie graph, scatter graph, level object, panel meter, graphical meter
	Function	Obtains the height of the object frame.

Property	Description	
decimal_point	Statement example	my.decimal_point = 1;
	Target object	Numerical display, numerical input
	Function	Specifies the number of digits after the decimal point. The setting range depends on the setting of the numerical display or numerical input. • When [Format String] is not set: 0 to [Digits] - 2 • When [Format String] is set: 0 to the number of sharp symbols (#) specified in [Format String] (number of display digits) This property is for a numerical display or numerical input object and enabled only when [Real] is selected for [Format] of [Display Format].
blink*1	Statement example	my.blink = 0;
	Target object	Numerical display, numerical input, text display, text input, comment display, parts display
	Function	Specifies [Blink] of the numerical value, text, or figure. 0: No blink. 1: The numerical value or text blinks. (Low speed) 2: The numerical value or text blinks. (Medium speed) 3: The numerical value or text blinks. (High speed) 128: No blink. 129: The numerical value, text, or figure blinks. (Low speed) 130: The numerical value, text, or figure blinks. (Medium speed) 131: The numerical value, text, or figure blinks. (High speed) Reading out my.blink after writing 128 causes the script to obtain 0.
highlight*1	Statement example	my.highlight = 0;
	Target object	Numerical display, numerical input, text display, text input, comment display
	Function	Specifies whether to invert the colors of characters on the object itself or not. 0: Does not invert the colors. 1: Inverts the colors.
part_no*1	Statement example	my.part_no = 1;
	Target object	Parts display
	Function	Specifies the part's number associated with the part to be displayed. The setting range is 0 to 32767. Depending on the parts number, the parts that can be displayed and operations are different. For details on parts numbers, refer to the following. ☞ Page 1435 Part No.
mark_color*1	Statement example	my.mark_color = 255;
	Target object	Parts display
	Function	Specifies the color to be changed when [Parts Type] is set to [Mark Data]. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
frame_color	Statement example	[w:D100] = my.frame_color;
	Target object	Numerical display, numerical input, text display, text input, date display, time display, comment display, line graph, trend graph, bar graph, band graph, pie graph, scatter graph, panel meter
	Function	Obtains [Frame Color] of the figure. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
plate_color*1	Statement example	my.plate_color = 255;
	Target object	Numerical display, numerical input, text display, text input, date display, time display, comment display, line graph, trend graph, bar graph, band graph, pie graph, scatter graph, panel meter
	Function	Specifies [Shape Color] of the figure. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
graph_color*1	Statement example	my.graph_color = 255;
	Target object	Scatter graph, level object, panel meter, graphical meter
	Function	Specifies [Color] of the points or lines of the scatter graph, [Level Color] of the level object, or [Needle Color] of the panel meter or graphical meter. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.

Property	Description	
back_color[*1]	Statement example	my.back_color = 0;
	Target object	Level object, panel meter
	Function	Specifies [Background Color] of the level object or [Background Color] of the meter panel for the panel meter. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
pattern[*1]	Statement example	my.pattern = 1;
	Target object	Level object, panel meter
	Function	Specifies [Pattern] of the mater panel. The setting range is 1 to 37. 0: Does not use any pattern. (Use is prohibited when a panel meter is used.) 1 to 37: Check the image of each pattern in the setting dialog of each object and figure.
pattern_bg_color	Statement example	my.pattern_bg_color = 255;
	Target object	Panel meter
	Function	Specifies [Fill Color] of the meter panel. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
fill_color	Statement example	my.fill_color = 255;
	Target object	Panel meter
	Function	Specifies [Fill Color] when the meter attribute is [Needle and Fill] or [Fill]. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
fill_bg_color	Statement example	my.fill_bg_color = 255;
	Target object	Panel meter
	Function	Specifies [Background Color] when the meter attribute is [Needle and Fill] or [Fill]. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
fill_pattern	Statement example	my.fill_pattern = 1;
	Target object	Panel meter
	Function	Specifies [Pattern] when the meter attribute is [Needle and Fill] or [Fill]. The setting range is 1 to 37. 0: Use is prohibited. 1 to 37: Check the image of each pattern in the setting dialog of each object and figure.
core_color	Statement example	my.core_color = 255;
	Target object	Panel meter
	Function	Specifies [Fill Color] of the core. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
core_bg_color	Statement example	my.core_bg_color = 255;
	Target object	Panel meter
	Function	Specifies [Background Color] of the core. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
core_pattern	Statement example	my.core_pattern = 1;
	Target object	Panel meter
	Function	Specifies [Pattern] of the core. The setting range is 1 to 37. 0: Use is prohibited. 1 to 37: Check the image of each pattern in the setting dialog of each object and figure.
text_color[*1]	Statement example	my.text_color = 255;
	Target object	Numerical display, numerical input, text display, text input, date display, time display, comment display
	Function	Specifies [Text Color] of numerical values or text. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.

Property	Description	
text_width	Statement example	my.text_width = 1;
	Target object	Numerical display, numerical input, text display, text input, date display, time display, comment display
	Function	Specifies the scale factor (width) of numbers and characters the object itself displays. 0: 0.5 times 1 to 8: 1 to 8 time (s) It obtains the scale factor in multiples of 16 dots when a number or character is referred to. When the font size exceeds 128 dots (8 times), 8 is obtained. If the font size is not a multiple of 16, a fraction is rounded down to obtain the scale factor. (For example, when referring to a character with a font size of 72 dots, it obtains 4 instead of 4.5.)
		If the font size is changed to a value larger than the one when the object was placed on the screen editor in GT Designer3, characters may be displayed incompletely. Redraw the screen by executing the "redraw_screen()" function.
		Changing the font size to a value larger than the original size increases the object frame size as well. If the object frame size of an object for which a shape frame is set exceeds the size of the shape frame, the error code 1144 of the object script is detected, and the script is interrupted. ☞ Page 2488 Errors and their corrective actions during script execution on the GOT (object script)
text_height	Statement example	my.text_height = 1;
	Target object	Numerical display, numerical input, text display, text input, date display, time display, comment display
	Function	Specifies the scale factor (height) of numbers and characters the object itself displays. 0: 0.5 times 1 to 8: 1 to 8 time (s) It obtains the scale factor in multiples of 16 dots when a number or character is referred to. When the font size exceeds 128 dots (8 times), 8 is obtained. If the font size is not a multiple of 16, a fraction is rounded down to obtain the scale factor. (For example, when referring to a character with a font size of 72 dots, it obtains 4 instead of 4.5.)
		If the font size is changed to a value larger than the one when the object was placed on the screen editor in GT Designer3, characters may be displayed incompletely. Redraw the screen by executing the "redraw_screen()" function.
		Changing the font size to a value larger than the original size increases the object frame size as well. If the object frame size of an object for which a shape frame is set exceeds the size of the shape frame, the error code 1144 of the object script is detected, and the script is interrupted. ☞ Page 2488 Errors and their corrective actions during script execution on the GOT (object script)
arrange	Statement example	my.arrange = 1;
	Target object	Numerical display, numerical input, text display, text input, comment display
	Function	Specifies the position of [Alignment] for the text. • 0: Left • 1: Right • 2: Center scale_max[0], scale_max[1], scale_max[2], scale_max[3]	Statement example	my.scale_max[0] = 255;
	Target object	Line graph, trend graph, bar graph, scatter graph, panel meter
	Function	Specifies the upper limit value of the scale. • scale_max[0]: Upper scale limit in the horizontal direction (lower side) • scale_max[1]: Upper scale limit in the vertical direction (left side) (It cannot be specified for the panel meter or bar graph.) • scale_max[2]: Upper scale limit in the horizontal direction (upper side) (It can be specified only for the trend graph.) • scale_max[3]: Upper scale limit in the vertical direction (right side) (It can be specified only for the trend graph.) The setting range is the same as that of the upper scale limit for each object. 
Property	Description	
scale_min[0], scale_min[1], scale_min[2], scale_min[3]	Statement example	my.scale_min[0] = 0;
	Target object	Line graph, trend graph, bar graph, scatter graph, panel meter
	Function	Specifies the lower limit value of the scale. • scale_min[0]: Lower scale limit in the horizontal direction (lower side) • scale_min[1]: Lower scale limit in the vertical direction (left side) (It cannot be specified for the panel meter or bar graph.) • scale_min[2]: Lower scale limit in the horizontal direction (upper side) (It can be specified only for the trend graph.) • scale_min[3]: Lower scale limit in the vertical direction (right side) (It can be specified only for the trend graph.) The setting range is the same as that of the lower scale limit for each object. security	Statement example	my.security = 0;
	Target object	Switch, lamp, numerical display, numerical input, text display, text input, date display, time display, comment display, parts display, frame animation, line graph, trend graph, bar graph, band graph, pie graph, scatter graph, level object, panel meter, graphical meter
	Function	Sets the security level of the object. The setting range is 0 to 15. For the object that can have the security levels of both input and display set with it, this property sets the security level of the display.
input_security	Statement example	my.input_security = 0;
	Target object	Switch, numerical input, text input
	Function	For the object that can have the security levels of both input and display set with it, this property sets the security level of the input. The setting range is 0 to 15.
draw_mode	Statement example	my.draw_mode = 0;
	Target object	Numerical display, numerical input, comment display, parts display
	Function	Specifies a drawing mode. • For numerical display, numerical input, and comment display 0: Transparent 1: XOR • For parts display 0: Replace 1: XOR 2: Overwrite Each drawing mode is the same as that which appears in the setting dialog of GT Designer3.
delay	Statement example	my.delay = 5;
	Target object	Switch
	Function	Specifies the delay time in second the object itself takes before it performs an action after a touch. It is disabled when [Delay] is set to [None] in GT Designer3. The setting range is 0 to 5. If 0 is set, the object itself takes the action immediately after the touch.
beep	Statement example	my.beep = 0;
	Target object	Switch
	Function	Specifies the length of the buzzer and the timing of it being made. 0: One shot 1: One shot (only when the operating condition is satisfied) 2: No buzzer 128: While a key is pressed 129: While a key is pressed (only when the operating condition is satisfied)

*1 When the object has various status imposed, such as the on/off status of a bit and a condition, the object property is reflected only in the normal cases (when the bit is off or the condition is set to 0).
When the bit is on or other than 0 is set for the condition, the object property is not reflected.

Precautions

The size of the displayed text may be different from the one before the project is converted.
If the text size is larger than the one before the conversion, the part of the text that extends off the display frame is not displayed.

■Timing at which the setting change of an object property is reflected

If an object property setting is changed, the object type and the object property type determine the timing at which the new setting is reflected.
For the correspondence between object types, object property types, and the timing at which the setting change of an object property is reflected, refer to the following.
☞ [Script] tab in the setting dialog for each object
If an object property setting is changed, the new setting is reflected at the following timing.

Timing	Action
Upon the setting change	The object display is refreshed upon the setting change of the object property. After the change of the object property related to actions such as beep, the next action performs a specified action.
When the object is updated	The object display is refreshed or the object operates with the new setting when the display or operating condition of the object is satisfied. The object may be displayed or operate incorrectly until the new setting is reflected. To reflect the setting immediately, execute "redraw_object()". ☞ Page 2460 Functions (screen control)
When the screen is updated	The object display is refreshed or the object operates with the new setting when screen switching is performed. To reflect the setting immediately, execute "redraw_screen()". ☞ Page 2460 Functions (screen control)

Point

To reflect the new settings of multiple object properties, use a single "redraw_object()" function to reduce the number of times that the object is redrawn.

```
my.text_height=2;
redraw_object();
my.arrange=1;
redraw_object();
```

→

```
my.text_height=2;

my.arrange=1;
redraw_object();
```

Functions (free figure drawing)

These functions display the figures on the monitor screen.

Property	Description	
d_line	Statement example	d_line(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Line type>, <Line width>, <Line color>)
	Function	Draws a line. Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
d_rectangle	Statement example	d_rectangle(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Line type>, <Line width>, <Line color>)
	Function	Draws a rectangle. Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
d_circle	Statement example	d_circle(<X coordinate>, <Y coordinate>, <Radius>, <Line type>, <Line width>, <Line color>)
	Function	Draws a circle.
d_ellipse	Statement example	d_ellipse(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Line type>, <Line width>, <Line color>)
	Function	Draws an ellipse. Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
p_rectangle	Statement example	p_rectangle(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Line type>, <Line width>, <Line color>, <Pattern>, <Figure color>, <Background color>)
	Function	Draws a rectangle (color fill). Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
p_circle	Statement example	p_circle(<X coordinate>, <Y coordinate>, <Radius>, <Line type>, <Line width>, <Line color>, <Pattern>, <Figure color>, <Background color>)
	Function	Draws a circle (color fill).

Property	Description	
p_ellipse	Statement example	p_ellipse(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Line type>, <Line width>, <Line color>, <Pattern>, <Figure color>, <Background color>)
	Function	Draws an ellipse (color fill). Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
d_textout	Statement example	d_textout(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Character X scale factor>, <Character Y scale factor>, <Character attribute>, <Character color>, <Character shadow color>, "<Text>")
	Function	Draws a text.
d_commentout	Statement example	d_commentout(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Character X scale factor>, <Character Y scale factor>, <Character attribute>, <Comment group No.>, <Comment No.>)
	Function	Displays a comment in a comment group. Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
screen_draw	Statement example	screen_draw(<screen draw flag>)
	Function	Specifies the area in which drawing is executed by the free figure drawing function. If the drawing area is not specified by screen_draw(), the drawing is executed in the object area. The object area is equivalent to the area indicated by the coordinates shown in the data list of GT Designer3.

■Argument

Argument	Description
<X coordinate 1>, <Y coordinate 1> <X coordinate 2>, <Y coordinate 2>	Specifies the area (specified by two points of (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>)) in which a figure is drawn in dots. The setting range is -32768 to 32767. (0, 0) indicates the coordinates of the upper left position of the object. Example) Ellipse (d_ellipse())  To specify the coordinates with a rectangle (d_rectangle), ellipse (d_ellipse), rectangle (filled) (p_rectangle), or ellipse (filled) (p_ellipse), the following patterns are available. • (<X coordinate 1>, <Y coordinate 1>) = Upper left, (<X coordinate 2>, <Y coordinate 2>) = Lower right • (<X coordinate 1>, <Y coordinate 1>) = Lower right, (<X coordinate 2>, <Y coordinate 2>) = Upper left • (<X coordinate 1>, <Y coordinate 1>) = Upper right, (<X coordinate 2>, <Y coordinate 2>) = Lower left • (<X coordinate 1>, <Y coordinate 1>) = Lower left, (<X coordinate 2>, <Y coordinate 2>) = Upper right
<X coordinate 1>, <Y coordinate 1>	Specifies the coordinates of the center of a figure in dots. The setting range is -32768 to 32767.
<Radius>	Specifies the radius of a circle in dots. The setting range is 1 to 32767.
<Line type>*1	Selects a line type from those shown below. <Line width>*1	Specifies a line width in dots. The setting range is 0 to 7. The setting value 0 is available only for the color fill functions (p_rectangle, p_circle, p_ellipse). When 0 is specified, the line is filled without the frame line displayed.
<Line color>, <Character color>, <Figure color>, <Character shadow color>	Specifies the color of a line, character, figure, background, and background of a character with the corresponding color code number. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
<Pattern>	Select a color fill pattern from the following. The setting range is 1 to 37. 0: Use is prohibited. 1 to 37: Check the image of each pattern in the setting dialog of each object and figure.

Argument	Description
<Character X scale factor>, <Character Y scale factor>	Specifies the scale factor of a character. It specifies 0 or 1 to 8. If 0 is specified, the scale factor is 0.5. <Character attribute>	Specifies the display attribute of a character. The explanation below assumes binary notation. When specifying in a script, change the representation meeting the applicable notation of the script, such as hexadecimal number.  • b1 to b0: Select the display type of a character. These bits can be used only for d_textout(). Specify 00 (fixed) for other functions. 00: Standard 01: Bold 10: Shadow 11: Engrave • b2: 0 (fixed) • b4 to b3: Select the alignment position of character strings in multiple lines. 00: Left justification 01: Right justification 10: Center justification 11: Use prohibited  • b8 to b5: 00 (fixed) • b9: Specify a font size. 0: 16 dots 1: 12 dots • b11 to b10: Specify a Kanji region. 00: Japanese 01: Chinese (Simplified) 10: Chinese (Traditional) 11: Korean • b12: Specify a font. 0: Mincho 1: Gothic
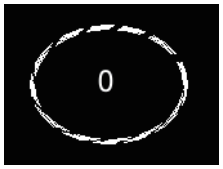
<Character>	Specify a character sting in up to 256 characters.
<Comment group No.>	Specify a comment group No. The setting range is 1 to 500.
<Comment No.>	Specify a comment No. The setting range is 0 to 32767.
<Screen draw flag>	Specifies the area in which drawing is executed by the free figure drawing function. 0: After the execution of screen_draw(), the figure is drawn in the object area. The object area is equivalent to the area indicated by the coordinates shown in the data list of GT Designer3. 1: After the execution of screen_draw(), the figure is drawn within the whole screen.

*1 To use the circle and ellipse drawing functions (d_circle(), d_ellipse(), p_circle(), p_ellipse()), set the solid line for the line type and 1 dot for the line width.
When a line type other than the solid line is specified for the line type and 2 dots or more is specified for the line width, the circle or ellipse is drawn as shown below.
Drawing example) d_ellipse() with the dashed line for the line type and 4 dots for the line width specified



■Number of figures that can be drawn

Up to 1280 figures can be drawn by one object script.

If the number of drawn figures exceeds 1280, the oldest figure is deleted and a new figure is drawn.

The maximum number of the text figures drawn with the d_textout or d_commentout function differs depending on the number of lines in the text figure.

Ex.

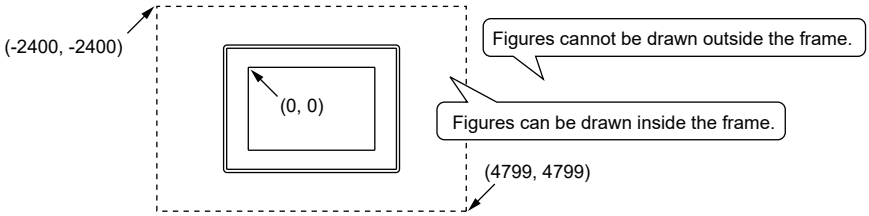
One-line text: 1280 figures

Two-line text: 640 figures

■Drawing area

Provided that the upper left corner of the GOT screen is (0, 0), you can draw figures in the area inside (-2400, -2400) to (4799, 4799).

If coordinates outside (-2400, -2400) to (4799, 4799) are specified, the figure will not be drawn.



Precautions

- The figure drawn by the free figure drawing function is designed to appear in the front on a layer.
- Even if the blink is set for the object using the free figure drawing function, the figure drawn by the function does not blink.
- If a figure drawn by the free figure drawing function overlaps with an object, the overlapping part of the figure or other objects may disappear.
- When the trigger type is other than [View Change] or [Synchronize Display Trigger], the object itself is overwritten and replaced with the figure drawn by the free figure drawing function. Therefore, the figure drawn by the free figure drawing function may be cleared.
- When using the free figure drawing function, set a trigger type other than [Key Code Input], [Input Fixation], or [Device Writing].

Drawing is not performed when the trigger type is set to [Key Code Input], [Input Fixation], or [Device Writing].
In this case, no error occurs.

Functions (screen control)

These functions redraw or delete a figure displayed by the free figure drawing function.

The functions (redraw_object(), clear_object()) are executed while the object script is executed.

The function (redraw_screen()) is executed at the timing of the screen being drawn after the execution of the object script.

Operator	Description	
redraw_object*1*2	Statement example	redraw_object()
	Function	Performs the following operations of the object itself. 1. Deletes a figure which was drawn using the free figure drawing function. 2. Redraws the object itself.
clear_object*2	Statement example	clear_object()
	Function	Deletes the following items. • Data (such as numbers or characters) the object itself has displayed • Figure drawn by the free figure drawing function of the object script for the object itself If the object is the type that can have a plate color set, such as an object for numerical display, character string display, and comment display, only the frame figure is displayed. If the object is other than those described above, the object itself is deleted.
redraw_screen*1	Statement example	redraw_screen()
	Function	Performs the following operations for the whole screen. 1. Deletes all figures drawn using the free figure drawing function. 2. Redraws all objects. The screen may flicker as it is displayed again.

*1 This function does not work when active (enabling or disabling the display) is set to 0 in the object property of the object itself.

*2 This function does not work when [Shape] is set to [None] in the [Style] tab for the switch whose [Text Type] is [Text].

Precautions

When the screen is refreshed by "redraw_screen", the following graph objects will be displayed again after the display is cleared.

- Trend graph
- Scatter graph

69.2.7 Available data and how to express the data

The following describes available data used for object scripts and how to express the data.
For object scripts, the data and the form of the expression that are available for project scripts and screen scripts are also available, as well as the data and the form of the expression described in this section.
For the data and form of the expression of project scripts and screen scripts, refer to the following.
☞ Page 2352 Available data and how to express the data

Object internal variables

Object internal variables are variables that have been allocated to inputs or outputs of objects.
Using object internal variables enables the following operations.

- Allowing the script to process monitor device values referring to them ($$)
- Changing the display on the object to the process result of the script ($V)
- Assigning the process result of the script with a touch switch ($W)

For reading and writing object internal variables, refer to the following.
☞ Page 2449 Object internal variables (input object script)
☞ Page 2450 Object internal variables (display object script)
☞ Page 2450 Object internal variables (switch object script)

Ex.
In a numerical display operation, when adding the device value (GD0) to the monitor device value ($$) and then displaying the result on the object ($V)
$V=$$+[w:GD0];

Point

Automatic adjustment to the decimal point
When the automatic adjustment to the decimal point is enabled, a value is processed as shown below.

- When a value is assigned to $V

The value which has been assigned to $V is assigned to the object as is.

- When a value is assigned to $W

The value which has been assigned to $W is assigned to the monitor device as is.
Example) In a numerical input operation, when the automatic adjustment to the decimal point is enabled and 2 is set for [Decimal Point]
When $V=1; is executed, 1.00 is displayed for the numerical input.
When "$W=1;" is executed, 1 is written to the monitor device.

Object property

With object properties, you can refer to or change (assign) the settings of an object drawn with GT Designer3.
For details on object properties, refer to the following.

• Reference and substitution

☞ Page 2451 Object property

• Setting method

☞ Object script tab of each object

■Format

When using an object property in a script, prefix the object property name with "my.".

Ex.

Changing the text color and blinking display according to the security level of the object

```
if(5<=my.security){ //If the object security level is 5 or higher
  my.text_color=224; //Changes the text color to red (224).
  my.blink=1; //Lets the display of the object blink at a low speed.
}else{ //If the object security level is lower than 5
  my.text_color=255; //Changes the text color to white (255).
  my.blink=0; //Does not let the object blink.
}
```

Precautions

• Properties that are not valid unless enabled by GT Designer3 settings

Among the setting items of objects, those which become valid only by GT Designer3 settings (such as the settings which are not valid unless another item is selected) cannot be referred or changed by the object properties.

• The numerical display or comment display movement on the GOT when a level is overlaid

If the objects are drawn with GT Designer3 so that the level can be overlaid, the numerical display or comment display correctly works only when it can be moved within the range of the level display.
If you move the numerical display or the comment display out of the area of the level display, the numerical display or the comment display cannot be displayed normally.
If you draw the numerical display or comment outside the area of the level display with GT Designer3, the numerical display or comment display is not superimposed even it is moved into the area of the level display.

Temporary device area

Object scripts can use temporary device areas in addition to the controller devices.
Temporary device areas are variables used when there is a delay in writing (assignment delay) to the controller devices or when device areas are required for operations, repetitive processing, and others.
For the temporary device areas, refer to the following.

☞ Page 2365 Available temporary device areas and how to express the temporary device areas

For the assignment delay, refer to the following.

☞ Page 2368 Assignment delay
☞ Page 2371 Assignment delay when an offset is specified

69.3 How to use object scripts

GT37 SoftGOT3000

This section explains how to use object scripts.

69.3.1 Setting procedure

The following shows the procedure for setting a script.

1. Configure the script settings with GT Designer3, such as the data type and trigger type.

☞ Page 2403 [Script] dialog

2. Create or edit a script with the script editor.

When you have edited a script with a commercially available text editor, import a locally saved text file.

☞ Page 2415 [Edit Script(script name)] dialog

3. Check the syntax of the script with GT Designer3.

☞ Page 2415 [Edit Script(script name)] dialog

If an error is detected, return to step 1 and correct the script.

A general C language compiler is also usable to simulate the operation.

☞ Page 2484 Simulation using a general C language compiler or debugger

4. Write the project from the personal computer to the GOT with GT Designer3.

☞ Page 408 Transferring data to the GOT

5. Start monitoring.

If the script runs properly, the creation of the script is complete.

When the script does not operate properly, return to step 1 and correct the script.

69.3.2 Operation

This section explains the functions and execution of object scripts.

Functions of object scripts

■Object internal variables

Object internal variables are variables that have been allocated to inputs or outputs of objects.

By using object internal variables, the monitor device values of an object can be operated and the operation result can be displayed on the object.

For details on the object internal variables, refer to the following.

- Types of object internal variables

☞ Page 2449 Control structure of object scripts

- Usage

☞ Page 2461 Object internal variables

■Object property

With object properties, you can read or change (write) the settings for an object drawn with GT Designer3.

The settings for the object on the screen can be changed automatically if the object property is changed during monitoring.

For details on object properties, refer to the following.

- Setting method

☞ Page 2462 Object property

- Expression

☞ Page 2451 Object property

■Free figure drawing function

Figures (such as a line, rectangle, circle, and character), comments, and others can be drawn on an object.

For information on how to set the free figure drawing function, refer to the following.

☞ Page 2456 Functions (free figure drawing)

To use the free figure drawing function, execute object scripts under the operating conditions other than those described below.

If the free figure drawing function is executed under the following operating conditions, no figure is drawn and no error occurs.

- When a key code is input
- When the input is confirmed
- When writing to a device is executed

■Screen control function

The screen control function controls redrawing or erasing of screens and objects.

For the screen control function types, refer to the following.

☞ Page 2460 Functions (screen control)

■Script user ID

A script user ID is a number that is set for an object script.

If the object script causes an error, the script user ID of the object script is stored in the GOT special register (GS).

By setting different user IDs for all object scripts, you can identify the object script with an error.

■Operating conditions of scripts

The execution of an object script can be tied to an input to the object, display on the object, or a touch on a touch switch, according to the object script type.

It is also possible for object scripts to be executed under conditions other than those described above.

For the operating conditions of object scripts, refer to the following.

☞ Page 968 Trigger type settings

Operating condition

Object scripts are executed when all the following conditions are satisfied.

- The screen where the object is placed has been displayed on the GOT.

The screen on which the target object is arranged must be displayed under the condition that the GOT and controller are connected.

- The object has been displayed and operating.

The target object must be displayed or in operation.

- The target object has no restriction imposed by the security function of the GOT.

When the security function is used, the object with the object script set at a high security level must not be restricted while it is on display or in operation.

- The operating condition of the script is satisfied.

The object script can be executed when the operating condition set for it is satisfied.

For details on the script operating conditions, refer to the following.

☞ Page 968 Trigger type settings

■Functions that cannot be set simultaneously

When any of the following items is set, object scripts cannot be used.

- [Data Operation] for [Operation Type]
- [Store Memory] for scatter graphs

■Object status

You cannot execute an object script when it is in either of the following statuses.

- The object is not displayed or operated because it has been extending off the screen.
- The object is not displayed or operated because no monitor device has been set.

■Executing an object script for the same window from multiple sources

When the same window is displayed from multiple sources including an overlap window, a superimpose window, and the overlay screen function, only the object script for the window that is displayed first is executed.

Even if the window displayed first is deleted, the object scripts for the windows displayed after the first one are not executed.

If, in the above situation, the same window is newly displayed from an overlap window, a superimpose window, or the overlay screen function, the object scripts for the multiple windows which are the same and have been already displayed are not executed but the object script for the new window is executed.

■Operating conditions of scripts when the trigger type is [Device Writing]

When [Trigger Type] of the object script is [Device Writing], [$W (Write Device)] must be set.

Otherwise, the script is not executed.

■Execution timing when [Trigger Type] is set to [ON Sampling] or [OFF Sampling]

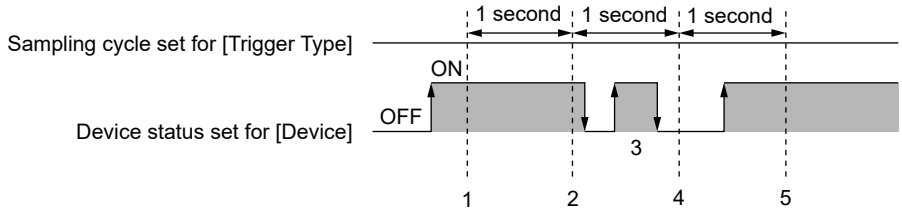
• Execution timing

The device status is checked in the sampling cycles set for [Trigger Type].

If the condition is not satisfied at the timing of the check, the object script is not executed.

Ex.

When [Trigger Type] is set to [ON Sampling] and the sampling cycle is set to 1 second



The object script is executed at timing 1.

The object script is executed at timing 2.

At timing 3, the object script is not executed because the timing does not match the end of one cycle and thus the condition is not checked.

At timing 4, the object script is not executed because the device condition is not satisfied.

The object script is executed at timing 5.

• Triggering the sampling cycle count when the device condition is satisfied

The sampling cycle set for [Trigger Type] does not depend on the device status. (The sampling cycle does not change whether the device is turned on or off.)

To start the cyclic sampling, configure the settings as shown below.

1. Set [Rise] or [Fall] for [Trigger Type].
2. Create a sequence program that turns the trigger device on or off when the object script should be executed.

■Execution timing when [Sampling], [ON Sampling], or [OFF Sampling] is set

The sampling cycle count starts and is reset at the following timing.

- When the object itself is displayed (in screen switching, a security level change, or other possible cases)
- When the language switches
- When the station No. switches
- When the security level changes

After the execution of any of the events above, the object script is executed at the start timing of the sampling cycle.

Execution unit

Object scripts are executed one by one.

Even if the trigger conditions of multiple scripts are satisfied, the scripts do not run simultaneously.

Execution order

Object scripts are executed in numerical order of object ID.

Execution status

Object scripts are processed as shown below according to the script status.

Script status	Processing
Waiting for turn	• Waits for the processing turn according to the execution order. • When the turn has come, the script enters the "Waiting for execution" status.
Waiting for execution	• The processing differs depending on the operating condition. Satisfied: The script enters the "Execution" status. Not satisfied: The script enters the "Waiting for turn" status, and the next script enters the "Waiting for execution" status.
Execution	• When the script has ended, the processing result is written to the PLC CPU and the script enters the "Waiting for turn" status. The next script enters the "Waiting for execution" status. • If a fatal error occurs, execution of the script stops and the script enters the "Stop" status.*1 • If an execution error occurs, execution of the script stops and the script enters the "Waiting for turn" status.*1
Stop	• The "Stop" status is held until the error history is cleared.

*1 For details on fatal errors and execution errors, refer to the following.
☞ Page 2488 Errors and their corrective actions during script execution on the GOT (object script)

Interruption

In any of the following cases, the corresponding script being processed stops and an error occurs.

- In division, when the divisor becomes 0 and the calculation becomes zero division
- When [BCD16], [BCD32], or [BCD64] is selected as the script data type but the monitor device value cannot be handled as BCD
- When [BCD16], [BCD32], or [BCD64] is selected as the script data type but the operation result is out of the BCD range
- When a controller device is specified as the write destination device of a while statement

For the available data type and data range, refer to the following.
☞ Page 2352 Available data and how to express the data
For details on the while statement, refer to the following.
☞ Page 2335 Control statement
For troubleshooting when the script processing is interrupted, refer to the following.
☞ Page 2484 Troubleshooting

Precautions

In the following cases, you may get an unexpected result of processing.

- When a format other than [BCD16], [BCD32], or [BCD64] is selected as the script data type but a constant out of the selected format range is included
- When [Unsigned BIN16] or [Unsigned BIN32] is selected as the script data type but a negative constant is included
- When a format other than [Real(32bit)] or [Real(64bit)] is selected as the script data type but a decimal is used as a constant

For details on data types, refer to the following.
☞ Page 2461 Available data and how to express the data

Number of writable devices

If the following type of devices is the target for writing, a single script can perform a single write operation of the type.

- Controller device

If the following types of devices are the targets for writing, a single script can perform the write operation of each type.

- GOT bit register (GB)
- GOT data register (GD)
- GOT special register (GS)
- Temporary device area (TMP)

Operation while data are being written to devices by an object script

• The execution process of the script is interrupted temporarily, and resumed after the completion of the write operation.

Interrupted operation restarts after the completion of write device.

• The display on the object is updated after the completion of the write operation.

Object display is updated after the completion of write device.

• Inputting a value by touching the object on the screen is enabled after the completion of the write operation.

Input is enabled after the completion of write device.

69.4 Program example

GT37 SoftGOT3000

This section explains program examples of object scripts.

69.4.1 Data operation by a numerical input script

Operation

Data operation is performed when a device value is written.

Screen image	Operation of each object
	Numerical input: When the written value is 0 or greater, the written value is multiplied by 10. When the written value is less than 0, the written value is set to 5000.

Program example

Item	Description	
Data type	Signed 16-bit binary	
Trigger type	When the input is confirmed	

Script	[w:TMP0] = $W;
	if([w:TMP0] >= 0) {
	$W = [w:TMP0] * 10;
	}else{
	$W = 5000;
	}
		//Stores the written value to the temporary area.
		//If the written value is 0 or greater,
		//the written value is multiplied by 10.
		//If the written value is less than 0,
		//the written value is set to 5000.

69.4.2 To start blinking after set time

Operation

A displayed value (monitored device value) blinks when it does not change for set time.

This operation is useful when urging the use of caution is necessary after set time.

Screen image	Operation of each object
	Numerical display: If the displayed value (monitored device value) does not change for 5 seconds, the characters blink in red.

Program example

Item	Description
Data type	Signed 16-bit binary
Trigger type	Cycle (1 second)

Item	Description	

Script	if([w:TMP0002] != $$){
	[w:TMP0001] = 5;
	[w:TMP0002] = $$;
	my.blink = 0;
	my.text_color = 0xFF;
	}else{
	if([w:TMP0001] > 0){
	[w:TMP0001] = [w:TMP0001] - 1;
	if([w:TMP0001] == 0){
	my.text_color = 0xE0;
	my.blink = 3;
	}
	}else{
	[w:TMP0001] = 5;
	}
	}
	redraw_object();
		//If the displayed value changes,
		//starts counting (sets time (seconds) when the blinking starts).
		//saves the displayed value.
		//sets so that blinking is not performed.
		//changes the character color to white.
		//If the displayed value does not change,
		//If the count is not 0,
		//starts counting down.
		//If counting down to 0,
		//changes the character color to red.
		//starts high-speed blinking.
		//Lets the object reflect this property.

69.4.3 Showing and hiding objects for input and touch operations

Operation

At screen switching, objects for specific input and touch operations are switched between being displayed and hidden according to the operating conditions.

Since objects used for input and touch operations are displayed only when necessary, this operation is useful for avoiding a wrong input.

Screen image	Operation of each object
	Numerical input: If M0 turns on, the object for numerical input is displayed. If M0 turns off, the object for numerical input is hidden. Switch 1 switch: If M1 turns on, the touch switch is displayed. If M1 turns off, the touch switch is hidden.

Monitor screen setting

Object name	Type	Setting item		Setting
Numerical input	Numerical input	Display condition, operating condition	Trigger type	ON
			Trigger device	M0
Switch 1	Switch	Operating condition	Trigger type	ON
			Trigger device	M1

Program example

Numerical input

Item	Description	
Data type	Signed 16-bit binary	
Trigger type	Ordinary	

Script	if([b:M0] == ON){
	my.active = 1;
	redraw_object();
	}else{
	my.active = 0;
	clear_object();
	}
		//Enables an update.
		//Updates the object.
		//Disables an update.
		//Clears the object.

Switch 1 switch

Item	Description	
Data type	Signed 16-bit binary	
Trigger type	Ordinary	

Script	if([b:M1] == ON){
	  my.active = 1;
	  redraw_object();
	}else{
	  my.active = 0;
	  clear_object();
	}
		//Enables an update.
		//Updates the object.
		//Disables an update.
		//Clears the object.

69.4.4 Drawing according to a device value

Operation

A figure is drawn on the screen according to a device value.

Screen image	Operation of each object
	Operation 1 lamp: Turns on if D500 is 1 and a circle is drawn around the lamp. Operation 2 lamp: Turns on if D500 is 2 and a circle is drawn around the lamp. Operation 3 lamp: Turns on if D500 is 3 and a circle is drawn around the lamp. Reset switch Resets operation 1 to operation 3. Operation 1 switch to operation 3 switch: Starts operation 1 to operation 3.

Monitor screen setting

Object name	Type	Setting item		Setting
Operation 1 lamp	Word lamp	Device		D500
		Text		Operation 1
		Condition 0	Lamp color	Red
		Condition 1	Range	$V<1
			Lamp color	Black
Operation 2 lamp	Word lamp	Device		D500
		Text		Operation 2
		Condition 0	Lamp color	Red
		Condition 1	Range	$V<2
			Lamp color	Black
Operation 3 lamp	Word lamp	Device		D500
		Text		Operation 3
		Condition 0	Lamp color	Red
		Condition 1	Range	$V<3
			Lamp color	Black
Reset switch	Word switch	Device		D500
		Set value (fixed)		0

Operation 1 switch	Word switch	Device		D500
		Set value (fixed)		1
		Text		Operation 1
Operation 2 switch	Word switch	Device		D500
		Set value (fixed)		2
		Text		Operation 2

Object name	Type	Setting item	Setting
Operation 3 switch	Word switch	Device	D500
		Set value (fixed)	3
		Text	Operation 3

Program example

Operation 1 lamp

Item	Description	
Data type	Signed 16-bit binary	
Trigger type	Ordinary	

Script	if ([w:D500] == 1){
	screen_draw(1);
	d_circle(57, 52, 65, 0, 2, 224);
	}else{
	screen_draw(1);
	d_circle(57, 52, 65, 0, 2, 255);
	}
		//If D500 is 1,
		//sets the drawing area to the whole screen.
		//draws a circle.
		//If D500 is not 1,
		//sets the drawing area to the whole screen.
		//deletes a circle. (draws a circle in the same color as the background color.)

Operation 2 lamp

Item	Description	
Data type	Signed 16-bit binary	
Trigger type	Ordinary	

Script	if ([w:D500] == 2){
	screen_draw(1);
	d_circle(57, 52, 65, 0, 2, 224);
	}else{
	screen_draw(1);
	d_circle(57, 52, 65, 0, 2, 255);
	}
		//If D500 is 2,
		//sets the drawing area to the whole screen.
		//draws a circle.
		//If D500 is not 2,
		//sets the drawing area to the whole screen.
		//deletes a circle. (draws a circle in the same color as the background color.)

Operation 3 lamp

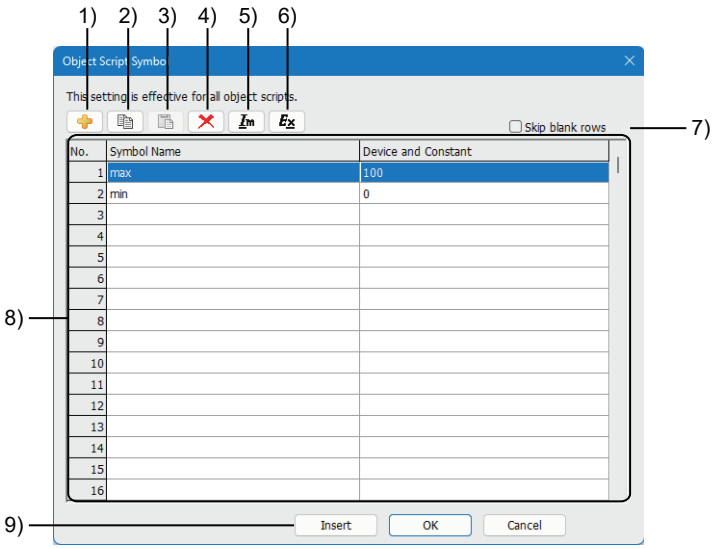
Item	Description	
Data type	Signed 16-bit binary	
Trigger type	Ordinary	

Script	if ([w:D500] == 3){
	screen_draw(1);
	d_circle(57, 52, 65, 0, 2, 224);
	}else{
	screen_draw(1);
	d_circle(57, 52, 65, 0, 2, 255);
	}
		//If D500 is 3,
		//sets the drawing area to the whole screen.
		//draws a circle.
		//If D500 is not 3,
		//sets the drawing area to the whole screen.
		//deletes a circle. (draws a circle in the same color as the background color.)

69.5 [Object Script Symbol] dialog

GT37 SoftGOT3000

This dialog is used for setting an object script.
Set symbols that can be commonly used for the object script.
Select [Common] → [Script] → [Object Script Symbol] from the menu to display the setting dialog.
Register character strings as script symbols.
Devices and constants in a script can be substituted by the registered character strings.
This setting is enabled only for the object script.



Item		Description
1)	[Add] button	This button is available when [Skip blank rows] is selected. Displays the [Add Object Script Symbol] dialog.  • [No.] Set a number for the script symbol to be added. The setting range is [1] to [10000]. • [Symbol Name] Set a character string to be described in a script. Up to 32 alphanumeric characters and symbols can be entered. However, the symbol # is not usable. • [Device and Constant] Set a device or constant for the symbol name. Up to 32 alphanumeric characters and symbols can be entered.
2)	[Copy] button	Copies the setting from the row selected in the script symbol list. Multiple rows can be copied at once. When [Skip blank rows] is selected, the settings in the hidden rows are also copied. The copied settings can be pasted to another script symbol setting dialog.

Item			Description
3)	[Paste] button		Pastes the copied setting to the selected row. When [Skip blank rows] is selected, the [Paste Symbol] dialog is displayed.  When pasting a setting to one row  When pasting settings to multiple rows • [Symbol No.] Set a symbol number for the destination row. The setting range is [1] to [10000]. • [First Symbol No.] Set a symbol number for the first destination row. The setting range is [1] to [10000].
4)	[Delete] button		Deletes the setting from the selected row. You can delete the settings from multiple rows at one time.
5)	[Import] button		Displays the [Open] dialog. Read the script symbol settings from a Unicode text file or CSV file.
6)	[Export] button		Displays the [Save As] dialog. Save the script symbol settings to a Unicode text file or CSV file. If multi-language characters are used in the settings, use the Unicode text file format. For the precautions for using a Unicode text file or CSV file, refer to the following. ☞ Page 3668 Precautions for using CSV file ☞ Page 3669 Precautions for using Unicode text file
7)	[Skip blank rows]		Displays only the rows in which script symbols have been registered.
8)	Script symbol list	[No.]	Lists the registered script symbols. [Symbol Name] and [Device and Constant] are editable. It is a row number. Clicking a row number selects the relevant row. The following operations can be performed on the selected row. • Copy: Ctrl + C • Paste: Ctrl + V • Delete: Delete
		[Symbol Name]	Set a character string to be described in a script. Up to 32 characters can be entered. However, the symbol # is not usable.
		[Device and Constant]	Set a device or constant for the symbol name. Up to 32 characters can be entered.
9)	[Insert] button		This item appears when this dialog is brought up from the [Edit Script(script name)] dialog. Inserts the selected script symbol into the script edit area in the [Edit Script(script name)] dialog.

Point

Editing method of scripts

You can edit scripts in the exported Unicode text file or CSV file using spreadsheet software and other software.

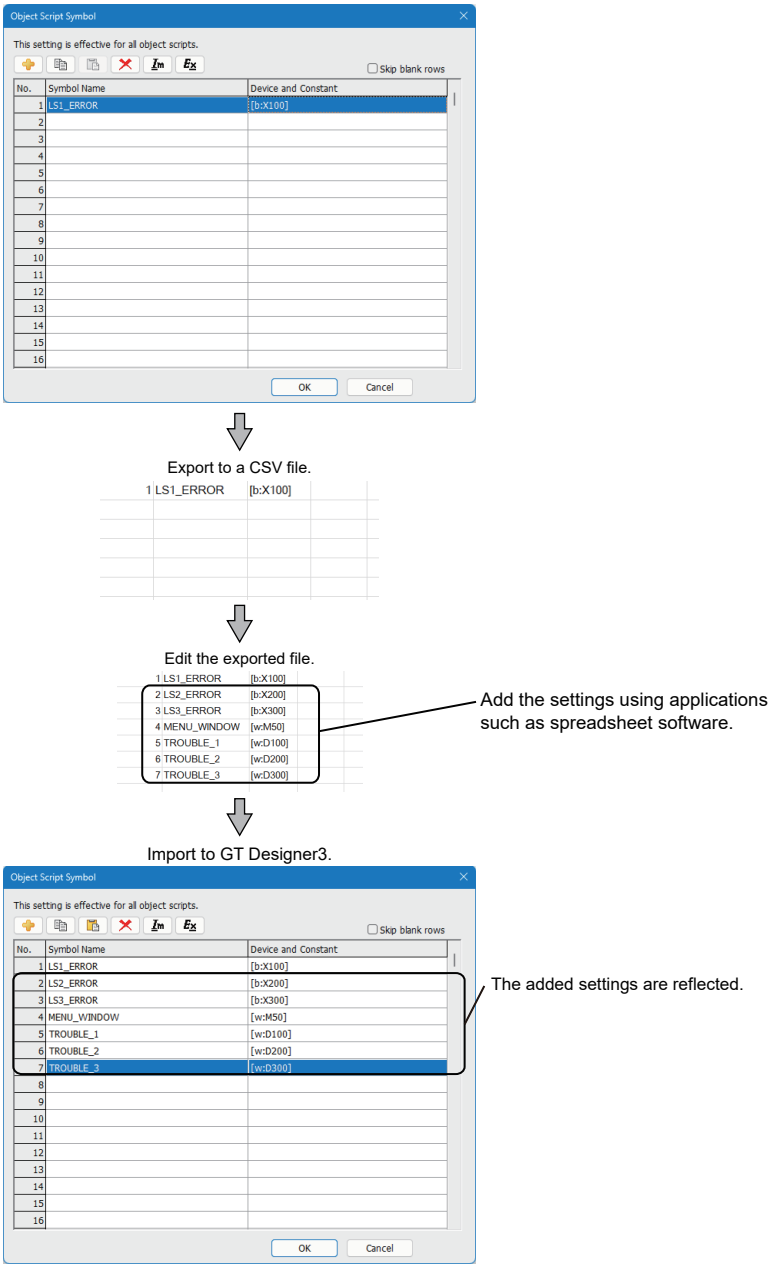
The edited Unicode text file or CSV file can be imported and read to GT Designer3.

Editing the exported file

When 0 is set at the beginning of the symbol name, device, or constant, 0 at the beginning may be deleted depending on the function of the application for editing files (spreadsheet software and other software).

Pay attention to the above for editing exported files.

Example) When script settings are exported into and imported from a CSV file

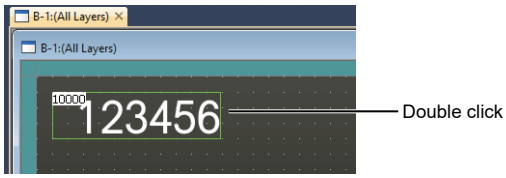


69.6 How to set object scripts

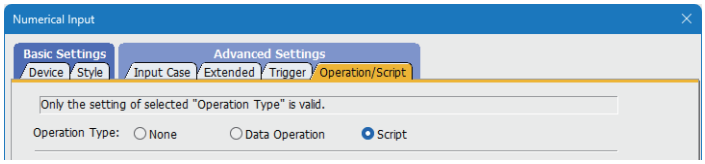
GT37 SoftGOT3000

☞ Page 2476 [Script] or [Operation/Script] tab for input object scripts
☞ Page 2478 [Script] or [Operation/Script] tab for display object scripts
☞ Page 2480 [Script] tab for switch object scripts

1. Double-click an arranged object to display the setting dialog.



2. Open the [Script] or [Operation/Script] tab to configure the setting for using the object script.



[Operation/Script] tab of the numerical input

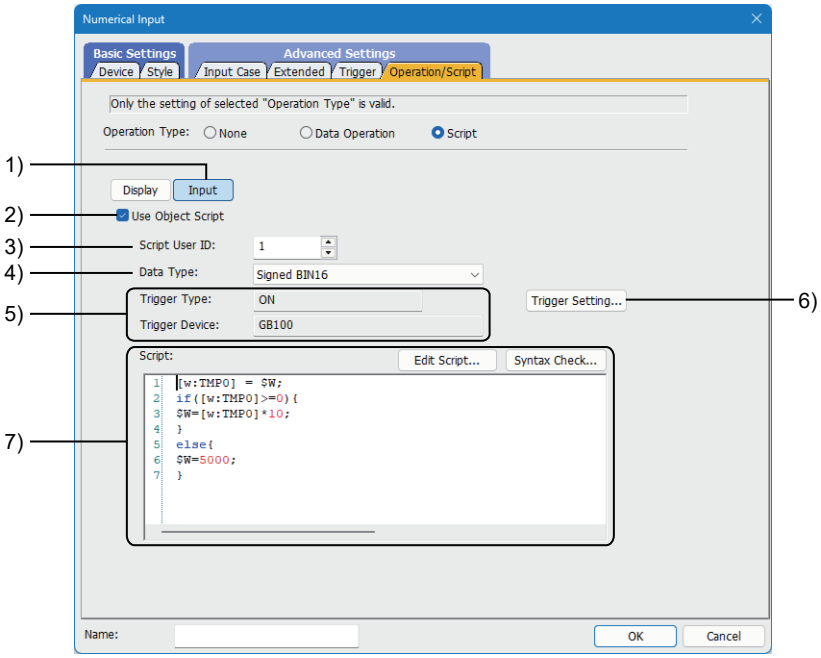
The setting of the [Script] or [Operation/Script] tab differs depending on the object type.
For details on the setting of the [Script] or [Operation/Script] tab for each object, refer to the following.

Object script type	Target object	Reference
Input object script	Numerical input, text input	☞ Page 2476 [Script] or [Operation/Script] tab for input object scripts
Display object script	Bit lamp, word lamp, numerical display, numerical input, text display, text input, date display, time display, comment display, parts display, frame animation, line graph, trend graph, bar graph, band graph, pie graph, scatter graph, historical trend graph, graphical meter, level object, panel meter	☞ Page 2478 [Script] or [Operation/Script] tab for display object scripts
Switch object script	Touch switch ([Switch] only)	☞ Page 2480 [Script] tab for switch object scripts

Precautions

If you close the setting dialog clicking the [OK] button after changing numerical input for numerical display or character string input for character string display, the input object script settings are cleared.
Only the display object script settings remain.

69.6.1 [Script] or [Operation/Script] tab for input object scripts



Screen for setting a numerical input object script

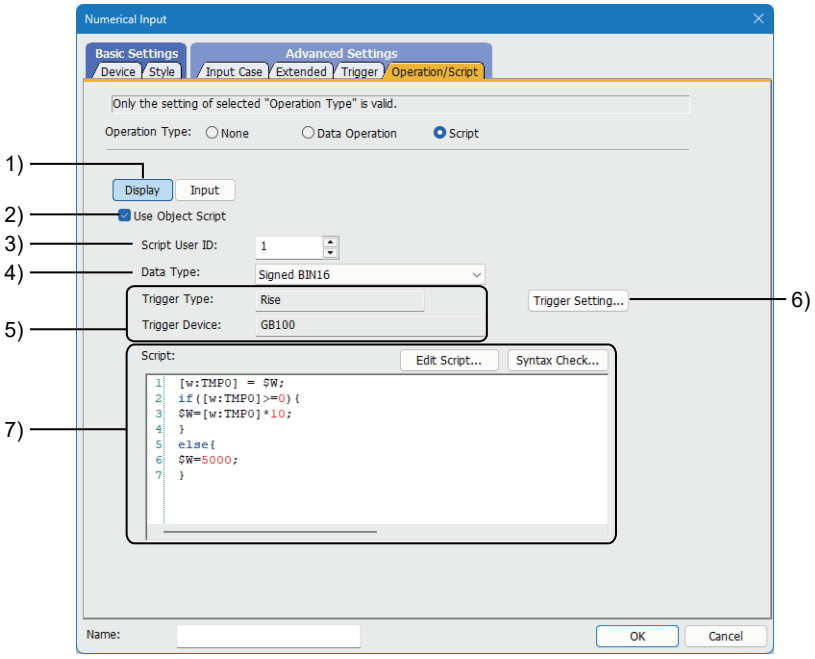
Item		Description
1)	[Input] button	To set an input object script, click the [Input] button. Then, the setting items of the input object script are displayed. This button is displayed only for the following objects. • [Numerical Input] • [Text Input]
2)	[Use Object Script]	Enables the object script.
3)	[Script User ID]	Specify a script user ID number. The setting range is [1] to [65535]. For each object script, specify a different script user ID number. Doing so enables you to identify the error-generated object script.
4)	[Data Type]	Select the data type of the script to be executed. The following shows selectable items. • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
5)	[Trigger Type], [Trigger Device]	Displays the operating condition and trigger device of the script which are set in the [Trigger Setting] dialog.

Item			Description
6)	[Trigger Setting] button		Click the [Trigger Setting] button to display the [Trigger Setting] dialog.  • [Trigger Type]*1 Select the operating condition of the script. The following shows selectable items. [Ordinary] [ON] [OFF] [Rise] [Fall] [Rise/Fall] [Sampling] [ON Sampling] [OFF Sampling] [Key Code Input] [Input Fixation] • [Settings] Set the device that triggers the script to run. (When [ON], [OFF], [Rise], [Fall], [Rise/Fall], [ON Sampling], or [OFF Sampling] is selected in [Trigger type]) When [Sampling], [ON Sampling], or [OFF Sampling] is selected, set the cycle in units of seconds. The setting range is [1] to [3600].*2
7)	[Script]	[Edit Script] button	Displays the content of the script. You can edit the script. After editing the script, click the [Syntax Check] button to check the syntax. The editor is opened to edit the script. ☞ Page 2415 [Edit Script(script name)] dialog
		[Syntax Check] button	Checks the syntax of the displayed script. The available device type and device range are also checked. ☞ Page 2487 Messages to be displayed at the syntax check

*1 For the precautions for selecting [ON], [OFF], [Sampling], [ON Sampling], or [OFF Sampling], refer to the following.
☞ Page 2465 Execution timing when [Trigger Type] is set to [ON Sampling] or [OFF Sampling]
☞ Page 2465 Execution timing when [Sampling], [ON Sampling], or [OFF Sampling] is set

*2 When the trigger condition is satisfied, the count of the cycle starts.
When [ON Sampling] is set and the cycle is set to 10 seconds, the script is executed 10 seconds after the device set in [Trigger Device] turns on. (When [Trigger Device] turns off within 10 seconds, the script is not executed.)
When the satisfied trigger condition becomes unsatisfied, the count of the cycle time is reset.
☞ Page 968 Trigger type settings

69.6.2 [Script] or [Operation/Script] tab for display object scripts



Screen for setting a display object script for numerical input

Item		Description
1)	[Display] button	To set an input object script, click the [Display] button. Then, the setting items of the input object script are displayed. This button is displayed only for the following objects. • [Numerical Input] • [Text Input]
2)	[Use Object Script]	Enables the object script.
3)	[Script User ID]	Specify a script user ID number. The setting range is [1] to [65535]. For each object script, specify a different script user ID number. Doing so enables you to identify the error-generated object script.
4)	[Data Type]	Select the data type of the script to be executed. The following shows selectable items. • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
5)	[Trigger Type], [Trigger Device]	Displays the operating condition and trigger device of the script which are set in the [Trigger Setting] dialog.

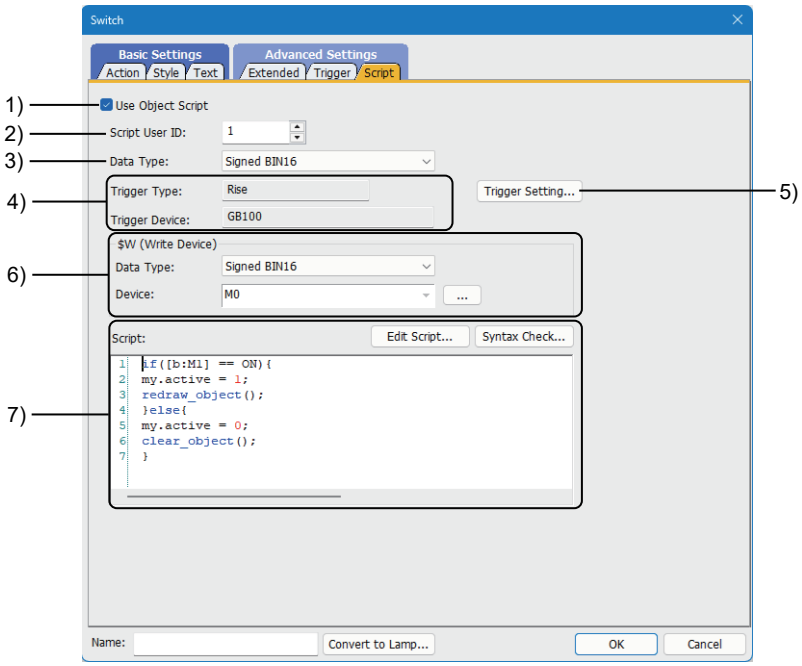
Item			Description
6)	[Trigger Setting] button		Click the [Trigger Setting] button to display the [Trigger Setting] dialog.  • [Trigger Type]*1 Select the operating condition of the script. The following shows selectable items. [Ordinary] [ON] [OFF] [Rise] [Fall] [Rise/Fall] [Sampling] [ON Sampling] [OFF Sampling] [View Change] [Synchronize Display Trigger]*2 • [Settings] Set the device that triggers the script to run. (When [ON], [OFF], [Rise], [Fall], [Rise/Fall], [ON Sampling], or [OFF Sampling] is selected in [Trigger type]) When [Sampling], [ON Sampling], or [OFF Sampling] is selected, set the cycle in units of seconds. The setting range is [1] to [3600].*3
7)	[Script]	[Edit Script] button	Displays the content of the script. You can edit the script. After editing the script, click the [Syntax Check] button to check the syntax. The editor is opened to edit the script. ☞ Page 2415 [Edit Script(script name)] dialog
		[Syntax Check] button	Checks the syntax of the displayed script. The available device type and device range are also checked. ☞ Page 2487 Messages to be displayed at the syntax check

*1 For the precautions for selecting [ON], [OFF], [Sampling], [ON Sampling], or [OFF Sampling], refer to the following.
☞ Page 2465 Execution timing when [Trigger Type] is set to [ON Sampling] or [OFF Sampling]
☞ Page 2465 Execution timing when [Sampling], [ON Sampling], or [OFF Sampling] is set

*2 This item is unavailable for the bit lamp, word lamp, date display, time display, graphical meter, and panel meter.

*3 When the trigger condition is satisfied, the count of the cycle starts.
When [ON Sampling] is set and the cycle is set to 10 seconds, the script is executed 10 seconds after the device set in [Trigger Device] turns on. (When [Trigger Device] turns off within 10 seconds, the script is not executed.)
When the satisfied trigger condition becomes unsatisfied, the count of the cycle time is reset.
☞ Page 968 Trigger type settings

69.6.3 [Script] tab for switch object scripts



Item		Description
1)	[Use Object Script]	Enables the object script.
2)	[Script User ID]	Specify a script user ID number. The setting range is [1] to [65535]. For each object script, specify a different script user ID number. Doing so enables you to identify the error-generated object script.
3)	[Data Type]	Select the data type of the script to be executed. The following shows selectable items. • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
4)	[Trigger Type], [Trigger Device]	Displays the operating condition and trigger device of the script which are set in the [Trigger Setting] dialog.

Item			Description
5)	[Trigger Setting] button		Click the [Trigger Setting] button to display the [Trigger Setting] dialog.  • [Trigger Type]*1 Select the operating condition of the script. The following shows selectable items. [Ordinary] [ON] [OFF] [Rise] [Fall] [Rise/Fall] [Sampling] [ON Sampling] [OFF Sampling] [Device Writing] • [Settings] Set the device that triggers the script to run. (When [ON], [OFF], [Rise], [Fall], [Rise/Fall], [ON Sampling], or [OFF Sampling] is selected in [Trigger type]) When [Sampling], [ON Sampling], or [OFF Sampling] is selected, set the cycle in units of seconds. The setting range is [1] to [3600].*2
6)	[$W (Write Device)]	[Data Type]	To assign the value processed in the script to the device with the touch switch, set the target device. Select the data type of the object internal variable $W (write device).
		[Device]	Set the object internal variable $W (write device). ☞ Page 833 Device, label, and tag settings
7)	[Script]	[Edit Script] button	Displays the content of the script. You can edit the script. After editing the script, click the [Syntax Check] button to check the syntax. The editor is opened to edit the script. ☞ Page 2415 [Edit Script(script name)] dialog
		[Syntax Check] button	Checks the syntax of the displayed script. The available device type and device range are also checked. ☞ Page 2487 Messages to be displayed at the syntax check

*1 For the precautions for selecting [ON], [OFF], [Sampling], [ON Sampling], or [OFF Sampling], refer to the following.
☞ Page 2465 Execution timing when [Trigger Type] is set to [ON Sampling] or [OFF Sampling]
☞ Page 2465 Execution timing when [Sampling], [ON Sampling], or [OFF Sampling] is set

*2 When the trigger condition is satisfied, the count of the cycle starts.
When [ON Sampling] is set and the cycle is set to 10 seconds, the script is executed 10 seconds after the device set in [Trigger Device] turns on. (When [Trigger Device] turns off within 10 seconds, the script is not executed.)
When the satisfied trigger condition becomes unsatisfied, the count of the cycle time is reset.
☞ Page 968 Trigger type settings

69.7 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for object scripts as required.
The following shows the functions that are available by configuring the relevant settings.

69.7.1 GOT internal devices

☞ Page 3581 GOT special register (GS)

Function	Setting item
Notifying that an object script error has occurred.	GS80.b0
Notifying that a BCD error has occurred.	GS80.b7
Notifying that a zero division error has occurred.	GS80.b8
Notifying that a communication error (including access to an invalid device) has occurred.	GS80.b12
Storing the start device number of the devices where the latest error record is stored. The devices range from GS82 to GS113.	GS81
Storing the object script error records (including script user IDs and error codes).	GS82 to GS113
Storing the device number of the device where the latest script execution record is stored. The device is in the range of GS115 to GS145.	GS114
Storing the script user IDs of the executed scripts.	GS115 to GS145
Storing a number showing the GOT data registers (GD) where the latest error record is stored. The GD devices are specified with GS432 and GS434.	GS159
Storing a number showing the GOT data registers (GD) where the latest script execution record is stored. The GD devices are specified with GS436 and GS438.	GS160
Notifying occurrence of an error while the integer-real number conversion is processed.	GS260.b14
Notifying the completion of the integer-real number conversion.	GS260.b15
Storing the error code of an error that occurred while the integer-real number conversion is processed.	GS261
Clearing object script error records as shown below. • GS80.b0, b7, b8, and b12 store 0. • GS81 stores -1. • GS82 to GS113 store 0.	GS387.b0
Re-executing the object script aborted due to an error.	GS387.b1
Setting the monitoring time for one script.	GS388
Controlling whether to run an object script upon screen switching or other applicable processes. The applicable script trigger types are as follows. • [Rise] • [Fall] • [Rise/Fall]	GS389
Storing the detailed object script error records.	GS432 GS434 GS435
Storing the detailed object script execution records.	GS436 GS438 GS439
Executing an integer-real number conversion.	GS460 GS461 GS462 GS463 GS464

Monitoring time of an object script

Specify the monitoring time of an object script with GS388.
If a script does not end after a lapse of the specified monitoring time, the script is aborted.
The setting range is 1 second to 300 seconds. (Units of 1 second)
If the set value falls outside this range, 10 seconds are assumed.
If error code 1015 is output during script execution, specify a longer monitoring time with GS388.

Running an object script upon an applicable process

Use GS389 to set whether to run an object script upon screen switching or other applicable processes.

When GS389 stores 0: Runs the script upon an applicable process.

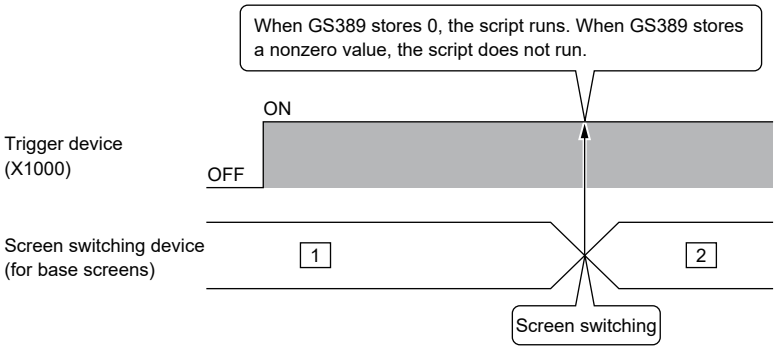
When GS389 stores a nonzero value: Does not run the script upon an applicable process.

The object script, which has the following trigger type setting, is targeted for executing the initial operation.

Trigger type	When running a script upon an applicable process
[Rise]	When the trigger device is on, the script runs upon screen switching or other applicable processes.
[Fall]	When the trigger device is off, the script runs upon screen switching or other applicable processes.
[Rise/Fall]	When the trigger device is on or off, the script runs upon screen switching or other applicable processes.

Ex.

When the object script ([Trigger Type]: [Rise], [Trigger Device]: X1000) is set for a switch on base screen 2



The following shows the processes upon which a script runs.

Process	Remarks
When the GOT is powered on or when the GOT returns from offline	—
Screen switching	The script set for the destination screen runs.
Security switching*1	—
Language switching*1	—
System language switching*1	—
Station No. switching*1	If a station No. switching device is set for a screen type, the script set for a screen of this type runs.
Buffer memory unit No. switching	—
When object script "redraw_screen()" is executed	—

*1 When [Perform script initial operation (screen/object) only when switching screens] is deselected on the [Option] tab in the [Script] dialog, the script runs upon the process.
☞ Page 2410 [Option] tab

69.8 Troubleshooting

GT37 SoftGOT3000

69.8.1 Simulation using a general C language compiler or debugger

Since scripts and C language are similar, you can simulate the scripts by making minor corrections using a general C language compiler or debugger.
Complicated scripts including many control statements can be debugged easily by using them.
The following shows the procedure to simulate scripts using a general C language compiler or debugger.

1. Export an object script created with GT Designer3 to a text file or Unicode text file (extension.txt) and change it into a C language source file (extension.c).

- Change of the file extension: text1.txt → text1.c

2. Open the C language source file in a commercially-available text editor and create a frame with "main(){}".
Describe "#include<stdio.h>" at the beginning.

- Additional description of "main" and "include"

Additional description→	#include<stdio.h>
Additional description→	main(){
	[w:TMP0001] = 0;
	while([w:TMP0000] < [w:D100]){
	if(!(([w:TMP0000] - 1900)%4)){
	[w:TMP0001] = [w:TMP0001] + 1;
	my.x = 200;
	my.scale_max[0] = 500;
	••• (Omitted) •••
	[w:TMP0010] = [w:TMP0002] + [w:TMP0003] + [w:TMP0004] -1;
	$W = [w:TMP0010]%7;
Additional description→	}

3. Change the description method of devices (variables, properties) from the one for scripts to the one for C language.

Using the following definitions to change the variables into the one for C language enables you to smoothly restore them into the GOT scripts.

Definition 1 [w: → _w

Definition 2 [b: → _b

Definition 3] → __

Definition 4 my. → my_

Definition 5 $W → device_write

Definition 6 $V → device_value

Definition 7 $$ → monitor_device

Definition 8 $K → key_input

Definition 9 [→ _

Using the batch replacement function of a commercially-available text editor may be useful for the change as well.

- Change of the description method of devices (variables)

	#include<stdio.h>
	main(){
Description change→	_wTMP0001__= 0;
Description change→	while(_wTMP0000__<_wD100__){
Description change→	if(!((_wTMP0000__-1900)%4)){
Description change→	_wTMP0001__=_wTMP0001__+1;
Description change→	my_x = 200;
Description change→	my_scale_max_0__ = 500;
	••• (Omitted) •••
Description change→	_wTMP0010__=_wTMP0002__+_wTMP0003__+_wTMP0004__-1;
Description change→	device_write = _wTMP0010__%7;
	}

4. For C language, variables to be used must be defined in advance.

Since only one data type can be set for one script, the same variable type of C language must be set for all the variables.

The following shows the data type of scripts.

If [BCD16], [BCD32], or [BCD64] is selected as the script data type, you cannot perform a simulation using the general C language compiler or debugger.

Data type of scripts	Variable type
Signed 16-bit binary	short
Unsigned 16-bit binary	unsigned short
Signed 32-bit binary	long
Unsigned 32-bit binary	unsigned long
Signed 64-bit binary	long long
Unsigned 64-bit binary	unsigned long long
BCD16	-
BCD32	
BCD64	
Real number (32 bits)	float
Real number (64 bits)	double

Use an appropriate property according to the property range.

Assign an internal variable whose variable type is the same as the data type of the script.

- Variable definition (auto variable declaration)

```
                    #include<stdio.h>
Description change→ void main(void){
Addition →            unsigned short _wTMP0000__;
Addition →            unsigned short _wTMP0001__;
Addition →            unsigned short _wTMP0002__;
Addition →            unsigned short _wD100__;
Addition →            short my_c;
Addition →            unsigned sort my_scale_max_0__;
Addition →            unsigned sort device_write;
                       ••• (Omitted) •••
                      _wTMP0001__=0;
                      while(_wTMP0000__<_wD100__){
                            if(!((_wTMP0000__-1900)%4)){
                              _wTMP0001__=_wTMP0001__+1;
                              my_x = 200;
                              my_scale_max_0__ = 500;
                       ••• ( Omitted) •••
                      _wTMP0010__=_wTMP0002__+_wTMP0003__+_wTMP0004__-1;
                      device_write = _wTMP0010__%7;
                    }
```

5. Perform a simulation with the general C language compiler or debugger.

The step run, variable watch, and other functions specific to the debugger can be used.

Precautions

- If [BCD16], [BCD32], or [BCD64] is selected as the script data type, you cannot perform a simulation using the general C language compiler or debugger.
- Since the set, rst, alt, bmov, and fmov statements are dedicated for scripts, you cannot perform a simulation using a general C language compiler or debugger.

Use assignment of 1 or 0 instead of the set or rst statement.

- When you use the system define (ON, OFF description) of the GOT as they are, the define for it must be added to the C language source file.
- The assignment delay which occurs when a script is executed on the GOT does not occur during a simulation using a general C language compiler or debugger.

Therefore, when performing a simulation, take a possibility of occurrence of assignment delays into consideration.

- By applying the measures above, a new program created using C language then debugged can be used as a GOT script.
- Offset device specification cannot be made in the above debugging process.

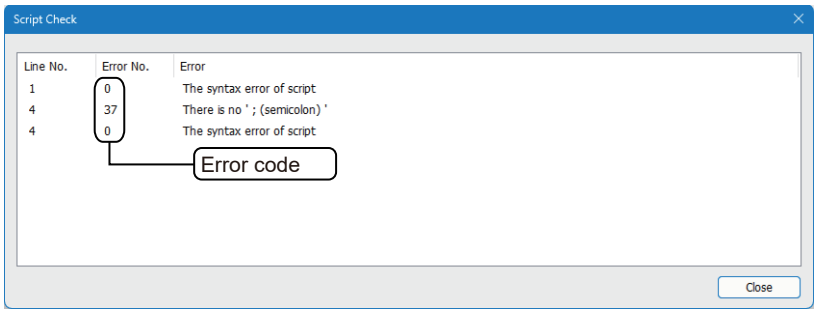
If you debug the offset specified device, it is necessary to set the corresponding device in advance.

69.8.2 Messages to be displayed at the syntax check

When you execute a syntax check, the [Script Check] dialog appears to display the error codes of the errors detected in a script.

For details on the error codes, refer to the following.

☞ Page 2436 List of syntax error codes



Some errors cannot be detected by the syntax check.

If any error which cannot be detected by the syntax check exists in the script, the error is detected when the script is executed on the GOT.

For the errors for the execution of a script and the corrective action on the GOT, refer to the following.

☞ Page 2488 Errors and their corrective actions during script execution on the GOT (object script)

69.8.3 Errors and their corrective actions during script execution on the GOT (object script)

The following shows how to check the errors and their error codes on the GOT.

Item	Description
Checking for the occurrence of an error	Check for the occurrence of the following errors. • Script error • BCD error • Zero division error • Communication error (including access to an invalid device) ☞ Page 2488 Checking the error status (object script)
Checking an error record	Check the following information of an error. • Script user ID • Error code ☞ Page 2489 Checking an error record (object script)
Checking a detailed error record	Check the following information of an error. • Error code • Script type • Screen number • Object ID • Screen type • Number of the displayed base screen ☞ Page 2490 Checking a detailed error record (object script)
Clearing error records	Turn on GS387.b0 to clear object script error records as shown below. • GS80.b0, b7, b8, and b12 store 0. • GS81 stores -1. • GS82 to GS113 store 0.
Re-executing the object script aborted due to an error	Turn on GS387.b1 to re-execute the object script aborted due to an error.

To check device values, use objects (including a numerical display and lamp).

Precautions

While the GOT displays any screen other than a user-created screen, the following operations are not available.

- Clearing object script error data or executing an object script stopped due to an error by using the Object Script Common Control (GS387)

☞ Page 3632 Object Script Common Control (GS387)

Perform the above operations while the GOT displays a user-created screen.

Checking the error status (object script)

The following GOT internal devices notify the error status.

GOT internal devices		Description
GS80	b0	Turns on when a script error occurs.
	b7	Turns on when a BCD error occurs.
	b8	Turns on when a zero division error occurs.
	b12	Turns on when a communication error (including access to an invalid device) occurs.

To reset each bit of GS80, turn on GS387.b0.

Checking an error record (object script)

When an error occurs, the error record is stored into the devices ranging from GS82 to GS113.

GS81 stores the start device number of the devices where the latest error record is stored.

To clear error records, turn on GS387.b0.

The following shows the operation of the relevant GOT internal devices.

GOT internal devices	Description
GS81	Stores the start device number of the devices where the latest error record is stored. The devices range from GS82 to GS113. The value of GS81 changes as follows each time an error occurs. -1 → 82 → 84 → 86 → 88 → ... → 112 (The next loop will start from 82.) Example) Relationship between the value of GS81 and the storage location of the latest error record • When GS81 stores 82, the latest error information is stored in GS82 and GS83. • When GS81 stores 112, the latest error information is stored in GS112 and GS113. Turning on GS387.b0 resets GS81 to -1.
GS82 to GS113	Stores the following information when a script error occurs. • Script number • Error code Two word devices are used for one error.  If the number of errors is 17 or more, the error records are overwritten starting from the oldest one.

Checking a detailed error record (object script)

The specified GOT data registers (GD) store error records.

These GD devices are specified with the following GOT special registers (GS).

- GS432: Specify the start device number of the GD devices to store error records.
- GS434: Specify the maximum number of error records.

Ex.

When GS432 (start device number) stores 1000, and GS434 (number of error records) stores 5

GD1000 to GD1007	··· 1st error record
GD1008 to GD1015	··· 2nd error record
GD1016 to GD1023	··· 3rd error record
GD1024 to GD1031	··· 4th error record
GD1032 to GD1039	··· 5th error record

Eight word devices are used for one error.

For details on an error record, refer to the following.

☞ Page 2491 Details on an error record (object script)

To start storing error records, turn on GS435.b0.

You can identify the devices storing the latest error record based on the values of GS432 and GS159.

The following shows the operation of the relevant GOT internal devices.

- Write device

GOT internal devices	Description
GS159	Stores a number showing the devices where the latest error record is stored. Data type: Signed binary Initial value: -1 Calculate the start device number of the devices storing the latest error record by using the following expression. • GS432 + (GS159 × 8) Example) When GS432 stores 1000, and GS159 stores 5 1000 + (5 × 8) = 1040 In this case, GD1040 to GD1047 (eight GD devices) store the latest error record.

- Read device

GOT internal devices		Description
GS432		Specify the start device number of the GD devices to store error records. Data type: Unsigned binary
GS434		Specify the maximum number of error records. Data type: Unsigned binary The setting range is 0 to 5000. If the device stores 0, no error record will be stored. If the device stores 5001 or more, up to 5000 records will be stored. GS435.b1 specifies the operation to be performed when the number of errors has exceeded the maximum number of error records.
GS435	b0	When this bit is turned on, storing error records starts. When this bit is turned off, storing error records ends.
	b1	Specifies the operation to be performed when the number of errors has exceeded the maximum number of error records specified with GS434. When this bit is turned on, storing error records stops. When this bit is turned off, storing error records continues by overwriting the oldest record.
	b11	When this bit is turned on, the records of warnings (that do not abort a script) are not stored.

Details on an error record (object script)

The following shows an example of how an error record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Error code	Error code of an error. For the error details and corrective actions, refer to the following. ☞ Page 2492 List of error codes during script execution (object script)
GD1001	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 10: Display object script or switch object script • 11: Input object script
GD1002	Screen number	Number of the screen where the object is placed.
GD1003	Object ID	ID of the object with a script error.
GD1004	Use prohibited	The device stores 0.
GD1005	Screen type	Type of the screen where the object is placed. The device stores any of the following values according to the screen type. • 200: Base screen • 210: Superimpose window 1 • 220: Superimpose window 2 • 310: Overlap window 1 • 320: Overlap window 2 • 330: Overlap window 3 • 340: Overlap window 4 • 350: Overlap window 5 • 400: User-created key window • 500: Dialog window substituted for a system message If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. • When a base screen is called, 1 is added. • When a window screen is called, 2 is added. Example) When a window screen is called from overlap window 3 330 + 2 = 332
GD1006	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1007	Use prohibited	The device stores 0.

List of error codes during script execution (object script)

Error code	Error category[*1]	Description	Corrective action
1002	Fatal error	Initialization of objects related to the object scripts failed when a screen is switched.	• Reduce the number of monitor devices in object scripts and base screens. • Reduce the number of object scripts presently executed.
1006	Fatal error	An error occurred in reading data from the device that always collects the data.	Correct the description of the device whose data is out of the specified device range.
1011	Execution error	Writing to a device failed.	Correct the description of the relevant script.
1014	Fatal error	The expression is too complicated to process.	Simplify the script operation expression by dividing it or by using other appropriate methods.
1015	Fatal error	The object script does not end although the object script monitoring time has elapsed.	• Check whether the script has gone into an endless loop. • Increase the value of the Object Script Monitoring Time (GS388).
1016	Fatal error	The access to a GOT internal device failed.	• Correct the operation for the GOT internal device, script, and sequence program. • Correct the description of the relevant script.
1017	Fatal error	The script where an error is detected by the syntax check of GT Designer3 was executed.	Correct the script where a syntax error is detected in GT Designer3.
1018	Fatal error	The access failed since a temporary device area outside the range has been specified.	Specify the temporary device area within the range.
1019	Fatal error	An 8-bit or 64-bit device is specified for an indirect device.	Correct the indirect device description in the relevant script.
1020	Fatal error	Writing to multiple devices was attempted in a single script.	Correct the number of write devices to the available number.
1021	Fatal error	An invalid device type was detected.	Correct the device to the one that can be used by the script.
1022	Fatal error	Temporary device areas for 32-bit data are used for the script of 64-bit data.	Correct the common settings of the relevant script.
1031	Fatal error	Reference of the internal variable was impossible.	Correct the internal valuable according to the object, object script, trigger type that allow referring to the internal variable.
1032	Fatal error	Assignment to the internal variable was impossible.	Correct the internal valuable according to the object, object script, trigger type that allow assigning to the internal variable.
1039	Fatal error	The script where an error is detected by the syntax check of GT Designer3 was executed.	Correct the script where a syntax error is detected in GT Designer3.
1045	Fatal error	Setting that is not in the object was referred to or changed.	Refer to or change the property that can be set by the object itself.
1057	Fatal error	The script where an error is detected by the syntax check of GT Designer3 was executed.	Correct the script where a syntax error is detected in GT Designer3.
1060			
1070	Fatal error	An error occurs in the trigger device setting.	Correct the trigger device setting.
1108	Execution error	The operation result cannot be handled in BCD data.	• Check the setting of the monitored device. • Correct the operation of the device which could not process BCD data.
1109	Execution error	The operation result was outside the BCD data range.	Correct the operation of the device whose BCD data is outside the range.
1110	Execution error	Zero division was executed.	Correct the zero division of the script.
1111	Execution error	A 64-bit operation overflow has occurred.	Check the description of the relevant script and correct it.
1131	Execution error	Reference of the internal variable was impossible.	Correct the internal variable to be referred to.
1141	Execution error	A value outside the property range was set.	Correct the assigned value of the property.
1142	Execution error	For the element number of the property that specifies an array, a value outside the range was set.	Correct the element number of the property that specifies an array.
1143	Execution error	• The object font was set to a font other than UD font or UD font (7-segment) to change the text size property. • A value outside the range was set to change the text size property.	Correct the assigned value of the property.

Error code	Error category*1	Description	Corrective action
1144	Execution error	The magnification value that exceeds the frame figure was set to change the text size property.	Correct the value assigned to the property.
1246	Warning	The number of decimal places specified for a numerical display or numerical input object cannot be read or written using an object property in the script.	The number of decimal places specified with a device cannot be read or written using an object property in the script. Correct the relevant setting.
1251	Warning	Either of the coordinate or radius is incorrect.	Correct the arguments of the free figure drawing function.
1252	Warning	Any of the line type, line width, or line color is incorrect.	Correct the arguments of the free figure drawing function.
1253	Warning	Any of the pattern, shape color, or background color is incorrect.	Correct the arguments of the free figure drawing function.
1254	Warning	Any of the character attribute, character color, character shade color, character size, character string code, or character string length is incorrect.	Correct the arguments of the free figure drawing function.
1255	Warning	No comment is assigned to the comment No. of the specified comment group No.	Correct the arguments of the free figure drawing function.
1256	Warning	The stored amount of drawing data exceeded the allowable capacity.	Reduce the number of functions.

*1 For details on the error categories, refer to the following.
☞ Page 2494 Error category of object scripts and operation at error occurrence

Error category of object scripts and operation at error occurrence

■Error category

The following shows the categories of the object script error codes. When an error occurs, the object script operates as follows.

Error category	Object script operations at error occurrence
Fatal error	The object script stops. Even if the trigger condition is satisfied again, the object script does not operate. For the object script where the error has occurred, drawing the object and writing to a device stop.*1
Execution error	The object script stops. If the trigger condition is satisfied again, the object script operates. For the object script where the error has occurred, drawing the object and writing to a device stop.*1 If this error occurs repeatedly, the subsequent errors are not written into GS82 to GS113.
Warning	The object script does not stop.

*1 The operation of the object with the object script where the error has occurred varies according to the set operating condition.

Operating condition of object script	Monitor function of object	Write function of object
When a key code is input When the input is confirmed When writing to a device is executed	Operates	Stops
When the view changes Synchronize Display Trigger Ordinary	Stops	Operates
Other than above	Stops	Stops

■Script which has been executed before an error occurs

Reflection of the written value and execution of a function differ depending on the target device to be written and function to be executed.

Writing to a device

If writing to a device is executed by the script which has been executed before an error occurs, the written value is reflected as follows.

○: Written value is reflected. —: Written value is not reflected.

Target device to be written	Operation at error occurrence
GOT internal devices (GB and GD)	○
GOT internal devices (Other than GB and GD)	—
Controller device	—
Temporary device area	○

Executing a function:

If a function is executed by the script which has been executed before an error occurs, the function is executed as follows.

○: Function is executed. —: Function is not executed.

Target function to be written or executed	Operation at error occurrence
Free figure drawing	—
Object update function	○
Object display clear function	○
Screen update function	○
Internal variable	—
Property	○

69.8.4 How to check an object script execution record

The following shows how to check a script execution record on the GOT.

Item	Description
Checking a script execution record	Check the script user ID of an executed script. ☞ Page 2495 How to check an object script execution record
Checking a detailed script execution record	Check the following information on an executed script. • Script type • Screen number • Object ID • Screen type • Number of the displayed base screen ☞ Page 2495 Checking a detailed script execution record (object script)

To check device values, use the device monitor function or objects (including a numerical display and lamp).

Checking an object script execution record

When a script runs, the script user ID is stored into the devices GS115 to GS145.

GS114 stores the device number of the device where the latest script execution record is stored.

The following shows the operation of the relevant GOT internal devices.

GOT internal devices	Description
GS114	Stores the device number of the device where the latest script execution record is stored. The device is in the range of GS115 to GS145. The value of GS114 changes as follows each time a script runs. -1 → 115 → 116 → 117 → 118 → ... → 145 (The next loop will start from 115.)
GS115 to GS145	Store the script user IDs of the executed scripts. One word device is used for one script. If the number of the executed scripts is 32 or more, the script execution records are overwritten starting from the oldest one.

Checking a detailed script execution record (object script)

The specified GOT data registers (GD) store script execution records.

These GD devices are specified with the following GOT special registers (GS).

- GS436: Specify the start device number of the GD devices to store script execution records.
- GS438: Specify the maximum number of script execution records.

Ex.

When GS436 (start device number) stores 1000, and GS438 (number of execution records) stores 5

GD1000 to GD1007	··· 1st execution record
GD1008 to GD1015	··· 2nd execution record
GD1016 to GD1023	··· 3rd execution record
GD1024 to GD1031	··· 4th error record
GD1032 to GD1039	··· 5th error record

Eight word devices are used for one script execution record.

For details on a script execution record, refer to the following.

☞ Page 2496 Details on an execution record (object script)

To start storing script execution records, turn on GS439.b0.

You can identify the devices storing the latest script execution record based on the values of GS436 and GS160.

The following shows the operation of the relevant GOT internal devices.

• Write device

GOT internal devices	Description
GS160	Stores a number showing the devices where the latest script execution record is stored. Data type: Signed binary Initial value: -1 Calculate the start device number of the devices storing the latest script execution record by using the following expression. • GS436 + (GS160 × 8) Example) When GS436 stores 1000, and GS160 stores 5 1000 + (5 × 8) = 1040 In this case, GD1040 to GD1047 (eight GD devices) store the latest script execution record.

• Read device

GOT internal devices		Description
GS436		Specify the start device number of the GD devices to store script execution records. Data type: Unsigned binary
GS438		Specify the maximum number of script execution records. Data type: Unsigned binary The setting range is 0 to 5000. If the device stores 0, no script execution record will be stored. If the device stores 5001 or more, up to 5000 records will be stored. GS439.b1 specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records.
GS439	b0	When this bit is turned on, storing script execution records starts. When this bit is turned off, storing script execution records ends.
	b1	Specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records specified with GS438. When this bit is turned on, storing script execution records stops. When this bit is turned off, storing script execution records continues by overwriting the oldest record.

Details on an execution record (object script)

The following shows an example of how a script execution record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 10: Display object script or switch object script • 11: Input object script
GD1001	Screen number	Number of the screen where the object is placed.
GD1002	Object ID	ID of the object where a script runs.
GD1003	Use prohibited	The device stores 0.
GD1004	Screen type	Type of the screen where the object is placed. The device stores any of the following values according to the screen type. • 200: Base screen • 210: Superimpose window 1 • 220: Superimpose window 2 • 310: Overlap window 1 • 320: Overlap window 2 • 330: Overlap window 3 • 340: Overlap window 4 • 350: Overlap window 5 • 400: User-created key window • 500: Dialog window substituted for a system message If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. • When a base screen is called, 1 is added. • When a window screen is called, 2 is added. Example) When a window screen is called from overlap window 3 330 + 2 = 332
GD1005	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1006	Use prohibited	The device stores 0.
GD1007	Use prohibited	The device stores 0.

PART 13 Device data transfer

70 Transferring data between devices ([Device Data Transfer])

70 Transferring data between devices ([Device Data Transfer])

GT37 SoftGOT3000

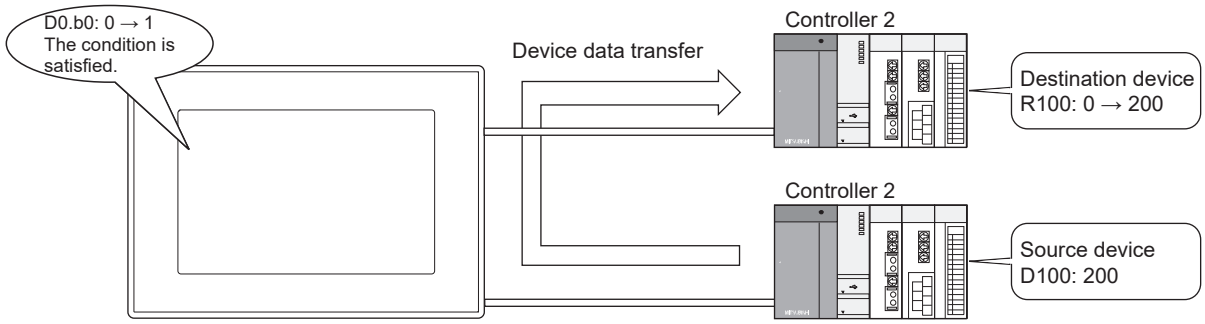
☞ Page 2499 Overview of the device data transfer function
☞ Page 2500 Specifications of device data transfer
☞ Page 2505 How to use device data transfer
☞ Page 2514 [Device Data Transfer List] dialog
☞ Page 2515 [Device Data Transfer] dialog
☞ Page 2519 Relevant settings

70.1 Overview of the device data transfer function

GT37 SoftGOT3000

Values can be read from specified devices and written into other devices with a trigger or at intervals.

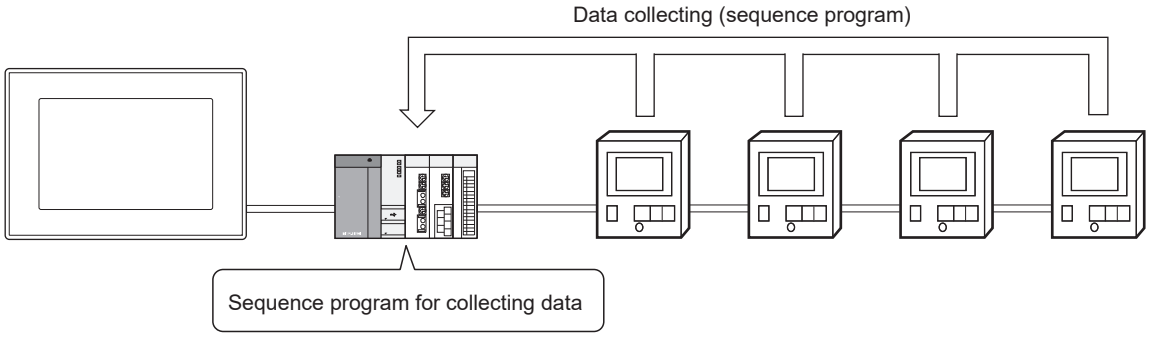
- Trigger condition: Rising edge of D0.b0
- Source device: D100 of controller 1
- Destination device: R100 of controller 2



By making device data transfers, the data of controllers can be collected without any sequence program.

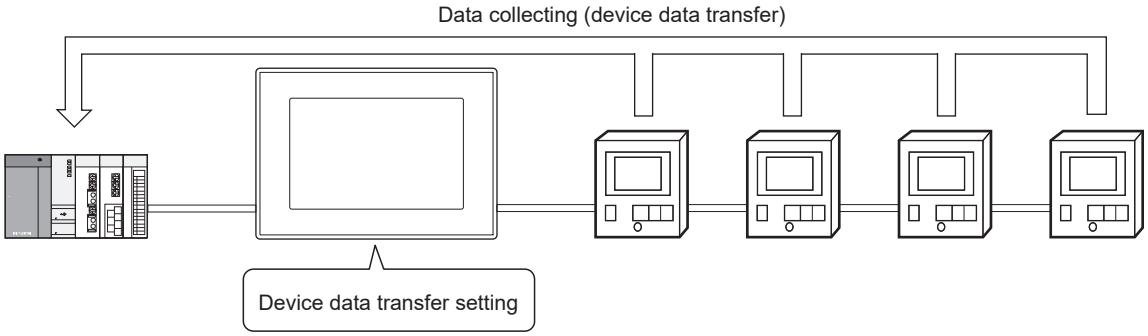
- Collecting the data of controllers without making device data transfers

A sequence program is required to collect the data of controllers. (The GOT only monitors the data.)



- Collecting the data of controllers making device data transfers

If device data transfers are set, no sequence program is required.



PART 13

70.2 Specifications of device data transfer

GT37 SoftGOT3000

70.2.1 System application (extended function)

To use the device data transfer, a system application (extended function) of [Device Data Transfer] is required.
Configuring one or more device data transfer settings incorporates the application into the package data automatically.
To use the function in GT SoftGOT3000, the system application (extended function) is not required.

70.2.2 Settable numbers

Up to 255 settings can be configured for one project.
☞ Page 2500 Data structure of device data transfer settings

70.2.3 Trigger to make device data transfers

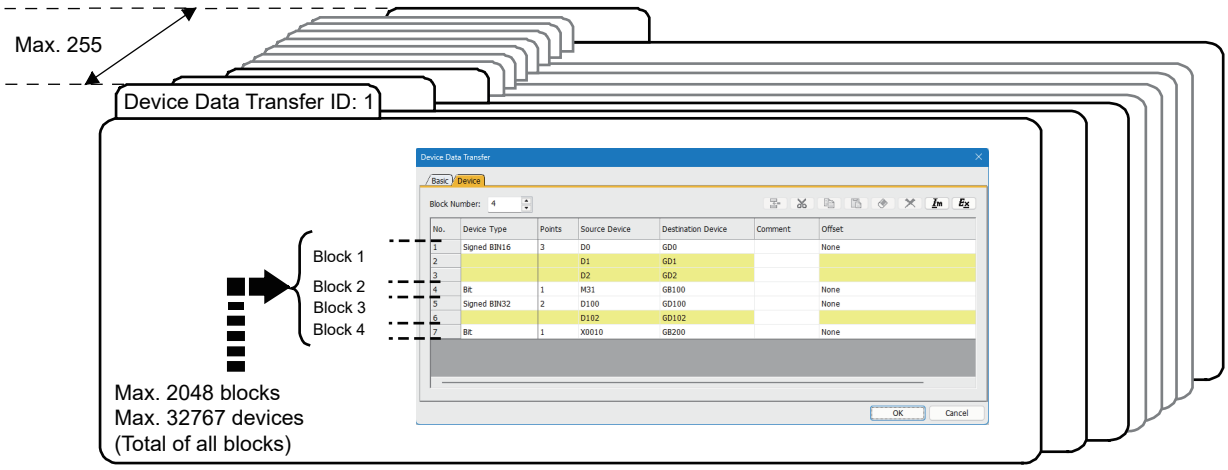
Any one of the following triggers is used as a trigger for device data transfers.

- Rising edge of the trigger device
- Falling edge of the trigger device
- Sampling

70.2.4 Data structure of device data transfer settings

If multiple settings of the following items are made, multiple device data transfers can be set for one device data transfer setting and device data transfer settings can be set for one project.

- [Device Data Transfer ID]
- [Block Number]



Device Data Transfer ID

Device data transfer ID is a number to identify each device data transfer setting.
Set the numbers in the [Basic] tab in the [Device Data Transfer] dialog.
☞ Page 2515 [Basic] tab

Block

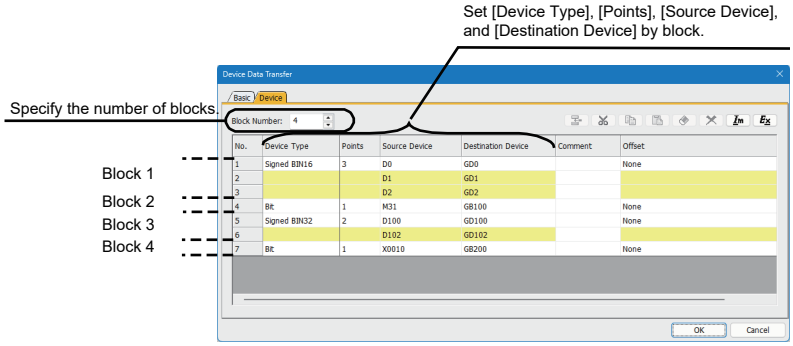
Blocks are units that divide device numbers and device types into groups.

Up to 2048 blocks can be set for one device data transfer setting (ID).

By setting device numbers and device types in block units, the following settings can be made.

- A device data transfer setting that involves multiple device types (such as bit or word)
- A device data transfer setting that involves consecutive devices and random devices

The following shows an example of a data transfer setting that involves bit devices and word devices (signed 16-bit binary and signed 32-bit binary data).



Set blocks in the [Device] tab in the [Device Data Transfer] dialog.

☞ Page 2515 [Device Data Transfer] dialog

■Relation between the number of blocks and transfer processing time

When a large number of blocks are set for a device data transfer setting, transfer processing may take a long time.

To shorten the processing time, reduce the number of blocks.

Device

■Number of devices that can be set

Regardless of the device type, up to 32767 devices can be set for one device data transfer ID.

The number of devices to be used depends on the device data type.

Device data type	Number of devices
Bit, 8-bit, 16-bit	1
32-bit	2
64-bit	4

■Relation to blocks

A single device number can be set for a single block.

To set consecutive device numbers, set the number of the devices in the same block.

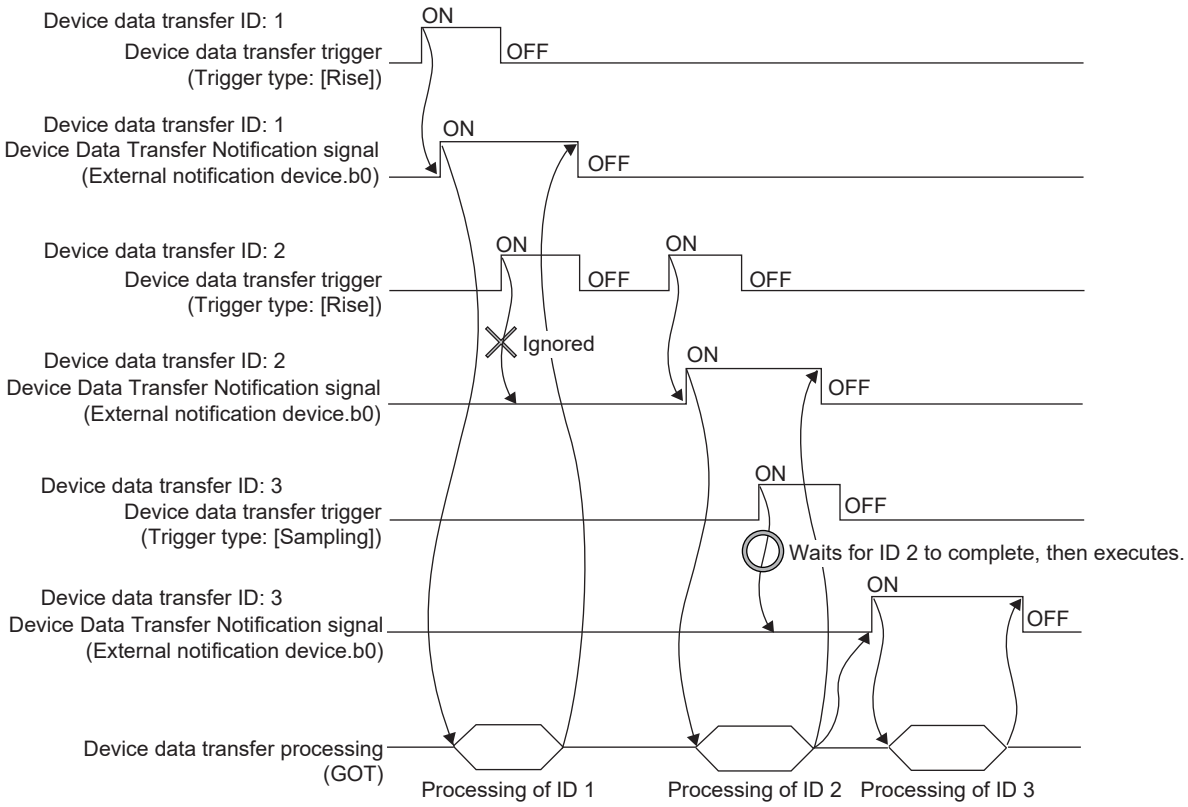
To set device numbers randomly, set the device numbers in different blocks.

70.2.5 Operations performed when multiple trigger conditions are satisfied simultaneously

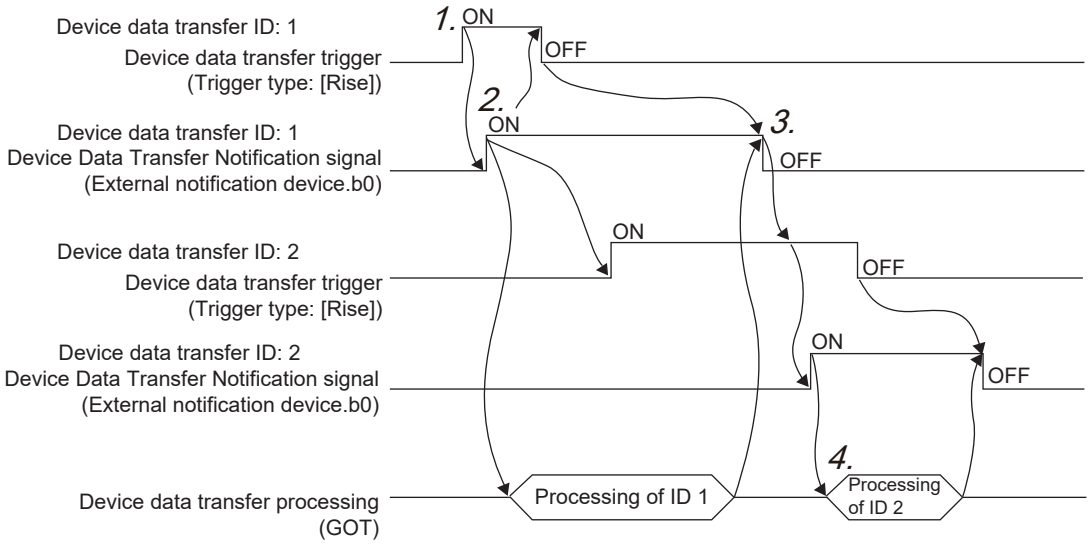
When the trigger condition for another device data transfer setting is satisfied while a device data transfer is being processed

If the trigger type is set to [Sampling], the GOT does not ignore the satisfied trigger condition, and executes the device data transfers subsequently.

If the trigger type is not set to [Sampling], the GOT ignores the satisfied trigger condition.



To execute the device data transfer without fail, select [Rise] for [Trigger Type] then time a handshake with the trigger device and Device Data Transfer Notification signal.



1. The device data transfer trigger (Device Data Transfer ID: 1) turns on.

2. The Device Data Transfer Notification signal (Device Data Transfer ID: 1) turns on.

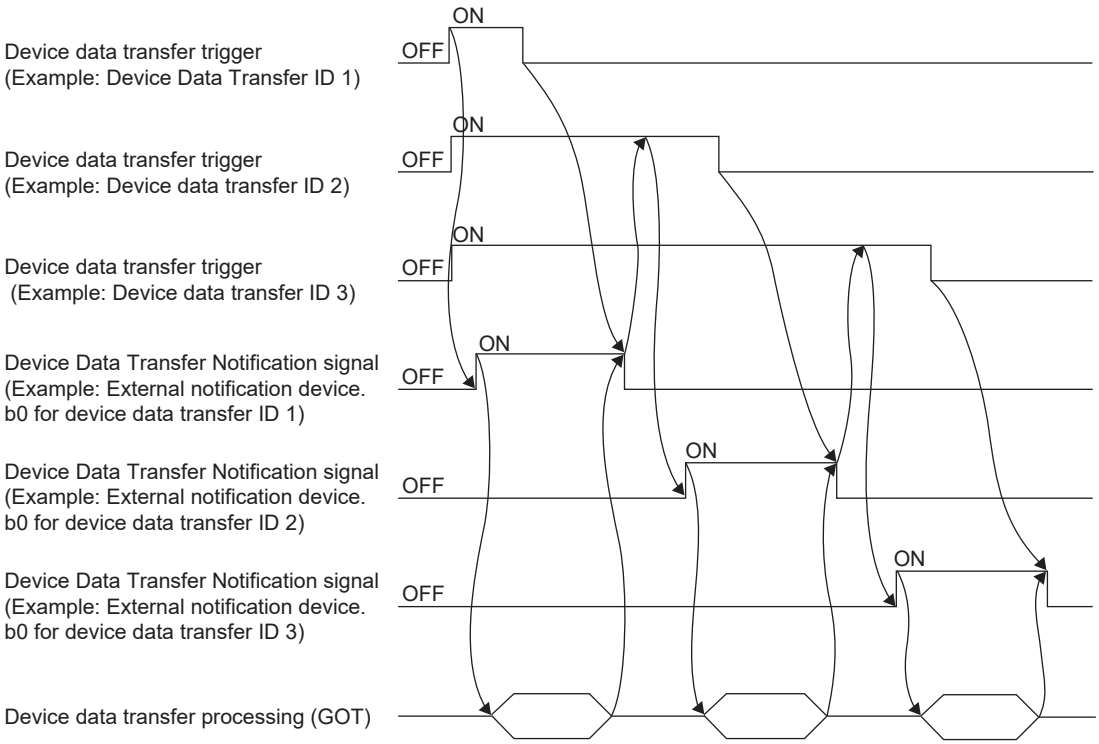
The device data transfer trigger (Device Data Transfer ID: 1) turns off and the device data transfer trigger (Device Data Transfer ID: 2) turns on.

3. Following the completion of the device data transfer processing and the off status of the device data transfer trigger (Device Data Transfer ID: 1), the Device Data Transfer Notification signal (Device Data Transfer ID: 1) turns off.

4. The next device data transfer is allowed to be processed and the device data trigger (Device Data Transfer ID: 2) which turned on in step 2 is enabled.

When trigger conditions for different device data transfer IDs are satisfied simultaneously

The device data transfer with the smallest ID is prioritized.



However, if multiple device data transfers satisfy the trigger conditions by the time one transfer is completed, the next transfer to be executed is the one with the smallest ID.

For example, if device data transfer triggers (Device Data Transfer ID: 1, 3) are satisfied by the time the device data transfer (Device Data Transfer ID: 1) is completed (device data transfer trigger: OFF → ON), the device data transfer (Device Data Transfer ID: 3) is executed next.

70.3 How to use device data transfer

GT37 SoftGOT3000

70.3.1 Setting procedure

The following shows the procedure for registering a device data transfer setting.

1. Select [Common] → [Device Data Transfer] from the menu.

The [Device Data Transfer List] dialog appears.

☞ Page 2514 [Device Data Transfer List] dialog

2. Click the [New] button.

The [Device Data Transfer] dialog appears. A device data transfer setting can be registered.

☞ Page 2515 [Device Data Transfer] dialog

3. For the [Basic] tab in [Trigger Type], set the timing with which device data transfers are triggered.

☞ Page 2515 [Basic] tab

4. Set [Source Device] and [Destination Device] in the [Device] tab.

☞ Page 2517 [Device] tab

5. Click the [OK] button.

The [Device Data Transfer] dialog closes.

6. Click the [Close] button.

The [Device Data Transfer List] dialog closes and the registration of the device data transfer setting is complete.

Point

When setting device data transfers, make sure that the data size does not exceed the available space in the user area for the GOT.

Depending on the settings, not all the set values (such as the number of devices) can be set to their maximum.

For example, if comments are set for each device, the setting size becomes larger.

For the available space in the GOT user area, refer to the following.

☞ Page 81 Drive configuration and capacity of the GOT

PART 13

70.3.2 Operations of device data transfers

Transferring device data

When a set trigger condition is satisfied, the values in the source device values are transferred to the destination devices.

Precautions

■Device data transfers and the status of the GOT

Depending on the GOT status, no device data transfer is executed.

The following lists the operations with which no device data transfer is executed.

- When writing BootOS, package data
- When restarting the GOT

If a device data transfer is interrupted by the above operations, the value in a source device cannot be synchronized with that in the destination device.

If a device data transfer is interrupted, execute the device data transfer again after the processing of the above operations has been completed.

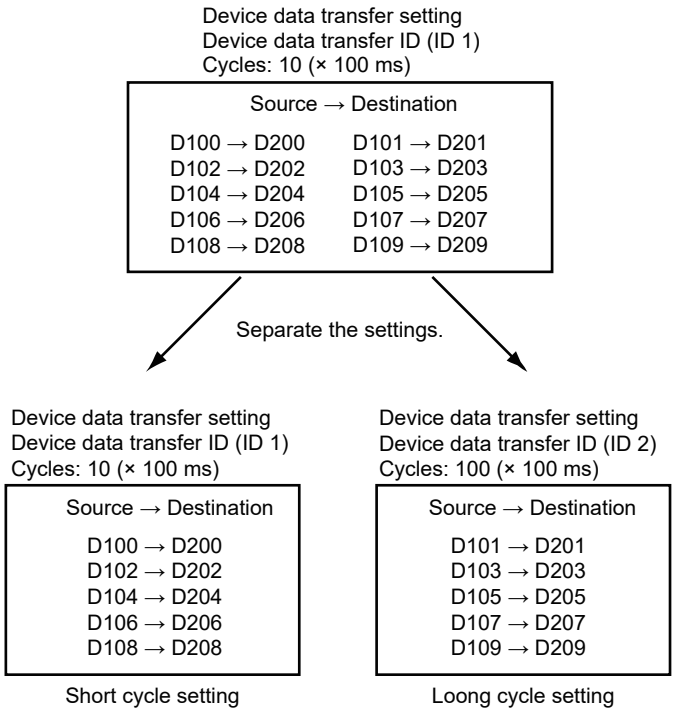
■If device data are not transferred as intended

In the following cases, device data may not be transferred normally.

- The communication between the GOT and controllers takes a long time because a large number of devices have been set.
- The intervals for a device data transfer trigger are short. (In a case where the trigger condition is satisfied while the device data transfer is still in the process of being made)
- Other functions (such as logging and recipe) have also been set.

Take one of the following countermeasures against the above situations.

- When selecting [Sampling] for the trigger type, reduce the number of devices per device data transfer setting of device data transfers made at short intervals (If there are device data transfers that do not require short intervals, set them for another device data transfer setting for which long intervals are set.)



- While the Device Data Transfer Notification signal is off, satisfy the trigger condition.

☞ Page 2509 Outputting the status of device data transfers to a device

- If the baud rate can be changed, increase the baud rate with controller settings.

■Overlap of source and destination devices

If source devices and destination devices overlap in the same device data transfer setting, the device data may not be transferred normally.

If the devices need overlapping, set the overlapping devices for different device data transfer settings.

The following shows an example of settings.

Ex.

Setting method for transferring the device values of D100, D105, D110 to D110, D115, D120 respectively (D110 overlaps.)

Device Data Transfer ID	Trigger type	Trigger device	Number of blocks	Source device	Destination device
1	Sampling	D1000.b0	1	D110	D120
2	Sampling	D1000.b0	2	D100	D110
				D105	D115

If the same trigger device (D1000.b0) is set for multiple device data transfer settings, transfer is executed from the one with the smallest device data transfer ID.

By transferring D110 prior to D100, the device value in D110 that has yet to be overwritten with the value in D100 can be transferred to D120.

Device Data Transfer ID	Trigger type	Trigger device	Number of blocks	Source device	Destination device
1	Sampling	D1000.b0	3	D110	D120
				D100	D110
				D105	D115

If the device data transfers are set for the same device data transfer setting, the value in D100 is transferred prior to D110 and the device value in D110 is overwritten with that in D100.

Then the device value in D110 is transferred to D120, which means that the device value in D100 is transferred to D120 as a result.

Reversing the data transfer direction (Switching the relation between the source device and destination device)

By switching the status of the transfer inverting flag device between on and off, the data transfer direction can be reversed accordingly. (The relation between the source and destination is reversed).

Therefore, data transfers in both directions (from the source to the destination and the other way around) can be made with one device data transfer setting.

The following shows the procedure for setting the transfer inverting flag device.

1. Select [Common] → [Device Data Transfer] from the menu.

The [Device Data Transfer List] dialog appears.

☞ Page 2514 [Device Data Transfer List] dialog

2. Click the [New] button or the [Edit] button.

The [Device Data Transfer] dialog appears.

☞ Page 2515 [Device Data Transfer] dialog

3. Set a device for [External Control Device] in the [Basic] tab.

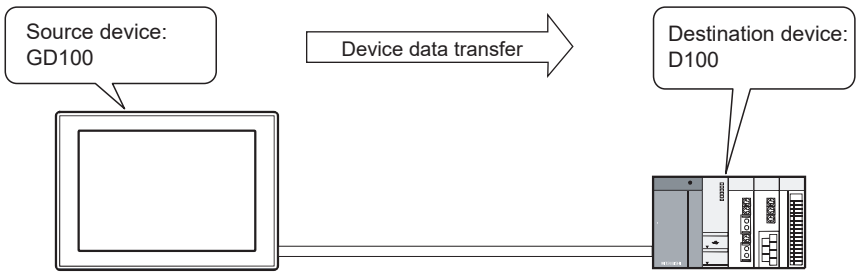
☞ Page 2515 [Basic] tab

Bit 1 of the set device is assigned as the transfer inverting flag device.

The following shows the relation between the transfer inverting flag device and source/destination.

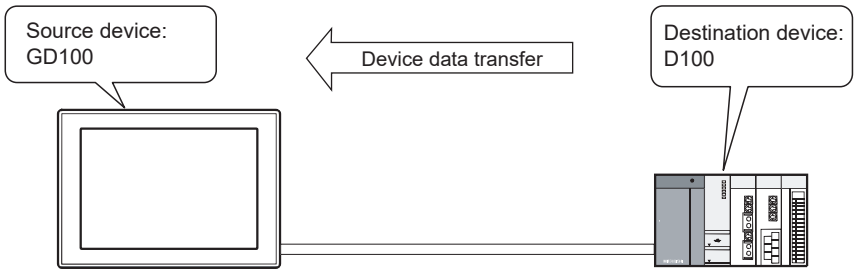
• When the transfer inverting flag device is off

Device data are transferred from the source device to the destination device.



• When the transfer inverting flag device is on

Device data are transferred from the destination device to the source device.



Turn on transfer inverting flag device before turning on the trigger device or simultaneously with the trigger device by writing a value to the word device.

Point

Using device data transfers instead of scripts

Instead of bmov, the function of scripts, device data transfers can be used.

The device data transfer communication is established only when the corresponding conditions are satisfied. On the other hand, the devices in a script require continuous communication. Hence, if device data transfers are used, the load due to the continuous communication is not imposed.

For scripts, refer to the following.

☞ Page 2325 Controlling operations with scripts ([Script])

70.3.3 Outputting the status of device data transfers to a device

When the external notification device is set, the status of device data transfers (such as the status in which a transfer is in the process of being made and presence/absence of an error) can be externally notified.
The following shows the procedure for setting the external notification device.

1. Select [Common] → [Device Data Transfer] from the menu.

The [Device Data Transfer List] dialog appears.

☞ Page 2514 [Device Data Transfer List] dialog

2. Click the [New] button or the [Edit] button.

The [Device Data Transfer] dialog appears.

☞ Page 2515 [Device Data Transfer] dialog

3. Select [External Notification Device] in the [Basic] tab then set a device.

☞ Page 2515 [Basic] tab

Signals are assigned as shown below.

- Bit 0: Device Data Transfer Notification signal
- Bit 14: BCD Conversion Error Notification signal
- Bit 15: Device Data Transfer Error Notification signal

Device Data Transfer Notification signal (external notification device.b0)

Notifies that a device data transfer is in the process of being made.

- The device data transfer trigger condition is satisfied → the external notification device.b0 turns on.
- No device data transfer trigger condition is satisfied and the device data transfer is complete → the external notification device.b0 turns off.

Even if this signal is on, a device data transfer can be made as long as the previous device data transfer has been completed.

BCD Conversion Error Notification signal (external notification device.b14)

Notifies whether an error has occurred or not during BCD conversion.

- An error occurs during BCD conversion → the external notification device.b14 turns on.

Even if an error occurs, device data are transferred.
However, the device values are not what you intend to transfer. Check the data before restarting the device data transfer.

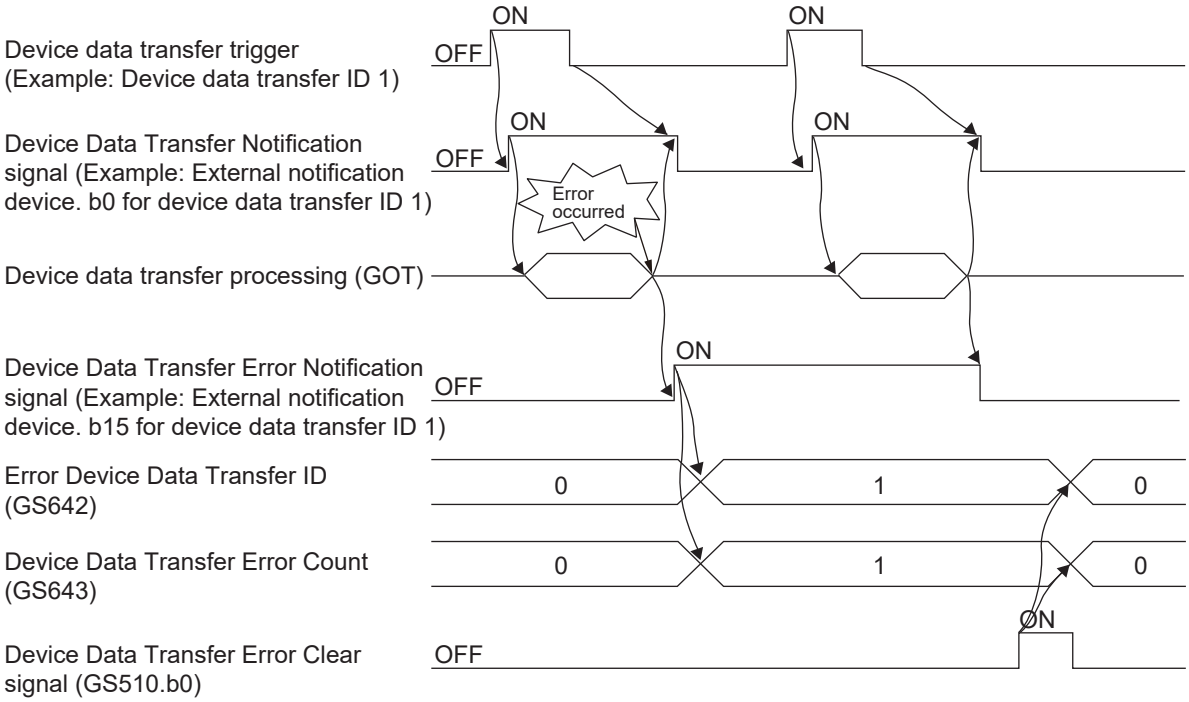
Device Data Transfer Error Notification signal (external notification device.b15)

Notifies whether an error has occurred or not during a device data transfer.

- An error occurs during a device data transfer → the external notification device.b15 turns on.
- The device data transfer which was executed after an error occurred is normally completed → the external notification device.b15 turns off.

The following shows the operations performed when an error occurs and corrective actions for the error.

When an error occurs, the following operations are performed.



1. The Device Data Transfer Error Notification signal (external notification device.b15) turns on.

2. The ID of the device data transfer with the error is stored in Error Device Data Transfer ID (GS642).

3. The value in Device Data Transfer Error Count (GS643) is incremented by one every time an error occurs.

4. A system error occurs.

After checking the message, identify the cause of the error and eliminate the error.

5. The device data transfer is restarted.

6. The device data transfer is successfully made and the Device Data Transfer Error Notification signal (external notification device.b15) turns off.

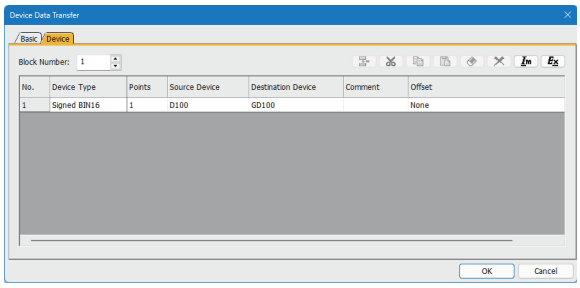
To clear Error Device Data Transfer ID (GS642) and Device Data Transfer Error Count (GS643), turn on the Device Data Transfer Error Clear signal (GS510.b0).

☞ Page 3581 GOT special register (GS)

70.3.4 Importing/exporting settings

You can edit exported Unicode text files and CSV files by using spreadsheet software.
Edited Unicode text files and CSV files can be imported to GT Designer3.

Ex.
Example of a CSV file



Export to a CSV file.

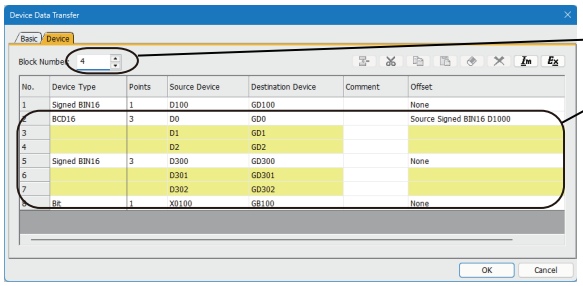
Device Data Transfer					
Block Numl	1				
Device Typ	Points	Source Dev	Destination	Comment	Offset
Signed BIN	1	D100	GD100		None

Edit the exported file.

Device Data Transfer					
Block Num	4				
Device Ty	Points	Source De	Destinatior	Comment	Offset
Signed BIN	1	D100	GD100		None
BCD16	3	D0	GD0		Source Signed BIN16 D1000
Signed BIN	3	D300	GD300		None
Bit	1	X0100	GB100		None

Add the settings
using applications
such as spreadsheet software.

Import to GT Designer3.



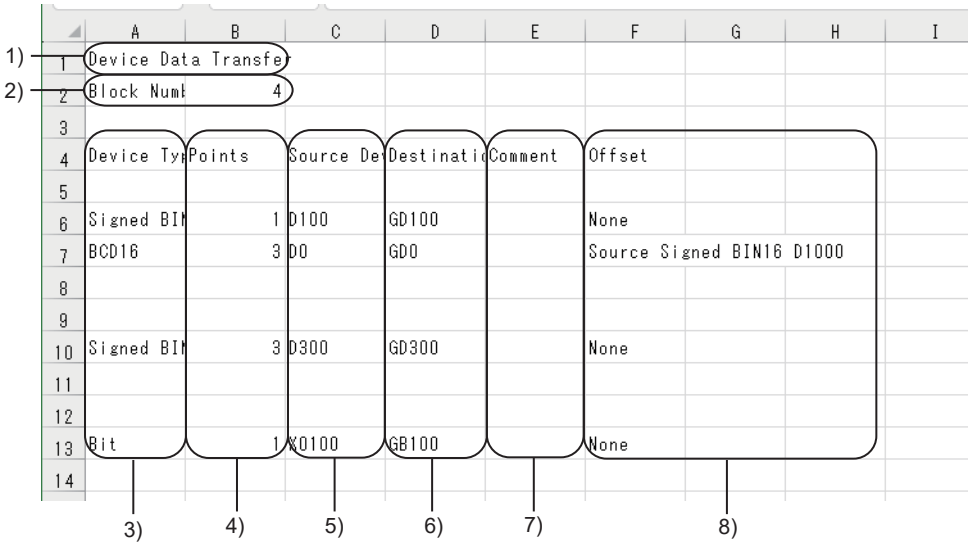
The added settings
are reflected.

Format of text files for device data transfers

The format of text files for device data transfers is common to both Unicode text files and CSV files.
However, use the following delimiters for each item.

- Unicode text file: Tab (\t)
- CSV file: Comma (,)

The following shows the format.



Item		Description
1)	Title	Displays "Device Data Transfer".
2)	Number of blocks	Set the number of blocks for device data transfers. The setting range is [1] to [2048].
3)	Device type	Set the data type of the device. The following shows the setting range. • Bit • Signed 8-bit binary • Unsigned 8-bit binary • Signed 16-bit binary • Unsigned 16-bit binary • Signed 32-bit binary • Unsigned 32-bit binary • Signed 64-bit binary • Unsigned 64-bit binary • BCD16 • BCD32 • BCD64 • Real number (32 bits) • Real number (64 bits)
4)	Points	Set the number of the target devices for the transfer by block. When a start device is set, consecutive devices are automatically specified according to the set number. The number of the specified devices including the start device is the same as the number set for this item.
5)	Source device	Set a device from which the value is read.
6)	Destination device	Set a device to which the value read from the source device is written.
7)	Comment	Set a comment. Up to 32 characters can be set.
8)	Offset	Set the target for an offset and the offset device. The following shows the range of settings for the offset target. • None • Source • Destination • Both When setting the source, destination, or both, input the offset device. Insert a one-byte space between the offset target and the offset device. If incorrectly input data are imported, GT Designer3 regards it as [None].

Point

• Using characters of multiple languages

When importing or exporting files in the multiple-language input environment, use Unicode text files.

The characters of multiple languages can be imported or exported normally by using Unicode text files.

For the precautions for using Unicode text files, refer to the following.

☞ Page 3669 Precautions for using Unicode text file

• Editing exported files

For the precautions for using a CSV file or Unicode text file, refer to the following.

☞ Page 3668 Precautions for using CSV file

☞ Page 3669 Precautions for using Unicode text file

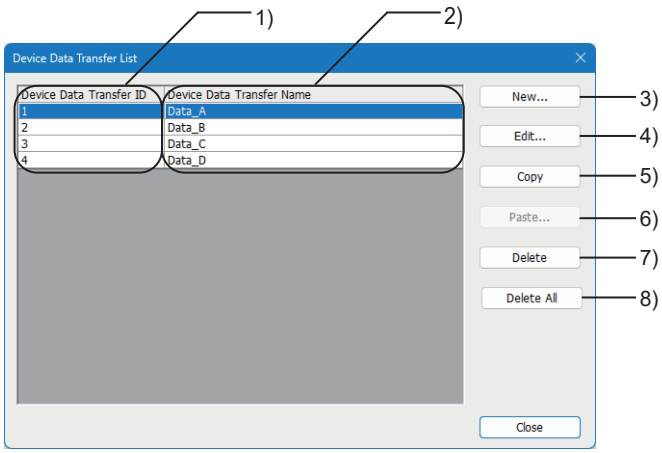
70.4 [Device Data Transfer List] dialog

GT37 SoftGOT3000

When device data transfers are made, values are read from specified devices and are written to other devices with a trigger or at intervals.

Select [Common] → [Device Data Transfer] from the menu to display the [Device Data Transfer List] dialog.

The dialog displays the settings of device data transfers in a list and manages them.



Item		Description
1)	[Device Data Transfer ID]	The number to identify each device data transfer setting.
2)	[Device Data Transfer Name]	Displays the names of device data transfer settings.
3)	[New] button	Creates a new device data transfer setting. ☞ Page 2515 [Device Data Transfer] dialog
4)	[Edit] button	Changes the settings of a selected device data transfer setting. ☞ Page 2515 [Device Data Transfer] dialog
5)	[Copy] button	Copies a selected device data transfer setting.
6)	[Paste] button	Pastes a copied device data transfer setting.  • [Destination ID] Set a Device Data Transfer ID.
7)	[Delete] button	Deletes a selected device data transfer setting.
8)	[Delete All] button	Deletes all the device data transfer settings.

70.5 [Device Data Transfer] dialog

GT37 SoftGOT3000

Set device data transfer settings.

☞ Page 2515 [Basic] tab

☞ Page 2517 [Device] tab

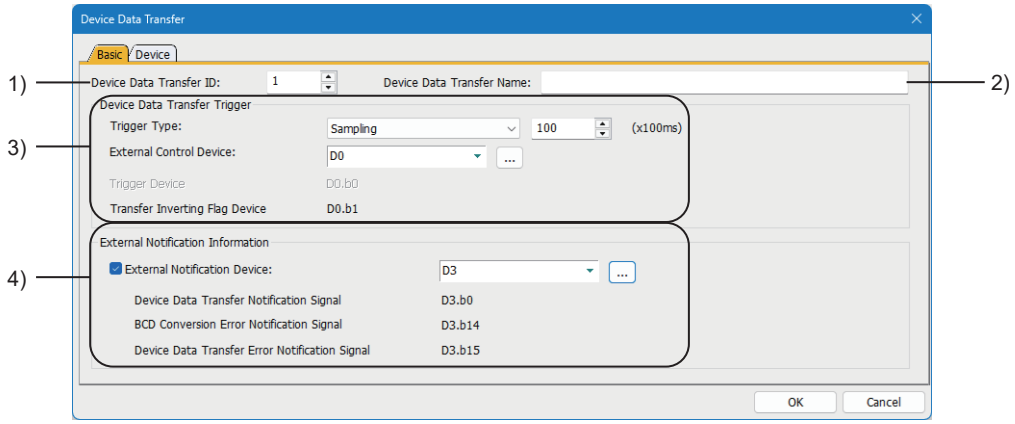
This dialog appears when the [New] button or [Edit] button in the [Device Data Transfer List] dialog is clicked.

☞ Page 2514 [Device Data Transfer List] dialog

70.5.1 [Basic] tab

GT37 SoftGOT3000

Set the device data transfer trigger and external notification information.



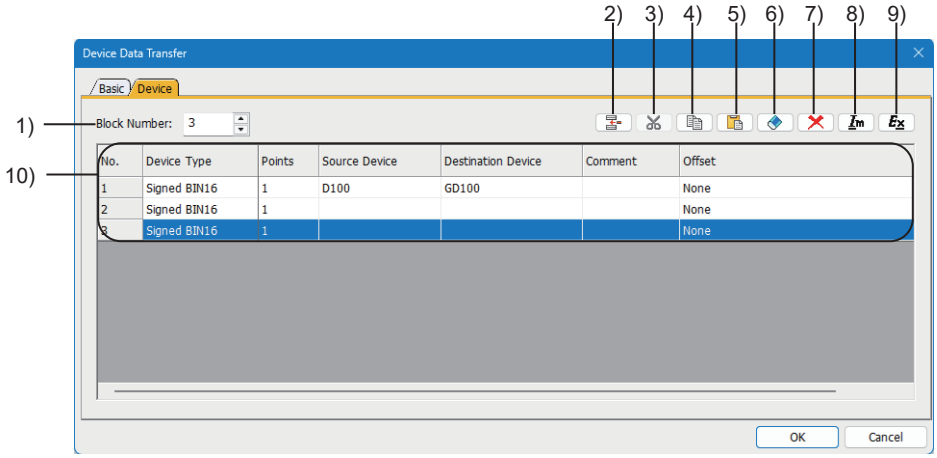
Item			Description
1)	[Device Data Transfer ID]		Set a number to identify the device data transfer setting. The setting range is [1] to [255]. ☞ Page 2500 Data structure of device data transfer settings
2)	[Device Data Transfer Name]		Set the name of the device data transfer setting. Up to 32 characters can be set.
3)	[Device Data Transfer Trigger]	—	Set a condition under which device values are transferred. ☞ Page 2506 Operations of device data transfers
		[Trigger Type]	Select an operating condition that triggers device value transfers. The following shows selectable items. • [Rise] • [Fall] • [Sampling] When selecting [Sampling], set a cycle in which transfers are executed. The setting range of [Sampling] is [1] to [36000].
		[External Control Device]	Set the target device for the operating condition of [Trigger Type]. ☞ Page 834 How to set devices, labels, and tags In the following cases, set this item. • When selecting [Rise] or [Fall] • When selecting [Sampling] and using [Transfer Inverting Flag Device]
		[Trigger Device]	When the value in a set device satisfies a set condition, the values in source devices are transferred to destination devices. Bit 0 of the device set for [External Control Device] is specified. This item is used when [Rise] or [Fall] is selected.
		[Transfer Inverting Flag Device]	When a set condition is satisfied, reverses the direction in which device values are transferred. (Device values are transferred from the destination to the source.) Bit 1 of the device set for [External Control Device] is specified.

Item			Description
4)	[External Notification Information]	—	Set a device that notifies the status of transfers. ☞ Page 2509 Outputting the status of device data transfers to a device
		[External Notification Device]	Set a device that receives notifications of the status of device value transfers. ☞ Page 834 How to set devices, labels, and tags
		[Device Data Transfer Notification Signal]	Notifies that device values are in the process of being transferred. Bit 0 of the device set for [External Notification Device] is specified.
		[BCD Conversion Error Notification Signal]	When an error occurs while a device value in BCD is being transferred, notifies the error. Bit 14 of the device set for [External Notification Device] is specified.
		[Device Data Transfer Error Notification Signal]	When an error occurs during a device value transfer, notifies the error. Bit 15 of the device set for [External Notification Device] is specified.

70.5.2 [Device] tab

GT37 SoftGOT3000

Displays set source devices and destination devices in a list and manages them.



Item		Description
1)	[Block Number]	Set the number of blocks for device data transfers. The setting range is [1] to [2048]. ☞ Page 2500 Data structure of device data transfer settings
2)	[Insert Block] button	Inserts a block above a selected block.
3)	[Cut] button	Cuts a selected block.
4)	[Copy] button	Copies a selected block.
5)	[Paste] button	Pastes a copied block.
6)	[Clear] button	Clears a comment.
7)	[Delete] button	Deletes a selected block.
8)	[Import] button	Imports the settings that were edited in a Unicode text file or CSV file to GT Designer3.
9)	[Export] button	Saves the settings made in this tab as a Unicode text file or CSV file.

Item			Description
10)	Device list	—	Lists set devices.
		[No.]	Displays the numbers that show the number of set devices.
		[Device Type]	Select the data type of the device to be set. The following shows selectable items. • [Bit] • [Signed BIN8] • [Unsigned BIN8] • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD16] • [BCD32] • [BCD64] • [Real(32bit)] • [Real(64bit)] Set this item prior to the device setting. When the device type is changed to another one that has a different data length, the device setting is cleared.*1*2
		[Points]	Set the number of the target devices for the transfer by block. When a start device is set, consecutive devices are automatically specified according to the set number. The number of the specified devices including the start device is the same as the number set for this item.
		[Source Device]	Set a device from which the value is read. ☞ Page 834 How to set devices, labels, and tags
		[Destination Device]	Set a device to which the value read from the source device is written. ☞ Page 834 How to set devices, labels, and tags
		[Comment]	Set a comment. A set comment is displayed in Unicode text file and CSV file. Up to 32 characters can be set.
		[Offset]	Displays the target for an offset and the offset device. ☞ Page 963 Offset  • [Offset Target] Select an offset target. The following shows selectable items. [None] [Source] [Destination] [Both] • [Data Type] Select the data type of the device to be set. The following shows selectable items. [Signed BIN16] [Signed BIN32] • [Offset Device] Set an offset device. When selecting [Destination], [Source], or [Both] for [Offset Target], set this item. When [Both] is selected for [Offset Target], a single device can be set for either [Source Device] or [Destination Device].

*1 Example 1) When changing the device type to another one that has a different data length

Before	After	Result
Signed 16-bit binary	Real number (32 bits)	Because the data length changes from 16 to 32 bits, the settings of [Source Device] and [Destination Device] are cleared.

*2 Example 2) When changing the device type to another one that has the same data length

Before	After	Result
Signed 16-bit binary	BCD16	Because the data lengths are the same, the settings of [Source Device] and [Destination Device] are retained.

70.6 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for device data transfers as required.
The following shows the functions that are available by configuring the relevant settings.

70.6.1 GOT internal devices

☞ Page 3581 GOT special register (GS)

Function	Setting item
Clearing Error Device Data Transfer ID and Device Data Transfer Error Count when turns on (Device Data Transfer Error Clear signal)	GS510.b0
Clearing Device Data Transfer Processing Time, Device Data Transfer Min. Processing Time, and Device Data Transfer Max. Processing Time when turns on (Device Data Transfer Processing Time Clear signal)	GS510.b1
If an error occurs during device data transfer, storing the Device Data Transfer ID of the device data transfer with the error (Error Device Data Transfer ID)	GS642
Storing the number of the errors that occurs due to device data transfers (Device Data Transfer Error Count)	GS643
Storing the processing time of a device data transfer (Device Data Transfer Processing Time)	GS644
When the processing time is stored in Device Data Transfer Processing Time, storing the Device Data Transfer ID of the completed device data transfer (Device Data Transfer ID)	GS645
Storing the shortest processing time ever stored in Device Data Transfer Processing Time (Device Data Transfer Min. Processing Time)	GS646
When the shortest processing time is stored in Device Data Transfer Min. Processing Time, storing the Device Data Transfer ID of the completed device data transfer (Device Data Transfer ID (Min. Processing Time))	GS647
Storing the longest processing time ever stored in Device Data Transfer Processing Time (Device Data Transfer Max. Processing Time)	GS648
When the longest processing time is stored in Device Data Transfer Max. Processing Time, storing the Device Data Transfer ID of the completed device data transfer (Device Data Transfer ID (Max. Processing Time))	GS649

PART 14 Trigger action

71 Operating a device as a trigger ([Trigger Action])

71 Operating a device as a trigger ([Trigger Action])

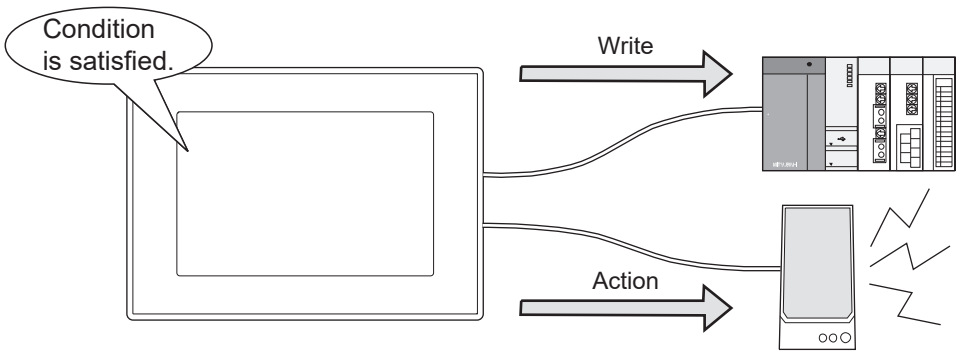
GT37 SoftGOT3000

☞ Page 2521 Overview of the trigger action function
☞ Page 2522 Specifications of trigger action
☞ Page 2524 How to use trigger action
☞ Page 2528 [Trigger Action] dialog
☞ Page 2530 [Trigger/Action] dialog
☞ Page 2539 [Sound Setting] dialog

71.1 Overview of the trigger action function

GT37 SoftGOT3000

When set conditions are satisfied, various operations can be performed: bit devices are turned on/off, values are written into word devices, screens are switched, and sounds are output.



PART 14

71.2 Specifications of trigger action

GT37 SoftGOT3000

71.2.1 Types of trigger actions

The following two types of trigger actions are provided.

Trigger actions common in a project

These trigger actions are set globally in a project.

All the devices set globally in a project are monitored.

Trigger actions for each screen

These trigger actions are set for each screen.

Base screens and window screens

Set devices are monitored only while the target screens are displayed by the GOT.

If the set overlay screen function calls the screen for which a trigger action is set, the trigger action will be executed on the called screen as well.

71.2.2 Number of trigger actions that can be set

Up to 600 trigger actions common in a project can be set. This also applies to trigger actions for each screen.

Precautions

When setting multiple trigger actions, set [Network No.] and [Station No.], setting items in the [Trigger/Action] dialog, to the same No.

☞ Page 2530 [Trigger/Action] dialog

71.2.3 Number of conditions that can be set

Up to two conditions under which trigger actions are executed can be set.

Select the first condition from the following.

- Ordinary
- Rise
- Fall
- Rise/Fall
- ON
- OFF
- ON Sampling
- OFF Sampling
- Sampling
- Range
- Bit Trigger

Select the second condition from the following.

- ON
- OFF
- Range
- Bit Trigger

However, if [Ordinary] is set for the first condition, the second condition cannot be set.

71.2.4 Actions that can be executed when set conditions are satisfied

- Keeping bit devices on while set conditions are satisfied
- Turning on bit devices
- Turning off bit devices
- Switching the status of bit devices between on and off
- Writing values into word devices
- Switching to a specified screen
- Outputting sounds with an external speaker

Precautions

Operation set for the trigger action is stopped when an error occurs.
The operation of all trigger actions are not executed after it is stopped.

71.2.5 Maximum number of write operations

Bit momentary, bit set, bit reset, bit alternate: 40
Data set (8 bits), data set (16 bits), data set (32 bits), data set (64 bits): 20

71.3 How to use trigger action

GT37 SoftGOT3000

71.3.1 Setting procedure

The following shows the procedure for setting a trigger action.

1. Select [Common] → [Trigger Action] from the menu.

The [Trigger Action] dialog appears.

☞ Page 2528 [Trigger Action] dialog

2. When setting a trigger action common in the project, display the [Project] tab.

☞ Page 2528 [Project] tab

When setting a trigger action for a screen, display the [Screen] tab and select the target screen.

☞ Page 2529 [Screen] tab

3. Click the [Add] button.

The [Trigger/Action] dialog appears. A trigger action can be registered.

☞ Page 2530 [Trigger/Action] dialog

4. In the [Trigger] tab, set a condition (trigger 1) under which the trigger action is executed.

☞ Page 2530 [Trigger] tab

When executing the trigger action when two conditions are satisfied, select [Trigger2] and set one more condition.

5. In the [Action] tab, set the action to be executed when the conditions are satisfied.

☞ Page 2532 [Action] tab

6. Click the [OK] button.

The [Trigger/Action] dialog closes.

7. Click the [OK] button in the [Trigger Action] dialog.

The dialog closes and the registration of the trigger action is complete.

71.3.2 Setting data sets

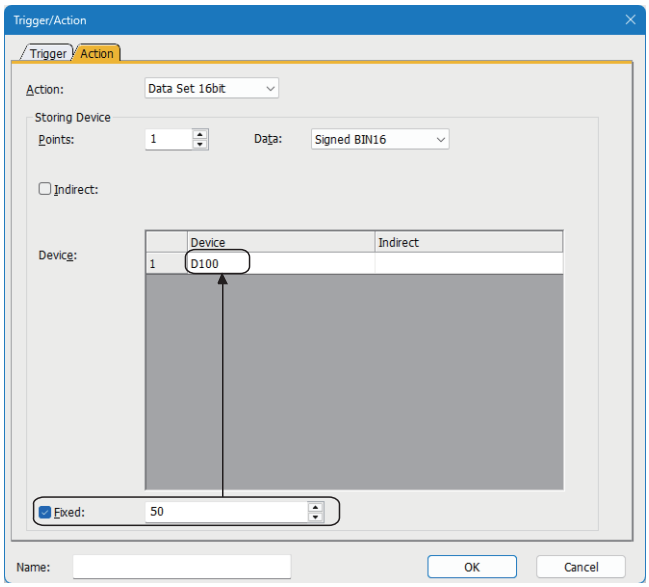
[Fixed] and [Indirect]

If [Fixed] and [Indirect] are set, a fixed value or the value in a word device is written into the target device.

[Fixed] and [Indirect] can be set together.

■[Fixed]

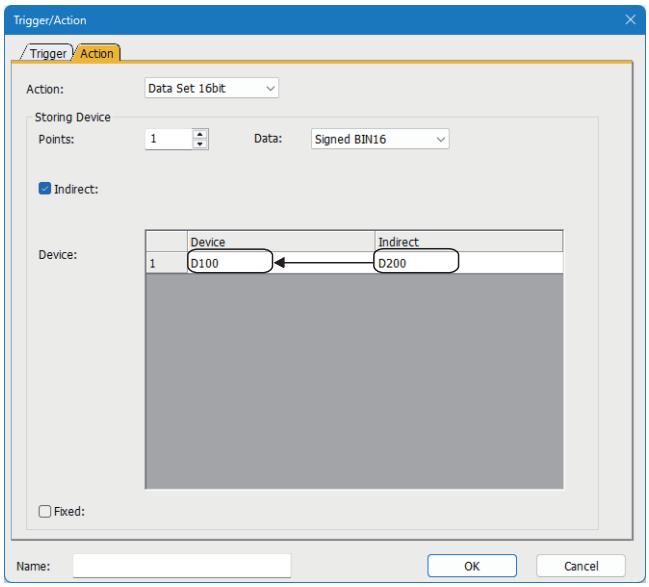
When set conditions are satisfied, the value set for [Fixed] is written into the target device.



When the set conditions are satisfied,
the fixed value (50) is written into D100.

■[Indirect]

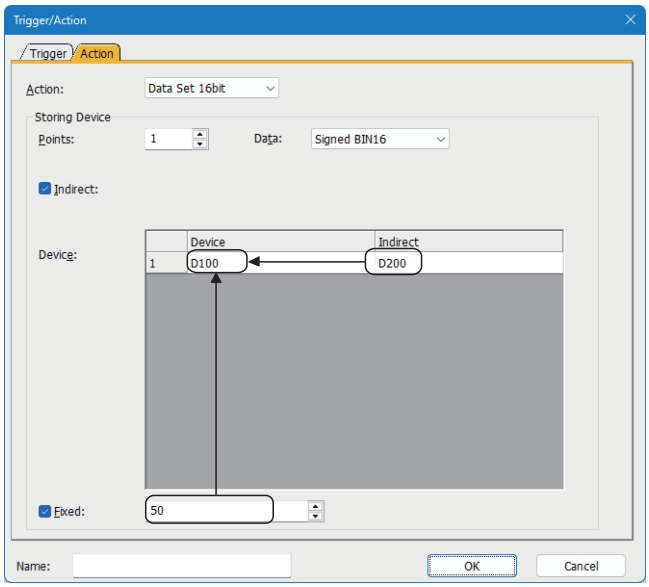
When set conditions are satisfied, the value in the indirect device set for [Indirect] is written into the target device.



When the set conditions are satisfied,
the value in D200 is written into D100.

■[Fixed] + [Indirect]

When set conditions are satisfied, the total of the value in the indirect device set for [Indirect] and the value set for [Fixed] is written into the target device.



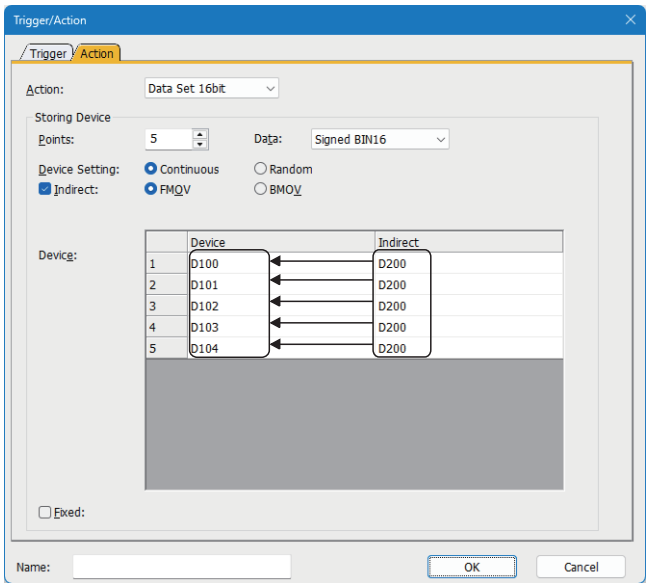
When the set conditions are satisfied, the value in D200 + the fixed value (50) is written into D100.

FMOV and BMOV

When setting two or more devices and selecting [Indirect], select a write operation that writes values to the target devices.

■[FMOV]

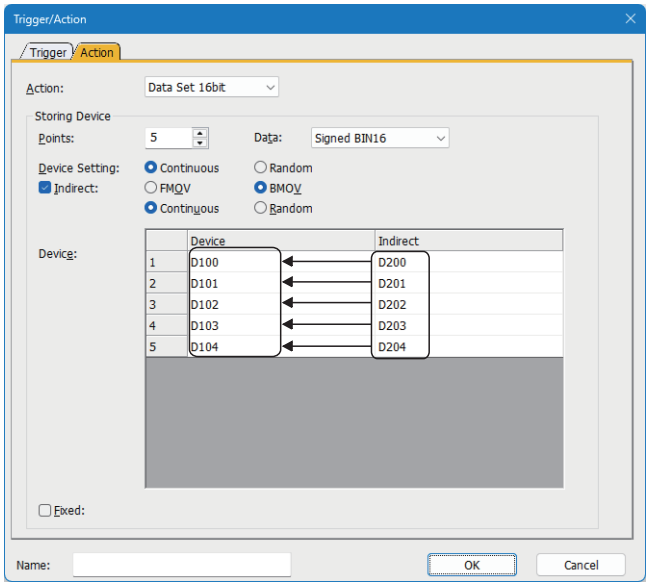
When set conditions are satisfied, the value in the word device set for [Indirect] is written into the target devices.



When the set conditions are satisfied,
the value in D200 is written into D100 to D104.

■[BMOV]

When set conditions are satisfied, the current values in the word devices individually set for [Indirect] is written into the corresponding target devices.



When the set conditions are satisfied, the values
in D200 to D204 are written into D100 to D104.

71.4 [Trigger Action] dialog

GT37 SoftGOT3000

When set conditions are satisfied, trigger actions are executed then various operations can be performed: bit devices are turned on/off, values are written into word devices, screens are switched, and sounds are output.

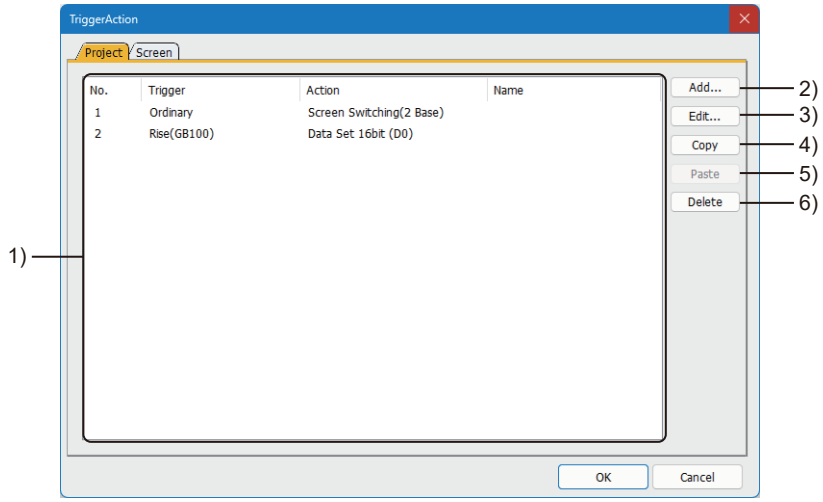
Select [Common] → [Trigger Action] from the menu.

☞ Page 2528 [Project] tab
☞ Page 2529 [Screen] tab

71.4.1 [Project] tab

GT37 SoftGOT3000

Displays set trigger actions globally set for the project in a list and manages them.

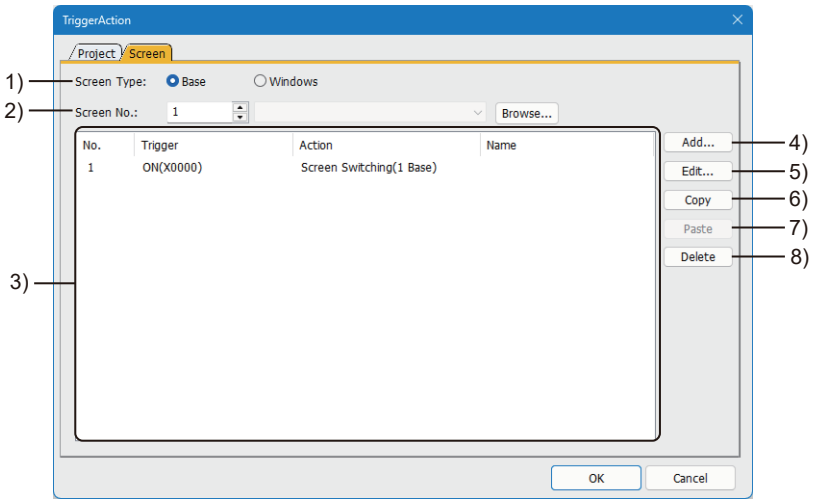


Item			Description
1)	Trigger action list	—	Lists set trigger actions.
		[No.]	Number of a trigger action
		[Trigger]	Trigger condition to execute the corresponding action
		[Action]	Action to be executed when the trigger condition is satisfied
		[Name]	Name of a trigger action
2)	[Add] button		Creates a trigger action. ☞ Page 2530 [Trigger/Action] dialog
3)	[Edit] button		Changes the settings of a selected trigger action. ☞ Page 2530 [Trigger/Action] dialog
4)	[Copy] button		Copies a selected trigger action.
5)	[Paste] button		Pastes a copied trigger action.
6)	[Delete] button		Deletes a selected trigger action.

71.4.2 [Screen] tab

GT37 SoftGOT3000

Displays trigger actions set for each screen in a list and manages them.



Item			Description
1)	[Screen Type]		Set the target screen for set trigger actions. The following shows selectable items. • [Base]: Uses a base screen. • [Windows]: Uses a window screen.
2)	[Screen No.]		Set the screen No. that has been assigned to the target screen for set trigger actions. Click the [Browse] button to open the screen image.
3)	Trigger action list	—	Lists set trigger actions.
		[No.]	Number of a trigger action
		[Trigger]	Trigger condition to execute the corresponding action
		[Action]	Action to be executed when the trigger condition is satisfied
		[Name]	Name of a trigger action
4)	[Add] button		Creates a trigger action. ☞ Page 2530 [Trigger/Action] dialog
5)	[Edit] button		Changes the settings of a selected trigger action. ☞ Page 2530 [Trigger/Action] dialog
6)	[Copy] button		Copies a selected trigger action.
7)	[Paste] button		Pastes a copied trigger action.
8)	[Delete] button		Deletes a selected trigger action.

71.5 [Trigger/Action] dialog

GT37 SoftGOT3000

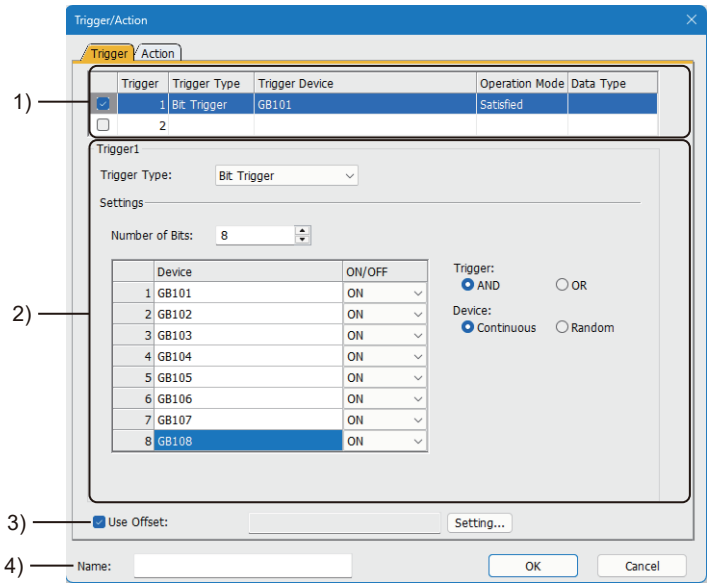
The [Trigger/Action] dialog is displayed when the [Add] button or [Edit] button in the [Trigger Action] dialog is clicked.

☞ Page 2530 [Trigger] tab
☞ Page 2532 [Action] tab

71.5.1 [Trigger] tab

GT37 SoftGOT3000

Set conditions under which set trigger actions are executed.



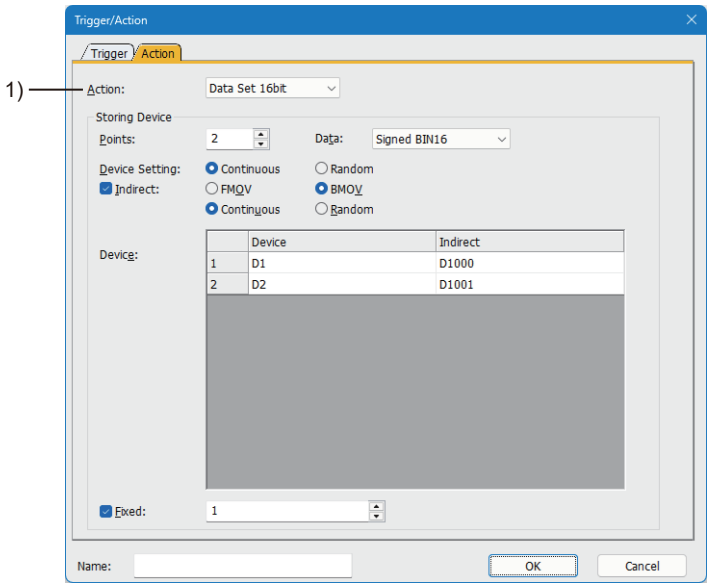
Item			Description
1)	Trigger 1 and trigger 2		Previews set conditions. Up to two conditions can be set. In cases where two conditions are set, trigger actions are executed when both of the conditions are satisfied. When selected, the conditions become valid.
2)	[Trigger1], [Trigger2]	—	Set items for a selected condition.
		[Trigger Type]	Set a condition under which trigger actions are executed. The following shows selectable items. Select the first condition from the following. • [Ordinary] • [Rise] • [Fall] • [Rise/Fall] • [ON] • [OFF] • [ON Sampling] • [OFF Sampling] • [Sampling] • [Range] • [Bit Trigger] Select the second condition from the following. • [ON] • [OFF] • [Range] • [Bit Trigger] However, if [Ordinary] is selected for the first condition, the second condition cannot be set.
		[Settings]	Set necessary items according to the item set for [Trigger Type]. ☞ Page 980 Trigger types of the functions running in the background

Item		Description
3)	[Use offset]	Displays the target for an offset and the offset device. This item can be set when trigger actions for each screen are set.
4)	[Name]	Set the name of a trigger action. Up to 100 characters can be set.

71.5.2 [Action] tab

GT37 SoftGOT3000

Set actions executed when set conditions are satisfied.



Item		Description
1)	[Action]	Set actions executed when set conditions are satisfied. The following shows selectable items. • [Momentary]: Turns on the target bit devices while the set conditions are satisfied. Turns off the target bit devices while the set conditions are not satisfied. The target bit devices cannot be turned on or off by other operations. • [Set]: Turns on the target bit devices. • [Reset]: Turns off the target bit devices. • [Alternate]: Switches the status of the target bit devices between on and off. • [Data Set 8bit]: Writes values into the target 8-bit devices. • [Data Set 16bit]: Writes values into the target 16-bit word devices. • [Data Set 32bit]: Writes values into the target 32-bit word devices. • [Data Set 64bit]: Writes values into the target 64-bit word devices. • [Screen Switching]: Switches screens. • [Sound Output]: Plays a sound, stops a playback, or mute/unmute the sound.

The setting items vary according to the selected action.

For the setting items for each action, refer to the following.

☞ Page 2533 [Momentary], [Set], [Reset], or [Alternate]

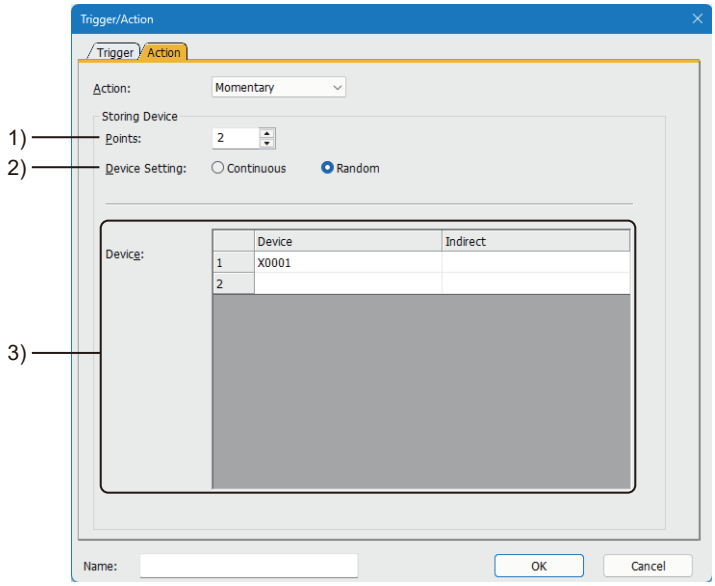
☞ Page 2534 [Data Set 8bit], [Data Set 16bit], [Data Set 32bit], or [Data Set 64bit]

☞ Page 2536 [Screen Switching]

☞ Page 2537 [Sound]

[Momentary], [Set], [Reset], or [Alternate]

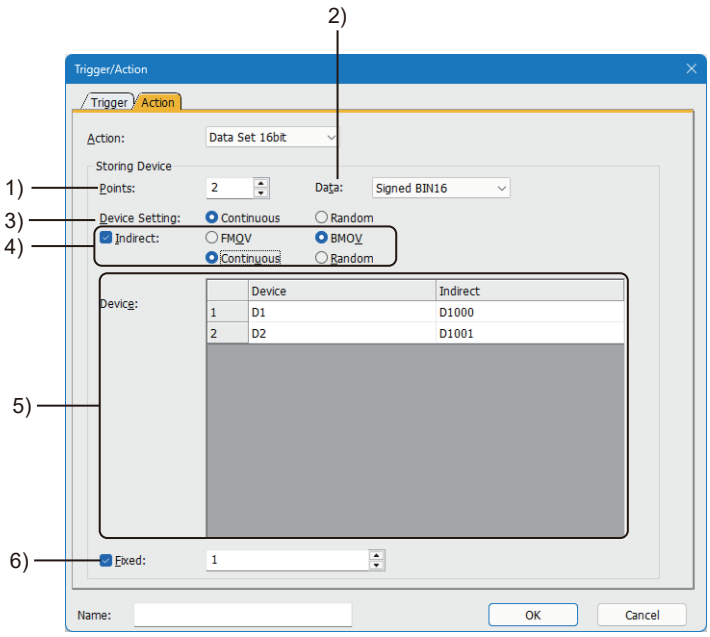
GT37 SoftGOT3000



Item		Description
1)	[Points]	Set the number of devices operated when set conditions are satisfied. The setting range is [1] to [40].
2)	[Device Setting]	When setting 2 or more for [Points], select the method of setting devices. The following shows selectable items. • [Continuous]: Automatically inputs consecutive devices in the table of [Device] when a start device is set. • [Random]: Sets devices one by one.
3)	[Device]	Set the devices operated when set conditions are satisfied. In the [Device] columns in the table, set the devices operated when set conditions are satisfied. The [Indirect] columns are not used.

[Data Set 8bit], [Data Set 16bit], [Data Set 32bit], or [Data Set 64bit]

GT37 SoftGOT3000

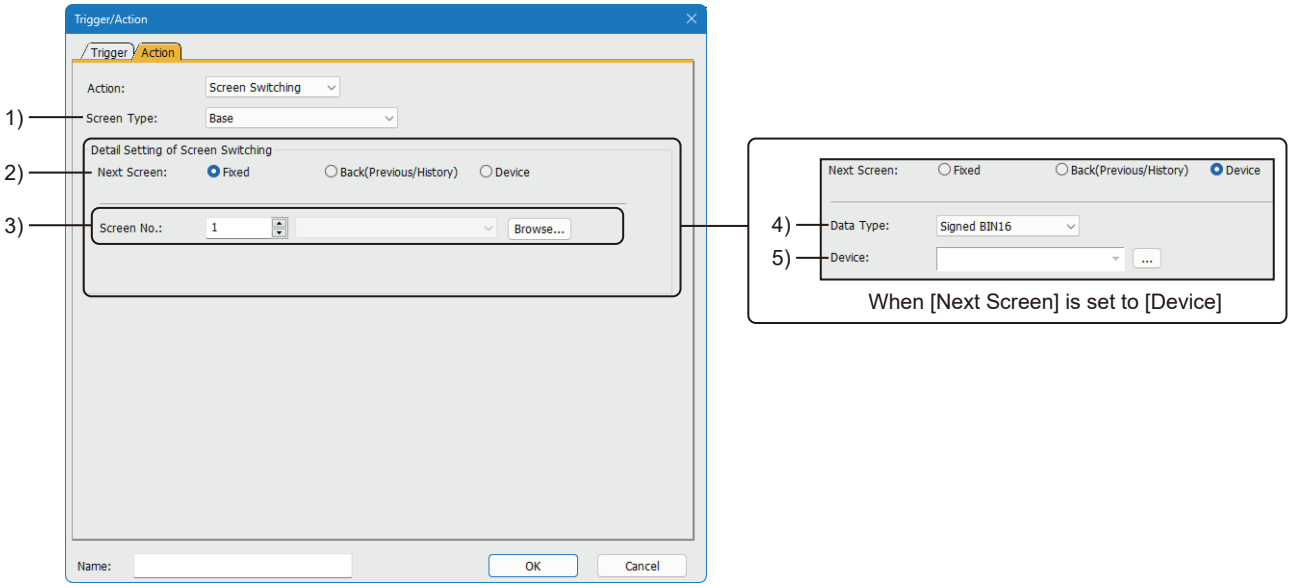


Item		Description
1)	[Points]	Set the number of devices to which values are written when set conditions are satisfied. The setting range is [1] to [20].
2)	[Data]	Select the data type of a value to be written to the target word device. The selectable items vary according to the selection for [Action]. • [Data Set 8bit]: [Signed BIN8], [Unsigned BIN8] • [Data Set 16bit]: [Signed BIN16], [Unsigned BIN16], [BCD16] • [Data Set 32bit]: [Signed BIN32], [Unsigned BIN32], [BCD32], [Real(32bit)] • [Data Set 64bit]: [Signed BIN64], [Unsigned BIN64], [BCD64], [Real(64bit)]
3)	[Device Setting]	When setting 2 or more for [Points], select the method of setting devices. The following shows selectable items. • [Continuous]: Sets consecutive devices starting from a set device. • [Random]: Sets devices one by one.
4)	[Indirect]	Writes the value of an indirect word device to a target word device when the set condition is satisfied. When setting 2 or more for [Points], select the method of setting indirect devices. The following shows selectable items. • [FMOV]: Set one indirect device. ☞ Page 2525 [Fixed] and [Indirect] • [BMOV]: Set indirect devices one by one. Select the method of setting indirect devices. The following shows selectable items. • [Continuous]: Sets consecutive devices starting from a set device. • [Random]: Sets devices one by one. ☞ Page 2527 FMOV and BMOV
5)	[Device]	Set the devices operated when set conditions are satisfied. In the [Device] columns in the table, set word devices into which values are written when set conditions are satisfied. In the [Indirect] columns in the table, set indirect devices. ☞ Page 834 How to set devices, labels, and tags

Item		Description
6)	[Fixed]	Set this item when writing a fixed value into the target word devices when set conditions are satisfied. The setting range depends on the setting of [Data]. • [Signed BIN8]: -128 to 127 • [Unsigned BIN8]: 0 to 255 • [Signed BIN16]: -32768 to 32767 • [Unsigned BIN16]: 0 to 65535 • [BCD16]: 0 to 9999 • [Signed BIN32]: -2147483648 to 2147483647 • [Unsigned BIN32]: 0 to 4294967295 • [BCD32]: 0 to 99999999 • [Real(32bit)]: -999999000000.0 to 999999000000.0 • [Signed BIN64]: -9223372036854775808 to 9223372036854775807 • [Unsigned BIN64]: 0 to 18446744073709551615 • [BCD64]: 0 to 9999999999999999 • [Real(64bit)]: -9999999999999900000000.0 to 9999999999999900000000.0 ☞ Page 2525 [Fixed] and [Indirect]

[Screen Switching]

GT37 SoftGOT3000

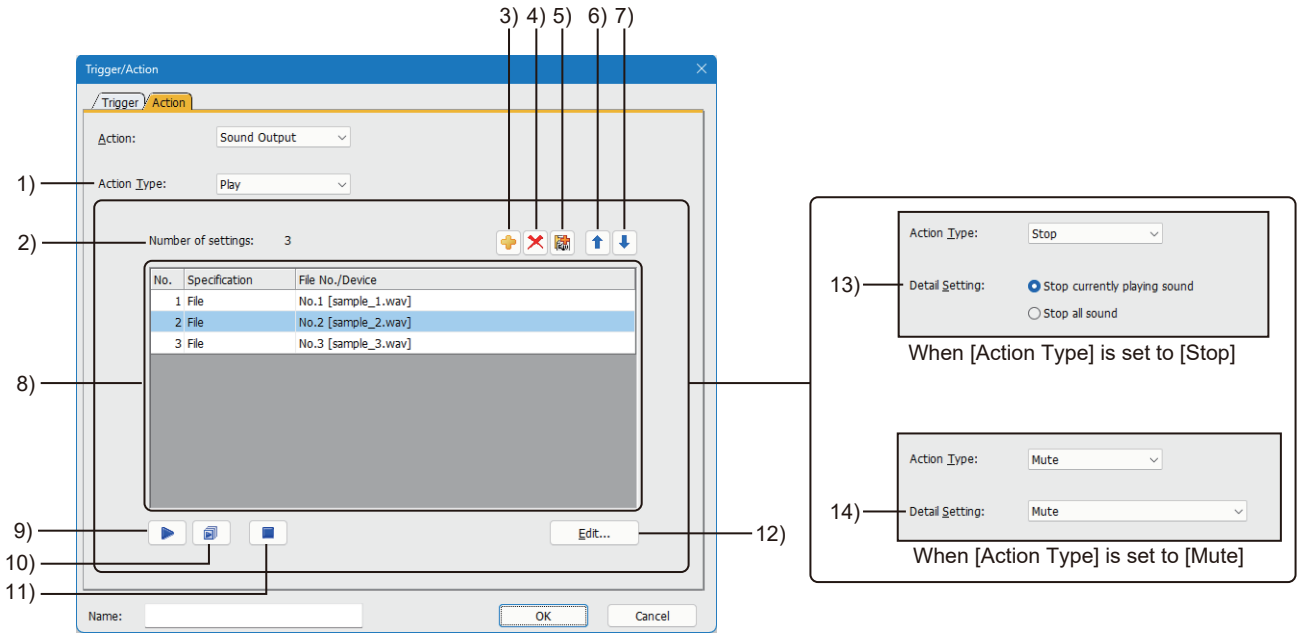


When [Next Screen] is set to [Fixed]

Item		Description
1)	[Screen Type]	Set the type of the destination screen. The following shows selectable items. • [Base] • [Overlap Window1] • [Overlap Window2] • [Overlap Window3] • [Overlap Window4] • [Overlap Window5] • [Superimpose Window1] • [Superimpose Window2] • [Dialog Window]
2)	[Next Screen]	Set the destination screen for switching. The following shows selectable items. • [Fixed] Select this item when switching to the screen that has given a specified screen No. • [Back(Previous/History)] Select this item when switching to the previously displayed screen. The hierarchy mode or history mode is settable in the [Environmental Setting] window ([Screen Switching/Window]). ☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window]) • [Device] Select this item when specifying the destination screen No. with a set device value.
3)	[Screen No.]	Set the destination screen number. Click the [Browse] button to open the screen image.
4)	[Data Type]	Select the data type of the device value. The following shows selectable items. • [Signed BIN16] • [BCD16]
5)	[Device]	Set a device. ☞ Page 834 How to set devices, labels, and tags

[Sound]

GT37 SoftGOT3000



When [Action Type] is set to [Play]

Item			Description
1)	[Action Type]		Select an action of the sound output. The following shows selectable items. • [Play] • [Stop] • [Mute]
2)	[Number of settings]		Total number of the play settings in the playlist.
3)	[Add] button		Adds a new play setting to the playlist.
4)	[Delete] button		Deletes a selected play setting in the playlist.
5)	[Duplicate] button		Copies a selected play setting in the playlist.
6)	[Up] button		Moves the cursor up one row in the playlist.
7)	[Down] button		Moves the cursor down one row in the playlist.
8)	Playlist	—	Lists the play settings of sound files. Up to 16 play settings can be configured. When the trigger condition is satisfied, the sound files specified in the playlist play continuously starting from the top of the list.
		[No.]	Number of a play setting. The corresponding sound files play in order of increasing number.
		[Specification]	Method of specifying a sound file. • [File]: Uses a file number to specify a sound file. • [Device]: Uses an indirect device to specify a sound file.
		[File No./Device]	Sound file number or the device to specify a sound file.
9)	[Play] button		Plays the sound file that corresponds to a selected play setting in the playlist.
10)	[Repeat] button		Plays the sound files specified in the playlist continuously, starting from the top of the list. If [Specification] is set to [Device] in a play setting, the corresponding sound file is skipped.
11)	[Stop] button		Stops the current playback.
12)	[Edit] button		Displays the [Sound Setting] dialog. Edit a selected play setting in the playlist. ☞ Page 2539 [Sound Setting] dialog

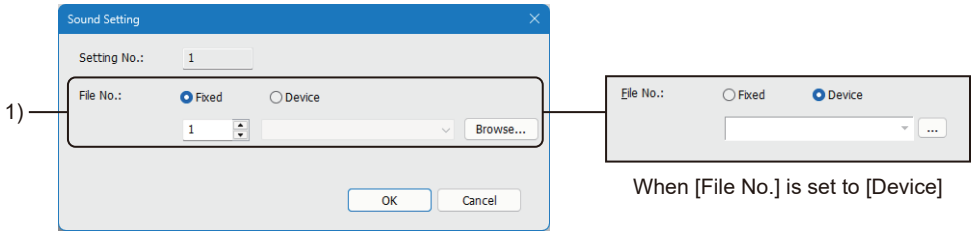
Item		Description
13)	[Detail Setting] (when [Action Type] is set to [Stop])	Select the behavior of the target action. • [Stop currently playing sound] Stops the current playback. The standby sound file plays subsequently. • [Stop all sound] Stops the current playback and cancels all standby sound files.
14)	[Detail Setting] (when [Action Type] is set to [Mute])	Select the behavior of the target action. • [Mute] • [Unmute] • [Mute/unmute]

71.6 [Sound Setting] dialog

GT37 SoftGOT3000

Set a sound file to play when the trigger condition is satisfied.

To display this dialog, in the [Action] tab of the [Trigger/Action] dialog, set [Action] to [Sound Output] and [Action Type] to [Play], and then click the [Edit] button.



When [File No.] is set to [Fixed]

When [File No.] is set to [Device]

Item		Description
1)	[File No.]	Select the method of specifying a sound file. The following shows selectable items. • [Fixed] Uses a sound file number to specify a sound file. After selecting this item, specify the file number of a registered sound file in the [Sound File List] dialog. The setting range is [1] to [500]. Click the [Browse] button to display the [Sound File List] dialog. Register or edit a sound file. ☞ Page 2715 [Sound File List] dialog • [Device] Uses the value of a specified device to specify a sound file. Select this item and set the device. ☞ Page 834 How to set devices, labels, and tags

PART 14

PART 15 Time action

72 Operating the set time as a trigger ([Time Action])

72 Operating the set time as a trigger ([Time Action])

GT37 SoftGOT3000

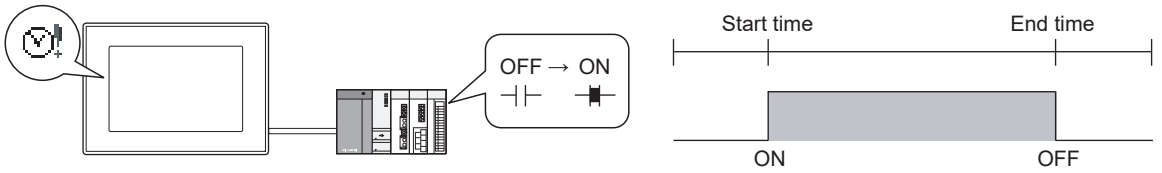
☞ Page 2541 Overview of the time action function
☞ Page 2543 Specifications of the time action
☞ Page 2543 How to use the time action
☞ Page 2549 [Time Action List] dialog
☞ Page 2551 [Time Action Attribute] dialog

72.1 Overview of the time action function

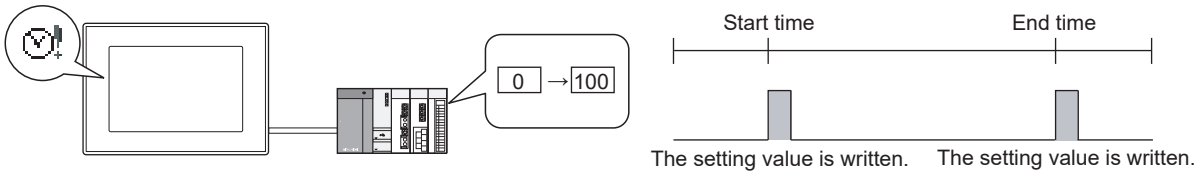
GT37 SoftGOT3000

Devices can be turned on/off and write operations on values can be performed at a specified day of the week and time.
This function works based on a day of the week and time the GOT keeps.

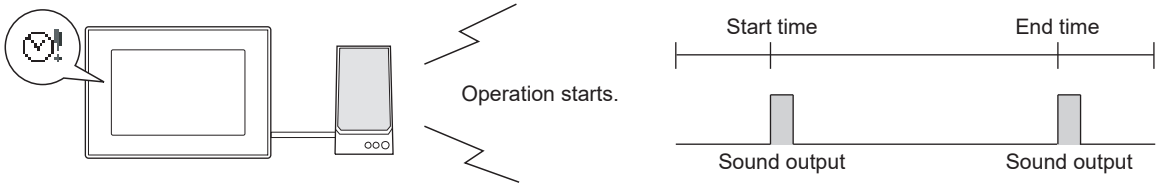
72.1.1 Turning on and off a bit device of a controller



72.1.2 Writing a value into a word device of a controller



72.1.3 Outputting sounds with an external speaker



Precautions

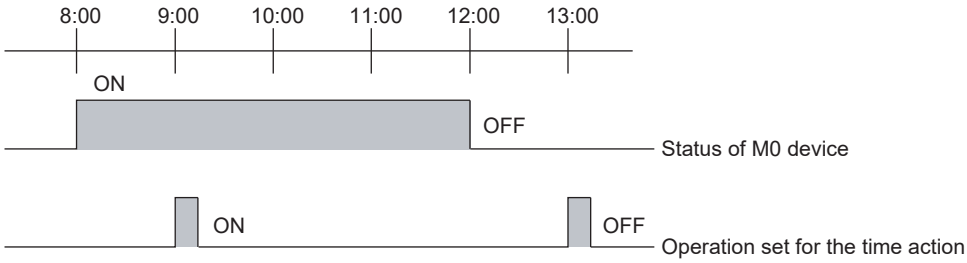
If the GOT's internal clock or the status of the set device is changed, the execution of time actions may be affected.
The following lists the operations that affect time actions.

• Turning on a set bit device before a specified time

Time actions do not start at the specified time.

Ex.

Setting where M0 turns on at 9:00



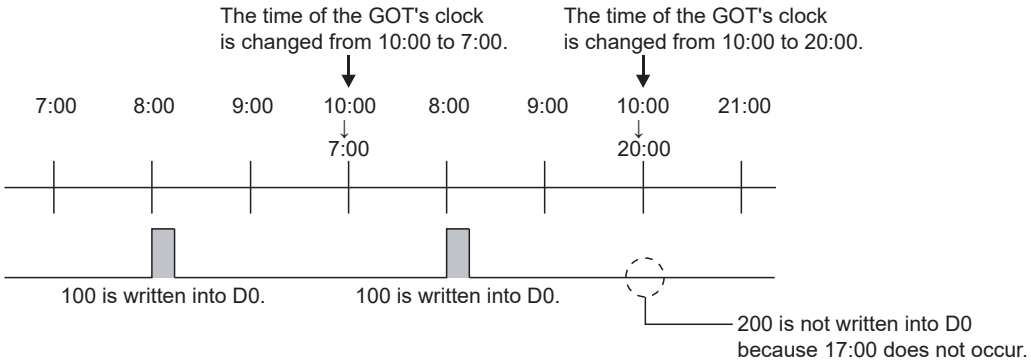
• When the GOT's internal clock is moved ahead/back

When the specified time when the action starts comes, the action starts.
However, if the current time, obtained after the clock has gone forward/back, is ahead of the specified time, the action does not start.
The following lists the operations that move the GOT's internal clock ahead/back.

Cause
When moving ahead/back the GOT's internal clock with the utility [Time setting] (by the time notification)
When the time of the controller is moved ahead/back (by the time setting)
When the clock is moved ahead/back with the GOT internal devices (GS513 to GS516)

Ex.

Setting where 100 is written to D0 at the start time 8:00 and 200 is written to D0 at the end time 17:00



72.2 Specifications of the time action

GT37 SoftGOT3000

72.2.1 Number of time actions that can be set

Up to 32 settings can be configured for one project.

Precautions

When using the same device for multiple time actions, do not make the executions overlap.

72.2.2 Actions that can be executed when set conditions are satisfied

- Turning on/off bit devices
- Writing values into word devices
- Outputting sounds with an external speaker

72.3 How to use the time action

GT37 SoftGOT3000

72.3.1 Setting procedure

The following shows the procedure for setting a time action.

1. Select [Common] → [Time Action] from the menu.

The [Time Action List] dialog appears.

☞ Page 2549 [Time Action List] dialog

2. Select a row in the time action list and click the [Edit] button.

The [Time Action Attribute] dialog appears.

☞ Page 2551 [Time Action Attribute] dialog

3. In the [Time] tab, set the day of the week and time when the time action starts.

☞ Page 2551 [Time] tab

4. In the [Action] tab, set the action executed at the specified day of the week and time.

☞ Page 2552 [Action] tab

5. Click the [OK] button.

The [Time Action Attribute] dialog is closed.

6. Click the [OK] button in the [Time Action List] dialog.

The dialog is closed and the registration of the time action is complete.

72.3.2 Setting the start and end days of the week and time for time actions

When setting the days of the week and time when time actions start and end, select either of the following items.

[Daily]

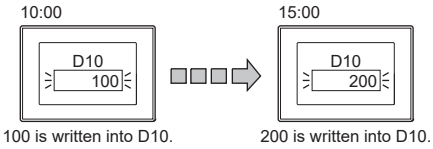
Select this item when setting the time when time actions start by day of the week.

The same action can be executed multiple times a week.

The start time and end time are required to be set in the same day.

Ex.

Writing a value into a word device at a specified time every day



[Through]

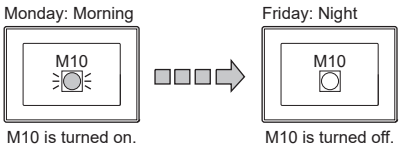
Select this item when the start and end time straddle days.

An action can be executed only once a week.

The start and end time can be set on different days of the week.

Ex.

Turning on a specified bit device on Monday morning and turning off on Friday night

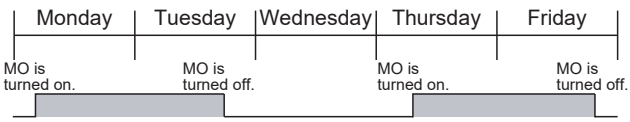


Point

When selecting [Through] for [Mode] and executing the same action twice or more a week, register the time action the number of times that the action is executed.

Example) Setting the same action executed twice a week

- Turing on M0 at a specified time on Monday AM, and turning off M0 at a specified time on Tuesday PM. (the setting of the first action)
- Executing no action on Wednesday
- Turing on M0 at a specified time on Thursday AM, and turning off M0 at a specified time on Friday PM. (the setting of the second action)



72.3.3 Controlling time actions

Time actions can be controlled with devices.
The settings of time actions can be output and changed.
The following shows the procedure for setting an external control.

1. Select [Common] → [Time Action] from the menu.

The [Time Action List] dialog appears.
☞ Page 2549 [Time Action List] dialog

2. Select [Enable External Control] and set a device.

☞ Page 2551 [Time Action Attribute] dialog

3. Select [Separate] or [Continuous] in [Device Setting].

Set an external control device for each time action.
Select a row in the time action list and click the [Edit] button.
The [Time Action Attribute] dialog appears.
☞ Page 2551 [Time Action Attribute] dialog

4. Select [External Control Device (8 Points)] in the [Time] tab and set a device.

☞ Page 2551 [Time] tab

Precautions

When the following operations are performed after the settings of a time action is changed with external control devices, the settings are reset to the original ones set with GT Designer3.

- Transferring package data
- Installing BootOS
- Powering off and restarting the GOT

External control devices

The settings of a time action can be stored in external control devices.

The setting items assigned to the devices depend on the selection for [Device Setting] in the [Time Action List] dialog.

When [Separate] is selected, the following devices are specified as external control devices.

- Three separate devices set in [External Control] in the [Time Action List] dialog
- Eight consecutive devices set for [External Control Device (8 Points)] in the [Time Action Attribute] dialog

If the device value for the day of the week when the time action starts and ends is 0, the setting of the time action is disabled.

Item	Device		Description
	[Separate]	[Continuous]	
Setting No. device	Set device*1	Set device*1	Refer to the following. ☞ Page 2546 [Setting No. Device]
External control signal device	Set device*1	Set device + 1*1	Refer to the following. ☞ Page 2547 [External Control Signal Device]
External control status notification device	Set device*1	Set device + 2*1	Refer to the following. ☞ Page 2547 [External Control Status Notification Device]
Mode	Set device*2	Set device + 3*1	Indicates [Mode] of the time action. • b0: 0 [Daily], 1 [Through] • b2 to b15: Use prohibited
Start day of the week, end day of the week	Set device + 1*2	Set device + 4*1	Indicates the days of the week when the time action starts and ends. When selecting [Daily] for [Mode] of the time action, do not use the device for the end day of the week. Start day of the week • b0: Sunday • b1: Monday • b2: Tuesday • b3: Wednesday • b4: Thursday • b5: Friday • b6: Saturday • b7: Use prohibited End day of the week • b8: Sunday • b9: Monday • b10: Tuesday • b11: Wednesday • b12: Thursday • b13: Friday • b14: Saturday • b15: Use prohibited
Start time (hour)	Set device + 2 *2	Set device + 5 *1	Indicates the time when the time action starts. (Data type: BCD)
Start time (minute)	Set device + 3 *2	Set device + 6 *1	
Start time (second)	Set device + 4 *2	Set device + 7 *1	
End Time (hour)	Set device + 5 *2	Set device + 8 *1	Indicates the time when the time action ends. (Data type: BCD)
End Time (minute)	Set device + 6 *2	Set device + 9 *1	
End Time (second)	Set device + 7 *2	Set device + 10*1	

*1 Devices set in [External Control] in the [Time Action List] dialog
☞ Page 2549 [Time Action List] dialog

*2 Devices set for [External Control Device (8 Points)] in the [Time Action Attribute] dialog
☞ Page 2551 [Time] tab

[Setting No. Device]

Store the setting No. (1 to 32) assigned to the target time action for the external control.

[External Control Signal Device]

Executes an external control.

Turn on the bit corresponding to the required operation.

If multiple bits are turned on, the rightmost is prioritized.

- b0: Output trigger

Outputs the data of the time action to the external control devices.

- b1: Change trigger

Changes the settings of the time action to those of the external control devices.

- b2: Use prohibited
- b3: Time action setting file storage trigger

Saves the time settings of all the time actions as the time action setting file.

- b4: Time action setting file deletion trigger

Deletes the time action setting file.

- b5 to b15: Use prohibited

Point

GOT's operations related to the time action setting file

When there is the time action setting file in the GOT at power on or reset, the GOT reads the time action settings from the time action setting file.

[External Control Status Notification Device]

Notifies the result of the execution of the external control.

After the completion of output or change, this device turns off automatically when the external control signal device is turned off.

- b0: Data were successfully output.
- b1: Data were successfully changed.
- b2: Error

A system error occurs.

- b3: The time action setting file was successfully saved.

Turns on when the time action setting file is successfully saved.

- b4: The time action setting file was successfully deleted.

Turns on when the time action setting file is successfully deleted.

- b5: The time action setting file was successfully read.

Turns on when the time action setting file in the GOT is successfully read out.

- b6 to b15: Use prohibited

Point

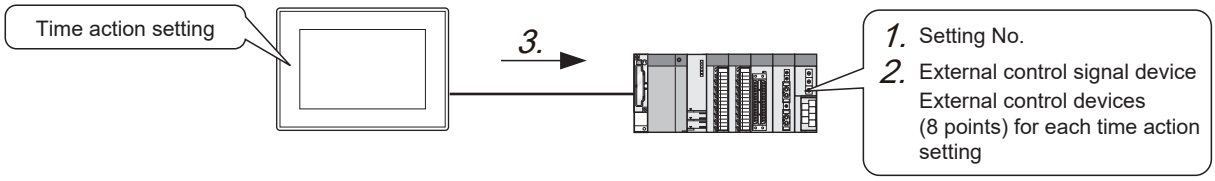
Disabling the time action setting file

To disable the read operation for reading from the time action setting file, perform either of the following operations then restart the GOT.

- Turn on b4 (time action setting file deletion trigger) of the external control device.
- Write the project in which it has become invalid to write the time action setting file to the GOT.

Examples of operations in external control

■Output (outputting the settings of a time action to external devices)

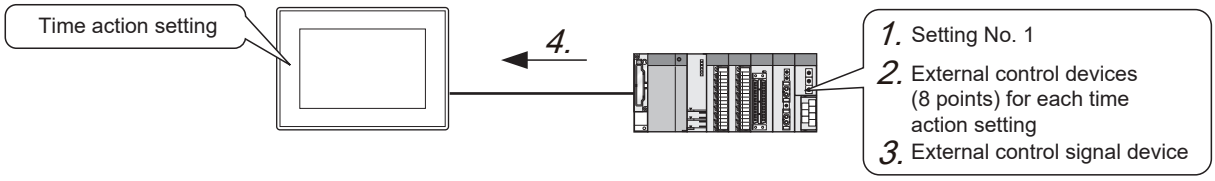


1. Set the setting No. assigned to the target time action for the change of settings.

2. Turn on b0 of the external control signal device.

3. The data of the time action are output to the external control devices.

■Change (changing the settings of the time action to those of the external devices)



1. Set the setting No. assigned to the target time action for the change of settings.

2. To the external control devices, write the values to replace with.

3. Turn on b1 of the external control signal device.

4. The time action is set with the values set above.

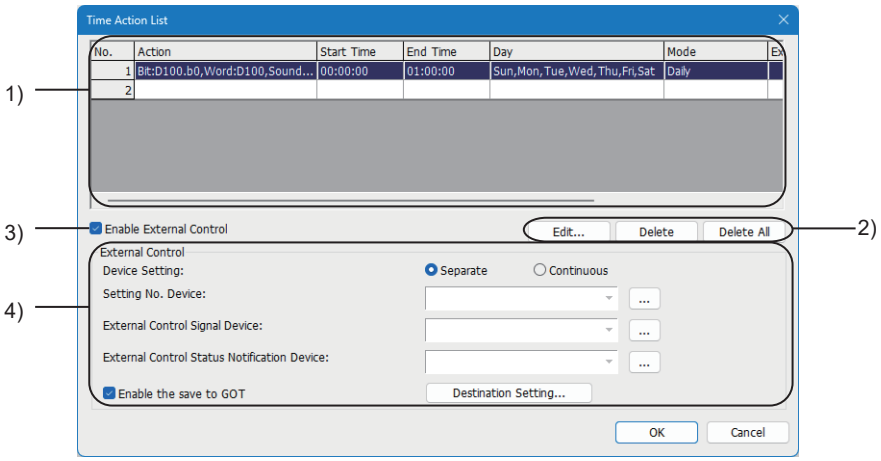
72.4 [Time Action List] dialog

GT37 SoftGOT3000

By time actions, devices can be turned on/off and write operations on values can be performed at a specified day of the week and time.

Select [Common] → [Time Action] from the menu to display the [Time Action List] dialog.

Set the operations of time actions, start time, and end time.



Item			Description
1)	Time action list	—	Lists set time actions. ☞ Page 2551 [Time Action Attribute] dialog
		[No.]	Displays the numbers that show the number of time actions.
		[Action]	Action to be executed when the trigger condition is satisfied
		[Start Time]	Displays the time when the time action starts.
		[End Time]	Displays the time when the time action ends.
		[Day]	Displays the day of the week when the time action is executed.
		[Mode]	Displays the mode in which the day of the week and time when the time action starts are specified.
		[External Control]	Displays a set external control device.
2)	[Edit] button	[Edit] button	Changes the settings of a selected time action. ☞ Page 2551 [Time Action Attribute] dialog
		[Delete] button	Deletes a selected time action.
		[Delete All] button	Deletes all the set time actions.
3)	[Enable External Control]		Set this item when controlling time actions with devices.

Item				Description
4)	[External Control]	—		Set each item of an external control.
		[Device Setting]	—	Select the setting method for external control devices.
			[Separate]	Set external control devices by time action. Eight word devices are required per time action. • [Setting No. Device] Set a device that specifies the time actions to be controlled. • [External Control Signal Device] Set a trigger device that executes the control. ☞ Page 2547 [External Control Signal Device] • [External Control Status Notification Device] Set a device that outputs the status of the time action. ☞ Page 2547 [External Control Status Notification Device]
			[Continuous]	Uses the same external control devices for all the set time actions. Eleven word devices are required. • [Setting No. Device(11 points)] Set a device that specifies the time actions to be controlled. Eleven consecutive devices counted from the specified device are set as external control devices.
		[Enable the save to GOT]		Set this item when it is necessary to save the time action setting file in the GOT. Setting this item enables b3 to b4 of the external control signal device and b3 to b5 of the external control status notification device. Setting this item enables the following operations. • Changing the settings of time actions with external control devices • Deleting the time action setting file ☞ Page 2547 [External Control Status Notification Device]
		[Destination Setting] button		Displays the [Destination Setting] dialog. Set items required to save the time action setting file in the GOT.  • [Drive Name] Set the destination drive. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT • [Folder Name] Set the name of the folder where files are stored. For the restrictions on the folder name used on the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT • [File Name] Set the name of the files to be saved. For the restrictions of the file name used in the GOT, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT

72.5 [Time Action Attribute] dialog

GT37 SoftGOT3000

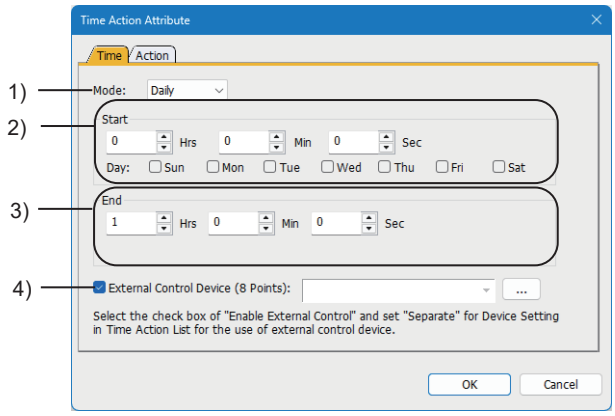
Click the [Edit] button in the [Time Action List] dialog to display the [Time Action Attribute] dialog.

☞ Page 2551 [Time] tab
☞ Page 2552 [Action] tab

72.5.1 [Time] tab

GT37 SoftGOT3000

Set the day of the week and time when the time action starts.

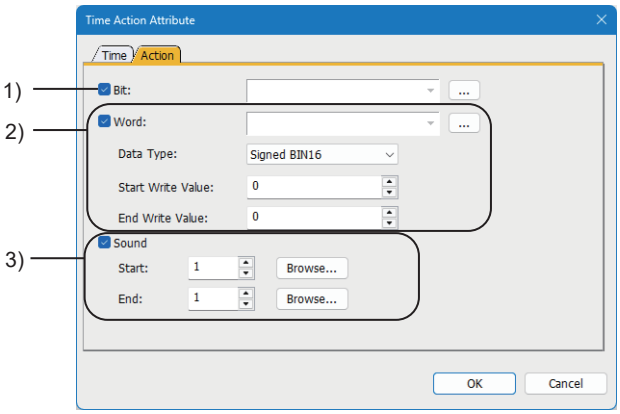


Item			Description
1)	[Mode]		Set the mode in which the day of the week and time when the time action starts are specified. The following shows selectable items. • [Daily]: Executes the time action on a specified day of the week. • [Through]: Enables the time action for the period between specified days of the week.
2)	[Start]	[Hrs], [Min], [Sec]	Set the time when the time actions starts.
		[Day]	When selecting [Daily] for [Mode], set the day of the week when the time action starts. Multiple days of the week can be selected. When selecting [Through] for [Mode], set the day of the week when the time action starts.
3)	[End]	[Hrs], [Min], [Sec]	Set the time when the time action ends.
		[Day]	When selecting [Through] for [Mode], set the day of the week when the time action ends.
4)	[External Control Device (8 Points)]		Set a device that controls the time action. ☞ Page 834 How to set devices, labels, and tags Eight consecutive devices counted from the specified device are set as external control devices. Set this item when selecting [Separate] for [Device] in [Time Action List].

72.5.2 [Action] tab

GT37 SoftGOT3000

Set the action to execute.



Item			Description
1)	[Bit]		Set this item to turn on a bit device at the start of the time action and to turn off at the end of the action. Set a bit device. ☞ Page 834 How to set devices, labels, and tags
2)	[Word]	—	Set this item to write values to a word device at the start and end of the time action. Set a word device. ☞ Page 834 How to set devices, labels, and tags
		[Data Type]	Set the data type of the word device. The following shows selectable items. • [Signed BIN8] • [Unsigned BIN8] • [Signed BIN16] • [Unsigned BIN16] • [Signed BIN32] • [Unsigned BIN32] • [Signed BIN64] • [Unsigned BIN64] • [BCD 16] • [BCD 32] • [BCD64] • [Real(32bit)] • [Real(64bit)]
		[Start Write Value], [End Write Value]	Set values to write to the word device at the start and end of the time action. The setting range depends on the setting of [Data Type].
3)	[Sound]	—	Set this item to replay a sound at the start and end of the time action. ☞ Page 2707 Outputting sound with the GOT (sound output function)
		[Start], [End]	Set the numbers assigned to the sound files output at the start and end of the time action. The setting range is [1] to [500]. If the [Browse] button is clicked, a sound can be selected from the list. ☞ Page 2715 [Sound File List] dialog

PART 16 Hard copy

73 Capturing the operating screen of the GOT ([Hard Copy])

73 Capturing the operating screen of the GOT ([Hard Copy])

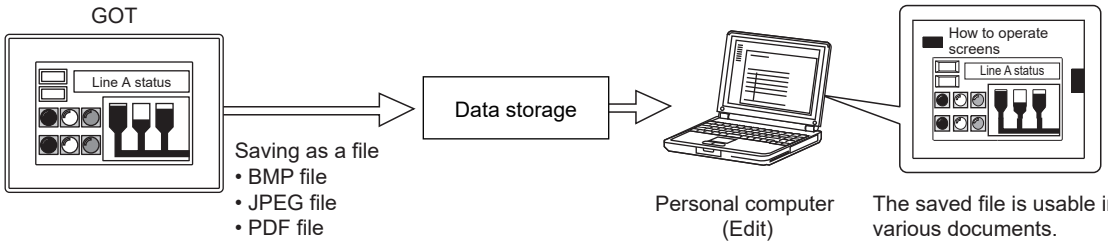
GT37 SoftGOT3000

☞ Page 2554 Overview of the hard copy function
☞ Page 2555 Specifications of the hard copy
☞ Page 2558 How to use the hard copy function
☞ Page 2559 [Hard Copy] dialog

73.1 Overview of the hard copy function

GT37 SoftGOT3000

The hard copy function captures the GOT screen image, and saves the image to a data storage as an image file or PDF file.
The monitor screen displayed on the GOT can be captured as it is. Capturing only a specified base screen or overlap window from the displayed screens is also possible.
Even if displayed screens overlap one another, a target screen only can be captured.
A screen not displayed on the GOT screen can also be captured. This allows you to capture a different screen while displaying the operation screen on the GOT.



The screen image output by the hard copy function can be used for creating an operating instruction manual or for troubleshooting.

For a PDF file output, a function that saves multiple screen images to a single PDF file is available, eliminating the need to combine the images as a document.
However, the numbers of the output target screens must be consecutive. Design screens considering that requirement.

73.2 Specifications of the hard copy

GT37 SoftGOT3000

73.2.1 Number of hard copies that can be set

One hard copy setting is available for one project.

73.2.2 Hard copy execution

Execute a hard copy using either of the following functions.

- Start trigger device
- Special function switch

Precautions

While a hard copy operation is being performed, the GOT interrupts its processing of screens being displayed.
The screen processing restarts after the completion of the hard copy.

73.2.3 Specification of the output destination

Specify a file as the output destination of the captured screen image.
For specification of the output file, refer to the following.
☞ Page 2559 [Hard Copy] dialog

73.2.4 Specifying a file format

Specify one of the following file formats for an output to a file.

- BMP file
- JPEG file
- PDF file

For details, refer to the following.
☞ Page 2559 [Hard Copy] dialog

73.2.5 Specifications for image file (BMP, JPEG) save

Maximum number of files to be saved

One screen image is saved to one file and up to 9999 files can be saved.

Precautions

■State of a new trigger while a file save is being executed

If the trigger condition for a file save is satisfied while another file save is being executed, the new trigger is invalid.

Make sure that the trigger condition for a new file save is satisfied after the ongoing file save is complete.

Check the Writing Notification device for completion of a file save.

☞ Page 2559 [Hard Copy] dialog

■To maintain file access performance

It is recommended to format the data storage before using it.

The number of files to be stored in a folder should be less than 500.

If 500 or more files are stored in a folder, the access performance may be degraded.

Repeated writing or deleting of data may degrade access performance, regardless of the number of files.

In such a case, format the data storage.

File name

A file name consists of the file name specified in GT Designer3 and file number.

Ex.

When [File Name] is set to [SNAP], and [Style] is set to [BMP]

Order in which image files are saved	File name
1st	SNAP0001.BMP
2nd	SNAP0002.BMP
:	:
9998th	SNAP9998.BMP
9999th	SNAP9999.BMP

73.2.6 Specifications for PDF file save

Maximum number of files to be saved

Up to 9999 files can be saved.

Saving multiple captured screen images to a single PDF file is available by specifying the number of screen images to be output.

File name

The file name specification is the same as that for image files (BMP, JPEG).

☞ Page 2556 File name

System application (add-on function)

To save a captured screen image as a PDF file, [Hard Copy PDF Output] must be selected from the system applications (add-on functions).

Configuring either of the following settings incorporates the application into the package data automatically.

- In the [Hard Copy] dialog, select [Fixed] - [PDF] for [Style].
- In the [Hard Copy] dialog, select [Device] for [Style], and select [Output PDF file].

Specifications of the page size and orientation

Specify the page size and orientation of the PDF file.

For details, refer to the following.

☞ Page 2559 [Hard Copy] dialog

73.3 How to use the hard copy function

GT37 SoftGOT3000

73.3.1 Setting procedure

The following shows the procedure for saving a captured screen image to a file.

1. Select [Common] → [Hard Copy] from the menu to display the [Hard Copy] dialog.

☞ Page 2559 [Hard Copy] dialog

2. Set [Destination] to [File].

3. In the [File] tab, set necessary items and click the [OK] button.

☞ Page 2559 [Hard Copy] dialog

For the methods of starting a hard copy, refer to the following.

☞ Page 2558 Starting a hard copy

73.3.2 Starting a hard copy

The following shows the procedure for starting a hard copy.

Using a start trigger device

Set the start trigger device for a file save.

1. Select [Common] → [Hard Copy] from the menu to display the [Hard Copy] dialog.

☞ Page 2559 [Hard Copy] dialog

2. In the [File] tab, select [Start Trigger Device].

3. Specify a start trigger device, and click the [OK] button.

To start a hard copy output, use a bit switch or other methods to turn on the start trigger device.

Set the ON and OFF times of the start trigger device to one second or more for each.

If you use the bit switch in which [Action] is set to [Momentary], configure the settings in the [Bit Switch] dialog ([Extended] tab) as shown below.

- Set [Delay] to [OFF].
- Set [Delay Time] to [1] second or more.

☞ Page 1199 [Switch] dialog

Using a special function switch

Configure the settings of a special function switch as shown below.

- Set [Switch Action] to [Start Hard Copy].
- Select [Specify the destination to output hard copies].
- Set [Destination] to [File].

Setting a start trigger device is unnecessary.

To start a hard copy output, touch the set special function switch.

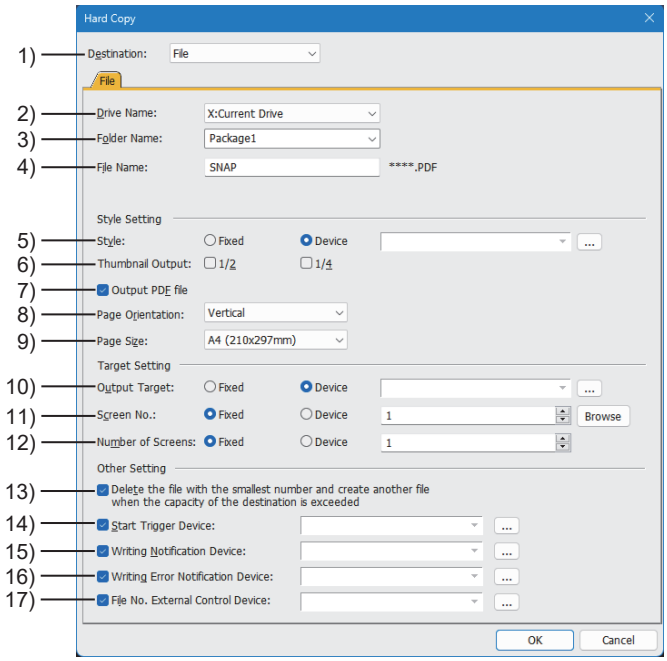
☞ Page 1230 [Special Function Switch] dialog

73.4 [Hard Copy] dialog

GT37 SoftGOT3000

Configure the hard copy settings.

Select [Common] → [Hard Copy] from the menu to display the [Hard Copy] dialog.



Item			Description
1)	[Destination]		Select [File]. A captured image is output to an image file.
2)	[Drive Name]		Set the destination drive. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
3)	[Folder Name]		Set the name of the folder where files are stored. Up to 65 characters can be set. When [1/2] or [1/4] is selected for [Thumbnail Output], up to 63 characters can be set. For the restrictions on the folder name, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
4)	[File Name]		Set the name of the files to be saved. Up to 67 characters can be set. When [1/2] or [1/4] is selected for [Thumbnail Output], up to 65 characters can be set. For the restrictions on the file name, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
5)	[Style]	—	Set the file format of a file to be saved.
		[Fixed]	Specify the file format of a file to be saved directly.
		[Device]	Specify the file format of a file to be saved using devices. You can specify a word device or word-specified bit device (data type: unsigned 16-bit binary data). The following shows the setting values. • 0: BMP • 1: JPEG • 2: PDF If a value other than the above is set, the hard copy is not executed and system alarm 367 is output. To specify the PDF format, be sure to select [Output PDF file].

Item			Description
6)	[Thumbnail Output]	—	Thumbnail output is not available for PDF files. This item is not displayed when [Fixed] is selected for [Style] and PDF is selected. If [Device] is selected for [Style] and PDF output is selected, any setting for this item will be invalid. Set this item to create a thumbnail of a captured image when the image is saved to a file. Example) [1/2] in size  If the output target is as follows, this item is disabled even though it is set, and system alarm 359 is output at a file output. • Displayed screen: Overlap windows 1 to 5 • Hidden screen: Window screen
		[1/2]	Creates a thumbnail that is half of normal screen size. The following shows the destination folder. • Folder name: Folder set with [Folder Name]\M • File name: Name set for [File Name]
		[1/4]	Creates a thumbnail that is a quarter of normal screen size. The following shows the destination folder. • Folder name: Folder set with [Folder Name]\S • File name: Name set for [File Name]
7)	[Output PDF file]		This item is displayed when [Device] is selected for [Style]. Be sure to select this item to execute a PDF output using a device.
8)	[Page Orientation]		Specify the PDF page orientation. The screen is scaled to fit the page size. Left, right, top, and bottom margins are provided on the page of the outputted PDF file. • [Vertical] Images are all vertically outputted regardless of the aspect ratio of the screen. • [Horizontal] Images are all horizontally outputted regardless of the aspect ratio of the screen. • [Automatic] The page orientation is automatically determined considering the aspect ratio of the output target screen so that the margins will be minimized. [Vertical] is set for square and vertically oriented screens whereas [Horizontal] is set for horizontally oriented screens.
9)	[Page Size]		Specify the PDF page size.
10)	[Output Target]	—	Specify an output target screen. To specify a screen other than the monitor screen being displayed, select [Screen Switching/Windows] and specify a screen not selected for [Take a hard copy of a screen other than the displayed monitor screen]. ☞ Page 542 [Screen Switching/Window]
		[Fixed]	Specify an output target screen directly.
		[Device]	Specify an output target screen using devices. You can specify a word device or word-specified bit device (data type: unsigned 16-bit binary data). The following shows the setting values. • 0: Displayed monitor screen • 1: Displayed base screen • 2: Displayed overlap window 1 • 3: Displayed overlap window 2 • 4: Displayed overlap window 3 • 5: Displayed overlap window 4 • 6: Displayed overlap window 5 • 7: Hidden base screen • 8: Hidden window screen

Item			Description
11)	[Screen No.]	—	Set this item when a hidden screen is specified as the output target. Specify the number of the screen whose image is to be output.
		[Fixed]	The setting range is [0] to [32767]. Click the [Browse] button to display the [Screen Image List] dialog.
		[Device]	You can specify a word device or word-specified bit device (data type: unsigned 16-bit binary data). Set a value within the range from 0 to 32767.
12)	[Number of screens]	—	Set this item when PDF is selected for [Style] and a hidden screen is selected for [Output Target]. If the screen numbers are consecutive, specifying the number of screens enables output of multiple screen images to a PDF file. Specify the number of screens to be output, counting from the screen number specified in [Screen No.].
		[Fixed]	The setting range is [1] to [100].
		[Device]	You can specify a word device or word-specified bit device (data type: unsigned 16-bit binary data). Set a value within the range from 1 to 100.
13)	[Delete the file with the smallest number and create another file when the capacity of the destination is exceeded]		Deletes an existing file and saves a new file when the save destination drive has insufficient free space.*1 If you deselect this item, a new file is not created when the destination drive has insufficient free space or file No. 9999 exists in the destination folder.
14)	[Start Trigger Device]		Set the device to start a hard copy (file save). For the setting method, refer to the following. ☞ Page 834 How to set devices, labels, and tags
15)	[Writing Notification Device]		Set the device to notify that a captured image is being saved to a file. For the setting method, refer to the following. ☞ Page 834 How to set devices, labels, and tags This device is on during an image file output.
16)	[Writing Error Notification Device]		Set the device to notify that saving a captured image to a file has failed. For the setting method, refer to the following. ☞ Page 834 How to set devices, labels, and tags This device turns on when an error occurs during an image file output. The device does not turn off automatically even after error recovery. You need to turn off the device.
17)	[File No. External Control Device]		Set the device that specifies the file number of a file to be saved. The data type of the device is unsigned 16-bit binary. For the setting method, refer to the following. ☞ Page 834 How to set devices, labels, and tags The valid range of the file number is 1 to 9999. If a specified file number exists, the corresponding file is overwritten. If a specified file number is outside the valid range, the file is not saved. This setting overrides the setting of [Delete the file with the smallest number and create another file when the capacity of the destination is exceeded]. (The GOT performs the operation with the latter item deselected.)

*1 Operation varies depending on the amount of free space of the destination drive and the file number of each file in the destination folder.

File number of a file in the destination folder	If the destination drive has enough free space	If the destination drive has insufficient free space
File No. 9999 existent	All existing files in the destination folder are deleted, and a new file is saved with file No. 1.	
File No. 9999 nonexistent	A new file is saved with the largest file number in the destination folder.	The existing files are deleted, starting from the one with the smallest file number in the destination folder, until a new file is saved. A new file is saved with the largest file number in the destination folder.

73.5 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the hard copy as required.
The following shows the functions that are available by configuring the relevant settings.

73.5.1 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Notifying that data is being output to a file. (Write device: System signal 2-1.b7)	[System Signal 2-1]
Notifying that the number of files in the save destination folder approaches the upper limit (9999) (Write device: System signal 2-1.b12)	[System Signal 2-1]

73.5.2 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item

PART 17 Barcode function

74 Using a barcode reader with the GOT (barcode function)

74 Using a barcode reader with the GOT (barcode function)

GT37 SoftGOT3000

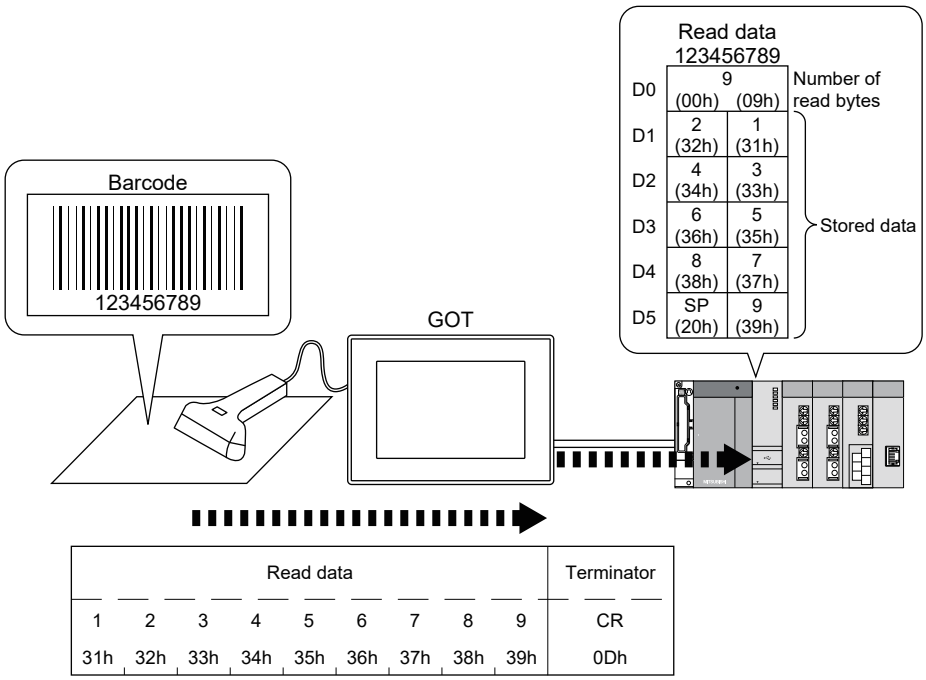
☞ Page 2565 Overview of the barcode function
☞ Page 2566 Specifications of the barcode function
☞ Page 2568 Basic use of the barcode function
☞ Page 2570 Advanced use of the barcode function
☞ Page 2572 [Bar Code] dialog
☞ Page 2578 System information settings
☞ Page 2579 Action of the barcode function
☞ Page 2586 Relevant settings

74.1 Overview of the barcode function

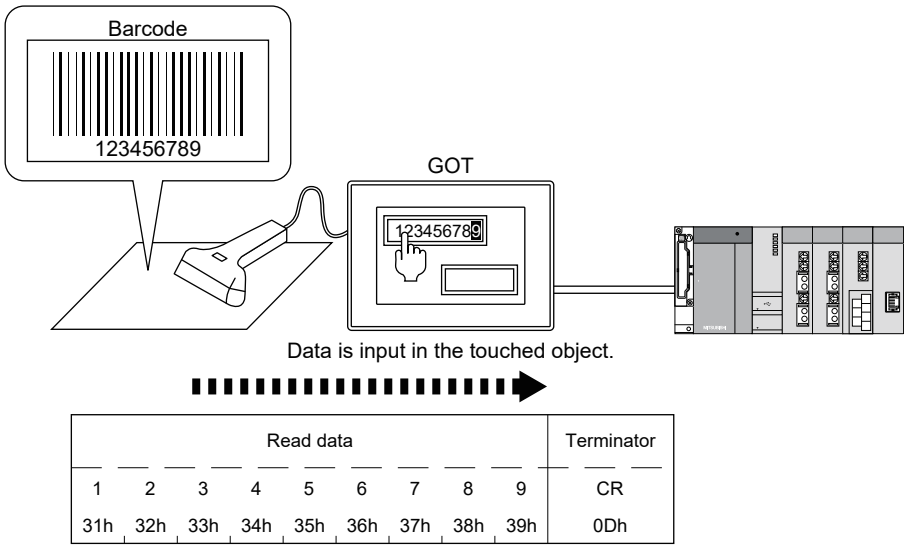
GT37 SoftGOT3000

The barcode function enables the GOT to read the data from a barcode by using a barcode reader.
The read data is processed as follows.

74.1.1 Writing read data into controllers



74.1.2 Directly inputting read data to objects (numerical input and text input)



74.2 Specifications of the barcode function

GT37 SoftGOT3000

74.2.1 System application (add-on function)

Serial barcode reader

To use the barcode function, a system application (add-on function) for [Bar Code (Serial)] is required.
Select [Use Serial Bar Code] in the [Bar Code] dialog ([Serial] tab) to automatically incorporate the system application into the package data.
☞ Page 2572 [Bar Code] dialog
In order to use this function with GT SoftGOT3000, this system application (add-on function) is not required.

USB barcode reader

To use the barcode function, a system application (add-on function) for [Bar Code (USB)] is required.
Select [Use USB Bar Code] in the [Bar Code] dialog ([USB] tab) to automatically incorporate the system application into the package data.
☞ Page 2572 [Bar Code] dialog

74.2.2 Applicable barcode readers

One serial barcode reader and one USB barcode reader are usable simultaneously.

Serial barcode reader

You can use the serial barcode readers that satisfy the header and terminator specifications referred to in the following.

☞ Page 2580 Header and terminator

For information on the validated serial barcode readers, refer to the following Technical Bulletin.

📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)

USB barcode reader

You can use the USB barcode readers that satisfy the following conditions.

- A USB keyboard interface is provided.
- The Japanese 106 keyboard or the English 101 keyboard is settable as the USB keyboard type.
- "Enter" is settable as the terminator.

When data is input from a USB barcode reader, the GOT only supports the ASCII code characters that can be output using a USB keyboard.

The GOT only recognizes ASCII code characters.

Katakana, Hiragana, and Kanji characters contained in a QR code cannot be read with USB barcode readers.

These characters are readable with serial barcode readers.

For information on the validated USB barcode readers, refer to the following Technical Bulletin.

📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)

74.2.3 Number of barcode function settings for one project

One setting can be configured per project.

74.2.4 Devices for storing data read by the barcode reader and the devices points

Devices that can store the data

The data can be stored in the word device.

The bit device cannot be specified as the word device.

Maximum number of devices

Up to 2000 device points can be set.

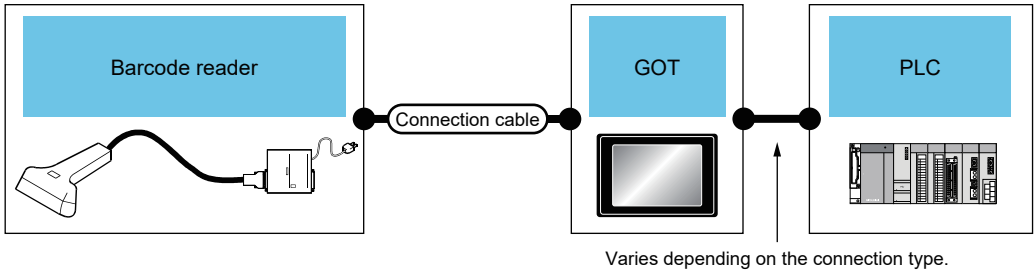
One read byte and up to 1999 read data are stored in the device.

74.3 Basic use of the barcode function

GT37 SoftGOT3000

74.3.1 System configuration

The following shows the system configuration of the barcode reader.



For information on the maximum number of connected devices, refer to the following.

☞ Page 2568 Maximum number of connected devices

Barcode reader	Connection cable	GOT	PLC
For the connectable barcode readers and system devices, the type of the barcode that can be read, and the connection cables, refer to the following Technical Bulletin. 📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)	Depending on the specifications of the barcode reader	GT37 SoftGOT3000 *1	For information on the system configuration between the GOT and the PLC, refer to the following. 📖GOT3000 Series User's Manual (Connection)

*1 For GT SoftGOT3000, connect the barcode reader to the interface of the personal computer.
GT SoftGOT3000 does not support USB barcode readers.

Maximum number of connected devices

Only one serial barcode reader or one USB barcode reader can access one GOT at a time.

Installing the barcode reader

The barcode reader can be attached to the GOT at any timing.

74.3.2 Setting procedure

Serial barcode reader

1. Connect a serial barcode reader to the GOT.

☞ Page 2568 System configuration

2. In the [Bar Code] dialog ([Serial] tab), configure the barcode function setting.

☞ Page 2572 [Bar Code] dialog

3. Set the system signal according to the channel number used.

☞ Page 2578 System information settings

4. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

5. Check that the barcode function is functioning properly.

☞ Page 2579 Action of the barcode function

USB barcode reader

1. Connect a USB barcode reader to the GOT.

☞ Page 2568 System configuration

2. In the [GOT Setup] window ([USB Host]), select [Use USB keyboard/USB bar code] and set [Keyboard Type] according to the setting of the USB barcode reader used.

☞ Page 634 [USB Host]

3. In the [Bar Code] dialog ([USB] tab), configure the barcode function setting.

☞ Page 2572 [Bar Code] dialog

4. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

5. Check that the barcode function is functioning properly.

☞ Page 2579 Action of the barcode function

74.4 Advanced use of the barcode function

GT37 SoftGOT3000

74.4.1 Directly inputting data to objects (numerical input or text input)

To directly input the data to the object (numerical input or text input), the setting for using the barcode function is required for the object.
When the object (numerical input or text input) is not in the ready state for the data read by the barcode reader to be directly input, the read data is cleared.
To input the data, touch the object (numerical input or text input) input, and read the data with the cursor displayed.

Precautions

When the special interrupt code output is enabled, the special interrupt code (23H) is output after a barcode is read.
When the data is directly input to an object and the barcode read completed signal is disabled, the special interrupt code is not output.
For the special interrupt code output through the microcomputer connection, refer to the following.
GOT3000 Series User's Manual (Connection)

74.4.2 Input completion notification settings

This setting is required when using a serial barcode reader.

When the input completion notification is disabled

Establishing a handshake is not required by using the External Device I/O signal and the External Device I/O Complete signal.
If the data is sequentially read into the object, old data is immediately overwritten by new data in each time.

When the input completion notification is enabled

The data cannot be input to the object until the External Device I/O signal is turned off by the External Device I/O Complete signal.
For the action of the System signal, refer to the following.
Page 2577 [Control Device]

74.4.3 Switching the behavior of the USB barcode reader

The Switch USB Barcode Input signal is usable to switch between the USB keyboard function and the barcode function.
For instruction on setting the Switch USB Barcode Input signal, refer to the following.
☞ Page 2576 [USB] tab

- When the Switch USB Barcode Input signal is on

The USB keyboard function is enabled.
For details on the USB keyboard function, refer to the following.
☞ Page 630 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host])

- When the Switch USB Barcode Input signal is off

The barcode function is enabled.

Precautions

When you use a USB barcode reader for writing the read data to specified devices, turn off the USB Barcode Input signal and the USB Barcode Read Completed signal before a barcode reading.
If a barcode reading is performed while the signals are on, the read data is deleted.

74.5 [Bar Code] dialog

GT37 SoftGOT3000

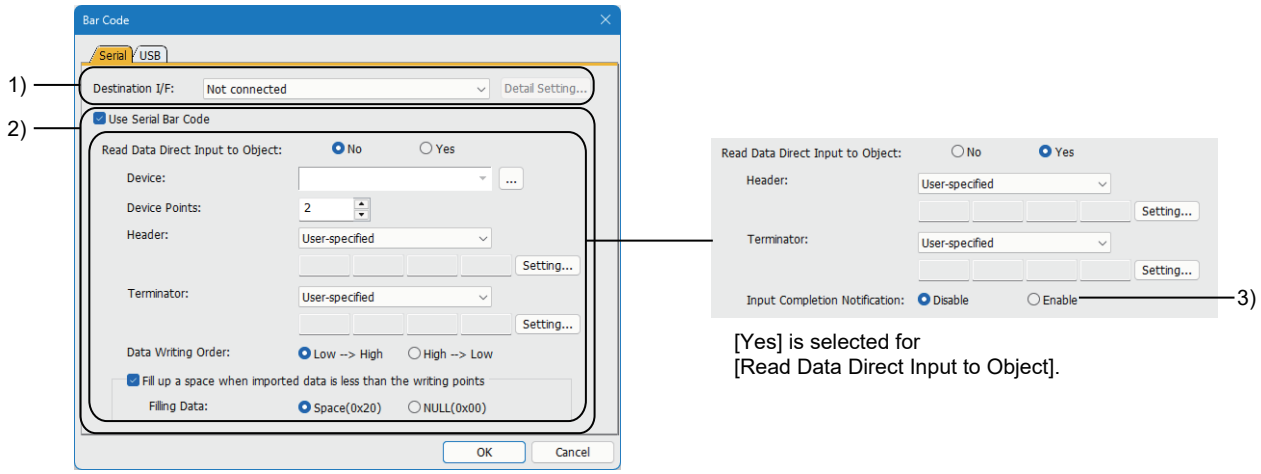
Select [Common] → [Peripheral Setting] → [Bar Code] from the menu to display the setting dialog.

☞ Page 2572 [Serial] tab
☞ Page 2576 [USB] tab

74.5.1 [Serial] tab

GT37 SoftGOT3000

This setting is required when using a serial barcode reader.



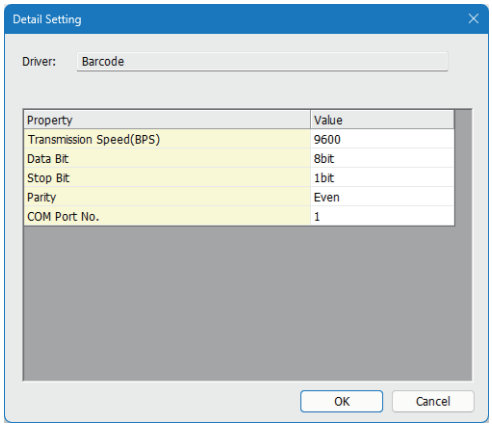
[No] is selected for [Read Data Direct Input to Object].

[Yes] is selected for [Read Data Direct Input to Object].

Item			Description
1)	[Destination I/F]	—	Set the interface of the GOT. The selectable items vary depending on the GOT model. • GT37 [RS422/485] [RS232] [Extend Unit] [Not connected] • GT SoftGOT3000 [Serial 1] [Serial 2] [Not connected]
		[Detail Setting] button	Configure the advanced settings in the [Detail Setting] window. For details, refer to the following. ☞ Page 2574 [Detail Setting] window (barcode)

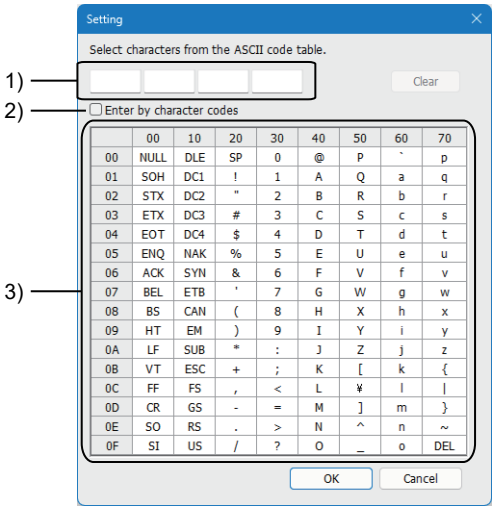
Item			Description
2)	[Use Serial Bar Code]	—	Enables the barcode function setting.
		[Read Data Direct Input to Object]	Select whether to write the data read by a serial barcode reader into controller devices, or to input the read data to an object (numerical input or text input). • [No]: Writes the data into the controller. • [Yes]: Directly inputs the data to the numerical input or text input. To directly input the data to the object (numerical input or text input), the setting for using the barcode reader is required for the object. ☞ Page 1328 [Numerical Input] dialog ☞ Page 1362 [Text Input] dialog
		[Device]	Set the start device of consecutive devices that store the data read by a serial barcode reader.
		[Device Points]	Set the number of devices that store the data read by the barcode reader. The setting range is [2] to [2000].
		[Header]	Select a header for the barcode read by a serial barcode reader. The following shows selectable items. • [None] • [STX] • [ENQ] • [User-specified]: Up to four bytes are settable. Specify a value for a byte in the range of 0x00 to 0xFF. When you select [User-specified], refer to the following. ☞ Page 2575 [Setting] dialog (for setting the header or terminator)
		[Terminator]	Select a terminator for the barcode read by a serial barcode reader. The following shows selectable items. • [ETX] • [LF] • [CR] • [CR+LF] • [User-specified]: Up to four bytes are settable. Specify a value for a byte in the range of 0x00 to 0xFF. When you select [User-specified], refer to the following. ☞ Page 2575 [Setting] dialog (for setting the header or terminator)
		[Data Writing Order]	Select the order of writing the data into the controller device. • [Low → High]: The data is written to the controller device from the lower 8 bits to the upper 8 bits. • [High → Low]: The data is written to the controller device from the upper 8 bits to the lower 8 bits.
		[Fill up a space when imported data is less than the writing points]	Select this item to fill blank devices with spaces or NULLs when the number of bytes of the data read by the barcode reader is less than the set device points. • [Space]: Fills the blank device with spaces (20H). • [NULL]: Fills the blank device with NULLs (00H).
3)	[Input Completion Notification]		Select whether to enable or disable the completion notification of data input processing by the System signal (External Device I/O signal and External Device I/O Complete signal). The setting range is [Disable] or [Enable]. ☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

[Detail Setting] window (barcode)



Item	Description
[Transmission Speed(BPS)]	Select the transmission speed. The following shows selectable items. • [4800] • [9600] • [19200] • [38400] • [57600] • [115200]
[Data Bit]	Select the data length. The following shows selectable items. • [7bit] • [8bit]
[Stop Bit]	Select the stop bit length. The following shows selectable items. • [1bit] • [2bit]
[Parity]	Select the type for a parity check. The following shows selectable items. • [None] • [Even] • [Odd]
[COM Port No.]	This item is displayed only for GT SoftGOT3000. Set the COM port number. The setting range is [1] to [63].

[Setting] dialog (for setting the header or terminator)

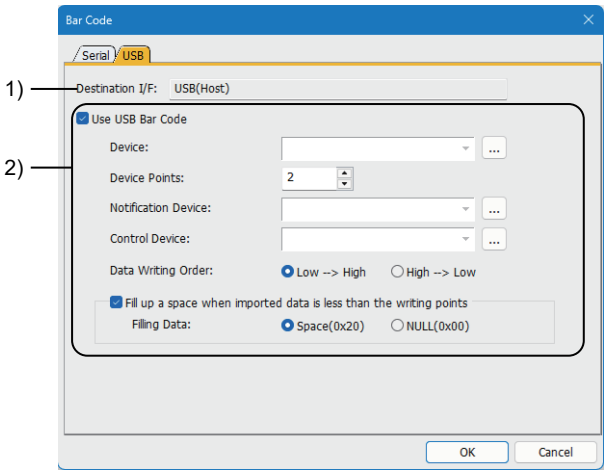


Item		Description
1)	Header/terminator entry field	Enter values for the header or terminator. A cell where an entry is made is counted as a valid byte.
2)	[Enter by character codes]	Enter values in hexadecimal.
3)	ASCII code table	Lists the selectable ASCII codes. Click a character to enter it into the header/terminator entry field.

74.5.2 [USB] tab

GT37 SoftGOT3000

This setting is required when using a USB barcode reader.



Item			Description
1)	[Destination I/F]		Displays the GOT interface to be used. The interface cannot be changed from [USB (Host)].
2)	[Use USB Bar Code]	—	Enables the barcode function setting.
		[Device]	Set the start device of consecutive devices that store the data read by a USB barcode reader.
		[Device Points]	Set the number of devices that store the data read by the barcode reader. The setting range is [2] to [2000].
		[Notification Device]	Set the device that notifies the processing status of the data read by a USB barcode reader. ☞ Page 834 How to set devices, labels, and tags A word device can be set. For the function of each bit of the device, refer to the following. ☞ Page 2576 [Notification Device]
		[Control Device]	Set the device that controls the processing of the data read by a USB barcode reader. ☞ Page 834 How to set devices, labels, and tags A word device can be set. For the function of each bit of the device, refer to the following. ☞ Page 2577 [Control Device]
		[Data Writing Order]	Select the order of writing the data into the controller device. • [Low → High]: The data is written to the controller device from the lower 8 bits to the upper 8 bits. • [High → Low]: The data is written to the controller device from the upper 8 bits to the lower 8 bits.
		[Fill up a space when imported data is less than the writing points]	Select this item to fill blank devices with spaces or NULLs when the number of bytes of the data read by the barcode reader is less than the set device points. • [Space]: Fills the blank device with spaces (20H). • [NULL]: Fills the blank device with NULLs (00H).

[Notification Device]

The following shows the function of each bit of the set device.

Bit number	Signal name	Function
b0 to b5	Use prohibited	—
b6	USB Barcode Input signal	Turns on when the data read by a USB barcode reader is stored to specified devices. Turns off when the USB Barcode Read Completed signal (b6 of the control device) turns on.
b7 to b15	Use prohibited	—

[Control Device]

The following shows the function of each bit of the set device.

Bit number	Signal name	Function
b0	Switch USB Barcode Input signal	Switches the behavior of the USB barcode reader. This signal is disabled when the Enable Operator Authentication signal (Control device.b1) is turned on and the GOT displays the screen for login with an external authentication device. • ON The USB keyboard function is enabled. For details on the USB keyboard function, refer to the following. ☞ Page 630 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host]) • OFF The barcode function is enabled.
b1	Enable Operator Authentication signal	Turn on this signal and display the screen for login with an external authentication device on the GOT to enable the operator authentication with a USB device. For details on the operator authentication, refer to the following. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2)) ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
b2	Enable USB Device Input During Operator Authentication signal	Turn on this signal to enable the operator authentication data read by a USB device to be saved into devices. For details on the operator authentication, refer to the following. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2)) ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
b3 to b4	Use prohibited	—
b5	Disable USB Barcode Input signal	The control is enabled when the Enable Operator Authentication signal (Control device.b1) is turned on and the GOT displays the screen for login with an external authentication device. Turn on this signal to disable the barcode function.
b6	USB Barcode Read Completed signal	Turn on this signal for the GOT to recognize that the stored barcode data has been transferred from the specified devices to different devices. Turn on this signal to turn off the USB Barcode Input signal (b6 of the notification device).
b7 to b15	Use prohibited	—

Precautions

If you switch between the ON and OFF states of the Switch USB Barcode Input signal while a USB barcode reader is reading data, unintended behavior may result.

Do not switch the ON and OFF states of the signal while a USB barcode reader is reading data.

74.6 System information settings

GT37 SoftGOT3000

This setting is required when using a serial barcode reader.

If you use a USB barcode reader, set [Notification Device] and [Control Device] in the [Bar Code] dialog ([USB] tab).

☞ Page 2576 [USB] tab

74.6.1 Setting the system information

Make sure to set one of the following System signals according to the channel No. you use.

For GT SoftGOT3000, set the System signal used for channel No. 5 of the GOT.

The barcode function is not available without the setting.

Channel No.	System signal
Channel No. 8	System signal 1-1, System signal 2-1
Channel No. 5	System signal 1-2, System signal 2-3
Channel No. 6	
Channel No. 7	

For details on system information, refer to the following.

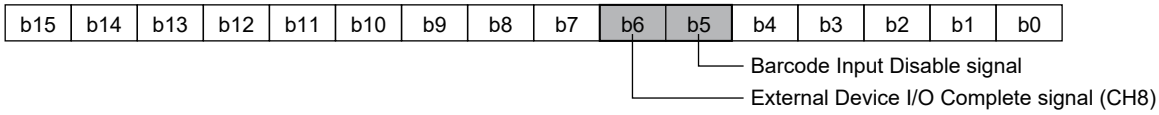
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

74.6.2 Action of the barcode function according to the System signal status

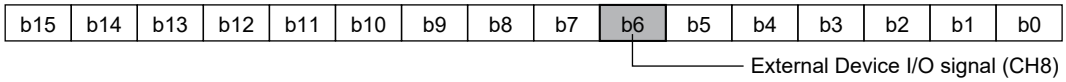
While the following System signals are on, the data read by the barcode reader is not written into the controller.

Use a sequence program or other methods to turn off the External Device I/O signal and the External Device I/O Complete signal.

System signal 1-1



System signal 2-1



74.7 Action of the barcode function

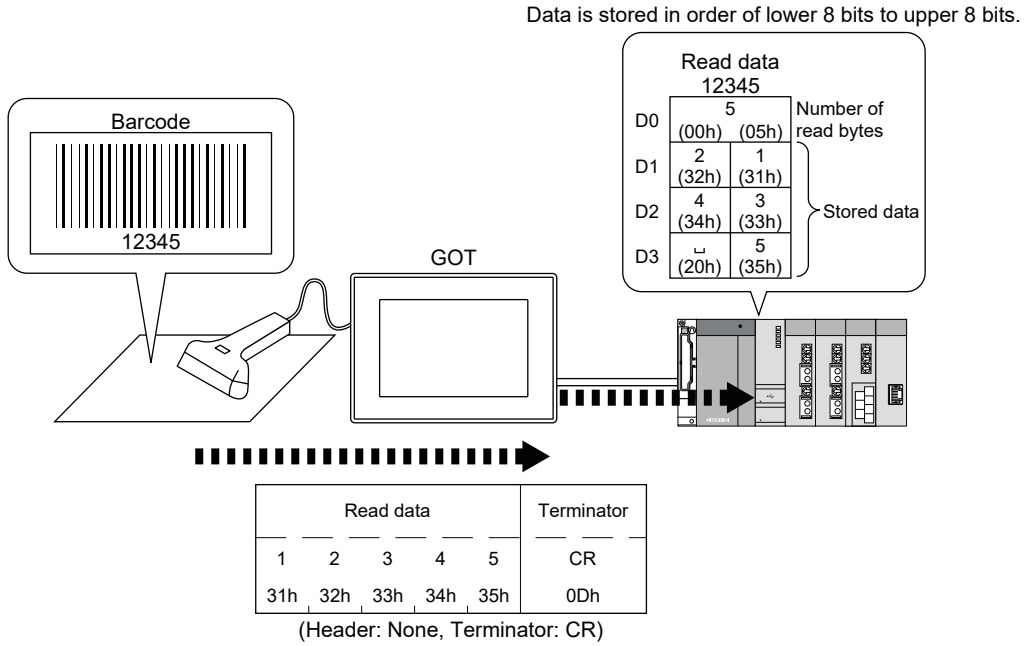
GT37 SoftGOT3000

74.7.1 Order of writing data into the controller

Set the order of writing the data read by the barcode reader into the controller.

Low → high

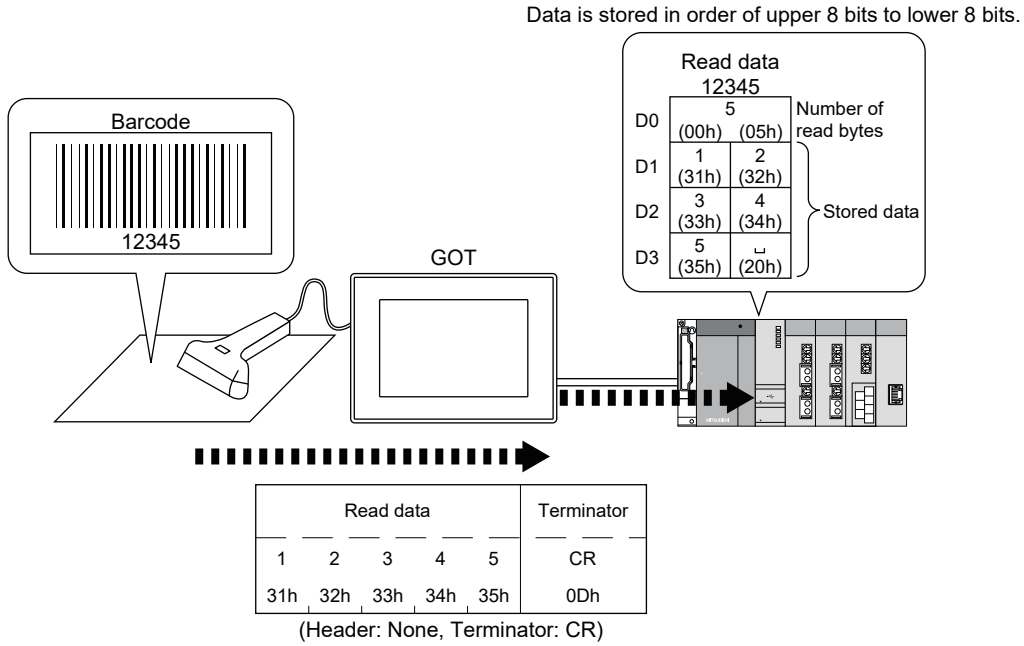
The data is written to the controller device from the lower 8 bits to the upper 8 bits.



(Header: None, Terminator: CR)

High → low

The data is written to the controller device from the upper 8 bits to the lower 8 bits.



(Header: None, Terminator: CR)

74.7.2 Header and terminator

If you use a serial barcode reader, set the header and terminator for the read barcode.

Item		Description
Header	None (Default)	The read data is as follows when the header is not added to the head of data. 	STX	The read data and STX are set as follows when STX is added to the head of data. 	ENQ	The read data and ENQ are set as follows when ENQ is added to the head of data. 	User-specified	The user-specified values are prepended to the read data. Example) When 41h, 42h, 43h, and 44h are specified 
Item		Description
Terminator	ETX	The read data and ETX are set as follows when ETX is added to the end of data. 	LF	The read data and LF are set as follows when LF is added to the end of data. 	CR (Default)	The read data and CR are set as follows when CR is added to the end of data. 	CR+LF	The read data and CR+LF are set as follows when CR+LF is added to the end of data. 	User-specified	The user-specified values are prepended to the read data. Example) When 61h, 62h, and 63h are specified 
74.7.3 Data to be stored in devices

The data read by the barcode reader is written into the controller device as the string data.

Ex.

Read data and order of writing the data

- Read data: 123456789
- Order of writing data: Low → high

When the number of read data is less than the set device points

Settings (Storage device: D0, Data points: 8)

Write device	Stored data	String data	
D0	0009h	-	The GOT writes the bytes of the read data.
D1	3231h	21	The GOT writes the read data sequentially from the lower byte.
D2	3433h	43	
D3	3635h	65	
D4	3837h	87	
D5	2039h	␣9	If the number of bytes of the read data is less than the set device points, select whether to fill the remaining devices with spaces (20h) or NULLs (00h).
D6	2020h	␣␣	
D7	2020h	␣␣	

␣: Space

When the number of read data is more than the set device points

Settings (Storage device: D0, Data points: 4)

Write device	Stored data	String data	
D0	0009h	-	The GOT writes the bytes of the read data.
D1	3231h	21	The GOT writes the read data sequentially from the lower byte.
D2	3433h	43	
D3	3635h	65	
			The data that exceeds the set device points is not written.

74.7.4 Operation example of the barcode function (Serial barcode reader)

The following shows the action timing of the barcode function.

Ex.

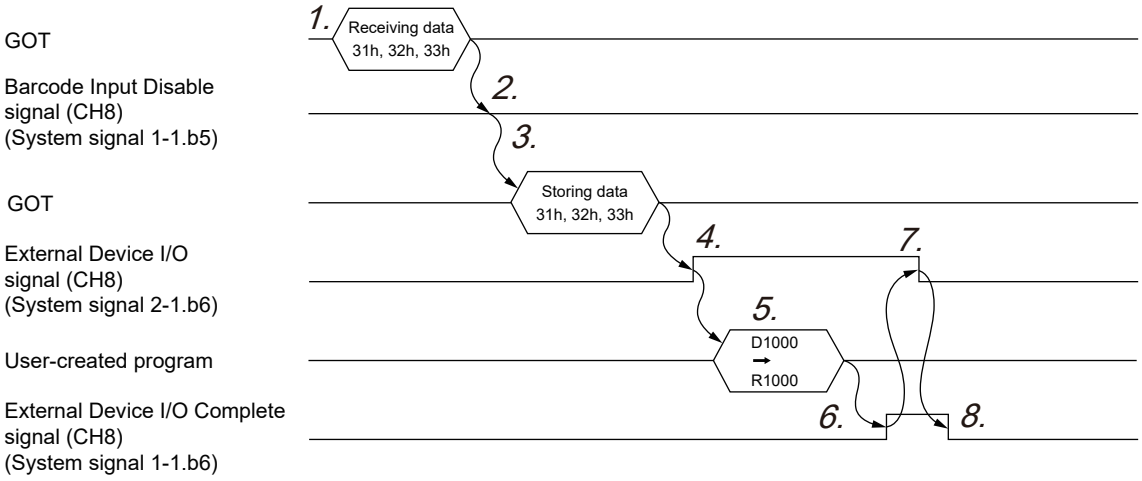
Settings in GT Designer3

- The barcode reader is connected to the GOT by using channel No.8.
- [No] is selected for [Read Data Direct Input to Object].
- System signal 1-1: D11
- System signal 2-1: D12
- Device: D1000
- Data points: 8

Control devices

Device	Item
System information	External Device I/O Complete signal (CH8) (System signal 1-1.b6), External Device I/O signal (CH8) (System signal 2-1.b6) ☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Handshake



1. The GOT receives data from a serial barcode reader.

2. When the Barcode Input Disable signal is off, the process proceeds to the next step.

3. The received data is stored to specified devices.

4. The External Device I/O signal (CH8) turns on upon storage of the data.

5. A user-created program transfers the stored data from the specified devices to different devices.

6. The user-created program turns on the External Device I/O Complete signal (CH8).

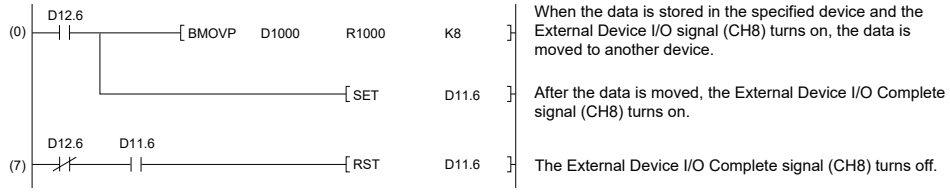
7. The External Device I/O signal (CH8) turns off upon turn-on of the External Device I/O Complete signal (CH8).

8. The user-created program turns off the External Device I/O Complete signal (CH8).

Example of the sequence program (When the GOT is connected to RCPU by using channel No. 8)

While the External Device I/O Complete signal and the External Device I/O signal are on, the data read by the barcode reader is not written into the controller.

Create a sequence program so that the External Device I/O Complete signal and the External Device I/O signal are turned off.



74.7.5 Operation example of the barcode function (USB barcode reader)

The following shows the action timing of the barcode function.

Ex.

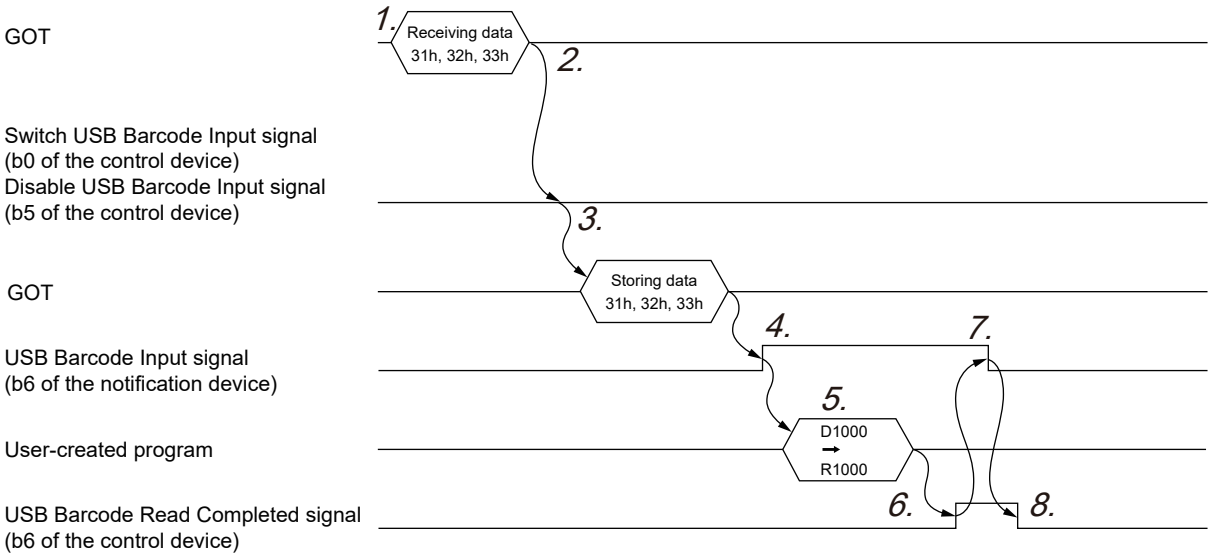
Settings in GT Designer3

- [Notification Device]: D11
- [Control Device]: D12
- Device: D1000
- Data points: 8

[Notification Device], [Control Device]

Device	Item
[Notification Device]	• USB Barcode Input signal (b6 of the notification device)
[Control Device]	• Switch USB Barcode Input signal (b0 of the control device) • Disable USB Barcode Input signal (b5 of the control device) • USB Barcode Read Completed signal (b6 of the control device)

Handshake



1. The GOT receives data from a USB barcode reader.

2. When the Switch USB Barcode Input signal and the Disable USB Barcode Input signal are off, the process proceeds to the next step.

3. The received data is stored to specified devices.

4. The USB Barcode Input signal turns on upon storage of the data.

5. A user-created program transfers the stored data from the specified devices to different devices.

6. The user-created program turns on the USB Barcode Read Completed signal.

7. The USB Barcode Input signal turns off upon turn-on of the USB Barcode Read Completed signal.

8. The user-created program turns off the USB Barcode Read Completed signal.

While the USB Barcode Input signal or the USB Barcode Read Completed signal is on, the read barcode data is not stored to the specified devices.

Create a sequence program so that the USB Barcode Input signal and the USB Barcode Read Completed signal are turned off.

74.8 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the barcode function as required.
The following shows the functions that are available by configuring the relevant settings.

74.8.1 GOT environmental settings (System information)

These settings are unavailable when a USB barcode reader is used.
Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Target channel	Function	Setting item
CH5	Switching the barcode function between enabled and disabled. (Read device: System signal 1-2.b2)	[System Signal 1-2]
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b0). (Read device: System signal 1-2.b3)	[System Signal 1-2]
	Notifying that the data read by the barcode reader is stored in the specified device. (Write device: System signal 2-3.b0)	[System Signal 2-3]
CH6	Switching the barcode function between enabled and disabled. (Read device: System signal 1-2.b5)	[System Signal 1-2] (Not available for GT SoftGOT3000.)
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b1). (Read device: System signal 1-2.b6)	[System Signal 1-2] (Not available for GT SoftGOT3000.)
	Notifying that the data read by the barcode reader is stored in the specified device. (Write device: System signal 2-3.b1)	[System Signal 2-3] (Not available for GT SoftGOT3000.)
CH7	Switching the barcode function between enabled and disabled. (Read device: System signal 1-2.b8)	[System Signal 1-2] (Not available for GT SoftGOT3000.)
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b2). (Read device: System signal 1-2.b9)	[System Signal 1-2] (Not available for GT SoftGOT3000.)
	Notifying that the data read by the barcode reader is stored in the specified device. (Write device: System signal 2-3.b2)	[System Signal 2-3] (Not available for GT SoftGOT3000.)
CH8	Switching the barcode function between enabled and disabled. (Read device: System signal 1-1.b5)	[System Signal 1-1] (Not available for GT SoftGOT3000.)
	Turning on this signal turns off the External Device I/O signal (System signal 2-1.b6) (Read device: System signal 1-1.b6)	[System Signal 1-1] (Not available for GT SoftGOT3000.)
	Notifying that the data read by the barcode reader is stored in the specified device. (Write device: System signal 2-1.b6)	[System Signal 2-1]

74.8.2 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Item
Notifying that the object is ready for receiving an direct input with a barcode reader or RFID. (Write device)	GS243.b15

PART 18 RFID function

75 Using an RFID with the GOT (RFID function)

75 Using an RFID with the GOT (RFID function)

GT37 SoftGOT3000

☞ Page 2589 Overview of the RFID function
☞ Page 2590 Specifications of the RFID function
☞ Page 2592 Basic use of the RFID function
☞ Page 2593 Advanced use of the RFID function
☞ Page 2595 [RFID] dialog
☞ Page 2598 System information settings
☞ Page 2599 Action of an RFID
☞ Page 2611 Relevant settings

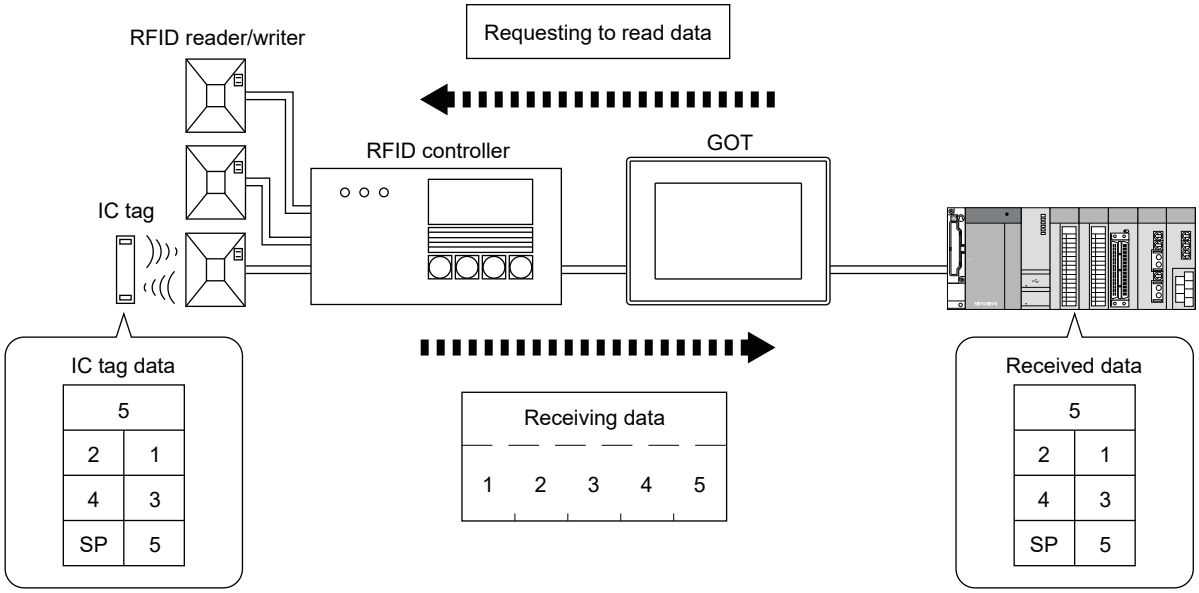
75.1 Overview of the RFID function

GT37 SoftGOT3000

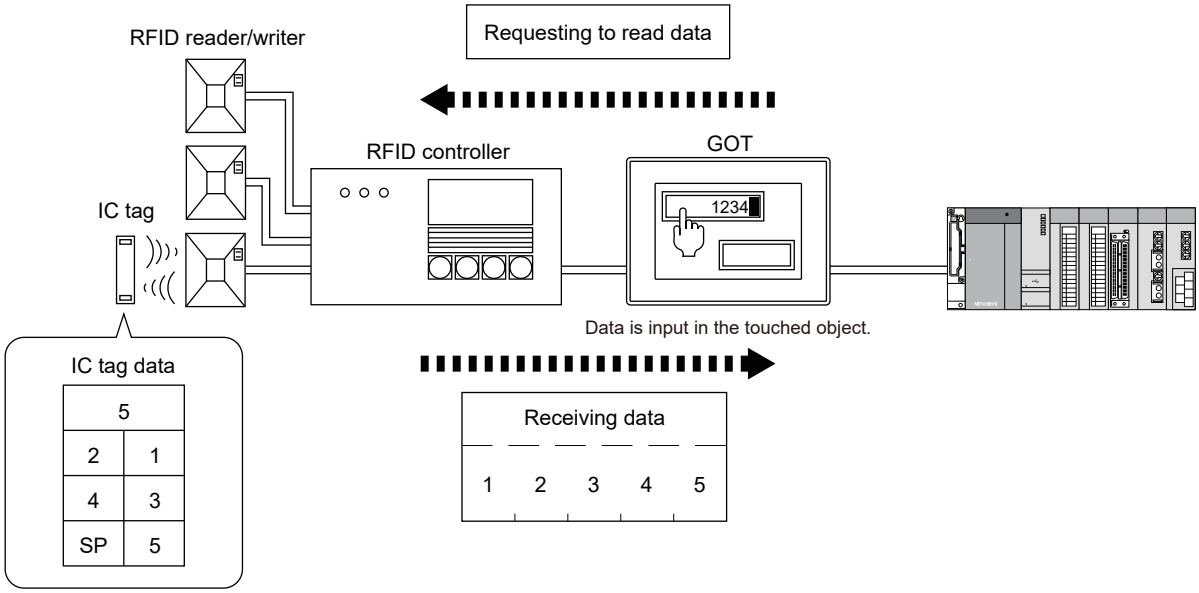
This function is used to send and receive data with the RFID controller reader/writer connected to the GOT, and to read the data received.

The read data is processed as follows.

75.1.1 Writing read data into controllers



75.1.2 Directly inputting read data to objects (numerical input and text input)



75.2 Specifications of the RFID function

GT37 SoftGOT3000

75.2.1 System application (add-on function)

To use the RFID function, a system application (add-on function) for [RFID] is required.

Select [Use RFID] in the [RFID] dialog to incorporate the application into the package data automatically.

☞ Page 2595 [RFID] dialog

In order to use this function with GT SoftGOT3000, this system application (add-on function) is not required.

75.2.2 Applicable RFID controllers

Applicable RFID controllers should meet the specifications of the dedicated protocol and nonprocedural protocol as shown below.

Protocol	Reference
Dedicated protocol (LSRF manufactured by LS ELECTRIC Co., Ltd.)	☞ Page 2604 When using a dedicated protocol (LSRF manufactured by LS ELECTRIC Co., Ltd.)
Dedicated protocol (ICU-60S manufactured by MARS TOHKEN SOLUTION CO.LTD.)	☞ Page 2604 When using a dedicated protocol (ICU-60S manufactured by MARS TOHKEN SOLUTION CO.LTD.) or a nonprocedural protocol
Nonprocedural protocol	☞ Page 2609 Nonprocedural protocol

Select the dedicated protocol that corresponds to the RFID controller to be used.

When no dedicated protocol corresponds to the RFID controller to be used, select the nonprocedural protocol.

For selecting the protocol, refer to the following.

📖GOT3000 Series User's Manual (Connection)

The following shows devices used for each protocol and a handshake example.

☞ Page 2599 Action of an RFID

For information on the validated RFID Controller, refer to the following Technical Bulletin.

📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)

75.2.3 Connecting the RFID controller for the operator authentication

To use an RFID controller for the operator authentication, the controller can only be connected via RS-232 communication to the RS-232/422/485 interface built into the GOT.

75.2.4 Number of RFID function settings for one project

One setting can be configured per project.

75.2.5 Devices for storing data read by RFID reader/writer and the number of device points

Devices that can store the data

The data can be stored in the word device.

The bit device cannot be specified as the word device.

Maximum number of devices

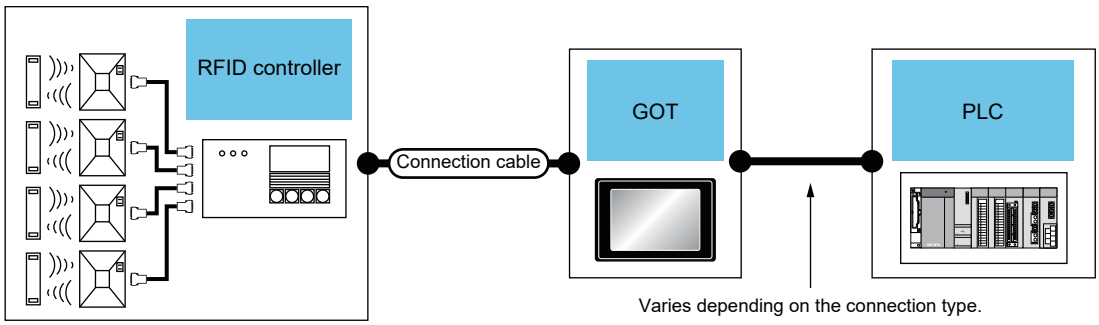
Up to 10000 devices can be set for the sent data and the received data in total.

75.3 Basic use of the RFID function

GT37 SoftGOT3000

75.3.1 System configuration

The following shows the system configuration of RFID.



For information on the maximum number of connected devices, refer to the following.

☞ Page 2592 Maximum number of connected devices

RFID controller Model	Connection cable	GOT	PLC
For the connectable RFID controllers and system devices, refer to the following Technical Bulletin. List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)	Depending on the specifications of the RFID controller	GT37 SoftGOT3000 *1	For information on the system configuration between the GOT and the PLC, refer to the following. GOT3000 Series User's Manual (Connection)

*1 For GT SoftGOT3000, connect the RFID controller to the interface of the personal computer.

Maximum number of connected devices

Only one RFID controller can access one GOT at a time.

Installing the RFID controller

The RFID controller can be attached to the GOT at any timing.

75.3.2 Setting procedure

1. Connect the GOT and the RFID.

☞ Page 2592 System configuration

2. Configure the settings for the RFID function in the [RFID] dialog.

☞ Page 2595 [RFID] dialog

3. Set the system signal according to the channel number used.

☞ Page 2598 System information settings

4. Write the package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

5. Operate the RFID function.

☞ Page 2599 Action of an RFID

75.4 Advanced use of the RFID function

GT37 SoftGOT3000

75.4.1 Directly inputting data to objects (numerical input or text input)

To directly input the data to the object (numerical input or text input), the setting for using the RFID function is required for the object.

Precautions

Do not store or change the send data after starting communication with the RFID controller.
Otherwise, a communication error may occur.

Action when the GOT receives an error

When the GOT receives an error from an RFID reader/writer, the received error is directly input to the object (numerical input or text input).
For details on errors, refer to the following.
☞ Page 2604 Errors during communication

Receiving data that is divided into segments

When the data that is divided into segments is received, the segments of the received data are not combined in one.
When the segments of data are received, each segment of data is directly input to the object (numerical input or text input) in each time.

Timing of starting communication

The RFID Request signal is not used for directly inputting data to the numerical input or text input.
The GOT starts communication with the RFID controller after the object (numerical input or text input) is touched and a cursor appears.
Set the data to be used for the communication with the RFID controller before displaying the cursor on the object (numerical input or text input).
The following shows the data used for each protocol communication.

Protocol	Data to be used for the communication with the RFID controller
Dedicated protocol (LSRF manufactured by LS ELECTRIC Co., Ltd.)	RFID Controller signal (IC tag communication time, RFID reader/writer No.)
Nonprocedural protocol	Send data area

For the RFID Controller signal and send data area, refer to the following.
☞ Page 2603 RFID Controller signal, send data area, and receive data area

RFID controllers that cannot directly input data

When the following RFID controllers are used, data cannot be directly input to the object.

■Communication using dedicated protocols

- ICU-60S manufactured by MARS TOHKEN SOLUTION CO.LTD.

■Communication using nonprocedural protocols

- RFID controllers that receive data for the first time after sending or receiving data in multiple times

Input completion notification

■When the input completion notification is disabled

Establishing a handshake is not required by using the External Device I/O signal and the External Device I/O Complete signal.
While the cursor is displayed, data is sequentially read to the object, and old data is immediately overwritten by new data in each time.

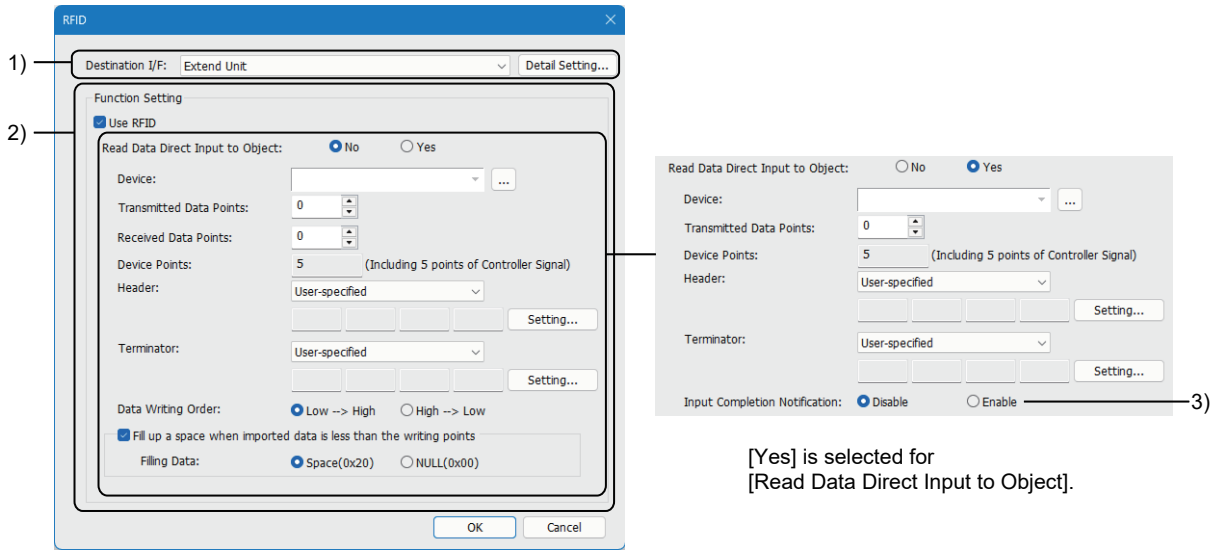
■When the input completion notification is enabled

The data cannot be input to the object until the External Device I/O Signal is turned off by the External Device I/O Complete signal.
For communication using nonprocedural protocols, turn off the RFID Receive signal before starting the following communication.
If the data input starts while the RFID Receive signal is turned on, the GOT cannot determine whether the data input is completed.
For the actions of the System signal and RFID Controller signal, refer to the following.
☞ Page 2604 When using a dedicated protocol (LSRF manufactured by LS ELECTRIC Co., Ltd.)

75.5 [RFID] dialog

GT37 SoftGOT3000

Select [Common] → [Peripheral Setting] → [RFID] from the menu to display the setting dialog.



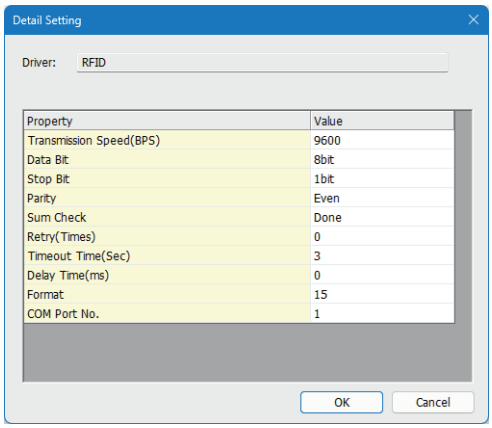
[No] is selected for [Read Data Direct Input to Object].

[Yes] is selected for [Read Data Direct Input to Object].

Item			Description
1)	[Destination I/F]	—	Set the interface of the GOT. The selectable items vary depending on the GOT model. • GT37 [RS-422/485] [RS-232] [Extend Unit] [Not connected] • GT SoftGOT3000 [Serial 1] [Serial 2] [Not connected]
		[Detail Setting] button	Configure the advanced settings in the [Detail Setting] window. For details, refer to the following. ☞ Page 2597 [Detail Setting] window (RFID)

Item			Description
2)	[Use RFID]	—	Select this item to enable the RFID setting.
		[Read Data Direct Input to Object]	Select whether to write the data read by the RFID reader/writer into the controller, or to directly input the read data to the object (numerical input or text input). • [No]: Writes the data into the controller. • [Yes]: Directly inputs the data to the numerical input or text input. To directly input the data to the object (numerical input or text input), the setting for using the RFID is required for the object. ☞ Page 1328 [Numerical Input] dialog ☞ Page 1362 [Text Input] dialog
		[Device]	Select a device to be used for the RFID function. Devices equivalent to 5 points starting from the selected device are set as the RFID Controller signal.
		[Transmitted Data Points]	Set this item when using a dedicated protocol (ICU-60S manufactured by MARS TOHKEN SOLUTION CO.LTD.) or a nonprocedural protocol. Set the number of pieces of data to be sent. The following shows the setting range. • [0] to [10000] If [No] is selected for [Read Data Direct Input to Object], the total number of [Transmitted Data Points] and [Received Data Points] must be 10000 or less.
		[Received Data Points]	Set the number of pieces of received data. The following shows the setting range. • [0] to [10000] The total number of [Transmitted Data Points] and [Received Data Points] must be 10000 or less.
		[Device Points]	The total of device points for [Transmitted Data Points], [Received Data Points], and the RFID Controller signal (5 points) is indicated.
		[Header]	Select this item when using the nonprocedural protocol. Select either of the following headers suitable for the protocol of the RFID controller to be used. The following shows selectable items. • [None] • [STX] • [ENQ] • [User-specified]: Up to four bytes are settable. Specify a value for a byte in the range of 0×00 to 0×FF. When you select [User-specified], refer to the following. ☞ Page 2575 [Setting] dialog (for setting the header or terminator)
		[Terminator]	Select this item when using the nonprocedural protocol. The following shows selectable items. • [ETX] • [LF] • [CR] • [CR+LF] • [User-specified]: Up to four bytes are settable. Specify a value for a byte in the range of 0×00 to 0×FF. When you select [User-specified], refer to the following. ☞ Page 2575 [Setting] dialog (for setting the header or terminator)
		[Data Writing Order]	Select the order of writing data into the controller device. • [Low → High]: The data is written to the controller device from the lower 8 bits to the upper 8 bits. • [High → Low]: The data is written to the controller device from the upper 8 bits to the lower 8 bits.
		[Fill up a space when imported data is less than the writing points]	Select this item to fill blank devices with spaces or NULLs when the number of bytes of the received data by the RFID reader/writer is less than the device points set for [Received Data Points]. After selecting this item, select the data to fill in blank devices. • [Space]: Fills the blank device with spaces (20H). • [NULL]: Fills the blank device with NULLs (00H).
3)	[Input Completion Notification]		Select whether to enable or disable the completion notification of data input processing by the System signal (External Device I/O signal and External Device I/O Complete signal) and the RFID Controller signal (RFID Receive signal). The following shows selectable items. • [Disable] • [Enable] ☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

75.5.1 [Detail Setting] window (RFID)



Item	Description
[Transmission Speed(BPS)]	Select the transmission speed. The following shows selectable items. • [4800] • [9600] • [19200] • [38400] • [57600] • [115200]
[Data Bit]	Select the data length. The following shows selectable items. • [7bit] • [8bit]
[Stop Bit]	Select the stop bit length. The following shows selectable items. • [1bit] • [2bit]
[Parity]	Select the type for a parity check. The following shows selectable items. • [None] • [Even] • [Odd]
[Sum Check]	Select whether to perform a sum check. The following shows selectable items. • [Done] • [None]
[Retry(Times)]	Set the number of retries to be performed when a communication error occurs. When no response is received after the retries, the communication times out. The range to be selected is [0] to [5].
[Timeout Time(Sec)]	Set a communication timeout period. The setting range is [3] to [30].
[Delay Time(ms)]	Set the send delay time to lower the load of the network and the connected PLCs. The setting range is [0] to [3000].
[Format]	Select the communication format. The following shows selectable items. • [10]: Dedicated protocol (LSRF manufactured by LS ELECTRIC Co., Ltd.) • [11]: Dedicated protocol (ICU-60S manufactured by MARS TOHKEN SOLUTION CO.LTD.) • [15]: Nonprocedural protocol
[COM Port No.]	This item is displayed only for GT SoftGOT3000. Set the COM port number. The setting range is [1] to [63].

75.6 System information settings

GT37 SoftGOT3000

75.6.1 Setting the system information

Make sure to set one of the following System signals according to the channel No. you use.
For GT SoftGOT3000, set the System signal used for channel No. 8 of the GOT.
The RFID function is unavailable without the settings.

Channel No.	System signal
Channel No. 8	System signal 1-1, System signal 2-1
Channel No. 5	System signal 1-2, System signal 2-3
Channel No. 6	
Channel No. 7	

For details on system information, refer to the following.
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

75.6.2 Action of the RFID function according to status of the control device

Depending on status of the control device to be used for communication, the GOT may not send or receive data to/from the RFID controller.
For control devices for each protocol, refer to the following.
☞ Page 2605 Example of the RFID action

75.7 Action of an RFID

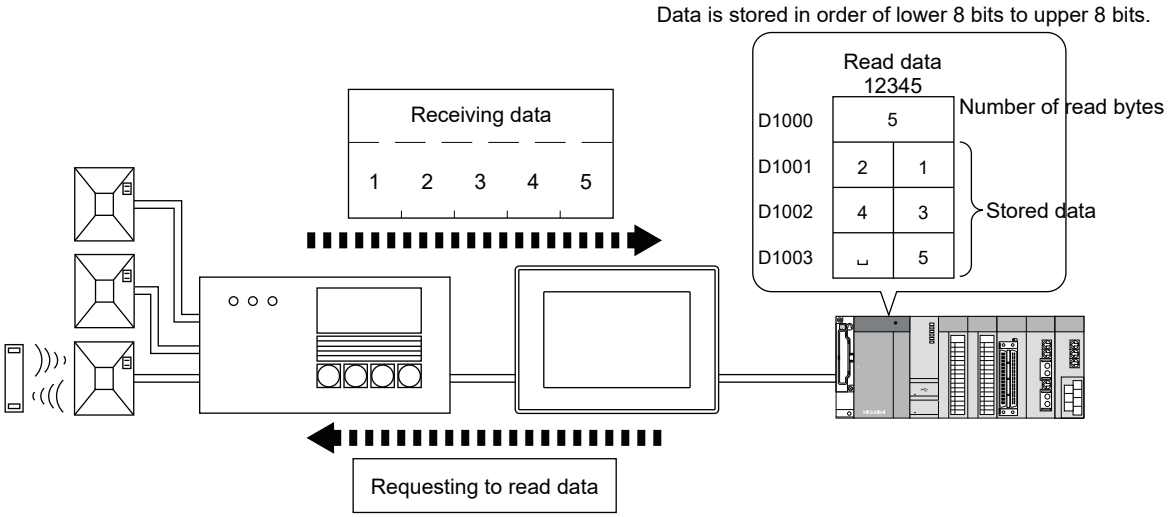
GT37 SoftGOT3000

75.7.1 Order of writing data into the controller

Set the order of writing the data read by the RFID reader/writer into the controller devices.

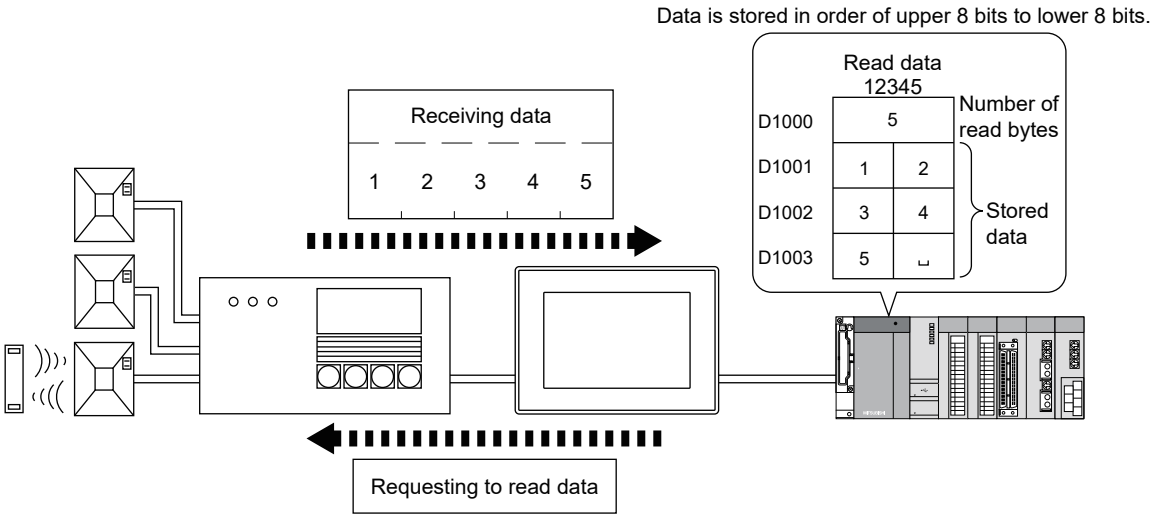
Low → high

The data is written to the controller device from the lower 8 bits to the upper 8 bits.



High → low

The data is written to the controller device from the upper 8 bits to the lower 8 bits.



75.7.2 Header and terminator

Set the header and terminator of the RFID read by the RFID.

Item		Description
Header	None (Default)	The read data is as follows when the header is not added to the head of data. 	STX	The read data and STX are set as follows when STX is added to the head of data. 	ENQ	The read data and ENQ are set as follows when ENQ is added to the head of data. 	User-specified	The user-specified values are prepended to the read data. Example) When 41h, 42h, 43h, and 44h are specified

Item		Description
Terminator	ETX	The read data and ETX are set as follows when ETX is added to the end of data. 	LF	The read data and LF are set as follows when LF is added to the end of data. 	CR (Default)	The read data and CR are set as follows when CR is added to the end of data. 	CR+LF	The read data and CR+LF are set as follows when CR+LF is added to the end of data. 	User-specified	The user-specified values are prepended to the read data. Example) When 61h, 62h, and 63h are specified 
75.7.3 Data to be stored in devices

The following shows how the GOT writes data to be sent or received by the RFID reader/writer into controller devices as string data.

Ex.

Received data and order of writing the data

- Received data: 123456789
- Order of writing data: Low → high

When the number of read data is less than the set device points

Settings (Storage device: D1005, Data points: 8)

Write device	Stored data	String data	
D1005	0009h	-	The GOT writes the bytes of the read data.
D1006	3231h	21	The GOT writes the read data sequentially from the lower byte.
D1007	3433h	43	
D1008	3635h	65	
D1009	3837h	87	
D1010	2039h	␣9	If the number of bytes of the read data is less than the set device points, select whether to fill the remaining devices with spaces (20h) or NULLs (00h).
D1011	2020h	␣␣	
D1012	2020h	␣␣	

␣: Space

When the number of read data is more than the set device points

Settings (Storage device: D1005, Data points: 4)

Write device	Stored data	String data	
D1005	0006h	-	The GOT writes the bytes of the read data.
D1006	3231h	21	The GOT writes the read data sequentially from the lower byte.
D1007	3433h	43	
D1008	3635h	65	
			The data that exceeds the set device points is not written.

75.7.4 RFID Controller signal, send data area, and receive data area

Set the RFID Controller signal for controlling data transmissions with the RFID function.

Set [Device] in the RFID dialog to automatically set the RFID Controller signal.

☞ Page 2595 [RFID] dialog

The following shows a setting example of the RFID Controller signal, send data points, and receive data points.

Ex.

RFID settings

- Device: D1000
- Send data points: 4
- Receive data points: 8

RFID Controller signal

Device	Bit number	Item	Description
D1000	b0	RFID Receive signal	The bit turns on when the GOT receives data from the RFID controller, when the nonprocedural protocol is used.
	b1 to b14	—	—
	b15	Error signal	The bit turns on when the GOT receives an Error signal.
D1001	b0 to b7	IC tag communication time	The time (seconds) that the RFID reader/writer sends or receives data to/from an IC tag is stored in the bits when the dedicated protocol (LSRF manufactured by LS ELECTRIC Co., Ltd.) is used.
	b8 to b15	RFID reader/writer No.	The RFID reader/writer No. of the device that sends or receives data to/from an IC tag is stored in the bits when the dedicated protocol (LSRF manufactured by LS ELECTRIC Co., Ltd.) is used.
D1002	b0 to b15	—	—
D1003	b0 to b7	Error No.	Error codes are stored in the bits when errors occur.
	b8 to b15	Number of errors	The number of error occurrences is stored in the bits.
D1004	b0 to b15	RFID communication time	The communication time for the RFID function is stored in the bits. • With the dedicated protocol The total elapsed time of sending and receiving data is stored. • With the nonprocedural protocol The elapsed time of sending or receiving data is not stored.

Send data area, receive data area

Device	Item	Description
D1005 to D1008	Send data area	The data to be sent to an IC tag is stored in the devices. The number of bytes for data to be sent is stored in the start device.
D1009 to D1016	Receive data area	The received data from an IC tag is stored in the devices. The number of bytes for the received data is stored in the start device.

75.7.5 Errors during communication

The GOT detects errors when the errors occur while the GOT communicates with the RFID controller.
For the RFID Controller signal, refer to the following.
☞ Page 2603 RFID Controller signal, send data area, and receive data area

When using a dedicated protocol (LSRF manufactured by LS ELECTRIC Co., Ltd.)

When an error occurs, the Error signal of the RFID Controller signal turns on, the number of error occurrences is counted, and an error code is stored in the error No.
Check if an error occurs with the Error signal of the RFID Controller signal.
The following shows error codes to be stored in the error No.

Error code	Description	Corrective action
FFh	Time out	Check if the cable is unplugged and check the RFID controller status. Take the following corrective actions. • Connect the cable again. • Correctly wire the cable. • Turn on the RFID controller.
FEh	SIO error	Check the communication settings and communication environments surrounding controllers. Set the communication settings for the RFID controller suitable for those for the GOT.
FDh	Send setting error	Set the station No. and time within the setting range.
FCh	Receive overflow	Set the receive data area suitable for the received data size.
14h	Time out or no IC tags	Make the GOT send a data read request when communications are available between an RFID controller and an IC tag.

For error codes and corrective actions other than the above, refer to the manual for the RFID controller.
After removing error causes, manually turn off the Error signal and send data again.

When using a dedicated protocol (ICU-60S manufactured by MARS TOHKEN SOLUTION CO.LTD.) or a nonprocedural protocol

When an error occurs, an error code is stored in the receive data area or the error No. of the RFID Controller signal.

■When the GOT receives an error reply from the RFID controller

When the GOT receives the error replay from the RFID controller, an error code is stored in the receive data area.
Check if an error occurs with the Error signal of the RFID Controller signal.
For errors and corrective actions, refer to the manual for the RFID controller.
After removing error causes, send data again.

■When the GOT receives no error reply from the RFID controller

When the GOT receives no error reply from the RFID controller, the GOT turns on the Error signal of the RFID Controller signal, and the error code is stored in the error No.
Check if an error occurs with the Error signal of the RFID Controller signal.
The following shows error codes to be stored in the error No.

Error code	Description	Corrective action
FFh	Time out	Check if the cable is unplugged and check the RFID controller status. Take the following corrective actions. • Connect the cable again. • Correctly wire the cable. • Turn on the RFID controller.
FEh	SIO error	Check the communication settings and communication environments surrounding controllers.
FDh	Send setting error	Correctly set the send data length.
FCh	Receive overflow	Set the receive data area suitable for the received data size.

After removing error causes, manually turn off the Error signal and send data again.

75.7.6 Example of the RFID action

Dedicated protocol (LSRF manufactured by LS ELECTRIC Co., Ltd.)

Ex.

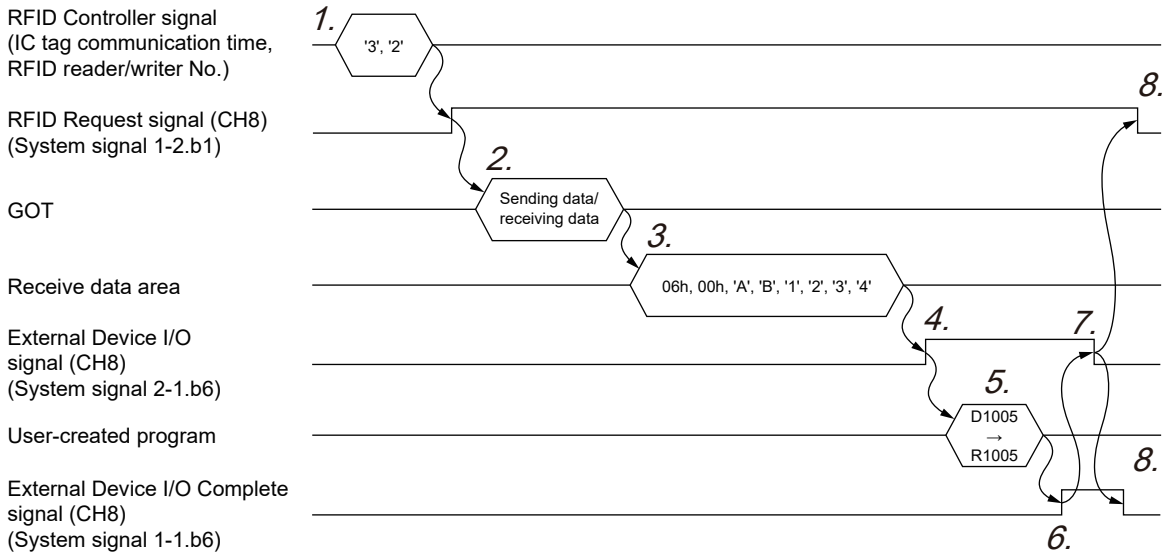
Settings with GT Designer3 (When the GOT is connected to the RFID controller by using channel No. 8)

- System signal 1-1: D10, System signal 1-2: D11, System signal 2-1: D12
- Device: D1000, Receive data points: 4

■Control devices

Device	Item
System information	External Device I/O Complete signal (CH8) (System signal 1-1.b6), RFID Request signal (CH8) (System signal 1-2.b1), External Device I/O signal (CH8) (System signal 2-1.b6) ☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])
RFID Controller signal	IC tag communication time, RFID reader/writer No. ☞ Page 2603 RFID Controller signal, send data area, and receive data area

■Handshake



1. Set the RFID reader/writer No. and the time that the RFID reader/writer sends data to an IC tag.

Example) RFID reader/writer No.: 3, Time to send data to IC tag: 2 seconds

2. Turn on the RFID Request signal, and then the RFID reader/writer communicates with an IC tag.

3. Data of the IC tag read by the RFID reader/writer is stored in the receive data area.

4. After data is stored in the receive data area, the GOT turns on the External Device I/O signal (CH8).

5. Move the data stored in the receive data area to any of the other devices.

6. Check that the data is moved, and then turn on the External Device I/O Complete signal (CH8).

7. The GOT turns off the External Device I/O Complete signal (CH8).

8. Turn off the External Device I/O Complete signal (CH8) and the RFID Request signal (CH8).

■Example of the sequence program (When the GOT is connected to RCPU by using channel No. 8)

After the GOT receives data from the RFID controller, make sure to turn off the External Device I/O Complete signal and the RFID Request signal.

When the External Device I/O Complete signal and the RFID Request signal are on, the GOT cannot read the data.

Create a sequence program so that the External Device I/O Complete signal and the RFID Request signal turn off.

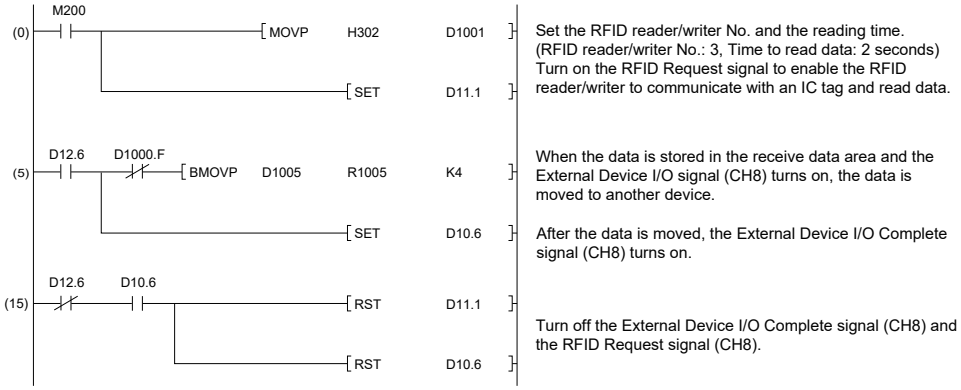
Point

Before using example programs

For applying the example programs in this manual to the actual system, make sure that the target system has no troubles on the control.

Signal to be used in a sequence program

- RFID reader/writer No. 3 read command: M200



Dedicated protocol (ICU-60S manufactured by MARS TOHKEN SOLUTION CO.LTD.)

Ex.

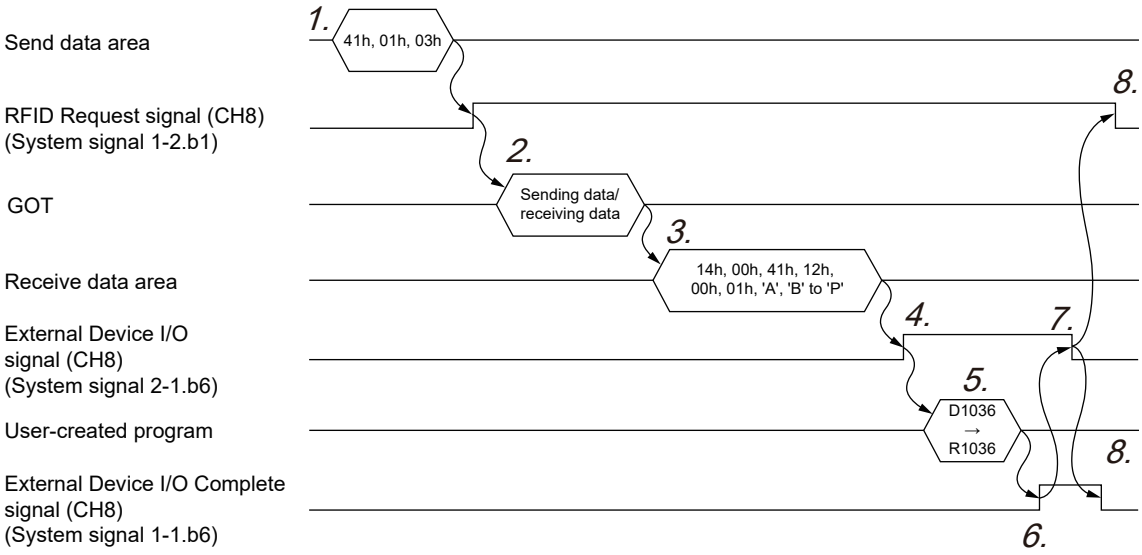
Settings with GT Designer3 (When the GOT is connected to the RFID controller by using channel No. 8)

- System signal 1-1: D10, System signal 1-2: D11, System signal 2-1: D12
- Device: D1000, Send data points: 30, Receive data points: 30

■Control devices

Device	Item
System information	External Device I/O Complete signal (CH8) (System signal 1-1.b6), RFID Request signal (CH8) (System signal 1-2.b1), External Device I/O signal (CH8) (System signal 2-1.b6) ☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

■Handshake



1. Set the data to be sent to the RFID controller in the send data area.

Set the data suitable for the protocol of the RFID controller to be used.

Example) Reading record No.3 by "rf_read" command

2. Turn on the RFID Request signal, and then the RFID reader/writer communicates with an IC tag.

3. Data of the IC tag read by the RFID reader/writer is stored in the receive data area.

4. After data is stored in the receive data area, the GOT turns on the External Device I/O signal (CH8).

5. Move the data stored in the receive data area to any of the other devices.

6. Check that the data is moved, and then turn on the External Device I/O Complete signal (CH8).

7. The GOT turns off the External Device I/O Complete signal (CH8).

8. Turn off the External Device I/O Complete signal (CH8) and the RFID Request signal (CH8).

■Example of the sequence program (When the GOT is connected to RCPU by using channel No. 8)

After the GOT receives data from the RFID controller, make sure to turn off the External Device I/O Complete signal and the RFID Request signal.

When the External Device I/O Complete signal and the RFID Request signal are on, the GOT cannot read the data.

Create a sequence program so that the External Device I/O Complete signal and the RFID Request signal turn off.

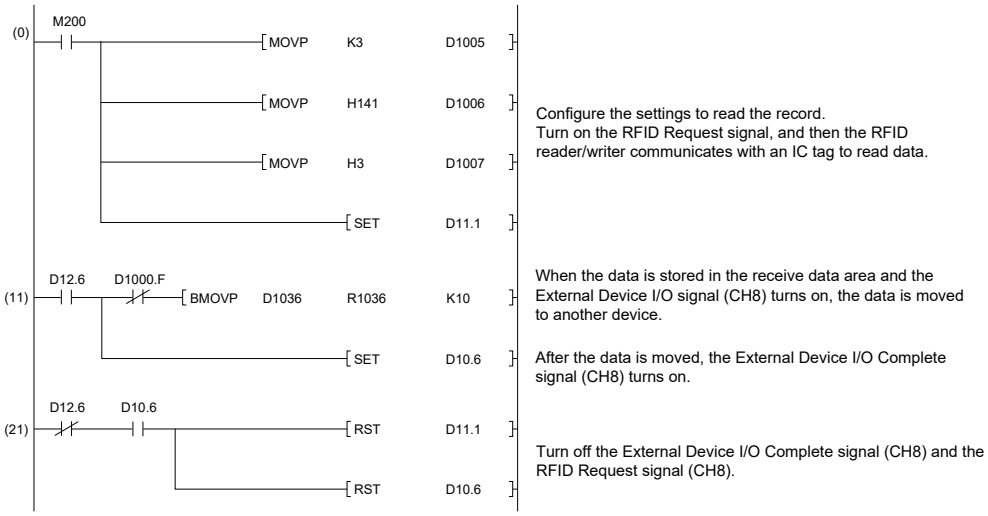
Point

Before using example programs

For applying the example programs in this manual to the actual system, make sure that the target system has no troubles on the control.

Signal to be used in a sequence program

- Record No.3 read command: M200



Nonprocedural protocol

Ex.

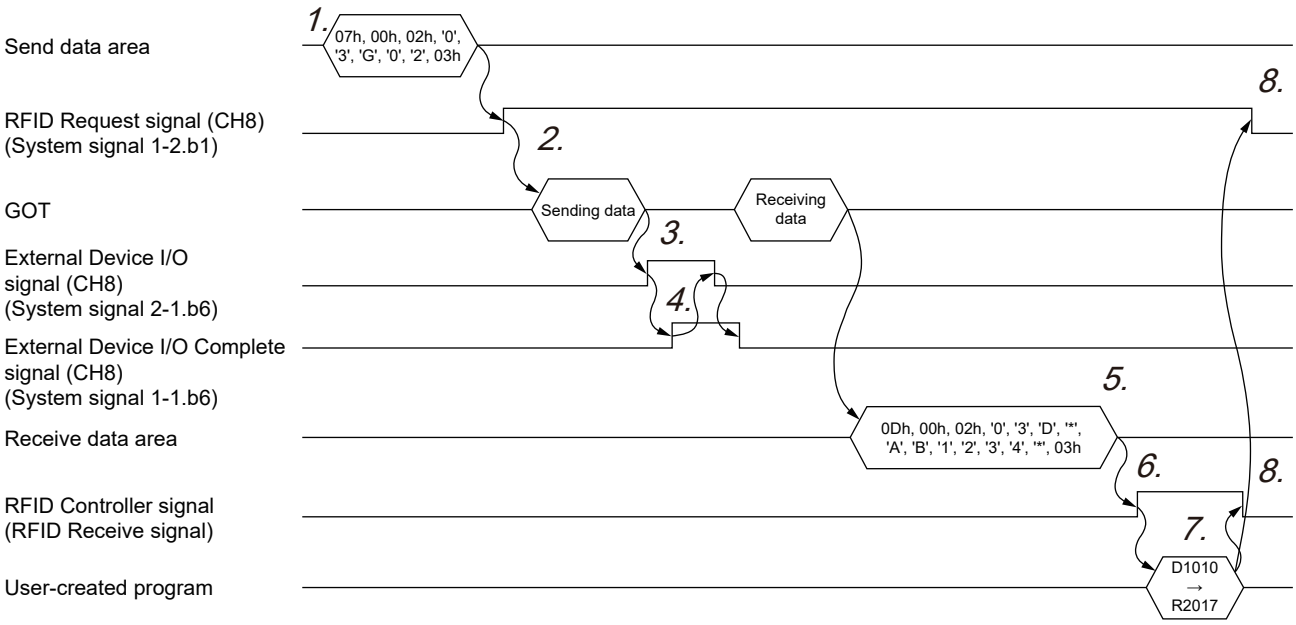
Settings with GT Designer3 (When the GOT is connected to the RFID controller by using channel No. 8)

- System signal 1-1: D10, System signal 1-2: D11, System signal 2-1: D12
- Device: D1000, Send data points: 5, Receive data points: 8

■Control devices

Device	Item
System information	External Device I/O Complete signal (CH8) (System signal 1-1.b6), RFID Request signal (CH8) (System signal 1-2.b1), External Device I/O signal (CH8) (System signal 2-1.b6) ☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])
RFID Controller signal	IC tag communication time, RFID reader/writer No. ☞ Page 2603 RFID Controller signal, send data area, and receive data area

■Handshake



1. Set the data to be sent to the RFID controller in the send data area.

Set the data suitable for the protocol of the RFID controller to be used.

Example) "07h, 00h, 02h, '0', '3', 'G', '0', '2', 03h"

2. Turn on the RFID request signal (CH8), and then the RFID reader/writer sends the data stored in the send data area to the IC tag.

3. The GOT turns on the External Device I/O signal (CH8).

4. Check that the External Device I/O signal (CH8) is on, and then turn on the External Device I/O Complete signal (CH8).

The GOT turns off the External Device I/O Complete signal (CH8).

Turn off the External Device I/O Complete signal (CH8).

5. The IC tag sends data to the RFID reader/writer, and the data is stored in the receive data area.

6. The GOT turns on the RFID Receive signal.

7. Move the data stored in the receive data area to any of the other devices.

8. Turn off the RFID Request signal (CH8) and the RFID Receive signal.

■Example of the sequence program (When the GOT is connected to RCPU by using channel No. 8)

Be sure to turn off the RFID Request signal and the RFID Receive signal before the GOT sends the next data read request to the RFID controller.

When the RFID Request signal and the RFID Receive signal are on, the GOT cannot communicate with the RFID controller. Create a sequence program so that the RFID Request signal and the RFID Receive signal turn off.

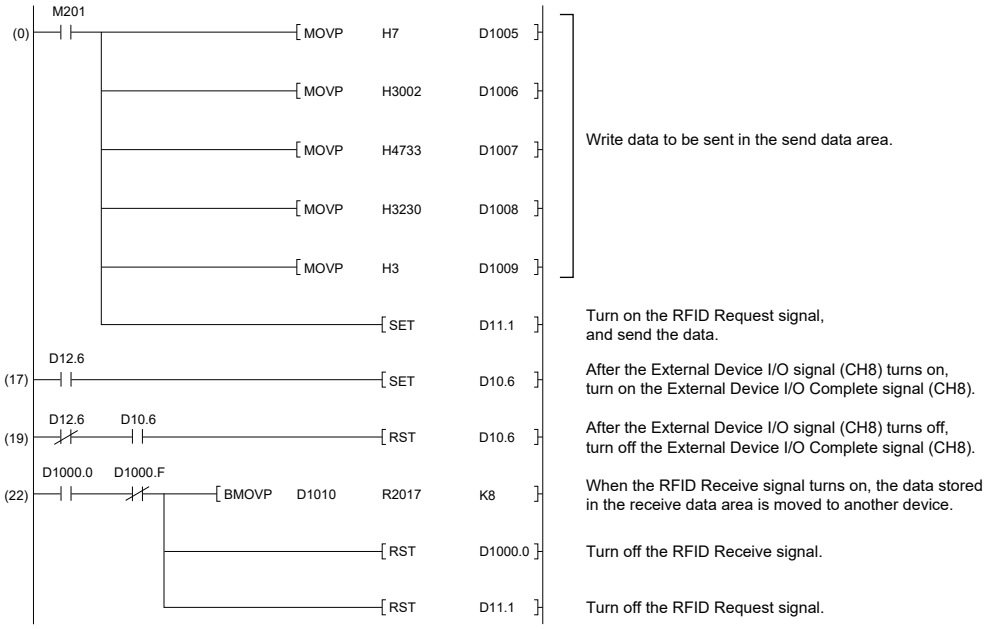
Point

Before using example programs

For applying the example programs in this manual to the actual system, make sure that the target system has no troubles on the control.

Signal to be used in a sequence program

- Data send command: M201



75.8 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the RFID function as required.
The following shows the functions that are available by configuring the relevant settings.

75.8.1 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Target channel	Function	Setting item
CH5	Turning on this signal requests the RFID controller to read data. (Read device: System signal 1-2.b4)	[System Signal 1-2] (Not available for GT SoftGOT3000.)
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b0). (Read device: System signal 1-2.b3)	[System Signal 1-2]
	Notifying that the data read by the RFID reader/writer is stored in the specified device when the dedicated protocol is used. Notifying that sending data to the RFID controllers is completed when the nonprocedural protocol is used. (Write device: System signal 2-3.b0)	[System Signal 2-3]
CH6	Turning on this signal requests the RFID controller to read data. (Read device: System signal 1-2.b7)	[System Signal 1-2] (Not available for GT SoftGOT3000.)
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b1). (Read device: System signal 1-2.b6)	[System Signal 1-2] (Not available for GT SoftGOT3000.)
	Notifying that the data read by the RFID reader/writer is stored in the specified device when the dedicated protocol is used. Notifying that sending data to the RFID controllers is completed when the nonprocedural protocol is used. (Write device: System signal 2-3.b1)	[System Signal 2-3] (Not available for GT SoftGOT3000.)
CH7	Turning on this signal requests the RFID controller to read data. (Read device: System signal 1-2.b10)	[System Signal 1-2] (Not available for GT SoftGOT3000.)
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b2). (Read device: System signal 1-2.b9)	[System Signal 1-2] (Not available for GT SoftGOT3000.)
	Notifying that the data read by the RFID reader/writer is stored in the specified device when the dedicated protocol is used. Notifying that sending data to the RFID controllers is completed when the nonprocedural protocol is used. (Write device: System signal 2-3.b2)	[System Signal 2-3] (Not available for GT SoftGOT3000.)
CH8	Turning on this signal requests the RFID controller to read data. (Read device: System signal 1-2.b1)	[System Signal 1-2]
	Turning on this signal turns off the External Device I/O signal (System signal 2-1.b6) (Read device: System signal 1-1.b6)	[System Signal 1-1]
	Notifying that the data read by the RFID reader/writer is stored in the specified device when the dedicated protocol is used. Notifying that sending data to the RFID controllers is completed when the nonprocedural protocol is used. (Write device: System signal 2-1.b6)	[System Signal 2-1]

75.8.2 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Notifying that external authentication of operator authentication function succeeds. (Write device)	GS240.b0
Notifying that external authentication of operator authentication function fails. (Write device)	GS240.b1
Notifying that the login screen for the external authentication of operator authentication function is displayed. (Write device)	GS240.b14
Notifying that the object is ready for receiving an direct input with a barcode reader or RFID. (Write device)	GS243.b15

PART 19 Remote personal computer operation (Ethernet) function

76 Operating a personal computer by using the GOT (remote personal computer operation function (Ethernet))

76 Operating a personal computer by using the GOT (remote personal computer operation function (Ethernet))

GT37 SoftGOT3000

☞ Page 2614 Overview of the remote personal computer operation function (Ethernet)
☞ Page 2615 Specifications of the remote personal computer operation function (Ethernet)
☞ Page 2619 How to use the remote personal computer operation function (Ethernet)
☞ Page 2622 [PC Remote Operation] dialog
☞ Page 2623 Personal computer settings
☞ Page 2633 Remote personal computer screen
☞ Page 2636 Relevant settings

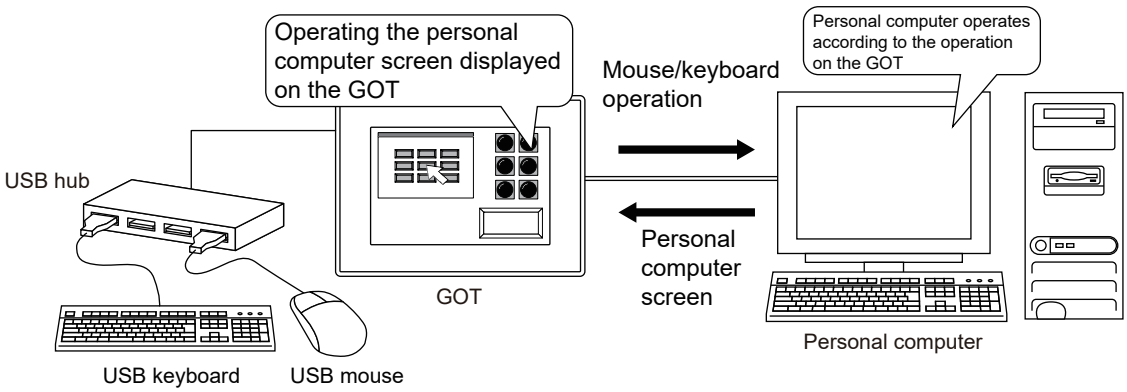
PART 19

76.1 Overview of the remote personal computer operation function (Ethernet)

GT37 SoftGOT3000

The remote personal computer operation (Ethernet) enables you to operate the personal computer by using the GOT via Ethernet.

76.1.1 Operating the personal computer on the GOT screen.



Using the USB mouse/keyboard function enables you to use the USB mouse and USB keyboard for the remote personal computer operation (Ethernet).

For details on the USB mouse/keyboard function, refer to the following.

☞ Page 630 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host])

76.2 Specifications of the remote personal computer operation function (Ethernet)

GT37 SoftGOT3000

☞ Page 2615 System application (add-on function)
☞ Page 2615 Remote personal computer operation function (Ethernet) to be set for one project
☞ Page 2615 Resource for the system window
☞ Page 2615 License number registration
☞ Page 2616 Required software to be installed
☞ Page 2616 Display modes of the remote personal computer screen
☞ Page 2617 Switching the remote personal computer screen
☞ Page 2618 SSH connection

76.2.1 System application (add-on function)

To use the remote personal computer operation function (Ethernet), a system application (add-on function) of [PC Remote Operation (Ethernet)] is required.
The system application is automatically incorporated into the package data when you select [Use PC Remote Operation (Ethernet)] in the [PC Remote Operation] dialog.
☞ Page 2622 [PC Remote Operation] dialog

76.2.2 Remote personal computer operation function (Ethernet) to be set for one project

One remote personal computer operation function is available for one project.

76.2.3 Resource for the system window

The remote personal computer operation function (Ethernet) displays windows as system windows.
Use two overlap windows as a resource to display a system window.
For the resource of the system window, refer to the following.
☞ Page 536 Using an overlap window as the system window

76.2.4 License number registration

To use the remote personal computer operation (Ethernet), register a license number on the GOT.
For information on how to register the license number, refer to the following.
☞ Page 3686 License registration method
When the license number is not registered, the 30 minutes of trial for the function is available upon connection to the VNC server.
Up to 30 trials are available.
To start a trail again, turn off and then on the GOT.
After 30 trials, you must register the license number to use the function.

76.2.5 Required software to be installed

Download UltraVNC (Win32 Full version) from the following website.

http://www.uvnc.com/

Note that the above website may be changed without notification.

The following UltraVNC versions have been validated by our company.

Name	Manufacturer	Version
UltraVNC	UltraVNC team	1.3.8.1

76.2.6 Display modes of the remote personal computer screen

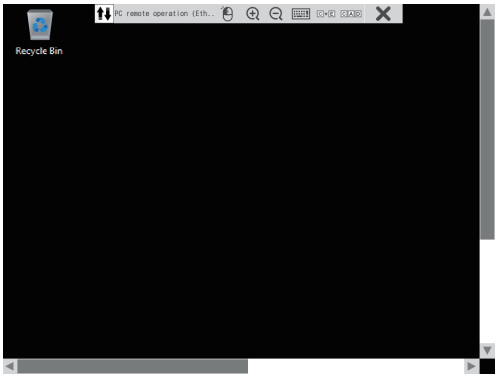
The remote personal computer screen is displayed in window display mode or full screen mode.

Use GS465.b8 to switch between the display modes.

☞ Page 3644 Remote Personal Computer Operation (Ethernet) Common Control (GS465)

If you do not set GS465.b8, the remote personal computer screen opens in window display mode.

Window display mode

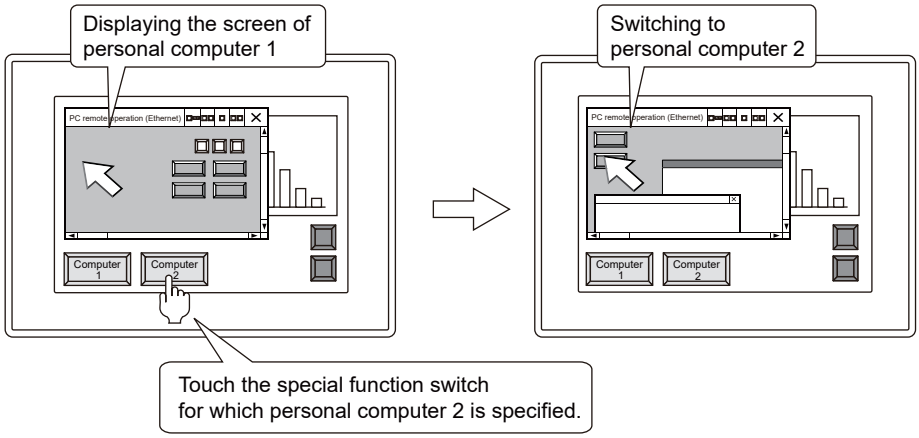


Full screen mode

Mode	Description
Window display mode	In window display mode, the remote personal computer screen appears over part of the base screen. The toolbar is always displayed at the top of the remote personal computer screen.
Full screen mode	The screen is displayed on the entire base screen. The toolbar is displayed when you open the remote personal computer screen or touch the toolbar display area (top). When the resolution is the same between the GOT and the personal computer, hiding the scroll bars with GS465.b7 displays the entire personal computer screen on the GOT.

76.2.7 Switching the remote personal computer screen

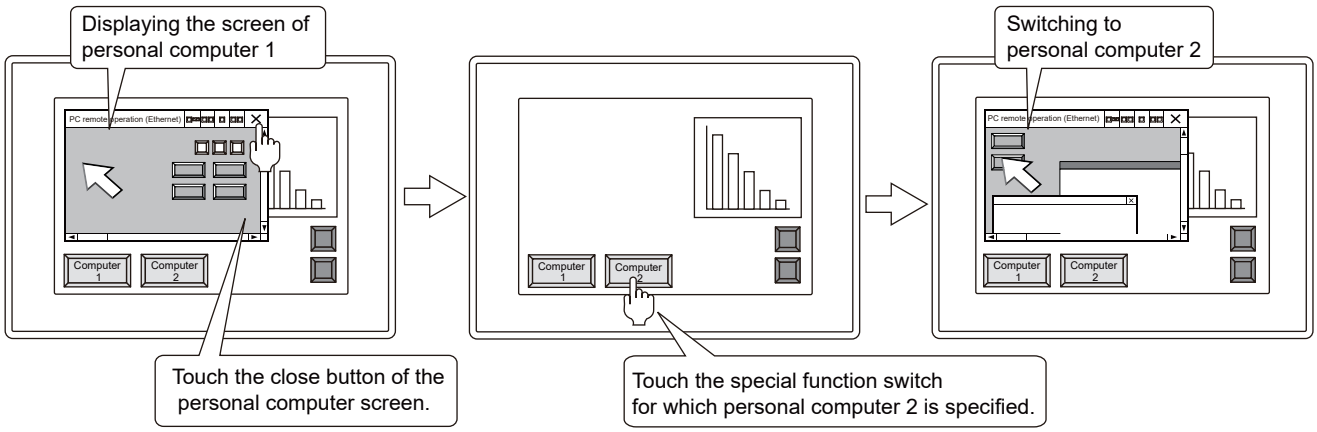
When the GOT is connected to multiple personal computers and displaying a remote screen, tuning on GS465.b10 allows switching between the connected personal computers without closing the remote screen.



While the remote screen is displayed, touching the function switch assigned to another connected personal computer switches the connection destination without closing the remote screen.

If GS465.b10 is turned off, an error message is displayed and the remote screen does not switch.

Touch the close button to close the remote screen, then touch the special function switch assigned to another connected personal computer to start its remote screen.



When the connected personal computer is switched without closing the remote screen, only the operation log [Touch switch: Application switching] is output.

76.2.8 SSH connection

The SSH connection encrypts communication and prevents information leakage.
To use SSH connection, install and configure an SSH server on a personal computer used for remote operation, and enable SSH connection in GT Designer3.

SSH server

This chapter provides an example of OpenSSH server setup on Windows 11.
☞ Page 2628 How to install and configure the SSH server

Enabling SSH connection in GT Designer3

For the special function switch to start the remote personal computer screen (remote personal computer operation (Ethernet)), select [Use SSH connection to encrypt communication path] on the [SP Function] tab and set the information of the SSH server.
☞ Page 1230 [Special Function Switch] dialog

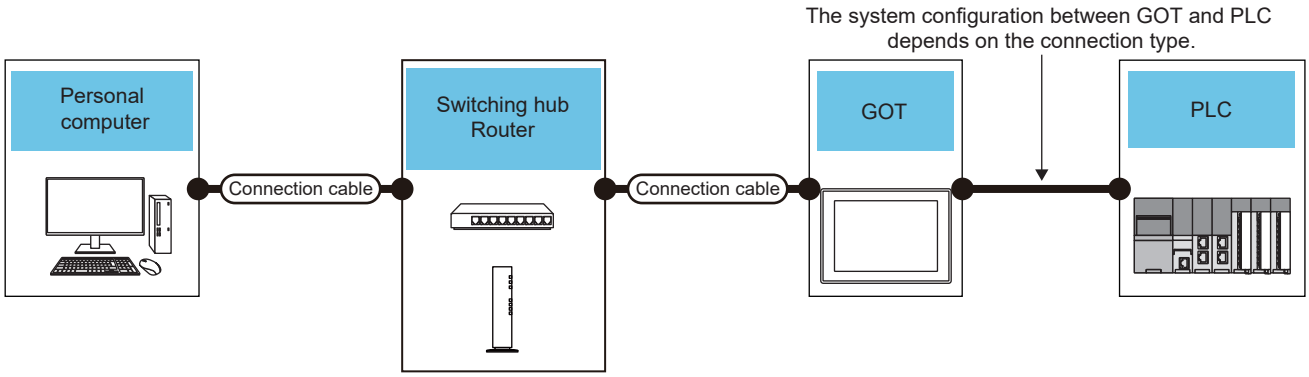
76.3 How to use the remote personal computer operation function (Ethernet)

GT37 SoftGOT3000

☞ Page 2619 System configuration
☞ Page 2621 Setting procedure

76.3.1 System configuration

The following shows the system configuration of the personal computer.



For details on the connection cable and maximum segment length, refer to the following.

☞ Page 2619 Connection cable
☞ Page 2620 Maximum segment length

For information on the maximum number of connected devices, refer to the following.

☞ Page 2620 Maximum number of connected devices

Personal computer (VNC server)	Connection cable	GOT (VNC client)		PLC
		Interface	Model	
Selected by users	Twisted pair cable	Built-in Ethernet interface of the GOT	GT37 SoftGOT3000	For information on the system configuration between the GOT and PLC, refer to the following. 📖GOT3000 Series User's Manual (Connection)

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

A straight cable is usable.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the Ethernet network system used.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.
The maximum length depends on the Ethernet equipment used.
The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs.
For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.
The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

Maximum number of connected devices

One VNC server can be accessed from one GOT at a time.

76.3.2 Setting procedure

The following shows how to configure the settings for the remote personal computer operation (Ethernet).

1. Connect the personal computer to the GOT.

☞ Page 2619 System configuration

2. Set the destination I/F for the Ethernet download in [Destination I/F] in [Ethernet Download] in the peripheral device setting ([PC (Data Transfer)] dialog).

☞ Page 450 [PC (Data Transfer)] dialog

3. Configure the settings for the remote personal computer operation (Ethernet) in the [PC Remote Operation] dialog.

☞ Page 2622 [PC Remote Operation] dialog

4. Set the GOT Ethernet interface.

☞ Page 713 Setting the GOT Ethernet interface ([GOT Ethernet Setting])

5. Place a special function switch on the GT Designer3 screen and set [Switch Action] to [PC Remote Operation (Ethernet)].

To encrypt communication, select [Use SSH connection to encrypt communication path].

For the special function switch settings, refer to the following.

☞ Page 1230 [Special Function Switch] dialog

6. Install the software on the personal computer.

☞ Page 2623 Personal computer settings

7. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

8. Register the license number to the GOT.

For the registration method, refer to the following.

☞ Page 3686 License registration method

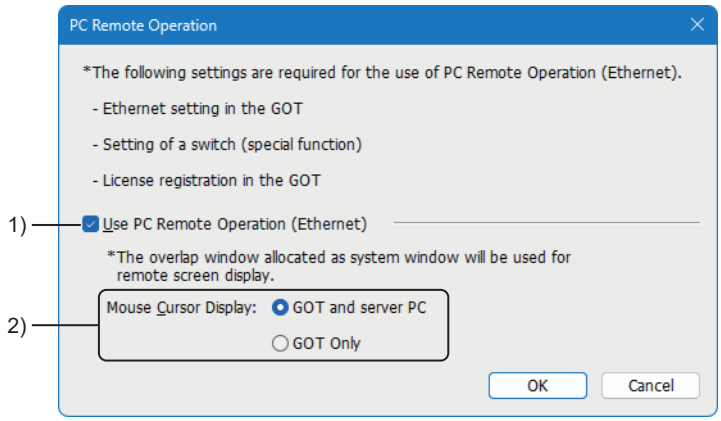
9. Open the personal computer screen on the GOT.

☞ Page 2633 Remote personal computer screen

76.4 [PC Remote Operation] dialog

GT37 SoftGOT3000

Select [Common] → [Peripheral Setting] → [PC Remote Operation] from the menu to display the setting dialog.



Item		Description	
1)	[Use PC Remote Operation (Ethernet)]	Select this item to enable the remote personal computer operation (Ethernet).	
2)	[Mouse Cursor Display]	—	Select how to display the mouse cursor on the GOT when the USB mouse is used.
		[GOT and server PC]	Select this item to display the mouse cursor on the GOT and the mouse cursor on the personal computer.
		[GOT Only]	Select this item to display only the mouse cursor on the GOT. The mouse cursor on the personal computer is not displayed.

76.5 Personal computer settings

GT37 SoftGOT3000

☞ Page 2624 How to install UltraVNC
☞ Page 2625 UltraVNC settings
☞ Page 2628 How to install and configure the SSH server

Precautions

Install the UltraVNC server using a user account with administrator privileges on the destination personal computer. Installation by a user without administrator privileges may result in issues such as settings not being applied correctly or the server not operating properly.

76.5.1 How to install UltraVNC

1. Download UltraVNC from the following website.

http://www.uvnc.com/

Note that the above website may be changed without notification.

2. Execute the downloaded file, and start the installer.

3. The setup window appears.

Click the [Next] button until the [License Agreement] screen is displayed.

Confirm the description in the screen, and then select [I accept the agreement].

4. Click the [Next] button until the [Select Destination Location] screen is displayed.

In the screen, enter the installation destination and click the [Next] button.

5. The [Select Components] screen appears.

Select [Full installation] or [UltraVNC Server Only], and click the [Next] button.

6. The [Select Start Menu Folder] screen appears.

Select the start menu folder to create a shortcut, and click the [Next] button.

7. The confirmation window appears to confirm whether to download the following software.

(For Windows 10 or later, the confirmation window does not appear. Proceed to Step 8.)

Software	Description
Optional non-GPL Mirror Driver 1.0.5	Select this item.
Optional non-GPL addons recommended for Vista	Select as needed. Since it depends on the personal computer used, use your own judgment.

8. The [Select Additional Tasks] screen appears.

Configure the settings as shown below, and click the [Next] button.

Setting item	Description
[Register UltraVNC Server as a system service]	Select this item. UltraVNC is registered in the system service.
[Start or restart UltraVNC service]	Select this item. The UltraVNC service becomes available.
[Create UltraVNC desktop icons]	Select this item to create a shortcut icon on the desktop.
[Associate UltraVNC Viewer with the .vnc file extension]	Select this item to open files with the .vnc extension using UltraVNC Viewer.

When [Full installation] is selected in the [Select Components] screen, setting items other than the above are also displayed.

Since the additional setting items depend on the personal computer you use, configure the settings as required.

9. The confirmation screen for installation appears.

Confirm the description in the screen, and then click the [Install] button.

Installation of UltraVNC starts.

10. Click the [Next] button until the [Completing the UltraVNC Setup Wizard] screen appears.

11. Click the [Finish] button to complete the installation.

76.5.2 UltraVNC settings

The following shows the setting method using UltraVNC version 1.3.8.1 as an example.

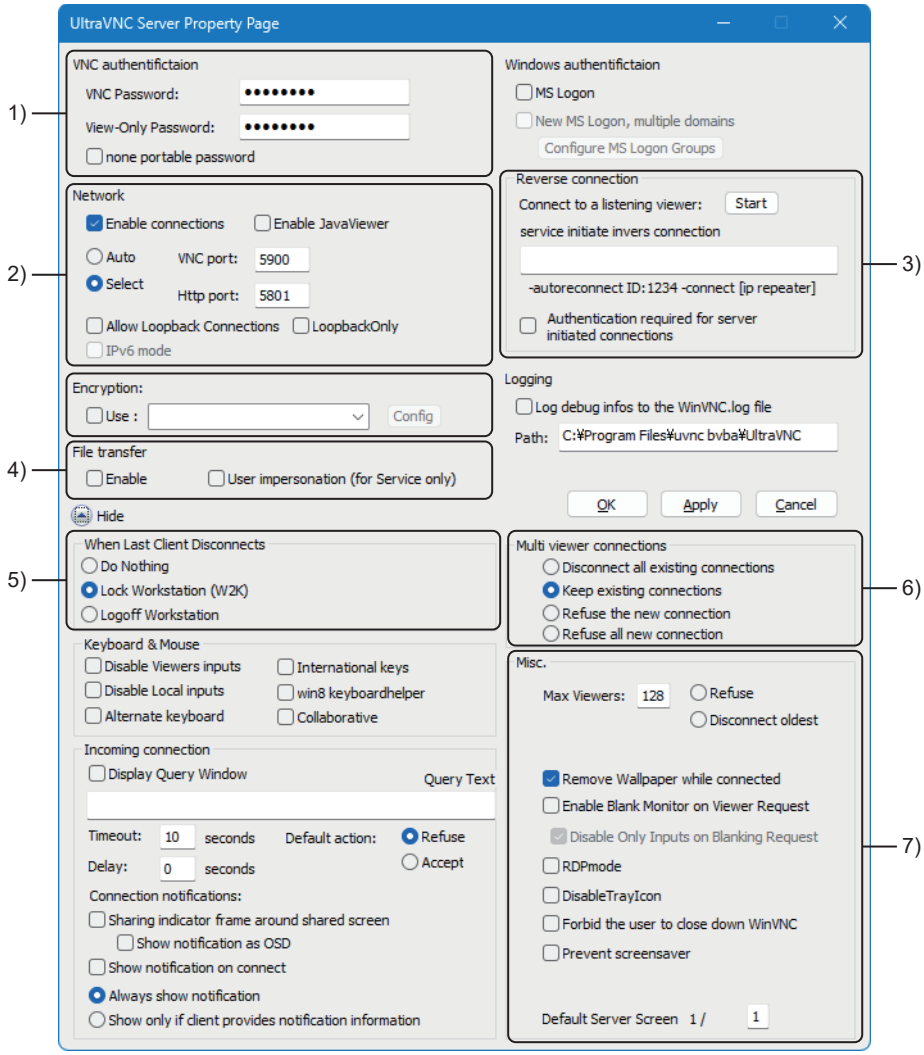
1. When UltraVNC is not started, click [UltraVNC] → [UltraVNC Server] from the start menu to start UltraVNC.

2. Right-click the UltraVNC icon on the system tray, and select [Admin Properties].

When the setting window appears, configure the settings as shown below.

The items to be displayed differ depending on the UltraVNC version.

No settings are required for the items not explained below.

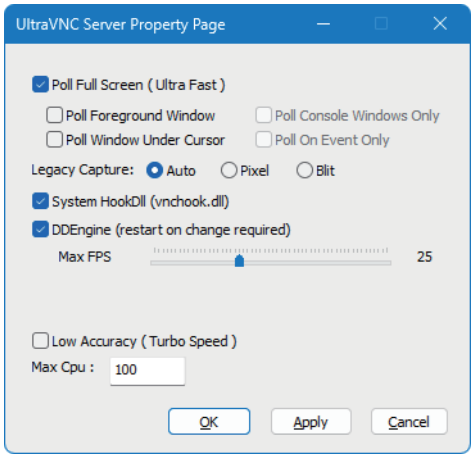


Item			Required setting
1)	[VNC authentification]	[VNC Password]	Set the VNC server password.
		[View-Only Password]	Set the VNC server (view only) password.
2)	[Network]	[Enable connections]	Keep this item selected, then click [Select].
		[Enable JavaViewer]	Deselect this item.
		[VNC port]	Set 5900 as the port number to be used for VNC connection.
		[Allow Loopback Connection]	Deselect this item.
3)	[Reverse connection]	[Authentication required for server initiated connections]	Deselect this item.
4)	[File Transfer]	[Enable]	Deselect this item.
		[User impersonation (for Service only)]	Deselect this item.
5)	[When Last Client Disconnects]		Select [Lock Workstation(W2K)].
6)	[Multi viewer connections]		Select [Keep existing connections].

Item			Required setting
7)	[Misc.]	[Max Viewers]	Set a value for the maximum number of viewers and select [Disconnect oldest].
		[Remove Wallpaper for Viewers]	Select this item.
		[Enable Blank Monitor on Viewer Request]	Deselect this item.
		[Disable Only Inputs on Blanking Request]	Select this item.

3. Right-click the UltraVNC icon on the system tray, and select [Properties].

The following shows the recommended settings in the displayed settings window.



Item	Recommended setting
[Poll Full Screen (Ultra Fast)]	Select this item.
[Poll Foreground Window]	Deselect this item.
[Poll Window Under Cursor]	Deselect this item.
[Poll Console Windows Only]	Deselect this item.
[Poll On Event Only]	Deselect this item.
[Legacy Capture]	Select [Auto].
[System HookDll]	Select this item.
[DDEngine (restart on charge required)]	Select this item.
[Max FPS]	Set a value.
[Low Accuracy (Turbo Speed)]	Deselect this item.
[Max Cpu]	Set a value.

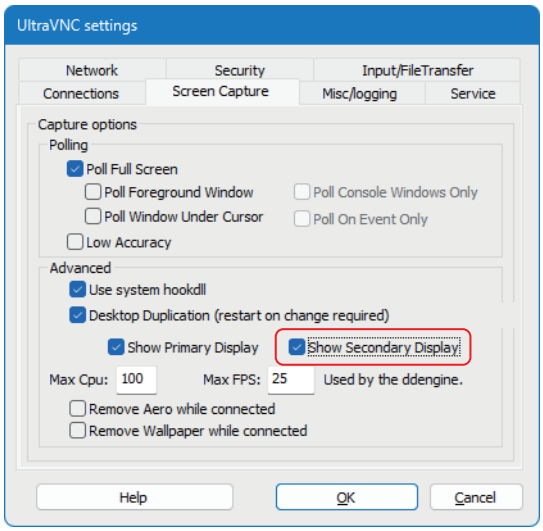
Precautions

■Behavior after pressing Ctrl + Alt + Delete

If [Show Secondary Display] is deselected on the UltraVNC server (Ver.1.3.8.1), pressing Ctrl + Alt + Delete and clicking the [Cancel] button on the displayed screen will disconnect the GOT from the UltraVNC server.

To select [Show Secondary Display] on the UltraVNC server (Ver.1.3.8.1), follow the steps below.

1. Select [All] → [UltraVNC] → [UltraVNC Server Settings] from the Windows start menu to display the [UltraVNC settings] dialog.
2. Select the [Screen Capture] tab, select [Show Secondary Display], and click the [OK] button.



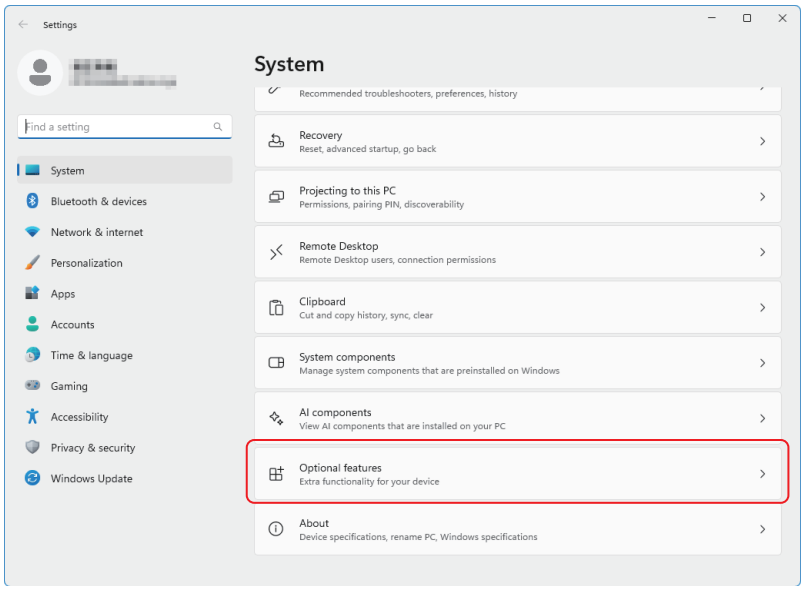
76.5.3 How to install and configure the SSH server

To use SSH connection, install and configure an SSH server on a personal computer used for remote operation.
This chapter provides an example of OpenSSH server setup on Windows 11.

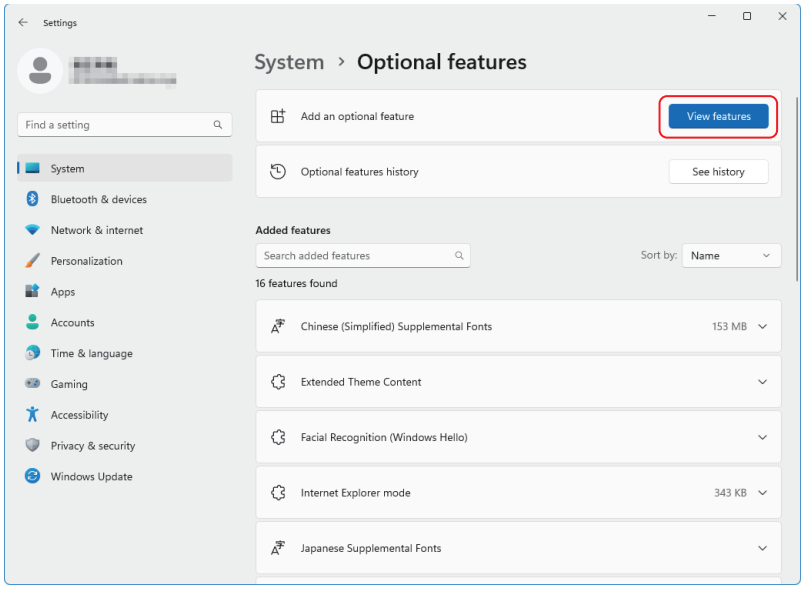
☞ Page 2628 How to install the OpenSSH server
☞ Page 2630 OpenSSH server settings and startup
☞ Page 2632 Creating an account for the OpenSSH server

How to install the OpenSSH server

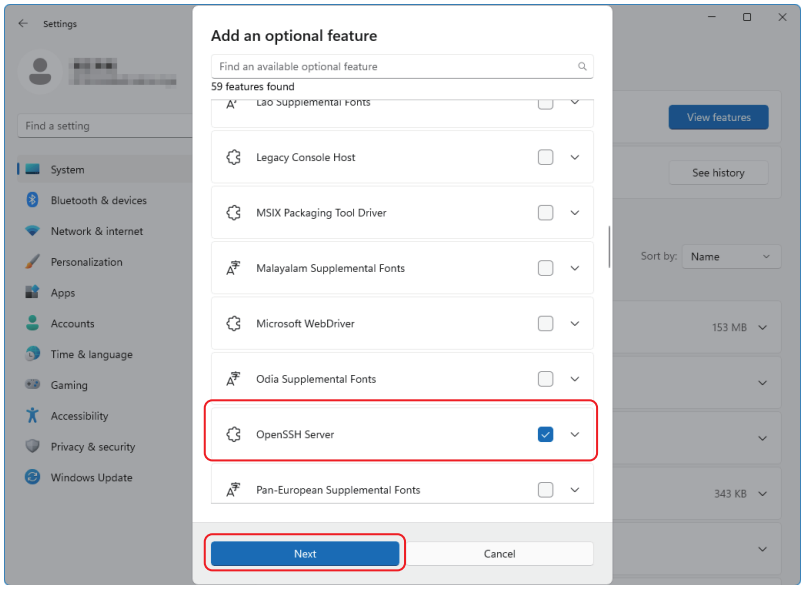
1. Click [All] → [Settings] from the Windows start menu to display the [Settings] window.
2. Click the [Option features] button.



3. Click the [View features] button.



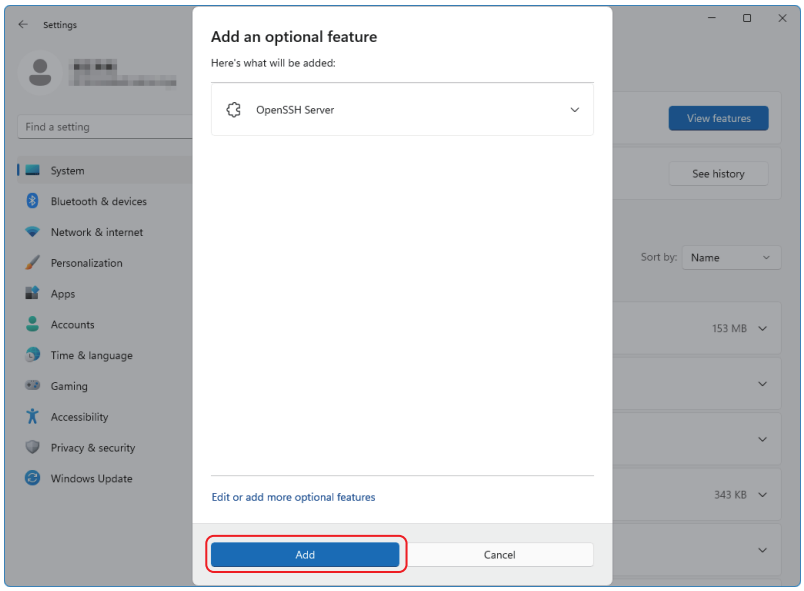
4. Select [OpenSSH Server] and click the [Next] button.



5. Click the [Add] button to start installation.

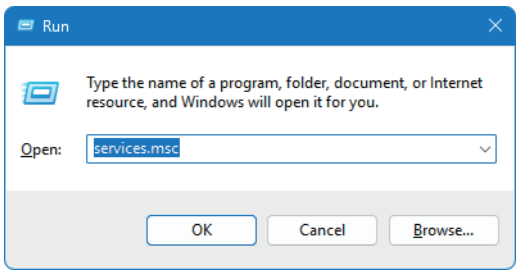
After the installation is completed, configure the settings.

☞ Page 2630 OpenSSH server settings and startup

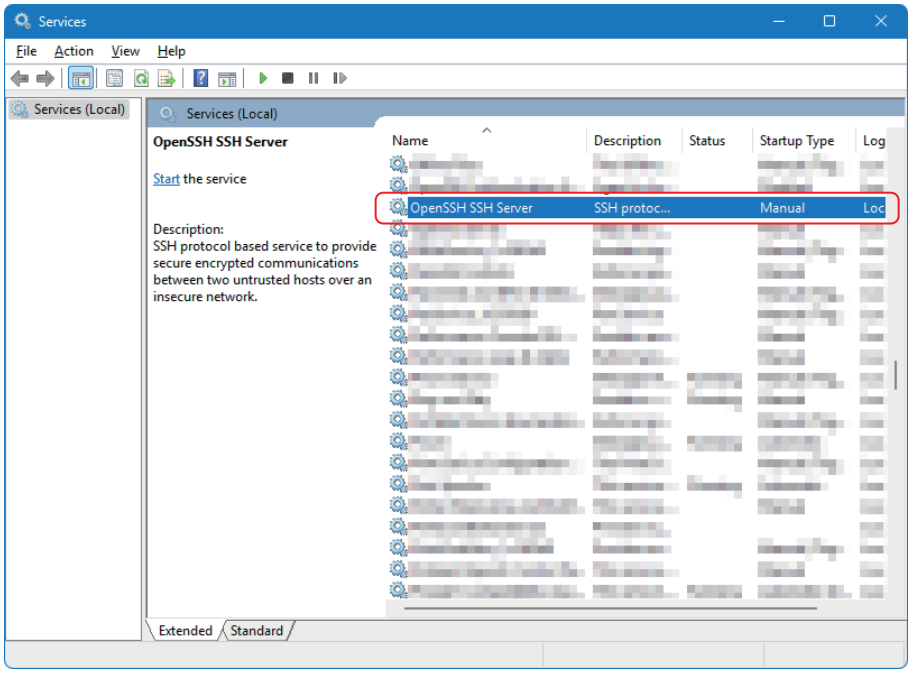


OpenSSH server settings and startup

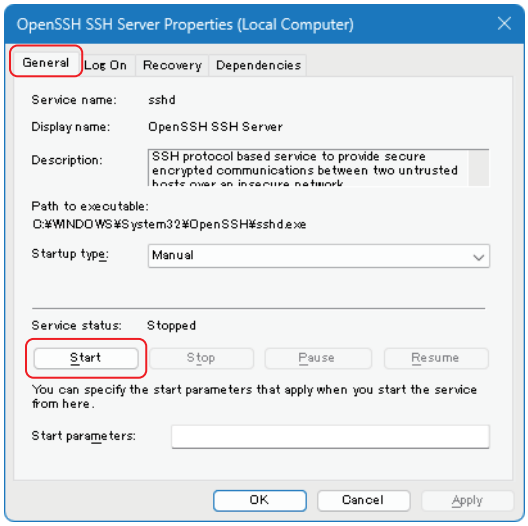
1. From the Windows start menu, select [All] → [Windows Tools], and double-click [Run] in the displayed [Windows Tools] window.
2. In the displayed [Run] dialog, type [services.msc] for [Open] and click the [OK] button to open the [Services] window.



3. Double-click the [OpenSSH SSH Server] to display its properties.



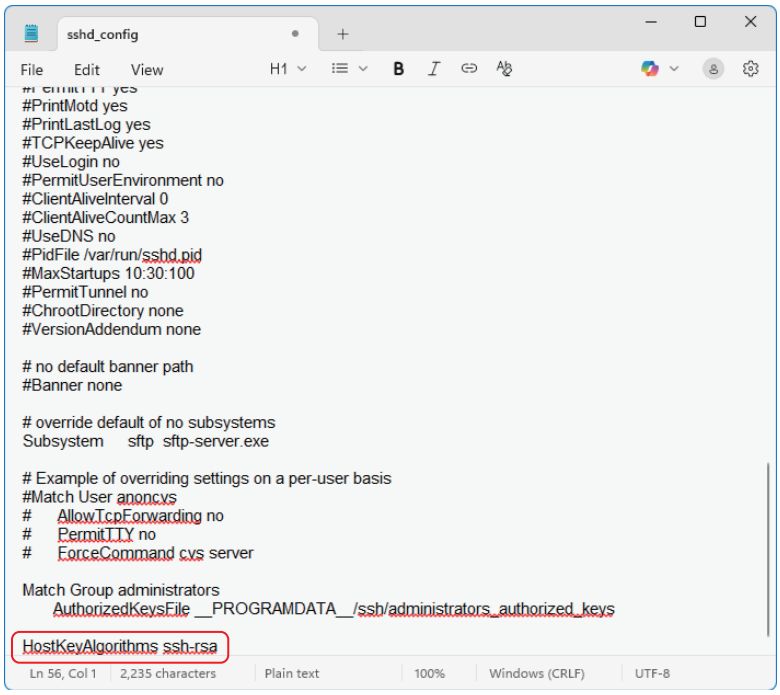
4. Click the [Start] button on the [General] tab to start the OpenSSH server.



5. When the OpenSSH server is started, a setting file is created in the following folder.

C:\ProgramData\ssh\sshd_config

Open the setting file with a text editor, add HostKeyAlgorithms ssh-rsa, and save the file.



6. Follow steps 1 through 3 to view the OpenSSH server properties.

7. Click the [Stop] button on the [General] tab to stop the OpenSSH server.

8. Click the [Start] button on the [General] tab to restart the OpenSSH server.

If you need to add an account for the OpenSSH server, refer to the following.

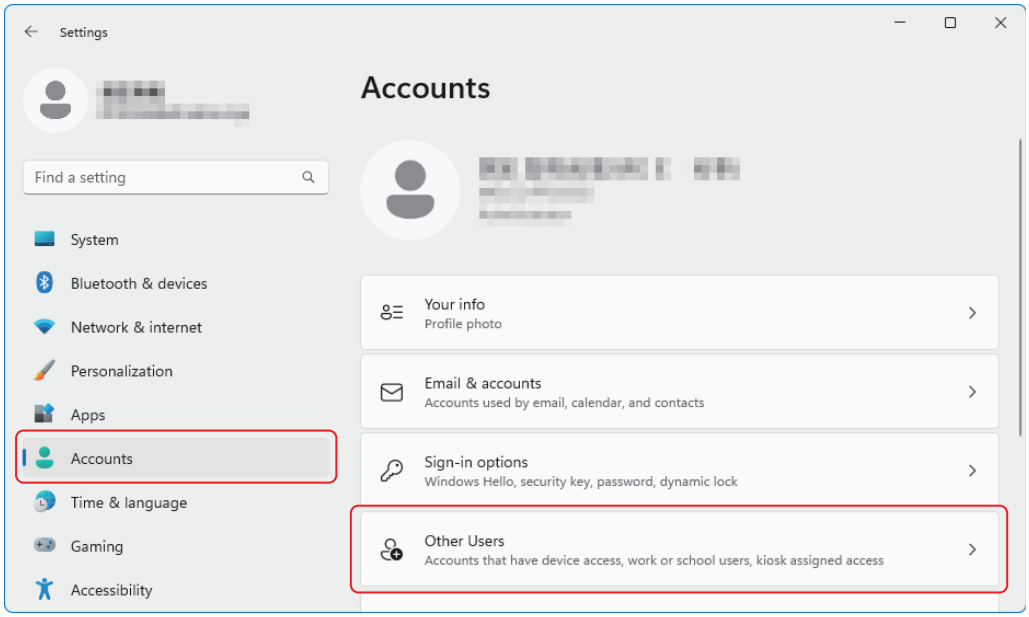
☞ Page 2632 Creating an account for the OpenSSH server

Creating an account for the OpenSSH server

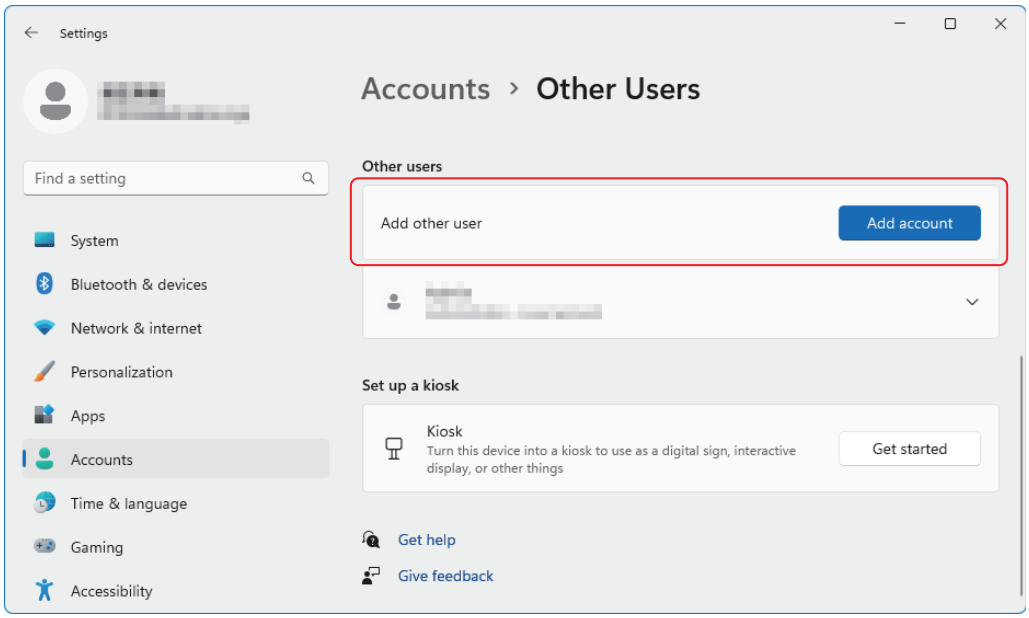
Use your Windows account to log in to the OpenSSH server.

If you need to add an account for the OpenSSH server, use the following steps.

1. Click [All] → [Settings] from the Windows start menu to display the [Settings] window.
2. Click [Accounts], then click [Other Users].



3. Click the [Add account] button for [Add other user].



4. Follow the prompts to add an account.

76.6 Remote personal computer screen

GT37 SoftGOT3000

☞ Page 2633 How to open the remote personal computer screen
☞ Page 2633 Changing the display mode
☞ Page 2634 How to operate the remote personal computer screen

76.6.1 How to open the remote personal computer screen

The remote personal computer screen opens using a special function switch with [Action] set to [PC Remote Operation (Ethernet)].
For the special function switch settings, refer to the following.
☞ Page 1230 [Special Function Switch] dialog

Precautions

■Display position of the remote personal computer screen (only in window display mode)
When all the following conditions are satisfied, the remote personal computer screen is displayed outside the GOT screen and cannot be moved or closed.

- [Display windows beyond the screen area] in the [Environmental Setting] window is selected.
- The maximum value is set to [Window Position] in the [Special Function Switch] dialog

76.6.2 Changing the display mode

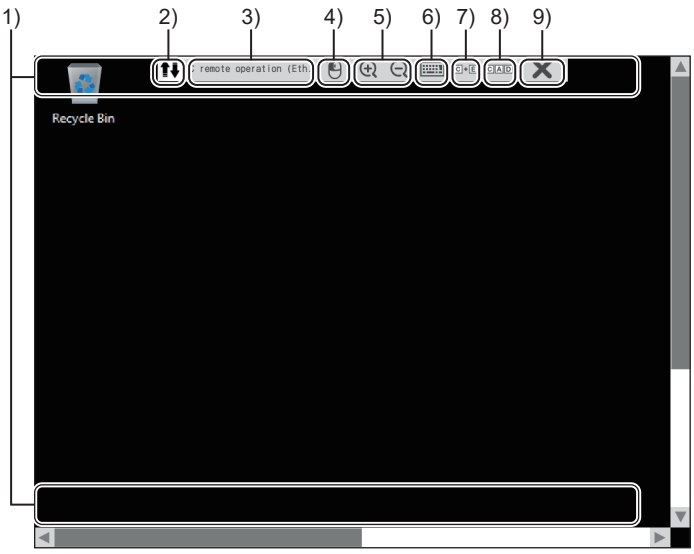
Use GS465.b8 to switch the display mode of the remote personal computer screen.

- When GS465.b8 is on: Full screen mode
- When GS465.b8 is off: Window display mode

Switch the display mode before opening the remote personal computer screen.

76.6.3 How to operate the remote personal computer screen

Window display mode



Full screen mode

Item		Description
1)	Toolbar display area (top) Toolbar display area (bottom)	Areas where toolbars are displayed. The display position (top or bottom of the screen) can be changed using the toolbar display position switch button. If no operation is performed on the toolbar for a specified time period, the toolbar is hidden. When the toolbar is hidden, touch the toolbar display area (top) to display the toolbar in the location it was previously displayed. The size of the areas is as follows. • Height: 40 dots • Width: The area excluding 32 dots from the right edge of the screen The size of the toolbars displayed within the area is 640 × 40 dots regardless of the screen resolution.
2)	Toolbar display position switching button	Switches the toolbar display position either at the top or at the bottom of the screen.
3)	Title bar	Displays the window title set for the special function switch.
4)	Click switching button	Touch this button to switch the click operation to the right-click. After switching, clicking any part of the screen cancels the right-click.
5)	Zoom in button Zoom out button	Changes the display magnification of the screen.
6)	[KBD] button	Displays the soft keyboard set for the special function switch. ☞ Page 2635 Soft keyboard operation
7)	[C+E] button	Executes the simultaneous press of the Ctrl and E keys.
8)	[CAD] button	Executes the simultaneous press of the Ctrl, Alt, and Delete keys.
9)	Close button	Closes the remote screen.

Precautions

■Forced close of the remote personal computer screen

The remote personal computer screen is forcedly closed in the following cases.

- When starting the utility
- When starting system applications (add-on functions) such as sequence program monitors, using a special function switch

To use the remote personal computer operation (Ethernet) after the monitor screen appears, reopen the remote personal computer screen using a special function switch.

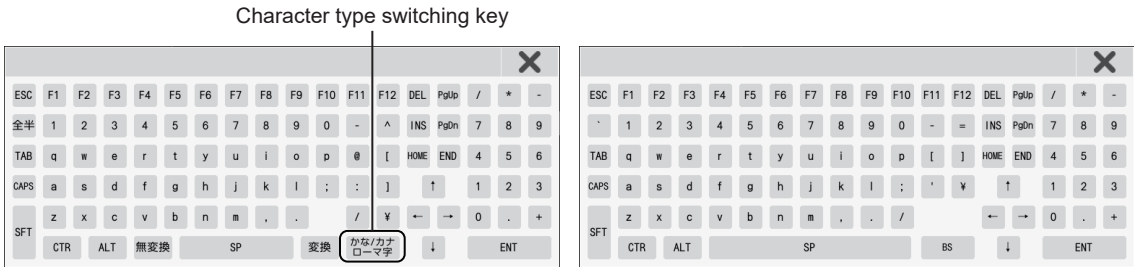
■Mouse cursor display when the USB mouse is installed or removed

When a USB mouse is connected or disconnected while the remote personal computer screen is displayed, the mouse cursor appears as shown below.

To display mouse cursors according to the GT Designer3 settings, close the remote personal computer screen and then reopen it.

Mouse cursor display setting	Mouse cursor display method	
GOT and server PC	Installed	Both the mouse cursor on the GOT and the mouse cursor on the personal computer are displayed.
	Removed	Only the mouse cursor on the personal computer is displayed. (The mouse cursor on the GOT is not displayed.)
GOT Only	Installed	Both the mouse cursor on the GOT and the mouse cursor on the personal computer are displayed.
	Removed	The mouse cursors are not displayed. (Neither the mouse cursor on the GOT nor the mouse cursor on the personal computer are displayed.)

Soft keyboard operation



Japanese 106 keyboard

English 101 keyboard

Touching and holding a key on the soft keyboard results in continuous input, equivalent to repeated key presses.
(The [SFT] key, the [ALT] key, the [CTR] key, and the [CAPS] key are excluded.)

Touching the [SFT] key, the [ALT] key, or the [CTR] key once keeps the state of holding down the key.
To release the key, perform one of the following operations.
Touch the same key again.
Touch any key other than the [SFT] key, the [ALT] key, or the [CTR] key.

The [CAPS] key is held down or released each time the key is touched.

Touching the title bar moves the soft keyboard as well as the key window.

Touching the [×] button closes the soft keyboard.

The Ultra VNC server does not support switching character string using the character type switching key.

Operation of a USB mouse and USB keyboard

For details on the USB mouse and USB keyboard, refer to the following.

☞ Page 630 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host])

76.7 Relevant settings

GT37 SoftGOT3000

Set the relevant settings other than the specific settings for the remote personal computer operation function (Ethernet) as required.

The following shows the functions that are available by configuring the relevant settings.

76.7.1 GOT environmental settings [Screen Switching/Windows]

Select [Common] → [GOT Environmental Setting] → [Screen Switching/Window] from the menu.

☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])

Function	Setting item
Specifying an overlap window to be used as a system window	[Use also as a system window]
Displaying a window that extends beyond the GOT screen (only in window display mode)	[Display windows beyond the screen area]

76.7.2 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Hiding the [CAD] button in the personal computer screen on the GOT	GS465.b0
Hiding the [C+E] button in the personal computer screen on the GOT	GS465.b1
Hiding the [KBD] button in the personal computer screen on the GOT	GS465.b2
Hiding the zoom in button and the zoom out button in the personal computer screen on the GOT, and fixing the display magnification to 100%	GS465.b3
Applying the display magnification specified for the special function switch that calls the personal computer screen. This function is enabled when GS465.b3 is turned on to fix the magnification to 100%.	GS465.b5
Hiding the click switching button of the personal computer screen on the GOT	GS465.b6
Hiding the scroll bars of the personal computer screen on the GOT	GS465.b7
Switching the display mode of the personal computer screen on the GOT	GS465.b8
Enabling the switching between personal computer screens while keeping the remote screen window displayed on the GOT connected to multiple personal computers.	GS465.b10

PART 20 VNC server function

77 Viewing the GOT from a personal computer (VNC server function)

77 Viewing the GOT from a personal computer (VNC server function)

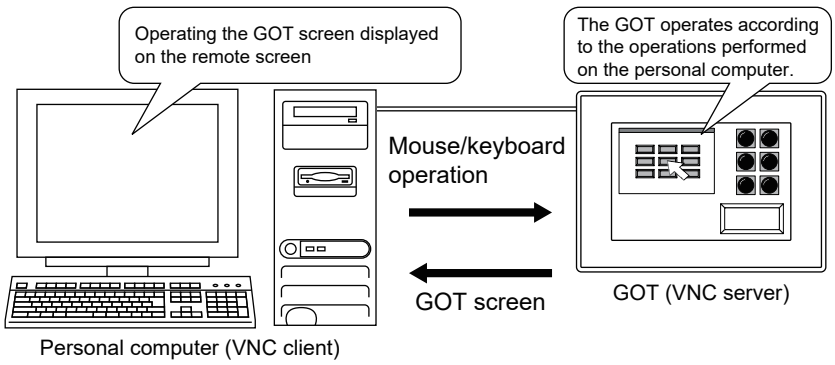
GT37 SoftGOT3000

☞ Page 2638 Overview of the VNC server function
☞ Page 2639 Specifications of the VNC server function
☞ Page 2647 How to use the VNC server function
☞ Page 2650 [VNC Server] dialog
☞ Page 2652 Personal computer setting
☞ Page 2658 Relevant settings

77.1 Overview of the VNC server function

GT37 SoftGOT3000

The VNC server function enables you to remotely operate the GOT from the personal computer at a distant location via Ethernet by using Virtual Network Computing (VNC).



77.2 Specifications of the VNC server function

GT37 SoftGOT3000

☞ Page 2639 System application (add-on function)
☞ Page 2639 Number of VNC server function settings for one project
☞ Page 2639 Specifications of the VNC server and VNC client
☞ Page 2639 License number registration
☞ Page 2640 Required software for the equipment that is used to remotely operate the GOT
☞ Page 2641 Authorization control
☞ Page 2646 SSH connection

77.2.1 System application (add-on function)

To use the VNC server function, a system application (add-on function) for [VNC Server] is required.
Selecting [Use VNC Server] in the [VNC Server] dialog automatically incorporates the system application into the package data.

☞ Page 2650 [VNC Server] dialog

77.2.2 Number of VNC server function settings for one project

One setting can be configured per project.

77.2.3 Specifications of the VNC server and VNC client

The GOT and the personal computer are used as a VNC server and a VNC client, respectively.

• VNC server

The VNC server is the GOT that is remotely operated from the personal computer by using this function.

☞ Page 2653 How to start and operate the remote screen

• VNC client

The VNC client is the personal computer or other equipment that is used to remotely operate the GOT by using this function.
VNC client software must be installed on the personal computer.
For the installation instructions, refer to the following.

☞ Page 2652 Personal computer setting

77.2.4 License number registration

To use the VNC server function, register a license number on the GOT.
For information on how to register the license number, refer to the following.

☞ Page 3686 License registration method

When the license number is not registered, the 30 minutes of trial for the function is available upon connection to the VNC server.
Up to 30 trials are available.
To start a trail again, turn off and then on the GOT.
After 30 trials, you must register the license number to use the function.

77.2.5 Required software for the equipment that is used to remotely operate the GOT

When the GOT is used as the VNC server, the VNC client software must be installed on the equipment that is used to remotely operate the GOT.
Install the either of the following VNC client software according to the equipment that is used to remotely operate the GOT.

For personal computer

• Applicable VNC client software

Name	Manufacturer	Version
UltraVNC	UltraVNC team	1.3.8.1 recommended

• Operating environment

For the operating environment of the software, refer to the following website.
☞ http://www.uvnc.com/

Precautions

Even while the USB mouse is used on the GOT with the USB mouse/keyboard function, the mouse cursor is not displayed on the remote screen of the personal computer.

For smartphone or tablet

• Applicable VNC client software

For the VNC client software whose operations have been validated, refer to the following Technical Bulletin.
📖VNC client software that can be used with the GOT3000 series VNC server function(GOT-A-0234)

• Operating environment

Depends on the smartphone or tablet you use.
Refer to the website of the smartphone or tablet.

• How to obtain the software

Depends on the smartphone or tablet you use.
How to obtain the software depends on the software which is applicable to the smartphone or tablet you use.

Precautions

The VNC client software may not operate properly depending on the OS on a smartphone or tablet, VNC client software version, and usage environment.
Conduct a comprehensive test of the software under real conditions before use.

77.2.6 Authorization control

Enabling the authorization control disables the simultaneous operation from the personal computer and the GOT.
To enable the authorization control, select [Restrict simultaneous operations of PC and GOT] in the [VNC Server] dialog.
☞ Page 2650 [VNC Server] dialog

Precautions

■Authorization control setting

Without the authorization control setting, do not operate the GOT and the remote screen of the personal computer simultaneously.
Doing so causes a malfunction, resulting in an accident.

■GOT internal device setting

When placing the touch switch that turns on the VNC Client Communication Control signal (GS1792.b0) or the VNC Client Operation Control signal (GS1792.b1) on the screen, set the touch switch not to be operated from the personal computer. (Example: Set the trigger condition so that the touch switch is disabled while the GOT communicates with the personal computer.)
If the signals are turned on while the GOT communicates with the personal computer, the following status is caused.

- When the VNC Client Communication Control signal is turned on

The communication with the personal computer is disconnected, and the GOT cannot communicate with the personal computer until the signal is turned off on the GOT.

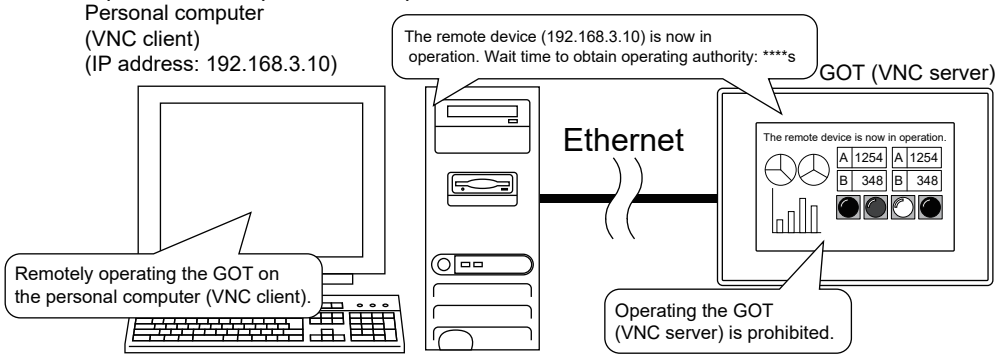
- When the VNC Client Operation Control signal is turned on

Though the communication with the personal computer is not disconnected, the personal computer cannot remotely operate the GOT.
For the GOT internal devices, refer to the following.
☞ Page 2658 GOT internal device

Obtaining the authorization

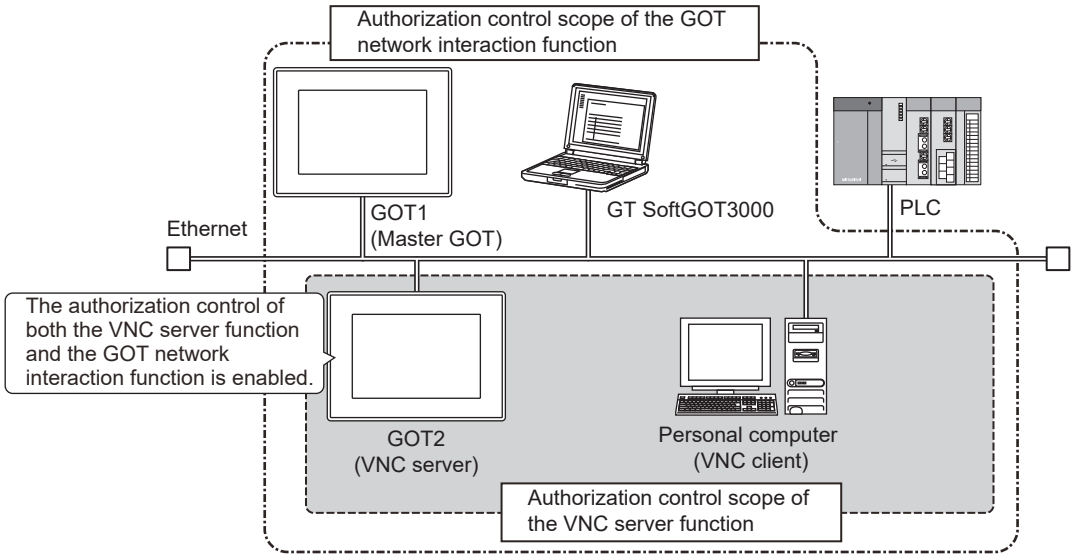
Enabling the authorization control allows you to operate the GOT on only the equipment (personal computer or GOT) that holds the authorization.
The equipment, whose popup display is clicked or touched when the authorization guarantee time is 0, obtains the authorization.
Once the personal computer or the GOT obtains the authorization, the authorized equipment holds the authorization until the authorization guarantee time is passed.
While the personal computer holds the authorization, [The remote device (###.###.###.###) is now in operation.] and [Wait time to obtain operating authority: ****s)] are alternately displayed on the screens of both equipment.
While the GOT holds the authorization, [The GOT is now in operation.] and [Wait time to obtain operating authority: ****s] are alternately displayed on the screens of both equipment.
###.###.###.### indicates the IP address of the personal computer as the VNC client.
The asterisks **** indicate the authorization guarantee time (second).
Set the authorization guarantee time in GT Designer3 or using the utility.
☞ Page 649 [VNC Server]
📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

Example: When the personal computer holds the authorization



Controlling the authorization among pieces of equipment

To control the authorization among pieces of equipment, use the VNC server function in combination with the GOT network interaction function.



The following shows the differences when the two functions are used in combination.

- To perform operations on the VNC server or VNC client, the authorization of both the VNC server function and the GOT network interaction function is required.
- The setting of [Guaranteed time of operational authority after the last operation] in the [GOT Setup] window becomes invalid. The authorization guarantee time set in the [GOT Network Interaction] dialog becomes valid.
- The popup display of the GOT network interaction function is applied to the VNC server or VNC client screen.

For details on the GOT network interaction function, refer to the following.

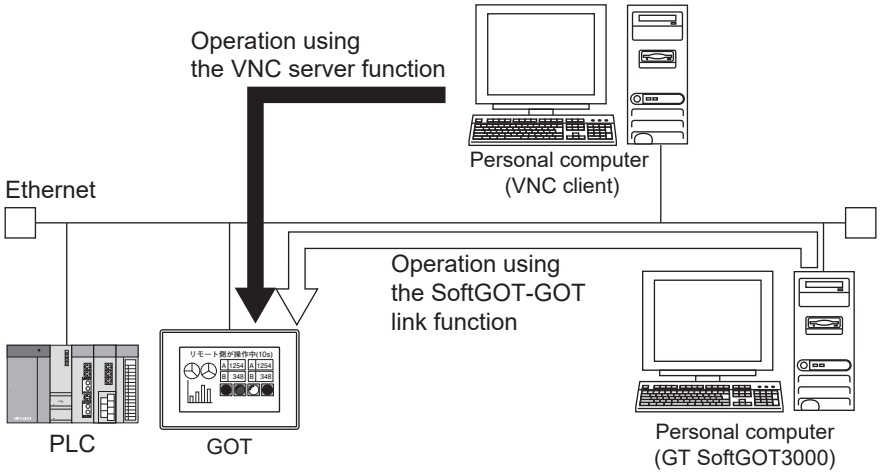
☞ Page 762 Setting the interaction function for equipment on Ethernet ([GOT Network Interaction])

Authorization control when the SoftGOT-GOT link function is used

When the GOT network interaction function is not used, the VNC server function and the SoftGOT-GOT link function control the authorization independently of each other.

(The authorization control of the SoftGOT-GOT link function is always enabled.)

The following shows the authorization control when the VNC server function and the SoftGOT-GOT link function are used in combination.



○: Available, ×: Not available

Authorization control setting of the VNC server function	Equipment with operation right	Operating the GOT		
		From GOT	From VNC client	From GT SoftGOT3000
Enabled	GOT (VNC server)	○	×	×
	Personal computer (VNC client)	×	○	×
	Personal computer (GT SoftGOT3000)	×	×	○
Disabled	GOT (VNC server)	○	○	×
	Personal computer (VNC client)	○	○	×
	Personal computer (GT SoftGOT3000)	×	×	○

How to identify the authorized equipment

Check the GOT internal device to identify the authorized equipment. (Authorized Equipment Notification signal, GS1230.b2)

☞ Page 2658 GOT internal device

Operation status popup notification function

This function notifies, with a popup display, the authorized equipment and the waiting time for the unauthorized equipment to obtain the authorization.

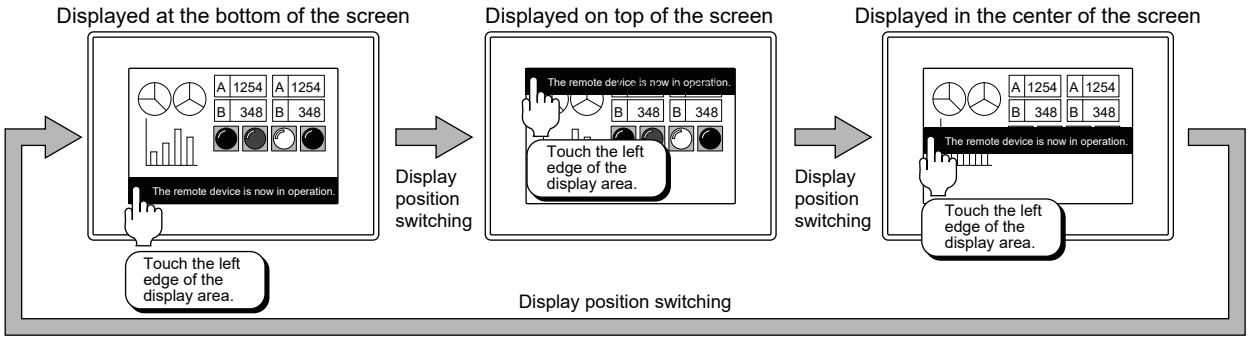
The display position of the operation status popup display is the same as that of the alarm popup display.

(To set the display position, select [Display alarms as popups] in the [Base Screen Property] dialog.)

The operation status popup display appears on the bottom, center, or top of the screen.

When the base screen is switched while the operation status popup display is performed, the operation status popup display appears at the display position of the alarm popup display which is set for the destination base screen.

Each touch of the leftmost portion of the operation status pop-up display switches its display position to the top, center, or bottom, in that order.



Configure the display setting on the GOT utility or GT Designer3.

For instruction on configuring the setting in the utility, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

For instruction on configuring the setting in GT Designer3, refer to the following.

☞ Page 314 [Basic] tab

77.2.7 SSH connection

The SSH connection encrypts the communication and prevents information leakage.
To use the SSH connection, install the SSH connection client software and configure the settings, then configure the settings in the [VNC Server] dialog.

SSH connection client software

The following shows the available SSH connection client software.

Name	Manufacturer	Version
Tera Term	TeraTerm Project	Version 5.2 is recommended.

For information on how to install the SSH connection client software, refer to the following.
☞ Page 2655 How to install Tera Term
☞ Page 2656 Tera Term settings

Settings in the [VNC Server] dialog

Select [Connect using SSH port forwarding] in the [VNC Server] dialog.
For the settings in the [VNC Server] dialog, refer to the following.
☞ Page 2650 [VNC Server] dialog

Precautions

■Settings when not using an SSH connection

When [Connect using SSH port forwarding] is selected, an SSH connection must be used for communications.
To enable communications without using an SSH connection, deselect [Connect using SSH port forwarding].

■Operation when password authentication fails

If authentication of [Operation/Monitoring password] or [Exclusive password for monitoring] fails after SSH connection is established, communication using SSH connection is disconnected.

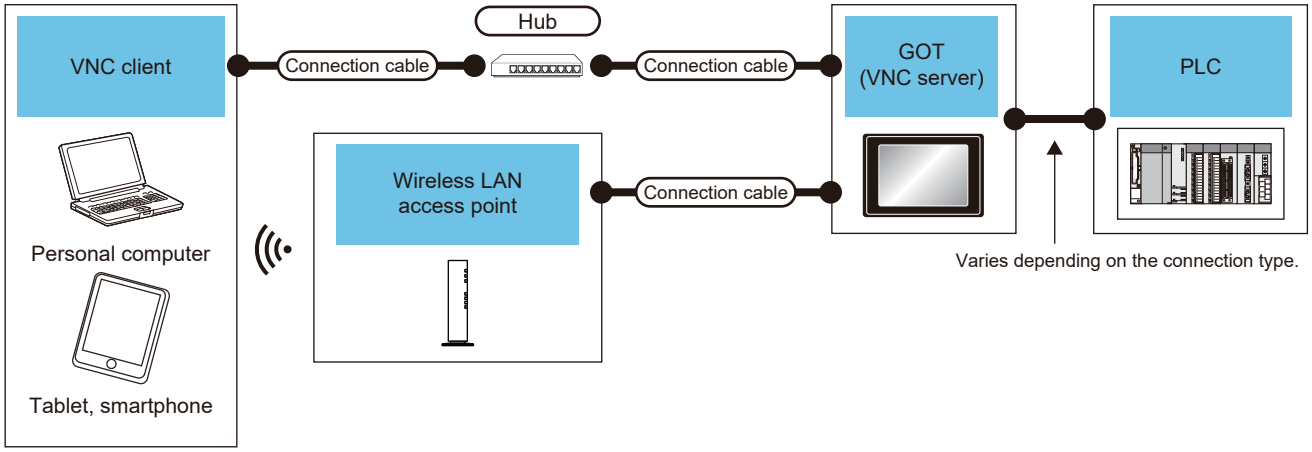
77.3 How to use the VNC server function

GT37 SoftGOT3000

☞ Page 2647 System configuration
☞ Page 2649 Setting procedure

77.3.1 System configuration

The following shows the system configuration of the personal computer.



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 2648 Connection cable
☞ Page 2648 Maximum segment length

For information on the maximum number of connected devices, refer to the following.

☞ Page 2648 Maximum number of connected devices

VNC client	Connection cable/ wireless LAN access point	GOT (VNC server)		PLC
		Interface	GOT model	
Selected by users	Shielded twisted pair cable Wireless LAN access point For the connectable wireless LAN access points and system devices, refer to the following Technical Bulletin. 📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)	Built-in Ethernet interface of the GOT	GT37 SoftGOT3000	For information on the system configuration between the GOT and the PLC, refer to the following. 📖GOT3000 Series User's Manual (Connection)

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

Straight-through cables can be used.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades.

For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance:

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

Maximum number of connected devices

Only one VNC client can access one GOT at a time.

77.3.2 Setting procedure

The following shows how to configure the settings for the VNC server function.

1. Connect the personal computer to the GOT.

☞ Page 2647 System configuration

2. Configure the settings for the VNC server function in the [VNC Server] dialog.

☞ Page 2650 [VNC Server] dialog

3. Set the GOT Ethernet interface.

☞ Page 713 Setting the GOT Ethernet interface ([GOT Ethernet Setting])

To control the authorization among devices on a network, set the GOT network interaction function.

☞ Page 762 Setting the interaction function for equipment on Ethernet ([GOT Network Interaction])

4. Write package data to the GOT.

Make sure to set [GOT IP Address] and [Peripheral S/W Communication Port No.] for the GOT in the [Communication Configuration] dialog.

☞ Page 451 [Communication Configuration] dialog

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

5. Register the license number to the GOT.

For information on how to register the license number, refer to the following.

☞ Page 3686 License registration method

6. Install the VNC client software on the personal computer or others, and configure the setting.

After the setting is completed, operate the GOT on the remote screen.

☞ Page 2652 How to install the UltraVNC

☞ Page 2653 How to start and operate the remote screen

7. To use an SSH connection, install the SSH connection client software and configure the settings.

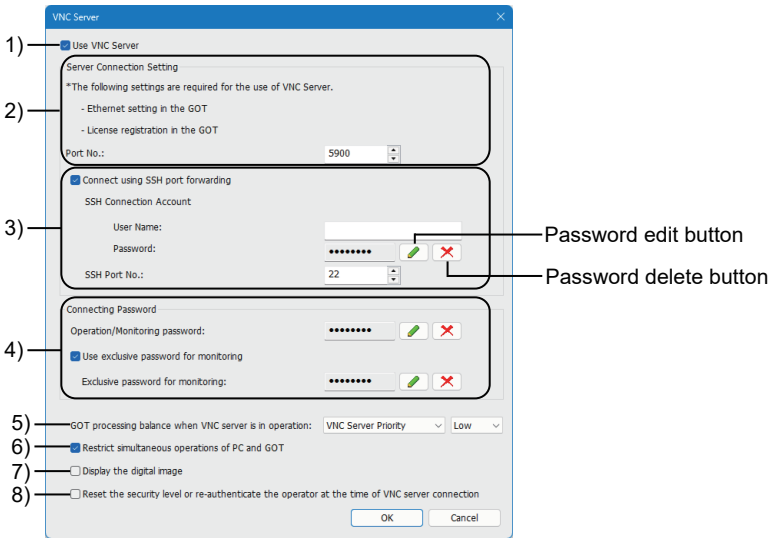
☞ Page 2655 How to install Tera Term

☞ Page 2656 Tera Term settings

77.4 [VNC Server] dialog

GT37 SoftGOT3000

Select [Common] → [Peripheral Setting] → [VNC Server] from the menu to display the setting dialog.



Item			Description
1)	[Use VNC Server]		Select this item to enable the VNC server function.
2)	[Server Connection Setting]	—	Configure the GOT connection settings.
		[Port No.]	Set the port number for the GOT to communicate with a VNC client. The setting range is [1024] to [65534]. Do not set the port number used for the other settings. Duplication of the port number disables communication. To change the number, it is recommended to use a number in the 50000s or higher.
3)	[Connect using SSH port forwarding]	—	Select this item to enable SSH connection.
		[User Name]	1 to 32 characters can be set for the user name. Alphanumeric characters (a to z, A to Z, 0 to 9) and the following symbols are usable for the user name. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~
		[Password]	Clicking the password edit button displays the [Password Edit] dialog. Clicking the password delete button deletes the password.
		[SSH Port No.]	Set the port number used for SSH connection. The setting range is [22] and [1024] to [65534]. Do not set the port number used for the other settings. Duplication of the port number disables communication. To change the number, it is recommended to use a number in the 50000s or higher.
4)	[Connecting Password]	—	Clicking the password edit button displays the [Password Edit] dialog. Clicking the password delete button deletes the password.
		[Operation/Monitoring password]	Set the password to remotely operate and display the GOT on the personal computer.
		[Use exclusive password for monitoring]	Select this item to only remotely display the GOT on the personal computer.
		[Exclusive password for monitoring]	Set the password to only remotely display the GOT on the personal computer.

Item			Description
5)	[GOT processing balance when VNC server is in operation]	—	Set the GOT load balance between the VNC server function processing and the other processing (including displaying the screens, and collecting the alarm data and logging data).
		[Standard]	Select this item to set the standard balance for the balance between the VNC server function processing and the other processing.
		[VNC Server Priority]	Assigns a higher priority to the VNC server function processing. The update rate of the remote screen increases. Select this item when the amount of the other processing is small. The following shows the priority setting range. • [Low] • [Medium] • [High] When the number of monitoring objects is large or the background processing (including the alarm function and logging function) is performed, the delay in GOT behavior may be caused. Consider the number of monitoring objects, alarm function settings, logging function settings, and others, and then set the GOT processing load balance.
		[GOT Monitoring Priority]	Assigns a higher priority to the other processing. The number of the other processing delays caused by the VNC server function decreases. Select this item when the amount of the other processing is large.
6)	[Restrict simultaneous operations of PC and GOT]		Select this item to disable the simultaneous operation from the GOT and the remote screen of the personal computer. Selecting the item enables the authorization control. ☞ Page 2641 Authorization control
7)	[Display the digital image]		Set whether to display an image such as a web camera image displayed on the GOT on the remote screen of the personal computer. The display area for such images displays the object, figure, or other item that is placed behind the image. When the remote screen of the personal computer displays such images displayed on the GOT, the update rate of the remote screen decreases.
8)	[Reset the security level or re-authenticate the operator at the time of VNC server connection]		Resets the security level or performs a forced logout of the GOT at the time of connection between the GOT (VNC server) and the VNC client.

Precautions

■Password setting

If the operation/monitoring password and the exclusive password for monitoring are the same, the password is valid as the operation/monitoring password.

■Load balance setting

Although processing of the VNC server function is prioritized, the speed of remote screen refresh may not change depending on the VNC client setting.

In this case, disconnect and reconnect the communication with the personal computer.

77.5 Personal computer setting

GT37 SoftGOT3000

☞ Page 2652 How to install the UltraVNC
☞ Page 2653 How to start and operate the remote screen
☞ Page 2655 How to install Tera Term
☞ Page 2656 Tera Term settings

77.5.1 How to install the UltraVNC

1. Download UltraVNC from the following website.

http://www.uvnc.com/

Note that the above website may be changed without notification.

2. Execute the downloaded file, and start the installer.

3. The setup window appears.

Click the [Next] button until the [License Agreement] screen is displayed.

Confirm the description in the screen, and then select [I accept the agreement].

4. Click the [Next] button until the [Select Destination Location] screen is displayed.

In the screen, select the location where the software is installed.

5. The [Select Components] screen appears.

Select [Full installation] or [UltraVNC Viewer Only], and click the [Next] button.

6. The [Select Start Menu Folder] screen appears.

Select the start menu folder to create a shortcut, and click the [Next] button.

7. The [Select Additional Tasks] screen appears.

To create the shortcut icon on the desktop, enable [Create UltraVNC desktop icons].

To open the file with the extension of .vnc by using UltraVNC Viewer, select [Associate UltraVNC Viewer with the .vnc file extension].

When [Full installation] is selected in the [Select Components] screen, setting items other than the above are also displayed. Since the additional setting items depend on the personal computer you use, configure the settings as required.

8. The confirmation screen for installation appears.

Confirm the description in the screen, and then click the [Install] button.

Installation of UltraVNC starts.

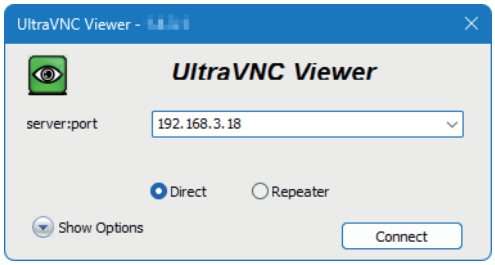
77.5.2 How to start and operate the remote screen

The remote screen of the personal computer is used to display and operate the GOT screen.

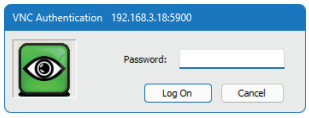
How to display the remote screen

Display the remote screen by using the VNC client software installed on the personal computer.

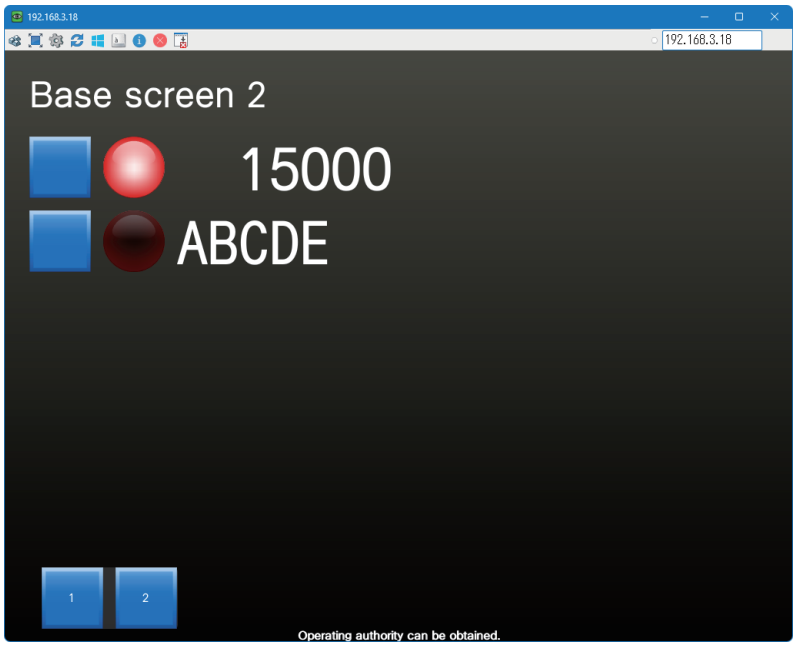
1. From the Windows start menu, select [All] → [UltraVNC], and click [UltraVNC Viewer] to start UltraVNC Viewer.
2. In the setting screen, set the GOT IP address in the [server:port] field and click the [Connect] button.



3. Enter the password (that is set in the [VNC Server] dialog) in the [Password] field, and click the [Log On] button.



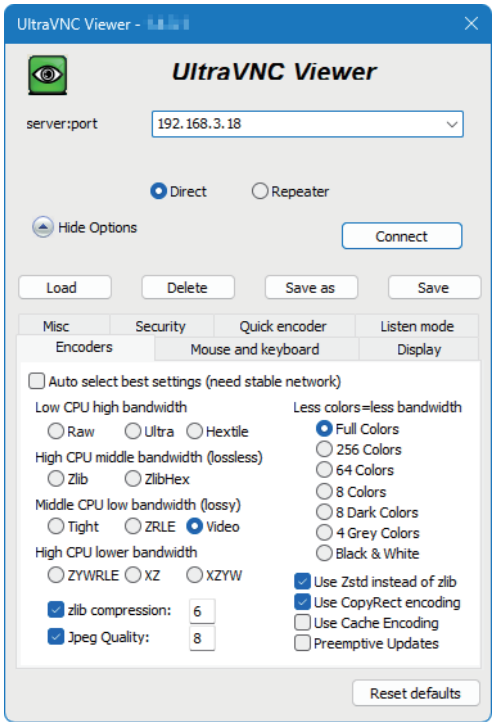
4. The remote screen appears.



■When the remote screen does not display the GOT screen

Even though the VNC client is connected to the VNC server by using the VNC client software, if the remote screen does not display the GOT screen, make sure to configure the setting as shown below.

Start UltraVNC Viewer, and click [Show Options].



Check that [Full Colors] is selected in [Less colors=less bandwidth] of the [Encoders] tab.

When [Full Colors] is not selected, deselect [Auto select best settings (need stable network)] and select [Full Colors].

■Compression format of the transferred image

The VNC server function supports the following image compression formats.

Select the image compression format in the [Encoders] tab.

Usually select [Hextile].

- Raw
- Hextile
- ZRLE

ZRLE provides a high compression rate for the images with many repeated patterns.

However, for the images with few repeated patterns, such as photos, ZRLE provides a low compression rate and a high processing load.

Select the image compression format according to the communication speed and the transferred screen layout.

Operating procedure

Clicking the remote screen of the personal computer is recognized as touching the corresponding position on the GOT.

The keyboard operation on the remote screen of the personal computer is also recognized as the key input on the GOT.

77.5.3 How to install Tera Term

1. Download Tera Term from the following website.

https://teratermproject.github.io/

Note that the above website may be changed without notification.

2. Execute the downloaded file, and start the installer.

3. [Select Setup Language] appears.

Select the language to be used and click the [OK] button.

4. [License Agreement] appears.

Select [I accept the agreement] and click the [Next] button.

5. [Select Destination Location] appears.

Specify the installation destination and click the [Next] button.

6. [Select Components] appears.

Select the components to be installed and click the [Next] button.

7. [Select Language] appears.

Select the language for the user interface and click the [Next] button.

8. [Select Start Manu Folder] appears.

Specify the folder where the program shortcut is to be created, and click the [Next] button.

9. [Select Additional Tasks] appears.

Select the additional task to be executed and click the [Next] button.

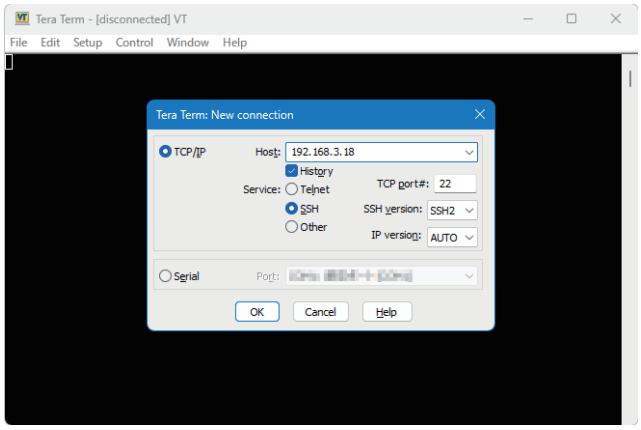
10. [Ready to Install] appears.

Check the details and click the [Install] button.

The Tera Term installation begins.

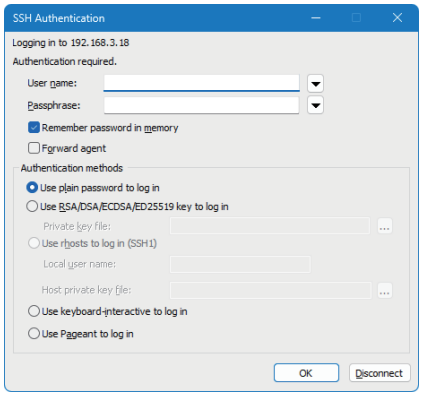
77.5.4 Tera Term settings

1. From the Windows start menu, select [All] → [Tera Term 5], and click [Tera Term] to start Tera Term.
2. The connection settings screen appears. Set [Host] and [TCP port] and click the [OK] button.



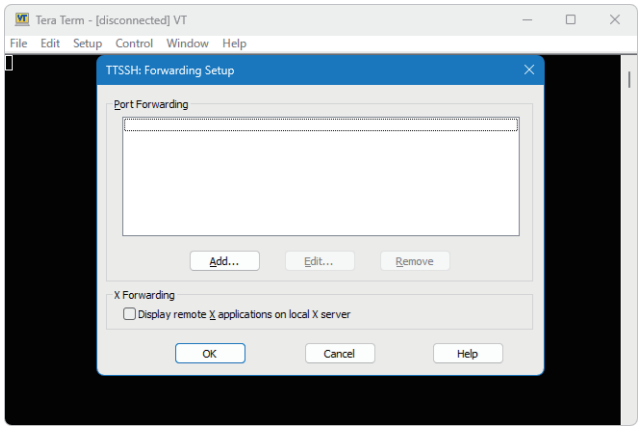
Item	Description
[Host]	IP address of the GOT
[TCP port]	[SSH Port No.] set in the [VNC Server] dialog in GT Designer3

3. The login screen appears. Enter the fields for [User name] and [Passphrase] and click the [OK] button.

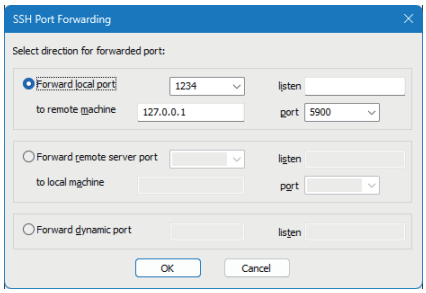


Item	Description
[User name]	[User Name] set in the [VNC Server] dialog in GT Designer3
[Passphrase]	[Password] set in the [VNC Server] dialog in GT Designer3

4. Select [Setup] → [SSH Forwarding] in Tera Term to display the [TTSSH: Forwarding Setup] dialog.

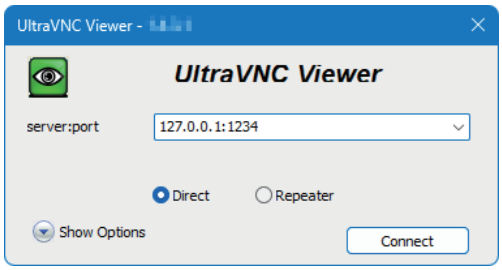


5. Click the [Add] button to display [Select direction for forwarded port].
Configure the settings for [Forward local port] and [to remote machine].



Item	Description
[Forward local port]	Port number used on the personal computer
[to remote machine]	127.0.0.1
	[Port No.] set in the [VNC Server] dialog in GT Designer3

6. Start UltraVNC Viewer and establish a VNC connection.



Item	Description
[Server:port]	• Server: IP address (127.0.0.1) entered in the field for [to remote machine] in Tera Term • port: Port number entered in the field for [Forward local port] in Tera Term

77.6 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the VNC server function as required.
The following shows the functions that are available by configuring the relevant settings.

77.6.1 GOT internal device

☞ Page 3581 GOT special register (GS)

VNC Server Function Control (GS1792)

Bit number	Signal name	Description
b0	VNC Client Communication Control signal	Enables/disables the communication from the VNC client. • 0: Communication from the VNC client enabled • 1: Communication from the VNC client disabled
b1	VNC Client Operation Control signal	Enables/disables the operation from the VNC client. • 0: Operation from the VNC client enabled • 1: Operation from the VNC client disabled
b2 to b7	Use prohibited	—
b8	Authorization Guarantee Time Cancel signal	Cancels the authorization guarantee time setting of the equipment which last operated the GOT, and enables the other equipment to operate. • 0: Authorization guarantee time valid • 1: Authorization guarantee time invalid
b9 to b15	Use prohibited	—

VNC Server Operation Status Notification (GS1230)

Bit number	Signal name	Description
b0	VNC Client Communication Status Notification signal	Notifies the communication status of the VNC client. • 0: VNC client communication suspended • 1: VNC client communication in operation
b1	VNC Client Operation Mode Notification signal	Notifies the operation mode of the VNC client. • 0: Only remote display enabled • 1: Remote display and operation enabled
b2	Authorized Equipment Notification signal	Notifies the equipment that holds the authorization. • 0: VNC server authorized • 1: VNC client authorized
b3 to b14	Use prohibited	—
b15	VNC Server Authorized Notification signal	Notifies the equipment that holds the authorization. • 0: VNC server authorized • 1: VNC client authorized

Communicating VNC Client Information Notification (GS1231 to GS1232)

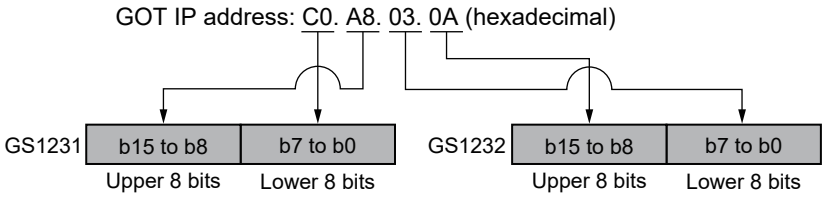
The IP address of the communicating VNC client is stored in hexadecimal.

0 is stored when the VNC client does not communicate with the VNC server.

Ex.

When the IP address of the VNC client is 192.168.3.10, the devices of GS1231 to GS1232 store C0.A8.03.0A.

The IP address is stored as shown below.



VNC Server Authorization Guarantee Status Notification (GS1233)

This device notifies the remaining authorization guarantee time (second).

When the device stores 0, the unauthorized equipment can obtain the authorization.

When the authorization control is set to [Disabled], the device stores 0.

VNC Server GOT Processing Balance Control (GS1798)

Set the load balance between processing of the VNC server function and processing of the other functions on the GOT, regardless of whether or not the GOT is connected with the VNC client.

When multiple bits are turned on, the bit with the smallest number is prioritized.

When all the bits are off, the GOT operates according to the setting of [GOT processing balance when VNC server is in operation].

☞ Page 2650 [VNC Server] dialog

PART 21 Digital image input function

78 Displaying and recording an image from a camera or video device on the GOT (digital image input/ recording function)

78 Displaying and recording an image from a camera or video device on the GOT (digital image input/recording function)

GT37 SoftGOT3000

In this chapter, web cameras and network cameras are collectively referred to as "cameras".

☞ Page 2661 Displaying and recording an image from a camera on the GOT
☞ Page 2679 Displaying the PC image on the GOT
☞ Page 2688 [Digital Image Input/Recording] dialog

78.1 Displaying and recording an image from a camera on the GOT

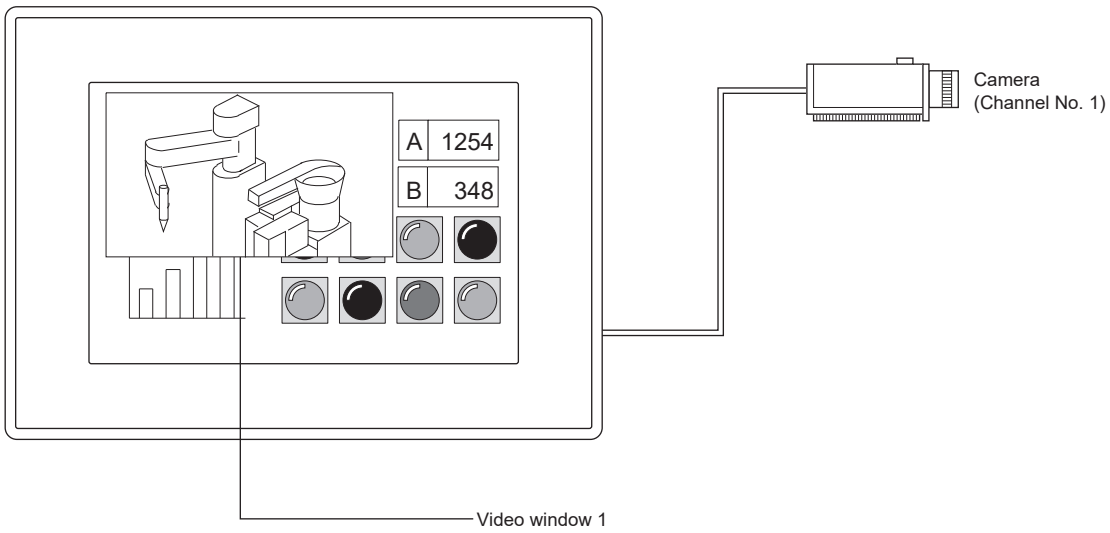
☞ Page 2662 Overview
☞ Page 2663 Specifications
☞ Page 2664 Basic use
☞ Page 2666 Advanced use
☞ Page 2678 Relevant settings

PART 21

78.1.1 Overview

GT37 SoftGOT3000

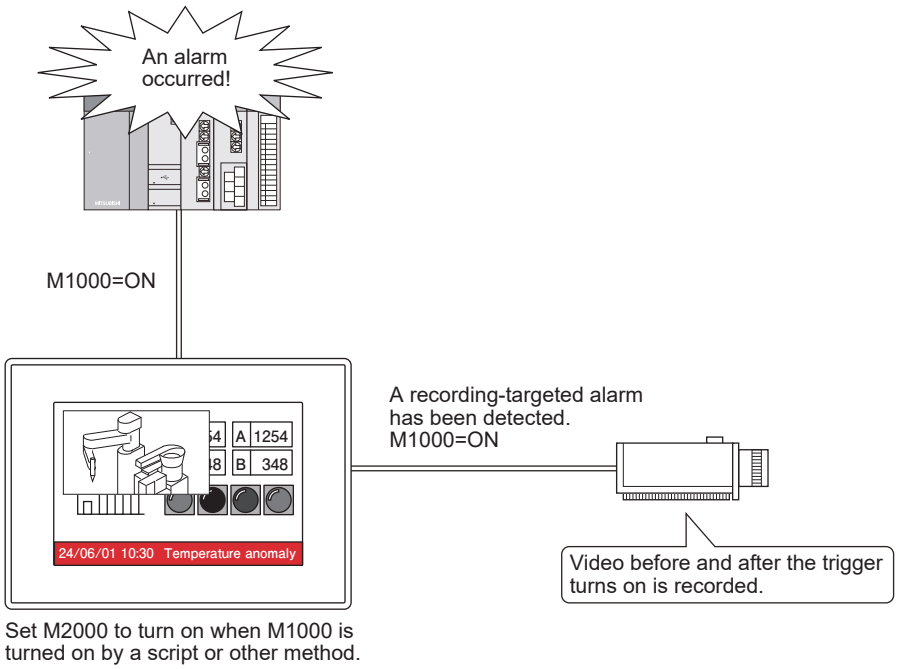
The digital image input/recording function displays or records video images taken by a camera on the video window.
As the video window operates independently of other screens, the base screen can be switched while leaving the video window open.



The recording function allows you to select a recording type: normal, long-time, or pre/post-event recording.
Setting a trigger device and linking it to alarm detection also enable the GOT to record a video image before and after the event when an alarm occurs.

Ex.

Alarm required to be recorded: M1000
Event trigger device: M2000



78.1.2 Specifications

GT37 SoftGOT3000

System application (add-on function)

To input images taken by a camera, the following system applications (add-on function) are required.

• [Digital Image Input(For USB Input)]

Selecting [Use the Digital Image Function] and then selecting [WEB Camera] or [PC Image] for [Input Device] in the [Digital Image Input/Recording] dialog automatically incorporates the system application into the package data.

• [Digital Image Input (Extended)]

Selecting [Use the Digital Image Function] and then selecting [Network Camera] for [Input Device] in the [Digital Image Input/Recording] dialog automatically incorporates the system application into the package data.

☞ Page 2688 [Digital Image Input/Recording] dialog

License number registration

To use a network camera, register a license number on the GOT.

For information on how to register the license number, refer to the following.

☞ Page 3686 License registration method

Version of the BootOS

To register the license number, the compatible version of BootOS is required for the GOT.

For information on the compatible BootOS version, refer to the following.

☞ Page 3732 Functions that require upgrading the versions of BootOS and CoreOS

How to display an image input from a camera

For the display methods of an image input from a camera, the full mode and clip mode are provided.

For details on each display mode, refer to the following.

☞ Page 2668 Displaying video in full mode

☞ Page 2670 Displaying video in clip mode

The following shows the differences between the full mode and clip mode.

Item	Full mode	Clip mode
Overview	Displays the total image.	Displays a part of the image in its original size.
Video window resolution	• Full-HD (1920×1080) • HD (1280×720) • VGA (640×480)	• Full-HD (1920×1080) • HD (1280×720) • VGA (640×480)
Changing the display size	100%, 50%, or 25% of the original size	Unchangeable (fixed at 100%)
Number of screens	1 (video window 1 only)	When the external extended control is enabled: 4 When the external extended control is disabled: 1 (video window 1 only)

Precautions

■Placing the object on the video window

Objects cannot be placed on the video window.

■Displaying a video window or personal computer (PC) image screen

A video window and a PC image screen cannot be displayed simultaneously.

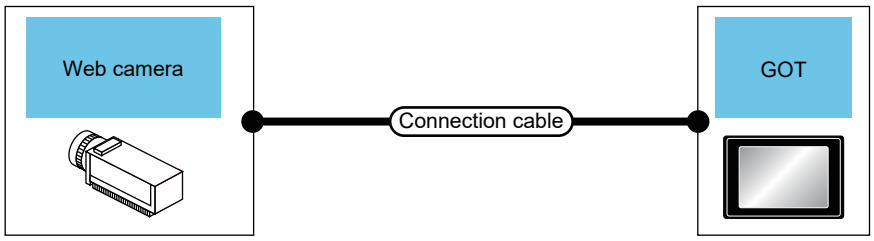
78.1.3 Basic use

GT37 SoftGOT3000

The image input from a camera can be displayed in various ways using the [Digital Image Input Common] device.
For details on the setting, refer to the following.
☞ Page 2666 Advanced use

System configuration

The following shows a system configuration.



For information on the maximum number of connected devices, refer to the following.
☞ Page 2664 Maximum number of connected devices

Connected device		Connection cable, switching hub*4	GOT	
			Interface	GOT model
WEB camera	Devices that satisfy all the following conditions*1*2: • UVC-compatible • JPEG-compatible	USB cable*3	USB interface	GT37 SoftGOT3000
Network camera	Devices that satisfy all the following conditions*1: • H.264 (Baseline profile compatible), JPEG compatible	*5*6	Built-in Ethernet interface of the GOT*7	

*1 For connectable camera types, refer to the following Technical Bulletin.
List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)
*2 Select a vision sensor to be used.
*3 Use a device that supports USB 2.0 or higher.
When using a hub, use a hub that supports USB 2.0 or higher.
When multiple devices are connected to a USB hub, images may not be displayed properly due to insufficient power supply.
*4 The cable length depends on the specifications of the camera used.
*5 For details on the connection method, refer to the manual of the network camera to be used.
*6 When connecting multiple network cameras, connect them to the GOT via a switching hub.
Also, when connecting network cameras that support PoE power supply, use a PoE-compatible switching hub.
*7 The first Ethernet port that successfully connects to a network camera will be enabled.
After establishing a connection with a network camera, any subsequent connections using a different port will be disabled.

■Maximum number of connected devices

The number of cameras that can access one GOT simultaneously is as follows.

- Web camera: 1
- Network camera: 4

Precautions

If a video signal is not input to the specified channel due to cable disconnection or power-off of a camera, a video image is not displayed.

Setting procedure

1. Connect the GOT and camera.

☞ Page 2664 System configuration

2. In GT Designer3, select [Common] → [Peripheral Setting] → [Digital Image Input/Recording] from the menu to display the [Digital Image Input/Recording] dialog.

☞ Page 2688 [Digital Image Input/Recording] dialog

3. In the [Digital Image Input/Recording] dialog, select [WEB Camera] or [Network Camera] for [Input Device], and configure each setting.

☞ Page 2688 [Digital Image Input/Recording] dialog

4. Once you have configured the setting, click the [OK] button.

5. Write the package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

6. When using a network camera, register the license number to the GOT.

For the registration method, refer to the following.

☞ Page 3686 License registration method

7. Display the video image on the GOT.

78.1.4 Advanced use

GT37 SoftGOT3000

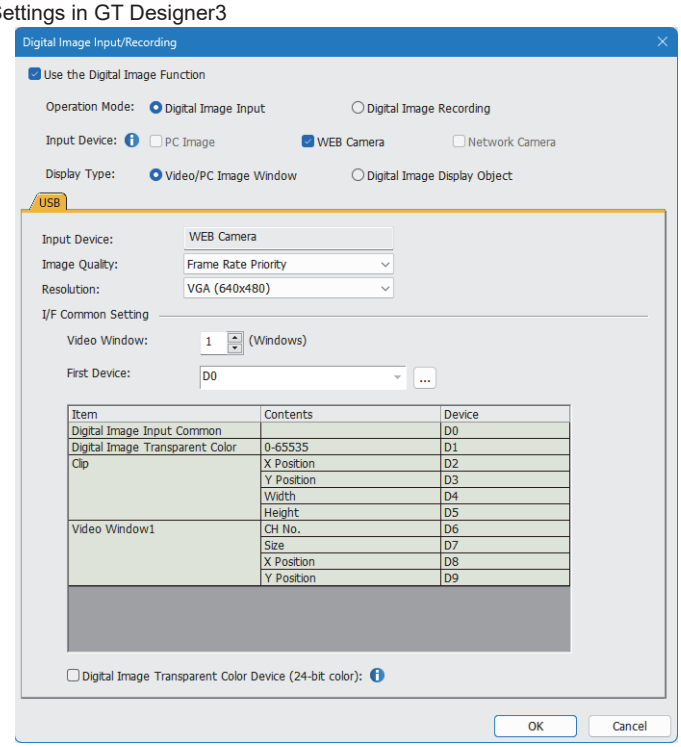
The following shows advanced display settings.

Displaying the video window

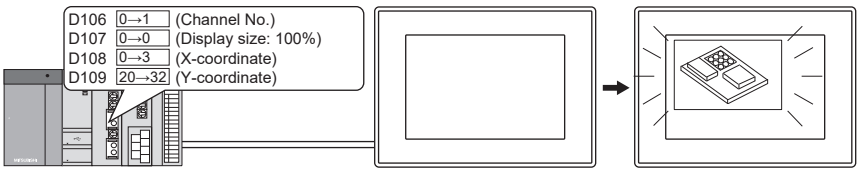
The video window is displayed when 1 is stored in the video window-channel number device.
(The video window does not have the close button)
The [Digital Image Input Common] device controls full mode display, clip mode display, transparent processing, and other operations.
Size and position of the video window can be controlled according to the values set at the corresponding devices (video window-size device, video window-X and Y coordinates devices).

Ex.
Displaying the image of channel number 1 on video window 1

Settings in GT Designer3



Operation



Video window 1 is displayed according to the specified channel No., size, and coordinates.

Display position of the video window

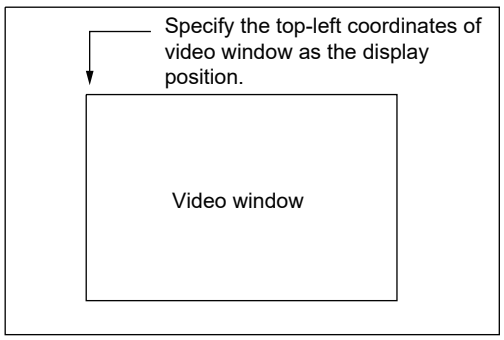
The video window is placed on the base screen or overlap window 1.

The video window display position is specified with the coordinates of the window upper left corner.

The base point is the upper left coordinate (0, 0) of the screen where the video window is placed.

The smallest of the following resolutions is set as the maximum size of the video window.

- Resolution of the input image
- GOT resolution



■Setting the display position

Set the display position with a multiple of 2 (dots).

Even if the display position is set with a value other than a multiple of 2 (dots), the position is automatically adjusted to a multiple of 2 (dots).

■Video window placed beyond the screen

If the video window is placed beyond the screen, display position of the video window is automatically adjusted to fit to the screen.

■Order of displaying the video window

The video window can be displayed over or behind the overlap window (1 or 2) or test window according to the setting for the [Digital Image Input Common] device.

☞ Page 2688 [Digital Image Input/Recording] dialog

However, the following items are displayed over the video window.

- Alarm popup display
- Key window
- Comment window
- Confirmation or similar message displayed on the GOT

Precautions

If a window with transparency is placed on a video window, the video window is invisible.

Moving the video window

The video window does not have the move button.

To move the video window, change the device values set for the display position (X and Y coordinates).

If multiple video windows are moved frequently, the overlap window may not be moved even when the window is touched.

In this case, move the overlap window by changing the device values or move it after moving the video window is completed.

Placing the video window on the overlap window

- The video window can be placed on the overlap window 1 only.
- Each window displayed on the front of the overlap window 1 is displayed over the video window.

For the display order of each window, refer to the following.

☞ Page 58 Screen types and specifications

- When the video window is placed on the overlap window 1, transparent processing will be automatically executed for the video window.

☞ Page 2673 Transparent processing

If figures or objects are set on the overlap window, figures or objects may be visible in the background of the video window.

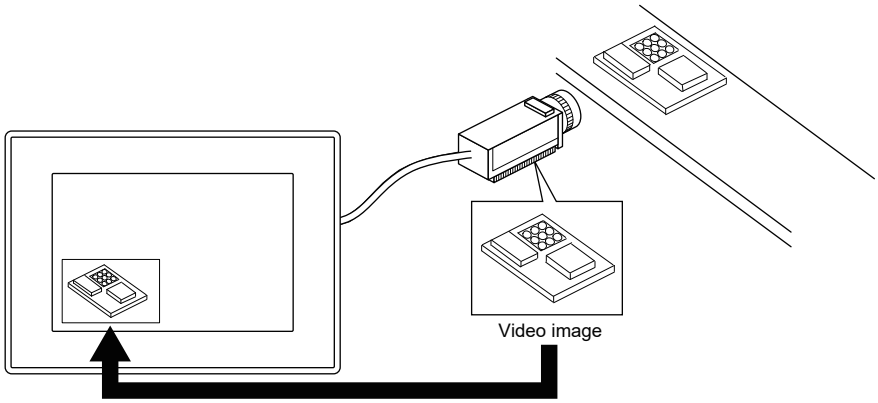
- If the display position (base screen or overlap window 1) is switched while the video window is displayed, the video window is closed temporarily and then opened at the specified position (base screen or overlap window 1).
- The size of the video window placed on the overlap window is not changed even when the video window is touched.

To change the size of the video window, change the value of the device set for window size change.

☞ Page 2688 [Digital Image Input/Recording] dialog

Displaying video in full mode

In full mode, an image taken by a camera is displayed on the GOT in the actual size.



The image taken by a web camera is displayed at actual size.

■Resolution and display size of the video window

In full mode, video windows are displayed in a size according to the camera resolution.

The display size of each video window can be changed in three levels (100%, 50%, or 25%).

■Changing the display size

The following shows changing the display size of the video window.

Method	Description
Changing the size by touching the video window	Changing the size by touching the video window can be disabled by turning on b4 of the [Digital Image Input Common] device. ☞ Page 2672 Settings of [Digital Image Input Common] device  When the video window display size is changed by touching, the window size changes as follows. • Display size change Display size: 100% → Display size: 50% → Display size: 25% → Display size: 50% → Display size: 100%
Changing the size by writing a value to the display size setting device	The following shows the window display sizes corresponding to values to be written. • 0: 100% • 1: 50% • 2: 25% 
■Displaying the multiple video windows

Do not display the same image (taken by the same channel) in multiple video windows.

If you display the same image in multiple video windows, the image is displayed only in the video window assigned with the smallest number and not displayed in other video windows.

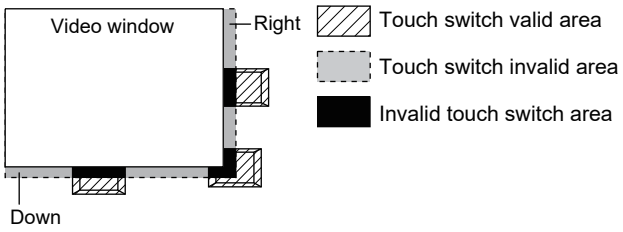
Precautions

The number of video windows that can be displayed simultaneously depends on the resolution of the video window.

Combination of video window resolutions	Number of windows that can be displayed
Full-HD (1920×1080)	1
HD (1280×720)	2
HD (1280×720) VGA (640×480)	4
VGA (640×480)	4

■Invalid area of a touch switch around the video window

Depending on the resolution of the video window after the display size is changed, some areas may become invalid for the touch switch.



The following shows the setting combination that results in invalid areas for the touch switch.

Resolution of video windows (dots)	Display size	Resolution of video windows (dots) after the display size is changed and invalid area of a touch switch
640×480	25%	160 × 120 Invalid area: Lower 8 dots

Precautions

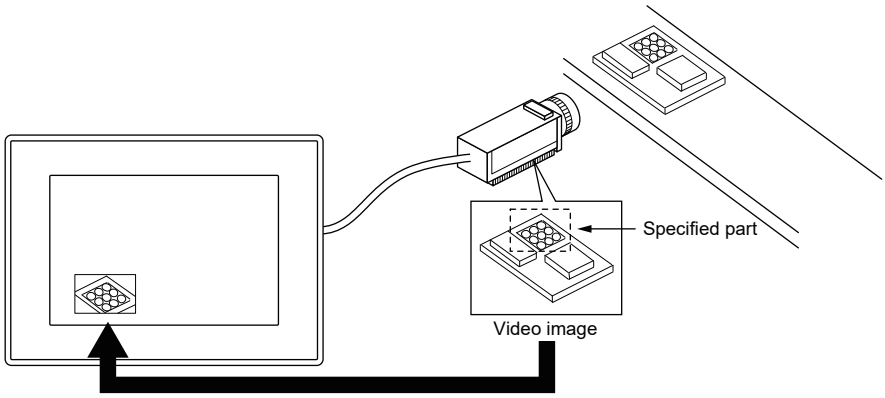
When the display size of the video window is returned to the previous display size by touch operation, the display position is also returned to the position when the video screen was displayed.

Displaying video in clip mode

This mode is used to specify a part (clip area) of the image taken by a camera and display it in the original size on the GOT. With this mode, the video window display area can be reduced without reducing the size of the image to be displayed.

The clip mode can be used only in video window 1.

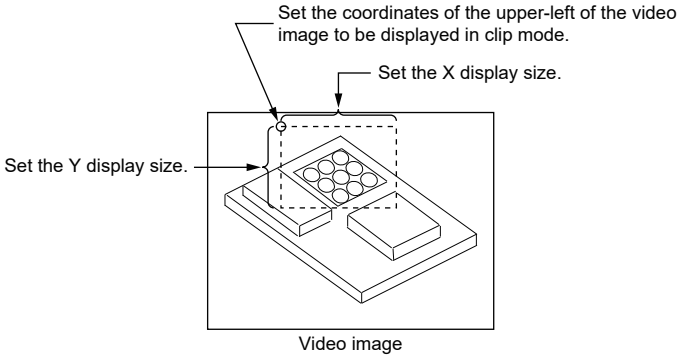
The clip mode cannot be used in video window 2 to 4.



■Selecting a clip area

To set a clip area, specify the upper left corner of the video image to be displayed using the coordinate values, and specify the vertical size and horizontal size.

The minimum vertical/horizontal size is 64 dots.



■Operations of video windows 2 to 4 in the clip mode

Method	Description
Switching from full mode to clip mode	If the mode is switched from the full mode to the clip mode while any or all of video windows 2 to 4 are open, these video windows are erased forcibly.
Switching from clip mode to full mode	When the mode is switched back from the clip mode to the full mode, any or all of video windows 2 to 4 are displayed according to the channel number, display position, and display size specified at that timing.
Displaying a still image	The video image displayed in the full or clip mode can be switched to a still image. When multiple video windows are displayed in the full mode, the video images displayed on the multiple video windows are all switched to still images. 
Precautions

■Operations that are invalid during still image display

The operations indicated below are disabled during still image display.

To enable these operations, switch the mode back to the motion video mode.

- Changing the video window channel
- Changing the display size
- Changing the display position
- Erasing the video window
- Displaying the video window

■Video window on the overlap window

When the image in the video window placed on the overlap window is switched to a still image, do not move the overlap window.

If the overlap window is moved, the still image is not displayed.

■Turning the GOT ON

When a still image is displayed (motion video/still image selection bit: ON), do not power on the GOT.

If the GOT is powered on while the bit is on, the video window cannot be displayed.

PART 21

Settings of [Digital Image Input Common] device

The device specified for [Digital Image Input Common] stores the data shown below.

Turning on or off each bit device controls the operation of the video window or PC image screen.

The settings for the video window are used in common to video windows 1 to 4.

Bit number	Description	Bit status	Remarks
b0*1	Selecting full mode or clip mode	ON: Clip mode OFF: Full mode	Valid when the video window is displayed. Bit status can be changed while the video window is displayed.
b1	Selecting the screen for placing the video window	ON: Overlap window 1 OFF: Selects the base screen.	Transparent processing is executed automatically when b1 is on.
b2	Selecting the transparent processing	ON: Executes the transparent processing. OFF: Does not execute the transparent processing.	☞ Page 2673 Transparent processing
b3	Selecting how to specify the transparent color	ON: Makes colors other than the specified color transparent. OFF: Makes the specified color transparent.	
b4	Selecting whether the display size of the video window is changed or not when the video window is touched	ON: Does not change the size. OFF: Changes the size.	Valid when the video window is displayed. Bit status can be changed while the video window is displayed.
b5	Selecting a motion video or still image*2	ON: Selects a still image. OFF: Selects a motion video.	☞ Page 2673 Transparent processing
b6*3	Selecting display priority for video windows (When b2 (selecting the transparent processing) is off)	ON: Displays the video window over the overlap window or test window. OFF: Displays the video window behind the overlap window or test window.	Valid when the video window is displayed. Bit status can be changed while the video window is displayed.
	Selecting transparent processing target screen (When b2 (selecting the transparent processing) is on)	ON: Base screen and overlap window OFF: Base screen	—
b7*4	Extended control	ON: Extended control enabled OFF: Extended control disabled	☞ Page 2676 Video window or PC image screen when the extended control is enabled
b8 to b9	Use prohibited	—	—
b10	Selecting the number of transparent colors	ON: 65536 colors mode OFF: 256 colors mode	☞ Page 2673 Transparent processing
b11 to b12	Use prohibited	—	—
b13*4	Display position of the PC image screen	ON: Displays on the middle side. OFF: Displays on the upper left side.	☞ Page 2673 Transparent processing
b14	Use prohibited	—	—
b15	Selecting whether to display the PC image screen (CH1)*5	ON: Displays the PC image screen OFF: Displays the GOT monitor screen.	☞ Page 2673 Transparent processing

*1 When b7 is on, b0 is disabled and the mode is fixed to the clip mode.

*2 When this bit is turned on with other bits at the same time, the contents of other bits are disregarded. (b5 has priority.)

*3 The contents of control depend on the setting values for selecting transparent processing (b2).

*4 When b7 is off and GS449.b0 is on, the PC image screen is displayed in the middle.
When b7 is off and GS449.b0 is off, the value set in b13 is enabled.
When b7 is on, the values set in GS449.b0 and b13 are disabled and the Extended Control signal determines the display position of the video window.
☞ Page 2676 Video window or PC image screen when the extended control is enabled

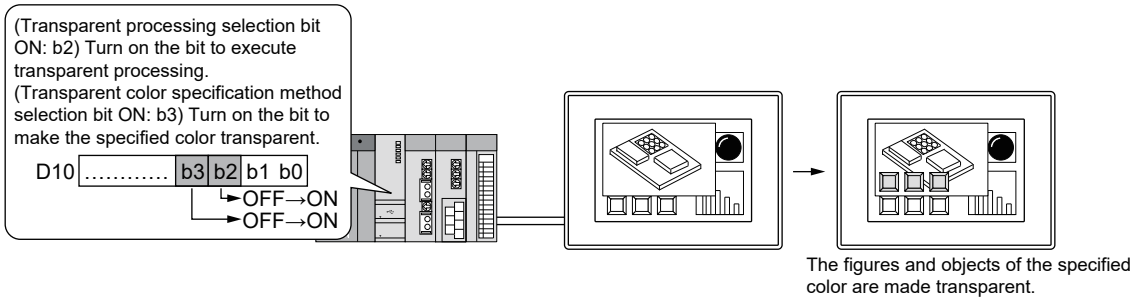
*5 When a user-created screen is displayed on the GOT, the PC image screen is displayed when the bit turns on.

Transparent processing

■Displaying transparent processing

Specify the transparent color to display objects or figures located behind the video window.

Select the transparent color from the specified color or the colors other than the specified color.



Ex.

When 0 (black) is selected for the transparent color

Transparent color specification method selection bit: b3	Transparent color	Display
OFF (makes the specified color transparent)	0 (black)	Figures or objects of colors other than black are visible on the video window.
ON (makes colors other than the specified color transparent)	0 (black)	Figures or objects in black color are visible on the video window.

Point

• Placing the video window on the overlap window

When the video window is placed on the overlap window 1, the transparent processing is automatically executed even if the transparent processing selection bit (b2) is OFF.

• Touch switches, numerical input, and text input behind the video window

By executing the transparent processing, objects such as touch switches, numerical input, and text input functions behind the video window are made visible.

(While the transparent processing is applied, the video window size does not change even if the video window is touched.)

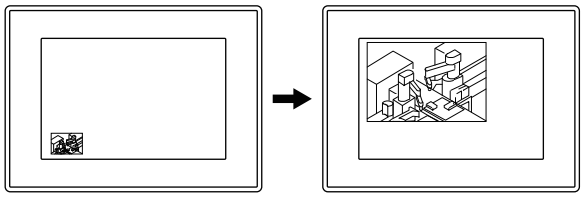
■Display examples (with and without transparent processing)

Method	Description
When transparent processing is not executed	The video window is displayed above the base screen. For overlap and test windows, it is selectable whether the video window is placed over or behind an overlap or test window.  Front display Back display
When transparent processing is executed	The video window is displayed behind the base screen. If the target of transparent processing is only the base screen, the overlap window is not made visible. If both the base screen and the overlap window are set as the target of transparent processing, both of them are made visible.  Transparent target: Base screen Transparent target: Base screen, overlap window

Usage examples of the video window

The following shows the usage examples of video window.

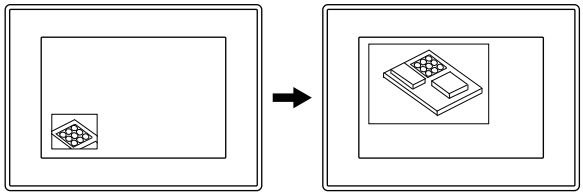
■ Small-size video windows are normally displayed at the bottom of the screen and the video windows are enlarged as necessary. (The size can be changed using the sequence program or the touch switch.)



The following shows the example of the setting when D100 is set in the start device.

Item		Device	Setting
[Video Window1]	[CH No.]	D106	1
	[Size]	D107	2→0
	[X Position]	D108	32
	[Y Position]	D109	480→0

■Small-size video windows are normally displayed at the bottom of the screen, and the video image is switched to the display of the full size as necessary. (The video display mode can be switched between full mode and clip mode using the sequence program or the touch switch.)



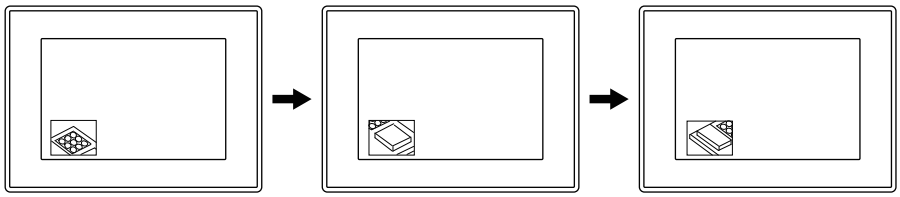
The following shows the example of the setting when D100 is set in the start device.

Item		Device	Setting
[Digital Image Input Common]		D100	Selecting full mode or clip mode D100.b0: ON → OFF
[Digital Image Transparent Color]	[0 to 65535]	D101	Selecting a transparent color
	[0(Black) to 255(White)]*1		
[Clip]	[X Position]	D102	70
	[Y Position]	D103	50
	[Width]	D104	256
	[Height]	D105	256
[Video Window1]	[CH No.]	D106	1
	[Size]	D107	0
	[X Position]	D108	32
	[Y Position]	D109	400→32

*1 When b10 is turned on by the [Digital Image Input Common] device, [0 to 65535] is set. When the bit is turned off, [0(Black) to 255(White)] is set.

■Changing the display position of video image

A part of a video image is displayed at the bottom of the screen and the display position is switched as necessary. (The X and Y coordinates of the area to be clipped can be switched by the sequence program or the touch switch.)



The following shows the example of the setting when D100 is set in the start device.

Item		Device	Setting
[Digital Image Input Common]		D100	Selects the clip mode.
[Digital Image Transparent Color]	[0 to 65535]	D101	Selecting a transparent color
	[0(Black) to 255(White)]*1		
[Clip]	[X Position]	D102	70 → 90 → 80
	[Y Position]	D103	50 → 60 → 20
	[Width]	D104	256
	[Height]	D105	256
[Video Window1]	[CH No.]	D106	1
	[Size]	D107	0
	[X Position]	D108	112
	[Y Position]	D109	112

*1 When b10 is turned on by the [Digital Image Input Common] device, [0 to 65535] is set. When the bit is turned off, [0(Black) to 255(White)] is set.

Video window or PC image screen when the extended control is enabled

When b7 (Extended Control signal) of the digital image input common device is turned on, the video window is always displayed in clip mode.

The value of the full mode or clip mode selection (b0) specified for the digital image input common device is invalid.

To disable the extended control function, refer to the following.

☞ Page 2672 Settings of [Digital Image Input Common] device

When the extended control is enabled, the following functions are available.

■Full-screen display

Specify the video window or PC image screen to be displayed in full-screen size for the Full-screen Display Control signal Import Window (GS1998).

☞ Page 3665 Full-screen Display Control signal (GS1998)

The hard copy function is not available during full-screen display.

■Display setting of the video window

To display the video window or PC image screen on the GOT in full-screen mode or clip mode, configure the following settings.

The default display position of the video window or PC image screen is the upper left corner of the GOT screen.

Device					Function
Video window 1	Video window 2	Video window 3	Video window 4	PC image screen	
GS1999	GS2009	GS2019	GS2029	—	Specifies the channel number to be displayed on the video window. ☞ Page 3666 Video Window 1 to 4 and PC Image Extended Control signal (GS1999 to GS2006, GS2009 to GS2016, GS2019 to GS2026, GS2029 to GS2036, GS2039 to GS2045) To display the channel number on the PC image screen, specify it using b15 of the [Digital Image Input Common] device. ☞ Page 2672 Settings of [Digital Image Input Common] device
GS2000	GS2010	GS2020	GS2030	GS2039	Specifies the display magnification of the video window or PC image screen. ☞ Page 3666 Video Window 1 to 4 and PC Image Extended Control signal (GS1999 to GS2006, GS2009 to GS2016, GS2019 to GS2026, GS2029 to GS2036, GS2039 to GS2045)
GS2001	GS2011	GS2021	GS2031	GS2040	Specifies the display size (width) of the video window or PC image screen in dots. ☞ Page 3666 Video Window 1 to 4 and PC Image Extended Control signal (GS1999 to GS2006, GS2009 to GS2016, GS2019 to GS2026, GS2029 to GS2036, GS2039 to GS2045)
GS2002	GS2012	GS2022	GS2032	GS2041	Specifies the display size (height) of the video window or PC image screen in dots. ☞ Page 3666 Video Window 1 to 4 and PC Image Extended Control signal (GS1999 to GS2006, GS2009 to GS2016, GS2019 to GS2026, GS2029 to GS2036, GS2039 to GS2045)

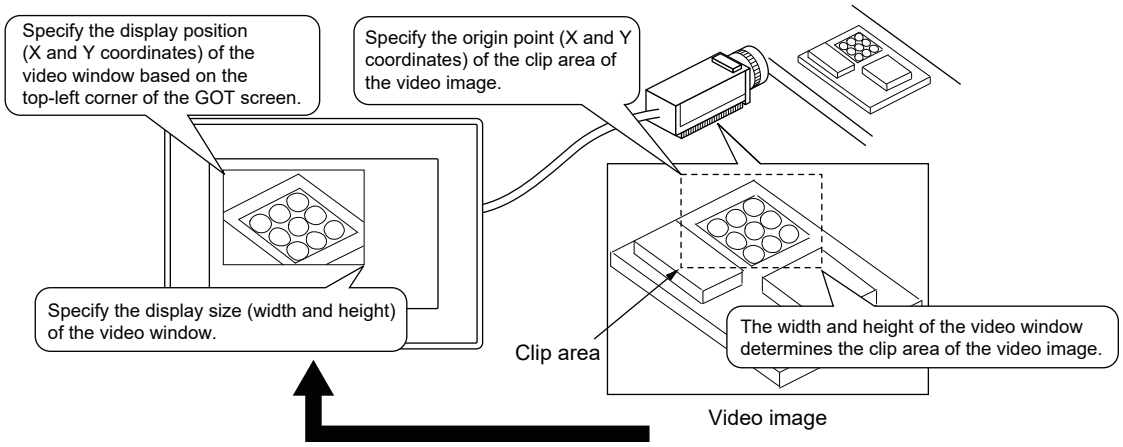
■Displaying the video image with the clip display by controlling the devices

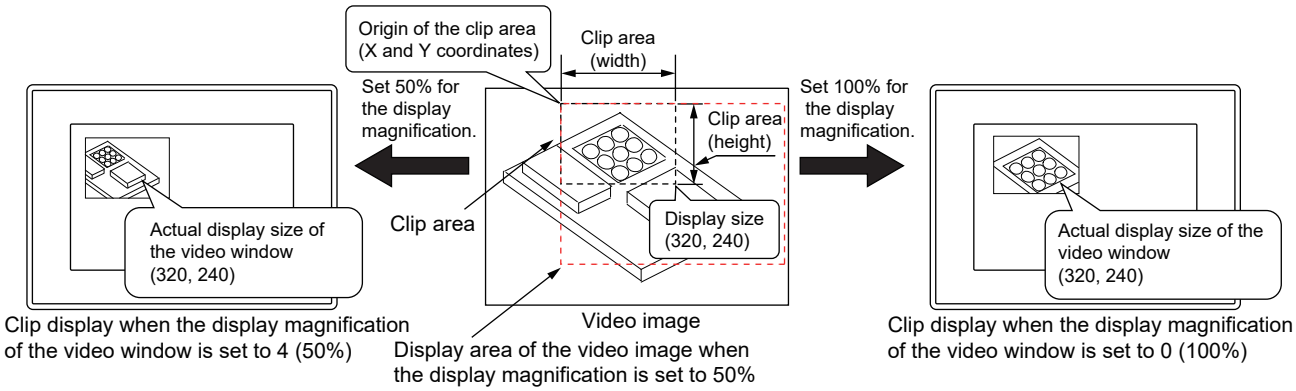


Displaying the video image by controlling it with the GOT internal devices.

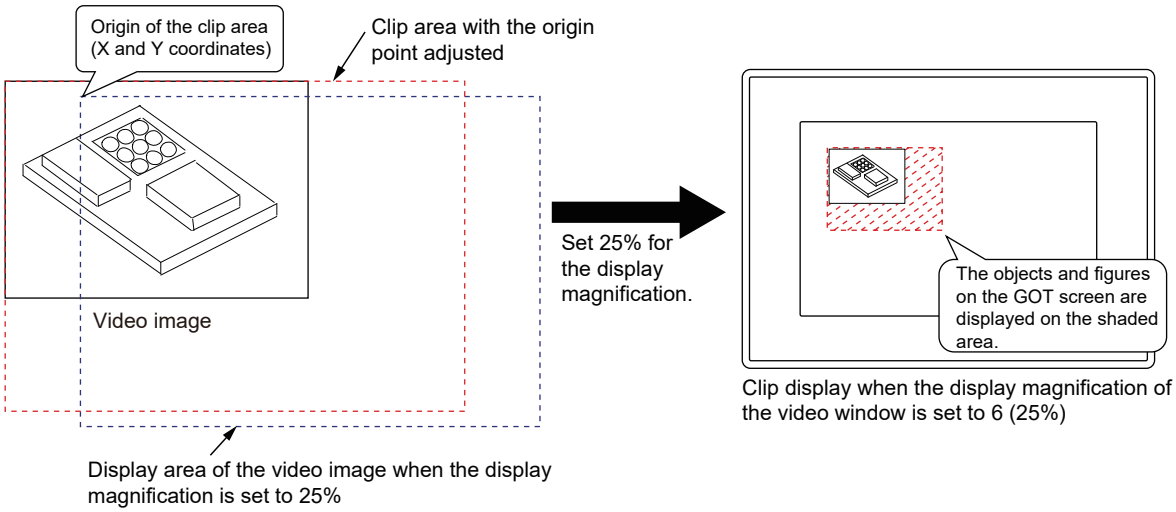
■Clip display when the display magnification is changed

If any other than 100% is set for the display magnification, the size of the video window displayed on the GOT is enlarged or reduced according to the set display magnification.

- Display example when the display magnification is 100% or 50%



- Display example when the display magnification is 25%



PART 21

78.1.5 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for camera image input as required.
The following shows the functions that are available by configuring the relevant settings.

GOT internal devices

Enabling b7 of the device specified in [Digital Image Input Common] enables the extended control.
Use the extended control to display the video window with the full-screen display or the clip display on the GOT.
For details on the devices, refer to the following.
☞ Page 3581 GOT special register (GS)
☞ Page 2676 Video window or PC image screen when the extended control is enabled

Function	Setting item
Checking if the input status of the video signal for CH1 is recognized	GS252.b8
Notifying that data storage usage has reached a certain percentage during pre- and post-event recording	GS1022.b0 to b1
Notifying that the number of files stored in the data storage reaches a certain number during recording before and after the event	GS1022.b2 to b7
Notifying that the data storage usage has reached a certain percentage during pre- and post-event recording	GS1022.b8 to b9
Notifying that the number of files stored in the data storage has reached a certain number during normal recording	GS1022.b10 to b15
Specifying the video window or PC image screen to be displayed in full screen when extended control is enabled	GS1998
Controlling video window 1 with the GOT internal devices when extended control is enabled	GS1999 to GS2006
Controlling video window 2 with the GOT internal devices when extended control is enabled	GS2009 to GS2016
Controlling video window 3 with the GOT internal devices when extended control is enabled	GS2019 to GS2026
Controlling video window 4 with the GOT internal devices when extended control is enabled	GS2029 to GS2036
Notifying the error status of the connected web camera	GS2070.b0
Notifying the information related to video signal input	GS2071.b0 GS2071.b2 to b5
Notifying the status of the network camera connected to channel 1	GS2073.b0 to b1 GS2073.b3 to b4
Notifying the status of the network camera connected to channel 2	GS2074.b0 to b1 GS2074.b3 to b4
Notifying the status of the network camera connected to channel 3	GS2075.b0 to b1 GS2075.b3 to b4
Notifying the status of the network camera connected to channel 4	GS2076.b0 to b1 GS2076.b3 to b4
Notifying the number of image reception errors from the network camera connected to channel 1	GS2077
Notifying the number of image reception errors from the network camera connected to channel 2	GS2078
Notifying the number of image reception errors from the network camera connected to channel 3	GS2079
Notifying the number of image reception errors from the network camera connected to channel 4	GS2080
Notifying the error when the number of video/PC image windows that can be displayed simultaneously has exceeded	GS2085.b0 to b4 GS2085.b6

78.2 Displaying the PC image on the GOT

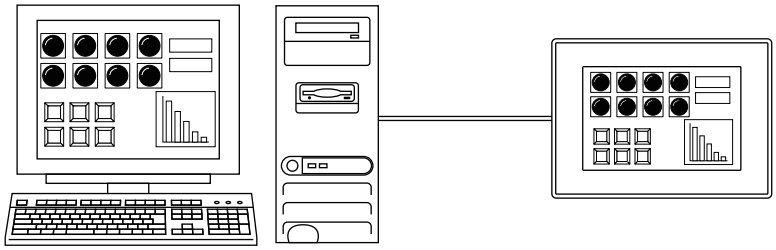
GT37 SoftGOT3000

☞ Page 2679 Overview
☞ Page 2680 Specifications
☞ Page 2681 Basic use
☞ Page 2682 Advanced use
☞ Page 2687 Relevant settings

78.2.1 Overview

GT37 SoftGOT3000

The image output from a video device, such as a personal computer, is displayed on the GOT.



PART 21

78.2.2 Specifications

GT37 SoftGOT3000

System application (add-on function)

Inputting the PC image requires [Digital Video Input] of the system application (add-on function).

Selecting [Use Digital Image Input] in the [Digital Image Input] dialog automatically incorporates the system application into the package data.

☞ Page 2688 [Digital Image Input/Recording] dialog

Specifications of the PC image to be input

■Resolution of the PC image

The following resolutions are supported.

- Full HD (1920 × 1080 dots)
- XGA (1024 × 768 dots)
- SVGA (800 × 600 dots)
- VGA (640 × 480 dots)

■Frame rate

Among the frame rates compatible with USB converters, the highest frame rate up to 30 fps will be applied.

For information on the supported USB converter, refer to the following Technical Bulletin.

📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)

For information on the frame rate of the USB converter, refer to the USB converter manual.

Precautions

When the resolution and frame rate are set outside the range for the video device, the image is not displayed properly.

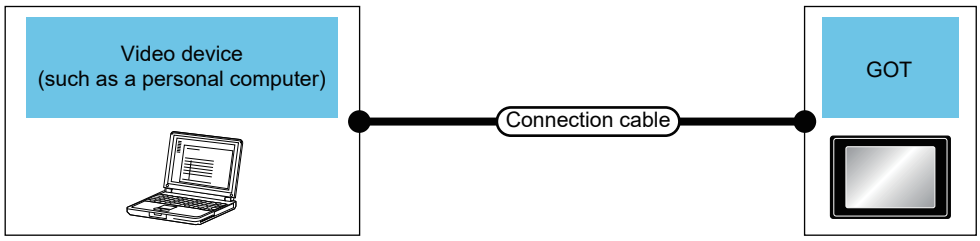
78.2.3 Basic use

GT37 SoftGOT3000

Various display methods are available for the PC image input through the device set in [Digital Video Input Common].
For details on the setting, refer to the following.
☞ Page 2682 Advanced use

System configuration

The following shows a system configuration.



For information on the maximum number of connected devices, refer to the following.
☞ Page 2681 Maximum number of connected devices

Connected device	Connection cable*1*2	GOT		
		Option	Interface	GOT model
For information on connectable video devices, refer to the following Technical Bulletin. 📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)	GT15-C50VG (5 m) or HDMI cable	USB converter*3	USB interface	GT37 SoftGOT3000

*1 The cable length depends on the specifications of the video device used.
*2 When using a hub, use a hub that supports USB 2.0 or higher.
When multiple devices are connected to a USB hub, images may not be displayed properly due to insufficient power supply.
*3 Use a USB converter that supports USB 2.0 or higher.
The USB converter must support the resolution and frame rate of the video device.
If a USB converter that does not support the resolution and frame rate of the video device is used, images may not be displayed properly.

■Maximum number of connected devices

Only one video device can access one GOT at a time.

Setting procedure

1. Connect the GOT and the video device.
☞ Page 2681 System configuration
2. Select [Common] → [Peripheral Setting] → [Digital Image Input] from the menu to display the [Digital Image Input] dialog.
☞ Page 2688 [Digital Image Input/Recording] dialog
3. In the [Digital Image Input] dialog, select [PC Image] for [Input Device], and configure each setting.
☞ Page 2688 [Digital Image Input/Recording] dialog
4. Once you have configured the setting, click the [OK] button.
5. Write the package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.
☞ Page 408 Transferring data to the GOT

6. Display the PC image screen on the GOT.

78.2.4 Advanced use

GT37 SoftGOT3000

The following shows advanced display settings.

How to display the PC image screen

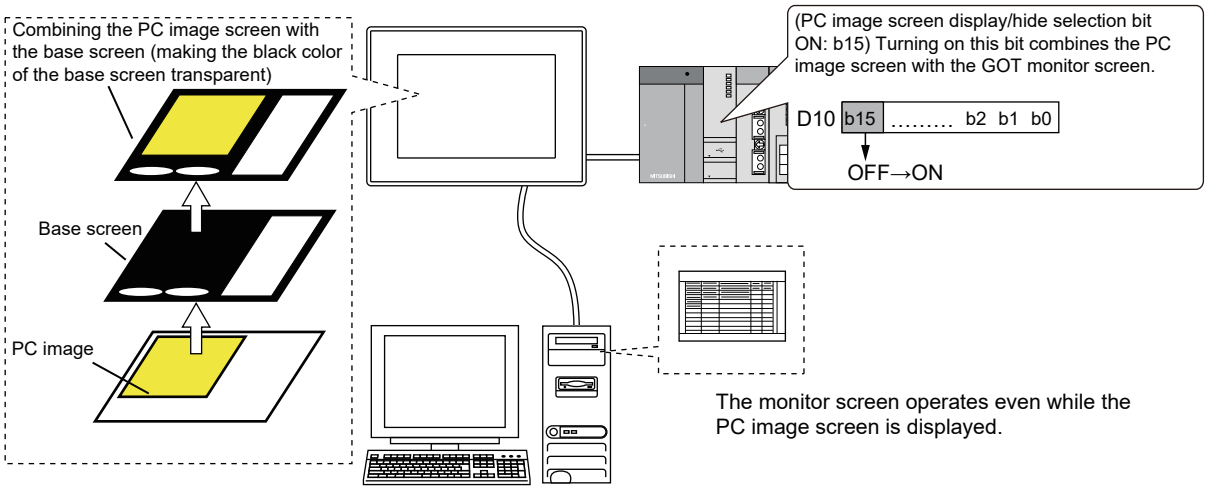
The PC image screen is combined with the GOT monitor screen according to the on or off setting of the PC image screen display/hide selection bit (bit device in the word device).

The PC image screen is combined with the base screen, with its black part made transparent.

Set the background color of the base screen on which to display the PC image screen to black.

For instruction on the screen color setting, refer to the following.

☞ Page 313 Base screen properties



Precautions	Description
Object function when the PC image screen is being displayed	Each object operates when the PC image screen is being displayed.
Restrictions when the PC image screen extends beyond the GOT screen	If the PC image screen extends beyond the GOT screen, the PC image may not be displayed correctly. Make sure that the PC image screen does not extend beyond the GOT screen.
Displaying a video window or PC image screen	A video window and a PC image screen cannot be displayed simultaneously.
Function unavailable in full screen mode	The hard copy function is not available during full-screen display.

■PC image display position

If the screen displaying the PC image is smaller than the resolution of the GOT screen, the image display position can be set to the upper left or center.

The display size can also be changed.

Set the display position and size of the PC image using [Digital Image Input Common] in the [Digital Image Input] dialog.

For the setting method, refer to the following.

☞ Page 2688 [Digital Image Input/Recording] dialog

■Screens that support PC image display

PC image display is available only for user-created screens.

PC image screens are not combined with screens other than user-created screens, such as utility screens and device monitor screens.

■Displaying a window screen

The overlap window and test window are displayed over the RGB screen after composition.

A superimpose window is displayed as a part of the base screen.

Precautions

If a window with transparency configured is placed in front of the PC image screen, the PC image screen is not displayed.

■Displaying video in clip mode

Specify a part of the PC image screen (clip area) to display it on the GOT in its original size.

To display the PC image screen in clip mode, configure the settings in [Digital Image Input Common] in the [Digital Image Input] dialog.

For the setting method, refer to the following.

☞ Page 2688 [Digital Image Input/Recording] dialog

■Efficient use of the PC image screen

It is convenient to create a touch switch without a shape at the position where the PC image screen is displayed. Configure the touch switch settings to hide the PC image screen or to display the monitor screen after hiding the PC image screen.

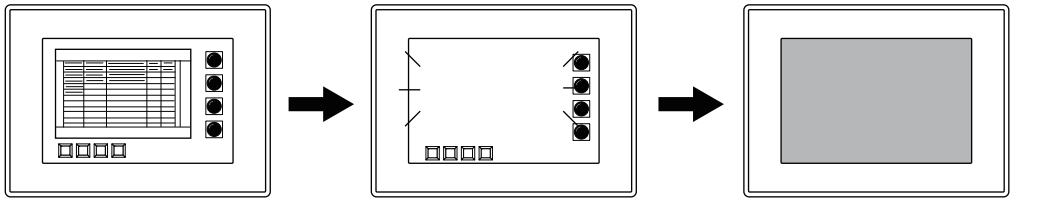
Usage	Description
Hiding the PC image screen	Configure the touch screen settings to turn off the PC image screen display/hide selection bit.
Displaying the monitor screen after hiding the PC image screen	Configure the touch switch settings to turn off the PC image screen display/hide selection bit and to display the monitor screen. Example) Displaying the monitor screen after hiding the PC image screen  Touch switch without a shape (PC image screen display/hide selection bit OFF + screen switching) Touch the screen while the PC image screen is displayed (touch the touch switch). The PC image screen is hidden and the monitor screen is displayed. Example) Hiding the PC image screen  Touch switch without a shape (PC image screen display/hide selection bit OFF) Touch the screen while the PC image screen is displayed (touch the touch switch). The PC image screen is hidden.

Screen save function of the PC image screen

While the PC image screen is displayed, the power saving function of the personal computer display is activated, followed by the GOT screen saver function.

When the power saving function of the personal computer display is not active, the GOT screen save function is disabled even if it is set on the GOT.

The PC image screen save function operates as shown below.



The PC image screen is displayed.

When the GOT detects the power saving state of the personal computer display, the PC image screen is hidden and only the monitor screen is displayed. (Turn on the GOT internal device (GS252.b15).)

When the screen save time set on the GOT has passed, the GOT enters screen save mode.

Relation between the personal computer status and the validity of the GOT screen save function

Personal computer status	Validity of GOT screen save function
Personal computer screen displayed	Invalid (Personal computer screen displayed)
Screen saver operating	
Display power saving function operating	Valid (Personal computer screen → Monitor screen → GOT screen save mode)

■Screen save operation while monitoring

While the PC image screen is hidden, the GOT screen save function operates independently of the power saving function of the personal computer display.

For details on the GOT screen save function, refer to the following.

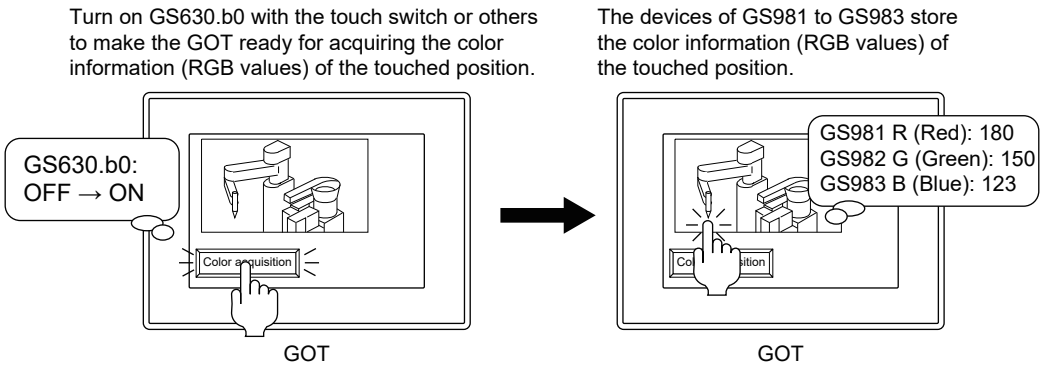
GOT3000 Series User's Manual (Utility & Maintenance Functions)

■When no PC image signal is input to the GOT

When no PC image signal is input to the GOT due to cable disconnection or other reasons, the GOT internal device (GS252.b15) turns on in the same way as when the power saving status of the personal computer display is detected.

Acquiring the color information of the touched position

By using the GOT special registers (GS devices), the color information of the touched position can be acquired.



The following shows the procedure to acquire the color information of the touched position.

1. Use the touch switch or others to turn on the Touched Position Color Acquisition Ready signal (GS630.b0).

Turning on the signal makes the GOT be ready for acquiring the color information of the touched position.

The Touch Position Color (GS981 to GS983) stores -1.

2. Touch the position where you acquire the color information.

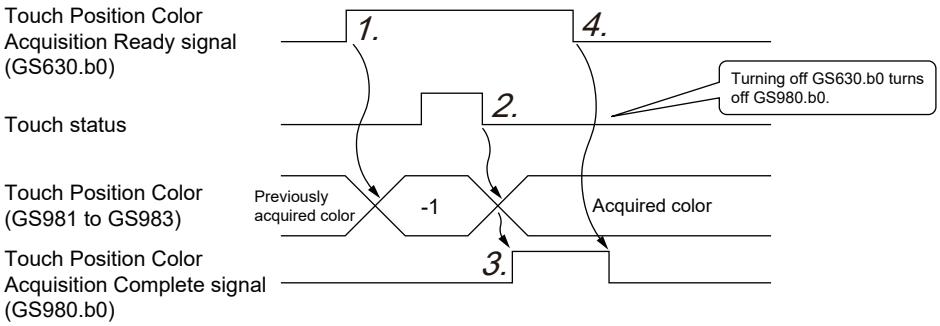
The Touch Position Color (GS981 to GS983) stores the color information of the touched position.

3. After the acquisition of the color information of the touched position, the Touch Position Color Acquisition Complete signal (GS980.b0) turns on.

Then, the GOT stops to acquire the color information.

4. Use the touch switch or others to turn off the Touch Position Color Acquisition Ready signal (GS630.b0).

Turning off the signal also turns off the Touched Position Color Acquisition Complete signal.



■Color information that can be acquired

Depending on the liquid crystal display, camera, or others, the acquired color information may not be exactly the same as the color of the real image.

■Timing when the color information cannot be acquired

The color information cannot be stored in the Touch Position Color (GS981 to GS983) during the following processes.

- Displaying a dialog window
- Moving a window screen
- Returning from the screen save mode
- Screen switching with the operation timing of [When a finger is touched (ON synchronous)]
- Touch operation
- Executing the hard copy function
- The Key-in Disable signal (System signal 1-1.b9) ON
- Acquiring the color information of the touched position

Short touch of the screen may cause the GOT not to recognize the touch operation.

Use the Touch Position Color Acquisition Complete signal (GS980.b0) to check whether the color information has been acquired.

When the signal does not turn on, the GOT has not acquired the color information.

Touch the screen again to acquire the color information.

■Influences on other functions

Acquiring the color information of the touched position may require a maximum of three seconds.

Therefore, it may cause delay in the processes of the other functions.

The hard copy function is also unavailable while the color information of the touched position is acquired.

78.2.5 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for PC image input as required.
The following shows the functions that are available by configuring the relevant settings.

GOT internal devices

Enabling b7 of the device specified in [Digital Image Input Common] enables the extended control.
Use the extended control to display the PC mage screen in full-screen mode or clip mode on the GOT.
For details on the devices, refer to the following.
☞ Page 3581 GOT special register (GS)
☞ Page 2676 Video window or PC image screen when the extended control is enabled

Function	Setting item
Checking if the PC image signal on CH1 is recognized	GS252.b15
Controlling the display position of the PC image screen	GS449.b0
Making the GOT be ready for acquiring the color information of the touched position	GS630.b0
Checking if the acquisition of the color information of the touched position is completed	GS980.b0
Acquiring the color information of the touched position	GS981 to GS983
Checking the input status of the PC image signal	GS1025
Checking the horizontal resolution of the PC image signal	GS1026
Checking the vertical resolution of the PC image signal	GS1027
Checking the frame rate of the PC image signal	GS1028
Specifying the video window or PC image screen to be displayed in full screen when extended control is enabled	GS1998
Notifying the error status of the connected USB converter	GS2070.b0
Notifying the error when the number of video/PC image windows that can be displayed simultaneously has exceeded	GS2085.b0 to b4 GS2085.b6

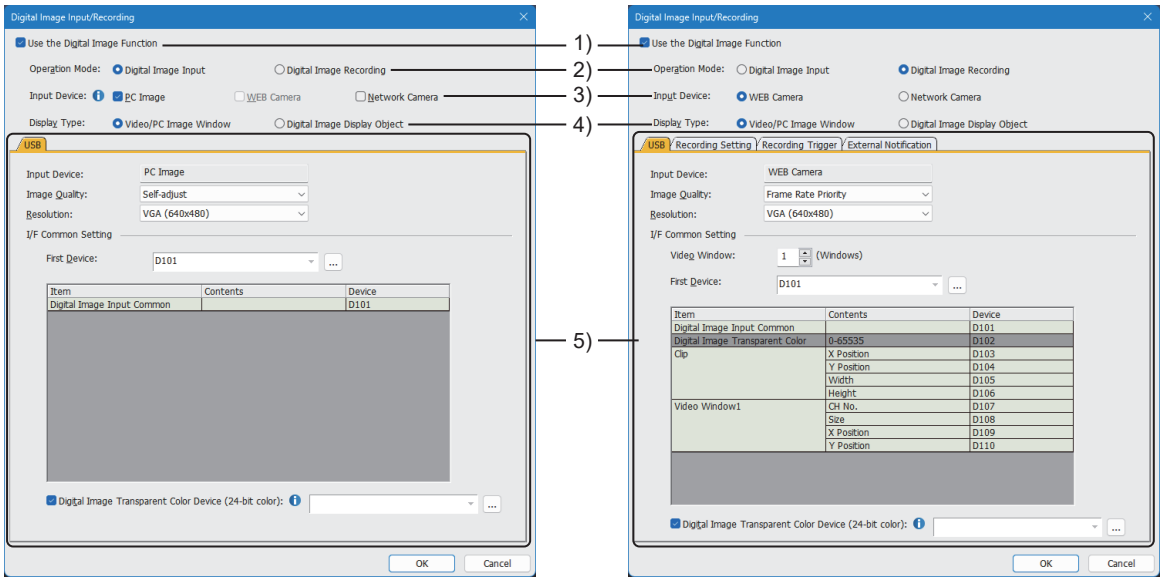
PART 21

78.3 [Digital Image Input/Recording] dialog

GT37 SoftGOT3000

Select [Common] → [Peripheral Setting] → [Digital Image Input/Recording] from the menu to display the setting dialog.
This dialog is common to the following functions.

- Digital image display object
- Digital image input/recording function



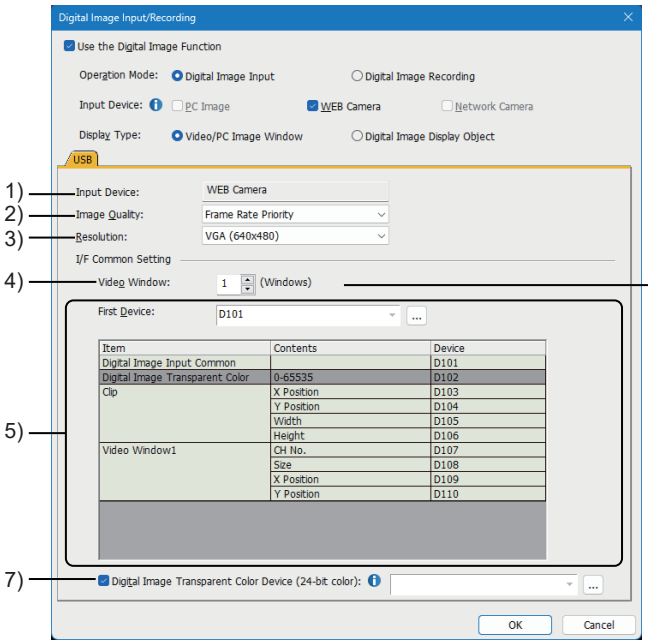
When [Operation Mode] is [Digital Image Input]

When [Operation Mode] is [Digital Image Recording]

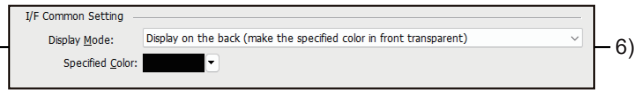
Item		Description
1)	[Use Digital Image Input]	Enables the following functions. • Digital image display object • Digital image input/recording function
2)	[Operation Mode]	Select the operation mode. The following shows selectable items. • [Digital Image Input] • [Digital Image Recording]
3)	[Input Device]	When the operation mode is set to [Digital Image Recording], [PC Image] is not displayed. Select an input device according to the function used. The following shows selectable items. • [PC Image] • [WEB Camera] • [Network Camera] [WEB Camera] and [PC Image] or [Network Camera] cannot be selected simultaneously.
4)	[Display Type]	Select the display type of the image. The following shows selectable items. • [Video/PC Image Window] • [Digital Image Display Object]
5)	Tab	The tab to be displayed depends on the combination of [Operation Mode], [Input Device], and [Display Type]. ☞ Page 2689 [USB] tab ☞ Page 2691 [Ethernet] tab ☞ Page 2693 [Recording Setting] tab ☞ Page 2695 [Recording Trigger] tab ☞ Page 2696 [External Notification] tab

78.3.1 [USB] tab

This item is displayed when [PC Image] or [WEB Camera] is selected for [Input Device].



When [Display Type] is [Video/PC Image Window]



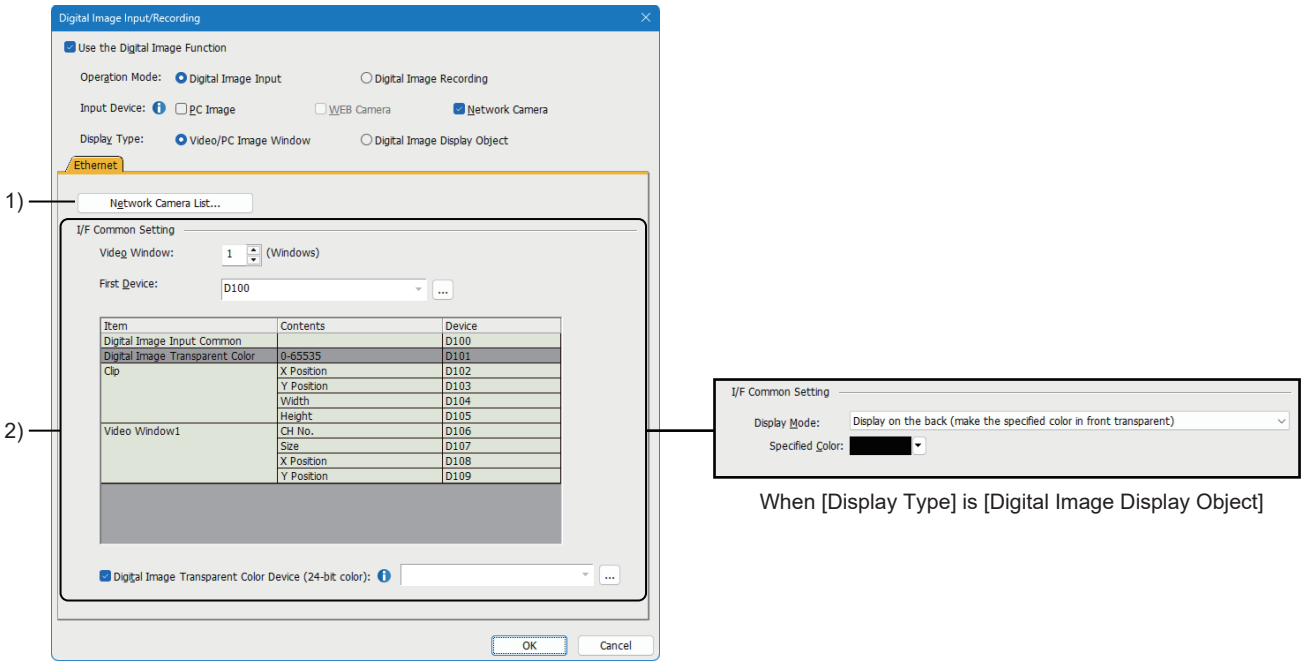
When [Display Type] is [Digital Image Display Object]

Item		Description
1)	[Input Device]	Displays the selected input device.
2)	[Image Quality]	Select the quality of the video to be displayed. The following shows selectable items. • [Self-adjust] • [Frame Rate Priority] • [Image Quality Priority] This item is fixed to [Frame Rate Priority] when [WEB Camera] is selected for [Input Device].
3)	[Resolution]	Set the resolution of the image to be displayed.
4)	[Video Window]	This item is displayed when [WEB Camera] is selected for [Input Device] and [Video/PC Image Window] is selected for [Display Type]. Specify the channel number to be displayed on the video window.

Item			Description
5)	[First Device]		This item is displayed when [Video/PC Image Window] is selected for [Display Type]. Set a start device of the devices to be used. By setting the first device, consecutive devices are automatically assigned to the following items.
	[Digital Image Input Common]		Displays the devices used to display the video window or PC image screen. The values of the device used to display the video window or PC image screen are processed as 16-bit binary values. ☞ Page 2672 Advanced use
	[Digital Image Transparent Color]		Appears when [WEB Camera] is selected for [Input Device]. Specify the transparent color for the transparent processing. The transparent color depends on the bit device set by b10 of [Digital Image Input Common]. • When b10 is on: 0 to 65535 • When b10 is off: 0 (Black) to 255 (White) ☞ Page 2672 Advanced use
	[Clip]		Appears when [WEB Camera] is selected for [Input Device]. • [X Position]: Specify the X coordinate to display a video image when the clip mode is used. • [Y Position]: Specify the Y coordinate to display a video image when the clip mode is used. • [Width]: Specify the width of a clipped image. • [Height]: Specify the height of a clipped image.
	[Video Window1] [Video Window2] [Video Window3] [Video Window4]		Appears when [WEB Camera] is selected for [Input Device]. The related setting items appear for each video window according to the set value of [Video Window]. • [CH No.]: Specify the channel number displayed on a video window. The setting range is [1]. • [Size]: Specify the display size of the video window. The following shows the setting range for the display size. 0: 100% 1: 50% 2: 25% When the display size of the video window is changed by touching the window, the value of the set device remains unchanged. • [X Position]: Specify the X coordinate of the video window. • [Y Position]: Specify the Y coordinate of the video window.
6)	[Display Mode]	—	Appears when [Use Digital Image Display Object] is selected. Set the GOT display mode for the digital image display object. For details on [Display Mode], refer to the following. ☞ Page 1853 Display mode
		[Display on the foreground]	Displays a digital image display object in front of the other figures and objects on the same screen. Overlapped figures and objects are hidden under the digital image display object. The transparent function is disabled.
		[Display on the specified color area]	Displays a digital image display object behind the other figures and objects on the same screen. The transparent function is enabled. Select a color to become transparent. ☞ Page 988 Color settings When setting [Background Color] for digital image display objects, select the same color for [Front Layer Transparent Color] and [Background Color]. Otherwise, the digital image display object is hidden under the background color.
		[Display on the area of other colors]	Displays a digital image display object behind the other figures and objects on the same screen. The transparent function is enabled. Select a color not to become transparent so that other colors become transparent. ☞ Page 988 Color settings When setting [Background Color] for digital image display objects, select the same color for [Front Layer Transparent Color] and [Background Color]. Otherwise, the digital image display object is hidden under the background color.
7)	[Digital Image Transparent Color Device (24-bit color)]		This item is displayed when [Video/PC Image Window] is selected for [Display Type]. Specify the transparent color for the transparent processing from 16770000 colors in a double-word device. To specify the color, use 8 bits (256 levels) for R, G, and B respectively, 24 bits in total. When this item is set, the following settings are invalid: • b10 and b11 of the [Digital Image Input Common] device • [Digital Image Transparent Color]

78.3.2 [Ethernet] tab

This item is displayed when [Network Camera] is selected for [Input Device].

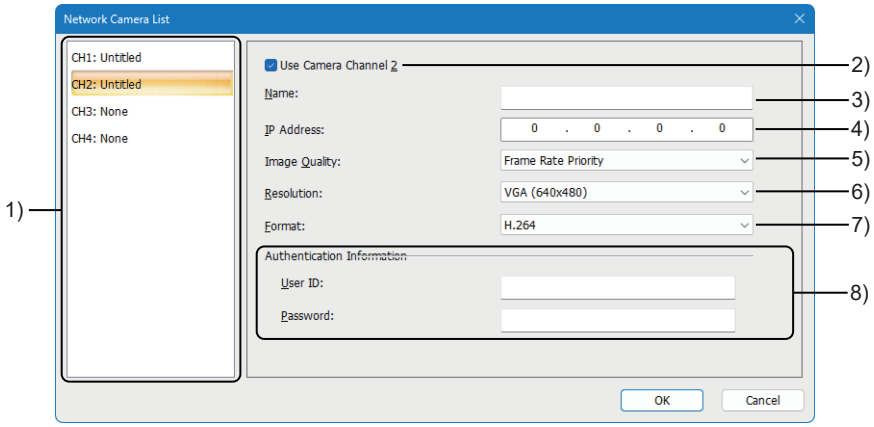


When [Display Type] is [Video/PC Image Window]

When [Display Type] is [Digital Image Display Object]

Item		Description
1)	[Network Camera List] button	Clicking this button displays the [Network Camera List] dialog. ☞ Page 2692 [Network Camera List] dialog
2)	[I/F Common Setting]	Setting items are the same as those in the [USB] tab. For details, refer to the following. ☞ Page 2689 [USB] tab

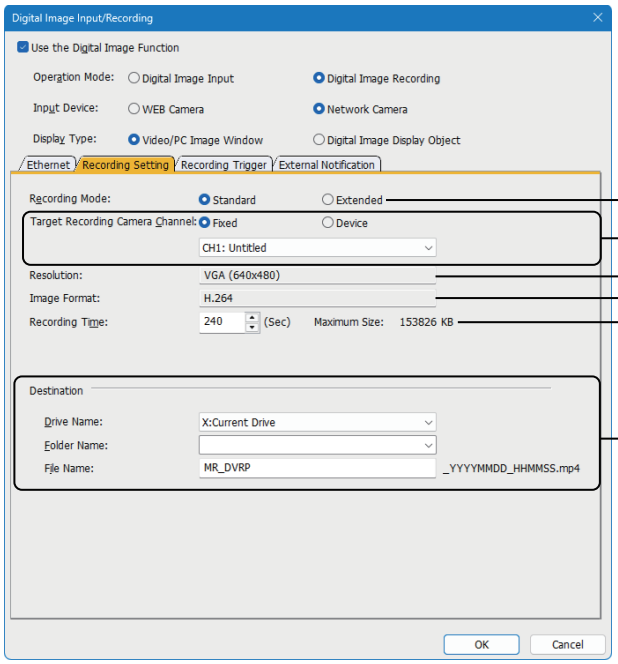
[Network Camera List] dialog



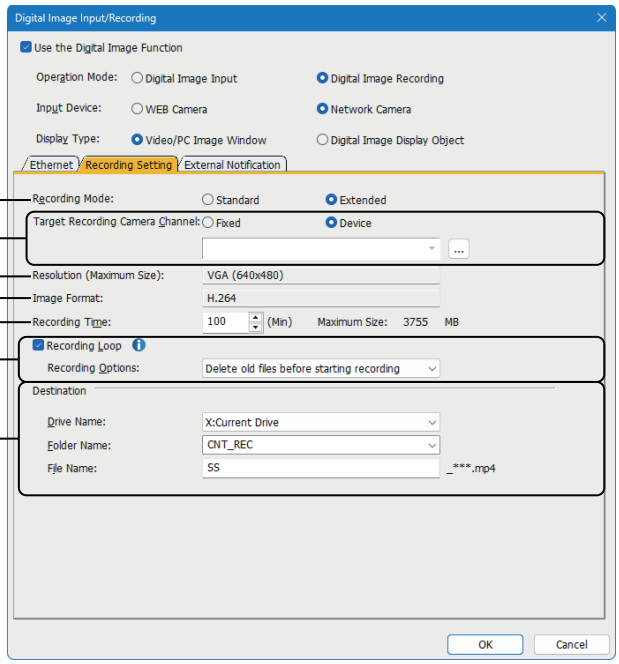
Item			Description
1)	Channel list		Displays the use status and name of each channel.
2)	[Use Camera Channel 2] [Use Camera Channel 3] [Use Camera Channel 4]		These items are displayed when CH2 to 4 are selected. Selecting each item enables the setting.
3)	[Name]		Set the name of the network camera. Up to 100 characters can be set.
4)	[IP Address]		Set the IP address of the network camera to be connected. The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].
5)	[Image Quality]		Select the quality of the video to be displayed. The following shows selectable items. • [Frame Rate Priority] • [Image Quality Priority]
6)	[Resolution]		Set the resolution of the image to be displayed.
7)	[Format]		Set the format of the image.
8)	[Authentication Information]	[User ID]	Set the user ID of the network camera. Up to 64 uppercase and lowercase alphabetic characters, numbers, one-byte spaces, and the symbols below are usable for a user ID. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~
		[Password]	Set the password for the network camera. Up to 64 uppercase and lowercase alphabetic characters, numbers, one-byte spaces, and the symbols below are usable for a password. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~

78.3.3 [Recording Setting] tab

This item is displayed when [Digital Image Recording] is selected for [Operation Mode].



When [Recording Mode] is [Standard], and
[Target Recording Camera Channel] is set to [Fixed]



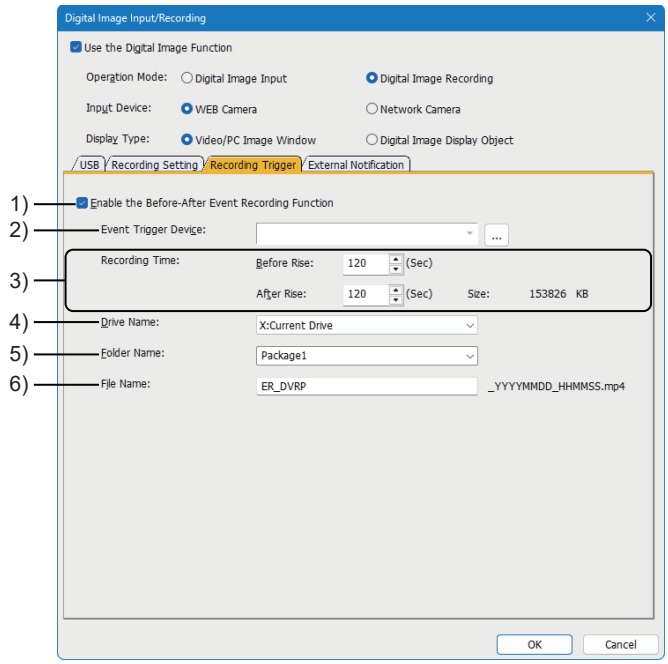
When [Recording Mode] is [Extended], and
[Target Recording Camera Channel] is set to [Device]

Item			Description
1)	[Recording Mode]		Set the recording mode. The following shows selectable items. • [Standard] • [Extended]
2)	[Target Recording Camera Channel]		Set the camera channel to be recorded. • [Fixed] Specify the camera channel to be recorded directly. • [Device] Specify the camera channel to be recorded with a device. Select this item and set the device.
3)	[Resolution] [Resolution (Maximum Size)]		The item name depends on the setting of [Target Recording Camera Channel]. Displays the resolution or the maximum size of the resolution.
4)	[Image Format]		Displays the format of the image to be recorded.
5)	[Recording Time]		Set the recording time. The setting range depends on the setting of [Recording Mode]. • [Standard]: [10] to [240] seconds • [Extended]: [15] to [3000] minutes The maximum size of the recording data is displayed based on the set recording time.
6)	[Recording Loop]	—	This item is displayed when [Extended] is selected for [Recording Mode]. Select this item to repeat recording.
		[Recording Options]	Select an option when [Recording Loop] is set. The following shows selectable items. • [Delete old files before starting recording] • [Use consecutive numbers when saving files]

Item			Description
7)	[Destination]	—	Set the destination to save recording data.
		[Drive Name]	Select a drive to store recording data. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
		[Folder Name]	Set the folder name of the destination to save recording data. For the character type and the number of characters available for folder names, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
		[File Name]	Set the file name of the recording data. The suffix of the file name depends on the setting of [Recording Mode]. For the character type and the number of characters available for file names, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT

78.3.4 [Recording Trigger] tab

This item is displayed when [Standard] is selected for [Recording Mode] in the [Recording Setting] tab.

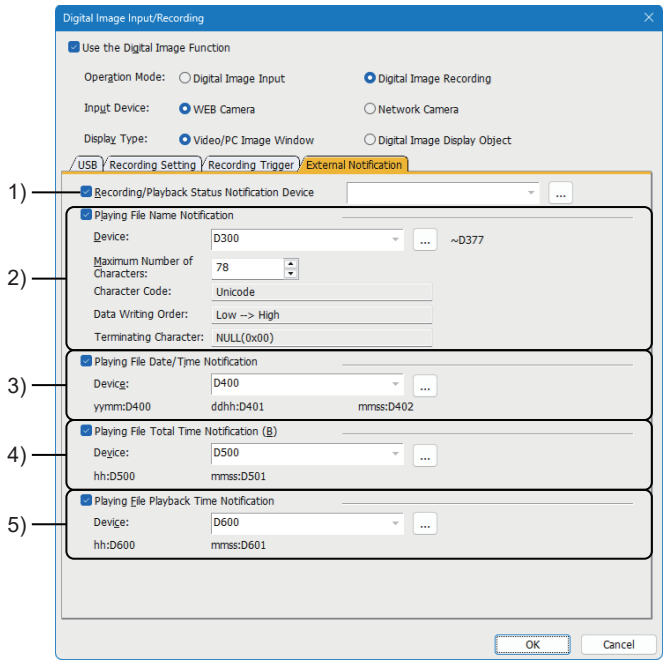


Item		Description
1)	[Enable the Before-After Event Recording Function]	Selecting this item enables the recording before and after the event function.
2)	[Event Trigger Device]	Set a trigger device for recording. ☞ Page 834 How to set devices, labels, and tags
3)	[Recording Time]	Set the recording time for [Before Rise] and [After Rise]. The setting range is [10] to [120] seconds. The size of the recording data is displayed based on the set recording time.
4)	[Drive Name]	Select a drive to store recording data. For the available drives by GOT model, refer to the following. ☞ Page 81 Drive configuration and capacity of the GOT
5)	[Folder Name]	Set the folder name of the destination to save recording data. For the character type and the number of characters available for folder names, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
6)	[File Name]	Set the file name of the recording data. For the character type and the number of characters available for file names, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT

PART 21

78.3.5 [External Notification] tab

This item is displayed when [Digital Image Recording] is selected for [Operation Mode].



Item			Description
1)	[Recording/Playback Status Notification Device]		Set a device for notifying the status of recording and playback. The data type is unsigned 16-bit binary. The following shows the notification details of each bit. • b0: Notifies the recording status. (0: Stop, 1: Recording) • b1: Notifies the enabled/disabled status of the recording before and after the event. (0: Disabled, 1: Enabled) • b2: Notifies the status of the recording before and after the event (0: Recording before the event, 1: Recording after the event) • b3: Use prohibited • b4 to 6: Notifies the status of the playback. (000: Stop, 001: Normal playback, 010: Pause, 100: Slow playback, 101: Fast-forward playback) • b7 to b15: Use prohibited ☞ Page 834 How to set devices, labels, and tags
2)	[Playing File Name Notification]	—	Selecting this item enables the notification of the playing file name.
		[Device]	Set a device to store the file name. As many devices as the number of characters specified in [Maximum Number of Characters] starting from a specified device are used. ☞ Page 834 How to set devices, labels, and tags
		[Maximum Number of Characters]	Set the maximum number of characters. The setting range is [1] to [78].
		[Character Code]	Displays the character code of the file name to be stored in the device. The character code is fixed to [Unicode].
		[Data Writing Order]	Displays the order in which the data is written into the device. It is fixed to [Low-->High].
		[Terminating Character]	Displays the termination character. It is fixed to [NULL(0x00)].
3)	[Playing File Date/Time Notification]		Set a device for notifying the recording date and time of the file to be played. Devices for three words starting from the set device are used. The data format is BCD. ☞ Page 834 How to set devices, labels, and tags
4)	[Playing File Total Time Notification]		Set a device for notifying the total time of the file to be played. Devices for two words starting from the set device are used. The data format is BCD. ☞ Page 834 How to set devices, labels, and tags
5)	[Playing File Playback Time Notification]		Set a device for notifying the playback time of the file to be played. Devices for two words starting from the set device are used. The data format is BCD. ☞ Page 834 How to set devices, labels, and tags

PART 22 Video output function

79 Displaying the GOT screen on an external display (video output function)

79 Displaying the GOT screen on an external display (video output function)

GT37 SoftGOT3000

☞ Page 2698 Overview of the video output function
☞ Page 2700 Specifications of the video output function
☞ Page 2704 How to use the video output function
☞ Page 2705 Relevant settings

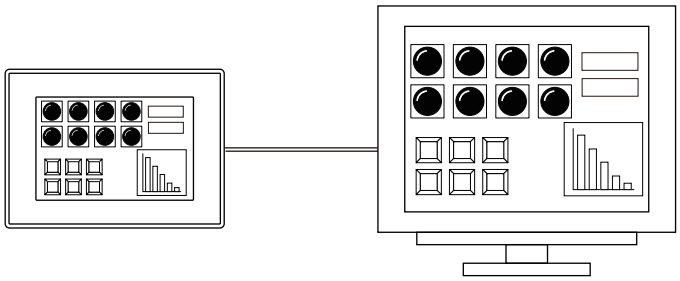
79.1 Overview of the video output function

GT37 SoftGOT3000

This function enables you to output the GOT screen to a commercially available display.

• Outputting the screen image displayed on the GOT

You can monitor the PLC status on the GOT and display the monitoring result on a big screen in a factory.

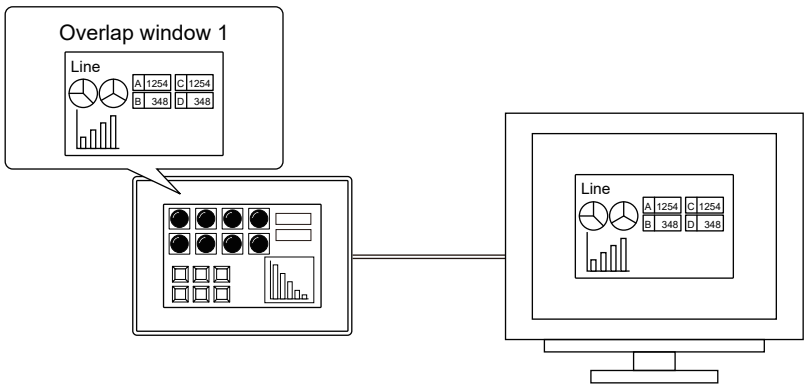


Outputting the screen on the GOT to a commercially available display

• Outputting an overlap window image

The specified overlap window image can be output to the display and used for the ANDON function.

When an overlap window image is output to the display, the window is not displayed on the GOT.



Outputting overlap window 1 to the display

Precautions

■Operation on the display

Even if the display supports touch operation, the objects on the display are cannot be operated via touch.

■When using the digital image input function

The screen output to the display cannot display images that use the digital image input function.

■Sound output

Sound cannot be output even if the sound output is set.

To output sound, use the sound output function.

☞ Page 2707 Outputting sound with the GOT (sound output function)

79.2 Specifications of the video output function

GT37 SoftGOT3000

79.2.1 Overlap window image to be output to the display

Select an overlap window image to be output to the display in the [GOT Setup] window ([Digital Image Output]).

☞ Page 647 [Digital Image Output]

The selected overlap window is not displayed on the GOT.

Disabled functions

The following functions set for the overlap window whose image is to be output to the display are disabled.

- Assignment to a system window
- Display position specification
- Display order specification
- Touch operation on the screens behind the overlap window
- Title bar display
- Automatic closing of the overlap window when the base screen is switched

Switching the screen

To switch the screen displayed on the overlap window, use a screen switching device or Go To Screen switch.

☞ Page 542 [Screen Switching/Window]

☞ Page 1220 [Go To Screen Switch] dialog

When 0 is set to the screen number, a black screen is output to the display.

Precautions

■Changing the screen image to be output to the display

When the project data, where the selection or deselection of [Use the digital image output] is changed in the [GOT Setup] window ([Digital Video Output]), is written, the GOT restarts.

■Precautions when outputting an overlap window image

• Display when transitioning a GOT screen to a screen other than a user-created screen

In this situation, [Monitoring has been stopped.] will appear on the display.

The screen to be displayed on the display at screen transition can be changed using GS633.

☞ Page 3581 GOT special register (GS)

• Effects of GOT screen switching on the displayed overlap windows

When the GOT screen switches to any screen other than a user-created screen (such as a utility screen), the monitoring of the displayed overlap windows also stops.

Switching to a user-created screen from any other screen (such as a utility screen) resumes monitoring of the displayed overlap windows, but data and other unsaved information in memory are deleted.

The following items do not retain their displays when monitoring resumes.

Items that do not retain their displays when monitoring resumes	Setting
Scatter graph	• When [Store Memory] is deselected and [Graph Type] is [Sample] • When [Store Memory] is deselected, [Graph Type] is [Batch], and [Display Mode] is [Locus]
Parts display	• When [Display Mode] is [Overwrite] • When [Display Mode] is [Locus]
Figures freely drawn using the object script	—

• Overlap window when GT Simulator3 is used

An overlap window image to be output to the display appears as a normal overlap window in GT Simulator3.

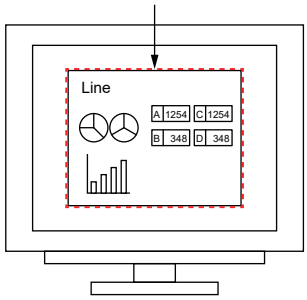
However, the title bar is not displayed. Configure a method to close the window.

79.2.2 Resolution of the screen to be output to the display

The screen image is output to the display in the GOT (output source) screen resolution.

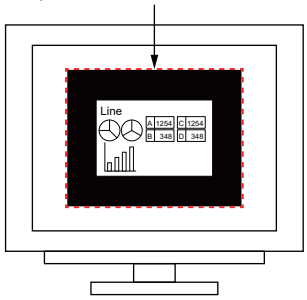
If an overlap window smaller than the GOT screen is output, space (black area) appears around the overlap window.

Red line: GOT screen resolution



Displaying an overlap window created in the same size as the GOT screen

Red line: GOT screen resolution
Black area: Extra space that shows the GOT screen resolution



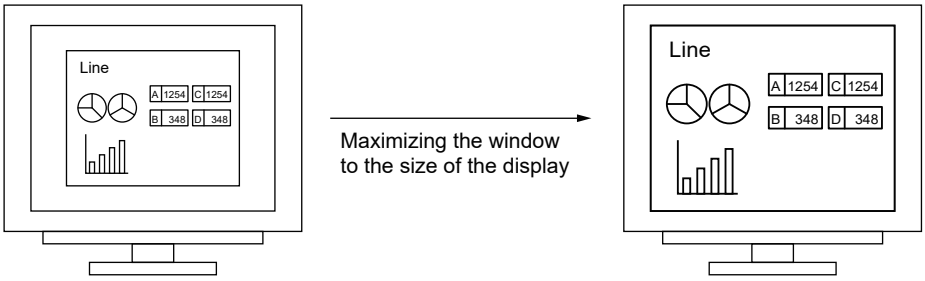
Displaying an overlap window created smaller than the GOT screen

When the screen is changed on the display, the screen, is resized according to the GOT screen resolution.

Since the window has extra space, the screen may not be resized as intended in some situations.

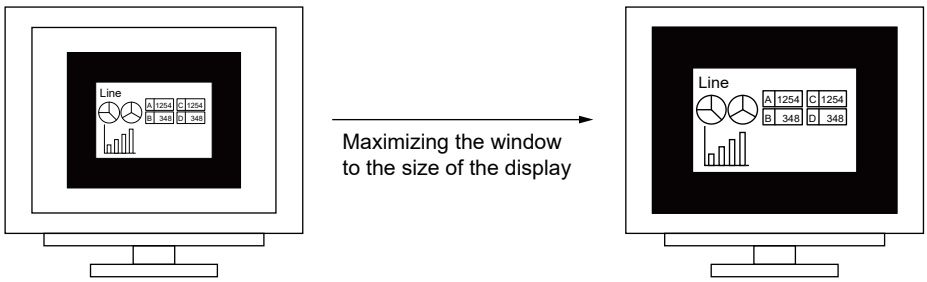
Ex.

Maximizing the screen on the display to the size of the display



Displaying an overlap window created in the same size as the GOT screen

The window without extra space will be expanded to full-screen.



Displaying an overlap window created smaller than the GOT screen

The window with extra space will not be expanded to full-screen.

It is recommended to create an overlap window whose image is to be output according to the screen resolution of the GOT.

Precautions

If you set vertical installation for the GOT and create a screen, use the display vertically.

79.2.3 Display on the external display showing a dialog window when the GOT is in screen saving mode

When the GOT is in screen saver mode, the external display will not enter screen saver mode.

When the GOT displays a dialog window, the display on the external display differs depending on what screen is output to the display.

- Outputting the screen image displayed on the GOT

The external display displays the screen showing a dialog window.

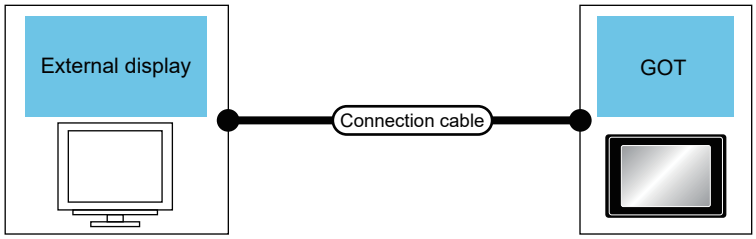
- Outputting an overlap window image

The external display displays the specified overlap window only.

79.3 How to use the video output function

GT37 SoftGOT3000

79.3.1 System configuration



For information on the maximum number of connected devices, refer to the following.

☞ Page 2704 Maximum number of connected devices

External display	Connection cable	Maximum cable length	GOT	
Model	Model		Interface	GOT model
HDMI-compatible display	HDMI cable	*1	Built-in digital image output interface	GT37 SoftGOT3000

*1 The maximum cable length varies depending on the cable specifications.

Maximum number of connected devices

Only one display can be connected to one GOT.

79.3.2 Setting procedure

1. Connect an external display to the GOT.

☞ Page 2704 System configuration

2. In the [GOT Setup] window ([Digital Image Output]), select [Use the digital image output].

☞ Page 647 [Digital Image Output]

3. To display an overlap window on the display, select the overlap window to output its image in the [GOT Setup] window ([Digital Image Output]).

4. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

5. Display the GOT screen on the external display.

79.4 Relevant settings

GT37 SoftGOT3000

The following shows the functions that are available by configuring the relevant settings.

79.4.1 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Available only when an overlap window is output to the display. Setting a screen to be displayed on the display at transition of a GOT screen to a screen other than a user-created screen	GS633
Setting the screen number of a screen other than an overlap window to be output to the display by setting 1 to GS633	GS634

PART 23 Sound output function

80 Outputting sound with the GOT (sound output function)

80 Outputting sound with the GOT (sound output function)

GT37 SoftGOT3000

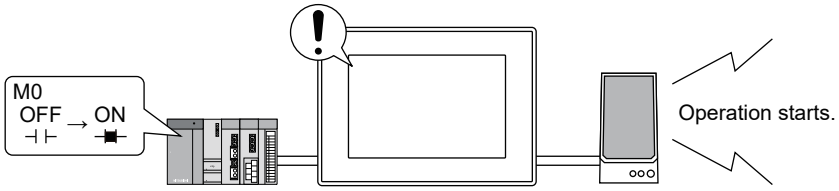
☞ Page 2707 Overview of the sound output function
☞ Page 2708 Specifications of the sound output function
☞ Page 2712 How to use the sound output function
☞ Page 2714 Registration of the speech synthesis license
☞ Page 2715 [Sound File List] dialog
☞ Page 2717 [Create New Sound File] or [Edit Sound File] dialog
☞ Page 2719 [Touch Key Sound Setting] dialog
☞ Page 2720 Relevant settings

80.1 Overview of the sound output function

GT37 SoftGOT3000

The sound output function outputs sounds through the audio equipment (including loudspeakers) that is connected to the GOT.

Ex.
Playing a sound when the condition of a trigger action is satisfied



The specified sound file will play when the set condition is satisfied (M0 is turned on).

80.1.1 Playing a sound

A sound plays when the condition of a trigger action or time action is satisfied or when a relevant switch is touched.

80.1.2 Stopping the playback

The current playback is stopped when the condition of a trigger action is satisfied or when a relevant switch is touched.

80.1.3 Muting or unmuting the sound

The sound is muted or unmuted when the condition of a trigger action is satisfied or when a relevant switch is touched.

Precautions

If you select [Unmute when starting MELSOFT GT SoftGOT3000] in the [Setting] dialog of GT SoftGOT3000, the application is unmuted regardless of the Windows sound settings.
If you deselect the item, the Windows sound settings are applied.
However, if you mute all sounds on Windows, GT SoftGOT3000 remains mute.

80.2 Specifications of the sound output function

GT37 SoftGOT3000

80.2.1 System application (add-on function)

To use the sound output function, a system application (add-on function) for [Sound Output] is required.
Creating one or more sound file in the [Sound File List] dialog automatically incorporates the system application into the package data.
In order to use this function with GT SoftGOT3000, this system application (add-on function) is not required.

80.2.2 Number of sound output function settings for one project

One setting can be configured per project.

80.2.3 Sound file specifications

The following shows the specifications of usable sound files for the sound output function.

Item	Specifications
File format	WAV format (48.000 kHz, 16 bits, mono)
Maximum number of registered sound files	500 files for one project
Maximum size of registered sound files in total	512 MB for one project
Maximum playback time	30 seconds for one file For a sound file with the playback time exceeding 30 seconds, the sound is cut off after 30 seconds.

Precautions

Sound cannot be output if audio equipment that does not support the sampling frequency (48.000 kHz) is connected.

80.2.4 Registrable sound file types

Message

The sound files of the message type are generated by converting the entered text into speech.
The speaker, speed, pitch, and volume of the voice are settable.
No sound file with the playback time exceeding 30 seconds is registrable.
To register or update the sound files of the message type, the speech synthesis license must be registered.
For information on how to register the speech synthesis license, refer to the following.
☞ Page 2714 Registration of the speech synthesis license

Sound effect

The sound files of the sound effect type come with GT Designer3.

Melody

The sound files of the melody type come with GT Designer3.

Precautions

Do not use the sound files of the sound effect type or melody type that are settable in the [Edit Sound File] dialog for any purpose other than the GOT sound output.

File

User-specified WAV sound files are imported to use.
The WAV sound files (48.000 kHz, 16 bits, mono) are imported as they are.
The WAV sound files in the following conditions are converted automatically at import.

- Sampling frequency: Any
- Number of bits: 8 bits or 16 bits
- Channel: Stereo or mono

The files are automatically converted into WAV format (48.000 kHz, 16 bits, mono).
To import any WAV sound file other than the above, convert the file into an applicable WAV sound file by using general-purpose audio editing software.

Precautions

In such a case, import the source file again.
The imported WAV sound file in the [Edit Sound File] dialog is not updated when you make a change to the import source file.

80.2.5 Playback specifications

One sound file plays at a time.

While a sound file is playing, if you specify another sound file to play, operation varies depending on the specified file number.

When the specified sound file differs from the playing one

The specified sound file is held on standby and plays after the current file has finished playing.

If you specify multiple sound files to play, the specified files play in the order in which the files are held on standby.

Up to 16 sound files are held on standby.

When the playing sound file or standby sound file is specified again

The sound file specified again does not play.

80.2.6 Functions working together with the sound output function

The sound output function is usable for the relevant functions shown below.

- Trigger action
- Time action
- Action of the switch (Sound output)
- Touch key sound of the touch switch

The following shows the availability of the operations of the sound output function by relevant function.

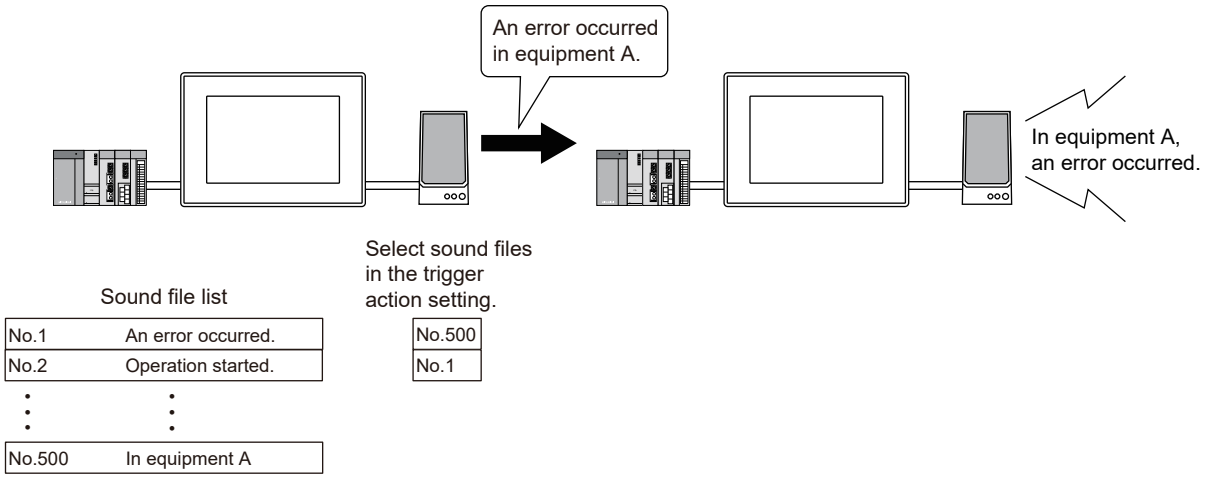
○: Available, —: Not available

Relevant function	Sound output function			
	Play	Stop	Mute or unmute	Continuous play of a playlist
Trigger action	○	○	○	○
Time action	○	—	—	—
Action of the switch (Sound output)	○	○	○	—*1

*1 To play the preselected sound files continuously with a corresponding switch, set the playlist in a trigger action setting and execute the trigger action with the switch.

80.2.7 Playing the preselected sound files continuously

You can select multiple sound files to play them continuously with one trigger action.



Up to 16 sound files are selectable for one trigger action.

The same sound file numbers can be specified for one trigger action.

For the setting method, refer to the following.

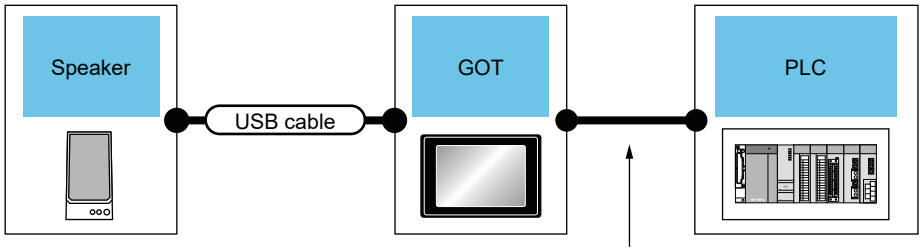
☞ Page 2521 Operating a device as a trigger ([Trigger Action])

Stopping the current playback cancels the other sound files that are selected for the same trigger action.

80.3 How to use the sound output function

GT37 SoftGOT3000

80.3.1 System configuration



For information on the maximum number of connected devices, refer to the following.

☞ Page 2712 Maximum number of connected devices

Speaker	Connection cable	GOT		PLC
Model		Interface	GOT	
Speakers connectable via USB For connectable speakers, refer to the following Technical Bulletin. 📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)	USB cable	Built-in USB interface	GT37 SoftGOT3000	For information on the system configuration between the GOT and the PLC, refer to the following. 📖GOT3000 Series User's Manual (Connection)
Built-in personal computer speaker or external speaker (If your personal computer has no sound function, use a sound card.)	Varies according to the specifications of the external speaker used.	Personal computer interface	GT37 SoftGOT3000	

Maximum number of connected devices

Only one speaker can be connected to one GOT.

80.3.2 Setting procedure

1. Connect the GOT and the speaker.

☞ Page 2712 System configuration

2. To import a sound file, convert the file as necessary.

To convert the file, use general-purpose audio editing software.

If you need sample data of sound file, consult your local sales office.

3. Edit or register a sound file in the [Sound File List] dialog.

☞ Page 2715 [Sound File List] dialog

4. Configure the setting of the relevant function to work with the sound output function.

- Trigger action

Set the sound output for a target action.

☞ Page 2530 [Trigger/Action] dialog

- Time action

Set the sound output for a target action.

☞ Page 2551 [Time Action Attribute] dialog

- Action of the switch (Sound output)

Set the sound output for the action of a target switch.

☞ Page 1199 [Switch] dialog

- Touch key sound of the touch switch

Configure the setting to use a specified sound file for the touch key sound.

☞ Page 2719 [Touch Key Sound Setting] dialog

5. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

80.4 Registration of the speech synthesis license

GT37 SoftGOT3000

To register or update a sound file of the message type in the [Edit Sound File] dialog, purchase and register the speech synthesis license (SW1DND-GTVO-M).

If the speech synthesis license is unregistered, each file is playable only in the [Edit Sound File] dialog.

For purchasing the speech synthesis license, contact your local sales office.

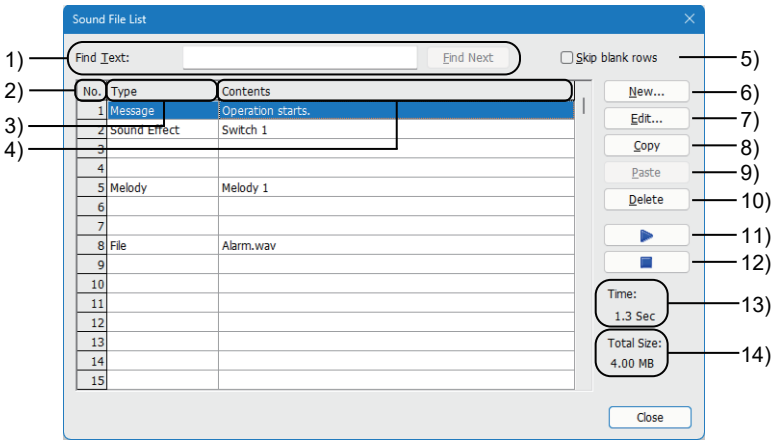
For registering the speech synthesis license, refer to the following.

GT Works Text to Speech License Registration Instructions

80.5 [Sound File List] dialog

GT37 SoftGOT3000

Select [Common] → [Sound] → [Sound File List] from the menu to display the setting dialog.
Register a sound file to play on the GOT.



Item		Description
1)	[Find Text]	Search the sound file list for a sound file based on the search keyword. The [Contents] column is searched. Up to 512 characters can be entered as the search keyword. Click the [Find Next] button to search for the next occurrence of the keyword.
2)	[No.]	Registered sound file number. Up to 500 sound files are registrable.
3)	[Type]	Sound file type ([Message], [Sound Effect], [Melody], or [File]) that is set in the [Edit Sound File] dialog.
4)	[Contents]	• When [Type] is set to [Message] The contents of a sound file (message) are displayed. • When [Type] is set to [Sound Effect] or [Melody] The title of a sound file is displayed. • When [Type] is set to [File] The file name of a sound file is displayed.
5)	[Skip blank rows]	Displays only the rows where sound files are set.
6)	[New] button	Displays the [Create New Sound File] dialog. ☞ Page 2717 [Create New Sound File] or [Edit Sound File] dialog Set a new sound file.
7)	[Edit] button	Displays the [Edit Sound File] dialog. ☞ Page 2717 [Create New Sound File] or [Edit Sound File] dialog Edit a selected sound file.
8)	[Copy] button	Copies a selected row. Multiple rows can be copied at once.

Item		Description
9)	[Paste] button	Pastes a copied row on a selected row. Multiple rows are pasted on an equal number of consecutive rows, starting from a selected row. When [Skip blank rows] is selected, clicking the [Paste] button displays the [Copy Sound File] dialog.  When one row is copied  When multiple rows are copied • [File No.] Set the file number of the destination row. The setting range is [1] to [500]. • [First File No.] Set the file number of the first destination row. The setting range is [1] to [500]. If the destination row has a sound file setting, the [Confirm Sound Overwrite] dialog appears.  • [Yes] Overwrites the row where the sound file specified in this dialog is set. • [Overwrite All] Overwrites all the rows. • [No] Does not overwrite the row where the sound file specified in this dialog is set. • [Cancel] Cancels the paste on the rows, starting from the one where the sound file specified in this dialog is set.
10)	[Delete] button	Deletes a selected sound file.
11)	[Play] button	Plays a selected sound file.
12)	[Stop] button	Stops the current playback.
13)	[Time]	Displays the playback time of a selected sound file.
14)	[Total Size]	Displays the total size of the registered sound files. Make sure that the total size of the files is 512 MB or less.

80.6 [Create New Sound File] or [Edit Sound File] dialog

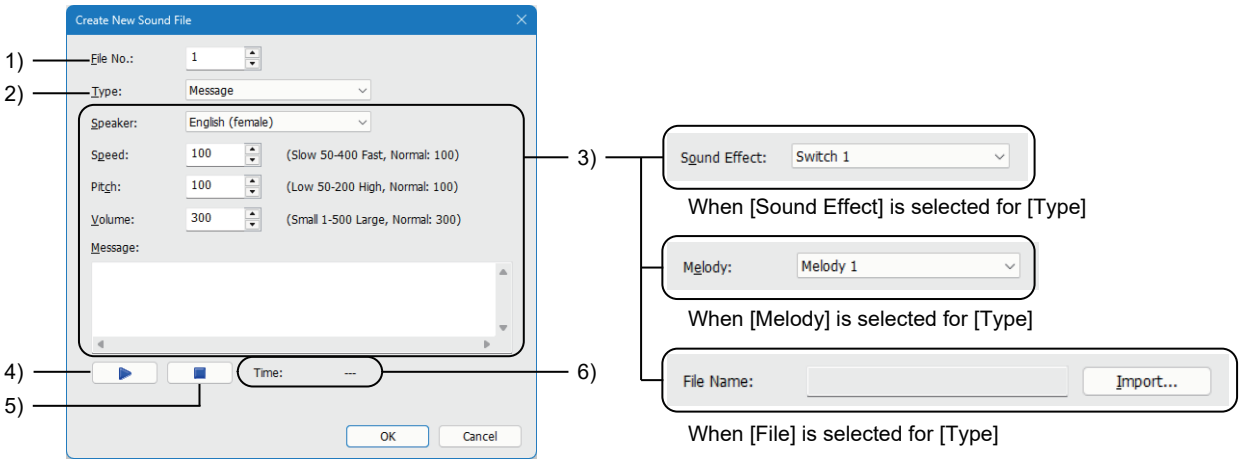
GT37 SoftGOT3000

Create or edit a sound file.

The dialog name varies with the display method.

To display this dialog, perform one of the following operations.

- In the [Sound File List] dialog, click the [New] button.
- In the [Sound File List] dialog, select a target sound file and click the [Edit] button.
- In the [Sound File List] dialog, double-click a target sound file.



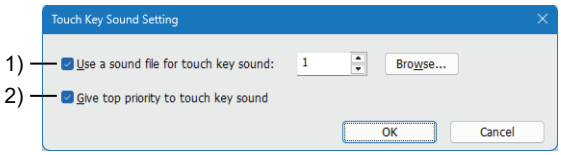
Item		Description
1)	[File No.]	Set a sound file number. The setting range is [1] to [500].
2)	[Type]	Select a sound file type. The following shows selectable items. • [Message]: Sound file that is generated by converting the entered text into speech • [Sound Effect]: Sound file that is supplied with GT Designer3 • [Melody]: Sound file that is supplied with GT Designer3 • [File]: User-specified WAV sound file to be imported To register or update the sound files of the message type, the speech synthesis license must be registered. For information on how to register the speech synthesis license, refer to the following. ☞ Page 2714 Registration of the speech synthesis license

Item			Description
3)	Detail setting	—	Set necessary items according to the selection for [Type].
		[Speaker]	Select the speaker to read aloud a message. The following shows selectable items. • [Japanese (female)] • [Japanese (male)] • [English (female)] • [English (male)] • [Simplified Chinese (female)] • [Simplified Chinese (male)] • [Traditional Chinese (female)] • [Korean (female)] • [Korean (male)] • [Spanish (female)] • [Spanish (male)]
		[Speed]	Set the speed of the synthesized voice. The setting range is [50] (slow) to [400] (fast).
		[Pitch]	Set the pitch of the synthesized voice. The setting range is [50] (low) to [200] (high).
		[Volume]	Set the volume of the synthesized voice. The setting range is [1] (small) to [500] (large).
		[Message]	Enter a message to be read aloud. Up to 1024 characters can be set. A line feed is counted as two characters.
		[Sound Effect]	Select a sound effect to play.
		[Melody]	Select a melody to play.
		[File Name]	Select a sound file to play. Click the [Import] button to display the [Open] dialog. Select a file to be imported to GT Designer3.
4)	[Play] button		Plays the sound file being edited.
5)	[Stop] button		Stops the current playback.
6)	[Time]		Displays the playback time of the sound file being edited. • When [Type] is set to [Message] The sound file whose playback time exceeds 30 seconds is not registrable. The playback time exceeding 30 seconds is displayed in red.

80.7 [Touch Key Sound Setting] dialog

GT37 SoftGOT3000

Select [Common] → [Sound] → [Touch Key Sound Setting] from the menu to display the setting dialog.
Configure the setting to play a sound file when a relevant touch switch is touched.



Item		Description
1)	[Use a sound file for touch key sound]	Plays a sound file when a relevant touch switch is touched. Perform one of the following operations to select a sound file. • Enter a sound file number. • Click the [Browse] button to display the [Sound File List] dialog, and select a sound file.
2)	[Give top priority to touch key sound]	Stops the current playback, cancels all standby sound files and plays the touch key sound when a relevant touch switch is touched.

80.8 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the sound output function as required.
The following shows the functions that are available by configuring the relevant settings.

80.8.1 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Stopping the current playback The standby sound file plays subsequently.	GS518.b0
Stopping the current playback and canceling all standby sound files	GS518.b1
Muting or unmuting the sound	GS518.b2
Notifying that a speaker is connected to the USB interface of the GOT	GS668.b14
Outputting the sound file number in execution to a device	GS669

PART 24 External I/O function, operation panel function

81 Using an external I/O device on the GOT (External I/O function and operation panel function)

81 Using an external I/O device on the GOT (External I/O function and operation panel function)

GT37 SoftGOT3000

☞ Page 2723 Overview of the external I/O function and the operation panel function
☞ Page 2724 Specifications of the external I/O function and the operation panel function
☞ Page 2726 How to use the external I/O function and the operation panel function
☞ Page 2730 [External I/O / Operation Panel] dialog
☞ Page 2732 [Action/Key Code Setting] dialog
☞ Page 2734 Relevant settings

81.1 Overview of the external I/O function and the operation panel function

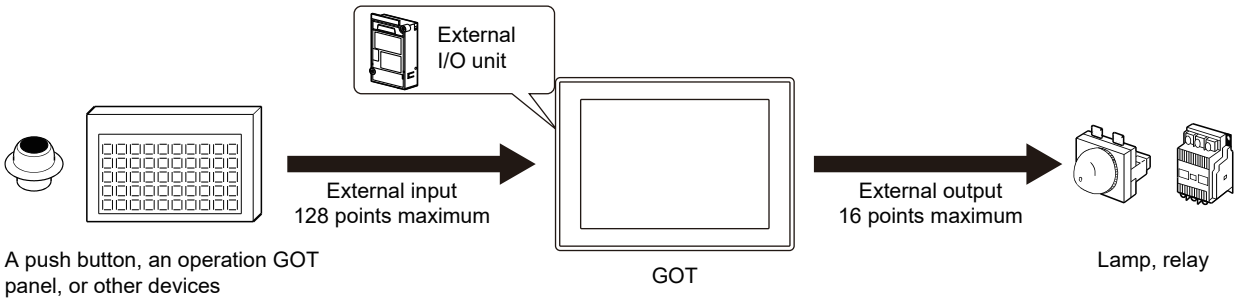
The following two functions are provided for using external I/O devices with the GOT.

External I/O function

The external I/O function enables signal input and output to and from external devices.

The GOT receives signals input from devices such as externally connected push buttons or the operation panel and stores their values in the GOT internal devices.

The GOT outputs the stored value as signals to external devices.



Operation panel function

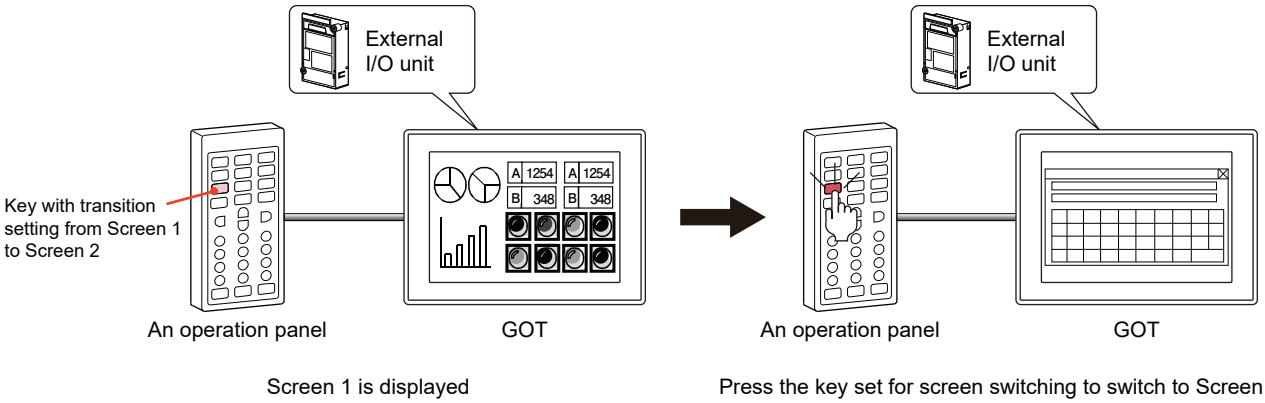
The operation panel function allows for switch operations such as input to numerical input objects and screen switching from an externally connected operation panel.

By assigning the GOT touch switch behavior to a user-created operation panel, input from the operation panel is enabled.

When using GT SoftGOT3000 for input operations, use the keyboard of the personal computer instead of the operation panel.

For details on using the keyboard with GT SoftGOT3000, refer to the following.

GT SoftGOT3000 User's Manual



81.2 Specifications of the external I/O function and the operation panel function

GT37 SoftGOT3000

☞ Page 2724 System application (add-on function)
☞ Page 2724 Number of external I/O function settings for one project
☞ Page 2724 Specifications of the external I/O
☞ Page 2725 Specifications of the operation panel
☞ Page 2725 Operation record (operation log)

81.2.1 System application (add-on function)

To use the external I/O function and the operation panel function, a system application (add-on function) of [External I/O / Operation Panel] is required.
The application is automatically incorporated into the package data by selecting [Destination I/F] in the [External I/O / Operation Panel] dialog.
☞ Page 2730 [External I/O / Operation Panel] dialog

81.2.2 Number of external I/O function settings for one project

One external I/O function setting is available for one project.

81.2.3 Specifications of the external I/O

Externally input signals are stored in the GOT internal devices.
The values in the GOT internal devices are output to the outside as output signals.
☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])
☞ Page 3577 GOT bit register (GB)
☞ Page 3581 GOT special register (GS)
The external I/O function supports the GOT internal devices and the System signals as shown below.

Item	GOT internal device	System Information
Input signal (X0 to X7)	GB30 to GB37	[External I/O Function Input Information1] The signals correspond to the bit numbers (b0 to b7) of the devices.
Input signal (X8 to XF)	GB50 to GB57	[External I/O Function Input Information2] The signals correspond to the bit numbers (b0 to b7) of the devices.
Input signal (X0 to XF) when the 128-point input is enabled*1	GS658 to GS665 The signals correspond to the bit numbers (b0 to b15) of the devices.	—
Output signal (Y0 to YF)	GB10 to GB25	[External I/O Function Output Information] The signals correspond to the bit numbers (b0 to b15) of the devices.

*1 To enable the 128-point input, turn on GS517.b0 (External I/O Function Notification/External I/O Control Function).

When the 128-point input is used for the external I/O function

If input signals X0 to XF turn on, the corresponding GOT internal devices (GB30 to GB37 and GB50 to GB57) also turn on. (The 128-point input is disabled, and GS517.b0 turns off.)

When the external signal output is controlled with the external I/O function

Do not simultaneously perform the following two operations: specifying the device for [External I/O Function Output Information] and writing the output value into GB10 to GB25.
If doing so, the signals may not be output properly to the external device.

81.2.4 Specifications of the operation panel

☞ Page 2725 Screens operable with the operation panel function
☞ Page 2725 Operation of the operation panel function

Screens operable with the operation panel function

The operation panel function is usable for the following screens.

- User-created screen
- Log-in screen (Operator authentication)
- Password change screen (Operator authentication)

For the key codes for the operation panel keys, which are usable on the log-in screen (operator authentication) and the password change screen (operator authentication), refer to the following.

☞ Page 2726 How to use the external I/O function and the operation panel function

The [OK] button and the [Cancel] button, which are in the messages on the GOT, operate with the following operation panel keys.

- [OK] button: [Enter] key, [Y] key, and [y] key
- [Cancel] button: [ESC] key, [N] key, and [n] key

When using the operation panel function on GT SoftGOT3000, use the function keys on the personal computer keyboard.

Operation of the operation panel function

The keys operate according to the set actions on any screens displayed on the GOT.

When you press a touch switch on the GOT and an operation panel key or a function key simultaneously, the operations are executed in order of detection.

81.2.5 Operation record (operation log)

Operations using the operation panel function are recorded in the operation log.

81.3 How to use the external I/O function and the operation panel function

GT37 SoftGOT3000

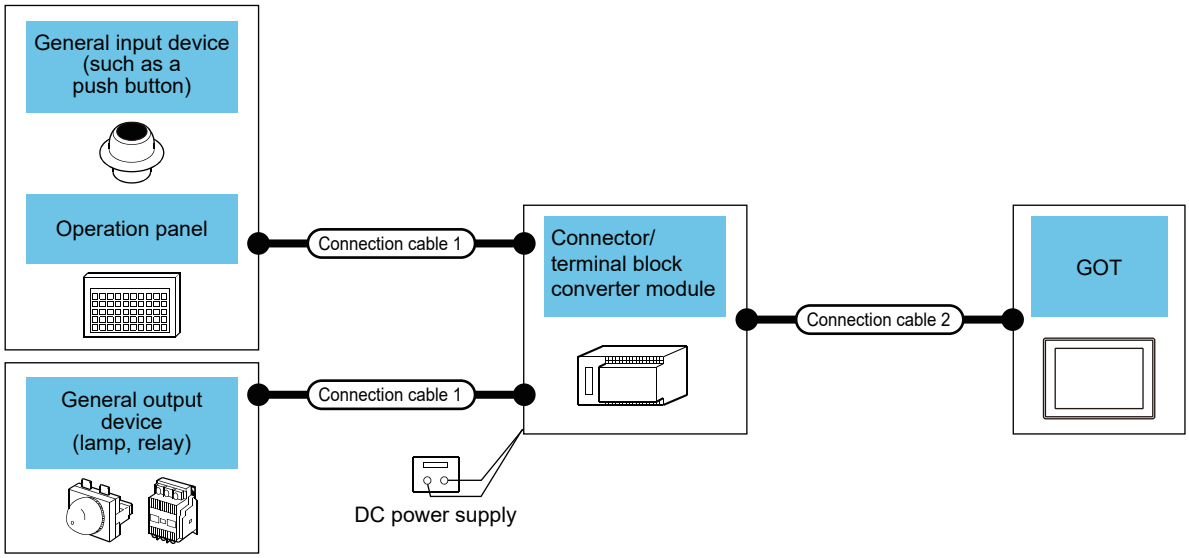
☞ Page 2726 System configuration
☞ Page 2728 Settings of the operation panel keys and the function keys
☞ Page 2729 Setting procedure

81.3.1 System configuration

☞ Page 2726 System configuration of the external I/O device
☞ Page 2727 System configuration of the operation panel

System configuration of the external I/O device

The following shows the system configuration of the external I/O device.



External I/O device	Connection cable 1	Connector/ terminal block conversion unit*2*3	Connection cable 2	GOT*5	
				Option unit	Model
General-purpose input device (such as a push button) Operation panel	User-created cable*1	A6TBY36-E A6TBY54-E *4	A8GT-C30TB	Extension interface converter unit (GT37-IF2000) + Extension unit for the GOT2000 (GT15-DIO, GT15-DIOR)	GT37
General-purpose output device (lamp, relay)					

*1 For information on how to create a cable, refer to the following.
GOT3000 Series User's Manual (Connection)

*2 The 24 V DC power must be supplied for the external I/O unit.
When the power supplied to the external I/O unit cuts off in the operation, the operation panel becomes disabled.
To use the operation panel again, supply the power to the external I/O unit and reset the GOT.

*3 When using the connector/terminal block converter module, you can input signals of up to 64 points.

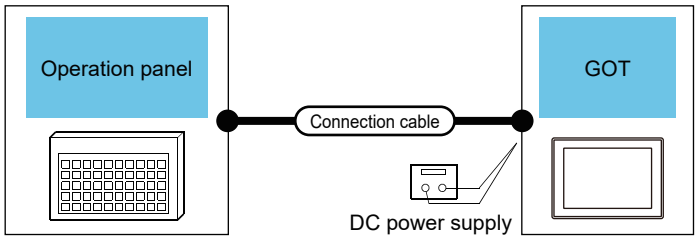
*4 The model of the connector/terminal block converter module depends on the I/O equipment and the operation panel you use.
For details, refer to the following.
GOT3000 Series User's Manual (Connection)

*5 To start the GOT, turn on the external power supply for the external I/O unit, and then turn on the GOT.
When the external power supply is shut off, a system alarm occurs.
When a system alarm occurs, signals cannot be input or output.
Cycle the power of the GOT or reset the GOT.
The GOT reset switch does not function when the bus connection is used.

System configuration of the operation panel

Since GT SoftGOT3000 uses a keyboard, the operation panel connection is not required.

The following shows the system configuration of the operation panel.



Name	Connection cable	GOT*3	
		Option unit	Model
Operation panel	User-created cable*1*2	Extension interface converter unit (GT37-IF2000) + Extension unit for the GOT2000 (GT15-DIO, GT15-DIOR)	GT37

*1 For information on how to create a cable, refer to the following.
GOT3000 Series User's Manual (Connection)

*2 The 24 V DC power must be supplied for the external I/O unit.
When the power supplied to the external I/O unit cuts off in the operation, the operation panel becomes disabled.
To use the operation panel again, supply the power to the external I/O unit and reset the GOT.

*3 To start the GOT, turn on the external power supply for the external I/O unit, and then turn on the GOT.
When the external power supply is shut off, a system alarm occurs.
When a system alarm occurs, signals cannot be input or output.
Cycle the power of the GOT or reset the GOT.
The GOT reset switch does not function when the bus connection is used.

81.3.2 Settings of the operation panel keys and the function keys

The following shows operation settings available for the operation panel keys and the function keys, as well as information on the key codes.

☞ Page 2728 Operation settings
☞ Page 2728 Key code
☞ Page 2729 Other key codes

Operation settings

One or more actions can be assigned to each operation panel key or function key as shown below.

Action type	Maximum settable value	Order of action excution priority for multiple actions*1
Data change	1	High priority
Key code	16	
Word set	20	
Set	20	
Reset	20	
Alternate	20	
Momentary	20	
Base screen switching	1	
Overlap window1	1	
Overlap window2	1	
Overlap window3	1	
Overlap window4	1	
Overlap window5	1	
Superimpose window1	1	
Superimpose window2	1	
Station No. switching	9	
Dialog window	1	Low priority
Total	135	

*1 The order of the actions, excluding the data change and the key code, can be changed on the [Action] tab in the [Action/Key Code Setting] dialog.

Key code

You can assign the following key codes for each object.

Up to 16 key codes are settable for one operation panel key or function key.

- Key codes for inputting alphanumeric characters (Numerical input, text input)
- Key codes for operating the object function

☞ Page 1191 Placing a touch switch

Other key codes

You can operate the following screens by assigning the key codes to the operation panel keys or function keys.

- Log-in screen (Operator authentication)
- Password change screen (Operator authentication)

The following shows the key codes usable on the screens.

Key code (h)	Specifications
0008h	Delete the rightmost character and shift the entire characters to the right by one character.
000Dh	Input the password.
001Bh	Cancel
0030h to 0039h 0041h to 005Ah 0061h to 007Ah	Input a numerical value and a character. For the key codes for numerical values and characters, refer to the following. ☞ Page 1191 Placing a touch switch
0088h	Delete a numerical value and a character being input.
0090h	Move cursor to the right inside object.
0091h	Move cursor to the left inside object.
0092h	Switch character input mode (Value).
0093h	Switch character input mode (Capital letter).
0094h	Switch character input mode (Small letter).

81.3.3 Setting procedure

When using the external I/O function or the operation panel function, configure the following settings.

Operating procedure

1. Connect the GOT to the external I/O device or the operation panel.

☞ Page 2726 System configuration

2. Select [Common] → [Peripheral Setting] → [External I/O /Operation Panel] from the menu to display the [External I/O / Operation Panel] dialog.

3. In the [External I/O / Operation Panel] dialog, configure the settings for the external I/O function and the operation panel function.

☞ Page 2730 [External I/O / Operation Panel] dialog

4. Write package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

5. Operate the external I/O device or the operation panel.

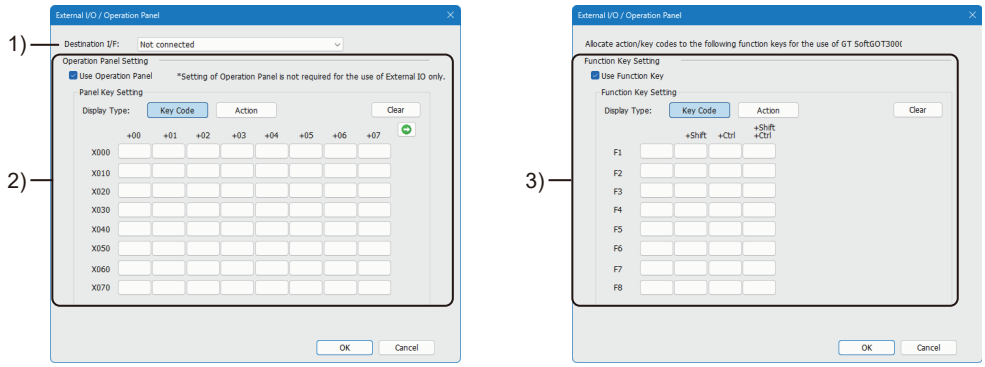
81.4 [External I/O / Operation Panel] dialog

GT37 SoftGOT3000

Set the actions and key codes to the operation panel keys or function keys.

Window

1. Select [Common] → [Peripheral Setting] → [External I/O /Operation Panel] from the menu to display the [External I/O / Operation Panel] dialog.



Item			Description
1)	[Destination I/F]		Not available for GT SoftGOT3000. Select a destination interface.
2)	[Operation Panel Setting]	[Use Operation Panel]	Not available for GT SoftGOT3000. Select this item to enable the operation panel function, and configure the following settings.
		[Panel Key Setting]	Assign actions to be performed at turning on and key codes for input signals. Two screens are displayed: [X000] to [X070] are displayed on the vertical axis, and either [+00] to [+07] or [+08] to [+15] on the horizontal axis. The key buttons correspond to the operation panel input signals (X000 to X07F) respectively. The setting area ([+00] to [+07] or [+08] to [+15]) can be switched with arrow buttons. Click the input signal button to display the [Action/Key Code Setting] dialog, and configure the action, trigger condition, and key code settings. Make sure to configure the proper action setting for each operation panel key button. ☞ Page 2732 [Action/Key Code Setting] dialog 		[Display Type]	Select the display type. • [Key Code] button Displays the key code set for the operation panel key. Example) [0042] • [Action] button Displays [*] on the operation panel key where the action is assigned. • [Clear] button Clears the setting.

Item			Description
3)	[Function Key Setting]	—	Appears when GT SoftGOT3000 is selected in the GOT type setting.
		[Use Function Key]	Select this item to enable the function key settings for GT SoftGOT3000, and configure the following settings.
		[Display Type]	Select the display type. • [Key Code] button Displays the key codes on the key buttons where the key codes are assigned. Example) [0042] • [Action] button Displays [*] on the key buttons where the actions are assigned. • [Clear] button Clears the setting.
		[Function Key Setting]	Assign actions to be performed at turning on and key codes for function keys. Click the function key setting button to display the [Action/Key Code Setting] dialog, and configure the action, trigger condition, and key code settings. The buttons correspond to keys F1 to F8 of the keyboard. In combination with the Shift key and the Ctrl key, up to 32 patterns are available. Make sure to configure the proper action setting for each function key. ☞ Page 2732 [Action/Key Code Setting] dialog

81.5 [Action/Key Code Setting] dialog

GT37 SoftGOT3000

Configure the operation settings and the trigger conditions for the operation panel keys or function keys.

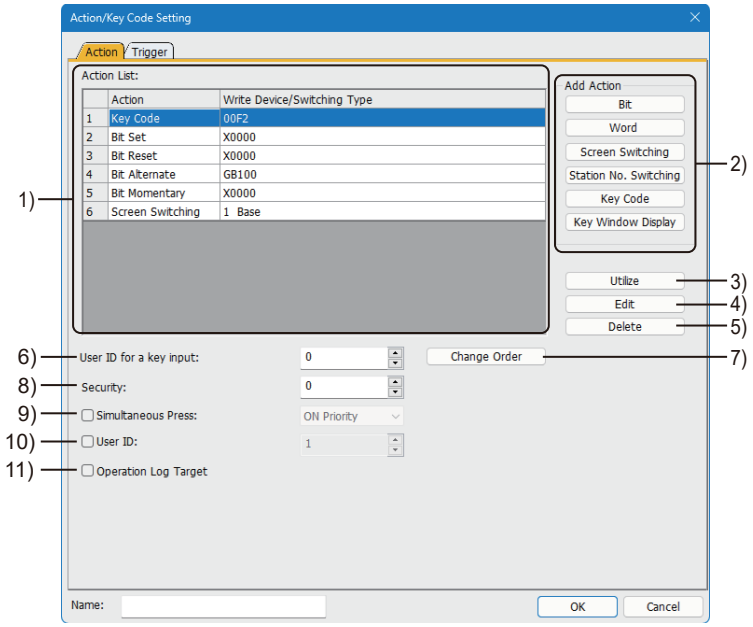
☞ Page 2732 [Action] tab
☞ Page 2733 [Trigger] tab

81.5.1 [Action] tab

Configure the operation settings (actions and key codes) for the operation panel keys or function keys.

For details on operation settings, refer to the following.

☞ Page 1191 Placing a touch switch



Item			Description
1)	[Action List]		Displays the set actions in the list. Actions are executed in the order set in [Action List]. To change the sorting order of actions, click the [Change Order] button and correct the order. The setting of each action can be changed in the edit dialog displayed by double-clicking the action in [Action List]. The setting method and action details (including bit and word) are the same as those for the touch switch.
2)	[Add Action]	[Bit] button	Set the function to turn on and off a bit device.
		[Word] button	Set the function to change a word device value.
		[Screen Switching] button	Configure the settings for the screen switching function. A dialog window cannot be specified for screen switching.
		[Station No. Switching] button	Configure the settings for the station number switching function. A dialog window cannot be specified for the switching mode.
		[Key Code] button	Set the code to be input to a numerical input object or a text input object with keys or code to operate an object.
		[Key Window Display] button	Set the key window display function.
3)	[Utilize] button		Select an action from [Action List] and then click the [Utilize] button to copy the action to [Action List].
4)	[Edit] button		Select an action from [Action List] and then click the [Edit] button to enable you to edit the action setting.
5)	[Delete] button		Select an action from [Action List] and click the [Delete] button to delete the action.
6)	[User ID for a key input]		Specify the user ID of the object to be operated using the key code set in the action list. The setting range is [0] to [65535].
7)	[Change Order] button		To change the order of the actions set in [Action List], click this button to display the [Change Order] dialog and change the order.

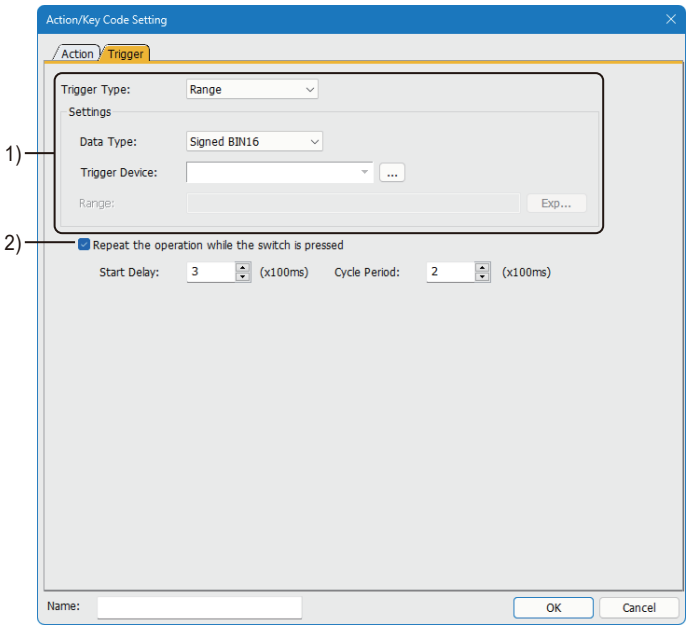
Item		Description
8)	[Security]	When using the security function, set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2)) ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
9)	[Simultaneous Press]	Select this item to disable the simultaneous press. When this item is selected, select whether to prioritize the on state or off state when multiple touch switches are simultaneously pressed. For details, refer to the following. ☞ Page 1195 Simultaneous press prohibition function ☞ Page 1268 Operation of [Simultaneous Press]
10)	[User ID]	Enables the user ID setting. The setting range is [1] to [65535]. When the user ID is set, you can identify the used operation panel key in the operation log. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log]) When multiple objects are set on the same screen editor, the target object may not operate. To make sure that the target object operates, match the user ID with the user ID of the target object.
11)	[Operation Log Target]	Select this item to record the operation log of the set object. ☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])

81.5.2 [Trigger] tab

Set the conditions that trigger the operation of operation panel keys or function keys.

For details on trigger conditions, refer to the following.

☞ Page 614 Configuring the utility settings ([GOT Setup])



Item		Description
1)	[Trigger Type]	Select a trigger condition for the operation panel key or function key. For the details of each item, refer to the following. ☞ Page 968 Trigger type settings
2)	[Repeat the operation while the switch is pressed]	Repeats the set actions while the operation panel key or the function key is pressed.

81.6 Relevant settings

GT37 SoftGOT3000

Set the relevant settings other than the specific settings for the external I/O function and the operation panel function as required.

The following shows the functions that are available by configuring the relevant settings.

81.6.1 GOT environmental settings [Screen Switching/Window]

Select [Common] → [GOT Environmental Setting] → [Screen Switching/Window] from the menu.

☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])

Function	Setting item
Setting the screen switching timing when you touch the Go To Screen switch. (OFF synchronous, ON synchronous)	[Operation Timing]

81.6.2 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu.

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Outputting signals to external devices when the external I/O function is used. (Read device)	[External I/O Function Output Information]
Notifying input signals from external devices or no power supply when the external I/O function is used. (Write device)	[External I/O Function Input Information1], [External I/O Function Input Information2]

81.6.3 GOT internal device

☞ Page 576 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Notifying input signals from external devices or outputting signals to external devices when the external I/O function is used.	GB10 to GB25, GB30 to GB37, GB50 to GB57
Enabling or disabling 128 signals to be input with the external I/O function.	GS517
Notifying the input status when 128 signals are enabled to be input with the external I/O function	GS658 to GS665

PART 25 GOT Mobile function

82 Monitoring a controller from tablets or other devices (GOT Mobile function)

82 Monitoring a controller from tablets or other devices (GOT Mobile function)

GT37 SoftGOT3000

82.1 Overview of the GOT Mobile function

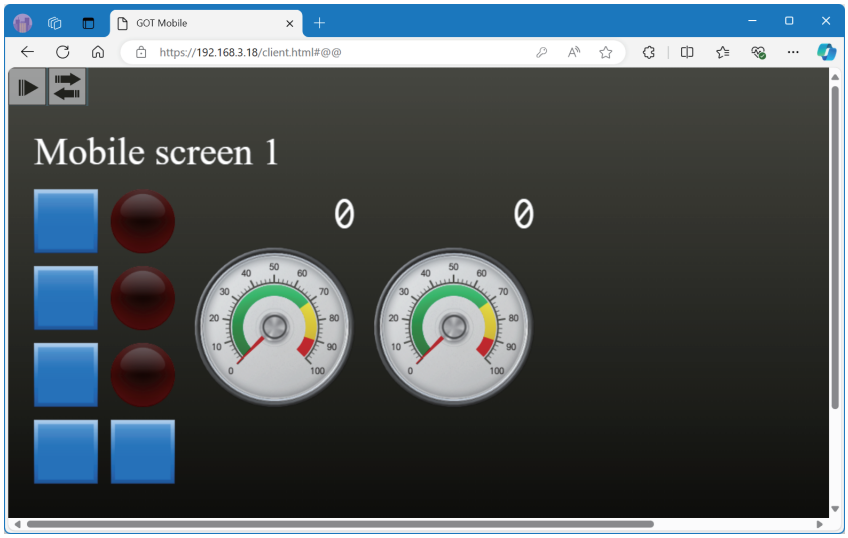
GT37 SoftGOT3000

In this section, the "server" and "client" refer to the server and client of the GOT Mobile function.
The server (GOT) is GT37 or GT SoftGOT3000.

⚠ WARNING

- Remote control is available through a network by using GOT functions, including the SoftGOT-GOT link function, the remote personal computer operation function, the VNC server function, and the GOT Mobile function.
  If these functions are used to perform remote control of control equipment, the field operator may not notice the remote control, possibly leading to an accident.
  In addition, a communication delay or interruption may occur depending on the network environment, and remote control of control equipment cannot be performed normally in some cases.
  Before using the above functions to perform remote control, fully grasp the circumstances of the field site and ensure safety.
- When operating the server (GOT) of the GOT Mobile function to disconnect a client, notify the operator of the client about the disconnection beforehand.
  Not doing so may cause an accident.
- Make sure to fully understand the GOT network interaction function before using this function to control the authorization among pieces of equipment to prevent simultaneous operations.
  The exclusive authorization control of the GOT network interaction function can be enabled or disabled for each screen. (For all screens, the exclusive authorization control is disabled by default.)
  Properly determine the screens for which the exclusive authorization control is required, and set the control by screen.
  A screen for which the exclusive authorization control is disabled can be operated simultaneously from pieces of equipment. Make sure to determine the operation period for each operator, fully grasp the circumstances of the field site, and ensure safety to perform operations.

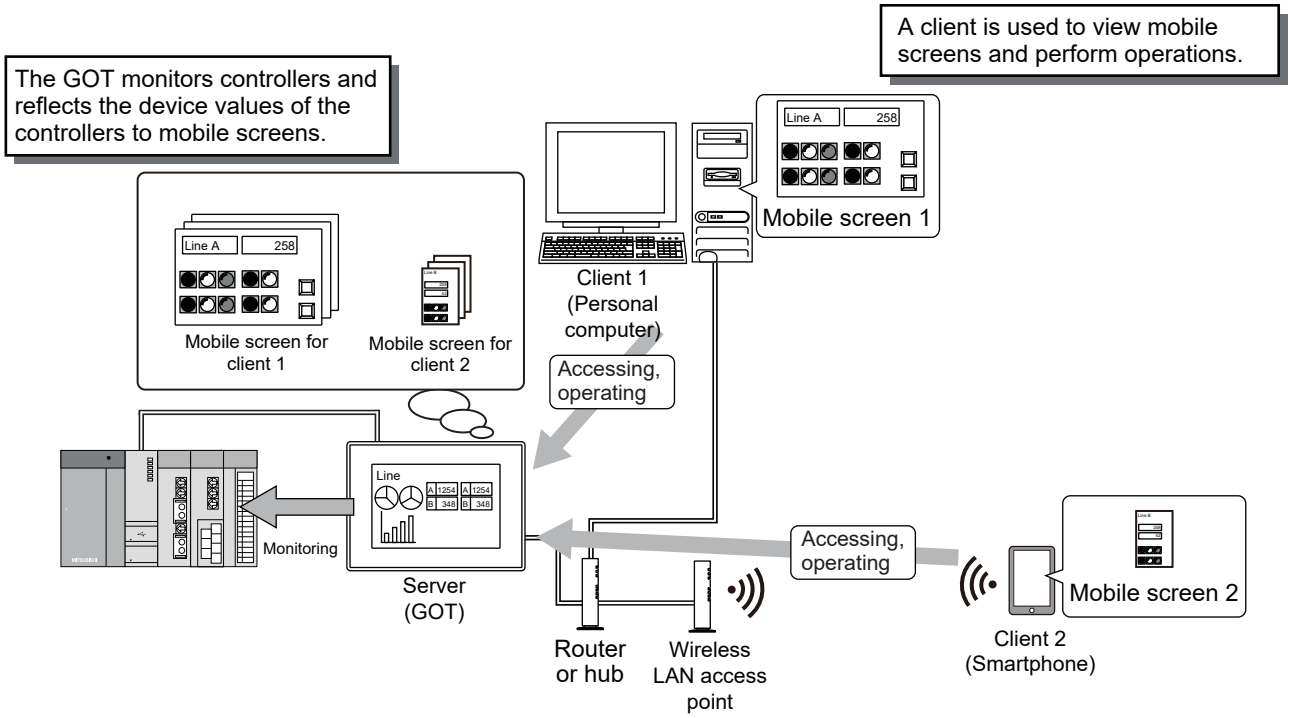
By using the GOT Mobile function, you can monitor a controller through the GOT from an information device, such as a tablet.
In the GOT Mobile function, the GOT operates as a server to provide mobile screens for clients.
Information devices, such as a tablet, use a browser as the GOT Mobile function client to access mobile screens in the server (GOT).



Access to a mobile screen in the server (GOT) from a web browser

After the client accesses a mobile screen, you can perform operations on the mobile screen to monitor a controller through the GOT.

The number of clients that can simultaneously access the server (GOT) differs depending on the model.



Overlap windows and superimpose windows can also be displayed on mobile screens.

On the GOT, base screens are created as [Base Screen] and overlap windows and superimpose windows are created as [Window Screen]. On the mobile application, these screens are created and used as [Mobile Screen].

The window screen is controlled by using a screen switching device.

☞ Page 2822 [Screen Switching/Window]

If an overlap window extends off the mobile screen area, the extended part is hidden (display of an off-screen window).

The overlap window can be displayed off to the right side or to the bottom of the screen.

On a mobile screen, displaying an off-screen overlap window is always enabled.

Displaying an off-screen window can be disabled on the GOT but not on mobile screens.

The following shows the methods of connecting the server (GOT) and clients.

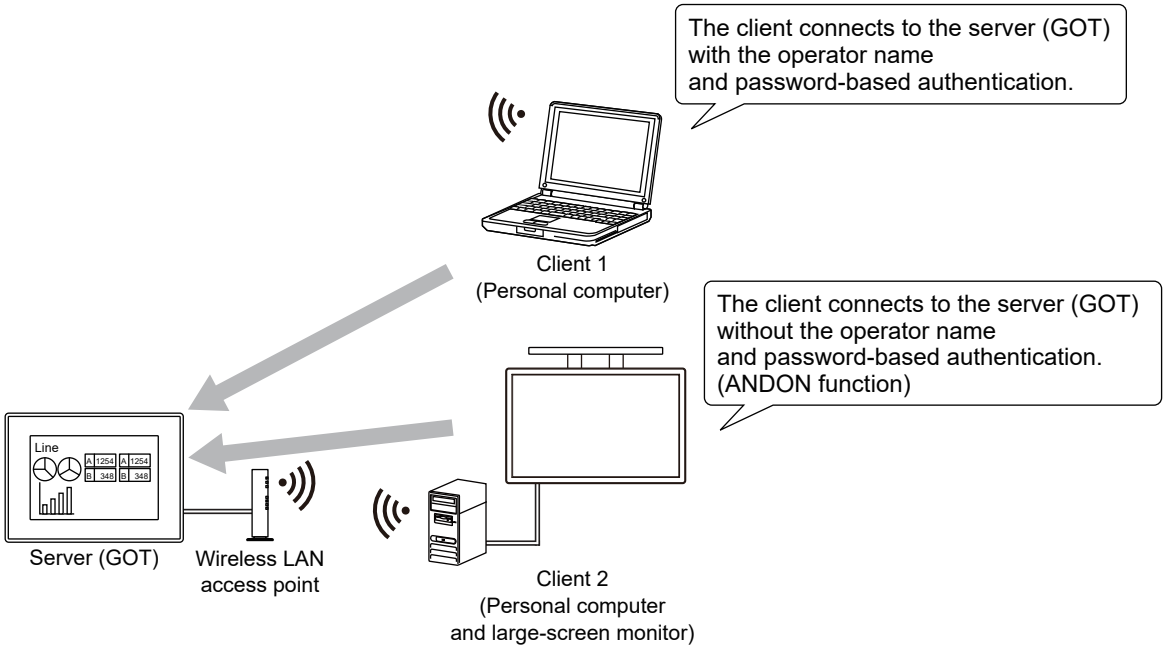
- Connection with the operator name and password-based authentication (The authentication screen appears.)
- Connection without the operator name and password-based authentication—ANDON function (The authentication screen does not appear.)

For the authentication, refer to the following.

☞ Page 2757 Authentication

For the ANDON function, refer to the following.

☞ Page 2812 ANDON function



82.2 Specifications of the GOT Mobile function

GT37 SoftGOT3000

☞ Page 2739 System application (add-on function)
☞ Page 2739 Number of GOT Mobile function settings for one project
☞ Page 2739 License number registration
☞ Page 2740 Operating environment
☞ Page 2742 Usable functions
☞ Page 2753 Mobile screen
☞ Page 2755 GOT Mobile device (VGB and VGD)
☞ Page 2757 Authentication
☞ Page 2759 Encrypted communication
☞ Page 2760 Public folder
☞ Page 2762 File manager
☞ Page 2765 Hard copy function
☞ Page 2765 Client connection using a contactless tag

82.2.1 System application (add-on function)

To use the GOT Mobile function, a system application (add-on function) for [GOT Mobile Setting] is required.
Selecting [Use GOT Mobile function] in the [GOT Mobile Setting] ([Basic Setting]) window automatically incorporates the system application into the package data.
☞ Page 2818 [Basic Setting]

82.2.2 Number of GOT Mobile function settings for one project

One setting can be configured per project.

82.2.3 License number registration

License registration is required to incorporate the GOT with the GOT Mobile function enabled into your product.
For information on how to register the license number, refer to the following.
When the GOT is a server
☞ Page 3686 License registration method
When GT SoftGOT3000 is a server
GT SoftGOT3000 User's Manual
If the license number is not registered, you can try the GOT Mobile function after starting the GOT, until the connection time between the client and the server (GOT) reaches 30 minutes.
During the trial, the mobile screen displays a watermark saying [License unregistration.] and the remaining trail time.
Up to two clients can access the server (GOT) simultaneously.
After 30 minutes, the connection with clients is forcibly disconnected.
The disconnection is performed even while you are operating the client. Therefore, the target controller may exhibit unintended behavior.

82.2.4 Operating environment

☞ Page 2740 Server specifications
☞ Page 2741 Client operating environment

Server specifications

The following shows the server specifications.

Item	GT37	GT SoftGOT3000
Port No.	• HTTPS (SSL) connection port No. 443 (standard), No. 1024 to No. 65535 (user-definable) • HTTP connection port No. 80 (standard), No. 1024 to No. 65535 (user-definable)	• HTTPS (SSL) connection port No. 443 (standard), No. 1024 to No. 65535 (user-definable)*3 • HTTP connection port No. 80 (standard), No. 1024 to No. 65535 (user-definable)*1*2*3
Maximum number of clients connectable simultaneously*4	5	15 per personal computer*5
Http timeout time (Time limit to respond to a request from a browser)	30 seconds	30 seconds
Operating environment of personal computers	—	OS: The following operating systems are compatible with Internet Information Services (IIS) 8.5 or later • Microsoft Windows Server 2019 Standard (64-bit) • Microsoft Windows Server 2016 Standard (64-bit) • Microsoft Windows 11 Enterprise (64-bit) • Microsoft Windows 11 Pro (64-bit) The hardware operating environment, such as CPU, memory, and hard disk space, is the same as that of GT SoftGOT3000. For information of the operating environment of GT SoftGOT3000, refer to the following. 📖GT SoftGOT3000 User's Manual
Other software	—	The following software is required. • Internet Information Services (IIS) 8.5 or later

*1 If firewall settings are configured for port numbers, open the ports as required.
*2 When using port No. 80, display the Internet Information Services (IIS) Manager dialog and click Stop in the Actions panel.
*3 Three consecutive numbers (specified port number and the following two consecutive numbers) are used.
There must be three or more consecutive numbers between the port numbers specified.
Example) When 8080 is specified for the port number, the ports 8081 and 8082 are also used.
*4 Indicates the number of clients (browsers), not the number of information devices, which are connectable to the server simultaneously.
Example) When you use five browsers on a tablet to access the server (GOT), the number of clients being connected is counted as five.
*5 A total of 20 modules are connectable when the Pocket GOT mobile app and GOT Mobile function are used together.

Precautions

A portion of the user area is reserved for the GOT Mobile function, and another portion of the area is reserved for clients according to the setting of [Simultaneous Client Connection].
Consider the available space in the user area, and set [Simultaneous Client Connection].
The GOT reserves 2 MB space for each client.
For the available space in the GOT user area, refer to the following.
☞ Page 81 Drive configuration and capacity of the GOT

Client operating environment

Network environment is required for operation.

Equipment	Item	Operating environment
Smartphone, tablet computer	Supported OS	• Android • iOS
	Recommended browser	Use a browser that supports HTML5, CSS3, JavaScript, and WebSocket Protocol (RFC 6455). • Chrome for Android • Safari • Firefox for Android • Firefox for iOS
Personal computer	Supported OS	• Windows 10 • Windows 11
	Recommended browser	Use a browser that supports HTML5, CSS3, JavaScript, and WebSocket Protocol (RFC 6455). • Google Chrome • Microsoft Edge • Firefox
GOT (except GT SoftGOT3000)	Browser	Use the web browser function of the system application (add-on function).

Precautions

If a client accesses the server (GOT) that has project data containing a large amount of mobile screen data, browsers may abend and mobile screens may not be displayed depending on the specifications of the client.
In such situations, reducing the project data size by deleting unnecessary mobile screens or objects may prevent this from happening.

82.2.5 Usable functions

GT37 SoftGOT3000

☞ Page 2742 Common functions
☞ Page 2748 Utility function
☞ Page 2748 Add-on function
☞ Page 2749 Figures that can be placed
☞ Page 2750 Objects that can be placed

The following shows the functions that can be used on a client.

Common functions

○: Available, ×: Not available

Function	Availability	Remarks
Standard GOT system font	×	The standard font of each client is used.
Optional GOT font	×	
Superimposition of objects	○	—
Base screen display	○	A mobile screen is used as a base screen.
Overlap window display	○	A mobile screen is used as overlap window 1 or 2.
Superimpose window display	○	A mobile screen is used as superimpose window 1 or 2.
Key window display	○	The standard key window for mobile screens is used. For details, refer to the following. ☞ Page 2744 Key window
Screen switching	○	The screen switching setting for mobile screens is used. For details, refer to the following. ☞ Page 2745 Screen switching
Station No. switching	×	The GOT monitoring target cannot be independently switched for each mobile screen. Although the station No. switching can be performed on a client, the change is applied to all the clients.
Buffer memory unit No. switching	×	The GOT monitoring target cannot be independently switched for each mobile screen. Although the buffer memory unit No. switching can be performed on a client, the change is applied to all the clients.
Language switching	○	The language switching setting for mobile screens is used. For details, refer to the following. ☞ Page 2746 Language switching
System information	×	The system information related to the screens and the objects cannot be used in mobile screens. For information on the notification and control of mobile screens, use the client information. For details, refer to the following. ☞ Page 2824 [Client Information]
GOT special register (GS)	×	The GOT special registers related to the screens and the objects cannot be used in mobile screens. For information on the notification and control of mobile screens, use the client information. For details, refer to the following. ☞ Page 2824 [Client Information]
Security authentication	○	For details, refer to the following. ☞ Page 2747 Screen security (level authentication and operator authentication)
Alarm monitoring	○	The results of GOT operations can also be used by the client. However, screens cannot be switched and sound will not be output.
Alarm popup display	○	The alarm popup display setting for mobile screens is used. For details, refer to the following. ☞ Page 2748 Alarm popup display
Trigger action (project)	○	The results of GOT operations can also be used by the client.
Trigger action (screen)	×	—
Time action	○	The results of GOT operations can also be used by the client.
Hard copy function	×	—

Function	Availability	Remarks
Comment	○	—
Figure	○	For details, refer to the following. ☞ Page 2749 Figures that can be placed
Object	○	For details, refer to the following. ☞ Page 2750 Objects that can be placed
GOT internal device	○	The GOT internal devices can be used for clients through the GOT Mobile devices (VGB and VGD). For details, refer to the following. ☞ Page 2755 GOT Mobile device (VGB and VGD) The GOT internal devices (GB and GD) can also be specified for clients without using the GOT Mobile devices (VGB and VGD).
SoftGOT3000 internal device	○	When GT SoftGOT3000 is set as the server (GOT), SoftGOT3000 internal devices (SGB and SGD) can be used. For details, refer to the following. 📖GT SoftGOT3000 User's Manual
Cursor movement	×	—
Operation Log	○	The results of GOT operations can also be used by the client.
Logging	○	
Recipe	○	
Project script	○	
Screen script	×	No screen script is settable for a mobile screen.
Object script	×	No object script is settable for an object on a mobile screen.
Multi-channel connection	×	The GOT Mobile device does not have a function to set a controller using multi-channel connection but can monitor a controller connected using multi-channel connection of the GOT or GT SoftGOT3000.
Vertical display	○	The size of a mobile screen is settable in the screen property.

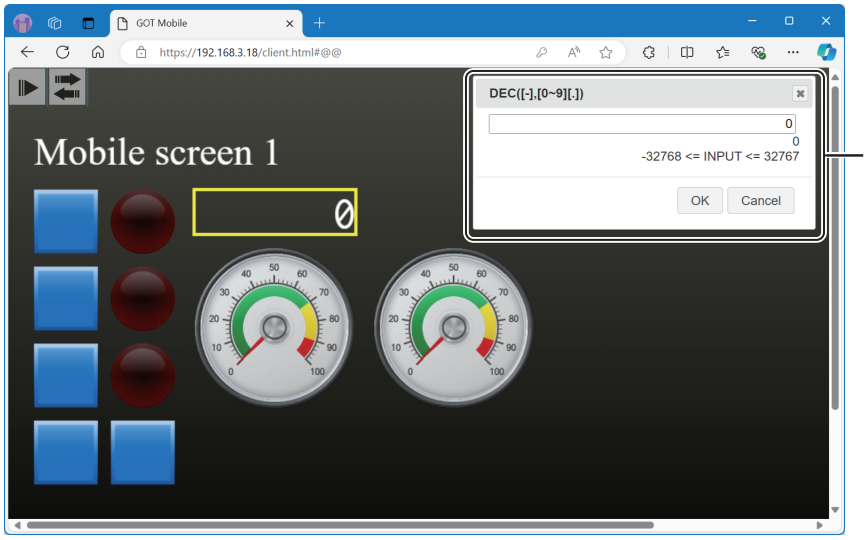
PART 25

■Key window

The standard key window for mobile screens is supported.

User-created windows are not supported.

When using a tablet or smartphone, input characters with the software keyboard.



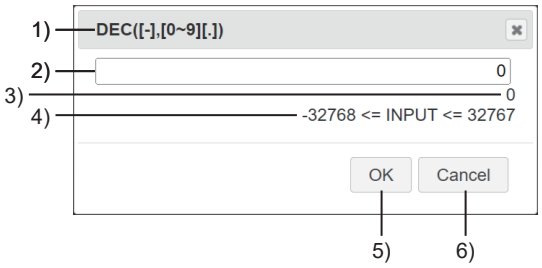
Standard key window for mobile screens

The minimum width of the standard key window is 420 dots.

Note that the actual display size of the standard key window varies with the resolution set on the client or the contents displayed on the key window.

Check the actual size of the key window size in the browser.

The following shows the setting items of the standard key window for mobile screens.



Item		Description
1)	Title bar	Displays the data type being input. • [BIN([0~9],[A~F])]: Binary • [OCT([0~9],[A~F]): Octal • [DEC([-],[0~9][.]): Decimal • [HEX([0~9],[A~F])]: Hexadecimal • [STRING]: Character string
2)	Input value display	Displays the input value.
3)	Current value display	Displays the current value of the device.
4)	Input range display	Displays the valid input range. (This item is not displayed for the text input.) The displayed input range depends on the number of displayed digits which is set for the numerical input. The following shows the meaning of displayed symbols. • [INPUT]: Value to be input • [<]: The left side of the symbol is less than the right side. • [<=]: The left side of the symbols is less than or equal to the right side. • [==]: The left side of the symbols is equal to the right side. • [!=]: The left side of the symbols differs from the right side.
5)	[OK] key (Enter key)	Confirms the input value.
6)	[Cancel] key	Cancels the input value.

■Screen switching

You can switch between mobile screens with the screen switching device dedicated to mobile screens.

This device is set independently of the GOT environmental setting.

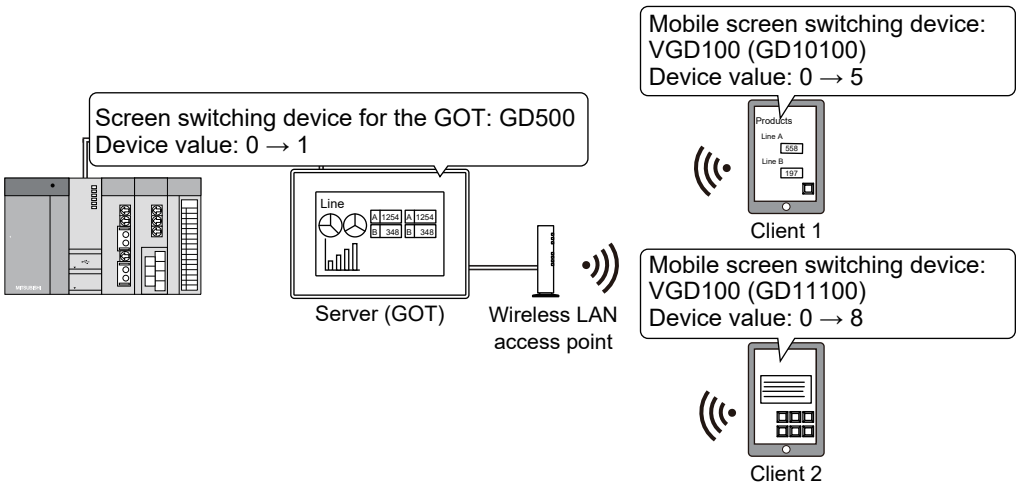
Therefore, when you switch between mobile screens on a client, the screen displayed on the GOT is not switched coincidentally.

To display different mobile screens on each client simultaneously, set a GOT Mobile device (VGB or VGD) for the screen switching device dedicated to mobile screens.

☞ Page 2755 GOT Mobile device (VGB and VGD)

Ex.

When [Points] is set to 1000 and [First Device] is set to GD10000 in the device (VGD) allocation setting



On a mobile screen, when screen switching is performed for the overlap window which is being moved, that overlap window is switched.

For the screen switching setting for mobile screens, refer to the following.

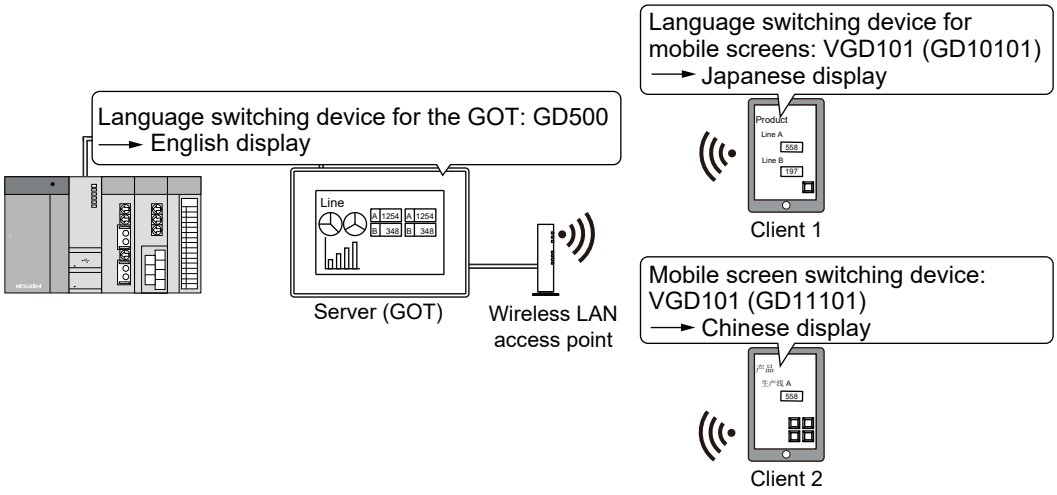
☞ Page 2822 [Screen Switching/Window]

PART 25

■Language switching

You can switch the languages of mobile screens with the language switching device dedicated to mobile screens.
Therefore, when you switch the languages of mobile screens on a client, the display language on the GOT is not switched coincidentally.
To switch between languages on a per-client basis, set a GOT Mobile device (VGB or VGD) for the language switching device dedicated to mobile screens.
☞ Page 2755 GOT Mobile device (VGB and VGD)

Ex.
When [Points] is set to 1000 and [First Device] is set to GD10000 in the device (VGD) allocation setting

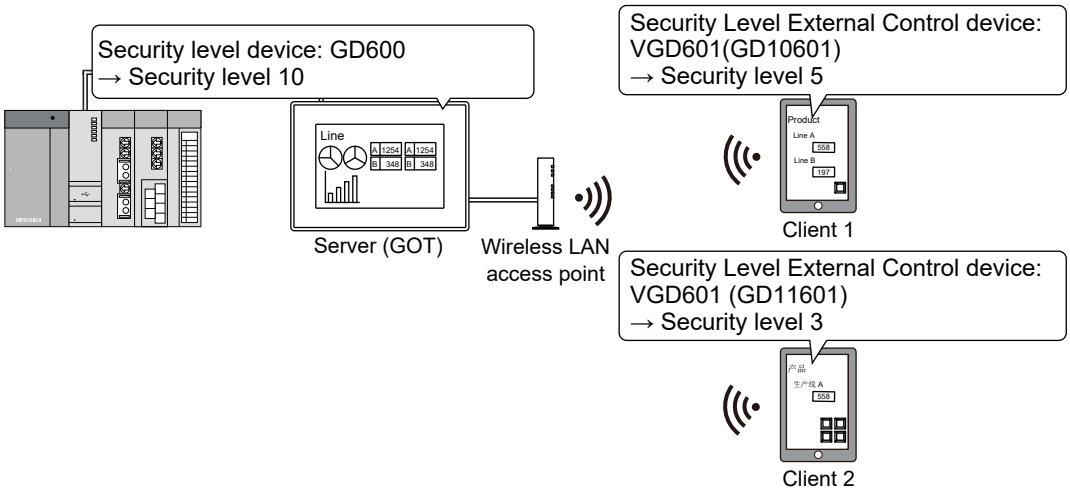


Except for the language switching device dedicated to mobile screens, the language switching settings configured in the [Environmental Setting] window are applied to the clients.
(The language switching settings are common to the GOT and the clients.)
The language switching device dedicated to mobile screens is settable when the language switching is enabled in the [Environmental Setting] window.
For the setting of the language switching device for mobile screens, refer to the following.
☞ Page 2746 Language switching

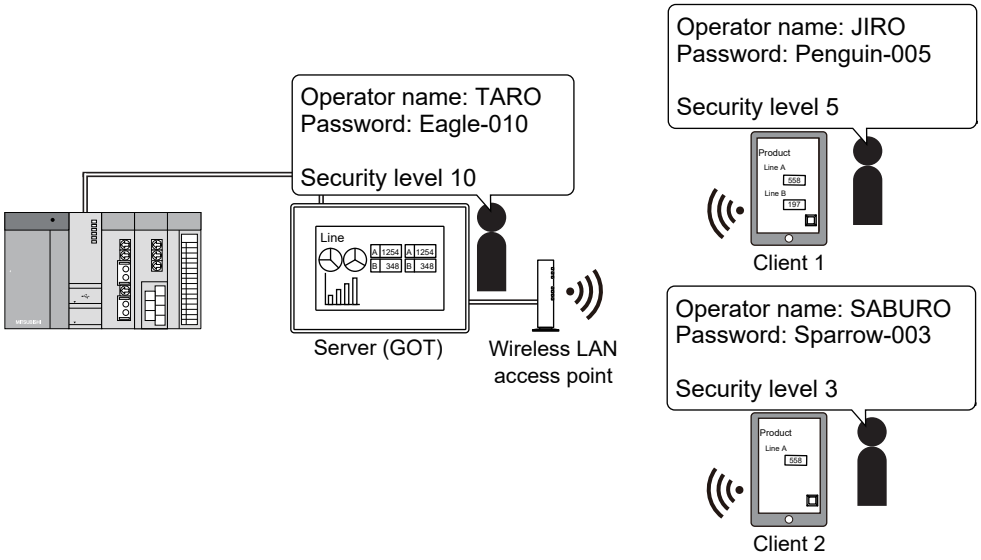
■Screen security (level authentication and operator authentication)

For the screen security on clients, the authentication method set in [Security] in the [Environmental Setting] window is applied.
When the security mode is mode 2, the authentication method is fixed to operator authentication.
(The authentication method is common to the GOT and the clients.)
When the level authentication is used, the GOT and each client can display a screen according to their security levels.
For the clients, the security level device (Security Level External Control device) dedicated to mobile screens is used for the level authentication.
To display a screen with different security levels on each client, set a GOT Mobile device (VGB or VGD) for the Security Level External Control device.
Except for the Security Level External Control device dedicated to mobile screens, the screen security settings configured in [Security] in the [Environmental Setting] windows are applied to the clients.

Ex.
When [Points] is set to 1000 and [First Device] is set to GD10000 in the device (VGD) allocation setting



When the operator authentication is used, you can log in or out from the GOT and each client with different operator accounts.
Configure the operator authentication settings for the GOT and the clients independently.
On the clients, the operator authentication through an external authentication device (such as a barcode reader or RFID controller) is not available.



For the screen security setting for clients, refer to the following.
☞ Page 2825 [Security]
For the screen security setting for the GOT, refer to the following.
☞ Page 3038 Restricting display and operation on the GOT (Screen security)

■Alarm popup display

You can use the alarm popup display dedicated to mobile screens.

The alarm popup display settings are not common to the GOT and the clients.

To use the alarm popup display on both the GOT and the clients, configure the alarm popup settings for the GOT and the mobile screens independently.

For the alarm popup display for mobile screens, some setting items have restrictions as shown below.

• [Basic] tab

[Close up the space between alarm comments] is not settable.

[Touch Mode] can be set to [None] or [Stage Hierarchy Switching] only.

• [Text Style] tab

[Font] is not settable.

When a mobile screen with alarm popup display settings configured is used as an overlap window screen or superimpose window screen, the settings become disabled.

For the alarm popup display settings, refer to the following.

☞ Page 2748 Alarm popup display

For the alarm popup display for mobile screens, an opaque popup window appears in a user-specified background color.

Utility function

The utility function cannot be used on clients.

Add-on function

The following add-on functions are usable.

- Contactless tag function
- Web browser function
- Encrypted communication function

■Contactless tag function

When the contactless tag embedded on the GOT is enabled, you can connect the client to the server (GOT) by placing the client over the contactless tag of the server (GOT).

For information on the contactless tag function, refer to the following.

☞ Page 2765 Client connection using a contactless tag

■Web browser function

When the web browser function is used, the GOT can be used as a client of the GOT Mobile function.

For information on the web browser function, refer to the following.

☞ Page 691 Setting the web browser function ([Web Browser])

■Encrypted communication

Encrypting the communication between the server and the client prevents unauthorized access and data leakage in the communication route.

For information on encrypted communication, refer to the following.

☞ Page 2759 Encrypted communication

Figures that can be placed

The following shows the figures that can be placed on mobile screens.

○: Available, ×: Not available

Figure	Availability	Restrictions
Text	○	• [Font], [Character Set], [Direction], and [KANJI Region], and some text effects are not settable.
Logo text	○	—
Line	○	• The [Lamp Feature] and [Trigger] tabs are not settable.
Line freeform	○	
Rectangle	○	
Polygon	○	
Circle	○	
Arc, sector	○	—
Table	○	—
Scale	○	—
Piping	○	• The [Lamp Feature] and [Trigger] tabs are not settable. • [Layer] is not settable.
Paint	×	—
Image data	○	—
Import DXF data	○	—
Import IGES data	○	—

For the figures on mobile screens, some setting items have restrictions.

• [Lamp Feature] tab and [Trigger] tab

The lamp feature and trigger settings are not available.

Therefore, a figure cannot be displayed in different styles according to the conditions. In this case, use a lamp object instead.

• [Font], [Direction], [KANJI Region], and text effects

Each client displays characters in its standard font.

Therefore, the font, orientation of characters, and KANJI region are not settable with GT Designer3.

To change the font or KANJI region, change the standard font of the client used.

The orientation of characters cannot be changed.

Only [Bold], [Solid], or [Raised] is settable for the text effect.

• [Layer]

For mobile screens, the layer settings are not available.

Figures and objects are always displayed in the order specified with GT Designer3.

Precautions

■Data size of the project containing a BMP image

When the GOT Mobile function is enabled, if a BMP image is used in a mobile screen or is registered as a part, the image is automatically converted to PNG format and saved as a new file.

Even if you do not use the BMP image registered as a part in a mobile screen, the image is converted to PNG format and saved as a new file.

Since the project contains both the BMP image and the PNG image, the project size becomes larger.

Objects that can be placed

The following shows the objects that can be placed on mobile screens.

○: Available, ×: Not available

Object		Availability	Restrictions
Touch switch	Switch	○	• In [Action List] of the [Action] tab, [Station No. Switching], [Key Window Display], and [Sound Output] are not selectable. • In the [Style] tab, [Reverse Switch Area] is not settable. • In the [Text] tab, [Font] and [Character Set] are not settable. • The [Script] tab is not settable. • In the [Extended] tab, [Buzzer], [KANJI Region], and [Layer] are not settable.
	Bit switch	○	• In the [Text] tab, [Font] and [Character Set] are not settable. • In the [Extended] tab, [KANJI Region] and [Layer] are not settable.
	Word switch	○	
	Go To Screen switch	○	• In the [Text] tab, [Font] and [Character Set] are not settable. • In the [Extended] tab, [Buzzer], [KANJI Region], and [Layer] are not settable.
	Change station No. switch	×	—
	Special function switch	○	• In the [SP Function] tab, items other than the following ones are not selectable for [Switch Action]. [Password (Security Level)] [Login/Logout (Operator)] [Password Change (Operator)] • In the [Text] tab, [Font] and [Character Set] are not settable. • In the [Extended] tab, [Buzzer], [KANJI Region], and [Layer] are not settable.
	Key window display switch	×	—
	Key code switch	○	• Becomes active when either of the following is selected for [Key Code Type] in the [Key Code] tab. [Numerical/Text Input] [Alarm Display] [Historical Trend Graph/Historical Data List] • In the [Text] tab, [Font] and [Character Set] are not settable. • In the [Extended] tab, [Buzzer], [KANJI Region], and [Layer] are not settable.
Lamp	Bit lamp	○	• In the [Text] tab, [Font] and [Character Set] are not settable. • In the [Extended] tab, [KANJI Region] and [Layer] are not settable. • The [Script] tab is not settable.
	Word lamp	○	• In the [Text] tab, [Font] and [Character Set] are not settable. • In the [Extended] tab, [KANJI Region] and [Layer] are not settable. • The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available.
	Lamp area	×	—
Numerical display		○	• In the [Device] tab, [Font] and [Font Width] are not settable. • In the [Extended] tab, [Display Mode], [KANJI Region], and [Layer] are not settable. • The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available.
Numerical input		○	• In the [Device] tab, [Font] and [Font Width] are not settable. • In the [Extended] tab, the following items are not settable. [Display Mode], [Move Destination ID], [Display input value on destination object location], [Input data using Bar Code/RFID], [KANJI Region], and [Layer] • The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available. • Use the standard key window for numerical input. Key code switches cannot be used.
Text display		○	• In the [Device/Style] tab, [Font], [Font Width], [Lock aspect ratio], and [Reverse] are not settable. • In the [Extended] tab, [Display Mode], [KANJI Region], and [Layer] are not settable. • The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available.
Text input		○	• In the [Device/Style] tab, [Font], [Font Width], [Lock aspect ratio], and [Reverse] are not settable. • In the [Extended] tab, the following items are not settable. [Display Mode], [Move Destination ID], [Display input value on destination object location], [Input data using Bar Code/RFID], [KANJI Region], and [Layer] • The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available. • Use the standard key window for numerical input. Key code switches cannot be used.

Object		Availability	Restrictions
Date/Time display		×	—
Comment display	Bit comment	○	• In the [Comment] tab, [Font], [Font Width], [Lock aspect ratio], and [Reverse] are not settable. • In the [Extended] tab, [Display Mode], [KANJI Region], and [Layer] are not settable. • The [Script] tab is not settable.
	Word comment	○	
	Simple comment	○	• [Font], [Font Width], [Lock aspect ratio], and [Reverse] are not settable.
Parts display		×	—
Frame animation		×	—
Historical data list display		○	• In the [Text/Style] tab, [Font], [Font Width], [Lock aspect ratio], and [Display the comments in Windows fonts] are not settable. • In the [Extended] tab, [KANJI Region] and [Layer] are not settable.
Alarm display (user)		○	• [Occurrence Log] cannot be set in the [Display] tab of the alarm display (user). • In the [Text] tab, [Font], [Font Width], [Lock aspect ratio], and [KANJI Region] are not settable. • In the [Style] tab, [Text color on cursor display] is not settable. • In the [Extended] tab, [Layer] is not settable.
Alarm display (system)		○	
Simple alarm display		×	—
System alarm display		○	• [Font], [Font Width], [Lock aspect ratio], and [Layer] are not settable.
Recipe display (record list)		×	—
Line graph		○	• In the [Style] tab, [Font] and [Font Width] are not settable. • In the [Extended] tab, [Layer] is not settable. • The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available.
Trend graph		○	
Bar graph		○	
Band graph		○	
Pie graph		○	
Scatter graph		○	• In the [Style] tab, [Font] and [Font Width] are not settable. • In the [Extended] tab, [Store Memory] and [Layer] are not settable. • The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available.
Historical trend graph		○	• In the [Style] tab, [Font] and [Font Width] are not settable. • In the [Extended] tab, [Layer] is not settable. • The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available.
Graphical meter		○	• In the [Text] tab, [Font], [Character Set], and [Font Width] are not settable. • In the [Scale] tab, [Font Width] is not settable. • In the [Extended] tab, [KANJI Region] and [Layer] are not settable. • The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available.
Level		×	—
Panel meter		×	—
Slider		×	—
Document display		×	—
Digital image display		×	—
Script part		×	—
Set overlay screen		○	• In the [Set Overlay Screen] window, only mobile screens are listed in the [Screen Selection] tree. • In the [Number Specification] window, [Screen Type] is fixed to [Mobile Screen].
Window position		○	This is enabled only when a mobile screen is displayed as the base screen. This is disabled when a mobile screen is displayed as an overlap window or superimpose window.
Key window object		×	—
Hyperlink		○	—

For the objects on mobile screens, some setting items have restrictions.

• Object script

No object script is settable for an object on a mobile screen.

Create a mobile screen without object scripts.

• Font and KANJI region

Each client displays characters in its standard font.

Therefore, the font and KANJI region are not settable with GT Designer3.

To change the font or KANJI region, change the standard font of the client used.

• Layers and display mode

For mobile screens, the layer settings are not available.

Therefore, the display mode ([Transparent] or [XOR]) of an object is not settable.

Figures and objects are always displayed in the order specified with GT Designer3.

• Set overlay screen

Only mobile screens can be called.

You cannot call another mobile screen from a called mobile screen.

Precautions

■Forcibly turning off a touch switch if the communication is lost (momentary switch forced off)

If a touch switch is released on a client after the client loses communication with the GOT, the GOT does not recognize the release.

After a specified time (default: 3 seconds) elapses, the GOT forcibly turns off the touch switch.

Use the Time to Force Mobile Momentary Switch OFF device (GS1899) to set the time from when communication is lost until when the GOT forcibly turns off the touch switch.

For details on the Time to Force Mobile Momentary Switch OFF device (GS1899), refer to the following.

☞ Page 3660 Time to Force Mobile Momentary Switch OFF (GS1899)

■Corrective action when a touch switch (bit momentary) does not operate

When the browser is Google Chrome, a touch switch with bit momentary set may not operate.

In such situations, check if the setting for [Touch Events API] is [Automatic] in the browser.

The following shows how to check or change the setting.

• For Google Chrome version earlier than 79

1. Enter "Chrome://flags" in the Google Chrome address bar.
2. Enter "Touch Events API" in the search field [Search flags] at the top of the screen.
3. Check if the setting for [Touch Events API] is [Automatic].

If [Disabled] is set, change the setting to [Automatic].

• For Google Chrome version 79 or later

The setting for [Touch Events API] cannot be checked.

[Automatic] is set for [Touch Events API] when Google Chrome is run from the shortcut created in the following steps.

1. Create a shortcut to Google Chrome.
2. Select [Properties] from the context menu of the shortcut to open the window.
3. Append "--touch-events" to the path in [Target] and click the [OK] button.

■Placing an object in the location of the operation menu bar on a mobile screen

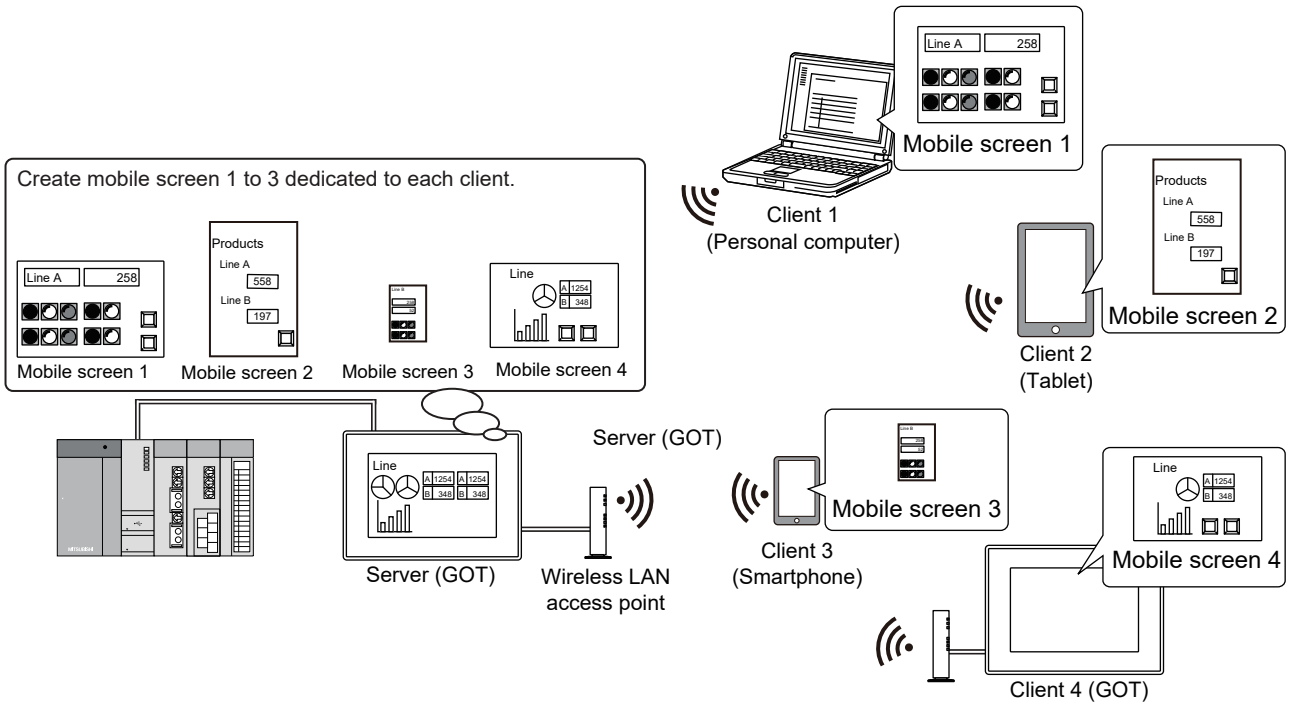
When you place an object, make sure that the object and the operation menu bar do not overlap each other.

Otherwise, the object is hidden under the menu bar and you cannot touch the object.

82.2.6 Mobile screen

The mobile screen is a monitor screen dedicated to clients.

Since the screen size is settable for each mobile screen, you can create mobile screens for each client according to the client display size.



For the functions, figures, and objects available on mobile screens, refer to the following.

☞ Page 2742 Usable functions

Mobile screens are created with GT Designer3, and the mobile screen data is contained in the GOT project.

For information on how to create a mobile screen, refer to the following.

☞ Page 2800 Creating a mobile screen

Created base screens or window screens can be copied to mobile screens.

For details, refer to the following.

☞ Page 2800 Copying a base screen or window screen to a mobile screen

Mobile screen specifications

Item	Specifications
Screen size (width × height) (dots)	16 to 3000 × 2 to 3000
Number of screens registrable	9999
Registrable screen number	0 to 32767
Number of simultaneously displayable screens	5

■Font and KANJI region

Each client displays characters in its standard font. Therefore, the font and KANJI region are not settable with GT Designer3.

To change the font or KANJI region, change the standard font of the client used.

■Layers and display mode

For mobile screens, the layer settings are not available.

Figures and objects are always displayed in the order specified with GT Designer3.

■Displaying the mobile screens in multiple languages

The display language of the mobile screens depends on the client OS.

To display the mobile screens in multiple languages, check that the client OS supports relevant languages.

■Mobile screen size

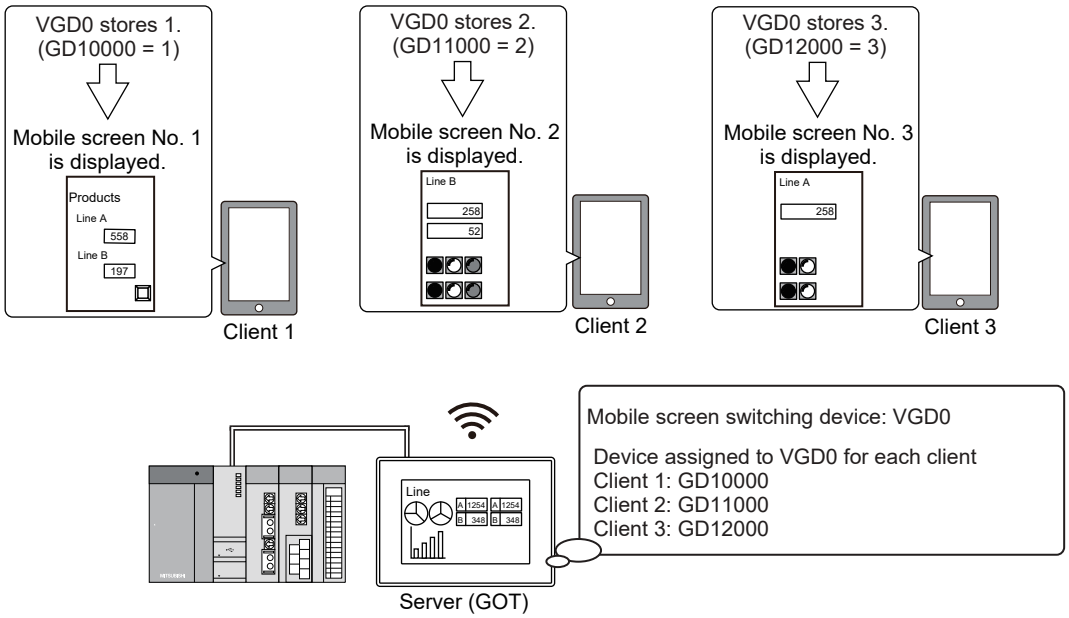
To determine the mobile screen size, consider the screen resolution and OS of the information device, and the browser characteristics.

If you set the mobile screen size the same as the resolution of the information device, a portion of the screen may not be displayed depending on the location of the OS status bar, browser tabs, or other conditions.

82.2.7 GOT Mobile device (VGB and VGD)

The GOT Mobile device (VGB and VGD) is a virtual device usable for a client.
Assign GOT internal devices (GB and GD) to GOT Mobile devices for a client. Thus, the GOT Mobile devices are used as internal devices for the client.

Ex.
When switching screens on multiple clients



Setting range and settable devices

Target device	Setting range of the GOT Mobile device	GOT Mobile device No. representation	Number of the GOT internal devices that can be assigned	GOT internal device that can be assigned
GOT Mobile bit register (VGB)	VGB0 to VGB32767	Decimal	32 to 32768 (in 32-point units)	GB64 to GB65535*1
GOT Mobile data register (VGD)	VGD0 to VGD32767	Decimal	2 to 32768 (in 2-point units)	GD0 to GD65535

*1 Do not assign GB0 to GB63 to the GOT Mobile device because these internal devices (GB0 to GB63) are already assigned for the GOT system.

Precautions

Use the GOT Mobile devices (VGB and VGD) in the following settings only.

- Setting for an object on a mobile screen
- Setting in the [GOT Mobile Setting] window
- Setting in the [Alarm Popup Display(GOT Mobile Setting)] dialog

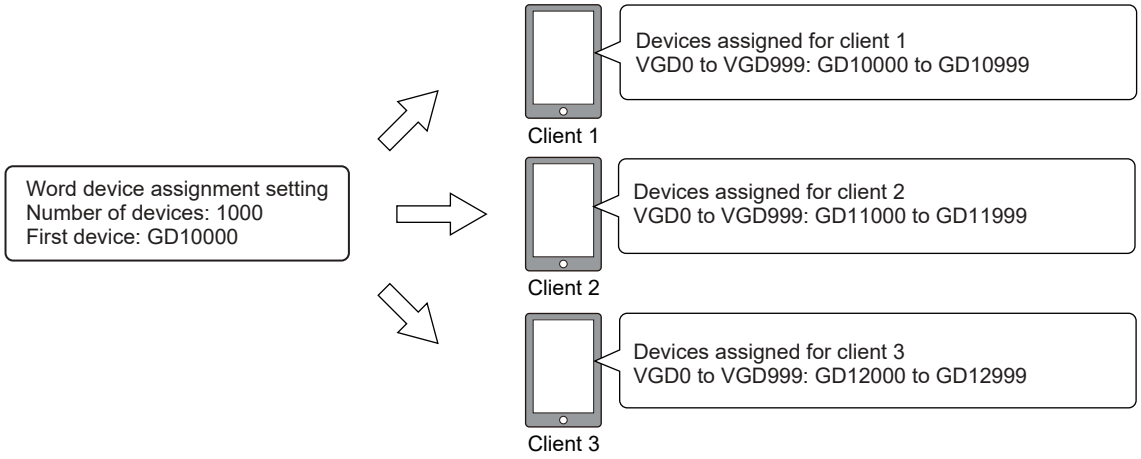
If you set the GOT Mobile devices for objects on screens other than mobile screens and for functions configured in the project, these objects and functions do not operate properly.

How to assign a GOT internal device

Set the number of devices to be assigned, and specify the first device assigned for client 1. Then, the set number of consecutive devices (starting from the specified first device) are automatically assigned to the GOT Mobile devices for each client.

Ex.

Assigning 1000 GOT internal devices (GD) to the GOT Mobile devices (VGD) for client 1, client 2, and client 3



For the GOT Mobile device setting, refer to the following.

☞ Page 2821 [Device Allocation Setting]

Clearing the values of the GOT Mobile devices

If you select [Initialize the devices (VGD, VGB) at the time of client connection] in the [GOT Mobile Setting] window ([Device Allocation Setting]), the values of the GOT Mobile devices assigned to a client are cleared when the client connects to the GOT.

If you deselect the item, the assigned devices retain the values stored in the last session.

☞ Page 2821 [Device Allocation Setting]

Precautions

If you deselect [Initialize the devices (VGD, VGB) at the time of client connection] in the [GOT Mobile Setting] window ([Device Allocation Setting]), the values of the GOT Mobile devices assigned to a client are not cleared automatically when the client starts accessing the GOT.

(The values stored before the access are retained.)

Configure the settings so that the values of the GOT Mobile devices are cleared when a client starts accessing the GOT or becomes disconnected from the GOT.

Note that restarting the GOT clears the values of the GOT Mobile devices that are assigned to each client.

82.2.8 Authentication

The following shows the methods of connecting the GOT and clients.

- Connection with the operator name and password-based authentication (The authentication screen appears.)
- Connection without the operator name and password-based authentication—ANDON function (The authentication screen does not appear.)

For the ANDON function, refer to the following.

☞ Page 2812 ANDON function

For the connection with the operator name and password-based authentication, a target client displays mobile screens upon being authenticated.

The authentication method is selectable between the GOT Mobile exclusive authentication and the operator authentication.

For instruction on the authentication setting, refer to the following.

☞ Page 2819 [Authentication Setting]

GOT Mobile exclusive authentication

This authentication method is dedicated to the GOT Mobile function.

The account dedicated to the GOT Mobile function is used for authentication.

The operator management information is not used.

After the GOT Mobile authentication succeeds, you can log in using the operator authentication or the level authentication.

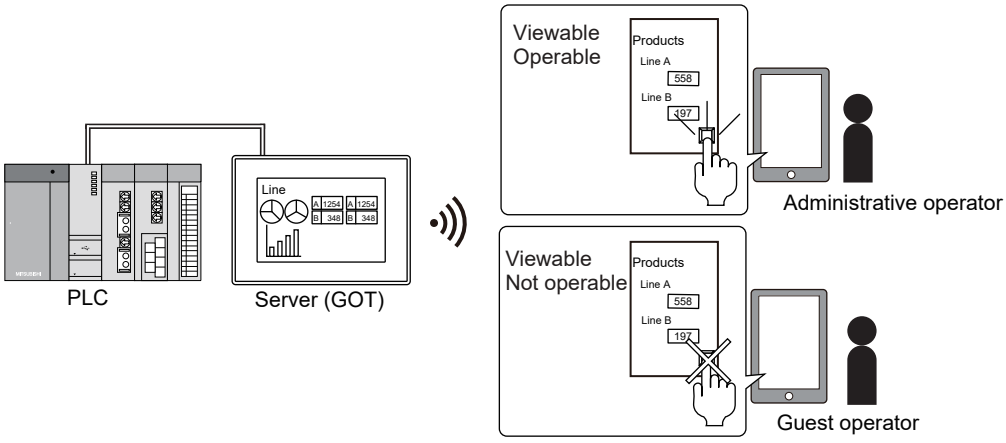
Two types of accounts are used in the GOT Mobile authentication: administrative operator account and guest operator account.

When authenticated with the administrative operator account, the client can obtain the operation right for the GOT network interaction function.

You can view a mobile screen in which the authorization control is enabled, and operate the objects on the mobile screen.

When authenticated with the guest operator account, the client cannot obtain the operation right for the GOT network interaction function.

You can view a mobile screen in which the authorization control is enabled, but cannot operate the objects on the mobile screen.



One administrative operator account and one guest operator account are settable for each project.

For the setting method, refer to the following.

☞ Page 2819 [Authentication Setting]

Operator authentication

This authentication needs an operator account in the operator management information file.
Make sure to preconfigure the operator authentication setting in [Security] in the [Environmental Setting] window.
Otherwise, the authentication method of the GOT Mobile function is fixed to the GOT Mobile exclusive authentication.
After the operator authentication succeeds, you can view mobile screens according to the operator account security level.
The authenticated client can obtain the operation right for the GOT network interaction function, regardless of the operator account security level.
When the security mode is mode 2, authentication with the operator with the corresponding authority is required.
If the operator account is logged out, the GOT automatically disconnects the client.
Even if the operator account is logged out because of the automatic logout time, the client becomes disconnected from the GOT.
The operator switching is not available on a client that is connected to the GOT.
To switch between operators, disconnect the target client from the GOT, and then perform the authentication with another operator account.
For details on the operator authentication, refer to the following.
☞ Page 3038 Restricting display and operation on the GOT (Screen security)
☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2))

Authorization control

You can prevent simultaneous operations from multiple clients and the GOT by enabling the authorization control.
Base screens, overlap windows, and superimpose windows for GOT Mobile are the targets for authorization control, which is the same as authorization control of GOT screens.
To control the authorization among clients and the GOT, use the GOT network interaction function in combination.
For details on the GOT network interaction function, refer to the following.
☞ Page 762 Setting the interaction function for equipment on Ethernet ([GOT Network Interaction])
You can check and control the operation right status of each client.
Use the following devices.

■Operational Authority Status Notification device

This device notifies the operation right status of each client.
Specify this device using the GOT Mobile device (VGD) or the word-specified GOT Mobile device (VGB).
☞ Page 2829 [Exclusive Control of Operational Authority]

Bit number	Function	Description
b0	Notifies whether the equipment obtains the operation right.	Turns on when the equipment obtains the operation right.
b1	Notifies whether the authorization control is enabled in the screen being displayed.	Turns on when the authorization control is enabled in the screen being displayed.
b2 to b15	-	Use prohibited

■Operational Authority Status Control device

This device controls the operation right among the clients.
Specify this device using the GOT Mobile device (VGD) or the word-specified GOT Mobile device (VGB).
☞ Page 2829 [Exclusive Control of Operational Authority]

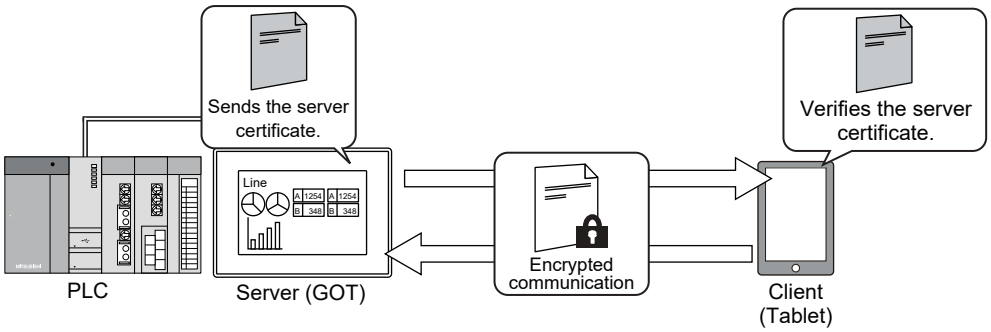
Bit number	Function	Description
b0	Disables the automatic acquisition of the operation right.	When this bit turns on, the automatic acquisition of the operation right becomes disabled. On unauthorized equipment, even if you switch a screen to another screen in which the authorization control is enabled, the equipment cannot automatically obtain the operation right.
b1 to b15	-	Use prohibited

82.2.9 Encrypted communication

Encrypting the communication between the server and the client prevents unauthorized access and data leakage in the communication route.

For details on encrypted communication, refer to the following.

☞ Page 3069 Encrypting communication data (Encrypted communication function)



The procedure to enable encrypted communication varies with the GOT model.

☞ Page 2771 Settings for encrypted communication (except GT SoftGOT3000)
☞ Page 2780 Settings for encrypted communication (GT SoftGOT3000)

82.2.10 Public folder

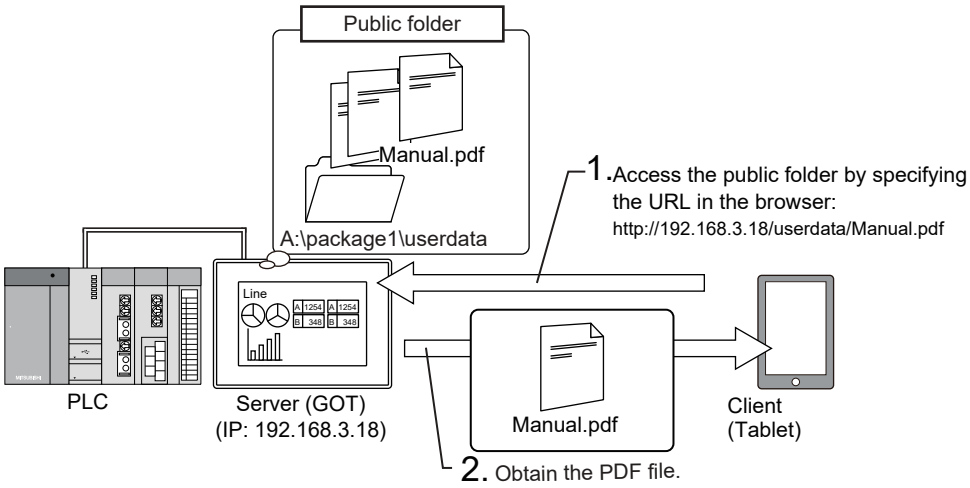
The server (GOT) uses the public folder to provide files for clients.

To access a file in the public folder on the server (GOT), specify the URL of the file in your browser.

No authentication is performed to access the public folder.

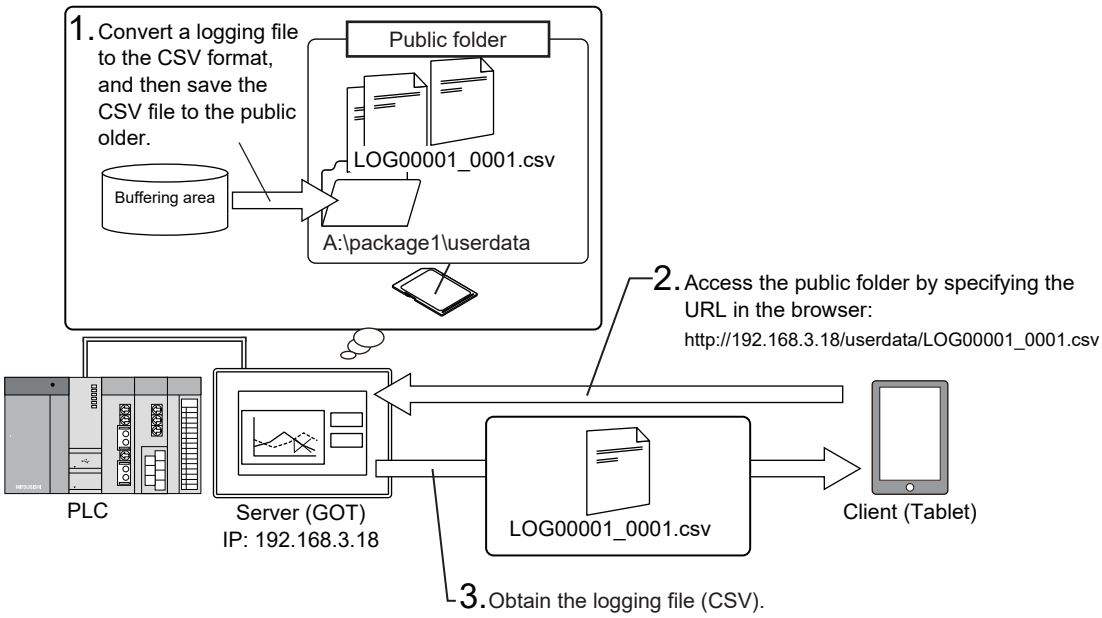
Ex.

Accessing a manual PDF file in the public folder from a client



Ex.

Saving a logging file to the public folder and accessing the file from a client



Enabling the public folder

To allow clients to access the public folder, select [Allow external access to GOT public folder] in [Basic Setting] in the [GOT Mobile Setting] window.

☞ Page 2818 [Basic Setting]

Creating the public folder

The public folder is created by the user.

Under the package folder of the GOT, create the public folder named "userdata".

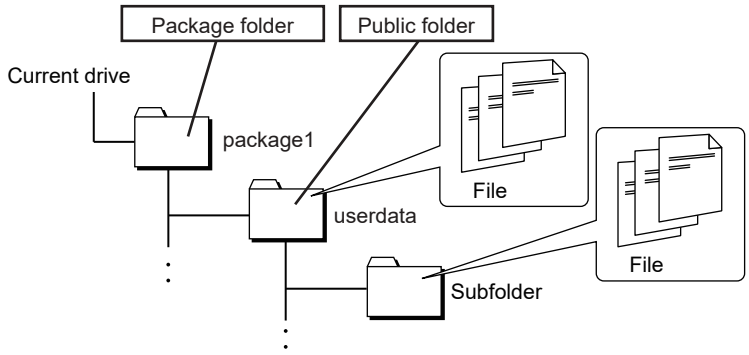
The package folder is in the current drive.

For details on the current drive, refer to the following.

☞ Page 81 Drive configuration and capacity of the GOT

If a sub folder is created under the public folder, files in the sub folder are also accessible.

Create sub folders when necessary.



Precautions

Each file in the public folder is accessible without authentication by specifying the URL of the file in the browser.

Once equipment is connected to the GOT by Ethernet, anyone can obtain the files in the public folder. Therefore, do not store your important data in the public folder.

Accessing a file in the public folder from a client

To access a file in the public folder, enter the URL of the file in the address bar of the browser in the following format.

- http://GOT IP address/userdata/sub folder name/file name

Enter the sub folder name only if a sub folder has been created.

To encrypt communications, start with "https://".

When you place a hyperlink object on a mobile screen and specify the URL of a file in the public folder in the object setting, touch the object to access the file.

For details on the hyperlink object, refer to the following.

☞ Page 1896 Placing a hyperlink on a mobile screen

Ex.

Input when encrypted communication is enabled

https://192.168.3.18/userdata/subfolder1/AAM00001.csv

82.2.11 File manager

Displays the file manager screen where you can view the folders and files in the public folder, or perform manipulations on them such as copying.

Item	Description
Viewing	The folders and files in the public folder are viewable.
Manipulations*1	The following manipulations are supported. • Copy • Cut (GT SoftGOT3000 does not support this manipulation on folders.) • Paste • Rename • New folder • Delete (GT SoftGOT3000 does not support this manipulation on folders.) Folders and files cannot be moved between the public folder and the other folders.

*1 When the GOT security mode is mode 2, files cannot be manipulated.

For the public folder, refer to the following.

☞ Page 2760 Public folder

When the security mode is mode 1, turn on GS1896.b1 to manipulate the folders and files in the public folder.

To limit users to perform the manipulations, specify a security level with GS1892.

When a security level (0 to 15) is specified with GS1892, the users with the specified security level and higher are allowed to perform the manipulations.

☞ Page 3581 GOT special register (GS)

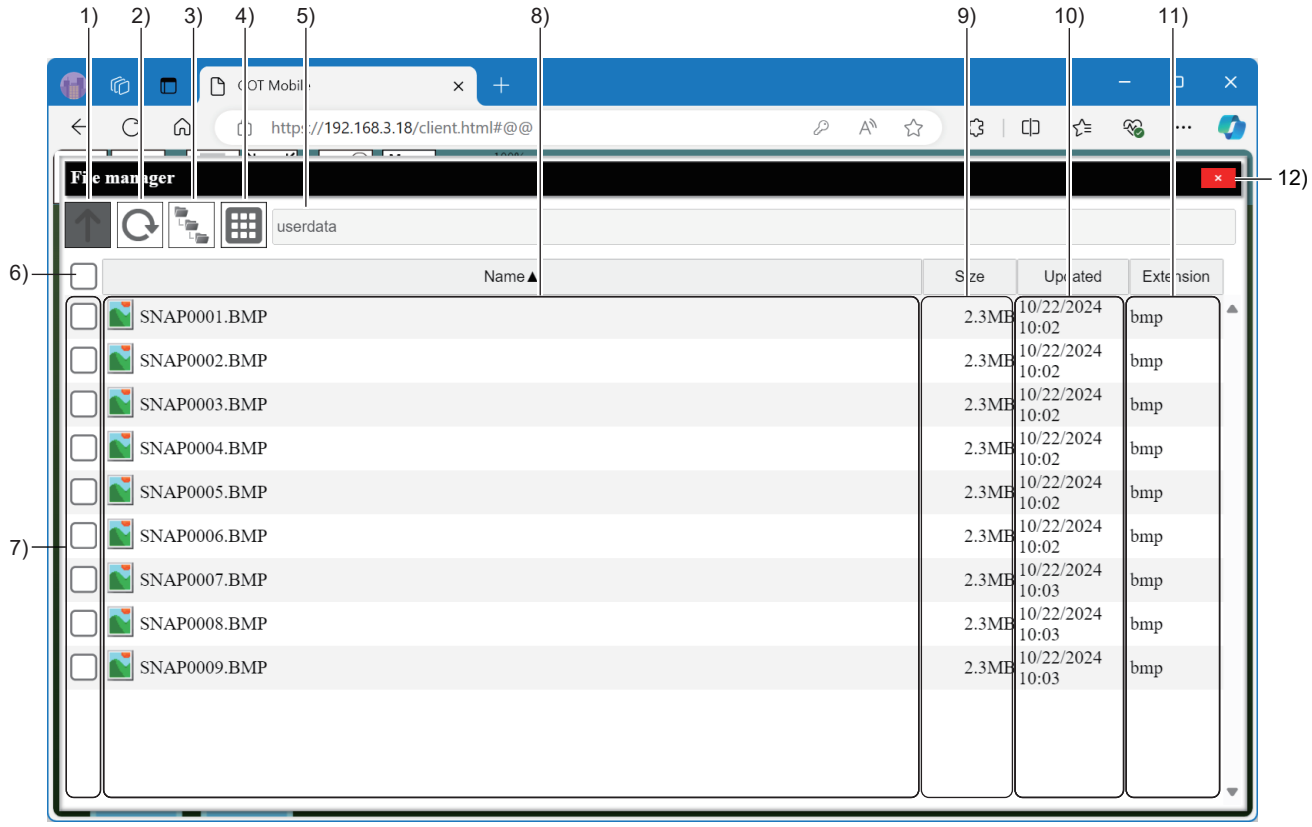
File manager screen

To display the file manager screen, touch the extended function button on the operation menu bar on the mobile screen, and select [File manager] from the displayed menu.

☞ Page 2809 Operation menu bar on the mobile screen

The mobile screen is not operable while the file manager screen is being displayed.

Touch a row to open the corresponding folder or file.



Item			Description
1)	Return button		Moves to the parent folder.
2)	Update button		Updates the contents of the file manager screen.
3)	Directory button		Displays the directory tree to the open folder. Touch the folder to move to in the tree structure.
4)	Manipulation buttons	[Copy]	Displays the menu for manipulating the folders and files listed. Copies the selected folder or file.
		[Cut]	GT SoftGOT3000 does not support this manipulation on folders. Cuts the selected folder or file.
		[Paste]	Pastes the copied or cut folder or file in the open folder.
		[Rename]	Renames the selected folder or file. For restrictions on the folder name and file name, refer to the following. ☞ Page 84 Restrictions for folder names and file names used in GOT
		[New folder]	Creates a folder.
		[Delete]	GT SoftGOT3000 does not support this manipulation on folders. Deletes the selected folder or file. If you delete a folder, the files in the folder will also be deleted even though they are in use.
5)	Address bar		Displays the path to the open folder.
6)	Select all checkbox		Selects all folders and files.
7)	Select checkbox		Selects a folder or file to be manipulated.
8)	[Name]		Displays the folder and file names.
9)	[Size]		Displays the size of files.
10)	[Updated]		Displays the updated date and time of folders and files.
11)	[Extension]		Displays the filename extensions.
12)	Close button		Closes the file manager screen.

Precautions

When the file manager is used for multiple tabs in the windows of the same browser, an error occurs.
Do not use the file manager for multiple tabs in the windows of the same browser.
You cannot move to the destination folder with the Return button in the file manager screen if you manipulate an open folder or file or its parent folders on the GOT.
In such a case, use the Directory button to display the directory tree, and select the folder to move to.

82.2.12 Hard copy function

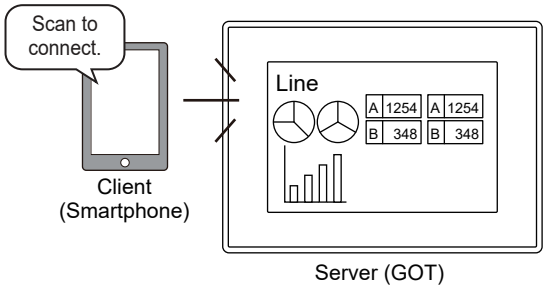
The hard copy function captures the current mobile screen in PNG format and outputs it to a new tab in the browser.
To execute the hard copy function, touch the extended function button on the operation menu bar on the mobile screen, and select [Hard Copy] from the displayed menu.
☞ Page 2809 Operation menu bar on the mobile screen
The image is displayed in full size (100%) that is set on GT Designer3.
Save the displayed image as necessary.
The following items are not captured in the screenshot by the hard copy function.

- Mouse pointer
- Operation menu bar on the mobile screen
- Authorization popup display
- Alarm popup display
- Key window
- Dialog

82.2.13 Client connection using a contactless tag

GT37 SoftGOT3000

When the contactless tag embedded in the server (GOT) is enabled, you can connect the client to the server (GOT) by placing the client over the contactless tag of the server (GOT).
This eliminates the need of opening a browser window to directly enter the URL or specify the IP address of the GOT directly.



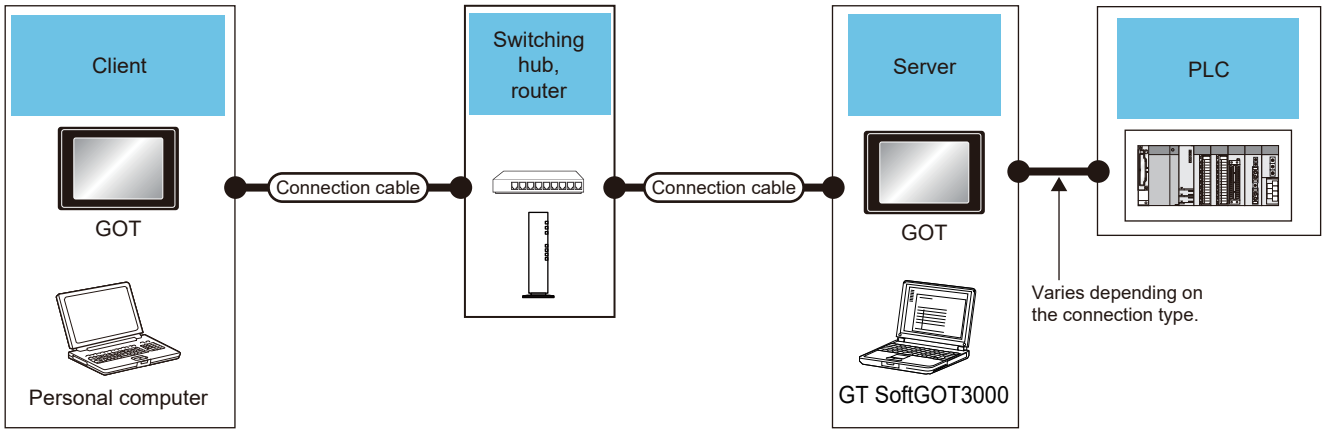
To connect the client to the server (GOT) using a contactless tag, you must make advance preparations such as connecting the client and a wireless LAN access point.
For information on the setting to enable a contactless tag, refer to the following.
☞ Page 667 Configuring the settings for the GOT contactless tag ([Contactless Tag])

82.3 System configuration of the GOT Mobile function

The following shows the system configuration of the GOT Mobile function.

☞ Page 2766 System configuration using cables
☞ Page 2768 System configuration via wireless LAN

System configuration using cables



Client (GOT, personal computer)	Connection cable, Switching hub, router	Server (GOT, GT SoftGOT3000)		PLC
		Interface	GOT model	
GT37, personal computer	• Cable Shielded twisted pair cable • Switching hub, router For information on connectable switching hubs and routers, refer to the following. ☞ Page 2766 Connection cable, connector, hub	Built-in Ethernet interface of the GOT	GT37 SoftGOT3000	For information on the system configuration between the GOT and the PLC, refer to the following. GOT3000 Series User's Manual (Connection)
		Ethernet interface of personal computer	GT37 SoftGOT3000	

■Connection cable, connector, hub

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (STP): Category 5 and 5e
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

A straight cable is usable.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades.

For the limit, contact the switching hub manufacturer.

Precautions

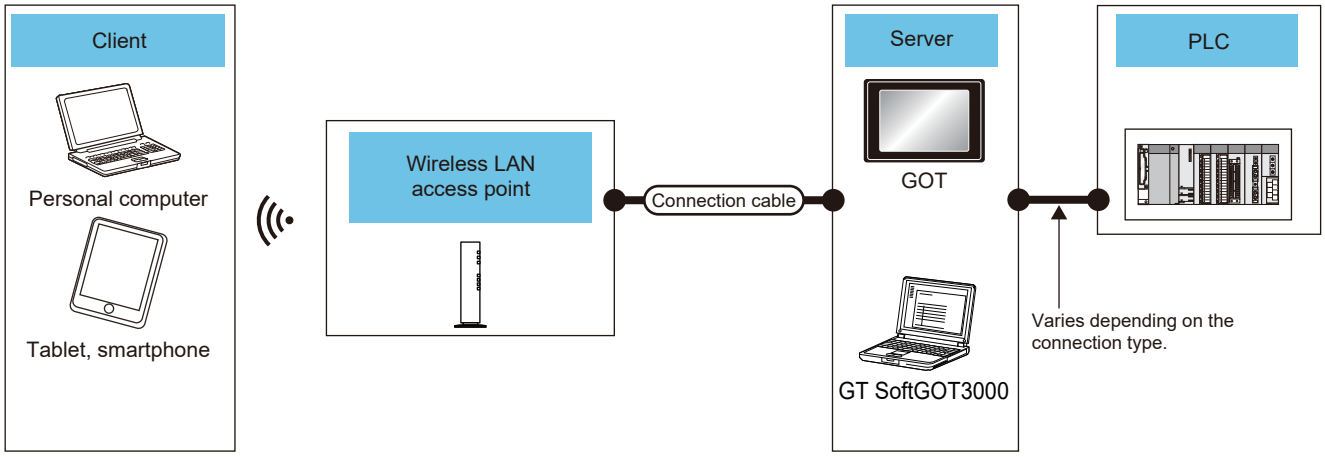
When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance:

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

PART 25

System configuration via wireless LAN



Client (Personal computer, tablet, or smartphone)	Wireless LAN access point	Server (GOT, GT SoftGOT3000)		PLC
		Interface	GOT model	
Personal computer, tablet, or smartphone	For information on the connectable wireless LAN access points and system devices, refer to the following Technical Bulletin.*1 📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)	Built-in Ethernet interface of the GOT	GT37 SoftGOT3000	For information on the system configuration between the GOT and the PLC, refer to the following. 📖GOT3000 Series User's Manual (Connection)
		Ethernet interface of personal computer	GT37 SoftGOT3000	

*1 The usable wireless LAN access point varies with the personal computer used.

82.4 Settings and connection method of the GOT Mobile function

GT37 SoftGOT3000

☞ Page 2770 Setting GT37 as a server
☞ Page 2778 Setting GT SoftGOT3000 as a server
☞ Page 2800 Creating a mobile screen
☞ Page 2802 Settings on the client
☞ Page 2802 Connecting the client with the server (GOT)
☞ Page 2809 Operations on the mobile screen

This section describes the settings required to use the GOT Mobile function and the method for connecting the client with the server (GOT).

The setting procedure for using the Mobile function differs depending on the model.

Item		Description	
		When the server is GT37	When the server is GT SoftGOT3000
Settings in GT Designer3	GOT Mobile function setting	☞ Page 2770 Setting GT37 as a server	☞ Page 2778 Setting GT SoftGOT3000 as a server
	Creating the mobile screen		
Settings on the client		☞ Page 2802 Settings on the client	
Connecting the client with the server (GOT)		☞ Page 2802 Connecting the client with the server (GOT)	

PART 25

82.4.1 Setting GT37 as a server

1. Set the GOT Ethernet interface.

☞ Page 713 Setting the GOT Ethernet interface ([GOT Ethernet Setting])

2. Configure the GOT Mobile function setting.

Select [Common] → [GOT Mobile Setting] from the menu to display the [GOT Mobile Setting] window ([Basic Setting]), then select [Use GOT Mobile function].

For information on the GOT Mobile function setting, refer to the following.

☞ Page 2817 [GOT Mobile Setting] window

3. Create a mobile screen.

☞ Page 2800 Creating a mobile screen

4. To encrypt the communication between the GOT and the client, enable encrypted communication referring to the following.

☞ Page 2771 Settings for encrypted communication (except GT SoftGOT3000)

5. If you have enabled external access to the GOT public folder, create the public folder under the package folder.

Create the package folder in the data storage to be installed in the current drive of the GOT.

Store the public folder (folder name: userdata) in the package folder.

☞ Page 2760 Public folder

After the public folder is created, install the data storage to the GOT.

6. To use the file manager, refer to the following.

☞ Page 2762 File manager

7. To connect the GOT and the client using a contactless tag, enable automatic connection with a contactless tag in the [GOT Setup] window ([Contactless Tag]).

☞ Page 667 Configuring the settings for the GOT contactless tag ([Contactless Tag])

For information on the client connection with a contactless tag, refer to the following.

☞ Page 2765 Client connection using a contactless tag

8. To connect the GOT and clients without the operator name and password-based authentication, configure the setting in the [GOT Mobile Setting] window ([ANDON Setting]).

☞ Page 2817 [GOT Mobile Setting] window

For the ANDON function, refer to the following.

☞ Page 2812 ANDON function

9. Connect the personal computer to the GOT, and write the project to the GOT.

☞ Page 408 Transferring data to the GOT

10. Register the license number to the GOT.

For information on how to register the license number, refer to the following.

☞ Page 3686 License registration method

11. Connect the client with the GOT (server).

☞ Page 2802 Connecting the client with the server (GOT)

Settings for encrypted communication (except GT SoftGOT3000)

For encrypted communications, the server certificate must be updated on the server (GOT) and imported on the client.

The following shows the required settings.

• Mandatory settings

Setting	Description	Target device
1. Enabling encrypted communication	☞ Page 2771 GOT Mobile function setting (GT Designer3)	Server (GOT)
2. Setting the server certificate information and updating the server certificate	☞ Page 2771 Setting the server certificate information and updating the server certificate (GT Designer3, server (GOT))	
3. Importing the server certificate	☞ Page 2771 Importing the server certificate (client)	Client

• Optional settings (if client authentication is used)

Setting	Description	Target device
1. Enabling client authentication	☞ Page 2771 GOT Mobile function setting (GT Designer3)	Server (GOT)
2. Creating the client certificate	☞ Page 2775 Creating and importing the client certificate (client, server (GOT))	Client
3. Importing the client certificate		Server (GOT)

■GOT Mobile function setting (GT Designer3)

Set the communication method for the GOT Mobile function to HTTPS (SSL).

In GT Designer3, select [Common] → [GOT Mobile Setting] to display the [GOT Mobile Setting] window ([Basic Setting]).

Then select [HTTPS(SSL)] for [Communication Method].

☞ Page 2818 [Basic Setting]

Select [Perform authentication with client certificates] to enable client authentication.

When this item is selected, create a client certificate on the client terminal and import it to the server (GOT).

☞ Page 2775 Creating and importing the client certificate (client, server (GOT))

■Setting the server certificate information and updating the server certificate (GT Designer3, server (GOT))

After setting the certificate information in [Information Protection Function] of GT Designer3, write the package data to the GOT.

Then, update the server certificate in the GOT utility. For details on the operations, refer to the following.

☞ Page 3076 Updating the server certificate with the GOT (except GT SoftGOT3000)

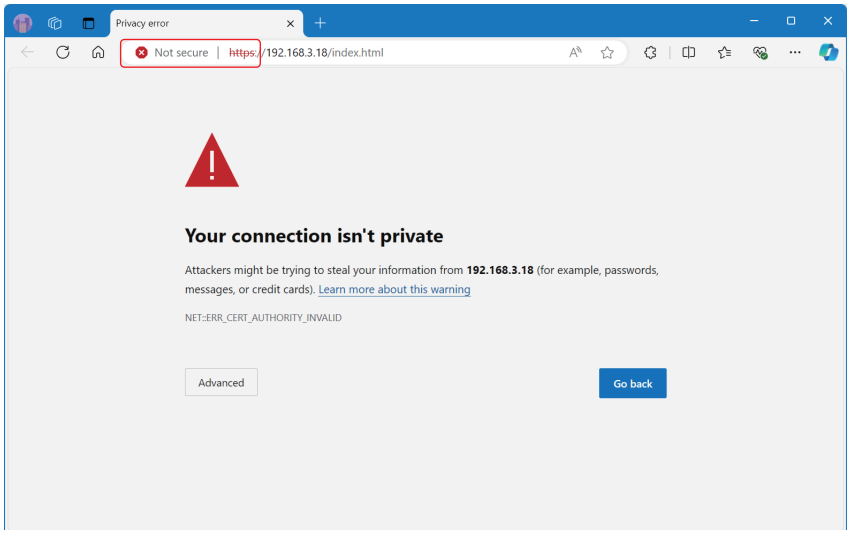
■Importing the server certificate (client)

Import the server certificate of the server (GOT) to the client.

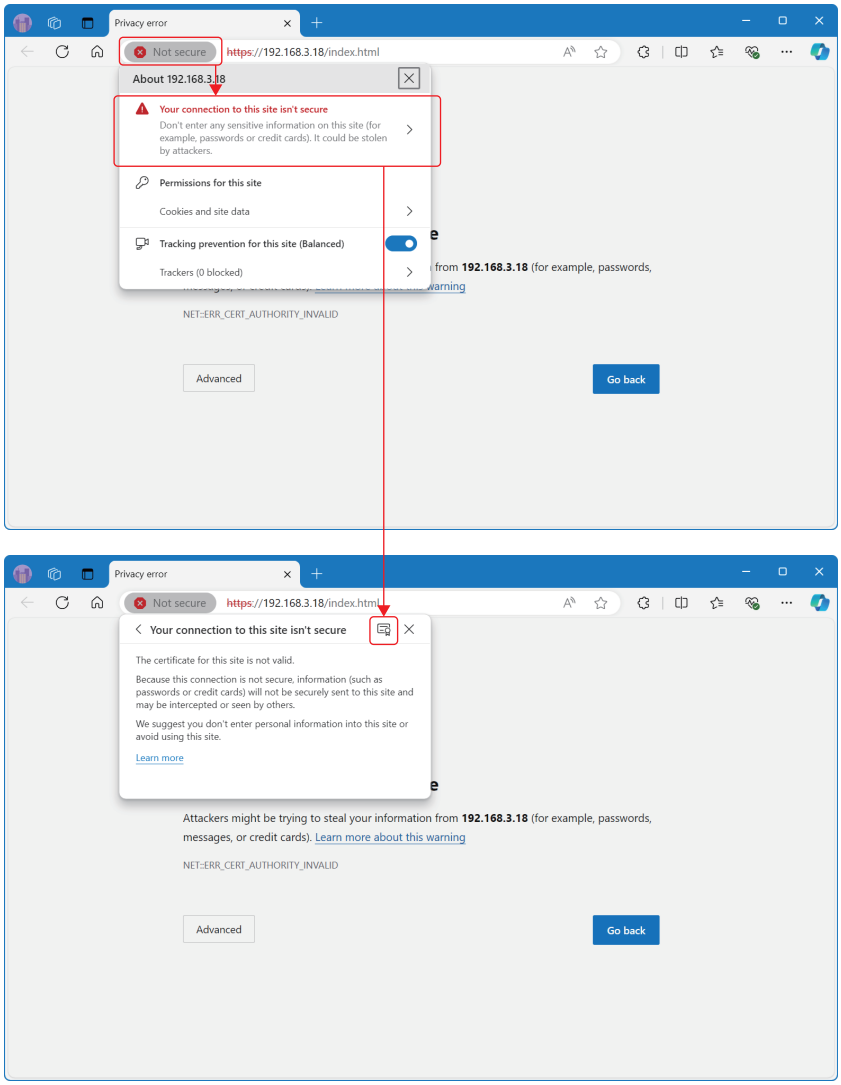
The following shows the importing procedures, using Microsoft Edge as an example.

1. Open the client's web browser and enter the URL of the access destination GOT to display the following screen.

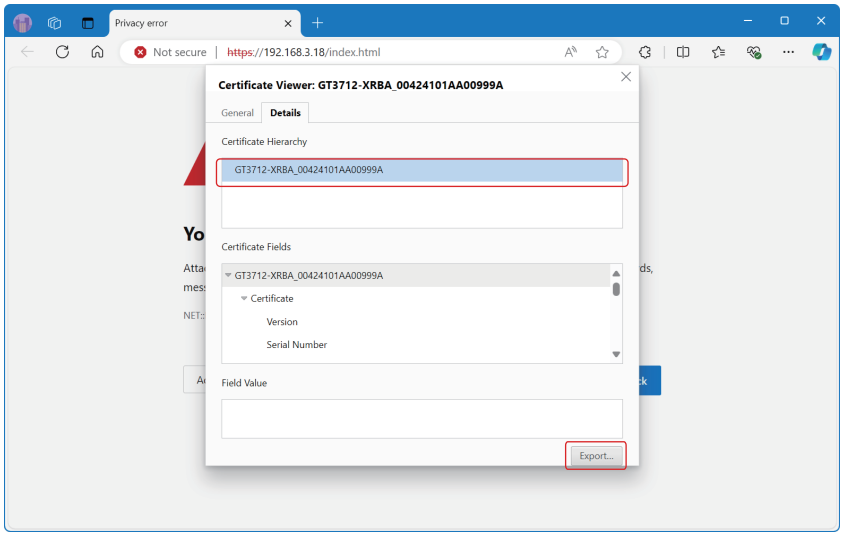
The communication is not protected because the server certificate has not been imported into the client.



2. Follow the steps below.



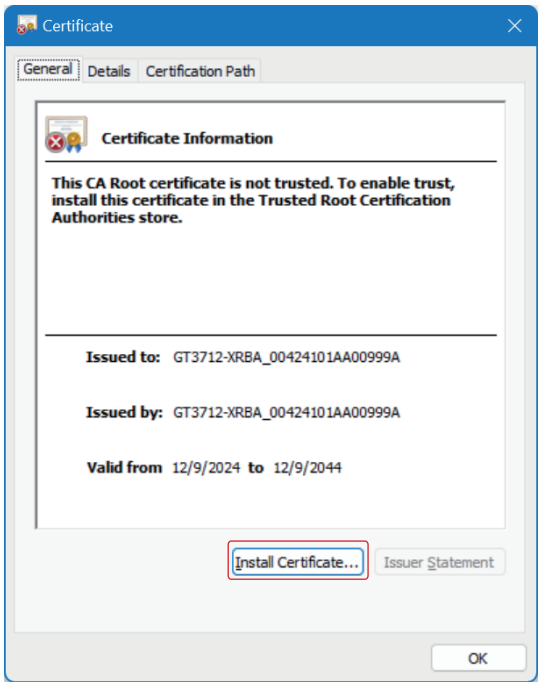
3. Select the server certificate in the [Details] tab of the displayed screen, and click the [Export] button.



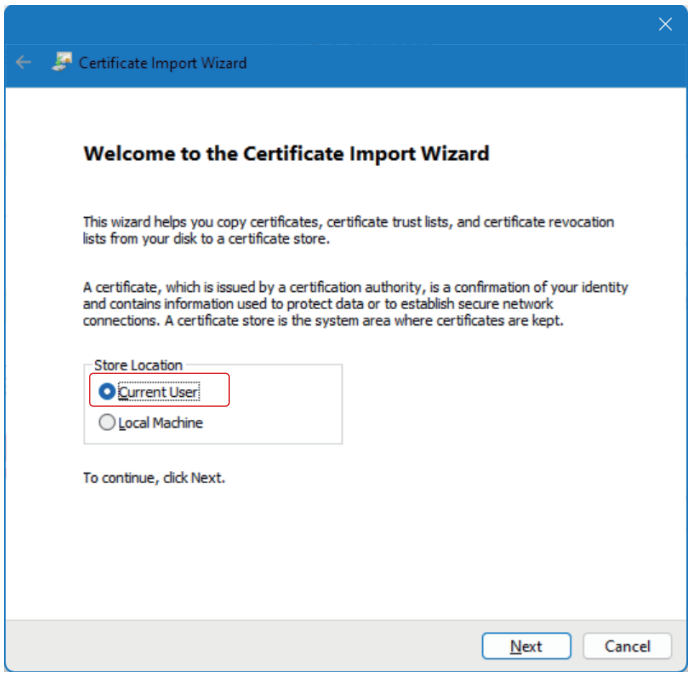
4. Save the server certificate when the [Save As] dialog appears.

5. Double-click the saved server certificate file.

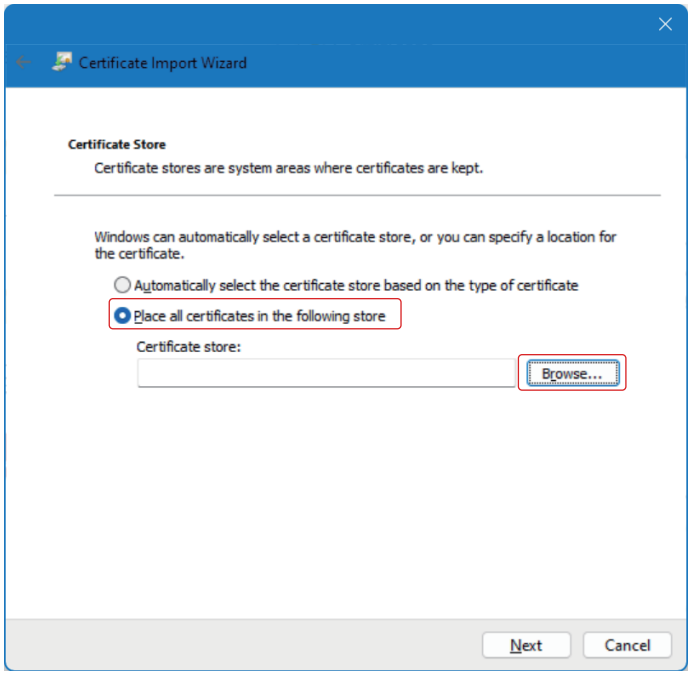
6. On the displayed screen, click the [Install Certificate] button.



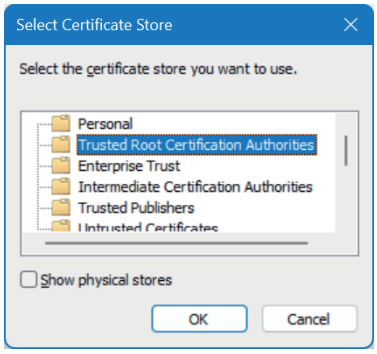
7. Set as follows on the displayed screen, then click the [Next] button.



8. Set as follows on the displayed screen, then click the [Browse] button.



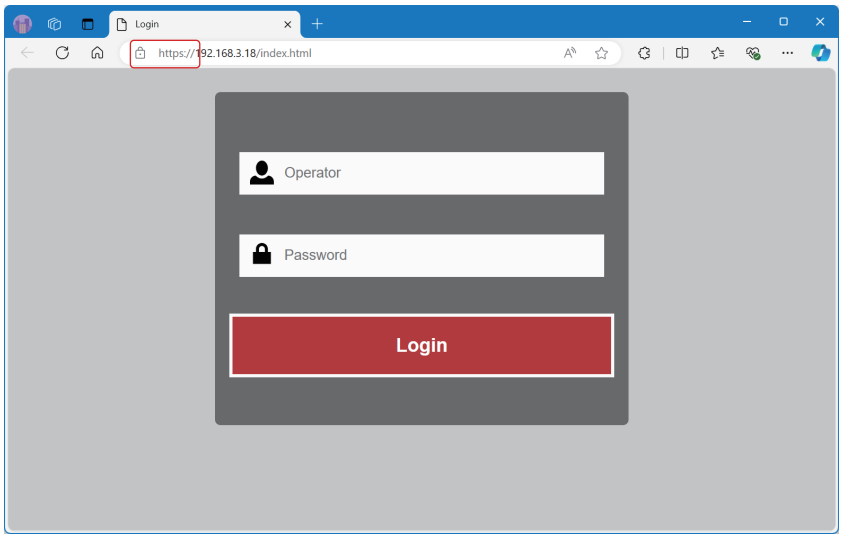
9. Set as follows on the displayed screen, then click the [OK] button.



10. Once you click the [Next] button on the displayed screen, the certificate will be imported.

11. Open the client's web browser and enter the URL of the access destination GOT.

The communication will then be protected.



■Creating and importing the client certificate (client, server (GOT))

The setting is required only when [Perform authentication with client certificates] is selected in [Basic Setting] in the [GOT Mobile Setting] window in GT Designer3.

After creating a client certificate on the client terminal, import it to the server (GOT) using the utility.

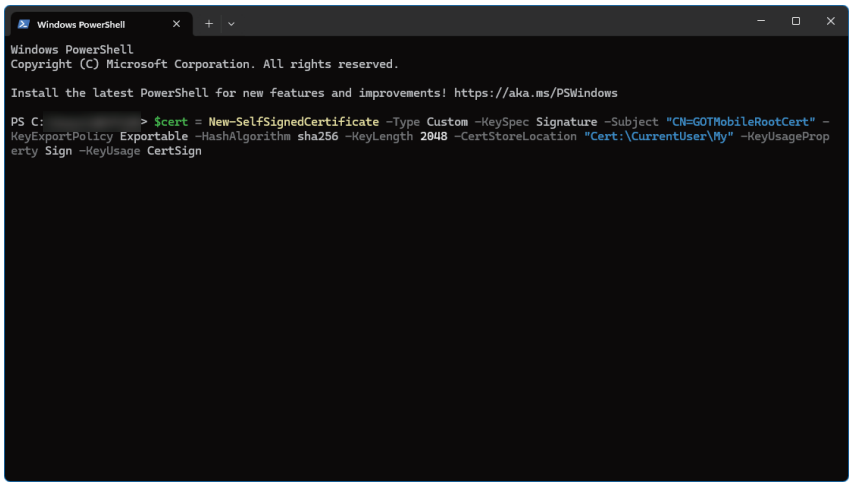
1. Create a self-signed certificate.

From the Windows start menu, select [All] → [Windows Tools], and double-click [Windows PowerShell] in the displayed [Windows Tools].

2. Execute the following command in Windows PowerShell.

Change "####" to a specific name.

$cert = New-SelfSignedCertificate -Type Custom -KeySpec Signature -Subject "CN=####" -KeyExportPolicy Exportable -HashAlgorithm sha256 -KeyLength 2048 -CertStoreLocation "Cert:\CurrentUser\My" -KeyUsageProperty Sign -KeyUsage CertSign

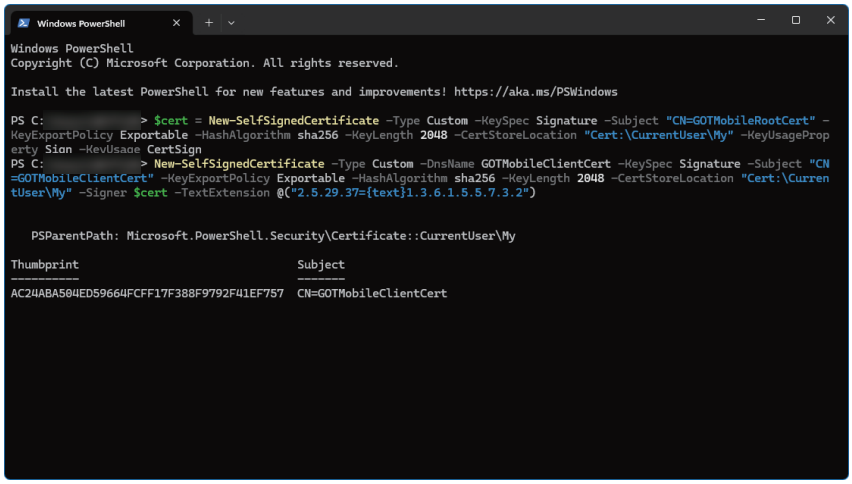


The created self-signed root certificate is placed in the personal certificate store of the user who executes the command.

3. Next, create a client certificate signed by the root certificate.

Execute the following command in Windows PowerShell.

New-SelfSignedCertificate -Type Custom -DnsName #### -KeySpec Signature -Subject "CN=####" -KeyExportPolicy Exportable -HashAlgorithm sha256 -KeyLength 2048 -CertStoreLocation "Cert:\CurrentUser\My" -Signer $cert -TextExtension @("2.5.29.37={text}1.3.6.1.5.5.7.3.2")



The created certificate is also placed in the personal certificate store of the user who executes the command, as well as the self-signed root certificate.

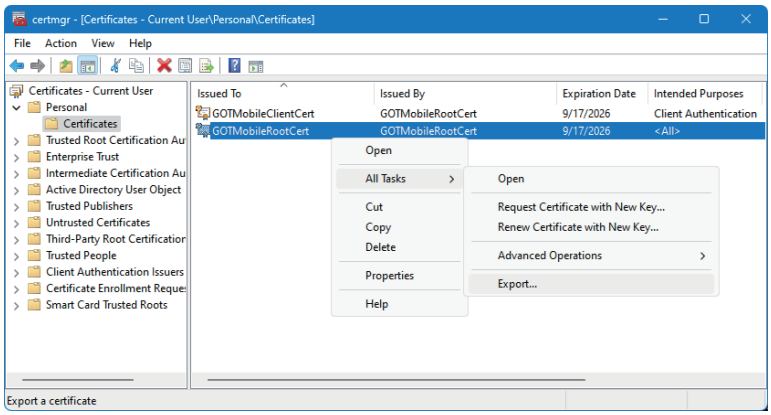
4. Next, export the root certificate.

If you execute the following command in Windows PowerShell, the [certmgr] (user certificate management) window will be displayed.

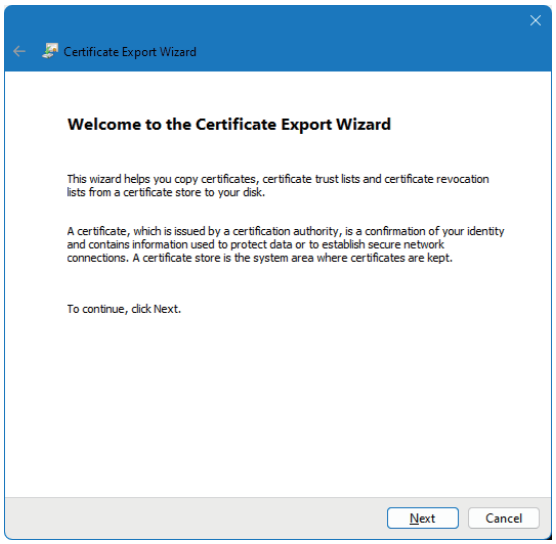
certmgr

5. Select [Personal] → [Certificates] to display the certificate list.

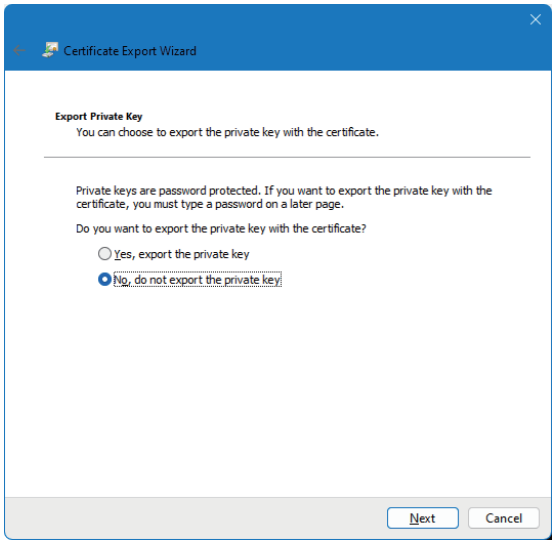
6. Right-click the self-signed root certificate created in step 2 from the list and select [All Tasks] → [Export].



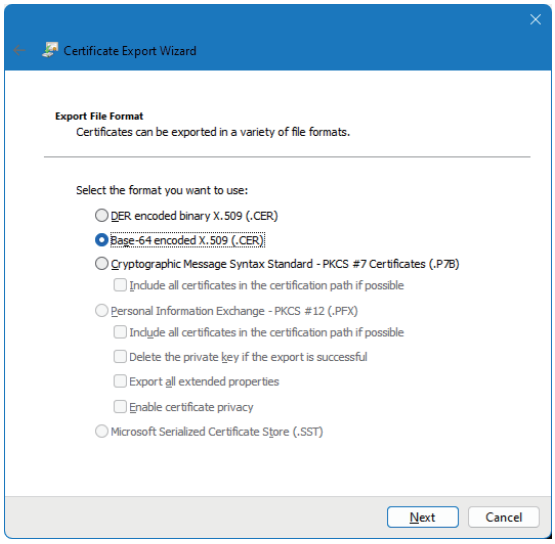
7. On the displayed [Certificate Export Wizard] dialog, click the [Next] button.



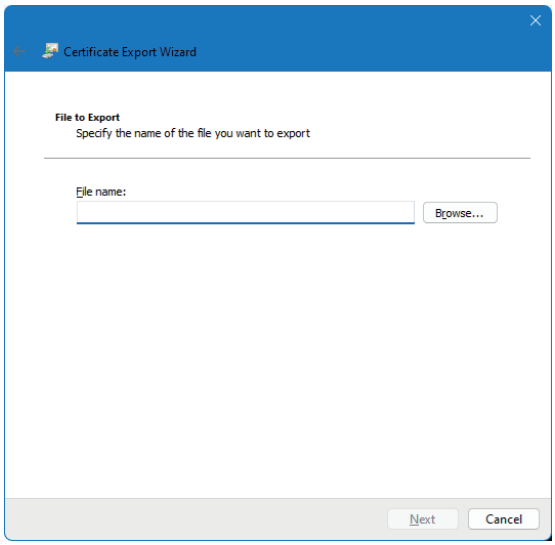
8. Select [No, do not export the private key] and click the [Next] button.



9. Select [Base-64 encoded X.509 (.CER)] for the export file format and click the [Next] button.



10. Enter a file name for the file to be exported, specify the save destination, and click the [Next] button.



11. Click the [Finish] button.

12. Check the displayed message and click the [OK] button.

13. Import the exported file to the GOT.

Model	Procedure
GOT (except GT SoftGOT3000)	Store the client certificate in the root folder of the data storage, and install the data storage to the GOT. Display the [Certificate of GOT] tab in the [Certificate management] screen in the utility, and click the [Import] button. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
GT SoftGOT3000	☞ Page 2795 Creating and importing the client certificate and importing it to GT SoftGOT3000 (client, server (GOT))

82.4.2 Setting GT SoftGOT3000 as a server

1. Enable Internet Information Services (IIS) and the required IIS components on a personal computer running GT SoftGOT3000.

For information on how to enable IIS, refer to the following.

☞ Page 2779 Enabling IIS

2. Configure the GOT Mobile function setting.

Select [Common] → [GOT Mobile Setting] from the menu to display the [GOT Mobile Setting] window ([Basic Setting]), then select [Use GOT Mobile function].

For information on the GOT Mobile function setting, refer to the following.

☞ Page 2817 [GOT Mobile Setting] window

3. Create a mobile screen.

☞ Page 2800 Creating a mobile screen

4. To encrypt the communication between the GOT and the client, enable encrypted communication referring to the following.

☞ Page 2780 Settings for encrypted communication (GT SoftGOT3000)

5. If you have enabled external access to the GOT public folder, create the public folder under the package folder.

Create the package folder on the virtual drive A.

Store the public folder (folder name: userdata) in the package folder.

☞ Page 2760 Public folder

When accessing the GT SoftGOT3000 public folder from multiple clients, it is necessary to configure the IIS settings.

☞ Page 2797 Settings to allow access to the GT SoftGOT3000 public folder from multiple clients

6. To use the file manager, refer to the following.

☞ Page 2762 File manager

7. To connect GT SoftGOT3000 and the clients without operator name and password-based authentication, configure the settings in the [GOT Mobile Setting] window ([ANDON Setting]).

☞ Page 2817 [GOT Mobile Setting] window

For the ANDON function, refer to the following.

☞ Page 2812 ANDON function

8. Register the license number to the GT SoftGOT3000.

GT SoftGOT3000 User's Manual

9. Start GT SoftGOT3000 and open the created project.

GT SoftGOT3000 User's Manual

10. Connect the client with the GOT (server).

☞ Page 2802 Connecting the client with the server (GOT)

Precautions

The following shows how to act when system alarm 621 occurs when GT SoftGOT3000 is set as a server.

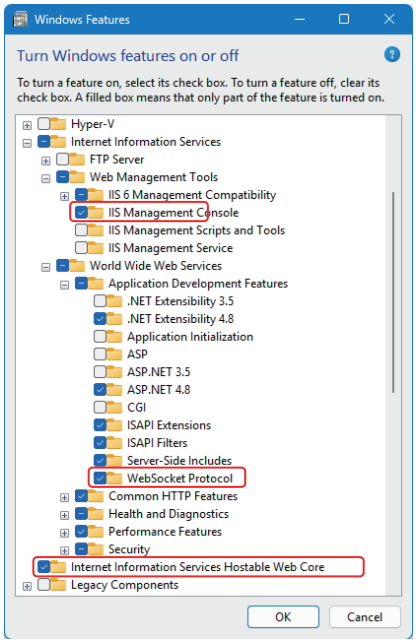
Cause	Corrective action
When port numbers are duplicated	Correct the port number to set different port numbers. There must be three or more consecutive numbers between the port numbers specified.
If GT SoftGOT3000 is abnormally terminated before starting the GOT Mobile function	Restart the personal computer.

Enabling IIS

The following shows the steps to enable Internet Information Services (IIS) and the required IIS components.
This is an example of Windows 11.

1. From the Windows start menu, select [All] → [Windows Tools], and double-click [Control Panel] in the displayed [Windows Tools].
2. In the displayed [Control Panel], select [Programs] → [Turn Windows features on or off].
3. The [Windows Features] window appears. Select the following items and click the [OK] button.

- IIS Management Console
- WebSocket Protocol
- Internet Information Services Hostable Web Core



IIS and the required IIS components are enabled.
IIS starts automatically at the OS startup by default.
To stop IIS or perform other operations, select [All] → [Windows Tools] from the Windows start menu, run [Internet Information Services (IIS) Manager], and use the [Actions] pane.

Settings for encrypted communication (GT SoftGOT3000)

For encrypted communications, the server certificate must be updated on the server (GOT) and imported on the client.
The following shows the required settings.

• Mandatory settings

Setting	Description		Target device
1. Enabling encrypted communication	☞ Page 2780 GOT Mobile function setting (GT Designer3)		Server (GOT)
2. Creating a server certificate	When the client browser is Safari on iOS or Firefox	Create a certificate authority certificate and a server certificate. ☞ Page 2781 Creating a certificate authority certificate and a server certificate (when using Safari on iOS or Firefox) (server (GOT))	
	When the client browser is Google Chrome or Microsoft Edge	Create a server certificate only. ☞ Page 2788 Creating a server certificate (when using Google Chrome or Microsoft Edge) (server (GOT))	
3. Importing the server certificate	☞ Page 2771 Importing the server certificate (client)		Client
4. Binding the server certificate to the port	☞ Page 2792 Binding the server certificate to the port (server (GOT))		Server (GOT)

• Optional settings (if client authentication is used)

Setting	Description	Target device
1. Enabling client authentication	☞ Page 2771 GOT Mobile function setting (GT Designer3)	Server (GOT)
2. Creating the client certificate	☞ Page 2775 Creating and importing the client certificate (client, server (GOT))	Client
3. Importing the client certificate		Server (GOT)

■GOT Mobile function setting (GT Designer3)

Set the communication method for the GOT Mobile function to HTTPS (SSL).
In GT Designer3, select [Common] → [GOT Mobile Setting] to display the [GOT Mobile Setting] window ([Basic Setting]).
Then select [HTTPS(SSL)] for [Communication Method].
☞ Page 2818 [Basic Setting]
Select [Perform authentication with client certificates] to enable client authentication.
When this item is selected, create a client certificate on the client terminal and import it to a personal computer (server (GOT)) where GT SoftGOT3000 is installed.
☞ Page 2795 Creating and importing the client certificate and importing it to GT SoftGOT3000 (client, server (GOT))
After setting the GOT Mobile function in GT Designer3, open the package data with GT SoftGOT3000.

■Creating a certificate authority certificate and a server certificate (when using Safari on iOS or Firefox) (server (GOT))

When using Safari on iOS or Firefox on user-selected OS as the client browser, create and import the certificate authority certificate and the server certificate on the personal computer (server (GOT)) where GT SoftGOT3000 is installed.
Configure the following settings on the personal computer where GT SoftGOT3000 (server) is installed.

1. Download OpenSSL from the following website.
https://slproweb.com/products/Win32OpenSSL.html
Note that the above website may be changed without notification.

2. Double-click the downloaded .exe file and follow the instructions in the displayed wizard to complete the installation.

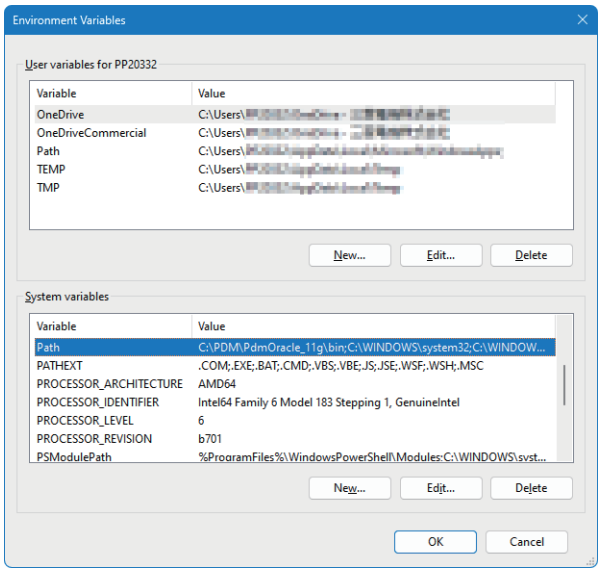
3. From the Windows start menu, select [All] → [Windows Tools], and double-click [Control Panel] in the displayed [Windows Tools].

4. In the displayed [Control Panel], select [System and Security] → [System].

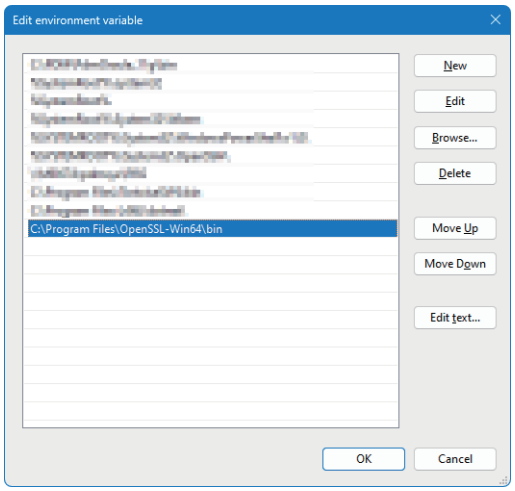
5. Click [Advanced system settings] beside [Related links].

6. The [Advanced] tab in [System Properties] is displayed. Click the [Environment Variables] button.

7. Select [Path] in [System variables], and then click the [Edit] button.



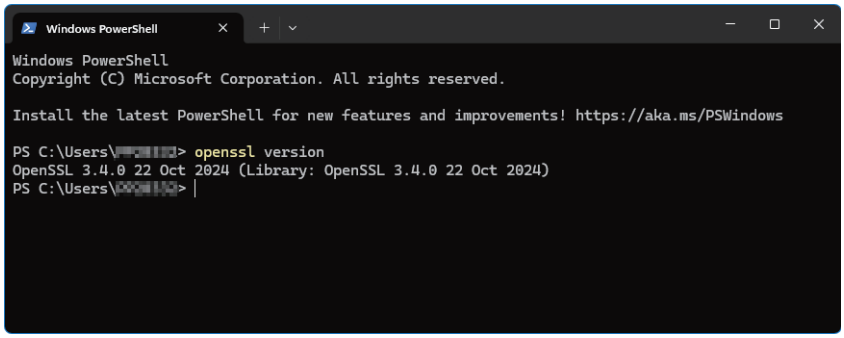
8. Click the [New] button in the [Edit environment variable] dialog and add the following path.
C:\Program Files\OpenSSL-Win64\bin



9. From the Windows start menu, select [All] → [Windows Tools], and double-click [Windows PowerShell] in the displayed [Windows Tools].

10. Execute the following command to check if the installed OpenSSL version is displayed.

openssl version



11. Create a certificate authority certificate.

Create a folder (hereafter, Folder A) in any path to store the certificate authority certificate.

12. From the Windows start menu, select [All] → [Windows Tools], and double-click [Windows PowerShell] in the displayed [Windows Tools].

13. Execute the following command to change the current folder to Folder A.

cd [Path to the folder]

Enter the path to Folder A in [Path to the folder].

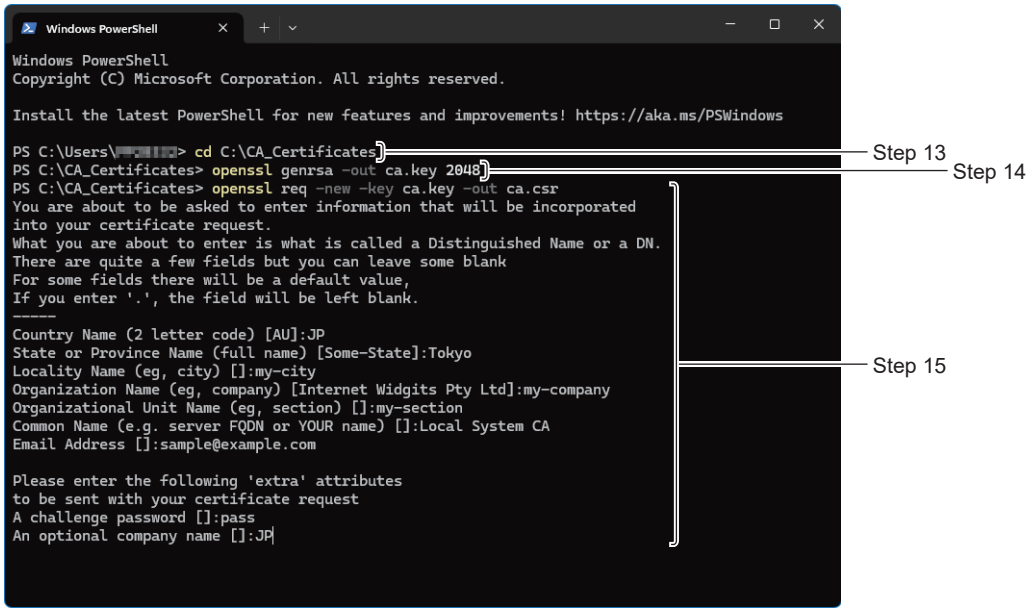
14. Execute the following command.

openssl genrsa -out ca.key 2048

15. Execute the following command.

openssl req -new -key ca.key -out ca.csr

Enter the relevant certificate details after executing the command.



16. Using a text editor, enter the following content and save it as ca.ext in Folder A.

```
[v3_ca]
basicConstraints = critical, CA:true
keyUsage = keyCertSign, cRLSign
extendedKeyUsage = serverAuth, clientAuth
subjectKeyIdentifier = hash
authorityKeyIdentifier = keyid,issuer
```

17. Execute the following command in Windows PowerShell.

openssl x509 -req -signkey ca.key -extfile ca.ext -extensions "v3_ca" -in ca.csr -out ca.crt -days 365 -sha256

18. Create a server certificate.

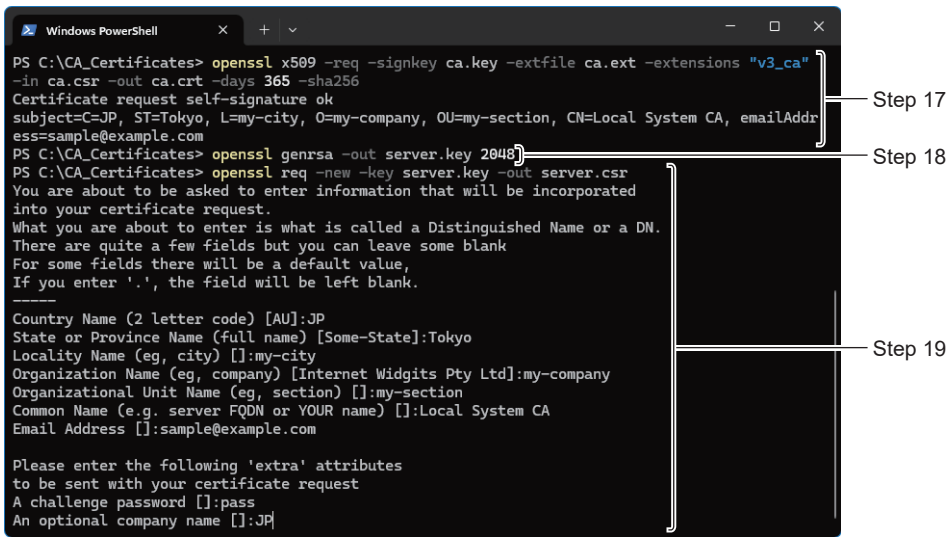
Execute the following command.

openssl genrsa -out server.key 2048

19. Execute the following command.

openssl req -new -key server.key -out server.csr

Enter the relevant certificate details after executing the command.



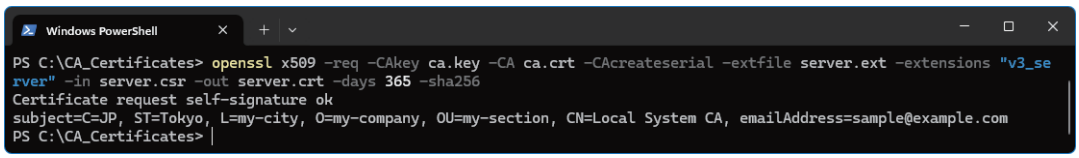
20. Using a text editor, enter the following content and save it as server.ext in Folder A.

Change the DNS and IP to match the personal computer environment.

```
[v3_server]
basicConstraints = critical, CA:false
keyUsage = digitalSignature, keyEncipherment
extendedKeyUsage = serverAuth, clientAuth
subjectKeyIdentifier = hash
authorityKeyIdentifier = keyid,issuer
subjectAltName = DNS:####,IP:###.###.###.###
```

21. Execute the following command.

openssl x509 -req -CAkey ca.key -CA ca.crt -CAcreateserial -extfile server.ext -extensions "v3_server" -in server.csr -out server.crt -days 365 -sha256



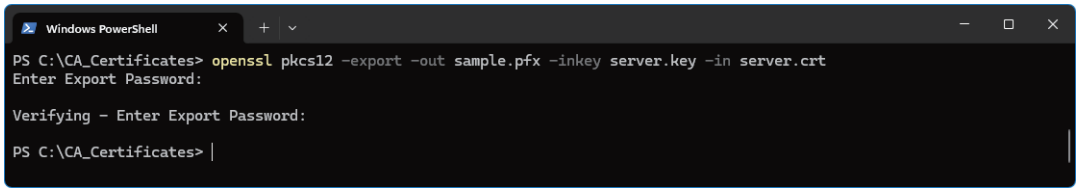
22. Execute the following command to create a certificate file (*.pfx).

Replace #### with a specific file name.

openssl pkcs12 -export -out ####.pfx -inkey server.key -in server.crt

A password and confirmation password must be entered.

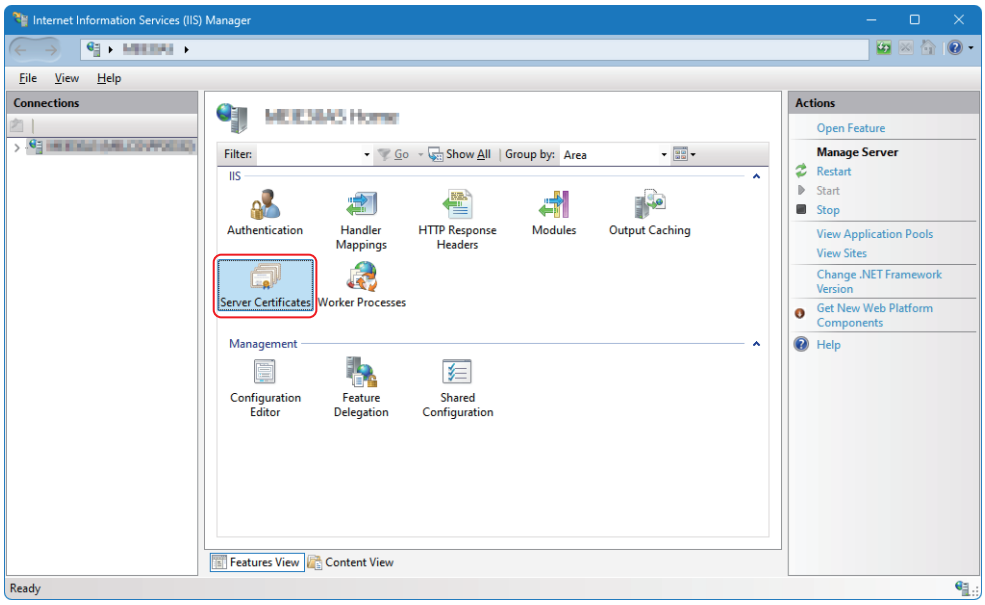
The entered password is not displayed on the Windows Powershell screen.



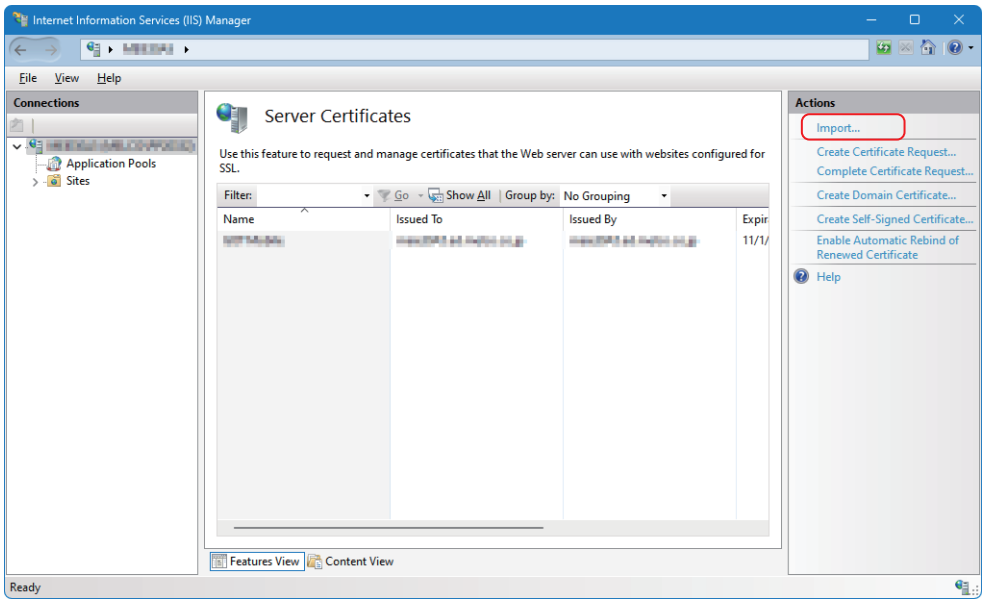
23. Import the created certificate.

From the Windows start menu, select [All] → [Windows Tools], and double-click [Internet Information Services (IIS) Manager] in the displayed [Windows Tools].

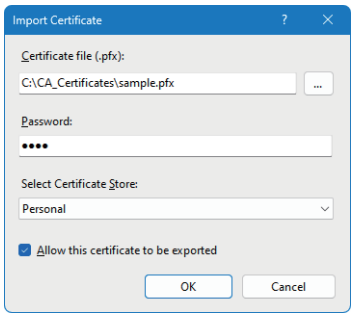
24. In the displayed [Internet Information Services (IIS) Manager], double-click [Server Certificates].



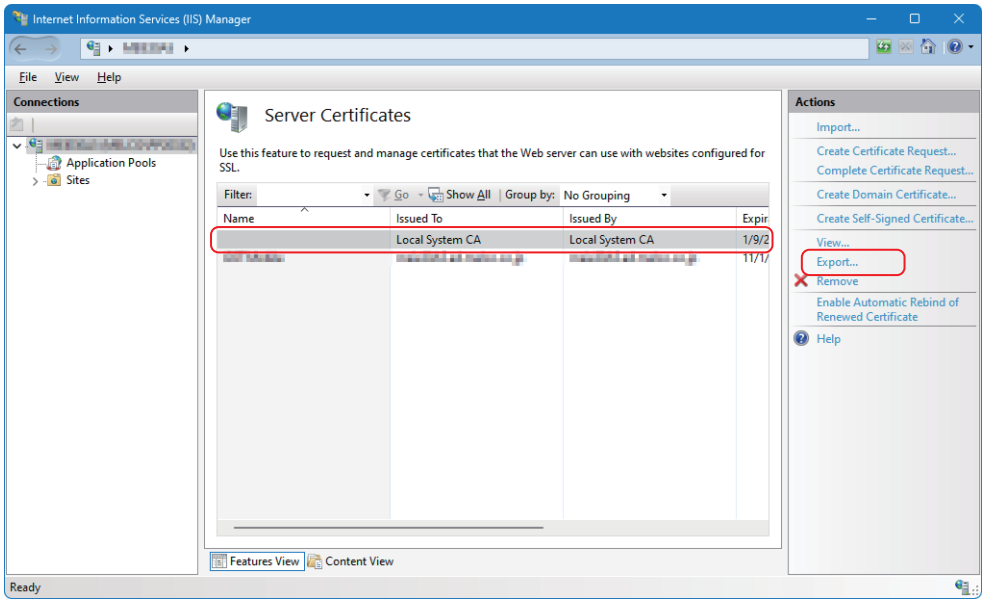
25. Click [Import].



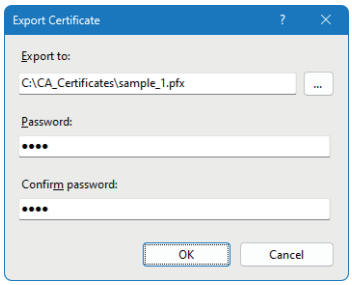
26. In the displayed dialog, specify the file (*.pfx) of the created certificate and the password, then click the [OK] button.
The certificate is imported.



27. Select the imported certificate and click [Export].

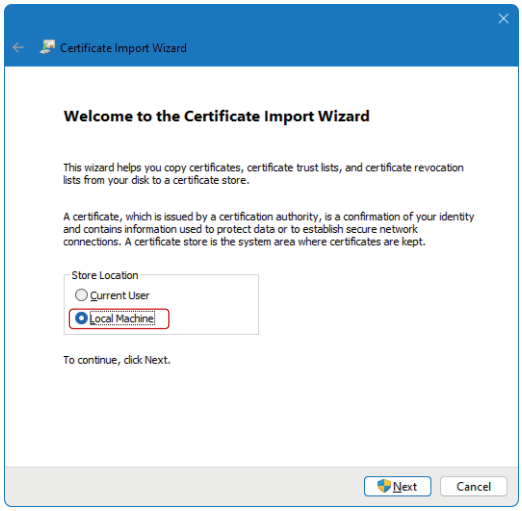


28. In the displayed dialog, specify the export destination path and the password, then click the [OK] button.
The certificate is exported.

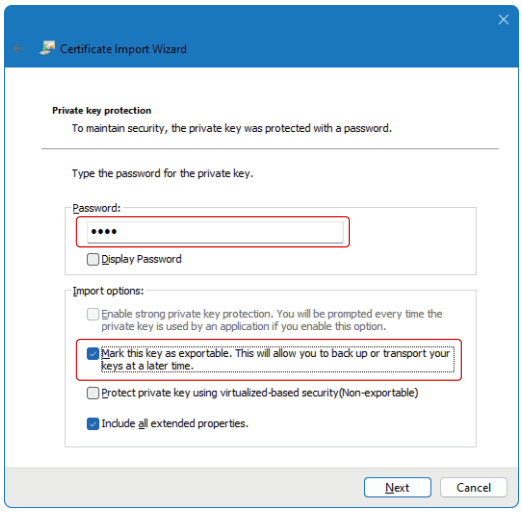


29. Double-click the file of the exported certificate.

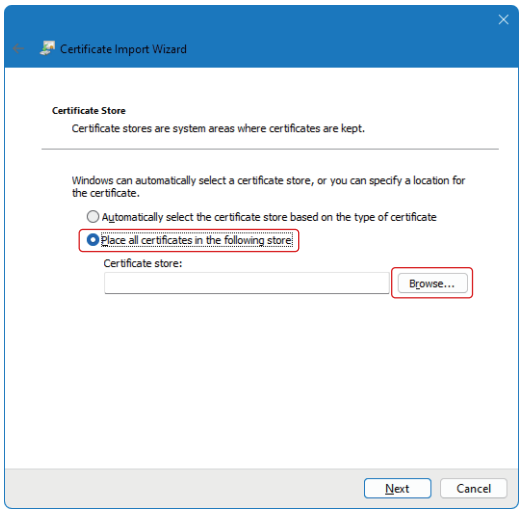
30. Set as follows on the displayed screen, then click the [Next] button.



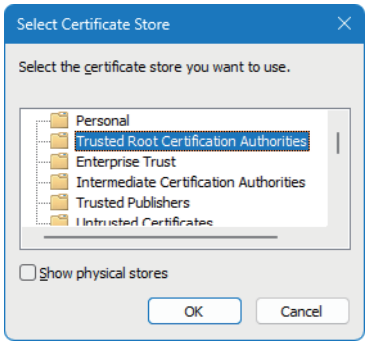
31. Proceed to the following screen, configure the settings as follows, and click the [Next] button.



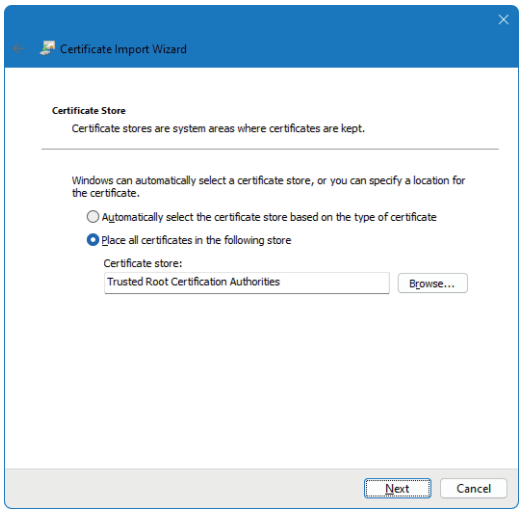
32. Set as follows on the displayed screen, then click the [Browse] button.



33. Set as follows on the displayed screen, then click the [OK] button.



34. Click the [Next] button.



35. Click the [Finish] button on the displayed screen to import the certificate.

Then, import the server certificate to the client.

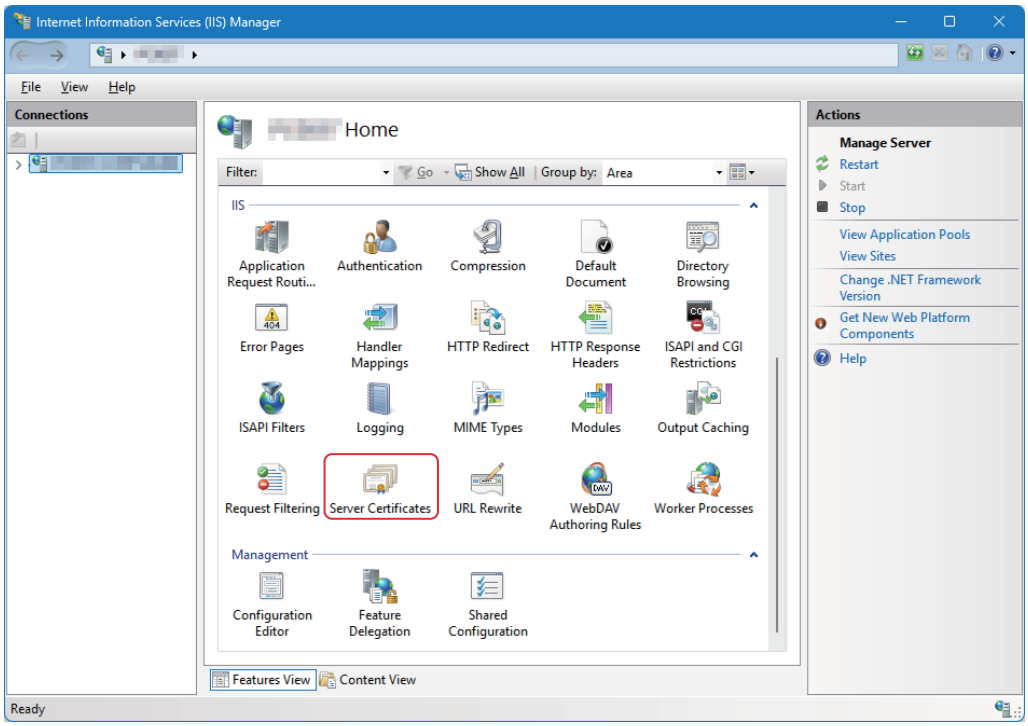
☞ Page 2791 Importing the server certificate (client)

■Creating a server certificate (when using Google Chrome or Microsoft Edge) (server (GOT))

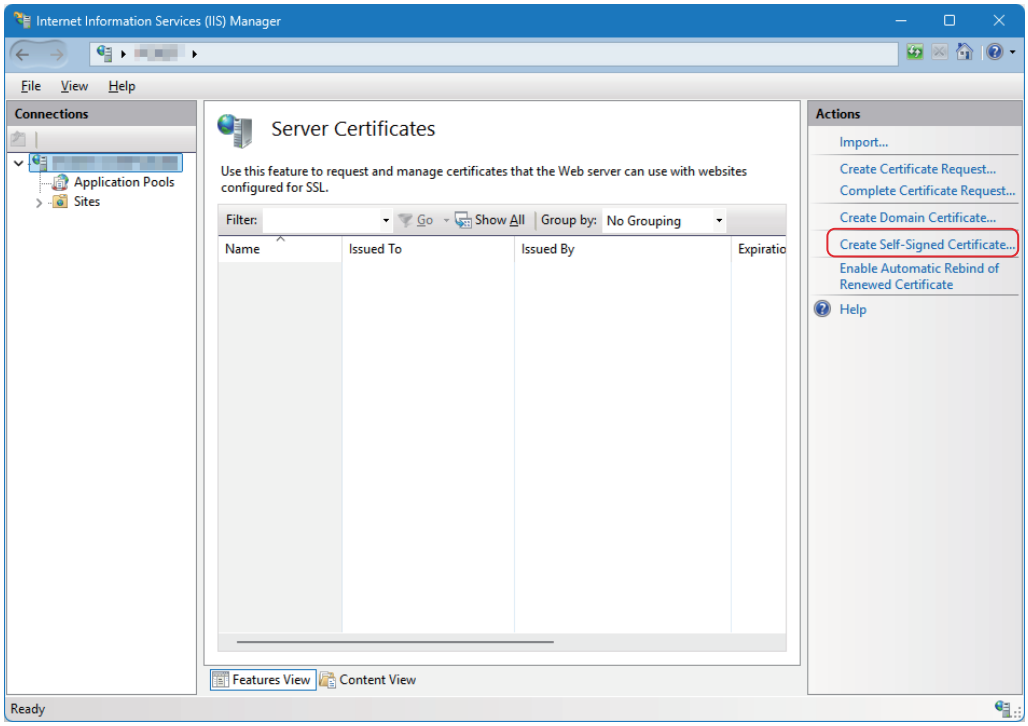
When using Google Chrome or Microsoft Edge as the client browser, create and import the server certificate using Internet Information Services (IIS) Manager on the personal computer (server (GOT)) where GT SoftGOT3000 is installed.

Configure the following settings on the personal computer where GT SoftGOT3000 (server) is installed.

1. From the Windows start menu, select [All] → [Windows Tools], and double-click [Internet Information Services (IIS) Manager] in the displayed [Windows Tools].
2. In the displayed [Internet Information Services (IIS) Manager], double-click [Server Certificates].

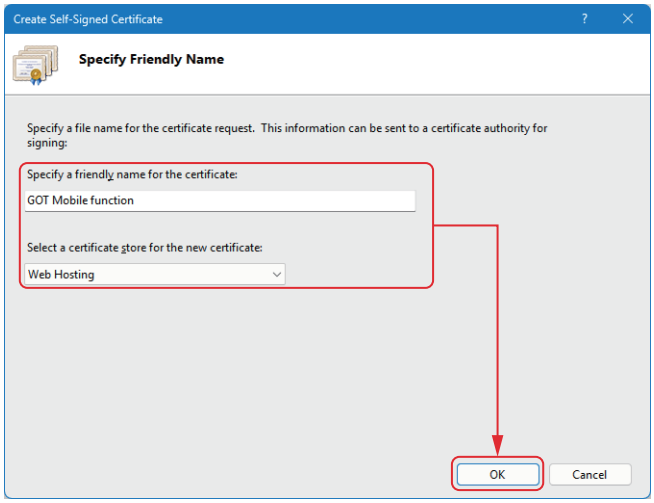


3. Click [Create Self-Signed Certificate] to open the setting window.

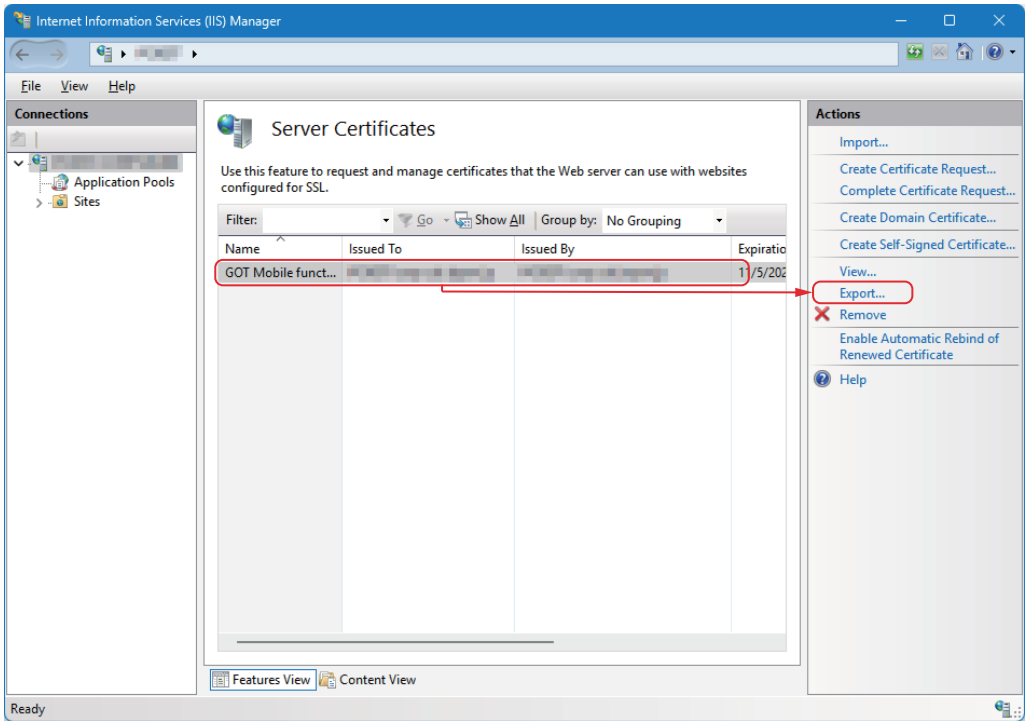


4. Configure the following items then click the [OK] button.

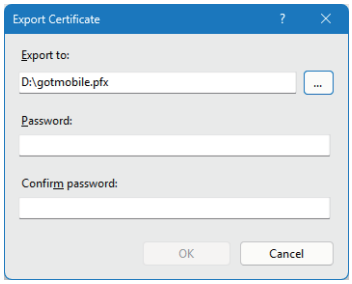
- Certificate friendly name: Enter a desired name.
- Certificate store for the new certificate: Select [Web Hosting]



5. Select the created server certificate and click [Export].

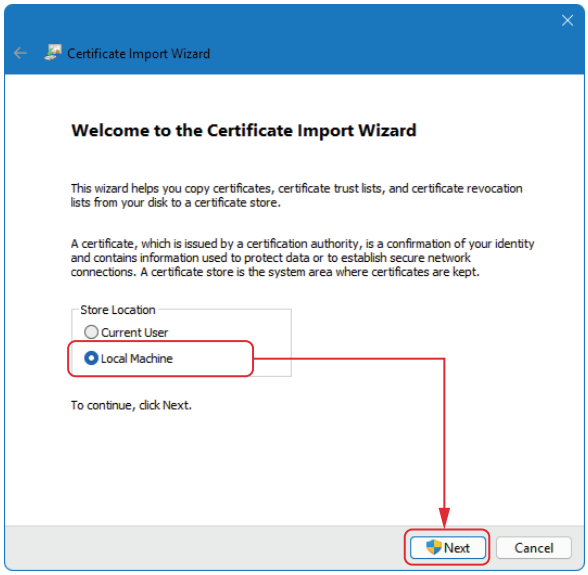


6. Specify an export destination and password, then click the [OK] button to export the server certificate to the user-specified folder.

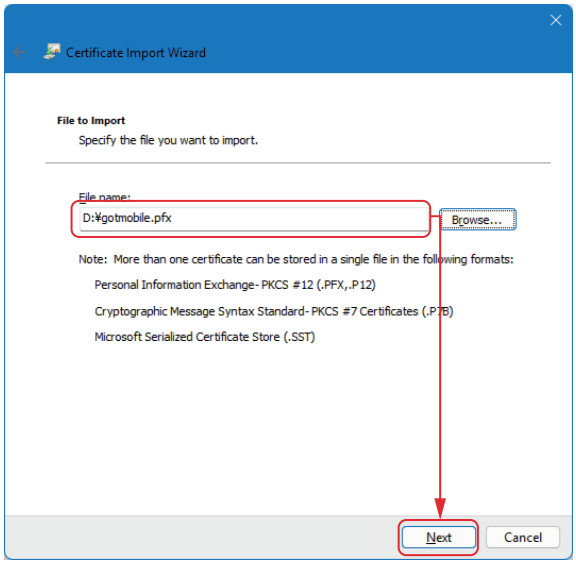


7. Double-click the exported server certificate to open the [Certificate Import Wizard].

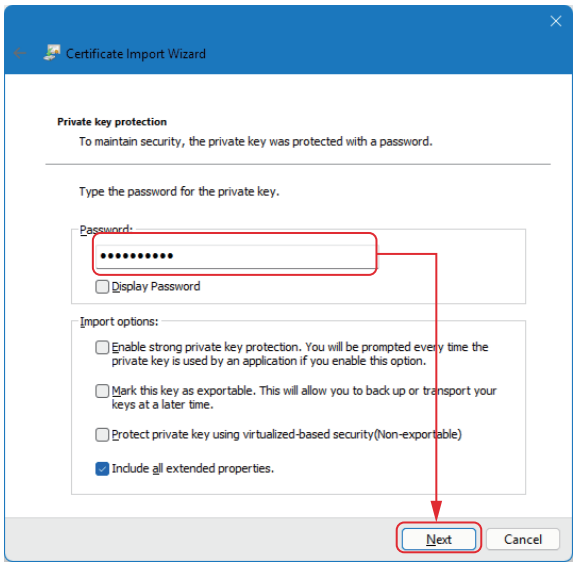
8. Select [Local Machine] for the saving destination, and click [Next].



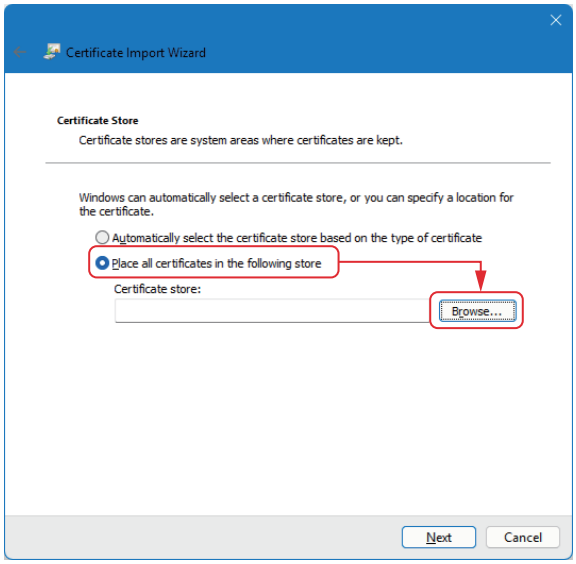
9. Set a user-selected file name for [File name] and click the [Next] button.



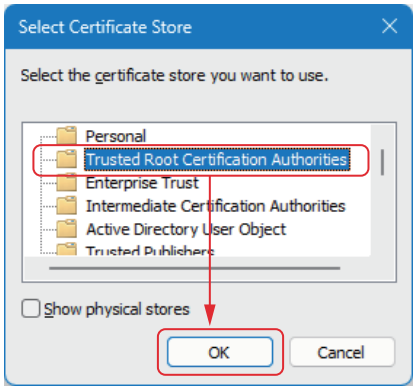
10. Enter the password specified when creating the server certificate then click the [Next] button.



11. Select [Place all certificates in the following store] and click the [Browse] button.



12. In the [Select Certificate Store] window, select [Trusted Root Certification Authorities] then click the [OK] button.



13. Click the [Next] button.

14. Click the [Finish] button to complete the import.

Then, import the server certificate to the client.

☞ Page 2791 Importing the server certificate (client)

■Importing the server certificate (client)

Import the server certificate of the personal computer (server (GOT)) where GT SoftGOT3000 is installed to the client.

The procedure is the same as when the GOT is a server.

Refer to the following.

☞ Page 2771 Importing the server certificate (client)

When you have also created a certificate authority certificate, copy the certificate file to the client and import it.

After importing the server certificate to the client, bind the server certificate to the port in the server (GOT).

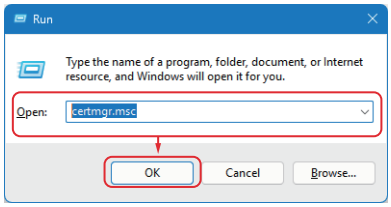
☞ Page 2792 Binding the server certificate to the port (server (GOT))

■Binding the server certificate to the port (server (GOT))

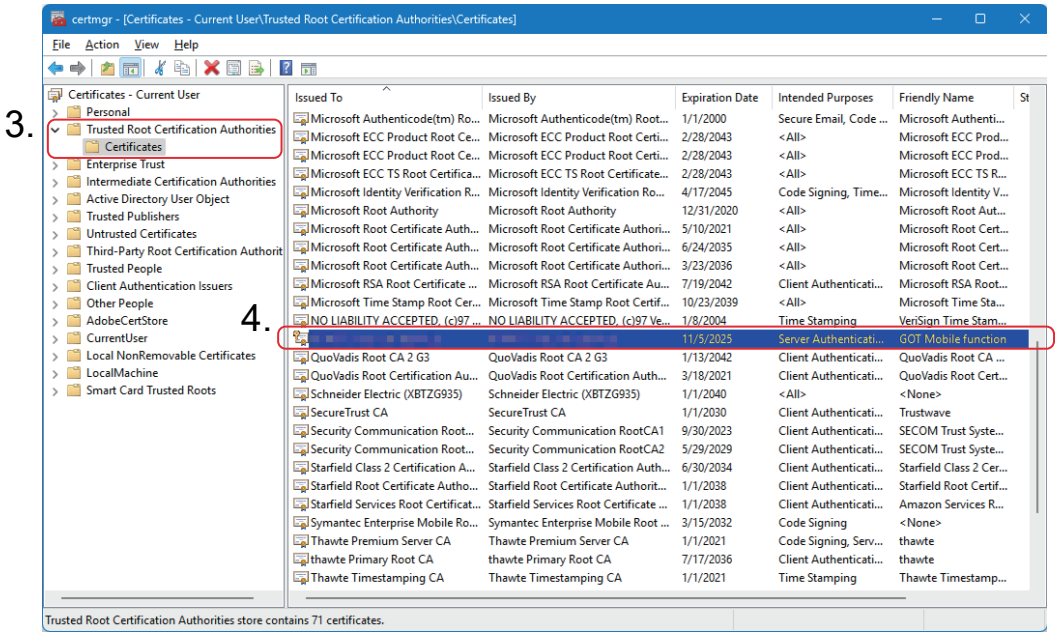
Assign the server certificate to the port. First, check the imported server certificate and copy the information necessary for port assignment. Then, assign it to the ports.

Configure the following settings on the personal computer where GT SoftGOT3000 (server) is installed.

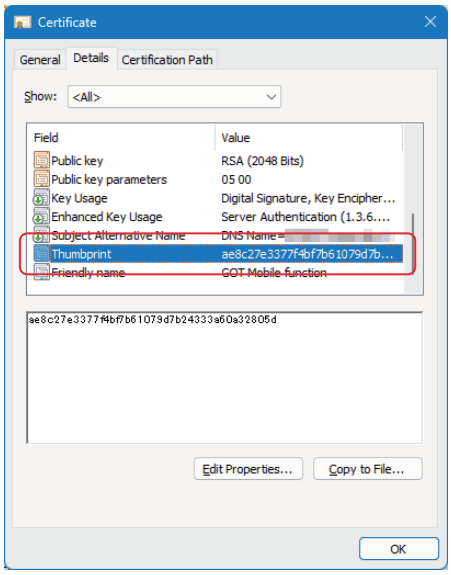
1. From the Windows start menu, select [All] → [Windows Tools], and double-click [Run] in the displayed [Windows Tools] window.
2. In the displayed [Run], type [certmgr.msc] for [Open] and click the [OK] button to open the [crtmgr] (user certificate management) window.



3. Select [Trusted Root Certification Authorities] → [Certificates] to display the certificate list.
4. Double-click the imported server certificate and open the certificate.



5. In the [Details] tab, copy and save the values of [Subject Alternative Name] and [Thumbprint] to Notepad or other application.



6. From the Windows start menu, select [All] → [Windows Tools], right-click [Command Prompt] in the displayed [Windows Tools], and click the [Run as administrator] menu.

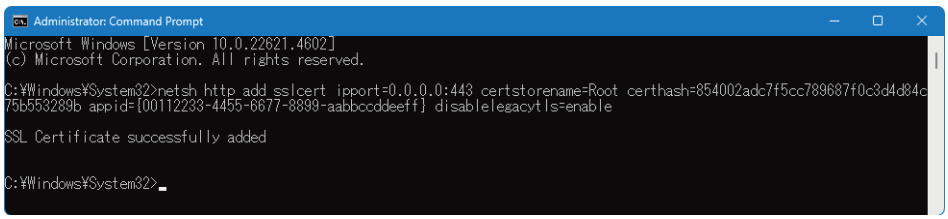
7. In the displayed [Command Prompt], execute the following command to bind the server certificate to the port.

GT SoftGOT3000 uses a total of three ports, as it uses two port numbers after the specified port. Binding is required for all three ports.

Only the first port has different commands depending on whether client authentication is enabled or disabled.

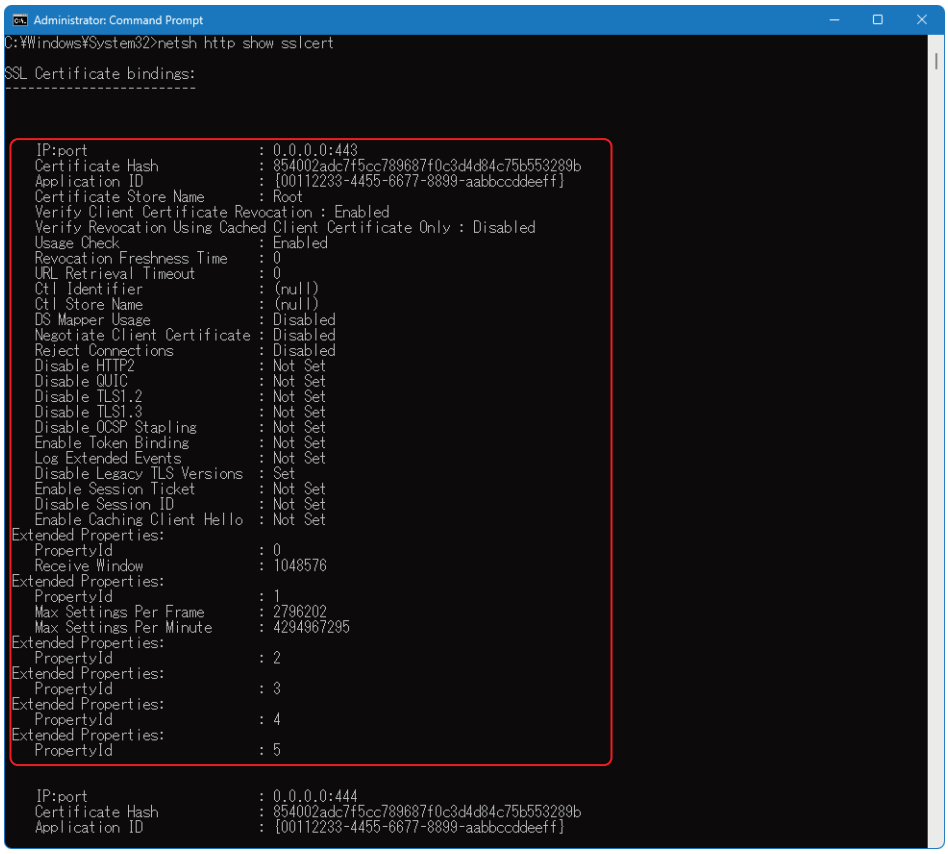
Port	Command to be input	
	Client certificate is enabled	Client certificate is disabled
First port	netsh http add sslcert ipport=0.0.0.0:[Port No.] certstorename=Root certhash=[Thumbprint] appid={[APPID]} disablelegacytls=enable clientcertnegotiation=enable	netsh http add sslcert ipport=0.0.0.0:[Port No.] certstorename=Root certhash=[Thumbprint] appid={[APPID]} disablelegacytls=enable
Second port	netsh http add sslcert ipport=0.0.0.0:[Port No.] certstorename=Root certhash=[Thumbprint] appid={[APPID]} disablelegacytls=enable	
Third port		

- [Port No.]: Port number used for the GOT Mobile function (for the second and third ports, +1 or +2 to the first port number)
- [Thumbprint]: Thumbprint of the server certificate obtained in step 5
- [APPID]: User-selected GUID (to be specified in the format xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx)



8. Execute the following command to check that binding has been performed.

netsh http show sslcert



For information on how to connect the client to the GOT (server), refer to the following.

☞ Page 2802 Connecting the client with the server (GOT)

■Creating and importing the client certificate and importing it to GT SoftGOT3000 (client, server (GOT))

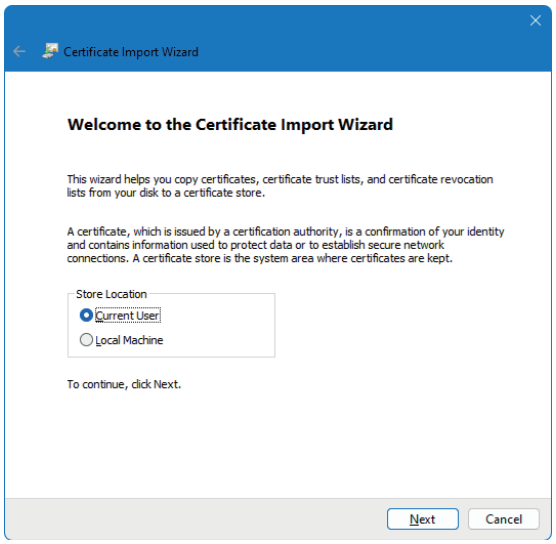
Create the client certificate used for client authentication, and import it to a personal computer (server (GOT)) where GT SoftGOT3000 is installed.

For details on how to create the client certificate, refer to the following.

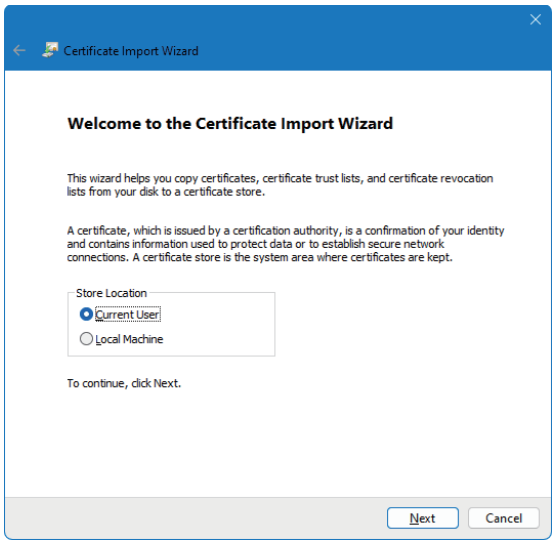
☞ Page 2775 Creating and importing the client certificate (client, server (GOT))

Operating procedure

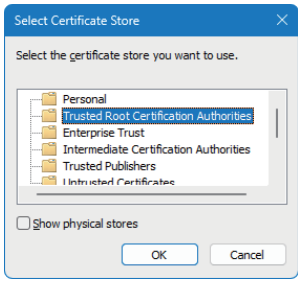
1. Copy the created client certificate file to the computer where GT SoftGOT3000 is installed.
2. Double-click the client certificate file to open the [Certificate Import Wizard].
3. Select [Current User] for the saving destination, and click [Next].



4. Select [Place all certificates in the following store] and click the [Browse] button.



5. In the [Select Certificate Store] window, select [Trusted Root Certification Authorities] then click the [OK] button.



6. Click the [Next] button.

7. Click the [Finish] button to complete the import.

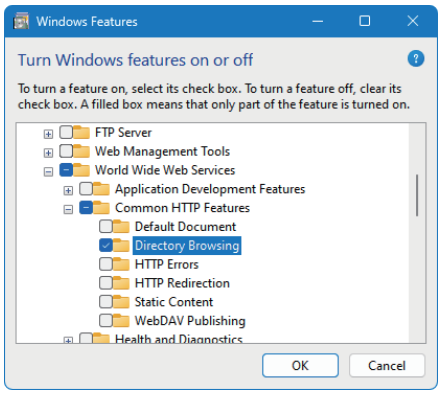
Settings to allow access to the GT SoftGOT3000 public folder from multiple clients

Configure the following settings in Internet Information Services (IIS).
If not, accessing the same file from more than one GOT Mobile client will cause an error in the web browser.

Operating procedure

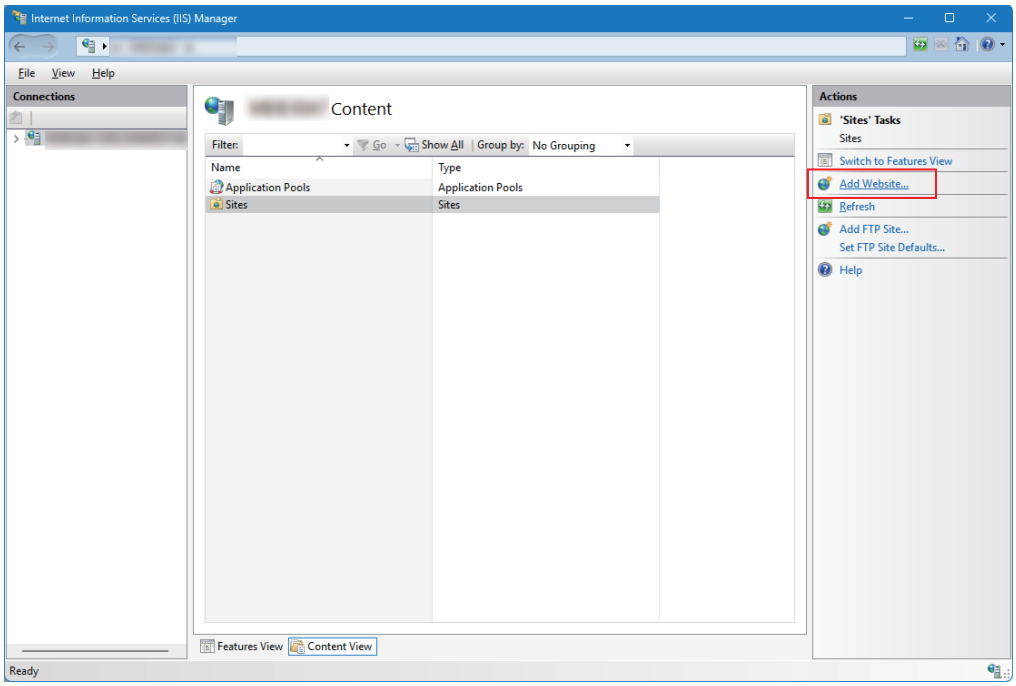
1. From the Windows start menu, select [All] → [Windows Tools], and double-click [Control Panel] in the displayed [Windows Tools].
2. In the displayed [Control Panel], select [Programs] → [Turn Windows features on or off].
3. The [Windows Features] window appears. Select the following item and click the [OK] button.

• Directory Browsing



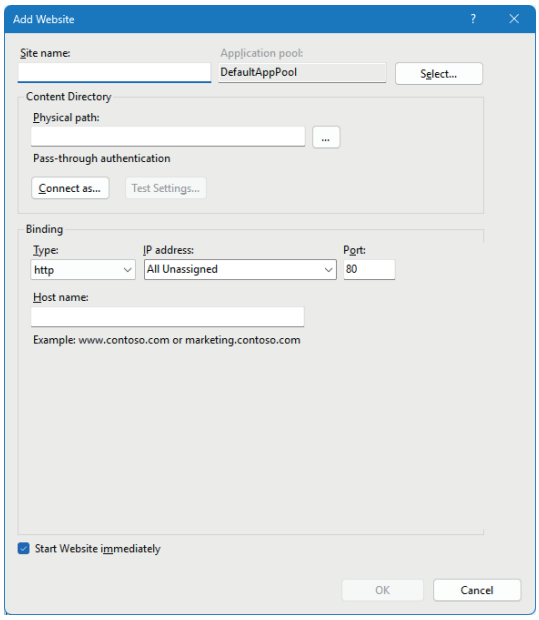
IIS and the required IIS components are enabled.

4. From the Windows start menu, select [All] → [Windows Tools], and double-click [Internet Information Services (IIS) Manager] in the displayed [Windows Tools].
5. In the displayed [Internet Information Services (IIS) Manager] window, select [Sites] and click [Add Website].

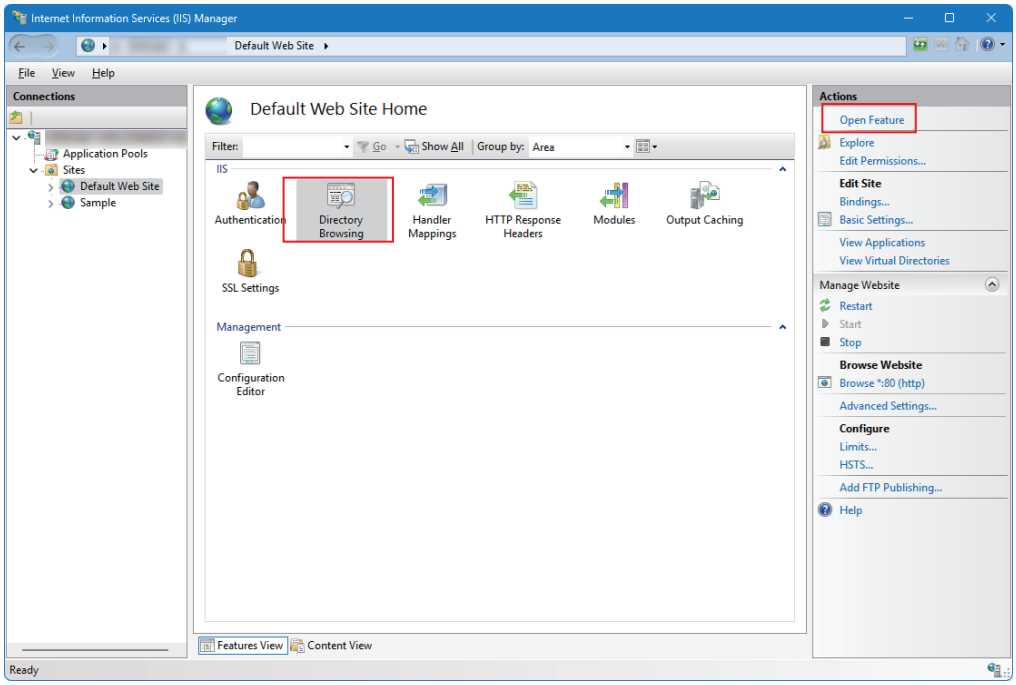


PART 25

6. In the displayed [Add Website] dialog, configure the settings for [Site name], [Physical path], and [Port] and click the [OK] button.

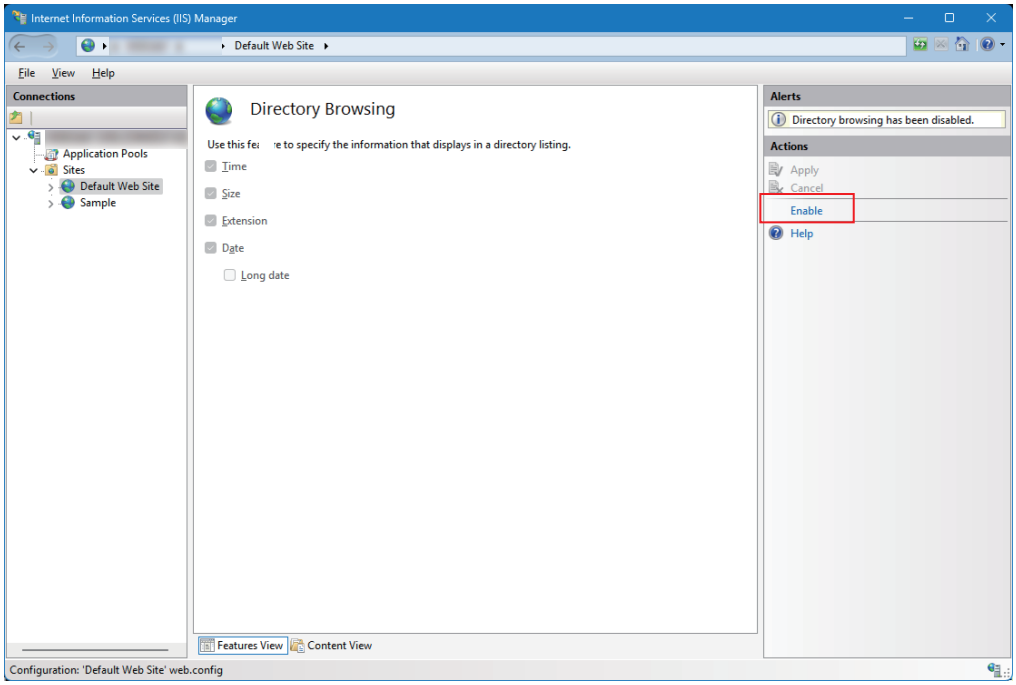


7. Enable browsing of the directory.



While the added website is selected, click [Directory Browsing], and then click [Open Feature].

8. Click [Enable].



9. Store the file in the directory where browsing is enabled.

Point

To access URLs from hyperlinks located on mobile screens, set the following in the [Basic Settings] tab of the [Hyperlink] dialog.

- [Action]: [Open a website]
- [URL]: URL set in IIS

☞ Page 1901 [Hyperlink] dialog

82.4.3 Creating a mobile screen

1. Perform one of the following operations to display the [Mobile Screen Property] dialog.

- Select [Screen] → [New] → [Mobile Screen] from the menu.
- In the [Screen] window, click the [New Screen] button and select [Mobile Screen] from the pull-down menu.

2. Configure the settings, and click the [OK] button.

☞ Page 2831 Mobile screen properties

Point

Created base screens or window screens can be copied to mobile screens.

☞ Page 2800 Copying a base screen or window screen to a mobile screen

3. A mobile screen is created and a screen editor appears in the work window.

Place figures and objects on the mobile screen.

☞ Page 1001 Placing figures and objects

Copying a base screen or window screen to a mobile screen

Created base screens or window screens can be copied to mobile screens.

The following shows the procedure to copy a screen.

1. In the [Screen] window, right-click on a base screen and window screen to be copied and select [Copy to Mobile Screen].

2. In the [Copy to Mobile Screen] dialog, set the destination screen number and other items.

☞ Page 2801 [Copy to Mobile Screen] dialog

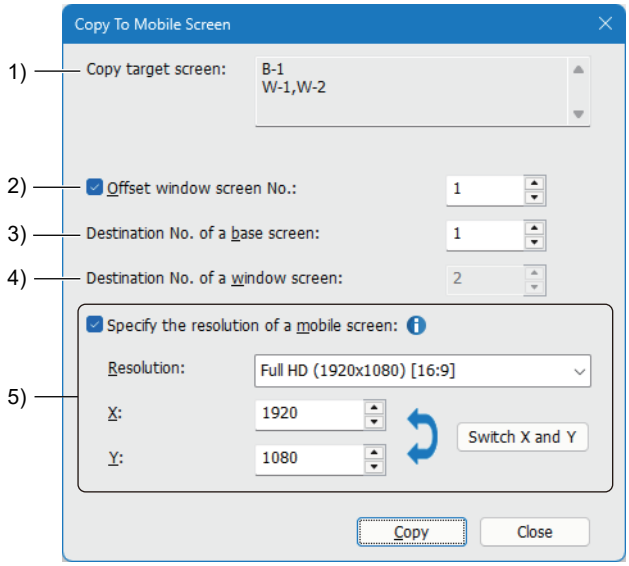
3. Click the [Copy] button to copy the screen to the mobile screen.

■Specifications for copying a screen to a mobile screen

The following shows the specifications for copying a screen to a mobile screen.

Item		Description
Screen	Expanded screen	Automatically resized according to the resolution of the model set in [GOT Type Setting].
	Screens that are prohibited from being displayed by the project security settings	Not available for copying. When multiple screens are simultaneously copied, the screen numbers of the screens that are not copied are skipped.
Object	Go To Screen switch	When the screen is also copied after being switched, the screen number will change to the one specified for the copied screen. The screen number will be retained if the screen is not copied after being switched. When [Offset window screen No.] is selected, the copy destination screen number is the sum of the copy source screen number and the offset value. If the sum is outside the range, the copy source screen number is retained.
	Set overlay screen	When a copy source screen has a set overlay screen object, the called screen is also copied. The screen number will be changed to the one specified for the copied screen (mobile screen). The original screen number will be retained when the called screen is a display-prohibited screen.

■[Copy to Mobile Screen] dialog



Item		Description
1)	[Copy target Screen]	Displays the screen numbers to be copied to the mobile screen. The screen numbers selected when [Copy to Mobile Screen] is pressed are displayed.
2)	[Offset window screen No.]	The sum of the copy source screen number and the offset value is the copy destination window screen number. Select this item to set the offset value to be added. This function is helpful when using a copied screen as a window screen for mobile application. On the GOT, base screens (screen type [B]) are differentiated from window screens (screen type [W]). On mobile applications, these screens are created as mobile screens [M] and are therefore not differentiated. Use this function to add an offset value of [1000], for example, then it will be possible to use screens with screen numbers in the 1000s as window screens.
3)	[Destination No. of a base screen]	Specify a screen number of the copy destination screen (mobile screen) to which the base screen is copied. The setting range is [0] to [32767].
4)	[Destination No. of a window screen]	Specify a screen number of the copy destination screen (mobile screen) to which the window screen is copied. The setting range is [0] to [32767]. When [Offset window screen No.] is selected, this item is grayed out.
5)	[Specify the resolution of a mobile screen]	Set the screen size of the mobile screen. For details on the setting, refer to the following. ☞ Page 2831 [Basic] tab

82.4.4 Settings on the client

Enable JavaScript and Cookie in the browser.
The method to enable JavaScript or Cookie differs depending on the browser.
The setting items may also differ depending on the information device and the browser version.
For the setting method, refer to the following.

Browser	Reference
Google Chrome for Android Google Chrome for Windows	☞ Google LLC Help website
Safari for iOS	☞ Apple Support website
Microsoft Edge for Windows	☞ Microsoft official website
Firefox Firefox (Android version) Firefox (iOS version)	☞ Firefox Help page

To encrypt the communication between the client and the server (GOT), the server certificate needs to be imported on the client.
☞ Page 2771 Settings for encrypted communication (except GT SoftGOT3000)
☞ Page 2780 Settings for encrypted communication (GT SoftGOT3000)

82.4.5 Connecting the client with the server (GOT)

To connect a client to the GOT, enter the URL of the destination GOT in the address bar in the browser, or use the contactless tag of the GOT.

Connection method	Model
☞ Page 2803 Connection by entering the URL of the destination GOT	GT37 SoftGOT3000
☞ Page 2807 Connection using a contactless tag	GT37 SoftGOT3000

Precautions

Do not turn off the GOT while the client is being operated.
If you turn off the GOT being accessed by a client, the browser of the client may not display a communication error message immediately.

Connection by entering the URL of the destination GOT

The following shows the procedure of the connection by directly entering the URL of the destination GOT.

Ex.
When using Google Chrome (for Android)

1. Start Google Chrome.
2. Touch the address bar, and enter the URL of the destination GOT with the software keyboard.

[index.html] can be omitted from the URL.

The URL of the destination GOT differs depending on whether encrypted communication is enabled or disabled.

Item		Example URL of the destination GOT
When encrypted communication is disabled		Connecting a client to the standard HTTP port No. 80 http://192.168.1.18/index.html GOT IP address
		Connecting a client to a user-specified HTTP port (example: port No. 8080) http://192.168.1.18:8080/index.html GOT IP address Port No.
When encrypted communication is enabled	GOT (except GT SoftGOT3000) is a server	Connecting a client to the standard HTTPS port No. 443 https://192.168.3.18/index.html GOT IP address
		Connecting a client to a user-specified HTTPS port (example: port No. 9443) https://192.168.3.18:9443/index.html Port No. GOT IP address
	GT SoftGOT3000 is a server	To use a subject alternative name for access, you need an environment that can resolve the subject alternative name to an IP address. Prepare a name resolution environment, such as a DNS server.
		Connecting a client to the standard HTTPS port No. 443 https://Subject Alternative Name:443/index.html Port No. Check the imported server certificate.
		Connecting a client to a user-specified HTTPS port (example: port No. 9443) https://Subject Alternative Name:9443/index.html Port No. Check the imported server certificate.

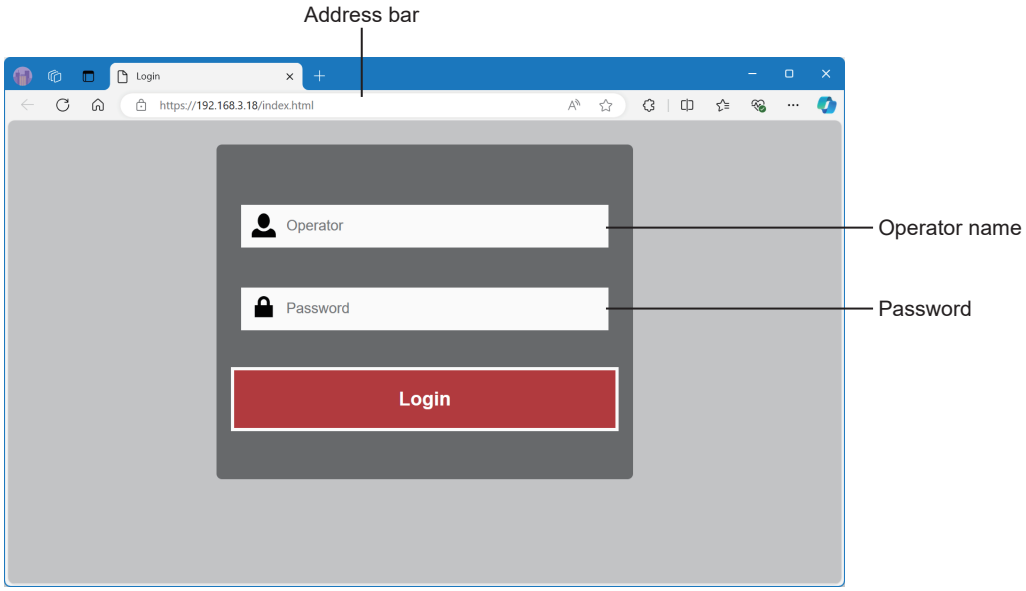
Point

The behavior of the client is customizable by appending specific parameters to the URL of the destination GOT.

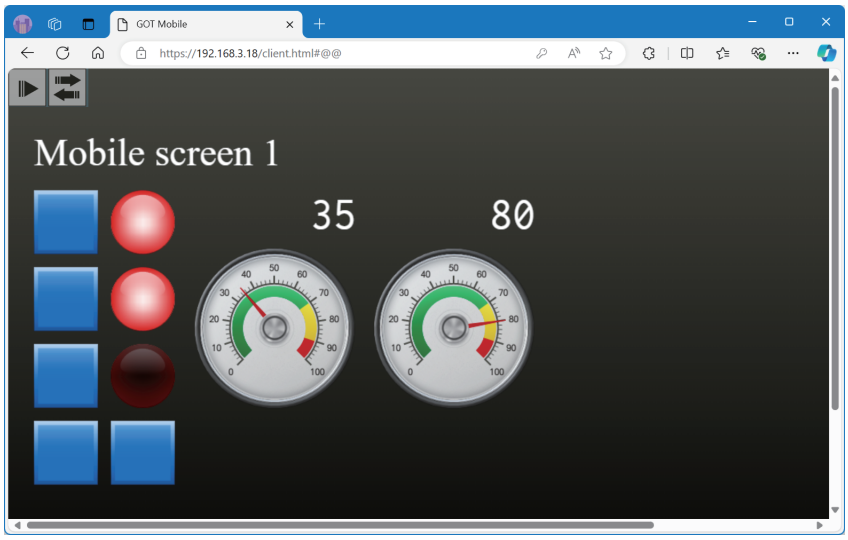
For details on the URL parameters, refer to the following.

☞ Page 2805 URL parameters

3. In the authentication screen, enter an operator name and password, and touch the [Login] button.



4. If the client is authenticated with the GOT, an applicable mobile screen appears in the browser.



Point

You can specify the mobile screen appearing after the client is authenticated to the GOT in the [GOT Mobile Setting] window. In [Screen Switching], select [Specify the No. of a screen to be displayed at the time of client connection] and specify a screen number.
If you do not specify the mobile screen, the smallest-numbered mobile screen appears.
☞ Page 2822 [Screen Switching/Window]

■URL parameters

The behavior of the client is customizable by appending specific parameters to the URL of the destination GOT.

The following shows available parameters.

Function	Parameter name	Setting value	Behavior without the target parameter	Remarks
Always fitting the mobile screen display on the width of the browser window	autofit	true false	Same as for specifying "false" (The target function is disabled.)	—
Hiding the operation menu bar on the mobile screen	hiddenmenu	true false	Same as for specifying "false" (The target function is disabled.)	When this function is enabled, zooming and scrolling the mobile screen display are not available.
Specifying a client number to connect to the GOT	clientno	1 to maximum number of simultaneous connections	A client number is automatically assigned.	The following client numbers cannot be specified. • Client number that is higher than the set value of [Simultaneous Client Connection] in the [GOT Mobile Setting] window ([Basic Setting]) • Client number of a client being connected to the GOT If you specify the client number set for [Target Client No.] in [ANDON Setting] of the [GOT Mobile Setting] window, also add the parameter for enabling the ANDON function (andon=true).
Enabling the ANDON function (Connecting to the GOT without the operator name and password-based authentication)	andon	true false	Same as for specifying "false" (The target function is disabled.)	When this function is enabled, the target client is not disconnected automatically even if no operation is performed on the client for a certain time. To use the ANDON function, settings must be configured in GT Designer3 and in the utility. For details, refer to the following. ☞ Page 2813 Settings required for the ANDON function
Specifying the screen number of the initial mobile screen appearing after the client connects to the GOT with authentication	initscreen	0 to 32767	The corresponding setting configured in GT Designer3 is applied.	To enable this function, turn on the Enable Initial Screen Specification with URL Parameter signal (GS1896.b0). This parameter setting overrides the setting of [Specify the No. of a screen to be displayed at the time of client connection] in the [GOT Mobile Setting] window ([Screen Switching]).
Displaying the disconnect screen (client.html) when the client disconnects the GOT	disconnectscreen	true false	Same as for specifying "false" (The target function is disabled.)	When this function is enabled, the screen that appears at the disconnection changes. • true: Displays the disconnect screen. • false: Displays the connection authentication screen. For details on the disconnect screen, refer to the following. ☞ Page 2816 Displaying the disconnect screen
Specifying the time (minutes) to reload the web page	reloadtime	1 to 43200	The reload time is not specified.	Reloads the web page at the specified time interval. Reloading is carried out while retaining parameters other than the URL parameter. If you specify the parameter to enable the ANDON function (andon=true) in the URL, it will be automatically connected when reloaded. If you do not specify the parameter to enable the ANDON function (andon=true) in the URL, the login screen will be displayed when reloading.

To use a parameter, append "?<Parameter name>=<Setting value>" to the URL of the destination GOT.

Delimit parameters with single ampersands (&).

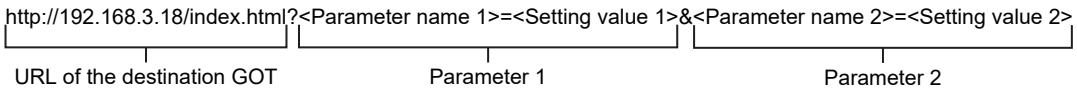
The used parameters must be different.

One-byte alphanumeric characters are usable for the parameters.

The parameters are case-sensitive.

Ex.

When encrypted communication is disabled



Example 1) When specifying client No. 3

http://192.168.3.18/index.html?clientno=3

Example 2) When setting the following functions

- Enabling the ANDON function
- Always fitting the mobile screen display on the width of the browser window
- Hiding the operation menu bar on the mobile screen

http://192.168.3.18/index.html?andon=true&autofit=true&hiddenmenu=true

Precautions

When a URL is entered in the address bar in the browser directly, the preloading function of the browser may work and the session between the GOT (server) and the client may be unintentionally maintained.

Preform the following operations if the number of connected clients exceeds the maximum number of simultaneously connectable clients even though no operator is logged in, or if a client that you have not connected is regarded to be connected.

- Exit the browser of the device being used.
- Check the client numbers of the connected clients on the utility screen, and turn on the disconnection signal for the target client.

Connection using a contactless tag

To connect the GOT (server) and the client using a contactless tag, the GOT (server) settings must be configured.

For information on the setting to enable a contactless tag, refer to the following.

☞ Page 667 Configuring the settings for the GOT contactless tag ([Contactless Tag])

The following shows the procedure to connect the client using the contactless tag of the GOT.

1. Enable the NFC function on the smartphone or tablet to be used as the client.

2. Connect the smartphone or tablet to a wireless LAN access point to enable communication with the GOT.

For information on how to connect the smartphone or tablet to a wireless LAN access point, refer to the following.

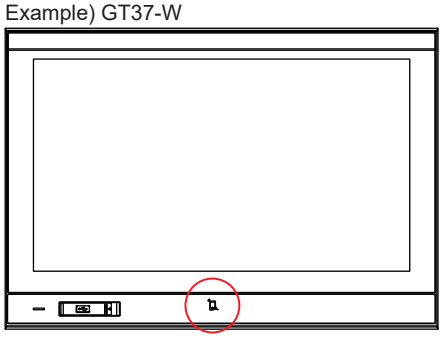
📖Manual of the wireless LAN access point used

3. Bring the client (smartphone or tablet) closer to the contactless tag of the GOT.

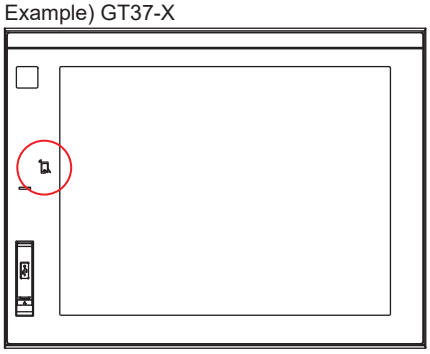
The position of the contactless tag varies depending on the GOT model.

The position of the contactless tag is marked with a contactless tag mark.

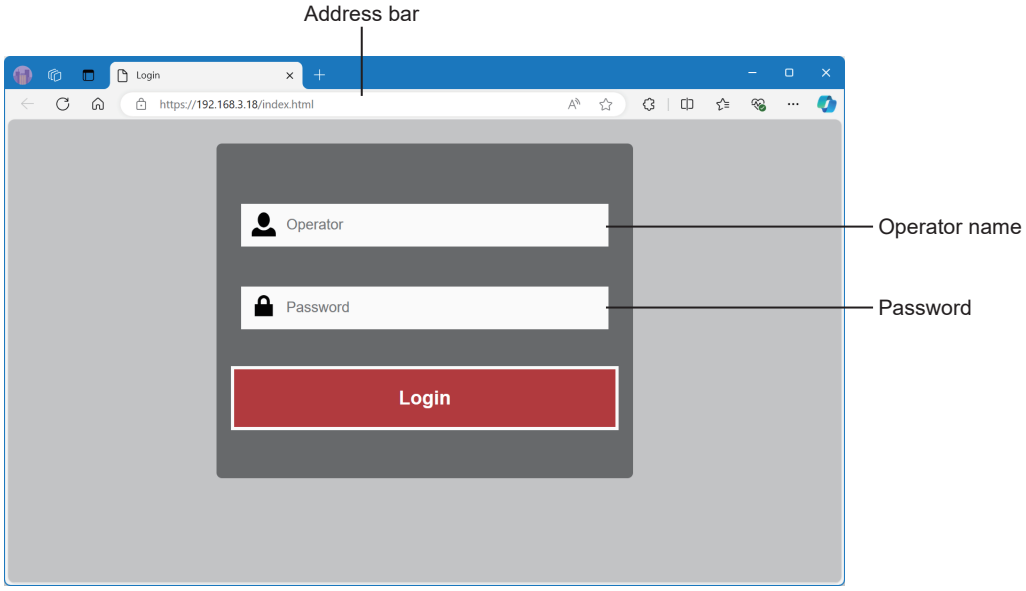
Example) GT37-W



Example) GT37-X

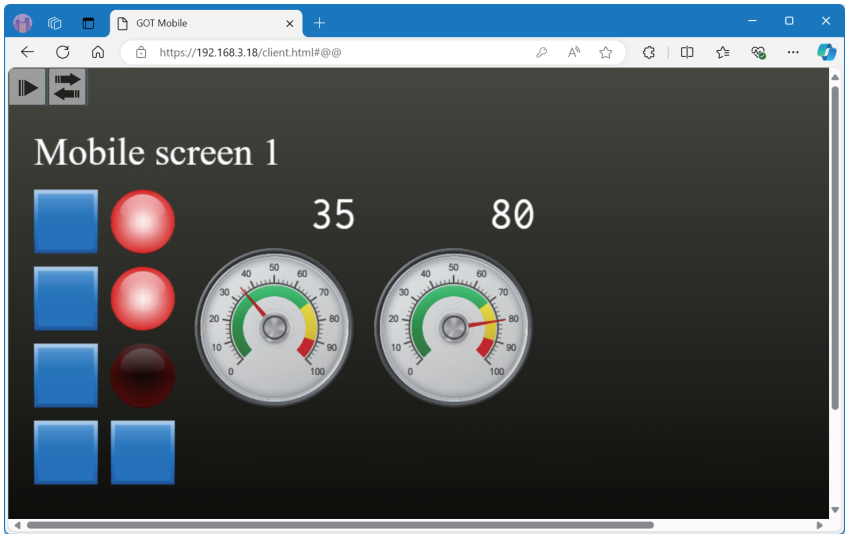


4. In the authentication screen, enter an operator name and password, and touch the [Login] button.



PART 25

5. If the client is authenticated with the GOT, an applicable mobile screen appears in the browser.



Point

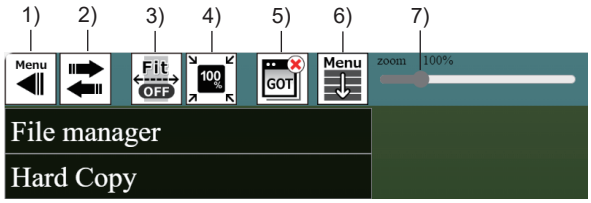
You can specify the mobile screen appearing after the client is authenticated to the GOT in the [GOT Mobile Setting] window. In [Screen Switching], select [Specify the No. of a screen to be displayed at the time of client connection] and specify a screen number.
If you do not specify the mobile screen, the smallest-numbered mobile screen appears.
☞ Page 2822 [Screen Switching/Window]

82.4.6 Operations on the mobile screen

☞ Page 2809 Operation menu bar on the mobile screen
☞ Page 2810 Zooming the mobile screen display
☞ Page 2811 Disconnecting a client

Operation menu bar on the mobile screen

The operation menu bar is displayed in the upper-left corner of a mobile screen to control the display.



Item		Description
1)	Expand/collapse button	Expands or collapses the operation menu bar. While the operation menu bar is expanded, you cannot touch the objects on the mobile screen. However, you can scroll the screen by a swipe or flick operation on a tablet or smartphone.
2)	Button to move the operation menu bar	Moves the operation menu bar from side to side.
3)	[Fit Width] button	Adjusts the mobile screen display to fit on the width of the browser window. While the [Fit Width] button is held down, the mobile screen display is fit on the width of the browser window automatically in the following timing. • When the screen is switched • When the width of the browser window is changed
4)	[100%] button	Displays the mobile screen display at its original magnification (100%).
5)	Disconnect button	Disconnects the client from the GOT.
6)	Extended function button	Displays a pull-down menu. • [File manager] Displays the file manager screen where you can view the folders and files in the public folder, or perform manipulations on them such as copying. ☞ Page 2762 File manager • [Hard Copy] Captures the current mobile screen in PNG format and outputs it to a new tab in the browser. ☞ Page 2765 Hard copy function
7)	Zoom slider	Zooms in or out the mobile screen display. Move the slider control to the right to zoom in the display, and move the slider control to the left to zoom out the display. The setting range is [10]% to [500]%.

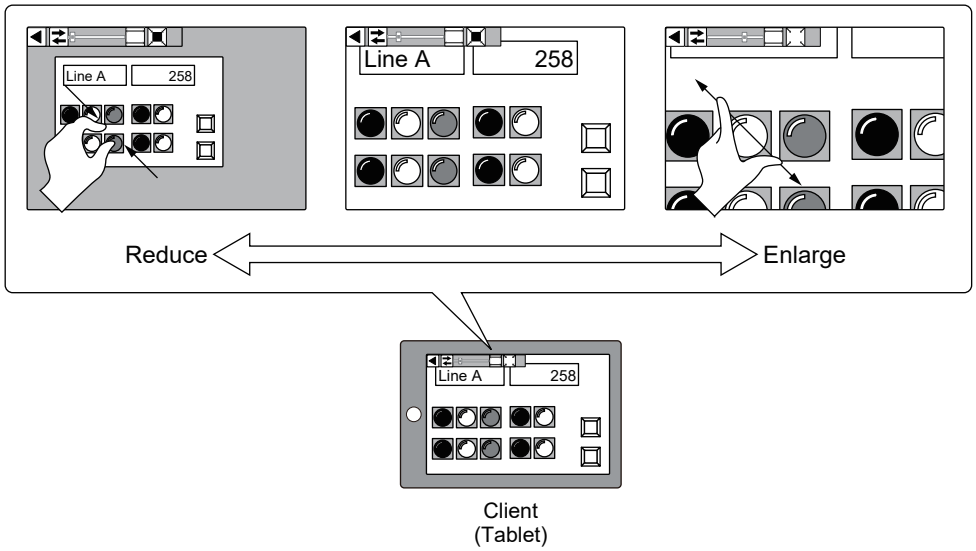
Precautions

While a mobile screen is being displayed, do not use the browser's [Back] button, [Forward] button, or [Refresh] button. Doing so disconnects the client from the GOT and returns you to the authentication screen.

Zooming the mobile screen display

When the operation menu bar is expanded on the mobile screen, you can pinch in or out to zoom the screen display (10% to 500%).

The screen display is zoomed by moving fingers toward or away from each other.



Precautions

While a mobile screen is being displayed, do not use the browser's zoom function.

Doing so may cause an unintended display, such as an enlarged or reduced operation menu bar.

Disconnecting a client

Once the client is disconnected from the GOT, the client is not automatically reconnected.
In such a case, reconnect the client to the GOT.

■Disconnection by user operation

If you perform any of the following operations, the client becomes disconnected from the GOT.

- Close an applicable browser.
- Perform a logout when the authentication method of the GOT Mobile function is set to the operator authentication.
- Touch the Disconnect button on the operation menu bar in the mobile screen.
- Turn on b0 of the client control device that is specified in [Client Information] of the [GOT Mobile Setting] window.
- Touch the [Disconnect] button on the [GOT Mobile information] screen in the utility.

■Disconnection by methods other than user operation

The client becomes disconnected in the following timing as well.

- When a communication timeout occurs on the GOT
- When the GOT is turned off
- When the GOT enters the offline mode because of package data writing or others
- When no operation is performed on the client for a certain time

(When [Automatically disconnect clients with no operation] is selected in [Basic Setting] of [GOT Mobile Setting] window)
When the ANDON function is used, the client is not disconnected.

- When the authentication method of the GOT Mobile function is set to the operator authentication, and the automatic logout is performed
- When the connection time exceeds 30 minutes without license registration

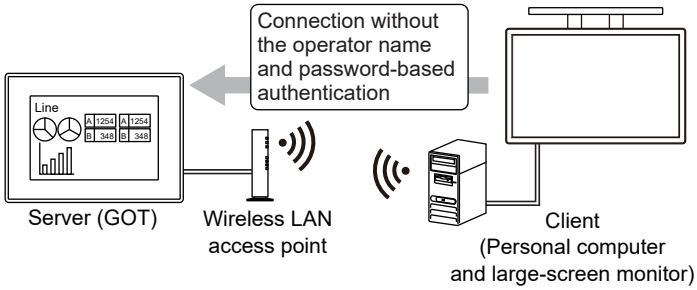
Precautions

Depending on the browser, connection with the GOT may be cut if the browser is used for a long period of time.
In such situations, perform authentication again to connect to the GOT.
If a hardware acceleration feature is used for the browser, disabling the feature may improve the situation.
☞ Page 2834 Troubleshooting for clients

82.5 ANDON function

GT37 SoftGOT3000

The ANDON function enables a specific client to connect to the GOT without the operator name and password-based authentication. (The authentication screen does not appear.)
This function is usable for applications, such as an andon display. You can specify a set of a personal computer and a large-screen monitor as a client to display mobile screens.



For information on how to use the ANDON function, refer to the following.
☞ Page 2813 Settings required for the ANDON function
By configuring the above setting and the client side setting in combination, the target client can display a mobile screen upon its power-on.
For details, refer to the following.
☞ Page 2814 Displaying a mobile screen on the client upon power-on
If you click the [OK] button in the confirmation dialog for disconnection while the ANDON function is enabled, the client does not become disconnected due to the automatic reconnection.
For how to display the disconnect screen without allowing a reconnection, refer to the following.
☞ Page 2816 Displaying the disconnect screen

82.5.1 Settings required for the ANDON function

The following shows the settings required for the ANDON function.

Settings in GT Designer3

1. Select [Common] → [GOT Mobile Setting] from the menu to display the [GOT Mobile Setting] window. In [ANDON Setting], select [Use ANDON function].
2. Select a client number targeted for the ANDON function.

☞ Page 2817 [GOT Mobile Setting] window

Precautions

When the ANDON function is used, anyone can access the GOT from the client without an operator name and a password. Take security measures for such a client, including limiting displayable screens.

Settings for the server (GOT)

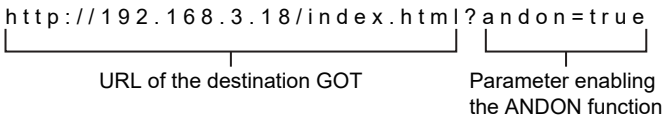
In [ANDON connection] of the utility, set the IP address of a client targeted for the ANDON function.
For the setting method, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

URL parameter setting

When you enter the URL of the destination GOT on the address bar in the browser, add the parameter for enabling the ANDON function.

Ex.
When encrypted communication is enabled



For details on the URL parameters, refer to the following.

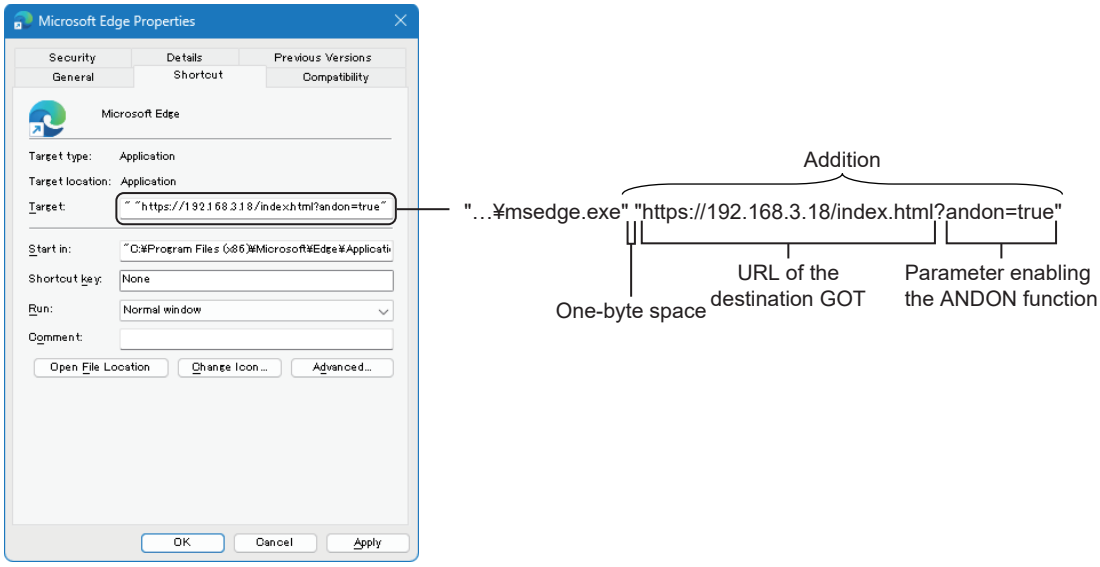
☞ Page 2805 URL parameters

82.5.2 Displaying a mobile screen on the client upon power-on

A client can display a mobile screen upon power-on without specific operations, such as logging into the OS, starting a browser, and entering a URL on the address bar.
The following shows the setting instructions using Windows 11 and Microsoft Edge as an example for encrypted communication

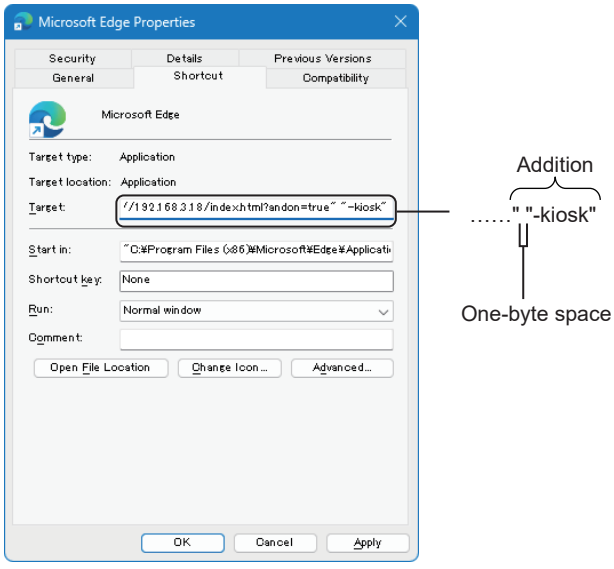
1. Set the destination of a Microsoft Edge shortcut by specifying the URL of the destination GOT and the parameter for enabling the ANDON function.

Create a Microsoft Edge shortcut, and select [Properties] from the right-click context menu.
In the [Shortcut] tab of the [Microsoft Edge Properties] dialog, add the URL and parameter to [Target] as shown below.



2. Configure the setting to open a browser in full screen mode.

In the [Shortcut] tab of the [Microsoft Edge Properties] dialog, add a one-byte space and "-kiosk" to [Target] as shown below.



3. Configure the setting to open the browser automatically upon startup of Windows.

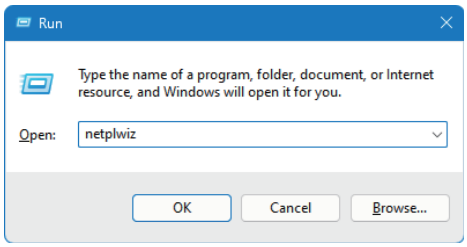
Place the Microsoft Edge shortcut set as above in the directory below.

[\Users\(User name)\AppData\Roaming\Microsoft\Windows\Start Menu\Programs\Startup]

4. Configure the setting to log into Windows automatically upon power-on of the client.

From the Windows start menu, select [All] → [Windows Tools], and double-click [Run] in the displayed [Windows Tools] window.

In the displayed [Run] dialog, type "netplwiz" in the [Open] field and click the [OK] button. The [User Accounts] dialog appears.



5. In the [Users] tab, select a user to log onto Windows automatically, and clear [Users must enter a user name and password to use this computer].

Click the [OK] button to display the [Automatically Log On] dialog.

Precautions

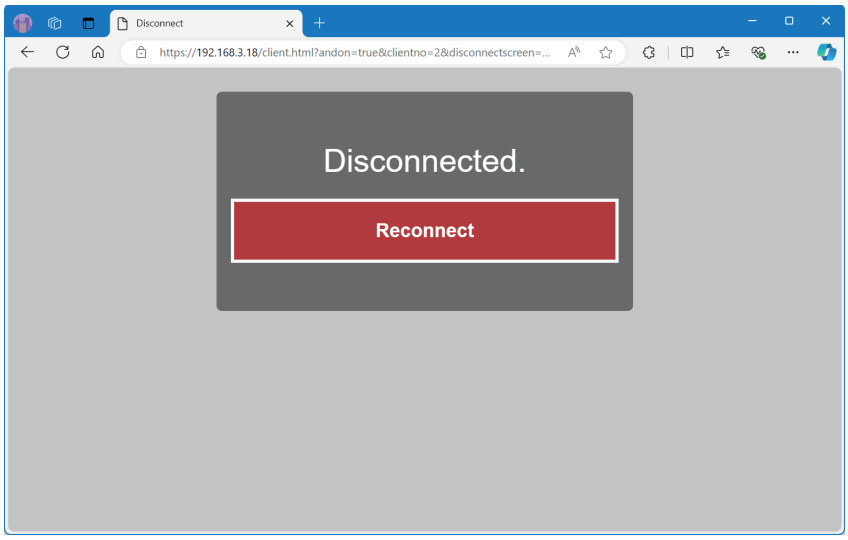
If the personal computer is joined to a Windows domain, [Users must enter a user name and password to use this computer] may not be displayed.

In this case, consult the administrator of the personal computer.

6. Enter the target user name and its password, and click the [OK] button.

82.5.3 Displaying the disconnect screen

When the ANDON function is used, clicking the OK button in the confirmation dialog for disconnection establishes an automatic reconnection without displaying the connection authentication screen.
Enable the URL parameter (disconnectscreen) to display the disconnect screen without allowing an automatic reconnection after clicking the OK button in the confirmation dialog for disconnection.



Clicking the [Reconnect] button establishes a reconnection.
When the ANDON function is not used, click the [Reconnect] button to display the connection authentication screen.
For details on the URL parameters, refer to the following.
☞ Page 2805 URL parameters

82.6 [GOT Mobile Setting] window

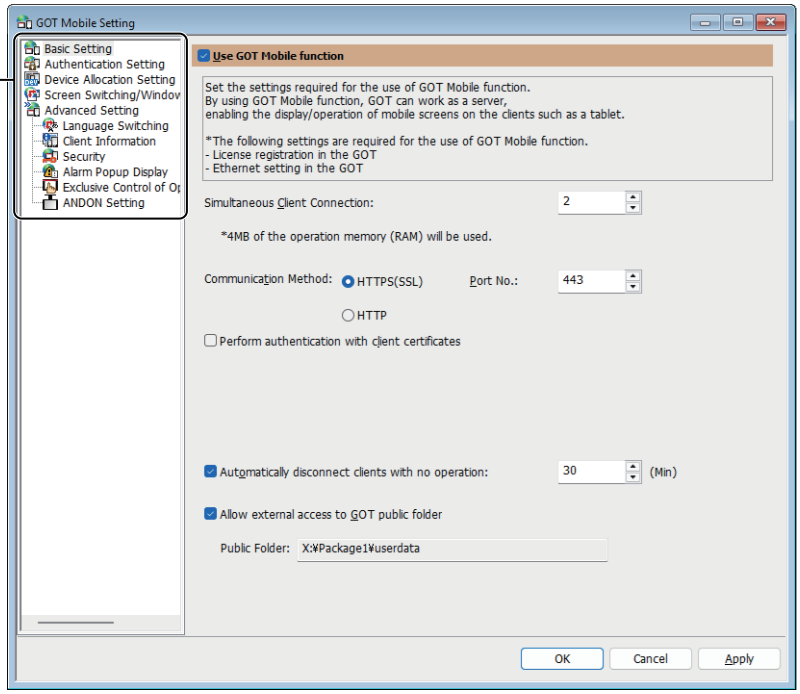
GT37 SoftGOT3000

Configure the GOT Mobile function setting.

Select [Common] → [GOT Mobile Setting] from the menu to display this window.

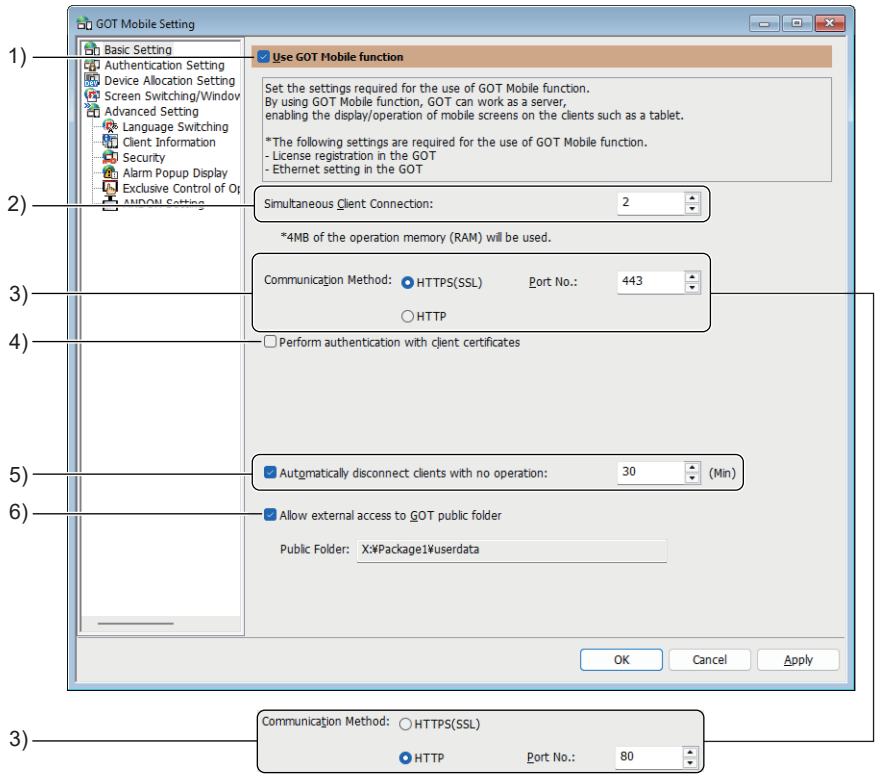
The display contents are changeable by selecting an item in the setting tree on the left of the window.

Setting tree



☞ Page 2818 [Basic Setting]
☞ Page 2819 [Authentication Setting]
☞ Page 2821 [Device Allocation Setting]
☞ Page 2822 [Screen Switching/Window]
☞ Page 2823 [Language Switching]
☞ Page 2824 [Client Information]
☞ Page 2825 [Security]
☞ Page 2828 [Alarm Popup Display]
☞ Page 2829 [Exclusive Control of Operational Authority]
☞ Page 2830 [ANDON Setting]

82.6.1 [Basic Setting]

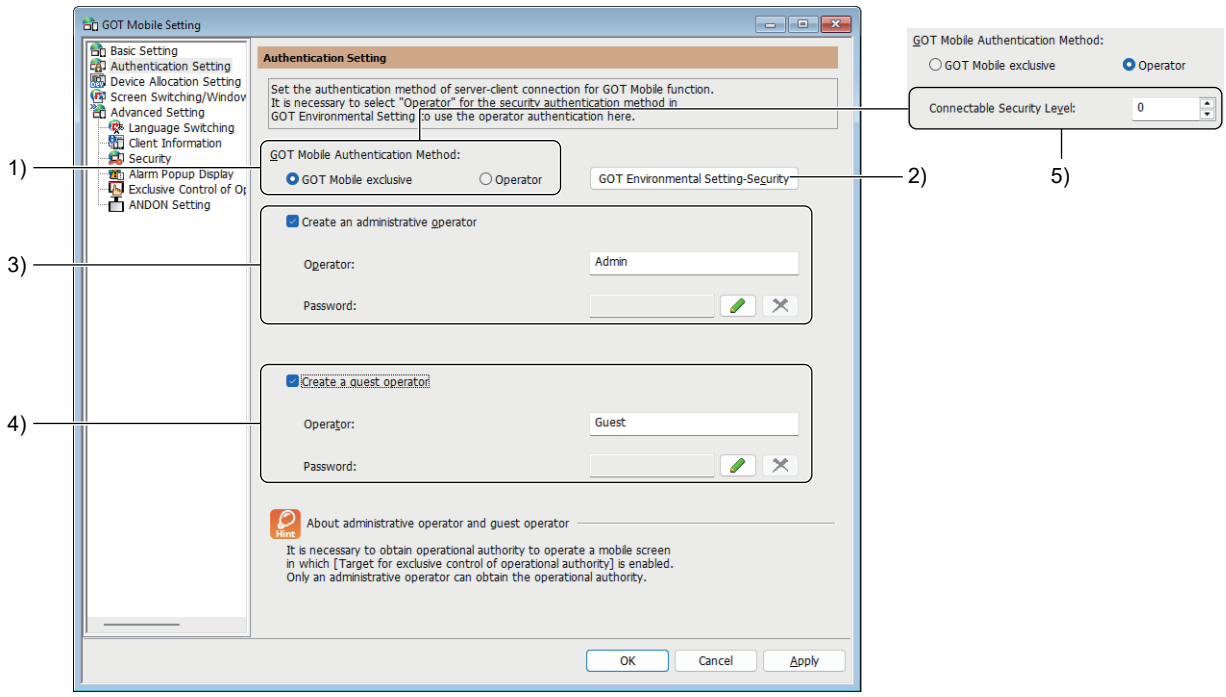


Item		Description
1)	[Use GOT Mobile function]	Enables the GOT Mobile function.
2)	[Simultaneous Client Connection]	Set the maximum number of clients connectable to the GOT simultaneously. The GOT reserves 2 MB space of the user area in the operation memory (RAM) for each client. The setting range depends on the GOT type. • GT37: [1] to [5] • GT SoftGOT3000: [1] to [15]
3)	[Communication Method]	Select the communication method for connection with the client. After selecting the communication method, specify the port number. • [HTTPS(SSL)]: [443], [1024] to [65535] • [HTTP]: [80], [1024] to [65535]
4)	[Perform authentication with client certificates]	Select this item to perform authentication with client certificates. It is recommended to select this item to enhance security for the ANDON connection. When this item is selected, it is necessary to import the client certificate created on the client terminal to the GOT.
5)	[Automatically disconnect clients with no operation]	Disconnects a client from the server (GOT) if no operation is performed on the client for a specified time period. Select this item, and specify the time period until disconnection is performed. The setting range is [1] minute to [60] minutes.
6)	[Allow external access to GOT public folder]	Allows clients to access the files in the GOT public folder. For details on the public folder, refer to the following. ☞ Page 2760 Public folder

82.6.2 [Authentication Setting]

For details on the authentication, refer to the following.

☞ Page 2757 Authentication



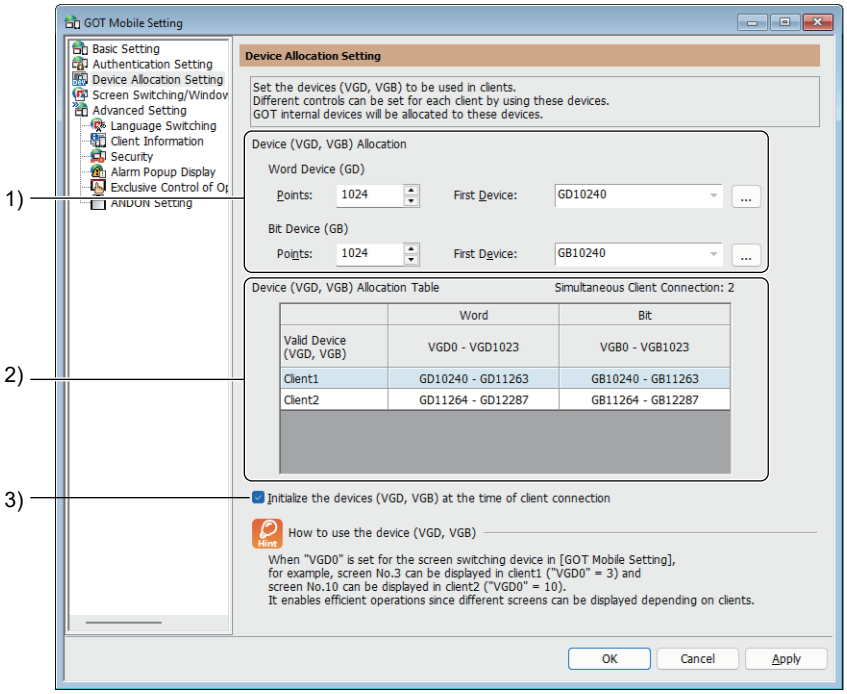
Item			Description
1)	[GOT Mobile Authentication Method]		Select an authentication method for connecting a client to the GOT. When the ANDON function is used, login using the operator authentication is not available. The following shows selectable items. • [GOT Mobile exclusive] • [Operator]
2)	[GOT Environmental Setting-Security] button		Displays the [Environmental Setting] window ([Security]). For the settings in the [Environmental Setting] window ([Security]), refer to the following. ☞ Page 3038 Restricting display and operation on the GOT (Screen security)
3)	[Create an administrative operator]	—	Set an administrator operator account for authentication. The administrative operator account can monitor and operate the mobile screen. This item is settable when [GOT Mobile Authentication Method] is set to [GOT Mobile exclusive]. Select this item, and set [Operator] and [Password].
		[Operator]	Set the operator name of the administrative operator. Up to 32 one-byte alphanumeric characters (uppercase letters and lowercase letters), one-byte spaces, and the following symbols are available for the operator name. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~ Note that the operator name or password cannot end in a one-byte space.
		[Password]	Set the password for the administrative operator. • Password display area The password is displayed as eight [●] regardless of the number of digits of the password set in the [Password Edit] dialog. • Edit button Click the Edit button to display the [Password Edit] dialog. • Delete button Deletes the set password.

Item			Description
4)	[Create a guest operator]	—	Set a guest operator account for authentication. The guest operator account can only monitor the mobile screen. This item is settable when [GOT Mobile Authentication Method] is set to [GOT Mobile exclusive]. Select this item, and set [Operator] and [Password].
		[Operator]	Set the operator name of the guest operator. Up to 32 one-byte alphanumeric characters (uppercase letters and lowercase letters), one-byte spaces, and the following symbols are available for the operator name. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { ¦ }~ Note that the operator name or password cannot end in a one-byte space.
		[Password]	Set the password for the guest operator. • Password display area The password is displayed as eight [●] regardless of the number of digits of the password set in the [Password Edit] dialog. • Edit button Click the Edit button to display the [Password Edit] dialog. • Delete button Deletes the set password.
5)	[Connectable Security Level]		Set the security level of the operator allowed to access the GOT. This item is settable when [GOT Mobile Authentication Method] is set to [Operator]. The setting range is [0] to [15].

82.6.3 [Device Allocation Setting]

For details on the GOT Mobile devices, refer to the following.

☞ Page 2755 GOT Mobile device (VGB and VGD)

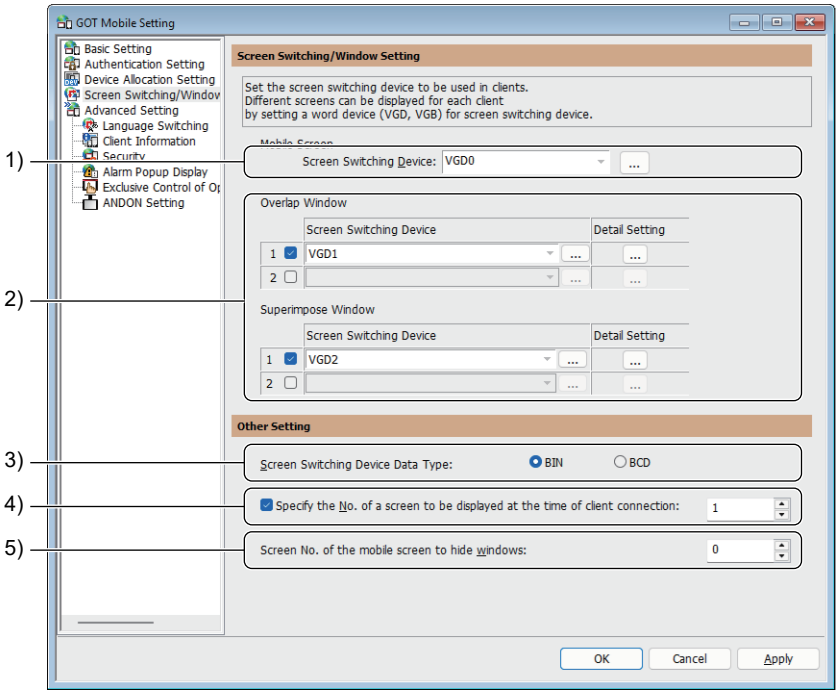


Item				Description
1)	[Device (VGD, VGB) Allocation]	—		Set GOT internal devices to be assigned to the GOT Mobile devices (VGD and VGB). The number of GOT internal devices (GD and GB) to be assigned is obtained by the following formula: [Points] × [Simultaneous Client Connection].
		[Word Device (GD)]	[Points]	Set the number of GOT internal devices (GD) to be assigned for one client. The value is settable in 2-point units. The setting range is [2] to [32768].
			[First Device]	Set the first GOT internal device (GD) to be assigned for client 1. The consecutive devices starting from [First Device] are assigned for clients. The total number of assigned devices is obtained by the following formula: [Points] × [Simultaneous Client Connection]. The setting range is [GD0] to [GD65535].
		[Bit Device (GB)]	[Points]	Set the number of GOT internal devices (GB) to be assigned for one client. The value is settable in 32-point units. The setting range is [32] to [32768].
			[First Device]	Set the first GOT internal device (GB) to be assigned for client 1. The consecutive devices starting from [First Device] are assigned for clients. The total number of assigned devices is obtained by the following formula: [Points] × [Simultaneous Client Connection]. The setting range is [GB0] to [GB65520].
2)	[Device (VGD, VGB) Allocation Table]	—		Shows the correspondence between the GOT Mobile devices and the assigned GOT internal devices by client number.
		[Simultaneous Client Connection]		Maximum number of clients connectable to the GOT simultaneously The value set in [Basic Setting] is displayed.
		[Valid Device (VGD, VGB)]		Setting range of GOT Mobile devices usable in clients
		[Client1] to [Client15]		GOT internal devices that are assigned for each client
3)	[Initialize the devices (VGD, VGB) at the time of client connection]			Clears the values of the GOT Mobile devices assigned to a client when the client connects to the GOT.

82.6.4 [Screen Switching/Window]

For details on screen switching on a client, refer to the following.

☞ Page 2745 Screen switching



Item		Description
1)	[Screen Switching Device]	Set the screen switching device for clients. You can specify a word device or word-specified bit device.
2)	Settings of overlap windows 1 and 2 and superimpose windows 1 and 2	Set whether to use overlap windows 1 and 2, superimpose windows 1 and 2, screen switching devices, display methods, and other items. For details, refer to the following. ☞ Page 542 [Screen Switching/Window]
3)	[Screen Switching Device Data Type]	Select the data type of the screen switching device for clients. The following shows selectable items. • [BIN]: Signed 16-bit binary or unsigned 16-bit binary • [BCD]: 16-bit binary coded decimal
4)	[Specify the No. of a screen to be displayed at the time of client connection]	Set the screen number of the mobile screen to be displayed immediately after the client becomes authenticated to the GOT. The setting range varies depending on the setting of [Screen Switching Device Data Type]. • For [BIN]: [0] to [32767] • For [BCD]: [0] to [9999]
5)	[Screen No. of the mobile screen to hide windows]	Set the screen number of a mobile screen. Then, the overlap windows and superimpose windows displayed on the screen are hidden. When the set number is stored in the screen switching device, the corresponding window is hidden.

Precautions

When you use multiple clients simultaneously, specify a GOT Mobile device as the mobile screen switching device.

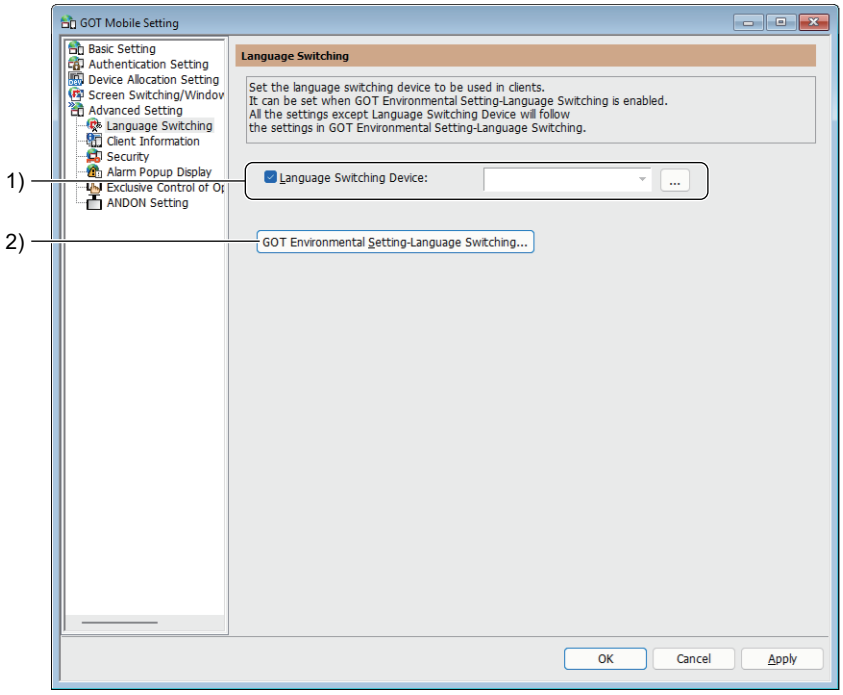
If any device other than a GOT Mobile device is specified as the screen switching device, all clients display the same screen when the screen switches.

☞ Page 2755 GOT Mobile device (VGB and VGD)

82.6.5 [Language Switching]

For details on language switching on the mobile screen, refer to the following.

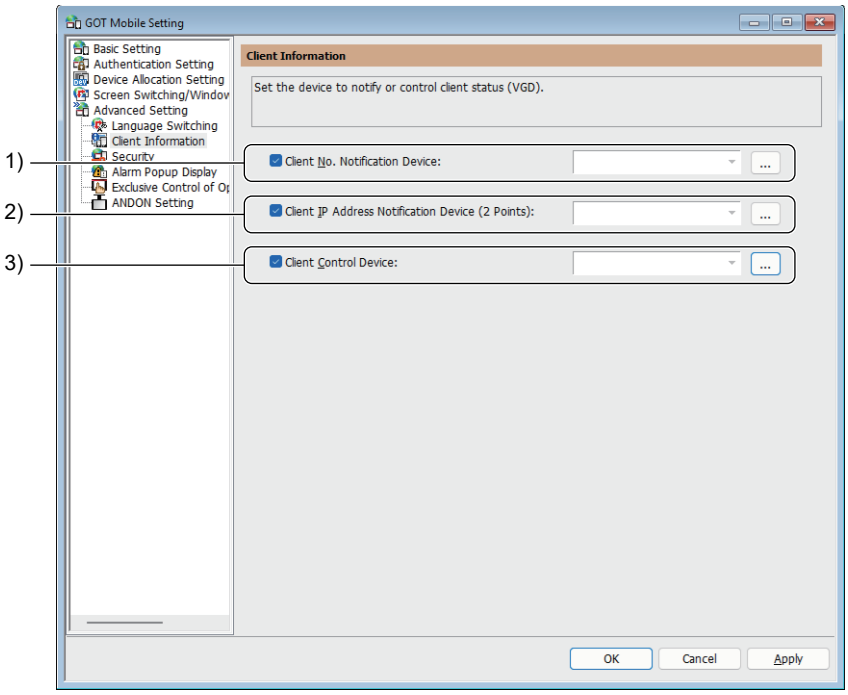
☞ Page 2746 Language switching



Item		Description
1)	[Language Switching Device]	Set the language switching device for clients. You can specify a word device or word-specified bit device.
2)	[GOT Environmental Setting-Language Switching] button	Displays the [Environmental Setting] window ([Language Switching]). For language switching on the mobile screen, the GOT environmental settings are applied except the setting of [Language Switching Device]. For the settings in the [Environmental Setting] window ([Language Switching]), refer to the following. ☞ Page 551 [Language Switching]

82.6.6 [Client Information]

Set the devices to notify the information on the client being connected or to control the state of the client.



Item		Description
1)	[Client No. Notification Device]	Set a device to store the client number of the client being connected. Select this item, and set the device. You can specify a GOT Mobile device (VGD) only. The data type of the device is unsigned 16-bit binary.
2)	[Client IP Address Notification Device (2 Points)]	Set a device to store the IP address of the client. Select this item, and set the device. You can specify a GOT Mobile device (VGD) only. Two consecutive word devices are reserved, starting from the specified device. The data type of the device is unsigned 32-bit binary. The IP address is stored as shown below. Example) When the IP address is 192.168.3.18 (decimal) 3)	[Client Control Device]	Set a device to control the state of the client being connected. Select this item, and set the device. Turning on b0 of the set device disconnects the client from the GOT. You can specify a GOT Mobile device (VGD) only. The data type of the device is unsigned 16-bit binary.

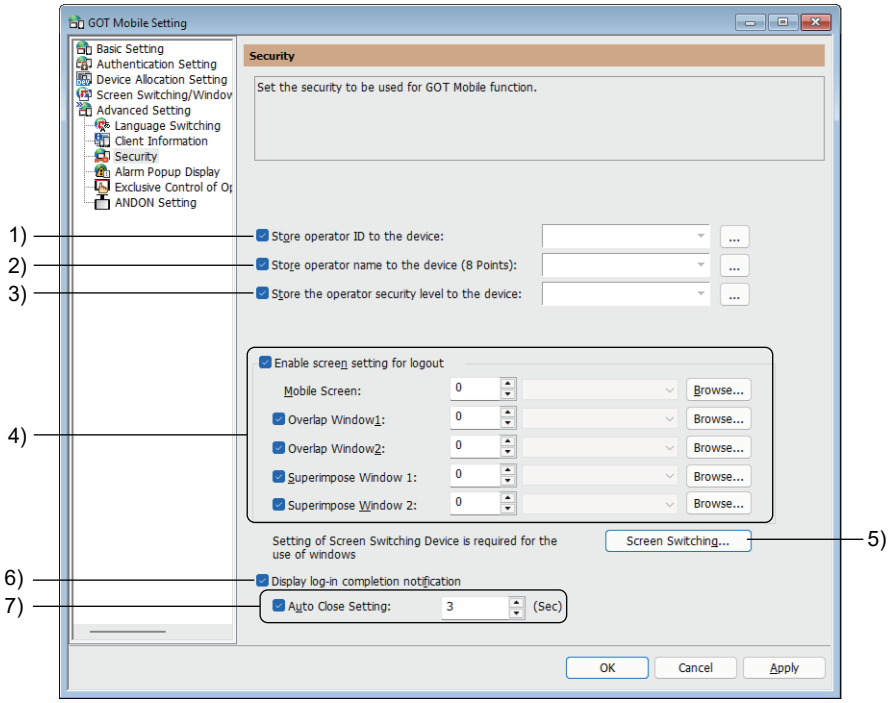
82.6.7 [Security]

The setting items differ according to the security mode and the authentication method of the screen security.

For details on the mobile screen security authentication, refer to the following.

☞ Page 2747 Screen security (level authentication and operator authentication)

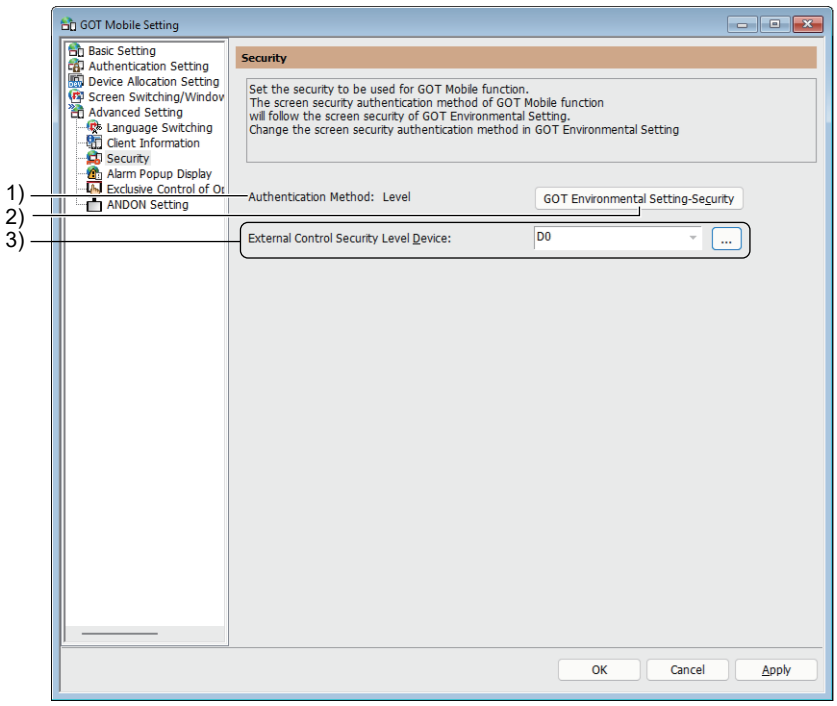
Security mode 2



Item		Description
1)	[Store operator ID to the device]	Set a device to store the ID number of the operator who is logged in from a client (Operator ID External Notification device). You can specify a GOT Mobile device (VGD) only. The specified device stores 0 when the operator logs out.
2)	[Store operator name to the device (8 Points)]	Set a device to store the name of the operator who is logged in from a client (Operator Name External Notification device). You can specify a GOT Mobile device (VGD) only. Eight consecutive word devices are reserved, starting from the specified device. If the operator name contains less than 16 characters, blank devices store 0. All the devices store 0 when the operator logs out.
3)	[Store the operator security level to the device]	Set a device to store the security level of the operator who is logged in from a client (Operator Level External Notification device). You can specify a GOT Mobile device (VGD) only. The specified device stores 0 when the operator logs out.
4)	[Enable screen setting for logout]	Set a screen to be displayed at logout. When using an overlap window or superimpose window, set a screen switching device in [Screen Switching/Window] in the [GOT Mobile Setting] window. Click the [Browse] button to display the [Screen Image List] dialog. For details on the [Image List] dialog, refer to the following. ☞ Page 3683 [Image List] dialog (screen)
5)	[Screen Switching] button	Displays the setting screen for the screen switching devices. ☞ Page 2822 [Screen Switching/Window]
6)	[Display log-in completion notification]	Displays a login completion notification dialog upon login.
7)	[Auto Close Setting]	Closes the login completion notification dialog automatically. Select this item, and specify the time period from when the login completion notification dialog appears until it closes. The setting range is [1] second to [60] seconds.

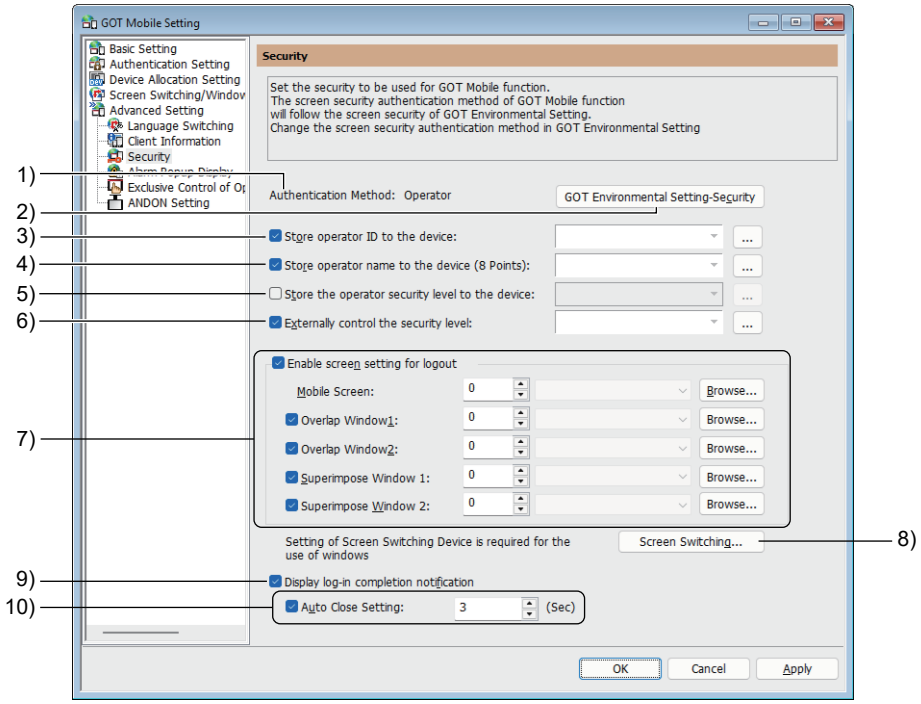
Security mode 1

■For the level authentication



Item		Description
1)	[Authentication Method]	Displays the security authentication method selected for [Authentication Method] in the [Environmental Setting] window ([Security]).
2)	[GOT Environmental Setting-Security] button	Displays the [Environmental Setting] window ([Security]). The security level password is common to the clients and the GOT. Change the authentication method and security level password for the GOT as necessary. For details, refer to the following. ☞ Page 3054 Level authentication
3)	[External Control Security Level Device]	Set a device to store the security level of a client. You can specify a word device or word-specified bit device.

■For the operator authentication

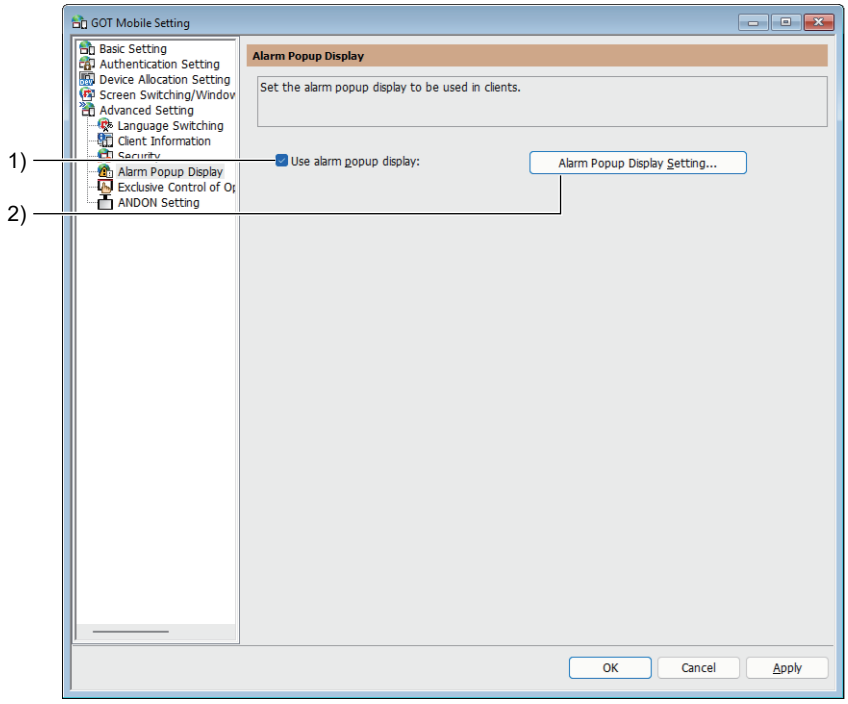


Item		Description
1)	[Authentication Method]	Displays the security authentication method selected for [Authentication Method] in the [Environmental Setting] window ([Security]).
2)	[GOT Environmental Setting-Security] button	Displays the [Environmental Setting] window ([Security]). Change the authentication method for the GOT as necessary. For details, refer to the following. ☞ Page 3055 Operator authentication (Mode 1)
3)	[Store operator ID to the device]	Set a device to store the ID number of the operator who is logged in from a client (Operator ID External Notification device). You can specify a GOT Mobile device (VGD) only. The specified device stores 0 when the operator logs out.
4)	[Store operator name to the device (8 Points)]	Set a device to store the name of the operator who is logged in from a client (Operator Name External Notification device). You can specify a GOT Mobile device (VGD) only. Eight consecutive word devices are reserved, starting from the specified device. If the operator name contains less than 16 characters, blank devices store 0. All the devices store 0 when the operator logs out.
5)	[Store the operator security level to the device]	Set a device to store the security level of the operator who is logged in from a client (Operator Level External Notification device). You can specify a GOT Mobile device (VGD) only. The specified device stores 0 when the operator logs out.
6)	[Externally control the security level]	Set a device to externally control the operator authentication on a client (Operator Authentication External Control device). You can specify a word device or word-specified bit device. For details on the security level control from an external device, refer to the following. ☞ Page 3047 Security level control from an external device
7)	[Enable screen setting for logout]	Set a screen to be displayed at logout. When using an overlap window or superimpose window, set a screen switching device in [Screen Switching/Window] in the [GOT Mobile Setting] window. Click the [Browse] button to display the [Screen Image List] dialog. For details on the [Image List] dialog, refer to the following. ☞ Page 3683 [Image List] dialog (screen)
8)	[Screen Switching] button	Displays the setting screen for the screen switching devices. ☞ Page 2822 [Screen Switching/Window]
9)	[Display log-in completion notification]	Displays a login completion notification dialog upon login.
10)	[Auto Close Setting]	Closes the login completion notification dialog automatically. Select this item, and specify the time period from when the login completion notification dialog appears until it closes. The setting range is [1] second to [60] seconds.

82.6.8 [Alarm Popup Display]

For details on the alarm popup display on mobile screens, refer to the following.

☞ Page 2748 Alarm popup display

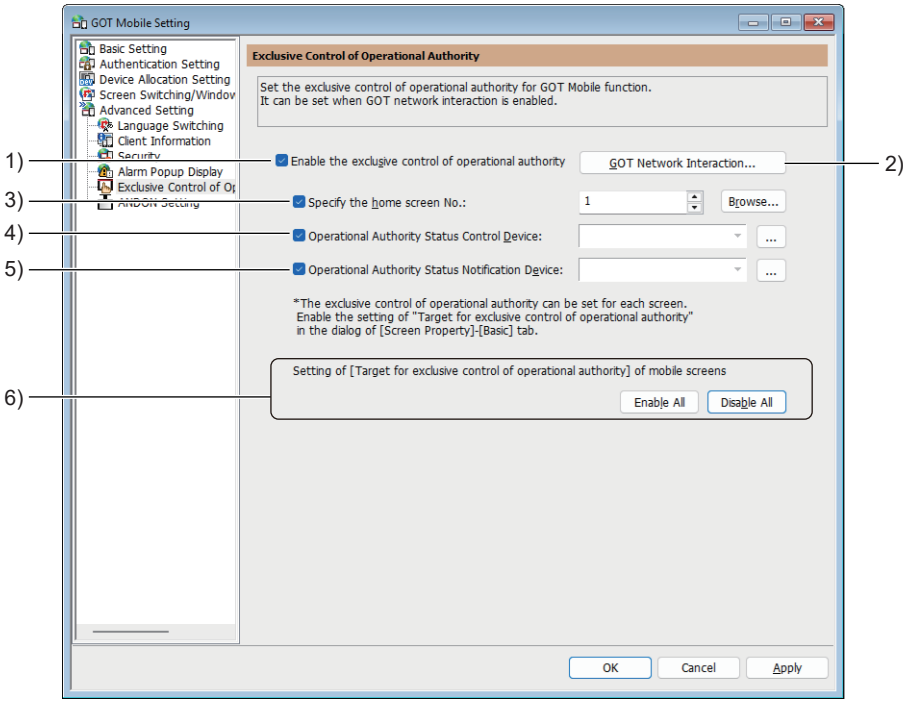


Item		Description
1)	[Use alarm popup display]	Uses the alarm popup display on mobile screens.
2)	[Alarm Popup Display Setting] button	Displays the following dialog to configure the alarm popup display setting for mobile screens. Clicking this button displays the following dialog.  To utilize the alarm popup display setting for the GOT, click the [Yes] button to display the [Alarm Popup Display(GOT Mobile Setting)] dialog. To not to utilize the alarm popup display setting for the GOT, click the [No] button to display the [Alarm Popup Display(GOT Mobile Setting)] dialog. ☞ Page 2105 Enabling the popup display for when an alarm occurs

82.6.9 [Exclusive Control of Operational Authority]

For details on the GOT network interaction function, refer to the following.

☞ Page 762 Setting the interaction function for equipment on Ethernet ([GOT Network Interaction])

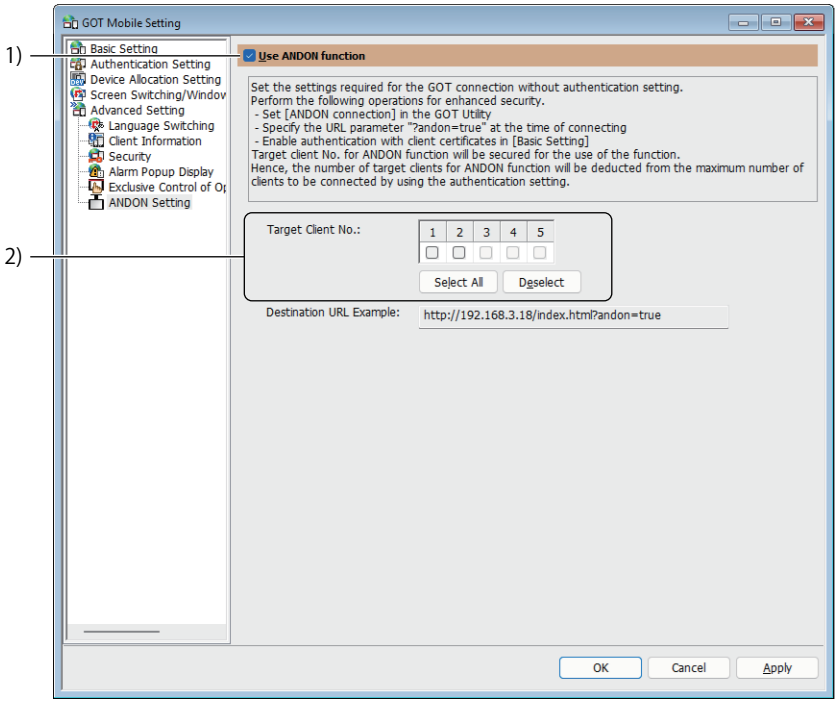


Item		Description
1)	[Enable the exclusive control of operational authority]	Enables the authorization control of the GOT network interaction function in the GOT Mobile function. This item is settable only when the GOT network interaction function is enabled. To enable authorization control, select [Target for exclusive control of operational authority] in the [Basic] tab of [Screen Property]. ☞ Page 2831 [Basic] tab
2)	[GOT Network Interaction] button	Displays the [GOT Network Interaction] dialog. For the settings in the [GOT Network Interaction] dialog, refer to the following. ☞ Page 772 [GOT Network Interaction] dialog
3)	[Specify the home screen No.]	Set a mobile screen to be displayed by the home screen button on the popup display of the GOT network interaction function. Select this item, and specify the screen number of the mobile screen. Make sure to disable the authorization control in the mobile screen set as the home screen. For details on the home screen in the GOT network interaction function, refer to the following. ☞ Page 766 Operation on target equipment Click the [Browse] button to select a mobile screen in thumbnail view in the [Image List] dialog. ☞ Page 3683 [Image List] dialog (screen)
4)	[Operational Authority Status Control Device]	Set a device to control the authorization status. Select this item, and set the device. You can specify a GOT Mobile device (VGD) or word-specified GOT Mobile device (VGB). For details on the Operational Authority Status Control device, refer to the following. ☞ Page 2758 Operational Authority Status Control device
5)	[Operational Authority Status Notification Device]	Set a device to notify the authorization status. Select this item, and set the device. You can specify a GOT Mobile device (VGD) or word-specified GOT Mobile device (VGB). For details on the Operational Authority Status Notification device, refer to the following. ☞ Page 2758 Operational Authority Status Notification device
6)	[Setting of [Target for exclusive control of operational authority] of mobile screens]	Enables or disables the setting of [Target for exclusive control of operational authority] in all mobile screens at once. For the mobile screen setting, refer to the following. ☞ Page 2831 Mobile screen properties

82.6.10 [ANDON Setting]

For details on the ANDON function, refer to the following.

☞ Page 2812 ANDON function



Item		Description
1)	[Use ANDON function]	Enables connection between the GOT and clients without the operator name and password-based authentication.
2)	[Target Client No.]	Select the target client number of the ANDON function. The number of settable clients depends on the model. The selected client connects to the GOT without the operator name and password-based authentication. Connection using the GOT Mobile exclusive authentication or the operator authentication is not applicable.

82.7 Mobile screen properties

GT37 SoftGOT3000

Set the properties of a mobile screen.

To display the properties, perform one of the following operations.

When creating a mobile screen:

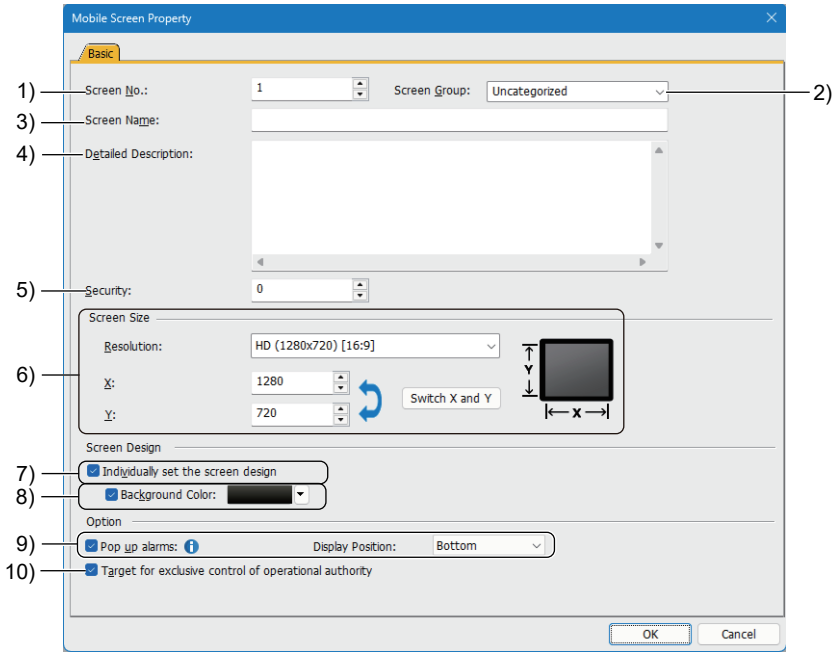
- Select [Screen] → [New] → [Mobile Screen] from the menu.
- In the [Screen] window, click the [New Screen] button and select [Mobile Screen].

When editing an existing mobile screen:

- Right-click a mobile screen, and select [Screen Property].
- Right-click a mobile screen in the tree in the [Screen] window, and select [Screen Property].

☞ Page 2831 [Basic] tab

82.7.1 [Basic] tab



Item		Description
1)	[Screen No.]	Set a screen number. The setting range is [0] to [32767]. The screen number cannot be changed if the [Mobile Screen Property] dialog has been brought up for multiple screens.
2)	[Screen Group]	Set a screen group. Up to 100 characters can be set.
3)	[Screen Name]	Set the title of the screen. Up to 100 characters can be set.
4)	[Detailed Description]	Set the explanation for the screen. Up to 512 characters can be set. A line feed is counted as two characters.
5)	[Security]	Set the security level. The setting range is [0] to [15]. If you do not use the security function of the GOT, select [0]. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2)) ☞ Page 3038 Restricting display and operation on the GOT (Screen security)

Item			Description
6)	[Screen Size]	—	Set the screen size.
		[Resolution]	Select the resolution of the mobile screen. The values of [X] and [Y] are automatically specified according to the selection for [Resolution]. [VGA (640×480) [4:3]] [SVGA (800×600) [4:3]] [XGA (1024×768) [4:3]] [QXGA (2048×1536) [4:3]] [WXGA (1280×800) [16:10]] [HD (1280×720) [16:9]] [FWXGA (1366×768) [16:9]] [Full HD (1920×1080) [16:9]] [WUXGA (1920×1200) [16:10]] [WQHD (2560×1440) [16:9]] [Custom] The above resolutions are approximate and should be used for reference. Adjust the resolution according to the information device and browser to be used.
		[X]	Screen width If you change a specified value, the selection for [Resolution] is changed to [Custom]. The setting range is [16] to [3000].
		[Y]	Screen height If you change a specified value, the selection for [Resolution] is changed to [Custom]. The setting range is [2] to [3000].
		[Switch X and Y] button	Interchanges the values of [X] and [Y]. If you click this button, the selection for [Resolution] is changed to [Custom].
7)	[Individually set the screen design]		Enables the individual screen design (including the background color), instead of the design selected in the [Screen Design] dialog.
8)	[Background Color]		Select a background color. For instruction on the color setting, refer to the following. ☞ Page 988 Color settings
9)	[Pop up alarms]	—	An alarm pops up when an alarm occurs.
		[Display Position]	Select the position to display an alarm to be popped up. The following shows selectable items. • [Top] • [Center] • [Bottom] Configure the following settings additionally. • User alarm settings or system alarm settings ☞ Page 2045 [User Alarm Observation] dialog ☞ Page 2097 [System Alarm Observation] dialog • Alarm popup display settings ☞ Page 2118 [Alarm Popup Display] dialog
10)	[Target for exclusive control of operational authority]		Enables the authorization control in the screen being edited. ☞ Page 2758 Authorization control To enable the authorization control throughout the project, select [Enable the exclusive control of operational authority] in the [GOT Mobile Setting] window ([Exclusive Control of Operational Authority]). ☞ Page 2829 [Exclusive Control of Operational Authority]

82.8 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific settings for the GOT Mobile function as required.
The following shows the functions that are available by configuring the relevant settings.
☞ Page 3581 GOT special register (GS)

82.8.1 GOT internal device

Function	Setting item
Storing the number of clients connected to the GOT	GS1400
Turned on when a client is connected to the GOT	GS1401.b1 to .b15
Specifying a security level with which folder and file manipulations are allowed on the file manager screen	GS1892
Setting whether to use the URL parameter (initscreen)	GS1896.b0
Enabling folder and file manipulations on the file manager screen*1	GS1896.b1
Disabling the addition of X-Frame-Options to the HTTP response header	GS1896.b2
Setting the time from when communication is lost between the GOT and a client until when the GOT forcibly turns off the touch switch being touched on the client	GS1899

*1 Always disabled when the security mode 2 is selected.

82.9 Troubleshooting

GT37 SoftGOT3000

If you have any trouble with the GOT Mobile function, check the operating environment first.

☞ Page 2740 Operating environment

For details, refer to the following Technical Bulletin as well.

📖Precautions for the GOT Mobile Function (for Japanese Market) (GOT-A-0090)

82.9.1 Troubleshooting for clients

The following shows the troubleshooting for clients.

Symptom	Cause	Corrective action
Although a URL is specified, a communication error occurs and no screen appears.	The specified URL is incorrect.	Enter the correct URL. ☞ Page 2802 Connecting the client with the server (GOT)
	The setting for connection to the server (GOT) is configured incorrectly.	Check that the system is configured correctly. ☞ Page 2766 System configuration of the GOT Mobile function If the system is configured correctly, check that the connection setting on the client and settings in the [GOT Ethernet Setting] dialog on GT Designer3 are configured correctly. ☞ Page 727 Setting channels
	The system application (add-on function) for the GOT Mobile function is not installed on the GOT.	Write the package data that contains the system application (add-on function) for the GOT Mobile function to the GOT. ☞ Page 2818 [Basic Setting]
After the authentication, the client stays at a black screen and no mobile screen appears.	When the communication method is HTTP, the antivirus software prevents the mobile screen from appearing.	Set any number other than 80 or 8080 for the HTTP port No. for GOT Mobile. ☞ Page 2818 [Basic Setting] If no mobile screen appears even after you change the port number, disable the antivirus software.
	When the communication method is HTTPS (SSL), the GOT server certificate is not registered in the client.	Register the GOT server certificate in the web browser. ☞ Page 2771 Settings for encrypted communication (except GT SoftGOT3000) ☞ Page 2780 Settings for encrypted communication (GT SoftGOT3000)
	No mobile screen appears due to unintended browser refresh when switching between tabs or other actions.	Close all browser tabs, restart the browser, and reconnect the server (GOT).
Response speed is low.	When you operate a mobile screen or an object on the mobile screen, the response speed or display refresh rate is low depending on the specifications of the client.	Reduce the number of objects or graph points on the mobile screen. The situation may improve.
The client is disconnected from the GOT.	Browser tabs may be switched or another application may be operated during communications with the server (GOT).	Connect the client to the server (GOT) again. Close unnecessary browser tabs or exit other applications. The situation may improve.
A mobile screen is enlarged.	The screen may be enlarged when displayed for the first time.	Adjust the screen to fit the width of the browser window using the [Fit Width] button on the mobile screen operation menu bar. Alternatively, preset the mobile screen size accordingly.
A message saying [License unregistration.] appears on the mobile screen.	The license of the GOT Mobile function is unregistered to the GOT.	Register the license of the GOT Mobile function to the GOT. ☞ Page 3686 License registration method 📖GT SoftGOT3000 User's Manual
The client is disconnected from the GOT after a lapse of 30 minutes.		

Symptom	Cause	Corrective action
After displaying a mobile screen, the client is disconnected after a certain period of time.	The client is communicating with the server (GOT) using USB-LAN conversion with [USB selective suspend setting] set to [Enable] in Windows.	Set [USB selective suspend setting] in Windows to [Disable] using the following procedure. 1. In Windows, select [Control Panel] - [Power Options]. 2. Click [Change plan settings] for the current power plan. 3. Click [Advanced settings]. 4. Select [USB settings] - [USB selective suspend setting] - [Disabled] and click the [OK] button.
The mobile screen stops displaying after extended use. After the mobile screen is displayed for a certain period of time, [Out Of Memory] appears on the web browser.	The web browser is using hardware acceleration or graphic acceleration.	• Disable hardware acceleration or graphic acceleration in the web browser settings. • Decrease the number of objects or graph points on the mobile screen. • Specify [reloadtime] as the URL parameter to enable reloading at a specified interval. ☞ Page 2805 URL parameters • Restart the web browser and then reconnect to the server (GOT). For the restart procedure, refer to the following. 📖Precautions for the GOT Mobile Function (GOT-A-0090)

82.9.2 Error messages on clients

Errors before authentication

Error message	Cause	Corrective action
Unsupported browser. Check the operating environment.	The browser does not support the following items. • HTML5 • CSS3 • JavaScript • WebSocket Protocol (RFC 6455)	Use a browser that meets operating environment conditions. ☞ Page 2741 Client operating environment
JavaScript is disabled. Enable JavaScript and connect again.	JavaScript is disabled in the browser.	Enable JavaScript in the browser. ☞ Page 2802 Settings on the client
Cookie is disabled. Enable Cookie and connect again.	Cookie is disabled in the browser.	Enable Cookie in the browser. ☞ Page 2802 Settings on the client

Errors at authentication

Error message	Cause	Corrective action
The operator name or password is incorrect. Please check the operator name or password and execute again.	An incorrect operator name or password has been entered at authentication.	Check the entered operator name and password.
The operator information is being edited in the destination device. Please wait for a while and try again.	The operator authentication cannot be performed because the operator management information file is being edited on the server (GOT).	Perform the operator authentication again after the edit is completed.
Exceeding the maximum number of connections and the connection cannot be made. Please wait for a while and try again.	The connection failed because the number of clients has exceeded the maximum number of simultaneously connectable clients. ☞ Page 2818 [Basic Setting]	• Reconnect to the GOT after any other client becomes disconnected from the GOT. • Check that no operator who has used the GOT Mobile function maintains a logged-in state.
Destination does not respond. Check the communication environment and connect again.	The client cannot communicate with the server (GOT) due to a radio disturbance or a failure in the information device.	Check that the communication environment between the server (GOT) and client is established properly.
The operator is locked or disabled and cannot log in. Please check with the administrator.	A locked operator account due to incorrect login attempts or a disabled operator account is used.	Ask your system administrator to unlock or enable the operator account.
Parameters specified in the URL is wrong. Please check parameters.	An incorrect URL parameter has been entered on the address bar in the browser.	Check the entered URL parameter. ☞ Page 2805 URL parameters
Parameters specified in the URL is invalid. Please check the connection destination setting.	The URL parameter setting is inconsistent with the settings on GT Designer3 or the GOT.	Check that the settings are configured correctly on GT Designer3 and the GOT. ☞ Page 2805 URL parameters
The client No. specified in the URL is in use and cannot be accessed. Please wait for a while and try again.	The connection failed because any other client is connecting to the GOT by using the specified client number.	Reconnect to the GOT after the client using the specified client number becomes disconnected from the GOT. ☞ Page 2805 URL parameters
The operator does not meet the connection conditions and cannot log in. Please check with the administrator.	The connection with the operator authentication failed because the security level of the operator is insufficient.	Ask your system administrator to check the security level setting.
Your password has expired and cannot log in. Please change the password on the connection destination.	The connection with the operator authentication failed because the entered password has expired.	Change the password on the GOT.

Errors in the process of monitoring

Error message	Cause	Corrective action
Trial time has expired. Connection disconnected.	The trial connection time has elapsed, and the client became disconnected from the server (GOT). This is because the license number of the GOT Mobile function is unregistered to the server (GOT).	Register the license of the GOT Mobile function to the GOT. ☞ Page 3686 License registration method 📖GT SoftGOT3000 User's Manual
Connection with destination is disconnected. Check the communication path.	Communication between the server (GOT) and client has been lost.	Connect the client to the server (GOT) again. If connection cannot be established, check that the communication environment between the server (GOT) and client is established properly.
Destination has changed to a offline mode. The connection has been terminated.	The server (GOT) disconnected the client, because the server (GOT) entered the offline mode because of package data writing or others.	Connect the client to the server (GOT) again.
Mobile screen was not operated for a set period of time. Connection terminated.	The server (GOT) disconnected the client, because the automatic logout time elapsed. ☞ Page 2818 [Basic Setting]	Connect the client to the server (GOT) again.
The operator information is being edited in the destination device. Please wait for a while and login and change password again.	You cannot log in using the operator authentication from the client. If you are already logged in, you cannot change your operator account password on the client. These are because the operator management information file is being edited on the server (GOT).	Perform the operator authentication again or change the password after the edit is completed.
You have been logged out. The connection has been terminated.	When you are logged in using the operator authentication, a logout is performed on the client.	Connect the client to the server (GOT) again.
Authentication method is set to the operator authentication. Operators cannot be changed.	The operator switching was denied because you are logged in using the operator authentication.	Log out of the operator account in use, and log in with another operator account.

PART 26 OPC UA server function

83 Monitoring controllers through the GOT (OPC UA server function)

83 Monitoring controllers through the GOT (OPC UA server function)

GT37 SoftGOT3000

☞ Page 2840 Overview of the OPC UA server function
☞ Page 2841 OPC UA server function specifications
☞ Page 2843 OPC UA tag specifications
☞ Page 2851 System configuration of the OPC UA server function
☞ Page 2852 OPC UA server function setting methods
☞ Page 2856 [OPC UA Server Settings] window
☞ Page 2860 [OPC UA Tag Setting] window
☞ Page 2866 Relevant settings
☞ Page 2866 Troubleshooting

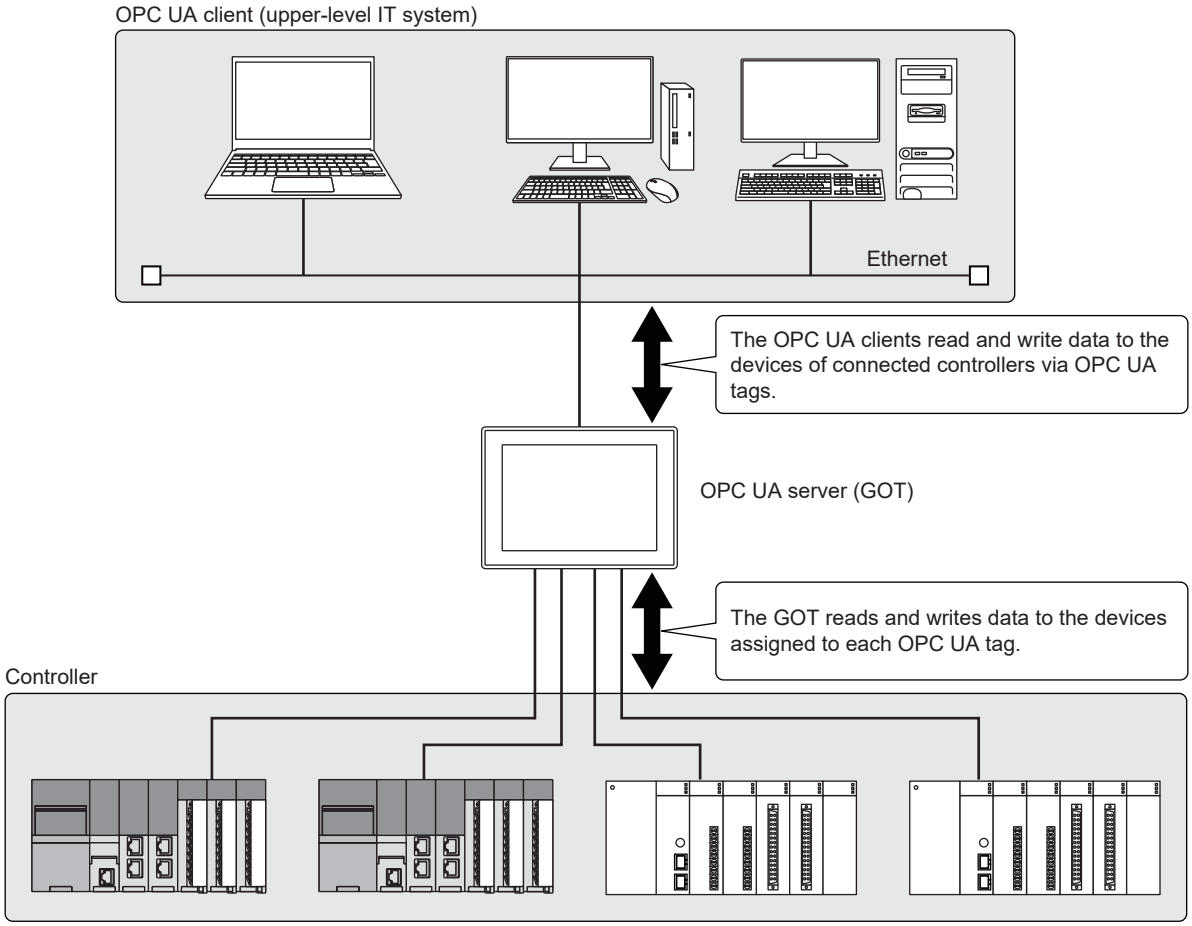
PART 26

83.1 Overview of the OPC UA server function

GT37 SoftGOT3000

The OPC UA server function enables the GOT to function as an OPC UA server and collect the values of devices assigned to OPC UA tags.

The OPC UA client (upper-level IT system) can access the OPC UA server (GOT) to read/write data to/from devices of connected controllers assigned to OPC UA tags.



OPC UA tag

OPC UA tags are character strings that are assigned to devices.

They support structure and string definitions.

Individual OPC UA tags can be configured to allow or deny reading and writing to and from the OPC UA client. (Configuration of the direction of access)

OPC UA server function security

The OPC UA server function uses the functions shown in the table below to prevent problems caused by unauthorized control due to malicious access of the GOT.

Function	Description
Security policy Security mode	Configures the security policy and security mode applied to the system. The security policy and security mode of both the OPC UA server and OPC UA client must match.
Encrypted communication function	Encrypts communication data when the GOT communicates with an external device. To perform encrypted communications, a digital certificate (hereafter "certificate") is required for the GOT and controllers. ☞ Page 3069 Encrypting communication data (Encrypted communication function)
User authentication	Authenticates users via a username and password when accessing the OPC UA server from the OPC UA client.

83.2 OPC UA server function specifications

GT37 SoftGOT3000

☞ Page 2841 OPC UA server specifications
☞ Page 2842 Required system application (add-on function)

83.2.1 OPC UA server specifications

The GOT runs as a server that is compliant with OPC UA standards (IEC 62451) and OPC Ver.1.03.
The GOT supports the following service sets.
○: Supported
—: Not supported

OPC UA standard		GOT support
Discovery Services	FindServers	○
	FindServersOnNetwork	—
	GetEndpoints	○
	RegisterServer	—
	RegisterServer2	—
SecureChannel Service Set	OpenSecureChannel	○
	CloseSecureChannel	○
Session Service Set	CreateSession	○
	ActivateSession	○
	CloseSession	○
	Cancel	—
NodeManagement Service Set	AddNodes	—
	AddReferences	—
	DeleteNodes	—
	DeleteReferences	—
View Service Set	Browse	○
	BrowseNext	○
	TranslateBrowsePathsToNodeIds	○
	RegisterNodes	—
	UnregisterNodes	—
Query Service Set	QueryFirst	—
	QueryNext	—
Attribute Service Set	Read	○
	HistoryRead	—
	Write	○
	HistoryUpdate	—
Method Service Set	Call	—
MonitoredItem Service Set	CreateMonitoredItems	○

	SetPublishingMode	○
	Publish	○
	Republish	○
	TransferSubscriptions	—
	DeleteSubscriptions	○

Specifications for reading OPC UA tags with OPC UA clients

Up to 32768 OPC UA tags can be monitored by OPC UA clients using the MonitoredItem Service Set.
OPC UA tags are read from the OPC UA server in accordance with the service set (MonitoredItem) and the settings supported by the OPC clients.

Support for MonitoredItem	OPC UA tag read specifications
Supported by OPC UA client	OPC UA tags are read according to the cycle (sampling interval) of MonitoredItem set by the OPC UA client. The cycle may not be respected depending on the load of the OPC UA server (GOT). Check whether tags are read cyclically with the cycle time stored in GS2057. GS2057 stores the current value of the cycle when a tag is updated. ☞ Page 3620 MonitoredItem Cycle Time Current Value (GS2057)
Not supported by OPC UA client	Reading OPC UA tags when a request is sent to the OPC UA server outside of a cycle.

Precautions

Depending on the frequency of requests from the OPC UA client, the OPC UA server (GOT) may be overloaded causing degraded communication.
Implement the following steps as necessary to reduce the load on the server:

- Reduce the number of OPC UA tags.
- Reduce the number of connected OPC UA clients.
- Increase the cycle time in which the OPC UA client collects tag data.

83.2.2 Required system application (add-on function)

To use the OPC UA server function, [OPC UA Server Function] must be selected from the system applications (add-on functions).
Selecting one or more OPC UA tags in the [OPC UA Tag Setting] window automatically incorporates this system application (add-on function) into the package data.

83.3 OPC UA tag specifications

☞ Page 2843 Assignable devices
☞ Page 2844 OPC UA tag setting specifications
☞ Page 2847 OPC UA tag data types and assignable device types
☞ Page 2848 Structures
☞ Page 2848 Array
☞ Page 2850 Operation memory (RAM) usage

OPC UA tags are character strings that are assigned to devices.
Create tag groups to organize tags into groups and hierarchies for use cases and other purposes.

Precautions

OPC UA tags created with the OPC UA server function in the project of the GOT used as an OPC UA server cannot be set as devices that are monitored by objects, etc.

83.3.1 Assignable devices

You can assign the following devices to OPC UA tags.

Assignable devices	Remarks
Devices of Mitsubishi Electric products	☞ Page 3128 Device range and settings of Mitsubishi Electric equipment
Devices of non-Mitsubishi Electric products	☞ Page 3487 Device range and settings of each controller
GOT internal device	☞ Page 3577 GOT internal devices
Labels and tags	Cannot be assigned to the following OPC UA tags: (Except RSLogix5000 tags) • String data type • Array

83.3.2 OPC UA tag setting specifications

Item		Specifications
OPC UA tag	Amount creatable (Total number of tag groups)	32768
	Max. size (Total number of tag groups)	25000 KB
	Tag name	1 to 255 characters One-byte alphanumeric characters and symbols (no invalid characters) ☞ Page 2846 Invalid characters
Tag group	Amount creatable (Total number of groups and structures. For arrays, structure array elements are included.)	10000
	Number of hierarchies	4 	Group name (Per hierarchy)	1 to 255 characters One-byte alphanumeric characters and symbols (no invalid characters) ☞ Page 2846 Invalid characters
	Total number of characters for tag groups and tag names	800 characters The total number of characters is the sum of the following: • Group name • Concatenation character (period) between each hierarchy • Tag name or member name of each hierarchy Example) Total number of characters: 14 + 2 + 9 = 25 characters  [Objects], the parent node of OPC UA tags, tag groups, and structures is not included in the total number of characters. ☞ Page 2860 [OPC UA Tag Setting] window

Item		Specifications
Structure definition	Amount creatable	128
	Number of members per structure	5120
	Number of hierarchies	5 	Structure definition name (Per hierarchy)	1 to 255 characters One-byte alphanumeric characters and symbols (no invalid characters) ☞ Page 2846 Invalid characters
	Total number of characters for structure definition names and member names	800 characters The total number of characters is the sum of the following: • Structure definition name • Concatenation character (period) between each hierarchy • Element name of structure array • Member name of each hierarchy Example) Total number of characters: 22 + 2 + 7 + 9 = 40 characters 	Data types that can be used for members	The same data types that can be set for OPC UA tags ☞ Page 2844 OPC UA tag setting specifications
Structure	Amount creatable (Total number of groups and structures)	10000
	Number of hierarchies (Total number of groups and structures)	9
	Total number of characters for structure definition names and member names	800 characters The total number of characters is the sum of the following: • Group name (only when using structures under a tag group hierarchy) • Structure definition name • Concatenation character (period) between each hierarchy • Element name of structure array • Member name of each hierarchy Example) Total number of characters: 7 + 22 + 3 + 7 + 9 = 48 characters  [Objects], the parent node of OPC UA tags, tag groups, and structures is not included in the total number of characters. ☞ Page 2860 [OPC UA Tag Setting] window

Invalid characters

The following characters and combinations cannot be used.

- [ ] . ; ( ) // & "
- Control codes (Unicode: U+0000 to U+001F (C0 control code), U+007F (delete character), U+0080 to U+009F (C1 control code))
- A combination of one or more spaces added to the prefix or suffix of the character string

83.3.3 OPC UA tag data types and assignable device types

The following table shows OPC UA data types, corresponding GOT data types, and assignable device types.
For the specifications when defining OPC UA tags as arrays, refer to the following.
☞ Page 2848 Array

OPC UA data type	Corresponding GOT data type*1	Assignable devices	
		Device type*2	Data type*3
Boolean	BOOL	BIT	Bit
		WORD	
		DWORD	
SByte	SINT	BIT	Signed 8-bit binary
		BYTE	
Byte	BYTE	BIT	Unsigned 8-bit binary
		BYTE	
Int16	INT	BIT	Signed 16-bit binary
		WORD	
UInt16	UINT	BIT	Unsigned 16-bit binary
		WORD	
Int32	DINT	BIT	Signed 32-bit binary
		WORD	
		DWORD	
UInt32	UDINT	BIT	Unsigned 32-bit binary
		WORD	
		DWORD	
Int64	LINT	WORD	Signed 64-bit binary
UInt64	ULINT	WORD	Unsigned 64-bit binary
Float	REAL	BIT	Real number (32-bit)
		WORD	
		DWORD	
Double	LREAL	WORD	Real number (64-bit)
String	STRING*4	BIT	Unsigned 16-bit binary
		WORD	
DateTime	Not supported	—	—
Guid	Not supported	—	—
ByteString	Not supported	—	—
XmlElement	Not supported	—	—
NodeId	Not supported	—	—
ExpandedNodeId	Not supported	—	—
StatusCode	Not supported	—	—
QualifiedName	Not supported	—	—
LocalizedText	Not supported	—	—
ExtensionObject	Not supported	—	—
DataValue	Not supported	—	—
Variant	Not supported	—	—
DiagnosticInfo	Not supported	—	—

*1 When configuring an OPC UA tag, select the data type from the [Data Type Selection] dialog.
☞ Page 2865 [Data Type Selection] dialog
*2 The device type that can be set for the data type.
A device with the applicable data length can be assigned to OPC UA tags.
*3 The data types that are applied to assigned devices.
The range of values that can be handled depends on the data type.
*4 Only character strings expressed in two-byte Unicode (UTF-16) characters are supported.

83.3.4 Structures

OPC UA tag structures can be created.

Structures can be used to collectively manage multiple associated OPC UA tags.

For information on structure definitions and structure setting specifications, refer to the following.

☞ Page 2844 OPC UA tag setting specifications

83.3.5 Array

OPC UA tags can be defined as arrays.

By defining a tag as an array, multiple pieces of data can be stored for one OPC UA tag.

Item	Specifications
Maximum number of dimensions	Three dimensions Example) Three-dimensional array Number of elements	The product of the elements in each dimension must be less than or equal to the maximum number of elements. The maximum number of elements differs depending on the data type. ☞ Page 2849 Data types that support arrays, maximum number of elements, and assignable device types
Relationship between elements and assigned devices	When the first device is specified, consecutive devices equal to the number of elements are assigned. Example) When assigning D0 as the first device for Array [3, 4, 5] which has the data type "INT" 
Data types that support arrays, maximum number of elements, and assignable device types

OPC UA data type	Corresponding GOT data type*1	Array definability	Maximum number of elements	Assignable devices		
				Device type*2	Data type*3	Assignability
Boolean	BOOL	Assignable	30000	BIT	Bit	Assignable
				WORD		Not assignable
				DWORD		Not assignable
SByte	SINT	Assignable	30000	BIT	Signed 8-bit binary	Assignable
				BYTE		
Byte	BYTE	Assignable	30000	BIT	Unsigned 8-bit binary	Assignable
				BYTE		
Int16	INT	Assignable	30000	BIT	Signed 16-bit binary	Assignable
				WORD		
UInt16	UINT	Assignable	30000	BIT	Unsigned 16-bit binary	Assignable
				WORD		
Int32	DINT	Assignable	15000	BIT	Signed 32-bit binary	Assignable
				WORD		
				DWORD		
UInt32	UDINT	Assignable	15000	BIT	Unsigned 32-bit binary	Assignable
				WORD		
				DWORD		
Int64	LINT	Assignable	7500	WORD	Signed 64-bit binary	Assignable
UInt64	ULINT	Assignable	7500	WORD	Unsigned 64-bit binary	Assignable
Float	REAL	Assignable	15000	BIT	Real number (32-bit)	Assignable
				WORD		
				DWORD		
Double	LREAL	Assignable	7500	WORD	Real number (64-bit)	Assignable
String	STRING	Not assignable	—	—	—	—
Structure	Structure	Assignable	5120	Depends on the data type set for the member by the structure definition.		

*1 When configuring an OPC UA tag, select the data type from the [Data Type Selection] dialog.
☞ Page 2865 [Data Type Selection] dialog

*2 The device type that can be set for the data type.
A device with the applicable data length can be assigned to OPC UA tags.

*3 The data types that are applied to assigned devices.
The range of values that can be handled depends on the data type.

83.3.6 Operation memory (RAM) usage

OPC UA tags are stored in the operation memory (RAM).

Operation memory (RAM) usage changes depending on the number of OPC UA tag settings.

Non-array OPC UA tags

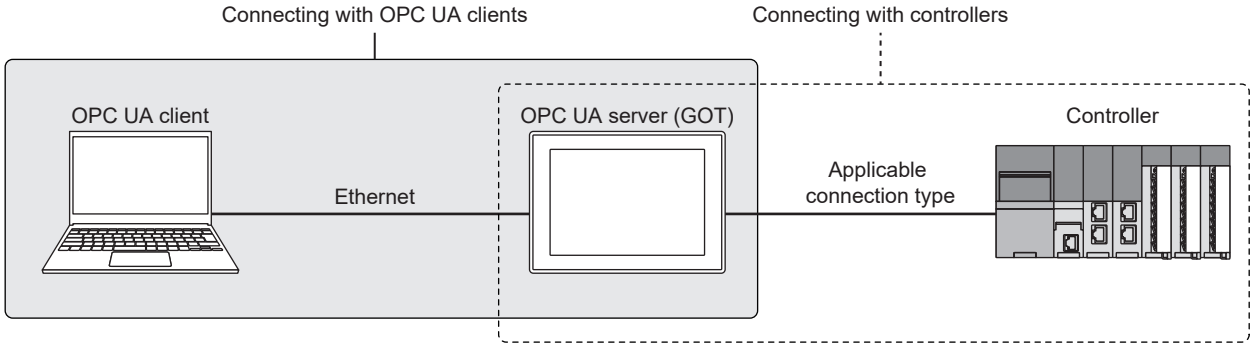
Corresponding GOT data type	RAM usage (bytes)
Other than STRING	160
STRING	160 + (No. of characters × 6) + 1

OPC UA tag defined as an array

Corresponding GOT data type	RAM usage (bytes)	
	One-dimensional array	Multidimensional array
BOOL	160 + (No. of elements × 1)	160 + (No. of dimensions × 4) + (Total No. of dimensions × 1)
SINT		
BYTE		
INT	160 + (No. of elements × 2)	160 + (No. of dimensions × 4) + (Total No. of dimensions × 2)
UINT		
DINT	160 + (No. of elements × 4)	160 + (No. of dimensions × 4) + (Total No. of elements × 4)
UDINT		
LINT	160 + (No. of elements × 8)	160 + (No. of dimensions × 4) + (Total No. of elements × 8)
ULINT		
REAL	160 + (No. of elements × 4)	160 + (No. of dimensions × 4) + (Total No. of elements × 4)
LREAL	160 + (No. of elements × 8)	160 + (No. of dimensions × 4) + (Total No. of elements × 8)

83.4 System configuration of the OPC UA server function

GT37 SoftGOT3000



83.4.1 Connecting with OPC UA clients

Item	Specifications
OPC UA client	The OPC UA server (GOT) supports connection with a client that is compliant with OPC UA Version 1.03. For recommended clients, refer to the following technical bulletin. 📖List of OPC UA Validated to Operate with the GOT3000 Series (GOT-A-0248-A)
Number of connectable OPC UA clients	Recommended: Up to five Maximum: 64
Ethernet cable Switching hub	Use the following cables: • 10BASE-T • 100BASE-TX • 1000BASE-T
Port number for communication with OPC UA clients	1024 to 5010, 5014 to 49152, 50000 to 65534
Endpoint URL of the OPC UA server	Check the [Communication Setup] tab in the [OPC UA Server Setting] window. ☞ Page 2857 [Communication Setting] tab

83.4.2 Connecting with controllers

For connection types and controllers that can connect to the GOT, refer to the following.

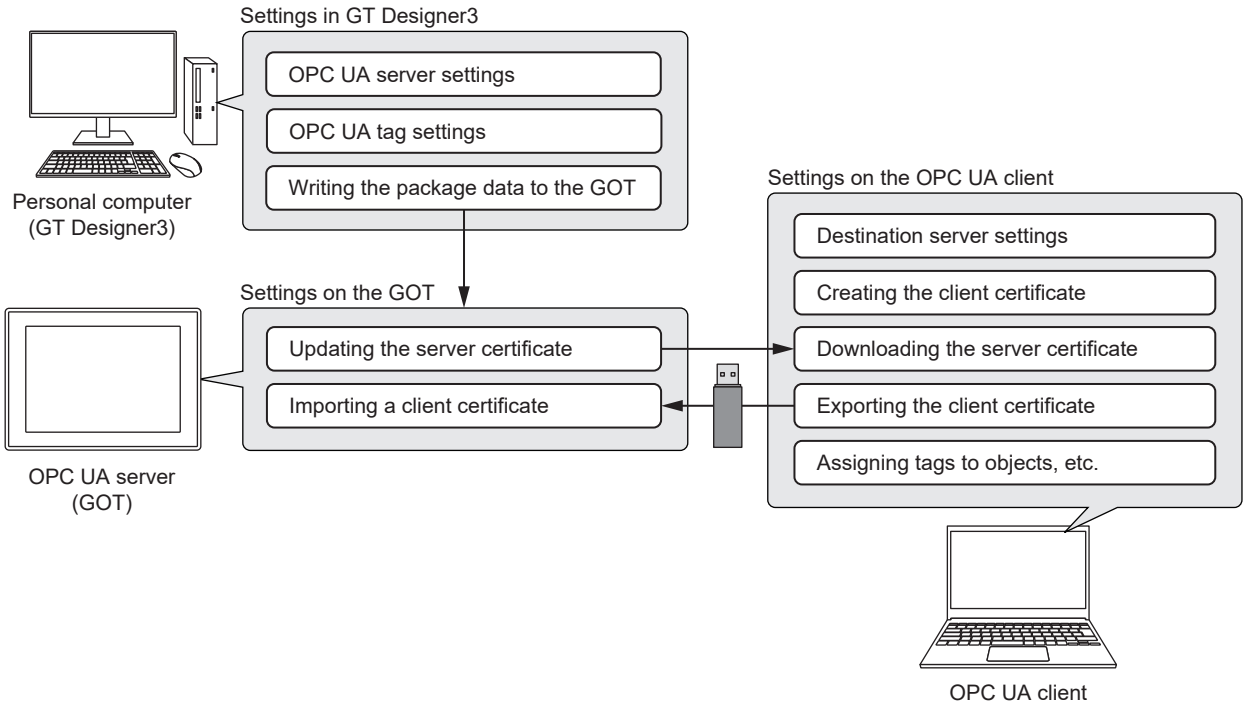
📖GOT3000 Series User's Manual (Connection)

PART 26

83.5 OPC UA server function setting methods

GT37 SoftGOT3000

Settings must be configured individually for the personal computer (GT Designer3), OPC UA server (GOT), and OPC UA client.



☞ Page 2853 Settings in GT Designer3
☞ Page 2854 Settings on the GOT
☞ Page 2855 Settings on the OPC UA client

83.5.1 Settings in GT Designer3

Configure the following settings in GT Designer3:

☞ Page 2853 OPC UA server settings
☞ Page 2853 OPC UA tag settings
☞ Page 2853 Writing package data

OPC UA server settings

Configure the settings so that the GOT operates as an OPC UA server.

1. Select [Common] → [OPC UA Server Setting] → [OPC UA Server Setting] from the menu to display the [OPC UA Server Setting] window.
2. Select [Use OPC UA server function] then set [Security Policy] and [Security Mode] in the [Communication Setup] tab.

☞ Page 2857 [Communication Setting] tab

3. Click the [Server Certificate Settings] button in the [Certificate Settings] tab to display the [Certificate] tab in the [Environmental Setting] window ([Information Protection Function]).

☞ Page 2858 [Certificate Setting] tab

4. Select [Set the certificate information], configure the server certificate settings, and click the [OK] button.

☞ Page 3078 [Certificate]

5. Select [Use user authentication] in the [User Authentication] tab in the [OPC UA Server Setting] window and set the authentication method.

☞ Page 2859 [User Authentication] tab

This completes the OPC UA server settings.

OPC UA tag settings

Create OPC UA tags and assign devices.

1. Select [Common] → [OPC UA Server Setting] → [OPC UA Tag Setting] from the menu to display the [OPC UA Tag Setting] window.

☞ Page 2860 [OPC UA Tag Setting] window

2. Create OPC UA tags and configure relevant settings.

Item	Description
How to create OPC UA tags	In the tree view area, select a tag group to register an OPC UA tag to. Set the tag name and assigned device in the OPC UA tag list. To define the tag as an array, select [Array] in the [Data Type Selection] dialog then set the number of elements.
How to create tag groups	In the tree view area, select which tag group hierarchy to create the tag group in. Click the [New Group] button and enter a name of the tag group to be created in the displayed [Group] dialog.
How to create structure definitions	In the tree view area, select which structure definition hierarchy to create the structure definition in. Click the [New Structured Data Type Definition] button and enter the information on the structure definition to be defined in the displayed [Structure Definition] dialog. To define the tag as an array, select [Array] in the [Structured Data Type Definition] dialog and set the number of elements.
How to create a structure	In the tree view area, select which tag group hierarchy to create the structure in. Click the [New Structured Data Type] button and enter the information on the structure to be created in the displayed [Structured Data Types] dialog. To define the tag as an array, select [Array] in the [Structured Data Types] dialog then set the number of elements.

Writing package data

For information on how to write package data to the GOT, refer to the following.

☞ Page 437 Writing data to the GOT

For information on the settings configured on the GOT once package data has been written, refer to the following.

☞ Page 2854 Settings on the GOT

83.5.2 Settings on the GOT

Prepare the server certificate.

Updating the server certificate

Update the GOT server certificate using the server certificate setting information.

Update the server certificate in [Certificate management] of the utility.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Importing a client certificate

Import the client certificate created by the OPC UA client to the GOT.

You can import the client certificate after it has been created by the OPC UA client.

Export the client certificate using the OPC UA client and store it in the data storage.

Store the client certificate file as follows.

Item	Description
Extension	*.der
Storage destination	Root data storage folder

Insert a data storage device into the GOT and import the certificate in [Certificate management] of the utility.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

83.5.3 Settings on the OPC UA client

The following table shows the settings to be configured on the OPC UA client.

For information on settings and operations on the OPC UA client, refer to the following.

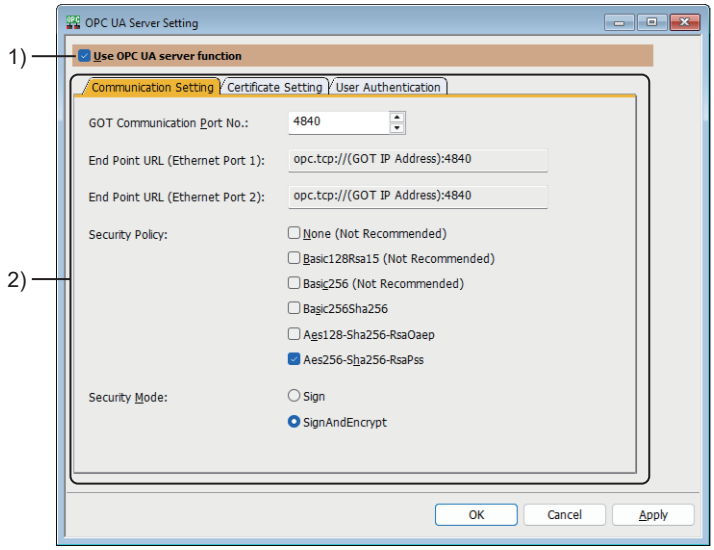
📖The manual of the OPC UA client used

Settings on the OPC UA client	Remarks
Settings on the connected OPC UA server	Configure the following settings according to the information set in the [OPC UA Server Setting] window ([Communication Setup] tab) in GT Designer3. ☞ Page 2857 [Communication Setting] tab • Endpoint URL • Security policy • Security mode • User authentication
Creating the client certificate	—
Downloading the server certificate	—
Exporting the client certificate	—
Assigning tags to objects, etc.	—

83.6 [OPC UA Server Settings] window

GT37 SoftGOT3000

Configure the relevant settings for the OPC UA server function.

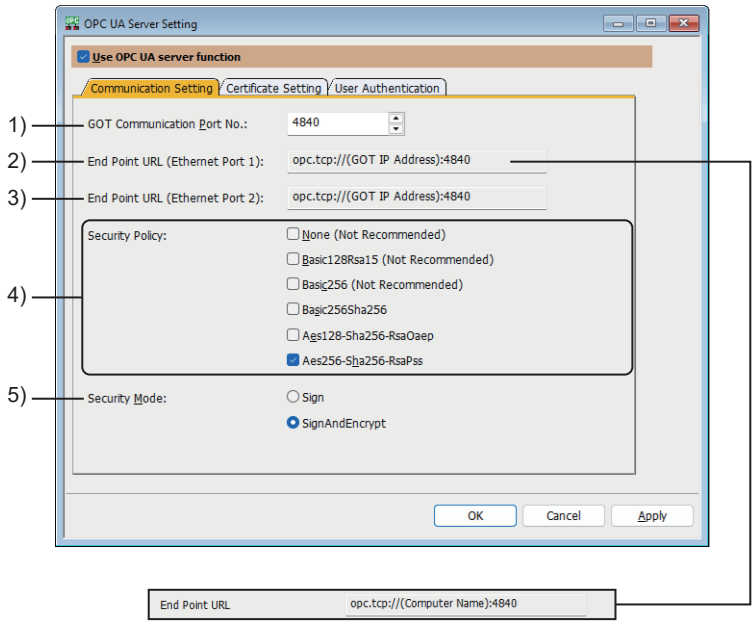


Item			Description
1)	[Use OPC UA server function]		Enables OPC UA server settings.
2)	Tab	[Communication Setting] tab	Set the security policy and the security mode. ☞ Page 2857 [Communication Setting] tab
		[Certificate Setting] tab	Set the information used to update the server certificate on the GOT. ☞ Page 2858 [Certificate Setting] tab
		[User Authentication] tab	Configure the user authentication settings. ☞ Page 2859 [User Authentication] tab

83.6.1 [Communication Setting] tab

GT37 SoftGOT3000

Set the security policy and the security mode.



For GT SoftGOT3000

Item		Description
1)	[GOT Communication Port No.]	Set the port number used for the communication with an OPC UA client. The setting range is 1024 to 5010, 5014 to 49152, and 50000 to 65534. Do not set the port number used for the other settings. Duplication of the port number disables communication. To change the number, it is recommended to use a number in the 50000s or higher.
2)	[End Point URL (Ethernet Port 1)]	The endpoint URL of the GOT. When setting the endpoint URL using the OPC UA client, replace [(GOT IP Address)] with the GOT IP address. ☞ Page 714 [GOT IP Address Setting] The GOT IP address can also be changed in the utility. When changing the IP address in the utility, check the [IP Address] of the utility. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
3)	[End Point URL (Ethernet Port 2)]	
4)	[End Point URL]	The endpoint URL of GT SoftGOT3000. When setting the endpoint URL using the OPC UA client, replace [(Computer Name)] with the GT SoftGOT3000 computer name.
5)	[Security Policy]	Select an encryption method for the communication data. Multiple methods can be selected.
6)	[Security Mode]	Select whether to require a signature or both a signature and encryption of communication data. This item does not appear if [None (Not Recommended)] is selected for [Security Policy].

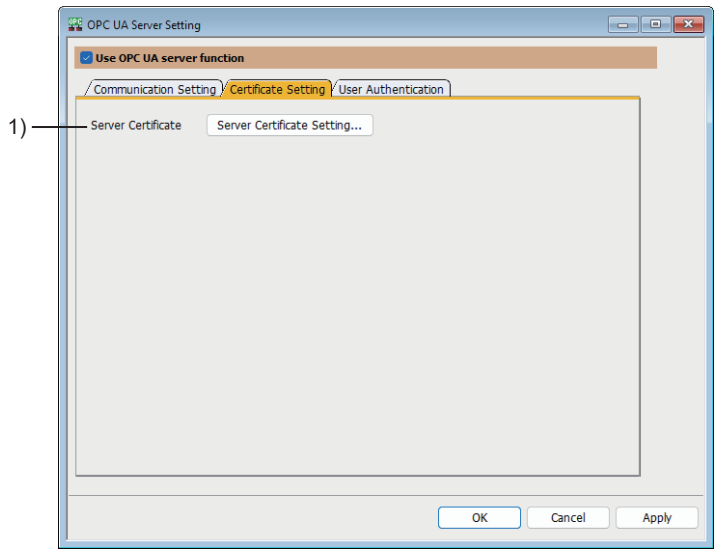
PART 26

83.6.2 [Certificate Setting] tab

GT37 SoftGOT3000

Set the information used to update the server certificate on the GOT.

The server certificate will be created in the utility after the package data configured with this setting has been written to the GOT.

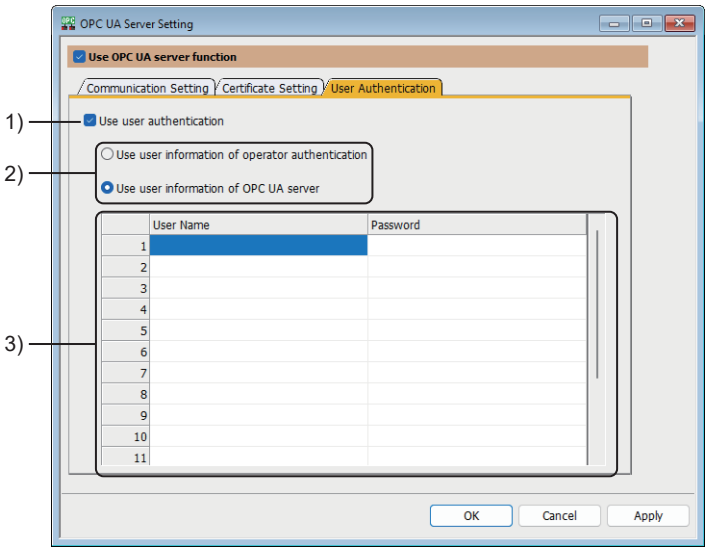


Item		Description
1)	[Server Certificate]	Click the [Server Certificate Setting] button to display the [Environmental Setting] window ([Information Protection Function]). ☞ Page 3078 [Certificate]

83.6.3 [User Authentication] tab

GT37 SoftGOT3000

Configure the user authentication settings.



Item			Description
1)	[Use user authentication]		Authenticates users via a username and password when accessing the OPC UA server from the OPC UA client. Select an authentication method.
2)	Authentication method	[Use user information of operator authentication]	Appears when the security mode is set to mode 2. ☞ Page 526 [Security Setting] Operator management information is used for operator authentication.
			If the information on the logged-in operator is changed, the connection with all OPC UA clients is disconnected.
			While an OPC UA client is accessing the OPC UA server (GOT), the operator is not automatically logged out and remains logged in even after the automatic logout time has elapsed. If automatic logout is required for the OPC UA server function, construct a mechanism that prevents the OPC UA client from accessing the OPC UA server (GOT) when no operation is performed on the OPC UA client for a certain period of time. Example) When no operation is performed, the OPC UA client terminal is locked and cannot be operated until the authentication is performed.
		[Use user information of OPC UA server]	Set a user name and password dedicated to the OPC UA server function, and use them for authentication.
3)	User information list	—	Configure the settings when the authentication method is set to [Use user information of OPC UA server]. Up to 16 pieces of user information can be registered.
		[User Name]	User names must consist of 0 to 32 one-byte alphanumeric characters.
		[Password]	Click the [...] button to display the [Password Edit] dialog and edit or register a password.

PART 26

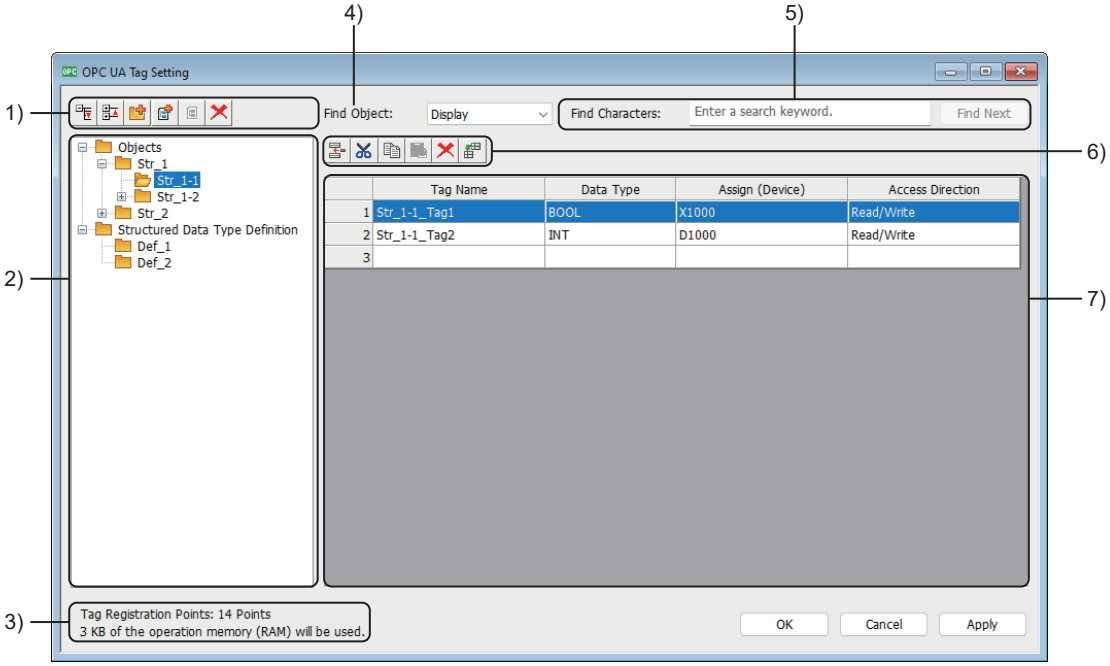
83.7 [OPC UA Tag Setting] window

GT37 SoftGOT3000

Create an OPC UA tag.

Precautions

If the OPC UA tag settings are changed, apply the tag change to the OPC UA client.
If you do not apply the changes to the OPC UA client, incorrect tags may be monitored.



Item			Description
1)	Tree view operation buttons	—	Buttons for operations within the tree view. 		[Unfold All] button	Expands all the nodes within the tree view.
		[Fold All] button	Retracts all nodes within the tree view.
		[New Group] button	Enabled when [Objects] or a tag group is selected in the tree view. Enter a group name in the displayed [Group] dialog. For information on tag group specifications, refer to the following. ☞ Page 2844 Specifications for reading OPC UA tags with OPC UA clients
		[New Structured Data Type] button	Enabled when [Objects] or a tag group is selected in the tree view. Create a structure in the [Structured Data Types] dialog. ☞ Page 2863 [Structured Data Types] dialog
		[New Structured Data Type Definition] button	Enabled when [Structured Data Type Definition] or a registered structure definition is selected in the tree view. Create a structure definition in the [Structured Data Type Definition] dialog. ☞ Page 2864 [Structured Data Type Definition] dialog
		[Cut] button	Edit the properties of the node selected in the tree view area. The structure definitions shown below cannot be edited. • Structure • Structure definition
		[Copy] button	
		[Paste] button	
		[Delete] button	
2)	Tree view	—	The following items are displayed in the tree: • Created tag groups • Created structures • Created structure definitions The default names [Objects] and [Structured Data Type Definition] cannot be changed. 		[Objects]	Parent node of OPC UA tags, tag groups, and structures.
		[Structured Data Type Definition]	Parent nodes of structure definitions.
3)	[Tag Registration Points]		The number of registered OPC UA tags and the amount of operation memory (RAM) in use.
4)	[Find Object]		Select the search target from the OPC UA tag list.

Item			Description
5)	[Find Characters]		Specify a search keyword. Up to 255 characters can be entered per comment. Click the [Find Next] button to execute the search.
6)	OPC UA tag list operation buttons	—	Operation buttons for the OPC UA tag list. 		[Insert Row] button	Edit the row selected in the OPC UA tag list.
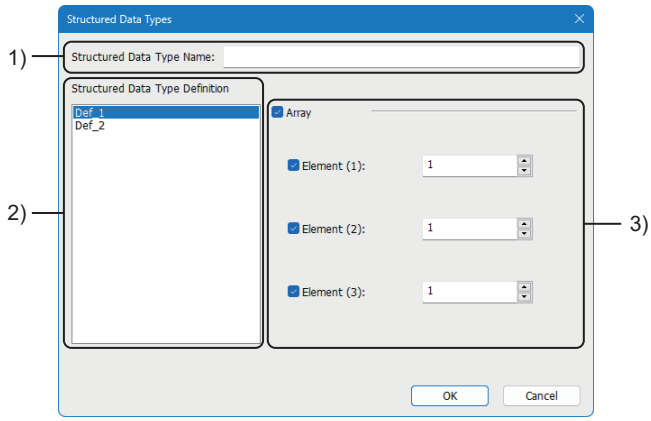
		[Cut] button	
		[Copy] button	
		[Paste] button	
		[Delete] button	
		[Batch Edit] button	Enabled when a row in the OPC UA tag list is selected. Batch edits the channel and network settings in the [Batch Edit] dialog for the devices assigned to the OPC UA tags. ☞ Page 2865 [Batch Edit] dialog (OPC UA tag) If the selected row is the one for a GOT internal device, which does not have the channel No. or network setting, or label (GT Designer3), the [Batch Edit] dialog does not appear.
7)	OPC UA tag list	—	Displays the settings of the selected node in the tree view. The settings will differ depending on the selected node.
		[Tag Name]	Set the tag name. For setting specifications, refer to the following. ☞ Page 2844 OPC UA tag setting specifications
		[Data Type]	Set the data type for OPC UA tags. Click the [...] button to select the data type in the displayed [Data Type Selection] dialog. ☞ Page 2865 [Data Type Selection] dialog Use the [Data Type Selection] dialog to also define tags and structures as an array.
		[Assign (Device)]	Set the devices to be assigned to OPC UA tags. ☞ Page 834 How to set devices, labels, and tags For the assignment of arrays, refer to the following. ☞ Page 2848 Array
		[Access Direction]	Selects the operations (read/write) that the OPC UA client is permitted to perform.

83.7.1 [Structured Data Types] dialog

GT37 SoftGOT3000

Creates structures from structure definitions.

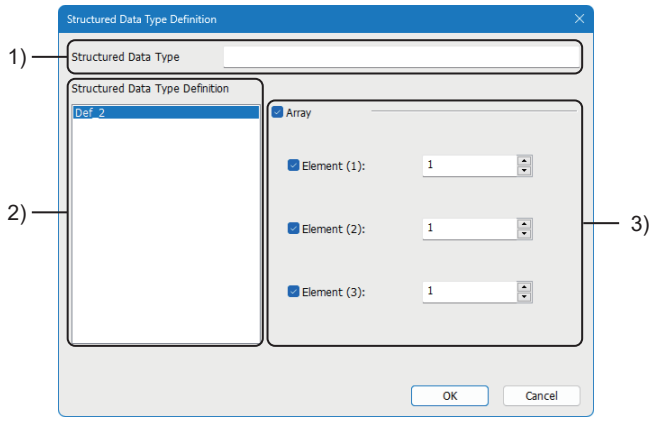


Item			Description
1)	[Structured Data Type Name]		Set a structure name. For setting specifications, refer to the following. ☞ Page 2844 OPC UA tag setting specifications
2)	[Structured Data Type Definition]		Select a structure definition. Use the [New Structured Data Type Definition] button in the [OPC UA Tag Setting] window to create a structure definition. ☞ Page 2860 [OPC UA Tag Setting] window
3)	[Array]	—	Set the structures to an array.
		[Element (1)]	Select the number of dimensions for the array to be defined then set the number of elements for each dimension. The setting range is [1] to [5120].
		[Element (2)]	
		[Element (3)]	

83.7.2 [Structured Data Type Definition] dialog

GT37 SoftGOT3000

Creates structure definitions.

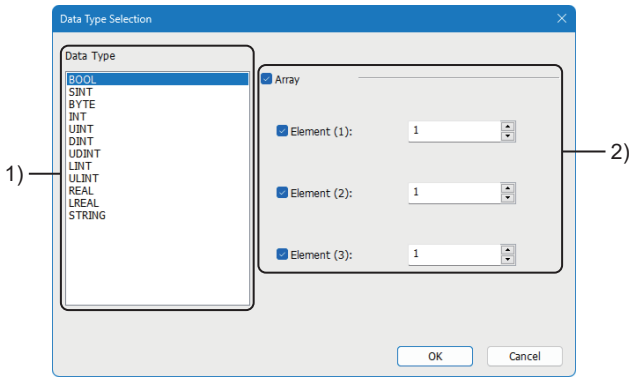


Item			Description
1)	[Structured Data Type]		Set a structure definition name. For setting specifications, refer to the following. ☞ Page 2844 OPC UA tag setting specifications
2)	[Structured Data Type Definition]		This item is displayed when any node other than [Structured Data Type Definition] (parent node of structure definitions) is selected in the tree view in the [OPC UA Tag Setting] window and this dialog is displayed. Select which structure definition to create. Structure definitions which cause a circular reference if selected are not displayed as options.
3)	[Array]	—	Set the structure definition to an array.
		[Element (1)]	Select the number of dimensions for the array to be defined then set the number of elements for each dimension. The setting range is [1] to [5120].
		[Element (2)]	
		[Element (3)]	

83.7.3 [Data Type Selection] dialog

GT37 SoftGOT3000

Select the data type of OPC UA tags.



Item			Description
1)	[Data Type]		Select the data type for the OPC UA tag selected in the OPC UA tag list in the [OPC UA Tag Setting] window.
2)	[Array]	—	Set the OPC UA tag to an array.
		[Element (1)]	Select the number of dimensions for the array to be defined then set the number of elements for each dimension. The setting range is [1] to [5120].
		[Element (2)]	
		[Element (3)]	

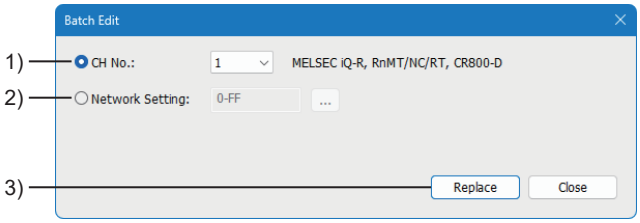
83.7.4 [Batch Edit] dialog (OPC UA tag)

Batch edits the channel or network settings for the devices assigned to the OPC UA tags.

The rows (OPC UA tags) selected in the OPC UA tag list in the [OPC UA Tag Setting] window are applicable.

For information on the batch edit dialog for labels (GT Designer3) in the [Label Group] window or [Register to Label] dialog, refer to the following.

☞ Page 891 [Batch Edit] dialog (label (GT Designer3))



Item		Description
1)	[CH No.]	Select the channel number after batch edit.
2)	[Network Setting]	Configure the network settings after batch edit. The settings differ depending on the controller. Refer to the descriptions of the device setting dialog for each controller. ☞ Page 3128 Device range and settings of Mitsubishi Electric equipment ☞ Page 3487 Device range and settings of each controller
3)	[Replace] button	Executes batch edit.

83.8 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings for the OPC UA server functions as required in addition to other specific settings.
The following shows the functions that are available by configuring the relevant settings.

83.8.1 GOT internal device

GT37 SoftGOT3000

☞ Page 3581 GOT special register (GS)

Function	Setting item
Uses the MonitoredItem service set from the OPC UA client to store the tag update cycle time (current value).	GS2057
Uses the MonitoredItem service set from the OPC UA client to store the tag update cycle time (minimum value).	GS2058
Uses the MonitoredItem service set from the OPC UA client to store the tag update cycle time (maximum value).	GS2058
Notifies of OPC UA server startup.	GS2060.b0
Disconnects established connections with all clients.	GS2563.b0

83.9 Troubleshooting

GT37 SoftGOT3000

Issue	Possible cause	Solution
Cannot connect to OPC UA client.	The security policies and/or security modes do not match.	Check that the security policy and security mode of both the OPC UA server and OPC UA client match.
	The client certificate of the OPC UA client you are trying to connect to is registered as an invalid certificate on the GOT.	If the client certificate has been accidentally registered as invalid, remove the certificate from the utility and register it as a valid certificate.
	The client certificate of the OPC UA client you are trying to connect to is not registered as a valid certificate on the GOT.	Register the client certificate as a valid certificate on the GOT.
	The client certificate has expired.	Recreate the client certificate on the OPC UA client and register it as a valid certificate on the GOT.
	The client certificate is corrupt.	
	The server certificate has expired.	Renew the server certificate in the utility.
	The username and/or password for user authentication is incorrect.	Enter the correct username and password.
	The maximum number of sessions has been reached.	Turn on GS2563.b0 and disconnect all connections.

PART 27 Controller monitoring function

84 Monitoring a controller through the GOT (server/client function)

84 Monitoring a controller through the GOT (server/client function)

GT37 SoftGOT3000

☞ Page 2869 Overview of the server/client function

☞ Page 2879 How to use the server/client function
☞ Page 2883 [Gateway Communication Setting]
☞ Page 2884 [Gateway-Server]
☞ Page 2885 [Gateway Client]
☞ Page 2886 Server/client function application examples
☞ Page 2891 Using the server/client function efficiently
☞ Page 2894 Precautions
☞ Page 2898 Relevant settings
☞ Page 2899 Troubleshooting

84.1 Overview of the server/client function

The server/client function allows for the remote monitoring and maintenance of a production site from an office.
You can access a GOT or GT SoftGOT3000 having the server function (hereafter "GOT (server)") through a client device, and easily collect or change device data of the controllers monitored by the GOT (server).
The following devices can be used as a client.

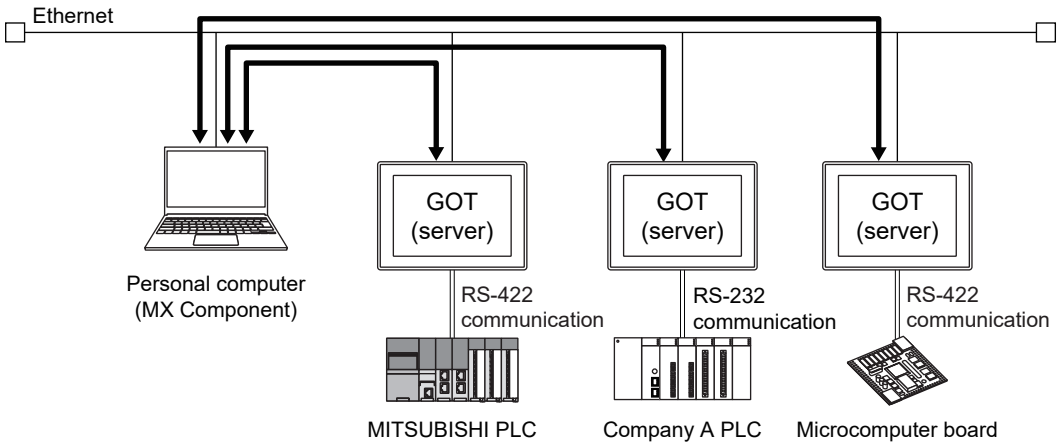
- Personal computer on which MX Component is installed (hereafter "personal computer (MX Component)")
- GOT to which the client function is granted (hereafter "GOT (client)")

Precautions

The server/client function does not support security functions such as encrypted communication and operator authentication.
If security functions are required, use the OPC UA server function and the OPC UA client connection.

84.1.1 Collecting or changing device data on a personal computer (MX Component) (server function)

When you use a personal computer (MX Component) as a client, GT SoftGOT3000 cannot be a server.
You can read/write device data of the controllers monitored by a GOT (server) on a personal computer (MX Component) connected to Ethernet.
Use the server function, and you can monitor multiple controllers on a personal computer by connecting the personal computer to a GOT (server) by Ethernet. The function has eliminated the need for establishing communications with controllers in their respective communication formats or installing the OPC UA server.
The function is available by installing MX Component. Communication settings for each controller is not required on the personal computer.



PART 27

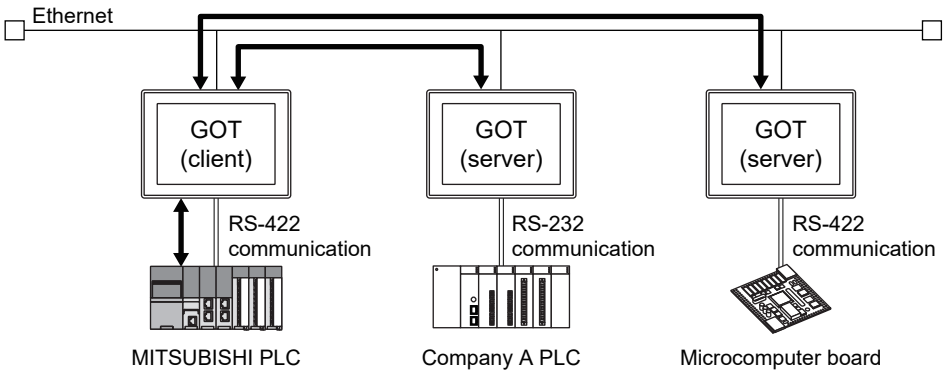
84.1.2 Collecting or changing device data monitored by another GOT on a GOT (server/client function)

GT SoftGOT3000 supports the server function but does not support the client function.

You can read/write device data of the controllers monitored by a GOT (server) by accessing the GOT (server) through a GOT (client) connected to Ethernet.

This enables you to monitor device data of different manufacturers' controllers collectively on one GOT (client).

One GOT (client) can be connected to up to 128 GOTs (servers).

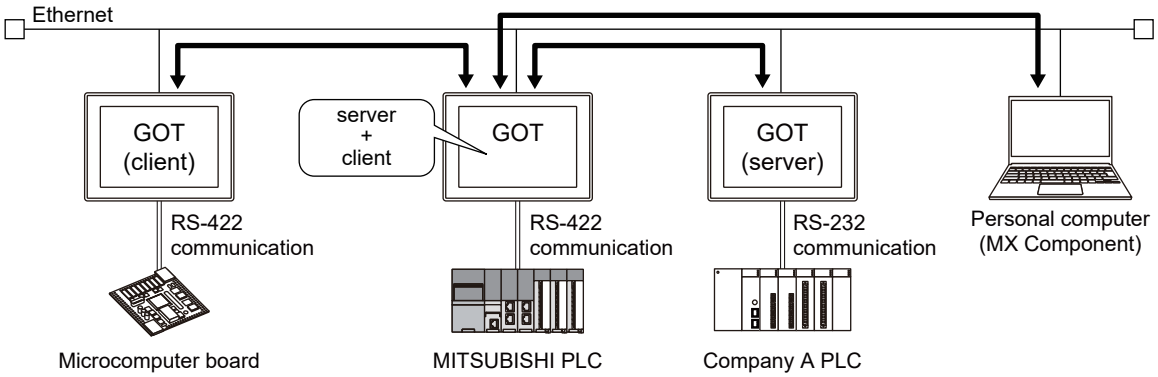


84.1.3 Using the server/client function in one GOT

Not available for GT SoftGOT3000.

The server/client function can be used in one GOT.

When a GOT has the server/client function, while collecting data of another GOT (server) you can send the data to a personal computer (MX Component) or another GOT (client) through the GOT.

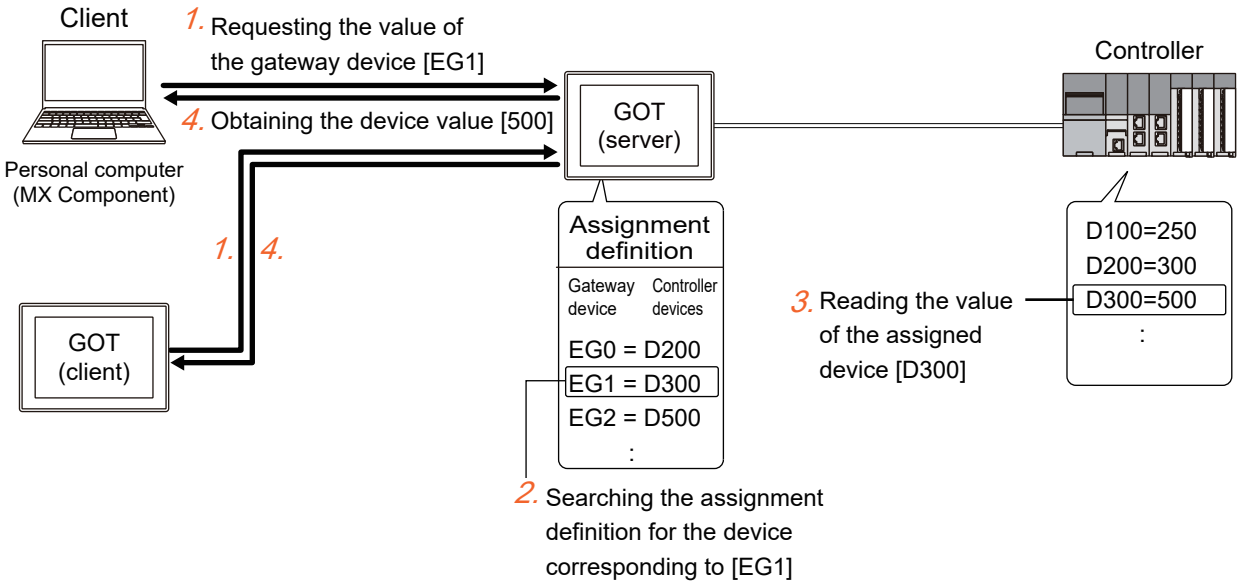


84.1.4 Flow of data

To collect or change device data of the controller monitored by a GOT (server) through a client, set the assignment definition of the virtual gateway devices (EG devices) and the corresponding devices of the monitored controller on the GOT (server). Then, you can access the gateway devices of the GOT (server) through the client and read/write the data of the controller devices assigned to the gateway devices.
Data is exchanged using the gateway devices set in the GOT (server). There is no need to consider the manufacturer and model of the monitored controller.

The following shows the flow of data when device data of a controller connected to a GOT (server) is read to a client.

Ex.
Reading the value of the controller's device [D300] to a client



1. The client requests the value of the gateway device [EG1] from the GOT (server).
2. The GOT (server) searches for the controller device assigned to the gateway device [EG1] based on the assignment definition of the gateway devices and controller devices.
3. The GOT (server) reads the value [500] of the assigned device [D300] from the controller.
4. The client obtains the value [500] read by the GOT (server).

How to access the gateway devices of the GOT (server) through a client depends on the client type.

Client type	How to access the gateway devices of the GOT (server)
Personal computer (MX Component)	Use the functions of MX Component. ☞ Page 2876 How to access the gateway devices of a GOT (server) from a personal computer (MX Component)
GOT (client)	Use the script function. ☞ Page 2877 How to access the gateway devices of a GOT (server) from a GOT (client)

84.2 Specifications of the server/client function

GT37 SoftGOT3000

☞ Page 2872 System application (add-on function)
☞ Page 2872 Number of server/client functions for one project
☞ Page 2872 GOTs and software applications usable as a server or client
☞ Page 2873 Specifications of the server/client function
☞ Page 2873 Monitoring access range

84.2.1 System application (add-on function)

To use the server/client function, [Gateway (Server/Client)] must be selected from the system applications (add-on functions). Configuring either of the following settings in the [Controller Setting] window incorporates the application into the package data automatically.

☞ Page 2884 [Gateway-Server]
☞ Page 2885 [Gateway Client]

84.2.2 Number of server/client functions for one project

One server function setting and one client function setting are available for one project.

84.2.3 GOTs and software applications usable as a server or client

The following GOTs and software applications can be used as a server or client.
Communication is possible between the personal computer (MX Component), GOT2000, and GOT3000, each using the server/client function.
Server: GT37, GT27, GT25, GT SoftGOT3000, and GT SoftGOT2000
Client: GT37, GT27, GT25, and MX Component
The following shows availability of server/client combinations.
○: Available
—: Not available

Server	Client	Availability
GT37, GT27, GT25	GT37	○
	GT27, GT25	○
	MX Component	○
GT SoftGOT3000	GT37	○
	MX Component	—
GT SoftGOT2000	GT37	○
	GT27, GT25	○
	MX Component	—

84.2.4 Specifications of the server/client function

The following shows the specifications of the server/client function.

Item		Specifications
Port No.	Server function	1024 to 65534
	Client function	1024 to 65534
Maximum number of nodes		The total number of the following nodes is 64 (recommended). • GOTs (server) • GOT (client) • Personal computers that communicate with GOTs
Number of accessible clients (GOTs and personal computers) to a server (GOT) simultaneously		Up to 5 units *1
Specifying other nodes		Specifying by an IP address, up to 128 nodes
Gateway device		Word device 32768 points: EG0 to EG32767
Compatible MX Component		MX Component Version 5.008J or later

*1 When six or more clients (GOTs and personal computers) access a server (GOT), the scripts of the clients may stop.

84.2.5 Monitoring access range

The following shows the access range for the server/client function.

To monitor controllers via the GOT, monitor the controller devices assigned to gateway devices.(Controller devices on the network are to be also assigned to gateway devices to be monitored.)

The monitoring access range is the same as that of the GOT.

For information on the GOT monitoring access range, refer to the following.

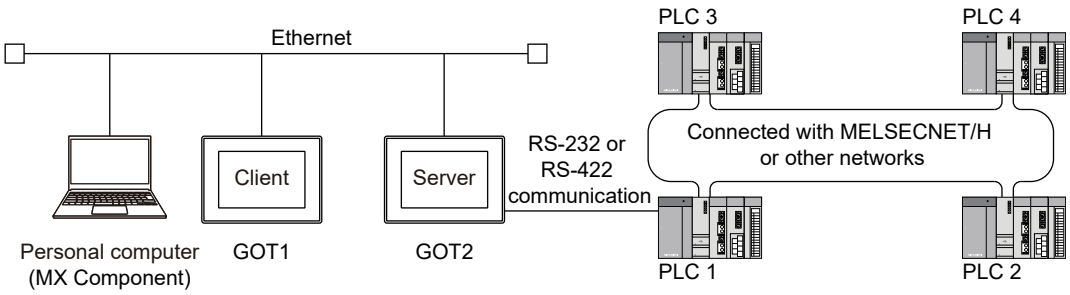
GOT3000 Series User's Manual (Connection)

The following shows the PLCs that can be accessed from GOT1 (client) and the personal computer (MX Component).

For the applicable connection types when GT SoftGOT3000 is a server, refer to the following.

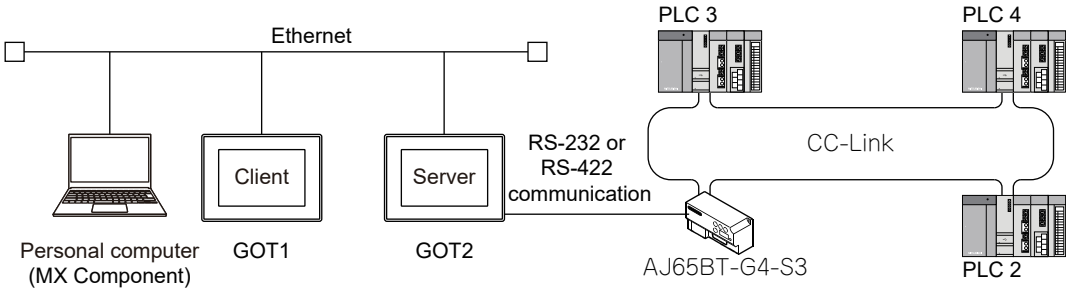
GT SoftGOT3000 User's Manual

When the connection type between GOT2 (server) and PLC1 is the direct CPU connection (serial) or serial communication connection



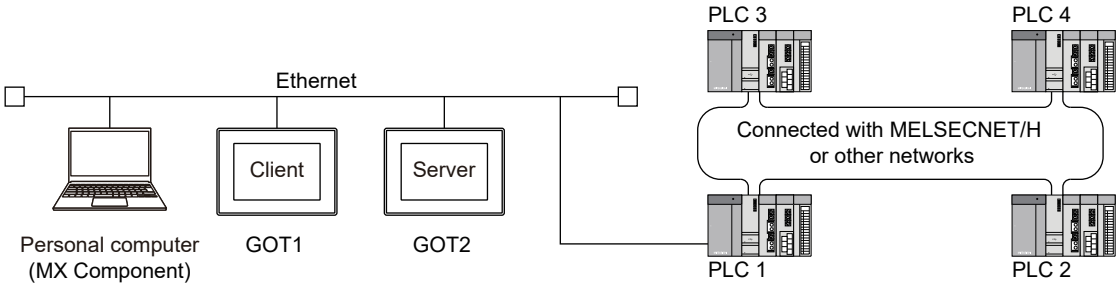
Access source	Access destination	
	GOT2 (server)	PLC1, PLC2, PLC3, PLC4
Personal computer (MX Component)	Monitoring the gateway devices or the controller devices	Monitoring the controller devices that are assigned to the gateway devices of GOT2 from the personal computer (MX Component) and GOT1 (client)
GOT1 (client)		

When the connection type between GOT2 (server) and PLCs is a CC-Link connection (via G4)



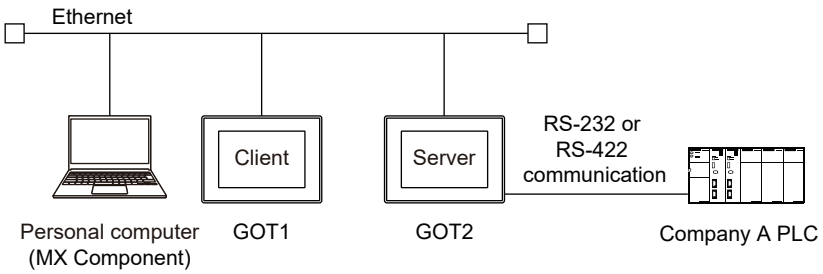
Access source	Access destination	
	GOT2 (server)	PLC1, PLC2, PLC3
Personal computer (MX Component)	Monitoring the gateway devices or the controller devices	Monitoring the controller devices that are assigned to the gateway devices of GOT2 from the personal computer (MX Component) and GOT1 (client)
GOT1 (client)		

When the connection type between GOT2 (server) and PLCs is an Ethernet connection



Access source	Access destination		
	GOT2 (server)	PLC1	PLC2, PLC3, PLC4
Personal computer (MX Component)	Monitoring the gateway devices or the controller devices		Monitoring the gateway devices or the controller devices from a personal computer (MX Component) and GOT1 (client)
GOT1 (client)			Monitoring the controller devices that are assigned to the gateway devices of GOT2 from the personal computer (MX Component) and GOT1 (client)

When the connection type between GOT2 (server), PLCs, and a temperature controller is another manufacturer's PLC connection



Access source	Access destination	
	GOT2 (server)	PLC, temperature controller
Personal computer (MX Component)	Monitoring the gateway devices or the controller devices	Monitoring the controller devices that are assigned to the gateway devices of GOT2 from the personal computer (MX Component) and GOT1 (client)
GOT1 (client)		

84.3 How to use the gateway devices

The gateway device is a virtual device exclusively used to perform the server/client function on the GOT.

GT37 SoftGOT3000

☞ Page 2875 Applicable gateway devices
☞ Page 2875 Assignable devices
☞ Page 2876 How to access the gateway devices of a GOT (server) from a personal computer (MX Component)
☞ Page 2877 How to access the gateway devices of a GOT (server) from a GOT (client)

84.3.1 Applicable gateway devices

The following shows the applicable gateway devices.

Device name		Device range	Device No. representation
Word device	EG	EG0 to EG32767	Decimal number
Bit device	EG	Specified bits of above word devices	Decimal number

84.3.2 Assignable devices

You can assign the following devices to gateway devices (EG).

- Controller devices that can be monitored by the GOT
- GOT internal device

However, some controller devices cannot be assigned.

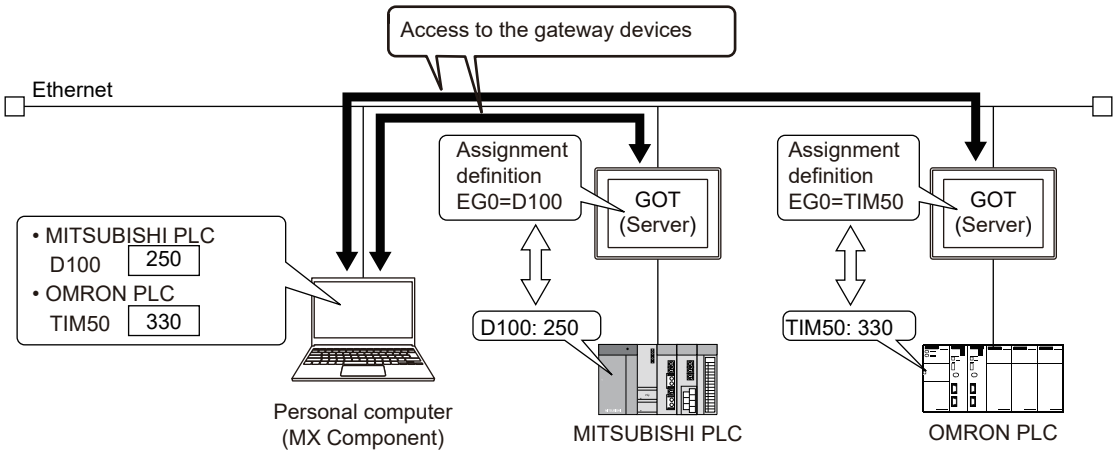
For information on which device can be assigned, refer to the following.

☞ Page 3128 Device range and settings of Mitsubishi Electric equipment
☞ Page 3487 Device range and settings of each controller

PART 27

84.3.3 How to access the gateway devices of a GOT (server) from a personal computer (MX Component)

Use the functions of MX Component to access the gateway devices of a GOT (server) from a personal computer (MX Component).



For the operation and the programming procedures of MX Component, refer to the following manuals.

MX Component Version 3 Operating Manual

MX Component Version 3 Programming Manual

The following shows the functions of MX Component that support the GOT.

Item	Device range
Open	Opens the communication line (starts the communication with the GOT).
Close	Closes the communication line (ends the communication with the GOT).
ReadDeviceBlock	Device batch read
ReadDeviceBlock2	
WriteDeviceBlock	Device batch write
WriteDeviceBlock2	
ReadDeviceRandom	Device random read
ReadDeviceRandom2	
WriteDeviceRandom	Device random write
WriteDeviceRandom2	
EntryDeviceStatus	Device status observation registration
FreeDeviceStatus	Cancels device status observation registration.
OnDeviceStatus	Event notification
SetDevice	Changes device data values.
SetDevice2	
GetDevice	Obtains device data values.
GetDevice2	
GetCpuType	Obtains GOT model information.

84.3.4 How to access the gateway devices of a GOT (server) from a GOT (client)

Use the script function of the GOT (client) to access the gateway devices of the GOT (server) from the GOT (client).

☞ Page 2325 Controlling operations with scripts ([Script])

Object scripts cannot be used since the gateway devices cannot be assigned to objects.

Use a project script or screen script.

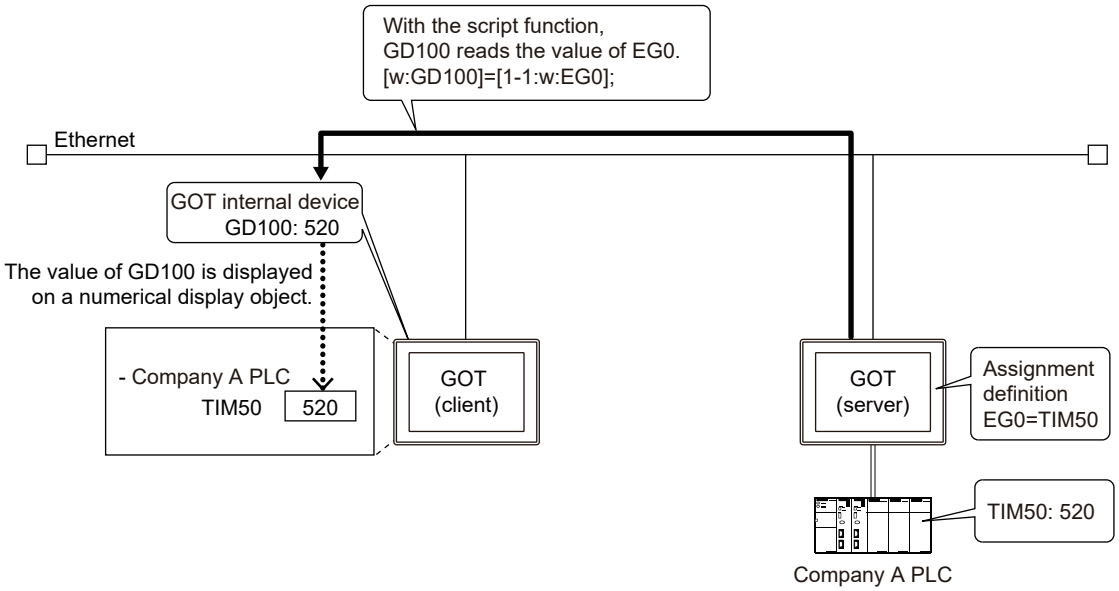
When reading the value of a gateway device

Using a script reads the value of a gateway device of a GOT (server) to an internal device of a GOT (client).

You can monitor the value read to the internal device using a numerical display object or others on the GOT (client).

For details on scripts, refer to the following.

☞ Page 2325 Controlling operations with scripts ([Script])



The following shows the settings required for a GOT (client) and a GOT (server).

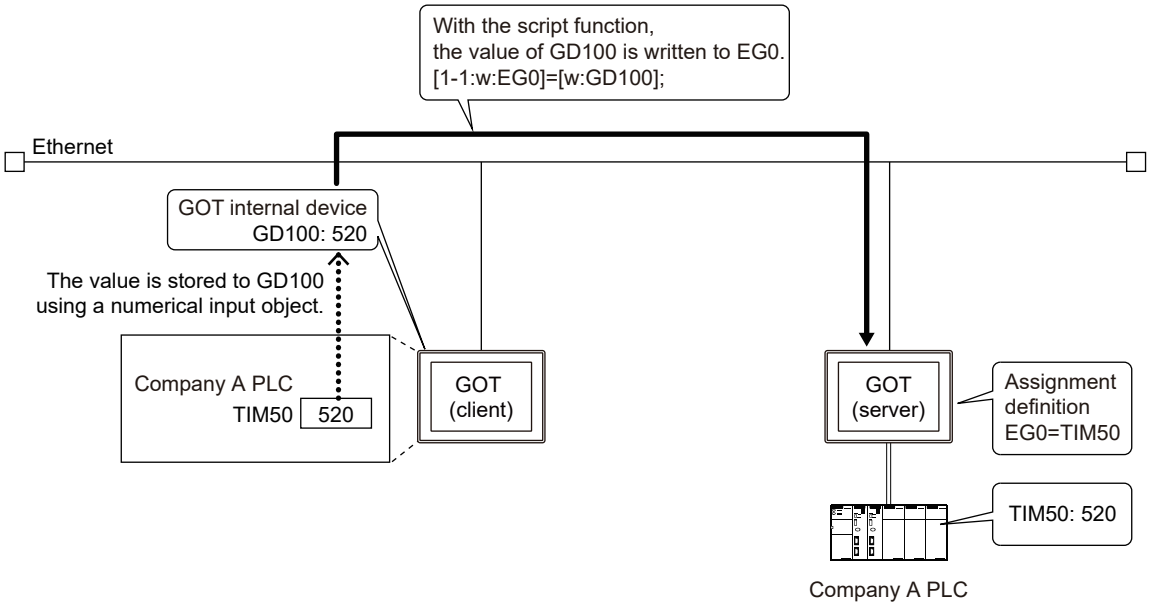
GOT	Required setting	Description
GOT (server)	Server setting	Configures the setting for assigning the device of the company A PLC CPU to the gateway device.
GOT (client)	Script	Configures the setting to read the gateway device value of the GOT (server) to internal device of the GOT (client).
	Client setting	Registers the GOT (server) from which the client reads the device value.
	Numerical display	Configures the setting for displaying the internal device value of the GOT (client).

When writing a value to the gateway device.

Write the value of the internal device of the GOT (client) to the gateway device of the GOT (server) by using a script.

Write the value to the GOT (client) internal device using a numerical input object or others.

A device of the GOT (server) can be also set as the write destination for the script.



GOT	Setting item	Description
GOT (server)	Server setting	Configures the setting for assigning the device of the company A PLC CPU to the gateway device.
GOT (client)	Script	Configures the setting to write the internal device value of GOT (client) to the gateway device of the GOT (server).
	Client setting	Registers the GOT (server) to which the value is written.
	Numerical input	Configures the setting for entering the value of the GOT (client) internal device.

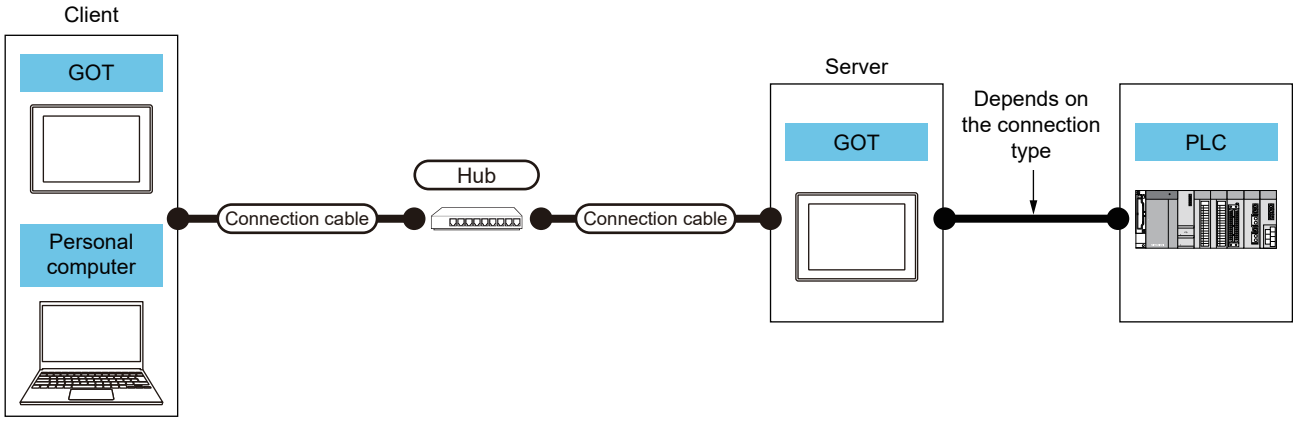
84.4 How to use the server/client function

GT37 SoftGOT3000

☞ Page 2879 System configuration
☞ Page 2881 Setting procedure
☞ Page 2882 Firewall setting

84.4.1 System configuration

The following shows the system configuration for the server/client function.



For details on the connection cable and maximum segment length, refer to the following.

☞ Page 2879 Connection cable
☞ Page 2880 Maximum segment length

Client (GOT, personal computer)		Connection cable	Server (GOT)	
GOT or personal computer	Interface		Interface	GOT
GT37	Built-in Ethernet interface of the GOT	Shielded twisted pair cable	Built-in Ethernet interface of the GOT	GT37
Personal computers with MX Component installed	Ethernet interface of personal computer		Ethernet interface of personal computer	Personal computer with GT SoftGOT3000 installed*1

*1 To use a personal computer, an Ethernet board/card is required.
For Ethernet boards/cards, refer to the following.
GT SoftGOT3000 User's Manual

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

A straight cable is usable.
When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.
The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.
Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.
Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

PART 27

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.
The maximum length depends on the Ethernet equipment used.
The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.
The following countermeasures may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

Precautions for system configuration

■Connection to the intranet

If the system needs to be secured against unauthorized access to the intranet, consult a network service provider or network administrator (someone responsible for tasks such as network planning and IP address management), and implement your own countermeasures.
Mitsubishi Electric Corporation assumes no responsibility for any consequences resulting from system troubles caused by the intranet connection.

■When a firewall is used

If a firewall disconnects the communication of the gateway function, take countermeasures such as changing the firewall port number.
If the system needs to be secured against unauthorized access when changing the firewall port number, consult the network administrator (someone responsible for tasks such as network planning and IP address management), and implement your own countermeasures.
Mitsubishi Electric Corporation assumes no responsibility for any consequences resulting from system troubles caused by changing the port number.

84.4.2 Setting procedure

The following shows the setting procedure for using the server/client function.

1. Consider the configuration of the whole system.

- Configuration of the whole system including controllers and GOTs
- Controller settings (including device assignment)
- GOT settings (including IP address, network number, and station number)

To use GT SoftGOT3000 as a server, configure the firewall settings.

For details, refer to the following.

☞ Page 2882 Firewall setting

2. Connect the GOT and the controller.

☞ Page 2879 System configuration

3. Configure the communication interface settings in [Controller Setting] → [Gateway Communication Setting] in the server project.

To use the GOT as a client, configure the settings in the client project.

☞ Page 2883 [Gateway Communication Setting]

To use GT SoftGOT3000 as a server, configure the [Gateway Server Function] settings in the setting dialog of GT SoftGOT3000.

📖GT SoftGOT3000 User's Manual

4. Set the IP address of the GOT.

☞ Page 714 [GOT IP Address Setting]

5. Configure the gateway server settings in [Controller Setting] → [Gateway Server] in the server project.

☞ Page 2884 [Gateway-Server]

6. To use the GOT as a client, configure the gateway client settings in [Controller Setting] → [Gateway Client] in the client project.

☞ Page 2885 [Gateway Client]

7. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

8. Check the GOT operation.

☞ Page 2886 Server/client function application examples

84.4.3 Firewall setting

To use GT SoftGOT3000 as a server, change the firewall setting.
The following shows the setting procedure.

1. Open the Start menu, search for [Control Panel], and open it.
2. If Control Panel is set to Category view, click [System and Security].
3. Click [Windows Defender Firewall] to display the [Windows Defender Firewall] dialog.
4. Click [Allow an app or feature through Windows Defender Firewall] in the left pane of the dialog to display the list of [Allowed apps and features].
5. Click the [Change settings] button.
6. In [Allowed apps and features], select the following options for [SGT3000].

- [Private]
- [Public]

If [SGT3000] is not listed, click the [Allow another app] button and add "SGT3000.exe".

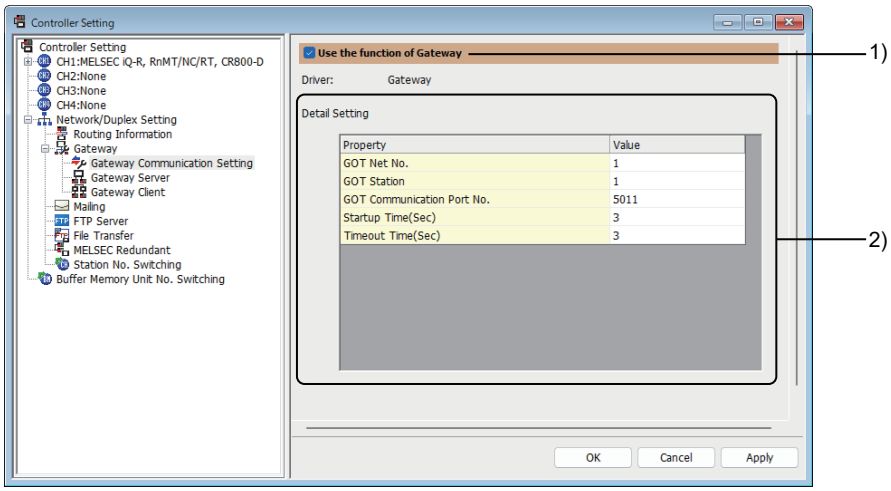
84.5 [Gateway Communication Setting]

GT37 SoftGOT3000

Configure the communication settings on the [Gateway Communication Setting] screen in the server/client project.

Window

1. Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
2. Select [Gateway Communication Setting] in the [Controller Setting] window.



Item			Description
1)	[Use the function of Gateway]		Select this item when using the client or server function.
2)	[Detail Setting]	—	Set the detailed communication format. The setting range depends on controllers. For details on the settings, refer to the following. GOT3000 Series User's Manual (Connection)
		[GOT Net No.]	Set the network No. of the GOT. The setting range is [1] to [239].
		[GOT Station]	Set the GOT's station number. The setting range is [1] to [64].
		[GOT Communication Port No.]	Set the port number used by the GOT for the connection with the Ethernet module. Do not set the port number used for the other settings. Duplication of the port number disables communication. To change the number, it is recommended to use a number in the 50000s or higher.
		[Startup Time(Sec)]	Not available for GT SoftGOT3000. Set the time period from the GOT startup to the beginning of the communication with the PLC CPU. The setting range is [3] to [255].
		[Timeout Time(Sec)]	Not available for GT SoftGOT3000. Set a communication timeout period. The setting range is [1] to [90].

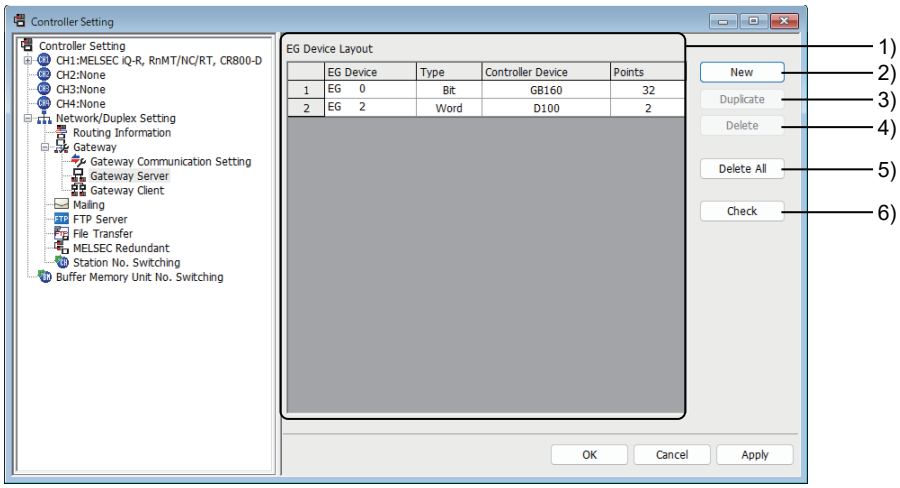
84.6 [Gateway-Server]

GT37 SoftGOT3000

On the [Gateway Server] settings screen in the server project, set the gateway devices used by the GOT (server) and the controller devices assigned to those gateway devices.

Window

1. Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
2. Select [Gateway Server] in the [Controller Setting] window.



Item			Description
1)	[EG Device Layout]	—	Assign the controller devices to the gateway devices (EG devices).
		[EG Device]	Set the gateway device. The setting range is [0] to [32766].
		[Type]	Select the device type to be assigned.
		[Controller Device]	Set the controller devices to be assigned to the gateway devices. When the multi-channel function is used, devices for channels No. 2 to 4 are displayed as channel No. + device.  For information on how to set the devices, refer to the following. ☞ Page 834 How to set devices, labels, and tags
		[Points]	Set the number of the devices to be assigned. The following shows the setting ranges of [Bit] and [Word] selected in [Type]. • [Bit]: [32] to [32768] • [Word]: [2] to [32768] A value outside the above ranges cannot be set. ☞ Page 2897 Precautions for assigning devices
2)	[New] button		Adds a new assignment setting to the list. Up to 1024 settings can be configured.
3)	[Duplicate] button		Adds the copy of a selected assignment setting to the list.
4)	[Delete] button		Deletes a selected assignment setting.
5)	[Delete All] button		Deletes all assignment settings.
6)	[Check] button		Checks if the settings are correct.

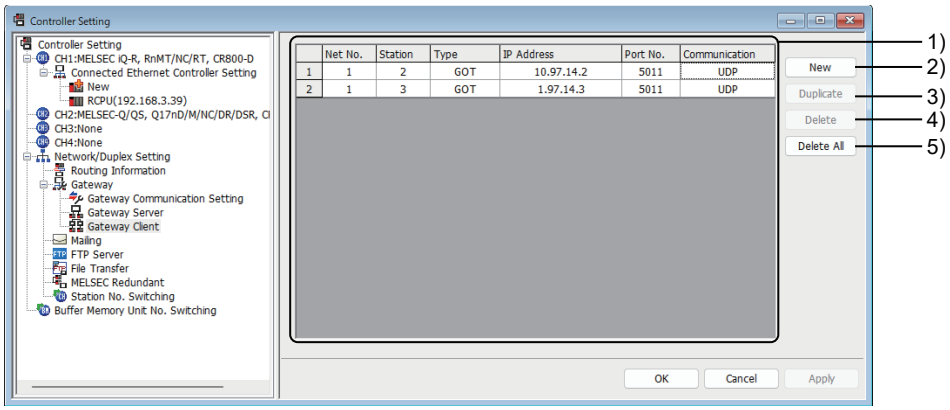
84.7 [Gateway Client]

GT37 SoftGOT3000

Register the GOTs (servers) to be monitored on the [Gateway Client] settings screen in the client project.
Up to 128 GOTs (servers) can be registered.

Window

1. Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
2. Select [Gateway Client] in the [Controller Setting] window.



Item			Description
1)	GOT list for the server function	—	Register the GOTs (server) to be monitored by the GOT (client).
		[Net No.]	Register the network number of each GOT. The setting range is [1] to [239].
		[Station]	Register the PLC No. (station number) of each GOT. The setting range is [1] to [64].
		[Type]	Register the type of the GOT used as a server.
		[IP Address]	Register the IP address of each GOT. The setting range is [0.0.0.0] to [255.255.255.255].
		[Port No.]	Register the port number of each GOT. The setting range is [1024] to [65534].
		[Communication]	Fixed to UDP.
2)	[New] button		Adds a new GOT (server).
3)	[Duplicate] button		Adds the copy of a selected GOT (server).
4)	[Delete] button		Deletes a selected GOT (server).
5)	[Delete All] button		Deletes all GOTs (server).

PART 27

84.8 Server/client function application examples

GT37 SoftGOT3000

The following shows examples of using the server/client function.

To apply the example programs in this section to the actual system, make sure that the programs cause no troubles in the target system.

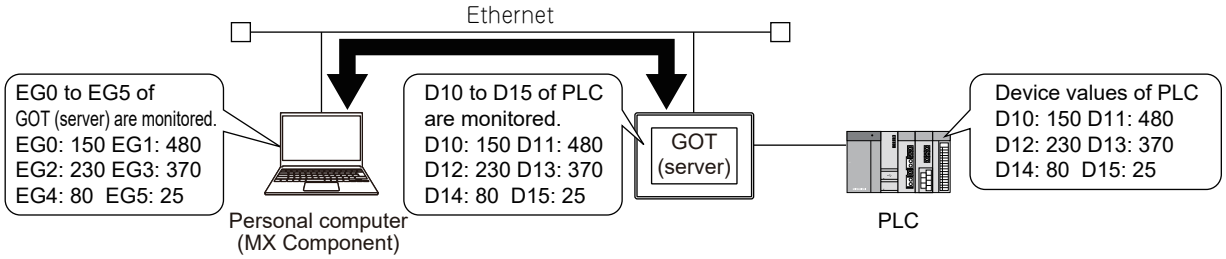
☞ Page 2886 Monitoring the PLC devices on a personal computer (MX Component) through a GOT

☞ Page 2887 Displaying the alarms occurred in multiple PLCs on the GOT (client)

☞ Page 2889 Monitoring and controlling the production status of multiple PLCs on the GOT (server)

84.8.1 Monitoring the PLC devices on a personal computer (MX Component) through a GOT

Monitor the values of the PLC devices D10 to D15 on a personal computer (MX Component) through a GOT (server).



Access EG0 to EG5 of the GOT (server) on the personal computer (MX Component).

Setting example of GOT (server)

• Settings for [Gateway Server]

EG device	Controller device	Device type	Points
EG0	D10	Word	6

Personal computer setting

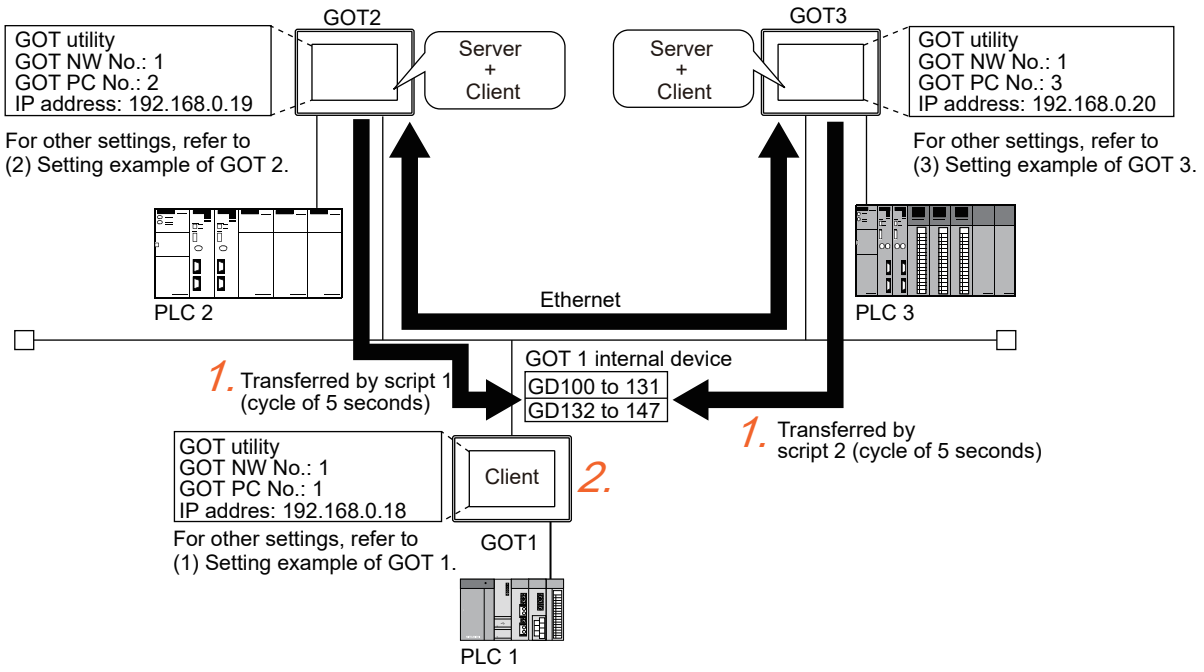
Access the GOT (server) by using MX Component.

For details on MX Component, refer to the following.

MX Component Version 3 Operating Manual

MX Component Version 3 Programming Manual

84.8.2 Displaying the alarms occurred in multiple PLCs on the GOT (client)



1. Transfer the device values of PLC2 and PLC3 to the internal devices of GOT1 (GD100 to GD147).

2. GOT1 monitors its own internal devices and displays the alarm information when an alarm occurs in PLC2 or PLC3.

Setting example of GOT1

• Settings for [Gateway Client]

N/W No.	Station No.	IP address
1	2	192.168.0.19
1	3	192.168.0.20

• Alarm display (alarm display for GOT2)

Set the comments displayed in the alarm display in advance.

Item	Description
Device points (number of alarms)	512 points (successive)
Device	GD100.b0

• Alarm display (alarm display for GOT3)

Set the comments displayed in the alarm display in advance.

Item	Description
Device points (number of alarms)	256 points (successive)
Device	GD132.b0

• Script (alarm display for GOT2)

Item		Description
Script 1	Type	Screen script
	Trigger type	Cycle: 5 seconds
	Data type	Unsigned BIN 16
	Example of script description	bmov([1-2:w:EG0],[w:GD100],32); //Transfers 32 points from EG0 of GOT2 to GD100 and subsequent devices of GOT1

PART 27

• Script (alarm display for GOT3)

Item		Description
Script 2	Type	Screen script
	Trigger type	Cycle: 5 seconds
	Data type	Unsigned BIN 16
	Example of script description	bmov([1-3:w:EG0],[w:GD132],16); //Transfers 16 points from EG0 of GOT3 to GD132 and subsequent devices of GOT1

Precautions

Do not set [Ordinary] or [Sampling, 2 sec.] for the trigger type in the script.
The setting may affect other monitoring operations.

Setting example of GOT2

• Settings for [Gateway Server]

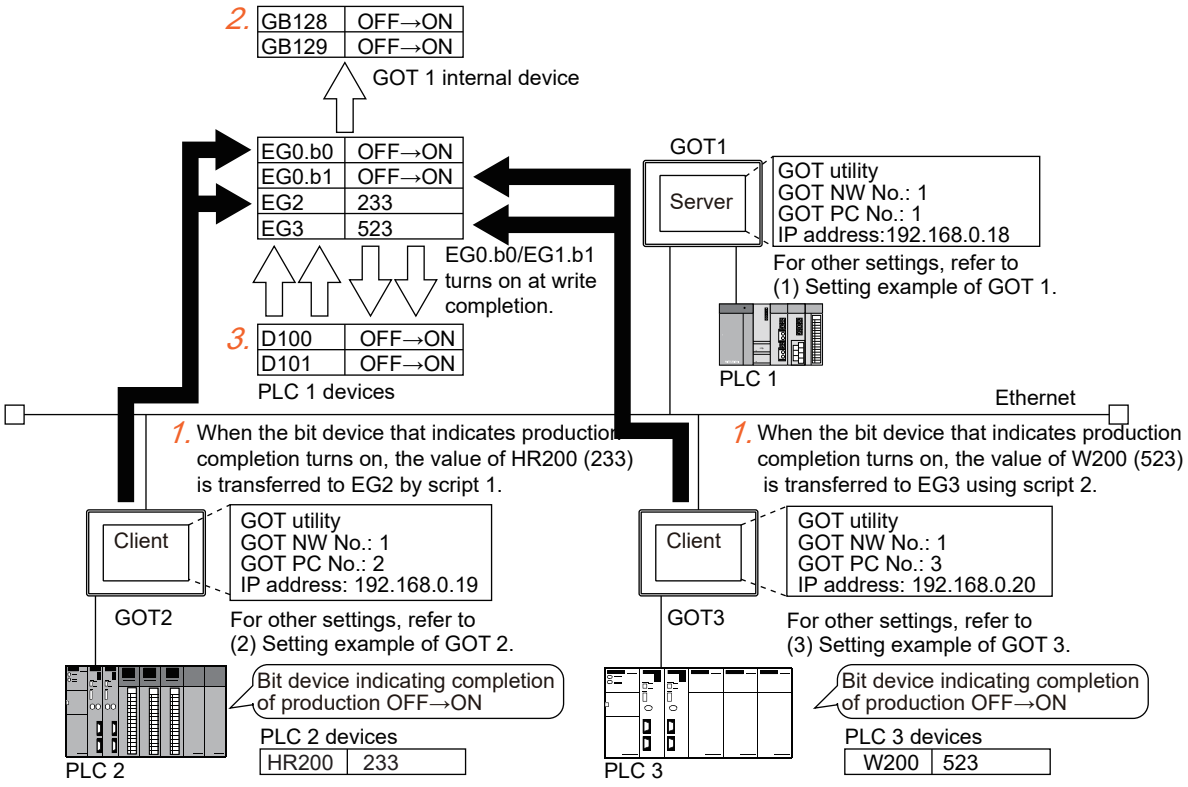
EG device	Controller device	Device type	Points
EG0	IB200	Bit	512

Setting example of GOT3

• Settings for [Gateway Server]

EG device	Controller device	Device type	Points
EG0	..300	Bit	256

84.8.3 Monitoring and controlling the production status of multiple PLCs on the GOT (server)



1. Transfer the device values of PLC2 and PLC3 to the EG devices (PLC1 devices) of GOT1 (server).

2. After the values are written to PLC1, the EG devices of GOT1 (internal devices (GB128, GB129) of GOT1) turn on. (Check a lamp or other indications to see if the writing is complete.)

3. GOT1 (server) checks the production status of PLC2 and PLC3 by monitoring the PLC1 devices.

Setting example of GOT1

• Settings for [Gateway Server]

EG device	Controller device	Device type	Points
EG0	GB128	Bit	32
EG2	D100	Word	2

• Numerical display (setting for 2 devices)

Item	Description
Device	D100 to D101
Network setting	Host station

• Lamp (setting for 2 devices)

Item	Description
Device	GB128 to GB129
Network setting	Host station

Setting example of GOT2

• Settings for [Gateway Client]

Register the information for the GOT1 (server) to be monitored.

N/W No.	Station No.	IP address
1	1	192.168.0.18

• Script

Item		Description
Script 1	Type	Screen script
	Trigger type	On: Bit device that indicates the production completion
	Data type	Unsigned BIN 16

	Example of script description	[1-1:w:EG2]=[w:HR200]; //Writes the production count to PLC1.
		set([1-1:b:EG0.00]); //Turns on the write completion signal.

Setting example of GOT3

• Settings for [Gateway Client]

Register the information for the GOT1 (server) to be monitored.

N/W No.	Station No.	IP address
1	1	192.168.0.18

• Script

Item		Description
Script 1	Type	Screen script
	Trigger type	On: Bit device that indicates the production completion
	Data type	Unsigned BIN 16

	Example of script description	[1-1:w:EG3]=[w:W200]; //The production volume is written to PLC1.
		set([1-1:b:EG0.01]); //Turns on the write completion signal.

84.9 Using the server/client function efficiently

This section explains how to use the server/client function efficiently.

☞ Page 2891 Script setting
☞ Page 2892 Gateway device setting
☞ Page 2893 Performance of the server/client function (reference value)

84.9.1 Script setting

If a program using gateway devices directly is executed, the number of times of the access to other stations' GOTs increases and the processing delays.

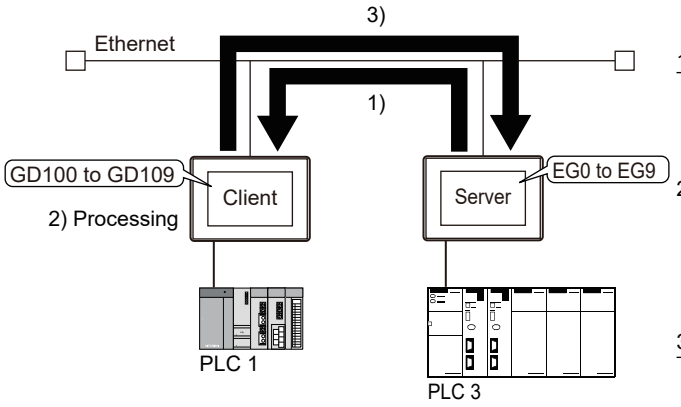
Execute batch read to the GOT internal devices and execute batch write after processing as shown below to decrease the number of accesses. Doing so improves the processing speed.

When executing batch read to store in the GOT internal device (GD) and executing batch write after processing

Access to the other station's GOT occurs twice: 1) and 3).

Hence, if one access requires 50 ms, about 100 ms is necessary in total.

The gateway devices are accessed in a batch when the execution condition of the script is satisfied. Therefore, the values of the gateway devices when the conditions are satisfied are processed and written.



Example of a script

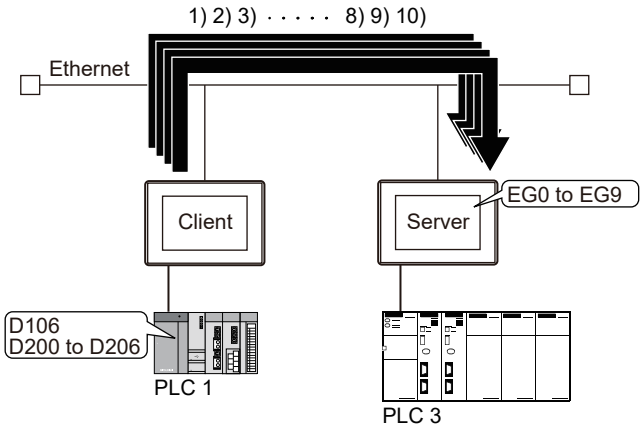
```
1) bmov([1-2:w:EG0],[w:GD100],10);
   [w:D200]=[w:GD100];
   [w:D201]=[w:GD101];
   [w:D202]=[w:GD102];
   [w:D203]=[w:GD103];
2) [w:D204]=[w:GD104];
   [w:GD105]=128;
   [w:GD106]=[w:D106];
   [w:D205]=[w:GD107];
   [w:D206]=[w:GD108];
   [w:GD109]=5433;
3) bmov([w:GD100],[1-2:w:EG0],10);
```

When using gateway devices directly

Access to the other station's GOT occurs 10 times: 1) to 10).

Hence, if one access requires 50 ms, about 500 ms is necessary in total.

The gateway devices are accessed sequentially when the execution condition of the script is satisfied. Therefore, values of the gateway devices that differ from themselves when the conditions are satisfied may be written.



Example of a script

```
1)  [w:D200]=[1-2:w:EG0];
2)  [w:D201]=[1-2:w:EG1];
3)  [w:D202]=[1-2:w:EG2];
4)  [w:D203]=[1-2:w:EG3];
5)  [w:D204]=[1-2:w:EG4];
6)  [1-2:w:EG5]=128;
7)  [1-2:w:EG6]=[w:D106];
8)  [w:D205]=[1-2:w:EG7];
9)  [w:D206]=[1-2:w:EG8];
10) [1-2:w:EG9]=5433;
```

PART 27

84.9.2 Gateway device setting

When assigning the devices of PLCs to gateway devices, assign the same type of devices of the same PLC together as far as possible.

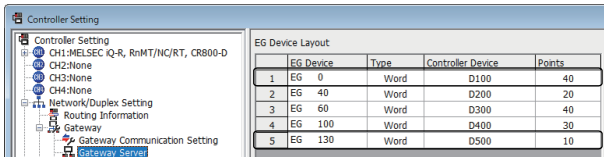
Set the same type of devices of the same PLC together as shown below to decrease the number of accesses. Doing so improves the processing speed.

☞ Page 2892 When the devices for the host station, other stations, and other PLCs are not set together

☞ Page 2892 When the devices of the host station, other stations, and other PLCs are set together

When the devices for the host station, other stations, and other PLCs are not set together

When the GOT (client) accesses the host devices of the GOT (server), program 1), which reads 40 points from EG0 and program 2), which reads 10 points from EG130, are necessary.

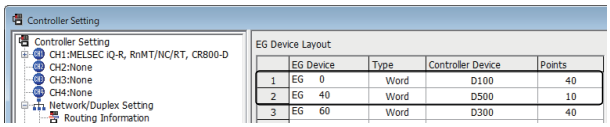


Example of a script

```
1) bmov([W:GD100],[1-2:w:EG0],40);
2) bmov([w:GD140],[1-2:w:EG130],10);
```

When the devices of the host station, other stations, and other PLCs are set together

When the GOT (client) accesses the host devices of the GOT (server), only program 1), which reads 50 points from EG0, is necessary.

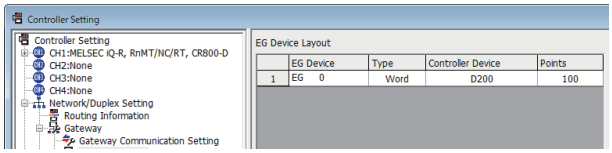


Example of a script

```
1) bmov([W:GD100],[1-2:w:EG0],50);
```

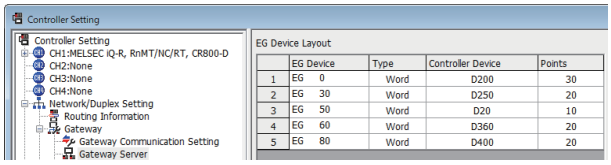
If the devices of the same PLC, used for the server/client function, are reserved as a set, as shown below, in the system design phase, the GOT (server) needs a smaller number of times of access and thus the processing speed improves.

If the devices of the same PLC are reserved as a set



If 100 points of devices are accessed,
PLC is accessed just 1 time.

If the devices of the same PLC are reserved separately



If 100 points of devices are accessed,
PLC is accessed 5 times.

84.9.3 Performance of the server/client function (reference value)

The following shows the performance (reference values) of the server/client function when [Script Setting] and [Gateway Device Setting] are set as shown above.

The reference values are obtained under the conditions shown below.

- The system is configured with one GOT (server) and one GOT (client).
- GOT (server): Numerical input (64 points) setting
- GOT (client): Numerical input (64 points) setting
- Number of assigned device points: 10 word devices

In a system with multiple GOTs (clients), the total response speed is equal to the number of GOTs (clients) multiplied by the response speed shown below.

Combinations for improving the efficiency		Response speed when direct CPU connection (serial) is used
Improving the efficiency of the script	**Improving the gateway device setting efficiency**	
○ ☞ Page 2891 When executing batch read to store in the GOT internal device (GD) and executing batch write after processing	○ ☞ Page 2892 When the devices of the host station, other stations, and other PLCs are set together	About 260 ms
○ ☞ Page 2891 When executing batch read to store in the GOT internal device (GD) and executing batch write after processing	× ☞ Page 2892 When the devices for the host station, other stations, and other PLCs are not set together	About 1300 ms
× ☞ Page 2891 When using gateway devices directly	○ ☞ Page 2892 When the devices of the host station, other stations, and other PLCs are set together	
× ☞ Page 2891 When using gateway devices directly	× ☞ Page 2892 When the devices for the host station, other stations, and other PLCs are not set together	

PART 27

84.10 Precautions

GT37 SoftGOT3000

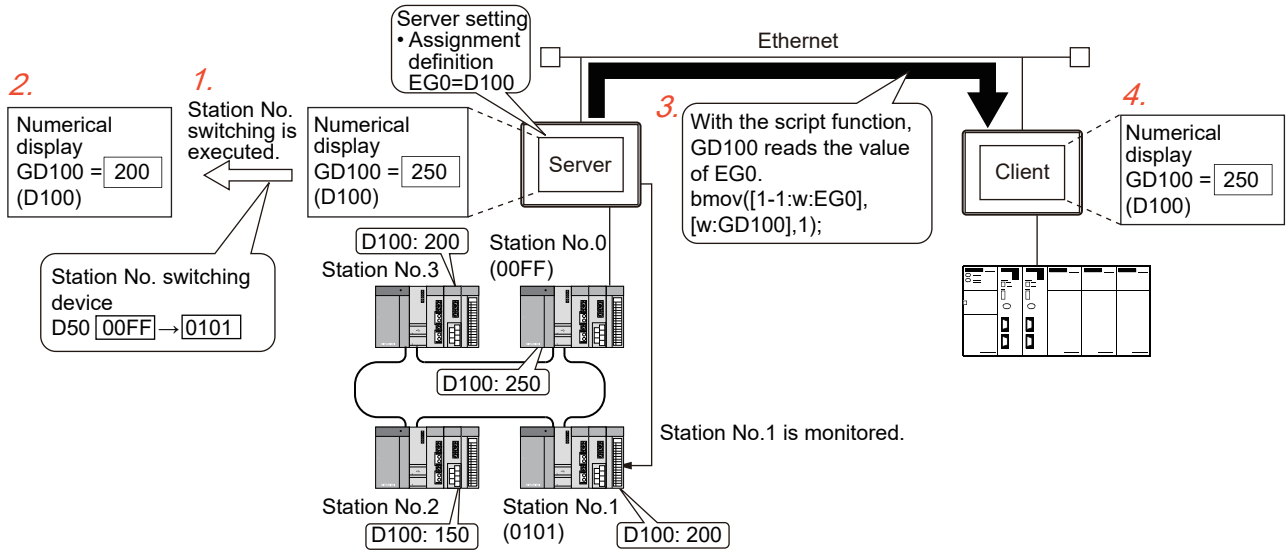
The following shows the precautions for using the server/client function.

☞ Page 2894 Precautions for station number switching
☞ Page 2895 Precautions on the script setting
☞ Page 2896 Precautions for monitoring
☞ Page 2897 Precautions for assigning devices

84.10.1 Precautions for station number switching

When monitoring gateway devices assigned to controller devices, the monitored devices are not affected by station number switching.

Create the screen for each station.



1. Execute the station number switching.

2. The numerical display on the GOT (server) changes as a result of the station number switching.

3. However, the station number switching does not affect the assignment of the gateway devices. Read the value of EG0 of the PLC (station number 0) to GD100 using the script.

4. The numerical display on the GOT (client) is does not change as a result of the station number switching.

84.10.2 Precautions on the script setting

Setting the trigger type

When setting the script, do not set the trigger type to [Ordinary] or [Sampling, 2 sec.].
The setting may affect other monitoring operations.

Monitoring gateway devices with a script

A script cannot be used to monitor the gateway devices of the GOT itself (GOT) where the script is executed.
To monitor the PLC devices assigned to the gateway devices, monitor the PLC devices directly.

Specifying the network number and PLC station number in a script

In the script, which accesses the gateway devices of the target GOT, specify the network number and the PLC station number of the target GOT.
Even if 0-FF (host station) is set for the target, the gateway devices cannot be monitored.

When using the bmov instruction in a script

A script does not run properly in the following cases.

- A bit device that cannot be specified as a word device is assigned to a gateway device. This gateway device is specified for a command specifying word devices.
- A word device that cannot be specified as a bit device is assigned to a gateway device. This gateway device is specified for a command specifying bit devices.

Do not specify such gateway devices for the commands specifying word devices and bit devices.
The following shows the commands specifying word devices and bit devices.

Item	Command type	Description
Commands specifying word devices	Function (application arithmetic operation)	sin, cos, tan, asin, acos, atan, abs, log, log10, exp, ldexp, sqrt
Commands specifying bit devices	Operator (bit device)	&, |, ~, ^, <<, >>
	Operator (assignment)	=
	Function (device operation)	set, rst, alt

For details on each device, refer to the following.
☞ Page 3487 Device range and settings of each controller
For details on each command, refer to the following.
☞ Page 2335 Control structures for scripts
☞ Page 2449 Control structure of object scripts

Number of devices used for the bmov and fmov functions

If the gateway devices are used for the bmov and fmov functions, up to 400 devices are usable.

84.10.3 Precautions for monitoring

Script execution error

If you monitor the gateway devices of the GOT (server) while the server or client cannot be used, such as when the GOT is powered off, a script execution error (error code 16) occurs on the GOT (client), causing the script to stop.
For the errors for the execution of a script, refer to the following.
☞ Page 2899 Troubleshooting

When monitoring a gateway device without an assigned PLC device

When a gateway device without an assigned PLC device is monitored, it is monitored as 0 (or off if a bit device is specified).
When a value is written, the value is invalid.

Screen save

During the execution of a script that uses gateway devices, the screen save time may be affected.
Canceling the screen saver (by a screen touch or human sensor) may take longer time than usual.
For example, if the screen processing time is two seconds, the screen save is canceled up to two seconds after the screen is touched.
When the automatic screen saver is set, the execution intervals may be longer than the specified interval.

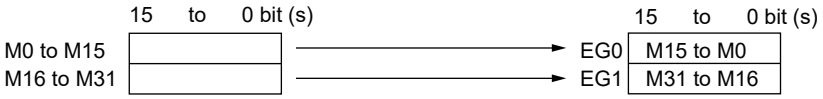
84.10.4 Precautions for assigning devices

The gateway devices are set in a set of two points.

Therefore, the number of assigned devices depends on the controller devices to be set.

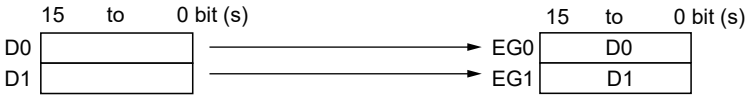
When assigning bit devices to gateway devices

Bit devices are assigned in a unit of 32 points.



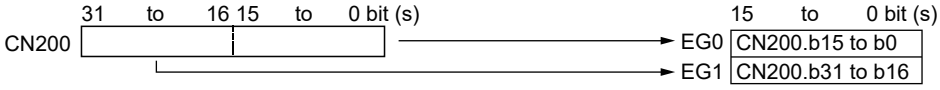
When assigning word devices to gateway devices

Word devices are assigned in a unit of 2 points.



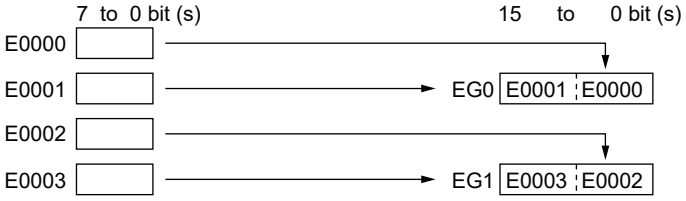
When assigning double-word devices to gateway devices

Double-word devices are assigned in a unit of 1 point.



When assigning 8-bit devices to gateway devices

The 8-bit devices are assigned in a unit of 4 points.



PART 27

84.11 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings in addition to the specific for the server/client function as required. The following shows the functions that are available by configuring the relevant settings.

☞ Page 3581 GOT special register (GS)

84.11.1 GOT internal device

Function	Setting item
Notifies the operation availability status of the server function.	GS200.b3
Notifies the operation availability status of the client function.	GS200.b4
Turns on when an error occurs in the use of the server function.	GS200.b14
Turns on when an error occurs in the use of the client function.	GS200.b15
Stores the number of errors that occur in the use of the server function.	GS210
Stores the error codes of errors that occur in the use of the server function.	GS211
Stores the year (upper byte, two lower digits of year) and the month (lower byte) with BCD code when an error occurs in the use of the server function.	GS212
Stores the year (upper byte) and the hour (lower byte) with BCD code when an error occurs in the use of the server function.	GS213
Stores the minute (upper byte) and the second (lower byte) with BCD code when an error occurs in the use of the server function.	GS214
Stores the lower part of the IP address of the GOT (client), where an error occurs in the use of the server function, with BCD code.	GS215
Stores the upper part of the IP address of the GOT (client), where an error occurs in the use of the server function, with BCD code.	GS216
Stores the number of errors that occur in the use of the client function.	GS220
Stores the error codes of errors that occur in the use of the client function.	GS221
Stores the year (upper byte, two lower digits of year) and the month (lower byte) with BCD code when an error occurs in the use of the client function.	GS222
Stores the day (upper byte, two lower digits of year) and the hour (lower byte) with BCD code when an error occurs in use of the client function.	GS223
Stores the minute (upper byte) and the second (lower byte) with BCD code when an error occurs in the use of the client function.	GS224
Stores the lower part of the IP address of the GOT (server), where an error occurs in the use of the client function, with BCD code.	GS225
Stores the upper part of the IP address of the GOT (server), where an error occurs in the use of the client function, with BCD code.	GS226
Clears the errors (GS200.b14, GS210 to GS216) of the server function.	GS400.b14
Clears the errors (GS200.b15, GS220 to GS226) of the client function.	GS400.b15

84.12 Troubleshooting

GT37 SoftGOT3000

☞ Page 2899 Troubleshooting for the server/client function
☞ Page 2900 Error information of the server/client function
☞ Page 2900 Error code list of the server/client function
☞ Page 2902 Error code list of MX Component

84.12.1 Troubleshooting for the server/client function

The following shows the troubleshooting for the server/client function.

Symptom		Cause	Corrective action
The server/client function does not work.	When all the bits of GS200 are off and the GOT does not respond to the ping command*1*2	The system application (extended function) for the server/client function is not installed on the GOT.	Write the package data, which contains the system application (extended function) for the server/client function, to the GOT. ☞ Page 408 Transferring data to the GOT
		No IP address has been set for the GOT.	Set the IP address for the GOT in the utility of the GOT.
		The port number of the personal computer (MX Component) is different from that of the GOT (5011).	Set the same port number for the personal computer (MX Component) as that of the GOT (5011).
	If any bit of GS200 is on and the GOT responds to the ping command*1*2	—	Refer to the troubleshooting for the functions corresponding to the bits that are on, and take corrective actions.
A gateway device cannot be monitored.		A device that does not exist in the server settings has been monitored.	Check the controller devices that have been assigned to the gateway devices.
		The IP address of the GOT to be monitored has been incorrectly set in the client settings.	Check the IP address of the GOT to be monitored.
		An error has occurred in either of the GOTs (server or client).	Check the GOT special registers GS211 and GS221 and take the corrective actions. ☞ Page 2900 Error code list of the server/client function
		A script function error has occurred.	Check the script function error and take the corrective actions. ☞ Page 2325 Controlling operations with scripts ([Script])

*1 For details on the Gateway Common Information (GS200), refer to the following.
☞ Page 3581 GOT special register (GS)

*2 To check if the GOT responds to the ping command, execute it from the personal computer to the GOT.

PART 27

84.12.2 Error information of the server/client function

The error information of the server/client function is stored in the GOT special register (GS).
Check the error information of the server/client function by monitoring the following GOT special registers.
For details on the GOT special registers, refer to the following.
☞ Page 3581 GOT special register (GS)

Write device	Function		Description
GS210	Server function	Error counter	Stores the number of errors that have occurred.
GS211		Error code	Stores the error code. ☞ Page 2900 Error code list of the server/client function
GS212		Error date and time	Stores the year (upper byte, two lower digits of year) and the month (lower byte) of the error occurrence date/time in BCD code.
GS213			Stores the day (upper byte) and the hour (lower byte) of the error occurrence date/time in BCD code.
GS214			Stores the minute (upper byte) and the second (lower byte) of the error occurrence date/time in BCD code.
GS215		Request source	Stores the lower part of the IP address of the GOT (client), where an error has occurred, with BIN code.
GS216			Stores the upper part of the IP address of the GOT (client), where an error has occurred, with BIN code.
GS220	Client function	Error counter	Stores the number of errors that have occurred.
GS221		Error code	Stores the error code. ☞ Page 2900 Error code list of the server/client function
GS222		Error date and time	Stores the year (upper byte, two lower digits of year) and the month (lower byte) of the error occurrence date/time in BCD code.
GS223			Stores the day (upper byte) and the hour (lower byte) of the error occurrence date/time in BCD code.
GS224			Stores the minute (upper byte) and the second (lower byte) of the error occurrence date/time in BCD code.
GS225		Request target	Stores the lower part of the IP address of the GOT (server), where an error has occurred, with BIN code.
GS226			Stores the upper part of the IP address of the GOT (server), where an error has occurred, with BIN code.

84.12.3 Error code list of the server/client function

The following lists the error codes that are stored in the GOT special registers GS211 (Server Function Error Code) and GS221 (Client Function Error Code).

Error code*1	Cause	Corrective action
490	A script was used for monitoring the gate device that executed the script.	• Change the monitor destination GOT specified in the script to another GOT. • Monitor the PLC devices directly without using the script.
491	A station that does not exist was accessed.	Check the network number, the PLC station number, and the Ethernet settings of the the monitor destination.
492	A communication timeout error has occurred.	• Specify a longer communication timeout period. ☞ Page 729 [Controller Setting] • Check the network. (Check if a firewall exists, execute Ping, or take other actions.) • Check for cable disconnection, and check the module mounting status.
493	A communication error has occurred.	• Check the network. (Check if a firewall exists, execute Ping, or take other actions.) • Check for cable disconnection, and check the module mounting status.

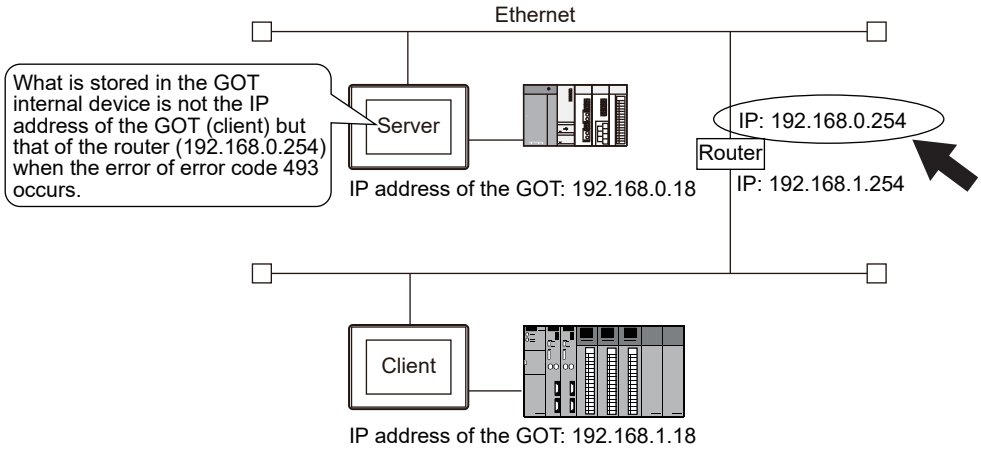
*1 The error caused in the GOT (server) is error code 493 only.

Error code 493 has occurred in the GOT (server).

The error may occur in a congested network.
If no error has occurred in the GOT (client), the communication recovers by the retry processing of the GOT (client) .

A system where a router is used

If error code 493 has occurred in the GOT (server), the router address is taken as the IP address of the target client.



An error has occurred in the GOT (client).

When an error occurs in the GOT (client), the script stops its operation.

When an error occurs, execute the script again after taking the corrective actions.

For details on scripts, refer to the following.

☞ Page 2325 Controlling operations with scripts ([Script])

Error code 492 has occurred in the GOT (client).

The error may occur when multiple GOTs (client) access the GOT (server).

Adjust the value of [Timeout Time].

Refer to the following calculation to set the value.

Timeout time that is already set × Number of GOTs (client) = [Timeout Time] after the adjustment

Error code 15 has occurred in the script error data.

If a large number of GOTs (clients) are accessing the GOT (server), a script that uses a gateway device may not finish even after the monitoring time has elapsed.

In this case, error code 15 is stored in the script error data (GS16 to GS47).

If the error occurs, adjust the value of [script monitoring time] (GS385).

Refer to the following calculation to set the value.

Timeout time that is already set × Number of GOTs (client) = [script monitoring time] after the adjustment

For details on the script, refer to the following.

☞ Page 2325 Controlling operations with scripts ([Script])

84.12.4 Error code list of MX Component

The following lists the error codes of the errors which occur when the GOT is accessed from MX Component.

Error code*1	Cause	Corrective action
0x0180840B	Timeout error Data could not be received within the timeout time.	■Corrective action for MX Component • Review the timeout value in the property. • Set the timeout value again in the communication setting utility. • Review the system including the PLC CPU, module settings, and cable status. • Retry the method. • Perform Close once and execute Open again. • Exit the program and restart the IBM-PC/AT compatible. 📖Programming Manual for MX Component ■Corrective action for the GOT • Check if the server settings for GT Designer3 are configured. ☞ Page 2884 [Gateway-Server]
0x010F4030	An unavailable device or device that does not exist has been assigned to the accessed gateway device.	Check that the device assignment is correct or the set devices exist in the server settings of GT Designer3.
0x010F4031	A device of PLCs outside the monitor range has been assigned to the accessed gateway device.	Check if the devices that are within the monitor range are assigned in the server settings of GT Designer3.
0x010F4B00	A communication timeout has occurred. A module is not mounted correctly or a cable is not correctly.	• Check for cable disconnection, and check the communication unit mounting status, and the PLC status. • The communication timeout may occur when the load on the PLC increases during the access to another station. In this case, move the data in another station to the PLC of the host station, and monitor the data at the host station. • If the sequence scan time is long, insert the COM instruction. • Check the GOT error codes for system alarms or system information.*2 When an error has occurred, take the corrective actions.

*1 When an error other than those listed above occurs, refer to the following.
📖MX Component Version 3 Operating Manual
📖MX Component Version 3 Programming Manual

*2 For details on the GOT error codes, refer to the following.
📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

PART 28 File transfer function

85 Transferring files between the GOT and peripheral devices (FTP server function)

86 Transferring files between the GOT and peripheral devices (file transfer function (FTP transfer))

87 Transferring files between the GOT drives (file transfer function (GOT internal transfer))

85 Transferring files between the GOT and peripheral devices (FTP server function)

GT37 SoftGOT3000

☞ Page 2905 Overview of the FTP server function
☞ Page 2906 Specifications of the FTP server function
☞ Page 2910 How to use the FTP server function
☞ Page 2913 [FTP Server]
☞ Page 2915 Procedures of the FTP server function
☞ Page 2924 Relevant settings
☞ Page 2925 Troubleshooting

85.1 Overview of the FTP server function

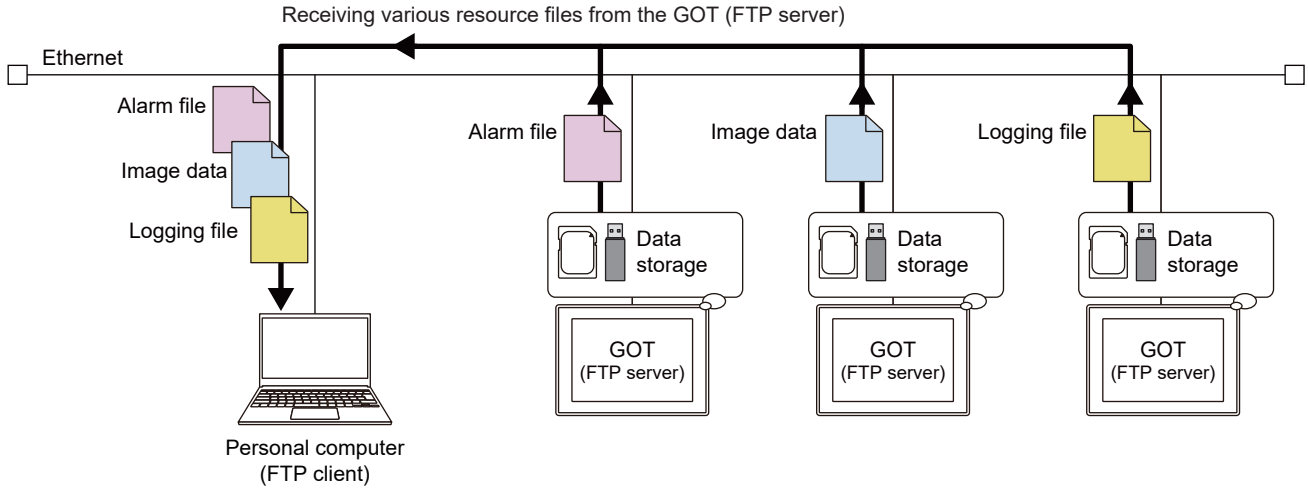
The FTP server function enables you to read/write a file from/to an external FTP client such as a personal computer via the GOT (FTP server).

Files can be read from or written to the on-site GOT using simple command operations from the office personal computer, enabling the following applications.

Reading GOT resource files on a personal computer

Resource files generated by the GOTs (alarm, logging, operation log, and other log files) and image files captured by the hard copy function are read via operations on the personal computer (FTP client).

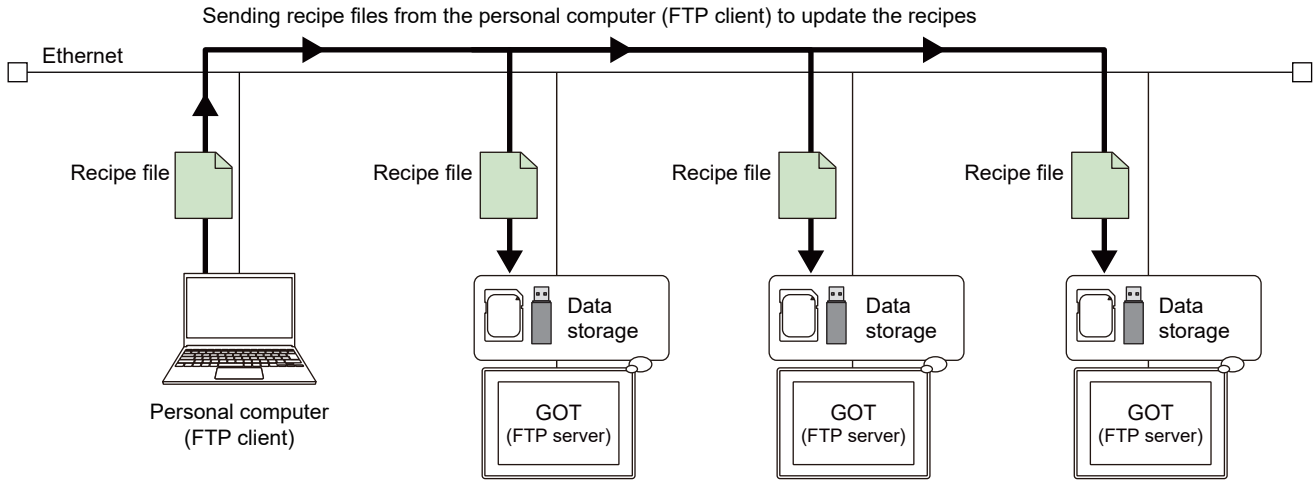
Use this function to read resource files from multiple GOTs via Ethernet.



Sending files from a personal computer to the GOT

Files created on a personal computer, such as recipe files, are written from the personal computer (FTP client) to the GOT (FTP server).

Use this function to edit resource files from multiple GOTs at once via Ethernet.



Precautions

To write recipe files from the FTP client to the GOT, set the same format of the recipe files as the one set with the recipe of the GOT.

To write recipe files from a personal computer at a distant location, check the procedure with field workers before writing recipe files.

PART 28

85.2 Specifications of the FTP server function

GT37 SoftGOT3000

☞ Page 2906 System application (add-on function)
☞ Page 2906 Number of FTP server function settings for one project
☞ Page 2906 Available FTP client
☞ Page 2907 Number of simultaneously connectable clients
☞ Page 2907 Available file size for file reading
☞ Page 2907 Character code
☞ Page 2907 Data which can be read and written using the FTP server function
☞ Page 2907 Authentication method for connecting to the FTP server
☞ Page 2908 Encrypted communication
☞ Page 2908 Operation record (operation log)
☞ Page 2909 Accessible range

85.2.1 System application (add-on function)

To use the FTP server function, [Gateway(FTP Server)] must be selected from the system applications (add-on functions). Selecting [Use the function of FTP Server] and configuring each setting in [FTP Server] in the [Controller Setting] window incorporate the application into the package data automatically.

☞ Page 2913 [FTP Server]

85.2.2 Number of FTP server function settings for one project

One setting can be configured per project.

85.2.3 Available FTP client

- FTP client compliant with RFC 959
- FTPS client compliant with RFC 2246 and RFC 4217
- FTP client which can be accessed from the Windows command prompt using the FTP command
- FTP client which supports the passive mode

For the FTP clients whose operations have been validated, refer to the following Technical Bulletin.

📖List of Devices Validated to Operate with the GOT3000 Series FTP Server Function/ File Transfer Function (GOT-A-0256)

Precautions

■Performing a test on the FTP client tool

Before using the FTP client tool, make sure to read the manual for the FTP client tool to check the functions and operating procedure, then conduct the test operation.

Some operations may not be supported by the GOT (FTP server) depending on the FTP client tool to be used.

Also, depending on the FTP client tool used, the FTP server function may not be usable because the GOT cannot support the extended command (quote) and issue GOT-dedicated commands.

■Behavior of the FTP client when disconnected

If the GOT is reset or powered off when it is connected to the FTP client, the behavior of the FTP client depends on the specifications of the FTP client tool to be used.

Use an FTP client tool which detects the FTP server down or properly shuts down the FTP client.

85.2.4 Number of simultaneously connectable clients

Up to eight clients can be connected simultaneously.

Use GS404 to specify the number of connectable clients.

When GS404 stores 0 or 9 or greater, one client can be connected.

85.2.5 Available file size for file reading

Unlimited. The maximum read size depends on the capacity of the data storage.

85.2.6 Character code

The character code used for communication is UTF-8.

This also allows for reading and writing of files with multibyte character file names.

85.2.7 Data which can be read and written using the FTP server function

The following files can be read and written using the FTP server function.

- CSV files
- Unicode text files
- Image data
- Binary format files (*.G3□)

Files with the following extensions cannot be read or written.

OUT, FON, INI, G3, PRF

Binary format files

Binary format files (*.G3□) can be read to a personal computer by using the Gateway Common Control (GS400.b8).

However, the following files cannot be read.

- G3
- G3D
- G3G

You can use the binary format file read to GT Designer3 as backup data. Some files can be converted to other formats using GT Designer3.

85.2.8 Authentication method for connecting to the FTP server

Depending on the security mode, the authentication method for connecting to the FTP server differs.

Security mode	Authentication method
Security mode 1	You can select either dedicated user authentication for the FTP server or [Operator Authentication]. [Operator Authentication] is only available if it is configured in the security settings.
Security mode 2	Operator authentication is performed. To connect to the FTP server using security mode 2 operator authentication, an operator with one of the following operation rights must perform authentication. Unauthorized operators cannot connect. • [Current drive reading] • [Current drive writing] • [Non-current drive reading/writing]

85.2.9 Encrypted communication

The FTP server function allows you to enable or disable FTPS, which encrypts communication between the GOT and the FTP client.
FTPS can prevent problems caused by unauthorized access.
For encrypted communication using FTPS, the certificate (server certificate) set in the GOT is used.
Enable or disable encrypted communication for the FTP server function using [Communication] on the [FTP Server] screen displayed in [Common] → [Controller Setting].

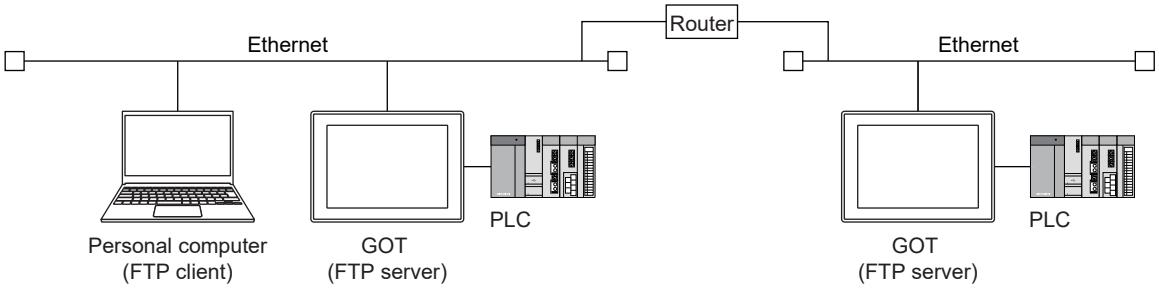
85.2.10 Operation record (operation log)

Encrypted communication, operator authentication, and file operations during the use of the FTP server function are recorded in the operation log.
Operations on the FTP server are recorded in the operation log with [FTP] as the operation source.
If the authentication method is [FTP Server Exclusive User Authentication], the user name of [FTP Server Exclusive User Authentication] is recorded as the operator name in the operation log (operator ID: [0]).
The following logs are recorded:

Log item	Event	FTP event	Remarks
Encrypted communication	Start of encrypted communication (connection)	When the FTPS connection starts	—
	Failed to start encrypted communication	When the FTPS connection fails to start	Certificate deficiencies or other issues
	End of encrypted communication (disconnection)	When the FTPS connection ends	—
Operator authentication	Login (successful)	When connection authentication is successful	—
	Login (failed)	When connection authentication fails	Authentication failed, automatic disconnection before login
	Logout	When a disconnection is performed on the FTP client	—
	Automatic logout	When automatic disconnection occurs due to the elapse of the automatic logout time.	—
	Forced logout	Forced disconnection by the Forced FTP Server Function Logout Signal (GS400.b2)	—
	Authentication prohibited (detection of unauthorized login attempts)	When multiple authentication attempts fail	Recorded on the operator management side
	Operator account lock	When the same operator fails consecutively	Recorded on the operator management side
	Automatic removal of authentication prohibition	After the prohibition period has elapsed	Recorded on the operator management side
File (drive) operation	File operation: Read	Reading files from the GOT	—
	File operation: Write	Writing files to the GOT	—
	File operation: Delete	Deleting files in the GOT	—
	File operation: Rename	Renaming a file in the GOT	—
	File creation: Create a folder	Creating a folder in the GOT	—
	File operation: Delete a folder	Deleting a folder in the GOT	—

85.2.11 Accessible range

The FTP server function allows the FTP client to access the GOTs on the network where the FTP client is connected.
When you use the FTP sever function via a relay device such as a router, consult with your network manager.



To simply determine whether file transfer is possible, issue a ping command to the GOT.

Ex.

Examples of the ping commands to be issued (when the Windows command prompt is used)

IP address of the GOT: 192.168.0.18

When file transfer is possible

```
C:\ping 192.168.0.18
  Pinging 192.168.0.18 with 32 bytes of data:

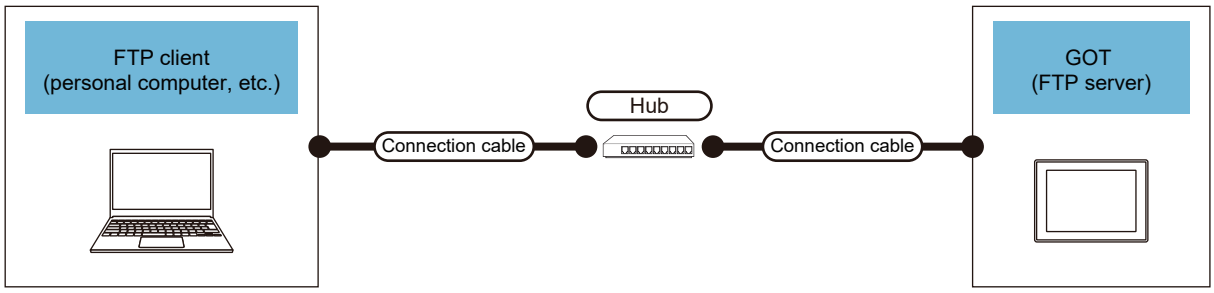
PART 28

85.3 How to use the FTP server function

GT37 SoftGOT3000

☞ Page 2910 System configuration
☞ Page 2912 Setting procedure

85.3.1 System configuration



FTP client	Connection cable	GOT	
		Interface	Model
Personal computer or others	Shielded twisted pair cable	Built-in Ethernet interface of the GOT	GT37 SoftGOT3000

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

A straight cable is usable.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

■Connection to the intranet

If the system needs to be secured against unauthorized access to the intranet, consult a network service provider or network administrator (someone responsible for tasks such as network planning and IP address management), and implement your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for any consequences resulting from system troubles caused by the intranet connection.

■Countermeasures against access delay

When multiple network devices (including GOTs) are connected to the same segment, the network load increases and therefore the communication performance between the GOT and PLC may be degraded.

The following countermeasures may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

■When a firewall is used

If a firewall disconnects the communication of the gateway function, take countermeasures such as changing the firewall port number.

If the system needs to be secured against unauthorized access when changing the firewall port number, consult the network administrator (someone responsible for tasks such as network planning and IP address management), and implement your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for any consequences resulting from system troubles caused by changing the port number.

85.3.2 Setting procedure

The following shows the setting procedure for using the FTP server function.

1. Consider the configuration of the whole system.

- Configuration of the whole system including controllers and GOTs
- Controller settings (including device assignment)
- GOT settings (including IP address, network number, and station number)

2. Connect the GOT and the controller.

☞ Page 2910 System configuration

3. Select [Common] → [Controller Setting] from the GT Designer3 menu to display the [Controller Setting] window. Select [FTP Server] and configure the required settings.

☞ Page 2913 [FTP Server]

4. To encrypt communication data using FTPS, refer to the following to enable encrypted communication.

☞ Page 3072 Target functions for encrypted communication and required settings

5. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

6. Check the GOT operation.

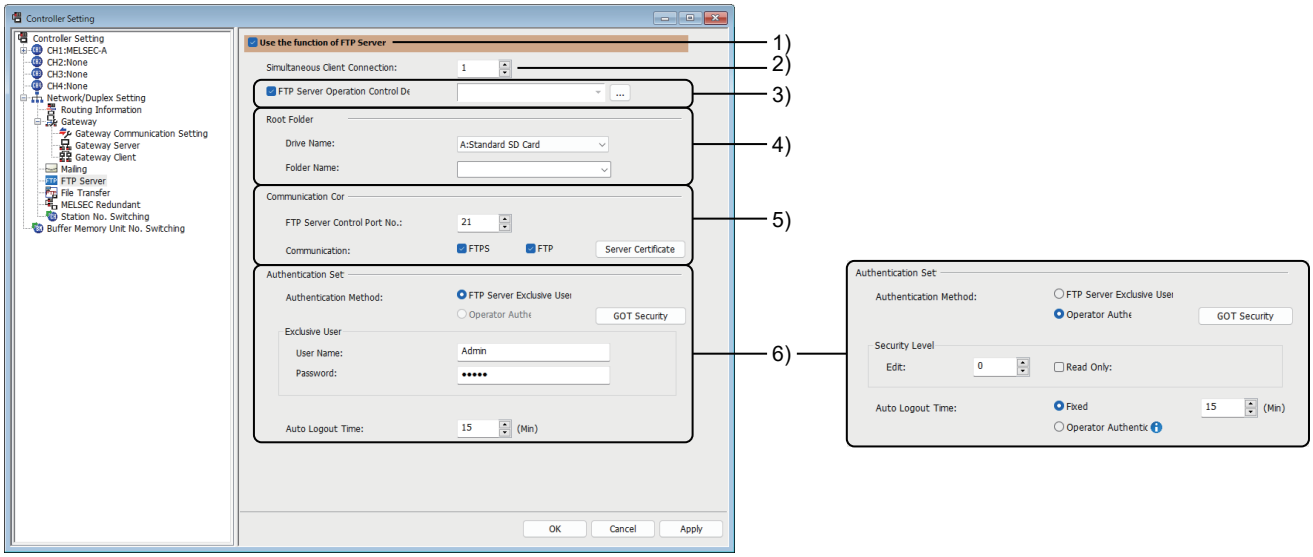
☞ Page 2915 Procedures of the FTP server function

85.4 [FTP Server]

On the [FTP Server] settings screen, configure the settings such as the control method for starting the FTP server function, whether to enable encrypted communication, and the authentication method.

Window

1. Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
2. Select [FTP Server] in the [Controller Setting] window.



Item			Description
1)	[Use the function of FTP Server]		Select this item when using the FTP server function.
2)	[Simultaneous Client Connection]		Specify the number of clients simultaneously connectable to the GOT. The setting range is [1] to [8].
3)	[FTP Server Operation Control Device]		Select this item to prevent the FTP server from starting simultaneously with the GOT and to control it with a device. Then, specify the control device (bit type). When the specified device is turned from off to on, the FTP server becomes operational. If the specified device is turned from on to off, the FTP server no longer accepts new connections and stops operating when the number of connections reaches zero. To immediately stop the FTP server by switching it from on to off, turn on the Forced FTP Server Function Logout Signal (GS400.b2) to perform a forced disconnection.
4)	[Root Folder]	[Drive Name]	Specify the GOT drive that can be accessed by the FTP server function. The path to the folder name (excluding the last [/]) is up to 72 characters long. Drives C and V cannot be specified.
		[Folder Name]	Set the folder name.
5)	[Communication Configuration]	[FTP Server Control Port No.]	Specify the control port number for the GOT. The setting range is [21] and [1024] to [65535]. Do not set the port number used for the other settings. Duplication of the port number disables communication. To change the number, it is recommended to use a number in the 50000s or higher.
		[Communication]	Select the communication method to be used. Select [FTPS] when using encrypted communication. Then, press the [Server Certificate] button, and configure the server certificate settings in the [Certificate] tab of the environmental settings window that appears. If the GOT server certificate has expired or is in another invalid state, the FTPS connection cannot be established even when it is required. ☞ Page 3078 [Certificate]

Item			Description
6)	[Authentication Setting]	[Authentication Method]	Specify the authentication method for connecting to the FTP server. The item that can be specified varies depending on the security mode.
			• Security mode 1 The default setting is [FTP Server Exclusive User Authentication]. Even in security mode 1, you can specify [Operator Authentication] if [Operator Authentication] is set in the security settings. When you press the [GOT Security] button, the [Screen Security] tab of the environmental settings window appears. Configure the settings as required.
			• Security mode 2 The setting is fixed to [Operator Authentication]. The required operation rights for authentication are as follows. Users without these operation rights cannot connect. ◇[Current drive reading] ◇[Current drive writing] ◇[Non-current drive reading/writing]
		[Security Level]	If [Operator Authentication] is specified as [Authentication Method], specify the security level that allows connection. There are two security levels: read/write and read-only. The read/write level takes precedence. The setting range is [0] to [15].
			• [Edit] Set the security level to read/write. Operators at or above the specified level can connect and perform operations such as reading, writing, and deleting files.
			• [Read Only] Set the security level to read-only. Operators at or above the level specified for this item, but below the level set in [Edit] can connect. File reading is available, but file writing and deleting are not available.
		Dedicated User	Set the login name and password for connecting to the GOT from an FTP client when [FTP Server Exclusive User Authentication] is specified for [Authentication Method].
			• [User Name] Only one login name can be set using 1 to 32 characters. One-byte alphanumeric characters (a to z, A to Z, and 0 to 9) can be used. The default login name is [Admin]. [anonymous] cannot be set.
			• [Password] Only one password can be set using 1 to 32 characters. One-byte alphanumeric characters, one-byte spaces, and the following symbols can be used. ! " # $ % & ‘ ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~ A one-byte space cannot be used at the start or end of a password.
		[Auto Logout Time]	The GOT automatically disconnects from the FTP client after a certain period of no command input during the connection. For this setting item, set the time before automatic disconnection to a value between [1] and [60]. If multiple FTP clients are connected to the GOT at the same time, this setting applies to all of them. If [FTP Server Exclusive User Authentication] is specified for [Authentication Method], specify [Auto Logout Time] in minutes. When [Operator Authentication] is specified for [Authentication Method], you can select [Fixed] and specify the automatic logout time in minutes, or select [Operator Authentication Link]. For [Operator Authentication Link], the automatic logout time set for the operator is applied. However, if the automatic logout time is set to [0] (disabled), 15 minutes will be applied as [Auto Logout Time].

85.5 Procedures of the FTP server function

GT37 SoftGOT3000

☞ Page 2915 Operating procedure
☞ Page 2919 FTP command list

85.5.1 Operating procedure

This section introduces the basic flow for accessing and operating the GOT from an FPT client using the FTP server function.
For these application examples, the Windows command prompt is used for accessing between the GOT and the FTP client.
When using a commercially available FTP client tool, refer to the manual of the FTP client tool used.
For the detailed operating procedure, refer to each item described as follows.

1. Connect to the GOT from the FTP client.

☞ Page 2916 Connecting to the GOT from the FTP client

2. Perform operations on the GOT.

When writing files to the GOT (data storage) or managing the directory, enable writing to the data storage of the GOT.

Manipulations	Reference
Reading the files in the GOT (data storage)	☞ Page 2916 Reading the files in the GOT (data storage)
Writing files to the GOT (data storage)	☞ Page 2917 Writing files to the GOT (data storage)
Managing the directory in the GOT (data storage)	☞ Page 2918 Managing the directory in the GOT (data storage)

For other available commands, refer to the following.

☞ Page 2919 FTP command list

3. Disconnect the FTP client from the GOT.

☞ Page 2918 Disconnecting the GOT from the FTP client

Connecting to the GOT from the FTP client

1. Starting the FTP client

Input [ftp] and press Enter.

2. Connecting with the GOT

Input [open], followed by the IP address of the GOT, and press Enter.

3. Inputting a login name

Input the registered login name and press Enter.

4. Inputting the password

Input the registered password and press Enter.

Ex.

Login image (When the line is properly connected.)

```
C:\>ftp
ftp>open 192.168.0.18
connected to 192.168.0.18
220 GOT3000 FTP server ready.
user:GOT3000
331 Password required.
Password:****
230 User logged in.
ftp>
```

Login image (If another personal computer has been connected to the GOT)

```
C:\>ftp
ftp>open 192.168.0.18
connected to 192.168.0.18
421 Session limit reached, closing control connection
user:GOT3000
connection closed by remote host
ftp>
```

Login image (When a wrong password is input)

```
C:\>ftp
ftp>open 192.168.0.18
connected to 192.168.0.18
220 GOT3000 FTP server ready.
user:GOT3000
331 Password required.
Password:****
530 Not logged in.
ftp>
```

Reading the files in the GOT (data storage)

Read the files from the GOT in the following procedure.

1. Notifying of no file conversion

Input [binary] and press Enter.

2. Reading files

Input [get], followed by the file name, and press Enter.

Ex.

```
ftp>binary
200 TYPE is now BINARY.
ftp>get SNAP0001.BMP
200 PORT command successful
150 Opening connection.
226 Closing data connection.
ftp: 63 bytes sent in 0.00 seconds 63000.00
K bytes/sec.
ftp>
```

Writing files to the GOT (data storage)

Write files to the GOT in the following procedure.

1. Notifying of no file conversion

Input [binary] and press Enter.

2. Entering the write mode (if not in the write mode)

Input [quote gtwr] and press Enter.

3. Display the file name to check that it is not already in use.

Input [ls] or [dir] and press Enter.

4. If the same file name is used in the GOT, delete the file.

Input [delete], followed by the file name, and press Enter.

5. Writing files

Input [put], followed by the file name, and press Enter.

Ex.

```
ftp>binary
200 TYPE is now BINARY.
ftp>quote gtwr
200 command successful.
ftp>ls
200 PORT command successful.
150 Opening connection.
SNAP0001.BMP
SNAP0002.BMP
226 Closing data connection.
ftp>delete SNAP.0001.BMP
250 File deleted Successfully.
ftp>put SNAP0001.BMP
200 PORT command successful
150 Opening connection.
226 Closing data connection.
ftp: 63 bytes sent in 0.00 seconds 63000.00
K bytes/sec.
ftp>
```

PART 28

Managing the directory in the GOT (data storage)

Create a directory using the following steps, then move to the created directory.

1. Displaying the current directory

Input [pwd] and press Enter.

2. Entering the write mode (if not in the write mode)

Input [quote gtwr] and press Enter.

3. Creating a directory

Input [mkdir], followed by the directory name, and press Enter.

4. Modifying the current directory

Input [cd], followed by the directory name, and press Enter.

Ex.

```
ftp>pwd
257 "A:/snapshot" is current directory.
ftp> quote gtwr
200 command successful.
ftp>mkdir bmpdata
275 MKD command successful.
ftp>cd bmpdata
250 CWD command successful.
ftp>pwd
257 "A:/snapshot/bmpdata" is current directoryftp>cd ..
250 CWD command successful.
ftp>pwd
257 "A:/snapshot" is current directory.
ftp>
```

Disconnecting the GOT from the FTP client

Disconnect the GOT from the FTP client in the following procedure.

1. Input [quit] (exit command) and press Enter.

Ex.

```
ftp>quit
221 User logged out. Good-Bye.
C:\>
```

Displaying errors

Errors related to the FTP server function are displayed on the FTP client.

For information on the error messages that may be displayed, refer to the following.

☞ Page 2926 Response codes of the FTP server function

Ex.

If a non-existent file (snap0010.bmp in this example) is intended to be read

```
ftp>get snap0010.bmp
200 PORT command successful.
550 snap0010.bmp:No such file or directory.
ftp>
```

85.5.2 FTP command list

The following lists the FTP commands that can be used with the FPT server function.

☞ Page 2919 Access mode switching
☞ Page 2919 General commands
☞ Page 2920 GOT-dedicated commands
☞ Page 2920 How to specify files
☞ Page 2921 Checking the connection status
☞ Page 2922 Disconnection
☞ Page 2922 Precautions

Access mode switching

There are two access modes for the FTP server: reference mode and write mode.

Depending on the specified access mode, different FTP commands are available to the client.

When logging in as an operator with read-only access using operator authentication, the mode is fixed to reference mode.

When logging in as a read-write operator, the default mode is set to write mode.

You can switch between reference mode and write mode using the mode change command from the GOT-dedicated commands.

General commands

The following table shows the general commands available for the Windows command prompt and the FTP client, and their compatibility with the FTP server function of the GOT.

The following commands cannot be used depending on the specifications of the FTP client to be used.

○: Available, —: Not available

Command name	Function	Reference mode	Write mode
append	Writes files additionally to the GOT.	—	○
ascii	Changes the file transfer mode to the ascii mode.	○	○
binary	Changes the file transfer mode to the binary mode.	○	○
bye	Exits the FTP client tool.	○	○
cd	Changes the current directory of the GOT.	○	○
cd	Disconnects from the GOT.	○	○
delete	Deletes files in the GOT.	—	○
dir	Reads the file information in the GOT.	○	○
get	Reads files from the GOT.	○	○
ls	Displays file names in the GOT.	○	○
mdelete	Deletes multiple files specified with a wild card.	—	○
mdir	Reads the file information in the GOT to a specified file.	○	○
mget	Reads multiple files specified with a wild card.	○	○
mkdir	Creates a directory in the GOT.	—	○
mls	Reads the file name in the GOT to a specified file.	○	○
mput	Writes multiple files specified with a wild card to the GOT.	—	○
open	Connects to the GOT.	○	○
put	Writes files to the GOT.	—	○
pwd	Displays the current directory of the GOT.	○	○
rename	Changes a file name in the GOT.	—	○
rmdir	Deletes a directory in the GOT.	—	○
quit	Disconnects from the GOT and exits the FTP client tool.	○	○
quote	Use this command when executing a GOT-dedicated command.	○	○
user	Input a user name and a password for logging in the GOT.	○	○
auth	Performs encrypted communication.	○	○
prot	Defines the protection level used for FTP connections.	○	○
pbsz	Provides encryption and authentication for FTP sessions to ensure data security.	○	○

Command name	Function	Reference mode	Write mode
ccc	Changes the transmission mode of the control connection in the FTP protocol from encrypted mode to plain text mode.	○	○

GOT-dedicated commands

When the GOT-dedicated commands are input with the command prompt, use quote.

For example, to use the command [gtwr], type [quote gtwr].

○: Available, —: Not available

Command name	Function	Reference mode	Write mode
gtwr	Changes the mode of the FTP server function of the GOT to the write mode.	○	○*1
gtrd	Changes the mode of the FTP server function of the GOT to the reference mode.	○*1	○
help	Displays the general commands of the FTP protocol supported by the FTP server function of the GOT.	○	○
gtds	Enables access to drive C on the GOT.	—	○

*1 The setting is disabled. (The command does not cause an error.)

How to specify files

There are two ways to specify files: by directly specifying a single file name or by using wild cards to specify files that match certain conditions.

■Specifying a single file name directly

Specify the drive name, file name, period, and extension of the file to be specified.

Ex.

Specifying [OPELOG_20250525_0001.G3O] in the [Package1/OPELOG] folder on drive A

A:/Package1/OPELOG/OPELOG_20250525_0001.G3O

Setting item	Description
Drive name	Specify one of the drives: A, B, C, E, F, G, or V. Drive C can only be used with GOT-dedicated commands. Drive V is used to enable high-speed image display switching for the parts display function. This drive can be used only when [Show image files in the memory card when Parts No. 9001-9999 is specified] is selected in the [Parts Setting] dialog.
Folder name and file name	One-byte alphanumeric characters, symbols, and Unicode characters can be used. One-byte spaces and the following values cannot be used. • COM1 to COM9, LPT0 to LPT9, AUX, CON, NUL, PRN, CLOCK$ • /\?*:|"<> • Surrogate pair characters (character codes: 0xD800 to 0xDBFF, 0xDC00 to 0xDFFF) Folder name starting with G3 cannot be used either. Set a folder name and file name so that the total number of characters used for the path is 78 or less. When specifying a hierarchical folder, separate folder names with a forward slash [/] or backslash [\]. The extension can be up to three characters long.
Extension	Files with the following extensions cannot be specified. OUT, FON, INI, G3, PRF

■Using wild cards to specify files that match certain conditions

You can use wild cards ([*], [?]) to specify file names that match certain conditions.

Ex.

When specifying only JPEG files: *.jpg

When specifying CSV files whose names start with "Main": Main*.csv

When specifying files whose extensions start with b: *.b??:

Checking the connection status

Check the connection status between the GOT and an FTP client with the following GOT special registers (GS).

Item	GOT special register (GS)	Description
Checking if one FTP client is connected to the GOT	GS200.b2	This device turns on when an FTP client is connected to the GOT. Check if an FTP client is connected to the GOT with this device.
Checking if multiple FTP clients are connected to the GOT	GS208	This device stores the number of the FTP clients connected to the GOT. Check that FTP clients are connected to the GOT by checking a change of the stored value.

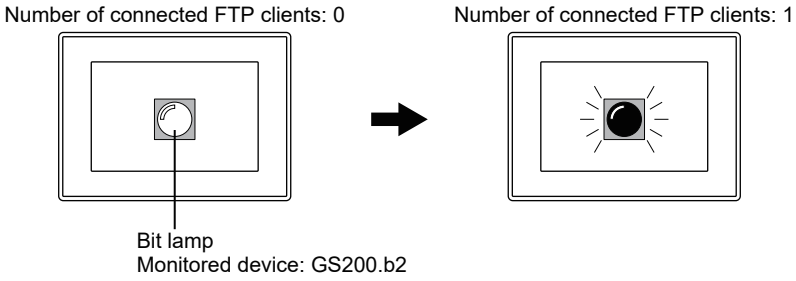
For details on the GOT special registers, refer to the following.

☞ Page 3581 GOT special register (GS)

Ex.

Notifying the connection status when one FTP client is connected

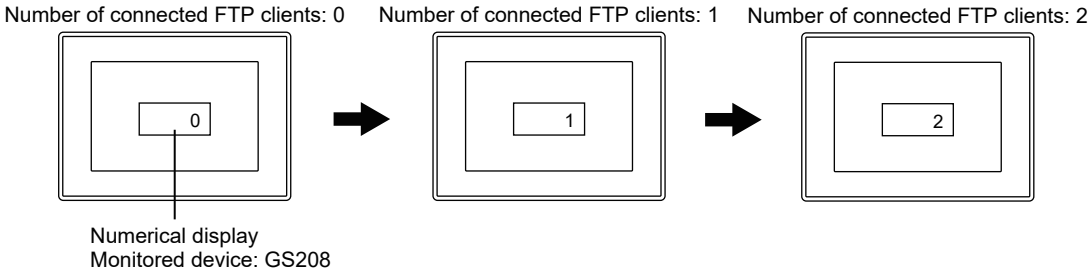
Specify GS200.b2 for a lamp object to notify whether an FTP client is connected.



Ex.

Notifying the connection status when multiple FTP clients are connected

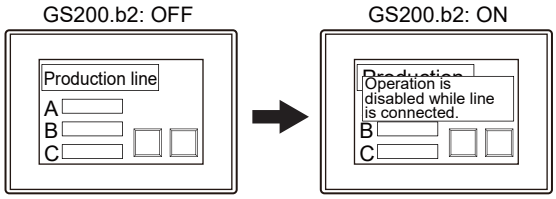
Specify GS208 for a numerical display object to display the number of connected FTP clients.



Ex.

Limiting operations

Use GS200.b2 as the trigger condition for a touch switch or numerical input object to limit the input during connection.



Configure the settings with the touch switch function or numerical input function so that input is allowed only when the device (GS200.b2) is off.

Disconnection

There are two methods for disconnection: automatic and manual.

Since the GOT cannot detect the error status of the FTP client, it does not immediately disconnect the connection if the FTP client cannot be shut down properly (for example, if the personal computer is powered off while connected).

However, the automatic logout time function automatically disconnects the connection after a certain period of time.

Disconnection method	Description
Automatic disconnection	If no commands are input from the FTP client within the automatic logout time set in the FTP server settings, the GOT automatically disconnects. For information on how to set the automatic logout time, refer to the following. ☞ Page 2913 [FTP Server]
Manual disconnection	Forcibly disconnect. Use the GOT special register GS400.b2 to forcibly disconnect all FTP clients. To disconnect, turn on GS400.b2. Check that the clients are disconnected, and then make sure to turn off GS400.b2. For details on the GOT special registers, refer to the following. ☞ Page 3581 GOT special register (GS)

Precautions

■Precautions for FTP login

• In the event of a forgotten password

If you forget the password for FTP login, you cannot connect the FTP client with the GOT.

Reset the password in [FTP Server] in the [Controller Setting] window.

☞ Page 2913 [FTP Server]

• If the login name or password is incorrectly input on the FTP software

When you input a login name or a password for FTP login incorrectly, you may need to exit the FTP client and input them again depending on the FTP software to be used.

• If Microsoft Internet Explorer does not display the user authentication screen

When you use Microsoft Internet Explorer, the user authentication screen may not be displayed.

Input the address of the GOT in the following format.

```
ftp://<User name>:<Password>@<The address name or the host name of the GOT>/
```

Ex.

When "AdminPass" is set for the password

```
ftp://Admin:AdminPass@192.168.0.18
```

■Reading multiple files using one command

If you read many files at once using one command (if you execute mget or mput specifying a wild card), the processing may be slowed down due to network congestion.

If processing is slow, issue commands separately to distribute the processing load.

■Retaining the connection when GOT becomes offline

Even if the GOT transitions to offline mode while connected to the FTP client (such as when downloading monitor screen data), the connection is held.

■Logging file

Do not write logging files to the GOT from FTP clients.

If logging files are written, they may be inconsistent with the logging function. As a result, the logging data may be initialized, or past data may not display correctly in the historical trend graph.

In addition, when reading a logging file, the logging collection process may be temporarily suspended due to exclusive control.

■Precautions for transferring a recipe file

Do not use the recipe when you transfer recipe files.

If the recipe file in the data storage is deleted while the recipe is processed, the function may not be performed properly.

If the recipe file is deleted even while the recipe is not processed, the error (system alarm: recipe file error) occurs when the recipe is performed next time.

☞ Page 2921 Checking the connection status

■Precautions for overwriting a file in the GOT

When overwriting files in the GOT using the FTP server function, check that the files are properly overwritten.

When an error occurs while files are written, the files which have been written in the GOT are deleted.

In that case, write the files again using the FTP server function.

■Login if an FTP client goes down

If an FTP client (personal computer) goes down, wait for the automatic logout time to elapse or turn on the forced logout signal (GS400.b2) to disconnect, and then log in again.

Check the connection status with GS200.b2 or GS208.

■Powering off the GOT during access to the files in the data storage

Do not power off the GOT while the FTP client accesses the files in the data storage of the GOT.

Doing so may cause the data corruption in the data storage.

■If the put command does not write data to the data storage

If the put command does not write data to the data storage, check that the following conditions are satisfied.

- The SD card cover of the GOT is closed.
- The write-protect switch of the data storage is turned off.

■Time stamp of the transfer file

The time stamp of a transfer file may differ from that of the file in the GOT data storage depending on the FTP client tool to be used.

When the time stamps differ, check the settings of the FTP client tool.

■Precautions for accessing files

Deleting certain files may cause the GOT to malfunction.

To prevent the GOT from operation errors, do not delete the files in the FTP server by accessing from the FTP client.

■To maintain file access performance

It is recommended to format the data storage before using it.

The number of files to be stored in a folder should be less than 500.

If 500 or more files are stored in a folder, file access performance may be lowered.

Repeated writing or deleting of data may lower access performance, regardless of the number of files.

In such a case, format the data storage.

85.6 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings other than those specific to the FTP server function as required.
The following shows the functions that are available by configuring the relevant settings.

85.6.1 GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Notifying that the FTP server function is ready	GS200.b1
Notifying that an FTP client is connected to the GOT	GS200.b2
Notifying the number of the FTP clients connected to the GOT	GS208
Forcibly disconnecting all FTP clients	GS400.b2
Enabling the reading of binary format files (*.G3□) from the FTP client	GS400.b8
Specifying the number of FTP clients connectable to the GOT simultaneously	GS404
Specifying drive V as the current directory when logging in to the FTP server	GS423.b10
Specifying the response string for the SYST command.	GS2575

85.7 Troubleshooting

GT37 SoftGOT3000

☞ Page 2925 Troubleshooting for the FTP server function
☞ Page 2926 Response codes of the FTP server function

85.7.1 Troubleshooting for the FTP server function

The following shows the troubleshooting for the FTP server function.

Symptom		Error details	Corrective action
The FTP server function does not work.	When all the bits of GS200 are off and the GOT does not respond to the ping command *1*2	The system application (add-on function) for the FTP server function is not installed on the GOT.	Write the package data that contains the system application (add-on function) for the FTP server function to the GOT.
		No IP address has been set for the GOT.	Set the IP address for the GOT in the utility of the GOT.
	If any bit of GS200 is on and the GOT responds to the ping command *1*2	—	Refer to the troubleshooting for the functions corresponding to the bits that are on, and take corrective actions.
Unable to connect to the GOT (FTP server)		[Use the function of FTP Server] is not enabled in the FTP server setting of GT Designer3.	Enable [Use the function of FTP Server].
		The number of connected FTP clients has reached the upper limit.	Perform either of the following operations, and then connect the GOT (FTP server) again. • Log out from other devices. • Change the number of connectable FTP clients with GS404.
		—	Issue a ping command to the GOT and check if the GOT responds to it.
		—	Consult with a network manager.
Unable to log in.		The login name or the password is incorrectly input.	Input the correct login name and password (case-sensitive).
Files cannot be written.		The GOT cannot recognize the file name.	For details on settable file names, refer to the following. ☞ Page 2920 How to specify files
		The FTP client is in the reference mode.	Change the mode of the function to the write mode.
		Overwriting is prohibited in the FTP client setting.	Correct the FTP client setting.
		The FTP client which does not send a file when the same file name exists in the FTP server is used.	Change the setting of the FTP client to enable sending (overwriting) files even when the same file name exists in the FTP server. Delete the file with the same name on the FTP server.
		The data storage is write-protected.	Cancel the write protection for the data storage.
		The SD card cover of the GOT is open.	Close the SD card cover of the GOT.
		The SD card is write-protected.	Check that the write protection for the SD card is canceled.
Files cannot be read.		The file to be read does not exist.	Use the dir or ls command to check if the file exists.
		The SD card cover of the GOT is open.	Close the SD card cover of the GOT.
		The SD card is write-protected.	Check that the write protection for the SD card is canceled.
Files cannot be deleted.		The data storage is write-protected.	Cancel the write protection for the data storage.
		The SD card cover of the GOT is open.	Close the SD card cover of the GOT.
		The SD card is write-protected.	Check that the write protection for the SD card is canceled.
The GOT was powered off during login.		—	Because the file being transferred may be damaged, do not use the file and delete it. The behavior of the FTP client depends on the specifications of the FTP client.
The FTP client software was forcibly exited during login.		—	Log in to the GOT again after the automatic logout time set in the FTP server settings has elapsed. The GOT logs out after the time set by the command has elapsed.
Some FTP clients cannot connect to the GOT FTP server.		The FTP client, AndFTP, cannot correctly parse the file list.	By setting [1] to GS2575, the FTP client can interpret the file list correctly to establish a connection. (AndFTP)

*1 For details on the Gateway Common Information (GS200), refer to the following.
☞ Page 3581 GOT special register (GS)
*2 To check if the GOT responds to the ping command, execute it from the personal computer to the GOT.

85.7.2 Response codes of the FTP server function

Response codes and messages (including errors) related to the FTP server function on the GOT are displayed on the FTP client.
The display of the responses differs depending on the FTP client tool to be used.

Normal conditions

Code	Message	Description
125	Data Connection already open; transfer starting	Start of transfer
150	Opening connection.	Establishment of connection for transfer
200	TYPE is now BINARY.	Setting to the binary transfer mode is successful.
	TYPE is now ASCII.	Setting to the ASCII transfer mode is successful.
	PORT command successful.	PORT command is successful.
	File structure set to NO RECORD	The data transfer structure type is set to File. (STRU)
	Command Okay.	Normal command
	Command successful.	
	NOOP -- did nothing as requested...hah!	NOOP command response
	File deleted successfully.	The DELE command is successful. (File deletion)
	RMD command successful.	The RMD command is successful. (Directory deletion)
	data is not protected.	Successfully disabled the protection on the data port for encrypted communication.
	data is protected.	Successfully enabled the protection on the data port for encrypted communication.
	PBSZ=0.	Completed the acceptance of the maximum protection buffer size.
	clear control session.	Completed the acceptance of the termination of encrypted communication (clear).
211	The following commands are recognized. (* =>'s not implemented)	List of available commands (Commands marked with * are not available.)
	Help end.	HELP display end
	Syntax: <Command name>...	HELP display of each command
215	GOT3000	SYST command response (GS2575 = 0)
	Windows_NT	SYST command response (GS2575 = 1)
220	GOT3000 FTP server ready.	Establishment of connection
221	User logged out. Good-Bye.	Connection end
226	Closing data connection.	End of connection for transfer
227	Entering Passive Mode (%d,%d,%d,%d,%d,%d)	The PASV command is successful. (Socket passive mode)
230	User logged in.	Logging in is successful.
	Guest login ok, access restrictions apply.	Guest user can log in. (Writing is unavailable.)
	Guest login ok, upload directory is %s.	Guest user can log in. (Writing is available.)
234	AUTH TLS OK.	Accepted the start of encrypted communication.
250	CWD command successful.	The CWD command is successful (current directory is changed).
	File deleted successfully.	The DELE command is successful.
	File renamed successfully.	The RNTO command is successful.
257	"/*****/****/**.***" is current directory.	Displaying the current directory
275	MKD command successful.	The MKD (creation of a directory) command is successful.
331	Password required.	A password is required.
	Guest login ok, send your complete e-mail address as password.	Guest user specification
350	Requested file action pending further information.	The RNFR command (setting of the target to be renamed) is successful.

Erroneous conditions

Error code	Error message	Description	Corrective action
202	Command not supported.	Unsupported command	The input command is not supported. Input a supported command.
221	You could at least say goodbye.	Command read error	Reading commands has failed. Input a correct command.
421	Timeout (%d seconds): closing connection.	Connection timeout	Connect to the GOT (FTP server) again.
	Service not available, closing control connection.	Unavailable client connection	After logging out from another device, connect to the GOT (FTP server) again.
	Session limit reached, closing control connection	Upper limit error of sessions (maximum four sessions)	The number of sessions has exceeded the upper limit. Reduce the number of sessions.
425	Can't open passive connection	PASV command failure	The access from the GOT has been blocked by the firewall of Windows. Allow the FTP server programs through the firewall of Windows.
	Can't open data connection	Data socket connection (accept) failure	Data socket connection has failed. Connect to the data socket again.
	Can't build data connection	Maximum number of retry exceedance error (connect)	Connection has failed within the set number of retry. Check that the FTP server and the FTP client are properly connected.
426	Connection closed; transfer aborted.	Transfer error	The data transfer has failed. Transfer the data again or check the connection status.
	Data connection error	Data socket connection error	Connect to the GOT (FTP server) again.
431	TLS connection can't be created.	Failed to create TLS context.	—
500	Syntax error, command unrecognized.	Syntax errors and commands cannot be recognized.	Check that syntax and commands are correctly input.
	don't recognize the AUTH command.	Encrypted communication is set to disabled.	—
	Only PBSZ=0 supported.	Failed to accept the maximum protection buffer size.	—
501	Syntax error in parameters or arguments.	CWD, CDUP, XCWD, XCUP command failure (The parameter is not a directory.)	Specify a correct directory for the parameter.
504	Command not implemented for that parameter	Parameter error of the commands	Input a correct value to the parameter of the command.
	the parameter (%s) is unknown.	Parameter syntax error. Commands are not recognized.	Check that syntax and commands are correctly input.
	Control session is already cleared, don't accept PROT command.	Failed to accept PROT command because encrypted communication was canceled (cleared).	—
	Only support parameter 'C' or 'P'.	Parameter syntax error. Commands are not recognized.	Check that syntax and commands are correctly input.
	Control session is already cleared, don't accept PBSZ command.	Failed to accept PBSZ command because encrypted communication was canceled (cleared).	—
	control session is already cleaned, cleaning control session is invalid.	Failed to accept CCC command because encrypted communication was canceled (cleared).	—
510	Command not supported.	Unsupported command	The input command is not supported. Input a supported command.
	Port open fails.	Port open failure	Opening the port has failed. Open the port.
	File open fails.	File open failure	Files could not be opened. Check that the files exist and the file name is correct.

Error code	Error message	Description	Corrective action
530	Not logged in.	Login failure	Check that the login name and password are correct. Check that the login name and password are correctly input.
	USER and PASS required	Command error (The command is executed without logging in.)	Log in and input commands.
	Requested action not taken.	Command execution failure	Check that commands are available.
	Can't access the file or the Directory.	Access unavailable	Check that the connection target can be accessed. Check that the connection target is allowed to be accessed.
	No files found or invalid directory or permission problem	The specified file or directory does not exist.	Check that the specified file or directory exists.
	%s:No such file or directory.	The file does not exist or the required operation is not allowed.	Check that the file exists. Enable the required operation and execute it again.
	Unimplemented TYPE %d	Unsupported transfer mode error	Send data in a supported transfer mode.
	%s: not a plain file	RETR, SIZE, MDTM command failure (The file is corrupted.)	Access a proper file.
551	Requested file action aborted.	Input file transfer error	Transfer the file again.
553	Requested action not taken.	File open failure (STOR)	The file may be damaged. Do not use the file and delete it.

Precautions

■Precautions for using FFFTP

When FFFTP is used with the FTP server function, [501 NLST: Options not supported] may be displayed on the screen and you may not be able to connect to the server.

In this case, conduct the following procedure to avoid errors.

1. Open the host list on FFFTP.
2. Select the [Special] tab.
3. Select [Use LIST command to get file list].
4. Click the [OK] button to close the dialog.

86 Transferring files between the GOT and peripheral devices (file transfer function (FTP transfer))

GT37 SoftGOT3000

☞ Page 2930 Overview of the file transfer function (FTP transfer)
☞ Page 2932 Specifications of the file transfer function (FTP transfer)
☞ Page 2935 How to use the file transfer function (FTP transfer)
☞ Page 2938 [File Transfer] (FTP transfer)
☞ Page 2948 Operation of the file transfer function (FTP transfer)
☞ Page 2954 Precautions
☞ Page 2956 Relevant settings
☞ Page 2957 Troubleshooting

PART 28

86.1 Overview of the file transfer function (FTP transfer)

GT37 SoftGOT3000

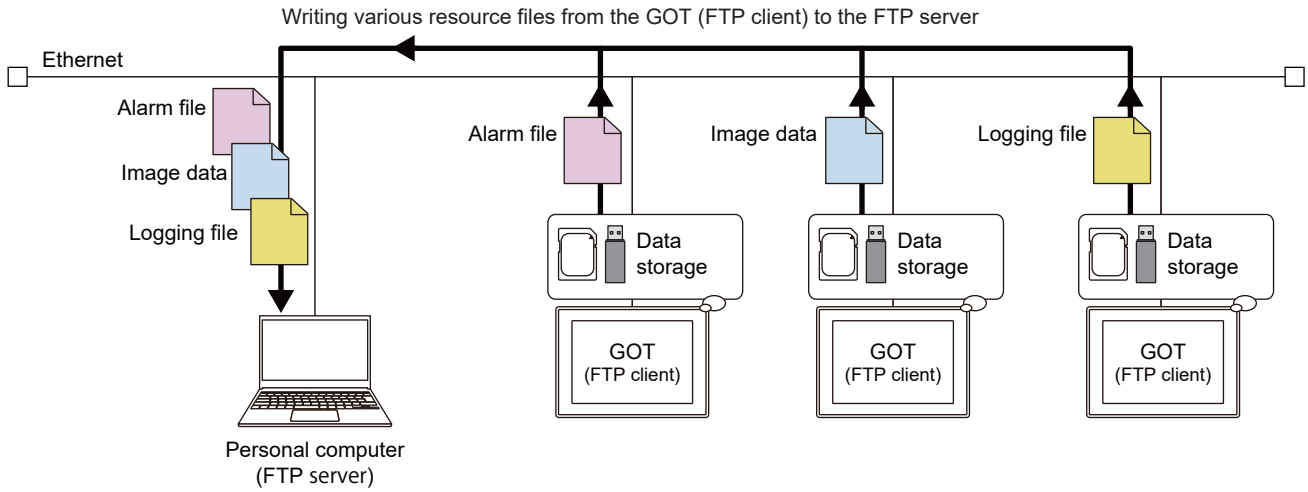
There are two types of file transfer functions: FTP transfer and GOT internal transfer.
FTP transfer enables you to read/write a file from/to an external FTP server via the GOT (FTP client).
GOT internal transfer enables you to copy or move files between folders within the GOT.
For information on GOT internal transfer, refer to the following.
☞ Page 2960 Transferring files between the GOT drives (file transfer function (GOT internal transfer))

Difference from the FTP server function

To read or write data between the GOT and an external device such as a personal computer, the FTP server function is also provided.
☞ Page 2904 Transferring files between the GOT and peripheral devices (FTP server function)
The FTP server function allows an FTP client, such as a personal computer, to read from or write to the GOT, which acts as an FTP server.
The file reading/writing timing depends on the operation of the personal computer and differs from the processing timing of the GOT.
To read the log file to the personal computer when the GOT has finished collecting logs, set up a method, for example, to monitor updates to the file using another application.
With the file transfer function (FTP transfer), the GOT can write/read the specified file to/from the FTP server when the trigger conditions are satisfied.
By performing trigger control, the GOT can manage the timing of file reading/writing, such as when files are generated or user operations occur.
This enables efficient data exchange with external personal computers.

Sending files from the GOT to the FTP server

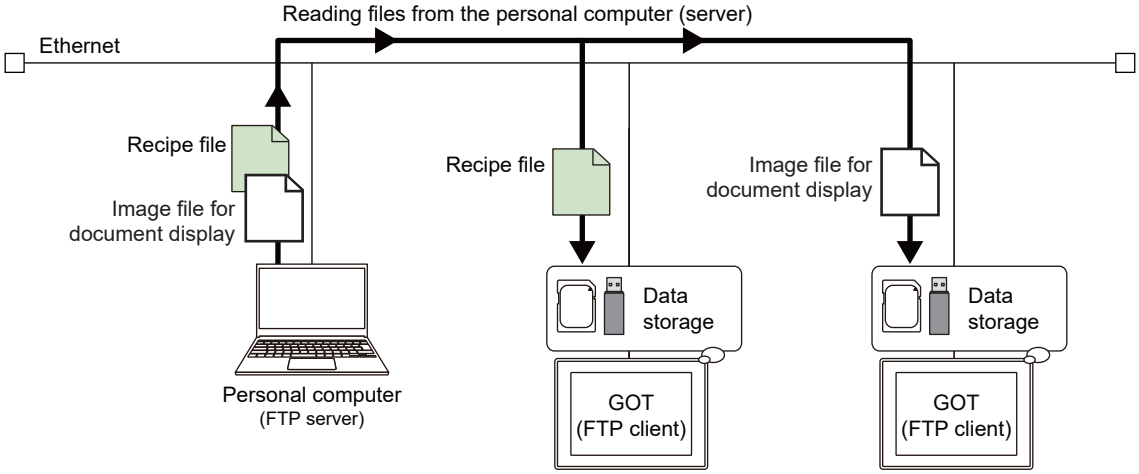
Resource files generated by the GOTs (alarm, logging, operation log, and other log files) and image files captured by the hard copy function are written to the personal computer (FTP server) via operations on the GOTs (FTP clients).



Obtaining the resource data from the FTP server

Files including resource data saved on the personal computer (FTP server) can be read via operations on the GOT (FTP client).

This function is used to obtain recipe files created on the personal computer and update the GOT recipe files, or to display image data saved on the personal computer on the GOT using a document display or other methods.



PART 28

86.2 Specifications of the file transfer function (FTP transfer)

GT37 SoftGOT3000

☞ Page 2932 System application (add-on function)
☞ Page 2932 Specifications of the FTP transfer
☞ Page 2933 FTP data transfer mode
☞ Page 2934 Encrypted communication
☞ Page 2934 Operation record (operation log)
☞ Page 2934 Character code
☞ Page 2934 Accessible range

86.2.1 System application (add-on function)

To use the file transfer function (FTP transfer), [File Transfer] must be selected from the system applications (add-on functions).
Selecting [Use the function of File Transfer] and configuring each setting in [File Transfer] in the [Controller Setting] window incorporate the application into the package data automatically.
☞ Page 2938 [File Transfer] (FTP transfer)

86.2.2 Specifications of the FTP transfer

The following shows the specifications of the file transfer function (FTP transfer).

Item	Specifications
Applicable FTP server	• FTP server compliant with RFC 959 • FTPS server compliant with RFC 2246 and RFC 4217 For the FTP servers whose operations have been validated by Mitsubishi Electric Corporation, refer to the following Technical Bulletin. 📖List of Devices Validated to Operate with the GOT3000 Series FTP Server Function/ File Transfer Function (GOT-A-0256)
Number of connectable FTP servers	Max. 64
Number of file transfer settings	Max. 100 (FTP transfer settings and GOT internal transfer settings in total; refer to Chapter 88)
Data communication methods and data formats	In the stream mode, the communication is performed with binary data.
Required devices for the file access	Data storage
Number of characters for file path	• <GOT folder path>\<Transfer file name>: Up to 78 one-byte alphanumeric characters and symbols in total (including backward slash marks) • <FTP server folder path>\<Transfer file name>: Up to 250 one-byte alphanumeric characters and symbols in total (including backward slash marks)

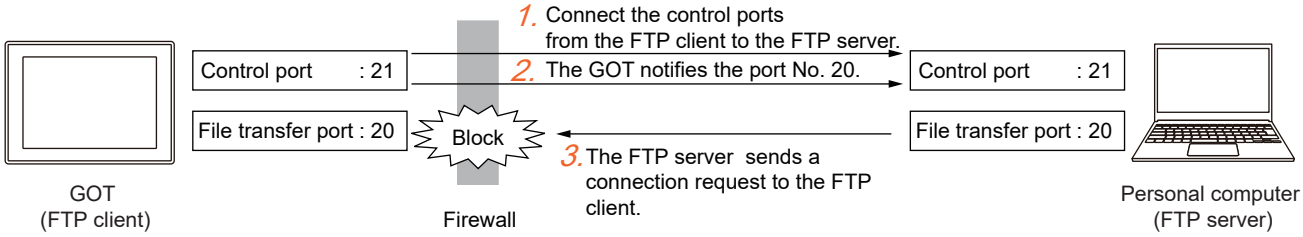
86.2.3 FTP data transfer mode

Specify PORT mode or PASV mode for the FTP connection method.

File transfer in PORT mode

1. Connect the control port of the GOT (FTP client) to the FTP server.
2. The GOT (FTP client) notifies the file transfer port number to the FTP server.
3. The FTP server sends a connection request to the GOT (FTP client) to send data using the notified port number.

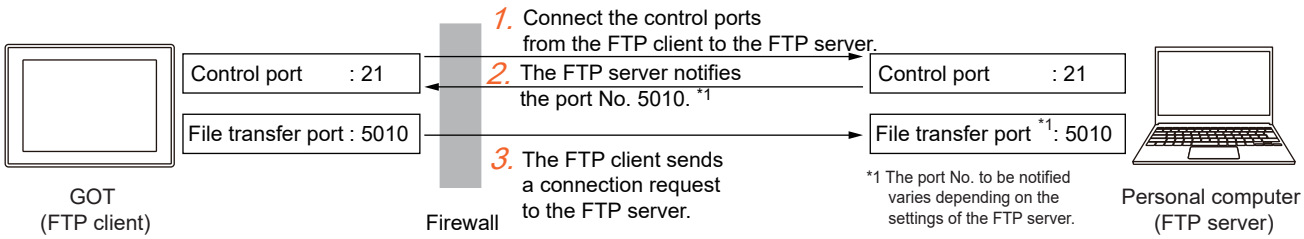
If the network is protected behind the firewall, the request is refused and thus the connection is not established.



File transfer in PASV mode

1. Connect the control port of the GOT (FTP client) to the FTP server.
2. The FTP server notifies the file transfer port number to the GOT (FTP client).
3. The GOT (FTP client) sends again a connection request to the FTP server for data communication using the notified port number.

Even if the network is protected behind the firewall, the connection is established.



PART 28

86.2.4 Encrypted communication

With the file transfer function (FTP transfer), you can specify whether to use FTPS, which encrypts the communication between the GOT and the FTP server.
FTPS can prevent problems caused by unauthorized access.
To use encrypted communication, configure the [Encryption Communication] setting in the [Destination FTP Server Setting] dialog.

86.2.5 Operation record (operation log)

Encrypted communication during use of the file transfer function (FTP transfer) is recorded in the operation log.
The following logs are recorded:

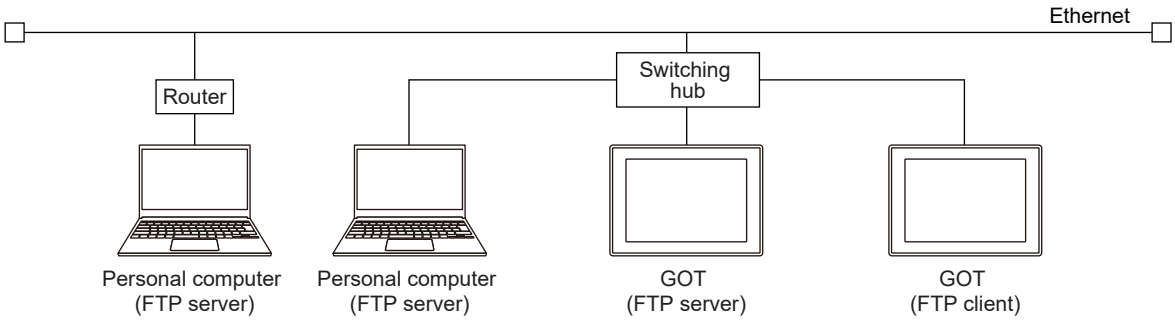
Log item	Event	FTP event	Remarks
Encrypted communication	Start of encrypted communication (connection)	When the FTPS connection starts	—
	Failed to start encrypted communication	When the FTPS connection fails to start	Certificate deficiencies or other issues
	End of encrypted communication (disconnection)	When the FTPS connection ends	—

86.2.6 Character code

The character code used for communication is UTF-8.
This also allows for reading and writing of files with multibyte character file names.

86.2.7 Accessible range

The GOT (FTP client) can access the FTP servers in the network to which the GOT is connected.
To connect to the FTP servers in a different network, the router is required.
The GOT (FTP client) also can access GOTs (FTP server).
If you use the GOT as an FTP server, write the project with the configured FTP server settings to the destination GOT.
☞ Page 2913 [FTP Server]

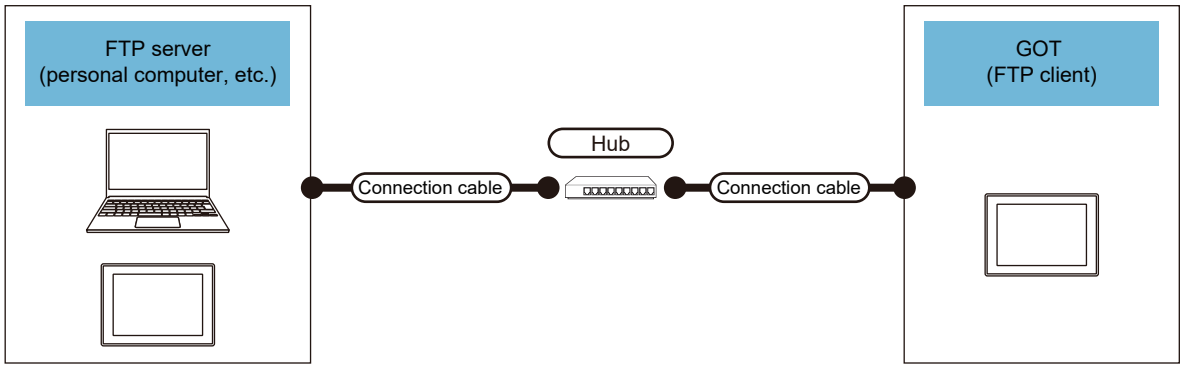


86.3 How to use the file transfer function (FTP transfer)

GT37 SoftGOT3000

☞ Page 2935 System configuration
☞ Page 2937 Setting procedure

86.3.1 System configuration



FTP server	Connection cable	GOT	
		Interface	Model
Personal computer GOT or other equipment	Shielded twisted pair cable	Built-in Ethernet interface of the GOT	GT37 SoftGOT3000

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

A straight cable is usable.
When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.
The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.
Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.
Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.
The maximum length depends on the Ethernet equipment used.
The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs.
For the limit, contact the switching hub manufacturer.

Precautions

■Countermeasures against access delay

When multiple network devices (including GOTs) are connected to the same segment, the network load increases and therefore the communication performance between the GOT and PLC may be degraded.

The following countermeasures may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

■Connection to the intranet

If the system needs to be secured against unauthorized access to the intranet, consult a network service provider or network administrator (someone responsible for tasks such as network planning and IP address management), and implement your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for any consequences that may arise from system troubles due to the intranet connection.

■When a firewall is used

If a firewall disconnects the communication of the file transfer function (FTP transfer), take countermeasures such as changing the firewall port number.

If the system needs to be secured against unauthorized access when changing the firewall port number, consult the network administrator (someone responsible for tasks such as network planning and IP address management), and implement your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for consequences that may arise from system troubles due to the change of the port number.

86.3.2 Setting procedure

The following shows the setting procedure for using the file transfer function (FTP transfer).

1. Consider the configuration of the whole system.

- Configuration of the whole system including controllers and GOTs
- Controller settings (including device assignment)
- GOT settings (including IP address, network number, and station number)

2. Connect the GOT and the controller.

☞ Page 2935 System configuration

3. In the [Controller Setting] window displayed by selecting [Common] → [Controller Setting] from the GT Designer3 menu, select [File Transfer] and then select [Use the function of File Transfer].

4. Configure the required settings for [Destination FTP Server Setting] and [File Transfer Setting].

☞ Page 2938 [File Transfer] (FTP transfer)

5. To encrypt communication data using FTPS, refer to the following to enable encrypted communication.

☞ Page 3072 Target functions for encrypted communication and required settings

6. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

7. Check the operation of the file transfer function (FTP transfer).

☞ Page 2948 Operation of the file transfer function (FTP transfer)

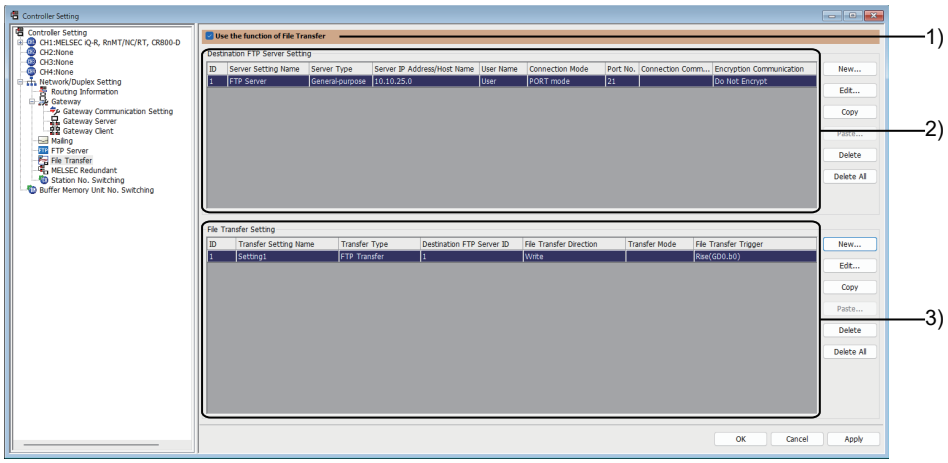
86.4 [File Transfer] (FTP transfer)

GT37 SoftGOT3000

On the [File Transfer] settings screen, register the destination FTP server and configure the combination of file transfer condition settings (file transfer settings).

Window

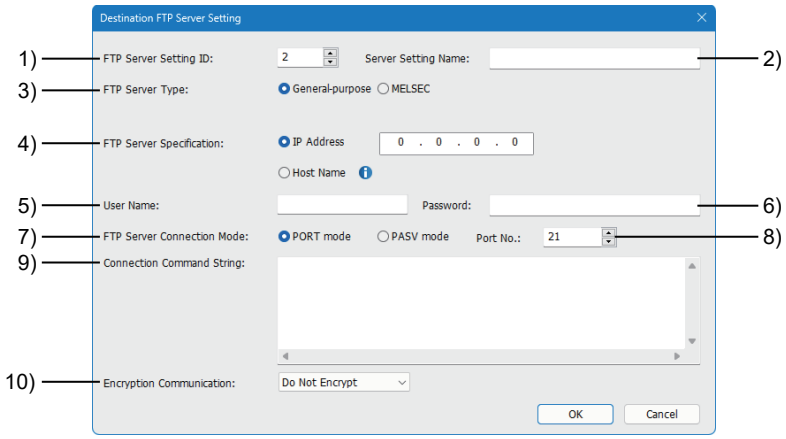
1. Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
2. Select [File Transfer] in the [Controller Setting] window.



Item			Description
1)	[Use the function of File Transfer]		Select this item when using the file transfer function.
2)	[Destination FTP Server Setting]	—	Lists the settings for connecting to FTP servers. Up to 64 FTP servers can be registered.
		[New] button	Adds a destination FTP server setting. Click the button to display the [Destination FTP Server Setting] dialog and add a new destination FTP server setting. ☞ Page 2939 [Destination FTP Server Setting] dialog
		[Edit] button	Changes a selected destination FTP server setting. Click the button to display the [Destination FTP Server Setting] dialog and edit the contents of the selected destination FTP server setting. ☞ Page 2939 [Destination FTP Server Setting] dialog
		[Copy] button	Click this button to copy the contents of the selected destination FTP server setting.
		[Paste] button	Pastes the copied contents of the destination FTP server setting. Click the button to display the [Destination FTP Server Setting] dialog and specify the destination FTP server setting ID.
		[Delete] button	Click this button to delete the contents of the selected destination FTP server setting.
		[Delete All] button	Click this button to delete the contents of all the destination FTP server settings.
3)	[File Transfer Setting]	—	Lists the file transfer settings. Up to 100 file transfer settings can be configured.
		[New] button	Adds a file transfer setting. Click the button to display the [File Transfer Setting] dialog and add a new file transfer setting. ☞ Page 2941 [File Transfer Setting] dialog (FTP transfer)
		[Edit] button	Changes a selected file transfer setting. Click the button to display the [File Transfer Setting] dialog and edit the contents of the selected file transfer setting. ☞ Page 2941 [File Transfer Setting] dialog (FTP transfer)
		[Copy] button	Copies the selected file transfer setting.
		[Paste] button	Pastes the copied file transfer setting to the specified destination. Click the button to display the [File Transfer Setting] dialog and specify the destination file transfer ID.
		[Delete] button	Deletes the selected file transfer setting.
		[Delete All] button	Deletes all the file transfer settings.

86.4.1 [Destination FTP Server Setting] dialog

Register the destination FTP server.



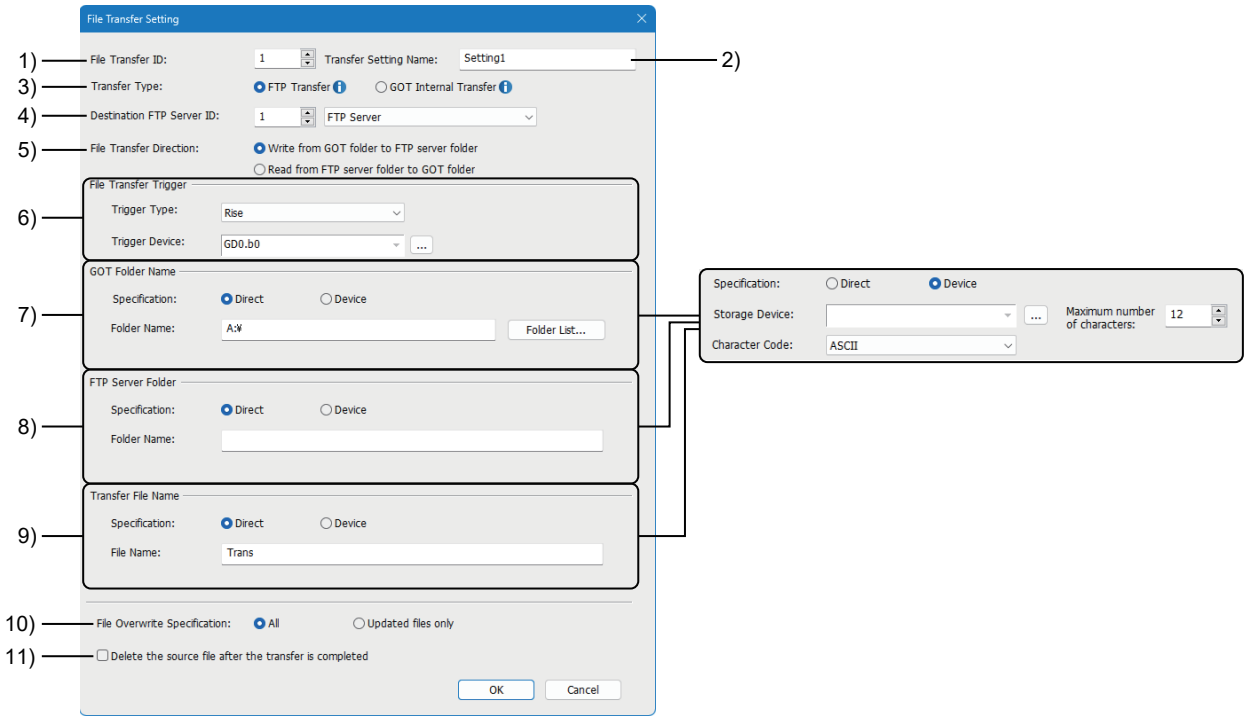
Item			Description
1)	[FTP Server Setting ID]		Set the ID to specify the destination FTP server setting. Set the number which does not overlap with that of other FTP server settings. The setting range is [1] to [32767].
2)	[Server Setting Name]		Set the name for the destination FTP server setting (optional). Up to 32 characters can be set.
3)	[FTP Server Type]	—	Select the type of the accessed FTP server. • [General-purpose] Select this item to access an FTP server other than a PLC. • [MELSEC] Select this item to access the FTP server function of the Mitsubishi Electric PLCs shown below. MELSEC MX Controller, MELSEC iQ-R series, MELSEC iQ-R (RnENCPU) series, MELSEC-QnUDV series, MELSEC-L series To access the MELSEC iQ-F series, select [General-purpose]. Even if you select [MELSEC] for the MELSEC iQ-F series, the GOT cannot communicate with the FTP server.
		[Remote Password]	This item appears when [MELSEC] is selected for [FTP Server Type]. Enter the remote password for the accessed PLC (FTP server).
4)	[FTP Server Specification]	—	Select the method of specifying the FTP server: [IP Address] or [Host Name].
		[IP Address]	Set the IP address of the destination FTP server. The setting range is [0.0.0.0] to [255.255.255.255].
		[Host Name]	Set the host name of the destination FTP server using up to 253 characters. One-byte alphanumeric characters (uppercase or lowercase) and symbols (hyphen (-) and period (.)) can be used. To specify the server with the host name, configure the DNS server settings in [GOT Ethernet Common Setting]. ☞ Page 717 [GOT Ethernet Common Setting]
5)	[User Name]		Up to 32 characters can be set as the user name for logging in to the FTP server. One-byte alphanumeric characters (uppercase or lowercase), one-byte spaces, and the following symbols can be used. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~
6)	[Password]		Up to 32 characters can be set as the password for logging in to the FTP server. One-byte alphanumeric characters (uppercase or lowercase), one-byte spaces, and the following symbols can be used. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~
7)	[FTP Server Connection Mode]		When [General-purpose] is selected for [FTP Server Type], set the connection mode for the FTP server. When [MELSEC] is selected for [FTP Server Type], this item is fixed to [PORT mode]. • [PORT mode] Select this item to connect in PORT mode. To access MELSEC iQ-F, select [PORT mode]. • [PASV mode] Select this item to establish connection in PASV mode.
8)	[Port No.]		Set the control port number of the FTP server to [21] or to a value between [1024] and [65535]. If an overlapped port No. is set, the communication with the FTP server may fail, or unexpected operation may occur in other equipment.

Item		Description
9)	[Connection Command String]	Set the command string to be issued when a connection with the FTP server is established. One-byte alphanumeric characters (uppercase or lowercase), one-byte spaces, and the following symbols can be used. ! " # $ % & ‘ ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~ Up to 10 lines with a maximum of 255 characters per line can be specified. For example, to enable writing to the GOT as an FTP server, specify [gtwr]. The available commands differ depending on FTP servers. For details, check the manual for the FTP server. The command string is sent only when the connection is established. It is not available for commands needed during the session.
10)	[Encryption Communication]	Specify whether to use encrypted communication when connecting to the FTP server. If you select [Encrypt (Explicit)] to encrypt communication data, refer to the following to enable encrypted communication. ☞ Page 3072 Target functions for encrypted communication and required settings

86.4.2 [File Transfer Setting] dialog (FTP transfer)

Set the transfer conditions.

Specify the destination FTP server, file transfer trigger, file transfer direction (write or read), write destination folder, transfer file name, and other details.



Item			Description
1)	[File Transfer ID]		Set the ID to specify the file transfer setting. Set the number which does not overlap with that of other file transfer settings. The setting range is [1] to [32767].
2)	[Transfer Setting Name]		Set the file transfer setting name (optional). Up to 32 characters can be set.
3)	[Transfer Type]		Select [FTP Transfer].
4)	[Destination FTP Server ID]		Set the destination FTP server setting ID for the file transfer. ☞ Page 2939 [Destination FTP Server Setting] dialog
5)	[File Transfer Direction]		Set the direction of the file transfer.
6)	[File Transfer Trigger]	—	Set the trigger to execute the file transfer.
		[Trigger Type]	Set the trigger type.
		[Trigger Device]	When selecting [Rise], [Fall], [ON Sampling], or [OFF Sampling] for the trigger type, set the bit device as the trigger device. ☞ Page 968 Trigger type settings

Item			Description
7)	[GOT Folder Name]	—	Set the folder path for the GOT (FTP client) to send and receive files. The folder division symbol "\" is not required at the end. The following drives are settable. Drive A Drive B Drive E Drive F Drive G Drive X (current drive) For the available drives by GOT model, refer to the following. ☞ 1Page 81 Drive configuration and capacity of the GOT For the restrictions on the folder name used in the GOT, refer to the following. ☞ 1Page 84 Restrictions for folder names and file names used in GOT
		[Specification]	Select a method to specify a GOT folder name. • [Direct] Select this item to enter the GOT folder name directly. • [Device] Select this item to specify the GOT folder indirectly with a device.
		[Folder Name]	When selecting [Direct] for [Specification], enter the folder name directly. Up to 76 one-byte alphanumeric characters and symbols can be entered for the folder path. If this field is left blank, the setting defaults to [A:\]. To select a GOT (FTP client) folder from the folders set in GT Designer3, click the [Folder List] button. Click the button to display the [Folder List] dialog and select the save destination folder name from the displayed list. ☞ Page 2945 [Folder List] dialog The selected item in the [Folder List] dialog is applied only to [GOT Folder Name]. It is not applied to [Transfer File Name].
		[Storage Device]	When selecting [Device] for [Specification], set the start device of consecutive word devices that store the GOT folder name. The number of the consecutive word devices is equal to half the set value of [Maximum number of characters] (fractions are rounded up). ☞ Page 2946 Indirect specification of folder names and file names
		[Maximum number of characters]	Set the maximum number of characters for the GOT folder name. The setting range is [8] to [76].
		[Character Code]	The folder name string is stored in the storage device using the specified character code.
8)	[FTP Server Folder]	—	Set the folder path for the FTP server to send and receive files. If the specified folder does not exist, the folder is automatically created. To access the default folder of the FTP server, do not specify a folder. Example) When the default folder of the FTP server is set to \root\ftp\file\ If no folder is specified, the GOT will access the default folder (\root\ftp\file\). If \hoge\ is specified, the GOT will access the specified folder (\root\ftp\file\hoge\). Up to 250 one-byte alphanumeric characters and symbols are settable for the folder path. The maximum number of characters and available characters differ depending on the specifications of the FTP server. Check the manual of the FTP server before setting. The folder division symbol "\" is not required at the end. For the restrictions on the folder name used in the GOT, refer to the following. ☞ 1Page 84 Restrictions for folder names and file names used in GOT
		[Specification]	Select the method of specifying the FTP server folder. • [Direct] Select this item to enter the FTP server folder name directly. • [Device] Select this item to specify the FTP server folder indirectly with a device.
		[Folder Name]	When selecting [Direct] for [Specification], enter the folder name directly.
		[Storage Device]	When selecting [Device] for [Specification], set the start device of consecutive word devices that store the FTP server folder name. The number of the consecutive word devices is equal to half the set value of [Maximum number of characters] (fractions are rounded up). ☞ Page 2946 Indirect specification of folder names and file names
		[Maximum number of characters]	Set the maximum number of characters for the FTP server folder name. The setting range is [8] to [250].
		[Character Code]	The folder name string is stored in the storage device using the specified character code.

Item			Description
9)	[Transfer File Name]	—	Set a transfer file name. Up to 75 one-byte alphanumeric characters and symbols are settable for the file name. One wildcard character can be used in the transfer file name. ☞ Page 2947 Specifying the transfer file with a wild card For the restrictions of the file name used in the GOT, refer to the following. ☞ 1Page 84 Restrictions for folder names and file names used in GOT
		[Specification]	Select the method of specifying the transfer file name. • [Direct] Select this item to enter the transfer file name directly. • [Device] Select this item to specify the transfer file name indirectly with a device.
		[File Name]	When selecting [Direct] for [Specification], enter the transfer file name directly.
		[Storage Device]	When selecting [Device] for [Specification], set the start device of consecutive word devices that store the transfer file name. The number of the consecutive word devices is equal to half the set value of [Maximum number of characters] (fractions are rounded up). ☞ Page 2946 [File Transfer Setting] dialog (FTP transfer)
		[Maximum number of characters]	Set the maximum number of characters for the transfer file name. The setting range is [8] to [75].
		[Character Code]	The file name string is stored in the storage device using the specified character code.
10)	[File Overwrite Specification]		Set the behavior to be performed when the transfer destination folder has a file with the same name as the transfer file. • [All] Overwrites files each time. • [Updated files only] Overwrites an existing file in the transfer destination folder only when the time stamp of the transfer file is equal to or newer than that of the existing file. Otherwise, the file is not transferred. For information on the time stamp of the transfer file, refer to the following. ☞ Page 2943 Time stamp of the transfer file ☞ Page 2943 GOT (FTP client) time and FTP server time
11)	[Delete the source file after the transfer is completed]		Select this item to delete the source file after the transfer is completed. Note the following when selecting this item. • Do not delete the files that the GOT refers to, such as a logging file, from the GOT folder. Otherwise, you cannot view such data on the GOT. • When specifying the transfer file name with a wildcard character, you may delete a required file unintentionally. If the transfer source folder has a required file, take one of the following measures. ◇Deselect [Delete the source file after the transfer is completed]. ◇Check in advance that only the files to be transferred are included when specifying the transfer file name with a wildcard character.

Point

To transfer only the logging files that are updated by the logging function, select [Updated files only]. Since the transferred files are not resent, the file transfer efficiency is increased.

Precautions

■Time stamp of the transfer file

The time stamp of the transfer file indicates the time taken from the destination FTP server when the file transfer to the destination folder is completed.

Depending on the destination FTP server, the time stamp of the transfer file may not be obtained.

In this case, the transfer file is overwritten each time regardless of the setting of [File Overwrite Specification].

■GOT (FTP client) time and FTP server time

When selecting [Updated files only] for [File Overwrite Specification], set the GOT (FTP client) time and FTP server time to be the same.

The time stamp of the transfer file indicates the time taken from the destination FTP server when the file transfer to the destination folder is completed.

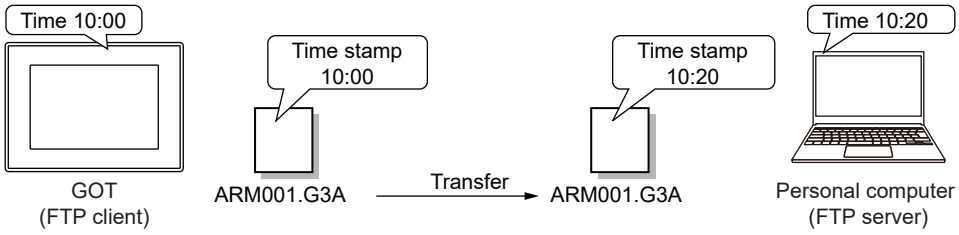
Therefore, when the GOT (FTP client) time and FTP server time are different, the latest file may be regarded as older than the file transferred last time.

In this case, the file is not transferred.

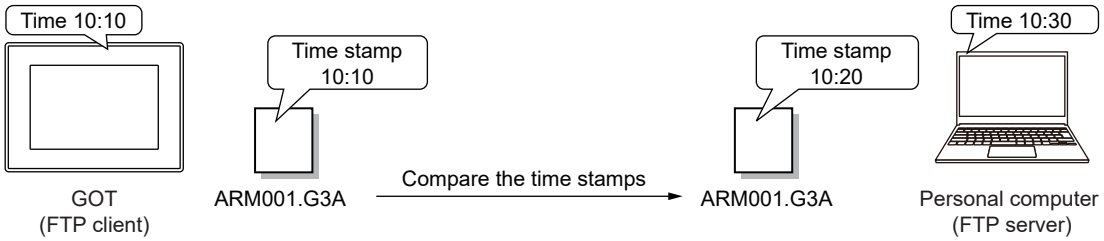
Ex.

When the time difference is 20 minutes between the GOT (FTP client) and personal computer (FTP server)

1. The GOT (FTP client) transfers the file created at 10:00.



2. The time stamps of the file created at 10:10 and the file on the server are compared.



3. Since the file is not recognized as the latest, the GOT does not transfer the file.

Select [All] for [File Overwrite Specification] if the time difference between the installation locations of the GOT (FTP client) and FTP server exists.

If the time difference between the installation locations exists, the GOT time and FTP server time may differ even the both time are set correctly. Therefore the time stamps cannot be compared properly.

■Indication in the file list of the FTP server

The GOT (FTP client) is compatible with the FTP servers that use alphanumerics to show the date and time information of the files in the file list.

If an FTP server uses characters other than alphanumerics such as Japanese kanji in the file list, the files cannot be transferred.

Configure the settings including the OS setting on the FTP server so that the FTP server uses alphanumerics to show the information in the file list.

To check the file list of the FTP server, issue a dir command or a list command in the command prompt on a personal computer that is connected to the FTP server.

Ex.

When the file list is displayed using alphanumeric characters

The server is compatible with the GOT (FTP client).

```
02-08-25  05:30PM              348000 sample1.txt
11-02-25  10:30AM              234000 sample2.txt
                                    :
```

Ex.

When the file list is displayed using alphanumeric characters

The server is compatible with the GOT (FTP client).

```
-rwxrwxrwx   1 owner   group      348000 Feb 8 17:30 sample1.txt
-rwxrwxrwx   1 owner   group      234000 Nov 2 10:30 sample2.txt
                                    :
```

Ex.

When the file list is displayed in Japanese characters

The FTP server is incompatible with the GOT (FTP client).

```
-rwxrwxrwx  1 owner  group      348000  2月 8日 17:30 sample1.txt
-rwxrwxrwx  1 owner  group      234000 11月 2日 10:30 sample2.txt
                                    :
```

■Folder path and transfer file name

The total number of characters of the folder path and transfer file name must be set as shown below.

If the total number of the characters exceeds the following limits, an error occurs.

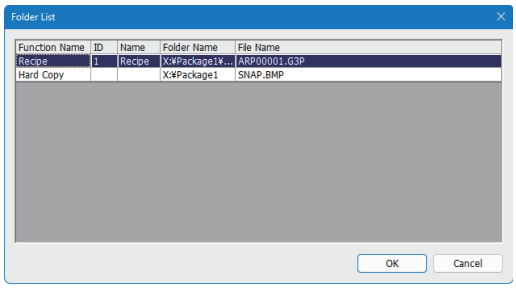
<GOT folder path>\<Transfer file name>: 78 characters or less (including backward slash marks)
<FTP server folder path>\<Transfer file name>: 250 characters or less (including backward slash marks)

Specify the folder path and transfer file name by using one-byte alphanumeric characters and symbols.

If you use two-byte characters, the specified file cannot be transferred.

[Folder List] dialog

When various function settings are configured in the project, the save destination folder names set for each function are displayed in the [Folder List] dialog.



The contents displayed in each item and display conditions are as follows.

Function name	Display condition	Items in the [Folder List] dialog			
		[ID]	[Name]	[Folder Name]	[File Name]
Comment	[Read comment data from the memory card] is selected in [Comment Group Property] - [Option Setting].	[Comment Group Property] - [Group No.]	Title field of [Comment Group Property]	[Drive Name] and [Folder Name] in the [Destination] dialog	[File Name] in the [Destination] dialog
User alarm monitoring	[Save alarm log files] is selected in [User Alarm Observation] - [File Save].	[User Alarm Observation] - [Basic] - [Alarm ID]	[User Alarm Observation] - [Basic] - [Alarm Name]	[Drive Name] and [Folder Name] for [Save Destination] in [File Save]	[File Save] - [Save Destination] - [File Name]
	[Save alarm log files] is selected in [User Alarm Observation] - [File Save], and [Destination] is set to [Change] in [User Alarm Observation] - [File Save] - [File Convert].			[Drive Name] and [Folder Name] for [Destination] in [File Save] - [File Convert]	[File Name] for [Destination] in [File Save] - [File Convert]
System alarm monitoring	[Save alarm log files] is selected in [System Alarm Observation] - [File Save].	(Blank)	(Blank)	[Drive Name] and [Folder Name] for [Save Destination] in [File Save]	[File Save] - [Save Destination] - [File Name]
	[Save alarm log files] is selected [System Alarm Observation] - [File Save], and [Destination] is set to [Change] in [System Alarm Observation] - [File Save] - [File Convert].			[Drive Name] and [Folder Name] for [Destination] in [File Save] - [File Convert]	[File Name] for [Destination] in [File Save] - [File Convert]

Function name	Display condition	Items in the [Folder List] dialog			
		[ID]	[Name]	[Folder Name]	[File Name]
Logging	When creating a logging setting (when [Logging List] - [(Logging List)] is not blank)	[Logging] - [Logging ID]	[Logging] - [Logging Name]	[Drive Name] and [Folder Name] in [Logging] - [Destination]	[File Name] in [Logging] - [Destination]
	[Output additional file] is selected in [Logging]			[Drive Name] and [Folder Name] in [Logging] - [Output additional file]	[File Name] in [Logging] - [Output additional file]
Recipe	[Data Storage (Recipe File)(read and write)] is selected in [Recipe] - [Basic] - [Recipe Data Save Location]	[Recipe] - [Basic] - [Recipe No.]	[Recipe] - [Basic] - [Recipe Name]	[Drive Name] and [Folder Name] in [Recipe] - [Basic]	[File name] in [Recipe] - [Basic]
	[Enable the file conversion external control] is selected in [Recipe] - [File Save].			[Drive Name] and [Folder Name] in [Recipe] - [File Save]	[File Name] in [Recipe] - [File Save]
Operation Log	[Collect operation logs] is selected in [GOT Environmental Setting] - [Operation Log] - [Basic].	(Blank)	(Blank)	[Save to] and [Folder Name] in [Basic]	[File Name] in [Basic]
	[Collect operation logs] is selected in [GOT Environmental Setting] - [Operation Log] - [Basic]. and [Save to] is set to [Change] in [GOT Environmental Setting] - [Operation Log] - [File Conversion].			[Drive Name] and [Folder Name] in [File Conversion]	[File Name] in [Drive Conversion]
Hard copy	[File] or [File + Printer] in [Hard Copy] - [Destination]	(Blank)	(Blank)	[Drive Name] and [Folder Name] for [File]	[File Name] for [File]
Digital image recording	[Operation Mode] is set to [Digital Image Recording] in [Digital Image Input/Recording]	(Blank)	(Blank)	[Drive Name] and [Folder Name] in [Recording Setting]	[File Name] in [Recording Setting]

Indirect specification of folder names and file names

When [Device] is selected for [Specification] in the folder name or file name setting, consecutive word devices starting from a specified device store the folder name or file name.

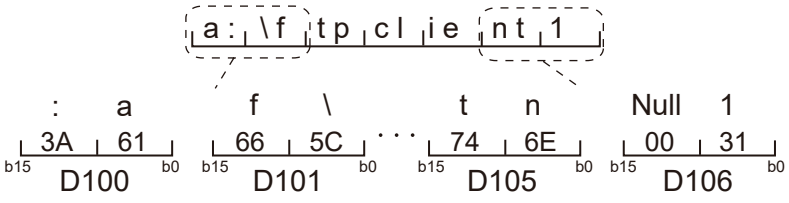
The number of the consecutive word devices is equal to half the set value of [Maximum number of characters] (fractions are rounded up).

Store the folder name or file name in ASCII code in each device, from the lower bit to the upper bit.

Store Null (0x00) at the end of the folder name.

Ex.

Example) Specifying the [ftpclient1] folder on drive A



Specifying the transfer file with a wild card

Use a wild card under the following conditions.

• Only [*] can be used as a wild card.

Example of valid use: [ARP*.DAT]

Example of invalid use: [ARP?????.DAT] .DAT]

• Only one [*] can be used.

However, only [*.*] is an exception.

Example of valid use: [*.DAT]

Example of invalid use: [ARP*.*]

• You can use [*] only immediately before [.] (period) for the file name.

Example of valid use: [ARP*.DAT]

Example of invalid use: [ARP*01.DAT]

• When you use [*] in the extension part of the file name, the extension must consist of the wild card only.

Example of valid use: [ARP00001.*]

Example of invalid use: [ARP00001.*AT]

Precautions

If the file name is specified with a wildcard character, a warning may be given at a file transfer.

Even if a warning is given, the file transfer process does not stop.

However, the file transfer may fail due to other causes, such as an invalid transfer file name or write-protect transfer destination folder.

Check the error code stored in the File Transfer Error No. (GS989), eliminate the cause, and then perform the file transfer again.

☞ Page 2958 Error codes for the file transfer function

PART 28

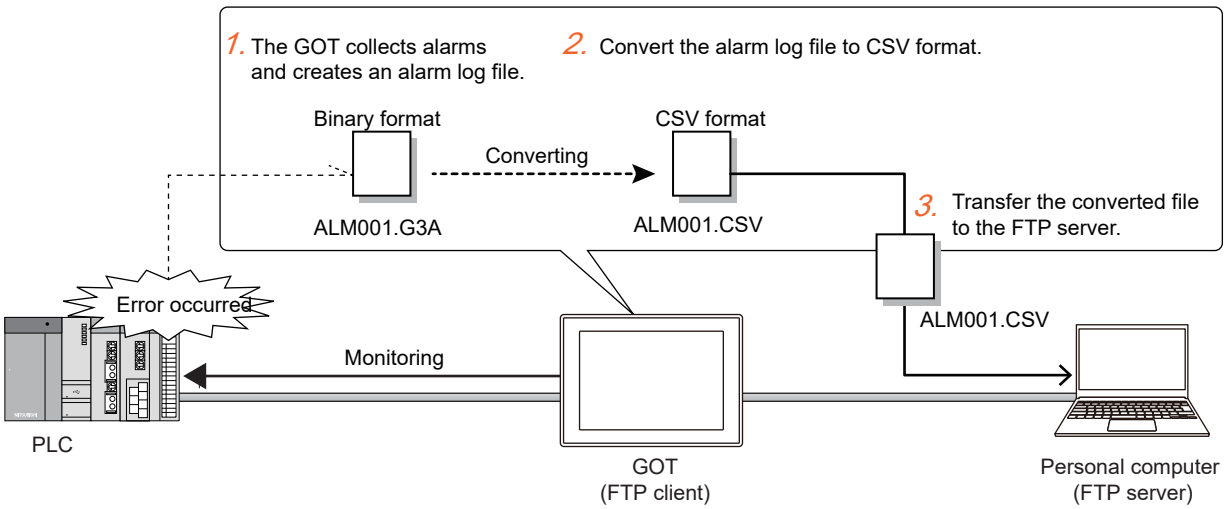
86.5 Operation of the file transfer function (FTP transfer)

GT37 SoftGOT3000

☞ Page 2948 Sending an alarm log file (application example)
☞ Page 2951 Checking the processing status
☞ Page 2953 Operation when the file transfer trigger conditions are satisfied

86.5.1 Sending an alarm log file (application example)

The following shows an example of converting the file of alarm logs collected by the GOT to a CSV file and writing it to an FTP server.
The file conversion is optional.



1. The GOT creates an alarm log file based on the collected alarm data.
2. Convert the alarm log file from the binary format to the CSV format by using the convert trigger device for the file.
3. Transfer the converted file to the FTP server.

Required settings

This application example requires the following settings.

■Alarm settings

Setting	Description		Reference
[Alarm Common Setting]	[Convert trigger device]	Set any bit device.	☞ Page 2043 [Alarm Common Setting] dialog
	[Convert-in-motion notification device]		
[User Alarm Observation]	[Basic] tab	Set the method of collecting the history. Select [Historical] or [Cumulative].	☞ Page 2045 [User Alarm Observation] dialog
	[Device] tab	Set the target device for observation.	
	[File Save] tab	Select [Save alarm log files] and set the save destination for the log file and the storage trigger. Select [Rise] for the trigger type of the storage trigger.	

■Settings of the file transfer function (FTP transfer)

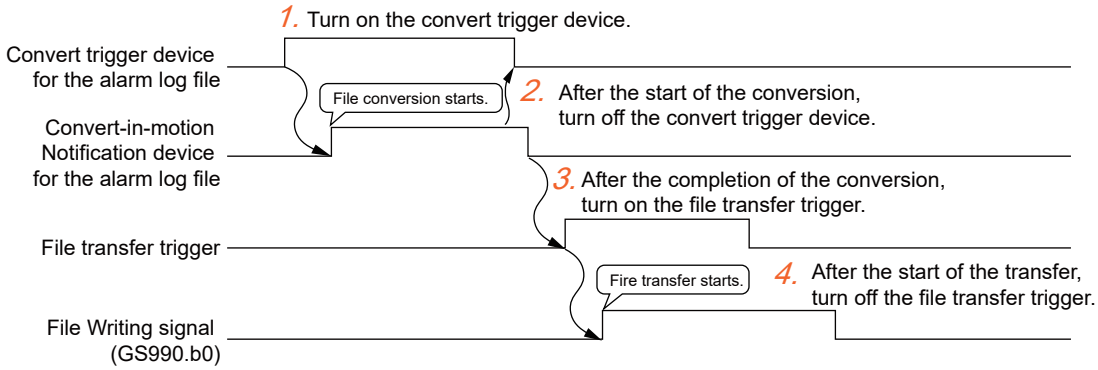
Setting	Description		Reference
[Destination FTP Server Setting]	Set the FTP server as the data transfer destination.		☞ Page 2939 [Destination FTP Server Setting] dialog
[File Transfer Setting]	[Transfer Type]	Select [FTP Transfer].	☞ Page 2941 [File Transfer Setting] dialog (FTP transfer)
	[File Transfer Trigger]	Set [Rise].	
	[Transfer File Name]	Set the name of the alarm log file specified in the alarm monitoring.	

■GOT special register (GS)

Setting	Description	Reference
GS990.b0	File Writing signal	☞ Page 2951 Write device

Action

The following shows an example of converting and transferring an alarm log file.



1. Turn on the convert trigger device for the alarm log file.

The GOT starts the file conversion and the Convert-in-motion Notification device turns on.

2. Turn off the convert trigger device after the start of the file conversion.

Upon completion of the file conversion, the Convert-in-motion Notification device turns off.

3. Turn on the file transfer trigger.

The GOT starts the file transfer and the File Writing signal (GS990.b0) turns on.

4. Turn off the file transfer trigger after the start of the file transfer.

Upon completion of the file transfer, the File Writing signal (GS990.b0) turns off.

For the convert trigger device for the alarm log file, refer to the following.

☞ Page 2043 [Alarm Common Setting] dialog

Turning on the file transfer trigger automatically

In the example above, the user needs to turn on the file transfer trigger after the file conversion.
The user also needs to turn off the convert trigger device for the alarm log file and file transfer trigger after the start of the processing.
Using two project scripts enables these operations to be performed automatically.
The following shows an example of settings.

■Device

Device name	Device number	Script which uses the device
Convert-in-motion Notification device for the alarm log file	GB100	Script No.1
Trigger device for script No.1		
Convert trigger device for the alarm log file	GB105	Script No.1
File transfer trigger	GB110	Script No.1, script No.2
File Writing signal	GS990.b0	Script No. 2
Trigger device for script No.2		

■Project script settings

Script No.	Description	Script
Script No.1	Set [Rise] for the trigger type. Use the Convert-in-motion Notification device for the alarm log file as the trigger device.	set([b: GB110]); //File transfer trigger ON rst([b: GB105]); // Alarm log file convert trigger OFF
Script No. 2	Set [Rise] for the trigger type. Use the File Writing signal (GS990.b0) as the trigger device.	rst([b: GB110]); //File transfer trigger OFF

86.5.2 Checking the processing status

With the file transfer function (FTP transfer), you can check the file transfer status, errors, and other relevant information by using GOT special registers (GS).

For details on the devices, refer to the following.

☞ Page 3581 GOT special register (GS)

Read device

Device	Name		Description
GS401	File Transfer Control		Controls the file transfer.
	b0	Clear File Transfer Error signal	Turn on this signal to clear the error code stored in the following device or to turn off the following signals. • File Transfer Error No. (GS989) • Warning signal (GS990.b14) • File Transfer Error signal (GS990.b15)
GS402	File Transfer Timeout Time		Set the timeout period for the file transfer. The default is 3 seconds. The setting range is [1] to [300] second(s). When the device value is set to 0 or 301 (or more), [3] seconds is applied.

Write device

Device	Name		Description
GS987	Executing File Transfer ID Notification		Stores the file transfer ID of the file transfer in execution.
GS988	Communicating FTP Server ID Notification		Stores the FTP server setting ID of the currently connected destination FTP server.
GS989	File Transfer Error No.		Stores the error code of an error that occurred in the file transfer. Turn on GS401.b0 to clear the stored error code. ☞ Page 2958 Error codes for the file transfer function
GS990	File Transfer Status		Notifies the file transfer processing status.
	b0	File Writing signal	Turns on when the GOT (FTP client) writes files to the FTP server. When [Trigger Type] is [Rise] or [Fall], this bit turns off when the trigger condition is dissatisfied after the file writing.
	b1	File Reading signal	Turns on when the GOT (FTP client) reads files from the FTP server.
	b2	FTP Server Connection Mode signal	Notifies the connection mode of the GOT (FTP client) and the FTP server. ON: PASV mode OFF: PORT mode
	b14	Warning signal	Turns on when the error with which the processing can be continued occurs during the file transfer. Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.
	b15	File Transfer Error signal	Turns on when the error with which the processing cannot be continued occurs during the file transfer. Files cannot be transferred while this signal is on. Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.
GS991	Number of Transfer Target Files		Stores the total number of files to be transferred. When the transfer file name is specified with the wild card, the total count includes the files which are not transferred due to an invalid number of characters for the folder name or other causes. However, the total count does not include files with invalid names, such as those consisting of two-byte characters. Holds the device value until the processing for the next file transfer ID is started.
GS992	Number of Transferred Files		Stores the total number of the files already transferred. The total count includes the files which are not transferred due to the error or other causes. Holds the device value until the processing for the next file transfer ID is started.

Precautions

■Handling of a file transfer error

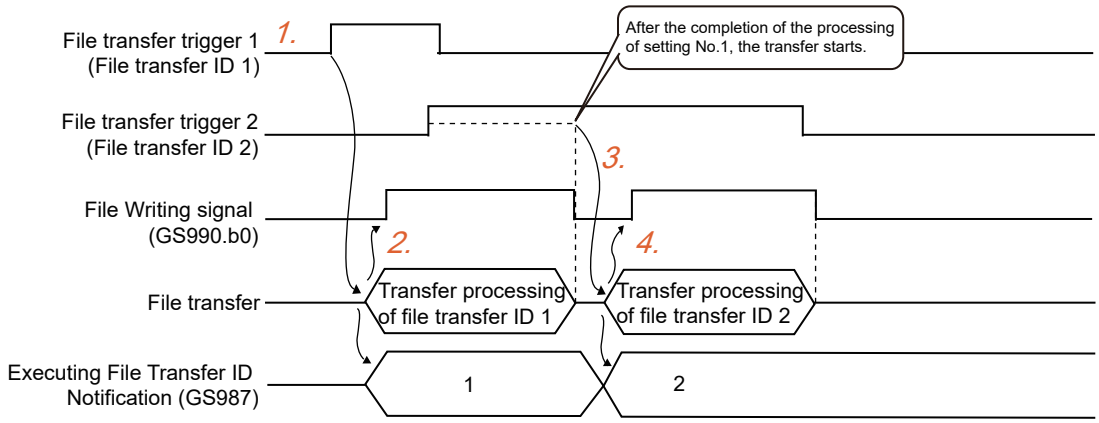
If an error occurs in the file transfer, turn on the Clear File Transfer Error signal (GS401.b0).

Upon turn-on of GS401.b0, the File Transfer Error signal (GS990.b15) is turned off.

While the File Transfer Error signal (GS990.b15) is on, the GOT does not start transferring the subsequent files because the file transfer is recognized to have an error.

86.5.3 Operation when the file transfer trigger conditions are satisfied

The following shows an operation example of the file transfer function when the conditions of two file transfer triggers are satisfied sequentially.



1. When the condition of file transfer trigger 1 is satisfied, the GOT starts the file transfer for file transfer ID 1.

2. The File Writing signal (GS990.b0) turns on, and the Executing File Transfer ID Notification device (GS987) stores 1.

3. While the File Writing signal (GS990.b0) is on, even if the condition of file transfer trigger 2 is satisfied, the GOT does not start the file transfer for file transfer ID 2.

Upon completion of the file transfer for file transfer ID 1, the File Writing signal (GS990.b0) turns off.

Then, the GOT starts the file transfer for file transfer ID 2.

4. The File Writing signal (GS990.b0) turns on, and the Executing File Transfer ID Notification device (GS987) stores 2.

Upon completion of the file transfer for file transfer ID 2, the File Writing signal (GS990.b0) turns off.

File transfer trigger at GOT startup

When the trigger type of the file transfer trigger is [Rise] and the trigger device is on at GOT startup, the trigger condition is satisfied.

When the trigger type is [Rise] and the trigger device is off, the trigger condition is also satisfied.

File transfer trigger condition satisfied during file transfer

A file transfer trigger condition satisfied during file transfer is processed as shown below.

■Trigger for the same file transfer setting

The file transfer trigger does not start the transfer even if the condition is satisfied.

■Trigger for a different file transfer setting

When the file transfer trigger condition is satisfied, the file is transferred after the previous file transfer is completed.

When multiple trigger conditions are satisfied during the file transfer, the files are transferred in order of the file transfer setting ID.

Trigger type of the file transfer trigger

When [Rise] or [Fall] is set for [Trigger Type] of the file transfer trigger, be sure to dissatisfy the trigger condition after the file transfer is started.

When the trigger condition remains satisfied, the File Writing Notification signal (GS990.b0) does not turn off even when the file transfer is completed.

86.6 Precautions

GT37 SoftGOT3000

☞ Page 2954 Precautions for transferring files
☞ Page 2955 Restrictions when using MELSEC iQ-F as an FTP server

86.6.1 Precautions for transferring files

The following shows the precautions for transferring files.

Offline status of the GOT

When the GOT becomes offline during the file transfer, the file transfer is interrupted.
During the file transfer, do not perform the operation that causes the GOT to be offline, such as establishing the communication with GT Designer3.

Using a recipe while a recipe file is transferred

Do not use the recipe while you transfer the recipe file to the GOT.
If the recipe file in the data storage is deleted while the recipe is processed, the function may not be performed properly.
If the recipe file is deleted even while the recipe is not processed, the error (system alarm: recipe file error) occurs when the recipe is performed next time.

Power off during the access to the data storage

Do not power off the GOT while the FTP server is accessing the file in the data storage of the GOT.
Doing so may cause the data corruption in the data storage.

File password when the FTP server function of a Mitsubishi Electric PLC is used

When the FTP server function of a Mitsubishi Electric PLC is used, the GOT cannot transfer a password-protected file.
Do not set a password for the file to be transferred with the file transfer function (FTP transfer).

Creating a folder when the FTP server function of a Mitsubishi Electric PLC is used

When you use the FTP server function of a Mitsubishi Electric PLC, the GOT cannot create a folder in the PLC by using the file transfer function (FTP transfer).
Create a file transfer destination folder in advance.

86.6.2 Restrictions when using MELSEC iQ-F as an FTP server

When using MELSEC iQ-F as an FTP server, note the following restrictions.

Setting the FTP server type

Select [General-purpose] for [FTP Server Type] in the [Destination FTP Server Setting] dialog.

If you select [MELSEC], the GOT cannot communicate with the FTP server.

Access in PASV mode

Set [FTP Server Connection Mode] to [PORT mode] in the [Destination FTP Server Setting] dialog.

The GOT cannot access the FTP server in PASV mode.

Writing files to the FTP server

Do not write files to the FTP server.

This operation is not available.

Only file reading is available.

86.7 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings other than those specific to the file transfer function (FTP transfer) as required.

86.7.1 GOT internal devices

☞ Page 3581 GOT special register (GS)

Function	Setting item
Turning on this signal to clear an error that occurred in the file transfer	GS401.b0
Setting the timeout period for FTP communication	GS402
Storing the file transfer ID of the file transfer in execution	GS987
Storing the FTP server setting ID of the connected FTP server	GS988
Storing the error code of an error that occurred in the file transfer	GS989
Notifying the file transfer processing status	GS990
Storing the total number of files to be transferred	GS991
Storing the total number of transferred files	GS992

86.8 Troubleshooting

GT37 SoftGOT3000

☞ Page 2957 Troubleshooting for the file transfer function (FTP transfer)
☞ Page 2958 Error codes for the file transfer function

86.8.1 Troubleshooting for the file transfer function (FTP transfer)

The following shows the troubleshooting for the file transfer function (FTP transfer).

Symptom		Error details	Corrective action
The file transfer function (FTP transfer) does not work.	When all the bits of GS200 are off and the GOT does not respond to the ping command *1*2	The system application (add-on function) for the file transfer function is not installed on the GOT.	Write the package data that contains the system application (add-on function) for the file transfer function to the GOT.
		No IP address has been set for the GOT.	Set the IP address for the GOT in the utility of the GOT.
	If any bit of GS200 is on and the GOT responds to the ping command *1*2	—	Refer to the troubleshooting for the functions corresponding to the bits that are on, and take corrective actions.
File cannot be transferred.		The system application (add-on function) for the file transfer function is not installed on the GOT.	Write the package data that contains the system application (add-on function) for the file transfer function to the GOT. ☞ Page 408 Transferring data to the GOT
		The connection setting with the FTP server is not configured properly.	Check the followings in [Destination FTP Server Setting]. • FTP server IP address, connection mode, and port No. • User name and password
		The FTP server is not working.	Check if the FTP server has stopped.

*1 For details on the Gateway Common Information (GS200), refer to the following.
☞ Page 3581 GOT special register (GS)

*2 To check if the GOT responds to the ping command, execute it from the personal computer to the GOT.

PART 28

86.8.2 Error codes for the file transfer function

The following lists the error codes that are stored in the GOT special register, GS989 (File Transfer Error No.).

Error code	Error details	Corrective action
1	The connection to the FTP server has failed.	• Check the IP address of the FTP server. • Check if a cable is connected. • Check the connection status of the HUB. • Check if the FTP server is working on the target device. • Check if the setting in [Destination FTP Server Setting] is configured properly.
2	Authentication of the FTP server has failed.	Check if the login username and the password for the accessed FTP server are correct.
	The authentication using the remote password has failed.	Check if the remote password for the PLC is correct.
3	FTP server Busy	The FTP server is not ready to accept client requests (busy state). Wait until it is ready.
4	FTP communication timeout	• Check if the communication line has not been physically interrupted. • Check the communication congestion.
5	Access to the target file to be written has failed.	• Check if the write destination drive is enabled. • Check if the write destination drive has enough available space. • Check if the file is not write-prohibited. • When using the GOT as the FTP server, check if the GOT is in the write enable mode. • When using the FTP server function of the PLC, check if a write destination folder exists. If no write destination folder exists, create one. • When using the FTP server function of the PLC, check if a password is set for the file to be transferred. If a password is set, cancel the password protection.
6	Access to the target file to be read has failed.	• Check if the target file exists. • Check if the file name specified in [File Transfer Setting] is correct. • Check if the data storage has been installed on the GOT. • Check if the SD card cover has been closed. • Check that the write protection for the SD card is canceled. • When using the FTP server function of the PLC, check if a password is set for the file to be transferred. If a password is set, cancel the password protection.
7	The file whose size is the file supported by the GOT or more was attempted to be transferred.	Check if the size of the transfer file is less than 2 GB.
10	• For the FTP transfer The GOT folder name is invalid. • For the GOT internal transfer The transfer source folder name is invalid.	Check that the GOT folder name or the transfer source folder name does not contain invalid characters, such as two-byte characters, or characters that are not allowed with the character code specified for [Character Code] in the [File Transfer Setting] dialog.
11	The transfer file name is invalid.	Check that the transfer file name does not contain invalid characters, such as two-byte characters, or characters that cannot be used with the character code specified for [Character Code] in the [File Transfer Setting] dialog.
12	The transfer source folder and destination folder have the same path.	Set different paths to the transfer source folder and the transfer destination folder.
50	The drive specification on the PLC side is incorrect.	When a PLC is used as a FTP server, only drive 2 (Memory card (ROM)) is accessible. Check if the setting of [FTP Server Folder] specified in the [File Transfer Setting] dialog is correct.
100	The destination FTP server setting ID which does not exist has been specified.	• Check if the destination FTP server setting ID specified in [File Transfer Setting] is correct. • Add the required destination FTP server setting.
200	Access to the storage device has failed when the file name or folder name is specified indirectly.	Check if the device setting used for the indirect specification is correct.
507	The total number of characters of the folder path and transfer file name exceeds the limit.	Check that the total number of the characters does not exceed the limit as shown below. • <GOT folder path>\<Transfer file name>: 78 characters or less (including backward slash marks) • <FTP server folder path>\<Transfer file name>: 250 characters or less (including backward slash marks) • <Transfer source folder path>\<Transfer file name>: 78 characters or less (including backward slash marks) • <Transfer destination folder path>\<Transfer file name>: 78 characters or less (including backward slash marks)
600 *1	The file transfer has been skipped because the total number of characters of the folder path and transfer file name exceeds the limit (only when the file is specified with a wildcard character).	

Error code	Error details	Corrective action
601 *1	Since the transfer file name contains invalid characters, the transfer processing was skipped (only when the file is specified with a wildcard character).	Check that the transfer file name does not contain invalid characters, such as two-byte characters, or characters that cannot be used with the character code specified for [Character Code] in the [File Transfer Setting] dialog.
602 *1	Since the file write operation failed, the transfer processing was skipped (only when the file is specified with a wildcard character).	• Another function might have been using the transfer file. Transfer the file again. • Check if the write destination drive has enough available space.
603 *1	Since the file read operation failed, the transfer processing was skipped (only when the file is specified with a wildcard character).	• The file might have been deleted before being transferred. Check if all the files have been transferred to the destination folder. • Check if the data storage has been installed on the GOT. • Check if the SD card cover has been closed. • Check that the write protection for the SD card is canceled.
606 *1	Since the file specified by the wild card did not exist, the file was not transferred (only when the file is specified with a wildcard character).	Check if the specified file name is correct.
607 *1	A file that exceeds the size supported by the GOT was attempted for transfer (only when the file is specified with a wildcard character).	Check if the size of the transfer file is less than 2 GB.
610 *1	Deleting the source file has failed.	Check if the source file is in a state in which it can be deleted.

*1 Even if a warning is given, the file transfer process does not stop.

87 Transferring files between the GOT drives (file transfer function (GOT internal transfer))

GT37 SoftGOT3000

☞ Page 2960 Overview of the file transfer function (GOT internal transfer)
☞ Page 2961 Specifications of the file transfer function (GOT internal transfer)
☞ Page 2962 How to use the file transfer function (GOT internal transfer)
☞ Page 2963 [File Transfer] (GOT internal transfer)
☞ Page 2967 Operation of the file transfer function (GOT internal transfer)
☞ Page 2970 Precautions
☞ Page 2970 Relevant settings
☞ Page 2970 Troubleshooting

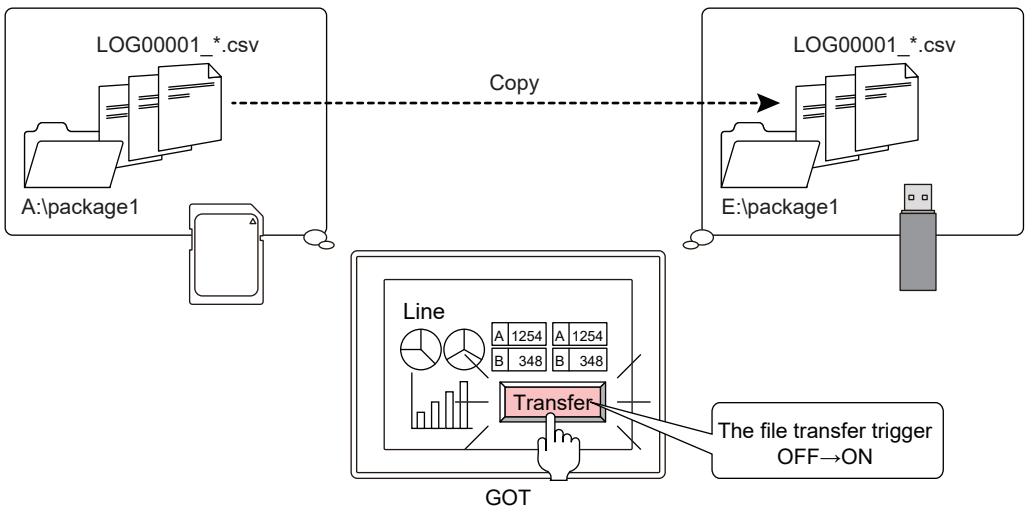
87.1 Overview of the file transfer function (GOT internal transfer)

GT37 SoftGOT3000

The file transfer function (GOT internal transfer) allows you to copy or move a file to another drive or folder within the GOT when the trigger conditions are satisfied.
By performing trigger control, the GOT can manage the timing of file transmission, such as when files are generated or user operations occur.

Copying the logging file from the SD card to the USB memory using a touch switch

The logging file saved on the SD card (drive A) can be copied to the front USB memory (drive E) by triggering an operation (device writing) using a touch switch.
Using a wild card to specify file names enables efficient copying of only updated files.



Point

Difference from the script function

When copying multiple files with a script, you need to first create a file list and then write a script that calls the copy function multiple times in a loop. With GOT internal transfer, you can easily copy and move files within the GOT by simply setting the source and destination folders, the transfer file names (wild cards supported), and a trigger.

87.2 Specifications of the file transfer function (GOT internal transfer)

GT37 SoftGOT3000

87.2.1 System application (add-on function)

To use the file transfer function (GOT internal transfer), [File Transfer] must be selected from the system applications (add-on functions).

Selecting [Use the function of File Transfer] and configuring the settings in [File Transfer] in the [Controller Setting] window incorporate the application into the package data automatically.

☞ Page 2963 [File Transfer] (GOT internal transfer)

87.2.2 Specifications of GOT internal transfer

The following shows the specifications of the file transfer function (GOT internal transfer).

Item	Specifications
Number of file transfer settings	Max. 100 (FTP transfer settings and GOT internal transfer settings in total)
Required devices for the file access	Data storage
Transfer target	Files in the transfer source folder The files in the sub folders are excluded.
Number of characters for file path	• <Transfer source folder path>\<Transfer file name>: Up to 78 one-byte alphanumeric characters and symbols in total (including backward slash marks) • <Transfer destination folder path>\<Transfer file name>: Up to 78 one-byte alphanumeric characters and symbols in total (including backward slash marks)

87.3 How to use the file transfer function (GOT internal transfer)

GT37 SoftGOT3000

87.3.1 Setting procedure

The following shows the setting procedure for using the file transfer function (GOT internal transfer).

1. In the [Controller Setting] window displayed by selecting [Common] → [Controller Setting] from the GT Designer3 menu, select [File Transfer] and then select [Use the function of File Transfer].
2. Click the [New] button in [File Transfer Setting], and configure the required settings in the displayed [File Transfer Setting] dialog.

☞ Page 2963 [File Transfer] (GOT internal transfer)

3. Write package data to the GOT.

For the communication method between the personal computer and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

4. Check the operation of the file transfer function (GOT internal transfer) on the GOT.

☞ Page 2967 Operation of the file transfer function (GOT internal transfer)

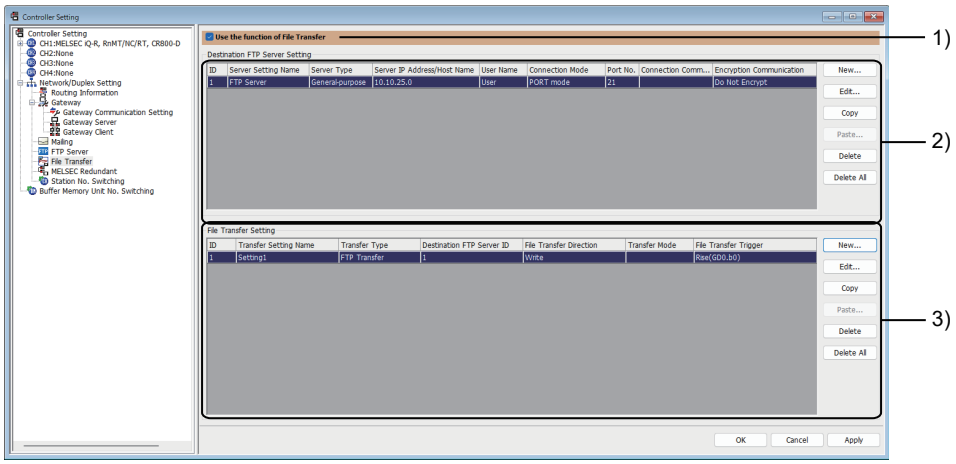
87.4 [File Transfer] (GOT internal transfer)

GT37 SoftGOT3000

On the [File Transfer] settings screen, configure the combination of file transfer condition settings (file transfer settings).

Window

1. Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
2. Select [File Transfer] in the [Controller Setting] window.

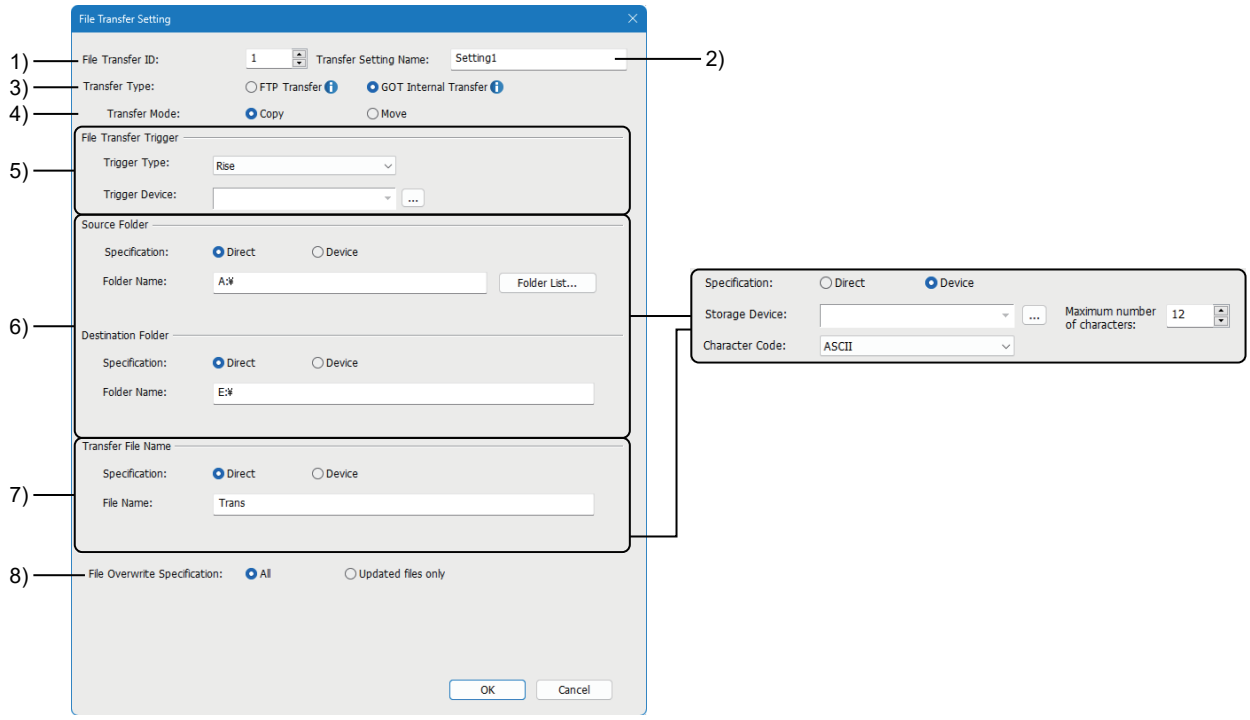


Item			Description
1)	[Use the function of File Transfer]		Select this item when using the file transfer function.
2)	[Destination FTP Server Setting]	—	Not used for GOT internal transfer.
3)	[File Transfer Setting]	—	Lists the file transfer settings. Up to 100 file transfer settings can be configured.
		[New] button	Adds a file transfer setting. Click the button to display the [File Transfer Setting] dialog and add a new file transfer setting. ☞ Page 2964 [File Transfer Setting] dialog (GOT internal transfer)
		[Edit] button	Changes a selected file transfer setting. Click the button to display the [File Transfer Setting] dialog and edit the contents of the selected file transfer setting. ☞ Page 2964 [File Transfer Setting] dialog (GOT internal transfer)
		[Copy] button	Copies the selected file transfer setting.
		[Paste] button	Pastes the copied file transfer setting to the specified destination. Click the button to display the [File Transfer Setting] dialog and specify the destination file transfer ID.
		[Delete] button	Deletes the selected file transfer setting.
		[Delete All] button	Deletes all the file transfer settings.

87.4.1 [File Transfer Setting] dialog (GOT internal transfer)

Set the transfer conditions.

Specify the file transfer trigger, transfer type (copy or move), transfer source and destination folders, and transfer file name.



Item			Description
1)	[File Transfer ID]		Set the ID to specify the file transfer setting. Set the number which does not overlap with that of other file transfer settings. The setting range is [1] to [32767].
2)	[Transfer Setting Name]		Set the file transfer setting name (optional). Up to 32 characters can be set.
3)	[Transfer Type]		Select [GOT Internal Transfer].
4)	[Transfer Mode]		Select the method of transferring a file.
5)	[File Transfer Trigger]	—	Set the trigger to execute the file transfer.
		[Trigger Type]	Set the trigger type.
		[Trigger Device]	When selecting [Rise], [Fall], [ON Sampling], or [OFF Sampling] for the trigger type, set the bit device as the trigger device. ☞ Page 968 Trigger type settings

Item			Description
6)	[Source Folder] [Destination Folder]	—	Specify the transfer source folder path. The folder division symbol "\" is not required at the end. The following drives are settable. Drive A Drive B Drive E Drive F Drive G Drive X (current drive) For the available drives by GOT model, refer to the following. ☞ 1Page 81 Drive configuration and capacity of the GOT For the restrictions on the folder name used in the GOT, refer to the following. ☞ 1Page 84 Restrictions for folder names and file names used in GOT
		[Specification]	Select how to specify the folder name. • [Direct] Select this item to enter the folder name directly. • [Device] Select this item to specify the folder indirectly with a device.
		[Folder Name]	When selecting [Direct] for [Specification], enter the folder name directly. Up to 76 one-byte alphanumeric characters and symbols can be entered for the folder path. To select a folder from the folders set in GT Designer3, click the [Folder List] button. Click the button to display the [Folder List] dialog and select the save destination folder name from the displayed list. The [Folder List] dialog is the same as that of FTP transfer. ☞ Page 2945 [Folder List] dialog The selected item in the [Folder List] dialog is applied only to [Source Folder]. It is not applied to [Transfer File Name].
		[Storage Device]	When selecting [Device] for [Specification], set the starting device of the consecutive word devices that store the folder name. The number of the consecutive word devices is equal to half the set value of [Maximum number of characters] (fractions are rounded up). ☞ Page 2966 Indirect specification of folder names and file names
		[Maximum number of characters]	Set the maximum number of characters for the folder name. The setting range is [8] to [76].
		[Character Code]	The folder name string is stored in the storage device using the specified character code.
7)	[Transfer File Name]	—	Set a transfer file name. Up to 75 one-byte alphanumeric characters and symbols are settable for the file name. One wildcard character can be used in the transfer file name. ☞ Page 2966 Specifying the transfer file with a wild card For the restrictions of the file name used in the GOT, refer to the following. ☞ 1Page 84 Restrictions for folder names and file names used in GOT
		[Specification]	Select the method of specifying the transfer file name. • [Direct] Select this item to enter the transfer file name directly. • [Device] Select this item to specify the transfer file name indirectly with a device.
		[File Name]	When selecting [Direct] for [Specification], enter the transfer file name directly.
		[Storage Device]	When selecting [Device] for [Specification], set the start device of consecutive word devices that store the transfer file name. The number of the consecutive word devices is equal to half the set value of [Maximum number of characters] (fractions are rounded up). ☞ Page 2964 [File Transfer Setting] dialog (GOT internal transfer)
		[Maximum number of characters]	Set the maximum number of characters for the transfer file name. The setting range is [8] to [75].
		[Character Code]	The folder name string is stored in the storage device using the specified character code.
8)	[File Overwrite Specification]		Set the behavior to be performed when the transfer destination folder has a file with the same name as the transfer file. • [All] Overwrites files each time. • [Updated files only] Overwrites an existing file in the transfer destination folder only when the time stamp of the transfer file is equal to or newer than that of the existing file. Otherwise, the file is not transferred.

Point

To transfer only the logging files that are updated by the logging function, select [Updated files only]. Since the transferred files are not resent, the file transfer efficiency is increased.

Precautions

■Moving a file

When selecting [Move] for [Transfer Mode], note the following.

• Moving a file that the GOT refers to

For a file (such as a logging file) that the GOT refers to, copy the file to another location instead of moving it.
Otherwise, you cannot view the file on the GOT because the file is deleted from the source folder after the file transfer is complete.

• Specifying the transfer file name with a wildcard character

When specifying the transfer file name with a wildcard character, you may delete a required file unintentionally.
If the transfer source folder has a required file, take one of the following measures.

◇Select [Copy] for [Transfer Mode].

◇Check in advance that only the files to be transferred are included when specifying the transfer file name with a wildcard character.

■Transferring files in the sub folders

The files in the sub folders of the transfer source folder are not transferred.

■Folder path and transfer file name

The total number of characters of the folder path and transfer file name must be set as shown below.
If the total number of the characters exceeds the following limits, an error occurs.

<Transfer source folder path>\<Transfer file name>: 78 characters or less (including backward slash marks)
<Transfer destination folder path>\<Transfer file name>: 78 characters or less (including backward slash marks)

Specify the folder path and transfer file name by using one-byte alphanumeric characters and symbols.
If you use two-byte characters, the specified file cannot be transferred.

Indirect specification of folder names and file names

When [Device] is selected for [Specification] in the folder name or file name setting, consecutive word devices starting from a specified device store the folder name or file name.
The details are the same as those of FTP transfer.
Refer to the following.

☞ Page 2946 Indirect specification of folder names and file names

Specifying the transfer file with a wild card

The conditions for using wild cards are the same as those for FTP transfer.
Refer to the following.

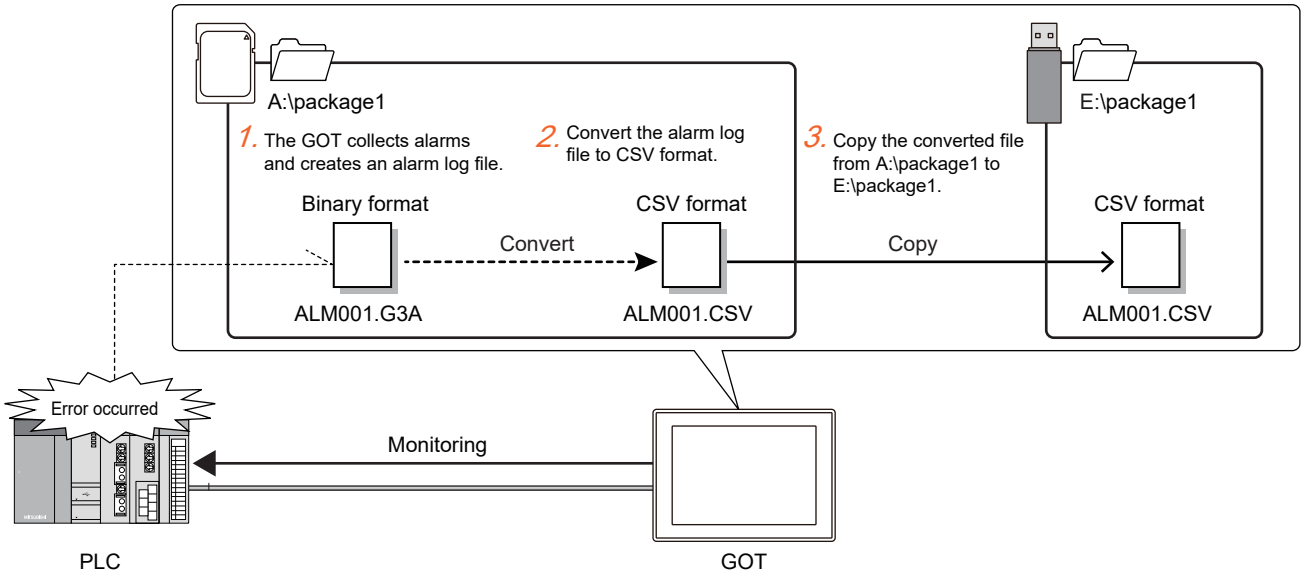
☞ Page 2947 Specifying the transfer file with a wild card

87.5 Operation of the file transfer function (GOT internal transfer)

GT37 SoftGOT3000

87.5.1 Copying an alarm log file to another drive (application example)

The following shows an example of converting the file of alarm logs collected by the GOT to a CSV file and copying it from the Package1 folder on drive A to the Package1 folder on drive E.
The file conversion is optional.



1. The GOT collects alarm data and creates an alarm log file in the Package1 folder on drive A.
2. Convert the alarm log file from the binary format to the CSV format by using the convert trigger device for the file.
3. Copy the converted file from folder Package1 on drive A to folder Package1 on drive E.

Required settings

This application example requires the following settings.

■Alarm settings

Setting	Description		Reference
[Alarm Common Setting]	[Convert trigger device]	Set any bit device.	☞ Page 2043 [Alarm Common Setting] dialog
	[Convert-in-motion notification device]		
[User Alarm Observation]	[Basic] tab	Set the method of collecting the history. Select [Historical] or [Cumulative].	☞ Page 2045 [User Alarm Observation] dialog
	[Device] tab	Set the target device for observation.	
	[File Save] tab	Select [Save alarm log files] and set the save destination for the log file and the storage trigger. Select [Rise] for the trigger type of the storage trigger.	

PART 28

■Settings of the file transfer function (GOT internal transfer)

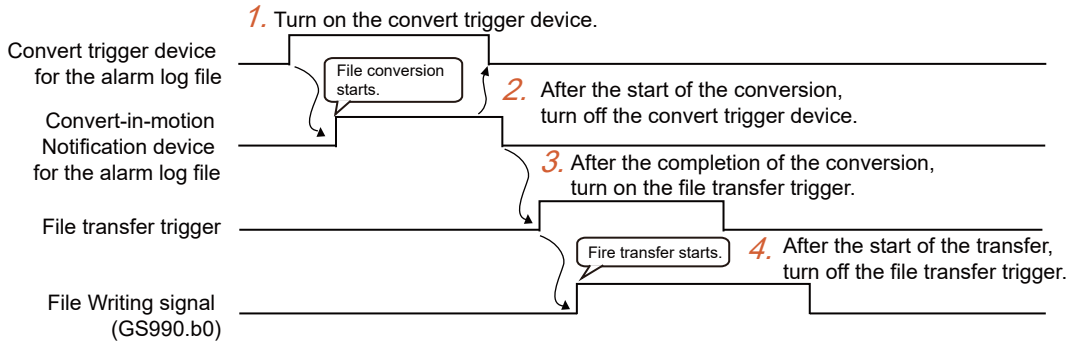
Setting	Description		Reference
[File Transfer Setting]	[Transfer Type]	Select [GOT Internal Transfer].	☞ Page 2964 [File Transfer Setting] dialog (GOT internal transfer)
	[Transfer Mode]	Select [Copy].	
	[File Transfer Trigger]	Set [Rise].	
	[Transfer File Name]	Set the name of the alarm log file specified in the alarm monitoring.	

■GOT special register (GS)

Setting	Description	Reference
GS990.b0	File Writing signal	☞ Page 2969 Write device

Action

The following shows an example of converting and transferring an alarm log file.



1. Turn on the convert trigger device for the alarm log file.

The GOT starts the file conversion and the Convert-in-motion Notification device turns on.

2. Turn off the convert trigger device after the start of the file conversion.

Upon completion of the file conversion, the Convert-in-motion Notification device turns off.

3. Turn on the file transfer trigger.

The GOT starts the file transfer and the File Writing signal (GS990.b0) turns on.

4. Turn off the file transfer trigger after the start of the file transfer.

Upon completion of the file transfer, the File Writing signal (GS990.b0) turns off.

For the convert trigger device for the alarm log file, refer to the following.

☞ Page 2043 [Alarm Common Setting] dialog

Turning on the file transfer trigger automatically

In the example above, the user needs to turn on the file transfer trigger after the file conversion.

The user also needs to turn off the convert trigger device for the alarm log file and file transfer trigger after the start of the processing.

Using two project scripts enables these operations to be performed automatically.

The setting example is the same as that of FTP transfer.

Refer to the following.

☞ Page 2950 Turning on the file transfer trigger automatically

87.5.2 Checking the processing status

With the file transfer function (GOT internal transfer), you can check the file transfer status, errors, and other relevant information by using GOT special registers (GS).
For details on the devices, refer to the following.
☞ Page 3581 GOT special register (GS)

Read device

Device	Name		Description
GS401	File Transfer Control		Controls the file transfer.
	b0	Clear File Transfer Error signal	Turn on this signal to clear the error code stored in the following device or to turn off the following signals. • File Transfer Error No. (GS989) • Warning signal (GS990.b14) • File Transfer Error signal (GS990.b15)

Write device

Device	Name		Description
GS987	Executing File Transfer ID Notification		Stores the file transfer ID of the file transfer in execution.
GS989	File Transfer Error No.		Stores the error code of an error that occurred in the file transfer. Turn on GS401.b0 to clear the stored error code. ☞ Page 2970 Error codes for the file transfer function
GS990	File Transfer Status		Notifies the file transfer processing status.
	b0	File Writing signal	Turns on during the file transfer. When [Trigger Type] is [Rise] or [Fall], this bit turns off when the trigger condition is dissatisfied after the file transfer.
	b14	Warning signal	Turns on when the error with which the processing can be continued occurs during the file transfer. Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.
	b15	File Transfer Error signal	Turns on when the error with which the processing cannot be continued occurs during the file transfer. Files cannot be transferred while this signal is on. Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.
GS991	Number of Transfer Target Files		Stores the total number of files to be transferred. When the transfer file name is specified with the wild card, the total count includes the files which are not transferred due to an invalid number of characters for the folder name or other causes. However, the total count does not include files with invalid names, such as those consisting of two-byte characters. Holds the device value until the processing for the next file transfer ID is started.
GS992	Number of Transferred Files		Stores the total number of the files already transferred. The total count includes the files which are not transferred due to the error or other causes. Holds the device value until the processing for the next file transfer ID is started.

Precautions

■Handling of a file transfer error

If an error occurs in the file transfer, turn on the Clear File Transfer Error signal (GS401.b0).
Upon turn-on of GS401.b0, the File Transfer Error signal (GS990.b15) is turned off.
While the File Transfer Error signal (GS990.b15) is on, the GOT does not start transferring the subsequent files because the file transfer is recognized to have an error.

87.5.3 Operation when the file transfer trigger conditions are satisfied

After the file transfer trigger conditions are satisfied, the operation is the same that of FTP transfer.
Refer to the following.
☞ Page 2953 Operation when the file transfer trigger conditions are satisfied

87.6 Precautions

GT37 SoftGOT3000

Offline status of the GOT

When the GOT becomes offline during the file transfer, the file transfer is interrupted.
During the file transfer, do not perform the operation that causes the GOT to be offline, such as establishing the communication with GT Designer3.

87.7 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings other than those specific to the file transfer function (GOT internal transfer) as required.

GOT internal devices

☞ Page 3581 GOT special register (GS)

Function	Setting item
Turning on this signal to clear an error that occurred in the file transfer	GS401.b0
Storing the file transfer ID of the file transfer in execution	GS987
Storing the error code of an error that occurred in the file transfer	GS989
Notifying the file transfer processing status	GS990
Storing the total number of files to be transferred	GS991
Storing the total number of transferred files	GS992

87.8 Troubleshooting

GT37 SoftGOT3000

Troubleshooting for the file transfer function (GOT internal transfer)

The following shows the troubleshooting for the file transfer function (GOT internal transfer).

Symptom	Error details	Corrective action
File cannot be transferred.	The system application (add-on function) for the file transfer function is not installed on the GOT.	Write the package data that contains the system application (add-on function) for the file transfer function to the GOT.

Error codes for the file transfer function

The error codes stored in GOT special register GS989 (File Transfer Error No.) are the same as those of FTP transfer.
Refer to the following.

☞ Page 2958 Error codes for the file transfer function

PART 29 Security settings

88 Protecting a project by registering users (Project security)

89 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2))

90 Restricting display and operation on the GOT (Screen security)

91 Configuring the security settings for operations in the utility (Functional operation security)

92 Configuring the security setting for transferring data (Data transfer security)

93 Protecting the files in the GOT (Information protection function)

94 Encrypting communication data (Encrypted communication function)

88 Protecting a project by registering users (Project security)

GT37 SoftGOT3000

☞ Page 2972 Overview of the project security
☞ Page 2974 Specifications of the project security
☞ Page 2980 How to use the project security
☞ Page 2984 [User Addition] dialog
☞ Page 2985 [User Management] dialog
☞ Page 2987 [Setup Access Authority] dialog
☞ Page 2988 [Change Password] dialog

88.1 Overview of the project security

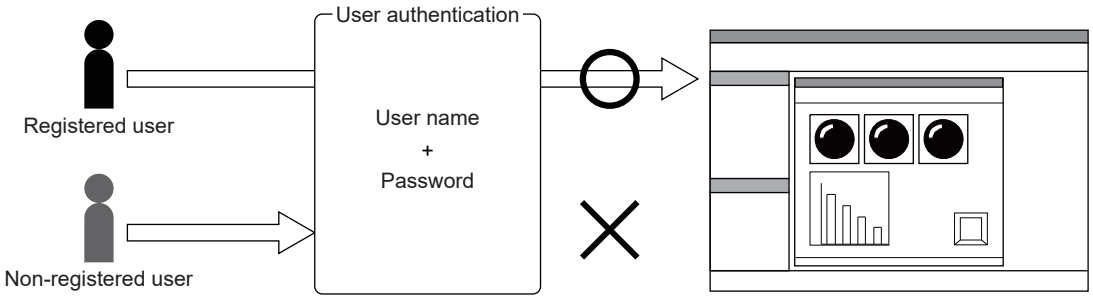
GT37 SoftGOT3000

Setting the project security restricts displaying and editing a project.
For specifications and settings of the project security, refer to the following.

☞ Page 2974 Specifications of the project security
☞ Page 2980 How to use the project security

Preventing a project from being browsed by unauthorized people

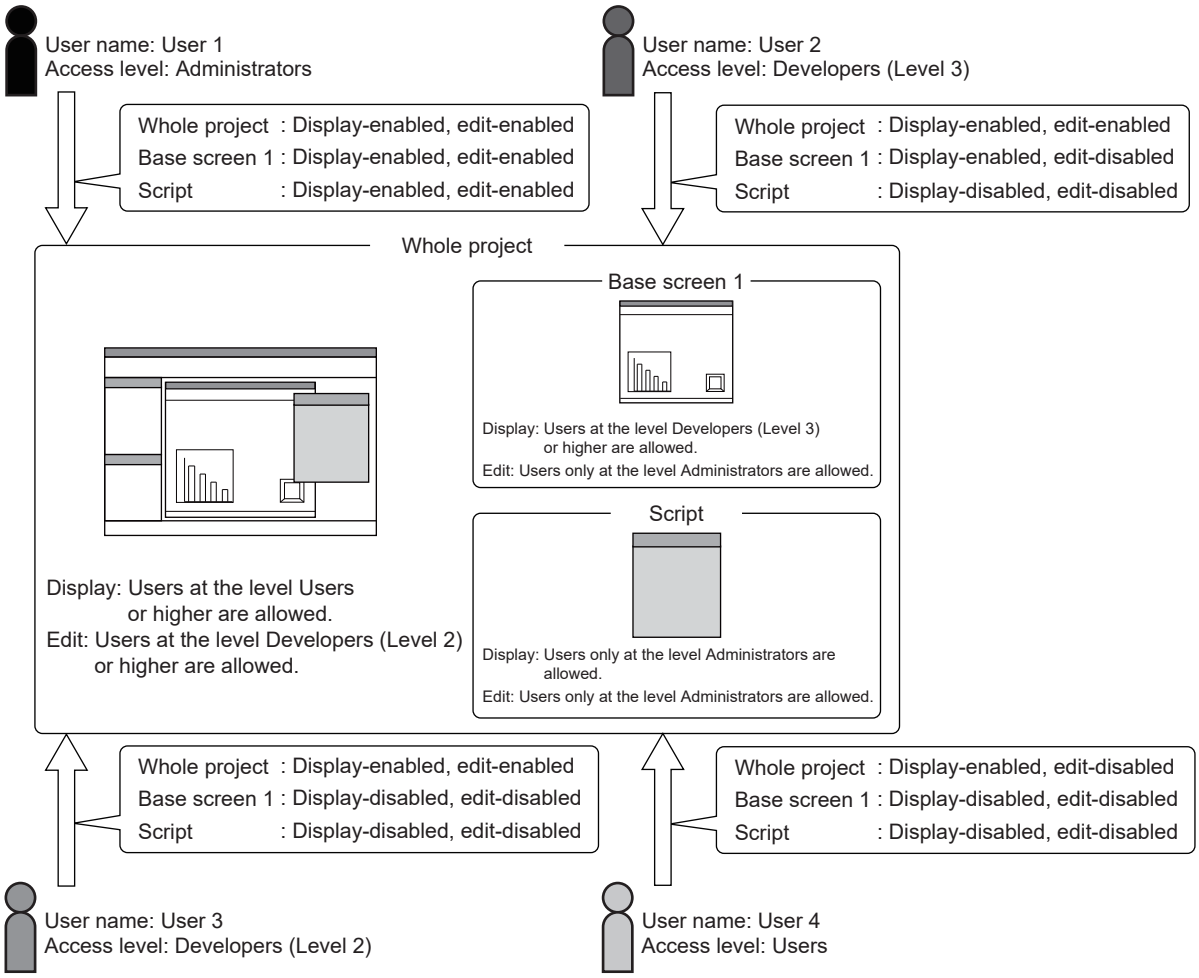
For the project which users are registered to, the user authentication is required for opening the project.
Only registered users can open the project.



Restricting for displaying and editing a project according to the access level of users

You can set restriction for displaying and editing the settings of the project according to the user's access level.

You can set restriction for displaying and editing specific screens and scripts individually besides the whole project.



88.2 Specifications of the project security

GT37 SoftGOT3000

☞ Page 2974 Operation restricted by the project security
☞ Page 2975 Concept of the project security
☞ Page 2977 Operating the project to which the project security is set
☞ Page 2978 Restricting the project operation by the access authority

88.2.1 Operation restricted by the project security

The project security restricts the following operations.

- Viewing and editing a project in GT Designer3
- Viewing and editing a project by screen according to the user access level
- Operation to open a project with GT SoftGOT3000

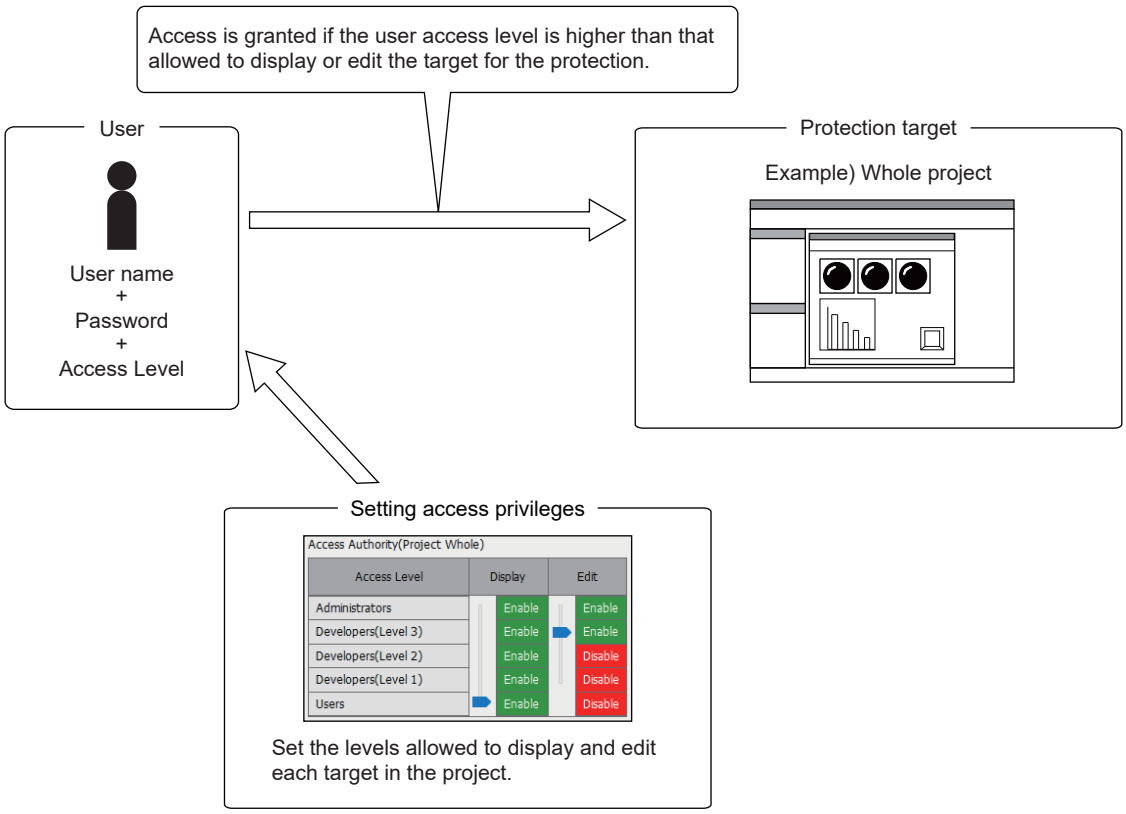
To restrict operations other than the above, configure other security function settings with reference to the following.

☞ Page 38 Security function

Using multiple security functions in combination further strengthens the security.

88.2.2 Concept of the project security

When registering users to the project, set their user names and passwords for authentication and their access level.
The access privilege set for the project, screens, or others and the user's access level determine whether the user can display and edit the project or not.

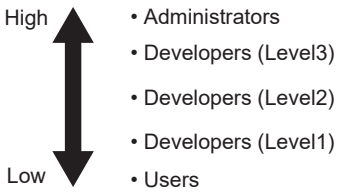


Number of registrable users

Up to 128 users can be registered.

Access level

The following five access levels are provided.



- Administrators
- Developers (Level3)
- Developers (Level2)
- Developers (Level1)
- Users

Access privilege type

The following two access privileges are provided.

Access privilege	Description
Display	Allows the user to display the project or screen settings. The users whose access levels do not allow them to display the project or settings cannot display the setting dialog or screen images.
Edit	Allows the user to edit, delete, and save the project or screen settings. The users whose access levels do not allow them to edit the project or settings can display the setting dialog or screen images, but cannot change the settings. If displaying is disabled, editing is always disabled.

Setting access privileges

You can set a bottom access level for displaying and editing each target in the project.
If displaying is disabled, editing is always disabled.

Access level	Access privilege	
	Display	Edit
Administrators	Enable (fixed)	Enable (fixed)
Developers(Level3)	Select Enable or Disable.	Select Enable or Disable.
Developers(Level2)	Select Enable or Disable.	Select Enable or Disable.
Developers(Level1)	Select Enable or Disable.	Select Enable or Disable.
Users	Select Enable or Disable.	Disable (fixed)

Protection target

The following shows the access privilege targets.

Access privilege target	Description
Whole project	You can collectively protect all settings in a project (such as the screen setting and common setting).
Base screen Window screen Mobile screen	Setting restriction stronger than the access privilege set for the whole project to the screens allows specific users to display or edit the screens. Access privileges can be set per screen.
Script	Setting restriction stronger than the access privilege set for the whole project to the scripts allows specific users to display or edit the scripts. The same access privilege is set for the project scripts, the screen scripts, the script symbols and the script list. The scripts of script parts objects, object scripts, and object script symbols are not protected.

Always set an access privilege for the whole project.
You can also set the access privilege for each base screen, window screen, and mobile screen, or those screens by screen type, and the whole of scripts. This allows specific users to display or edit the relevant screens or scripts.

88.2.3 Operating the project to which the project security is set

Logging in to a project

To open the project to which the project security is set, the user authentication is required.

Input the registered user name and password to log in to the project.

To log in to the project with another user name, close the project and open it again.

If any password or user information is changed, the changes are effective in the next login.

Package data transfer and the project security

■Writing package data

The setting of the project security is written to the GOT with the package data.

If a project with the project security in the GOT is overwritten by writing package data with different project security into the GOT, the project security in the GOT is overwritten as well.

The project security can be set even after the package data is written to the GOT.

■Reading the package data

If the project security is set to a project in the GOT and the project is read from the GOT, the project security is read as well.

To open the project read from the GOT, the user authentication is required.

To restrict reading of a project from the GOT, use a function different from the project security.

The function to be used differs depending on the security mode.

Security mode	Description
Mode 1	☞ Page 3062 Configuring the security setting for transferring data (Data transfer security)
Mode 2	☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2))

Canceling the project security

Deleting all the registered users cancels the project security.

☞ Page 2982 Deleting a user

Opening a project with GT SoftGOT3000

The operation to open a project to which the project security is set differs depending on the security mode.

Security mode	Operation
Mode 1	User authentication is performed. Enter the registered user name and password to open the project.
Mode 2	User authentication using project security is not performed. Operator authentication (mode 2) is performed in mode 2. ☞ Page 2989 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2))

88.2.4 Restricting the project operation by the access authority

The following shows available operations and unavailable operations according to the user's access privilege.

☞ Page 2978 Operations for the project
☞ Page 2979 Operations for the screens
☞ Page 2979 Operations for the scripts
☞ Page 2979 Operations for the libraries

Operations for the project

■Display-allowed and edit-allowed users

The users can open the project to add, change, or delete screens or settings including the common setting and save the project.

The same access privilege set for the whole project is applied to the screen that has been newly added.

The same access privilege set for the screen that has been overwritten is applied to the target screen to be overwritten.

If the access authority is set for screens or scripts individually, the following operations are restricted.

Operation	Restriction	Condition
Changing the GOT type	In the [GOT Type Setting] dialog, the change of [Type] cannot be determined.	The project includes a screen or a script that cannot be edited by the user who is logging in.
Changing the communication settings	In the [Controller Setting] window, the changes of [Manufacturer] and [Type] cannot be determined.	
Verifying projects between the GOT and GT Designer3	The project in GT Designer3 cannot be verified with the one in the GOT.	The project includes a screen or a script that cannot be displayed by the user who is logging in.
Verifying the project being opened with the saved project	The project being opened cannot be verified with the saved project.	

■Display-allowed and edit-prohibited users

The users can open the project, but cannot add, change, and delete the settings and save the project.

Only the following operations are allowed for those users.

- Deleting a project
- Writing package data to the GOT or the data storage
- Verifying projects between the GOT and GT Designer3
- Verifying the project being opened with the saved project
- Setting the project security
- Printing (Display-disabled screens or scripts cannot be printed.)

If the access authority is set for screens or scripts individually, the following operations are restricted.

Operation	Restriction	Condition
Verifying projects between the GOT and GT Designer3	The project in GT Designer3 cannot be verified with the one in the GOT.	The project includes a screen or a script that cannot be displayed by the user who is logging in.
Verifying the project being opened with the saved project	The project being opened cannot be verified with the saved project.	

■Display-prohibited and edit-prohibited users

The users cannot open the project.

The users cannot write package data to the GOT or the data storage.

Operations for the screens

■Display-allowed and edit-allowed users

The users can display, copy, change, and delete the screens.

If a screen to be displayed by the set overlay screen or in the window preview is display-disabled, a dummy screen will be displayed.

■Display-allowed and edit-prohibited users

The users can display and copy the screens, but cannot change or delete them.

The users can copy figures and objects on the screens, but cannot arrange, move, change, and delete them.

If a screen to be displayed by the set overlay screen or in the window preview is display-disabled, a dummy screen will be displayed.

■Display-prohibited and edit-prohibited users

The users cannot display, change, and delete the screens.

The information on the display-disabled screens is not displayed in the windows where the list of the settings is displayed such as the data browser.

The display-disabled screens are displayed when simulation is executed.

Operations for the scripts

■Display-allowed and edit-allowed users

The users can display and change the script setting.

Even when the users are allowed to edit scripts, they cannot edit the screen script set on an edit-disabled screen.

■Display-allowed and edit-prohibited users

The user can display the script setting, but cannot add, change or delete the setting.

■Display-prohibited and edit-prohibited users

The user cannot display the script setting.

The information on the scripts is not displayed in the windows where the list of the settings is displayed such as the data browser.

Operations for the libraries

Even the users who are not allowed to edit the project can register, change, and delete the library data.

88.3 How to use the project security

GT37 SoftGOT3000

☞ Page 2980 For the first setting of the project security
☞ Page 2981 Logging in to the project
☞ Page 2982 User management (addition, deletion, and change)
☞ Page 2983 Setting an access privilege
☞ Page 2983 Changing a password

88.3.1 For the first setting of the project security

First, register a user whose access level is Administrators.

1. Select [Project] → [Security] → [User Management] from the menu to display the [User Addition] dialog.
(After the first user is registered, the [User Management] dialog is displayed by the operation above.)

2. Set [User Name], [Access Level], [Password], [Re-enter Password] and click the [OK] button.
☞ Page 2984 [User Addition] dialog

3. The set user is registered and the user is logged in the project.

4. Overwrite the project.
☞ Page 224 Overwriting a project

5. Add other users and set the access privilege of them.
☞ Page 2982 User management (addition, deletion, and change)
☞ Page 2983 Setting an access privilege

Point

Do not forget the user name and the password for Administrators.
If you do so, you cannot open the project.

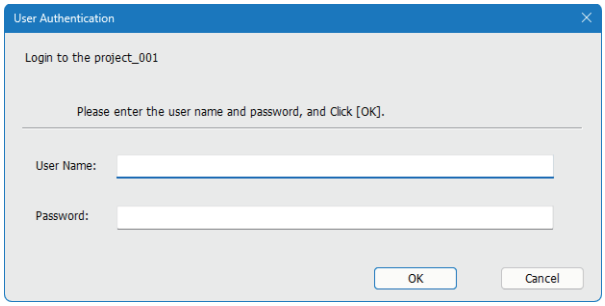
88.3.2 Logging in to the project

1. Open the project with GT Designer3.

☞ Page 216 Opening a project

2. The [User Authentication] dialog is displayed.

Input the user name and the password for logging in and click the [OK] button.



3. When the user is authorized, the project opens.

The name of the user who is logged in the project is displayed on the status bar of GT Designer3.

Point

When you forget a password, log in to the project as the user whose access level is Administrators and change the password.

If you forget the user name and the password for the user whose access level is Administrators, you cannot open the project.

Delete the project and create a new project.

88.3.3 User management (addition, deletion, and change)

Only the users who are allowed to edit the whole project can manage the user information.

The manageable range of users differs depending on the access level of the user who is logged in.

Access level	Manageable range of users
Administrators	The user can add other users and change the user information over the full range of the access levels.
Developers(Level3) Developers(Level2) Developers(Level1)	The user can add other users or change the user information. However, the access level of the users to be added or changed must be lower than that of the user who is logged in.
Users	The user cannot add other users and change the user information.

Adding a user

1. Select [Project] → [Security] → [User Management] from the menu to display the [User Management] dialog.

☞ Page 2985 [User Management] dialog

2. Click the [Add] button to display the [User Addition] dialog.

☞ Page 2984 [User Addition] dialog

3. Set [User Name], [Access Level], [Password], [Re-enter Password] and click the [OK] button to register the set user.
4. Click the [OK] button in the [User Management] dialog to determine the setting.

Deleting a user

1. Select [Project] → [Security] → [User Management] from the menu to display the [User Management] dialog.

☞ Page 2985 [User Management] dialog

2. Select a user to be deleted and click the [Delete] button to delete the user.
3. Click the [OK] button in the [User Management] dialog to determine the change.

Changing the user information

1. Select [Project] → [Security] → [User Management] from the menu to display the [User Management] dialog.

☞ Page 2985 [User Management] dialog

2. Select a user to be changed and click the [Replace] button to display the [Change User Data] dialog.

☞ Page 2986 [Change User Data] dialog

3. Set [User Name] and [Access Level] and click the [OK] button to change the user information.
4. Click the [OK] button in the [User Management] dialog to determine the change.

88.3.4 Setting an access privilege

Only the users who are allowed to edit the whole project can set the access privilege.

1. Select [Project] → [Security] → [Setup Access Authority] from the menu to display the [Setup Access Authority] dialog.

☞ Page 2987 [Setup Access Authority] dialog

2. Set the access privilege and click the [OK] button to determine the setting.

88.3.5 Changing a password

Only the users who are allowed to edit the whole project can change the passwords.

Changing the password of the user currently logging in

1. Select [Project] → [Security] → [Change Password] from the menu to display the [Change Password] dialog.

☞ Page 2988 [Change Password] dialog

2. Set [Old Password], [New Password], and [Re-enter Password] and click the [OK] button to change the password.

Changing the password of the user who is managed by the project

1. Select [Project] → [Security] → [User Management] from the menu to display the [User Management] dialog.

☞ Page 2985 [User Management] dialog

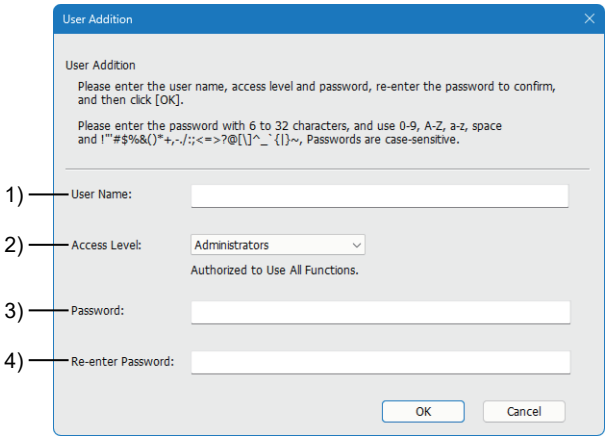
2. Select the user whose password is to be changed and click the [Password change] button to display the [Change Password] dialog.

☞ Page 2988 [Change Password] dialog

3. Set [New Password] and [Re-enter Password] and click the [OK] button to change the password.
4. Click the [OK] button in the [User Management] dialog to determine the change.

88.4 [User Addition] dialog

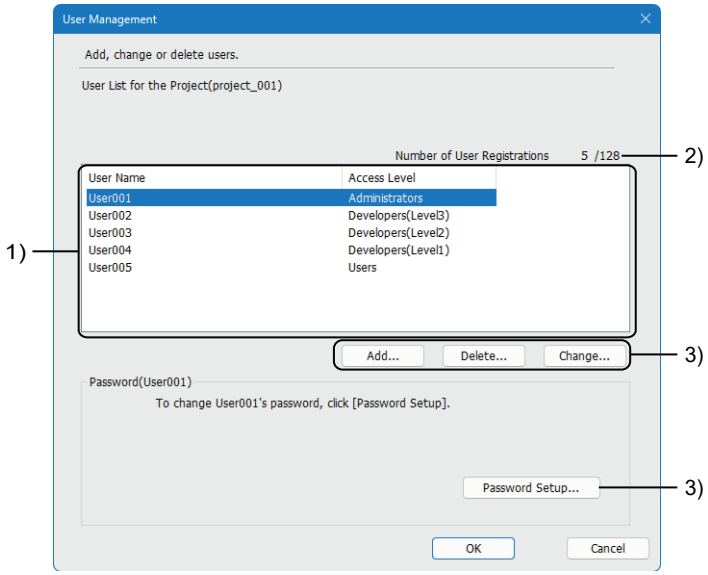
GT37 SoftGOT3000



Item		Description
1)	[User Name]	Set a user name for authentication. Up to 20 characters can be set. Numeric characters, A to Z, a to z, a one-byte space, and the following symbols are available. !"#$%&()*+,-./:;<=>?@[\]^_`{|}~ The characters are case-sensitive. You cannot place a one-byte space at the end of a user name. You cannot set a user name which is already registered.
2)	[Access Level]	Select an access level for the user to be set. High • Administrators • Developers (Level3) • Developers (Level2) • Developers (Level1) Low • Users For the first setting of the project security, the user access level is fixed to [Administrators]. The Administrators level allows the user to select any access level. The Developers(Level3), Developers(Level2), and Developers(Level1) levels allow the user to select only an access level lower than that of the user who is logged in.
3)	[Password]	Set a password for authentication. The password must be between 6 to 32 characters. Numeric characters, A to Z, a to z, a one-byte space, and the following symbols are available. !"#$%&'()*+,-./:;<=>?@[\]^_`{|}~ The characters are case-sensitive. The input password is displayed as asterisks.
4)	[Re-enter Password]	Input the same password as the one input in [Password]. The input password is displayed as asterisks.

88.5 [User Management] dialog

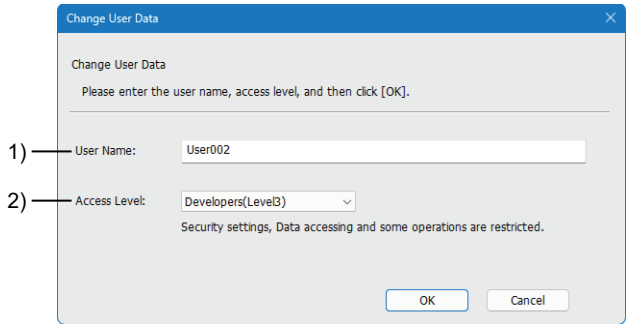
GT37 SoftGOT3000



Item			Description
1)	User list		Displays the user names and the access levels of the registered users.
2)	[Number of User Registrations]		The number of registered users
3)	Management button	—	Use these buttons to manage the users. The Administrators level allows the user to add other users and change the user information across all access levels. The Developers(Level3), Developers(Level2), and Developers(Level1) levels allow the user to add other users and change the user information within access levels lower than those of the user who is logged in.
		[Add] button	Displays the [User Addition] dialog. Click this button to add a user. ☞ Page 2984 [User Addition] dialog
		[Delete] button	Deletes the user selected in the user list. Deleting all the registered users cancels the security setting.
		[Change] button	Displays the [Change User Data] dialog. You can change the access level and the password of the user selected in the user list. ☞ Page 2986 [Change User Data] dialog
		[Password Setup] button	Displays the [Change Password] dialog. You can change the password of the user selected in the user list. ☞ Page 2988 [Change Password] dialog

88.5.1 [Change User Data] dialog

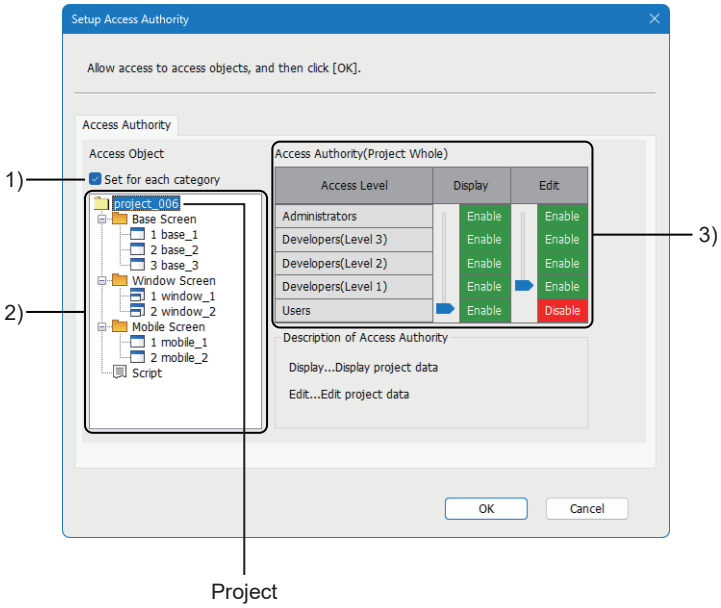
GT37 SoftGOT3000



Item		Description
1)	[User Name]	Set a user name for authentication. Up to 20 characters can be set. Numeric characters, A to Z, a to z, a one-byte space, and the following symbols are available. !"#$%&()*+,-./:;<=>?@[\]^_`{|}~ The characters are case-sensitive. You cannot place a one-byte space at the end of a user name. You cannot set a user name which is already registered.
2)	[Access Level]	Select an access level for the user to be set. High • Administrators • Developers (Level3) • Developers (Level2) • Developers (Level1) Low • Users The Administrators level allows the user to select any access level. The Developers(Level3), Developers(Level2), and Developers(Level1) levels allow the user to select only an access level lower than that of the user who is logged in.

88.6 [Setup Access Authority] dialog

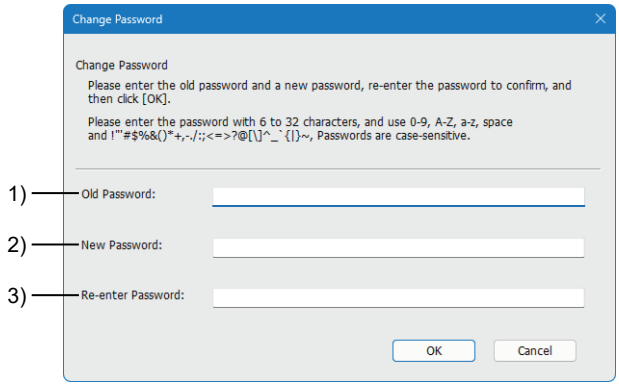
GT37 SoftGOT3000



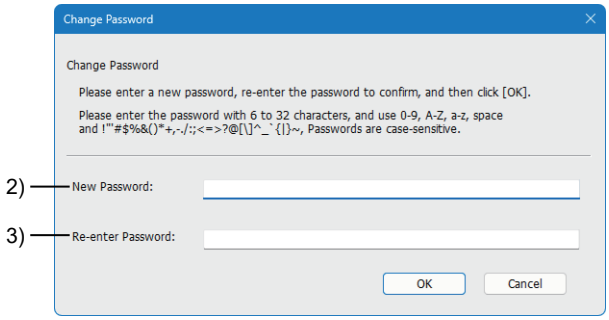
Item			Description
1)	[Set for each category]		Allows you to set the access privilege for the base screens, window screens, mobile screens, or the whole of scripts. Displays the targets for which the access privilege are set in the tree view in the access target list.
2)	Access target list	—	Select a target for which the access privilege is set.
		Project	Set an access privilege for the whole project.
		[Base Screen] [Window Screen] [Mobile Screen]	Lists the base screens, window screens, and mobile screens. The access privilege is settable for each screen. To set the access privilege by screen type, select [Base Screen], [Window Screen], or [Mobile Screen].
			Even if users are disallowed to edit a screen, an edit-enabled part, script, or others set for the screen is not protected.
		[Script]	Sets the same access privilege for the project scripts, screen scripts, script lists, and the whole script symbols. This setting is not applied to script parts, object scripts, and object script symbols.
3)	[Access Authority]	—	Move each slider up and down to set an access privilege for a target selected from the access target list. The Administrators level allows the user to set an access privilege across all access levels. The Developers(Level3), Developers(Level2), and Developers(Level1) levels allow the user to set an access privilege within access levels lower than those of the user who is logged in. Example) For the user whose access level is Developers(Level2)  If the access privilege is set for the screens and scripts individually, only the user who is allowed to edit the screens or the scripts can change their access levels.
		[Display]	Set a bottom access level for displaying the target selected in the access target list.
		[Edit]	Set a bottom access level for editing the target selected in the access target list.

88.7 [Change Password] dialog

GT37 SoftGOT3000



When the password of a login user is changed



When the password of a user who is not logged in is changed

Item		Description
1)	[Old Password]	Input the current password for authentication. The input password is displayed as asterisks.
2)	[New Password]	Set a new password. The password must be between 6 to 32 characters. Numeric characters, A to Z, a to z, a one-byte space, and the following symbols are available. !"#$%&'()*+,-./:;<=>?@[\]^_`{|}~ The characters are case-sensitive. The input password is displayed as asterisks.
3)	[Re-enter Password]	Input the same password as the one input in [New Password]. The input password is displayed as asterisks.

89 Restricting GOT screen operations and access from external devices (operator authentication (Mode 2))

GT37 SoftGOT3000

☞ Page 2991 Specifications of the operator authentication (Mode 2)
☞ Page 3002 How to set the operator authentication (Mode 2)
☞ Page 3003 Registering or editing an operator or group
☞ Page 3004 Editing an operator on a personal computer
☞ Page 3032 Common settings relevant to authentication (Operator authentication setting)
☞ Page 3034 Login
☞ Page 3034 Logout
☞ Page 3035 [Security] ([Screen Security] tab) (Mode 2)
☞ Page 3037 Relevant settings

Point

This function can be used when the security mode is set to mode 2.

The operator authentication (Mode 2) is a function to register operators to the GOT and restrict GOT screen operations and access from external devices.
Each operator has the operator information including the operator name, password, level, and group.
Restrict operations and access as follows.

Restriction system	Description
Restriction by level	Set security levels for screens and objects, which enable display and operation of the screens and objects. An operator can operate the screens and objects with the levels equal to or lower than the level of the operator. Example) Restrict displayable objects for each operator. Restriction by operation authority	Each operator belongs to one group and is granted the operation authority of the group to which the operator belongs. The operator can perform operations covered by the granted operation authority only. 
The information on the operator who performed an operation is recorded in the operation log, allowing you to check who did what operation and when.

☞ Page 1909 Configuring the settings for collecting the GOT operation history ([Operation Log])

89.1 Specifications of the operator authentication (Mode 2)

GT37 SoftGOT3000

☞ Page 2991 Protection target
☞ Page 2991 Authentication type
☞ Page 2992 Operator specifications
☞ Page 2993 Group specifications
☞ Page 3001 Operator management information

89.1.1 Protection target

The following table lists the operations and functions protected by the operator authentication (Mode 2).

Protection target		Restriction system	Description
GOT screen operation	Switching to the utility	Restriction by operation authority	Only operators with the corresponding operation authorities can perform these operations.
	Displaying each setting screen from the utility		
	Switching between user-created screens	Restriction by level	Set security levels for screens and objects, which enable display and operation of the screens and objects. An operator can operate the screens and objects with the levels equal to or lower than the level of the operator.
	Displaying an object		
	Operating an object		
Data transfer		Restriction by operation authority	Authentication is performed when the GOT is accessed from GT Designer3 or Data Transfer Tool. Only operators with the operation authority which allows the data transfer can transfer data.
GOT Mobile function			Authentication is performed when the server (GOT) is accessed from a client. Only operators with the corresponding operation authorities can access the server (GOT).
OPC UA server function			
FTP server function			

For the operation authorities and corresponding operations, refer to the following.

☞ Page 2994 Operation authorities

89.1.2 Authentication type

Operators are authenticated with the operator name and password.

Authentication with a barcode reader or RFID controller (external authentication) can also be used for authentication to operate GOT screens.

☞ Page 3033 External authentication

89.1.3 Operator specifications

Up to 1000 operators can be registered to one GOT.

For information on how to register or edit an operator, refer to the following.

Method	Reference
With the utility	☞ Page 3003 Registering or editing an operator or group
With a personal computer	☞ Page 3004 Editing an operator on a personal computer

Each operator has the following operator information.

Operator information	Description
Operator name	An identifier to determine the operator. The setting range is 1 character to 16 characters. Alphanumeric characters, one-byte spaces, and the following symbols are usable. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [¥] ^ _ { | } ~ A one-byte space at the end of a string is invalidated. Alphabetic characters are case-sensitive. Duplication is not possible.
Password	A password used to authenticate the operator. The character type and the number of characters are determined by [Password requirement settings] set in the [Operator authentication management] screen ([Authentication setting] tab). ☞ Page 3032 Common settings relevant to authentication (Operator authentication setting)
Group	Each operator belongs to one group. The operation authority is set for each group, and the operator is grated the operation authority of the group to which the operator belongs. ☞ Page 2993 Group specifications
Operator ID	An ID assigned to each operator. The ID of the logged-in operator is stored in the specified device when [Store operator ID to the device] is enabled in the [Environmental Setting] window ([Security]). The setting range is [1] to [32767]. Duplication is not possible.
Level	A value to specify the display and operation to be allowed. An operator can operate the screens and objects with the levels equal to or lower than the level of the operator. The setting range is [0] to [15].
Making a password indefinite	The password expiration date can be made indefinite. If it is not made indefinite, [Password expiration date] set in the [Operator authentication management] screen ([Authentication setting] tab) is applied.
Disabling an operator account	Login attempts to a disabled operator account fail. Use this function in the following cases. • To avoid deleting the operator information • To disable the operator temporarily
Changing the password at the next login	The password must be changed at the next login. This function is used to prompt the operator to change the password set by the administrator. The message will not appear after the password is changed at the next login.
External authentication	Set whether to use an external device for the authentication. When performing external authentication, set the external authentication ID. The external authentication ID is used to perform authentication using information read with an external device such as an RFID controller. In the information read with an external device, the data (starting position and available byte number) used as the external authentication ID is determined by [External authentication ID] set in the [Operator authentication management] screen ([Authentication setting] tab).
Operator account lock	If the same operator fails authentication consecutively within 5 minutes, the account for that operator is locked. For the number of consecutive failures before the account is locked, [Lock operator individually after login failures] set in the [Operator authentication management] screen ([Authentication setting] tab) is applied. Login attempts to a locked operator account fail. The locked state is not cleared until an operator with either of the following operation authorities unlocks the account in the [Operator authentication management] screen ([Operator information] tab). • [Edit operator information] • [Sub-administrator authority]
Password history	The history of passwords used in the past. For the number of passwords saved in the history, [Specify number of pwd histories] set in the [Operator authentication management] screen ([Authentication setting] tab) is applied.
Password change date	The last date and time the password was changed.

89.1.4 Group specifications

Up to 16 groups can be registered to one GOT.

You can register or edit a group in the utility.

☞ Page 3003 Registering or editing an operator or group

The following shows the group types.

Group type	Description
Administrators group	This group has all the operation authorities. The group is provided by default and cannot be edited. At least one operator must belong to the Administrators group.
Users group	This group can operate user-created screens. The group is provided by default and cannot be edited.
User-defined group	This group can be created by users. The group name and operation authority can be edited. Up to 14 groups can be registered.

Each group has the following group information.

Item	Description
Group number	This item is fixed to [1] for the Administrators group and [2] for the Users group. The setting range for user-defined groups is [3] to [16]. Duplication is not possible.
Group name	Name of the group. This item is fixed to [Administrators] for the Administrators group and [Users] for the Users group. The setting range is 1 character to 20 characters. Alphanumeric characters, one-byte spaces, and the following symbols are usable. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [¥] ^ _ { | } ~ A one-byte space at the end of a string is invalidated. Alphabetic characters are case-sensitive. Duplication is not possible.
Operation authority	Authority to operate GOT screens and access information assets. ☞ Page 2994 Operation authorities

Operation authorities

The following shows the operation authorities that can be granted to groups.

Operation authority	Authority by group			Model
	Administrators group	Users group	User-defined group	
☞ Page 2994 User screen operation	Authorized	Authorized	Authorized	GT37 SoftGOT3000
☞ Page 2995 [Current drive reading]	Authorized	Not authorized	Editable

☞ Page 2996 [Security Mode change]	Authorized	Not authorized	Editable	GT37 SoftGOT3000

*1 Only [Edit operator information] or [Sub-administrator authority] can be granted.

■User screen operation

Operators with this authority can perform the following operations.

Operation	Remarks
Displaying an object	Only the objects with the security levels (display) equal to or lower than the level of the operator are displayed.
Operating an object	Only the objects with the security levels (operation) equal to or lower than the level of the operator can be operated.
Switching between user-created screens	The screen can be switched to a user-created screen with the security level equal to or lower than the level of the operator only. The following shows the target screens. • Base screen • Window screen • Mobile screen Switching to the utility is not supported by this authority.

■[Current drive reading]

Operators with this authority can perform the following operations.

Operation	Remarks
Switching to the utility	A user-created screen can be switched to the utility.
Copying files and folders	Files and folders on the current drive can be copied using the utility. For utility menu items that can be displayed by operators with this authority, refer to the following. ☞ Page 2997 Operation authorities and utility display restrictions To copy files and folders on a drive other than the current drive, the [Non-current drive reading/writing] authority is required.
Reading files and folders	Files and folders on the current drive can be read using GT Designer3 or Data Transfer Tool.

■[Current drive writing]

Operators with this authority can perform the following operations.

Operation	Remarks
Switching to the utility	A user-created screen can be switched to the utility.
Editing files and folders	Files and folders on the current drive can be converted, moved, renamed, or deleted, or a new folder can be created using the utility. For utility menu items that can be displayed by operators with this authority, refer to the following. ☞ Page 2997 Operation authorities and utility display restrictions Even with only this authority, the operator can specify a drive other than the current drive as the destination for file conversion or movement.
Writing files and folders	Files and folders can be written using GT Designer3 or Data Transfer Tool to the current drive.

■[Non-current drive reading/writing]

Operators with this authority can perform the following operations.

Operation	Remarks
Switching to the utility	A user-created screen can be switched to the utility.
Editing files and folders	Files and folders not on the current drive can be converted, copied, moved, renamed, or deleted, or a new folder can be created using the utility. For utility menu items that can be displayed by operators with this authority, refer to the following. ☞ Page 2997 Operation authorities and utility display restrictions Even with only this authority, the operator can specify the current drive as the destination for file conversion, copy, or movement.
Reading/writing files and folders	Files and folders can be read from/written to a drive other than the current drive using GT Designer3 or Data Transfer Tool.

■[GOT settings in the utility]

Operators with this authority can perform the following operations.

Operation	Remarks
Switching to the utility	A user-created screen can be switched to the utility.
Displaying each setting screen from the utility	For utility menu items that can be displayed by operators with this authority, refer to the following. ☞ Page 2997 Operation authorities and utility display restrictions

■[Startup package data reading/writing / F/W update]

Operators with this authority can perform the following operations.

Some operations require access authority to the destination drive.

Operation	Remarks
Switching to the utility	A user-created screen can be switched to the utility.
Displaying each setting screen from the utility	For utility menu items that can be displayed by operators with this authority, refer to the following. ☞ Page 2997 Operation authorities and utility display restrictions
Reading/writing package data	Package data can be read or written using GT Designer3 or Data Transfer Tool. Access privilege is not required for the destination drive.
Installing the BootOS	The BootOS can be installed from GT Designer3. Access privilege is not required for the destination drive.
Installing the BootOS or CoreOS via a data storage	The BootOS or CoreOS copied to a data storage can be installed to the GOT. Access privilege is not required for the destination drive.

■[Open a project data / Start monitoring]

Operators with this authority can perform the following operations.

Operation	Remarks
Switching to the utility	A user-created screen can be switched to the utility.
Displaying each setting screen from the utility	For utility menu items that can be displayed by operators with this authority, refer to the following. ☞ Page 2997 Operation authorities and utility display restrictions
Opening a project with GT SoftGOT3000	A project to be monitored can be changed. (The authority to start monitoring is not required.)
Starting monitoring with GT SoftGOT3000 using the SoftGOT-GOT link function	Monitoring is started for a project read from the GOT using the SoftGOT-GOT link function.

■[Reading/writing a device from an external device]

Operators with this authority can perform the following operations.

Operation	Remarks
Access from an OPC UA client	The OPC UA server (GOT) can be accessed from an OPC UA client.
Internal device interface function	You can monitor the GOT internal devices of GT SoftGOT3000 from a user-created application.

■[Edit operator information]

Operators with this authority can perform the following operations.

Operation	Remarks
Switching to the utility	A user-created screen can be switched to the utility.
Displaying each setting screen from the utility	For utility menu items that can be displayed by operators with this authority, refer to the following. ☞ Page 2997 Operation authorities and utility display restrictions

■[Sub-administrator authority]

Operators with this authority can perform the following operations.

Operation	Remarks
Switching to the utility	A user-created screen can be switched to the utility.
Displaying each setting screen from the utility	For utility menu items that can be displayed by operators with this authority, refer to the following. ☞ Page 2997 Operation authorities and utility display restrictions

The settings related to the operators with the [Sub-administrator authority] rights, such as the level that allows change of the operator authentication settings, are configured on the [Authentication setting] tab of the [Operator authentication management] screen.

The settings can be configured only by the operators with the [Edit Operator Management Information] rights.

☞ Page 3032 Common settings relevant to authentication (Operator authentication setting)

■[GOT Full Initialization / Security Mode change]

Operators with this authority can perform the following operations.

Operation	Remarks
Switching to the utility	A user-created screen can be switched to the utility.
All GOT data initialization	The [Full GOT reset] screen of the utility can be displayed.
Changing the security mode	The package data can be written to the GOT and the security mode can be changed.

■[Security Mode change]

Operators with this authority can perform the following operations.

Operation	Remarks
Switching to the utility	A user-created screen can be switched to the utility.
Changing the security mode	The security mode can be changed.

Operation authorities and utility display restrictions

The display of some utility menu items is restricted by operator's operation authority.
The following shows the operation authorities required to display each menu item.
If an operator has any of the required operation authorities, the corresponding menu item will be displayed.
In this section, operation authorities are represented by the numbers shown below.

No.	Operation authority
1	User screen operation
2	[Current drive reading]
3	[Current drive writing]
4	[Non-current drive reading/writing]
5	[GOT settings in the utility]
6	[Startup package data reading/writing / F/W update]
7	[Open a project data / Start monitoring]
8	[Reading/writing a device from an external device]
9	[Edit operator information]
10	[Sub-administrator authority]
11	[GOT Full Initialization / Security Mode change]

89.1.5 Operator management information

Information on registered operators and common settings related to authentication are called operator management information.

The operator management information can be exported to a data storage as the operator management information file and edited on a personal computer.

☞ Page 3004 Editing an operator on a personal computer

Performing one of the following operations deletes the file from the GOT.

Operation	Description
Installing the BootOS to the GOT	The information is deleted when data is written with the following settings configured on the [GOT Write] tab of the [Communicate with GOT] dialog. • Select [BootOS] for [Write Data]. • Select [Write after deleting all the package folders with the same name in GOT].
Installing the BootOS or CoreOS to the GOT via a data storage	The file is deleted when data is written from the memory card where it is written to the GOT with the following settings configured on the [BootOS/CoreOS Write] tab of the [Communicate with Memory Card] dialog. • Select [BootOS] or [CoreOS] for [Write Data]. • Select [Delete the package data on write].
Executing all GOT data initialization in the utility	📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
Changing the security mode	The information is deleted when package data in security mode 1 is written to the GOT in security mode 2.

89.2 How to set the operator authentication (Mode 2)

GT37 SoftGOT3000

When the security mode is mode 2, the operator authentication (Mode 2) is always enabled.

Point

If operator management information in security mode 1 exists on the GOT, writing package data in security mode 2 will delete the operator management information in security mode 1.

1. Configure the following settings in GT Designer3 as necessary.

Item		Required setting
GOT screen operation	Switching between user-created screens	For each screen, set a security level from which the screen switching is allowed. ☞ Page 313 Base screen properties ☞ Page 323 Window screen properties ☞ Page 2831 Mobile screen properties
	Displaying an object	Set a security level for each object to allow display and operation. For objects that can be operated such as touch switches and numerical inputs, set security levels for both display and operation. ☞ Setting dialog for each object ([Extended] tab)
	Operating an object	
	Special function switch for login/logout	Place a special function switch, and set [Action] in the [Function Setting] tab to [Login/Logout (Operator)].
	External authentication	For the settings required for authentication using a barcode reader or RFID controller, refer to the following. ☞ Page 3033 External authentication
External notification of the information on the logged-in operator		Set the items in the [Environmental Setting] window ([Security]) displayed by selecting [Common] → [GOT Environmental Setting] → [Security] from the menu. ☞ Page 3035 [Security] ([Screen Security] tab) (Mode 2)
Specifying the screen to be displayed after logout		

2. The operation depends on the GOT.

GOT	Setting
GOT (except GT SoftGOT3000)	Write package data to the GOT. When package data is written for the first time, a dialog to register an operator appears. To write package data to a GOT to which any operators are registered, authentication with the operator having the corresponding operation authority is required.
GT SoftGOT3000	Start GT SoftGOT3000 and open the package data. If no operator belongs to the Administrators group, a screen to register an operator appears.

3. Register the operator in the utility.

☞ Page 3003 Registering or editing an operator or group

89.2.1 When forgetting the operator name and password

When forgetting the operator name and password of an operator who has operation rights for [Edit operator information] or [Sub-administrator authority], operations such as writing package data or unlocking the operator will be disabled.

If such operation becomes disabled, install CoreOS to reset the GOT to its factory settings, and re-register the operator.

When creating an SD card for installing CoreOS on the GOT, select [Delete the package data on write] in the [Communicate with Memory Card] dialog ([BootOS/CoreOS Write] tab) to eliminate the need for operator authentication during the installation of CoreOS.

For instructions on installing CoreOS on the GOT, refer to the following.

☞ Page 448 Installing CoreOS on the GOT

89.3 Registering or editing an operator or group

GT37 SoftGOT3000

An operator or group can be registered or edited in the utility.

Touch [Operator authentication] on the [GOT basic set] tab of the utility to display the [Operator authentication management] screen.

For information on the operation method, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Operation	Method
Registering/editing an operator	Set it on the [Operator information] tab of the [Operator authentication management] screen. For information on the operator specifications, refer to the following. ☞ Page 2992 Operator specifications
Editing a group (granting operation authorities)	Set it on the [Group information] tab of the [Operator authentication management] screen. For information on the group specifications, refer to the following. ☞ Page 2993 Group specifications

To display the screen, perform authentication with the operator having the corresponding operation authority.

Editable settings depend on the operation authority and level of the logged-in operator.

☞ Page 2994 Operation authorities

89.4 Editing an operator on a personal computer

☞ Page 3005 Operating procedure
☞ Page 3011 GOT Operator Management Information Conversion Tool Ver. 3

This section describes information on both the security modes 1 and 2.

Information on registered operators can be exported to a data storage as the operator management information file and edited on a personal computer.

Importing the edited file into the GOT updates the operator information in the GOT.

To edit the operator management information file on the personal computer, convert the file format using GOT Operator Management Information Conversion Tool Ver. 3.

89.4.1 Operating procedure

Operator authentication is performed for each operation.
Available operations depend on the operator to be authenticated.

Operation step		Operator to be authenticated		
		Mode 1: Administrator Mode 2: Operator with operation authority for [Edit operator information]	**Mode 1: Sub administrator**	**Mode 2: Operator with [Sub-administrator authority]**
1	☞ Page 3006 Operation on the GOT (export)			
2	☞ Page 3007 Operation on a personal computer (G3U → CSV) ☞ Page 3008 Operation on a personal computer (CSV → G3U)		 Only the information editable by the operator authenticated at the time of conversion and import is imported from the CSV file into the G3U file.	
3	☞ Page 3010 Operation on the GOT (import)	 Only the information editable by the operator authenticated at the time of import is imported into the operator management information in the GOT.		Information cannot be imported.

Precautions

■Resetting the password expiration date

When the expiration date of the password is set to a value other than 0 days, setting the password in the CSV file and importing the converted G3U file into the GOT reset the number of remaining days until the expiration date.
If the password expiration date was set to 30 days and the operator information is edited on the personal computer after 25 days, the number of remaining days until the expiration date becomes as follows.

Operation	Password expiration date after the G3U file is imported
When the password is edited in the CSV file	Editing the password in the CSV file resets the number of remaining days until the expiration date to 30.
When the password is not edited in the CSV file	The number of remaining days until the expiration date remains 5.

Operation on the GOT (export)

1. Log in any one of the following operators.

Security mode	Operator	Reference
Mode 1	Administrator	☞ Page 3051 Login for the operator authentication with a password
	Sub administrator	
Mode 2	Operator with operation authority for [Edit operator information]	☞ Page 3034 Login
	Operator with [Sub-administrator authority]	

2. Touch [Operator authentication] on the [GOT basic set] tab of the utility to display the [Operator authentication management] screen.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

3. Touching the [Export] button in the [Operator information] tab displays a dialog to select the drive.

When the security mode is mode 2, the selectable drives depend on the operation authority the operator has.

4. Select a drive, and touch the [OK] button to display a dialog to set the encryption password.

5. Enter an encryption password, and then touch the [Enter] button to display a dialog to confirm the encryption password.

The password must be eight characters or more and include at least two of the following character types.

- Uppercase alphabet (A to Z)
- Lowercase alphabet (a to z)
- Numbers
- Symbols

6. Enter the same password again, and touch the [Enter] button. The operator management information file (AUTHINF.G3U) is exported directly under the selected drive.

7. Perform either of the following operations according to the GOT model.

GOT model	Operation
GOT (except GT SoftGOT3000)	Store the G3U file in the data storage, and remove it from the GOT. For information on how to remove the data storage, refer to the following. 📖GOT3000 Series User's Manual (Hardware)
GT SoftGOT3000	Use the G3U file stored in the virtual drive. ☞ Page 83 Drive configuration and capacity of GT SoftGOT3000

Convert the G3U file into a CSV file using GOT Operator Management Information Conversion Tool Ver. 3, and edit it.

☞ Page 3007 Operation on a personal computer (G3U → CSV)

Operation on a personal computer (G3U → CSV)

1. Perform either of the following operations according to the GOT model.

GOT model	Operation
GOT (except GT SoftGOT3000)	Install the data storage that contains the G3U file to the personal computer. For information on how to install the data storage, refer to the following. GOT3000 Series User's Manual (Hardware)
GT SoftGOT3000	Use the G3U file stored in the virtual drive. ☞ Page 83 Drive configuration and capacity of GT SoftGOT3000

2. Start GOT Operator Management Information Conversion Tool Ver. 3.

☞ Page 3012 How to start GOT operator management information conversion tool

3. Configure the following settings, and click the [Convert] button.

☞ Page 3012 Setting items of GOT Operator Management Information Conversion Tool Ver. 3

- Select [Convert operator management information file into CSV file].
- Enter the full path of the G3U file name in [Source file].

4. In the [Enter encryption password] dialog displayed, enter the encryption password and click the [OK] button.

5. Perform any one of the following operations according to the dialog displayed.

Security mode	Dialog	Operation
Mode 1	[Administrator password entry] dialog	Enter the administrator password.
	[Administrator authentication] dialog	Enter the operator name and password of a sub administrator.
Mode 2	[Administrator authentication] dialog	Enter the operator name and password of any one of the following operators. • Operator with operation authority for [Edit operator information] • Operator with [Sub-administrator authority]

Contents to be output to the CSV file depend on the operator to be authenticated.

The following contents affect the processing of the operation on a personal computer (CSV → G3U).

Security mode	Operator	Content to be output
Mode 1	Administrator	[SUB_ADMIN_FORMAT] is not output in the header part.
	Sub administrator	[SUB_ADMIN_FORMAT] is output in the header part.
Mode 2	Operator with operation authority for [Edit operator information]	[SUB_ADMIN_FORMAT] is not output in the header part.
	Operator with [Sub-administrator authority]	[SUB_ADMIN_FORMAT] is output in the header part.

6. After the [OK] button is clicked and authentication succeeds, a CSV file is created in the folder where the conversion source file is stored.

If a file with the same name as the destination file already exists, the file is renamed to the backup file name (AUTHINF.CSV.BAK).

The backup file can be used as a CSV file by removing the [.BAK] at the end.

7. Check the configuration and edit the operator information.

Editable information depends on the authenticated operator.

☞ Page 3014 CSV file (AUTHINF.CSV) configuration (Mode 1)

☞ Page 3020 CSV file (AUTHINF.CSV) configuration (Mode 2)

After editing the CSV file, convert it into a G3U file using GOT Operator Management Information Conversion Tool Ver. 3.

☞ Page 3008 Operation on a personal computer (CSV → G3U)

Operation on a personal computer (CSV → G3U)

The processing depends on the configuration of the CSV file to be converted.

Configuration of CSV file	Reference
[SUB_ADMIN_FORMAT] not described in the header part	☞ Page 3008 Converting a CSV file into G3U format
[SUB_ADMIN_FORMAT] described in the header part	☞ Page 3009 Importing contents of a CSV file into a G3U file

If an error occurs at the conversion, an error log file is output.

☞ Page 3009 Error log file (GTOperatorInfoConv.log) during conversion

■Converting a CSV file into G3U format

1. Start GOT Operator Management Information Conversion Tool Ver. 3.

☞ Page 3012 How to start GOT operator management information conversion tool

2. Configure the following settings, and click the [Convert] button.

☞ Page 3012 Setting items of GOT Operator Management Information Conversion Tool Ver. 3

- Select [Generate operator management information file from CSV file].
- Enter the full path of the CSV file name in [Source file].

3. In the [Enter encryption password] dialog displayed, enter the encryption password and click the [OK] button.

4. In the [Enter encryption password] dialog displayed, enter the same password again and click the [OK] button.

A G3U file is created in the folder where the CSV file is stored.

If a file with the same name as the destination file already exists, the file is renamed to the backup file name (AUTHINF.G3U.BAK).

The backup file can be used as a G3U file by removing the [.BAK] at the end.

5. Perform either of the following operations according to the GOT model.

GOT model	Operation
GOT (except GT SoftGOT3000)	Store the G3U file in the data storage, and remove it from the personal computer.
GT SoftGOT3000	When the G3U file is stored in a drive other than the virtual drive, move it directly under the virtual drive. ☞ Page 83 Drive configuration and capacity of GT SoftGOT3000

Importing the G3U file into the utility updates the operator management information in the GOT.

☞ Page 3010 Operation on the GOT (import)

■Importing contents of a CSV file into a G3U file

1. Store the following files in the same folder.

- Edited CSV file
- G3U file converted into the CSV file

2. Start GOT Operator Management Information Conversion Tool Ver. 3.

☞ Page 3012 How to start GOT operator management information conversion tool

3. Configure the following settings, and click the [Convert] button.

☞ Page 3012 Setting items of GOT Operator Management Information Conversion Tool Ver. 3

- Select [Generate operator management information file from CSV file].
- Enter the full path of the CSV file name in [Source file].

4. In the [Enter encryption password] dialog displayed, enter the encryption password and click the [OK] button.

5. In the [Administrator authentication] dialog displayed, enter the operator name and password of either of the following operators, and click the [OK] button.

Security mode	Operator
Mode 1	Sub administrator
Mode 2	Operator with [Sub-administrator authority]

A G3U file in which the contents of the CSV file are imported is created in the same folder.

Only the information editable by the operator authenticated at the time of import is imported into the G3U file.

The file name of the G3U file before the import is changed to AUTHINF.G3U.BAK.

The backup file can be used as a G3U file by removing the [.BAK] at the end.

6. Perform either of the following operations according to the GOT model.

GOT model	Operation
GOT (except GT SoftGOT3000)	Store the G3U file in the data storage, and remove it from the personal computer.
GT SoftGOT3000	When the G3U file is stored in a drive other than the virtual drive, move it directly under the virtual drive. ☞ Page 83 Drive configuration and capacity of GT SoftGOT3000

Importing the G3U file into the utility updates the operator management information in the GOT.

☞ Page 3010 Operation on the GOT (import)

■Error log file (GTOperatorInfoConv.log) during conversion

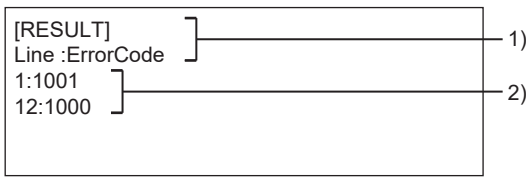
If an error occurs during the conversion/import from a CSV file into a G3U file, an error log file (GTOperatorInfoConv.log) is created in the same folder as the conversion source file.

If the folder already has a file with the same name, the file is overwritten.

In the following cases, the error log file is not output.

- No error has occurred.
- The security mode of the CSV file is incorrect.

Checking the error location (line) in the CSV file and the error cause (error code) is available.



Item		Description
1)	Header part	The header part of the error file. (The character strings are fixed.)
2)	Error code	The error line numbers and the error codes are displayed. (Line number: Error code) ☞ Page 3028 Error code list

Operation on the GOT (import)

1. Perform either of the following operations according to the GOT model.

GOT model	Operation
GOT (except GT SoftGOT3000)	Install the data storage that contains the G3U file to the GOT. For information on how to install the data storage, refer to the following. GOT3000 Series User's Manual (Hardware)
GT SoftGOT3000	Use the G3U file stored in the virtual drive. ☞ Page 83 Drive configuration and capacity of GT SoftGOT3000

2. Log in any one of the following operators.

Security mode	Operator	Reference
Mode 1	Administrator	☞ Page 3051 Login for the operator authentication with a password
	Sub administrator	
Mode 2	Operator with operation authority for [Edit operator information]	☞ Page 3034 Login

3. Touch the [Import] button on the [Operator information] tab of the [Operator authentication management] screen to display a dialog to select a drive.

When the security mode is mode 2, the selectable drives depend on the operation authority the operator has.

4. Select a drive and touch the [OK] button to display the [Admin password authentication] dialog.

Depending on the screen displayed, perform any one of the following operations.

Security mode		Operation
Mode 1	When the sub-administrator is disabled	Enter the administrator password.
	When the sub-administrator is enabled	Enter the operator name and password of any one of the following operators. • Administrator • Sub-administrator (only a sub-administrator registered in the G3U file to be imported and not disabled)
Mode 2		Enter the operator name and password of an operator with operation authority for [Edit operator information].

5. Touch the [Enter] button to display a dialog to enter the encryption password.

6. Enter the password set at the creation of the G3U file, and then touch the [Enter] button.

When the authentication is successful, the operator management information on the GOT is updated with the imported contents.

Only the information editable by the operator authenticated at the time of import is imported.

89.4.2 GOT Operator Management Information Conversion Tool Ver. 3

☞ Page 3011 How to obtain the tool
☞ Page 3011 Operating environment
☞ Page 3012 How to start GOT operator management information conversion tool
☞ Page 3012 Setting items of GOT Operator Management Information Conversion Tool Ver. 3
☞ Page 3012 Execution with a command line
☞ Page 3014 CSV file (AUTHINF.CSV) configuration (Mode 1)
☞ Page 3020 CSV file (AUTHINF.CSV) configuration (Mode 2)
☞ Page 3028 Error code list

GOT Operator Management Information Conversion Tool Ver. 3 is a tool to convert the file format of the operator management information file for GOT3000.

Conversion between the following file formats is supported.

File format		Remarks
Conversion source	Conversion destination	
G3U	CSV	—
CSV	G3U	Only the CSV files with the data structure supported by GOT Operator Management Information Conversion Tool Ver. 3 can be converted.

How to obtain the tool

Consult your local sales office.

Operating environment

Item	Description
Model	Personal computer that runs Windows
OS*1*2	• Microsoft Windows 11 Education (64-bit) • Microsoft Windows 11 Enterprise (64-bit) • Microsoft Windows 11 Pro (64-bit) • Microsoft Windows 11 Home (64-bit) • Microsoft Windows 10 Enterprise (32-bit, 64-bit) • Microsoft Windows 10 Pro (32-bit, 64-bit) • Microsoft Windows 10 Home (32-bit, 64-bit)
CPU	The system requirements for the above OSs must be met. For the system requirements for the OSs, refer to the following. ☞ Microsoft official website
Memory	
Hard disk space	500 KB or more
Display	Resolution: SVGA (800 × 600 dots) or higher
Display color	High Color (16 bits) or higher

*1 Japanese version of GOT Operator Management Information Conversion Tool Ver. 3 is compatible with the Japanese version of Windows.
English version of GOT Operator Management Information Conversion Tool Ver. 3 is compatible with the English version of Windows.

*2 The following functions are not supported.
Touch feature
Modern UI Style
Operation in a virtual environment such as Hyper-V
Tablet mode
Unified Write Filter
Operation in an environment with the text cursor indicator turned on

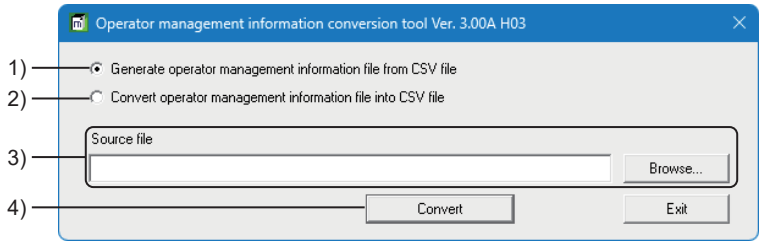
How to start GOT operator management information conversion tool

Installing GOT Operator Management Information Conversion Tool Ver. 3 is not required.

Copy the execution file (GTOperatorInfoConv.exe) in a folder, and then execute the file in the folder.

Starting multiple windows of this tool at the same time is not supported.

Setting items of GOT Operator Management Information Conversion Tool Ver. 3



Item		Description	
1)	[Generate operator management information file from CSV file]	Converts a CSV file into an operator management information file. Clicking the [Convert] button performs the operation according to the contents of the CSV file.	
		[SUB_ADMIN_FORMAT] not described in the header part	A G3U file is created from the CSV file specified in [Source file].
		[SUB_ADMIN_FORMAT] described in the header part	The contents of the CSV file specified in [Source file] are imported into the G3U file. Before the conversion, make sure to store the CSV file and the G3U file in the same folder. After the conversion, a log file is output.
2)	[Convert operator management information file into CSV file]	Converts a G3U file into a CSV file. Select this item and click the [Convert] button to convert the G3U file specified in [Source file] into a CSV file. After the conversion, the CSV file and the conversion source file are stored in the same folder.	
3)	[Source file]	Specify a path of the conversion source file. By clicking the [Brouse] button, the path of the conversion source file can be specified in the [Open CSV file] dialog. The setting range is up to 255 one-byte characters.	
4)	[Convert] button	Click this button to execute the file conversion.	

Execution with a command line

You can execute GOT Operator Management Information Conversion Tool Ver. 3 with a command line.

Perform either of the following operations to start Command Prompt.

- From the Windows start menu, select [All] → [Windows Tools], and double-click [Command Prompt] in the displayed [Windows Tools] (for Windows 11).
- Type "cmd" in the search box on the taskbar and execute.

Describe a command line in the following formats.

Security mode	Format
Mode 1	GTOperatorInfoConv.exe filename /p Cryptography_Password [Operator_Password] [/f] [/l] [/-c] [/s opname] [/help] [/?]
Mode 2	GTOperatorInfoConv.exe filename Cryptography_Password opname [Operator_Password] [/f] [/l] [/-c] [/help] [/?]

The options in square brackets are omittable.

The following table lists the details on commands and options.

Type	Format	Description		
Command	GTOperatorInfoConv.exe	The file conversion is performed as shown below.		
		G3U → CSV		Converts a G3U file into a CSV file.
		CSV → G3U	[SUB_ADMIN_FORMAT] not described in the header part	Creates a G3U file in the same folder as the conversion source CSV file.
			[SUB_ADMIN_FORMAT] described in the header part	Imports the contents of the conversion source CSV file into the G3U file stored in the same folder. After the conversion, another command prompt starts and displays the conversion result.
Option	filename*1*2	Specify the operator management information file to be converted (*.CSV or *.G3U) with the absolute path.		
	/p	Available only in mode 1. Specify Cryptography_Password (encryption password) after /p.		
	Cryptography_Password*1*2	Enter the encryption password for the operator management information file. In mode 1, it can be specified after /p.		
	opname*1*2	Enter the operator name. Enter the operator name as shown below depending on the type of conversion.		
		Mode 1	G3U (sub-administrator registered) → CSV	Operator name of an administrator or sub administrator
			G3U (sub-administrator not registered) → CSV	Not required
			CSV → G3U (file conversion)	Not required
			CSV→G3U (import)	Operator name of a sub administrator
		Mode 2	G3U → CSV	Operator name of an operator with either of the following operation authorities • [Edit operator information] • [Sub-administrator authority]
			File conversion from CSV into G3U	Operator name of an operator with operation authority for [Edit operator information]
			Import from CSV into G3U	Operator name of an operator with [Sub-administrator authority]
	Operator_Password*1*2	Enter the password for the operator. For the password, the same string as any options cannot be specified. If specified, it is treated as an option instead of a password.		
	/f	If the conversion destination folder already has a file with the same name, the file is overwritten. When the contents of a CSV file are imported to the G3U file by the following operators, this option is invalid. • Mode 1: Sub administrator • Mode 2: Operator with [Sub-administrator authority]		
	/l	Outputs the conversion result to an operator management information conversion log file. The operator management information conversion log file is output to the folder where the conversion source file is stored. If the folder already has a file with the same name as that of the operator management information conversion log file, the file is overwritten. ☞ Page 3014 Operator management information conversion log file (GTOperatorInfoConvResult.txt) configuration		
	/-c	Does not start the command prompt to display the conversion result.		
	/s	Available only in mode 1. Specifies a sub-administrator to execute the file conversion. Specify opname (operator name) after /s.		
	/help	Displays how to use options on the command prompt. If these options are specified, the other options are ignored and the conversion is not executed.		
	/?			

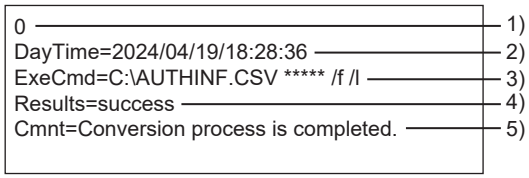
*1 If the path or password satisfies any of the following conditions, enclose it in double quotation marks (" ").
• Includes a one-byte space.
• Begins with a double quotation mark (").
A string in which a one-byte space and double quotation mark (") are next to each other cannot be used even if it is enclosed in double quotation marks (" ").

*2 If the path or password satisfies all the following conditions, a command error may occur when the command is executed.
• Includes a special symbol (such as &, |, >, and <).
• Includes a double quotation mark (").
Any path or password which causes a command error cannot be used in the command prompt.

■Operator management information conversion log file (GTOperatorInfoConvResult.txt) configuration

The operator management information conversion log file is output when the conversion is executed with a command line.

The file is output to the folder where the conversion source file is stored.



Item		Description
1)	Conversion result code	The conversion result code is output in the following formats. • [0]: Normal end • [1]: Abnormal end
2)	Conversion date	It is output in the following format: Year/Month/Day/Hour:Minute:Second
3)	Executed command	The executed command is output. The encryption password and operator password are output as [*****].
4)	Conversion result	The conversion result is output in the following formats. • [success]: Normal end • [failure]: Abnormal end
5)	Message	The message at the conversion completion is output.

CSV file (AUTHINF.CSV) configuration (Mode 1)

A CSV file consists of the header part and the operator part.

Set each setting item without changing the order of the items.

☞ Page 3015 Header part (Mode 1)

☞ Page 3018 Operator part (Mode 1)

Precautions

■When the data format is invalid

In the following cases, the data format is invalid and a CSV file is not converted into an operator management information file.

- A necessary setting item is deleted.
- When the order of the setting items is changed
- When any of the settings is incorrect
- An unnecessary item exists.

■Header part (Mode 1)

In the header part, configure the common setting for each operator information.

Items to be output vary with the settings, such as administrator privileges.

1)	GOT_OPERATOR_AUTHENTICATION_INFO_GOT3000		
2)	DATA_VERSION	1	
3)	SECURITY_MODE	1	
5)	AUTH_TYPE	EXT_AUTH+P	
6)	PASS_TYPE	ENCRYPTED	
7)	AUTO_LOGOUT_TIME	300	
8)	PASS_EXP_DATE	42	
9)	EXT_AUTH_ID_TOP	2	
10)	EXT_AUTH_ID_LEN	4	
11)	EXT_UNIT_CH	8	
12)	LOGIN_LOCK_NUM	0	
13)	LOGIN_LOCK_CANCEL_TIME	10	
14)	LOGIN_LOCK_TIME	5	
15)	OPE_LOCK_NUM	3	
16)	OPE_LOCK_TIME	5	
17)	PASS_REQ_TYPE	0	
18)	PASS_REQ_MIN_LEN	1	
19)	PASS_REQ_STR_TYPE	0	
20)	PASS_EXP_NOTICE	0	
21)	SUB_ADMIN_FLG	0	
22)	OUTPUT_ALL_OPE	0	
23)	IS_FUNC_SET	0	
24)	FUNC_SET_LEVEL	15	
25)	PASS_HIST_NUM	1	

Created by an administrator

1)	GOT_OPERATOR_AUTHENTICATION_INFO_GOT3000		
2)	DATA_VERSION	1	
3)	SECURITY_MODE	1	
4)	SUB_ADMIN_FORMAT	USER:user4	15
5)	AUTH_TYPE	EXT_AUTH+P	
6)	PASS_TYPE	ENCRYPTED	
7)	AUTO_LOGOUT_TIME	300	
8)	PASS_EXP_DATE	42	
9)	EXT_AUTH_ID_TOP	2	
10)	EXT_AUTH_ID_LEN	4	
11)	EXT_UNIT_CH	8	
12)	LOGIN_LOCK_NUM	0	
13)	LOGIN_LOCK_CANCEL_TIME	10	
14)	LOGIN_LOCK_TIME	5	
15)	OPE_LOCK_NUM	3	
16)	OPE_LOCK_TIME	5	
17)	PASS_REQ_TYPE	0	
18)	PASS_REQ_MIN_LEN	1	
19)	PASS_REQ_STR_TYPE	0	
20)	PASS_EXP_NOTICE	0	
22)	OUTPUT_ALL_OPE	1	
24)	FUNC_SET_LEVEL	15	
25)	PASS_HIST_NUM	1	

Created by a sub-administrator

Item		Description	
1)	[GOT_OPERATOR_AUTHENTICATION_INFO_GOT3000]	Keyword to declare that the file is an operator management information file for GOT3000. This item cannot be edited.	
2)	[DATA_VERSION]	Data structure version of the CSV file.	
3)	[SECURITY_MODE]	Security mode. This item cannot be edited.	
4)	[SUB_ADMIN_FORMAT]	Keyword to indicate that the CSV file is converted from a G3U file by a sub administrator. After the keyword, the operator name and level of the operator who has performed the file conversion are output. The operator name is output in the following format: [USER:Username]. The security level is output in the range from [0] to [15]. This item is output only in CSV files created by a sub administrator. This item cannot be edited.	
5)	[AUTH_TYPE]*1	Authentication type of the operator authentication.	
		[ID_PASS]	Authentication is performed with the operator name and password.
		[EXT_AUTH]	Authentication is performed with the external device connected to the RS232/422/485 interface of the GOT.
		[EXT_AUTH+P]	Authentication is performed with the external device connected to the RS232/422/485 interface of the GOT. Authentication with the operator name and password can be performed as well. (Auxiliary authentication)
		[EXT_AUTHUSB]	Authentication is performed with the external device connected to the USB interface of the GOT.
		[EXT_AUTHUSB+P]	Authentication is performed with the external device connected to the USB interface of the GOT. Authentication with the operator name and password can be performed as well. (Auxiliary authentication)
6)	[PASS_TYPE]	Setting method of the password.	
		[ENCRYPTED]	The password is encrypted. An unencrypted password is encrypted when the file is converted into a CSV file.
		[PLAIN]	The password is not encrypted.

Item		Description	
7)	[AUTO_LOGOUT_TIME]*1	Time period from when the last operation is performed until when the automatic logout is performed. The setting range is [0] (Invalid) or [60] seconds to [7200] seconds.	
8)	[PASS_EXP_DATE]*1	Number of days until the password expiration date The setting range is [0] (Invalid), or [1] to [1000] days.	
9)	[EXT_AUTH_ID_TOP]*1	Starting position of the data used as the external authentication ID in the information read with an external device. The setting range is [0] to [1998] bytes. The total set value of [EXT_AUTH_ID_TOP] and [EXT_AUTH_ID_LEN] must be 2000 or less. If the total set value exceeds 2000, the file cannot be converted correctly.	
10)	[EXT_AUTH_ID_LEN]*1	Length of the data used as the external authentication ID in the information read with an external device. The setting range is [2] to [16] bytes. The total set value of [EXT_AUTH_ID_TOP] and [EXT_AUTH_ID_LEN] must be 2000 or less. If the total set value exceeds 2000, the file cannot be converted correctly.	
11)	[EXT_UNIT_CH]*1	Channel for connecting an external device to be used for external authentication. This item is fixed to [8].	
12)	[LOGIN_LOCK_NUM]*1	Number of consecutive failed login attempts for the GOT to recognize an incorrect login. The setting range is [0] (Invalid), or [3] to [10] times.	
13)	[LOGIN_LOCK_CANCEL_TIME]*1	Time period during which the re-authentication operation is disabled after it is judged that incorrect login attempts have been made. The setting range is [1] second to [3600] seconds.	
14)	[LOGIN_LOCK_TIME]*1	Time period in which consecutive failed login attempts increment the failed login count. This item is fixed to [5] minutes.	
15)	[OPE_LOCK_NUM]*1	Number of consecutive failed login attempts to the same operator account for the GOT to recognize an incorrect login. The setting range is [0] (Invalid), or [3] to [10] times.	
16)	[OPE_LOCK_TIME]*1	Time period in which consecutive failed login attempts to the same operator increment the failed login count. This item is fixed to [5] minutes.	
17)	[PASS_REQ_TYPE]*1	Password requirements.	
		[0]	Up to 64 characters can be set. The character types are not checked.
		[1]	This item depends on the settings of [PASS_REQ_MIN_LEN] and [PASS_REQ_STR_TYPE].
18)	[PASS_REQ_MIN_LEN]*1	This item is used only when [PASS_REQ_TYPE] is [1]. Minimum number of characters of a password to be a password requirement. The setting range is [1] character to [64] characters.	
19)	[PASS_REQ_STR_TYPE]*1	This item is used only when [PASS_REQ_TYPE] is [1]. Character type requirements for a password.	
		[0]	The character types are not checked.
		[1]	Checks if a password contains at least two of the following character types. • Alphabet (A to Z and a to z) • Numbers, symbols, and one-byte spaces
		[2]	Checks if a password contains at least three of the following character types. • Alphabet (A to Z and a to z) • Numbers • Symbols and one-byte spaces
		[3]	Checks if a password contains the following four types of characters. • Uppercase alphabet (A to Z) • Lowercase alphabet (a to z) • Numbers • Symbols and one-byte spaces
20)	[PASS_EXP_NOTICE]*1	Setting to notify the user that the password expiration date is approaching. When the number of remaining days until the password expiration date is equal to or less than the set number of days, a message prompting you to change the password appears at login. The setting range is [0] days (Invalid), or [1] to [30] days.	
21)	[SUB_ADMIN_FLG]	Setting to enable or disable sub administrators. • [0]: Disabled • [1]: Enabled This item is output only in CSV files created by an administrator.	

Item		Description
22)	[OUTPUT_ALL_OPE]	When a sub-administrator performs a G3U → CSV conversion, this setting determines whether to output the operator information uneditable by the sub-administrator to the operator part. • [0]: Not output • [1]: Output This item is output only in CSV files created by either of the following operators. • Administrator • Sub-administrator who has both editing permissions for operator authentication settings and security level 15 When [SUB_ADMIN_FLG] is set to [0] (disabling the sub-administrator), converting a CSV file to a G3U file changes the value to [0].
23)	[IS_FUNC_SET]	Editability of the header part (operator authentication setting) by sub administrators. • [0]: Not allowed • [1]: Allowed This item is output only in CSV files created by an administrator. When [SUB_ADMIN_FLG] is set to [0] (disabling the sub-administrator), converting a CSV file to a G3U file changes the value to [0].
24)	[FUNC_SET_LEVEL]	Level of sub administrators from which editing the operator authentication setting is enabled. The setting range is [0] to [15]. This item is output only in CSV files created by either of the following operators. • Administrator • Sub-administrator who has both editing permissions for operator authentication settings and security level 15
25)	[PASS_HIST_NUM]*1	Number of previously set passwords saved in the history. The setting range is [0] (Invalid), or [1] to [5] times.

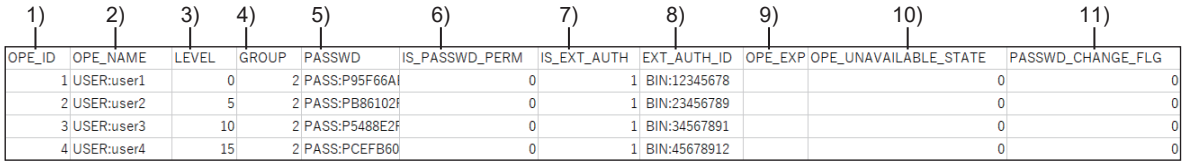
*1 This item is output only in CSV files created by operators with levels where changing the operator authentication setting is allowed.

■Operator part (Mode 1)

In the operator part, set the individual operator information.

Information to be output depends on the operator authenticated at the time of the CSV file creation.

Authenticated operator		Output information
Administrator		Information on all operators other than the administrator is output.
Sub-administrator (level 15)	[Enable op auth settings change] is selected	Information on all operators including the administrator is output.
	Other than the above	Only the operator information that satisfies the following condition is output. • Operators with levels equal to or lower than the authenticated operator
Sub-administrator (level 14 or lower)	• [Show non-editable operators] is selected • [Enable op auth settings change] is deselected	Information on all operators other than the administrator is output. The following operators' information is invalid even if edited. • Operators with levels higher than the authenticated operator
	Other than the above	Only the operator information that satisfies the following condition is output. • Operators with levels equal to or lower than the authenticated operator



1) OPE_ID	2) OPE_NAME	3) LEVEL	4) GROUP	5) PASSWD	6) IS_PASSWD_PERM	7) IS_EXT_AUTH	8) EXT_AUTH_ID	9) OPE_EXP	10) OPE_UNAVAILABLE_STATE	11) PASSWD_CHANGE_FLG
1	USER:user1	0	2	PASS:P95F66A	0	1	BIN:12345678		0	0
2	USER:user2	5	2	PASS:PB86102	0	1	BIN:23456789		0	0
3	USER:user3	10	2	PASS:P5488E2	0	1	BIN:34567891		0	0
4	USER:user4	15	2	PASS:PCEFB60	0	1	BIN:45678912		0	0

Item		Description	
1)	[OPE_ID][*1][*2]	Operator ID. The setting range is [1] to [32766].	
2)	[OPE_NAME][*2]	Operator name. For information on the operator name specifications, refer to the following. ☞ Page 3044 Operator management information When editing a CSV file directly, add [USER:] to the start of data. Otherwise, an error occurs when the file is converted to a G3U file. Not editable in the administrator row. Even if edited, the editing is not reflected in the G3U file.	
3)	[LEVEL][*1][*2]	Operator level. The setting range is [0] to [15]. When edited by a sub-administrator, this item can be set to the level of the sub-administrator or lower.	
4)	[GROUP][*1][*2]	Group number of the group to which the operator belongs. • [2]: Users group • [3]: Sub Admins group	
5)	[PASSWD]	Password for the operator. Up to 64 one-byte alphanumeric characters (a to z, A to Z, 0 to 9) and symbols as shown below can be used. (Alphabetic characters are case sensitive.) • ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [¥] ^ _ { | } ~ • One-byte space (However, a one-byte space used at the end of the operator name is invalid.) When you set a password in a CSV file, prepend the string "PASS:" to the password. Otherwise, an error occurs when the file is converted to a G3U file. [PASS:] is not included in the password's character count.	
		Since the password entered in the CSV file is displayed as it is, be careful when handling the CSV file. The following methods are available as measures against password leakage.	
		Setting the password in the utility	Leave the password not set in the CSV file, and set it after the operator management information is imported into the GOT.
		Encrypting the password by reconversion	Set [ENCRYPTED] for [PASS_TYPE] in the header part. ☞ Page 3015 Header part (Mode 1) Convert the file format from CSV into G3U using GOT Operator Management Information Conversion Tool Ver. 3. The password can be encrypted by converting the converted G3U file into a CSV file again using GOT Operator Management Information Conversion Tool Ver. 3.
6)	[IS_PASSWD_PERM][*1]	Setting to determine whether the password is permanent. The following shows the setting range. • [0]: The password is not permanent. • [1]: The password is permanent.	

Item		Description
7)	[IS_EXT_AUTH][*1]	Whether to use external authentication. The following shows the setting range. • [0]: Not used • [1]: Used When [AUTH_TYPE] in the operator part is set to [ID_PASS] (authentication with operator name and password), converting a CSV file to a G3U file changes the value to [0].
8)	[EXT_AUTH_ID][*1]	External authentication ID. The number of bytes depends on the set value of [EXT_AUTH_ID_LEN] in the header part. Set the external authentication ID with hexadecimal numbers. When editing a CSV file directly, add [BIN:] to the start of data. Otherwise, an error occurs when the file is converted to a G3U file. If [AUTH_TYPE] is set to [ID_PASS] in the header part, setting this item is not required because external authentication is not used.
9)	[OPE_EXP]	Not used Leave the area blank.
10)	[OPE_UNAVAILABLE_STATE][*2]	Whether to enable or disable the operator. The following shows the setting range. • [0]: Enables the operator account. • [1]: Disables the operator account.
11)	[PASSWD_CHANGE_FLG][*1]	Setting whether to display a message requesting a password change at next login. The following shows the setting range. • [0]: Does not display the message. • [1]: Displays the message.

*1 A hyphen (-) is output in the administrator row.

*2 Editing is not available for the row of the sub-administrator authenticated to generate a CSV file for editing.
Even if edited, the editing is not reflected in the G3U file.

CSV file (AUTHINF.CSV) configuration (Mode 2)

A CSV file consists of the header part, group part, and the operator part.

Set each setting item without changing the order of the items.

☞ Page 3021 Header part (Mode 2)
☞ Page 3024 Group part (Mode 2)
☞ Page 3026 Operator part (Mode 2)

Precautions

■When the data format is invalid

In the following cases, the data format is invalid and a CSV file is not converted into an operator management information file.

- A necessary setting item is deleted.
- When the order of the setting items is changed
- When any of the settings is incorrect
- An unnecessary item exists.

■Header part (Mode 2)

In the header part, configure the common setting for each operator information.

Items to be output vary with the settings, such as administrator privileges.

1)	GOT_OPERATOR_AUTHENTICATION_INFO_GOT3000	
2)	DATA_VERSION	1
3)	SECURITY_MODE	2
5)	AUTH_TYPE	ID_PASS
6)	PASS_TYPE	ENCRYPTED
7)	AUTO_LOGOUT_TIME	300
8)	PASS_EXP_DATE	42

Created by an operator with [Sub-administrator authority]

Item		Description	
1)	[GOT_OPERATOR_AUTHENTICATION_INFO_GOT3000]	Keyword to declare that the file is an operator management information file for GOT3000. This item cannot be edited.	
2)	[DATA_VERSION]	Data structure version of the CSV file.	
3)	[SECURITY_MODE]	Security mode. This item cannot be edited.	
4)	[SUB_ADMIN_FORMAT]	Keyword to indicate that the CSV file is converted from a G3U file by an operator with [Sub-administrator authority]. After the keyword, the operator name and level of the operator who has performed the file conversion are output. The operator name is output in the following format: [USER:Username]. The security level is output in the range from [0] to [15]. This item is output only in CSV files created by operators with [Sub-administrator authority]. This item cannot be edited.	
5)	[AUTH_TYPE]*1	Authentication type of the operator authentication.	
		[ID_PASS]	Authentication is performed with the operator name and password.
		[EXT_AUTH+P]	Authentication is performed with the external device connected to the RS232/422/485 interface of the GOT. Authentication with the operator name and password can be performed as well. (Auxiliary authentication)
		[EXT_AUTHUSB+P]	Authentication is performed with the external device connected to the USB interface of the GOT. Authentication with the operator name and password can be performed as well. (Auxiliary authentication)
6)	[PASS_TYPE]	Setting method of the password.	
		[ENCRYPTED]	The password is encrypted. An unencrypted password is encrypted when the file is converted into a CSV file.
		[PLAIN]	The password is not encrypted.
7)	[AUTO_LOGOUT_TIME]*1	Time period from when the last operation is performed until when the automatic logout is performed. The setting range is [0] (Invalid) or [60] seconds to [7200] seconds.	
8)	[PASS_EXP_DATE]*1	Number of days until the password expiration date The setting range is [0] (Invalid), or [1] to [1000] days.	

Item		Description	
9)	[EXT_AUTH_ID_TOP]*1	Starting position of the data used as the external authentication ID in the information read with an external device. The setting range is [0] to [1998] bytes. The total set value of [EXT_AUTH_ID_TOP] and [EXT_AUTH_ID_LEN] must be 2000 or less. If the total set value exceeds 2000, the file cannot be converted correctly.	
10)	[EXT_AUTH_ID_LEN]*1	Length of the data used as the external authentication ID in the information read with an external device. The setting range is [2] to [16] bytes. The total set value of [EXT_AUTH_ID_TOP] and [EXT_AUTH_ID_LEN] must be 2000 or less. If the total set value exceeds 2000, the file cannot be converted correctly.	
11)	[EXT_UNIT_CH]*1	Channel for connecting an external device to be used for external authentication. This item is fixed to [8].	
12)	[LOGIN_LOCK_NUM]*1	Number of consecutive failed login attempts for the GOT to recognize an incorrect login. The setting range is [0] (Invalid), or [3] to [10] times.	
13)	[LOGIN_LOCK_CANCEL_TIME]*1	Time period during which the re-authentication operation is disabled after it is judged that incorrect login attempts have been made. The setting range is [1] second to [3600] seconds.	
14)	[LOGIN_LOCK_TIME]*1	Time period in which consecutive failed login attempts increment the failed login count. This item is fixed to [5] minutes.	
15)	[OPE_LOCK_NUM]*1	Number of consecutive failed login attempts to the same operator account for the GOT to recognize an incorrect login. The setting range is [0] (Invalid), or [3] to [10] times.	
16)	[OPE_LOCK_TIME]*1	Time period in which consecutive failed login attempts to the same operator increment the failed login count. This item is fixed to [5] minutes.	
17)	[PASS_REQ_TYPE]*1	Password requirements.	
		[0]	Up to 64 characters can be set. The character types are not checked.
		[1]	This item depends on the settings of [PASS_REQ_MIN_LEN] and [PASS_REQ_STR_TYPE].
		[2]	The setting range is 8 to 64 characters. Checks if a password contains at least two of the following character types. • Alphabet (A to Z and a to z) • Numbers, symbols, and one-byte spaces
		[3]	The setting range is 8 to 64 characters. Checks if a password contains at least three of the following character types. • Alphabet (A to Z and a to z) • Numbers • Symbols and one-byte spaces
18)	[PASS_REQ_MIN_LEN]*1	This item is used only when [PASS_REQ_TYPE] is [1]. Minimum number of characters of a password to be a password requirement. The setting range is [1] character to [64] characters.	
19)	[PASS_REQ_STR_TYPE]*1	This item is used only when [PASS_REQ_TYPE] is [1]. Character type requirements for a password.	
		[0]	The character types are not checked.
		[1]	Checks if a password contains at least two of the following character types. • Alphabet (A to Z and a to z) • Numbers, symbols, and one-byte spaces
		[2]	Checks if a password contains at least three of the following character types. • Alphabet (A to Z and a to z) • Numbers • Symbols and one-byte spaces
		[3]	Checks if a password contains the following four types of characters. • Uppercase alphabet (A to Z) • Lowercase alphabet (a to z) • Numbers • Symbols and one-byte spaces
20)	[PASS_EXP_NOTICE]*1	Setting to notify the user that the password expiration date is approaching. When the number of remaining days until the password expiration date is equal to or less than the set number of days, a message prompting you to change the password appears at login. The setting range is [0] days (Invalid), or [1] to [30] days.	
21)	[OUTPUT_ALL_OPE]*2	When a sub-administrator with [Sub-administrator authority] performs a G3U to CSV file conversion, this setting determines whether to output the operator information uneditable by the sub-administrator to the operator part. • [0]: Not output • [1]: Output	

Item		Description
22)	[IS_FUNC_SET]*2	Editability of the header part (operator authentication setting) by operators with [Sub-administrator authority]. • [0]: Not allowed • [1]: Allowed
23)	[FUNC_SET_LEVEL]*2	Level of operators from which editing the operator authentication setting is enabled. The setting range is [0] to [15].
24)	[PASS_HIST_NUM]*1	Number of previously set passwords saved in the history. The setting range is [0] (Invalid), or [1] to [5] times.
25)	[EDITABLE_GROUP]*2	Set the group where the operator authentication setting can be edited. The setting range is [2] to [16]. Example) When group numbers 2, 8, and 16 are editable, the setting value is 2_8_16. For the groups set as editable groups, the following operations can be performed. • Adding operators to the group • Editing operators who belong to the group

*1 This item is output only in CSV files created by operators with levels where changing the operator authentication setting is allowed.

*2 This item is output only in CSV files created by operators with operation authority for [Edit operator information].

■Group part (Mode 2)

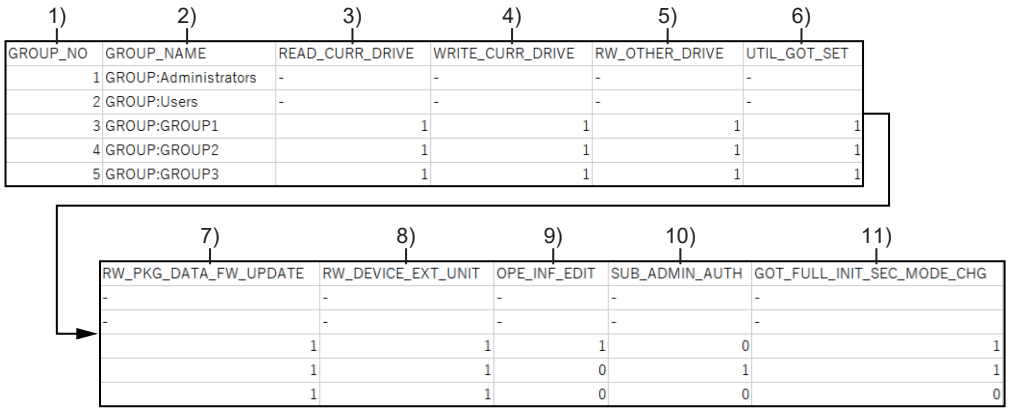
In the group part, set the individual group information.

For information on the group specifications, refer to the following.

☞ Page 2993 Group specifications

Information to be output and editability depend on the operator authenticated at the time of the CSV file creation.

Authenticated operator	Output information	Editability
Operator with operation authority for [Edit operator information]	Information on all groups is output.	Only user-defined groups can be edited.
Operator with [Sub-administrator authority]	Only the information on groups set as editable groups in the editable group setting is output.	This item cannot be edited.



Item		Description
1)	[GROUP_NO]	Group number. The setting range is [1] to [16]. This setting is fixed to [1] for the Administrators group and [2] for the Users group.
2)	[GROUP_NAME]	Group name. For information on the group name specifications, refer to the following. ☞ Page 2993 Group specifications The group name is output in the following format: [GROUP:Group name]. When editing a CSV file directly, add [GROUP:] to the start of data.
3)	[READ_CURR_DRIVE]*1	For details on the operation rights, refer to the following. ☞ Page 2995 [Current drive reading] • [0]: Without operation authority • [1]: With operation authority
4)	[WRITE_CURR_DRIVE]*1	For details on the operation rights, refer to the following. ☞ Page 2995 [Current drive writing] • [0]: Without operation authority • [1]: With operation authority
5)	[RW_OTHER_DRIVE]*1	For details on the operation rights, refer to the following. ☞ Page 2995 [Non-current drive reading/writing] • [0]: Without operation authority • [1]: With operation authority
6)	[UTIL_GOT_SET]*1	For details on the operation rights, refer to the following. ☞ Page 2995 [GOT settings in the utility] • [0]: Without operation authority • [1]: With operation authority
7)	[RW_PKG_DATA_FW_UPDATE]*1	The type of operation rights differ depending on the GOT model. For details on the operation authority on the GOT (except GT SoftGOT3000), refer to the following. ☞ Page 2995 [Startup package data reading/writing / F/W update] • [0]: Without operation authority • [1]: With operation authority
8)	[RW_DEVICE_EXT_UNIT]*1	For details on the operation rights, refer to the following. ☞ Page 2996 [Reading/writing a device from an external device] • [0]: Without operation authority • [1]: With operation authority
9)	[OPE_INF_EDIT]*1	For details on the operation rights, refer to the following. ☞ Page 2996 [Edit operator information] • [0]: Without operation authority • [1]: With operation authority

Item		Description
10)	[SUB_ADMIN_AUTH]*1	For details on the operation rights, refer to the following. ☞ Page 2996 [Sub-administrator authority] • [0]: Without operation authority • [1]: With operation authority
11)	[GOT_FULL_INIT_SEC_MODE_CHG]*1	For details on the operation rights, refer to the following. ☞ Page 2996 [GOT Full Initialization / Security Mode change] • [0]: Without operation authority • [1]: With operation authority

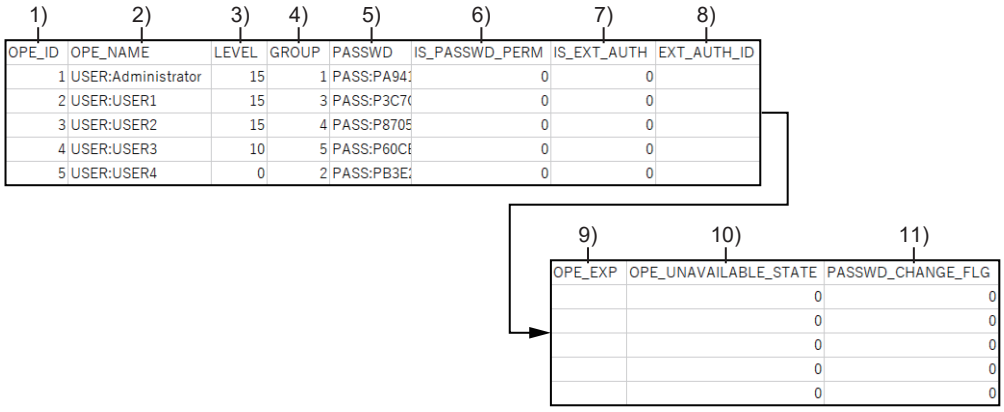
*1 This item is output only in CSV files created by operators with operation authority for [Edit operator information].

■Operator part (Mode 2)

In the operator part, set the individual operator information.

Information to be output depends on the operator authenticated at the time of the CSV file creation.

Authenticated operator		Output information
Operator with operation authority for [Edit operator information]		Information on all operators is output.
Operator with [Sub-administrator authority]	[Show non-editable operators] is selected	Information on all operators is output. The following operators' information is invalid even if edited. • Operators with levels higher than the authenticated operator • Operators who belong to groups not editable
	[Show non-editable operators] is deselected	Only the operator information that satisfies all of the following conditions is output. • Operators with levels equal to or lower than the authenticated operator • The operators belong to editable groups.



Item		Description	
1)	[OPE_ID]*1	Operator ID. The setting range is [1] to [32767].	
2)	[OPE_NAME]*1	Operator name. For information on the operator name specifications, refer to the following. ☞ Page 2992 Operator specifications When editing a CSV file directly, add [USER:] to the start of data. Otherwise, an error occurs when the file is converted to a G3U file.	
3)	[LEVEL]*1	Operator level. The setting range is [0] to [15]. When edited by an operator with [Sub-administrator authority], this item can be set to the level of the operator or lower.	
4)	[GROUP]*1	Group number of the group to which the operator belongs.	
		Operator with operation authority for [Edit operator information]	The setting range is [1] to [16].
		Operator with [Sub-administrator authority]	Only the group numbers of groups set as editable groups in the editable group setting can be set.
5)	[PASSWD]	Password for the operator. The character type and the number of characters are determined by [Password requirement settings] set in the [Operator authentication management] screen ([Authentication setting] tab). ☞ Page 3032 Common settings relevant to authentication (Operator authentication setting) When you set a password in a CSV file, prepend the string "PASS:" to the password. Otherwise, an error occurs when the file is converted to a G3U file. [PASS:] is not included in the password's character count.	
		Since the password entered in the CSV file is displayed as it is, be careful when handling the CSV file. The following methods are available as measures against password leakage.	
		Setting the password in the utility	Leave the password not set in the CSV file, and set it after the operator management information is imported into the GOT.
		Encrypting the password by reconversion	Set [ENCRYPTED] for [PASS_TYPE] in the header part. ☞ Page 3021 Header part (Mode 2) Convert the CSV file into a G3U file using GOT Operator Management Information Conversion Tool Ver. 3. The password can be encrypted by converting the converted G3U file into a CSV file again using GOT Operator Management Information Conversion Tool Ver. 3.

Item		Description
6)	[IS_PASSWD_PERM]	Setting to determine whether the password is permanent. The following shows the setting range. • [0]: The password is not permanent. • [1]: The password is permanent.
7)	[IS_EXT_AUTH]	Whether to use external authentication. The following shows the setting range. • [0]: Not used • [1]: Used When [AUTH_TYPE] in the operator part is set to [ID_PASS] (authentication with operator name and password), converting a CSV file to a G3U file changes the value to [0].
8)	[EXT_AUTH_ID]	External authentication ID. The number of bytes depends on the set value of [EXT_AUTH_ID_LEN] in the header part. Set the external authentication ID with hexadecimal numbers. When editing a CSV file directly, add [BIN:] to the start of data. Otherwise, an error occurs when the file is converted to a G3U file. If [AUTH_TYPE] is set to [ID_PASS] in the header part, setting this item is not required because external authentication is not used.
9)	[OPE_EXP]	Not used Leave the area blank.
10)	[OPE_UNAVAILABLE_STATE][*1]	Whether to enable or disable the operator. The following shows the setting range. • [0]: Enables the operator account. • [1]: Disables the operator account.
11)	[PASSWD_CHANGE_FLG]	Setting whether to display a message requesting a password change at next login. The following shows the setting range. • [0]: Does not display the message. • [1]: Displays the message.

*1 Editing is not available for the row of the sub-administrator authenticated to generate a CSV file for editing.
Even if edited, the editing is not reflected in the G3U file.

Error code list

The following shows the errors and the corrective actions corresponding to the error codes output to the error log file and others.

Only one error related to the settings of each group or operator is detected per line in the CSV file.

Some errors depend on the security mode.

○: Applicable

—: Not applicable

Error code	Error message	Corrective action	Mode 1	Mode 2
1000	The configuration of the CSV file is invalid. An error other than the errors corresponding to error codes 1001 to 1016.	Check if the specified CSV file is correct.	○	○
1001	The header part of the CSV file is invalid.	Check that the order of the keywords, the character strings, and the set values in the header part are correct. Correct them as necessary.	○	○
	The operator name or level following [SUB_ADMIN_FORMAT] in the header part is invalid.	Check that the operator name string following [SUB_ADMIN_FORMAT] and the setting value for the level are correct. Correct them as necessary.	○	○
	The CSV file ends in the middle of the header section.	Check if the format of the specified CSV file is correct.	○	○
	The number of rows in the header part of the CSV file is invalid.	Check if the header part includes any empty row. Correct the header part as necessary.	○	○
1010	The specified operator ID number is invalid.	Check that each operator ID number in the operator part is within the setting range and does not contain invalid characters. Correct the operator ID number as necessary.	○	○
1011	The operator name is invalid.	Check that each operator name in the operator part is within the setting range and does not contain invalid characters. Correct the operator name as necessary.	○	○
1012	The specified operator level is invalid.	Check that each security level in the operator part is within the setting range and does not contain invalid characters. Correct the security level as necessary.	○	○
1013	The specified password is invalid.	Check the following and correct the password as necessary. • The character string and the number of characters in the operator part of the password are correct. • If the password is not encrypted, it satisfies the password requirements. • If the password is encrypted, it is represented as a hexadecimal value.	○	○
1014	The value to set the password permanent is invalid.	Check that the value to set the password permanent is valid. Correct the value as necessary.	○	○
1015	The set value of the setting whether to set the external authentication ID is invalid.	Check that the set value is valid. Correct the value as necessary.	○	○
1016	The specified external authentication ID number is invalid.	Check that each external authentication ID number is valid. Correct the ID number as necessary. Check that the authentication type set in the header part requires the setting of external authentication ID numbers.	○	○
1017	The set value of the setting whether to disable an operator account is invalid.	Check that the set value is valid. Correct the value as necessary.	○	○
1018	The set value of the setting whether to change the password at the next login is invalid.	Check that the set value is valid. Correct the value as necessary.	○	○
1019	An item uneditable by the authenticated sub-administrator is specified.	Import the file with a sub-administrator account with the level where editing the item is allowed.	○	—
	An item uneditable by the authenticated operator is specified.	Import the file with an operator account with [Sub-administrator authority] and the level where editing the item is allowed.	—	○

Error code	Error message	Corrective action	Mode 1	Mode 2
1020	Any operator who satisfies all the following conditions is set in the CSV file. • The set level is higher than that of the sub-administrator authenticated at the time of import. • The operator does not exist in the G3U file (import destination).	Import the file with a sub-administrator account with the level where editing the item is allowed.	○	—
	Settings of the CSV file satisfy all the following conditions. • Any operator whose level is higher than that of the sub-administrator authenticated at the time of import is set. • [OUTPUT_ALL_OPE] (setting for displaying non-editable operators) is [0] (not output).			
	Any operator who satisfies all the following conditions is set in the CSV file. • The set level is higher than that of the operator authenticated at the time of import. • The operators belong to editable groups. • The operator does not exist in the G3U file (import destination) or is editable.	Import the file with an operator account with [Sub-administrator authority] and the level where editing the item is allowed.	—	○
	Settings of the CSV file satisfy all the following conditions. • Any operator whose level is higher than that of the sub-administrator authenticated at the time of import is set. • [OUTPUT_ALL_OPE] (setting for displaying non-editable operators) is [0] (not output). • An operator belonging to a non-editable group in the imported G3U file is set.			
1021	The specified operator name has already existed.	Change the operator name to a different one.	○	○
1022	The specified operator ID number has already existed.	Change the operator ID to a different one.	○	○
1023	The specified external authentication ID number has already existed.	Change the external authentication ID to a different one.	○	○
1024	The number of operator accounts has exceeded the registration limit.	Delete some operator accounts so that the number of accounts except administrators becomes 1000 or less.	○	—
		Delete some operator accounts so that the number of accounts becomes 1000 or less.	—	○
1025	The specified Administrator is invalid.	Check the specified Administrator. In the Administrator settings, only the following items can be edited. • [PASSWD] (Password) • [OPE_UNAVAILABLE_STATE] (Disabling an operator account) The set values of items other than [OPE_NAME] and the above are [-].	○	—
	An Administrator exists in the CSV file, except in the following case. • The authenticated sub-administrator is at level 15, and also [IS_FUNC_SET] (which determines if an operator with sub-administrator privileges can edit the header section (operator authentication settings)) is set to [1] (enabled).	Delete the Administrator from the CSV file.	○	—

Error code	Error message	Corrective action	Mode 1	Mode 2
1026	Information on the sub-administrator entered in [SUB_ADMIN_FORMAT] in the header part is not entered in the operator part.	Enter the information on the operator entered in [SUB_ADMIN_FORMAT] in the header part in the operator part.	○	—
	Any of the following uneditable items has been edited in the sub-administrator information. • [PASSWD] (Password) • [IS_PASSWD_PERM] (Setting to set the password permanent) • [EXT_AUTH_ID] (External authentication ID) • [PASSWD_CHANGE_FLG] (Changing a password at the next login)	Edit the editable items only.	○	—
	Information on the operator entered in [SUB_ADMIN_FORMAT] in the header part is not entered in the operator part.	Enter the information on the operator entered in [SUB_ADMIN_FORMAT] in the header part in the operator part.	—	○
	Any of the uneditable items has been edited in information on an operator with [Sub-administrator authority]. If the operator is not in an editable group, no item can be edited. If the operator is in an editable group, the following items cannot be edited. • [PASSWD] (Password) • [IS_PASSWD_PERM] (Setting to set the password permanent) • [EXT_AUTH_ID] (External authentication ID) • [PASSWD_CHANGE_FLG] (Changing a password at the next login)	Edit the editable items only.	—	○
1028	The specified group is invalid.	Check for any settings that apply to the following. Correct the setting as necessary. • A value outside the setting range is set. • An invalid character string is set. • When importing a CSV file to a G3U file, a group No. that cannot be edited is set. • A nonexistent group No. is set.	—	○
1030	The specified group name has already existed.	Change the group name to a different one.	—	○
1031	The specified group No. has already existed.	Change the group number to a different one.	—	○
1033	No operator belongs to the Administrators group.	Set one or more operators in the Administrators group.	○	○
1034	The specified group No. is invalid.	Check that the group No. set in the group part falls within the setting range and that no invalid characters are used. Correct the setting as necessary.	—	○
1035	The specified group name is invalid.	Check that the group name set in the group part does not exceed the maximum character limit and that no invalid characters are used. Correct the setting as necessary.	—	○
1036	The setting value for [READ_CURR_DRIVE] (operation authority for [Current drive reading]) is invalid.	Check that the setting value for [READ_CURR_DRIVE] is valid. Correct the value as necessary.	—	○
1037	The setting value for [WRITE_CURR_DRIVE] (operation authority for [Current drive writing]) is invalid.	Check that the setting value for [WRITE_CURR_DRIVE] is valid. Correct the value as necessary.	—	○
1038	The setting value for [RW_OTHER_DRIVE] (operation authority for [Non-current drive reading/writing]) is invalid.	Check that the setting value for [RW_OTHER_DRIVE] is valid. Correct the value as necessary.	—	○
1039	The setting value for [UTIL_GOT_SET] (operation authority for [GOT settings in the utility]) is invalid.	Check that the setting value for [UTIL_GOT_SET] is valid. Correct the value as necessary.	—	○
1040	For GOT (except GT SoftGOT3000), the setting value for [RW_PKG_DATA_FW_UPDATE] (operation authority for [Startup package data reading/writing / F/W update]) is invalid.	Check that the setting value for [RW_PKG_DATA_FW_UPDATE] is valid. Correct the value as necessary.	—	○
1041	The setting value for [RW_DEVICE_EXT_UNIT] (operation authority for [Reading/writing a device from an external device]) is invalid.	Check that the setting value for [RW_DEVICE_EXT_UNIT] is valid. Correct the value as necessary.	—	○
1042	The setting value for [OPE_INF_EDIT] (operation authority for [Edit operator information]) is invalid.	Check that the setting value for [OPE_INF_EDIT] is valid. Correct the value as necessary.	—	○

Error code	Error message	Corrective action	Mode 1	Mode 2
1043	The setting value for [SUB_ADMIN_AUTH] (operation authority for [Sub-administrator authority]) is invalid. Or, both [OPE_INF_EDIT] (operation authority for [Edit operator information]) and [SUB_ADMIN_AUTH] (operation authority for [Sub-administrator authority]) are enabled.	Check for any settings that apply to the following. Correct the setting as necessary. • The setting value for [SUB_ADMIN_AUTH] is invalid. • Both [OPE_INF_EDIT] and [SUB_ADMIN_AUTH] are enabled.	—	○
1044	The setting value for [GOT_FULL_INIT_SEC_MODE_CHG] (operation authority for [GOT Full Initialization / Security Mode change]) is invalid.	Check that the setting value for [GOT_FULL_INIT_SEC_MODE_CHG] is valid. Correct the value as necessary.	—	○
1045	The Administrators group or the Users group does not exist in the group part.	Check that the Administrators group or the Users group exists in the CSV file. Correct the setting as necessary.	—	○
1046	The editable group does not match between the CSV file and the G3U file (import destination).	Check that the editable group matches between the CSV file and the G3U file (import destination). Correct the group as necessary.	—	○
1047	A group number that does not exist in the group part exists in the editable group of the header part.	Set only the group number that exists in the group part for the editable group.	—	○
2000	The file format of the operator management information file is invalid.	Check if the specified operator management information file is correct.	○	○
2001	The level of the authenticated sub-administrator differs from the level entered in [SUB_ADMIN_FORMAT] in the header part.	Perform authentication with an account with the same level as [SUB_ADMIN_FORMAT] in the header part.	○	—
	The level of the authenticated operator differs from the level entered in [SUB_ADMIN_FORMAT] in the header part.	Perform authentication with an account with the same level as [SUB_ADMIN_FORMAT] in the header part.	—	○
3000	The file path after conversion exceeds 255 characters.	The converted file is output to the same folder as the source file. Change the storage destination of the conversion source file so that the path is short.	○	○
3001	The security mode does not match between the CSV file and the G3U file (import destination).	Check that the security mode matches between the CSV file and the G3U file (import destination). Import a CSV file to a G3U file with the same security mode.	○	○
4294967295	An unexpected error has occurred.	Contact us.	○	○

89.5 Common settings relevant to authentication (Operator authentication setting)

GT37 SoftGOT3000

Configure common settings relevant to authentication in the utility.

Touch [Operator authentication] on the [GOT basic set] tab of the utility to display the [Operator authentication management] screen.

In the [Operator authentication management] screen, select the [Authentication setting] tab.

For information on the operation method, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

On the [Authentication setting] tab, configure the following settings.

Item	Description	
Automatic logout time	Set the time period from when the last operation is performed until when the automatic logout is performed.	
Password expiration date	Set the password expiration date. For an operator account whose password has been expired, a dialog prompting you to change the password appears when the authentication succeeds.	
Password expiration prenotification	Set the number of remaining days for prenotification of the password expiration date. A dialog notifying the number of remaining days until the expiration date appears when the number of remaining days until the expiration date is equal to or less than the set number of days.	
Authentication type for screen operation	Select the authentication method for operating GOT screens. For external authentication, you can set whether the authentication method can be switched to the one using the operator name and password in case the external device fails. (Auxiliary authentication)	
	[Operator name + password]	Authentication is performed with the operator name and password. The login screen is displayed during login attempts.
	[External authentication (serial)]	Authentication is performed with the external device connected to channel number 8. The external authentication login screen is displayed during login attempts. For the external authentication, refer to the following. ☞ Page 3033 External authentication
	[External authentication (USB)]	Not available for GT SoftGOT3000. Authentication is performed with the external device connected via USB (host). The external authentication login screen is displayed during login attempts. For the external authentication, refer to the following. ☞ Page 3033 External authentication
External authentication ID	Set the data used as the external authentication ID in the information read with an external device with the starting position and available byte number.	
Settings relevant to incorrect login detection	When the number of consecutive failed login attempts exceeds the specified number of times within five minutes, it is judged that incorrect login attempts have been made. The number of consecutive failed login attempts is managed for each protection target function. ☞ Page 2991 Protection target When incorrect login attempts are detected, login attempts to all operator accounts are disabled for a certain period. Set the number of consecutive failed login attempts for judging incorrect login attempts and the period for which login attempts are prohibited when it is judged that incorrect login attempts have been made.	
Settings relevant to operator account lock	When the number of consecutive failed login attempts with the same operator name exceeds the specified number of times within five minutes, the operator account is locked. The number of consecutive failed login attempts is managed for each operator. ☞ Page 2992 Operator specifications Set the number of consecutive failed login attempts until the operator account is locked.	

Item	Description	
Password requirement setting	Set the requirements for operator passwords. The following character types can be used. • Uppercase alphabet (A to Z) • Lowercase alphabet (a to z) • Numbers • Symbols, one-byte spaces (One-byte spaces at the end are invalid.) The following symbols can be used. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [¥] ^ _ { | }~	
	[Strong]	The setting range is 8 to 64 characters. Whether the password contains at least three of the available character types is checked.
	[Middle]	The setting range is 8 to 64 characters. Whether the password contains at least two of the available character types is checked.
	[Customize]	Set the requirement for the number of characters in [Specify min number of characters]. Set the requirement for the character type in [Specify by character type].
	[None]	Up to 64 characters can be set. The character types are not checked.
Number of passwords used	Set the number of previously set passwords saved in the history.	
Sub-administrator authority setting	Configure the settings for operators with [Sub-administrator authority].	
	[Show non-editable operators]	Set whether to display the operator information uneditable by the logged-in operator.
	[Enable op auth settings change]	Set the editability of the operator authentication setting and the level of operators from which editing is enabled.
	[Editable groups]	Set editable groups. For the groups set as editable groups, the following operations can be performed. • Adding operators to the group • Editing operators who belong to the group

89.5.1 External authentication

For GOT screen operations, authentication can be performed with an external device.

For external authentication, the external authentication ID is used instead of the operator name and password.

For the usable external devices, refer to the following Technical Bulletin.

📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)

The following shows the settings for using an external device.

External device used	Required setting	
	Setting in the [Operator authentication management] screen ([Authentication setting] tab) of the utility	Settings in GT Designer3
USB barcode reader	Select [External authentication (USB)] for [Authentication method for screen operation].	For the settings to use a USB barcode reader, refer to the following. ☞ Page 2564 Using a barcode reader with the GOT (barcode function) Turning on b1 of the set control device enables external authentication with a USB barcode reader.
RFID controller	Select [External authentication (serial] for [Authentication method for screen operation].	For the settings to use an RFID controller, refer to the following. ☞ Page 2588 Using an RFID with the GOT (RFID function)

For the utility setting, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

89.6 Login

GT37 SoftGOT3000

This section describes the operations and processing for which login is required.
When a login attempt is made and the authentication succeeds, the operator account becomes the logged in state.
The login status is managed for each of the following functions.

Function	Description
GOT screen operation	Touching the special function switch ([Login/Logout (Operator)]) in the logged out state displays the login screen. Follow the login screen instructions to perform the login operation. Upon successful authentication, you are logged in. Only one operator account can be logged in.
	The login screen is also displayed during the following operations. • When the screen is switched to the one with security level 1 or more in the logged out state • When the screen is switched to the one with a security level higher than that of the logged in operator • When the [Switch] button is touched in the operator switching/logout selection dialog • When an operation which requires the operation authority is performed in the logged out state
	Displays a login completion notification dialog upon successful authentication. The behavior of this dialog can be changed to either of the following based on the setting. • Not displaying the dialog • Automatically closing the dialog after the specified time has elapsed ☞ Page 3035 [Security] ([Screen Security] tab) (Mode 2)
Data transfer	Authentication is performed when the GOT is accessed from GT Designer3 or Data Transfer Tool. Enter the operator name and password in the displayed dialog. Only operators with the operation authority which allows the data transfer can transfer data. Only one operator account can be logged in.
GOT Mobile function	Authentication is performed when the server (GOT) is accessed from a client. Only operators with the corresponding operation authorities can access the server (GOT). Simultaneous logins from multiple clients (operators) are supported.
OPC UA server function	
FTP server function	

Even if the following processing occurs, any changes to the settings and status do not affect the logged-in operator account, and the login status is maintained.

- Updating the operator management information
- Disabling an operator account
- Operator account lock

89.7 Logout

GT37 SoftGOT3000

This section describes the operations and processing by which logout is performed.

Function	Description
GOT screen operation	Touching the special function switch for which [Login/Logout (Operator)] is set in the logged in state displays the operator switching/logout selection dialog. Touch the [Logout] button to log out.
	When the time without operation exceeds the automatic logout time, automatic logout occurs. However, while the [Operator authentication management] screen is displayed, automatic logout does not occur even if the time without operation exceeds the automatic logout time.
	Logout is performed in the following cases as well. • When the GOT is restarted because of package data writing or others • When the [Switch] button in the operator switching/logout selection dialog is touched and another operator is successfully authenticated on the displayed login screen
Data transfer	Logout is performed when writing or reading is completed using GT Designer3 or Data Transfer Tool.

89.8 [Security] ([Screen Security] tab) (Mode 2)

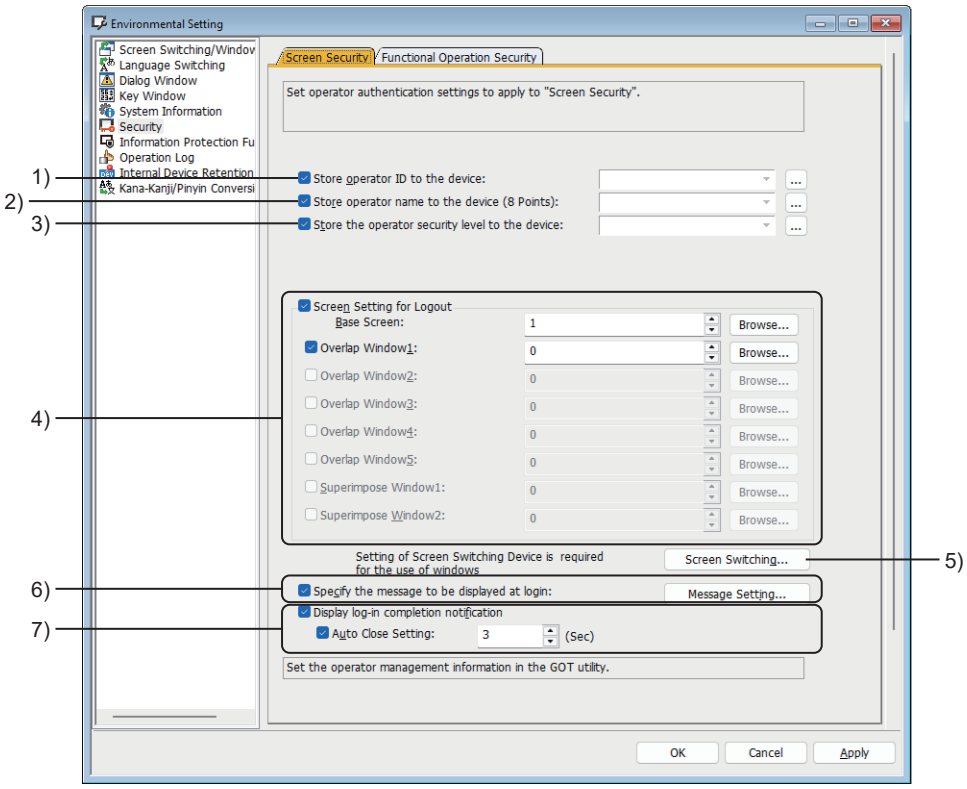
GT37 SoftGOT3000

Configure the operator authentication (Mode 2) settings.

When the security mode is mode 2, the operator authentication is always enabled.

For the screens that are displayed when the security mode is mode 1, refer to the following.

☞ Page 3053 [Security] ([Screen Security] tab) (Mode 1)

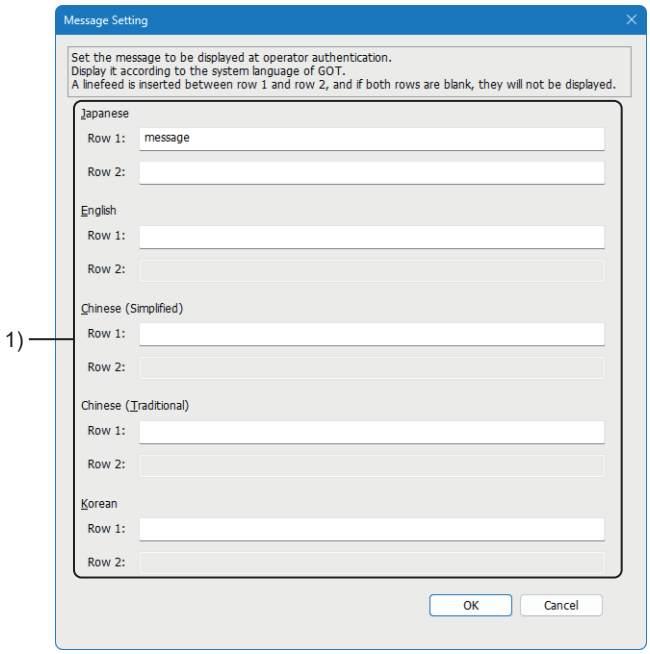


Item		Description
1)	[Store operator ID to the device]	Set a device to store the operator ID of the logged-in operator (operator ID external notification device). You can specify a word device or word-specified bit device. ☞ Page 834 How to set devices, labels, and tags The operator ID external notification device stores 0 when the operator logs out.
2)	[Store operator name to the device (8 Points)]	Set a device to store the operator name of the logged-in operator (operator name external notification device). You can specify a word device or word-specified bit device. ☞ Page 834 How to set devices, labels, and tags From the set device, 8 points of the word device or 128 points of the bit device is used. If the operator name contains less than 16 characters, blank devices store 0. If no operator is logged in, all devices store 0.
3)	[Store the operator security level to the device]	Set a device to store the security level of the logged-in operator (operator level external notification device). You can specify a word device or word-specified bit device. ☞ Page 834 How to set devices, labels, and tags If no operator is logged in, the device stores 0.
4)	[Screen Setting for Logout]	Set a screen to be displayed at logout. To specify the window screen to be displayed when logout is performed, select each window. Setting the checkbox of each window is enabled by setting the screen switching device corresponding to the window.
5)	[Screen Switching] button	Displays [Screen Switching/Window] of the [Environmental Setting] window. ☞ Page 542 [Screen Switching/Window]

Item			Description
6)	[Specify the message to be displayed at login]		Set the message to be displayed on the GOT screen at login. The message is set in the [Message Setting] dialog that opens from the [Message Setting] button. ☞ Page 3036 [Message Setting] dialog
7)	[Display log-in completion notification]	—	Displays the login completion notification dialog upon successful authentication. This setting applies to the dialog that appears upon successful authentication during the login operation on the GOT3000 screen. Set the behavior of the dialog that appears upon successful authentication during the login operation on the client of the GOT Mobile function in the [GOT Mobile Setting] window ([Security]). ☞ Page 2825 [Security]
		[Auto Close Setting]	Automatically closes the login completion notification dialog after it is displayed. When this item is selected, set the time until the dialog is automatically closed. The setting range is [1] second to [60] seconds.

89.8.1 [Message Setting] dialog

Set the message to be displayed on the GOT screen at login using operator authentication (mode 2).



Item		Description
1)	[Japanese] [English] [Chinese (Simplified)] [Chinese (Traditional)] [Korean]	Set a message for each system language. When a message is set for [Row 1], a message can be set for [Row 2]. Up to 58 characters can be set per line. A two-byte character is counted as two characters. The following symbols can be used. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [¥] ^ _ { | } ~

89.9 Relevant settings

GT37 SoftGOT3000

Configure the relevant settings other than the specific settings for the operator authentication (Mode 2) as required.
The following shows the functions that are available by configuring the relevant settings.

89.9.1 GOT internal device

GT37 SoftGOT3000

☞ Page 3581 GOT special register (GS)

Function	Setting item
Notifying that the authentication with the external device is successful	GS240.b0
Notifying that the authentication with the external device failed	GS240.b1
Notifying that the login screen or operator re-authentication screen is being displayed regardless of authentication method.	GS240.b13
Notifying that the login screen for authentication with the external device is being displayed	GS240.b14
Notifying that the external authentication ID input key window is displayed.	GS240.b15
Notifying the screen that cannot be displayed because of the insufficient security level.	GS241.b1 to b4, b8 to b12 GS1241.b0 to b2, b8 to b10
Notifying that the login is blocked due to incorrect login attempts	GS242.b0
Notifying that an operator ID is locked due to incorrect login attempts	GS242.b1
Prohibiting deletion of the existing operator information	GS621.b0
Prohibiting editing of the inactivated operator information	GS621.b1
Inactivating the [Import] button on the [Operator information] tab in the [Operator authentication management] screen of the utility	GS621.b2

90 Restricting display and operation on the GOT (Screen security)

GT37 SoftGOT3000

☞ Page 3039 Restricting display and operation on the GOT with level authentication
☞ Page 3042 Restricting display and operation on the GOT with operator authentication (mode 1)
☞ Page 3053 [Security] ([Screen Security] tab) (Mode 1)

Point

This function can be used with GOT2000 when the security mode is set to mode 1.
Changing the security mode to mode 2 further strengthens the security function.

Set the security level for screens and objects to control the screen display.
Security setting is available as shown below.

Target	Description
Base screen Window screen Mobile screen	You can set a security level for the screen itself.
Object	You can set a security level for individual objects placed on the screen. For numerical input, numerical display, text input, and text display, you can set different security levels for input objects and display objects.

To restrict operations other than GOT screen display and object operations, configure other security function settings with reference to the following.
☞ Page 38 Security function
Using multiple security functions in combination further strengthens the security.

Precautions

When designing screens, do not set security to the initial screen appearing upon startup of the GOT. You can use the screen switching function or others to switch the initial screen to a screen with security.

Authentication method

The following two authentication methods are available.

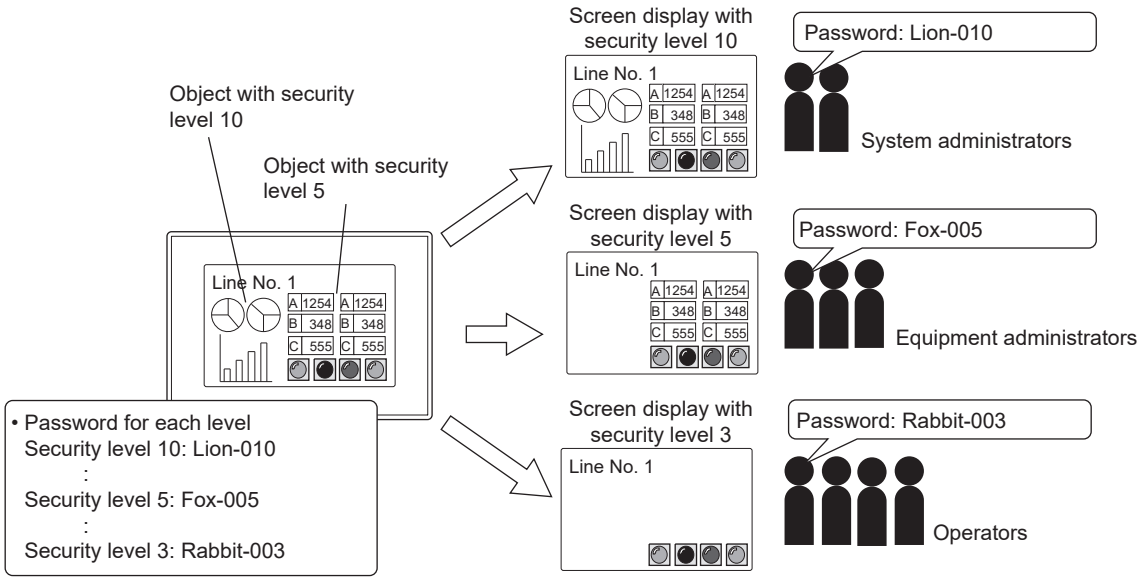
Authentication method	Description
Level authentication	The level authentication is an authentication method with a password set for each security level. ☞ Page 3039 Restricting display and operation on the GOT with level authentication
Operator authentication (Mode 1)	The operator authentication is an authentication method with the operator management information set for each operator. ☞ Page 3042 Restricting display and operation on the GOT with operator authentication (mode 1)

90.1 Restricting display and operation on the GOT with level authentication

GT37 SoftGOT3000

☞ Page 3039 Settings for the level authentication
☞ Page 3040 How to switch the security level in the GOT

The level authentication is performed using user-specified passwords corresponding to each security level.
Use the level authentication to configure a system which allows the operators in upper hierarchies to control all the operations which can be made by the operators in lower hierarchies.



90.1.1 Settings for the level authentication

The following shows the procedure for configuring the level authentication settings.

1. Configure the project settings in GT Designer3.

Display [Security] of the [Environmental Setting] window and configure the following settings in the [Screen Security] tab.

☞ Page 3054 Level authentication

Item	Setting
[Authentication Method]	Select [Level].
[Security Level Device]	Set any word device or bit device specified as a word device.
[Security Level Password]	Set a password for each security level. Passwords may not be duplicated across security levels.

2. Set the security level for each screen and objects on the screens.

Target	Reference
Base screen Window screen Mobile screen	Set a security level for each screen. ☞ Page 313 Base screen properties ☞ Page 323 Window screen properties ☞ Page 2831 Mobile screen properties
Object	Set a security level for each object to allow display and operation. For objects that can be operated such as touch switches and numerical inputs, set security levels for both display and operation. ☞ Setting dialog for each object ([Extended] tab)

90.1.2 How to switch the security level in the GOT

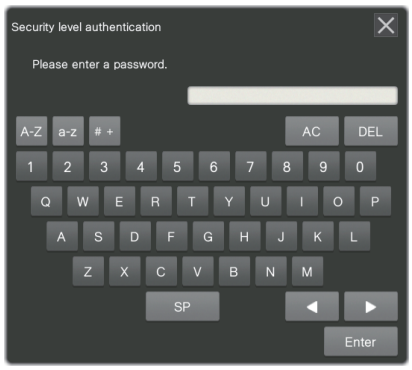
Two methods are available for switching the security level in the GOT as follows.

☞ Page 3040 Inputting passwords for each security level in the [Security level authentication] dialog
☞ Page 3041 Storing the security level value to the security level device
☞ Page 3041 Precautions on switching the security level

Inputting passwords for each security level in the [Security level authentication] dialog

The [Security level authentication] dialog is displayed by the following operations.

- Touch the special function switch to which [Password (Security Level)] is set.
- Display the utility and touch the [Password authentication] button or [Security] in the [GOT basic set] tab.



[Security level authentication] dialog

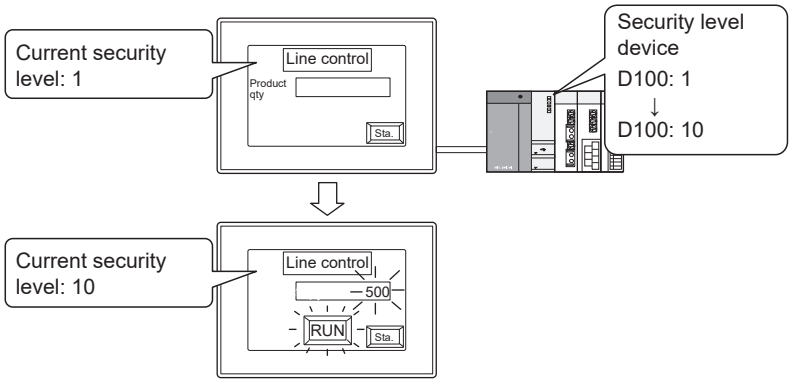
The [Security level authentication] dialog is also displayed when an operation is performed for which the current security level is insufficient.

When the dialog appears due to an insufficient security level during screen switching, changing the security level device to resolve the issue will close the dialog and switch the screen.

☞ Page 3041 Storing the security level value to the security level device

Storing the security level value to the security level device

The security level device is used to notify and change the current security level.
Store the value of the security level to this device, and the security level is switched accordingly.
For example, when the security level is [1], writing [10] to the security level device [D100] switches the security level to [10].



The display changes according to the security level.

Place a word switch to which security levels are assigned on the screen, so that the user can switch between the security levels with a single touch on the switch.
For a user who switches the security level between the high security level for maintenance and inspection and security level for regular operation, the switch is useful when switching the security level to the level for regular operation.
The switch eliminates the need for distributing multiple passwords according to the operation level.

Point

The processing, such as the following, performed at screen switching is also performed when the value in the security level device changes.

- Initial operation of a project script, screen script, or script parts object

Precautions on switching the security level

When switching the security level temporarily to a higher level for maintenance and inspection or other operations, make sure to return the security level to the level for regular users after the operation.
Otherwise, an unauthorized user can perform operation that must not be performed by that user.

90.2 Restricting display and operation on the GOT with operator authentication (mode 1)

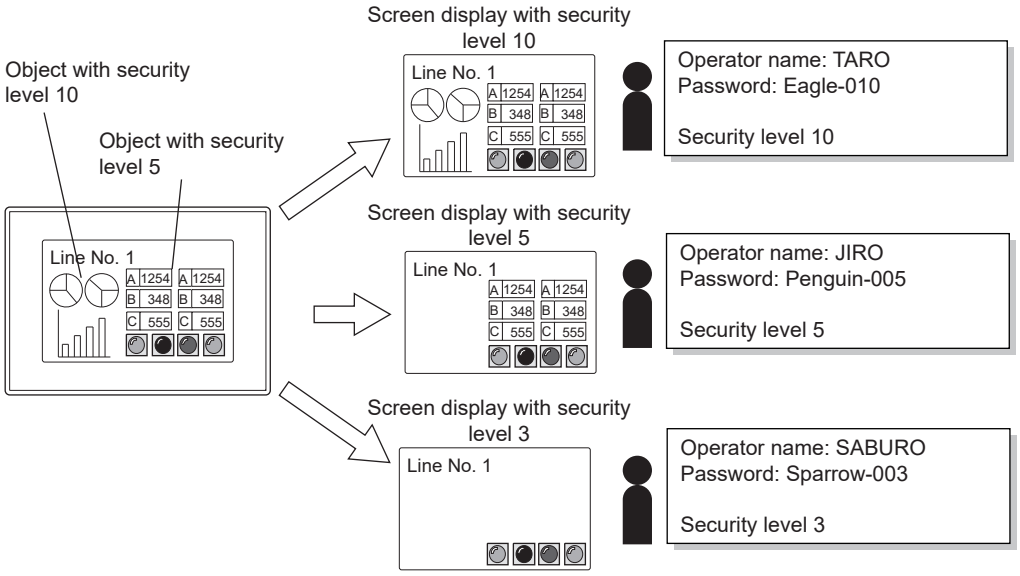
GT37 SoftGOT3000

☞ Page 3043 Specifications of the operator authentication (Mode 1)
☞ Page 3049 Operator authentication (Mode 1) settings
☞ Page 3051 How to use the operator authentication (Mode 1)
☞ Page 3052 Editing the operator management information on a personal computer
☞ Page 3052 Relevant settings

The operator authentication (Mode 1) is performed based on the operator management information corresponding to each operator.

To record the operator login information, use the operation log function in combination.

With setting the automatic logout and the password expiration date, the security can be enhanced.



90.2.1 Specifications of the operator authentication (Mode 1)

☞ Page 3043 Authentication method
☞ Page 3044 Operator management information
☞ Page 3045 Group
☞ Page 3046 Password expiration date
☞ Page 3046 Password expiration prenotification
☞ Page 3047 Saving the password history
☞ Page 3047 Automatic logout
☞ Page 3047 Security level control from an external device
☞ Page 3047 Forced logout
☞ Page 3047 Auxiliary authentication
☞ Page 3048 Block of login due to incorrect login attempts
☞ Page 3048 Lock of an operator account due to incorrect login attempts
☞ Page 3048 Password requirements

Authentication method

The operator authentication (Mode 1) includes the following authentication types.

Authentication method	Description
Authentication with a password	The operator is authenticated with an operator name and password that are input by the operator. Authentication with an external device	The operator is authenticated with the external authentication ID that is input using an external device. For the usable external devices, refer to the following Technical Bulletin. 📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233) Example) When using an RFID controller as an external device 
Operator management information

The operator management information is the information to determine and authenticate the login operator, which includes the operator name and the password.

Except for the administrator, up to 1000 operators can be registered in one GOT.

Input the operator management information with the [Operator information management] screen of the utility or a personal computer.

For information on how to input the operator management information from the GOT utility, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

For editing the operator management information on a personal computer, refer to the following.

☞ Page 3052 Editing the operator management information on a personal computer

The following shows the detailed operator management information.

Item	Description
Operator name	A name for determine the operator. Up to 16 alphanumeric characters (capital letters and small letters), one-byte spaces, and the following symbols are available for the operator name. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~ (The administrator name is fixed to [Administrator].)
Operator ID	Numbers that are assigned to each operator. The setting range is 1 to 32766. (The administrator ID number is fixed to [-].)
Group	Each operator belongs to one group. The privileges of an operator are determined by the group to which the operator belongs. ☞ Page 3045 Group
Password	A password to log in the GOT. Up to 64 uppercase and lowercase alphabetic characters, numbers, one-byte spaces, and the symbols below are usable for a password. ! " # $ % & ' ( ) * + , ` - . / : ; < = > ? @ [\ ] ^ _ { | } ~ It is recommended to make a complicated password by combining alphanumeric characters (capital letters and small letters) and symbols.
External authentication ID	ID number to be input from an external device when an operator is authenticated with the device. This item cannot be set for the administrator account. The setting range is 4 to 32 digits (up to 8 words) in hexadecimal. When you do not use an external device, inputting the external authentication ID can be omitted.
Security level	A security level to which an operator belongs. This item cannot be set for the administrator account. The setting range is [0] to [15].
Password expiration date setting	Set whether to enable or disable the password expiration date. This item cannot be set for the administrator account.
Disabling an operator account	Set whether to enable or disable each operator account. The disabled operator account is not usable for login. (The administrator account or a sub-administrator account can be disabled.)
Changing a password at the next login	Set whether to display a message prompting for a password change at the next login. The message does not appear after the password change. This setting prompts each operator to change the initial password set by the administrator.
Administrator privileges	Set whether to grant administrator privileges to an operator. An operator with administrator privileges becomes a sub administrator.
Password history	The specified number of passwords used are saved. The setting range is [0] (Invalid), or [1] to [5] times.

You can export the set operator management information to the data storage and import to other GOTs.

Performing one of the following operations deletes the file from the GOT.

Operation	Description
Installing the BootOS to the GOT	The information is deleted when data is written with the following settings configured on the [GOT Write] tab of the [Communicate with GOT] dialog. • Select [BootOS] for [Write Data]. • Select [Write after deleting all the package folders with the same name in GOT].
Installing the BootOS or CoreOS to the GOT via a data storage	Set the following items in the [BootOS/CoreOS Write] tab of the [Communicate with Memory Card] dialog. The information is deleted when the installation of the BootOS or CoreOS is executed using a data storage in which data is written. • Select [BootOS] or [CoreOS] for [Write Data]. • Select [Delete the package data on write].

Operation	Description
Executing all GOT data initialization in the utility	GOT3000 Series User's Manual (Utility & Maintenance Functions)
Changing the security mode	The information is deleted when package data in security mode 2 is written to the GOT in security mode 1.

Group

You cannot register or edit groups.

The following shows the group types.

Group type	Description
Administrators group	Operators who belong to this group are administrators. ☞ Page 3045 Administrator Only operators whose name is [Administrator] can belong to this group.
Sub admins group	Operators who belong to this group are sub administrators. ☞ Page 3045 Sub administrator
Users group	Operators who belong to this group can operate the user-created screens.

■Administrator

Administrator refers to the account preset in the GOT for management use only.

You cannot delete this account.

The following items must always be set as follows for the operator management information.

Item	Setting
[Operator Name]	[Administrator]
[Operator ID]	[-]
[Group]	[Administrators]

Administrators can only edit the operator management information and operator authentication settings.

An administrator account cannot be used as an operator account to perform operations on the GOT.

For details on the operations that can be performed by administrators, refer to the following.

☞ Page 3046 Operations that can be performed by administrators and sub administrators

■Sub administrator

Sub-administrator refers to an operator with administrator privileges.

To register an operator as a sub administrator, set the following items in the [Operator authentication management] screen of the utility.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Setting	Description
[Operator information] tab	Set [Group] to [Sub Adminis] for the operator to be a sub administrator.
[Authentication setting] tab	Select [Use sub administrator].

Sub administrators can perform the following operations.

- Editing information on operators having a lower security level (Deleting itself is not allowed.)
- Editing some of the operator authentication settings

For details on the operations that can be performed by sub administrators, refer to the following.

☞ Page 3046 Operations that can be performed by administrators and sub administrators

Even if you are already logged in as a sub administrator, you must be authenticated by an administrator to perform operations that require administrator privileges.

■Operations that can be performed by administrators and sub administrators

The following table shows the operations that can be performed by administrators and sub administrators on the [Operator authentication management] screen of the utility.

Operations that can be performed by sub administrators depend on the security level and operator authentication settings.

○: Operable

—: Not operable

[Operator authentication management] screen			Administrator	Sub administrator		
				[Enable op auth settings change] is selected		[Enable op auth settings change] is deselected
				Level 15	Level 14 or lower	
[Operator Management] tab	Registering, editing, or deleting the operator management information		○	○*1	○*1	○*1
	Editing the operator management information on the administrator		○	○	—	—
[Authentication setting] tab	Settings other than the administrator setting		○	○*2	○*2	—
	Administrator setting	[Use sub administrator]	○	—	—	—
		[Show non-editable operators]	○	○	—	—
		[Enable op auth settings change]	○	—	—	—
		[Level that can be changed]	○	○	—	—

*1 A sub-administrator can manipulate the operator management information on operators having a lower security level.

*2 This operation is not allowed if the sub-administrator has a lower level than the level specified in [Enable op auth settings change].

Password expiration date

You can set an expiration date for a password.

Set the expiration date for the password in the [Operator authentication management] screen ([Authentication setting] tab) of the utility.

For information on how to set the expiration date for the password, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

You can enable or disable the set password expiration date for each operator by using the setting of the operator management information.

For details on the operator management information, refer to the following.

☞ Page 3044 Operator management information

Password expiration prenotification

You can display a dialog prenotifying the password expiration date at login.

Set the password expiration prenotification in the [Operator authentication management] screen ([Authentication setting] tab) of the utility.

For setting the password expiration prenotification, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

Saving the password history

The history of passwords used is saved.

When saving the password history is enabled, you cannot set the same password as the one saved in the history.

Enable saving the password history in the [Operator authentication management] screen ([Authentication setting] tab) of the utility.

For the setting method, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Automatic logout

You can set operator accounts to automatically log out after a certain period of inactivity.

Set the automatic logout in the [Operator authentication management] screen ([Authentication setting] tab) of the utility.

For information on how to set the automatic logout, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

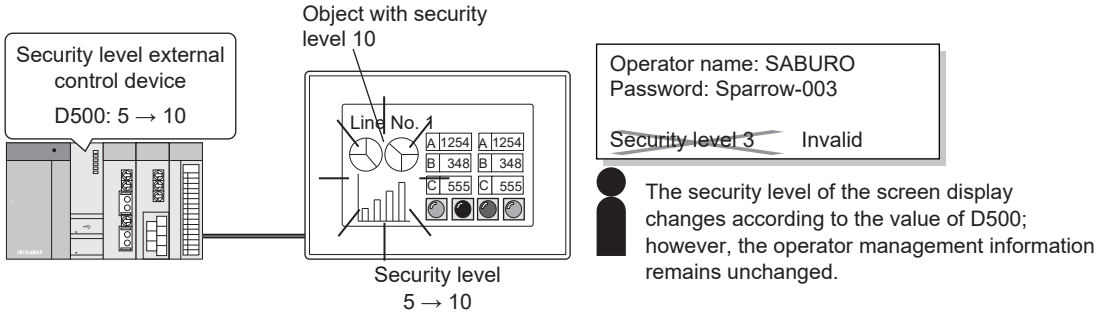
Security level control from an external device

You can control the security level of the targets that can be displayed by the operator who is logged in the GOT from an external device.

Store the security level value to the security level external control device to change the security level of the operator.

In this case, the new security level is not reflected to the relevant operator management information.

When this setting is enabled, the security level specified in the operator management information becomes invalid.



To enable the security level control from an external device, select [Externally control the security Level] in the [Screen Security] tab in [Security] of the [Environmental Setting] window.

Then, set the security level external control device.

☞ Page 3055 Operator authentication (Mode 1)

Forced logout

When the operator authentication external control device is set, operators can be forcibly logged out by turning on the Forced Logout signal (.b0).

For information on how to set the operator authentication external control device, refer to the following.

☞ Page 3056 Operator authentication external control device

Auxiliary authentication

For the operator authentication with an external device, the operator authentication may not be properly performed due to an error such as a device failure.

Enable the auxiliary authentication beforehand so that the authentication is executed by switching to the operator authentication with a password.

For information on how to set the auxiliary authentication, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Block of login due to incorrect login attempts

When login attempts fail consecutively more than the specified number of failed login times ([Invalid login count]) within five minutes, the GOT recognizes an incorrect login.

In such a case, the GOT enters the invalid login state and operators cannot log in until the login block time elapses.

To clear the invalid login state during the block time, perform one of the following operations.

- Display the [Operator authentication management] screen of the utility.
- Restart the GOT.

Set the invalid login count and login block time in the [Operator authentication management] screen ([Authentication setting] tab) of the utility.

For the setting method, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

You can monitor the invalid login state with a GOT special register (GS).

When the login is blocked within the login block time period, GS242.b0 turns on.

For details on GS242 (Incorrect Login signal), refer to the following.

☞ Page 3600 Unauthorized Log-in Operation Notification (GS242)

Lock of an operator account due to incorrect login attempts

If an operator consecutively fails to log in more than the specified number of failed login times ([Operator lock count]), the operator account is locked.

The locked operator account is not usable for logins until the administrator or a sub-administrator unlocks this account.

Unlock an operator account in the [Operator authentication management] screen ([Operator information] tab) of the utility.

Set the operator lock count in the [Operator authentication management] screen ([Authentication setting] tab) of the utility.

For the setting method, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

You can check whether an operator account is locked with a GOT special register (GS).

When an operator account is locked, GS242.b1 turns on.

For details on GS242 (Incorrect Login signal), refer to the following.

☞ Page 3600 Unauthorized Log-in Operation Notification (GS242)

Password requirements

You can set the minimum number of characters and the character types as password requirements.

When you set a password on the GOT, the password is checked for password requirements.

The passwords set before the requirements are specified, and the passwords set in the operator management information file (*.CSV) are not checked.

For setting the password requirements, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

90.2.2 Operator authentication (Mode 1) settings

To perform the operator authentication (mode 1), configure the relevant settings in GT Designer3 and the GOT.

☞ Page 3049 Settings in GT Designer3
☞ Page 3050 Settings on the GOT

Point

If operator management information in security mode 2 exists on the GOT, writing package data in security mode 1 will delete the operator management information in security mode 2.

Settings in GT Designer3

1. Configure the project settings in GT Designer3.

Open the [Security] setting screen of the [Environmental Setting] window. Select [Operator] for [Authentication Method] of the [Screen Security] tab.

Configure other settings and set various devices as necessary.

☞ Page 3055 Operator authentication (Mode 1)
☞ Page 3052 Relevant settings

2. To use external devices, configure the settings as shown below.

External device used	Required setting
Serial barcode reader	For the settings to use serial barcodes, refer to the following. ☞ Page 2564 Using a barcode reader with the GOT (barcode function) As for the channel to which the serial barcode reader is connected, select [8] for [CH No.] in the [I/F Communication Setting]. ☞ Page 713 Setting the GOT Ethernet interface ([GOT Ethernet Setting])
USB barcode reader	For the settings to use a USB barcode reader, refer to the following. ☞ Page 2564 Using a barcode reader with the GOT (barcode function) Turning on b1 of the set control device enables external authentication with a USB barcode reader.
RFID controller	For the settings to use an RFID controller, refer to the following. ☞ Page 2588 Using an RFID with the GOT (RFID function)

3. Set the security level for each screen and objects on the screens.

Target	Reference
Base screen Window screen Mobile screen	For each screen, set a security level from which the screen switching is allowed. ☞ Page 313 Base screen properties ☞ Page 323 Window screen properties ☞ Page 2831 Mobile screen properties
Object	Set a security level for each object to allow display and operation. For objects that can be operated such as touch switches and numerical inputs, set security levels for both display and operation. ☞ Setting dialog for each object ([Extended] tab)

4. Write package data to the GOT.

Precautions

■Precautions for drawing

Set the security level of 0 for the screen displayed when logging out of the GOT.

When a security level (1 or more) is set for the screen displayed when logging out of the GOT, the screen for login is displayed after logging out of the GOT.

Settings on the GOT

1. At the first startup, set the administrator password.

In the [Operator information management] screen, set a password for the administrator.

2. Configure the settings common to operator authentication (operator authentication settings).

Touch [Operator authentication] on the [GOT basic set] tab of the utility to display the [Operator authentication management] screen.

3. Select the [Authentication setting] tab and configure the following settings according to the authentication method used.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Authentication method	Setting	
Authentication with a password	[Auth method]: Select [Operator name + password].	
Authentication with an external device	[Authentication Method]	Select [External auth (serial)] or [External auth (USB)].
	[Initial position input]	Set the starting position of the external authentication ID in the data read from the external device.
	[Valid byte count input]	Set the number of bytes for the external authentication ID.
	Example) When the character string of the received data is as follows and the external authentication ID is [25A3B7] • Received character string: [STX] 2 5 A 3 B 7 [ETX] • Hexadecimal notation: 02 32 35 41 33 42 37 03 Set the following values. • [Initial position input]: 0 • [Valid byte count input]: 6	

4. Display the [Operator information] tab of the [Operator authentication management] screen and register the operator management information.

The following shows the items to set.

- Operator name
- Operator ID
- Password
- Security level

For details on the operator management information, refer to the following.

☞ Page 3044 Operator management information

Precautions

■Password management

Delete the operator management information on the operator who has stopped using the GOT.

Leaving the operator management information increases the risk of invalid operations.

The administrator password cannot be checked later. Therefore, always make a note of the password.

When the administrator password is forgotten, the operator management information cannot be registered, edited, and deleted.

■Solutions when forgetting the password or external authentication ID

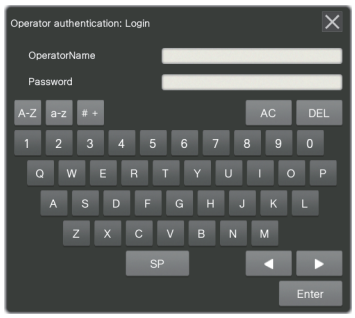
Situation	Solution
When forgetting the password	Delete the information on the operator who forgot the password from the [Operator authentication management] screen ([Operator information] tab), and register the operator management information again.
When forgetting the external authentication ID	Check the external authentication ID in the [Operator authentication management] screen ([Operator information] tab), and set the external authentication ID for the external device again.
When forgetting the administrator password	Delete the operator management information, and register all operator management information again. For the deletion of the operator management information, refer to the following. ☞ Page 3044 Operator management information

90.2.3 How to use the operator authentication (Mode 1)

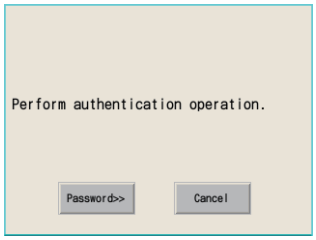
☞ Page 3051 Login for the operator authentication with a password
☞ Page 3051 Logout
☞ Page 3051 Forced logout

Login for the operator authentication with a password

1. Display the login screen.



Login screen for password authentication



Login screen for external device authentication

Display the login screen using either of the following methods.

- Touch the special function switch to which [Log-in/Log-out (Operator Authentication)] is set.
- Touch the [Login/Logout] button in the utility.

The login screen is also displayed when operation for which the level of the logged in operator is insufficient is performed.
When the login screen appears due to an insufficient level during screen switching, changing the value of the external control device to resolve the issue will close the login screen and switch the screen.

☞ Page 3047 Security level control from an external device

2. The operation differs depending on the authentication type.

Authentication type	Operation
Authentication with a password	Input an operator name and password, and touch the [Enter] button. ☞ Page 2831 Mobile screen properties
Authentication with an external device	Input the external authentication ID by using an external device such as an RFID controller.

3. For the operator authentication with a password, you can log in when the correct user name and password are input.
For the operator authentication with an external device, you can log in when the correct external authentication ID is input.

Logout

1. Perform either of the following operations to display a dialog for switching the operator or logging out.

- Touch the special function switch to which [Log-in/Log-out (Operator Authentication)] is set.
- Touch the [Login/Logout] button in the utility.

2. To log out, touch the [Logout] button.

To switch the operator, touch the [Switch] button to display the login screen.
The current operator account is still in the logged-in state.
To cancel logging out, touch the [Cancel] button.

Forced logout

You can force the operator to log out by turning on the Forced Logout signal (.b0) of the operator authentication external control device.
Do not leave this signal on because the forced logout is triggered with each turn-on of this signal.
For details on the operator authentication external control device, refer to the following.

☞ Page 3056 Operator authentication external control device

90.2.4 Editing the operator management information on a personal computer

Refer to the following.

☞ Page 3004 Editing an operator on a personal computer

90.2.5 Relevant settings

Configure the relevant settings other than the specific settings for the operator authentication (mode 1) as required.

The following shows the functions that are available by configuring the relevant settings.

GOT internal device

☞ Page 3581 GOT special register (GS)

Function	Setting item
Notifying that the authentication with the external device is successful	GS240.b0
Notifying that the authentication with the external device failed	GS240.b1
Notifying that the login screen or operator re-authentication screen is being displayed regardless of authentication method.	GS240.b13
Notifying that the login screen for authentication with the external device is being displayed	GS240.b14
Notifying that the external authentication ID input key window is displayed.	GS240.b15
Notifying the screen that cannot be displayed because of the insufficient security level.	GS241.b1 to b4, b8 to b12 GS1241.b0 to b2, b8 to b10
Notifying that the login is blocked due to incorrect login attempts	GS242.b0
Notifying that an operator ID is locked due to incorrect login attempts	GS242.b1
Prohibiting deletion of the existing operator information	GS621.b0
Prohibiting editing of the inactivated operator information	GS621.b1
Inactivating the [Import] button on the [Operator information] tab in the [Operator authentication management] screen of the utility	GS621.b2

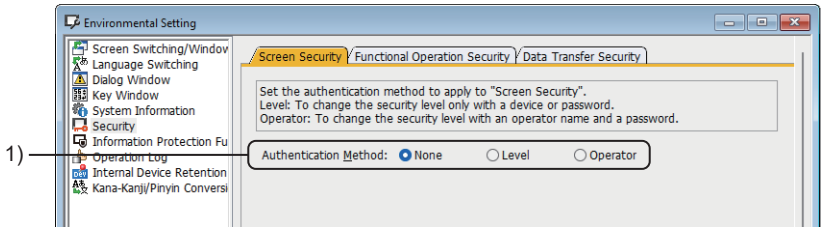
90.3 [Security] ([Screen Security] tab) (Mode 1)

GT37 SoftGOT3000

Set the security for the GOT in [Security].

Select [Common] → [GOT Environmental Setting] → [Security] from the menu to display this window.

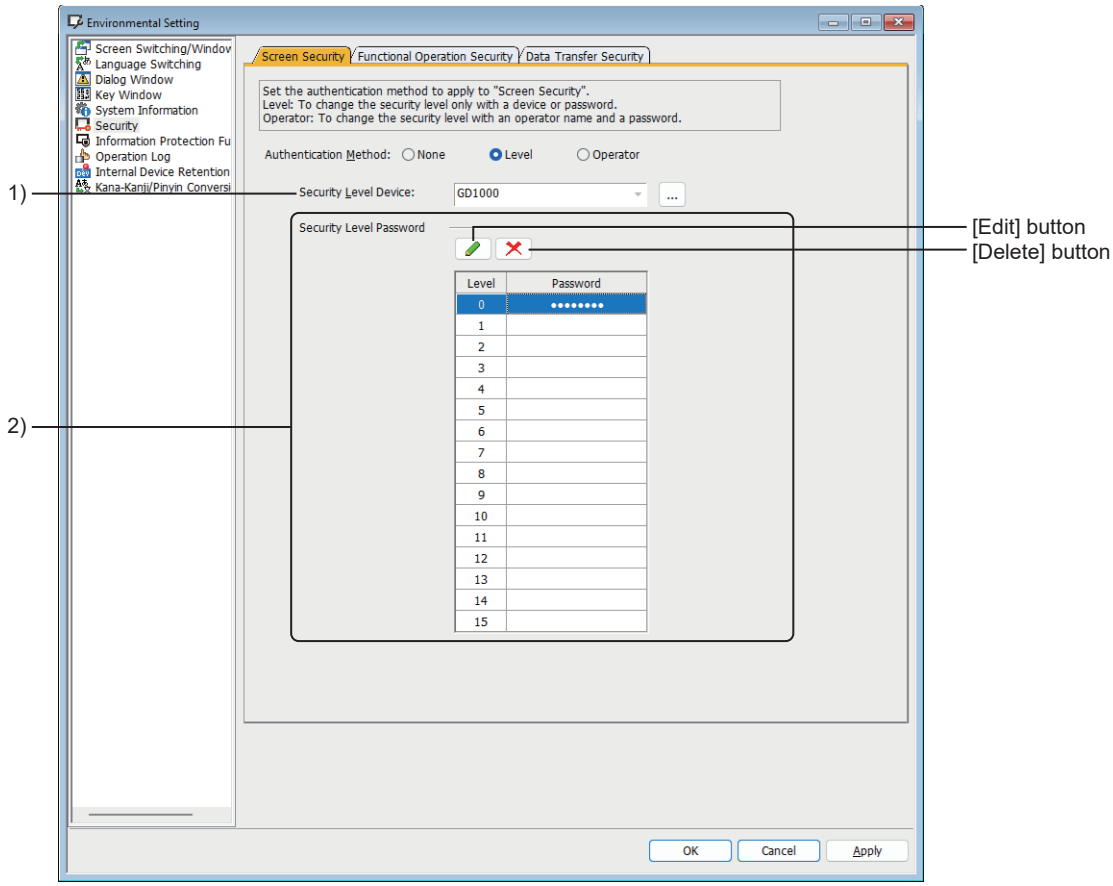
Display the [Screen Security] tab and select the authentication method used in [Authentication Method].



Item		Description
1)	[Authentication Method]	Select the authentication method for the screen security. ☞ Page 3054 Level authentication ☞ Page 3055 Operator authentication (Mode 1) When not performing authentication, select [Do not use].

90.3.1 Level authentication

Set the level authentication.



Item		Description
1)	[Security Level Device]	Set the device to which the security level value of the screen displayed on the GOT is stored. Set the device to set a password for each security level in [Security Level Password]. To change the security level, change the level device value from a controller.
2)	[Security Level Password]	The authentication password for each security level is displayed in a list. The password is displayed in [********]. Select the security level and click the [Edit] button to display the [Password Edit] dialog, where you will register or edit a password. Selecting the security level and clicking the [Delete] button delete the password. When deleting the password, inputting the current password is not required.

Precautions

The level authentication increases the risk of invalid operations because all operators can know the password for each security level.

When using the level authentication, manage the password strictly by changing the password frequently.

The registered password cannot be checked later. Therefore, always make a note of the password.

When the password is forgotten, security levels cannot be changed.

If you forget the password, delete the password and set a new password with GT Designer3.

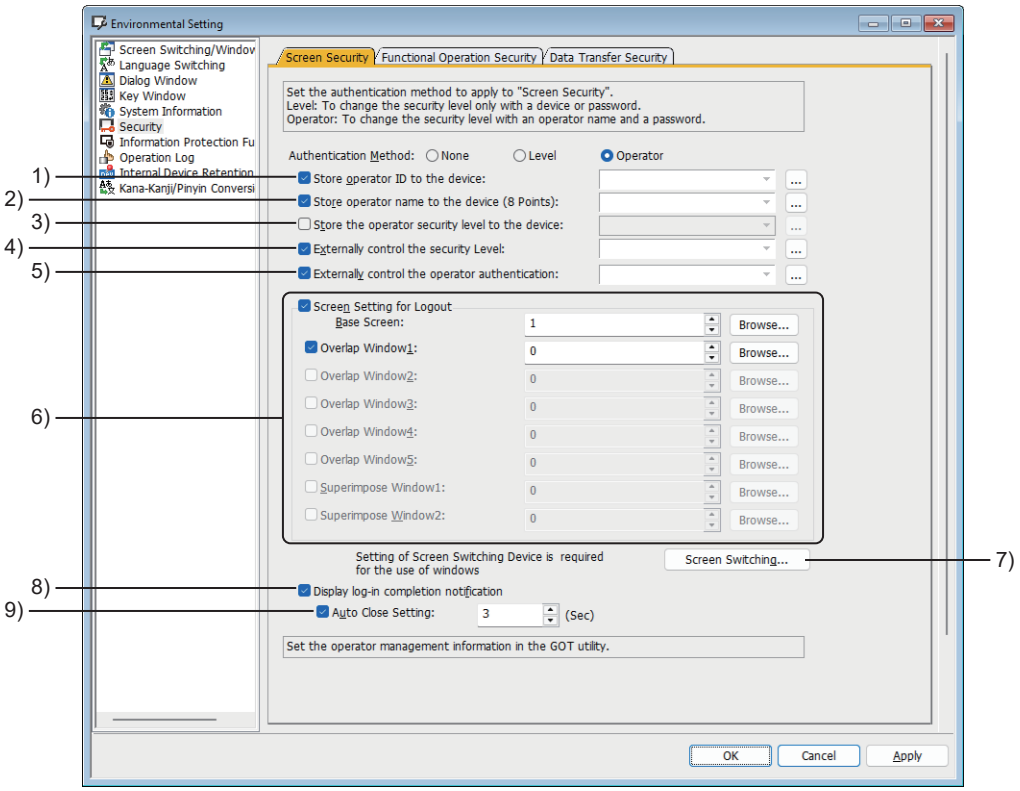
After setting, write the project to the GOT again.

90.3.2 Operator authentication (Mode 1)

Configure the operator authentication (mode 1) settings.

For the screens that are displayed when the security mode is mode 2, refer to the following.

☞ Page 3035 [Security] ([Screen Security] tab) (Mode 2)



Item		Description
1)	[Store operator ID to the device]	Set a device to store the operator ID of the logged-in operator (operator ID external notification device). You can specify a word device or word-specified bit device. ☞ Page 834 How to set devices, labels, and tags The specified device stores 0 when the operator logs out.
2)	[Store operator name to the device (8 Points)]	Set a device to store the operator name of the logged-in operator (operator name external notification device). You can specify a word device or word-specified bit device. ☞ Page 834 How to set devices, labels, and tags Setting the device reserves 8 points of the word device or 128 points of the bit device. If the operator name contains less than 16 characters, blank devices store 0. All the devices store 0 when the operator logs out.
3)	[Store the operator security level to the device]	Set a device to store the security level of the logged-in operator (operator level external notification device). You can specify a word device or word-specified bit device. ☞ Page 834 How to set devices, labels, and tags The specified device stores 0 when the operator logs out.
4)	[Externally control the security level]	Set a device to change the security level of the login operator externally (security level external control device). You can specify a word device or word-specified bit device. ☞ Page 834 How to set devices, labels, and tags ☞ Page 3047 Security level control from an external device
5)	[Externally control the operator authentication]	Set a device to control the operator authentication externally (operator authentication external control device). You can specify a word device or word-specified bit device. ☞ Page 834 How to set devices, labels, and tags ☞ Page 3056 Operator authentication external control device
6)	[Screen Setting for Logout]	Set a screen to be displayed at logout. Select each window screen to set a window screen displayed when logging out of the GOT. To set a window screen, set the screen switching device. Timing to display the set screen differs according to operation when logging out of the GOT. After logging out of the GOT by a touch switch (special function switch) or the automatic logout function, the set screen is displayed. If you have logged out using the utility, the specified screen will be displayed when you move from the utility to the user-created screen after logging out.

Item		Description
7)	[Screen Switching] button	Displays [Screen Switching/Window] of the [Environmental Setting] window. ☞ Page 542 [Screen Switching/Window]
8)	[Display log-in completion notification]	Displays a login completion notification dialog upon login.
9)	[Auto Close Setting]	Closes the login completion notification dialog automatically. Select this item, and specify the time period from when the login completion notification dialog appears until it closes. The setting range is [1] second to [60] seconds.

Operator authentication external control device

Bit number	Signal name	Description
b0	Forced Logout signal	Turning on this signal forcibly logs out an operator currently logging in. The Forced Logout signal operates at the signal rising. Therefore, this signal does not operate even if it is always turned on. Also, without the user login, this signal does not operate even if it is turned on. Before turning off this signal, check that the Operator ID External Notification device stores 0.
b1 to b15	—	Use prohibited

Point

Security level after the forced logout

When an operator security level becomes lower than the one set for the currently-displaying screen after the forced logout, each screen operates as follows.

• Base screen

The login screen is displayed.

• Window screen

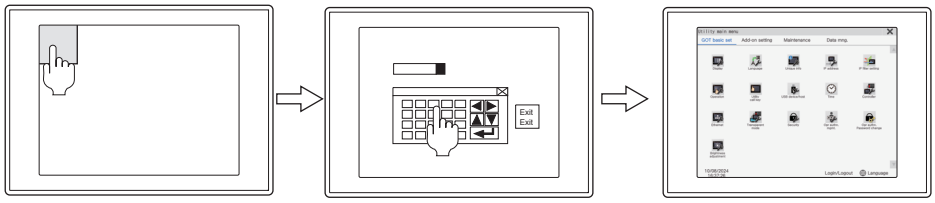
The window screens (overlap windows and superimposed windows) are deleted.

91 Configuring the security settings for operations in the utility (Functional operation security)

GT37 SoftGOT3000

☞ Page 3057 Operations restricted by functional operation security
☞ Page 3057 Settings for the functional operation security
☞ Page 3058 [Security] ([Functional Operation Security] tab)

The functional operation security restricts the display of the utility and the editing of parameters for some monitoring functions.



Switching to the utility screen | Input a password. | The utility appears when the input password is correct.

To restrict operations other than utility startup, configure other security function settings with reference to the following.

☞ Page 38 Security function

Using multiple security functions in combination further strengthens the security.

91.1 Operations restricted by functional operation security

GT37 SoftGOT3000

The following operations are restricted by functional operation security.

○: Supported

—: Unsupported

Restricted item		Security mode	
		Mode 1	Mode 2
Utility startup		○	—
R motion monitor	Display of the [Param. Setting] screen	○	○
Sequence program monitor (ladder display)	Display of the device test window	○	○
	Display of the [Ladder editor] screen	○	○

*1 In mode 2, utility startup is restricted by the operator's operation authority.

☞ Page 2994 Operation authorities

91.2 Settings for the functional operation security

GT37 SoftGOT3000

The following shows the procedure for setting the functional operation security.

1. Select [Common] → [GOT Environmental Setting] → [Security] from the menu to display the [Environmental Setting] window ([Security]).
2. In the [Functional Operation Security] tab, set the password.

☞ Page 3058 [Security] ([Functional Operation Security] tab)

91.3 [Security] ([Functional Operation Security] tab)

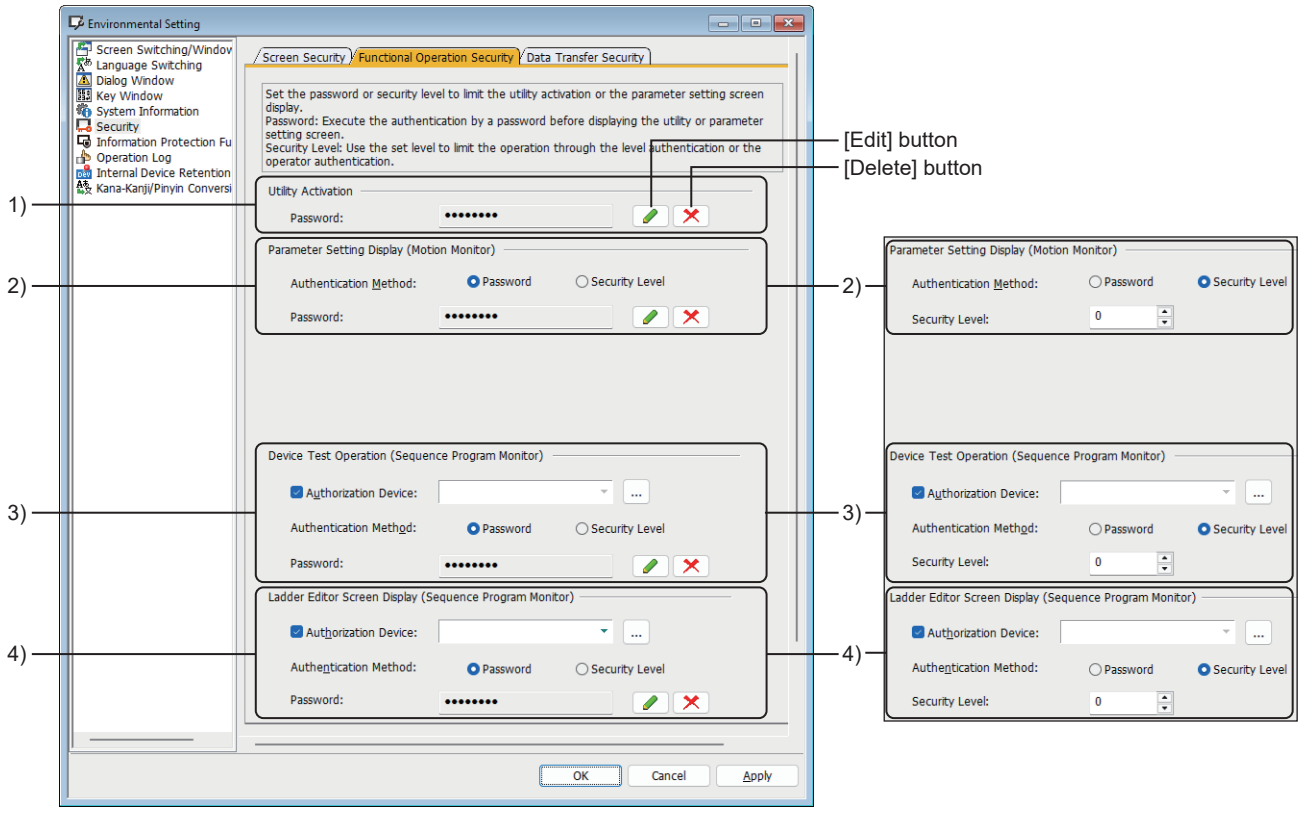
GT37 SoftGOT3000

The displayed content varies depending on the security mode.

☞ Page 3058 [Functional Operation Security] tab (mode 1)
☞ Page 3060 [Functional Operation Security] tab (mode 2)

91.3.1 [Functional Operation Security] tab (mode 1)

GT37 SoftGOT3000



Item			Description
1)	[Utility]	[Password]	Set a password to restrict starting up the utility. When the password is set, [********] is displayed. Click the [Edit] button to display the [Password Edit] dialog for registering or editing a password. Clicking the [Delete] button deletes the password.

Item			Description
2)	[Parameter Setting Display (Motion Monitor)]	[Authentication Method]	This item appears when an option other than [None] is selected for [Authentication Method] in the [Screen Security] tab. Set a method to restrict the display of the [Param. Setting] screen for the R motion monitor.
		[Password]	This item appears in either of the following conditions. • [None] is selected for [Authentication Method] in the [Screen Security] tab. • [Password] is selected for [Authentication Method]. Set a password to restrict the display of the screen. When the password is set, [********] is displayed. Click the [Edit] button to display the [Password Edit] dialog for registering or editing a password. Clicking the [Delete] button deletes the password.
		[Security Level]	This item appears when [Security Level] is selected for [Authentication Method]. Set the required security level for the screen display. The screen display is allowed when the security level is equal to or higher than the set security level.
3)	[Device Test Operation (Sequence Program Monitor)]	—	Restricts the display of the device test window for the sequence program monitor (ladder display).
		[Authorization Device]	Restricts the display of the screen using an authorization device (bit device). When the authorization device is on, the screen display is allowed.
		[Authentication Method]	This item appears when an option other than [None] is selected for [Authentication Method] in the [Screen Security] tab. Select a method to restrict the display of the screen.
		[Password]	This item appears in either of the following conditions. • [None] is selected for [Authentication Method] in the [Screen Security] tab. • [Password] is selected for [Authentication Method]. Set a password to restrict the display of the screen. When the password is set, [********] is displayed. Click the [Edit] button to display the [Password Edit] dialog for registering or editing a password. Clicking the [Delete] button deletes the password.
		[Security Level]	This item appears when [Security Level] is selected for [Authentication Method]. Set the required security level for the screen display. The screen display is allowed when the security level is equal to or higher than the set security level.
4)	[Ladder Editor Screen Display (Sequence Program Monitor)]	—	Restricts the display of the [Ladder editor] screen for the sequence program monitor (ladder display).
		[Authorization Device]	Restricts the display of the screen using an authorization device (bit device). When the authorization device is on, the screen display is allowed.
		[Authentication Method]	This item appears when an option other than [None] is selected for [Authentication Method] in the [Screen Security] tab. Select a method to restrict the display of the screen.
		[Password]	This item appears in either of the following conditions. • [None] is selected for [Authentication Method] in the [Screen Security] tab. • [Password] is selected for [Authentication Method]. Set a password to restrict the display of the screen. When the password is set, [********] is displayed. Click the [Edit] button to display the [Password Edit] dialog for registering or editing a password. Clicking the [Delete] button deletes the password.
		[Security Level]	This item appears when [Security Level] is selected for [Authentication Method]. Set the required security level for the screen display. The screen display is allowed when the security level is equal to or higher than the set security level.

Precautions

The registered password cannot be checked later. Therefore, always make a note of the password.

If you forget the password, use [Utilize Project] to create a new project.

☞ Page 226 Utilizing other project data

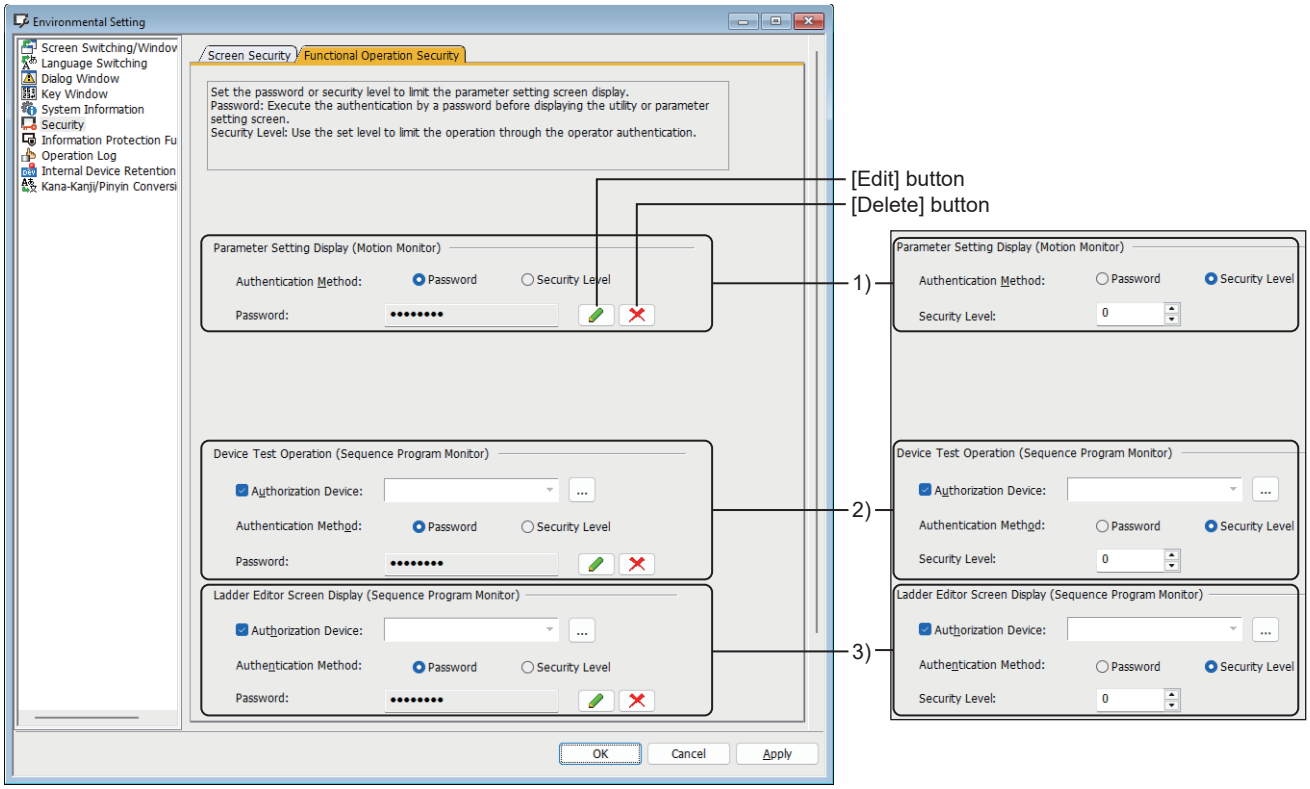
Deselect [GOT Environmental Setting/GOT Setup] from items to be utilized to initialize all the settings for the GOT environmental settings and the GOT setup.

At this time, the password is deleted.

After configuring the settings for the GOT environmental settings and the GOT setup, write the created project to the GOT.

91.3.2 [Functional Operation Security] tab (mode 2)

GT37 SoftGOT3000



Item			Description
1)	[Parameter Setting Display (Motion Monitor)]	[Authentication Method]	Set a password to restrict the display of the [Param. Setting] screen for the R motion monitor.
		[Password]	This item appears when [Password] is selected for [Authentication Method]. Set a password to restrict the display of the screen. When the password is set, [********] is displayed. Click the [Edit] button to display the [Password Edit] dialog for registering or editing a password. Clicking the [Delete] button deletes the password.
		[Security Level]	This item appears when [Security Level] is selected for [Authentication Method]. Set the required security level for the screen display. The screen display is allowed when the security level of the login operator is equal to or higher than the set security level.
2)	[Device Test Operation (Sequence Program Monitor)]	—	Restricts the display of the device test window for the sequence program monitor (ladder display).
		[Authorization Device]	Restricts the display of the screen using an authorization device (bit device). When the authorization device is on, the screen display is allowed.
		[Authentication Method]	Select a method to restrict the display of the screen.
		[Password]	This item appears when [Password] is selected for [Authentication Method]. Set a password to restrict the display of the screen. When the password is set, [********] is displayed. Click the [Edit] button to display the [Password Edit] dialog for registering or editing a password. Clicking the [Delete] button deletes the password.
		[Security Level]	This item appears when [Security Level] is selected for [Authentication Method]. Set the required security level for the screen display. The screen display is allowed when the security level of the login operator is equal to or higher than the set security level.

Item			Description
3)	[Ladder Editor Screen Display (Sequence Program Monitor)]	—	Restricts the display of the [Ladder editor] screen for the sequence program monitor (ladder display).
		[Authorization Device]	Restricts the display of the screen using an authorization device (bit device). When the authorization device is on, the screen display is allowed.
		[Authentication Method]	Select a method to restrict the display of the screen.
		[Password]	This item appears when [Password] is selected for [Authentication Method]. Set a password to restrict the display of the screen. When the password is set, [********] is displayed. Click the [Edit] button to display the [Password Edit] dialog for registering or editing a password. Clicking the [Delete] button deletes the password.
		[Security Level]	This item appears when [Security Level] is selected for [Authentication Method]. Set the required security level for the screen display. The screen display is allowed when the security level of the login operator is equal to or higher than the set security level.

Precautions

The registered password cannot be checked later. Therefore, always make a note of the password.

If you forget the password, use [Utilize Project] to create a new project.

☞ Page 226 Utilizing other project data

Deselect [GOT Environmental Setting/GOT Setup] from items to be utilized to initialize all the settings for the GOT environmental settings and the GOT setup.

At this time, the password is deleted.

After configuring the settings for the GOT environmental settings and the GOT setup, write the created project to the GOT.

92 Configuring the security setting for transferring data (Data transfer security)

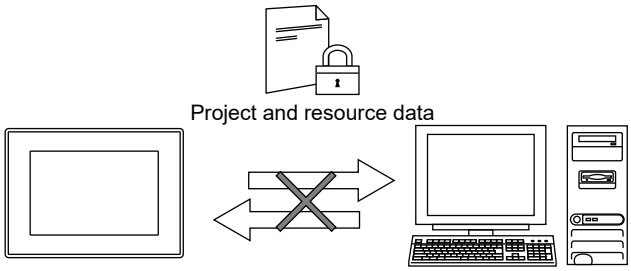
GT37 SoftGOT3000

☞ Page 3064 Settings for the data transfer security
☞ Page 3064 [Security] ([Data Transfer Security] tab)

Point

This function can be used when the security mode is set to mode 1.

The data transfer security prevents unauthorized reading and writing of a project and resource data by password-based authentication.



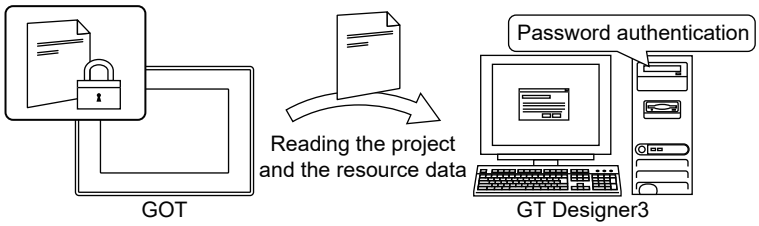
To restrict operations other than data transfer, configure other security function settings with reference to the following.

☞ Page 38 Security function

Using multiple security functions in combination further strengthens the security.

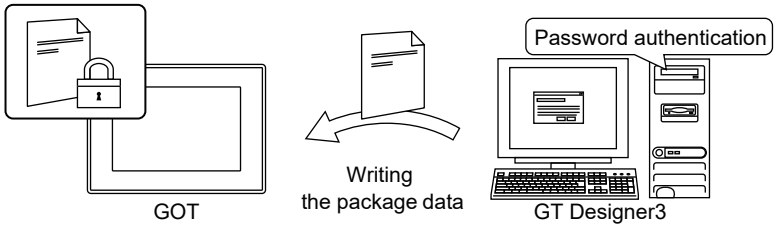
Restricting reading the project and the resource data

After the data transfer security is set for the project, an authentication with a password is required for reading the project or the resource data.



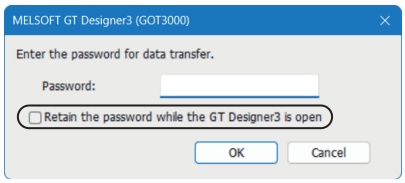
Protecting the project written to the GOT

For the project which the data transfer security is set to, an authentication with a password is required for overwriting.



When all the following conditions are satisfied, inputting a password is not required because the authentication is performed automatically.

- The project IDs or package folder names match each other between the project contained in package data to be written and the existing project in the GOT.
- The set data transfer passwords match each other between the project contained in package data to be written and the existing project in the GOT.
- At the first writing of package data, [Retain the password while the GT Designer3 is open] was selected in the dialog for inputting the data transfer password.



You can check and change the project ID in the [Project Information] dialog.

☞ Page 224 Giving a title to a project

92.1 Settings for the data transfer security

GT37 SoftGOT3000

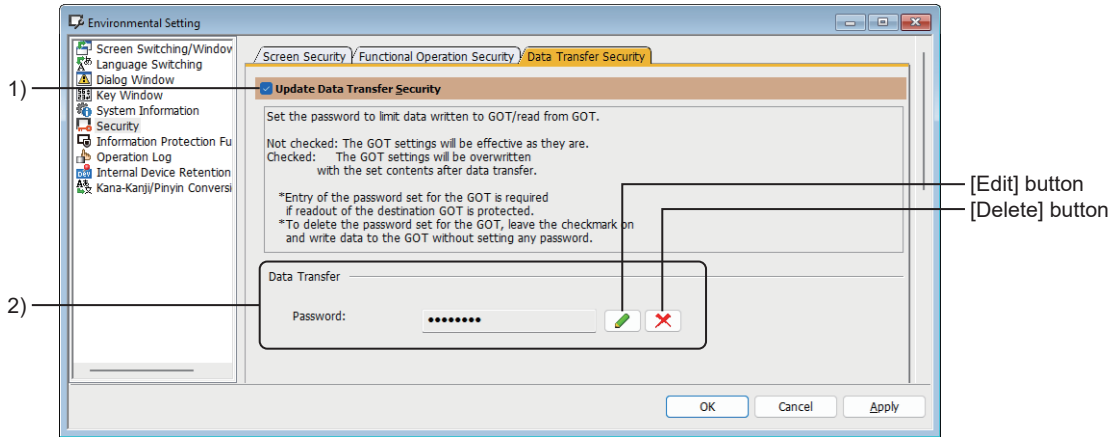
The following shows the procedure for setting the data transfer security.

1. Select [Common] → [GOT Environmental Setting] → [Security] from the menu to display the [Environmental Setting] window ([Security]).
2. In the [Data Transfer Security] tab, set the password.

☞ Page 3064 [Security] ([Data Transfer Security] tab)

92.2 [Security] ([Data Transfer Security] tab)

GT37 SoftGOT3000



Item			Description
1)	[Update Data Transfer Security]		Overwrites the data transfer security set with GT Designer3 to the GOT when the package data is written. Select this item to set [Data Transfer] items.
2)	[Data Transfer]	—	Set a password to restrict data transfer.
		Password	When the password is set, [********] is displayed. Click the [Edit] button to display the [Password Edit] dialog for registering or editing a password. Clicking the [Delete] button deletes the password.

Precautions

The registered password cannot be checked later. Therefore, always make a note of the password.

If you forget the password, install the BootOS again.

Installing the BootOS again deletes all data in the GOT, such as the project and the resource data.

93 Protecting the files in the GOT (Information protection function)

GT37 SoftGOT3000

☞ Page 3065 File tampering check function
☞ Page 3066 Confidentiality protection function
☞ Page 3067 How to set the information protection function
☞ Page 3068 [File Protection]

The information protection function protects the files in the GOT.

The function is composed of the following functions.

- File tampering check function
- Confidentiality protection function

93.1 File tampering check function

This function verities that files affecting the control of the GOT have not been tampered with.

The function prevents unauthorized changes to data due to operation mistakes or other factors.

No setting is required because the file tampering check function is always enabled.

93.2 Confidentiality protection function

GT37 SoftGOT3000

This function protects the confidentiality by setting passwords for files in the GOT (such as a project and resource data).
To enable the confidentiality protection function, select [Use file protection function] in the [File Protection] tab of the [Environmental Setting] window ([Information Protection Function]).
☞ Page 3068 [File Protection]

93.2.1 Encryption target and password setting method

The following files require authentication for operations such as writing and reading by setting a password.

Encryption target		Password setting method
Project		Set a password for the following operations. • Writing the package data to the GOT • Writing the package data to a memory card ☞ Page 412 File protection
Package data		Set a password for saving the package data. ☞ Page 223 Naming and saving the project as package data (*.GTYS)
GT SoftGOT3000 execution file		Set a password for saving the GT SoftGOT3000 execution file. ☞ Page 222 Naming and saving the project as project data (*.GTY) or a GT SoftGOT3000 execution file (*.GTYP)
Resource data	Operation log file	Set a password on the [File Protection] tab in the [Environmental Setting] window ([Information Protection Function]). ☞ Page 3068 [File Protection]
	Alarm file	
	Logging file	
	Recipe file	

93.3 How to set the information protection function

GT37 SoftGOT3000

The following shows how to set the information protection function.

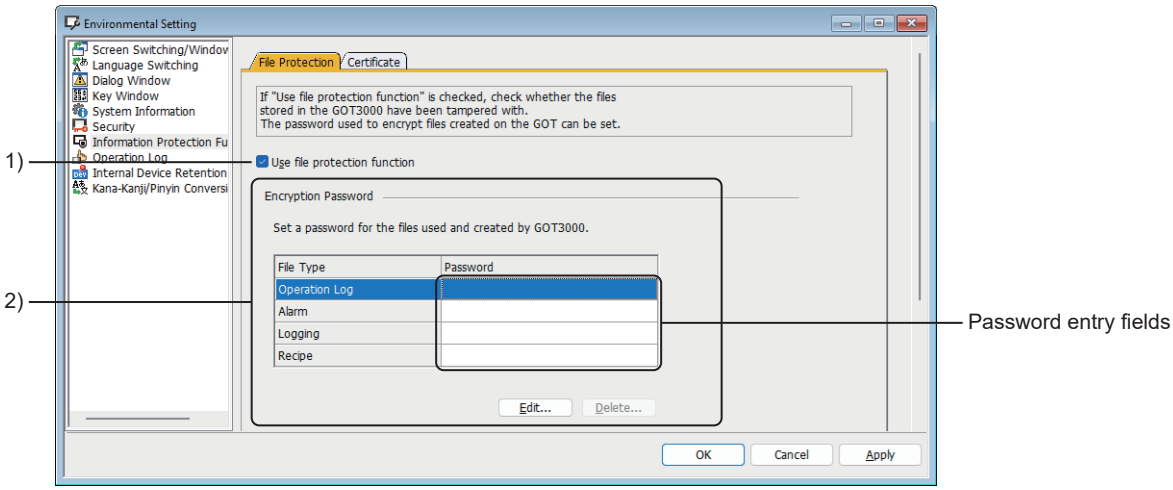
1. Select [Common] → [GOT Environmental Setting] → [Information Protection Function] from the menu to display the [Environmental Setting] window ([Information Protection Function]).
2. Configure the settings in the [File Protection] tab.

☞ Page 3068 [File Protection]

93.4 [File Protection]

GT37 SoftGOT3000

Configure the information protection function settings.



Item		Description
1)	[Use file protection function]	Enables the following functions. • File tampering check function • Confidentiality protection function For details on each function, refer to the following. ☞ Page 3065 File tampering check function ☞ Page 3066 Confidentiality protection function
2)	[Encryption Password]	Set a password for each type of resource file generated by the GOT. The resource file is encrypted and a password is required for conversion. Selecting a password entry field and clicking the [Edit] button displays the [Password Edit] dialog that allows you to register or edit the password. Selecting the password entry field and clicking the [Delete] button deletes the password.

Point

For information on how to set a password for the project or package data, refer to the following.
☞ Page 3066 Encryption target and password setting method

Precautions

■Changing or deleting the password

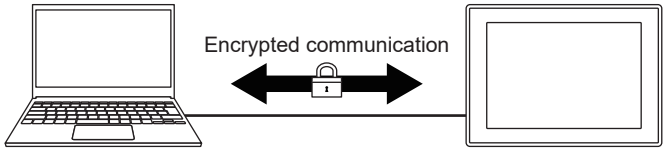
Even after the registered password is changed or deleted, the old password is required to convert the resource file generated before the password change or deletion.

94 Encrypting communication data (Encrypted communication function)

GT37 SoftGOT3000

☞ Page 3070 Specifications of the encrypted communication function
☞ Page 3072 Target functions for encrypted communication and required settings
☞ Page 3076 Creating and managing the certificate
☞ Page 3078 [Certificate]

The encrypted communication function encrypts communication data when the GOT communicates with an external device.
Encryption only applies to communications between the GOT and devices directly connected by Ethernet.
Communications via a PLC or other controllers are not encrypted.



To perform encrypted communications, a digital certificate (hereafter "certificate") is required for the GOT and controllers.
Certificates are data used for passing keys for encrypted communications to controllers.
There are the following types of certificates.

Certificate	Description
Server certificate	A certificate created by the server. The server presents this certificate to prove its authenticity in response to a request from the client during server authentication. The server certificate created by the GOT is a self-signed certificate that has not been approved by a certificate authority.
Client certificate	A certificate created by the client. The client presents this certificate to prove its authenticity in response to a request from the server during client authentication.
Certificate issued by a certificate authority (Root certificate and intermediate certificate)	A certificate issued and published by a certificate authority. It is used to verify the authenticity of a certificate.

The required certificate differs depending on the target function for encrypted communication.
☞ Page 3072 Target functions for encrypted communication and required settings

94.1 Specifications of the encrypted communication function

GT37 SoftGOT3000

☞ Page 3070 Certificate specifications
☞ Page 3070 Authentication method
☞ Page 3071 Checking the certificate expiration date

94.1.1 Certificate specifications

Item	Description
Format	X509 format
Encrypted communication protocol	• TLS1.2, TLS1.3 • DTLS1.2 • SSH2.0

94.1.2 Authentication method

The following shows the authentication methods between the server and client.

Authentication method	Description
Server authentication	The client authenticates the server. Client authentication	The server and client mutually authenticate. 
94.1.3 Checking the certificate expiration date

The GOT interprets the expiration date set for each certificate as UTC±0 and checks for expiration by comparing it with the GOT's clock.

The certificate expiration date check is performed at the following timing.

GOT model	Check timing	Check target	Remarks
GOT (except GT SoftGOT3000)	GOT startup	Other than certificates issued by a certificate authority	Performed after the time setting at the GOT startup.
	Fixed interval	Other than certificates issued by a certificate authority	Performed every other day after the GOT startup.
	When used	Certificate to be used	—
GT SoftGOT3000	At the start of monitoring	All the certificates stored in the started module	Performed after the time setting at the GOT startup.
	Fixed interval	All the certificates stored in the started module	Performed every other day after the GOT startup.
	When used	Certificate to be used	—

The GOT issues system alarm 752 to notify that the certificate is about to expire 90 days before the expiration date.

When a certificate expires, system alarm 753 occurs.

When the GOT Mobile function is used in GT SoftGOT3000, no notifications regarding the certificate expiration date are provided.

Precautions

■Changing the GOT's clock

The certificate expiration date check uses the following clocks.

- GOT (except GT SoftGOT3000): GOT's clock
- GT SoftGOT3000: Personal computer's clock

If the clocks of the GOT and personal computer have been changed, the certificate may be valid or invalid.

■Time zone setting

Match the time zone settings between the GOT and the controller to be connected.

The GOT's clock with the time zone applied is used to create a certificate or perform encrypted communication.

94.2 Target functions for encrypted communication and required settings

The following table lists the functions where communication data is encrypted and the required settings for encryption.

☞ Page 3072 Function where the GOT serves as a server
☞ Page 3074 Function where the GOT serves as a client

94.2.1 Function where the GOT serves as a server

Target function for encrypted communication	Required setting	Model
Communication with GT Designer3 and Data Transfer Tool	☞ Page 3072 Communication with GT Designer3 and Data Transfer Tool	GT37 SoftGOT3000
SoftGOT-GOT link function	☞ Page 3072 SoftGOT-GOT link function	
FTP server function	☞ Page 3073 FTP server function	
VNC server function	The communication data is encrypted using SSH port forwarding. No certificate is used. ☞ Page 2638 Viewing the GOT from a personal computer (VNC server function)	
GOT network interaction function	☞ Page 3073 GOT network interaction function	GT37 SoftGOT3000
GOT Mobile function	☞ Page 3073 GOT Mobile function	GT37 SoftGOT3000
OPC UA server function	Client authentication is performed when a client accesses the server (GOT). The GOT requires a server certificate and the client certificate of the controller. ☞ Page 2839 Monitoring controllers through the GOT (OPC UA server function)	GT37 SoftGOT3000

Communication with GT Designer3 and Data Transfer Tool

When the personal computer and GOT are directly connected via Ethernet, server authentication is performed during data transfer.

Configure the following settings in GT Designer3.

Setting	Description
Opening the port for encrypted communication	Set the port for encrypted communication to open. (The default setting is open.) If it is set to close, communication cannot be established. ☞ Page 717 [GOT Ethernet Common Setting]
Enabling encrypted communication	Select [Perform the encryption communication] in the [Communication Configuration] dialog. ☞ Page 451 [Communication Configuration] dialog

SoftGOT-GOT link function

Server authentication is performed when GT SoftGOT3000 accesses a server.

Device	Setting	Description
GOT	Creating a server certificate	Set the certificate setting information in GT Designer3 and update the server certificate with the GOT. ☞ Page 3076 Updating the server certificate with the GOT (except GT SoftGOT3000)
GT SoftGOT3000	Enabling encrypted communication	In the [Set] dialog of GT SoftGOT3000, select [Execute Encrypted Communication] under [SoftGOT-GOT Link Function]. 📖GT SoftGOT3000 User's Manual
	Importing the certificate	Import the server certificate to the personal computer with GT SoftGOT3000 installed.

FTP server function

Server authentication is performed when a client accesses the server (GOT).

Device	Setting	Description
GOT	Enabling encrypted communication	Select [FTPS] under [Communication] in the [Controller Setting] window ([FTP Server]). (Default setting: Selected) ☞ Page 2913 [FTP Server]
	Creating a server certificate	Set the certificate setting information in GT Designer3 and update the server certificate with the GOT. ☞ Page 3076 Updating the server certificate with the GOT (except GT SoftGOT3000)
Client	Importing the certificate	Import the GOT server certificate to the client terminal.

GOT network interaction function

Server authentication is performed when a client accesses a server.

Device	Setting		Description
Server	Enabling encrypted communication		Select [Perform Encryption Communication with Server Certificates] in the [GOT Network Interaction] dialog. ☞ Page 772 [GOT Network Interaction] dialog
	Creating a server certificate	GOT (except GT SoftGOT3000)	Set the certificate setting information in GT Designer3 and update the server certificate with the GOT. ☞ Page 3076 Updating the server certificate with the GOT (except GT SoftGOT3000)
		GT SoftGOT3000	Set the certificate setting information in GT Designer3 and create a server certificate in GT SoftGOT3000. ☞ Page 3077 Creating a server certificate in GT SoftGOT3000
Client	Importing the certificate		Import the server certificate to the client terminal.

GOT Mobile function

Server authentication or client authentication is performed when a client accesses the server (GOT).

Device	Setting		Description
GOT	Enabling encrypted communication		Select [HTTPS(SSL)] for [Communication Method] in the [GOT Mobile Setting] window ([Basic Setting]). (The default setting is [HTTPS(SSL)].) ☞ Page 2818 [Basic Setting] Select [Perform authentication with client certificates] to enable client authentication. (It is recommended to enhance security for the ANDON connection.) When this item is selected, create a client certificate on the client terminal and import it to the server (GOT).
	Creating a server certificate	GOT (except GT SoftGOT3000)	Set the certificate setting information in GT Designer3 and update the server certificate with the GOT. ☞ Page 3076 Updating the server certificate with the GOT (except GT SoftGOT3000)
		GT SoftGOT3000	Create a server certificate with Internet Information Services (IIS). ☞ Page 2780 Settings for encrypted communication (GT SoftGOT3000)
	Importing the client certificate	GOT (except GT SoftGOT3000)	Required when [Perform authentication with client certificates] is selected in [Basic Setting] in the [GOT Mobile Setting] window. ☞ Page 2775 Creating and importing the client certificate (client, server (GOT))
		GT SoftGOT3000	Required when [Perform authentication with client certificates] is selected in [Basic Setting] in the [GOT Mobile Setting] window. ☞ Page 2795 Creating and importing the client certificate and importing it to GT SoftGOT3000 (client, server (GOT))
Client	Importing the server certificate	GOT (except GT SoftGOT3000)	Import the GOT server certificate to the client terminal.
		GT SoftGOT3000	To connect a client to the GOT, enter the URL of the destination GOT into the address bar of the client's browser. The URL must have a subject alternative name.
	Creating the client certificate		Required when [Perform authentication with client certificates] is selected in [Basic Setting] in the [GOT Mobile Setting] window. Create the client certificate in the client terminal. ☞ Page 2775 Creating and importing the client certificate (client, server (GOT))

94.2.2 Function where the GOT serves as a client

Target function for encrypted communication	Required setting	Model
Encrypted communication with the MELSEC MX Controller	The GOT requires the server certificate of the connected device. GOT3000 Series User's Manual (Connection)	GT37 SoftGOT3000
OPC UA client	Client authentication is performed when the client (GOT) accesses a server. The GOT requires the client certificate and server certificate of the connected device. Page 3074 OPC UA client	GT37 SoftGOT3000
VPN connection function	The communication data is encrypted using Secomea's products. No certificate is used. Page 671 Setting the VPN connection function of the GOT ([VPN Connection])	GT37 SoftGOT3000
Web browser function	Server authentication is performed using a certificate issued by a certificate authority when accessing an HTTPS-enabled web server. The certificate issued by the certificate authority is transferred to the GOT when the [Web Browser] function of the system application (add-on function) is written.	GT37 SoftGOT3000
Mail send function	Server authentication is performed when the client (GOT) accesses a server. The GOT requires the server certificate of the connected device. The certificate issued by the certificate authority is transferred to the GOT when the [Mail Send] function of the system application (add-on function) is written. Page 3075 Mail send function	GT37 SoftGOT3000
File transfer (FTP client) function	Server authentication is performed when the client (GOT) accesses a server. The GOT requires the server certificate of the connected device. Page 3075 File transfer (FTP client) function	GT37 SoftGOT3000
Remote personal computer operation function (Ethernet)	The communication data is encrypted using SSH port forwarding. No certificate is used. Page 2628 How to install and configure the SSH server	GT37 SoftGOT3000

OPC UA client

Server authentication is performed when the OPC UA client (GOT) accesses the OPC UA server.

Device	Setting	Description
OPC UA server	Creating a server certificate	Create a server certificate on the OPC UA server. For information on settings and operations on the OPC UA server, refer to the following. Manual of the OPC UA server used
	Importing the client certificate	Import the GOT client certificate to the OPC UA server terminal.
OPC UA client (GOT)	Creating the client certificate	Set the certificate setting information in GT Designer3 and create a client certificate with the GOT. Page 3077 Creating a client certificate with the GOT (except GT SoftGOT3000) Page 3077 Creating a client certificate with GT SoftGOT3000
	Importing the server certificate	Import the OPC UA server certificate to the OPC UA client (GOT).

Mail send function

Server authentication is performed when the client (GOT) accesses a server.

Device	Setting	Description
Server	Creating a server certificate	Create a server certificate. For information on settings and operations on the server, refer to the following. Manual of the server used
Client (GOT)	Importing the certificate	Import the server certificate to the client (GOT).

File transfer (FTP client) function

Server authentication is performed when the client (GOT) accesses a server.

Device	Setting	Description
Server	Creating a server certificate	Create a server certificate. For information on settings and operations on the server, refer to the following. Manual of the server used
Client (GOT)	Importing the certificate	Import the server certificate to the client (GOT).

94.3 Creating and managing the certificate

GT37 SoftGOT3000

You can perform operations related to certificates in [Certificate management] of the utility.

Device	Operation	Reference
Certificate of the GOT (Server certificate)	Update	📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
	Export	
Certificate of the GOT (client certificate)	Create	
	Update	
	Delete	
	Export	
Certificate of the controller	Delete	Store the file exported from the controller to the data storage. Then, install it to the GOT and import the certificate of the controller in the utility. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
	Import	
	Register to the trusted certificate	

The following shows the procedures to configure the certificate settings in GT Designer3, create the certificate, and update it with the GOT.

☞ Page 3076 Updating the server certificate with the GOT (except GT SoftGOT3000)
☞ Page 3077 Creating a client certificate with the GOT (except GT SoftGOT3000)
☞ Page 3077 Creating a server certificate in GT SoftGOT3000
☞ Page 3077 Creating a client certificate with GT SoftGOT3000

94.3.1 Updating the server certificate with the GOT (except GT SoftGOT3000)

Point

If there is no server certificate, the GOT automatically creates a server certificate at timings such as when the GOT is started so that the data transfer from/to GT Designer3 or Data Transfer Tool can be always encrypted. To apply the setting information on the certificate configured in GT Designer3, update the certificate with the GOT.

Operating procedure

1. Select [Common] → [GOT Environmental Setting] → [Information Protection Function] from the menu to display the [Environmental Setting] window ([Information Protection Function]).
2. Configure the settings on the [Certificate] tab.

☞ Page 3078 [Certificate]

3. Write the package data to the GOT.

☞ Page 408 Transferring data to the GOT

4. Display the [Certificate management] screen ([Certificate of GOT] tab) in the utility and check if a message prompting you to update the server certificate is displayed.

If the message is displayed, select [Server certificate] and touch the [Update] button to update the server certificate.
📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

94.3.2 Creating a client certificate with the GOT (except GT SoftGOT3000)

Operating procedure

1. Select [Common] → [GOT Environmental Setting] → [Information Protection Function] from the menu to display the [Environmental Setting] window ([Information Protection Function]).
2. Configure the settings on the [Certificate] tab.

☞ Page 3078 [Certificate]

3. Write the package data to the GOT.

☞ Page 408 Transferring data to the GOT

4. Display the [Certificate management] screen ([Certificate of GOT] tab) in the utility, select [Client certificate], and touch the [Create] button to create a client certificate.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

94.3.3 Creating a server certificate in GT SoftGOT3000

Operating procedure

1. Select [Common] → [GOT Environmental Setting] → [Information Protection Function] from the menu to display the [Environmental Setting] window ([Information Protection Function]).
2. Configure the settings on the [Certificate] tab.

☞ Page 3078 [Certificate]

3. Open the project with GT SoftGOT3000 and start monitoring.

When monitoring starts, a server certificate is automatically created.

📖GT SoftGOT3000 User's Manual

94.3.4 Creating a client certificate with GT SoftGOT3000

Operating procedure

1. Select [Common] → [GOT Environmental Setting] → [Information Protection Function] from the menu to display the [Environmental Setting] window ([Information Protection Function]).
2. Configure the settings on the [Certificate] tab.

☞ Page 3078 [Certificate]

3. Open the project with GT SoftGOT3000 and start monitoring.

📖GT SoftGOT3000 User's Manual

4. Display the [Certificate management] screen ([Certificate of GOT] tab) in the utility, select [Client certificate], and touch the [Create] button to create a client certificate.

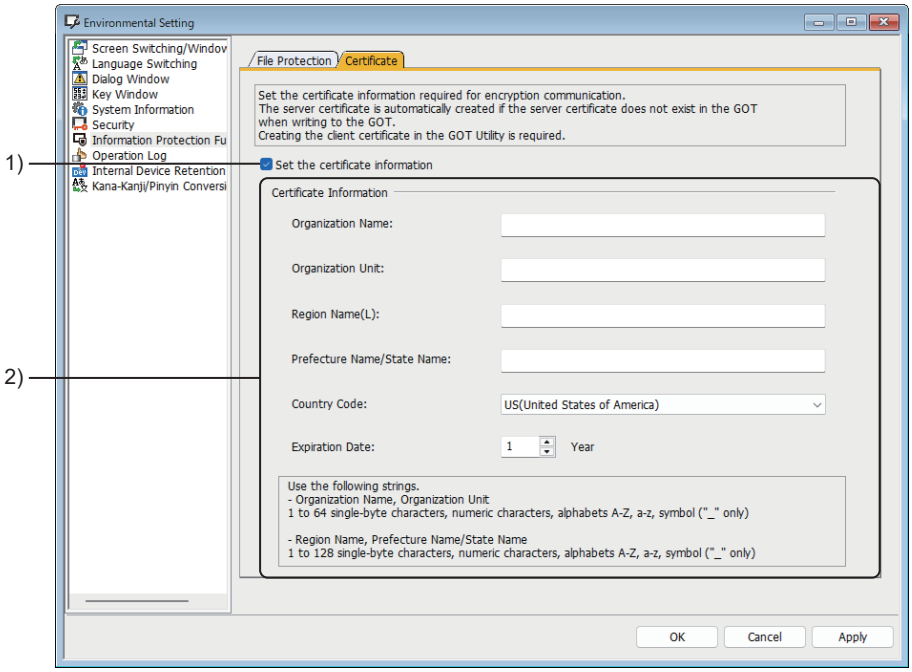
94.4 [Certificate]

GT37 SoftGOT3000

Configure the settings to create a server certificate and client certificate with the GOT.



Item			Description
1)	[Set the certificate information]		Enable the encrypted communication function and configure the certificate settings. For procedures from configuring certificate settings in GT Designer3 to creating and updating certificates on the GOT, refer to the following. ☞ Page 3076 Updating the server certificate with the GOT (except GT SoftGOT3000) ☞ Page 3077 Creating a client certificate with the GOT (except GT SoftGOT3000) ☞ Page 3077 Creating a server certificate in GT SoftGOT3000 ☞ Page 3077 Creating a client certificate with GT SoftGOT3000
2)	[Certificate Information]	—	Settings for creating a certificate with the GOT.
		[Organization Name]	Set the organization name.
		[Organization Unit]	Set the division name.
		[Region Name]	Set the city name.
		[Prefecture Name/State Name]	Set the prefecture name or state name.
		[Country Code]	Select the country code.
		[Expiration Date]	Set the expiration date of the certificate. The setting range is [1] year to [20] years.

PART 30 Troubleshooting

95 Checking the causes and corrective actions for errors (GOT diagnostics)

96 Reproducing GOT operations offline (GOT offline monitor)

95 Checking the causes and corrective actions for errors (GOT diagnostics)

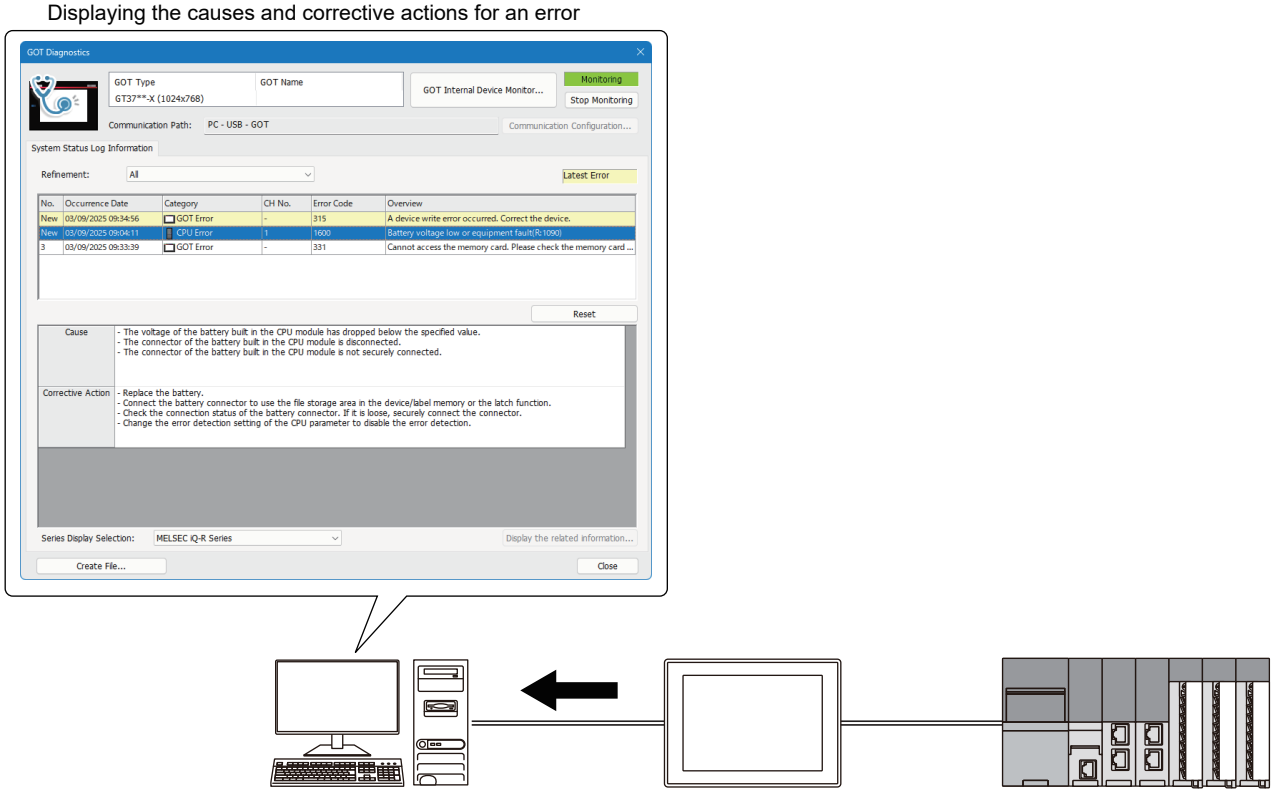
GT37 SoftGOT3000

☞ Page 3080 Overview of GOT diagnostics
☞ Page 3081 Specifications of the GOT diagnostics
☞ Page 3083 Displaying GOT error information
☞ Page 3085 Saving the contents of the error list to a file
☞ Page 3086 Monitoring GOT internal devices
☞ Page 3089 [GOT Diagnostics] dialog

95.1 Overview of GOT diagnostics

GOT diagnostics is a function that obtains error information from the connected GOT and displays the error details, causes, and corrective actions on the screen.
With GT Designer3 on a personal computer, you can check error information for the GOT, connected devices, and networks, allowing for quick troubleshooting without needing to go on-site.

Displaying the causes and corrective actions for an error



GOT diagnostics mainly provides the following three functions.

Function	Description
☞ Page 3083 Displaying GOT error information	Obtains error information from the connected GOT and displays the error details, causes, and corrective actions on the screen.
☞ Page 3085 Saving the contents of the error list to a file	The error information displayed on the screen can be saved to a file. Saving the information to a file enables its use in analyzing the cause of the error.
☞ Page 3086 Monitoring GOT internal devices	The GOT internal device monitor function allows you to monitor current values of GOT internal devices on the screen and rewrite them as needed.

95.2 Specifications of the GOT diagnostics

GT37 SoftGOT3000

☞ Page 3081 Errors identified through GOT diagnostics
☞ Page 3081 Operation related to the security mode
☞ Page 3081 Encrypted communication
☞ Page 3082 Precautions

95.2.1 Errors identified through GOT diagnostics

GOT diagnostics can detect the following errors.
Script parts are not covered by GOT diagnostics.

Error monitored by GOT diagnostics	Description
System alarm	• GOT error • CPU error • Network error
Script error	• Project script • Screen script • Object script

95.2.2 Operation related to the security mode

When the security mode of the connected GOT is mode 2, operator authentication is performed before GOT diagnostics.

95.2.3 Encrypted communication

When the personal computer and GOT are directly connected by Ethernet, communication data can be encrypted when transferred.
To encrypt the communication, open [Encryption Communication Port No.] in the [GOT Ethernet Setting] window and select [Perform encryption communication] in the [Communication Configuration] dialog.

☞ Page 717 [GOT Ethernet Common Setting]
☞ Page 451 [Communication Configuration] dialog

95.2.4 Precautions

The following shows the precautions for using GOT diagnostics.

Power saving function of the personal computer

Before performing the GOT diagnostics, disable the power saving function of the personal computer and Windows.
For details on power saving function settings, refer to the manual of the personal computer or Windows Help.

Performing the GOT diagnostics while the FA transparent function is used

While the controller programming software communicates with a controller by using the FA transparent function, the GOT diagnostics cannot start.
To perform the GOT diagnostics, make sure that the FA transparent function is not in use.

GOT diagnostics while firmware update is in progress

The GOT diagnostics cannot start while firmware update of the communication unit mounted on the GOT is in progress.
To perform the GOT diagnostics, make sure that the firmware update is not in progress.

System alarms (CPU errors and network errors) displayed in the GOT diagnostics and the controller status

In the GOT diagnostics, system alarms (CPU errors and network errors) are displayed based on the error history recorded in the GOT (System status log). Therefore, the alarms does not indicate the controller status.
To check the latest controller status, use one of the following methods.

- Using a diagnostics function of the controller programming software

Manual for the programming software used

- Checking system alarms by selecting [Maintenance] → [System alarm] in the GOT utility

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Resetting script error data

You cannot reset scrip error data in the following cases.

- The GOT displays a screen in which no script is set.
- The GOT displays the utility screen.

Reset scrip error data while the GOT displays a screen in which a script is set.

Precautions for using the CC-Link IE TSN connection

When a controller is monitored using the CC-Link IE TSN connection, system alarms (CPU errors) are not displayed.

95.3 Displaying GOT error information

The following shows the procedure for executing GOT diagnostics and displaying GOT error information on the screen.

1. Connect the personal computer to the GOT.

For the connection method, refer to the following.

☞ Page 420 Connecting a personal computer to the GOT

2. Select [Debug/Check] → [GOT Diagnostics] from the GT Designer3 menu.

The [Communication Configuration] dialog appears.

☞ Page 451 [Communication Configuration] dialog

If either of the following settings is configured, the [GOT Diagnostics] dialog appears. Proceed to Step 4.

- On the [Operation] tab in the [Options] dialog, [Display the dialog of Communication Setting before displaying the dialog of Communicate with GOT/GOT Diagnostics] is deselected.
- In the [Communication Configuration] dialog, [Display the dialog of [Communication Configuration] the next time as well] is deselected.

3. In the [Communication Configuration] dialog, configure the settings according to the communication path between the GOT and the personal computer, and click the [OK] button.

The [GOT Diagnostics] dialog appears.

☞ Page 3089 [GOT Diagnostics] dialog

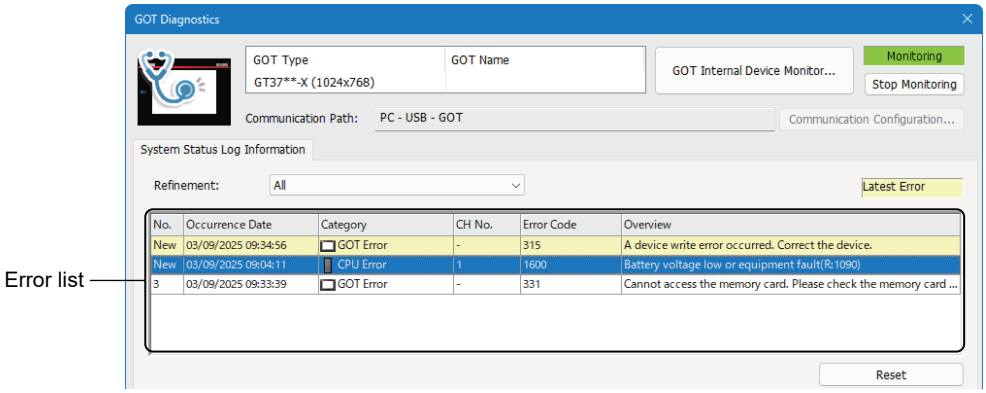
4. As needed, narrow down the errors displayed on the screen by selecting the following items.

Setting item	Description
[Refinement]	Select the type of errors to be displayed on the screen.
[Series Display Selection]	This item appears when a system alarm (CPU error) of MITSUBISHI equipment is selected in the error list. Select the controller series to which the display contents of [Overview], [Cause], and [Corrective Action] for the system alarm (CPU error) correspond. Click the [Start Monitoring] button to automatically identify the series of the controller in which a selected error occurred.

5. Click the [Start Monitoring] button.

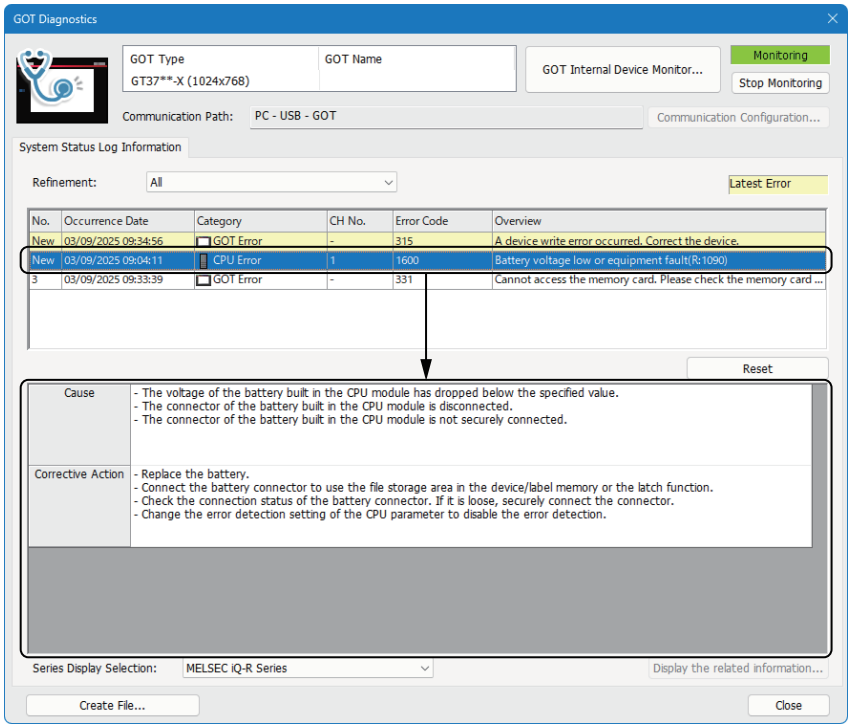
The errors currently occurring in the GOT are displayed in a list.

The errors are displayed in order of occurrence date and time.



6. Click an error in the error list to display its causes and corrective actions.

If an error with supplementary information is selected, click the [Related information] button to display a relevant page of GT Designer3 Help.



7. After the error is resolved, click the [Reset] button to clear the error details.

Errors resolved during monitoring will remain on the screen until they are reset.

Click the [Reset] button to obtain the latest error information and display it on the screen.

95.4 Saving the contents of the error list to a file

You can save the list of errors displayed in the [GOT Diagnosis] dialog to a CSV file or a Unicode text file.
Saving the information to a file enables its use in analyzing the cause of the error.

1. Display the [GOT Diagnostics] dialog and click the [Start Monitoring] button.

☞ Page 3083 Displaying GOT error information

2. If necessary, set [Refinement] and [Series Display Selection] to narrow down the error information to be displayed on the screen.

Only the error information displayed on the screen is output to a file.
To output all errors, set [Refinement] to [All].

3. Select the [Create File] button to save the file.

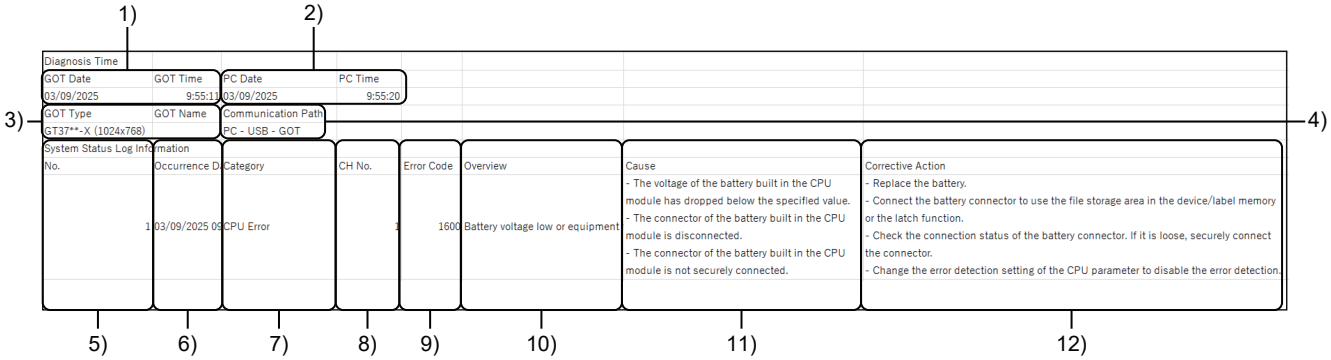
For the format of the saved file, refer to the following.

☞ Page 3085 Format of the saved file

Format of the saved file

The following shows the format of a saved file containing error information.

Ex.
CSV file



Item		Description
1)	GOT date, GOT time	GOT date and time when GT Designer3 obtained the last error information
2)	Personal computer date, personal computer time	Personal computer date and time when the error information was saved to a file
3)	Connected GOT	Type and name of the connected GOT
4)	[Communication Path]	Communication path between the personal computer and the GOT
5)	[No.]	Number indicating the order of displaying errors
6)	[Occurrence Date]	Date and time on which an error occurred
7)	[Category]	Error category
8)	[CH No.]	Number of the channel where an error occurred
9)	[Error Code]	Error code for a system alarm or script error
10)	[Overview]	Details on a system alarm or script error
11)	[Cause]	Causes of an error
12)	[Corrective Action]	Corrective actions for an error

95.5 Monitoring GOT internal devices

The GOT internal device monitor is provided to monitor the internal devices of the connected GOT in GT Designer3.
Use the free registration list function to manage the GOT internal devices to be monitored.
By registering an internal device in the free registration list, you can check the current value of the device.
You can also change the device value by rewriting it in the free registration list.
The free registration list can be created to suit your needs for each project, screen (base screen or window screen), or internal device to be monitored.
The free registration list includes import and export functions, allowing you to use spreadsheet software or other tools to register and edit devices.
☞ Page 3086 Specifications of the GOT internal device monitor
☞ Page 3087 How to use the GOT internal device monitor

95.5.1 Specifications of the GOT internal device monitor

☞ Page 3086 Devices that can be monitored
☞ Page 3086 Specifications of the free registration list

Devices that can be monitored

You can monitor the GOT internal devices (GB, GD, and GS) and change their current values.
☞ Page 3577 GOT internal devices
However, the current values of the following devices are not user-changeable.
- GB0 to GB63
- Write devices of the GOT special registers (GS)

Specifications of the free registration list

A created free registration list is retained after GT Designer3 exits.
Up to 32 free registration lists can be created.
Up to 32 characters are available for a free registration list name.
The following characters cannot be used in a free registration list name.
\ / : ; * ? " < > | .
Up to 6 free registration windows can be open simultaneously.
Up to 256 devices are registrable in one free registration list.

95.5.2 How to use the GOT internal device monitor

☞ Page 3087 Monitoring GOT internal devices
☞ Page 3087 Creating a free registration list

Monitoring GOT internal devices

The following shows the procedure for monitoring GOT internal devices.

1. Configure the settings to enable the GOT internal device monitor.

In the [GOT Setup] window ([GOT Internal Device Monitor]), select the following items.

- [Update the GOT internal device monitor setting]
- [Use GOT internal device monitor in the GOT diagnostics function]

To change the values of GOT internal devices by using the GOT internal device monitor, select [Allow GOT internal devices to be changed].

☞ Page 644 Configuring the settings for the GOT internal device monitor ([GOT Internal Device Monitor])

2. Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

☞ Page 408 Transferring data to the GOT

3. Select [Debug/Check] → [GOT Diagnostics] from the GT Designer3 menu to display the [GOT Diagnostics] dialog.

☞ Page 3089 [GOT Diagnostics] dialog

4. In the [GOT Diagnostics] dialog, click [GOT Internal Device Monitor] to display the [GOT Internal Device Monitor] window.

5. Register the GOT internal devices to be monitored in a free registration list.

☞ Page 3087 Creating a free registration list

6. Starts monitoring using the GOT internal device monitor.

When [Monitoring] is displayed in the [GOT Diagnostics] dialog, monitoring starts immediately.

Perform one of the following operations if [Monitoring] is not displayed.

- Select [Online] → [Start] from the menu.
- Click the [Start connection to GOT] button on the toolbar.
- Click the [Start Monitoring] button in the [GOT Diagnostics] dialog.

☞ Page 3088 [GOT Internal Device Monitor] window

Monitoring of the internal GOT devices starts, and the device values appear in the [Current Value] field.

If the setting allows value changes, changing the value in the [Current Value] field immediately stores the updated value in the device.

Precautions

- With the GOT internal device monitor, the values of GOT internal devices can be changed in GT Designer3. In such cases, the GOT may not behave as intended.

To prevent device values from being changed in GT Designer3, deselect [Allow GOT internal devices to be changed] in the [GOT Setup] window ([GOT Internal Device Monitor]).

- The current value cannot be displayed or changed when byte or quad word data format is specified for the GOT internal device monitor.

[--] is displayed in the cell for the current value.

Creating a free registration list

You can create a free registration list by either registering a device or importing an already-exported file containing existing free registration lists.

The creation method is the same as that for the free registration list used in the simulator.

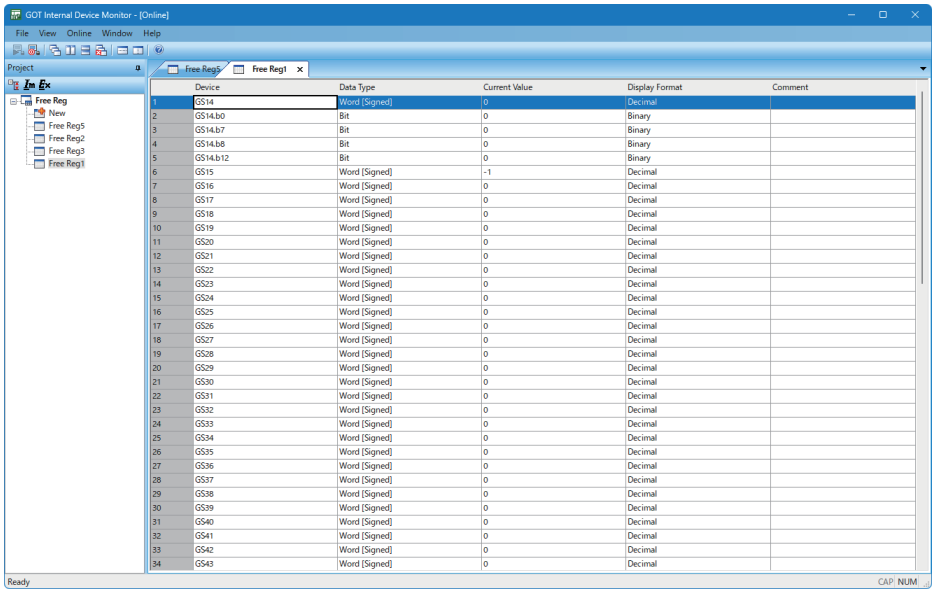
For details, refer to the following.

☞ Page 398 Creating a free registration list

[GOT Internal Device Monitor] window

Items in the [GOT Internal Device Monitor] window are the same as those in the simulator's [Device Monitor] window. For details, refer to the following.

☞ Page 401 [Device Monitor] window

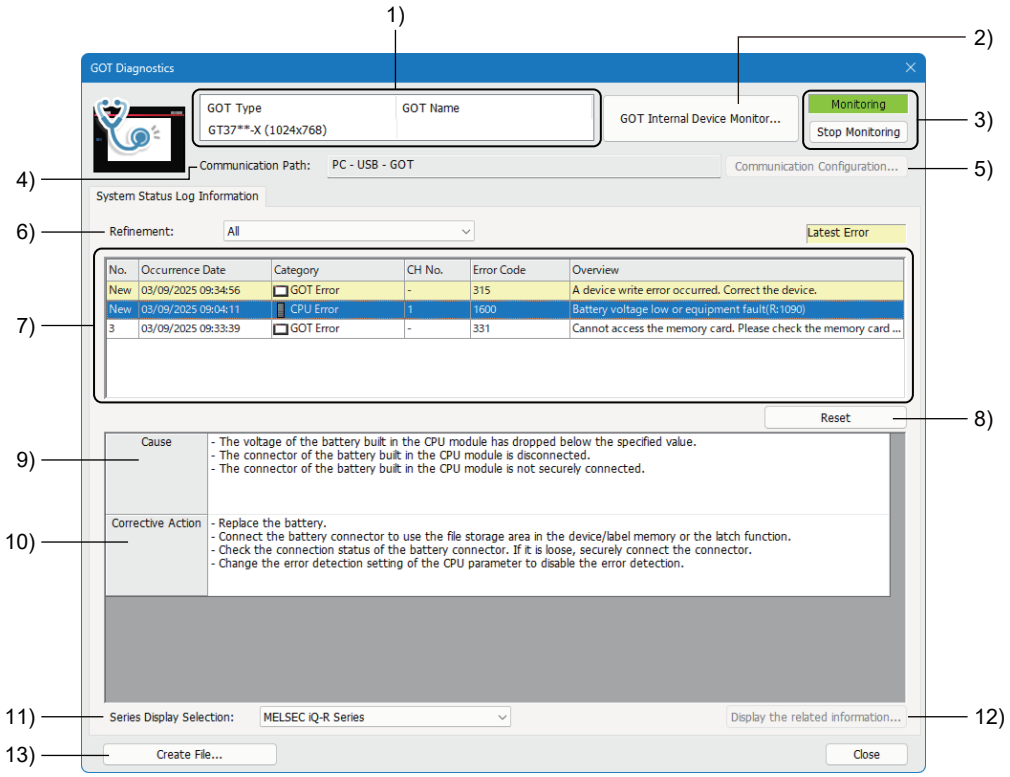


95.6 [GOT Diagnostics] dialog

The [GOT Diagnostics] dialog displays a list of information on errors currently occurring in the connected GOT. When you select an error to check, the cause and corrective actions are listed.

The errors displayed on the screen can be narrowed down by error type.

To display this window, select [Debug/Check] → [GOT Diagnostics] from the menu.



Item		Description
1)	Connected GOT	Displays the GOT type and GOT name obtained from the connected GOT.
2)	[GOT Internal Device Monitor] button	Press the button to display the [GOT Internal Device Monitor] window. ☞ Page 3088 [GOT Internal Device Monitor] window
3)	[Start Monitoring] button, [Stop Monitoring] button	Starts or stops the GOT diagnostics.
4)	[Communication Path]	Displays the communication path between the personal computer and the GOT.
5)	[Communication Configuration] button	Displays the [Communication Configuration] dialog. Set the communication path between the personal computer and the GOT. ☞ Page 451 [Communication Configuration] dialog
6)	[Refinement]	Select the category of errors to be displayed in the error list.
7)	Error list	Lists the errors currently occurring on the connected GOT. Errors are displayed in reverse chronological order. If the number of errors exceeds the maximum number of displayed errors, earlier errors are not displayed. The latest errors in each category are indicated with [New] in the [No.] column. The maximum number of displayed errors depends on the error type. • System alarm (GOT error): 30 • System alarm (CPU error or network error): 30 • Script error (Project script or screen script): 15 • Object script error: 15 For the system alarm (GOT error), script error, and object script error, correct an error and click the [Reset] button to delete the error from the error list. For the precautions on the system alarm, refer to the following. ☞ Page 1543 Specifications of the system alarm display
8)	[Reset] button	Resets error data in the GOT, and updates the error list. Corrected system alarms (GOT errors) and script errors are deleted from the error list. Others remain in the list.
9)	[Cause]	Causes of an error selected in the error list
10)	[Corrective Action]	Corrective actions to correct an error selected in the error list

Item		Description
11)	[Series Display Selection]	This item appears when a system alarm (CPU error) of MITSUBISHI equipment is selected in the error list. Select the controller series to which the display contents of [Overview], [Cause], and [Corrective Action] for the system alarm (CPU error) correspond. Upon updating the error list, selecting a relevant error automatically identifies the series of the controller in which the error occurred.
12)	[Related information] button	Appears when a script error with supplementary information is selected. Displays GT Designer3 Help, showing a relevant page for an error selected in the error list.
13)	[Create File] button	Saves the contents of the error list to a CSV or Unicode text file. ☞ Page 3085 Saving the contents of the error list to a file

96 Reproducing GOT operations offline (GOT offline monitor)

GT37 SoftGOT3000

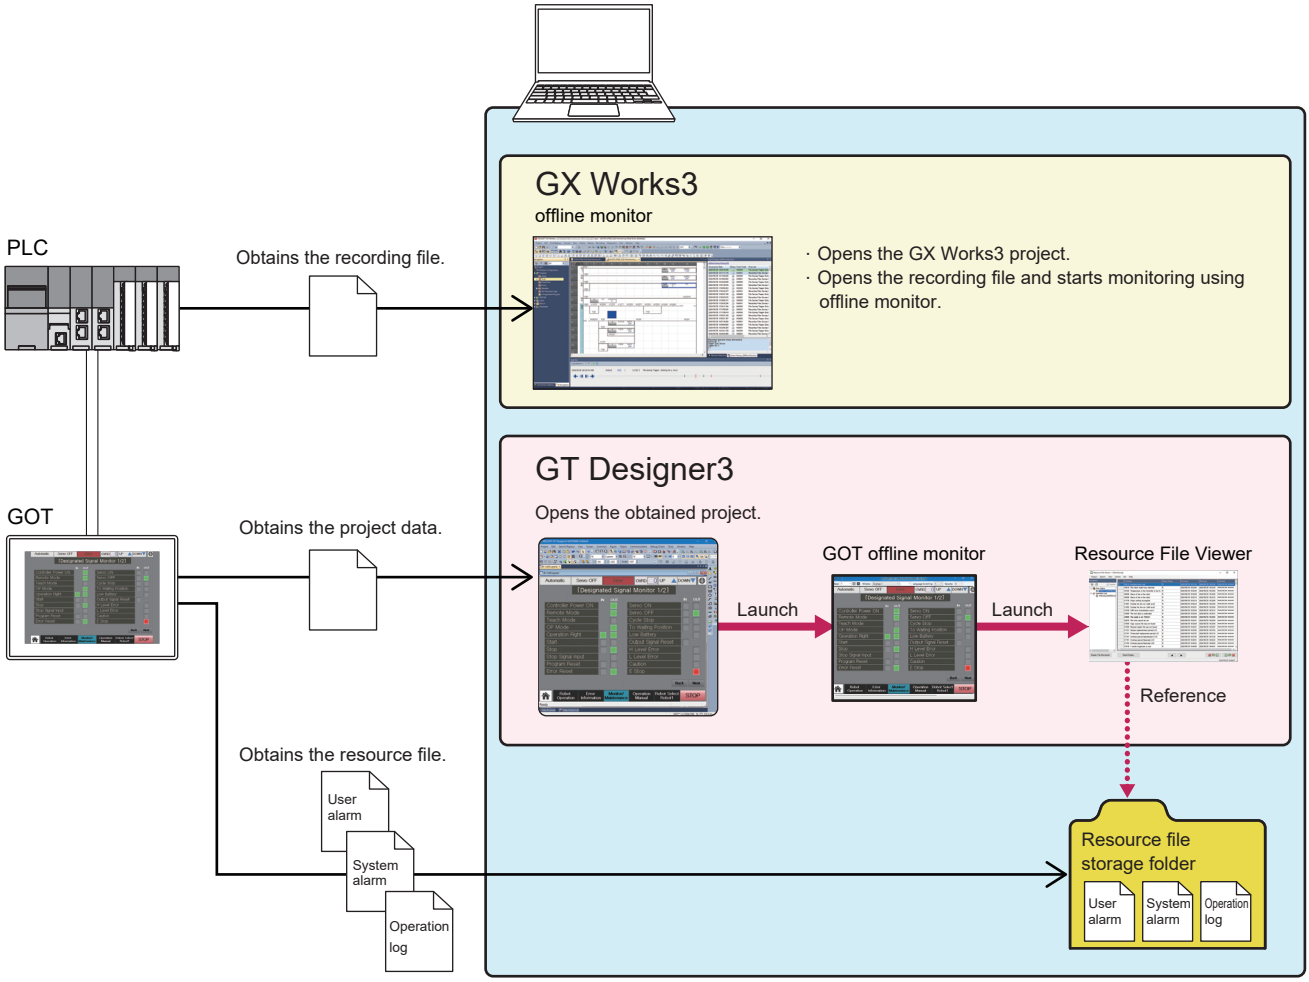
☞ Page 3092 Outline of the GOT offline monitor
☞ Page 3095 Specifications of the GOT offline monitor
☞ Page 3105 Procedure for using the GOT offline monitor
☞ Page 3106 Screen layout of the GOT offline monitor
☞ Page 3108 Connection and environmental settings for the GOT offline monitor
☞ Page 3112 Basic operations of the GOT offline monitor
☞ Page 3114 Useful functions of the GOT offline monitor
☞ Page 3117 How to use a Resource File Viewer module

96.1 Outline of the GOT offline monitor

The GOT offline monitor function reproduces the operation of the on-site GOT monitor screen on a personal computer using a recording file created by the system recorder.

Multiple data sources, such as GX Works3 recording files, GX Works3 project files, GT Designer3 project files, and GOT-generated resource files, can be integrated and checked, enabling you to understand the overall system and quickly pinpoint the causes of errors.

Since data can be checked and analyzed offline without visiting the site, remote troubleshooting is possible.



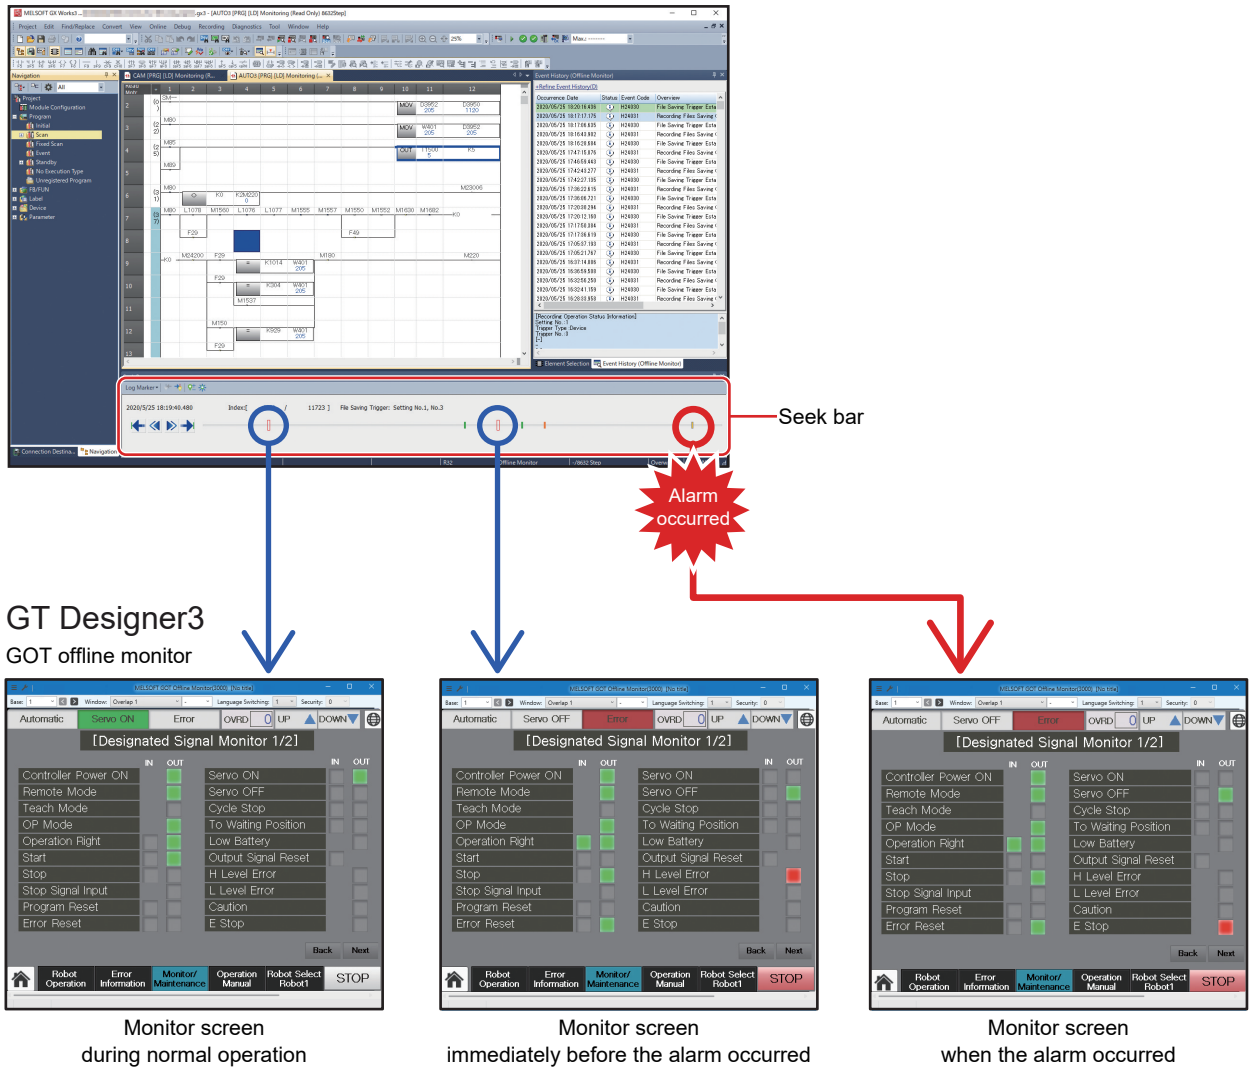
The following shows the main functions of the GOT offline monitor.

☞ Page 3093 Interaction with GX Works3
☞ Page 3093 Device monitor
☞ Page 3094 Resource File Viewer

Interaction with GX Works3

Connecting to the offline monitor with GX Works3 recording files enables reproduction of the situation when a trouble occurred, using GOT project data on the monitor screen.

By reproducing the GOT operation screen in sync with the seek bar in the GX Works3 offline monitor, you can correlate the GOT operations and the waveforms and programs on the GX Works3 side.



Monitor screen during normal operation

Monitor screen immediately before the alarm occurred

Monitor screen when the alarm occurred

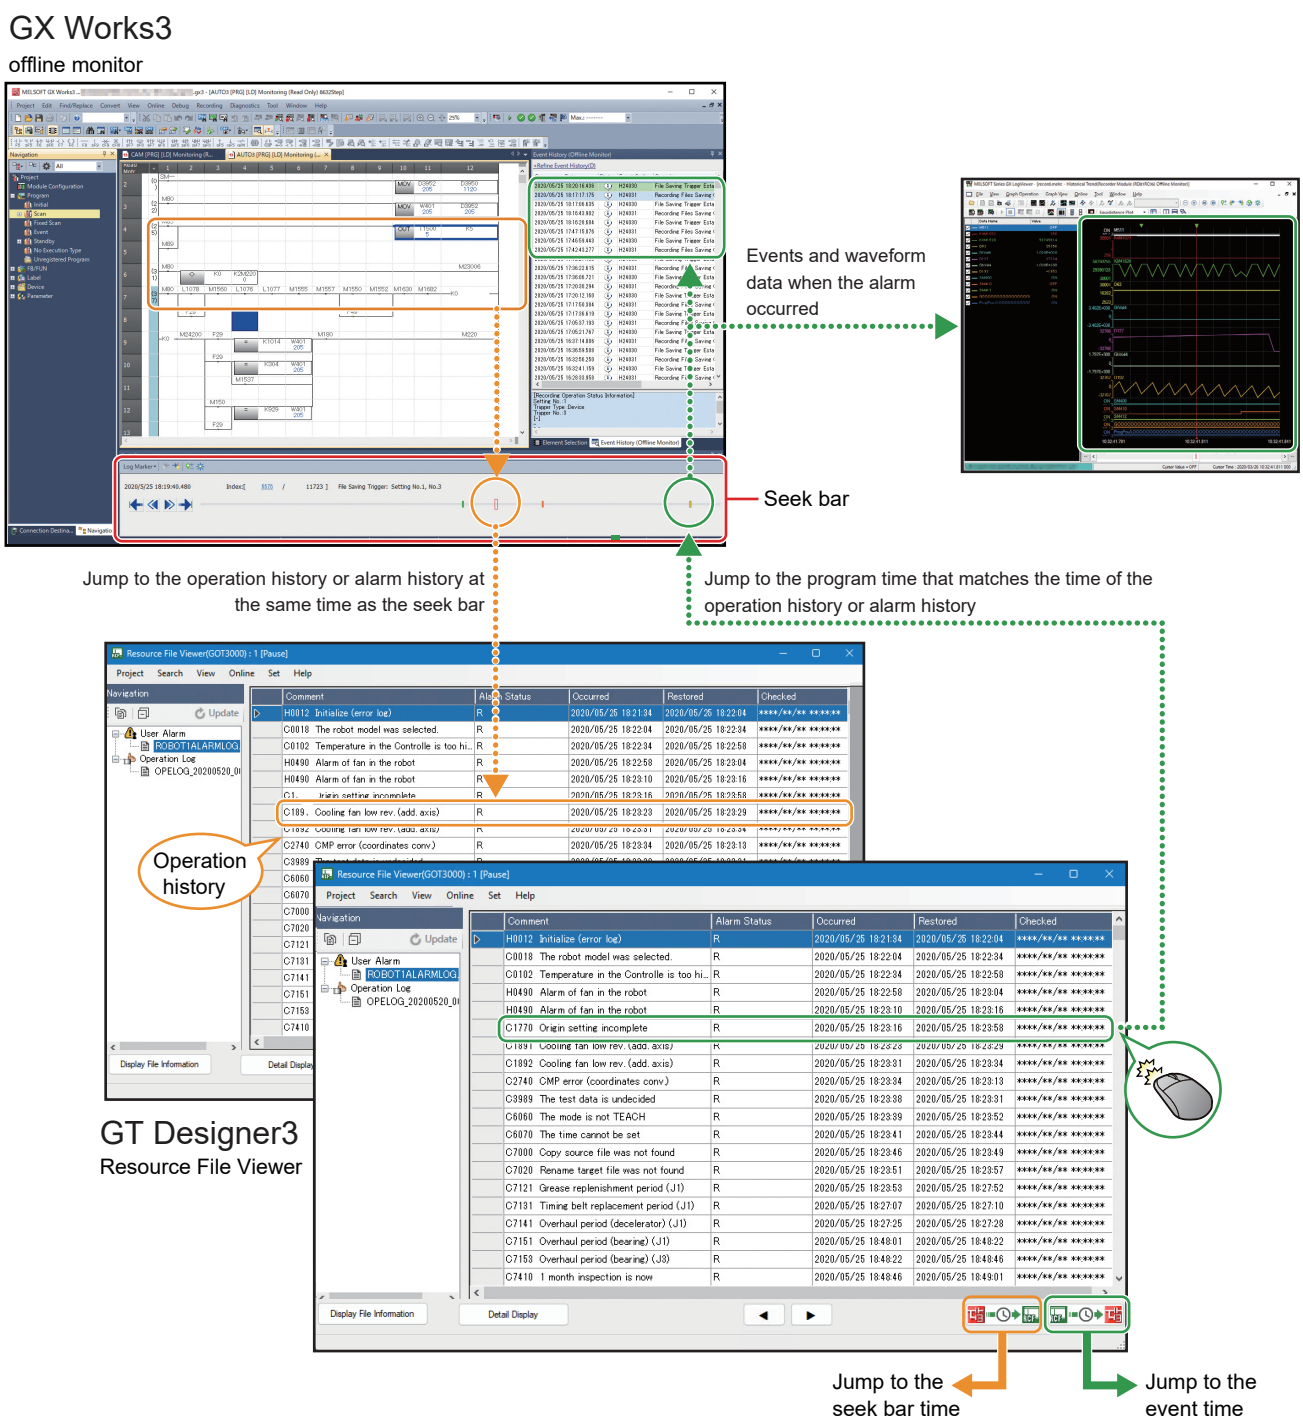
Device monitor

With the device monitor, you can rewind in time using the GX Works3 seek bar and check the device value at a specific point.

Resource File Viewer

Resource File Viewer is a function that allows you to precisely review the operation and alarm histories before and after a trouble occurs, using the data recorded by the GOT.

The seek bar time of the GX Works3 offline monitor can be synchronized with the times of GOT events (such as operation history and alarm history), allowing you to clearly identify which GOT operation caused the problem.



96.2 Specifications of the GOT offline monitor

GT37 SoftGOT3000

☞ Page 3095 GOTs compatible with the offline monitor function
☞ Page 3095 Supported GX Works3 software version
☞ Page 3095 Number of GX Works3 offline monitors that can be monitored
☞ Page 3096 Required data
☞ Page 3096 Device range for monitoring
☞ Page 3096 Monitoring-supported channels
☞ Page 3097 Functions supported by the offline monitor
☞ Page 3103 Destination to save data
☞ Page 3104 Clock specifications

96.2.1 GOTs compatible with the offline monitor function

The following GOTs are compatible with the GOT offline monitor function.

- GT37**-FH
- GT37**-WX
- GT37**-X
- GT SoftGOT3000

Precautions

■Display of the GOT offline monitor and the GOT

The display of the GOT offline monitor may differ from the display of the GOT.
Check the actual display of the GOT.

■Precautions when the GOT type is GT SoftGOT3000

- Unavailable GOT internal devices

GOT internal devices (GS493 to GS498, GS500 to GS507) are unavailable for the GOT offline monitor.

- Unavailable functions

The following functions are unavailable for the GOT offline monitor.
◇Application start-up
◇SoftGOT-GOT link function

96.2.2 Supported GX Works3 software version

Use GX Works3 version 1.110Q or later.

96.2.3 Number of GX Works3 offline monitors that can be monitored

One GX Works3 offline monitor can be monitored.

96.2.4 Required data

The following files are required to use the GOT offline monitor:

- GX Works3 recording file (required)
- GX Works3 project file (used to create a recording file) (required)
- GT Designer3 project file (used to create a recording file) (required)
- GOT alarm file, operation log file (used to create a recording file) (required when using Resource File Viewer)

96.2.5 Device range for monitoring

The following shows the device range for monitoring.

Read only devices

The devices that satisfy all of the following requirements can be read.

Writing is not available.

Requirement	Reference
Devices that can be monitored by GX Works3	📖GX Works3 Operating Manual
Devices that can be monitored by the GOT (Except the timer set value (TS) and counter set value (CS) of the Mitsubishi Electric PLC)	☞ Page 3128 Device range and settings of Mitsubishi Electric equipment

Readable/writable devices

The following shows the readable/writable devices.

- GOT internal devices
- SoftGOT3000 internal devices

96.2.6 Monitoring-supported channels

If the project data supports multiple channels, only channel 1 can be monitored.

The other channels are ignored.

To monitor a device on a channel other than channel 1, select [Search/Replace] → [Batch Edit] → [CH No.] from the menu and set channel 1 for the debug target channel in GT Designer3.

Ex.

When channel 1 and 2 are used and channel 2 is to be monitored

1. Change channel 1 to channel 3 in a batch.
2. Change channel 2 to channel 1 in a batch.

For the batch edit of the channels, refer to the following.

☞ Page 147 Changing the set values collectively (Batch Edit)

96.2.7 Functions supported by the offline monitor

The following shows the functions that are supported or not supported by the GOT offline monitor.

☞ Page 3097 Figures and objects
☞ Page 3098 Functions running in the background
☞ Page 3099 Functions used with peripheral devices
☞ Page 3100 Common functions for screen display/control and other relevant/extended functions

96.2.8 Destination to save data

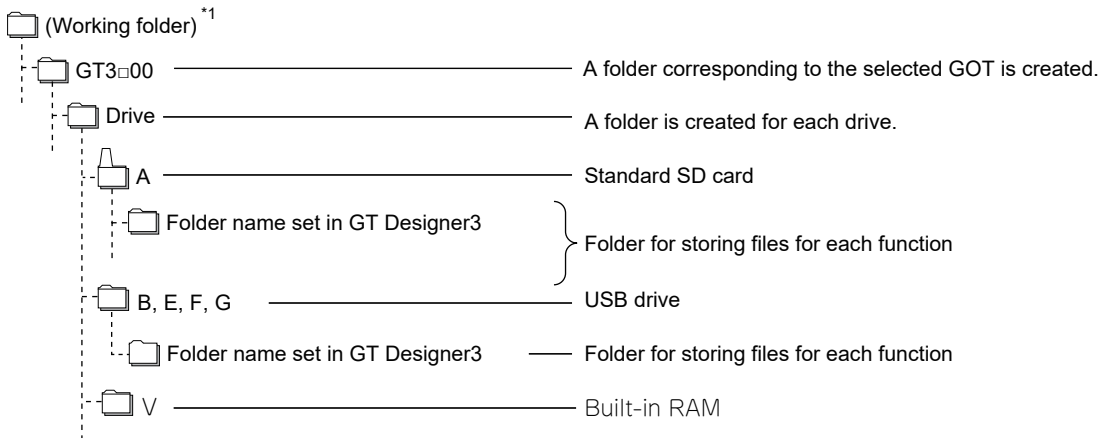
Folders in the hard disk of the personal computer are handled by the GOT offline monitor as the virtual drive.

☞ Page 3103 For functions saving data into a data storage or file server
☞ Page 3104 For functions requiring the user to save data into a data storage
☞ Page 3104 Working folder

For functions saving data into a data storage or file server

When a data storage is specified to save files for functions including object functions and add-on functions, data is saved onto the hard drive of the personal computer.

The files for each function are saved into the folders as shown below.



The drive unavailable to the monitoring target GOT is not usable.

*1 For the working folder, refer to the following.

☞ Page 3104 Working folder

Precautions

To store image files in drive V and use them for parts displays, satisfy all the following conditions.

- Store the image files directly under drive V using the FTP server function or other Windows-supported functions.
- Use IMG1.jpg, IMG2.jpg, IMG3.jpg, and IMG4.jpg only for the file name and extension.
- Do not store any file other than IMG1.jpg, IMG2.jpg, IMG3.jpg, and IMG4.jpg.
- Limit the total file size to less than 8 MB.

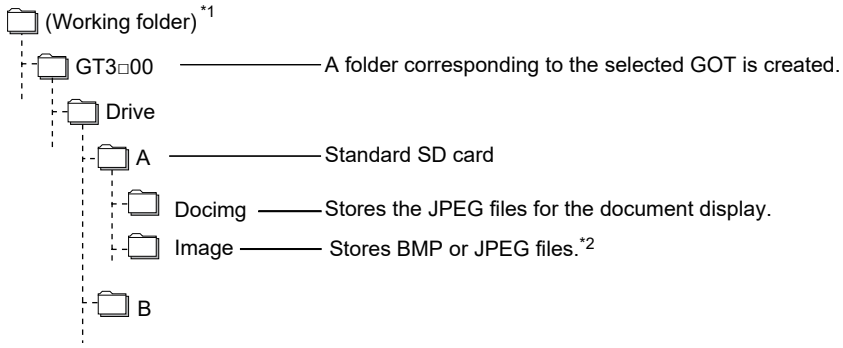
The files in drive V are deleted at the start or end of monitoring.

For functions requiring the user to save data into a data storage

When registering BMP, JPEG, or PNG files used as parts, or data for document display, save them in the hard disk of the personal computer.

Store each data in the following (user-created) folders.

(The drive to be used depends on the specifications of the object or setting.)



*1 For the working folder, refer to the following.
☞ Page 3104 Working folder

*2 You can change the file name.
For information on how to use BMP or JPEG files, refer to the following.
☞ Page 816 How to use parts ([Parts])

Working folder

The following shows a working folder.

Users\(user name)\AppData\Local\MITSUBISHI\GSS3_3000

To display the following hidden folders, configure the setting in Windows.

Users\(user name)\AppData\Local

96.2.9 Clock specifications

The clock display during monitoring with the GOT offline monitor uses the clock data from the personal computer (the GOT reads and uses the clock data from the PLC CPU).

[Adjust for daylight saving time automatically] on the personal computer is not applicable. Do not enable this setting.

96.3 Procedure for using the GOT offline monitor

GT37 SoftGOT3000

The following shows the procedure for using the GOT offline monitor.
Before starting the GOT offline monitor, start GX Works3, open the project used for monitoring, and ensure that the relevant recording file is read in the GX Works3 offline monitor.

1. Start GX Works3, open the project file used for monitoring, read the recording file to be monitored, and start offline monitoring.

GX Works3 Operating Manual

2. Start GT Designer3 and open the project to be monitored in the GOT offline monitor.

3. Perform either of the following operations to display the GOT offline monitor settings dialog.

- Select [Debug/Check] → [GOT Offline Monitor] → [Setting] from the menu.
- Click the [GOT Offline Monitor: Set] button on the toolbar.

4. Configure each setting in [Connection] and click the [OK] button.

Setting	Description
[File path]	Set the path to the recording file read from the GX Works3 offline monitor.
[Detail Setting] [Option]	Configure each setting. When another station is set in the built-in Ethernet port setting or station No. 0 is set for the module in GX Works3, the network information cannot be acquired automatically. Apply the network information to [Additional Allocation] in the [Setting] dialog ([Communication Setup] tab). For details, refer to the following. ☞ Page 3109 [Connection]

5. Perform either of the following operations to start the GOT offline monitor.

- Select [Debug/Check] → [GOT Offline Monitor] → [Activate] from the menu.
- Click the [GOT Offline Monitor: Activate] button on the toolbar.

The GOT offline monitor starts and connects to the GX Works3 offline monitor to start monitoring.
If you skip Step 4 (recording file path setting) to start the GOT offline monitor, the [Recording File Setting] dialog appears for the first time. In the [Recording File Setting] dialog, select the recording file to be monitored and click the [OK] button to start monitoring.

6. Move the GX Works3 seek bar.

As the seek bar moves, the GOT offline monitor reproduces the GOT operation screen and program status for the corresponding time.

☞ Page 3112 Basic operations of the GOT offline monitor
☞ Page 3114 Useful functions of the GOT offline monitor

7. Select [Project] → [Exit] from the GOT offline monitor menu.

This will exit the GOT offline monitor.
If GT Designer3 is exited while the GOT offline monitor is running, the GOT offline monitor started from GT Designer3 also exits. If you perform [New], [Utilize], [Open], or [Close] for a project in GT Designer3 while the GOT offline monitor is running, the GOT offline monitor will exit.

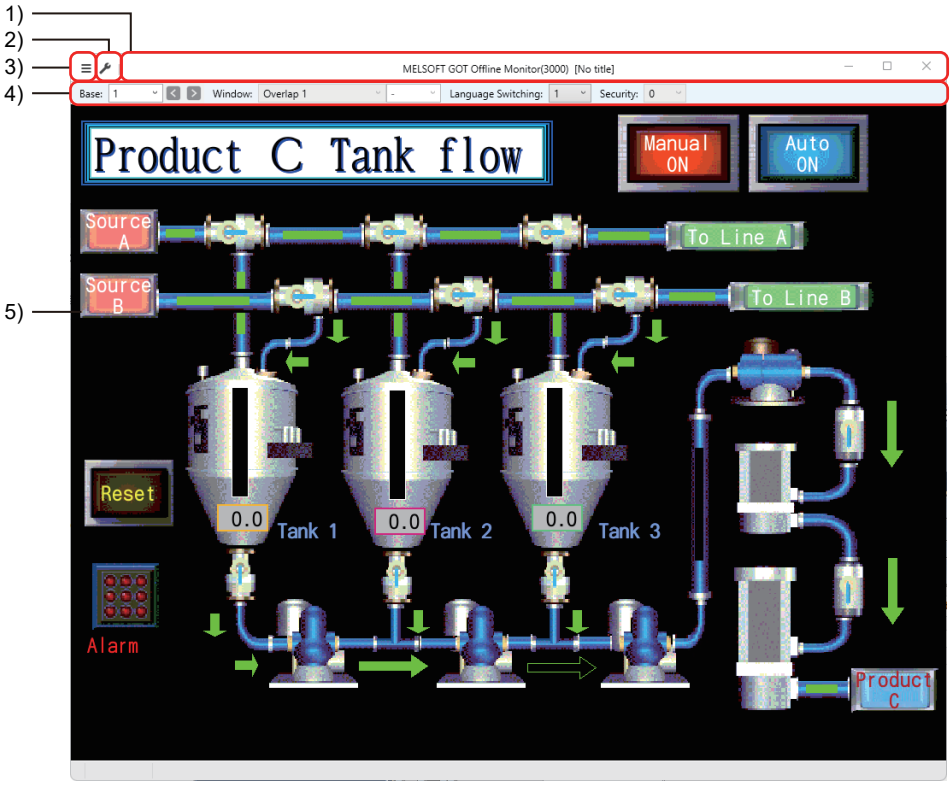
Precautions

■Reconnection after exiting the GX Works3 offline monitor

When the GOT offline monitor and the GX Works3 offline monitor are connected, exiting the GX Works3 offline monitor disconnects the GOT offline monitor.
For reconnection, exit the GOT offline monitor and Resource File Viewer, then start the GX Works3 offline monitor. After that, start the GOT offline monitor and Resource File Viewer.

96.4 Screen layout of the GOT offline monitor

GT37 SoftGOT3000



Item		Description
1)	Title bar	Displays the software name and the project name. The icons to minimize, maximize, and close the screen are also displayed. Select [Debug/Check] → [GOT Offline Monitor] → [Setting] from the GT Designer3 menu, then select the items to be displayed in the setting dialog ([Items displayed in the title bar] in [Display]).
2)	[Setting] button	Click this button to display the GOT offline monitor settings dialog. ☞ Page 3108 Connection and environmental settings for the GOT offline monitor
3)	Menu button	Click this button to display the GOT offline monitor operation menu. ☞ Page 3107 Menu
4)	Toolbar	Enables you to operate the monitored base screen or window, switch between languages, and perform security operations. ☞ Page 3107 Toolbar
5)	Monitor screen	Monitored contents are displayed. Each operation can also be performed from the right-click menu on the screen.

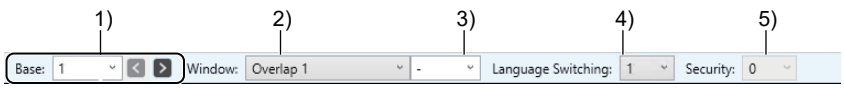
96.4.1 Menu

The following shows the menu structure. Menu items other than [Project] can also be executed from the right-click menu on the monitor screen.

Menu		Description	Shortcut key
[Project]	[Snap Shot]	Saves a screen as a file. (BMP format and JPEG format) ☞ Page 393 Taking snap shots	Ctrl + H
	[Print Setup]	Set a printer. ☞ Page 394 Configuring the printer settings	—
	[Page Setup]	Adjusts the page layout for printing. ☞ Page 394 Page settings	—
	[Print Preview]	Displays a print preview. ☞ Page 394 Previewing print image	—
	[Print]	Outputs the settings of the project into a file. ☞ Page 394 Printing	Ctrl + P
[Display]	[Scroll Bar]	Switches display or non-display of a scroll bar. ☞ Page 395 Displaying scroll bars	—
	[Full Screen Mode]	Sets and cancels the full screen mode. ☞ Page 396 Displaying the screen in full screen mode	Alt + F9
[Set]		Displays the [Set] dialog. ☞ Page 3108 Connection and environmental settings for the GOT offline monitor	—
[Tool]	[Start of Device Monitor] [End of Device Monitor]	Starts or ends the device monitor. ☞ Page 3114 Using the device monitor	—
	[Resource Data]	Refers to the resource data. ☞ Page 3116 Opening resource data files	Ctrl + R
	[Keyboard]	Enables or disables the keyboard input. ☞ Page 395 Operating the numerical input or text input with a keyboard	—
[Resource File Viewer]	[Resource File Viewer Operation]	Displays the [Resource File Viewer Operation] window. ☞ Page 3117 Setting the resource files to be monitored in each module	—
	[Start All]	Starts all enabled Resource File Viewer modules in the [Resource File Viewer Operation] window.	—
	[Activate All]	Activates all currently running Resource File Viewer modules.	—
	[End All]	Ends all currently running Resource File Viewer modules.	—
	[Start Resource File Viewer n] [End Resource File Viewer n]	Starts or ends Resource File Viewer n. "n" represents a number from 1 to 8.	—
[Help]	[GT Designer3 Help]	Displays GT Designer3 Help.	F1
[Exit]		Exits the GOT offline monitor.	Alt + F4

96.4.2 Toolbar

The toolbar provides the following functions:
In full screen display, the toolbar is hidden.



Item		Description
1)	Base	Switch the number of the base screen to be displayed on the monitor screen using the pull-down menu or the arrow buttons.
2)	Window	Select the type of the window screen to be displayed on the monitor screen.
3)	Window screen number	Switch the number of the window screen to be displayed on the monitor screen from the pull-down menu.
4)	Language switching	Select the column number for a comment group to be displayed. The selectable numbers range from [1] to [30].
5)	Screen security	Switch the security level. The selectable levels range from [0] to [15].

96.5 Connection and environmental settings for the GOT offline monitor

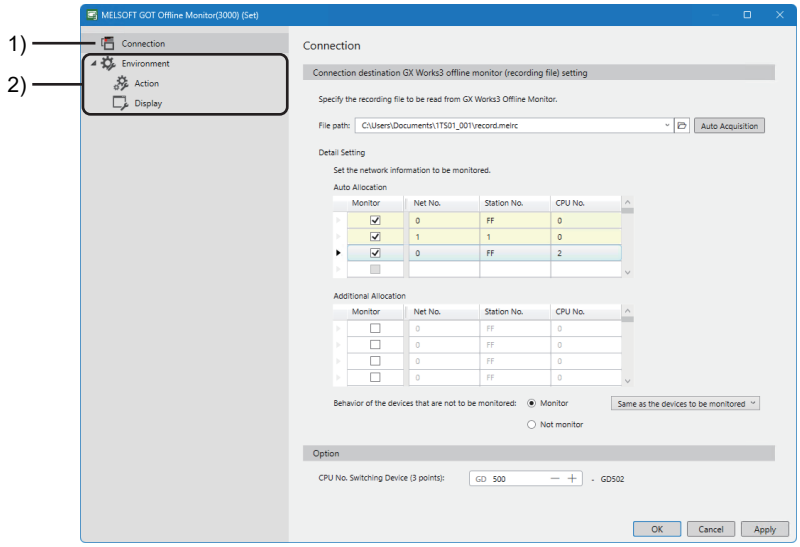
GT37 SoftGOT3000

Before using the GOT offline monitor, configure the connection and environmental settings.

1. Select [Debug/Check] → [GOT Offline Monitor] → [Setting] from the GT Designer3 menu.

The settings screen appears.

2. Select the setting category from the setting tree on the left.



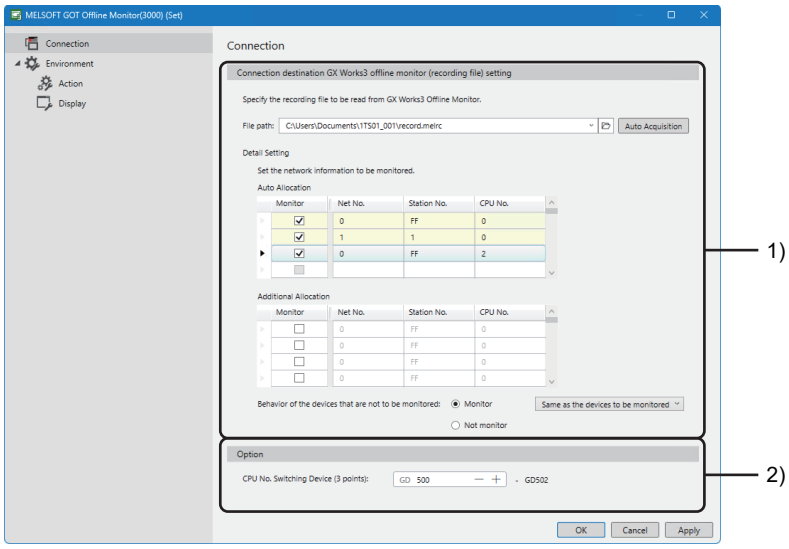
Setting		Description
1)	☞ Page 3109 [Connection]	Configure the connection settings for the controller to be monitored.
2)	☞ Page 3110 [Environment]	Configure the operation and screen display settings to execute monitoring.

3. Click the [Apply] button to save the settings.

Click the [OK] button to save the settings and close the screen.

96.5.1 [Connection]

Configure the connection settings for the controller to be monitored.



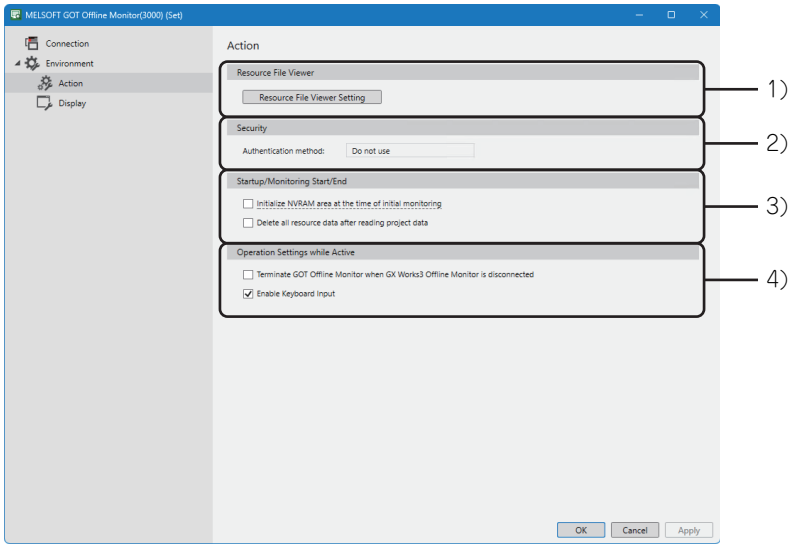
Item		Description
1)	[File path]	Set the path to the recording file read from the GX Works3 offline monitor. • When the GX Works3 offline monitor is not running Click the folder icon to select a recording file. • When the GX Works3 offline monitor is running Click the [Auto Acquisition] button to acquire the path to the recording file read from the GX Works3 offline monitor.
	[Auto Allocation]	Select the network information of the controllers to be monitored. The first and second lines display default values. The third and subsequent lines display [Net No.], [Station No.], and [CPU No.] of the GX Works3 offline monitor, which are automatically obtained from the file path. If any of [Net No.], [Station No.], or [CPU No.] is not obtained, no information is displayed in the cell.
	[Additional Allocation]	To monitor another station, set the network information of the target controller for monitoring.
	[Behavior of the devices of the stations that are not to be monitored]	Select whether to monitor the devices of station numbers not targeted for monitoring in [Auto Allocation] or [Additional Allocation].
	How to monitor the devices	Select how to display the devices when [Monitor] is selected for [Behavior of the devices that are not to be monitored].
2)	[CPU No. Switching Device (3 points)]	Set the start device number of the GOT data registers (GD) to specify a CPU number. The setting range is [0] to [65520]. Specify the value of [CPU No. switching GD device first No. (3 points)] set in the [Controller Setting] window in GT Designer3. If you set a different number, proper monitoring is not performed.

96.5.2 [Environment]

Configure the operation and screen display settings to execute the GOT offline monitor.

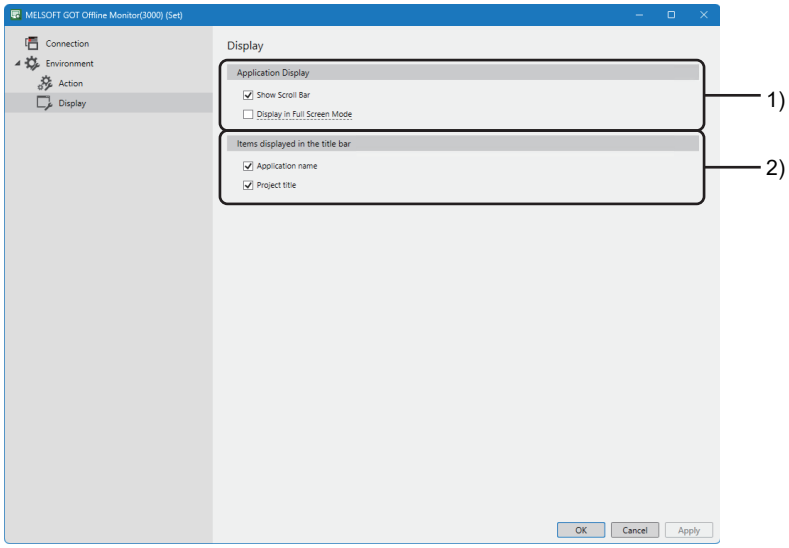
☞ Page 3110 [Action]
☞ Page 3111 [Display]

[Action]



Item			Description
1)	[Resource File Viewer]		Configure the settings of Resource File Viewer. Click the [Resource File Viewer Setting] button to display the [Resource File Viewer Setting] dialog. ☞ Page 3118 [Resource File Viewer Operation] window
2)	[Security]	[Authentication method]	Displays the authentication method set in the project data.
3)	[Startup/Monitoring Start/End]	[Initialize NVRAM area at the time of initial monitoring]	Select this item to initialize the nonvolatile RAM area when monitoring starts for the first time. The following functions save data to the nonvolatile RAM area. • User alarm monitoring • System alarm monitoring • Logging • Recipe • Internal device retention
		[Delete all resource data after reading project data]	Select this item to delete all the user data in the working folder when monitoring starts for the first time. Hierarchies under folders A, B, E, F, and G found in "Users\(User name)\AppData\Local\MITSUBISHI\GSS3_3000" When this setting is enabled, system alarms can be prevented if the recipe settings or alarm history settings of the read screen data differ from the recipe files or alarm data in the working folder.
		[Terminate GOT Offline Monitor when GX Works3 Offline Monitor is disconnected]	Select whether to end the GOT offline monitor when the GX Works3 offline monitor is disconnected.
4)	[Operation Settings while Active]	[Enable Keyboard Input]	Select this item to enable keyboard input during monitoring.

[Display]



Item			Description
1)	[Application Display]	[Show Scroll Bar]	Select this item to display scroll bars on the monitor screen.
		[Display in Full Screen Mode]	Select this item to execute full screen display (with the title bar and status bar hidden) when starting the monitoring.
2)	[Items displayed in the title bar]		Select the options to be displayed in the title bar.

96.6 Basic operations of the GOT offline monitor

GT37 SoftGOT3000

☞ Page 3112 Starting the GOT offline monitor
☞ Page 3112 Exiting the GOT offline monitor
☞ Page 3113 Switching the screen to be monitored
☞ Page 3113 Switching the display language
☞ Page 3113 Switching the security level

96.6.1 Starting the GOT offline monitor

Refer to the following.

☞ Page 3105 Procedure for using the GOT offline monitor

96.6.2 Exiting the GOT offline monitor

Exit the GOT offline monitor from GT Designer3 or the GOT offline monitor itself.

When the GOT offline monitor is exited, the connection to the GX Works3 offline monitor is terminated.

☞ Page 3112 In GT Designer3
☞ Page 3112 In the GOT offline monitor
☞ Page 3112 At disconnection of the GX Works3 offline monitor

In GT Designer3

End the GOT offline monitor by either of the following methods.

- Select [Debug/Check] → [GOT Offline Monitor] → [Exit] from the menu.
- Click the [GOT Offline Monitor: Exit] button on the toolbar.

In the GOT offline monitor

End the GOT offline monitor by either of the following methods.

- Select [Project] → [Exit] from the menu.
- Select [Online] → [Monitor Stop] from the menu.
- Click the [×] button.

At disconnection of the GX Works3 offline monitor

When [End GOT Offline Monitor when connecting to GX Works3 Offline Monitor] is selected in the [Action Setup] tab in the [Setting] dialog, the GOT offline monitor automatically ends when the GX Works3 offline monitor is disconnected.

☞ Page 3110 [Action]

96.6.3 Switching the screen to be monitored

Switch the currently monitored screen in the project by either of the following methods.

- Use the pull-down menu on the toolbar or arrow buttons.

☞ Page 3107 Toolbar

- Use a Go To Screen switch.

Switching by using a device is not available.

☞ Page 1220 [Go To Screen Switch] dialog

For details on the screen switching, refer to the following.

☞ Page 530 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])

96.6.4 Switching the display language

The GOT switches comments displayed on the object by changing the value (column number of the comment group) using the pull-down menu on the toolbar.

By registering messages in each language in the columns of the comment group, you can switch the language of the displayed comments.

☞ Page 3107 Toolbar

For details on the language switching, refer to the following.

☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching])

96.6.5 Switching the security level

Switch the security level using the pull-down menu on the toolbar.

By switching between security levels, you can check the displayed content and operability of the screen for each security level.

☞ Page 3107 Toolbar

For details on the screen security, refer to the following.

☞ Page 3035 [Security] ([Screen Security] tab) (Mode 2)

☞ Page 3038 Restricting display and operation on the GOT (Screen security)

96.7 Useful functions of the GOT offline monitor

GT37 SoftGOT3000

The following shows useful functions available in the GOT offline monitor.

☞ Page 3114 Using the device monitor
☞ Page 3116 Opening resource data files
☞ Page 3116 Checking the GOT operation logs and alarm history (Resource File Viewer)

The operations for the following functions are the same as those in the simulator.
Refer to each section.

☞ Page 393 Taking snap shots
☞ Page 394 Printing the screen
☞ Page 395 Operating the numerical input or text input with a keyboard
☞ Page 395 Displaying scroll bars
☞ Page 396 Displaying the screen in full screen mode

96.7.1 Using the device monitor

You can monitor the virtual devices of a controller connected to the GOT offline monitor using the device monitor.
Internal devices not set on the GOT screen, as well as any devices of the controller can be monitored, allowing you to check device values when an error occurs.
Manage monitored devices using the free registration list function.
By registering an internal device in the free registration list, you can check the current value of the device.
You can also change the device value by rewriting it in the free registration list.
As a result, you can efficiently check the operation of the project after the device value changes.
Multiple free registration lists can be created to suit your needs for each project, screen (base or window), or device to be monitored (such as X devices and GD devices).
The free registration list includes import and export functions, allowing you to use spreadsheet software or other tools to register and edit devices.

☞ Page 3114 Specifications of the device monitor
☞ Page 3115 Starting and ending the device monitor
☞ Page 3115 Checking and changing the device value in the free registration list
☞ Page 3115 Creating a free registration list
☞ Page 3116 [Device Monitor] window

Specifications of the device monitor

■Starting the device monitor

The device monitor can only be started when the GOT offline monitor and the GX Works3 offline monitor are connected and monitoring is in progress.

■Monitoring-supported devices

GOT internal devices, GT SoftGOT3000 internal devices, and virtual controller devices can be monitored.
The availability of reading and writing in the device monitor depends on the device type.
For the devices that can be monitored by the GOT offline monitor, refer to the following.

☞ Page 3096 Device range for monitoring

■Specifications of the free registration list

A created free registration list is retained after exiting the GOT offline monitor.

Up to 32 free registration lists can be created.

Up to 32 characters are available for a free registration list name.

The following characters cannot be used in a free registration list name.

\ / : ; * ? " < > | .

Up to 6 free registration windows can be open simultaneously.

Up to 256 devices are registrable in one free registration list.

■Precautions

- An increase in the number of monitored devices causes monitoring performance degradation in the GOT offline monitor.

■Restrictions

- Label/tag communication is not supported.
- Communication using the label of GT Designer3 (3000) is not supported.
- Communication is not supported when the CPU number and the module number are indirectly specified.

Starting and ending the device monitor

■Starting the device monitor

Perform either of the following operations during monitoring with the GOT offline monitor to start the device monitor.

- Select [Tool] → [Start or Stop Device Monitor] from the GOT offline monitor menu.
- Select [Tool] → [Start or Stop Device Monitor] from the right-click menu of the GOT offline monitor.

■Ending the device monitor

Perform one of the following operations to exit the device monitor.

- Select [File] → [Exit] from the device monitor menu.
- Click the [×] button on the title bar of the device monitor.
- Press Alt + F4 on the device monitor.
- Select [Tool] → [Start or Stop Device Monitor] from the GOT offline monitor menu.
- Select [Tool] → [Start or Stop Device Monitor] from the right-click menu of the GOT offline monitor.
- Exiting the GOT offline monitor

Checking and changing the device value in the free registration list

By registering a device in the free registration list and starting monitoring, you can check the current value of the device on the screen.

1. Create a free registration list.

☞ Page 398 Creating a free registration list

2. If [Monitoring] is not displayed in the title bar of the [Device Monitor] window, perform one of the following operations.

- Select [Online] → [Start] from the device monitor menu.
- Click the [Start the communication] button on the toolbar of the device monitor.

Device monitoring begins and the device value is displayed in the [Current Value] field.

When you change the value in the [Current Value] field, the new value is immediately stored in the device.

Creating a free registration list

You can create a free registration list by either registering a device or importing an already-exported file containing existing free registration lists.

The creation method is the same as that for the free registration list used in the simulator.

For details, refer to the following.

☞ Page 398 Creating a free registration list

[Device Monitor] window

The settings in the [Device Monitor] window of the GOT offline monitor are the same as those in the [Device Monitor] window of the simulator.

For details, refer to the following.

☞ Page 401 [Device Monitor] window

96.7.2 Opening resource data files

Open resource data files saved on the personal computer (such as alarm log files, recipe files, data log files, and operation log files, with extensions .csv, .txt, .bmp, and .jpg).

1. Perform one of the following operations to display the [Refer To Resource Data] dialog.

- Select [Tool] → [Resource Data] from the menu.
- Select [Tool] → [Resource Data] from the right-click menu.
- Press Ctrl + R.

2. Select the file to be referenced in the [Refer To Resource Data] dialog, and click the [Open] button.

The selected resource data is displayed.

96.7.3 Checking the GOT operation logs and alarm history (Resource File Viewer)

To reproduce the situation at the site, Resource File Viewer is available as a tool to check which alarms were displayed at the time of the error and what operations were performed on the GOT.

Supported resource files are those shown below, recorded by the GOT operating in conjunction with GX Works.

- User alarms (G3A, CSV, TXT)
- System alarms (G3A, CSV, TXT)
- Operation logs (G3O, CSV, TXT) (including GT SoftGOT3000 application logs)

When these resource files are read into Resource File Viewer, the GOT operation history and alarm history are displayed in a list.

By using the following functions available in Resource File Viewer, you can quickly find the intended alarm or operation log history.

Function	Details
Search	By specifying the file type, date and time, or a keyword, you can search the alarm and operation log histories for matching records.
Time synchronization with the GX Works3 offline monitor	The seek bar time of the GX Works3 offline monitor can be synchronized with the times of GOT events (such as operation and alarm histories). As a result, you can correlate the operation history and ladder program transitions when an alarm occurs. In conjunction with operations in the GX Works3 offline monitor, relevant errors and logs from the resource file can be precisely displayed.

Point

If the operation log file has the extension .G3O, all detailed logs are displayed.

To display the log as a regular log, convert the operation log file to a CSV file or a Unicode text file containing the regular logs in advance.

96.8 How to use a Resource File Viewer module

GT37 SoftGOT3000

This section explains how to use Resource File Viewer (linked startup) started from the GOT offline monitor.

☞ Page 3117 Setting the resource files to be monitored in each module
☞ Page 3119 Starting monitoring with a Resource File Viewer module
☞ Page 3119 Refreshing the Resource File Viewer display
☞ Page 3119 Exiting Resource File Viewer
☞ Page 3120 Searching for histories in the resource files
☞ Page 3120 Monitoring the histories at the same time as the GX Works3 offline monitor
☞ Page 3120 Changing the items to be displayed in the history display area
☞ Page 3121 Switching the display language for Resource File Viewer
☞ Page 3121 Switching the display language of the resource file history
☞ Page 3122 Screen layout of a Resource File Viewer module

Up to 8 Resource File Viewer modules can be started.
The storage location and file type for each Resource File Viewer module can be specified in advance in the [Resource File Viewer Operation] window. This allows you to select which module to start based on your purpose.
Obtain resource files from the GOT in advance and store them in a folder.

96.8.1 Setting the resource files to be monitored in each module

In the [Resource File Viewer Operation] window, set the storage location and file type of the resource files to be read to each Resource File Viewer module.

1. Perform one of the following operations in the GOT offline monitor.

- Select [Resource File Viewer] → [Resource File Viewer Operation].
- Click the [Resource File Viewer Setting] button in [Action] in the settings dialog.

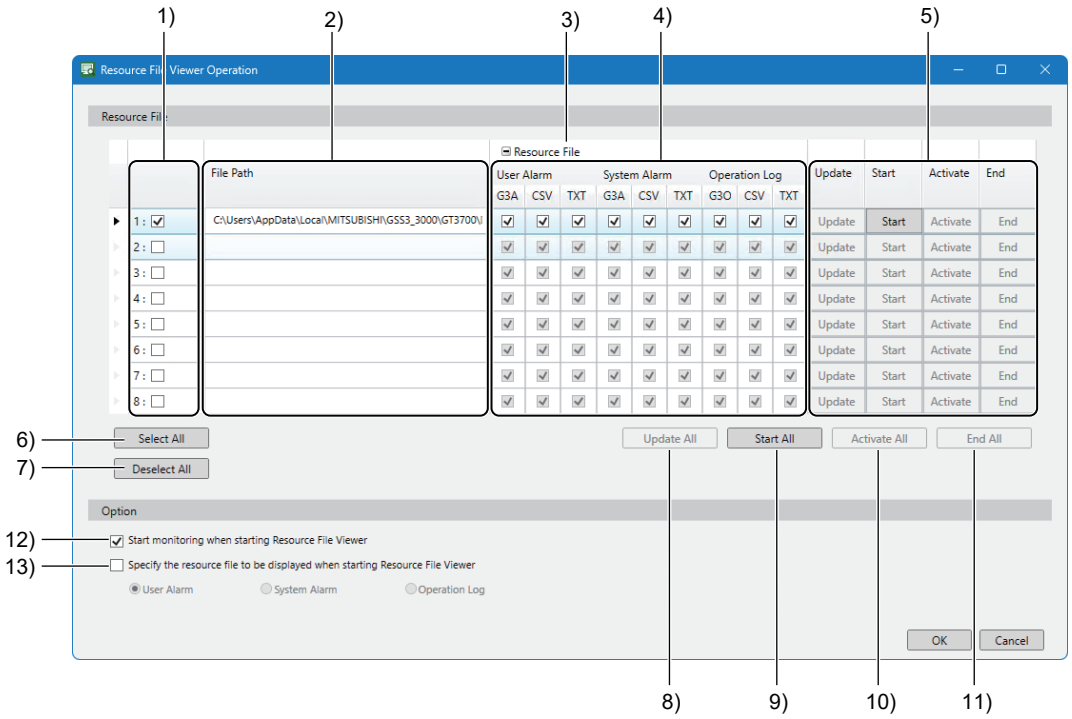
[Resource File Viewer Operation] window appears.

2. Set the storage location, file type, and extension of the resource files to be read in the field for each module.

For details on each setting item, refer to the following.

3. Click the [OK] button.

[Resource File Viewer Operation] window



Item			Description
1)	No.		Select this item to enable the setting. The selected Resource File Viewer module can be started.
2)	[File path]		Specify the folder that stores the resource file to be displayed in Resource File Viewer. The resource file must be created with the project data used in the GOT offline monitor.
3)	[Resource File]		Switch between displaying and hiding the resource file specification area.
4)	Resource file specification area		Select the extensions of the resource files to be displayed in Resource File Viewer.
5)	Operation area	—	Select operations for each Resource File Viewer module number.
		[Update] button	Refreshes the display of the running Resource File Viewer module. Use this button after changing the file path or extension, or after updating the file.
		[Start] button	Starts Resource File Viewer.
		[Activate] button	Activates Resource File Viewer.
		[End] button	Ends Resource File Viewer.
6)	[Select All] button		Selects all Resource File Viewer module numbers.
7)	[Deselect All] button		Deselects all Resource File Viewer module numbers.
8)	[Update All] button		Refresh all the displays of the running Resource File Viewer modules.
9)	[Start All] button		Starts all target Resource File Viewer modules.
10)	[Activate All] button		Activates all currently running Resource File Viewer modules.
11)	[End All] button		Ends all currently running Resource File Viewer modules.
12)	[Start monitoring when starting Resource File Viewer]		Starts monitoring at a start of a Resource File Viewer module.
13)	[Specify the resource file to be displayed when starting Resource File Viewer]		Specify the type of the resource files to be displayed at a start of a Resource File Viewer module.

96.8.2 Starting monitoring with a Resource File Viewer module

1. Use one of the following methods to start a Resource File Viewer module.

- Select [Resource File Viewer] → [Start All] from the GOT offline monitor menu.
- Select [Resource File Viewer] → [Start Resource File Viewer n] from the GOT offline monitor menu (n is a number from 1 to 8).
- Click the [Start] or [Start All] button in the [Resource File Viewer Operation] window.

The resource file set in the [Resource File Viewer Operation] window is read.

2. Select [Online] → [Monitor Start] in the [Resource File Viewer] window.

Connection with the GX Works3 offline monitor is established and monitoring starts.

96.8.3 Refreshing the Resource File Viewer display

While Resource File Viewer is running, if you change the storage location or extension of the file to be read, or if you update, add, or delete the file, the display is refreshed.

When changing the resource file storage location or extension

1. Open the [Resource File Viewer Operation] window and change [File path] or the extension setting as needed.
2. Click the [Update] button to update the resource files displayed in Resource File Viewer.

When a resource file has been changed, added, or deleted

1. Perform either of the following operations.

- Click the [Update] button in the [Navigation] window of Resource File Viewer.
- Click the [Update] button in the [Resource File Viewer Operation] window.

The resource files displayed in Resource File Viewer are updated.

96.8.4 Exiting Resource File Viewer

Disconnect the GX Works3 offline monitor to stop monitoring.
Exit the GOT offline monitor or Resource File Viewer.

Exiting the GOT offline monitor

Exit Resource File Viewer by either of the following methods.

- Select [Resource File Viewer] → [End All] from the GOT offline monitor menu.
- Select [Resource File Viewer] → [End Resource File Viewer n] from the GOT offline monitor menu (n is a number from 1 to 8).
- Click the [End] button in the [Resource File Viewer Operation] window.
- Exit the GOT offline monitor.

Exiting Resource File Viewer

Exit Resource File Viewer by either of the following methods.

- Select [Project] → [Exit Application] from the menu.
- Click the [×] button.

96.8.5 Searching for histories in the resource files

You can search for histories in the resource files by specifying criteria such as resource file type, keywords, and date/time.
The list of matching histories can be exported and saved.

1. Perform either of the following operations to display the [Search] dialog.

- Ctrl + F
- Select [Search] → [Search] from the menu.

☞ Page 3125 [Search] dialog

2. Set the search criteria for each item and click the [Search] button to display the matching histories in the search results list.

When monitoring is inactive, double-click a history in the search results list to select the corresponding history in the history display area.
Click the [Export] button to export the contents of the search results list to a file.

96.8.6 Monitoring the histories at the same time as the GX Works3 offline monitor

The seek bar time of the GX Works3 offline monitor can be synchronized with the times of GOT events (such as operation and alarm histories).
As a result, you can correlate the operation history and ladder program transitions when an alarm occurs.
This function does not work while monitoring is inactive.

Reading the clock time of the GX Works3 offline monitor

Reading the seek bar time of the GX Works3 offline monitor into Resource File Viewer enables you to monitor log and alarm histories collected at the same time as the seek bar.
Click the [Adjust date and time of GX Works3 Offline Monitor to those of Resource File Viewer.] button to select the history at the same time as the GX Works3 offline monitor in the history display area.

☞ Page 3122 Screen layout of a Resource File Viewer module

Writing the clock time of a Resource File Viewer module

Write the time of the history selected in Resource File Viewer to the GX Works3 offline monitor.
As a result, you can monitor events that occur at the same time as the GX Works3 offline monitor.

1. Select a history in the history display area and perform either of the following operations.

- Click the [Adjust date and time of GX Works3 Offline Monitor to those of Resource File Viewer.] button in Resource File Viewer.
- Double-click the history selected in the history display area.

This is available when [Read/write GX Works3 Offline Monitor time on a selected date and time] in the [Action Setup] dialog is selected.

☞ Page 3122 Screen layout of a Resource File Viewer module

The event occurred at the same time as the history selected in Resource File Viewer is selected in the GX Works3 offline monitor.

96.8.7 Changing the items to be displayed in the history display area

1. Select [View] → [Display Items] from the menu to display the [Display Item Setting] dialog.
2. Set the items to be displayed and their order in the history display area.

For details on the operation buttons, refer to the following.

☞ Page 3126 [Display Item Setting] dialog (Resource File Viewer)

96.8.8 Switching the display language for Resource File Viewer

The following shows how to switch the display language for Resource File Viewer menu or other items.

1. Select [View] → [Switch Display Language] from the menu to display the [Switch Display Language] dialog.
2. Select the language to switch to in [Display Language], then click the [OK] button to immediately change the display language.

96.8.9 Switching the display language of the resource file history

If the resource file is a binary file, the display language of the history can be switched.

How to switch the display language depends on the resource file type.

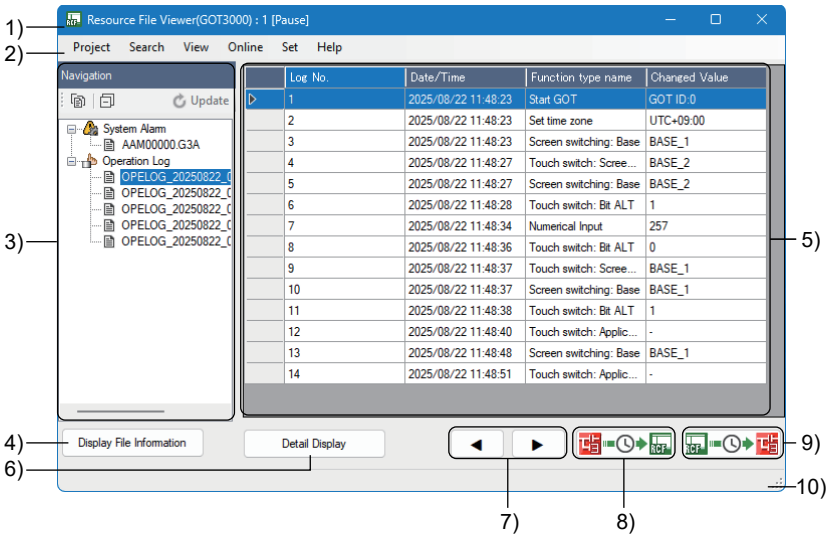
Switch the display language before starting Resource File Viewer.

Type	Description
User alarm	The data is displayed in the display language set in [Language Switching] in the GOT offline monitor. ☞ Page 3113 Switching the display language
System alarm Operation log	The data is displayed in the system language set on the GOT while the GOT offline monitor is running. ☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching])

96.8.10 Screen layout of a Resource File Viewer module

This section explains the screen displayed when Resource File Viewer is started from the GOT offline monitor (linked startup). For the screen layout of Resource File Viewer when starting it directly from the RCFView.exe (independent startup), refer to the following.

☞ Page 2007 Viewing the operation log file (Resource File Viewer)



Item		Description
1)	Title bar	Displays the Resource File Viewer module number and monitoring status. The icons to minimize, maximize, and close the screen are also displayed.
2)	Menu bar	Displays the operation menus for Resource File Viewer.☞ Page 3123 Menu bar
3)	[Navigation]	Displays the resource files with the extensions selected in [Resource File] in the [Resource File Viewer Operation] window. The [Unfold All] and [Fold All] buttons open and close the tree. • [!] Appears when a resource file has been updated, added, deleted, or renamed. • [Update] button Updates the resource files.
4)	[Display File Information] button	Displays the [Display File Information] dialog. ☞ Page 3123 [Display File Information] dialog
5)	History display area	Displays the details (operation and alarm histories) of the resource file selected in [Navigation]. Set the display items in the [Display Item Setting] dialog. ☞ Page 3123 [Display File Information] dialog
6)	[Detail Display] button	Displays the [Detail Display] dialog. You can check the details of the selected operation and alarm histories. ☞ Page 3123 [Detail Display] dialog
7)	Arrow buttons	Switch the resource files displayed in the history display area.
8)	Click the [Adjust date and time of GX Works3 Offline Monitor to those of Resource File Viewer.] Button	Selects the logs occurred at the same time as specified time in the GX Works3 offline monitor.
9)	[Adjust date and time of GX Works3 Offline Monitor to those of Resource File Viewer.] Button	Selects the events in the GX Works3 offline monitor that occurred at the same time as the specified time in Resource File Viewer.
10)	Status bar	Displays the time read from the GX Works3 offline monitor.

Menu bar

Menu		Description	Shortcut key
[Project]	[Exit Application]	Exits Resource File Viewer.	Alt + F4
[Search]		Search for the resource files read to Resource File Viewer. ☞ Page 3125 [Search] dialog	Ctrl + F
[Display]	[Navigation]	Displays or hides [Navigation].	—
	[Display Items]	Set the items to be displayed in the history display area. ☞ Page 3126 [Display Item Setting] dialog (Resource File Viewer)	—
	[Switch Display Language]	Switch the display language of Resource File Viewer.	—
[Online]	[Start Monitoring]	Establish connection between the GX Works3 offline monitor and the GOT offline monitor to start monitoring.	F3
	[Stop Monitoring]	Disconnects the GX Works3 offline monitor to stop monitoring.	Alt + F3
[Set]	[Resource File Viewer Operation]	[Resource File Viewer Operation] window appears. ☞ Page 3118 [Resource File Viewer Operation] window	—
	[Action]	Configure the settings related to the history display area. ☞ Page 3126 [Action Setup] dialog	—
[Help]	[GT Designer3 Help]	Displays GT Designer3 Help.	F1

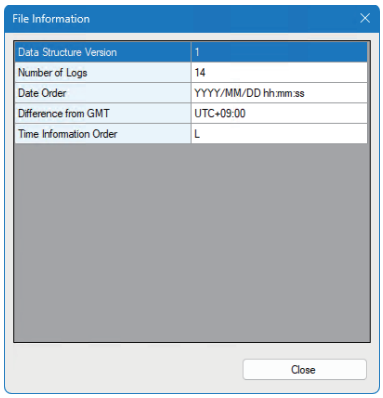
[Display File Information] dialog

Displays the information of the resource file selected in [Navigation].

The displayed items depend on the resource file type.

Ex.

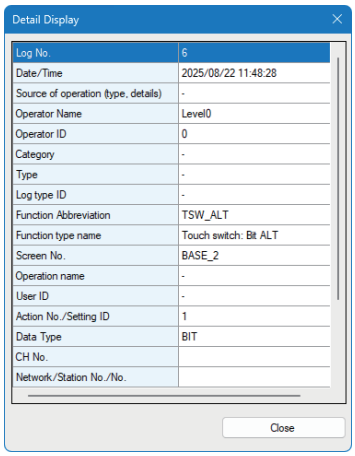
For operation logs



[Detail Display] dialog

Displays the details of the history selected in the history display area.

The displayed items depend on the resource file type.



■User alarm

Item	Description
Upper Comment No.	The No. of the upper level comment
Middle Comment No.	The No. of the middle level comment
Comment No.	The No. of the basic comment
Comment	The comment of the basic alarm
Alarm Status	The status of the alarm
Occurred	The date and time on which the alarm occurred
Restored	The date and time on which the alarm was corrected
Checked	The date and time on which the alarm was confirmed
Level	The level set for the alarm
Group	The group set for the alarm
Frequency of Occurrences	The number of alarms that occurred
Cumulative Down Time	Cumulative down time
Down Time	Down time
Occurrence word log	Occurrence word log

■System alarm

Item	Description
Error No.	The No. of the error
Comment	System alarm message
Alarm Status	The status of the alarm
Occurred	The date and time on which the alarm occurred
Restored	The date and time on which the alarm was corrected
Checked	The date and time on which the alarm was confirmed
CH No.	Channel No.
Network/Station No./No.	Network No., station No., and module No.
Device	The name of the device
Screen Type	The type of the screen • BASE: Base screen • OVL1 to OVL5: Overlap windows 1 to 5 • SPI1 to SPI2: Superimpose windows 1 to 2 • DLG: Dialog window • PNL: Operation panel • KEY: Key window
Definition Screen No	The No. of the definition screen • B: Base screen • W: Window screen
Object ID	Object ID
Function Name	Function Name
Drive Name	The name of the drive

■Operation log

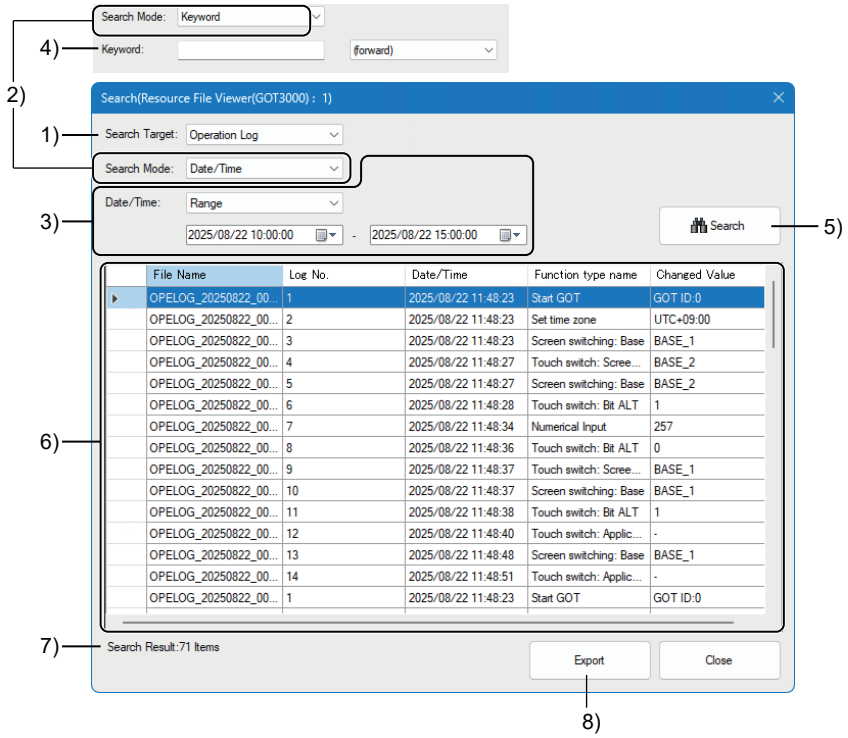
The output items depend on the operations to be recorded.

For the output items and information for each operation, refer to the following.

☞ Page 1921 Collection item

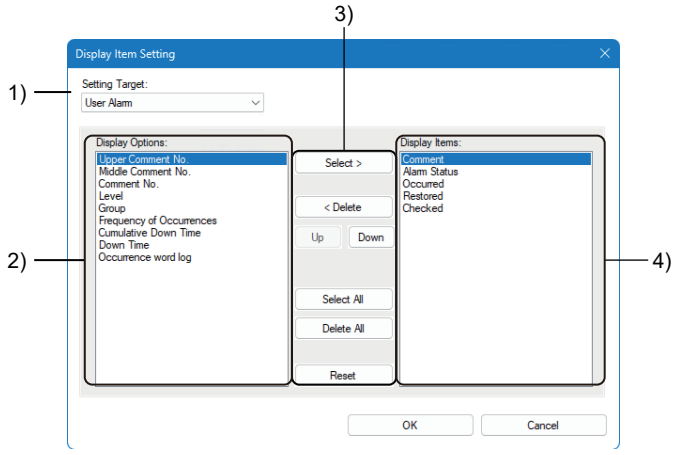
[Search] dialog

Searches the logs in the resource files displayed in [Navigation].



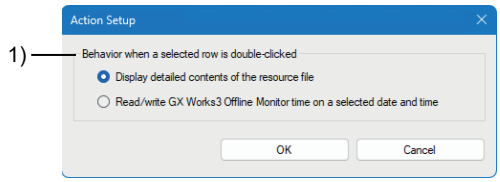
Item		Description	
1)	[Search Target]	Select the file type of the resource data to be searched for.	
2)	[Search Mode]	Select the method of searching.	
3)	[Date/Time]	Set this field when [Search Mode] is set to [Date/Time]. The settings depend on the resource file type.	
		User alarm and system alarm log files	Select the date and time targeted for a search. Based on the selection above, select the search period.
		Operation log file	Based on the recorded dates and time of the operation logs, select the search period.
4)	[Keyword]	Enter here when [Search Mode] is set to [Keyword]. Specify the keyword for a search in the resource files. Up to 1024 characters can be entered. The characters are case-sensitive. After a search with [Keyword] left blank, the search result will be 0.	
5)	[Search] button	Start searching. Search results are displayed in the search result list.	
6)	Search result list	Displays the search results. When monitoring is inactive, double-click a history in the search results list to select the corresponding history in the history display area.	
7)	[Search Result]	The number of the resource files are displayed in the search result list.	
8)	[Export] button	Saves the search result list as a CSV file or a Unicode text file. Set [File name] and [Save as type] in the displayed dialog and click the [Save] button to export the search result list.	

[Display Item Setting] dialog (Resource File Viewer)



Item			Description
1)	[Setting Target]		Select the file type of the resource data set as the display items.
2)	[Display Options]		Options of the items displayed in the search result list Select an item and click the [Select] button to move the item to [Display Items].
3)	Operation buttons	[Select] button	Moves the item selected in [Display Options] to [Display Items].
		[Delete] button	Moves the item selected in [Display Items] to [Display Options].
		[Up] button [Down] button	Move the item selected in [Display Items] upward or downward.
		[Select All] button	Moves all the items in [Display Options] to [Display Items].
		[Delete All] button	Moves all the items in [Display Items] to [Display Options].
		[Reset] button	Restores the items in [Display Items] to the default ones.
4)	[Display Items]		Items to be displayed in the search result list If any item is selected and the [Delete] button is clicked, the selected item is moved to [Display Options]. The top-to-bottom order in [Display Items] corresponds to the left-to-right order in the search results list. If any item is selected and the [Up] button or the [Down] button is clicked, the position of the selected item is moved upward or downward.

[Action Setup] dialog



Item		Description
1)	[Behavior when a selected row is double-clicked]	Select the behavior when the history selected in the history display area is double-clicked. • [Display detailed contents of the resource file] Open the [Detail Display] dialog to display the log details. • [Read/write GX Works3 Offline Monitor time on a selected date and time] Write the time of the row selected in Resource File Viewer to the GX Works3 offline monitor. As a result, you can monitor events that occur at the same time.

PART 31 Device range and settings

97 Device range and settings of Mitsubishi Electric equipment

98 Device range and settings of each controller

97 Device range and settings of Mitsubishi Electric equipment

This chapter describes the range of devices settable in GT Designer3.
The settable range varies with the selection for [Controller Type] in the [Controller Setting] window.
Configure the device setting according to the specifications of the controller to be used.
Device specifications differ depending on the controller model even among the controllers of the same series.
If a nonexistent device or a device number out of the range is set for an object, other objects for which correct devices are set may not be monitored.

☞ Page 3129 Device setting dialog (Mitsubishi Electric equipment)

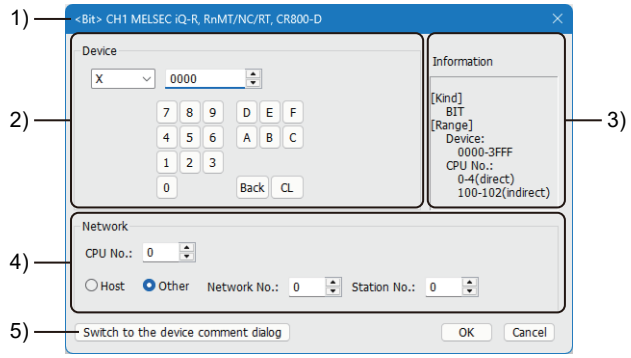
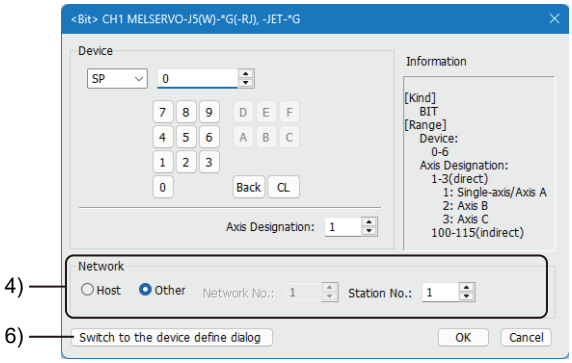
97.1 Device setting dialog (Mitsubishi Electric equipment)

Set a device to be monitored.



[MELSEC iQ-R, RnMT/NC/RT, CR800-D]



[MELSERVO-J5(W)-*G(-RJ), -JET-*G]

Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of X0000  The setting items vary with the selected device name.  When [X] is selected for the device name  When [SP] is selected for the device name

Item		Description
3)	[Information]	Displays the setting range of each setting item according to the selected device.
4)	[Network]	Set the station number of the controller to be monitored. The setting items depend on the controller setting. ☞ Page 3131 Network setting for connection to the Mitsubishi Electric PLC ☞ Page 3133 Network setting for connection to the Mitsubishi Electric servo amplifier ☞ Page 3135 Network setting for connection to the Mitsubishi Electric inverter
5)	[Switch to the device comment dialog] button	You can open the device comment setting dialog to check the device comments imported to GT Designer3. For details, refer to the following. ☞ Page 961 Device comment setting dialog
6)	[Switch to the device define dialog] button	You can open the device definition setting dialog to check the definitions of the virtual servo amplifier or inverter devices. For details, refer to the following. ☞ Page 962 Device definition setting dialog

For the formats of devices, refer to the following.

For details, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

For the specifications of each device, refer to the following.

☞ Page 3137 [MELSEC MX Controller]

☞ Page 3165 [MELSEC iQ-R, RnMT/NC/RT, CR800-D]

☞ Page 3253 [MELSEC iQ-L]

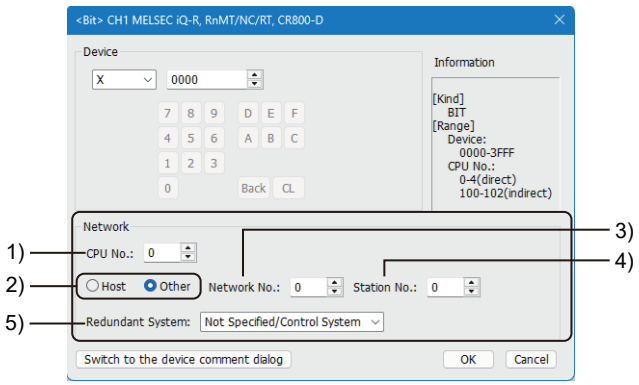
☞ Page 3465 [FREQROL 800/E700NE(Batch monitor)]

97.1.1 Network setting for connection to the Mitsubishi Electric PLC

Configure the following settings for connecting to a Mitsubishi Electric PLC.

Ex.

Device setting dialog for [MELSEC iQ-R, RnMT/NC/RT, CR800-D]



Item		Description
1)	[CPU No.]	Set the CPU number of the controller. ☞ Page 3132 Setting the CPU number
2)	Station type specification	Select the station type (host or other) for the controller to be monitored. • [Host]: The controller to be monitored is the host station. • [Other]: The controller to be monitored is not the host station. When monitoring link relay (B) and link register (W) assigned in link parameter and network parameter, select [Host]. If [Other] is selected, the cyclic transmission will be changed to the transient transmission irrespective of the network type, resulting in delay of the object display. Set RX, RY, RWw, RWr, LB, or LW as [Host] when monitoring a cyclic device.
3)	[Network No.]	This item appears when [Other] is selected for the station type. Set the network number.
4)	[Station No.]	This item appears when [Other] is selected for the station type. Specify a station number.
5)	[Redundant System]	This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] of the [Controller Setting] window. The following shows selectable items. • [Not Specified/Control System] • [Standby System] Example) Display terminology of the control system 1-1/1-S W0.b0 [-S] is displayed for a device of the standby system. For details, refer to the following. ☞ Page 744 Configuring the setting of the MELSEC redundant function

Setting the CPU number

The setting range depends on the system configuration of the monitoring target.

Item	Description
When monitoring a single CPU system	Set the CPU number to [0].
When monitoring a multiple CPU system	Set the CPU number to any of [1] to [4].
When monitoring an inverter	Set the CPU number to [0].

To specify a CPU number with the value of a GOT data register (GD), refer to the following.

☞ Page 3132 Indirect specification of a CPU number

Indirect specification of a CPU number

To set a GOT data register (GD) to specify a CPU number, set [CPU No. switching GD device first No. (3 points)] in the [Controller Setting] window.

For details, refer to the following.

☞ Page 729 [Controller Setting]

When using GT SoftGOT3000, [CPU No. switching GD device first No. (3 points)] can also be set in GT SoftGOT3000.

GT SoftGOT3000 User's Manual

The following shows the correspondence between CPU numbers and GOT data registers (GD).

Ex.

When 500 is set to [CPU No. switching GD device first No. (3 points)]

Three consecutive devices, starting from GD500, are set to specify CPU numbers.

CPU No.	GOT data registers (GD)	Setting range
100	GD500	[1] to [4] (Setting an invalid value causes a communication timeout error.)
101	GD501	
102	GD502	

Upon the GOT startup, 0 is stored in the specified GD devices until values are set.

If you set the GD devices on the screen that appears upon the GOT startup, a communication timeout error occurs.

To avoid such situation, set the GD devices so that their values are retained at a power failure.

For details, refer to the following.

☞ Page 601 Configuring the settings for retaining GOT internal device data at power failure ([Internal Device Retention])

Precautions

■When the multi-channel connection is used

When specifying GD devices for multiple channels, set different GD devices to [CPU No. switching GD device first No. (3 points)].

GD10 to GD25 are used to specify the monitoring targets, such as the station number of an inverter.

When setting GD devices for a different channel, set different GD devices to [CPU No. switching GD device first No. (3 points)].

■When the indirect specification function is used

Do not change the value of the specified device while a touch switch with the bit momentary is being pressed.

Doing so may cause the touch switch to exhibit unintended behavior.

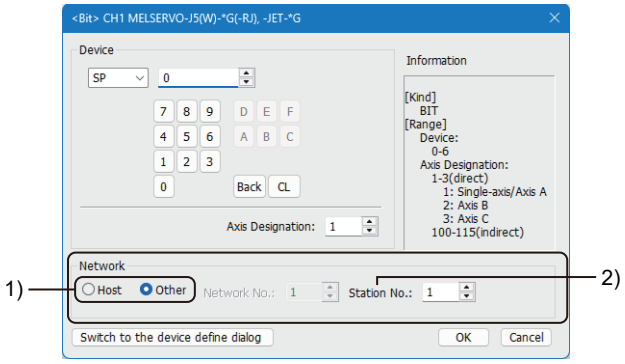
97.1.2 Network setting for connection to the Mitsubishi Electric servo amplifier

☞ Page 3133 Network setting for Ethernet connection
☞ Page 3134 Network setting for non-network connection type (serial connection)

Network setting for Ethernet connection

Ex.

Device setting dialog for [MELSERVO-J5(W)-*G(-RJ), -JET-*G]

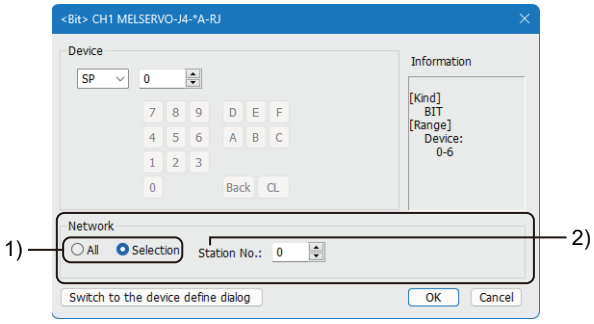


Item		Description
1)	Station type specification	Select the station type (host or other) for the controller to be monitored. • [Host]: The controller to be monitored is the host station. • [Other]: The controller to be monitored is not the host station.
2)	[Station No.]	This item appears when [Other] is selected for the station type. Specify a station number.

Network setting for non-network connection type (serial connection)

Ex.

Device setting dialog for [MELSERVO-J4-*A-RJ]



Item		Description	
1)	Monitor target specification	Set the monitoring target of the set device.	
		[All]	Select this item when writing data to all servo amplifiers connected. During a monitoring, the servo amplifier of the station No. 0 is monitored. When inputting data by the numerical input, the data is written to all servo amplifiers connected during inputting and the servo amplifier of the station No. 0 is monitored during other than inputting (displaying). When [All] is selected for a device, network No. 0 and station No. FF are displayed in the device list window and the printed report.
		[Selection]	Specify the station number of a servo amplifier to be monitored.
2)	[Station No.]	This item appears when [Selection] is selected for the monitor target specification. The setting range is [0] to [31] (direct) or [100] to [115] (indirect). For indirect specification of a station number, refer to the following. ☞ Page 3134 Indirect specification of a station number (for connection to a servo amplifier)	

■Indirect specification of a station number (for connection to a servo amplifier)

When you specify any of 100 to 115 for the station number, the value of the corresponding GOT data register (GD10 to GD25) is used as the station number.

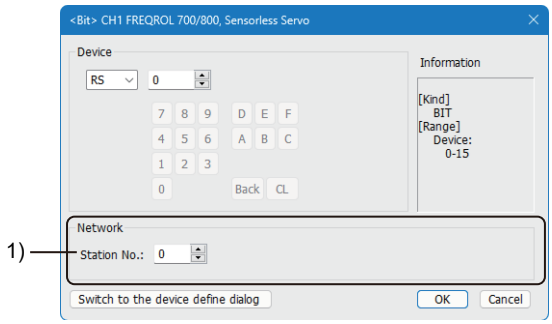
The following shows the correspondence between station number setting values and GOT data registers (GD).

Station No.	GOT data registers (GD)	Setting range
100	GD10	[0] to [31] Setting a value outside the range causes a timeout error.
101	GD11	
:	:	
114	GD24	
115	GD25	

97.1.3 Network setting for connection to the Mitsubishi Electric inverter

☞ Page 3135 Network setting for [FREQROL 700/800, Sensorless Servo]
☞ Page 3136 Network setting for [FREQROL 800/E700NE(Batch monitor)]

Network setting for [FREQROL 700/800, Sensorless Servo]



Item		Description
1)	[Station No.]	Set the station number of the inverter to be monitored. The setting range is [0] to [31] (direct) or [100] to [115] (indirect). For indirect specification of a station number, refer to the following. ☞ Page 3135 Indirect specification of a station number (for connecting an inverter)

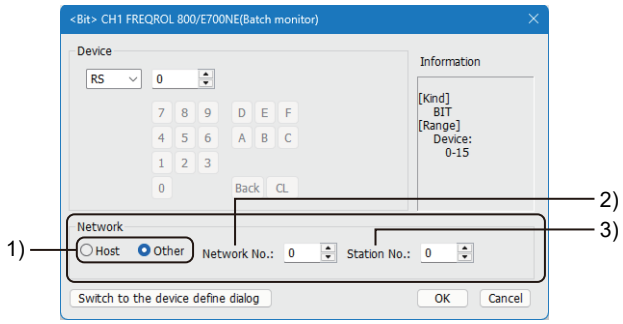
■Indirect specification of a station number (for connecting an inverter)

When you specify any of 100 to 115 for the station number, the value of the corresponding GOT data register (GD10 to GD25) is used as the station number.

The following shows the correspondence between station number setting values and GOT data registers (GD).

Station No.	GOT data registers (GD)	Setting range
100	GD10	[0] to [31] Setting a value outside the above range causes a device range error.
101	GD11	
:	:	
114	GD24	
115	GD25	

Network setting for [FREQROL 800/E700NE(Batch monitor)]



Item		Description
1)	Station type specification	Select the station type (host or other) for the controller to be monitored. • [Host]: The controller to be monitored is the host station. • [Other]: The controller to be monitored is not the host station.
2)	[Network No.]	This item appears when [Other] is selected for the station type. Set the network number. The setting range is [1] to [239].
3)	[Station No.]	This item appears when [Other] is selected for the station type. Set the station number of the inverter to be monitored. The setting range is [1] to [120]. Valid station numbers vary depending on the connection type. For indirect specification of a station number for non-network connection type, refer to the following. ☞ Page 3135 Indirect specification of a station number (for connecting an inverter)

CMD*3	Operation command	Decimal	0 to 63	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3161 Virtual servo amplifier devices ([MELSEC MX Controller])

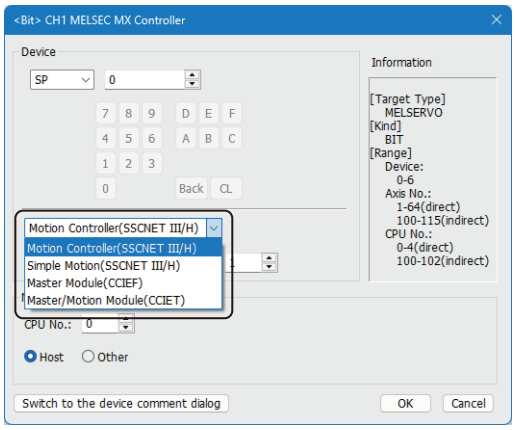
*3 Virtual inverter device
For details, refer to the following.
☞ Page 3164 Virtual inverter devices ([MELSEC MX Controller])

*4 If a bit-specified word device is used in the random read processing, GT Simulator3 uses the value of the bit device in block No. 0 only. The bit device status depends on the SFC program status (active or inactive). When the SFC program is inactive, the bit device is off (stores 0).
If a step relay (S) is used in the random read processing, specify the relevant step relay (block) (BLS).

97.2.2 Setting virtual bit devices for servo amplifiers ([MELSEC MX Controller])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (RD77MS). The following items are displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (RD77GF).
[Master/Motion Module(CCIET)]	Select this item to connect the GOT through the master station on the CC-Link IE TSN and a Motion module (RD78G(H)). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
SP	[Motion Controller(SSCNET III/H)]	A(Axis No.)-SP(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	A64-SP0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-SP(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	UFF-A64-SP0
	[Master Module(CCIEF)]	SP(Device) • Device (decimal): 0 to 6	SP0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-SP(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	AA3-SP0

Device name	Device notation and setting range		Notation example
OM	[Motion Controller(SSCNET III/H)]	A(Axis No.)-OM(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	A64-OM0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OM(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	UFF-A64-OM0
	[Master Module(CCIEF)]	OM(Device) • Device (decimal): 0 to 2, 4 to 5	OM0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-OM(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	AA3-OM0
TMB	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMB(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	A64-TMB1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMB(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	UFF-A64-TMB1
	[Master Module(CCIEF)]	TMB(Device) • Device (decimal): 1 to 6	TMB1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMB(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	AA3-TMB1
OTI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-OTI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	A64-OTI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OTI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	UFF-A64-OTI0
	[Master Module(CCIEF)]	OTI(Device) • Device (decimal): 0 to 5	OTI0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-OTI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	AA3-OTI0
GFDI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-GFDI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A64-GFDI1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-GFDI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A64-GFDI1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-GFDI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-GFDI0
ECCDI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ECCDI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A64-ECCDI1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ECCDI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A64-ECCDI1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ECCDI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-ECCDI0

For indirect specification of a module number, axis number, or axis designation, refer to the following.

☞ Page 3142 Indirect specification of a module number ([MELSEC MX Controller])

☞ Page 3143 Indirect specification of an axis number or axis designation ([MELSEC MX Controller])

Indirect specification of a module number ([MELSEC MX Controller])

To set a GOT data register (GD) to specify a module number, set [Module No. switching GD device first No. (16 points)] in the [Controller Setting] window.

For details, refer to the following.

☞ Page 729 [Controller Setting]

In GT SoftGOT3000, set [Module No. switching GD device first No. (16 points)] in the [Communication Setup] dialog.

GT SoftGOT3000 User's Manual

The following shows the correspondence between module numbers and GOT data registers (GD).

Ex.

When 550 is set to [Module No. switching GD device first No. (16 points)]

Sixteen consecutive devices, starting from GD550, are set to specify module numbers.

Module No.	GOT data registers (GD)	Setting range
100	GD550	[000] to [0FF] Setting a value outside the above range causes a device range error.
101	GD551	
:	:	
10E	GD564	
10F	GD565	

Upon the GOT startup, 0 is stored in the specified GD devices until values are set.

If you set the GD devices on the screen that appears upon the GOT startup, module No. 0 is monitored unintentionally, or a device range error occurs.

To avoid such situation, set the GD devices so that their values are retained at a power failure.

For details, refer to the following.

☞ Page 601 Configuring the settings for retaining GOT internal device data at power failure ([Internal Device Retention])

Precautions

■When the multi-channel connection is used

When setting GD devices for multiple channels, set different GD devices to [Module No. switching GD device first No. (16 points)].

GD10 to GD25 are used to specify the monitoring targets, such as the station number of an inverter.

When setting GD devices for a different channel, set different GD devices to [Module No. switching GD device first No. (16 points)].

■When the indirect specification function is used

Do not change the value of the specified device while a touch switch with the bit momentary is being pressed.

Doing so may cause the touch switch to exhibit unintended behavior.

Indirect specification of an axis number or axis designation ([MELSEC MX Controller])

To use GOT data registers (GD) to specify an axis number or axis designation, set [Servo axis switching GD device first No. (16 points)] in the [Controller Setting] window.

For details, refer to the following.

☞ Page 729 [Controller Setting]

In GT SoftGOT3000, set [Servo axis switching GD device first No. (16 points)] in the [Communication Setup] dialog.

📖GT SoftGOT3000 User's Manual

The following shows the relationship between the axis number or axis designation and the GOT data register (GD).

Ex.

When 10 is set to [Servo axis switching GD device first No. (16 points)]

Sixteen consecutive devices, starting from GD10, are set to specify an axis number.

Axis No. or axis designation	GOT data registers (GD)	Setting range
100	GD10	• Axis number [1] to [64] • Axis designation [1]: Single-axis/Axis A [2]: Axis B [3]: Axis C Setting a value outside the above range causes a device range error.
101	GD11	
:	:	
114	GD24	
115	GD25	

Upon the GOT startup, 0 is stored in the specified GD devices until values are set.

If you set the GD devices on the screen that appears upon the GOT startup, a device range error occurs.

To avoid such situation, set the GD devices so that their values are retained at a power failure.

For details, refer to the following.

☞ Page 601 Configuring the settings for retaining GOT internal device data at power failure ([Internal Device Retention])

Precautions

■When the multi-channel connection is used

When specifying GD devices for multiple channels, set different GD devices to [Servo axis switching GD device first No. (16 points)].

GD10 to GD25 are used to specify the monitoring targets, such as the station number of an inverter.

When setting GD devices for a different channel, set different GD devices to [Servo axis switching GD device first No. (16 points)].

■When the indirect specification function is used

Do not change the value of the specified device while a touch switch with the bit momentary is being pressed.

Doing so may cause the touch switch to exhibit unintended behavior.

97.2.3 Availability of writing/reading data to/from bit devices ([MELSEC MX Controller])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/W	-/-	R/W	R/W	-/-

JnW	Link register (link direct)	Hexadecimal	J(Network No.n)-W(Device) Notation example: J1-W00000 • Network No.n (decimal): 1 to 239 • Device (hexadecimal): 00000 to 83FFF	○	○
JnSW	Link special register (link direct)	Hexadecimal	J(Network No.n)-SW(Device) Notation example: J1-SW000 • Network No.n (decimal): 1 to 239 • Device (hexadecimal): 000 to FFF	○	○
U3E0G	CPU buffer memory access device	Decimal	U3E0-G(Device) Notation example: U3E0-G100 • Device (decimal): 0 to 268435455	○	○
RD	Refresh data register	Decimal	0 to 4194303	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3161 Virtual servo amplifier devices ([MELSEC MX Controller])

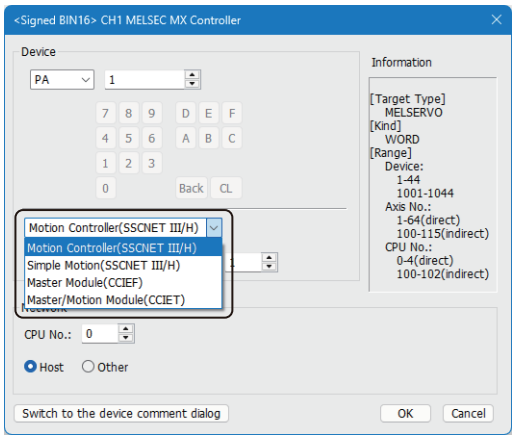
*3 The device name depends on the servo amplifier.
MR-J5-G(-RJ) or MR-J5W□-G: Motor extension setting parameter
Other than MR-J5-G(-RJ) or MR-J5W□-G: Linear servo motor/DD motor setting parameter

*4 PVS is a virtual device corresponding to the servo parameter (PV) of MR-J5-G(-RJ), MR-J5W□-G, and MR-JET-G.
Use the virtual device (PVS) to read/write data from/to the servo parameter (PV).

97.2.5 Setting virtual word devices for servo amplifiers ([MELSEC MX Controller])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (RD77MS). The following items are displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (RD77GF).
[Master/Motion Module(CCIET)]	Select this item to connect the GOT through the master station on the CC-Link IE TSN and a Motion module (RD78G(H)). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
PA	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PA(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	A64-PA1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PA(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	UFF-A64-PA1
	[Master Module(CCIEF)]	PA (Device) • Device (decimal): 1 to 44, 1001 to 1044	PA1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PA(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	AA3-PA1

Device name	Device notation and setting range		Notation example
PB	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PB(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	A64-PB1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PB(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	UFF-A64-PB1
	[Master Module(CCIEF)]	PB(Device) • Device (decimal): 1 to 92, 1001 to 1092	PB1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PB(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	AA3-PB1
PC	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PC(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	A64-PC1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PC(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	UFF-A64-PC1
	[Master Module(CCIEF)]	PC(Device) • Device (decimal): 1 to 90, 1001 to 1090	PC1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PC(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	AA3-PC1
PD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PD(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	A64-PD1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	UFF-A64-PD1
	[Master Module(CCIEF)]	PD(Device) • Device (decimal): 1 to 72, 1001 to 1072	PD1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	AA3-PD1
PO	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PO(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	A64-PO1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PO(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	UFF-A64-PO1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PO(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	AA3-PO1
PS	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PS(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	A64-PS1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PS(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	UFF-A64-PS1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	AA3-PS1

Device name	Device notation and setting range		Notation example
PU	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PU(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	A64-PU1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PU(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	UFF-A64-PU1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PU(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	AA3-PU1
PT	[Master Module(CCIEF)]	PT(Device) • Device (decimal): 1 to 90, 1001 to 1090	PT1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PT(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	AA3-PT1
PL	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PL(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	A64-PL1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PL(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	UFF-A64-PL1
	[Master Module(CCIEF)]	PL(Device) • Device (decimal): 1 to 72, 1001 to 1072	PL1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PL(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	AA3-PL1
PN	[Master Module(CCIEF)]	PN(Device) • Device (decimal): 1 to 32, 1001 to 1032	PN1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PN(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	AA3-PN1
PVS	[Master/Motion Module(CCIET)]	AA(Axis designation)-PVS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	AA3-PVS1
ST	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ST(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	A64-ST0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ST(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	UFF-A64-ST0
	[Master Module(CCIEF)]	ST(Device) • Device (decimal): 0 to 48	ST0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ST(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	AA3-ST0
PE	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PE(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 88, 1001 to 1088	A64-PE1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PE(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 88, 1001 to 1088	UFF-A64-PE1
	[Master Module(CCIEF)]	PE(Device) • Device (decimal): 1 to 88, 1001 to 1088	PE1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PE(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 88, 1001 to 1088	AA3-PE1

Device name	Device notation and setting range		Notation example
PF	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PF(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	A64-PF1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PF(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	UFF-A64-PF1

*1 Only reading is available for OTS0 to OTS5.

97.2.7 Monitoring-supported double-word devices ([MELSEC MX Controller])

The following table shows monitoring-supported double-word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3160 Availability of writing/reading data to/from double-word devices ([MELSEC MX Controller])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
LTN	Long timer current value	Decimal	0 to 2621055	×	×
LCN	Long counter current value	Decimal	0 to 4933727	×	×
LSN	Long retentive timer current value	Decimal	0 to 2621055	×	×
ZZ	Index register (32 bits)	Decimal	0 to 22	×	×
LZ	Index register (32 bits)	Decimal	0 to 11	×	×
ALD*2	Life diagnosis	Decimal	☞ Page 3158 Setting virtual double-word devices for servo amplifiers ([MELSEC MX Controller])	×	×
TMI*2	Input signal for test operation (for test operation)	Decimal	☞ Page 3158 Setting virtual double-word devices for servo amplifiers ([MELSEC MX Controller])	×	×
TMO*2	Forced output of signal pin (for test operation)	Decimal	☞ Page 3158 Setting virtual double-word devices for servo amplifiers ([MELSEC MX Controller])	×	×
TMD*2	Set data (for test operation)	Decimal	☞ Page 3158 Setting virtual double-word devices for servo amplifiers ([MELSEC MX Controller])	×	×
AL*3	Faults history	Decimal	0 to 899	×	×
LPr*3*4	Parameter (32-bit)	Decimal	0 to 1500	×	×
OP*3	Operation parameter	Decimal	0 to 5	×	×
PV*3	Current value monitor	Decimal	1 to 143	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3161 Virtual servo amplifier devices ([MELSEC MX Controller])

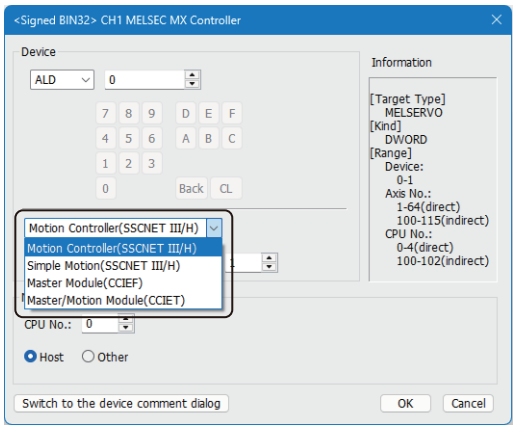
*3 Virtual inverter device
For details, refer to the following.
☞ Page 3164 Virtual inverter devices ([MELSEC MX Controller])

*4 If you specify LPr900 to LPr935, the following item is displayed in the device setting dialog.
[Setting items (for calibration parameters)]: [Bias/gain value], [Analog input value]
Enclose the device number in parentheses when selecting [Analog input value].
Example 1) Notation when [Bias/gain value] is selected: LPr900
Example 2) Notation when [Analog input value] is selected: LPr(900)
When LPr900 or LPr901 (Calibration parameter) is specified, selecting [Bias/gain value] or [Analog input value] does not affect the monitoring target.

97.2.8 Setting virtual double-word devices for servo amplifiers ([MELSEC MX Controller])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (RD77MS). The following items are displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (RD77GF).
[Master/Motion Module(CCIET)]	Select this item to connect the GOT through the master station on the CC-Link IE TSN and a Motion module (RD78G(H)). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
ALD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ALD(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A64-ALD0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ALD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A64-ALD0
	[Master Module(CCIEF)]	ALD(Device) • Device (decimal): 0 to 1	ALD0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ALD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-ALD0

Device name	Device notation and setting range		Notation example
TMI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	A64-TMI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	UFF-A64-TMI0
	[Master Module(CCIEF)]	TMI(Device) • Device (decimal): 0 to 2	TMI0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	AA3-TMI0
TMO	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMO(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0	A64-TMO0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMO(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0	UFF-A64-TMO0
	[Master Module(CCIEF)]	TMO(Device) • Device (decimal): 0	TMO0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMO(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0	AA3-TMO0
TMD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMD(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	A64-TMD0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	UFF-A64-TMD0
	[Master Module(CCIEF)]	TMD(Device) • Device (decimal): 0 to 1, 3	TMD0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	AA3-TMD0

For indirect specification of a module number, axis number, or axis designation, refer to the following.

☞ Page 3142 Indirect specification of a module number ([MELSEC MX Controller])

☞ Page 3143 Indirect specification of an axis number or axis designation ([MELSEC MX Controller])

97.2.9 Availability of writing/reading data to/from double-word devices ([MELSEC MX Controller])

The following shows the availability of writing/reading data to/from double-word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of double-word data
LTN	-/-	R/W	-/-	-/-
LCN	-/-	R/W	-/-	-/-
LSN	-/-	R/W	-/-	-/-
ZZ	-/-	R/W	-/-	-/-

JnSB	Link special relay (link direct)	Hexadecimal	J(Network No.n)-SB(Device) Notation example: J1-SB000 • Network No.n (decimal): 1 to 239 • Device (hexadecimal): 000 to FFF	○	○
IOST*3	I/O terminal monitor	Decimal	0 to 127	×	×
CMD*3	Operation command	Decimal	0 to 63	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3191 Virtual servo amplifier devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

*3 Virtual inverter device
For details, refer to the following.

☞ Page 3243 Virtual inverter devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

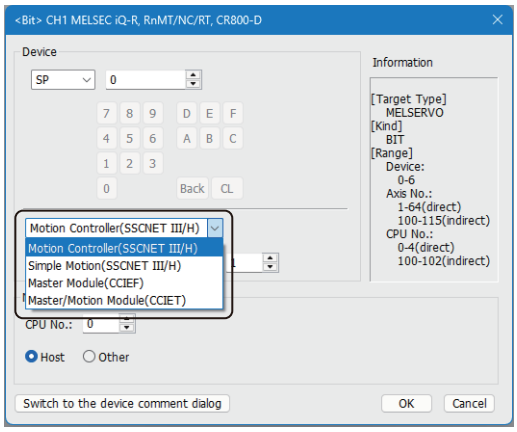
*4 For the maximum number of devices when an extended SRAM cassette is installed, refer to the following.
MELSEC iQ-R CPU Module User's Manual (Application)

*5 If a bit-specified word device is used in the random read processing, GT Simulator3 uses the value of the bit device in block No. 0 only. The bit device status depends on the SFC program status (active or inactive). When the SFC program is inactive, the bit device is off (stores 0).
If a step relay (S) is used in the random read processing, specify the relevant step relay (block) (BLS).

97.3.2 Setting virtual bit devices for servo amplifiers ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (RD77MS). The following items are displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (RD77GF).
[Master/Motion Module(CCIET)]	Select this item to connect the GOT through the master station on the CC-Link IE TSN and a Motion module (RD78G(H)). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
SP	[Motion Controller(SSCNET III/H)]	A(Axis No.)-SP(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	A64-SP0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-SP(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	UFF-A64-SP0
	[Master Module(CCIEF)]	SP(Device) • Device (decimal): 0 to 6	SP0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-SP(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	AA3-SP0

Device name	Device notation and setting range		Notation example
OM	[Motion Controller(SSCNET III/H)]	A(Axis No.)-OM(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	A64-OM0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OM(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	UFF-A64-OM0
	[Master Module(CCIEF)]	OM(Device) • Device (decimal): 0 to 2, 4 to 5	OM0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-OM(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	AA3-OM0
TMB	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMB(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	A64-TMB1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMB(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	UFF-A64-TMB1
	[Master Module(CCIEF)]	TMB(Device) • Device (decimal): 1 to 6	TMB1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMB(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	AA3-TMB1
OTI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-OTI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	A64-OTI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OTI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	UFF-A64-OTI0
	[Master Module(CCIEF)]	OTI(Device) • Device (decimal): 0 to 5	OTI0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-OTI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	AA3-OTI0
GFDI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-GFDI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A64-GFDI1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-GFDI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A64-GFDI1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-GFDI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-GFDI0
ECCDI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ECCDI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A64-ECCDI1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ECCDI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A64-ECCDI1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ECCDI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-ECCDI0

For indirect specification of a module number, axis number, or axis designation, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

To set a GOT data register (GD) to specify a module number, set [Module No. switching GD device first No. (16 points)] in the [Controller Setting] window.

For details, refer to the following.

☞ Page 729 [Controller Setting]

In GT SoftGOT3000, set [Module No. switching GD device first No. (16 points)] in the [Communication Setup] dialog.

📖GT SoftGOT3000 User's Manual

The following shows the correspondence between module numbers and GOT data registers (GD).

Ex.

When 550 is set to [Module No. switching GD device first No. (16 points)]

Sixteen consecutive devices, starting from GD550, are set to specify module numbers.

Module No.	GOT data registers (GD)	Setting range
100	GD550	[000] to [0FF] ([001] to [010] when [MELSEC iQ-F] is selected for [Controller Type] in the [Controller Setting] window) Setting a value outside the above range causes a device range error.
101	GD551	
:	:	
10E	GD564	
10F	GD565	

Upon the GOT startup, 0 is stored in the specified GD devices until values are set.

If you set the GD devices on the screen that appears upon the GOT startup, module No. 0 is monitored unintentionally, or a device range error occurs.

To avoid such situation, set the GD devices so that their values are retained at a power failure.

For details, refer to the following.

☞ Page 601 Configuring the settings for retaining GOT internal device data at power failure ([Internal Device Retention])

Precautions

■When the multi-channel connection is used

When setting GD devices for multiple channels, set different GD devices to [Module No. switching GD device first No. (16 points)].

GD10 to GD25 are used to specify the monitoring targets, such as the station number of an inverter.

When setting GD devices for a different channel, set different GD devices to [Module No. switching GD device first No. (16 points)].

■When the indirect specification function is used

Do not change the value of the specified device while a touch switch with the bit momentary is being pressed.

Doing so may cause the touch switch to exhibit unintended behavior.

Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

To use GOT data registers (GD) to specify an axis number or axis designation, set [Servo axis switching GD device first No. (16 points)] in the [Controller Setting] window.

For details, refer to the following.

☞ Page 729 [Controller Setting]

In GT SoftGOT3000, set [Servo axis switching GD device first No. (16 points)] in the [Communication Setup] dialog.

📖GT SoftGOT3000 User's Manual

The following shows the relationship between the axis number or axis designation and the GOT data register (GD).

Ex.

When 10 is set to [Servo axis switching GD device first No. (16 points)]

Sixteen consecutive devices, starting from GD10, are set to specify an axis number.

Axis No. or axis designation	GOT data registers (GD)	Setting range
100	GD10	• Axis number [1] to [64] • Axis designation [1]: Single-axis/Axis A [2]: Axis B [3]: Axis C Setting a value outside the above range causes a device range error.
101	GD11	
:	:	
114	GD24	
115	GD25	

Upon the GOT startup, 0 is stored in the specified GD devices until values are set.

If you set the GD devices on the screen that appears upon the GOT startup, a device range error occurs.

To avoid such situation, set the GD devices so that their values are retained at a power failure.

For details, refer to the following.

☞ Page 601 Configuring the settings for retaining GOT internal device data at power failure ([Internal Device Retention])

Precautions

■When the multi-channel connection is used

When specifying GD devices for multiple channels, set different GD devices to [Servo axis switching GD device first No. (16 points)].

GD10 to GD25 are used to specify the monitoring targets, such as the station number of an inverter.

When setting GD devices for a different channel, set different GD devices to [Servo axis switching GD device first No. (16 points)].

■When the indirect specification function is used

Do not change the value of the specified device while a touch switch with the bit momentary is being pressed.

Doing so may cause the touch switch to exhibit unintended behavior.

97.3.3 Availability of writing/reading data to/from bit devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/W	-/-	R/W	R/W	-/-
Y	R/W	-/-	R/W	R/W	-/-

JnW	Link register (link direct)	Hexadecimal	J(Network No.n)-W(Device) Notation example: J1-W00000 • Network No.n (decimal): 1 to 239 • Device (hexadecimal): 00000 to 83FFF	○	○
JnSW	Link special register (link direct)	Hexadecimal	J(Network No.n)-SW(Device) Notation example: J1-SW000 • Network No.n (decimal): 1 to 239 • Device (hexadecimal): 000 to FFF	○	○
U3E0G	CPU buffer memory access device	Decimal	U3E0-G(Device) Notation example: U3E0-G100 • Device (decimal): 0 to 268435455	○	○
U3E1G	CPU buffer memory access device	Decimal	U3E1-G(Device) Notation example: U3E1-G100 • Device (decimal): 0 to 268435455	○	○
U3E2G	CPU buffer memory access device	Decimal	U3E2-G(Device) Notation example: U3E2-G100 • Device (decimal): 0 to 268435455	○	○
U3E3G	CPU buffer memory access device	Decimal	U3E3-G(Device) Notation example: U3E3-G100 • Device (decimal): 0 to 268435455	○	○
RD	Refresh data register	Decimal	0 to 1048575	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.

☞ Page 3191 Virtual servo amplifier devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

*3 For the maximum number of devices when an extended SRAM cassette is installed, refer to the following.
MELSEC iQ-R CPU Module User's Manual (Application)

*4 For monitoring the multiple CPU high speed transmission memory, the CPU buffer memory access device (HG) for RCPU is monitored.
The CPU buffer memory access device (G) is not monitored.

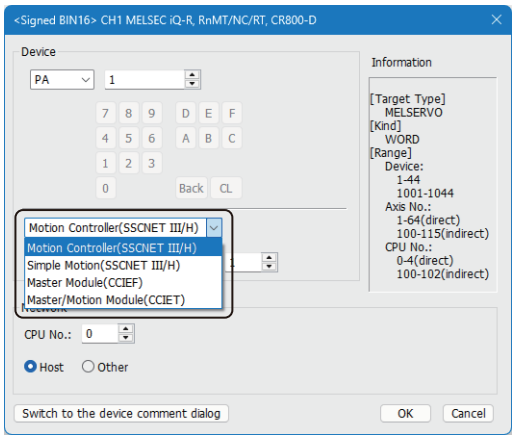
*5 The device name depends on the servo amplifier.
MR-J5-G(-RJ) or MR-J5W□-G: Motor extension setting parameter
Other than MR-J5-G(-RJ) or MR-J5W□-G: Linear servo motor/DD motor setting parameter

*6 PVS is a virtual device corresponding to the servo parameter (PV) of MR-J5-G(-RJ), MR-J5W□-G, and MR-JET-G.
Use the virtual device (PVS) to read/write data from/to the servo parameter (PV).

97.3.5 Setting virtual word devices for servo amplifiers ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (RD77MS). The following items are displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (RD77GF).
[Master/Motion Module(CCIET)]	Select this item to connect the GOT through the master station on the CC-Link IE TSN and a Motion module (RD78G(H)). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
PA	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PA(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	A64-PA1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PA(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	UFF-A64-PA1
	[Master Module(CCIEF)]	PA (Device) • Device (decimal): 1 to 44, 1001 to 1044	PA1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PA(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	AA3-PA1

Device name	Device notation and setting range		Notation example
PB	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PB(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	A64-PB1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PB(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	UFF-A64-PB1
	[Master Module(CCIEF)]	PB(Device) • Device (decimal): 1 to 92, 1001 to 1092	PB1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PB(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	AA3-PB1
PC	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PC(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	A64-PC1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PC(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	UFF-A64-PC1
	[Master Module(CCIEF)]	PC(Device) • Device (decimal): 1 to 90, 1001 to 1090	PC1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PC(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	AA3-PC1
PD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PD(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	A64-PD1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	UFF-A64-PD1
	[Master Module(CCIEF)]	PD(Device) • Device (decimal): 1 to 72, 1001 to 1072	PD1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	AA3-PD1
PO	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PO(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	A64-PO1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PO(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	UFF-A64-PO1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PO(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	AA3-PO1
PS	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PS(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	A64-PS1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PS(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	UFF-A64-PS1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	AA3-PS1

Device name	Device notation and setting range		Notation example
PU	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PU(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	A64-PU1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PU(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	UFF-A64-PU1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PU(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	AA3-PU1
PT	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PT(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	A64-PT1
	[Master Module(CCIEF)]	PT(Device) • Device (decimal): 1 to 90, 1001 to 1090	PT1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PT(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	AA3-PT1
PL	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PL(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	A64-PL1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PL(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	UFF-A64-PL1
	[Master Module(CCIEF)]	PL(Device) • Device (decimal): 1 to 72, 1001 to 1072	PL1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PL(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	AA3-PL1
PN	[Master Module(CCIEF)]	PN(Device) • Device (decimal): 1 to 32, 1001 to 1032	PN1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PN(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	AA3-PN1
PVS	[Master/Motion Module(CCIET)]	AA(Axis designation)-PVS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	AA3-PVS1
ST	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ST(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	A64-ST0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ST(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	UFF-A64-ST0
	[Master Module(CCIEF)]	ST(Device) • Device (decimal): 0 to 48	ST0

*1 Only reading is available for NPA1 and NPA2001 to NPA2032.

*2 Only reading is available for OTS0 to OTS5.

97.3.7 Monitoring-supported double-word devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

The following table shows monitoring-supported double-word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3190 Availability of writing/reading data to/from double-word devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
LTN*4	Long timer current value	Decimal	0 to 2529407	×	×
LCN*4	Long counter current value	Decimal	0 to 4761215	×	×
LSN*4	Long retentive timer current value	Decimal	0 to 2529407	×	×
ZZ	Index register (32 bits)	Decimal	0 to 22	×	×
LZ	Index register (32 bits)	Decimal	0 to 11	×	×
ALD*2	Life diagnosis	Decimal	☞ Page 3188 Setting virtual double-word devices for servo amplifiers ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])	×	×
TMI*2	Input signal for test operation (for test operation)	Decimal	☞ Page 3188 Setting virtual double-word devices for servo amplifiers ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])	×	×
TMO*2	Forced output of signal pin (for test operation)	Decimal	☞ Page 3188 Setting virtual double-word devices for servo amplifiers ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])	×	×
TMD*2	Set data (for test operation)	Decimal	☞ Page 3188 Setting virtual double-word devices for servo amplifiers ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])	×	×
AL*3	Faults history	Decimal	0 to 899	×	×
LPr*3*5	Parameter (32-bit)	Decimal	0 to 1500	×	×
OP*3	Operation parameter	Decimal	0 to 5	×	×
PV*3	Current value monitor	Decimal	1 to 143	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3191 Virtual servo amplifier devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

*3 Virtual inverter device
For details, refer to the following.
☞ Page 3243 Virtual inverter devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

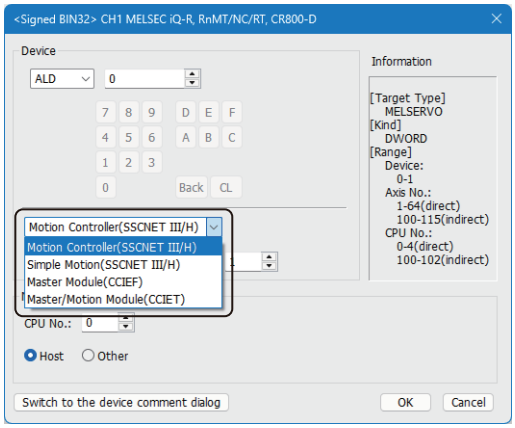
*4 For the maximum number of devices when an extended SRAM cassette is installed, refer to the following.
MELSEC iQ-R CPU Module User's Manual (Application)

*5 If you specify LPr900 to LPr935, the following item is displayed in the device setting dialog.
[Setting items (for calibration parameters)]: [Bias/gain value], [Analog input value]
Enclose the device number in parentheses when selecting [Analog input value].
Example 1) Notation when [Bias/gain value] is selected: LPr900
Example 2) Notation when [Analog input value] is selected: LPr(900)
When LPr900 or LPr901 (Calibration parameter) is specified, selecting [Bias/gain value] or [Analog input value] does not affect the monitoring target.

97.3.8 Setting virtual double-word devices for servo amplifiers ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (RD77MS). The following items are displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (RD77GF).
[Master/Motion Module(CCIET)]	Select this item to connect the GOT through the master station on the CC-Link IE TSN and a Motion module (RD78G(H)). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
ALD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ALD(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A64-ALD0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ALD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A64-ALD0
	[Master Module(CCIEF)]	ALD(Device) • Device (decimal): 0 to 1	ALD0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ALD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-ALD0

Device name	Device notation and setting range		Notation example
TMI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	A64-TMI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	UFF-A64-TMI0
	[Master Module(CCIEF)]	TMI(Device) • Device (decimal): 0 to 2	TMI0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	AA3-TMI0
TMO	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMO(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0	A64-TMO0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMO(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0	UFF-A64-TMO0
	[Master Module(CCIEF)]	TMO(Device) • Device (decimal): 0	TMO0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMO(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0	AA3-TMO0
TMD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMD(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	A64-TMD0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	UFF-A64-TMD0
	[Master Module(CCIEF)]	TMD(Device) • Device (decimal): 0 to 1, 3	TMD0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	AA3-TMD0

For indirect specification of a module number, axis number, or axis designation, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.3.9 Availability of writing/reading data to/from double-word devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

The following shows the availability of writing/reading data to/from double-word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of double-word data

When using the encoder communication circuit diagnosis instruction, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Basic parameter ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

Use an appropriate device according to the write destination of the servo amplifier.

- PA1 to PA44: Writing data to the RAM of a servo amplifier
- PA1001 to PA1044: Writing data to the FlashROM or EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

I/O setting parameter ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

Use an appropriate device according to the write destination of the servo amplifier.

- PD1 to PD72: Writing data to the RAM of a servo amplifier
- PD1001 to PD1072: Writing data to the FlashROM or EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Network setting parameter ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

Use an appropriate device according to the write destination of the servo amplifier.

- PN1 to PN32: Writing data to the RAM of a servo amplifier
- PN1001 to PN1032: Writing data to the FlashROM or EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Extension setting No.2 parameter ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

Use an appropriate device according to the write destination of the servo amplifier.

- PE1 to PE88: Writing data to the RAM of a servo amplifier
- PE1001 to PE1088: Writing data to the FlashROM or EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Extension setting No.4 parameter ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

Use an appropriate device according to the write destination of the servo amplifier.

- PW1 to PW99: Writing data to the RAM of a servo amplifier
- PW1001 to PW1099: Writing data to the FlashROM or EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

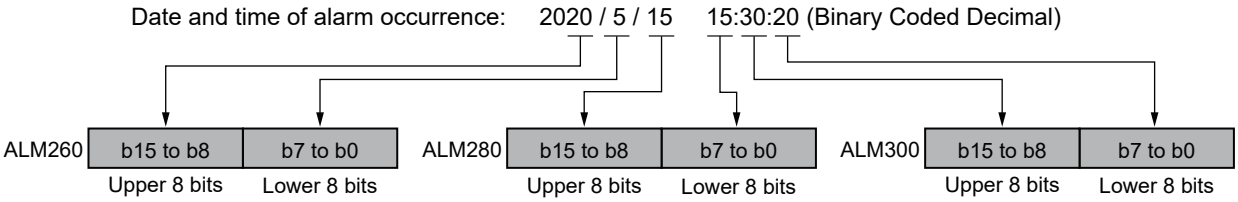
*1 Set [Data Type] and [Format] as shown below for the objects for which this device is set.
[Data Type]: [Unsigned BIN32]
[Format]: [Hexadecimal]

Specifications of ALM260 to ALM275, ALM280 to ALM295, and ALM300 to ALM315 ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

The date and time of alarm occurrence are stored in BCD code in the upper eight bits and lower eight bits of each device.
The time zone setting of the controller is applied to the date and time to be acquired.

Ex.
When the date and time of the most recent alarm occurrence is 15:30:20 May 15, 2020



In either of the following cases, 0 is stored.

- When the date and time of alarm occurrence are those of 1999 or earlier
- When the controller is MR-J5(W)-B(-RJ) or MR-J5-B-LL

Point table (position) ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

Use an appropriate device according to the write destination of the servo amplifier.

- POS1 to POS255: Writing data to the RAM of a servo amplifier
- POS1001 to POS1255: Writing data to the FlashROM or EEPROM of a servo amplifier

MD21	Machine diagnosis data: Belt tension threshold estimation	—	—	—	—	—	—	○	○	○	○	○*3

*1 While the servo amplifier is estimating the corresponding machine status in the machine diagnosis, do not write data to the parameters of the servo amplifier from another GOT.
Doing so may cause the servo amplifier to malfunction.

*2 When MD2 indicates that the servo amplifier does not complete the machine diagnosis (is estimating or warning of the machine status), do not monitor MD3 to MD6 (friction states) and MD7 to MD10 (vibration/oscillation states).
To start monitoring those devices upon the estimation completion, set [Trigger] in the applicable object settings.

*3 The commands assigned to MD12 to MD21 are not supported by MR-JET-G.
When the commands are used, the read values will be indefinite.

When using the set data (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

97.3.11 Precautions for virtual servo amplifier devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

When handling real numbers for virtual servo amplifier devices

For the servo amplifier, if a real number is written to a virtual device, only the integer portion of the number is stored into the device.

Ex.

When 12.34 is entered with the numerical input on the GOT, the value is written as 1234 to the device of the servo amplifier.

If the data type of the virtual servo amplifier device is set to [Real], the value after the writing may differ from the one before the writing.

Additionally, the monitoring process may take a longer time.

Therefore, select one of the following items as the data type of the virtual device.

- Signed 16-bit binary data
- Unsigned 16-bit binary data
- Signed 32-bit binary data
- Unsigned 32-bit binary data

When you use the value of the virtual servo amplifier device, remember that only the integer portion of the value is stored in the device.

To display a real number on the numerical display or numerical input object, set [Format] to [Real] and select [Adjust Decimal Point Range] in the object setting.

Data type and format settings for using virtual servo amplifier devices

To specify virtual servo amplifier devices in the object setting or other settings, the data type and format must be set according to the notation of the values handled by the virtual devices.

For notation of the virtual device values, refer to the following.

Instruction manual for the servo amplifier used

MR Configurator2 Help

When real numbers are stored in virtual devices, set the data type as shown below instead of setting [Real].

The following shows a setting example for using virtual servo amplifier devices for an object.

Ex.

When using a numerical display

Notation of the virtual device values	Setting
Decimal number (positive values only)	• [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 65536 or more) • [Format]: [Unsigned Decimal]
Decimal number (positive and negative values)	• [Data Type]: [Signed BIN16] ([Signed BIN32] for -32769 or less, and 32768 or more) • [Format]: [Signed Decimal]
Hexadecimal number	• [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 0x10000 or more) • [Format]: [Hexadecimal]
Decimal point notation (positive values only)	• [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] as necessary) • [Format]: [Real] • [Digits (Integral)]: Set the number of digits in the integral portion. • [Digits (Fractional)]: Set the number of digits in the fractional portion. • [Adjust Decimal Point Range]: Selected
Decimal point notation (positive and negative values)	• [Data Type]: [Signed BIN16] ([Signed BIN32] as necessary) • [Format]: [Real] • [Digits (Integral)]: Set the number of digits in the integral portion. • [Digits (Fractional)]: Set the number of digits in the fractional portion. • [Adjust Decimal Point Range]: Selected
When the notation varies by digit	• [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 0x10000 or more) • [Format]: [Hexadecimal] • On the [Operation/Script] tab, select [Data Operation] for [Operation Type], and set [Bit Mask] or [Bit Shift].

Specifying consecutive virtual servo amplifier devices

The GOT does not support writing/reading data to/from consecutive virtual servo amplifier devices.

97.3.12 Virtual inverter devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

The following shows the correspondence between the virtual devices used in the GOT and the inverter data.

For the relationship between the parameters and terminals, refer to the following.
Manual of the inverter used

*2 Use an inverter having SERIAL (serial number) "□□211○○○○○○" or later.
SERIAL (serial number) is provided on the rating plate of the inverter.

Operation command ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

*1 When the GOT is connected to the PU connector and the operation mode is set to the PU operation mode, the device cannot be used.

*2 The monitor data can be changed by the settings of Pr.178 to Pr.189 (input terminal function selection).
For the relationship between the parameters and terminals, refer to the following.
📖Manual of the inverter used

*3 The device is invalid for the initial state of the inverter in which a function that cannot be controlled by the GOT is set or no function is set.
Change the relevant setting in Pr.178 to Pr.189 (input terminal function selection).

*4 Use an inverter having SERIAL (serial number) "□□211○○○○○○" or later.
SERIAL (serial number) is provided on the rating plate of the inverter.

When using the operation command, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.
Operation when a CMD device is turned on	☞ Page 3246 Operation when turning on/off one of the CMD3 to CMD12 devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D]) ☞ Page 3246 Operation when turning on/off one of the CMD48 to CMD52 devices (MELSEC iQ-R, RnMT/NC/RT, CR800-D])

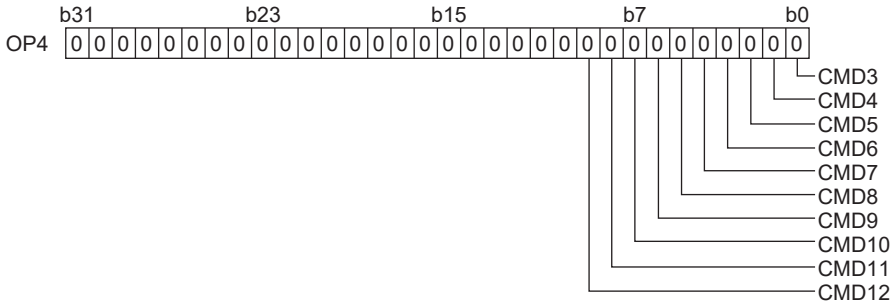
Operation when turning on/off one of the CMD3 to CMD12 devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

The CMD3 to CMD12 devices cannot be controlled simultaneously.

When you turn on/off one of the CMD3 to CMD12 devices, the rest of these devices are turned off.

Use OP4 to control multiple devices from CMD3 to CMD12 simultaneously.

The following shows the relationship between CMD3 to CMD12 and OP4.



Ex.

Turning on the CMD3 (RL terminal) and CMD12 (RES terminal) devices

For a hexadecimal value, write 0201.

For a decimal value, write 513.

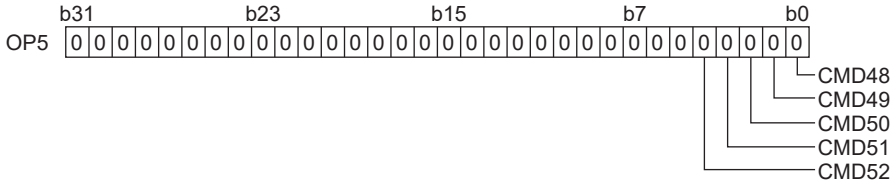
Operation when turning on/off one of the CMD48 to CMD52 devices (MELSEC iQ-R, RnMT/NC/RT, CR800-D])

The CMD48 to CMD52 devices cannot be controlled simultaneously.

When you turn on/off one of the CMD48 to CMD52 devices, the rest of these devices are turned off.

Use OP5 to control multiple devices from CMD48 to CMD52 simultaneously.

The following shows the relationship between CMD48 to CMD52 and OP5.



Ex.

Turning on the CMD48 (NET X1 input) and CMD52 (NET X5 input) devices

For a hexadecimal value, write 0011.

For a decimal value, write 17.

Alarm history ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

Parameter (32-bit) ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

The virtual device numbers (LPr) used in the GOT correspond to the inverter parameter numbers.

For the inverter parameters, refer to the following.

Manual of the inverter used

When using a parameter (32-bit), note the following.

Precautions	Description
When setting 8888 or 9999 to a 32-bit parameter (LPr) of an inverter	Values 8888 and 9999 are used for particular purposes. From the GOT, if you set these numbers to a parameter that can accept a value with a fractional part, it is recommended to set the data type to [Real].

Operation parameter ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

LCT	Long counter contact	Decimal	0 to 413695	○	○ Not usable as word data
LSC	Long retentive timer coil	Decimal	0 to 219775	○	○ Not usable as word data
LSS	Long retentive timer contact	Decimal	0 to 219775	○	○ Not usable as word data

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
BL	SFC block	Decimal	0 to 319	×	×
BLS	Step relay (block)	Decimal	BL(SFC Block No.)-S(Device) Notation example: BL1-S3 • SFC Block No. (decimal): 0 to 319 • Device (decimal): 0 to 511	×	×
SP*2	Servo amplifier request	Decimal	☞ Page 3256 Setting virtual bit devices for servo amplifiers ([MELSEC iQ- L])	×	×
OM*2	Operation mode selection	Decimal	☞ Page 3256 Setting virtual bit devices for servo amplifiers ([MELSEC iQ- L])	×	×
TMB*2	Instruction demand (for test operation)	Decimal	☞ Page 3256 Setting virtual bit devices for servo amplifiers ([MELSEC iQ- L])	×	×
OTI*2	One-touch tuning instruction	Decimal	☞ Page 3256 Setting virtual bit devices for servo amplifiers ([MELSEC iQ- L])	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

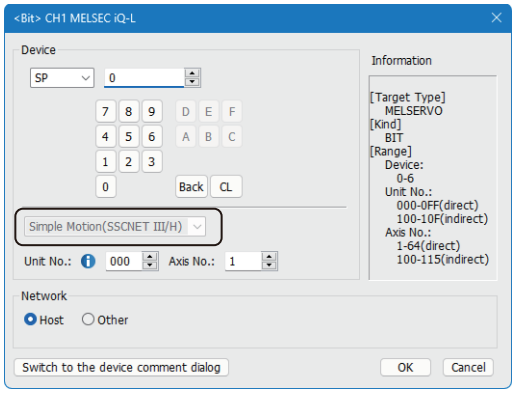
*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3264 Virtual servo amplifier devices ([MELSEC iQ- L])

*3 If a bit-specified word device is used in the random read processing, GT Simulator3 uses the value of the bit device in block No. 0 only. The bit device status depends on the SFC program status (active or inactive). When the SFC program is inactive, the bit device is off (stores 0).
If a step relay (S) is used in the random read processing, specify the relevant step relay (block) (BLS).

97.4.2 Setting virtual bit devices for servo amplifiers ([MELSEC iQ- L])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

When [MELSEC iQ-L] is selected, the connection type is fixed as shown in the following table.



Item	Description
[Simple Motion(SSCNET III/H)]	Connection through a Simple Motion module • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
SP	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-SP(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	UFF-A64-SP0
OM	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OM(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	UFF-A64-OM0
TMB	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMB(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	UFF-A64-TMB1
OTI	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OTI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	UFF-A64-OTI0

For indirect specification of a module or axis number, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.4.3 Availability of writing/reading data to/from bit devices ([MELSEC iQ- L])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/W	-/-	R/W	R/W	-/-
Y	R/W	-/-	R/W	R/W	-/-
B	R/W	-/-	R/W	R/W	-/-
M	R/W	-/-	R/W	R/W	-/-
L	R/W	-/-	R/W	R/W	-/-

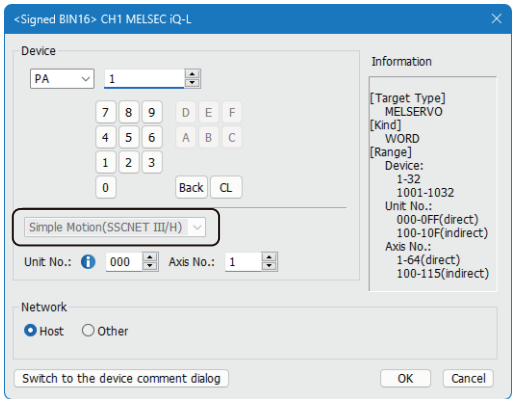
97.4.5 Setting virtual word devices for servo amplifiers ([MELSEC iQ- L])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

When [MELSEC iQ-L] is selected, the connection type is fixed as shown in the following table.



Item	Description
[Simple Motion(SSCNET III/H)]	Connection through a Simple Motion module • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
PA	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PA(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	UFF-A64-PA1
PB	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PB(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 64, 1001 to 1064	UFF-A64-PB1
PC	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PC(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 80, 1001 to 1080	UFF-A64-PC1

Device name	Device notation and setting range		Notation example
PD	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 48, 1001 to 1048	UFF-A64-PD1
PL	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PL(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 48, 1001 to 1048	UFF-A64-PL1
ST	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ST(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	UFF-A64-ST0
PE	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PE(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 64, 1001 to 1064	UFF-A64-PE1
PF	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PF(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 64, 1001 to 1064	UFF-A64-PF1
ALM	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ALM(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 11 to 59, 200 to 215, 220 to 235, 240 to 255	UFF-A64-ALM0
MD	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-MD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 18	UFF-A64-MD0
OTS	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OTS(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 3	UFF-A64-OTS0
DI	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-DI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	UFF-A64-DI0
DO	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-DO(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 4	UFF-A64-DO0

For indirect specification of a module or axis number, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3264 Virtual servo amplifier devices ([MELSEC iQ- L])

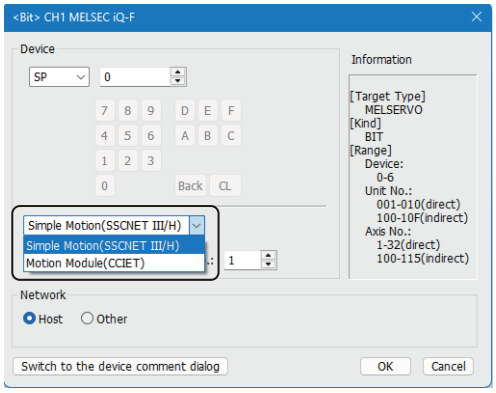
*3 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3278 Virtual servo amplifier devices ([MELSEC iQ-F])

*4 The target device of the host station can be monitored only.
Monitoring the target device of any other station causes a system error.

97.5.2 Setting virtual bit devices for servo amplifiers ([MELSEC iQ-F])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Simple Motion(SSCNET III/H)]	Connection through a Simple Motion module • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Motion Module(CCIET)]	Select this item to connect the GOT through a Motion module (FX5-nSSC-G). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
SP	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-SP(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	U10-A32-SP0
	[Motion Module(CCIET)]	AA(Axis designation)-SP(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	AA3-SP0
OM	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OM(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	U10-A32-OM0
	[Motion Module(CCIET)]	AA(Axis designation)-OM(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	AA3-OM0
TMB	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMB(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	U10-A32-TMB1
	[Motion Module(CCIET)]	AA(Axis designation)-TMB(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	AA3-TMB1
OTI	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OTI(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	U10-A32-OTI0
	[Motion Module(CCIET)]	AA(Axis designation)-OTI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	AA3-OTI0
GFDI	[Motion Module(CCIET)]	AA(Axis designation)-GFDI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-GFDI0

Device name	Device notation and setting range		Notation example
ECCDI	[Motion Module(CCIET)]	AA(Axis designation)-ECCDI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-ECCDI0

For indirect specification of a module or axis number, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.5.3 Availability of writing/reading data to/from bit devices ([MELSEC iQ-F])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/W	-/-	R/W	R/W	-/-
Y	R/W	-/-	R/W	R/W	-/-
B	R/W	-/-	R/W	R/W	-/-
M	R/W	-/-	R/W	R/W	-/-
L	R/W	-/-	R/W	R/W	-/-
S	R/W	-/-	R/W	R/W	-/-
F	R/W	-/-	R/W	R/W	-/-
TC	R/W	-/-	-/-	-/-	-/-

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3278 Virtual servo amplifier devices ([MELSEC iQ-F])

*3 The target device of the host station can be monitored only.
Monitoring the target device of any other station causes a system error.

*4 Available for the file register of block No. switched with the RSET instruction.

*5 Only the intelligent function module on the station connected to GOT can be specified.
Set the buffer memory within the address range of the buffer memory existing in the intelligent function module.

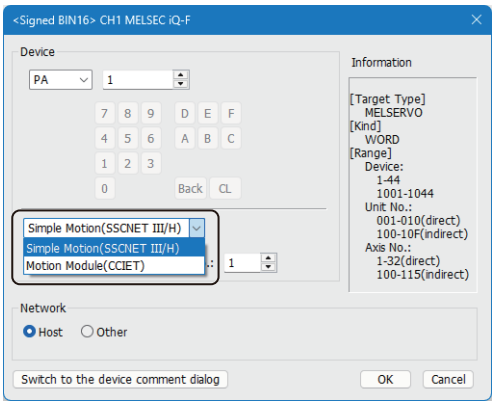
*6 The device name depends on the servo amplifier.
MR-J5-G(-RJ) or MR-J5W□-G: Motor extension setting parameter
Other than MR-J5-G(-RJ) or MR-J5W□-G: Linear servo motor/DD motor setting parameter

*7 PVS is a virtual device corresponding to the servo parameter (PV) of MR-J5-G(-RJ), MR-J5W□-G, and MR-JET-G.
Use the virtual device (PVS) to read/write data from/to the servo parameter (PV).

97.5.5 Setting virtual word devices for servo amplifiers ([MELSEC iQ-F])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Simple Motion(SSCNET III/H)]	Connection through a Simple Motion module • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Motion Module(CCIET)]	Select this item to connect the GOT through a Motion module (FX5-nSSC-G). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
PA	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PA(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	U10-A32-PA1
	[Motion Module(CCIET)]	AA(Axis designation)-PA(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	AA3-PA1
PB	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PB(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	U10-A32-PB1
	[Motion Module(CCIET)]	AA(Axis designation)-PB(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	AA3-PB1
PC	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PC(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	U10-A32-PC1
	[Motion Module(CCIET)]	AA(Axis designation)-PC(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	AA3-PC1
PD	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PD(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	U10-A32-PD1
	[Motion Module(CCIET)]	AA(Axis designation)-PD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	AA3-PD1
PO	[Motion Module(CCIET)]	AA(Axis designation)-PO(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	AA3-PO1

Device name	Device notation and setting range		Notation example
PS	[Motion Module(CCIET)]	AA(Axis designation)-PS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	AA3-PS1
PU	[Motion Module(CCIET)]	AA(Axis designation)-PU(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	AA3-PU1
PT	[Motion Module(CCIET)]	AA(Axis designation)-PT(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	AA3-PT1
PL	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PL(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	U10-A32-PL1
	[Motion Module(CCIET)]	AA(Axis designation)-PL(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	AA3-PL1
PN	[Motion Module(CCIET)]	AA(Axis designation)-PN(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	AA3-PN1
PVS	[Motion Module(CCIET)]	AA(Axis designation)-PVS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	AA3-PVS1
ST	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ST(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	U10-A32-ST0
	[Motion Module(CCIET)]	AA(Axis designation)-ST(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	AA3-ST0
PE	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PE(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 88, 1001 to 1088	U10-A32-PE1
	[Motion Module(CCIET)]	AA(Axis designation)-PE(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 88, 1001 to 1088	AA3-PE1
PF	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PF(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	U10-A32-PF1
	[Motion Module(CCIET)]	AA(Axis designation)-PF(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	AA3-PF1
NPA	[Motion Module(CCIET)]	NPA(Device) • Device (decimal): 1 to 12, 2001 to 2032	NPA1
ALM	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ALM(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 11 to 59, 200 to 215, 220 to 235, 240 to 255, 260 to 275, 280 to 295, 300 to 315	U10-A32-ALM0
	[Motion Module(CCIET)]	AA(Axis designation)-ALM(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 11 to 59, 200 to 215, 220 to 235, 240 to 255, 260 to 275, 280 to 295, 300 to 315	AA3-ALM0
POS	[Motion Module(CCIET)]	AA(Axis designation)-POS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-POS1
SPD	[Motion Module(CCIET)]	AA(Axis designation)-SPD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-SPD1
ACT	[Motion Module(CCIET)]	AA(Axis designation)-ACT(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-ACT1

Device name	Device notation and setting range		Notation example
DCT	[Motion Module(CCIET)]	AA(Axis designation)-DCT(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-DCT1
DWL	[Motion Module(CCIET)]	AA(Axis designation)-DWL(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-DWL1
AUX	[Motion Module(CCIET)]	AA(Axis designation)-AUX(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-AUX1
MCD	[Motion Module(CCIET)]	AA(Axis designation)-MCD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-MCD1
MD	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-MD(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 21	U10-A32-MD0
	[Motion Module(CCIET)]	AA(Axis designation)-MD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 21	AA3-MD0
GFDS	[Motion Module(CCIET)]	AA(Axis designation)-GFDS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	AA3-GFDS0
ECCDS	[Motion Module(CCIET)]	AA(Axis designation)-ECCDS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	AA3-ECCDS0
OTS	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OTS(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5, 3000	U10-A32-OTS0
	[Motion Module(CCIET)]	AA(Axis designation)-OTS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5, 3000	AA3-OTS0
DI	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-DI(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	U10-A32-DI0
	[Motion Module(CCIET)]	AA(Axis designation)-DI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	AA3-DI0
DO	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-DO(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 4	U10-A32-DO0
	[Motion Module(CCIET)]	AA(Axis designation)-DO(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 4	AA3-DO0

For indirect specification of a module or axis number, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.5.6 Availability of writing/reading data to/from word devices ([MELSEC iQ-F])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type

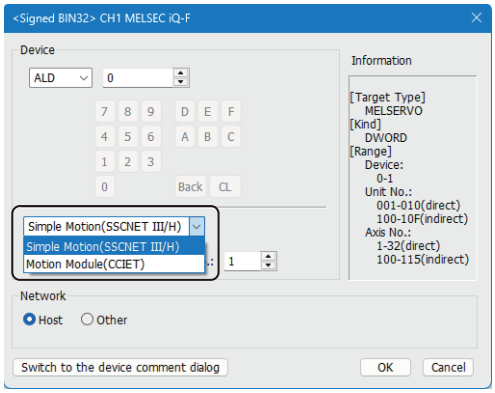
*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3278 Virtual servo amplifier devices ([MELSEC iQ-F])

97.5.8 Setting virtual double-word devices for servo amplifiers ([MELSEC iQ-F])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Simple Motion(SSCNET III/H)]	Connection through a Simple Motion module • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Motion Module(CCIET)]	Select this item to connect the GOT through a Motion module (FX5-nSSC-G). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
ALD	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ALD(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	U10-A32-ALD0
	[Motion Module(CCIET)]	AA(Axis designation)-ALD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-ALD0
TMI	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMI(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	U10-A32-TMI0
	[Motion Module(CCIET)]	AA(Axis designation)-TMI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	AA3-TMI0
TMO	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMO(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0	U10-A32-TMO0
	[Motion Module(CCIET)]	AA(Axis designation)-TMO(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0	AA3-TMO0
TMD	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMD(Device) • Unit No. (hexadecimal): 01 to 10 (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	U10-A32-TMD0
	[Motion Module(CCIET)]	AA(Axis designation)-TMD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	AA3-TMD0

For indirect specification of a module or axis number, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.5.9 Availability of writing/reading data to/from double-word devices ([MELSEC iQ-F])

The following shows the availability of writing/reading data to/from double-word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of double-word data
LCN	-/-	R/W	-/-	-/-
LZ	-/-	R/W	-/-	-/-

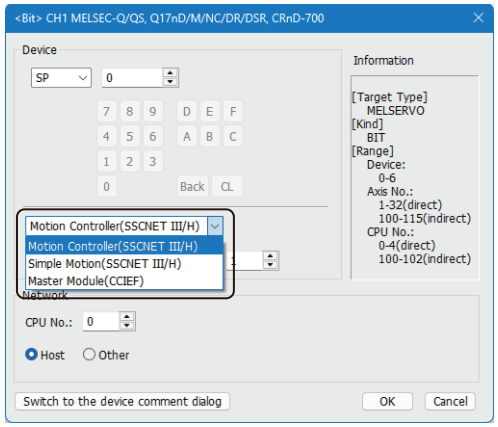
97.6.2 Setting virtual bit devices for servo amplifiers ([MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (QD77MS). The following item is displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (QD77GF).

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
SP	[Motion Controller(SSCNET III/H)]	A(Axis No.)-SP(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	A32-SP0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-SP(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	UFF-A32-SP0
	[Master Module(CCIEF)]	SP(Device) • Device (decimal): 0 to 6	SP0
OM	[Motion Controller(SSCNET III/H)]	A(Axis No.)-OM(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	A32-OM0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OM(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	UFF-A32-OM0
	[Master Module(CCIEF)]	OM(Device) • Device (decimal): 0 to 2, 4 to 5	OM0

Device name	Device notation and setting range		Notation example
TMB	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMB(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	A32-TMB1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMB(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	UFF-A32-TMB1
	[Master Module(CCIEF)]	TMB(Device) • Device (decimal): 1 to 6	TMB1
OTI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-OTI(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	A32-OTI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OTI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	UFF-A32-OTI0
	[Master Module(CCIEF)]	OTI(Device) • Device (decimal): 0 to 5	OTI0
GFDI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-GFDI(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A32-GFDI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-GFDI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A32-GFDI0
ECCDI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ECCDI(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A32-ECCDI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ECCDI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A32-ECCDI0

For indirect specification of a module or axis number, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.6.3 Availability of writing/reading data to/from bit devices ([MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

The GOT can only read data from the device when the QS001CPU is used.

To write data to the consecutive devices of a Q172DR(CR750-Q), use the Q172DR(CR750-Q) with firmware version R6b or later.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/W	-/-	R/W	R/W	-/-

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3295 Virtual servo amplifier devices ([MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700])

*3 Do not set a file register by GT Designer3 when executing multiple programs with the file of the file register set at [Use the same file name as the program.] by the PLC parameter of GX Developer.
Otherwise, read or write at GOT will be erroneous.

*4 Available for the file register of block No. switched with the RSET instruction.

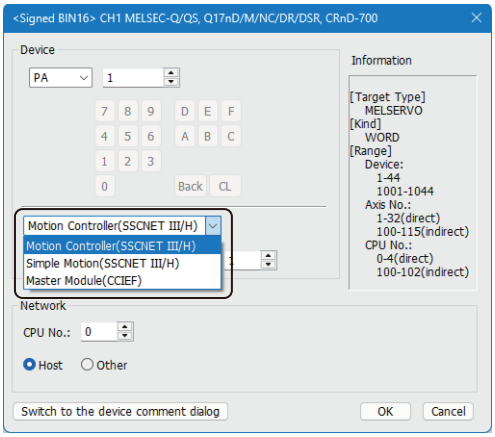
*5 Available for the file register of block number of file name switched with the QDRSET instruction.

*6 Do not use the local device set in a MELSEC-Q system.
If used, the correct monitoring is disabled.

97.6.5 Setting virtual word devices for servo amplifiers ([MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (QD77MS). The following item is displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (QD77GF).

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
PA	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PA(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	A32-PA1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PA(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	UFF-A32-PA1
	[Master Module(CCIEF)]	PA (Device) • Device (decimal): 1 to 44, 1001 to 1044	PA1
PB	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PB(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	A32-PB1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PB(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	UFF-A32-PB1
	[Master Module(CCIEF)]	PB(Device) • Device (decimal): 1 to 92, 1001 to 1092	PB1

Device name	Device notation and setting range		Notation example
PC	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PC(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	A32-PC1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PC(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	UFF-A32-PC1

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.6.6 Availability of writing/reading data to/from word devices ([MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700])

The following shows the availability of writing/reading data to/from word devices by device type.

The GOT can only read data from the device when the QS001CPU is used.

To write data to the consecutive devices of a Q172DR(CR750-Q), use the Q172DR(CR750-Q) with firmware version R6b or later.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3295 Virtual servo amplifier devices ([MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700])

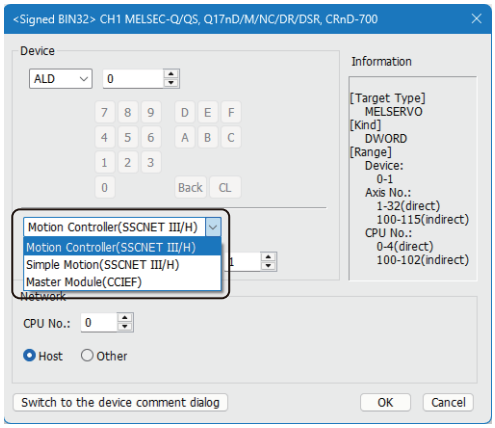
*3 Virtual inverter device
For details, refer to the following.
☞ Page 3296 Virtual inverter devices ([MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700])

*4 If you specify LPr900 to LPr935, the following item is displayed in the device setting dialog.
[Setting items (for calibration parameters)]: [Bias/gain value], [Analog input value]
Enclose the device number in parentheses when selecting [Analog input value].
Example 1) Notation when [Bias/gain value] is selected: LPr900
Example 2) Notation when [Analog input value] is selected: LPr(900)
When LPr900 or LPr901 (Calibration parameter) is specified, selecting [Bias/gain value] or [Analog input value] does not affect the monitoring target.

97.6.8 Setting virtual double-word devices for servo amplifiers ([MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (QD77MS). The following item is displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (QD77GF).

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
ALD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ALD(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A32-ALD0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ALD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A32-ALD0
	[Master Module(CCIEF)]	ALD(Device) • Device (decimal): 0 to 1	ALD0
TMI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMI(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	A32-TMI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	UFF-A32-TMI0
	[Master Module(CCIEF)]	TMI(Device) • Device (decimal): 0 to 2	TMI0

Device name	Device notation and setting range		Notation example
TMO	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMO(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0	A32-TMO0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMO(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0	UFF-A32-TMO0
	[Master Module(CCIEF)]	TMO(Device) • Device (decimal): 0	TMO0
TMD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMD(Device) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	A32-TMD0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	UFF-A32-TMD0
	[Master Module(CCIEF)]	TMD(Device) • Device (decimal): 0 to 1, 3	TMD0

For indirect specification of a module or axis number, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.6.9 Availability of writing/reading data to/from double-word devices ([MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700])

The following shows the availability of writing/reading data to/from double-word devices by device type.

The GOT can only read data from the device when the QS001CPU is used.

To write data to the consecutive devices of a Q172DR(CR750-Q), use the Q172DR(CR750-Q) with firmware version R6b or later.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.

☞ Page 3310 Virtual servo amplifier devices ([MELSEC-L])

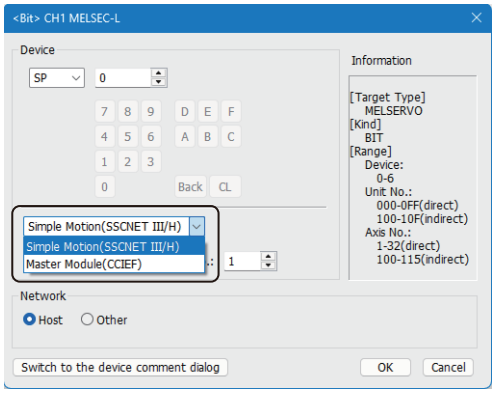
*3 Virtual inverter device
For details, refer to the following.
☞ Page 3311 Virtual inverter devices ([MELSEC-L])

*4 Do not use the local device set in a MELSEC-L system.
If used, the correct monitoring is disabled.
D32768 or later can be used for data register (D).

97.7.2 Setting virtual bit devices for servo amplifiers ([MELSEC-L])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (LD77MS). The following item is displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
SP	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-SP(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	UFF-A32-SP0
	[Master Module(CCIEF)]	SP(Device) • Device (decimal): 0 to 6	SP0
OM	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OM(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	UFF-A32-OM0
	[Master Module(CCIEF)]	OM(Device) • Device (decimal): 0 to 2, 4 to 5	OM0
TMB	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMB(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	UFF-A32-TMB1
	[Master Module(CCIEF)]	TMB(Device) • Device (decimal): 1 to 6	TMB1
OTI	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OTI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	UFF-A32-OTI0
	[Master Module(CCIEF)]	OTI(Device) • Device (decimal): 0 to 5	OTI0

For indirect specification of a module or axis number, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.7.3 Availability of writing/reading data to/from bit devices ([MELSEC-L])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/W	-/-	R/W	R/W	-/-
Y	R/W	-/-	R/W	R/W	-/-
B	R/W	-/-	R/W	R/W	-/-
M	R/W	-/-	R/W	R/W	-/-
L	R/W	-/-	R/W	R/W	-/-
S	R/W	-/-	R/W	R/W	-/-
F	R/W	-/-	R/W	R/W	-/-
TC	R/W	-/-	-/-	-/-	-/-
TT	R/W	-/-	-/-	-/-	-/-
CC	R/W	-/-	-/-	-/-	-/-
CT	R/W	-/-	-/-	-/-	-/-
SC	R/W	-/-	-/-	-/-	-/-
SS	R/W	-/-	-/-	-/-	-/-
SB	R/W	-/-	R/W	R/W	-/-
SM	R/W	-/-	R/W	R/W	-/-
RX	R/W	-/-	R/W	R/W	-/-
RY	R/W	-/-	R/W	R/W	-/-
SP	-/W	-/-	-/-	-/-	-/-
OM	-/W	-/-	-/-	-/-	-/-
TMB	-/W	-/-	-/-	-/-	-/-
OTI	-/W	-/-	-/-	-/-	-/-
IOST	R/-	-/-	-/-	-/-	-/-
CMD	-/W	-/-	-/-	-/-	-/-

97.7.4 Monitoring-supported word devices ([MELSEC-L])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3307 Availability of writing/reading data to/from word devices ([MELSEC-L])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications[*1]	
				Assignment to EG devices	Access using a client
TN[*6]	Timer current value	Decimal	0 to 32767	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 3310 Virtual servo amplifier devices ([MELSEC-L])

*3 Do not set a file register by GT Designer3 when executing multiple programs with the file of the file register set at [Use the same file name as the program.] by the PLC parameter of GX Developer.
Otherwise, read or write at GOT will be erroneous.

*4 Available for the file register of block No. switched with the RSET instruction.

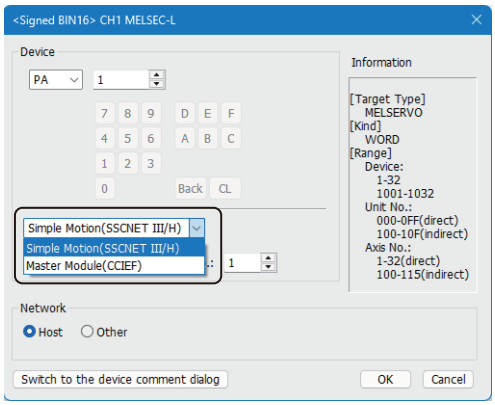
*5 Available for the file register of block number of file name switched with the QDRSET instruction.

*6 Do not use the local device set in a MELSEC-L system.
If used, the correct monitoring is disabled.
D32768 or later can be used for data register (D).

97.7.5 Setting virtual word devices for servo amplifiers ([MELSEC-L])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (LD77MS). The following item is displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
PA	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PA(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	UFF-A32-PA1
	[Master Module(CCIEF)]	PA (Device) • Device (decimal): 1 to 32, 1001 to 1032	PA1
PB	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PB(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 64, 1001 to 1064	UFF-A32-PB1
	[Master Module(CCIEF)]	PB(Device) • Device (decimal): 1 to 64, 1001 to 1064	PB1
PC	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PC(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 80, 1001 to 1080	UFF-A32-PC1
	[Master Module(CCIEF)]	PC(Device) • Device (decimal): 1 to 80, 1001 to 1080	PC1
PD	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 48, 1001 to 1048	UFF-A32-PD1
	[Master Module(CCIEF)]	PD(Device) • Device (decimal): 1 to 48, 1001 to 1048	PD1
PT	[Master Module(CCIEF)]	PT(Device) • Device (decimal): 1 to 80, 1001 to 1080	PT1

Device name	Device notation and setting range		Notation example
PL	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PL(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 48, 1001 to 1048	UFF-A32-PL1
	[Master Module(CCIEF)]	PL(Device) • Device (decimal): 1 to 48, 1001 to 1048	PL1
PN	[Master Module(CCIEF)]	PN(Device) • Device (decimal): 1 to 32, 1001 to 1032	PN1
ST	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ST(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	UFF-A32-ST0
	[Master Module(CCIEF)]	ST(Device) • Device (decimal): 0 to 48	ST0
PE	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PE(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 64, 1001 to 1064	UFF-A32-PE1
	[Master Module(CCIEF)]	PE(Device) • Device (decimal): 1 to 64, 1001 to 1064	PE1
PF	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PF(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 64, 1001 to 1064	UFF-A32-PF1
	[Master Module(CCIEF)]	PF(Device) • Device (decimal): 1 to 64, 1001 to 1064	PF1
ALM	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ALM(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 11 to 59, 200 to 215, 220 to 235, 240 to 255	UFF-A32-ALM0
	[Master Module(CCIEF)]	ALM(Device) • Device (decimal): 0 to 1, 11 to 59, 200 to 215, 220 to 235, 240 to 255	ALM0

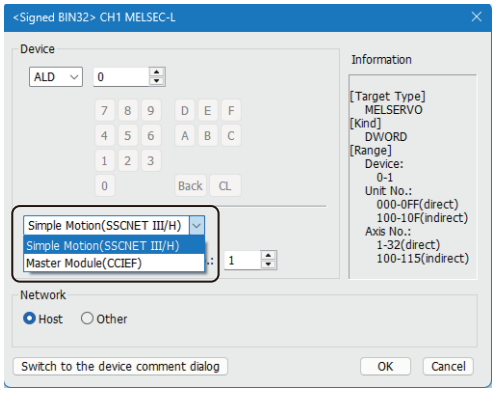
97.7.8 Setting virtual double-word devices for servo amplifiers ([MELSEC-L])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (LD77MS). The following item is displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
ALD	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ALD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A32-ALD0
	[Master Module(CCIEF)]	ALD(Device) • Device (decimal): 0 to 1	ALD0
TMI	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMI(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	UFF-A32-TMI0
	[Master Module(CCIEF)]	TMI(Device) • Device (decimal): 0 to 2	TMI0
TMO	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMO(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0	UFF-A32-TMO0
	[Master Module(CCIEF)]	TMO(Device) • Device (decimal): 0	TMO0
TMD	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMD(Device) • Module No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 32 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	UFF-A32-TMD0
	[Master Module(CCIEF)]	TMD(Device) • Device (decimal): 0 to 1, 3	TMD0

For indirect specification of a module or axis number, refer to the following.

☞ Page 3171 Indirect specification of a module number ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.7.9 Availability of writing/reading data to/from double-word devices ([MELSEC-L])

The following shows the availability of writing/reading data to/from double-word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of double-word data
ALD	-/-	R/-	-/-	-/-
TMI	-/-	-/W	-/-	-/-
TMO	-/-	-/W	-/-	-/-
TMD	-/-	-/W	-/-	-/-
AL	-/-	R/-	-/-	-/-
LPr	-/-	R/W	-/-	-/-
OP	-/-	R/W	-/-	-/-
PV	-/-	R/-	-/-	-/-

97.7.10 Virtual servo amplifier devices ([MELSEC-L])

97.8.1 Monitoring-supported bit devices ([MELSEC-A])

The following table shows monitoring-supported bit devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3313 Availability of writing/reading data to/from bit devices ([MELSEC-A])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
X*3	Input relay	Hexadecimal	0000 to 1FFF	○	○
Y*3	Output relay	Hexadecimal	0000 to 1FFF	○	○
B*3	Link relay	Hexadecimal	0000 to 7FFF	○	○
M*3	Internal relay	Decimal	0 to 8999 9256 to 32767	○	○
M*2	Special internal relay	Decimal	9000 to 9255	○	○
L*3	Latch relay	Decimal	0 to 32767	○	○
F*3	Annunciator	Decimal	0 to 32767	○	○
TC	Timer coil	Decimal	0 to 32767	○	○ Not usable as word data
TT	Timer contact	Decimal	0 to 32767	○	○ Not usable as word data
CC	Counter coil	Decimal	0 to 32767	○	○ Not usable as word data
CT	Counter contact	Decimal	0 to 32767	○	○ Not usable as word data
SB	Link special relay	Hexadecimal	0000 to 07FF	○	○
RX*4	Remote input	Hexadecimal	000 to 7FF	○	○
RY*4	Remote output	Hexadecimal	000 to 7FF	○	○
LB*4	Link relay	Hexadecimal	0000 to 1FFF	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 If the special internal relay (M) is converted to the word device, treat 9000 of the device No. as 0 and set in multiples of 16.
Example) M9000, M9016, M9240

*3 The device number must be set in multiples of 16.

*4 The target device of the host station can be monitored only.
Monitoring the target device of any other station causes a system error.

97.8.2 Availability of writing/reading data to/from bit devices ([MELSEC-A])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/W	-/-	R/W	R/W	-/-
Y	R/W	-/-	R/W	R/W	-/-
B	R/W	-/-	R/W	R/W	-/-
M	R/W	-/-	R/W	R/W	-/-
L	R/W	-/-	R/W	R/W	-/-
F	R/W	-/-	R/W	R/W	-/-
TC	R/W	-/-	-/-	-/-	-/-
TT	R/W	-/-	-/-	-/-	-/-
CC	R/W	-/-	-/-	-/-	-/-
CT	R/W	-/-	-/-	-/-	-/-
SB	R/W	-/-	R/W	R/W	-/-
RX	R/W	-/-	R/W	R/W	-/-
RY	R/W	-/-	R/W	R/W	-/-
LB	R/W	-/-	R/W	R/W	-/-

97.8.3 Monitoring-supported word devices ([MELSEC-A])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3315 Availability of writing/reading data to/from word devices ([MELSEC-A])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
TN	Timer current value	Decimal	0 to 32767	○	○
CN	Counter current value	Decimal	0 to 32767	○	○
D	Data register	Decimal	0 to 8999 9256 to 32767	○	○
D	Special data register	Decimal	9000 to 9255	○	○
W	Link register	Hexadecimal	0000 to 7FFF	○	○
SW	Link special register	Hexadecimal	0000 to 07FF	○	○
R	File register	Decimal	0 to 32767	○	○
ER	Extension file register(Block)	Decimal	ER (R block)-(Device) Notation example: ER255-100 • R block (decimal): 1 to 255 • Device (decimal): 0 to 8191	○	○
ZR	Extension file register	Decimal	0 to 1042431	○	○
Z	Index register	Decimal	0 to 6	○	○ Not usable as bit data
V	Index register	Decimal	0 to 6	○	○ Not usable as bit data
BM*2	Buffer memory (Intelligent function module)	Decimal	GM(R block)-(Device) Notation example: BMFF-100 • BM start No. (hexadecimal): 00 to FF • Device (decimal): 0 to 32767 For the BM start No., set the first 2 digits of the 3-digit number that represents the start I/O number of the buffer memory for the intelligent function module.	○	○ Not usable as bit data
Ww	Remote register	Hexadecimal	000 to 7FF	○	○
Wr	Remote register	Hexadecimal	000 to 7FF	○	○
LW	Link register	Hexadecimal	0000 to 1FFF	○	○
A	Accumulator	Decimal	0 to 1	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Only the intelligent function module on the station connected to GOT can be specified.
Set the buffer memory within the address range of the buffer memory existing in the intelligent function module.

97.8.4 Availability of writing/reading data to/from word devices ([MELSEC-A])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
TN	R/W	R/W	-/-	R/W
CN	R/W	R/W	-/-	R/W
D	R/W	R/W	-/-	R/W
W	R/W	R/W	-/-	R/W
SW	R/W	R/W	-/-	R/W
R	R/W	R/W	-/-	R/W
ER	R/W	R/W	-/-	R/W
ZR	R/W	R/W	-/-	R/W
Z	R/W	R/W	-/-	-/-
V	R/W	R/W	-/-	R/W
BM	R/W	R/W	-/-	-/-
Ww	R/W	R/W	-/-	R/W
Wr	R/W	R/W	-/-	R/W
LW	R/W	R/W	-/-	R/W
A	R/W	R/W	-/-	R/W

97.9.1 Monitoring-supported bit devices ([MELSEC-FX])

The following table shows monitoring-supported bit devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3316 Availability of writing/reading data to/from bit devices ([MELSEC-FX])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
X	Input relay	Octal	0000 to 0377	○	○
Y	Output relay	Octal	0000 to 0377	○	○
M	Auxiliary relay	Decimal	0 to 7679	○	○
M	Special aux relay	Decimal	8000 to 8511	○	○
S	State	Decimal	0 to 4095	○	○
T	Timer contact	Decimal	0 to 511	○	○ Not usable as word data
C	Counter contact	Decimal	0 to 255	○	○ Not usable as word data

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

97.9.2 Availability of writing/reading data to/from bit devices ([MELSEC-FX])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/W	-/-	R/W	R/W	-/-
Y	R/W	-/-	R/W	R/W	-/-
M	R/W	-/-	R/W	R/W	-/-
S	R/W	-/-	R/W	R/W	-/-
T	R/W	-/-	-/-	-/-	-/-
C	R/W	-/-	-/-	-/-	-/-

97.9.3 Monitoring-supported word devices ([MELSEC-FX])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3322 Availability of writing/reading data to/from word devices ([MELSEC-FX])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
T	Timer current value	Decimal	0 to 511	○	○
C*3	Counter current value	Decimal	0 to 255	○	○
D	Data register	Decimal	0 to 7999	○	○
D	Special data register	Decimal	8000 to 8511	○	○
R	Extension register	Decimal	0 to 32767	○	○
Z	Index register	Decimal	0 to 7	○	○ Not usable as bit data
V	Index register	Decimal	0 to 7	○	○ Not usable as bit data
BM*5	Buffer memory	Decimal	☞ Page 3318 Setting the buffer memory device ([MELSEC-FX])	○	○
TS*2*4*6	Timer set value	Decimal	0 to 511	○	○
CS*3*4*6	Counter set value	Decimal	0 to 255	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Only 16-bit (1-word) specification is possible.

*3 For CS0 to CS199 and C0 to C199, only 16-bit (1-word) specification is allowed.
For CS200 to CS255 and C200 to C255, only 32-bit (2-word) specification is allowed.

*4 The setting values of the timer and counter, which are not used for the program, cannot be monitored.
If monitoring is executed, a reading error occurs.

*5 Usable only for special blocks or special units compatible with FX1N, FX1NC, FX2N, FX2NC, FX3G, FX3GC, FX3U, or FX3UC.
(Except FX0N-3A, FX2N-2AD, and FX2N-2DA)

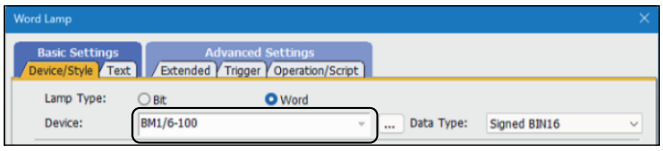
*6 GT SoftGOT3000 and GT Simulator3 cannot monitor the set values.

97.9.4 Setting the buffer memory device ([MELSEC-FX])

Buffer memory format ([MELSEC-FX])

The following shows the format in the setting dialog of objects or others.

Ex.
Unit No.: 1, MASK: 6, Device: 100



Device name	Format
Buffer memory	BM(Unit No.)/(MASK)-(Device)

The buffer memory format includes the following elements.

Item	Description	
MASK	Setting range	0 to 6
	Device No. representation	Decimal
	Explanation	Set this item when only specific bit of the buffer memory is monitored or written. When this item is 0, /(MASK) is unnecessary. For the processing corresponding to each setting value, refer to the following. ☞ Page 3319 MASK setting ([MELSEC-FX])
Module No.	Setting range	0 to 7 (direct), 100 to 115 (indirect)
	Device No. representation	Decimal
	Explanation	Set the unit number of the special block or special unit to be monitored or written. The unit number (No. 0 to No. 7) is assigned to the unit or block in order of distance from the main unit. For details on the unit number, refer to the following. 📖User's Manual (Hardware) of the MELSEC-FX used For indirect specification of a unit number, refer to the following. ☞ Page 3321 Indirect specification of a unit number ([MELSEC-FX])
Device	Setting range	0 to 32767
	Device No. representation	Decimal
	Explanation	Buffer memory

MASK setting ([MELSEC-FX])

The following shows the processing corresponding to each setting value for MASK.

MASK	Processing	
	Data type: 16-bit	**Data type: 32-bit**
0	The buffer memory value is monitored or written.	
1	Only b0 to b3 of the buffer memory is monitored or written. Example) Monitoring BM0 = 4321H with MASK 1: Monitored value = 0001H  Example) Writing the input value (4321H) to BM0 = 0000H with MASK 1: BM0 = 0001H  	Only b0 to b3 and b16 to b19 of the buffer memory is monitored or written. Example) Monitoring BM0 = 87654321H with MASK 1: Monitored value = 00050001H  Example) Writing the input value (87654321H) to BM0 = 00000000H with MASK 1: BM0 = 00050001H 2	Only b4 to b7 of the buffer memory is monitored or written. Example) Monitoring BM0 = 4321H with MASK 2: Monitored value = 0002H  Example) Writing the input value (4321H) to BM0 = 0000H with MASK 2: BM0 = 0010H  	Only b4 to b7 and b20 to b23 of the buffer memory is monitored or written. Example) Monitoring BM0 = 87654321H with MASK 2: Monitored value = 00060002H  Example) Writing the input value (87654321H) to BM0 = 00000000H with MASK 2: BM0 = 00500010H 
MASK	Processing	
	Data type: 16-bit	**Data type: 32-bit**
3	Only b8 to b11 of the buffer memory is monitored or written. Example) Monitoring BM0 = 4321H with MASK 3: Monitored value = 0003H  Example) Writing the input value (4321H) to BM0 = 0000H with MASK 3: BM0 = 0100H  	Only b8 to b11 and b28 to b31 of the buffer memory is monitored or written. Example) Monitoring BM0 = 87654321H with MASK 3: Monitored value = 00070003H  Example) Writing the input value (87654321H) to BM0 = 00000000H with MASK 3: BM0 = 00050001H 4	Only b12 to b15 of the buffer memory is monitored or written. Example) Monitoring BM0 = 4321H with MASK 4: Monitored value = 0004H  Example) Writing the input value (4321H) to BM0 = 0000H with MASK 4: BM0 = 1000H  	Only b12 to b15 and b28 to b31 of the buffer memory is monitored or written. Example) Monitoring BM0 = 87654321H with MASK 4: Monitored value = 00080004H  Example) Writing the input value (87654321H) to BM0=00000000H with MASK 4: BM0=50001000H 5	Only b0 to b7 of the buffer memory is monitored or written. Example) Monitoring BM0 = 4321H with MASK 5: Monitored value = 0021H  Example) Writing the input value (4321H) to BM0 = 0000H with MASK 5: BM0 = 0021H  	Only b0 to b7 and b16 to b13 of the buffer memory is monitored or written. Example) Monitoring BM0 = 87654321H with MASK 5: Monitored value = 00650021H  Example) Writing the input value (87654321H) to BM0=00000000H with MASK 5: BM0=00650021H 
MASK	Processing	
	Data type: 16-bit	Data type: 32-bit
6	Only b8 to b15 of the buffer memory is monitored or written. Example) Monitoring BM0 = 4321H with MASK 6: Monitored value = 0043H  Example) Writing the input value (4321H) to BM0 = 0000H with MASK 6: BM0 = 2100H  	Only b8 to b15 and b24 to b31 of the buffer memory is monitored or written. Example) Monitoring BM0 = 87654321H with MASK 6: Monitored value = 00870043H  Example) Writing the input value (87654321H) to BM0=00000000H with MASK 6: BM0=65002100H 
Indirect specification of a unit number ([MELSEC-FX])

When you specify any of 100 to 115 for the unit number, the value of the corresponding GOT internal register (GD10 to GD25) is used as the unit number of a special block or special unit.

The following shows the correspondence between module numbers and GOT data registers (GD).

Module No.	GOT data registers (GD)	Setting range
100	GD10	[0] to [7] Setting a value outside the above range causes a device range error. If a nonexistent unit number is set, a communication timeout error occurs.
101	GD11	
:	:	
114	GD24	
115	GD25	

Precautions for using the buffer memory

When the special block or special unit is turned off, the data in the buffer memory, except the data in some keep areas, are initialized.

When the GOT monitors the buffer memory, the scan time of the PLC may momentarily increase.

Specify 16-bit data for a 16-bit buffer memory, and specify 32-bit data for a 32-bit buffer memory.

If 16-bit data is specified for a 32-bit buffer memory, monitoring/writing may not be performed properly.

For the data size of each buffer memory, refer to the following.

User's Manual of the special block or special unit used

When reading/writing data from/to the special block or special unit is performed by interrupting the sequence program, monitoring the buffer memory from the GOT or writing data from the GOT to the buffer memory may not be performed properly.

97.9.5 Availability of writing/reading data to/from word devices ([MELSEC-FX])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data*1
T	R/W	R/W	-/-	R/W
C	R/W	R/W	-/-	R/W
D	R/W	R/W	-/-	R/W
R	R/W	R/W	-/-	R/W
Z	R/W	R/W	-/-	R/W

BM	R/W	R/W	-/-	R/W
TS	R/W	-/-	-/-	-/-
CS	R/W	R/W	-/-	-/-

*1 When executing the touch switch function that has been set during the bit specification of the word device, do not write any data to the word device through the sequence program.

97.9.6 Protection using a keyword ([MELSEC-FX])

How to select a protection level by using a keyword

You can set a protection level for equipment that is allowed to access the FX PLC online, and three protection levels are selectable.

When performing monitoring or changing settings with any on-line equipment is required, specify a keyword with referring to the following.

Registered keyword	Description
When registering a keyword only	Select a protection level by specifying an applicable letter for the initial letter in a keyword. All operations prohibited: Specify a keyword beginning with A, D to F, or 0 to 9. Incorrect write/read prohibited: Specify a keyword beginning with B. Incorrect write prohibited: Specify a keyword beginning with C.
When registering a keyword and the second keyword	Select a protection level in [Registration condition].

Monitoring availability at each keyword protection level

The following shows the device monitoring availability at each keyword protection level.

Item		When registering a keyword only			When registering a keyword and the second keyword			Keyword not registered or protection canceled
		All operations prohibited	Incorrect write/read prohibited	Write prohibited	All online operations prohibited	Read/write prohibited	Write prohibited	
Monitoring devices		○	○	○	—	○	○	○
Changing devices	Value of T or C, and file registers (D1000 and the following)	—*1	—*1	—*1	—	○	○	○
	Other than the above	○	○	○	—	○	○	○

*1 When the value of the T or C device is set indirectly, changing the device is available.

Difference between all online operations prohibition and all operations prohibition

When all online operations are prohibited, the programming tool and GOT cannot display devices and input data.
When all operations are prohibited, you cannot perform all operations with the programming tool, but the GOT can display devices and input data.

97.10 [MELIPC]

GT37 SoftGOT3000

This section shows the device range of MELIPC (MI5122-VW).
The settable device range is the same when [MELIPC] is selected and when [MELSEC iQ-R, RnMT/NC/RT, CR800-D] is selected.
For the device range when the GOT is connected to the MELSEC iQ-R series, refer to the following.
☞ Page 3165 [MELSEC iQ-R, RnMT/NC/RT, CR800-D]

97.11 [MELSERVO-J3-*A]

Servo amplifier request ([MELSERVO-J3-*A])

Virtual device name	Name	Symbol
SP0	Status display data clear	—
SP1	Current alarm clear	—
SP2	Alarm history clear	—
SP3	External input signal prohibited	—
SP4	External output signal prohibited	—
SP5	External input signal resumed	—
SP6	External output signal resumed	—

When using the servo amplifier request, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Operation mode selection ([MELSERVO-J3-*A])

Virtual device name	Name	Symbol
OM0	Normal mode (not test operation mode)	—
OM1	JOG operation	—
OM2	Positioning operation	—
OM3	Motorless operation	—
OM4	Output signal (DO) forced output	—

When using the operation mode selection, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Instruction demand (for test operation) ([MELSERVO-J3-*A])

Virtual device name	Name	Symbol
TMB1	Temporary stop command	—
TMB2	Test operation (positioning operation) start command	—
TMB3	Forward rotation direction	—
TMB4	Reverse rotation direction	—
TMB5	Restart for remaining distance	—
TMB6	Remaining distance clear	—

When using the instruction demand (for test operation), note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Basic parameter ([MELSERVO-J3-*A])

Use an appropriate device according to the write destination of the servo amplifier.

- PA1 to PA50: Writing data to the RAM of a servo amplifier
- PA1001 to PA1050: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PA1, PA1001	Control mode	*STY
PA2, PA1002	Regenerative brake option	*REG
PA3, PA1003	Absolute position detection system	*ABS
PA4, PA1004	Function selection A-1	*AOP1
PA5, PA1005	Number of command input pulses per revolution	*FBP
PA6, PA1006	Electronic gear numerator (command pulse multiplication numerator)	CMX
PA7, PA1007	Electronic gear denominator (command pulse multiplication denominator)	CDV
PA8, PA1008	Auto tuning mode	ATU
PA9, PA1009	Auto tuning response	RSP
PA10, PA1010	In-position range	INP
PA11, PA1011	Forward rotation torque limit	TLP
PA12, PA1012	Reverse rotation torque limit	TLN
PA13, PA1013	Command pulse input form	*PLSS
PA14, PA1014	Rotation direction selection	*POL
PA15, PA1015	Encoder output pulses	*ENR
PA16 to PA18, PA1016 to PA1018	For manufacturer setting	—
PA19, PA1019	Parameter block	*BLK

Gain filter parameter ([MELSERVO-J3-*A])

Use an appropriate device according to the write destination of the servo amplifier.

- PB1 to PB50: Writing data to the RAM of a servo amplifier
- PB1001 to PB1050: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PB1, PB1001	Adaptive tuning mode (Adaptive filter II)	FILT
PB2, PB1002	Vibration suppression control tuning mode (advanced vibration suppression control)	VRFT
PB3, PB1003	Position command acceleration/deceleration time constant (position smoothing)	PST
PB4, PB1004	Feed forward gain	FFC
PB5, PB1005	For manufacturer setting	—
PB6, PB1006	Ratio of load inertia moment to servo motor inertia moment	GD2
PB7, PB1007	Model loop gain	PG1
PB8, PB1008	Position loop gain	PG2
PB9, PB1009	Speed loop gain	VG2
PB10, PB1010	Speed integral compensation	VIC
PB11, PB1011	Speed differential compensation	VDC
PB12, PB1012	For manufacturer setting	—
PB13, PB1013	Machine resonance suppression filter 1	NH1
PB14, PB1014	Notch shape selection 1	NHQ1
PB15, PB1015	Machine resonance suppression filter 2	NH2
PB16, PB1016	Notch shape selection 2	NHQ2
PB17, PB1017	For manufacturer setting	—
PB18, PB1018	Low-pass filter setting	LPF
PB19, PB1019	Vibration suppression control vibration frequency setting	VRF1
PB20, PB1020	Vibration suppression control resonance frequency setting	VRF2
PB21 to PB22, PB1021 to PB1022	For manufacturer setting	—
PB23, PB1023	Low-pass filter selection	VFBF
PB24, PB1024	Slight vibration suppression control	*MVS
PB25, PB1025	Function selection B-1	*BOP1
PB26, PB1026	Gain changing selection	*CDP
PB27, PB1027	Gain changing condition	CDL
PB28, PB1028	Gain changing time constant	CDT
PB29, PB1029	Ratio of load inertia moment to servo motor after gain switching	GD2B
PB30, PB1030	Gain changing position loop gain	PG2B
PB31, PB1031	Gain changing speed loop gain	VG2B
PB32, PB1032	Gain changing speed integral compensation	VICB
PB33, PB1033	Suppression control and vibration frequency setting after gain switching	VRF1B
PB34, PB1034	Suppression control and vibration resonance setting after gain switching	VRF2B
PB35 to PB45, PB1035 to PB1045	For manufacturer setting	—

Extension setting parameter ([MELSERVO-J3-*A])

Use an appropriate device according to the write destination of the servo amplifier.

- PC1 to PC50: Writing data to the RAM of a servo amplifier
- PC1001 to PC1050: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PC1, PC1001	Acceleration time constant	STA
PC2, PC1002	Deceleration time constant	STB
PC3, PC1003	S-pattern acceleration/deceleration time constant	STC
PC4, PC1004	Torque command time constant	TQC
PC5, PC1005	Internal speed command1/limit1	SC1
PC6, PC1006	Internal speed command2/limit2	SC2
PC7, PC1007	Internal speed command3/limit3	SC3
PC8, PC1008	Internal speed command4/limit4	SC4
PC9, PC1009	Internal speed command5/limit5	SC5
PC10, PC1010	Internal speed command6/limit6	SC6
PC11, PC1011	Internal speed command7/limit7	SC7
PC12, PC1012	Analog speed command maximum speed/limit maximum speed	VCM
PC13, PC1013	Analog torque command maximum output	TLC
PC14, PC1014	Analog monitor 1 output	MOD1
PC15, PC1015	Analog monitor 2 output	MOD2
PC16, PC1016	Electromagnetic brake sequence output	MBR
PC17, PC1017	Zero speed	ZSP
PC18, PC1018	Alarm history clear	*BPS
PC19, PC1019	Encoder output pulse selection	*ENRS
PC20, PC1020	Station number setting	*SNO
PC21, PC1021	Communication function selection	*SOP
PC22, PC1022	Function selection C-1	*COP1
PC23, PC1023	Function selection C-2	*COP2
PC24, PC1024	Function selection C-3	*COP3
PC25, PC1025	For manufacturer setting	—
PC26, PC1026	Function selection C-5	*COP5
PC27 to PC29, PC1027 to PC1029	For manufacturer setting	—
PC30, PC1030	Acceleration time constant 2	STA2
PC31, PC1031	Deceleration time constant 2	STB2
PC32, PC1032	Command input pulse multiplication numerator 2	CMX2
PC33, PC1033	Command input pulse multiplication numerator 3	CMX3
PC34, PC1034	Command input pulse multiplication numerator 4	CMX4
PC35, PC1035	Internal torque limit 2	TL2
PC36, PC1036	Status display selection	*DMD
PC37, PC1037	Analog speed command offset/limit offset	VCO
PC38, PC1038	Analog torque command offset/limit offset	TPO
PC39, PC1039	Analog monitor 1 offset	MO1
PC40, PC1040	Analog monitor 2 offset	MO2
PC41 to PC50, PC1041 to PC1050	For manufacturer setting	—

I/O setting parameter ([MELSERVO-J3-*A])

Use an appropriate device according to the write destination of the servo amplifier.

- PD1 to PD50: Writing data to the RAM of a servo amplifier
- PD1001 to PD1050: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PD1, PD1001	Input signal automatic ON selection 1	*DIA1
PD2, PD1002	For manufacturer setting	—
PD3, PD1003	Input device selection 1 (CN1-15)	*DI1
PD4, PD1004	Input device selection 2 (CN1-16)	*DI2

External input signal ([MELSERVO-J3-*A])

Virtual device name	Name	Symbol	Data to be read from the servo amplifier
DI0	Input device statuses	—	For the mapping of the bits corresponding to the data to be read, refer to the following. MR-J3-_A Instruction Manual
DI1	External input pin statuses	—	
DI2	Statuses of input devices switched on through communication	—	

External output signal ([MELSERVO-J3-*A])

Virtual device name	Name	Symbol	Data to be read from the servo amplifier
DO0	Output device statuses	—	For the mapping of the bits corresponding to the data to be read, refer to the following. MR-J3-_A Instruction Manual
DO1	External output pin statuses	—	

Input signal for test operation (for test operation) ([MELSERVO-J3-*A])

Virtual device name	Name	Symbol
TMI0	Input signal for test operation	—

When using the input signal for test operation (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

Forced output of signal pin (for test operation) ([MELSERVO-J3-*A])

Virtual device name	Name	Symbol
TMO0	Forced output of signal pin	—

When using the forced output of signal pin (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

Set data (for test operation) ([MELSERVO-J3-*A])

Virtual device name	Name	Symbol
TMD0	Writes the speed (test mode)	—
TMD1	Writes the acceleration/deceleration time constant (test mode)	—
TMD3	Writes the moving distance (test mode)	—

When using the set data (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

97.11.8 Precautions for virtual servo amplifier devices ([MELSERVO-J3-*A])

Monitoring servo amplifier

Carefully read the manual of servo amplifier to be connected and fully understand the operating procedures before monitoring.

Before operation, check the parameter settings and adjust them as required. Improper settings may cause some machines to perform unexpected operation.

The parameter settings must not be changed excessively. Operation will be insatiable.

Data length of a virtual device

Set the data length of a virtual device as shown below.

Virtual device	Data length
PRM, ST, AL, PA, PB, PC, PD, POS, SPD, ACT, DCT, DWL, AUX	16 bits or 32 bits Depending on the servo amplifier data
DI, DO, TMI, TMO, TMD	32 bits

If the above data length is not set, data will be specified incorrectly for the servo amplifier or cannot be properly monitored by the GOT.

Item	Operation	
Monitoring	Handling 16-bit data as 32-bit data	The upper 16 bits are displayed as 0.
	Handling 32-bit data as 16-bit data	The lower 16 bits only are displayed.
Writing	The GOT writes within the range of data length set. Note that the servo amplifier responds correctly while the written data is invalid in the servo amplifier side when the written data is out of the range of values which can be set by the servo amplifier.	

Memory to which parameter values are written

Parameter values are written to the RAM or EEPROM of a servo amplifier.

Write destination	Precautions
RAM	Remember that the written parameter values are cleared when the servo amplifier is turned off.
EEPROM	The written parameter values are not cleared when the servo amplifier is turned off. However, there is a limit on the number of times data can be written to EEPROM. If you update the data frequently (at least once an hour), write parameter values to RAM. For details, refer to the manual of the servo amplifier used.

Data type and format settings for using virtual servo amplifier devices (direct connection between the GOT and servo amplifier)

To specify virtual servo amplifier devices in the object setting or other settings, the data type and format must be set according to the notation of the values handled by the virtual devices.

For notation of the virtual device values, refer to the following.

Instruction manual for the servo amplifier used

MR Configurator2 Help

The following shows a setting example for using virtual servo amplifier devices for an object.

Ex.

When using a numerical display

Notation of the virtual device values	Setting
Decimal number (positive values only)	• [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 65536 or more) • [Format]: [Unsigned Decimal]
Decimal number (positive and negative values)	• [Data Type]: [Signed BIN16] ([Signed BIN32] for -32769 or less, and 32768 or more) • [Format]: [Signed Decimal]
Hexadecimal number	• [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 0x10000 or more) • [Format]: [Hexadecimal]
Decimal point notation (positive values only)	• [Data Type]: [Real] • [Format]: [Real] • [Digits (Integral)]: Set the number of digits in the integral portion. • [Digits (Fractional)]: Set the number of digits in the fractional portion.
Decimal point notation (positive and negative values)	
When the notation varies by digit	• [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 0x10000 or more) • [Format]: [Hexadecimal] • On the [Operation/Script] tab, select [Data Operation] for [Operation Type], and set [Bit Mask] or [Bit Shift].

Specifying consecutive virtual servo amplifier devices

The GOT does not support writing/reading data to/from consecutive virtual servo amplifier devices.

97.12.1 Monitoring-supported bit devices ([MELSERVO-J3-*T])

The following table shows monitoring-supported virtual bit devices for servo amplifiers.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3339 Availability of writing/reading data to/from bit devices ([MELSERVO-J3-*T])

For details on virtual servo amplifier devices, refer to the following.

☞ Page 3343 Virtual servo amplifier devices ([MELSERVO-J3-*T])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
SP	Servo amplifier request	Decimal	0 to 6	×	×
OM	Operation mode selection	Decimal	0 to 5	×	×
TMB	Instruction demand (for test operation)	Decimal	1 to 6	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.

☞ Page 2868 Monitoring a controller through the GOT (server/client function)

97.12.2 Availability of writing/reading data to/from bit devices ([MELSERVO-J3-*T])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
SP	-/W	-/-	-/-	-/-	-/-
OM	-/W	-/-	-/-	-/-	-/-
TMB	-/W	-/-	-/-	-/-	-/-

97.12.3 Monitoring-supported word devices ([MELSERVO-J3-*T])

The following table shows monitoring-supported virtual word devices for servo amplifiers.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3341 Availability of writing/reading data to/from word devices ([MELSERVO-J3-*T])

For details on virtual servo amplifier devices, refer to the following.

☞ Page 3343 Virtual servo amplifier devices ([MELSERVO-J3-*T])

Servo amplifier request ([MELSERVO-J3-*T])

Virtual device name	Name	Symbol
SP0	Status display data clear	—
SP1	Current alarm clear	—
SP2	Alarm history clear	—
SP3	External input signal prohibited	—
SP4	External output signal prohibited	—
SP5	External input signal resumed	—
SP6	External output signal resumed	—

When using the servo amplifier request, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Operation mode selection ([MELSERVO-J3-*T])

Virtual device name	Name	Symbol
OM0	Normal mode (not test operation mode)	—
OM1	JOG operation	—
OM2	Positioning operation	—
OM3	Motorless operation	—
OM4	Output signal (DO) forced output	—
OM5	Single-step feed	—

When using the operation mode selection, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Instruction demand (for test operation) ([MELSERVO-J3-*T])

Virtual device name	Name	Symbol
TMB1	Temporary stop command	—
TMB2	Test operation (positioning operation) start command	—
TMB3	Forward rotation direction	—
TMB4	Reverse rotation direction	—
TMB5	Restart for remaining distance	—
TMB6	Remaining distance clear	—

When using the instruction demand (for test operation), note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Basic parameter ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- PA1 to PA50: Writing data to the RAM of a servo amplifier
- PA1001 to PA1050: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PA1, PA1001	Control mode	*STY
PA2, PA1002	Regenerative brake option	*REG
PA3, PA1003	Absolute position detection system	*ABS
PA4, PA1004	Function selection A-1	*AOP1
PA5, PA1005	Feeding function selection	*FTY
PA6, PA1006	Electronic gear numerator	*CMX
PA7, PA1007	Electronic gear denominator	*CDV
PA8, PA1008	Auto tuning mode	ATU
PA9, PA1009	Auto tuning response	RSP
PA10, PA1010	In-position range	INP
PA11, PA1011	Forward rotation torque limit	TLP
PA12, PA1012	Reverse rotation torque limit	TLN
PA13, PA1013	For manufacturer setting	—
PA14, PA1014	Rotation direction selection	*POL
PA15, PA1015	Encoder output pulses	*ENR
PA16 to PA18, PA1016 to PA1018	For manufacturer setting	—
PA19, PA1019	Parameter block	*BLK

Gain filter parameter ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- PB1 to PB50: Writing data to the RAM of a servo amplifier
- PB1001 to PB1050: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PB1, PB1001	Adaptive tuning mode (Adaptive filter II)	FILT
PB2, PB1002	Vibration suppression control tuning mode (advanced vibration suppression control)	VRFT
PB3, PB1003	For manufacturer setting	—
PB4, PB1004	Feed forward gain	FFC
PB5, PB1005	For manufacturer setting	—
PB6, PB1006	Ratio of load inertia moment to servo motor inertia moment	GD2
PB7, PB1007	Model loop gain	PG1
PB8, PB1008	Position loop gain	PG2
PB9, PB1009	Speed loop gain	VG2
PB10, PB1010	Speed integral compensation	VIC
PB11, PB1011	Speed differential compensation	VDC
PB12, PB1012	For manufacturer setting	—
PB13, PB1013	Machine resonance suppression filter 1	NH1
PB14, PB1014	Notch shape selection 1	NHQ1
PB15, PB1015	Machine resonance suppression filter 2	NH2
PB16, PB1016	Notch shape selection 2	NHQ2
PB17, PB1017	For manufacturer setting	—
PB18, PB1018	Low-pass filter setting	LPF
PB19, PB1019	Vibration suppression control vibration frequency setting	VRF1
PB20, PB1020	Vibration suppression control resonance frequency setting	VRF2
PB21 to PB22, PB1021 to PB1022	For manufacturer setting	—
PB23, PB1023	Low-pass filter selection	VFBF
PB24, PB1024	Slight vibration suppression control	*MVS
PB25, PB1025	For manufacturer setting	—
PB26, PB1026	Gain changing selection	*CDP
PB27, PB1027	Gain changing condition	CDL
PB28, PB1028	Gain changing time constant	CDT
PB29, PB1029	Ratio of load inertia moment to servo motor after gain switching	GD2B
PB30, PB1030	Gain changing position loop gain	PG2B
PB31, PB1031	Gain changing speed loop gain	VG2B
PB32, PB1032	Gain changing speed integral compensation	VICB
PB33, PB1033	Suppression control and vibration frequency setting after gain switching	VRF1B
PB34, PB1034	Suppression control and vibration resonance setting after gain switching	VRF2B
PB35 to PB45, PB1035 to PB1045	For manufacturer setting	—

Extension setting parameter ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- PC1 to PC50: Writing data to the RAM of a servo amplifier
- PC1001 to PC1050: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PC1, PC1001	For manufacturer setting	—
PC2, PC1002	Home position return type	*ZTY
PC3, PC1003	Direction of home position return	*ZDIR
PC4, PC1004	Home position return speed	ZRF
PC5, PC1005	Creep speed	CRF
PC6, PC1006	Home position shift distance	ZST
PC7, PC1007	Home position return position data	*ZPS

PC41 to PC50, PC1041 to PC1050	For manufacturer setting	—

I/O setting parameter ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- PD1 to PD50: Writing data to the RAM of a servo amplifier
- PD1001 to PD1050: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PD1, PD1001	Input signal automatic ON selection 1	*DIA1
PD2, PD1002	For manufacturer setting	—

Point table (position) ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- POS1 to POS255: Writing data to the RAM of a servo amplifier
- POS1001 to POS1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
POS1 to POS255, POS1001 to POS1255	Point table/position data No. 1 to No. 255	—

Point table (speed) ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- SPD1 to SPD255: Writing data to the RAM of a servo amplifier
- SPD1001 to SPD1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
SPD1 to SPD255, SPD1001 to SPD1255	Point table/speed data No. 1 to No. 255	—

Point table (acceleration time constant) ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- ACT1 to ACT255: Writing data to the RAM of a servo amplifier
- ACT1001 to ACT1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
ACT1 to ACT255, ACT1001 to ACT1255	Point table/acceleration time constant No. 1 to No. 255	—

Point table (deceleration time constant) ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- DCT1 to DCT255: Writing data to the RAM of a servo amplifier
- DCT1001 to DCT1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
DCT1 to DCT255, DCT1001 to DCT1255	Point table/deceleration time constant No. 1 to No. 255	—

Point table (dwell) ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- DWL1 to DWL255: Writing data to the RAM of a servo amplifier
- DWL1001 to DWL1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
DWL1 to DWL255, DWL1001 to DWL1255	Point table/dwell No. 1 to No. 255	—

Point table (auxiliary function) ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- AUX1 to AUX255: Writing data to the RAM of a servo amplifier
- AUX1001 to AUX1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
AUX1 to AUX255, AUX1001 to AUX1255	Point table/auxiliary function No. 1 to No. 255	—

Point table (M code) ([MELSERVO-J3-*T])

Use an appropriate device according to the write destination of the servo amplifier.

- MCD1 to MCD255: Writing data to the RAM of a servo amplifier
- MCD1001 to MCD1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
MCD1 to MCD255, MCD1001 to MCD1255	Point table/M code No. 1 to No. 255	—

External input signal ([MELSERVO-J3-*T])

Virtual device name	Name	Symbol	Data to be read from the servo amplifier
DI0	Input device statuses 1	—	For the mapping of the bits corresponding to the data to be read, refer to the following. ☞ MR-J3-_T Instruction Manual
DI1	Input device statuses 2	—	
DI2	Input device statuses 3	—	
DI3	External input pin statuses 1	—	
DI4	External input pin statuses 2	—	
DI5	Statuses of input devices switched on through communication 1	—	For the mapping of the bits corresponding to the data to be read or written, refer to the following. ☞ MR-J3-_T Instruction Manual
DI6	Statuses of input devices switched on through communication 2	—	
DI7	Statuses of input devices switched on through communication 3	—	

External output signal ([MELSERVO-J3-*T])

Virtual device name	Name	Symbol	Data to be read from the servo amplifier
DO0	Output device statuses 1	—	For the mapping of the bits corresponding to the data to be read, refer to the following. ☞ MR-J3-_T Instruction Manual
DO1	Output device statuses 2	—	
DO2	Output device statuses 3	—	
DO3	External output pin statuses 1	—	
DO4	External output pin statuses 2	—	

Input signal for test operation (for test operation) ([MELSERVO-J3-*T])

Virtual device name	Name	Symbol
TMI0	Input signal for test operation 1	—
TMI1	Input signal for test operation 2	—
TMI2	Input signal for test operation 3	—

When using the input signal for test operation (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

Forced output of signal pin (for test operation) ([MELSERVO-J3-*T])

Virtual device name	Name	Symbol
TMO0	Forced output from signal pin (CN6)	—
TMO1	Forced output from signal pin (CN10)	—

When using the forced output of signal pin (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

Set data (for test operation) ([MELSERVO-J3-*T])

Virtual device name	Name	Symbol
TMD0	Writes the speed (test mode)	—
TMD1	Writes the acceleration/deceleration time constant (test mode)	—
TMD3	Writes the moving distance (test mode)	—

When using the set data (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

97.12.8 Precautions for virtual servo amplifier devices ([MELSERVO-J3-*T])

For the precautions for virtual servo amplifier devices, refer to the following.

Extension setting parameter ([MELSERVO-J4-*A, -JE-*A])

Use an appropriate device according to the write destination of the servo amplifier.

- PC1 to PC80: Writing data to the RAM of a servo amplifier
- PC1001 to PC1080: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Servo amplifier request ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
SP0	Status display data clear	—
SP1	Current alarm clear	—
SP2	Alarm history clear	—
SP3	External input signal prohibited	—
SP4	External output signal prohibited	—
SP5	External input signal resumed	—
SP6	External output signal resumed	—

When using the servo amplifier request, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Operation mode selection ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
OM0	Normal mode (not test operation mode)	—
OM1	JOG operation	—
OM2	Positioning operation	—
OM4	Output signal (DO) forced output	—
OM5	Single-step feed operation	—

When using the operation mode selection, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Instruction demand (for test operation) ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
TMB1	Temporary stop command	—
TMB2	Test operation (positioning operation) start command	—
TMB3	Forward rotation direction	—
TMB4	Reverse rotation direction	—
TMB5	Restart for remaining distance	—
TMB6	Remaining distance clear	—

When using the instruction demand (for test operation), note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

One-touch tuning instruction ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
OTI0	One-touch tuning start command (Basic mode)	—
OTI1	One-touch tuning start command (High mode)	—
OTI2	One-touch tuning start command (Low mode)	—
OTI3	One-touch tuning stop command	—
OTI4	Return to initial value	—
OTI5	Return to value before adjustment	—

Basic parameter ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- PA1 to PA32: Writing data to the RAM of a servo amplifier
- PA1001 to PA1032: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PA1, PA1001	Operation mode	*STY
PA2, PA1002	Regenerative brake option	*REG
PA3, PA1003	Absolute position detection system	*ABS
PA4, PA1004	Function selection A-1	*AOP1
PA5, PA1005	Number of command input pulses per revolution	*FBP
PA6, PA1006	Electronic gear numerator (command pulse multiplication numerator)/number of gear teeth on machine side	*CMX
PA7, PA1007	Electronic gear denominator (command pulse multiplication denominator)/number of gear teeth on servo motor side	*CDV
PA8, PA1008	Auto tuning mode	ATU
PA9, PA1009	Auto tuning response	RSP
PA10, PA1010	In-position range	INP
PA11, PA1011	Forward rotation torque limit/positive direction thrust limit	TLP
PA12, PA1012	Reverse rotation torque limit/negative direction thrust limit	TLN
PA13, PA1013	Command pulse input form	*PLSS
PA14, PA1014	Rotation direction selection/travel direction selection	*POL
PA15, PA1015	Encoder output pulses	*ENR
PA16, PA1016	Encoder output pulses 2	*ENR2
PA17, PA1017	Servo motor series setting	*MSR
PA18, PA1018	Servo motor type setting	*MTY
PA19, PA1019	Parameter block	*BLK
PA20, PA1020	Tough drive setting	*TDS
PA21, PA1021	Function selection A-3	*AOP3
PA22, PA1022	Position control composition selection	*PCS
PA23, PA1023	Drive recorder arbitrary alarm trigger setting	DRAT
PA24, PA1024	Function selection A-4	AOP4
PA25, PA1025	One-touch tuning - Overshoot permissible level	OTHOV
PA26, PA1026	Function selection A-5	*AOP5
PA27 to PA32, PA1027 to PA1032	For manufacturer setting	—

Gain filter parameter ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- PB1 to PB64: Writing data to the RAM of a servo amplifier
- PB1001 to PB1064: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PB1, PB1001	Adaptive tuning mode (Adaptive filter II)	FILT
PB2, PB1002	Vibration suppression control tuning mode (advanced vibration suppression control II)	VRFT
PB3, PB1003	Position command acceleration/deceleration time constant (position smoothing)	PST
PB4, PB1004	Feed forward gain	FFC
PB5, PB1005	For manufacturer setting	—
PB6, PB1006	Load inertia moment ratio/Load mass ratio	GD2
PB7, PB1007	Model loop gain	PG1
PB8, PB1008	Position loop gain	PG2
PB9, PB1009	Speed loop gain	VG2

Virtual device name	Name	Symbol
PB10, PB1010	Speed integral compensation	VIC
PB11, PB1011	Speed differential compensation	VDC
PB12, PB1012	Overshoot amount compensation	OVA
PB13, PB1013	Machine resonance suppression filter 1	NH1
PB14, PB1014	Notch shape selection 1	NHQ1
PB15, PB1015	Machine resonance suppression filter 2	NH2
PB16, PB1016	Notch shape selection 2	NHQ2
PB17, PB1017	Shaft resonance suppression filter	NHF
PB18, PB1018	Low-pass filter setting	LPF
PB19, PB1019	Vibration suppression control 1 - Vibration frequency	VRF11
PB20, PB1020	Vibration suppression control 1 - Resonance freq.	VRF12
PB21, PB1021	Vib. supp. ctrl. 1 - Vibration frequency damping	VRF13
PB22, PB1022	Vib. supp. ctrl. 1 - Resonance frequency damping	VRF14
PB23, PB1023	Low-pass filter selection	VFBF
PB24, PB1024	Slight vibration suppression control	*MVS
PB25, PB1025	Function selection B-1	*BOP1
PB26, PB1026	Gain changing function	*CDP
PB27, PB1027	Gain changing condition	CDL
PB28, PB1028	Gain changing time constant	CDT
PB29, PB1029	Load to motor inertia ratio/load to motor mass ratio after gain switching	GD2B
PB30, PB1030	Gain changing position loop gain	PG2B
PB31, PB1031	Gain changing speed loop gain	VG2B
PB32, PB1032	Gain changing speed integral compensation	VICB
PB33, PB1033	Vib. supp. ctrl. 1 - Vib. frq. after gain changing	VRF1B
PB34, PB1034	Vibration suppression control 1 - Resonance frequency after gain switching	VRF2B
PB35, PB1035	Vibration suppression control 1 - Vibration frequency damping after gain switching	VRF3B
PB36, PB1036	Vibration suppression control 1 - Resonance frequency damping after gain switching	VRF4B
PB37 to PB44, PB1037 to PB1044	For manufacturer setting	—
PB45, PB1045	Command notch filter	CNHF
PB46, PB1046	Machine resonance suppression filter 3	NH3
PB47, PB1047	Notch shape selection 3	NHQ3
PB48, PB1048	Machine resonance suppression filter 4	NH4
PB49, PB1049	Notch shape selection 4	NHQ4
PB50, PB1050	Machine resonance suppression filter 5	NH5
PB51, PB1051	Notch shape selection 5	NHQ5
PB52, PB1052	Vibration suppression control 2 - Vibration frequency	VRF21
PB53, PB1053	Vibration suppression control 2 - Resonance frequency	VRF22
PB54, PB1054	Vibration suppression control 2 - Vibration frequency damping	VRF23
PB55, PB1055	Vibration suppression control 2 - Resonance frequency damping	VRF24
PB56, PB1056	Vibration suppression control 2 - Vibration frequency after gain switching	VRF21B
PB57, PB1057	Vibration suppression control 2 - Resonance frequency after gain switching	VRF22B
PB58, PB1058	Vibration suppression control 2 - Vibration frequency damping after gain switching	VRF23B
PB59, PB1059	Vibration suppression control 2 - Resonance frequency damping after gain switching	VRF24B
PB60, PB1060	Model loop gain after gain switching	PG1B
PB61 to PB64, PB1061 to PB1064	For manufacturer setting	—

Extension setting parameter ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- PC1 to PC80: Writing data to the RAM of a servo amplifier
- PC1001 to PC1080: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol
PC1, PC1001	JOG operation acceleration time constant/acceleration time constant 1	STA
PC2, PC1002	JOG operation deceleration time constant/deceleration time constant 1	STB
PC3, PC1003	S-pattern acceleration/deceleration time constant	*STC
PC4, PC1004	Torque command time constant/thrust command time constant	TQC
PC5, PC1005	Automatic operation speed 1	SC1
PC6, PC1006	Automatic operation speed 2	SC2
PC7, PC1007	Manual operation speed 1	SC3
PC8, PC1008	Internal speed command4/limit4	SC4
PC9, PC1009	Internal speed command5/limit5	SC5
PC10, PC1010	Internal speed command6/limit6	SC6

I/O setting parameter ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- PD1 to PD48: Writing data to the RAM of a servo amplifier
- PD1001 to PD1048: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Point table (position) ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- POS1 to POS255: Writing data to the RAM of a servo amplifier
- POS1001 to POS1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
POS1 to POS255, POS1001 to POS1255	Point table/position data No. 1 to No. 255	—

Point table (speed) ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- SPD1 to SPD255: Writing data to the RAM of a servo amplifier
- SPD1001 to SPD1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
SPD1 to SPD255, SPD1001 to SPD1255	Point table/speed data No. 1 to No. 255	—

Point table (acceleration time constant) ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- ACT1 to ACT255: Writing data to the RAM of a servo amplifier
- ACT1001 to ACT1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
ACT1 to ACT255, ACT1001 to ACT1255	Point table/acceleration time constant No. 1 to No. 255	—

Point table (deceleration time constant) ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- DCT1 to DCT255: Writing data to the RAM of a servo amplifier
- DCT1001 to DCT1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
DCT1 to DCT255, DCT1001 to DCT1255	Point table/deceleration time constant No. 1 to No. 255	—

Point table (dwell) ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- DWL1 to DWL255: Writing data to the RAM of a servo amplifier
- DWL1001 to DWL1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
DWL1 to DWL255, DWL1001 to DWL1255	Point table/dwell No. 1 to No. 255	—

Point table (auxiliary function) ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- AUX1 to AUX255: Writing data to the RAM of a servo amplifier
- AUX1001 to AUX1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
AUX1 to AUX255, AUX1001 to AUX1255	Point table/auxiliary function No. 1 to No. 255	—

Point table (M code) ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- MCD1 to MCD255: Writing data to the RAM of a servo amplifier
- MCD1001 to MCD1255: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
MCD1 to MCD255, MCD1001 to MCD1255	Point table/M code No. 1 to No. 255	—

Machine diagnosis data ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
MD0	Machine diagnosis data, station number	—
MD1	Machine diagnosis data shift judgment (test mode)	—
MD2	Machine diagnosis data status	—
MD3	Machine diagnosis data coulomb friction torque in positive direction	—
MD4	Machine diagnosis data friction torque at rated speed in positive direction	—
MD5	Machine diagnosis data coulomb friction torque in negative direction	—
MD6	Machine diagnosis data friction torque at rated speed in negative direction	—
MD7	Machine diagnosis data oscillation frequency (motor is stopped)	—
MD8	Machine diagnosis data vibration level (motor is stopped)	—
MD9	Machine diagnosis data oscillation frequency (motor is operating)	—
MD10	Machine diagnosis data vibration level (motor is operating)	—
MD11	Machine diagnosis data, rated speed at forward or reverse rotation torque	—

One-touch tuning data ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
OTS0	One-touch tuning status confirmation	—
OTS1	Error code list	—
OTS2	Settling time	—
OTS3	Overshoot amount	—

External input signal ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol	Data to be read from the servo amplifier
DI0	Input device statuses 1	—	For the mapping of the bits corresponding to the data to be read, refer to the following. MR-J4-_A_(-RJ)/MR-J4-03A6(-RJ) SERVO AMPLIFIER INSTRUCTION MANUAL
DI1	Input device statuses 2	—	
DI2	Input device statuses 3	—	
DI3	External input pin statuses	—	
DI4	Statuses of input devices switched on through communication 1	—	For the mapping of the bits corresponding to the data to be read or written, refer to the following. MR-J4-_A_(-RJ)/MR-J4-03A6(-RJ) SERVO AMPLIFIER INSTRUCTION MANUAL
DI5	Statuses of input devices switched on through communication 2	—	
DI6	Statuses of input devices switched on through communication 3	—	

External output signal ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol	Data to be read from the servo amplifier
DO0	Output device statuses 1	—	For the mapping of the bits corresponding to the data to be read, refer to the following. MR-J4-_A_(-RJ)/MR-J4-03A6(-RJ) SERVO AMPLIFIER INSTRUCTION MANUAL
DO1	Output device statuses 2	—	
DO2	Output device statuses 3	—	
DO3	Output device statuses 4	—	
DO4	External output pin statuses	—	

Current position latch data ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
LD0	Position data unit	—
LD1	Current position latch data	—

Value of the general-purpose register (Rx) ([MELSERVO-J4-*A-RJ])

Use an appropriate device according to the write destination of the servo amplifier.

- RR1 to RR4: Writing data to the RAM of a servo amplifier
- RR1001 to RR1004: Writing data to the EEPROM of a servo amplifier

Virtual device name	Name	Symbol
RR1, RR1001	Value of the general-purpose register (R1)	—
RR2, RR1002	Value of the general-purpose register (R2)	—
RR3, RR1003	Value of the general-purpose register (R3)	—
RR4, RR1004	Value of the general-purpose register (R4)	—

Value of the general-purpose register (Dx) ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
RD1	Value of the general-purpose register (D1)	—
RD2	Value of the general-purpose register (D2)	—
RD3	Value of the general-purpose register (D3)	—
RD4	Value of the general-purpose register (D4)	—

Life diagnosis ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
ALD0	Cumulative power-on time	—
ALD1	Number of inrush current switching times	—

Input signal for test operation (for test operation) ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
TMI0	Input signal for test operation 1	—
TMI1	Input signal for test operation 2	—
TMI2	Input signal for test operation 3	—

When using the input signal for test operation (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

Forced output of signal pin (for test operation) ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
TMO0	Forced output of signal pin	—

When using the forced output of signal pin (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

Set data (for test operation) ([MELSERVO-J4-*A-RJ])

Virtual device name	Name	Symbol
TMD0	Writes the speed (test mode)	—
TMD1	Writes the acceleration/deceleration time constant (test mode)	—
TMD3	Writes the moving distance (test mode)	—

When using the set data (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

97.14.8 Precautions for virtual servo amplifier devices ([MELSERVO-J4-*A-RJ])

For the precautions for virtual servo amplifier devices, refer to the following.

☞ Page 3336 Precautions for virtual servo amplifier devices ([MELSERVO-J3-*A])

97.15.1 Monitoring-supported bit devices ([MELSERVO-JE-*C])

The following table shows monitoring-supported virtual bit devices for servo amplifiers.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3399 Availability of writing/reading data to/from bit devices ([MELSERVO-JE-*C])

For details on virtual servo amplifier devices, refer to the following.

☞ Page 3403 Virtual servo amplifier devices ([MELSERVO-JE-*C])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
SP	Servo amplifier request	Decimal	0 to 6	×	×
OM	Operation mode selection	Decimal	0 to 2 4 to 5	×	×
TMB	Instruction demand (for test operation)	Decimal	1 to 6	×	×
OTI	One-touch tuning instruction	Decimal	0 to 5	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

97.15.2 Availability of writing/reading data to/from bit devices ([MELSERVO-JE-*C])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
SP	-/W	-/-	-/-	-/-	-/-
OM	-/W	-/-	-/-	-/-	-/-
TMB	-/W	-/-	-/-	-/-	-/-
OTI	-/W	-/-	-/-	-/-	-/-

97.15.3 Monitoring-supported word devices ([MELSERVO-JE-*C])

The following table shows monitoring-supported virtual word devices for servo amplifiers.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3401 Availability of writing/reading data to/from word devices ([MELSERVO-JE-*C])

For details on virtual servo amplifier devices, refer to the following.

☞ Page 3403 Virtual servo amplifier devices ([MELSERVO-JE-*C])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client

Servo amplifier request ([MELSERVO-JE-*C])

Virtual device name	Name	Symbol
SP0	Status display data clear	—
SP1	Current alarm clear	—
SP2	Alarm history clear	—
SP3	External input signal prohibited	—
SP4	External output signal prohibited	—
SP5	External input signal resumed	—
SP6	External output signal resumed	—

When using the servo amplifier request, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Operation mode selection ([MELSERVO-JE-*C])

Virtual device name	Name	Symbol
OM0	Normal mode (not test operation mode)	—
OM1	JOG operation	—
OM2	Positioning operation	—
OM4	Output signal (DO) forced output	—
OM5	Single-step feed operation	—

When using the operation mode selection, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Instruction demand (for test operation) ([MELSERVO-JE-*C])

Virtual device name	Name	Symbol
TMB1	Temporary stop command	—
TMB2	Test operation (positioning operation) start command	—
TMB3	Forward rotation direction	—
TMB4	Reverse rotation direction	—
TMB5	Restart for remaining distance	—
TMB6	Remaining distance clear	—

When using the instruction demand (for test operation), note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

One-touch tuning instruction ([MELSERVO-JE-*C])

Virtual device name	Name	Symbol
OTI0	One-touch tuning start command (Basic mode)	—
OTI1	One-touch tuning start command (High mode)	—
OTI2	One-touch tuning start command (Low mode)	—
OTI3	One-touch tuning stop command	—
OTI4	Return to initial value	—
OTI5	Return to value before adjustment	—

Basic parameter ([MELSERVO-JE-*C])

Use an appropriate device according to the write destination of the servo amplifier.

- PA1 to PA32: Writing data to the RAM of a servo amplifier
- PA1001 to PA1032: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Device name	Name	Symbol
PA1, PA1001	Operation mode	*STY
PA2, PA1002	Regenerative brake option	*REG
PA3, PA1003	Absolute position detection system	*ABS
PA4, PA1004	Function selection A-1	*AOP1
PA5, PA1005	Number of command input pulses per revolution	*FBP
PA6, PA1006	Electronic gear numerator	CMX
PA7, PA1007	Electronic gear denominator	CDV
PA8, PA1008	Auto tuning mode	ATU
PA9, PA1009	Auto tuning response	RSP
PA10, PA1010	In-position range	INP
PA11, PA1011	Forward rotation torque limit	TLP
PA12, PA1012	Reverse rotation torque limit	TLN
PA13, PA1013	Command pulse input form	*PLSS
PA14, PA1014	Rotation direction selection	*POL
PA15, PA1015	Encoder output pulses	*ENR
PA16, PA1016	Encoder output pulses 2	*ENR2
PA17 to PA18, PA1017 to PA1018	For manufacturer setting	—
PA19, PA1019	Parameter block	*BLK
PA20, PA1020	Tough drive setting	*TDS
PA21, PA1021	Function selection A-3	*AOP3
PA22, PA1022	For manufacturer setting	—
PA23, PA1023	Drive recorder arbitrary alarm trigger setting	DRAT
PA24, PA1024	Function selection A-4	*AOP4
PA25, PA1025	One-touch tuning - Overshoot permissible level	OTHOV
PA26, PA1026	Function selection A-5	*AOP5
PA27, PA1027	For manufacturer setting	—
PA28, PA1028	Function selection A-6	*AOP6
PA29 to PA32, PA1029 to PA1032	For manufacturer setting	—

Gain filter parameter ([MELSERVO-JE-*C])

Use an appropriate device according to the write destination of the servo amplifier.

- PB1 to PB64: Writing data to the RAM of a servo amplifier
- PB1001 to PB1064: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Device name	Name	Symbol
PB1, PB1001	Adaptive tuning mode (Adaptive filter II)	FILT
PB2, PB1002	Vibration suppression control tuning mode (advanced vibration suppression control II)	VRFT
PB3, PB1003	Position command acceleration/deceleration time constant (position smoothing)	PST
PB4, PB1004	Feed forward gain	FFC
PB5, PB1005	For manufacturer setting	—
PB6, PB1006	Load inertia moment ratio	GD2
PB7, PB1007	Model control gain	PG1

Device name	Name	Symbol
PB8, PB1008	Position control gain	PG2
PB9, PB1009	Speed control gain	VG2
PB10, PB1010	Speed integral compensation	VIC
PB11, PB1011	Speed differential compensation	VDC
PB12, PB1012	Overshoot amount compensation	OVA
PB13, PB1013	Machine resonance suppression filter 1	NH1
PB14, PB1014	Notch shape selection 1	NHQ1
PB15, PB1015	Machine resonance suppression filter 2	NH2
PB16, PB1016	Notch shape selection 2	NHQ2
PB17, PB1017	Shaft resonance suppression filter	NHF
PB18, PB1018	Low-pass filter setting	LPF
PB19, PB1019	Vibration suppression control 1 - Vibration frequency	VRF11
PB20, PB1020	Vibration suppression control 1 - Resonance frequency	VRF12
PB21, PB1021	Vibration suppression control 1 - Vibration frequency damping	VRF13
PB22, PB1022	Vibration suppression control 1 - Resonance frequency damping	VRF14
PB23, PB1023	Low-pass filter setting	VFBF
PB24, PB1024	Slight vibration suppression control	*MVS
PB25, PB1025	Function selection B-1	*BOP1
PB26, PB1026	Gain switching function	*CDP
PB27, PB1027	Gain switching condition	CDL
PB28, PB1028	Gain switching time constant	CDT
PB29, PB1029	Load to motor inertia ratio after gain switching	GD2B
PB30, PB1030	Position loop gain after gain switching	PG2B
PB31, PB1031	Speed loop gain after gain switching	VG2B
PB32, PB1032	Speed integral compensation after gain switching	VICB
PB33, PB1033	Vibration suppression control 1 - Vibration frequency after gain switching	VRF1B
PB34, PB1034	Vibration suppression control 1 - Resonance frequency after gain switching	VRF2B
PB35, PB1035	Vibration suppression control 1 - Vibration frequency damping after gain switching	VRF3B
PB36, PB1036	Vibration suppression control 1 - Resonance frequency damping after gain switching	VRF4B
PB37 to PB44, PB1037 to PB1044	For manufacturer setting	—
PB45, PB1045	Command notch filter	CNHF
PB46, PB1046	Machine resonance suppression filter 3	NH3
PB47, PB1047	Notch shape selection 3	NHQ3

Extension setting parameter ([MELSERVO-JE-*C])

Use an appropriate device according to the write destination of the servo amplifier.

- PC1 to PC80: Writing data to the RAM of a servo amplifier
- PC1001 to PC1080: Writing data to the EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Machine diagnosis data ([MELSERVO-JE-*C])

Virtual device name	Name	Symbol
MD0	Machine diagnosis data parameter number	—
MD1	Machine diagnosis data shift judgment (test mode)	—
MD2*1	Machine diagnosis data status	—
MD3*2	Machine diagnosis data coulomb friction torque in positive direction	—
MD4*2	Machine diagnosis data friction torque at rated speed in positive direction	—
MD5*2	Machine diagnosis data coulomb friction torque in negative direction	—
MD6*2	Machine diagnosis data friction torque at rated speed in negative direction	—
MD7*2	Machine diagnosis data oscillation frequency (motor is stopped)	—
MD8*2	Machine diagnosis data vibration level (motor is stopped)	—
MD9*2	Machine diagnosis data oscillation frequency (motor is operating)	—
MD10*2	Machine diagnosis data vibration level (motor is operating)	—
MD11	Machine diagnosis data, rated speed at forward or reverse rotation torque	—

*1 While the servo amplifier is estimating the corresponding machine status in the machine diagnosis, do not write data to the parameters of the servo amplifier from another GOT.
Doing so may cause the servo amplifier to malfunction.

*2 When MD2 indicates that the servo amplifier does not complete the machine diagnosis (is estimating or warning of the machine status), do not monitor MD3 to MD6 (friction states) and MD7 to MD10 (vibration/oscillation states).
To start monitoring those devices upon the estimation completion, set [Trigger] in the applicable object settings.

Life diagnosis ([MELSERVO-JE-*C])

Virtual device name	Name	Symbol
ALD0	Cumulative power-on time	—
ALD1	Number of inrush current switching times	—

Input signal for test operation (for test operation) ([MELSERVO-JE-*C])

Virtual device name	Name	Symbol
TMI0	Input signal for test operation 1	—
TMI1	Input signal for test operation 2	—
TMI2	Input signal for test operation 3	—

When using the input signal for test operation (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

Forced output of signal pin (for test operation) ([MELSERVO-JE-*C])

Virtual device name	Name	Symbol
TMO0	Forced output of signal pin	—

When using the forced output of signal pin (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

Set data (for test operation) ([MELSERVO-JE-*C])

Virtual device name	Name	Symbol
TMD0	Writes the speed (test mode)	—
TMD1	Writes the acceleration/deceleration time constant (test mode)	—
TMD3	Writes the moving distance (test mode)	—

When using the set data (for test operation), note the following.

Precautions	Description
Writing a value to a virtual device using an object	Numerical input cannot be used. Use a word switch for writing.

97.15.8 Precautions for virtual servo amplifier devices ([MELSERVO-JE-*C])

For the precautions for virtual servo amplifier devices, refer to the following.

☞ Page 3241 Precautions for virtual servo amplifier devices ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.16 [MELSERVO-J5(W)-*G(-RJ), -JET-*G]

97.16.1 Monitoring-supported bit devices ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

The following table shows monitoring-supported virtual bit devices for servo amplifiers.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3420 Availability of writing/reading data to/from bit devices ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

For details on virtual servo amplifier devices, refer to the following.

☞ Page 3426 Virtual servo amplifier devices ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
SP	Servo amplifier request	Decimal	AA(Axis designation)-SP(Device) Notation example: AA3-SP0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	×	×
OM	Operation mode selection	Decimal	AA(Axis designation)-OM(Device) Notation example: AA3-OM0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	×	×
TMB	Instruction demand (for test operation)	Decimal	AA(Axis designation)-TMB(Device) Notation example: AA3-TMB1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	×	×
OTI	One-touch tuning instruction	Decimal	AA(Axis designation)-OTI(Device) Notation example: AA3-OTI0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	×	×
GFDI	Gear failure diagnosis instruction	Decimal	AA(Axis designation)-GFDI(Device) Notation example: AA3-GFDI0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	×	×
ECCDI	Encoder communication circuit diagnosis instruction	Decimal	AA(Axis designation)-ECCDI(Device) Notation example: AA3-ECCDI0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

For indirect specification of an axis designation, refer to the following.

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.16.2 Availability of writing/reading data to/from bit devices ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
SP	-/W	-/-	-/-	-/-	-/-
OM	-/W	-/-	-/-	-/-	-/-
TMB	-/W	-/-	-/-	-/-	-/-
OTI	-/W	-/-	-/-	-/-	-/-
GFDI	-/W	-/-	-/-	-/-	-/-
ECCDI	-/W	-/-	-/-	-/-	-/-

97.16.3 Monitoring-supported word devices ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

The following table shows monitoring-supported virtual word devices for servo amplifiers.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3424 Availability of writing/reading data to/from word devices ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

For details on virtual servo amplifier devices, refer to the following.

☞ Page 3426 Virtual servo amplifier devices ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

○: Available

×: Not available

Device name		Device No. representation	Setting range	EG device specifications[*1]	
				Assignment to EG devices	Access using a client
PA	Basic parameter	Decimal	AA(Axis designation)-PA(Device) Notation example: AA3-PA1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	×	×
PB	Gain filter parameter	Decimal	AA(Axis designation)-PB(Device) Notation example: AA3-PB1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	×	×
PC	Extension setting parameter	Decimal	AA(Axis designation)-PC(Device) Notation example: AA3-PC1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	×	×
PD	I/O setting parameter	Decimal	AA(Axis designation)-PD(Device) Notation example: AA3-PD1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	×	×
PT	Positioning control parameter	Decimal	AA(Axis designation)-PT(Device) Notation example: AA3-PT1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	×	×
PN	Network setting parameter	Decimal	AA(Axis designation)-PN(Device) Notation example: AA3-PN1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	×	×
ST	Status display	Decimal	AA(Axis designation)-ST(Device) Notation example: AA3-ST0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	×	×
PE	Extension setting No.2 parameter	Decimal	AA(Axis designation)-PE(Device) Notation example: AA3-PE1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 88, 1001 to 1088	×	×
PF	Extension setting No.3 parameter	Decimal	AA(Axis designation)-PF(Device) Notation example: AA3-PF1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	×	×
ALM	Alarm (Current alarm)	Decimal	AA(Axis designation)-ALM(Device) Notation example: AA3-ALM0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 11 to 59	×	×

Device name		Device No. representation	Setting range	EG device specifications[*1]	
				Assignment to EG devices	Access using a client
ALM	Alarm (Alarm history)	Decimal	AA(Axis designation)-ALM(Device) Notation example: AA3-ALM200 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 200 to 215, 220 to 235, 240 to 255, 260 to 275, 280 to 295, 300 to 315	×	×
POS	Point table (position)	Decimal	AA(Axis designation)-POS(Device) Notation example: AA3-POS1 • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	×	×
SPD	Point table (speed)	Decimal	AA(Axis designation)-SPD(Device) Notation example: AA3-SPD1 • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	×	×
ACT	Point table (acceleration time constant)	Decimal	AA(Axis designation)-ACT(Device) Notation example: AA3-ACT1 • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	×	×
DCT	Point table (deceleration time constant)	Decimal	AA(Axis designation)-DCT(Device) Notation example: AA3-DCT1 • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	×	×
DWL	Point table (dwell)	Decimal	AA(Axis designation)-DWL(Device) Notation example: AA3-DWL1 • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	×	×
AUX	Point table (auxiliary function)	Decimal	AA(Axis designation)-AUX(Device) Notation example: AA3-AUX1 • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	×	×
MCD	Point table (M code)	Decimal	AA(Axis designation)-MCD(Device) Notation example: AA3-MCD1 • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	×	×
MD	Machine diagnosis data	Decimal	AA(Axis designation)-MD(Device) Notation example: AA3-MD0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 21	×	×
OTS	One-touch tuning data	Decimal	AA(Axis designation)-OTS(Device) Notation example: AA3-OTS0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5, 3000	×	×
DI	External input signal	Decimal	AA(Axis designation)-DI(Device) Notation example: AA3-DI0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	×	×
DO	External output signal	Decimal	AA(Axis designation)-DO(Device) Notation example: AA3-DO0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 4	×	×

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
PO	Option unit parameter	Decimal	AA(Axis designation)-PO(Device) Notation example: AA3-PO1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	×	×
PS	Special parameter	Decimal	AA(Axis designation)-PS(Device) Notation example: AA3-PS1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	×	×
PL*2	Motor extension parameter	Decimal	AA(Axis designation)-PL(Device) Notation example: AA3-PL1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	×	×
	Linear servo motor/DD motor setting parameter			×	×
PU	Multi encoder parameter	Decimal	AA(Axis designation)-PU(Device) Notation example: AA3-PU1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	×	×
PVS	Positioning extension parameter	Decimal	AA(Axis designation)-PVS(Device) Notation example: AA3-PVS1 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	×	×
NPA	Network basic parameter	Decimal	1 to 12 2001 to 2032	×	×
GFDS	Gear failure diagnosis data	Decimal	AA(Axis designation)-GFDS(Device) Notation example: AA3-GFDS0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	×	×
ECCDS	Encoder communication circuit diagnosis data	Decimal	AA(Axis designation)-ECCDS(Device) Notation example: AA3-ECCDS0 • Axis designation: 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 The device name depends on the servo amplifier.
MR-J5-G(-RJ) or MR-J5W□-G: Motor extension setting parameter
Other than MR-J5-G(-RJ) or MR-J5W□-G: Linear servo motor/DD motor setting parameter

For indirect specification of an axis designation, refer to the following.

☞ Page 3172 Indirect specification of an axis number or axis designation ([MELSEC iQ-R, RnMT/NC/RT, CR800-D])

97.16.4 Availability of writing/reading data to/from word devices ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
PA	R/W	R/W	-/-	-/-
PB	R/W	R/W	-/-	-/-
PC	R/W	R/W	-/-	-/-
PD	R/W	R/W	-/-	-/-
PT	R/W	R/W	-/-	-/-
PN	R/W	R/W	-/-	-/-

ECCDI1	CN2L encoder communication circuit diagnosis start command	—	○	○	○

When using the encoder communication circuit diagnosis instruction, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.

Basic setting parameter ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

Use an appropriate device according to the write destination of the servo amplifier.

- PA1 to PA44: Writing data to the RAM of a servo amplifier
- PA1001 to PA1044: Writing data to the FlashROM or EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Extension setting parameter ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

Use an appropriate device according to the write destination of the servo amplifier.

- PC1 to PC90: Writing data to the RAM of a servo amplifier
- PC1001 to PC1090: Writing data to the FlashROM or EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Network setting parameters ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

Use an appropriate device according to the write destination of the servo amplifier.

- PN1 to PN32: Writing data to the RAM of a servo amplifier
- PN1001 to PN1032: Writing data to the FlashROM or EEPROM of a servo amplifier

For the parameters prefixed by an asterisk (*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

Virtual device name	Name	Symbol	MR-J5-G(-RJ), MR-J5W□-G	MR-JET-G	MR-J5D□-G
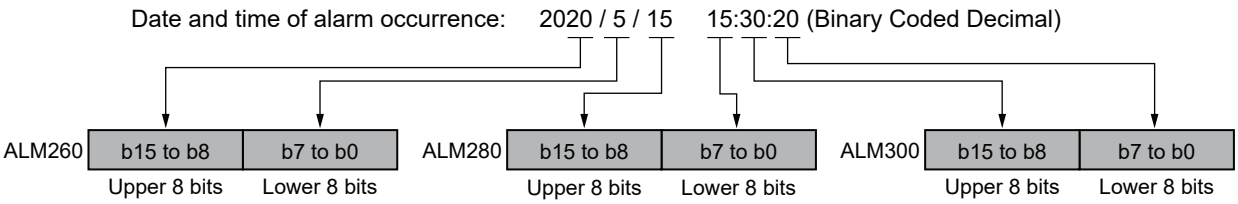
ALM315	Alarm occurrence time (minute, second) in alarm history: 15th alarm in past	—	○	○	○

*1 Set [Data Type] and [Format] as shown below for the objects for which this device is set.
[Data Type]: [Unsigned BIN32]
[Format]: [Hexadecimal]

Specifications of ALM260 to ALM275, ALM280 to ALM295, and ALM300 to ALM315 ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

The date and time of alarm occurrence are stored in BCD code in the upper eight bits and lower eight bits of each device.
The time zone setting of the controller is applied to the date and time to be acquired.
Example) When the date and time of the most recent alarm occurrence is 15:30:20 May 15, 2020



When the date and time of alarm occurrence are those of 1999 or earlier, 0 is displayed.

Point table (position) ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

Use an appropriate device according to the write destination of the servo amplifier.

- POS1 to POS255: Writing data to the RAM of a servo amplifier
- POS1001 to POS1255: Writing data to the FlashROM or EEPROM of a servo amplifier

○: Available
—: Not available

Virtual device name	Name	Symbol	MR-J5-G(-RJ), MR-J5W□-G	MR-JET-G	MR-J5D□-G
POS1 to POS255, POS1001 to POS1255	Point table/position data No. 1 to No. 255	—	○	○	○

Point table (speed) ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

Use an appropriate device according to the write destination of the servo amplifier.

- SPD1 to SPD255: Writing data to the RAM of a servo amplifier
- SPD1001 to SPD1255: Writing data to the FlashROM or EEPROM of a servo amplifier

○: Available
—: Not available

Virtual device name	Name	Symbol	MR-J5-G(-RJ), MR-J5W□-G	MR-JET-G	MR-J5D□-G
SPD1 to SPD255, SPD1001 to SPD1255	Point table/speed data No. 1 to No. 255	—	○	○	○

Point table (acceleration time constant) ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

Use an appropriate device according to the write destination of the servo amplifier.

- ACT1 to ACT255: Writing data to the RAM of a servo amplifier
- ACT1001 to ACT1255: Writing data to the FlashROM or EEPROM of a servo amplifier

○: Available

—: Not available

Virtual device name	Name	Symbol	MR-J5-G(-RJ), MR-J5W□-G	MR-JET-G	MR-J5D□-G
ACT1 to ACT255, ACT1001 to ACT1255	Point table/acceleration time constant No. 1 to No. 255	—	○	○	○

Point table (deceleration time constant) ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

Use an appropriate device according to the write destination of the servo amplifier.

- DCT1 to DCT255: Writing data to the RAM of a servo amplifier
- DCT1001 to DCT1255: Writing data to the FlashROM or EEPROM of a servo amplifier

○: Available

—: Not available

Virtual device name	Name	Symbol	MR-J5-G(-RJ), MR-J5W□-G	MR-JET-G	MR-J5D□-G
DCT1 to DCT255, DCT1001 to DCT1255	Point table/deceleration time constant No. 1 to No. 255	—	○	○	○

Point table (dwell) ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

Use an appropriate device according to the write destination of the servo amplifier.

- DWL1 to DWL255: Writing data to the RAM of a servo amplifier
- DWL1001 to DWL1255: Writing data to the FlashROM or EEPROM of a servo amplifier

○: Available

—: Not available

Virtual device name	Name	Symbol	MR-J5-G(-RJ), MR-J5W□-G	MR-JET-G	MR-J5D□-G
DWL1 to DWL255, DWL1001 to DWL1255	Point table/dwell No. 1 to No. 255	—	○	○	○

Point table (auxiliary function) ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

Use an appropriate device according to the write destination of the servo amplifier.

- AUX1 to AUX255: Writing data to the RAM of a servo amplifier
- AUX1001 to AUX1255: Writing data to the FlashROM or EEPROM of a servo amplifier

○: Available

—: Not available

Virtual device name	Name	Symbol	MR-J5-G(-RJ), MR-J5W□-G	MR-JET-G	MR-J5D□-G

MD18	Machine diagnosis data trouble prediction status	—	○	○[*3]	○
MD19	Machine diagnosis data: Belt tension estimation value	—	○	○[*3]	○

Virtual device name	Name	Symbol	MR-J5-G(-RJ), MR-J5W□-G	MR-JET-G	MR-J5D□-G
MD20	Machine diagnosis data: static friction used in failure prediction	—	○	○*3	○
MD21	Machine diagnosis data: Belt tension threshold estimation	—	○	○*3	○

*1 While the servo amplifier is estimating the corresponding machine status in the machine diagnosis, do not write data to the parameters of the servo amplifier from another GOT.
Doing so may cause the servo amplifier to malfunction.

*2 When MD2 indicates that the servo amplifier does not complete the machine diagnosis (is estimating or warning of the machine status), do not monitor MD3 to MD6 (friction states) and MD7 to MD10 (vibration/oscillation states).
To start monitoring those devices upon the estimation completion, set [Trigger] in the applicable object settings.

*3 The commands assigned to MD12 to MD21 are not supported by MR-JET-G.
When the commands are used, the read values will be indefinite.

One-touch tuning data ([MELSERVO-J5(W)-*G(-RJ), -JET-*G])

○: Available

—: Not available

Virtual device name	Name	Symbol	MR-J5-G(-RJ), MR-J5W□-G	MR-JET-G	MR-J5D□-G

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
A	Alarm definition	Decimal	0 to 7	○	×
Pr	Parameter	Decimal	0 to 1500	○	×
SP	Special parameter	Decimal	108 to 127	○	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

97.17.4 Availability of writing/reading data to/from word devices ([FREQROL 700/800, Sensorless Servo])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
A	R/-	-/-	-/-	-/-
Pr	R/W	-/-	-/-	-/-
SP*1	R/W	-/-	-/-	-/-

*1 Only reading is available for SP111 to SP114.
Only writing is available for SP124 and SP125.

97.17.5 Virtual inverter devices ([FREQROL 700/800, Sensorless Servo])

The following shows the correspondence between the virtual devices used in the GOT and the inverter data.

For details on the inverter parameters, refer to the following.

☞ Manual of the inverter used

Virtual device name	Reference
RS	☞ Page 3459 Inverter status monitor ([FREQROL 700/800, Sensorless Servo])
WS	☞ Page 3460 Operation command ([FREQROL 700/800, Sensorless Servo])
	☞ Page 3461 When activating WS devices ([FREQROL 700/800, Sensorless Servo])

Inverter status monitor ([FREQROL 700/800, Sensorless Servo])

The settable devices vary by inverter model.

For the settable devices of each inverter, refer to the following.

📖Manual of the inverter used

Parameter settings may have been changed in the inverter.

To use the devices, check the parameters and set the parameters as required.

Ex.

Example) When using the FR-A800 series

Virtual device name	Name
RS0	RUN (Inverter running)
RS1	During forward rotation
RS2	During reverse rotation
RS3	SU (Up to frequency)
RS4	OL (Overload warning)
RS5	IPF (Instantaneous power failure/undervoltage)
RS6	FU (Output frequency detection)
RS7	ABC1 (Fault)
RS8	ABC2
RS9	Safety monitor output
RS15	Fault occurrence

Operation command ([FREQROL 700/800, Sensorless Servo])

The settable devices vary by inverter model.

For the settable devices of each inverter, refer to the following.

📖Manual of the inverter used

Parameter settings may have been changed in the inverter.

To use the devices, check the parameters and set the parameters as required.

Ex.

Example) When using the FR-A800 series

Virtual device name	Name
WS0*1*2	AU (Terminal 4 input selection)
WS1	Forward rotation command
WS2	Reverse rotation command
WS3*1*2	RL (Low-speed operation command)
WS4*1*2	RM (Middle-speed operation command)
WS5*1*2	RH (High-speed operation command)
WS6*1*2	RT (Second function selection)
WS7*1*2	MRS (Output stop)
WS8*1*2*3	JOG (Jog operation selection)
WS9*1*2*3	CS (Selection of automatic restart after instantaneous power failure, flying start)
WS10*1*2*3	STOP (Start self-holding selection)
WS11*1*2*3	RES (Inverter reset)

*1 When the GOT is connected to the PU connector and the operation mode is set to the PU operation mode, the device cannot be used.

*2 The monitor data can be changed by the settings of Pr.178 to Pr.189 (input terminal function selection).
For the relationship between the parameters and terminals, refer to the following.
📖Manual of the inverter used

*3 The device is invalid for the initial state of the inverter in which a function that cannot be controlled by the GOT is set or no function is set.
Change the relevant setting in Pr.178 to Pr.189 (input terminal function selection).

When using the operation command, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.
When activating WS devices	☞ Page 3461 When activating WS devices ([FREQROL 700/800, Sensorless Servo])

When activating WS devices ([FREQROL 700/800, Sensorless Servo])

More than one WS device cannot turn on at once.

Turning on one WS device turns off the other WS devices.

Use SP122 or SP121 to turn on multiple WS devices simultaneously.

☞ Page 3464 Specifications of SP122 and SP121 ([FREQROL 700/800, Sensorless Servo])

The following shows the specifications of WS devices.

WS device	Specifications
WS0 to WS7	GOT's virtual devices corresponding to the inverter's operation commands (instruction code: HFA, bit length: 8 bits)  The function of each bit differs depending on the inverter. Example) A800 series inverter • WS0: AU (Terminal 4 input selection) • WS1: Forward rotation command • WS2: Reverse rotation command • WS3: RL (Low-speed operation command) • WS4: RM (Middle-speed operation command) • WS5: RH (High-speed operation command) • WS6: RT (Second function selection) • WS7: MRS (Output stop) When you turn on one of the WS0 to WS7 devices, the rest of these devices are turned off. Example) When you turn on WS1 WS0 and WS2 to WS7 are turned off.
WS8 to WS15	WS8 to WS11 are GOT's virtual devices corresponding to the inverter's operation commands (extended) (instruction code: HF9, bit length: 16 bits).  The function of each bit differs depending on the inverter. Example) A800 series inverter • WS8: JOG (Jog operation selection) • WS9: CS (Selection of automatic restart after instantaneous power failure, flying start) • WS10: STOP (Start self-holding selection) • WS11: RES (Inverter reset) Turning on a device out of WS8 to WS11 turns off WS0 to WS15 except the one that is turned on. Example) When you turn on WS9 WS0 to WS8 and WS10 to WS15 are turned off.

Alarm definition ([FREQROL 700/800, Sensorless Servo])

The settable devices vary by inverter model.

For the settable devices of each inverter, refer to the following.

Manual of the inverter used

Ex.

Example) When using the FR-A800 series

Virtual device name	Name
A0	Second fault in past
A1	Latest fault
A2	Fourth fault in past
A3	Third fault in past
A4	Sixth fault in past
A5	Fifth fault in past
A6	Eighth fault in past
A7	Seventh fault in past

Parameter ([FREQROL 700/800, Sensorless Servo])

The virtual device numbers (Pr) used in the GOT correspond to the inverter parameter numbers.

For the inverter parameters, refer to the following.

Manual of the inverter used

When using a parameter, note the following.

Precautions	Description
When setting 8888 or 9999 to a parameter (Pr) of an inverter	Values 8888 and 9999 are used for particular purposes. To set these values to inverter parameters, write the following values to the GOT virtual device. • To set 8888: 65520 • To set 9999: 65535
When setting calibration parameters Pr900 to Pr905	Write one of the following values to SP108 (second parameter changing) as required. • H00: Offset/gain • H01: Analog • H02: Analog value at terminal

Special parameter ([FREQROL 700/800, Sensorless Servo])

If the GOT reads or writes data from or to a virtual device (SP), the inverter's instruction code corresponding to the SP device is used for communication.

For instruction details, and values to be read and written, refer to the following.

📖Manual of the inverter used

Ex.

Example) When using the FR-A800 series

Virtual device name	Name	Instruction code (hexadecimal)	
		Read	Writing
SP108	Second parameter changing	—	—
SP109	Set frequency (RAM)	0502	8502
SP110	Set frequency (RAM, EEPROM)	0503	8503
SP111	Output frequency/speed	0800	—
SP112	Output current	0800	—
SP113	Output voltage	0800	—
SP114	Special monitor	0800	—
SP115	Special monitor selection No.	—	—
SP116	Faults history batch clear / Latest fault, Second fault in past	0631 0632	8628
SP117	Third fault in past, Fourth fault in past	0633 0634	—
SP118	Fifth fault in past, Sixth fault in past	0635 0636	—
SP119	Seventh fault in past, Eighth fault in past	0637 0638	—
SP121*1*2	Inverter status monitor (extended) / Operation command (extended)	0504 0624	8504
SP122*1*2	Inverter status monitor / Operation command	0504	8504
SP123	Operation mode	0510	8510 8511 8514
SP124	All parameter clear	—	84F0: Parameter clear 84F8: Parameter clear (excluding communication parameters) 84F1: All parameter clear 84F9: All parameter clear (excluding communication parameters)
SP125	Inverter reset	—	84E0: Inverter reset (no response) 84E1: Inverter reset (after acknowledgement)
SP127	Link parameter extended setting	—	—

*1 When the GOT is connected to the PU connector and the operation mode is set to the PU operation mode, the multispeed operation (WS3 to WS7, SP121, SP122) cannot be used.
For using the multi-speed operation, follow either of the operations below.
Connect the GOT to the RS-485 terminal and set the operation mode to the NET operation mode (Computer link operation mode), and then operate the inverter.
Change the motor speed with the set frequency (SP109, SP110), and then operate the inverter with the forward or reverse rotation (WS1, WS2, SP121, SP122).

*2 For the specifications of SP122 and SP121, refer to the following.
☞ Page 3464 Specifications of SP122 and SP121 ([FREQROL 700/800, Sensorless Servo])

Specifications of SP122 and SP121 ([FREQROL 700/800, Sensorless Servo])

SP122 and SP121 are the GOT's virtual devices corresponding to the inverter's ordinary and extended operation commands. The following shows the specifications of SP122 and SP121.

SP device	Specifications
SP122	GOT's virtual device corresponding to the inverter's operation command (instruction code: HFA, bit length: 8 bits) The function of each bit differs depending on the inverter. Example) A800 series inverter • SP122.b0: AU (Terminal 4 input selection) • SP122.b1: Forward rotation command • SP122.b2: Reverse rotation command • SP122.b3: RL (Low-speed operation command) • SP122.b4: RM (Middle-speed operation command) • SP122.b5: RH (High-speed operation command) • SP122.b6: RT (Second function selection) • SP122.b7: MRS (Output stop) To send more than one command simultaneously, convert the binary value of the bits to be turned on to a decimal value, and write the decimal value to SP122. Example) Sending forward rotation command and RL (Low-speed operation command) simultaneously Binary: 00001010 Decimal: 10 Write 10 to SP122.
SP121	GOT's virtual device corresponding to the inverter's operation commands (instruction code: HF9, bit length: 16 bits) The function of each bit differs depending on the inverter. Example) A800 series inverter • SP121.b0: AU (Terminal 4 input selection) • SP121.b1: Forward rotation command • SP121.b2: Reverse rotation command • SP121.b3: RL (Low-speed operation command) • SP121.b4: RM (Middle-speed operation command) • SP121.b5: RH (High-speed operation command) • SP121.b6: RT (Second function selection) • SP121.b7: MRS (Output stop) • SP121.b8: JOG (Jog operation selection) • SP121.b9: CS (Selection of automatic restart after instantaneous power failure, flying start) • SP121.b10: STOP (Start self-holding selection) • SP121.b11: RES (Inverter reset) • SP121.b12 to SP122.b15: Not used To send more than one command simultaneously, convert the binary value of the device (with applicable bits on) to a decimal value, and write the decimal value to SP121. Example) Sending forward rotation command, RL (Low-speed operation command), and JOG (Jog operation selection) simultaneously Binary: 0000000100001010 Decimal: 266 Write 266 to SP121.

*1 The virtual device is also usable for the conventional model.
When you create a project, use a different device.

The lists of virtual devices shown in this section explain some inverter models using the following abbreviations.

Series	Abbreviation	Model
FR-A800 Plus series	CRN	FR-A8□0-CRN FR-A8□2-CRN FR-A8□0-E-CRN FR-A8□2-E-CRN
	R2R	FR-A8□0-R2R FR-A8□2-R2R FR-A8□0-E-R2R FR-A8□2-E-R2R
	AWH	FR-A8□0-AWH FR-A8□0-E-AWH
	LC	FR-A8□0-LC FR-A8□0-E-LC
FR-E800 series	E800	FR-E8□0
	E	FR-E8□0-E
FR-D800 series	D800	FR-D8□0
	E	FR-D8□0-E

Inverter status monitor ([FREQROL 800/E700NE(Batch monitor)])

Parameter settings may have been changed in the inverter.

To use the devices, check the parameters and set the parameters as required.

*1 When the GOT is connected to the PU connector and the operation mode is set to the PU operation mode, the device cannot be used.

*2 The monitor data can be changed by the settings of Pr.178 to Pr.189 (input terminal function selection).
For the relationship between the parameters and terminals, refer to the following.
📖Manual of the inverter used

*3 The device is invalid for the initial state of the inverter in which a function that cannot be controlled by the GOT is set or no function is set.
Change the relevant setting in Pr.178 to Pr.189 (input terminal function selection).

When using the operation command, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.
When activating WS devices	☞ Page 3473 Operation when turning on/off the WS devices ([FREQROL 800/E700NE(Batch monitor)])

Operation when turning on/off the WS devices ([FREQROL 800/E700NE(Batch monitor)])

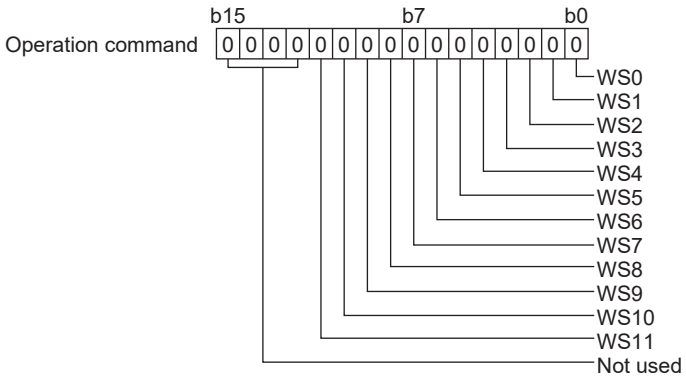
When you turn on/off one of the WS0 to WS15 devices, the rest of these devices are turned off.

Ex.

When you turn on WS9

WS0 to WS8 and WS10 to WS15 are turned off.

The following shows the relationship between the inverter's operation commands and WS devices.



The function of each bit differs depending on the inverter.

Ex.

A800 series inverter

- WS0: AU (Terminal 4 input selection)
- WS1: Forward rotation command
- WS2: Reverse rotation command
- WS3: RL (Low-speed operation command)
- WS4: RM (Middle-speed operation command)
- WS5: RH (High-speed operation command)
- WS6: RT (Second function selection)
- WS7: MRS (Output stop)
- WS8: JOG (Jog operation selection)
- WS9: CS (Selection of automatic restart after instantaneous power failure, flying start)
- WS10: STOP (Start self-holding selection)
- WS11: RES (Inverter reset)

Use SP122 or SP121 to control multiple WS devices simultaneously.

SERIAL (serial number) is provided on the rating plate of the inverter.

When using the operation command, note the following.

Precautions	Description
When setting a device for a bit switch	Do not select [Alternate] for [Switch Action] of the bit switch.
Operation when a CMD device is turned on	☞ Page 3477 Operation when turning on/off one of the CMD3 to CMD12 devices ([FREQROL 800/E700NE(Batch monitor)]) ☞ Page 3477 Operation when turning on/off one of the CMD48 to CMD52 devices ([FREQROL 800/E700NE(Batch monitor)])

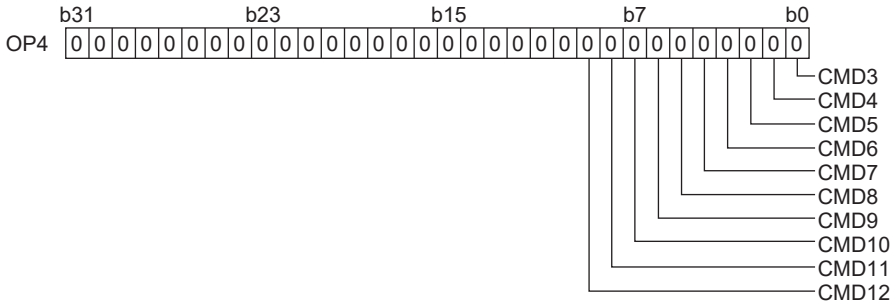
Operation when turning on/off one of the CMD3 to CMD12 devices ([FREQROL 800/E700NE(Batch monitor)])

The CMD3 to CMD12 devices cannot be controlled simultaneously.

When you turn on/off one of the CMD3 to CMD12 devices, the rest of these devices are turned off.

Use OP4 to control multiple devices from CMD3 to CMD12 simultaneously.

The following shows the relationship between CMD3 to CMD12 and OP4.



Ex.

Turning on the CMD3 (RL terminal) and CMD12 (RES terminal) devices

For a hexadecimal value, write 0201.

For a decimal value, write 513.

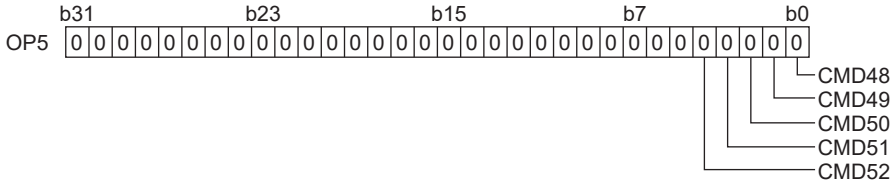
Operation when turning on/off one of the CMD48 to CMD52 devices ([FREQROL 800/E700NE(Batch monitor)])

The CMD48 to CMD52 devices cannot be controlled simultaneously.

When you turn on/off one of the CMD48 to CMD52 devices, the rest of these devices are turned off.

Use OP5 to control multiple devices from CMD48 to CMD52 simultaneously.

The following shows the relationship between CMD48 to CMD52 and OP5.



Ex.

Turning on the CMD48 (NET X1 input) and CMD52 (NET X5 input) devices

For a hexadecimal value, write 0011.

For a decimal value, write 17.

Parameter, parameter (32-bit) ([FREQROL 800/E700NE(Batch monitor)])

The virtual device numbers (Pr and LPr) used in the GOT correspond to the inverter parameter numbers.

For the inverter parameters, refer to the following.

Manual of the inverter used

When using a parameter, note the following.

Precautions	Description
When setting 8888 or 9999 to a parameter (Pr) of an inverter	Values 8888 and 9999 are used for particular purposes. To set these values to inverter parameters using the virtual devices, write the following values from the GOT. • To set 8888: 65520 • To set 9999: 65535
When setting 8888 or 9999 to a 32-bit parameter (LPr) of an inverter	Values 8888 and 9999 are used for particular purposes. To set these values to inverter parameters, write the following values to the GOT virtual device. • To set 8888: 8888 • To set 9999: 9999 It is recommended to set the data type to [Real] for a parameter that can accept a value with a fractional part.
When specifying a calibration parameter or PID display	If you specify Pr900 to Pr933 (Calibration parameter), or Pr934 and Pr935 (PID display), whether the value below must be written to SP108 (Second parameter changing) depends on the specified device number and inverter model. • H00: Offset/gain • H01: Analog • H02: Analog value at terminal

*1 When the GOT is connected to the PU connector and the operation mode is set to the PU operation mode, SP121.b1, SP121.b2, SP122.b1, and SP122.b2 can be used.
For the specifications of SP122 and SP121, refer to the following.
☞ Page 3480 Specifications of SP122 and SP121 ([FREQROL 800/E700NE(Batch monitor)])

Specifications of SP122 and SP121 ([FREQROL 800/E700NE(Batch monitor)])

SP122 and SP121 are the GOT's virtual devices corresponding to the inverter's operation commands.

The following shows the specifications of SP122 and SP121.

SP device	Specifications
SP122	The function of each bit differs depending on the inverter. Example) A800 series inverter • SP122.b0: AU (Terminal 4 input selection) • SP122.b1: Forward rotation command • SP122.b2: Reverse rotation command • SP122.b3: RL (Low-speed operation command) • SP122.b4: RM (Middle-speed operation command) • SP122.b5: RH (High-speed operation command) • SP122.b6: RT (Second function selection) • SP122.b7: MRS (Output stop) • SP122.b8 to b15: Fixed to 0 SP122 (virtual device) is used to maintain compatibility with the conventional model. When [FREQROL 800/E700NE(Batch monitor)] is set, writing a value to SP122 clears each bit of SP122.b8 to SP122.b15. To send more than one command simultaneously, convert the binary value of the bits to be turned on to a decimal value, and write the decimal value to SP122. Example) Sending forward rotation command and RL (Low-speed operation command) simultaneously Binary: 0000000000001010 Decimal: 10 Write 10 to SP122.
SP121	The function of each bit differs depending on the inverter. Example) A800 series inverter • SP121.b0: AU (Terminal 4 input selection) • SP121.b1: Forward rotation command • SP121.b2: Reverse rotation command • SP121.b3: RL (Low-speed operation command) • SP121.b4: RM (Middle-speed operation command) • SP121.b5: RH (High-speed operation command) • SP121.b6: RT (Second function selection) • SP121.b7: MRS (Output stop) • SP121.b8: JOG (Jog operation selection) • SP121.b9: CS (Selection of automatic restart after instantaneous power failure, flying start) • SP121.b10: STOP (Start self-holding selection) • SP121.b11: RES (Inverter reset) To send more than one command simultaneously, convert the binary value of the device (with applicable bits on) to a decimal value, and write the decimal value to SP121. Example) Sending forward rotation command, RL (Low-speed operation command), and JOG (Jog operation selection) simultaneously Binary: 0000000100001010 Decimal: 266 Write 266 to SP121.

*1 When the GOT is connected to the PU connector and the operation mode is set to the PU operation mode, the device cannot be used.

*2 The monitor data can be changed by the settings of Pr.178 to Pr.189 (input terminal function selection).
For the relationship between the parameters and terminals, refer to the following.
Manual of the inverter used

*3 The device is invalid for the initial state of the inverter in which a function that cannot be controlled by the GOT is set or no function is set.
Change the relevant setting in Pr.178 to Pr.189 (input terminal function selection).

*4 Use an inverter having SERIAL (serial number) "□□211○○○○○○" or later.
SERIAL (serial number) is provided on the rating plate of the inverter.

98 Device range and settings of each controller

This chapter describes the range of devices settable in GT Designer3.
The settable range varies with the selection for [Controller Type] in the [Controller Setting] window.
Configure the device setting according to the specifications of the controller to be used.
Device specifications differ depending on the controller model even among the controllers of the same series.
If a nonexistent device or a device number out of the range is set for an object, other objects for which correct devices are set may not be monitored.

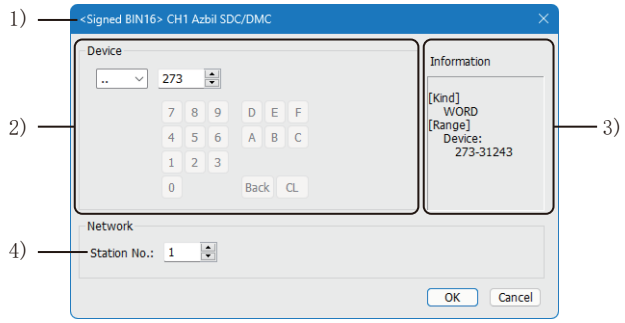
98.1 AZBIL equipment ([Azbil SDC/DMC])

GT37 SoftGOT3000

Item	Reference
Device setting dialog	☞ Page 3488 Device setting dialog ([Azbil SDC/DMC])
Specifications of word devices	☞ Page 3489 Monitoring-supported word devices ([Azbil SDC/DMC])
	☞ Page 3489 Availability of writing/reading data to/from word devices ([Azbil SDC/DMC])

98.1.1 Device setting dialog ([Azbil SDC/DMC])

Set a device to be monitored.



Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of ..273 3)	[Information]	Displays the setting range of each setting item according to the selected device.
4)	[Station No.]	Specify a station number. The setting range is [0] to [127] (direct) or [200] to [215] (indirect). For indirect specification of a station number, refer to the following. ☞ Page 3488 Indirect specification of a station number ([Azbil SDC/DMC])

Indirect specification of a station number ([Azbil SDC/DMC])

When you specify any of 200 to 215 for the station number, the value of the corresponding GOT data register (GD10 to GD25) is used as the station number.

The following shows the correspondence between station number setting values and GOT data registers (GD).

Station No.	GOT data register (GD)	Setting range
200	GD10	[0] to [127] Setting a value outside the above range causes a device range error.
201	GD11	
:	:	
214	GD24	
215	GD25	

98.1.2 Monitoring-supported word devices ([Azbil SDC/DMC])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3489 Availability of writing/reading data to/from word devices ([Azbil SDC/DMC])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
..	Data	Decimal	273 to 31243	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.

☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.1.3 Availability of writing/reading data to/from word devices ([Azbil SDC/DMC])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
..	R/W	-/-	-/-	R/W

98.2 OMRON equipment ([OMRON SYSMAC])

GT37 SoftGOT3000

Item	Reference
Device setting dialog	☞ Page 3490 Device setting dialog ([OMRON SYSMAC])

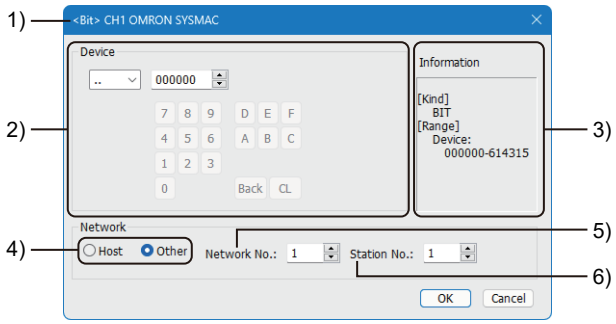
Specifications of word devices	☞ Page 3493 Monitoring-supported word devices ([OMRON SYSMAC])
	☞ Page 3493 Availability of writing/reading data to/from word devices ([OMRON SYSMAC])

98.2.1 Device setting dialog ([OMRON SYSMAC])

Set a device to be monitored.



Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of ..000000 3)	[Information]	Displays the setting range of each setting item according to the selected device.
4)	Station type specification	Select the station type (host or other) for the controller to be monitored.
5)	[Network No.]	This item appears when [Other] is selected for the station type. Set the network number.
6)	[Station No.]	This item appears when [Other] is selected for the station type. Specify a station number.

98.2.2 Monitoring-supported bit devices ([OMRON SYSMAC])

The following table shows monitoring-supported bit devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3492 Availability of writing/reading data to/from bit devices ([OMRON SYSMAC])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
..	I/O relay, Internal auxiliary relay	Decimal	..(Channel No.)(Bit No.) Notation example: ..614300 The two rightmost digits represent a bit number. • Channel No. (decimal): 0000 to 6143 • Bit No.: 00 to 15	○	○
LR	Data link relay	Decimal	LR(Channel No.)(Bit No.) Notation example: LR19900 The two rightmost digits represent a bit number. • Channel No. (decimal): 000 to 199 • Bit No.: 00 to 15	○	○
HR	Holding relay	Decimal	HR(Channel No.)(Bit No.) Notation example: HR51100 The two rightmost digits represent a bit number. • Channel No. (decimal): 000 to 511 • Bit No.: 00 to 15	○	○
WR	Internal auxiliary relay, Work relay	Decimal	WR(Channel No.)(Bit No.) Notation example: WR51100 The two rightmost digits represent a bit number. • Channel No. (decimal): 000 to 511 • Bit No.: 00 to 15	○	○
TIM	Timer contact	Decimal	0 to 4095	○	○
CNT	Counter contact	Decimal	0 to 4095	○	○
AR	Auxiliary memory relay	Decimal	AR(Channel No.)(Bit No.) Notation example: AR1153500 The two rightmost digits represent a bit number. • Channel No. (decimal): 00000 to 11535 • Bit No.: 00 to 15	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.

☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.2.3 Availability of writing/reading data to/from bit devices ([OMRON SYSMAC])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
..	R/W	-/-	R/W	R/W	-/-
LR	R/W	-/-	R/W	R/W	-/-
HR	R/W	-/-	R/W	R/W	-/-
WR	R/W	-/-	R/W	R/W	-/-
TIM	R/-	-/-	-/-	-/-	-/-
CNT	R/-	-/-	-/-	-/-	-/-
AR	R/W	-/-	R/W	R/W	-/-

98.2.4 Monitoring-supported word devices ([OMRON SYSMAC])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3493 Availability of writing/reading data to/from word devices ([OMRON SYSMAC])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
TIM*2*3	Timer (current value)	Decimal	0 to 4095	○	○
CNT*2*3	Counter (current value)	Decimal	0 to 4095	○	○
DM	Data memory	Decimal	0 to 32767	○	○
EM*4	Extension data memory, EM current bank	Decimal	0 to 32767	○	○
E*4	Extension data memory	Hexadecimal + decimal	E(Bank No.)-(Device) Notation example: E18-100 • Bank No. (hexadecimal): 0 to 18 • Device (decimal): 0 to 32767	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 A valid value ranges from 0 to 9999. (This applies to the 16 bit/32 bit device data.)

*3 This is handled as a BCD value in the PLC. When serial connection is used between the PLC and the GOT, this is handled as an unsigned 16-bit binary data in the GOT.
For the object for monitoring on the GOT, select [Unsigned BIN16] for [Data Type].

*4 Writing or reading data extending across banks is not possible.

98.2.5 Availability of writing/reading data to/from word devices ([OMRON SYSMAC])

The following shows the availability of writing/reading data to/from word devices by device type.

When executing the touch switch function that has been set during the bit specification of the word device, do not write any data to the word device through the sequence program.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
TIM	R/W	R/W	-/-	R/W
CNT	R/W	R/W	-/-	R/W
DM	R/W	R/W	-/-	R/W
EM	R/W	R/W	-/-	R/W
E	R/W	R/W	-/-	R/W

98.3 OMRON equipment ([OMRON NJ/NX])

GT37 SoftGOT3000

Item	Reference
Device setting dialog	☞ Page 3494 Device setting dialog ([OMRON NJ/NX])
Device specifications	☞ Page 3494 Monitoring-supported devices ([OMRON NJ/NX])

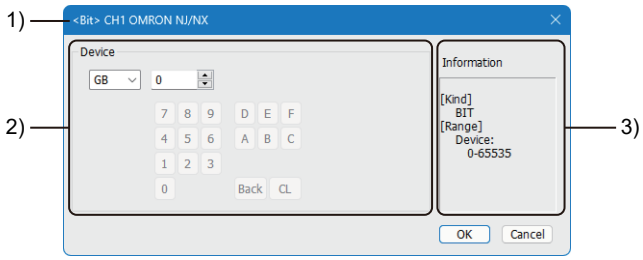
98.3.1 Device setting dialog ([OMRON NJ/NX])

Set a device to be monitored.

In the device setting dialog, only GOT internal devices are settable.

For setting the OMRON NJ/NX tags, refer to the following.

☞ Page 921 How to set OMRON NJ/NX tags



Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed.
3)	[Information]	Displays the setting range of each setting item according to the selected device.

98.3.2 Monitoring-supported devices ([OMRON NJ/NX])

To monitor the OMRON NJ or NX series, use OMRON NJ/NX tags.

For the usable OMRON NJ/NX tags, refer to the following.

☞ Page 922 Usable OMRON NJ/NX tags

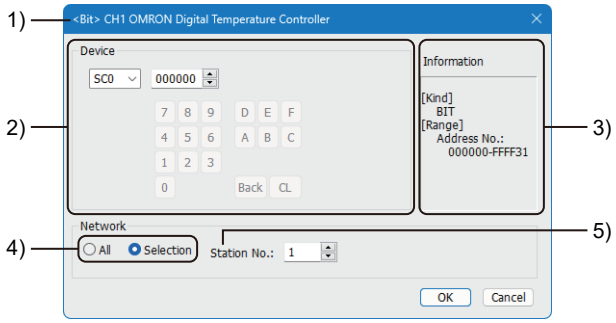
98.4 OMRON equipment ([OMRON Digital Temperature Controller])

GT37 SoftGOT3000

Item	Reference
Device setting dialog	☞ Page 3496 Device setting dialog ([OMRON Digital Temperature Controller])
Specifications of bit devices	☞ Page 3497 Monitoring-supported bit devices ([OMRON Digital Temperature Controller])
	☞ Page 3497 Availability of writing/reading data to/from bit devices ([OMRON Digital Temperature Controller])
Specifications of word devices	☞ Page 3498 Monitoring-supported word devices ([OMRON Digital Temperature Controller])
	☞ Page 3498 Availability of writing/reading data to/from word devices ([OMRON Digital Temperature Controller])
Specifications of double-word devices	☞ Page 3499 Monitoring-supported double-word devices ([OMRON Digital Temperature Controller])
	☞ Page 3500 Availability of writing/reading data to/from double-word devices ([OMRON Digital Temperature Controller])

98.4.1 Device setting dialog ([OMRON Digital Temperature Controller])

Set a device to be monitored.



Item		Description	
1)	Title	Data type and channel number of the device to be set	
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of SC0000000 	
3)	[Information]	Displays the setting range of each setting item according to the selected device.	
4)	Monitor target specification	Set the monitoring target of the set device.	
		[All]	Select this item when writing data to all the connected temperature controllers. During monitoring, the temperature controller of station No. 1 is monitored. When writing the data in numerical input, data is written to all connected temperature controllers during input, and the temperature controller of station No. 1 is monitored during other than input (displaying).
		[Selection]	Select this item when monitoring the temperature controller that has the specified station number.
5)	[Station No.]	This item appears when [Selection] is selected for the monitor target specification. The setting range is [0] to [99] (direct) or [100] to [115] (indirect). For indirect specification of a station number, refer to the following. ☞ Page 3496 Indirect specification of a station number ([OMRON Digital Temperature Controller])	

Indirect specification of a station number ([OMRON Digital Temperature Controller])

When you specify any of 100 to 115 for the station number, the value of the corresponding GOT data register (GD10 to GD25) is used as the station number.

The following shows the correspondence between station number setting values and GOT data registers (GD).

Station No.	GOT data register (GD)	Setting range
100	GD10	[0] to [99] Setting a value outside the above range causes a device range error.
101	GD11	
:	:	
114	GD24	
115	GD25	

98.4.2 Monitoring-supported bit devices ([OMRON Digital Temperature Controller])

The following table shows monitoring-supported bit devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3497 Availability of writing/reading data to/from bit devices ([OMRON Digital Temperature Controller])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
SC0	Status(Variable type C0)	Hexadecimal + decimal	SC0(Address No.)(Bit No.) Notation example: SC0FFFF00 • Address number (hexadecimal): 0000 to FFFF • Bit No. (decimal): 00 to 31	○	○ (Not usable as word data)
SC4	Status(Variable type C4)	Hexadecimal + decimal	SC4(Address No.)(Bit No.) Notation example: SC4FFFF00 • Address number (hexadecimal): 0000 to FFFF • Bit No. (decimal): 00 to 31	○	○ (Not usable as word data)

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.

☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.4.3 Availability of writing/reading data to/from bit devices ([OMRON Digital Temperature Controller])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
SC0	R/-	-/-	-/-	-/-	-/-
SC4	R/-	-/-	-/-	-/-	-/-

98.4.4 Monitoring-supported word devices ([OMRON Digital Temperature Controller])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3498 Availability of writing/reading data to/from word devices ([OMRON Digital Temperature Controller])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
A*2*3	Operation command	Hexadecimal	0000 to 00FF	○	○ (Not usable as bit data)

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Numerical input cannot be used.
Use a word switch for writing.

*3 This device corresponds to the command code in the operation instruction command of CompoWay/F communication.

98.4.5 Availability of writing/reading data to/from word devices ([OMRON Digital Temperature Controller])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
A	-/W	-/-	-/-	-/-

98.4.6 Monitoring-supported double-word devices ([OMRON Digital Temperature Controller])

The following table shows monitoring-supported double-word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

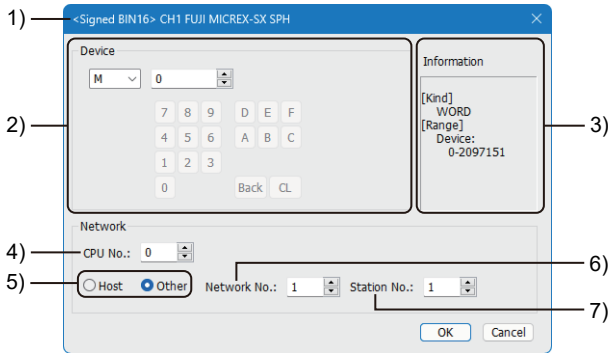
Notation of devices	☞ Page 3509 Notation of devices ([FUJI MICREX-SX SPH])

98.6.1 Device setting dialog ([FUJI MICREX-SX SPH])

Set a device to be monitored.



Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of M0 3)	[Information]	Displays the setting range of each setting item according to the selected device.
4)	[CPU No.]	Set the CPU number of the controller.
5)	Station type specification	Select the station type (host or other) for the controller to be monitored.
6)	[Network No.]	This item appears when [Other] is selected for the station type. Set the network number.
7)	[Station No.]	This item appears when [Other] is selected for the station type. Specify a station number.

98.6.2 Monitoring-supported word devices ([FUJI MICREX-SX SPH])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3508 Availability of writing/reading data to/from word devices ([FUJI MICREX-SX SPH])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
M	Non-retain memory	Decimal	0 to 2097151	○	○
L	Retain memory	Decimal	0 to 2097151	○	○
SM	System memory	Decimal	0 to 511	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.6.3 Availability of writing/reading data to/from word devices ([FUJI MICREX-SX SPH])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data*1
M	R/W	R/W	-/-	R/W
L	R/W	R/W	-/-	R/W
SM	R/W	R/W	-/-	R/W

*1 The GOT reads the value from a device and then write a value to the device.
Do not change the device value with a sequence program until the GOT completes writing a value to the device.

98.6.4 Notation of devices ([FUJI MICREX-SX SPH])

The notation of devices differs between the FUJI PLC programming software and GT Designer3.
The notation also differs according to the type of FUJI PLC programming software.

Notation of devices in the single CPU system ([FUJI MICREX-SX SPH])

n: Device number

Device		Notation of devices in GT Designer3	Notation of devices in the PLC programming software	
			SX-Programmer Expert(D300win)	SX-Programmer Standard
Non-retain memory	Word device	Mn	%MW1.n	WMn
	Double-word device		%MD1.n	DMn
	Bit-specified word device	Mn.b0 to Mn.b15	%MX1.n.00 to %MX1.n.15	Mn0 to MnF*1
Retain memory	Word device	Ln	%MW3.n	WLn
	Double-word device		%MD3.n	DLn
	Bit-specified word device	Ln.b0 to Ln.b15	%MX3.n.00 to %MX3.n.15	Ln0 to LnF*1
System memory	Word device	SMn	%MW10.n	WSMn
	Double-word device		%MD10.n	DSMn
	Bit-specified word device	SMn.b0 to SMn.b15	%MX10.n.00 to %MX10.n.15	SMn0 to SMnF*1

*1 The device number is not displayed when it is 0.

Notation of devices in the multiple CPU system ([FUJI MICREX-SX SPH])

n: Device number

p: CPU number

Device		Notation of devices in GT Designer3	Notation of devices in the PLC programming software	
			SX-Programmer Expert(D300win)	SX-Programmer Standard
Non-retain memory	Word device	0-FF/p Mn	%MWp.1.n	WMp.n
	Double-word device		%MDp.1.n	DMp.n
	Bit-specified word device	0-FF/p Mn.b0 to 0-FF/p Mn.b15	%MXp.1.n.00 to %MXp.1.n.15	Mp.n0 to Mp.nF*1

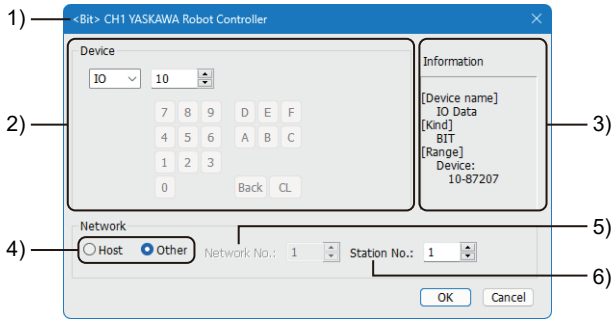
98.9.1 Device setting dialog ([YASKAWA Robot Controller])

Set a device to be monitored.



Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of IO10
3)	[Information]	Displays the setting range of each setting item according to the selected device.
4)	Station type specification	Select the station type (host or other) for the controller to be monitored.
5)	[Network No.]	This item appears when [Other] is selected for the station type. Set the network number. The setting range is [1] (fixed).
6)	[Station No.]	This item appears when [Other] is selected for the station type. Specify a station number. The setting range is [1] to [120].

98.9.2 Monitoring-supported bit devices ([YASKAWA Robot Controller])

The following table shows monitoring-supported bit devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3519 Availability of writing/reading data to/from bit devices ([YASKAWA Robot Controller])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
IO	IO Data	Decimal + octal	IO(Byte address)(Bit address) Notation example: IO87200 The rightmost digit is a bit address. • Byte address (decimal): 1 to 8720 • Bit address (octal): 0 to 7 For the relationship between the data and device range of the robot controller, refer to the following. ☞ Page 3518 IO Data device details ([YASKAWA Robot Controller])	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.9.3 IO Data device details ([YASKAWA Robot Controller])

The following shows the relationship between the data and device range of the robot controller.

The rightmost digit of each device number is a bit address.

Device range	Virtual device name
10 to 5127	Robot general-purpose input
10010 to 15127	Robot general-purpose output
20010 to 25127	External input
27010 to 29567	Network input
30010 to 35127	External output
37010 to 39567	Network output
40010 to 42567	Robot-dedicated input
50010 to 55127	Robot-dedicated output
60010 to 60647	Interface panel input
70010 to 79997	Auxiliary relay
80010 to 85127	Robot control status
87010 to 87207	Pseudo input

98.9.4 Availability of writing/reading data to/from bit devices ([YASKAWA Robot Controller])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
IO*1	R/W	-/-	R/W	-/-	-/-

*1 Availability of reading/writing depends on the device number.

☞ Page 3518 IO Data device details ([YASKAWA Robot Controller])

98.9.5 Monitoring-supported byte devices ([YASKAWA Robot Controller])

The following table shows monitoring-supported byte devices.

To check whether writing/reading data to/from each device is available, refer to the following.

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
B	Byte Variable	Decimal	0 to 1999	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.

☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.9.6 Availability of writing/reading data to/from byte devices ([YASKAWA Robot Controller])

The following shows whether writing/reading data to/from byte devices is available by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
B	-/-	R/W	-/-	-/-	-/-

98.9.7 Monitoring-supported word devices ([YASKAWA Robot Controller])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3521 Availability of writing/reading data to/from word devices ([YASKAWA Robot Controller])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
I	Integer Variable	Decimal	0 to 1999	○	○
M	Resister Data	Decimal	0 to 999	○	○
RC*2	Robot Control	Hexadecimal + decimal + decimal	RC(Command No.)-(Instance)((Attribute)) Notation example: RC70-8720(13) • Command No. (hexadecimal): 70 to 8C, 300 to 30C • Instance (decimal): 0 to 8720 • Attribute (decimal): 0 to 13 For the relationship between data that can be acquired using Robot Control and the virtual GOT devices, refer to the following. ☞ Page 3521 Robot Control device details ([YASKAWA Robot Controller])	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Not available for a text display or text input object.

98.9.8 Robot Control device details ([YASKAWA Robot Controller])

Data that can be acquired using the Robot Control is assigned to the GOT virtual device (RC device).
Specify the Command No., Instance, and Attribute for the RC device to enable monitoring of the corresponding data.
Note the following when using the RC device.

Precautions	Description
Basic use of the RC device	Read all the elements to a GOT internal device in a batch using the script function or device data transfer function to monitor the data stored in the device. Setting the RC device to an object or others to monitor each element individually will decrease the monitoring speed.
Setting of the device data type and number of devices	Check the size of each data corresponding to the Command No., Instance, and Attribute to be specified. Set the data type and number of devices in the device settings so that the corresponding data can be stored.
Objects for which the RC device cannot be used	Do not specify the RC device directly in the following object settings for which consecutive devices are used. • Text display: Monitor device • Text input: Monitor device • Parts movement: [Device] (When [Specified coordinates] is selected for [Move Way]) • Simple alarm display: Monitor device (When [Continuous] is selected for [Device No.]) • Recipe display (record list): [Control target record name], [Narrow down record names], or [Cursor row record name] • Trend graph: Monitor device (When [Continuous] is selected for [Device Setting]) • Document display: [Keyword Device] As described in the column for Basic use of the RC device, read all the elements to a GOT internal device in a batch to monitor the data stored in the device.

For details on each command, refer to the following.
📖Manual of the YASKAWA robot controller
The GOT supports the following commands.

Command No. (hexadecimal)	Command name
72	Status information read command
73	Execution job information read command
74	Axis configuration information read command
75	Robot position data read command
76	Position deviation read command
77	Torque data read command
7F	Robot position variable (P) read/write command
82	Alarm reset/error cancel command
88	Control time acquisition command
307	Robot position variable (P) multi-read/-write command
30A	Alarm data read command (subcode character string supported)
30B	Alarm history read command (subcode character string supported)

98.9.9 Availability of writing/reading data to/from word devices ([YASKAWA Robot Controller])

The following shows the availability of writing/reading data to/from word devices by device type.
R/W: Both read and write
R/-: Read only
-/W: Write only
-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
I	R/W	-/-	-/-	-/-
M	R/W	-/-	-/-	-/-
RC	R/W	R/W	-/-	R/-

98.9.10 Monitoring-supported double-word devices ([YASKAWA Robot Controller])

The following table shows monitoring-supported double-word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3522 Availability of writing/reading data to/from double-word devices ([YASKAWA Robot Controller])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
D	Double Int Variable	Decimal	0 to 1999	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.

☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.9.11 Availability of writing/reading data to/from double-word devices ([YASKAWA Robot Controller])

The following shows the availability of writing/reading data to/from double-word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of double-word data
D	-/-	R/W	-/-	-/-

98.9.12 Precautions ([YASKAWA Robot Controller])

Precautions when writing devices in a batch ([YASKAWA Robot Controller])

When many devices are written in a batch using the recipe function or device data transfer function, system alarm 402 (communication timeout error) may occur.

Take either of the following corrective actions.

- Specifying a longer communication timeout period
- Reducing the number of devices written in a batch

98.10 YOKOGAWA equipment ([YOKOGAWA FA-M3])

L	Link relay	Decimal + decimal	L(FA link relay No. - 1)(Link relay No.) Notation example: L70001 • FA link module No. - 1 (decimal): 0 to 7 (Set the link module No. minus 1.) • Link relay No. (decimal): 0001 to 8192	○	○
E	Shared relay	Decimal	1 to 4096	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.

☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.10.3 Availability of writing/reading data to/from bit devices ([YOKOGAWA FA-M3])

The following shows the availability of writing/reading data to/from bit devices by device type.
When the device type is other than the bit type, set the device No. in multiples of 16.
R/W: Both read and write
R/-: Read only
-/W: Write only
-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/-	-/-	R/-	R/-	-/-
Y	R/W	-/-	R/W	R/W	-/-
I	R/W	-/-	R/W	R/W	-/-
TU	R/W	-/-	-/-	-/-	-/-
CU	R/W	-/-	-/-	-/-	-/-
M	R/W	-/-	R/W	R/W	-/-
L	R/W	-/-	R/W	R/W	-/-
E	R/W	-/-	R/W	R/W	-/-

98.10.4 Monitoring-supported word devices ([YOKOGAWA FA-M3])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3527 Availability of writing/reading data to/from word devices ([YOKOGAWA FA-M3])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
TP	Timer	Decimal	1 to 3072	○	○ (Not usable as bit data)
CP	Counter	Decimal	1 to 3072	○	○ (Not usable as bit data)
D	Data register	Decimal	1 to 65535	○	○
Z	Special register	Decimal	1 to 1024	○	×

W	Link register	Decimal + decimal	W(FA link module No. - 1)(Link register No.) Notation example: W70001 • FA link module No. - 1 (decimal): 0 to 7 (Set the link module No. minus 1.) • Link register No. (decimal): 0001 to 8192	○	×
F	Cache register	Decimal	000001 to 524288	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.

☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.10.5 Availability of writing/reading data to/from word devices ([YOKOGAWA FA-M3])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
TP	R/W	R/W	-/-	-/-
CP	R/W	R/W	-/-	-/-
D	R/W	R/W	-/-	R/W
Z	R/W	R/W	-/-	R/W
B	R/W	R/W	-/-	R/W
V	R/W	R/W	-/-	R/W
TS	R/-	R/-	-/-	-/-
CS	R/-	R/-	-/-	-/-
R	R/W	R/W	-/-	R/W
W	R/W	R/W	-/-	R/W
F	R/W	R/W	-/-	R/W

98.10.6 Precautions ([YOKOGAWA FA-M3])

Behavior when setting a device outside the device range ([YOKOGAWA FA-M3])

If a device outside the setting range is set for an object, the value display at the object is indefinite.

However, no error is displayed for system alarm.

A device to be set for an object must be in the device range of YOKOGAWA PLC.

For the device range of YOKOGAWA PLC, refer to the manual below.

📖Manual of YOKOGAWA PLC

98.11 ALLEN-BRADLEY equipment ([AB MicroLogix])

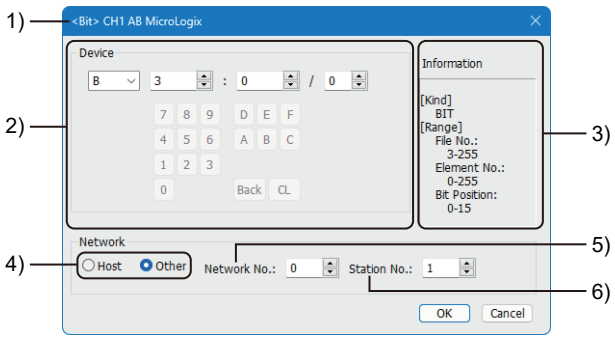
	☞ Page 3533 Availability of writing/reading data to/from double-word devices ([AB MicroLogix])

98.11.1 Device setting dialog ([AB MicroLogix])

Set a device to be monitored.



Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of B3:0/0 3)	[Information]	Displays the setting range of each setting item according to the selected device.
4)	Station type specification	Select the station type (host or other) for the controller to be monitored.
5)	[Network No.]	This item appears when [Other] is selected for the station type. Set the network number.
6)	[Station No.]	This item appears when [Other] is selected for the station type. Specify a station number.

98.11.2 Monitoring-supported bit devices ([AB MicroLogix])

The following table shows monitoring-supported bit devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3530 Availability of writing/reading data to/from bit devices ([AB MicroLogix])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

The GOT reads the value from a device and then write a value to the device.

Do not change the device value with a sequence program until the GOT completes writing a value to the device.

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
I	Input	Decimal	I:(Slot No.).(Element No.)/(Bit position) Notation example: I:16.7/0 • Slot No. (decimal): 0 to 16 • Element No. (decimal): 0 to 7 • Bit position (decimal): 0 to 15	○	○
O	Output	Decimal	O:(Slot No.).(Element No.)/(Bit position) Notation example: O:16.7/0 • Slot No. (decimal): 0 to 16 • Element No. (decimal): 0 to 7 • Bit position (decimal): 0 to 15	○	○
B	Bit	Decimal	B(File No.):(Element No.)/(Bit position) Notation example: B3:255/0 • File No. (decimal): 3 to 255 • Element No. (decimal): 0 to 255 • Bit position (decimal): 0 to 15	○	○
T	Timer (completion bit)	Decimal	T(File No.):(Element No.)/13(DN) Notation example: T3:255/13(DN) • File No. (decimal): 3 to 255 • Element No. (decimal): 0 to 255	○	×
	Timer (timing bit)		T(File No.):(Element No.)/14(TT) Notation example: T3:255/14(TT) • File No. (decimal): 3 to 255 • Element No. (decimal): 0 to 255		
C	Counter (completion bit)	Decimal	C(File No.):(Element No.)/13(DN) Notation example: C3:255/13(DN) • File No. (decimal): 3 to 255 • Element No. (decimal): 0 to 255	○	×
	Counter (down counter)		C(File No.):(Element No.)/14(CD) Notation example: C3:255/14(CD) • File No. (decimal): 3 to 255 • Element No. (decimal): 0 to 255		
	Counter (up counter)		C(File No.):(Element No.)/15(CU) Notation example: C3:255/15(CU) • File No. (decimal): 3 to 255 • Element No. (decimal): 0 to 255		

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.11.3 Availability of writing/reading data to/from bit devices ([AB MicroLogix])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
I	R/W	-/-	-/-	-/-	-/-
O	R/W	-/-	-/-	-/-	-/-
B	R/W	-/-	-/-	-/-	-/-
T	R/W	-/-	-/-	-/-	-/-
C	R/W	-/-	-/-	-/-	-/-

98.11.4 Monitoring-supported word devices ([AB MicroLogix])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3532 Availability of writing/reading data to/from word devices ([AB MicroLogix])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

R	File Register	Decimal	00000 to 32767	○	○
ZR	File Register	Decimal	000000 to 524287	○	○
U*2	Analog Data Register	Hexadecimal + decimal	U(BaseNo.)(SlotNo.).(Special module No.) Notation example: U7F.00 • BaseNo. (hexadecimal): 0 to 7 • SlotNo. (hexadecimal): 0 to F • Special module No. (decimal): 00 to 31	○	○
N	Comm. Data Register	Decimal	00000 to 21503	○	○
Z	Index register	Decimal	000 to 255	○	○
T	Timer current value	Decimal	0000 to 8191	○	○ (Not usable as bit data)
C	Counter current value	Decimal	0000 to 4095	○	○ (Not usable as bit data)

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 When the device type is the double-word (32 bits) type, set an even number for the special module number only.

98.14.5 Availability of writing/reading data to/from word devices ([LS ELECTRIC XGK])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
D	R/W	R/W	-/-	R/W
R	R/W	R/W	-/-	R/W
ZR	R/W	R/W	-/-	R/W
U	R/W	R/W	-/-	R/W
N	R/W	R/W	-/-	R/W
Z	R/W	R/W	-/-	R/W
T	R/W	R/W	-/-	-/-
C	R/W	R/W	-/-	-/-

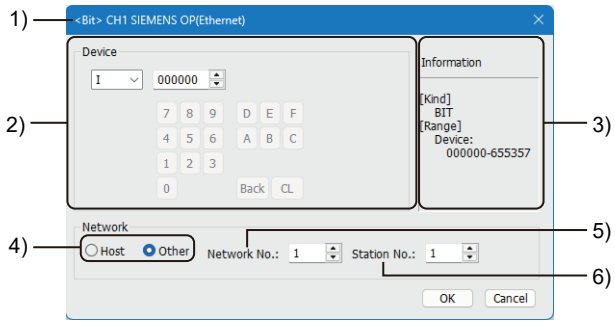
98.15.1 Device setting dialog ([SIEMENS OP(Ethernet)])

Set a device to be monitored.



Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of I000000 3)	[Information]	Displays the setting range of each setting item according to the selected device.
4)	Station type specification	Select the station type (host or other) for the controller to be monitored. • [Host]: The controller set for [Host Address] of the [Controller Setting] window is monitored. • [Other]: The controller having the specified station number is monitored.
5)	[Network No.]	This item appears when [Other] is selected for the station type. Set the network number.
6)	[Station No.]	This item appears when [Other] is selected for the station type. Specify a station number.

98.15.2 Monitoring-supported bit devices ([SIEMENS OP(Ethernet)])

The following table shows monitoring-supported bit devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3545 Availability of writing/reading data to/from bit devices ([SIEMENS OP(Ethernet)])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

The notation of device setting is different between the SIEMENS PLC peripheral software and GOT.

For the notation of devices, refer to the following.

☞ Page 3551 Notation of devices

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
I	Input relay	Decimal + octal	I(Byte address)(Bit address) Notation example: I655350 • Byte address (decimal): 00000 to 65535 • Bit address (octal): 0 to 7	○	○ (Not usable as word data)
Q*2	Output relay	Decimal + octal	Q(Byte address)(Bit address) Notation example: Q655350 • Byte address (decimal): 00000 to 65535 • Bit address (octal): 0 to 7	○	○ (Not usable as word data)
V	Variable memory	Decimal + octal	V(Byte address)(Bit address) Notation example: V204790 • Byte address (decimal): 00000 to 20479 • Bit address (octal): 0 to 7	○	○ (Not usable as word data)
M	Bit memory	Decimal + octal	M(Byte address)(Bit address) Notation example: M655350 • Byte address (decimal): 00000 to 65535 • Bit address (octal): 0 to 7	○	○ (Not usable as word data)
S	Sequence control relay	Decimal + octal	S(Byte address)(Bit address) Notation example: S310 • Byte address (decimal): 00 to 31 • Bit address (octal): 0 to 7	○	○
T	Timer	Decimal	0 to 255	○	×
C	Counter	Decimal	0 to 255	○	×
SM	Special memory	Decimal + octal	SM(Byte address)(Bit address) Notation example: SM20470 • Byte address (decimal): 0000 to 2047 • Bit address (octal): 0 to 7	○	○ (Not usable as word data)

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Writing is possible only while the programmable controller is running.

98.15.3 Availability of writing/reading data to/from bit devices ([SIEMENS OP(Ethernet)])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
I*1	R/W	-/-	-/-	-/-	-/-
Q*1	R/W	-/-	-/-	-/-	-/-
V*1	R/W	-/-	-/-	-/-	-/-
M*1	R/W	-/-	-/-	-/-	-/-
S*1	R/W	-/-	-/-	-/-	-/-
T	R/-	-/-	-/-	-/-	-/-
C	R/-	-/-	-/-	-/-	-/-
SM*1	R/W	-/-	-/-	-/-	-/-

*1 To use the device as word data, use the word device that has the same device name appended with "W".
Example) Use IW for I.

98.15.4 Monitoring-supported byte devices ([SIEMENS OP(Ethernet)])

The following table shows monitoring-supported byte devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3546 Availability of writing/reading data to/from byte devices ([SIEMENS OP(Ethernet)])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
IB	Input relay	Decimal	0 to 65535	×	×
QB	Output relay	Decimal	0 to 65535	×	×
MB	Bit memory	Decimal	0 to 65535	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.

☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.15.5 Availability of writing/reading data to/from byte devices ([SIEMENS OP(Ethernet)])

The following shows whether writing/reading data to/from byte devices is available by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of byte data
IB	R/W	-/-	-/-	-/-	-/-
QB	R/W	-/-	-/-	-/-	-/-
MB	R/W	-/-	-/-	-/-	-/-

98.15.6 Monitoring-supported word devices ([SIEMENS OP(Ethernet)])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3548 Availability of writing/reading data to/from word devices ([SIEMENS OP(Ethernet)])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
T*2	Timer	Decimal	0 to 65535	○	○ (Not usable as bit data)
C	Counter	Decimal	0 to 65535	○	○ (Not usable as bit data)
DB*3*4*5	Data register	Decimal	DB(Data block No.).DBW(Device) Notation example: DB65535.DBW0 • Data block No. (decimal): 1 to 65535 • Device (Data word No.) (decimal): 0 to 65534 (Set an even number.)	○	○
VW*5	Variable memory	Decimal	0 to 20478	○	○ (Not usable as bit data)
IW*5	Input relay	Decimal	0 to 65534	○	○ (Not usable as bit data)
QW*5*6	Output relay	Decimal	0 to 65534	○	○ (Not usable as bit data)
MW*5	Bit memory	Decimal	0 to 65534	○	○ (Not usable as bit data)
AIW*5	Analog input	Decimal	0 to 110	○	×
AQW*5*6	Analog output	Decimal	0 to 110	○	○ (Not usable as bit data)
SMW*5	Special memory	Decimal	0 to 2046	○	○ (Not usable as bit data)
SW*5	Sequence control relay	Decimal	0 to 30	○	○ (Not usable as bit data)

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

*2 Only one device can be set as the write destination.
Do not set this device as the write destination for a function to write data to consecutive devices such as the recipe function.

*3 It is necessary to define the data block using a peripheral software or sequence program, before using this device.

*4 Continuous access across data blocks is not possible.

*5 When the device type is the word (16 bits) type, set an even number for the device number.
When the device type is the double-word (32 bits) type, set the device number in multiples of 4.

*6 Writing is possible only while the programmable controller is running.

98.15.7 Availability of writing/reading data to/from word devices ([SIEMENS OP(Ethernet)])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
T	R/W	R/W	-/-	-/-
C	R/W	R/W	-/-	-/-
DB	R/W	R/W	-/-	R/W
VW*1	R/W	R/W	-/-	-/-
IW*1	R/W	R/W	-/-	-/-
QW*1	R/W	R/W	-/-	-/-
MW*1	R/W	R/W	-/-	-/-
AIW	R/-	R/-	-/-	-/-
AQW	R/W	R/W	-/-	-/-
SMW*1	R/W	R/W	-/-	-/-
SW*1	R/W	R/W	-/-	-/-

*1 To use the device as bit data, use the bit device that has the same device name without "W".
Example) Use I for IW.

98.15.8 Monitoring-supported double-word devices ([SIEMENS OP(Ethernet)])

The following table shows monitoring-supported double-word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3549 Availability of writing/reading data to/from double-word devices ([SIEMENS OP(Ethernet)])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
ID	Input relay	Decimal	0 to 65532 (Set the number in multiples of 4.)	×	×
QD	Output relay	Decimal	0 to 65532 (Set the number in multiples of 4.)	×	×
MD	Bit memory	Decimal	0 to 65532 (Set the number in multiples of 4.)	×	×
HC	High-speed counter	Decimal	0 to 3	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.

☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.15.9 Availability of writing/reading data to/from double-word devices ([SIEMENS OP(Ethernet)])

The following shows the availability of writing/reading data to/from double-word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of double-word data
ID	-/-	R/W	-/-	-/-
QD	-/-	R/W	-/-	-/-
MD	-/-	R/W	-/-	-/-
HC	-/-	R/-	-/-	-/-

98.15.10 Offset specifications ([SIEMENS OP(Ethernet)])

The following shows the offset specifications of each device when using the offset function.

For the notation and range of devices, refer to the following.

☞ Page 3544 Monitoring-supported bit devices ([SIEMENS OP(Ethernet)])
☞ Page 3546 Monitoring-supported byte devices ([SIEMENS OP(Ethernet)])
☞ Page 3547 Monitoring-supported word devices ([SIEMENS OP(Ethernet)])
☞ Page 3549 Monitoring-supported double-word devices ([SIEMENS OP(Ethernet)])

Device		Offset specifications
Bit device	I	When the bit address is increased by 8 bits, the byte address is increased by 1 byte. Example) Offset for I000000 When offset value is 10, I000012 is monitored.
	Q	
	V	
	M	
	S	
	SM	
	T	Example) Offset for T0 When offset value is 10, T10 is monitored.
	C	
Byte device	IB	Example) Offset for IB0 When offset value is 10, IB10 is monitored.
	QB	
	MB	
Word device	T	Example) Offset for T0 When offset value is 10, T10 is monitored.
	C	
	DB	The offset target is device number (data word number). When a bit is specified, the bit is not supported for the bit number offset.
		Example) Offset for DB1.DBW0 When offset value is 10, DB1.DBW10 is monitored.
	VW	Example) Offset for VW0 When offset value is 10, VW10 is monitored.
	IW	
	QW	
	MW	
	AIW	
	AQW	
	SMW	
	SW	
Double-word device	ID	Example) Offset for ID0 When offset value is 10, ID10 is monitored.
	QD	
	MD	
	HC	Example) Offset for HC0 When offset value is 1, HC1 is monitored.

98.15.11 Notation of devices

The notation of device setting is different between the SIEMENS PLC peripheral software and GOT.

Notation of bit devices

Notation in the GOT	Notation in the PLC
Q0007	Q0.7

Notation of bit-specified data register

Notation in the GOT	Notation in the PLC
DB1.DBW0.b0	DB1.DBX1.0
DB1.DBW0.b1	DB1.DBX1.1
:	:
DB1.DBW0.b7	DB1.DBX1.7
DB1.DBW0.b8	DB1.DBX0.0
:	:
DB1.DBW0.b15	DB1.DBX0.7
DB1.DBW2.b0	DB1.DBX3.0
:	:
DB1.DBW2.b7	DB1.DBX3.7
DB1.DBW2.b8	DB1.DBX2.0

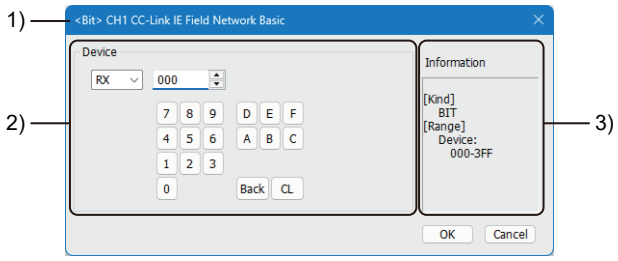
98.16.1 Device setting dialog ([CC-Link IE Field Network Basic])

Set a device to be monitored.



Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of RX000 3)	[Information]	Displays the setting range of each setting item according to the selected device.

98.16.2 Monitoring-supported bit devices ([CC-Link IE Field Network Basic])

The following table shows monitoring-supported bit devices.
The device range shown in this section indicates the maximum settable values in GT Designer3.
The range of devices that can actually be monitored depends on the number of stations occupied by remote stations that are set in the master station.
Before setting the device range, check the number of occupied stations that are assigned to the GOT.
If a nonexistent device or a device number out of the range is set for an object, other objects for which correct devices are set may not be monitored.
To check whether writing/reading data to/from each device is available, refer to the following.
☞ Page 3553 Availability of writing/reading data to/from bit devices ([CC-Link IE Field Network Basic])
For the formats of devices, refer to the following.
☞ Page 849 Formats of devices, labels, and tags
○: Available
× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
RX	Remote input	Hexadecimal	000 to 3FF	○	○
RY	Remote output	Hexadecimal	000 to 3FF	○	○

98.16.3 Availability of writing/reading data to/from bit devices ([CC-Link IE Field Network Basic])

The following shows the availability of writing/reading data to/from bit devices by device type.
When the device type is other than the bit type, set the device No. in multiples of 16.
R/W: Both read and write
R/-: Read only
-/W: Write only
-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
RX	R/W	-/-	R/W	R/W	-/-
RY	R/W	-/-	R/W	R/W	-/-

98.16.4 Monitoring-supported word devices ([CC-Link IE Field Network Basic])

The following table shows monitoring-supported word devices.
The device range shown in this section indicates the maximum settable values in GT Designer3.
The range of devices that can actually be monitored depends on the number of stations occupied by remote stations that are set in the master station.
Before setting the device range, check the number of occupied stations that are assigned to the GOT.
If a nonexistent device or a device number out of the range is set for an object, other objects for which correct devices are set may not be monitored.
To check whether writing/reading data to/from each device is available, refer to the following.
☞ Page 3554 Availability of writing/reading data to/from word devices ([CC-Link IE Field Network Basic])
For the formats of devices, refer to the following.
☞ Page 849 Formats of devices, labels, and tags
○: Available
× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
Ww	Remote register	Hexadecimal	000 to 1FF	○	○
Wr	Remote register	Hexadecimal	000 to 1FF	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.16.5 Availability of writing/reading data to/from word devices ([CC-Link IE Field Network Basic])

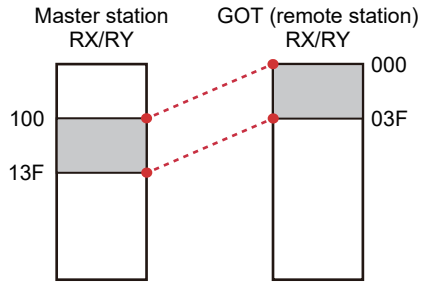
The following shows the availability of writing/reading data to/from word devices by device type.
R/W: Both read and write
R/-: Read only
-/W: Write only
-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
Ww	R/W	R/W	-/-	R/W
Wr	R/W	R/W	-/-	R/W

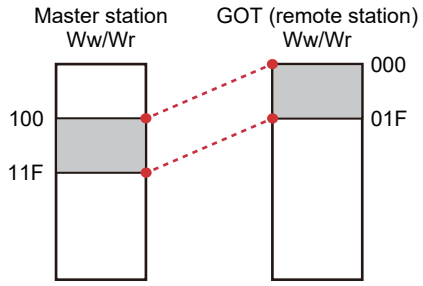
98.16.6 Remote device setting of the GOT (remote station) ([CC-Link IE Field Network Basic])

The devices assigned to the GOT in the master station are allocated in the range starting from the first number in the GOT.
The following shows the examples of device assignment in the master station and in the GOT (remote station).
In the example of remote device assignment (RX/RY 1 station occupied), the remote devices assigned to the GOT (remote station) are RX100 to RX13F and RY100 to RY13F in the master station. Note that the corresponding remote devices in the GOT are RX000 to RX03F and RY000 to RY03F.

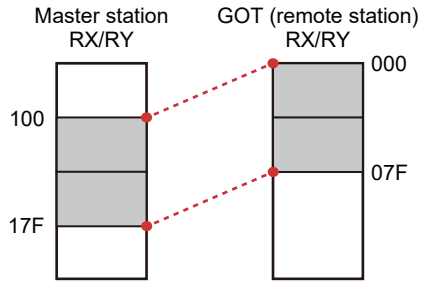
Example of remote device assignment
RX/RY 1 station occupied



Example of remote device assignment
Ww/Wr 1 station occupied



Example of remote device assignment
RX/RY 2 station occupied



Example of remote device assignment
Ww/Wr 2 station occupied

98.17.3 Availability of writing/reading data to/from bit devices ([SLMP])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/W	-/-	R/W	R/W	-/-
Y	R/W	-/-	R/W	R/W	-/-
B	R/W	-/-	R/W	R/W	-/-
M	R/W	-/-	R/W	R/W	-/-
L	R/W	-/-	R/W	R/W	-/-
F	R/W	-/-	R/W	R/W	-/-
V	R/W	-/-	R/W	R/W	-/-
TC	R/W	-/-	-/-	-/-	-/-
TS	R/W	-/-	-/-	-/-	-/-
CC	R/W	-/-	-/-	-/-	-/-
CS	R/W	-/-	-/-	-/-	-/-
STC	R/W	-/-	-/-	-/-	-/-
STS	R/W	-/-	-/-	-/-	-/-
SB	R/W	-/-	R/W	R/W	-/-
SM	R/W	-/-	R/W	R/W	-/-
DX	R/W	-/-	R/W	R/W	-/-
DY	R/W	-/-	R/W	R/W	-/-
JnX	R/W	-/-	R/W	R/W	-/-
JnY	R/W	-/-	R/W	R/W	-/-
JnB	R/W	-/-	R/W	R/W	-/-
JnSB	R/W	-/-	R/W	R/W	-/-

98.17.4 Monitoring-supported word devices ([SLMP])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3561 Availability of writing/reading data to/from word devices ([SLMP])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
TN	Timer (current value)	Decimal	0 to 16777215	○	○ (Not usable as bit data)
CN	Counter (current value)	Decimal	0 to 16777215	○	○ (Not usable as bit data)
STN	Retentive timer (current value)	Decimal	0 to 16777215	○	○ (Not usable as bit data)
D	Data register	Decimal	0 to 16777215	○	○
SD	Special register	Decimal	0 to 16777215	○	○
W	Link register	Hexadecimal	000000 to FFFFFF	○	○
SW	Link special register	Hexadecimal	000000 to FFFFFF	○	○
R	File register (Block switching method)	Decimal	0 to 16777215	○	○
ZR	File register (Serial number access method)	Hexadecimal	000000 to FFFFFF	○	○
Z	Index register	Decimal	0 to 16777215	○	○
G	Module access device (buffer memory)	Decimal	U(Unit No.)-G(Device) Notation example: UFF-G0 • Unit No.(hexadecimal): 00 to FF • Device (decimal): 0 to 16777215	○	○
U3E0G	CPU buffer memory	Decimal	U3E0-G(Device) Notation example: U3E0-G0 • Device (decimal): 0 to 16777215	○	○
U3E1G	CPU buffer memory	Decimal	U3E1-G(Device) Notation example: U3E1-G0 • Device (decimal): 0 to 16777215	○	○
U3E2G	CPU buffer memory	Decimal	U3E2-G(Device) Notation example: U3E2-G0 • Device (decimal): 0 to 16777215	○	○
U3E3G	CPU buffer memory	Decimal	U3E3-G(Device) Notation example: U3E3-G0 • Device (decimal): 0 to 16777215	○	○
U3E0HG	Fixed-cycle area of the CPU buffer memory (multiple CPU high speed transmission memory)	Decimal	U3E0-HG(Device) Notation example: U3E0-HG0 • Device (decimal): 0 to 16777215	○	○
U3E1HG	Fixed-cycle area of the CPU buffer memory (multiple CPU high speed transmission memory)	Decimal	U3E1-HG(Device) Notation example: U3E1-HG0 • Device (decimal): 0 to 16777215	○	○
U3E2HG	Fixed-cycle area of the CPU buffer memory (multiple CPU high speed transmission memory)	Decimal	U3E2-HG(Device) Notation example: U3E2-HG0 • Device (decimal): 0 to 16777215	○	○
U3E3HG	Fixed-cycle area of the CPU buffer memory (multiple CPU high speed transmission memory)	Decimal	U3E3-HG(Device) Notation example: U3E3-HG0 • Device (decimal): 0 to 16777215	○	○

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
JnW	Link register (link direct device)	Hexadecimal	J(Network No.)-W(Device) Notation example: J1-W000000 • Network No. (decimal): 1 to 239 • Device (hexadecimal): 000000 to FFFFFF	○	○
JnSW	Link special register (link direct device)	Hexadecimal	J(Network No.)-SW(Device) Notation example: J1-SW000000 • Network No. (decimal): 1 to 239 • Device (hexadecimal): 000000 to FFFFFF	○	○
RD	Refresh data register	Decimal	0 to 4294967295	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.17.5 Availability of writing/reading data to/from word devices ([SLMP])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
TN	R/W	R/W	-/-	-/-
CN	R/W	R/W	-/-	-/-
STN	R/W	R/W	-/-	-/-
D*1	R/W	R/W	-/-	R/W
SD*1	R/W	R/W	-/-	R/W
W*1	R/W	R/W	-/-	R/W
SW*1	R/W	R/W	-/-	R/W
R*1	R/W	R/W	-/-	R/W
ZR*1	R/W	R/W	-/-	R/W
Z	R/W	R/W	-/-	-/-
G	R/W	R/W	-/-	R/W
U3E0G	R/W	R/W	-/-	R/W
U3E1G	R/W	R/W	-/-	R/W
U3E2G	R/W	R/W	-/-	R/W
U3E3G	R/W	R/W	-/-	R/W
U3E0HG	R/W	R/W	-/-	R/W
U3E1HG	R/W	R/W	-/-	R/W
U3E2HG	R/W	R/W	-/-	R/W
U3E3HG	R/W	R/W	-/-	R/W
JnW	R/W	R/W	-/-	R/W
JnSW	R/W	R/W	-/-	R/W
RD	R/W	R/W	-/-	R/W

*1 When bit specification of word device is performed, the GOT reads the value from a device and then write a value to the device. Do not change the device value with a sequence program until the GOT completes writing a value to the device.

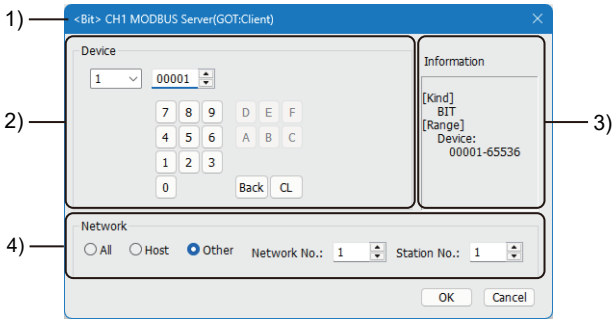
98.18 MODBUS ([MODBUS Server(GOT:Client)])

GT37 SoftGOT3000

Item	Reference
Device setting dialog	☞ Page 3562 Device setting dialog ([MODBUS Server(GOT:Client)])
Specifications of bit devices	☞ Page 3565 Monitoring-supported bit devices ([MODBUS Server(GOT:Client)])
	☞ Page 3565 Availability of writing/reading data to/from bit devices ([MODBUS Server(GOT:Client)])
Specifications of word devices	☞ Page 3566 Monitoring-supported word devices ([MODBUS Server(GOT:Client)])
	☞ Page 3566 Availability of writing/reading data to/from word devices ([MODBUS Server(GOT:Client)])
Notation of devices	☞ Page 3567 Notation of devices ([MODBUS Server(GOT:Client)])
Function code	☞ Page 3568 Function code ([MODBUS Server(GOT:Client)])

98.18.1 Device setting dialog ([MODBUS Server(GOT:Client)])

Set a device to be monitored.



Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of 100001 3)	[Information]	Displays the setting range of each setting item according to the selected device.
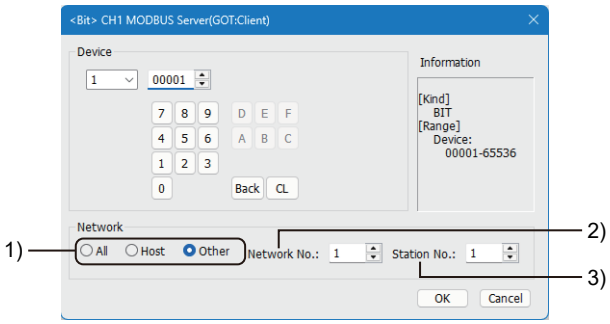
4)	[Network]	The setting depends on the connection type. The setting items depend on the controller setting. ☞ Page 3563 Network setting for the MODBUS/RTU connection ([MODBUS Server(GOT:Client)]) ☞ Page 3564 Network setting for the MODBUS/TCP connection ([MODBUS Server(GOT:Client)])

Network setting for the MODBUS/RTU connection ([MODBUS Server(GOT:Client)])



Item			Description
1)	Monitor target specification	—	Set the monitoring target of the set device.
		[All]	Select this item when writing data to all the connected controllers. During monitoring, the controller set for [Host Address] of the [Controller Setting] window is monitored. When data is input from a numerical input object, the data is written to all the connected controllers. When no data is input, the controller set for [Host Address] is monitored.
		[Host]	Select this item when monitoring the controller set as the host station.
		[Other]	Select this item when monitoring the controller that has the specified station number.
2)	[Network No.]		This item appears when [Other] is selected for the station type. For the MODBUS/RTU connection, set 1.
3)	[Station No.]		This item appears when [Other] is selected for the station type. Specify a station number. The setting range is [1] to [247] (direct) or [248] to [254] (indirect). For indirect specification of a station number, refer to the following. ☞ Page 3563 Indirect specification of a station number for the MODBUS/RTU master connection ([MODBUS Server(GOT:Client)])

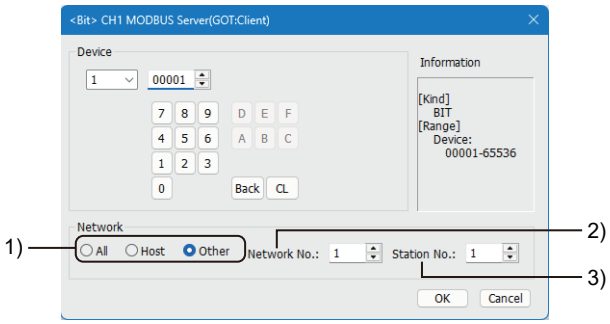
Indirect specification of a station number for the MODBUS/RTU master connection ([MODBUS Server(GOT:Client)])

When you specify any of 248 to 254 for the station number, the value of the corresponding GOT data register (GD10 to GD16) is used as the station number.

The following shows the correspondence between station number setting values and GOT data registers (GD).

Station No.	GOT data register (GD)	Setting range
248	GD10	[0] to [255] Setting a value outside the above range causes a device range error. When "0" is set, "All station specification (broadcast)" is specified. When "255" is set, the host station is specified.
249	GD11	
:	:	
253	GD15	
254	GD16	

Network setting for the MODBUS/TCP connection ([MODBUS Server(GOT:Client)])



Item			Description
1)	Monitor target specification	—	Set the monitoring target of the set device.
		[All]	Not available to the MODBUS/TCP connection.
		[Host]	Select this item when monitoring the controller set as the host station.
		[Other]	Select this item when monitoring the controller that has the specified station number.
2)	[Network No.]		This item appears when [Other] is selected for the station type. Set the network number. The setting range is [1] to [239].
3)	[Station No.]		This item appears when [Other] is selected for the station type. Specify a station number. The setting range is [1] to [247].

98.18.2 Monitoring-supported bit devices ([MODBUS Server(GOT:Client)])

The following table shows monitoring-supported bit devices.
The device range of MODBUS equipment varies by model.
When a model whose device range is not a specified using a multiple of 16 is used, monitoring to the maximum within the range may not be possible.
In this case, the device range is up to the number divisible by 16.

Ex.
For a model whose coil device range is from 0 to 9999
The range that can be actually monitored is from 0 to 9984.

To check whether writing/reading data to/from each device is available, refer to the following.
☞ Page 3565 Availability of writing/reading data to/from bit devices ([MODBUS Server(GOT:Client)])
For the formats of devices, refer to the following.
☞ Page 849 Formats of devices, labels, and tags
○: Available
× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
1	Input relay	Decimal	00001 to 65536	○	○ (Not usable as word data)
0	Coils	Decimal	00001 to 65536	○	○ (Not usable as word data)

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.18.3 Availability of writing/reading data to/from bit devices ([MODBUS Server(GOT:Client)])

The following shows the availability of writing/reading data to/from bit devices by device type.
When the device type is other than the bit type, set the device No. in multiples of 16.
R/W: Both read and write
R/-: Read only
-/W: Write only
-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
1	R/-	-/-	-/-	-/-	-/-
0	R/W	-/-	-/-	-/-	-/-

98.18.4 Monitoring-supported word devices ([MODBUS Server(GOT:Client)])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 3566 Availability of writing/reading data to/from word devices ([MODBUS Server(GOT:Client)])

For the formats of devices, refer to the following.

☞ Page 849 Formats of devices, labels, and tags

○: Available

× Not available

Device name		Device No. representation	Setting range	EG device specifications*1	
				Assignment to EG devices	Access using a client
4	Holding register	Decimal	00001 to 65536	○	○ (Not usable as bit data)
3	Input register	Decimal	00001 to 65536	○	○ (Not usable as bit data)
6	Extension file register	Decimal	(File No.)-6(Device) Notation example: 418-600000 • File No. (decimal): 0 to 418 • Device (decimal): 00000 to 09999	○	○ (Not usable as bit data)

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
☞ Page 2868 Monitoring a controller through the GOT (server/client function)

98.18.5 Availability of writing/reading data to/from word devices ([MODBUS Server(GOT:Client)])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
4	R/W	R/W	-/-	R/W
3	R/-	R/-	-/-	R/-
6	R/W	R/W	-/-	R/W

98.18.6 Notation of devices ([MODBUS Server(GOT:Client)])

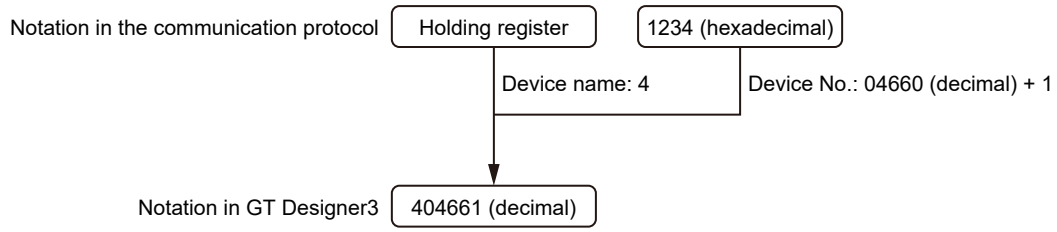
The notation of addresses and that of devices differ between the MODBUS/RTU communication protocol and GT Designer3. Set the devices using the notation used in GT Designer3.

Notation in the communication protocol		Notation in GT Designer3	
Device name	**Address (hexadecimal)**	**Device name**	**Device No. (decimal)**
Coils	0000 to FFFF	0	00001 to 65536
Input relay	0000 to FFFF	1	00001 to 65536
Input register	0000 to FFFF	3	00001 to 65536
Holding register	0000 to FFFF	4	00001 to 65536
Extension file register	0000 to 270F	6	00000 to 09999

Ex.

Monitoring the holding register 1234 (hexadecimal)

Set 404661 in GT Designer3.



98.18.7 Function code ([MODBUS Server(GOT:Client)])

The GOT supports the following function codes.

Function code	Function	Number of devices that are accessible with one message [Unit: point(s)]	
		MODBUS/RTU	MODBUS/TCP
0x01	Read Coils	1 to 2000	1 to 1000
0x02	Read Discrete Inputs	1 to 2000	1 to 1000
0x03	Read Holding Registers	1 to 125	1 to 125
0x04	Read Input Registers	1 to 125	1 to 125
0x05	Write Single Coil	1	1
0x06	Write Single Register	1	1
0x0F	Write Multiple Coils	1 to 1968	1 to 800
0x10	Write Multiple Register	1 to 123	1 to 123
0x14	Read File Record	1 to 124	1 to 124
0x15	Write File Record	1 to 122	1 to 122

☞ Page 3579 GOT data register (GD)
☞ Page 3581 GOT special register (GS)

Appendix 1.1 GOT bit register (GB)

GT37 SoftGOT3000

Device	Function	Model
GB0 to GB9	Use prohibited	-
GB10 to GB25	External output (Y0 to YF) when GB device is on	GT37 SoftGOT3000
GB26 to GB29	Use prohibited	-
GB30 to GB37	Turning on when external input (X0 to X7) is on	GT37 SoftGOT3000
GB38	Turning on without the power supply	
GB39	Use prohibited	-
GB40	Always ON	GT37 SoftGOT3000
GB41	Always OFF	
GB42	Turning on when a screen switching occurs	
GB43 to GB49	Use prohibited	-
GB50 to GB57	Turning on when external input (X8 to XF) is on	GT37 SoftGOT3000
GB58 to GB63	Use prohibited	-
GB64 to GB65535	User area	GT37 SoftGOT3000

External output for Y0 to YF (GB10 to GB25)

When the external I/O function is used, if one of these GB devices turns on, the corresponding signal is output to the external I/O device.

The following shows the correspondence between the GB devices and the signals.

GB device	Signal name	GB device	Signal name	GB device	Signal name	GB device	Signal name
GB10	Y0 output	GB14	Y4 output	GB18	Y8 output	GB22	YC output
GB11	Y1 output	GB15	Y5 output	GB19	Y9 output	GB23	YD output
GB12	Y2 output	GB16	Y6 output	GB20	YA output	GB24	YE output
GB13	Y3 output	GB17	Y7 output	GB21	YB output	GB25	YF output

External input for X0 to X7 and X8 to XF (GB30 to GB37, GB50 to GB57)

When the external I/O function is used, if a signal is input from the external I/O device, the corresponding GB device turns on.
The following shows the correspondence between the GB devices and the signals.

GB device	Signal name	GB device	Signal name	GB device	Signal name	GB device	Signal name
GB30	X0 input	GB34	X4 input	GB50	X8 input	GB54	XC input
GB31	X1 input	GB35	X5 input	GB51	X9 input	GB55	XD input
GB32	X2 input	GB36	X6 input	GB52	XA input	GB56	XE input
GB33	X3 input	GB37	X7 input	GB53	XB input	GB57	XF input

Without power supply (GB38)

When the external I/O function is used, if no power is supplied to the external device, this device turns on.

Always ON (GB40)

Always on.
The action is the same as b4 of Common Information 1 (GS0).

Always OFF (GB41)

Always off.
The action is the same as b5 of Common Information 1 (GS0).

Turning on when a screen switching occurs (GB42)

Turns on when switching the following screens occurs.

- Base screen
- Overlap window 1, 2, 3, 4, 5
- Superimpose window 1, 2
- When an overlap window is closed

You need to turn off this device.

Appendix 1.2 GOT data register (GD)

GT37 SoftGOT3000

GD devices are listed as follows.

Device	Function	Model
GD0 to GD65535	User area	GT37 SoftGOT3000

A

Designation of a station number using GD (only for the temperature controller connection, inverter connection and servo amplifier connection)

If 100 to 115 is set for a station number. in the setting of device, a station number can be designated by the value of GD10 to GD25.

You can change the station number to be monitored by simply changing the device value.

For information on the device settings, refer to the following.

☞ Page 835 Setting a device in the device setting dialog

■When used together with the station number switching device

The station number switching device has higher priority.

■When objects that monitor different channel numbers are arranged on the same screen

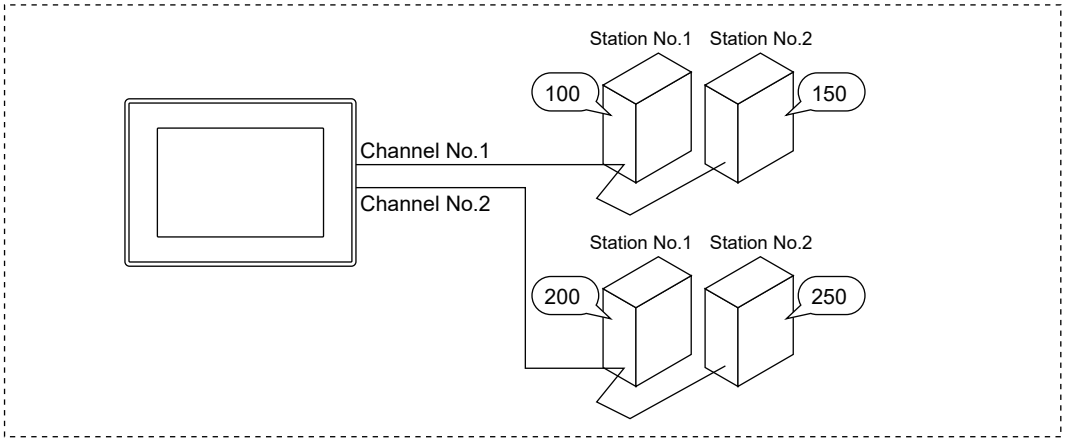
To monitor different station numbers by individual objects, use GD10 to GD25.

If a station number switching device is used, the monitored station number of an unintended object may change. (Especially when multiple channel numbers are set as targets for switching)

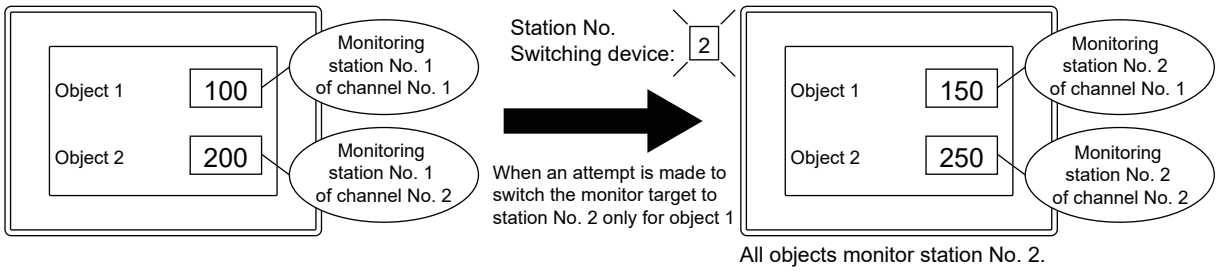
Ex.

When channel No. 1 and No. 2 are the monitoring targets for the station number switching device

The monitoring target station numbers are switched when the values of GD10 to GD25 are changed.

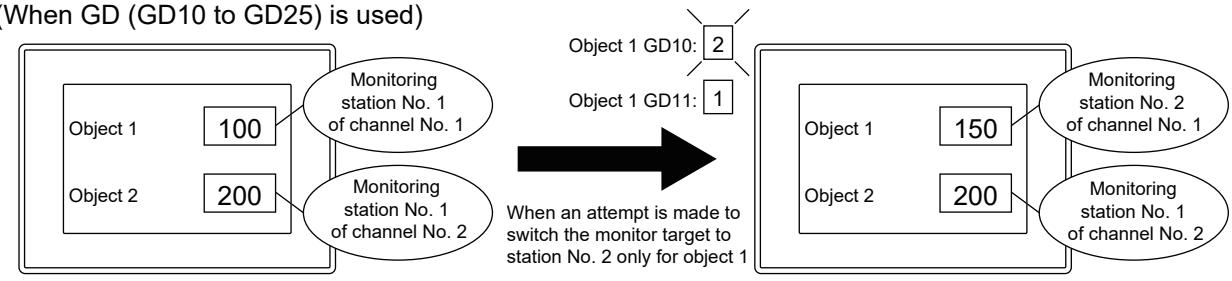


(When using the Station No.Switching device)



All objects monitor station No. 2.

(When GD (GD10 to GD25) is used)



Only object 1 monitors station No. 2.

Appendix 1.3 GOT special register (GS)

GT37 SoftGOT3000

The GOT special register includes the following two types.

Type	Range	Description
Write device	GS0 to GS383 GS640 to GS2559	Writing values by the GOT notifies a user of the status of GOT. ☞ Page 3581 Write device list
Read device	GS384 to GS639 GS1792 to GS3072	Writing values by a user controls the behavior of GOT. ☞ Page 3623 List of read devices

Point

Functions affected by GOT special register

Some GOT special registers affect multiple functions on the GOT.

For the relation between each GOT special register and GOT functions, refer to the following.

☞ Relevant settings for each function

Write device list

Write device (GS0 to GS383)

■Common Information 1 (GS0)

• b0: Repeats turning on and off for every communication cycle. (For channel No. 1)

One cycle is the time for the GOT to read the data of the objects on the displayed screen and the data set in the common settings.

• b1: Turns on when the base or window screen is switched and remains on until a cycle of the on-screen setting processing is complete.

This also applies to station number switching, security level change, and language switching.

It is used to check (debug) the screen switch setting processing.

• b2: Turns on when the base or window screen is switched and remains on until a cycle of the trigger action processing for the project and screen display is complete.

This also applies to station number switching, security level change, and language switching.

Use this bit to trigger an action only once when switching the screen.

The initial value is set with the screen trigger action and used as an interlock to execute the process with a screen script.

• b3: Turns on while the initial screen is displayed at power-on.

It turns off when the base screen is switched over.

• b4: Always on

The action is the same as GB40 (Always ON).

• b5: Always off

The action is the same as GB41 (Always OFF).

• b6 to b7: Use prohibited

• b8: Repeats turning on and off for every communication cycle. (For channel No. 2)*1

• b9: Repeats turning on and off for every communication cycle. (For channel No. 3)*1

• b10: Repeats turning on and off for every communication cycle. (For channel No. 4)*1

• b11 to b14: Use prohibited

• b15: Turns on during screen gesture mode and turns off during normal operation mode.

*1 One cycle is the time for the GOT to read the data of the objects on the displayed screen and the data set in the common settings.

■Base Screen Information (GS1)

• b0: Repeats turning on and off for every communication cycle while the base screen is displayed. (For channel No. 1)

• b1: Turns on when the base screen is switched and remains on until a cycle of the on-screen setting processing is complete.

This also applies to station number switching, security level change, and language switching.

It is used to check (debug) the screen switch setting processing.

• b2: Turns on when the base screen is switched and remains on until a cycle of the trigger action processing is complete.

This applies to station number switching, security level change, and language switching.

Use this bit to trigger an action only once when switching the screen.

The initial value is set with the screen trigger action and used as an interlock to execute the process with a screen script.

• b3 to b7: Use prohibited

• b8: Repeats turning on and off for every communication cycle while the base screen is displayed. (For channel No. 2)

• b9: Repeats turning on and off for every communication cycle while the base screen is displayed. (For channel No. 3)

• b10: Repeats turning on and off for every communication cycle while the base screen is displayed. (For channel No. 4)

• b11 to b15: Use prohibited

■GOT ID (GS3)

Notifies the user of the GOT ID.

The notified GOT IDs range from 0 to 32767.

If no GOT ID is used, 0 is notified.

■1 Second Binary Counter (GS7)

Starts counting every second immediately after the power is switched on.

When a value is written by the user, counting starts from the written value.

It is used to check how long the time has elapsed from specific timing (operation and others).

Data type: Unsigned binary

Counting range: 0 to 65535

When counting reaches the maximum value, a new counting starts from 0.

■Scan Time of Monitor (GS8)

Stores the time (ms) of a complete processing cycle set on the display screen as binary data.

Data will be updated when all of the processing set on the display screen is complete.

An error of plus or minus 10 ms may be produced depending on the processing settings.

Also, it does not apply to the objects that have not been processed by the security function.

It is useful for load checking (debug) of the monitor processing.

■Scan Counter of Monitor (GS10)

Counts up the number of cycles every time the processing cycle set on the display screen is complete.

It is used to check (debug) the number of scan of monitor.

Data type: Unsigned binary

Counting range: 0 to 65535

When counting reaches the maximum value, a new counting starts from 0.

■Script Common Information (GS14)

The following script types are supported: project script, screen script, and script part.

Stores error occurrence information.

- b0: Turns on when an error occurs.
- b1 to b6: Use prohibited
- b7: Turns on when a BCD error occurs.
- b8: Turns on when a zero division error occurs.
- b9 to b11: Use prohibited
- b12: Turns on in communication error occurrence (including access to the device out of range).
- b13 to b15: Use prohibited

■Script Error Pointer (GS15)

The following script types are supported: project script and screen script.

Stores a number showing the start device number of the devices where the latest error record is stored.

Each error record is stored in two Script Error Data devices (GS16 to GS47).

The value at GS15 is changed as shown below each time an error occurs.

-1 → 16 → 18 → ⋯ → 46 (The sequence returns to 16 and repeats afterward.)

The following shows the relationship between the value of GS15 and the storage destination of the latest error record.

- When GS15 stores 16, the latest error record is stored in GS16 and GS17.
- When GS15 stores 18, the latest error record is stored in GS18 and GS19.
- When GS15 stores 46, the latest error record is stored in GS46 and GS47.

■Script error data (GS16 to GS47)

The following script types are supported: project script and screen script.

Stores the script numbers and error codes for the error-generated scripts.

Two word devices are used for one error.

If the number of errors is 17 or more, the error records are overwritten starting from the oldest one.

■Script Execute Pointer (GS48)

The following script types are supported: project script and screen script.

Stores the device number of the device where the latest script execution number is stored.

Each script execution number is stored in one Script Execute No. device (GS49 to GS79).

The value at GS48 changes as shown below each time the project script and the screen script are executed.

-1 → 49 → 50 → ⋯ → 79 (The sequence returns to 49 and repeats afterward.)

The following shows the relationship between the value of GS48 and the storage destination of the latest script execution number.

- When GS48 stores 49, the latest script execution number is stored in GS49.
- When GS48 stores 50, the latest script execution number is stored in GS50.
- When GS48 stores 79, the latest script execution number is stored in GS79.

■Script Execute No. (GS49 to GS79)

The following script types are supported: project script and screen script.

Store the script numbers of the executed scripts.

One word device is used for one script.

If the number of the executed scripts is 32 or more, the script execution records are overwritten starting from the oldest one.

■Object Script Common Information (GS80)

Stores error occurrence information.

- b0: Turns on when an error occurs.
- b1 to b6: Use prohibited
- b7: Turns on when a BCD error occurs.
- b8: Turns on when a zero division error occurs.
- b9 to b11: Use prohibited
- b12: Turns on in communication error occurrence (including access to the device out of range).
- b13 to b15: Use prohibited

■Object Script Error Pointer (GS81)

Stores a number showing the start device number of the devices where the latest error record is stored.

Each error record is stored in two object script error data devices (GS82 to GS113).

The value at GS81 changes as shown below each time an error occurs.

-1 → 82 → 84 → ⋯ → 112 (The sequence returns to 82 and repeats afterward.)

The following shows the relationship between the value of GS81 and the storage destination of the error code of the latest error.

- When GS81 stores 82, the latest error record is stored in GS82 to GS83.
- When GS81 stores 84, the latest error record is stored in GS84 to GS85.
- When GS81 stores 112, the latest error record is stored in GS112 to GS113.

■Object script error data (GS82 to GS113)

Store the script user IDs and error codes for the error-generated object scripts.

Two word devices are used for one error.

If the number of errors is 17 or more, the error records are overwritten starting from the oldest one.

■Object Script Execute Pointer (GS114)

Displays the device number of the device in which the latest script user ID is stored.

Each script user ID is stored in one Object Script Execute No. device (GS115 to GS145).

The value in GS114 changes as follows each time an object script is executed.

-1 → 115 → 116 → ⋯ → 145 (The sequence returns to 115 and repeats afterward.)

The following shows the relationship between the value of GS114 and the storage destination of the latest script user ID.

- When GS114 stores 115, the latest script user ID is stored in GS115.
- When GS114 stores 116, the latest script user ID is stored in GS116.
- When GS114 stores 145, the latest script user ID is stored in GS145.

■Object script execute No. (GS115 to GS145)

Stores the script user ID of the executed object script.

One word device is used for one script.

If the number of the executed scripts is 32 or more, the script execution records are overwritten starting from the oldest one.

■File Operation Function Information (GS154)

The following script types are supported: project script, screen script, and script part.

Notifies the execution status of the file operation function.

- b0: Turns on when a file operation function is executed.

Turns off after the execution is complete.

- b1 to b14: Use prohibited
- b15: Turns on when an error occurs with a file operation function.

The bit turns off when the next file operation function is completed normally.

This bit does not turn off even if the Script Error Clear signal (GS384.b0) is turned on.

■Latest Script Error Info Pointer (GS157)

The following script types are supported: project script, screen script, and script part.

Stores a number showing the devices where the latest error record is stored.

Data type: Signed binary

Initial value: -1

Calculate the start device number of the devices storing the latest error record by using the following expression.

- GS392 + (GS157 × 8)

■Latest Executed Script Pointer (GS158)

The following script types are supported: project script, screen script, and script part.

Stores a number showing the devices where the latest script execution record is stored.

Data type: Signed binary

Initial value: -1

Calculate the start device number of the devices storing the latest script execution record by using the following expression.

- GS396 + (GS158 × 8)

■Latest Object Script Error Info Pointer (GS159)

Stores a number showing the area where the latest object script error record is stored.

Data type: Signed binary

Initial value: -1

Calculate the start device number of the devices storing the latest error record by using the following expression.

- GS432 + (GS159 × 8)

■Latest Executed Object Script Pointer (GS160)

Stores a number showing the area where the latest object script execution record is stored.

Data type: Signed binary

Initial value: -1

Calculate the start device number of the devices storing the latest script execution record by using the following expression.

- GS436 + (GS160 × 8)

■Ethernet Port 2 GOT IP Address (GS194, GS195), Ethernet Port 1 GOT IP Address (GS198, GS199)

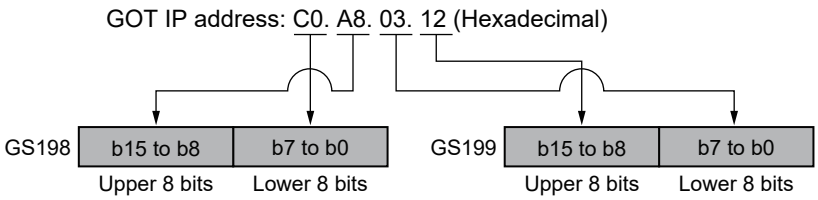
Stores the GOT IP address that is specified for the GOT Ethernet interface in hexadecimal.

The following shows the IP address to be stored to each device.

GOT IP address	Destination device
GOT IP address for Ethernet port 1	GS198, GS199
GOT IP address for Ethernet port 2	GS194, GS195

Ex.

When the GOT IP address for Ethernet port 1 is 192.168.3.18 (decimal)



■Gateway Common Information (GS200)

Notifies the common information of the gateway function.

- b0: Turns on while the mail send function is ready.
- b1: Turns on while the FTP server function is ready.
- b2: Turns on when an FTP client is logged in.
- b3: Notifies that the server function is ready.
- b4: Notifies that the client function is ready.
- b5 to b10: Use prohibited
- b11: Turns on when an error occurs in the mail send function.
- b12 and b13: Use prohibited
- b14: Turns on when an error occurs in the server function.
- b15: Turns on when an error occurs in the client function.

■Mail Send Function Error Counter (GS201)

Counts the number of the errors that have occurred in the mail send function.

The count ranges from 1 to 65535. If the error count is 65535 or more, the counter value is 65535, but the error code, error occurrence date and time, and sender data are updated.

■Mail Send Function Error Code (GS202)

Stores the error codes that occurred in the mail send function.

For information on the stored error codes, refer to the following.

☞ Page 2191 Error code and error message of the mail send function

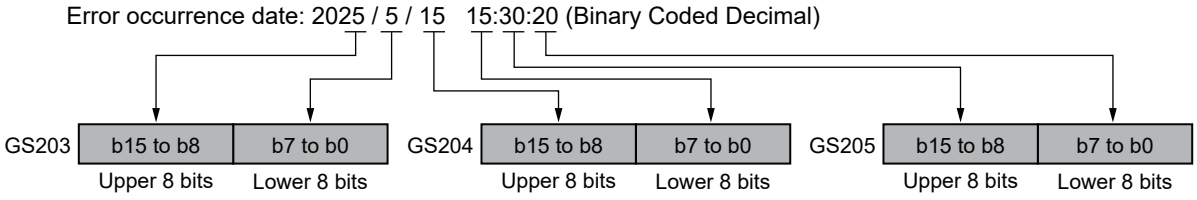
■Mail Send Function Error Occurrence Date And Time (GS203 to GS205)

Stores the error occurrence date and time in BCD code.

- GS203: Stores the year (upper byte, last two digits of the year) and the month (lower byte) of the error occurrence date and time in BCD code when an error occurs in the mail send function.
- GS204: Stores the day (upper byte) and the hour (lower byte) of the error occurrence date and time in BCD code when an error occurs in the mail send function.
- GS205: Stores the minute (upper byte) and the second (lower byte) of the error occurrence date and time in BCD code when an error occurs in the mail send function.

Ex.

When the error occurrence date is 15:30:20 May 15, 2025



■Mail Send Function Send Source (GS206)

Notifies the type of the function that has caused the error in the mail sending process.

- 0: No error
- 1: User alarm observation
- 2 or more: Use prohibited

■Number of Connected FTP Clients (GS208)

Notifies the number of the clients connected to the FTP server.

Clients are counted when the OPEN command (an FTP command) is executed.

■Server Function Error Counter (GS210)

Counts the number of the errors that have occurred in the server function.

The count ranges from 1 to 65535. If the error count is 65535 or more, the counter value is 65535, but the error code and the error occurrence date and time are updated.

■Server Function Error Code (GS211)

Stores the error codes that occurred in the server function.

The following lists the error codes to be stored.

Error code	Description	Corrective action
490	A script was used for monitoring the gate device that executed the script.	• Change the monitor destination GOT specified in the script to another GOT. • Monitor the PLC devices directly without using the script.
491	A station that does not exist was accessed.	Check the network number, the PLC station number, and the Ethernet settings of the monitor destination.
492	A communication timeout error has occurred.	• Specify a longer communication timeout period. ☞ Page 729 [Controller Setting] • Check the network. (Check if a firewall exists, execute ping, or take other actions.) • Check for cable disconnection, and check the module mounting status.
493	A communication error has occurred.	• Check the network (check if a firewall exists, perform a ping test, etc.). • Check for cable disconnection, and check the module mounting status.

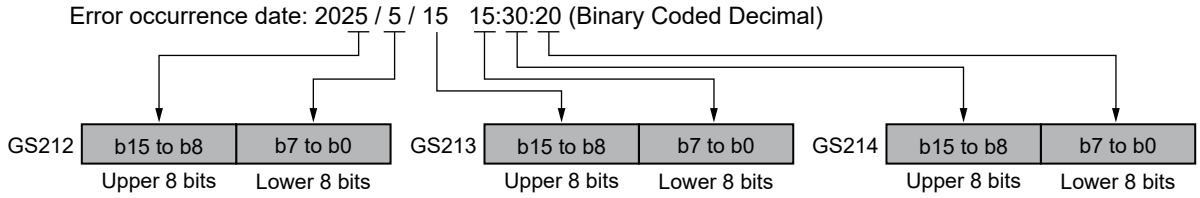
■Server Function Error Occurrence Date And Time (GS212 to GS214)

Stores the error occurrence date and time in BCD code.

- GS212: Stores the year (upper byte, last two digits of the year) and the month (lower byte) of the error occurrence date and time in BCD code when an error occurs in the server function.
- GS213: Stores the year (upper byte) and the hour (lower byte) of the error occurrence date and time in BCD code when an error occurs in the server function.
- GS214: Stores the minute (upper byte) and the second (lower byte) of the error occurrence date and time in BCD code when an error occurs in the server function.

Ex.

When the error occurrence date is 15:30:20 May 15, 2025



■Server Function Error Client (GS215, GS216)

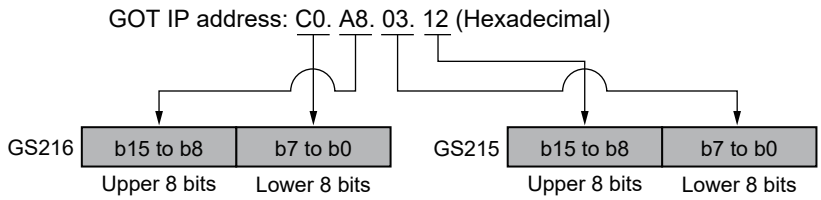
Stores the IP address of the GOT (client) where the error occurred in hexadecimal.

- GS215: Stores the lower part of the IP address of the GOT (client) where a server function error occurred in binary code.
- GS216: Stores the upper part of the IP address of the GOT (client) where a server function error occurred in binary code.

If the IP address of the GOT (client) where the error occurred is unknown, FFFF is displayed as four hexadecimal digits for both GS215 and GS216.

Ex.

When the GOT IP address is 192.168.3.18 (decimal)



■Client Function Error Counter (GS220)

Counts the number of the errors that have occurred in the client function.

The count ranges from 1 to 65535. If the error count is 65535 or more, the counter value is 65535, but the error code and the error occurrence date and time are updated.

■Client Function Error Code (GS221)

Stores the error codes that occurred in the client function.

The following lists the error codes to be stored.

Error code	Details of error and cause	Corrective action
490	A script was used for monitoring the gate device that executed the script.	• Change the monitor destination GOT specified in the script to another GOT. • Monitor the PLC devices directly without using the script.
491	A station that does not exist was accessed.	Check the network number, the PLC station number, and the Ethernet settings of the monitor destination.
492	A communication timeout error has occurred.	• Specify a longer communication timeout period. ☞ Page 729 [Controller Setting] • Check the network. (Check if a firewall exists, execute ping, or take other actions.) • Check for cable disconnection, and check the module mounting status.
493	A communication error has occurred.	• Check the network. (Check if a firewall exists, execute ping, or take other actions.) • Check for cable disconnection, and check the module mounting status.

■Client Function Error Occurrence Date And Time (GS222 to GS224)

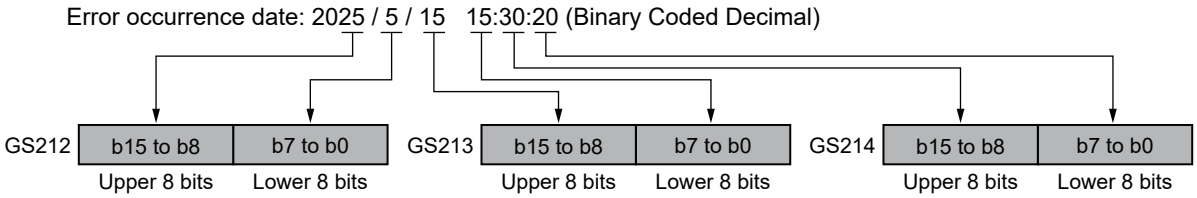
Stores the error occurrence date and time in BCD code.

- GS222: Stores the year (upper byte, last two digits of the year) and the month (lower byte) of the error occurrence date and time in BCD code when an error occurs in the client function.
- GS223: Stores the day (upper byte) and the hour (lower byte) of the error occurrence date and time in BCD code when an error occurs in the client function.
- GS224: Stores the minute (upper byte) and the second (lower byte) of the error occurrence date and time in BCD code when an error occurs in the client function.

If the IP address of the GOT (client) where the error occurred is unknown, FFFF is displayed as four hexadecimal digits for both GS215 and GS216.

Ex.

When the error occurrence date is 15:30:20 May 15, 2025



■Client Function Error Server (GS225, GS226)

Stores the IP address of the GOT (server) where the error occurred in hexadecimal.

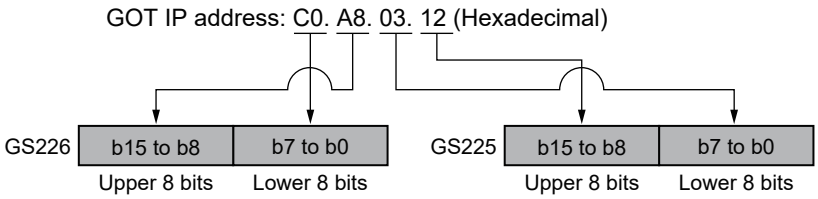
GS225: Stores the lower part of the IP address of the GOT (server) where the error occurred in binary code.

GS226: Stores the upper part of the IP address of the GOT (server) where the error occurred in binary code.

If the IP address of the GOT (server) where the error occurred is unknown, FFFF is displayed as four hexadecimal dig?its for both GS225 and GS226.

Ex.

When the GOT IP address is 192.168.3.18 (decimal)



A

■No. Of Faulty Stations (GS230)

Stores the number of stations where CPU error was detected.

The station where error occurs can be checked with GS231 to GS238.

☞ Page 3598 Ethernet Faulty Station Information (GS231 to GS238)

When the redundant setting is configured, these GS devices do not operate.

- b0 to b7: Stores the number of faulty stations.
- b8 to b15: Use prohibited

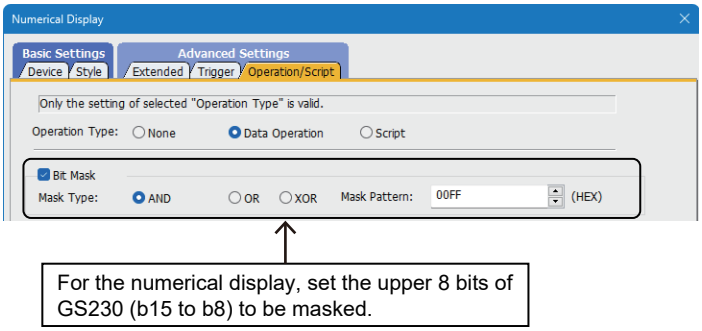
Point

Monitoring GS230 by numerical display

To monitor GS230 by numerical display and others, perform mask processing using data operation function as follows.

☞ Page 1053 How to set the data operation

Example) Setting of numerical display (the [Operation/Script] tab)



■Ethernet Faulty Station Information (GS231 to GS238)

When Ethernet connection is used, the bit corresponding to the station with a communication error turns on.

When multi-channel connection is used, the Ethernet-connected controller with the smallest channel number is monitored.

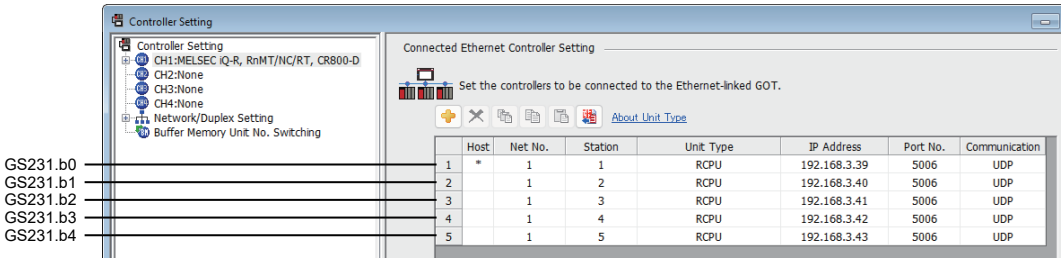
To monitor the faulty station information of multiple channels, use the following GOT special registers (GS).

☞ Page 3604 Faulty Station Information (CH1 to CH4) (GS281 to GS288, GS301 to GS308, GS321 to GS328, GS341 to GS348)

0: No error

1: Error

When the Ethernet module has restored from the error, the bit turns off.



Device	Ethernet setting number															
	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
GS231	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
GS232	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
GS233	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33
GS234	64	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49
GS235	80	79	78	77	76	75	74	73	72	71	70	69	68	67	66	65
GS236	96	95	94	93	92	91	90	89	88	87	86	85	84	83	82	81
GS237	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97

■External Authentication Status Notification (GS240)

• b0: Turns on when external authentication is successful.

This bit turns off when the login screen is displayed regardless of the authentication method.

• b1: Turns on when external authentication fails.

This bit turns off when the login screen is displayed regardless of the authentication method.

• b2 to b12: Use prohibited

• b13: Notifies the operator authentication reception status.

This bit turns on when the login screen is displayed and turns off when it is hidden, regardless of the authentication method.

• b14: Notifies the external authentication reception status.

This bit turns on when the login screen for external authentication is displayed and turns off when it is hidden, regardless of the authentication method.

• b15: Turns on when the key window for entering the external authentication ID is displayed and turns off when it is hidden.

Depending on the status of b13 and b14, you can check whether the authentication mode is external authentication or password authentication.

This enables the detection of switching to auxiliary authentication (password authentication) during external authentication.

b13	b14	Authentication mode
OFF	OFF	Not in operator authentication reception mode
ON	OFF	Password authentication (operator name + password)
ON	ON	External authentication (serial connection or USB connection)

■Insufficient Security Level Notification (GS241)

Turns on when the screen cannot be displayed because of the insufficient security level.

• b0: Use prohibited

• b1: Turns on when the overlap window 1 cannot be displayed.

• b2: Turns on when the overlap window 2 cannot be displayed.

• b3: Turns on when the superimpose window 1 cannot be displayed.

- b4: Turns on when the superimpose window 2 cannot be displayed.
- b5 to b7: Use prohibited
- b8: Turns on when a called screen on the base screen cannot be displayed.
- b9: Turns on when a called screen on the overlap window 1 cannot be displayed.
- b10: Turns on when a called screen on the overlap window 2 cannot be displayed.
- b11: Turns on when a called screen on the superimpose window 1 cannot be displayed.
- b12: Turns on when a called screen on the superimpose window 2 cannot be displayed.
- b13 to b15: Use prohibited

b1 to b4 turn off when a screen is displayed.

They also turn off when 0 is stored in a screen switching device.

b8 to b12 turn off when a called screen is displayed.

■Unauthorized Log-in Operation Notification (GS242)

- b0: Turns on when an incorrect login is detected.

Turns off upon the lapse of the set login block time or unlocking an operator account by logging in as the administrator.

- b1: Turns on when any operator account is locked.

Turns off when no operator account is locked.

- b2 to b15: Use prohibited

■Object Direct Input Reception Notification (GS243)

- b0 to b14: Use prohibited
- b15: Turns on while the object is accepting direct data entry from the barcode reader or RFID controller.

■SoftGOT-GOT Link Status Control/Notification (GS244)

When the GOT network interaction function is enabled, only GS244.b2 operates.

- b0: Turns on while GT SoftGOT3000 is communicating with the GOT.
- b1: Turns on when the GOT obtains the operation right.
- b2: Notifies whether the GOT or GT SoftGOT3000 is in use.

0: GOT

1: GT SoftGOT3000 (This value changes to 0 if GT SoftGOT3000 is not communicating with the GOT.)

- b3: Turns on when the GOT obtains the exclusive authorization (always off for GT SoftGOT3000).
- b4: Turns on when the dedicated screen for the utility or the extended function is displayed (always off for GT SoftGOT3000).
- b5 to b15: Use prohibited

■Drive Accessibility (GS251)

Notifies whether each drive is accessible.

- b0: Turns on when data can be read and written from and to drive A.
- b1: Turns on when data can be read and written from and to drive B.
- b2: Turns on when data can be read and written from and to drive E.
- b3: Turns on when data can be read and written from and to drive F.
- b4: Turns on when data can be read and written from and to drive G.
- b5 to b7: Use prohibited
- b8: Turns on when data forbids writing to drive A.
- b9: Turns on when data forbids writing to drive B.
- b10: Turns on when data forbids writing to drive E.
- b11: Turns on when data forbids writing to drive F.
- b12: Turns on when data forbids writing to drive G.
- b13 to b15: Use prohibited

For the available drives by GOT model, refer to the following.

☞ Page 81 Drive configuration and capacity of the GOT

■Error Detection Common Information (GS252)

• b0 to b7: Use prohibited

• b8 to b11: Turns on the corresponding bit when no video signal is input to CH1 to CH4.

The corresponding bit is automatically turned off when a video signal is input to CH1 to CH4.

• b12 to b14: Use prohibited

• b15: Turns on when the PC image signal for CH1 is not input.

When the PC image signal for CH1 is input, this bit automatically turns off.

This bit turns off when b15 of the device specified for [Digital Image Input] is turned off (to hide the PC image screen for channel 1).

For details, refer to the following.

☞ Page 2661 Displaying and recording an image from a camera or video device on the GOT (digital image input/recording function)

■Invalid Access from Ethernet Port 1, Invalid Access from Ethernet Port 2 (GS254)

Notifies an invalid write/read request from GT Designer3 while the writing or reading of package data is disabled with the Ethernet Port 1 Access Control or Ethernet Port 2 Access Control device (GS454).

• b0: Available when the Prohibit System Package Write signal (GS454.b0) is on.

Turns on when the GOT receives a package data (system application) write request from GT Designer3 through Ethernet port 1.

When the Prohibit System Package Write signal (GS454.b0) turns off, this bit also turns off.

• b1: Available when the Prohibit Project Data Write signal (GS454.b1) is on.

Turns on when the GOT receives a package data (project data) write request from GT Designer3 through Ethernet port 1.

When the Prohibit Project Data Write signal (GS454.b1) turns off, this bit also turns off.

• b2 to b3: Use prohibited

• b4: Available when the Prohibit System Package Write signal (GS454.b4) is on.

Turns on when the GOT receives a package data (system application) write request from GT Designer3 through Ethernet port 2.

When the Prohibit System Package Write signal (GS454.b4) turns off, this bit also turns off.

• b5: Available when the Prohibit Project Data Write signal (GS454.b5) is on.

Turns on when the GOT receives a package data (project data) write request from GT Designer3 through Ethernet port 2.

When the Prohibit Project Data Write signal (GS454.b5) turns off, this bit also turns off.

• b6 to b7: Use prohibited

• b8: Available when the Prohibit Project Data Read signal (GS454.b8) is on.

Turns on when the GOT receives a package data read request from GT Designer3 through Ethernet port 1.

When the Prohibit Project Data Read signal (GS454.b8) turns off, this bit also turns off.

• b9 to b11: Use prohibited

• b12: Available when the Prohibit Project Data Read signal (GS454.b12) is on.

Turns on when the GOT receives a package data read request from GT Designer3 through Ethernet port 2.

When the Prohibit Project Data Read signal (GS454.b12) turns off, this bit also turns off.

• b13 to b15: Use prohibited

☞ Page 3641 Ethernet Port 1 Access Control, Ethernet Port 2 Access Control (GS454)

■Intensity Notification (GS255)

Stores the current intensity and the brightness adjustment mode of the GOT display section.

• b0 to b14: Store the current intensity.

Notification is provided on a scale from 1 to 100.

Intensity notification is provided by an 8-level scale from 1 to 8 or 32-level scale from 101 to 132 using the intensity control information, or by a 32-level scale from 101 to 132 using the intensity adjustment function of the utility.

When the intensity is set on the 8-level scale from 1 to 8 using the intensity control information, if the actual intensity on the 32-level scale corresponds to a value on the 8-level scale, the value is notified for the lower 15 bits of the intensity notification information (example: 114 on the 32-level scale is notified as 4).

If there is no corresponding value, the value on the 32-level scale is notified (example: 115 is notified as 115).

If the value of the intensity control information does not correspond to a value on the 8-level scale, the value on the 32-level scale is notified.

Intensity	Notified value	Intensity	Notified value	Intensity	Notified value	Intensity	Notified value
1	1	9	109	17	117	25	125
2	102	10	3	18	118	26	126
3	103	11	111	19	5	27	127
4	104	12	112	20	120	28	7
5	2	13	113	21	121	29	129
6	106	14	4	22	122	30	130
7	107	15	115	23	6	31	131
8	108	16	116	24	124	32	8

• b15: Sets the current brightness adjustment mode.

The bit turns on when the brightness adjustment mode is set to the low intensity.

The bit turns off when the brightness adjustment mode is set to normal.

The Intensity Notification is stored when the Intensity Control or the Intensity Control by the intensity adjustment function of the utility is performed.

For details on the Intensity Control, refer to the following.

☞ Page 3642 Intensity Control (GS455)

For the intensity adjustment function of the utility, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

■FA Transparent Status (GS256)

Notifies the status of the FA transparent function.

The values to be stored and their statuses are as follows.

0: Ordinary monitoring

1: In transparent mode

2: In pass-through mode

■Integer <- -> Real Number Conversion Status (GS260)

The following script types are supported: project script, screen script, and script part.

Stores the conversion completion notification and error occurrence status into each bit.

If the Conversion Start Indication (GS460.b15) is turned off (0), each bit becomes 0.

☞ Page 3643 Conversion Start Indication (GS460)

• b0 to b13: Use prohibited

• b14: Turns on when error occurs during conversion processing by GOT.

(Stores an error code in GS261)

☞ Page 3602 Integer ←→ Real Number Conversion Error Code (GS261)

• b15: Turns on when conversion is completed by GOT.

■Integer ←→ Real Number Conversion Error Code (GS261)

The following script types are supported: project script, screen script, and script part.

Stores the error during conversion.

Stores 0 when the conversion is completed normally.

Error codes stored in GS261 are as follows.

Error code	Description	Remarks
1	The Conversion Start Indication is not initialized.	The conversion processing is not executed.
2	The setting of the Conversion Start Indication is incorrectly configured.	
3	The number of devices is out of range.	
4	The device is out of range.	
5	The conversion source and destination are the same.	
6	Not used	—
7	Conversion error (such as an overflow)	The conversion processing continues.

■System Alarm GOT Error Channel No. (GS262)

If a system alarm (GOT error) occurs, the corresponding channel number is stored.

0 is stored when the system alarm is cleared.

With some system alarms, channel numbers are not stored.

For details, refer to the following manuals.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

■System Alarm CPU Error Channel No. (GS263)

If a system alarm (CPU error) occurs, the corresponding channel number is stored.

0 is stored when the system alarm is cleared.

■System Alarm Network Error Channel No. (GS264)

If a system alarm (network error) occurs, the corresponding channel number is stored.

0 is stored when the system alarm is cleared.

■SNTP Time Synchronization Setting Status (GS265)

Notifies the status of the SNTP time synchronization setting.

The values to be stored and their statuses are as follows.

0: No SNTP time synchronization setting or failure

1: Synchronizing with SNTP

■SNTP Time Query Result (GS266 to GS272)

Stores the SNTP Time Query Result.

The following shows the values to be stored.

- GS266: The four-digit year data is stored.
- GS267: The month data, 01 to 12, is stored.
- GS268: The day data, 01 to 31, is stored.
- GS269: The hour data, 00 to 23, is stored.
- GS270: The minute data, 00 to 59, is stored.
- GS271: The second data, 00 to 59, is stored.
- GS272: The day-of-the-week data, 0 to 6, is stored.

(0: Sunday 1: Monday 2: Tuesday 3: Wednesday 4: Thursday 5: Friday 6: Saturday)

■Document Display Status (GS276)

- b0: Turns on when a specified file is not displayable.

Turns off when the file is displayed appropriately.

For the cause of the display failure, refer to the following.

☞ Page 1812 Precautions

- b1: Turns on when a PDF file cannot be cached for display.

Turns off when the cached PDF file is displayed.

For the cause of the cache failure, refer to the following.

☞ Page 1812 Displaying a cached document

- b2: Turns on when a PDF document is displayed in high quality (144 dpi resolution).
- b3: Turns on when the display size of the document is changed by GS523.b3.

Turns off when GS523.b3 is turned off.

☞ Page 3649 Document Display Common Control (GS523)

- b4 to b15: Use prohibited

■Notify Automatic Connection Status (GS277)

Notifies the communication status between the controllers supporting the automatic connection and the GOT.

- b0: Turns on when the automatic connection is enabled in the setting of the controller (CH1).
- b1: Turns on when the automatic connection process is completed between the controller (CH1) and the GOT.
- b2: Turns on when the automatic connection is enabled in the setting of the controller (CH2).
- b3: Turns on when the automatic connection process is completed between the controller (CH2) and the GOT.
- b4: Turns on when the automatic connection is enabled in the setting of the controller (CH3).
- b5: Turns on when the automatic connection process is completed between the controller (CH3) and the GOT.

• b6: Turns on when the automatic connection is enabled in the setting of the controller (CH4).
• b7: Turns on when the automatic connection process is completed between the controller (CH4) and the GOT.
• b8 to b15: Use prohibited

■Standard SD Card Information (GS279)

• b0: Turns on when an SD card is inserted into the standard SD card interface.
Check the Drive Accessibility device (GS251) to see if the SD card is accessible.
☞ Page 3600 Drive Accessibility (GS251)
• b1 to b15: Use prohibited

■Faulty Monitor Station signal (CH1 to CH4) (GS280, GS300, GS320, GS340)

• b0 to b7: Stores the number of stations where a communication error was detected during Ethernet connection (excluding Ethernet connection of the microcomputer).
• b8 to b15: Use prohibited

■Faulty Station Information (CH1 to CH4) (GS281 to GS288, GS301 to GS308, GS321 to GS328, GS341 to GS348)

Turns on the bit corresponding to the station number of the station where a communication error is detected during Ethernet connection, CC-Link IE Field Network connection, inverter connection, or servo amplifier connection.
(For the multi-channel connection, the bit of the device corresponding to each channel number (CH1 to CH4) turns on.)
0: No error
1: Error
When the faulty station is restored from the error, the bit turns off.
The following shows the compatible communication drivers.
○: Supported, —: Not supported

Communication driver	Supported/ Unsupported		Communication driver	Supported/ Unsupported	
	Host station	Other station		Host station	Other station
[Bus(Q)]	—	—	[Ethernet(MELSERVO), Gateway]	○	○

*1 Only the faulty station can be detected in the same network.
*2 The station monitoring function is not supported because communication is disabled when the master station is in multicast mode.
*3 To detect a faulty station in the CC-Link IE TSN connection, use the following GOT special registers (GS).
☞ Page 3617 Faulty Station Information (CC-Link IE TSN) (GS1281 to GS1288)
The following shows the station numbers for each device.

The station corresponding to each device differs according to whether the Ethernet connection is used or not.

• Ethernet connection: 1 to 128

Device				Ethernet setting number															
CH1	CH2	CH3	CH4	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

*1 This station number is not used for the CC-Link IE Controller Network connection.

*2 This station number is not used for the CC-Link IE Field Network connection.

Point

• Range of detectable faulty stations

The GOT cannot detect errors with station No. 128 or later, or station-substation No. 9-0 or later.

• Dealing with a faulty station

◇Automatically stopping monitoring a faulty station

The GOT automatically stops monitoring a connected station where a communication timeout error occurs so as not to retard the monitoring of the other connected stations (no setting is required).

◇Disconnecting the specified station from the GOT with the GOT special register (GS)

You can disconnect the specified controller from the GOT by using the GOT special register (GS).

☞ Page 3650 Monitor Station Disconnection (CH1 to CH4) (GS531 to GS538, GS541 to GS548, GS551 to GS558, GS561 to GS568)

Doing so helps avoid the occurrence of a communication timeout error even if the specified controller is removed for changing a module or other reasons (no system alarm appears on the GOT).

However, depending on the type of connection cables used, the GOT may not monitor the controllers that are connected to the removed one.

■Channel Observation Notification Information Signal (CH1) (GS299, GS319, GS339, GS359)

Notifies the communication status of each channel.

- b0: Turns on if a connection error occurs.
- b1 to b15: Use prohibited

The following shows the compatible communication drivers.

○: Supported, —: Not supported

Communication driver	Supported/ Unsupported	Communication driver	Supported/ Unsupported

■GOT Network No./Station No. Notification (CH1 to CH4) (GS376 to GS383)

When the GOT starts, the devices store a network number and a station number of the GOT connected with the Ethernet connection.

When the GOT is connected with other than the Ethernet connection, the devices store 0.

Device				Description
CH1	CH2	CH3	CH4	
GS376	GS378	GS380	GS382	Network number (1 to 239)
GS377	GS379	GS381	GS383	Station number (1 to 64)

Write devices (GS640 to GS2070)

■Error Device Data Transfer ID (GS642)

Stores the device data transfer ID with the executed device data if an error occurs during device data transfer.

■Device Data Transfer Error Count (GS643)

Stores the number of errors occurred during device data transfer. (Maximum 65535 times)

When errors occur 65535 times or more, the value remains 65535.

The device data transfer ID with the executed device data is stored in the error device data transfer ID.

■Device Data Transfer Processing Time (GS644)

Stores the processing time taken for one device data transfer. (0 to 60000 (×10 ms))

Stores 60000 (×10 ms) when the device data transfer processing time is 600 seconds or more.

■Device Data Transfer ID (GS645)

Stores the device data transfer ID with the executed device data transfer.

■Device Data Transfer Min. Processing Time (GS646)

Stores the minimum processing time in all of the processing times stored in the Device Data Transfer Processing Time (GS644).

(0 to 60000 (×10 ms))

■Device Data Transfer ID (Min. Processing Time) (GS647)

Stores the device data transfer ID with the executed device data transfer when GS646 stores the minimum processing time.

■Device Data Transfer Max. Processing Time (GS648)

Stores the maximum processing time in all of the processing times stored in the Device Data Transfer Processing Time (GS644).

(0 to 60000 (×10 ms))

■Device Data Transfer ID (Max. Processing Time) (GS649)

Stores the device data transfer ID with the executed device data transfer when GS648 stores the maximum processing time.

■Present Time (GS650 to GS653)

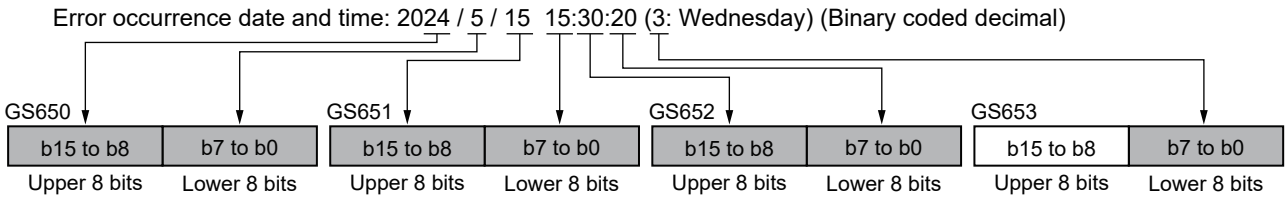
Stores the current time with BCD code.

The day-of-the-week data, 0 to 6, is stored.

(0: Sunday 1: Monday 2: Tuesday 3: Wednesday 4: Thursday 5: Friday 6: Saturday)

Ex.

When the error occurrence date is 15:30:20 May 15, 2024 (Wednesday)



■Touch Status External Notification (X-coordinate) (GS654)

Stores the x-coordinate of touched position when the GOT screen is touched on.

■Touch Status External Notification (Y-coordinate) (GS655)

Stores the Y-coordinate of touched position when the GOT screen is touched on.

■Touch Status External Notification (Touch Status) (GS656)

The following values are stored in the device depending on the touched screen types when the GOT screen is touched on.

0: Without touching

1: Touching the base screen

2: Touching a touchable object on the base screen

11: Touching overlap window 1

12: Touching a touchable object on overlap window 1

21: Touching on the overlap window 2

22: Touching a touchable object on overlap window 2

31: Touching overlap window 3

32: Touching a touchable object on overlap window 3

41: Touching overlap window 4

42: Touching a touchable object on overlap window 4

51: Touching overlap window 5

52: Touching a touchable object on overlap window 5

61: Touching the video window

71: Touching the key window

72: Touching a touchable object on the key window

81: Touching the comment window

91: Touching the popup display

2001: Touching the dialog window

2002: Touching a touchable object in the dialog window

■Trigger Backup Processing Setting No. Notification Signal (GS657)

The GOT notifies users of the trigger backup processing status.

Stores the channel number of the backup trigger setting if a trigger backup is being processed.

Stores 0 when the trigger backup processing is not executed.

■Extended External Input Status Notification Signal (GS658 to GS665)

When the 128-point input is enabled with the external I/O function, the bit corresponding to the detected input signal turns on.

When the 128-point input is disabled, the devices are always off.

To enable the 128-point input, turn on GS517.b0 (External I/O Function Notification/External I/O Control Function).

0: Signal off

1: Signal on

The following shows the devices for each bit.

	Extended External Input Status Notification Signal	External input signal															
		+00	+01	+02	+03	+04	+05	+06	+07	+08	+09	+0A	+0B	+00	+0C	+0D	+0F
X000	GS658	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
X010	GS659	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
X020	GS660	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
X030	GS661	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
X040	GS662	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
X050	GS663	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
X060	GS664	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
X070	GS665	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15

Point

Controlling a signal with controllers

The above signals can be controlled with controllers when the trigger action and the script function are used.

■Sound Status Information (GS668)

- b0 to b13: Use prohibited
- b14: Turns on when USB audio is connected.

When USB audio is removed, this bit turns off.

- b15: Use prohibited

■Sound File Number During Play (GS669)

Stores the sound file number during the play in the device.

When no sound file exists during the play, 0 is stored in the device.

■Notify Number of Hard Copy Output Screens signal (GS693)

Stores the number of screens for which hard copy output has been completed.

When the start trigger condition is satisfied, 0 is stored. The target screens are counted one by one at completion of output regardless of the output file format or output settings of the target screen.

■Object Position upon Cursor Display (GS694, GS695)

Store the upper-left coordinates of the object (numerical input or text input) on which the cursor is displayed.

- GS694: X coordinate
- GS695: Y coordinate

The devices store 0 if the cursor is not displayed on any object.

■Expanded Base Screen Position (GS696, GS697)

Stores the upper-left coordinates of the area of the expanded base screen currently displayed on the GOT.

- GS696: X coordinate
- GS697: Y coordinate

The devices store 0 when the original size base screen is displayed on the GOT.

■Touch Position Color Acquisition Complete signal (GS980)

- b0: Turns on when the Touch Position Color (GS981 to GS983) stores a value.

Turning on the bit cancels the touch position color acquisition ready status.

Turning off the Touch Position Color Acquisition Ready Signal (GS630.b0) turns off the bit.

- b1 to b15: Use prohibited

■Touch Position Color Information (GS981 to GS983)

Notifies the color information at the touched position.

The GOT acquires the color information with RGB. The following GOT special registers (GS) store the RGB values (0 to 255).

- R: GS981
- G: GS982
- B: GS983

Turning on the Touch Position Color Acquisition Ready Signal (GS630.b0) stores -1 in R, G, and B respectively.

After the signal (GS630.b0) turns on, the GOT acquires the color information at the first touch and release of the screen.

■Authorization Guarantee Status Notification signal (GS984)

This signal is disabled when the GOT network interaction function is used.

Stores the remaining authorization guarantee time (seconds) when the authorization guarantee time is set in GT SoftGOT3000 (Single channel) or the GOT.

■Executing File Transfer ID Notification (GS987)

Stores the file transfer setting ID of the file transfer currently in execution.

■Communicating FTP Server ID Notification (GS988)

Stores the FTP server setting ID of the currently connected destination FTP server setting.

For GOT internal transfer, the device stores 0.

■File Transfer Error No. (GS989)

Stores the error code of an error that occurred in the file transfer.

Turn on GS401.b0 to clear the stored error code.

The following lists the error codes to be stored.

Error code	Description	Corrective action
1	The connection to the FTP server has failed.	• Check the IP address of the FTP server. • Check if a cable is connected. • Check the connection status of the HUB. • Check if the FTP server is working on the target device. • Check if the destination FTP server setting is configured properly.
2	Authentication of the FTP server has failed.	Check if the user name and password are correct.
3	FTP server Busy	The FTP server is not ready to accept client requests (busy state). Wait until it is ready.
4	FTP communication timeout	• Check if the communication line has not been physically interrupted. • Check the communication congestion.
5	Access to the target file to be written has failed.	• Check if the write destination drive is enabled. • Check if the write destination drive has enough available space. • Check if the file is not write-prohibited. • When using the GOT as the FTP server, check if the GOT is in the write enable mode.
6	Access to the target file to be read has failed.	• Check if the target file exists. • Check if the file name specified in the file transfer settings is correct. • Check if data storage has been installed on the GOT. • Check if the SD card cover has been closed. • Check that the SD card access switch is turned on. • Check that the write protection for the SD card is canceled.
7	The file whose size exceeds the file size supported by the GOT was attempted to be transferred.	Check that the size of the transfer file is less than 2 GB.
10	• For the FTP transfer The GOT folder name is invalid. • For the GOT internal transfer The transfer source folder name is invalid.	Check that the GOT folder name or the transfer source folder name does not contain invalid characters, such as two-byte characters, or characters that are not allowed with the character code specified for [Character Code] in the [File Transfer Setting] dialog.
11	The transfer file name is invalid.	Check that the transfer file name does not contain invalid characters, such as two-byte characters, or characters that cannot be used with the character code specified for [Character Code] in the [File Transfer Setting] dialog.
12	The transfer source folder and destination folder have the same path.	Set different paths to the transfer source folder and the transfer destination folder.
13	Drive N is specified for both the transfer source folder and the transfer destination folder.	Specify drive N for only one of the transfer source folder and the transfer destination folder.
50	The drive specification on the PLC side is incorrect.	When a PLC is used as a FTP server, only drive 2 (Memory card (ROM)) is accessible. Check if the setting of [FTP Server Folder] specified in the [File Transfer Setting] dialog is correct.
100	The destination FTP server setting ID which does not exist has been specified.	• Check if the destination FTP server setting ID specified in [File Transfer Setting] is correct. • Add the required destination FTP server setting.
200	Access to the storage device has failed when the file name or folder name is specified indirectly.	Check if the device setting used for the indirect specification is correct.
507	The total number of characters of the folder path and transfer file name exceeds the limit.	Check that the total number of the characters does not exceed the limit as shown below. • <GOT folder path>\<Transfer file name>: 78 characters or less (including backward slash marks) • <FTP server folder path>\<Transfer file name>: 250 characters or less (including backward slash marks) • <Transfer source folder path>\<Transfer file name>: 78 characters or less (including backward slash marks) • <Transfer destination folder path>\<Transfer file name>: 78 characters or less (including backward slash marks)
600 *1	The file transfer has been skipped because the total number of characters of the folder path and transfer file name exceeds the limit (only when the file is specified with a wildcard character).	
601 *1	Since invalid characters had been used for the transfer file name, the transfer processing was skipped. (only when the file is specified with a wildcard character).	Check that the transfer file name does not contain invalid characters, such as two-byte characters, or characters that cannot be used with the character code specified for [Character Code] in the [File Transfer Setting] dialog.

Error code	Description	Corrective action
602 *1	Since the write operation for the file had failed, the transfer processing was skipped. (only when the file is specified with a wildcard character).	• Another function might have been using the transfer file. Transfer the file again. • Check if the write destination drive has enough available space.
603 *1	Since the read operation for the file had failed, the transfer processing was skipped. (only when the file is specified with a wildcard character).	• The file might have been deleted before being transferred. Check if all the files have been transferred to the destination folder. • Check if data storage has been installed on the GOT. • Check if the SD card cover has been closed. • Check that the SD card access switch is turned on. • Check that the write protection for the SD card is canceled.
606 *1	Since the file specified by the wild card did not exist, the file was not transferred (only when the file is specified with a wildcard character).	Check if the specified file name is correct.
607 *1	A file that exceeds the size supported by the GOT was attempted for transfer (only when the file is specified with a wildcard character).	Check that the size of the transfer file is less than 2 GB.
610 *1	Deleting the source file has failed.	Check if the source file is in a state in which it can be deleted.

*1 Even if a warning is given, the file transfer process does not stop.

■File Transfer Status (GS990)

Notifies the file transfer processing status.

• b0: Turns on when the GOT (FTP client) writes files to the FTP server, or the GOT transfers files within itself.

When [Trigger Type] is [Rise] or [Fall], be sure to dissatisfy the trigger condition after the file transfer is started.

When the trigger condition remains satisfied, this bit does not turn off even after the file transfer is completed.

• b1: Turns on when the GOT (FTP client) reads files from the FTP server.

• b2: Notifies the connection mode of the GOT (FTP client) and the FTP server.

ON: PASV mode

OFF: PORT mode

• b3 to b13: Use prohibited

• b14: Turns on when the error with which the processing can be continued occurs during the file transfer.

Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.

• b15: Turns on when the error with which the processing cannot be continued occurs during the file transfer.

Files cannot be transferred while this signal is on.

Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.

■Number of Transfer Target Files (GS991)

Stores the total number of files to be transferred.

When the transfer file name is specified with the wild card, the total count includes the files which are not transferred due to an invalid number of characters for the folder name or other causes.

However, only files with invalid names, such as those containing two-byte character, are not counted.

Holds the device value until the processing for the next file transfer ID is started.

■Number of Transferred Files (GS992)

Stores the total number of files which is completely transferred.

The total count includes the files which are not transferred due to the error or other causes.

Holds the device value until the processing for the next file transfer ID is started.

■Number of Successfully Transferred Files (GS993)

Stores the number of files successfully transferred after the file transfer process has started.

Files skipped with errors are not counted.

Holds the device value until the processing for the next file transfer ID is started.

■Recipe Status (GS1010)

Notifies the processing status of recipe data when the recipe data is manipulated using a special function switch ([Switch Action]: [Recipe Data Operation]).

☞ Page 2274 Exporting a recipe file by using a special function switch (Recipe data operation)

- b0: Turns on when the recipe data is imported.
- b1: Turns on when the recipe data is exported.
- b2: Turns on when the recipe special control is executed.

Turns off after the control is complete and the Execute Special Control signal (GS1800.b2) is turned off.

- b3 to b13: Use prohibited
- b14: Turns on after importing or exporting the recipe data is complete.

Turns off when another recipe data manipulation is performed or the Clear Status Information signal (GS1800.b14) is turned on.

☞ Page 3658 Recipe Control (GS1800)

- b15: Turns on when importing or exporting the recipe data fails.

Turns off when another recipe data manipulation is performed or the Clear Status Information signal (GS1800.b14) is turned on.

☞ Page 3658 Recipe Control (GS1800)

■Recipe Special Control Result (GS1011)

Notifies the result of the recipe special control.

Stores 0 if the control is complete.

Stores a value other than 0 if an error occurs.

For the error codes and solutions, refer to the following.

☞ Page 2295 Error code list

This device is reset to 0 upon turn-on of the Execute Special Control signal (GS1800.b2).

■Recipe Special Control No. (GS1012)

Notifies the search result (record No.) of the recipe special control.

This device is reset to 0 upon turn-on of the Execute Special Control signal (GS1800.b2).

■Recipe Display (Record List) Target Recipe No. (GS1013)

Notifies the recipe number for the records displayed on the recipe display (record list).

This device stores 0 in the following cases.

- No recipe display (record list) is placed on the screen.
- A nonexistent recipe setting is specified to be displayed on the recipe display (record list).
- The recipe display (record list) is not displayed because the display condition is unsatisfied or the security level is insufficient.

For information on how to link the recipe function with the recipe display (record list) by using GOT special registers, refer to the following.

☞ Page 2296 Link with the recipe display (record list) by using GOT special registers

■Recipe Display (Record List) Selected Record No. (GS1014)

Stores the record number selected on the recipe display (record list).

This device stores 0 in the following cases.

- No recipe display (record list) is placed on the screen.
- A nonexistent recipe setting is specified to be displayed on the recipe display (record list).
- The recipe display (record list) is not displayed because the display condition is unsatisfied or the security level is insufficient.
- No cursor is displayed on the recipe display (record list).

For information on how to link the recipe function with the recipe display (record list) by using GOT special registers, refer to the following.

☞ Page 2296 Link with the recipe display (record list) by using GOT special registers

■Recipe Display (Record List) Target Record No. (GS1015)

Stores the record number of the record manipulated on the recipe display (record list) while GS1809.b0 is on.
This device stores 0 when the record number is not identified.
☞ Page 3658 Recipe Display (Record List) Control (GS1809)

■Recipe Display (Record List) Record Manipulation Result (GS1016)

Notifies the record manipulation result of the recipe display (record list) while GS1809.b0 is on.
This device turns off when GS1809.b15 is turned on.
☞ Page 3658 Recipe Display (Record List) Control (GS1809)

- b0: Turns on when the device values of a record and those of the PLC match at the record verification.
- b1: Turns on when the device values of a record and those of the PLC do not match at the record verification.
- b2: Turns on when no device value is set in the record at the record verification.
- b3 to b10: Use prohibited
- b11: Turns on when a record verification is unsuccessful.
- b12: Turns on when a record deletion is unsuccessful.
- b13: Turns on when a record writing is unsuccessful.
- b14: Turns on when a record reading is unsuccessful.
- b15: Turns on when a record renaming is unsuccessful.

■Video File Maintenance Information (GS1022)

Notifies the amount of data storage used and the number of video files while the Start Video File Information Notification signal (GS522.b1) is on.
This function is usable only when [Enable the Before-After Event Recording Function] is selected and [Event Trigger Device] is set in the [Digital Image Input/Recording] dialog ([Recording Trigger] tab).
This device turns off upon the turn-off of the Start Video File Information Notification signal (GS522.b1).
☞ Page 3648 Special Control During Specific Function Execution (GS522)

- b0: Turns on when data storage usage reaches 60%.
- b1: Turns on when data storage usage reaches 80%.
- b2: Turns on when the number of video files in the data storage reaches 80.
- b3: Turns on when the number of video files in the data storage reaches 110.
- b4: Turns on when the number of video files in the data storage reaches 150.
- b5: Turns on when the number of video files in the data storage reaches 400.
- b6: Turns on when the number of video files in the data storage reaches 450.
- b7: Turns on when the number of video files in the data storage reaches 500.
- b8 to b15: Use prohibited

■USB Drive Common Information (GS1024)

GT SoftGOT3000 does not support b0 to b7.

- b0: Turns on when the USB memory connected to drive E on the GOT is ready for removal after the USB Drive Common Control (GS1824.b0) turns on.
- b1: Turns on when the USB memory connected to drive F on the GOT is ready for removal after the USB Drive Common Control (GS1824.b1) turns on.
- b2: Turns on when the USB memory connected to drive B on the GOT is ready for removal after the USB Drive Common Control (GS1824.b2) turns on.
- b3: Turns on when the USB memory connected to drive G on the GOT is ready for removal after the USB Drive Common Control (GS1824.b3) turns on.
- b4: Turns on when the USB memory connected to drive E on the GOT is ready for removal after the USB Drive Common Control (GS1824.b4) turns on.
- b5: Turns on when the USB memory connected to drive F on the GOT is ready for removal after the USB Drive Common Control (GS1824.b5) turns on.
- b6: Turns on when the USB memory connected to drive B on the GOT is ready for removal after the USB Drive Common Control (GS1824.b6) turns on.
- b7: Turns on when the USB memory connected to drive G on the GOT is ready for removal after the USB Drive Common Control (GS1824.b7) turns on.

• b8: Turns on when drive E recognizes the USB memory or memory card adapter.
• b9: Turns on when drive F recognizes the USB memory or memory card adapter.
• b10: Turns on when drive B recognizes the USB memory or memory card adapter.
• b11: Turns on when drive G recognizes the USB memory or memory card adapter.
• b12: Turns on when drive E can access the USB memory or memory card.
• b13: Turns on when drive F can access the USB memory or memory card.
• b14: Turns on when drive B can access the USB memory or memory card.
• b15: Turns on when drive G can access the USB memory or memory card.

b8 to b11 turn on also when a memory card is not inserted into the memory card adapter.

b12 to b15 turn off when a memory card is not inserted into the memory card adapter.

When GS1824.b0 to b7 are turned off, b0 to b7 of this device are also turned off.

For the available drives by GOT model, refer to the following.

☞ Page 81 Drive configuration and capacity of the GOT

■PC Image Input Status Notification (GS1025)

Notifies information about the channel set to be displayed.

The value of each bit is all [0] in the initial state (at GOT startup).

The value corresponding to the input signal is stored when the personal computer image is displayed by the digital image input common device.

Thereafter, the value is updated when the input channel for the personal computer image is changed.

• b0: Turns on when a signal is input.
• b1: Turns on when the GOT being used supports the resolution and frequency of the input signal.
• b2: Always on
• b3 to b15: Use prohibited

■PC Image Input Resolution (Horizontal) (GS1026)

When GS1025.b0 turns on, the device stores the horizontal resolution (dots) of the personal computer image input signal.

Stores 0 if no signal is input or the resolution of the signal cannot be identified.

■PC Image Input Resolution (Vertical) (GS1027)

When GS1025.b0 turns on, the device stores the vertical resolution (dots) of the personal computer image input signal.

Stores 0 if no signal is input or the resolution of the signal cannot be identified.

■PC Image Input Refresh Rate (GS1028)

When GS1025.b0 turns on, the device stores the frequency (Hz) of the personal computer image input signal.

Stores 0 if no signal is input or the frequency of the signal cannot be identified.

■Digital Image Display (Object) Status Notification (CH1 to CH2) (GS1030, GS1035)

Notifies information on the digital video input display object.

• b0: Turns on when a signal is input.
• b1: Turns on when the GOT being used supports the resolution and frequency of the input signal.
• b2: Always on
• b3 to b15: Use prohibited

■Digital Image Display (Object) Resolution (Horizontal) (CH1 to CH2) (GS1031, GS1036)

Stores the horizontal resolution (dots) of the input signal from the digital video input object.

Stores 0 if no signal is input or the resolution cannot be identified.

■Digital Image Display (Object) Resolution (Vertical) (CH1 to CH2) (GS1032, GS1037)

Stores the vertical resolution (dots) of the input signal from the digital video input object.

Stores 0 if no signal is input or the resolution cannot be identified.

■Digital Image Display (Object) Refresh Rate (CH1 to CH2) (GS1033, GS1038)

Stores the frequency (Hz) of the input signal from the digital video input object.

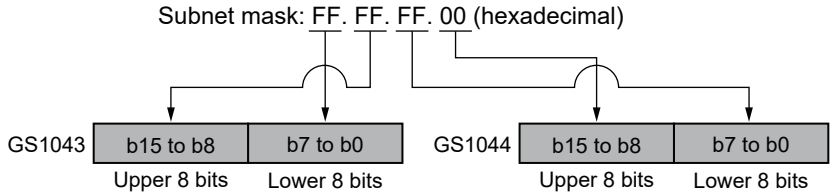
Stores 0 if no signal is input or the frequency cannot be identified.

■Ethernet Port 1 Subnet Mask Notification (GS1043, GS1044), Ethernet Port 2 Subnet Mask Notification (GS1045, GS1046)

Stores the subnet mask that is specified for the GOT Ethernet port 1 or port 2 in hexadecimal.

Ex.

When the subnet mask for Ethernet port 1 is 255.255.255.0 (decimal)



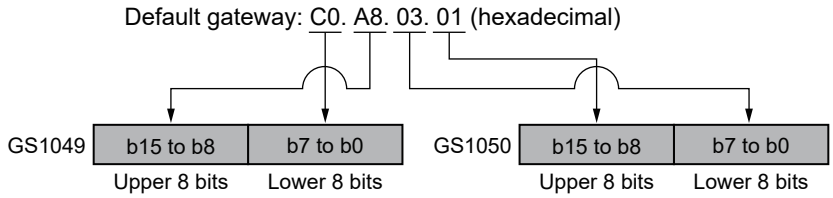
When the subnet mask for Ethernet port 2 is invalid, 0.0.0.0 (decimal) is stored in GS1045 and GS1046.

■Default Gateway Notification (GS1049 to GS1050)

Stores the default gateway set in the GOT in hexadecimal.

Ex.

When the default gateway is 192.168.3.1 (decimal)



■Label Name Resolution Status (Common, CH1 to CH4) (GS1080, GS1081 to GS1084)

Notifies the status of the label name resolution.

GS1080 notifies the status relevant to all channels.

GS1081 to GS1084 each notify the status of the corresponding channel (CH1 to CH4).

- b0: Use prohibited
- b1: Notifies that the label name resolution is being executed.

For GS1080, this bit turns on while the label name resolution is being executed on any of the channels.

For GS1081 to GS1084, this bit turns on while the label name resolution is being executed on the corresponding channel.

- b2: Notifies that the label name resolution completes.

For GS1080, this bit turns on when the label name resolution completes on all the channels.

For GS1081 to GS1084, this bit turns on when the label name resolution completes on the corresponding channel.

- b3: Notifies that the label name resolution is canceled.

For GS1080, this bit turns on when the label name resolution is canceled on any of the channels.

For GS1081 to GS1084, this bit turns on when the label name resolution is canceled on the corresponding channel.

- b4 to b14: Use prohibited
- b15: Notifies that an error has occurred during the label name resolution.

For GS1080, this bit turns on when a label name resolution error occurs on any of the channels.

For GS1081 to GS1084, this bit turns on when a label name resolution error occurs on the corresponding channel.

For details on how to use the bits, refer to the following.

☞ Page 916 Manually performing the label name resolution

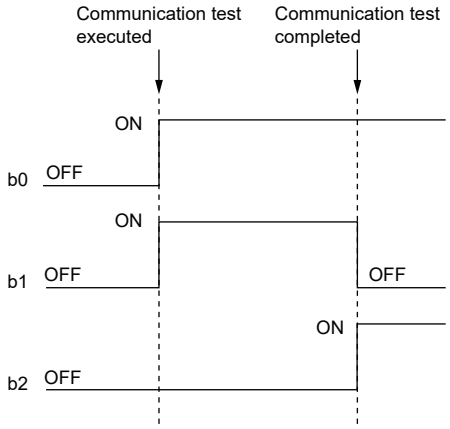
A

■CC-Link IE TSN Module Communication Test Status (GS1114)

Notifies the execution status of a communication test of the CC-Link IE TSN communication unit.

- b0: Turns on when a communication test is executed.
- b1: Is on while a communication test is being executed.
- b2: Turns on when a communication test is complete.
- b3 to b15: Use prohibited

The following shows the status of each bit during a communication test.



For details on the communication test of the CC-Link IE TSN communication unit, refer to the following.

GOT3000 Series User's Manual (Connection)

■CC-Link IE TSN Module Communication Test Error (GS1115)

Notifies that an error has occurred during a communication test of the CC-Link IE TSN communication unit.

- b0: Turns on if there is a problem with the port 1 side of the CC-Link IE TSN communication unit.
- b1: Turns on if there is a problem with the connection interface (port 1) or the Ethernet cable terminal connected to port 1.
- b2: Turns on if there is a problem with the Ethernet cable connected to port 1 of the CC-Link IE TSN communication unit.
- b3 to b7: Use prohibited
- b8: Turns on if there is a problem with the port 2 side of the CC-Link IE TSN communication unit.
- b9: Turns on if there is a problem with the connection interface (port 2) or the Ethernet cable terminal connected to port 2.
- b10: Turns on if there is a problem with the Ethernet cable connected to port 2 of the CC-Link IE TSN communication unit.
- b11 to b15: Use prohibited

For details on the communication test of the CC-Link IE TSN communication unit, refer to the following.

GOT3000 Series User's Manual (Connection)

■Special Function Switch Special Control (GS1220)

- b0: Turns on when an error occurs during the iQSS utility special control.

This signal turns off at a start of the iQSS utility special control.

- b1 to b15: Use prohibited

■iQSS Utility Special Control Error Sensor Device No. (GS1221)

Stores the affected sensor device number when an error occurs during the iQSS utility special control.

The data type is unsigned 16-bit binary.

When no error occurs, the reset value (65535) is stored.

■VNC Server Operation Status Notification (GS1230)

- b0: Turns on while the VNC server communicates with the VNC client.
- b1: Turns on when the VNC client is allowed to display the VNC server screen and to remotely operate the VNC server.

Turns off when the VNC client is allowed to only display the VNC server screen.

- b2: Turns on when the VNC client holds the authorization.

Turns off when the VNC server holds the authorization.

- b3 to b14: Use prohibited
- b15: Turns on when the VNC client holds the authorization.

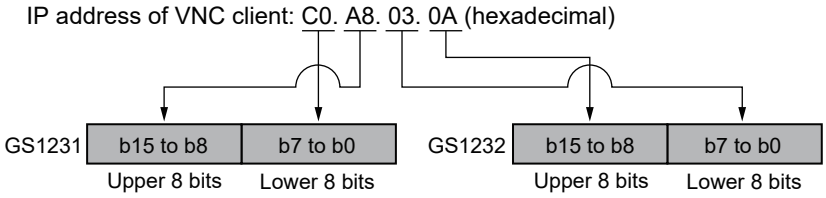
Turns off when the VNC server holds the authorization.

■VNC Client IP Address (GS1231, GS1232)

Stores the IP address of VNC client 1 which is communicating with the VNC server in hexadecimal.

Ex.

When the IP address of VNC client 1 is 192.168.3.10 (decimal)



■VNC Server Authorization Guarantee Status Notification (GS1233)

Stores the remaining authorization guarantee time (second).

■Insufficient Security Level Notification (GS1241)

Turns on the corresponding bit when the screen cannot be displayed due to insufficient security level.• b0: Turns on when overlap window 3 cannot be displayed.• b1: Turns on when overlap window 4 cannot be displayed.• b2: Turns on when overlap window 5 cannot be displayed.• b3 to b7: Use prohibited• b8: Turns on when a called screen on overlap window 3 is be displayed.• b9: Turns on when a called screen on overlap window 4 cannot be displayed.• b10: Turns on when a called screen on overlap window 5 cannot be displayed.• b11 to b15: Use prohibited

■Faulty Monitor Station signal (CC-Link IE TSN) (GS1280)

- b0 to b7: Stores the number of faulty monitor stations in the CC-Link IE TSN connection.
- b8 to b15: Use prohibited

■Faulty Station Information (CC-Link IE TSN) (GS1281 to GS1288)

Turn on the bit that corresponds to the faulty monitor station number in the CC-Link IE TSN network.

0: No error

1: Error

When the faulty station is restored from the error, the bit turns off.

The following shows the station numbers for each device.

Device	Station number corresponding to each bit															
	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
GS1281	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
GS1282	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
GS1283	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
GS1284	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
GS1285	79	78	77	76	75	74	73	72	71	70	69	68	67	66	65	64
GS1286	95	94	93	92	91	90	89	88	87	86	85	84	83	82	81	80
GS1287	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
GS1288	-	-	-	-	-	-	-	120	119	118	117	116	115	114	113	112

■CC-Link IE TSN Connection Status (GS1297)

Notifies whether the GOT is connectable to the network in CC-Link IE TSN Connection.

After checking the connection with the master station at the startup, the GOT is connectable to the network.

- 0 or 1: Not connectable because the connection has not been confirmed.
- 2: Connectable

■Number of Connected GOT Mobile Function Clients (GS1400)

Stores the number of clients connected to the server (GOT).

■GOT Mobile Function Connection Status (GS1401)

Notifies the connection status between the server (GOT) and each client.

GT37 supports b0 to b5.

- b0: Use prohibited
- b1: Turns on when client 1 connects to the server (GOT).
- b2: Turns on when client 2 connects to the server (GOT).
- b3: Turns on when client 3 connects to the server (GOT).
- b4: Turns on when client 4 connects to the server (GOT).
- b5: Turns on when client 5 connects to the server (GOT).
- b6: Turns on when client 6 connects to the server (GOT).
- b7: Turns on when client 7 connects to the server (GOT).
- b8: Turns on when client 8 connects to the server (GOT).
- b9: Turns on when client 9 connects to the server (GOT).
- b10: Turns on when client 10 connects to the server (GOT).
- b11: Turns on when client 11 connects to the server (GOT).
- b12: Turns on when client 12 connects to the server (GOT).
- b13: Turns on when client 13 connects to the server (GOT).
- b14: Turns on when client 14 connects to the server (GOT).
- b15: Turns on when client 15 connects to the server (GOT).

■Authorization Status Information (GS1460)

Notifies the information on the operation right for the GOT network interaction function.

This device operates on each GOT in the control group.

- b0: Turns on when the equipment obtains the operation right.
- b1: Turns on when the equipment displays a screen in which the authorization control is enabled.
- b2 to b15: Use prohibited

■Master GOT IP Address (GS1461 to GS1462)

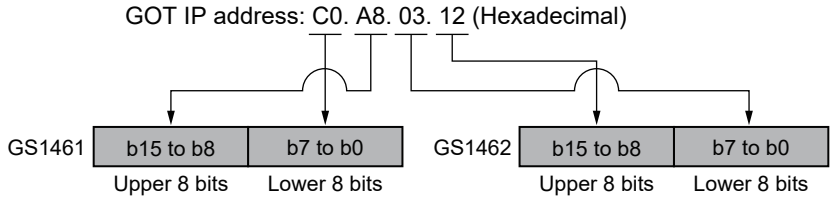
Store the IP address of the master GOT in hexadecimal when GS1460.b0 turns on.

Stores 0 when GS1460.b0 is off.

These devices operate on each GOT in the control group.

Ex.

When the IP address of the master GOT is 192.168.3.18 (decimal)



■Time Elapsed from Authorization Acquisition (GS1463)

Stores the time (second) elapsed since GS1460.b0 turned on.

If the time exceeds 65536 seconds, the value update stops.

Stores 0 when GS1460.b0 is off.

This device operates on each GOT in the control group.

■Authorization Guarantee Time (GS1464)

Stores the remaining authorization guarantee time (second) when GS1460.b0 is on.

Stores 0 when GS1460.b0 is off.

This device operates on each GOT in the control group.

■Authorization Management Information (GS1465)

Notifies the information on the operation right for the GOT network interaction function.

This device is activated on the master GOT.

- b0: Turns on when any equipment obtains the operation right.
- b1: Turns on when devices except the master GOT is prohibited from obtaining the operation right (when GS1796.b0 is on).
- b2: Turns on when all devices including the master GOT are prohibited from obtaining the operation right (when GS1796.b2 is on).
- b3 to b15: Use prohibited

■Authorized Equipment IP Address (GS1466, GS1467)

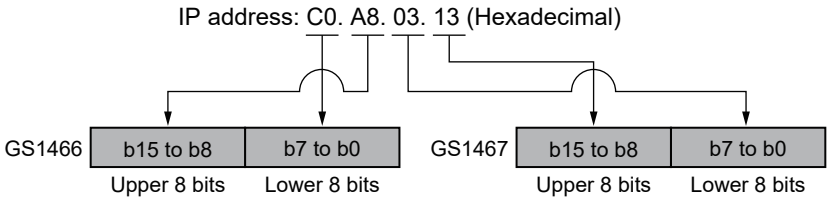
Store the IP address of the device with the operation right when GS1465.b0 turns on.

Stores 0 when GS1465.b0 is off.

These devices are activated on the master GOT.

Ex.

When the IP address of the device with the operation right is 192.168.3.19 (decimal)



■Authorized Equipment Type (GS1468)

Stores the type of the device with the operation right when GS1465.b0 turns on.

Stored value	Type
0	GOT
1	GT SoftGOT3000
2	GOT Mobile function client

Stores 0 when GS1465.b0 is off.

These devices are activated on the master GOT.

■Authorized Equipment ID Information (GS1469)

Stores the ID number of the device with the operation right when GS1465.b0 turns on.

The value to be stored varies depending on the device type.

Type	Value to be stored
GOT	GOT ID (1 to 32767)
GT SoftGOT3000	GT SoftGOT3000 module number (1 to 32767)
GOT Mobile function client	GOT Mobile function client number (1 to 15)

Stores 0 when GS1465.b0 is off.

These devices are activated on the master GOT.

■Authorization Use Time (GS1470)

Stores the time (second) elapsed since GS1465.b0 turned on.

If the time exceeds 65536 seconds, the value update stops.

Stores 0 when GS1465.b0 is off.

These devices are activated on the master GOT.

■GOT Ethernet Setting Change Status (GS1500)

Notifies the status of the GOT Ethernet setting change.

- b0: Turns on while the Ethernet setting is being changed.

When the Execute GOT Ethernet Setting Change signal (GS1901.b0) turns off, this bit also turns off.

- b1: Turns on when the Ethernet setting change has completed.
- b2: Turns on when changes are made in the Ethernet setting by using the GOT Ethernet Setting Change devices (GS1900 to GS1908).

Restart the GOT to apply the new Ethernet setting.

- b3 to b14: Use prohibited
- b15: Turns on when an error occurs during the Ethernet setting change.

For details on the GOT Ethernet Setting Change devices (GS1900 to GS1908), refer to the following.

☞ Page 3661 GOT Ethernet Setting Change (GS1900 to GS1908)

■VPN Connection Function Status Notification (GS2051)

Notifies the operating status of the VPN connection.

- b0: Turns on when connection is established between SiteManager and GateManager of the GOT.
- b1: Turns on when SiteManager is running.
- b2 to b15: Use prohibited

■MonitoredItem Cycle Time Current Value (GS2057)

Stores the current cycle time in milliseconds for the client connecting to the GOT's OPC UA server to update tags using the MonitoredItem service set.

The setting range is 0 to 65535.

If the value is 65536 or greater, 65535 is stored.

■MonitoredItem Cycle Time Minimum Value (GS2058)

Stores the minimum cycle time in milliseconds for the client connecting to the GOT's OPC UA server to update tags using the MonitoredItem service set.

The setting range is 0 to 65535.

If the value is 65536 or greater, 65535 is stored.

■MonitoredItem Cycle Time Maximum Value (GS2059)

Stores the maximum cycle time in milliseconds for the client connecting to the GOT's OPC UA server to update tags using the MonitoredItem service set.

The setting range is 0 to 65535.

If the value is 65536 or greater, 65535 is stored.

■OPC Server Function Status Notification (GS2060)

Notifies the startup status of the OPC server.

- b0: Turns on when the OPC server starts normally.
- b1 to b15: Use prohibited

■Web Browser Function Status Notification (GS2065)

Notifies the status of the web browser.

- b0 to b14: Use prohibited
- b15: Turns on when an error occurs during the web browser function operation and the function stops.

This can happen if the web browser function is used for a long time.

To use the web browser again, restart the GOT.

This signal remains on until the GOT is restarted.

■Web Camera/USB Converter Status Notification (GS2070)

Notifies the status of the web camera or USB converter.

- b1 to b14: Use prohibited
- b0: Turns on when the memory size required for connecting a web camera or USB converter reaches the upper limit.
- b1 to b15: Use prohibited

■Video Signal Input Status Notification (GS2071)

Notifies the status of video signal input.

- b0: Turns on when there is a video signal input to web camera channel 1.
- b1: Use prohibited
- b2 to b5: Turns on when there is a video signal input to network camera channels 1 to 4.
- b6 to b15: Use prohibited

■Video Signal Input Object Function Status Notification (GS2072)

Notifies the input status of the video signal when a video image is about to be displayed on the digital image display object.

- b0: Turns on if there is a video signal input to web camera channel 1 when a video image is about to be displayed on the digital image display object.
- b1: Use prohibited
- b2 to b5: Turns on when there is a video signal input to network camera channels 1 to 4 and a video image is about to be displayed on the digital image display object.
- b6 to b15: Use prohibited

■Network Camera Error Status Notification (CH1 to CH4) (GS2073 to GS2076)

If an error occurs when a network camera is used, the corresponding bit of the corresponding device turns on.

For example, if GS2073.b0 turns on, a network camera detection error has occurred on CH1.

Bit	Device				Description
	GS2073	GS2074	GS2075	GS2076	
b0	CH1	CH2	CH3	CH4	Network Camera Not Detected Error This signal turns on when the network camera cannot be detected at the specified IP address or through the UDP port.
b1	CH1	CH2	CH3	CH4	Network Camera Account Authentication Error This signal turns on when the network camera cannot be detected at the specified IP address or through the UDP port.
b3	CH1	CH2	CH3	CH4	Network Camera Setting Error This signal turns on when an error occurs in the network camera settings.
b4	CH1	CH2	CH3	CH4	Network Camera Connection Error This signal turns on when the connection to a network camera fails, or when nothing is received after the connection is established.
b5	CH1	CH2	CH3	CH4	Network Camera Profile Error This signal turns on when the H.264 compression profile set for the network camera is set to any option other than Baseline.
b6	CH1	CH2	CH3	CH4	Network Camera Media Profile Count Limit Error This signal turns on when the number of media profiles set for the network camera exceeds the limit and images are not displayed.

■Network Camera Video Reception Error (CH1 to CH4) (GS2077 to GS2080)

Stores the number of times invalid video was received the network camera.

Resets the value when RTP reception is restarted.

■Combination Invalid Error Status Notification (GS2085)

This bit turns on when the maximum number of video/personal computer image windows that can be displayed simultaneously is exceeded.

Bit	Input target image	Channel	Description
b0	Network camera	CH1	0: Other (enabled or unused) 1: Disabled
b1		CH2	
b2		CH3	
b3		CH4	
b4	Web camera	CH1	Fixed to 0
b6	Personal computer image	CH1	

■Destination Authentication Status Notification (CH1 to CH4) (GS2200 to GS2231)

Notifies the logon status of the destination authentication.

The bit shows the status for each channel and connected station for stations that are logged on by the destination authentication function.

1: Logon status

0: Logoff status

The specification of the network number is invalid, and only stations on the same network as the GOT are supported.

When the authentication is performed by specifying a host station, the logon status is notified if the station is a device that supports the destination authentication.

The bit information to be stored is as follows.

Device				Station number															
CH1	CH2	CH3	CH4	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
GS2200	GS2208	GS2216	GS2224	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0*1
GS2201	GS2209	GS2217	GS2225	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
GS2202	GS2210	GS2218	GS2226	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
GS2203	GS2211	GS2219	GS2227	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
GS2204	GS2212	GS2220	GS2228	79	78	77	76	75	74	73	72	71	70	69	68	67	66	65	64
GS2205	GS2213	GS2221	GS2229	95	94	93	92	91	90	89	88	87	86	85	84	83	82	81	80
GS2206	GS2214	GS2222	GS2230	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
GS2207	GS2215	GS2223	GS2231	—	—	—	—	—	—	—	120	119	118	117	116	115	114	113	112

*1 Indicates the master station depending on the connection type.
Status notification is disabled when the corresponding station is a station other than the GOT.

Read device (GS384 to GS639)

■Script Common Control (GS384)

The following script types are supported: project script, screen script, and script part.

Notifies the information common to project scripts and screen scripts.

• b0: When this bit is turned on, the script error records are cleared as shown below.

GS14.b0, b7, b8, and b12 store 0.

GS15 stores -1.

GS16 to GS47 store 0.

• b1: When this bit is turned on, the project script or screen script aborted due to an error is re-executed.

• b2 to b15: Use prohibited

For the precautions on the script error, refer to the following.

☞ Page 2431 GOT internal device

■Script Monitoring Time (GS385)

The following script types are supported: project script, screen script, and script part.

Specify the monitoring time of a project script, screen script, or script of a script parts object in seconds.

If a script does not end after the lapse of the timeout period, the script processing is aborted.

The setting range is [1] (second) to [300] (seconds).

If an invalid value is specified, 10 seconds are assumed.

■Project/Screen Script Initial Operation (GS386)

Set whether to run a project script, screen script, or script of a script parts object upon screen switching or other applicable processes.

• When GS386 stores 0, the script runs.

• When GS386 stores a nonzero value, the script does not run.

This setting is applied to the project scripts, screen scripts, and script parts where the following trigger types are set.

• [Rise]:

When the trigger device is on, the script runs upon screen switching or other applicable processes.

• [Fall]:

When the trigger device is off, the script runs upon screen switching or other applicable processes.

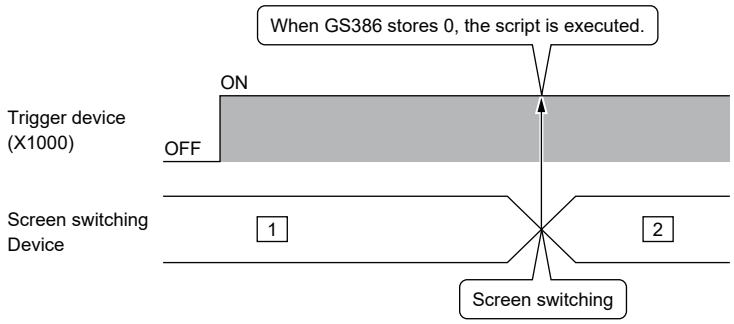
• [Rise/Fall]:

When the trigger device is on or off, the script runs upon screen switching or other applicable processes.

Ex.

When a screen script ([Trigger Type]: [Rise], [Trigger Device]: X1000) is set for base screen 2

After base screen 1 is switched to base screen 2, if the trigger device (X1000) turns on, the screen script set for base screen 2 is executed.



The following processes trigger applicable scripts to run.

Project script

• When the GOT is powered on or when the GOT returns from offline

Screen script

• Screen switching

The script set for the destination screen runs upon screen switching.

If [Perform script initial operation (screen/object) only when switching screens] is deselected in the [Script] dialog, each of the following processes triggers the relevant script to run.

☞ Page 2410 [Option] tab

- Security switching
- Language switching
- System language switching
- Station number switching

When the station number switching devices are set by screen type, the scripts that are set for the screens of the target screen type are executed.

- Offset switching

Only the screen scripts are executed.

On a screen having a script setting, when offset switching occurs in any device of the screen, the script is executed.

- Buffer memory unit number switching
- When object script "redraw_screen()" is executed

■Object Script Common Control (GS387)

Notifies the information common to object scripts.

- b0: When this bit is turned on, the object script error records are cleared as shown below.

GS80.b0, b7, b8, and b12 store 0.

GS81 stores -1.

GS82 to GS113 store 0.

- b1: When this bit is turned on, the object script aborted due to an error is re-executed.
- b2 to b15: Use prohibited

For the precautions on the object script error, refer to the following.

☞ Page 2431 GOT internal device

■Object Script Monitoring Time (GS388)

Specify the monitoring time of an object script in seconds.

If a script does not end after the lapse of the timeout period, the script processing is aborted.

The setting range is [1] (second) to [300] (seconds).

If an invalid value is specified, 10 seconds are assumed.

■Object Script Initial Operation (GS389)

Set whether to run an object script upon screen switching or other applicable processes.

- When GS389 stores 0, the object script runs.
- When GS389 stores a nonzero value, the object script does not run.

This setting is applied to the object scripts where the following trigger types are set.

- [Rise]:

When the trigger device is on, the script runs upon screen switching or other applicable processes.

- [Fall]:

When the trigger device is off, the script runs upon screen switching or other applicable processes.

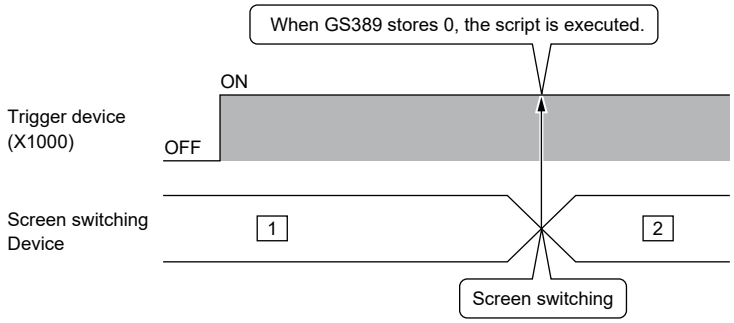
- [Rise/Fall]:

When the trigger device is on or off, the script runs upon screen switching or other applicable processes.

Ex.

When an object script ([Trigger Type]: [Rise], [Trigger Device]: X1000) is set for a switch on base screen 2

After base screen 1 is switched to base screen 2, if the trigger device (X1000) turns on, the object script of the switch on base screen 2 is executed.



The following processes trigger applicable scripts to run.

- Screen switching

The script set for the destination screen runs upon screen switching.

If [Perform script initial operation (screen/object) only when switching screens] is deselected in the [Script] dialog, each of the following processes triggers the relevant script to run.

☞ Page 2410 [Option] tab

- Security switching
- Language switching
- System language switching
- Station number switching

When the station number switching devices are set by screen type, the scripts that are set for the screens of the target screen type are executed.

- Buffer memory unit number switching
- When object script "redraw_screen()" is executed

■File Operation Data Storage Order (GS390)

The following script types are supported: project script, screen script, and script part.

Select the order in which data is stored when using the file_read or file_write function in a script.

[Low-->High]: Stores data from the lower-order bytes.

[High-->Low]: Stores data from the higher-order bytes.

Alternatively, you can configure the data storage order setting on GT Designer3.

This setting becomes invalid when GS390 stores 1 or 2.

The following shows examples of settings.

- When GS390 stores 0, data is stored in the order specified on GT Designer3.
- When GS390 stores 1, data is stored from the lower-order bytes.
- When GS390 stores 2, data is stored from the higher-order bytes.
- When GS390 stores 3 or more, data is stored in the order specified on GT Designer3.

■Start GD Device for Script Error Info Notification (GS392)

The following script types are supported: project script, screen script, and script part.

Specify the start device number of the GD devices to store error records.

Data type: Unsigned binary

■Number of Script Error Info Outputs (GS394)

The following script types are supported: project script, screen script, and script part.

Specify the maximum number of error records.

Data type: Unsigned binary

The setting range is 0 to 5000.

If the device stores 0, no error record will be stored.

If the device stores 5001 or more, up to 5000 records will be stored.

GS395.b1 specifies the operation to be performed when the number of errors has exceeded the maximum number of error records.

The following shows an example of how an error record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Error code	Error code of an error. For the error details and corrective actions, refer to the following. ☞ Page 2442 List of script execution error codes
GD1001	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 1: Project script • 2: Screen script (set for a base screen) • 3: Screen script (set for a window screen) • 4: Script part
GD1002	Screen number	Number of the screen for which the script is set. The device stores 0 for a project script.
GD1003	Script number or object ID	The data differs according to the script type. • For project scripts and screen scripts: script number • For script parts: object ID
GD1004	Execution order number	Script execution order number specified on GT Designer3 The device stores any of the following values according to the script type. • For project scripts: 1 to 256 • For screen scripts: 1 to 256 (per screen) • For script parts: 1 to 16 (per script parts object)
GD1005	Screen type	Type of the screen for which the script is set. The device stores any of the following values according to the screen type. • 200: Base screen • 210: Superimpose window 1 • 220: Superimpose window 2 • 310: Overlap window 1 • 320: Overlap window 2 • 330: Overlap window 3 • 340: Overlap window 4 • 350: Overlap window 5 If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. • When a base screen is called, 1 is added. • When a window screen is called, 2 is added. Example) When a window screen is called from overlap window 3 330 + 2 = 332 The device stores 0 for a project script.
GD1006	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1007	Use prohibited	The device stores 0.

■Script Error Info Output Common Control (GS395)

The following script types are supported: project script, screen script, and script part.

- b0: When this bit is turned on, storing error records starts.

When this bit is turned off, storing error records ends.

- b1: Specifies the operation to be performed when the number of errors has exceeded the maximum number of error records specified with GS394.

When this bit is turned on, storing error records stops.

When this bit is turned off, storing error records continues by overwriting the oldest record.

- b2 to b7: Use prohibited
- b8: When this bit is turned on, the project script error records are not stored.
- b9: When this bit is turned on, the screen script error records are not stored.
- b10: When this bit is turned on, the script error records of script parts objects are not stored.
- b11: When this bit is turned on, the records of warnings that do not abort a script are not stored.
- b12 to b15: Use prohibited

■Start GD Device for Script Event Notification (GS396)

The following script types are supported: project script, screen script, and script part.

Specify the start device number of the GD devices to store script execution records.

Data type: Unsigned binary

■Number of Script Event Outputs (GS398)

The following script types are supported: project script, screen script, and script part.

Specify the maximum number of script execution records.

Data type: Unsigned binary

The setting range is 0 to 5000.

If the device stores 0, no script execution record will be stored.

If the device stores 5001 or more, up to 5000 records will be stored.

GS399.b1 specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records.

The following shows an example of how a script execution record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 1: Project script • 2: Screen script (set for a base screen) • 3: Screen script (set for a window screen) • 4: Script part
GD1001	Screen number	Number of the screen for which the script is set. The device stores 0 for a project script.
GD1002	Script number or object ID	The data differs according to the script type. • For project scripts and screen scripts: script number • For script parts: object ID
GD1003	Execution order number	Script execution order number specified on GT Designer3 The device stores any of the following values according to the script type. • For project scripts: 1 to 256 • For screen scripts: 1 to 256 (per screen) • For script parts: 1 to 16 (per script parts object)

Storage device	Item	Description
GD1004	Screen type	Type of the screen for which the script is set. The device stores any of the following values according to the screen type. • 200: Base screen • 210: Superimpose window 1 • 220: Superimpose window 2 • 310: Overlap window 1 • 320: Overlap window 2 • 330: Overlap window 3 • 340: Overlap window 4 • 350: Overlap window 5 If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. • When a base screen is called, 1 is added. • When a window screen is called, 2 is added. Example) When a window screen is called from overlap window 3 330 + 2 = 332 The device stores 0 for a project script.
GD1005	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1006	Use prohibited	The device stores 0.
GD1007	Use prohibited	The device stores 0.

■Script Event Output Common Control (GS399)

The following script types are supported: project script, screen script, and script part.

• b0: When this bit is turned on, storing script execution records starts.

When this bit is turned off, storing script execution records ends.

• b1: Specifies the operation to be performed when the number of executed scripts has exceeded the maximum number of script execution records specified with GS398.

When this bit is turned on, storing script execution records stops.

When this bit is turned off, storing script execution records continues by overwriting the oldest record.

• b2 to b7: Use prohibited

• b8: When this bit is turned on, the project script execution records are not stored.

• b9: When this bit is turned on, the screen script execution records are not stored.

• b10: When this bit is turned on, the script execution records of script parts objects are not stored.

• b11 to b15: Use prohibited

■Gateway Common Control (GS400)

Controls the FTP server function.

b0 to b1: Use prohibited

b2: When this bit is turned on, all FTP clients connected to the FTP server are forcibly disconnected.

b3 to b7: Use prohibited

b8: When this bit is turned on, binary files (*.G3□) (excluding G3, G3D, and G3G) become readable from all the FTP clients that are connected to the FTP server.

b9 and b10: Use prohibited

b11: When this bit is turned on, the error occurring in the mail send function is cleared. (GS200.b11 and GS201 to GS206 are cleared.)

b12 and b13: Use prohibited

b14: When this bit is turned on, the error occurring in the server function is cleared. (GS200.b14 and GS210 to GS216 are cleared.)

b15: When this bit is turned on, the error occurring in the client function is cleared. (GS200.b15 and GS220 to GS226 are cleared.)

■File Transfer Control (GS401)

b0: When this bit is turned on, the error code stored in the following device is cleared or the following signals are turned off.

• File Transfer Error No. (GS989)

• Warning signal (GS990.b14)

• File Transfer Error signal (GS990.b15)

b1 to b15: Use prohibited

■File Transfer Timeout Time (GS402)

Set the timeout period for FTP communication in units of seconds.

If a script does not end after the lapse of the timeout period, the script processing is aborted.

The setting range is [1] (second) to [300] (seconds).

If an invalid value is specified, 3 seconds are assumed.

■Maximum Number of Connected FTP Clients (GS404)

This GS device is enabled only when 1 is specified for [Simultaneous Client Connection].

Specify the number of FTP clients connectable to the FTP server.

The setting range is 1 to 4.

If an invalid value is specified, 1 is assumed.

Changing the number of connectable FTP clients does not affect the already-connected FTP clients.

■GOT Information Output Common Control (GS405)

• b0: When this bit is turned on, the GOT serial number is output to the devices specified with GS406.

If 10 word devices cannot be reserved, the output is not executed.

• b1: When this bit is turned on, the MAC address of Ethernet port 1 is output to the devices specified with GS408.

If 3 word devices cannot be reserved, the output is not executed.

• b2: When this bit is turned on, the MAC address of Ethernet port 2 is output to the devices specified with GS410.

If 3 word devices cannot be reserved, the output is not executed.

• b3 to b15: Use prohibited

■Serial No. Output Destination (GS406)

Specify the start device number of the GOT data registers (GD) to store the GOT serial number.

Ten GD devices, starting from the specified device, are used to store the GOT serial number.

■Ethernet Port 1 MAC Address Destination (GS408)

Specify the start device number of the GOT data registers (GD) to store the MAC address of Ethernet port 1.

Three GD devices, starting from the specified device, are used to store the MAC address.

■Ethernet Port 2 MAC Address Destination (GS410)

Specify the start device number of the GOT data registers (GD) to store the MAC address of Ethernet port 2.

Three GD devices, starting from the specified device, are used to store the MAC address.

■Current Directory Designation when Logging in to the FTP Server Function (GS423)

Specify the current directory immediately after logging in to the FTP server.

• b0 to b9: Use prohibited

• b10: When this bit is turned on, drive V is specified as the current directory.

• b11 to b15: Use prohibited

■Start GD Device for Object Script Error Info Notification (GS432)

Specify the start device number of the GD devices to store error records.

Data type: Unsigned binary

■Number of Object Script Error Info Outputs (GS434)

Specify the maximum number of error records.

Data type: Unsigned binary

The setting range is 0 to 5000.

If the device stores 0, no error record will be stored.

If the device stores 5001 or more, up to 5000 records will be stored.

GS435.b1 specifies the operation to be performed when the number of errors has exceeded the maximum number of error records.

The following shows an example of how an error record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Error code	Error code of an error. For the error details and corrective actions, refer to the following. ☞ Page 2492 List of error codes during script execution (object script)

Storage device	Item	Description
GD1001	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 10: Display object script or switch object script • 11: Input object script
GD1002	Screen number	Number of the screen where the object is placed.
GD1003	Object ID	ID of the object where a script error has occurred.
GD1004	Use prohibited	The device stores 0.
GD1005	Screen type	Type of the screen where the object is placed. The device stores any of the following values according to the screen type. • 200: Base screen • 210: Superimpose window 1 • 220: Superimpose window 2 • 310: Overlap window 1 • 320: Overlap window 2 • 330: Overlap window 3 • 340: Overlap window 4 • 350: Overlap window 5 • 400: User-created key window • 500: Dialog window substituted for a system message If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. • When a base screen is called, 1 is added. • When a window screen is called, 2 is added. Example) When a window screen is called from overlap window 3 330 + 2 = 332
GD1006	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1007	Use prohibited	The device stores 0.

■Object Script Error Info Output Common Control (GS435)

• b0: When this bit is turned on, storing error records starts.

When this bit is turned off, storing error records ends.

• b1: Specifies the operation to be performed when the number of errors has exceeded the maximum number of error records specified with GS434.

When this bit is turned on, storing error records stops.

When this bit is turned off, storing error records continues by overwriting the oldest record.

• b2 to b10: Use prohibited

• b11: When this bit is turned on, the records of warnings that do not abort a script are not stored.

• b12 to b15: Use prohibited

■Start GD Device for Object Script Event Notification (GS436)

Specify the start device number of the GD devices to store script execution records.

Data type: Unsigned binary

■Number of Object Script Event Outputs (GS438)

Specify the maximum number of script execution records.

Data type: Unsigned binary

The setting range is 0 to 5000.

If the device stores 0, no script execution record will be stored.

If the device stores 5001 or more, up to 5000 records will be stored.

GS439.b1 specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records.

The following shows an example of how a script execution record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 10: Display object script or switch object script • 11: Input object script
GD1001	Screen number	Number of the screen where the object is placed.
GD1002	Object ID	ID of the object where a script runs.
GD1003	Use prohibited	The device stores 0.
GD1004	Screen type	Type of the screen where the object is placed. The device stores any of the following values according to the screen type. • 200: Base screen • 210: Superimpose window 1 • 220: Superimpose window 2 • 310: Overlap window 1 • 320: Overlap window 2 • 330: Overlap window 3 • 340: Overlap window 4 • 350: Overlap window 5 • 400: User-created key window • 500: Dialog window substituted for a system message If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. • When a base screen is called, 1 is added. • When a window screen is called, 2 is added. Example) When a window screen is called from overlap window 3 330 + 2 = 332
GD1005	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1006	Use prohibited	The device stores 0.
GD1007	Use prohibited	The device stores 0.

■Object Script Event Output Common Control (GS439)

• b0: When this bit is turned on, storing script execution records starts.

When this bit is turned off, storing script execution records ends.

• b1: Specifies the operation to be performed when the number of executed scripts has exceeded the maximum number of script execution records specified with GS438.

When this bit is turned on, storing script execution records stops.

When this bit is turned off, storing script execution records continues by overwriting the oldest record.

• b2 to b15: Use prohibited

■Exclusive Authorization Control (GS447)

Controls the authorization of the SoftGOT-GOT link function.

This control is disabled when the GOT network interaction function is used.

• b0: When this bit is turned on, the GOT obtains the exclusive authorization.

• b1: When this bit is turned on, the authorization guarantee time for the SoftGOT-GOT link function is disabled and GS984 (Authorization Guarantee Status Notification signal) stores 0.

• b2 to b15: Use prohibited

■PC Image Display Common Control (GS449)

Notifies the GOT of the display position of the personal computer image when its resolution is lower than that of the GOT.

- b0: When this bit is turned on, the personal computer image is displayed in the center of the GOT screen.

When this bit is turned off, the personal computer image is displayed in the upper-left corner of the GOT screen.

- b1 to b15: Use prohibited

■Monitor Common Control (GS450)

- b0: When this bit is turned on, a confirm message is displayed after numerical or text data (numerical input or text input) is input .
- b1: Controls the displaying methods of the message displayed when an numeric value exceeding the valid range is input.

Turning on displays a message during the numerical input.

Turning off displays a message after the numeric value is input.

- b2: When this bit is turned on, the system signal 1-1.b4 (Numeric Value Input Read Complete signal), system signal 2-1.b4 (Numeric Value Input signal), [Numeric Value Input Number], [Current Cursor Display User ID], and [Previous Cursor Display User ID] in the [Environmental Setting] window ([System Information]) are activated during the input as well.
- b3: When this bit is turned on, 0 is stored into [Current Cursor Display Object], [Previous Cursor Display Object], [Current Cursor Display User ID], and [Previous Cursor Display User ID] in the [Environmental Setting] window ([System information]) when a cursor is erased.
- b4: When this bit is turned on, the Kana-Kanji conversion or Pinyin conversion function is activated when text input is used.

The conversion function selected for [Kana-Kanji/Pinyin Conversion] in the [Environmental Setting] window ([Kana-Kanji/Pinyin Conversion]) is activated.

- b5: When this bit is turned on, the key window is forcibly closed if the input condition (the trigger condition or security level for the object) is not satisfied during a value or text input.
- b6: When this bit is turned on, the key window for inputting binary values is displayed for the numerical input whose format is binary.
- b7: When this bit is turned on, the key window for inputting octal values is displayed for the numerical input whose format is octal.
- b8: When this bit is turned on, BMP, JPEG, and PNG files in the data storage can be used as a part for parts display.

Turning off displays parts registered by GT Designer3.

When [Show image files in the memory card at the time of specifying Parts No. 9001-9999] is selected in the [Parts Setting] dialog, a BMP, JPEG, or PNG file in the data storage is used as a part regardless of the on or off status of this signal.

☞ Page 1416 Placing a parts display

- b9: When this bit is turned on, the GOT retains the state of the historical trend graph displayed before screen switching and displays the same graph state after switching back to the graph screen.

☞ Page 1693 Placing a historical trend graph

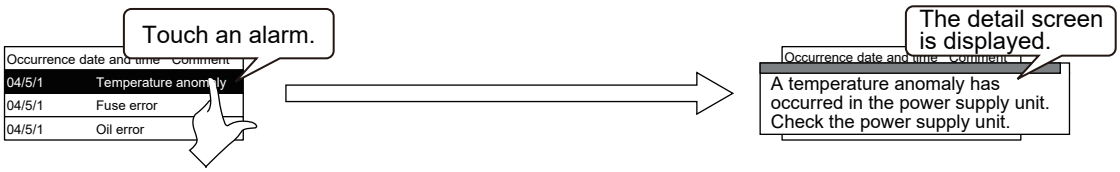
- b10: When this bit is turned on, the upper and lower limit symbols on the trend graph and the historical trend graph are hidden.
- b11: Use prohibited
- b12: Controls the switching timing when the bit alternate, bit set, or bit reset is set for a touch switch, and the switch is used for screen or station number switching.

☞ Page 1191 Placing a touch switch

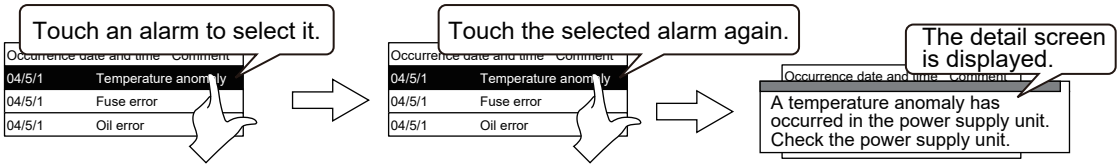
- b13: When this bit is turned on, the data storage stores the history of the screen switching.
- b14: When this bit is turned on, the screen switching mode is switched from the previous mode to history mode.
- b15: While this bit is on, touching an alarm once in the alarm display (user) displays the detail screen.

While this bit is off, touching an alarm twice in the alarm display (user) displays the detail screen.

When GS450.b15 is on



When GS450.b15 is off



■Auto Screen Save Time (GS451)

Stores the time until the monitor screen display is turned off by the clean save function as a value from 1 to 60 (minutes).

When the stored value is 61 or greater, the value is processed as 60.

If 0 is stored, the screen save time set in the utility is applied.

If the value is changed during the screen save, the changed value becomes effective after the screen save is canceled.

■Ethernet Port 1 Access Control, Ethernet Port 2 Access Control (GS454)

Controls the operations through an Ethernet network.

- b0: When this bit is turned on, writing the package data (system applications) through Ethernet port 1 is disabled.
- b1: When this bit is turned on, writing the package data (project data) through Ethernet port 1 is disabled.
- b2 to b3: Use prohibited
- b4: When this bit is turned on, writing the package data (system applications) through Ethernet port 2 is disabled.
- b5: When this bit is turned on, writing the package data (project data) through Ethernet port 2 is disabled.
- b6 to b7: Use prohibited
- b8: When this bit is turned on, reading data through Ethernet port 1 is disabled.
- b9 to b11: Use prohibited
- b12: When this bit is turned on, reading data through Ethernet port 2 is disabled.
- b13 to b15: Use prohibited

■Intensity Control (GS455)

Sets the intensity and the brightness adjustment mode of the GOT display section.

- b0 to b14: When the bits store a setting value, the intensity of the backlight changes to the one corresponding to the setting value.

A value can be set on the 8-level scale from 1 to 8 or 32-level scale from 101 to 132.

If 0 and 9 to 100, or 133 or more is set, the setting for the intensity adjustment function for the utility is applied.

The following shows the correspondence between setting values for the device and the intensity.

Setting value of GS455	8 levels	32 levels
0	The intensity setting of the utility is applied.	
1	1	—
:	:	
8	8	
9	The intensity setting of the utility is applied.	
:		
100		
101	—	101
:		:
132		132
133	The intensity setting of the utility is applied.	
:		

The following table shows the correspondence between the 8-level scale and the 32-level scale.

Intensity	
8 levels	**32 levels**
1	1 or 101
2	5 or 105
3	10 or 110
4	14 or 114
5	19 or 119
6	23 or 123
7	28 or 128
8	32 or 132

- b15: When the bit turns on, the brightness adjustment mode is set to low intensity.

The intensity of the GOT can be confirmed by the Intensity Notification (GS255).

☞ Page 3601 Intensity Notification (GS255)

For the specifications of the GOT display section, refer to the following.

GOT3000 Series User's Manual (Hardware)

Point

The Intensity Control (GS455) changes the setting value of the intensity temporarily.
If the GOT is turned off after the setting value is changed by the Intensity Control (GS455), the value is returned to the value set in the utility.

■Text Code Format Control (GS456)

The character code used for the text display or the text input is changeable.

This device is enabled only when the character code is determined by the system language or Unicode.

If you change the character code, the KANJI region for the kanji characters displayed on the text display or the text input is also changed.

The character code is changed to one corresponding to the stored value as shown below.

Stored value	Character code	KANJI region of displayed kanji characters
0	ASCII code, Shift JIS code	Japanese
1	Shift JIS code	Japanese
2	ASCII code	Japanese
3	GB code	Simplified Chinese
4	KS code	Japanese
5	BIG5	Traditional Chinese

• Timing of change

A change to the specified character code format is reflected at one of the following timings.

◇Switching the screen (except for key windows or dialog windows)

◇Switching the security level

◇Switching the language

◇Switching the station number

◇Switching the buffer memory unit number

◇Executing the function (redraw_screen()) of the object script

• Applied KANJI region

If the UD font corresponding to the KANJI region of the selected character code is not written to the GOT, the written UD font is applied.

The following is an example in using the GOT that has only Japanese as the standard font (standard). If the character code is changed to GB code, the KANJI region of the displayed kanji characters is set to Japanese.

• How to reflect the new setting at the GOT startup

You can reflect the new setting at the GOT startup by using the object script.

Ex.

When changing the character code to GB code at GOT startup

On the screen displayed at the GOT startup, place an object where the following object script is set.

Setting item for the script	Setting details
Trigger type	[Rise]
Trigger device	GS0.b4 (Common Information 1: Always ON Signal)
Script	[w:GS456] = 3; redraw_screen();

■Pass-through Transparent Stop Control (GS457)

When 1 is set at this area, pass-through transparent stop request is performed.

By using this area, the user can expedite recovery from the pass-through transparent recovery waiting status.

This area is effective only when 2 (pass-through mode in operation) is set for FA transparent status (GS256).

0: No stop request

1: No stop request

■Conversion Start Indication (GS460)

The following script types are supported: project script, screen script, and script part.

• b0: Converts unsigned 16-bit binary data to a 32-bit real number with the integer ⇔ real number conversion function.

• b1: Converts signed 16-bit binary data to a 32-bit real number with the integer ⇔ real number conversion function.

• b2 to b3: Use prohibited

• b4: Converts a 32-bit real number to unsigned 16-bit binary data with the integer ⇔ real number conversion function.

• b5: Converts a 32-bit real number to signed 16-bit binary data with the integer ⇔ real number conversion function.

• b6 to b14: Use prohibited

• b15: Starts a conversion with the integer ⇔ real number conversion function.

■Number of Conversion Devices (GS461)

The following script types are supported: project script, screen script, and script part.

Specify the number of devices to be converted with the integer ⇔ real number conversion function.

1 to 4096 conversion devices can be specified.

■Conversion Source Head Device No. (GS462)

The following script types are supported: project script, screen script, and script part.

Specify the start device of GOT internal devices (GD) that store the value before conversion with the integer ⇔ real number conversion function.

■Conversion Destination Head Device No. (GS463)

The following script types are supported: project script, screen script, and script part.

Stores the conversion results of the conversion with the integer ⇔ real number conversion function and specifies the start device of the GOT internal devices (GD).

■Storage Error Value (GS464)

The following script types are supported: project script, screen script, and script part.

Specify the value to be stored in the conversion destination device if a conversion error occurs during conversion between an integer and a real number.

■Remote Personal Computer Operation (Ethernet) Common Control (GS465)

Set whether to display the operation buttons on the personal computer screen on the GOT, and specify the display magnification of the personal computer screen.

The settings are applied when the remote personal computer screen is launched.

For details on the remote personal computer operation function (Ethernet), refer to the following.

☞ Page 2613 Operating a personal computer by using the GOT (remote personal computer operation function (Ethernet))

- b0: When this bit is turned on, the [CAD] button is hidden.
- b1: When this bit is turned on, the [C+E] button is hidden.
- b2: When this bit is turned on, the [KBD] button is hidden.
- b3: When this bit is turned on, the zoom in button and the zoom out button are hidden.
- b4: Use prohibited
- b5: Specifies the display magnification of the personal computer screen to be applied when b3 is turned on.

When this bit is turned on, the display magnification specified on GT Designer3 is applied.

When this bit is turned off, the display magnification is fixed to 100%.

- b6: When this bit is turned on, the click switching button is hidden.
- b7: When this bit is turned on, the scroll bars of the personal computer screen on the GOT are hidden.
- b8: When this bit is turned on, the personal computer screen on the GOT opens in the full screen mode.

For the display modes of the personal computer screen on the GOT, refer to the following.

☞ Page 2613 Operating a personal computer by using the GOT (remote personal computer operation function (Ethernet))

- b9: When this bit is on, the GOT (VNC server) can be connected to a vision sensor described in the following Technical Bulletin.

📖List of VNC Servers Supporting the Remote Personal Computer Operation (Ethernet) Function Validated to Operate with the GOT3000 Series (GOT-A-0257)

- b10: When the GOT connected with multiple personal computers displays a remote screen window, use this bit to set the action when the touch switch to open the specified personal computer screen without closing the remote screen window is touched.

When this bit is on, the personal computer screen on the GOT is switched.

When this bit is off, the personal computer screen on the GOT is not switched and an error message is displayed.

For switching the personal computer screen on the GOT, refer to the following.

☞ Page 2617 Switching the remote personal computer screen

- b11 to b15: Use prohibited

■Unit of Drive Free Space (GS466)

Specify the unit of values to be stored in the Drive Empty Capacity Information devices of the system information.

☞ Page 585 Drive Empty Capacity Information

This setting applies to all the drives when the system information is updated.

The setting range is 0 to 2.

If you set a value outside the setting range, each target device stores a value in bytes.

Stored value	Unit	Remarks
0	byte	Each target device notifies up to 2 GB free space.
1	Kbyte	Each target device notifies up to 2 TB free space. (1 Kbyte = 1024 bytes) The fractional portion is rounded off. Example) For 1.1 Kbytes of free space, 1 is stored.
2	Mbyte	Each target device notifies up to 2 PB free space. (1 Mbyte = 1024 Kbytes) The fractional portion is rounded off. Example) For 1.2 Mbytes of free space, 1 is stored.

If you change the specified unit, the maximum size of free space to be notified is changed. Note that the capacity of the data storage usable in the GOT remains unchanged.

■Monitor Common Control 2 (GS467)

- b0: When this bit is turned on, the cursor moves to a different alarm on the alarm display (user) after the alarm under the cursor is deleted.

The cursor display position after the deletion varies with the displayed contents on the alarm display (user).

If an alarm is displayed below the deleted alarm, the cursor moves to this alarm after the deletion.

If all the other alarms are displayed above the deleted alarm, the cursor moves to the alarm at the bottom after the deletion.

If all the alarms are deleted, the cursor is hidden after the deletion.

When this bit is off, the cursor is hidden.

- b1: Turning on this bit displays the key window for text input (key window that supports Kana-Kanji/Pinyin conversion).

The default display for Kana-Kanji conversion is hiragana characters (first half).

The default display for Pinyin (Simplified) conversion is lowercase English letters.

Turning off this bit displays the system key window for text input.

This bit must be on when the Kana-Kanji/Pinyin (Simplified) conversion function is enabled and the text input enters the input state.

When this signal is turned on and a key window that supports Kana-Kanji conversion is displayed, the hiragana and katakana key window is displayed even if the system language is not set to [Japanese].

When a user-created key window is used, the Kana-Kanji/Pinyin (Simplified) conversion key window is not displayed even if this setting is turned on. Instead, the user-created key window takes priority.

- b2 to b15: Use prohibited

■Kanji Region Control (GS468)

The KANJI region used for the text display or text input is changeable.

This setting is applied to all the text displays and text inputs where [Character Code] is set to [Unicode].

The KANJI region is changed according to the stored value as shown below.

Stored value	KANJI region
0	Not changed
1	Japanese
2	Simplified Chinese
3	Traditional Chinese

- Timing of change

A change to the specified KANJI region is reflected at one of the following timings.

◇Switching the screen (except for key windows or dialog windows)

◇Switching the security level

◇Switching the language

◇Switching the station number

◇Switching the buffer memory unit number

◇Executing the function (redraw_screen()) of the object script

• Applied KANJI region

If the UD font corresponding to the KANJI region of the selected character code is not written to the GOT, the written UD font is applied.

• How to reflect the new setting at the GOT startup

You can reflect the new setting at the GOT startup by using the object script.

Ex.

When changing the KANJI region to Simplified Chinese at GOT startup

On the screen displayed at the GOT startup, place an object where the following object script is set.

Setting item for the script	Setting details
Trigger type	[Rise]
Trigger device	GS0.b4 (Common Information 1: Always ON Signal)
Script	[w:GS468] = 2; redraw_screen();

■SoftGOT and Other Applications Start Signal (GS493 to GS498)

b0 to b15: When this bit is turned on, the application assigned to each bit in GT SoftGOT3000 runs.

This function is enabled only when [Effective] in [Allocation Setting] of [Basic Application Startup] is selected in GT SoftGOT3000.

■GT SoftGOT3000 Common Control (GS500)

• b0: When this bit is turned on, the dialog to exit GT SoftGOT3000 is displayed.

If exiting is canceled in the displayed dialog, the signal turns off.

• b1: When this bit is turned on, GT SoftGOT3000 is displayed in the full screen mode.

When this bit is turned off, the full screen mode of GT SoftGOT3000 is canceled.

• b2 to b15: Use prohibited

■GT SoftGOT3000 Application Start Signal (GS501, GS502)

b0 to b15: When this bit is turned on, the application assigned to each bit in GT SoftGOT3000 runs.

This function is enabled only when [Effective] in [Allocation Setting] of [Basic Application Startup] is selected in GT SoftGOT3000.

■GT SoftGOT3000 Full Screen Size (Width) (GS503)

When using the full screen mode function of GT SoftGOT3000, set the width (640 to 1920 dots) of the GT SoftGOT3000 monitor screen.

When the set value is 640 or less, the value is processed as 640. When the set value is 1920 or more, the value is processed as 1920.

■GT SoftGOT3000 Full Screen Size (Height) (GS504)

When using the full-screen display function of GT SoftGOT3000, set the height (480 to 1920 dots) of the GT SoftGOT3000 monitor screen.

When the set value is 480 or less, the value is processed as 480. When the set value is 1920 or more, the value is processed as 1920.

■GT SoftGOT3000 Advanced Application Start Signal (GS505 to GS507)

Starts an application in GT SoftGOT3000 using a value stored in GS505 and a bit of GS506 to GS507.

This function is enabled only when [Effective] in [Allocation Setting] of [Advanced Application Startup] is selected in GT SoftGOT3000.

For setting the devices from GS505 to 507 as triggers for the application, refer to the following manual.

GT SoftGOT3000 User's Manual

■Device Data Transfer Information (GS510)

- b0: When this bit is turned on, the device stores 0 in the Error Device Data Transfer ID (GS642) and the Device Data Transfer Error Count (GS643).
- b1: When this bit is turned on, the device stores 0 in the Device Data Transfer Processing Time (GS644), the Device Data Transfer Min. Processing Time (GS646), and the Device Data Transfer Max. Processing Time (GS648).
- b2 to b15: Use prohibited

■Time Change Information (GS512)

- b0: When this bit is turned on, the GOT clock data is changed to the data set for the Changed Time (GS513 to GS516).

When the time is changed, the clock data of the external device is also changed (time notification function).

- b1 to b15: Use prohibited

■Changed Time (GS513 to GS516)

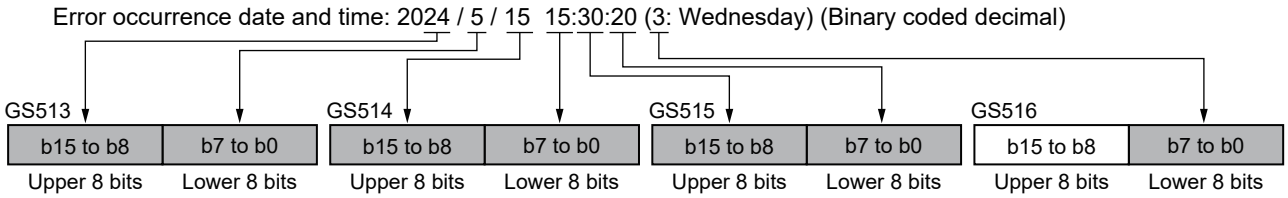
Stores the current time with BCD code.

The day-of-the-week data, 0 to 6, is stored.

(0: Sunday 1: Monday 2: Tuesday 3: Wednesday 4: Thursday 5: Friday 6: Saturday)

Ex.

Example) When the error occurrence date is 15:30:20 May 15, 2024 (Wednesday)



■External I/O Function Notification/External I/O Control Function (GS517)

- b0: When this bit is turned on, the 128-point input can be executed with the external I/O function.

When this bit is turned off, the 16-point input can be executed.

- b1 to b15: Use prohibited

Point

128-point input

Without the 128-point input (when the above device turns off), the GOT internal device turns on when the 16-point input is executed with the input terminal.

With the 128-point input (when the above device turns on), the 16-point input with the input terminal is used with the 8-point scan signal and the 128-point input (16 × 8) is performed.

For connection diagrams of each signal with the external I/O function, refer to the following manual.

GOT3000 Series User's Manual (Connection)

■Sound Output Common Control (GS518)

- b0: Turn on this bit to stop the current playback.
- b1: Turn on this bit to stop the current playback and cancel all standby sound files.
- b2: Turn on this bit to mute the sound.
- b3 to b15: Use prohibited

■Buffering And File Access Control (GS520)

- b0: When this bit is turned on, the whole data in the buffering area is stored in the destination drive at the timing of the rising edge.
- b1 to b15: Use prohibited

■Trigger Backup Data Send Delay (GS521)

The backup/restoration function can set the delay time for backup communication intervals.
Setting of the delay time can reduce the load of other processes (such as monitoring objects) with the backup process.
The delay time determined by the set value is listed as follows.

Set value	Delay time
0	None
1 to 100	Set value × 5 (ms)
101 or more	500 (ms)

Point

Setting of Trigger Backup Data Send Delay
Backup communication times are longer than a default when the Trigger Backup Data Send Delay is set.
Set the suitable delay time to match the processing condition of backup function and others (such as monitoring objects).

■Special Control During Specific Function Execution (GS522)

- b0: When this bit is turned on during backup or restoration, background processing such as alarms, logging, and communication with registered devices is stopped. Only communication for the backup or restoration process is executed.

After the backup/restoration process, background processing and communication with registered devices are automatically resumed.

- b1: Only available for GT37.

Controls the start and stop of the function to notify the data storage usage capacity and the number of video files.
Turning on this bit starts the function to notify the data storage usage capacity and the number of video files.
Turning off this bit stops the function to notify the data storage usage capacity and the number of video files.
When this bit is off, the Memory Card Usage signal (GS1022.b0 to b1, b8 to b9) and the Number of Memory Card Files signal (GS1022.b2 to b7, b10 to b15) are reset.

- b2: When this bit is on, the character code is changed to Unicode and data is tab-delimited during a binary-to-CSV conversion or the creation of a CSV file.

Turn on this bit before executing the following operations.
· Converting a binary file (alarm log file, logging file, recipe file, or operation log file) to a CSV file
· Writing/reading data to/from a recipe file in CSV format
· Reading a CSV file from drive C of the GOT to a personal computer
· Copying a CSV file from drive C to any other drive
Make sure that this bit is on when you execute the following operations using the CSV file that has been converted from another format or created during the turn-on of the bit.
· Converting the CSV file to a binary file
· Performing an operation that uses the CSV file as a recipe file

- b3: When this bit is turned on, all buttons except the [List] and [Latest] buttons are disabled on the [Operation Log Information] screen of the utility.
- b4 to b5: Use prohibited
- b6: Available for GT37.

Controls whether to acquire GOT data package in conjunction with trigger backups performed by the backup/restoration function. Turning on this bit executes GOT data package acquisition upon successful completion of a trigger backup, regardless of the trigger settings (CH No.).
If the trigger backup fails, the acquisition is not performed. When this bit is off, GOT data package acquisition is not performed. The reflection timing corresponds to when the trigger condition is satisfied for each trigger setting (CH No.).

- b7: Turning on this bit closes the system window and switches the base screen when executing base screen switching while displaying the system window.

The system window is not closed if the base screen remains the same before and after switching.
For system windows, refer to the following.
☞ Page 536 Using an overlap window as the system window

- b8 to b15: Use prohibited

■Document Display Common Control (GS523)

• b0: When this bit is turned on, PDF files are not cached, and the cached PDF files are not displayed and updated.

• b1: When this bit is turned on, the search history file is not created or updated.

• b2: When this bit is turned on, an A4 or smaller PDF document is displayed in high quality (144 dpi resolution).

When this bit is turned off, a PDF document is displayed in standard quality (72 dpi resolution).

• b3: When this bit is turned on while a PDF document is displayed, the document is fit to the object width.

When a document is displayed for the first time while this bit is on, the document is fit to the object width, regardless of the selection for [Initial Display Size].

• b4 to b15: Use prohibited

■Delay Hard Copy Execution (GS526)

Set delay time to output a hidden screen image using the hard copy function.

When the start trigger condition is satisfied, the hard copy processing is executed after the set delay time has passed.

Set the delay time as below according to the values to be stored.

Set value	Delay time
0	None
1 to 10	1 to 10 seconds
11 or more	10 seconds

■Network No. For Monitor Station Disconnected (CH1 to CH4) (GS530, GS540, GS550, GS560)

Controls the disconnection and the connection of the monitor stations by the station.

• b0 to b7: the network No. for the station to be disconnected is specified. (0 to 239)

One network No. can be specified per channel.

• b8 to b15: Use prohibited

The devices are enabled only when the following communication drivers are used.

[Bus(A/QnA)]

[Bus(Q)]

Specify the station to be disconnected by using the following GOT special registers.

☞ Page 3650 Monitor Station Disconnection (CH1 to CH4) (GS531 to GS538, GS541 to GS548, GS551 to GS558, GS561 to GS568)

■Monitor Station Disconnection (CH1 to CH4) (GS531 to GS538, GS541 to GS548, GS551 to GS558, GS561 to GS568)

Each bit corresponds to a station number when one of the following communication drivers is used. Turning on a bit disconnects the corresponding station from the GOT.

The following shows the communication drivers supported by the GOT model.

○: Supported, —: Not supported

Communication driver	Supported/ Unsupported	Communication driver	Supported/ Unsupported
[Bus(Q)]	○	[Ethernet(MELSERVO), Gateway]	○
[Serial (MELSEC)]	○	[Ethernet(YASKAWA),Gateway]	○
[MELSECNET/H]	—	[Ethernet(YASKAWA MP3000),Gateway]	○
[CC-Link Ver2(ID)]	—	[Ethernet(YASKAWA High Speed Ethernet Server), Gateway]	○

For the multi-channel connection, the target bit of the device corresponding to each channel number (CH1 to CH4) turns on.

1: Disconnected

0: Connected

The following shows the station numbers for each device.

The station corresponding to each device differs according to whether the Ethernet connection is used or not.

• Ethernet connection: 1 to 128

Device				Ethernet setting number															
CH1	CH2	CH3	CH4	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
GS531	GS541	GS551	GS561	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
GS532	GS542	GS552	GS562	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
GS533	GS543	GS553	GS563	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33
GS534	GS544	GS554	GS564	64	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49
GS535	GS545	GS555	GS565	80	79	78	77	76	75	74	73	72	71	70	69	68	67	66	65
GS536	GS546	GS556	GS566	96	95	94	93	92	91	90	89	88	87	86	85	84	83	82	81
GS537	GS547	GS557	GS567	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97

GS538	GS548	GS558	GS568	127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112

Precautions

- The GOT cannot disconnect station No. 128 or later, or station-substation No. 9-0 or later.
- Stations with indirectly specified station numbers cannot be disconnected using the above devices.

For details on the indirect specification, refer to the following.

GOT3000 Series User's Manual (Connection)

■Channel Shutdown Control Information (CH1 to CH4) (GS539, GS549, GS559, GS569)

Communication of each channel is prohibited.

Turning on this signal turns off the Channel Observation Notification Information Signal (GS299, GS319, GS339, GS359) for the channel whose communication is prohibited.

☞ Page 3606 Channel Observation Notification Information Signal (CH1) (GS299, GS319, GS339, GS359)

- b0: While the bit is on, communication of each channel is prohibited.
- b1 to b15: Use prohibited

The following shows the compatible communication drivers.

○: Supported, —: Not supported

Communication driver	Supported/ Unsupported	Communication driver	Supported/ Unsupported

■MODBUS Communication Control Function (GS570 to GS576, GS590 to GS596, GS597 to GS603, GS604 to GS610, GS611 to GS617)

When some controllers do not comply with the specifications, this function enables the GOT to reduce the communication delay in the MODBUS network.

The availability of function codes is controlled when MODBUS/RTU or MODBUS/TCP connection is used.

The MODBUS Communication Control Function contains two types: the MODBUS Communication Control Function (Common) and the MODBUS Communication Control Function (CH1 to CH4). For the MODBUS Communication Control Function (Common), the device values are applied to all relevant channels. For the MODBUS Communication Control Function (CH1 to CH4), the device values are applied to each applicable channel.

Use GS579 to determine which type of the MODBUS Communication Control Function is applied.

☞ Page 3653 Channel Setting of MODBUS Communication Control Function (GS579)

When applicable devices store a value as shown below, the GOT operates with the values specified in the communication setting of the utility.

- For the MODBUS Communication Control Function (Common), GS571 to GS576 each store 0.
- For the MODBUS Communication Control Function (CH1), GS591 to GS596 each store 0.
- For the MODBUS Communication Control Function (CH2), GS598 to GS603 each store 0.
- For the MODBUS Communication Control Function (CH3), GS605 to GS610 each store 0.
- For the MODBUS Communication Control Function (CH4), GS612 to GS617 each store 0.

Device					Function
Common	CH1	CH2	CH3	CH4	
GS570.b0	GS590.b0	GS597.b0	GS604.b0	GS611.b0	When the bit turns on, function code 0Fh (write multiple coils) becomes unavailable.
GS570.b1	GS590.b1	GS597.b1	GS604.b1	GS611.b1	When the bit turns on, function code 10h (write multiple holding registers) becomes unavailable.
GS570.b2 to b15	GS590.b2 to b15	GS597.b2 to b15	GS604.b2 to b15	GS611.b2 to b15	Use prohibited
GS571	GS591	GS598	GS605	GS612	Set the maximum number of devices (1 to 2000) for a message with function code 01h (read coils). When 0 is set, the maximum number of devices is set as shown below. • MODBUS/TCP: 1000 • MODBUS/RTU: 2000 When a value other than the above is set, the maximum number of devices is 2000.
GS572	GS592	GS599	GS606	GS613	Set the maximum number of devices (1 to 2000) for a message with function code 02h (read input relays). When 0 is set, the maximum number of devices is set as shown below. • MODBUS/TCP: 1000 • MODBUS/RTU: 2000 When a value other than the above is set, the maximum number of devices is 2000.
GS573	GS593	GS600	GS607	GS614	Set the maximum number of devices (1 to 125) for a message with function code 03h (read holding registers). When a value other than 1 to 125 is set, the maximum number of devices is 125.
GS574	GS594	GS601	GS608	GS615	Set the maximum number of devices (1 to 125) for a message with the function code 04h (read input registers). When a value other than 1 to 125 is set, the maximum number of devices is 125.
GS575	GS595	GS602	GS609	GS616	Set the maximum number of devices for a message with the function code 0Fh (write multiple coils). The following shows the setting range of the maximum number of devices. • MODBUS/TCP: 1 to 800 • MODBUS/RTU: 1 to 1968 When 0 is set, the maximum number of devices is 800. When a value other than the above is set, the maximum value in the setting range is applied. When GS570.b0 stores 1, [0F] is not used; therefore, the setting for GS575 is invalid.
GS576	GS596	GS603	GS610	GS617	Set the maximum number of devices per message when using function code 10h (write multiple holding registers). The following shows the setting range of the maximum number of devices. • MODBUS/TCP: 1 to 100 • MODBUS/RTU: 1 to 123 When 0 is set, the maximum number of devices is 100. When a value other than the above is set, the maximum value in the setting range is applied. When GS570.b1 stores 1, [10] is not used; therefore, the setting for GS576 is invalid.

Point

• Function codes supported by the GOT

For details on the function codes supported by the GOT, refer to the following.

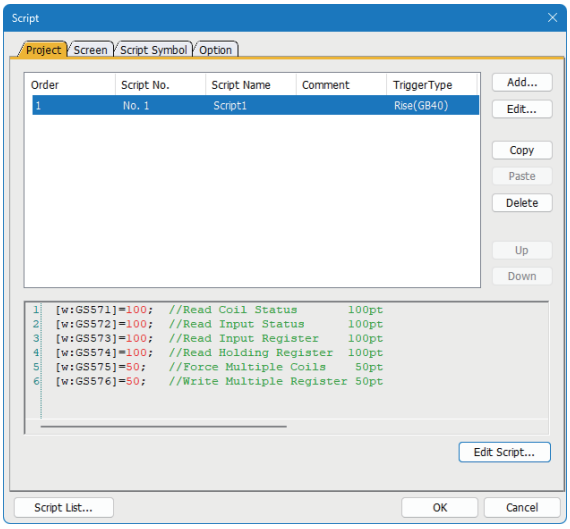
☞ Page 3568 Function code ([MODBUS Server(GOT:Client)])

• Setting MODBUS Communication Control Function

Set the MODBUS Communication Control Function at the GOT startup with the project script or others.

Do not change the setting after the communication starts.

The communication error may occur.



Setting example of project script

■Channel Setting of MODBUS Communication Control Function (GS579)

The MODBUS Communication Control Function setting can be selected for each channel.

When all bits of GS579 are off, all channels operate with the values of the common settings (GS570 to GS576).

☞ Page 3652 MODBUS Communication Control Function (GS570 to GS576, GS590 to GS596, GS597 to GS603, GS604 to GS610, GS611 to GS617)

• b0: The MODBUS Communication Control Function for CH1 can be selected.

Turning on this bit applies the MODBUS Communication Control Function (CH1) (GS590 to GS596).

Turning off this bit applies the MODBUS Communication Control Function (Common) (GS570 to GS576).

• b1: The MODBUS Communication Control Function for CH2 can be selected.

Turning on this bit applies the MODBUS Communication Control Function (CH2) (GS597 to GS603).

Turning off this bit applies the MODBUS Communication Control Function (Common) (GS570 to GS576).

• b2: The MODBUS Communication Control Function for CH3 can be selected.

Turning on this bit applies the MODBUS Communication Control Function (CH3) (GS604 to GS610).

Turning off this bit applies the MODBUS Communication Control Function (Common) (GS570 to GS576).

• b3: The MODBUS Communication Control Function for CH4 can be selected.

Turning on this bit applies the MODBUS Communication Control Function (CH4) (GS611 to GS617).

Turning off this bit applies the MODBUS Communication Control Function (Common) (GS570 to GS576).

• b4 to b15: Use prohibited

■Microcomputer Connection Extended Setting (CH1 to CH4) (GS580 to GS583)

• b0 to b70: Use prohibited

• b8: For the microcomputer connection (Ethernet), when the bit turns on, if the data format of the message format is Format 3 or 4, communication packets are fully compatible with those of the GOT-F900 series microcomputer connection.

(ON: Fully compatible, OFF: Partly compatible)

For details on the message format of the microcomputer connection (Ethernet), refer to the following.

GOT3000 Series User's Manual (Connection)

• b9 to b15: Use prohibited

■CC-Link IE TSN Control (GS620)

- b0: When the bit is turned on, the firmware update of the CC-Link IE TSN communication unit is prohibited.
- b1 to b15: Use prohibited

■Operator Management Common Control (GS621)

Controls the operator information management.

- b0: Turning on this bit inactivates the delete button on the operator management screen. This disables deletion of the existing operator information.

If the GOT has operator information that does not exist in the operator management file to be imported, the GOT retains its operator information.

When the operator name or operator ID to be imported is the same as that of the import destination, the operator information is not imported.

- b1: Turning on this bit inactivates the edit button on the operator management screen. This disables editing of the operator information when an inactivated operator is selected.

If both b0 and b1 are on, the inactivated operator information is not updated when an operator management information file is imported.

- b2: Turning on this bit inactivates the import button on the operator management screen.
- b3 to b15: Use prohibited

■System Screen Operation Restriction (GS622)

Restricts operation on the screens in the [Data mng.] tab of the utility.

This device is applied when the target screen is displayed.

Even if the signal is turned on or off while the target screen is displayed, restrictions cannot be switched.

- b0: Turning on this bit restricts access to the specified drives on the [Alarm info.], [Image file], [Recipe Information], [Logging info.], [Operation Log Information], and [SD card format] screens of the utility.

Use GS623 or GS624 to specify the drives to which access is restricted.

- b1: Turning on this bit restricts the display of the [Package management] and [GOT data package acquisition] screens.

When the target screen is selected in the [Data mng.] tab, an error dialog appears.

- b2: Turning on this bit restricts the display of the [NVRAM management] screen.

When the [NVRAM management] screen is selected in the [Data mng.] tab, an error dialog appears.

- b3 to b15: Use prohibited

For details on the utility screens, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

For the available drives by GOT model, refer to the following.

☞ Page 81 Drive configuration and capacity of the GOT

■Specify Drive to Prohibit Write Operation (System Screen) (GS623)

Prohibits writing to the specified drives when GS622.b0 is on.

On an access-restricted screen, if you display the contents of a drive to which writing is prohibited, the buttons relevant to writing become inactive.

If you perform conversion, copying, or moving of data to the drive to which writing is prohibited, the attempt fails and an error dialog appears.

This device is applied when the target screen is displayed.

Even if the signal is turned on or off while the target screen is displayed, restrictions cannot be switched.

- b0: Turning on this bit prohibits writing to all drives.
- b1: Turning on this bit prohibits writing to drive A.
- b2: Turning on this bit prohibits writing to drive B.
- b3: Turning on this bit prohibits writing to drive E.
- b4: Turning on this bit prohibits writing to drive F.
- b5: Turning on this bit prohibits writing to drive G.
- b6: Turning on this bit prohibits writing to drive N.
- b7 to b15: Use prohibited

■Specify Drive to Hide (System Screen) (GS624)

Restricts access to specified drives when GS622.b0 is on.

If you perform conversion, copying, or moving of data to the drive to which access is restricted, the attempt fails and an error dialog appears.

This device is applied when the target screen is displayed.

Even if the signal is turned on or off while the target screen is displayed, restrictions cannot be switched.

- b0: Turning on this bit restricts access to all drives.

The screen itself is hidden because there are no operations that can be performed on the target screen.

- b1: Turning on this bit restricts access to drive A.
- b2: Turning on this bit restricts access to drive B.
- b3: Turning on this bit restricts access to drive E.
- b4: Turning on this bit restricts access to drive F.
- b5: Turning on this bit restricts access to drive G.
- b6: Turning on this bit restricts access to drive N.
- b7 to b15: Use prohibited

■Touch Position Color Acquisition Ready Signal (GS630)

- b0: Turning on the bit makes the GOT ready for acquiring the color information at the touched position on the GOT screen.

In this status, even when an object or others is touched, the object or others does not function.

Turning off the bit without acquiring the color information cancels the status.

- b1 to b15: Use prohibited

■Date Format Control (GS632)

Controls the date format used for the operation log information of the utility by turning b0 and b1 on or off.

This is available for the [Operation Log Data List] screen.

This is also available for the dialogs displayed from the [Operation Log Data List] screen.

The specified data format is applied to the [Operation Log Data List] screen when the screen is displayed.

GS632.b0	GS632.b1	Date format
OFF	OFF	Not controlled (Date format of the system language)
ON	OFF	Year, month, day
OFF	ON	Month, day, year
ON	ON	Day, month, year

■Specify Notification While Monitoring Stopped (GS633)

This device is available only when an overlap window is output to the display using the video output function.

Specify the display when the GOT screen transitions to a screen dedicated to the utility or add-on function while using the video output function.

- 0: Displays the monitoring stopped message in the center of the screen.

This message does not appear if the size of the overlap window to be output to the display is less than 190 dots × 56 dots.

- 1. Displays the screen specified using GS634.

The monitoring stopped message appears in the center of the screen when: 0 is specified for the screen number, the screen having the specified number does not exist, or the screen security level is insufficient.

- 2: Retains the screen on the display without notifying monitoring stopped.

When 3 or greater value is input, the value is handled as 0.

■Specify Screen No. to be Displayed While Monitoring Stopped (GS634)

Specify the screen number of the window to be displayed when GS633 is 1.

Only figures can be displayed on the window screen while monitoring is stopped.

■Base Screen Size Expansion Common Control (GS635)

- b0: Turning on this bit displays the specified area on the GOT when a base screen switched to an expanded screen.

To specify the upper-left coordinates of the area to be in view, use GS636 and GS637.

- b1: Turning on this bit disables swiping to scroll the screen.
- b2 to b15: Use prohibited

■Specify Expanded Base Screen Position (GS636, GS637)

Specify the upper-left coordinates of the area to be in view, when the screen is switched to an expanded base screen.

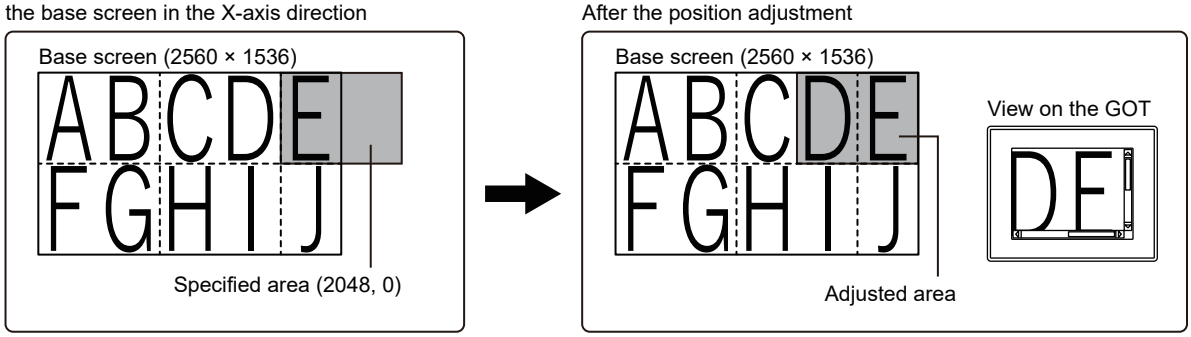
- GS636: X coordinate
- GS637: Y coordinate

If the specified area extends off the base screen, the area is adjusted to fit within the base screen.

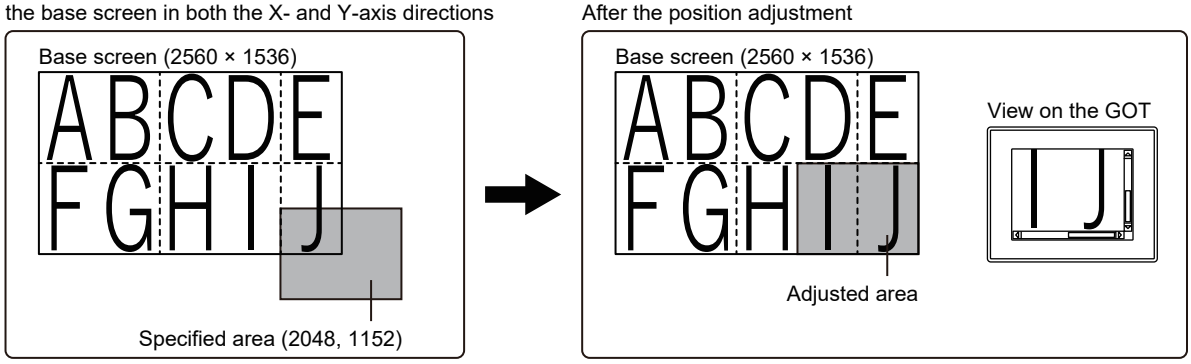
Ex.

Displaying an expanded base screen (2560 × 1536) on GT37-X (1024 × 768)

When the specified area extends off the base screen in the X-axis direction



When the specified area extends off the base screen in both the X- and Y-axis directions



■GOT Reset Control (GS639)

- b0 to b13: Use prohibited
- b14: When the bit is turned on, all the GOT functions exit. (The GOT power can be turned off safely.)
- b15: When the bit is turned on, the software reset for the GOT is performed at the rising edge timing.

Read devices (GS1792 to GS2567)

■VNC Server Function Control (GS1792)

This control is disabled when the GOT network interaction function is used.

- b0: When the bit is turned on, the device disables communication from the VNC client.
- b1: When the bit is turned on, the device disables operations from the VNC client.
- b2 to b7: Use prohibited
- b8: When the bit is turned on, the authorization guarantee time for the VNC server function is disabled.
- b9 to b15: Use prohibited

■Gesture Common Control (GS1794)

Controls gesture operations.

- b0: When the bit turns on, the object gesture function becomes disabled.

The single touch operation of the object remains enabled.

- b1: When the bit turns on, the single touch operation of the object becomes disabled.

The object gesture function remains enabled.

- b2 to b15: Use prohibited

■Authorization Status Control (GS1795)

Controls the authorization of the GOT network interaction function.

This device operates on each GOT in the control group.

- b0: When this bit turns on, the automatic acquisition of the operation right becomes disabled.

On a device without operation right, even if you switch a screen to another screen in which the authorization control is enabled, the device cannot automatically obtain the operation right.

- b1 to b15: Use prohibited

■Authorization Management Control (GS1796)

Controls the authorization of the GOT network interaction function.

These devices are activated on the master GOT.

- b0: When this bit turns on, devices except the master GOT are prohibited from obtaining the authorization.

The device with the operation right (other than the master GOT) will release the operation right.

When the bit is used in combination with b1, the operation right can be released during the authorization guarantee time.

- b1: When this bit turns on, the authorization guarantee time becomes invalid.
- b2: When this bit turns on, all devices including the master GOT are prohibited from obtaining the authorization.

The device with the operation right will release the operation right.

When the bit is used in combination with b1, the operation right can be released during the authorization guarantee time.

- b3 to b15: Use prohibited

■VNC Server GOT Processing Balance Control (GS1798)

Set the load balance between processing of the VNC server function and processing of the other functions on the GOT, regardless of whether or not the GOT is connected with the VNC client.

- b0: Turning on this bit prioritizes processing of the functions in the GOT.

The delay in internal processing due to the VNC server function is reduced.

- b1: Turning on this bit applies standard balance between processing of the VNC server function and processing of the other functions in the GOT.
- b2: Turning on this bit prioritizes processing of the VNC server function.

The speed of remote screen refresh is higher than that when b0 or b1 is on.

- b3: Turning on this bit prioritizes processing of the VNC server function.

The priority on the processing of the VNC function and the speed of remote screen refresh are higher than those when b2 is on.

- b4: Turning on this bit prioritizes processing of the VNC server function.

The priority on the processing of the VNC function and the speed of remote screen refresh are higher than those when b3 is on.

- b5 to b15: Use prohibited

When multiple bits are turned on, the bit having the smallest number is prioritized.

When all the bits are off, the GOT operates according to the setting of [GOT processing balance when VNC server is in operation].

☞ Page 2650 [VNC Server] dialog

■Recipe Control (GS1800)

- b0 to b1: Use prohibited
- b2: When this bit is turned on, the recipe special control is executed.
- b3 to b13: Use prohibited
- b14: When this bit is turned on, the Operation Completed signal (GS1010.b14) and the Operation Error signal (GS1010.b15) turn off.

☞ Page 3612 Recipe Status (GS1010)

- b15: Use prohibited

■Recipe Special Control Action (GS1801)

Specify the control action. The action varies with the stored value.

0: Resets the Recipe Special Control Result device (GS1011) and the Recipe Special Control No. device (GS1012) to 0.

1: Reads a record from the target recipe data into GOT data registers (GD).

2: Overwrites the values of a record in the target recipe data with the values of GOT data registers (GD).

4: Outputs recipe information to GOT data registers (GD).

5: Searches the target recipe data based on the values of GOT data registers (GD).

■Recipe Special Control Target Type (GS1802)

Specify the target of the recipe special control.

- b0: When this bit is turned on, record information (record number, record attribute, and record name) is set as the control target.
- b1: When this bit is turned on, the update date and time of a record is set as the control target.
- b2: When this bit is turned on, the device values of a record are set as the control target.
- b3: When this bit is turned on, device comments are set as the control target.
- b4 to b15: Use prohibited

■Recipe Special Control Start GD Device No. (GS1803)

Specify the start device number of the GOT internal devices (GD) to be used.

■Recipe Special Control Recipe No. (GS1805)

Specify the recipe number of a target recipe setting.

■Recipe Special Control Record No. (GS1806)

Specify the record number of a target record.

■Recipe Special Control Row No. (GS1807)

Specify the start row of a record as necessary.

Subtract 1 from a target row number, and then set the result.

Example 1) To specify row number 1, set 0.

Example 2) To specify row number 65536, set 65535.

■Recipe Special Control Points (GS1808)

Specify the number of target rows of a record as necessary.

Starting from the row specified with GS1807, the specified number of rows are targeted for the recipe special control.

■Recipe Display (Record List) Control (GS1809)

- b0: Turning on this bit hides the confirmation or notification dialog that appears during a record manipulation after this bit is turned on.

So, you can skip the confirmation step.

The manipulation result is notified by GS1015 and GS1016.

☞ Page 3613 Recipe Display (Record List) Target Record No. (GS1015)

☞ Page 3613 Recipe Display (Record List) Record Manipulation Result (GS1016)

- b1 to b14: Use prohibited
- b15: When this bit is turned on, GS1016 turns off.

This bit is invalid when the recipe display (record list) is not displayed.
When the recipe display (record list) is displayed while this bit is on, GS1016 turns off.

■Special Function Switch Special Control (GS1810)

• b0: Turning on this bit enables the iQSS utility special control function.

While this signal is on, press the special function switch for which [iQSS Utility] is selected for [Switch Action] to execute the iQSS utility special control.

• b1 to b15: Use prohibited

For details on the iQSS utility special control function, refer to the following.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

For the special function switch settings, refer to the following.

☞ Page 1243 Settings for [iQSS Utility]

■iQSS Utility Special Control Start GD Device No. Specification (GS1811)

Specify the start device number of the GD devices used for the iQSS utility special control.

Setting range: 0 to 65529 Data type: Unsigned binary

Parameters are stored in seven GD devices from the start device specified using this device.

The following shows the structure of the parameters to be stored.

Example) When GD1000 is set as the start device

Storage destination device (GD)	Parameter
GD1000	Sensor device No.: 0 to 65534
GD1001	When connected to an RCPU, QCPU, or LCPU Start XY address: 0x0000 to 0x0FE0 When connected to an FX5CPU Intelligent module No.: 0x01 to 0x10
GD1002	For the bit remote module Device address: 0 to 254 The device stores 0 when any value from 255 to 65535 is set. For the word remote module Device address: 0 to 510 The device stores 0 when any value from 511 to 65535 is set.
GD1003	Device I/O type • 0: Bit input • 64: Bit output • 128: Bit input/output • 256: Word input • 320: Word output • 384: Word input/output
GD1004	Screen to be displayed • 00: Monitor screen • 01: Parameter information screen b0 and b1 are used as parameters.
GD1005	Error code of the ASLINK remote module: 100 to 65535 For details on the error codes, refer to the following manual. 📖AnyWireASLINK Master Module User's Manual
GD1006	Error codes used for the iQSS utility special control function • 0: Normal startup • 1: Target network module not found • 2: Target CPU not found • 3: Information read error • 4: Target sensor device not found • 5: Profile not found • 6: Address/station number duplicated • 7: Incorrect profile

■iQSS Utility Special Control Number of Parameters (GS1812)

Specify the number of sensor devices used for the iQSS utility special control.

The data type is unsigned 16-bit binary.

Example) When setting 500 to GS1811 and 2 to GS1812

• GD500 to GD506: Parameters to start the first sensor device are stored.

• GD507 to GD513: Parameters to start the second sensor device are stored.

■SD Card Access Switch Status Control (GS1820)

• b0: When the bit is turned on, the control for GS1820.b1 is enabled.

When the bit is turned off, the control for GS1820.b1 is disabled.

• b1: When the bit is turned on, the access to the SD card is allowed.

• b2 to b15: Use prohibited

■USB Drive Common Control (GS1824)

• b0: When the bit is turned on, the USB memory connected to drive E on the GOT can be removed.

• b1: When the bit is turned on, the USB memory connected to drive F on the GOT can be removed.

• b2: When the bit is turned on, the USB memory connected to drive B on the GOT can be removed.

• b3: When the bit is turned on, the USB memory connected to drive G on the GOT can be removed.

• b4: When the bit is turned on, the USB memory connected to drive E on the GOT can be removed.

• b5: When the bit is turned on, the USB memory connected to drive F on the GOT can be removed.

• b6: When the bit is turned on, the USB memory connected to drive B on the GOT can be removed.

• b7: When the bit is turned on, the USB memory connected to drive G on the GOT can be removed.

• b8 to b15: Use prohibited

For the available drives by GOT model, refer to the following.

☞ Page 81 Drive configuration and capacity of the GOT

■Label Name Resolution Control (GS1880)

• b0: Use prohibited

• b1: When this bit is turned on, the label name resolution is performed.

• b2: While this bit is on, executing the label name resolution resolves the label names that have been unresolved in the past resolution during the PLC initial processing.

This operation does not resolve the unresolved label names resulting from the nonexistence of the relevant labels on the PLC side, and system alarm 328 occurs. Accordingly, you can find out which cause is responsible for the unresolved label names.

☞ Page 918 Precautions for the label name resolution

• b3 to b15: Use prohibited

For details on how to use the bits, refer to the following.

☞ Page 916 Manually performing the label name resolution

■GOT Mobile File Operation Security Level (GS1892)

Specify a security level with which file manipulations are allowed in the GOT Mobile function, ranging from 0 to 15.

If an invalid value is specified, 0 is assumed.

If 0 is specified, file manipulations are allowed without operator authentication and level authentication.

■GOT Mobile Common Control (GS1896)

Specify the behavior of the GOT Mobile function.

• b0: When this bit is turned on, the URL parameter (initscreen) is enabled.

☞ Page 2753 Mobile screen

• b1: When this bit is turned on, file manipulations with the file manager are enabled.

When the GOT is in security mode 2, this signal is always off.

• b2: When this bit is turned on, the addition of X-Frame-Options to the HTTP response header is disabled.

• b3 to b15: Use prohibited

■Time to Force Mobile Momentary Switch OFF (GS1899)

Set the time from when communication is lost between the GOT and a client until when the GOT forcibly turns off the touch switch being touched on the client.

If a touch switch is released on a client after the client loses communication with the GOT, the GOT does not recognize the release.

After a specified time (default: 3 seconds) elapses, the GOT forcibly turns off the touch switch.

The following shows the setting range.

Device value	Type of Ethernet setting to be changed
0 to 2, 31 or more	3000 ms (3 seconds)

Device value	Type of Ethernet setting to be changed
3 to 30	300 ms to 3000 ms (Settable in units of 100 ms)

■GOT Ethernet Setting Change (GS1900 to GS1908)

Change the GOT Ethernet setting without using the utility.

Point

Precautions for changing the Ethernet setting

Make sure to restart the GOT after you change the Ethernet setting by using the GOT Ethernet Setting Change devices (GS1900 to GS1908).

Even though the new Ethernet setting is displayed in the utility, the GOT does not operates with the new setting until you restart the GOT.

The following shows the procedure for changing the Ethernet setting.

1. Specify the category of an Ethernet setting item by using the GOT Ethernet Setting Change Category device (GS1900).

☞ Page 3662 GOT Ethernet Setting Change Category (GS1900)

2. Store a new value to the New GOT Ethernet Setting device (GS1903 to GS1908) that corresponds to the Ethernet setting item to be changed.

☞ Page 3663 New GOT Ethernet Setting (GS1903 to GS1908)

3. Turn on the relevant bit of the GOT Ethernet Setting Change Item device (GS1902) that corresponds to the New GOT Ethernet Setting device storing the new value.

☞ Page 3662 GOT Ethernet Setting Change Item (GS1902)

4. Turn on the Execute GOT Ethernet Setting Change signal (GS1901.b0) to execute the Ethernet setting change.

☞ Page 3662 Execute GOT Ethernet Setting Change (GS1901)

5. After the setting change has completed, the GOT Ethernet Setting Change Completed signal (GS1500.b1) and the GOT Ethernet Setting Changed signal (GS1500.b2) turn on.

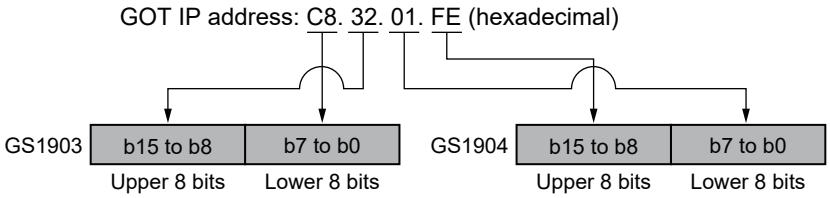
☞ Page 3620 GOT Ethernet Setting Change Status (GS1500)

Restart the GOT.

Ex.

When changing the GOT IP address for Ethernet port 1 to 200.50.1.254 (decimal)

1. Store 1 to GS1900.
2. Store new values to GS1903 and GS1904 as shown below.



3. Turn on GS1902.b0.
4. Turn on GS1901.b0 to execute the Ethernet setting change.
5. After the setting change has completed, GS1500.b1 and GS1500.b2 turn on.

Restart the GOT.

For details on the devices (GS1900 to GS1908) used to change the GOT Ethernet settings, refer to the following.

☞ Page 3662 GOT Ethernet Setting Change Category (GS1900)
☞ Page 3662 Execute GOT Ethernet Setting Change (GS1901)
☞ Page 3662 GOT Ethernet Setting Change Item (GS1902)
☞ Page 3663 New GOT Ethernet Setting (GS1903 to GS1908)

■GOT Ethernet Setting Change Category (GS1900)

The following shows the correspondence between the setting values and the categorized Ethernet setting items.

Setting value	Type of Ethernet setting to be changed
1	• GOT IP address for Ethernet port 1 • Subnet mask for Ethernet port 1 • Default gateway
2	• Channel number • Host station • GOT network number • GOT station number
3	• Not used
4	• GOT IP address for Ethernet port 2 • Subnet mask for Ethernet port 2 • Setting to disable Ethernet port 2
5	• Channel number • Setting number in the connected Ethernet controller setting • Network number for a controller
6	• Channel number • Setting number in the connected Ethernet controller setting • Station number of a controller
7	• Channel number • Setting number in the connected Ethernet controller setting • IP address of a controller

■Execute GOT Ethernet Setting Change (GS1901)

- b0: Turning on the bit executes the Ethernet setting change. The item to be changed is specified by using the GOT Ethernet Setting Change Category device (GS1900) and the GOT Ethernet Setting Change Item device (GS1902).
- b1 to b15: Use prohibited

■GOT Ethernet Setting Change Item (GS1902)

Set an Ethernet setting item to be changed. The category of the item is specified by using the GOT Ethernet Setting Change Category device (GS1900).

- b0 to b4: Turning on the bit sets the corresponding Ethernet setting item to be changed.

The following shows the correspondence between the bits and the Ethernet setting items.

GS1900 setting value: 1 to 4

GS1902	Ethernet setting to be changed (setting value of GS1900)			
	1	2	3	4
b0	GOT IP address for Ethernet port 1	Channel number	Use prohibited	GOT IP address for Ethernet port 2
b1	Use prohibited	Host station	Use prohibited	Use prohibited
b2	Subnet mask for Ethernet port 1	GOT network number	Use prohibited	Subnet mask for Ethernet port 2
b3	Use prohibited	GOT station number	Use prohibited	Use prohibited
b4	Default gateway	Use prohibited		Setting to disable Ethernet port 2

GS1900 setting value: 5 to 7

GS1902	Ethernet setting to be changed (setting value of GS1900)		
	5	6	7
b0	Channel number	Channel number	Channel number
b1	Setting number in the connected Ethernet controller setting	Setting number in the connected Ethernet controller setting	Setting number in the connected Ethernet controller setting
b2	Network number for a controller	Station number of a controller	IP address of a controller
b3	Use prohibited		
b4			

- b5 to b15: Use prohibited

■New GOT Ethernet Setting (GS1903 to GS1908)

The device that corresponds to the Ethernet setting item to be changed stores a new value.

When the Execute GOT Ethernet Setting Change signal (GS1901.b0) is turned on, the Ethernet setting is updated with the new value.

The following shows the correspondence between the devices and the Ethernet setting items.

GS1900 setting value: 1 to 4

New GOT Ethernet setting	Ethernet setting (setting value of GS1900)			
	1	2	3	4
GS1903	GOT IP address for Ethernet port 1	Channel number	Use prohibited	GOT IP address for Ethernet port 2
GS1904		Host station		
GS1905	Subnet mask for Ethernet port 1	GOT network number	Use prohibited	Subnet mask for Ethernet port 2
GS1906		GOT station number		
GS1907	Default gateway	Use prohibited	Use prohibited	Setting to disable Ethernet port 2
GS1908				Use prohibited

GS1900 setting value: 5 to 7

New GOT Ethernet setting	Ethernet setting (setting value of GS1900)		
	5	6	7
GS1903	Channel number	Channel number	Channel number
GS1904	Setting number in the connected Ethernet controller setting	Setting number in the connected Ethernet controller setting	Setting number in the connected Ethernet controller setting
GS1905	Network number for a controller	Station number of a controller	IP address of a controller
GS1906	Use prohibited	Use prohibited	
GS1907	Use prohibited		
GS1908			

The following shows how to set a new value.

• When the GOT Ethernet Setting Change Category device (GS1900) stores 1

Set new values in hexadecimal for the following items.

◇GOT IP address for Ethernet port 1

◇Subnet mask for Ethernet port 1

◇Default gateway

• The following shows the setting range of each item. (Decimal)

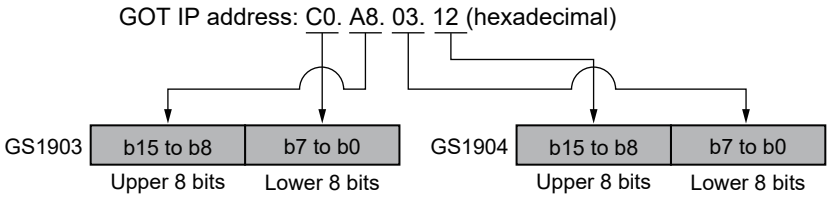
◇GOT IP address: 0.0.0.0 to 223.255.255.255

◇Subnet mask and default gateway: 0.0.0.0 to 255.255.255.255

If you do not use the subnet mask or default gateway, set the item to 0.0.0.0.

Ex.

When changing the GOT IP address for Ethernet port 1 to 192.168.3.18 (decimal)



• When the GOT Ethernet Setting Change Category device (GS1900) stores 2

◇Channel number

Set the channel number of a controller for which the host station, GOT network number, or GOT station number is changed.

The setting range is 1 to 4.

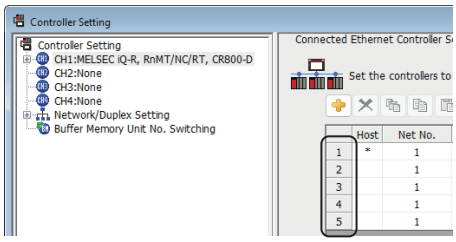
◇Host station, GOT network number, and GOT station number

Set the host station, GOT network number, or GOT station number for the controller connected to the specified channel.

The following shows the setting range of each item.

Host station: 1 to 128

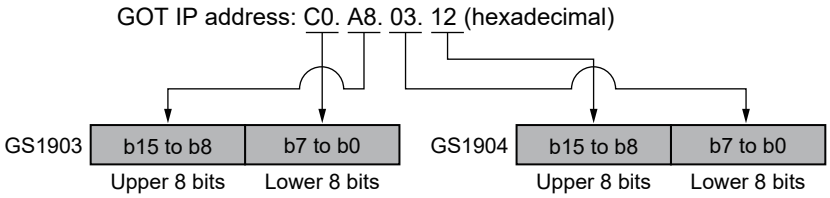
GOT network number: The setting range depends on the controller used.
GOT station number: The setting range depends on the controller used.
For details, refer to the following.
📖GOT3000 Series User's Manual (Connection)
To set the host station, specify a setting number existing in the connected Ethernet controller setting.



• When the GOT Ethernet Setting Change Category device (GS1900) stores 4

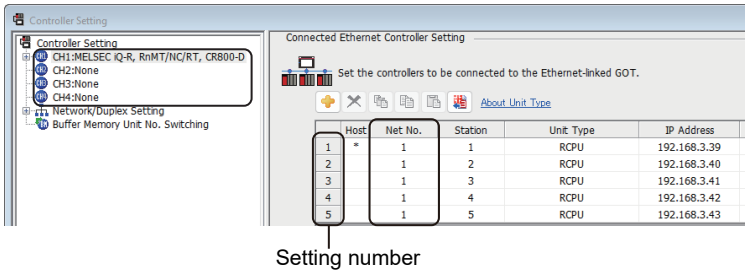
Set the GOT IP address or subnet mask for Ethernet port 2 in hexadecimal with GS1903 to GS1906.
The following shows the setting range of each item. (Decimal)
◇GOT IP address: 0.0.0.0 to 223.255.255.255
◇Subnet mask: 0.0.0.0 to 255.255.255.255
If you do not use the subnet mask, set the item to 0.0.0.0.

Ex.
When changing the GOT IP address to 192.168.4.20 (decimal)



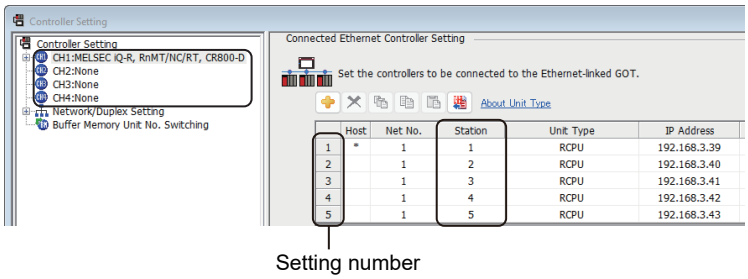
Set whether to enable or disable Ethernet port 2 with GS1907.
To disable Ethernet port 2, turn on GS1907.b0.

• When the GOT Ethernet Setting Change Category device (GS1900) stores 5



◇Channel number and the setting number in the connected Ethernet controller setting
Set the channel number and setting number of a controller for which the network number is changed.
The following shows the setting range of each item.
Channel number: 1 to 4
Setting number in the connected Ethernet controller setting: 1 to 128
◇Network number for a controller
Set the network number for a controller.
The setting range varies with the controller.
For details, refer to the following.
📖GOT3000 Series User's Manual (Connection)

• When the GOT Ethernet Setting Change Category device (GS1900) stores 6



◇Channel number and the setting number in the connected Ethernet controller setting

Set the channel number and setting number of a controller whose station number is changed.

The following shows the setting range of each item.

Channel number: 1 to 4

Setting number in the connected Ethernet controller setting: 1 to 128

◇Station number of the controller

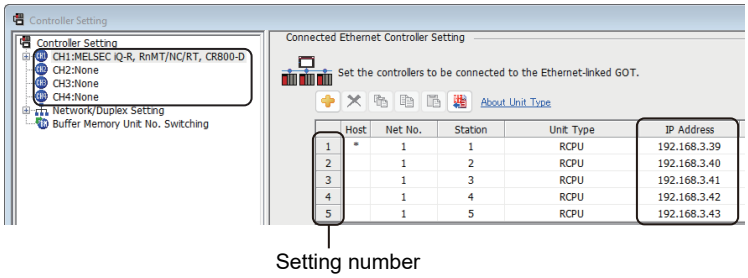
Set the station number of a controller.

The setting range varies with the controller.

For details, refer to the following.

GOT3000 Series User's Manual (Connection)

• When the GOT Ethernet Setting Change Category device (GS1900) stores 7



◇Channel number and the setting number in the connected Ethernet controller setting

Set the channel number and setting number of a controller whose IP address is changed.

The following shows the setting range of each item.

Channel number: 1 to 4

Setting number in the connected Ethernet controller setting: 1 to 128

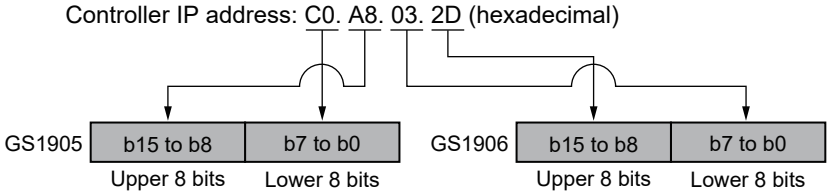
◇IP address of the controller

Set the IP address of a controller in hexadecimal.

The setting range is 0.0.0.0 to 223.255.255.255 (decimal).

Ex.

When changing the IP address of the controller to 192.168.3.45 (decimal)



■Full-screen Display Control signal (GS1998)

Specify the number of the video window to be displayed in full-screen size.

For the setting other than the following values, the operation is the same as when 0 is stored.

• 0: Does not provide full-screen display. (Displays each video window according to its setting.)

• 1 to 4: Displays the video window corresponding to the specified number in full-screen size.

• 5: Provides the full-screen display of the personal computer image.

■Video Window 1 to 4 and PC Image Extended Control signal (GS1999 to GS2006, GS2009 to GS2016, GS2019 to GS2026, GS2029 to GS2036, GS2039 to GS2045)

To display the video window or PC image screen on the GOT in full-screen mode or clip mode, configure the settings for video window 1 to 4 and the PC image screen.

The default display position of the video window or PC image screen is the upper left corner of the GOT screen.

Device					Function
Video window 1	Video window 2	Video window 3	Video window 4	PC image screen	
GS1999	GS2009	GS2019	GS2029	—	Specifies the channel number to be displayed on the video window. The setting value is fixed to 1. To display the channel number on the PC image screen, specify it using b15 of the [Digital Image Input Common] device. ☞ Page 2672 Settings of [Digital Image Input Common] device
GS2000	GS2010	GS2020	GS2030	GS2039	Specifies the display magnification of the video window or PC image screen. The display size (width and height) specified in the settings for the video windows and the personal computer image is the reference. • 8: 200% • 7: 400% • 0: 100% • 1: 87.5% • 2: 75% • 3: 62.5% • 4: 50% • 5: 37.5% • 6: 25% • Other than the above: 100%
GS2001	GS2011	GS2021	GS2031	GS2040	Specifies the display size (width) of the video window or PC image screen in dots. Specify a value within the range of the resolution for the maximum input signal or the GOT resolution, whichever is lower.
GS2002	GS2012	GS2022	GS2032	GS2041	Specifies the display size (height) of the video window or PC image screen in dots. Specify a value within the range of the resolution for the maximum input signal or the GOT resolution, whichever is lower.
GS2003	GS2013	GS2023	GS2033	GS2042	Specifies the display position (X-coordinate) of the video window or PC image screen in dots based on the upper left corner of the GOT screen. Specify a value within the range of the resolution for the maximum input signal or the GOT resolution, whichever is lower.
GS2004	GS2014	GS2024	GS2034	GS2043	Specifies the display position (Y-coordinate) of the video window or PC image screen in dots based on the upper left corner of the GOT screen. Specify a value within the range of the resolution for the maximum input signal or the GOT resolution, whichever is lower.
GS2005	GS2015	GS2025	GS2035	GS2044	Specifies the origin (X-coordinate) of the clip area of the input image using a value based on the coordinate for 100% display. Specify a value within the range of the resolution for the input image. The window size is a minimum width and height of 64 dots each. The window is resized based on the specified clip origin. For the input image, the clip area is determined by the width and height of the video window. Therefore, when the window is resized, its size on the GOT screen is adjusted according to the reduction ratio. Example) When the video window width and height are 100 and 100 and the window is displayed at 50%, the input image is displayed at a size of (50, 50) on the GOT screen.
GS2006	GS2016	GS2026	GS2036	GS2045	Specifies the origin (Y-coordinate) of the clip area of the input image using a value based on the coordinate for 100% display. Specify a value within the range of the resolution for the input image. The window size is a minimum width and height of 64 dots each. The window is resized based on the specified clip origin. For the input image, the clip area is determined by the width and height of the video window. Therefore, when the window is resized, its size on the GOT screen is adjusted according to the reduction ratio. For examples, refer to the descriptions on GS2005 to GS2044.

■Web Browser Control (GS2562)

Specifies the behavior of the web browser.

- b0: Turning on this bit hides the browser toolbar display switching button on the application toolbar.
- b1: Turning on this bit hides the browser toolbar.
- b2: Turning on this bit hides the click switching button on the application toolbar.
- b3: Turning on this bit hides the zoom in and out buttons on the application toolbar.
- b4 to b9: Use prohibited
- b10: Turning on this bit displays the web browser window in full screen mode. Turning off this bit displays the web browser window in window display mode.
- b11: Turning on this bit launches another web browser window when the displayed web browser window is closed.

When this bit is turned off, the dialog notifying that another web browser window cannot be launched when the displayed web browser window is closed.

- b12: Turning on this bit disables JavaScript of the web browser.
- b13: Use prohibited
- b14: Turning on this bit displays the [Logs] menu on the browser setting screen.

From the [Logs] menu, the log display screen for webpage designers can be displayed.

- b15: Turning on this bit enables the iframe history.

■OPC Server Function Control (GS2563)

Controls the connections between the OPC server and the clients.

- b0: Turning on this bit disconnects all clients.

■Special Control Function 2 During Specific Application Execution (GS2564)

Controls the functions that can be operated with the utility.

- b0: Turning on this bit allows manipulation and viewing of only G3P files in [Recipe information] of the utility.
- b1: Turning on this bit allows viewing of only G3L files in [Logging information] of the utility.
- b2: Turning on this bit allows viewing of only G3A files in [Alarm information] of the utility.

■VPN Operation Status Control (GS2565)

Controls the operation of SiteManager.

- b0: Turning on this bit starts the operation of (connection with) SiteManager.

Turning off this bit stops the operation of (disconnects) SiteManager.

■Transparent End Time (GS2567)

Specify the time from the last relay of communication data to the interruption of the FA transparent function in seconds.

After the FA transparent function is interrupted, the GOT monitors the changed controller according to its settings.

The setting range is 3 to 90.

If a value outside the range is specified, the operation is performed in 30 seconds. The set value is applied before the FA transparent function is started.

For information on the FA transparent function, refer to the following.

GOT3000 Series User's Manual (Connection)

■FTP Server Function Extend Command Control (GS2575)

Specify the response string for the SYST command when the FTP server function is used.

The following shows the response string for each set value.

Set value	String
0	GOT3000
1	Windows_NT

Appendix 2 Precautions for using CSV file

GT37 SoftGOT3000

This section describes precautions for using an imported/exported CSV file in GT Designer3.

How to save CSV files

To edit a CSV file in Microsoft Excel and use the file in GT Designer3, save the file in the CSV (comma delimited) file format (*.csv).

The file cannot be used if saved in the CSV UTF-8 (comma delimited) file format (*.csv).

Editing the exported file

If a device in use has a name starting with 0, the 0 may be deleted by a function to edit files such as spreadsheet software or other applications.

If a file is saved with the leading zero removed from a device name, the file cannot be imported normally.

When using a device whose name starts with 0, use a text editor or similar tool to edit the file.

Appendix 3 Precautions for using Unicode text file

GT37 SoftGOT3000

This section describes precautions for using a Unicode text file imported or exported in GT Designer3.

How to save Unicode text files

To edit and use a Unicode text file exported in GT Designer3, save the file in the Unicode text file format (*.txt).
The character code applicable to Unicode text files is Unicode (file format: UTF16 LittleEndian).

Displaying Unicode text files

To display Unicode text files on a personal computer and others, use software compatible with Unicode.
Software that is not compatible with the Unicode cannot display Unicode text files properly.

Displaying Unicode text files using Microsoft Excel

To open a Unicode text file that contains a comment of multiple lines by Microsoft Excel, drag the Unicode text file to the Microsoft Excel.
Methods other than above cannot display Unicode text files by Microsoft Excel properly.

A

Appendix 4 Specifications of resource data

GT37 SoftGOT3000

☞ Page 3670 Common specifications of CSV files and Unicode text files
☞ Page 3670 Size of the resource data file

Appendix 4.1 Common specifications of CSV files and Unicode text files

Binary files created using the following functions can be viewed on a personal computer when the files are converted to CSV files or Unicode text files.

- User alarm monitoring
- System alarm monitoring
- Logging
- Recipe
- Operation log

The following shows the specifications of the file formats.

File format	Specifications
CSV format (*.CSV)	• Character codes: ASCII and Shift JIS • Delimiter: Comma (,) Before converting a data file containing any character other than the ASCII and Shift JIS code characters to a CSV file, turn on GS522.b2. Then, the file is converted to a file with an extension of CSV in the following specifications, and the characters are correctly displayed. • Character codes: Unicode • Delimiter: Tab ☞ Page 3648 Special Control During Specific Function Execution (GS522)
Unicode text format (*.TXT)	• Character codes: Unicode • Delimiter: Tab

Appendix 4.2 Size of the resource data file

GT37 SoftGOT3000

Some functions of the GOT store the resource data into a data storage.

The following shows the expressions for calculating the size of the resource data to be stored into a data storage by each function.

The sizes determined by the expressions are approximate.

A determined size may be different from the actual size of the resource data.

☞ Page 3671 User alarm monitoring
☞ Page 3672 System alarm monitoring
☞ Page 3673 Logging
☞ Page 3674 Recipe

☞ Page 3678 Video file
☞ Page 3678 Label name resolution information

User alarm monitoring

■Binary file (*.G3A)

History mode	
144 + (A × 2) + (18 × B) + (20 × C) bytes	
A	Number of characters of the alarm name
B	Number of alarms
C	Number of stored events

Cumulative mode (when [Display the same alarm occurring multiple times as another item] is deselected)	
144 + (A × 2) + (48 × B) bytes	
A	Number of characters of the alarm name
B	Number of alarms

Cumulative mode (when [Display the same alarm occurring multiple times as another item] is selected)	
144 + (A × 2) + (26 × B) + (32 × C) bytes	
A	Number of characters of the alarm name
B	Number of alarms
C	Number of stored events

■CSV file

When counting the number of characters in an alarm name or the average number of characters in a comment, count a one-byte character as 0.5 character and a two-byte character as 1 character.

History mode	
422 + (A × 2) + (14 + B + C + D + (E × 2) + (F × 3) + G + H) × J bytes	
A	Number of characters of the alarm name
B	Number of digits of the upper comment number
C	Number of digits of the middle comment number
D	Number of digits of the basic alarm comment number
E	Average number of characters of comments
F	Length of the date and time string
G	Number of digits of the level
H	Number of digits of the group
J	Number of alarms

Cumulative mode	
457 + (A × 2) + (39 + B + C + D + (E × 2) + (F × 3) + G + H + J) × K bytes	
A	Number of characters of the alarm name
B	Number of digits of the upper comment number
C	Number of digits of the middle comment number
D	Number of digits of the basic alarm comment number
E	Average number of characters of comments
F	Length of the date and time string
G	Number of digits of the level
H	Number of digits of the group
J	Number of digits of the frequency of alarm occurrences
K	Number of alarms

■Unicode text file

Size of the CSV file × 2 bytes

System alarm monitoring

■Binary file (*.G3A)

(1) History mode (when [Get detailed alarm information] is deselected)	
128 + (24 × A) bytes	
A	Number of stored events

(2) History mode (when [Get detailed alarm information] is selected)	
128 + (52 × A) bytes	
A	Number of stored events

History mode (when [Record label/tag name at the time of alarm generation] is selected)	
((1) or (2)) + (((2 + (B × 2) rounded up to a multiple of 4) × A)	
A	Number of stored events
B	Number of characters to be recorded

■CSV file

When counting the average number of characters in a comment or the number of characters in a function name, count a one-byte character as 0.5 character and a two-byte character as 1 character.

447 + (20 + A + (B × 2) + C + D + E + F + G + H + J + (K × 2) + L) × M bytes	
A	Average number of alarm number characters
B	Average number of characters of comments
C	Length of the date and time string
D	Number of channel number characters
E	Number of network number, station number, and module number characters
F	Number of characters of the device name
G	Number of digits of the screen number
H	Number of digits of the definition screen number
J	Number of digits of the object ID
K	Number of characters of the function name
L	Number of characters of the drive name
M	Number of alarms

■Unicode text file

Size of the CSV file × 2 bytes

Logging

■Binary file (*.G3L)

152 + A + B + D + E + F + G bytes	
A*1	2 + 2 × Number of characters used in [Logging Name]
B*1	C × Total number of points set in each block in the [Device] tab
C*1	2 + 2 × Number of characters used in [Device Comment]
D*1	4 × Total number of points set in each block in the [Device] tab
E*1	12 × Number of blocks
F*1	4 × Number of blocks
G*1	H × Number of logs per file
H	4 + J + K
J*1	2 + ((L × 2) + 7) / 8
K*1	L × 2
L	M + N + P + Q + (R × 2) + (S × 4)
M	Total number of points for blocks with the following device type [Bit]
N	Total number of points for blocks with the following device type [Signed BIN8] or [Unsigned BIN8]
P	Total number of points for blocks with the following device type [Signed BIN16], [Unsigned BIN16], or [BCD16]
Q	Total number of points for blocks with the following device type [String]
R	Total number of points for blocks with the following device type [Signed BIN32], [Unsigned BIN32], [BCD32], or [Real(32bit)]
S	Total number of points for blocks with the following device type [Signed BIN64], [Unsigned BIN64], [BCD64], or [Real(64bit)]

*1 Rounded up to a multiple of 4.

■CSV file

215 + [N1] + [N2] × [N3] bytes		
[N1]	(A + 17) × B	
[N2]	20 + (C + 1) × B	
[N3]	Number of logs in the file	
A	Average number of characters of device comments	
B	Total number of device points set to the block	
C	Number of display digits	
	When the display format is real (exponential expression)	Number of display digits + 5
	When the display format is real (fixed decimal) and the number of decimal places is 0	Number of digits of the integer part (number of display digits)
	When the display format is real (fixed decimal) and the number of decimal places is 1 or more	Number of digits of the integer part (number of display digits) + 1 + Number of decimal places

■Unicode text file

Size of the CSV file × 2 bytes

Recipe

■Binary file (*.G3P)

216 +[N1] + [N2] + [N3] + [N4] bytes	
[N1]	16 × A
[N2]	4 × B
[N3]*1	(2 + (2 × C)) × B
[N4]*1	D × M
A	Value set for [Block Number] in the [Device] tab
B	Total number of points set in each block in the [Device] tab
C	Number of characters
D*1	80 + E × 2
E	F + G + H + J + (K × 2) + (L × 4)
F	Total number of points for blocks with the following device type [Bit]
G	Total number of points for blocks with the following device type [Signed BIN8] or [Unsigned BIN8]
H	Total number of points for blocks with the following device type [Signed BIN16], [Unsigned BIN16], or [BCD16]
J	Total number of points for blocks with the following device type [String]
K	Total number of points for blocks with the following device type [Signed BIN32], [Unsigned BIN32], [BCD32], or [Real(32bit)]
L	Total number of points for blocks with the following device type [Signed BIN64], [Unsigned BIN64], [BCD64], or [Real(64bit)]
M	Value set for [Record Number] in the [Device] tab

*1 Rounded up to a multiple of 4.

■CSV file

240 + [N1] + [N2] + [N3] bytes	
[N1]	Number of characters of the record name
[N2]	(A + B + C + D) × (18 + E)
[N3]	F × (25 + A × 2 + B × 7 + C × 12 + H × 2)
A	Number of bit device points
B	Number of word device points
C	Number of double-word device points
D	Number of blocks with the device type [String]
E	Number of characters of the device comment
F	Number of records When the recipe file is in CSV or Unicode text format, 1 is assumed regardless of the recipe settings.
H	Total number of words in devices (with the device type [String])

■Unicode text file

Size of the CSV file × 2 bytes

Operation log

■Binary file (*.G3O)

64 + ([N1] + [N2] + ... + [Nm]) bytes

"[N1] + [N2] + ... + [Nm]" indicates the total size of each log.

The following table shows the size per log for each log type.

Log type	Size (byte)	Log type	Size (byte)
GOT startup	Max. 88	Recipe display (record list): Record name change	Max. 396
GOT termination	12	Recipe display (record list): Read	Max. 328
GOT simple restart	12	Recipe display (record list): Write	Max. 328
GOT project restart	12	Recipe display (record list): Deletion	Max. 328
GOT restart by reset	12	Object script (trigger type [Key Code Input])	Max. 280
GOT offline mode transition	12	Operator authentication: Login successful	Max. 36
GOT background processing stop	12	Operator authentication: Login/re-login failed	Max. 36
GOT background processing restart	12	Operator authentication: Logout	Max. 36
Application switching	16	Operator authentication: Automatic logout	Max. 36
Application startup, exit	20	Operator authentication: Forced logout	Max. 36
Clock setting (External device to GOT)	16	Operator authentication: Operator switching successful	Max. 36
Clock setting (SNTP)	16	Operator authentication: Operator switching failed	Max. 36
Clock setting (GS)	16	Operator authentication: Password changed	Max. 36
Time zone change	24	Operator authentication: Password change failed	Max. 36
Displayed system language	Max. 48	Operator authentication: Operator account lock	Max. 32
Screen switching	Max. 84	Operator management: Started	Max. 40
Station number switching	16	Operator management: Start failed	Max. 40
Language switching	16	Operator management: End	Max. 40
Buffer memory unit number switching	16	Operator management operation: Save	Max. 36
Security level change (Device value change)	16	Operator management operation: Undo	Max. 36
SoftGOT-GOT link connection	6	Operator management operation: Import	Max. 196
SoftGOT-GOT link disconnection	16	Operator management operation: Export	Max. 196
SoftGOT-GOT link authorization transfer	20	Operator management changed (function settings): Authentication type	Max. 44
VNC server connection	16	Operator management changed (function settings): Automatic logout	Max. 44
VNC server disconnection	16	Operator management changed (function settings): Password expiration date	Max. 48
VNC server authorization transfer	20	Operator management changed (function settings): External authentication ID	Max. 48
Screen gesture	20	Operator management changed (function settings): Authentication prohibited	Max. 48
System language switching	Max. 72	Operator management changed (function settings): Operator account lock	Max. 44
Security level change (Password entry)	Max. 40	Operator management changed (function settings): Password requirements	Max. 48
Clock function (changed in the utility)	Max. 40	Operator management changed (function settings): Password history	Max. 44
Time zone change (in the utility)	Max. 48	Operator management changed (function settings): Sub administrator	Max. 44
GOT ID switching	Max. 40	Operator management changed (operator management): Addition of operator	Max. 64
Touch switch: Bit set	Max. 280	Operator management changed (operator management): Deletion of operator	Max. 64
Touch switch: Bit reset	Max. 280	Operator management changed (operator management): Editing of operator	Max. 68
Touch switch: Bit alternate	Max. 280	Operator management (at startup): New file creation	Max. 12
Touch switch: Bit momentary	Max. 280	Operator management (at startup): File corruption	Max. 12

Log type	Size (byte)	Log type	Size (byte)
Touch switch: Word set	Max. 288	Operator management (at startup): Corrupted file restoration	Max. 40
Touch switch: Application switching	Max. 256	Operator management (at startup): Abnormal end	Max. 40
Touch switch: Screen switching	Max. 260	Functional operation security	Max. 44
Touch switch: Station number switching	Max. 260	Numerical input: Base device	Max. 456
Touch switch: Auto repeat start	Max. 256	Numerical input: Option write device	Max. 276
Touch switch: Auto repeat end	Max. 260	Numerical input: Option write completion device	Max. 276
Touch switch: Screen gesture	Max. 256	Text input	Max. 1080
Touch switch: Recipe operation import	Max. 420	Text input: Option write completion device	Max. 276
Touch switch: Recipe operation export	Max. 420	Alarm display (list, history): User alarm deletion	Max. 256
Alarm display (list, history): Deletion of all the user alarms	Max. 256	GOT Mobile: Disconnection	20
Alarm display (list, history): System alarm deletion	Max. 256	GOT Mobile: Forced disconnection (Control information)	20
Alarm display (list, history): Deletion of all the system alarms	Max. 256	GOT Mobile: End of trial connection	20
Alarm display (list, history): System alarm reset	Max. 256	GOT Mobile: Abnormal disconnection due to a communication error	20
Alarm display (list, history): User alarm reset	Max. 288	GOT Mobile: Virtual device allocation	48
Slider control	Max. 336	Authorization management: Obtained	20
GOT Mobile: Connection established	Max. 295	Authorization management: Released	20
GOT Mobile: Trial connection established	Max. 295	Authorization use: Obtained	44
GOT Mobile: Connection authentication failed	Max. 295	Authorization use: Released	44
GOT Mobile: Number of clients exceeded the upper limit	Max. 295	Authorization use: Failed to obtain	44

■CSV file

248 + ([N1] + [N2] + ... + [Nm]) bytes

"[N1] + [N2] + ... + [Nm]" indicates the total size of each log.

The following table shows the size per log for each log type.

Log type	Size (byte)	Log type	Size (byte)
GOT startup	154	Text input: Option write completion device	152
GOT termination	93	Text input	588
GOT simple restart	103	User alarm (Deletion)	174
GOT project restart	112	User alarm (Deletion of all the user alarms)	176
GOT restart by reset	108	User alarm (Reset)	195
GOT offline mode transition	113	System alarm (Deletion)	174
GOT background processing stop	116	System alarm (Deletion of all the system alarms)	176
GOT background processing restart	118	System alarm (Reset)	195
Application switching	139	Slider control	151
Application start	128	Recipe display (record list): Record name change	180
Application termination	126	Recipe display (record list): Read	161
Time setting (External device)	182	Recipe display (record list): Write	161
Time setting (SNTP)	179	Recipe display (record list): Deletion	168
Time setting (GS)	176	Object script	218
Time zone change	125	Operator authentication: Login	119
System language switching (Device)	115	Operator authentication: Logout	119
Screen switching	193	Operator authentication: Login failed	123
Station number switching	129	Operator authentication: Automatic logout	128
Language switching	103	Operator authentication: Forced logout	128
Buffer memory unit number switching	118	Operator authentication: Operator switching successful	125
Level change (Device)	111	Operator authentication: Operator switching failed	127
VNC server connection	114	Operator authentication: Password changed	116
Screen gesture	114	Operator authentication: Password change failed	128
System language switching	171	Operator authentication: Operator account lock	117

Numerical input	228		
Numerical input (Write device)	221		
Numerical input (Write completion device)	227		

■Unicode text file

Size of the CSV file × 2 bytes

Hard copy

■BMP file

The file size depends on the resolution of the GOT.

GOT resolution	Size (byte)
Full HD (1920 × 1080)	6,220,854
WXGA (1280 × 800)	3,072,054
XGA (1024 × 768)	2,359,350
WVGA (800 × 480)	1,152,054
VGA (640 × 480)	921,654
WQVGA (480 × 272)	391,734

■JPEG file

The file size depends on the contents displayed on the GOT screen.

Video file

■Standard recording

For a video (H.264, common to VGA/HD/Full-HD, 1 Mbps, maximum 30 fps)

[1 file size] = [Recording time (seconds)] × (131,072 [bytes] + 960 [bytes]) + 1,118 [bytes]	
131,072 [bytes]	Size in bytes converted from 1 Mbps (1 × 1024 × 1024 ÷ 8)
960 [bytes]	30 [fps] × variable part size (32 [bytes]) of MP4 structure
1,118 [bytes]	Fixed part size of MP4 structure (video only)

Since the file size of compressed video is determined by the bit rate and frame rate, a common calculation formula applies to VGA, HD, and Full-HD, regardless of resolution. Although the frame rate may vary depending on the camera's image quality settings, it does not significantly affect the file size. Therefore, the calculation assumes a fixed maximum frame rate of 30 fps.

■Recording before and after the event

[1 file size] = [(Recording duration (seconds)] = [pre-event duration (seconds)] + [post-event duration (seconds)]) × 132,032 [bytes] + 1,118 [bytes]

■Long-duration recording

A common calculation formula applies to VGA, HD, and Full-HD.

For long-duration recording, each file is calculated based on 7.5 minutes.

[Total video file size] = [Total number of files] × (132,032 [bytes] × 450 [seconds] (7.5 minutes) + 1,118 [bytes])	
[Total number of files]	(Drawing recording time [minutes] ÷ 7.5 [minutes]) + 1 (rounded down to the nearest decimal point)

Label name resolution information

■Batch method

32 + (36 × A) + (68 × B) bytes	
A	Number of connections
B	Total number of labels for each connection

■Split method

32 + (36 × A) + (68 × B) + C bytes	
A	Number of connections
B	Total number of labels for each connection
C	8 + (20 × Maximum number of blocks) × (A + 1)

Appendix 5 Specifications and operations of the nonvolatile RAM user area

GT37 SoftGOT3000

Some functions of the GOT use the non-volatile RAM user area.

This chapter describes the following.

☞ Page 3679 Functions that use the non-volatile RAM user area

☞ Page 3679 Size of data stored in the non-volatile RAM user area (byte)

☞ Page 3681 Operations performed on the nonvolatile RAM user area

Appendix 5.1 Functions that use the non-volatile RAM user area

GT37 SoftGOT3000

The following functions save data to the non-volatile RAM user area.

Applicable function	Number of settings	Capacity
User alarm monitoring	Max. 10	500 KB (total)
System alarm monitoring	Max. 1	
Logging	Max. 20	
Recipe	Max. 20	
Internal device retention	Max. 1	

Appendix 5.2 Size of data stored in the non-volatile RAM user area (byte)

GT37 SoftGOT3000

The following shows the expressions for calculating the size of the non-volatile RAM user area used by each function.

The sizes determined by the expressions are approximate and may differ from the actual sizes.

Check the actual sizes in the following setting dialogs.

Page where the formula is described	Setting dialog

☞ Page 3680 Recipe	☞ Page 2311 [Recipe] dialog
☞ Page 3681 Internal device retention	—

User alarm monitoring

((1) rounded up to a multiple of 64) × 2

The formula assigned to (1) differs depending on the mode as listed below.

Mode		Formula assigned to (1)
Occurring mode		256 + (16 × Number of monitored alarms)
History mode		256 + (20 × Number of histories) + [(2 × Number of monitored alarms) rounded up to a multiple of 4]
Cumulative mode	When [Display the same alarm occurring multiple times as another item] is deselected	256 + (32 × Number of monitored alarms)
	When [Display the same alarm occurring multiple times as another item] is selected	256 + (32 × Number of histories) + [(10 × Number of monitored alarms) rounded up to a multiple of 4] + [(2 × Number of monitored alarms) rounded up to a multiple of 4]

System alarm monitoring

((1) rounded up to a multiple of 64) × 2

The formula assigned to (1) differs depending on the mode as listed below.

Mode		Formula assigned to (1)
Occurring mode	When [Get detailed alarm information] is deselected	256 + (20 × Number of histories)
	When [Get detailed alarm information] is selected	256 + (48 × Number of histories)
History mode	When [Get detailed alarm information] is deselected	256 + (24 × Number of histories)
	When [Get detailed alarm information] is selected	256 + (52 × Number of histories)

■When [Record label/tag name at the time of alarm generation] is selected

The formula assigned to (1) differs depending on the mode.

Refer to the above table.

(1) + ((2 + (number of characters to be recorded × 2)) rounded up to a multiple of 4) × number of histories

Logging

[192 + A × E + (4 × F)] rounded up to a multiple of 64

The following table explains the alphabets used in the formula.

Alphabet		Description
A		Log size for one item = [(6 + B ÷ 4) rounded up to a multiple of 4] + [(B × 2) rounded up to a multiple of 4]
B	—	Total number of collection target device points (16-bit conversion) = (C × 2) + D
	C	Total number of 32-bit device points = Total number of points with the device types [Signed BIN32], [Unsigned BIN32], and [BCD32]
	D	Device other than C = Total number of points with the device types [Bit], [Signed BIN16], [Unsigned BIN16], [BCD16], and [String]
	E	Number of stored logs
F		Number of blocks

Recipe

256 + (16 × A) + (B × G)

The following table explains the alphabets used in the formula.

Alphabet		Description
A		[Block Number] in the [Device] tab
B	—	Size of one record = 80 + ((C + D + E + (F × 2)) × 2)
	C	Total number of bit device points = Total number of points for blocks with the device type [Bit]
	D	Total number of 16-bit device points = Total number of points for blocks with the device types [Signed BIN16], [Unsigned BIN16], and [BCD16]
	E	Total number of string points = Total number of points for with the device type [String]
	F	Total number of 32-bit device points = Total number of blocks with the device types [Signed BIN32], [Unsigned BIN32], [BCD32], and [Real(32bit)]
G		[Record Number] in the [Device] tab

Internal device retention

(192 + ("A" rounded up to a multiple of 64)) × 2

The following table explains the alphabets used in the formula.

Alphabet		Description
A		44 + B + D
B	—	GD setting = 32 + (2 × C)
	C	Number of GOT data registers (GD) If the GD devices are not set (number of points is 0), B is not added.
D	—	GB setting = 32 + 4 × ((E ÷ 32) - (F ÷ 32) + 1) In the result of (E / 32) and (F / 32), the numbers after the decimal point are omitted.
	E	Last device number = F + G - 1 If the GB devices are not set (number of points is 0), D is not added.
	F	Start device number of the GOT bit registers (GB)
	G	Number of GOT bit registers (GB)

Appendix 5.3 Operations performed on the nonvolatile RAM user area

☞ Page 3681 Data deletion in the nonvolatile RAM user area
☞ Page 3681 Backing up the data stored in the nonvolatile RAM user area
☞ Page 3681 Influence when changing the nonvolatile RAM user area afterward

Data deletion in the nonvolatile RAM user area

The data saved in the nonvolatile RAM user area is deleted under the following conditions.

- Project data or a system application is written with [Initialize nonvolatile RAM user area at the time of writing project] selected in the [Communicate with GOT] dialog.
- The nonvolatile RAM user area is initialized by using [NVRAM management] in the utility.
- The clear trigger device set in [Buffering] of the user alarm monitoring setting or the system alarm monitoring setting turns on.
- [Initialize NVRAM area at the time of initial monitoring] is set in GT SoftGOT3000.

Backing up the data stored in the nonvolatile RAM user area

Back up or restore the data stored in the nonvolatile RAM user area by using [NVRAM management] of the utility.
For details on backup/restore, refer to the following.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

Influence when changing the nonvolatile RAM user area afterward

If you change the setting of the nonvolatile RAM user area after starting the GOT operation, data saving may become impossible.

■When changing the size of the nonvolatile RAM user area used

If the size of the nonvolatile RAM user area used is changed in the setting for the function that uses the nonvolatile RAM user area, the data stored in the RAM user area will be initialized.

Details of the change	Influence
Reducing the size	The data is saved to the initialized area. The remaining area is reserved as a free area.

Details of the change	Influence
Increasing the size	The area used is initialized and the data is saved to another area. If the area required for saving the data is insufficient, an error occurs. If an error occurs, initialize the nonvolatile RAM user area, reduce the data size to 500 KB or less, and save the data again. Example) When increasing the size for ID 1 from 100 KB to 200 KB 
■When deleting the settings of the functions that use the nonvolatile RAM user area

When the setting of each function is deleted, the nonvolatile RAM user area used for saving the data is reserved as an unused area.

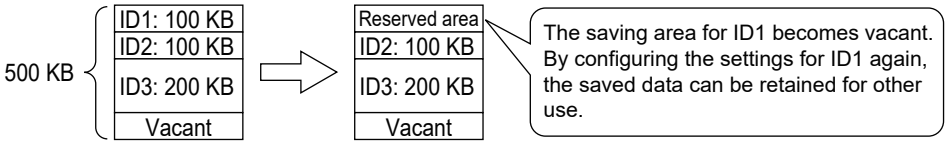
Initialize the unused area to use it.

For initialization of the nonvolatile RAM user area, refer to the following.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Ex.

Deleting the setting of ID 1



■Others

If the data saved in the nonvolatile RAM user area is not restored at the GOT startup, a system alarm occurs.

If a system alarm occurs, a part of the nonvolatile RAM user area may be corrupted.

Initialize the nonvolatile RAM user area.

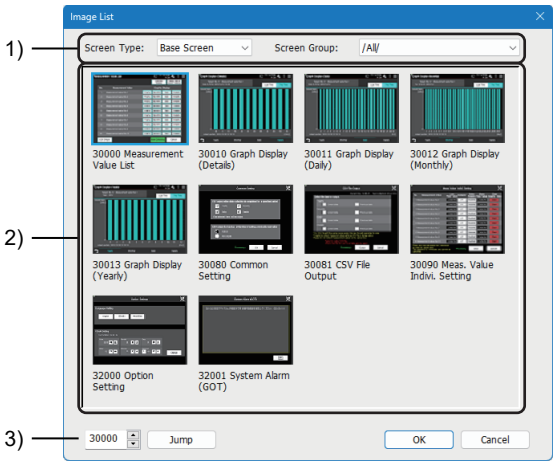
GOT3000 Series User's Manual (Utility & Maintenance Functions)

Appendix 6 Common dialog

☞ Page 3683 [Image List] dialog (screen)
☞ Page 3684 [Date/Time Setting] dialog (screen)
☞ Page 3685 [Password Edit] dialog
☞ Page 3685 [Edit Comment] dialog

Appendix 6.1 [Image List] dialog (screen)

GT37 SoftGOT3000

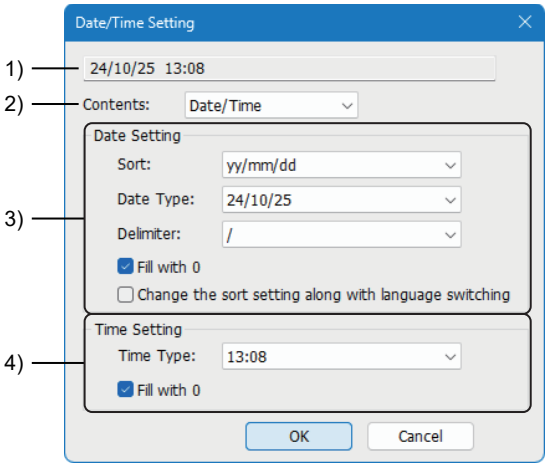


Item		Description
1)	[Screen Type]	This item is displayed when the [Image] button is clicked in the [Set Overlay Screen] dialog displayed on a base screen or window screen. Select the type of the screen to be displayed in the screen image field.
	[Screen Group]	Select the screen group to be displayed in the screen image field.
2)	Screen image list	Displays the thumbnail, screen number, and title of the screen image.
3)	Screen number entry field	Enter a screen number and click the [Jump] button to select the thumbnail of the specified screen in the screen image list.

A

Appendix 6.2 [Date/Time Setting] dialog (screen)

GT37 SoftGOT3000

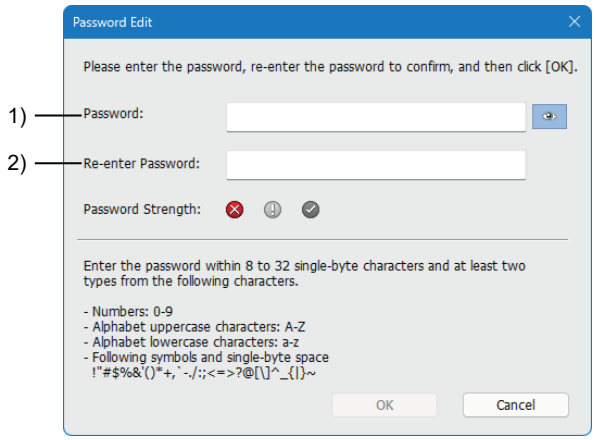


Item			Description
1)	Preview		Previews the date and time based on the current settings.
2)	[Contents]		Select the date and time to be displayed.
3)	[Date Setting]	[Sort]	Select a sorting order of year, month and date. When [Change the sort setting along with language switching] is selected, a sorting order cannot be selected.
		[Date Type]	Select the display format of the date.
		[Delimiter]	Select a delimiter used for separating expressions of year, month and date.
		[Fill with 0]	When the month and/or date are/is in single digit, 0 is displayed before the single-digit number.
		[Change the sort setting along with language switching]	Changes the sorting order of the date according to the setting for [Region Setting] in the [Environmental Setting] window ([Language Switching]). ☞ Page 546 Setting for switching the language displayed on the GOT ([Language Switching]) If an item containing Japanese characters is selected for [Date Format], this item is grayed out and cannot be set.
4)	[Time Setting]	[Time Type]	Select the display format of the time.
		[Fill with 0]	When the time, minute, and/or second are/is in single digit, 0 is displayed before the single-digit number.

Appendix 6.3 [Password Edit] dialog

GT37 SoftGOT3000

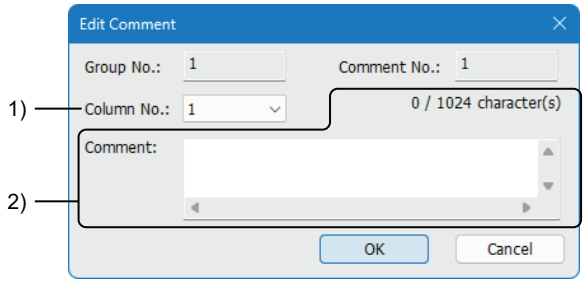
The [Password Edit] dialog is used to register or edit passwords.
The contents of this dialog vary depending on which dialog or screen button was used to open it, but its basic functions are the same.
The following shows an example of the [Password Edit] screen.
The range and allowable character count for the password vary depending on the function.



Item		Description
1)	[Password]	Set a new password.
2)	[Re-enter Password]	Input the password set in [Password] for the confirmation.

Appendix 6.4 [Edit Comment] dialog

GT37 SoftGOT3000



Item		Description
1)	[Column No.]	Select the column No. of the comment to be edited.
2)	[Comment]	Edit the comment in the comment group. If an unregistered comment group No. or comment No. is displayed, create a new comment. Up to 1024 characters can be set for the comment. The number of characters of the input comment is displayed on the upper right of the comment entry field. A one-byte or two-byte character is counted as one character, and a line feed is counted as two characters.

A

Appendix 7 License registration method

GT37 SoftGOT3000

To use the following add-on function of the GOT3000, license registration is required for the relevant functions.

Add-on function	License product name	License product model
GOT Mobile function	GOT Mobile function license	GT30-WEBSKEYA1-☐
VNC server function	VNC server function license	GT30-VNCSKEYA1-☐
VPN connection function	VPN connection function license	GT30-VPNKEYA1-☐
Remote personal computer operation function (Ethernet)	License for the remote personal computer operation function (Ethernet)	GT30-PCRAKEYA1-☐
Multimedia function	Multimedia function license	GT30-MMRKEYA1-☐

To register the license, first purchase the required license and then apply for the activation file.

After receiving the activation file, register the license.

☞ Page 3686 Information required for activation file application

☞ Page 3686 Applying for the activation file and registering the license

☞ Page 3687 Application for reissuing the activation file

For details on the license registration to use GT SoftGOT3000, refer to the following manual.

GT SoftGOT3000 User's Manual

Appendix 7.1 Information required for activation file application

The following information is required to apply for the activation file.

Required information	Description
License product name	It is provided on the purchased license certificate.
License product model	
License product ID	
GOT model	It is required to request the activation file for the GOT3000 add-on function. This can be checked on the [GOT Information] screen in the utility. GOT3000 Series User's Manual (Utility & Maintenance Functions) The model can also be checked with the rating plate or 2D code on the GOT rear face.
GOT serial number	
E-mail address	E-mail address to receive the activation file

Appendix 7.2 Applying for the activation file and registering the license

When you apply for the activation file on the website, the file will be sent by e-mail.

After receiving the file, use it to register the license in the GOT utility.

1. Launch a web browser and access the URL below to display the terms and conditions screen of the HMI GOT activation file request form.

https://www.mitsubishielectric.com/contact/ssl/php/1477/kiyaku.php?fid=1477

2. If you agree to the terms and conditions and apply for the GOT activation file, click [I agree and move to new application form].

If you do not agree to the terms and conditions, close the screen.

If you do not agree to the terms and conditions, you will not be able to apply for the activation file.

3. When the application form appears, enter the required information and press the [Confirm Information] button.

Precautions

• Do not use one-byte katakana or special symbols, as they may not be transmitted correctly.
Enter katakana using two-byte characters.
• Only one model can be applied for at a time.
If applying for multiple models, apply separately for each model.
• It may take several days to issue the activation file.
• Depending on the entered information, the activation file may not be issued.

4. When the confirmation screen appears, review the entered information and click the [Register] button to send the data.

5. When an e-mail is received at the address registered in the application form, change the extension of the attached activation file to zip and unzip it.

The folder structure of the unzip activation file is as follows:

(GOT serial number)\G3LICENSE\APKEYnnnnnnnn.INI

6. Copy the [G3LICENSE] folder and its contents to the data storage.

7. Install the data storage mentioned in step 6 to the GOT.

8. Register the license in the [License management] screen in the GOT utility.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Appendix 7.3 Application for reissuing the activation file

To use the activation file already registered in the GOT on another GOT due to a malfunction of the GOT or other reasons, access the HMI GOT activation file request form and click [I agree and move to reissue application form], and apply for reissuance of the activation file.

https://www.mitsubishielectric.com/contact/ssl/php/1477/kiyaku.php?fid=1477

Precautions

You can apply for reissuance of the activation file only once through the reissue application form.
If a second or subsequent reissuance is required, consult your local sales office.

Appendix 8 Open source software

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally

submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work,

excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise,

unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction,
and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by
the copyright owner that is granting the License.
"Legal Entity" shall mean the union of the acting entity and all

other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual,

worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided

that such additional attribution notices cannot be construed
as modifying the License.

You may add Your own copyright statement to Your modifications and
may provide additional or different license terms and conditions
for use, reproduction, or distribution of Your modifications, or
for any such Derivative Works as a whole, provided Your use,
reproduction, and distribution of the Work otherwise complies with
the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise,
any Contribution intentionally submitted for inclusion in the Work
by You to the Licensor shall be under the terms and conditions of
this License, without any additional terms or conditions.
Notwithstanding the above, nothing herein shall supersede or modify
the terms of any separate license agreement you may have executed
with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade
names, trademarks, service marks, or product names of the Licensor,
except as required for reasonable and customary use in describing the
origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or
agreed to in writing, Licensor provides the Work (and each
Contributor provides its Contributions) on an "AS IS" BASIS,
WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or
implied, including, without limitation, any warranties or conditions
of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A
PARTICULAR PURPOSE. You are solely responsible for determining the
appropriateness of using or redistributing the Work and assume any
risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory,
whether in tort (including negligence), contract, or otherwise,
unless required by applicable law (such as deliberate and grossly
negligent acts) or agreed to in writing, shall any Contributor be
liable to You for damages, including any direct, indirect, special,
incidental, or consequential damages of any character arising as a
result of this License or out of the use or inability to use the
Work (including but not limited to damages for loss of goodwill,
work stoppage, computer failure or malfunction, or any and all
other commercial damages or losses), even if such Contributor
has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing
the Work or Derivative Works thereof, You may choose to offer,
and charge a fee for, acceptance of support, warranty, indemnity,
or other liability obligations and/or rights consistent with this
License. However, in accepting such obligations, You may act only
on Your own behalf and on Your sole responsibility, not on behalf
of any other Contributor, and only if You agree to indemnify,

defend, and hold each Contributor harmless for any liability
incurred by, or claims asserted against, such Contributor by reason
of your accepting any such warranty or additional liability.

GNU LESSER GENERAL PUBLIC LICENSE
Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.
51 Franklin Street, Suite 500, Boston, MA 02110-1335, USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts
as the successor of the GNU Library Public License, version 2, hence
the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these

rights. These restrictions translate to certain responsibilities for
you if you distribute copies of the library or if you modify it.

  For example, if you distribute copies of the library, whether gratis
or for a fee, you must give the recipients all the rights that we gave
you. You must make sure that they, too, receive or can get the source
code. If you link other code with the library, you must provide
complete object files to the recipients, so that they can relink them
with the library after making changes to the library and recompiling
it. And you must show them these terms so they know their rights.

  We protect your rights with a two-step method: (1) we copyright the
library, and (2) we offer you this license, which gives you legal
permission to copy, distribute and/or modify the library.

  To protect each distributor, we want to make it very clear that
there is no warranty for the free library. Also, if the library is
modified by someone else and passed on, the recipients should know
that what they have is not the original version, so that the original
author's reputation will not be affected by problems that might be
introduced by others.

  Finally, software patents pose a constant threat to the existence of
any free program. We wish to make sure that a company cannot
effectively restrict the users of a free program by obtaining a
restrictive license from a patent holder. Therefore, we insist that
any patent license obtained for a version of the library must be
consistent with the full freedom of use specified in this license.

  Most GNU software, including some libraries, is covered by the
ordinary GNU General Public License. This license, the GNU Lesser
General Public License, applies to certain designated libraries, and
is quite different from the ordinary General Public License. We use
this license for certain libraries in order to permit linking those
libraries into non-free programs.

  When a program is linked with a library, whether statically or using
a shared library, the combination of the two is legally speaking a
combined work, a derivative of the original library. The ordinary
General Public License therefore permits such linking only if the
entire combination fits its criteria of freedom. The Lesser General
Public License permits more lax criteria for linking other code with
the library.

  We call this license the "Lesser" General Public License because it
does Less to protect the user's freedom than the ordinary General
Public License. It also provides other free software developers Less
of an advantage over competing non-free programs. These disadvantages
are the reason we use the ordinary General Public License for many
libraries. However, the Lesser license provides advantages in certain
special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

A

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control

compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library,

and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a

work, in isolation, is not a derivative work of the Library, and
therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library
creates an executable that is a derivative of the Library (because it
contains portions of the Library), rather than a "work that uses the
library". The executable is therefore covered by this License.
Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file
that is part of the Library, the object code for the work may be a
derivative work of the Library even though the source code is not.
Whether this is true is especially significant if the work can be
linked without the Library, or if the work is itself a library. The
threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data
structure layouts and accessors, and small macros and small inline
functions (ten lines or less in length), then the use of the object
file is unrestricted, regardless of whether it is legally a derivative
work. (Executables containing this object code plus portions of the
Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may
distribute the object code for the work under the terms of Section 6.
Any executables containing that work also fall under Section 6,
whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or
link a "work that uses the Library" with the Library to produce a
work containing portions of the Library, and distribute that work
under terms of your choice, provided that the terms permit
modification of the work for the customer's own use and reverse
engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the
Library is used in it and that the Library and its use are covered by
this License. You must supply a copy of this License. If the work
during execution displays copyright notices, you must include the
copyright notice for the Library among them, as well as a reference
directing the user to the copy of this License. Also, you must do one
of these things:

a) Accompany the work with the complete corresponding
machine-readable source code for the Library including whatever
changes were used in the work (which must be distributed under
Sections 1 and 2 above); and, if the work is an executable linked
with the Library, with the complete machine-readable "work that
uses the Library", as object code and/or source code, so that the
user can modify the Library and then relink to produce a modified
executable containing the modified Library. (It is understood
that the user who changes the contents of definitions files in the

Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining

where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that

system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU

FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Suite 500, Boston, MA 02110-1335, USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library `Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of Ty Coon>, 1 April 1990
Ty Coon, President of Vice

That's all there is to it!

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for

you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.
When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes

a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not

covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those

sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE

LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library `Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of Ty Coon>, 1 April 1990
Ty Coon, President of Vice

That's all there is to it!

Appendix 8.14 freetype

The FreeType Project LICENSE

2006-Jan-27

Copyright 1996-2002, 2006 by
David Turner, Robert Wilhelm, and Werner Lemberg

Introduction
==========

The FreeType Project is distributed in several archive packages;
some of them may contain, in addition to the FreeType font engine,
various tools and contributions which rely on, or relate to, the
FreeType Project.

This license applies to all files found in such packages, and
which do not fall under their own explicit license. The license
affects thus the FreeType font engine, the test programs,
documentation and makefiles, at the very least.

This license was inspired by the BSD, Artistic, and IJG
(Independent JPEG Group) licenses, which all encourage inclusion
and use of free software in commercial and freeware products
alike. As a consequence, its main points are that:

o We don't promise that this software works. However, we will be
interested in any kind of bug reports. (`as is' distribution)
o You can use this software for whatever you want, in parts or
full form, without having to pay us. (`royalty-free' usage)

o You may not pretend that you wrote this software. If you use
it, or only parts of it, in a program, you must acknowledge
somewhere in your documentation that you have used the
FreeType code. (`credits')

We specifically permit and encourage the inclusion of this

software, with or without modifications, in commercial products.
We disclaim all warranties covering The FreeType Project and
assume no liability related to The FreeType Project.

Finally, many people asked us for a preferred form for a
credit/disclaimer to use in compliance with this license. We thus
encourage you to use the following text:

"""
Portions of this software are copyright © <year> The FreeType
Project (www.freetype.org). All rights reserved.
"""

Please replace <year> with the value from the FreeType version you
actually use.

Legal Terms
==========

0. Definitions

Throughout this license, the terms `package', `FreeType Project',
and `FreeType archive' refer to the set of files originally
distributed by the authors (David Turner, Robert Wilhelm, and
Werner Lemberg) as the `FreeType Project', be they named as alpha,
beta or final release.

`You' refers to the licensee, or person using the project, where
`using' is a generic term including compiling the project's source
code as well as linking it to form a `program' or `executable'.
This program is referred to as `a program using the FreeType
engine'.

This license applies to all files distributed in the original
FreeType Project, including all source code, binaries and
documentation, unless otherwise stated in the file in its
original, unmodified form as distributed in the original archive.
If you are unsure whether or not a particular file is covered by
this license, you must contact us to verify this.

The FreeType Project is copyright (C) 1996-2000 by David Turner,
Robert Wilhelm, and Werner Lemberg. All rights reserved except as
specified below.

1. No Warranty

THE FREETYPE PROJECT IS PROVIDED `AS IS' WITHOUT WARRANTY OF ANY
KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO,

WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. IN NO EVENT WILL ANY OF THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY DAMAGES CAUSED BY THE USE OR THE INABILITY TO USE, OF THE FREETYPE PROJECT.

2. Redistribution

This license grants a worldwide, royalty-free, perpetual and irrevocable right and license to use, execute, perform, compile, display, copy, create derivative works of, distribute and sublicense the FreeType Project (in both source and object code forms) and derivative works thereof for any purpose; and to authorize others to exercise some or all of the rights granted herein, subject to the following conditions:

- Redistribution of source code must retain this license file (`FTL.TXT') unaltered; any additions, deletions or changes to the original files must be clearly indicated in accompanying documentation. The copyright notices of the unaltered, original files must be preserved in all copies of source files.

- Redistribution in binary form must provide a disclaimer that states that the software is based in part of the work of the FreeType Team, in the distribution documentation. We also encourage you to put an URL to the FreeType web page in your documentation, though this isn't mandatory.

These conditions apply to any software derived from or based on the FreeType Project, not just the unmodified files. If you use our work, you must acknowledge us. However, no fee need be paid to us.

3. Advertising

Neither the FreeType authors and contributors nor you shall use the name of the other for commercial, advertising, or promotional purposes without specific prior written permission.

We suggest, but do not require, that you use one or more of the following phrases to refer to this software in your documentation or advertising materials: `FreeType Project', `FreeType Engine', `FreeType library', or `FreeType Distribution'.

As you have not signed this license, you are not required to accept it. However, as the FreeType Project is copyrighted material, only this license, or another one contracted with the authors, grants you the right to use, distribute, and modify it. Therefore, by using, distributing, or modifying the FreeType Project, you indicate that you understand and accept all the terms

of this license.

4. Contacts

There are two mailing lists related to FreeType:

o freetype@nongnu.org

Discusses general use and applications of FreeType, as well as future and wanted additions to the library and distribution. If you are looking for support, start in this list if you haven't found anything to help you in the documentation.

o freetype-devel@nongnu.org

Discusses bugs, as well as engine internals, design issues, specific licenses, porting, etc.

Our home page can be found at

https://www.freetype.org

This manual confers no industrial property rights or any rights of any other kind, nor does it confer any patent licenses. Mitsubishi Electric Corporation cannot be held responsible for any problems involving industrial property rights which may occur as a result of using the contents noted in this manual.

© 2025 MITSUBISHI ELECTRIC CORPORATION

Warranty

Please check the following product warranty details before using this product.

■1. Gratis Warranty Term and Gratis Warranty Range

If any faults or defects (hereinafter "Failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the sales representative or Mitsubishi Service Company.
However, if repairs are required onsite at domestic or overseas location, expenses to send an engineer will be solely at the customer's discretion.
Mitsubishi shall not be held responsible for any re-commissioning, maintenance, or testing on-site that involves replacement of the failed module.

(1) Gratis Warranty Term

The gratis warranty term of the product shall be for thirty-six (36) months after the date of purchase or delivery to a designated place.
Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be forty-two (42) months.
The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.

(2) Gratis Warranty Range

(a) The customer shall be responsible for the primary failure diagnosis unless otherwise specified.
If requested by the customer, Mitsubishi Electric Corporation or its representative firm may carry out the primary failure diagnosis at the customer's expense.
The primary failure diagnosis will, however, be free of charge should the cause of failure be attributable to Mitsubishi Electric Corporation.

(b) The range shall be limited to normal use within the usage state, usage methods, and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.

(c) Even within the gratis warranty term, repairs shall be charged in the following cases.

- Failure occurring from inappropriate storage or handling, carelessness or negligence by the user.
  Failure caused by the user's hardware or software design.
- Failure caused by unapproved modifications, etc., to the product by the user.
- When the Mitsubishi product is assembled into a user's device, Failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
- Failure that could have been avoided if consumable parts designated in the instruction manual had been correctly serviced or replaced.
- Replacing consumable parts such as a battery
- Failure caused by external irresistible forces such as fires or abnormal voltages, and Failure caused by force majeure such as earthquakes, lightning, wind and water damage.
- Failure caused by reasons that could not be predicted by scientific technology standards at the time of shipment from Mitsubishi.
- Any other failure found not to be the responsibility of Mitsubishi or that admitted not to be so by the user.

■2. Onerous repair term after discontinuation of production

(1) Mitsubishi shall accept onerous product repairs for seven (7) years after production of the product is discontinued.
Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.

(2) Mitsubishi shall not accept a request for product supply (including spare parts) after production is discontinued.

■3. Overseas service

Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center.
Note that the repair conditions at each FA Center may differ.

■4. Exclusion of loss in opportunity and secondary loss from warranty liability

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:

(1) Damages caused by any cause found not to be the responsibility of Mitsubishi.

(2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.

(3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.

(4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

■5. Changes in product specifications

The specifications given in the catalogs, manuals, or technical documents are subject to change without prior notice.

Trademarks

MELSEC, MELSOFT, MELHMI, GOT, CC-Link, and CC-Link IE are registered trademarks or trademarks of Mitsubishi Electric Corporation in Japan and other countries.
Microsoft, Excel, Internet Explorer, Microsoft Edge, Visual Basic, Visual C++, Visual C#, Windows, and Windows Server are trademarks of the Microsoft group of companies.
MODBUS is a registered trademark of Schneider Electric SA.
