MITSUBISHI ELECTRIC

GRAPHIC OPERATION TERMINAL MELHMI

GOT3000

GOT3000 Series
User's Manual (Connection)

-GT37 wide model
-GT37 model

Safety precautions

Always read the precautions before using this product.

Also read this manual and the relevant manuals mentioned in this manual carefully, and use the product properly while paying full attention to safety.

Note that the precautions in this manual apply only to this product.

The safety precautions are divided into the following levels: ⚠ WARNING and ⚠ CAUTION.

⚠ **WARNING**	**Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.**
⚠ **CAUTION**	**Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage.**

Note that failure to observe ⚠ CAUTION may lead to a serious accident depending on the circumstances.

Make sure to observe both warnings and cautions to ensure personal safety.

Ensure that this manual is easily accessible to all users of this product.

[Design precautions]

⚠WARNING

- To check the operating status of each station if a network communication error occurs, refer to the manual for the interface module used.
  Not doing so may cause an accident due to false output or malfunction.
- If you change the data during operation, provide an interlock using the program of the PLC to ensure that the entire system always works safely.
  Establish a mechanism to handle data communication between the personal computer and PLC CPU if a data communication error occurs in the system.
- To maintain the security (availability, integrity, and confidentiality) of the GOT and the system against unauthorized access, DoS[*1] attacks, computer viruses, and other cyberattacks from unreliable networks and devices via network, take appropriate measures such as firewalls, virtual private networks (VPNs), and antivirus solutions.
  Mitsubishi Electric shall have no responsibility or liability for any problems involving GOT trouble and system trouble by unauthorized access, DoS attacks, computer viruses, and other cyberattacks.
  *1 DoS: A denial-of-service (DoS) attack disrupts services by overloading systems or exploiting vulnerabilities, resulting in a denial-of-service (DoS) state.
- Periodically check our vulnerability site, and if any vulnerabilities are found, upgrade the software and related components.
- Some failures of the GOT, communication unit or cable may keep the outputs on or off.
  Some failures of the touch panel may cause a malfunction of input objects such as a touch switch.
  Create an external monitoring circuit to check for output signals which may lead to a serious accident.
  Not doing so may cause an accident due to false output or malfunction.

[Design precautions]

⚠WARNING

- Do not use the GOT as the warning device that warns you of serious accidents.
  For the device that displays or outputs serious warnings, provide an independent redundant hardware or mechanical interlock.
  Not doing so may cause an accident due to false output or malfunction.
- When the GOT backlight has a failure, the POWER LED blinks (lime green/unlit) and the display section dims. In such a case, the input by the touch switch(es) is disabled.
- When multiple points of the display section are touched simultaneously, an accident may occur due to false output or malfunction.
  [GT37-W]
  The display section of the GOT is capacitive.
  Touching three points or more simultaneously on the display section may cause an accident due to false output or malfunction.
  Do not do so.
  [GT37-X]
  The display section of the GOT is an analog-resistive type touch panel.
  Touching two points or more simultaneously on the display section may cause an accident due to false output or malfunction.
  If you do so, a touch switch near the touched points may operate.
  Do not touch two points or more simultaneously on the display section.
- If you have changed a program or parameter of the controller (such as a PLC) that is monitored by the GOT, reset the GOT or turn off the GOT and immediately turn it on again.
  Not doing so may cause an accident due to false output or malfunction.
- If a communication fault (including cable disconnection) occurs during monitoring on the GOT, communication between the GOT and PLC CPU is suspended and the GOT becomes inoperative.
  A system where the GOT is used should be configured to perform any significant operation to the system by using the switches of a device other than the GOT on the assumption that a GOT communication fault will occur.
  Not doing so may cause an accident due to false output or malfunction.

[Design precautions]

⚠CAUTION

- When the GOT connects to an Ethernet network, the IP address setting is restricted according to the system configuration.
  When a GOT1000 series model is on an Ethernet network, do not set the IP address 192.168.0.18 for the GOT and the controller on this network.
  Doing so may cause IP address duplication at the GOT startup, adversely affecting the communication of the device with the IP address 192.168.0.18.
  The operation at IP address duplication depends on the devices and the system.
- When using the Ethernet interfaces, set an IP address for each interface to access a different network.
- Turn on the controllers and the network devices to be ready for communication before they communicate with the GOT.
  Not doing so may cause a communication error on the GOT.
- Do not run control line cables and communication cables together with or near main circuit cables, power line cables, or other cables.
  Run these cables separately from such wiring and keep them a minimum of 100 mm apart.
  Not doing so may cause a malfunction due to noise.
- Turn on the controllers and the network devices to be ready for communication before they communicate with GT SoftGOT3000.
  Not doing so may cause a communication error on GT SoftGOT3000.

[Installation precautions]

⚠WARNING

- Before installing or removing the GOT on or from the control panel, shut off all phases of the external power supply used by the system.
  Not doing so may result in an electric shock, product damage or malfunction.
- Before installing/removing the communication unit or the option unit on/from the GOT, shut off all phases of the external power supply used by the system.
  Not doing so may result in an electric shock, product damage or malfunction.

[Installation precautions]

⚠CAUTION

- Use the GOT in the environment that satisfies the general specifications described in the User's Manual (Hardware) of the GOT used.
  Not doing so can cause an electric shock, fire, malfunction, or product damage or deterioration.
- When installing the GOT on the control panel, use a Phillips-head screwdriver No. 2 to tighten mounting screws within the specified torque range as shown below.
  • Specified torque range: (0.36 N·m to 0.48 N·m)
  Undertightening may cause the unit to fall off, short circuit, or malfunction.
  Overtightening may cause the unit to fall off, short circuit, or malfunction due to damage to the screws or the unit.
- To install a communication unit or an option unit on the GOT, the extension interface converter unit must be installed onto the extension interface of the GOT.
  When installing the extension interface converter unit and a communication unit or an option unit, tighten the mounting screws within the specified torque range (0.36 N·m to 0.48 N·m) with a cross-head screwdriver No. 2.
- When closing the USB environmental protection cover, fix the cover to the GOT by pushing the [△] mark on the latch firmly to comply with the protective structure.
- Remove the protective film of the GOT.
  Continued use of the GOT with the protective film attached may prevent the film from being removed. In addition, for the models equipped with the human sensor function, using the GOT with the protective film may cause the human sensor not to function properly.
- Do not use or store the product in an environment subject to direct sunlight, rain, high temperatures, dust, high humidity, or frequent vibration.
- When using the GOT in the environment of oil or chemicals, use the protective cover for oil.
  Not doing so can cause failure or malfunction due to the oil or chemical entering into the GOT.
- Do not operate the product with its display section frozen.
  The water droplets on the display section may freeze at a low temperature.
  Touch switches and other input objects may malfunction if the display section is frozen.

[Wiring precautions]

⚠WARNING

- Before wiring, make sure to shut off all phases of the external power supply used by the system.
  Not doing so may result in an electric shock, product damage or malfunction.

[Wiring precautions]

⚠CAUTION

- Connect the communication cable to the interface connector of the personal computer, and tighten the mounting screws and terminal screws within the specified torque range.
  Undertightening may cause a short circuit or malfunction.
  Overtightening may damage the screws or personal computer interface, causing a short circuit or malfunction.
  Also, do not apply excessive force to the connector or bend the cable excessively.
  Doing so may cause contact failure or disconnection.
- Make sure to ground the FG terminal and LG terminal of the GOT power supply section using a grounding wire dedicated to the GOT. (Ground resistance: 100 Ω or less, ground cable diameter: 1.6 mm or more)
  Not doing so may result in an electric shock or malfunction.
- When wiring the GOT power section, tighten the terminal screws using a Phillips-head screwdriver No. 2 within the specified torque range below.
  • Specified torque range: (0.5 N·m to 0.8 N·m)
- Use an applicable solderless terminal for terminal processing of a wire to the GOT power supply section and tighten them with the specified torque.
  Using a solderless spade terminal can cause it to fall off and lead to a malfunction if the terminal screws become loose.
- Correctly wire the GOT power supply section after confirming the rated voltage and terminal layout of the product.
  Not doing so can cause a fire or malfunction.
- Plug the communication cable into the GOT interface or the connector of the connected unit, and tighten the mounting screws and the terminal screws within the specified torque range (0.5 N·m to 0.8 N·m).
  Undertightening may cause a short circuit or malfunction.
  Overtightening may cause a short circuit or malfunction due to damage to the screws or unit.
- Exercise care to avoid foreign matter such as chips and wire offcuts entering the unit.
  Not doing so can cause a fire, failure or malfunction.

[Input operation precautions]

⚠WARNING

- Thoroughly read the manual to fully understand the operating procedures before performing input operations on a user-created screen (such as turning a bit device on or off, changing the current value of a word device, changing the set or current value of a timer or counter, or changing the current value of a buffer memory or parameter).
  During the input operation, never change the data of the devices which are used to perform significant operation for the system.
  Doing so may cause an accident due to an incorrect output or malfunction.

[Startup/maintenance precautions]

⚠WARNING

- Do not touch the terminals while power is on.
  Close the terminal block cover before supplying power.
  Not doing so may cause an electric shock or malfunction.
- Before cleaning or terminal screw retightening, make sure to shut off the external power supply in all phases.
  Not doing so may cause damage to the personal computer interface or malfunction.
  Undertightening may cause a short circuit or malfunction.
  Overtightening may damage the screws or personal computer interface, causing a short circuit or malfunction.
- Correctly connect the battery connector.
  Do not perform the following actions on the battery:
  • Charging, disassembling, heating, throwing into fire, short-circuiting, soldering, etc.
  Improper handling of the battery may cause heat generation, explosion, or ignition, resulting in injury or fire hazards.
- Before cleaning or terminal screw retightening, make sure to shut off all phrases of the external power supply.
  Not doing so may cause the unit to fail or malfunction.
  Undertightening may cause a short circuit or malfunction.
  Overtightening may cause a short circuit or malfunction due to damage to the screws or unit.

[Startup/maintenance precautions]

⚠CAUTION

- Do not disassemble or modify the unit.
  Doing so can cause a failure, malfunction, injury or fire.
- Do not touch the conductive and electronic parts of the unit directly.
  Doing so may cause a unit malfunction or failure.
- The cables connected to the unit must be run in ducts or clamped.
  Not doing so can cause the unit or cable to be damaged due to the dangling, motion or accidental pulling of the cables, or can cause a malfunction due to a cable connection fault.
- When unplugging the cable connected to the unit, do not hold and pull from the cable portion.
  Doing so can cause the unit or cable to be damaged or can cause a malfunction due to a cable connection fault.
- Do not drop the unit or subject it to strong shock.
  A unit damage may result.
- Do not drop or give an impact to the battery mounted to the unit.
  Doing so may damage the battery, causing the battery fluid to leak inside the battery.
  If the battery is dropped or given an impact, dispose of it without using it.
- Before touching the unit, always touch grounded metals, etc. to discharge static electricity from human body, etc.
  Not doing so may cause the unit to fail or malfunction.
- Use the battery manufactured by Mitsubishi Electric Corporation.
  Use of other batteries may cause a risk of fire or explosion.
- Dispose of the used battery promptly.
  Keep it away from children.
  Do not disassemble and dispose of it in fire.
- Before replacing the battery or setting the terminating resistor using a selector switch, make sure to shut off all phases of the external power supply.
  Not doing so can cause the unit to fail or malfunction due to static electricity.
- When setting the terminating resistor using the selector switch, do not use a pointed metal object.
- When the extension unit is not used, do not leave it uncovered.
  Otherwise, the unit may fail or malfunction due to static electricity.
- Turn off the power when cleaning the GOT.
  Also, before cleaning, ensure that the GOT is properly installed on the control panel.

[Touch panel precautions]

⚠WARNING

- For the analog-resistive film type touch panels, normally the adjustment is not required. However, the difference between a touched position and the object position may occur as the period of use elapses. When any difference between a touched position and the object position occurs, execute the touch panel calibration.
  When any difference between a touched position and the object position occurs, other object may be activated. This may cause an unexpected operation due to incorrect output or malfunction.
- For the capacitive touch panel, pay attention to the following points.
  • If the FG terminal of the GOT is not grounded, operability deterioration or malfunction may result.
  • If water, oil, or any other conductive material adheres to the GOT display, the GOT may malfunction. In such a case, wipe it off before use.

[Precautions for use of the data storage]

⚠WARNING

- If the SD card in drive A of the GOT is removed while the GOT is accessing it, the GOT may stop processing for about 20 seconds.
  During this stop, you cannot operate the GOT, and the functions running in the background, including the screen refresh, alarm, logging, and script, also stop.
  This stop may affect the system operation, causing an accident.
  Before removing the SD card, check that the SD card access LED is off.

[Precautions for use of the data storage]

⚠CAUTION

- If you remove the data storage from the GOT while the GOT is accessing it, the data storage or files may get damaged.
  Before removing the data storage, check the SD card access LED, relevant system signal, or others to make sure that the data storage is not being accessed.
  If the data storage is damaged, the GOT may not function properly.
- Turning off the GOT while it accesses the SD card results in damage to the SD card and files.
- After inserting an SD card into the GOT, make sure to close the SD card cover.
  Not doing so may prevent the data from being read or written.
- To remove the data storage from the GOT, follow the procedure for removal on the utility screen of the GOT. After the successful completion dialog appears, remove the data storage while holding it carefully.
  Not doing so may cause the data storage to drop, resulting in damage or failure.

[Precautions for use]

⚠CAUTION

- Do not press the GOT display section with a pointed object such as a pen or screwdriver.
  Doing so may result in damage or failure.
- When inserting a USB device into a USB interface of the GOT, make sure to insert the device into the interface firmly.
  Not doing so may cause a malfunction due to poor contact.
- The digital video output interface of the GOT is intended solely for output.
  Do not connect this interface to the output terminal of another device.
  Doing so may result in failure.
- Do not touch the edges of the analog resistive touch panel (display section) repeatedly.
  Doing so may result in failure.
- When the extension unit is not used, do not leave it uncovered.
  Otherwise, the unit may fail or malfunction due to static electricity.
- Do not turn off the GOT while data is being written to the storage memory (ROM) or SD card.
  Doing so may corrupt the data, rendering the GOT inoperative.

[Remote control precautions]

⚠WARNING

- Remote control is available through a network by using GOT functions, including the VNC server function and the GOT Mobile function.
  If these functions are used to perform remote control of control equipment, the field operator may not notice the remote control, possibly leading to an accident.
  In addition, a communication delay or interruption may occur depending on the network environment, and remote control of control equipment cannot be performed normally in some cases.
  Before using the above functions to perform remote control, fully grasp the circumstances of the field site and ensure safety.
- When operating the server (GOT) of the GOT Mobile function to disconnect a client, notify the operator of the client about the disconnection beforehand.
  Not doing so may cause an accident.

[Disposal precautions]

⚠CAUTION

- Dispose of the product as industrial waste.
  When disposing of batteries, separate them from other wastes according to the local regulations.
  (For details on the battery directive in the EU member states, refer to the User's Manual (Hardware) of the GOT used.)

[Transportation precautions]

⚠CAUTION

- When transporting lithium batteries, make sure to treat them based on the transport regulations.
  (For details on the regulated models, refer to the User's Manual (Hardware) of the GOT used.)
- Since the unit is a precision device, avoid any impact that exceeds the general specifications described in the User's Manual (Hardware) of the GOT used during transportation.
  Not doing so may cause the unit to fail.
  Check if the unit operates correctly after transportation.
- Prevent the entry of halogens (including fluorine, chlorine, bromine, and iodine) contained in fumigants used for fumigating wood packaging materials, or a product failure may occur.
  Make sure that fumigant residues will not enter the product, or use an alternative (heat treatment or others) to fumigation.
  Before packing the product, disinfect wood packaging materials and eliminate insects from the materials.

Product application

(1) Mitsubishi graphic operation terminal ("the PRODUCT") shall be used in conditions;
i) where any problem, fault or failure occurring in the PRODUCT, if any, shall not lead to any major or serious accident;
and
ii) where the backup and fail-safe function are systematically or automatically provided outside of the PRODUCT for the case of any problem, fault or failure occurring in the PRODUCT.

(2) The PRODUCT has been designed and manufactured for the purpose of being used in general industries.
MITSUBISHI ELECTRIC SHALL HAVE NO RESPONSIBILITY OR LIABILITY (INCLUDING, BUT NOT LIMITED TO ANY AND ALL RESPONSIBILITY OR LIABILITY BASED ON CONTRACT, WARRANTY, TORT, PRODUCT LIABILITY) FOR ANY INJURY OR DEATH TO PERSONS OR LOSS OR DAMAGE TO PROPERTY CAUSED BY the PRODUCT THAT ARE OPERATED OR USED IN APPLICATION NOT INTENDED OR EXCLUDED BY INSTRUCTIONS, PRECAUTIONS, OR WARNING CONTAINED IN MITSUBISHI ELECTRIC USER'S, INSTRUCTION AND/OR SAFETY MANUALS, TECHNICAL BULLETINS AND GUIDELINES FOR the PRODUCT. ("Prohibited Application")
- Nuclear Power Plants and any other power plants operated by Power companies, and/or any other cases in which the public could be affected if any problem or fault occurs in the PRODUCT.
- Railway companies or Public service purposes, and/or any other cases in which establishment of a special quality assurance system is required by the Purchaser or End User.
- Aircraft or Aerospace, Medical applications, Train equipment, transport equipment such as Elevator and Escalator, Incineration and Fuel devices, Vehicles, Manned transportation, Equipment for Recreation and Amusement, and Safety devices, handling of Nuclear or Hazardous Materials or Chemicals, Mining and Drilling, and/or other applications where there is a significant risk of injury to the public or property.

Notwithstanding the above restrictions, Mitsubishi Electric may in its sole discretion, authorize use of the PRODUCT in one or more of the Prohibited Applications, provided that the usage of the PRODUCT is limited only for the specific applications agreed to by Mitsubishi Electric and provided further that no special quality assurance or fail-safe, redundant or other safety features which exceed the general specifications of the PRODUCTs are required. For details, please contact the Mitsubishi Electric representative in your region.

(3) Mitsubishi Electric shall have no responsibility or liability for any problems involving graphic operation terminal trouble and system trouble caused by DoS attacks, unauthorized access, computer viruses, and other cyberattacks.

Introduction

Thank you for choosing Mitsubishi Electric Graphic Operation Terminal (GOT).
Before using the product, read this manual carefully and make sure you understand the functions and performance of the GOT for correct use.

23.2 MELSERVO-J4 series (serial connection) 1764

CHAPTER 24 Connection through a PLC 1774

24.1 MELSERVO-J4 series (connection through a PLC) 1774
24.2 MELSERVO-J5, JET series (connection through a PLC) 1779
24.3 MELSERVO-JE-□B series (connection through a PLC) 1788

CHAPTER 25 Settable device range 1791

25.1 Device setting dialog (Mitsubishi Electric equipment) 1791
25.2 [MELSERVO-J3-*A] 1792
25.3 [MELSERVO-J3-*T] 1804
25.4 [MELSERVO-J4-*A, -JE-*A] 1818
25.5 [MELSERVO-J4-*A-RJ] 1838
25.6 [MELSERVO-JE-*C] 1862
25.7 [MELSERVO-J5(W)-*G(-RJ), -JET-*G] 1881
25.8 [MELSEC MX Controller] 1917
25.9 [MELSEC iQ-R, RnMT/NC/RT, CR800-D] 1917
25.10 [MELSEC iQ-F] 1917
25.11 [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700] 1917
25.12 [MELSEC-L] 1917

PART 7 Mitsubishi Electric robot controller

CHAPTER 26 Ethernet connection 1919

26.1 CR800-D (Built-in Ethernet port connection) 1919
26.2 CRnD-700 (Built-in Ethernet port connection) 1931

CHAPTER 27 Settable device range 1942

27.1 Device setting dialog (Mitsubishi Electric equipment) 1942
27.2 [MELSEC iQ-R, RnMT/NC/RT, CR800-D] 1942
27.3 [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700] 1942

PART 8 Mitsubishi Electric CNC

CHAPTER 28 CC-Link connection (intelligent device station) 1944

28.1 M700VS/M70V series (CC-Link connection (intelligent device station)) 1944
28.2 M800/M80 series (CC-Link connection (intelligent device station)) 1952

PART 9 AZBIL equipment

CHAPTER 29 Control equipment (serial connection) 1961

29.1 Connectable devices 1961
29.2 System configuration 1962
29.3 Connection diagram 1972
29.4 GOT side settings 1979
29.5 Control equipment side settings 1982

CHAPTER 30 Settable device range 1987

30.1 AZBIL equipment ([Azbil SDC/DMC]) 1987

PART 10 OMRON equipment

CHAPTER 31 PLC (Ethernet connection) 1990

31.1 SYSMAC CJ2, CP2 series (Built-in Ethernet port connection) 1990
31.2 SYSMAC CJ1, CJ2, CS1 series (Ethernet module connection) 1999
31.3 NJ, NX (Built-in Ethernet port connection) 2007
31.4 NJ (Ethernet module connection) 2015

CHAPTER 32 Temperature controller (serial connection) 2022

32.1 Connectable devices 2022
32.2 System configuration 2023
32.3 Connection diagram 2030
32.4 GOT side settings 2037
32.5 Temperature controller side settings 2039

CHAPTER 33 Settable device range 2044

33.1 OMRON equipment ([OMRON SYSMAC]) 2044
33.2 OMRON equipment ([OMRON NJ/NX]) 2048

33.3 OMRON equipment ([OMRON Digital Temperature Controller]) 2049

PART 11 KEYENCE equipment

CHAPTER 34 PLC (Ethernet connection) 2056

34.1 Connectable devices 2056
34.2 System configuration 2057
34.3 GOT side settings 2061
34.4 PLC side settings 2065

CHAPTER 35 Settable device range 2066

35.1 KEYENCE equipment ([KEYENCE KV-700/1000/3000/5000/7000/8000]) 2066

PART 12 FUJI equipment

CHAPTER 36 PLC (Ethernet connection) 2074

36.1 Connectable devices 2074
36.2 System configuration 2075
36.3 GOT side settings 2078
36.4 PLC side settings 2082

CHAPTER 37 Settable device range 2083

37.1 FUJI equipment ([FUJI MICREX-SX SPH]) 2083

PART 13 YASKAWA equipment

CHAPTER 38 PLC (Ethernet connection) 2087

38.1 MP3000 series (Built-in Ethernet port connection) 2087
38.2 MP2000 series (Ethernet module connection) 2096

CHAPTER 39 Robot controller (Ethernet connection) 2108

39.1 Connectable devices 2108
39.2 System configuration 2109
39.3 GOT side settings 2111
39.4 Robot controller side settings 2115

CHAPTER 40 Settable device range 2116

40.1 YASKAWA equipment ([YASKAWA MP2000]) 2116
40.2 YASKAWA equipment ([YASKAWA MP3000]) 2120
40.3 YASKAWA equipment ([YASKAWA Robot Controller]) 2123

PART 14 YOKOGAWA equipment

CHAPTER 41 PLC (Ethernet connection) 2130

41.1 Connectable devices 2130
41.2 System configuration 2131
41.3 GOT side settings 2135

41.4 PLC side settings 2139

CHAPTER 42 Settable device range 2141

42.1 YOKOGAWA equipment ([YOKOGAWA FA-M3]) 2141

PART 15 ALLEN-BRADLEY equipment

CHAPTER 43 PLC (Ethernet connection) 2148

43.1 AB MicroLogix series (Built-in EtherNet/IP port connection) 2148
43.2 AB MicroLogix series (EtherNet/IP communication module connection) 2154
43.3 AB Control/CompactLogix (Built-in EtherNet/IP port connection) 2160
43.4 AB Control/CompactLogix (EtherNet/IP communication module connection) 2166
43.5 AB Control/CompactLogix (Tag) (Built-in EtherNet/IP port connection) 2173
43.6 AB Control/CompactLogix (Tag) (EtherNet/IP communication module connection) 2179

CHAPTER 44 Settable device range 2186

44.1 ALLEN-BRADLEY equipment ([AB MicroLogix]) 2186
44.2 ALLEN-BRADLEY equipment ([AB Control/CompactLogix]) 2192
44.3 ALLEN-BRADLEY equipment ([AB Control/CompactLogix(Tag)]) 2196

PART 16 LS ELECTRIC equipment

CHAPTER 45 PLC (Ethernet connection) 2198

45.1 Connectable devices 2198
45.2 System configuration 2199
45.3 GOT side settings 2203
45.4 PLC side settings 2207

CHAPTER 46 Settable device range 2208

46.1 LS ELECTRIC equipment ([LS ELECTRIC XGK]) 2208

PART 17 SIEMENS equipment

CHAPTER 47 PLC (Ethernet connection) 2213

47.1 Connectable devices 2213
47.2 System configuration 2214
47.3 GOT side settings 2218
47.4 PLC side settings 2222

CHAPTER 48 Settable device range 2224

48.1 SIEMENS equipment ([SIEMENS OP(Ethernet)]) 2225

PART 18 Microcomputer

CHAPTER 49 Microcomputer (Ethernet connection) 2234

49.1 Microcomputer connection (Ethernet) 2234
49.2 System configuration 2236

49.3 Device data area 2238
49.4 Message format 2252
49.5 GOT side settings 2303

CHAPTER 50 Microcomputer (serial connection) 2307

50.1 Microcomputer connection (serial) 2307
50.2 System configuration 2309
50.3 Connection diagram 2310
50.4 Device data area 2312
50.5 Message format 2326
50.6 GOT side settings 2375

CHAPTER 51 Settable device range 2378

51.1 Microcomputer ([Computer]) 2378

PART 19 MODBUS

CHAPTER 52 MODBUS/TCP 2382

52.1 Client connection (MODBUS/TCP connection) 2382
52.2 Server connection (MODBUS/TCP connection) 2398

CHAPTER 53 MODBUS/RTU 2404

53.1 Client connection (MODBUS/RTU connection) 2404
53.2 Server connection (MODBUS/RTU connection) 2417

CHAPTER 54 Settable device range 2429

54.1 MODBUS ([MODBUS Server(GOT:Client)]) 2430
54.2 MODBUS ([MODBUS Client(GOT:Server)]) 2436

PART 20 CLPA

CHAPTER 55 SLMP connection 2441

55.1 Connectable devices 2441
55.2 System configuration 2441
55.3 GOT side settings 2443
55.4 SLMP equipment side settings 2448

CHAPTER 56 Settable device range 2449

56.1 CLPA ([SLMP]) 2450

CHAPTER 57 CC-Link IE Field Network Basic connection 2455

57.1 Connectable devices 2455
57.2 System configuration 2456
57.3 GOT side settings 2459
57.4 Master station side settings 2462
57.5 Troubleshooting 2463

CHAPTER 58 Settable device range 2464
58.1 CLPA ([CC-Link IE Field Network Basic]) 2464

PART 21 OPC UA

CHAPTER 59 OPC UA client 2469
59.1 Connectable devices 2469
59.2 System configuration 2469
59.3 GOT side settings 2472
59.4 OPC UA server side settings 2479

CHAPTER 60 OPC UA server 2481
60.1 Connectable devices 2481
60.2 System configuration 2481
60.3 GOT side settings 2483
60.4 OPC UA client side settings 2485

CHAPTER 61 Settable device range 2486
61.1 OPC ([OPC UA]) 2486

PART 22 Peripherals

CHAPTER 62 Sound output device connection 2488
62.1 Connectable devices 2488
62.2 System configuration 2488
62.3 GOT side settings 2489

CHAPTER 63 External I/O device connection 2490
63.1 Connectable devices 2490
63.2 System configuration 2491
63.3 Connection diagram 2493
63.4 GOT side settings 2505

CHAPTER 64 Barcode reader connection 2507
64.1 Connectable devices 2507
64.2 System configuration 2508
64.3 GOT side settings 2510
64.4 System configuration example 2514

CHAPTER 65 Remote personal computer connection (Ethernet connection) 2520
65.1 Connectable devices 2520
65.2 System configuration 2521
65.3 GOT side settings 2523

CHAPTER 66 GOT Mobile connection 2525
66.1 Connectable devices 2525
66.2 System configuration 2526
66.3 GOT side settings 2528

CHAPTER 67 VNC server connection 2530
67.1 Connectable devices . . . 2530
67.2 System configuration . . . 2531
67.3 GOT side settings . . . 2533

CHAPTER 68 Camera, video device, and external display connection 2535
68.1 Connectable devices . . . 2535
68.2 System configuration . . . 2536
68.3 GOT side settings . . . 2538

CHAPTER 69 Digital image device connection 2541
69.1 Connectable devices . . . 2541
69.2 System configuration . . . 2542
69.3 GOT side settings . . . 2545

CHAPTER 70 RFID connection 2546
70.1 Connectable devices . . . 2546
70.2 System configuration . . . 2547
70.3 GOT side settings . . . 2549

PART 23 FA transparent

CHAPTER 71 FA transparent function 2553
71.1 FA transparent function . . . 2553
71.2 Compatible engineering software . . . 2554
71.3 Available GOT internal devices . . . 2555
71.4 Precautions . . . 2556

CHAPTER 72 Accessing with GX Works3 2558
72.1 MELSEC MX Controller (MX-R Model) . . . 2559
72.2 MELSEC MX Controller (MX-F Model) . . . 2569
72.3 PLC CPU (MELSEC iQ-R series) . . . 2571
72.4 PLC CPU (MELSEC iQ-F series) . . . 2584
72.5 CNC C80 . . . 2590
72.6 CC-Link IE Field Network head module . . . 2591
72.7 GOT side settings . . . 2598
72.8 Personal computer side settings . . . 2601
72.9 Precautions for using GX Works3 . . . 2637

CHAPTER 73 Accessing with CW Configurator 2639
73.1 C Controller module (MELSEC iQ-R series) . . . 2639
73.2 MELSECWinCPU (MELSEC iQ-R series) . . . 2647
73.3 GOT side settings . . . 2652
73.4 Personal computer side settings . . . 2654

CHAPTER 74 Accessing with PX Developer 2675
74.1 PLC CPU (MELSEC-Q series (Q mode)) . . . 2675
74.2 GOT side settings . . . 2679
74.3 Personal computer side settings . . . 2681

CHAPTER 75 Accessing with GX Works2 2688
75.1 PLC CPU (MELSEC-Q series (Q mode)) 2688
75.2 C Controller module (MELSEC-Q series) 2711
75.3 PLC CPU (MELSEC-L series) 2717
75.4 Motion CPU (MELSEC-Q series) 2724
75.5 PLC CPU (MELSEC-F series) 2730
75.6 CC-Link IE Field Network head module 2734
75.7 GOT side settings 2735
75.8 Personal computer side settings 2737
75.9 Precautions for using GX Works2 2777

CHAPTER 76 Accessing with GX LogViewer 2781
76.1 PLC CPU (MELSEC-Q series (Q mode)) 2781
76.2 PLC CPU (MELSEC-L series) 2786
76.3 GOT side settings 2788
76.4 Personal computer side settings 2791

CHAPTER 77 Accessing with MT Works2 2796
77.1 Motion CPU (MELSEC iQ-R series) 2797
77.2 Motion CPU (MELSEC-Q series) 2799
77.3 GOT side settings 2804
77.4 Personal computer side settings 2806

CHAPTER 78 Accessing with MR Configurator2 2824
78.1 Servo amplifier 2825
78.2 GOT side settings 2829
78.3 Personal computer side settings 2831

CHAPTER 79 Accessing with FR Configurator2 2832
79.1 Inverter 2833
79.2 GOT side settings 2843
79.3 Personal computer side settings 2846

CHAPTER 80 Accessing with RT ToolBox3 2856
80.1 Robot controller (MELSEC iQ-R series) 2857
80.2 Robot controller (MELSEC-Q series) 2858
80.3 GOT side settings 2861
80.4 Personal computer side settings 2864

CHAPTER 81 Accessing with CPU Module Logging Configuration Tool 2892
81.1 PLC CPU (MELSEC iQ-R series) 2893
81.2 PLC CPU (MELSEC-Q series (Q mode)) 2895
81.3 PLC CPU (MELSEC-L series) 2898
81.4 GOT side settings 2901
81.5 Personal computer side settings 2903

CHAPTER 82 Accessing with MX Component (MX Sheet) 2907
82.1 PLC CPU (MELSEC iQ-R series) 2907
82.2 Motion CPU (MELSEC iQ-R series) 2911
82.3 PLC CPU (MELSEC iQ-F series) 2914

82.4 PLC CPU (MELSEC-Q series (Q mode)) 2917
82.5 C Controller module (MELSEC-Q series) 2927
82.6 Motion CPU (MELSEC-Q series) 2932
82.7 PLC CPU (MELSEC-L series) 2935
82.8 PLC CPU (MELSEC-F series) 2939
82.9 GOT side settings 2942
82.10 Personal computer side settings 2945

Relevant manuals

Point

e-Manual refers to the Mitsubishi Electric FA electronic book manuals that can be browsed using a dedicated tool.

e-Manual has the following features:

- Required information can be cross-searched in multiple manuals.
- Other manuals can be accessed from the links in the manual.
- Hardware specifications of each part can be found from the product figures.
- Pages that users often browse can be bookmarked.
- Sample programs can be copied to the engineering tool.

GOT units and option units

Abbreviations and generic terms		Description
Extension interface converter unit		This unit connects the extension unit of the GOT2000 series and GOT1000 series to the GOT3000 series.
Extension unit	Communication unit	A unit, such as the serial communication unit or CC-Link IE TSN communication unit, installed on the GOT to enable communication with other devices
	Option unit	A unit, such as an external I/O unit, installed on the GOT to provide specific functions
Option		Options, such as SD cards, batteries, and protective sheets, installed on the GOT for use

Software

■Software related to GOT

Abbreviations and generic terms	Description
GT Works3	Software that comprehensively supports screen design for the GOT
GT Works3 Version1	
GT Designer3	Screen design software for the GOT3000 series, GOT2000 series, and GOT1000 series
GT Designer3 (GOT3000)	Screen design software for the GOT3000 series
Speech synthesis license	License to use the speech synthesis function
VNC server function license	License to use the VNC server function with the GOT3000
VPN function license	License to use the VPN function with the GOT3000
License for the remote personal computer operation function (Ethernet)	License to use the remote personal computer operation function (Ethernet) in the GOT3000
Multimedia function license	License to perform the following with the GOT3000 • Use a network camera. • Record or play images taken by a network camera or web camera.
License for GT SoftGOT3000	License to use GT SoftGOT3000
GOT Mobile function license for GOT3000	License to use the GOT Mobile function with the GOT3000
GOT Mobile function license for GT SoftGOT3000	License to use the GOT Mobile function with GT SoftGOT3000
GENESIS64 Advanced	GENESIS64 server application (GEN64-APP)
GENESIS64 Basic SCADA	GENESIS64 server application (GEN64-BASIC)
GENESIS64	Generic term of GENESIS64 Advanced and GENESIS64 Basic SCADA
GT Simulator3	Screen simulator GT Simulator3 for the GOT3000 series
GT SoftGOT3000	Software that performs the same functions as the GOT3000 on a personal computer or panel computer
GT OPC UA Client	OPC UA server connection setting software

■Software related to iQ Works

Abbreviations and generic terms	Description
iQ Works	iQ Platform compatible engineering environment MELSOFT iQ Works
MELSOFT Navigator	Integrated development environment software included in the iQ Platform-compatible engineering environment, MELSOFT iQ Works
MELSOFT iQ AppPortal	Integrated application management software

■Other software

Abbreviations and generic terms		Description
GX Works3		Programmable controller engineering software
GX Works2		
Controller simulator	GX Simulator3	Simulation function of GX Works3
	GX Simulator2	Simulation function of GX Works2
	GX Simulator	Ladder logic test tool function software package
GX Developer		Programmable controller programming software
GX LogViewer		Dedicated logging data viewer
MI Configurator		Configuration and monitor tool for Mitsubishi Electric industrial computers
PX Developer		FBD software package for process control
MT Works2		Motion controller engineering software
MT Developer		Integrated start-up support software for motion controller Q series
CW Configurator		Setting/monitoring tools for the C Controller module and MELSECWinCPU
MR Configurator2		Servo configuration software
MR Configurator		Servo configuration software
FR Configurator2		Inverter setup software
FR Configurator		Inverter setup software
NC Configurator2		CNC parameter setting support software
NC Configurator		CNC parameter setting support tool
FX Configurator-FP		Parameter setting, monitoring, and testing software
FX Configurator-EN-L		FX3U-ENET-L type Ethernet module setting software
RT ToolBox3		Robot program creation software
RT ToolBox2		Robot program creation software
MX Component		Communication library
MX Sheet		Communication support software package
CPU Module Logging Configuration Tool		CPU Module Logging Configuration Tool

PART 1 How to read this manual

1 Useful information

1 Useful information

☞ Page 32 Finding the reference manual

1.1 Finding the reference manual

This section describes the main GOT manuals and their contents.
The following abbreviations are used for the manual names.

Manual name	Abbreviation	Main contents
GT Designer3 (GOT3000) Screen Design Manual	GTD	• Screen operation with GT Designer3 • Settings of the functions that run on the GOT • Functions enabled by connecting the GOT and controllers
GOT3000 Series User's Manual (Hardware)	HW	• GOT hardware specifications • How to connect cables to and install units on the GOT
GOT3000 Series User's Manual (Utility & Maintenance Functions)	UT	• How to operate the utility • How to use dedicated screens such as the sequence program monitor • System alarms and corrective actions
GOT3000 Series User's Manual (Connection)	Connection	• Devices connectable with the GOT • System configuration • Communication settings • FA transparent function (reading and writing programs between a personal computer and a controller via the GOT)
GT SoftGOT3000 User's Manual	SGT	• How to operate GT SoftGOT3000

The following contents and their reference manuals are shown below.

☞ Page 33 Operations related to package data, BootOS, and CoreOS (data transfer)
☞ Page 33 How to protect the GOT and data
☞ Page 33 Operating the GOT using gestures
☞ Page 34 How to use GOT peripherals
☞ Page 34 Settings that can be changed in the utility or in GT Designer3
☞ Page 36 Devices, labels, and tags that can be monitored with the GOT
☞ Page 36 Drive configuration and capacity of the GOT
☞ Page 36 Differences between GT SoftGOT3000 functions and other functions

1.1.1 Operations related to package data, BootOS, and CoreOS (data transfer)

○: Available
—: Not available

Information on...	Reference				
	GTD	HW	UT	Connection	SGT
Reading/writing the package data	○	—	—	—	—
Writing the BootOS and the CoreOS (version upgrade)	○	—	—	—	—
How to use the package data of the GOT with another GOT (uploading and downloading)	—	—	○	—	—

1.1.2 How to protect the GOT and data

○: Available
—: Not available

Information on...	Reference				
	GTD	HW	UT	Connection	SGT
Security functions of the GOT and GT Designer3	○	—	—	—	○

1.1.3 Operating the GOT using gestures

○: Available
—: Not available

Information on...	Reference				
	GTD	HW	UT	Connection	SGT
Operating the GOT screen using gestures	○	—	—	—	—
Operating objects using gestures	○	—	—	—	—

1.1.4 How to use GOT peripherals

○: Available

—: Not available

Information on...	Reference				
	GTD	HW	UT	Connection	SGT
How to use a barcode reader	○	—	—	○ ☞ Page 2507 Barcode reader connection	—
How to use an RFID controller	○	—	—	○ ☞ Page 2546 RFID connection	—
How to operate the personal computer from the GOT	○	—	—	○ ☞ Page 2520 Remote personal computer connection (Ethernet connection)	—
How to use a VNC server	○	—	—	○ ☞ Page 2530 VNC server connection	—
How to display or record images from a camera, video device, or other equipment on the GOT	○	—	—	○ ☞ Page 2535 Camera, video device, and external display connection	—
How to display the GOT screen on an external display	○	—	—	○ ☞ Page 2535 Camera, video device, and external display connection	—
How to play a sound file through speakers	○	—	—	○ ☞ Page 2488 Sound output device connection	—
How to use an external I/O device or an operation panel	○	—	—	○ ☞ Page 2490 External I/O device connection	—
How to monitor a controller on a tablet via the GOT	○	—	—	○ ☞ Page 2525 GOT Mobile connection	—
How to use the GOT as an OPC UA server	○	—	—	—	—
How to monitor a controller via the GOT	○	—	—	—	—
How to access GOT files from a peripheral	○	—	—	—	—
How to access files on an external server from the GOT	○	—	—	—	—

1.1.5 Settings that can be changed in the utility or in GT Designer3

The following shows whether utility menus can be set in GT Designer3.

When the package data is written to the GOT, the utility settings of the GOT can be updated to those of GT Designer3.

PART 2 Procedure for starting the GOT

2 Procedure before operation

3 Multi-channel function

2 Procedure before operation

GT37 SoftGOT3000

This section explains the general procedure before operation.
The procedure before operation differs between GT SoftGOT3000 and the other GOTs.
The procedure also differs depending on the security mode set for the project.
For the procedure before operating a GOT other than GT SoftGOT3000 and the differences depending on the security mode, refer to the following.
☞ Page 39 Procedure before operating the GOT
For the procedure before operating GT SoftGOT3000 and the differences depending on the security mode, refer to the following.
☞ Page 40 Procedure before operating GT SoftGOT3000

What is the security mode?

The GOT's security function has two security modes.

Security mode	Description
Mode 1	The security functions compatible with the GOT2000 series can be used.
Mode 2 (default)	More robust security functions than mode 1 can be used.

Security mode settings can be configured only with GT Designer3.
For details, refer to the following.
GT Designer3 (GOT3000) Screen Design Manual

2.1 Procedure before operating the GOT

GT37 SoftGOT3000

This section explains the procedure before operating the GOT and the manuals describing the details.
The procedure before operation differs depending on the security mode.
The necessity of each step is shown below.
○: Required, △: Optional, —: Not required

Step		Security mode		Reference
		Mode 1	Mode 2	
1	Install GT Designer3 on the personal computer.	○	○	📖GT Works3 Version1 Installation Instructions
2	Create a project with GT Designer3.	○	○	📖GT Designer3 (GOT3000) Screen Design Manual
	Set the Ethernet interface of the GOT when connecting the GOT and the controller via Ethernet.	△	△	📖GT Designer3 (GOT3000) Screen Design Manual
	Configure the settings for connecting the controller to the GOT.	○	○	☞ GOT side settings in each chapter
3	Install the battery (sold separately) in the GOT.	△*1	○	📖GOT3000 Series User's Manual (Hardware)
4	Install the extension unit and options on the GOT.	△	△	📖GOT3000 Series User's Manual (Hardware)
5	Install the GOT on the control panel.	○	○	📖GOT3000 Series User's Manual (Hardware)
6	Provide wiring to the power supply section of the GOT.	○	○	📖GOT3000 Series User's Manual (Hardware)
7	Turn on the GOT. The GOT includes a preinstalled demo screen project at the time of factory shipment. After the GOT is started and the initial settings are configured, the demo screen is displayed.	○	○	—
8	Write the project created with GT Designer3 to the GOT.*2	○	○	📖GT Designer3 (GOT3000) Screen Design Manual
	Enter the password when the file protection function is enabled.	△	△	📖GT Designer3 (GOT3000) Screen Design Manual
	If the security mode set for the project is mode 2, register the information of the operator with administrator privileges in the GOT.	—	○	📖GT Designer3 (GOT3000) Screen Design Manual
9	Turn off the GOT and connect the GOT and the controller.	○	○	☞ System configuration in each chapter
10	Turn on the GOT and the controller to start monitoring. You can check whether the GOT is monitoring normally.	○	○	☞ Page 39 How to check whether the GOT is operating correctly

*1 Install a battery to retain the clock data even when the GOT is powered off.
*2 When a project is written to the GOT, the demo screen project is overwritten.

How to check whether the GOT is operating correctly

The following methods can be used to check for any issues with the operation of the project written to the GOT or the communication status with the controller.

Check	Method
Check whether the GOT recognizes the controller.	This can be checked on the [Communication setting] screen of the utility. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
Check if an error (system alarm) has occurred in the GOT, controller, or network.	When an error occurs in the GOT, controller, or network, the GOT outputs a system alarm (error code and error message). The system alarm can be checked on the [System alarm] of the utility. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)
Check that the settings enable the GOT to communicate with the controller correctly and that the connection cable is connected properly.	This can be checked on the [I/O check] of the utility. 📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

2.2 Procedure before operating GT SoftGOT3000

GT37 SoftGOT3000

This section explains the procedure before operating GT SoftGOT3000 and the manuals describing the details.
The procedure before operation differs depending on the security mode.
The necessity of each step is shown below.
○: Required, △: Optional, —: Not required

Step		Security mode		Reference
		Mode 1	Mode 2	
1	Install GT SoftGOT3000 on the personal computer.	○	○	GT Works3 Version1 Installation Instructions
	When creating a project, install GT Designer3 on the personal computer.	○	○	GT Works3 Version1 Installation Instructions
2	Start GT SoftGOT3000 and register the GT SoftGOT3000 license.	○	○	GT SoftGOT3000 User's Manual
	When starting GT SoftGOT3000 for the first time, set a password for the GT SoftGOT3000 application log file.	○	○	GT SoftGOT3000 User's Manual

	Configure the settings to connect GT SoftGOT3000 and the controller.	○	○	GOT3000 Series User's Manual (Connection)
4	Connect the personal computer with GT SoftGOT3000 installed to the controller.	○	○	☞ System configuration in each chapter
5	Open the project in GT SoftGOT3000.	○	○	GT SoftGOT3000 User's Manual
	Enter the password when the file protection function is enabled.	△	△	GT Designer3 (GOT3000) Screen Design Manual GT SoftGOT3000 User's Manual
	When the security mode set for the project is mode 2, register the information of the operator with administrator privileges to GT SoftGOT3000.	—	○	GT Designer3 (GOT3000) Screen Design Manual GT SoftGOT3000 User's Manual
6	Perform monitoring with GT SoftGOT3000 using the project.	○	○	GT SoftGOT3000 User's Manual
	The following shows how to check if GT SoftGOT3000 is monitoring correctly. • When an error occurs, the details of the error can be checked on the [System alarm] screen of the utility.	○	○	GOT3000 Series User's Manual (Utility & Maintenance Functions)

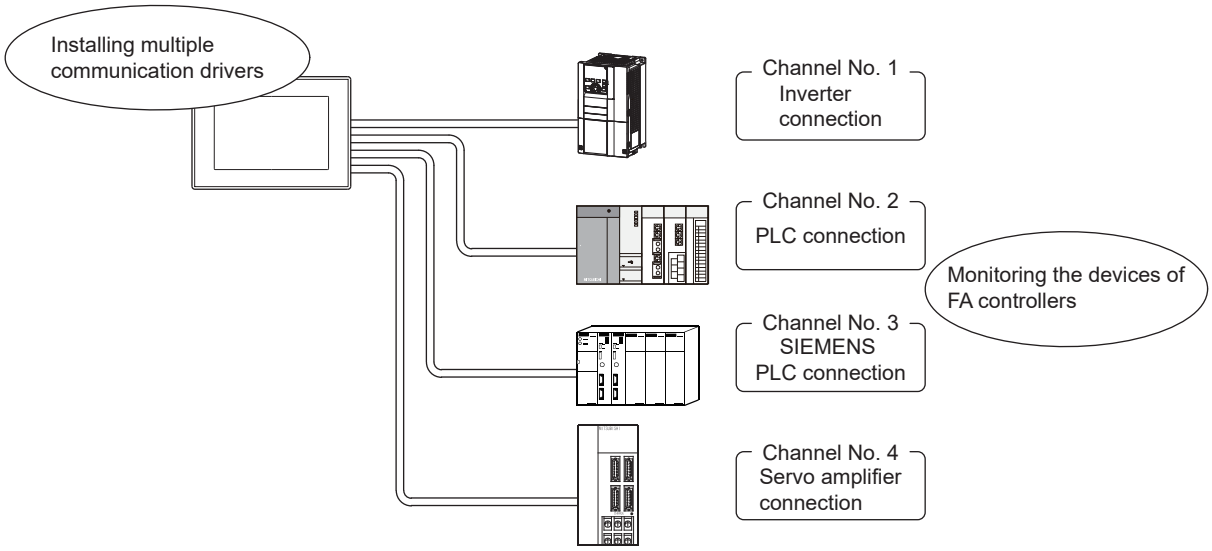
3 Multi-channel function

☞ Page 41 What is multi-channel function?
☞ Page 43 System configuration example
☞ Page 44 GOT side settings
☞ Page 56 Precautions
☞ Page 57 Multi-channel Function Check Sheet

PART 2

3.1 What is multi-channel function?

Multi-channel Function is a function to monitor up to four FA controllers (PLC CPU, inverter, servo amplifier, etc.) on one GOT by writing multiple communication drivers in the GOT.



This manual describes the procedure to use the multi-channel function, based on the following system configuration example.

☞ Page 43 System configuration example

The system configuration between GOT and the controllers when using the multi-channel function is the same as that of when not using the multi-channel function.

For details, refer to the following.

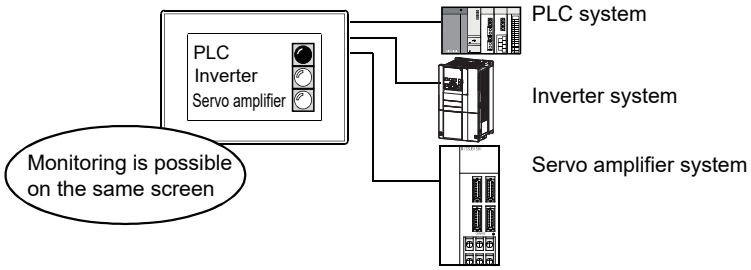
☞ Each chapter indicating the system configuration

Features of the multi-channel function

■With a single unit of GOT, the system consisting of PLC CPU, inverter, servo amplifier and other controllers can be configured.

One GOT can monitor a PLC CPU, inverter and servo amplifier, etc. Therefore, the system configuration, in which several controllers are mixed, can be easily established.

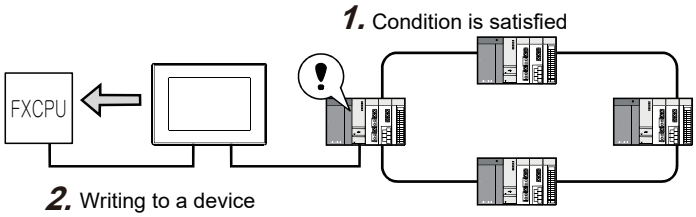
In addition, each system can be monitored on the GOT screen, and the unified management of the information is possible.



■Controlling FXCPU/third party PLC, etc. through the network (CC-Link IE Field Network, etc.)

It is possible to control FXCPU/third party PLC, etc. through the network (CC-Link IE Field Network, etc.).

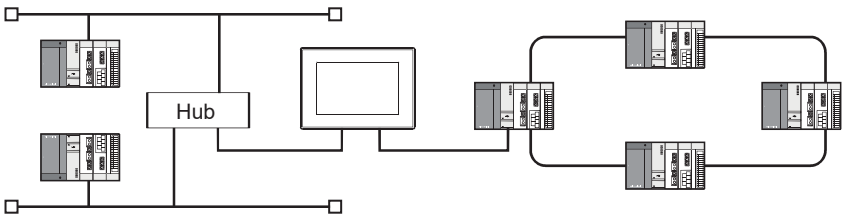
For example, it is possible to execute read/write of a device such as FXCPU when the condition is satisfied, using the device of the PLC CPU on the network (CC-Link IE Field Network, etc.) as the trigger for action.



■With one GOT, the Ethernet connection and the network connection are available in combination.

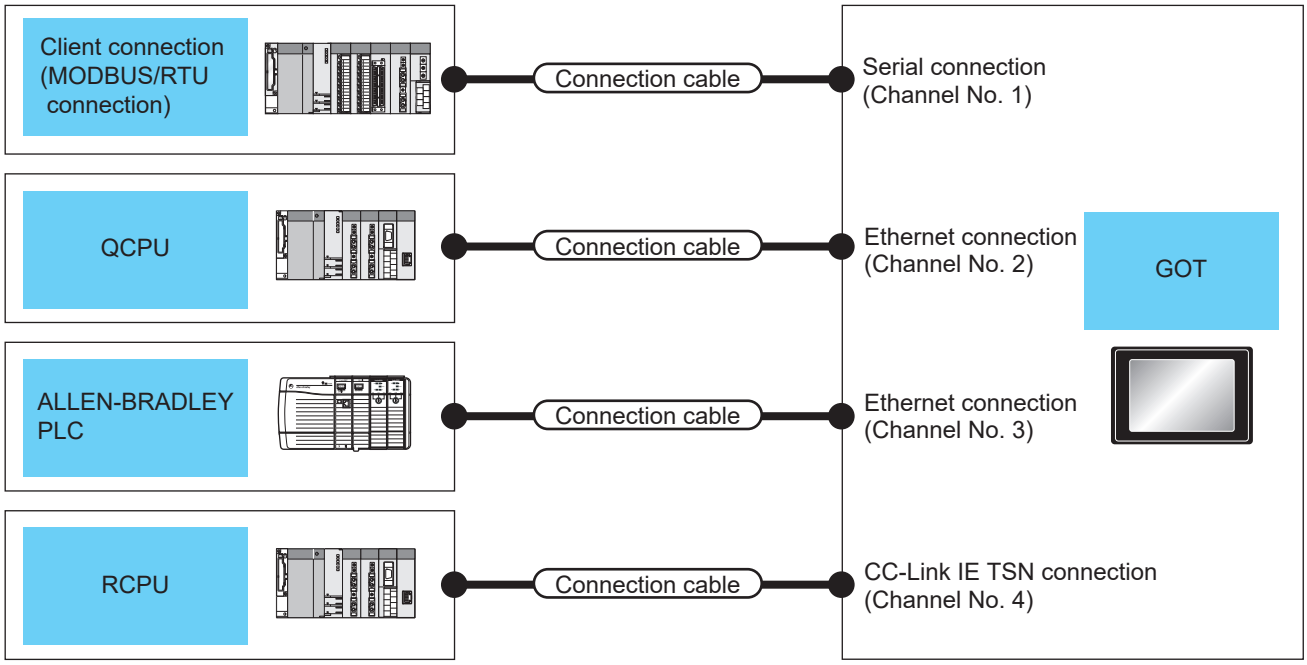
One GOT can make the Ethernet connections and the network connection. Therefore, the system configuration, in which several networks are linked, can be established.

Also, the GOT can monitor multiple controllers on an Ethernet network. (Multi-channel Ethernet connection)



3.2 System configuration example

Each system can be monitored on the GOT screen, and the unified management of the information is possible.
The system configuration, in which several connection types such as the serial connection, Ethernet connections and the network connection are mixed, can be established with one GOT.
For details on the connection type and channel number to be used, refer to the following.
☞ Page 46 Determining the connection type and channel No. (System selection)



Controller	Connection type	Connection cable	GOT			Number of connectable equipment
			Channel No.	Interface	Model	
MODBUS/RTU	Serial connection	For the system configuration between the GOT and the controller, refer to the following. ☞ Each chapter indicating the system configuration	1	Built-in RS-232 interface	GT37 SoftGOT3000	Varies depending on the connection type. ☞ System configuration in each chapter
QCPU	Ethernet connection		2	Built-in Ethernet interface of GOT		
ALLEN-BRADLEY PLC	Ethernet connection		3			
RCPU	CC-Link IE TSN connection		4	GT37-IF2000 + GT25-J71GN13-T2		

Point

The following shows the drivers that can be set to Channels No. 5 to 8.
For the system configuration and connection condition with the controller, refer to the chapter of each controller.

Channel No.	Driver *1	Reference
5 to 8	Barcode reader, RFID controller	➠ Barcode reader connection ➠ RFID connection

*1 Only one channel number can be assigned to one driver.

3.3 GOT side settings

3.3.1 Basics of interface selection

This section explains basic knowledge of the multi-channel function.

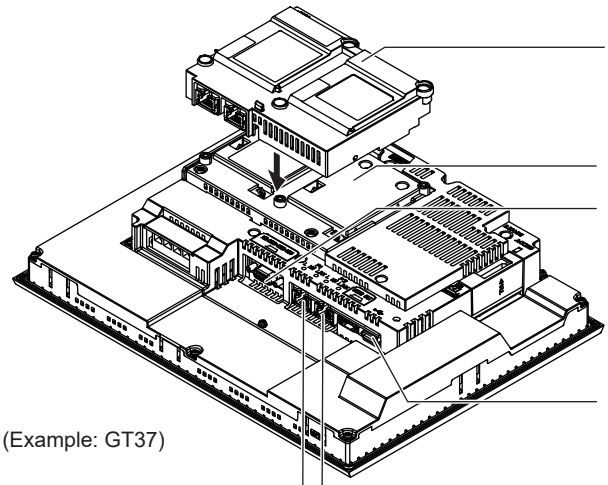
For the steps from system selection to screen design, refer to the following.

☞ Page 45 General flow from system selection to drawing

Multi-channel function specifications

How the units are installed and the multi-channel function specifications are described below.

■Image drawing of unit installation



(Example: GT37)

■Specifications

Item	Specifications	Description
Max. number of channels	Max. 4 channels	In the CC-Link IE TSN and CC-Link IE Field Network connections, only 1 channel can be set for one GOT. For the Ethernet connection and the MODBUS/TCP connection, up to 4 channels can be set. When the Ethernet interface built in the GOT is used for the Ethernet download, the connection is not included in the count of the number of channels. The interface used for connecting external devices or other functions is not included in the channel count.*1
Max. installable number of modules	1	Install the GT37-IF2000, then install the extension unit.
Allowable number of stages	Max. 1 stage	One extension unit can be installed.

*1 The following external devices and functions can be used.
- Barcode reader
- RFID controller
- FA transparent function
- OS install
- Writing project data

3.3.2 General flow from system selection to drawing

System selection for using the multi-channel function is explained below.

Make selection and setting for the multi-channel function by following the order shown below.

1. System selection

Determine the connection type and the channel No. to be used.

☞ Page 46 Determining the connection type and channel No. (System selection)

2. Interface selection

Determine the GOT side interface and communication units to be used for the multichannel function.

☞ Page 48 Determining the GOT side interface (Interface selection)

3. Make settings for Communication Settings.

☞ Page 52 Setting for communication settings

4. Confirm items to know before starting drawing.

☞ Page 54 Items to be checked before starting drawing

3.3.3 Determining the connection type and channel No. (System selection)

Determining the connection type

The combinations of the network connection, Ethernet connection, and the serial connection are available as shown in the following table.

Connection type		Reference
Network connection	CC-Link IE TSN connection	☞ Page 743 CC-Link IE TSN connection
	CC-Link IE Field Network connection	☞ Page 921 CC-Link IE Field Network connection
Ethernet connection	Ethernet connection CC-Link IE TSN connection (built-in Ethernet)	☞ Page 61 Ethernet connection
	Robot controller connection	☞ Page 1919 Ethernet connection
	Third party PLC connection (Ethernet connection)	☞ Page 2148 PLC (Ethernet connection) ☞ Page 2213 PLC (Ethernet connection)
	Microcomputer connection (Ethernet)	☞ Page 2234 Microcomputer (Ethernet connection)
	MODBUS/TCP connection	☞ Page 2382 MODBUS/TCP
Serial connection	MODBUS/RTU connection	☞ Page 2404 MODBUS/RTU

The following shows the applicable combinations of connection types, the number of channels, and restricted functions.
○: Allowed △: Restricted —: Unavailable

Allowable combination of connection types	GOT to be used	Functions that are restricted by the connection type*1	
	GT37	FA transparent function	
		USB	Ethernet
• Network connection: 1 channel • Ethernet connection: 1 to 3 channels	Max. 4 channels	○	○
• Ethernet connection: 4 channels	Max. 4 channels	○	○

*1 When the functions below are used, the connectable number of channels may be restricted depending on the combination of the functions to be used.
• Barcode function, RFID function
• Digital image input function
• Sound output function
For details, refer to the following.
☞ Page 48 Determining the GOT side interface (Interface selection)

Determining the channel No.

■Channel No. of PLC, inverter, servo amplifier, robot controller

After determining the connection type to be used, determine the channel Nos. (CH No. 1 to CH No. 4) to be used for the respective connection types.

There are no special cautions to be attended to for determining channel Nos.

Set the channel No. by selecting [Common] → [Controller Setting] from the menu.

📖GT Designer3 (GOT3000) Screen Design Manual

■Channel No. of external devices (barcode reader, RFID controller, and personal computer)

When connecting a barcode reader, RFID controller, or personal computer, select the channel No. (No. 5 to No. 8) for each external device.

• Number of external devices that can be connected to the GOT

One barcode reader, RFID controller, or personal computer can be connected to one GOT.

One driver must be set for one channel No. (No. 5 to No. 8) in the communication settings.

• Operator authentication (external authentication)

When using the operator authentication (external authentication), the RFID controller or barcode reader is available for the channel No. 8 only.

Write down the following items selected in this section on the check sheet.

Selection of connection type

Write down the name of the connection type to be used.

(1) Channel No. of PLC, Motion controller, inverter, servo amplifier, robot controller (CH No. 1 to 4)

CH No.	① Selection of connection type	② Selection of interface (communication unit)
1	Connection name PLC connection	
2	Connection name Inverter connection	
3	Connection name Servo amplifier connection	
4	Connection name PLC connection	

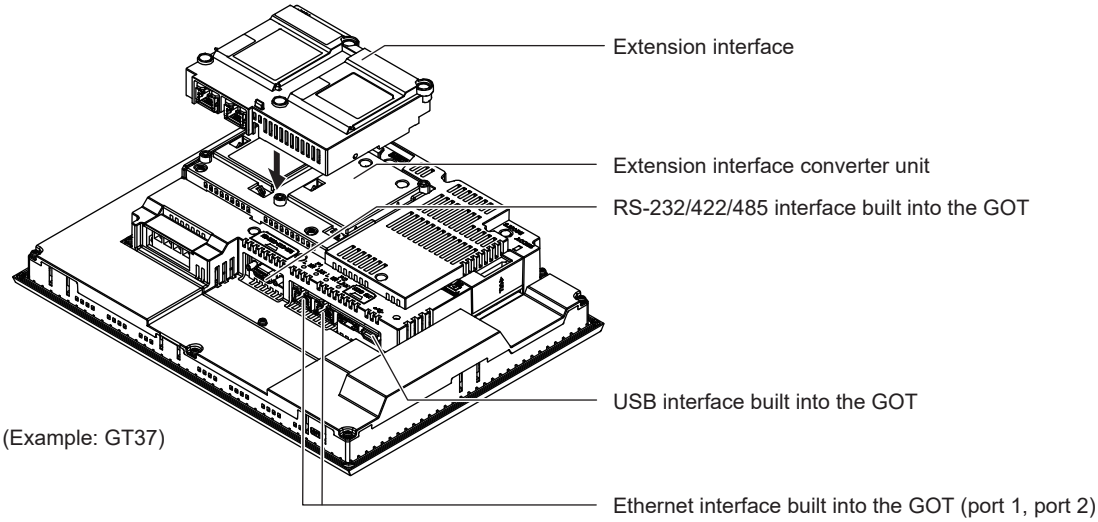
(2) Channel No. of barcode reader, RFID controller, personal computer (CH No. 5 to 8)

CH No.	① Selection of connection type	② Selection of interface (communication unit)
5	Connection name Barcode reader connection	
6	Connection name	
7	Connection name	
8	Connection name RFID controller connection	

3.3.4 Determining the GOT side interface (Interface selection)

To use the multi-channel function, add interfaces to the GOT with the following methods if required.

- Use communication units installed on the extension interfaces with the RS-232/422/485 interface, and/or the Ethernet interface built in the GOT.



(Example: GT37)

Select the interface to be used to enable the selected connection.

Select the interfaces according to the connection type by referring to the following.

Selected connection type	Reference for required interface and communication unit
• CC-Link IE TSN connection • CC-Link IE Field Network connection	☞ Page 49 GOT interface used for network connection
• Ethernet connection	☞ Page 49 GOT interface used for Ethernet connection or CC-Link IE TSN connection (built-in Ethernet)
• Third party PLC connection (Ethernet connection)	
• Robot controller connection	
• Microcomputer connection (Ethernet)	
• MODBUS/TCP connection	
• MODBUS/RTU connection	☞ Page 49 GOT interface used for serial connection
• Other functions	☞ Page 49 GOT interface used for other functions

GOT interface used for network connection

For the network connection, use the following communication units.

Type	Communication unit
CC-Link IE TSN communication unit	GT37-IF2000+GT25-J71GN13-T2
CC-Link IE Field Network communication unit	GT37-IF2000+GT15-J71GF13-T2

GOT interface used for Ethernet connection or CC-Link IE TSN connection (built-in Ethernet)

For the Ethernet connection or CC-Link IE TSN connection (built-in Ethernet), use the following interface built in the GOT.

Type	Interface built in the GOT
Interface built in the GOT	Ethernet interface*1

*1 Up to four channels can be used.

GOT interface used for serial connection

For the serial connection, use the following interfaces built in the GOT and communication units in combinations.
Provide interfaces equivalent to the number of channels used for serial connection.

Type	Interface built in the GOT, communication unit
Interface built in the GOT	RS-232/422/485 interface
Serial communication module	• GT37-IF2000+GT15-RS2-9P • GT37-IF2000+GT15-RS4-9S • GT37-IF2000+GT15-RS4-TE

GOT interface used for other functions

For the following functions, use the interfaces built in the GOT and communication units.

Function	Interface built in the GOT, communication unit
Ethernet download	• Ethernet interface
Barcode function	• RS-232/422/485 interface • USB interface • GT37-IF2000+GT15-RS2-9P • GT37-IF2000+GT15-RS4-9S • GT37-IF2000+GT15-RS4-TE
RFID function	• RS-232/422/485 interface • GT37-IF2000+GT15-RS2-9P • GT37-IF2000+GT15-RS4-9S • GT37-IF2000+GT15-RS4-TE

Precautions

Check if the number of channels for the multi-channel function to be used is restricted or not. If it is restricted, review the system configuration.

Write Check Sheet

Write down the following items selected in this section on the check sheet.

② Selection of interface (communication unit)

Write down the interface name and the model name of the communication unit to be used for each connection type.

(1) Channel No. of PLC, Motion controller, inverter, servo amplifier, robot controller (CH No. 1 to 4)

CH No.	① Selection of connection type	② Selection of interface (communication unit)
1	Connection name PLC connection	Ethernet interface built into the GOT
2	Connection name Inverter connection	Ethernet interface built into the GOT
3	Connection name Servo amplifier connection	Ethernet interface built into the GOT
4	Connection name PLC connection	Ethernet interface built into the GOT

(2) Channel No. of barcode reader, RFID controller, personal computer (CH No. 5 to 8)

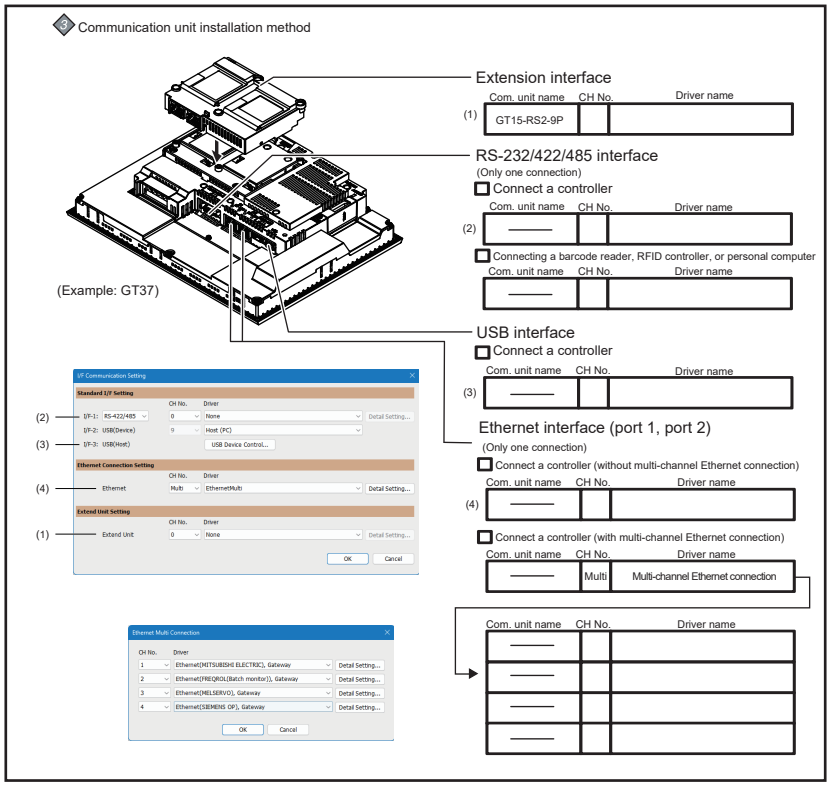
CH No.	① Selection of connection type	② Selection of interface (communication unit)
5	Connection name Barcode reader connection	GT37-IF2000+GT15-RS2-9P
6	Connection name	
7	Connection name	
8	Connection name RFID controller connection	RS-232 interface built into the GOT

Write Check Sheet

Write down the following items on the check sheet.

③ Communication unit installation method

1. Write down the name of the communication unit to be used for each connection type.



2. After writing down the names of communication units, write down the CH No. to be assigned to each unit based on the entries in Check sheet No. 1 (selection of connection type and interface).

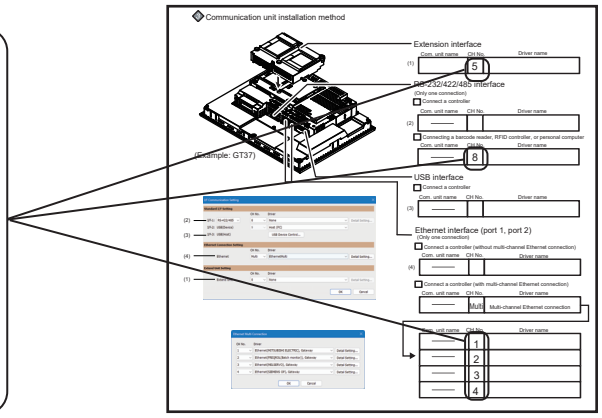
Check sheet No.1 (selection of the connection type and interface)

(1) Channel No. of PLC, Motion controller, inverter, servo amplifier, robot controller (CH No. 1 to 4)

CH No.	Selection of connection type	Selection of interface (communication unit)
1	Connection name PLC connection	Ethernet interface built into the GOT
2	Connection name Inverter connection	Ethernet interface built into the GOT
3	Connection name Servo amplifier connection	Ethernet interface built into the GOT
4	Connection name PLC connection	Ethernet interface built into the GOT

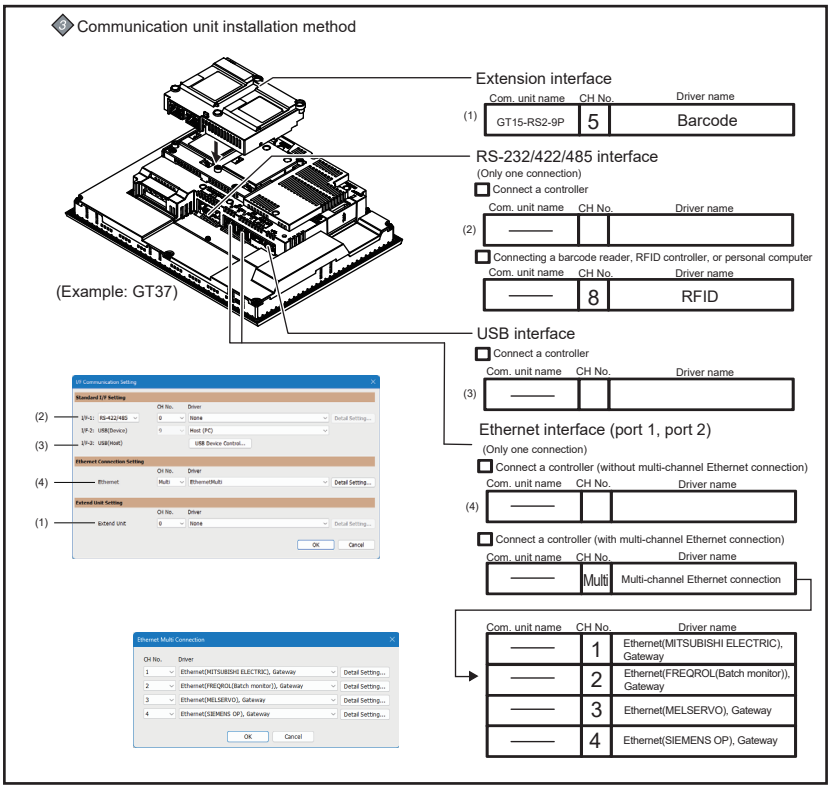
(2) Channel No. of barcode reader, RFID controller, personal computer (CH No. 5 to 8)

CH No.	Selection of connection type	Selection of interface (communication unit)
5	Connection name Barcode reader connection	GT37-IF2000+GT15-RS2-9P
6	Connection name	
7	Connection name	
8	Connection name RFID controller connection	RS-232 interface built into the GOT



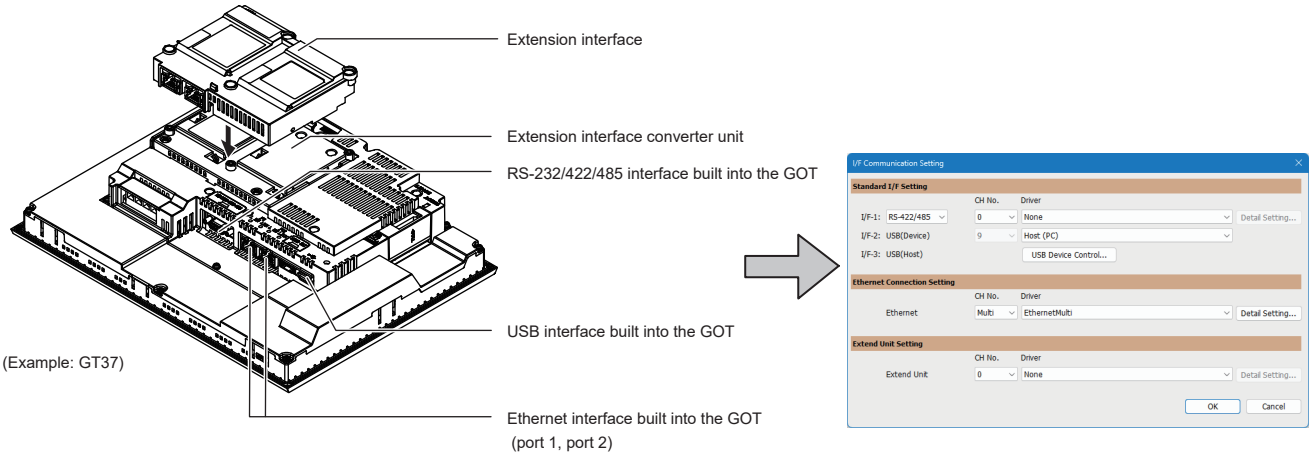
3. After writing down the CH No., write down the communication driver name for each connection type. For the communication drivers used for the respective connection types, refer to the following.

Chapter of each connection type



3.3.5 Setting for communication settings

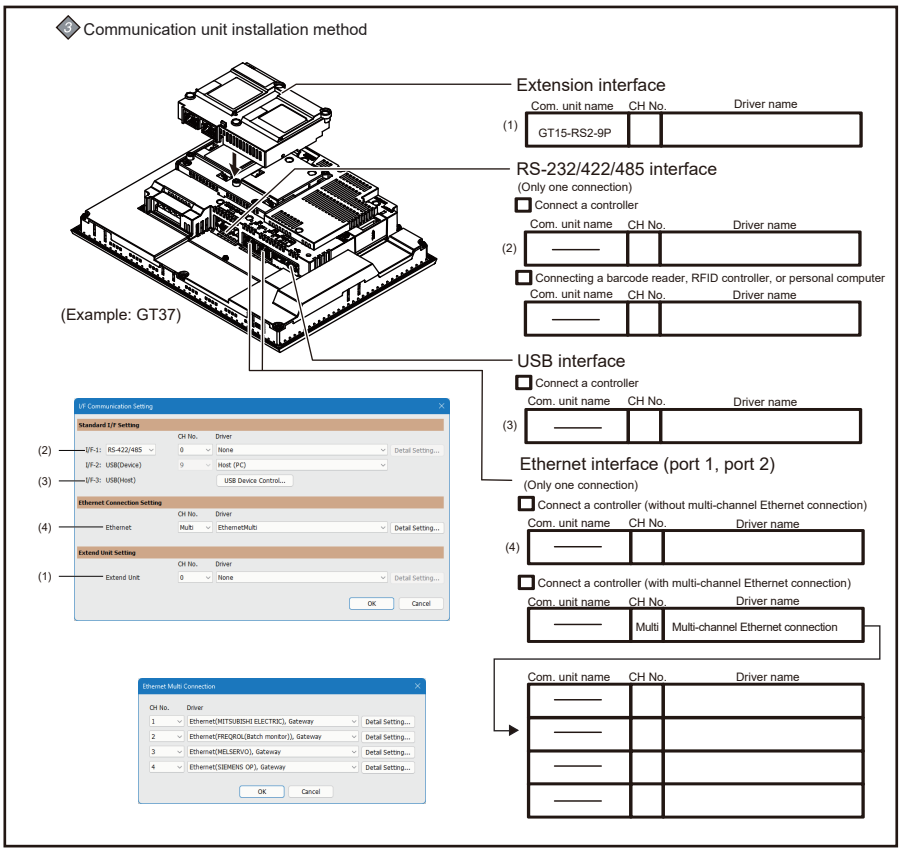
Make communication settings based on the interface and the installation position of the respective communication units.



Check

Configure the controller settings in GT Designer3 by referring to the check sheet where the necessary information has been written.

The positions on the check sheet indicate the positions of the settings on the controller settings screen.

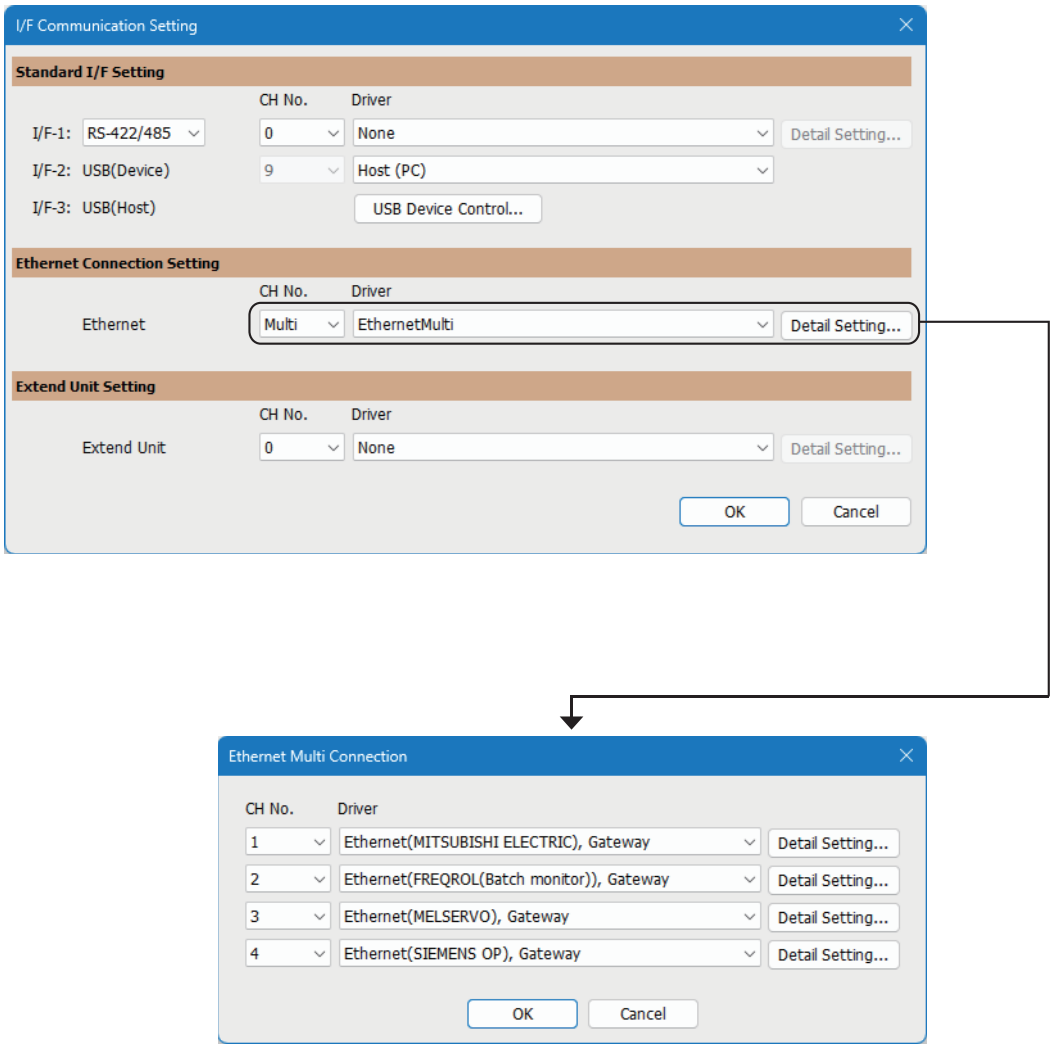


This completes the controller settings for the multi-channel function.

Create a screen with GT Designer3.

Ex.

Setting example for Ethernet connection (4 channels)



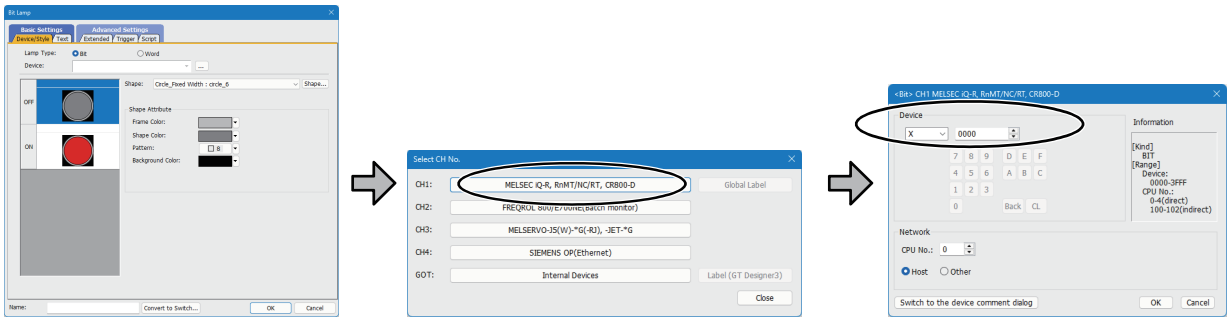
3.3.6 Items to be checked before starting drawing

The following describes that should be understood before starting drawing and the functions that should be set beforehand when using the multi-channel function.

Device settings

It is necessary to set the device to be used together with the CH No.

GT Designer3 (GOT3000) Screen Design Manual



1. Click the device setting button.

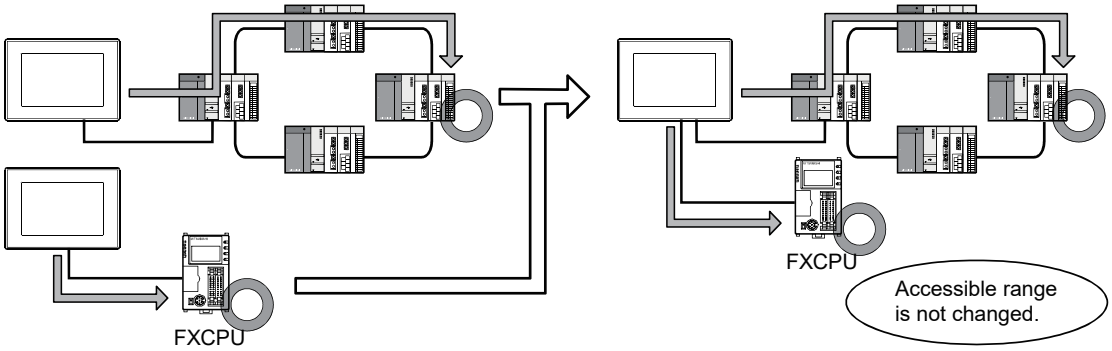
2. Click the controller to be set.

3. Set the device.

Access range for monitoring

The access range for monitoring is not changed even when the multi-channel function is used.

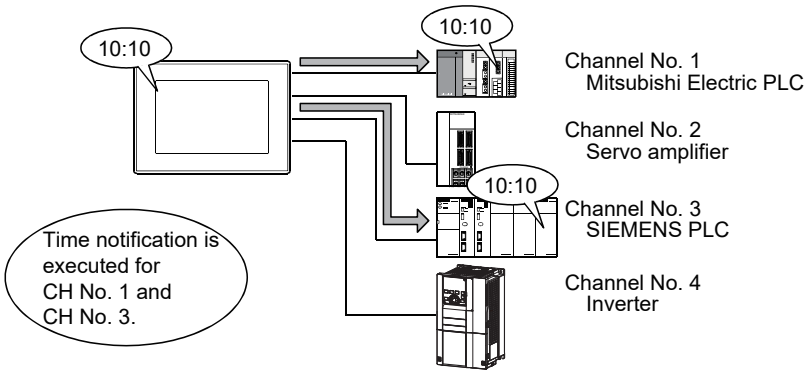
Access range for monitoring in each chapter



Clock function

Set the controller for which adjust/broadcast should be executed by the CH No.

GT Designer3 (GOT3000) Screen Design Manual



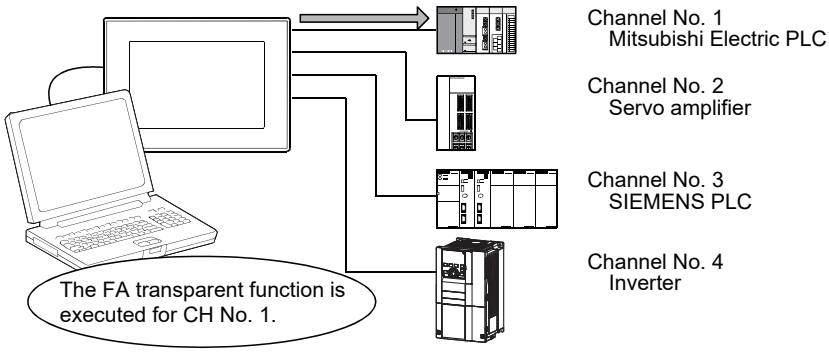
FA transparent function

Set the controller for which the FA transparent function should be executed by the CH No.

☞ Setting communication interface in each chapter in FA transparent

The set CH No. can be changed by the Utility.

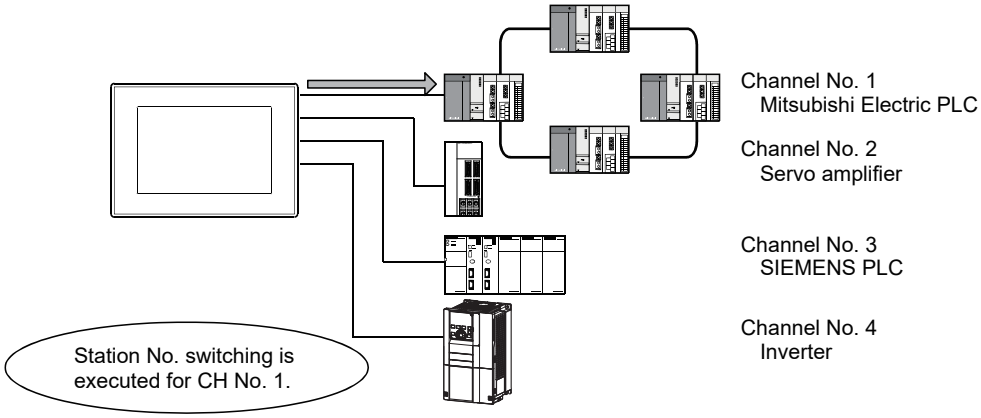
To execute the FA transparent function for other CH No., change the CH No. using the Utility.



Station No. switching function

Set the controller for which the station No. switching function should be executed by the CH No.

GT Designer3 (GOT3000) Screen Design Manual



3.4 Precautions

3.4.1 Occurrence of the same system alarm at different channels

When the advanced system alarm is used, if the system alarms with the same error code occur in different channels the GOT treats the alarms as the same system alarm.
Therefore, if the system alarms with the same error code occur one by one, the time of later system alarm occurrence is not reflected to the GOT.

3.4.2 Confirmation of the channel No. at which a system alarm occurred

When a system alarm occurred, confirm the channel No. where the alarm occurred, using the procedure indicated below.

- Check by [System alarm display] of the utility.

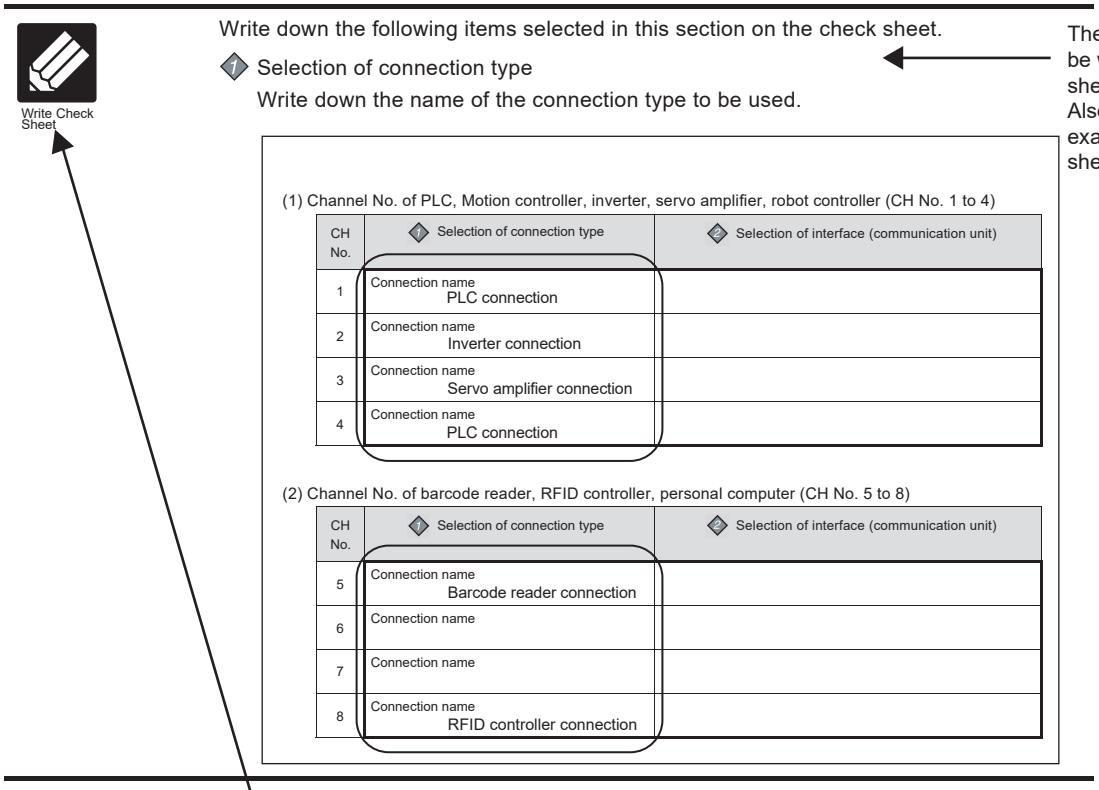
GOT3000 Series User's Manual (Utility & Maintenance Functions)

- Monitor the internal devices of the GOT.

GT Designer3 (GOT3000) Screen Design Manual

3.5 Multi-channel Function Check Sheet

This section provides the check sheet to be used for Communication Settings when the multi-channel function is used. Checking items explained in these sections using the check sheet on the following page allows you to complete the setting for the multi-channel function.



The following symbols are used for each purpose.

Indicates parts where items and details are to be written.
Confirm the details and write them on the check sheet.

Indicates parts where written details are to be checked.
Confirm the details and configure the controller settings.

Check sheet No.1 (selection of connection type and interface)

(1) Channel No. of PLC, Motion controller, inverter, servo amplifier, robot controller (CH No. 1 to 4)

CH No.	① Selection of connection type	② Selection of interface (communication unit)

☞ Page 308 MELSEC iQ-F series (Ethernet module connection)
☞ Page 341 MELSEC-Q series (Built-in Ethernet port connection)
☞ Page 391 MELSEC-Q series (Ethernet module connection)
☞ Page 436 MELSEC-L series (Built-in Ethernet port connection)
☞ Page 461 MELSEC-L series (Ethernet module connection)
☞ Page 480 MELSEC-A series (Ethernet module connection)
☞ Page 500 MELSEC-F series (Ethernet module connection)

4.1 MELSEC MX Controller (MX-R Model) (Built-in Ethernet port connection)

☞ Page 62 Connectable devices
☞ Page 63 System configuration
☞ Page 66 GOT side settings
☞ Page 76 PLC side settings
☞ Page 89 Encrypted communication
☞ Page 91 Connection to the PLC with the authentication function enabled
☞ Page 93 Access range for monitoring

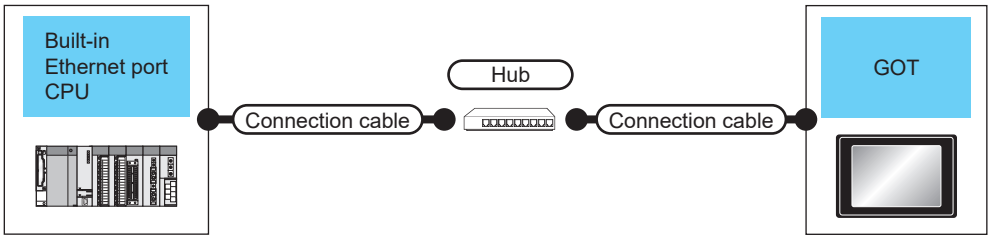
4.1.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64	○	GT37 SoftGOT3000
	MXR500-128 MXR500-256	○	GT37 SoftGOT3000

4.1.2 System configuration



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 64 Connection cable

☞ Page 64 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 64 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	Model
MELSEC MX Controller (MX-R Model)*1*2*3*4	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the built-in Ethernet port CPU, refer to the manual of the PLC to be used.

*2 For [Unit Type] to be selected in [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 73 [Connected Ethernet Controller Setting]

*3 Connect to the Ethernet port (P3) of the MELSEC MX Controller.

*4 When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.
For information on how to logon and logoff, refer to the following.

☞ Page 91 Logon to the PLC

☞ Page 91 Logoff from the PLC

The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.
Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.

☞ Page 91 Creating a project

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

■When [Unit Type] in [Connected Ethernet Controller Setting] is [MX-R(Ethernet)] or [MX-R(Ethernet Encryption)]

Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP+TLS+DTLS		
MELSEC MX Controller (MX-R Model)	120	64	GT37 SoftGOT3000	119 (16 or less recommended)

■When [Unit Type] in [Connected Ethernet Controller Setting] is [MX-R(CC-Link IE TSN)]

Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP		
MELSEC MX Controller (MX-R Model)	8	8	GT37 SoftGOT3000	119 (8 or less recommended)

Connection to the built-in Ethernet port of the built-in Ethernet port CPU

Connect the GOT after turning on the network equipment such as the built-in Ethernet port CPU or hub to enable communications.

If the GOT cannot communicate with the built-in Ethernet port CPU, a communication error may occur on the GOT.

4.1.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

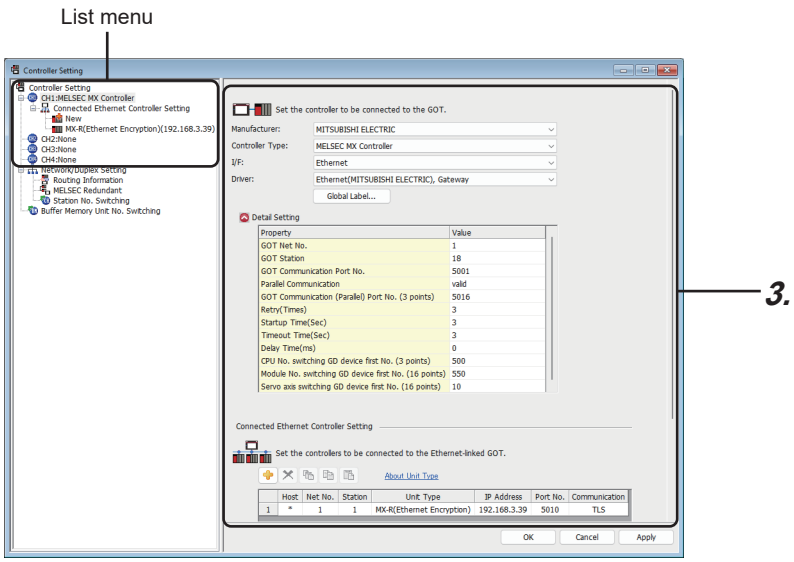
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC MX Controller]
[I/F]	[Ethernet]
[Driver]	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 68 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 73 [Connected Ethernet Controller Setting]

4. When you have completed the settings, click the [OK] button.

Point

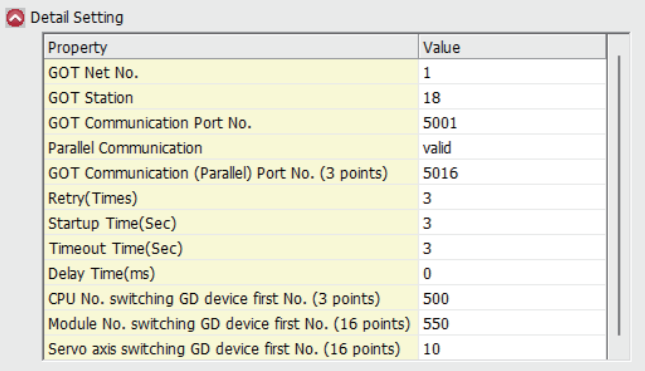
The controller settings can be checked in [I/F Communication Setting].

For details, refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]*3	Set this item when using other models together. Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 70 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]*3	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 71 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 72 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 73 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

*3 Set values when using MELSEC iQ-R series or MELSEC-Q series mixed.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

■When connecting multiple GOTs

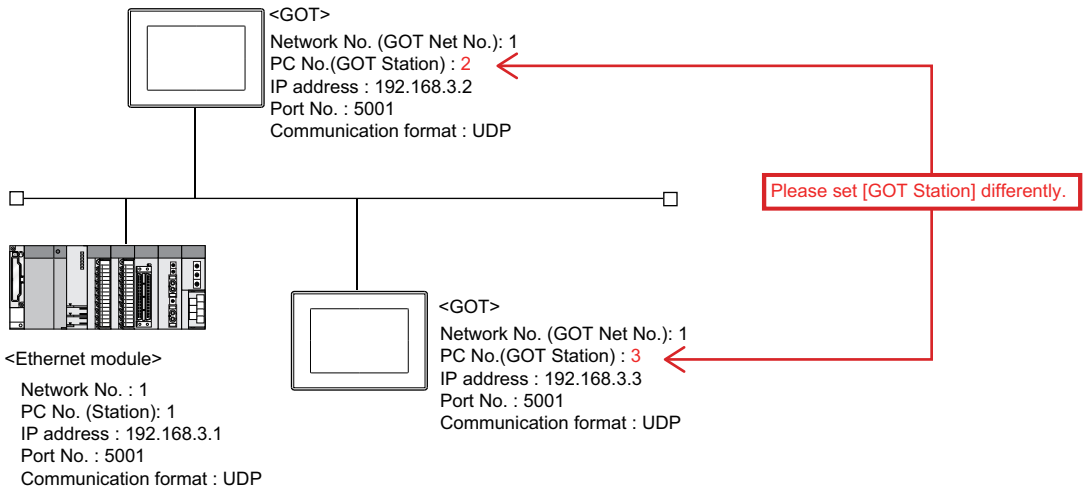
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 68 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

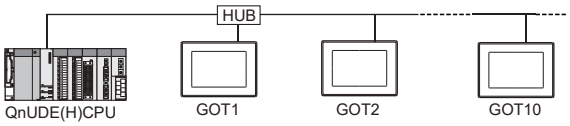
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup Time	3sec (default)	4sec	4sec
Timeout Time	3sec (default)	4sec	4sec

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

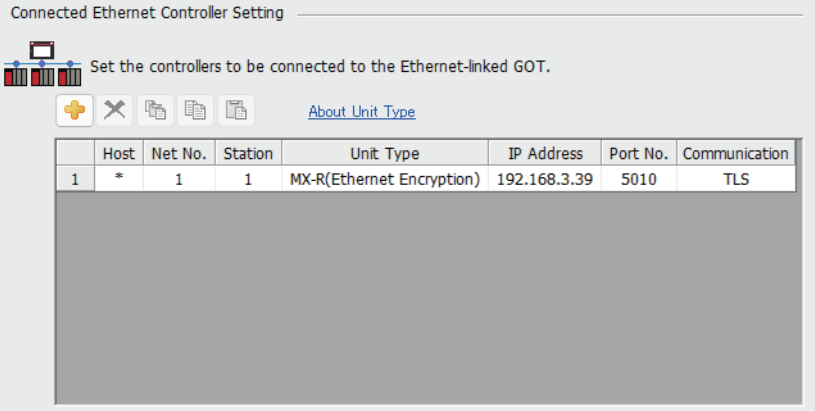
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	☞ Page 73 [Station]
[Unit Type]	Select the model of the connected Ethernet equipment.	☞ Page 73 [Unit Type]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 73 [Port No.], [Communication]
[Communication]	Set the communication format of the connected Ethernet equipment.	☞ Page 73 [Port No.], [Communication]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].
☞ Page 68 [Detail Setting]

■[Unit Type]

Select an item for [Unit Type] as shown below.

GOT connection destination	[Unit Type]
MELSEC MX Controller (MX-R Model)	• When using the built-in Ethernet port for communication: [MX-R(Ethernet)] • When using the built-in CC-Link IE TSN port for communication: [MX-R(CC-Link IE TSN)] • When using the built-in Ethernet port for encrypted communication: [MX-R(Ethernet Encryption)]*1

*1 For details on encrypted communication, refer to the following.
☞ Page 89 Encrypted communication

■[Station]

The setting range is as follows:

[Unit Type]	[Station]
[MX-R(Ethernet)] [MX-R(Ethernet Encryption)]	[1] to [120]
[MX-R(CC-Link IE TSN)]	[0]

■[Port No.], [Communication]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[MX-R(Ethernet)]	[5006]	[UDP]
	[5007]	[TCP]
[MX-R(CC-Link IE TSN)]	[5001]	[UDP]
	[5002]	[TCP]
[MX-R(Ethernet Encryption)]	[1] to [4999], [5010] to [65534]	[TLS], [DTLS]

■When [Unit Type] is [MX-R(Ethernet)] or [MX-R(Ethernet Encryption)]

When [MX-R(Ethernet)], [MX-R(Ethernet Encryption)] is selected for [Unit Type], [Port No.] can be changed.
There is no setting for the network number and PLC number of built-in Ethernet port CPU (Port number: 5006, 5007).
The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

■Connection to the built-in Ethernet port PLC with [Communication] set to [TCP]

During communication with the built-in Ethernet port PLC with [Communication] set to [TCP], using the FA transparent function may change the setting from [TCP] to [UDP] and start communication with the PLC with the new setting.
In this case, communication with the built-in Ethernet port PLC cannot be executed normally.
Take the following corrective action.

Phenomenon	Cause	Corrective action
Communication fails when using the FA transparent function.	When the multi-channel Ethernet connection is used, [TCP] and [UDP] are used to the same IP address, and then the FA transparent function is used for the channel set to [TCP].	Execute the FA transparent function for the channel set to [UDP].

Point

Changing the host station on the GOT
[Host] can be changed with the utility function of the GOT.
For details on the setting method, refer to the following manual.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

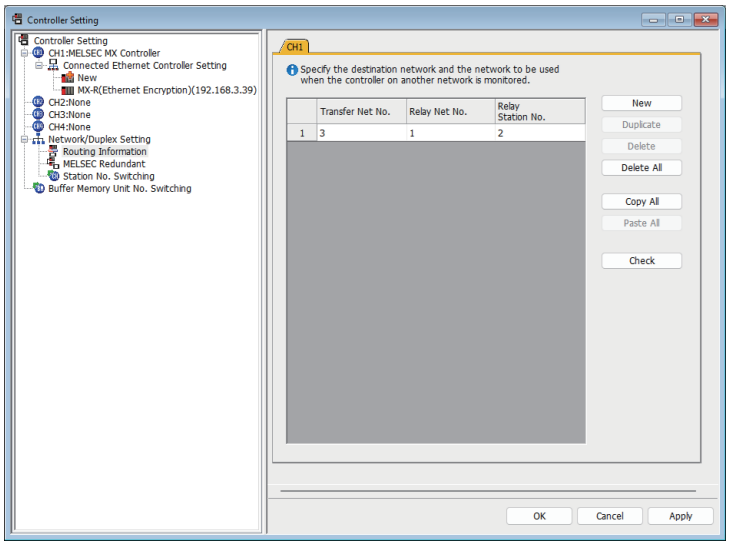
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

Page 76 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.1.4 PLC side settings

Model		Reference
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64 MXR500-128 MXR500-256	☞ Page 76 Connection to the built-in Ethernet port CPU of the MELSEC MX Controller (MX-R Model)

Connection to the built-in Ethernet port CPU of the MELSEC MX Controller (MX-R Model)

This section describes the settings of the GOT and the built-in Ethernet port CPU in the system configuration shown below.

☞ Page 76 One-to-one connection with the GOT side communication format set to UDP
☞ Page 79 One-to-one connection with the GOT side communication format set to TCP, TLS, or DTLS
☞ Page 82 Multi-connection with the GOT side communication format set to UDP
☞ Page 85 Multi-connection with the GOT side communication format set to TCP, TLS, or DTLS

Point

• Built-in Ethernet port CPU

For details on the built-in Ethernet port CPU, refer to the following manual.

📖Manual of the MELSEC MX Controller

• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

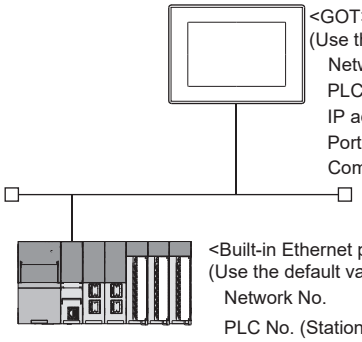
☞ Page 69 When connecting multiple GOTs

■One-to-one connection with the GOT side communication format set to UDP

• System configuration

For one-to-one connection, no settings are required on the PLC side.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



<GOT>
(Use the default value for settings other than the following.)

Network No. (GOT Net No.)*3	: 1
PLC No. (GOT Station)*3	: 1
IP address	: 192.168.3.18
Port No.	: 5001
Communication format	: UDP (fixed)

<Built-in Ethernet port CPU>*1
(Use the default value for the following settings.)

Network No.	: 1 (virtual)*2
PLC No. (Station)*3	: 2 (virtual)*2
IP address	: 192.168.3.39
Port No.	: 5006 (fixed)
Communication format	: UDP (fixed)

*1 For the settings when using system devices such as a hub, refer to the following.
☞ Page 82 Multi-connection with the GOT side communication format set to UDP

*2 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*3 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 66 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to the Built-in Ethernet port RCPU

The setting items for the network number and station number do not exist on the PLC side.

Set the network number and station number on the GOT side.

When doing so, set a network number not used in the system.

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	MX-R(Ethernet)
	[IP Address]	192.168.3.39
	[Port No.]	5006
	[Communication]	UDP

*1 Set the same value as [GOT Net No.].

*2 Set a value not set for [GOT Station].

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.39

Reply from 192.168.3.39:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.39

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

Manual of the MELSEC MX Controller

■One-to-one connection with the GOT side communication format set to TCP, TLS, or DTLS

The following shows an example when the communication format is TCP.

Point

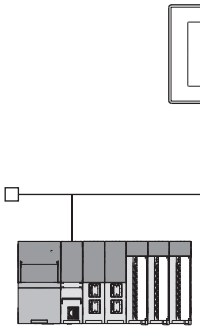
For information on encrypted communication settings, refer to the following.

☞ Page 89 Encrypted communication

• System configuration

For one-to-one connection, no settings are required on the PLC side.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



<GOT>
(Use the default value for settings other than the following.)
Network No. (GOT Net No.)*3 : 1
PLC No. (GOT Station)*3 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : TCP

<Built-in Ethernet port CPU>*1
(Use the default value for the following settings.)
Network No. : 1 (virtual)*2
PLC No. (GOT Station)*3 : 2 (virtual)*2
IP address : 192.168.3.39

*1 For the settings when using system devices such as a hub, refer to the following.
☞ Page 85 Multi-connection with the GOT side communication format set to TCP, TLS, or DTLS

*2 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*3 For the following settings, the setting names are different on the PLC side and the GOT side.

	[IP Address]	192.168.3.1	192.168.3.2
	[Port No.]	5006	5006
	[Communication]	UDP	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number and PLC numbers of other PLCs on the same network.

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.1

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

Manual of the MELSEC MX Controller

■Multi-connection with the GOT side communication format set to TCP, TLS, or DTLS

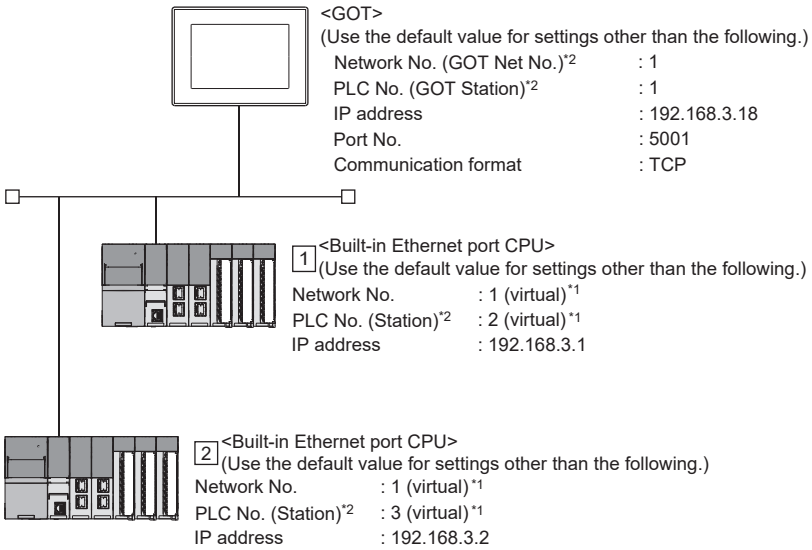
The following shows an example when the communication format is TCP.

Point

For information on encrypted communication settings, refer to the following.

☞ Page 89 Encrypted communication

- System configuration



*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

	[Port No.]	5007	5007
	[Communication]	TCP*3	TCP*3

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number.

*3 When [MX-R(Ethernet Encryption)] is set for [Unit Type], set TLS or DTLS.

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

\>Ping 192.168.3.1

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works3

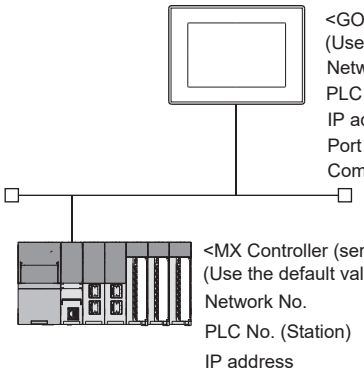
The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

Manual of the MELSEC MX Controller

4.1.5 Encrypted communication

The following describes the encrypted communication.



<GOT (client)>
(Use the default value for settings other than the following.)
Network No. (GOT Net No.) : 1
PLC No. (GOT Station) : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : TLS or DTLS

<MX Controller (server)>
(Use the default value for the following settings.)
Network No. : 1 (virtual)
PLC No. (Station) : 2 (virtual)
IP address :192.168.3.39

Client	Server
GOT	MELSEC MX Controller

For the PLC side settings, refer to the following.

☞ Page 79 One-to-one connection with the GOT side communication format set to TCP, TLS, or DTLS
☞ Page 85 Multi-connection with the GOT side communication format set to TCP, TLS, or DTLS

Precautions

■When the faulty monitor CPU station repeatedly turns on and off

When DTLS encrypted communication fails, the GS device of the faulty monitor CPU station turns on and the station monitoring turns on.

After that, if ping test with the controller is successful, the GS device of the faulty monitor CPU station turns off.

If DTLS encrypted communication remains unsuccessful, the GS device of the faulty monitor CPU station repeatedly turns on and off.

In that case, correct the DTLS encrypted communication settings.

■When communication is terminated without notifying the encrypted communication stop

The connection may not be reestablished if the communication is terminated, such as by powering off the GOT or disconnecting the Ethernet cable between the GOT and the controller, without issuing the encrypted communication stop notification to the controller.

To reestablish the connection, perform one of the following operation.

- Restart the controller.
- Set a connection monitoring timer to the encrypted communication port of the controller, and reconnect it after the specified time in seconds has elapsed.

Encrypted communication version

The version of the encrypted communication used by the GOT depends on the MELSEC MX Controller settings.

Version setting of the encrypted communication for the MELSEC MX Controller	Version of the encrypted communication used by the GOT
TLS1.3	TLS1.3
TLS1.3/TLS1.2	TLS1.3
TLS1.2	TLS1.2
DTLS1.2	DTLS1.2
Other than the above	Unsupported

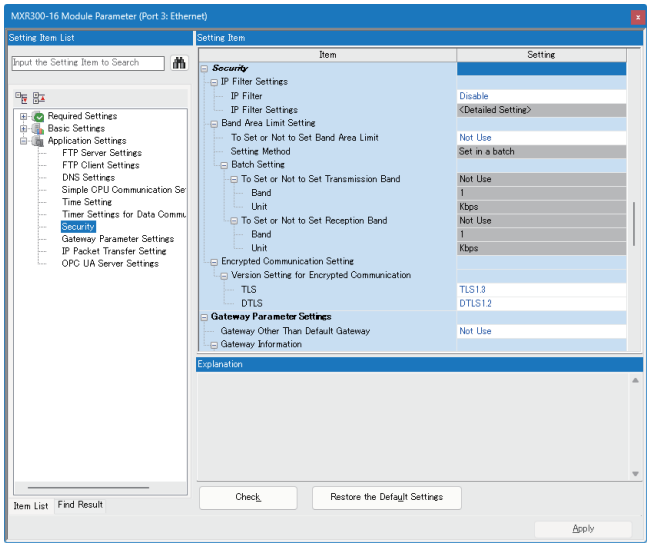
Setting procedure of the encrypted communication

The following shows the setting procedure of the encrypted communication.

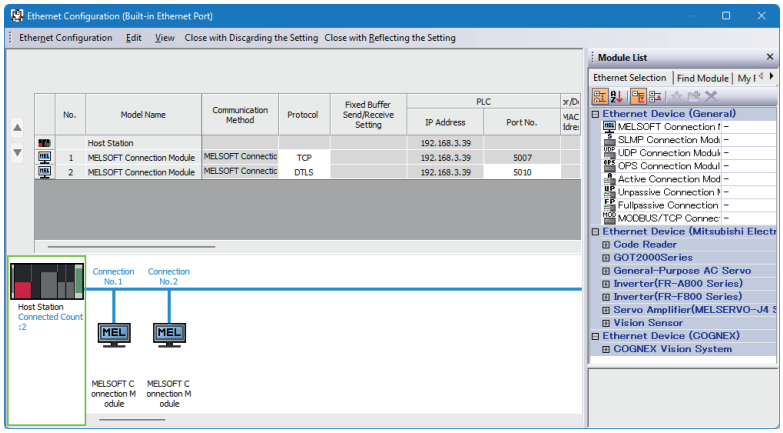
■Settings in GX Works3

Operating procedure

1. Select [Application Setting] → [Security] → [Version Setting for Encrypted Communication] to set the version.



2. Select [Basic Setting] → [External Device Configuration], and select a port number for the encrypted communication port.



3. Select [Project] → [Security] → [Certificate Management] to create a server certificate.

For information on how to create a server certificate, refer to the following.

Manual of the MELSEC MX Controller

4. Write a project to the MELSEC MX Controller.

■Settings in GT Designer3 and the GOT

For details on the GT Designer3 and GOT settings, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Operating procedure

1. Set [MX-R(Ethernet Encryption)] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
2. Download the project data in the GOT.
3. Import the server certificate of the MELSEC MX Controller created and saved in GX Works3 from the utility screen.

4.1.6 Connection to the PLC with the authentication function enabled

Logon to the PLC

When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.

Touch a special function switch (Destination Authentication) set in the project to display the key window.

Enter the [User Name] and [Password] to log on.

For information on how to set a special function switch, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Logoff from the PLC

Touch a special function switch (Destination Authentication) set in the project to log off.

Reading and writing of cyclic devices

Cyclic devices communicate using an expansion unit, allowing read and write operations even in the logged-off state.

Precautions

■Creating a project

At GOT startup, the PLC is in logoff state.

The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.

Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.

For information on how to set screens and functions, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Take the following precautions when creating a project.

Item		Precautions for using the destination authentication function
[Environmental Setting]	[Screen Switching/Window]	Set the GOT internal device as the screen switching device. As well as logoff operation by GOT, reset on the PLC side or other operations can also make the PLC in logoff state. By setting the GOT internal device as the screen switching device, a screen can be switched even in logoff state due to reset on the PLC side or other operations.
	[Language Switching]	Set the GOT internal device as the language switching device. When a PLC device is set, comments cannot be displayed in logoff state.
	[System Information]	Set the GOT internal device as the system information device. When a PLC device is set, a system alarm occurs in logoff state.
	[Security]	It is recommended not to use screen security (level authentication and operator authentication) for connection with the PLC with the destination authentication function enabled.
		When using the level authentication, set the GOT internal device as the security level device.
Screen setting	Screen displayed immediately after GOT startup	Place a special function switch (Destination Authentication) to perform destination authentication for logging on to the PLC. Do not configure the setting to monitor the PLC devices.
	Screen number	Specify the screen number ranges separately for the screen displayed in logoff state and the screen displayed in logon state. Separating the screen number ranges makes screen transition in logoff state easy to consider. Example) Before authentication: 1 to 100, after authentication: 101 or later
	Screen switching control at logoff	Configure the setting using trigger actions or other methods so that the screen switches at logoff to the screen displayed before authentication.
Function that is not recommended for use when connecting with the PLC with the destination authentication function enabled		• Screen security (level authentication and operator authentication) • GOT Mobile function (Destination authentication cannot be performed on a mobile screen.)
Others	Function to specify the conditions other than the trigger device	Specify the trigger indirectly by using trigger actions or other methods. Example) When the PLC device controls the input range for a numerical input
	Function that cannot specify the trigger device	By scripts or device data transfer using the GOT internal device, read and write the PLC device only in logon state. Example) Alarm monitoring of the connected device

■Character code applicable for [User Name].

For logon to the PLC from the GOT, only ASCII code characters can be available for [User Name] in the key window and the [Destination Authentication] window.

When setting [User Name] for the PLC, set [User Name] of the user operating the PLC from the GOT in the ASCII code.

For the list of the ASCII code available in GOT, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

■Access level of the user who can log on

When logging on to the PLC from the GOT, only the users whose access level is [Users] can log on.

Users with the access level [Administrators] or [Developers] cannot log on.

When monitoring the PLC from the GOT, set the users whose access level is [Users] for the PLC.

■Changing the user authentication function settings

The user authentication settings (user name and password) cannot be changed from the GOT.

Use GX Works3 to change the settings registered in the PLC.

■Obtaining and updating CPU errors

The GOT cannot obtain CPU errors unless you log on to the PLC.

To update the CPU error of the system alarm displayed on the GOT, log on to the PLC from the GOT.

4.1.7 Access range for monitoring

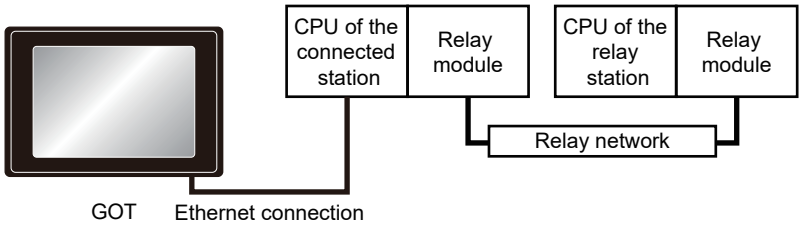
When the GOT is connected to the CPU of the station connected via Ethernet, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station							
	Relay network	CPU of the relay station						
		MXR	MXF	RCPU	LCPU	QCPU (Q mode)	QSCPU	FX5CPU
MX-R	Ethernet	○*7	—	○*5	○	○*6	○	○*3
	CC-Link IE TSN	○*7	○*7	○*1	—	—	—	○*3
	CC-Link IE Controller Network	○*7	—	○	—	○	○	—
	CC-Link IE Field Network	○*7	—	○	○	○*2	○	○*4

*1 RnCPU, RnENCPU, RnSFCPU, C Controller module (MELSEC iQ-R series), and WinCPU (MELSEC iQ-R series) are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*3 FX5U and FX5UC are supported.

*4 FX5U, FX5UC, and FX5UJ are supported.

*5 The C Controller module (MELSEC iQ-R series) is not supported.

*6 The C Controller module (MELSEC-Q series) is not supported.

*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
• For MELSEC MX Controller (MX-R Model)
☞ Page 90 Setting procedure of the encrypted communication
• For MELSEC MX Controller (MX-F Model)
☞ Page 153 Setting procedure of the encrypted communication

4.2 MELSEC MX Controller (MX-R Model) (Ethernet module connection)

☞ Page 94 Connectable devices
☞ Page 95 System configuration
☞ Page 99 GOT side settings
☞ Page 109 PLC side settings
☞ Page 122 Connection to the PLC with the authentication function enabled
☞ Page 124 Access range for monitoring

4.2.1 Connectable devices

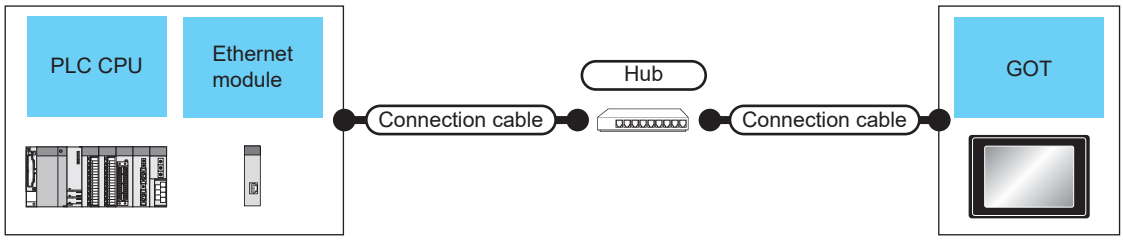
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Ethernet module	Connectable model
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64	○	RJ71EN71 RJ71GN11-T2 RJ71GN11-EIP	GT37 SoftGOT3000
	MXR500-128 MXR500-256	○	RJ71EN71 RJ71GN11-T2 RJ71GN11-EIP	GT37 SoftGOT3000

4.2.2 System configuration

Connection to Ethernet module



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 96 Connection cable

☞ Page 96 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 96 Maximum number of connected devices

Controller	Ethernet module*1*2	Connection cable	GOT	
			Interface	Model
MELSEC MX Controller (MX-R Model)*3	RJ71EN71	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the Ethernet module, refer to the following manual.
MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)

*2 Select [RJ71EN71] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 106 [Connected Ethernet Controller Setting]

*3 When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.
For information on how to logon and logoff, refer to the following.
☞ Page 122 Logon to the PLC

☞ Page 122 Logoff from the PLC
The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.
Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.
☞ Page 122 Creating a project

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

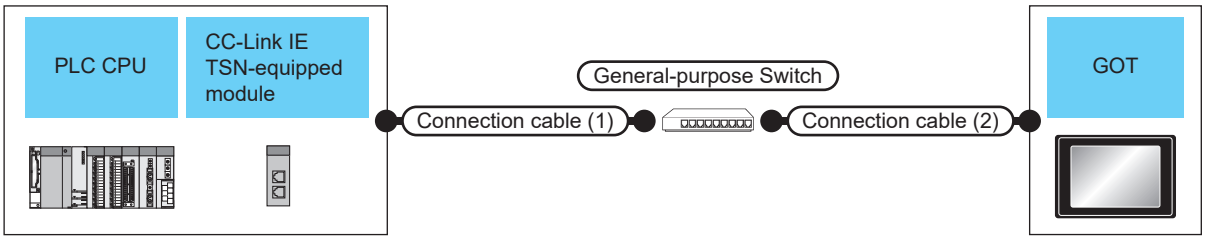
■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one Ethernet module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC MX Controller (MX-R Model)	RJ71EN71	119	17	GT37 SoftGOT3000	119 (16 or less recommended)

Connection to CC-Link IE TSN-equipped module



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 98 Connection cable

☞ Page 98 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 98 Maximum number of connected devices

Controller	CC-Link IE TSN-equipped module*2*3	Connection cable (1)	External device	Connection cable (2)	GOT	
					Interface	Model
MELSEC MX Controller (MX-R Model)*5	RJ71GN11-T2 RJ71GN11-EIP*4	Twisted pair cable	General-purpose Switch*1	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
					Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For usable General-purpose Switches, refer to the following.
MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)
MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

*2 For the system configuration of the CC-Link IE TSN-equipped module, refer to the following manuals.
MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)
MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

*3 Select [RJ71GN11-T2/RD78G(H)] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 106 [Connected Ethernet Controller Setting]

*4 Connect the cable to the P1 port of the RJ71GN11-EIP.

*5 When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.
For information on how to logon and logoff, refer to the following.
☞ Page 122 Logon to the PLC
☞ Page 122 Logoff from the PLC
The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.
Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.
☞ Page 122 Creating a project

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables and connectors that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one CC-Link IE TSN-equipped module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC MX Controller (MX-R Model)	RJ71GN11-T2 RJ71GN11-EIP	8	8	GT37 SoftGOT3000	119 (8 or less recommended)

4.2.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

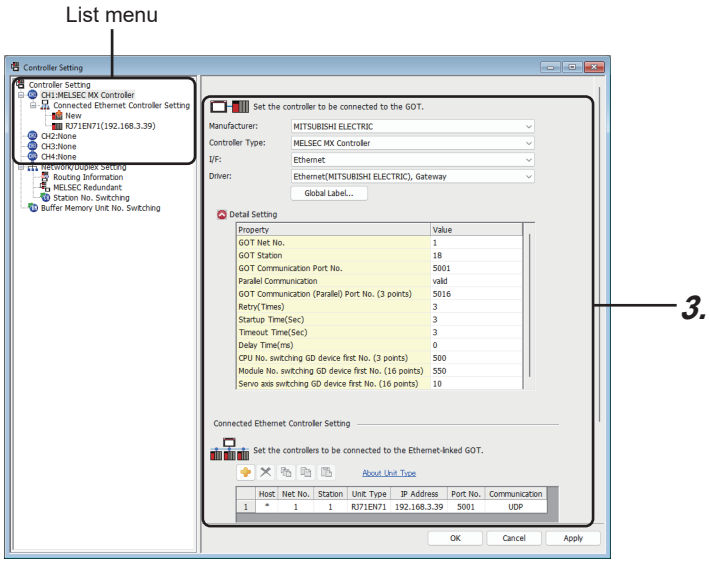
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC MX Controller]
[I/F]	[Ethernet]
[Driver]	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 101 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 106 [Connected Ethernet Controller Setting]

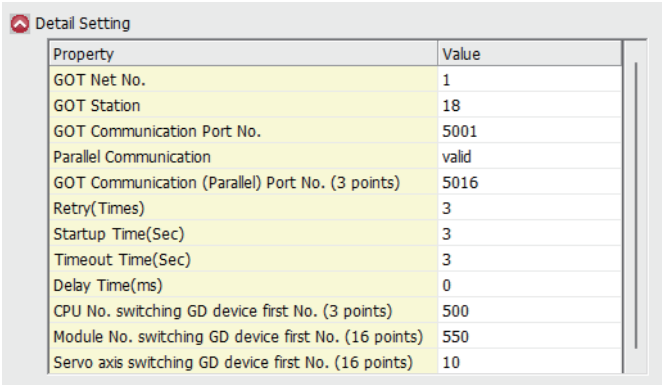
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]*3	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 103 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]*3	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 104 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 105 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 106 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

*3 Set values when using MELSEC iQ-R series or MELSEC-Q series mixed.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

■When connecting multiple GOTs

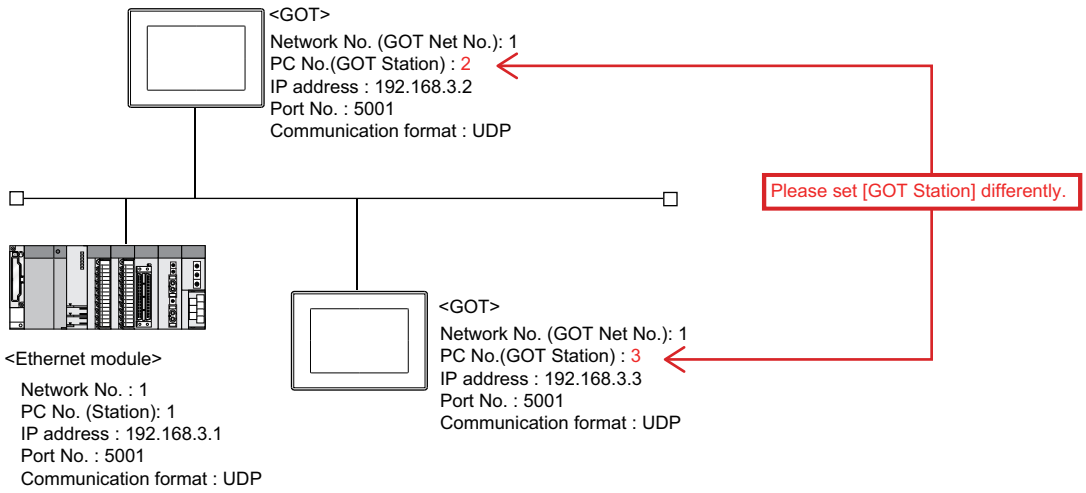
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 101 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

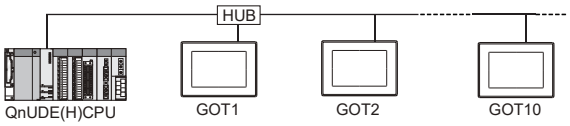
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup Time	3sec (default)	4sec	4sec
Timeout Time	3sec (default)	4sec	4sec

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

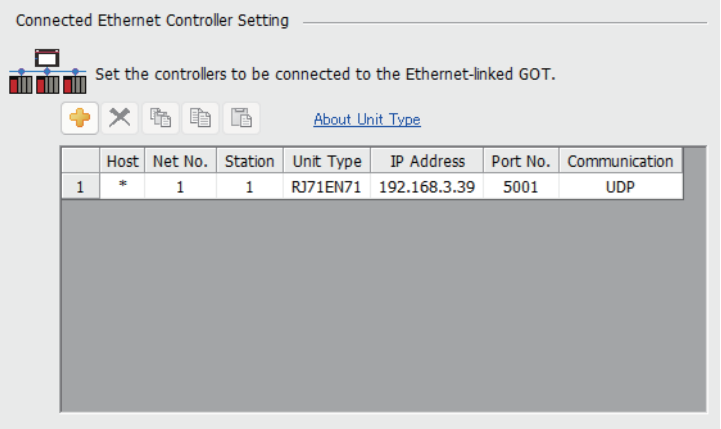
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	☞ Page 106 [Station]
[Unit Type]	Select the model of the connected Ethernet equipment.	☞ Page 106 [Unit Type]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 106 [Port No.]
[Communication]	Set the communication format of the connected Ethernet equipment.	[UDP], [TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].
☞ Page 101 [Detail Setting]

■[Unit Type]

Select an item for [Unit Type] as shown below.

GOT connection destination	[Unit Type]
Ethernet module (MELSEC iQ-R series)	[RJ71EN71]
CC-Link IE TSN master/local module (MELSEC iQ-R series)	[RJ71GN11-T2/RD78G(H)]

■[Port No.]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[RJ71EN71], [RJ71GN11-T2/RD78G(H)]	[5001]	[UDP]
	[5002]	[TCP]

■[Station]

The setting range of the station number differs depending on the setting for [Controller Type].

[Unit Type]	Setting range for [Station]
[RJ71EN71]	[1] to [120]
[RJ71GN11-T2/RD78G(H)]	[0] to [120]

■Connection to the PLC via the Ethernet module with [Communication] set to [TCP]

During communication with the PLC via the Ethernet module with [Communication] set to [TCP], using the FA transparent function may change the setting from [TCP] to [UDP] and start communication with the PLC via the Ethernet module with the new setting.

In this case, communication with the PLC via the Ethernet module cannot be executed normally.

Take the following corrective action.

Phenomenon	Cause	Corrective action
Communication fails when using the FA transparent function.	When the multi-channel Ethernet connection is used, [TCP] and [UDP] are used to the same IP address, and then the FA transparent function is used for the channel set to [TCP].	Execute the FA transparent function for the channel set to [UDP].

Point

Changing the host station on the GOT

[Host] can be changed with the utility function of the GOT.

For details on the setting method, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

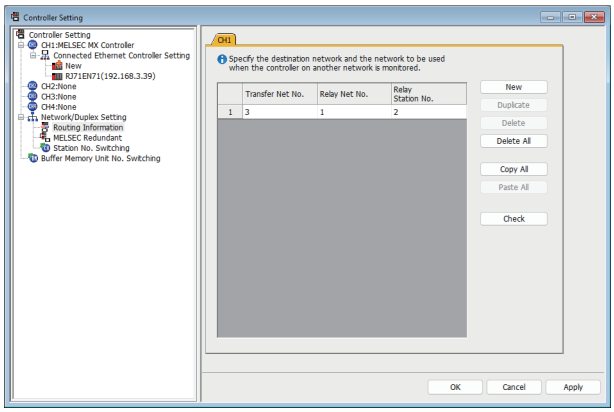
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

Manual of the MELSEC MX Controller



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 109 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.2.4 PLC side settings

Model		Reference
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64	☞ Page 109 Connection to Ethernet module (MELSEC iQ-R series) ☞ Page 118 Connection to CC-Link IE TSN-equipped module
	MXR500-128 MXR500-256	

Connection to Ethernet module (MELSEC iQ-R series)

This section describes the settings of the GOT and the Ethernet module (MELSEC iQ-R series) in the system configuration shown below.

☞ Page 109 When the GOT's communication format is UDP
☞ Page 113 When the GOT's communication format is TCP

Point

• Ethernet module (MELSEC iQ-R series)

For details on the Ethernet module (MELSEC iQ-R series), refer to the following manual.

📖MELSEC iQ-R series manuals

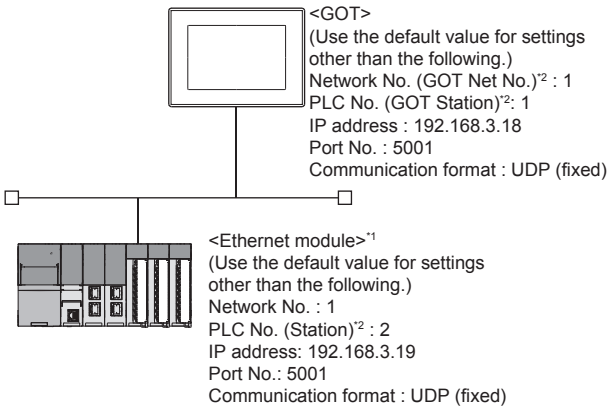
• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 102 When connecting multiple GOTs

■When the GOT's communication format is UDP

• System configuration



*1 The Ethernet module is mounted on the base unit slot 0.
The Start XY No. of the Ethernet module is set to "0".

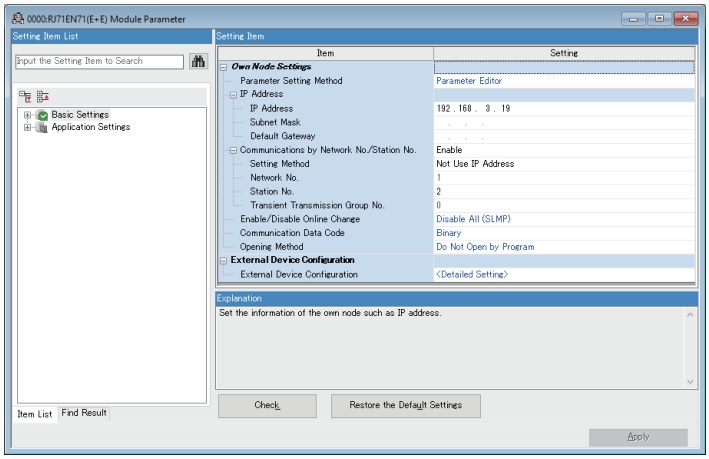
*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

• [Module Parameter] of GX Works3

Module parameters of the Ethernet module

Set [Module Parameter] of the port under [Module information].



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[IP Address]	192.168.3.19	○
[Subnet Mask]	—	—
[Default Gateway]	—	—
[Communications by Network No./Station No.]	Enable	○
[Setting Method]	IP address not used	○
[Network No.]*1	1	○
[Station No.]*2	2	○
[Transient Transmission Group No.]	(Use default value)	—
[Enable/Disable Online Change]		—
[Communication Data Code]		—
[Opening Method]		—
[External Device Configuration]	—	—

*1 Set the same network number as that of the GOT.

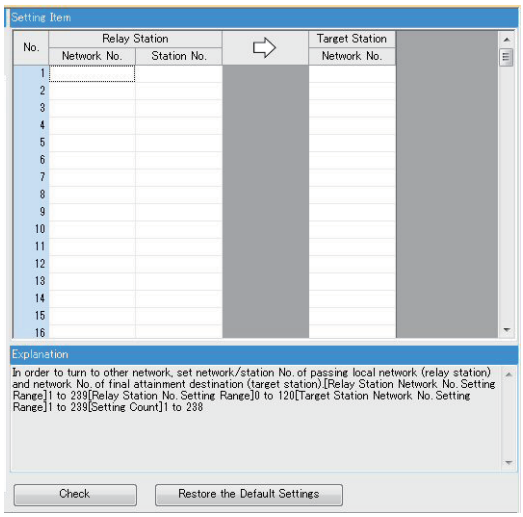
*2 Do not set the same station No. as that of the GOT.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access networks specified with 238 different target station network numbers.



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 108 Routing parameter settings

Communication confirmation

The communication status can be checked with the LINK LED on the Ethernet module.

For checking the communication status, refer to the following.

☞ • Checking the communication status of the Ethernet module

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 99 GOT side settings

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	RJ71EN71
	[IP Address]	192.168.3.19
	[Port No.]	5001
	[Communication]	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number.

• Checking the communication status of the Ethernet module

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.19

Reply from 192.168.3.19:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.19

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

Ethernet diagnostics of GX Works3

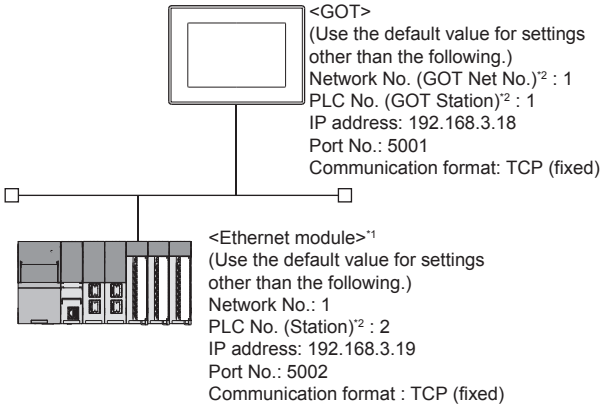
The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-R series manuals

■When the GOT's communication format is TCP

• System configuration



*1 The Ethernet module is mounted on the base unit slot 0.
The Start XY No. of the Ethernet module is set to "0".

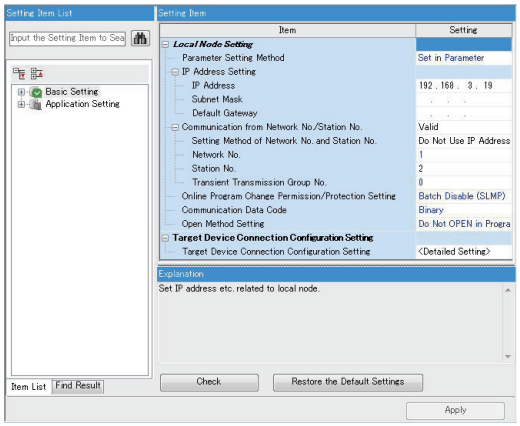
*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

• [Module Parameter] of GX Works3

Module parameters of the Ethernet module

Set [Module Parameter] of the port under [Module information].



○: Necessary, △: As necessary, —: Not necessary

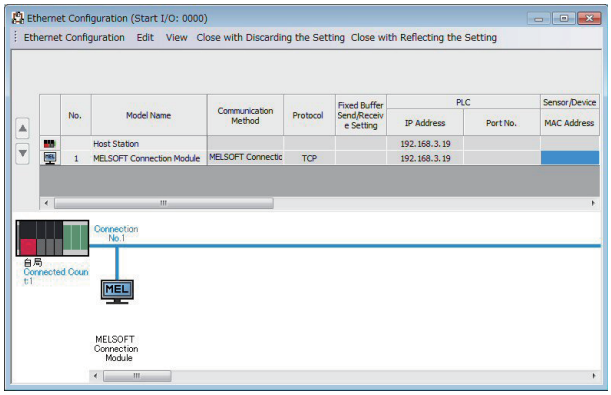
Item	Setting value	Setting for GOT connection
[IP Address]	192.168.3.19	○
[Subnet Mask]	—	—
[Default Gateway]	—	—
[Communications by Network No./Station No.]	Enable	○
[Setting Method]	IP address not used	○
[Network No.]*1	1	○
[Station No.]*2	2	○
[Transient Transmission Group No.]	(Use default value)	—
[Enable/Disable Online Change]		—
[Communication Data Code]		—
[Opening Method]		—
[External Device Configuration]	☞ Target device connection configuration settings	○

*1 Set the same network number as that of the GOT.

*2 Do not set the same station No. as that of the GOT.

Target device connection configuration settings

Configure the settings for all the connected GOTs.



Item	Setting value
[Protocol]	(Use default value)
[Communication Method]	MELSOFT connection
[Port No.]	(Use default value)

Point

When changing the module parameter

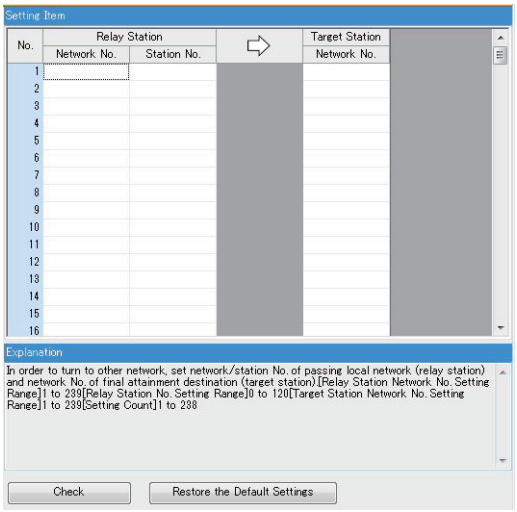
After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access networks specified with 238 different target station network numbers.



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 108 Routing parameter settings

Communication confirmation

The communication status can be checked with the LINK LED on the Ethernet module.

For checking the communication status, refer to the following.

☞ • Checking the communication status of the Ethernet module

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 99 GOT side settings

• Checking the communication status of the Ethernet module

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.19

Reply from 192.168.3.19:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.19

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Mounting condition of the Ethernet module

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-R series manuals

Connection to CC-Link IE TSN-equipped module

This section describes the settings of the GOT and CC-Link IE TSN-equipped module in the system configuration shown below.

Point

• CC-Link IE TSN-equipped module

For details on the CC-Link IE TSN-equipped module, refer to the following manual.

MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

• Connecting multiple GOTs

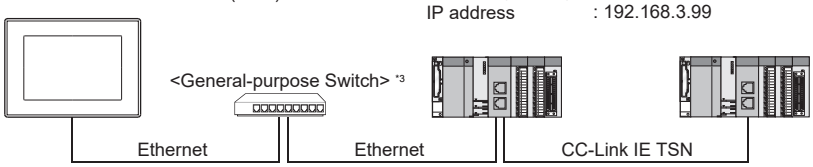
When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

Page 102 When connecting multiple GOTs

■System configuration

<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.) *2 : 1
PLC No. (GOT Station) *2 : 18
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP (fixed)

<CC-Link IE TSN master/local module 2> *1
(The settings other than the following are set to the default)
Station type : Master station
Network No. : 1
PLC No. (Station) *2 : 0 (fixed)
IP address : 192.168.3.99



<CC-Link IE TSN master/local module 1> *1
(The settings other than the following are set to the default)
Station type : Local station
Network No. : 1
PLC No. (Station) *2 : 1
IP address : 192.168.3.1

*1 The CC-Link IE TSN master/local module is mounted on slot 0 of the base unit.
The start XY number of the CC-Link IE TSN master/local module is set to "0".

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

*3 General-purpose Switch is required to connect the GOT and the CC-Link IE TSN master/local module.
For usable General-purpose Switches, refer to the following.
MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

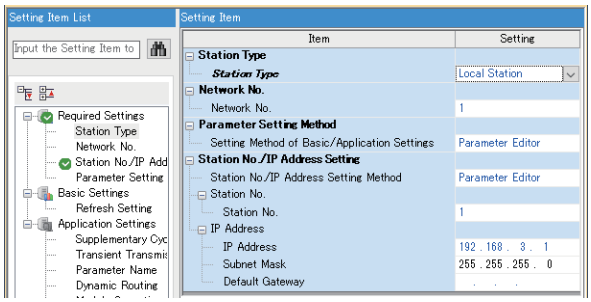
■[Module Parameter] of GX Works3

For details on the settings of the PLC, refer to the following manual.

MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

Ex.

Settings of CC-Link IE TSN master/local module 1



Item	Setting value	
	CC-Link IE TSN master/local module 1	CC-Link IE TSN master/local module 2

Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	1*2
	[Unit Type]	RJ71GN11-T2/RD78G(H)
	[IP Address]	192.168.3.1
	[Port No.]*3	5001
	[Communication]*3	UDP

*1 Set the same value as the GOT net number.
*2 Set a value different from the GOT station number.
*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5002
[Communication]: TCP

■Checking the communication status of the CC-Link IE TSN-equipped module

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.1

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Connection status of the CC-Link IE TSN-equipped module

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the CC-Link IE TSN-equipped module specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-R series manuals

4.2.5 Connection to the PLC with the authentication function enabled

Logon to the PLC

When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.

Touch a special function switch (Destination Authentication) set in the project to display the key window.

Enter the [User Name] and [Password] to log on.

For information on how to set a special function switch, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Logoff from the PLC

Touch a special function switch (Destination Authentication) set in the project to log off.

Reading and writing of cyclic devices

Cyclic devices communicate using an expansion unit, allowing read and write operations even in the logged-off state.

Precautions

■Creating a project

At GOT startup, the PLC is in logoff state.

The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.

Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.

For information on how to set screens and functions, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Take the following precautions when creating a project.

Item		Precautions for using the destination authentication function
[Environmental Setting]	[Screen Switching/Window]	Set the GOT internal device as the screen switching device. As well as logoff operation by GOT, reset on the PLC side or other operations can also make the PLC in logoff state. By setting the GOT internal device as the screen switching device, a screen can be switched even in logoff state due to reset on the PLC side or other operations.
	[Language Switching]	Set the GOT internal device as the language switching device. When a PLC device is set, comments cannot be displayed in logoff state.
	[System Information]	Set the GOT internal device as the system information device. When a PLC device is set, a system alarm occurs in logoff state.
	[Security]	It is recommended not to use screen security (level authentication and operator authentication) for connection with the PLC with the destination authentication function enabled.
		When using the level authentication, set the GOT internal device as the security level device.
Screen setting	Screen displayed immediately after GOT startup	Place a special function switch (Destination Authentication) to perform destination authentication for logging on to the PLC. Do not configure the setting to monitor the PLC devices.
	Screen number	Specify the screen number ranges separately for the screen displayed in logoff state and the screen displayed in logon state. Separating the screen number ranges makes screen transition in logoff state easy to consider. Example) Before authentication: 1 to 100, after authentication: 101 or later
	Screen switching control at logoff	Configure the setting using trigger actions or other methods so that the screen switches at logoff to the screen displayed before authentication.
Function that is not recommended for use when connecting with the PLC with the destination authentication function enabled		• Screen security (level authentication and operator authentication) • GOT Mobile function (Destination authentication cannot be performed on a mobile screen.)
Others	Function to specify the conditions other than the trigger device	Specify the trigger indirectly by using trigger actions or other methods. Example) When the PLC device controls the input range for a numerical input
	Function that cannot specify the trigger device	By scripts or device data transfer using the GOT internal device, read and write the PLC device only in logon state. Example) Alarm monitoring of the connected device

■Character code applicable for [User Name].

For logon to the PLC from the GOT, only ASCII code characters can be available for [User Name] in the key window and the [Destination Authentication] window.

When setting [User Name] for the PLC, set [User Name] of the user operating the PLC from the GOT in the ASCII code.

For the list of the ASCII code available in GOT, refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

■Access level of the user who can log on

When logging on to the PLC from the GOT, only the users whose access level is [Users] can log on.

Users with the access level [Administrators] or [Developers] cannot log on.

When monitoring the PLC from the GOT, set the users whose access level is [Users] for the PLC.

■Changing the user authentication function settings

The user authentication settings (user name and password) cannot be changed from the GOT.

Use GX Works3 to change the settings registered in the PLC.

■Obtaining and updating CPU errors

The GOT cannot obtain CPU errors unless you log on to the PLC.

To update the CPU error of the system alarm displayed on the GOT, log on to the PLC from the GOT.

4.2.6 Access range for monitoring

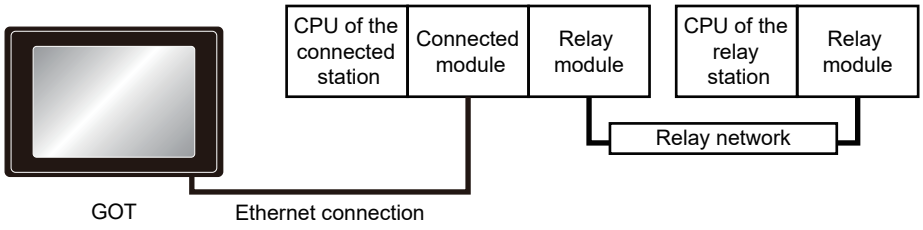
When the GOT is connected to the CPU of the station connected via Ethernet, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station						
		Relay network	CPU of the relay station					
			MXR	RCPU	LCPU	QCPU (Q mode)	QSCPU	FX5CPU
MX-R	☞ Page 94 Connectable devices	Ethernet	○*7	○*5	○	○*6	○	○*3
		CC-Link IE TSN	○*7	○*1	—	—	—	○*3
		CC-Link IE Field Network	○*7	○	○	○*2	○	○*4
RJ72GF15-T2	☞ Page 94 Connectable devices	CC-Link IE Field Network	○*7	○	○	○*2	○	○*4

*1 RnCPU, RnENCPU, RnSFCPU, and MELSECWinCPU (MELSEC iQ-R series) are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*3 FX5U and FX5UC are supported.

*4 FX5U, FX5UC, and FX5UJ are supported.

*5 The C Controller module (MELSEC iQ-R series) is not supported.

*6 The C Controller module (MELSEC-Q series) is not supported.

*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
• For MELSEC MX Controller (MX-R Model)
☞ Page 90 Setting procedure of the encrypted communication
• For MELSEC MX Controller (MX-F Model)
☞ Page 153 Setting procedure of the encrypted communication

4.3 MELSEC MX Controller (MX-F Model) (Built-in Ethernet port connection)

☞ Page 125 Connectable devices
☞ Page 126 System configuration
☞ Page 129 GOT side settings
☞ Page 139 PLC side settings
☞ Page 152 Encrypted communication
☞ Page 155 Connection to the PLC with the authentication function enabled
☞ Page 157 Access range for monitoring

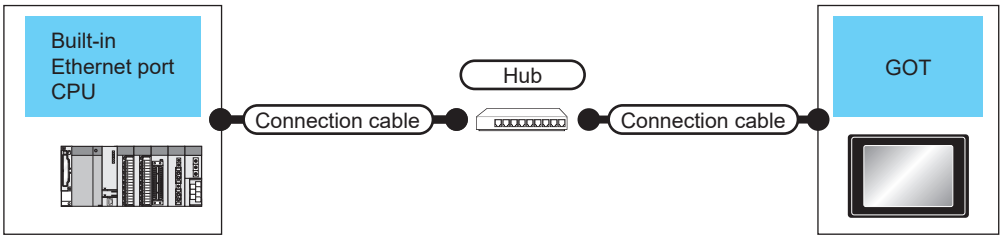
4.3.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC MX Controller (MX-F Model)	MXF100-8-N32 MXF100-8-P32 MXF100-16-N32 MXF100-16-P32	○	GT37 SoftGOT3000

4.3.2 System configuration



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 127 Connection cable

☞ Page 127 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 127 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	Model
MELSEC MX Controller (MX-F Model)*1*2*3*4	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the built-in Ethernet port CPU, refer to the manual of the PLC to be used.

*2 For [Unit Type] to be selected in [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 136 [Connected Ethernet Controller Setting]

*3 Connect to the Ethernet port (P3) of the MELSEC MX Controller.

*4 When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.
For information on how to logon and logoff, refer to the following.
☞ Page 155 Logon to the PLC
☞ Page 155 Logoff from the PLC
The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.
Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.
☞ Page 155 Creating a project

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

■When [Unit Type] in [Connected Ethernet Controller Setting] is [MX-F(Ethernet)] or [MX-F(Ethernet Encryption)]

Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP+TLS+DTLS		
MELSEC MX Controller (MX-F Model)	120	32	GT37 SoftGOT3000	119 (16 or less recommended)

■When [Unit Type] in [Connected Ethernet Controller Setting] is [MX-F(CC-Link IE TSN)]

Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP		
MELSEC MX Controller (MX-F Model)	8	8	GT37 SoftGOT3000	119 (8 or less recommended)

Connection to the built-in Ethernet port of the built-in Ethernet port CPU

Connect the GOT after turning on the network equipment such as the built-in Ethernet port CPU or hub to enable communications.

If the GOT cannot communicate with the built-in Ethernet port CPU, a communication error may occur on the GOT.

4.3.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

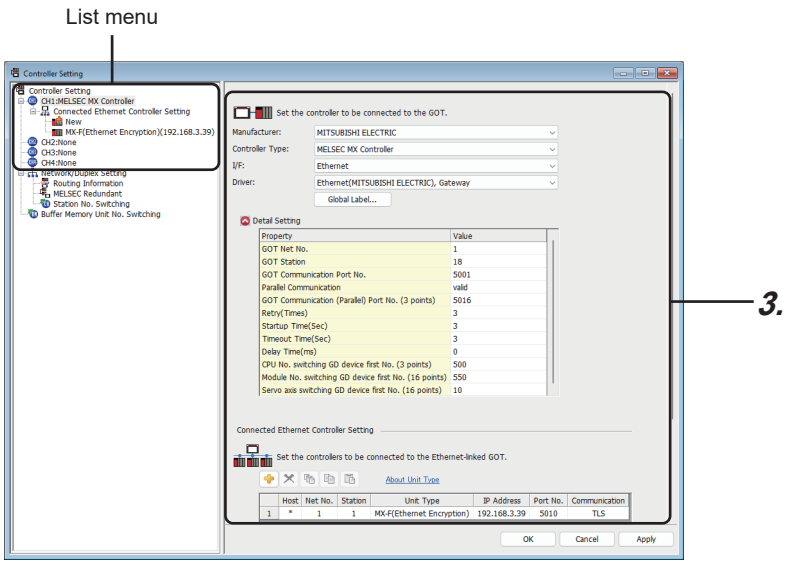
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC MX Controller]
[I/F]	[Ethernet]
[Driver]	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 131 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 136 [Connected Ethernet Controller Setting]

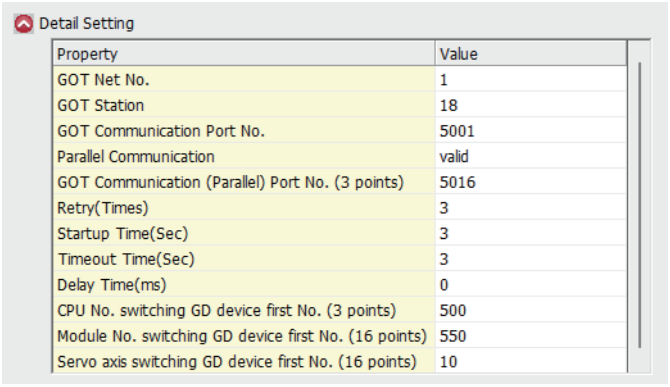
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]*3	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 133 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]*3	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 134 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 135 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 136 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

*3 Set values when using MELSEC iQ-R series or MELSEC-Q series mixed.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

■When connecting multiple GOTs

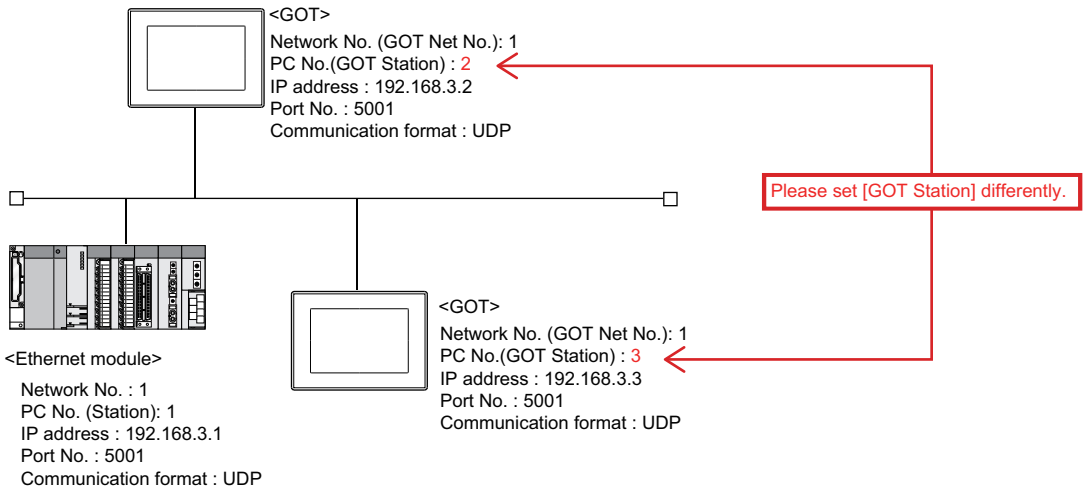
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 131 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

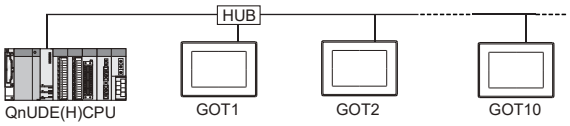
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup Time	3sec (default)	4sec	4sec
Timeout Time	3sec (default)	4sec	4sec

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	01 to 10 Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

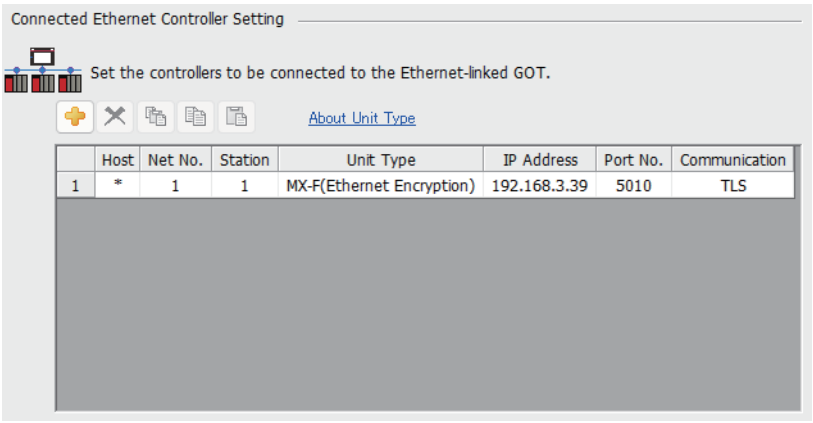
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	[1] to [120]
[Unit Type]	Select the model of the connected Ethernet equipment.	☞ Page 136 [Unit Type]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 136 [Port No.], [Communication]
[Communication]	Set the communication format of the connected Ethernet equipment.	☞ Page 136 [Port No.], [Communication]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].
☞ Page 131 [Detail Setting]

■[Unit Type]

Select an item for [Unit Type] as shown below.

GOT connection destination	[Unit Type]
MELSEC MX Controller (MX-F Model)	• When using the built-in Ethernet port for communication: [MX-F(Ethernet)] • When using the built-in CC-Link IE TSN port for communication: [MX-F(CC-Link IE TSN)] • When using the built-in Ethernet port for encrypted communication: [MX-F(Ethernet Encryption)]*1

*1 For details on encrypted communication, refer to the following.
☞ Page 152 Encrypted communication

■[Station]

The setting range is as follows:

[Unit Type]	[Station]
[MX-F(Ethernet)] [MX-F(Ethernet Encryption)]	[1] to [120]
[MX-F(CC-Link IE TSN)]	[0]

■[Port No.], [Communication]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[MX-F(Ethernet)]	[5006]	[UDP]
	[5007]	[TCP]
[MX-F(CC-Link IE TSN)]	[5001]	[UDP]
	[5554]	[TCP]
[MX-F(Ethernet Encryption)]	[1] to [4999], [5010] to [65534]	[TLS], [DTLS]

■When [Unit Type] is [MX-F(Ethernet)]

When [MX-F(Ethernet)] is selected for [Unit Type], the setting of [Port No.] can be changed.

There is no setting for the network number and PLC number of built-in Ethernet port CPU (Port number: 5006, 5007).

The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

■Connection to the built-in Ethernet port PLC with [Communication] set to [TCP]

During communication with the built-in Ethernet port PLC with [Communication] set to [TCP], using the FA transparent function may change the setting from [TCP] to [UDP] and start communication with the PLC with the new setting.

In this case, communication with the built-in Ethernet port PLC cannot be executed normally.

Take the following corrective action.

Phenomenon	Cause	Corrective action
Communication fails when using the FA transparent function.	[UDP] is not available in the open settings of the built-in Ethernet port PLC.	Add [UDP] to the PLC side open settings.
	When the multi-channel Ethernet connection is used, [TCP] and [UDP] are used to the same IP address, and then the FA transparent function is used for the channel set to [TCP].	Execute the FA transparent function for the channel set to [UDP].

Point

Changing the host station on the GOT

[Host] can be changed with the utility function of the GOT.

For details on the setting method, refer to the following manual.

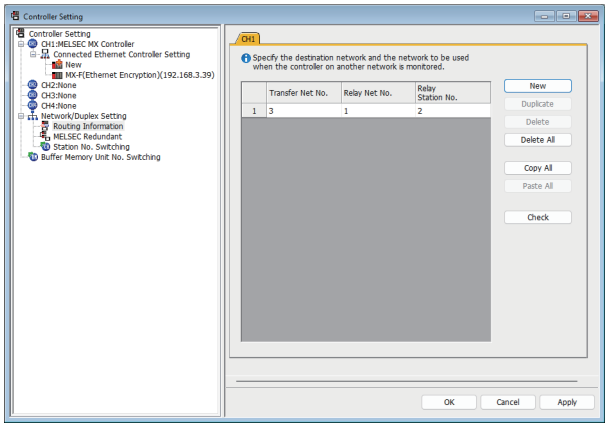
GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 139 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.3.4 PLC side settings

Model		Reference
MELSEC MX Controller (MX-F Model)	MXF100-8-N32 MXF100-8-P32 MXF100-16-N32 MXF100-16-P32	☞ Page 139 Connection to the built-in Ethernet port CPU of the MELSEC MX Controller (MX-F Model)

Connection to the built-in Ethernet port CPU of the MELSEC MX Controller (MX-F Model)

This section describes the settings of the GOT and the built-in Ethernet port CPU in the system configuration shown below.

☞ Page 139 One-to-one connection with the GOT side communication format set to UDP
☞ Page 142 One-to-one connection with the GOT side communication format set to TCP, TLS, or DTLS
☞ Page 145 Multi-connection with the GOT side communication format set to UDP
☞ Page 148 Multi-connection with the GOT side communication format set to TCP, TLS, or DTLS

Point

• Built-in Ethernet port CPU

For details on the built-in Ethernet port CPU, refer to the following manual.

📖Manual of the MELSEC MX Controller

• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

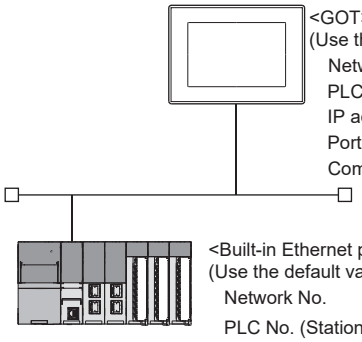
☞ Page 132 When connecting multiple GOTs

■One-to-one connection with the GOT side communication format set to UDP

• System configuration

For one-to-one connection, no settings are required on the PLC side.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



<GOT>
(Use the default value for settings other than the following.)
Network No. (GOT Net No.)*3 : 1
PLC No. (GOT Station)*3 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP (fixed)

<Built-in Ethernet port CPU>*1
(Use the default value for the following settings.)
Network No. : 1 (virtual)*2
PLC No. (Station)*3 : 2 (virtual)*2
IP address : 192.168.3.39
Port No. : 5006 (fixed)
Communication format : UDP (fixed)

*1 For the settings when using system devices such as a hub, refer to the following.
☞ Page 145 Multi-connection with the GOT side communication format set to UDP

*2 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*3 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 129 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to the Built-in Ethernet port RCPU

The setting items for the network number and station number do not exist on the PLC side.

Set the network number and station number on the GOT side.

When doing so, set a network number not used in the system.

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	MX-F(Ethernet)
	[IP Address]	192.168.3.39
	[Port No.]	5006
	[Communication]	UDP

*1 Set the same value as [GOT Net No.].

*2 Set a value not set for [GOT Station].

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.39

Reply from 192.168.3.39:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.39

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

Manual of the MELSEC MX Controller

■One-to-one connection with the GOT side communication format set to TCP, TLS, or DTLS

The following shows an example when the communication format is TCP.

Point

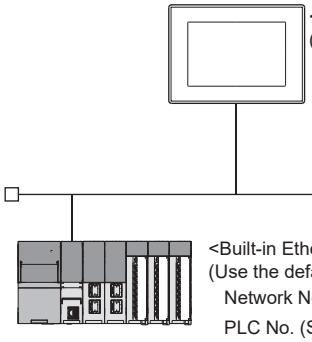
For information on encrypted communication settings, refer to the following.

☞ Page 152 Encrypted communication

• System configuration

For one-to-one connection, no settings are required on the PLC side.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



<GOT>
(Use the default value for settings other than the following.)
Network No. (GOT Net No.)*3 : 1
PLC No. (GOT station)*3 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : TCP

<Built-in Ethernet port CPU>*1
(Use the default value for the following settings.)
Network No. : 1 (virtual)*2
PLC No. (Station)*3 : 2 (virtual)*2
IP address : 192.168.3.39

*1 For the settings when using system devices such as a hub, refer to the following.
☞ Page 148 Multi-connection with the GOT side communication format set to TCP, TLS, or DTLS

*2 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*3 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting

	[IP Address]	192.168.3.1	192.168.3.2
	[Port No.]	5006	5006
	[Communication]	UDP	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number and PLC numbers of other PLCs on the same network.

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.1

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

Manual of the MELSEC MX Controller

■Multi-connection with the GOT side communication format set to TCP, TLS, or DTLS

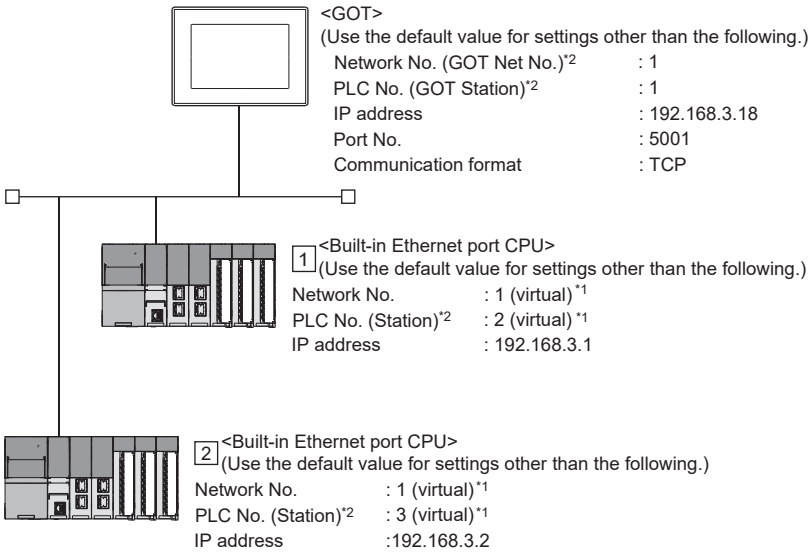
The following shows an example when the communication format is TCP.

Point

For information on encrypted communication settings, refer to the following.

☞ Page 152 Encrypted communication

• System configuration



*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.

☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

	[Station]	2*2	3*2
	[Unit Type]	MX-F(Ethernet)*3	MX-F(Ethernet)*3
	[IP Address]	192.168.3.1	192.168.3.2
	[Port No.]	5007	5007
	[Communication]	TCP*3	TCP*3

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number.

*3 When [MX-F(Ethernet Encryption)] is set for [Unit Type], set TLS or DTLS.

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.1

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works3

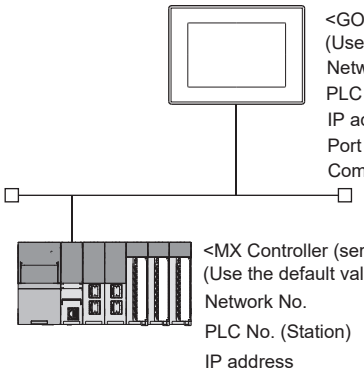
The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

Manual of the MELSEC MX Controller

4.3.5 Encrypted communication

The following describes the encrypted communication.



<GOT (client)>
(Use the default value for settings other than the following.)
Network No. (GOT Net No.) : 1
PLC No. (GOT Station) : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : TLS or DTLS

<MX Controller (server)>
(Use the default value for the following settings.)
Network No. : 1 (virtual)
PLC No. (Station) : 2 (virtual)
IP address : 192.168.3.39

Client	Server
GOT	MELSEC MX Controller

For the PLC side settings, refer to the following.

☞ Page 142 One-to-one connection with the GOT side communication format set to TCP, TLS, or DTLS
☞ Page 148 Multi-connection with the GOT side communication format set to TCP, TLS, or DTLS

Precautions

■When the faulty monitor CPU station repeatedly turns on and off

When DTLS encrypted communication fails, the GS device of the faulty monitor CPU station turns on and the station monitoring turns on.

After that, if ping test with the controller is successful, the GS device of the faulty monitor CPU station turns off.

If DTLS encrypted communication remains unsuccessful, the GS device of the faulty monitor CPU station repeatedly turns on and off.

In that case, correct the DTLS encrypted communication settings.

■When communication is terminated without notifying the encrypted communication stop

The connection may not be reestablished if the communication is terminated, such as by powering off the GOT or disconnecting the Ethernet cable between the GOT and the controller, without issuing the encrypted communication stop notification to the controller.

To reestablish the connection, perform one of the following operation.

- Restart the controller.
- Set a connection monitoring timer to the encrypted communication port of the controller, and reconnect it after the specified time in seconds has elapsed.

Encrypted communication version

The version of the encrypted communication used by the GOT depends on the MELSEC MX Controller settings.

Version setting of the encrypted communication for the MELSEC MX Controller	Version of the encrypted communication used by the GOT
TLS1.3	TLS1.3
TLS1.3/TLS1.2	TLS1.3
TLS1.2	TLS1.2
DTLS1.2	DTLS1.2
Other than the above	Unsupported

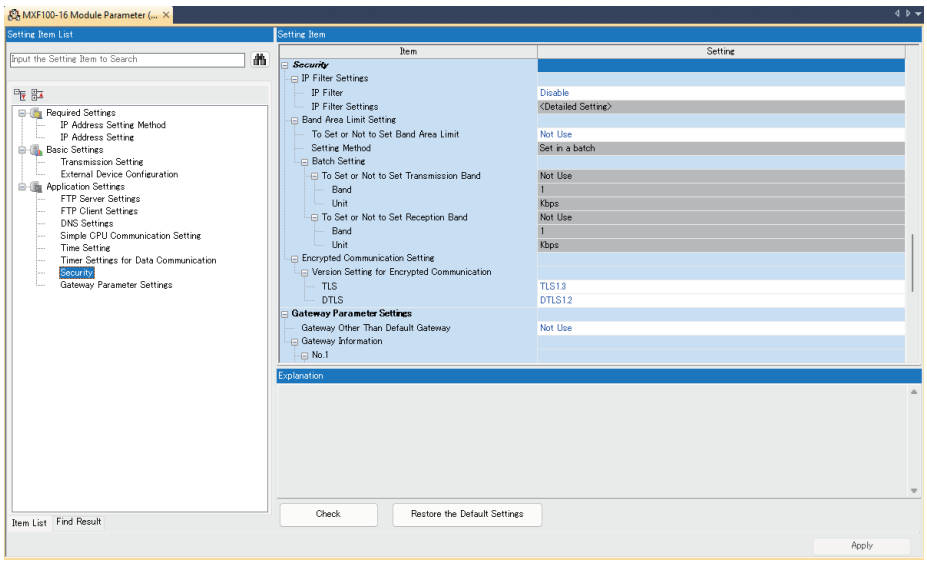
Setting procedure of the encrypted communication

The following shows the setting procedure of the encrypted communication.

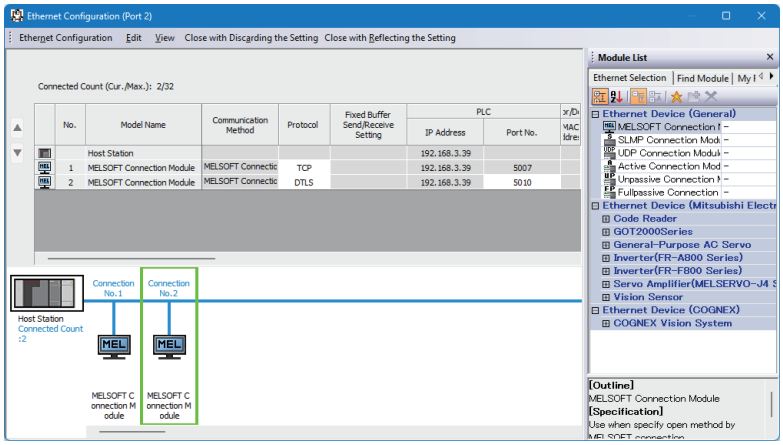
■Settings in GX Works3

Operating procedure

1. Select [Application Setting] → [Security] → [Version Setting for Encrypted Communication] to set the version.



2. Select [Basic Setting] → [External Device Configuration], and select a port number for the encrypted communication port.



3. Select [Project] → [Security] → [Certificate Management] to create a server certificate.

For information on how to create a server certificate, refer to the following.

Manual of the MELSEC MX Controller

4. Write a project to the MELSEC MX Controller.

■Settings in GT Designer3 and the GOT

For details on the GT Designer3 and GOT settings, refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

Operating procedure

1. Set [MX-F(Ethernet Encryption)] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
2. Download the project data in the GOT.
3. Import the server certificate of the MELSEC MX Controller created and saved in GX Works3 from the utility screen.

4.3.6 Connection to the PLC with the authentication function enabled

Logon to the PLC

When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.

Touch a special function switch (Destination Authentication) set in the project to display the key window.

Enter the [User Name] and [Password] to log on.

For information on how to set a special function switch, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Logoff from the PLC

Touch a special function switch (Destination Authentication) set in the project to log off.

Reading and writing of cyclic devices

Cyclic devices communicate using an expansion unit, allowing read and write operations even in the logged-off state.

Precautions

■Creating a project

At GOT startup, the PLC is in logoff state.

The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.

Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.

For information on how to set screens and functions, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Take the following precautions when creating a project.

Item		Precautions for using the destination authentication function
[Environmental Setting]	[Screen Switching/Window]	Set the GOT internal device as the screen switching device. As well as logoff operation by GOT, reset on the PLC side or other operations can also make the PLC in logoff state. By setting the GOT internal device as the screen switching device, a screen can be switched even in logoff state due to reset on the PLC side or other operations.
	[Language Switching]	Set the GOT internal device as the language switching device. When a PLC device is set, comments cannot be displayed in logoff state.
	[System Information]	Set the GOT internal device as the system information device. When a PLC device is set, a system alarm occurs in logoff state.
	[Security]	It is recommended not to use screen security (level authentication and operator authentication) for connection with the PLC with the destination authentication function enabled.
		When using the level authentication, set the GOT internal device as the security level device.
Screen setting	Screen displayed immediately after GOT startup	Place a special function switch (Destination Authentication) to perform destination authentication for logging on to the PLC. Do not configure the setting to monitor the PLC devices.
	Screen number	Specify the screen number ranges separately for the screen displayed in logoff state and the screen displayed in logon state. Separating the screen number ranges makes screen transition in logoff state easy to consider. Example) Before authentication: 1 to 100, after authentication: 101 or later
	Screen switching control at logoff	Configure the setting using trigger actions or other methods so that the screen switches at logoff to the screen displayed before authentication.
Function that is not recommended for use when connecting with the PLC with the destination authentication function enabled		• Screen security (level authentication and operator authentication) • GOT Mobile function (Destination authentication cannot be performed on a mobile screen.)
Others	Function to specify the conditions other than the trigger device	Specify the trigger indirectly by using trigger actions or other methods. Example) When the PLC device controls the input range for a numerical input
	Function that cannot specify the trigger device	By scripts or device data transfer using the GOT internal device, read and write the PLC device only in logon state. Example) Alarm monitoring of the connected device

■Character code applicable for [User Name].

For logon to the PLC from the GOT, only ASCII code characters can be available for [User Name] in the key window and the [Destination Authentication] window.

When setting [User Name] for the PLC, set [User Name] of the user operating the PLC from the GOT in the ASCII code.

For the list of the ASCII code available in GOT, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

■Access level of the user who can log on

When logging on to the PLC from the GOT, only the users whose access level is [Users] can log on.

Users with the access level [Administrators] or [Developers] cannot log on.

When monitoring the PLC from the GOT, set the users whose access level is [Users] for the PLC.

■Changing the user authentication function settings

The user authentication settings (user name and password) cannot be changed from the GOT.

Use GX Works3 to change the settings registered in the PLC.

■Obtaining and updating CPU errors

The GOT cannot obtain CPU errors unless you log on to the PLC.

To update the CPU error of the system alarm displayed on the GOT, log on to the PLC from the GOT.

4.3.7 Access range for monitoring

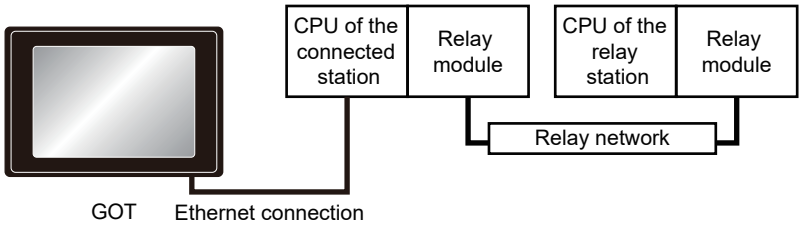
When the GOT is connected to the CPU of the station connected via Ethernet, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station							
	Relay network	CPU of the relay station						
		MXR	MXF	RCPU	LCPU	QCPU (Q mode)	QSCPU	FX5CPU
MX-F	CC-Link IE TSN	○*3	○*3	○*1	—	—	—	○*2

*1 RnCPU, RnENCPU, RnSFCPU, and MELSECWinCPU (MELSEC iQ-R series) are supported.

*2 FX5U and FX5UC are supported.

*3 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
• For MELSEC MX Controller (MX-R Model)
☞ Page 90 Setting procedure of the encrypted communication
• For MELSEC MX Controller (MX-F Model)
☞ Page 153 Setting procedure of the encrypted communication

4.4 MELSEC MX Controller (MX-F Model) (Ethernet module connection)

☞ Page 158 Connectable devices
☞ Page 159 System configuration
☞ Page 163 GOT side settings
☞ Page 173 PLC side settings
☞ Page 185 Connection to the PLC with the authentication function enabled
☞ Page 187 Access range for monitoring

4.4.1 Connectable devices

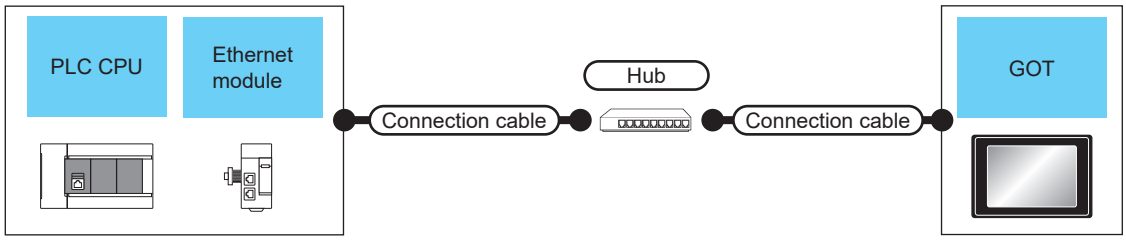
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Ethernet module	Connectable model
MELSEC MX Controller (MX-F Model)	MXF100-8-N32 MXF100-8-P32 MXF100-16-N32 MXF100-16-P32	○	FX5-ENET/IP FX5-EIP FX5-CCLGN-MS	GT37 SoftGOT3000

4.4.2 System configuration

Connection to Ethernet module



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 160 Connection cable

☞ Page 160 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 160 Maximum number of connected devices

Controller	Ethernet module*1*2	Connection cable	GOT	
			Interface	Model
MELSEC MX Controller (MX-F Model)*3	FX5-ENET/IP FX5-EIP	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the Ethernet module, refer to the following manual.
MELSEC iQ-F FX5-ENET/IP User's Manual
MELSEC iQ-F FX5-EIP User's Manual

*2 Select [FX5-ENET] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 170 [Connected Ethernet Controller Setting]

*3 When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.
For information on how to logon and logoff, refer to the following.
☞ Page 185 Logon to the PLC
☞ Page 185 Logoff from the PLC
The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.
Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.
☞ Page 185 Creating a project

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (double-shielded STP or STP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

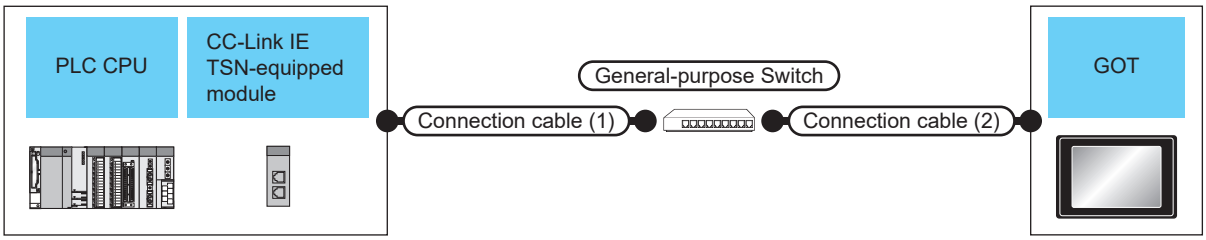
Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC MX Controller (MX-F Model)	FX5-ENET/IP FX5-EIP	32	32	GT37 SoftGOT3000	63 (16 or less recommended)

Connection to CC-Link IE TSN-equipped module



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 162 Connection cable

☞ Page 162 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 162 Maximum number of connected devices

Controller	CC-Link IE TSN-equipped module*2*3	Connection cable (1)	External device	Connection cable (2)	GOT	
					Interface	Model
MELSEC MX Controller (MX-F Model)*4	FX5-CCLGN-MS	Twisted pair cable	General-purpose Switch*1	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
					Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For usable General-purpose Switches, refer to the following.
MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

*2 For the system configuration of the CC-Link IE TSN-equipped module, refer to the following manual.
MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

*3 Select [FX5-CCLGN-MS/FX5-nSSC-G] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 170 [Connected Ethernet Controller Setting]

*4 When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.
For information on how to logon and logoff, refer to the following.
☞ Page 185 Logon to the PLC
☞ Page 185 Logoff from the PLC
The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.
Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.
☞ Page 185 Creating a project

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (double-shielded STP or STP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables and connectors that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

Maximum segment length

The maximum segment length (length between General-purpose Switch and a node) is 100 m.

Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC MX Controller (MX-F Model)	FX5-CCLGN-MS	8	8	GT37 SoftGOT3000	63 (8 or less recommended)

4.4.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

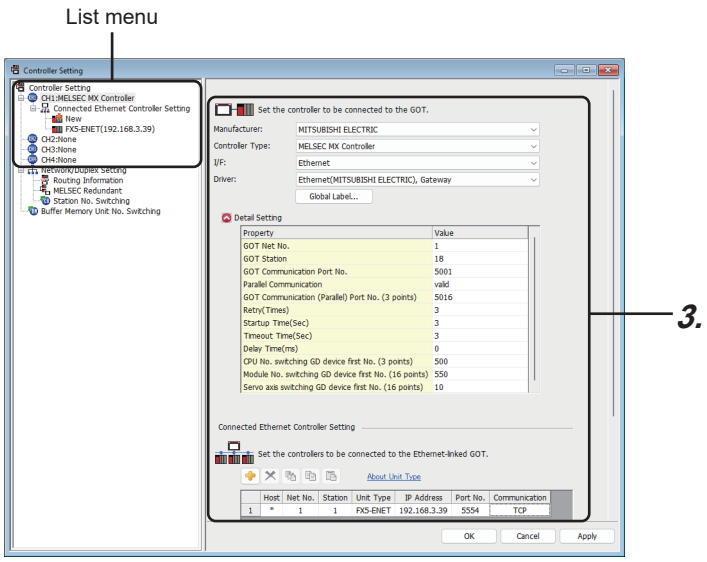
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC MX Controller]
[I/F]	[Ethernet]
[Driver]	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 165 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 170 [Connected Ethernet Controller Setting]

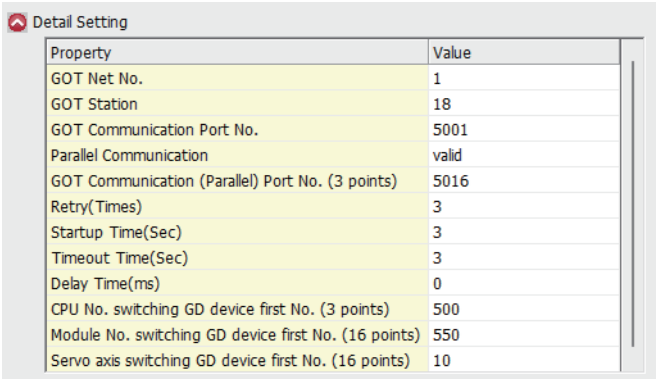
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]*3	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 167 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]*3	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 167 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 169 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 170 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

*3 Set values when using MELSEC iQ-R series or MELSEC-Q series mixed.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

■When connecting multiple GOTs

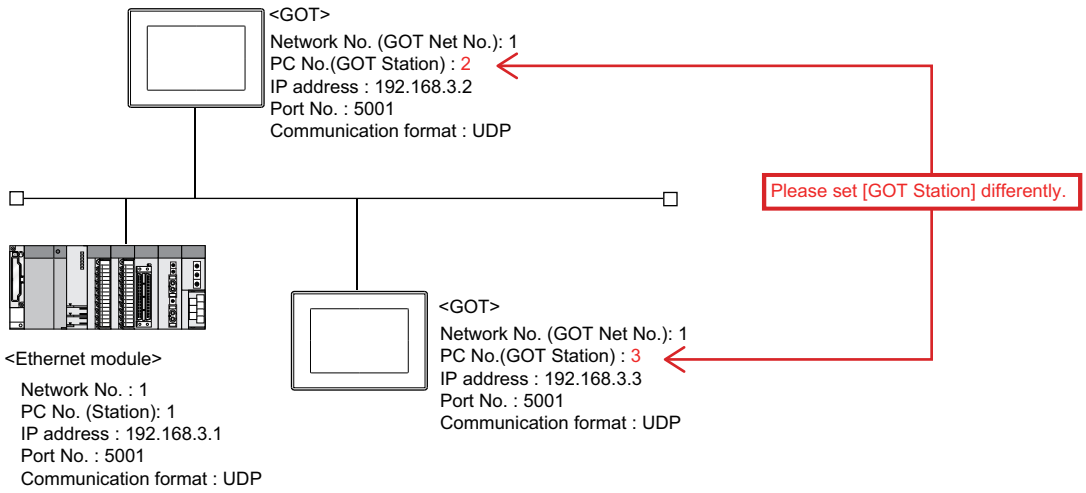
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 165 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

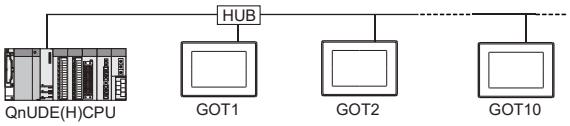
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup Time	3sec (default)	4sec	4sec
Timeout Time	3sec (default)	4sec	4sec

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	01 to 10 Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

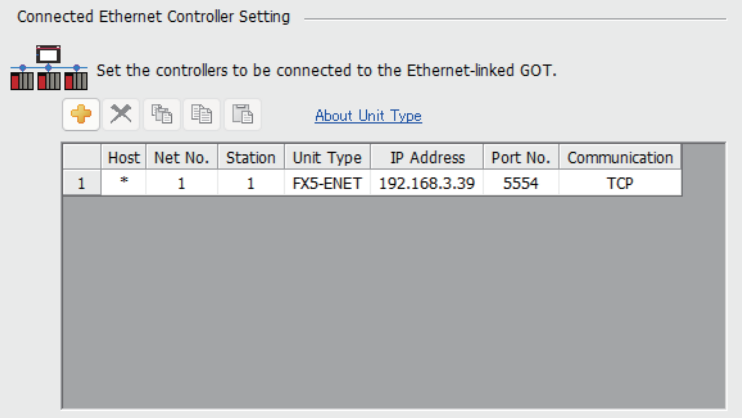
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	☞ Page 170 [Station No.]
[Unit Type]	Select the model of the connected Ethernet equipment.	☞ Page 170 [Unit Type]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 170 [Port No.]
[Communication]	Set the communication format of the connected Ethernet equipment.	[UDP], [TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].
☞ Page 165 [Detail Setting]

■[Unit Type]

Select an item for [Unit Type] as shown below.

GOT connection destination	[Unit Type]
Ethernet module (MELSEC iQ-F series)	[FX5-ENET]
CC-Link IE TSN master/local module(MELSEC iQ-F series)	[FX5-CCLGN-MS/FX5-nSSC-G]

■[Port No.]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[FX5-ENET]	[5554]	[TCP]
	[5555]	[UDP]
[FX5-CCLGN-MS/FX5-nSSC-G]	[5001]	[UDP]
	[5554]	[TCP]

■[Station No.]

The setting range of the station number differs depending on the setting for [Controller Type].

[Unit Type]	Setting range for [Station]
[FX5-ENET]	[1] to [120]
[FX5-CCLGN-MS/FX5-nSSC-G]	[0] to [120]

■When the unit type is [FX5-ENET]

There is no setting for the network number and PLC number when the unit type is [FX5-ENET].

The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

■When the unit type is [FX5-CCLGN-MS/FX5-nSSC-G]

The network number and station number in the object setting dialog must match the network number and PLC number of the CPU connected via the Ethernet module.

Point

Changing the host station on the GOT

[Host] can be changed with the utility function of the GOT.

For details on the setting method, refer to the following manual.

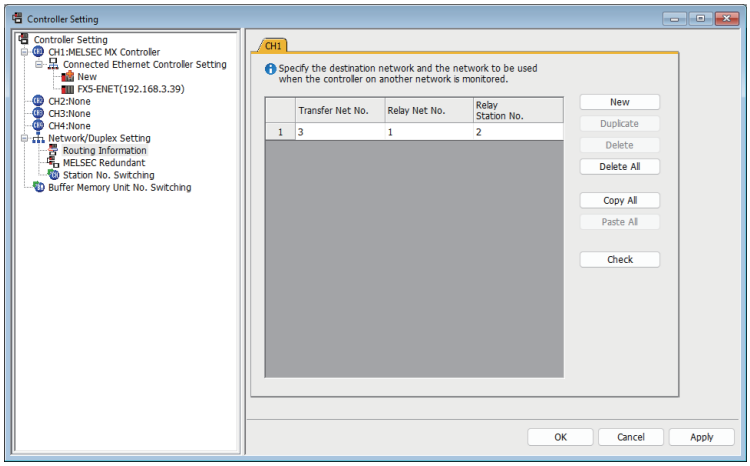
GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 173 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.4.4 PLC side settings

Model		Reference
MELSEC MX Controller (MX-F Model)	MXF100-8-N32 MXF100-8-P32 MXF100-16-N32 MXF100-16-P32	☞ Page 173 Connection to Ethernet module (MELSEC iQ-F series) ☞ Page 181 Connection to CC-Link IE TSN-equipped module

Connection to Ethernet module (MELSEC iQ-F series)

This section describes the settings of the GOT and the Ethernet module (MELSEC iQ-F series) in the system configuration shown below.

☞ Page 173 When the GOT's communication format is UDP
☞ Page 177 When the GOT's communication format is TCP

Point

• Ethernet module (MELSEC iQ-F series)

For details on the Ethernet module (MELSEC iQ-F series), refer to the following manual.

📖MELSEC iQ-F series manuals

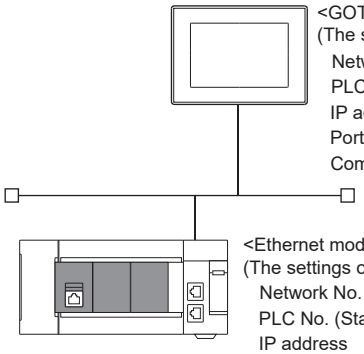
• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 166 When connecting multiple GOTs

■When the GOT's communication format is UDP

• System configuration



<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.)*2 : 1
PLC No. (GOT Station)*2 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP (fixed)

<Ethernet module>
(The settings other than the following are set to the default)
Network No. : 1 (virtual)*1
PLC No. (Station)*2 : 2 (virtual)*1
IP address : 192.168.3.251 (Default)
Port No. : 5555 (fixed)
Communication format : UDP (fixed)

*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

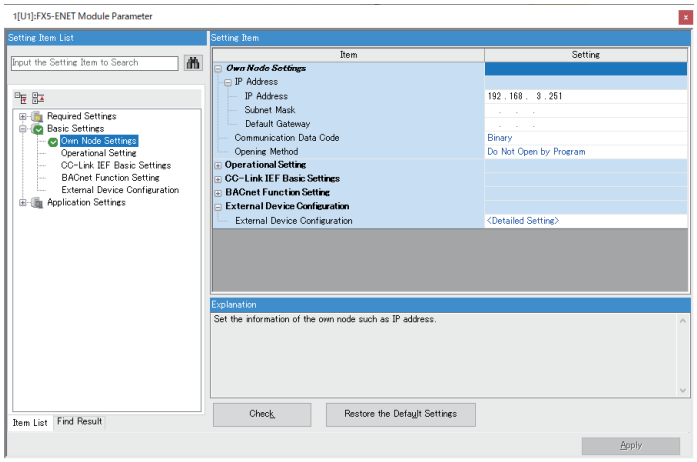
• [Module Parameter] of GX Works3

For the connection with FX5-ENET/IP, use GX Works3 version 1.075D or later.

For the connection with FX5-EIP, use GX Works3 version 1.120A or later.

Module parameters of the Ethernet module

Set [Module Parameter] of the port under [Module information].



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[IP Address]	192.168.3.251	○
[Subnet Mask]	—	—
[Default Gateway]	—	—
[Communication Data Code]	(Use default value)	—
[Opening Method]	(Use default value)	—
[External Device Configuration]	—	—

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 163 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to Ethernet module (MELSEC iQ-F series)

The setting items for the network number and station number do not exist on the PLC side.

Set the network number and station number on the GOT side.

When doing so, set a network number not used in the system.

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	FX5-ENET
	[IP Address]	192.168.3.251
	[Port No.]	5555
	[Communication]	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number.

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.251

Reply from 192.168.3.251:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.251

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

Ethernet diagnostics of GX Works3

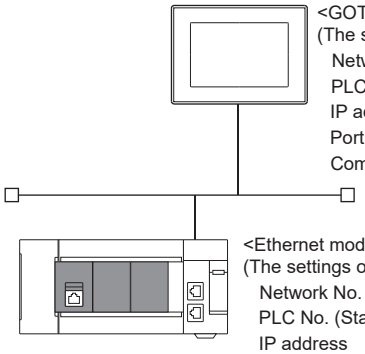
The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-F series manuals

■When the GOT's communication format is TCP

• System configuration



<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.)*2 : 1
PLC No. (GOT Station)*2 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : TCP (fixed)

<Ethernet module>
(The settings other than the following are set to the default)
Network No. : 1 (virtual) *1
PLC No. (Station)*2 : 2 (virtual) *1
IP address : 192.168.3.251 (Default)
Port No. : 5554 (fixed)
Communication format : TCP (fixed)

*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

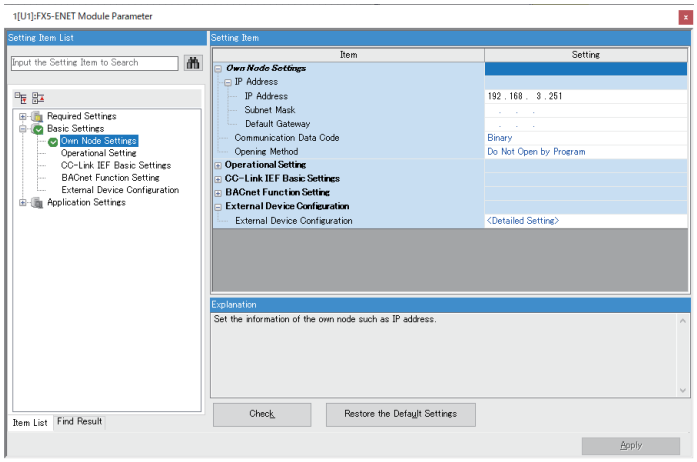
• [Module Parameter] of GX Works3

For the connection with FX5-ENET/IP, use GX Works3 version 1.075D or later.

For the connection with FX5-EIP, use GX Works3 version 1.120A or later.

Module parameters of the Ethernet module

Set [Module Parameter] of the port under [Module information].



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[IP Address]	192.168.3.251	○

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	FX5-ENET
	[IP Address]	192.168.3.251
	[Port No.]	5554
	[Communication]	TCP

*1 Set the same value as the GOT net number.
*2 Set a value different from the GOT station number.

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.251

Reply from 192.168.3.251:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.251

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-F series manuals

Connection to CC-Link IE TSN-equipped module

This section describes the settings of the GOT and CC-Link IE TSN-equipped module in the system configuration shown below.

Point

• CC-Link IE TSN-equipped module

For details on the CC-Link IE TSN-equipped module, refer to the following manual.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

• Connecting multiple GOTs

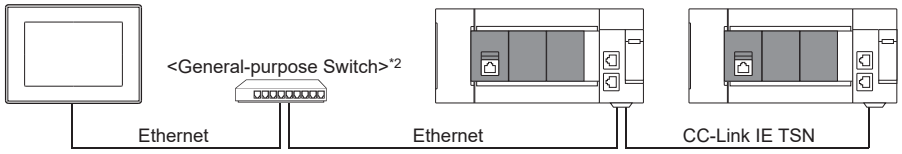
When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

Page 166 When connecting multiple GOTs

■System configuration

<GOT>
(Use the default value for settings other than the following.)
Network No. (GOT Net No.)*1 : 1
PLC No. (GOT Station)*1 : 18
IP address : 192.168.3.18
Port No : 5001
Communication format : UDP (fixed)

<CC-Link IE TSN master/local module 2>
(Use the default value for settings other than the following.)
Station type : Master station
Network No. : 1
PLC No. (Station)*1 : 0 (fixed)
IP address : 192.168.3.99



<CC-Link IE TSN master/local module 1>
(Use the default value for settings other than the following.)
Station type : Local station
Network No. : 1
PLC No. (Station)*2 : 1
IP address : 192.168.3.11

*1 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

*2 General-purpose Switch is required to connect the GOT and the CC-Link IE TSN master/local module.
For usable General-purpose Switches, refer to the following.
MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

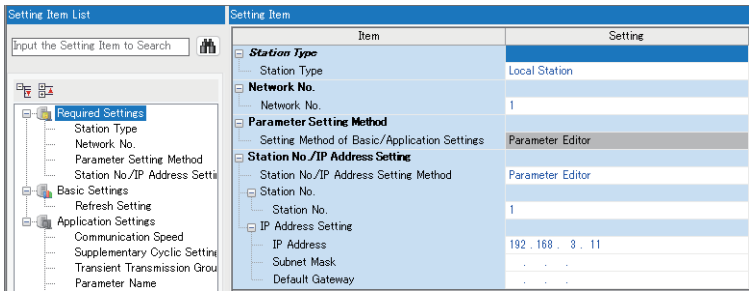
■[Module Parameter] of GX Works3

For details on the settings of the PLC, refer to the following manual.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

Ex.

Settings of CC-Link IE TSN master/local module 1



Item	Setting value	
	CC-Link IE TSN master/local module 1	CC-Link IE TSN master/local module 2
[Station Type]	Local station	Master station
[Network No.]	1	1
[Station No.]	1	0
[IP Address]	192.168.3.11	192.168.3.99

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 163 GOT side settings

• Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	18
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station No.]	1*2
	[Unit Type]	FX5-CCLGN-MS/FX5-nSSC-G
	[IP Address]	192.168.3.11
	[Port No.]*3	5001
	[Communication]*3	UDP

*1 Set the same value as the GOT net number.
*2 Set a value different from the GOT station number.
*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5554
[Communication]: TCP

■Checking the communication status of the CC-Link IE TSN-equipped module

• When using Windows Command Prompt

1) At normal end

C:\>Ping 192.168.3.11

Reply from 192.168.3.11:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.11

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the CC-Link IE TSN-equipped module specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-F series manuals

4.4.5 Connection to the PLC with the authentication function enabled

Logon to the PLC

When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.

Touch a special function switch (Destination Authentication) set in the project to display the key window.

Enter the [User Name] and [Password] to log on.

For information on how to set a special function switch, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Logoff from the PLC

Touch a special function switch (Destination Authentication) set in the project to log off.

Reading and writing of cyclic devices

Cyclic devices communicate using an expansion unit, allowing read and write operations even in the logged-off state.

Precautions

■Creating a project

At GOT startup, the PLC is in logoff state.

The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.

Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.

For information on how to set screens and functions, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Take the following precautions when creating a project.

Item		Precautions for using the destination authentication function
[Environmental Setting]	[Screen Switching/Window]	Set the GOT internal device as the screen switching device. As well as logoff operation by GOT, reset on the PLC side or other operations can also make the PLC in logoff state. By setting the GOT internal device as the screen switching device, a screen can be switched even in logoff state due to reset on the PLC side or other operations.
	[Language Switching]	Set the GOT internal device as the language switching device. When a PLC device is set, comments cannot be displayed in logoff state.
	[System Information]	Set the GOT internal device as the system information device. When a PLC device is set, a system alarm occurs in logoff state.
	[Security]	It is recommended not to use screen security (level authentication and operator authentication) for connection with the PLC with the destination authentication function enabled.
		When using the level authentication, set the GOT internal device as the security level device.
Screen setting	Screen displayed immediately after GOT startup	Place a special function switch (Destination Authentication) to perform destination authentication for logging on to the PLC. Do not configure the setting to monitor the PLC devices.
	Screen number	Specify the screen number ranges separately for the screen displayed in logoff state and the screen displayed in logon state. Separating the screen number ranges makes screen transition in logoff state easy to consider. Example) Before authentication: 1 to 100, after authentication: 101 or later
	Screen switching control at logoff	Configure the setting using trigger actions or other methods so that the screen switches at logoff to the screen displayed before authentication.
Function that is not recommended for use when connecting with the PLC with the destination authentication function enabled		• Screen security (level authentication and operator authentication) • GOT Mobile function (Destination authentication cannot be performed on a mobile screen.)
Others	Function to specify the conditions other than the trigger device	Specify the trigger indirectly by using trigger actions or other methods. Example) When the PLC device controls the input range for a numerical input
	Function that cannot specify the trigger device	By scripts or device data transfer using the GOT internal device, read and write the PLC device only in logon state. Example) Alarm monitoring of the connected device

■Character code applicable for [User Name].

For logon to the PLC from the GOT, only ASCII code characters can be available for [User Name] in the key window and the [Destination Authentication] window.

When setting [User Name] for the PLC, set [User Name] of the user operating the PLC from the GOT in the ASCII code.

For the list of the ASCII code available in GOT, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

■Access level of the user who can log on

When logging on to the PLC from the GOT, only the users whose access level is [Users] can log on.

Users with the access level [Administrators] or [Developers] cannot log on.

When monitoring the PLC from the GOT, set the users whose access level is [Users] for the PLC.

■Changing the user authentication function settings

The user authentication settings (user name and password) cannot be changed from the GOT.

Use GX Works3 to change the settings registered in the PLC.

■Obtaining and updating CPU errors

The GOT cannot obtain CPU errors unless you log on to the PLC.

To update the CPU error of the system alarm displayed on the GOT, log on to the PLC from the GOT.

4.4.6 Access range for monitoring

Only the connected CPU can be accessed.

4.5 MELSEC iQ-R series (Built-in Ethernet port connection)

☞ Page 188 Connectable devices
☞ Page 190 System configuration
☞ Page 198 GOT side settings
☞ Page 209 PLC side settings
☞ Page 231 Access range for monitoring
☞ Page 232 How to monitor a redundant system

4.5.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

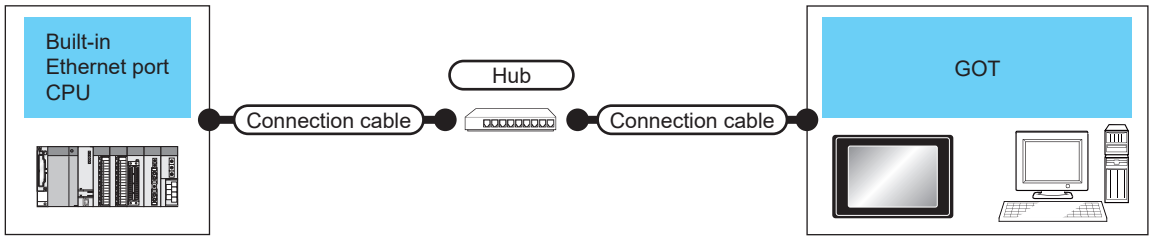
Controller	Model	Clock	Connectable model
MELSEC iQ-R series	R00CPU R01CPU R02CPU R04CPU R08CPU R16CPU R32CPU R120CPU	○	GT37 SoftGOT3000
	R08PCPU*1 R16PCPU*1 R32PCPU*1 R120PCPU*1	○	GT37 SoftGOT3000
	R04ENCPU R08ENCPU R16ENCPU R32ENCPU R120ENCPU	○	GT37 SoftGOT3000
	R08PSFCPU*2 R16PSFCPU*2 R32PSFCPU*2 R120PSFCPU*2	○	GT37 SoftGOT3000
	R08SFCPU*3 R16SFCPU*3 R32SFCPU*3 R120SFCPU*3	○	GT37 SoftGOT3000
Motion CPU (MELSEC iQ-R series)	R16MTCPU R32MTCPU R64MTCPU*5	○	GT37 SoftGOT3000
C Controller module (MELSEC iQ-R series)	R12CCPU-V	○	GT37 SoftGOT3000
MELSECWinCPU (MELSEC iQ-R series)	R102WCPU-W	—	GT37 SoftGOT3000

Controller	Model	Clock	Connectable model
CNC C80	R16NCCPU-S1*4	○	GT37 SoftGOT3000
Robot controller (MELSEC iQ-R series)	CR800-R (R16RTCPU)	○	GT37 SoftGOT3000

*1 Mount a redundant function module R6RFM next to the RnPCPU on the base unit when building a redundant system.
*2 Mount the SIL2 function module R6PSFM and the redundant function module R6RFM next to the RnPSFCPU on the base unit.
*3 Mount a safety function module R6SFM next to the RnSFCPU on the base unit.
The RnSFCPU and the safety function module R6SFM must have the same pair version.
If their pair versions differ, the RnSFCPU does not operate.
*4 Connect the cable to the DISPLAY I/F on the R16NCCPU-S1.
*5 Use a module with OS software version 06 or later.

4.5.2 System configuration

Connection to the built-in Ethernet port CPU



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 191 Connection cable

☞ Page 191 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 192 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	Model
MELSEC iQ-R series[*1*2*3] Robot controller CR800-R (R16RTCPU)	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000
Motion CPU (MELSEC iQ-R series)[*1*2*3]	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000
C Controller module (MELSEC iQ-R series)[*3]	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000
MELSECWinCPU (MELSEC iQ-R series)[*3]	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the built-in Ethernet port CPU, refer to the manual of the PLC to be used.
*2 For [Unit Type] to be selected in [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 205 [Connected Ethernet Controller Setting]
*3 For connection to RnENCPU via the multiple CPU system, the firmware version of the RnENCPU must be 14 or later.

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.
Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.
Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.
When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.
The maximum length depends on the Ethernet equipment used.
The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs.
For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.
The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP		
MELSEC iQ-R series	119	17	GT37 SoftGOT3000	119 (16 or less recommended)
Robot controller CR800-R (R16RTCPU)	119	17	GT37 SoftGOT3000	119 (16 or less recommended)
	16	16	GT37 SoftGOT3000	128
Motion CPU (MELSEC iQ-R series)	1	15	GT37 SoftGOT3000	119 (16 or less recommended)
	16	16	GT37 SoftGOT3000	128
C Controller module (MELSEC iQ-R series)	119	17	GT37 SoftGOT3000	119 (16 or less recommended)
	1	1	GT37 SoftGOT3000	128
MELSECWinCPU (MELSEC iQ-R series)	119	17	GT37 SoftGOT3000	119 (16 or less recommended)

■Connection to the built-in Ethernet port of the built-in Ethernet port CPU

Connect the GOT after turning on the network equipment such as the built-in Ethernet port CPU or hub to enable communications.

If the GOT cannot communicate with the built-in Ethernet port CPU, a communication error may occur on the GOT.

■Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.

If you start the GOT before the PLC runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

📖GT Designer3 (GOT3000) Screen Design Manual

■Connection to RnSFCPU

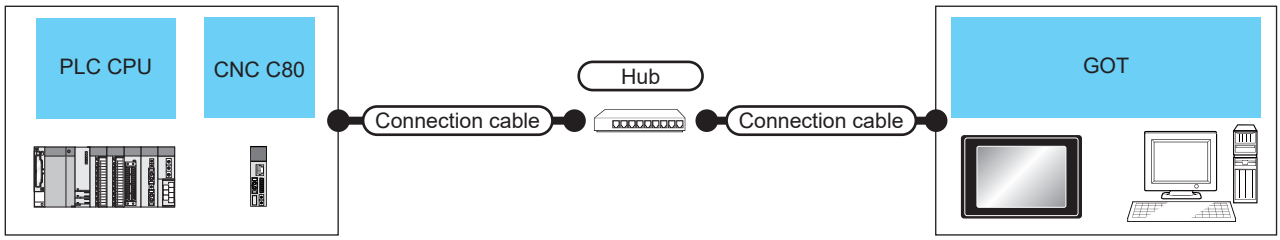
RnSFCPU takes 10 seconds or more to run.

If you start the GOT before the RnSFCPU runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

📖GT Designer3 (GOT3000) Screen Design Manual

Connection to Display I/F



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 195 Connection cable

☞ Page 195 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 195 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	Model
CNC C80(R16NCCPU-S1)*1*2	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the CNC C80, refer to the following manual.
C80 Series Setup Manual

*2 Select [RnNCCPU] for [Unit Type] in [Connected Ethernet Controller Setting] of GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 205 [Connected Ethernet Controller Setting]

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

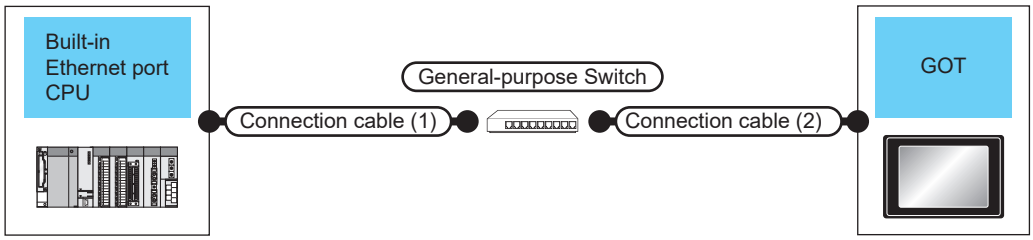
Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP		
CNC C80 (R16NCCPU-S1)	8	8	GT37 SoftGOT3000	128

Connection to Motion module through the built-in Ethernet port of PLC

The following shows the system configuration for monitoring the global labels of the Motion module with the GOT.

Point

To monitor the global labels of the Motion module with the GOT, connect the GOT and Motion module through the built-in Ethernet port of the PLC.
If the GOT is connected to the built-in port of the Motion module, the global labels of the Motion module cannot be monitored.



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 197 Connection cable

☞ Page 197 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 197 Maximum number of connected devices

Controller	Motion module*2	Connection cable (1)	External device	Connection cable (2)	GOT	
					Interface	Model
MELSEC iQ-R series (RnCPU, RnENCPU, RnSFCPU)*3*5 C Controller module (MELSEC iQ-R series)*4	RD78G4 RD78G8 RD78G16 RD78G32 RD78G64 RD78GHV RD78GHW	Twisted pair cable	General-purpose Switch*1	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
					Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For usable General-purpose Switches, refer to the following.
MELSEC iQ-R Motion Module User's Manual (Startup)

*2 For the system configuration of the Motion module, refer to the following manual.
MELSEC iQ-R Motion Module User's Manual (Startup)

*3 Select [RCPU] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
Set either of the following values for [Port No.].
• UDP: [5006]
• TCP: [5007]
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 198 GOT side settings

*4 Select [RnCCPU/RnWCPU] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
Set either of the following values for [Port No.].
• UDP: [5006]
• TCP: [5007]
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 205 [Connected Ethernet Controller Setting]

*5 To use the multiple CPU system when the GOT is connected to RnENCPU, the firmware version of the RnENCPU must be 10 or later.

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables, connectors, and hubs that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

■Maximum segment length

The maximum segment length (length between General-purpose Switch and a node) is 100 m.

■Maximum number of connected devices

Only one GOT can access one Motion module at a time.

Before accessing the Motion module being monitored by the GOT, end the monitoring by the GOT.

4.5.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

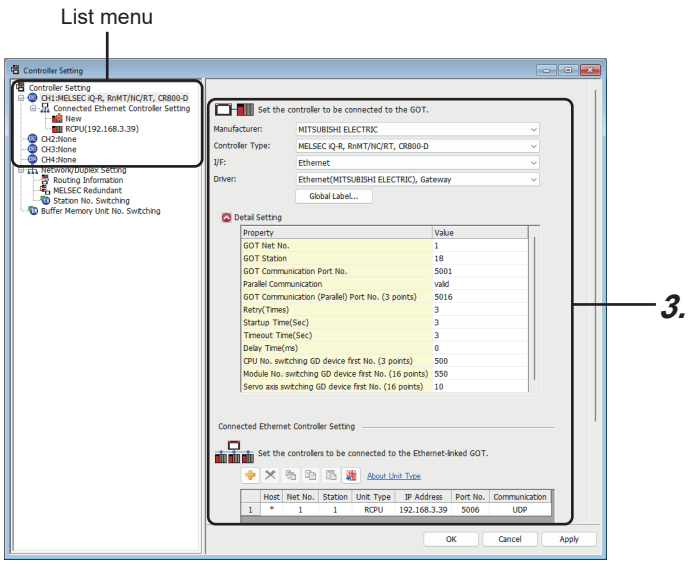
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[I/F]	[Ethernet]
[Driver]	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 200 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 205 [Connected Ethernet Controller Setting]

4. When you have completed the settings, click the [OK] button.

Point

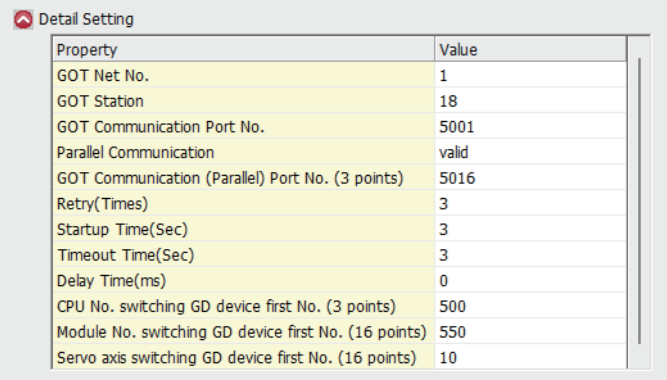
The controller settings can be checked in [I/F Communication Setting].

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]*3	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 202 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 203 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 204 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 205 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

*3 When the MELSEC redundant settings are enabled, [Parallel Communication] is set to [invalid].

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

■When connecting multiple GOTs

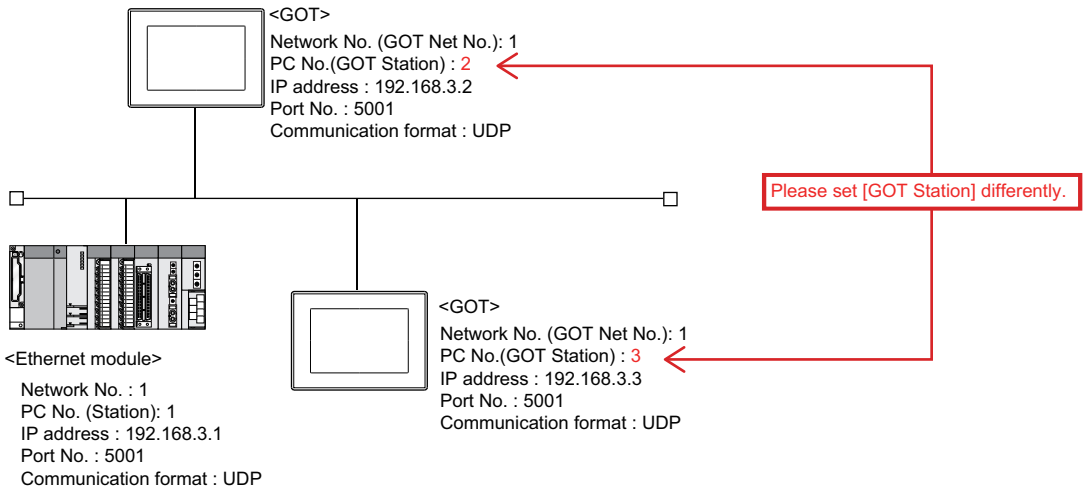
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 200 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

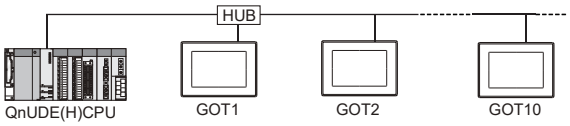
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup Time	3sec (default)	4sec	4sec
Timeout Time	3sec (default)	4sec	4sec

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

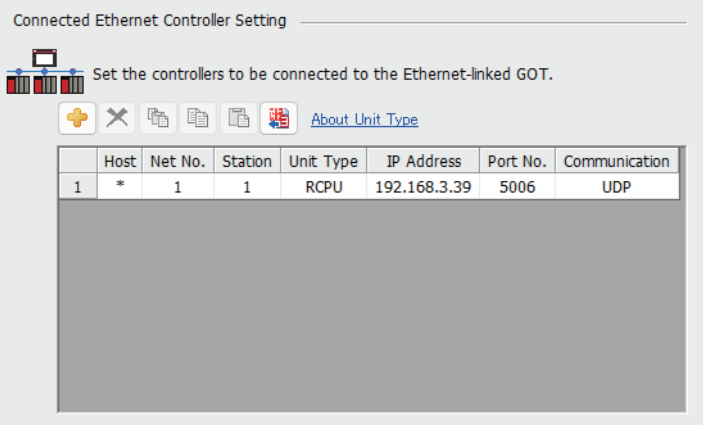
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	☞ Page 206 [Station]
[Unit Type]	Select the model of the connected Ethernet equipment.	☞ Page 206 [Unit Type]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 206 [Port No.]
[Communication]	Set the communication format of the connected Ethernet equipment.	[UDP], [TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].

☞ Page 200 [Detail Setting]

■[Unit Type]

Select an item for [Unit Type] as shown below.

GOT connection destination	[Unit Type]
RCPU,RnMTCPU	[RCPU]
C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series)	[RnCCPU/RnWCPU]
CNC C80	[RnNCCPU]
RnENCPU (Port CPU P1)	[RCPU]
RnENCPU (Port P1)	[RJ71EN71]
RnENCPU (Port P2)	
CR800-R (R16RTCPU)	[CR800]

■[Port No.]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[RCPU]	[5001] (Select this item to enable the network number and PLC number of the built-in Ethernet port CPU.)	[UDP]
	[5006]	[UDP]
	[5007]	[TCP]
[RnCCPU/RnWCPU], [RnNCCPU], [CR800]	[5006]	[UDP]
	[5007]	[TCP]
[RJ71EN71]	[5001]	[UDP]
	[5002]	[TCP]

■[Station]

The setting range of the station number differs depending on the setting for [Controller Type].

[Unit Type]	Setting range for [Station]
[RCPU] [RnCCPU/RnWCPU] [RnNCCPU] [RJ71EN71]	[1] to [120]
[CR800]	[1] to [64]

■Selecting [RCPU] for [Unit Type]

When [RCPU] is selected for [Unit Type], the setting of [Port No.] can be changed.

• When [Port No.] is set to [5001]

For RCPU with the following firmware versions, the network number and PLC number can be set for built-in Ethernet port CPU (Port number: 5001).

R00CPU, R01CPU, R02CPU: 08 or later

Other RCPU: 40 or later

The network number and station number in the object setting dialog must match the network number and PLC number of the built-in Ethernet port CPU.

For connection to a built-in Ethernet port CPU with [Unit Type] other than [RCPU], do not set [5001] to [Port No.]. Otherwise, monitoring becomes unavailable.

• When [Port No.] is set to [5006] or [5007]

There is no setting for the network number and PLC number of built-in Ethernet port CPU (Port number: 5006, 5007).

The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

■Connection to the built-in Ethernet port PLC with [Communication] set to [TCP]

During communication with the built-in Ethernet port PLC with [Communication] set to [TCP], using the FA transparent function may change the setting from [TCP] to [UDP] and start communication with the PLC with the new setting.

In this case, communication with the built-in Ethernet port PLC cannot be executed normally.

Take the following corrective action.

Phenomenon	Cause	Corrective action
Communication fails when using the FA transparent function.	When the multi-channel Ethernet connection is used, [TCP] and [UDP] are used to the same IP address, and then the FA transparent function is used for the channel set to [TCP].	Execute the FA transparent function for the channel set to [UDP].

Point

Changing the host station on the GOT

[Host] can be changed with the utility function of the GOT.

For details on the setting method, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

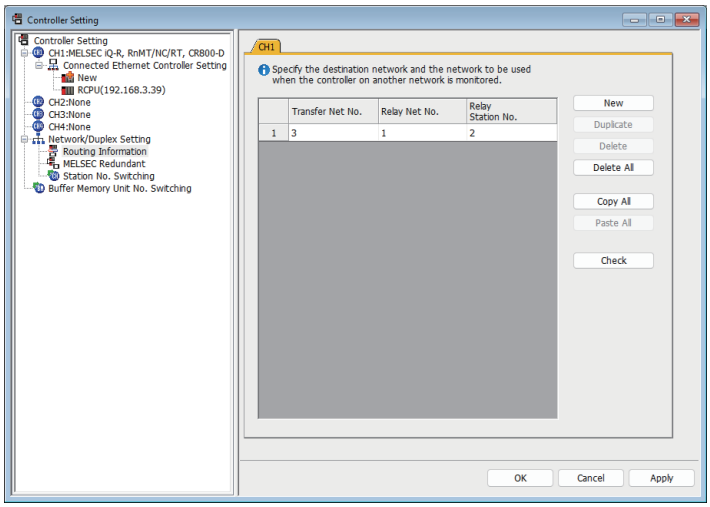
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC iQ-R CPU Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 209 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.5.4 PLC side settings

Model		Reference
MELSEC iQ-R series	R00CPU R01CPU R02CPU R04CPU R08CPU R16CPU R32CPU R120CPU R08PCPU R16PCPU R32PCPU R120PCPU R04ENCPU R08ENCPU R16ENCPU R32ENCPU R120ENCPU R08PSFCPU R16PSFCPU R32PSFCPU R120PSFCPU R08SFCPU R16SFCPU R32SFCPU R120SFCPU	☞ Page 210 Connection to the built-in Ethernet port CPU of the MELSEC iQ-R series

CNC C80	R16NCCPU-S1	☞ Page 210 Connection to the built-in Ethernet port CPU of the MELSEC iQ-R series
Robot controller (MELSEC iQ-R series)	CR800-R (R16RTCPU)	☞ Page 210 Connection to the built-in Ethernet port CPU of the MELSEC iQ-R series

Precautions

Do not set a remote password on the RCPU.
Doing so disables monitoring with the GOT.

Connection to the built-in Ethernet port CPU of the MELSEC iQ-R series

This section describes the settings of the GOT and the built-in Ethernet port CPU in the system configuration shown below.

☞ Page 210 One-to-one connection with the GOT side communication format set to UDP
☞ Page 213 One-to-one connection with the GOT side communication format set to TCP
☞ Page 216 Multi-connection with the GOT side communication format set to UDP
☞ Page 219 Multi-connection with the GOT side communication format set to TCP

Point

• Built-in Ethernet port CPU

For details on the built-in Ethernet port CPU, refer to the following manual.

📖MELSEC iQ-R series manuals

• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

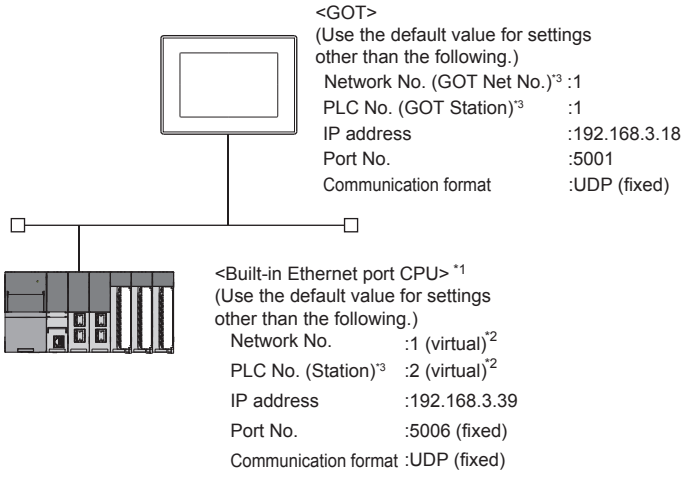
☞ Page 201 When connecting multiple GOTs

■One-to-one connection with the GOT side communication format set to UDP

• System configuration

For one-to-one connection, no settings are required on the PLC side.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



*1 For the settings when using system devices such as a hub, refer to the following.
☞ Page 216 Multi-connection with the GOT side communication format set to UDP

*2 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*3 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 198 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to the Built-in Ethernet port RCPU

The setting items for the network number and station number do not exist on the PLC side.

Set the network number and station number on the GOT side.

When doing so, set a network number not used in the system.

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	RCPU*3
	[IP Address]	192.168.3.39
	[Port No.]	5006
	[Communication]	UDP

*1 Set the same value as [GOT Net No.].

*2 Set a value not set for [GOT Station].

*3 For CR800-R (R16RTCPU), set [CR800].

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.39

Reply from 192.168.3.39:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.39

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

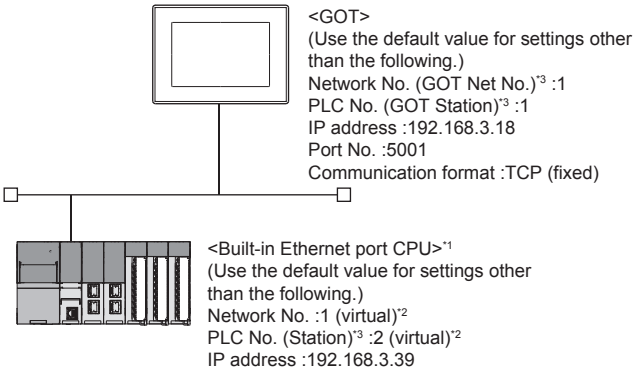
MELSEC iQ-R series manuals

■One-to-one connection with the GOT side communication format set to TCP

• System configuration

For one-to-one connection, no settings are required on the PLC side.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



*1 For the settings when using system devices such as a hub, refer to the following.
☞ Page 219 Multi-connection with the GOT side communication format set to TCP

*2 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*3 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.1

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-R series manuals

Connection to C Controller module (MELSEC iQ-R series)

This section describes the settings of the GOT and C Controller module (MELSEC iQ-R series) in the system configuration shown below.

Use CW Configurator for the C Controller module (MELSEC iQ-R series) communication settings.

Point

• C Controller module (MELSEC iQ-R series)

For details on the C Controller module (MELSEC iQ-R series), refer to the following manual.

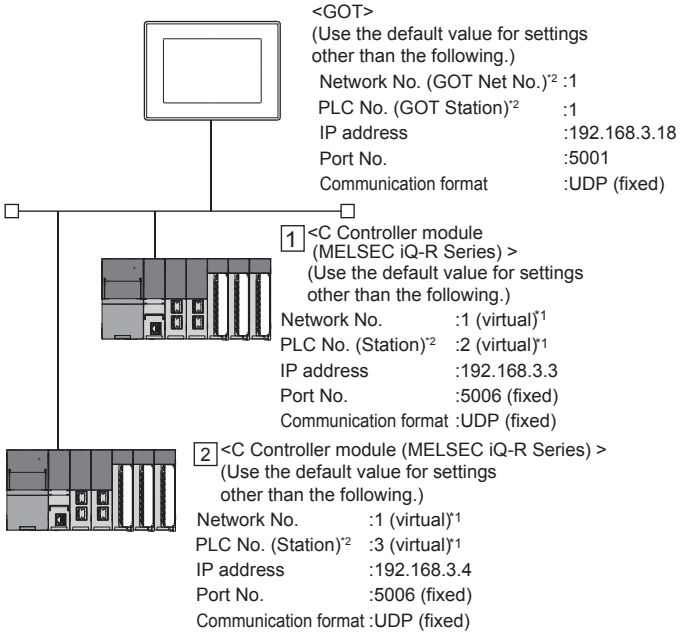
📖Manuals of the C Controller module (MELSEC iQ-R series)

• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 201 When connecting multiple GOTs

■System configuration



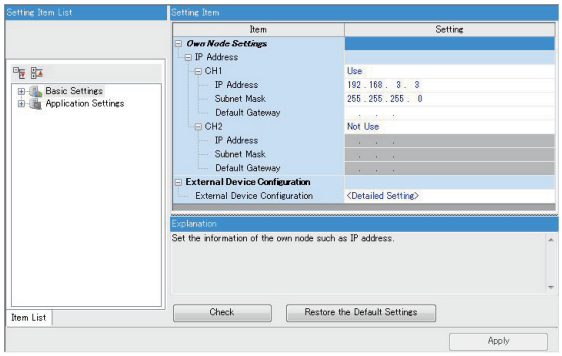
*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.

☞ Page 225 [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

■[Module parameter] of CW Configurator



○: Necessary, △: As necessary, —: Not necessary

Item*1	Setting value	Setting for GOT connection
[CH1]	Use	—
[IP Address]	192.168.3.3	—
[Subnet Mask]	—	—
[Default Gateway]	—	—
[CH2]	Not used	—
[IP Address]	—	—
[Subnet Mask]	—	—
[Default Gateway]	—	—
[External Device Configuration]	—	—

*1 Set the IP address corresponding to the channel number to be used for connection to the GOT.

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 199 [Controller Setting]

Point

[Connected Ethernet Controller Setting] for connection to the built-in Ethernet port CPU
The setting items for the network number and station number do not exist on the PLC side.
Set the network number and station number on the GOT side.
When doing so, set a network number not used in the system.

• Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value	
		1	2
Ethernet setting No. 1	[Host]	*	—
	[Net No.]	1*1	1*1
	[Station]	2*2	3*2
	[Unit Type]	RnCCPU/RnWCPU	RnCCPU/RnWCPU
	[IP Address]	192.168.3.3	192.168.3.4
	[Port No.]*3	5006	5006
	[Communication]*3	UDP	UDP

*1 Set the same value as the GOT net number.
*2 Set a value different from the GOT station number and PLC numbers of other PLCs on the same network.
*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5007
[Communication]: TCP

■Checking the communication status of the C Controller module (MELSEC iQ-R series)

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.3

Reply from 192.168.3.3:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.3

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the C Controller module (MELSEC iQ-R series) specified by the ping command

Point

Ethernet diagnostics of CW Configurator

The Ethernet diagnostics of CW Configurator enables ping tests from the PLC.

For details on the Ethernet diagnostics of CW Configurator, refer to the following manual.

Manuals of the C Controller module (MELSEC iQ-R series)

Connection to MELSECWinCPU (MELSEC iQ-R series)

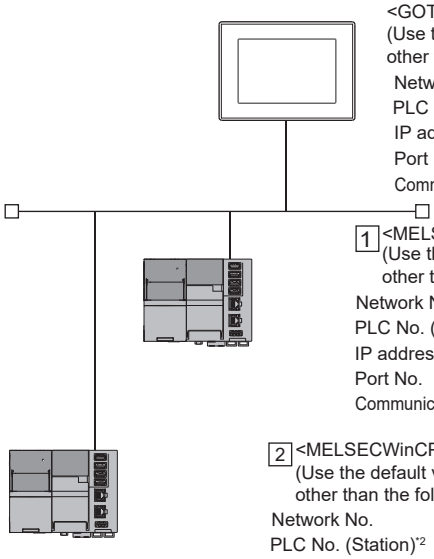
This section describes the settings of the GOT and MELSECWinCPU (MELSEC iQ-R series) in the system configuration shown below.

Point

For details on MELSECWinCPU (MELSEC iQ-R series), refer to the following manual.

Manuals of MELSECWinCPU (MELSEC iQ-R series)

■System configuration



<GOT>
(Use the default value for settings other than the following.)
Network No. (GOT Net No.)*2 :1

	[Port No.]*3	5006	5006
	[Communication]*3	UDP	UDP

*1 Set the same value as the GOT net number.
*2 Set a value different from the GOT station number and PLC numbers of other PLCs on the same network.
*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5007
[Communication]: TCP

■Checking the communication status of the MELSECWinCPU (MELSEC iQ-R series)

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.3

Reply from 192.168.3.3:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.3

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the MELSECWinCPU (MELSEC iQ-R series) specified by the ping command

Point

Ethernet diagnostics of CW Configurator

The Ethernet diagnostics of CW Configurator enables ping tests from the PLC.

For details on the Ethernet diagnostics of CW Configurator, refer to the following manual.

MELSEC iQ-R MELSECWinCPU Module User's Manual

Connection to Motion module through built-in Ethernet port of PLC

For the connection between the GOT and the built-in Ethernet port CPU of the MELSEC iQ-R series, refer to the following.

Page 210 Connection to the built-in Ethernet port CPU of the MELSEC iQ-R series

For details on the Motion module, refer to the following manual.

MELSEC iQ-R Motion Module User's Manual (Startup)

4.5.5 Access range for monitoring

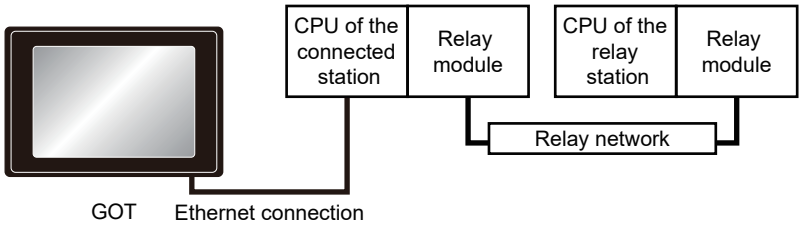
When the GOT is connected to the CPU of the station connected via Ethernet, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station										
	Relay network	CPU of the relay station									
		MXR	MXF	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU

	CC-Link IE Field Network	○*7	—	○	○	○*2	○	—	—	—	○*4

*1 RnCPU, RnENCPU, RnSFCPU, and MELSECWinCPU (MELSEC iQ-R series) are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*3 FX5U and FX5UC are supported.

*4 FX5U, FX5UC, and FX5UJ are supported.

*5 The C Controller module (MELSEC iQ-R series) is not supported.

*6 The C Controller module (MELSEC-Q series) is not supported.

*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
• For MELSEC MX Controller (MX-R Model)
☞ Page 90 Setting procedure of the encrypted communication
• For MELSEC MX Controller (MX-F Model)
☞ Page 153 Setting procedure of the encrypted communication

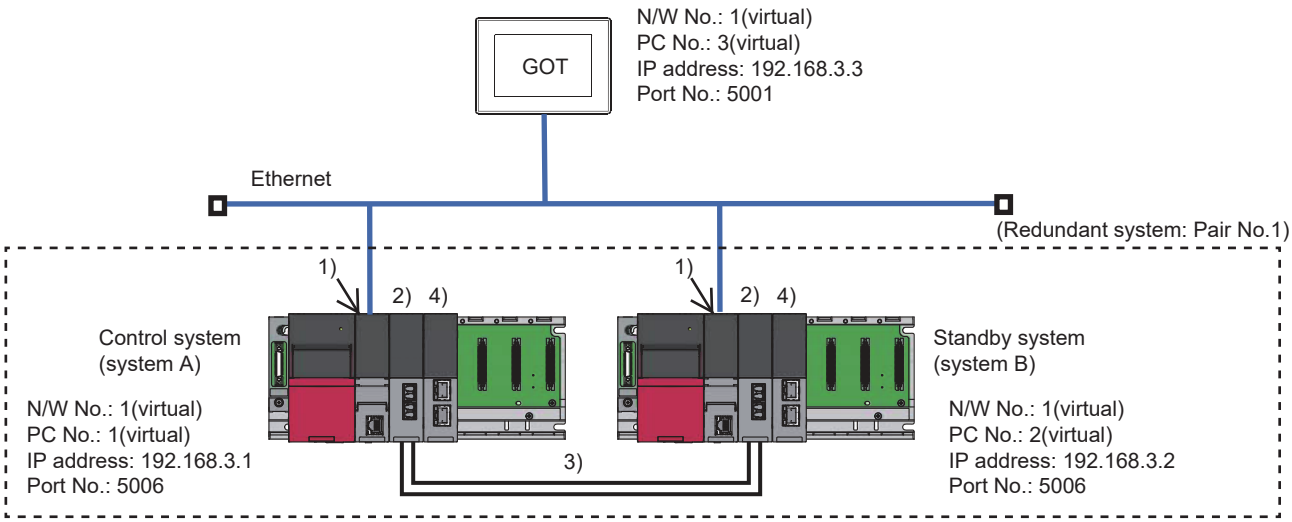
4.5.6 How to monitor a redundant system

☞ Page 232 One-to-one connection of the GOT and the redundant system
☞ Page 235 1:n connection with redundant system
☞ Page 237 Mixed connection of redundant system and non-redundant system
☞ Page 239 MELSEC redundant settings
☞ Page 241 Precautions

One-to-one connection of the GOT and the redundant system

■System configuration example

The following connection configuration examples are explained.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link IE Field Network Master/Local module

■Connection method

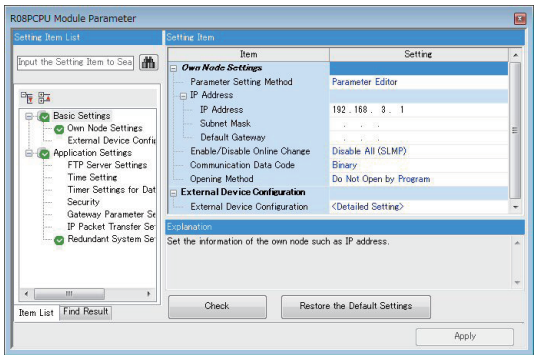
Connect the built-in Ethernet port CPU and the GOT.

☞ Page 188 MELSEC iQ-R series (Built-in Ethernet port connection)

■PLC side settings

• Control system (system A) PLC settings (GX Works3)

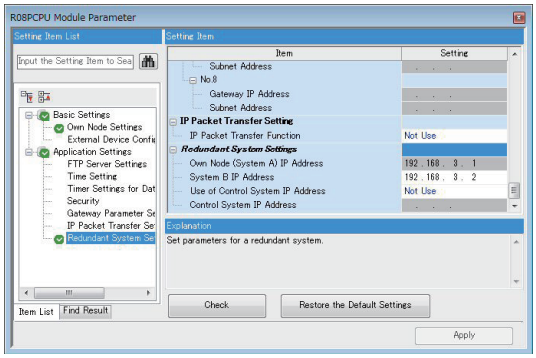
Built-in Ethernet port settings



Item	Setting value
[IP Address]	192.168.3.1
[Subnet Mask]	—
[Default Gateway]	—
[Enable/Disable Online Change]	(Use default value)
[Communication Data Code]	
[Open Method]	
[External Device Configuration]	—

• Standby system (system B) PLC settings (GX Works3)

Redundant Setting



Item	Setting value
[System B IP Address]	192.168.3.2
[Control system IP address availability]	Not used

Point

[Control system IP address availability] setting

Set [Control system IP address availability] to [Not Use].

If [Use] is selected, the GOT will not follow when the system is switched.

■GOT side settings

Set GT Designer3 as follows.

Setting item	Setting details		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	Host (The control system is monitored.)	
	[Other]	[Network No.]: Network number of Ethernet	
		[Station No.]: Station number of the control system	
	[Redundant System]	The system to be monitored ([Not Specified/Control System], [Standby System]) can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
Connected Ethernet controller settings	 ☞ Page 205 [Connected Ethernet Controller Setting]		
MELSEC redundant settings	 ☞ Page 239 MELSEC redundant settings		

■Monitoring target change when system switching occurs in a redundant system

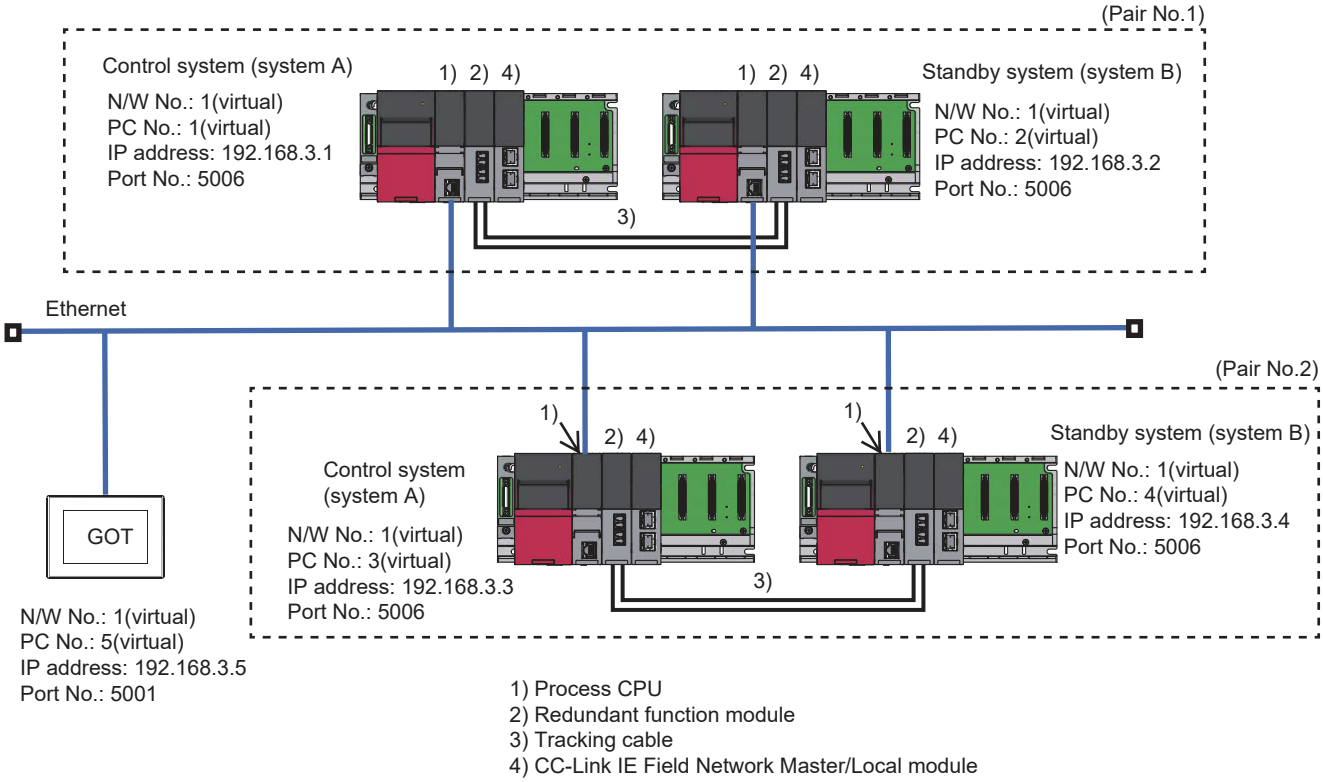
When system switching occurs, the CPU (PLC station No. 2) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

1:n connection with redundant system

■System configuration example

The following connection configuration examples are explained.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link IE Field Network Master/Local module

■Connection method

Connect the Ethernet network system and the GOT.

☞ Page 188 MELSEC iQ-R series (Built-in Ethernet port connection)

■PLC side settings

☞ Page 233 PLC side settings

■GOT side settings

Set GT Designer3 as follows.

Setting item	Setting details		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	Host (The control system is monitored.)	
	[Other]	[Network No.]: 1	
		[Station No.]: Station number of the control system	
	[Redundant System]	The system to be monitored ([Not Specified/Control System], [Standby System]) can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
Connected Ethernet controller settings	 ☞ Page 205 [Connected Ethernet Controller Setting]		
MELSEC redundant settings	 ☞ Page 239 MELSEC redundant settings		

■Monitoring target change when system switching occurs in a redundant system

• Redundant system-1

When system switching occurs, the CPU (PLC station No. 2) becomes the control system and continues the control.
The GOT automatically starts monitoring according to the specified system.

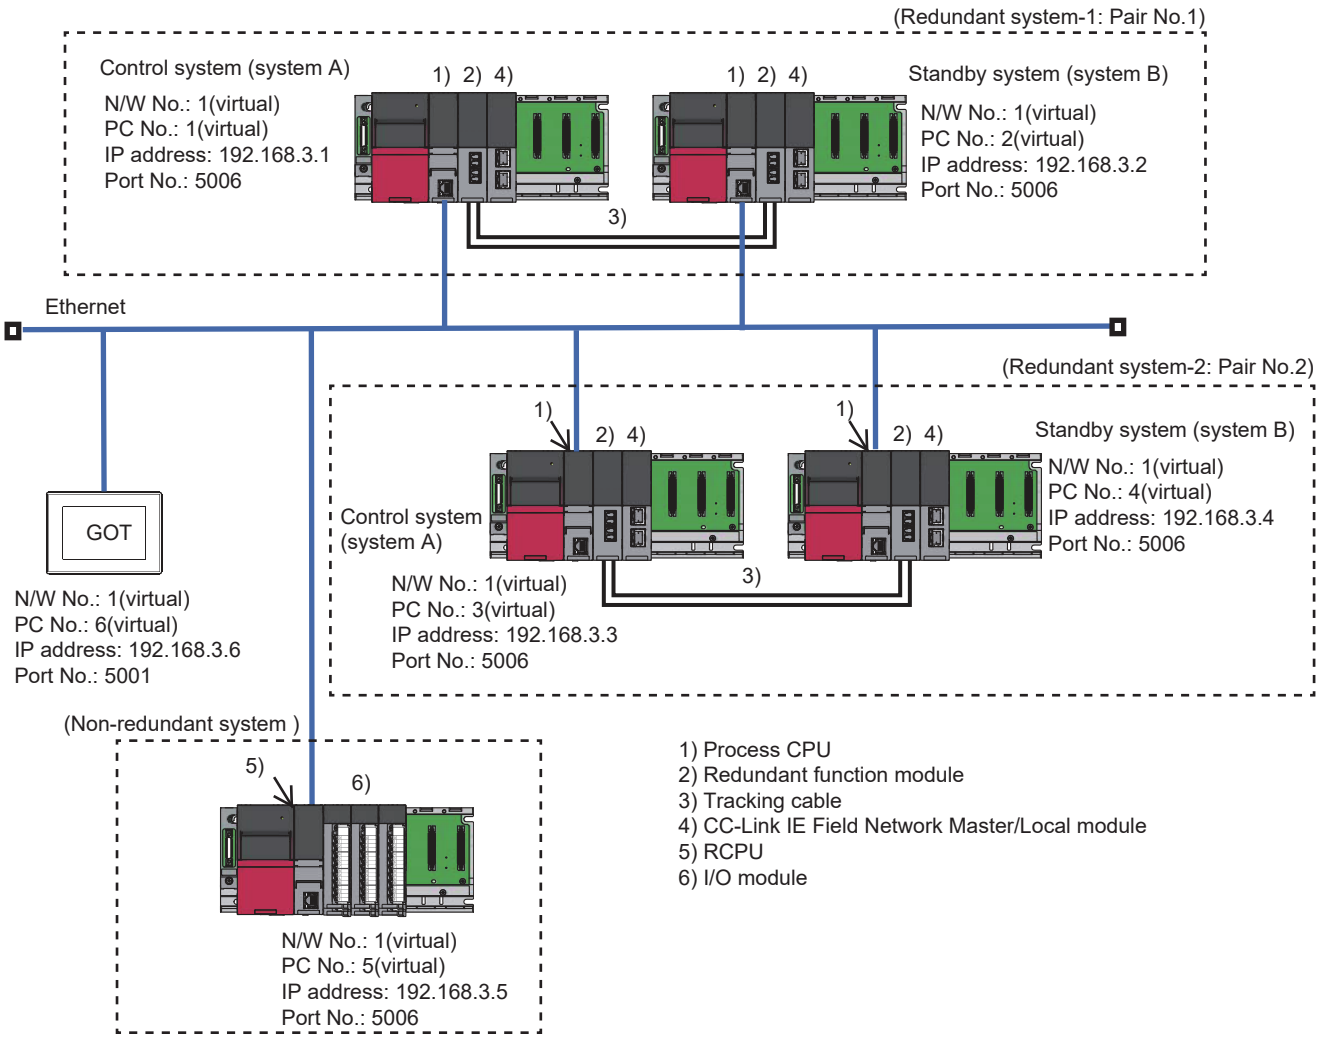
• Redundant system-2

When system switching occurs, the CPU (PLC station No. 4) becomes the control system and continues the control.
The GOT automatically starts monitoring according to the specified system.

Mixed connection of redundant system and non-redundant system

■System configuration example

The following connection configuration examples are explained.



■Connection method

Connect the Ethernet network system and the GOT.

☞ Page 188 MELSEC iQ-R series (Built-in Ethernet port connection)

■PLC side settings

☞ Page 233 PLC side settings

■GOT side settings

Set GT Designer3 as follows.

Setting item	Setting details		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	Host (The control system is monitored.)	
	[Other]	[Network No.]: 1	
		[Station No.]: Station number of the control system	
	[Redundant System]	The system to be monitored ([Not Specified/Control System], [Standby System]) can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
Connected Ethernet controller settings	 ☞ Page 205 [Connected Ethernet Controller Setting]		
MELSEC redundant settings	 ☞ Page 239 MELSEC redundant settings		

■Monitoring target change when system switching occurs in a redundant system

☞ Page 236 Monitoring target change when system switching occurs in a redundant system

MELSEC redundant settings

This section describes the settings for the GOT to automatically change the monitoring target of the RCPU redundant system.

Point

Before configuring the MELSEC redundant settings

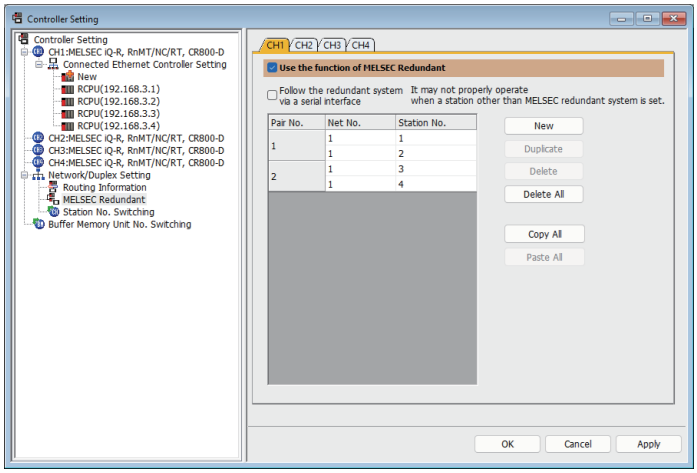
In the MELSEC redundant settings, do not set a station outside the redundant RCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC redundant setting dialog, settings can be made for each channel of the controller.

The following shows an example of redundant CPU pair numbers 1 to 2, network number 1, and redundant CPU station numbers 1 to 4 for the Ethernet connection (station number 5).

Ex.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Copies one setting of the selected pair number and adds it below the bottom row.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 240 Pair number

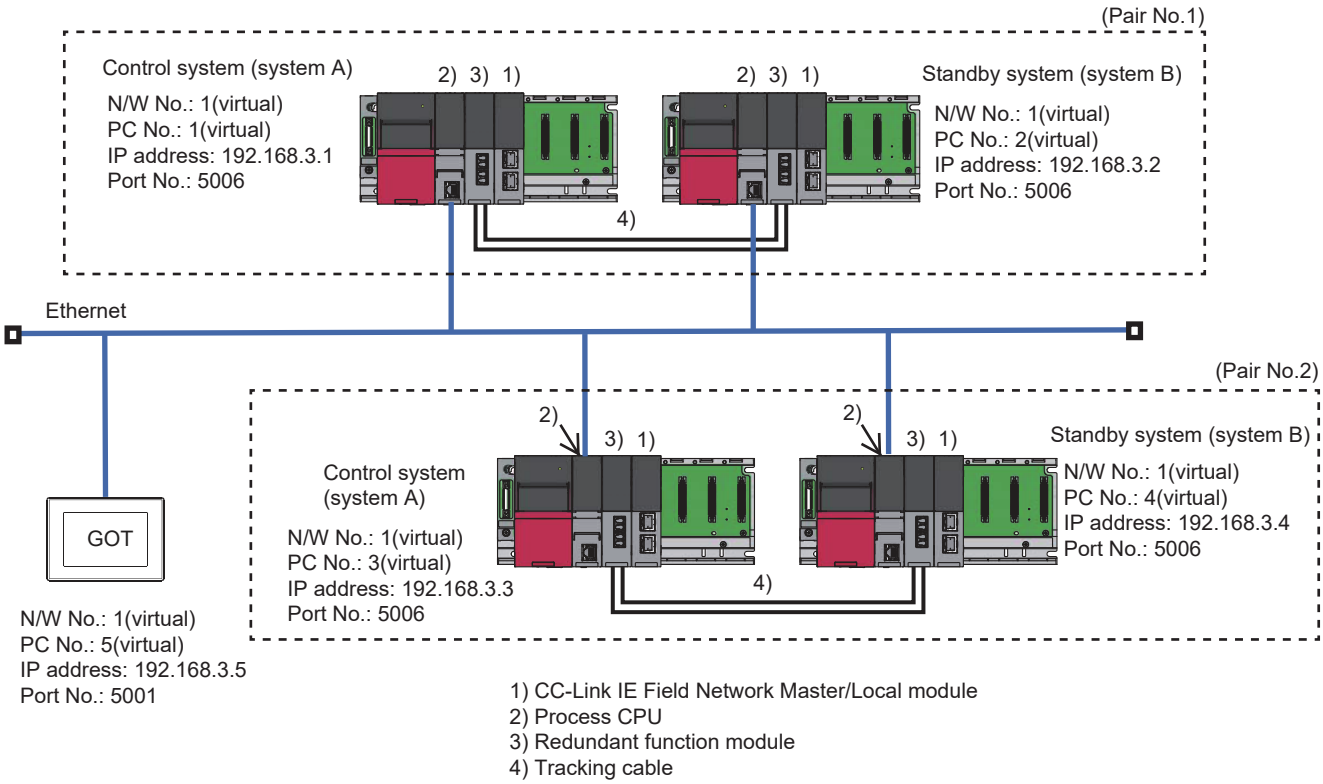
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of Ethernet connection in the RCPU redundant system. (Pair No. 1 to No. 2)

Ex.



Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- Pairing of the last station No. and station No. 1 (Example: Station No. 64 and station No. 1) is not allowed.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the redundant mode of the RCPU redundant system, and does not support the process mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

• 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

[450: Path has changed or timeout occurred in redundant system.] appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, [451: The MELSEC redundant setting and actual system configuration do not match.] appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings. If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm [315 Device writing error. Correct device.] is not detected.

4.6 MELSEC iQ-R series (Ethernet module connection)

☞ Page 242 Connectable devices
☞ Page 245 System configuration
☞ Page 252 GOT side settings
☞ Page 263 PLC side settings
☞ Page 280 Access range for monitoring
☞ Page 281 How to monitor a redundant system

4.6.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Ethernet module	Connectable model
MELSEC iQ-R series	R00CPU R01CPU R02CPU R04CPU R08CPU R16CPU R32CPU R120CPU	○	RJ71EN71 RJ71GN11-T2*5 RJ71GN11-EIP*5 RD78G4*5*6 RD78G8*5*6 RD78G16*5*6 RD78G32*5*6 RD78G64*5*6 RD78GHV*5*6 RD78GHW*5*6	GT37 SoftGOT3000

*1 Mount a redundant function module R6RFM next to the RnPCPU on the base unit when building a redundant system.
*2 Mount the SIL2 function module R6PSFM and the redundant function module R6RFM next to the RnPSFCPU on the base unit.
*3 Mount a safety function module R6SFM next to the RnSFCPU on the base unit.
The RnSFCPU and the safety function module R6SFM must have the same pair version.
If their pair versions differ, the RnSFCPU does not operate.
*4 Use firmware version 12 or later when building a redundant system.
*5 The following shows the connectable PLC CPUs and their firmware versions for connection with each module.

Model	Firmware version			
	Connection to RJ71GN11-T2	Connection to RJ71GN11-EIP	Connection to RD78G4, RD78G8, RD78G16, RD78G32, or RD78G64	Connection to RD78GHV or RD78GHW

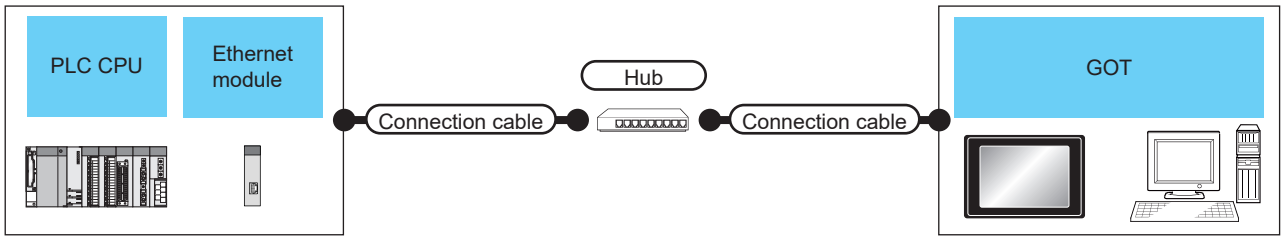
*6 Use a Motion module with software version 06 or later.
For the PLC CPU firmware version and GX Works3 version that support the Motion module, refer to the following.
MELSEC iQ-R Motion Module User's Manual (Application)

*7 For connection to the CC-Link IE TSN master/local module or Motion module, use the C Controller module (MELSEC iQ-R series) with firmware version 15 or later.

*8 Use a module with OS software version 06 or later.

4.6.2 System configuration

Connection to Ethernet module



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 246 Connection cable

☞ Page 246 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 246 Maximum number of connected devices

Controller	Ethernet module*1*2	Connection cable	GOT	
			Interface	Model
MELSEC iQ-R series Motion CPU (MELSEC iQ-R series) CR800-R (R16RTCPU) CNC C80 (R16NCCPU-S1) CC-Link IE Field Network head module (MELSEC iQ-R series)	RJ71EN71	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the Ethernet module, refer to the following manual.
MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)

*2 Select [RJ71EN71] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 259 [Connected Ethernet Controller Setting]

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

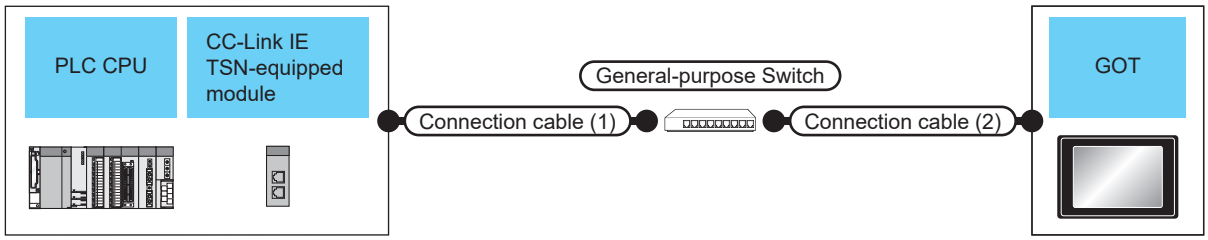
■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one Ethernet module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC iQ-R series Motion CPU (MELSEC iQ-R series) CR800-R (R16RTCPU)	RJ71EN71	119	17	GT37 SoftGOT3000	119 (16 or less recommended)
CNC C80 (R16NCCPU-S1)		8		GT37 SoftGOT3000	128
CC-Link IE Field Network head module (MELSEC iQ-R series)		119	17	GT37 SoftGOT3000	119 (16 or less recommended)
		64	64	GT37 SoftGOT3000	128

Connection to CC-Link IE TSN-equipped module



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 249 Connection cable

☞ Page 249 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 249 Maximum number of connected devices

Controller	CC-Link IE TSN-equipped module*2*3	Connection cable (1)	External device	Connection cable (2)	GOT	
					Interface	Model
MELSEC iQ-R series (RnCPU, RnENCPU, RnSFCPU) C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series)	RJ71GN11-T2	Twisted pair cable	General-purpose Switch*1	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
					Ethernet interface of personal computer	GT37 SoftGOT3000
MELSEC iQ-R series (RnCPU, RnENCPU)	RJ71GN11-EIP*4	Twisted pair cable	General-purpose Switch*1	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
					Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For usable General-purpose Switches, refer to the following.
MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)
MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

*2 For the system configuration of the CC-Link IE TSN-equipped module, refer to the following manuals.
MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)
MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

*3 Select [RJ71GN11-T2/RD78G(H)] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 259 [Connected Ethernet Controller Setting]

*4 Connect the cable to the P1 port of the RJ71GN11-EIP.

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables and connectors that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

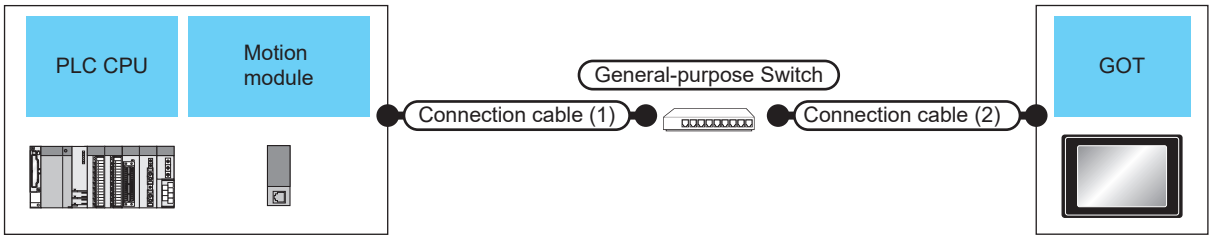
Controller				GOT	
Model		Number of GOTs connectable to one CC-Link IE TSN-equipped module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC iQ-R series (RnCPU, RnENCPU, RnSFCPU)	RJ71GN11-T2	8	8	GT37 SoftGOT3000	119 (8 or less recommended)
		119	17	GT37 SoftGOT3000	119 (16 or less recommended)
C Controller module (MELSEC iQ-R series)		8	8	GT37 SoftGOT3000	119 (8 or less recommended)
		64	64	GT37 SoftGOT3000	128
MELSECWinCPU (MELSEC iQ-R series)		8	8	GT37 SoftGOT3000	119 (8 or less recommended)
		64	64	GT37 SoftGOT3000	119 (16 or less recommended)
MELSEC iQ-R series (RnCPU, RnENCPU)	RJ71GN11-EIP	8	8	GT37 SoftGOT3000	119 (8 or less recommended)
		119	17	GT37 SoftGOT3000	119 (16 or less recommended)

Connection to built-in Ethernet port of Motion module

The following shows the system configuration for monitoring the devices of the PLC CPU with the GOT.

Point

To monitor the global labels of the Motion module with the GOT, connect the GOT and Motion module through the built-in Ethernet port of the PLC.
If the GOT is connected to the built-in port of the Motion module, the global labels of the Motion module cannot be monitored.



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 251 Connection cable
☞ Page 251 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 251 Maximum number of connected devices

Controller	Motion module*2*3	Connection cable (1)	External device	Connection cable (2)	GOT	
					Interface	Model
MELSEC iQ-R series (RnCPU, RnENCPU, RnSFCPU) C Controller module (MELSEC iQ-R series)	RD78G4 RD78G8 RD78G16 RD78G32 RD78G64 RD78GHV RD78GHW	Twisted pair cable	General-purpose Switch*1	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
					Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For usable General-purpose Switches, refer to the following.
MELSEC iQ-R Motion Module User's Manual (Startup)

*2 For the system configuration of the Motion module, refer to the following manual.
MELSEC iQ-R Motion Module User's Manual (Startup)

*3 Select [RJ71GN11-T2/RD78G(H)] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 259 [Connected Ethernet Controller Setting]

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables, connectors, and hubs that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

■Maximum segment length

The maximum segment length (length between General-purpose Switch and a node) is 100 m.

■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one Motion module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC iQ-R series (RnCPU, RnENCPU, RnSFCPU) C Controller module (MELSEC iQ-R series)	RD78G4 RD78G8 RD78G16 RD78G32 RD78G64 RD78GHV RD78GHW	8	8	GT37 SoftGOT3000	119 (8 or less recommended)
		64	64	GT37 SoftGOT3000	128

Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.

If you start the GOT before the PLC runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

Connection to RnSFCPU

RnSFCPU takes 10 seconds or more to run.

If you start the GOT before the RnSFCPU runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

4.6.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

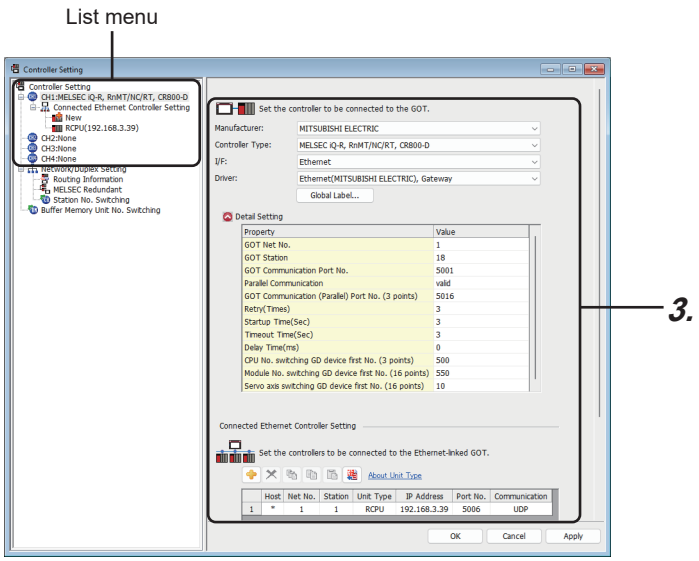
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[I/F]	[Ethernet]
[Driver]	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 254 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 259 [Connected Ethernet Controller Setting]

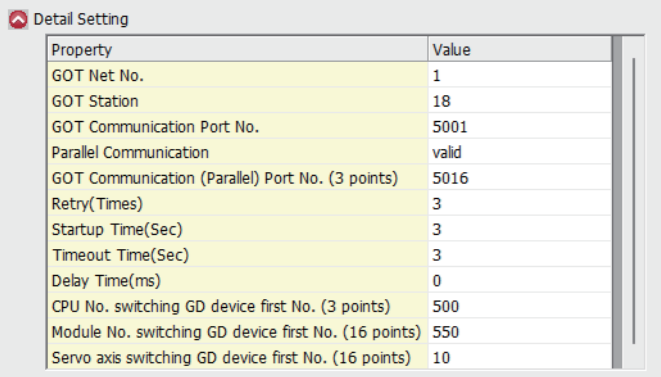
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]*3	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 256 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 257 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 258 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 259 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

*3 When the MELSEC redundant settings are enabled, [Parallel Communication] is set to [invalid].

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

■When connecting multiple GOTs

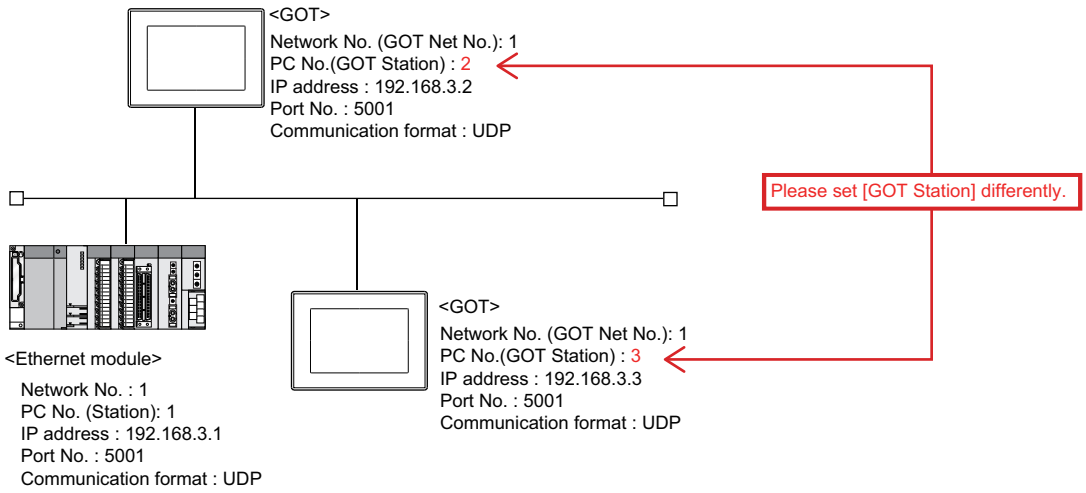
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 254 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

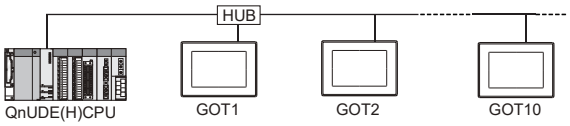
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup Time	3sec (default)	4sec	4sec
Timeout Time	3sec (default)	4sec	4sec

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

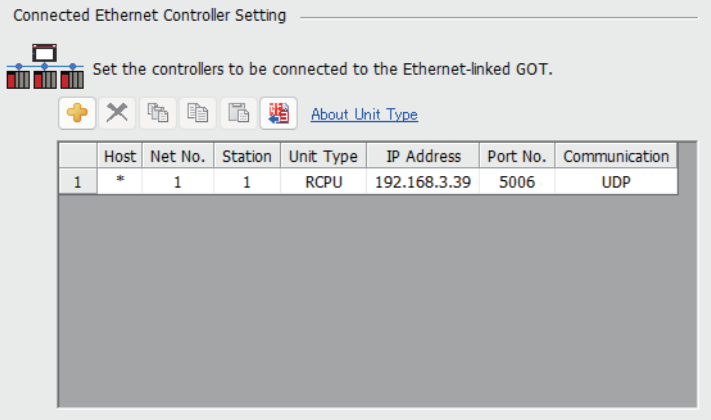
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	☞ Page 260 [Station]
[Unit Type]	Select the model of the connected Ethernet equipment.	☞ Page 260 [Unit Type]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 260 [Port No.]
[Communication]	Set the communication format of the connected Ethernet equipment.	[UDP], [TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].
☞ Page 254 [Detail Setting]

■[Unit Type]

Select an item for [Unit Type] as shown below.

GOT connection destination	[Unit Type]
RnCPU, RnSFCPU, RnENCPU (Port CPU P1)	[RCPU]
C Controller module (MELSEC iQ-R series)	[RnCCPU/RnWCPU]
Ethernet module (MELSEC iQ-R series)	[RJ71EN71]
CC-Link IE TSN master/local module (MELSEC iQ-R series) Motion module (MELSEC iQ-R series)	[RJ71GN11-T2/RD78G(H)]

■[Port No.]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[RCPU], [RnCCPU/RnWCPU]	[5006]	[UDP]
	[5007]	[TCP]
[RJ71EN71], [RJ71GN11-T2/RD78G(H)]	[5001]	[UDP]
	[5002]	[TCP]

■[Station]

The setting range of the station number differs depending on the setting for [Controller Type].

[Unit Type]	Setting range for [Station]
[RCPU] [RnCCPU/RnWCPU] [RJ71EN71]	[1] to [120]
[RJ71GN11-T2/RD78G(H)]	[0] to [120]

■Selecting [RCPU] for [Unit Type]

There is no setting for the network number and PLC number of built-in Ethernet port CPU (Port number: 5006, 5007).
The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

■Connection to the PLC via the Ethernet module with [Communication] set to [TCP]

During communication with the PLC via the Ethernet module with [Communication] set to [TCP], using the FA transparent function may change the setting from [TCP] to [UDP] and start communication with the PLC via the Ethernet module with the new setting.
In this case, communication with the PLC via the Ethernet module cannot be executed normally.
Take the following corrective action.

Phenomenon	Cause	Corrective action
Communication fails when using the FA transparent function.	When the multi-channel Ethernet connection is used, [TCP] and [UDP] are used to the same IP address, and then the FA transparent function is used for the channel set to [TCP].	Execute the FA transparent function for the channel set to [UDP].

Point

Changing the host station on the GOT
[Host] can be changed with the utility function of the GOT.
For details on the setting method, refer to the following manual.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

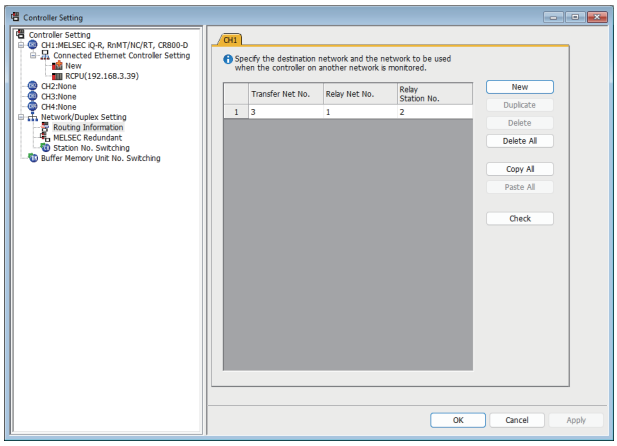
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC iQ-R CPU Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

Page 263 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.6.4 PLC side settings

CC-Link IE Field Network head module	RJ72GF15-T2	☞ Page 264 Connection to Ethernet module (MELSEC iQ-R series)

Precautions

Do not set a remote password on the RCPU.
Doing so disables monitoring with the GOT.

Connection to Ethernet module (MELSEC iQ-R series)

This section describes the settings of the GOT and the Ethernet module (MELSEC iQ-R series) in the system configuration shown below.

☞ Page 264 When the GOT's communication format is UDP
☞ Page 269 When the GOT's communication format is TCP

Point

• Ethernet module (MELSEC iQ-R series)

For details on the Ethernet module (MELSEC iQ-R series), refer to the following manual.

📖MELSEC iQ-R series manuals

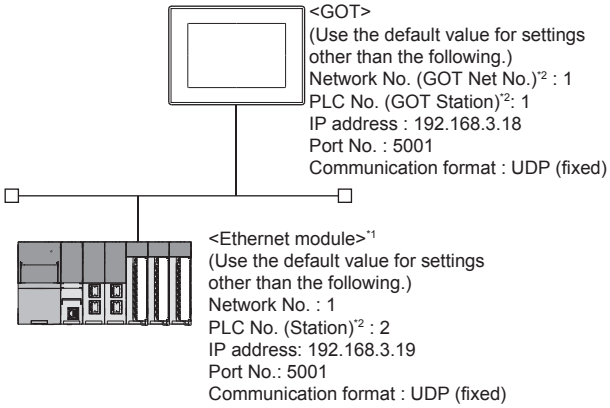
• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 255 When connecting multiple GOTs

■When the GOT's communication format is UDP

• System configuration



*1 The Ethernet module is mounted on the base unit slot 0.
The Start XY No. of the Ethernet module is set to "0".

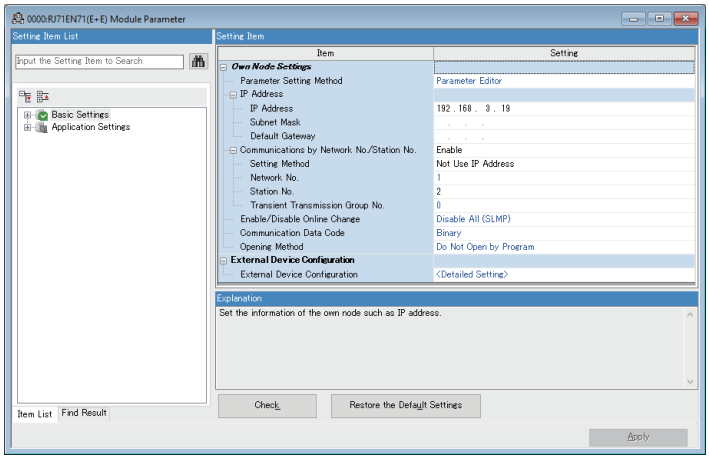
*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

• [Module Parameter] of GX Works3

Module parameters of the Ethernet module

Set [Module Parameter] of the port under [Module information].



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[IP Address]	192.168.3.19	○
[Subnet Mask]	—	—
[Default Gateway]	—	—
[Communications by Network No./Station No.]	Enable	○
[Setting Method]	IP address not used	○
[Network No.]*1	1	○
[Station No.]*2	2	○
[Transient Transmission Group No.]	(Use default value)	—
[Enable/Disable Online Change]		—
[Communication Data Code]		—
[Opening Method]		—
[External Device Configuration]	—	—

*1 Set the same network number as that of the GOT.

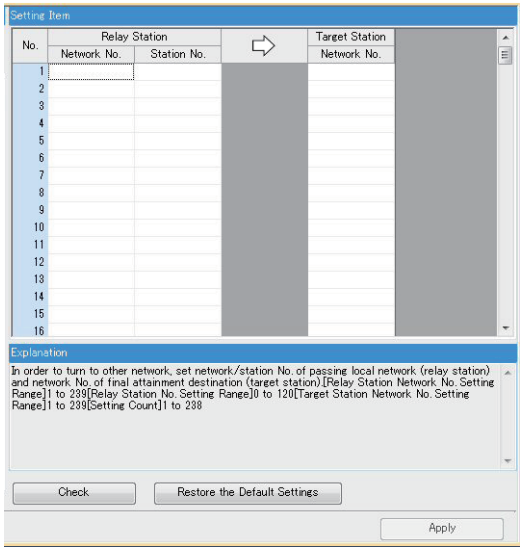
*2 Do not set the same station No. as that of the GOT.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access networks specified with 238 different target station network numbers.



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 262 Routing parameter settings

Communication confirmation

The communication status can be checked with the LINK LED on the Ethernet module.

For checking the communication status, refer to the following.

☞ • Checking the communication status of the Ethernet module

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 252 GOT side settings

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	RJ71EN71
	[IP Address]	192.168.3.19
	[Port No.]	5001
	[Communication]	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number.

• Checking the communication status of the Ethernet module

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.19

Reply from 192.168.3.19:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.19

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

Ethernet diagnostics of GX Works3

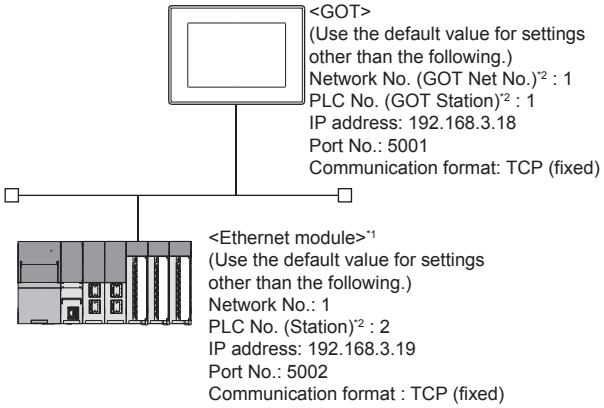
The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-R series manuals

■When the GOT's communication format is TCP

• System configuration



*1 The Ethernet module is mounted on the base unit slot 0.
The Start XY No. of the Ethernet module is set to "0".

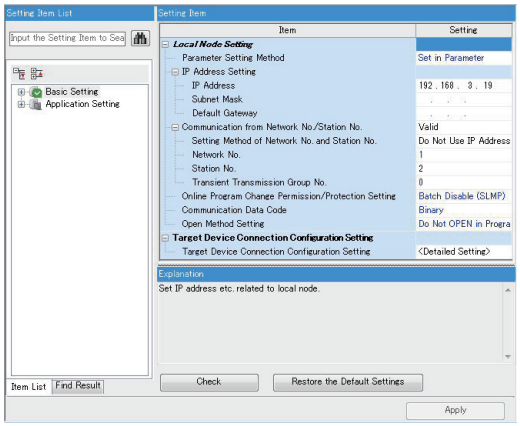
*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

• [Module Parameter] of GX Works3

Module parameters of the Ethernet module

Set [Module Parameter] of the port under [Module information].



○: Necessary, △: As necessary, —: Not necessary

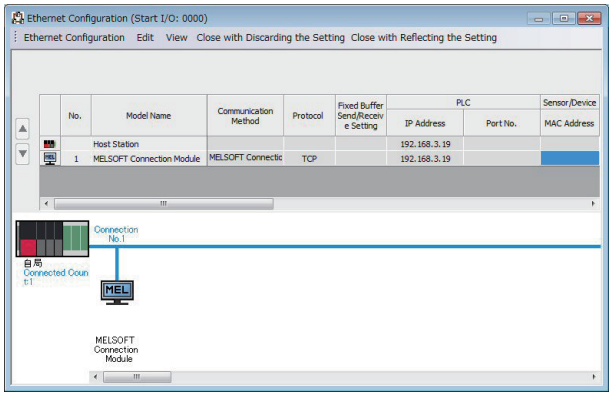
Item	Setting value	Setting for GOT connection
[IP Address]	192.168.3.19	○
[Subnet Mask]	—	—
[Default Gateway]	—	—
[Communications by Network No./Station No.]	Enable	○
[Setting Method]	IP address not used	○
[Network No.]*1	1	○
[Station No.]*2	2	○
[Transient Transmission Group No.]	(Use default value)	—
[Enable/Disable Online Change]		—
[Communication Data Code]		—
[Opening Method]		—
[External Device Configuration]	☞ Target device connection configuration settings	○

*1 Set the same network number as that of the GOT.

*2 Do not set the same station No. as that of the GOT.

Target device connection configuration settings

Configure the settings for all the connected GOTs.



Item	Setting value
[Protocol]	(Use default value)
[Communication Method]	MELSOFT connection
[Port No.]	(Use default value)

Point

When changing the module parameter

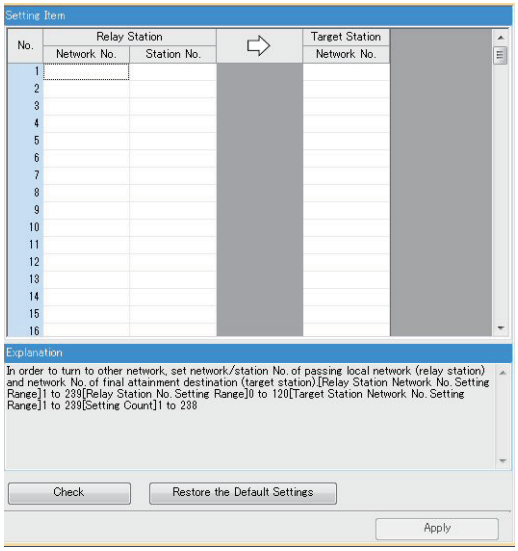
After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access networks specified with 238 different target station network numbers.



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 262 Routing parameter settings

Communication confirmation

The communication status can be checked with the LINK LED on the Ethernet module.

For checking the communication status, refer to the following.

☞ • Checking the communication status of the Ethernet module

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 252 GOT side settings

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1
	[Station No.]	2
	[Unit Type]	RJ71EN71
	[IP Address]	192.168.3.19
	[Port No.]	5002
	[Communication]	TCP

• Checking the communication status of the Ethernet module

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.19

Reply from 192.168.3.19:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.19

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Mounting condition of the Ethernet module

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-R series manuals

Connection to CC-Link IE TSN-equipped module

This section describes the settings of the GOT and CC-Link IE TSN-equipped module in the system configuration shown below.

Point

• CC-Link IE TSN-equipped module

For details on the CC-Link IE TSN-equipped module, refer to the following manual.

MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

• Connecting multiple GOTs

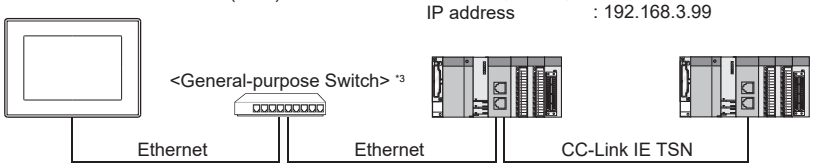
When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

Page 255 When connecting multiple GOTs

■System configuration

<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.) *2 : 1
PLC No. (GOT Station) *2 : 18
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP (fixed)

<CC-Link IE TSN master/local module 2> *1
(The settings other than the following are set to the default)
Station type : Master station
Network No. : 1
PLC No. (Station) *2 : 0 (fixed)
IP address : 192.168.3.99



<CC-Link IE TSN master/local module 1> *1
(The settings other than the following are set to the default)
Station type : Local station
Network No. : 1
PLC No. (Station) *2 : 1
IP address : 192.168.3.1

*1 The CC-Link IE TSN master/local module is mounted on slot 0 of the base unit.
The start XY number of the CC-Link IE TSN master/local module is set to "0".

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

*3 General-purpose Switch is required to connect the GOT and the CC-Link IE TSN master/local module.
For usable General-purpose Switches, refer to the following.
MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

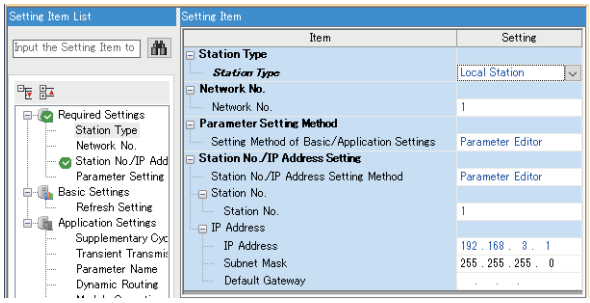
■[Module Parameter] of GX Works3

For details on the settings of the PLC, refer to the following manual.

MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

Ex.

Settings of CC-Link IE TSN master/local module 1



Item	Setting value	
	CC-Link IE TSN master/local module 1	CC-Link IE TSN master/local module 2
[Station Type]	Local station	Master station
[Network No.]	1	1
[Station No.]	1	0
[IP Address]	192.168.3.1	192.168.3.99

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 252 GOT side settings

• Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	18
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	1*2
	[Unit Type]	RJ71GN11-T2/RD78G(H)
	[IP Address]	192.168.3.1
	[Port No.]*3	5001
	[Communication]*3	UDP

*1 Set the same value as the GOT net number.
*2 Set a value different from the GOT station number.
*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5002
[Communication]: TCP

■Checking the communication status of the CC-Link IE TSN-equipped module

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.1

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Connection status of the CC-Link IE TSN-equipped module

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the CC-Link IE TSN-equipped module specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-R series manuals

Connection to built-in Ethernet port of Motion module

This section describes the settings of the GOT and Motion module in the system configuration shown below.

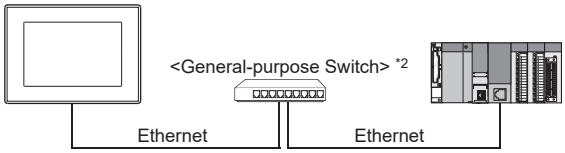
Point

For details on the Motion module, refer to the following manual.

MELSEC iQ-R Motion Module User's Manual (Startup)

■System configuration

<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.) *1 : 1
PLC No. (GOT Station) *1 : 18
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP



<Motion module>
(The settings other than the following are set to the default)
Network No. : 1
PLC No. (Station) *1 : 0(fixed)
IP address : 192.168.3.39

*1 For the following settings, the setting names differ on the PLC side and on the GOT side.

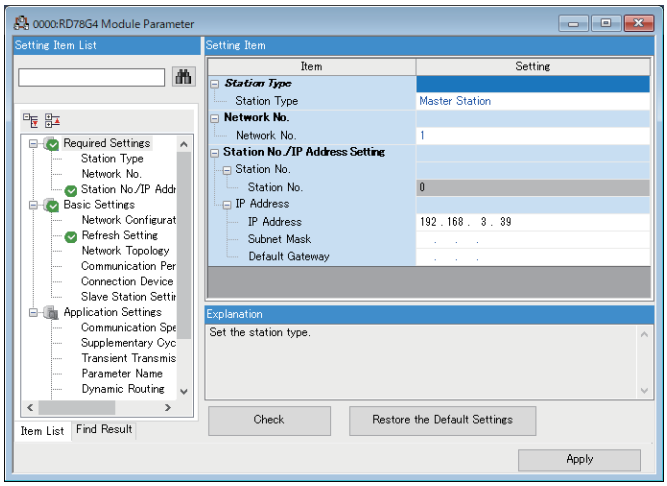
Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

*2 For usable General-purpose Switches, refer to the following.
MELSEC iQ-R Motion Module User's Manual (Startup)

■[Module Parameter (Network)] of GX Works3

For details on the Motion module side settings, refer to the following.

MELSEC iQ-R Motion Module User's Manual (Network)



Item	Setting value
[Network No.]	1
[IP Address]	192.168.3.39

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 252 GOT side settings

• Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	18
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	0
	[Unit Type]	RJ71GN11-T2/RD78G(H)
	[IP Address]	192.168.3.39
	[Port No.]	5001
	[Communication]*2	UDP

*1 Set the same value as the GOT net number.

*2 If you set [Communication] to [TCP], set [Port No.] to [5002].

■Checking the communication status of the Motion module

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.39

Reply from 192.168.3.39:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.39

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

IP address of the Motion module specified by the ping command

Operation state of PLC CPU (faulty or not)

Connection status of the Motion module

Cable connecting condition

Switch settings and network parameter settings

4.6.5 Access range for monitoring

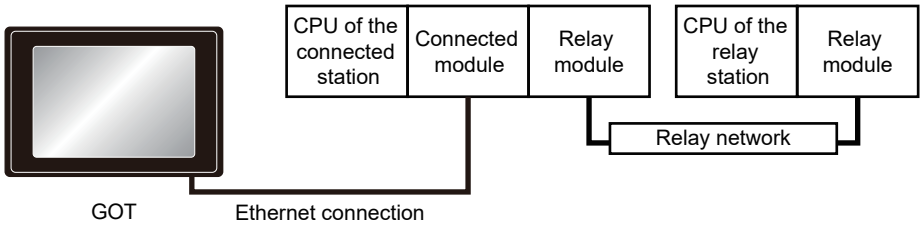
When the GOT is connected to the CPU of the station connected via Ethernet, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station									
		Relay network	CPU of the relay station								
			MXR	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
RCPU	☞ Page 242 Connectable devices	Ethernet	○*7	○*5	○	○*6	○	—	○	—	○*3
		CC-Link IE TSN	○*7	○*1	—	—	—	—	—	—	○*3
		CC-Link IE Controller Network	○*7	○	—	○	○	—	—	—	—
		CC-Link IE Field Network	○*7	○	○	○*2	○	—	—	—	○*4
RJ72GF15-T2	☞ Page 242 Connectable devices	CC-Link IE Field Network	○*7	○	○	○*2	○	—	—	—	○*4

*1 RnCPU, RnENCPU, RnSFCPU, and MELSECWinCPU (MELSEC iQ-R series) are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*3 FX5U and FX5UC are supported.

*4 FX5U, FX5UC, and FX5UJ are supported.

*5 The C Controller module (MELSEC iQ-R series) is not supported.

*6 The C Controller module (MELSEC-Q series) is not supported.

*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
☞ Page 90 Setting procedure of the encrypted communication

4.6.6 How to monitor a redundant system

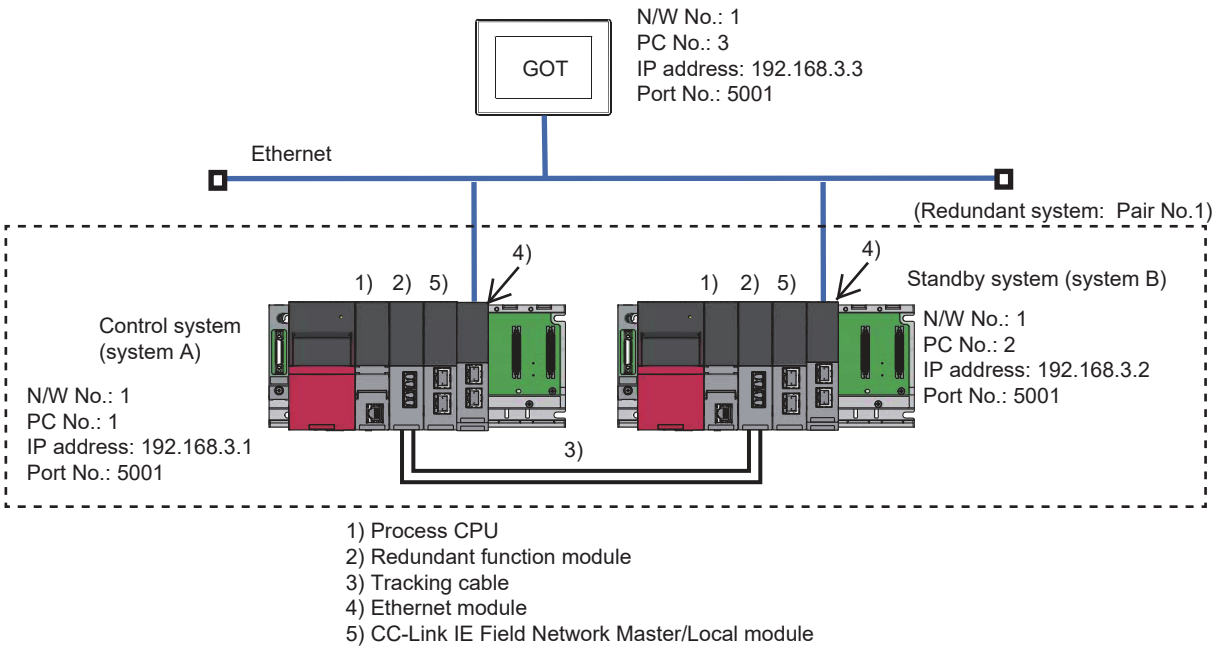
☞ Page 281 One-to-one connection of the GOT and the redundant system
☞ Page 284 1:n connection of GOT and redundant system
☞ Page 286 Mixed connection of redundant system and non-redundant system
☞ Page 288 MELSEC redundant settings
☞ Page 290 Precautions

PART 3

One-to-one connection of the GOT and the redundant system

■System configuration example

The following connection configuration examples are explained.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) Ethernet module
5) CC-Link IE Field Network Master/Local module

■Connection method

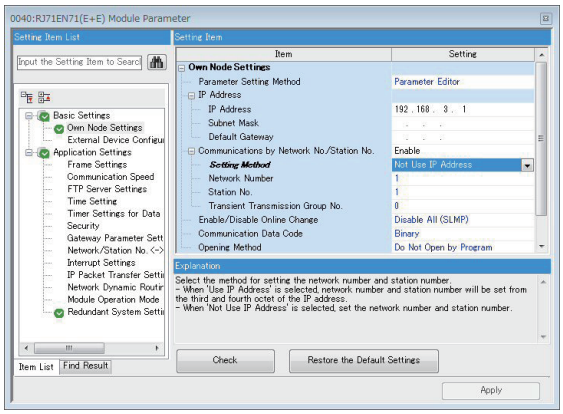
Connect the Ethernet network system and the GOT.

☞ Page 242 MELSEC iQ-R series (Ethernet module connection)

■PLC side settings (GX Works3)

• Control system (system A) PLC settings

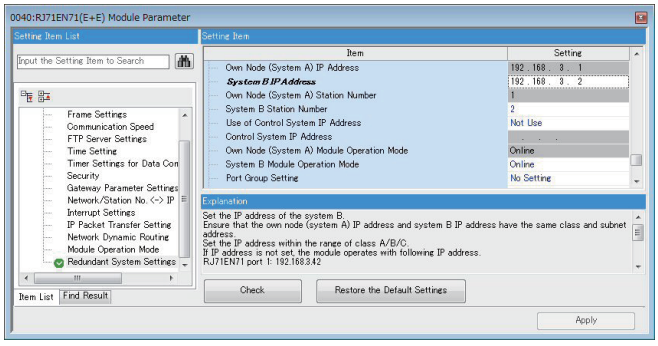
Module parameter settings of the Ethernet module



Item	Setting value
[IP Address]	192.168.3.1
[Subnet Mask]	—
[Default Gateway]	—
[Setting Method]	IP address not used
[Network No.]	1
[Station No.]	1
[Transient Transmission Group No.]	(Use default value)
[Enable/Disable Online Change]	
[Communication Data Code]	
[Opening Method]	
[External Device Configuration]	—

• Standby system (system B) PLC settings (GX Works3)

Redundant Setting



Item	Setting value
[System B IP Address]	192.168.3.2
[System B Station Number]	2
[Control system IP address availability]	Not used
[System B Module Operation Mode]	Online mode

Point

[Control system IP address availability] setting

Set [Control system IP address availability] to [Not use] (default).

If [Use] is selected, the GOT will not follow when the system is switched.

■GOT side settings

Set GT Designer3 as follows.

Setting item	Setting details		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	Host (The control system is monitored.)	
	[Other]	[Network No.]: 1	
		[Station No.]: Station number of the control system	
	[Redundant System]	The system to be monitored ([Not Specified/Control System], [Standby System]) can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
Connected Ethernet controller settings	 ☞ Page 259 [Connected Ethernet Controller Setting]		
MELSEC redundant settings	 ☞ Page 288 MELSEC redundant settings		

■Monitoring target change when system switching occurs in a redundant system

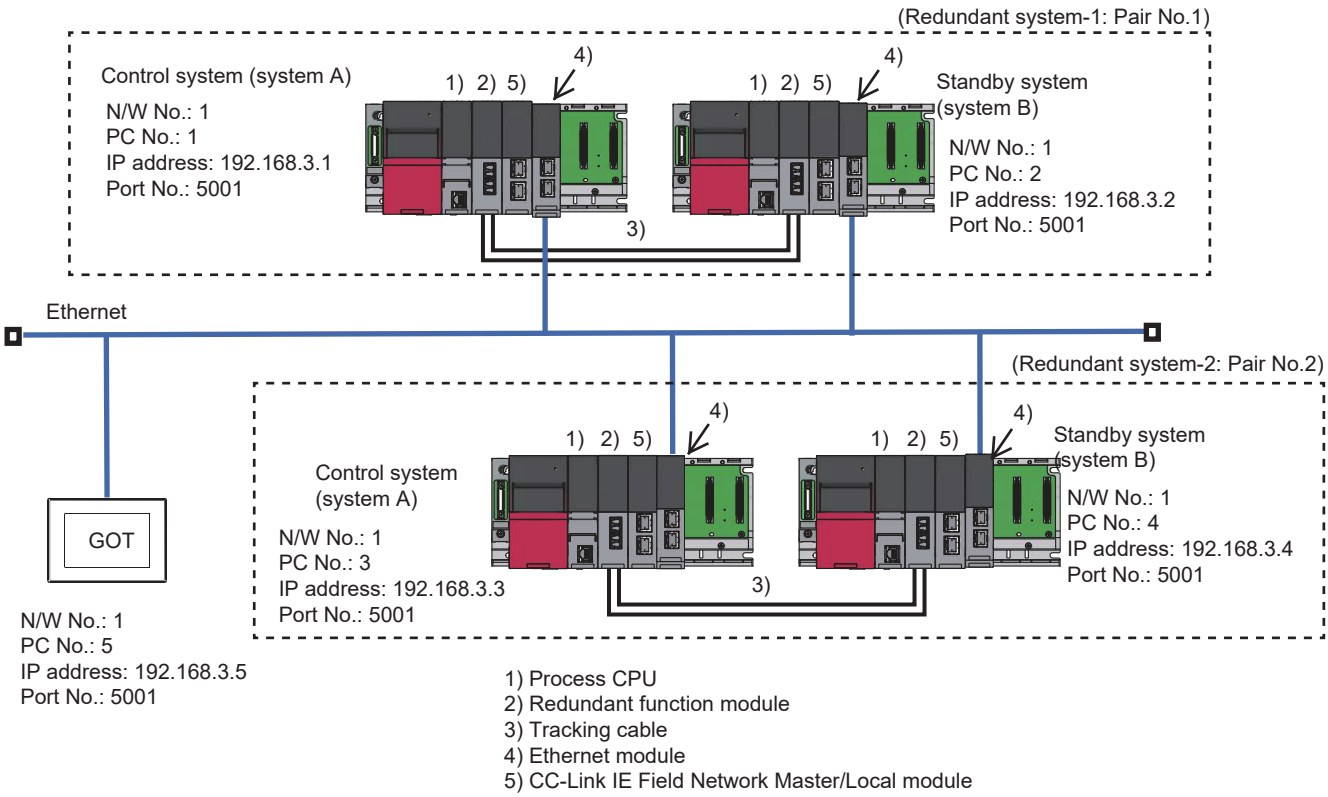
When system switching occurs, the CPU (PLC station No. 2) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

1:n connection of GOT and redundant system

■System configuration example

The following connection configuration examples are explained.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) Ethernet module
5) CC-Link IE Field Network Master/Local module

■Connection method

Connect the Ethernet network system and the GOT.

☞ Page 242 MELSEC iQ-R series (Ethernet module connection)

■PLC side settings (GX Works3)

☞ Page 282 PLC side settings (GX Works3)

■GOT side settings

Set GT Designer3 as follows.

Setting item	Setting details		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	Host (The control system is monitored.)	
	[Other]	[Network No.]: 1	
		[Station No.]: Station number of the control system	
	[Redundant System]	The system to be monitored ([Not Specified/Control System], [Standby System]) can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
Connected Ethernet controller settings	 ☞ Page 259 [Connected Ethernet Controller Setting]		
MELSEC redundant settings	 ☞ Page 288 MELSEC redundant settings		

■Monitoring target change when system switching occurs in a redundant system

• Redundant system-1

When system switching occurs, the CPU (PLC station No. 2) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

• Redundant system-2

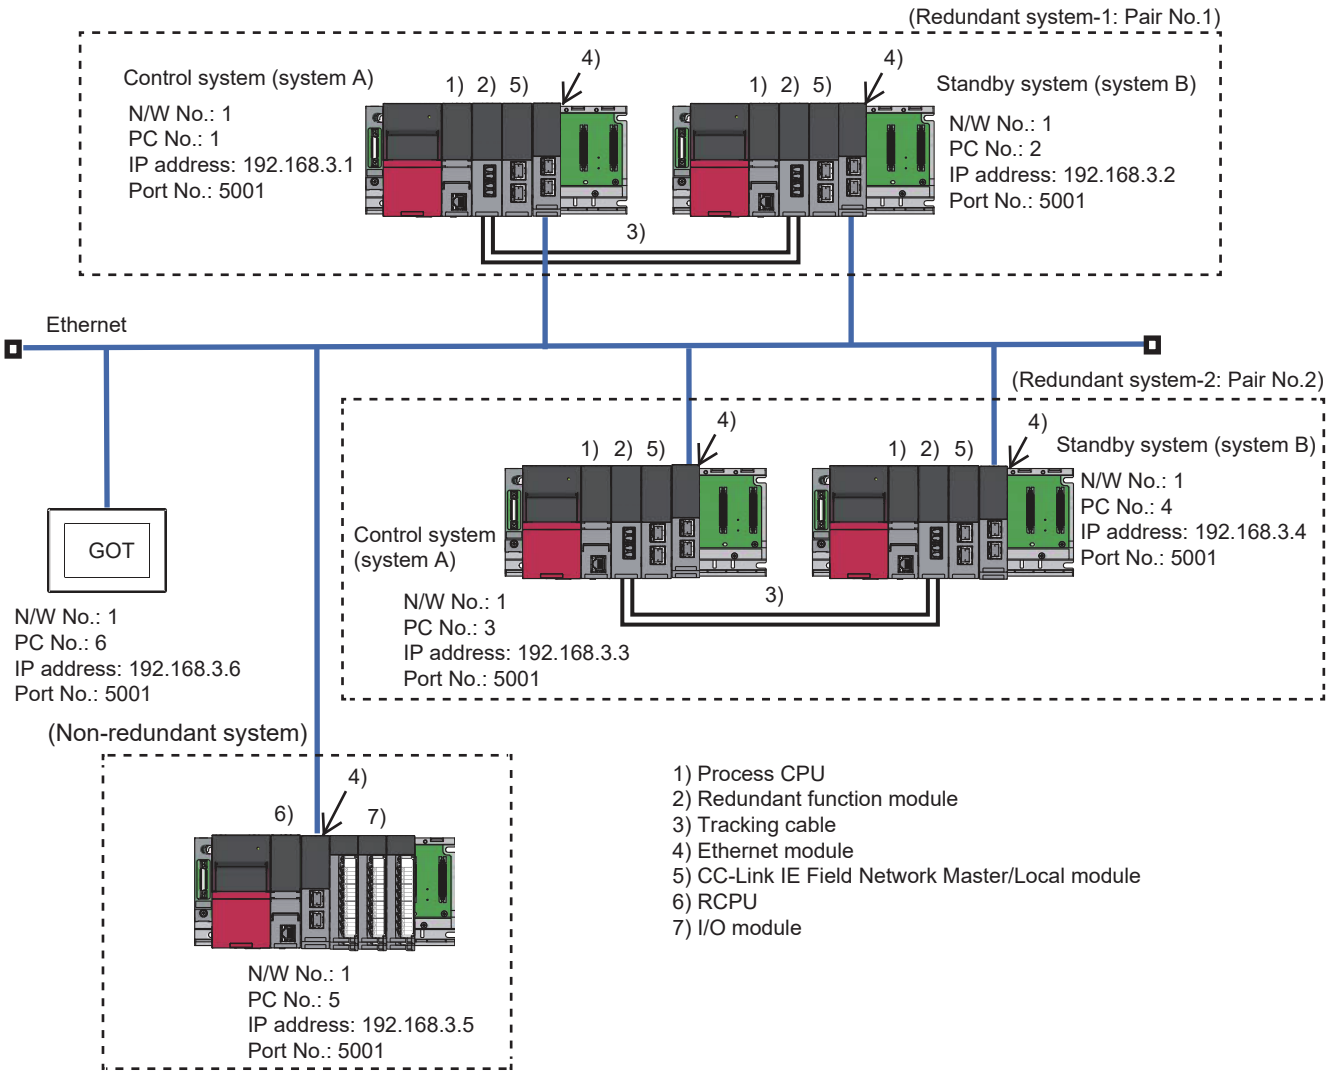
When system switching occurs, the CPU (PLC station No. 4) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

Mixed connection of redundant system and non-redundant system

■System configuration example

The following connection configuration examples are explained.



■Connection method

Connect the Ethernet network system and the GOT.

☞ Page 242 MELSEC iQ-R series (Ethernet module connection)

■PLC side settings (GX Works3)

☞ Page 282 PLC side settings (GX Works3)

■GOT side settings

Set GT Designer3 as follows.

Setting item	Setting details		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	Host (The control system is monitored.)	
	[Other]	[Network No.]: 1	
		[Station No.]: Station number of the control system	
	[Redundant System]	The system to be monitored ([Not Specified/Control System], [Standby System]) can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
Connected Ethernet controller settings	 ☞ Page 259 [Connected Ethernet Controller Setting]	
MELSEC redundant settings	 ☞ Page 288 MELSEC redundant settings		

■Monitoring target change when system switching occurs in a redundant system

☞ Page 285 Monitoring target change when system switching occurs in a redundant system

MELSEC redundant settings

This section describes the settings for the GOT to automatically change the monitoring target of the RCPU redundant system.

Point

Before configuring the MELSEC redundant settings

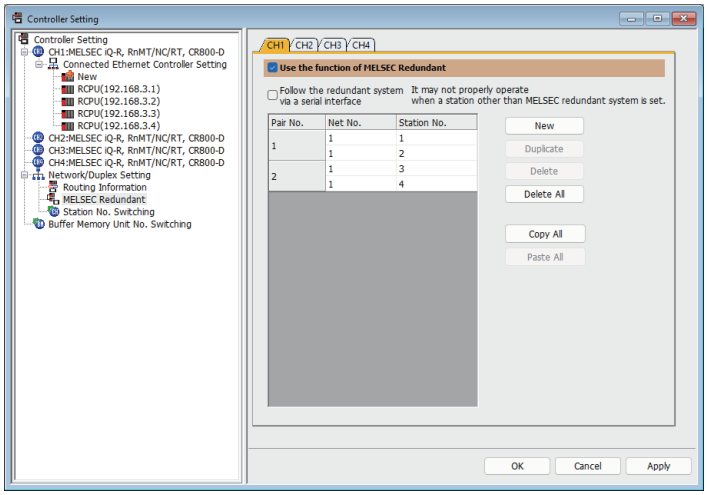
In the MELSEC redundant settings, do not set a station outside the redundant RCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC redundant setting dialog, settings can be made for each channel of the controller.

The following shows an example of redundant CPU pair numbers 1 to 2, network number 1, and redundant CPU station numbers 1 to 4 for the Ethernet connection (station number 5).

Ex.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Copies one setting of the selected pair number and adds it below the bottom row.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 289 Pair number

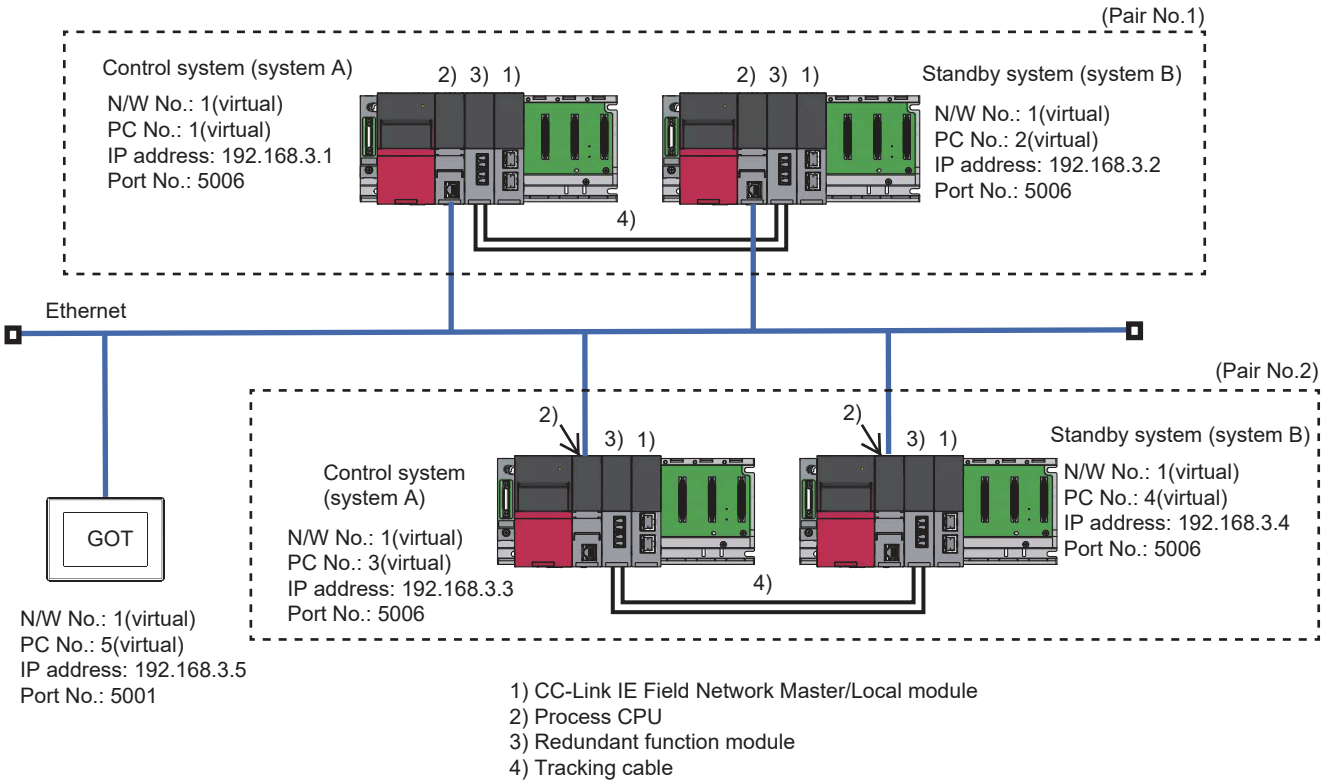
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of Ethernet connection in the RCPU redundant system. (Pair No. 1 to No. 2)

Ex.



1) CC-Link IE Field Network Master/Local module
2) Process CPU
3) Redundant function module
4) Tracking cable

Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- Pairing of the last station No. and station No. 1 (Example: Station No. 64 and station No. 1) is not allowed.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the redundant mode of the RCPU redundant system, and does not support the process mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

• 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

[450: Path has changed or timeout occurred in redundant system.] appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, [451: The MELSEC redundant setting and actual system configuration do not match.] appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings. If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm [315 Device writing error. Correct device.] is not detected.

4.7 MELSEC iQ-F series (Built-in Ethernet port connection)

☞ Page 291 Connectable devices
☞ Page 292 System configuration
☞ Page 294 GOT side settings
☞ Page 303 PLC side settings
☞ Page 307 Access range for monitoring

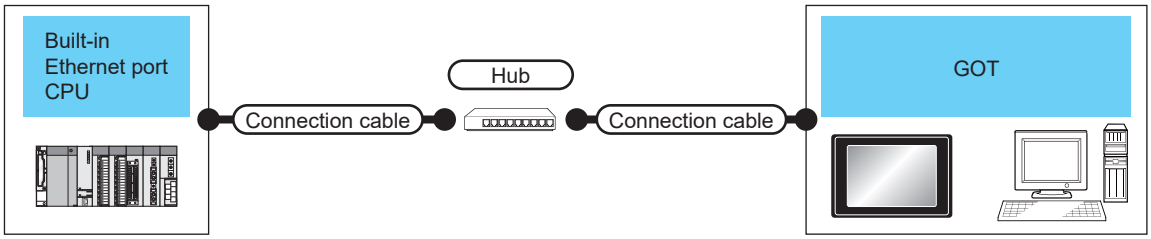
4.7.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC iQ-F series	FX5U FX5UC	○	GT37 SoftGOT3000
	FX5UJ	○	GT37 SoftGOT3000
	FX5S	○	GT37 SoftGOT3000

4.7.2 System configuration



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 293 Connection cable

☞ Page 293 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 293 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	Model
MELSEC iQ-F series*1*2	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the built-in Ethernet port CPU, refer to the manual of the PLC to be used.

*2 For [Unit Type] to be selected in [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 301 [Connected Ethernet Controller Setting]

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (double-shielded STP or STP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP		
MELSEC iQ-F series	—	8	GT37 SoftGOT3000	63 (16 or less recommended)

Connection to the built-in Ethernet port of the built-in Ethernet port CPU

Connect the GOT after turning on the network equipment such as the built-in Ethernet port CPU or hub to enable communications.

If the GOT cannot communicate with the built-in Ethernet port CPU, a communication error may occur on the GOT.

4.7.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

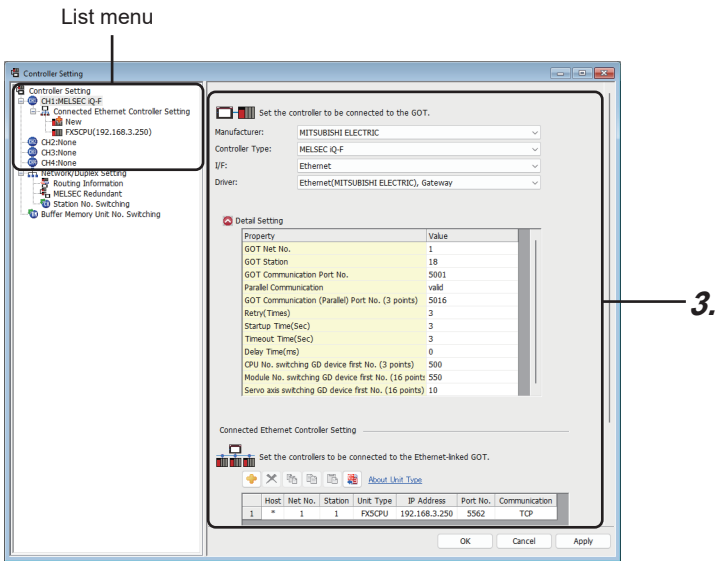
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-F]
[I/F]	[Ethernet]
[Driver]	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 296 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 301 [Connected Ethernet Controller Setting]

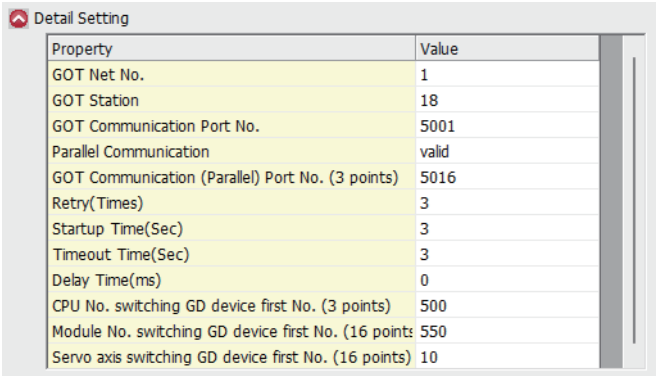
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 298 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 299 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 300 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 301 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

■When connecting multiple GOTs

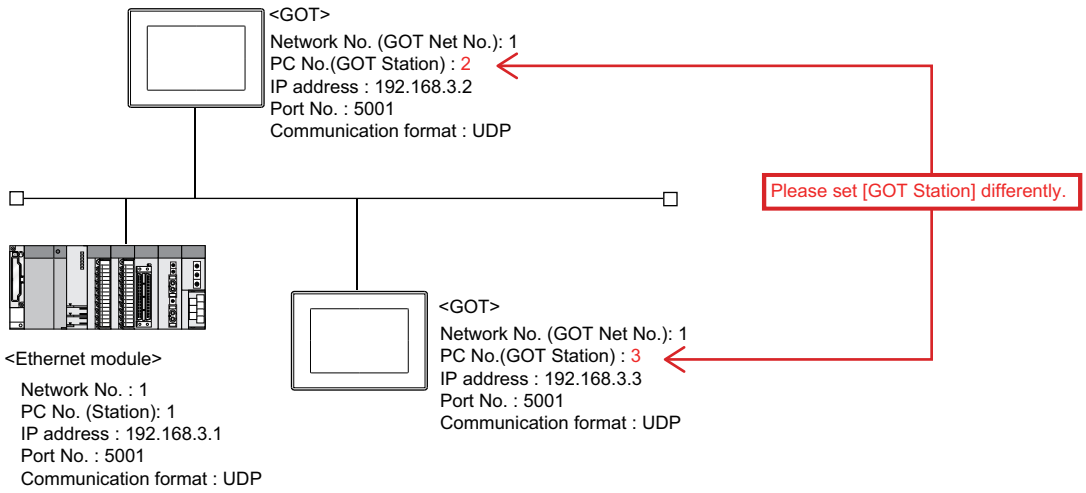
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 296 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

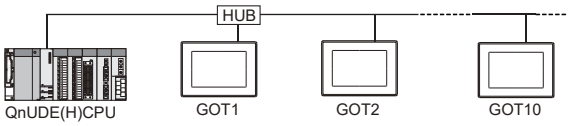
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup Time	3sec (default)	4sec	4sec
Timeout Time	3sec (default)	4sec	4sec

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	01 to 10 Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

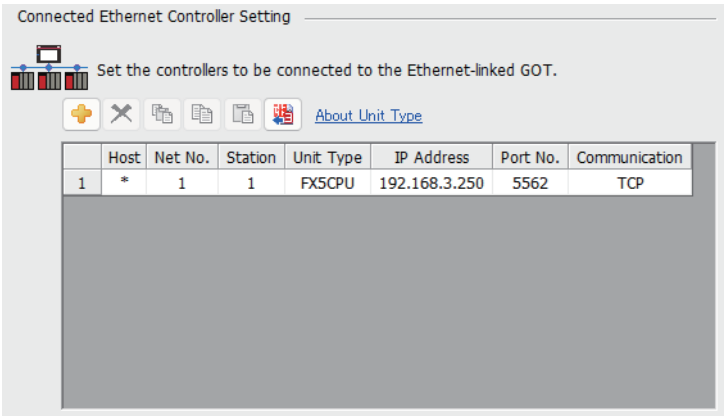
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	[1] to [120]
[Unit Type]	Select the model of the connected Ethernet equipment.	[FX5CPU]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	[5562]
[Communication]	Set the communication format of the connected Ethernet equipment.	[TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].

☞ Page 296 [Detail Setting]

■Network number and PLC number of FX5CPU

There is no setting for the network number and PLC number of FX5CPU.

The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

Point

Changing the host station on the GOT

[Host] can be changed with the utility function of the GOT.

For details on the setting method, refer to the following manual.

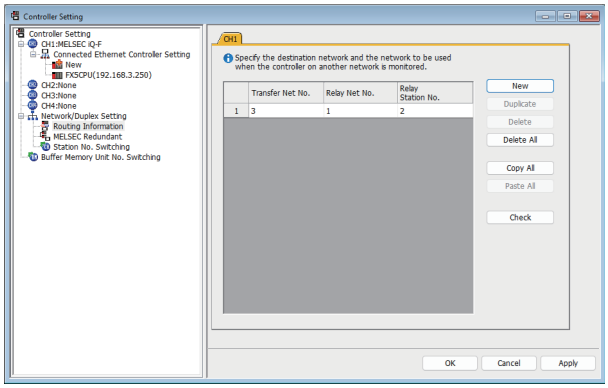
GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 303 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.7.4 PLC side settings

Model		Reference
MELSEC iQ-F series	FX5U FX5UC FX5UJ FX5S	☞ Page 303 Connection to the built-in Ethernet port CPU of the MELSEC iQ-F series

Precautions

Do not set a remote password on the FX5CPU.
Doing so disables monitoring with the GOT.

Connection to the built-in Ethernet port CPU of the MELSEC iQ-F series

This section describes the settings of the GOT and the built-in Ethernet port CPU in the system configuration shown below.

Point

• Built-in Ethernet port CPU

For details on the built-in Ethernet port CPU, refer to the following manual.

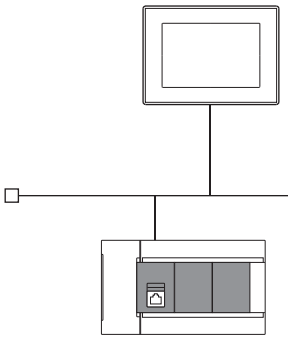
📖MELSEC iQ-F series manuals

• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 297 When connecting multiple GOTs

■System configuration



<GOT>
(Use the default value for settings other than the following.)
Network No. (GOT Net No.)*2 :1
PLC No. (GOT Station)*2 :1
IP address :192.168.3.18
Port No. :5001
Communication format :TCP (fixed)

1 <Connecting to Built-in Ethernet port CPU>
(The following settings are set to the default)
Network No. : 1 (virtual)*1
PLC No. (Station)*2 : 2 (virtual)*1
IP address : 192.168.3.250 (default)
Port No. : 5562 (fixed)
Communication format : TCP (fixed)

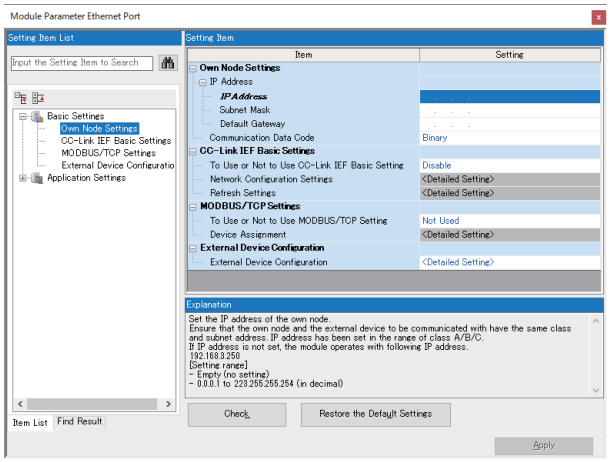
*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ Page 305 [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

■[Module Parameter] of GX Works3

• Built-in Ethernet port settings



○: Necessary, △: As necessary, —: Not necessary

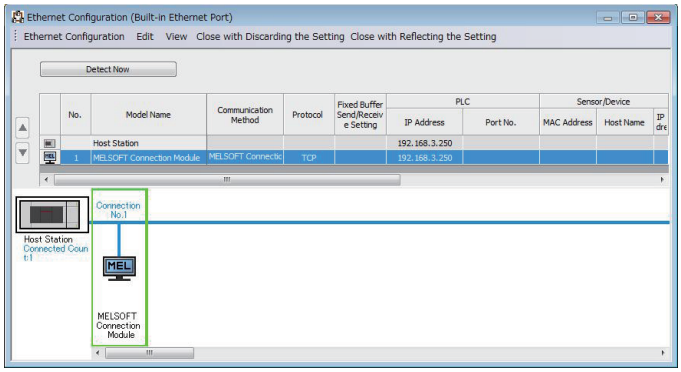
Item	Setting value	Setting for GOT connection
[IP Address]	(Use default value)	△
[Subnet Mask]	—	—
[Default Gateway]	—	—
[Communication Data Code]	(Use default value)	△
[External Device Configuration]	☞ • Target device connection configuration settings	○

• Target device connection configuration settings

Configure the settings for all the connected GOTs.

Point

Even if the target device connection configuration setting is not executed, 1 GOT can be connected.
When connecting to the PLC in Ethernet connection with programming tools such as GX Works3, these programming tools and PLC may not be connected.
In this case, configure the settings for all the connected GOTs.



Item	Setting value
[Protocol]	(Use default value)
[Communication Method]	MELSOFT connection
[Port No.]	(Use default value)

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 294 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to the built-in Ethernet port CPU
The setting items for the network number and station number do not exist on the PLC side.
Set the network number and station number on the GOT side.
When doing so, set a network number not used in the system.

- Built-in Ethernet port settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

- GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

- Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	FX5CPU
	[IP Address]	192.168.3.250
	[Port No.]	5562
	[Communication]	TCP

*1 Set the same value as the GOT net number.
*2 Set a value different from the GOT station number and PLC numbers of other PLCs on the same network.

■Checking the communication state of the built-in Ethernet port CPU

• When using Windows Command Prompt

1) At normal end

C:\>Ping 192.168.3.250

Reply from 192.168.3.250:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.250

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

4.7.5 Access range for monitoring

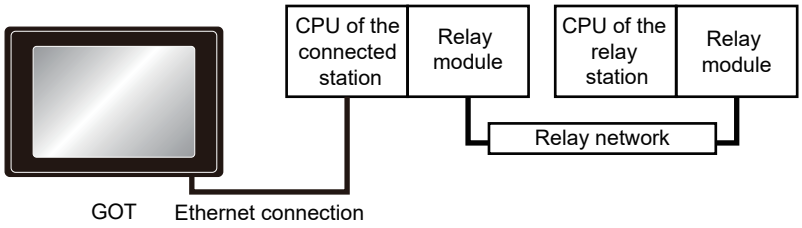
When the GOT is connected to the CPU of the station connected via Ethernet, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station										
	Relay network	CPU of the relay station									
		MXR	MXF	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
FX5CPU*4	Ethernet	—	—	○*5	○	○*6	○	—	○	—	○*3
	CC-Link IE TSN	○*7	○*7	○*1	—	—	—	—	—	—	○*3
	CC-Link IE Field Network	○*7	—	○	○	○*2	○	—	—	—	○*4

*1 RnCPU, RnENCPU, RnSFCPU, and MELSECWinCPU (MELSEC iQ-R series) are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*3 FX5U and FX5UC are supported.

*4 FX5U, FX5UC, and FX5UJ are supported.

*5 The C Controller module (MELSEC iQ-R series) is not supported.

*6 The C Controller module (MELSEC-Q series) is not supported.

*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
• For MELSEC MX Controller (MX-R Model)
☞ Page 90 Setting procedure of the encrypted communication
• For MELSEC MX Controller (MX-F Model)
☞ Page 153 Setting procedure of the encrypted communication

4.8 MELSEC iQ-F series (Ethernet module connection)

☞ Page 308 Connectable devices
☞ Page 309 System configuration
☞ Page 315 GOT side settings
☞ Page 325 PLC side settings
☞ Page 340 Access range for monitoring

4.8.1 Connectable devices

The following table shows the connectable models.

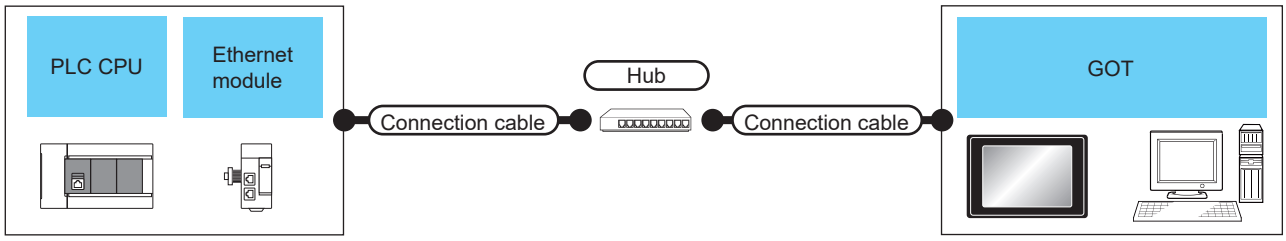
○: Supported, —: Not supported

Controller	Model	Clock	Ethernet module	Connectable model
MELSEC iQ-F series	FX5U*1*2 FX5UC*1*2	○	FX5-ENET FX5-ENET/IP FX5-EIP FX5-CCLGN-MS FX5-40SSC-G FX5-80SSC-G	GT37 SoftGOT3000
	FX5UJ*3	○	FX5-ENET FX5-ENET/IP FX5-EIP FX5-CCLGN-MS	GT37 SoftGOT3000

*1 When using FX5-ENET or FX5-ENET/IP, use firmware Ver. 1.240 or later.
*2 When using FX5-EIP, use firmware Ver. 1.340 or later.
*3 When using FX5-EIP, use firmware Ver. 1.100 or later.

4.8.2 System configuration

Connection to Ethernet module



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 310 Connection cable

☞ Page 310 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 310 Maximum number of connected devices

Controller	Ethernet module*1*2	Connection cable	GOT	
			Interface	Model
MELSEC iQ-F series (FX5U, FX5UC, FX5UJ)	FX5-ENET FX5-ENET/IP FX5-EIP	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the Ethernet module, refer to the following manuals.
MELSEC iQ-F FX5-ENET User's Manual
MELSEC iQ-F FX5-ENET/IP User's Manual
MELSEC iQ-F FX5-EIP User's Manual

*2 Select [FX5-ENET] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 322 [Connected Ethernet Controller Setting]

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (double-shielded STP or STP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

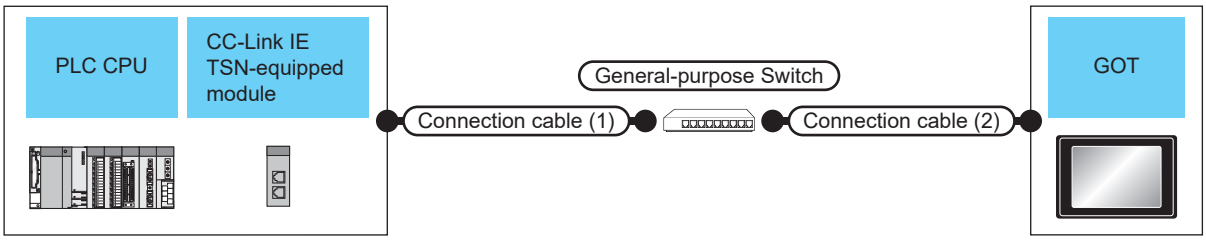
Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one Ethernet module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC iQ-F series (FX5U, FX5UC, FX5UJ)	FX5-ENET FX5-ENET/IP FX5-EIP	32	32	GT37 SoftGOT3000	63 (16 or less recommended)

Connection to CC-Link IE TSN-equipped module



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 312 Connection cable

☞ Page 312 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 312 Maximum number of connected devices

Controller	CC-Link IE TSN-equipped module*2*3	Connection cable (1)	External device	Connection cable (2)	GOT	
					Interface	Model
MELSEC iQ-F series (FX5U, FX5UC, FX5UJ)	FX5-CCLGN-MS	Twisted pair cable	General-purpose Switch*1	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
					Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For usable General-purpose Switches, refer to the following.
MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

*2 For the system configuration of the CC-Link IE TSN-equipped module, refer to the following manual.
MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

*3 Select [FX5-CCLGN-MS/FX5-nSSC-G] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 322 [Connected Ethernet Controller Setting]

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (double-shielded STP or STP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables and connectors that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

Maximum segment length

The maximum segment length (length between General-purpose Switch and a node) is 100 m.

Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

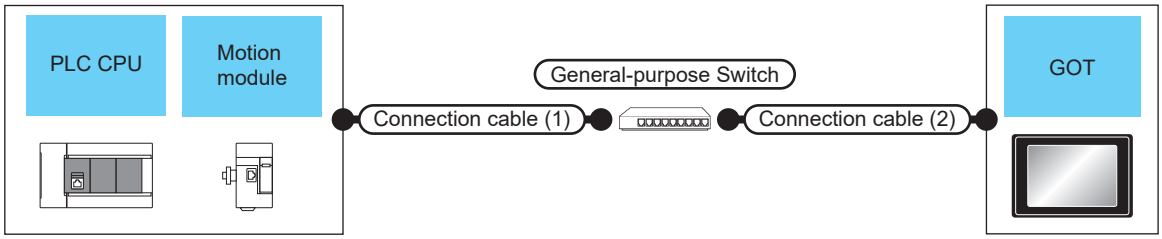
The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one CC-Link IE TSN-equipped module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC iQ-F series (FX5U, FX5UC, FX5UJ)	FX5-CCLGN-MS	8	8	GT37 SoftGOT3000	63 (8 or less recommended)

Connection to Motion module

Point

To monitor the global labels of the Motion module with the GOT, connect the GOT and Motion module through the built-in Ethernet port of the PLC.
If the GOT is connected to the built-in port of the Motion module, the global labels of the Motion module cannot be monitored.



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 314 Connection cable
☞ Page 314 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 314 Maximum number of connected devices

Controller	Motion module*2*3	Connection cable (1)	External device	Connection cable (2)	GOT	
					Interface	Model
MELSEC iQ-F series (FX5U, FX5UC)	FX5-40SSC-G FX5-80SSC-G	Twisted pair cable	General-purpose Switch*1	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
					Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For usable General-purpose Switches, refer to the following.
MELSEC iQ-F FX5 Motion Module/Simple Motion Module User's Manual (Startup)

*2 For the system configuration of the Motion module, refer to the following manual.
MELSEC iQ-F FX5 Motion Module/Simple Motion Module User's Manual (Startup)

*3 Select [FX5-CCLGN-MS/FX5-nSSC-G] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 322 [Connected Ethernet Controller Setting]

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (double-shielded STP or STP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables and connectors that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

Maximum segment length

The maximum segment length (length between General-purpose Switch and a node) is 100 m.

Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one Motion module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC iQ-F series (FX5U, FX5UC)	FX5-40SSC-G FX5-80SSC-G	8	8	GT37 SoftGOT3000	63 (8 or less recommended)

4.8.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

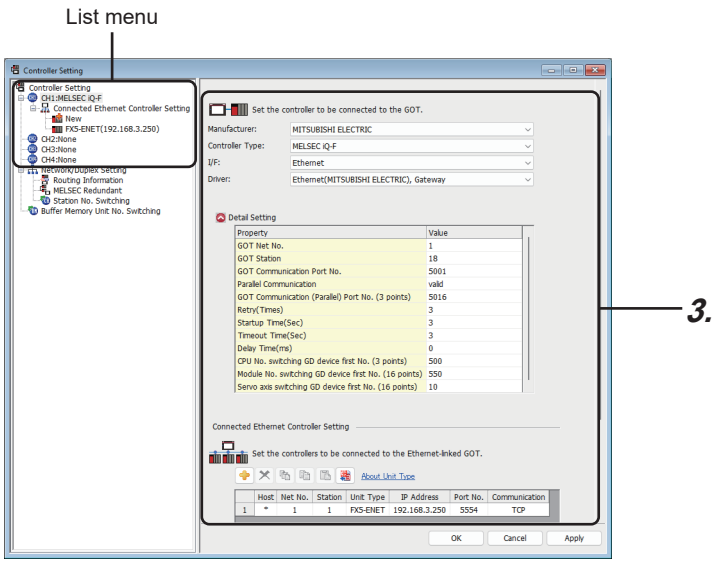
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-F]
[I/F]	[Ethernet]
[Driver]	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 317 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 322 [Connected Ethernet Controller Setting]

4. When you have completed the settings, click the [OK] button.

Point

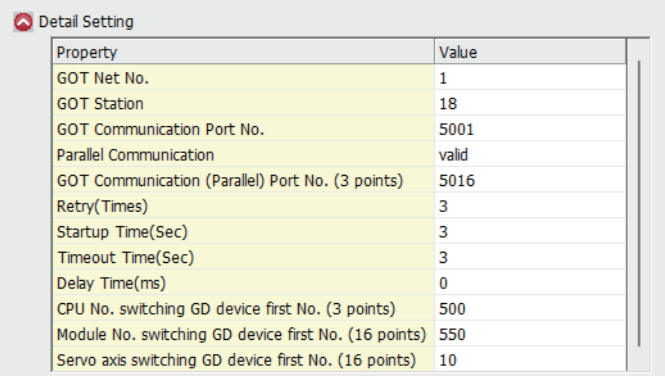
The controller settings can be checked in [I/F Communication Setting].

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 319 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 320 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 321 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 322 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

■When connecting multiple GOTs

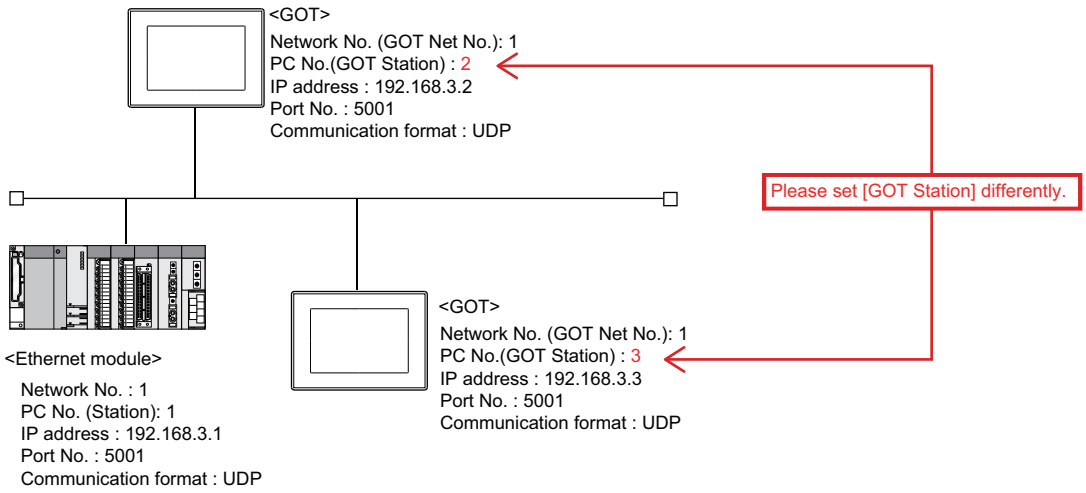
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 317 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

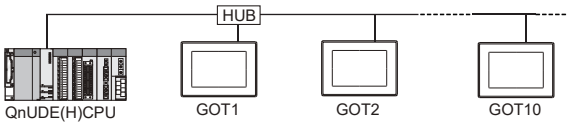
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup Time	3sec (default)	4sec	4sec
Timeout Time	3sec (default)	4sec	4sec

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	01 to 10 Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

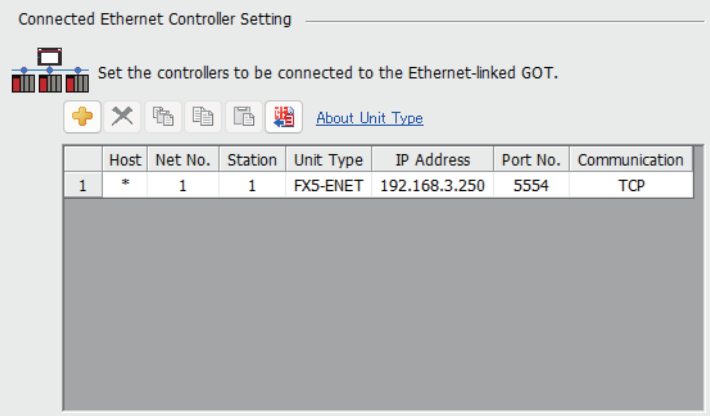
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	☞ Page 323 [Station No.]
[Unit Type]	Select the model of the connected Ethernet equipment.	☞ Page 323 [Unit Type]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 323 [Port No.]
[Communication]	Set the communication format of the connected Ethernet equipment.	[UDP], [TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].
☞ Page 317 [Detail Setting]

■[Unit Type]

Select an item for [Unit Type] as shown below.

GOT connection destination	[Unit Type]
Ethernet module (MELSEC iQ-F series)	[FX5-ENET]
CC-Link IE TSN master/local module(MELSEC iQ-F series) Motion module (MELSEC iQ-F series)	[FX5-CCLGN-MS/FX5-nSSC-G]

■[Port No.]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[FX5-ENET]	[5554]	[TCP]
	[5555]	[UDP]
[FX5-CCLGN-MS/FX5-nSSC-G]	[5001]	[UDP]
	[5554]	[TCP]

■[Station No.]

The setting range of the station number differs depending on the setting for [Controller Type].

[Unit Type]	Setting range for [Station]
[FX5-ENET]	[1] to [120]
[FX5-CCLGN-MS/FX5-nSSC-G]	[0] to [120]

■Network number and PLC number of FX5CPU

There is no setting for the network number and PLC number of FX5CPU.

The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

Point

Changing the host station on the GOT

[Host] can be changed with the utility function of the GOT.

For details on the setting method, refer to the following manual.

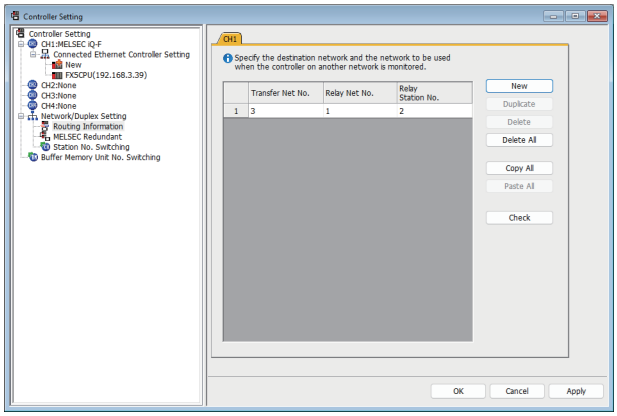
GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 325 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.8.4 PLC side settings

Model		Reference
MELSEC iQ-F series	FX5U FX5UC	☞ Page 325 Connection to Ethernet module (MELSEC iQ-F series) ☞ Page 333 Connection to CC-Link IE TSN-equipped module ☞ Page 337 Connection to built-in Ethernet port of Motion module
	FX5UJ	☞ Page 325 Connection to Ethernet module (MELSEC iQ-F series) ☞ Page 333 Connection to CC-Link IE TSN-equipped module

Precautions

Do not set a remote password on the FX5CPU.
Doing so disables monitoring with the GOT.

Connection to Ethernet module (MELSEC iQ-F series)

This section describes the settings of the GOT and the Ethernet module (MELSEC iQ-F series) in the system configuration shown below.

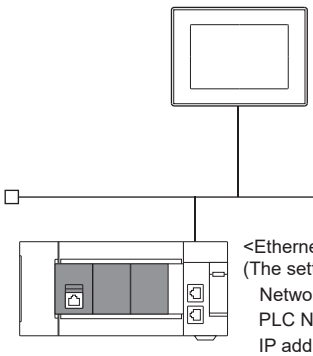
☞ Page 325 When the GOT's communication format is UDP
☞ Page 329 When the GOT's communication format is TCP

Point

• Ethernet module (MELSEC iQ-F series)
For details on the Ethernet module (MELSEC iQ-F series), refer to the following manual.
📖MELSEC iQ-F series manuals
• Connecting multiple GOTs
When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.
☞ Page 318 When connecting multiple GOTs

■When the GOT's communication format is UDP

• System configuration



<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.)*2 : 1
PLC No. (GOT Station)*2 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP (fixed)

<Ethernet module>
(The settings other than the following are set to the default)
Network No. : 1 (virtual)*1
PLC No. (Station)*2 : 2 (virtual)*1
IP address : 192.168.3.251 (Default)
Port No. : 5555 (fixed)
Communication format : UDP (fixed)

*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3
*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

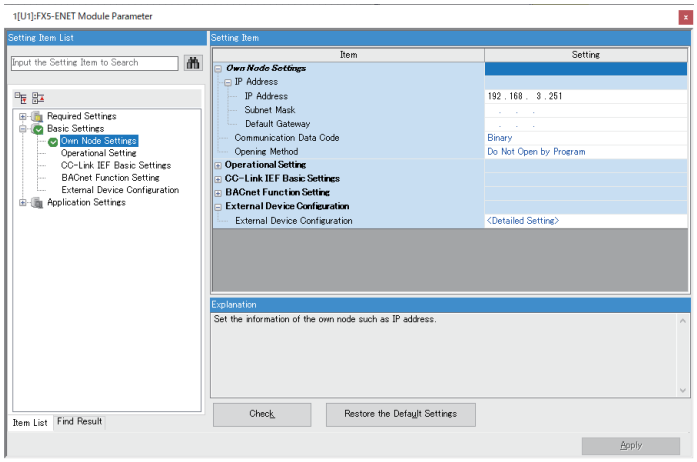
• [Module Parameter] of GX Works3

For the connection with FX5-ENET or FX5-ENET/IP, use GX Works3 version 1.075D or later.

For the connection with FX5-EIP, use GX Works3 version 1.120A or later.

Module parameters of the Ethernet module

Set [Module Parameter] of the port under [Module information].



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[IP Address]	192.168.3.251	○
[Subnet Mask]	—	—
[Default Gateway]	—	—
[Communication Data Code]	(Use default value)	—
[Opening Method]	(Use default value)	—
[External Device Configuration]	—	—

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 315 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to Ethernet module (MELSEC iQ-F series)

The setting items for the network number and station number do not exist on the PLC side.

Set the network number and station number on the GOT side.

When doing so, set a network number not used in the system.

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

	[Port No.]	5555
	[Communication]	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number.

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.251

Reply from 192.168.3.251:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.251

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

Ethernet diagnostics of GX Works3

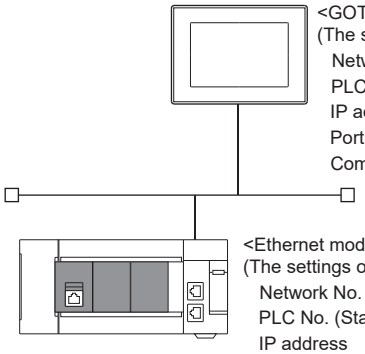
The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-F series manuals

■When the GOT's communication format is TCP

• System configuration



<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.)*2 : 1
PLC No. (GOT Station)*2 : 1

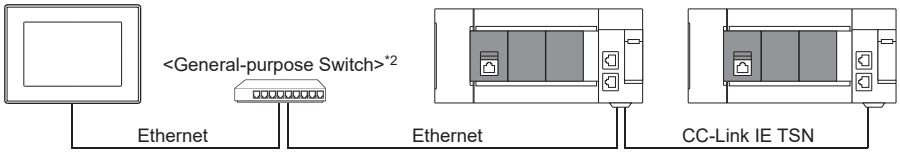
IP address : 192.168.3.99



<CC-Link IE TSN master/local module 1>
(Use the default value for settings other than the following.)
Station type : Local station
Network No. : 1
PLC No. (Station)*2 : 1
IP address : 192.168.3.11

*1 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

*2 General-purpose Switch is required to connect the GOT and the CC-Link IE TSN master/local module.
For usable General-purpose Switches, refer to the following.
MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

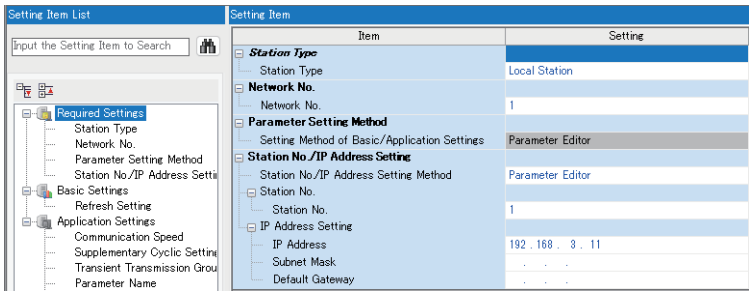
■[Module Parameter] of GX Works3

For details on the settings of the PLC, refer to the following manual.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

Ex.

Settings of CC-Link IE TSN master/local module 1



Item	Setting value	
	CC-Link IE TSN master/local module 1	CC-Link IE TSN master/local module 2
[Station Type]	Local station	Master station
[Network No.]	1	1
[Station No.]	1	0
[IP Address]	192.168.3.11	192.168.3.99

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 315 GOT side settings

• Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	18
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station No.]	1*2
	[Unit Type]	FX5-CCLGN-MS/FX5-nSSC-G
	[IP Address]	192.168.3.11
	[Port No.]*3	5001
	[Communication]*3	UDP

*1 Set the same value as the GOT net number.
*2 Set a value different from the GOT station number.
*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5554
[Communication]: TCP

■Checking the communication status of the CC-Link IE TSN-equipped module

• When using Windows Command Prompt

1) At normal end

C:\>Ping 192.168.3.11

Reply from 192.168.3.11:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.11

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the CC-Link IE TSN-equipped module specified by the ping command

Point

Ethernet diagnostics of GX Works3

The Ethernet diagnostics of GX Works3 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

MELSEC iQ-F series manuals

Connection to built-in Ethernet port of Motion module

This section describes the settings of the GOT and Motion module in the system configuration shown below.

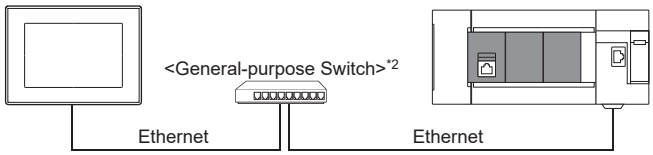
Point

For details on the Motion module, refer to the following manual.

MELSEC iQ-F FX5 Motion Module/Simple Motion Module User's Manual (Startup)

■System configuration

<GOT>
(Use the default value for settings other than the following.)
Network No. (GOT Net No.)*1 : 1
PLC No. (GOT Station)*1 : 18
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP



<Motion module>
(Use the default value for settings other than the following.)
Network No. : 1
PLC No. (Station)*1 : 0 (fixed)
IP address : 192.168.3.249

*1 For the following settings, the setting names differ on the PLC side and on the GOT side.

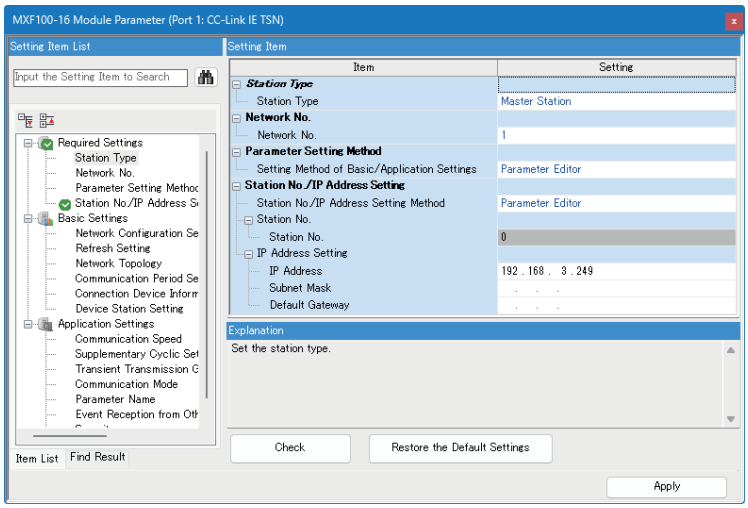
Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

*2 For usable General-purpose Switches, refer to the following.
MELSEC iQ-F FX5 Motion Module/Simple Motion Module User's Manual (Startup)

■[Module Parameter (Network)] of GX Works3

For details on the Motion module side settings, refer to the following.

MELSEC iQ-F FX5 Motion Module/Simple Motion Module User's Manual (Startup)



Item	Setting value
[Network No.]	1
[IP Address]	192.168.3.249

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 315 GOT side settings

- Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	18
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

- GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

- Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	0
	[Unit Type]	FX5-CCLGN-MS/FX5-nSSC-G
	[IP Address]	192.168.3.249
	[Port No.]	5001
	[Communication]*2	UDP

*1 Set the same value as the GOT net number.

*2 If you set [Communication] to [TCP], set [Port No.] to [5002].

■Checking the communication status of the Motion module

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.249

Reply from 192.168.3.249:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.249

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

IP address of the Motion module specified by the ping command

Operation state of PLC CPU (faulty or not)

Connection status of the Motion module

Cable connecting condition

Switch settings and network parameter settings

Connection to Motion module through built-in Ethernet port of PLC

For the connection between the GOT and the built-in Ethernet port CPU of the MELSEC iQ-F series, refer to the following.

☞ Page 303 Connection to the built-in Ethernet port CPU of the MELSEC iQ-F series

For details on the Motion module, refer to the following manual.

📖MELSEC iQ-F FX5 Motion Module/Simple Motion Module User's Manual (Startup)

4.8.5 Access range for monitoring

Only the connected CPU can be accessed.

4.9 MELSEC-Q series (Built-in Ethernet port connection)

☞ Page 341 Connectable devices
☞ Page 342 System configuration
☞ Page 349 GOT side settings
☞ Page 359 PLC side settings
☞ Page 390 Access range for monitoring

4.9.1 Connectable devices

The following table shows the connectable models.

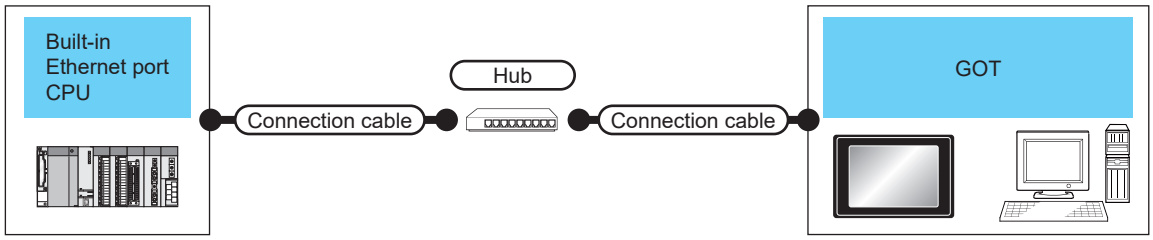
○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC-Q (Q mode)	Q03UDECPU Q04UDEHCPU Q06UDEHCPU Q10UDEHCPU Q13UDEHCPU Q20UDEHCPU Q26UDEHCPU Q50UDEHCPU Q100UDEHCPU	○	GT37 SoftGOT3000
	Q03UDVCPU Q04UDVCPU Q06UDVCPU Q13UDVCPU Q26UDVCPU	○	GT37 SoftGOT3000
CNC C70	Q173NCCPU*3	○	GT37 SoftGOT3000
C Controller module (Q series)	Q12DCCPU-V*1 Q24DHCCPU-V/VG Q24DHCCPU-LS Q26DHCCPU-LS	○	GT37 SoftGOT3000
Robot controller (Q series)	CR800-Q (Q172DSRCPU)*2	○	GT37 SoftGOT3000

*1 Use a module having a serial number stating with 12042 or later in the first 5 digits.
*2 Ethernet connections can be established via the PERIPHERAL I/F of the robot controller or either of the following.
• Ethernet module (QJ71E71)
• Ethernet port built in the PLC CPU
*3 Connect the cable to the DISPLAY I/F on the Q173NCCPU.

4.9.2 System configuration

Connection to the built-in Ethernet port CPU



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 343 Connection cable

☞ Page 343 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 344 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	Model
MELSEC-QnUDE(H)*1*2 MELSEC-QnUD(P)V*1*2 CR800-Q (Q172DSRCPU)	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000
C Controller module (Q series)	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the built-in Ethernet port CPU, refer to the manual of the PLC to be used.

*2 For [Unit Type] to be selected in [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 356 [Connected Ethernet Controller Setting]

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
		UDP	TCP		
MELSEC-QnUDE(H) MELSEC-QnUD(P)V		16 (UDP and TCP in total)		GT37 SoftGOT3000	63 (16 or less recommended)
CR800-Q (Q172DSRCPU)		16 (UDP and TCP in total)		GT37 SoftGOT3000	63 (16 or less recommended)
C Controller module (Q series)	Q12DCCPU-V	Basic mode: 1 Extended mode: 16	Basic mode: 1 Extended mode: 16	GT37 SoftGOT3000	63 (16 or less recommended)
	Q24DHCCPU-V/VG/LS	16	16	GT37 SoftGOT3000	63 (16 or less recommended)

■Connection to the built-in Ethernet port of the built-in Ethernet port CPU

Connect the GOT after turning on the network equipment such as the built-in Ethernet port CPU or hub to enable communications.

If the GOT cannot communicate with the built-in Ethernet port CPU, a communication error may occur on the GOT.

■Connection via the multiple CPU system

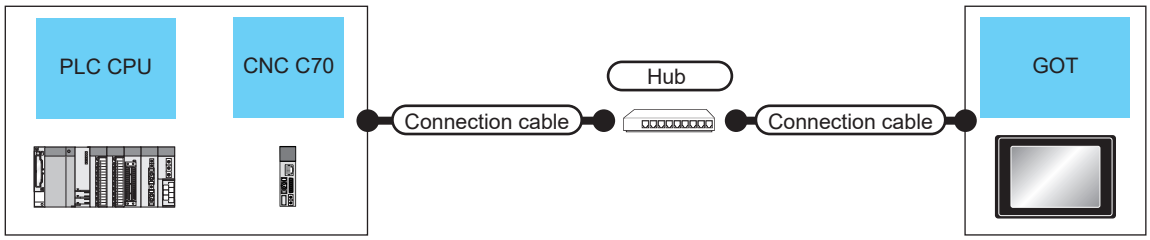
When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.

If you start the GOT before the PLC runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

Connection to Display I/F



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 346 Connection cable

☞ Page 346 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 346 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	Model
CNC C70 (Q173NCCPU)*1*2	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the CNC C70, refer to the following manual.
C70 Series SET UP MANUAL

*2 Select [Q17nNC] for [Unit Type] in [Connected Ethernet Controller Setting] of GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 356 [Connected Ethernet Controller Setting]

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

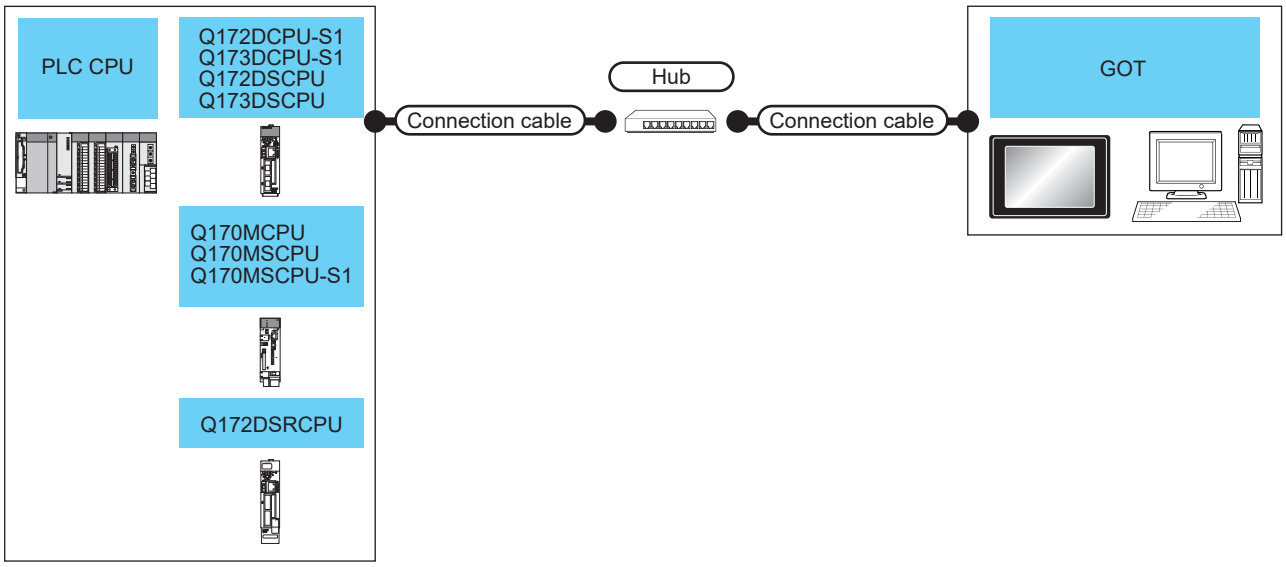
■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller		GOT	
Model	Number of GOTs connectable to one PLC	Model	Number of connectable controllers per GOT channel
CNC C70 (Q173NCCPU)	16 GOTs for 1 network	GT37 SoftGOT3000	63 (16 or less recommended)

Connection to PERIPHERAL I/F



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 348 Connection cable

☞ Page 348 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 348 Maximum number of connected devices

Controller*1	Connection cable	GOT	
		Interface	Model
Motion CPU (Q series) Q172DCPU-S1 Q173DCPU-S1 Q172DSCPU Q173DSCPU Q170MCPU Q170MSCPU Q170MSCPU-S1 MR-MQ100 CR800-Q (Q172DSRCPU)	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000

*1 Select [QnUD(P)V/QnUDE(H)] for [Unit Type] in [Connected Ethernet Controller Setting] of GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 356 [Connected Ethernet Controller Setting]

Point

Access to other networks

Other networks cannot be accessed through the PERIPHERAL I/F.

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 30 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP		
Motion CPU (Q series) Q172DCPU-S1 Q173DCPU-S1 Q172DSCPU Q173DSCPU Q170MCPU Q170MSCPU Q170MSCPU-S1 MR-MQ100 CR800-Q (Q172DSRCPU)	16	16	GT37 SoftGOT3000	128

4.9.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

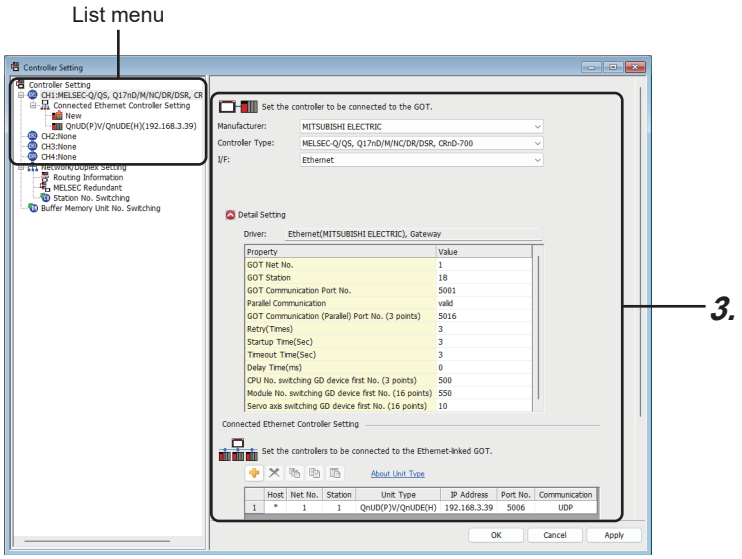
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-Q/QS,Q17nD/M/NC/DR/DSR,CRnD-700]
[I/F]	[Ethernet]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 351 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 356 [Connected Ethernet Controller Setting]

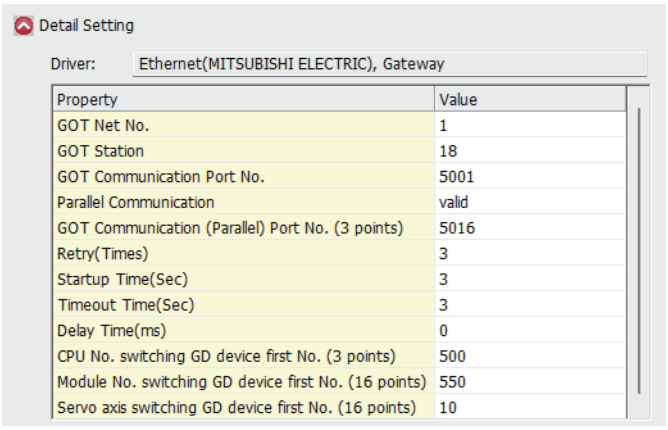
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]*3	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 353 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 354 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 355 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 356 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

*3 For connection to the QCPU, do not set [5009] for the GOT communication port number. Doing so disables communications.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

■When connecting multiple GOTs

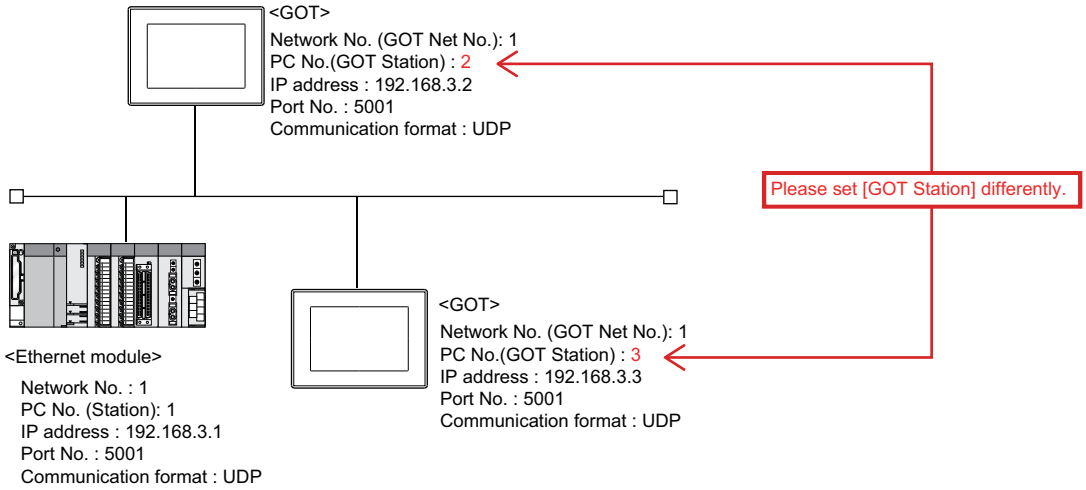
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

Page 351 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

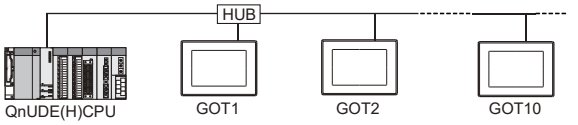
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup Time	3sec (default)	4sec	4sec
Timeout Time	3sec (default)	4sec	4sec

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

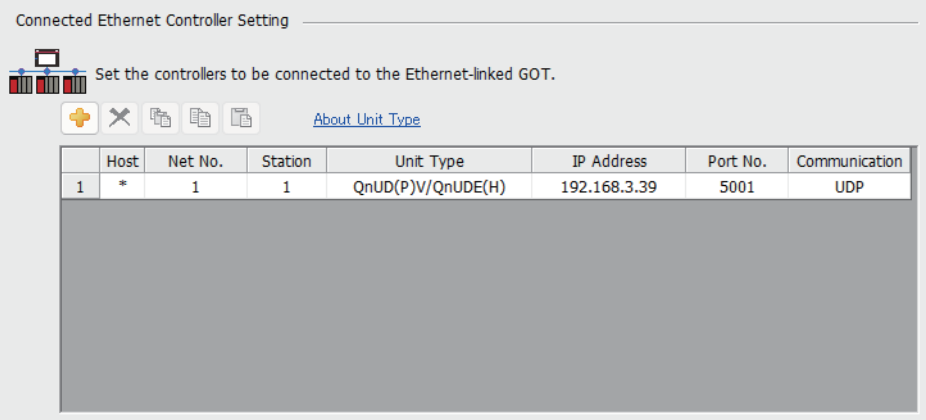
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	[1] to [64]
[Unit Type]	Select the model of the connected Ethernet equipment.	☞ Page 356 [Unit Type]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 356 [Port No.]
[Communication]	Set the communication format of the connected Ethernet equipment.	[UDP], [TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].
☞ Page 351 [Detail Setting]

■[Unit Type]

Select an item for [Unit Type] as shown below.

GOT connection destination	[Unit Type]
QnUD(P)V, QnUDE(H)	[QnUD(P)V/QnUDE(H)]
Q17nNCCPU	[Q17nNC]
C Controller module (Q series)	[QnD(H)CCPU]
CR800-Q (Q172DSRCPU)	[Q17nDSR]

■[Port No.]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[QnUD(P)V/QnUDE(H)]	[5001] (Select this item to enable the network number and PLC number of the built-in Ethernet port CPU.)	[UDP]
	[5006]	[UDP]
	[5007]	[TCP]
[Q17nNC]	[5001]	[UDP]
	[5002]	[TCP]
[QnD(H)CCPU]	[5006]	[UDP]
	[5007]	[TCP]
[Q17nDSR]	[5001]	[UDP]

■When selecting [QnUD(P)V/QnUDE(H)] for [Unit Type]

When [QnUD(P)V/QnUDE(H)] is selected for [Unit Type], [Port No.] can be changed.

• When [Port No.] is set to [5001]

For QnUDVCPU having a serial number starting with 17052 or later in the first 5 digits, a network number and a PLC number can be set for the built-in Ethernet port CPU (Port number: 5001).

The network number and station number in the object setting dialog must match the network number and PLC number of the built-in Ethernet port CPU.

For connection to a built-in Ethernet port CPU with [Unit Type] other than [QnUD(P)V/QnUDE(H), do not set [5001] to [Port No.].

Otherwise, monitoring becomes unavailable.

• When [Port No.] is set to [5006] or [5007]

There is no setting for the network number and PLC number of built-in Ethernet port CPU (Port number: 5006, 5007).

The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

■Connection to the built-in Ethernet port PLC with [Communication] set to [TCP]

During communication with the built-in Ethernet port PLC with [Communication] set to [TCP], using the FA transparent function may change the setting from [TCP] to [UDP] and start communication with the PLC with the new setting.

In this case, communication with the built-in Ethernet port PLC cannot be executed normally.

Take the following corrective action.

Phenomenon	Cause	Corrective action
Communication fails when using the FA transparent function.	[UDP] is not available in the open settings of the built-in Ethernet port PLC.	Add [UDP] to the PLC side open settings.
	When the multi-channel Ethernet connection is used, [TCP] and [UDP] are used to the same IP address, and then the FA transparent function is used for the channel set to [TCP].	Execute the FA transparent function for the channel set to [UDP].

Point

Changing the host station on the GOT

[Host] can be changed with the utility function of the GOT.

For details on the setting method, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

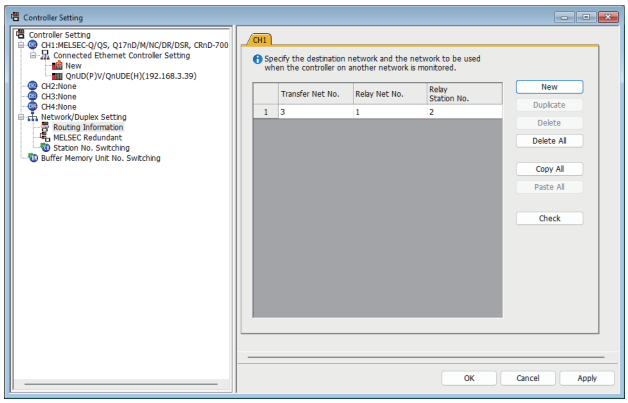
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC-Q/L Ethernet Interface Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

Page 359 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.9.4 PLC side settings

Model		Reference
MELSEC-Q (Q mode)	Q03UDECPU Q04UDEHCPU Q06UDEHCPU Q10UDEHCPU Q13UDEHCPU Q20UDEHCPU Q26UDEHCPU Q50UDEHCPU Q100UDEHCPU Q03UDVCPU Q04UDVCPU Q06UDVCPU Q13UDVCPU Q26UDVCPU	☞ Page 360 Connection to the built-in Ethernet port CPU of the MELSEC-Q series

Motion CPU (Q series)	Q172CPUN Q173CPUN Q172HCPU Q173HCPU Q172DCPU Q173DCPU Q172DCPU-S1 Q173DCPU-S1 Q172DSCPU Q173DSCPU Q170MCPU Q170MSCPU Q170MSCPU-S MR-MQ100	☞ Page 377 Connection to PERIPHERAL I/F

Precautions

Do not set a remote password on the QCPU (Q mode).
Doing so disables monitoring with the GOT.

Connection to the built-in Ethernet port CPU of the MELSEC-Q series

This section describes the settings of the GOT and the built-in Ethernet port CPU in the system configuration shown below.

☞ Page 360 One-to-one connection with the PLC side [MELSOFT Connection Extended Setting] set to the default value
☞ Page 363 One-to-one connection with the PLC side [MELSOFT Connection Extended Setting] set to [Use]
☞ Page 368 Multiple connection with the PLC side [MELSOFT Connection Extended Setting] set to the default value
☞ Page 372 Multiple connection with the PLC side [MELSOFT Connection Extended Setting] set to [Use]

Point

• Built-in Ethernet port CPU

For details on the built-in Ethernet port CPU, refer to the following manual.

📖QnUCPU User's Manual (Communication via Built-in Ethernet Port)

• Connecting multiple GOTs

When connecting two or more GOTs in the Ethernet network, set each [GOT Station] to the GOT.

☞ Page 352 When connecting multiple GOTs

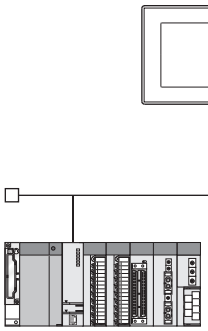
■One-to-one connection with the PLC side [MELSOFT Connection Extended Setting] set to the default value

• System configuration

For one-to-one connection, no settings are required on the PLC side.

Set [Port No.] to [5006] and [Communication] to [UDP] to communicate with the PLC.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.)*3 : 1
PLC No. (GOT Station)*3 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP (fixed)

<Connecting to Built-in Ethernet port CPU> *1
(The following settings are set to the default)
Network No. : 1 (virtual) *2
PLC No. (Station)*3 : 2 (virtual) *2
IP address : 192.168.3.39
Communication format : UDP

*1 For the settings when using system devices such as a hub, refer to the following.
☞ Page 368 Multiple connection with the PLC side [MELSOFT Connection Extended Setting] set to the default value

*2 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

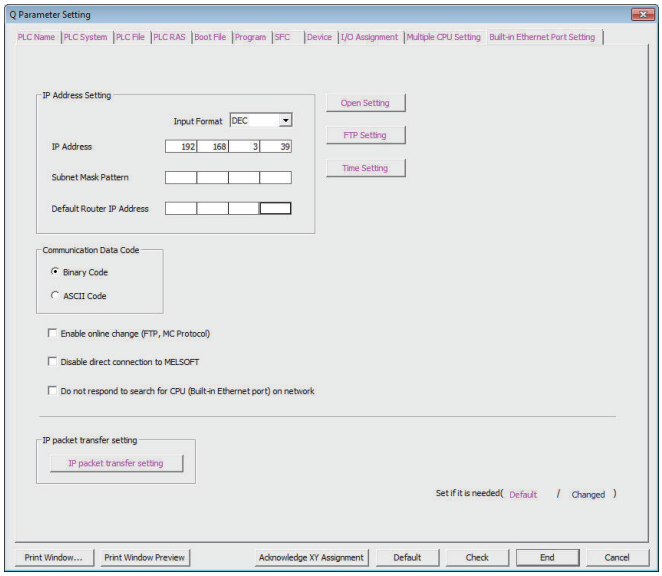
*3 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

• [PLC parameter] of GX Works2

Use GX Works2 Version 1.535H or later.

Built-in Ethernet port settings



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[IP Address]	192.168.3.39	○

[Open System]	MELSOFT connection

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 349 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to the Built-in Ethernet port QCPU or LCPU

The setting items for the network number and station number do not exist on the PLC side.

Set the network number and station number on the GOT side.

When doing so, set a network number not used in the system.

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	QnUD(P)V/QnUDE(H)*4
	[IP Address]	192.168.3.39
	[Port No.]*3	5006
	[Communication]*3	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number.

*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5007
[Communication]: TCP

*4 For CR800-Q (Q172DSRCPU), set [Q17nDSR].

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.39

Reply from 192.168.3.39:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.39

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works2

The Ethernet diagnostics of GX Works2 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works2, refer to the following manual.

QCPU User's Manual (Hardware Design, Maintenance and Inspection)

■One-to-one connection with the PLC side [MELSOFT Connection Extended Setting] set to [Use]

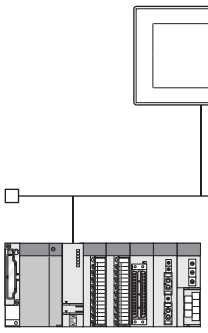
• System configuration

Set [Port No.] to [5001] and [Communication] to [UDP] to communicate with the PLC.

[MELSOFT Connection Extended Setting] is available for QnUDVCPU.

Set [MELSOFT Connection Extended Setting] to [Use], and configure the other settings.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.)*2 : 1
PLC No. (GOT Station)*2 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP (fixed)

<Connecting to Built-in Ethernet port CPU> *1
(The following settings are set to the default)
Network No. : 1
PLC No. (Station)*2 : 2
IP address : 192.168.3.39
Communication format : UDP

*1 Use the QnUDVCPU having a serial number starting with 17052 or later in the first 5 digits.

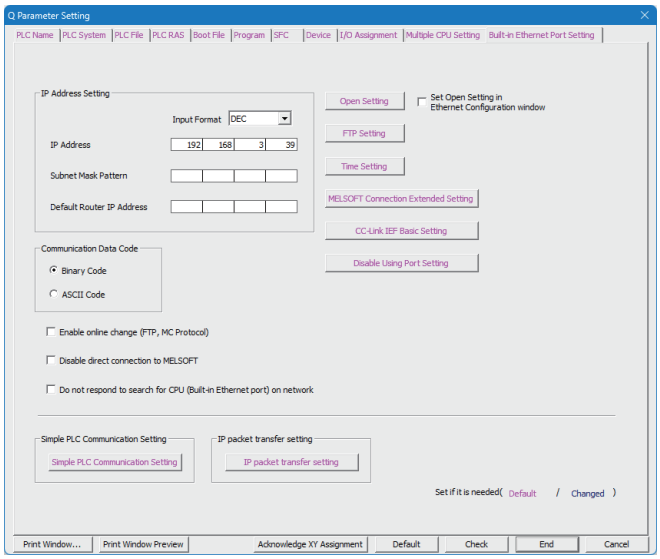
*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

• [PLC parameter] of GX Works2

Use GX Works2 Version 1.535H or later.

Built-in Ethernet port settings



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[IP Address]	192.168.3.39	○
[Subnet Mask Pattern]	—	—
[Default Router IP Address]	—	—
[Communication Data Code]	(Use default value)	△
[Enable online change (FTP, MC protocol)]		△

Item	Setting value	Setting for GOT connection
[MELSOFT Connection Extended Setting]	Use	○
[Network No.]	1	○
[Station No.]	2	○

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 349 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to the Built-in Ethernet port QCPU or LCPU

The setting items for the network number and station number do not exist on the PLC side.

Set the network number and station number on the GOT side.

When doing so, set a network number not used in the system.

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	QnUD(P)V/QnUDE(H)*3
	[IP Address]	192.168.3.39
	[Port No.]	5001
	[Communication]	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number.

*3 For CR800-Q (Q172DSRCPU), set [Q17nDSR].

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.39

Reply from 192.168.3.39:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.39

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works2

The Ethernet diagnostics of GX Works2 enables ping tests from the PLC.

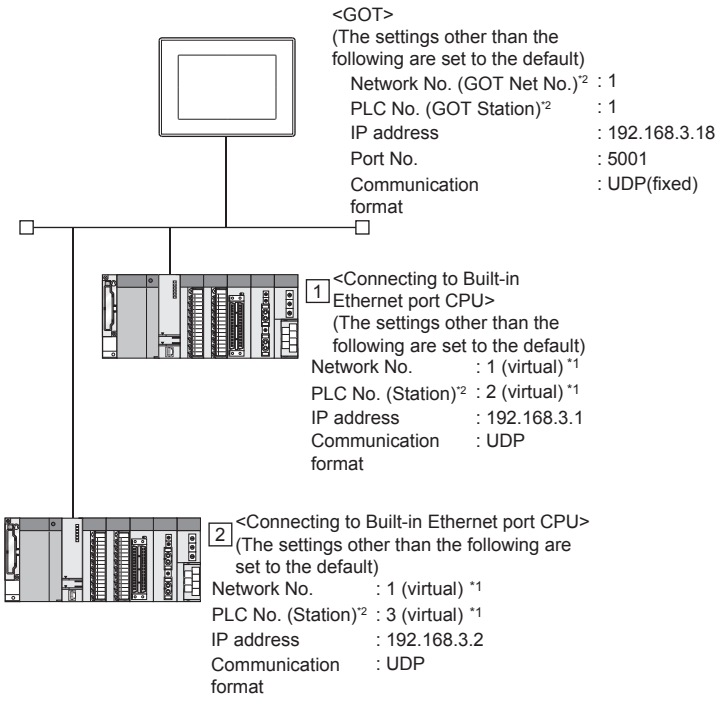
For details on the Ethernet diagnostics of GX Works2, refer to the following manual.

QCPU User's Manual (Hardware Design, Maintenance and Inspection)

■Multiple connection with the PLC side [MELSOFT Connection Extended Setting] set to the default value

• System configuration

Set [Port No.] to [5006] and [Communication] to [UDP] to communicate with the PLC.



*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

• [PLC parameter] of GX Works2

	[Port No.]*3	5006	5006
	[Communication]*3	UDP	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number and PLC numbers of other PLCs on the same network.

*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5007
[Communication]: TCP

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.1

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works2

The Ethernet diagnostics of GX Works2 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works2, refer to the following manual.

QCPU User's Manual (Hardware Design, Maintenance and Inspection)

■Multiple connection with the PLC side [MELSOFT Connection Extended Setting] set to [Use]

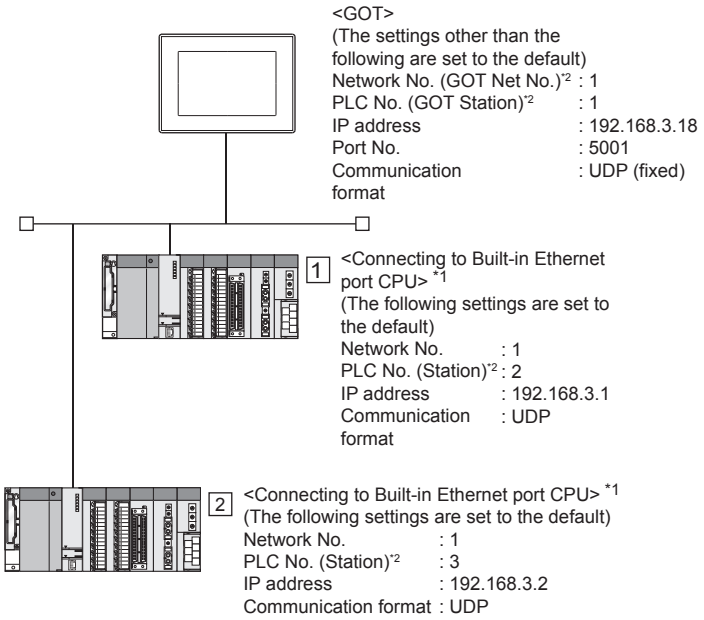
• System configuration

Set [Port No.] to [5001] and [Communication] to [UDP] to communicate with the PLC.

[MELSOFT Connection Extended Setting] is available for QnUDVCPU.

Set [MELSOFT Connection Extended Setting] to [Use], and configure the other settings.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



*1 Use the QnUDVCPU having a serial number starting with 17052 or later in the first 5 digits.

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

• [PLC parameter] of GX Works2

Use GX Works2 Version 1.535H or later.

	[Communication]	UDP	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number and PLC numbers of other PLCs on the same network.

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.1

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works2

The Ethernet diagnostics of GX Works2 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works2, refer to the following manual.

QCPU User's Manual (Hardware Design, Maintenance and Inspection)

Connection to PERIPHERAL I/F

This section describes the settings of the GOT and the Built-in Ethernet port Motion CPU in the following system configuration.

Point

• GOT type setting

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

• CPU No. specification of Q170MCPU and Q170MSCPU(-S1)

Set whether to monitor the PLC CPU area or the Motion CPU area of Q170MCPU or Q170MSCPU(-S1) by the CPU No. specification. For details, refer to the following.

Page 398 Connection to Q170MCPU or Q170MSCPU(-S1)

• PLC type of GX Works2, GX Developer

When creating a program, set the following PLC type:

For Q173D(S)CPU and Q172D(S)CPU: QnUD(E)(H)CPU

For Q170MCPU and Q170MSCPU(-S1): Q03UDCPU

• Built-in Ethernet port CPU

For details on the built-in Ethernet port CPU, refer to the following manual.

User's manual of Q173D(S)CPU/Q172D(S)CPU, Q170MCPU, and Q170MS(-S1)CPU

• Connecting multiple GOTs

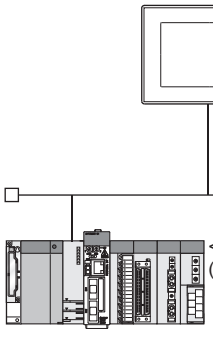
When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

Page 352 When connecting multiple GOTs

■System configuration

Leave the Built-in Ethernet port Motion CPU settings as default in the following system configuration.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.)*3 : 1
PLC No. (GOT Station)*3 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP (fixed)

<Connecting to Built-in Ethernet port CPU> *1
(The following settings are set to the default)
Network No. : 1 (virtual) *2
PLC No. (Station)*3 : 2 (virtual) *2
IP address : 192.168.3.39
Open system : MELSOFT connection (fixed)

*1 For the settings when using system devices such as a hub, refer to the following.
Page 360 Connection to the built-in Ethernet port CPU of the MELSEC-Q series

*2 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
Page 379 [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

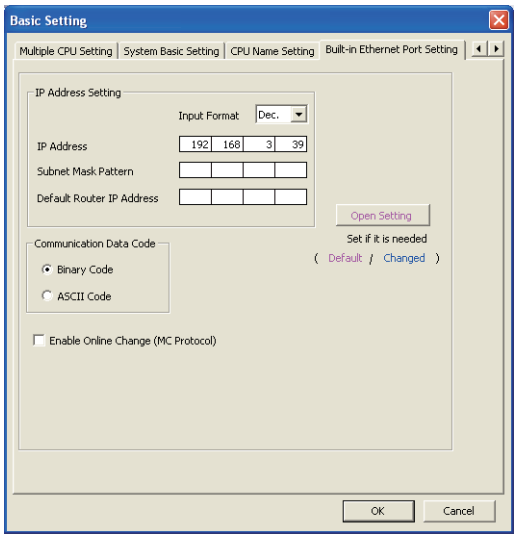
*3 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

■Basic setting of MT Works2

Use the default values of the basic setting for the system configuration above.

• Built-in Ethernet port settings



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[IP Address]	192.168.3.39	○

	[IP Address]	192.168.3.39*3
	[Port No.]*4	5006
	[Communication]*4	UDP

*1 Set the same value as the GOT net number.
*2 Set a value different from the GOT station number.
*3 Set the value to the IP address of the Built-in Ethernet port Motion CPU.
*4 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5007
[Communication]: TCP

■Checking the communication state of the built-in Ethernet port CPU

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.39

Reply from 192.168.3.39:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.39

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works2 and GX Developer

The Ethernet diagnostics of GX Works2 and GX Developer enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works2 and GX Developer, refer to the following manuals.

GX Works2 Version1 Operating Manual (Common)

GX Developer Version8 Operating Manual

Connection to Display I/F (CNC C70)

This section describes the settings of the GOT and Display I/F (CNC C70) in the system configuration shown below.

Point

• Display I/F (CNC C70)

For details on the Display I/F (CNC C70), refer to the following manual.

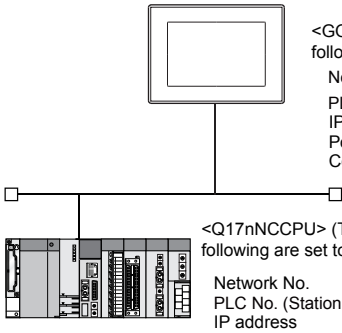
C70 Series SET UP MANUAL

• Connecting multiple GOTs

When connecting two or more GOTs in the Ethernet network, set each [GOT Station] to the GOT.

Page 352 When connecting multiple GOTs

■System configuration



<GOT> (The settings other than the following are set to the default)

Network No. (GOT Net No.)*1	: 239
PLC No. (GOT Station)*1	: 1
IP address	: 192.168.1.1
Port No.	: 5001
Communication format	: UDP (fixed)

<Q17nNCCPU> (The settings other than the following are set to the default)

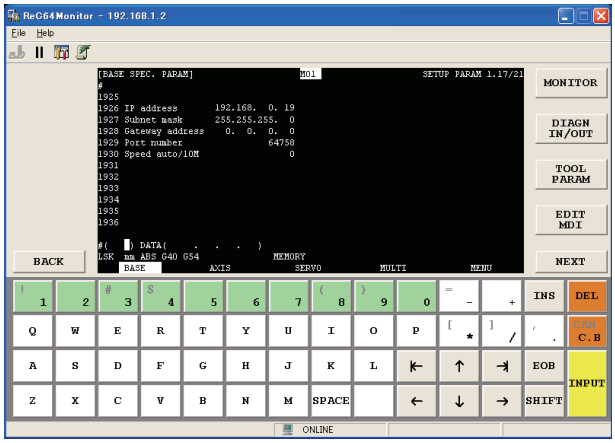
Network No.	: 239
PLC No. (Station)*1	: 2
IP address	: 192.168.1.2
Port No.	: 5001
Communication format	: UDP(fixed)

*1 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

■IP address settings of CNC C70

• Remote monitor tool



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[IP address]	192.168.1.2	○
[Subnet mask]	255.255.255.0	○
[Gateway address]	0.0.0.0	○
[Port number]	64758	○
[Speed auto/10M]	0	○

• Communication confirmation

The CNC C70 can communicate with the GOT when INIT.LED of the CNC C70 is lit.

For checking the communication status, refer to the following.

☞ Page 383 Checking the communication state of the CNC C70

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 349 GOT side settings

• Controller settings

Item	Setting value
[GOT Net No.]	239
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.1.1
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	239
	[Station No.]	2
	[Unit Type]	Q17nNC
	[IP Address]	192.168.1.2
	[Port No.]*1	5001
	[Communication]*1	UDP

*1 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5002
[Communication]: TCP

■Checking the communication state of the CNC C70

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.1.2

Reply from 192.168.1.2:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.1.2

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Mounting condition of CNC C70

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the CNC C70 specified by the ping command

Connection to C Controller module (Q series)

This section describes the settings of the GOT and C Controller module (Q series) in the system configuration shown below.

Point

• C Controller module (Q series)

For details on the C Controller module (Q series), refer to the following manual.

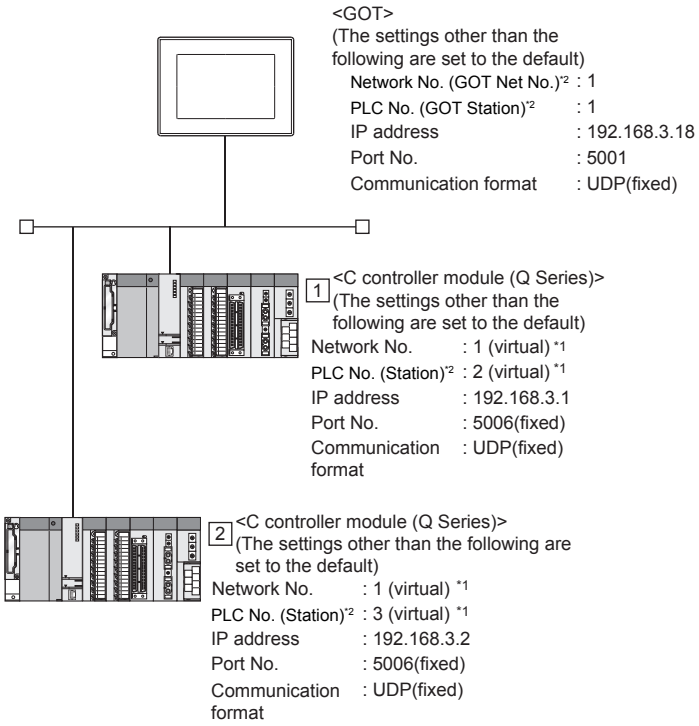
C Controller Module User's Manual (Hardware Design, Function Explanation)

• Connecting multiple GOTs

When connecting two or more GOTs in the Ethernet network, set each [GOT Station] to the GOT.

☞ Page 352 When connecting multiple GOTs

■System configuration



*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.

☞ Page 388 [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

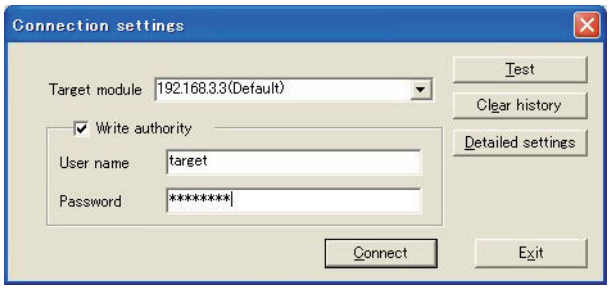
*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

■Setting the utility of the C Controller module (Q series) (for Q12DCCPU-V)

Use SW3PVC-CCPU-E Ver.3.05F or later for the C Controller (Q series) setting utility.

• Connection settings



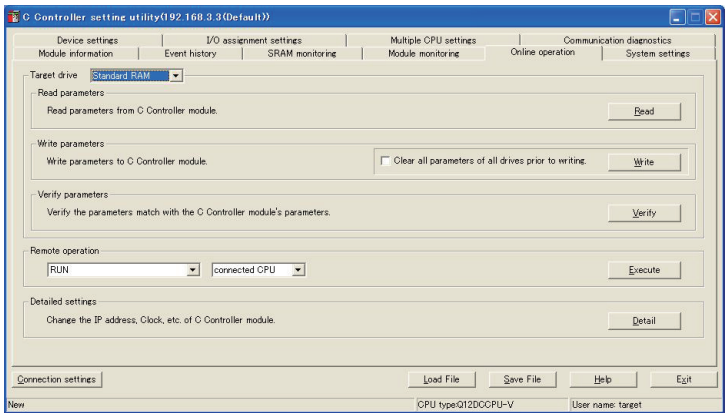
○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Target module]*1	192.168.3.3	○
[Write authority]	Selected	○
[User name]*2	target	○
[Password]*2	password	○
[Detail Setting]	—	△

*1 If the IP address of the C Controller module (Q series) has been changed, input the changed IP address or host name.

*2 If the account of the C Controller module (Q series) has been changed, input the changed user name and password.

• Online operation



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Detailed settings]	☞ • Detail settings	○

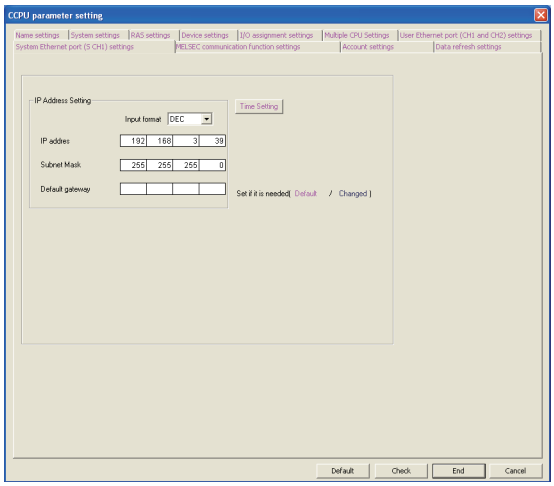
■Setting the utility of the C Controller module (Q series) (for Q24DHCCPU-V/VG/LS)

Use SW4PVC-CCPU-E for the C Controller (Q series) setting utility.

- Connection settings



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[IP Address]*1	192.168.3.39	○
[Subnet Mask]	255.255.255.0	○
[Default Gateway]	—	—

*1 If the IP address of the C Controller module (Q series) has been changed, input the changed IP address.

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 349 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to C Controller module (Q series)
The setting items for the network number and station number do not exist on the PLC side.
Set the network number and station number on the GOT side.
When doing so, set a network number not used in the system.

• Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value	
		1	2
Ethernet setting No. 1	[Host]	*	—
	[Net No.]	1*1	1*1
	[Station]	2*2	3*2
	[Unit Type]	QnD(H)CCPU	QnD(H)CCPU
	[IP Address]	192.168.3.1	192.168.3.2
	[Port No.]*3	5006	5006
	[Communication]*3	UDP	UDP

*1 Set the same value as the GOT net number.
*2 Set a value different from the GOT station number and PLC numbers of other PLCs on the same network.
*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5007
[Communication]: TCP

■Checking the communication state of the C Controller module (Q series)

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.1

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the C Controller module (Q series) specified by the ping command

4.9.5 Access range for monitoring

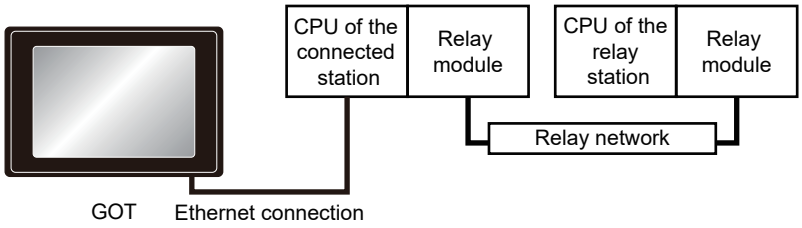
When the GOT is connected to the CPU of the station connected via Ethernet, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

*1 QnUDVCPU, QnUDECPU, and QnUDEHCPU are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*3 AnUCPU and AnUSCPU are supported.

*4 FX5U and FX5UC are supported.

*5 FX5U, FX5UC, and FX5UJ are supported.

*6 The C Controller module (MELSEC iQ-R series) is not supported.

*7 The C Controller module (MELSEC-Q series) is not supported.

*8 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
☞ Page 90 Setting procedure of the encrypted communication

4.10 MELSEC-Q series (Ethernet module connection)

☞ Page 392 Connectable devices
☞ Page 394 System configuration
☞ Page 399 GOT side settings
☞ Page 410 PLC side settings
☞ Page 422 Access range for monitoring
☞ Page 423 How to monitor a redundant system

4.10.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Ethernet module	Connectable model
MELSEC-Q (Q mode)	Q00JCPU Q00CPU*1 Q01CPU*1 Q02CPU*1	○	QJ71E71-100 QJ71E71-B5 QJ71E71-B2 QJ71E71	GT37 SoftGOT3000

	Q172DCPU-S1 Q173DCPU-S1 Q172DSCPU Q173DSCPU Q170MCPU*3 Q170MSCPU*4 Q170MSCPU-S1*4 MR-MQ100	○	QJ71E71-100 QJ71E71-B5 QJ71E71-B2 QJ71E71	GT37 SoftGOT3000
MELSECNET/H remote I/O station	QJ72LP25-25 QJ72LP25G QJ72BR15	—	QJ71E71-100 QJ71E71-B5 QJ71E71-B2 QJ71E71	GT37 SoftGOT3000
CC-Link IE Field Network Ethernet adapter module	NZ2GF-ETB	—	—	GT37 SoftGOT3000
CNC C70	Q173NCCPU	○	QJ71E71-100 QJ71E71-B5 QJ71E71-B2 QJ71E71	GT37 SoftGOT3000
Robot controller (Q series)	CRnQ-700 (Q172DRCPU)*5 CR750-Q (Q172DRCPU)*5 CR751-Q (Q172DRCPU)*5 CR800-Q (Q172DSRCPU)*6	○	QJ71E71-100 QJ71E71-B5 QJ71E71-B2 QJ71E71	GT37 SoftGOT3000

*1 To configure a multiple CPU system, use a CPU with function version B or later.

*2 When using SV13, SV22, or SV43, use a Motion CPU with the following version of OS installed.
- SW6RN-SV13Q□: 00H or later
- SW6RN-SV22Q□: 00H or later
- SW6RN-SV43Q□: 00B or later

*3 When using Ethernet module, only the first step can be used on the extension base unit (Q52B/Q55B).

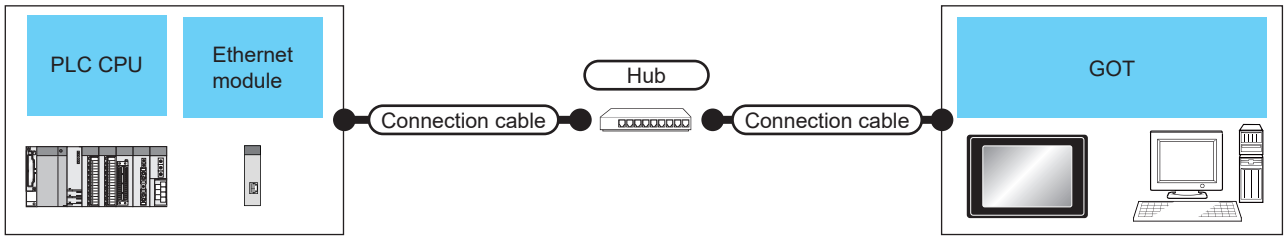
*4 When using Ethernet module, the extension base unit (Q5□B/Q6□B) can be used.

*5 The Display I/F of the robot controller cannot be connected.
Ethernet connections can be established via either of the following.
- Ethernet module (QJ71E71)
- Ethernet port built in the PLC CPU

*6 Ethernet connections can be established via the PERIPHERAL I/F of the robot controller or either of the following.
- Ethernet module (QJ71E71)
- Ethernet port built in the PLC CPU

4.10.2 System configuration

Connection to Ethernet module



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 395 Connection cable

☞ Page 395 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 395 Maximum number of connected devices

Controller	Ethernet module*1*2	Connection cable	GOT	
			Interface	Model
MELSEC-Q (Q mode) Motion CPU (Q series)*3 CNC C70 (Q173NCCPU) Robot controller (CRnQ-700) CR800-Q (Q172DSRCPU) MELSEC-QS	QJ71E71-100 QJ71E71-B5 QJ71E71-B2 QJ71E71	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the Ethernet module, refer to the following manual.
MQ Corresponding Ethernet Interface Module User's Manual (Basic)

*2 Select [QJ71E71] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 407 [Connected Ethernet Controller Setting]

*3 When using the peripheral I/F of Q170MCPU, Q17nDCPU-S1 or MR-MQ100, refer to the following.
☞ Page 347 Connection to PERIPHERAL I/F

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

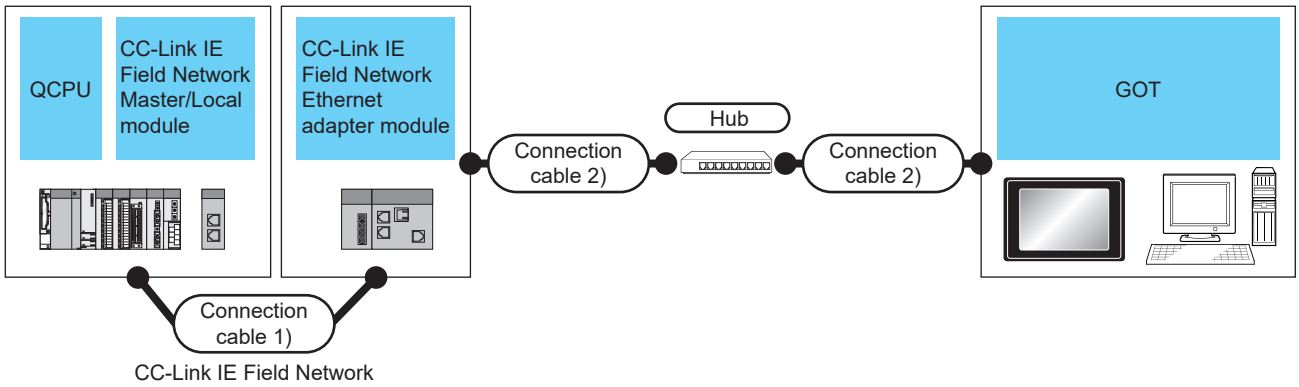
■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one Ethernet module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC-Q (Q mode) Motion CPU (Q series) Robot controller (CRnQ-700) CR800-Q (Q172DSRCPU) MELSEC-QS	QJ71E71-100 QJ71E71-B5 QJ71E71-B2 QJ71E71	63	17	GT37 SoftGOT3000	63 (16 or less recommended)
CNC C70 (Q173NCCPU)					128

Connection to NZ2GF-ETB



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 397 Connection cable

☞ Page 397 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 397 Maximum number of connected devices

Controller	CC-Link IE Field Network Master/Local module	Connection cable (1)	CC-Link IE Field Network Ethernet adapter module	Connection cable (2)	GOT	
					Interface	Model
Universal model QCPU C Controller module (Q series)	QJ71GF11-T2*2	Double-shielded twisted pair cable*1	NZ2GF-ETB	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
					Ethernet interface of personal computer	GT37 SoftGOT3000

*1 Use cables with the following specifications.

Connector	Range
Category 5e or higher Shielded RJ-45	Cable that satisfies the following specifications: IEEE802.3 1000BASE-T ANSI/TIA/EIA-568-B (Category 5e)

*2 For the system configuration on the CC-Link IE Field Network module side, refer to the following manual.
CC-Link IE Field Network Ethernet Adapter Module User's Manual

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

■Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

■Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one Ethernet module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
Universal model QCPU C Controller module (Q series)	QJ71GF11-T2	128*1 (16 or less recommended)	128*1 (16 or less recommended)	GT37 SoftGOT3000	63 (16 or less recommended)

*1 The number of connectable GOTs for one network is 63 units (at most).

Connection to QSCPU

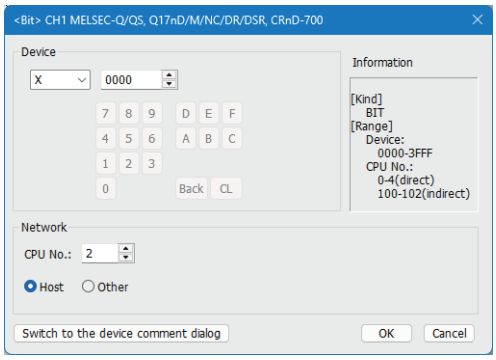
The GOT can only read device data and sequence programs by the ladder monitor function in the QSCPU.
The GOT cannot write any data to the QSCPU.

Connection to Q170MCPU or Q170MSCPU(-S1)

Set [CPU No.] to 2 in the device setting to monitor the device of the Motion CPU area (CPU No. 2).
When [CPU No.] is set to 1, the device on the PLC CPU area (CPU No. 1) is monitored.
When [CPU No.] is set to 0, the monitoring target differs depending on the GOT connection destination.
Refer to the following.

GOT connection destination	Monitoring target
QJ71E71 module	PLC CPU area (CPU No. 1)
Q170MCPU Q170MSCPU(-S1)	Motion CPU area (CPU No. 2)

When [CPU No.] is set to the number other than 0 to 2, a communication error occurs and the monitoring cannot be executed.
For the setting of [CPU No.], refer to the following.
GT Designer3 (GOT3000) Screen Design Manual



Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.
If you start the GOT before the PLC runs, a system alarm occurs.
Adjust the time to display the GOT startup screen to prevent a system alarm.
GT Designer3 (GOT3000) Screen Design Manual

Connection to PERIPHERAL I/F

- Monitoring other stations

The GOT cannot monitor other stations. Routing parameter settings are invalid.

- Monitoring servo amplifiers from a robot controller through a simple motion module

When a GOT is connected to the PERIPHERAL I/F of the robot controller, servo amplifiers cannot be monitored through a simple motion module.

- Monitoring a CPU module on a different network from CR800-Q (Q172DSRCPU)

When a CPU module number on a different network is specified for PERIPHERAL I/F of CR800-Q (Q172DSRCPU), the specified CPU module number within the host network is monitored.

4.10.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

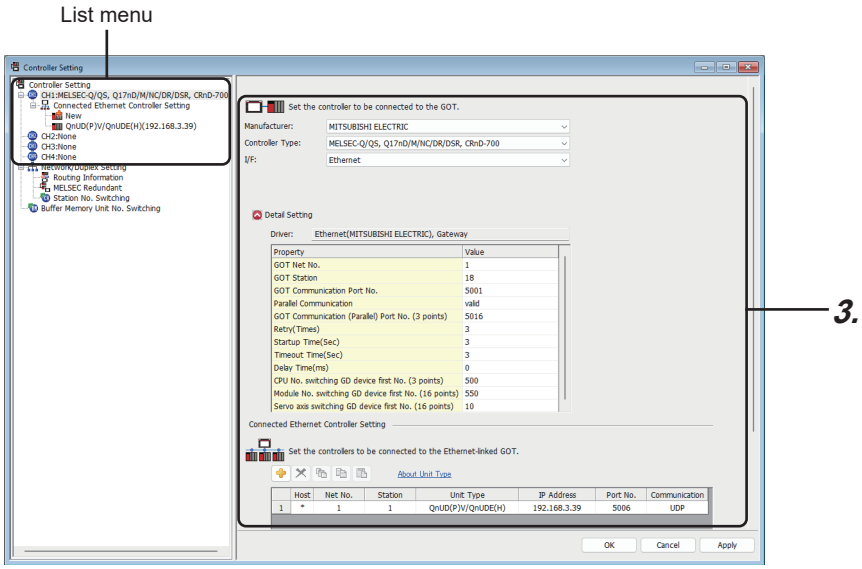
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
[I/F]	[Ethernet]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 401 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 407 [Connected Ethernet Controller Setting]

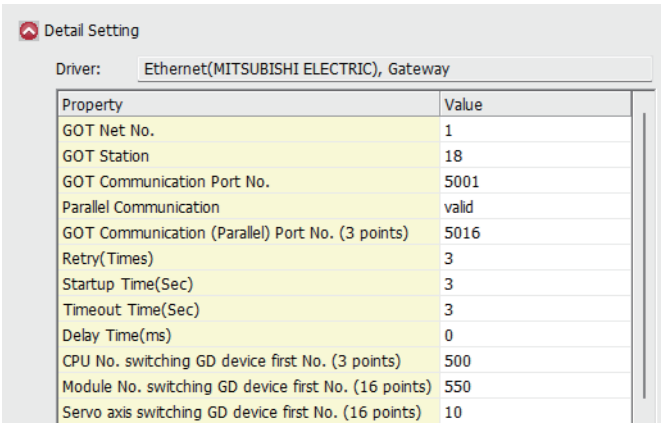
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*2*4	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]*3	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]*5	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]*1	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 404 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 405 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 406 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 To connect the GOT with the Ethernet module (Q series) in the one-on-one relationship without using a hub, set [Timeout Time] to 6 seconds or longer.
*2 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 407 [Connected Ethernet Controller Setting]
*3 For connection to the QCPU, do not set [5009] for the GOT communication port number. Doing so disables communications.
*4 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.
*5 When the MELSEC redundant settings are enabled, [Parallel Communication] is set to [invalid].

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

■When connecting multiple GOTs

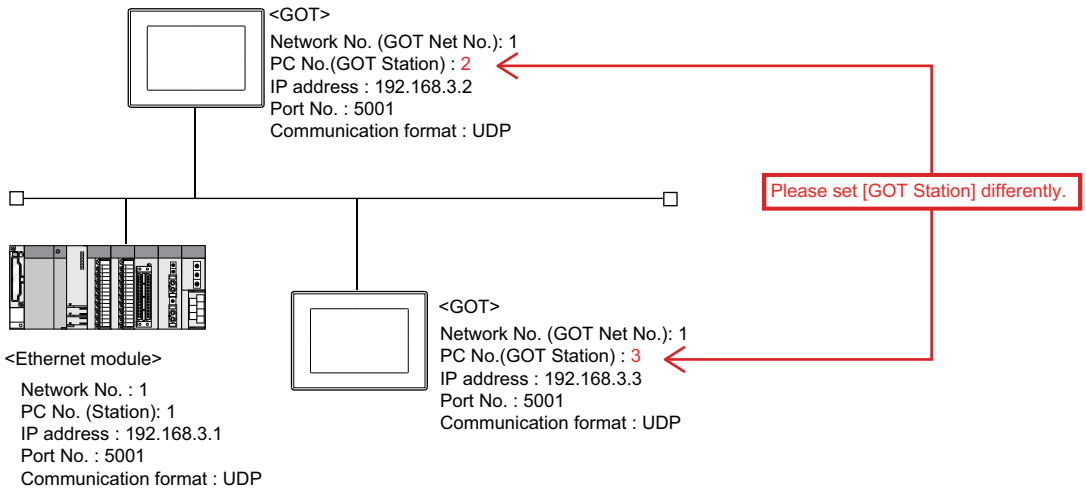
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 401 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

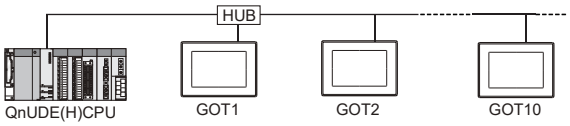
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup Time	3sec (default)	4sec	4sec
Timeout Time	3sec (default)	4sec	4sec

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

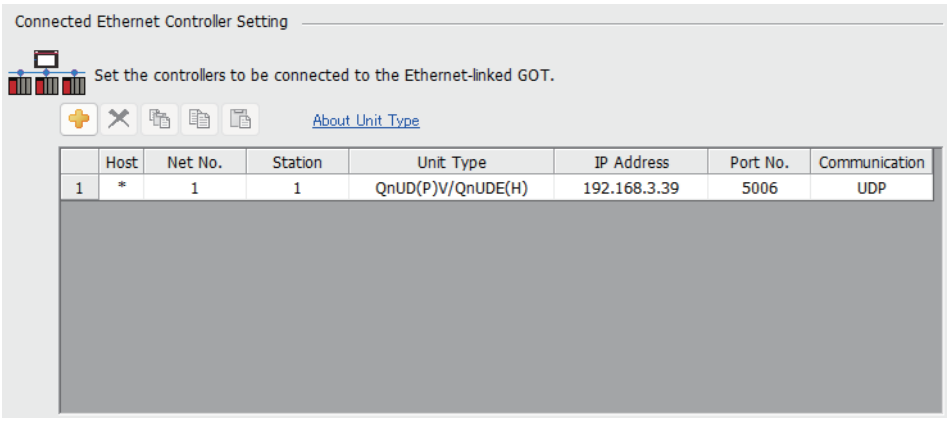
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	[1] to [64]
[Unit Type]	Select the model of the connected Ethernet equipment.	☞ Page 407 [Unit Type]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 407 [Port No.]
[Communication]	Set the communication format of the connected Ethernet equipment.	[UDP], [TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].
☞ Page 401 [Detail Setting]

■[Unit Type]

Select an item for [Unit Type] as shown below.

GOT connection destination	[Unit Type]
Ethernet module	[QJ71E71/LJ71E71]
NZ2GF-ETB	[NZ2GF-ETB]
QnUD(P)V, QnUDE(H), QCPU, Q170MCPU, Q170MSCPU(-S1), Q173D(S)CPU(-S1), Q172D(S)CPU(-S1)	[QnUD(P)V/QnUDE(H)]
CR800-Q (Q172DSRCPU)	[Q17nDSR]

■[Port No.]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[QJ71E71/LJ71E71], [NZ2GF-ETB]	[5001]	[UDP]
	[5002]	[TCP]
[QnUD(P)V/QnUDE(H)]	[5006]	[UDP]
	[5007]	[TCP]
[Q17nDSR]	[5001]	[UDP]

■When selecting [QnUD(P)V/QnUDE(H)] for [Unit Type]

There is no setting for the network number and PLC number of built-in Ethernet port CPU (Port number: 5006, 5007).
The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

■Connection to the PLC via the Ethernet module with [Communication] set to [TCP]

During communication with the PLC via the Ethernet module with [Communication] set to [TCP], using the FA transparent function may change the setting from [TCP] to [UDP] and start communication with the PLC via the Ethernet module with the new setting.
In this case, communication with the PLC via the Ethernet module cannot be executed normally.
Take the following corrective action.

Phenomenon	Cause	Corrective action
Communication fails when using the FA transparent function.	[UDP] is not available in the open settings of the built-in Ethernet port PLC.	Add [UDP] to the PLC side open settings.
	When the multi-channel Ethernet connection is used, [TCP] and [UDP] are used to the same IP address, and then the FA transparent function is used for the channel set to [TCP].	Execute the FA transparent function for the channel set to [UDP].

Point

Changing the host station on the GOT
[Host] can be changed with the utility function of the GOT.
For details on the setting method, refer to the following manual.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

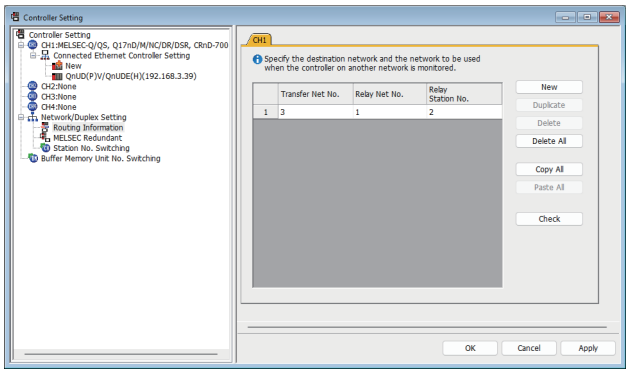
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC-Q/L Ethernet Interface Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 410 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.10.4 PLC side settings

	CR800-Q (Q172DSRCPU)	☞ Page 412 Connection to Ethernet module (MELSEC-Q series)

Precautions

Do not set a remote password on the QCPU (Q mode).
Doing so disables monitoring with the GOT.

Connection to Ethernet module (MELSEC-Q series)

This section describes the settings of the GOT and the Ethernet module (MELSEC-Q series) in the system configuration shown below.

Point

• Ethernet module (MELSEC-Q series)

For details on the Ethernet module (MELSEC-Q series), refer to the following manual.

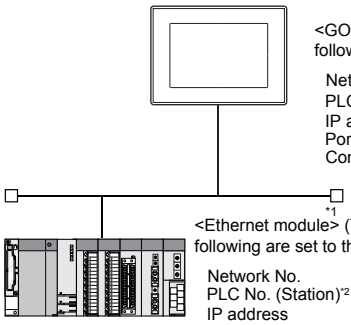
📖Q Corresponding Ethernet Interface Module User's Manual (Basic)

• Connecting multiple GOTs

When connecting two or more GOTs in the Ethernet network, set each [GOT Station] to the GOT.

☞ Page 403 When connecting multiple GOTs

■System configuration



<GOT> (The settings other than the following are set to the default)

Network No. (GOT Net No.)*2 : 1
PLC No. (GOT Station)*2 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP (fixed)

*1

<Ethernet module> (The settings other than the following are set to the default)

Network No. : 1
PLC No. (Station)*2 : 2
IP address : 192.168.3.19
Port No. : 5001
Communication format : UDP(fixed)

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

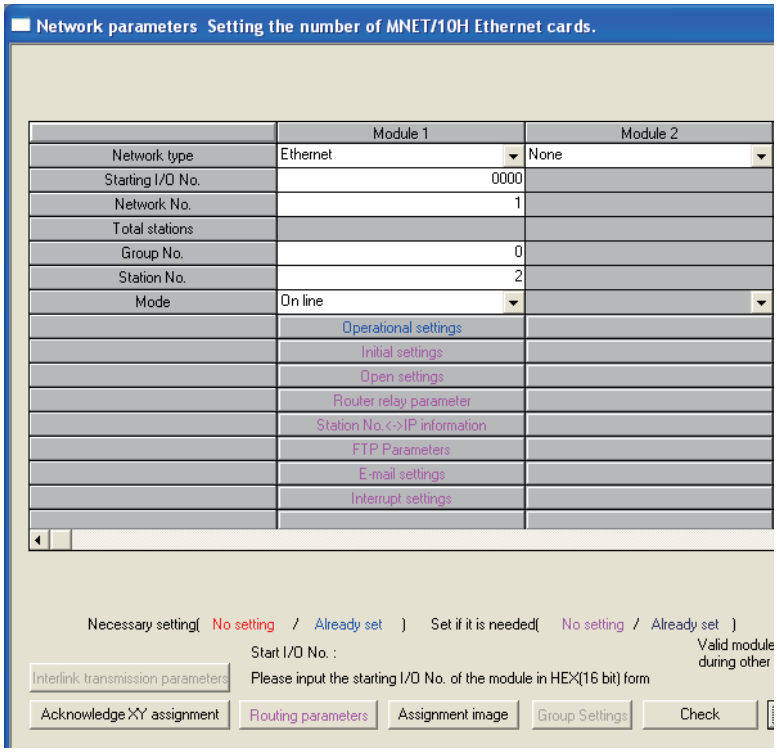
Point

When connecting to Q170MCPU

For connection to Q170MCPU, the start I/O number of the Ethernet module is set to 70.

■[Network parameter] of GX Developer

• Network parameter



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Network Type]	Ethernet	○
[Starting I/O No.]*1	0000H	○
[Network No.]*2	1	○
[Group No.]	0	○
[Station No.]*3	2	○

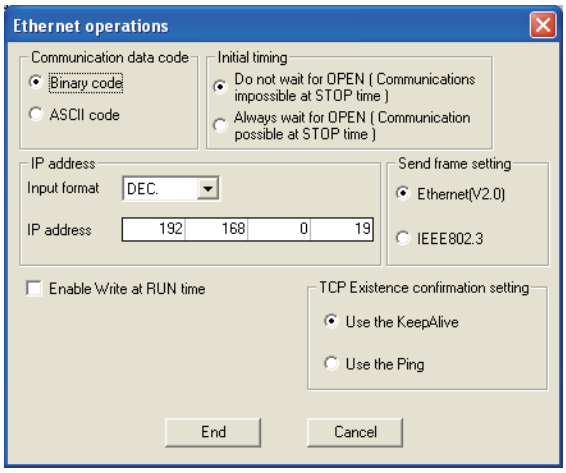
[Router relay parameter]		—
[Station No.<->IP information]		—
[FTP Parameters]		—
[E-mail settings]		—
[Interrupt settings]		—
[Redundant settings]*4		△
[Routing parameters]	☞ • Routing parameters	△

*1 When using Q170MCPU or Q170MSCPU(-S1), set the start I/O No. to 0070H.
*2 Set the same network number as that of the GOT.
*3 Do not set the same station No. as that of the GOT.
*4 Set when using Ethernet module in a redundant QnPRHCPU system.

• Operation settings



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Communication Data Code]*1	(Use default value)	—
[IP address]	192.168.3.19	○
[Initial timing]*1	(Use default value)	—
[Send frame setting]		—
[Enable Write at RUN time]*1		—
[TCP Existence confirmation setting]		—

*1 Because port number 5001 is fixed, the GOT operates as follows regardless of this setting.
• [Communication Data Code]: [Binary Code]
• [Initial timing]: [Always wait for OPEN (Communication possible at STOP time)] (Communications are possible while the PLC CPU is stopped.)
• [Enable Write at RUN time]: Enable write at RUN time (Data can be written while the PLC CPU is running.)

Point

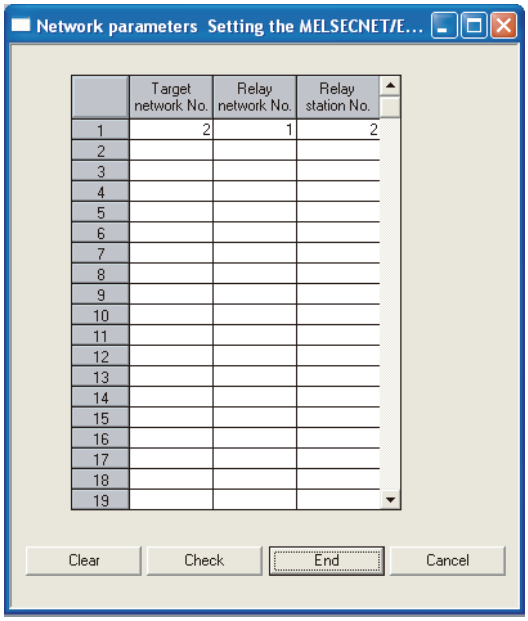
When changing the network parameter
After writing network parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• Routing parameters

Up to 64 network numbers can be set for [Target network No.].

However, the same number cannot be set in [Target network No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Target network No.].



Item	Range
[Target network No.]	[1] to [239]
[Relay network No.]	[1] to [239]
[Relay station No.]	[0] to [64]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

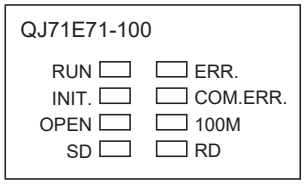
☞ Page 409 [Controller Setting]

• Communication confirmation

The INIT.LED on the Ethernet module turns on when the module is ready to communicate.

For checking the communication status, refer to the following.

☞ Page 417 Checking the communication status of the Ethernet module



*1

*1 The LED indications shown in the figure are for the QJ71E71-100.

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 399 GOT side settings

• Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1
	[Station No.]	2
	[Unit Type]	QJ71E71
	[IP Address]	192.168.3.19
	[Port No.]*1	5001
	[Communication]*1	UDP

*1 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5002
[Communication]: TCP

■Checking the communication status of the Ethernet module

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.19

Reply from 192.168.3.19:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.19

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Mounting condition of the Ethernet module

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

Ethernet diagnostics of GX Developer

The Ethernet diagnostics of GX Developer enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Developer, refer to the following manual.

User's manual of the Ethernet module used

Connection to NZ2GF-ETB

This section describes the settings of the GOT, CC-Link IE Field Network Ethernet adapter module (NZ2GF-ETB), and PLC in the system configuration shown below.

Point

• CC-Link IE Field Network Ethernet adapter module (NZ2GF-ETB)

For details on the CC-Link IE Field Network Ethernet adapter module (NZ2GF-ETB), refer to the following.

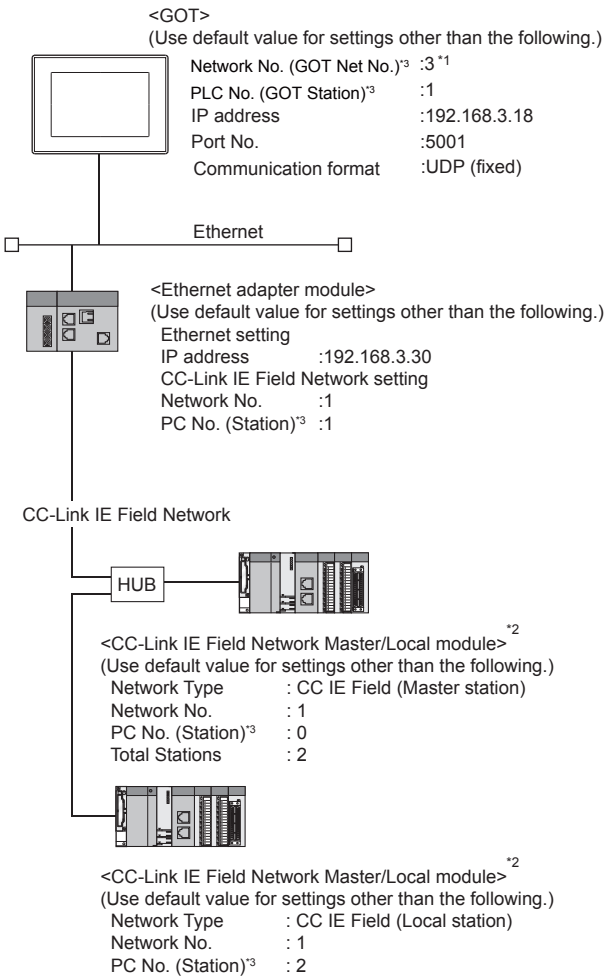
Manual of the CC-Link IE Field Network Ethernet adapter module

• Connecting multiple GOTs

When connecting two or more GOTs in the Ethernet network, set each [GOT Station] to the GOT.

Page 403 When connecting multiple GOTs

■System configuration



*1 Apply the third octet (network number) of the Ethernet adapter module's IP address to the GOT network number.

*2 The CC-Link IE Field Network Master/Local module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Field Network master/local module is set to 0.

*3 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

■GX Works2 network parameter Ethernet, CC IE, MELSECNET

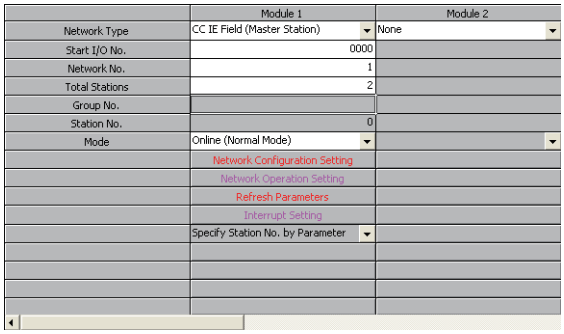
For details on the settings of the PLC, refer to the following manual.

MELSEC-Q CC-Link IE Field Network Master/Local Module User's Manual

- Settings of network type, network number, and total number of stations

Ex.

Master station settings



Item	Setting value	
	Master station	Local station
[Network Type]	CC IE Field (Master station)	CC IE Field (Local station)
[Network No.]	1	1
[Total Stations]	2	—
[Station No.]	0	2

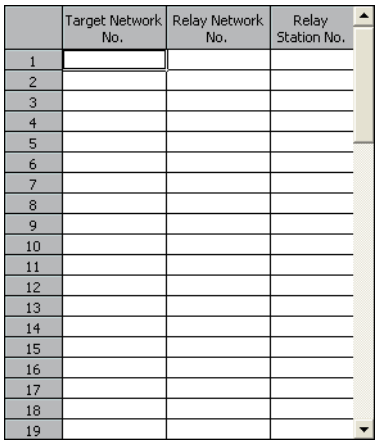
- Routing parameter settings

Set the following as necessary.

Up to 64 network numbers can be set for [Target Network No.].

However, the same number cannot be set in [Transfer Network No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Target Network No.].



Item	Range
[Target Network No.]	[1] to [239]
[Relay Network No.]	[1] to [239]
[Relay Station No.]	[0] to [64]

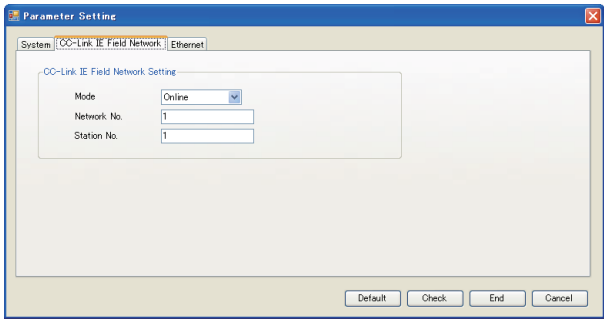
■Ethernet Adapter Module setting

Set the parameter with the Ethernet adapter module setting tool.

For details on the setting method, refer to the following manual.

📖CC-Link IE Field Network Ethernet Adapter Module User's Manual

- CC-Link IE Field Network setting

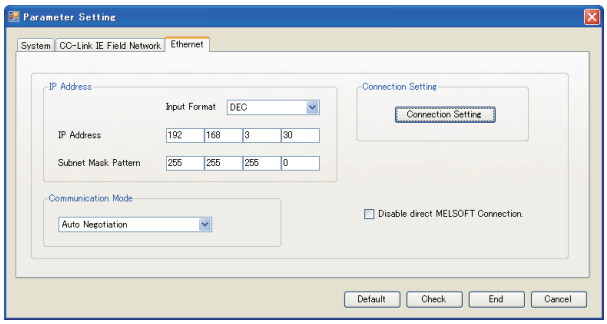


Item	Setting value
[Network No.]	1*1
[Station No.]	1*2

*1 Set the same value as the network number set on the PLC side.

*2 Set a value other than the network No. set on the PLC side.

- Ethernet settings



Item	Setting value
[IP Address]	192.168.3.30*1

*1 Set [IP Address] within the following ranges.

192.168.3.30

Set the fourth octet within the range from 1 to 64.

Set the third octet within the range from 1 to 239.

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 399 GOT side settings

• Controller settings

Item	Setting value
[GOT Net No.]	3*1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

*1 Apply the third octet (network number) of the Ethernet adapter module's IP address to [GOT Net No.].

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	3*1
	[Station]	30*2
	[Unit Type]	NZ2GF-ETB
	[IP Address]	192.168.3.30*3
	[Port No.]*4	5001
	[Communication]*4	UDP

*1 Apply the third octet (network number) of the Ethernet adapter module's IP address.
*2 Apply the fourth octet (PLC number) of the Ethernet adapter module's IP address.
*3 Set according to the Ethernet adapter module IP address.
*4 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5002
[Communication]: TCP

• Routing parameter settings

Item	Setting value
[Target network No.]	1*1
[Relay network No.]	3*2
[Relay Station No.]	30*3

*1 Set the same value as the network number of the Ethernet adapter module.
*2 Apply the third octet (network number) of the Ethernet adapter module's IP address.
*3 Apply the fourth octet (PLC number) of the Ethernet adapter module's IP address.

4.10.5 Access range for monitoring

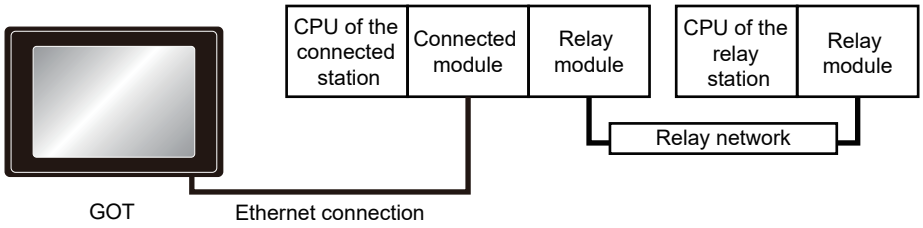
When the GOT is connected to the CPU of the station connected via Ethernet, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station								
		Relay network	CPU of the relay station							
			RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
QnUCPU QnUDCPU QnUDHCPU QnUDECPU QnUDEHCPU QnUDVCPU	☞ Page 392 Connectable devices	Ethernet	—	○	○*3	○	—	○	—	—
		CC-Link IE Controller Network	—	—	○	○	—	—	—	—
		CC-Link IE Field Network	—	○	○*1	○	—	—	—	—
		MELSECNET/H, MELSECNET/10	—	—	○	○	○	○	○*2	—
QnJCPU QnCPU QnHCPU QnPHCPU QnPRHCPU	☞ Page 392 Connectable devices	Ethernet	—	○	○*3	○	—	○	—	—
		CC-Link IE Controller Network	—	—	○	○	—	—	—	—
		MELSECNET/H, MELSECNET/10	—	—	○	○	○	○	○*2	—
NZ2GF-ETB	☞ Page 392 Connectable devices	CC-Link IE Field Network	—	—	○*1	—	—	—	—	—
QJ72LP25-25 QJ72LP25G	☞ Page 392 Connectable devices	MELSECNET/H, MELSECNET/10	—	—	○	—	—	—	—	—

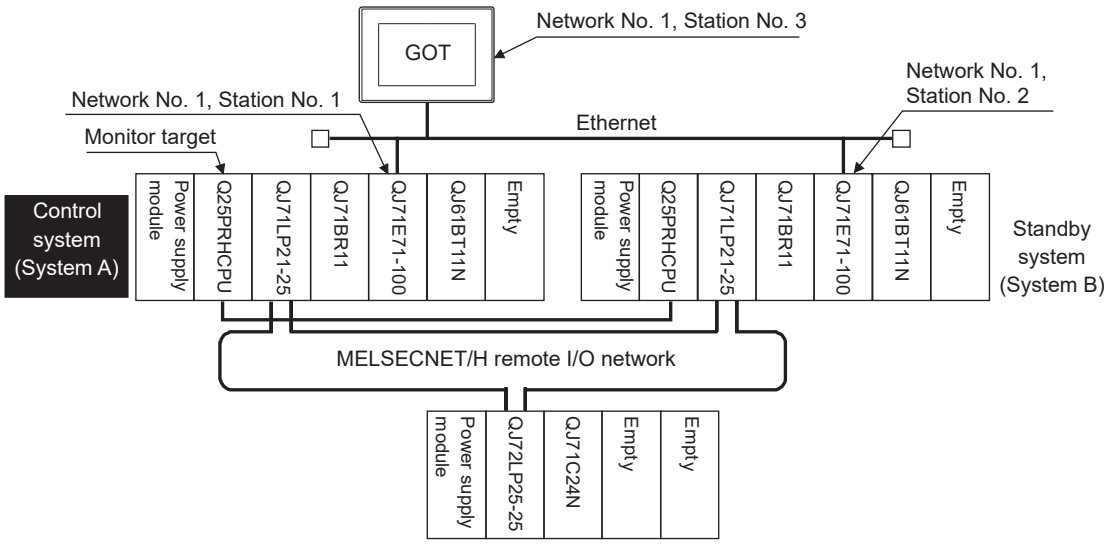
*1 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*2 AnUCPU and AnUSCPU are supported.

*3 The C Controller module (MELSEC-Q series) is not supported.

4.10.6 How to monitor a redundant system

This section explains the Ethernet connection that connects the GOT to the Ethernet network system.
The following shows an example of connecting the GOT to the Ethernet network.



Connection method

Connect the Ethernet network system and the GOT.
Configure the Ethernet module settings (network number, station number, and IP address, and others) for the Ethernet modules of systems A and B on the GOT side.
For details, refer to the following.
☞ Page 391 MELSEC-Q series (Ethernet module connection)

Settings in GT Designer3

Set GT Designer3 as follows.

Setting item	Setting details		Model
[Controller Type]	MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	Host (The control system is monitored.)	
	[Other]	[Network No.]: Network number of Ethernet	
		[Station No.]: Station number of the control system	
MELSEC redundant settings	☞ Page 432 MELSEC redundant settings		

To specify the station number which was set for the MELSEC redundant settings in the device settings, set the station number as the other station.

Monitoring target change when system switching occurs in a redundant system

When system switching occurs, the Ethernet module station No. 2 continues to control the Ethernet network system as the control system.

Since the GOT monitors the control system, he monitoring target is automatically changed to the Ethernet module station No. 2.

Point

When monitoring control system without MELSEC redundant settings

When system switching occurs, the Ethernet module station No. 2 continues to control the Ethernet network system as the control system.

Since the GOT monitors the station of the specified station number, the monitoring target cannot be changed to the station No. 2 in response to the system switching.

As a countermeasure, create a screen to monitor the PLC CPU of the control system by switching the station numbers between System A and System B using the script function.

☞ Page 425 Switch the Monitor Target to the Control System Using the Script Function

Switch the Monitor Target to the Control System Using the Script Function

This section describes how to create a script screen to automatically change the monitoring target (station number) at the occurrence of system switching even if the MELSEC redundant settings are not configured.

The script executes the station No. switching function or screen switching function.

The following shows the advantages and disadvantages of the station number switching function and screen switching function.

Function	Advantage	Disadvantage
Station No. switching function	The monitor screens for Station No. 1 (control system) and Station No. 2 (standby system) can be created on one screen.	Some objects do not allow the station number to be switched.
Screen switching function	All objects can be used since monitor screens are created for each station number.	Monitor screens must be created separately for Station No. 1 (control system) and Station No. 2 (standby system).

The following explains how to use each function.

■Method for using the station No. switching function

As a feature of this function, monitor screens for Station No. 1 (control system) and Station No. 2 (standby system) can be created on one screen.

If the system switching occurs, the GOT can change the monitoring target to the control system PLC CPU on the same monitor screen.

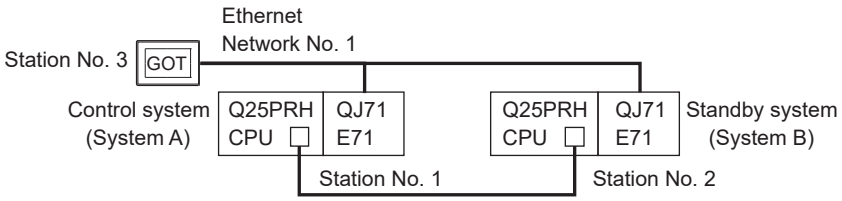
To achieve this, the script of the GOT monitors the special relay SM1515 (Control system identification flag) of the PLC CPU and stores the station number of the latest control system into the station number switching device.

Restrictions: Some objects do not allow the station number to be switched.

GT Designer3 (GOT3000) Screen Design Manual

- Setting procedure

System configuration example



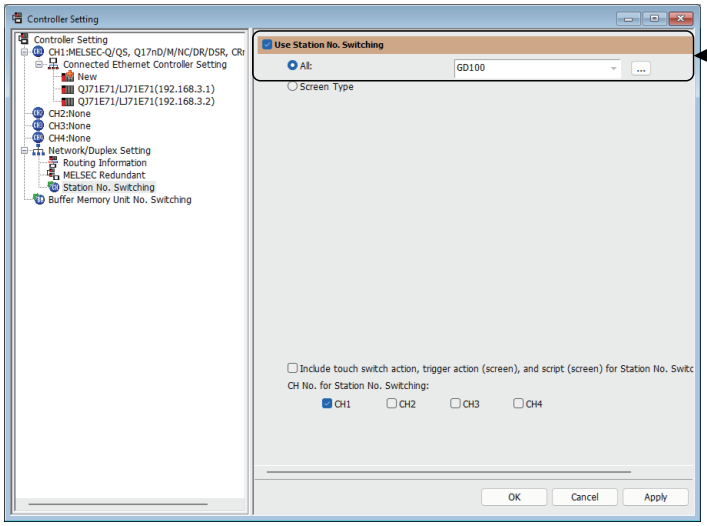
Connected module	Network number	Station No.
Ethernet module of control system	1	1
Ethernet module of standby system		2
GOT connected to the Ethernet network		3

1. Set the station number switching device.

Select [Common] → [Controller Setting] → [Station No. switching] → [All], and set the internal device GD100 as the station number switching device.

Do not use a PLC CPU device as a screen switching device.

Since the device information is transferred by the tracking transfer function of the redundant system, the trigger action may be disabled.



Set here.

2. Set the trigger action.

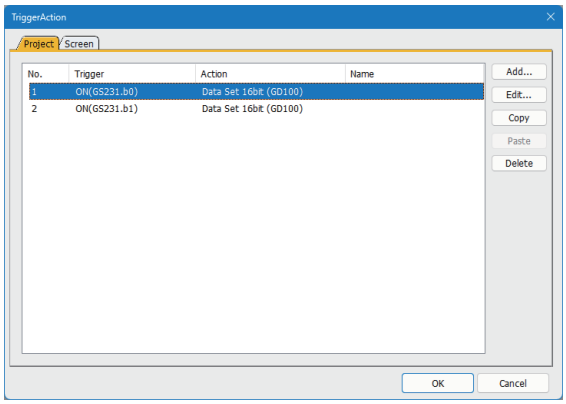
Select [Common] → [Trigger Action] and configure the settings to switch the station number when the faulty station information (GS231) from the station monitoring turns on.

For network number 1 and station number 2, set 258 (0102H).

Condition 1	: GS231.b0 (while ON)	← When b0 is ON, Station No. 1 is abnormal.
Operation	: GD100=258(0102H)	← Station No. is changed to 2.

Condition 1	: GS231.b1 (while ON)	← When b1 is ON, Station No. 2 is abnormal.
Operation	: GD100=257(0101H)	← Station No. is changed to 1.

Create the trigger action in the project on the Project tab.



Point

Setting for the trigger action function

For the trigger action function, hexadecimals cannot be used.

To use the trigger action function, set the N/W No. and the station No. of the PLC CPU in [Unsigned BIN]. (For the trigger action function, set [Unsigned BIN] for [Storing Device])

The following shows a setting example.

- For network number 1 and station number 1 (0101H), set 257.
- For network number 10 and station number 10 (0A0AH), set 2570.

3. Create a monitor screen.

In the device setting (network setting) of each object, set network number 1 and station number 1 of the control system.

4. On the screen 1, set the switch for writing the station No. 1 to the station number switching device.

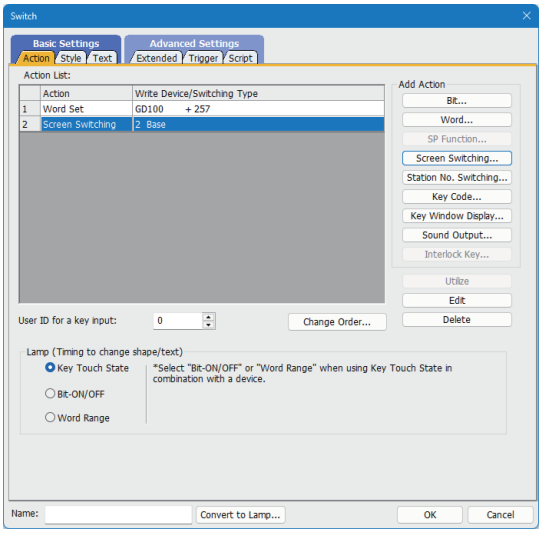
After the GOT is started up, the station number switching device value of the GOT is 0.

For Ethernet connection, the monitor becomes abnormal when the station number switching device value is "0".

Therefore, set the switch for writing the station number to the station number switching device and the switch for shifting to the monitor screen on the screen 1.

To make this setting, select [Object] → [Switch] → [Bit Switch].

The following shows an example of setting GD100=257 (0101H: Network No. 1, Station No. 1) and base screen=2 to one switch. (Base screen 2 is the actually monitoring screen)

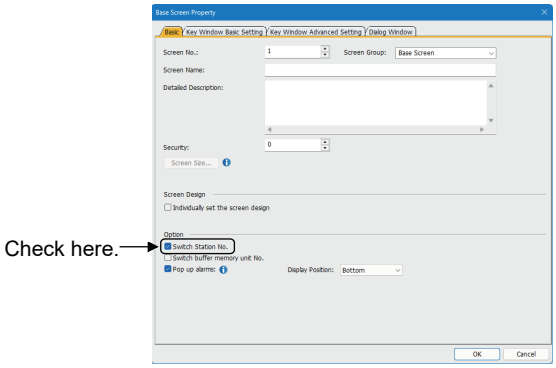


5. Validate the station No. switching function.

Select [Screen] → [Base Screen Property], and select [Switch Station No.] in the [Basic] tab to enable the station No. switching function.

Make this setting for each monitor screen.

However, do not make this setting on the screen 1 created in step 4.



6. Change the station number switching device value in the script.

Select [Common] → [Script] → [Script], and create a script of checking the SM1515 status of the current monitor station and changing the station number switching device if the status is OFF (standby system). You will create the script for each monitor screen.

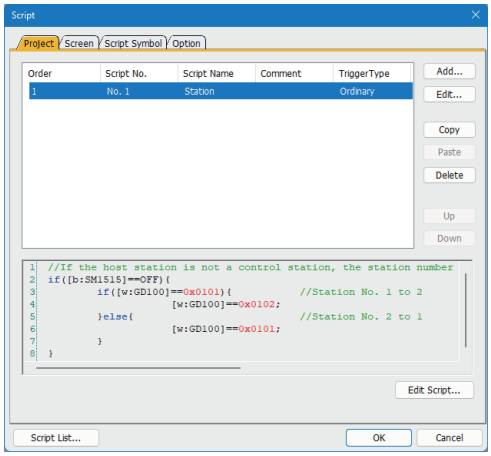
Set the trigger type of the script to [Ordinary] or [Sampling(about 3s)].

```
// If the host station is not a control station, the station number is switched to that of the other station.
if([b:SM1515]==OFF){
        if([w:GD100]==0x0101){                  // Station No. 1 to 2
                [w:GD100]=0x0102;
        }else{                                  // Station No. 2 to 1
                [w:GD100]=0x0101;
        }
}
```

Create a script so that the network number and station number are set to the station switching device.

If the network number is 1 and station number is 2, create a script as [w:GD100]=0x0102.

Set the created script for each screen on the Screen tab.



■Method for using the screen changing function

As a feature of this function, monitor screens are created for each station number. When the system switching occurs, the GOT can change the monitoring target to the control system PLC CPU on the other monitor screen.

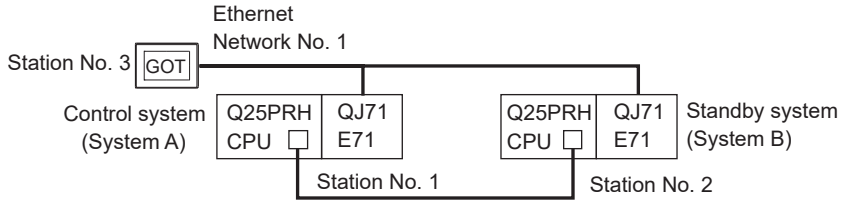
To achieve this, the script of the GOT monitors the special relay SM1515 (Control system identification flag) of the PLC CPU and stores the screen number corresponding to the latest station number of the control system into the screen switching devices.

There are the following 8 different screen switching devices. Set the screen switching devices for all screens to be used.

(1) Base screen switching device
(2) Overlap window 1 switching device
(3) Overlap window 2 switching device
(4) Overlap window 3 switching device
(5) Overlap window 4 switching device
(6) Overlap window 5 switching device
(7) Superimpose window 1 switching device
(8) Superimpose window 2 switching device

• Setting procedure

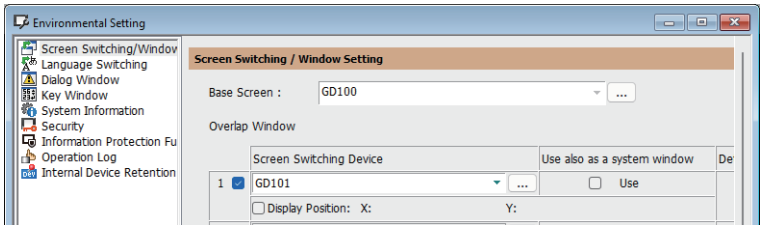
System configuration example



Connected module	Network number	Station No.
Ethernet module of control system	1	1
Ethernet module of standby system		2
GOT connected to the Ethernet network		3

1. Set the screen switching device of the base screen.

Select [Common] → [GOT Environmental Setting] → [Screen Switching/Window], and set the internal device GD100 as the base screen switching device.

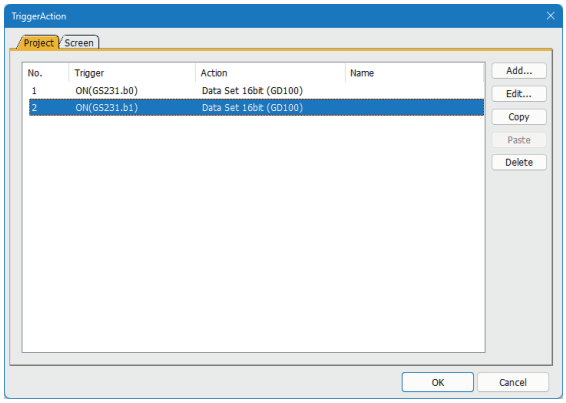


2. Set the trigger action.

Select [Common] → [Trigger Action] and configure the settings to switch the station number when the faulty station information (GS231) from the station monitoring turns on.

Condition 1	: GS231.b0 (while ON)	← When b0 is ON, Station No. 1 is abnormal.
Operation	: GD100=2	← Screen No. is changed to 2.

Condition 1	: GS231.b1 (while ON)	← When b1 is ON, Station No. 2 is abnormal.
Operation	: GD100=1	← Screen No. is changed to 1.



3. Set a monitor screen.

- Create a monitor screen with objects whose network settings set to station No. 1 on screen No. 1 (1-1).
- Create a monitor screen with objects whose network settings set to station No. 2 on screen No. 2 (1-2).

4. Change the screen switching device value in the script.

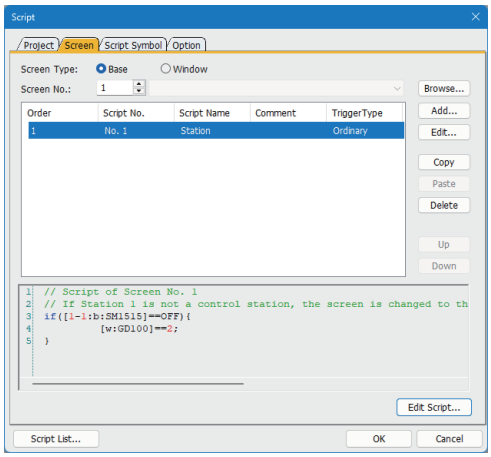
By selecting [Common] → [Script] → [Script], create a script for each monitor screen that checks the SM1515 status of the current monitor station, and if it is OFF (standby system), changes the station number switching device value.

Set the trigger type of the script to [Ordinary] or [Sampling(about 3s)].

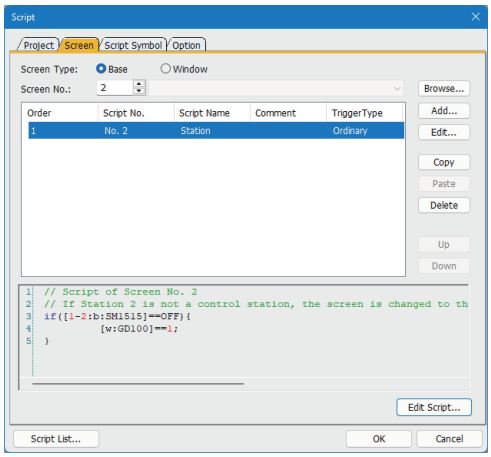
```
// Script of Screen No. 1
// If Station 1 is not a control station, the screen is changed to that of Station 2.
if([1-1:b:SM1515]==OFF){
[w:GD100]=2;
}
```

```
// Script of Screen No. 2
// If Station 2 is not a control station, the screen is changed to that of Station 1.
if([1-2:b:SM1515]==OFF){
[w:GD100]=1;
}
```

- Script screen of screen No. 1



- Script screen of screen No. 2



MELSEC redundant settings

This section describes the settings for the GOT to automatically change the monitoring target of the QCPU redundant system.

Point

Before configuring the MELSEC redundant settings

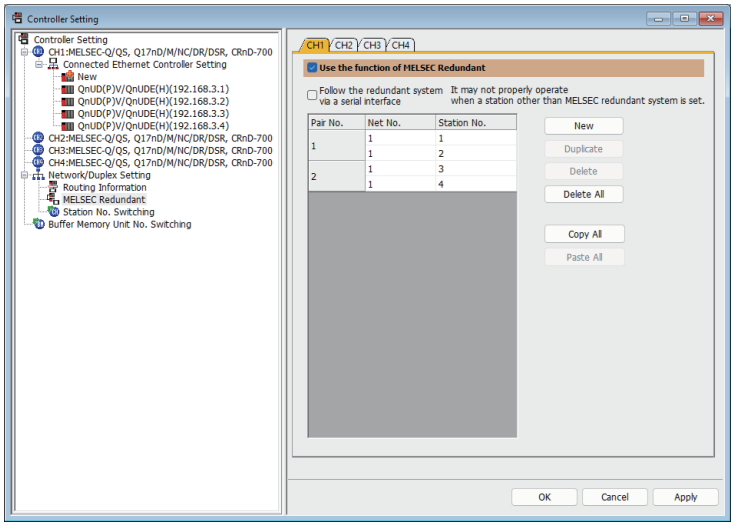
In the MELSEC redundant settings, do not set a station outside the redundant QCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC redundant setting dialog, settings can be made for each channel of the controller.

The following shows an example of redundant CPU pair numbers 1 to 2, network number 1, and redundant CPU station numbers 1 to 4 for the Ethernet connection (station number 5).

Ex.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Copies one setting of the selected pair number and adds it below the bottom row.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 433 Pair number

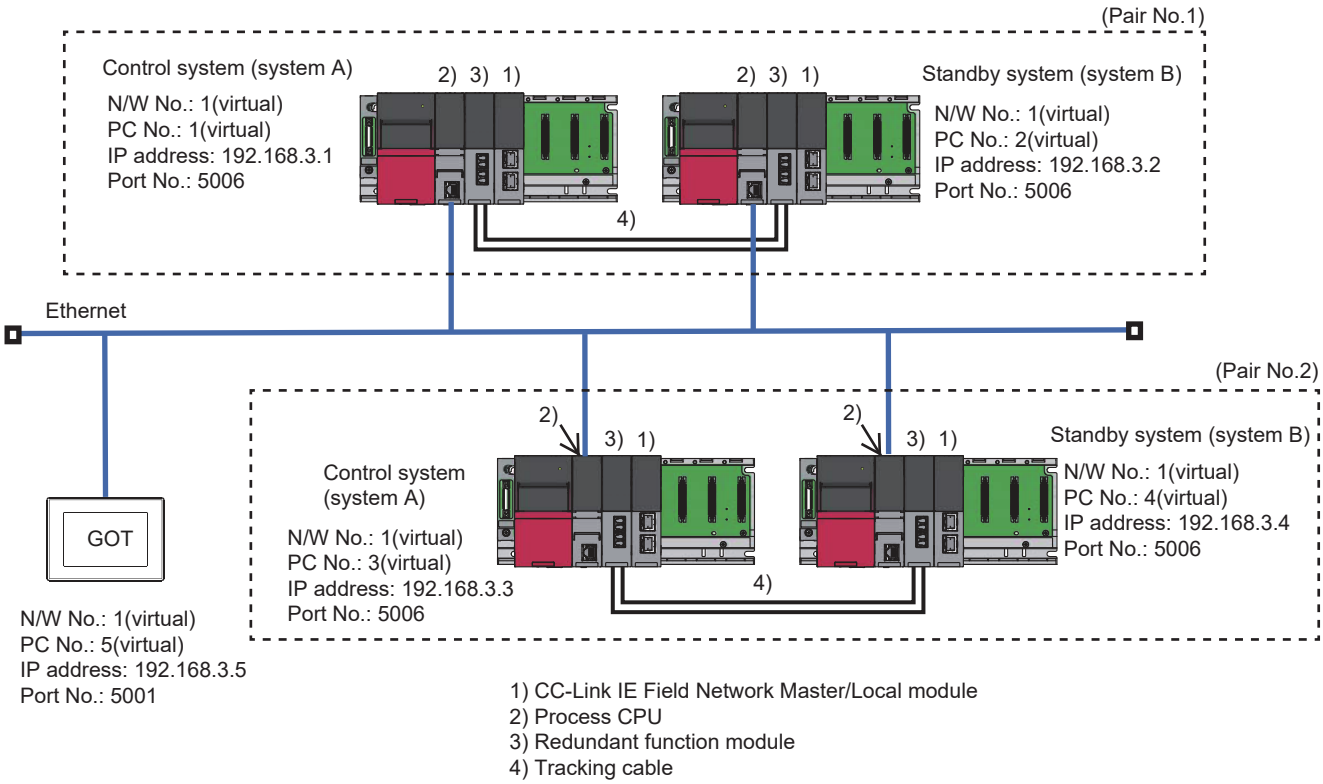
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of Ethernet connection in the RCPU redundant system. (Pair No. 1 to No. 2)

Ex.



Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- Pairing of the last station No. and station No. 1 (Example: Station No. 64 and station No. 1) is not allowed.
- Make sure that the QCPU in the station for which MELSEC redundant settings are configured is a redundant CPU. If any of the QCPUs to which the MELSEC redundant settings are configured is not a redundant CPU, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the operation mode of the QCPU redundant system, and does not support the debug mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

• 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

[450: Path has changed or timeout occurred in redundant system.] appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, [451: The MELSEC redundant setting and actual system configuration do not match.] appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings. If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm [315 Device writing error. Correct device.] is not detected.

■Connection to the remote I/O station

• The GOT can monitor only the following GOT functions.

Monitor function and device monitor function

• The GOT does not allow the PLC CPU clock of the master station to be set in the clock setting of the utility.

The master station clock will not change even if the clock setting is made.

Use GX Works2 or similar software to set the PLC CPU clock of the master station.

■Option functions including the ladder monitor

A message "Unable to communicate with CPU." is displayed when system switching occurs while an option function such as the ladder monitor is used.

■When the QCPU redundant system is in the debug mode

When the QCPU redundant system is in the debug mode, do not configure the MELSEC redundant system settings on the GOT side when connecting the GOT.

4.11 MELSEC-L series (Built-in Ethernet port connection)

☞ Page 436 Connectable devices
☞ Page 437 System configuration
☞ Page 440 GOT side settings
☞ Page 451 PLC side settings
☞ Page 460 Access range for monitoring

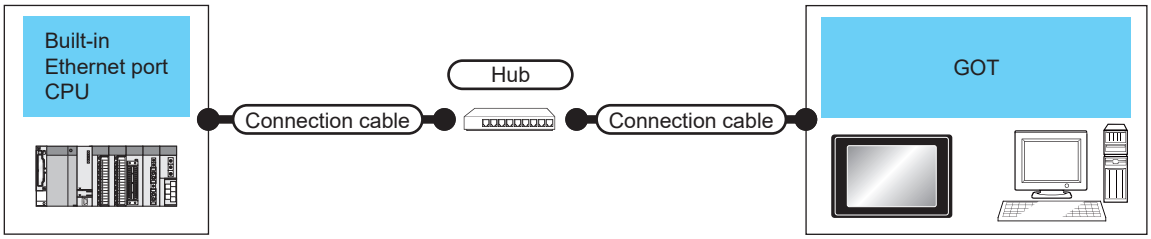
4.11.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC-L series	L02CPU L06CPU L26CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT	○	GT37 SoftGOT3000

4.11.2 System configuration



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 438 Connection cable

☞ Page 438 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 438 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	Model
MELSEC-L*1*2	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
		Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the built-in Ethernet port CPU, refer to the manual of the PLC to be used.

*2 For [Unit Type] to be selected in [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 448 [Connected Ethernet Controller Setting]

PART 3

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP		
MELSEC-L	16 (UDP and TCP in total)		GT37 SoftGOT3000	63 (16 or less recommended)
	16	16	GT37 SoftGOT3000	63 (16 or less recommended)

Connection to the built-in Ethernet port of the built-in Ethernet port CPU

Connect the GOT after turning on the network equipment such as the built-in Ethernet port CPU or hub to enable communications.

If the GOT cannot communicate with the built-in Ethernet port CPU, a communication error may occur on the GOT.

GOT startup for connection to LCPU

LCPU may diagnose the SD card (file system check, recovery processing, etc.) when the LCPU is turned off then on or reset. Therefore, it takes time until the SD card becomes available.

If the GOT is started during this time, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

4.11.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

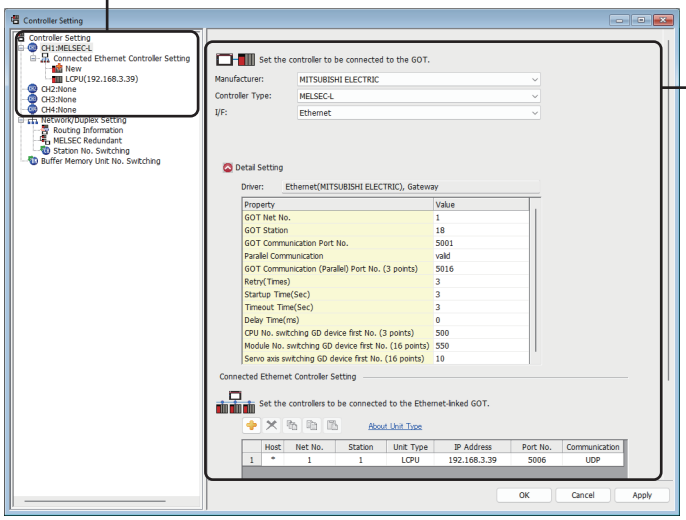
The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.

List menu



3.

Operating procedure

1. Select [Common] → [Controller Setting] from the menu.

2. In the [Controller Setting] window, select the channel number to be used from the list menu.

3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-L]
[I/F]	[Ethernet]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 442 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 448 [Connected Ethernet Controller Setting]

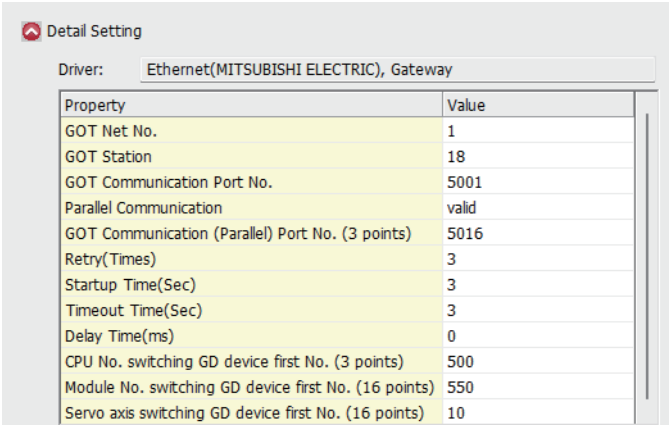
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station][*1][*2]	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.][*3]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 445 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 446 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 447 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 448 [Connected Ethernet Controller Setting]
*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.
*3 For connection to the LCPU, do not set [5009] for the GOT communication port number.
Doing so disables communications.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

PART 3

■When connecting multiple GOTs

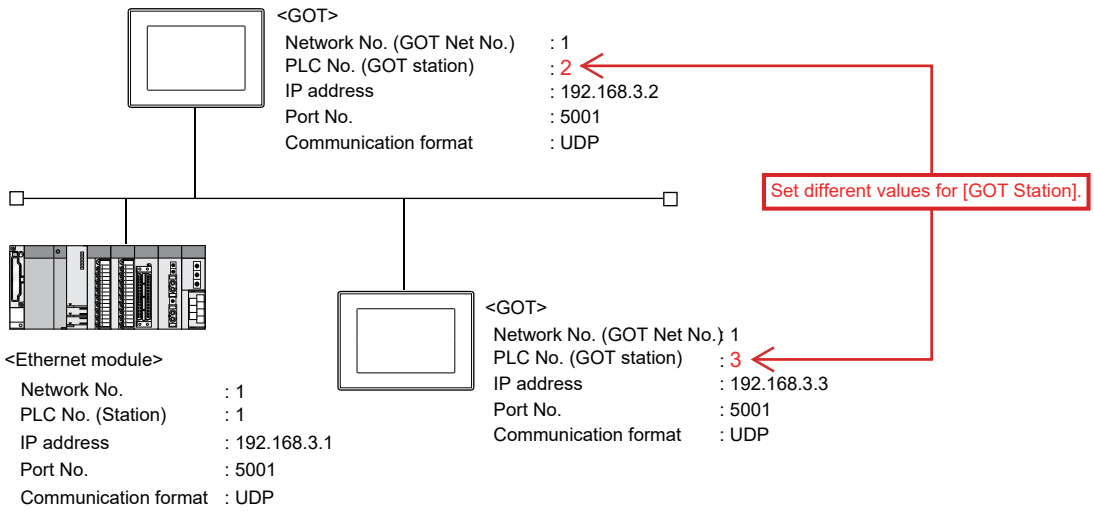
• Settings for [GOT Station]

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 442 [Detail Setting]

The following shows a system configuration example.

Ex.



• Settings to start up multiple GOTs simultaneously

When connecting multiple GOTs to one built-in Ethernet port CPU, adjust the timing of GOT communication start.

When the communication concentrates on the PLC, the communication between GOT and PLC becomes difficult, and the monitoring by GOT may not start.

As a method for adjusting the timing, communicating one GOT alone first, and then communicating the other GOTs is effective.

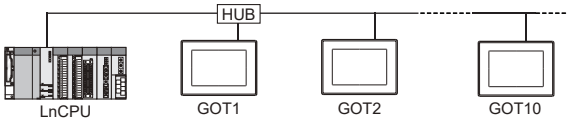
Set the following items on each GOT.

[Startup Time] in [Detail Setting] or [Title Display Time] of [GOT Setup]

[Timeout Time] in [Detail Setting]

The following shows a setting example.

Ex.



Item	GOT1	GOT2	GOT10
Startup time	3 s (default)	4 s	4 s
Timeout time	3 s (default)	4 s	4 s

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

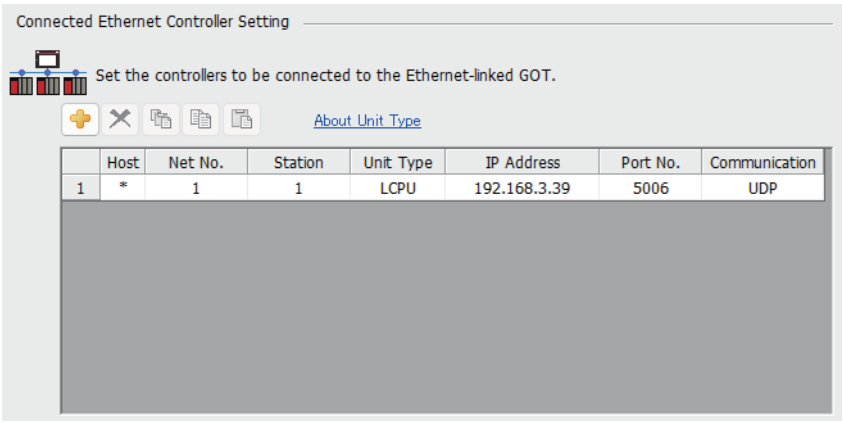
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	[1] to [64]
[Unit Type]	Select the model of the connected Ethernet equipment.	[LCPU]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 448 [Port No.]
[Communication]	Set the communication format of the connected Ethernet equipment.	[UDP], [TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].
☞ Page 442 [Detail Setting]

■[Port No.]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[LCPU]	[5006]	[UDP]
	[5007]	[TCP]

■Network number and PLC number of LCPU

There is no setting for the network number and PLC number of built-in Ethernet port CPU (Port number: 5006, 5007).
The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

■Connection to the built-in Ethernet port PLC with [Communication] set to [TCP]

During communication with the built-in Ethernet port PLC with [Communication] set to [TCP], using the FA transparent function may change the setting from [TCP] to [UDP] and start communication with the PLC with the new setting.
In this case, communication with the built-in Ethernet port PLC cannot be executed normally.
Take the following corrective action.

Phenomenon	Cause	Corrective action
Communication fails when using the FA transparent function.	[UDP] is not available in the open settings of the built-in Ethernet port PLC.	Add [UDP] to the PLC side open settings.
	When the multi-channel Ethernet connection is used, [TCP] and [UDP] are used to the same IP address, and then the FA transparent function is used for the channel set to [TCP].	Execute the FA transparent function for the channel set to [UDP].

Point

Changing the host station on the GOT
[Host] can be changed with the utility function of the GOT.
For details on the setting method, refer to the following manual.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

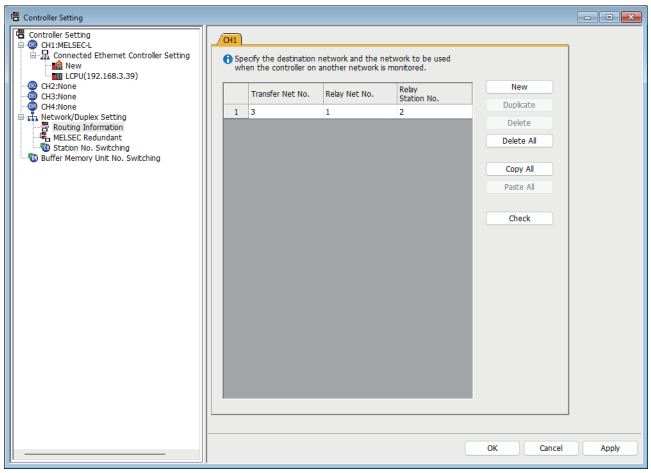
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC-Q/L Ethernet Interface Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]*1	[1] to [239]
[Relay Station No.]*1	[0] to [120]

*1 To access a different network via the built-in Ethernet port CPU, set the values of [Net No.] and [Station] that are set in [Connected Ethernet Controller Setting] in GT Designer3.

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

Page 451 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.11.4 PLC side settings

Model		Reference
MELSEC-L series	L02CPU L06CPU L26CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT	☞ Page 452 Connection to the built-in Ethernet port CPU of the MELSEC-L series

Precautions

Do not set a remote password on the LCPU.
Doing so disables monitoring with the GOT.

Connection to the built-in Ethernet port CPU of the MELSEC-L series

This section describes the settings of the GOT and the built-in Ethernet port CPU in the system configuration shown below.

☞ Page 452 One-to-one connection
☞ Page 456 Multi-connection

Point

• Built-in Ethernet port CPU

For details on the built-in Ethernet port CPU, refer to the following manual.

📖MELSEC-L CPU Module User's Manual (Built-In Ethernet Function)

• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 444 When connecting multiple GOTs

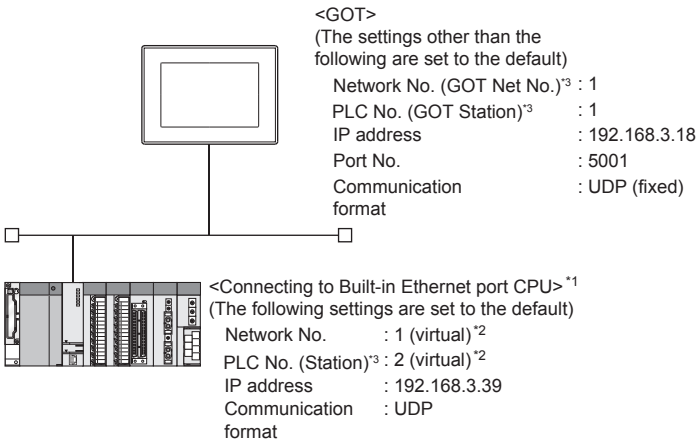
■One-to-one connection

• System configuration

For one-to-one connection, no settings are required on the PLC side.

Set [Port No.] to [5006] and [Communication] to [UDP] to communicate with the PLC.

Configure the settings in [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, and then connect the built-in Ethernet port CPU and the GOT.



*1 For the settings when using system devices such as a hub, refer to the following.
☞ Page 456 Multi-connection

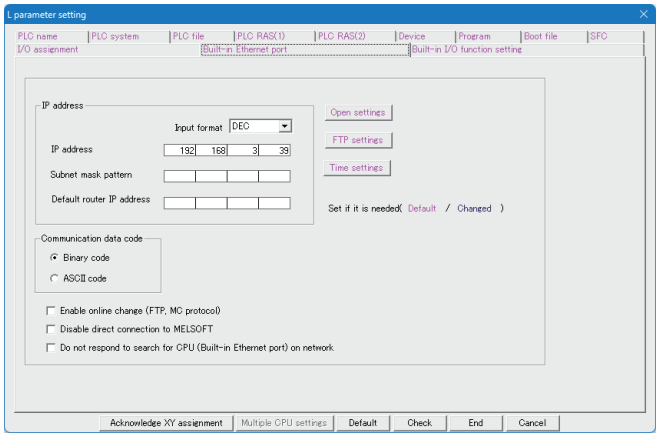
*2 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*3 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

• [PLC parameter] of GX Developer

[Built-in Ethernet Port Setting]



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection

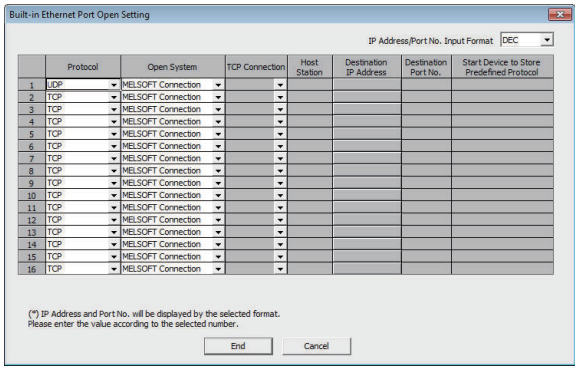
Open settings

Configure the settings for all the connected GOTs.



Item	Setting value
[Protocol]	UDP, TCP
[Open System]	MELSOFT connection

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 440 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to the Built-in Ethernet port LCPU

The setting items for the network number and station number do not exist on the PLC side.

Set the network number and station number on the GOT side.

When doing so, set a network number not used in the system.

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1*1
	[Station]	2*2
	[Unit Type]	LCPU
	[IP Address]	192.168.3.39
	[Port No.]*3	5006
	[Communication]*3	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number.

*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5007
[Communication]: TCP

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.39

Reply from 192.168.3.39:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.39

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works2

The Ethernet diagnostics of GX Works2 enables ping tests from the PLC.

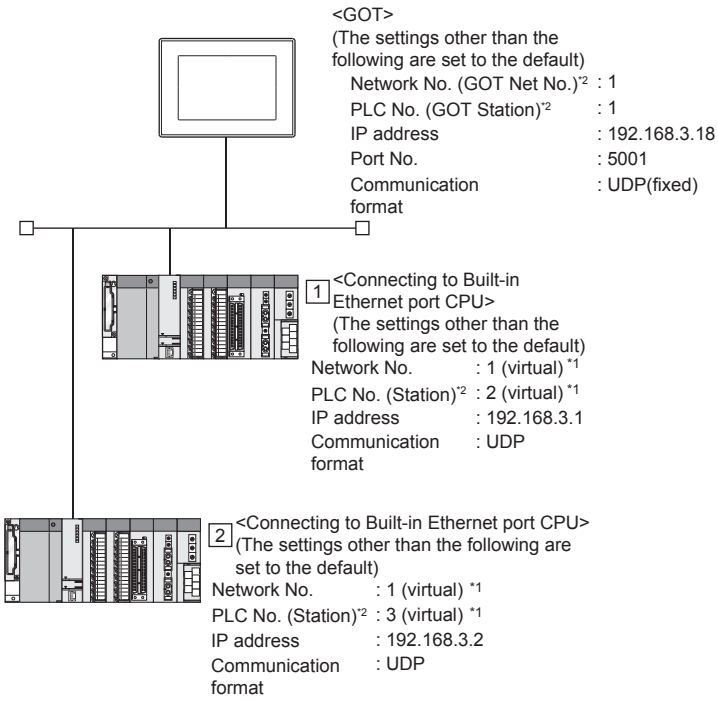
For details on the Ethernet diagnostics of GX Works2, refer to the following manual.

MELSEC-L CPU Module User's Manual (Hardware Design, Maintenance and Inspection)

■Multi-connection

• System configuration

Set [Port No.] to [5006] and [Communication] to [UDP] to communicate with the PLC.



*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.

☞ • [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station No.]	[GOT Station]	[Station No.]

• [PLC parameter] of GX Developer

• [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 440 GOT side settings

Point

[Connected Ethernet Controller Setting] for connection to the built-in Ethernet port CPU

The setting items for the network number and station number do not exist on the PLC side.

Set the network number and station number on the GOT side.

When doing so, set a network number not used in the system.

Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

Connected Ethernet controller settings

Item		Setting value	
		1	2
Ethernet setting No. 1	[Host]	*	—
	[Net No.]	1*1	1*1
	[Station]	2*2	3*2
	[Unit Type]	LCPU	LCPU
	[IP Address]	192.168.3.1	192.168.3.2
	[Port No.]*3	5006	5006
	[Communication]*3	UDP	UDP

*1 Set the same value as the GOT net number.

*2 Set a value different from the GOT station number and PLC numbers of other PLCs on the same network.

*3 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5007
[Communication]: TCP

• Checking the communication state of the built-in Ethernet port CPU

When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.1

Reply from 192.168.3.1:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.1

Request timed out.

In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the built-in Ethernet port CPU specified by the ping command

Point

Ethernet diagnostics of GX Works2

The Ethernet diagnostics of GX Works2 enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works2, refer to the following manual.

MELSEC-L CPU Module User's Manual (Hardware Design, Maintenance and Inspection)

4.11.5 Access range for monitoring

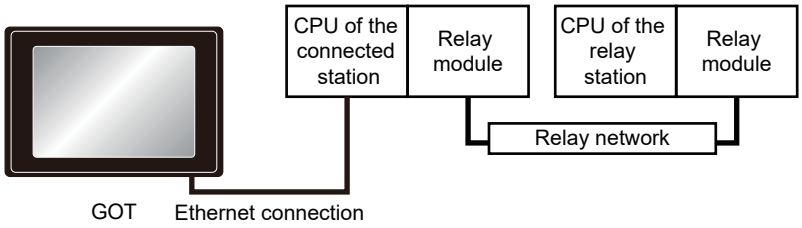
When the GOT is connected to the CPU of the station connected via Ethernet, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station							
	Relay network	CPU of the relay station						
		RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
LCPU	Ethernet	—	○	○*2	○	—	○	—	—
	CC-Link IE Field Network	—	○	○*1	○	—	—	—	—

*1 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*2 The C Controller module (MELSEC-Q series) is not supported.

4.12 MELSEC-L series (Ethernet module connection)

☞ Page 461 Connectable devices
☞ Page 462 System configuration
☞ Page 464 GOT side settings
☞ Page 473 PLC side settings
☞ Page 479 Access range for monitoring

4.12.1 Connectable devices

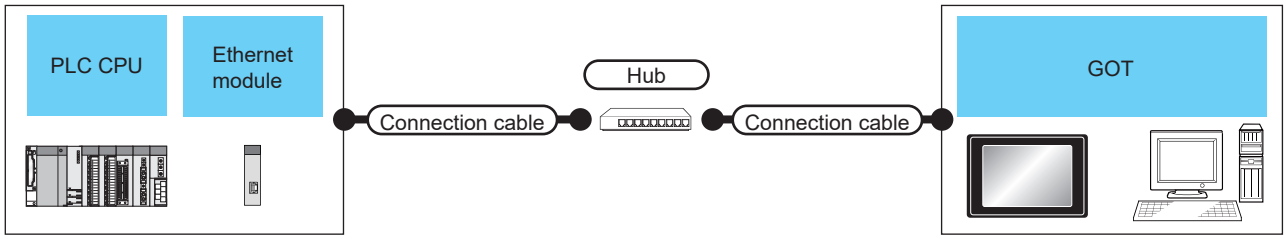
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Ethernet module	Connectable model
MELSEC-L series	L02CPU L06CPU L26CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT	○	LJ71E71-100	GT37 SoftGOT3000
	L02SCPU*1 L02SCPU-P*1	○	LJ71E71-100	GT37 SoftGOT3000

*1 Use a module having a serial number stating with 12042 or later in the first 5 digits.

4.12.2 System configuration



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 463 Connection cable

☞ Page 463 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 463 Maximum number of connected devices

Controller	Ethernet module*1*2	Connection cable	GOT	
			Interface	Model
MELSEC-L	LJ71E71-100	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the Ethernet module, refer to the following manual.
MELSEC-L Ethernet Interface Module User's Manual (Basic)

*2 Select [LJ71E71] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 471 [Connected Ethernet Controller Setting]

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one Ethernet module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC-L	LJ71E71-100	63	17	GT37 SoftGOT3000	63 (16 or less recommended)

GOT startup for connection to LCPU

LCPU may diagnose the SD card (file system check, recovery processing, etc.) when the LCPU is turned off then on or reset. Therefore, it takes time until the SD card becomes available.

If the GOT is started during this time, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

4.12.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

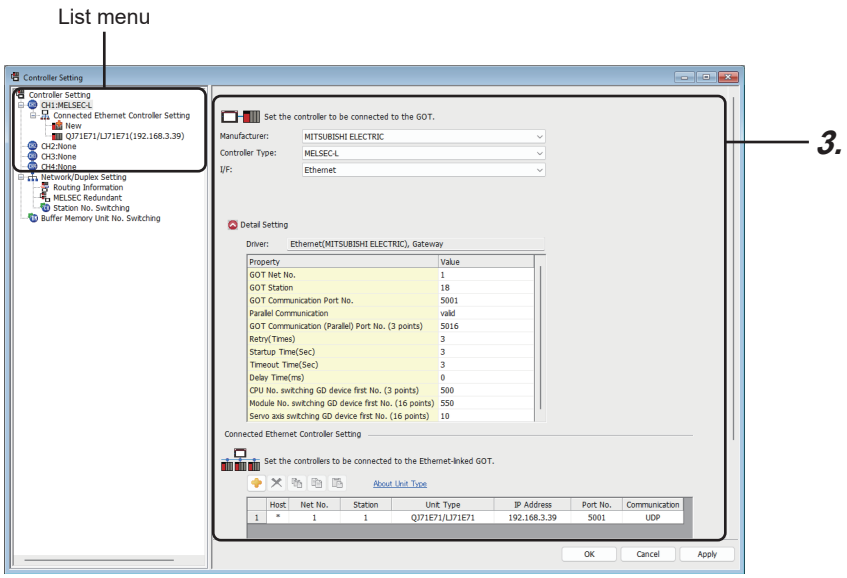
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-L]
[I/F]	[Ethernet]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 466 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 471 [Connected Ethernet Controller Setting]

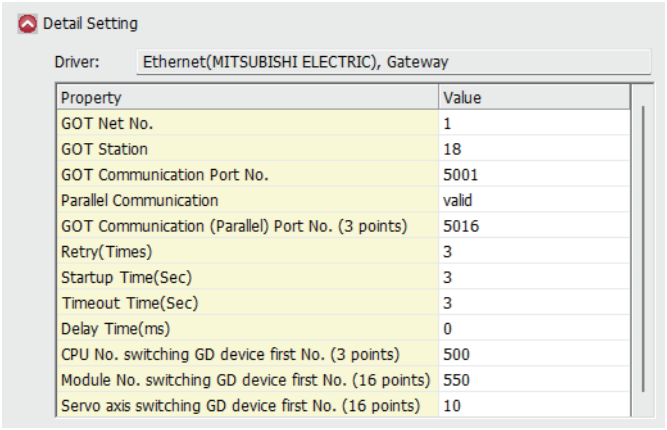
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station][*1][*2]	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.][*3]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 468 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 469 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 470 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 471 [Connected Ethernet Controller Setting]
*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.
*3 For connection to the LCPU, do not set [5009] for the GOT communication port number.
Doing so disables communications.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

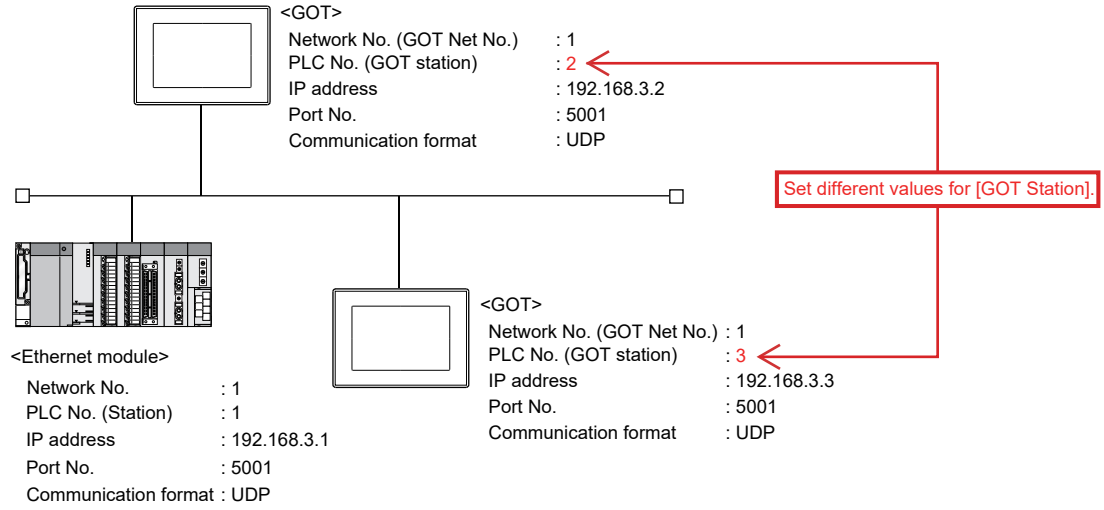
■When connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 466 [Detail Setting]

The following shows a system configuration example.

Ex.



■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

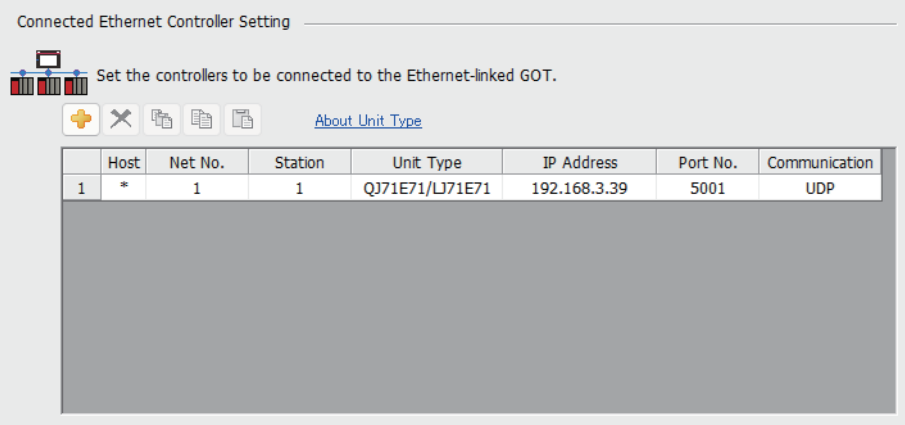
• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	[1] to [64]
[Unit Type]	Select the model of the connected Ethernet equipment.	[QJ71E71/LJ71E71]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 471 [Port No.]
[Communication]	Set the communication format of the connected Ethernet equipment.	[UDP], [TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].

☞ Page 466 [Detail Setting]

■[Port No.]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[QJ71E71/LJ71E71]	[5001]	[UDP]
	[5002]	[TCP]

Point

Changing the host station on the GOT

[Host] can be changed with the utility function of the GOT.

For details on the setting method, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

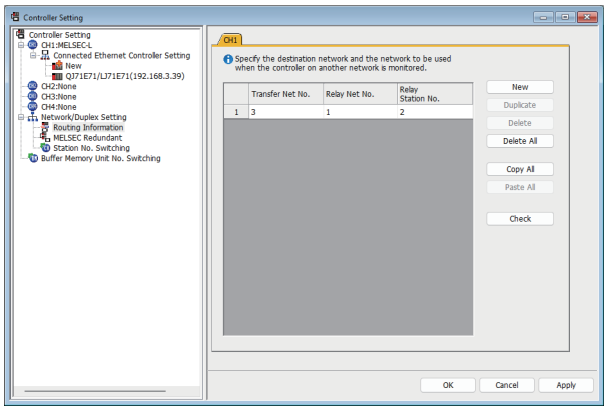
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC-Q/L Ethernet Interface Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 473 PLC side settings

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.12.4 PLC side settings

Model		Reference
MELSEC-L series	L02CPU L06CPU L26CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT L02SCPU L02SCPU-P	☞ Page 473 Connection to Ethernet module (MELSEC-L series)

Precautions

Do not set a remote password on the LCPU.
Doing so disables monitoring with the GOT.

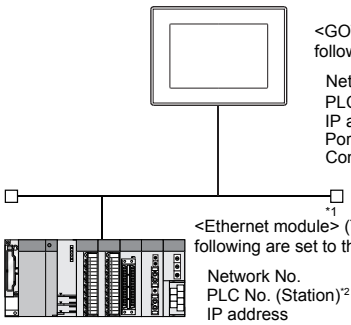
Connection to Ethernet module (MELSEC-L series)

This section describes the settings of the GOT and the Ethernet module (MELSEC-L series) in the system configuration shown below.

Point

• Ethernet module (MELSEC-L series)
For details on the Ethernet module (MELSEC-L series), refer to the following manual.
📖MELSEC-L Ethernet Interface Module User's Manual (Basic)
• Connecting multiple GOTs
When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.
☞ Page 467 When connecting multiple GOTs

■System configuration



<GOT> (The settings other than the following are set to the default)
Network No. (GOT Net No.)*2 : 1
PLC No. (GOT Station)*2 : 1
IP address : 192.168.3.18
Port No. : 5001
Communication format : UDP (fixed)

*1

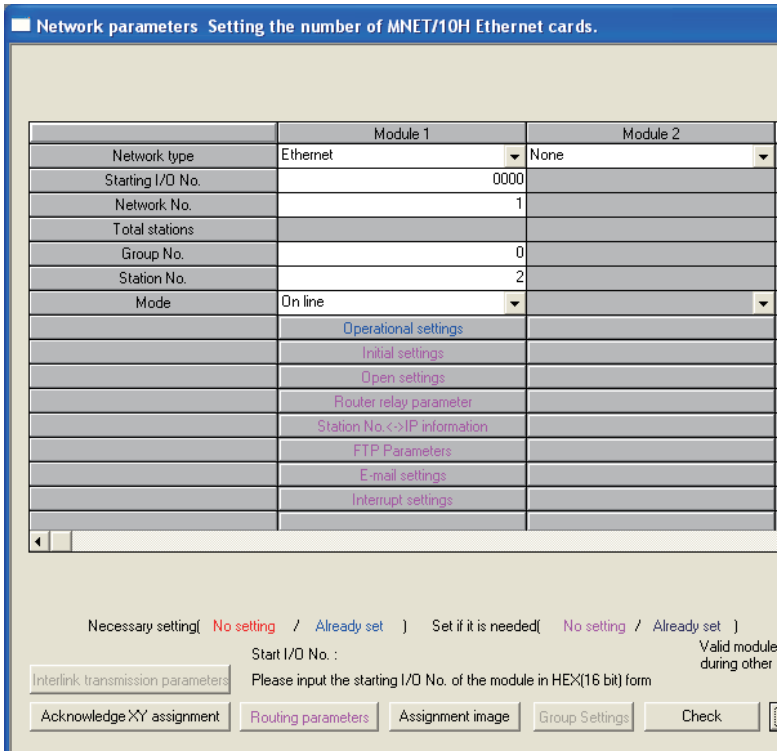
<Ethernet module> (The settings other than the following are set to the default)
Network No. : 1
PLC No. (Station)*2 : 2
IP address : 192.168.3.19
Port No. : 5001
Communication format : UDP(fixed)

*1 The Ethernet module is mounted on the base unit slot 0.
The start I/O number of the Ethernet module is set to 0.
*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

■[Network parameter] of GX Developer

• Network parameter



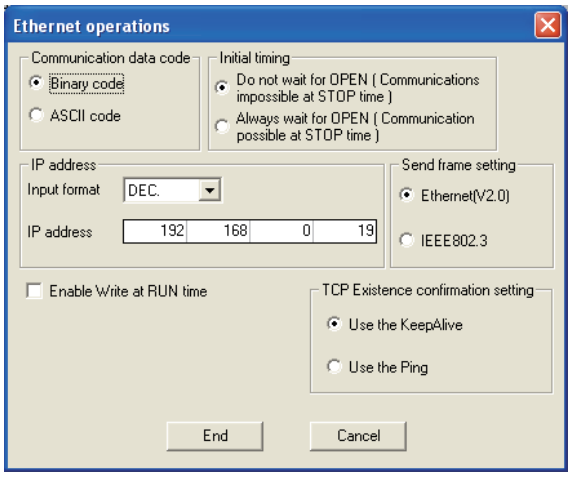
○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Network Type]	Ethernet	○
[Starting I/O No.]	0000H	○
[Network No.]*1	1	○
[Group No.]	0	○
[Station No.]*2	2	○
[Mode]	Online	○
[Operation setting]	☞ • Operation settings	○
[Initial settings]	(Use default value)	△
[Open settings]		—
[Router relay parameter]		—
[Station No.<->IP information]		—
[FTP Parameters]		—
[E-mail settings]		—
[Interrupt settings]		—

*1 Set the same network number as that of the GOT.

*2 Do not set the same station No. as that of the GOT.

• Operation settings



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Communication Data Code]*1	(Use default value)	—
[IP address]	192.168.3.19	○
[Initial timing]*1	(Use default value)	—
[Send frame setting]		—
[Enable Write at RUN time]*1		—
[TCP Existence confirmation setting]		—

*1 Because port number 5001 is fixed, the GOT operates as follows regardless of this setting.
- Communication date code: [Binary code]
- Initial timing: [Always wait for OPEN] (Communications are possible while the PLC CPU is stopped.)
- Enable Write at RUN time: [Enable Write at RUN time] (Data can be written while the PLC CPU is running.)

Point

When changing the network parameter

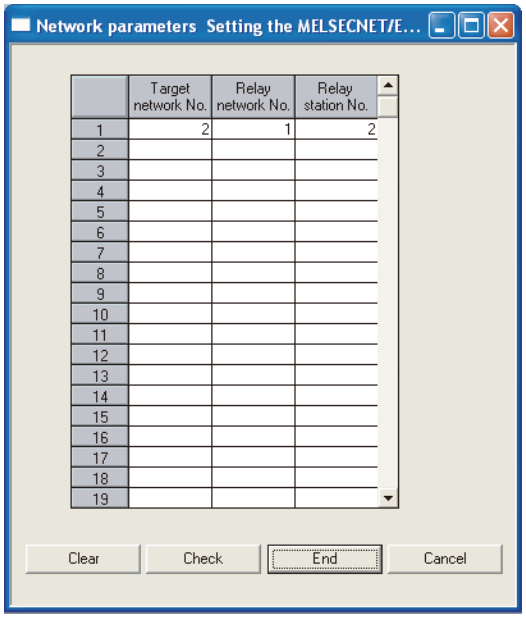
After writing network parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• Routing parameters

Up to 64 network numbers can be set for [Target network No.].

However, the same destination network number cannot be set twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Target network No.].



Item	Range
[Target network No.]	[1] to [239]
[Relay network No.]	[1] to [239]
[Relay station No.]	[0] to [64]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

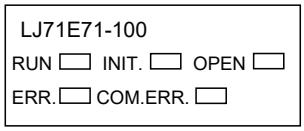
☞ Page 472 Routing parameter settings

• Communication confirmation

The INIT.LED on the Ethernet module turns on when the module is ready to communicate.

For checking the communication status, refer to the following.

☞ Page 478 Checking the communication status of the Ethernet module



*1

*1 The LED indications shown in the figure are for the LJ71E71-100.

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 464 GOT side settings

• Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5001
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1
	[Station No.]	2
	[Unit Type]	QJ71E71/LJ71E71
	[IP Address]	192.168.3.19
	[Port No.]*1	5001
	[Communication]*1	UDP

*1 The following settings can also be configured for [Port No.] and [Communication].
[Port No.]: 5002
[Communication]: TCP

■Checking the communication status of the Ethernet module

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.19

Reply from 192.168.3.19:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.19

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Mounting condition of the Ethernet module

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

Ethernet diagnostics of GX Developer

The Ethernet diagnostics of GX Developer enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

User's manual of the Ethernet module used

4.12.5 Access range for monitoring

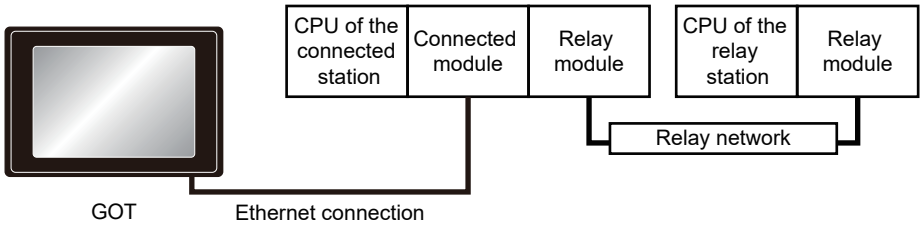
When the GOT is connected to the CPU of the station connected via Ethernet, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station								
		Relay network	CPU of the relay station							
			RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
LCPU	☞ Page 461 Connectable devices	Ethernet	—	○	○*2	○	—	○	—	—
		CC-Link IE Field Network	—	○	○*1	○	—	—	—	—
		SSCNETIII/H	—	—	○*3	—	—	—	—	—

*1 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*2 The C Controller module (MELSEC-Q series) is not supported.

*3 Only the C Controller module (MELSEC-Q series) is supported.

4.13 MELSEC-A series (Ethernet module connection)

☞ Page 481 Connectable devices
☞ Page 482 System configuration
☞ Page 485 GOT side settings
☞ Page 491 PLC side settings
☞ Page 499 Access range for monitoring

4.13.1 Connectable devices

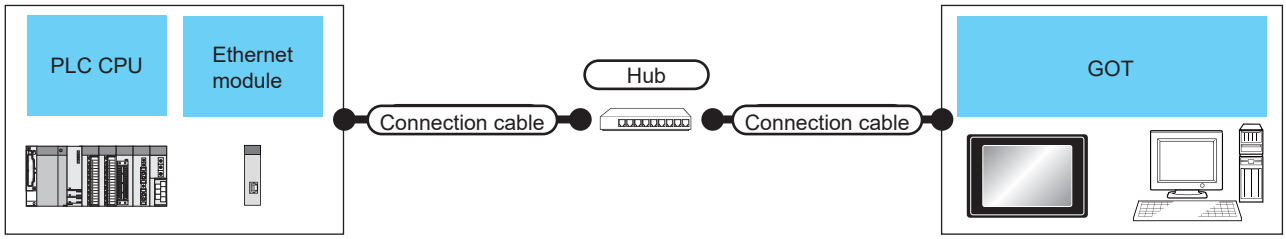
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Ethernet module	Connectable model
MELSEC-A (AnCPU)	A2UCPU A2UCPU-S1 A3UCPU A4UCPU A2ACPU A2ACPUP21 A2ACPUR21 A2ACPU-S1 A2ACPUP21-S1 A2ACPUR21-S1 A3ACPU A3ACPUP21 A3ACPUR21 A1NCPU A1NCPUP21 A1NCPUR21 A2NCPU A2NCPUP21 A2NCPUR21 A2NCPU-S1 A2NCPUP21-S1 A2NCPUR21-S1 A3NCPU A3NCPUP21 A3NCPUR21	○	AJ71E71N3-T AJ71E71N-B5 AJ71E71N-B2 AJ71E71N-T AJ71E71N-B5T AJ71E71-S3	GT37 SoftGOT3000
MELSEC-A (AnSCPU)	A2USCPU A2USCPU-S1 A2USHCPU-S1 A1SCPU A1SCPUC24-R2 A1SHCPU A2SCPU A2SCPU-S1 A2SHCPU A2SHCPU-S1 A1SJCPU A1SJCPU-S3 A1SJHCPU	○	A1SJ71E71N3-T A1SJ71E71N-B5 A1SJ71E71N-B2 A1SJ71E71N-T A1SJ71E71N-B5T A1SJ71E71-B5-S3 A1SJ71E71-B2-S3	GT37 SoftGOT3000
MELSEC-A*1	A0J2HCPU A0J2HCPUP21 A0J2HCPUR21 A0J2HCPU-DC24	—	AJ71E71N3-T AJ71E71N-B5 AJ71E71N-B2 AJ71E71N-T AJ71E71N-B5T AJ71E71-S3	GT37 SoftGOT3000
Motion CPU (A series)	A273UCPU A273UHCPU A273UHCPU-S3 A373UCPU A373UCPU-S3	○	AJ71E71N3-T AJ71E71N-B5 AJ71E71N-B2 AJ71E71N-T AJ71E71N-B5T	GT37 SoftGOT3000
	A171SCPU A171SCPU-S3 A171SCPU-S3N A171SHCPU A171SHCPUN A172SHCPU A172SHCPUN A173UHCPU A173UHCPU-S1	○	A1SJ71E71N3-T A1SJ71E71N-B5 A1SJ71E71N-B2 A1SJ71E71N-T A1SJ71E71N-B5T	GT37 SoftGOT3000

*1 When GT SoftGOT3000 is connected, the monitoring range varies depending on the Ethernet module to be used. For details, refer to the following.
User's manual of the Ethernet module used

4.13.2 System configuration



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 483 Connection cable

☞ Page 483 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 484 Maximum number of connected devices

Controller	Ethernet module*1*2	Connection cable	GOT	
			Interface	Model
MELSEC-A (AnCPU) MELSEC-A	AJ71E71N3-T AJ71E71N-B5 AJ71E71N-B2 AJ71E71N-T AJ71E71N-B5T AJ71E71-S3	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000
MELSEC-A (AnSCPU)	A1SJ71E71N3-T A1SJ71E71N-B5 A1SJ71E71N-B2 A1SJ71E71N-T A1SJ71E71N-B5T A1SJ71E71-B5-S3 A1SJ71E71-B2-S3	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000
Motion CPU (A series) large type	AJ71E71N3-T AJ71E71N-B5 AJ71E71N-B2 AJ71E71N-T AJ71E71N-B5T	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000
Motion CPU (A series) small type	A1SJ71E71N3-T A1SJ71E71N-B5 A1SJ71E71N-B2 A1SJ71E71N-T A1SJ71E71N-B5T	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the Ethernet module, refer to the following manual.
For A Ethernet Interface Module User's Manual
*2 Select [AJ71E71] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
Page 489 [Connected Ethernet Controller Setting]

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.
Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.
Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.
When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.
The maximum length depends on the Ethernet equipment used.
The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs.
For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.
The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)
The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one Ethernet module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC-A series Motion CPU (A series)	AJ71E71N3-T AJ71E71N-B5 AJ71E71N-B2 AJ71E71N-T AJ71E71N-B5T AJ71E71-S3 A1SJ71E71N3-T A1SJ71E71N-B5 A1SJ71E71N-B2 A1SJ71E71N-T A1SJ71E71N-B5T A1SJ71E71-B5-S3 A1SJ71E71-B2-S3	8	—	GT37 SoftGOT3000	63 (4 or less recommended)

Communication using Ethernet module (A series)

When using an Ethernet module (A series), communication is available only in the same segment.
Communication via a router or the gateway is not available.

4.13.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

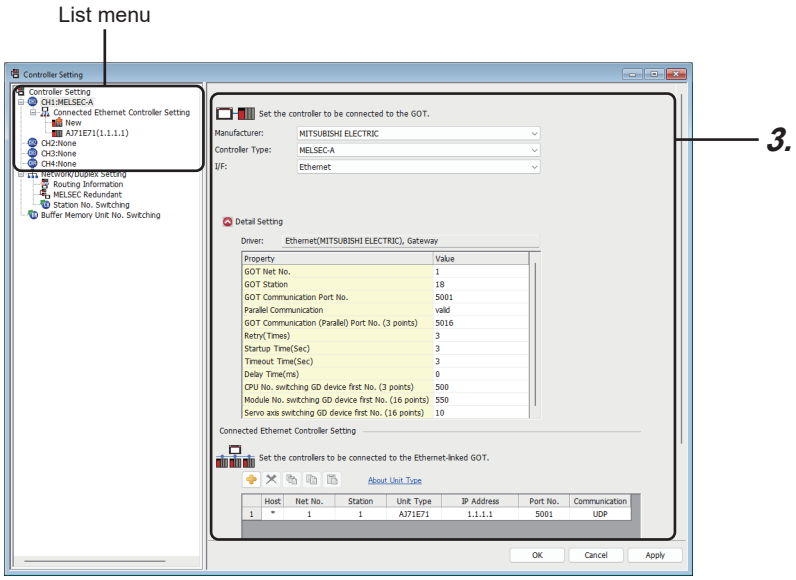
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-A]
[I/F]	[Ethernet]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 487 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 489 [Connected Ethernet Controller Setting]

4. When you have completed the settings, click the [OK] button.

Point

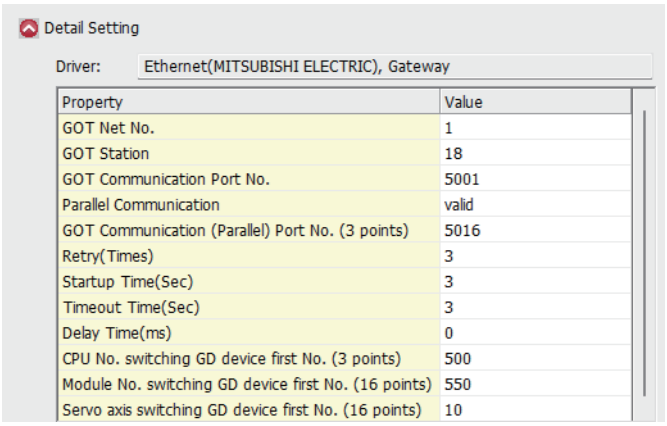
The controller settings can be checked in [I/F Communication Setting].

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Ethernet(MITSUBISHI ELECTRIC), Gateway]
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Parallel Communication]	Enables or disables the parallel communication. When this setting is enabled, [GOT Communication (Parallel) Port No. (3 points)] can be set. When communicating with multiple devices on a single channel, distributing the communication ports can reduce the communication load.	[valid], [invalid]
[GOT Communication (Parallel) Port No. (3 points)]	Set the GOT port number used for the parallel communication.	• [Parallel Communication] is [invalid]: [0] • [Parallel Communication] is [valid]: [1024] to [5008], [5014] to [49150], [49171] to [65532]
[Retry(Times)]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms
[CPU No. switching GD device first No. (3 points)]	The item is displayed but cannot be set.	—
[Module No. switching GD device first No. (16 points)]	The item is displayed but cannot be set.	—
[Servo axis switching GD device first No. (16 points)]	The item is displayed but cannot be set.	—

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 489 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

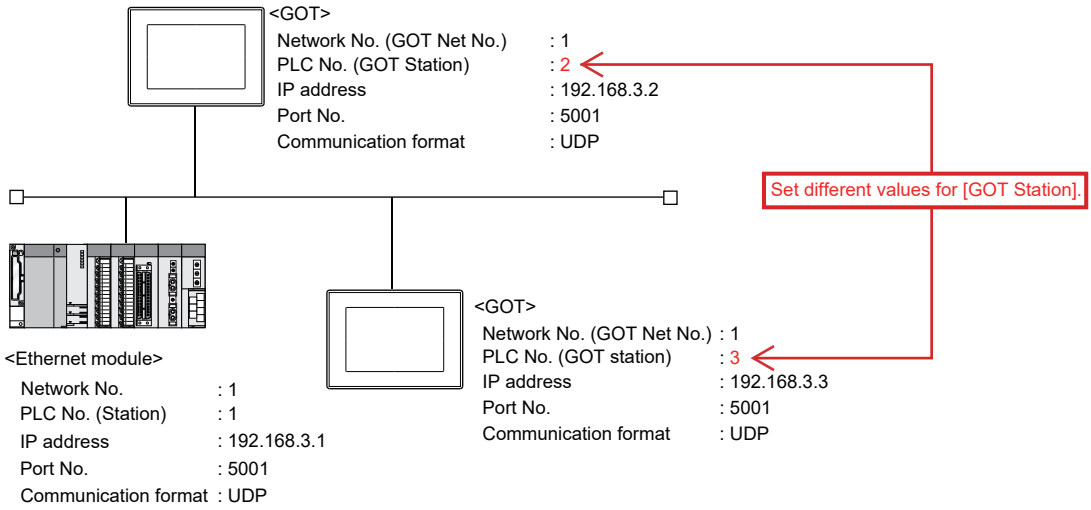
■When connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 487 [Detail Setting]

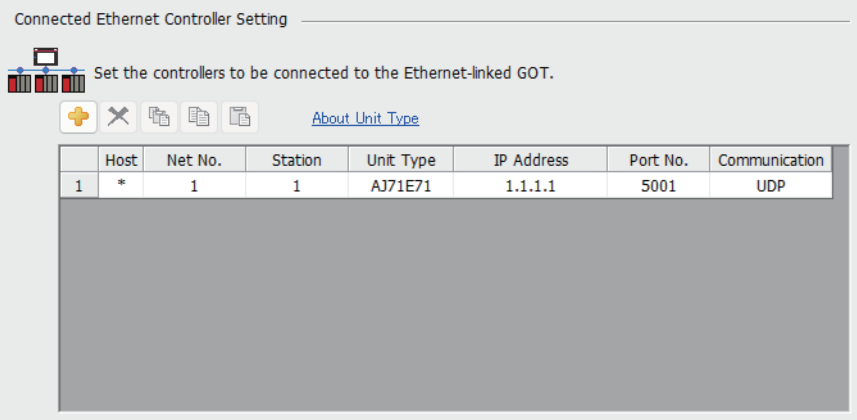
The following shows a system configuration example.

Ex.



■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	[1] to [64]
[Unit Type]	Select the model of the connected Ethernet equipment.	[AJ71E71]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	[1024] to [65535]
[Communication]	Set the communication format of the connected Ethernet equipment.	[UDP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].

☞ Page 487 [Detail Setting]

Point

Changing the host station on the GOT

[Host] can be changed with the utility function of the GOT.

For details on the setting method, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.
To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.
When the multi-channel connection can be used, set a different network number for each channel.

4.13.4 PLC side settings

Connection to Ethernet module (A series)

This section describes the settings of the GOT and the Ethernet module (A series) in the system configuration shown below.

Point

• Ethernet module (A series)

For details on the Ethernet module (A series), refer to the following manual.

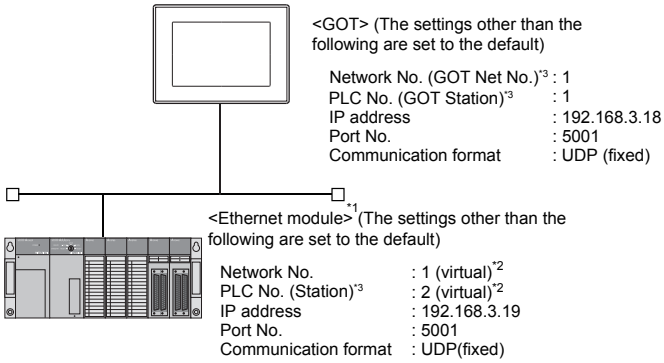
📖For A Ethernet Interface Module User's Manual

• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 488 When connecting multiple GOTs

■System configuration



*1 The Ethernet module is mounted on the base unit slot 0.
The start I/O number of the Ethernet module is set to 0.

*2 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ Page 498 [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

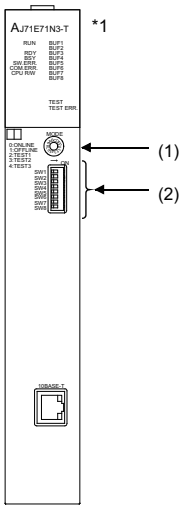
*3 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

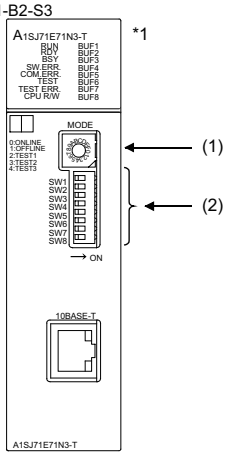
■Switch settings for the Ethernet module

Set the operation mode setting switch and exchange condition setting switch.

AJ71E71N3-T, AJ71E71N-B5, AJ71E71N-B2, AJ71E71N-T, AJ71E71N-B5T, AJ71E71-S3



A1SJ71E71N3-T, A1SJ71E71N-B5, A1SJ71E71N-B2, A1SJ71E71N-T, A1SJ71E71N-B5T, A1SJ71E71-B5-S3, A1SJ71E71-B2-S3



*1 The figures are of AJ71E71N3-T and A1SJ71E71N3-T.

PART 3

• Operation mode setting switch

○: Necessary, △: As necessary, —: Not necessary

Operation mode setting switch	Description	Setting value	Setting for GOT connection
	Online	0	○

• Exchange condition setting switch

The exchange condition setting switches of A1SJ71E71-B5-S3 and A1SJ71E71-B2-S3 are specified as the below.

○: Necessary, △: As necessary, —: Not necessary

Exchange condition setting switch	Setting switch	Description	Setting value	Setting for GOT connection
	SW1	Selection of line processing at TCP timeout error	OFF	△
	SW2	Data code setting (binary code)	OFF	○
	SW3	(Must not to be used)	OFF	—
	SW4			
	SW5			
	SW6			
	SW7	CPU exchange timing setting (Enable write at RUN time)	ON	○
	SW8	Initial timing setting	OFF	△
	SW1	Selection of line processing at TCP timeout error	OFF	△
	SW2	Data code setting (binary code)	OFF	○
	SW3	CPU exchange timing setting (Enable write at RUN time)	ON	○
	SW4	Initial timing setting	OFF	△

Point

When the switch setting has been changed

Turn off then on or reset the PLC CPU.

■Sequence program

The sequence program for initial processing and communication line opening processing are required.

• Programming condition

This program performs the initial processing of the Ethernet module and the opening processing of connection number 1 when the PLC CPU stops, then starts running.

I/O signal of Ethernet module

📖For A Ethernet Interface Module User's Manual

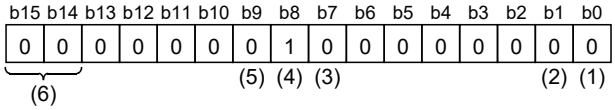
Device used by user

Device	Application
M102	COM.ERR turned off command
D100	IP address of Ethernet module
D110	Application setting
D111	Port No. of Ethernet module
D112 to D113	IP address of GOT
D114	Port No. of GOT
D200	Initial fault code

Buffer memory settings used in the present example

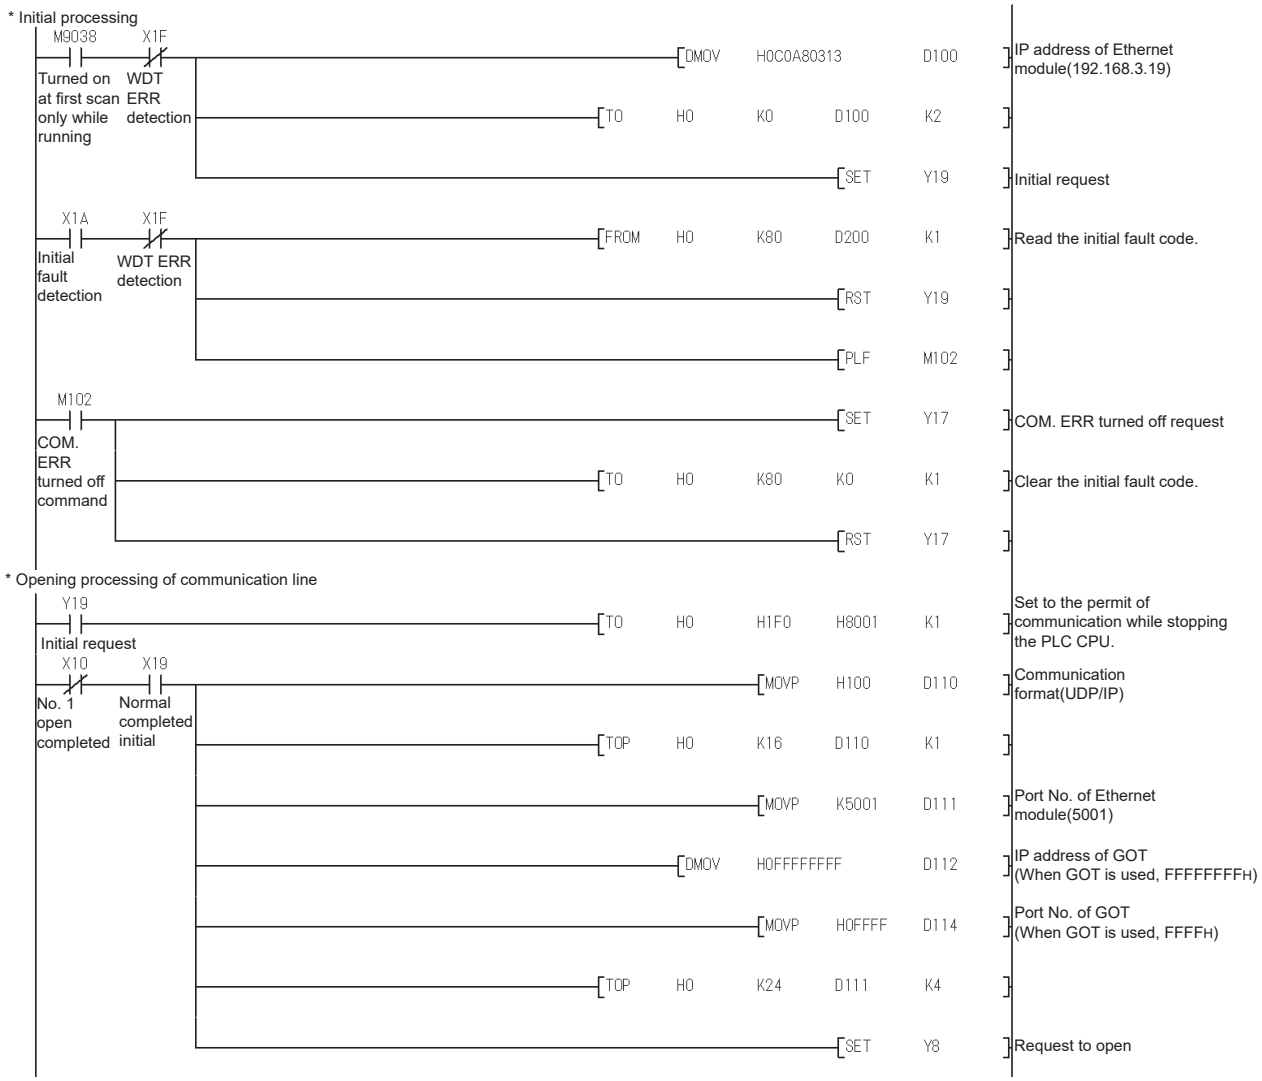
Buffer memory address Dec (Hex)	Item	Setting value
0 to 1 (0 to 1H)	IP address of Ethernet module	C0A80313H (192.168.3.19)
16 (10H)	Application setting*1	100H
24 (18H)	Port No. of Ethernet module	5001
25 to 26 (19 to 1AH)	IP address of GOT	FFFFFFFFH
27 (1BH)	Port No. of GOT	FFFFH
80 (50H)	Initial fault code	—

*1 The details of the application settings are shown below.
Settings (1), (2), and (3) can be changed by the user.
Settings (4), (5), and (6) are fixed.



(1) Fixed buffer application
0: For sending; no exchange
1: For receiving
(2) Existence check
0: No
1: Yes
(3) Pairing open
0: No
1: Yes
(4) Communication format (Set to "1" (UDP/IP).)
0: TCP/IP
1: UDP/IP
(5) Fixed buffer exchange (Set to "0" (With procedure).)
0: With procedure
1: Without procedure
(6) Open method (Set to "00" (Active, UDP/IP).)
00: Active, UDP/IP
10: Unpassive
11: Fullpassive

• Example of sequence program



Point

When changing the sequence program

After writing the sequence program to the PLC CPU, turn off then on or reset the PLC CPU.

• Communication confirmation

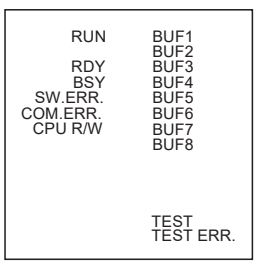
The RDY LED on the Ethernet module turn on when the module is ready to communicate.

For checking the communication status, refer to the following.

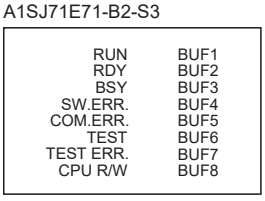
☞ Page 498 Checking the communication status of the Ethernet module

The BUF1 LED turns on when the opening processing of connection number 1 is completed successfully at execution of the sequence program example described above.

AJ71E71N3-T, AJ71E71N-B5, AJ71E71N-B2, AJ71E71N-T, AJ71E71N-B5T, AJ71E71-S3



A1SJ71E71N3-T, A1SJ71E71N-B5, A1SJ71E71N-B2, A1SJ71E71N-T, A1SJ71E71N-B5T, A1SJ71E71-B5-S3, A1SJ71E71-B2-S3



■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 485 GOT side settings

• Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5002
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1
	[Station No.]	2
	[Unit Type]	AJ71E71
	[IP Address]	192.168.3.19
	[Port No.]	5001
	[Communication]	UDP

■Checking the communication status of the Ethernet module

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.19

Reply from 192.168.3.19:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.19

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Mounting condition of the Ethernet module

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

Ethernet diagnostics of GX Developer

The Ethernet diagnostics of GX Developer enables ping tests from the PLC.

For details on the Ethernet diagnostics of GX Works3, refer to the following manual.

📖User's manual of the Ethernet module used

4.13.5 Access range for monitoring

Only the connected CPU can be accessed.

4.14 MELSEC-F series (Ethernet module connection)

☞ Page 500 Connectable devices
☞ Page 501 System configuration
☞ Page 505 GOT side settings
☞ Page 511 PLC side settings
☞ Page 517 Access range for monitoring

4.14.1 Connectable devices

The following table shows the connectable models.

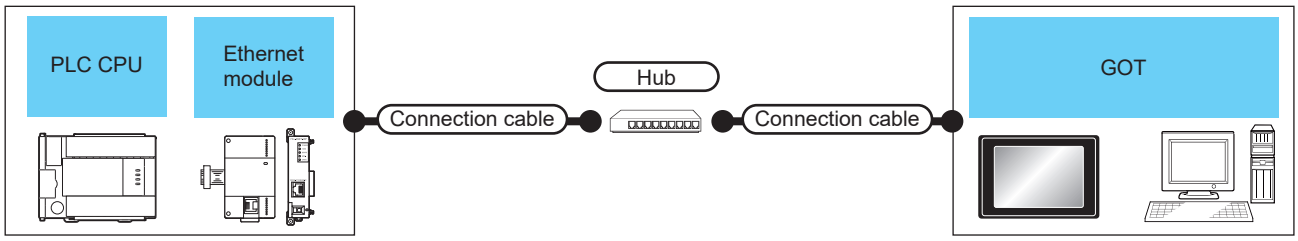
○: Supported, —: Not supported

Controller	Model	Clock	Ethernet module	Connectable model
MELSECMELSEC-F series*1	FX3S FX3G FX3GC FX3GE FX3U FX3UC	○	FX3U-ENET-L FX3U-ENET-ADP FX3U-ENET	GT37 SoftGOT3000

*1 The supported version of the main units varies depending on the Ethernet module to be used as shown below.

Ethernet module	FX3U(C)	FX3G(C)	FX3S
FX3U-ENET-L	Ver. 2.21 or later	FX3U-ENET-L is not supported.	
FX3U-ENET	Ver. 2.21 or later	FX3U-ENET is not supported.	
FX3U-ENET-ADP	Ver. 3.10 or later	Ver. 2.00 or later	Ver. 1.20 or later

4.14.2 System configuration



For details on the connection cables and the maximum segment length, refer to the following.

☞ Page 504 Connection cable

☞ Page 504 Maximum segment length

For details on the maximum number of connected devices, refer to the following.

☞ Page 504 Maximum number of connected devices

Controller	Ethernet module*1*2	Connection cable	GOT	
			Interface	Model
FX3U	FX3U-ENET-L	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000
FX3U, FX3G	FX3U-ENET	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000
FX3UC	FX3UC-1PS-5V, FX2NC-CNV-IF + FX3U-ENET-L*3	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000
FX3UC, FX3GC	FX3UC-1PS-5V, FX2NC-CNV-IF + FX3U-ENET*3	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000

Controller	Ethernet module[*1*2]	Connection cable	GOT	
			Interface	Model
FX3U FX3UC-32MT-LT(-2)	FX3U-232-BD, FX3U-485-BD, FX3U-422-BD, FX3U-USB-BD, FX3U-8AV-BD, FX3U-CNV-BD + FX3U-ENET-ADP[*4*5]	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000
FX3UC-□□/DS FX3UC-□□/DSS	FX3U-ENET-ADP	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000
FX3G	FX3G-CNV-ADP + FX3U-ENET-ADP[*5]	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000
FX3GC	FX3U-ENET-ADP[*5]	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000
FX3S	FX3S-CNV-ADP + FX3U-ENET-ADP[*5]	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			Ethernet interface of personal computer	GT37 SoftGOT3000

*1 For the system configuration of the Ethernet module, refer to the following manual.
📖FX series Ethernet interface manual

*2 Select [FX] for [Unit Type] in [Connected Ethernet Controller Setting] in GT Designer3.
For [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.
☞ Page 509 [Connected Ethernet Controller Setting]

*3 When using an Ethernet module with the FX3UC series, FX2NC-CNV-IF or FX3UC-1PS-5V is required.

*4 When using an Ethernet module with the FX3U series, FX3U-232-BD, FX3U-485-BD, FX3U-422-BD, FX3U-USB-BD, FX3U-8AV-BD, or FX3U-CNV-BD is required.

*5 The FX3U-ENET-ADP occupies one channel of the extension communication adapter (two channels max.) of FX3U(C) or FX3G(C), or one channel of the extension communication adapter (one channel max.) of FX3S.
One CPU allows the connection of only one FX3U-ENET-ADP.

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
10BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher
100BASE-TX	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5e or higher

The destination device connected with the twisted pair cable varies with the configuration of the Ethernet network system used.

Connect the cable to the Ethernet module, hub, or other system equipment corresponding to the applicable Ethernet network system.

Use cables, connectors, and hubs that meet the IEEE802.3 10BASE-T/100BASE-TX/1000BASE-T standards.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Maximum segment length

The maximum segment length (length between a hub and a node) is 100 m.

The maximum length depends on the Ethernet equipment used.

The following shows the number of connectable hubs when a repeater hub is used.

- 10BASE-T: Up to 4 for a cascade connection (within 500 m)
- 100BASE-TX: Up to 2 for a cascade connection (within 205 m)
- 1000BASE-T: The number differs depending on the hub to be used.

When switching hubs are used, there is no theoretical limit to the number of cascade connections between switching hubs. For the limit, contact the switching hub manufacturer.

Precautions

When multiple network devices (including GOTs) are connected in the same segment, the network load increases and the transmission speed between the GOT and PLC may be reduced.

The following actions may improve the communication performance.

- Use a switching hub compatible with 1000BASE-T (1 Gbps) or more.
- Reduce the number of devices monitored by the GOT.

Maximum number of connected devices

Up to 128 CPU modules can be connected to channels No. 1 to No. 4 of one GOT. (16 or less recommended)

The following shows the number of connectable controllers per GOT channel and the number of GOTs connectable to one controller.

Controller				GOT	
Model		Number of GOTs connectable to one Ethernet module		Model	Number of connectable controllers per GOT channel
PLC CPU	Module	UDP	TCP		
MELSEC-F series	FX3U-ENET-L	—	2	GT37 SoftGOT3000	63 (16 or less recommended)
	FX3U-ENET FX3U-ENET-ADP	—	4	GT37 SoftGOT3000	63 (16 or less recommended)

4.14.3 GOT side settings

[GOT Ethernet Setting]

Set the GOT Ethernet interface in GT Designer3.

Item	Description
[GOT IP Address Setting]	Set the IP address of the GOT.
[GOT Ethernet Common Setting]	Set the default gateway and other common items for GOT Ethernet interfaces.
[IP filter Setting]	The GOT allows or blocks access from IP addresses specified in the filtering list.

For details on the setting, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Set the GT SoftGOT3000 Ethernet interface on the personal computer.

Precautions

Do not use 0 and 255 at the end of an IP address.

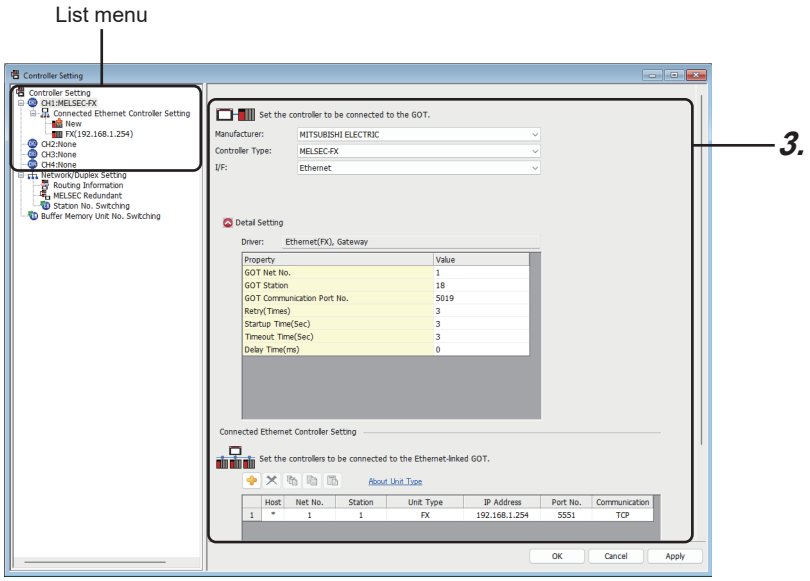
(Numbers of *.*.*.0 and *.*.*.255 are used by the system.)

The GOT may not monitor the controller correctly with the above numbers.

Consult with the administrator of the network before setting an IP address to the GOT.

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-FX]
[I/F]	[Ethernet]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 507 [Detail Setting]
[Connected Ethernet Controller Setting]	Configure the settings according to the controller to be connected. ☞ Page 509 [Connected Ethernet Controller Setting]

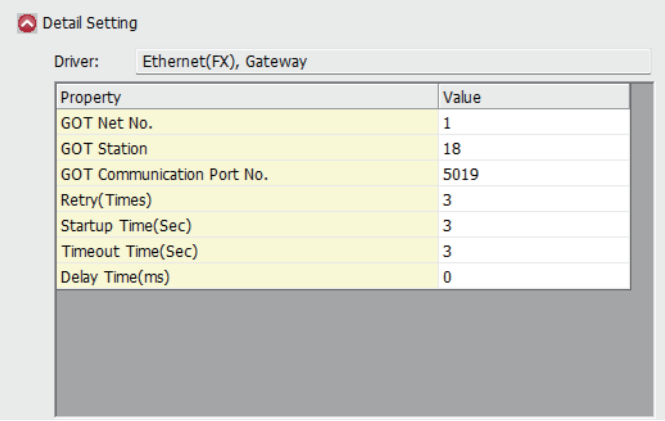
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Ethernet(FX), Gateway]
[GOT Net No.]	Set the network number of the GOT.	[1] to [239]
[GOT Station]*1*2	Set the station number of the GOT.	[1] to [64]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Startup Time]	Set the time period from the GOT startup until the start of communication with the PLC CPU.	[3] seconds to [255] seconds
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [10000] ms

*1 Set values not set for [Station] in [Connected Ethernet Controller Setting].
☞ Page 509 [Connected Ethernet Controller Setting]

*2 When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

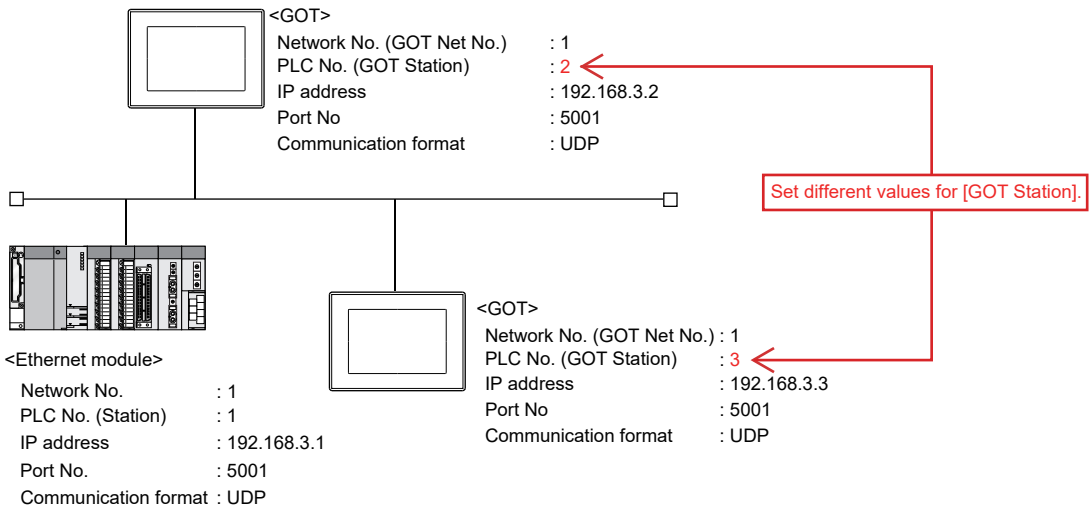
■When connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 507 [Detail Setting]

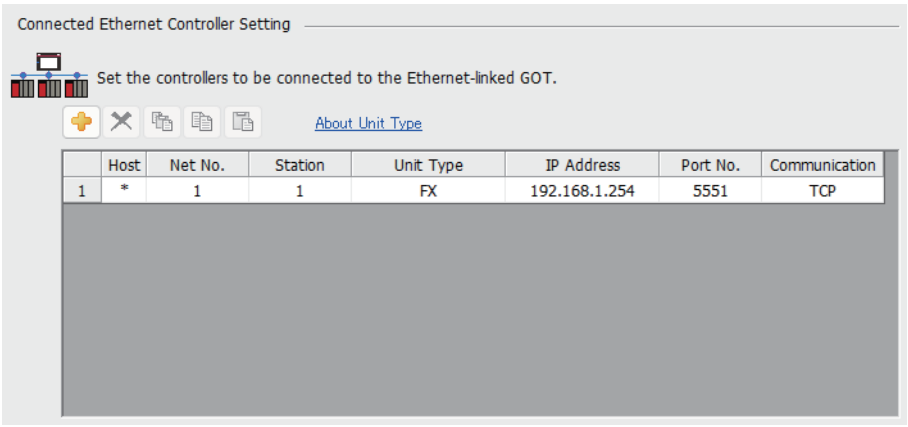
The following shows a system configuration example.

Ex.



■[Connected Ethernet Controller Setting]

Set the controller to be connected to the GOT by Ethernet.



Item	Description	Range
[Host]	The host is displayed. It refers to a station that can be connected without setting a station number. The host is indicated with an asterisk (*).	—
[Net No.]	Set the network number of the connected Ethernet equipment.	[1] to [239]
[Station]*2	Set the station number of the connected Ethernet equipment.	[1] to [64]
[Unit Type]	Select the model of the connected Ethernet equipment.	[FX]
[IP Address]	Set the IP address of the connected Ethernet equipment.	[0.0.0.0] to [255.255.255.255]
[Port No.]*1	Set the port number of the connected Ethernet equipment.	☞ Page 509 [Port No.]
[Communication]	Set the communication format of the connected Ethernet equipment.	[TCP]

*1 Match the port number of the CPU and [Port No.] of [Connected Ethernet Controller Setting].

*2 Set values not set for [GOT Station] in [Detail Setting].
☞ Page 507 [Detail Setting]

■[Port No.]

The setting range is as follows:

[Unit Type]	[Port No.]	[Communication]
[FX]	[5551] (When using FX3U-ENET-L or FX3U-ENET)	[TCP]
	[5556] (When using FX3U-ENET-ADP)	[TCP]

■Network number and PLC number of FXCPU

There is no setting for the network number and PLC number of FXCPU.

The values of [Network No.] and [Station No.] in the object setting dialog must be the same as the values of [Net No.] and [Station] in [Connected Ethernet Controller Setting].

Point

Changing the host station on the GOT

[Host] can be changed with the utility function of the GOT.

For details on the setting method, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

Precautions

If the network numbers of the GOT and PLC do not match on the same Ethernet network, monitoring of the PLC is not possible.

To enable monitoring, set the same network number as that of the GOT or connect an Ethernet module to the PLC and configure the routing settings to monitor the PLC as a different network.

When the multi-channel connection can be used, set a different network number for each channel.

4.14.4 PLC side settings

Model		Reference
MELSEC-FX	FX3S FX3G FX3GC FX3U FX3UC	☞ Page 511 Connection to Ethernet module (FX series)

Connection to Ethernet module (FX series)

This section describes the settings of the GOT and the Ethernet module (FX series) in the system configuration shown below.

Point

• Ethernet module (FX series)

For details on the Ethernet module (FX series), refer to the following manual.

📖FX3U-ENET-L User's Manual

📖FX3U-ENET User's Manual

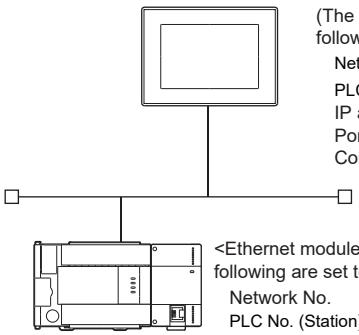
📖FX3U-ENET-ADP User's Manual

• Connecting multiple GOTs

When connecting multiple GOTs in the Ethernet network, set a different value for [GOT Station] for each GOT.

☞ Page 508 When connecting multiple GOTs

■System configuration



<GOT>
(The settings other than the following are set to the default)
Network No. (GOT Net No.)*2 : 1
PLC No. (GOT Station)*2 : 1
IP address : 192.168.3.18
Port No. : 5019
Communication format : TCP (fixed)

<Ethernet module> (The settings other than the following are set to the default)
Network No. : 1 (virtual)*1
PLC No. (Station)*2 : 2 (virtual)*1
IP address : 192.168.3.19
Port No. : 5551
Communication format : TCP (fixed)

*1 Although the setting is nonexistent on the PLC side, set a virtual value on the GOT side.
☞ Page 516 [Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

*2 For the following settings, the setting names are different on the PLC side and the GOT side.

Setting	Setting name		
	PLC side	GOT side	
		Controller setting	Connected Ethernet controller setting
Network number	[Network No.]	[GOT Net No.]	[Net No.]
PLC number	[Station]	[GOT Station]	[Station]

■Ethernet parameter settings of FX Configurator-EN-L and FX Configurator-EN

• Ethernet settings

Set the Ethernet parameter using FX Configurator-EN-L or FX Configurator-EN.

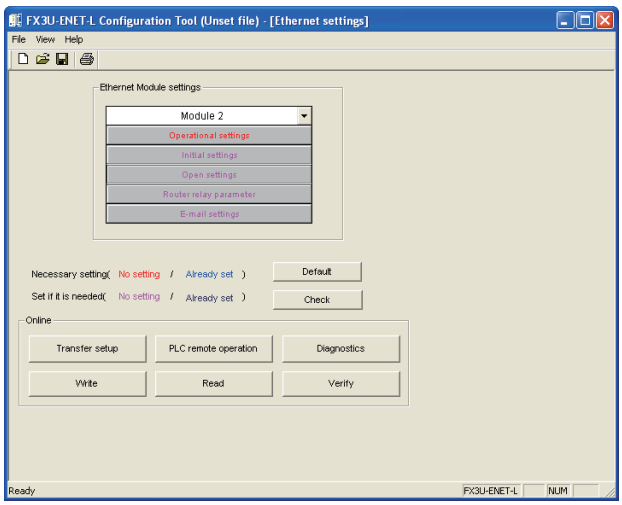
For using FX Configurator-EN-L, install GX Developer Ver. 8.88S or later on the personal computer.

For using FX Configurator-EN, install GX Developer Ver. 8.25B or later on the personal computer.

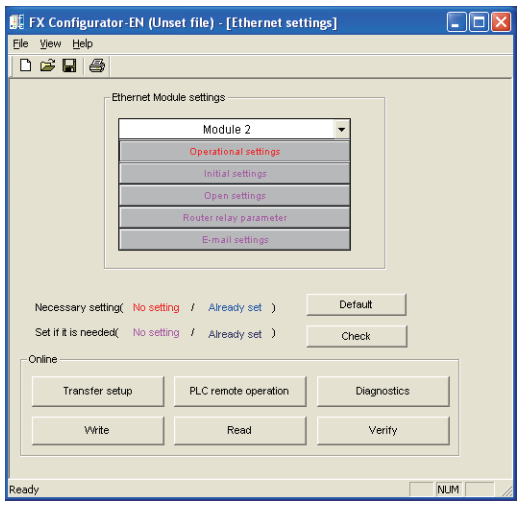
For details on the engineering tools, refer to the following manuals.

📖FX Configurator-EN-L Operation Manual

📖FX Configurator-EN Operation Manual



FX Configurator-EN-L



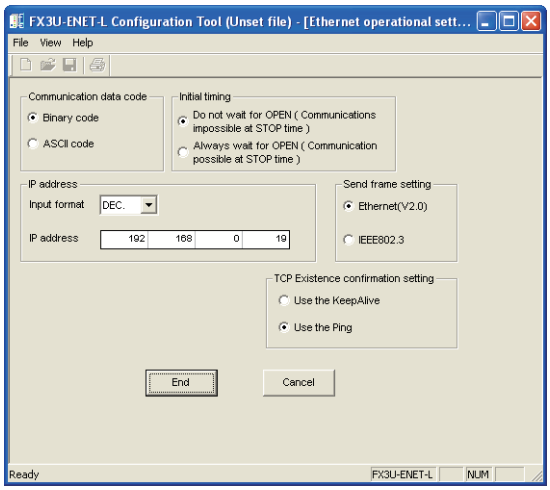
FX Configurator-EN

○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
Module	Module 0*1	○
[Operation setting]	☞ • Operation settings	○
[Initial settings]	(Use default value)	—
[Open settings]	☞ • Open settings	○
[Router relay parameter]	(Use default value)	—
[E-mail settings]		—

*1 Set the number of the Ethernet module.

• Operation settings



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Communication Data Code]*1	(Use default value)	—
[IP address]	192.168.3.19*2	○
[Initial timing]*1	(Use default value)	—
[Send frame setting]		—
[TCP Existence confirmation setting]		—

*1 Because port number 5551 is fixed, the GOT operates as follows regardless of this setting.
- Communication date code: [Binary code]
- Initial timing: [Always wait for OPEN] (Communications are possible while the PLC CPU is stopped.)

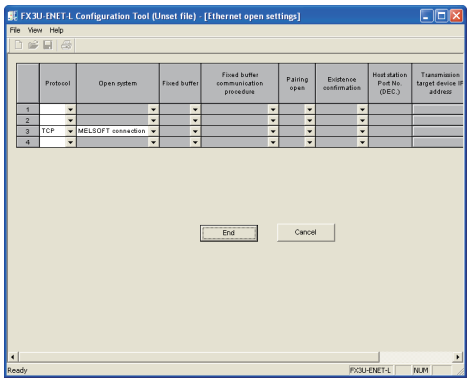
*2 The default value of IP address is 192.168.1.254. Set the IP address corresponding to the system configuration.

Point

When changing Ethernet parameter

After writing Ethernet parameters to the PLC CPU, turn off then on the or reset the PLC CPU.

• Open settings



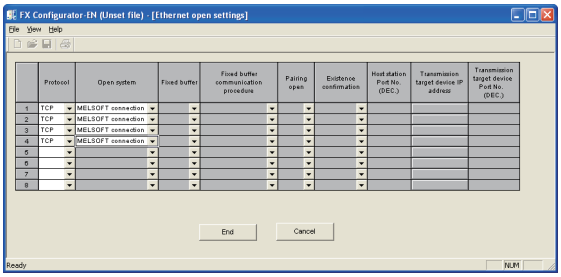
○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Protocol]	TCP	○
[Open System]	MELSOFT connection	○
[Fixed buffer]	(Use default value)	—
[Fixed buffer communication procedure]		—
[Pairing open]		—
[Existence confirmation]		—
[Host station Port No. (DEC.)]		—
[Transmission target device IP address]		—
[Transmission target device Port No. (DEC.)]		—

Point

When connecting multiple devices

The number of protocols equivalent to that of the GOTs and devices must be set.



■Ethernet parameter settings of FX3U-ENET-ADP

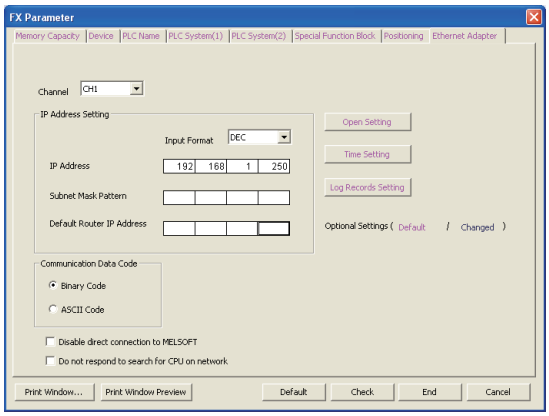
• Ethernet settings

Set the Ethernet parameters in [FX Parameter] of GX Works2.

To set FX3U-ENET-ADP, GX Works2 Ver.1.90U or later is required.

For details on FX3U-ENET-ADP, refer to the following manual.

FX3U-ENET-ADP User's Manual



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Channel]	CH1 or CH2*1	—
[IP Address Setting]	192.168.3.19*2	○
[Open settings]	☞ • Open settings	○
[Communication Data Code]	(Use default value)	—
[Disable direct connection to MELSOFT]		—
[Do not respond to search for CPU on network]		—

*1 Set a channel according to the installation position of FX3U-ENET-ADP on the CPU body.

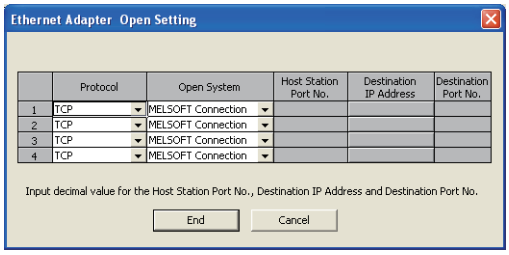
*2 The default value of IP address is 192.168.1.250. Set the IP address corresponding to the system configuration.

Point

When changing Ethernet parameter

After writing Ethernet parameters to the PLC CPU, turn off then on the PLC CPU.

• Open settings



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Protocol]	TCP	○
[Open System]	MELSOFT connection	○
[Host Station Port No.]	(Use default value)	—
[Transmission target device IP address]		—
[Destination Port No.]		—

Point

When connecting multiple devices

The number of protocols equivalent to that of the GOTs and devices must be set.

■[Controller Setting] and [Connected Ethernet Controller Setting] of GT Designer3

For the setting method of [Controller Setting] and [Connected Ethernet Controller Setting] in GT Designer3, refer to the following.

☞ Page 505 GOT side settings

• Controller settings

Item	Setting value
[GOT Net No.]	1
[GOT Station]	1
[GOT Communication Port No.]	5019
[Retry]	3 times
[Startup Time]	3 seconds
[Timeout Time]	3 seconds
[Delay Time]	0 ms

• GOT Ethernet settings

Item	Setting value
[GOT IP Address]	192.168.3.18
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Peripheral S/W Communication Port No.]	5015
[Transparent Port No.]	5014

• Connected Ethernet controller settings

Item		Setting value
Ethernet setting No. 1	[Host]	*
	[Net No.]	1
	[Station No.]	2
	[Unit Type]	FX
	[IP Address]	192.168.3.19*1
	[Port No.]	< When using FX3U-ENET-L or FX3U-ENET> 5551 <When using FX3U-ENET-ADP> 5556
	[Communication]	TCP

*1 Set the value according to the IP address of the connected PLC.

■Checking the communication status of the Ethernet module

• When using Windows Command Prompt

Execute a ping command in Windows Command Prompt.

1) At normal end

C:\>Ping 192.168.3.19

Reply from 192.168.3.19:bytes=32 time<1ms TTL=32

2) At abnormal end

C:\>Ping 192.168.3.19

Request timed out.

• In the case of abnormal end

In the case of abnormal end, check the following and execute the ping command again.

Mounting condition of the Ethernet module

Cable connecting condition

Switch settings and network parameter settings

Operation state of PLC CPU (faulty or not)

IP address of the Ethernet module specified by the ping command

Point

The Ethernet diagnostics of FX Configurator-EN-L or FX Configurator-EN enables ping tests from the PLC.

For details on the Ethernet diagnostics of the engineering tools, refer to the following manuals.

📖FX Configurator-EN-L Operation Manual

📖FX Configurator-EN Operation Manual

4.14.5 Access range for monitoring

Only the connected CPU can be accessed.

5.1 MELSEC MX Controller (MX-R Model) (serial communication connection)

☞ Page 518 Connectable devices
☞ Page 519 System configuration
☞ Page 521 Connection diagram
☞ Page 524 GOT side settings
☞ Page 529 PLC side settings
☞ Page 529 Access range for monitoring

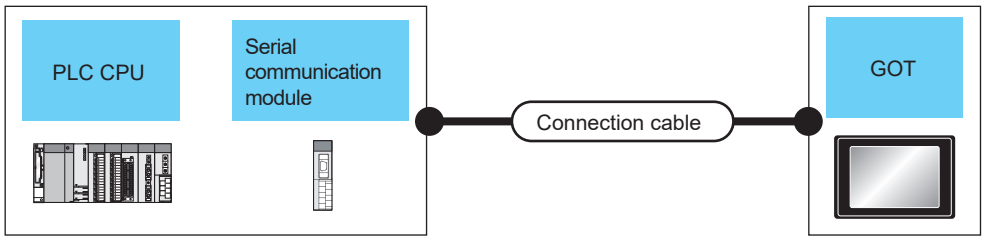
5.1.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Serial communication module	Connectable model
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64	○	RJ71C24 RJ71C24-R2 RJ71C24-R4	GT37 SoftGOT3000
	MXR500-128 MXR500-256	○	RJ71C24 RJ71C24-R2 J71C24-R4	GT37 SoftGOT3000

5.1.2 System configuration



For details on the maximum number of connected devices, refer to the following.

☞ Page 520 Maximum number of connected devices

PLC			Connection cable		GOT	
Controller	**Serial communication module**[*1]	**Communication type**	**Cable model**	**Maximum length**	**Interface**	**Model**
MELSEC MX Controller (MX-R Model)	RJ71C24 RJ71C24-R2	RS-232	GT09-C30R2-9P (3 m) + GT35-C02HR2-9P or ☞ Page 521 RS-232 connection diagram (1)	15 m	Built-in RS-232 interface	GT37 SoftGOT3000
			GT09-C30R2-9P (3 m) or ☞ Page 521 RS-232 connection diagram (1)		GT37-IF2000 + GT15-RS2-9P	GT37 SoftGOT3000
	RJ71C24 RJ71C24-R4	RS-422	GT09-C30R4-6C (3 m) GT09-C100R4-6C (10 m) GT09-C200R4-6C (20 m) GT09-C300R4-6C (30 m) or ☞ Page 521 RS-422 connection diagram (1)	1200 m	Built-in RS-422 interface	GT37 SoftGOT3000
			☞ Page 522 RS-422 connection diagram (2)(4-wire) or ☞ Page 523 RS-422 connection diagram (3)(2-wire)	1200 m[*2*4]	Built-in RS-422 interface + FA-LTBGT2R4CBL05 (0.5 m)[*3] FA-LTBGT2R4CBL10 (1 m)[*3] FA-LTBGT2R4CBL20 (2 m)[*3]	GT37 SoftGOT3000
			GT09-C30R4-6C (3 m) GT09-C100R4-6C (10 m) GT09-C200R4-6C (20 m) GT09-C300R4-6C (30 m) or ☞ Page 521 RS-422 connection diagram (1)	1200 m	GT37-IF2000 + GT15-RS4-9S	GT37 SoftGOT3000
			☞ Page 522 RS-422 connection diagram (2)(4-wire) or ☞ Page 523 RS-422 connection diagram (3)(2-wire)	1200 m[*2*4]	GT37-IF2000 + GT15-RS4-9S + FA-LTBGT2R4CBL05 (0.5 m)[*3] FA-LTBGT2R4CBL10 (1 m)[*3] FA-LTBGT2R4CBL20 (2 m)[*3]	GT37 SoftGOT3000

*1 For the system configuration of the serial communication module, refer to the following manual.
MELSEC iQ-R series manuals

*2 The shortest specification on the PLC side is prioritized.

*3 The terminal block converter module is manufactured by MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.
For details on the product, contact MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.

*4 The cable length of the terminal block converter module is included.

Maximum number of connected devices

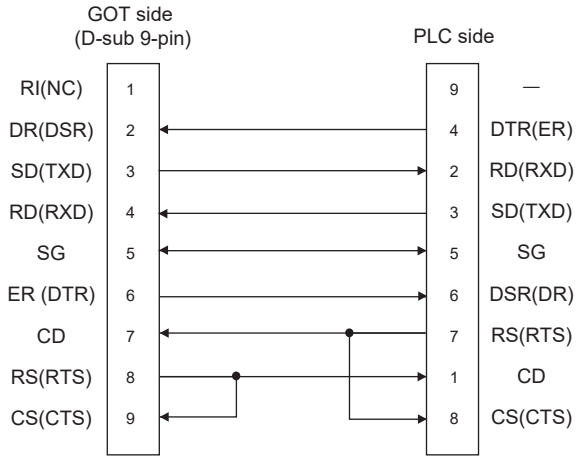
The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC MX Controller (MX-R Model)	Two GOTs for one serial communication module

5.1.3 Connection diagram

The following diagram shows the connection between the GOT and the controller.

RS-232 connection diagram (1)



Preparation of the RS-232 cable

■Cable length

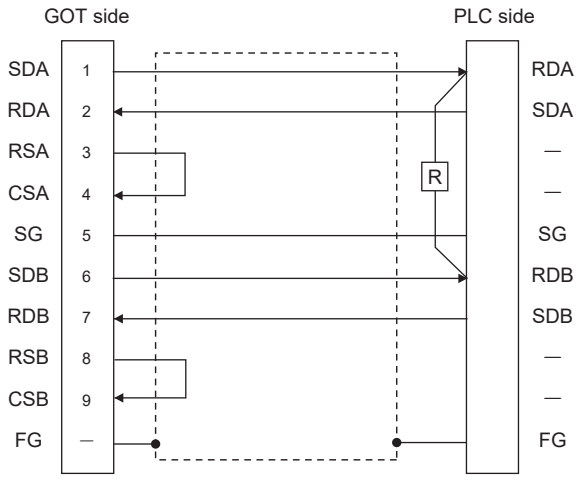
The length of the RS-232 cable must be 15 m or less.

■GOT side connector

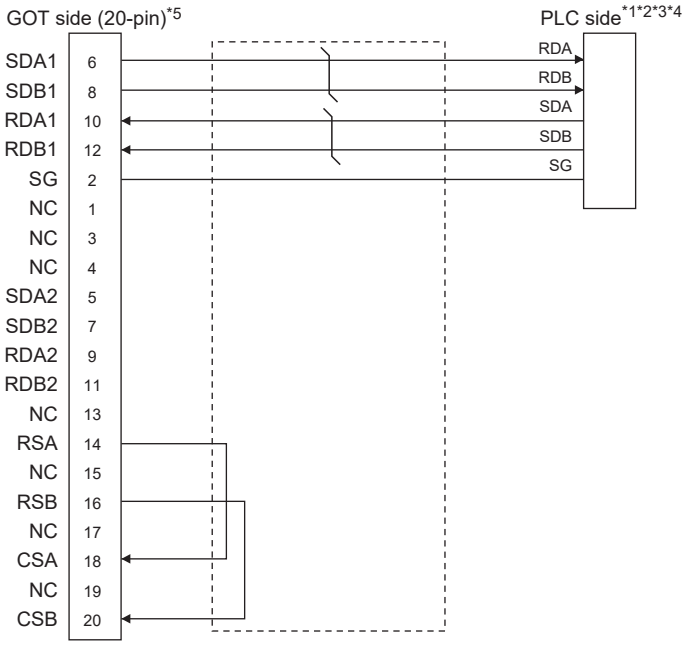
For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

RS-422 connection diagram (1)



RS-422 connection diagram (2)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

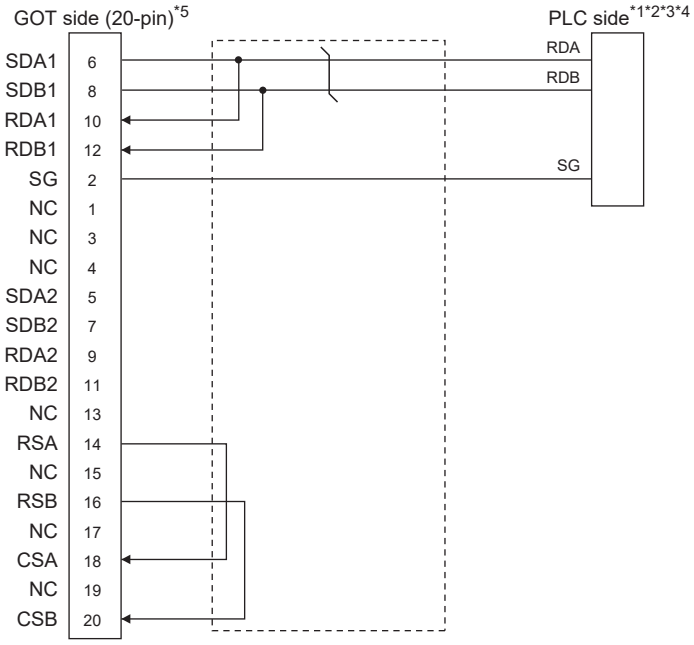
*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

RS-422 connection diagram (3)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CTS, RTS, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

Preparation of the RS-422 cable

■Cable length

The length of the RS-422 cable must be 1200 m or less.

■GOT side connector

For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

Connecting terminating resistors

■GOT side

When connecting a PLC to the GOT, a terminating resistor must be connected to the GOT.

Set the terminating resistor setting switch to "Not used".

For the procedure to set the terminating resistor, refer to the following.

☞ Page 2956 Terminating resistors of GOT

■Serial communication module or computer link module side

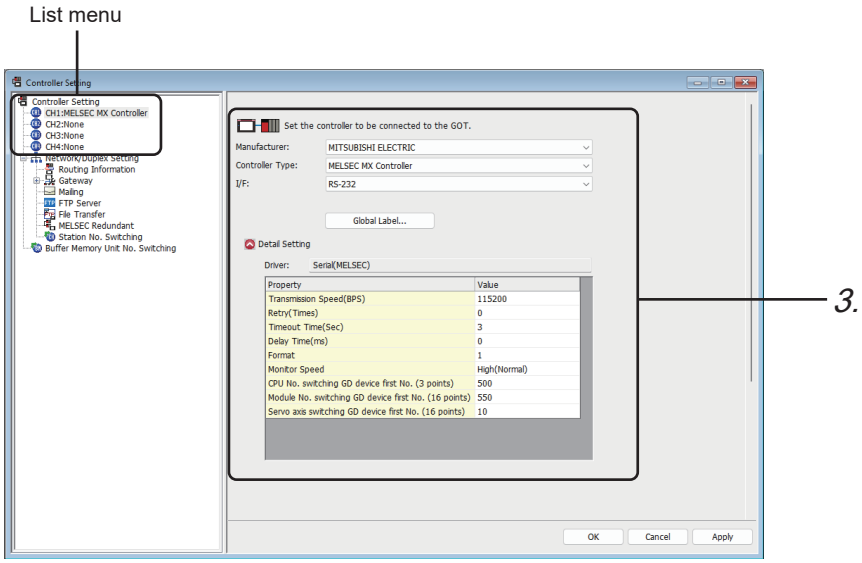
Connect a terminating resistor (330 Ω 1/4 W) to the serial communication module or computer link module side. For instructions on connecting terminating registers, refer to the following manual.

📖User's manual of the serial communication module or computer link module used

5.1.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item		Description
[Manufacturer]		[MITSUBISHI ELECTRIC]
[Controller Type]		[MELSEC MX Controller]
[I/F]	For GOT	• [RS-232] • [RS-422/485] • [Extend Unit]
	For GT SoftGOT3000	• [Serial 1] • [Serial 2]
[Detail Setting]		Configure the settings according to the usage environment. ☞ Page 525 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

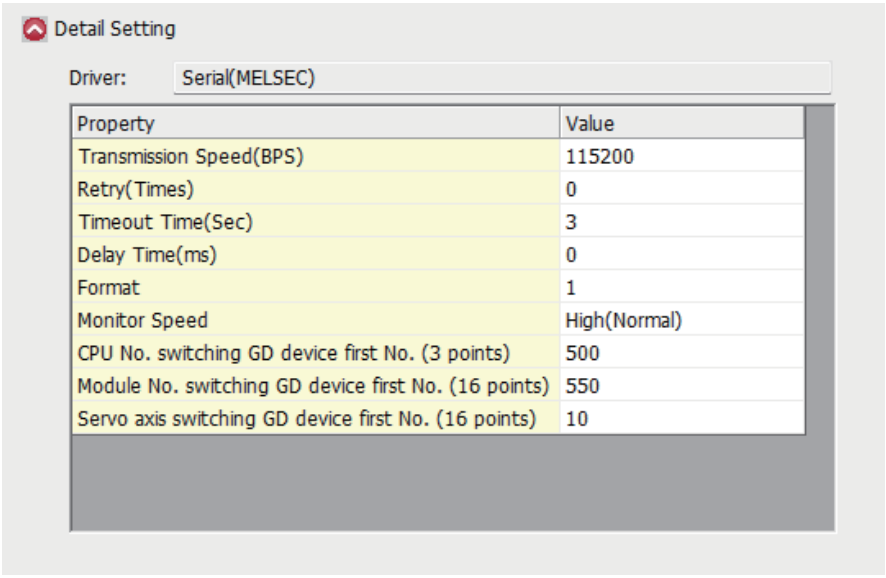
Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

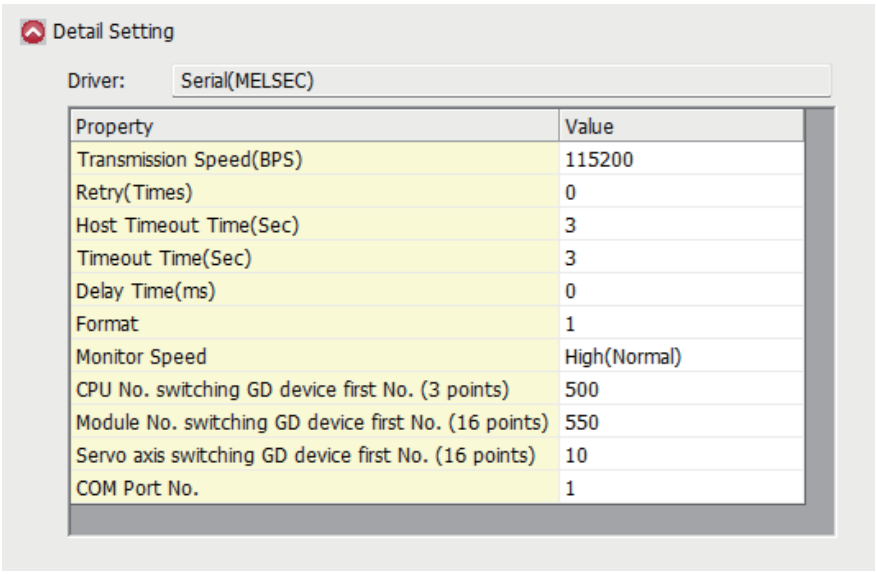
■[Detail Setting]

Configure the settings according to the usage environment.

- For GOT



- For GT SoftGOT3000



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Serial (MELSEC)]
[Transmission Speed]	Set this item to change the transmission speed used for communication with the connected equipment.	[9600] bps, [19200] bps, [38400] bps, [57600] bps, [115200] bps
[Retry]	Specify the number of retries to be performed during communication.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Host Timeout Time]*1	Set the time period until a communication timeout during monitoring of the host station.	[1] second to [90] seconds
[Timeout Time]	Specify the time period for a communication to time out.	[1] second to [30] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Format]*4	Set the communication format.	[1], [2]
[Monitor Speed]*3	Set the monitor speed of the GOT. This setting is not valid in all systems.	[High(Normal)]*2 [Middle] [Low]

Item	Description	Range
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 527 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 528 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 528 Start device number of the GD devices for module number switching	[0] to [65520]
[COM Port No.]*1	Specify the COM port number for communication.	[1] to [63]

*1 This item is displayed in GT SoftGOT3000 only.

*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.

*3 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
📖GT Designer3 (GOT3000) Screen Design Manual

*4 Set this item when replacing the F900 series with the GOT3000 series.

- To change the transmission speed of the serial communication module connected to the F900 to 115200 bps, configure the settings as follows.

[Intelligent function module switch setting] of PLC

Switch No.	CH1 side	CH2 side
Switch 1	0000H	-
Switch 2	0000H	-
Switch 3	-	0000H
Switch 4	-	0000H
Switch 5	0000H	0000H

GOT communication settings

Item	Setting value
Format	1

- To continue using the transmission speed of 38400 bps for the serial communication module connected to the F900, configure the settings as follows.

GOT communication settings

Item	Setting value
Format	2

Point

- Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.
For details on the GT37 utility, refer to the following manual.
📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

- Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Specifying a module number with a device

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Point

By setting the GOT internal device, the GOT can disconnect specific parts from the controller's multiple connections.

For example, a faulty station that has a communication timeout can be disconnected from the system.

For details on the setting contents of the GOT internal device, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual

5.1.5 PLC side settings

No setting is required on the controller.

5.1.6 Access range for monitoring

Only the connected CPU can be accessed.

5.2 MELSEC iQ-R series (serial communication connection)

☞ Page 530 Connectable devices
☞ Page 532 System configuration
☞ Page 534 Connection diagram
☞ Page 537 GOT side settings
☞ Page 542 PLC side settings
☞ Page 543 Access range for monitoring
☞ Page 544 How to monitor a redundant system

5.2.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Serial communication module[*4*5]	Connectable model
MELSEC iQ-R series	R00CPU R01CPU R02CPU R04CPU R08CPU R16CPU R32CPU R120CPU	○	RJ71C24 RJ71C24-R2 RJ71C24-R4	GT37 SoftGOT3000

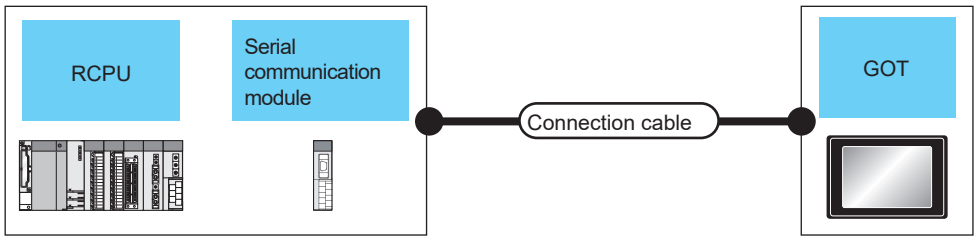
Controller	Model	Clock	Serial communication module*4*5	Connectable model
Robot controller (MELSEC iQ-R series)	CR800-R (R16RTCPU)	○	RJ71C24 RJ71C24-R2 RJ71C24-R4	GT37 SoftGOT3000
CC-Link IE Field Network head module	RJ72GF15-T2	—	RJ71C24 RJ71C24-R2 RJ71C24-R4	GT37 SoftGOT3000

*1 Mount a redundant function module R6RFM next to the RnPCPU on the base unit when building a redundant system.
*2 Mount a safety function module R6SFM next to the RnSFCPU on the base unit.
The RnSFCPU and the safety function module R6SFM must have the same pair version.
If their pair versions differ, the RnSFCPU does not operate.
*3 Use a serial port of the serial communication module controlled by another module in the multiple CPU system.
*4 Use firmware version 07 or later when building a redundant system.
*5 RS-485 communication cannot be performed.
The A0J2-C214-S1 cannot be used.
*6 Use a module with OS software version 06 or later.

5.2.2 System configuration



For details on the maximum number of connected devices, refer to the following.

☞ Page 533 Maximum number of connected devices

PLC			Connection cable		GOT

*1 For the system configuration of the serial communication module, refer to the following manual.
MELSEC iQ-R series manuals

*2 The shortest specification on the PLC side is prioritized.

*3 The terminal block converter module is manufactured by MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.
For details on the product, contact MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.

*4 The cable length of the terminal block converter module is included.

Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC iQ-R series Motion CPU (MELSEC iQ-R series) C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series) CNC C80 Robot controller (MELSEC iQ-R series) CC-Link IE Field Network head module	Two GOTs for one serial communication module

Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.

If you start the GOT before the PLC runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

Connection to RnSFCPU

The RnSFCPU takes 10 seconds or more to run.

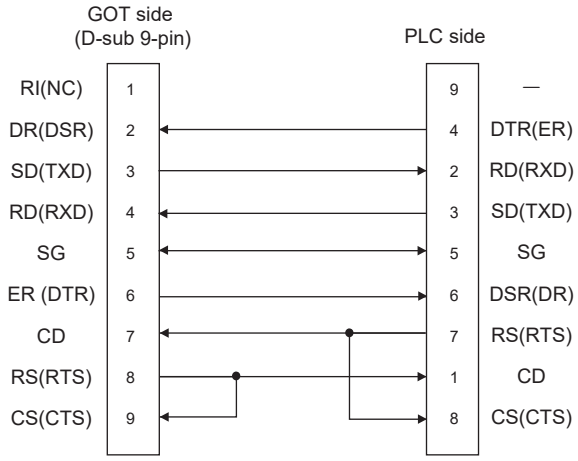
If the GOT is started during this time, a system alarm occurs. Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

5.2.3 Connection diagram

The following diagram shows the connection between the GOT and the controller.

RS-232 connection diagram (1)



Preparation of the RS-232 cable

■Cable length

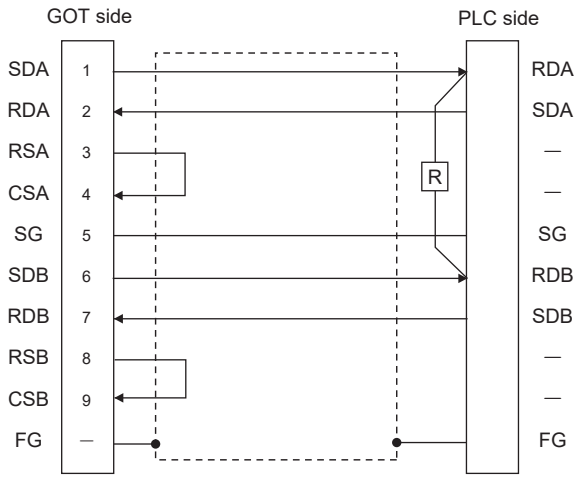
The length of the RS-232 cable must be 15 m or less.

■GOT side connector

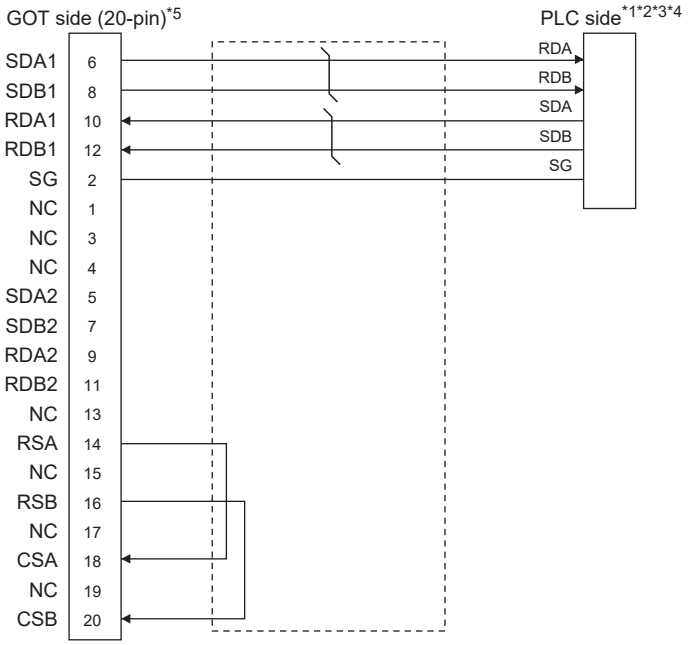
For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

RS-422 connection diagram (1)



RS-422 connection diagram (2)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

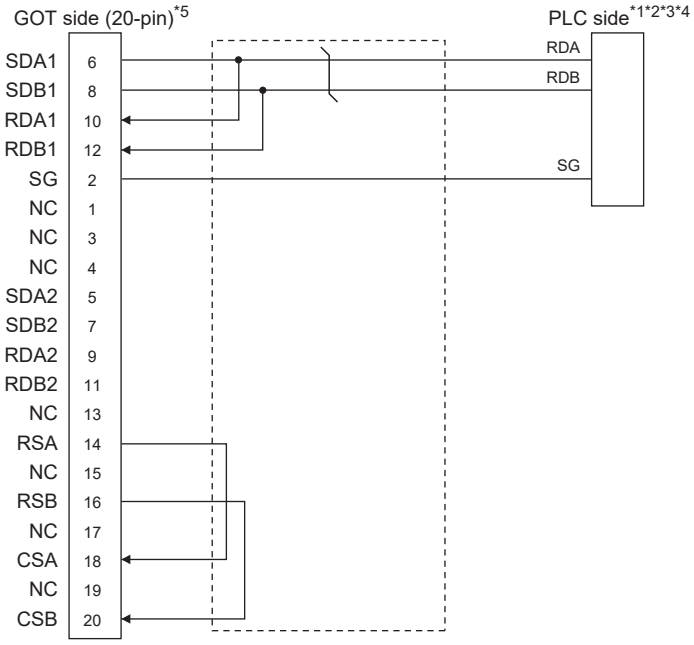
*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

RS-422 connection diagram (3)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

Preparation of the RS-422 cable

■Cable length

The length of the RS-422 cable must be 1200 m or less.

■GOT side connector

For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

Connecting terminating resistors

■GOT side

When connecting a PLC to the GOT, a terminating resistor must be connected to the GOT.

Set the terminating resistor setting switch to "Not used".

For the procedure to set the terminating resistor, refer to the following.

☞ Page 2956 Terminating resistors of GOT

■Serial communication module or computer link module side

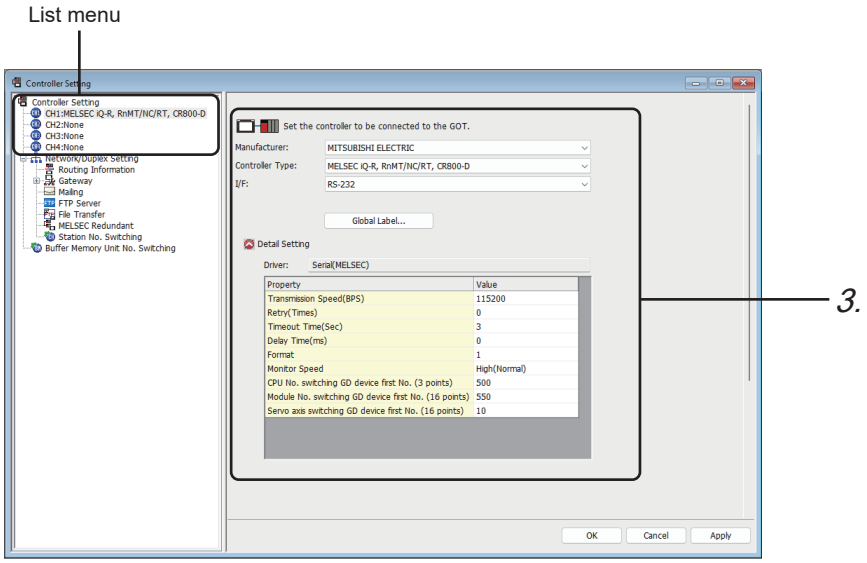
Connect a terminating resistor (330 Ω 1/4 W) to the serial communication module or computer link module side. For instructions on connecting terminating registers, refer to the following manual.

📖User's manual of the serial communication module or computer link module used

5.2.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item		Description
[Manufacturer]		[MITSUBISHI ELECTRIC]
[Controller Type]		[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[I/F]	For GOT	• [RS-232] • [RS-422/485] • [Extend Unit]
	For GT SoftGOT3000	• [Serial 1] • [Serial 2]
[Detail Setting]		Configure the settings according to the usage environment. ☞ Page 538 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

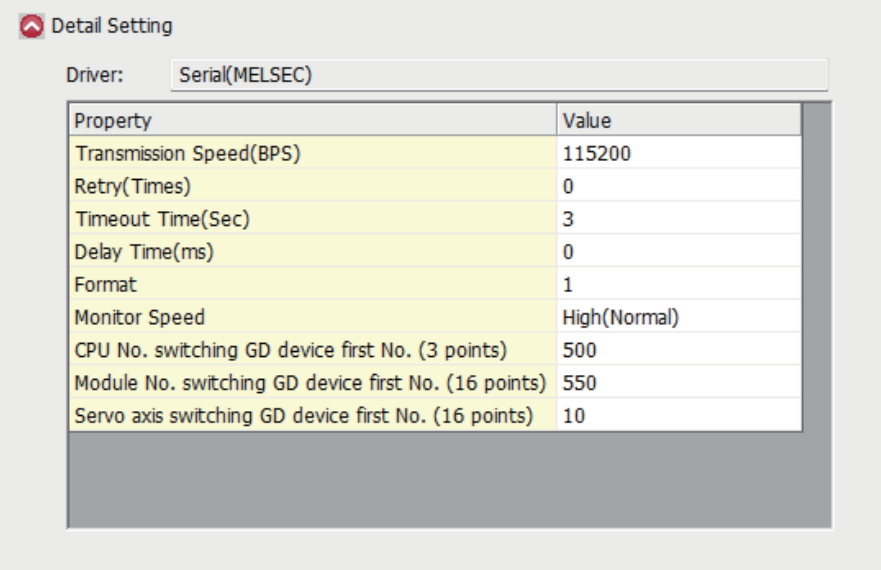
Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

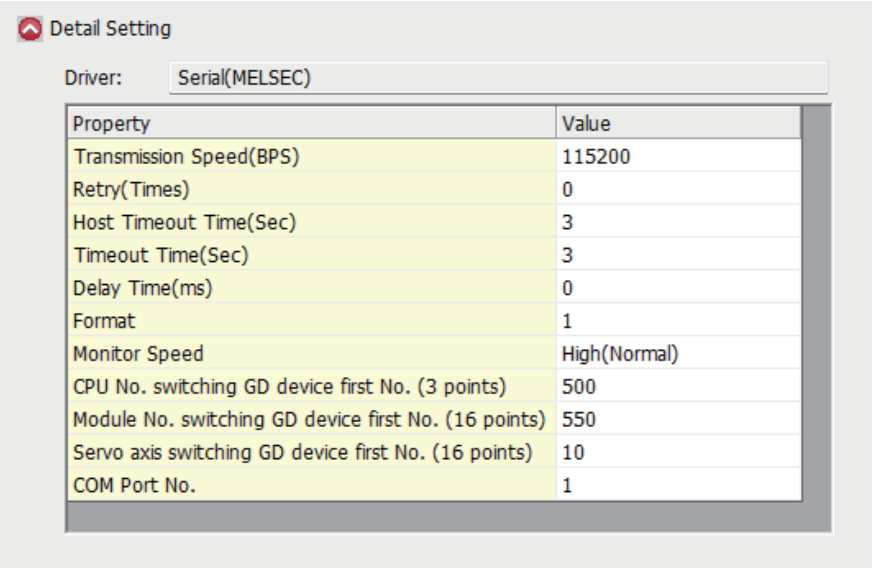
■[Detail Setting]

Configure the settings according to the usage environment.

• For GOT



• For GT SoftGOT3000



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Serial (MELSEC)]
[Transmission Speed]	Set this item to change the transmission speed used for communication with the connected equipment.	[9600] bps, [19200] bps, [38400] bps, [57600] bps, [115200] bps
[Retry]	Specify the number of retries to be performed during communication.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Host Timeout Time]*1	Set the time period until a communication timeout during monitoring of the host station.	[1] second to [90] seconds
[Timeout Time]	Specify the time period for a communication to time out.	[1] second to [30] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Format]*4	Set the communication format.	[1], [2]
[Monitor Speed]*3	Set the monitor speed of the GOT. This setting is not valid in all systems.	[High(Normal)]*2 [Middle] [Low]

Item	Description	Range
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 540 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 541 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 542 Start device number of the GD devices for servo axis switching	[0] to [65520]
[COM Port No.]*1	Specify the COM port number for communication.	[1] to [63]

*1 This item is displayed in GT SoftGOT3000 only.

*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.

*3 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
📖GT Designer3 (GOT3000) Screen Design Manual

*4 Set this item when replacing the F900 series with the GOT3000 series.

- To change the transmission speed of the serial communication module connected to the F900 to 115200 bps, configure the settings as follows.

[Intelligent function module switch setting] of PLC

Switch No.	CH1 side	CH2 side
Switch 1	0000H	-
Switch 2	0000H	-
Switch 3	-	0000H
Switch 4	-	0000H
Switch 5	0000H	0000H

GOT communication settings

Item	Setting value
Format	1

- To continue using the transmission speed of 38400 bps for the serial communication module connected to the F900, configure the settings as follows.

GOT communication settings

Item	Setting value
Format	2

Point

- Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.
For details on the GT37 utility, refer to the following manual.
📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

- Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Specifying a module number with a device

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Point

By setting the GOT internal device, the GOT can disconnect specific parts from the controller's multiple connections.

For example, a faulty station that has a communication timeout can be disconnected from the system.

For details on the setting contents of the GOT internal device, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual

5.2.5 PLC side settings

No setting is required on the controller.

5.2.6 Access range for monitoring

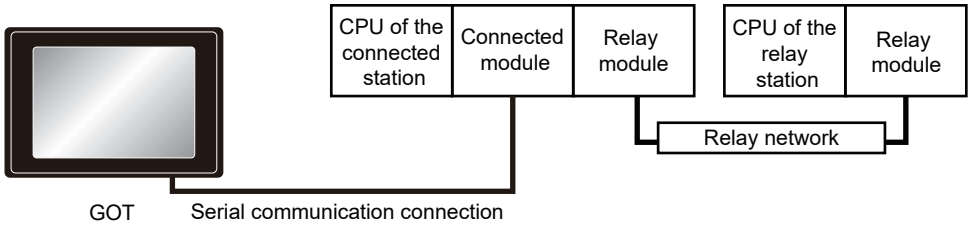
When the GOT is connected to the CPU of the station connected by serial communication connection, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station									
		Relay network	CPU of the relay station								
			MXR	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
RCPU	☞ Page 530 [Controller Setting]	Ethernet	○*7	○*5	○	○*6	○	—	○	—	○*3
		CC-Link IE TSN	○*7	○*1	—	—	—	—	—	—	○*3

*1 RnCPU, RnENCPU, RnSFCPU, and MELSECWinCPU (MELSEC iQ-R series) are supported.
*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.
*3 FX5U and FX5UC are supported.
*4 FX5U, FX5UC, and FX5UJ are supported.
*5 The C Controller module (MELSEC iQ-R series) is not supported.
*6 The C Controller module (MELSEC-Q series) is not supported.
*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
☞ Page 90 Setting procedure of the encrypted communication
*8 AnUCPU and AnUSCPU are supported.

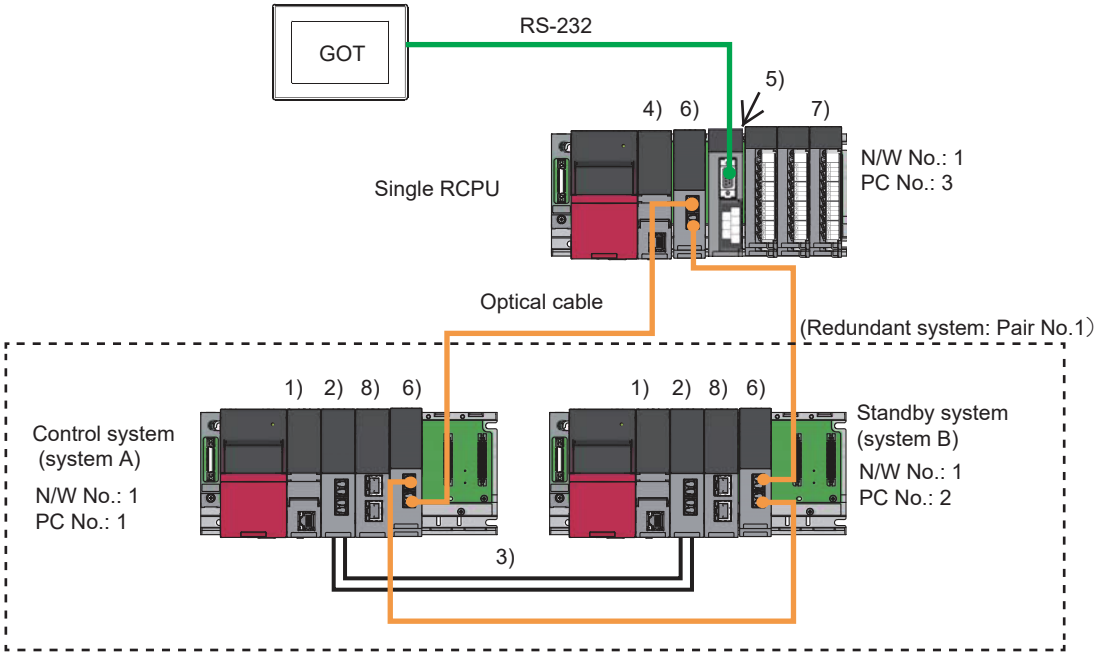
5.2.7 How to monitor a redundant system

☞ Page 544 One-to-one connection of the GOT and the redundant system
☞ Page 546 MELSEC redundant settings
☞ Page 548 Precautions

One-to-one connection of the GOT and the redundant system

■System configuration example

The following describes a connection configuration example for connecting the GOT to a redundant CPU via the serial communication module mounted on the extension base unit for the redundant system.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) RCPU
5) Serial communication module
6) CC-Link IE Controller Network module
7) I/O module
8) CC-Link IE Field Network master/local module

■Connection method

Connect the serial communication module (mounted on remote I/O station) to the GOT.

☞ Page 518 Serial connection

■PLC side settings (GX Works3)

- Redundant CPU

☞ Page 885 How to monitor a redundant system

- Single RCPU

Item	Setting value
Network No.	1
PLC station No.	3

☞ Page 885 How to monitor a redundant system

■GOT side settings

Set GT Designer3 as follows.

Setting item	Contents of setting		Model
Model	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	Host	-	
	Other	Network No.: 1	
		PLC station No.: Station number of the control system	
	Control system/ standby system	The system (control system/standby system) to be monitored can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
MELSEC redundant setting	 ☞ Page 546 MELSEC redundant settings		

■Monitoring target change when system switching occurs in a redundant system

When system switching occurs, the CPU (Network No. 1, PLC station No. 2) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

MELSEC redundant settings

This section describes the settings for the GOT to automatically change the monitoring target of the RCPU redundant system.

Point

Before configuring the MELSEC redundant settings

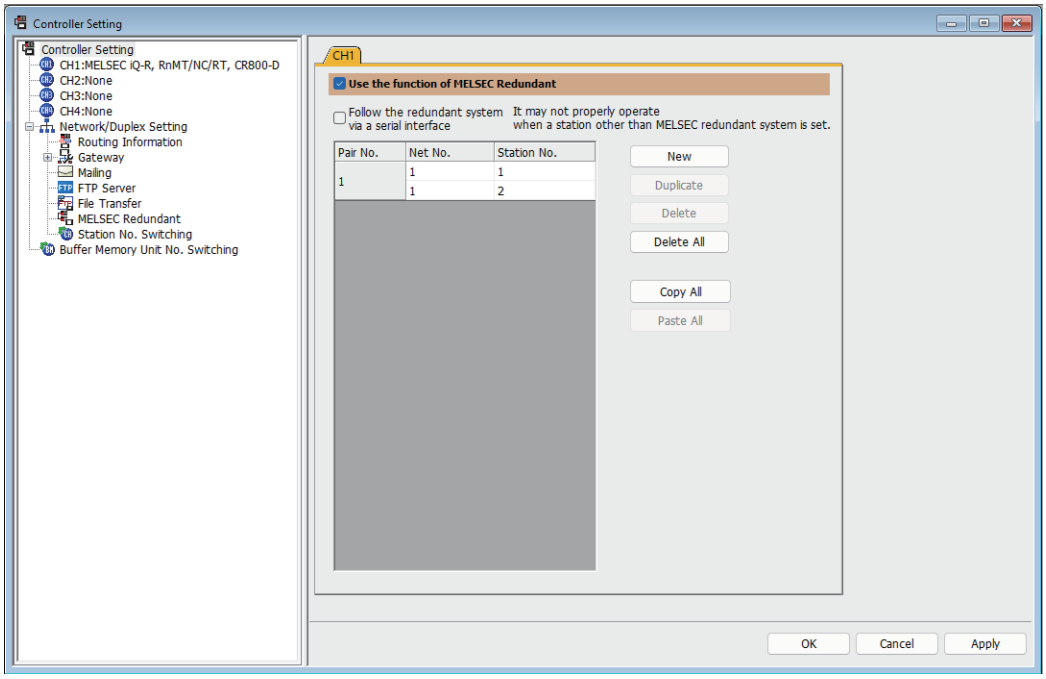
In the MELSEC redundant settings, do not set a station outside the redundant RCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC redundant setting dialog, settings can be made for each channel of the controller.

The following shows an example of the serial connection (station No. 4) with redundant CPU pair No. 1 to No. 2, network No. 1, and redundant CPU station No. 0 to No. 3.

Ex.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Copies one setting of the selected pair number and adds it below the bottom row.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 547 Pair number

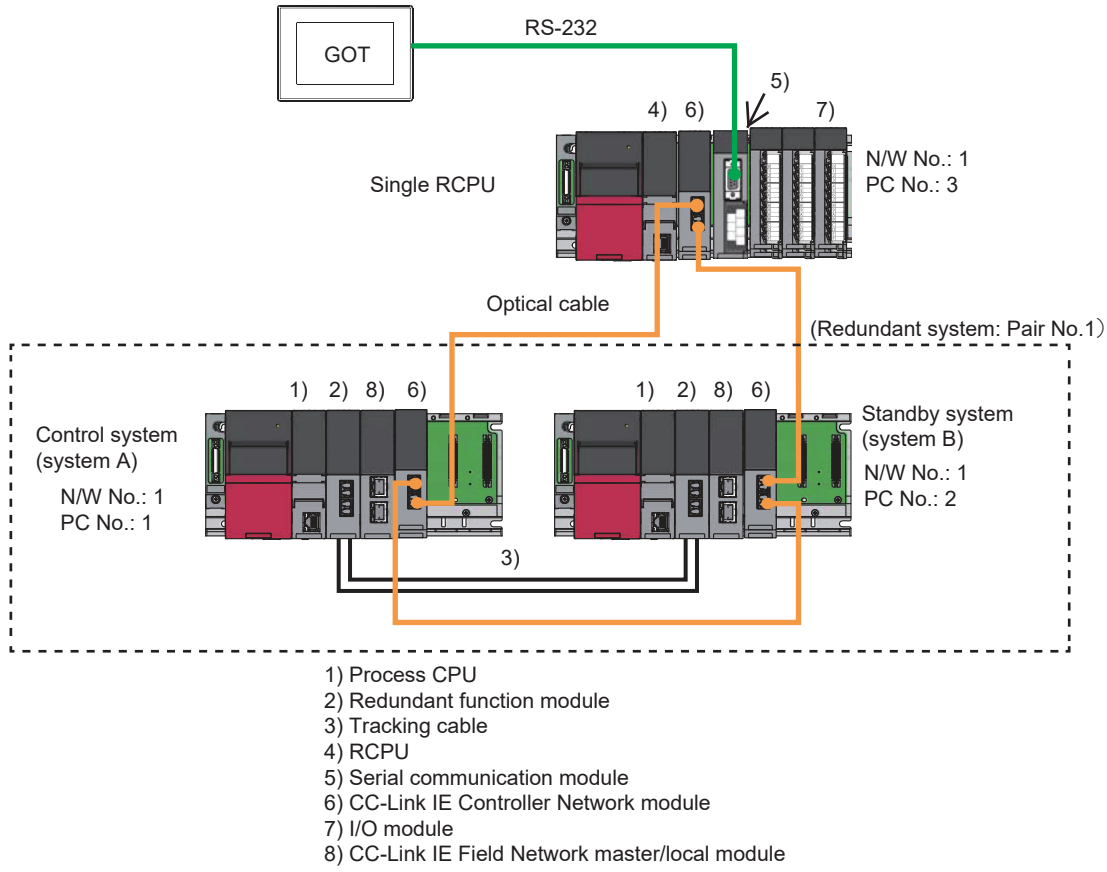
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of serial connection in the RCPU redundant system. (Pair No. 1 to No. 2)

Ex.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) RCPU
5) Serial communication module
6) CC-Link IE Controller Network module
7) I/O module
8) CC-Link IE Field Network master/local module

Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- The last station number and station number 1 (example: station number 64 and station number 1) cannot be paired.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the redundant mode of the RCPU redundant system, and does not support the process mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

• 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

[450: Path has changed or timeout occurred in redundant system.] appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, [451: The MELSEC redundant setting and actual system configuration do not match.] appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings. If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm [315 Device writing error. Correct device.] is not detected.

5.3 MELSEC iQ-F series (Built-in serial port connection)

☞ Page 549 Connectable devices
☞ Page 550 System configuration
☞ Page 555 Connection diagram
☞ Page 558 GOT side settings
☞ Page 562 PLC side settings
☞ Page 562 Access range for monitoring

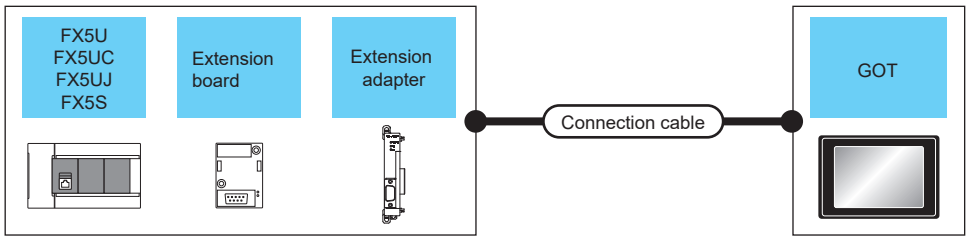
5.3.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC iQ-F series	FX5U FX5UC FX5UJ FX5S	○	GT37 SoftGOT3000

5.3.2 System configuration



☞ Page 550 When connecting via RS-232 communication
☞ Page 551 When connecting via RS-422 communication

*1 Use the RS-485 communication terminal block of the PLC to perform RS-422 communications.
*2 The shortest specification on the PLC side is prioritized.
*3 The terminal block converter module is manufactured by MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.
For details on the product, contact MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.
*4 The cable length of the terminal block converter module is included.

Maximum number of connected devices

The following shows the number of connectable GOTs.

■When connecting via RS-232 communication

Controller				
Model	**Function extension board**	**Extension adapter**	**Communication type**	**Number of connectable devices*1**
FX5U FX5UJ FX5S	FX5-232-BD	—	RS-232	One GOT for one extension board
FX5U FX5UC FX5UJ FX5S	—	FX5-232ADP	RS-232	One GOT for one extension adapter

*1 When an extension board (communication board) and an extension adapter are connected, one GOT and one peripheral device such as a personal computer with GX Works3 installed can be connected to the board and the adapter, respectively.

■When connecting via RS-422 communication

Controller				
Model	**Function extension board**	**Extension adapter**	**Communication type**	**Number of connectable devices*2**
FX5U FX5UJ FX5S	FX5-422-BD-GOT	—	RS-422	One GOT for one extension board
FX5U FX5UC	—	—	RS-422*1	One GOT for one PLC built-in port
FX5U FX5UJ FX5S	FX5-485-BD	—	RS-422*1	One GOT for one extension board
FX5U FX5UC FX5UJ FX5S	—	FX5-485ADP	RS-422*1	One GOT for one extension adapter

*1 Use the RS-485 communication terminal block of the PLC to perform RS-422 communications.

*2 When an extension board (communication board) and an extension adapter are connected, one GOT and one peripheral device such as a personal computer with GX Works3 installed can be connected to the board and the adapter, respectively.

Connection to MELSEC iQ-F series

Point

MELSEC iQ-F series communication settings

For details on the MELSEC iQ-F series communication settings, refer to the following manual.

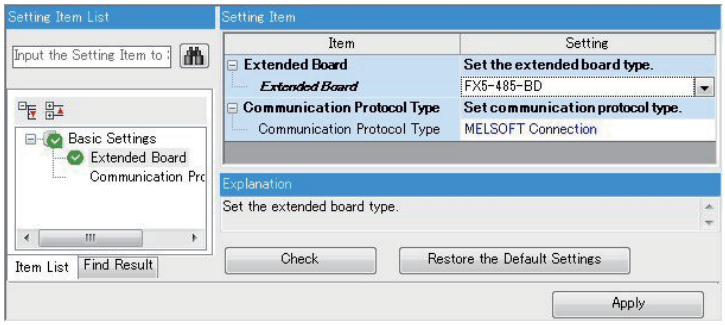
MELSEC iQ-F series manuals

Leave the module parameter settings as default (MELSOFT connection).

Setting a value other than the default disables communication with the GOT.

■Module parameter setting

(When using the FX5-485-BD)



Point

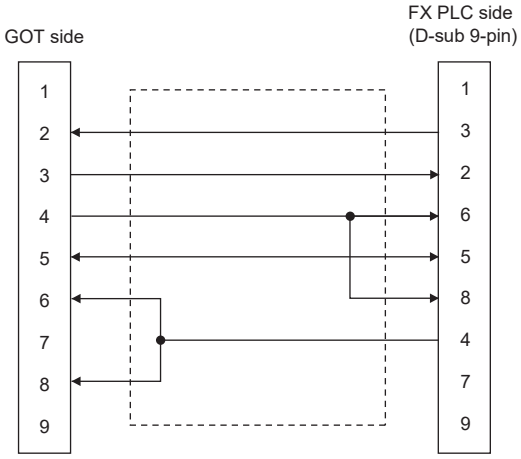
When changing the module parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

5.3.3 Connection diagram

The following diagram shows the connection between the GOT and the controller.

RS-232 connection diagram (1)



Preparation of the RS-232 cable

■Cable length

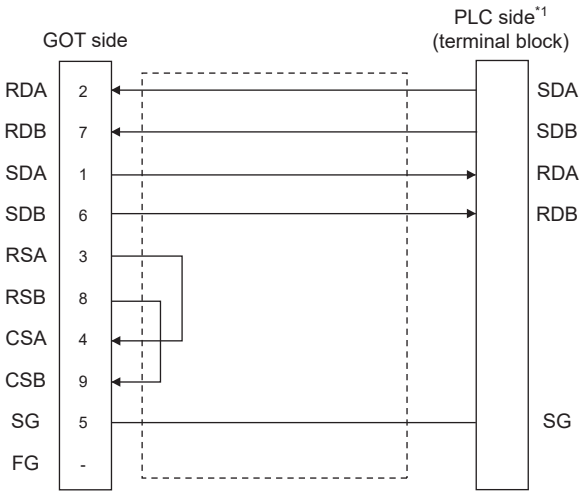
The length of the RS-232 cable must be 15 m or less.

■GOT side connector

For the GOT side connector, refer to the following.

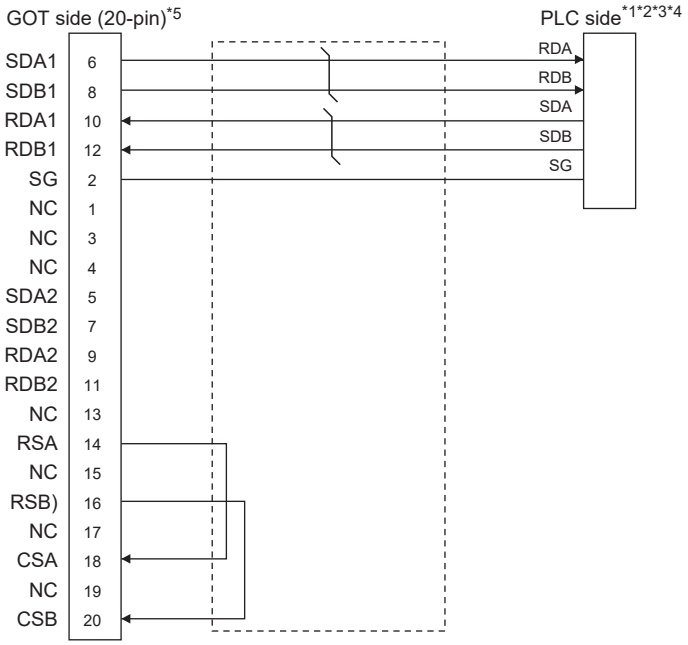
☞ Page 2954 GOT connector specifications

RS-422 connection diagram (1)



*1 Set the terminating resistor of the PLC side to "330Ω ".

RS-422 connection diagram (2)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

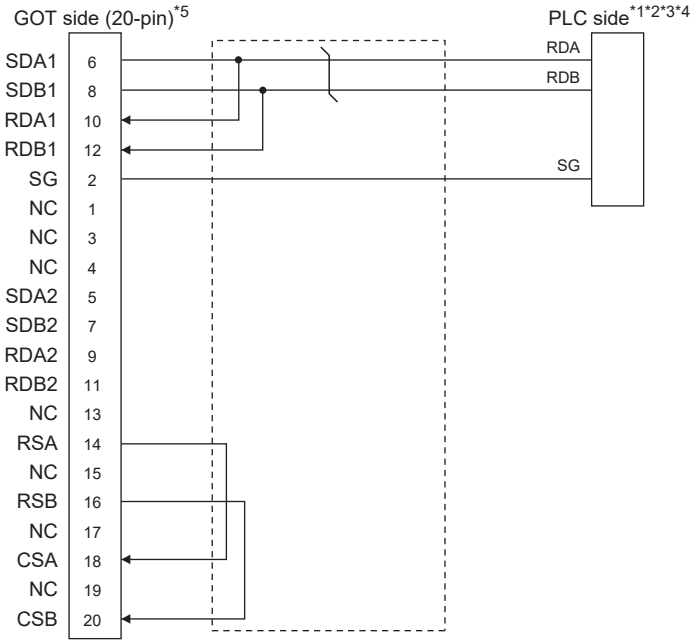
*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

RS-422 connection diagram (3)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

Preparation of the RS-422 cable

■Cable length

The length of the RS-422 cable must be 30 m or less.

■GOT side connector

For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

Connecting terminating resistors

■GOT side

When connecting a PLC to the GOT, a terminating resistor must be connected to the GOT.

Set the terminating resistor setting switch to "Not used".

For the procedure to set the terminating resistor, refer to the following.

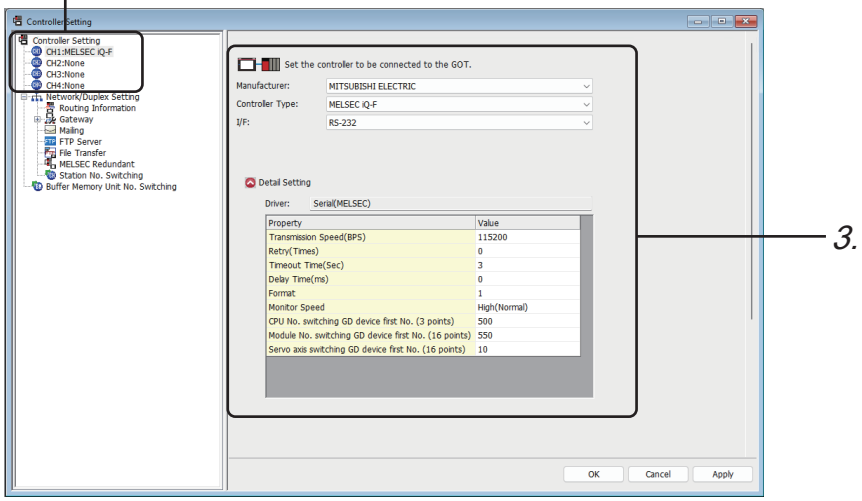
☞ Page 2956 Terminating resistors of GOT

5.3.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.

List menu



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item		Description
[Manufacturer]		[MITSUBISHI ELECTRIC]
[Controller Type]		[MELSEC iQ-F]
[I/F]	For GOT	• [RS-232] • [RS-422/485] • [Extend Unit]
	For GT SoftGOT3000	• [Serial 1] • [Serial 2]
[Detail Setting]		Configure the settings according to the usage environment. ☞ Page 559 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

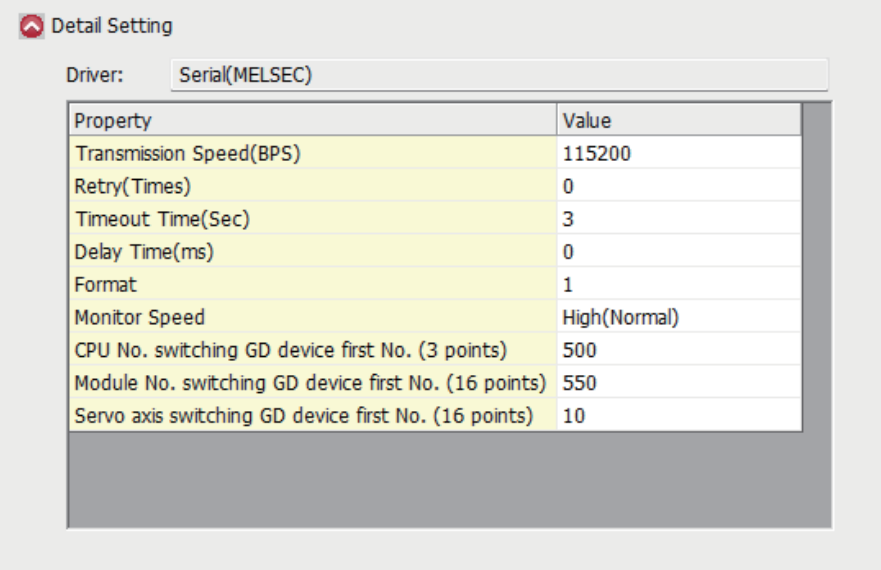
Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

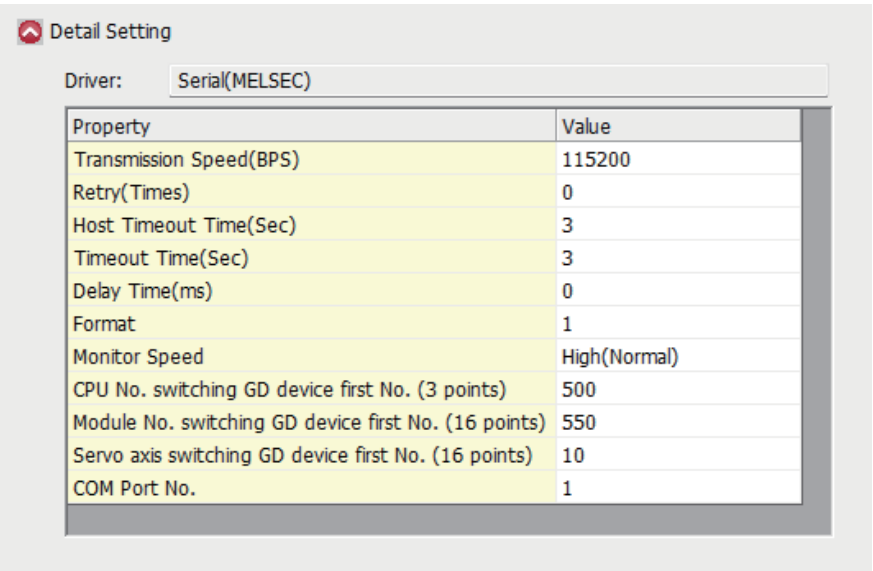
■[Detail Setting]

Configure the settings according to the usage environment.

- For GOT



- For GT SoftGOT3000



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Serial (MELSEC)]
[Transmission Speed]	Set this item to change the transmission speed used for communication with the connected equipment.	[9600] bps, [19200] bps, [38400] bps, [57600] bps, [115200] bps
[Retry]	Specify the number of retries to be performed during communication.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Host Timeout Time]*1	Set the time period until a communication timeout during monitoring of the host station.	[1] second to [90] seconds
[Timeout Time]	Specify the time period for a communication to time out.	[1] second to [30] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Format]	Set the communication format.	[1], [2]
[Monitor Speed]*3	Set the monitor speed of the GOT. This setting is not valid in all systems.	[High(Normal)]*2 [Middle] [Low]

Item	Description	Range
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 560 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 561 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 561 Start device number of the GD devices for servo axis switching	[0] to [65520]
[COM Port No.]*1	Specify the COM port number for communication.	[1] to [63]

*1 This item is displayed in GT SoftGOT3000 only.
*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.
*3 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
GT Designer3 (GOT3000) Screen Design Manual

Point

• Communication interface settings in the GT37 utility
The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.
For details on the GT37 utility, refer to the following manual.
GOT3000 Series User's Manual (Utility & Maintenance Functions)
• Priority of the settings in [Controller Setting]
When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number
[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.
Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].
[CPU No.] is specified with three consecutive GD devices, starting from the set device number.
When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen
Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.
• Indirect specification of a CPU number for multi-channel connection
If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.
Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.
• Indirect specification of a station number and a CPU number for multi-channel connection
When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.
Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Specifying a module number with a device

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Unit No.	GD device	Setting range
100	GD550	01 to 10 Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Point

By setting the GOT internal device, the GOT can disconnect specific parts from the controller's multiple connections.

For example, a faulty station that has a communication timeout can be disconnected from the system.

For details on the setting contents of the GOT internal device, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual

5.3.5 PLC side settings

No setting is required on the controller.

5.3.6 Access range for monitoring

Only the connected CPU can be accessed.

5.4 MELSEC-Q series (Built-in serial port connection)

☞ Page 564 Connectable devices
☞ Page 566 System configuration
☞ Page 568 GOT side settings
☞ Page 574 PLC side settings
☞ Page 574 Access range for monitoring
☞ Page 575 How to monitor a redundant system

5.4.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC-Q (Q mode)	Q00JCPU Q00CPU[*1] Q01CPU[*1] Q02CPU[*1]	○	GT37 SoftGOT3000

					GT37-IF2000 + GT15-RS4-9S	GT37 SoftGOT3000

*1 Product manufactured by MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.
For details on the product, contact MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.

Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC-Q	One GOT for one PLC

Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.

If you start the GOT before the PLC runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

Connection to QCPU

Do not set the serial communication function of Q00UJ/Q00U/Q01U/Q02U/Q03UD/Q04UDH/Q06UDH/Q10UDH/Q13UDH/Q20UDH/Q26UDHCPU, Q00/Q01CPU.

If it is set, communications may be unavailable.

Connection to Q170MCPU or Q170MSCPU(-S1)

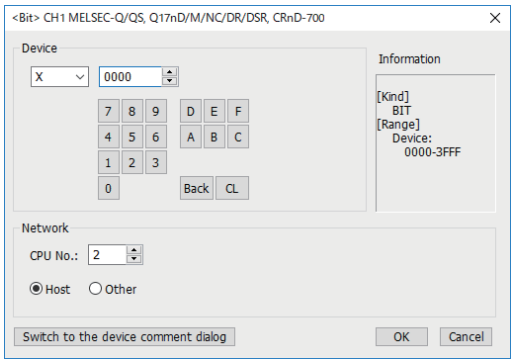
Set [CPU No.] to 2 in the device setting to monitor the device of the Motion CPU area (CPU No. 2).

When [CPU No.] is set to 0 or 1, the device on the PLC CPU area (CPU No. 1) is monitored.

When [CPU No.] is set to the number other than 0 to 2, a communication error occurs and the monitoring cannot be executed.

For the setting of [CPU No.], refer to the following.

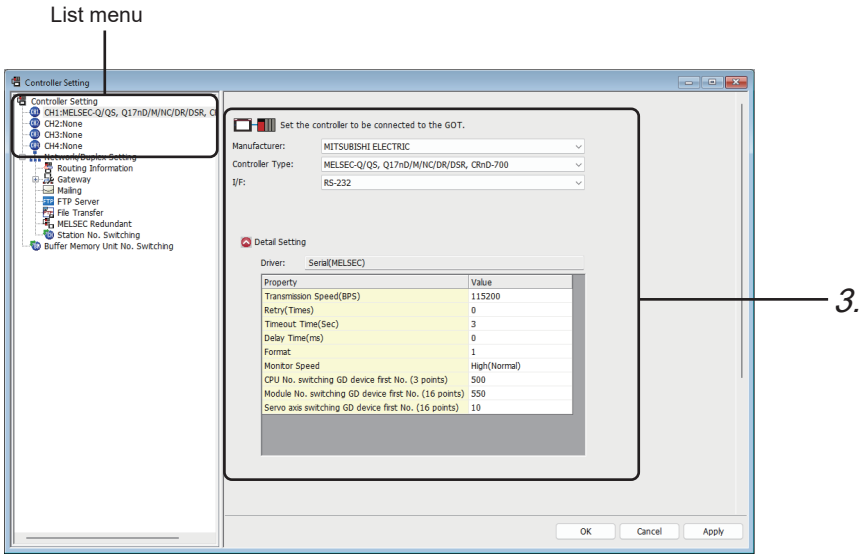
GT Designer3 (GOT3000) Screen Design Manual



5.4.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item		Description
[Manufacturer]		[MITSUBISHI ELECTRIC]
[Controller Type]		[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
[I/F]	For GOT	• [RS-232] • [RS-422/485] • [Extend Unit]
	For GT SoftGOT3000	• [Serial 1] • [Serial 2]
[Detail Setting]		Configure the settings according to the usage environment. ☞ Page 569 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

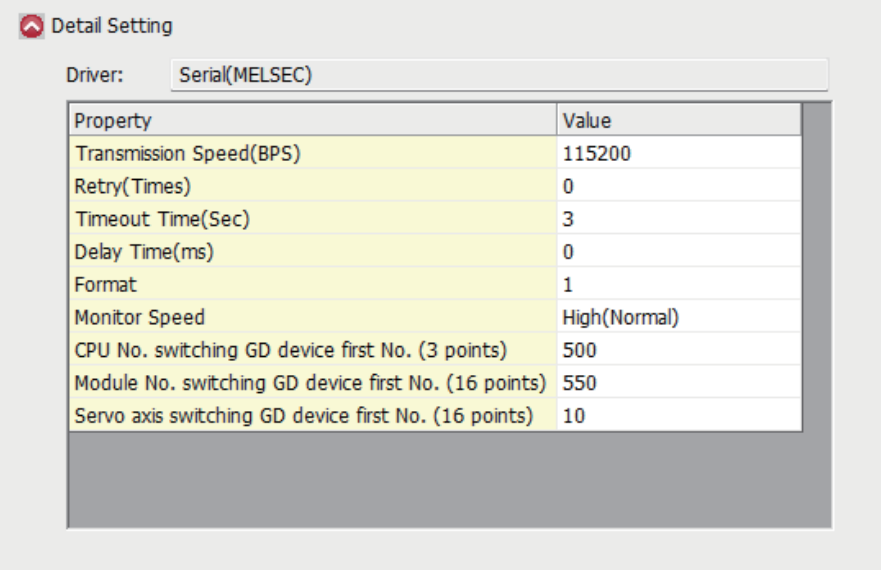
Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

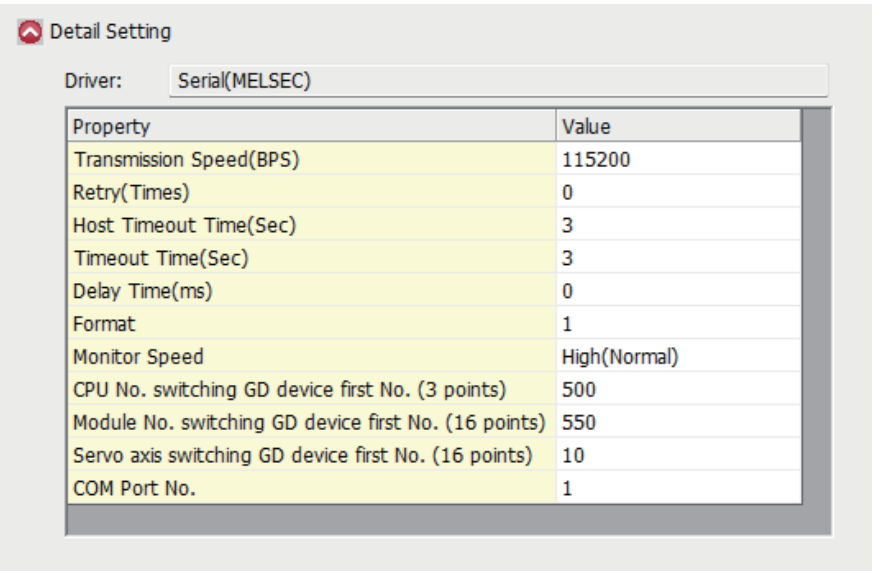
■[Detail Setting]

Configure the settings according to the usage environment.

- For GOT



- For GT SoftGOT3000



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Serial (MELSEC)]
[Transmission Speed]	Set this item to change the transmission speed used for communication with the connected equipment.	[9600] bps, [19200] bps, [38400] bps, [57600] bps, [115200] bps
[Retry]	Specify the number of retries to be performed during communication.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Host Timeout Time]*1	Set the time period until a communication timeout during monitoring of the host station.	[1] second to [90] seconds
[Timeout Time]	Specify the time period for a communication to time out.	[1] second to [30] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Format]	Set the communication format.	[1], [2]
[Monitor Speed]*4	Set the monitor speed of the GOT. This setting is not valid in all systems.	[High(Normal)]*2 [Middle] [Low]*3

Item	Description	Range
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 571 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 572 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 573 Start device number of the GD devices for servo axis switching	[0] to [65520]
[COM Port No.]*1	Specify the COM port number for communication.	[1] to [63]

*1 This item is displayed in GT SoftGOT3000 only.

*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen. However, when connected to Q00UJ/Q00U/Q01U/Q02UCPU or Q00J/Q00/Q01CPU, the sequence scan time may be affected. If you want to avoid the influence on the sequence scan time, do not set [High(Normal)].

*3 Set this range if you want to avoid the influence on the sequence scan time further than the [Middle] setting for connection to Q00UJ/Q00U/Q01U/Q02UCPU and Q00J/Q00/Q01CPU. However, the monitor speed may be reduced.

*4 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle]. If [Monitor speed] is set to [Low], a system error occurs when reading or writing. For details, refer to the following manual.
GT Designer3 (GOT3000) Screen Design Manual

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Specifying a module number with a device

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Point

By setting the GOT internal device, the GOT can disconnect specific parts from the controller's multiple connections.

For example, a faulty station that has a communication timeout can be disconnected from the system.

For details on the setting contents of the GOT internal device, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual

5.4.4 PLC side settings

No setting is required on the controller.

5.4.5 Access range for monitoring

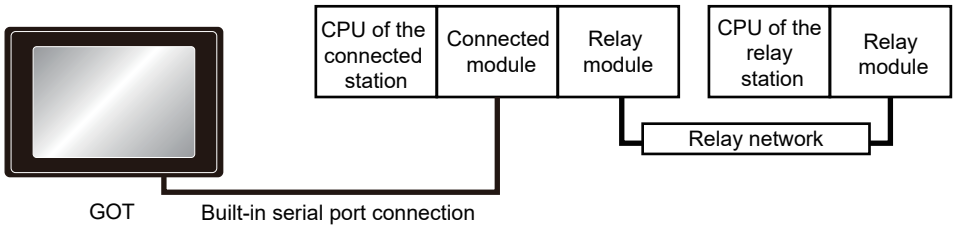
When the GOT is connected to the CPU of the station connected by built-in serial port connection, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station								
	Relay network	CPU of the relay station							
		RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
QnUCPU QnUHCPU	Ethernet	—	○	○*3	○	—	○	—	—
	CC-Link IE Controller Network	—	—	○	○	—	—	—	—
	CC-Link IE Field Network	—	○	○*1	○	—	—	—	—
	MELSECNET/H, MELSECNET/10	—	—	○	○	○	○	○*2	—
QnJCPU QnCPU QnHCPU QnPHRCPU	Ethernet	—	○	○*3	○	—	○	—	—
	CC-Link IE Controller Network	—	—	○	○	—	—	—	—
	MELSECNET/H, MELSECNET/10	—	—	○	○	○	○	○*2	—
QJ72LP25-25 QJ72LP25G	MELSECNET/H, MELSECNET/10	—	—	○	—	—	—	—	—

*1 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

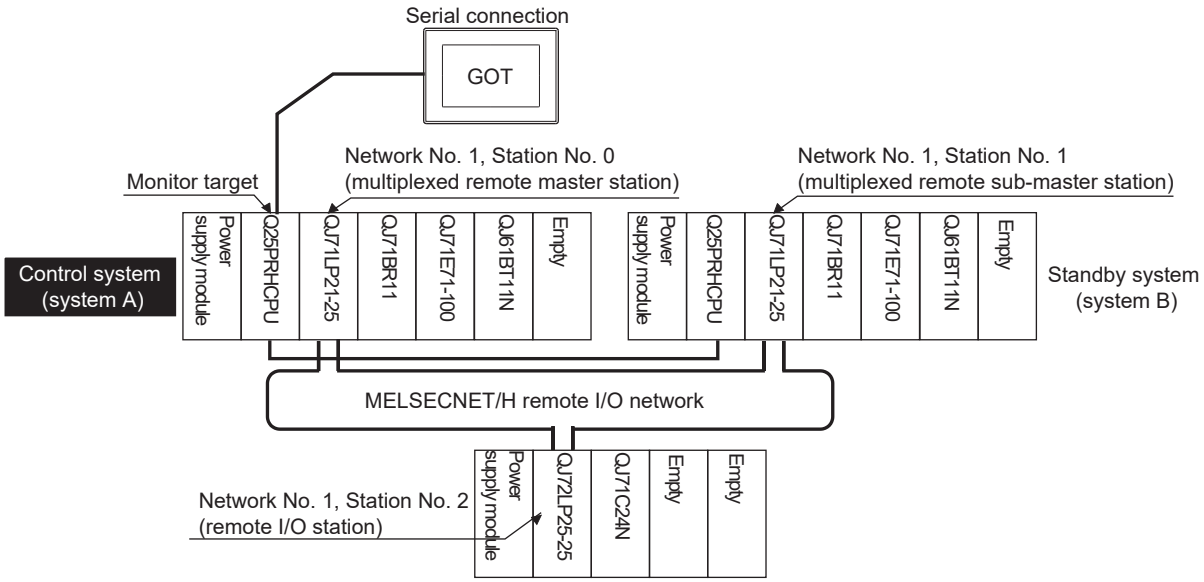
*2 AnUCPU and AnUSCPU are supported.

*3 The C Controller module (MELSEC-Q series) is not supported.

5.4.6 How to monitor a redundant system

This section explains the built-in serial port connection used to connect the GOT to a PLC CPU in the redundant system.
For the built-in serial port connection, use one GOT or two GOTs.

Example using a single GOT



■Connection method

Connect the GOT to the RS-232 interface of the PLC CPU (Q12PRHCPU, Q25PRHCPU) in the control system of the redundant system.

For details, refer to the following.

☞ Page 563 MELSEC-Q series (Built-in serial port connection)

■Settings in GT Designer3

Set GT Designer3 as follows.

Setting item	Contents of setting	Model
Model	MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700	GT37 SoftGOT3000
Device setting (Network setting)	Host station	
MELSEC redundant setting	☞ Page 581 MELSEC redundant settings	

■Monitoring target change when system switching occurs in a redundant system

When system switching occurs, the PLC CPU (another station) that has switched to the control system continues the operation of the host station.

Since the GOT monitors the control system, the monitoring target is automatically changed to the other station.

Point

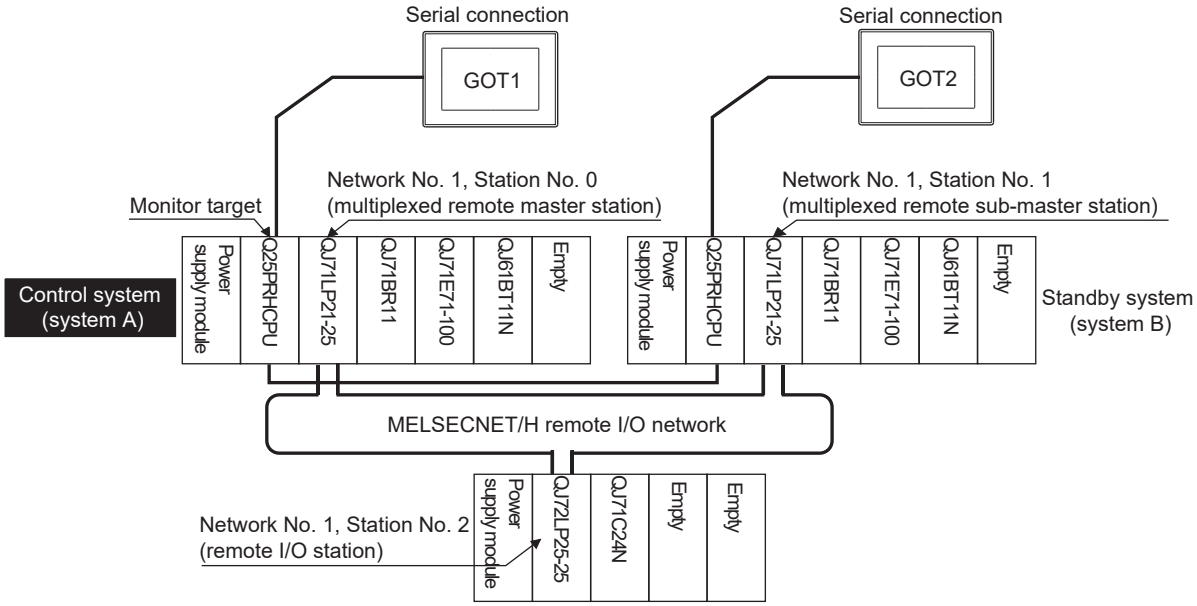
When monitoring control system without MELSEC redundant settings

If system switching occurs without the MELSEC redundant settings, the GOT cannot change the monitoring target at the time of system switching since it monitors the connected PLC CPU (host station).

As a countermeasure, reconnect the cable from the PLC CPU of the previous control system to the PLC CPU of the control system after system switching.

Example using two GOTs

Connect one GOT to each PLC CPU to support system switching.



■Connection method

Connect the GOTs to the RS-232 interfaces of the PLC CPUs (Q12PRHCPU and Q25PRHCPU) in the control and standby systems of the redundant system.

For details, refer to the following.

☞ Page 518 Serial connection

■Settings in GT Designer3

Set GT Designer3 as follows.

Setting item	Contents of setting	Model
Model	MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700	GT37, SoftGOT3000
Device setting (Network setting)	Host station	
MELSEC redundant setting	☞ Page 581 MELSEC redundant settings	

■Monitoring target change when system switching occurs in a redundant system

When system switching occurs, the GOT cannot change the monitoring target automatically.

After system switching, monitoring continues on the GOT connected to the PLC CPU.

Unlike when using a single GOT, there is no need for cable reconnection to the connected PLC CPU.

Point

To automatically monitor the control system after system switching with a single GOT, configure the MELSEC redundant settings.

☞ Page 581 MELSEC redundant settings

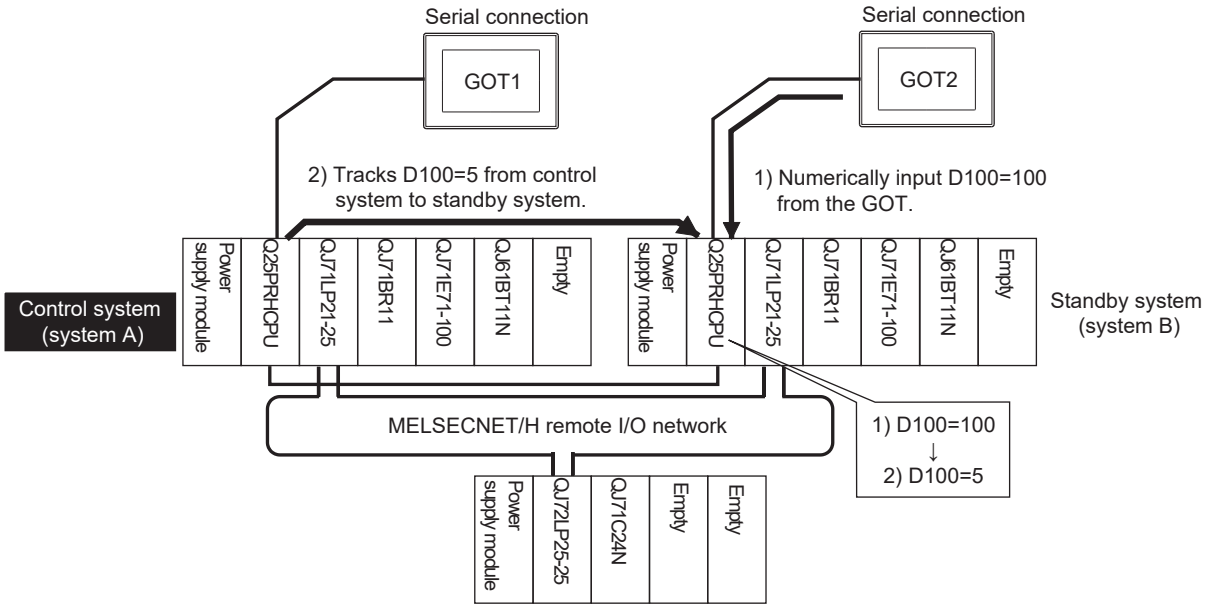
Precautions for built-in serial port connection to a CPU in the redundant system without MELSEC redundant settings

- The GOT monitors only the connected PLC CPU and cannot change the monitoring target in a redundant system.

To enable monitoring target change, reconnect the cable between the GOT and the PLC CPU to another PLC CPU, or connect a GOT to each PLC CPU.

- When monitoring a PLC CPU in a redundant system using the direct CPU connection (serial), only the PLC CPU connected to the GOT can be monitored.
- When connected to the standby system PLC CPU, the writing of the GOT to a device in the connected PLC CPU is not reflected. Design a monitor screen that disables writing to the standby system.

In the redundant system, the tracking function transfers device data from control system to standby system.
When the tracking function is enabled, the device value of the standby system PLC CPU is overwritten by the device value transferred from the control system to the standby system even if the GOT writes to the standby system PLC CPU (Numerical input, Ascii input, Script, Recipe, or others).



As countermeasures to the above, perform the following.

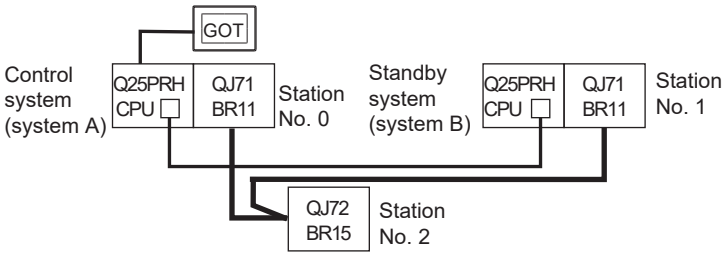
- Display a monitor screen which indicates that "the connected PLC CPU is the standby system" on a GOT when connecting the GOT to the standby system PLC CPU.
- To display the specified monitor screen when connecting the GOT to the standby system PLC CPU, use the special relay SM1515 (Control status identification flag) of the PLC CPU.

(When the SM1515 is OFF, the connected PLC CPU is the standby system)

- Control the operation of each object by the SM1515, which is set for the operation condition.
- For the screen switching device, use a GOT internal device.

If a device of the PLC CPU is used, the trigger action operation of the GOT may be disabled since the device data of the PLC CPU will is overwritten by the device value transferred with the redundant system tracking function.
The following diagram shows an example of screen setting using SM1515.

System configuration example: when using one GOT

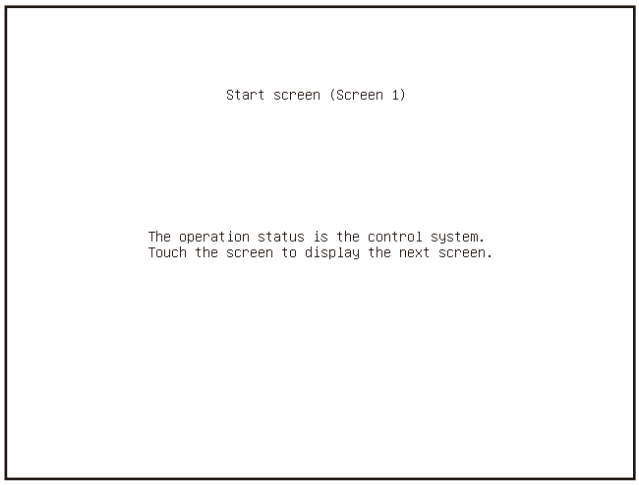


Create a monitor screen on the base screen 1 that performs the following operations for when connecting a GOT to control system and standby system.

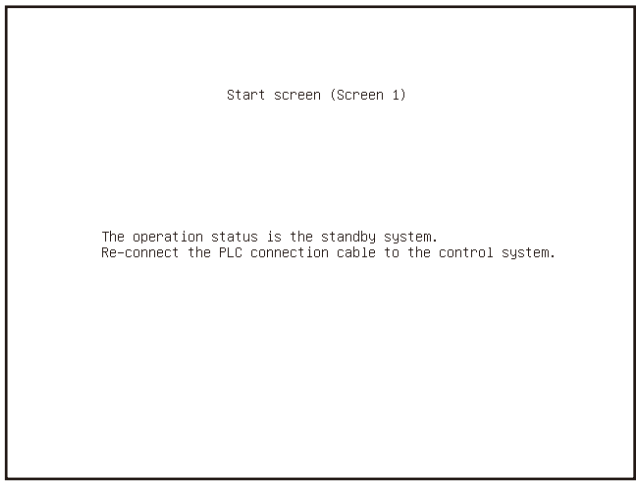
1) When connecting to the control system, the monitor screen displays a message calling a touch switch operation, by which the screen switches to the next screen.

2) When connecting to the standby system, the monitor screen displays a message calling the reconnection of the connection cable.

1) When connecting to the control system



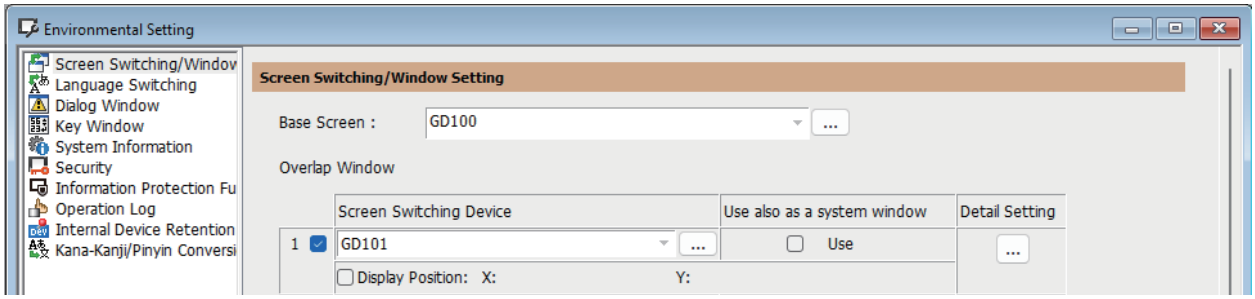
2) When connecting to the standby system



1. Set the screen switching device of the base screen.

Select [Common] → [GOT Environmental Setting] → [Screen Switching/Window], and set the internal device GD100 as the base screen switching device.

(Do not use PLC CPU devices for the screen switching device. If used, the Trigger Action operation of the GOT may be disabled since the device data of the PLC CPU is overwritten by the device value transferred with the redundant system tracking function.)

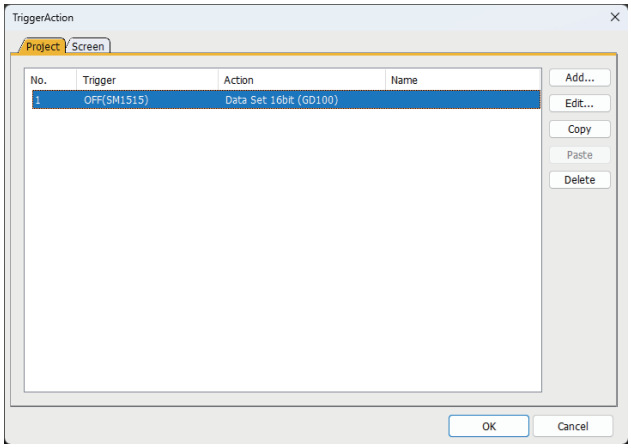


2. Set the trigger action.

Make the setting so that the base screen 1 is displayed when the connected PLC CPU is the standby system (SM1515 is OFF) in the project specified by selecting [Common] → [Trigger Action].

Condition 1: SM1515 (while OFF) ← When SM1515 is OFF, the connected PLC CPU is the standby system. Operation: GD100=1 ← Switch the screen to base screen 1.

Create the trigger action in the project on the Project tab.



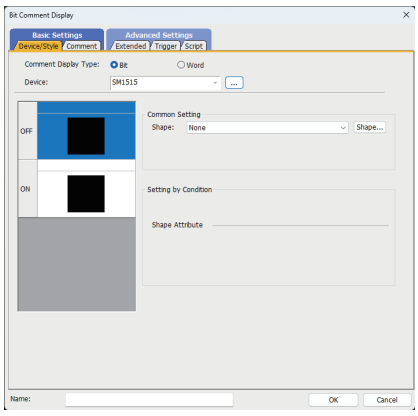
3. Set the comment display on the base screen 1.

Set a comment to be displayed on the base screen 1 depending on the system status (ON/OFF of the SM1515) of the connected PLC CPU using the Comment Display (Bit).

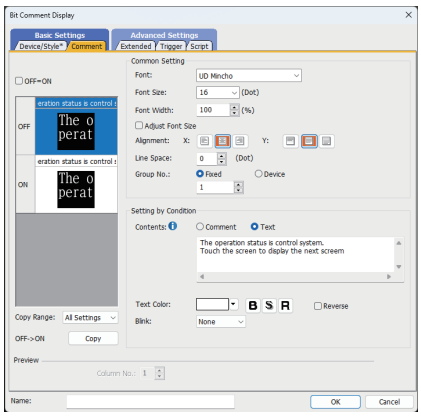
Select [Object] → [Comment Display] → [Bit Comment] and set Comment Display (Bit).

Device/Style tab Device: SM1515 Shape: None Comment tab: Basic Comment Comment Display Type, Text (ON): The operation status is control system. Touch the screen to display the next screen. Comment Display Type, Text (OFF): The operation status is standby system. Reconnect the PLC connection cable to the control system.

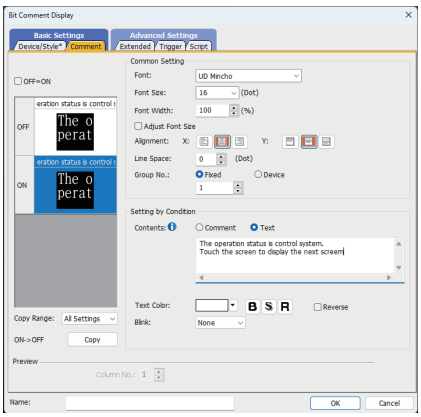
1) Device/Style tab screen



2) Comment tab screen (ON status)



3) Comment tab screen (OFF status)



4. Set the touch switches on the base screen 1.

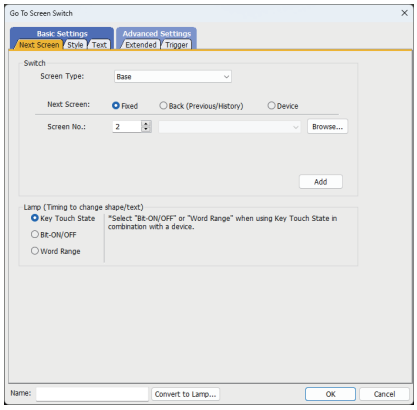
By using the go to screen switch function, set a touch switch for shifting the screen to the next screen with a screen touch, when the connected PLC CPU is the control system (SM1515 is ON).

Select [Object] → [Switch] → [Go To Screen Switch] and set the screen switching function.

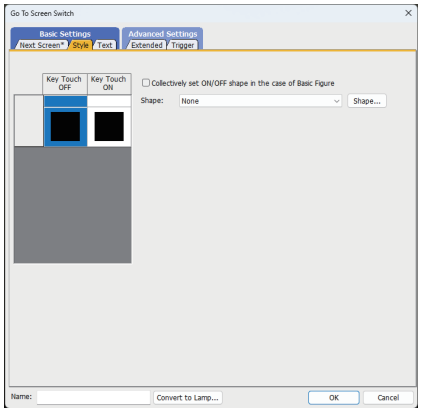
Set the same size for the touch switch as the base screen size so that touching any place of the screen enables the switch operation.

Next Screen tab
Screen Type: Base
Next Screen: Fixed, 2
Style tab
Display Style: None (Shape)
Trigger tab
Trigger Type: ON
Trigger Device: SM1515

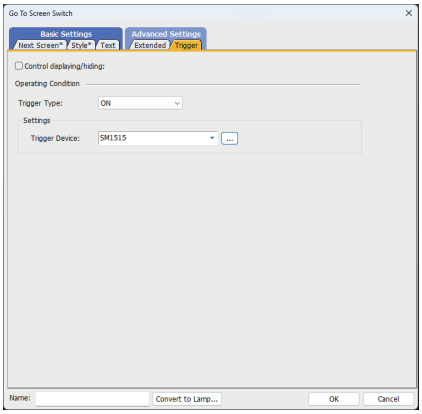
1) Next Screen tab



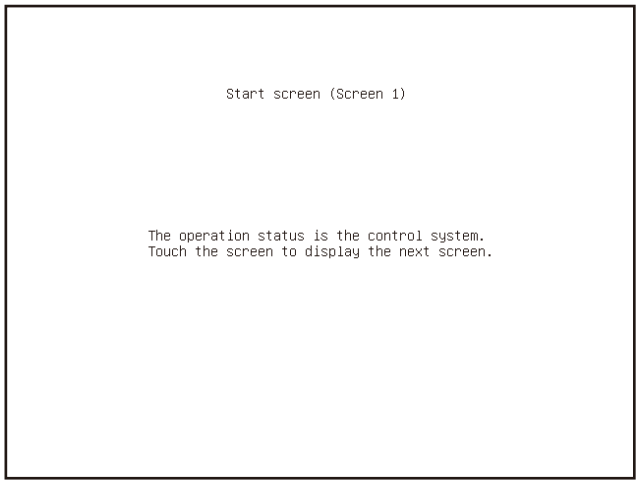
2) Style tab screen



3) Trigger tab screen



The following shows the created base screen 1.



MELSEC redundant settings

This section describes the settings for the GOT to automatically change the monitoring target of the QCPU redundant system.

Point

Before configuring the MELSEC redundant settings

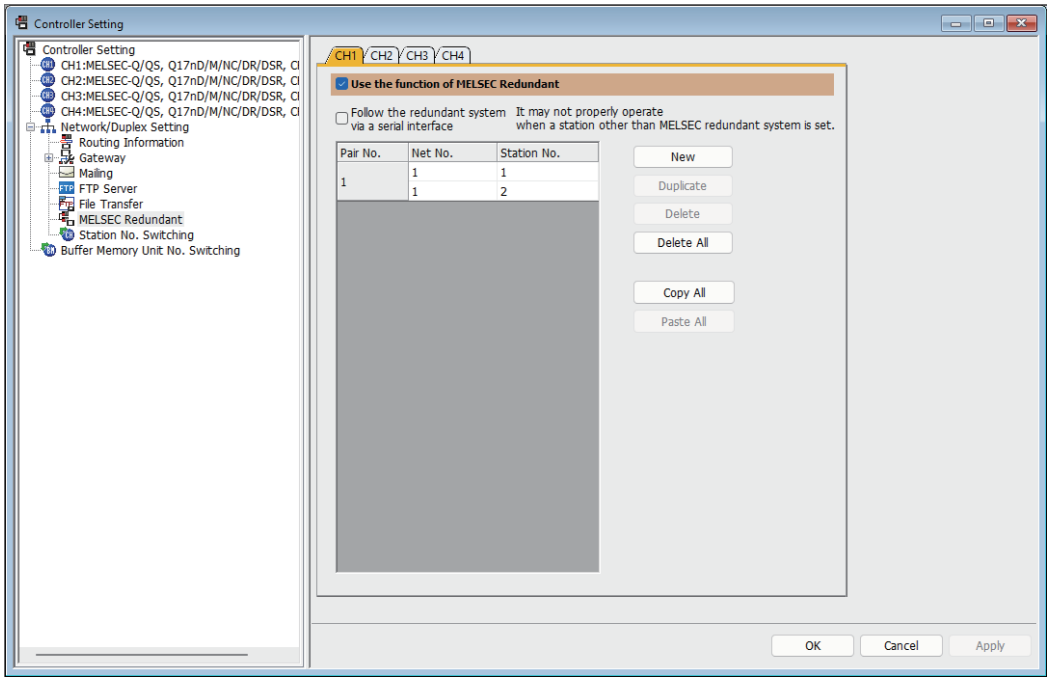
In the MELSEC redundant settings, do not set a station outside the redundant QCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC redundant setting dialog, settings can be made for each channel of the controller.

The following shows an example of the serial connection (station No. 4) with redundant CPU pair No. 1 to No. 2, network No. 1, and redundant CPU station No. 0 to No. 3.

Ex.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Copies one setting of the selected pair number and adds it below the bottom row.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 582 Pair number

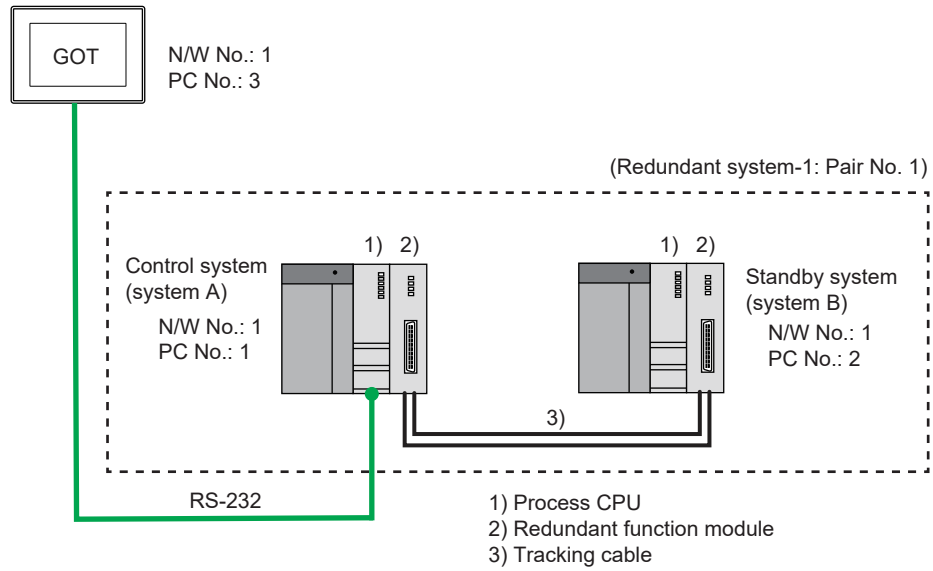
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of serial connection in the QCPU redundant system. (Pair No.1)

Ex.



Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- The last station number and station number 1 (example: station number 64 and station number 1) cannot be paired.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the operation mode of the QCPU redundant system, and does not support the debug mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

- 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

[450: Path has changed or timeout occurred in redundant system.] appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, [451: The MELSEC redundant setting and actual system configuration do not match.] appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings. If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm [315 Device writing error. Correct device.] is not detected.

■Connection to the remote I/O station

• The GOT can monitor only the following GOT functions.

Monitor function, system monitor function

• The GOT does not allow the PLC CPU clock of the master station to be set in the clock setting of the utility.

The master station clock will not change even if the clock setting is made.

Use GX Works2 or similar software to set the PLC CPU clock of the master station.

■Option functions including the ladder monitor

A message "Unable to communicate with CPU." is displayed when system switching occurs while an option function such as the ladder monitor is used.

■In the built-in serial port connection

In the built-in serial port connection, the GOT fails to automatically change the monitoring target in the following cases.

• When the power supply to the CPU where the GOT is connected is OFF

• When the cable connecting the GOT with the CPU is broken

• When the tracking is disabled

■When the QCPU redundant system is in the debug mode

When the QCPU redundant system is in the debug mode, do not make the MELSEC redundant system setting for the GOT side when connecting the GOT.

5.5 MELSEC-Q series (serial communication connection)

☞ Page 584 Connectable devices
☞ Page 587 System configuration

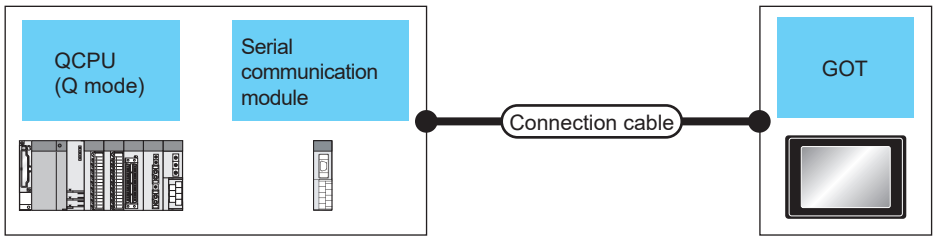
*1 To configure a multiple CPU system, use a CPU with function version B or later.
*2 Use a module having a serial number starting with 12042 or later.
*3 When using SV13, SV22, or SV43, use a Motion CPU with the following version of OS installed.
• SW6RN-SV13Q□: 00E or later
• SW6RN-SV22Q□: 00E or later
• SW6RN-SV43Q□: 00B or later
*4 Use main modules with the following product numbers.
• Q172CPU: Product number K******* or later
• Q173CPU: Product number J******* or later
*5 RS-485 communication cannot be performed.
The A0J2-C214-S1 cannot be used.
*6 Either CH1 or CH2 can be used for the function version A.
Both CH1 and CH2 can be used together for the function version B or later.
*7 Only CH2 can be connected.
*8 Use a serial port of the serial communication module controlled by another module in the multiple CPU system.

5.5.2 System configuration



For details on the maximum number of connected devices, refer to the following.

☞ Page 588 Maximum number of connected devices

PLC			Connection cable		GOT	
Controller	**Serial communication module**[*1]	**Communication type**	**Cable model**	**Maximum length**	**Interface**	**Model**

*1 For the system configuration of the serial communication module, refer to the following manual.
Q Corresponding Serial Communication Module User's Manual (Basic)
For details on the system configuration on the modem interface module side, refer to the following manual.
Modem Interface Module User's Manual
*2 The shortest specification on the PLC side is prioritized.
*3 The terminal block converter module is manufactured by MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.
For details on the product, contact MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.
*4 The cable length of the terminal block converter module is included.

Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC-Q	Two GOTs for one serial communication module*1 One GOT for one modem interface module

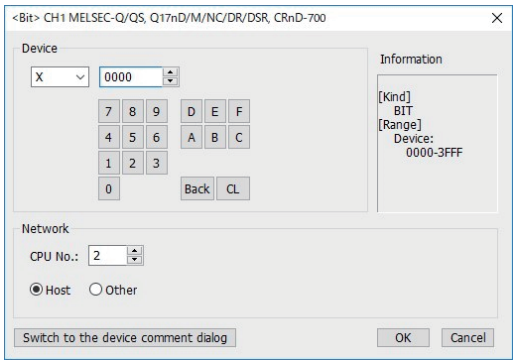
*1 Two GOTs can be connected with the function version B or later of the serial communication module.

Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.
If you start the GOT before the PLC runs, a system alarm occurs.
Adjust the time to display the GOT startup screen to prevent a system alarm.
GT Designer3 (GOT3000) Screen Design Manual

When monitoring the Q170MCPU or Q170MSCPU(-S1)

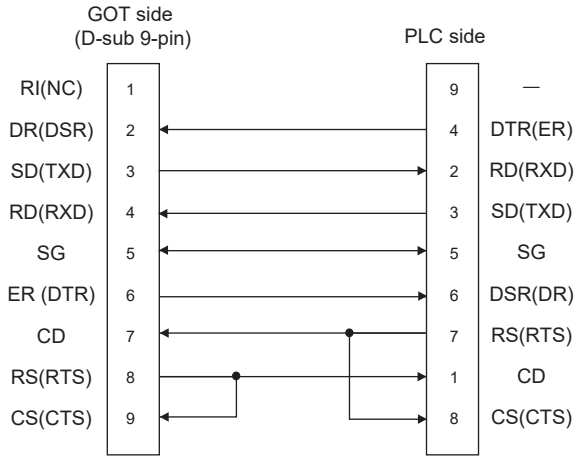
Set [CPU No.] to 2 in the device setting to monitor the device of the Motion CPU area (CPU No. 2).
When [CPU No.] is set to 0 or 1, the device on the PLC CPU area (CPU No. 1) is monitored.
When [CPU No.] is set to the number other than 0 to 2, a communication error occurs and the monitoring cannot be executed.
For the setting of [CPU No.], refer to the following.
GT Designer3 (GOT3000) Screen Design Manual



5.5.3 Connection diagram

The following diagram shows the connection between the GOT and the controller.

RS-232 connection diagram (1)



Preparation of the RS-232 cable

■Cable length

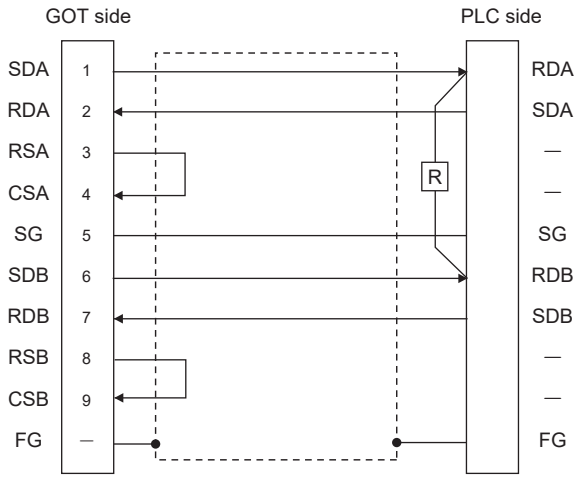
The length of the RS-232 cable must be 15 m or less.

■GOT side connector

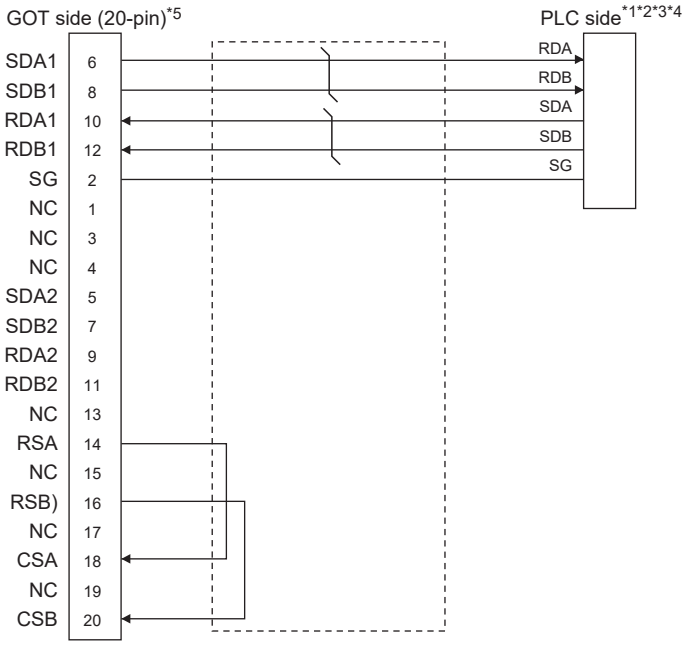
For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

RS-422 connection diagram (1)



RS-422 connection diagram (2)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

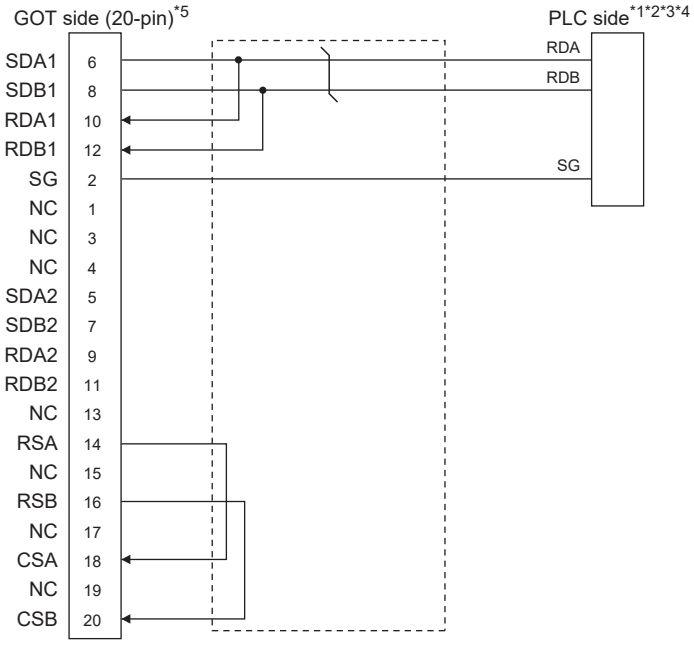
*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

RS-422 connection diagram (3)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

Preparation of the RS-422 cable

■Cable length

The length of the RS-422 cable must be 1200 m or less.

■GOT side connector

For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

Connecting terminating resistors

■GOT side

When connecting a PLC to the GOT, a terminating resistor must be connected to the GOT.

Set the terminating resistor setting switch to "Not used".

For the procedure to set the terminating resistor, refer to the following.

☞ Page 2956 Terminating resistors of GOT

■Serial communication module or computer link module side

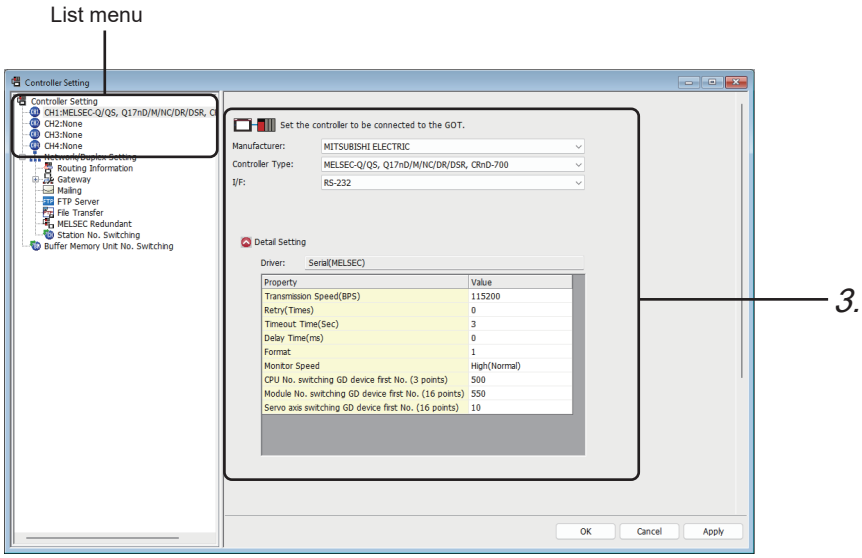
Connect a terminating resistor (330 Ω 1/4 W) to the serial communication module or computer link module side. For instructions on connecting terminating registers, refer to the following manual.

📖User's manual of the serial communication module or computer link module used

5.5.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item		Description
[Manufacturer]		[MITSUBISHI ELECTRIC]
[Controller Type]		[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
[I/F]	For GOT	• [RS-232] • [RS-422/485] • [Extend Unit]
	For GT SoftGOT3000	• [Serial 1] • [Serial 2]
[Detail Setting]		Configure the settings according to the usage environment. ☞ Page 593 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

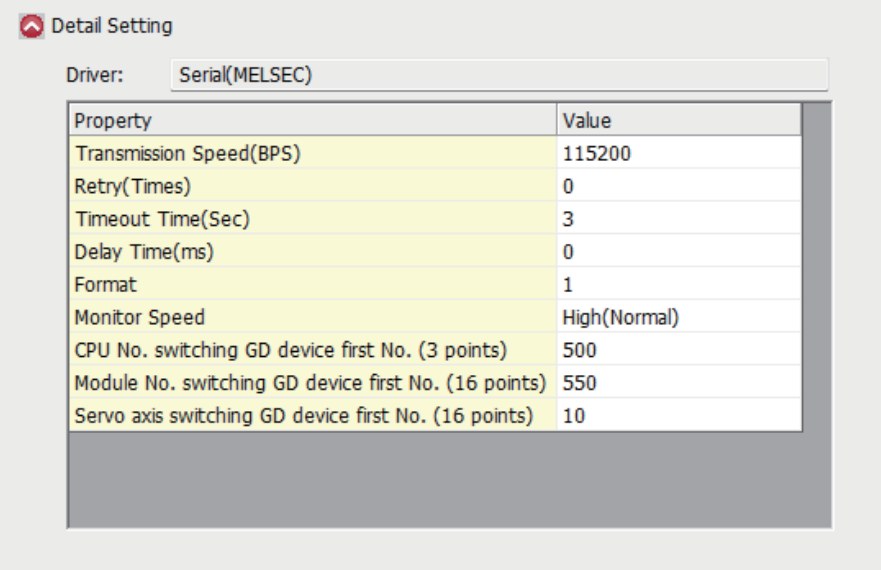
Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

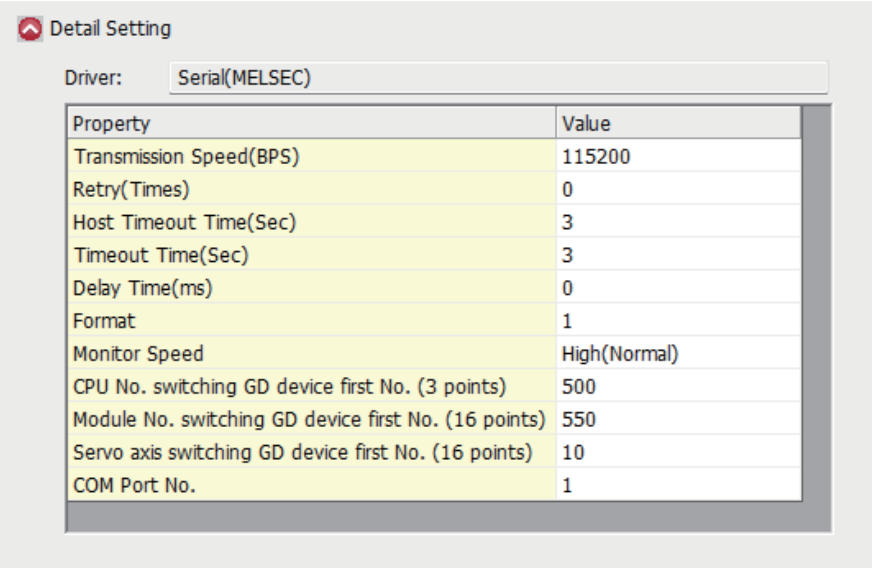
■[Detail Setting]

Configure the settings according to the usage environment.

- For GOT



- For GT SoftGOT3000



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Serial (MELSEC)]
[Transmission Speed]	Set this item to change the transmission speed used for communication with the connected equipment.	[9600] bps, [19200] bps, [38400] bps, [57600] bps, [115200] bps
[Retry]	Specify the number of retries to be performed during communication.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Host Timeout Time]*1	Set the time period until a communication timeout during monitoring of the host station.	[1] second to [90] seconds
[Timeout Time]	Specify the time period for a communication to time out.	[1] second to [30] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Format]*5	Set the communication format.	[1], [2]
[Monitor Speed]*4	Set the monitor speed of the GOT. This setting is not valid in all systems.	[High(Normal)]*2 [Middle] [Low]*3

Item	Description	Range
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 595 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 596 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 597 Start device number of the GD devices for servo axis switching	[0] to [65520]
[COM Port No.]*1	Specify the COM port number for communication.	[1] to [63]

*1 This item is displayed in GT SoftGOT3000 only.

*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen. However, when connected to Q00UJ/Q00U/Q01U/Q02UCPU or Q00J/Q00/Q01CPU, the sequence scan time may be affected. If you want to avoid the influence on the sequence scan time, do not set [High(Normal)].

*3 Set this range if you want to avoid the influence on the sequence scan time further than the [Middle] setting for connection to Q00UJ/Q00U/Q01U/Q02UCPU and Q00J/Q00/Q01CPU. However, the monitor speed may be reduced.

*4 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle]. If [Monitor speed] is set to [Low], a system error occurs when reading or writing. For details, refer to the following manual.
GT Designer3 (GOT3000) Screen Design Manual

*5 Set this item when replacing the F900 series with the GOT3000 series.

- To change the transmission speed of the serial communication module connected to the F900 to 115200 bps, configure the settings as follows.

[Intelligent function module switch setting] of PLC

Switch No.	CH1 side	CH2 side
Switch 1	0000H	-
Switch 2	0000H	-
Switch 3	-	0000H
Switch 4	-	0000H
Switch 5	0000H	0000H

GOT communication settings

Item	Setting value
Format	1

- To continue using the transmission speed of 38400 bps for the serial communication module connected to the F900, configure the settings as follows.

GOT communication settings

Item	Setting value
Format	2

Point

- Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.
For details on the GT37 utility, refer to the following manual.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

- Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Specifying a module number with a device

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Point

By setting the GOT internal device, the GOT can disconnect specific parts from the controller's multiple connections.

For example, a faulty station that has a communication timeout can be disconnected from the system.

For details on the setting contents of the GOT internal device, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual

The GOT operates under the following transmission specifications when it is connected to a Mitsubishi Electric PLC in the computer link connection.

Transmission specifications	Setting
Data bit	8 bits
Parity bit	Yes (Odd)
Stop bit	1 bit
Sum check	Yes
Transmission speed (Baud rate)	Set the same transmission speed on both the GOT and the PLC.

Point

• Serial communication module (MELSEC-Q series)

For details on the serial communication module (MELSEC-Q series), refer to the following manual.

Q Corresponding Serial Communication Module User's Manual (Basic)

• Modem interface module

For details on the modem interface module, refer to the following manual.

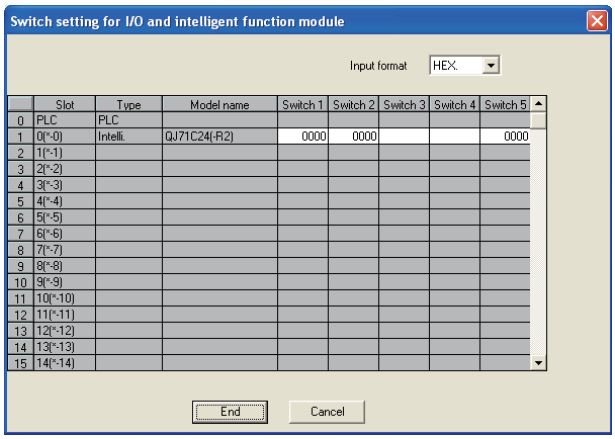
Modem Interface Module User's Manual

■[Intelligent function module switch setting] in GX Developer

[Intelligent function module switch setting] in GX Developer is not necessary. (When [Intelligent function module switch setting] is not configured, the module runs in GX Developer connection mode.)

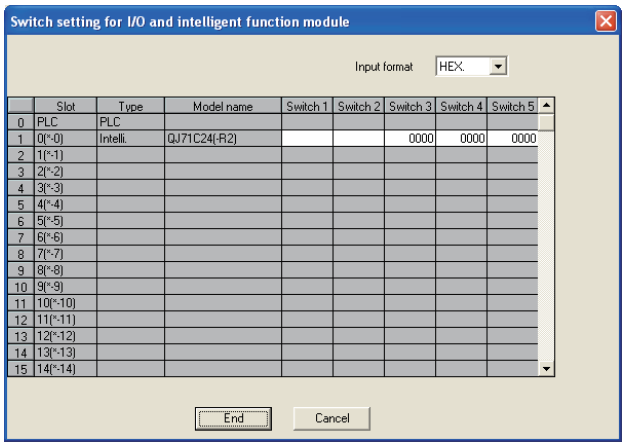
A module can be also connected to the GOT by configuring [Intelligent function module switch setting] in GX Developer as shown below.

• When connecting to the CH1 side



Switch No.	Bit		Description			Setting value*3
	Position	Specified value				
Switch 1	b0	OFF	CH1 transmission settings*1	Operation setting	(Operates according to the GOT side specifications.)	0000H
	b1	OFF		Data bit		
	b2	OFF		Parity bit		
	b3	OFF		Even/odd parity		
	b4	OFF		Stop bit		
	b5	OFF		Sum check code		
	b6	OFF		Write during RUN		
	b7	OFF		Setting modifications		
	b8 to b15	—	CH1 transmission speed setting*2			
Switch 2	—		CH1 Communication protocol setting		GX Developer connection	0000H
Switch 5	—		Station number setting		0th station	0000H

• When connecting to the CH2 side



Switch No.	Bit		Description			Setting value*3
	Position	Specified value				
Switch 3	b0	OFF	CH2 transmission settings*1	Operation setting	(Operates according to the GOT side specifications.)	0000H
	b1	OFF		Data bit		
	b2	OFF		Parity bit		
	b3	OFF		Even/odd parity		
	b4	OFF		Stop bit		
	b5	OFF		Sum check code		
	b6	OFF		Write during RUN		
	b7	OFF		Setting modifications		
	b8 to b15	—	CH2 transmission speed setting*2			
Switch 4	—		CH2 Communication protocol setting		GX Developer connection	0000H
Switch 5	—		Station number setting		0th station	0000H

*1 The module operates under the following transmission specifications.

Transmission specifications	Setting details
Operation setting	Independent
Data bit	8 bits
Parity bit	Yes
Even/odd parity	Odd
Stop bit	1 bit
Sum check code	Yes

*2 The serial communication module operates at the transmission speed set on the GOT.

*3 When the value of switch setting is other than [0], the setting of [Format] and [Transmission Speed] on the GOT side are required to be changed.

☞ Page 593 [Detail Setting]

Point

• When [Intelligent function module switch setting] is configured

After writing PLC parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• Connection of multiple GOTs

To some serial communication module models, two GOTs can be connected using both CH1 and CH2.

Model	Connection of 2 GOTs	
	Function version A	Function version B
QJ71C24(-R2)	△	○
QJ71C24N(-R2/R4)	-	○

○: 2 GOTs connectable, △: 1 GOT connectable, -: Not applicable

• When connecting to the modem interface module

When the modem interface module is connected, only CH2 can be used.

5.5.6 Access range for monitoring

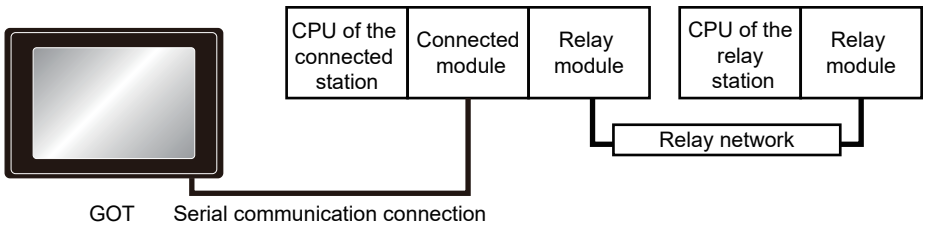
When the GOT is connected to the CPU of the station connected by serial communication connection, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station								
		Relay network	CPU of the relay station							
			RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU

*1 The shortest specification on the PLC side is prioritized.

*2 Product manufactured by MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.
For details on the product, contact MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.

*3 The cable length of the terminal block converter module is included.

Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	Number of connectable devices
MELSEC-L	One GOT for one PLC

GOT startup for connection to LCPU

■When a system alarm occurs at GOT startup

LCPU may diagnose the SD card (file system check, recovery processing, etc.) when the LCPU is turned off then on or reset.

Therefore, it takes time until the SD card becomes available.

If the GOT is started during this time, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

■When the module is L02SCPU or L02SCPU-P

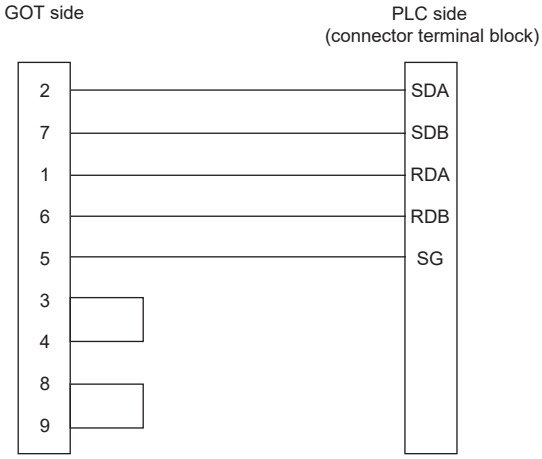
Do not set the serial communication function of L02SCPU or L02SCPU-P.

If it is set, communications may be unavailable.

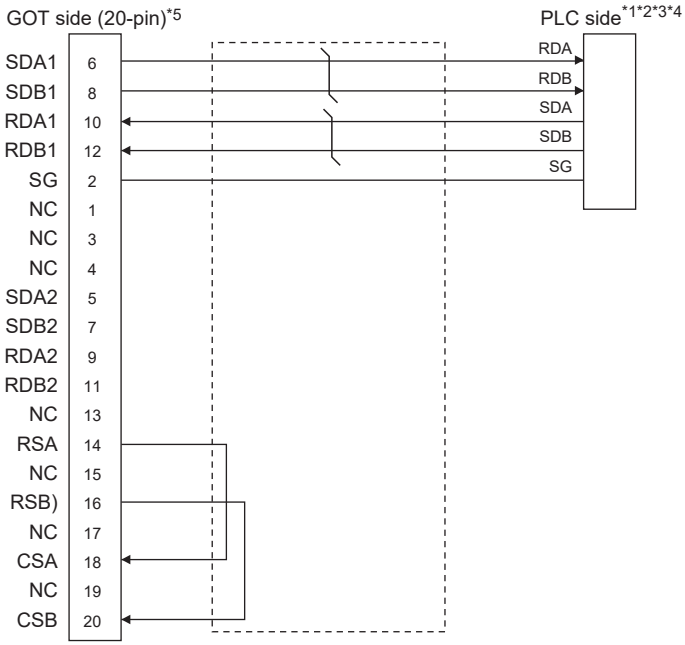
5.6.3 Connection diagram

The following diagram shows the connection between the GOT and the controller.

RS-422 connection diagram (1)



RS-422 connection diagram (2)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

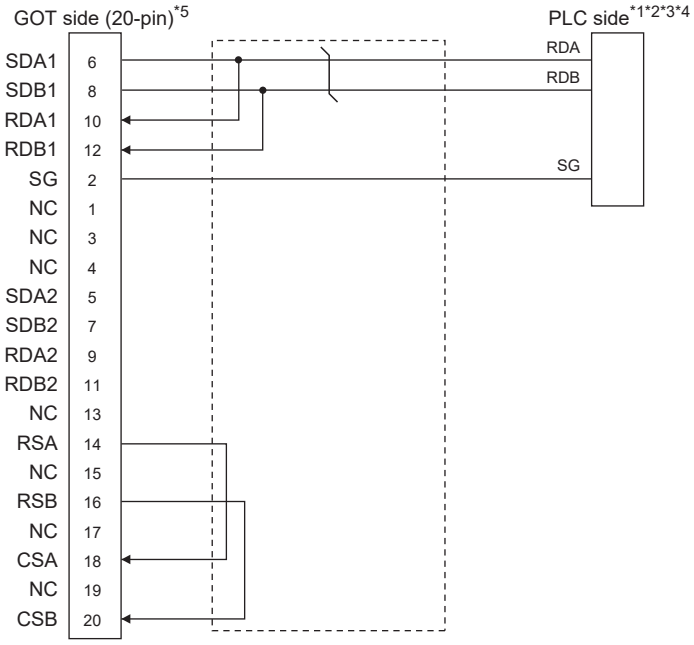
*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

RS-422 connection diagram (3)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

Preparation of the RS-422 cable

■Cable length

The length of the RS-422 cable must be 1200 m or less.

■GOT side connector

For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

Connecting terminating resistors

■GOT side

When connecting a PLC to the GOT, a terminating resistor must be connected to the GOT.

Set the terminating resistor setting switch to "Not used".

For the procedure to set the terminating resistor, refer to the following.

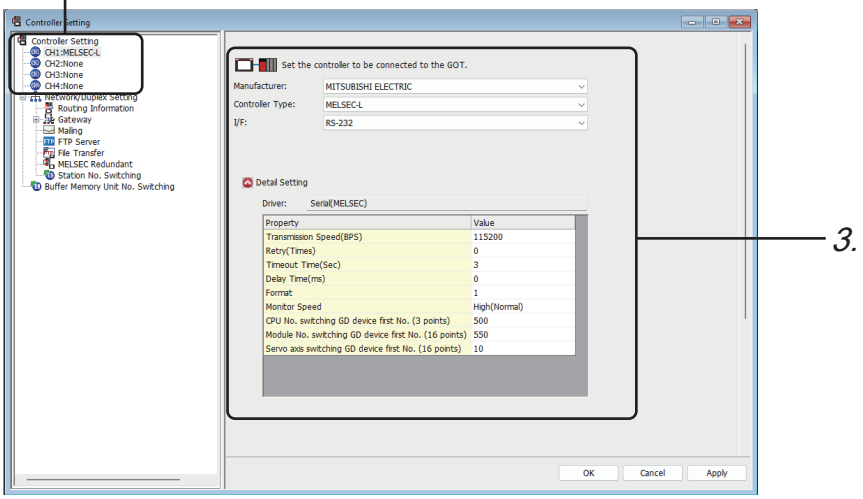
☞ Page 2956 Terminating resistors of GOT

5.6.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.

List menu



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item		Description
[Manufacturer]		[MITSUBISHI ELECTRIC]
[Controller Type]		[MELSEC-L]
[I/F]	For GOT	• [RS-232] • [RS-422/485] • [Extend Unit]
	For GT SoftGOT3000	• [Serial 1] • [Serial 2]
[Detail Setting]		Configure the settings according to the usage environment. ☞ Page 610 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

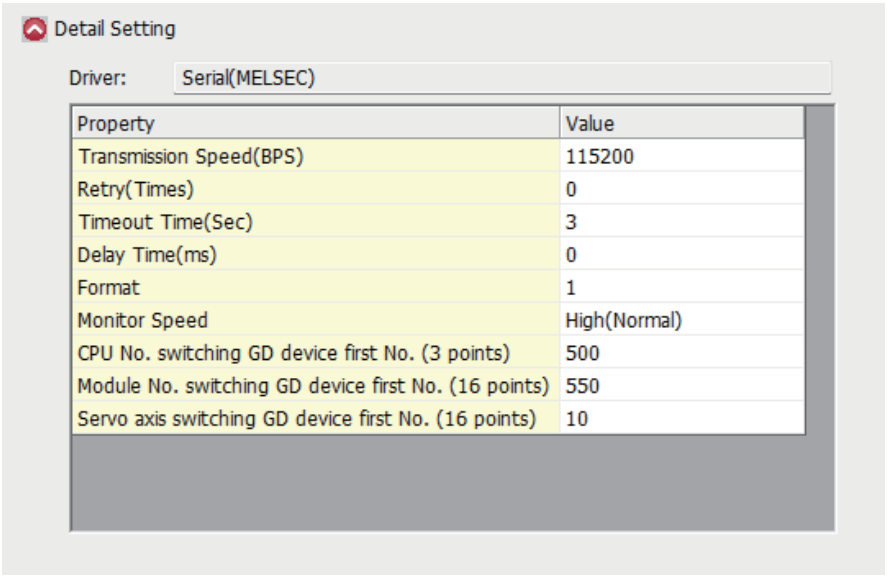
Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

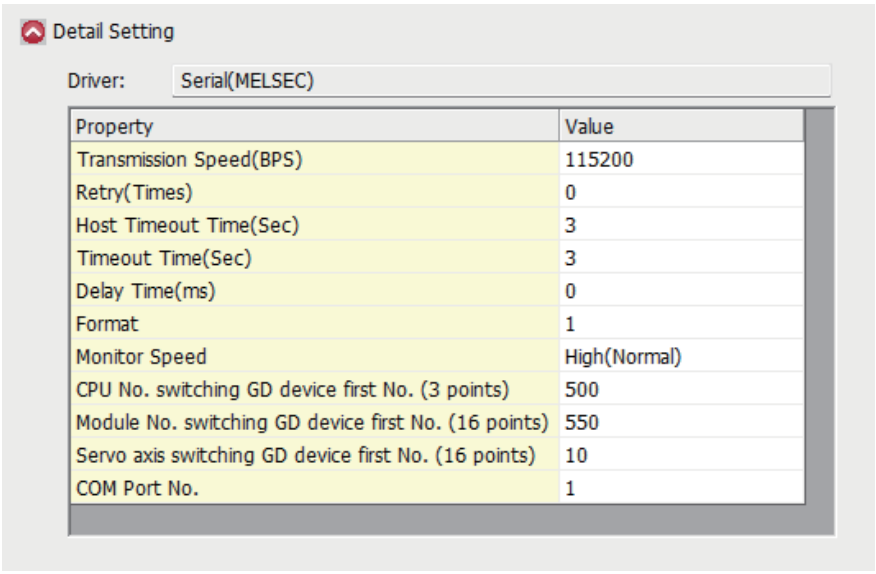
■[Detail Setting]

Configure the settings according to the usage environment.

- For GOT



- For GT SoftGOT3000



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Serial (MELSEC)]
[Transmission Speed]	Set this item to change the transmission speed used for communication with the connected equipment.	[9600] bps, [19200] bps, [38400] bps, [57600] bps, [115200] bps
[Retry]	Specify the number of retries to be performed during communication.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Host Timeout Time]*1	Set the time period until a communication timeout during monitoring of the host station.	[1] second to [90] seconds
[Timeout Time]	Specify the time period for a communication to time out.	[1] second to [30] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Format]*3	Set the communication format.	[1], [2]
[Monitor Speed]*4	Set the monitor speed of the GOT. This setting is not valid in all systems.	[High(Normal)]*2 [Middle] [Low]

Item	Description	Range
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 612 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 613 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 614 Start device number of the GD devices for servo axis switching	[0] to [65520]
[COM Port No.]*1	Specify the COM port number for communication.	[1] to [63]

*1 This item is displayed in GT SoftGOT3000 only.

*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.

*3 The format setting differs depending on the controller.
L6ADP-R4 adapter: [2]
Other than L6ADP-R4 adapter: [1]

*4 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
📖GT Designer3 (GOT3000) Screen Design Manual

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Specifying a module number with a device

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Point

By setting the GOT internal device, the GOT can disconnect specific parts from the controller's multiple connections.

For example, a faulty station that has a communication timeout can be disconnected from the system.

For details on the setting contents of the GOT internal device, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual

5.6.5 PLC side settings

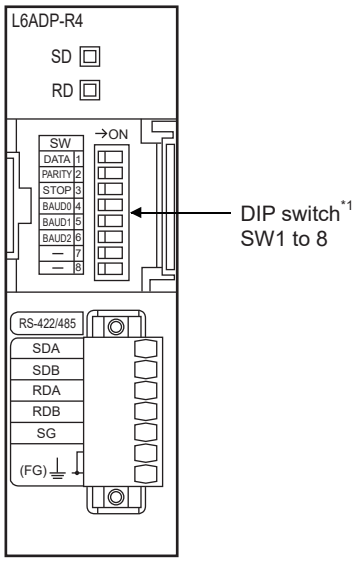
No setting is required on the controller.

When a GOT and an LCPU are connected via an L6ADP-R4/L6ADP-R2 adapter, set the following communication setting.

For L6ADP-R2 adopter, only the communication setting of GX Works2 is performed.

L6ADP-R4 adapter settings

Set the communication settings using the DIP switches of the L6ADP-R4 adapter.



*1 SW7 and SW8 are not used.

■DIP switches (SW1 to SW3)

Set the data length, parity bit, and stop bit.

Setting switch	Description	Setting value	
SW1	Data length*1	OFF	7bit
		ON	8bit
SW2	Parity*1	OFF	Disable
		ON	Enable
SW3	Stop bit*1	OFF	1bit
		ON	2bit

*1 Adjust the settings with GOT settings.
☞ Page 610 [Detail Setting]

■DIP switches (SW4 to SW6)

Set the transmission speed.

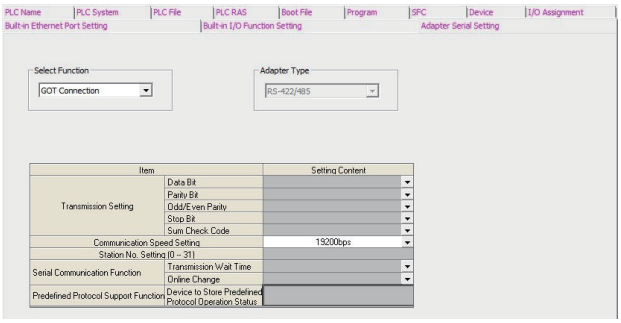
Setting switch	Transmission speed*1				
	9600 bps	19200 bps	38400 bps	57600 bps	115200 bps
SW4	ON	OFF	ON	OFF	ON
SW5	ON	OFF	OFF	ON	ON
SW6	OFF	ON	ON	ON	ON

*1 Adjust the settings with GOT settings.
☞ Page 610 [Detail Setting]

GX Works2 settings

Set the communication speed in GX Works2.

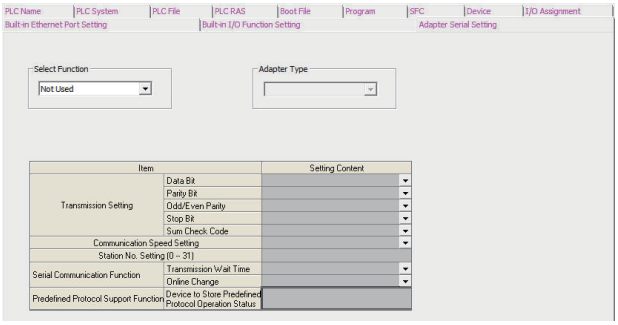
■For L6ADP-R4 adapter



1. Click [PLC parameter] → [Adapter Serial Setting].
2. Set [GOT Connection] in [Select Function].
3. Adjust [Communication Speed Setting] with the GOT communication setting.

☞ Page 610 [Detail Setting]

■For L6ADP-R2 adapter



1. Click [PLC parameter] → [Adapter Serial Setting].
2. Check that [Not Used] (default) is set in [Select Function].

Point

L6ADP-R4/L6ADP-R2 adapter

For details on the L6ADP-R4/L6ADP-R2 adapter, refer to the following manual.

MELSEC-L CPU Module User's Manual (Hardware Design, Maintenance and Inspection)

5.6.6 Access range for monitoring

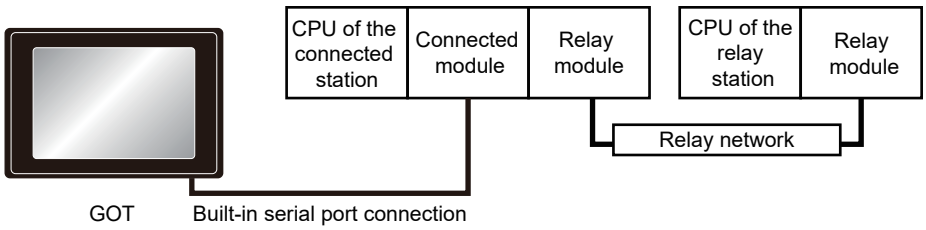
When the GOT is connected to the CPU of the station connected by built-in serial port connection, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station								
	Relay network	CPU of the relay station							
		RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
LCPU	Ethernet	—	○	○*2	○	—	○	—	—
	CC-Link IE Field Network	—	○	○*1	○	—	—	—	—

*1 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*2 The C Controller module (MELSEC-Q series) is not supported.

5.7 MELSEC-L series (serial communication connection)

☞ Page 618 Connectable devices
☞ Page 619 System configuration
☞ Page 621 Connection diagram
☞ Page 624 GOT side settings
☞ Page 630 PLC side settings
☞ Page 633 Access range for monitoring

5.7.1 Connectable devices

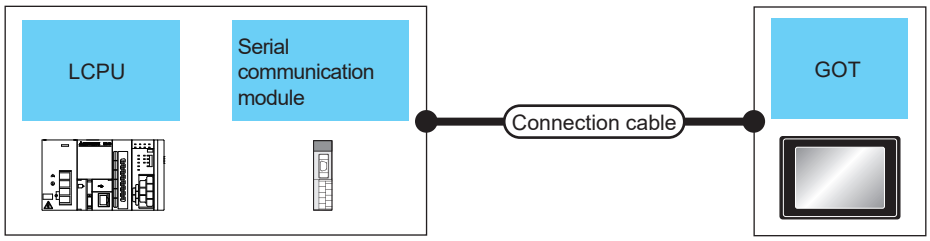
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Serial communication module*1	Connectable model
MELSEC-L	L02CPU L06CPU L26CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT L02SCPU L02SCPU-P	○	LJ71C24 LJ71C24-R2	GT37 SoftGOT3000

*1 Communication cannot be performed with RS-485.

5.7.2 System configuration



For details on the maximum number of connected devices, refer to the following.

☞ Page 620 Maximum number of connected devices

PLC			Connection cable		GOT	
Controller	Serial communication module*1	Communication type	Cable model	Maximum length	Interface	Model
MELSEC-L	LJ71C24 LJ71C24-R2	RS-232	GT09-C30R2-9P (3 m) + GT35-C02HR2-9P or ☞ Page 621 RS-232 connection diagram (1)	15 m	Built-in RS-232 interface	GT37 SoftGOT3000
			GT09-C30R2-9P (3 m) or ☞ Page 621 RS-232 connection diagram (1)		GT37-IF2000 + GT15-RS2-9P	GT37 SoftGOT3000

*1 For the system configuration of the serial communication module, refer to the following manual.
MELSEC-L Serial Communication Module User's Manual (Basic)

*2 The shortest specification on the PLC side is prioritized.

*3 The terminal block converter module is manufactured by MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.
For details on the product, contact MITSUBISHI ELECTRIC ENGINEERING COMPANY LIMITED.

*4 The cable length of the terminal block converter module is included.

Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC-L	Two GOTs for one serial communication module

GOT startup for connection to LCPU

LCPU may diagnose the SD card (file system check, recovery processing, etc.) when the LCPU is turned off then on or reset.

Therefore, it takes time until the SD card becomes available. If the GOT is started during this time, a system alarm occurs.

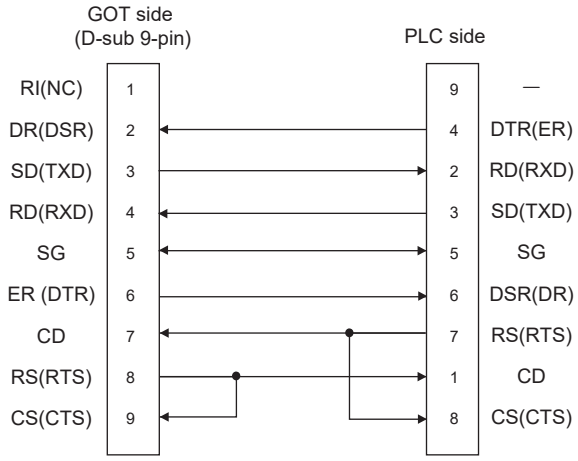
Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

5.7.3 Connection diagram

The following diagram shows the connection between the GOT and the controller.

RS-232 connection diagram (1)



Preparation of the RS-232 cable

■Cable length

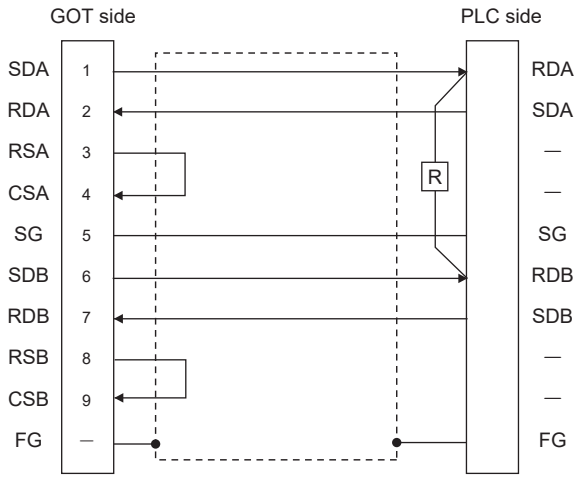
The length of the RS-232 cable must be 15 m or less.

■GOT side connector

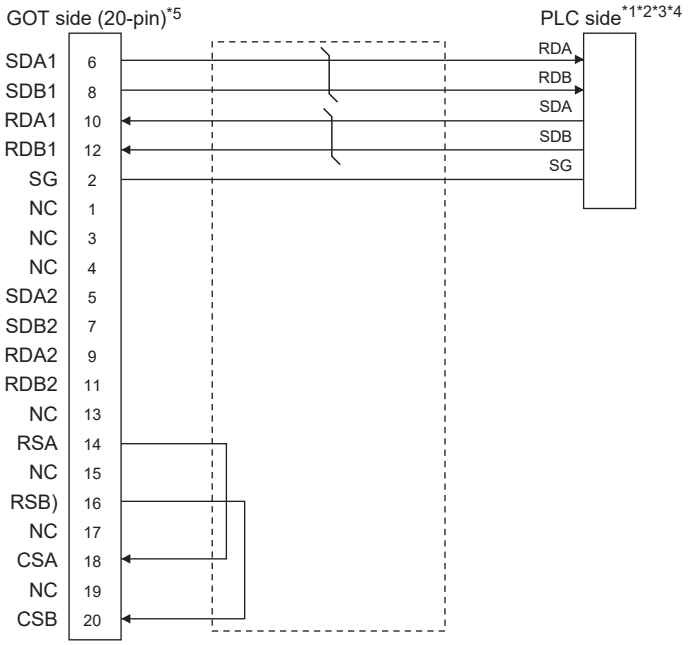
For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

RS-422 connection diagram (1)



RS-422 connection diagram (2)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

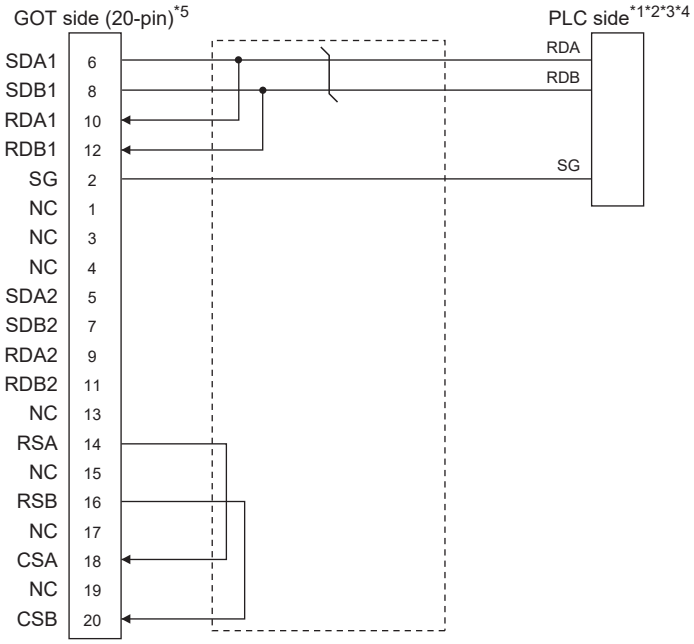
*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

RS-422 connection diagram (3)



*1 The pin arrangement on the PLC side may differ from the arrangement shown above, for example, when the SDA/SDB and RDA/RDB pins are independent.
In this case, connect the cables and wires as described in the PLC manual.

*2 Some PLCs do not have SG.
In this case, wiring between the GOT and SG is unnecessary.

*3 Some PLCs require the control line (CSA, CSB, RSA, RSB, etc.) to be controlled.
Make sure to connect the cables and wires as described in the PLC manual.

*4 For the terminating resistor of the PLC, refer to the manual of the PLC to be used.

*5 The GOT at the end requires a terminating resistor setting.
Set the terminating resistor setting switch on the GOT to 100Ω.
☞ Page 2956 Terminating resistors of GOT

Preparation of the RS-422 cable

■Cable length

The length of the RS-422 cable must be 1200 m or less.

■GOT side connector

For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

Connecting terminating resistors

■GOT side

When connecting a PLC to the GOT, a terminating resistor must be connected to the GOT.

Set the terminating resistor setting switch to "Not used".

For the procedure to set the terminating resistor, refer to the following.

☞ Page 2956 Terminating resistors of GOT

■Serial communication module or computer link module side

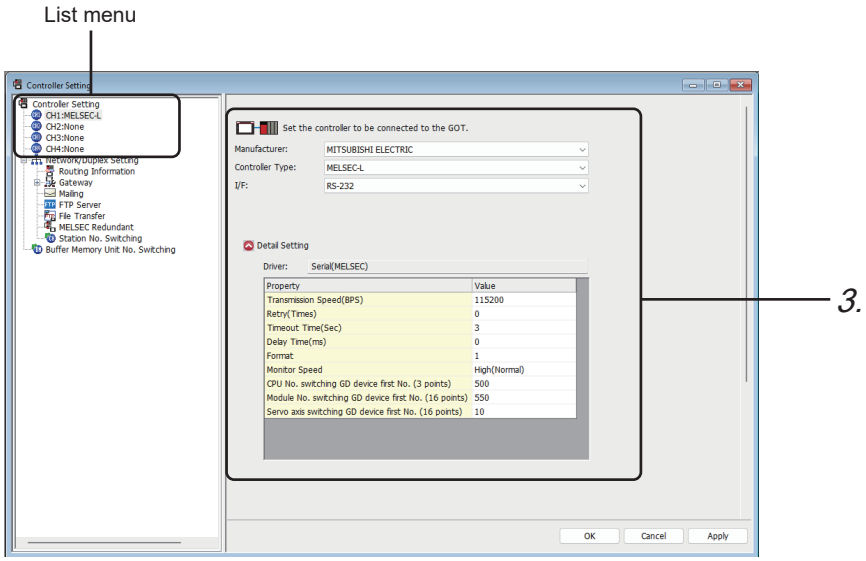
Connect a terminating resistor (330 Ω 1/4 W) to the serial communication module or computer link module side. For instructions on connecting terminating registers, refer to the following manual.

📖User's manual of the serial communication module or computer link module used

5.7.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item		Description
[Manufacturer]		[MITSUBISHI ELECTRIC]
[Controller Type]		[MELSEC-L]
[I/F]	For GOT	• [RS-232] • [RS-422/485] • [Extend Unit]
	For GT SoftGOT3000	• [Serial 1] • [Serial 2]
[Detail Setting]		Configure the settings according to the usage environment. ☞ Page 625 [Detail Setting]

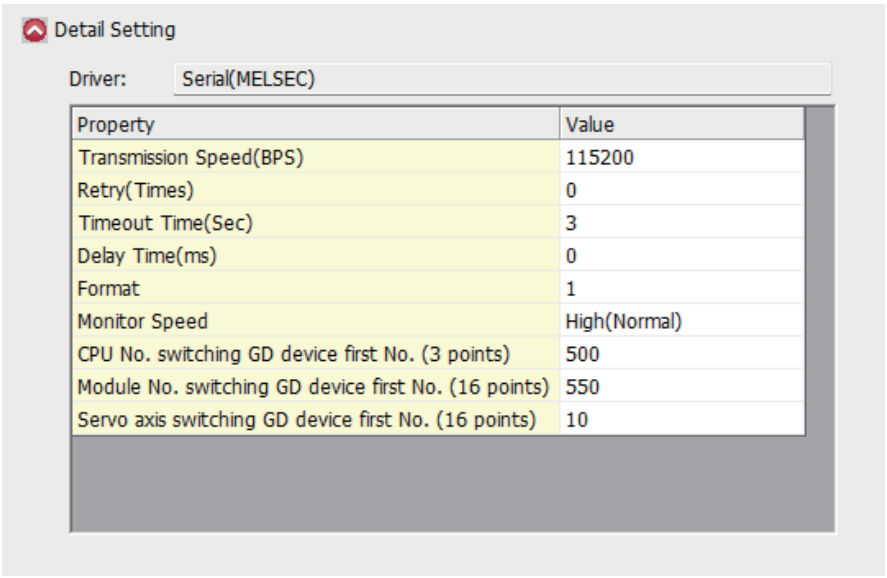
4. When you have completed the settings, click the [OK] button.

Point

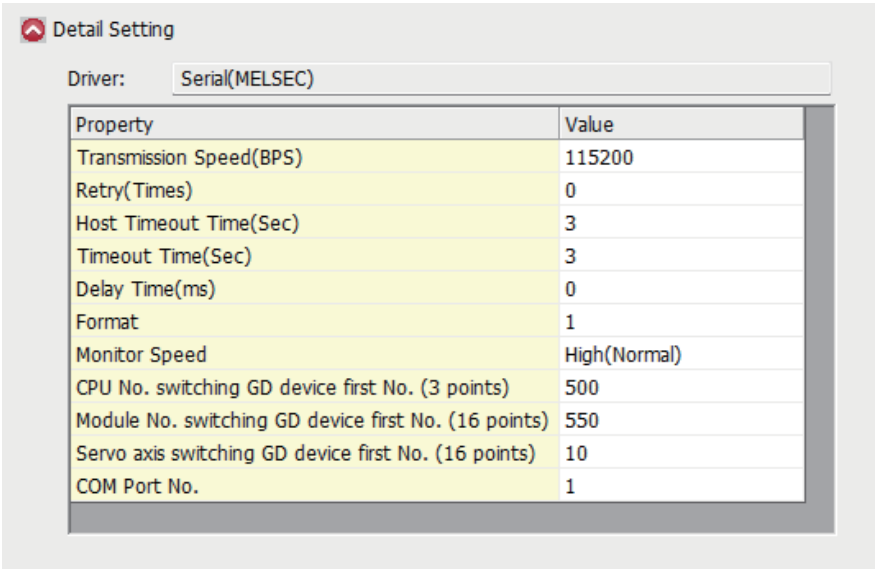
The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



- For GT SoftGOT3000



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Serial (MELSEC)]
[Transmission Speed]	Set this item to change the transmission speed used for communication with the connected equipment.	[9600] bps, [19200] bps, [38400] bps, [57600] bps, [115200] bps
[Retry]	Specify the number of retries to be performed during communication.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Host Timeout Time]*1	Set the time period until a communication timeout during monitoring of the host station.	[1] second to [90] seconds
[Timeout Time]	Specify the time period for a communication to time out.	[1] second to [30] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Format]*3	Set the communication format.	[1], [2]
[Monitor Speed]*4	Set the monitor speed of the GOT. This setting is not valid in all systems.	[High(Normal)]*2 [Middle] [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 627 Start device number of the GD devices for CPU number switching	[0] to [65520]

Item	Description	Range
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 628 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 629 Start device number of the GD devices for servo axis switching	[0] to [65520]
[COM Port No.]*1	Specify the COM port number for communication.	[1] to [63]

*1 This item is displayed in GT SoftGOT3000 only.
*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.
*3 Set this item when replacing the F900 series with the GOT3000 series.

• To change the transmission speed of the serial communication module connected to the F900 to 115200 bps, configure the settings as follows.

[Intelligent function module switch setting] of PLC

Switch No.	CH1 side	CH2 side
Switch 1	0000H	-
Switch 2	0000H	-
Switch 3	-	0000H
Switch 4	-	0000H
Switch 5	0000H	0000H

GOT communication settings

Item	Setting value
Format	1

• To continue using the transmission speed of 38400 bps for the serial communication module connected to the F900, configure the settings as follows.

GOT communication settings

Item	Setting value
Format	2

*4 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
📖GT Designer3 (GOT3000) Screen Design Manual

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Specifying a module number with a device

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Point

By setting the GOT internal device, the GOT can disconnect specific parts from the controller's multiple connections.

For example, a faulty station that has a communication timeout can be disconnected from the system.

For details on the setting contents of the GOT internal device, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual

5.7.5 PLC side settings

Model		Refer to
MELSEC-L	L02CPU L06CPU L26CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT L02SCPU L02SCPU-P	☞ Page 631 Connection to MELSEC-L series

The GOT operates under the following transmission specifications when it is connected to a Mitsubishi Electric PLC in the computer link connection.

Transmission specifications	Setting
Data bit	8 bits
Parity bit	Yes (Odd)
Stop bit	1 bit
Sum check	Yes
Transmission speed (Baud rate)	Set the same transmission speed on both the GOT and the PLC.

Point

• Serial communication module (MELSEC-L series)

For details on the serial communication module (MELSEC-L series), refer to the following manual.

MELSEC-L Serial Communication Module User's Manual (Basic)

• Modem interface module

For details on the modem interface module, refer to the following manual.

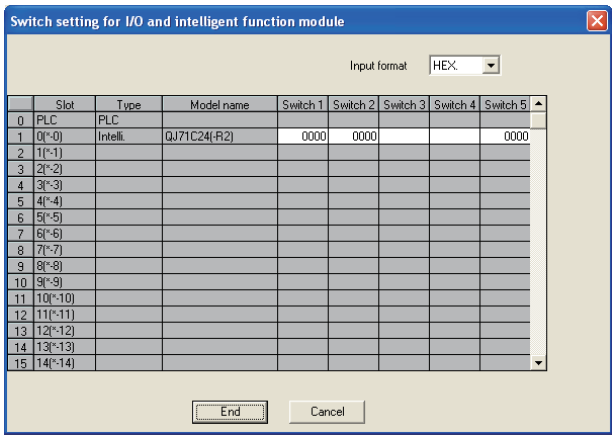
Modem Interface Module User's Manual

■[Intelligent function module switch setting] in GX Developer

[Intelligent function module switch setting] in GX Developer is not necessary. (When [Intelligent function module switch setting] is not configured, the module runs in GX Developer connection mode.)

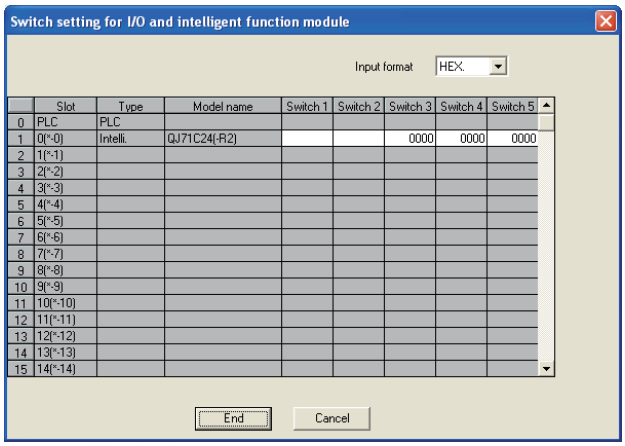
A module can be also connected to the GOT by configuring [Intelligent function module switch setting] in GX Developer as shown below.

• When connecting to the CH1 side



Switch No.	Bit		Description			Setting value*3
	Position	Specified value				
Switch 1	b0	OFF	CH1 transmission settings*1	Operation setting	(Operates according to the GOT side specifications.)	0000H
	b1	OFF		Data bit		
	b2	OFF		Parity bit		
	b3	OFF		Even/odd parity		
	b4	OFF		Stop bit		
	b5	OFF		Sum check code		
	b6	OFF		Write during RUN		
	b7	OFF		Setting modifications		
	b8 to b15	—	CH1 transmission speed setting*2			
Switch 2	—		CH1 Communication protocol setting		GX Developer connection	0000H
Switch 5	—		Station number setting		0th station	0000H

• When connecting to the CH2 side



Switch No.	Bit		Description			Setting value*3
	Position	Specified value				
Switch 3	b0	OFF	CH2 transmission settings*1	Operation setting	(Operates according to the GOT side specifications.)	0000H
	b1	OFF		Data bit		
	b2	OFF		Parity bit		
	b3	OFF		Even/odd parity		
	b4	OFF		Stop bit		
	b5	OFF		Sum check code		
	b6	OFF		Write during RUN		
	b7	OFF		Setting modifications		
	b8 to b15	—	CH2 transmission speed setting*2			
Switch 4	—		CH2 Communication protocol setting		GX Developer connection	0000H
Switch 5	—		Station number setting		0th station	0000H

*1 The module operates under the following transmission specifications.

Transmission specifications	Setting details
Operation setting	Independent
Data bit	8 bits
Parity bit	Yes
Even/odd parity	Odd
Stop bit	1 bit
Sum check code	Yes

*2 The serial communication module operates at the transmission speed set on the GOT.

*3 When the value of switch setting is other than [0], the setting of [Format] and [Transmission Speed] on the GOT side are required to be changed.

☞ Page 625 [Detail Setting]

Point

• When [Intelligent function module switch setting] is configured

After writing PLC parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• Connection of multiple GOTs

To some serial communication module models, two GOTs can be connected using both CH1 and CH2.

Model	Connection of 2 GOTs	
	Function version A	Function version B
LJ71C24(-R2)	○	-

○: 2 GOTs connectable, -: Not applicable

• When connecting to the modem interface module

When the modem interface module is connected, only CH2 can be used.

5.7.6 Access range for monitoring

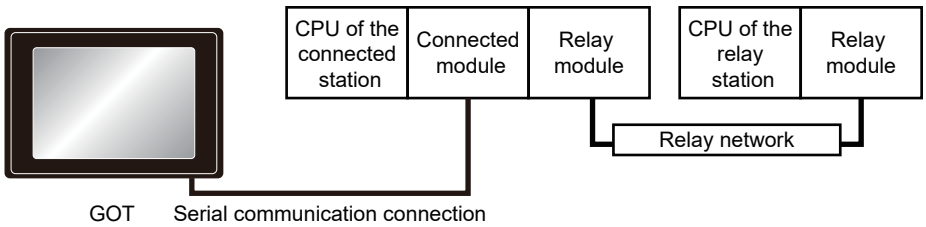
When the GOT is connected to the CPU of the station connected by serial communication connection, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station								
		Relay network	CPU of the relay station							
			RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
LCPU	☞ Page 618 Connectable devices	Ethernet	—	○	○*2	○	—	○	—	—
		CC-Link IE Field Network	—	○	○*1	○	—	—	—	—

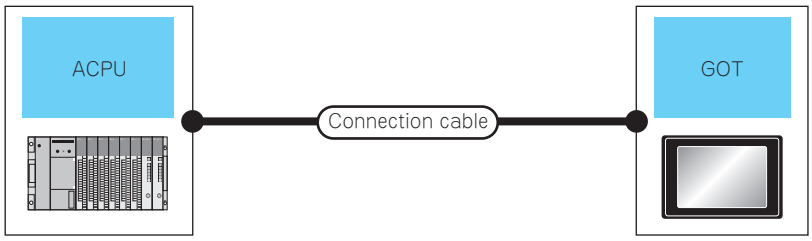
*1 When monitoring AnNCPU, only the following or later software version is used to write to the CPU.
• AnNCPU(S1) with link: Version L or later, AnNCPU(S1) without link: Version H or later

*2 When monitoring A0J2HCPU or A2SCPU, only the following or later software version is used to write to the CPU.
• A0J2HCPU (with/without link): Version E or later
• A0J2HCPU-DC24: Version B or later
• A2SCPU: Version H or later

5.8.2 System configuration



For details on the maximum number of connected devices, refer to the following.

☞ Page 636 Maximum number of connected devices

PLC		Connection cable		GOT	
Controller	Communication type	Cable model	Maximum length	Interface	Model
MELSEC-A	RS-422	GT01-C30R4-25P (3 m) GT01-C100R4-25P (10 m) GT01-C200R4-25P (20 m) GT01-C300R4-25P (30 m)	30 m	Built-in RS-422 interface	GT37 SoftGOT3000
				GT37-IF2000 + GT15-RS2-9S	GT37 SoftGOT3000
Motion CPU (A series)	RS-422	GT01-C30R4-25P (3 m) GT01-C100R4-25P (10 m) GT01-C200R4-25P (20 m) GT01-C300R4-25P (30 m)	30 m	Built-in RS-422 interface	GT37 SoftGOT3000
				GT37-IF2000 + GT15-RS4-9S	GT37 SoftGOT3000

Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	Number of connectable devices
MELSEC-A	One GOT for one PLC

Connection with the motion controller A series

When the following motion controller A series is connected, LINK UNIT ERROR (42) may occur in the SCPU (CPU for PLC control) depending on the content of the displayed screen.

- A171SHCPU, A171SHCPUN, A172SHCPU, A172SHCPUN

In this case, reduce the number of monitored devices to less than 128.

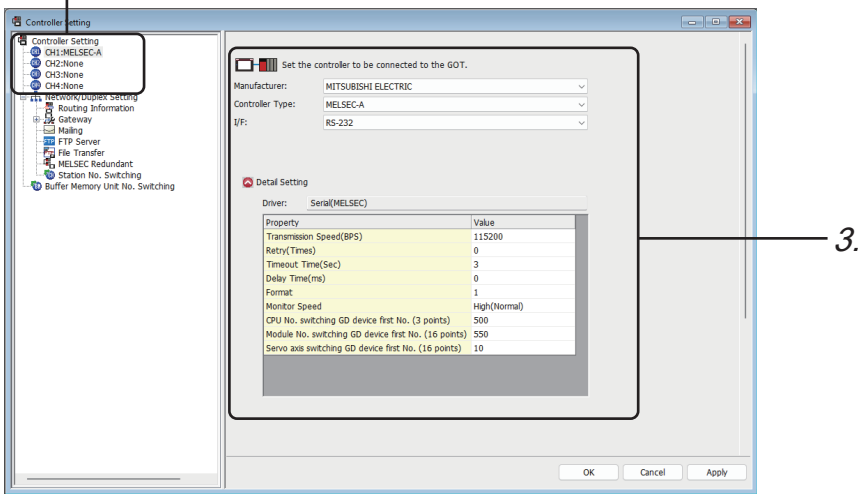
The number of monitored devices includes the number of devices of functions running in the background such as alarm, logging, and script in addition to the displayed base screens and window screens.

5.8.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.

List menu



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item		Description
[Manufacturer]		[MITSUBISHI ELECTRIC]
[Controller Type]		[MELSEC-A]
[I/F]	For GOT	• [RS-232] • [RS-422/485] • [Extend Unit]
	For GT SoftGOT3000	• [Serial 1] • [Serial 2]
[Detail Setting]		Configure the settings according to the usage environment. ☞ Page 638 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

Point

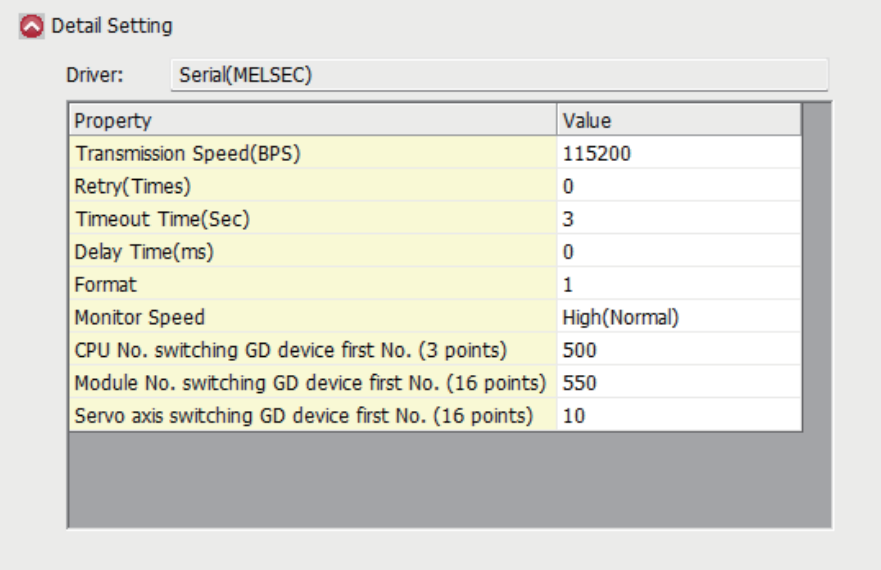
The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

PART 3

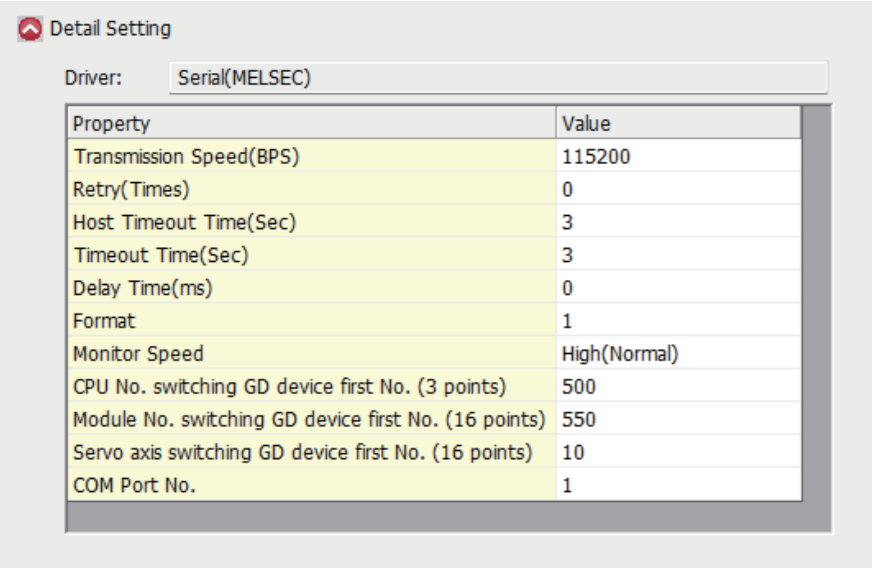
■[Detail Setting]

Configure the settings according to the usage environment.

• For GOT



• For GT SoftGOT3000



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Serial (MELSEC)]
[Transmission Speed]	Set this item to change the transmission speed used for communication with the connected equipment.	[9600] bps, [19200] bps, [38400] bps, [57600] bps, [115200] bps
[Retry]	Specify the number of retries to be performed during communication.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Host Timeout Time]*1	Set the time period until a communication timeout during monitoring of the host station.	[1] second to [90] seconds
[Timeout Time]	Specify the time period for a communication to time out.	[1] second to [30] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Format]	Set the communication format.	[1], [2]
[Monitor Speed]*3	Set the monitor speed of the GOT. This setting is not valid in all systems.	[High(Normal)]*2 [Middle] [Low]

Item	Description	Range
[CPU No. switching GD device first No. (3 points)]	The item is displayed but cannot be set.	—
[Module No. switching GD device first No. (16 points)]	The item is displayed but cannot be set.	—
[Servo axis switching GD device first No. (16 points)]	The item is displayed but cannot be set.	—
[COM Port No.]*1	Specify the COM port number for communication.	[1] to [63]

*1 This item is displayed in GT SoftGOT3000 only.
*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.
*3 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
GT Designer3 (GOT3000) Screen Design Manual

Point

• Communication interface settings in the GT37 utility
The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.
For details on the GT37 utility, refer to the following manual.
GOT3000 Series User's Manual (Utility & Maintenance Functions)
• Priority of the settings in [Controller Setting]
When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

5.8.4 PLC side settings

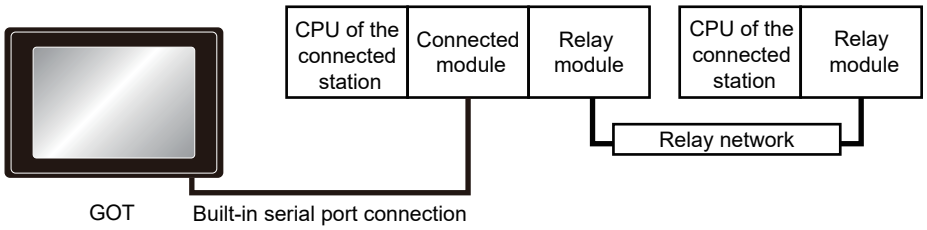
No setting is required on the controller.

5.8.5 Access range for monitoring

When the GOT is connected to the CPU of the station connected by built-in serial port connection, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)
To monitor other networks, routing parameter settings are necessary.
For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station								
	Relay network	CPU of the relay station

			GT01-C30R2-9S (3 m) or ☞ Page 647 RS-232 connection diagram (1)		GT37-IF2000 + GT15-RS2-9S	GT37 SoftGOT3000

*1 When connecting using a function extension board or a special adapter, check the communication settings.
☞ Page 645 When using the function extension board and special adapter

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
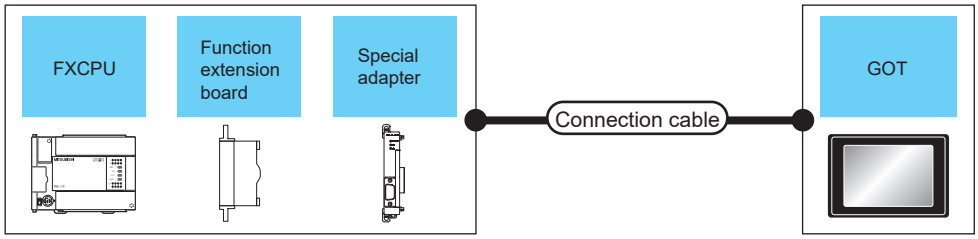
Model	Number of connectable devices*1
FX3G FX3S FX3GE FX3GC-□□/D FX3GC-□□/DSS FX3UC-□□/D FX3UC-□□/DS FX3UC-□□/DSS	One GOT for one special adapter

*1 When connecting a function extension board (communication board) and a special adapter, one GOT and one peripheral such as a personal computer with GX Developer installed can be connected to the board and the adapter, respectively.

When using the function extension board and special adapter



For details on the maximum number of connected devices, refer to the following.

☞ Page 645 Maximum number of connected devices

PLC				Connection cable		GOT	
Controller	**Function extension board**	**Expansion adapter**	**Communication type**	**Cable model**	**Maximum length**	**Interface**	**Model**
FX3U FX3UC-□□-LT(-2)	FX3G-232-BD FX3U-232-BD FX3G-422-BD FX3U-422-BD	FX3U-232ADPFX3U-232ADP-MB	RS-232	GT01-C30R2-9S (3 m) + GT35-C02HR2-9P or ☞ Page 647 RS-232 connection diagram (1)	15 m	Built-in RS-232 interface	GT37 SoftGOT3000
				GT01-C30R2-9S (3 m) or ☞ Page 647 RS-232 connection diagram (1)		GT37-IF2000 + GT15-RS2-9S	GT37 SoftGOT3000

*1 When connecting using a function extension board or a special adapter, check the communication settings.
☞ Page 645 When using the function extension board and special adapter

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices*1**
FX3U FX3UC-□□-LT(-2)	One GOT for one special adapter

*1 When connecting a function extension board (communication board) and a special adapter, one GOT and one peripheral such as a personal computer with GX Developer installed can be connected to the board and the adapter, respectively.

Connection to FXCPU

■When connecting to FX3 series

When the keyword of FXCPU (FX3 series) has been set, GOT may not be able to monitoring.

Perform an I/O check again.

☞ (Page 39 How to check whether the GOT is operating correctly) If the I/O check result is normal, check keyword registration status of the CPU.

■When connecting with function extension board or communication special adapter

When a sequence program and settings that the FXCPU communicates with devices other than the GOT are set with software, including GX Developer, the FXCPU cannot communicate with the GOT.

• Settings with sequence program

Check the sequence program and delete the following.

📖FX SERIES PROGRAMMABLE CONTROLLERS USER'S MANUAL - Data Communication Edition

No protocol communication (RS instruction)

Sequence program with the computer link, N:N network, and parallel link

Parameter setting

Set the following special registers to 0.

Other than FX3U and FX3UC: D8120

FX3U, FX3UC: D8120, D8400, D8420

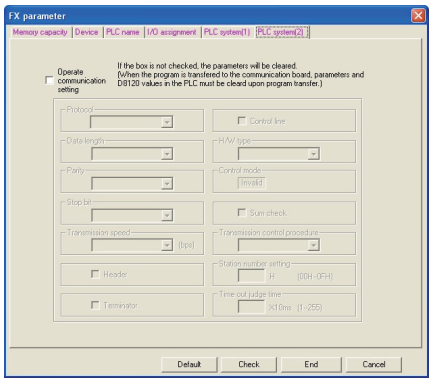
FX3G, FX3GC, FX3GE: D8120, D8400, D8420, D8370

FX3S: D8120, D8400

• Settings with GX Developer

Select [PLC parameter] in [Parameter], and then click the PLC system(2) tab on the FX parameter screen.

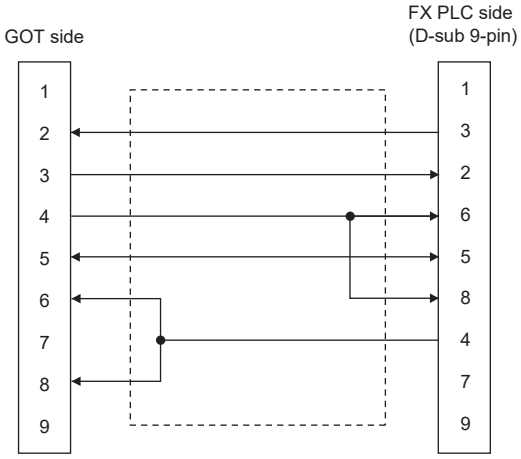
Uncheck [Operate communication setting], and then transfer the parameter to the programmable controller. After the transfer, turn off the programmable controller, and then turn on the programmable controller again.



5.9.3 Connection diagram

The following diagram shows the connection between the GOT and the controller.

RS-232 connection diagram (1)



Preparation of the RS-232 cable

■Cable length

The length of the RS-232 cable must be 15 m or less.

■GOT side connector

For the GOT side connector, refer to the following.

☞ Page 2954 GOT connector specifications

Connecting terminating resistors

■GOT side

When connecting a PLC to the GOT, a terminating resistor must be connected to the GOT.

Set the terminating resistor setting switch to "Not used".

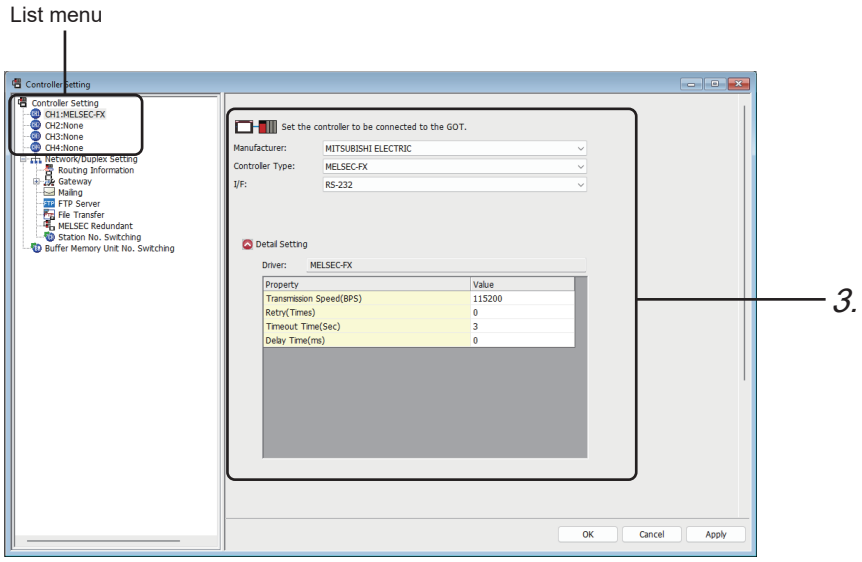
For the procedure to set the terminating resistor, refer to the following.

☞ Page 2956 Terminating resistors of GOT

5.9.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item		Description
[Manufacturer]		[MITSUBISHI ELECTRIC]
[Controller Type]		[MELSEC-FX]
[I/F]	For GOT	• [RS-232] • [RS-422/485] • [Extend Unit]
	For GT SoftGOT3000	• [Serial 1] • [Serial 2]
[Detail Setting]		Configure the settings according to the usage environment. ☞ Page 538 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

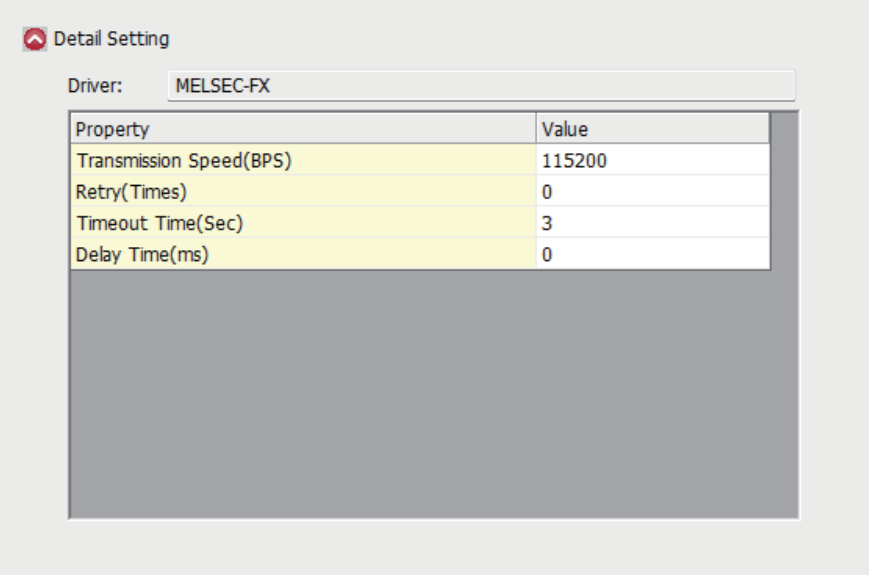
Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

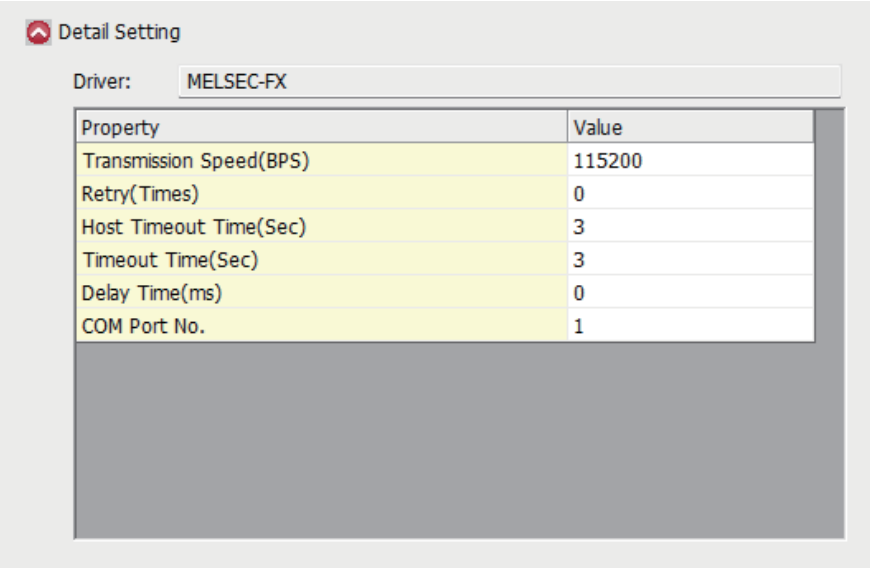
■[Detail Setting]

Configure the settings according to the usage environment.

• For GOT



• For GT SoftGOT3000



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[Serial (MELSEC)]
[Transmission Speed]	Set this item to change the transmission speed used for communication with the connected equipment.	[9600] bps, [19200] bps, [38400] bps, [57600] bps, [115200] bps
[Retry]	Specify the number of retries to be performed during communication.	GOT: [0] times to [5] times GT SoftGOT3000: [0] times to [10] times
[Host Timeout Time]*1	Set the time period until a communication timeout during monitoring of the host station.	[1] second to [90] seconds
[Timeout Time]	Specify the time period for a communication to time out.	[1] second to [30] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[COM Port No.]*1	Specify the COM port number for communication.	[1] to [63]

*1 This item is displayed in GT SoftGOT3000 only.

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

5.9.5 PLC side settings

No setting is required on the controller.

5.9.6 Access range for monitoring

Only the connected CPU can be accessed.

6 USB connection

☞ Page 651 MELSEC iQ-R series (USB connection)
☞ Page 659 MELSEC iQ-F series (USB connection)
☞ Page 665 MELSEC-Q series (USB connection)
☞ Page 673 MELSEC-L series (USB connection)
☞ Page 678 MELSEC-F series (USB connection)

PART 3

6.1 MELSEC iQ-R series (USB connection)

☞ Page 651 Connectable devices
☞ Page 652 System configuration
☞ Page 654 Connection cable
☞ Page 654 GOT side settings
☞ Page 657 PLC side settings
☞ Page 658 Access range for monitoring

6.1.1 Connectable devices

The following table shows the connectable models.

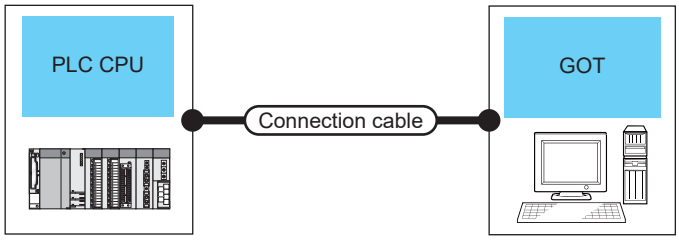
○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC iQ-R series	R00CPU R01CPU R02CPU R04CPU R08CPU R16CPU R32CPU R120CPU	○	GT37 SoftGOT3000
	R08PCPU*2 R16PCPU*2 R32PCPU*2 R120PCPU*2	○	GT37 SoftGOT3000
	R04ENCPU R08ENCPU R16ENCPU R32ENCPU R120ENCPU	○	GT37 SoftGOT3000
	R08SFCPU*1 R16SFCPU*1 R32SFCPU*1 R120SFCPU*1	○	GT37 SoftGOT3000
	R08PSFCPU*3 R16PSFCPU*3 R32PSFCPU*3 R120PSFCPU*3	○	GT37 SoftGOT3000
Motion CPU (MELSEC iQ-R series)	R16MTCPU R32MTCPU R64MTCPU	○	GT37 SoftGOT3000

Controller	Model	Clock	Connectable model
C Controller module (MELSEC iQ-R series)	R12CCPU-V*4	○	GT37 SoftGOT3000
CNC C80	R16NCCPU-S1*4	○	GT37 SoftGOT3000
Robot controller (MELSEC iQ-R series)	CR800-R (R16RTCPU)*4	○	GT37 SoftGOT3000

*1 Mount the safety function module (R6SFM) next to the CPU module on the base unit.
The CPU module and the safety function module (R6SFM) must have the same pair version.
If their pair versions differ, the CPU module does not operate.
*2 The redundant system is configurable by mounting the redundant function module (R6RFM).
*3 Mount a SIL2 function module (R6PSFM) and a redundant function module (R6RFM) next to a SIL2 process CPU on the base unit.
*4 This module has no USB port to connect to a personal computer. Monitor the module via an RCPU in the multiple CPU system.

6.1.2 System configuration



For details on the connection cable, refer to the following.
☞ Page 654 Connection cable
For details on the maximum number of connected devices, refer to the following.
☞ Page 653 Maximum number of connected devices

PLC	Maximum length	GOT	
Model		Interface	Model
MELSEC iQ-R series C Controller module (MELSEC iQ-R series)	3 m	USB interface of personal computer	GT37 SoftGOT3000
Motion CPU (MELSEC iQ-R series)	5 m	USB interface of personal computer	GT37 SoftGOT3000
CNC C80 Robot controller CR800-R (R16RTCPU)	Access these models via an RCPU in the multiple CPU system.		

Precautions

Stop monitoring before connecting or disconnecting the USB cable, resetting the PLC, or turning the power on or off. Otherwise, a communication timeout may occur and monitoring may not recover.
If the communication error is not fixed, remove the USB cable. After 5 seconds or more elapse, reconnect the cable. (The error may occur at first communication after the above operation. From the next time, the programmable controller functions normally.)

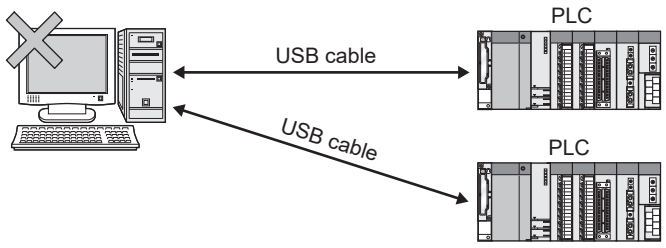
Maximum number of connected devices

The USB connection allows one PLC to connect to one of the GT SoftGOT3000 channels 1 to 4.
One GT SoftGOT3000 module is connectable to one PLC.

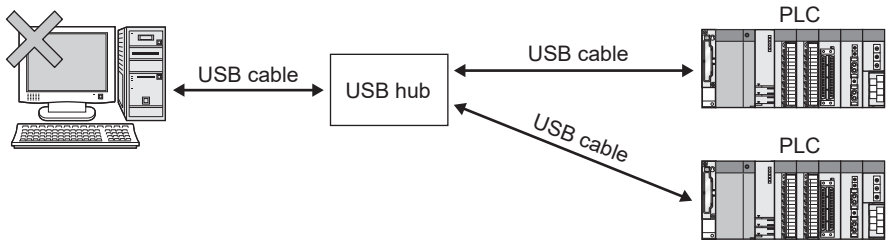
Precautions

Multiple PLCs are not connectable to one personal computer via a USB port or USB hub.
The following shows the system configurations that cannot be used.

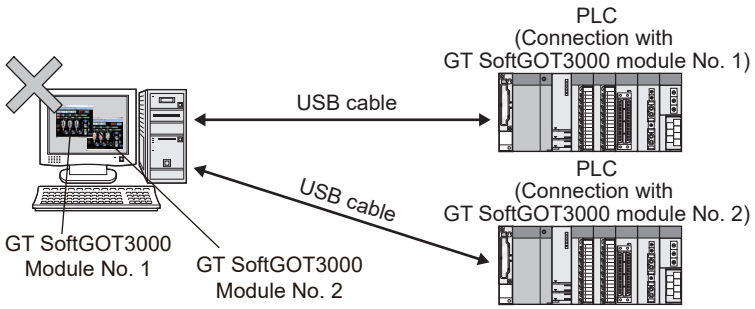
• Connection from a personal computer with multiple USB ports to multiple PLCs



• Connection to multiple PLCs via a USB hub



• Connection from multiple GT SoftGOT3000 modules to multiple PLCs



6.1.3 Connection cable

For the USB cables validated by Mitsubishi Electric Corporation, refer to the following Technical Bulletin.

📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)

For Technical Bulletins, go to the Mitsubishi Electric Factory Automation Global Website.

www.MitsubishiElectric.com/fa

Precautions

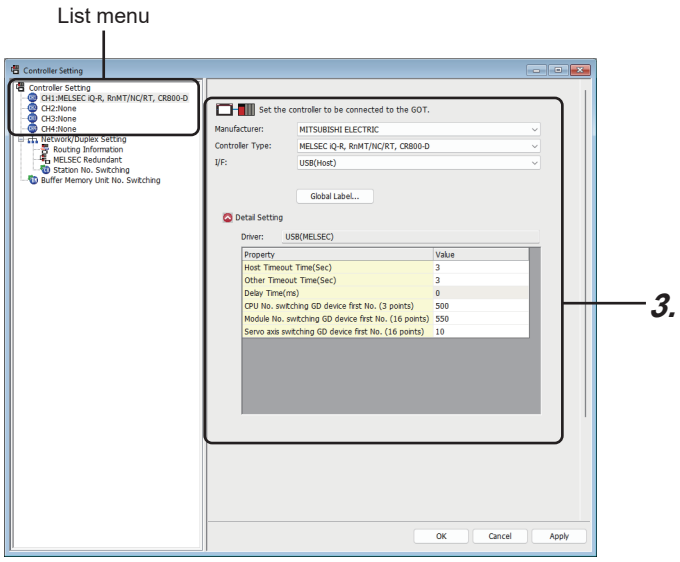
The USB cable can be used with the USB driver already installed.

For the specifications and precautions for cables, refer to the manual of each product.

6.1.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[I/F]	[USB(Host)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 655 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

Point

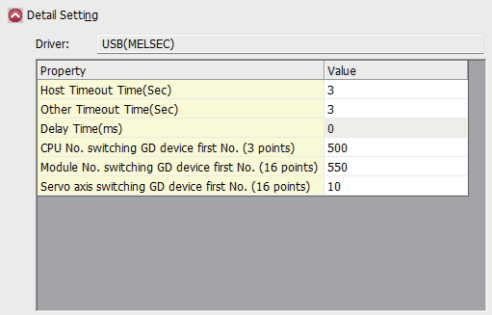
The controller settings can be checked in [I/F Communication Setting].

For details, refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[USB(MELSEC)]
[Host Timeout Time(Sec)]	Set the time period until a communication timeout during monitoring of the host station.	[1] (second) to [90] (seconds)
[Other Timeout Time(Sec)]	Set the time period until a communication timeout during monitoring of other stations.	[1] (second) to [30] (seconds)
[Delay Time(ms)]	Set the delay time for reducing the load of the network and destination PLC.	[0](ms)
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 655 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 656 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 657 Start device number of the GD devices for servo axis switching	[0] to [65520]

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

6.1.5 PLC side settings

No setting is required on the controller.

6.1.6 Access range for monitoring

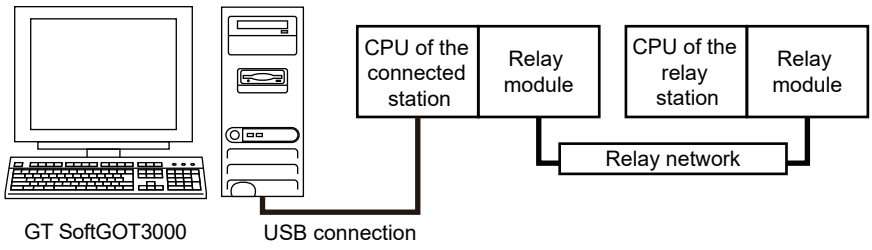
When GT SoftGOT3000 is connected to the CPU of the station connected via USB, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station								
	Relay network	CPU of the relay station							
		RCPU	LCPU	QCPU (Q mode)	QSCPU*1	QCPU (A mode)	QnACPU	ACPU	FX5CPU
RCPU	Ethernet	○*3	○	○	○	—	—	—	—
	CC-Link IE TSN	○	—	—	—	—	—	—	—
	CC-Link IE Controller Network	○	—	○	○	—	—	—	—
	CC-Link IE Field Network	○	○	○	○	—	—	—	○*2

*1 The routing parameter cannot be set for the QSCPU, and therefore the networks on which the CPU is not located are inaccessible.

*2 Use an intelligent function module (FX5-CCLIEF) as an intelligent device station to connect to the CC-Link IE Field Network.

*3 When connecting to the built-in Ethernet port of the RCPU (relay station CPU), access is possible only when the following conditions are satisfied.

• RCPU firmware version 39 or later

• In GX Works3, communications using the network number and the station number are enabled, and the network number and the station number are set.

6.2 MELSEC iQ-F series (USB connection)

☞ Page 659 Connectable devices
☞ Page 659 System configuration
☞ Page 660 Connection cable
☞ Page 661 GOT side settings
☞ Page 663 PLC side settings
☞ Page 664 Access range for monitoring

6.2.1 Connectable devices

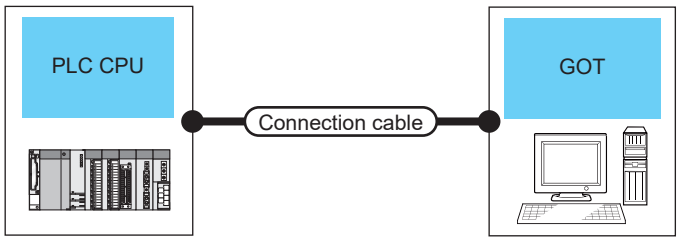
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC iQ-F series	FX5UJ FX5S	○*1	GT37 SoftGOT3000

*1 The time setting function or the time notification function is performed to CPU No. 1.

6.2.2 System configuration



For details on the connection cable, refer to the following.

☞ Page 660 Connection cable

For details on the maximum number of connected devices, refer to the following.

☞ Page 660 Maximum number of connected devices

PLC	Maximum length	GOT	
Model		Interface	Model
MELSEC iQ-F series (FX5UJ, FX5S)	3 m	USB interface of personal computer	GT37 SoftGOT3000

Precautions

Stop monitoring before connecting or disconnecting the USB cable, resetting the PLC, or turning the power on or off. Otherwise, a communication timeout may occur and monitoring may not recover.

If the communication error is not fixed, remove the USB cable. After 5 seconds or more elapse, reconnect the cable. (The error may occur at first communication after the above operation. From the next time, the programmable controller functions normally.)

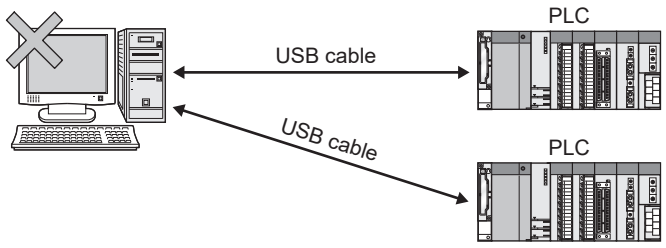
Maximum number of connected devices

The USB connection allows one PLC to connect to one of the GT SoftGOT3000 channels 1 to 4.
One GT SoftGOT3000 module is connectable to one PLC.

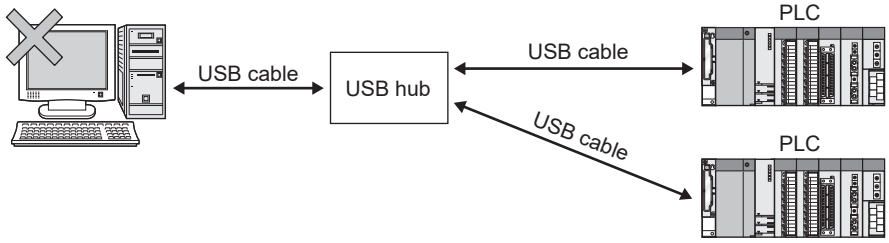
Precautions

Multiple PLCs are not connectable to one personal computer via a USB port or USB hub.
The following shows the system configurations that cannot be used.

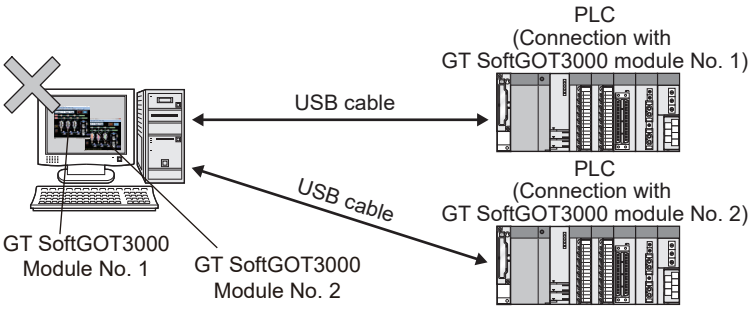
• Connection from a personal computer with multiple USB ports to multiple PLCs



• Connection to multiple PLCs via a USB hub



• Connection from multiple GT SoftGOT3000 modules to multiple PLCs



6.2.3 Connection cable

For the USB cables validated by Mitsubishi Electric Corporation, refer to the following Technical Bulletin.
📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)
For Technical Bulletins, go to the Mitsubishi Electric Factory Automation Global Website.
www.MitsubishiElectric.com/fa

Precautions

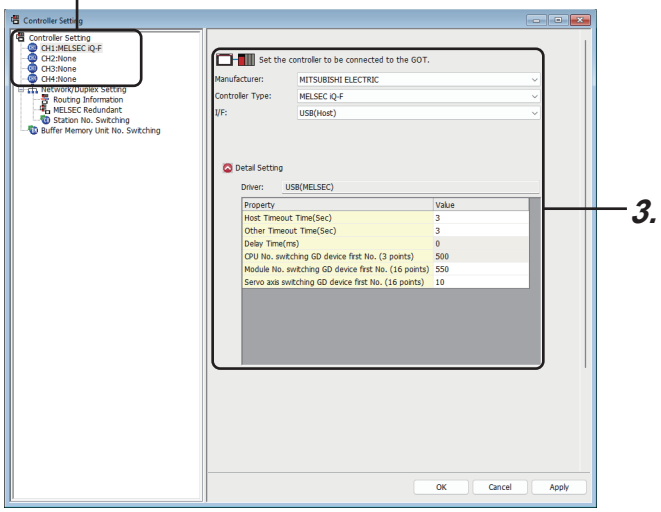
The USB cable can be used with the USB driver already installed.
For the specifications and precautions for cables, refer to the manual of each product.

6.2.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.

List menu



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-F]
[I/F]	[USB(Host)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 662 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

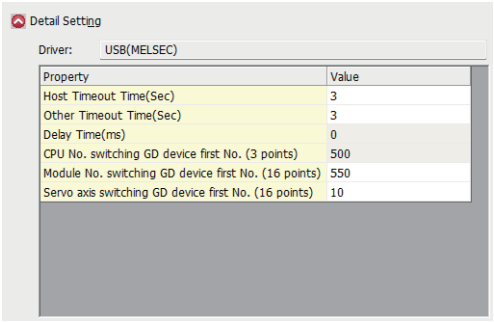
Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

PART 3

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[USB(MELSEC)]
[Host Timeout Time(Sec)]	Set the time period until a communication timeout during monitoring of the host station.	[1] (second) to [90] (seconds)
[Other Timeout Time(Sec)]	Set the time period until a communication timeout during monitoring of other stations.	[1] (second) to [30] (seconds)
[Delay Time(ms)]	Set the delay time for reducing the load of the network and destination PLC.	[0](ms)
[CPU No. switching GD device first No. (3 points)]	Not used	—
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 662 Start device number of the GD devices for module number switching	[0] to [65520]

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	01 to 10 Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

6.2.5 PLC side settings

No setting is required on the controller.

6.2.6 Access range for monitoring

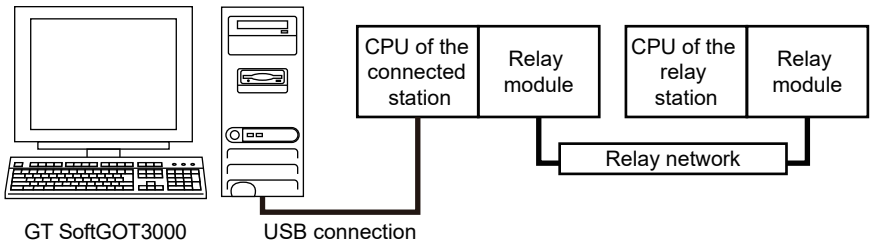
When GT SoftGOT3000 is connected to the CPU of the station connected via USB, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station								
	Relay network	CPU of the relay station							
		RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
FX5CPU	CC-Link IE Field Network	—	—	—	—	—	—	—	○*1

*1 Use an intelligent function module (FX5-CCLIEF) as an intelligent device station to connect to the CC-Link IE Field Network.

6.3 MELSEC-Q series (USB connection)

☞ Page 666 Connectable devices
☞ Page 668 System configuration
☞ Page 670 Connection cable
☞ Page 670 GOT side settings
☞ Page 672 PLC side settings
☞ Page 672 Access range for monitoring

6.3.1 Connectable devices

The following table shows the connectable models.

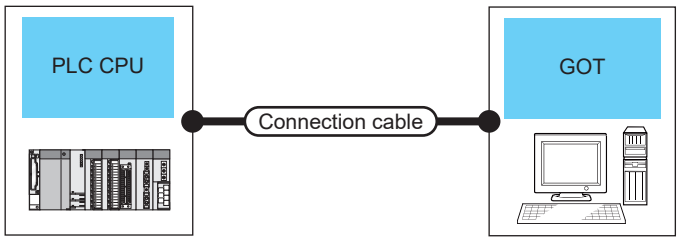
○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC-Q (Q mode)	Q02HCPU[*1] Q06HCPU[*1] Q12HCPU[*1] Q25HCPU[*1]	○	GT37 SoftGOT3000
	Q02PHCPU Q06PHCPU Q12PHCPU Q25PHCPU	○	GT37 SoftGOT3000
	Q00UJCPU Q00UJCPU(-S8)	○	GT37 SoftGOT3000
	Q00UCPU Q01UCPU Q02UCPU Q03UDCPU	○	GT37 SoftGOT3000
	Q04UDHCPU Q06UDHCPU Q10UDHCPU Q13UDHCPU Q20UDHCPU Q26UDHCPU	○	GT37 SoftGOT3000
	Q03UDECPU Q04UDEHCPU Q06UDEHCPU Q10UDEHCPU Q13UDEHCPU Q20UDEHCPU Q26UDEHCPU Q50UDEHCPU Q100UDEHCPU	○	GT37 SoftGOT3000
	Q03UDVCPU Q04UDVCPU Q06UDVCPU Q13UDVCPU Q26UDVCPU	○	GT37 SoftGOT3000
C Controller module (Q series)	Q12DCCPU-V[*2] Q24DHCCPU-V[*2] Q24DHCCPU-LS[*2] Q26DHCCPU-LS[*2] Q24DHCCPU-VG[*2]	○	GT37 SoftGOT3000
MELSEC-QS	QS001CPU[*3*8]	○	GT37 SoftGOT3000
Motion CPU (Q series)	Q172DSCPU Q173DSCPU Q170MCPU[*4*5*6] Q170MSCPU[*4*5] Q170MSCPU-S1[*4*5]	○	GT37 SoftGOT3000

Controller	Model	Clock	Connectable model
CNC C70	Q173NCCPU*7	○	GT37 SoftGOT3000
Robot controller (Q series)	CRnQ-700 (Q172DRCPU)*7 CR750-Q (Q172DRCPU)*7 CR751-Q (Q172DRCPU)*7 CR800-Q (Q172DSRCPU)*7	○	GT37 SoftGOT3000

*1 To configure a multiple CPU system, use a CPU with function version B or later.
*2 Use a C Controller module having a serial number starting with 12012 or later in the first 5 digits.
*3 Writing data to a QS001CPU always causes an error.
*4 Only the PLC CPU area (CPU number 1) can be monitored. The PERIPHERAL I/F cannot be used.
*5 Monitor the CPU as a Q03UDCPU.
*6 The following requirements must be satisfied.
Software: MT Works2 version 1.23Z
CPU model: Q170M SV43
*7 This module has no USB port for connection to a personal computer. Monitor the module via an QCPU in the multiple CPU system.
*8 To communicate with the CPU, configure the following settings in the device setting dialog on GT Designer3.
Set [CPU No.] to 0.
Select [Host].

6.3.2 System configuration



For details on the connection cable, refer to the following.

☞ Page 670 Connection cable

For details on the maximum number of connected devices, refer to the following.

☞ Page 669 Maximum number of connected devices

PLC	Maximum length	GOT	
Model		Interface	Model
QCPU (Q mode) C Controller module QSCPU Motion CPU (Q series)*1	3 m	USB interface of personal computer	GT37 SoftGOT3000
CNC C70 CRnQ-700 CR750-Q CR751-Q	Access these models via a QnUCPU in the multiple CPU system.		
CR800-Q (Q172DSRCPU)	Access the model via any of the following CPUs in the multiple CPU system. • QnUDECPU • QnUDVCPU • QnUDEHCPU		

*1 For the Motion CPUs (Q series), only the PLC CPU area (CPU number 1) of Q170MCPU or Q170MSCPU can be accessed.

Precautions

Stop monitoring before connecting or disconnecting the USB cable, resetting the PLC, or turning the power on or off. Otherwise, a communication timeout may occur and monitoring may not recover.

If the communication error is not fixed, remove the USB cable. After 5 seconds or more elapse, reconnect the cable. (The error may occur at first communication after the above operation. From the next time, the programmable controller functions normally.)

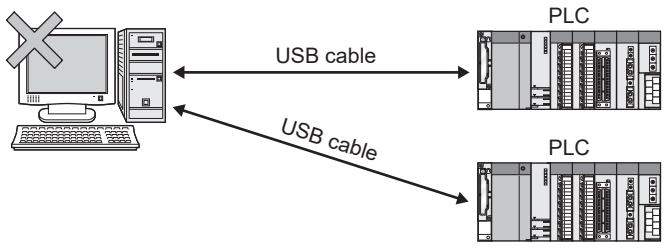
Maximum number of connected devices

The USB connection allows one PLC to connect to one of the GT SoftGOT3000 channels 1 to 4.
One GT SoftGOT3000 module is connectable to one PLC.

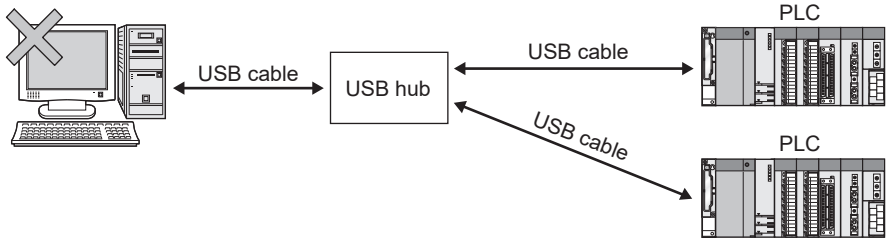
Precautions

Multiple PLCs are not connectable to one personal computer via a USB port or USB hub.
The following shows the system configurations that cannot be used.

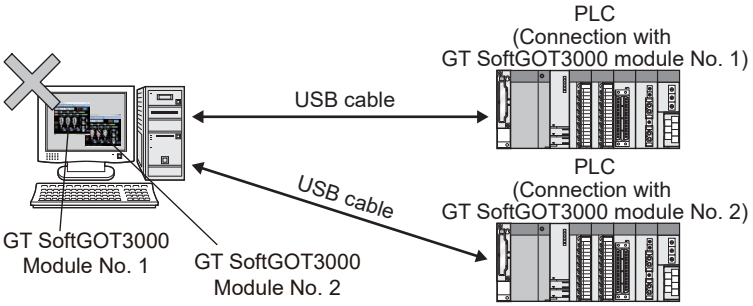
• Connection from a personal computer with multiple USB ports to multiple PLCs



• Connection to multiple PLCs via a USB hub



• Connection from multiple GT SoftGOT3000 modules to multiple PLCs



6.3.3 Connection cable

For the USB cables validated by Mitsubishi Electric Corporation, refer to the following Technical Bulletin.

📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)

For Technical Bulletins, go to the Mitsubishi Electric Factory Automation Global Website.

www.MitsubishiElectric.com/fa

Precautions

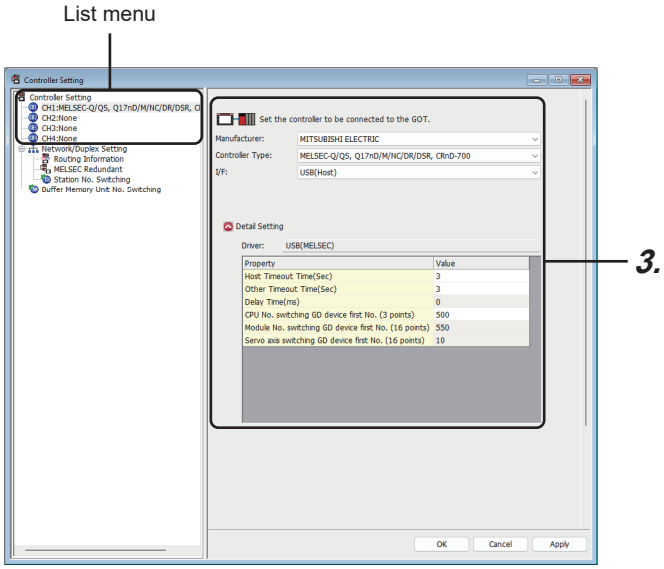
The USB cable can be used with the USB driver already installed.

For the specifications and precautions for cables, refer to the manual of each product.

6.3.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
[I/F]	[USB(Host)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 671 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

Point

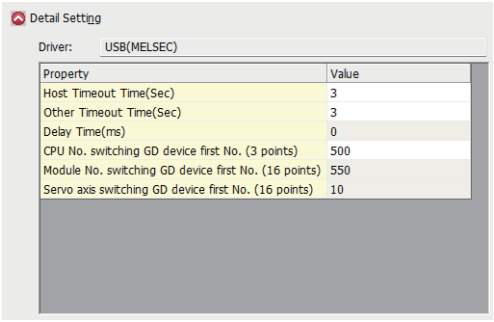
The controller settings can be checked in [I/F Communication Setting].

For details, refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[USB(MELSEC)]
[Host Timeout Time(Sec)]	Set the time period until a communication timeout during monitoring of the host station.	[1] (second) to [90] (seconds)
[Other Timeout Time(Sec)]	Set the time period until a communication timeout during monitoring of other stations.	[1] (second) to [30] (seconds)
[Delay Time(ms)]	Set the delay time for reducing the load of the network and destination PLC.	[0](ms)
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 671 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Not used	—
[Servo axis switching GD device first No. (16 points)]	Not used	—

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

6.3.5 PLC side settings

No setting is required on the controller.

6.3.6 Access range for monitoring

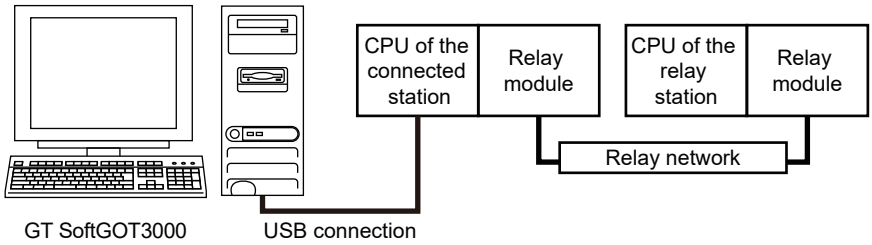
When GT SoftGOT3000 is connected to the CPU of the station connected via USB, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station								
	Relay network	CPU of the relay station							
		RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU*2	ACPU*3	FX5CPU
QCPU QSCPU	Ethernet	○	○	○	○	—	○	—	○
	CC-Link IE Controller Network	○	—	○	○	—	—	—	○
	CC-Link IE Field Network	○	○	○*1	○	—	—	—	○
	MELSECNET/H, MELSECNET/10	○	—	○	○	○	○	○	○

*1 Only the Universal model QCPU is supported.

2 MELDAS C6 is inaccessible.

*3 Depending on the CPU type, the access range is different.
Refer to the following table.
○: Accessible, △: Accessible when the connected CPU is the control station

Connected station	CPU of the relay station	
	AnA(AnN)CPU	AnUCPU
QCPU	△	○

6.4 MELSEC-L series (USB connection)

☞ Page 673 System configuration
☞ Page 674 Connection cable
☞ Page 675 GOT side settings
☞ Page 676 PLC side settings
☞ Page 677 Access range for monitoring

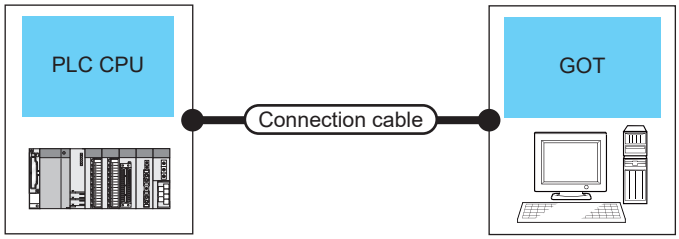
6.4.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC-L series	L02CPU L06CPU L26CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT	○	GT37 SoftGOT3000
	L02SCPU L02SCPU-P	○	GT37 SoftGOT3000

6.4.2 System configuration



For details on the connection cable, refer to the following.

☞ Page 674 Connection cable

For details on the maximum number of connected devices, refer to the following.

☞ Page 674 Maximum number of connected devices

PLC	Maximum length	GOT	
Model		Interface	Model
LCPU	3 m	USB interface of personal computer	GT37 SoftGOT3000

Precautions

Stop monitoring before connecting or disconnecting the USB cable, resetting the PLC, or turning the power on or off. Otherwise, a communication timeout may occur and monitoring may not recover.

If the communication error is not fixed, remove the USB cable. After 5 seconds or more elapse, reconnect the cable. (The error may occur at first communication after the above operation. From the next time, the programmable controller functions normally.)

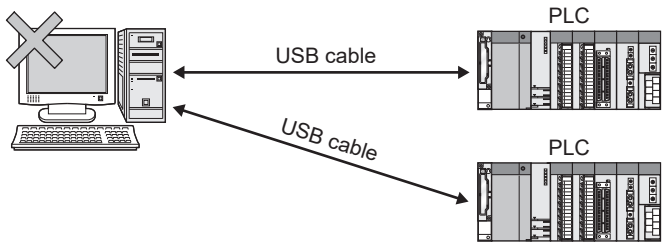
Maximum number of connected devices

The USB connection allows one PLC to connect to one of the GT SoftGOT3000 channels 1 to 4.
One GT SoftGOT3000 module is connectable to one PLC.

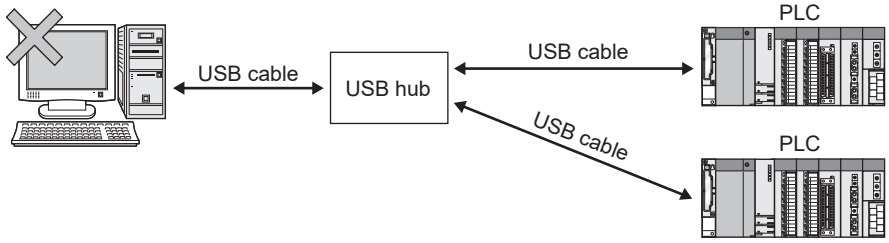
Precautions

Multiple PLCs are not connectable to one personal computer via a USB port or USB hub.
The following shows the system configurations that cannot be used.

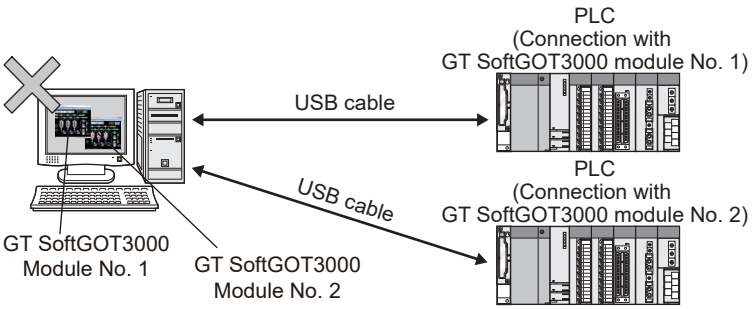
• Connection from a personal computer with multiple USB ports to multiple PLCs



• Connection to multiple PLCs via a USB hub



• Connection from multiple GT SoftGOT3000 modules to multiple PLCs



6.4.3 Connection cable

For the USB cables validated by Mitsubishi Electric Corporation, refer to the following Technical Bulletin.
📖List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)
For Technical Bulletins, go to the Mitsubishi Electric Factory Automation Global Website.
www.MitsubishiElectric.com/fa

Precautions

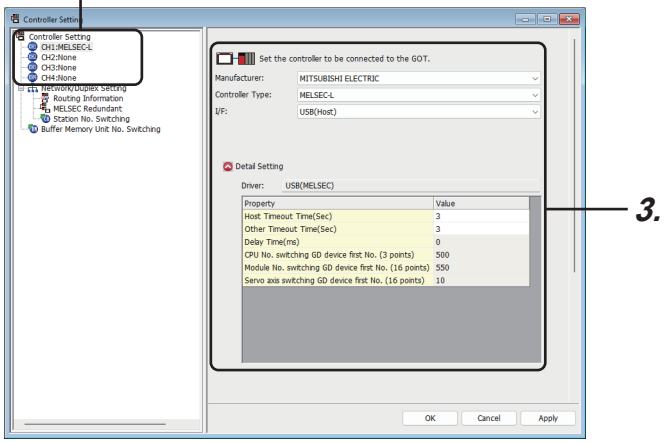
The USB cable can be used with the USB driver already installed.
For the specifications and precautions for cables, refer to the manual of each product.

6.4.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.

List menu



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-L]
[I/F]	[USB(Host)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 676 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

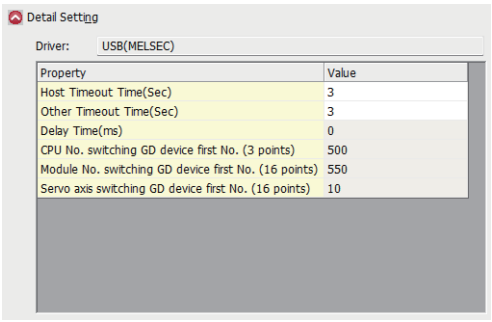
Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

PART 3

■[Detail Setting]

Configure the settings according to the usage environment.

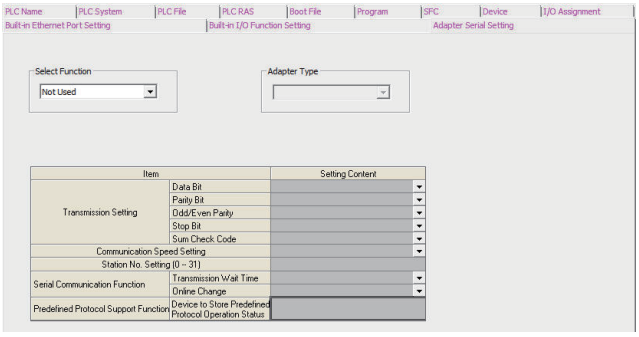


Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[USB(MELSEC)]
[Host Timeout Time(Sec)]	Set the time period until a communication timeout during monitoring of the host station.	[1] (second) to [90] (seconds)
[Other Timeout Time(Sec)]	Set the time period until a communication timeout during monitoring of other stations.	[1] (second) to [30] (seconds)
[Delay Time(ms)]	Set the delay time for reducing the load of the network and destination PLC.	[0](ms)
[CPU No. switching GD device first No. (3 points)]	Not used	—
[Module No. switching GD device first No. (16 points)]	Not used	—
[Servo axis switching GD device first No. (16 points)]	Not used	—

6.4.5 PLC side settings

For connection of GT SoftGOT3000 and LCPU via the L6ADP-R2 adapter, configure the communication settings using GX Works2.

For other configurations, no setting is required on the controller.



1. Click [PLC parameter] → [Adapter Serial Setting].
2. Check that [Not Used] is set to [Select Function].

Point

L6ADP-R2 adapter

For details on the L6ADP-R2 adapter, refer to the following manual.

MELSEC-L CPU Module User's Manual (Hardware Design, Maintenance and Inspection)

6.4.6 Access range for monitoring

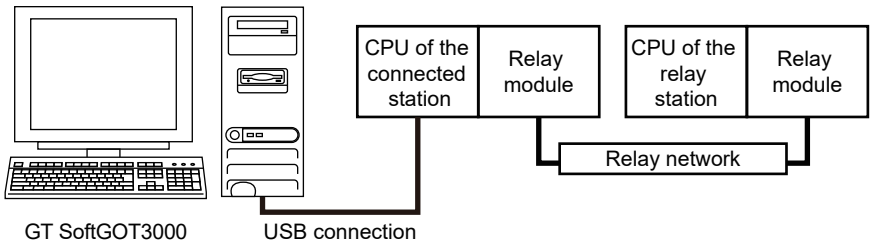
When GT SoftGOT3000 is connected to the CPU of the station connected via USB, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station								
	Relay network	CPU of the relay station							
		RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
LCPU	Ethernet	○	○	○	○	—	—	—	○
	CC-Link IE Field Network	○	○	○*1	○	—	—	—	○

*1 Only the Universal model QCPU is supported.

6.5 MELSEC-F series (USB connection)

☞ Page 678 Connectable devices
☞ Page 678 System configuration
☞ Page 679 Connection cable
☞ Page 680 GOT side settings
☞ Page 681 PLC side settings
☞ Page 681 Access range for monitoring

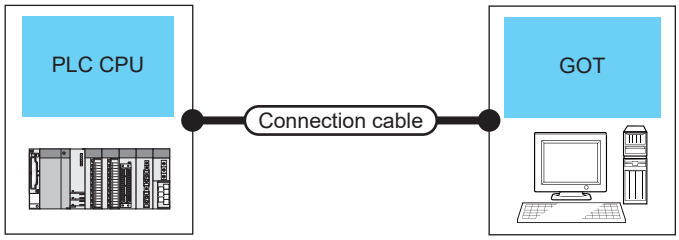
6.5.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	Connectable model
MELSEC-F series	FX3S FX3G FX3GC FX3GE	○	GT37 SoftGOT3000

6.5.2 System configuration



For details on the connection cable, refer to the following.

☞ Page 679 Connection cable

For details on the maximum number of connected devices, refer to the following.

☞ Page 679 Maximum number of connected devices

PLC	Maximum length	GOT	
Model		Interface	Model
FXCPU	3 m	USB interface of personal computer	GT37 SoftGOT3000

Precautions

Stop monitoring before connecting or disconnecting the USB cable, resetting the PLC, or turning the power on or off. Otherwise, a communication timeout may occur and monitoring may not recover.

If the communication error is not fixed, remove the USB cable. After 5 seconds or more elapse, reconnect the cable. (The error may occur at first communication after the above operation. From the next time, the programmable controller functions normally.)

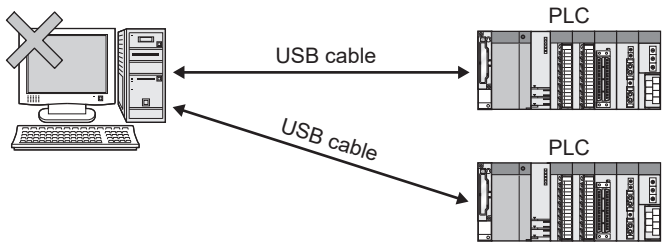
Maximum number of connected devices

The USB connection allows one PLC to connect to one of the GT SoftGOT3000 channels 1 to 4.
One GT SoftGOT3000 module is connectable to one PLC.

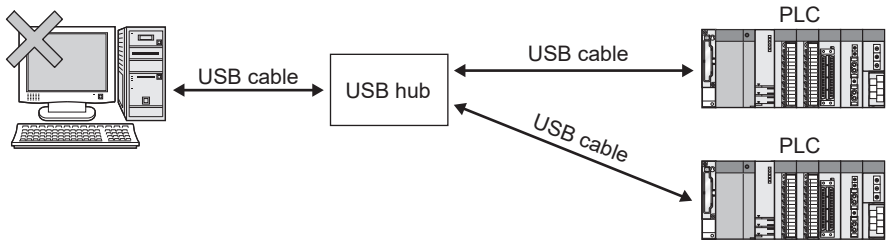
Precautions

Multiple PLCs are not connectable to one personal computer via a USB port or USB hub.
The following shows the system configurations that cannot be used.

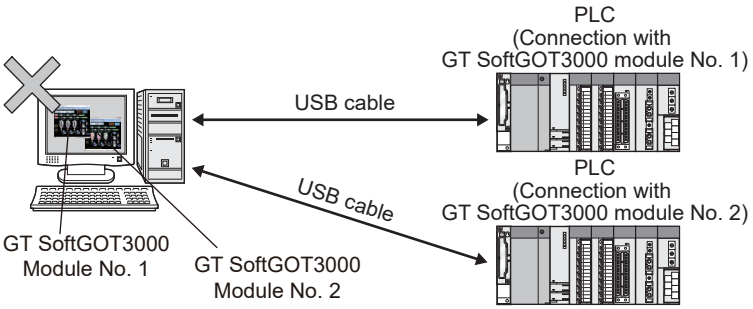
• Connection from a personal computer with multiple USB ports to multiple PLCs



• Connection to multiple PLCs via a USB hub



• Connection from multiple GT SoftGOT3000 modules to multiple PLCs



6.5.3 Connection cable

For the USB cables validated by Mitsubishi Electric Corporation, refer to the following Technical Bulletin.
List of Valid Devices Applicable for GOT3000 Series (GOT-A-0233)
For Technical Bulletins, go to the Mitsubishi Electric Factory Automation Global Website.
www.MitsubishiElectric.com/fa

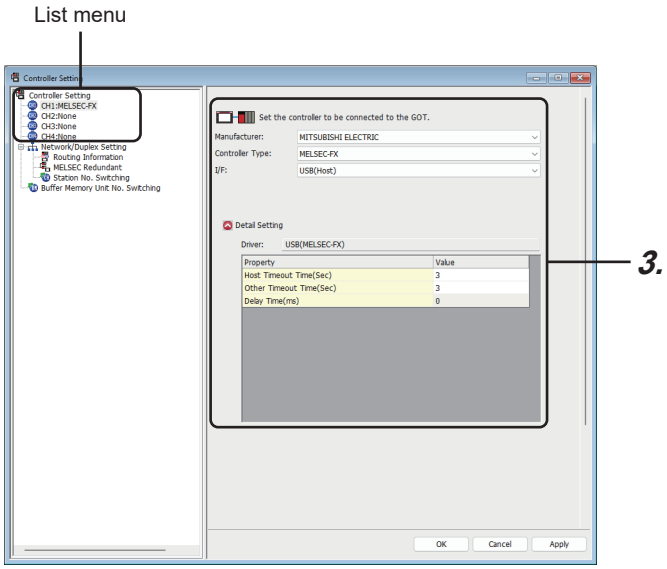
Precautions

The USB cable can be used with the USB driver already installed.
For the specifications and precautions for cables, refer to the manual of each product.

6.5.4 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-FX]
[I/F]	[USB(Host)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 681 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

Point

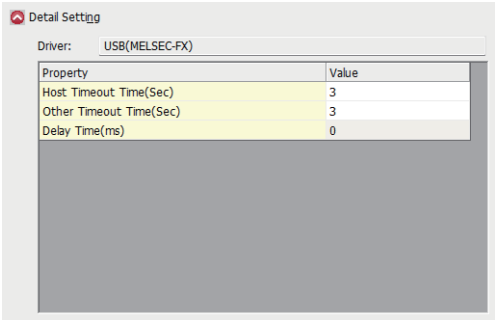
The controller settings can be checked in [I/F Communication Setting].

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[USB(MELSEC-FX)]
[Host Timeout Time(Sec)]	Set the time period until a communication timeout during monitoring of the host station.	[1] (second) to [90] (seconds)
[Other Timeout Time(Sec)]	Set the time period until a communication timeout during monitoring of other stations.	[1] (second) to [30] (seconds)
[Delay Time(ms)]	Set the delay time for reducing the load of the network and destination PLC.	[0](ms)

6.5.5 PLC side settings

No setting is required on the controller.

6.5.6 Access range for monitoring

Only the connected CPU can be accessed.

7 Bus connection

	Q172DCPU-S1 Q173DCPU-S1 Q172DSCPU Q173DSCPU Q170MCPU Q170MSCPU Q170MSCPU-S1	○	GT37 SoftGOT3000
CNC C70	Q173NCCPU	○	GT37 SoftGOT3000
Robot controller (Q series)	CRnQ-700(Q172DRCPU) CR750-Q (Q172DRCPU) CR751-Q (Q172DRCPU) CR800-Q (Q172DSRCPU)	○	GT37 SoftGOT3000

*1 When using the bus extension connector box, attach it to the extension base. (Connecting it to the main base is not allowed.)
*2 To configure a multiple CPU system, use a CPU with function version B or later.
*3 Use a module having a serial number starting with 12042 or later.
*4 When using SV13, SV22, or SV43, use a Motion CPU with the following version of OS installed.
- SW6RN-SV13Q□: 00E or later
- SW6RN-SV22Q□: 00E or later
- SW6RN-SV43Q□: 00B or later

7.1.2 System configuration

Point

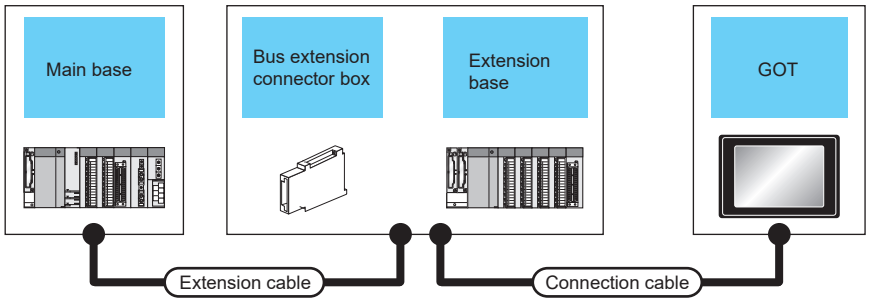
When [CONTROL BUS ERR] or [UNIT VERIFY ERR] occurs

Noise due to a long bus connection cable may cause a malfunction.

Check whether a signal line such as bus cable is placed near the equipment to operate.

If the line is close to the equipment, make a distance of 100 mm or more from the equipment.

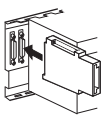
When one GOT is connected



PLC					Connection cable	GOT		Maximum length
Main base		Extension cable*1	Extension base			Interface	Model	
Main base	Bus extension connector box*2		Extension base	Bus extension connector box*2				
Main base	—	—	—	—	GT15-QC06B (0.6 m) GT15-QC12B (1.2 m) GT15-QC30B (3 m) GT15-QC50B (5 m) GT15-QC100B (10 m)	GT37-IF2000 + GT15-75QBUSL GT15-75QBUS2L GT15-QBUS GT15-QBUS2	GT37 SoftGOT3000	Between main base and GOT: 13.2 m (including extension cable length)
	—	Extension cable (13.2 m or less)	Extension base	—				
	A9GT-QCNB*3	—	—	—	GT15-QC06B (0.6 m) GT15-QC12B (1.2 m) GT15-QC30B (3 m) GT15-QC50B (5 m) GT15-QC100B (10 m) GT15-QC150BS (15 m) GT15-QC200BS (20 m) GT15-QC250BS (25 m) GT15-QC300BS (30 m) GT15-QC350BS (35 m)	GT37-IF2000 + GT15-75QBUSL GT15-75QBUS2L GT15-QBUS GT15-QBUS2	GT37 SoftGOT3000	Between main base and GOT: 37 m (including extension cable length)
	—	Extension cable (13.2 m or less)	Extension base	A9GT-QCNB				

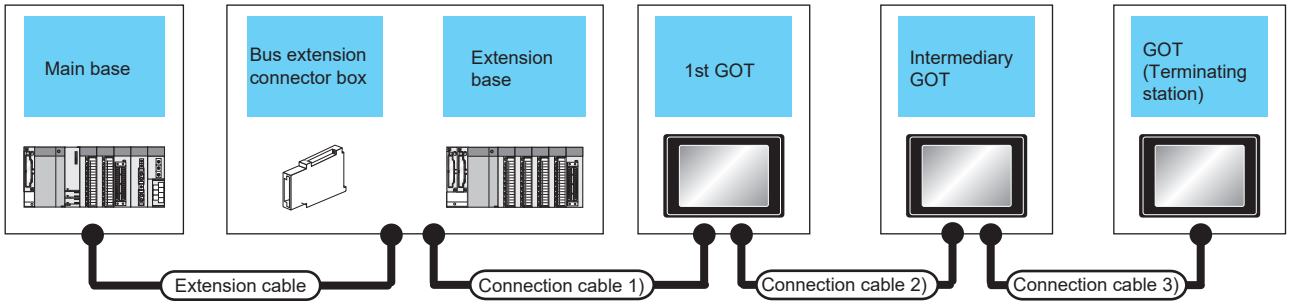
*1 For the extension cables, refer to the MELSEC-Q catalog (L(NA)08032).

*2 When installing the GOT 13.2 m or more away from the main base unit, the bus extension connector box is required.
Attach the bus extension connector box to the extension connector of the base unit.
Also, connect the connection cable to the bus extension connector box.
When using no extension base unit: Attach it to the main base unit.
When using the extension base unit: Attach it to the extension base unit on the last stage.



*3 When using Q00JCPU, Q00UJCPU, or Q00UJCPU-S8, attach the bus extension connector box to the extension base.
(Connecting it to the main base is not allowed. When the GOT is connected to the main base, the distance between the main base and the GOT must be within 13.2 m.)

When two to five GOTs are connected



PLC					Connection cable 1)	GOT (1st)		
Main base		Extension cable*1	Extension base			Interface*5	Model	
Main base	Bus extension connector box*2		Extension base	Bus extension connector box*2				
Main base	—	—	—	—	GT15-QC06B (0.6 m) GT15-QC12B (1.2 m) GT15-QC30B (3 m) GT15-QC50B (5 m) GT15-QC100B (10 m)	GT37-IF2000 + GT15-75QBUS2L GT15-QBUS2	GT37 SoftGOT3000	Refer to 1) in the table below. →

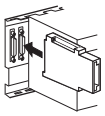
	A9GT-QCNB*3	—	—	—	GT15-QC06B (0.6 m) GT15-QC12B (1.2 m) GT15-QC30B (3 m) GT15-QC50B (5 m) GT15-QC100B (10 m) GT15-QC150BS (15 m) GT15-QC200BS (20 m) GT15-QC250BS (25 m) GT15-QC300BS (30 m) GT15-QC350BS (35 m)	GT37-IF2000 + GT15-75QBUS2L GT15-QBUS2	GT37 SoftGOT3000	3) →
	—	Extension cable (13.2 m or less)	Extension base	A9GT-QCNB		GT37-IF2000 + GT15-75QBUS2L GT15-QBUS2	GT37 SoftGOT3000	4) →

Connection cable 2)		GOT (intermediary)*3		Connection cable 3)	GOT (terminating station)*4		Maximum length
		Interface*5	Model		Interface*5	Model	
1)	GT15-QC06B (0.6 m) GT15-QC12B (1.2 m) GT15-QC30B (3 m) GT15-QC50B (5 m) GT15-QC100B (10 m) GT15-QC150BS (15 m) GT15-QC200BS (20 m) GT15-QC250BS (25 m) GT15-QC300BS (30 m) GT15-QC350BS (35 m)	GT37-IF2000 + GT15-75QBUS2L GT15-QBUS2	GT37 SoftGOT3000	GT15-QC06B (0.6 m) GT15-QC12B (1.2 m) GT15-QC30B (3 m) GT15-QC50B (5 m) GT15-QC100B (10 m) GT15-QC150BS (15 m) GT15-QC200BS (20 m) GT15-QC250BS (25 m) GT15-QC300BS (30 m) GT15-QC350BS (35 m)	GT37-IF2000 + GT15-75QBUSL GT15-75QBUS2L GT15-QBUS GT15-QBUS2	GT37 SoftGOT3000	Between main base and GOT (1st): 13.2 m Between main base and GOT (last): 37 m
2)		GT37-IF2000 + GT15-75QBUS2L GT15-QBUS2	GT37 SoftGOT3000		GT37-IF2000 + GT15-75QBUSL GT15-75QBUS2L GT15-QBUS GT15-QBUS2	GT37 SoftGOT3000	Between main base and GOT (1st): 13.2 m (incl. extension cable length) Between main base and GOT (last): 37 m (incl. extension cable length)
3)		GT37-IF2000 + GT15-75QBUS2L GT15-QBUS2	GT37 SoftGOT3000		GT37-IF2000 + GT15-75QBUSL GT15-75QBUS2L GT15-QBUS GT15-QBUS2	GT37 SoftGOT3000	Between main base and GOT (last): 37 m
4)		GT37-IF2000 + GT15-75QBUS2L GT15-QBUS2	GT37 SoftGOT3000		GT37-IF2000 + GT15-75QBUSL GT15-75QBUS2L GT15-QBUS GT15-QBUS2	GT37 SoftGOT3000	Between main base and GOT (last): 37 m (incl. extension cable length)

*1 For the extension cables, refer to the MELSEC-Q catalog (L(NA)08032).

*2 When installing the GOT 13.2 m or more away from the main base unit, the bus extension connector box is required.
Attach the bus extension connector box to the extension connector of the base unit.
When using no extension base unit: Attach it to the main base unit.
When using the extension base unit: Attach it to the extension base unit on the last stage.
Also, connect the connection cable to the bus extension connector box.
Set the same stage number as that of the GOT for the bus extension connector box.
For details on the stage number setting, refer to the following.
☞ Page 688 [Controller Setting]



*3 When using Q00JCPU, Q00UJCPU, or Q00UJCPU-S8, attach the bus extension connector box to the extension base.
(Connecting it to the main base is not allowed. When the GOT is connected to the main base, the distance between the main base and the first GOT must be within 13.2 m.)

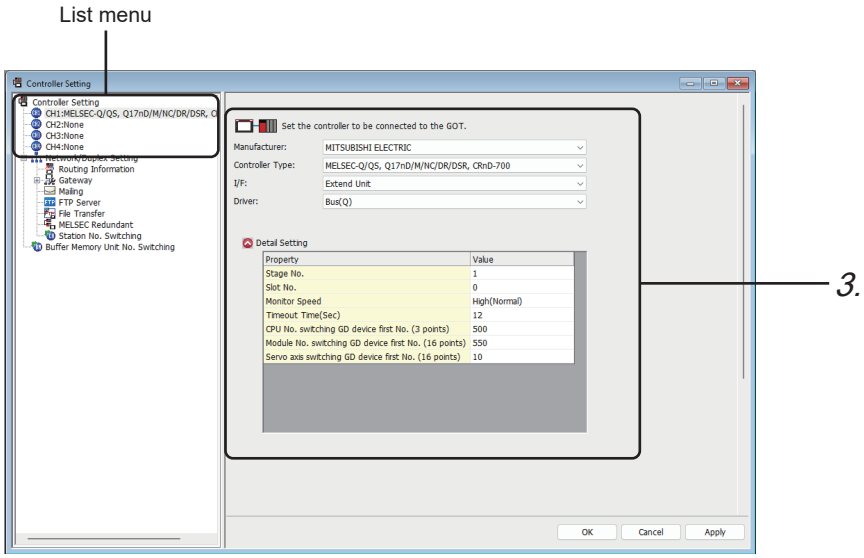
*4 When connecting three or more GOTs, the overall cable length is restricted.
☞ Page 700 When connecting multiple GOTs

*5 Bus connection unit
GT15-75QBUSL, GT15-QBUS: Used for the terminating GOT (not used for an intermediary GOT).
GT15-75QBUS2L, GT15-QBUS2: Used for an intermediary GOT (also used for the terminating GOT).

7.1.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
[I/F]	[Extend Unit]
[Driver]	[Bus(Q)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 689 [Detail Setting]

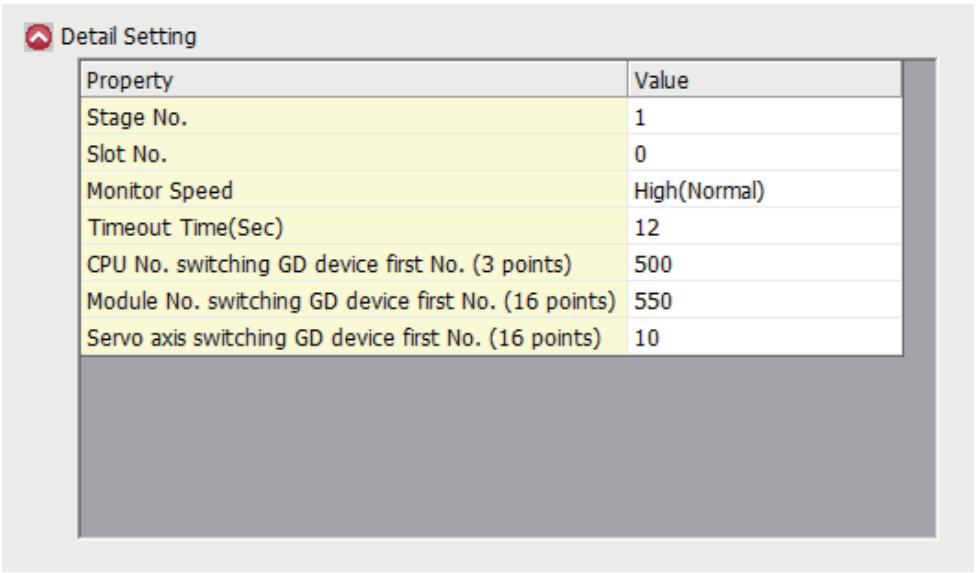
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Number of Stages]*1	Set the number of the base unit stage to which the CPU module is installed in the PLC.	[1] to [7]
[Slot No.]	Set the slot number to which the CPU module is installed in the PLC.	[0] to [9]
[Monitor Speed]*4	Set the monitor speed of the GOT. This setting is not valid in all systems.	[High(Normal)]*2 [Middle] [Low]*3
[Timeout Time]	Set the time period for a communication to time out.	[12] seconds to [90] seconds
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 690 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 691 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 692 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 When using a QA1S6□B extension base unit, assign the GOT as a stage next to the Q□□B extension base unit in the stage number setting.
For details, refer to the following.
☞ Page 700 When using the QA1S6□B extension base unit

*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen. However, when connected to Q00UJ/Q00U/Q01U/Q02UCPU or Q00J/Q00/Q01CPU, the sequence scan time may be affected. If you want to avoid the influence on the sequence scan time, do not set [High(Normal)]. (This setting hardly affects QCPUs other than the above.)

*3 Set this range if you want to avoid the influence on the sequence scan time further than the [Middle] setting when connecting to Q00UJ/Q00U/Q01U/Q02UCPU or Q00J/Q00/Q01CPU.
However, the monitor speed may be reduced.

*4 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle]. If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
📖GT Designer3 (GOT3000) Screen Design Manual

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Precedence in communication settings

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Point

By setting the GOT internal device, the GOT can disconnect specific parts from the controller's multiple connections.

For example, a faulty station that has a communication timeout can be disconnected from the system.

For details on the setting contents of the GOT internal device, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual

■Setting the number of stages and the slot number

Point

Before setting the number of sages and the slot number

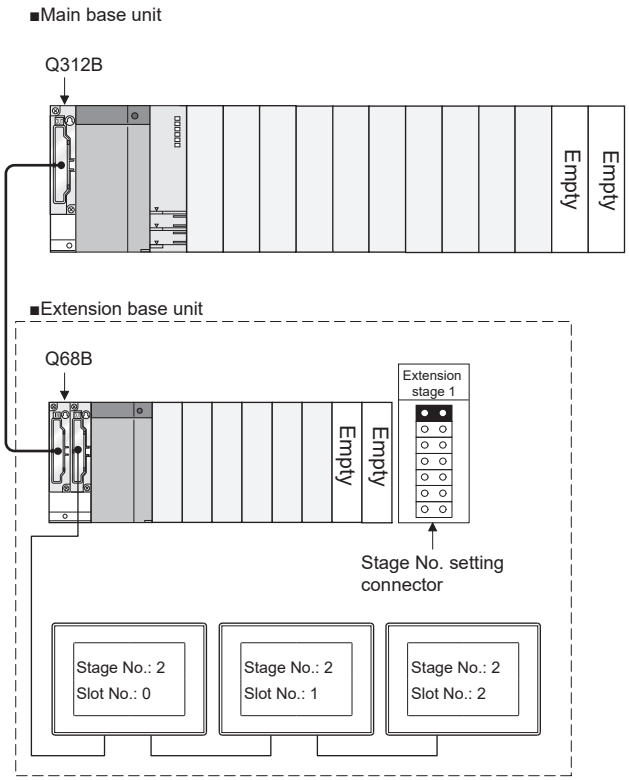
The PLC CPU recognizes the GOT as follows.

- QCPU (Q mode): Intelligent function module of 16 I/O points
- Other than QCPU (Q mode): Intelligent function module of 32 I/O points

In [Detail setting], assign the GOT to an empty I/O slot on the PLC CPU.

- When connecting to QCPU (Q mode)

Set an additional stage (16 points × 10 slots) for GOT connection, and assign a GOT to one of the I/O slots.
(Assigning the GOT to an empty slot on the main base or extension base is not allowed.)



Point

When using the bus extension connector box

Set the stage number switch on the bus extension connector box to the same stage number as the GOT.

For details on the setting method, refer to the following manual.

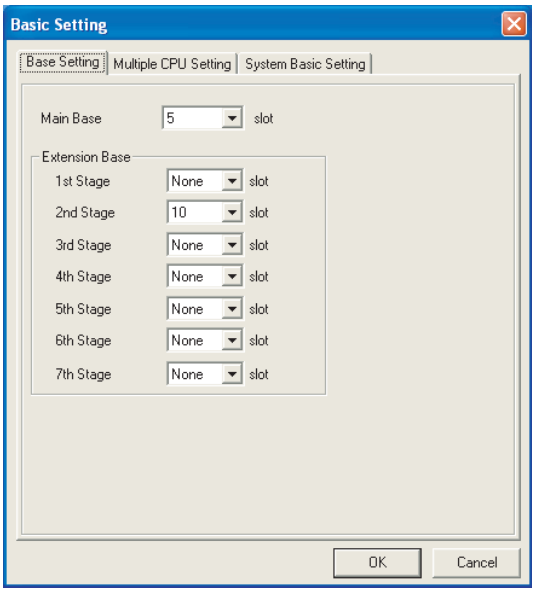
A9GT-QCNB Type Bus Extension Connector Box User's Manual

Point

When connecting to Motion CPU (Q series)

In the [Base Setting] on MT Developer, set "10" to the number of slots for the extension base used for GOT connection.

Example: When setting "2" to the stage number and "0" to the slot number in the communication interface settings, set "10" to the number of slots on the second stage.



Point

Setting unused I/O slots to empty (0 points) (only when connecting to QCPU (Q mode))

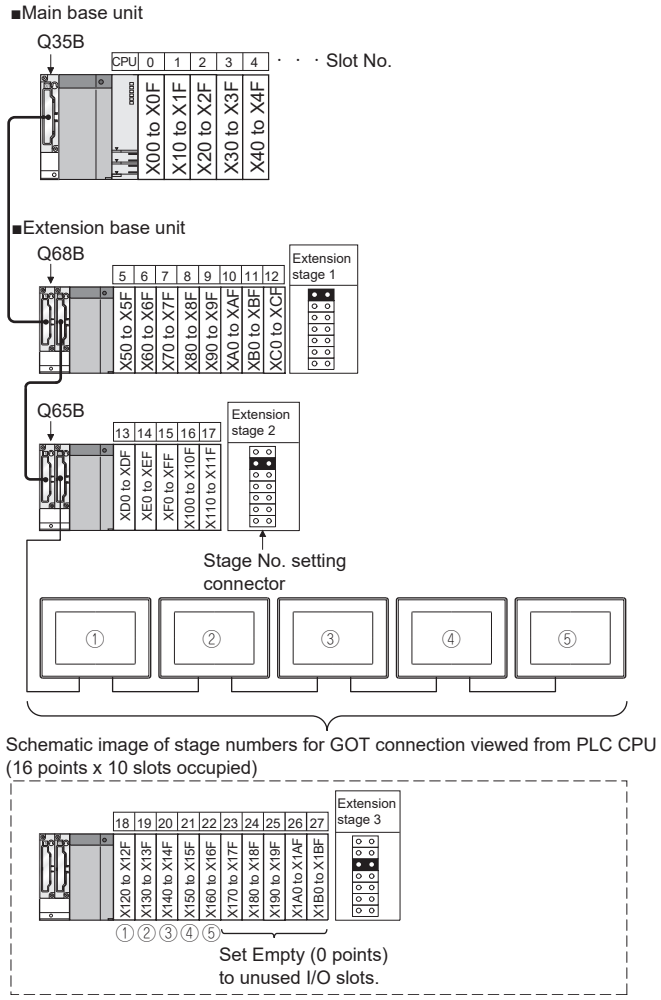
Setting unused I/O slots as empty slots (0 points) from [PC parameters] → [I/O assignments] of GX Developer allows you to use I/O numbers of "16 points × number of empty slots" for other purposes.

For details on I/O assignment settings, refer to the following manuals.

QnUCPU User's Manual (Function Explanation, Program Fundamentals)

Qn(H)/QnPH/QnPRHCPU User's Manual (Function Explanation, Program Fundamentals)

Example) I/O assignment (when 16 points are assigned to each of all modules installed with the PLC CPU)



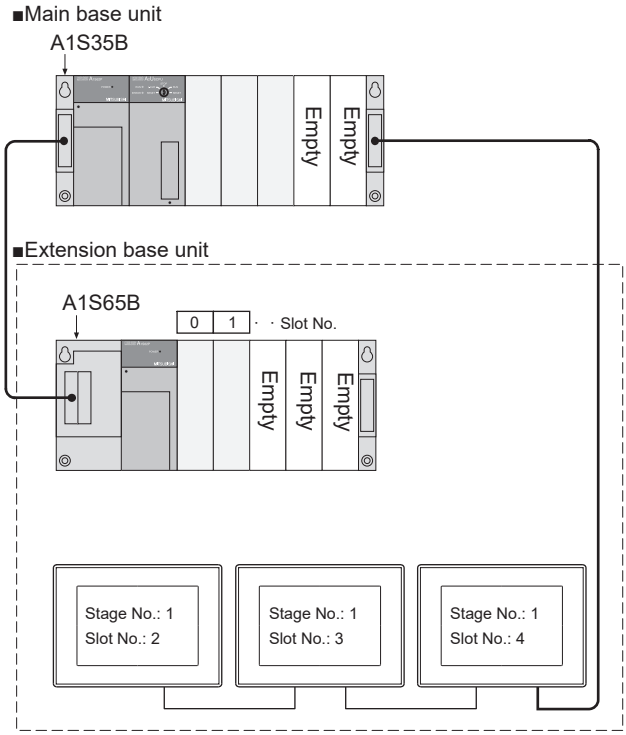
• When connecting to a controller other than QCPU (Q mode)

Assign the GOT to an empty I/O slot on the extension base.

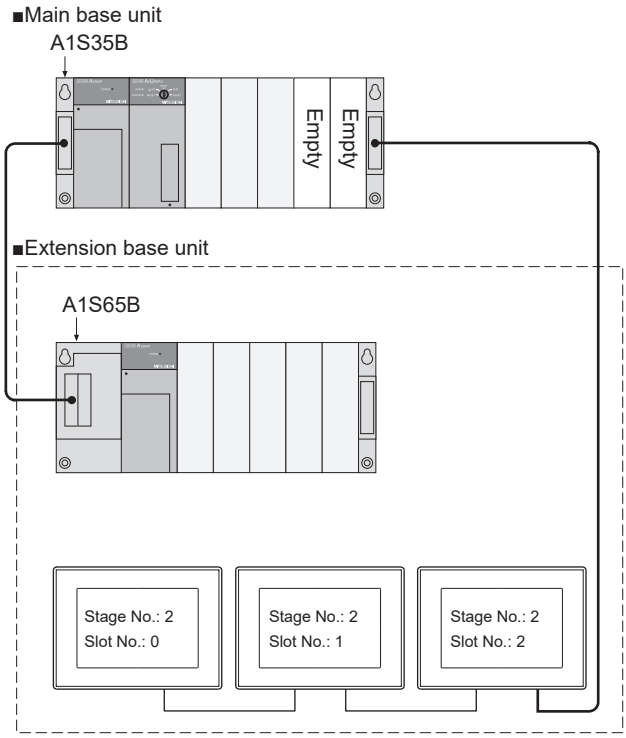
When there is no extension base or no empty I/O slots are left on an extension base, set an additional stage, and assign the GOT to one of the I/O slots.

(Assigning the GOT to an empty slot on the main base is not allowed.)

◇ When there is an empty I/O slot on the extension base



◇ When there are no empty I/O slots on the extension base



7.1.4 Precautions

When turning on the GOT

■System configuration

The PLC CPU remains in the reset status until the GOT is started.
Therefore, no sequence program will run until then.
A system configuration in which the GOT is turned on from a sequence program is not available.

■Time taken until the PLC runs after power-on of the GOT

When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.
If you start the GOT before the PLC runs, a system alarm occurs.
Adjust the startup logo display time in the GOT setup so that no system alarm occurs.
For details, refer to the following manual.
📖GT Designer3 (GOT3000) Screen Design Manual

■Power-on order of the GOTs and PLC

• Power-on order for connection of three GOTs or more (when connecting QCPU (Q mode))

For the power-on order, refer to the following.
☞ Page 699 Restrictions on the overall cable length by the number of connected GOTs

• Power-on order of the other GOTs and PLCs

The GOT and PLC can both be started up whichever of these devices is turned on first. (There is no specific order in which they are powered on.)
However, the operation is as follows when the GOT is turned on followed by the PLC.
If the PLC power is off when the GOT power is turned on, a system alarm (No. 402: timeout error) occurs.
Upon power-on of the PLC CPU, the GOT automatically starts monitoring.
Use the system information to reset the alarm.
For information on the system Information, refer to the following manual.
📖GT Designer3 (GOT3000) Screen Design Manual

When turning off or cycling the power to the GOT

■Precautions for cycling the power to the GOT

Do not cycle the power to the GOT while the GOT is communicating with the PLC.
Depending on the power-off timing, communication with the PLC is disabled.
Before doing so, be sure to turn off the PLC first.

Point

When one of the following operations is performed, the GOT is automatically restarted. You do not need to turn off the PLC.

• When writing a package data from GT Designer3 or a data storage location
• When changing utility settings

■When turning off the GOT before a user-created screen is displayed

When the GOT is turned off before a user-created screen is displayed on the GOT, subsequent communications may be no longer possible.
In such a case, cycle the power to the PLC CPU and GOT.

■Precautions for connection of three GOTs or more (when connecting QCPU (Q mode))

☞ Page 699 Restrictions on the overall cable length by the number of connected GOTs

Reset switch on the GOT

When bus connection is used, the reset switch on the GOT does not function.

When powering off or resetting the PLC

■When powering off or resetting the PLC during monitoring

If the PLC is powered off or reset during monitoring, a system alarm (No. 402: timeout error) occurs.

When the PLC CPU is restored, the GOT automatically resumes monitoring.

Use the system information to reset the alarm.

For information on the system Information, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual

■When turning off or resetting the PLC CPU before a user-created screen is displayed

When the PLC CPU is turned off or reset before the user-created screen is displayed on the GOT, subsequent communications may be no longer possible.

In such a case, cycle the power to the PLC CPU and GOT.

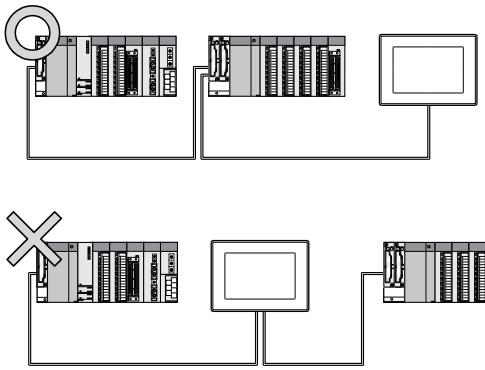
■Precautions for connection of three GOTs or more (when connecting QCPU (Q mode))

Page 699 Restrictions on the overall cable length by the number of connected GOTs

Position of the GOT

Always connect the GOT to the last base unit.

Connecting a GOT between base units is not allowed.



When the GOT is bus-connected to a PLC CPU without installing the communication driver

When the GOT is bus-connected to a PLC CPU without installing the standard monitor OS and the communication driver for the bus connection to the GOT, the PLC CPU is reset. (GX Developer cannot communicate with the PLC CPU.)

In this case, disconnecting the bus connection cable from the GOT will cancel the reset status of the PLC CPU.

When designing the system

When the GOT power is off, the following currents are supplied to the GOT from the PLC CPU side (the power supply module on the main base unit). (The GOT does not operate when the power is off.)

Design the system so that the 5 V DC current consumption of the modules on the main base unit and the total current consumption of the GOTs will not exceed the rated output current of 5 V DC of the power supply module in use.

Connected CPU	No. of connected GOTs	Total current consumption
When connecting to QCPU (Q mode)	5	2200 mA
	4	1760 mA
	3	1320 mA
	2	880 mA
	1	440 mA
When connecting to a controller other than QCPU (Q mode)	3	360 mA
	2	240 mA
	1	120 mA

When assigning GOT I/O signals

Do not use the I/O signals assigned to the PLC CPU in sequence programs, as these signals are used by the GOT system. When these signals are used, GOT functions cannot be assured.

When connecting to QCPU (Q mode)

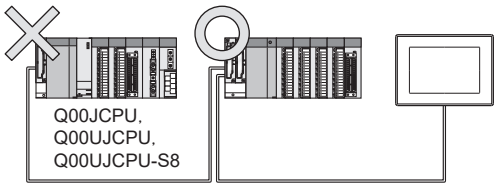
■Restrictions on the overall cable length by the number of connected GOTs

The following restrictions apply when three or more GOTs are connected.

No. of connected GOTs	Overall cable length	Restrictions	Overall cable length	Restrictions
1	(No restrictions)			
2				
3	Less than 25 m	(No restrictions)	25 to 37 m	Use the same power supply for the PLC and all the GOTs, and power on/off these devices simultaneously.
4	Less than 20 m		20 to 37 m	
5	Less than 15 m		15 to 37 m	

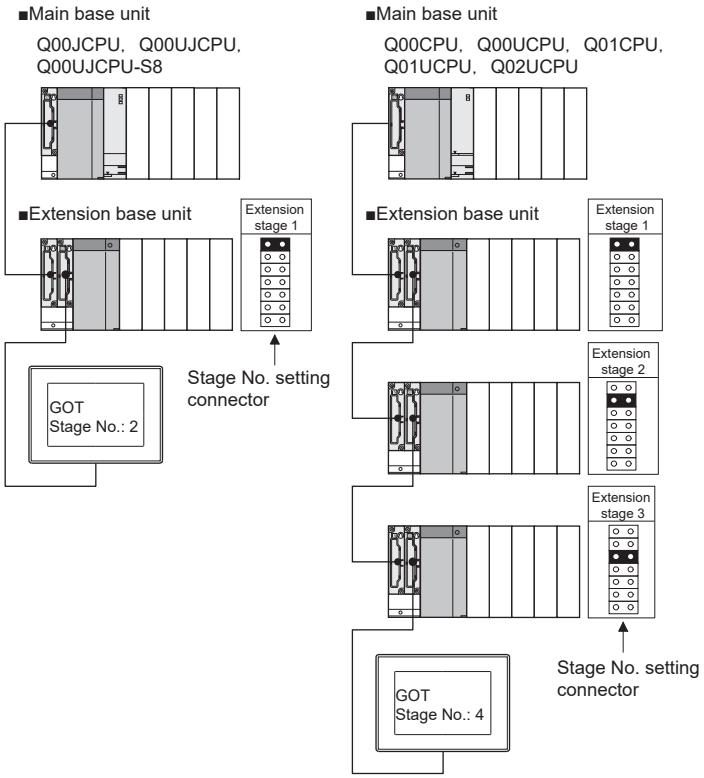
■When using the Q00JCPU, Q00UJCPU, or Q00UJCPU-S8

The bus extension connector box can be connected only to the extension base unit.
(Connecting it to the main base unit is not allowed.)



■When using Q00J/Q00UJ/Q00/Q00U/Q01/Q01U/Q02UCPU

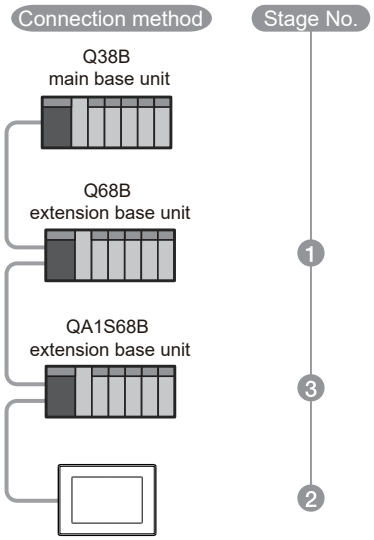
When a GOT is bus-connected to Q00JCPU, Q00UJCPU, or Q00UJCPU-S8, the number of extension stages including the GOT must be 2 or less.
When a GOT is bus-connected to Q00CPU, Q00UCPU, Q01CPU, Q01UCPU or Q02UCPU, the number of extension stages including the GOT must be 4 or less.



■When using the QA1S6□B extension base unit

Although a GOT is physically connected to the last of all extension base units, in the stage number setting, assign the GOT as a stage next to the last Q□□B type extension base unit.

Assign the QA1S6□B type extension base unit as a stage next to the GOT.

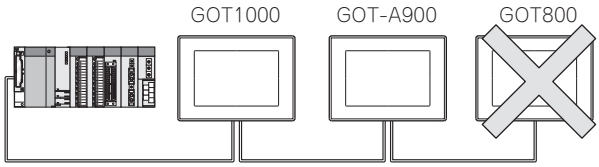


When connecting multiple GOTs

■System including different GOT series

The GOT3000 series can be connected with GOT2000 series, GOT1000 series, and GOT-A900 series.

The GOT3000 series cannot be connected with GOTs other than GOT2000 series, GOT1000 series, and GOT-A900 series.



■Restrictions on the number of connected GOTs

The number of connected GOTs is restricted according to the connected CPU and the number of intelligent function modules.

Connected CPU	Number of connectable GOTs	Total number of connectable GOTs and intelligent function modules*1
QCPU (Q mode), Motion CPU (Q series)	5	5 GOTs + 6 intelligent function modules*2

*1 Indicates the following models:
AD51(S3), AD51H(S3), AD51FD(S3), AD57G(S3), AJ71C21(S1), AJ71C22(S1), AJ71C23, AJ71C24(S3/S6/S8), AJ71UC24, AJ71E71(-S3), AJ71E71N-B2/B5/T/B5T, AJ71E71N3-T, AJ61BT11 (in intelligent mode only), A1SJ71C24(-R2/PRF/R4), A1SJ71UC24(-R2/PRF/R4), A1SJ71E71-B2/B5(-S3), A1SJ71E71N-B2/B5/T/B5T, A1SJ71E71N3-T, A1SD51S, A1SJ61BT11 (in intelligent mode only)

*2 Only the A1SD51S can be connected to the QCPU (Q mode).

When using a PLC CPU in the direct mode

Note that when the I/O control mode of the PLC CPU is the direct mode, and if the first GOT is connected to the main or extension base unit with a 5 m extension cable (GT15-AC50B, GT15-A1SC50NB), the input X of the empty I/O slot cannot be used.

No restrictions apply when the I/O control mode is the refresh mode.

On PLC CPUs whose I/O control mode can be selected by a switch, set the I/O control mode to the refresh mode before use.

Point

Example of using input X of an empty I/O slot

- When input X is assigned on the MELSECNET/10 network
- When input X of an empty I/O slot is turned on/off by the computer link module
- When input X of an empty I/O slot is turned on/off by the touch switch function (Bit SET/RST/Alternate/Momentary) of GOT

When monitoring the Q170MCPU or Q170MSCPU(-S1)

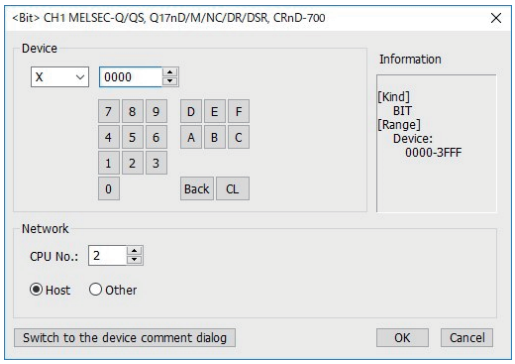
Set [CPU No.] to 2 in the device setting to monitor the device of the Motion CPU area (CPU No. 2).

When [CPU No.] is set to 0 or 1, the device on the PLC CPU area (CPU No. 1) is monitored.

When [CPU No.] is set to the number other than 0 to 2, a communication error occurs and the monitoring cannot be executed.

For the setting of [CPU No.], refer to the following.

GT Designer3 (GOT3000) Screen Design Manual



Troubleshooting

For troubleshooting, refer to the User's Manual of the GOT used.

7.1.5 Access range for monitoring

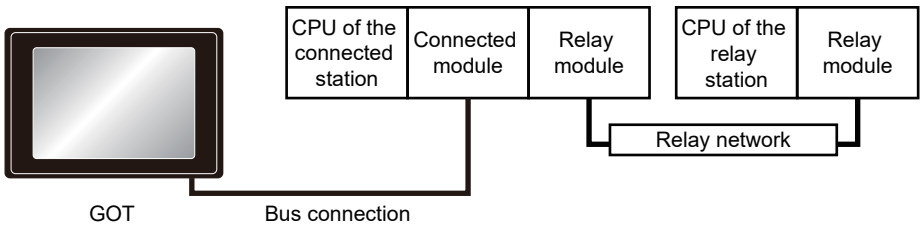
When the GOT is connected to the CPU of the station connected by bus connection, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station								
	Relay network	CPU of the relay station							
		RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU

8.1.1 Connectable devices

Point

• Connectable network

For MELSECNET/H connection, use the MNET/H mode or MNET/H extension mode with MELSECNET/H.
Connect the GOT to the following network systems as a normal station.
MELSECNET/H network system (PLC to PLC network) optical loop system
MELSECNET/H network system (PLC to PLC network) coaxial bus system
Connection to the remote I/O network is not allowed.
For MELSECNET/10 connection, use the MNET/10 mode with MELSECNET/H.
Connect the GOT to the following network systems as a normal station.
MELSECNET/10 network system (PLC to PLC network) optical loop system
MELSECNET/10 network system (PLC to PLC network) coaxial bus system
Connection to the remote I/O network is not allowed.

• MELSECNET/H network module

When connecting the MELSECNET/H network module to the MELSECNET/H network system, specify the MELSECNET/H mode or the MELSECNET/H extended mode as a network type.
When connecting the MELSECNET/H network module to the MELSECNET/10 network system, specify the MNET/10 mode as a network type.

The following table shows the connectable models.
○: Supported, —: Not supported

Controller	Model	Clock	MELSECNET/H network module		Connectable model
			Optical loop	Coaxial bus	
MELSEC-Q series (Q mode)	Q00JCPU Q00CPU*1 Q01CPU*1 Q02CPU*1	○	QJ71LP21 QJ71LP21-25 QJ71LP21S-25	QJ71BR11*1	GT37 SoftGOT3000
	Q02HCPU*1 Q06HCPU*1 Q12HCPU*1 Q25HCPU*1	○	QJ71LP21 QJ71LP21-25 QJ71LP21S-25	QJ71BR11*1	GT37 SoftGOT3000

CNC C70	Q173NCCPU	○	QJ71LP21 QJ71LP21-25 QJ71LP21S-25	QJ71BR11*1	GT37 SoftGOT3000

Controller	Model	Clock	MELSECNET/H network module		Connectable model
			Optical loop	Coaxial bus	
Robot controller (Q series)	CRnQ-700(Q172DRCPU) CR750-Q(Q172DRCPU) CR751-Q(Q172DRCPU) CR800-Q(Q172DSRCPU)	○	QJ71LP21 QJ71LP21-25 QJ71LP21S-25	QJ71BR11*1	GT37 SoftGOT3000

*1 Use a CPU and an MELSECNET/H network module with function version B or later.
*2 Use a module having a serial number stating with 12042 or later in the first 5 digits.
*3 When using SV13, SV22, or SV43, use a Motion CPU with the following version of OS installed.
- SW6RN-SV13Q□: 00E or later
- SW6RN-SV22Q□: 00E or later
- SW6RN-SV43Q□: 00B or later

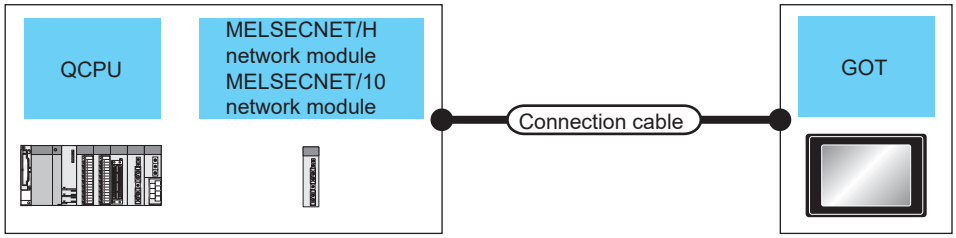
Precautions

For information on the version restrictions of the MELSECNET/H network module, refer to the following manual.

Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)

8.1.2 System configuration

Connection to optical loop system



For details on the maximum length, refer to the following.

☞ Page 706 Maximum length

For details on the maximum number of connected devices, refer to the following.

☞ Page 707 Maximum number of connected devices

PLC			Connection cable	GOT	
Model	**MELSECNET/H network module*1**	**Communication type**	**Cable model**	**Interface**	**Model**
MELSEC-Q (Q mode) MELSEC-QS Motion CPU (Q series) CNC C70 Robot controller (Q series)	QJ71LP21 QJ71LP21-25 QJ71LP21S-25	MELSECNET/H	Optical fiber cable*2	GT37-IF2000 + GT15-J71LP23-25	GT37 SoftGOT3000
		MELSECNET/10	Optical fiber cable*2	GT37-IF2000 + GT15-J71LP23-25*3	GT37 SoftGOT3000

		MELSECNET/10	Optical fiber cable*2	GT37-IF2000 + GT15-J71LP23-25*3	GT37 SoftGOT3000

*1 For the system configuration of the MELSECNET/H network module, refer to the following manual.
📖Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)

*2 For details on the optical fiber cable, refer to the following manual.
📖Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)

*3 In the controller settings, select the MELSECNET/10 mode. For the setting method, refer to the following.
☞ Page 711 [Controller Setting]

■Maximum length

The overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the total number of stations.

For details, refer to the following manual.

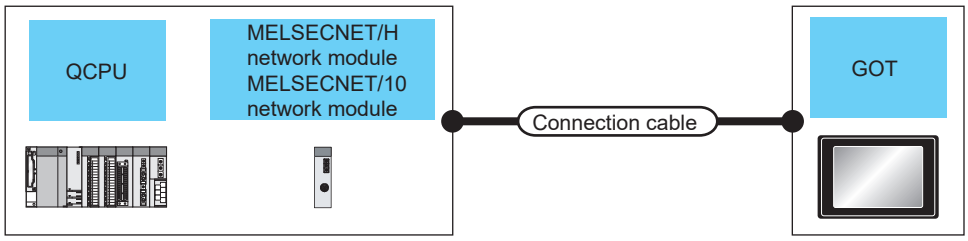
📖Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC-Q (Q mode) C Controller module (Q series) MELSEC-QS Motion CPU (Q series) CNC C70 Robot controller (Q series)	63 GOTs

Connection to the coaxial bus system



For details on the maximum length, refer to the following.

☞ Page 707 Maximum length

For details on the maximum number of connected devices, refer to the following.

☞ Page 708 Maximum number of connected devices

PLC			Connection cable	GOT	
Model	**MELSECNET/H network module*1**	**Communication type**	**Cable model**	**Interface**	**Model**
MELSEC-Q (Q mode) MELSEC-QS Motion CPU (Q series) CNC C70 Robot controller (Q series)	QJ71BR11	MELSECNET/H	Coaxial cable*2	GT37-IF2000 + GT15-J71BR13	GT37 SoftGOT3000
		MELSECNET/10	Coaxial cable*2	GT37-IF2000 + GT15-J71BR13*3	GT37 SoftGOT3000
C Controller module (Q series)	QJ71BR11	MELSECNET/H	Coaxial cable*2	GT37-IF2000 + GT15-J71BR13	GT37 SoftGOT3000
		MELSECNET/10	Coaxial cable*2	GT37-IF2000 + GT15-J71BR13*3	GT37 SoftGOT3000

*1 For the system configuration of the MELSECNET/H network module, refer to the following manual.
Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)

*2 For the coaxial cable, refer to the following manual.
Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)

*3 In the controller settings, select the MELSECNET/10 mode.
For the setting method, refer to the following.
☞ Page 711 [Controller Setting]

■Maximum length

The overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the total number of stations.

For details, refer to the following manual.

Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC-Q (Q mode) C Controller module (Q series) MELSEC-QS Motion CPU (Q series) CNC C70 Robot controller (Q series)	31 GOTs

Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.

If you start the GOT before the PLC runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

Connection to QCPU (Q mode)

Use function version B or later of the MELSECNET/H network module and QCPU (Q mode).

Connection to Q17nDCPU, Q170MCPU, Q170MSCPU(-S1), CNC C70, CRnQ-700, or CR800-Q (Q172DSRCPU)

The Q17nDCPU, Q170MCPU, Q170MSCPU(-S1), CNC C70, CRnQ-700, and CR800-Q (Q172DSRCPU) are applicable to the MELSECNET/H connection (PLC to PLC network) only.

For connecting the GOT to the MELSECNET/10 network system (PLC to PLC network), set the MELSECNET/H network system (PLC to PLC network) to the MELSECNET/10 mode.

Connection to QSCPU

The GOT can only read device data and sequence programs by the ladder monitor function in the QSCPU.

The GOT cannot write any data to the QSCPU.

Connection to Q170MCPU or Q170MSCPU(-S1)

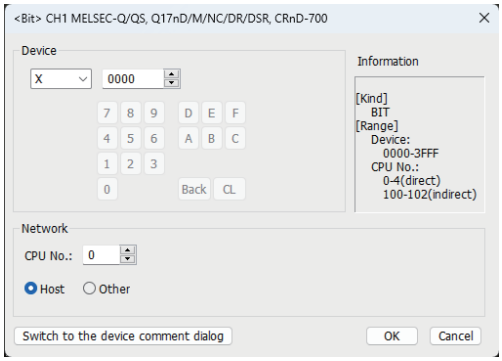
Set [CPU No.] to 2 in the device setting to monitor the device of the Motion CPU area (CPU No. 2).

When [CPU No.] is set to 0 or 1, the device on the PLC CPU area (CPU No. 1) is monitored.

When [CPU No.] is set to the number other than 0 to 2, a communication error occurs and the monitoring cannot be executed.

For the setting of [CPU No.], refer to the following.

GT Designer3 (GOT3000) Screen Design Manual



Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

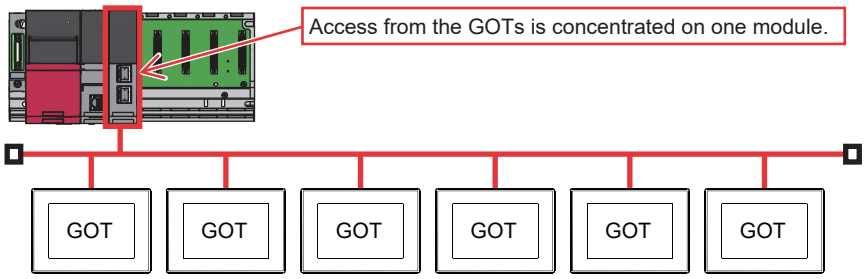
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

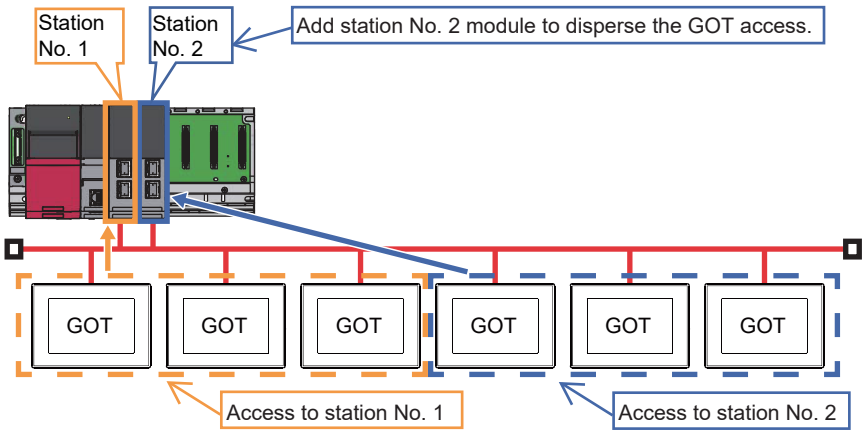
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

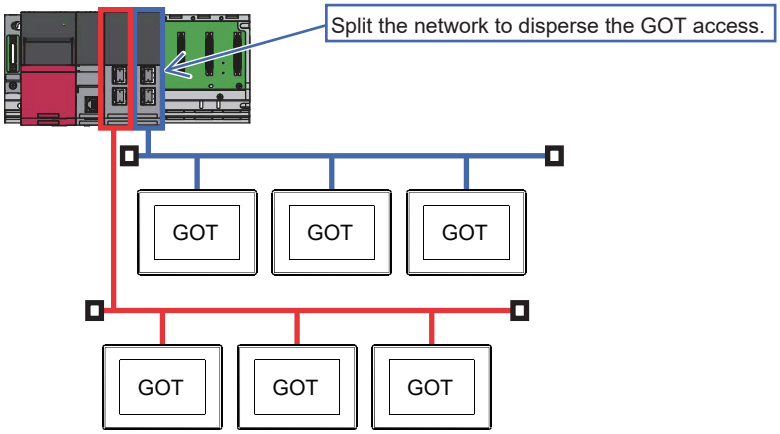
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Network configuration

Use MELSECNET/H connection (PLC to PLC network), MELSECNET/H connection (PLC to PLC network) in the MNET/10 mode, or MELSECNET/10 connection (PLC to PLC network) to configure a network including the GOT.

The following networks including the GOT cannot be configured.

• MELSECNET/H (Remote I/O network)

• MELSECNET/10 (Remote I/O network)

■GOT startup in the MELSECNET/H or MELSECNET/10 connection

In the MELSECNET/H or MELSECNET/10 connection, the data link is started approximately 10 seconds after the GOT startup.

■When a network error occurs in the system alarm

In the MELSECNET/H or MELSECNET/10 connection, when a network error occurs in the system alarm, the system alarm message cannot be canceled even though the causes are removed.

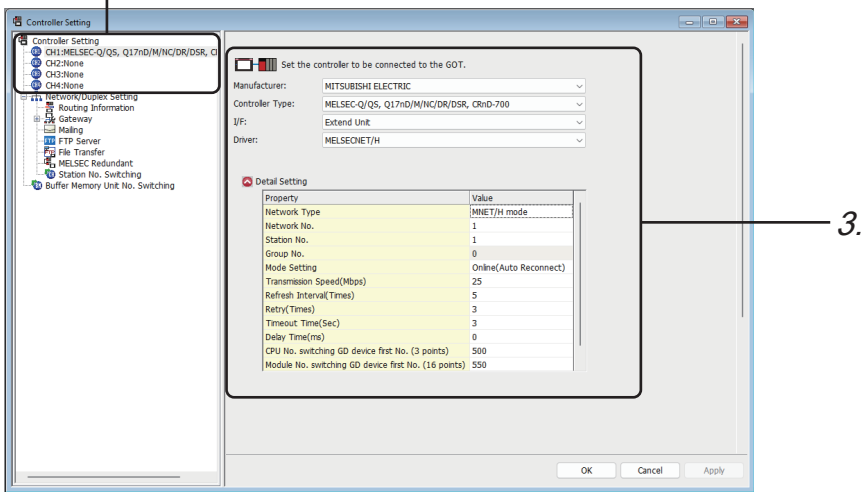
To cancel the system alarm display, restart the GOT.

8.1.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.

List menu



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
[I/F]	[Extend Unit]
[Driver]	[MELSECNET/H]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 712 [Detail Setting]

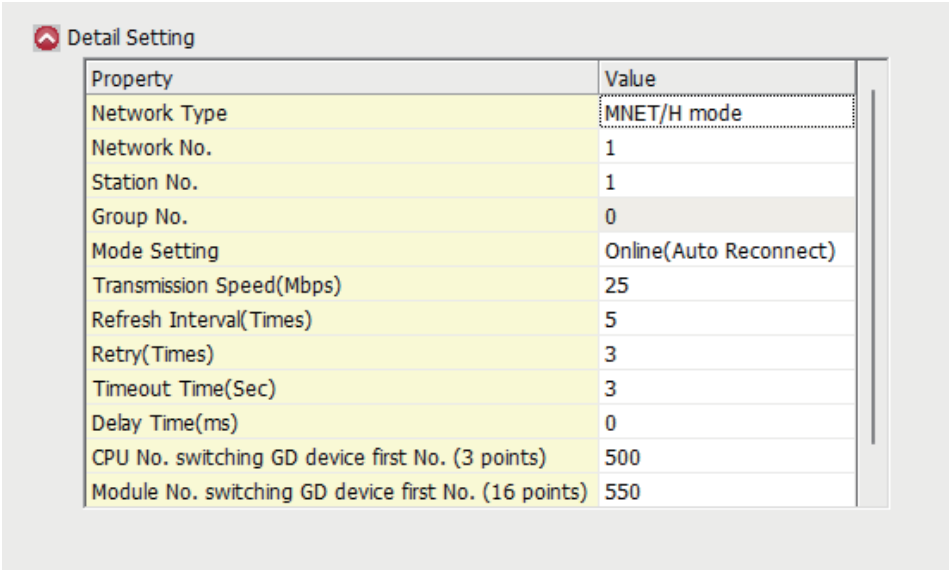
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Network Type]	Set the network type.	[MNET/H mode], [MNET/10 mode], [MNET/H Extended mode]*1
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [64]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT.	[Online(Auto Reconnect)], [Offline], [Forward loop]*2, [Reverse loop]*2, [Test between master stations]*2, [Test between slave stations]*2, [Self-loopback test]*2, [Internal self-loopback test]*2, [H/W test]*2
[Transmission Speed]	—	[10] Mbps, [25] Mbps
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication.	[1] time to [1000] times
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 713 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 714 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 715 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 To monitor the redundant QCPU system, use function version D or later of QCPU having a serial number starting with 07102 or later in the first 5 digits.
Use GX Developer Version 8.29F or later.

*2 For details, refer to the following manual.
📖Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)

Point

• When connecting to the MELSECNET/10 network

When connecting to the MELSECNET/10 network using the MELSECNET/H communication unit, set [MNET/10 mode] in [Network Type].

• Communication interface settings in the utility

The communication interface setting can be changed on the utility's [Communication setting] after writing [Controller Setting] of project data.

For details on the utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the utility, the latest settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

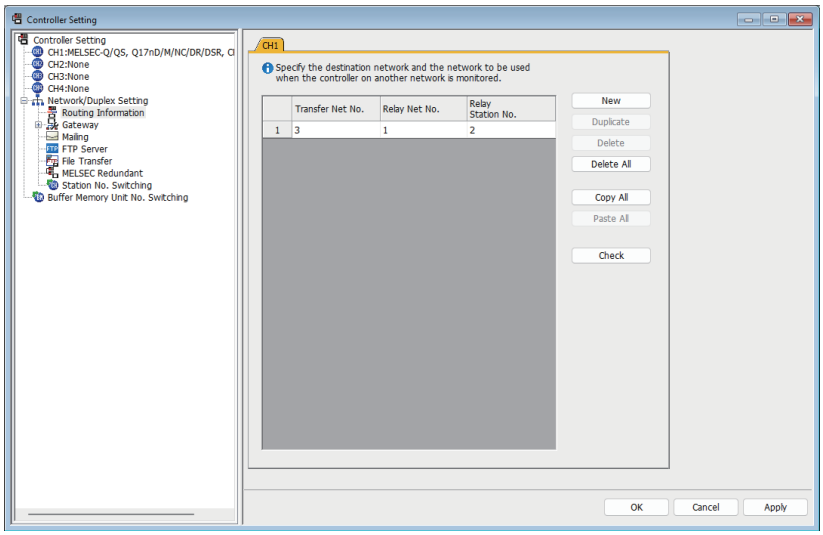
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

Page 717 PLC side settings when connecting to MELSECNET/H

Precautions

Specify all the network modules on the same network as the same network type.

(The MELSECNET/H mode and the MELSECNET/H extended mode cannot be mixed.)

When connecting to MELSECNET/H in the QCPU redundant system, [MELSECNET/H Extended Mode] cannot be specified as the network type.

8.1.4 PLC side settings when connecting to MELSECNET/H

This section describes the settings of the GOT and MELSECNET/H network module in the following system configuration. When connecting the MELSECNET/H network module to the MELSECNET/H network system, specify the MELSECNET/H mode or the MELSECNET/H extended mode as a network type.

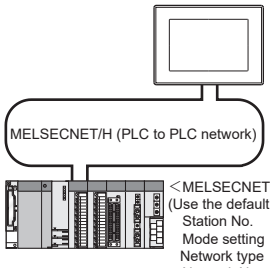
Point

MELSECNET/H network module

For details on the MELSECNET/H network module, refer to the following manual.

Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)

System configuration



＜GOT＞
(Use the default value for settings other than the following.)
Network type : MNET/H mode
Network No. : 1
Station No. : 2
Mode setting : Online (auto reconnection)
Network range assignment*2 : LB0100H to LB01FFH
LW0100H to LW01FFH
Transmission speed : 10Mbps

＜MELSECNET/H network module＞ *1
(Use the default value for settings other than the following.)
Station No. : 1
Mode setting : Online (10Mbps)
Network type : MNET/H mode (Control station)
Network No. : 1
Total stations : 2
Network range assignment*2 : LB0000H to LB00FFH
LW0000H to LW00FFH

*1 The MELSECNET/H network module is mounted on slot 0 of the base unit.
The start I/O number of the MELSECNET/H network module is set to "0".

*2 The network type must be set according to the number of assignment of send points for each station.
When the number of assignment is 2000 bytes or less: MELSECNET/H mode
When the number of assignment is more than 2000 bytes: MELSECNET/H extended mode

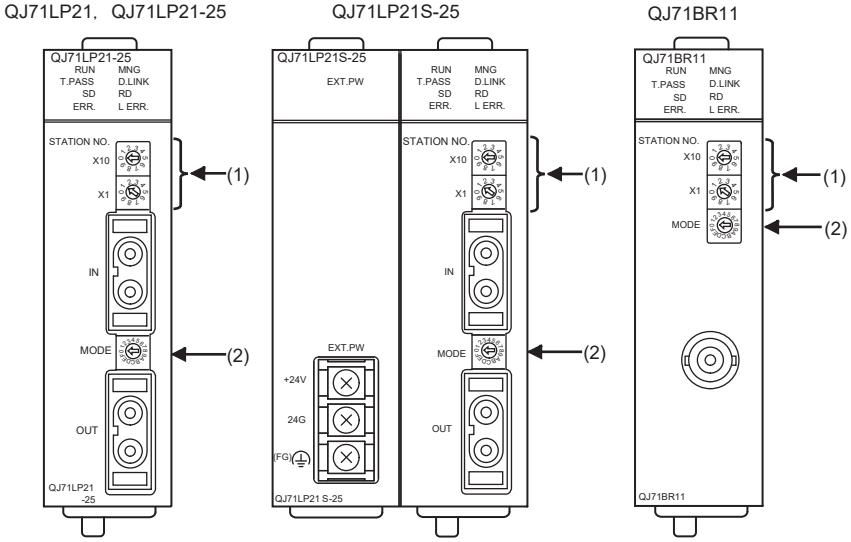
Point

Connection to Q170MCPU or Q170MSCPU(-S1)

For connection to Q170MCPU or Q170MSCPU(-S1), the start I/O No. of the MELSECNET/H network module is set to "70".

Switch settings for the MELSECNET/H network module

Set the station number setting switch and mode setting switch.



■Station number setting switch

○: Necessary, △: As necessary, —: Not necessary

Station number setting switch	Description	Setting value	Setting for GOT connection
STATION NO. X10 X1 	Station number setting (station No. 1)*1	1	○

*1 Do not set the same station No. as that of the GOT.

■Mode setting switch

○: Necessary, △: As necessary, —: Not necessary

Mode setting switch	Description	Setting value	Setting for GOT connection
MODE	Mode setting (online: 10 Mbps)*1	0	○

*1 Set the same mode setting and transmission speed as those of the GOT.

Point

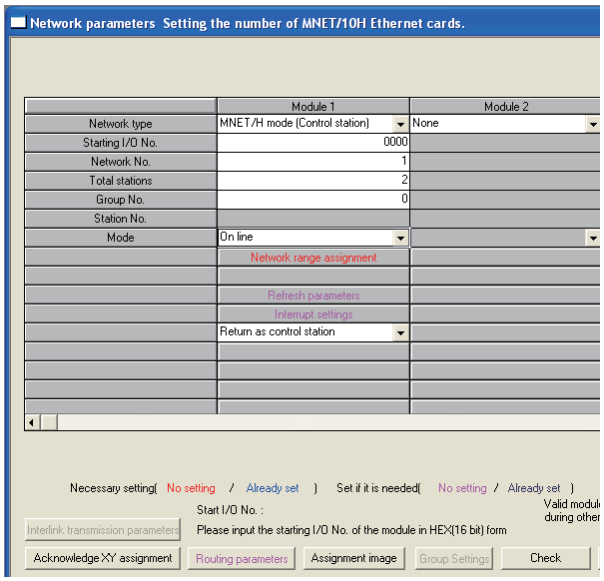
When the switch setting has been changed
Turn off then on or reset the PLC CPU.

Parameter settings

■Connecting to MELSEC-Q or QS series

• [Network parameter] of GX Developer

Network parameter



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Network type]	MNET/H mode (Control station) (fixed)	○
[Starting I/O No.]*1	0000H	○
[Network No.]*2	1	○
[Total stations]	2	○
[Group No.]	0 (fixed)	○
[Mode]*3	Online	○
[Network range assignment]	☞ Network range assignment	△

Item	Setting value	Setting for GOT connection
[Refresh parameters]	(Use default value)	△

Connection to MELSECNET/H network module

This section describes the settings of the GOT and MELSECNET/H network module in the following system configuration. When connecting the MELSECNET/H network module to the MELSECNET/10 network system, specify the MELSECNET/10 mode as a network type.

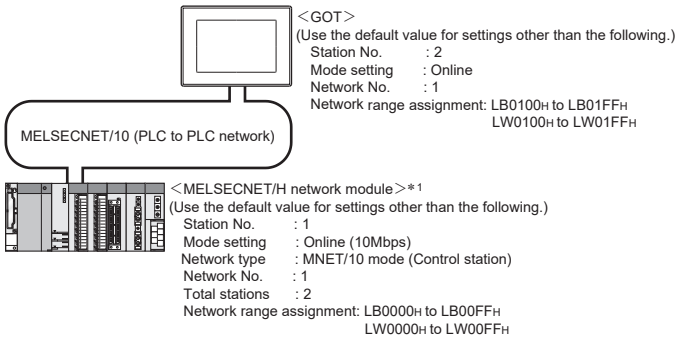
Point

MELSECNET/H network module

For details on the MELSECNET/H network module, refer to the following manual.

Q Corresponding MELSECNET/H Network System Reference Manual (PLC to PLC network)

■System configuration



<GOT>
(Use the default value for settings other than the following.)
Station No. : 2
Mode setting : Online
Network No. : 1
Network range assignment: LB0100H to LB01FFH
LW0100H to LW01FFH

<MELSECNET/H network module>*1
(Use the default value for settings other than the following.)
Station No. : 1
Mode setting : Online (10Mbps)
Network type : MNET/10 mode (Control station)
Network No. : 1
Total stations : 2
Network range assignment: LB0000H to LB00FFH
LW0000H to LW00FFH

*1 The MELSECNET/H network module is mounted on slot 0 of the base unit.
The start I/O number of the MELSECNET/H network module is set to "0".

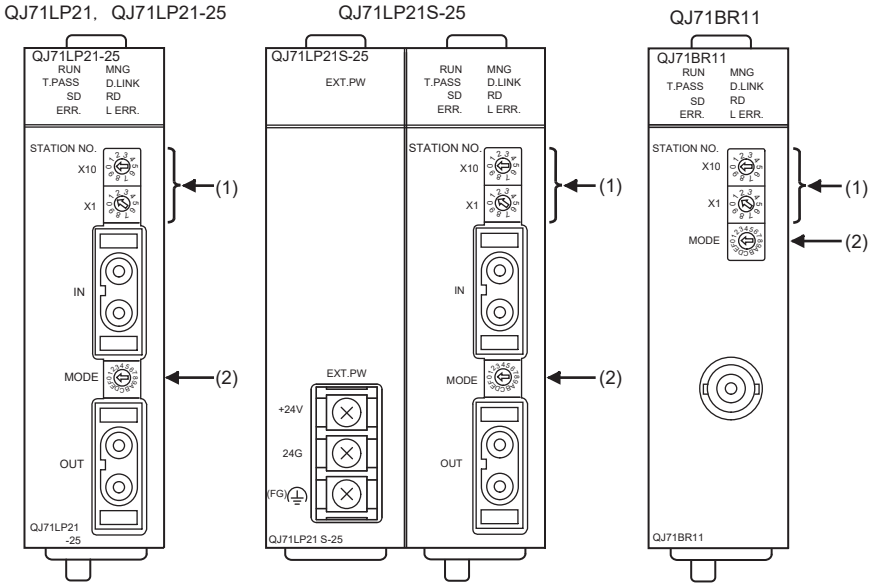
Point

Connection to Q170MCPU or Q170MSCPU(-S1)

For connection to Q170MCPU or Q170MSCPU(-S1), the start I/O number of the MELSECNET/H network module is set to "70".

■Switch settings for the MELSECNET/H network module

Set the station number setting switch and mode setting switch.



- Station number setting switch

○: Necessary, △: As necessary, —: Not necessary

Station number setting switch	Description	Setting value	Setting for GOT connection
STATION NO. X10 X1	Station number setting (station No. 1)*1	1	○

*1 Do not set the same station No. as that of the GOT.

- Mode setting switch

○: Necessary, △: As necessary, —: Not necessary

Mode setting switch	Description	Setting value	Setting for GOT connection
MODE	Mode setting (online: 10 Mbps)	0 (fixed)	○

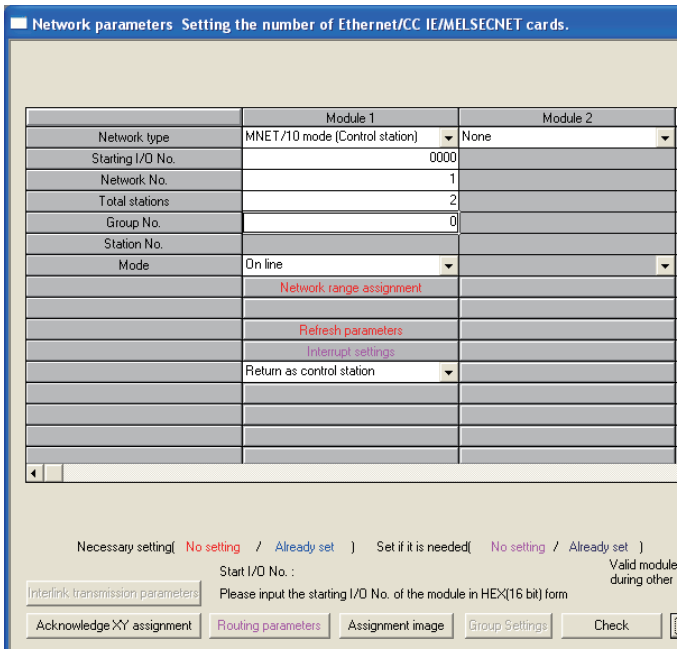
Point

When the switch setting has been changed
Turn off then on or reset the PLC CPU.

■Parameter settings (when connecting to MELSEC-Q or QS series)

• [Network parameter] of GX Developer

Network parameter



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection

Station number setting switch	2: Station No. 2
Mode setting switch	0: Online (fixed)

Point

Settings for the MELSECNET/10 communication unit

For the setting method of the MELSECNET/10 communication unit, refer to the following.

☞ Page 711 [Controller Setting]

8.1.6 Access range for monitoring

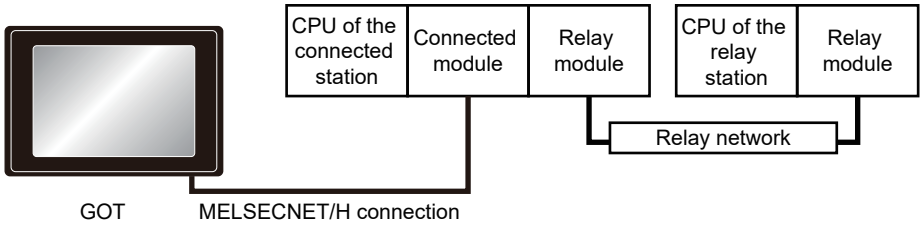
When the GOT is connected to the CPU of the station connected by MELSECNET/H connection, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Relay station								
	Relay network	CPU of the relay station							
		RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
QnUCPU QnUDCPU QnUDHCPU QnUDECPU QnUDEHCPU QnUDVCPU	Ethernet	—	○	○*3	○	—	○	—	—
	CC-Link IE Controller Network	—	—	○	○	—	—	—	—

	CC-Link IE Controller Network	—	—	○	○	—	—	—	—
	CC-Link IE Field Network	—	○	○*1	○	—	—	—	—
	MELSECNET/H, MELSECNET/10	—	—	○	○	○	○	○*2	—

*1 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*2 AnUCPU and AnUSCPU are supported.

*3 The C Controller module (MELSEC-Q series) is not supported.

Precautions

Only the PLC CPU of the same network number can be monitored in the GOT.

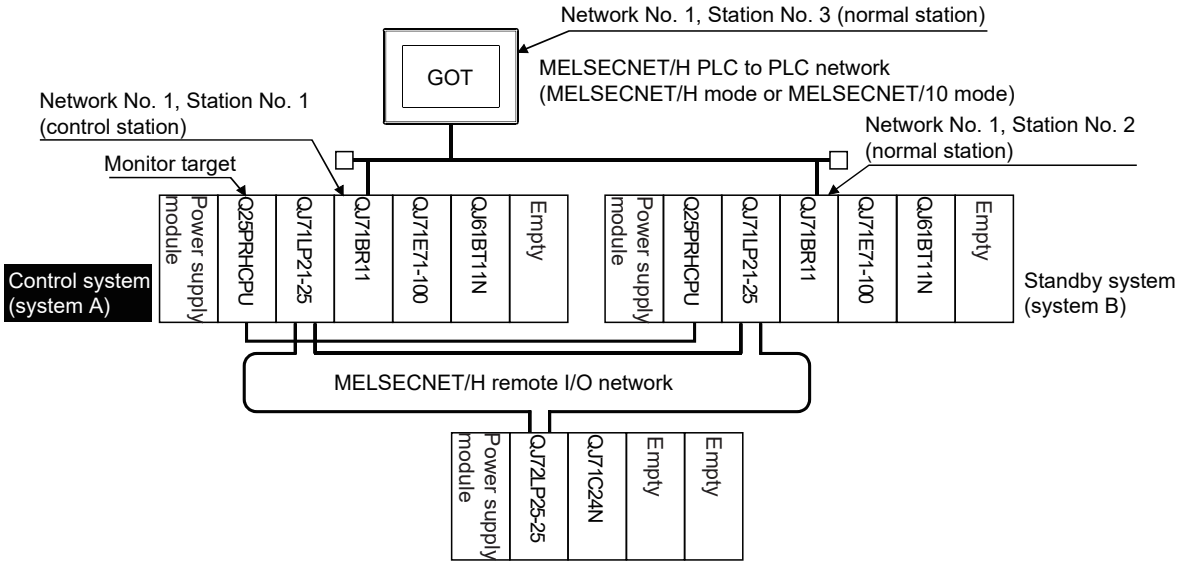
For details, refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual

8.1.7 How to monitor a redundant system

This section explains the MELSECNET/H connection and MELSECNET/10 connection (network system) that connect the GOT to the MELSECNET/H and MELSECNET/10 network system.

The following shows an example of connecting the GOT set as the normal station to the MELSECNET/H network system.



Connection method

Connect the MELSECNET/H network system and the GOT.

For details, refer to the following.

☞ Page 703 MELSECNET/H connection

Settings in GT Designer3

Set GT Designer3 as follows.

Setting item	Setting details		Model
Model	MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700		GT37, SoftGOT3000
Device setting (Network setting)	Other	NW No.: Network No. of MELSECNET/H PLC to PLC network	
		PLC station No.: Station number of the control system	
MELSEC redundant settings	☞ Page 740 MELSEC redundant settings		

Monitoring target change when system switching occurs in a redundant system

When system switching occurs, the network module station No. 2 switches from the normal station to the sub-control station, and continues to control the MELSECNET/H network system as the control system.

Since the GOT monitors the control system, the monitoring target is automatically changed to the network module station No. 2.

Point

When monitoring control system without MELSEC redundant settings

When system switching occurs, the network module station No. 2 switches from the normal station to the sub-control station, and continues to control the MELSECNET/H network system as the control system.

Since the GOT monitors the station of the specified station number, the monitoring target cannot be changed to the station No. 2 in response to the system switching.

As a countermeasure, create a screen to monitor the PLC CPU of the control system by switching the station numbers between System A and System B using the script function.

☞ Page 734 Switch the Monitor Target to the Control System Using the Script Function

Switch the Monitor Target to the Control System Using the Script Function

This section describes how to create a script screen to automatically change the monitoring target (station number) at the occurrence of system switching even if the MELSEC redundant settings are not configured.

The script executes the station number switching function or screen switching function.

The following shows the advantages and disadvantages of the station number switching function and screen switching function.

Function	Advantage	Disadvantage
Station number switching function	The monitor screens for Station No. 1 (control system) and Station No. 2 (standby system) can be created on one screen.	Some objects do not allow the station number to be switched.
Screen switching function	All objects can be used since monitor screens are created for each station number.	Monitor screens must be created separately for Station No. 1 (control system) and Station No. 2 (standby system).

The following explains how to use each function.

■Method for using the station number switching function

As a feature of this function, monitor screens for Station No. 1 (control system) and Station No. 2 (standby system) can be created on one screen.

If the system switching occurs, the GOT can change the monitoring target to the control system PLC CPU on the same monitor screen.

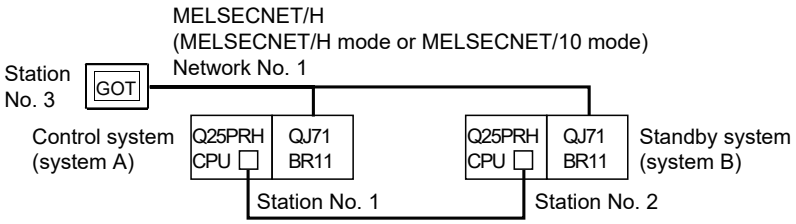
To achieve this, the script of the GOT monitors the special relay SM1515 (Control system identification flag) of the PLC CPU and stores the station number of the latest control system into the station number switching device.

Restrictions: Some objects do not allow the station number to be switched.

GT Designer3 (GOT3000) Screen Design Manual

- Setting procedure

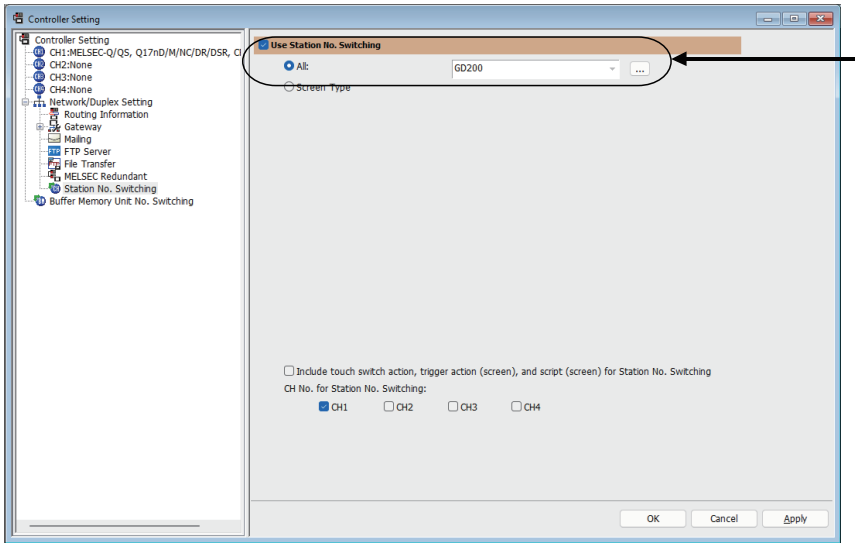
System configuration example



Connected module	Network number	Station No.
MELSECNET/H network module of control system	1	1
MELSECNET/H network module of standby system		2
GOT connected to MELSECNET/H network or MELSECNET/10 network		3

1. Set the station number switching device.

Select [Common] → [Controller Setting] → [Station No. switching], and set the internal device GD200 as the station number switching device.



Configure the setting here.

2. Set the trigger action.

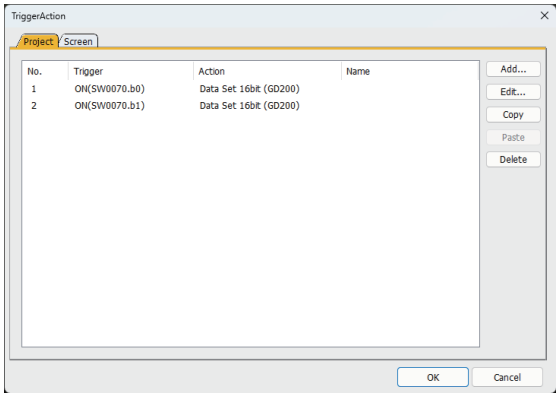
Select [Common] → [Trigger Action] and configure the settings to switch the station number when the faulty station information (GS231) from the station monitoring turns on.

For network number 1 and station number 2, set 258 (0102H).

Condition 1	: SW70.b0 (while ON)	← When b0 is ON, station No. 1 is faulty.
Operation	: GD200 = 2	← Station number is changed to No. 2.

Condition 1	: SW70.b1 (while ON)	← When b1 is ON, station No. 2 is faulty.
Operation	: GD200 = 1	← Station number is changed to No. 1.

Create the trigger action in the project on the Project tab.



Point

Setting for the trigger action function

For the trigger action function, hexadecimals cannot be used.

To use the trigger action function, set the N/W No. and the station No. of the PLC CPU in [Unsigned BIN]. (For the trigger action function, set [Unsigned BIN] for [Storing Device])

The following shows a setting example.

- For network number 1 and station number 1 (0101H), set 257.
- For network number 10 and station number 10 (0A0AH), set 2570.

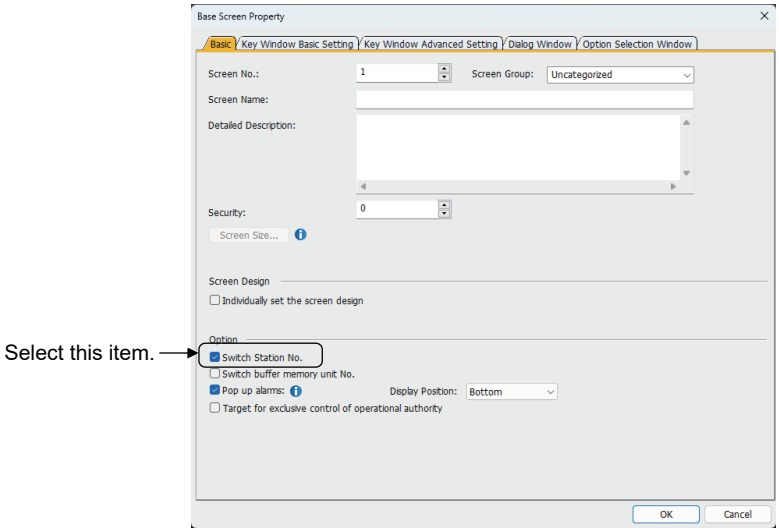
3. Create a monitor screen.

In the device setting (network setting) of each object, set network number 1 and station number 1 of the control system.

4. Validate the station number switching function.

Select [Screen] → [Screen Property], and select [Switch Station No.] in the [Basic] tab to enable the station number switching function.

Make this setting for each monitor screen.



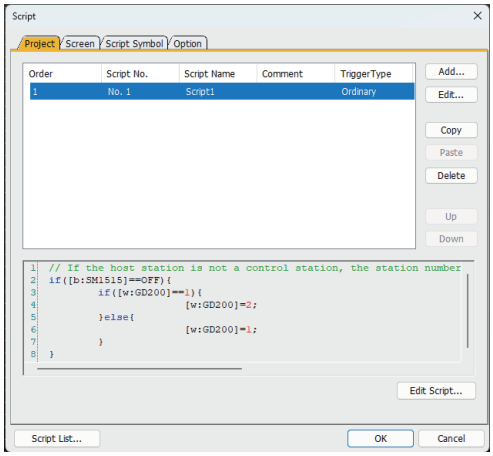
5. Change the station number switching device value in the script.

Select [Common] → [Script] → [Script], and create a script of checking the SM1515 status of the current monitor station and changing the station number switching device if the status is OFF (standby system). You will create the script for each monitor screen.

Set the trigger type of the script to [Ordinary] or [Sampling(about 3s)].

```
// If the host station is not a control station, the station number is switched to that of the other station.
if([b:SM1515]==OFF){
        if([w:GD200]==1){
                [w:GD200]=2;
        }else{
                [w:GD200]=1;
        }
}
```

Set the created script for each screen on the Screen tab.



Point

When a redundant system is only connected to the MELSECNET/H network, SW56 (Current control station) can be set as the station number switching device.

In this case, even if the system switching occurs, the GOT continuously monitors the station number of the currently active control station.

■Method for using the screen changing function

As a feature of this function, monitor screens are created for each station number. When the system switching occurs, the GOT can change the monitoring target to the control system PLC CPU on the other monitor screen.

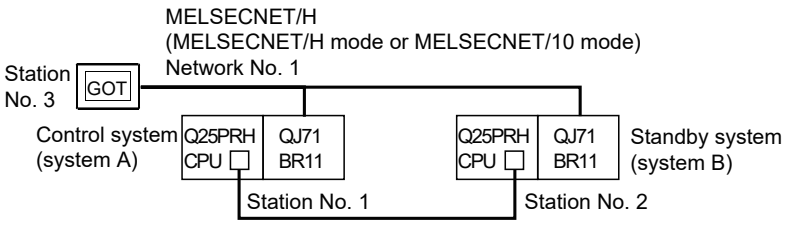
To achieve this, the script of the GOT monitors the special relay SM1515 (Control system identification flag) of the PLC CPU and stores the screen number corresponding to the latest station number of the control system into the screen switching devices.

There are the following 8 different screen switching devices. Set the screen switching devices for all screens to be used.

(1) Base screen switching device
(2) Overlap window 1 switching device
(3) Overlap window 2 switching device
(4) Overlap window 3 switching device
(5) Overlap window 4 switching device
(6) Overlap window 5 switching device
(7) Superimpose window 1 switching device
(8) Superimpose window 2 switching device

• Setting procedure

System configuration example

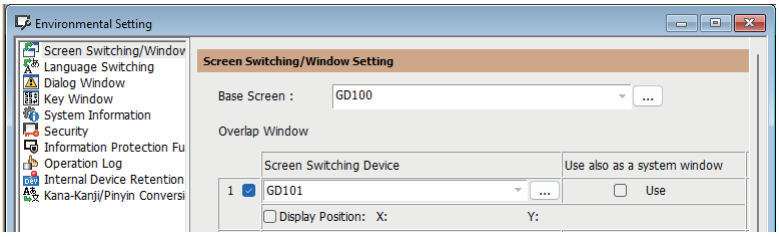


Connected module	Network No.	Station No.
MELSECNET/H network module of control system	1	1
MELSECNET/H network module of standby system		2
GOT connected to MELSECNET/H network or MELSECNET/10 network		3

1. Set the screen switching device of the base screen.

Select [Common] → [GOT Environmental Setting] → [Screen Switching/Window], and set the internal device GD100 as the base screen switching device.

(Do not use PLC CPU devices for the screen switching device. If used, the Trigger Action operation of the GOT may be disabled since the device data of the PLC CPU is overwritten by the device value transferred with the redundant system tracking function.)

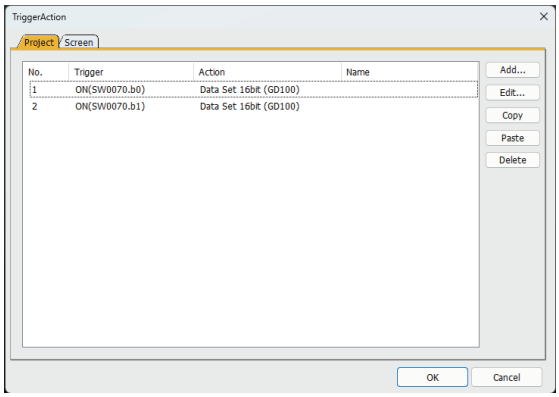


2. Set the trigger action.

Select [Common] → [Trigger Action] and configure the settings to switch the station number when the faulty station information (GS231) from the station monitoring turns on.

Condition 1	: SW70.b0 (while ON)	← When b0 is ON, station No. 1 is faulty.
Operation	: GD100 = 2	← Station number is changed to No. 2.

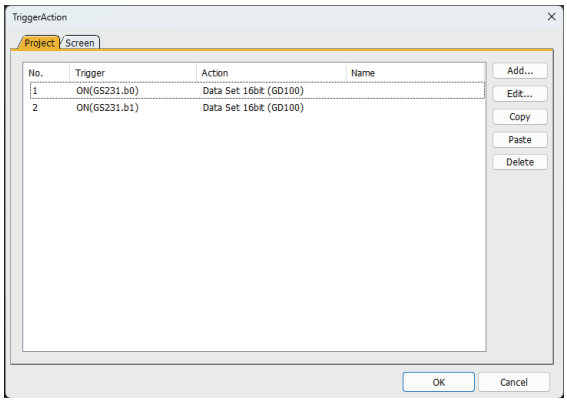
Condition 1	: SW70.b0 (while ON)	← When b1 is ON, station No. 2 is faulty.
Operation	: GD100 = 1	← Station number is changed to No. 1.



Select [Common] → [Trigger Action] and configure the settings to switch the station number when the faulty station information (GS231) from the station monitoring turns on.

Condition 1	: GS231.b0 (while ON)	← When b0 is ON, station No. 1 is faulty.
Operation	: GD100 = 2	← Screen number is changed to No. 2.

Condition 1	: GS231.b1 (while ON)	← When b1 is ON, station No. 2 is faulty.
Operation	: GD100 = 1	← Screen number is changed to No. 1.



3. Set a monitor screen.

- Create a monitor screen with objects whose network settings set to station No. 1 on screen No. 1 (1-1).
- Create a monitor screen with objects whose network settings set to station No. 2 on screen No. 2 (1-2).

4. Change the screen switching device value in the script.

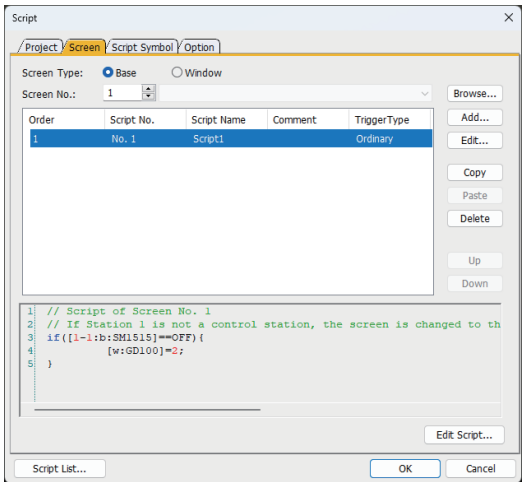
By selecting [Common] → [Script] → [Script], create a script for each monitor screen that checks the SM1515 status of the current monitor station, and if it is OFF (standby system), changes the station number switching device value.

Set the trigger type of the script to [Ordinary] or [Sampling(about 3s)].

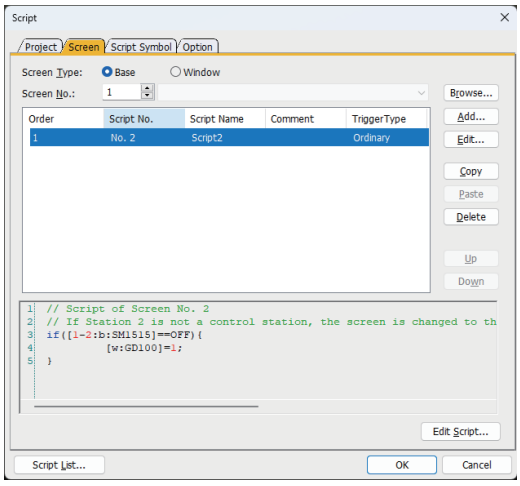
```
// Script of screen No. 1
// If station 1 is not a control station, the screen is switched to that of station 2.
if([1-1:b:SM1515]==OFF){
        [w:GD100]=2;
}
```

```
// Script of screen No. 2
// If station 2 is not a control station, the screen is switched to that of station 1.
if([1-2:b:SM1515]==OFF){
        [w:GD100]=1;
}
```

- Script screen of screen No. 1



- Script screen of screen No. 2



Point

When a redundant system is only connected to the MELSECNET/H network, SW56 (Current control station) can be set as the screen number switching device.

In this case, even if the system switching occurs, the GOT continuously monitors the station number of the currently active control station.

MELSEC redundant settings

This section describes the settings for the GOT to automatically change the monitoring target of the QCPU redundant system.

Point

Before configuring the MELSEC redundant settings

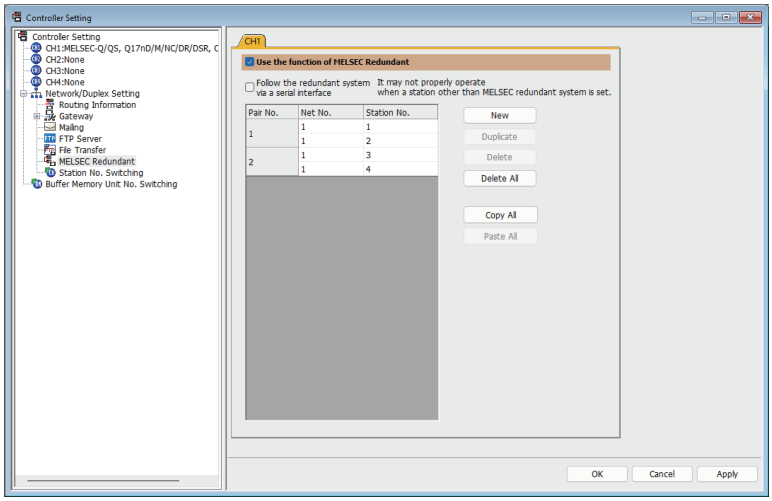
In the MELSEC redundant settings, do not set a station outside the redundant QCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC redundant setting dialog, settings can be made for each channel of the controller.

The following shows an example of the MELSECNET/H connection (station No. 4) with redundant CPU pair No. 1 to No. 2, network No. 1, and redundant CPU station No. 0 to No. 3.

Ex.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Copies one setting of the selected pair number and adds it below the bottom row.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 741 Pair number

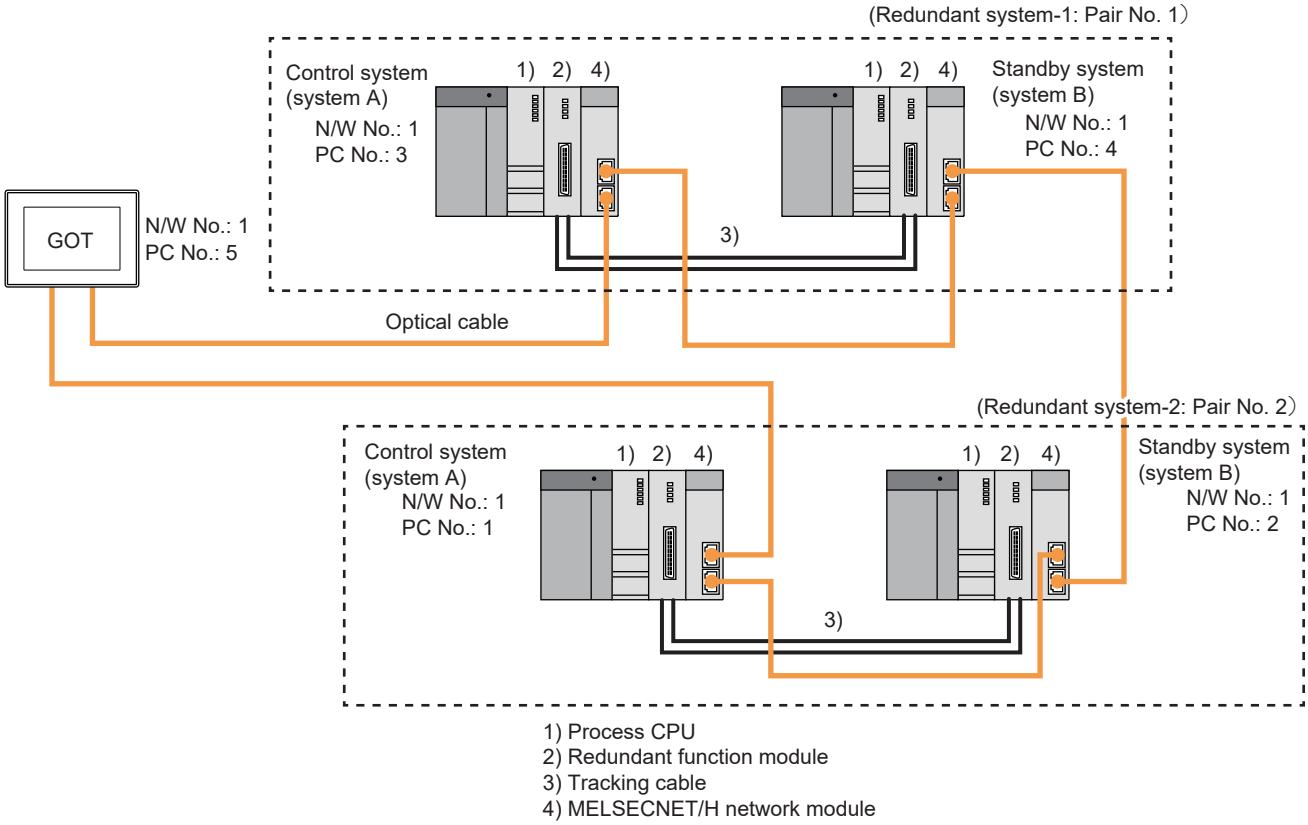
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of MELSECNET/H connection in the QCPU redundant system. (Pair No. 1 to No. 2)

Ex.



Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- The last station number and station number 1 (example: station number 64 and station number 1) cannot be paired.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the operation mode of the QCPU redundant system, and does not support the debug mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

- 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

[450: Path has changed or timeout occurred in redundant system.] appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, [451: The MELSEC redundant setting and actual system configuration do not match.] appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings.

If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm [315 Device writing error. Correct device.] is not detected.

■Connection to the remote I/O station

• The GOT can monitor only the following GOT functions.

Monitor function and device monitor function

• The GOT does not allow the PLC CPU clock of the master station to be set in the clock setting of the utility.

The master station clock will not change even if the clock setting is made.

Use GX Works2 or similar software to set the PLC CPU clock of the master station.

■MELSECNET/H connection

To monitor the redundant QCPU system using the MELSECNET/H connection, use function version D or later of QCPU having a serial number starting with "07102" or later in the first 5 digits. Use GX Developer Version 8.29F or later.

■Option functions including the ladder monitor

A message "Unable to communicate with CPU." is displayed when system switching occurs while an option function such as the ladder monitor is used.

■Monitor display speed

For the MELSECNET/H connection, if the control station on the MELSECNET/H network or MELSECNET/10 network fails and is taken over by a station other than the redundant system (QCPU), a timeout occurs as a system alarm.

If this occurs, the monitor display speed may slow down.

■When the QCPU redundant system is in the debug mode

When the QCPU redundant system is in the debug mode, do not configure the MELSEC redundant system settings on the GOT side when connecting the GOT.

9 CC-Link IE TSN connection

☞ Page 744 MELSEC MX Controller (MX-R Model) (CC-Link IE TSN connection)
☞ Page 772 MELSEC MX Controller (MX-F Model) (CC-Link IE TSN connection)
☞ Page 796 MELSEC iQ-R series (CC-Link IE TSN connection)
☞ Page 822 MELSEC iQ-F series (CC-Link IE TSN connection)

9.1 MELSEC MX Controller (MX-R Model) (CC-Link IE TSN connection)

☞ Page 744 Connectable devices
☞ Page 745 System configuration
☞ Page 749 GOT side settings
☞ Page 758 PLC side settings
☞ Page 764 Connection to the PLC with the authentication function enabled
☞ Page 766 Access range for monitoring
☞ Page 767 Firmware of the CC-Link IE TSN communication unit

9.1.1 Connectable devices

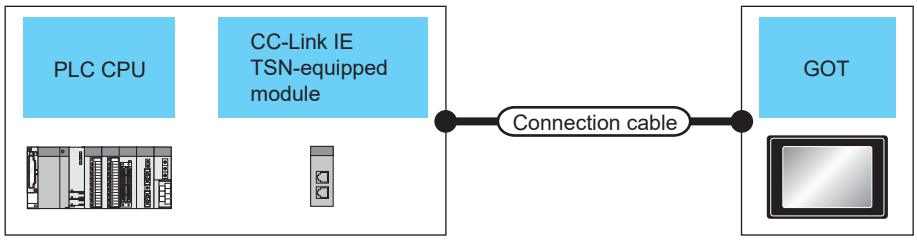
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	CC-Link IE TSN-equipped module	Connectable model
MELSEC MX Controller (MX-R Model)*1	MXR300-16 MXR300-32 MXR300-64	○	RJ71GN11-T2 RJ71GN11-EIP RJ71GN11-SX	GT37 SoftGOT3000
	MXR500-128 MXR500-256	○	RJ71GN11-T2 RJ71GN11-EIP RJ71GN11-SX	GT37 SoftGOT3000

*1 When using the CC-Link IE TSN (built-in Ethernet) communication driver, connect the GOT to the built-in Ethernet port (P1, P2) of the MX Controller.

9.1.2 System configuration



For details on the connection cable and overall cable length, refer to the following.

☞ Page 746 Connection cable

☞ Page 746 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 746 Maximum number of connected devices

Controller	CC-Link IE TSN-equipped module*1	Connection cable	GOT	
			Interface	Model
MELSEC MX Controller (MX-R Model)*6	RJ71GN11-T2*3 RJ71GN11-EIP*4*5 RJ71GN11-SX*7	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			GT37-IF2000 + GT25-J71GN13-T2*1*2	

*1 Depending on the combination of the firmware version of the CC-Link IE TSN-equipped module on the master station and the firmware version of the CC-Link IE TSN communication unit (GT25-J71GN13-T2), the GOT cannot access the network.
For the combinations of firmware versions, refer to the following.
☞ Page 771 Firmware versions of the CC-Link IE TSN-equipped module on the master station and the CC-Link IE TSN communication unit

*2 The firmware version must be 05 or later when monitoring a network where a controller compatible with CC-Link IE TSN protocol version 2.0 exists.
For information on how to check or update the firmware version of the CC-Link IE TSN communication unit, refer to the following.
☞ Page 770 Firmware of the CC-Link IE TSN communication unit

*3 For the ring connection, use firmware version 10 or later.

*4 The ring connection is not supported.

*5 Connect the cable to the P1 port of the RJ71GN11-EIP.

*6 When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.
For information on how to logon and logoff, refer to the following.
☞ Page 764 Logon to the PLC

☞ Page 764 Logoff from the PLC
The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.
Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.
☞ Page 764 Creating a project

*7 This module can be used only when a connection to the PLC with the authentication function enabled.

Point

For the system configuration of the CC-Link IE TSN-equipped module, refer to the following manuals.

MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

Precautions

■Connection to a CC-Link IE TSN-equipped module by Ethernet

The CC-Link IE TSN communication unit (GT25-J71GN13-T2) does not support the Ethernet connection.

For the Ethernet connection, use an Ethernet interface built in the GOT.

For details on the Ethernet connection, refer to the following.

☞ Page 97 Connection to CC-Link IE TSN-equipped module

■Connection status check after the GOT startup

The connection with the network cannot be established until the connection check with the master station is completed after the GOT startup.

To check the status of connection with the master station, use the CC-Link IE TSN Connection Status (GS1297) of the GOT internal device.

For details on the CC-Link IE TSN Connection Status (GS1297), refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (double-shielded, STP) or shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (double-shielded, STP) or shielded twisted pair cable (STP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

When using a hub, use a TSN Switch or General-purpose Switch according to the system configuration.

For usable TSN Switches and General-purpose Switches, refer to the following.

📖MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

📖MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manuals.

📖MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

📖MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

Maximum number of connected devices

The following shows the applicable GOT and the maximum number of connected devices.

Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP		
MELSEC MX Controller (MX-R Model)	119	119	GT37 SoftGOT3000	1

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

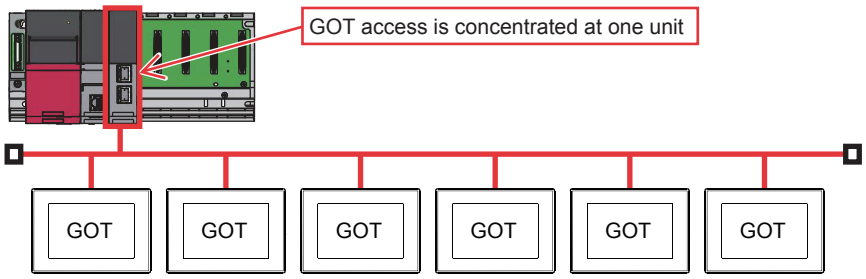
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

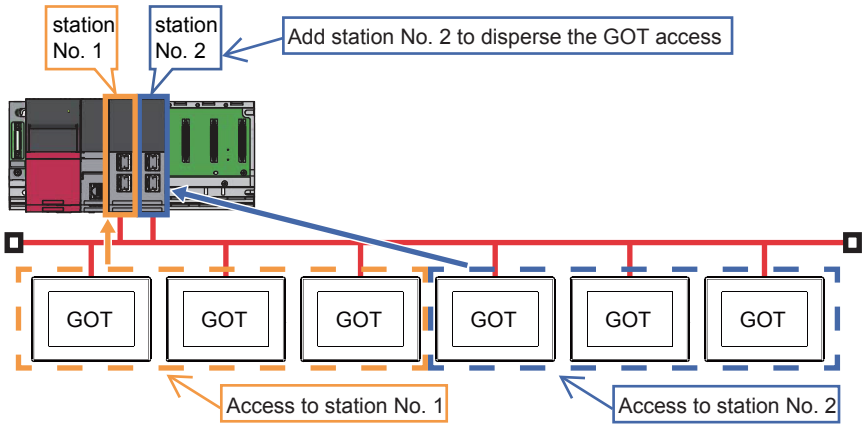
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

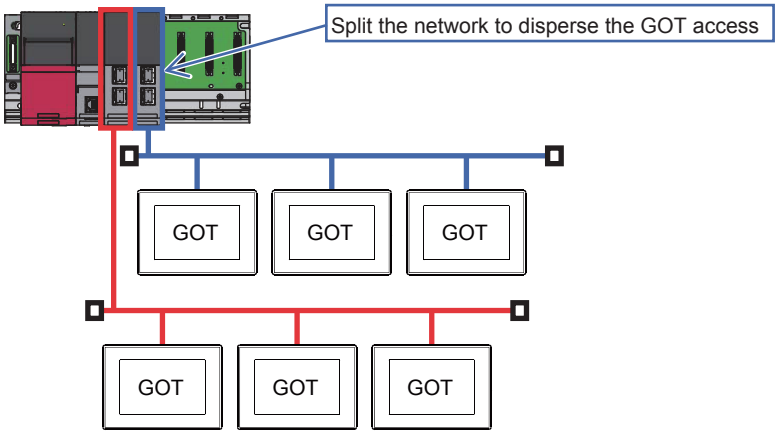
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

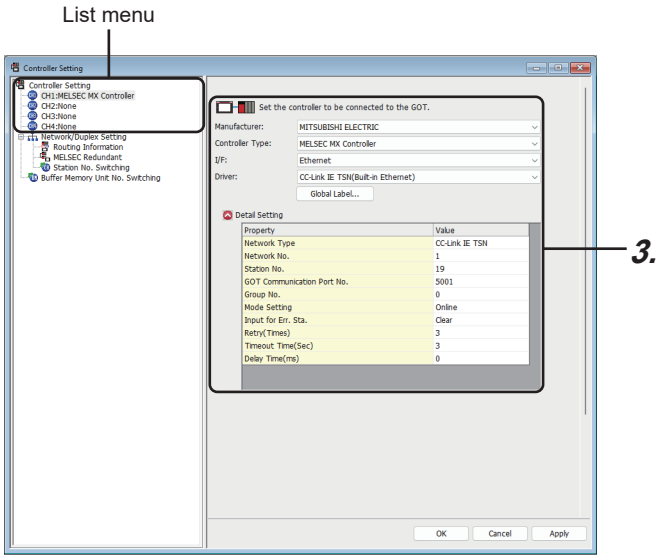
Split the network to disperse the GOT access.



9.1.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC MX Controller]
[I/F]	• [Ethernet] • [Extend Unit]
[Driver]	• When [Ethernet] is selected for [I/F]: [CC-Link IE TSN (Built-in Ethernet)] • When [Extend Unit] is selected for [I/F]: [CC-Link IE TSN]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 750 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

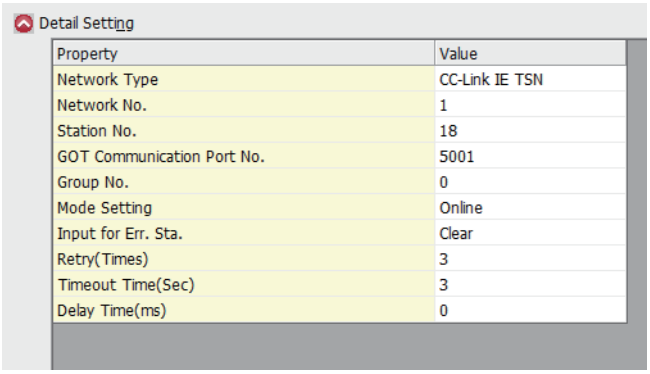
Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.

- [CC-Link IE TSN (built-in Ethernet)]



Item	Description	Range
[Network Type]	Set the network type.	[CC-Link IE TSN]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the unit communication test mode, refer to the following. ☞ Page 753 Unit communication test	[Online]
[Input for Err. Sta.]	Set whether to hold or clear the input from the station where the data link has failed due to power-off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms

Precautions

■Communication driver

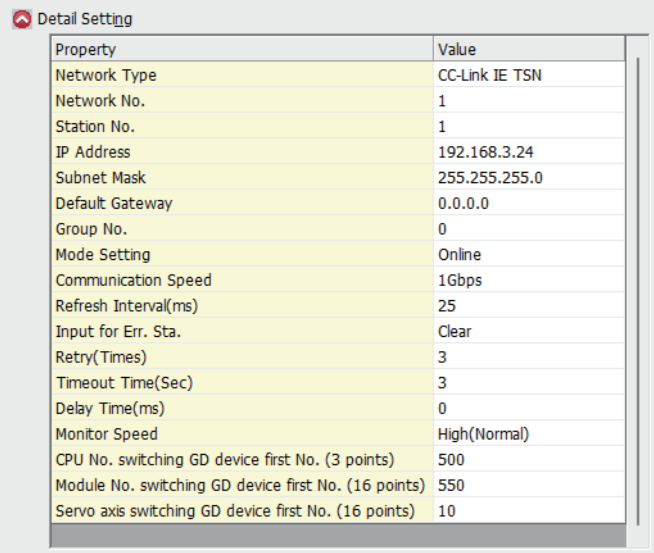
To set CC-Link IE TSN (built-in Ethernet), use port 1 on the built-in Ethernet interface of the GOT.

Two or more CC-Link IE TSN (built-in Ethernet) cannot be set in one GOT at the same time.

■Authentication class for communication

When CC-Link IE TSN (built-in Ethernet) is used for connection, communication is available only for the master station of authentication class B.

• [CC-Link IE TSN]



Item	Description	Range
[Network Type]	Set the network type.	[CC-Link IE TSN]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[IP Address]*1	Set the IP address of the GOT.	[0.0.0.1] to [223.255.255.254]
[Subnet Mask]	When a subnetwork is used, set the subnet mask. (Only for connection via router) If the sub network is not used, the default value is set.	[0.0.0.0] to [255.255.255.255]*2
[Default Gateway]	Set the router address of the default gateway where the GOT is connected. (Only for connection via router)	[0.0.0.0] to [223.255.255.254]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the unit communication test mode, refer to the following. ☞ Page 753 Unit communication test	[Online], [Offline], [Module Communication Test]
[Communication Speed]	Set the communication speed of the GOT.	[1Gbps], [100Mbps]*3
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication.	[1] ms to [1000] ms
[Input for Err. Sta.]	Set whether to hold or clear the input from the station where the data link has failed due to power-off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]	Set the monitor speed of the CC-Link IE TSN network. This setting is not valid in all systems.	[High(Normal)], [Middle], [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 754 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 755 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 756 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 If any of the following settings is configured in the IP address, a communication timeout error occurs.
- The third octet and fourth octet are all 1 (*.*.255.255) or all 0 (*.*.0.0).
- The host part is all 1 (*.*.*.255) or all 0 (*.*.*.0).
- Some reserved addresses determined for special applications

For details, refer to the following manuals.
MELSEC iQ-R CC-Link IE TSN User's Manual (Application)
MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

*2 When the subnet mask field is filled with 0, the operation is the same as when the field is left blank.

*3 When setting to 100Mbps, the following conditions must be satisfied.
- CC-Link IE TSN communication unit (GT25-J71GN13-T2): Firmware version 02 or later
- CC-Link IE TSN master/local module (RJ71GN11-T2): Firmware version 04 or later

Point

- Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

- Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

- Setting the refresh interval

For [Refresh Interval(ms)] in [Controller Setting] in GT Designer3, set 5 ms or more per 1K words for the total size of the device set in [Network Configuration Settings] in GX Works3.

Setting less than 5 ms may affect the processing of the GOT such as a decrease of the monitoring speed.

The following shows setting examples of the total device size and refresh interval.

Total device size	Refresh Interval
1K words	5 ms or more
2K words	10 ms or more
3K words	15 ms or more
5K words	25 ms or more
36K words	180 ms or more

■Unit communication test

In the unit communication test, connect port 1 and port 2 of the CC-Link IE TSN communication unit mounted on the GOT with a network cable, and check if the unit operates properly with the GOT.

The following shows the test procedure and how to check the test result.

1. Perform either of the following operations to set the GOT to the unit communication test mode.

- Write the project data for which [Mode Setting] in [Detail Setting] is set to [Stand-alone test mode] to the GOT.
- Set [Mode setting] in [Detail setting] to [Module Communication Test] in the GOT utility.

2. A unit communication test will start at GOT startup.

3. After the test is complete, check the result with the ERR LED on the communication unit and GOT internal devices (CC-Link IE TSN Module Communication Test Status (GS1114) or CC-Link IE TSN Module Communication Test Error (GS1115)).

Check		Test result
ERR LED on the communication unit		OFF: Normal ON: Error
GOT internal device	CC-Link IE TSN Module Communication Test Status (GS1114)	Notifies the execution status of a communication test of the CC-Link IE TSN communication unit. • b0: Turns on when a communication test is executed. • b1: Turns on while a communication test is being executed. • b2: Turns on when a communication test is complete. • b3 to b15: Use prohibited
	CC-Link IE TSN Module Communication Test Error (GS1115)	Notifies that an error has occurred during a communication test of the CC-Link IE TSN communication unit. • b0: Turns on if there is a problem with the port 1 side of the CC-Link IE TSN communication unit. • b1: Turns on if there is a problem with the connection interface (port 1) of the CC-Link IE TSN communication unit or the Ethernet cable terminal. • b2: Turns on if there is a problem with the port 1 side Ethernet cable of the CC-Link IE TSN communication unit. • b3 to b7: Use prohibited • b8: Turns on if there is a problem with the port 2 side of the CC-Link IE TSN communication unit. • b9: Turns on if there is a problem with the connection interface (port 2) of the CC-Link IE TSN communication unit or the Ethernet cable terminal. • b10: Turns on if there is a problem with the port 2 side Ethernet cable of the CC-Link IE TSN communication unit. • b11 to b15: Use prohibited

For details on the GOT internal devices (CC-Link IE TSN Module Communication Test Status (GS1114) and CC-Link IE TSN Module Communication Test Error (GS1115)), refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

4. If no error is detected, change the setting of [Mode Setting] from [Module Communication Test] in [Detail setting].

Since the communication with the controller is not performed when [Mode setting] is set to [Module Communication Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the communication unit.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

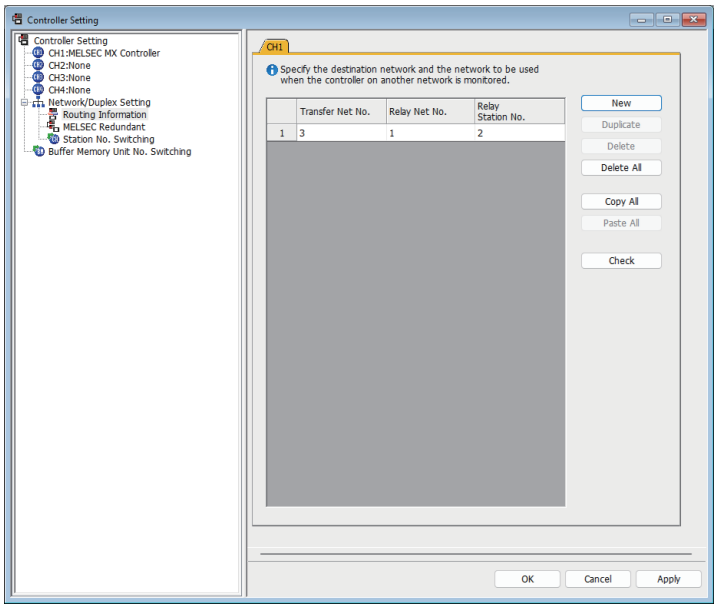
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

Manual of the MELSEC MX Controller



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 758 PLC side settings

9.1.4 PLC side settings

Model		Reference
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64 MXR500-128 MXR500-256	☞ Page 758 Connection to the MELSEC MX Controller (MX-R Model)

Connection to the MELSEC MX Controller (MX-R Model)

This section describes the settings of the GOT and CC-Link IE TSN-equipped module in the system configuration shown below.

Point

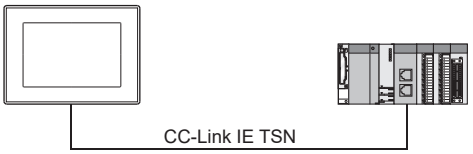
For details on the CC-Link IE TSN-equipped module, refer to the following manual.
📖MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)
📖MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

■System configuration

The following shows a system configuration example for connection to the CC-Link IE TSN master/local module (RJ71GN11-T2).

Ex.

<GOT>
(Use the default value for settings other than the following.)
Network type : CC-Link IE TSN
Network No. : 1
PLC No. (GOT Station) : 1
IP address : 192.168.3.24
Mode Setting : Online



<CC-Link IE TSN Master/Local module>*1
(Use the default value for settings other than the following.)
Station type : Master Station
Network No. : 1
PLC No. (Station) : 0
IP address : 192.168.3.253

*1 The CC-Link IE TSN master/local module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE TSN master/local module is set to 0.

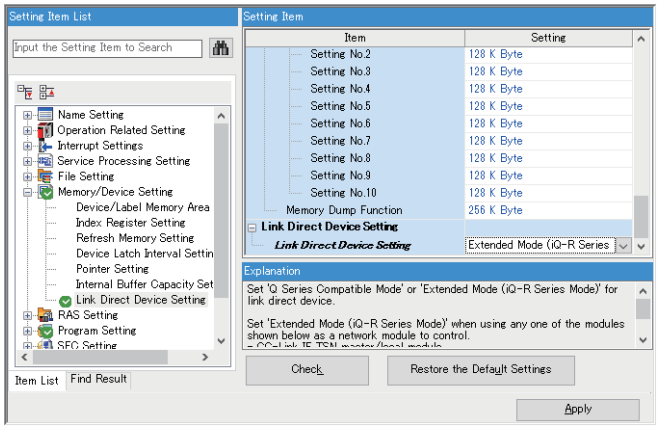
■[Parameter] in GX Works3

The following shows a parameter setting example for connecting to the CC-Link IE TSN master/local module (RJ71GN11-T2).

Point

- For the ring connection with the CC-Link IE TSN master/local module (RJ71GN11-T2), use GX Works3 version 1.065T or later.
- For connection with the CC-Link IE TSN Plus master/local module (RJ71GN11-EIP), use GX Works3 version 1.082L or later.

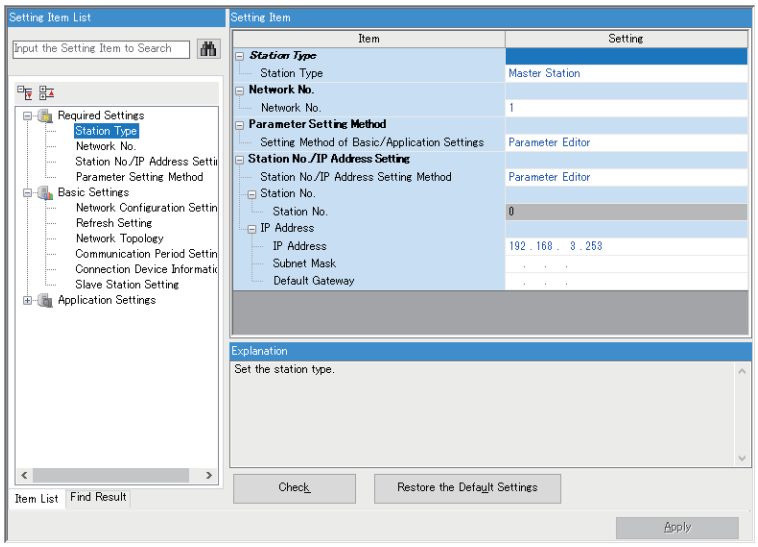
- CPU parameter



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Link Direct Device Setting]	Extended Mode (iQ-R Series Mode)	○

• Module parameter



○: Necessary, △: As necessary, —: Not necessary

Item		Setting value	Setting for GOT connection
[Station Type]		Master station	○
[Network No.]*1		1	○
[Setting Method of Basic/Application Settings]		Set in parameter	○
[Station No./IP Address Setting Method]		Set in parameter	○
[Station No.]		0	○
[IP Address]		192.168.3.253	△
[Subnet Mask]		—	—
[Default Gateway]		—	—
[Network Configuration Settings]		☞ • Network configuration settings	○
[Refresh Setting]		Use default value.	△
[Network Topology]		Line, star, line and star mixed	○
[Basic Period Setting]	[Setting in Units of 1µs]	Not set	○
	[Communication Period Interval Setting (Do not Set it in Units of 1µs)]	1000.00 µs	○
	[System Reservation Time]	20.00 µs	○
	[Cyclic Transmission Time (CC IE TSN)]	500.00 µs	○
[Multiple Period Setting]	[Normal-Speed]	×4	○
	[Low-Speed]	×16	○
	[Authentication Class Setting]	• When the communication driver is [CC-Link IE TSN]: Authentication class B • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: Authentication class A	○
	[Disconnection Detection Setting]	4 times	○

*1 Set the same network number as that of the GOT.

Point

• When changing the module parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• When the GOT monitors a cyclic device of other stations

Set [Communication Mode] of the master station to [Multicast].

Precautions

When monitoring the master and local stations on the same network as the GOT using transient transmission, the stations that can be monitored differ depending on the setting of [Communication Mode] of the CC-Link IE TSN-equipped module.

[Communication Mode]	Availability of monitoring
[Unicast]	Master station only
[Multicast]	Master station
	Local station that satisfies the following conditions • Being set as a local station in the network configuration setting • Not being a reserved or error invalid station

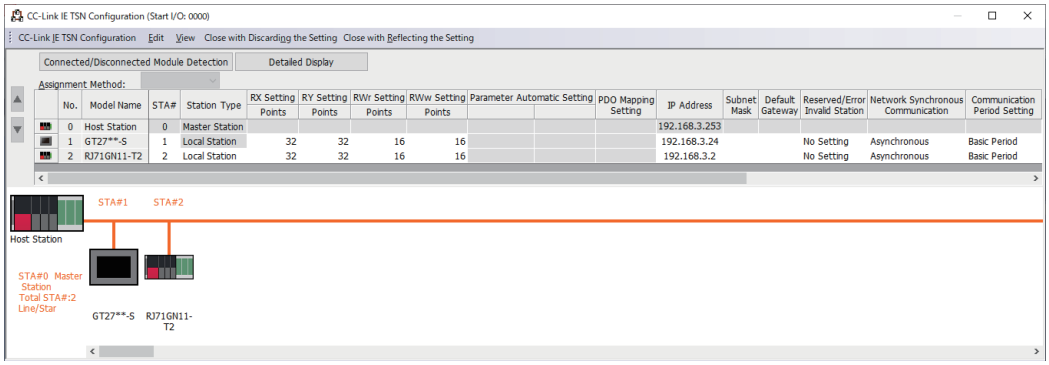
For the settings of the CC-Link IE TSN-equipped module, refer to the following.

MELSEC iQ-R CC-Link IE TSN User's Manual (Application)

MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

To monitor the master and local stations on other networks using transient transmission, use a master station or local station that can be monitored on the same network as the GOT as a relay station.

• Network configuration settings



○: Necessary, △: As necessary, —: Not necessary

Item		Setting value	Setting for GOT connection
[Station No.]		1	△
[Station Type]		• When the communication driver is [CC-Link IE TSN]: Local station • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: Remote station	△
[RX Setting]	[Points]	32	△
[RY Setting]	[Points]	32	△
[RWr Setting]	[Points]	• When the communication driver is [CC-Link IE TSN]: 16 • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: 4	△
[RWw Setting]	[Points]	• When the communication driver is [CC-Link IE TSN]: 16 • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: 4	△
[IP Address]		192.168.3.24	△
[Reserved/Error Invalid Station]		No setting	△
[Network Synchronous Communication]		Asynchronous	△
[Communication Period Setting]		Basic Period	△*1

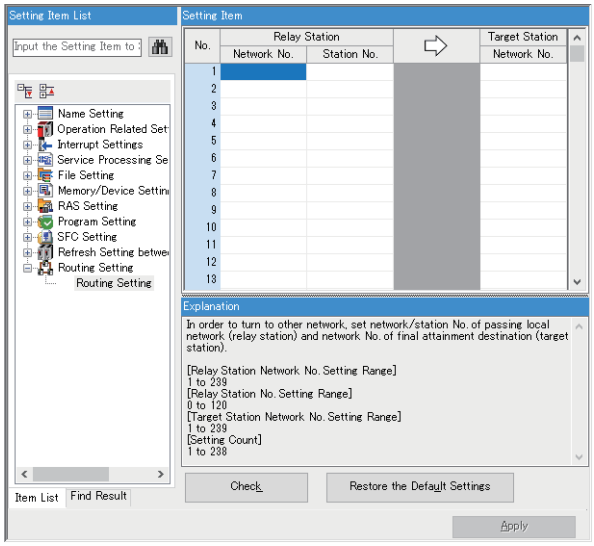
*1 When communication is performed at 100 Mbps using [CC-Link IE TSN (built-in Ethernet)], connection may not be established if [Communication Period Setting] is not set to [Low] in the device station setting.

Precautions

When a local station with the CC-Link IE TSN-compatible switching hub connected (linked-up) is added, IP address duplication is not detected at the destination station.
If IP address duplication (error code 1802H) is detected, disconnect the relevant local station from the network.
Otherwise, transient transmission may be performed to an unintended station because multiple stations with the same IP address exist on the network.

• Routing settings

Up to 238 target network numbers can be set.
However, the same number cannot be set twice or more (multiple times).
The GOT (host station) can access 238 different networks specified in the column of [Target Station Network No.].



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source
Routing parameter settings are also necessary for the request source GOT.
For the setting, refer to the following.
☞ Page 757 Routing parameter settings

■[Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC-Link IE TSN
[Network No.]	1: Network No. 1
[Station No.]	1: Station No. 1
[IP Address]	192.168.3.24
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Group No.]	0
[Mode Setting]	Online
[Communication Speed]	1 Gbps
[Refresh Interval]	25 ms
[Input for Err. Sta.]	Clear
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

• [Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 749 [Controller Setting]

9.1.5 Connection to the PLC with the authentication function enabled

Logon to the PLC

When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.

Touch a special function switch (Destination Authentication) set in the project to display the key window.

Enter the [User Name] and [Password] to log on.

For information on how to set a special function switch, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Logoff from the PLC

Touch a special function switch (Destination Authentication) set in the project to log off.

Precautions

■Creating a project

At GOT startup, the PLC is in logoff state.

The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.

Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.

For information on how to set screens and functions, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Take the following precautions when creating a project.

Item		Precautions for using the destination authentication function
[Environmental Setting]	[Screen Switching/Window]	Set the GOT internal device as the screen switching device. As well as logoff operation by GOT, reset on the PLC side or other operations can also make the PLC in logoff state. By setting the GOT internal device as the screen switching device, a screen can be switched even in logoff state due to reset on the PLC side or other operations.
	[Language Switching]	Set the GOT internal device as the language switching device. When a PLC device is set, comments cannot be displayed in logoff state.
	[System Information]	Set the GOT internal device as the system information device. When a PLC device is set, a system alarm occurs in logoff state.
	[Security]	It is recommended not to use screen security (level authentication and operator authentication) for connection with the PLC with the destination authentication function enabled.
		When using the level authentication, set the GOT internal device as the security level device.
Screen setting	Screen displayed immediately after GOT startup	Place a special function switch (Destination Authentication) to perform destination authentication for logging on to the PLC. Do not configure the setting to monitor the PLC devices.
	Screen number	Specify the screen number ranges separately for the screen displayed in logoff state and the screen displayed in logon state. Separating the screen number ranges makes screen transition in logoff state easy to consider. Example) Before authentication: 1 to 100, after authentication: 101 or later
	Screen switching control at logoff	Configure the setting using trigger actions or other methods so that the screen switches at logoff to the screen displayed before authentication.
Function that is not recommended for use when connecting with the PLC with the destination authentication function enabled		• Screen security (level authentication and operator authentication) • GOT Mobile function (Destination authentication cannot be performed on a mobile screen.)
Others	Function to specify the conditions other than the trigger device	Specify the trigger indirectly by using trigger actions or other methods. Example) When the PLC device controls the input range for a numerical input
	Function that cannot specify the trigger device	By scripts or device data transfer using the GOT internal device, read and write the PLC device only in logon state. Example) Alarm monitoring of the connected device

■Character code applicable for [User Name].

For logon to the PLC from the GOT, only ASCII code characters can be available for [User Name] in the key window and the [Destination Authentication] window.

When setting [User Name] for the PLC, set [User Name] of the user operating the PLC from the GOT in the ASCII code.

For the list of the ASCII code available in GOT, refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

■Access level of the user who can log on

When logging on to the PLC from the GOT, only the users whose access level is [Users] can log on.

Users with the access level [Administrators] or [Developers] cannot log on.

When monitoring the PLC from the GOT, set the users whose access level is [Users] for the PLC.

■Changing the user authentication function settings

The user authentication settings (user name and password) cannot be changed from the GOT.

Use GX Works3 to change the settings registered in the PLC.

■Obtaining and updating CPU errors

The GOT cannot obtain CPU errors unless you log on to the PLC.

To update the CPU error of the system alarm displayed on the GOT, log on to the PLC from the GOT.

9.1.6 Access range for monitoring

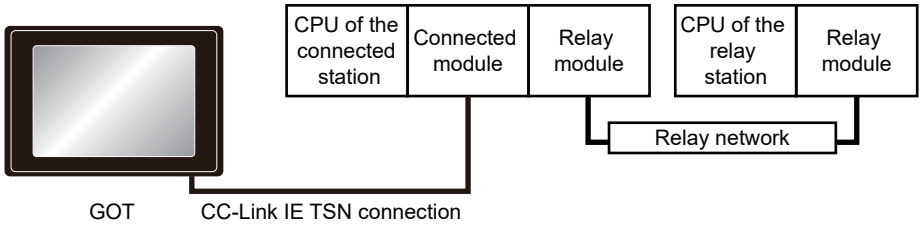
When GOT is connected to the CPU of the station connected via CC-Link IE TSN, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station								
		Relay network	CPU of the relay station							
			MXR	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
MX-R	☞ Page 744 Connectable devices	Ethernet	○*7	○*5	○	○*6	○	—	○	—	○*3
		CC-Link IE TSN	○*7	○*1	—	—	—	—	—	—	○*3
		CC-Link IE Field Network	○*7	○	○	○*2	○	—	—	—	○*4

*1 RnCPU, RnENCPU, RnSFCPU, and MELSECWinCPU (MELSEC iQ-R series) are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*3 FX5U and FX5UC are supported.

*4 FX5U, FX5UC, and FX5UJ are supported.

*5 The C Controller module (MELSEC iQ-R series) is not supported.

*6 The C Controller module (MELSEC-Q series) is not supported.

*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
☞ Page 90 Setting procedure of the encrypted communication

9.1.7 Firmware of the CC-Link IE TSN communication unit

Firmware versions and supported functions

Available functions differ depending on the firmware version of the CC-Link IE TSN communication unit.

Firmware version	Supported function
01	Cyclic transmission (line connection, star connection)
02	• Multicast mode • Communication speed 100Mbps • Time setting function • Firmware update function
03	Ring connection
05	CC-Link IE TSN protocol version 2.0

How to check the firmware version

Check the firmware version in the text display on the GOT.

Set the text display as follows.

- Device: SW003D
- Number of displayed digits: 2

For details on the text display object, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Firmware update

Use the firmware update tool installed to a personal computer to update the firmware of the CC-Link IE TSN communication unit through a network.

The following shows how to execute firmware update.

Point

• CC-Link IE TSN firmware update tool

For details on the firmware update tool, such as the operating environment, installation procedure, and operating procedure, refer to the following.

CC-Link IE TSN Firmware Update Tool Reference Manual

• CC-Link IE TSN communication unit

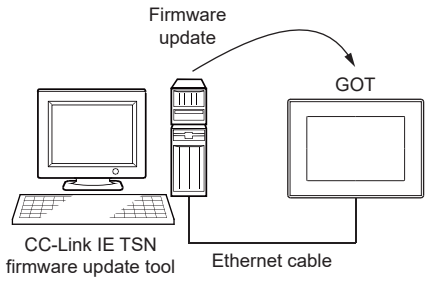
For details on the CC-Link IE TSN communication unit, refer to the following.

CC-Link IE TSN Communication Unit User's Manual

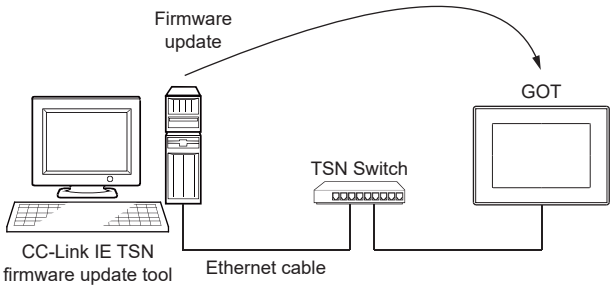
■Connection method

Use one of the following methods to connect the personal computer on which the firmware update tool is to run and the CC-Link IE TSN communication unit on the GOT.

• Direct connection



• Connection via a hub



Point

For the connection via a hub, use a TSN Switch.

For details on the TSN Switch, refer to the following.

MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)
MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

■Firmware update procedure

Update the firmware as follows.

1. Stop communication of the CC-Link IE TSN communication unit in which the firmware is updated.

Perform one of the following operations to stop communication.

- Disconnect the master station from the network.
- Disconnect the host station from the network.

2. Configure the settings required for the firmware update tool.

- Network configuration settings

Item	Setting
Module	GT25-J71GN13-T2
IP Address	IP address of the CC-Link IE TSN communication unit
FTP Username	GT25-J71GN13
FTP Password	GT25-J71GN13

- Application settings

Item	Setting
FTP Mode	Active Mode
Firmware Update Timeout(s)	900sec

For the settings other than the above, refer to the following.

CC-Link IE TSN Firmware Update Tool Reference Manual

3. Update the firmware of the CC-Link IE TSN communication unit.

4. After the update, the GOT on which the unit is mounted is restarted.

After the restart, the CC-Link IE TSN communication unit operates with the updated firmware.

Point

Firmware file

For the firmware file used for update, contact your local sales office.

Precautions for firmware update

The following shows the precautions for executing firmware update.

■When firmware update is not performed

Make sure to stop communication of the CC-Link IE TSN communication unit, and then execute firmware update.

In the following cases, firmware update of the CC-Link IE TSN communication unit is not performed.

• While CC-Link IE TSN Control (GS620.b0) is on

Turn off this bit.

For details on the CC-Link IE TSN Control (GS620.b0), refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

• While the CC-Link IE TSN communication unit is communicating

Disconnect the master station or host station from the network to stop communication of the CC-Link IE TSN communication unit.

• While the GOT is being operated with GT Designer3

Do not perform operations such as writing the package data and executing the GOT diagnostics with GT Designer3.

• Performing an operation that makes the GOT offline

Do not perform any operation that makes the GOT offline in the utility.

■Power-off during firmware update

Do not turn off the GOT during firmware update.

Doing so may cause the CC-Link IE TSN communication unit to become unusable.

■Hardware version of the CC-Link IE TSN communication unit

Firmware update may not be available depending on the combination of the hardware and firmware versions of the CC-Link IE TSN communication unit.

If firmware update cannot be performed, check the error code of the firmware update tool.

■Firmware downgrade

If the version of the firmware file used for the update tool is earlier than the firmware version of the target CC-Link IE TSN communication unit, a warning message prompting for downgrading is displayed.

Select a new firmware file to execute firmware update.

Otherwise, execute downgrading.

■GT Designer3 version and CC-Link IE TSN communication unit firmware version

The combination of the GT Designer3 version and CC-Link IE TSN communication unit (GT25-J71GN13-T2) firmware version is restricted.

The following shows the combinations of the GT Designer3 version and the CC-Link IE TSN communication unit firmware version.

○: Supported, —: Not supported

GT Designer3 version	CC-Link IE TSN communication unit (GT25-J71GN13-T2)	
	01	02 or later
Version1.217B to Version1.220E	○	—
Version1.225K or later	—	○

Update the firmware of the CC-Link IE TSN communication unit (GT25-J71GN13-T2) with firmware version 01 so that the GT Designer3 version 1.225K or later supports the unit.

For firmware update of the CC-Link IE TSN communication unit (GT25-J71GN13-T2), refer to the following.

☞ Page 767 Firmware of the CC-Link IE TSN communication unit

■Firmware versions of the CC-Link IE TSN-equipped module on the master station and the CC-Link IE TSN communication unit

Depending on the combination of firmware versions of the modules and units, the GOT cannot access the network.

The following shows the module and unit firmware version combinations.

○: Accessible, —: Inaccessible

CC-Link IE TSN-equipped module on the master station		CC-Link IE TSN communication unit (GT25-J71GN13-T2)	
		01	02 or later
RJ71GN11-T2	03 or earlier	○	—
	04 or later	—	○
RJ71GN11-EIP	From the first product	—	○

Update the firmware of the module or unit so that the GOT can access the network.

For firmware update of the CC-Link IE TSN equipped module (RJ71GN11-T2, RJ71GN11-EIP), refer to the following.

📖MELSEC iQ-R Module Configuration Manual

📖MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

For firmware update of the CC-Link IE TSN communication unit (GT25-J71GN13-T2), refer to the following.

☞ Page 767 Firmware of the CC-Link IE TSN communication unit

9.2 MELSEC MX Controller (MX-F Model) (CC-Link IE TSN connection)

☞ Page 772 Connectable devices
☞ Page 773 System configuration
☞ Page 777 GOT side settings
☞ Page 786 PLC side settings
☞ Page 790 Connection to the PLC with the authentication function enabled
☞ Page 791 Access range for monitoring
☞ Page 792 Firmware of the CC-Link IE TSN communication unit

9.2.1 Connectable devices

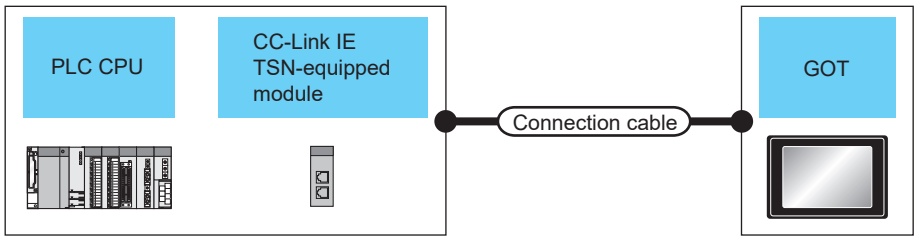
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	CC-Link IE TSN-equipped module	Connectable model
MELSEC MX Controller (MX-F Model)*1	MXF100-8-N32 MXF100-8-P32 MXF100-16-N32 MXF100-16-P32	○	FX5-CCLGN-MS	GT37 SoftGOT3000

*1 When using the CC-Link IE TSN (built-in Ethernet) communication driver, connect the GOT to the built-in Ethernet port (P1, P2) of the MX Controller.

9.2.2 System configuration



For details on the connection cable and overall cable length, refer to the following.

☞ Page 774 Connection cable
☞ Page 774 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 774 Maximum number of connected devices

Controller	CC-Link IE TSN-equipped module	Connection cable	GOT	
			Interface	Model
MELSEC MX Controller (MX-F Model)*1	FX5-CCLGN-MS	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			GT37-IF2000 + GT25-J71GN13-T2	

*1 When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.
For information on how to logon and logoff, refer to the following.
☞ Page 790 Logon to the PLC
☞ Page 790 Logoff from the PLC
The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.
Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.
☞ Page 790 Creating a project

Point

For the system configuration of the CC-Link IE TSN-equipped module, refer to the following manual.
📖MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

Precautions

■Connection to a CC-Link IE TSN-equipped module by Ethernet

The CC-Link IE TSN communication unit (GT25-J71GN13-T2) does not support the Ethernet connection.
For the Ethernet connection, use an Ethernet interface built in the GOT.
For details on the Ethernet connection, refer to the following.
☞ Page 97 Connection to CC-Link IE TSN-equipped module

■Connection status check after the GOT startup

The connection with the network cannot be established until the connection check with the master station is completed after the GOT startup.
To check the status of connection with the master station, use the CC-Link IE TSN Connection Status (GS1297) of the GOT internal device.
For details on the CC-Link IE TSN Connection Status (GS1297), refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (double-shielded, STP) or shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (double-shielded, STP) or shielded twisted pair cable (STP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

When using a hub, use a TSN Switch or General-purpose Switch according to the system configuration.

For usable TSN Switches and General-purpose Switches, refer to the following.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manual.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

Maximum number of connected devices

The following shows the applicable GOT and the maximum number of connected devices.

Controller			GOT	
Model	Number of GOTs connectable to one PLC		Model	Number of connectable controllers per GOT channel
	UDP	TCP		
MELSEC MX Controller (MX-F Model)	119	119	GT37 SoftGOT3000	1

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

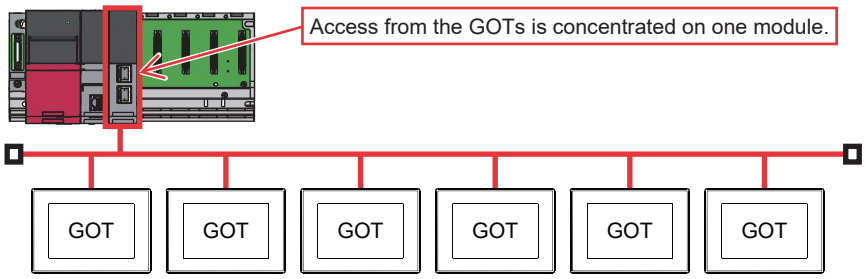
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

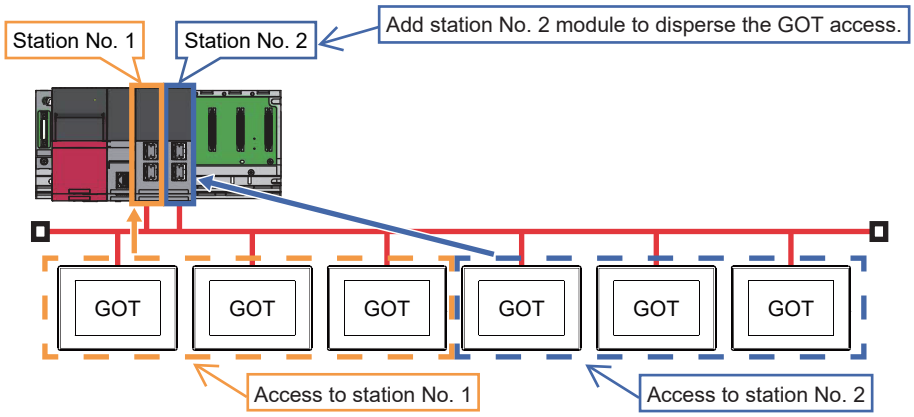
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

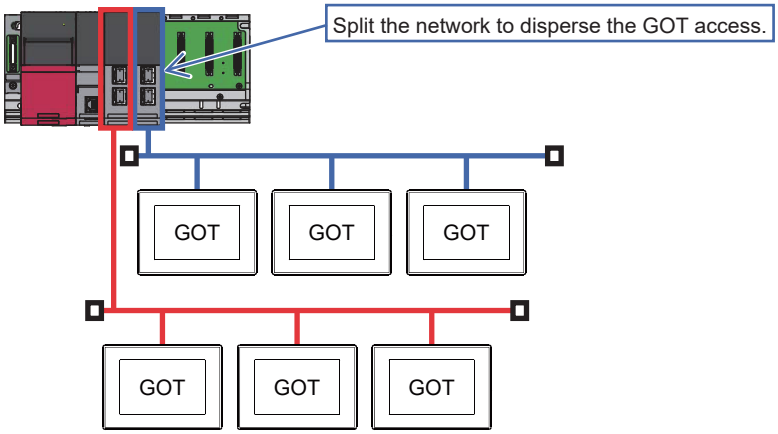
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.

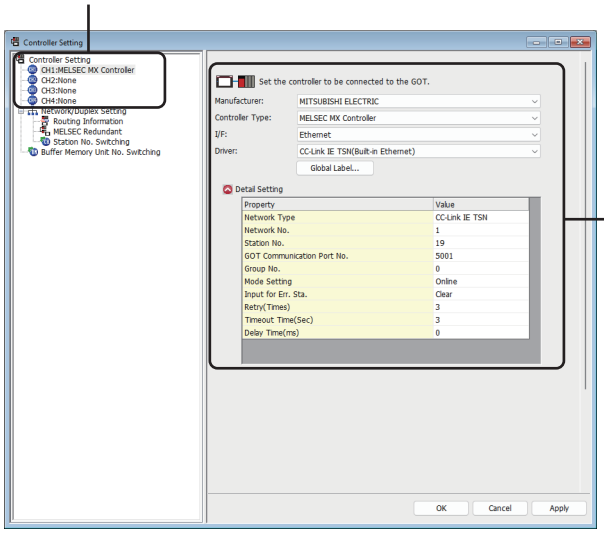


9.2.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.

List menu



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC MX Controller]
[I/F]	• [Ethernet] • [Extend Unit]
[Driver]	• When [Ethernet] is selected for [I/F]: [CC-Link IE TSN (Built-in Ethernet)] • When [Extend Unit] is selected for [I/F]: [CC-Link IE TSN]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 778 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

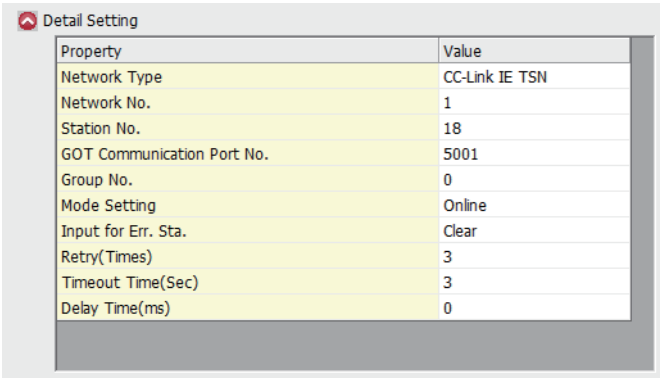
Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.

- [CC-Link IE TSN (built-in Ethernet)]



Item	Description	Range
[Network Type]	Set the network type.	[CC-Link IE TSN]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024 to 5010], [5014 to 49152], [49171 to 65534]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the unit communication test mode, refer to the following. ☞ Page 781 Unit communication test	[Online]
[Input for Err. Sta.]	Set whether to hold or clear the input from the station where the data link has failed due to power-off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms

Precautions

■Communication driver

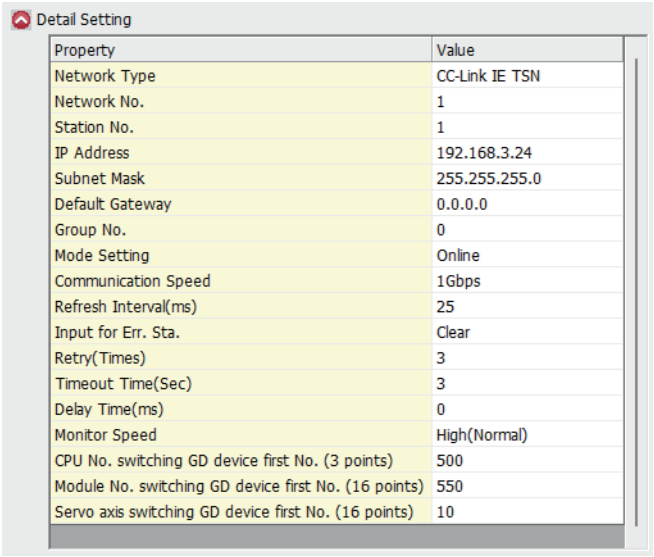
To set CC-Link IE TSN (built-in Ethernet), use port 1 on the built-in Ethernet interface of the GOT.

Two or more CC-Link IE TSN (built-in Ethernet) cannot be set in one GOT at the same time.

■Authentication class for communication

When CC-Link IE TSN (built-in Ethernet) is used for connection, communication is available only for the master station of authentication class B.

• [CC-Link IE TSN]



Item	Description	Range
[Network Type]	Set the network type.	[CC-Link IE TSN]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[IP Address][*1]	Set the IP address of the GOT.	[0.0.0.1] to [223.255.255.254]
[Subnet Mask]	When a subnetwork is used, set the subnet mask. (Only for connection via router) If the sub network is not used, the default value is set.	[0.0.0.0] to [255.255.255.255][*2]
[Default Gateway]	Set the router address of the default gateway where the GOT is connected. (Only for connection via router)	[0.0.0.0] to [223.255.255.254]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the unit communication test mode, refer to the following. ☞ Page 781 Unit communication test	[Online], [Offline], [Module Communication Test]
[Communication Speed]	Set the communication speed of the GOT.	[1Gbps], [100Mbps]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication.	[1] ms to [1000] ms
[Input for Err. Sta.]	Set whether to hold or clear the input from the station where the data link has failed due to power-off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]	Set the monitor speed of the CC-Link IE TSN network. This setting is not valid in all systems.	[High(Normal)], [Middle], [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 782 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 783 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 784 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 If any of the following settings is configured in the IP address, a communication timeout error occurs.
• The third octet and fourth octet are all 1 (*.*.255.255) or all 0 (*.*.0.0).
• The host part is all 1 (*.*.*.255) or all 0 (*.*.*.0).
• Some reserved addresses determined for special applications
For details, refer to the following manuals.
MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

*2 When the subnet mask field is filled with 0, the operation is the same as when the field is left blank.

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

• Setting the refresh interval

For [Refresh Interval(ms)] in [Controller Setting] in GT Designer3, set 5 ms or more per 1K words for the total size of the device set in [Network Configuration Settings] in GX Works3.

Setting less than 5 ms may affect the processing of the GOT such as a decrease of the monitoring speed.

The following shows setting examples of the total device size and refresh interval.

Total device size	Refresh Interval
1K words	5 ms or more
2K words	10 ms or more
3K words	15 ms or more
5K words	25 ms or more
36K words	180 ms or more

■Unit communication test

In the unit communication test, connect port 1 and port 2 of the CC-Link IE TSN communication unit mounted on the GOT with a network cable, and check if the unit operates properly with the GOT.

The following shows the test procedure and how to check the test result.

1. Perform either of the following operations to set the GOT to the unit communication test mode.

- Write the project data for which [Mode Setting] in [Detail Setting] is set to [Stand-alone test mode] to the GOT.
- Set [Mode setting] in [Detail setting] to [Module Communication Test] in the GOT utility.

2. A unit communication test will start at GOT startup.

3. After the test is complete, check the result with the ERR LED on the communication unit and GOT internal devices (CC-Link IE TSN Module Communication Test Status (GS1114) or CC-Link IE TSN Module Communication Test Error (GS1115)).

Check		Test result
ERR LED on the communication unit		OFF: Normal ON: Error
GOT internal device	CC-Link IE TSN Module Communication Test Status (GS1114)	Notifies the execution status of a communication test of the CC-Link IE TSN communication unit. • b0: Turns on when a communication test is executed. • b1: Turns on while a communication test is being executed. • b2: Turns on when a communication test is complete. • b3 to b15: Use prohibited
	CC-Link IE TSN Module Communication Test Error (GS1115)	Notifies that an error has occurred during a communication test of the CC-Link IE TSN communication unit. • b0: Turns on if there is a problem with the port 1 side of the CC-Link IE TSN communication unit. • b1: Turns on if there is a problem with the connection interface (port 1) of the CC-Link IE TSN communication unit or the Ethernet cable terminal. • b2: Turns on if there is a problem with the port 1 side Ethernet cable of the CC-Link IE TSN communication unit. • b3 to b7: Use prohibited • b8: Turns on if there is a problem with the port 2 side of the CC-Link IE TSN communication unit. • b9: Turns on if there is a problem with the connection interface (port 2) of the CC-Link IE TSN communication unit or the Ethernet cable terminal. • b10: Turns on if there is a problem with the port 2 side Ethernet cable of the CC-Link IE TSN communication unit. • b11 to b15: Use prohibited

For details on the GOT internal devices (CC-Link IE TSN Module Communication Test Status (GS1114) and CC-Link IE TSN Module Communication Test Error (GS1115)), refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

4. If no error is detected, change the setting of [Mode Setting] from [Module Communication Test] in [Detail setting].

Since the communication with the controller is not performed when [Mode setting] is set to [Module Communication Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the communication unit.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	01 to 10 Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

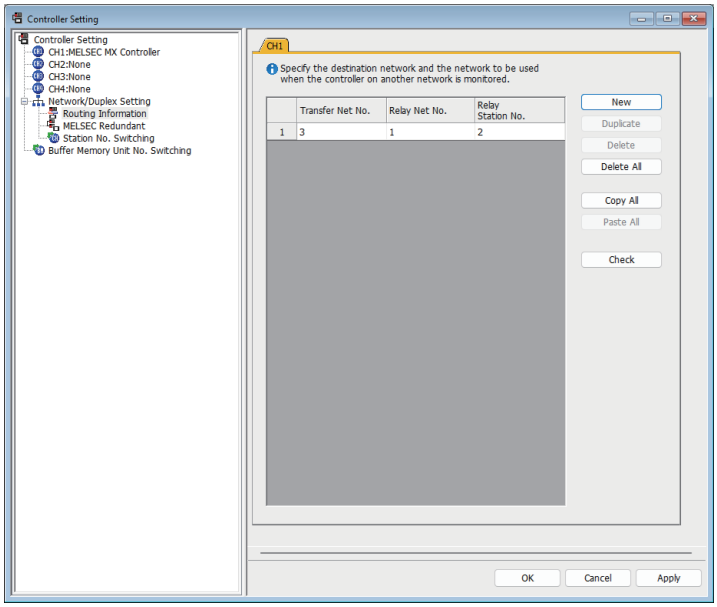
Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 786 PLC side settings

9.2.4 PLC side settings

Model		Reference
MELSEC MX Controller (MX-F Model)	MXF100-8-N32 MXF100-8-P32 MXF100-16-N32 MXF100-16-P32	☞ Page 786 Connection to the MELSEC MX Controller (MX-F Model)

Connection to the MELSEC MX Controller (MX-F Model)

This section describes the settings of the GOT and CC-Link IE TSN-equipped module in the system configuration shown below.

Point

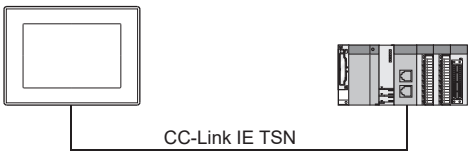
For details on the CC-Link IE TSN-equipped module, refer to the following manual.
MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

■System configuration

The following shows a system configuration example for connection to the CC-Link IE TSN master/local module (FX5-CCLGN-MS).

Ex.

<GOT>
(Use the default value for settings other than the following.)
Network type : CC-Link IE TSN
Network No. : 1
PLC No. (GOT Station) : 1
IP address : 192.168.3.24
Mode Setting : Online



<CC-Link IE TSN Master/Local module>*1
(Use the default value for settings other than the following.)
Station type : Master Station
Network No. : 1
PLC No. (Station) : 0
IP address : 192.168.3.253

*1 The CC-Link IE TSN master/local module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE TSN master/local module is set to 0.

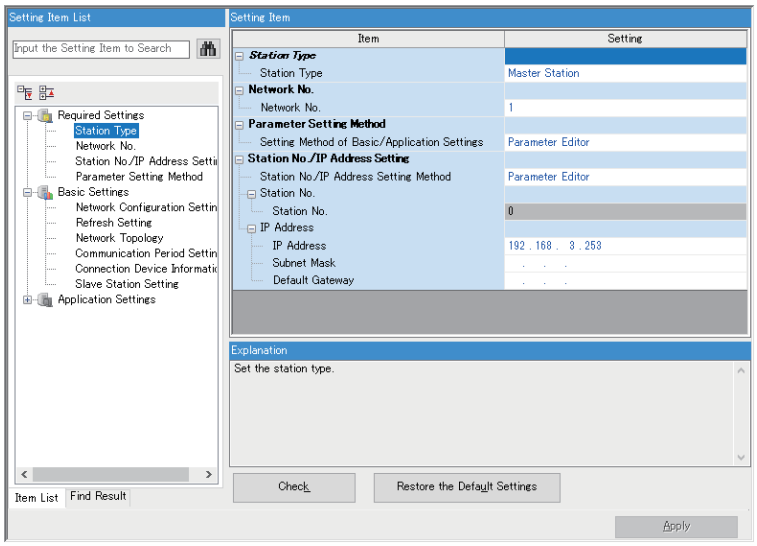
■[Parameter] in GX Works3

The following shows a parameter setting example for connection to the CC-Link IE TSN master/local module (FX5-CCLGN-MS).

Point

For connection to the CC-Link IE TSN master/local module (FX5-CCLGN-MS), use GX Works3 version 1.085P or later.

• Module parameter



○: Necessary, △: As necessary, —: Not necessary

Item		Setting value	Setting for GOT connection
[Station Type]		Master station	○
[Network No.]*1		1	○
[Setting Method of Basic/Application Settings]		Set in parameter	○
[Station No./IP Address Setting Method]		Set in parameter	○
[Station No.]		0	○
[IP Address]		192.168.3.253	△
[Subnet Mask]		—	—
[Default Gateway]		—	—
[Network Configuration Settings]		☞ • Network configuration settings	○
[Refresh Setting]		Use default value.	△
[Network Topology]		Line, star, line and star mixed	○
[Basic Period Setting]	[Setting in Units of 1µs]	Not set	○
	[Communication Period Interval Setting (Do not Set it in Units of 1µs)]	1000.00 µs	○
	[Cyclic Transmission Time (CC IE TSN)]	500.00 µs	○
[Multiple Period Setting]	[Normal-Speed]	×4	○
	[Low-Speed]	×16	○
	[Authentication Class Setting]	• When the communication driver is [CC-Link IE TSN]: Authentication class B • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: Authentication class A	○
	[Disconnection Detection Setting]	4 times	○

*1 Set the same network number as that of the GOT.

Point

• When changing the module parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• When the GOT monitors a cyclic device of other stations

Set [Communication Mode] of the master station to [Multicast].

Precautions

When monitoring the master and local stations on the same network as the GOT using transient transmission, the stations that can be monitored differ depending on the setting of [Communication Mode] of the CC-Link IE TSN-equipped module.

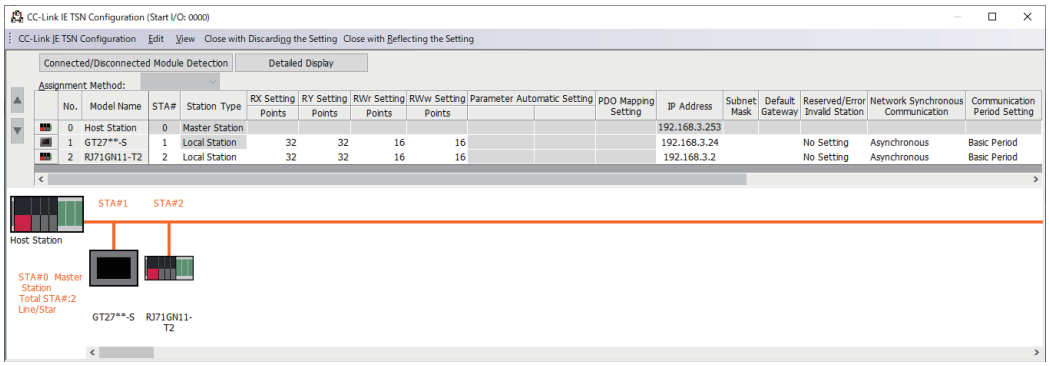
[Communication Mode]	Availability of monitoring
[Unicast]	Master station only
[Multicast]	Master station
	Local station that satisfies the following conditions • Being set as a local station in the network configuration setting • Not being a reserved or error invalid station

For the settings of the CC-Link IE TSN-equipped module, refer to the following.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

To monitor the master and local stations on other networks using transient transmission, use a master station or local station that can be monitored on the same network as the GOT as a relay station.

• Network configuration settings



○: Necessary, △: As necessary, —: Not necessary

Item		Setting value	Setting for GOT connection
[Station No.]		1	△
[Station Type]		• When the communication driver is [CC-Link IE TSN]: Local station • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: Remote station	△
[RX Setting]	[Points]	32	△
[RY Setting]	[Points]	32	△
[RWr Setting]	[Points]	• When the communication driver is [CC-Link IE TSN]: 16 • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: 4	△
[RWw Setting]	[Points]	• When the communication driver is [CC-Link IE TSN]: 16 • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: 4	△
[IP Address]		192.168.3.24	△
[Reserved/Error Invalid Station]		No setting	△
[Network Synchronous Communication]		Asynchronous	△
[Communication Period Setting]		Basic Period	△*1

*1 When communication is performed at 100 Mbps using [CC-Link IE TSN (built-in Ethernet)], connection may not be established if [Communication Period Setting] is not set to [Low] in the device station setting.

Precautions

When a local station with the CC-Link IE TSN-compatible switching hub connected (linked-up) is added, IP address duplication is not detected at the destination station.

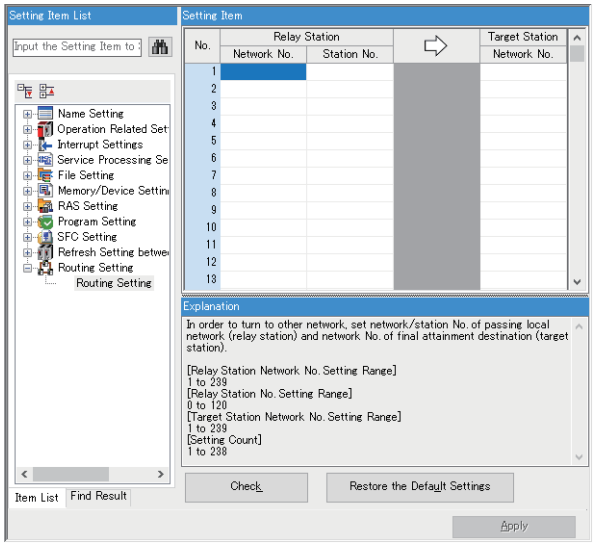
If IP address duplication (error code 1802H) is detected, disconnect the relevant local station from the network. Otherwise, transient transmission may be performed to an unintended station because multiple stations with the same IP address exist on the network.

• Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access 238 different networks specified in the column of [Target Station Network No.].



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 785 Routing parameter settings

■[Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC-Link IE TSN
[Network No.]	1: Network No. 1
[Station No.]	1: Station No. 1
[IP Address]	192.168.3.24
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Group No.]	0
[Mode Setting]	Online
[Communication Speed]	1 Gbps
[Refresh Interval]	25 ms
[Input for Err. Sta.]	Clear
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

• [Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 777 [Controller Setting]

9.2.5 Connection to the PLC with the authentication function enabled

Logon to the PLC

When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.

Touch a special function switch (Destination Authentication) set in the project to display the key window.

Enter the [User Name] and [Password] to log on.

For information on how to set a special function switch, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Logoff from the PLC

Touch a special function switch (Destination Authentication) set in the project to log off.

Precautions

■Creating a project

At GOT startup, the PLC is in logoff state.

The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.

Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.

For information on how to set screens and functions, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Take the following precautions when creating a project.

Item		Precautions for using the destination authentication function
[Environmental Setting]	[Screen Switching/Window]	Set the GOT internal device as the screen switching device. As well as logoff operation by GOT, reset on the PLC side or other operations can also make the PLC in logoff state. By setting the GOT internal device as the screen switching device, a screen can be switched even in logoff state due to reset on the PLC side or other operations.
	[Language Switching]	Set the GOT internal device as the language switching device. When a PLC device is set, comments cannot be displayed in logoff state.
	[System Information]	Set the GOT internal device as the system information device. When a PLC device is set, a system alarm occurs in logoff state.
	[Security]	It is recommended not to use screen security (level authentication and operator authentication) for connection with the PLC with the destination authentication function enabled.
		When using the level authentication, set the GOT internal device as the security level device.
Screen setting	Screen displayed immediately after GOT startup	Place a special function switch (Destination Authentication) to perform destination authentication for logging on to the PLC. Do not configure the setting to monitor the PLC devices.
	Screen number	Specify the screen number ranges separately for the screen displayed in logoff state and the screen displayed in logon state. Separating the screen number ranges makes screen transition in logoff state easy to consider. Example) Before authentication: 1 to 100, after authentication: 101 or later
	Screen switching control at logoff	Configure the setting using trigger actions or other methods so that the screen switches at logoff to the screen displayed before authentication.
Function that is not recommended for use when connecting with the PLC with the destination authentication function enabled		• Screen security (level authentication and operator authentication) • GOT Mobile function (Destination authentication cannot be performed on a mobile screen.)
Others	Function to specify the conditions other than the trigger device	Specify the trigger indirectly by using trigger actions or other methods. Example) When the PLC device controls the input range for a numerical input
	Function that cannot specify the trigger device	By scripts or device data transfer using the GOT internal device, read and write the PLC device only in logon state. Example) Alarm monitoring of the connected device

■Character code applicable for [User Name].

For logon to the PLC from the GOT, only ASCII code characters can be available for [User Name] in the key window and the [Destination Authentication] window.

When setting [User Name] for the PLC, set [User Name] of the user operating the PLC from the GOT in the ASCII code.

For the list of the ASCII code available in GOT, refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

■Access level of the user who can log on

When logging on to the PLC from the GOT, only the users whose access level is [Users] can log on.

Users with the access level [Administrators] or [Developers] cannot log on.

When monitoring the PLC from the GOT, set the users whose access level is [Users] for the PLC.

■Changing the user authentication function settings

The user authentication settings (user name and password) cannot be changed from the GOT.

Use GX Works3 to change the settings registered in the PLC.

■Obtaining and updating CPU errors

The GOT cannot obtain CPU errors unless you log on to the PLC.

To update the CPU error of the system alarm displayed on the GOT, log on to the PLC from the GOT.

9.2.6 Access range for monitoring

Only the connected CPU can be accessed.

9.2.7 Firmware of the CC-Link IE TSN communication unit

Firmware versions and supported functions

Available functions differ depending on the firmware version of the CC-Link IE TSN communication unit.

Firmware version	Supported function
01	Cyclic transmission (line connection, star connection)
02	• Multicast mode • Communication speed 100Mbps • Time setting function • Firmware update function
03	Ring connection
05	CC-Link IE TSN protocol version 2.0

How to check the firmware version

Check the firmware version in the text display on the GOT.

Set the text display as follows.

- Device: SW003D
- Number of displayed digits: 2

For details on the text display object, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Firmware update

Use the firmware update tool installed to a personal computer to update the firmware of the CC-Link IE TSN communication unit through a network.

The following shows how to execute firmware update.

Point

• CC-Link IE TSN firmware update tool

For details on the firmware update tool, such as the operating environment, installation procedure, and operating procedure, refer to the following.

CC-Link IE TSN Firmware Update Tool Reference Manual

• CC-Link IE TSN communication unit

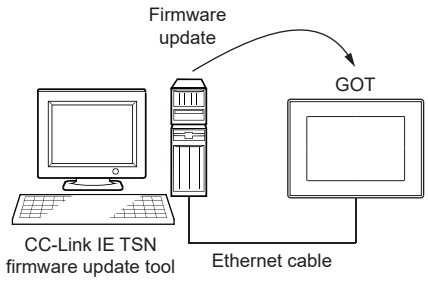
For details on the CC-Link IE TSN communication unit, refer to the following.

CC-Link IE TSN Communication Unit User's Manual

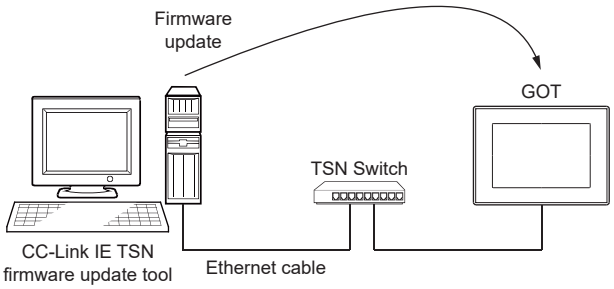
■Connection method

Use one of the following methods to connect the personal computer on which the firmware update tool is to run and the CC-Link IE TSN communication unit on the GOT.

• Direct connection



• Connection via a hub



Point

For the connection via a hub, use a TSN Switch.

For details on the TSN Switch, refer to the following.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

■Firmware update procedure

Update the firmware as follows.

1. Stop communication of the CC-Link IE TSN communication unit in which the firmware is updated.

Perform one of the following operations to stop communication.

- Disconnect the master station from the network.
- Disconnect the host station from the network.

2. Configure the settings required for the firmware update tool.

- Network configuration settings

Item	Setting
Model	GT25-J71GN13-T2
IP Address	IP address of the CC-Link IE TSN communication unit
FTP Username	GT25-J71GN13
FTP Password	GT25-J71GN13

- Application settings

Item	Setting
FTP Mode	Active Mode
Firmware Update Timeout(s)	900sec

For the settings other than the above, refer to the following.

CC-Link IE TSN Firmware Update Tool Reference Manual

3. Update the firmware of the CC-Link IE TSN communication unit.

4. After the update, the GOT on which the unit is mounted is restarted.

After the restart, the CC-Link IE TSN communication unit operates with the updated firmware.

Point

Firmware file

For the firmware file used for update, contact your local sales office.

Precautions for firmware update

The following shows the precautions for executing firmware update.

■When firmware update is not performed

Make sure to stop communication of the CC-Link IE TSN communication unit, and then execute firmware update.

In the following cases, firmware update of the CC-Link IE TSN communication unit is not performed.

• While CC-Link IE TSN Control (GS620.b0) is on

Turn off this bit.

For details on the CC-Link IE TSN Control (GS620.b0), refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

• While the CC-Link IE TSN communication unit is communicating

Disconnect the master station or host station from the network to stop communication of the CC-Link IE TSN communication unit.

• While the GOT is being operated with GT Designer3

Do not perform operations such as writing the package data and executing the GOT diagnostics with GT Designer3.

• Performing an operation that makes the GOT offline

Do not perform any operation that makes the GOT offline in the utility.

■Power-off during firmware update

Do not turn off the GOT during firmware update.

Doing so may cause the CC-Link IE TSN communication unit to become unusable.

■Hardware version of the CC-Link IE TSN communication unit

Firmware update may not be available depending on the combination of the hardware and firmware versions of the CC-Link IE TSN communication unit.

If firmware update cannot be performed, check the error code of the firmware update tool.

■Firmware downgrade

If the version of the firmware file used for the update tool is earlier than the firmware version of the target CC-Link IE TSN communication unit, a warning message prompting for downgrading is displayed.

Select a new firmware file to execute firmware update.

Otherwise, execute downgrading.

■GT Designer3 version and CC-Link IE TSN communication unit firmware version

The combination of the GT Designer3 version and CC-Link IE TSN communication unit (GT25-J71GN13-T2) firmware version is restricted.

The following shows the combinations of the GT Designer3 version and the CC-Link IE TSN communication unit firmware version.

○: Supported, —: Not supported

GT Designer3 version	CC-Link IE TSN communication unit (GT25-J71GN13-T2)	
	01	02 or later
Version1.217B to Version1.220E	○	—
Version1.225K or later	—	○

Update the firmware of the CC-Link IE TSN communication unit (GT25-J71GN13-T2) with firmware version 01 so that the GT Designer3 version 1.225K or later supports the unit.

For firmware update of the CC-Link IE TSN communication unit (GT25-J71GN13-T2), refer to the following.

☞ Page 792 Firmware of the CC-Link IE TSN communication unit

9.3 MELSEC iQ-R series (CC-Link IE TSN connection)

☞ Page 796 Connectable devices
☞ Page 798 System configuration
☞ Page 802 GOT side settings
☞ Page 811 PLC side settings
☞ Page 816 Access range for monitoring
☞ Page 817 Firmware of the CC-Link IE TSN communication unit

9.3.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	CC-Link IE TSN-equipped module or Motion module	Connectable model
MELSEC iQ-R series	R00CPU[*1] R01CPU[*1] R02CPU[*1] R04CPU[*2] R08CPU[*2] R16CPU[*2] R32CPU[*2] R120CPU[*2]	○	RJ71GN11-T2 RJ71GN11-EIP RD78G4 RD78G8 RD78G16 RD78G32 RD78G64 RD78GHV RD78GHW	GT37 SoftGOT3000
	R04ENCPU[*2] R08ENCPU[*2] R16ENCPU[*2] R32ENCPU[*2] R120ENCPU[*2]	○	RJ71GN11-T2 RJ71GN11-EIP RD78G4 RD78G8 RD78G16 RD78G32 RD78G64 RD78GHV RD78GHW	GT37 SoftGOT3000
	R08SFCPU[*3] R16SFCPU[*3] R32SFCPU[*3] R120SFCPU[*3]	○	RJ71GN11-T2 RD78G4 RD78G8 RD78G16 RD78G32 RD78G64 RD78GHV RD78GHW	GT37 SoftGOT3000
C Controller module (MELSEC iQ-R series)	R12CCPU-V[*4]	○	RJ71GN11-T2	GT37 SoftGOT3000
MELSECWinCPU (MELSEC iQ-R series)	R102WCPU-W	○	RJ71GN11-T2	GT37 SoftGOT3000

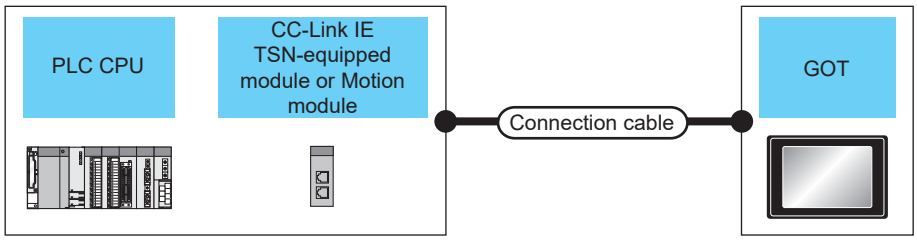
*1 Use the following firmware version.
When configuring a line topology or star topology using RJ71GN11-T2: 11 or later
When configuring a ring topology using RJ71GN11-T2: 18 or later
When using RJ71GN11-EIP: 29 or later

*2 Use the following firmware version.
When configuring a line topology or star topology using RJ71GN11-T2: 43 or later
When configuring a ring topology using RJ71GN11-T2: 50 or later
When using RJ71GN11-EIP: 62 or later

*3 Use firmware version 20 or later.

*4 Use firmware version 15 or later.

9.3.2 System configuration



For details on the connection cable and overall cable length, refer to the following.

☞ Page 799 Connection cable

☞ Page 799 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 800 Maximum number of connected devices

Controller	CC-Link IE TSN-equipped module or Motion module	Connection cable	GOT	
			Interface	Model
MELSEC iQ-R series C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series)	RJ71GN11-T2*1*3	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			GT37-IF2000 + GT25-J71GN13-T2*1*2	
MELSEC iQ-R series (RnCPU, RnENCPU)	RJ71GN11-EIP*1*4*5	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			GT37-IF2000 + GT25-J71GN13-T2*1*2	
MELSEC iQ-R series	RD78G4*1 RD78G8*1 RD78G16*1 RD78G32*1 RD78G64*1 RD78GHV*1 RD78GHW*1	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			GT37-IF2000 + GT25-J71GN13-T2*1*2	

*1 Depending on the combination of the firmware version of the CC-Link IE TSN-equipped module or Motion module on the master station and the firmware version of the CC-Link IE TSN communication unit (GT25-J71GN13-T2), the GOT cannot access the network.
For the combinations of firmware versions, refer to the following.
☞ Page 821 Firmware versions of the CC-Link IE TSN-equipped module or Motion module on the master station and the CC-Link IE TSN communication unit

*2 The firmware version must be 05 or later when monitoring a network where a controller compatible with CC-Link IE TSN protocol version 2.0 exists.
For information on how to check or update the firmware version of the CC-Link IE TSN communication unit, refer to the following.
☞ Page 817 Firmware of the CC-Link IE TSN communication unit

*3 For the ring connection, use firmware version 10 or later.

*4 The ring connection is not supported.

*5 Connect the cable to the P1 port of the RJ71GN11-EIP.

Point

For the system configuration of the CC-Link IE TSN-equipped module, refer to the following manuals.

MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

For the system configuration of the Motion module, refer to the following manual.

MELSEC iQ-R Motion Module User's Manual (Startup)

Precautions

■Multiple CPU configuration

When accessing a CPU in a multiple CPU configuration via a CC-Link IE TSN network, ensure that the firmware version of the CPU is as shown below.

CPU	Firmware version
R00CPU, R01CPU, R02CPU	11 or later
R04CPU, R08CPU, R16CPU, R32CPU, R120CPU, R04ENCPU, R08ENCPU, R16ENCPU, R32ENCPU, R120ENCPU	43 or later

■Ethernet connection with a CC-Link IE TSN-equipped module or Motion module

The CC-Link IE TSN communication unit (GT25-J71GN13-T2) does not support the Ethernet connection.

For the Ethernet connection, use an Ethernet interface built in the GOT.

For details on the Ethernet connection, refer to the following.

☞ Page 248 Connection to CC-Link IE TSN-equipped module

☞ Page 196 Connection to Motion module through the built-in Ethernet port of PLC

☞ Page 250 Connection to built-in Ethernet port of Motion module

■Connection status check after the GOT startup

The connection with the network cannot be established until the connection check with the master station is completed after the GOT startup.

To check the status of connection with the master station, use the CC-Link IE TSN Connection Status (GS1297) of the GOT internal device.

For details on the CC-Link IE TSN Connection Status (GS1297), refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (double-shielded, STP) or shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (double-shielded, STP) or shielded twisted pair cable (STP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

When using a hub, use a TSN Switch or General-purpose Switch according to the system configuration.

For usable TSN Switches and General-purpose Switches, refer to the following.

📖MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

📖MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

📖MELSEC iQ-R Motion Module User's Manual (Startup)

Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manuals.

📖MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

📖MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

📖MELSEC iQ-R Motion Module User's Manual (Startup)

Maximum number of connected devices

The following shows the number of GOTs connectable to one controller.

Controller	
Model	**Number of GOTs connectable to one PLC**
MELSEC iQ-R series C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series)	120

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

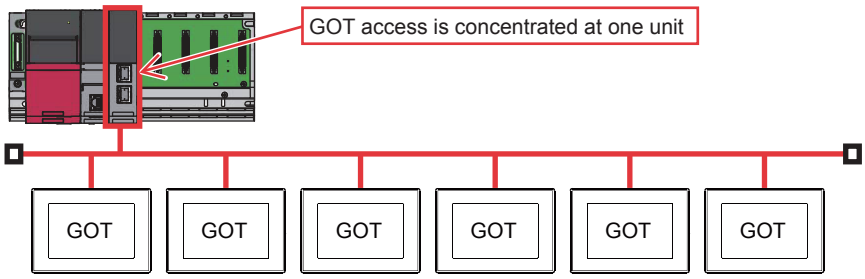
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

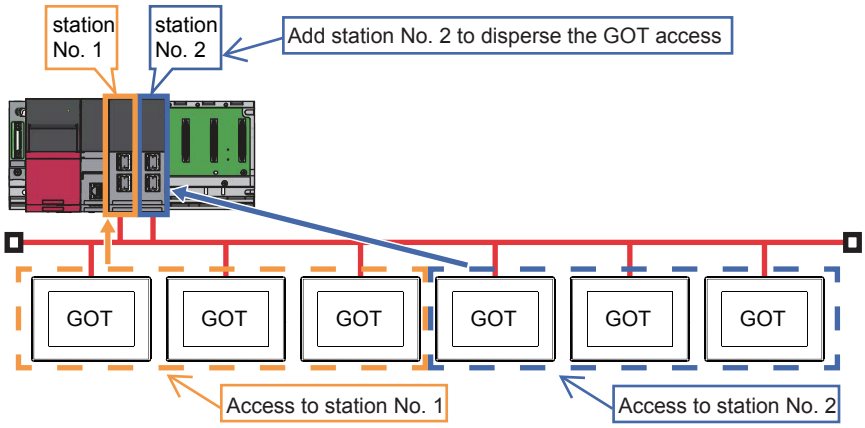
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

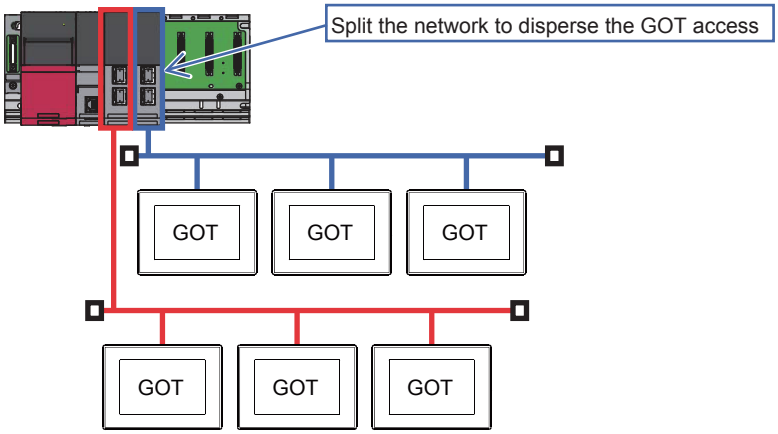
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

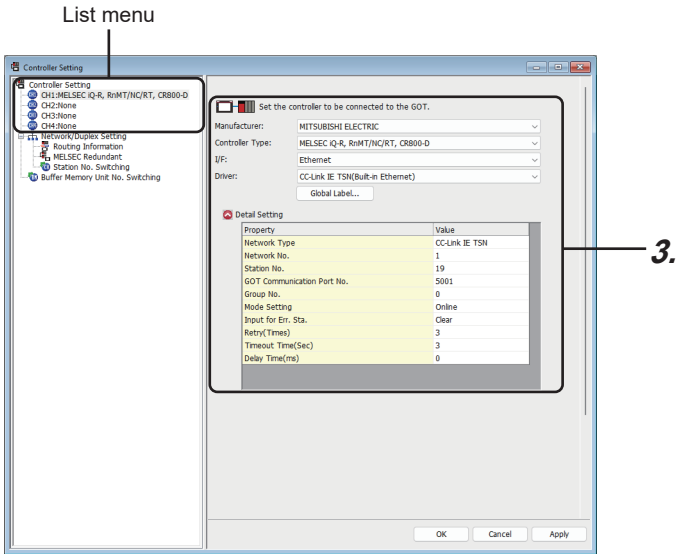
Split the network to disperse the GOT access.



9.3.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[I/F]	• [Ethernet] • [Extend Unit]
[Driver]	• When [Ethernet] is selected for [I/F]: [CC-Link IE TSN (Built-in Ethernet)] • When [Extend Unit] is selected for [I/F]: [CC-Link IE TSN]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 803 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

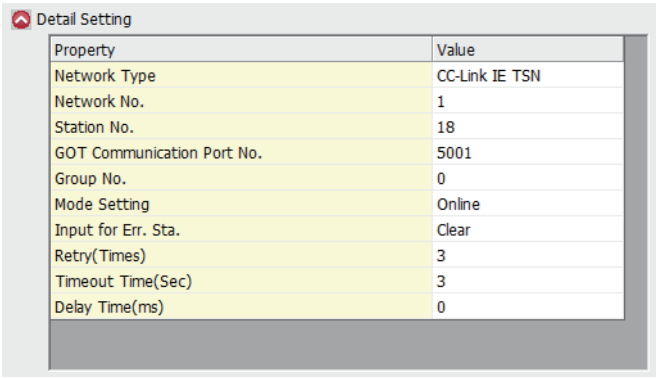
Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.

- [CC-Link IE TSN (built-in Ethernet)]



Item	Description	Range
[Network Type]	Set the network type.	[CC-Link IE TSN]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024] to [5010], [5014] to [49152], [49171] to [65534]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the unit communication test mode, refer to the following. ☞ Page 806 Unit communication test	[Online]
[Input for Err. Sta.]	Set whether to hold or clear the input from the station where the data link has failed due to power-off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms

Precautions

■Communication driver

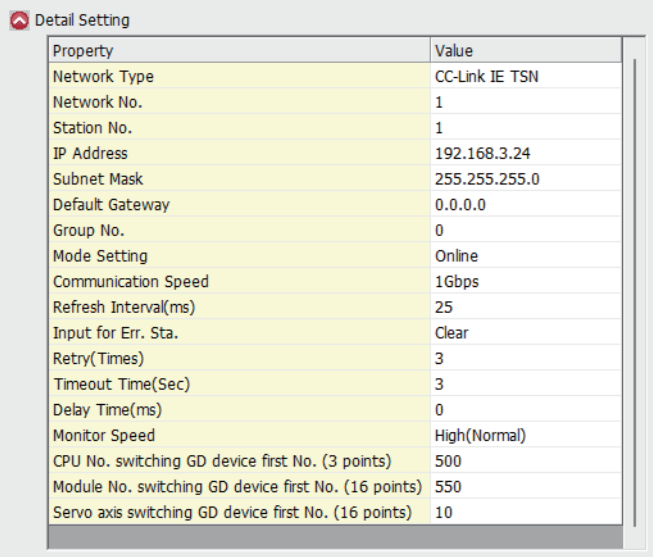
To set CC-Link IE TSN (built-in Ethernet), use port 1 on the built-in Ethernet interface of the GOT.

Two or more CC-Link IE TSN (built-in Ethernet) cannot be set in one GOT at the same time.

■Authentication class for communication

When CC-Link IE TSN (built-in Ethernet) is used for connection, communication is available only for the master station of authentication class B.

• [CC-Link IE TSN]



Item	Description	Range
[Network Type]	Set the network type.	[CC-Link IE TSN]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[IP Address][*1]	Set the IP address of the GOT.	[0.0.0.1] to [223.255.255.254]
[Subnet Mask]	When a subnetwork is used, set the subnet mask. (Only for connection via router) If the sub network is not used, the default value is set.	[0.0.0.0] to [255.255.255.255][*2]
[Default Gateway]	Set the router address of the default gateway where the GOT is connected. (Only for connection via router)	[0.0.0.0] to [223.255.255.254]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the unit communication test mode, refer to the following. ☞ Page 806 Unit communication test	[Online], [Offline], [Module Communication Test]
[Communication Speed]	Set the communication speed of the GOT.	[1Gbps], [100Mbps][*3]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication.	[1] ms to [1000] ms
[Input for Err. Sta.]	Set whether to hold or clear the input from the station where the data link has failed due to power-off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]	Set the monitor speed of the CC-Link IE TSN network. This setting is not valid in all systems.	[High(Normal)], [Middle], [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 807 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 808 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 809 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 If any of the following settings is configured in the IP address, a communication timeout error occurs.
• The third octet and fourth octet are all 1 (*.*.255.255) or all 0 (*.*.0.0).
• The host part is all 1 (*.*.*.255) or all 0 (*.*.*.0).
• Some reserved addresses determined for special applications
For details, refer to the following manuals.
MELSEC iQ-R CC-Link IE TSN User's Manual (Application)
MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual
MELSEC iQ-R Motion Module User's Manual (Network)
*2 When the subnet mask field is filled with 0, the operation is the same as when the field is left blank.
*3 When setting to 100Mbps, the following conditions must be satisfied.
• CC-Link IE TSN communication unit (GT25-J71GN13-T2): Firmware version 02 or later
• CC-Link IE TSN master/local module (RJ71GN11-T2): Firmware version 04 or later

Point

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

• Setting the refresh interval

For [Refresh Interval(ms)] in [Controller Setting] in GT Designer3, set 5 ms or more per 1K words for the total size of the device set in [Network Configuration Settings] in GX Works3.

Setting less than 5 ms may affect the processing of the GOT such as a decrease of the monitoring speed.

The following shows setting examples of the total device size and refresh interval.

Total device size	Refresh Interval
1K words	5 ms or more
2K words	10 ms or more
3K words	15 ms or more
5K words	25 ms or more
36K words	180 ms or more

■Unit communication test

In the unit communication test, connect port 1 and port 2 of the CC-Link IE TSN communication unit mounted on the GOT with a network cable, and check if the unit operates properly with the GOT.

The following shows the test procedure and how to check the test result.

1. Perform either of the following operations to set the GOT to the unit communication test mode.

- Write the project data for which [Mode Setting] in [Detail Setting] is set to [Stand-alone test mode] to the GOT.
- Set [Mode setting] in [Detail setting] to [Module Communication Test] in the GOT utility.

2. A unit communication test will start at GOT startup.

3. After the test is complete, check the result with the ERR LED on the communication unit and GOT internal devices (CC-Link IE TSN Module Communication Test Status (GS1114) or CC-Link IE TSN Module Communication Test Error (GS1115)).

Check		Test result
ERR LED on the communication unit		OFF: Normal ON: Error
GOT internal device	CC-Link IE TSN Module Communication Test Status (GS1114)	Notifies the execution status of a communication test of the CC-Link IE TSN communication unit. • b0: Turns on when a communication test is executed. • b1: Turns on while a communication test is being executed. • b2: Turns on when a communication test is complete. • b3 to b15: Use prohibited
	CC-Link IE TSN Module Communication Test Error (GS1115)	Notifies that an error has occurred during a communication test of the CC-Link IE TSN communication unit. • b0: Turns on if there is a problem with the port 1 side of the CC-Link IE TSN communication unit. • b1: Turns on if there is a problem with the connection interface (port 1) of the CC-Link IE TSN communication unit or the Ethernet cable terminal. • b2: Turns on if there is a problem with the port 1 side Ethernet cable of the CC-Link IE TSN communication unit. • b3 to b7: Use prohibited • b8: Turns on if there is a problem with the port 2 side of the CC-Link IE TSN communication unit. • b9: Turns on if there is a problem with the connection interface (port 2) of the CC-Link IE TSN communication unit or the Ethernet cable terminal. • b10: Turns on if there is a problem with the port 2 side Ethernet cable of the CC-Link IE TSN communication unit. • b11 to b15: Use prohibited

For details on the GOT internal devices (CC-Link IE TSN Module Communication Test Status (GS1114) and CC-Link IE TSN Module Communication Test Error (GS1115)), refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

4. If no error is detected, change the setting of [Mode Setting] from [Module Communication Test] in [Detail setting].

Since the communication with the controller is not performed when [Mode setting] is set to [Module Communication Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the communication unit.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

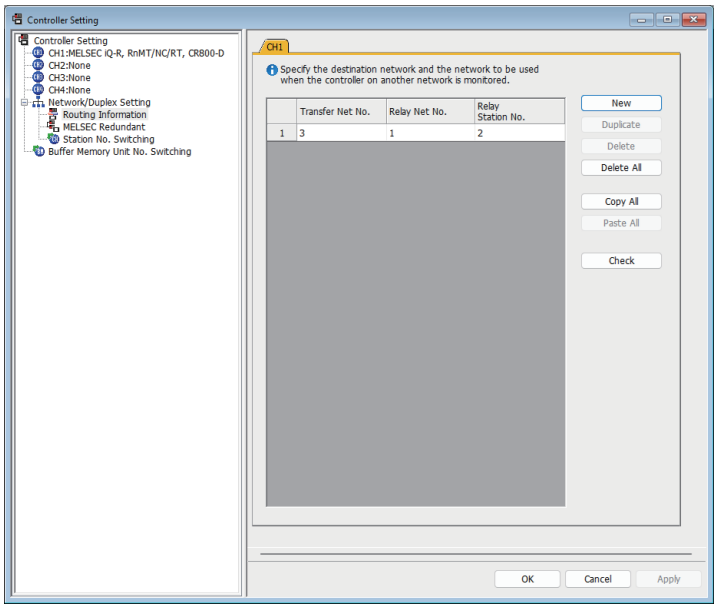
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC iQ-R CPU Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 811 PLC side settings

9.3.4 PLC side settings

Model		Reference
MELSEC iQ-R series	R00CPU R01CPU R02CPU R04CPU R08CPU R16CPU R32CPU R120CPU R04ENCPU R08ENCPU R16ENCPU R32ENCPU R120ENCPU R08SFCPU R16SFCPU R32SFCPU R120SFCPU	☞ Page 811 Connection to MELSEC iQ-R series
C Controller module (MELSEC iQ-R series)	R12CCPU-V	☞ Page 811 Connection to MELSEC iQ-R series
MELSECWinCPU (MELSEC iQ-R series)	R102WCPU-W	☞ Page 811 Connection to MELSEC iQ-R series

Connection to MELSEC iQ-R series

This section describes the settings of the GOT, CC-Link IE TSN-equipped module, and Motion module in the system configuration shown below.

Point

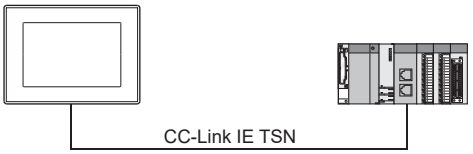
For details on the CC-Link IE TSN-equipped module, refer to the following manuals.
📖MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)
📖MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual
For details on the Motion module, refer to the following manual.
📖MELSEC iQ-R Motion Module User's Manual (Startup)

■System configuration

The following shows a system configuration example for connection to the CC-Link IE TSN master/local module (RJ71GN11-T2).

Ex.

<GOT>
(Use the default value for settings other than the following.)
Network type : CC-Link IE TSN
Network No. : 1
PLC No. (GOT Station) : 1
IP address : 192.168.3.24
Mode Setting : Online



<CC-Link IE TSN Master/Local module>*1
(Use the default value for settings other than the following.)
Station type : Master Station
Network No. : 1
PLC No. (Station) : 0
IP address : 192.168.3.253

*1 The CC-Link IE TSN master/local module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE TSN master/local module is set to 0.

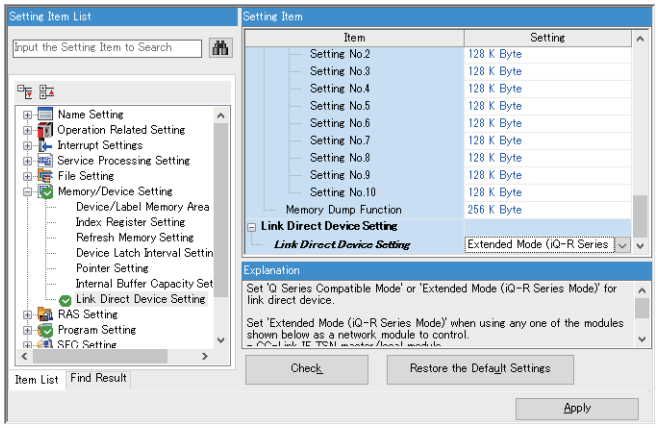
■[Parameter] in GX Works3

The following shows a parameter setting example for connecting to the CC-Link IE TSN master/local module (RJ71GN11-T2).

Point

- For the ring connection with the CC-Link IE TSN master/local module (RJ71GN11-T2), use GX Works3 version 1.065T or later.
- For connection with the CC-Link IE TSN Plus master/local module (RJ71GN11-EIP), use GX Works3 version 1.082L or later.

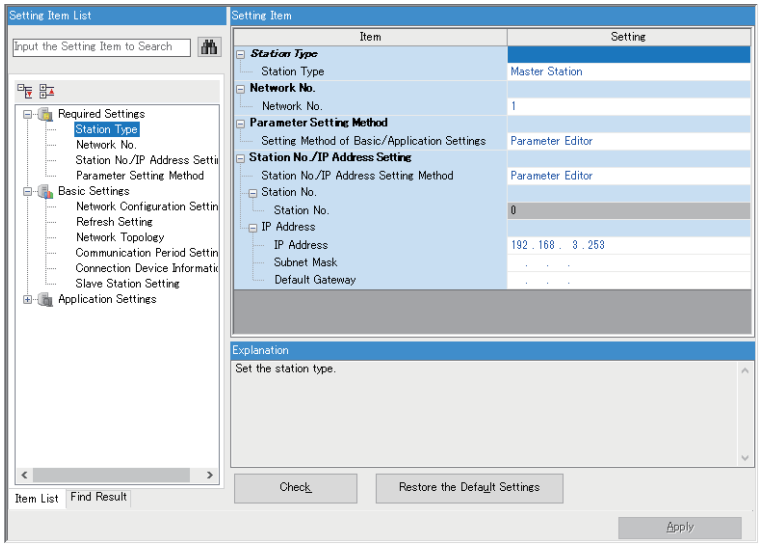
• CPU parameter



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Link Direct Device Setting]	Extended Mode (iQ-R Series Mode)	○

• Module parameter



○: Necessary, △: As necessary, —: Not necessary

Item		Setting value	Setting for GOT connection
[Station Type]		Master station	○
[Network No.]*1		1	○
[Setting Method of Basic/Application Settings]		Set in parameter	○
[Station No./IP Address Setting Method]		Set in parameter	○
[Station No.]		0	○
[IP Address]		192.168.3.253	△
[Subnet Mask]		—	—
[Default Gateway]		—	—
[Channel No.]*2		Set in parameter	○
[Network Configuration Settings]		☞ • Network configuration settings	○
[Refresh Setting]		Use default value.	△
[Network Topology]		Line, star, line and star mixed	○
[Basic Period Setting]	[Setting in Units of 1µs]	Not set	○
	[Communication Period Interval Setting (Do not Set it in Units of 1µs)]	1000.00 µs	○
	[System Reservation Time]	20.00 µs	○
	[Cyclic Transmission Time (CC IE TSN)]	500.00 µs	○
[Multiple Period Setting]	[Normal-Speed]	×4	○
	[Low-Speed]	×16	○
	[Authentication Class Setting]	• When the communication driver is [CC-Link IE TSN]: Authentication class B • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: Authentication class A	○
	[Disconnection Detection Setting]	4 times	○

*1 Set the same network number as that of the GOT.
*2 Setting is required for connection to MELSECWinCPU (MELSEC iQ-R series).

Point

• When changing the module parameter
After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.
• When the GOT monitors a cyclic device of other stations
Set [Communication Mode] of the master station to [Multicast].

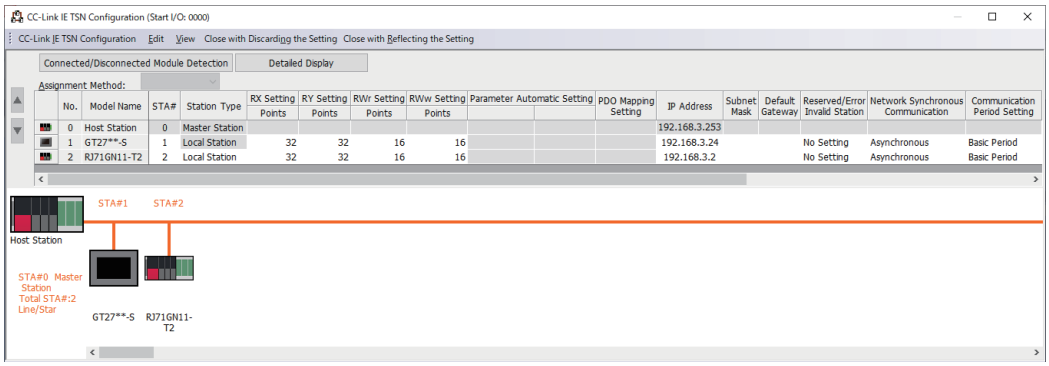
Precautions

When monitoring the master and local stations on the same network as the GOT using transient transmission, the stations that can be monitored differ depending on the setting of [Communication Mode] of the CC-Link IE TSN-equipped module or the Motion module.

[Communication Mode]	Availability of monitoring
[Unicast]	Master station only
[Multicast]	Master station
	Local station that satisfies the following conditions • Being set as a local station in the network configuration setting • Not being a reserved or error invalid station

For the settings of the CC-Link IE TSN-equipped module or Motion module, refer to the following.
📖MELSEC iQ-R CC-Link IE TSN User's Manual (Application)
📖MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual
📖MELSEC iQ-R Motion Module User's Manual (Network)
To monitor the master and local stations on other networks using transient transmission, use a master station or local station that can be monitored on the same network as the GOT as a relay station.

• Network configuration settings



○: Necessary, △: As necessary, —: Not necessary

Item		Setting value	Setting for GOT connection
[Station No.]		1	△
[Station Type]		• When the communication driver is [CC-Link IE TSN]: Local station • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: Remote station	△
[RX Setting]	[Points]	32	△
[RY Setting]	[Points]	32	△
[RWr Setting]	[Points]	• When the communication driver is [CC-Link IE TSN]: 16 • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: 4	△
[RWw Setting]	[Points]	• When the communication driver is [CC-Link IE TSN]: 16 • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: 4	△
[IP Address]		192.168.3.24	△
[Reserved/Error Invalid Station]		No setting	△
[Network Synchronous Communication]		Asynchronous	△
[Communication Period Setting]		Basic Period	△*1

*1 When communication is performed at 100 Mbps using [CC-Link IE TSN (built-in Ethernet)], connection may not be established if [Communication Period Setting] is not set to [Low] in the device station setting.

Precautions

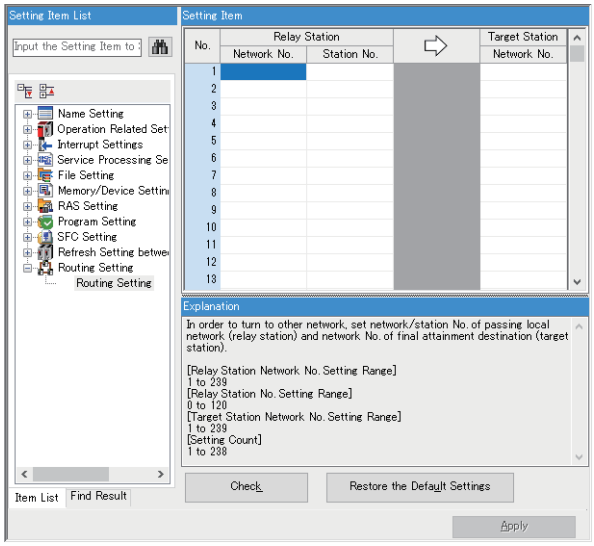
When a local station with the CC-Link IE TSN-compatible switching hub connected (linked-up) is added, IP address duplication is not detected at the destination station.
If IP address duplication (error code 1802H) is detected, disconnect the relevant local station from the network. Otherwise, transient transmission may be performed to an unintended station because multiple stations with the same IP address exist on the network.

• Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access 238 different networks specified in the column of [Target Station Network No.].



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 810 Routing parameter settings

■[Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC-Link IE TSN
[Network No.]	1: Network No. 1
[Station No.]	1: Station No. 1
[IP Address]	192.168.3.24
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Group No.]	0
[Mode Setting]	Online
[Communication Speed]	1 Gbps
[Refresh Interval]	25 ms
[Input for Err. Sta.]	Clear
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

• [Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 802 [Controller Setting]

9.3.5 Access range for monitoring

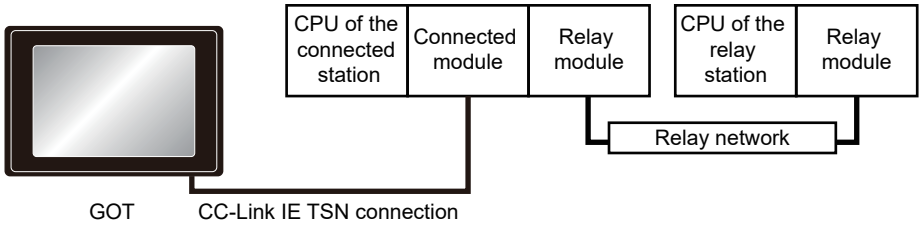
When GOT is connected to the CPU of the station connected via CC-Link IE TSN, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station									
		Relay network	CPU of the relay station								
			MXR	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
RCPU	☞ Page 796 Connectable devices	Ethernet	○*7	○*5	○	○*6	○	—	○	—	○*3

		CC-Link IE Field Network	○*7	○	○	○*2	○	—	—	—	○*4
		MELSECNET/H, MELSECNET/10	—	—	—	○	○	○	○	○*8	—
C Controller module (MELSEC iQ-R series)	☞ Page 796 Connectable devices	CC-Link IE TSN	○*7	○*1	—	—	—	—	—	—	○*3
		CC-Link IE Controller Network	○*7	○	—	○	○	—	—	—	—
		CC-Link IE Field Network	○*7	○	○	○*2	○	—	—	—	○*4
		MELSECNET/H, MELSECNET/10	—	—	—	○	○	○	○	○*8	—

*1 RnCPU, RnENCPU, RnSFCPU, and MELSECWinCPU (MELSEC iQ-R series) are supported.
*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.
*3 FX5U and FX5UC are supported.
*4 FX5U, FX5UC, and FX5UJ are supported.
*5 The C Controller module (MELSEC iQ-R series) is not supported.
*6 The C Controller module (MELSEC-Q series) is not supported.
*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
☞ Page 90 Setting procedure of the encrypted communication
*8 AnUCPU and AnUSCPU are supported.

9.3.6 Firmware of the CC-Link IE TSN communication unit

Firmware versions and supported functions

Available functions differ depending on the firmware version of the CC-Link IE TSN communication unit.

Firmware version	Supported function
01	Cyclic transmission (line connection, star connection)
02	• Multicast mode • Communication speed 100Mbps • Time setting function • Firmware update function
03	Ring connection
05	CC-Link IE TSN protocol version 2.0

How to check the firmware version

Check the firmware version in the text display on the GOT.

Set the text display as follows.

- Device: SW003D
- Number of displayed digits: 2

For details on the text display object, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Firmware update

Use the firmware update tool installed to a personal computer to update the firmware of the CC-Link IE TSN communication unit through a network.

The following shows how to execute firmware update.

Point

- CC-Link IE TSN firmware update tool

For details on the firmware update tool, such as the operating environment, installation procedure, and operating procedure, refer to the following.

CC-Link IE TSN Firmware Update Tool Reference Manual

- CC-Link IE TSN communication unit

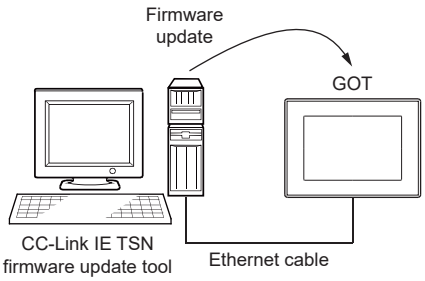
For details on the CC-Link IE TSN communication unit, refer to the following.

CC-Link IE TSN Communication Unit User's Manual

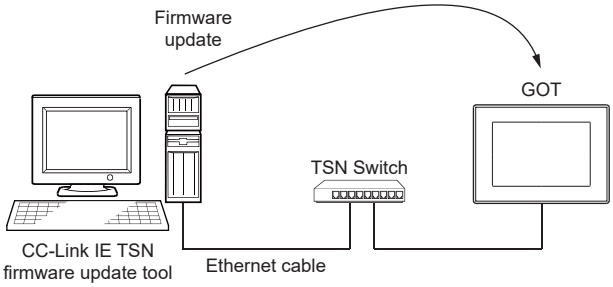
■Connection method

Use one of the following methods to connect the personal computer on which the firmware update tool is to run and the CC-Link IE TSN communication unit on the GOT.

- Direct connection



- Connection via a hub



Point

For the connection via a hub, use a TSN Switch.

For details on the TSN Switch, refer to the following.

MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual

MELSEC iQ-R Motion Module User's Manual (Startup)

■Firmware update procedure

Update the firmware as follows.

1. Stop communication of the CC-Link IE TSN communication unit in which the firmware is updated.

Perform one of the following operations to stop communication.

- Disconnect the master station from the network.
- Disconnect the host station from the network.

2. Configure the settings required for the firmware update tool.

- Network configuration settings

Item	Setting
Module	GT25-J71GN13-T2
IP Address	IP address of the CC-Link IE TSN communication unit
FTP Username	GT25-J71GN13
FTP Password	GT25-J71GN13

- Application settings

Item	Setting
FTP Mode	Active Mode
Firmware Update Timeout(s)	900sec

For the settings other than the above, refer to the following.

CC-Link IE TSN Firmware Update Tool Reference Manual

3. Update the firmware of the CC-Link IE TSN communication unit.

4. After the update, the GOT on which the unit is mounted is restarted.

After the restart, the CC-Link IE TSN communication unit operates with the updated firmware.

Point

Firmware file

For the firmware file used for update, contact your local sales office.

Precautions for firmware update

The following shows the precautions for executing firmware update.

■When firmware update is not performed

Make sure to stop communication of the CC-Link IE TSN communication unit, and then execute firmware update.

In the following cases, firmware update of the CC-Link IE TSN communication unit is not performed.

• While CC-Link IE TSN Control (GS620.b0) is on

Turn off this bit.

For details on the CC-Link IE TSN Control (GS620.b0), refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

• While the CC-Link IE TSN communication unit is communicating

Disconnect the master station or host station from the network to stop communication of the CC-Link IE TSN communication unit.

• While the GOT is being operated with GT Designer3

Do not perform operations such as writing the package data and executing the GOT diagnostics with GT Designer3.

• Performing an operation that makes the GOT offline

Do not perform any operation that makes the GOT offline in the utility.

■Power-off during firmware update

Do not turn off the GOT during firmware update.

Doing so may cause the CC-Link IE TSN communication unit to become unusable.

■Hardware version of the CC-Link IE TSN communication unit

Firmware update may not be available depending on the combination of the hardware and firmware versions of the CC-Link IE TSN communication unit.

If firmware update cannot be performed, check the error code of the firmware update tool.

■Firmware downgrade

If the version of the firmware file used for the update tool is earlier than the firmware version of the target CC-Link IE TSN communication unit, a warning message prompting for downgrading is displayed.

Select a new firmware file to execute firmware update.

Otherwise, execute downgrading.

■GT Designer3 version and CC-Link IE TSN communication unit firmware version

The combination of the GT Designer3 version and CC-Link IE TSN communication unit (GT25-J71GN13-T2) firmware version is restricted.

The following shows the combinations of the GT Designer3 version and the CC-Link IE TSN communication unit firmware version.

○: Supported, —: Not supported

GT Designer3 version	CC-Link IE TSN communication unit (GT25-J71GN13-T2)	
	01	02 or later
Version1.217B to Version1.220E	○	—
Version1.225K or later	—	○

Update the firmware of the CC-Link IE TSN communication unit (GT25-J71GN13-T2) with firmware version 01 so that the GT Designer3 version 1.225K or later supports the unit.

For firmware update of the CC-Link IE TSN communication unit (GT25-J71GN13-T2), refer to the following.

☞ Page 817 Firmware of the CC-Link IE TSN communication unit

■Firmware versions of the CC-Link IE TSN-equipped module or Motion module on the master station and the CC-Link IE TSN communication unit

Depending on the combination of firmware versions of the modules and units, the GOT cannot access the network.

The following shows the module and unit firmware version combinations.

○: Accessible, —: Inaccessible

CC-Link IE TSN-equipped module or Motion module on the master station		CC-Link IE TSN communication unit (GT25-J71GN13-T2)	
		01	02 or later
RJ71GN11-T2	03 or earlier	○	—
	04 or later	—	○
RJ71GN11-EIP	From the first product	—	○
RD78G(H)	19 or earlier	—	—
	20 or later	—	○

Update the firmware of the module or unit so that the GOT can access the network.

For firmware update of the CC-Link IE TSN-equipped module (RJ71GN11-T2, RJ71GN11-EIP) or Motion module (RD78G(H)), refer to the following.

📖MELSEC iQ-R Module Configuration Manual
📖MELSEC iQ-R CC-Link IE TSN Plus Master/Local Module User's Manual
📖MELSEC iQ-R Motion Module User's Manual (Application)

For firmware update of the CC-Link IE TSN communication unit (GT25-J71GN13-T2), refer to the following.

☞ Page 817 Firmware of the CC-Link IE TSN communication unit

9.4 MELSEC iQ-F series (CC-Link IE TSN connection)

☞ Page 822 Connectable devices
☞ Page 823 System configuration
☞ Page 826 GOT side settings
☞ Page 835 PLC side settings
☞ Page 840 Access range for monitoring
☞ Page 841 Firmware of the CC-Link IE TSN communication unit

9.4.1 Connectable devices

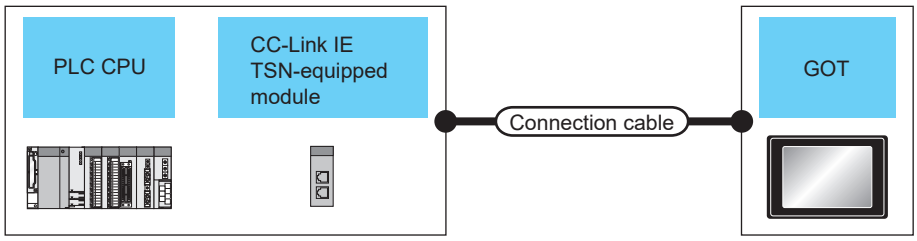
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	CC-Link IE TSN-equipped module	Connectable model
MELSEC iQ-F series	FX5U*1 FX5UC*1 FX5UJ*2	○	FX5-CCLGN-MS	GT37 SoftGOT3000

*1 Use firmware version 1.250 or later.
*2 Use firmware version 1.040 or later.

9.4.2 System configuration



For details on the connection cable and overall cable length, refer to the following.

☞ Page 824 Connection cable

☞ Page 824 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 824 Maximum number of connected devices

Controller	CC-Link IE TSN-equipped module	Connection cable	GOT	
			Interface	Model
MELSEC iQ-F series	FX5-CCLGN-MS	Twisted pair cable	Built-in Ethernet interface of GOT	GT37 SoftGOT3000
			GT37-IF2000 + GT25-J71GN13-T2	

Point

For the system configuration of the CC-Link IE TSN-equipped module, refer to the following manual.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

Precautions

■Connection to a CC-Link IE TSN-equipped module by Ethernet

The CC-Link IE TSN communication unit (GT25-J71GN13-T2) does not support the Ethernet connection.

For the Ethernet connection, use an Ethernet interface built in the GOT.

For details on the Ethernet connection, refer to the following.

☞ Page 311 Connection to CC-Link IE TSN-equipped module

■Connection status check after the GOT startup

The connection with the network cannot be established until the connection check with the master station is completed after the GOT startup.

To check the status of connection with the master station, use the CC-Link IE TSN Connection Status (GS1297) of the GOT internal device.

For details on the CC-Link IE TSN Connection Status (GS1297), refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
100BASE-TX	Shielded twisted pair cable (double-shielded, STP) or shielded twisted pair cable (STP) of category 5 or higher
1000BASE-T	Shielded twisted pair cable (double-shielded, STP) or shielded twisted pair cable (STP) of category 5e or higher

For the twisted pair cable, use a straight cable.

Use cables that meet the IEEE802.3 100BASE-TX/1000BASE-T standards.

When using a hub, use a TSN Switch or General-purpose Switch according to the system configuration.

For usable TSN Switches and General-purpose Switches, refer to the following.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manual.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

Maximum number of connected devices

The following shows the number of GOTs connectable to one controller.

Controller	
Model	**Number of GOTs connectable to one PLC**
MELSEC iQ-F series	60

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

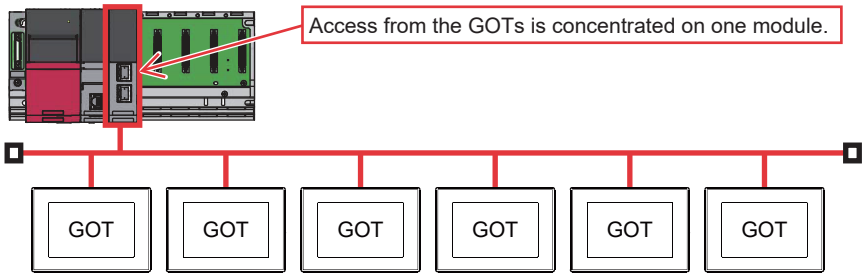
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

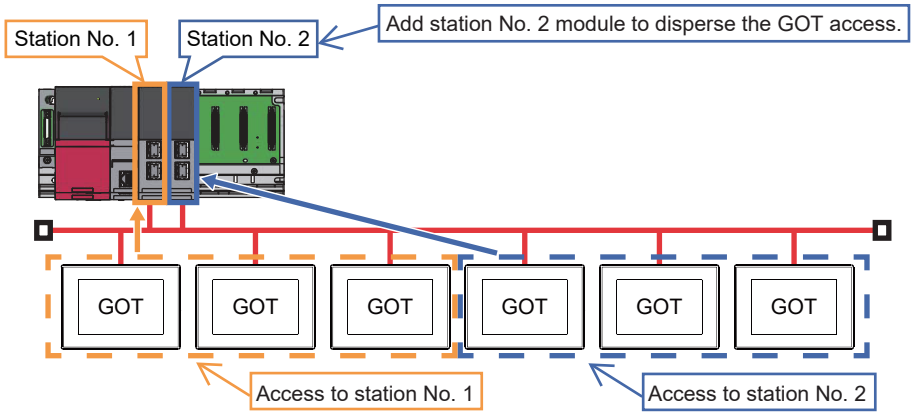
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

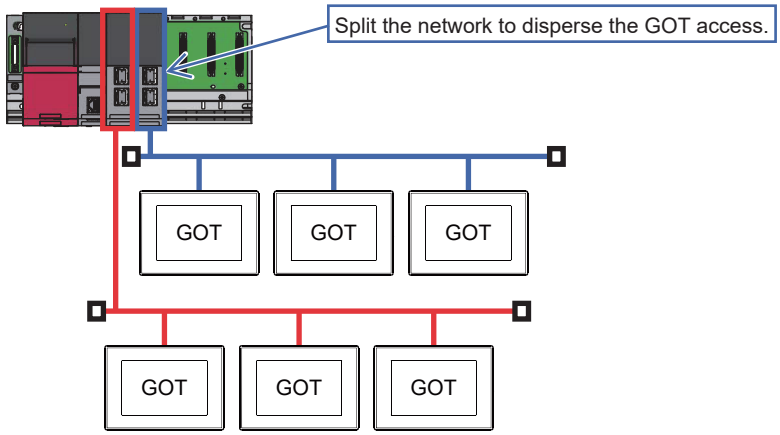
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

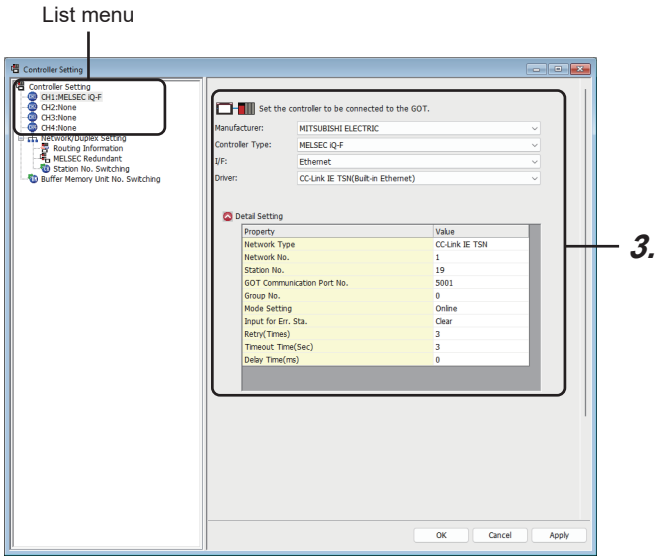
Split the network to disperse the GOT access.



9.4.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-F]
[I/F]	• [Ethernet] • [Extend Unit]
[Driver]	• When [Ethernet] is selected for [I/F]: [CC-Link IE TSN (Built-in Ethernet)] • When [Extend Unit] is selected for [I/F]: [CC-Link IE TSN]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 827 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

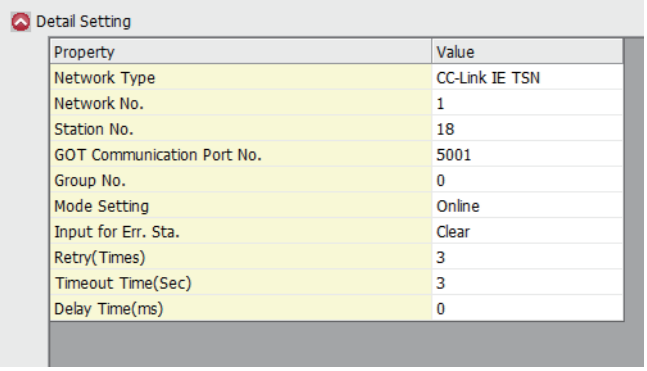
Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.

- [CC-Link IE TSN (built-in Ethernet)]



Item	Description	Range
[Network Type]	Set the network type.	[CC-Link IE TSN]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[GOT Communication Port No.]	Set the GOT port number for connection with the Ethernet module.	[1024 to 5010], [5014 to 49152], [49171 to 65534]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the unit communication test mode, refer to the following. ☞ Page 830 Unit communication test	[Online]
[Input for Err. Sta.]	Set whether to hold or clear the input from the station where the data link has failed due to power-off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms

Precautions

■Communication driver

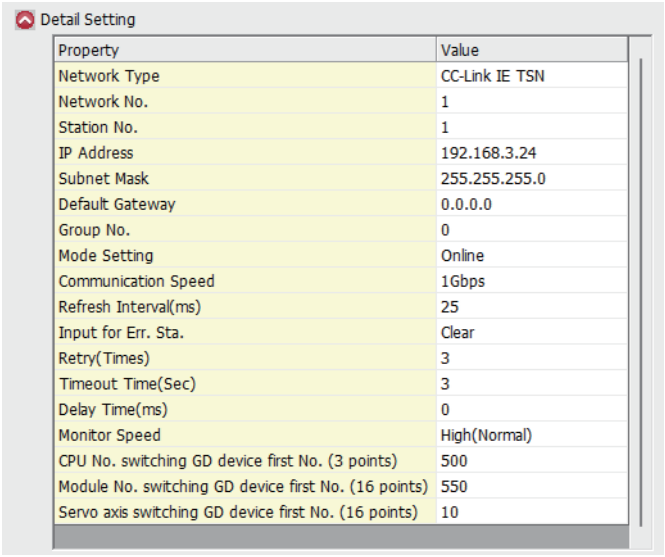
To set CC-Link IE TSN (built-in Ethernet), use port 1 on the built-in Ethernet interface of the GOT.

Two or more CC-Link IE TSN (built-in Ethernet) cannot be set in one GOT at the same time.

■Authentication class for communication

When CC-Link IE TSN (built-in Ethernet) is used for connection, communication is available only for the master station of authentication class B.

• [CC-Link IE TSN]



Item	Description	Range
[Network Type]	Set the network type.	[CC-Link IE TSN]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[IP Address][*1]	Set the IP address of the GOT.	[0.0.0.1] to [223.255.255.254]
[Subnet Mask]	When a subnetwork is used, set the subnet mask. (Only for connection via router) If the sub network is not used, the default value is set.	[0.0.0.0] to [255.255.255.255][*2]
[Default Gateway]	Set the router address of the default gateway where the GOT is connected. (Only for connection via router)	[0.0.0.0] to [223.255.255.254]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the unit communication test mode, refer to the following. ☞ Page 830 Unit communication test	[Online], [Offline], [Module Communication Test]
[Communication Speed]	Set the communication speed of the GOT.	[1Gbps], [100Mbps]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication.	[1] ms to [1000] ms
[Input for Err. Sta.]	Set whether to hold or clear the input from the station where the data link has failed due to power-off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]	Set the monitor speed of the CC-Link IE TSN network. This setting is not valid in all systems.	[High(Normal)], [Middle], [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 831 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 832 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 833 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 If any of the following settings is configured in the IP address, a communication timeout error occurs.
- The third octet and fourth octet are all 1 (*.*.255.255) or all 0 (*.*.0.0).
- The host part is all 1 (*.*.*.255) or all 0 (*.*.*.0).
- Some reserved addresses determined for special applications

For details, refer to the following manuals.
MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

*2 When the subnet mask field is filled with 0, the operation is the same as when the field is left blank.

Point

- Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.
For details on the GT37 utility, refer to the following manual.
GOT3000 Series User's Manual (Utility & Maintenance Functions)

- Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

- Setting the refresh interval

For [Refresh Interval(ms)] in [Controller Setting] in GT Designer3, set 5 ms or more per 1K words for the total size of the device set in [Network Configuration Settings] in GX Works3.
Setting less than 5 ms may affect the processing of the GOT such as a decrease of the monitoring speed.
The following shows setting examples of the total device size and refresh interval.

Total device size	Refresh Interval
1K words	5 ms or more
2K words	10 ms or more
3K words	15 ms or more
5K words	25 ms or more
36K words	180 ms or more

■Unit communication test

In the unit communication test, connect port 1 and port 2 of the CC-Link IE TSN communication unit mounted on the GOT with a network cable, and check if the unit operates properly with the GOT.

The following shows the test procedure and how to check the test result.

1. Perform either of the following operations to set the GOT to the unit communication test mode.

- Write the project data for which [Mode Setting] in [Detail Setting] is set to [Stand-alone test mode] to the GOT.
- Set [Mode setting] in [Detail setting] to [Module Communication Test] in the GOT utility.

2. A unit communication test will start at GOT startup.

3. After the test is complete, check the result with the ERR LED on the communication unit and GOT internal devices (CC-Link IE TSN Module Communication Test Status (GS1114) or CC-Link IE TSN Module Communication Test Error (GS1115)).

Check		Test result
ERR LED on the communication unit		OFF: Normal ON: Error
GOT internal device	CC-Link IE TSN Module Communication Test Status (GS1114)	Notifies the execution status of a communication test of the CC-Link IE TSN communication unit. • b0: Turns on when a communication test is executed. • b1: Turns on while a communication test is being executed. • b2: Turns on when a communication test is complete. • b3 to b15: Use prohibited
	CC-Link IE TSN Module Communication Test Error (GS1115)	Notifies that an error has occurred during a communication test of the CC-Link IE TSN communication unit. • b0: Turns on if there is a problem with the port 1 side of the CC-Link IE TSN communication unit. • b1: Turns on if there is a problem with the connection interface (port 1) of the CC-Link IE TSN communication unit or the Ethernet cable terminal. • b2: Turns on if there is a problem with the port 1 side Ethernet cable of the CC-Link IE TSN communication unit. • b3 to b7: Use prohibited • b8: Turns on if there is a problem with the port 2 side of the CC-Link IE TSN communication unit. • b9: Turns on if there is a problem with the connection interface (port 2) of the CC-Link IE TSN communication unit or the Ethernet cable terminal. • b10: Turns on if there is a problem with the port 2 side Ethernet cable of the CC-Link IE TSN communication unit. • b11 to b15: Use prohibited

For details on the GOT internal devices (CC-Link IE TSN Module Communication Test Status (GS1114) and CC-Link IE TSN Module Communication Test Error (GS1115)), refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

4. If no error is detected, change the setting of [Mode Setting] from [Module Communication Test] in [Detail setting].

Since the communication with the controller is not performed when [Mode setting] is set to [Module Communication Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the communication unit.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	01 to 10 Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

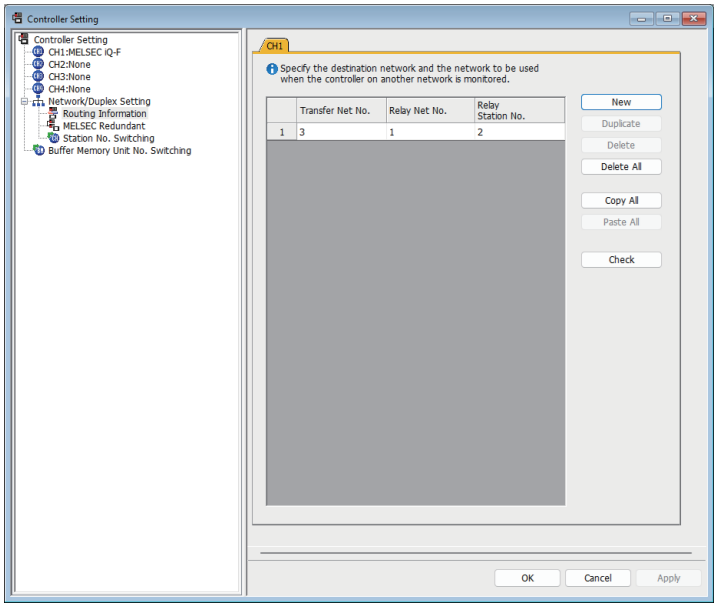
Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 835 PLC side settings

9.4.4 PLC side settings

Model		Reference
MELSEC iQ-F series	FX5U FX5UC FX5UJ	☞ Page 835 Connection to MELSEC iQ-F series

Connection to MELSEC iQ-F series

This section describes the settings of the GOT and CC-Link IE TSN-equipped module in the system configuration shown below.

Point

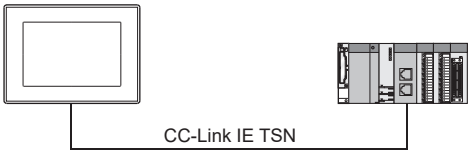
For details on the CC-Link IE TSN-equipped module, refer to the following manual.
MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

■System configuration

The following shows a system configuration example for connection to the CC-Link IE TSN master/local module (FX5-CCLGN-MS).

Ex.

<GOT>
(Use the default value for settings other than the following.)
Network type : CC-Link IE TSN
Network No. : 1
PLC No. (GOT Station) : 1
IP address : 192.168.3.24
Mode Setting : Online



<CC-Link IE TSN Master/Local module>*1
(Use the default value for settings other than the following.)
Station type : Master Station
Network No. : 1
PLC No. (Station) : 0
IP address : 192.168.3.253

*1 The CC-Link IE TSN master/local module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE TSN master/local module is set to 0.

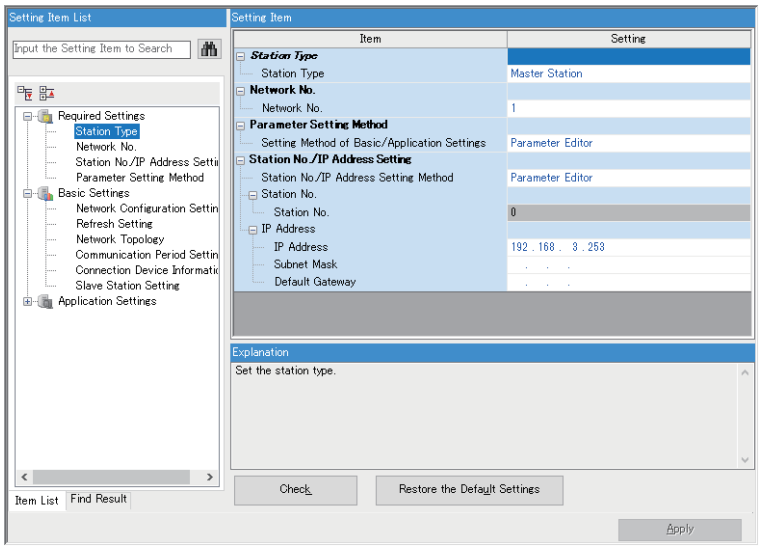
■[Parameter] in GX Works3

The following shows a parameter setting example for connection to the CC-Link IE TSN master/local module (FX5-CCLGN-MS).

Point

For connection to the CC-Link IE TSN master/local module (FX5-CCLGN-MS), use GX Works3 version 1.085P or later.

• Module parameter



○: Necessary, △: As necessary, —: Not necessary

Item		Setting value	Setting for GOT connection
[Station Type]		Master station	○
[Network No.]*1		1	○
[Setting Method of Basic/Application Settings]		Set in parameter	○
[Station No./IP Address Setting Method]		Set in parameter	○
[Station No.]		0	○
[IP Address]		192.168.3.253	△
[Subnet Mask]		—	—
[Default Gateway]		—	—
[Network Configuration Settings]		☞ • Network configuration settings	○
[Refresh Setting]		Use default value.	△
[Network Topology]		Line, star, line and star mixed	○
[Basic Period Setting]	[Setting in Units of 1µs]	Not set	○
	[Communication Period Interval Setting (Do not Set it in Units of 1µs)]	1000.00 µs	○
	[Cyclic Transmission Time (CC IE TSN)]	500.00 µs	○
[Multiple Period Setting]	[Normal-Speed]	×4	○
	[Low-Speed]	×16	○
	[Authentication Class Setting]	• When the communication driver is [CC-Link IE TSN]: Authentication class B • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: Authentication class A	○
	[Disconnection Detection Setting]	4 times	○

*1 Set the same network number as that of the GOT.

Point

• When changing the module parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• When the GOT monitors a cyclic device of other stations

Set [Communication Mode] of the master station to [Multicast].

Precautions

When monitoring the master and local stations on the same network as the GOT using transient transmission, the stations that can be monitored differ depending on the setting of [Communication Mode] of the CC-Link IE TSN-equipped module.

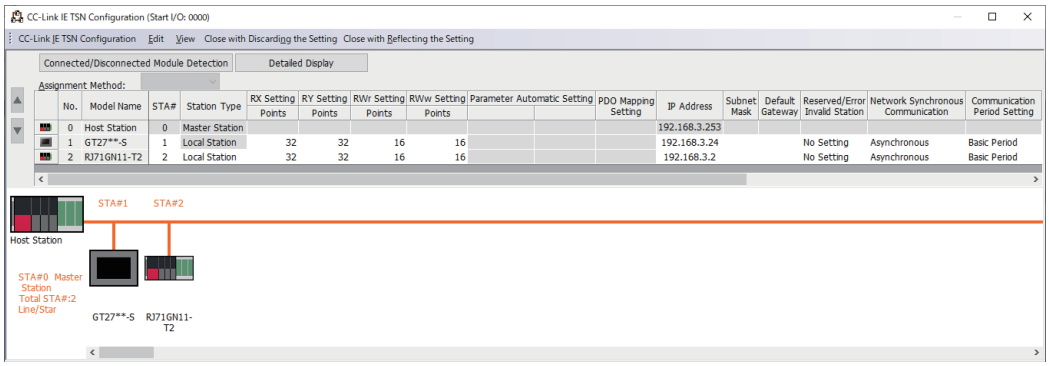
[Communication Mode]	Availability of monitoring
[Unicast]	Master station only
[Multicast]	Master station
	Local station that satisfies the following conditions • Being set as a local station in the network configuration setting • Not being a reserved or error invalid station

For the settings of the CC-Link IE TSN-equipped module, refer to the following.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

To monitor the master and local stations on other networks using transient transmission, use a master station or local station that can be monitored on the same network as the GOT as a relay station.

• Network configuration settings



○: Necessary, △: As necessary, —: Not necessary

Item		Setting value	Setting for GOT connection
[Station No.]		1	△
[Station Type]		• When the communication driver is [CC-Link IE TSN]: Local station • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: Remote station	△
[RX Setting]	[Points]	32	△
[RY Setting]	[Points]	32	△
[RWr Setting]	[Points]	• When the communication driver is [CC-Link IE TSN]: 16 • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: 4	△
[RWw Setting]	[Points]	• When the communication driver is [CC-Link IE TSN]: 16 • When the communication driver is [CC-Link IE TSN (Built-in Ethernet)]: 4	△
[IP Address]		192.168.3.24	△
[Reserved/Error Invalid Station]		No setting	△
[Network Synchronous Communication]		Asynchronous	△
[Communication Period Setting]		Basic Period	△*1

*1 When communication is performed at 100 Mbps using [CC-Link IE TSN (built-in Ethernet)], connection may not be established if [Communication Period Setting] is not set to [Low] in the device station setting.

Precautions

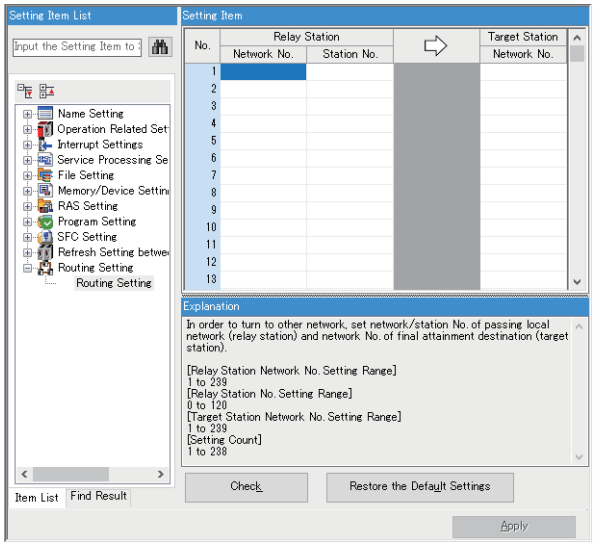
When a local station with the CC-Link IE TSN-compatible switching hub connected (linked-up) is added, IP address duplication is not detected at the destination station.
If IP address duplication (error code 1802H) is detected, disconnect the relevant local station from the network.
Otherwise, transient transmission may be performed to an unintended station because multiple stations with the same IP address exist on the network.

• Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access 238 different networks specified in the column of [Target Station Network No.].



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 834 Routing parameter settings

■[Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC-Link IE TSN
[Network No.]	1: Network No. 1
[Station No.]	1: Station No. 1
[IP Address]	192.168.3.24
[Subnet Mask]	255.255.255.0
[Default Gateway]	0.0.0.0
[Group No.]	0
[Mode Setting]	Online
[Communication Speed]	1 Gbps
[Refresh Interval]	25 ms
[Input for Err. Sta.]	Clear
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

• [Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 826 [Controller Setting]

9.4.5 Access range for monitoring

Only the connected CPU can be accessed.

9.4.6 Firmware of the CC-Link IE TSN communication unit

Firmware versions and supported functions

Available functions differ depending on the firmware version of the CC-Link IE TSN communication unit.

Firmware version	Supported function
01	Cyclic transmission (line connection, star connection)
02	• Multicast mode • Communication speed 100Mbps • Time setting function • Firmware update function
03	Ring connection
05	CC-Link IE TSN protocol version 2.0

How to check the firmware version

Check the firmware version in the text display on the GOT.

Set the text display as follows.

- Device: SW003D
- Number of displayed digits: 2

For details on the text display object, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Firmware update

Use the firmware update tool installed to a personal computer to update the firmware of the CC-Link IE TSN communication unit through a network.

The following shows how to execute firmware update.

Point

• CC-Link IE TSN firmware update tool

For details on the firmware update tool, such as the operating environment, installation procedure, and operating procedure, refer to the following.

CC-Link IE TSN Firmware Update Tool Reference Manual

• CC-Link IE TSN communication unit

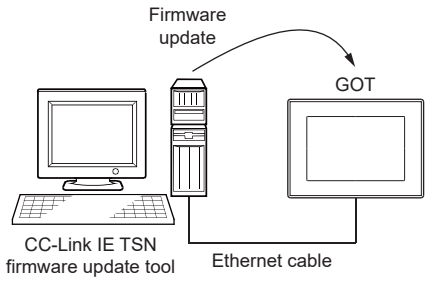
For details on the CC-Link IE TSN communication unit, refer to the following.

CC-Link IE TSN Communication Unit User's Manual

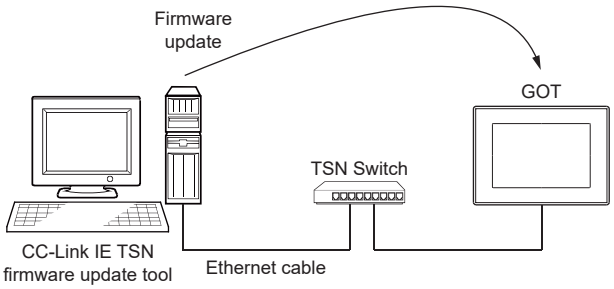
■Connection method

Use one of the following methods to connect the personal computer on which the firmware update tool is to run and the CC-Link IE TSN communication unit on the GOT.

• Direct connection



• Connection via a hub



Point

For the connection via a hub, use a TSN Switch.

For details on the TSN Switch, refer to the following.

MELSEC iQ-F FX5 User's Manual (CC-Link IE TSN)

■Firmware update procedure

Update the firmware as follows.

1. Stop communication of the CC-Link IE TSN communication unit in which the firmware is updated.

Perform one of the following operations to stop communication.

- Disconnect the master station from the network.
- Disconnect the host station from the network.

2. Configure the settings required for the firmware update tool.

- Network configuration settings

Item	Setting
Model	GT25-J71GN13-T2
IP Address	IP address of the CC-Link IE TSN communication unit
FTP Username	GT25-J71GN13
FTP Password	GT25-J71GN13

- Application settings

Item	Setting
FTP Mode	Active Mode
Firmware Update Timeout(s)	900sec

For the settings other than the above, refer to the following.

CC-Link IE TSN Firmware Update Tool Reference Manual

3. Update the firmware of the CC-Link IE TSN communication unit.

4. After the update, the GOT on which the unit is mounted is restarted.

After the restart, the CC-Link IE TSN communication unit operates with the updated firmware.

Point

Firmware file

For the firmware file used for update, contact your local sales office.

Precautions for firmware update

The following shows the precautions for executing firmware update.

■When firmware update is not performed

Make sure to stop communication of the CC-Link IE TSN communication unit, and then execute firmware update.

In the following cases, firmware update of the CC-Link IE TSN communication unit is not performed.

• While CC-Link IE TSN Control (GS620.b0) is on

Turn off this bit.

For details on the CC-Link IE TSN Control (GS620.b0), refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

• While the CC-Link IE TSN communication unit is communicating

Disconnect the master station or host station from the network to stop communication of the CC-Link IE TSN communication unit.

• While the GOT is being operated with GT Designer3

Do not perform operations such as writing the package data and executing the GOT diagnostics with GT Designer3.

• Performing an operation that makes the GOT offline

Do not perform any operation that makes the GOT offline in the utility.

■Power-off during firmware update

Do not turn off the GOT during firmware update.

Doing so may cause the CC-Link IE TSN communication unit to become unusable.

■Hardware version of the CC-Link IE TSN communication unit

Firmware update may not be available depending on the combination of the hardware and firmware versions of the CC-Link IE TSN communication unit.

If firmware update cannot be performed, check the error code of the firmware update tool.

■Firmware downgrade

If the version of the firmware file used for the update tool is earlier than the firmware version of the target CC-Link IE TSN communication unit, a warning message prompting for downgrading is displayed.

Select a new firmware file to execute firmware update.

Otherwise, execute downgrading.

■GT Designer3 version and CC-Link IE TSN communication unit firmware version

The combination of the GT Designer3 version and CC-Link IE TSN communication unit (GT25-J71GN13-T2) firmware version is restricted.

The following shows the combinations of the GT Designer3 version and the CC-Link IE TSN communication unit firmware version.

○: Supported, —: Not supported

GT Designer3 version	CC-Link IE TSN communication unit (GT25-J71GN13-T2)	
	01	02 or later
Version1.217B to Version1.220E	○	—
Version1.225K or later	—	○

Update the firmware of the CC-Link IE TSN communication unit (GT25-J71GN13-T2) with firmware version 01 so that the GT Designer3 version 1.225K or later supports the unit.

For firmware update of the CC-Link IE TSN communication unit (GT25-J71GN13-T2), refer to the following.

☞ Page 841 Firmware of the CC-Link IE TSN communication unit

10 CC-Link IE Controller Network connection

☞ Page 845 MELSEC MX Controller (MX-R Model) (CC-Link IE Controller Network connection)
☞ Page 861 MELSEC iQ-R series (CC-Link IE Controller Network connection)
☞ Page 893 MELSEC-Q series (CC-Link IE Controller Network connection)

10.1 MELSEC MX Controller (MX-R Model) (CC-Link IE Controller Network connection)

☞ Page 845 Connectable devices
☞ Page 846 System configuration
☞ Page 849 GOT side settings
☞ Page 855 PLC side settings
☞ Page 860 Access range for monitoring

10.1.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

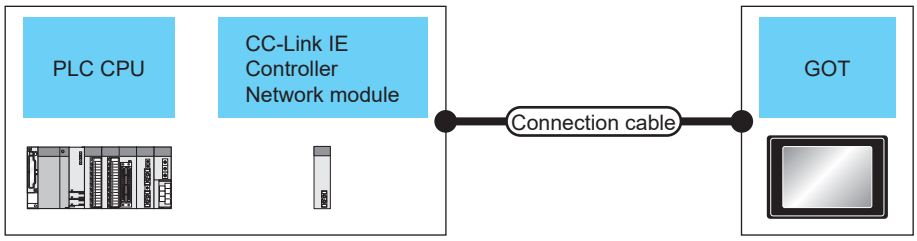
Controller	Model	Clock	PLC side interface	Connectable model
			CC-Link IE Controller Network communication unit	
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64	○	RJ71GP21-SX RJ71GP21S-SX	GT37 SoftGOT3000
	MXR500-128 MXR500-256	○	RJ71GP21-SX RJ71GP21S-SX	GT37 SoftGOT3000

Precautions

For information on the version restrictions of the CC-Link IE Controller Network module, refer to the following manual.

CC-Link IE Controller Network Reference Manual

10.1.2 System configuration



For details on the maximum length of the connection cable, refer to the following.

☞ Page 846 Maximum length

For details on the maximum number of connected devices, refer to the following.

☞ Page 846 Maximum number of connected devices

PLC		Communication type	Connection cable	GOT	
Controller	CC-Link IE Controller Network communication unit*1			Interface	Model
MELSEC MX Controller (MX-R Model)	RJ71GP21-SX RJ71GP21S-SX	CC-Link IE Controller Network	Optical fiber cable*2	GT37-IF2000 + GT15-J71GP23-SX (optical loop type)*3	GT37 SoftGOT3000

*1 For the CC-Link IE Controller Network extended mode, the serial number must start with 12052 or later.
For the system configuration on the CC-Link IE Controller Network module side, refer to the following manual.
CC-Link IE Controller Network Reference Manual

*2 For details on the optical fiber cable, refer to the following manual.
CC-Link IE Controller Network Reference Manual

*3 For the CC-Link IE Controller Network extended mode, the serial number must be 02910908******* or later.

Maximum length

The overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the total number of stations.

For details, refer to the following manual.

CC-Link IE Controller Network Reference Manual

Maximum number of connected devices

The following shows the number of GOTs connectable to one controller.

Controller	
Model	Number of GOTs connectable to one PLC
MELSEC MX Controller (MX-R Model)	119

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed. Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

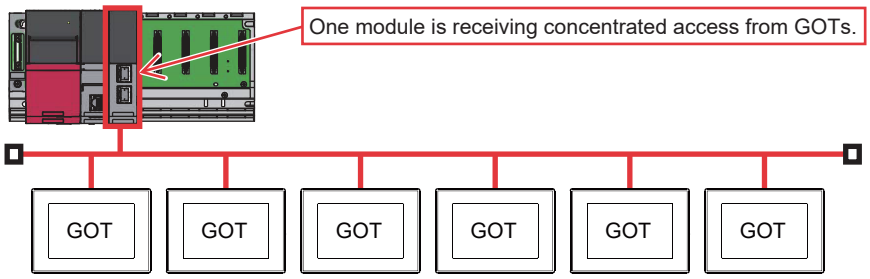
■Split GOT connection destinations into several systems

Add a master/local unit on the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

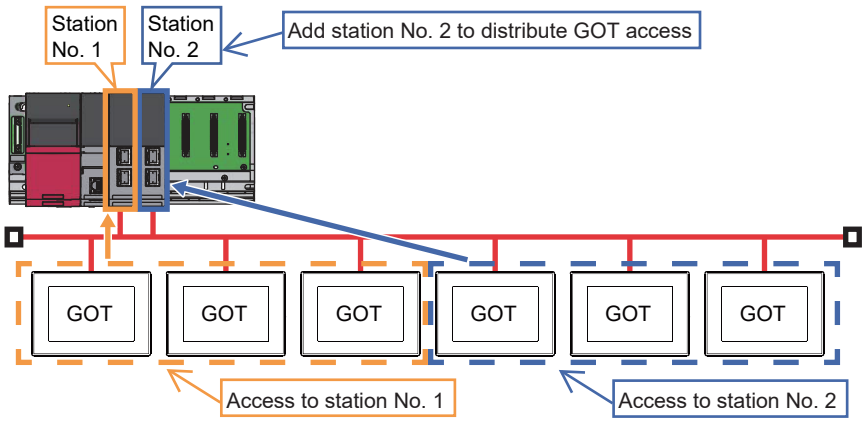
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

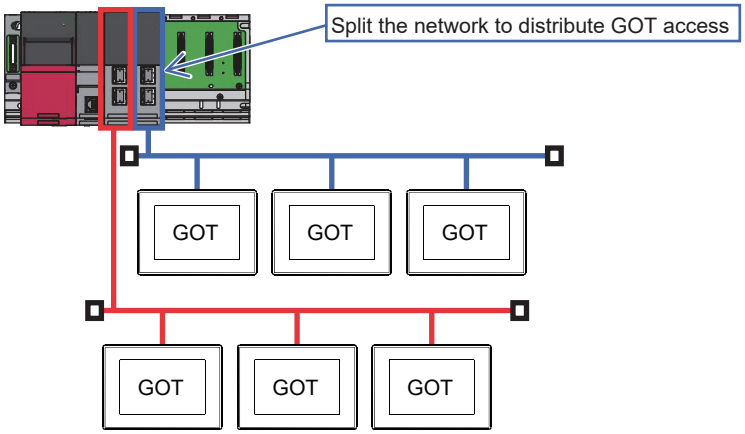
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT connected to the CC-Link IE Controller Network

For the CC-Link IE Controller Network connection, the data link is started approximately 13 seconds after the GOT startup.

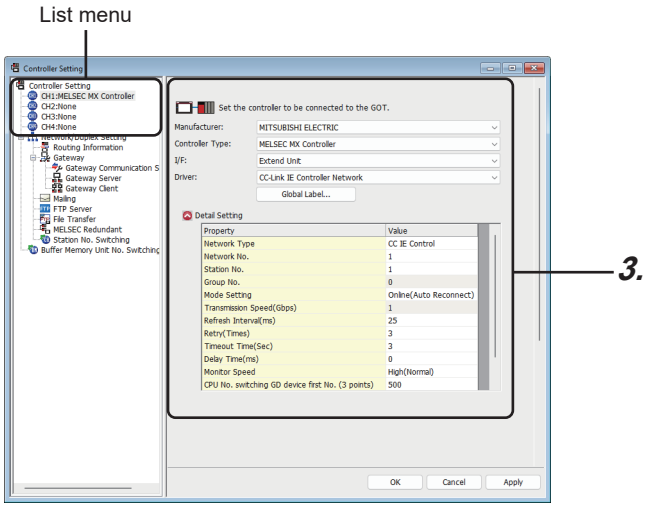
■When a network error occurs in the system alarm

In the CC-Link IE Controller Network connection, when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

10.1.3 GOT side settings

[Controller Setting]



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC MX Controller]
[I/F]	[Extend Unit]
[Driver]	[CC-Link IE Controller Network]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 850 [Detail Setting]

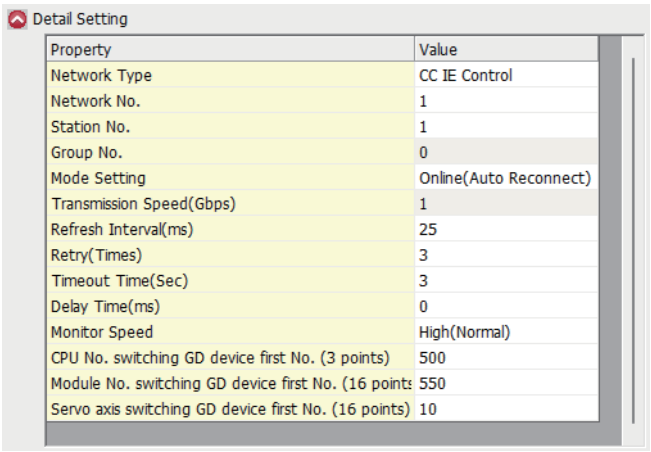
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Network Type][*3]	Set the network type.	[CC IE Control], [CC IE Control Extended Mode]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[Group No.]	-	[0]
[Mode]	Set the operation mode of the GOT.	[Online(Auto Reconnect)], [Offline], [H/W test][*1], [Self-loopback test][*1], [Internal self-loopback test][*1], [Line test][*1], [Test stations][*1]
[Transmission Speed]	-	[1Gbps]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication. This setting is effective when [Block data assurance per station is available.] is selected for the network parameter on the control station side of CC-Link IE Controller Network.	[1] ms to [1000] ms
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed][*4]	Set the monitor speed for the CC-Link IE Controller Network. This setting is not valid in all systems.	[High(Normal)][*2], [Middle], [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 851 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 852 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 853 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 For details, refer to the following manual.
CC-Link IE Controller Network Reference Manual
*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.
*3 For the CC-Link IE Controller Network extended mode, select [CC IE Control Extended Mode].
The extended mode can be used in GT Designer3 version 1.22Y or later.
*4 When using a global label, to read or write more than 235 two-byte characters, set the [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
GT Designer3 (GOT3000) Screen Design Manual

Point

• Example of communication detail settings

For the example of communication detail settings, refer to the following.

Page 855 PLC side settings

• Communication interface settings in the utility

The communication interface setting can be changed on the utility's [Communication setting] after writing [Controller Setting] of project data.

For details on the utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the controller settings

When the settings are configured in GT Designer3 or in the utility, the latest settings are effective.

• Network type

Be sure to set the same network types for the CPU side and the GOT side.

If the network types of the CPU side and the GOT side are different, an error is displayed in the system alarm of the GOT side.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 network numbers can be set for [Transfer Net No.].

However, the same destination network number cannot be set twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

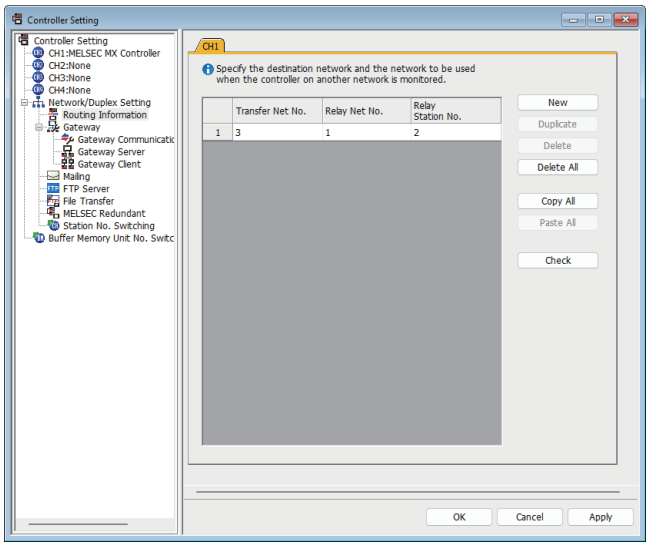
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC iQ-R CPU Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

• Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 855 PLC side settings

• Parameter reflection function of MELSOFT Navigator

The color of the cells for the items which are reflected to GT Designer3 from MELSOFT Navigator changes to green. Set items, which are displayed in green cells, from the MELSOFT Navigator.

When the settings of the transfer network number, relay network number, or relay station number are reflected to the parameter from MELSOFT Navigator, those settings are added. Items set in advance are not deleted.

However, if the target network number overlaps, the item set in advance is overwritten.

The routing information is used manually by the user when the data is created. Therefore, after changing the network configuration by MELSOFT Navigator, create a routing information again.

For details on creating the routing information, refer to the MELSOFT Navigator help.

10.1.4 PLC side settings

Model		Reference
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64 MXR500-128 MXR500-256	☞ Page 855 Connection to MELSEC MX Controller (MX-R Model)

Point

• CC-Link IE Controller Network module

For details on the CC-Link IE Controller Network module, refer to the following manual.

📖CC-Link IE Controller Network Reference Manual

• Data link status check

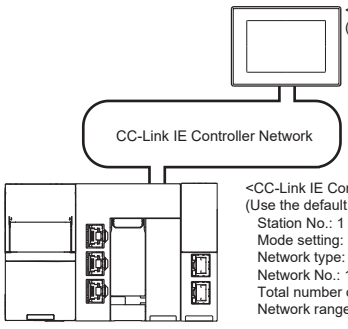
Refer to the following.

☞ Page 860 Access range for monitoring

Connection to MELSEC MX Controller (MX-R Model)

This section describes the settings of the GOT and CC-Link IE Controller Network module in the system configuration shown below.

■System configuration 1 (Network Type: CC IE Control)

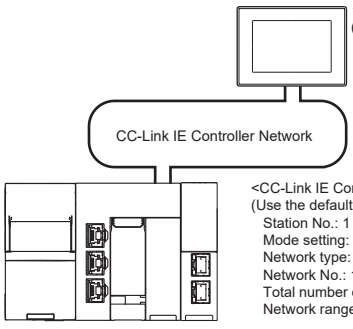


<GOT>
(Use the default value for settings other than the following.)
Network type: CC IE Control
Network No.: 1
Station No.: 2
Mode setting: Online (auto reconnection)
Network range assignment: LB0100H to LB01FFH
LW00100H to LW001FFH
Monitor speed: High

<CC-Link IE Controller Network module>*1
(Use the default value for settings other than the following.)
Station No.: 1
Mode setting: Online
Network type: CC IE Control (control station)
Network No.: 1
Total number of (sub) stations: 2
Network range assignment: LB0000H to LB00FFH
LW00000H to LW000FFH

*1 The CC-Link IE Controller Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Controller Network module is set to 0.

■System configuration 2 (Network Type: CC IE Control extended mode)



<GOT>
(Use the default value for settings other than the following.)
Network type: CC IE Control extended mode
Network No.: 1
Station No.: 2
Mode setting: Online (auto reconnection)
Network range assignment: LB0100H to LB01FFH
LW00100H to LW001FFH
Monitor speed: High

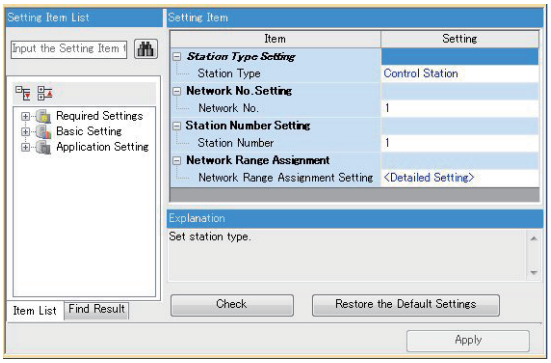
<CC-Link IE Controller Network module>*1
(Use the default value for settings other than the following.)
Station No.: 1
Mode setting: Online
Network type: CC IE Control extended mode (control station)
Network No.: 1
Total number of (sub) stations: 2
Network range assignment: LB0000H to LB00FFH
LW00000H to LW000FFH

*1 The CC-Link IE Controller Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Controller Network module is set to 0.

■Parameter settings for system configuration 1 (Network Type: CC IE Control) for connection to MELSEC MX Controller (MX-R Model)

• [Module Parameter] in GX Works3

Module parameter

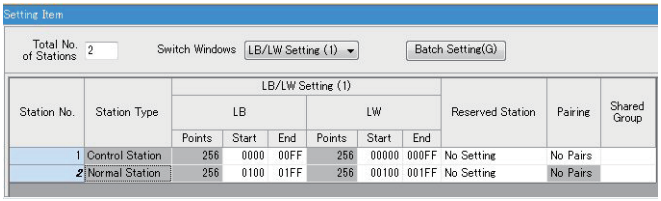


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Control station	○
[Network No.]*1	1	○
[Station Number Setting]	1	○
[Network Range Assignment]	☞ Network range assignment	△

*1 Set the same network number as that of the GOT.

Network range assignment



○: Necessary, △: As necessary, —: Not necessary

Item				Setting value	Setting for GOT connection
[LB/LW Setting (1)]*1	[LB]	Station No. 1	[Start]	0000H	△
			[End]	00FFH	△
		Station No. 2	[Start]	0100H	△
			[End]	01FFH	△
	[LW]	Station No. 1	[Start]	00000H	△
			[End]	000FFH	△
		Station No. 2	[Start]	00100H	△
			[End]	001FFH	△
[LB/LW Setting (2)]*1				No setting	△
[LX/LY Setting (1)]*1				No setting	△
[LX/LY Setting (2)]*1				No setting	△
[Reserved Station]				(Use default value)	△
[Pairing]					△

*1 Be sure to set it to perform the cyclic transmission.

Point

When changing the module parameter

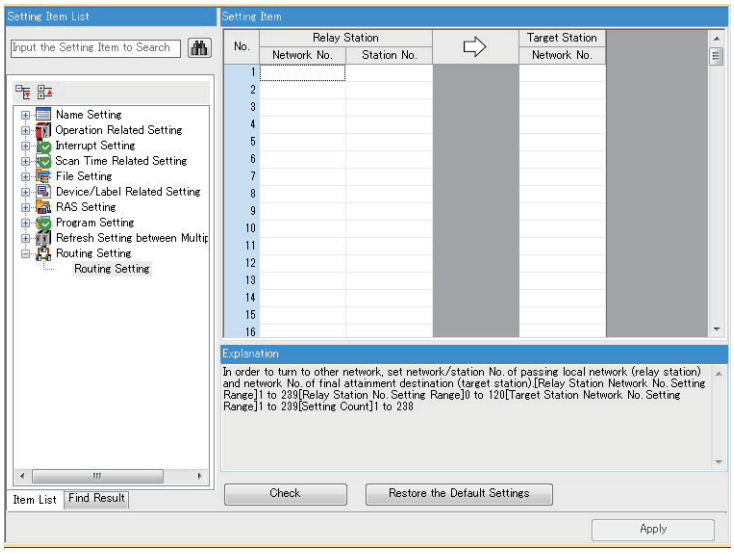
After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access 238 different networks specified in the column of [Target Station Network No.].



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 854 Routing parameter settings

■System configuration 1 (Network Type: CC IE Control): [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Control
[Network No.]	1: Network No. 1
[Station No.]	2: Station No. 2
[Group No.]	0
[Mode Setting]	Online (auto reconnection)
[Transmission Speed]	1 Gbps
[Refresh Interval]	1 ms
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

[Controller Setting] in GT Designer3

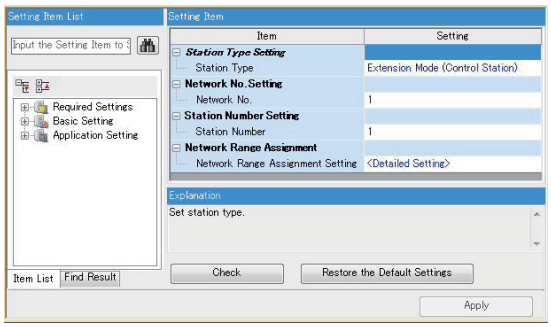
For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 849 [Controller Setting]

■Module parameter settings for system configuration 2 (Network Type: Extended mode)

• [Module Parameter] in GX Works3

Module parameter

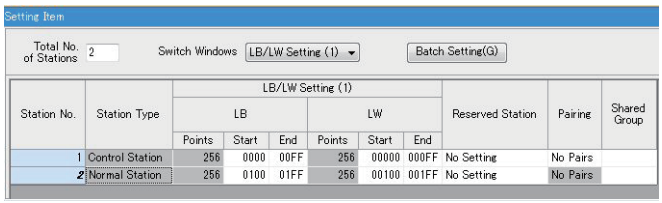


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Extension Mode (Control Station)	○
[Network No.]*1	1	○
[Station Number Setting]	1	○
[Network Range Assignment]	☞ Network range assignment	△

*1 Set the same network number as that of the GOT.

Network range assignment



○: Necessary, △: As necessary, —: Not necessary

Item				Setting value	Setting for GOT connection
[LB/LW Setting (1)]*1	[LB]	Station No. 1	[Start]	0000H	△
			[End]	00FFH	△
		Station No. 2	[Start]	0100H	△
			[End]	01FFH	△
	[LW]	Station No. 1	[Start]	00000H	△
			[End]	000FFH	△
		Station No. 2	[Start]	00100H	△
			[End]	001FFH	△
[LB/LW Setting (2)]*1				No setting	△
[LX/LY Setting (1)]*1				No setting	△
[LX/LY Setting (2)]*1				No setting	△
[Reserved Station]				(Use default value)	△
[Pairing]					△

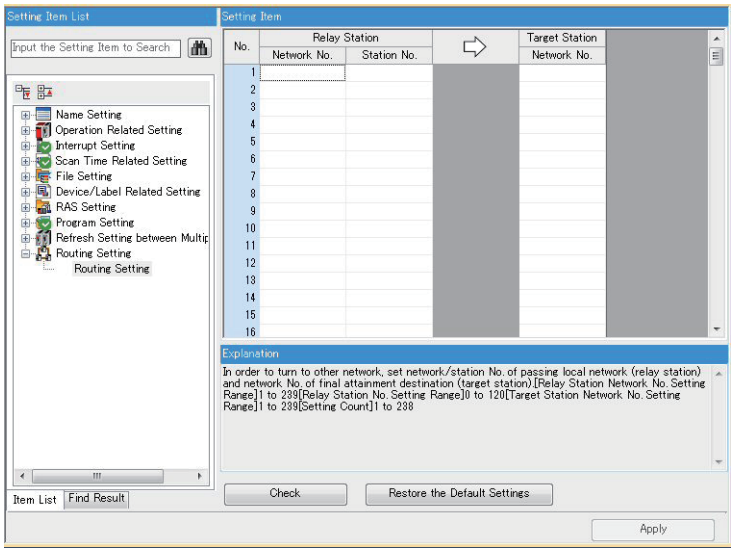
*1 Be sure to set it to perform the cyclic transmission.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access 238 different networks specified in the column of [Target Station Network No.].



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 854 Routing parameter settings

- [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Control extended mode
[Network No.]	1: Network No. 1
[Station No.]	2: Station No. 2
[Group No.]	0
[Mode Setting]	Online (auto reconnection)
[Refresh Interval]	1 ms
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

Network type of the GOT side

When the network is in the extended mode, be sure to set the network type of the GOT side to [CC IE Control Extended Mode].

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 849 [Controller Setting]

10.1.5 Access range for monitoring

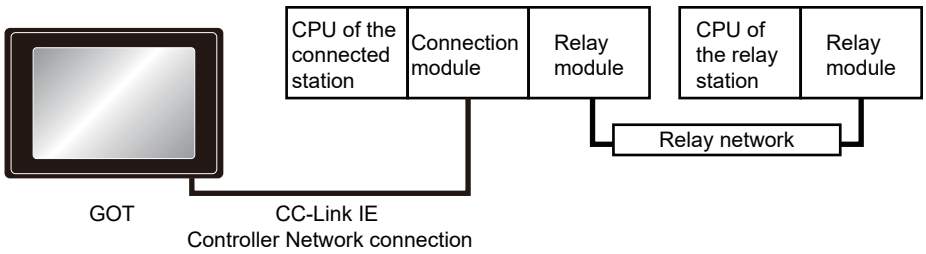
When the GOT is connected to the CPU of the station connected via CC-Link IE Controller Network, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station								
		Relay network	CPU of the relay station							
			MXR	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
MX-R	☞ Page 845 Connectable devices	Ethernet	○*7	○*5	○	○*6	○	—	○	—	○*3
		CC-Link IE TSN	○*7	○*1	—	—	—	—	—	—	○*3

		CC-Link IE Field Network	○*7	○	○	○*2	○	—	—	—	○*4
		MELSECNET/H, MELSECNET/10	—	—	—	○	○	○	○	○*8	—

*1 RnCPU, RnENCPU, RnSFCPU, C Controller module (MELSEC iQ-R series), and MELSECWinCPU (MELSEC iQ-R series) are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, QnUDHCPU, and C Controller module (MELSEC-Q series) are supported.

*3 FX5U and FX5UC are supported.

*4 FX5U, FX5UC, and FX5UJ are supported.

*5 The C Controller module (MELSEC iQ-R series) is not supported.

*6 The C Controller module (MELSEC-Q series) is not supported.

*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
☞ Page 90 Setting procedure of the encrypted communication

*8 AnUCPU and AnUSCPU are supported.

10.2 MELSEC iQ-R series (CC-Link IE Controller Network connection)

☞ Page 861 Connectable devices
☞ Page 863 System configuration
☞ Page 866 GOT side settings
☞ Page 873 PLC side settings
☞ Page 884 Access range for monitoring
☞ Page 885 How to monitor a redundant system

10.2.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	PLC side interface	Connectable model
			CC-Link IE Controller Network communication unit	
MELSEC iQ-R series	R00CPU R01CPU R02CPU R04CPU R08CPU R16CPU R32CPU R120CPU	○	RJ71GP21-SX	GT37 SoftGOT3000
	R08PCPU*1 R16PCPU*1 R32PCPU*1 R120PCPU*1	○	RJ71GP21-SX*4	GT37 SoftGOT3000
	R04ENCPU R08ENCPU R16ENCPU R32ENCPU R120ENCPU	○	RJ71GP21-SX	GT37 SoftGOT3000
	R08PSFCPU*2 R16PSFCPU*2 R32PSFCPU*2 R120PSFCPU*2	○	RJ71GP21-SX*4	GT37 SoftGOT3000
	R08SFCPU*3 R16SFCPU*3 R32SFCPU*3 R120SFCPU*3	○	RJ71GP21-SX	GT37 SoftGOT3000
Motion CPU (MELSEC iQ-R series)	R16MTCPU R32MTCPU R64MTCPU*5	○	RJ71GP21-SX*6	GT37 SoftGOT3000
C Controller module (MELSEC iQ-R series)	R12CCPU-V	○	RJ71GP21-SX	GT37 SoftGOT3000
MELSECWinCPU (MELSEC iQ-R series)	R102WCPU-W	—	RJ71GP21-SX	GT37 SoftGOT3000

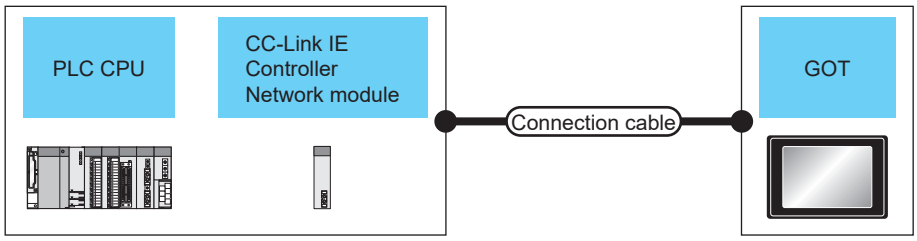
Controller	Model	Clock	PLC side interface	Connectable model
			CC-Link IE Controller Network communication unit	
CNC C80	R16NCCPU-S1	○	RJ71GP21-SX	GT37 SoftGOT3000
Robot controller (MELSEC iQ-R series)	CR800-R(R16RTCPU)	○	RJ71GP21-SX	GT37 SoftGOT3000

*1 Mount a redundant function module R6RFM next to the RnPCPU on the base unit when building a redundant system.
*2 Mount the SIL2 function module R6PSFM and redundant function module R6RFM next to the RnPSFCPU on the base unit.
*3 Mount a safety function module R6SFM next to the RnSFCPU on the base unit.
The RnSFCPU and the safety function module R6SFM must have the same pair version.
If their pair versions differ, the RnSFCPU does not operate.
*4 Use firmware version 12 or later when building a redundant system.
*5 Use a module with OS software version 06 or later.
*6 When monitoring a Motion CPU from a different network, use a Motion CPU with OS software version 3 or later.

Precautions

For information on the version restrictions of the CC-Link IE Controller Network module, refer to the following manual.
CC-Link IE Controller Network Reference Manual

10.2.2 System configuration



For details on the maximum length of the connection cable, refer to the following.

☞ Page 863 Maximum length

For details on the maximum number of connected devices, refer to the following.

☞ Page 863 Maximum number of connected devices

PLC		Communication type	Connection cable	GOT	
Controller	CC-Link IE Controller Network communication unit*1			Interface	Model
MELSEC iQ-R series C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series) Motion CPU (MELSEC iQ-R series) CNC C80 Robot controller (MELSEC iQ-R series)	RJ71GP21-SX	CC-Link IE Controller Network	Optical fiber cable*2	GT37-IF2000 + GT15-J71GP23-SX (optical loop type)*3	GT37 SoftGOT3000

*1 For the CC-Link IE Controller Network extended mode, the serial number must start with 12052 or later.
For the system configuration on the CC-Link IE Controller Network module side, refer to the following manual.
CC-Link IE Controller Network Reference Manual

*2 For details on the optical fiber cable, refer to the following manual.
CC-Link IE Controller Network Reference Manual

*3 For the CC-Link IE Controller Network extended mode, the serial number must be 02910908******* or later.

Maximum length

The overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the total number of stations.

For details, refer to the following manual.

CC-Link IE Controller Network Reference Manual

Maximum number of connected devices

The following shows the number of GOTs connectable to one controller.

Controller	
Model	Number of GOTs connectable to one PLC
MELSEC iQ-R series Motion CPU (MELSEC iQ-R series) C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series) CNC C80 Robot controller (MELSEC iQ-R series)	119

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed. Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

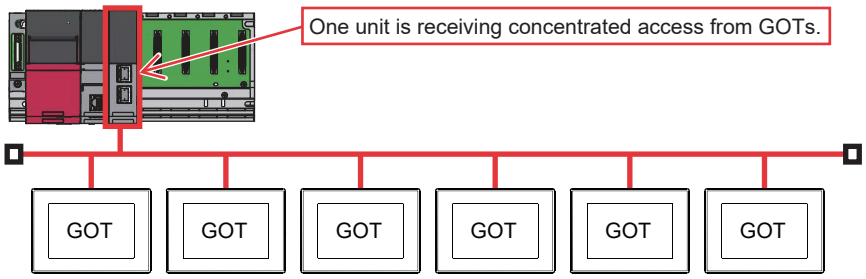
■Split GOT connection destinations into several systems

Add a master/local unit on the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

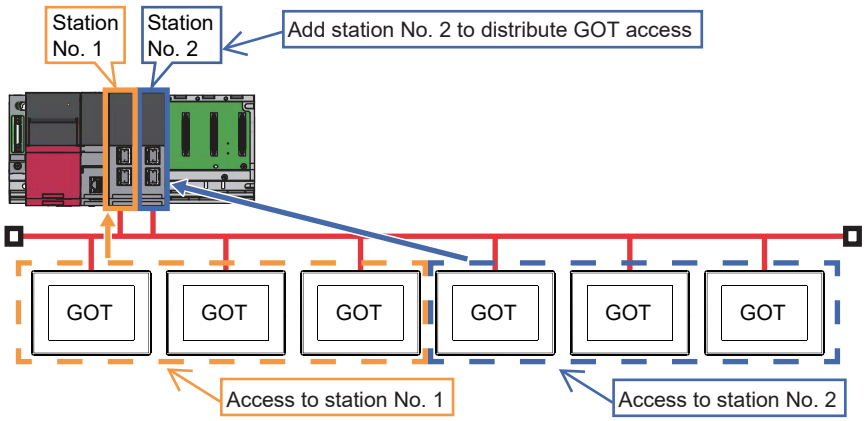
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

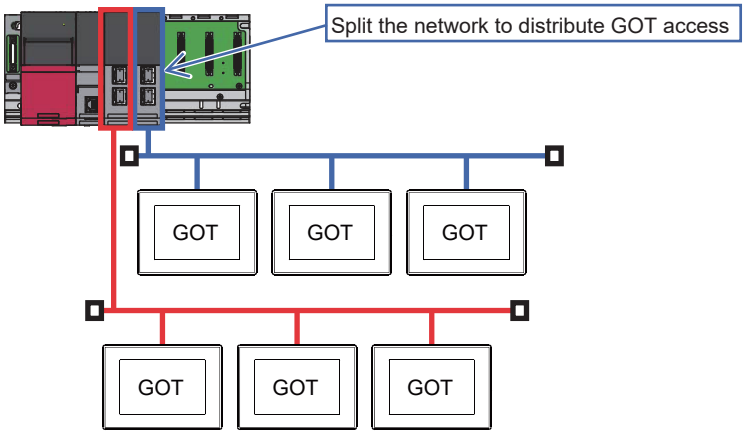
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT connected to the CC-Link IE Controller Network

For the CC-Link IE Controller Network connection, the data link is started approximately 13 seconds after the GOT startup.

■When a network error occurs in the system alarm

In the CC-Link IE Controller Network connection, when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

■Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes the following time to run.

MELSEC iQ-R series, Motion CPU (MELSEC iQ-R series): 10 seconds or more

If the GOT is started during the above time, a system alarm occurs.

Adjust the opening screen time in the GOT setup so that no system alarm occurs.

📖GT Designer3 (GOT3000) Screen Design Manual

■Connection to RnSFCPU

The RnSFCPU takes 10 seconds or more to run.

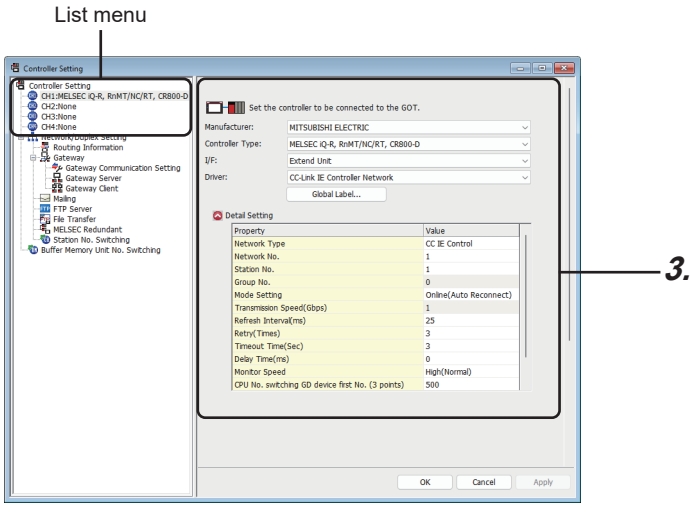
If the GOT is started before the RnSFCPU runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

📖GT Designer3 (GOT3000) Screen Design Manual

10.2.3 GOT side settings

[Controller Setting]



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[I/F]	[Extend Unit]
[Driver]	[CC-Link IE Controller Network]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 867 [Detail Setting]

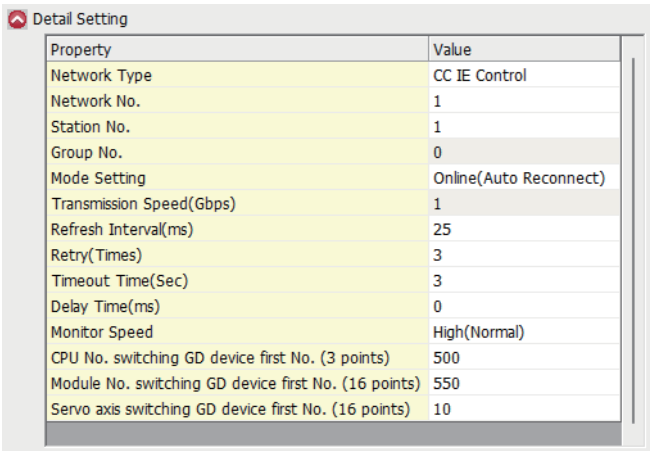
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Network Type]*3	Set the network type.	[CC IE Control], [CC IE Control Extended Mode]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[Group No.]	-	[0]
[Mode]	Set the operation mode of the GOT.	[Online(Auto Reconnect)], [Offline], [H/W test]*1, [Self-loopback test]*1, [Internal self-loopback test]*1, [Line test]*1, [Test stations]*1
[Transmission Speed]	-	[1Gbps]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication. This setting is effective when [Block data assurance per station is available.] is selected for the network parameter on the control station side of CC-Link IE Controller Network.	[1] ms to [1000] ms
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]*4	Set the monitor speed for the CC-Link IE Controller Network. This setting is not valid in all systems.	[High(Normal)]*2, [Middle], [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 869 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 870 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 871 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 For details, refer to the following manual.
CC-Link IE Controller Network Reference Manual
*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.
*3 For the CC-Link IE Controller Network extended mode, select [CC IE Control Extended Mode]. The extended mode can be used in GT Designer3 version 1.22Y or later.
*4 When using a global label, to read or write more than 235 two-byte characters, set the [Monitor speed] to [High(Normal)] or [Middle]. If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
GT Designer3 (GOT3000) Screen Design Manual

Point

• Example of communication detail settings

For the example of communication detail settings, refer to the following.

Page 873 PLC side settings

• Communication interface settings in the utility

The communication interface setting can be changed on the utility's [Communication setting] after writing [Controller Setting] of project data.

For details on the utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the controller settings

When the settings are configured in GT Designer3 or in the utility, the latest settings are effective.

• Network type

Be sure to set the same network types for the CPU side and the GOT side.

If the network types of the CPU side and the GOT side are different, an error is displayed in the system alarm of the GOT side.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 network numbers can be set for [Transfer Net No.].

However, the same destination network number cannot be set twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

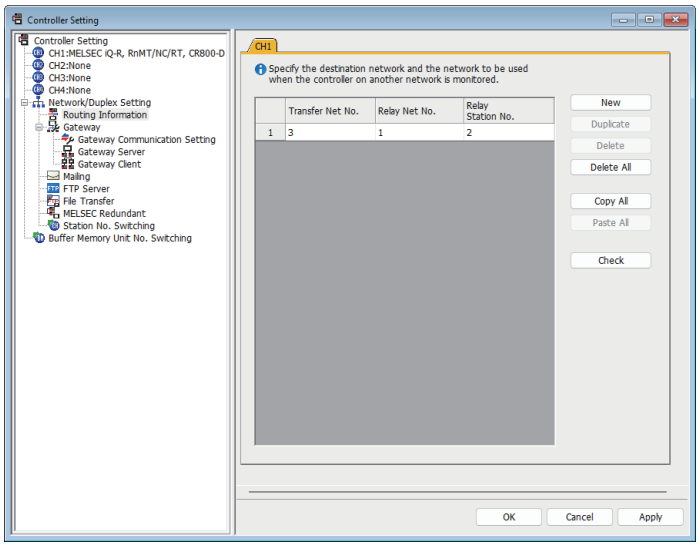
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC iQ-R CPU Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

• Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 873 PLC side settings

• Parameter reflection function of MELSOFT Navigator

The color of the cells for the items which are reflected to GT Designer3 from MELSOFT Navigator changes to green. Set items, which are displayed in green cells, from the MELSOFT Navigator.

When the settings of the transfer network number, relay network number, or relay station number are reflected to the parameter from MELSOFT Navigator, those settings are added. Items set in advance are not deleted.

However, if the target network number overlaps, the item set in advance is overwritten.

The routing information is used manually by the user when the data is created. Therefore, after changing the network configuration by MELSOFT Navigator, create a routing information again.

For details on creating the routing information, refer to the MELSOFT Navigator help.

10.2.4 PLC side settings

Point

• CC-Link IE Controller Network module

For details on the CC-Link IE Controller Network module, refer to the following manual.

📖CC-Link IE Controller Network Reference Manual

• Data link status check

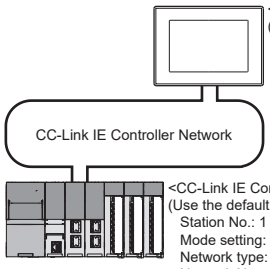
Refer to the following.

☞ Page 884 Access range for monitoring

Connection to MELSEC iQ-R series

This section describes the settings of the GOT and CC-Link IE Controller Network module in the system configuration shown below.

■System configuration 1 (Network Type: CC IE Control)

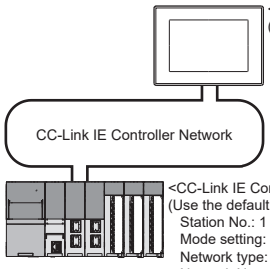


<GOT>
(Use the default value for settings other than the following.)
Network type: CC IE Control
Network No.: 1
Station No.: 2
Mode setting: Online (auto reconnection)
Network range assignment: LB0100H to LB01FFH
LW00100H to LW001FFH
Monitor speed: High

<CC-Link IE Controller Network module> *1
(Use the default value for settings other than the following.)
Station No.: 1
Mode setting: Online
Network type: CC IE Control (control station)
Network No. :1
Total number of (sub) stations: 2
Network range assignment: LB0000H to LB00FFH
LW00000H to LW000FFH

*1 The CC-Link IE Controller Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Controller Network module is set to 0.

■System configuration 2 (Network Type: CC IE Control extended mode)



<GOT>
(Use the default value for settings other than the following.)
Network type: CC IE Control extended mode
Network No.: 1
Station No.: 2
Mode setting: Online (auto reconnection)
Network range assignment: LB0100H to LB01FFH
LW00100H to LW001FFH
Monitor speed: High

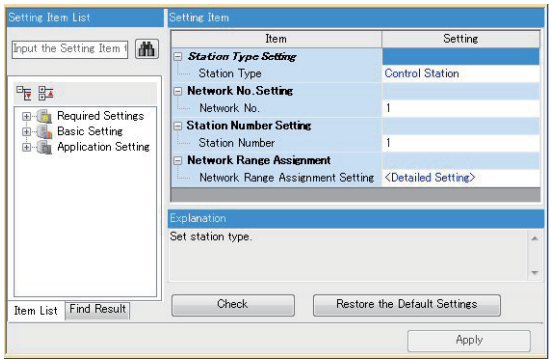
<CC-Link IE Controller Network module> *1
(Use the default value for settings other than the following.)
Station No.: 1
Mode setting: Online
Network type: CC IE Control extended mode (control station)
Network No.: 1
Total number of (sub) stations: 2
Network range assignment: LB0000H to LB00FFH
LW00000H to LW000FFH

*1 The CC-Link IE Controller Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Controller Network module is set to 0.

■Parameter settings for system configuration 1 (Network Type: CC IE Control) for connection to MELSEC iQ-R series

• [Module Parameter] in GX Works3

Module parameter

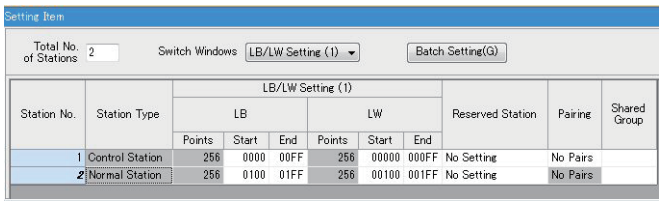


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Control station	○
[Network No.]*1	1	○
[Station Number Setting]	1	○
[Network Range Assignment]	☞ Network range assignment	△

*1 Set the same network number as that of the GOT.

Network range assignment



○: Necessary, △: As necessary, —: Not necessary

Item				Setting value	Setting for GOT connection
[LB/LW Setting (1)]*1	LB	Station No. 1	[Start]	0000H	△
			[End]	00FFH	△
		Station No. 2	[Start]	0100H	△
			[End]	01FFH	△
	LW	Station No. 1	[Start]	00000H	△
			[End]	000FFH	△
		Station No. 2	[Start]	00100H	△
			[End]	001FFH	△
[LB/LW Setting (2)]*1				No setting	△
[LX/LY Setting (1)]*1				No setting	△
[LX/LY Setting (2)]*1				No setting	△
[Reserved Station]				(Use default value)	△
[Pairing]					△

*1 Be sure to set it to perform the cyclic transmission.

Point

When changing the module parameter

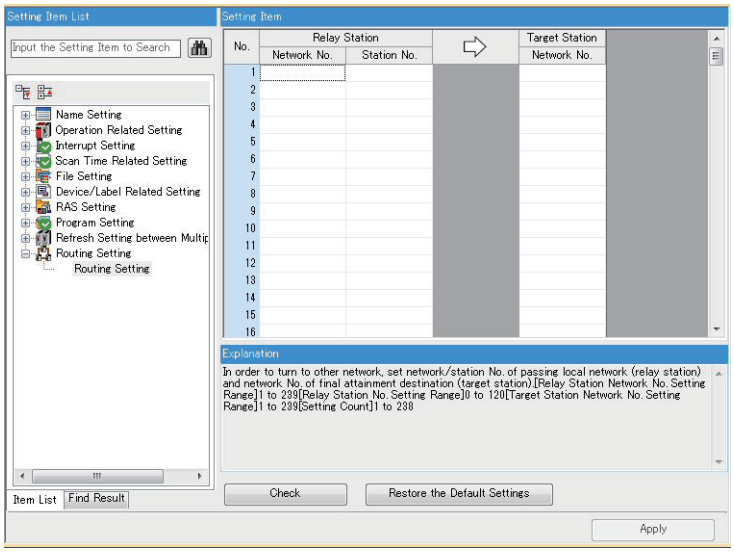
After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access 238 different networks specified in the column of [Target Station Network No.].



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 872 Routing parameter settings

■System configuration 1 (Network Type: CC IE Control): [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Control
[Network No.]	1: Network No. 1
[Station No.]	2: Station No. 2
[Group No.]	0
[Mode Setting]	Online (auto reconnection)
[Transmission Speed]	1 Gbps
[Refresh Interval]	1 ms
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

[Controller Setting] in GT Designer3

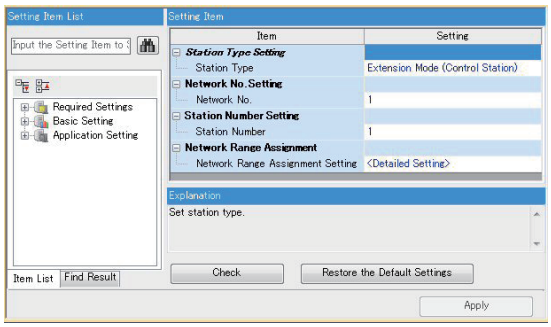
For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 866 [Controller Setting]

■Module parameter settings for system configuration 2 (Network Type: Extended mode)

• [Module Parameter] in GX Works3

Module parameter

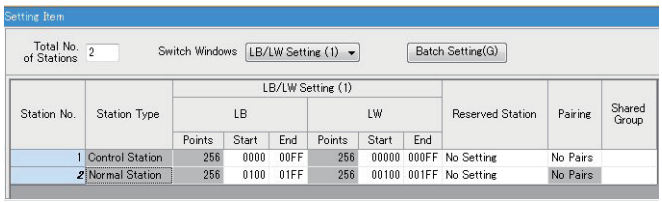


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Extension Mode (Control Station)	○
[Network No.]*1	1	○
[Station Number]	1	○
[Network Range Assignment]	☞ Network range assignment	△

*1 Set the same network number as that of the GOT.

Network range assignment



○: Necessary, △: As necessary, —: Not necessary

Item				Setting value	Setting for GOT connection
[LB/LW Setting (1)]*1	[LB]	Station No. 1	[Start]	0000H	△
			[End]	00FFH	△
		Station No. 2	[Start]	0100H	△
			[End]	01FFH	△
	[LW]	Station No. 1	[Start]	00000H	△
			[End]	000FFH	△
		Station No. 2	[Start]	00100H	△
			[End]	001FFH	△
[LB/LW Setting (2)]*1				No setting	△
[LX/LY Setting (1)]*1				No setting	△
[LX/LY Setting (2)]*1				No setting	△
[Reserved Station]				(Use default value)	△
[Pairing]					△

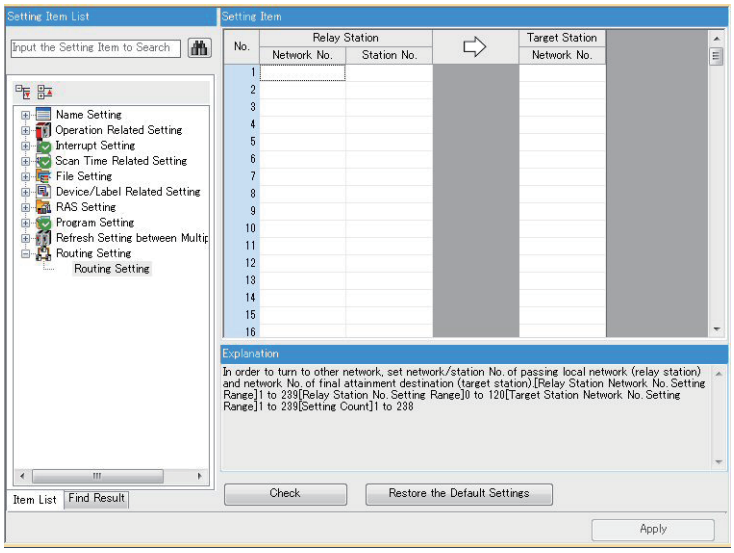
*1 Be sure to set it to perform the cyclic transmission.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access 238 different networks specified in the column of [Target Station Network No.].



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 872 Routing parameter settings

- [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Control extended mode
[Network No.]	1: Network No. 1
[Station No.]	2: Station No. 2
[Group No.]	0
[Mode Setting]	Online (auto reconnection)
[Refresh Interval]	1 ms
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

Network type of the GOT side

When the network is in the extended mode, be sure to set the network type of the GOT side to [CC IE Control Extended Mode].

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

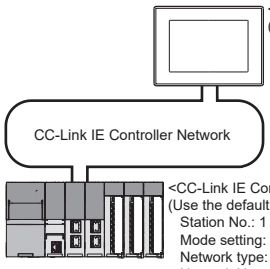
☞ Page 866 [Controller Setting]

Connection to C Controller (MELSEC iQ-R series) / MELSECWinCPU module (MELSEC iQ-R series)

This section describes the settings of the GOT and C Controller (MELSEC iQ-R series) / MELSECWinCPU module (MELSEC iQ-R series) in the following system configuration.

Use CW Configurator for the C Controller (MELSEC iQ-R series) / MELSECWinCPU module (MELSEC iQ-R series) communication settings.

■System configuration 1 (Network Type: CC IE Control)

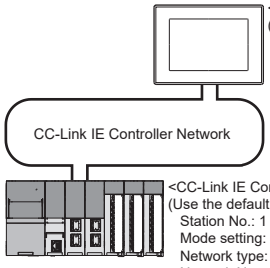


<GOT>
(Use the default value for settings other than the following.)
Network type: CC IE Control
Network No.: 1
Station No.: 2
Mode setting: Online (auto reconnection)
Network range assignment: LB0100H to LB01FFH
LW00100H to LW001FFH
Monitor speed: High

<CC-Link IE Controller Network module> *1
(Use the default value for settings other than the following.)
Station No.: 1
Mode setting: Online
Network type: CC IE Control (control station)
Network No.: 1
Total number of (sub) stations: 2
Network range assignment: LB0000H to LB00FFH
LW00000H to LW000FFH

*1 The CC-Link IE Controller Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Controller Network module is set to 0.

■System configuration 2 (Network Type: CC IE Control extended mode)



<GOT>
(Use the default value for settings other than the following.)
Network type: CC IE Control extended mode
Network No.: 1
Station No.: 2
Mode setting: Online (auto reconnection)
Network range assignment: LB0100H to LB01FFH
LW00100H to LW001FFH
Monitor speed: High

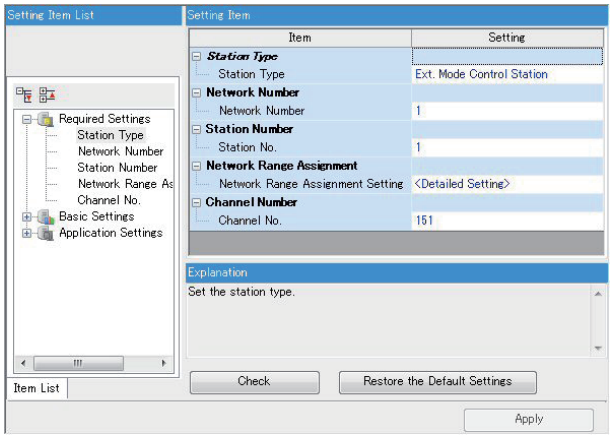
<CC-Link IE Controller Network module> *1
(Use the default value for settings other than the following.)
Station No.: 1
Mode setting: Online
Network type: CC IE Control extended mode (control station)
Network No.: 1
Total number of (sub) stations: 2
Network range assignment: LB0000H to LB00FFH
LW00000H to LW000FFH

*1 The CC-Link IE Controller Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Controller Network module is set to 0.

■Parameter settings for system configuration 1 (Network Type: CC IE Control) for connection to MELSEC iQ-R series

• [Module parameter] in CW Configurator

Module parameter

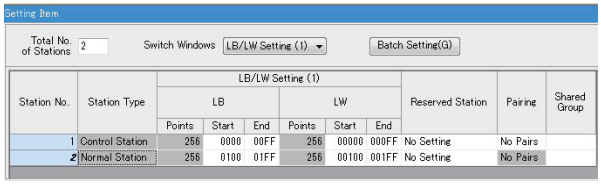


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Control station	○
[Network No.]*1	1	○
[Station Number]	1	○
[Network Range Assignment]	☞ Network range assignment	△
[Channel No.]	(Use default value)	—

*1 Set the same network number as that of the GOT.

Network range assignment



○: Necessary, △: As necessary, —: Not necessary

Item				Setting value	Setting for GOT connection
[LB/LW Setting (1)]*1	[LB]	Station No. 1	[Start]	0000H	△
			[End]	00FFH	△
		Station No. 2	[Start]	0100H	△
			[End]	01FFH	△
	[LW]	Station No. 1	[Start]	00000H	△
			[End]	000FFH	△
		Station No. 2	[Start]	00100H	△
			[End]	001FFH	△
[LB/LW Setting (2)]*1				No setting	△
[LX/LY Setting (1)]*1				No setting	△
[LX/LY Setting (2)]*1				No setting	△
[Reserved Station]				(Use default value)	△
[Pairing]					△

*1 Be sure to set it to perform the cyclic transmission.

Point

When changing the module parameter

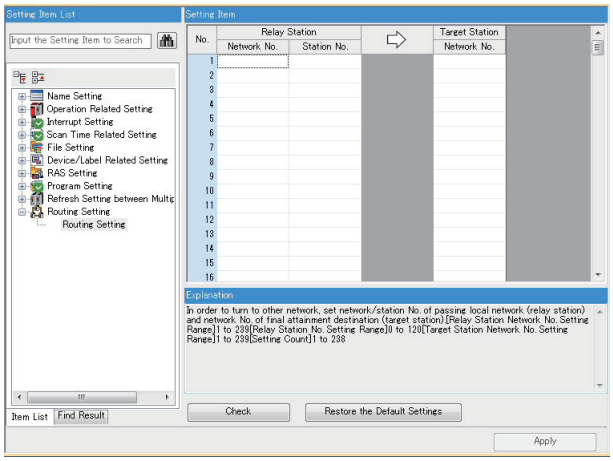
After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access 238 different networks specified in the column of [Target Station Network No.].



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 872 Routing parameter settings

■System configuration 1 (Network Type: CC IE Control): [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Control
[Network No.]	1: Network No. 1
[Station No.]	2: Station No. 2
[Group No.]	0
[Mode Setting]	Online (auto reconnection)
[Transmission Speed]	1 Gbps

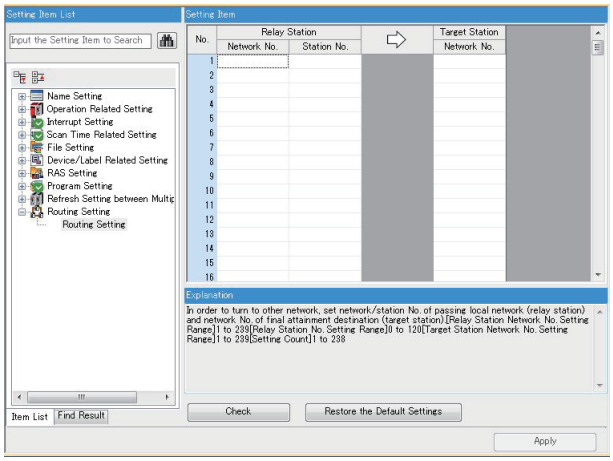
Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access 238 different networks specified in the column of [Target Station Network No.].



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 872 Routing parameter settings

- [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Control extended mode
[Network No.]	1: Network No. 1
[Station No.]	2: Station No. 2
[Group No.]	0
[Mode Setting]	Online (auto reconnection)
[Refresh Interval]	1 ms
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

Network type of the GOT side

When the network is in the extended mode, be sure to set the network type of the GOT side to [CC IE Control Extended Mode].

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 866 [Controller Setting]

10.2.5 Access range for monitoring

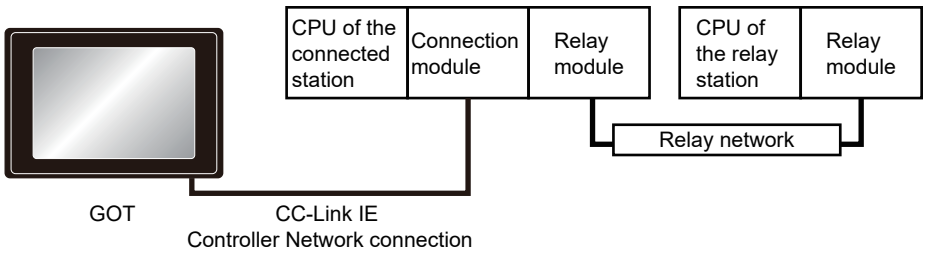
When the GOT is connected to the CPU of the station connected via CC-Link IE Controller Network, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station									
		Relay network	CPU of the relay station								
			MXR	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
RCPU	☞ Page 861 Connectable devices	Ethernet	○*7	○*5	○	○*6	○	—	○	—	○*3
		CC-Link IE TSN	○*7	○*1	—	—	—	—	—	—	○*3
		CC-Link IE Controller Network	○*7	○	—	○	○	—	—	—	—
		CC-Link IE Field Network	○*7	○	○	○*2	○	—	—	—	○*4
		MELSECNET/H, MELSECNET/10	—	—	—	○	○	○	○	○*8	—
C Controller module (MELSEC iQ-R series)	☞ Page 861 Connectable devices	CC-Link IE TSN	○*7	○*1	—	—	—	—	—	—	○*3
		CC-Link IE Controller Network	○*7	○	—	○	○	—	—	—	—
		CC-Link IE Field Network	○*7	○	○	○*2	○	—	—	—	○*4
		MELSECNET/H, MELSECNET/10	—	—	—	○	○	○	○	○*8	—

*1 RnCPU, RnENCPU, RnSFCPU, C Controller module (MELSEC iQ-R series), and MELSECWinCPU (MELSEC iQ-R series) are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, QnUDHCPU, and C Controller module (MELSEC-Q series) are supported.

*3 FX5U and FX5UC are supported.

*4 FX5U, FX5UC, and FX5UJ are supported.

*5 The C Controller module (MELSEC iQ-R series) is not supported.

*6 The C Controller module (MELSEC-Q series) is not supported.

*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
☞ Page 90 Setting procedure of the encrypted communication

*8 AnUCPU and AnUSCPU are supported.

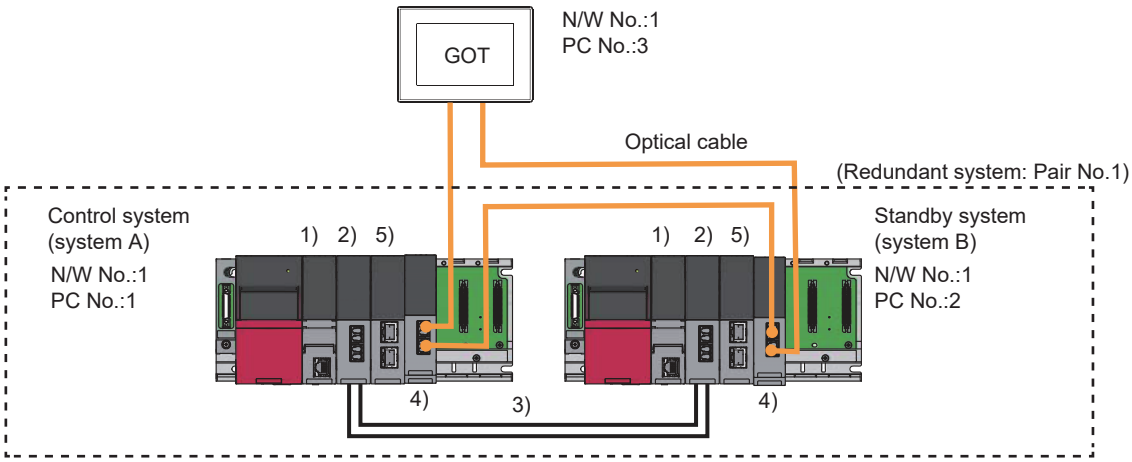
10.2.6 How to monitor a redundant system

☞ Page 885 One-to-one connection of the GOT and the redundant system
☞ Page 887 1:n connection of the GOT and the redundant system
☞ Page 889 Mixed connection of redundant and non-redundant systems
☞ Page 890 MELSEC redundant settings
☞ Page 892 Precautions

One-to-one connection of the GOT and the redundant system

■System configuration example

The following connection configuration examples are explained.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link IE Controller Network module
5) CC-Link IE Field Network master/local module

■Connection method

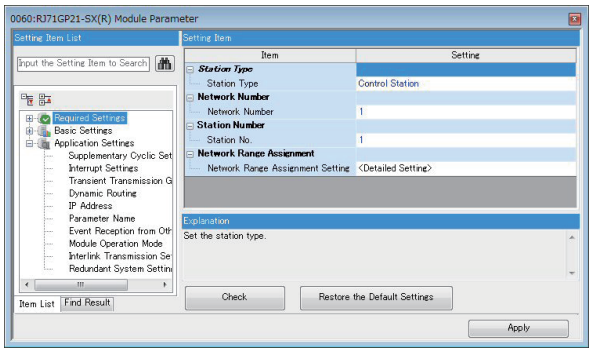
Connect the CC-Link IE Controller Network system and the GOT.

☞ Page 861 MELSEC iQ-R series (CC-Link IE Controller Network connection)

■PLC side settings (GX Works3)

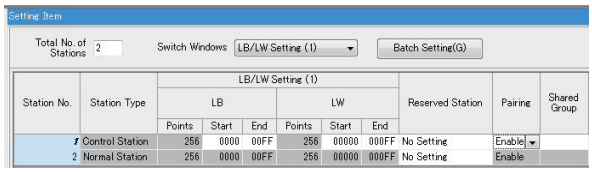
• Control system (system A) PLC settings

Module parameter



Item	Setting value
[Station Type]	Control station
[Network No.]	1
[Station Number]	1
[Network Range Assignment]	☞ Network range assignment

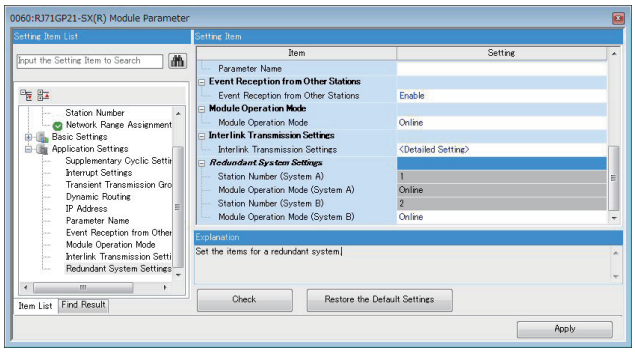
Network range assignment



Item	Setting value
Pairing	Enable

• Control system (system A) PLC settings

Redundant setting



Item	Setting value
B system module operation mode	Online mode

■GOT side settings

Set GT Designer3 as follows.

Setting item	Setting details		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	—	
	[Other]	[Network No.]: 1	
		[Station No.]: Station number of the control system	
	[Redundant System]	The system to be monitored ([Not Specified/Control System], [Standby System]) can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
MELSEC redundant setting	 ☞ Page 890 MELSEC redundant settings		

■Monitoring target change when system switching occurs in a redundant system

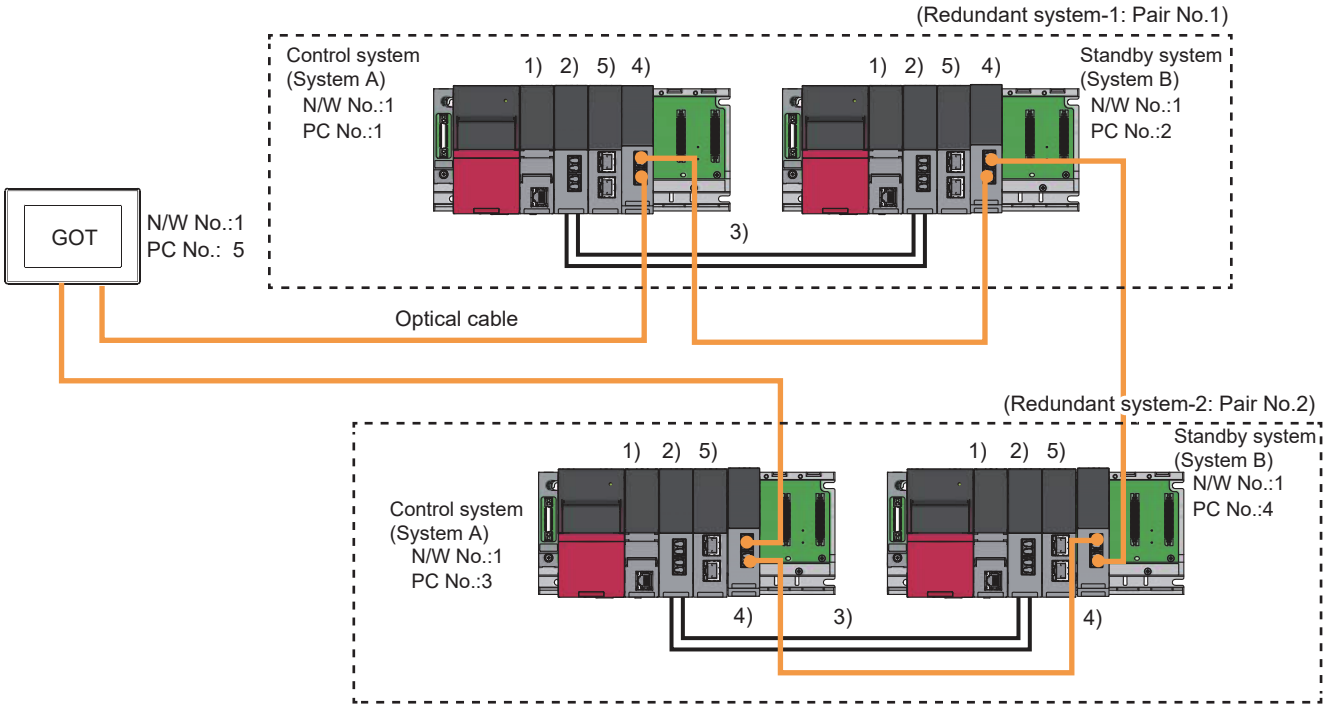
When system switching occurs, the CPU (PLC station No. 2) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

1:n connection of the GOT and the redundant system

■System configuration example

The following connection configuration examples are explained.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link IE Controller Network module
5) CC-Link IE Field Network master/local module

■Connection method

Connect the CC-Link IE Controller Network system and the GOT.

☞ Page 861 MELSEC iQ-R series (CC-Link IE Controller Network connection)

■PLC side settings (GX Works3)

☞ Page 886 PLC side settings (GX Works3)

■GOT side settings

Set GT Designer3 as follows.

Setting item	Setting details		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	—	
	[Other]	[Network No.]: 1	
		[Station No.]: Station number of the control system	
	[Redundant System]	The system to be monitored ([Not Specified/Control System], [Standby System]) can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
MELSEC redundant setting	 ☞ Page 890 MELSEC redundant settings		

■Monitoring target change when system switching occurs in a redundant system

• Redundant system-1

When system switching occurs, the CPU (PLC station No. 2) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

• Redundant system-2

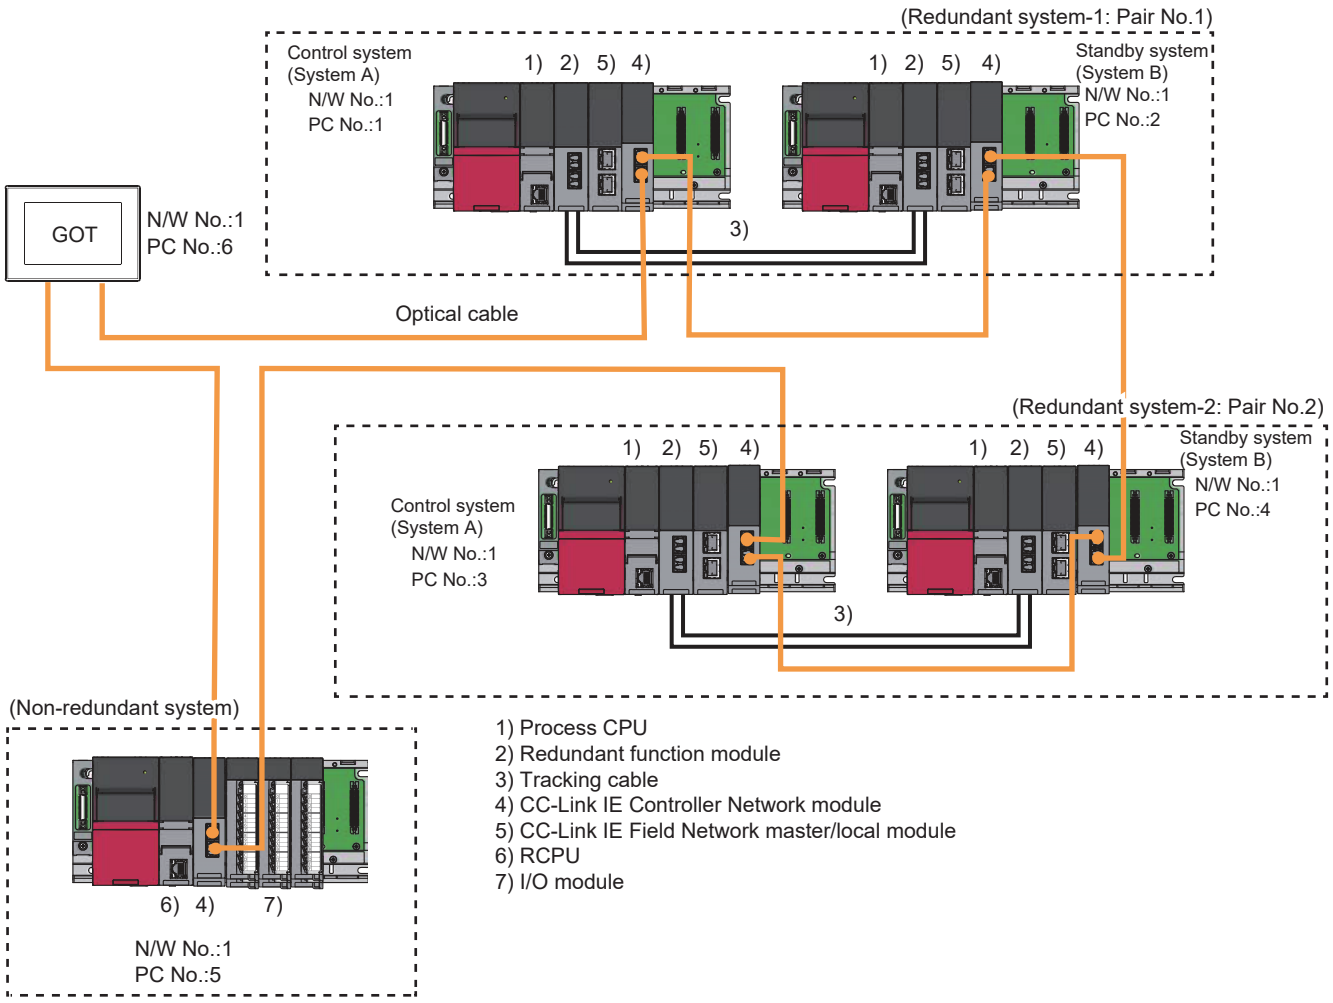
When system switching occurs, the CPU (PLC station No. 4) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

Mixed connection of redundant and non-redundant systems

■System configuration example

The following connection configuration examples are explained.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link IE Controller Network module
5) CC-Link IE Field Network master/local module
6) RCPU
7) I/O module

■Connection method

Connect the CC-Link IE Controller Network system and the GOT.

☞ Page 887 GOT side settings

■Monitoring target change when system switching occurs in a redundant system

☞ Page 888 Monitoring target change when system switching occurs in a redundant system

MELSEC redundant settings

This section describes the settings for the GOT to automatically change the monitoring target of the RCPU redundant system.

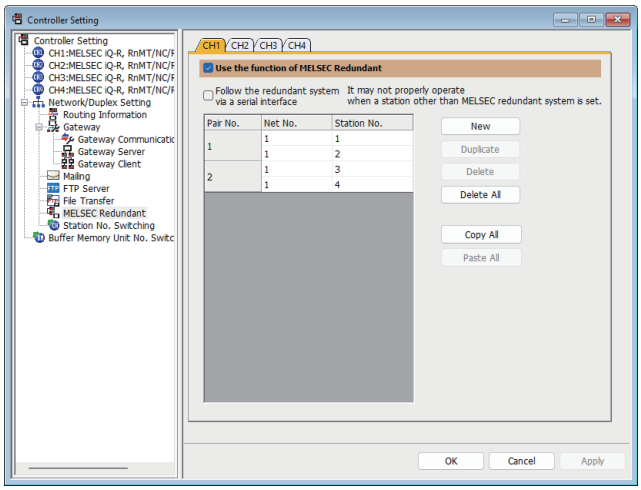
Point

Before configuring the MELSEC redundant settings

In the MELSEC redundant settings, do not set a station outside the redundant RCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC Redundant dialog, settings can be made for each channel of the controller.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Adds a new pair number.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 891 Pair number

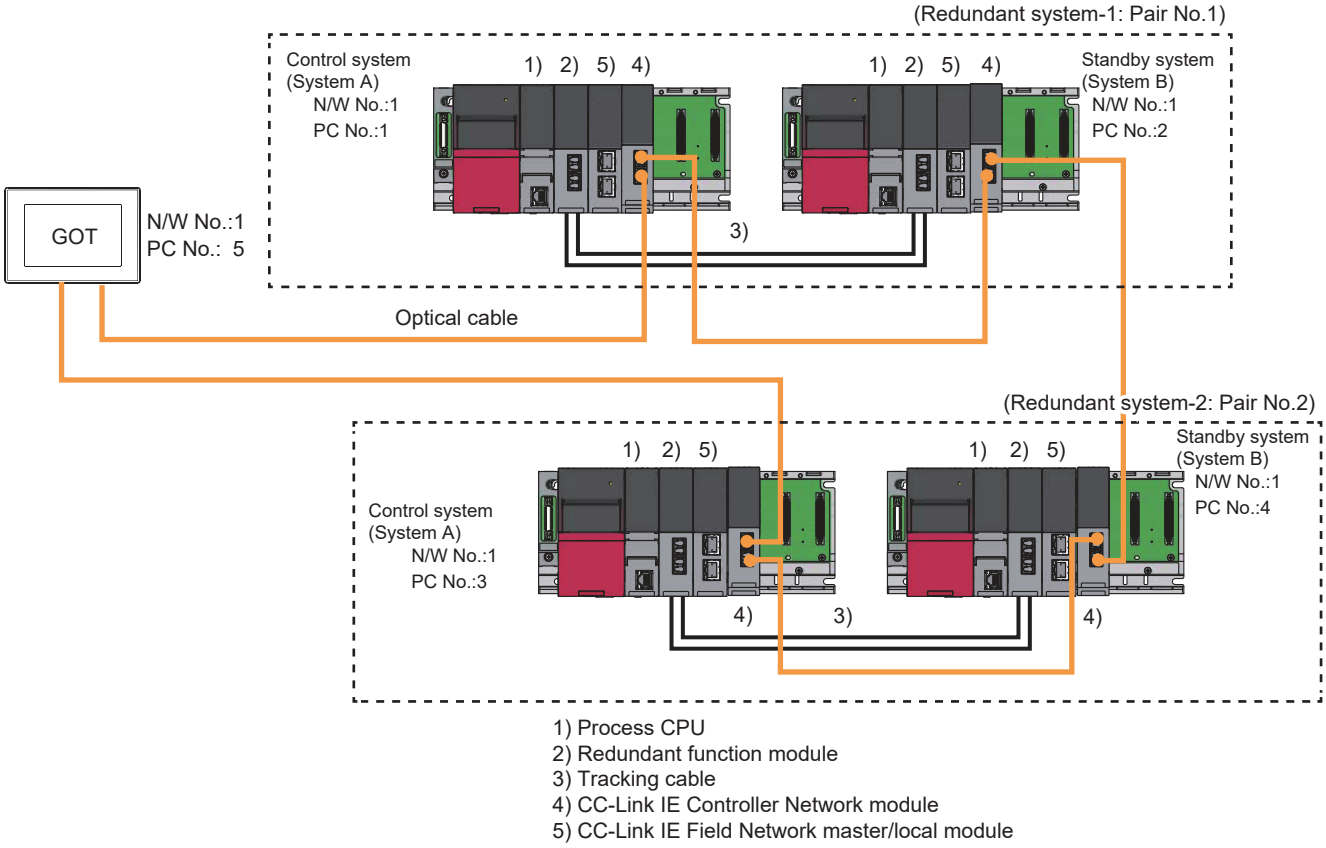
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of the CC-Link IE Controller Network connection in the RCPU redundant system. (Pair No. 1 to No. 2)

Ex.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link IE Controller Network module
5) CC-Link IE Field Network master/local module

Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- Pairing of the last station No. and station No. 1 (Example: Station No. 64 and station No. 1) is not allowed.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the redundant mode of the RCPU redundant system, and does not support the process mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

• 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

"450: Path has changed or timeout occurred in redundant system." appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, "451: The MELSEC redundant setting and actual system configuration do not match." appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings. If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm "315 Device writing error. Correct device." is not detected.

■Option functions including the ladder monitor

A message "Unable to communicate with CPU." is displayed when system switching occurs while an option function such as the ladder monitor is used.

10.3 MELSEC-Q series (CC-Link IE Controller Network connection)

☞ Page 893 Connectable devices
☞ Page 896 System configuration
☞ Page 900 GOT side settings
☞ Page 907 PLC side settings
☞ Page 916 Access range for monitoring
☞ Page 917 How to monitor a redundant system

10.3.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	PLC side interface	Connectable model
			CC-Link IE Controller Network communication unit	
MELSEC-Q (Q mode)	Q00JCPU Q00CPU*1 Q01CPU*1	○	QJ71GP21-SX*5 QJ71GP21S-SX*5	GT37 SoftGOT3000

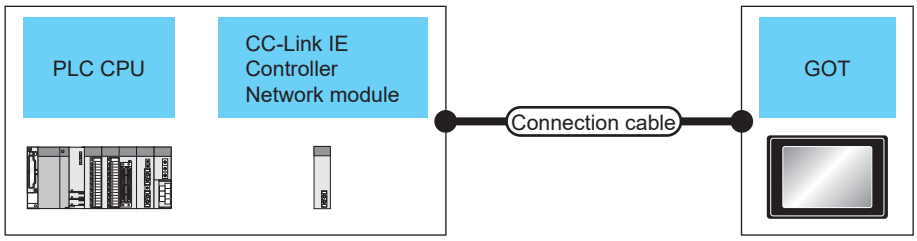
*1 To configure a multiple CPU system, use a CPU with function version B or later.
*2 Use a module having a serial number stating with 12042 or later in the first 5 digits.
*3 Only the first step can be used on the extension base unit (Q52B/Q55B).
*4 The extension base unit (Q5□B/Q6□B) can be used.
*5 Use a CC-Link IE Controller Network module with function version D or later.
*6 Use a CPU having a serial number stating with 09012 or later in the first 5 digits.
*7 If the number of stations on one network is 65 or more, use a CC-Link IE Controller Network module having a serial number starting with 09042 or later in the first 5 digits.
*8 Use a CC-Link IE Controller Network module having a serial number starting with 09011 or later in the first 5 digits.
*9 Use a CPU having a serial number stating with 10042 or later in the first 5 digits.
*10 Use a CC-Link IE Controller Network module having a serial number starting with 09042 or later in the first 5 digits.
*11 Use a CPU having a serial number stating with 09042 or later in the first 5 digits.
*12 Writing data to a QS001CPU always causes an error.
*13 Use a CPU having a serial number stating with 12012 or later in the first 5 digits.
*14 The following requirements must be satisfied.
Software: MT Works2 version 1.23Z
CPU model: Q170M SV43
*15 For GT SoftGOT3000, configure the multiple CPU system using a QCPU (Q mode).

Precautions

For information on the version restrictions of the CC-Link IE Controller Network module, refer to the following manual.
CC-Link IE Controller Network Reference Manual

10.3.2 System configuration



For details on the maximum length of the connection cable, refer to the following.

☞ Page 896 Maximum length

For details on the maximum number of connected devices, refer to the following.

☞ Page 896 Maximum number of connected devices

PLC		Communication type	Connection cable	GOT	
Controller	CC-Link IE Controller Network communication unit*1			Interface	Model
MELSEC-Q (Q mode)*4 C Controller module (Q series) MELSEC-QS Motion CPU (Q series) CNC C70 Robot controller (Q series)	QJ71GP21-SX QJ71GP21S-SX	CC-Link IE Controller Network	Optical fiber cable*2	GT37-IF2000 + GT15-J71GP23-SX (optical loop type)*3	GT37 SoftGOT3000

*1 For the CC-Link IE Controller Network extended mode, the serial number must start with 12052 or later.
For the system configuration on the CC-Link IE Controller Network module side, refer to the following manual.
CC-Link IE Controller Network Reference Manual

*2 For details on the optical fiber cable, refer to the following manual.
CC-Link IE Controller Network Reference Manual

*3 For the CC-Link IE Controller Network extended mode, the serial number must be 02910908******* or later.

*4 When the CC-Link IE Controller Network is in the extended mode, only MELSEC-Q series Universal model QCPU can be used.

Maximum length

The overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the total number of stations.

For details, refer to the following manual.

CC-Link IE Controller Network Reference Manual

Maximum number of connected devices

The following shows the number of GOTs connectable to one controller.

Controller	
Model	Number of GOTs connectable to one PLC
MELSEC-Q (Q mode) Motion CPU (Q series) C Controller module (Q series) MELSEC-QS CNC C70 Robot controller (Q series)	119*1

*1 When the Universal model QCPU is the control station, up to 119 GOTs can be connected.
When a QCPU other than the Universal model is the control station, up to 63 GOTs can be connected.
The Basic model QCPU and the QSCPU cannot be used as the control station.

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed. Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

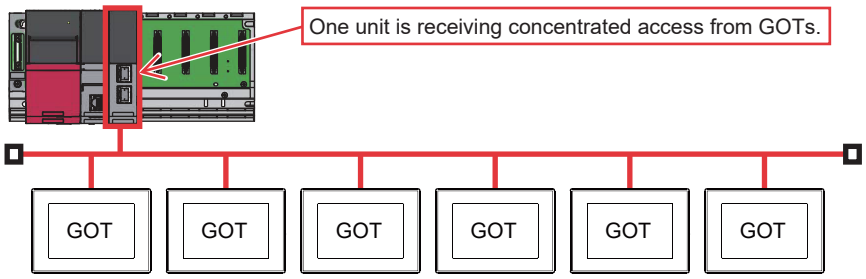
■Split GOT connection destinations into several systems

Add a master/local unit on the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

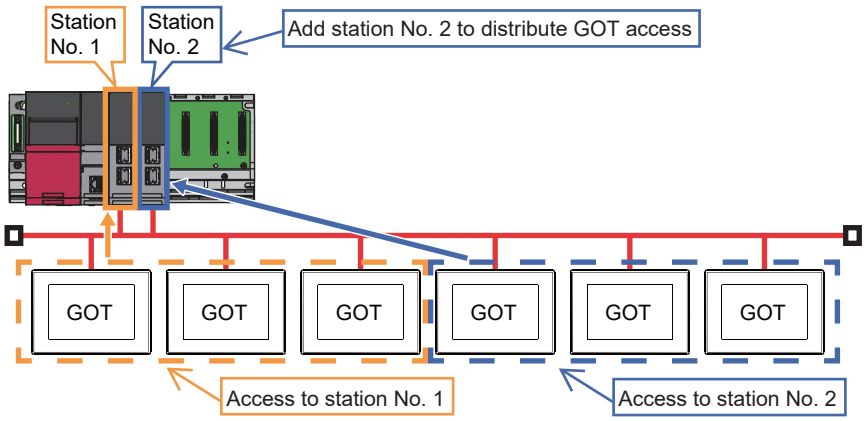
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

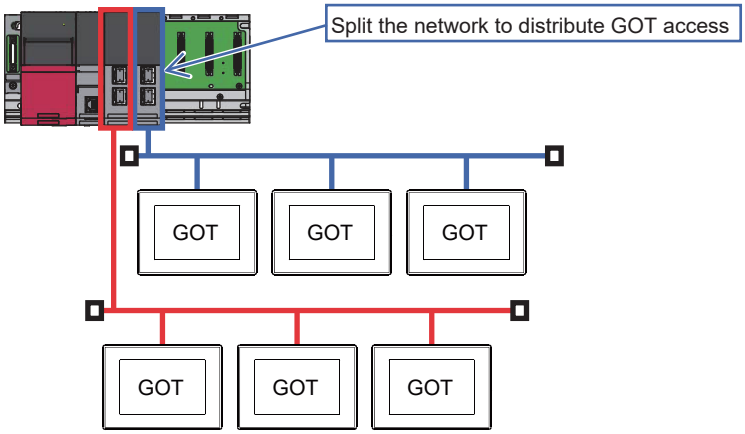
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT connected to the CC-Link IE Controller Network

For the CC-Link IE Controller Network connection, the data link is started approximately 13 seconds after the GOT startup.

■When a network error occurs in the system alarm

In the CC-Link IE Controller Network connection, when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

■Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes the following time to run.

QCPU (Q mode), Motion CPU (Q series): 10 seconds or more

If the GOT is started during the above time, a system alarm occurs. Adjust the opening screen time in the GOT setup so that no system alarm occurs.

📖GT Designer3 (GOT3000) Screen Design Manual

■Connection to QSCPU

The GOT can only read device data and sequence programs by the ladder monitor function in the QSCPU.

The GOT cannot write any data to the QSCPU.

■Connection to Q170MCPU or Q170MSCPU(-S1)

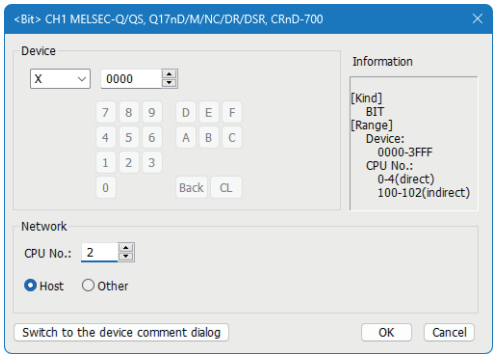
Set [CPU No.] to 2 in the device setting to monitor the device of the Motion CPU area (CPU No. 2).

When [CPU No.] is set to 0 or 1, the device on the PLC CPU area (CPU No. 1) is monitored.

When [CPU No.] is set to the number other than 0 to 2, a communication error occurs and the monitoring cannot be executed.

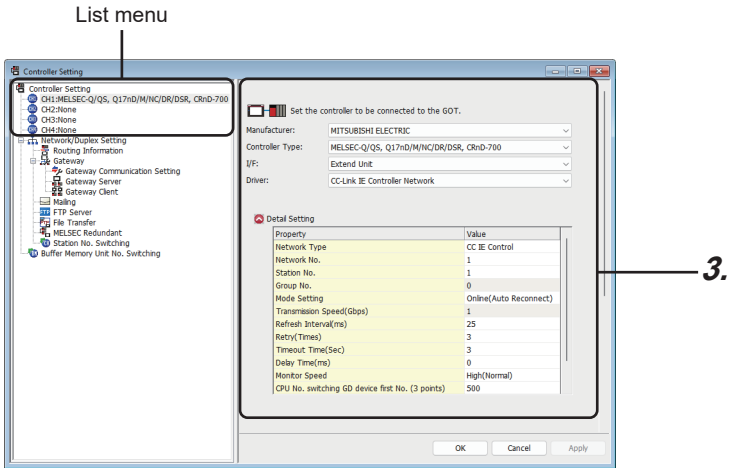
For the setting of [CPU No.], refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual



10.3.3 GOT side settings

[Controller Setting]



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
[I/F]	[Extend Unit]
[Driver]	[CC-Link IE Controller Network]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 901 [Detail Setting]

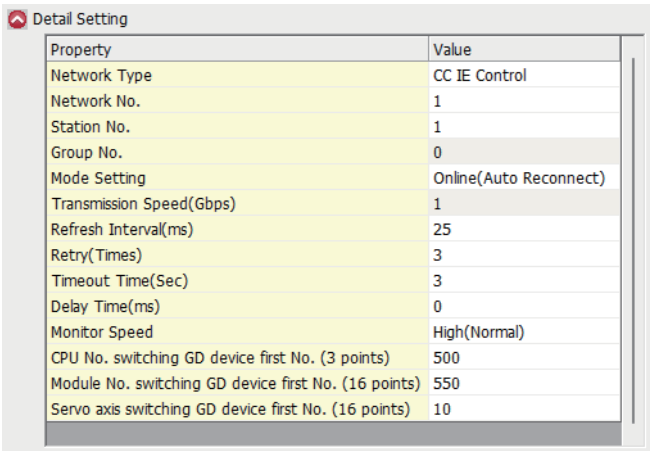
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Network Type]*4	Set the network type.	[CC IE Control], [CC IE Control Extended Mode]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[Group No.]	-	[0]
[Mode]	Set the operation mode of the GOT.	[Online(Auto Reconnect)], [Offline], [H/W test]*1, [Self-loopback test]*1, [Internal self-loopback test]*1, [Line test]*1, [Test stations]*1
[Transmission Speed]	-	[1Gbps]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication. This setting is effective when [Block data assurance per station is available.] is selected for the network parameter on the control station side of CC-Link IE Controller Network.	[1] ms to [1000] ms
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]*5	Set the monitor speed for the CC-Link IE Controller Network. This setting is not valid in all systems.	[High(Normal)]*2, [Middle]*3, [Low]*3
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 903 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 904 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 905 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 For details, refer to the following manual.
CC-Link IE Controller Network Reference Manual

*2 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen. However, the range may affect the sequence scan time when connecting to Q00UJ/Q00U/Q01U/Q02UCPU or Q00J/Q00/Q01CPU. If you want to avoid the influence on the sequence scan time, do not set [High(Normal)]. (This setting hardly affects QCPUs other than the above.)

*3 Set this item if you want to avoid the influence on the sequence scan time further than the [Middle] setting when connecting to Q00UJ/Q00U/Q01U/Q02UCPU or Q00J/Q00/Q01CPU. However, the monitor speed may be reduced.

*4 For the CC-Link IE Controller Network extended mode, select [CC IE Control Extended Mode]. The extended mode can be used in GT Designer3 version 1.22Y or later.

*5 When using a global label, to read or write more than 235 two-byte characters, set the [Monitor speed] to [High(Normal)] or [Middle]. If [Monitor speed] is set to [Low], a system error occurs when reading or writing. For details, refer to the following manual.
GT Designer3 (GOT3000) Screen Design Manual

Point

• Example of communication detail settings

For the example of communication detail settings, refer to the following.

☞ Page 855 PLC side settings

• Communication interface settings in the utility

The communication interface setting can be changed on the utility's [Communication setting] after writing [Controller Setting] of project data.

For details on the utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the controller settings

When the settings are configured in GT Designer3 or in the utility, the latest settings are effective.

• Network type

Be sure to set the same network types for the CPU side and the GOT side.

If the network types of the CPU side and the GOT side are different, an error is displayed in the system alarm of the GOT side.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 network numbers can be set for [Transfer Net No.].

However, the same destination network number cannot be set twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

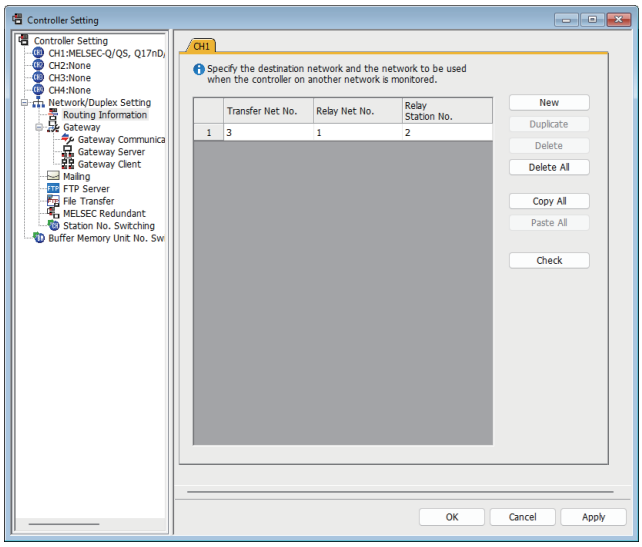
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC-Q CC-Link IE Controller Network Reference Manual



Item		Range
[Transfer Net No.]		[1] to [239]
[Relay Net No.]		[1] to [239]
[Relay Station No.]	Universal model QCPU	[0] to [120]
	QCPU other than the Universal model*1	[0] to [64]

*1 The Basic model QCPU and the QSCPU are not included.

Point

• Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 907 PLC side settings

• Parameter reflection function of MELSOFT Navigator

The color of the cells for the items which are reflected to GT Designer3 from MELSOFT Navigator changes to green. Set items, which are displayed in green cells, from the MELSOFT Navigator.

When the settings of the transfer network number, relay network number, or relay station number are reflected to the parameter from MELSOFT Navigator, those settings are added. Items set in advance are not deleted.

However, if the target network number overlaps, the item set in advance is overwritten.

The routing information is used manually by the user when the data is created. Therefore, after changing the network configuration by MELSOFT Navigator, create a routing information again.

For details on creating the routing information, refer to the MELSOFT Navigator help.

Point

• CC-Link IE Controller Network module

For details on the CC-Link IE Controller Network module, refer to the following manual.

CC-Link IE Controller Network Reference Manual

• Data link status check

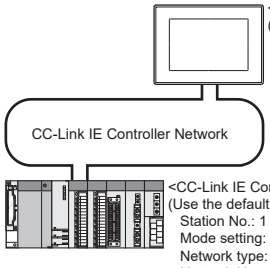
Refer to the following.

Page 916 Access range for monitoring

Connection to MELSEC-Q series

This section describes the settings of the GOT and CC-Link IE Controller Network module in the system configuration shown below.

■System configuration 1 (Network Type: CC IE Control)



<GOT>
(Use the default value for settings other than the following.)
Network type: CC IE Control
Network No.: 1
Station No.: 2
Mode setting: Online (auto reconnection)
Network range assignment: LB0100H to LB01FFH
LW00100H to LW001FFH
Monitor speed: High

<CC-Link IE Controller Network module> *1
(Use the default value for settings other than the following.)
Station No.: 1
Mode setting: Online
Network type: CC IE Control (control station)
Network No.: 1
Total number of (sub) stations: 2
Network range assignment: LB0000H to LB00FFH
LW00000H to LW000FFH

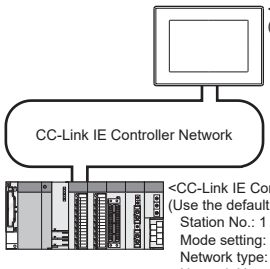
*1 The CC-Link IE Controller Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Controller Network module is set to 0.

Point

Connection to Q170MCPU or Q170MSCPU(-S1)

For connection to Q170MCPU or Q170MSCPU(-S1), the start I/O number of the CC-Link IE Controller Network module is set to 70.

■System configuration 2 (Network Type: CC IE Control extended mode)



<GOT>
(Use the default value for settings other than the following.)
Network type: CC IE Control extended mode
Network No.: 1
Station No.: 2
Mode setting: Online (auto reconnection)
Network range assignment: LB0100H to LB01FFH
LW00100H to LW001FFH
Monitor speed: High

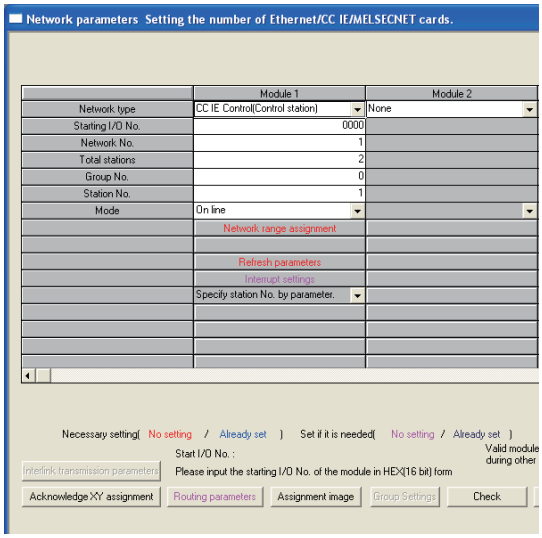
<CC-Link IE Controller Network module> *1
(Use the default value for settings other than the following.)
Station No.: 1
Mode setting: Online
Network type: CC IE Control extended mode (control station)
Network No.: 1
Total number of (sub) stations: 2
Network range assignment: LB0000H to LB00FFH
LW00000H to LW000FFH

*1 The CC-Link IE Controller Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Controller Network module is set to 0.

■Parameter settings for system configuration 1 (Network Type: CC IE Control) for connection to MELSEC-Q or QS series

• [Network parameter] in GX Developer

Network parameter

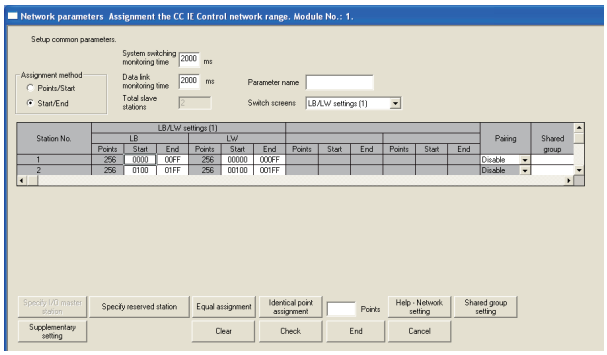


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Network type]	CC IE Control (control station)	○
[Starting I/O No.]*1	0000H	○
[Network No.]*2	1	○
[Total stations]	2	○
[Group No.]	0	○
[Station No.]	1	○
[Mode]*3	Online	○
[Network range assignment]	☞ Network range assignment	△
[Refresh parameters]	(Use default value)	△
[Interrupt settings]		—
[Interlink transmission parameters]		—
[Routing parameters]	☞ Routing parameters	△

*1 When using Q170MCPU or Q170MSCPU(-S1), set it according to the system configuration.
*2 Set the same network number as that of the GOT.
*3 Set the same mode setting as that of the GOT.

Network range assignment



○: Necessary, △: As necessary, —: Not necessary

Item				Setting value	Setting for GOT connection
[Monitoring time]				2000	△
[LB/LW settings (1)]*1	[LB]	Station No. 1	[Start]	0000H	△
			[End]	00FFH	△
		Station No. 2	[Start]	0100H	△
			[End]	01FFH	△
	[LW]	Station No. 1	[Start]	00000H	△
			[End]	000FFH	△
		Station No. 2	[Start]	00100H	△
			[End]	001FFH	△
[LX/LY settings]*1				No setting	△
[Specify I/O master station]*1				No setting	△
[Specify reserved station]				No setting	△
[Supplementary setting]				(Use default value)	△

*1 Be sure to set it to perform the cyclic transmission.

Point

When changing the network parameter

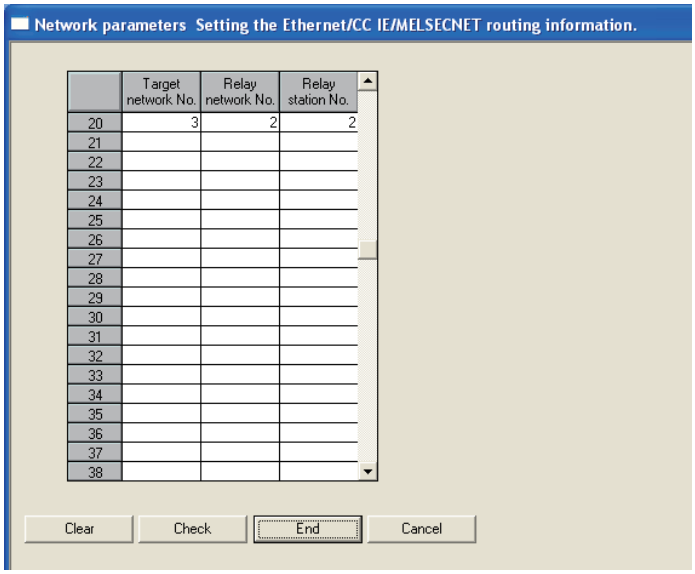
After writing network parameters to the PLC CPU, turn off then on or reset the PLC CPU.

Routing parameters

Up to 64 network numbers can be set for [Target network No.].

However, the same destination network number cannot be set twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Target network No.].



Item	Range
[Target network No.]	[1] to [239]
[Relay network No.]	[1] to [239]
[Relay station No.]	[0] to [120]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

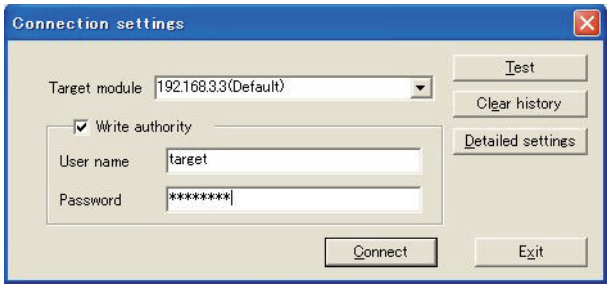
For the setting, refer to the following.

☞ Page 906 Routing parameter settings

■Parameter settings for system configuration 1 (Network Type: CC IE Control) for connection to C Controller module (Q series)

Use SW3PVC-CCPU-E Ver.3.05F or later for the CC IE Control utility.

- Connection settings between personal computer and C controller module (Q Series)



○: Necessary, △: As necessary, —: Not necessary

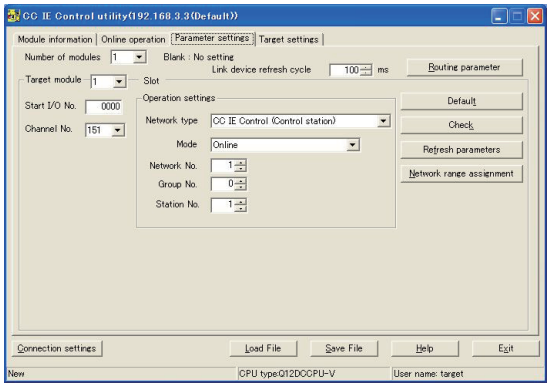
Item	Setting value	Setting for GOT connection
[Target module]*1	192.168.3.3 (Default)	○
[Write authority]	Mark the checkbox	○
[User name]*2	target	○
[Password]*2	password	○
[Detailed settings]	-	△

*1 If the IP address of the C Controller module (Q Series) has been changed, input the changed IP address or host name.

*2 If the account of the C Controller module (Q Series) has been changed, input the changed user name and password.

• CC IE Control utility's [Parameter settings]

Network parameter



○: Necessary, △: As necessary, —: Not necessary

[Specify I/O master station]*1				No setting	△
[Specify reserved station]				No setting	△
[Supplementary settings]				(Use default value)	△

*1 Be sure to set it to perform the cyclic transmission.

Point

When changing the network parameter

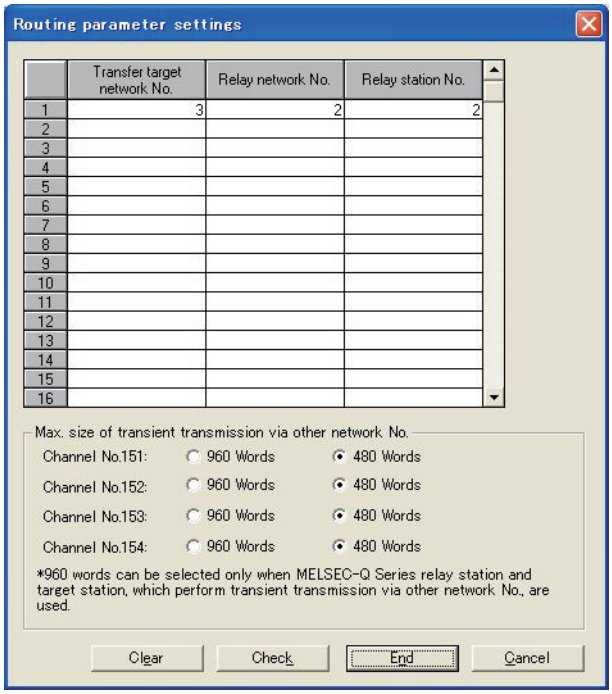
After writing network parameters to the C Controller module (Q series), turn off then on or reset the C Controller module (Q series).

Routing parameters

Up to 64 network numbers can be set for [Transfer target network No.].

However, the same destination network number cannot be set twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer target network No.].



Item	Range
[Transfer target network No.]	[1] to [239]
[Relay network No.]	[1] to [239]
[Relay station No.]	[0] to [120]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 906 Routing parameter settings

■System configuration 1 (Network Type: CC IE Control): [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Control
[Network No.]	1: Network No. 1
[Station No.]	2: Station No. 2
[Group No.]	0
[Mode Setting]	Online (auto reconnection)
[Transmission Speed]	1 Gbps
[Refresh Interval]	1 ms
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

[Controller Setting] in GT Designer3

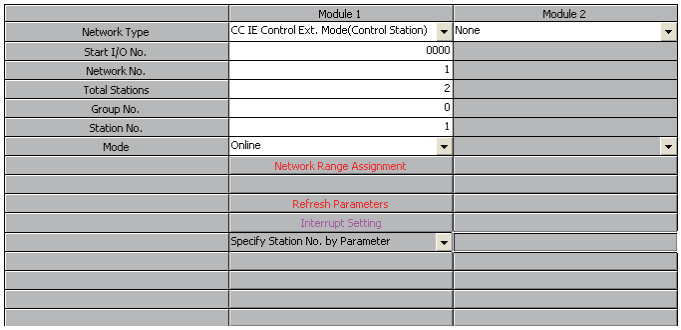
For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 900 [Controller Setting]

■Parameter settings for system configuration 2 (Network Type: Extended mode) for connection to Universal model QCPU

• [Network parameter] in GX Works2

Network parameter



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Network type]	CC IE Control extended mode (control station)	○
[Start I/O No.]	0000H	○
[Network No.]	1	○
[Total Stations]	2	○
[Group No.]	0	○
[Station No.]	1	○
[Mode]	Online	○
[Network Range Assignment]	Same as the following setting ☞ [Network parameter] in GX Developer	?
[Refresh Parameters]	(Use default value)	?
[Interrupt Setting]		×
[Interlink transmission parameters]		×
[Routing parameters]	Same as the following setting ☞ [Network parameter] in GX Developer	?

• [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Control extended mode
[Network No.]	1: Network No. 1
[Station No.]	2: Station No. 2
[Group No.]	0
[Mode Setting]	Online (auto reconnection)
[Refresh Interval]	1 ms
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

• Network type of the GOT side

When the network is in the extended mode, be sure to set the network type of the GOT side to [CC IE Control Extended Mode].

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 900 [Controller Setting]

• Network type of the PLC side

Only GX Works2 can set [CC IE Control Ext. Mode(Control Station)] or [CC IE Control Ext. Mode(Normal Station)].

The CPU which is compatible with the extended mode is the Universal model QCPU only.

10.3.5 Access range for monitoring

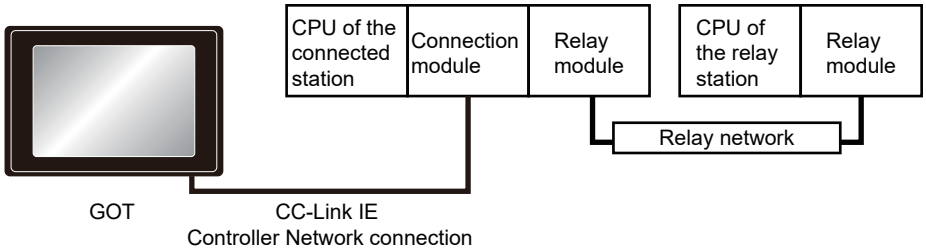
When the GOT is connected to the CPU of the station connected via CC-Link IE Controller Network, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station								
		Relay network	CPU of the relay station							
			MXR	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
QnUDVCPU QnUDECPU QnUDEHCPU QnUCPU QnUDCPU QnUDHCPU	☞ Page 893 Connectable devices	Ethernet	—	—	○	○*2	○	—	○	—	—
		CC-Link IE Controller Network	—	—	—	○	○	—	—	—	—

		CC-Link IE Field Network	—	—	○	○*1	○	—	—	—	—
		MELSECNET/H, MELSECNET/10	—	—	—	○	○	○	○	○*3	—

*1 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, QnUDHCPU, and C Controller module (MELSEC-Q series) are supported.

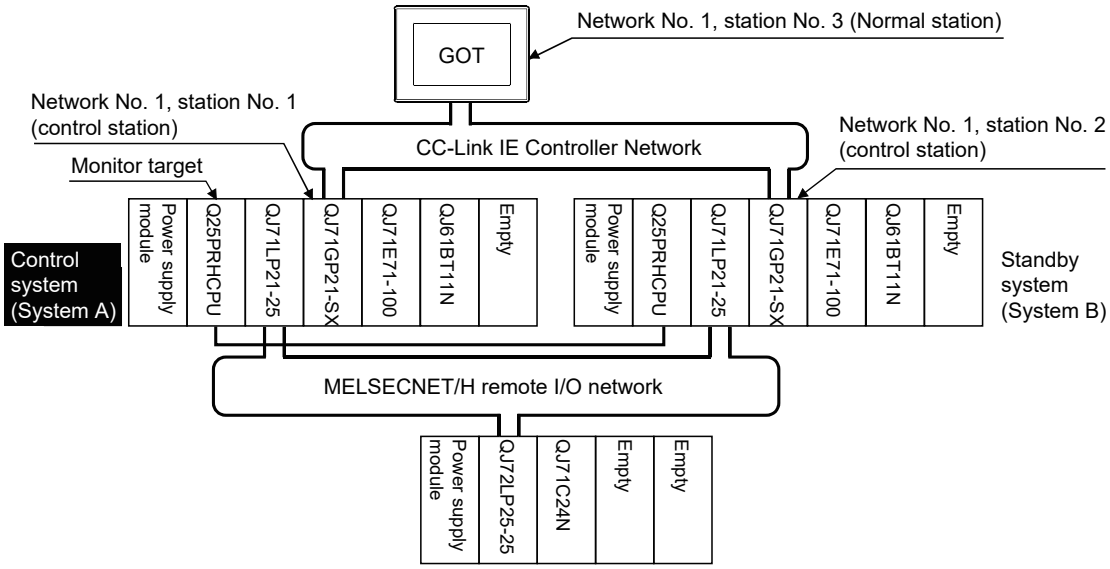
*2 The C Controller module (MELSEC-Q series) is not supported.

*3 AnUCPU and AnUSCPU are supported.

10.3.6 How to monitor a redundant system

This section describes the CC-Link IE Controller Network connection for connecting the GOT to the CC-Link IE Controller Network.

The following shows an example of connecting the GOT set as the normal station to the CC-Link IE Controller Network.



Connection method

Connect the CC-Link IE Controller Network and the GOT.

For details, refer to the following.

☞ Page 893 MELSEC-Q series (CC-Link IE Controller Network connection)

Settings in GT Designer3

Set GT Designer3 as follows.

Setting item	Setting details		Model
Type	MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700		GT37 SoftGOT3000
Device setting (Network setting)	Other	[Network No.]: Network number of CC-Link IE Controller Network	
		[Station No.]: Station number of the control system	
MELSEC redundant setting	☞ Page 918 MELSEC redundant settings		

Monitoring target change when system switching occurs in a redundant system

When system switching occurs, the network module station No. 2 switches from the normal station to the sub-control station, and continues to control the CC-Link IE Controller Network as the control system.

Since the GOT monitors the control system, the monitoring target is automatically changed to the network module station No. 2.

MELSEC redundant settings

This section describes the settings for the GOT to automatically change the monitoring target of the QCPU redundant system.

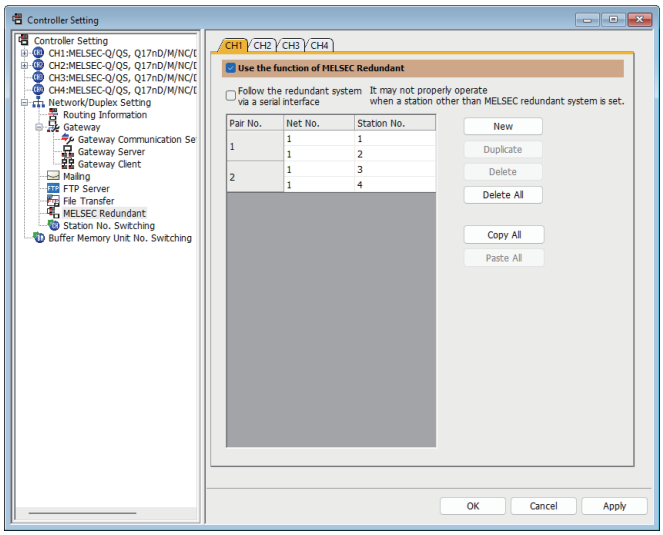
Point

Before configuring the MELSEC redundant settings

In the MELSEC redundant settings, do not set a station outside the redundant QCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC Redundant dialog, settings can be made for each channel of the controller.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Adds a new pair number.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 919 Pair number

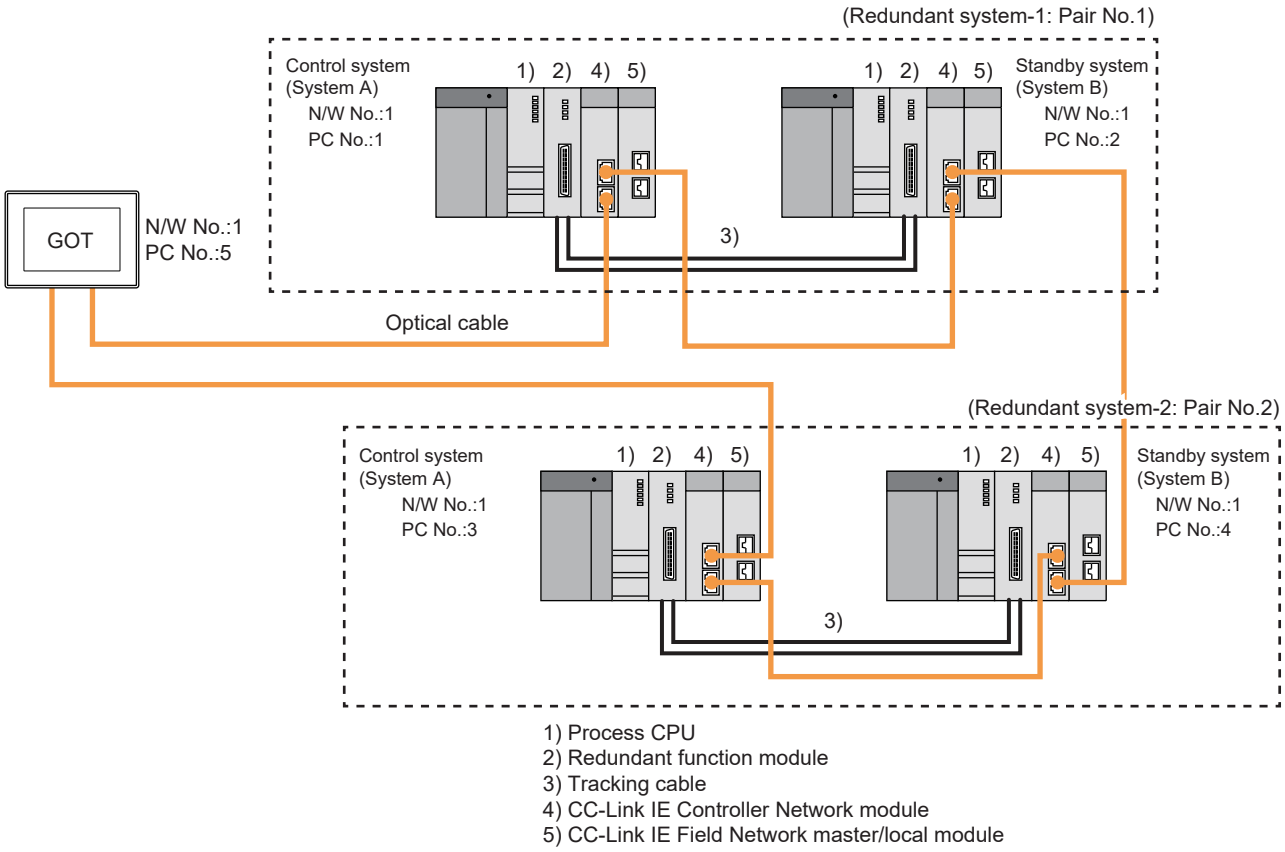
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of the CC-Link IE Controller Network connection in the QCPU redundant system. (Pair No. 1 to No. 2)

Ex.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link IE Controller Network module
5) CC-Link IE Field Network master/local module

Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- Pairing of the last station No. and station No. 1 (Example: Station No. 64 and station No. 1) is not allowed.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the redundant mode of the RCPU redundant system, and does not support the process mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

• 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

"450: Path has changed or timeout occurred in redundant system." appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, "451: The MELSEC redundant setting and actual system configuration do not match." appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings. If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm "315 Device writing error. Correct device." is not detected.

■Option functions including the ladder monitor

A message "Unable to communicate with CPU." is displayed when system switching occurs while an option function such as the ladder monitor is used.

■When the QCPU redundant system is in the debug mode

When the QCPU redundant system is in the debug mode, do not configure the MELSEC redundant system settings on the GOT side when connecting the GOT.

11 CC-Link IE Field Network connection

☞ Page 921 MELSEC MX Controller (MX-R Model) (CC-Link IE Field Network connection)
☞ Page 940 MELSEC iQ-R series (CC-Link IE Field Network connection)
☞ Page 968 MELSEC iQ-F series (CC-Link IE Field Network connection)
☞ Page 981 MELSEC-Q series (CC-Link IE Field Network connection)
☞ Page 1001 MELSEC-L series (CC-Link IE Field Network connection)

11.1 MELSEC MX Controller (MX-R Model) (CC-Link IE Field Network connection)

☞ Page 921 Connectable devices
☞ Page 922 System configuration
☞ Page 926 GOT side settings
☞ Page 934 PLC side settings
☞ Page 937 Connection to the PLC with the authentication function enabled
☞ Page 939 Access range for monitoring

11.1.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

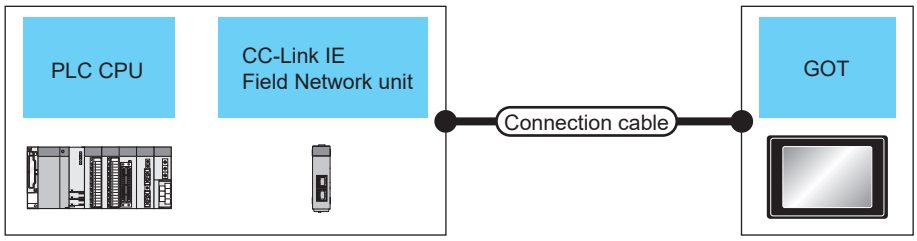
Controller	Model	Clock	PLC side interface	Connectable model
			CC-Link IE Field Network communication unit	
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64	○	RJ71GF11-T2 RJ71EN71	GT37 SoftGOT3000
	MXR500-128 MXR500-256	○	RJ71GF11-T2 RJ71EN71	GT37 SoftGOT3000

Precautions

For information on the version restrictions of the CC-Link IE Field Network module, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

11.1.2 System configuration



For details on the connection cable and overall cable length, refer to the following.

☞ Page 922 Connection cable

☞ Page 923 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 923 Maximum number of connected devices

Controller	CC-Link IE Field Network communication unit	Connection cable	GOT	
			Interface	Model
MELSEC MX Controller (MX-R Model)*2	RJ71GF11-T2 RJ71EN71*3	Twisted pair cable	GT37-IF2000 + GT15-J71GF13-T2*1	GT37 SoftGOT3000

*1 If there is a submaster station in the network configuration, use software version C or later.
The software version is the 10th digit of the serial number described on the rating plate of the unit.

*2 When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.
For information on how to logon and logoff, refer to the following.
☞ Page 937 Logon to the PLC
☞ Page 937 Logoff from the PLC
The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.
Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.
☞ Page 937 Creating a project

*3 Connection to the PLC with the authentication function enabled is not supported.

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
1000BASE-T	Shielded twisted pair cable (STP) of category 5e or higher

Use cables that meet the IEEE802.3 1000BASE-T standard.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Use hubs that satisfy the following conditions.

- Compliant with the IEEE802.3 (1000BASE-T) standard
- Include Auto MDI/MDI-X.
- Include an automatic negotiation function.
- Switching hub (Do not use repeater hubs.)

Recommended switching hub (Mitsubishi Electric products)

Type	Model
Industrial switching hub	NZ2EHG-T8

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

Maximum number of connected devices

The following shows the number of GOTs connectable to one controller.

Controller	
Model	**Number of GOTs connectable to one PLC**
MELSEC MX Controller (MX-R Model)	120

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

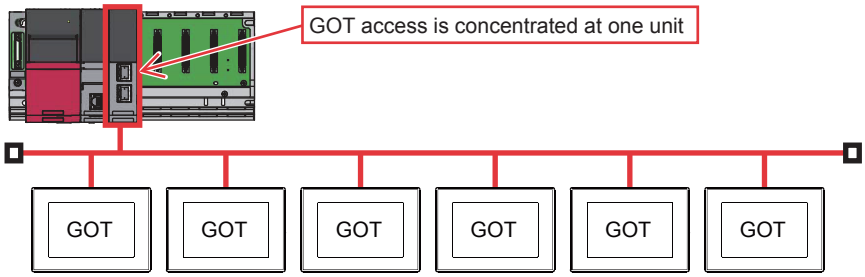
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

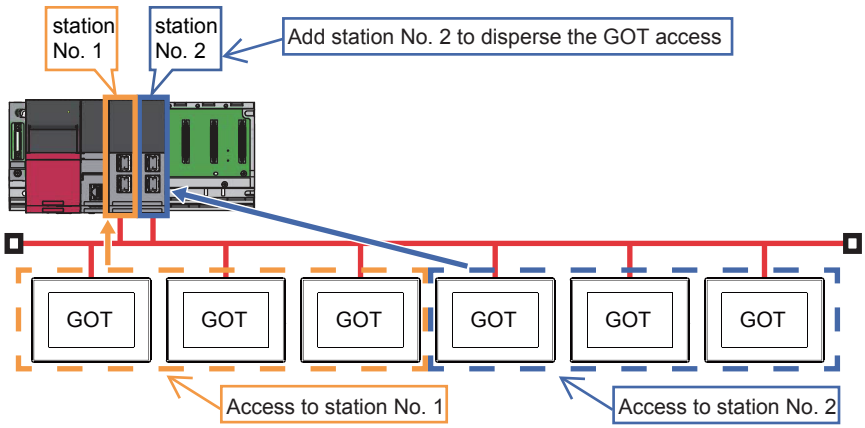
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

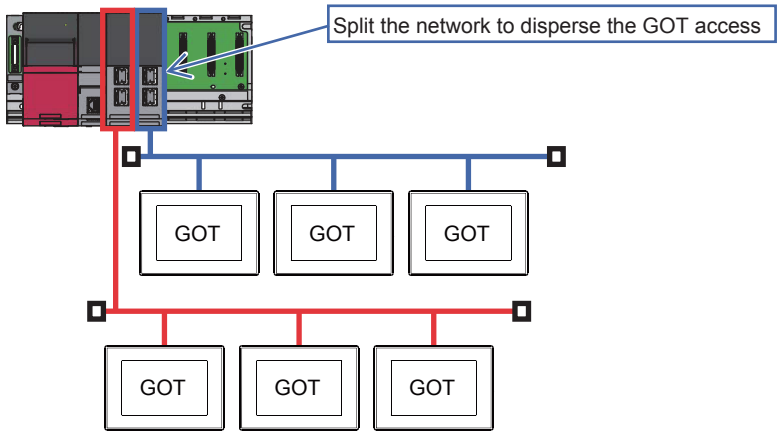
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT connected to the CC-Link IE Field Network

For the CC-Link IE Field Network connection, the data link is started approximately 15 seconds after the GOT startup.

■When a network error occurs in the system alarm

In the CC-Link IE Field Network connection, when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.
To cancel the system alarm display, restart the GOT.

■Data link failure in other stations at GOT startup

At GOT startup, the data link failure may occur in other stations.
However, after the failure occurrence, the GOT reconnects automatically and monitors the devices properly.
To avoid such data link failure, start up the GOT 10 seconds earlier than the master station.
However, if the master station does not complete startup when the GOT starts monitoring (10 seconds after the GOT startup), the communication timeout occurs in the GOT.
For details, refer to the following manual.
CC-Link IE Field Network Master/Local Module User's Manual

■Data link failure in all stations at GOT startup or cable connection/disconnection

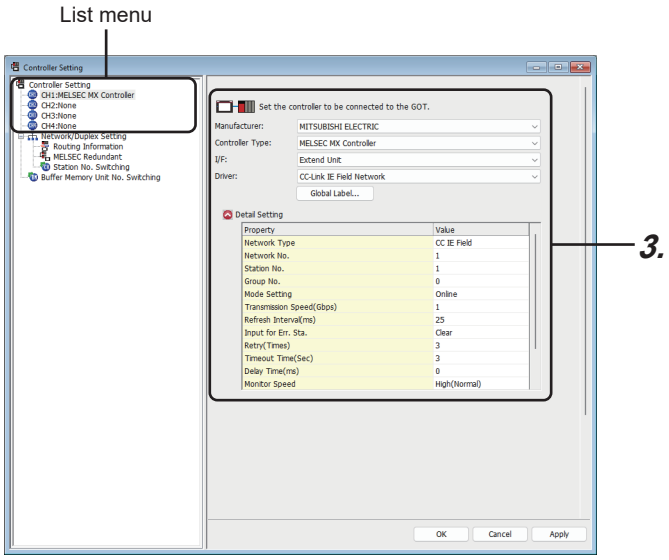
At GOT startup, the communication is broken temporarily between PORT1 and PORT2 in the CC-Link IE Field module which is installed on the GOT.
Thus, as the GOT or a station between the GOT and the master station is reconnected, the data link failure may occur on all stations.
GOT startup includes the following operations.

- Turning on the GOT
- Resetting the GOT main unit
- Operating the utility
- Downloading the project including the communication settings
- Downloading the OS

11.1.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC MX Controller]
[I/F]	[Extend Unit]
[Driver]	[CC-Link IE Field Network]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 927 [Detail Setting]

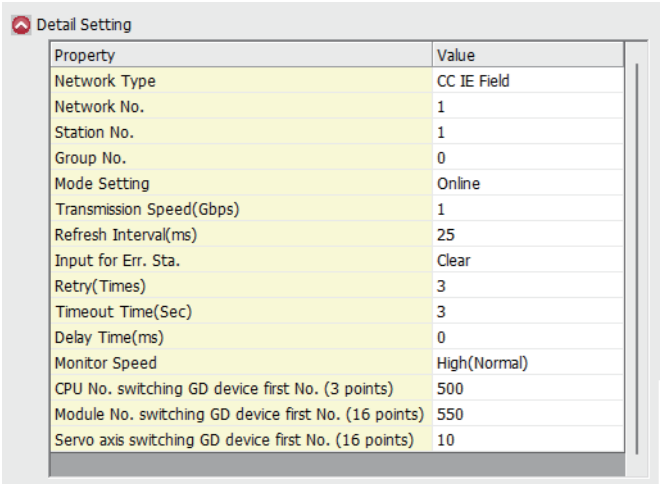
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Network Type]	Set the network type.	[CC IE Field]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the hardware test and self-loopback test, refer to the following. ☞ Page 929 Hardware test ☞ Page 929 Self-loopback test	[Online], [Offline], [H/W test], [Self-loopback test]
[Transmission Speed]	—	[1Gbps]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication.	[1] ms to [1000] ms
[Input for Err. Sta.]	Set whether to hold or clear the input from the station whose data link has become faulty due to powering off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]*2	Set the monitor speed for the CC-Link IE Field Network. This setting is not valid in all systems.	[High(Normal)]*1, [Middle], [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 930 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 931 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 932 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.

*2 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
📖GT Designer3 (GOT3000) Screen Design Manual

Precautions

When the output is required to be held at the data link failure, set [Input for Err. Sta.] to [Hold] in the controller setting of the GOT.

Point

• Example of communication detail settings

For the example of communication detail settings, refer to the following.

☞ Page 934 PLC side settings

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

📖GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

• Network type

Be sure to set the same network types for the CPU side and the GOT side.

If the network types of the CPU side and the GOT side are different, an error is displayed in the system alarm of the GOT side.

■Hardware test

For a hardware test, mount a CC-Link IE Field Network communication unit on the GOT, and check if the unit operates properly with the GOT.

The following shows the hardware test procedure.

1. Perform either of the following operations to set the GOT to the hardware test mode.
   - Write the project data for which [Mode Setting] in [Detail Setting] is set to [H/W test] to the GOT.
   - Set [Mode setting] of [Detail setting] to [H/W Test] in the GOT utility.
2. A hardware test will start at GOT startup.
3. After the test is complete, check the result with the ERR LED on the CC-Link IE Field Network communication unit.
   - OFF: Normal
   - ON: Error
4. If no error is detected, change the setting of [Mode Setting] from [H/W test] in [Detail Setting].

Since the communication with the controller is not performed when [Mode setting] is set to [H/W Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the CC-Link IE Field Network communication unit.

■Self-loopback test

In a self-loopback test, connect port 1 and port 2 of the CC-Link IE Field Network communication unit mounted on the GOT with a network cable, and check if the unit operates properly with the GOT.

The following shows the self-loopback test procedure.

1. Perform either of the following operations to set the GOT to the self-loopback test mode.
   - Write the project data for which [Mode Setting] in [Detail Setting] is set to [Self-loopback test] to the GOT.
   - Set [Mode setting] in [Detail setting] to [Self-loopback Test] in the GOT utility.
2. A self-loopback test will start at a GOT startup.
3. After the test is complete, check the result with the ERR LED on the CC-Link IE Field Network communication unit.
   - OFF: Normal
   - ON: Error
4. If no error is detected, change the setting of [Mode Setting] from [Self-loopback test] in [Detail Setting].

Since the communication with the controller is not performed when [Mode setting] is set to [Self-loopback Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the CC-Link IE Field Network communication unit.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

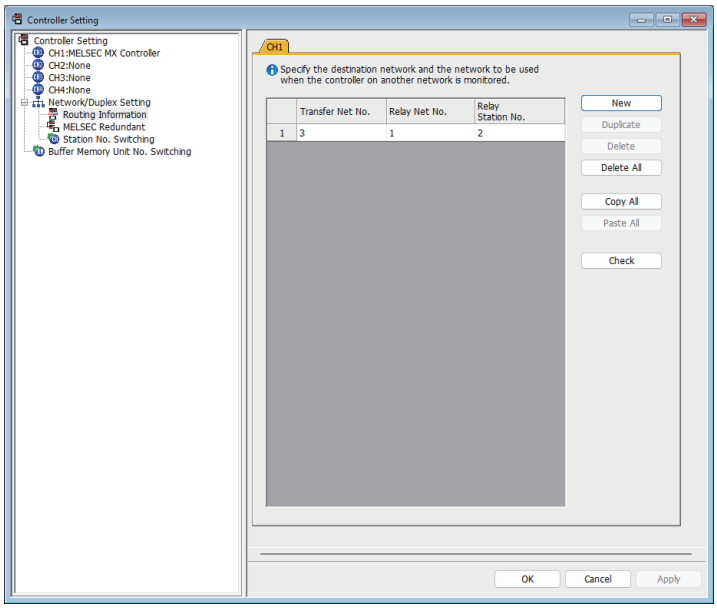
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC iQ-R CPU Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 934 PLC side settings

11.1.4 PLC side settings

Model		Reference
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64 MXR500-128 MXR500-256	☞ Page 934 Connection to the MELSEC MX Controller (MX-R Model)

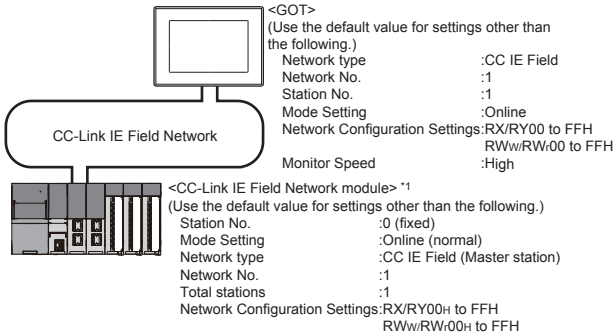
For details on the CC-Link IE Field Network module, refer to the following manual.

📖CC-Link IE Field Network Master/Local Module User's Manual

Connection to the MELSEC MX Controller (MX-R Model)

This section describes the settings of the GOT and CC-Link IE Field Network module in the system configuration shown below.

■System configuration (Network Type: CC IE Field)

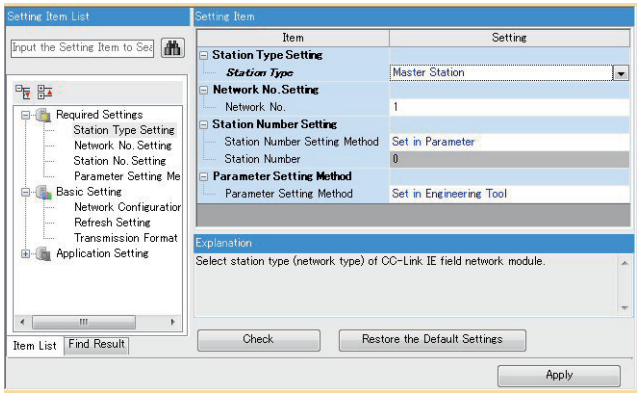


*1 The CC-Link IE Field Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Field Network module is set to 0.

■Module parameter settings of the system configuration (Network Type: CC IE Field)

• [Module Parameter] of GX Works3

Module parameter

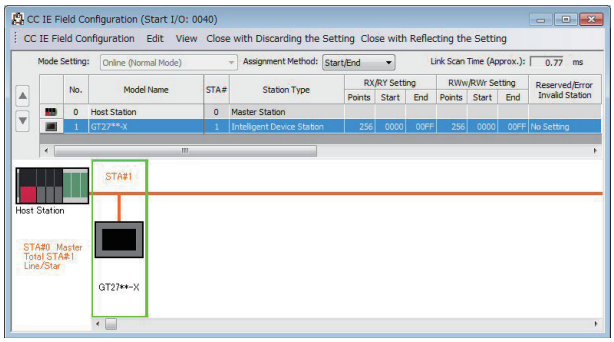


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Master station	○
[Network No.]*1	1	○
[Station Number Setting Method]	Set in parameter	○
[Station No.]	0	○
[Parameter Setting Method]	Set in Engineering Tool	○
[Network Configuration Settings]	☞ Network configuration settings	△

*1 Set the same network number as that of the GOT.

Network configuration settings



○: Necessary, △: As necessary, —: Not necessary

Item			Setting value	Setting for GOT connection
[RX/RY setting]*1	Station No. 1	[Start]	0000H	△
		[End]	00FFH	△
[RWw/RWr setting]*1	Station No. 1	[Start]	0000H	△
		[End]	00FFH	△
[Reserved/Error Invalid Station]			No setting	△

*1 Be sure to set it to perform the cyclic transmission.

Point

• When changing the module parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• GOT station type

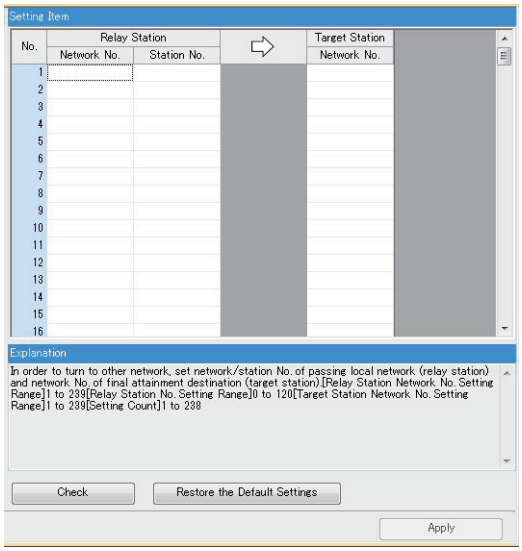
Set the GOT as an intelligent device station.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access networks specified with 238 different target station network numbers.



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 933 Routing parameter settings

■System configuration (Network Type: CC IE Field): [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Field
[Network No.]	1: Network No. 1
[Station No.]	1: Station No. 1
[Group No.]	0
[Mode Setting]	Online
[Refresh Interval]	25 ms
[Input for Err. Sta.]	Clear
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

[Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 926 [Controller Setting]

11.1.5 Connection to the PLC with the authentication function enabled

Logon to the PLC

When the GOT monitors the PLC with the authentication function enabled, logon to the PLC is required.

Touch a special function switch (Destination Authentication) set in the project to display the key window.

Enter the [User Name] and [Password] to log on.

For information on how to set a special function switch, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Logoff from the PLC

Touch a special function switch (Destination Authentication) set in the project to log off.

Precautions

■Creating a project

At GOT startup, the PLC is in logoff state.

The GOT cannot monitor the PLC devices until logon to the PLC from the GOT is complete.

Therefore, create a project assuming that the GOT cannot communicate with the PLC for a certain period.

For information on how to set screens and functions, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Take the following precautions when creating a project.

Item		Precautions for using the destination authentication function
[Environmental Setting]	[Screen Switching/Window]	Set the GOT internal device as the screen switching device. As well as logoff operation by GOT, reset on the PLC side or other operations can also make the PLC in logoff state. By setting the GOT internal device as the screen switching device, a screen can be switched even in logoff state due to reset on the PLC side or other operations.
	[Language Switching]	Set the GOT internal device as the language switching device. When a PLC device is set, comments cannot be displayed in logoff state.
	[System Information]	Set the GOT internal device as the system information device. When a PLC device is set, a system alarm occurs in logoff state.
	[Security]	It is recommended not to use screen security (level authentication and operator authentication) for connection with the PLC with the destination authentication function enabled.
		When using the level authentication, set the GOT internal device as the security level device.
Screen setting	Screen displayed immediately after GOT startup	Place a special function switch (Destination Authentication) to perform destination authentication for logging on to the PLC. Do not configure the setting to monitor the PLC devices.
	Screen number	Specify the screen number ranges separately for the screen displayed in logoff state and the screen displayed in logon state. Separating the screen number ranges makes screen transition in logoff state easy to consider. Example) Before authentication: 1 to 100, after authentication: 101 or later
	Screen switching control at logoff	Configure the setting using trigger actions or other methods so that the screen switches at logoff to the screen displayed before authentication.
Function that is not recommended for use when connecting with the PLC with the destination authentication function enabled		• Screen security (level authentication and operator authentication) • GOT Mobile function (Destination authentication cannot be performed on a mobile screen.)
Others	Function to specify the conditions other than the trigger device	Specify the trigger indirectly by using trigger actions or other methods. Example) When the PLC device controls the input range for a numerical input
	Function that cannot specify the trigger device	By scripts or device data transfer using the GOT internal device, read and write the PLC device only in logon state. Example) Alarm monitoring of the connected device

■Character code applicable for [User Name].

For logon to the PLC from the GOT, only ASCII code characters can be available for [User Name] in the key window and the [Destination Authentication] window.

When setting [User Name] for the PLC, set [User Name] of the user operating the PLC from the GOT in the ASCII code.

For the list of the ASCII code available in GOT, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

■Access level of the user who can log on

When logging on to the PLC from the GOT, only the users whose access level is [Users] can log on.

Users with the access level [Administrators] or [Developers] cannot log on.

When monitoring the PLC from the GOT, set the users whose access level is [Users] for the PLC.

■Changing the user authentication function settings

The user authentication settings (user name and password) cannot be changed from the GOT.

Use GX Works3 to change the settings registered in the PLC.

■Obtaining and updating CPU errors

The GOT cannot obtain CPU errors unless you log on to the PLC.

To update the CPU error of the system alarm displayed on the GOT, log on to the PLC from the GOT.

11.1.6 Access range for monitoring

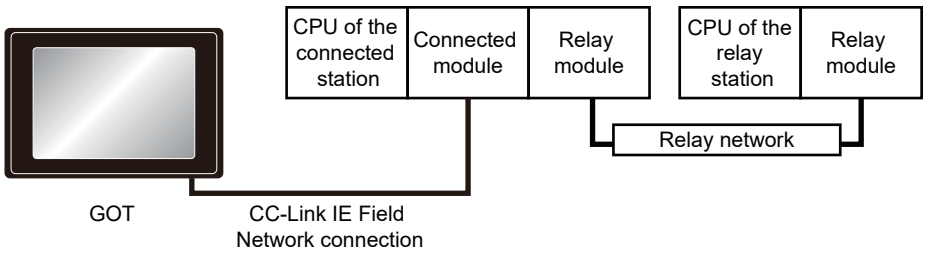
When GOT is connected to the CPU of the station connected via CC-Link IE Field Network, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station								
		Relay network	CPU of the relay station							
			MXR	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
MX-R	☞ Page 921 Connectable devices	Ethernet	○*7	○*5	○	○*6	○	—	○	—	○*3
		CC-Link IE TSN	○*7	○*1	—	—	—	—	—	—	○*3
		CC-Link IE Field Network	○*7	○	○	○*2	○	—	—	—	○*4
RJ72GF15-T2	☞ Page 921 Connectable devices	CC-Link IE Field Network	—	○	○	○*2	○	—	—	—	○*4

*1 RnCPU, RnENCPU, RnSFCPU, and MELSECWinCPU (MELSEC iQ-R series) are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*3 FX5U and FX5UC are supported.

*4 FX5U, FX5UC, and FX5UJ are supported.

*5 The C Controller module (MELSEC iQ-R series) is not supported.

*6 The C Controller module (MELSEC-Q series) is not supported.

*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
☞ Page 90 Setting procedure of the encrypted communication

11.2 MELSEC iQ-R series (CC-Link IE Field Network connection)

☞ Page 940 Connectable devices
☞ Page 942 System configuration
☞ Page 947 GOT side settings
☞ Page 954 PLC side settings
☞ Page 960 Access range for monitoring
☞ Page 961 How to monitor a redundant system

11.2.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	PLC side interface		Connectable model
			CC-Link IE Field Network communication unit	Built-in port	
MELSEC iQ-R series	R00CPU R01CPU R02CPU R04CPU R08CPU R16CPU R32CPU R120CPU	○	RJ71GF11-T2 RJ71EN71 RD77GF4*8 RD77GF8*8 RD77GF16*8 RD77GF32*8	—	GT37 SoftGOT3000
	R08PCPU*1 R16PCPU*1 R32PCPU*1 R120PCPU*1	○	RJ71GF11-T2*4 RJ71EN71*4 RD77GF4*8 RD77GF8*8 RD77GF16*8 RD77GF32*8	—	GT37 SoftGOT3000
	R04ENCPU R08ENCPU R16ENCPU R32ENCPU R120ENCPU	○	RJ71GF11-T2 RJ71EN71 RD77GF4*8 RD77GF8*8 RD77GF16*8 RD77GF32*8	○*5	GT37 SoftGOT3000
	R08PSFCPU*2 R16PSFCPU*2 R32PSFCPU*2 R120PSFCPU*2	○	RJ71GF11-T2 RJ71EN71*4 RD77GF4*8 RD77GF8*8 RD77GF16*8 RD77GF32*8	—	GT37 SoftGOT3000
	R08SFCPU*3 R16SFCPU*3 R32SFCPU*3 R120SFCPU*3	○	RJ71GF11-T2 RJ71EN71 RD77GF4*8 RD77GF8*8 RD77GF16*8 RD77GF32*8	—	GT37 SoftGOT3000
Motion CPU (MELSEC iQ-R series)	R16MTCPU R32MTCPU R64MTCPU*6	○	RJ71GF11-T2*7 RJ71EN71*7	—	GT37 SoftGOT3000
C Controller module (MELSEC iQ-R series)	R12CCPU-V	○	RJ71GF11-T2 RJ71EN71 RD77GF4*8 RD77GF8*8 RD77GF16*8 RD77GF32*8	—	GT37 SoftGOT3000

Controller	Model	Clock	PLC side interface		Connectable model
			CC-Link IE Field Network communication unit	Built-in port	
CNC C80	R16NCCPU-S1	○	RJ71GF11-T2 RJ71EN71	—	GT37 SoftGOT3000
Robot controller (MELSEC iQ-R series)	CR800-R (R16RTCPU)	○	RJ71GF11-T2 RJ71EN71	—	GT37 SoftGOT3000
CC-Link IE Field Network head module	RJ72GF15-T2	—	—	○	GT37 SoftGOT3000

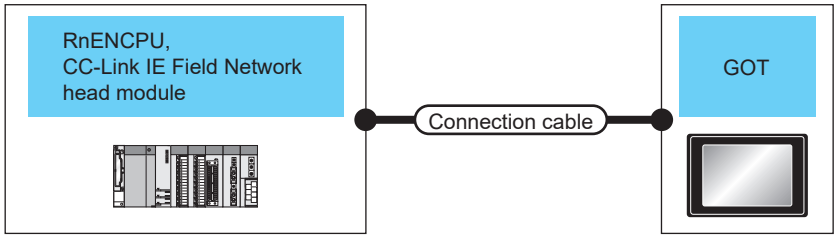
*1 Mount a redundant function module R6RFM next to the RnPCPU on the base unit when building a redundant system.
*2 Mount the SIL2 function module R6PSFM and redundant function module R6RFM next to the RnPSFCPU on the base unit.
*3 Mount a safety function module R6SFM next to the RnSFCPU on the base unit.
The RnSFCPU and the safety function module R6SFM must have the same pair version.
If their pair versions differ, the RnSFCPU does not operate.
*4 Use firmware version 12 or later when building a redundant system.
*5 The built-in ports (P1 and P2) are available.
*6 Use a module with OS software version 06 or later.
*7 When monitoring a Motion CPU from a different network, use a Motion CPU with OS software version 3 or later.
*8 For connection to the RD77GF4, RD77GF8, RD77GF16 and RD77GF32, refer to the following manual.
RD77GF Simple Motion Module User's Manual

Precautions

For information on the version restrictions of the CC-Link IE Field Network module, refer to the following manual.
CC-Link IE Field Network Master/Local Module User's Manual

11.2.2 System configuration

Connection to the built-in port of the PLC or CC-Link IE Field Network head module



For details on the connection cable and overall cable length, refer to the following.

☞ Page 942 Connection cable

☞ Page 942 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 943 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	Model
MELSEC iQ-R series*2 CC-Link IE Field Network head module (RJ72GF15-T2)	Twisted pair cable	GT37-IF2000 + GT15-J71GF13-T2*1	GT37 SoftGOT3000

*1 If there is a submaster station in the network configuration, use software version C or later.
The software version is the 10th digit of the serial number described on the rating plate of the unit.

*2 For the connectable PLCs, refer to the following.
☞ Page 940 Connectable devices

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
1000BASE-T	Shielded twisted pair cable (STP) of category 5e or higher

Use cables that meet the IEEE802.3 1000BASE-T standard.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Use hubs that satisfy the following conditions.

- Compliant with the IEEE802.3 (1000BASE-T) standard
- Include Auto MDI/MDI-X.
- Include an automatic negotiation function.
- Switching hub (Do not use repeater hubs.)

Recommended switching hub (Mitsubishi Electric products)

Type	Model
Industrial switching hub	NZ2EHG-T8

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

■Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

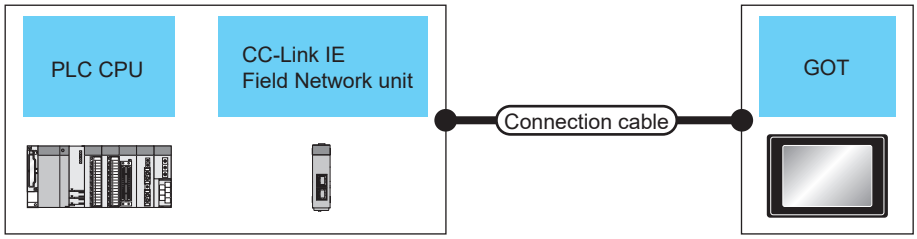
■Maximum number of connected devices

The following shows the number of GOTs connectable to one controller.

Controller	
Model	**Number of GOTs connectable to one PLC**
MELSEC iQ-R series	120
CC-Link IE Field Network head module	119*1

*1 The number of connectable device stations is 120 (1 CC-Link IE Field Network head module and 119 GOTs).

Connection to CC-Link IE Field Network communication unit



For details on the connection cable and overall cable length, refer to the following.

☞ Page 944 Connection cable

☞ Page 944 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 944 Maximum number of connected devices

Controller	CC-Link IE Field Network communication unit	Connection cable	GOT	
			Interface	Model
MELSEC iQ-R series C Controller module (MELSEC iQ-R series)	RJ71GF11-T2 RJ71EN71 RD77GF4 RD77GF8 RD77GF16 RD77GF32	Twisted pair cable	GT37-IF2000 + GT15-J71GF13-T2*1*2	GT37 SoftGOT3000
Motion CPU (MELSEC iQ-R series) CNC C80 Robot controller (MELSEC iQ-R series)	RJ71GF11-T2 RJ71EN71	Twisted pair cable	GT37-IF2000 + GT15-J71GF13-T2*1*2	GT37 SoftGOT3000

*1 For connection to the RCPU redundant system, use the product with hardware version C or later.
For information on how to check the hardware version, refer to the following.
GOT3000 Series User's Manual (Hardware)

*2 If there is a submaster station in the network configuration, use software version C or later.
The software version is the 10th digit of the serial number described on the rating plate of the unit.

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
1000BASE-T	Shielded twisted pair cable (STP) of category 5e or higher

Use cables that meet the IEEE802.3 1000BASE-T standard.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Use hubs that satisfy the following conditions.

- Compliant with the IEEE802.3 (1000BASE-T) standard
- Include Auto MDI/MDI-X.
- Include an automatic negotiation function.
- Switching hub (Do not use repeater hubs.)

Recommended switching hub (Mitsubishi Electric products)

Type	Model
Industrial switching hub	NZ2EHG-T8

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

■Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

■Maximum number of connected devices

The following shows the number of GOTs connectable to one controller.

Controller	
Model	**Number of GOTs connectable to one PLC**
MELSEC iQ-R series Motion CPU (MELSEC iQ-R series) C Controller module (MELSEC iQ-R series) CNC C80 Robot controller (MELSEC iQ-R series)	120

■Connection to RnSFCPU

The RnSFCPU takes 10 seconds or more to run.

If the GOT is started during this time, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

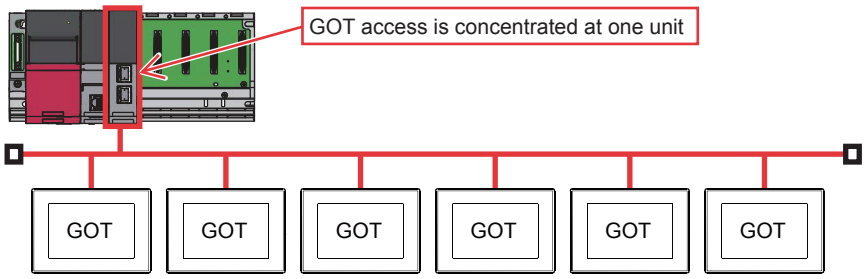
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

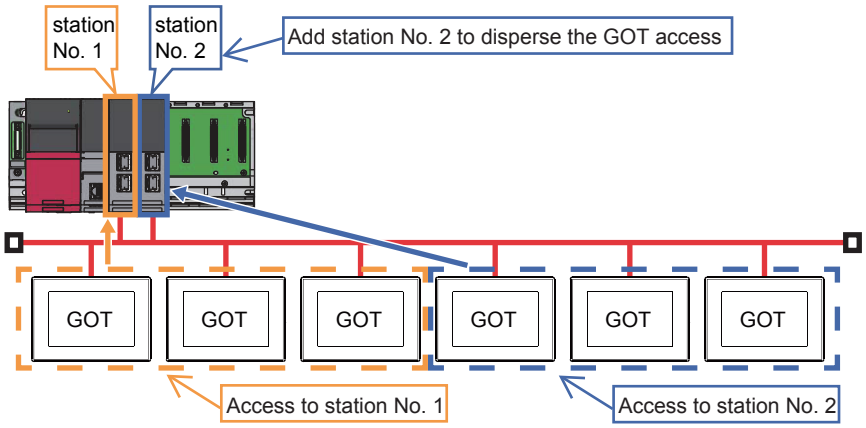
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

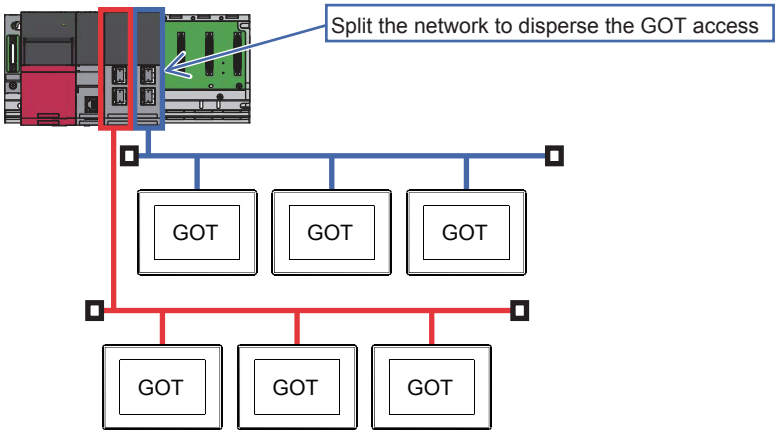
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT connected to the CC-Link IE Field Network

For the CC-Link IE Field Network connection, the data link is started approximately 15 seconds after the GOT startup.

■When a network error occurs in the system alarm

In the CC-Link IE Field Network connection, when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

■Data link failure in other stations at GOT startup

At GOT startup, the data link failure may occur in other stations.

However, after the failure occurrence, the GOT reconnects automatically and monitors the devices properly.

To avoid such data link failure, start up the GOT 10 seconds earlier than the master station.

However, if the master station does not complete startup when the GOT starts monitoring (10 seconds after the GOT startup), the communication timeout occurs in the GOT.

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

■Data link failure in all stations at GOT startup or cable connection/disconnection

At GOT startup, the communication is broken temporarily between PORT1 and PORT2 in the CC-Link IE Field module which is installed on the GOT.

Thus, as the GOT or a station between the GOT and the master station is reconnected, the data link failure may occur on all stations.

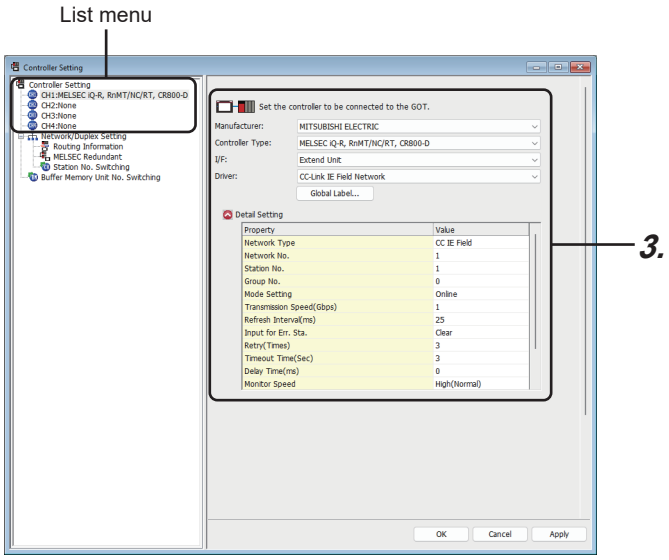
GOT startup includes the following operations.

- Turning on the GOT
- Resetting the GOT main unit
- Operating the utility
- Downloading the project including the communication settings
- Downloading the OS

11.2.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[I/F]	[Extend Unit]
[Driver]	[CC-Link IE Field Network]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 948 [Detail Setting]

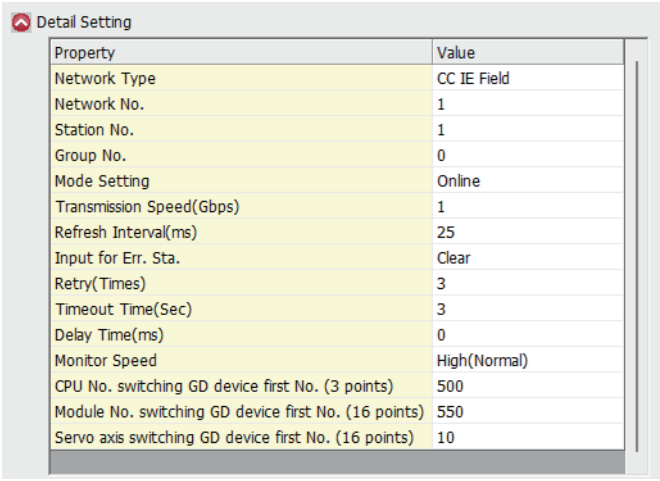
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Network Type]	Set the network type.	[CC IE Field]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the hardware test and self-loopback test, refer to the following. ☞ Page 949 Hardware test ☞ Page 950 Self-loopback test	[Online], [Offline], [H/W test], [Self-loopback test]
[Transmission Speed]	—	[1Gbps]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication.	[1] ms to [1000] ms
[Input for Err. Sta.]	Set whether to hold or clear the input from the station whose data link has become faulty due to powering off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]*2	Set the monitor speed for the CC-Link IE Field Network. This setting is not valid in all systems.	[High(Normal)]*1, [Middle], [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 950 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 951 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 952 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.
*2 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
GT Designer3 (GOT3000) Screen Design Manual

Precautions

When the output is required to be held at the data link failure, set [Input for Err. Sta.] to [Hold] in the controller setting of the GOT.

Point

• Example of communication detail settings

For the example of communication detail settings, refer to the following.

Page 954 PLC side settings

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

• Network type

Be sure to set the same network types for the CPU side and the GOT side.

If the network types of the CPU side and the GOT side are different, an error is displayed in the system alarm of the GOT side.

■Hardware test

For a hardware test, mount a CC-Link IE Field Network communication unit on the GOT, and check if the unit operates properly with the GOT.

The following shows the hardware test procedure.

1. Perform either of the following operations to set the GOT to the hardware test mode.

• Write the project data for which [Mode Setting] in [Detail Setting] is set to [H/W test] to the GOT.

• Set [Mode setting] of [Detail setting] to [H/W Test] in the GOT utility.

2. A hardware test will start at GOT startup.

3. After the test is complete, check the result with the ERR LED on the CC-Link IE Field Network communication unit.

• OFF: Normal

• ON: Error

4. If no error is detected, change the setting of [Mode Setting] from [H/W test] in [Detail Setting].

Since the communication with the controller is not performed when [Mode setting] is set to [H/W Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the CC-Link IE Field Network communication unit.

■Self-loopback test

In a self-loopback test, connect port 1 and port 2 of the CC-Link IE Field Network communication unit mounted on the GOT with a network cable, and check if the unit operates properly with the GOT.

The following shows the self-loopback test procedure.

1. Perform either of the following operations to set the GOT to the self-loopback test mode.

- Write the project data for which [Mode Setting] in [Detail Setting] is set to [Self-loopback test] to the GOT.
- Set [Mode setting] in [Detail setting] to [Self-loopback Test] in the GOT utility.

2. A self-loopback test will start at a GOT startup.

3. After the test is complete, check the result with the ERR LED on the CC-Link IE Field Network communication unit.

- OFF: Normal
- ON: Error

4. If no error is detected, change the setting of [Mode Setting] from [Self-loopback test] in [Detail Setting].

Since the communication with the controller is not performed when [Mode setting] is set to [Self-loopback Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the CC-Link IE Field Network communication unit.

■Start device number of the GD devices for CPU number switching

- Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

- Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

- Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

- Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

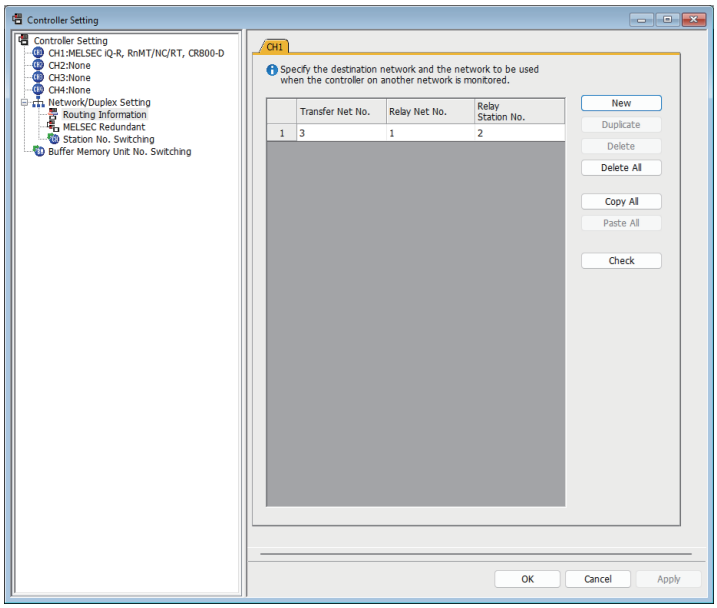
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC iQ-R CPU Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 954 PLC side settings

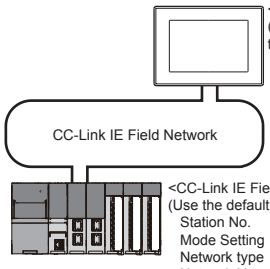
For details on the CC-Link IE Field Network module, refer to the following manual.

📖CC-Link IE Field Network Master/Local Module User's Manual

Connection to MELSEC iQ-R series

This section describes the settings of the GOT and CC-Link IE Field Network module in the system configuration shown below.

■System configuration (Network Type: CC IE Field)



<GOT>
(Use the default value for settings other than the following.)
Network type :CC IE Field
Network No. :1
Station No. :1
Mode Setting :Online
Network Configuration Settings:RX/RY00 to FFH
RWw/RWr00 to FFH
Monitor Speed :High

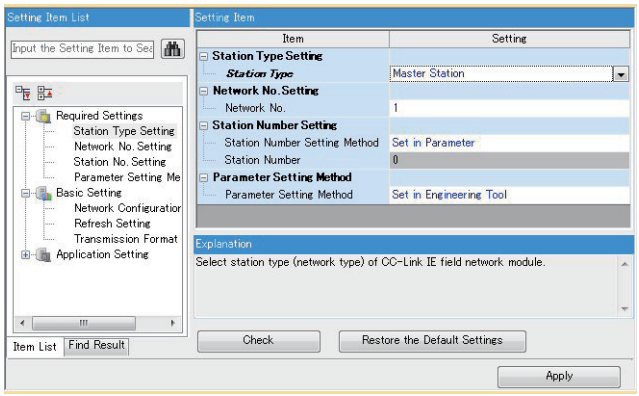
<CC-Link IE Field Network module> *1
(Use the default value for settings other than the following.)
Station No. :0 (fixed)
Mode Setting :Online (normal)
Network type :CC IE Field (Master station)
Network No. :1
Total stations :1
Network Configuration Settings:RX/RY00H to FFH
RWw/RWr00H to FFH

*1 The CC-Link IE Field Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Field Network module is set to 0.

■Module parameter settings of the system configuration (Network Type: CC IE Field)

• [Module Parameter] of GX Works3

Module parameter



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection

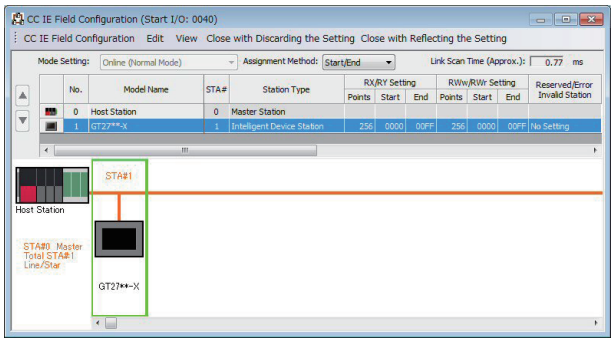
Network configuration settings



○: Necessary, △: As necessary, —: Not necessary

Item			Setting value	Setting for GOT connection
[RX/RY setting]*1	Station No. 1	[Start]	0000H	△
		[End]	00FFH	△
[RWw/RWr setting]*1	Station No. 1	[Start]	0000H	△
		[End]	00FFH	△
[Reserved/Error Invalid Station]			No setting	△

*1 Be sure to set it to perform the cyclic transmission.

Point

• When changing the module parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• GOT station type

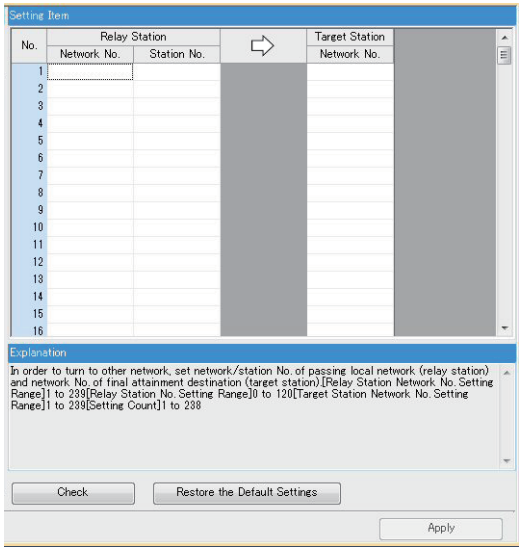
Set the GOT as an intelligent device station.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access networks specified with 238 different target station network numbers.



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 953 Routing parameter settings

■System configuration (Network Type: CC IE Field): [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Field
[Network No.]	1: Network No. 1
[Station No.]	1: Station No. 1
[Group No.]	0
[Mode Setting]	Online
[Refresh Interval]	25 ms
[Input for Err. Sta.]	Clear
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

[Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

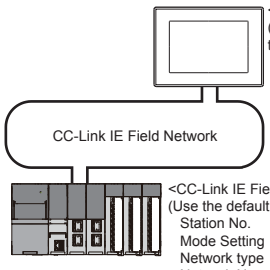
☞ Page 947 [Controller Setting]

Connection to C Controller module (MELSEC iQ-R series)

This section describes the settings of the GOT and C Controller module (MELSEC iQ-R series) in the system configuration shown below.

Use CW Configurator for the C Controller module (MELSEC iQ-R series) communication settings.

■System configuration (Network Type: CC IE Field)



<GOT>
(Use the default value for settings other than the following.)
Network type :CC IE Field
Network No. :1
Station No. :1
Mode Setting :Online
Network Configuration Settings:RX/RY00 to FFH
RWw/RWr00 to FFH
Monitor Speed :High

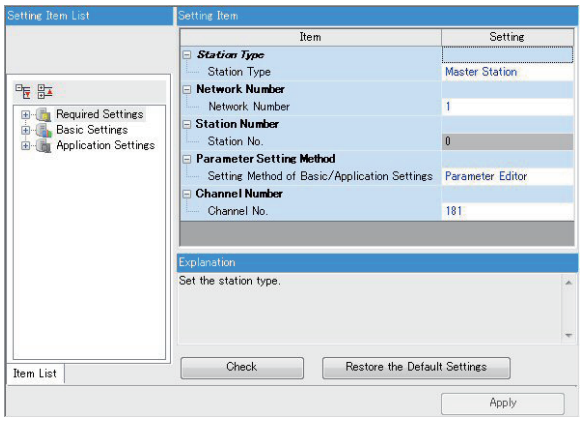
<CC-Link IE Field Network module> *1
(Use the default value for settings other than the following.)
Station No. :0 (fixed)
Mode Setting :Online (normal)
Network type :CC IE Field (Master station)
Network No. :1
Total stations :1
Network Configuration Settings:RX/RY00H to FFH
RWw/RWr00H to FFH

*1 The CC-Link IE Field Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Field Network module is set to 0.

■Module parameter settings of the system configuration (Network Type: CC IE Field)

• [Module parameter] of CW Configurator

Module parameter

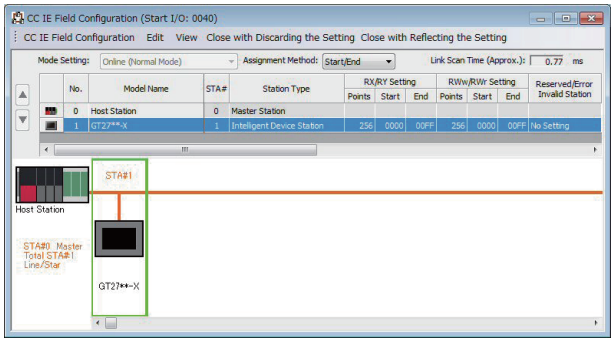


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Master station	○
[Network No.]*1	1	○
[Station No.]	0	○
[Parameter Setting Method]	Set in parameter	○
[Channel No.]	(Use default value)	—
[Network Configuration Settings]	☞ Network configuration settings	△

*1 Set the same network number as that of the GOT.

Network configuration settings



○: Necessary, △: As necessary, —: Not necessary

Item			Setting value	Setting for GOT connection
[RX/RY setting]*1	Station No. 1	[Start]	0000H	△
		[End]	00FFH	△
[RWw/RWr setting]*1	Station No. 1	[Start]	0000H	△
		[End]	00FFH	△
[Reserved/Error Invalid Station]			No setting	△

*1 Be sure to set it to perform the cyclic transmission.

Point

• When changing the module parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• GOT station type

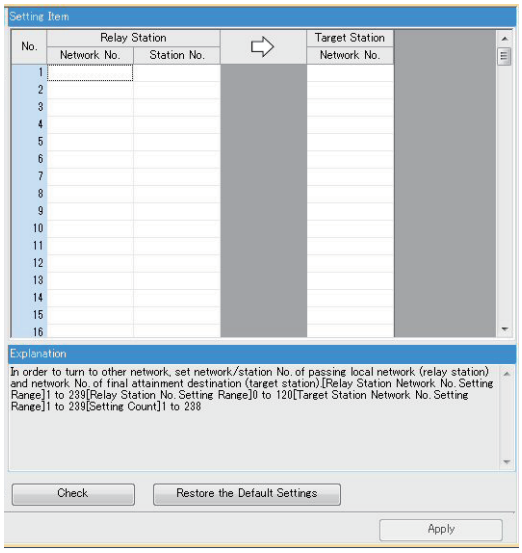
Set the GOT as an intelligent device station.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access networks specified with 238 different target station network numbers.



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 953 Routing parameter settings

■System configuration (Network Type: CC IE Field): [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Field
[Network No.]	1: Network No. 1
[Station No.]	1: Station No. 1
[Group No.]	0
[Mode Setting]	Online
[Refresh Interval]	25 ms
[Input for Err. Sta.]	Clear
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

[Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 947 [Controller Setting]

11.2.5 Access range for monitoring

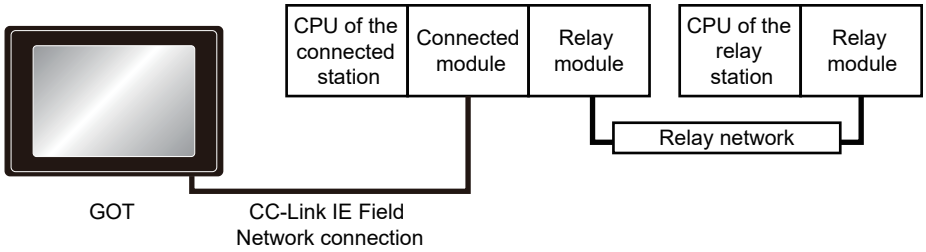
When GOT is connected to the CPU of the station connected via CC-Link IE Field Network, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station									
		Relay network	CPU of the relay station								
			MXR	RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU

*1 RnCPU, RnENCPU, RnSFCPU, and MELSECWinCPU (MELSEC iQ-R series) are supported.

*2 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*3 FX5U and FX5UC are supported.

*4 FX5U, FX5UC, and FX5UJ are supported.

*5 The C Controller module (MELSEC iQ-R series) is not supported.

*6 The C Controller module (MELSEC-Q series) is not supported.

*7 Regardless of whether encrypted communications are performed, the MELSEC MX Controller can be used as the relay station.
To perform encrypted communication, settings need to be configured.
For details, refer to the following.
☞ Page 90 Setting procedure of the encrypted communication

*8 AnUCPU and AnUSCPU are supported.

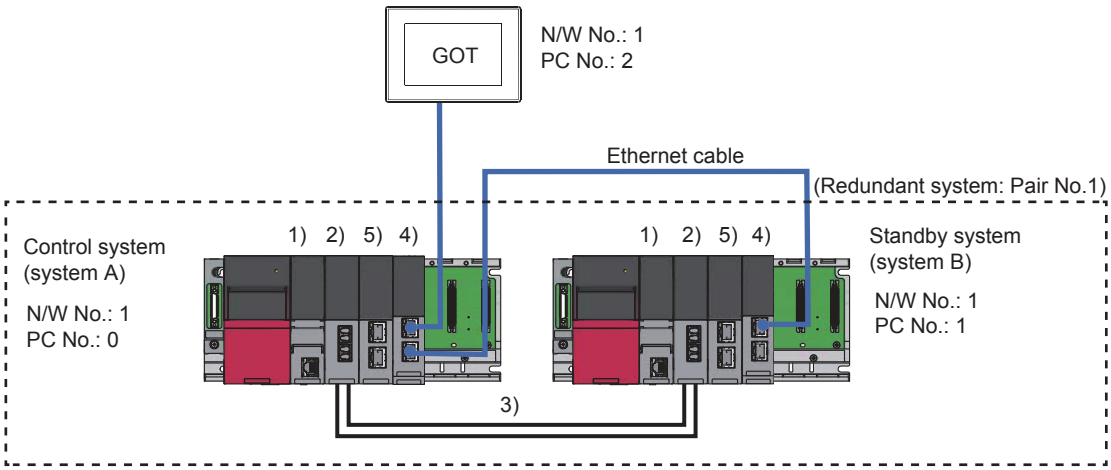
11.2.6 How to monitor a redundant system

☞ Page 961 One-to-one connection of the GOT and the redundant system
☞ Page 963 1:n connection of GOT and redundant system
☞ Page 964 Mixed connection of redundant system and non-redundant system
☞ Page 965 MELSEC redundant setting
☞ Page 967 Precautions

One-to-one connection of the GOT and the redundant system

■System configuration example

The following connection configuration examples are explained.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link IE Field Network Master/Local module (GOT connection)
5) CC-Link IE Field Network Master/Local module (Remote I/O station connection)

■Connection method

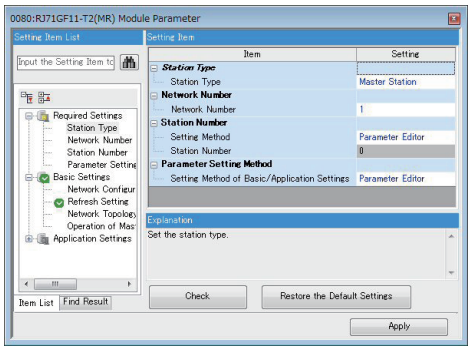
Connect the CC-Link IE Field Network system to the GOT.

☞ Page 940 MELSEC iQ-R series (CC-Link IE Field Network connection)

■PLC side settings (GX Works3)

• Control system (system A) PLC settings

Module parameter



Item	Setting value

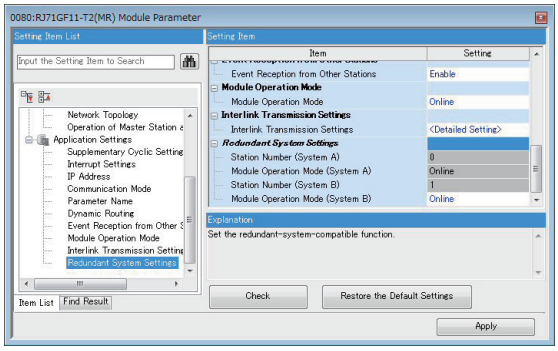
Redundant Setting



Item	Setting value
[B system module operation mode]	Online mode

■GOT side settings

Set GT Designer3 as follows.

Setting item	Contents of setting		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	—	
	[Other]	[Network No.]: 1	
		[Station No.]: Station number of the control system	
	[Redundant System]	The system to be monitored ([Not Specified/Control System], [Standby System]) can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
MELSEC redundant setting	 ☞ Page 965 MELSEC redundant setting		

■Monitoring target change when system switching occurs in a redundant system

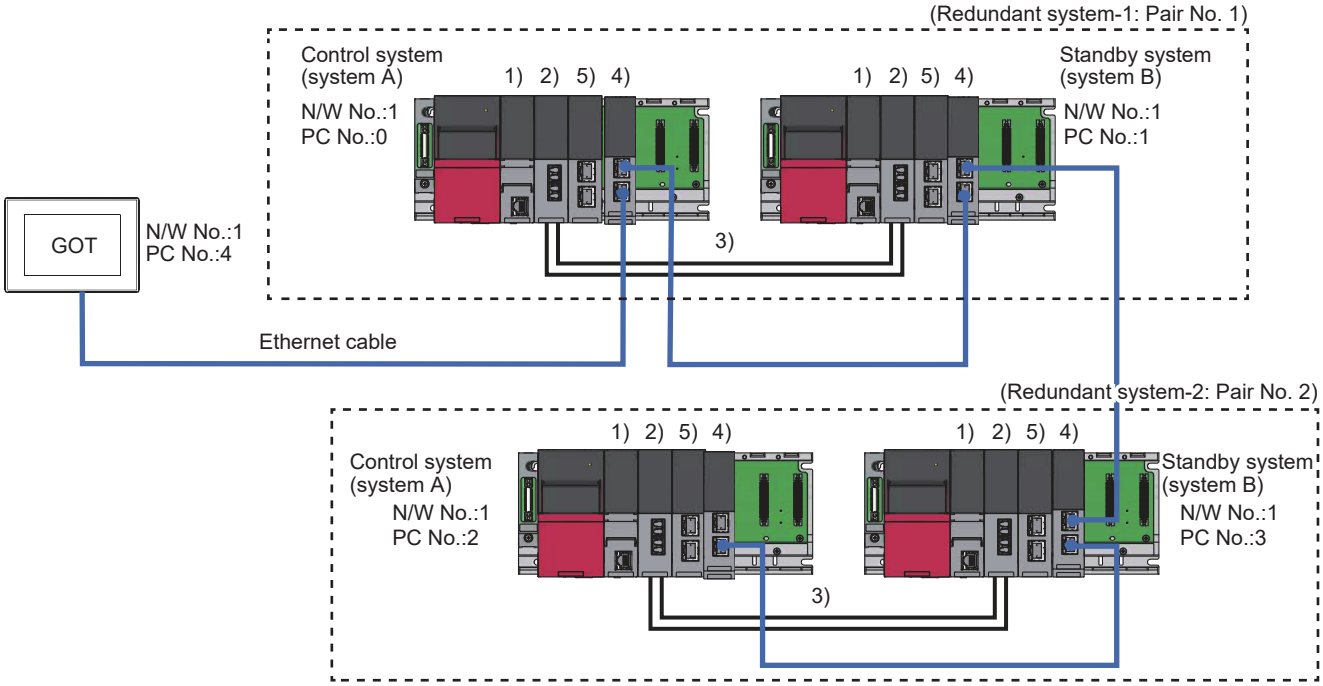
When system switching occurs, the CPU (PLC station No. 1) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

1:n connection of GOT and redundant system

■System configuration example

The following connection configuration examples are explained.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link IE Field Network master/local module (connected to GOT)
5) CC-Link IE Field Network master/local module (connected to remote I/O station)

■Connection method

Connect the CC-Link IE Field Network system to the GOT.

☞ Page 940 MELSEC iQ-R series (CC-Link IE Field Network connection)

■PLC side settings (GX Works3)

☞ Page 961 PLC side settings (GX Works3)

■GOT side settings

Set GT Designer3 as follows.

Setting item	Contents of setting		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	[Host]	—	
	[Other]	[Network No.]: 1	
		[Station No.]: Station number of the control system	
	[Redundant System]	The system to be monitored ([Not Specified/Control System], [Standby System]) can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
MELSEC redundant setting	 ☞ Page 965 MELSEC redundant setting		

■Monitoring target change when system switching occurs in a redundant system

• Redundant system-1

When system switching occurs, the CPU (PLC station No. 1) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

• Redundant system-2

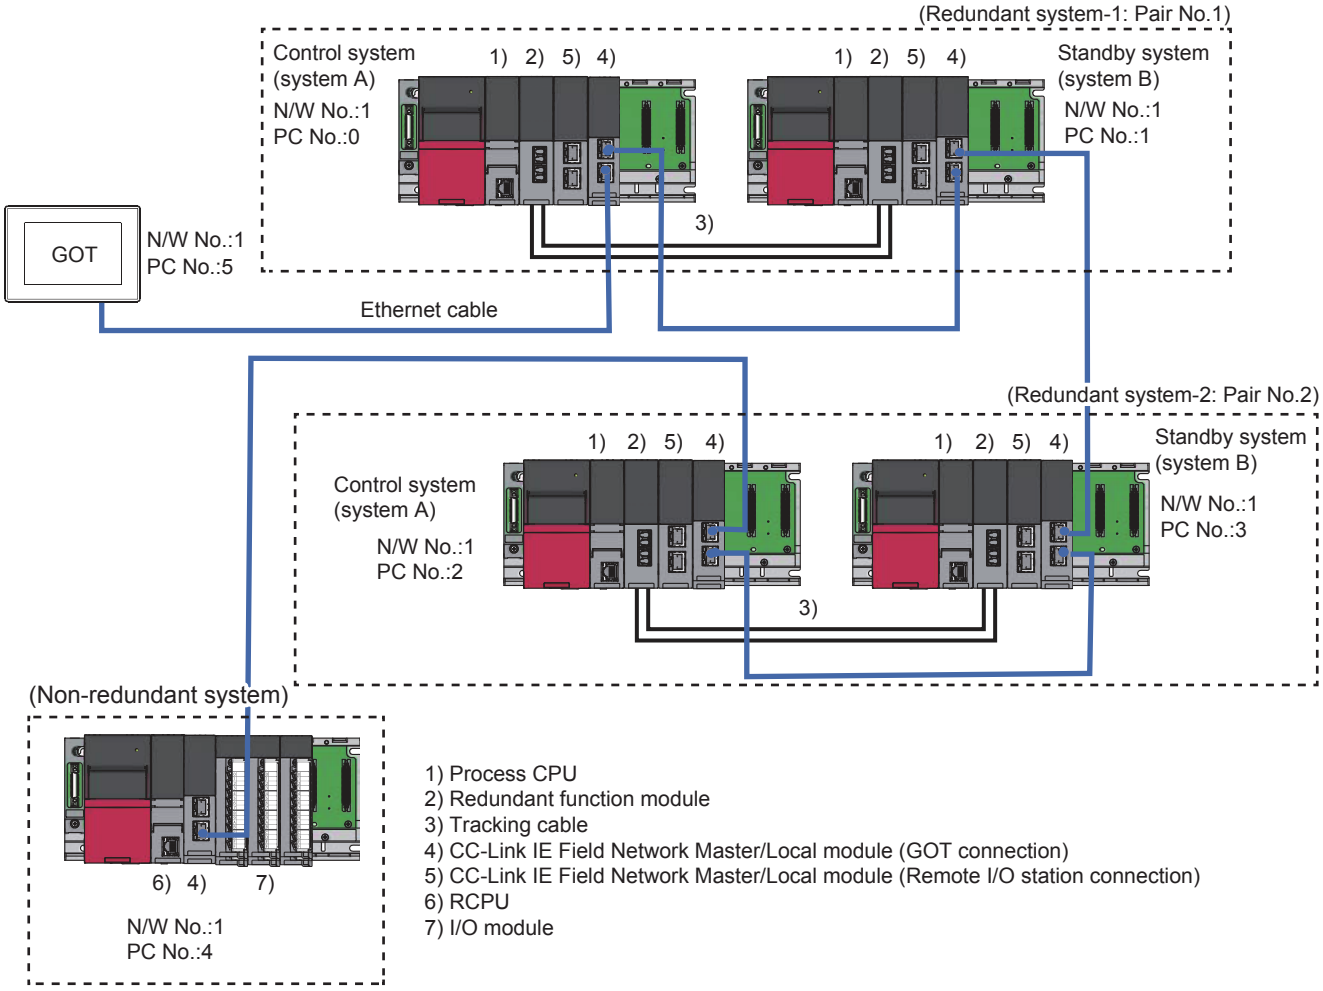
When system switching occurs, the CPU (PLC station No. 3) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

Mixed connection of redundant system and non-redundant system

■System configuration example

The following connection configuration examples are explained.



■Connection method

Connect the CC-Link IE Field Network system to the GOT.

☞ Page 940 MELSEC iQ-R series (CC-Link IE Field Network connection)

■PLC side settings (GX Works3)

☞ Page 961 PLC side settings (GX Works3)

■GOT side settings

☞ Page 963 GOT side settings

■Monitoring target change when system switching occurs in a redundant system

☞ Page 964 Monitoring target change when system switching occurs in a redundant system

MELSEC redundant setting

This section describes the settings for the GOT to automatically change the monitoring target of the RCPU redundant system.

Point

Before configuring the MELSEC redundant settings

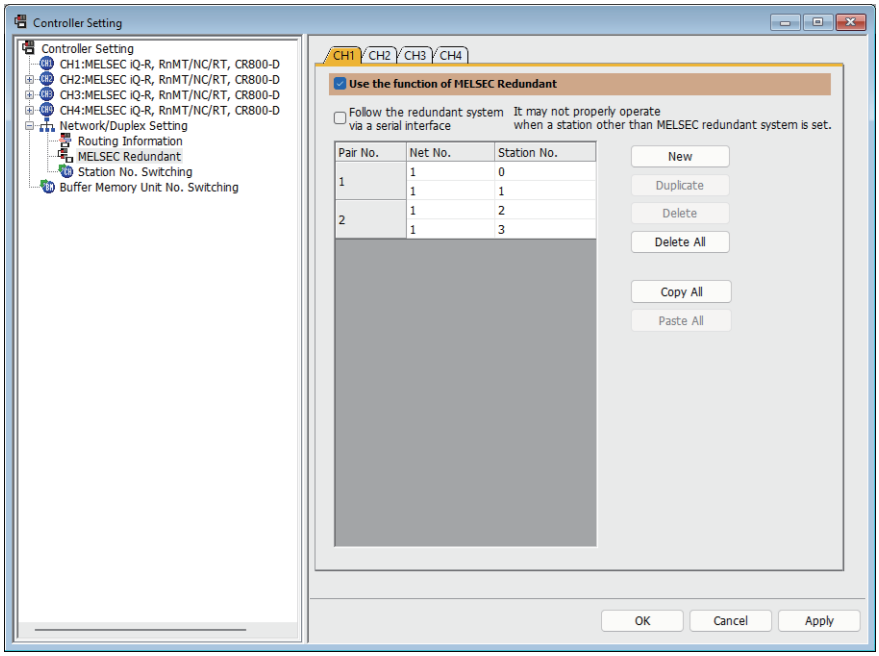
In the MELSEC redundant settings, do not set a station outside the redundant RCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC redundant setting dialog, settings can be made for each channel of the controller.

The following shows an example of the CC-Link IE Field Network connection (station No. 4) with redundant CPU pair No. 1 to No. 2, network No. 1, and redundant CPU station No. 0 to No. 3.

Ex.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Copies one setting of the selected pair number and adds it below the bottom row.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 966 Pair number

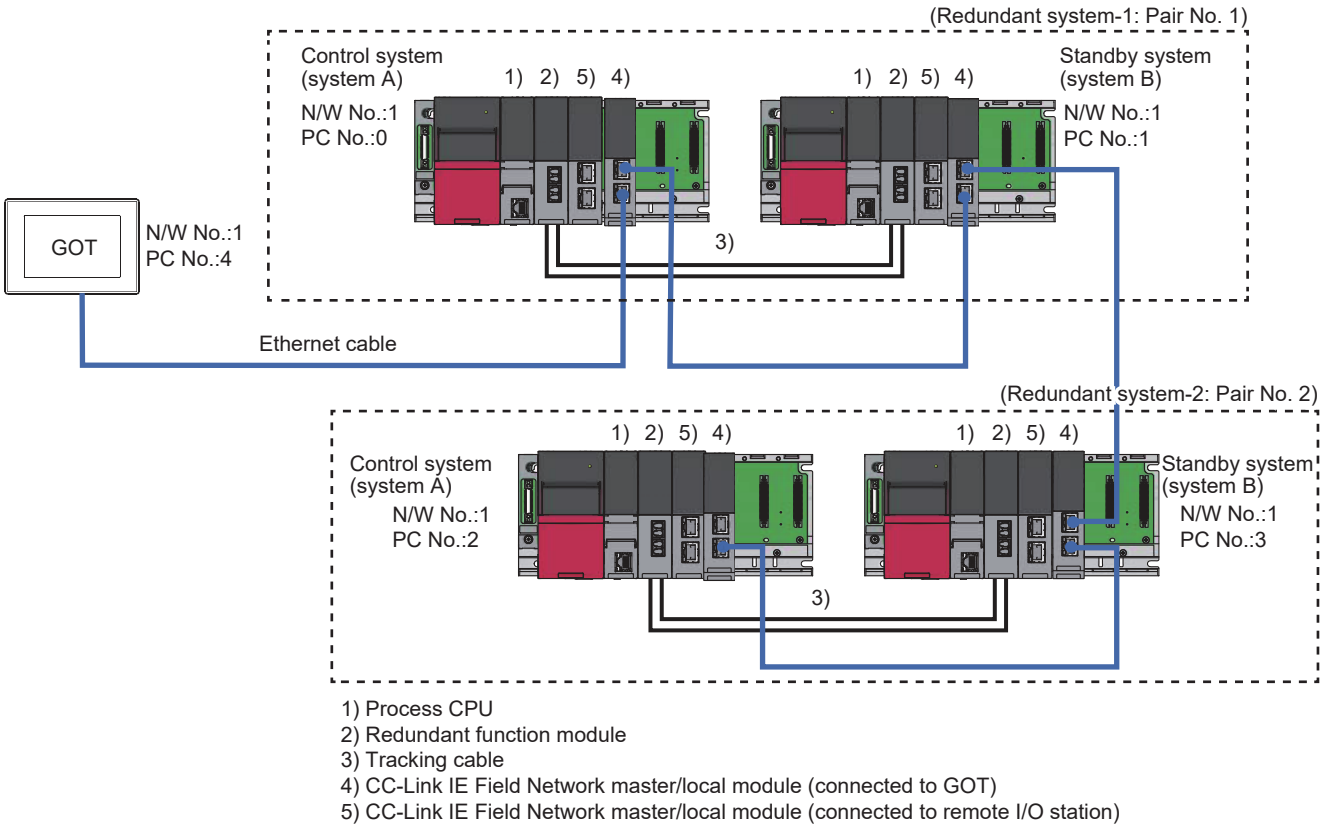
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of the CC-Link IE Field Network connection in the RCPU redundant system. (Pair No. 1 to No. 2)

Ex.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link IE Field Network master/local module (connected to GOT)
5) CC-Link IE Field Network master/local module (connected to remote I/O station)

Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- The last station number and station number 1 (example: station number 64 and station number 1) cannot be paired.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the redundant mode of the RCPU redundant system, and does not support the process mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

• 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

[450: Path has changed or timeout occurred in redundant system.] appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, [451: The MELSEC redundant setting and actual system configuration do not match.] appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings. If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm [315 Device writing error. Correct device.] is not detected.

11.3 MELSEC iQ-F series (CC-Link IE Field Network connection)

☞ Page 968 Connectable devices
☞ Page 969 System configuration
☞ Page 972 GOT side settings
☞ Page 979 PLC side settings
☞ Page 980 Access range for monitoring

11.3.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

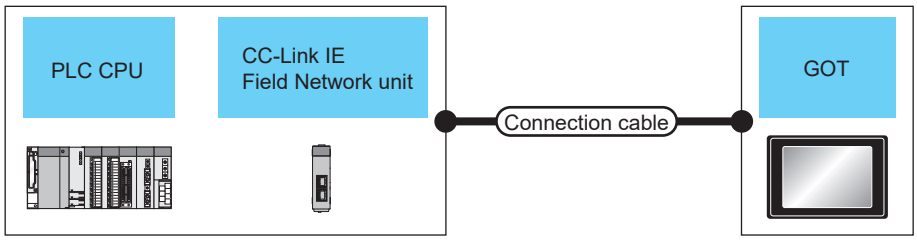
Controller	Model	Clock	CC-Link IE Field Network communication unit	Connectable model
MELSEC iQ-F series	FX5U FX5UC FX5UJ	○	FX5-CCLIEF	GT37 SoftGOT3000

Precautions

For information on the version restrictions of the CC-Link IE Field Network module, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

11.3.2 System configuration



For details on the connection cable and overall cable length, refer to the following.

☞ Page 969 Connection cable
☞ Page 969 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 970 Maximum number of connected devices

Controller	CC-Link IE Field Network communication unit	Connection cable	GOT	
			Interface	Model
MELSEC iQ-F series	FX5-CCLIEF	Twisted pair cable	GT37-IF2000 + GT15-J71GF13-T2*1	GT37 SoftGOT3000

*1 If there is a submaster station in the network configuration, use software version C or later.
The software version is the 10th digit of the serial number described on the rating plate of the unit.

Connection cable

Use a connection cable that meets the following standards.

Standard	Category
1000BASE-T	Shielded twisted pair cable (STP) of category 5e or higher

Use cables that meet the IEEE802.3 1000BASE-T standard.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Use hubs that satisfy the following conditions.

- Compliant with the IEEE802.3 (1000BASE-T) standard
- Include Auto MDI/MDI-X.
- Include an automatic negotiation function.
- Switching hub (Do not use repeater hubs.)

Recommended switching hub (Mitsubishi Electric products)

Type	Model
Industrial switching hub	NZ2EHG-T8

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

Maximum number of connected devices

The number of connectable device stations is 120 (1 PLC and 119 GOTs).

The following shows the number of GOTs connectable to one controller.

Controller	
Model	**Number of GOTs connectable to one PLC**
MELSEC iQ-F series	119

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

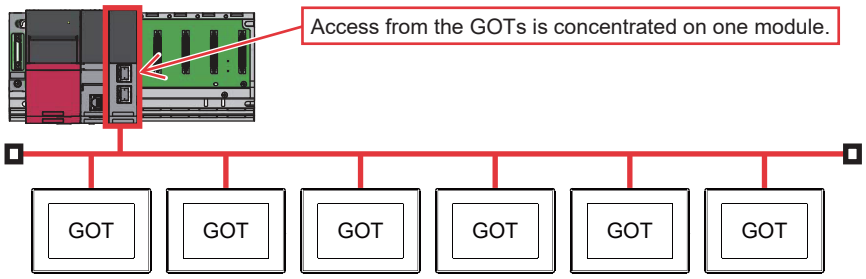
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

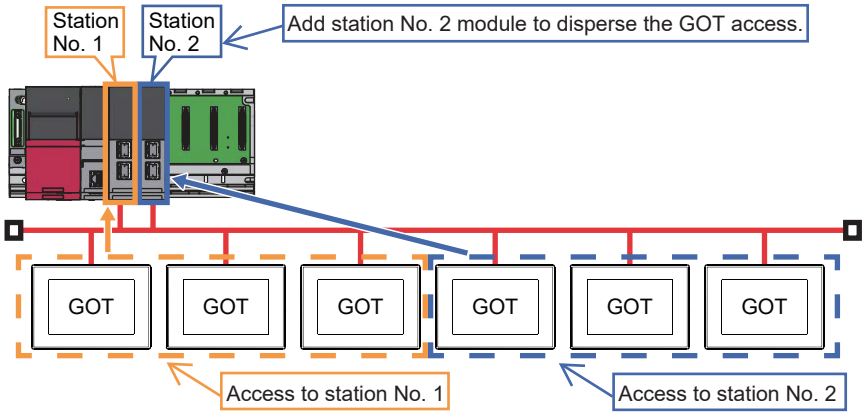
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

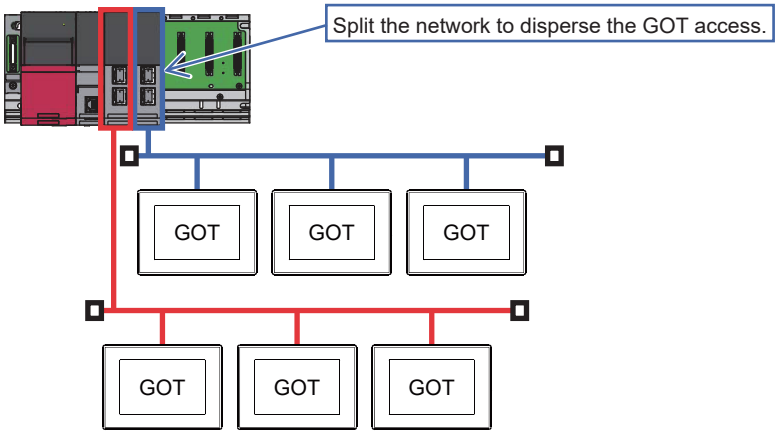
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT connected to the CC-Link IE Field Network

For the CC-Link IE Field Network connection, the data link is started approximately 15 seconds after the GOT startup.

■When a network error occurs in the system alarm

In the CC-Link IE Field Network connection, when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

■Data link failure in other stations at GOT startup

At GOT startup, the data link failure may occur in other stations.

However, after the failure occurrence, the GOT reconnects automatically and monitors the devices properly.

To avoid such data link failure, start up the GOT 10 seconds earlier than the master station.

However, if the master station does not complete startup when the GOT starts monitoring (10 seconds after the GOT startup), the communication timeout occurs in the GOT.

For details, refer to the following manual.

📖CC-Link IE Field Network Master/Local Module User's Manual

■Data link failure in all stations at GOT startup or cable connection/disconnection

At GOT startup, the communication is broken temporarily between PORT1 and PORT2 in the CC-Link IE Field module which is installed on the GOT.

Thus, as the GOT or a station between the GOT and the master station is reconnected, the data link failure may occur on all stations.

GOT startup includes the following operations.

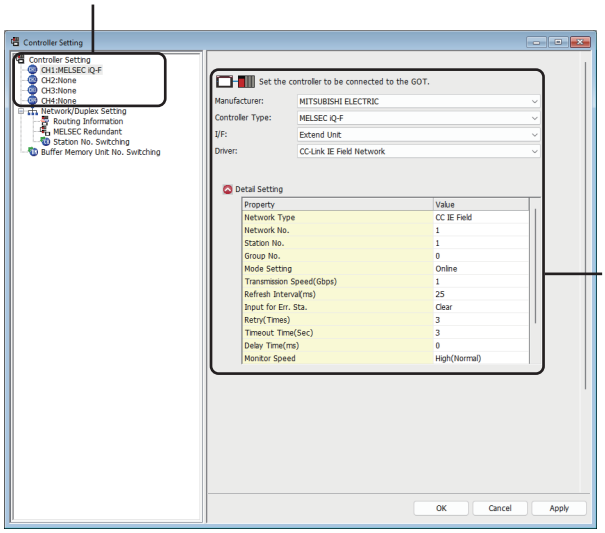
- Turning on the GOT
- Resetting the GOT main unit
- Operating the utility
- Downloading the project including the communication settings
- Downloading the OS

11.3.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.

List menu



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-F]
[I/F]	[Extend Unit]
[Driver]	[CC-Link IE Field Network]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 973 [Detail Setting]

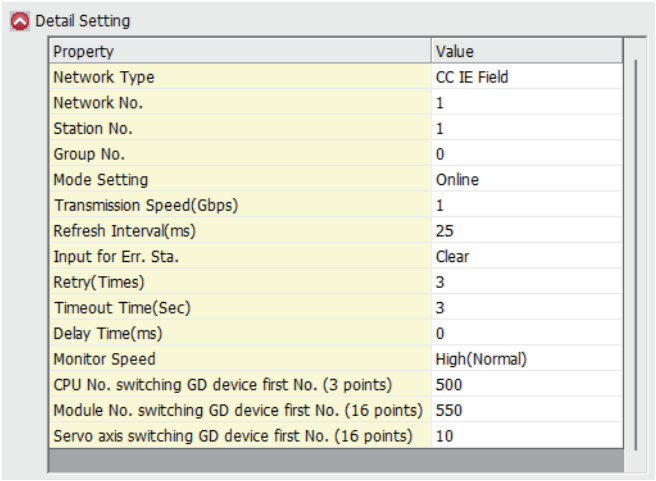
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Network Type]	Set the network type.	[CC IE Field]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the hardware test and self-loopback test, refer to the following. ☞ Page 974 Hardware test ☞ Page 975 Self-loopback test	[Online], [Offline], [H/W test], [Self-loopback test]
[Transmission Speed]	—	[1Gbps]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication.	[1] ms to [1000] ms
[Input for Err. Sta.]	Set whether to hold or clear the input from the station whose data link has become faulty due to powering off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]*2	Set the monitor speed for the CC-Link IE Field Network. This setting is not valid in all systems.	[High(Normal)]*1, [Middle], [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 975 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 976 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 977 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.
*2 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
GT Designer3 (GOT3000) Screen Design Manual

Precautions

When the output is required to be held at the data link failure, set [Input for Err. Sta.] to [Hold] in the controller setting of the GOT.

Point

• Example of communication detail settings

For the example of communication detail settings, refer to the following.

Page 979 PLC side settings

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

• Network type

Be sure to set the same network types for the CPU side and the GOT side.

If the network types of the CPU side and the GOT side are different, an error is displayed in the system alarm of the GOT side.

■Hardware test

For a hardware test, mount a CC-Link IE Field Network communication unit on the GOT, and check if the unit operates properly with the GOT.

The following shows the hardware test procedure.

1. Perform either of the following operations to set the GOT to the hardware test mode.

• Write the project data for which [Mode Setting] in [Detail Setting] is set to [H/W test] to the GOT.

• Set [Mode setting] of [Detail setting] to [H/W Test] in the GOT utility.

2. A hardware test will start at GOT startup.

3. After the test is complete, check the result with the ERR LED on the CC-Link IE Field Network communication unit.

• OFF: Normal

• ON: Error

4. If no error is detected, change the setting of [Mode Setting] from [H/W test] in [Detail Setting].

Since the communication with the controller is not performed when [Mode setting] is set to [H/W Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the CC-Link IE Field Network communication unit.

■Self-loopback test

In a self-loopback test, connect port 1 and port 2 of the CC-Link IE Field Network communication unit mounted on the GOT with a network cable, and check if the unit operates properly with the GOT.

The following shows the self-loopback test procedure.

1. Perform either of the following operations to set the GOT to the self-loopback test mode.

- Write the project data for which [Mode Setting] in [Detail Setting] is set to [Self-loopback test] to the GOT.
- Set [Mode setting] in [Detail setting] to [Self-loopback Test] in the GOT utility.

2. A self-loopback test will start at a GOT startup.

3. After the test is complete, check the result with the ERR LED on the CC-Link IE Field Network communication unit.

- OFF: Normal
- ON: Error

4. If no error is detected, change the setting of [Mode Setting] from [Self-loopback test] in [Detail Setting].

Since the communication with the controller is not performed when [Mode setting] is set to [Self-loopback Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the CC-Link IE Field Network communication unit.

■Start device number of the GD devices for CPU number switching

- Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

- Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

- Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

- Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	01 to 10 Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

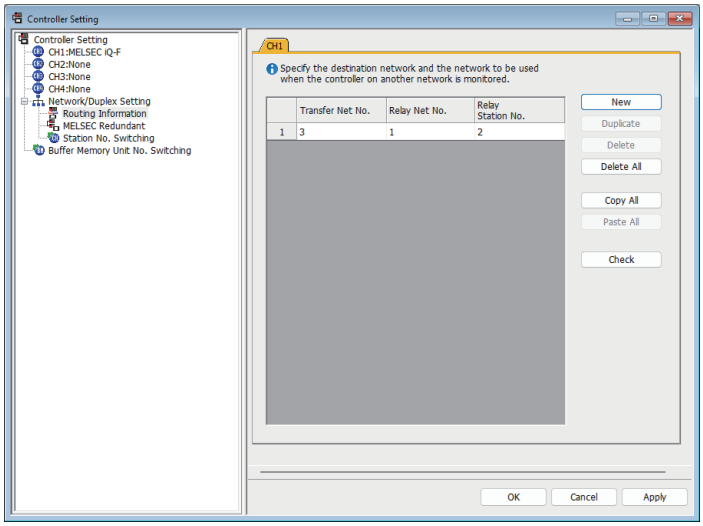
Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 979 PLC side settings

11.3.4 PLC side settings

Model		Reference
MELSEC iQ-F series	FX5U FX5UC FX5UJ	☞ Page 979 Connection to MELSEC iQ-F series

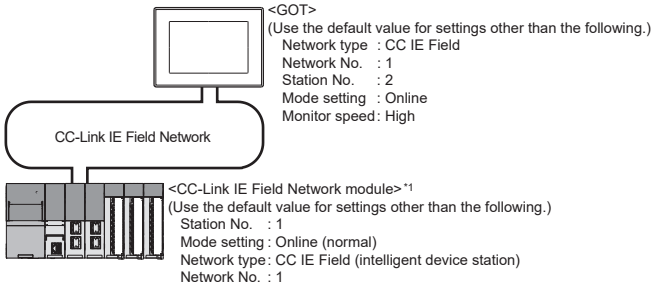
For details on the CC-Link IE Field Network module, refer to the following manual.

📖CC-Link IE Field Network Master/Local Module User's Manual

Connection to MELSEC iQ-F series

This section describes the settings of the GOT and CC-Link IE Field Network module in the system configuration shown below.

■System configuration (Network Type: CC IE Field)

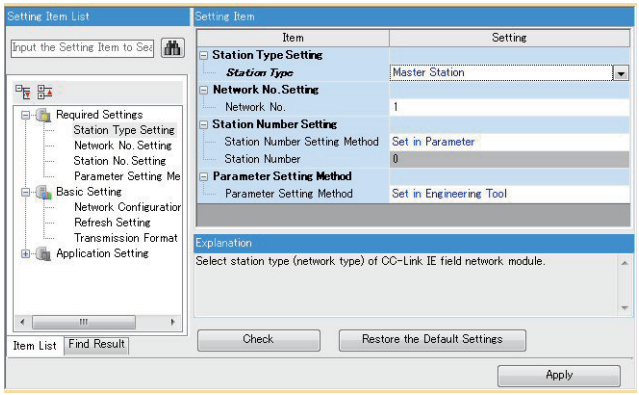


*1 The CC-Link IE Field Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Field Network module is set to 0.

■Module parameter settings of the system configuration (Network Type: CC IE Field)

• [Module Parameter] of GX Works3

Module parameter



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Intelligent device station	○
[Network No.]*1	1	○
[Station Number Setting Method]	Set in parameter	○
[Station No.]	0	○
[Parameter Setting Method]	Set in Engineering Tool	○

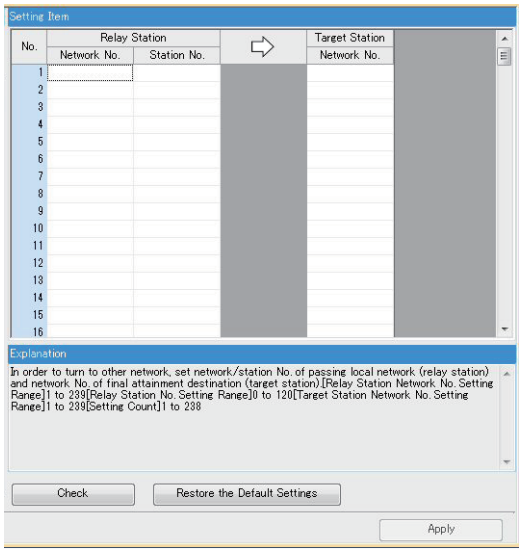
*1 Set the same network number as that of the GOT.

Routing settings

Up to 238 target network numbers can be set.

However, the same number cannot be set twice or more (multiple times).

The GOT (host station) can access networks specified with 238 different target station network numbers.



Item		Range
[Relay Station]	[Network No.]	[1] to [239]
	[Station No.]	[0] to [120]
[Target Station]	[Network No.]	[1] to [239]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 978 Routing parameter settings

■System configuration (Network Type: CC IE Field): [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Field
[Network No.]	1: Network No. 1
[Station No.]	2: Station No. 2
[Group No.]	0
[Mode Setting]	Online
[Refresh Interval]	25 ms
[Input for Err. Sta.]	Clear
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

[Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 972 [Controller Setting]

11.3.5 Access range for monitoring

Only the connected CPU can be accessed.

11.4 MELSEC-Q series (CC-Link IE Field Network connection)

☞ Page 981 Connectable devices
☞ Page 983 System configuration
☞ Page 988 GOT side settings
☞ Page 995 PLC side settings
☞ Page 1000 Access range for monitoring

11.4.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	PLC side interface		Connectable model
			CC-Link IE Field Network communication unit	Built-in port	
MELSEC-Q (Q mode)	Q00UJCPU Q00UJCPU-S8	○	QJ71GF11-T2 QD77GF4*6 QD77GF8*6 QD77GF16*6	—	GT37 SoftGOT3000
	Q00UCPU Q01UCPU Q02UCPU Q03UDCPU	○	QJ71GF11-T2 QD77GF4*6 QD77GF8*6 QD77GF16*6	—	GT37 SoftGOT3000
	Q04UDHCPU Q06UDHCPU Q10UDHCPU Q13UDHCPU Q20UDHCPU Q26UDHCPU	○	QJ71GF11-T2 QD77GF4*6 QD77GF8*6 QD77GF16*6	—	GT37 SoftGOT3000
	Q03UDECPU Q04UDEHCPU Q06UDEHCPU Q10UDEHCPU Q13UDEHCPU Q20UDEHCPU Q26UDEHCPU Q50UDEHCPU Q100UDEHCPU	○	QJ71GF11-T2 QD77GF4*6 QD77GF8*6 QD77GF16*6	—	GT37 SoftGOT3000
	Q03UDVCPU Q04UDVCPU Q06UDVCPU Q13UDVCPU Q26UDVCPU	○	QJ71GF11-T2 QD77GF4*6 QD77GF8*6 QD77GF16*6	—	GT37 SoftGOT3000
C Controller module (Q series)	Q12DCCPU-V*1 Q24DHCCPU-V/VG Q24DHCCPU-LS Q26DHCCPU-LS	○	QJ71GF11-T2 QD77GF4*6 QD77GF8*6 QD77GF16*6	—	GT37 SoftGOT3000
MELSEC-QS	QS001CPU*2	○	QS0J71GF11-T2	—	GT37 SoftGOT3000
Motion CPU (Q series)	Q170MCPU*3*5 Q170MSCPU*4 Q170MSCPU-S1*4	○	QJ71GF11-T2 QD77GF4*6 QD77GF8*6 QD77GF16*6	—	GT37 SoftGOT3000

Controller	Model	Clock	PLC side interface		Connectable model
			CC-Link IE Field Network communication unit	Built-in port	
CC-Link IE Field Network Ethernet adapter module	NZ2GF-ETB	—	—	○	GT37 SoftGOT3000
CNC C70	Q173NCCPU	○	QJ71GF11-T2 QD77GF4*6 QD77GF8*6 QD77GF16*6	—	GT37 SoftGOT3000
Robot controller (Q series)	CRnQ-700 (Q172DRCPU) CR750-Q (Q172DRCPU) CR751-Q (Q172DRCPU) CR800-Q (Q172DSRCPU)	○	QJ71GF11-T2 QD77GF4*6 QD77GF8*6 QD77GF16*6	—	GT37 SoftGOT3000

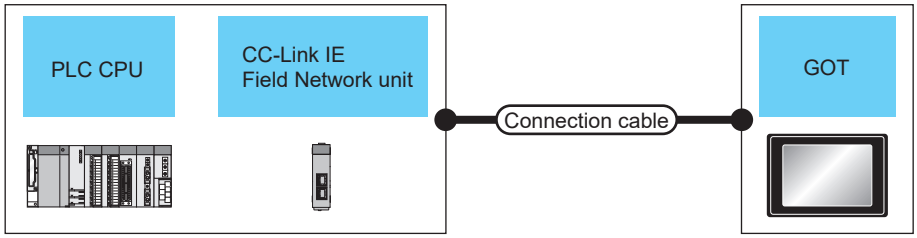
*1 Use a module having a serial number stating with 12042 or later in the first 5 digits.
*2 Use a CPU having a serial number stating with 13042 or later in the first 5 digits.
Use GX Developer Version 8.98C or later.
*3 Only the first step can be used on the extension base unit (Q52B/Q55B).
*4 The extension base unit (Q5□B/Q6□B) can be used.
*5 Use a module having a serial number starting with 12012.
*6 For connection to the QD77GF4, QD77GF8, QD77GF16, refer to the following manual.
QD77GF Simple Motion Module User's Manual

Precautions

For information on the version restrictions of the CC-Link IE Field Network module, refer to the following manual.
CC-Link IE Field Network Master/Local Module User's Manual

11.4.2 System configuration

Connection to CC-Link IE Field Network communication unit



For details on the connection cable and overall cable length, refer to the following.

☞ Page 983 Connection cable

☞ Page 983 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 984 Maximum number of connected devices

Controller	CC-Link IE Field Network communication unit	Connection cable	GOT	
			Interface	Model
MELSEC-Q (Q mode) C Controller module (Q series) Motion CPU (Q series) CNC C70 Robot controller (Q series)	QJ71GF11-T2 QD77GF4 QD77GF8 QD77GF16	Twisted pair cable	GT37-IF2000 + GT15-J71GF13-T2*1	GT37 SoftGOT3000
MELSEC-QS	QS0J71GF11-T2	Twisted pair cable	GT37-IF2000 + GT15-J71GF13-T2*1	GT37 SoftGOT3000

*1 If there is a submaster station in the network configuration, use software version C or later.
The software version is the 10th digit of the serial number described on the rating plate of the unit.

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
1000BASE-T	Shielded twisted pair cable (STP) of category 5e or higher

Use cables that meet the IEEE802.3 1000BASE-T standard.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Use hubs that satisfy the following conditions.

- Compliant with the IEEE802.3 (1000BASE-T) standard
- Include Auto MDI/MDI-X.
- Include an automatic negotiation function.
- Switching hub (Do not use repeater hubs.)

Recommended switching hub (Mitsubishi Electric products)

Type	Model
Industrial switching hub	NZ2EHG-T8

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

■Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manual.

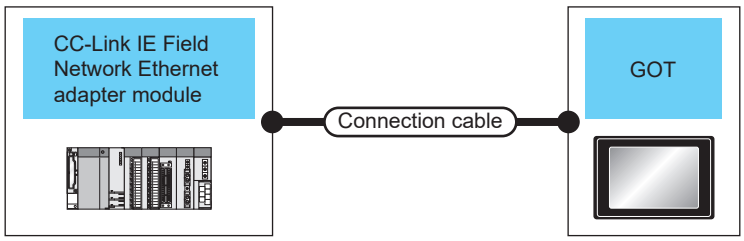
CC-Link IE Field Network Master/Local Module User's Manual

■Maximum number of connected devices

The following shows the number of GOTs connectable to one controller.

Controller	
Model	**Number of GOTs connectable to one PLC**
MELSEC-Q (Q mode) C Controller module (Q series) MELSEC-QS Motion CPU (Q series) CNC C70 Robot controller (Q series)	120

Connection to CC-Link IE Field Network Ethernet adapter module



For details on the connection cable and overall cable length, refer to the following.

☞ Page 984 Connection cable

☞ Page 985 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 985 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	**Model**
CC-Link IE Field Network Ethernet adapter module (NZ2GF-ETB)	Twisted pair cable	GT37-IF2000 + GT15-J71GF13-T2*1	GT37 SoftGOT3000

*1 If there is a submaster station in the network configuration, use software version C or later.
The software version is the 10th digit of the serial number described on the rating plate of the unit.

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
1000BASE-T	Shielded twisted pair cable (STP) of category 5e or higher

Use cables that meet the IEEE802.3 1000BASE-T standard.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Use hubs that satisfy the following conditions.

- Compliant with the IEEE802.3 (1000BASE-T) standard
- Include Auto MDI/MDI-X.
- Include an automatic negotiation function.
- Switching hub (Do not use repeater hubs.)

Recommended switching hub (Mitsubishi Electric products)

Type	Model
Industrial switching hub	NZ2EHG-T8

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

■Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manual.

📖CC-Link IE Field Network Master/Local Module User's Manual

■Maximum number of connected devices

The number of connectable device stations is 120 (1 CC-Link IE Field Network Ethernet adapter module and 119 GOTs).

The following shows the number of GOTs connectable to one controller.

Controller	
Model	**Number of GOTs connectable to one PLC**
CC-Link IE Field Network Ethernet adapter module	119

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

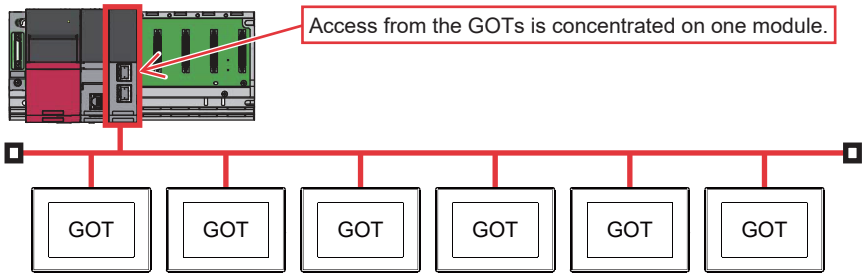
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

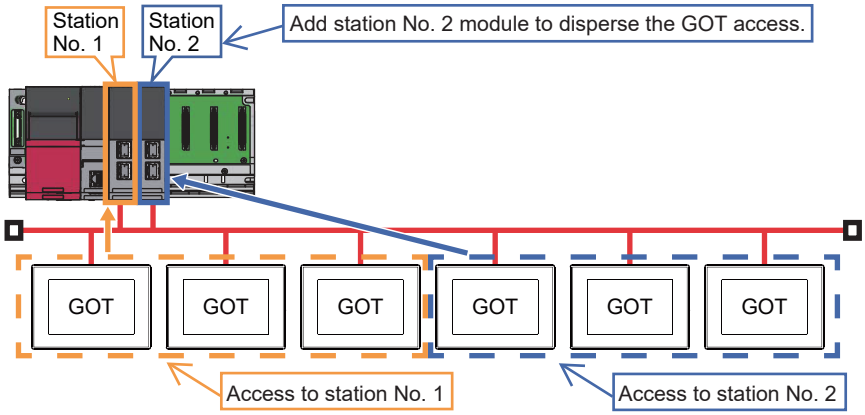
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

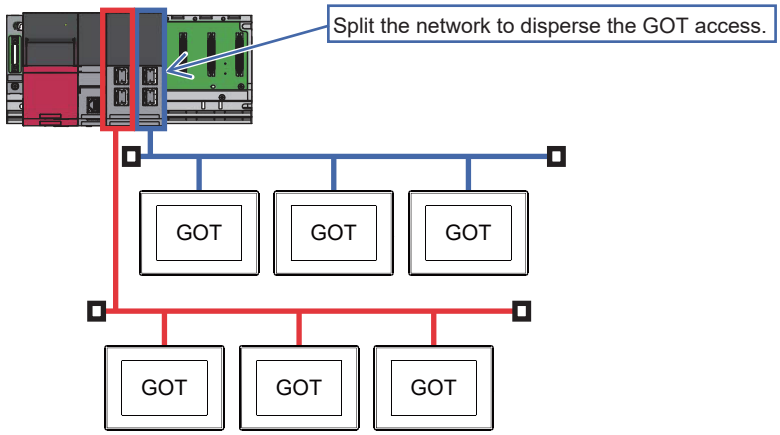
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

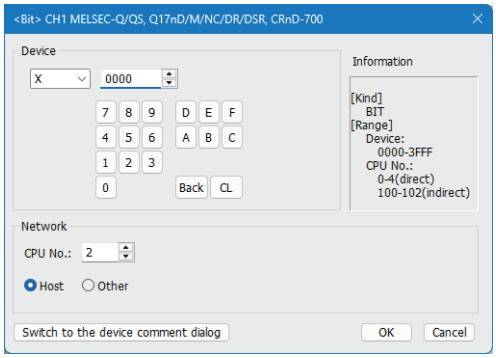
■Connection to Q170MCPU or Q170MSCPU(-S1)

The Motion CPU area (CPU No. 2) cannot be monitored.

Set [CPU No.] to 0 or 1. The device of the PLC CPU area (CPU number 1) is monitored.

For the setting of [CPU No.], refer to the following.

GT Designer3 (GOT3000) Screen Design Manual



■Starting the GOT connected to the CC-Link IE Field Network

For the CC-Link IE Field Network connection, the data link is started approximately 15 seconds after the GOT startup.

■When a network error occurs in the system alarm

In the CC-Link IE Field Network connection, when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

■Data link failure in other stations at GOT startup

At GOT startup, the data link failure may occur in other stations.

However, after the failure occurrence, the GOT reconnects automatically and monitors the devices properly.

To avoid such data link failure, start up the GOT 10 seconds earlier than the master station.

However, if the master station does not complete startup when the GOT starts monitoring (10 seconds after the GOT startup), the communication timeout occurs in the GOT.

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

■Data link failure in all stations at GOT startup or cable connection/disconnection

At GOT startup, the communication is broken temporarily between PORT1 and PORT2 in the CC-Link IE Field module which is installed on the GOT.

Thus, as the GOT or a station between the GOT and the master station is reconnected, the data link failure may occur on all stations.

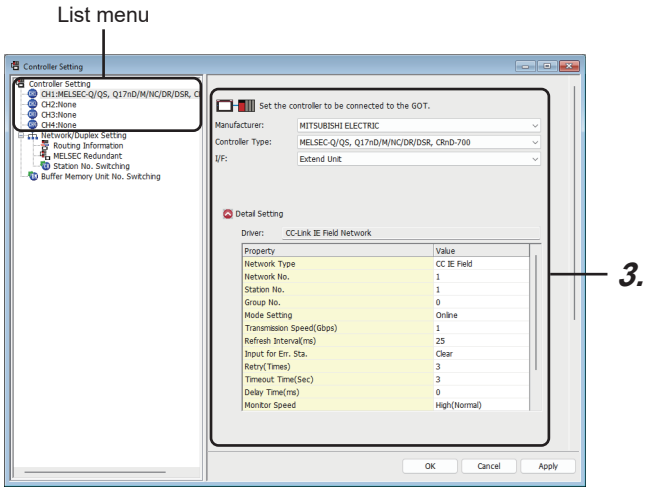
GOT startup includes the following operations.

- Turning on the GOT
- Resetting the GOT main unit
- Operating the utility
- Downloading the project including the communication settings
- Downloading the OS

11.4.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-Q/QS,Q17nD/M/NC/DR/DSR,CRnD-700]
[I/F]	[Extend Unit]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 989 [Detail Setting]

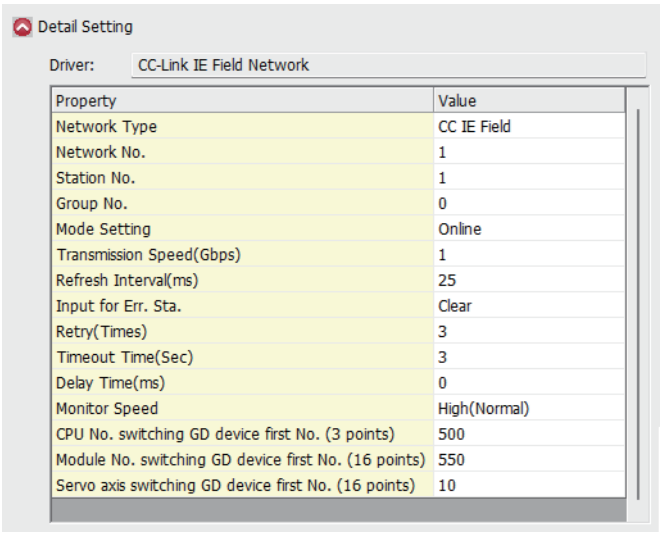
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[CC-Link IE Field Network]
[Network Type]	Set the network type.	[CC IE Field]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the hardware test and self-loopback test, refer to the following. ☞ Page 991 Hardware test ☞ Page 991 Self-loopback test	[Online], [Offline], [H/W test], [Self-loopback test]
[Transmission Speed]	—	[1Gbps]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication.	[1] ms to [1000] ms
[Input for Err. Sta.]	Set whether to hold or clear the input from the station whose data link has become faulty due to powering off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]*3	Set the monitor speed for the CC-Link IE Field Network. This setting is not valid in all systems.	[High(Normal)]*1, [Middle], [Low]*2
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 991 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 992 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. ☞ Page 993 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.
However, the range may affect the sequence scan time for connection to Q00UJ/Q00U/Q01U/Q02UCPU.
If you want to avoid the influence on the sequence scan time, do not set [High(Normal)].

*2 Set this range if you want to avoid the influence on the sequence scan time further than the [Middle] setting for connection to Q00UJ/Q00U/Q01U/Q02UCPU.
However, the monitor speed may be reduced.

*3 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
GT Designer3 (GOT3000) Screen Design Manual

Precautions

When the output is required to be held at the data link failure, set [Input for Err. Sta.] to [Hold] in the controller setting of the GOT.

Point

• Example of communication detail settings

For the example of communication detail settings, refer to the following.

Page 995 PLC side settings

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

• Network type

Be sure to set the same network types for the CPU side and the GOT side.

If the network types of the CPU side and the GOT side are different, an error is displayed in the system alarm of the GOT side.

■Hardware test

For a hardware test, mount a CC-Link IE Field Network communication unit on the GOT, and check if the unit operates properly with the GOT.

The following shows the hardware test procedure.

1. Perform either of the following operations to set the GOT to the hardware test mode.
   - Write the project data for which [Mode Setting] in [Detail Setting] is set to [H/W test] to the GOT.
   - Set [Mode setting] of [Detail setting] to [H/W Test] in the GOT utility.
2. A hardware test will start at GOT startup.
3. After the test is complete, check the result with the ERR LED on the CC-Link IE Field Network communication unit.
   - OFF: Normal
   - ON: Error
4. If no error is detected, change the setting of [Mode Setting] from [H/W test] in [Detail Setting].

Since the communication with the controller is not performed when [Mode setting] is set to [H/W Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the CC-Link IE Field Network communication unit.

■Self-loopback test

In a self-loopback test, connect port 1 and port 2 of the CC-Link IE Field Network communication unit mounted on the GOT with a network cable, and check if the unit operates properly with the GOT.

The following shows the self-loopback test procedure.

1. Perform either of the following operations to set the GOT to the self-loopback test mode.
   - Write the project data for which [Mode Setting] in [Detail Setting] is set to [Self-loopback test] to the GOT.
   - Set [Mode setting] in [Detail setting] to [Self-loopback Test] in the GOT utility.
2. A self-loopback test will start at a GOT startup.
3. After the test is complete, check the result with the ERR LED on the CC-Link IE Field Network communication unit.
   - OFF: Normal
   - ON: Error
4. If no error is detected, change the setting of [Mode Setting] from [Self-loopback test] in [Detail Setting].

Since the communication with the controller is not performed when [Mode setting] is set to [Self-loopback Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the CC-Link IE Field Network communication unit.

■Start device number of the GD devices for CPU number switching

- Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

- Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

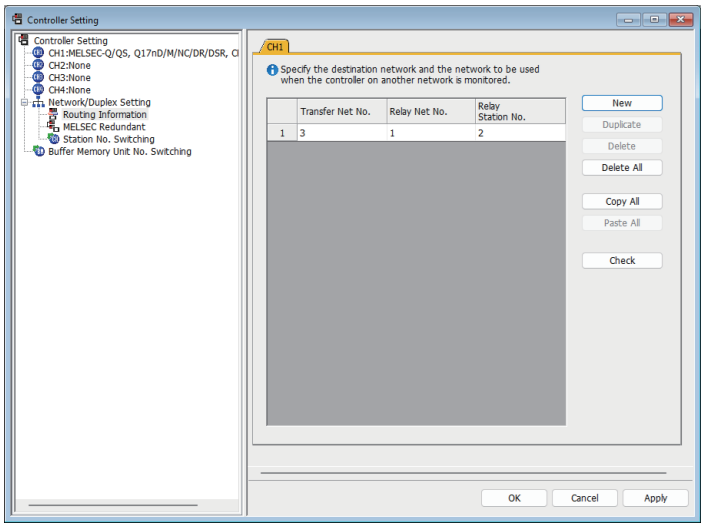
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC-Q CC-Link IE Field Network Master/Local Module User's Manual



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 995 PLC side settings

11.4.4 PLC side settings

Model		Reference

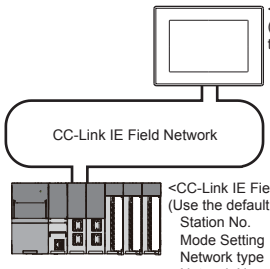
For details on the CC-Link IE Field Network module, refer to the following manual.

📖CC-Link IE Field Network Master/Local Module User's Manual

Connection to MELSEC-Q series

This section describes the settings of the GOT and CC-Link IE Field Network module in the system configuration shown below.

■System configuration (Network Type: CC IE Field)



<GOT>
(Use the default value for settings other than the following.)
Network type :CC IE Field
Network No. :1
Station No. :1
Mode Setting :Online
Network Configuration Settings:RX/RY00 to FFH
RWw/RWr00 to FFH
Monitor Speed :High

<CC-Link IE Field Network module> *1
(Use the default value for settings other than the following.)
Station No. :0 (fixed)
Mode Setting :Online (normal)
Network type :CC IE Field (Master station)
Network No. :1
Total stations :1
Network Configuration Settings:RX/RY00H to FFH
RWw/RWr00H to FFH

*1 The CC-Link IE Field Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Field Network module is set to 0.

Point

Connection to Q170MCPU or Q170MSCPU(-S1)

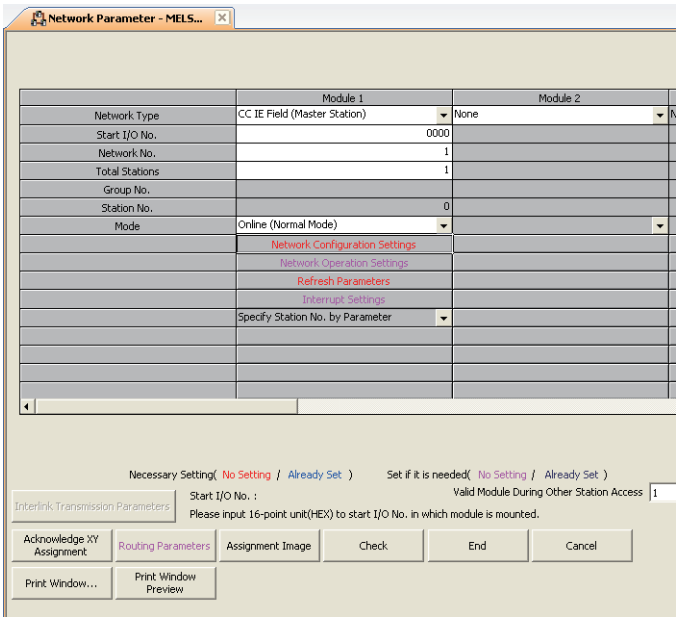
For connection to Q170MCPU or Q170MSCPU(-S1), the start I/O number of the CC-Link IE Field Network module is set to 70.

■Parameter settings of the system configuration (Network Type: CC IE Field)

• [Network parameter] of GX Works2

Use GX Works2 Version 1.31H or later.

Network parameter



○: Necessary, △: As necessary, —: Not necessary

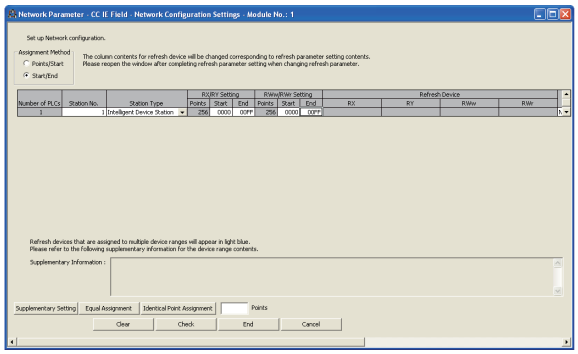
Item	Setting value	Setting for GOT connection
[Network Type]	CC IE Field (Master station)	○
[Starting I/O No.]*1	0000H	○
[Network No.]*2	1	○
[Total stations]	1	○
[Station No.]	0	○
[Mode]*3	Online (Normal Mode)	○
[Network Configuration Settings]	☞ Network configuration settings	△
[Refresh parameters]	(Use default value)	△
[Interrupt settings]		—
[Interlink transmission parameters]		—
[Routing parameters]	☞ Routing parameters	△

*1 When using Q170MCPU or Q170MSCPU(-S1), set it according to the system configuration.

*2 Set the same network number as that of the GOT.

*3 Set the same mode setting as that of the GOT.

Network configuration settings



○: Necessary, △: As necessary, —: Not necessary

Item			Setting value	Setting for GOT connection
RX/RY setting*1	Station No. 1	[Start]	0000H	△
		[End]	00FFH	△
RWw/RWr setting*1	Station No. 1	[Start]	00000H	△
		[End]	000FFH	△
Reserved/Error Invalid Station			No setting	△

*1 Be sure to set it to perform the cyclic transmission.

Point

• When changing the network parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• GOT station type

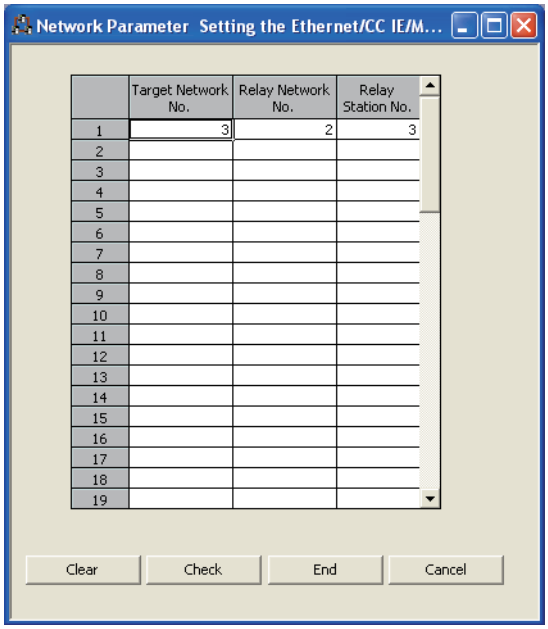
Set the GOT as an intelligent device station.

Routing parameters

Up to 64 settings can be configured for [Target Network No.].

However, the same number cannot be set in [Target Network No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Target Network No.].



Item	Range
[Target Network No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 994 Routing parameter settings

■System configuration (Network Type: CC IE Field): [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Field
[Network No.]	1: Network No. 1
[Station No.]	1: Station No. 1
[Group No.]	0
[Mode Setting]	Online
[Refresh Interval]	25 ms
[Input for Err. Sta.]	Clear
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

[Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 988 [Controller Setting]

11.4.5 Access range for monitoring

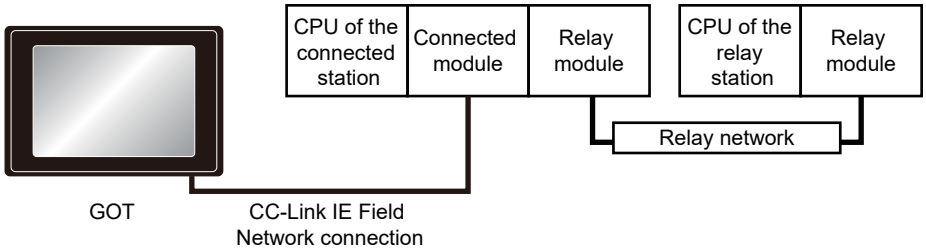
When GOT is connected to the CPU of the station connected via CC-Link IE Field Network, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station								
		Relay network	CPU of the relay station							
			RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
QCPU*1	☞ Page 981 Connectable devices	Ethernet	—	○	○*3	○	—	○	—	—
		CC-Link IE Controller Network	—	—	○	○	—	—	—	—
		CC-Link IE Field Network	—	○	○*1	○	—	—	—	—
		MELSECNET/H, MELSECNET/10	—	—	○	○	○	○	○*2	—
C Controller module (MELSEC-Q series)	☞ Page 981 Connectable devices	CC-Link IE Controller Network	—	—	○	○	—	—	—	—
		CC-Link IE Field Network	—	○	○*1	○	—	—	—	—
		MELSECNET/H, MELSECNET/10	—	—	○	○	○	○	○*2	—

*1 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*2 AnUCPU and AnUSCPU are supported.

*3 The C Controller module (MELSEC-Q series) is not supported.

11.5 MELSEC-L series (CC-Link IE Field Network connection)

☞ Page 1001 Connectable devices
☞ Page 1002 System configuration
☞ Page 1006 GOT side settings
☞ Page 1013 PLC side settings
☞ Page 1017 Access range for monitoring

11.5.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	PLC side interface		Connectable model
			CC-Link IE Field Network communication unit	Built-in port	
MELSEC-L series	L02CPU*1 L06CPU*1 L26CPU*1 L26CPU-BT*1 L02CPU-P*1 L06CPU-P*1 L26CPU-P*1 L26CPU-PBT*1 L02SCPU*1 L02SCPU-P*1	○	LJ71GF11-T2	—	GT37 SoftGOT3000
CC-Link IE Field Network head module	LJ72GF15-T2	—	—	○	GT37 SoftGOT3000

*1 Use a module having a serial number starting with 13012 or later in the first 5 digits.

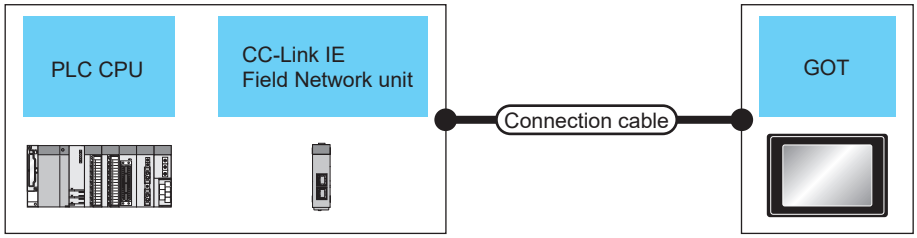
Precautions

For information on the version restrictions of the CC-Link IE Field Network module, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

11.5.2 System configuration

Connection to CC-Link IE Field Network communication unit



For details on the connection cable and overall cable length, refer to the following.

☞ Page 1002 Connection cable

☞ Page 1002 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1003 Maximum number of connected devices

Controller	CC-Link IE Field Network communication unit	Connection cable	GOT	
			Interface	Model
MELSEC-L series	LJ71GF11-T2	Twisted pair cable	GT37-IF2000 + GT15-J71GF13-T2*1	GT37 SoftGOT3000

*1 If there is a submaster station in the network configuration, use software version C or later.
The software version is the 10th digit of the serial number described on the rating plate of the unit.

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
1000BASE-T	Shielded twisted pair cable (STP) of category 5e or higher

Use cables that meet the IEEE802.3 1000BASE-T standard.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Use hubs that satisfy the following conditions.

- Compliant with the IEEE802.3 (1000BASE-T) standard
- Include Auto MDI/MDI-X.
- Include an automatic negotiation function.
- Switching hub (Do not use repeater hubs.)

Recommended switching hub (Mitsubishi Electric products)

Type	Model
Industrial switching hub	NZ2EHG-T8

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

■Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manual.

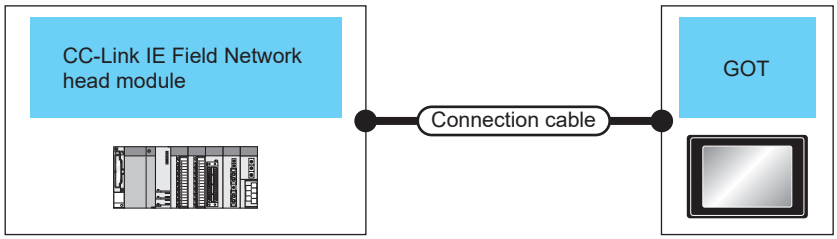
CC-Link IE Field Network Master/Local Module User's Manual

■Maximum number of connected devices

The following shows the number of GOTs connectable to one controller.

Controller	
Model	**Number of GOTs connectable to one PLC**
MELSEC-L series	120

Connection to CC-Link IE Field Network head module



For details on the connection cable and overall cable length, refer to the following.

☞ Page 1003 Connection cable

☞ Page 1003 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1004 Maximum number of connected devices

Controller	Connection cable	GOT	
		Interface	**Model**
CC-Link IE Field Network head module	Twisted pair cable	GT37-IF2000 + GT15-J71GF13-T2*1	GT37 SoftGOT3000

*1 If there is a submaster station in the network configuration, use software version C or later.
The software version is the 10th digit of the serial number described on the rating plate of the unit.

■Connection cable

Use a connection cable that meets the following standards.

Standard	Category
1000BASE-T	Shielded twisted pair cable (STP) of category 5e or higher

Use cables that meet the IEEE802.3 1000BASE-T standard.

When only one GOT is connected, the GOT can be directly connected to the controller without a hub.

Use hubs that satisfy the following conditions.

- Compliant with the IEEE802.3 (1000BASE-T) standard
- Include Auto MDI/MDI-X.
- Include an automatic negotiation function.
- Switching hub (Do not use repeater hubs.)

Recommended switching hub (Mitsubishi Electric products)

Type	Model
Industrial switching hub	NZ2EHG-T8

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

■Overall length

The overall cable length is 12100 m.

The overall cable length and cable length between stations vary depending on the connection method (line, star, or ring), the system configuration, etc.

For details, refer to the following manual.

CC-Link IE Field Network Master/Local Module User's Manual

■Maximum number of connected devices

The number of connectable device stations is 120 (1 CC-Link IE Field Network Ethernet adapter module and 119 GOTs).

The following shows the number of GOTs connectable to one controller.

Controller	
Model	**Number of GOTs connectable to one PLC**
CC-Link IE Field Network head module	119

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

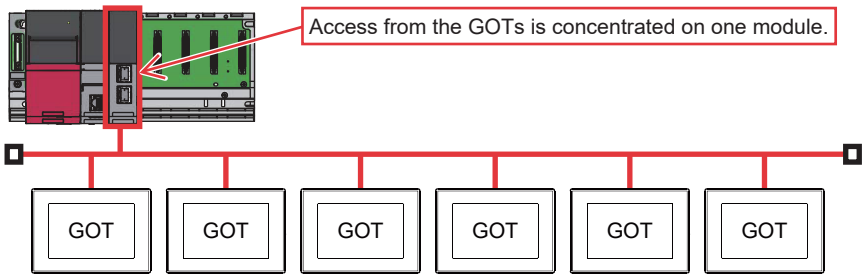
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

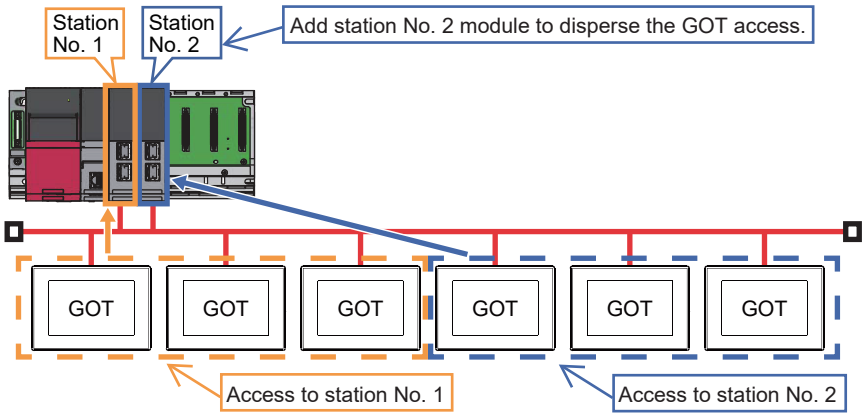
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

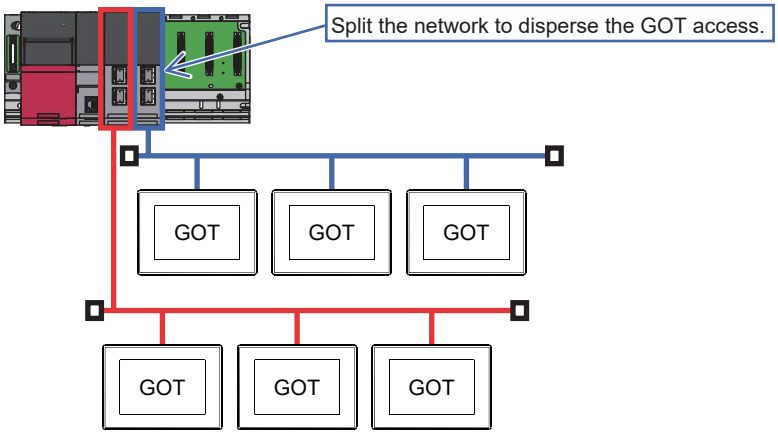
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT connected to the CC-Link IE Field Network

For the CC-Link IE Field Network connection, the data link is started approximately 15 seconds after the GOT startup.

■When a network error occurs in the system alarm

In the CC-Link IE Field Network connection, when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

■Data link failure in other stations at GOT startup

At GOT startup, the data link failure may occur in other stations.

However, after the failure occurrence, the GOT reconnects automatically and monitors the devices properly.

To avoid such data link failure, start up the GOT 10 seconds earlier than the master station.

However, if the master station does not complete startup when the GOT starts monitoring (10 seconds after the GOT startup), the communication timeout occurs in the GOT.

For details, refer to the following manual.

📖CC-Link IE Field Network Master/Local Module User's Manual

■Data link failure in all stations at GOT startup or cable connection/disconnection

At GOT startup, the communication is broken temporarily between PORT1 and PORT2 in the CC-Link IE Field module which is installed on the GOT.

Thus, as the GOT or a station between the GOT and the master station is reconnected, the data link failure may occur on all stations.

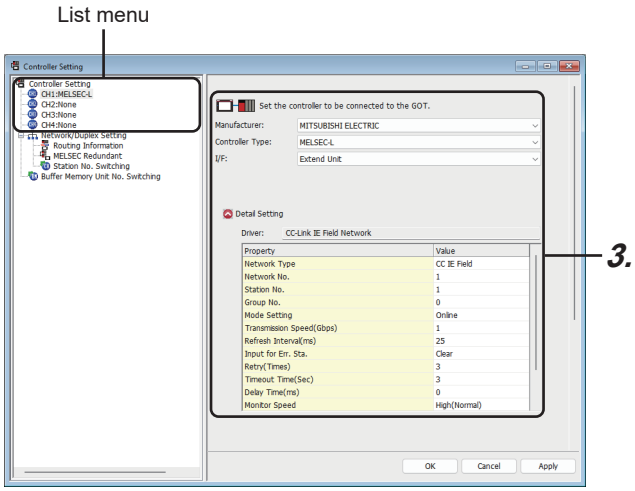
GOT startup includes the following operations.

- Turning on the GOT
- Resetting the GOT main unit
- Operating the utility
- Downloading the project including the communication settings
- Downloading the OS

11.5.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-L]
[I/F]	[Extend Unit]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 1007 [Detail Setting]

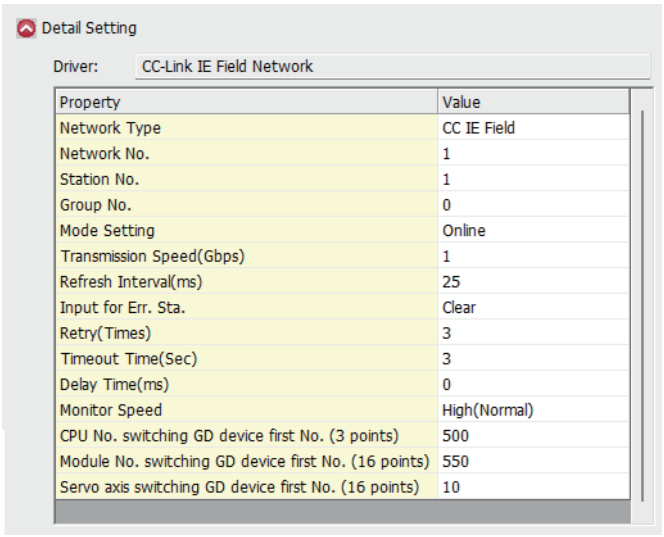
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Driver]	This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].	[CC-Link IE Field Network]
[Network Type]	Set the network type.	[CC IE Field]
[Network No.]	Set the network number.	[1] to [239]
[Station No.]	Set the station number of the GOT.	[1] to [120]
[Group No.]	—	[0]
[Mode Setting]	Set the operation mode of the GOT. For details on the hardware test and self-loopback test, refer to the following. ☞ Page 1008 Hardware test ☞ Page 1009 Self-loopback test	[Online], [Offline], [H/W test], [Self-loopback test]
[Transmission Speed]	—	[1Gbps]
[Refresh Interval]	Set the number of refreshes to secure the send/receive data per station during communication.	[1] ms to [1000] ms
[Input for Err. Sta.]	Set whether to hold or clear the input from the station whose data link has become faulty due to powering off or other reasons.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set the delay time for reducing the load of the network and destination PLC.	[0] ms to [300] ms
[Monitor Speed]*2	Set the monitor speed for the CC-Link IE Field Network. This setting is not valid in all systems.	[High(Normal)]*1, [Middle], [Low]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 1009 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 1010 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 1011 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 This setting is effective for collecting large data with the logging, recipe, or such function on a screen other than the monitor screen.

*2 When using a global label to read or write more than 235 two-byte characters, set [Monitor speed] to [High(Normal)] or [Middle].
If [Monitor speed] is set to [Low], a system error occurs when reading or writing.
For details, refer to the following manual.
📖GT Designer3 (GOT3000) Screen Design Manual

Precautions

When the output is required to be held at the data link failure, set [Input for Err. Sta.] to [Hold] in the controller setting of the GOT.

Point

• Example of communication detail settings

For the example of communication detail settings, refer to the following.

☞ Page 1013 PLC side settings

• Controller settings using the GT37 utility

The controller settings can be changed in [Communication Settings] of the GT37 utility after writing [Communication Settings] of project data to GT37.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When the settings are configured in GT Designer3 or in the GT37 utility, the latest settings are effective.

• Network type

Be sure to set the same network types for the CPU side and the GOT side.

If the network types of the CPU side and the GOT side are different, an error is displayed in the system alarm of the GOT side.

■Hardware test

For a hardware test, mount a CC-Link IE Field Network communication unit on the GOT, and check if the unit operates properly with the GOT.

The following shows the hardware test procedure.

1. Perform either of the following operations to set the GOT to the hardware test mode.

• Write the project data for which [Mode Setting] in [Detail Setting] is set to [H/W test] to the GOT.

• Set [Mode setting] of [Detail setting] to [H/W Test] in the GOT utility.

2. A hardware test will start at GOT startup.

3. After the test is complete, check the result with the ERR LED on the CC-Link IE Field Network communication unit.

• OFF: Normal

• ON: Error

4. If no error is detected, change the setting of [Mode Setting] from [H/W test] in [Detail Setting].

Since the communication with the controller is not performed when [Mode setting] is set to [H/W Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the CC-Link IE Field Network communication unit.

■Self-loopback test

In a self-loopback test, connect port 1 and port 2 of the CC-Link IE Field Network communication unit mounted on the GOT with a network cable, and check if the unit operates properly with the GOT.

The following shows the self-loopback test procedure.

1. Perform either of the following operations to set the GOT to the self-loopback test mode.

- Write the project data for which [Mode Setting] in [Detail Setting] is set to [Self-loopback test] to the GOT.
- Set [Mode setting] in [Detail setting] to [Self-loopback Test] in the GOT utility.

2. A self-loopback test will start at a GOT startup.

3. After the test is complete, check the result with the ERR LED on the CC-Link IE Field Network communication unit.

- OFF: Normal
- ON: Error

4. If no error is detected, change the setting of [Mode Setting] from [Self-loopback test] in [Detail Setting].

Since the communication with the controller is not performed when [Mode setting] is set to [Self-loopback Test], the communication timeout error occurs when the device of controller is monitored.

5. If any error is detected, replace the CC-Link IE Field Network communication unit.

■Start device number of the GD devices for CPU number switching

- Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

- Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

- Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

- Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Routing parameter settings

Up to 64 settings can be configured for [Transfer Net No.].

However, the same number cannot be set in [Transfer Net No.] twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Transfer Net No.].

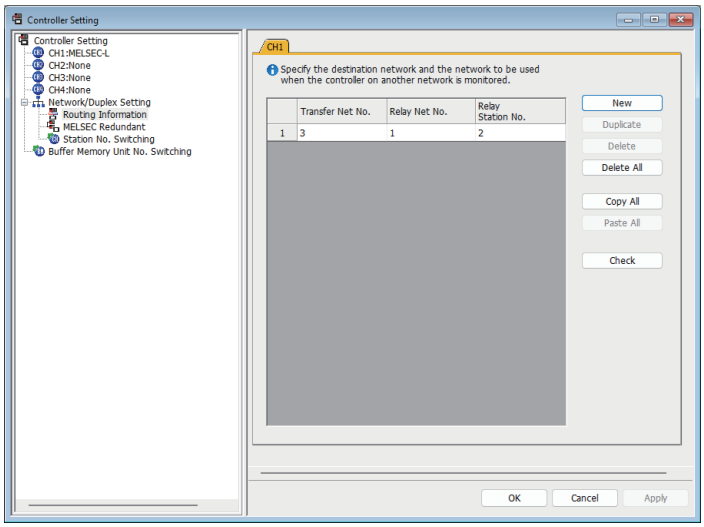
Point

Routing parameter settings

When communicating within the host network, routing parameter settings are not required.

For details on routing parameters, refer to the following manual.

MELSEC-Q/L Ethernet Interface Module User's Manual (Application)



Item	Range
[Transfer Net No.]	[1] to [239]
[Relay Net No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the relay station

Routing parameter settings are also necessary for the relay station.

For the setting, refer to the following.

☞ Page 1013 PLC side settings

11.5.4 PLC side settings

Model		Reference
MELSEC-L series	L02CPU L06CPU L26CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT L02SCPU L02SCPU-P	☞ Page 1013 Connection to MELSEC-L series
CC-Link IE Field Network head module	LJ72GF15-T2	☞ Page 1013 Connection to MELSEC-L series

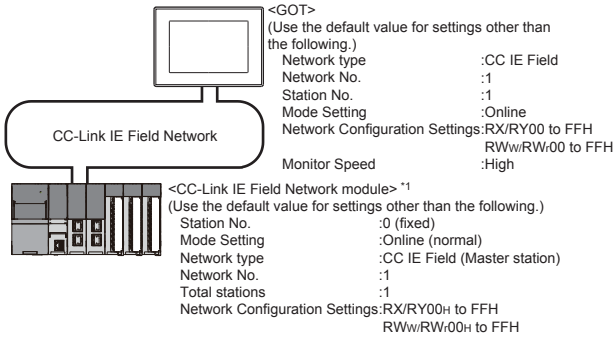
For details on the CC-Link IE Field Network module, refer to the following manual.

📖CC-Link IE Field Network Master/Local Module User's Manual

Connection to MELSEC-L series

This section describes the settings of the GOT and CC-Link IE Field Network module in the system configuration shown below.

■System configuration (Network Type: CC IE Field)



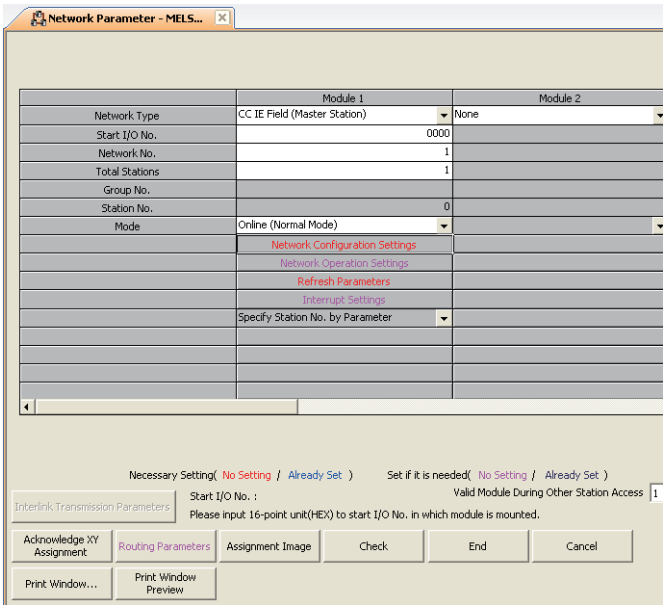
*1 The CC-Link IE Field Network module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link IE Field Network module is set to 0.

■Parameter settings of the system configuration (Network Type: CC IE Field)

• [Network parameter] of GX Works2

Use GX Works2 Version 1.31H or later.

Network parameter



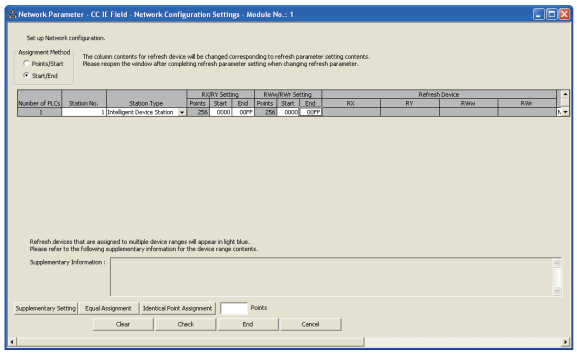
○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Network Type]	CC IE Field (Master station)	○
[Starting I/O No.]	0000H	○
[Network No.]*1	1	○
[Total stations]	1	○
[Station No.]	0	○
[Mode]*2	Online (Normal Mode)	○
[Network Configuration Settings]	☞ Network configuration settings	△
[Refresh parameters]	(Use default value)	△
[Interrupt settings]		—
[Interlink transmission parameters]		—
[Routing parameters]	☞ Routing parameters	△

*1 Set the same network number as that of the GOT.

*2 Set the same mode setting as that of the GOT.

Network configuration settings



○: Necessary, △: As necessary, —: Not necessary

Item			Setting value	Setting for GOT connection
RX/RY setting*1	Station No. 1	[Start]	0000H	△
		[End]	00FFH	△
RWw/RWr setting*1	Station No. 1	[Start]	00000H	△
		[End]	000FFH	△
Reserved/Error Invalid Station			No setting	△

*1 Be sure to set it to perform the cyclic transmission.

Point

- When changing the network parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

- GOT station type

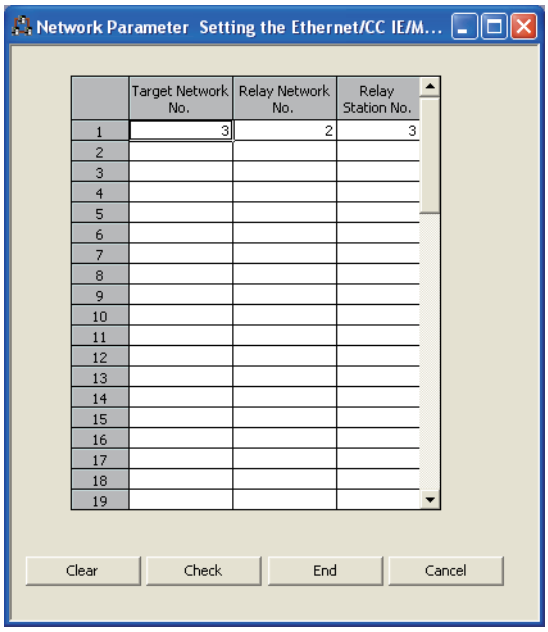
Set the GOT as an intelligent device station.

Routing parameters

Up to 64 settings can be configured for [Target Network No.].

However, the same destination network number cannot be set twice or more (multiple times).

The GOT (host station) can access 64 different networks specified under [Target Network No.].



Item	Range
[Target Network No.]	[1] to [239]
[Relay Network No.]	[1] to [239]
[Relay Station No.]	[0] to [120]

Point

Routing parameter settings for the request source

Routing parameter settings are also necessary for the request source GOT.

For the setting, refer to the following.

☞ Page 1012 Routing parameter settings

■System configuration (Network Type: CC IE Field): [Controller Setting] in GT Designer3

Item	Setting value
[Network Type]	CC IE Field
[Network No.]	1: Network No. 1
[Station No.]	1: Station No. 1
[Group No.]	0
[Mode Setting]	Online
[Refresh Interval]	25 ms
[Input for Err. Sta.]	Clear
[Retry]	3 times
[Timeout Time]	3 seconds
[Delay Time]	0 ms
[Monitor Speed]	High(Normal)

Point

[Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 1006 [Controller Setting]

11.5.5 Access range for monitoring

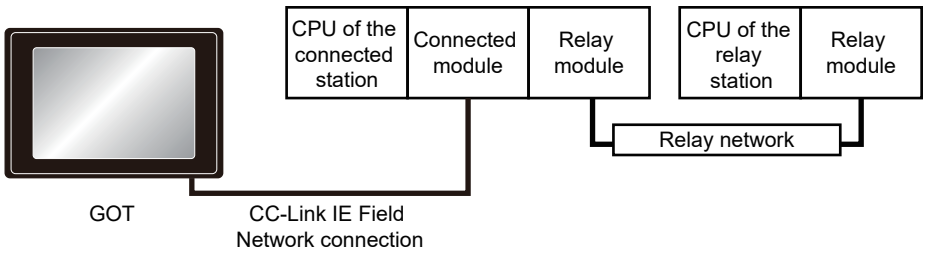
When GOT is connected to the CPU of the station connected via CC-Link IE Field Network, the range accessible via the CPU is as follows.

Point

• When monitoring other networks (Routing parameter settings)

To monitor other networks, routing parameter settings are necessary.

For the routing parameter settings, refer to the reference manual of the network connected.



○: Accessible, —: Inaccessible

CPU of the connected station	Connected module	Relay station								
		Relay network	CPU of the relay station							
			RCPU	LCPU	QCPU (Q mode)	QSCPU	QCPU (A mode)	QnACPU	ACPU	FX5CPU
LCPU	☞ Page 1001 Connectable devices	Ethernet	—	○	○*2	○	—	○	—	—
		CC-Link IE Field Network	—	○	○*1	○	—	—	—	—
LJ72GF15-T2	☞ Page 1001 Connectable devices	CC-Link IE Field Network	—	○	○*1	○	—	—	—	—

*1 QnUDVCPU, QnUDECPU, QnUDEHCPU, QnUCPU, QnUDCPU, and QnUDHCPU are supported.

*2 The C Controller module (MELSEC-Q series) is not supported.

12 CC-Link connection (intelligent device station)

☞ Page 1018 MELSEC MX Controller (MX-R Model) (CC-Link connection (intelligent device station))
☞ Page 1038 MELSEC MX Controller (MX-F Model) (CC-Link connection (intelligent device station))

☞ Page 1170 MELSEC-F series (CC-Link connection (intelligent device station))

12.1 MELSEC MX Controller (MX-R Model) (CC-Link connection (intelligent device station))

☞ Page 1018 Connectable devices
☞ Page 1019 System configuration
☞ Page 1023 GOT side settings
☞ Page 1029 PLC side settings
☞ Page 1037 Access range for monitoring

12.1.1 Connectable devices

The following table shows the connectable models.

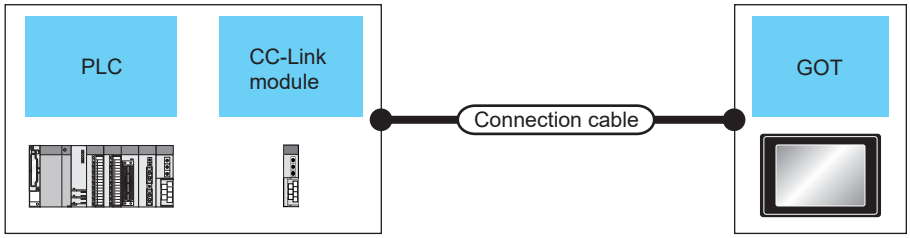
○: Supported, —: Not supported

Controller	Model	Clock	CC-Link module	Connectable model
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64	○	RJ61BT11*1	GT37 SoftGOT3000
	MXR500-128 MXR500-256	○	RJ61BT11*1	GT37 SoftGOT3000

*1 Use firmware version 04 or later when building a redundant system.

12.1.2 System configuration

Connection with CC-Link Ver.1 compatible



For details on the overall length, refer to the following.

☞ Page 1019 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1019 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC MX Controller (MX-R Model)	RJ61BT11	CC-Link (Ver. 1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1023 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

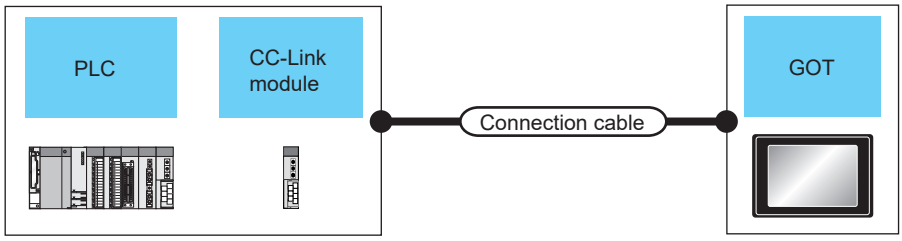
MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	Number of connectable devices
MELSEC MX Controller (MX-R Model)	26 GOTs

Connection with CC-Link Ver.2 compatible



For details on the overall length, refer to the following.

☞ Page 1020 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1020 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC MX Controller (MX-R Model)	RJ61BT11	CC-Link (Ver.2)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.2.
For details on settings, refer to the following.
☞ Page 1023 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

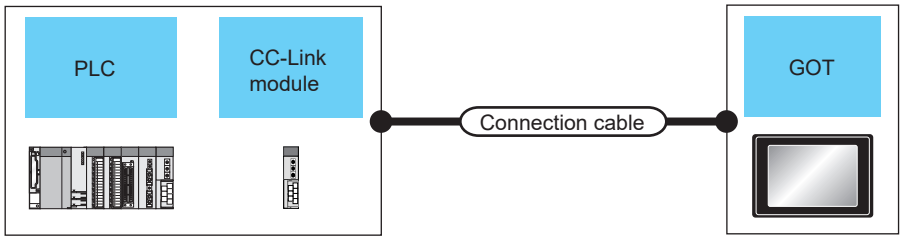
MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	Number of connectable devices
MELSEC MX Controller (MX-R Model)	26 GOTs

Connection with CC-Link Ver.1/Ver.2 compatibles mixed



For details on the overall length, refer to the following.

☞ Page 1021 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1021 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC MX Controller (MX-R Model)	RJ61BT11	CC-Link (Ver.2)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000
		CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*4	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.2.
For details on settings, refer to the following.
☞ Page 1023 [Controller Setting]

*4 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1023 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	Number of connectable devices
MELSEC MX Controller (MX-R Model)	26 GOTs

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

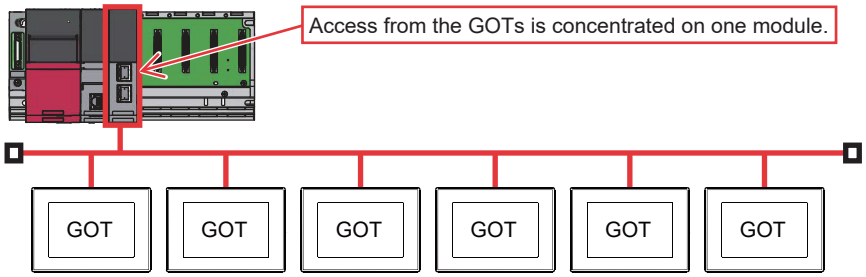
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

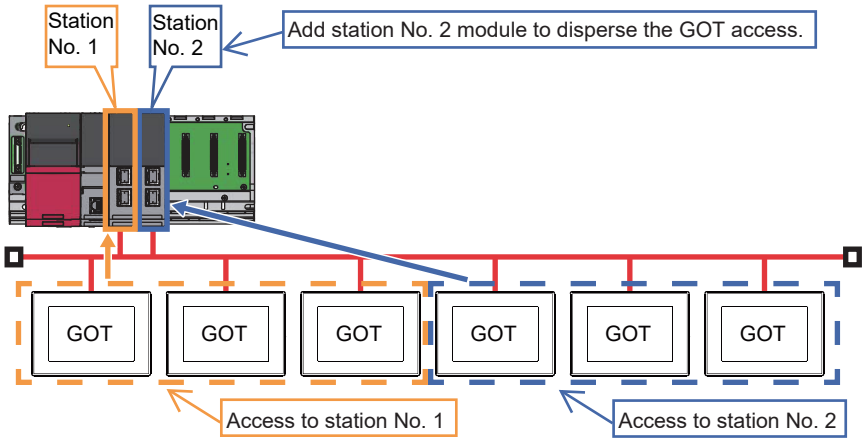
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

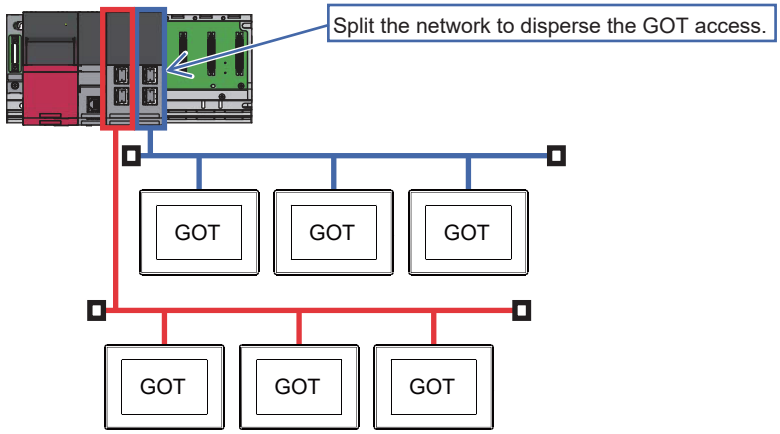
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT in CC-Link connection (intelligent device station)

For the CC-Link connection (intelligent device station), the data link is started approximately 10 seconds after the GOT startup.

■When a network error occurs in the system alarm

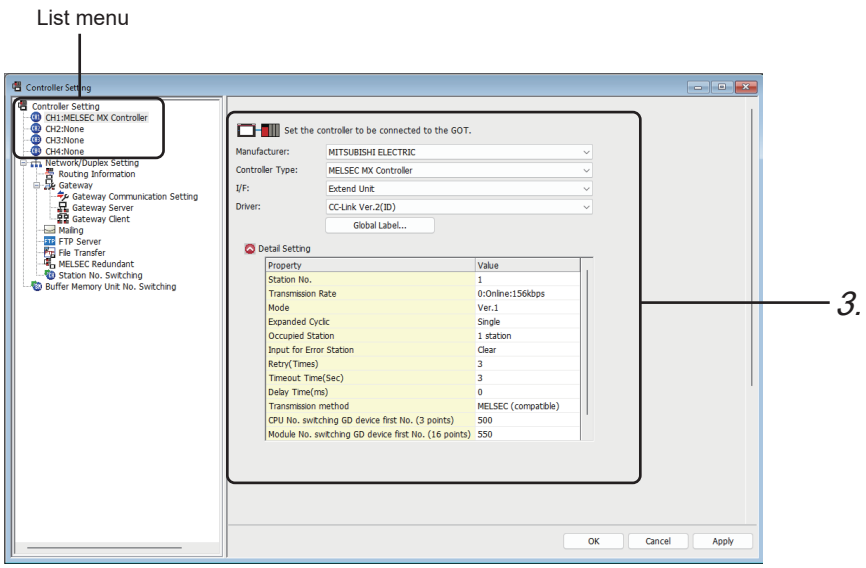
In the CC-Link connection (intelligent device station), when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

12.1.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC MX Controller]
[I/F]	[Extend Unit]
[Driver]	[CC-Link Ver.2 (ID)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 1024 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

Point

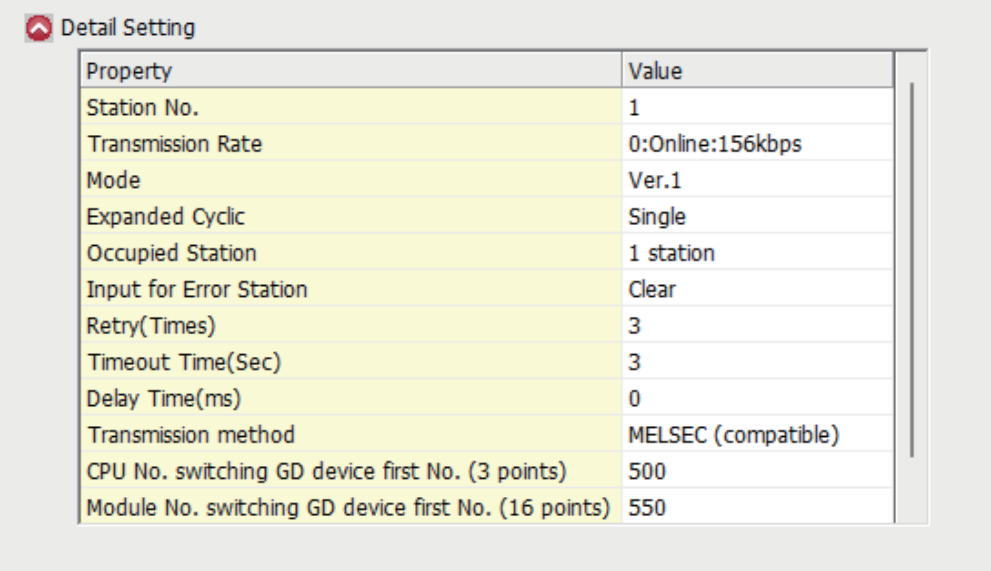
The controller settings can be configured and checked in [I/F Communication Setting].

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Station No.]	Set the station number of the GOT.	[1] to [64]
[Transmission Rate]*1	Set the transmission speed and a mode of the GOT.	[0] to [E]
[Mode]	Set the operation mode of the GOT.	[Ver.1], [Ver.2], [Additional], [Offline]
[Expanded Cyclic]	Set the cyclic point expansion.	[Single], [Double], [Quadruple], [Octuple]
[Occupied Station]	Set the number of stations occupied by the GOT.	[1 Station], [4 Stations]
[Input for Error Station]	Set whether to clear or hold the error at an error occurrence.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Transmission method]	Set the CC-Link transmission method.	[MELSEC (compatible)], [Cyclic]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 1025 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 1026 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 1027 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Transmission speed settings

The following lists the transmission speed settings of the CC-Link communication.

Setting value	Description
0	Online: 156 kbps
1	Online: 625 kbps
2	Online: 2.5 Mbps
3	Online: 5 Mbps
4	Online: 10 Mbps
5	Line test: 156 kbps
6	Line test: 625 kbps
7	Line test: 2.5 Mbps

Setting value	Description
8	Line test: 5 Mbps
9	Line test: 10 Mbps
A	Hardware test: 156 kbps
B	Hardware test: 625 kbps
C	Hardware test: 2.5 Mbps
D	Hardware test: 5 Mbps
E	Hardware test: 10 Mbps

For details on the hardware test, refer to the following manual.

MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Precautions

■Using cyclic transmission

• I/O signals for the master station

Do not turn on the reserved output signals in the output signals (remote output: RY) to the GOT from the master station.
When the reserved output signal is turned on, the PLC system may malfunction.
For the assignment of I/O signals in the GOT, refer to the following manuals.
📖MODEL GT15-J61BT13 CC-Link communication unit User's Manual
📖GT15 CC-Link communication unit User's Manual

• Access range for monitoring

The remote I/O (RX and RY) and remote register (RWr and RWw) monitoring ranges vary depending on the mode of the master station in the CC-Link system.

Mode of master station	Monitoring	
	Data for each station compatible with CC-Link Ver.1	Data for each station compatible with CC-Link Ver.2
Remote network mode	○	—
Remote network Ver.1 mode	○	—
Remote network Ver.2 mode	○	○*1
Remote network additional mode	○	○

○: Available, ×: Not available (All "0"), —: System configuration not available

*1 Monitoring is available only when the GT15-J61BT13 CC-Link communication unit is used.

• When the GOT malfunctions

The state of cyclic output before fault is held.

■Connection with CC-Link Ver.1 compatible

For connection with CC-Link Ver.1 compatible, the device setting must be configured within the range of the specifications of the controller.
When a device number out of the range is set, proper monitoring may not be possible.

12.1.4 PLC side settings

Model		Reference
MELSEC MX Controller (MX-R Model)	MXR300-16 MXR300-32 MXR300-64	☞ Page 1030 Connection to MELSEC MX Controller (MX-R Model) with Ver.1 compatible ☞ Page 1032 Connection to MELSEC MX Controller (MX-R Model) with Ver.2 compatible ☞ Page 1035 Connection to MELSEC MX Controller (MX-R Model) with Ver.1/Ver.2 compatibles mixed
	MXR500-128 MXR500-256	

The GOT operates as the stations with the following specifications in the CC-Link system.

Station information	Description
Station type	Intelligent device station, Ver.1 intelligent device station, or Ver.2 intelligent device station
Number of stations occupied	1 station or 4 stations

Point

Number of stations occupied

The number of stations occupied is the setting for determining the number of link device points (RX/RY/RWw/RWr) used by the GOT.

To use multiple numbers of link device points in cyclic transmission between the GOT and CC-Link module, set the number of stations occupied as 4 stations occupied.

The number of link device points when 1 station occupied or 4 stations occupied is shown below.

• CC-Link Ver.2

Link device	Extended cyclic setting							
	Single		Double		Quadruple		Octuple	
	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote output (RY)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote register (RWw)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points
Remote register (RWr)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points

• CC-Link Ver.1

Link device	Number of stations occupied	
	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points
Remote output (RY)	32 points	128 points
Remote register (RWw)	4 points	16 points
Remote register (RWr)	4 points	16 points

Connection to MELSEC MX Controller (MX-R Model) with Ver.1 compatible

This section describes the setting method of the GOT and the Ver.1 compatible CC-Link module (MELSEC MX Controller (MX-R Model)) in the system configuration shown below.

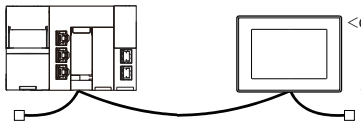
Point

CC-Link module (MELSEC MX Controller (MX-R Model))

For details on the CC-Link module (MELSEC MX Controller (MX-R Model)), refer to the following manual.

MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

■System configuration



<GOT>(Use the default value for settings other than the following.)

Station type	: Intelligent device station
Station No.	: Station No. 1
Number of stations occupied	: 1 station occupied
Transmission speed	: 156kbps

<CC-Link module> *1 (Use the default value for settings other than the following.)

Type	: Master station
Station No.	: Station No. 0
Mode setting	: Remote network ver. 1 mode
Total number of connected devices	: 1
Transmission speed	: 156kbps

*1 The CC-Link module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link module is set to "0".

Point

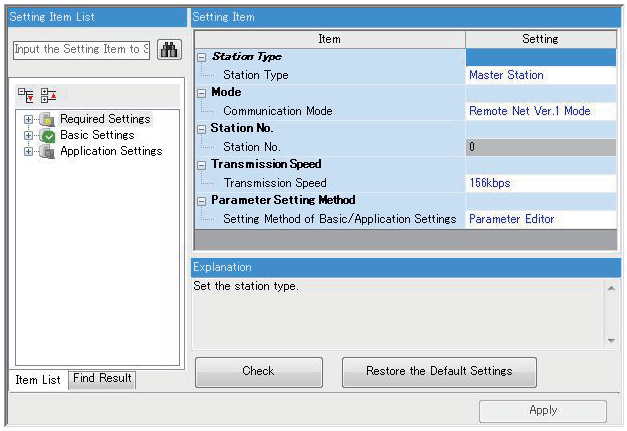
When the switch setting has been changed

Turn off then on or reset the PLC CPU.

■Module parameter settings of GX Works3

• [Module Parameter] of GX Works3

Module parameter

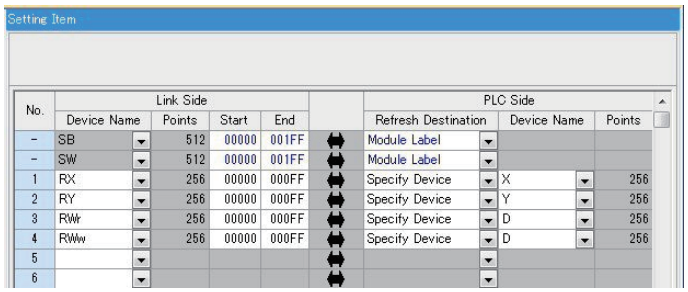


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Master station	○
[Mode]	Remote network Ver.1 mode	○
[Station No.]	0 (fixed)	△
[Transmission Speed]*1	156 kbps	○
[Parameter Setting Method]	Set in parameter	—

*1 Adjust the settings with the GOT settings.

Link refresh setting



○: Necessary, △: As necessary, —: Not necessary

☞ Page 1023 [Controller Setting]

Connection to MELSEC MX Controller (MX-R Model) with Ver.1/Ver.2 compatibles mixed

This section describes the setting method of the GOT and the CC-Link module (MELSEC MX Controller (MX-R Model)) when Ver.1/Ver.2 compatible modules are mixed in the system configuration shown below.

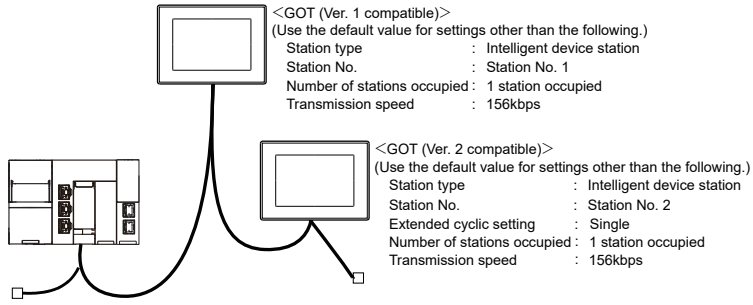
Point

CC-Link module (MELSEC MX Controller (MX-R Model))

For details on the CC-Link module (MELSEC MX Controller (MX-R Model)), refer to the following manual.

MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

■System configuration



<GOT (Ver. 1 compatible)>
(Use the default value for settings other than the following.)
Station type : Intelligent device station
Station No. : Station No. 1
Number of stations occupied : 1 station occupied
Transmission speed : 156kbps

<GOT (Ver. 2 compatible)>
(Use the default value for settings other than the following.)
Station type : Intelligent device station
Station No. : Station No. 2
Extended cyclic setting : Single
Number of stations occupied : 1 station occupied
Transmission speed : 156kbps

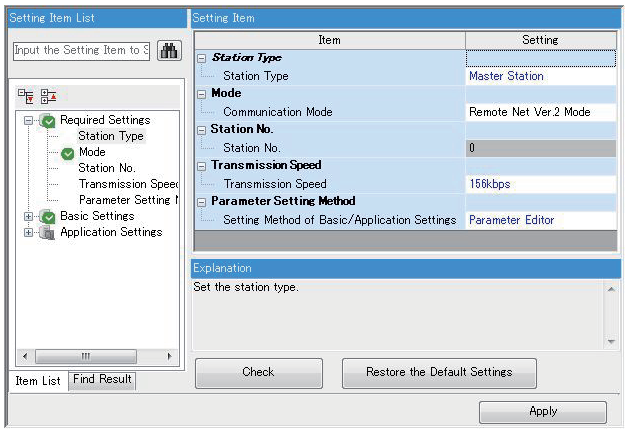
<CC-Link module> *1
(Use the default value for settings other than the following.)
Type : Master station
Station No. : Station No. 0
Mode setting : Remote network ver. 2 mode
Total number of connected devices : 2
Transmission speed : 156kbps

*1 The CC-Link module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link module is set to "0".

■Module parameter settings of GX Works3

• [Module Parameter] of GX Works3

Module parameter

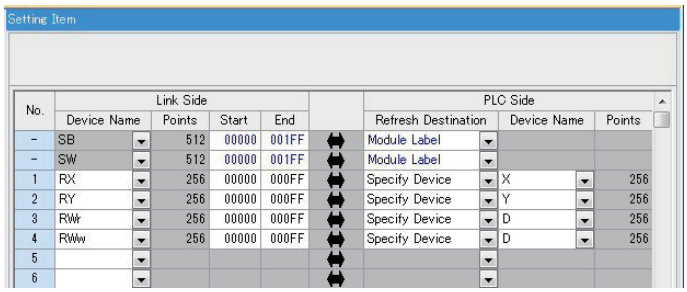


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Master station	○
[Mode]	Remote network Ver.1 mode	○
[Station No.]	0 (fixed)	△
[Transmission Speed]*1	156 kbps	○
[Parameter Setting Method]	Set in parameter	—

*1 Adjust the settings with the GOT settings.

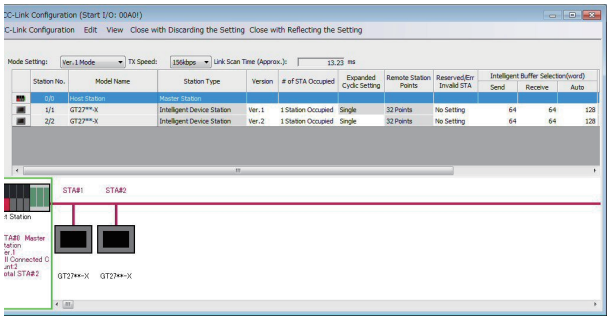
Link refresh setting



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Special relay (SB) refresh device]	—	△
[Special register (SW) refresh device]	—	△
[Remote input (RX) refresh device]	Set this item as necessary.	△
[Remote output (RY) refresh device]		△
[Remote register (RWr) refresh device]		△

CC-Link configuration setting



CC-Link configuration setting of station No. 1 (GOT)

○: Necessary, △: As necessary, —: Not necessary

Item*1	Setting value	Setting for GOT connection
[Station Type]	Ver.1 intelligent device station (fixed)	○
[# of STA Occupied]*2	1 station occupied	○
[Reserved/Err Invalid STA]	No setting	○
[Intelligent Buffer Selection(word)]	(Use default value)	—

CC-Link configuration setting of station No. 2 (GOT)

○: Necessary, △: As necessary, —: Not necessary

Item*1	Setting value	Setting for GOT connection
[Station Type]	Ver.2 intelligent device station (fixed)	○
[Expanded Cyclic Setting]*2	Single	○
[# of STA Occupied]*2	1 station occupied	○
[Reserved/Err Invalid STA]	No setting	○
[Intelligent Buffer Selection(word)]	(Use default value)	—

*1 When the [Mode] of the CC-Link module is set to [Remote Net Ver.2 Mode], [Remote Station Points] can be set.
[Remote Station Points] is a setting for the remote I/O station.
The default value (32 points) must be used on the GOT.

*2 Set the same setting as that of the GOT.

Point

When changing the module parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

■[Controller Setting] in GT Designer3

• Communication settings of station No. 1 (GOT)

Item	Setting value

12.1.5 Access range for monitoring

Only the connected CPU can be accessed.

12.2 MELSEC MX Controller (MX-F Model) (CC-Link connection (intelligent device station))

☞ Page 1038 Connectable devices
☞ Page 1038 System configuration
☞ Page 1042 GOT side settings
☞ Page 1048 PLC side settings
☞ Page 1051 Access range for monitoring

12.2.1 Connectable devices

The following table shows the connectable models.

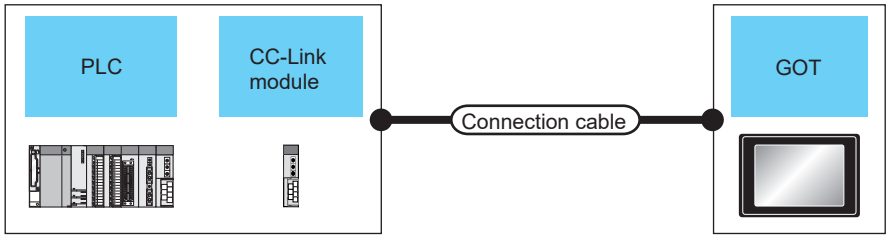
○: Supported, —: Not supported

Controller	Model	Clock	CC-Link module	Connectable model
MELSEC MX Controller (MX-F Model)	MXF100-8-N32 MXF100-8-P32 MXF100-16-N32 MXF100-16-P32	○	FX5-CCL-MS*1	GT37 SoftGOT3000

*1 When the FX5-CCL-MS is used, the bus conversion module (FX5-CNV-BUS) is required.

12.2.2 System configuration

Connection with CC-Link Ver.1 compatible



For details on the overall length, refer to the following.

☞ Page 1039 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1039 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC MX Controller (MX-F Model)	FX5-CCL-MS*4	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1042 [Controller Setting]

*4 When the FX5-CCL-MS is used, the bus conversion module (FX5-CNV-BUS) is required.

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

📖MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC MX Controller (MX-F Model)	8 GOTs

Connection with CC-Link Ver.2 compatible

*4 When the FX5-CCL-MS is used, the bus conversion module (FX5-CNV-BUS) is required.

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	Number of connectable devices
MELSEC MX Controller (MX-F Model)	8 GOTs

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

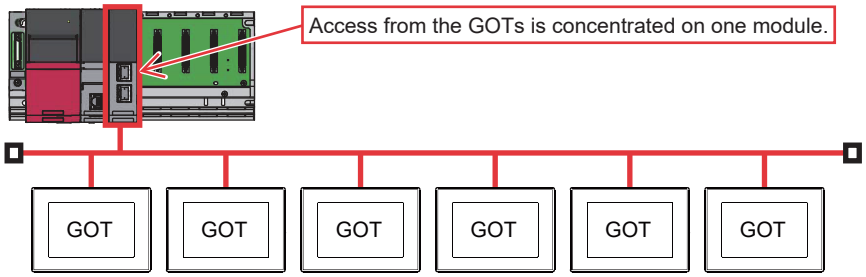
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

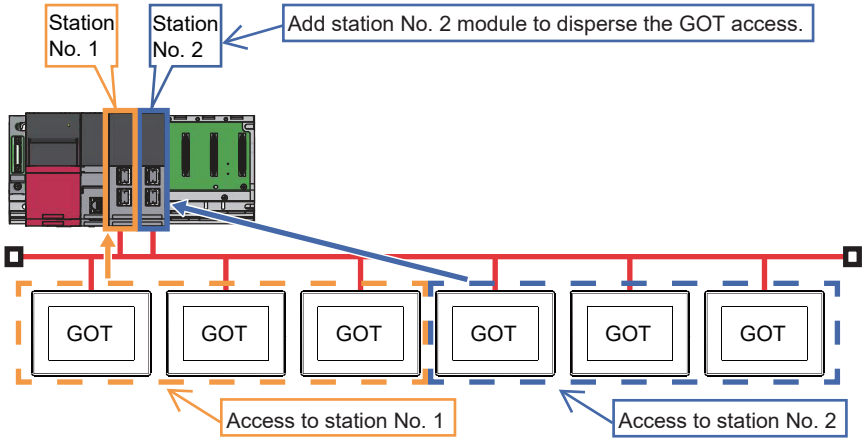
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

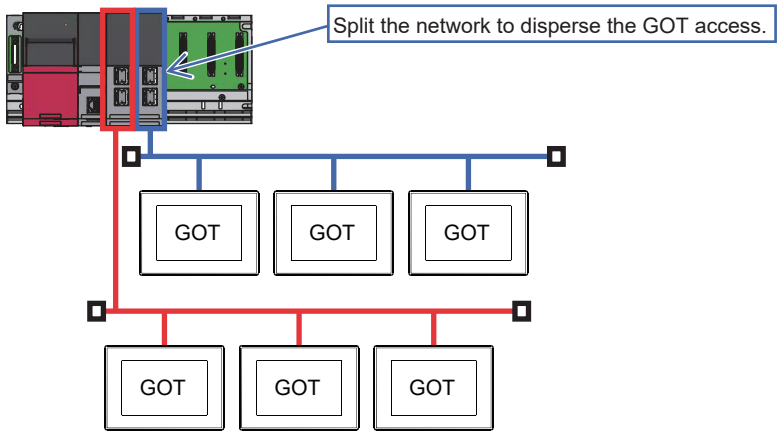
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT in CC-Link connection (intelligent device station)

For the CC-Link connection (intelligent device station), the data link is started approximately 10 seconds after the GOT startup.

■When a network error occurs in the system alarm

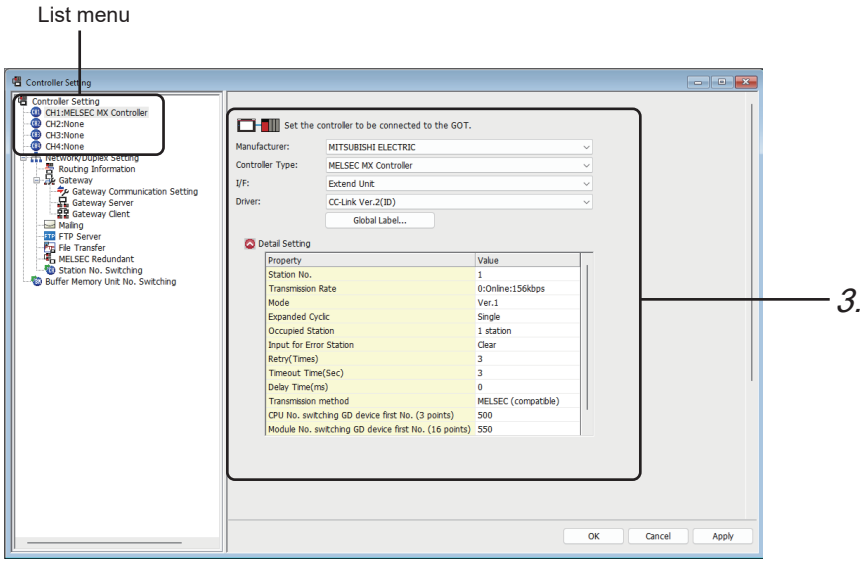
In the CC-Link connection (intelligent device station), when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

12.2.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC MX Controller]
[I/F]	[Extend Unit]
[Driver]	[CC-Link Ver.2 (ID)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 1043 [Detail Setting]

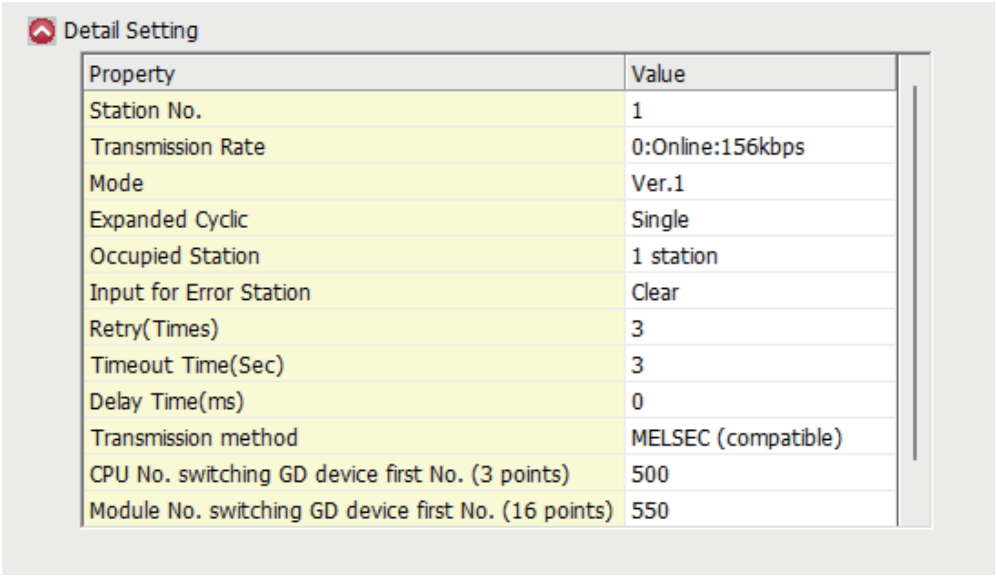
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Station No.]	Set the station number of the GOT.	[1] to [64]
[Transmission Rate]*1	Set the transmission speed and a mode of the GOT.	[0] to [E]
[Mode Setting]	Set the operation mode of the GOT.	[Ver.1], [Ver.2], [Additional], [Offline]
[Expanded Cyclic]	Set the cyclic point expansion.	[Single], [Double], [Quadruple], [Octuple]
[Occupied Station]	Set the number of stations occupied by the GOT.	[1 Station], [4 Stations]
[Input for Error Station]	Set whether to clear or hold the error at an error occurrence.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Transmission method]*2	Set the CC-Link transmission method.	[MELSEC (compatible)], [Cyclic]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 1044 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 1045 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 1046 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Transmission speed settings

The following lists the transmission speed settings of the CC-Link communication.

Setting value	Description
0	Online: 156 kbps
1	Online: 625 kbps
2	Online: 2.5 Mbps
3	Online: 5 Mbps
4	Online: 10 Mbps
5	Line test: 156 kbps
6	Line test: 625 kbps
7	Line test: 2.5 Mbps

Setting value	Description
8	Line test: 5 Mbps
9	Line test: 10 Mbps
A	Hardware test: 156 kbps
B	Hardware test: 625 kbps
C	Hardware test: 2.5 Mbps
D	Hardware test: 5 Mbps
E	Hardware test: 10 Mbps

For details on the hardware test, refer to the following manual.

MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual

*2 Set the transmission method to [Cyclic].

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Precautions

■Using cyclic transmission

• I/O signals for the master station

Do not turn on the reserved output signals in the output signals (remote output: RY) to the GOT from the master station.
When the reserved output signal is turned on, the PLC system may malfunction.
For the assignment of I/O signals in the GOT, refer to the following manuals.
📖MODEL GT15-J61BT13 CC-Link communication unit User's Manual
📖GT15 CC-Link communication unit User's Manual

• Access range for monitoring

The remote I/O (RX and RY) and remote register (RWr and RWw) monitoring ranges vary depending on the mode of the master station in the CC-Link system.

Mode of master station	Monitoring	
	Data for each station compatible with CC-Link Ver.1	Data for each station compatible with CC-Link Ver.2
Remote network mode	○	—
Remote network Ver.1 mode	○	—
Remote network Ver.2 mode	○	○*1
Remote network additional mode	○	○

○: Available, ×: Not available (All "0"), —: System configuration not available

*1 Monitoring is available only when the GT15-J61BT13 CC-Link communication unit is used.

• When the GOT malfunctions

The state of cyclic output before fault is held.

■Connection with CC-Link Ver.1 compatible

For connection with CC-Link Ver.1 compatible, the device setting must be configured within the range of the specifications of the controller.
When a device number out of the range is set, proper monitoring may not be possible.

12.2.4 PLC side settings

Model		Reference
MELSEC MX Controller (MX-F Model)	MXF100-8-N32 MXF100-8-P32 MXF100-16-N32 MXF100-16-P32	☞ Page 1049 Connection to MELSEC MX Controller (MX-F Model) with Ver.1/Ver.2 compatibles mixed

The GOT operates as the stations with the following specifications in the CC-Link system.

Station information	Description
Station type	Intelligent device station, Ver.1 intelligent device station, or Ver.2 intelligent device station
Number of stations occupied	1 station or 4 stations

Point

Number of stations occupied

The number of stations occupied is the setting for determining the number of link device points (RX/RY/RWw/RWr) used by the GOT.

To use multiple numbers of link device points in cyclic transmission between the GOT and CC-Link module, set the number of stations occupied as 4 stations occupied.

The number of link device points when 1 station occupied or 4 stations occupied is shown below.

• CC-Link Ver.2

Link device	Extended cyclic setting							
	Single		Double		Quadruple		Octuple	
	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote output (RY)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote register (RWw)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points
Remote register (RWr)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points

• CC-Link Ver.1

Link device	Number of stations occupied	
	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points
Remote output (RY)	32 points	128 points
Remote register (RWw)	4 points	16 points
Remote register (RWr)	4 points	16 points

Connection to MELSEC MX Controller (MX-F Model) with Ver.1/Ver.2 compatibles mixed

This section describes the setting method of the GOT and the CC-Link module (MELSEC MX Controller (MX-F Model)) when Ver.1/Ver.2 compatible modules are mixed in the system configuration shown below.

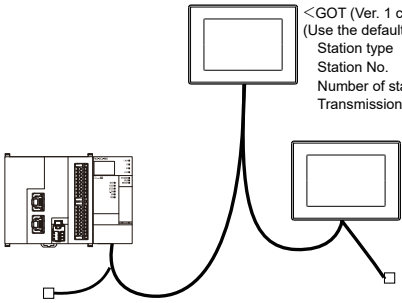
Point

CC-Link module (MELSEC MX Controller (MX-F Model))

For details on the CC-Link module (MELSEC MX Controller (MX-F Model)), refer to the following manual.

MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual

■System configuration



<GOT (Ver. 1 compatible)>
(Use the default value for settings other than the following.)
Station type : Intelligent device station
Station No. : Station No. 1
Number of stations occupied : 1 station occupied
Transmission speed : 156kbps

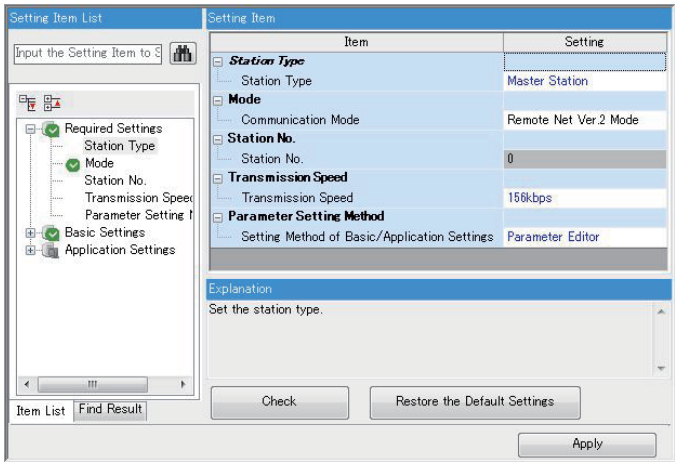
<GOT (Ver. 2 compatible)>
(Use the default value for settings other than the following.)
Station type : Intelligent device station
Station No. : Station No. 2
Extended cyclic setting : Single
Number of stations occupied : 1 station occupied
Transmission speed : 156kbps

<CC-Link module>
(Use the default value for settings other than the following.)
Type : Master station
Station No. : Station No. 0
Mode setting : Remote network ver. 2 mode
Total number of connected devices : 2
Transmission speed : 156kbps

■Module parameter settings of GX Works3

• [Module Parameter] of GX Works3

Module parameter

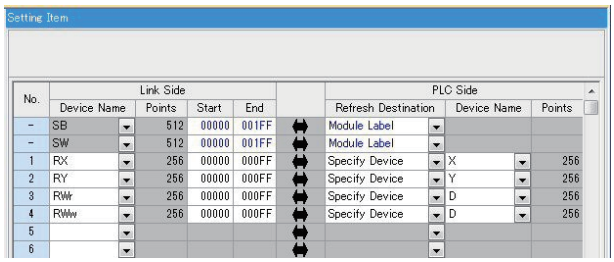


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Master station	○
[Mode]	Remote network Ver.1 mode	○
[Station No.]	0 (fixed)	△
[Transmission Speed]*1	156 kbps	○
[Parameter Setting Method]	Set in parameter	—

*1 Adjust the settings with the GOT settings.

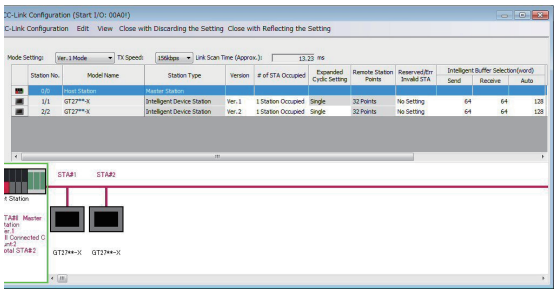
Link refresh setting



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Special relay (SB) refresh device]	Set this item as necessary.	△
[Special register (SW) refresh device]		△
[Remote input (RX) refresh device]		△
[Remote output (RY) refresh device]		△
[Remote register (RWr) refresh device]		△
[Remote register (RWw) refresh device]		△

CC-Link configuration setting



CC-Link configuration setting of station No. 1 (GOT)

○: Necessary, △: As necessary, —: Not necessary

Item*1	Setting value	Setting for GOT connection
[Station Type]	Ver.1 intelligent device station (fixed)	○
[# of STA Occupied]*2	1 station occupied	○
[Reserved/Err Invalid STA]	No setting	○
[Intelligent Buffer Selection(word)]	(Use default value)	—

CC-Link configuration setting of station No. 2 (GOT)

○: Necessary, △: As necessary, —: Not necessary

Item*1	Setting value	Setting for GOT connection
[Station Type]	Ver.2 intelligent device station (fixed)	○
[Expanded Cyclic Setting]*2	Single	○
[# of STA Occupied]*2	1 station occupied	○
[Reserved/Err Invalid STA]	No setting	○
[Intelligent Buffer Selection(word)]	(Use default value)	—

*1 When the [Mode] of the CC-Link module is set to [Remote Net Ver.2 Mode], [Remote Station Points] can be set.
[Remote Station Points] is a setting for the remote I/O station.
The default value (32 points) must be used on the GOT.

*2 Set the same setting as that of the GOT.

Point

When changing the module parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

■[Controller Setting] in GT Designer3

• Communication settings of station No. 1 (GOT)

Item	Setting value
[Station No.]	1: Station No. 1
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.1: Remote network Ver.1 mode
[Expanded Cyclic]	Single (Use default value)
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	Cyclic

• Communication settings of station No. 2 (GOT)

Item	Setting value
[Station No.]	2: Station No. 2
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.2: Remote network Ver.2 mode
[Expanded Cyclic]	Single
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	Cyclic

12.2.5 Access range for monitoring

Only the connected CPU can be accessed.

12.3 MELSEC iQ-R series (CC-Link connection (intelligent device station))

☞ Page 1052 Connectable devices
☞ Page 1053 System configuration
☞ Page 1058 GOT side settings
☞ Page 1064 PLC side settings
☞ Page 1072 Access range for monitoring
☞ Page 1073 How to monitor a redundant system

12.3.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

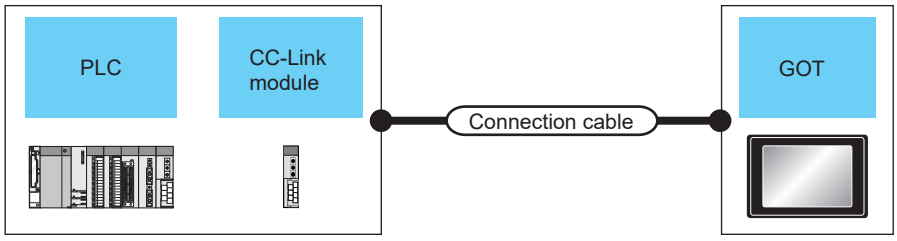
Controller	Model	Clock	CC-Link module	Connectable model
MELSEC iQ-R series	R00CPU R01CPU R02CPU R04CPU R08CPU R16CPU R32CPU R120CPU	○	RJ61BT11*4	GT37 SoftGOT3000
	R08PCPU*1 R16PCPU*1 R32PCPU*1 R120PCPU*1	○	RJ61BT11*4	GT37 SoftGOT3000
	R08PSFCPU*2 R16PSFCPU*2 R32PSFCPU*2 R120PSFCPU*2	○	RJ61BT11*4	GT37 SoftGOT3000
	R08SFCPU*3 R16SFCPU*3 R32SFCPU*3 R120SFCPU*3	○	RJ61BT11*4	GT37 SoftGOT3000
	R04ENCPU R08ENCPU R16ENCPU R32ENCPU R120ENCPU	○	RJ61BT11*4	GT37 SoftGOT3000
Motion CPU (MELSEC iQ-R series)	R16MTCPU R32MTCPU R64MTCPU	○	RJ61BT11*4	GT37 SoftGOT3000
C Controller module (MELSEC iQ-R series)	R12CCPU-V	○	RJ61BT11*4	GT37 SoftGOT3000
MELSECWinCPU (MELSEC iQ-R series)	R102WCPU-W	—	RJ61BT11*4	GT37 SoftGOT3000

Controller	Model	Clock	CC-Link module	Connectable model
CNC C80	R16NCCPU-S1	○	RJ61BT11*4	GT37 SoftGOT3000
Robot controller (MELSEC iQ-R series)	CR800-R (R16RTCPU)	○	RJ61BT11*4	GT37 SoftGOT3000

*1 Mount a redundant function module R6RFM next to the RnPCPU on the base unit when building a redundant system.
*2 Mount the SIL2 function module R6PSFM and the redundant function module R6RFM next to the RnPSFCPU on the base unit.
*3 Mount a safety function module R6SFM next to the RnSFCPU on the base unit.
The RnSFCPU and the safety function module R6SFM must have the same pair version.
If their pair versions differ, the RnSFCPU does not operate.
*4 Use firmware version 04 or later when building a redundant system.

12.3.2 System configuration

Connection with CC-Link Ver.1 compatible



For details on the overall length, refer to the following.
☞ Page 1053 Overall length
For details on the maximum number of connected devices, refer to the following.
☞ Page 1054 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC iQ-R series Motion CPU (MELSEC iQ-R series) C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series) CNC C80 CR800-R (R16RTCPU)	RJ61BT11	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)
*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/
*3 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1042 [Controller Setting]

■Overall length

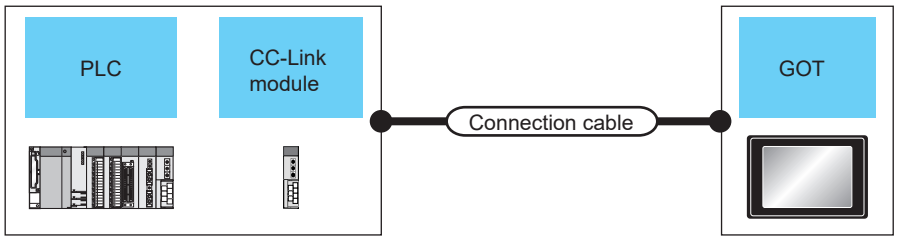
The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.
For details, refer to the following manual.
MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC iQ-R series Motion CPU (MELSEC iQ-R series) C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series) CNC C80 CR800-R (R16RTCPU)	26 GOTs

Connection with CC-Link Ver.2 compatible



For details on the overall length, refer to the following.

☞ Page 1054 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1054 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC iQ-R series Motion CPU (MELSEC iQ-R series) C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series) CNC C80 CR800-R (R16RTCPU)	RJ61BT11	CC-Link (Ver.2)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.2.
For details on settings, refer to the following.
☞ Page 1042 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

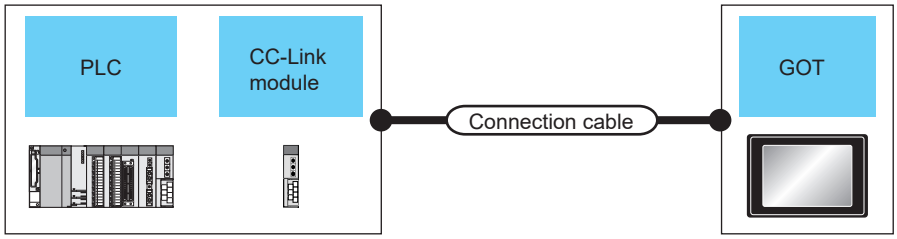
MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC iQ-R series Motion CPU (MELSEC iQ-R series) C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series) CNC C80 CR800-R (R16RTCPU)	26 GOTs

Connection with CC-Link Ver.1/Ver.2 compatibles mixed



For details on the overall length, refer to the following.

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.2.
For details on settings, refer to the following.
☞ Page 1059 [Detail Setting]

*4 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1059 [Detail Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC iQ-R series Motion CPU (MELSEC iQ-R series) C Controller module (MELSEC iQ-R series) MELSECWinCPU (MELSEC iQ-R series) CNC C80 CR800-R (R16RTCPU)	26 GOTs

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

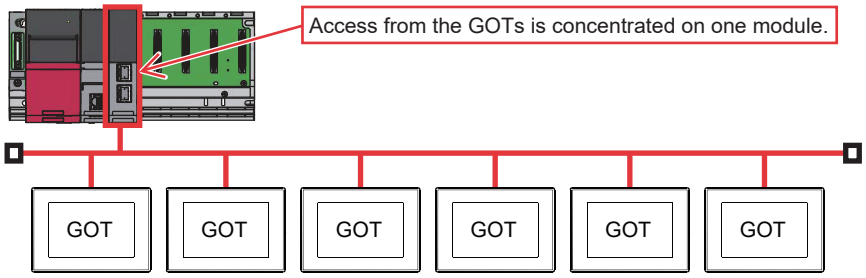
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

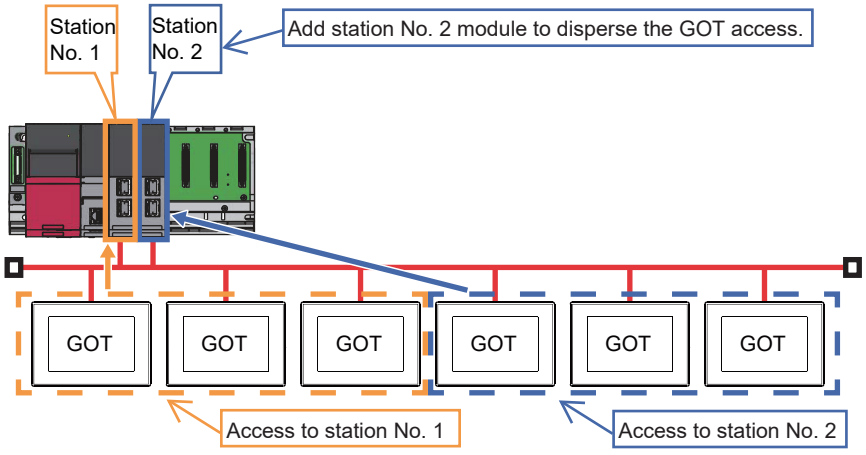
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

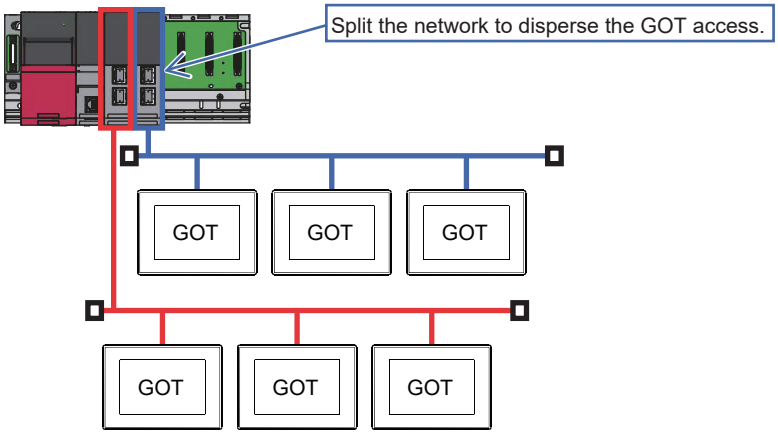
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.

If you start the GOT before the PLC runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

Connection to RnSFCPU

The RnSFCPU takes 10 seconds or more to run.

If the GOT is started during this time, a system alarm occurs.

To prevent a system alarm from occurring, adjust the title display time in the [GOT Setup] dialog.

GT Designer3 (GOT3000) Screen Design Manual

Precautions

■Starting the GOT in CC-Link connection (intelligent device station)

For the CC-Link connection (intelligent device station), the data link is started approximately 10 seconds after the GOT startup.

■When a network error occurs in the system alarm

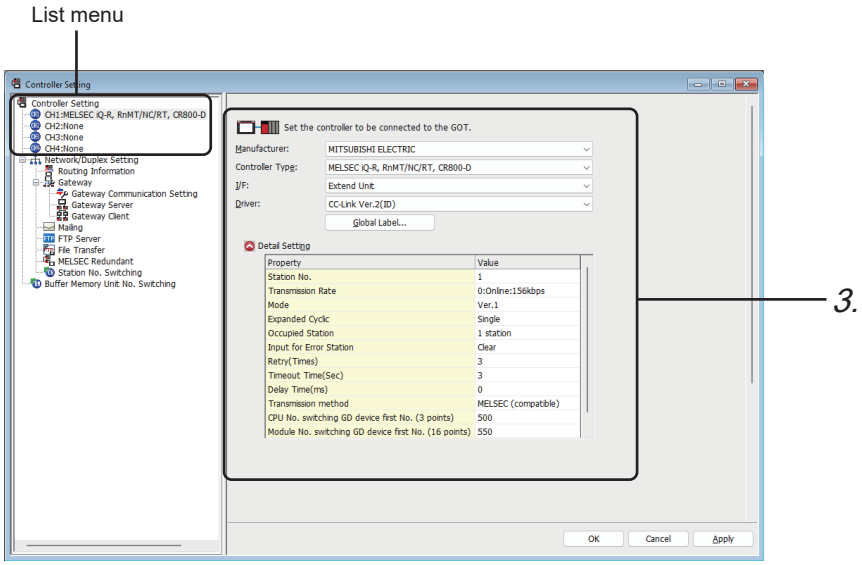
In the CC-Link connection (intelligent device station), when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

12.3.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[I/F]	[Extend Unit]
[Driver]	[CC-Link Ver.2 (ID)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 1059 [Detail Setting]

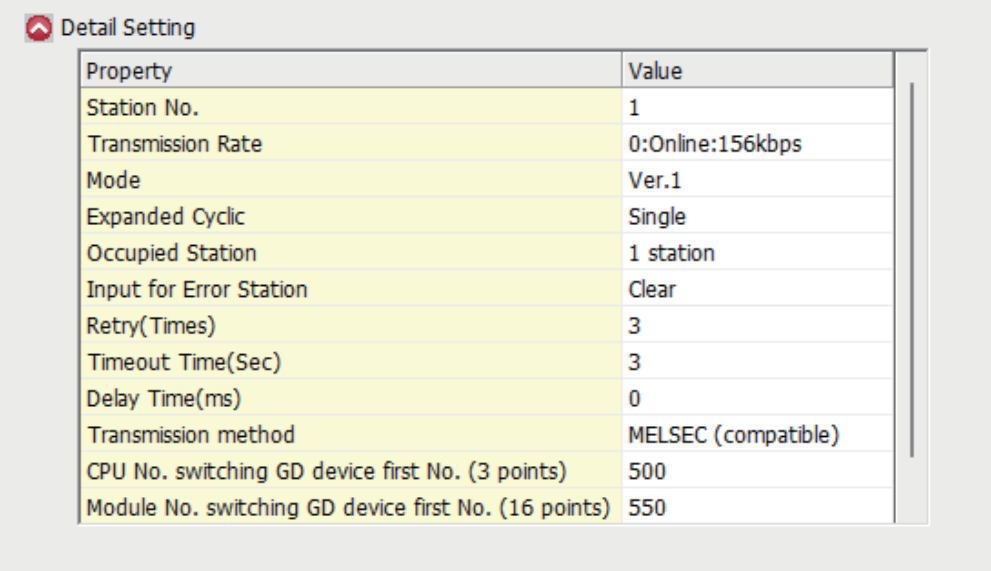
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Station No.]	Set the station number of the GOT.	[1] to [64]
[Transmission Rate]*1	Set the transmission speed and a mode of the GOT.	[0] to [E]
[Mode Setting]	Set the operation mode of the GOT.	[Ver.1], [Ver.2], [Additional], [Offline]
[Expanded Cyclic]	Set the cyclic point expansion.	[Single], [Double], [Quadruple], [Octuple]
[Occupied Station]	Set the number of stations occupied by the GOT.	[1 Station], [4 Stations]
[Input for Error Station]	Set whether to clear or hold the error at an error occurrence.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Transmission method]	Set the CC-Link transmission method.	[MELSEC (compatible)], [Cyclic]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 1060 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 1061 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 1062 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Transmission speed settings

The following lists the transmission speed settings of the CC-Link communication.

Setting value	Description
0	Online: 156 kbps
1	Online: 625 kbps
2	Online: 2.5 Mbps
3	Online: 5 Mbps
4	Online: 10 Mbps
5	Line test: 156 kbps
6	Line test: 625 kbps
7	Line test: 2.5 Mbps

Setting value	Description
8	Line test: 5 Mbps
9	Line test: 10 Mbps
A	Hardware test: 156 kbps
B	Hardware test: 625 kbps
C	Hardware test: 2.5 Mbps
D	Hardware test: 5 Mbps
E	Hardware test: 10 Mbps

For details on the hardware test, refer to the following manual.

MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Precautions

■Using cyclic transmission

• I/O signals for the master station

Do not turn on the reserved output signals in the output signals (remote output: RY) to the GOT from the master station.
When the reserved output signal is turned on, the PLC system may malfunction.
For the assignment of I/O signals in the GOT, refer to the following manuals.
📖MODEL GT15-J61BT13 CC-Link communication unit User's Manual
📖GT15 CC-Link communication unit User's Manual

• Access range for monitoring

The remote I/O (RX and RY) and remote register (RWr and RWw) monitoring ranges vary depending on the mode of the master station in the CC-Link system.

Mode of master station	Monitoring	
	Data for each station compatible with CC-Link Ver.1	Data for each station compatible with CC-Link Ver.2
Remote network mode	○	—
Remote network Ver.1 mode	○	—
Remote network Ver.2 mode	○	○*1
Remote network additional mode	○	○

○: Available, ×: Not available (All "0"), —: System configuration not available

*1 Monitoring is available only when the GT15-J61BT13 CC-Link communication unit is used.

• When the GOT malfunctions

The state of cyclic output before fault is held.

■Connection with CC-Link Ver.1 compatible

For connection with CC-Link Ver.1 compatible, the device setting must be configured within the range of the specifications of the controller.
When a device number out of the range is set, proper monitoring may not be possible.

The GOT operates as the stations with the following specifications in the CC-Link system.

Station information	Description
Station type	Intelligent device station, Ver.1 intelligent device station, or Ver.2 intelligent device station
Number of stations occupied	1 station or 4 stations

Point

Number of stations occupied

The number of stations occupied is the setting for determining the number of link device points (RX/RY/RWw/RWr) used by the GOT.

To use multiple numbers of link device points in cyclic transmission between the GOT and CC-Link module, set the number of stations occupied as 4 stations occupied.

The number of link device points when 1 station occupied or 4 stations occupied is shown below.

• CC-Link Ver.2

Link device	Extended cyclic setting							
	Single		Double		Quadruple		Octuple	
	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote output (RY)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote register (RWw)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points
Remote register (RWr)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points

• CC-Link Ver.1

Link device	Number of stations occupied	
	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points
Remote output (RY)	32 points	128 points
Remote register (RWw)	4 points	16 points
Remote register (RWr)	4 points	16 points

Connection to MELSEC iQ-R series with Ver.1 compatible

This section describes the setting method of the GOT and the Ver. 1 compatible CC-Link module (MELSEC iQ-R series) in the system configuration shown below.

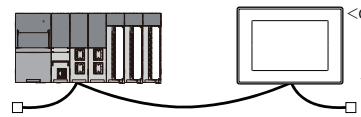
Point

CC-Link module (MELSEC iQ-R series)

For details on the CC-Link module (MELSEC iQ-R series), refer to the following manual.

MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

■System configuration



<GOT>(Use the default value for settings other than the following.)
Station type : Intelligent device station
Station No. : Station No. 1
Number of stations occupied : 1 station occupied
Transmission speed : 156kbps

<CC-Link module>*1 (Use the default value for settings other than the following.)
Type : Master station
Station No. : Station No. 0
Mode setting : Remote network ver. 1 mode
Total number of connected devices : 1
Transmission speed : 156kbps

*1 The CC-Link module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link module is set to "0".

Point

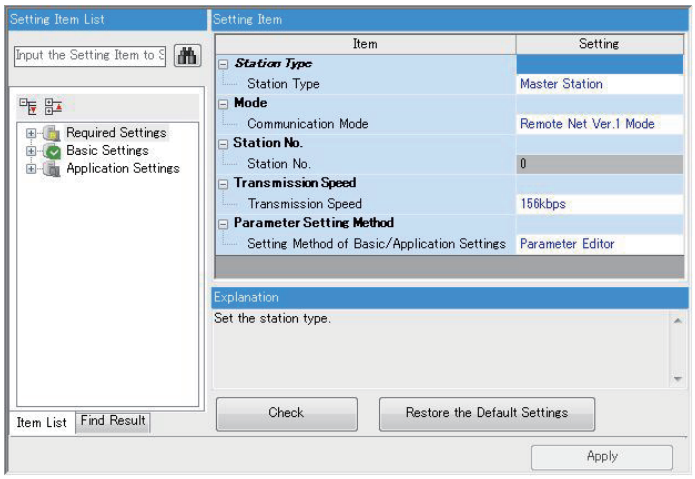
When the switch setting has been changed

Turn off then on or reset the PLC CPU.

■Module parameter settings of GX Works3

• [Module Parameter] of GX Works3

Module parameter

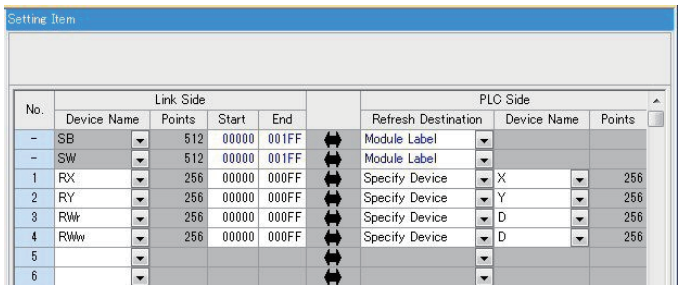


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Master station	○
[Mode]	Remote network Ver.1 mode	○
[Station No.]	0 (fixed)	△
[Transmission Speed]*1	156 kbps	○
[Parameter Setting Method]	Set in parameter	—

*1 Adjust the settings with the GOT settings.

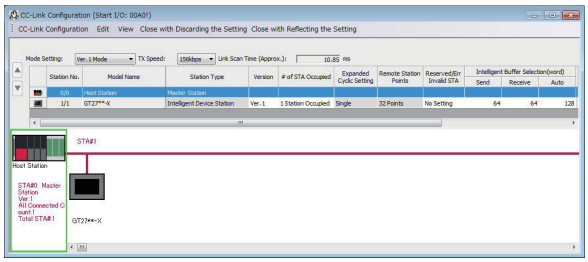
Link refresh setting



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Special relay (SB) refresh device]	—	△
[Special register (SW) refresh device]	—	△
[Remote input (RX) refresh device]	Set this item as necessary.	△
[Remote output (RY) refresh device]		△
[Remote register (RWr) refresh device]		△

CC-Link configuration setting



○: Necessary, △: As necessary, —: Not necessary

Item*1	Setting value	Setting for GOT connection
[Station Type]	Intelligent device station (fixed)	○
[# of STA Occupied]*2	1 station occupied	○
[Reserved/Err Invalid STA]	No setting	○
[Intelligent Buffer Selection(word)]	(Use default value)	—

*1 When the [Mode] of the CC-Link module is set to [Remote Net Ver.1 Mode], [Remote Station Points] cannot be set.
*2 Set the same setting as that of the GOT.

Point

When changing the module parameter
After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

■[Controller Setting] in GT Designer3

Item	Setting value
[Station No.]	1: Station No. 1
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.1: Remote network Ver.1 mode
[Expanded Cyclic]	Single (Use default value)
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	MELSEC (compatible)

Point

[Controller Setting] in GT Designer3
For the setting method of [Controller Setting] in GT Designer3, refer to the following.
☞ Page 1058 [Controller Setting]

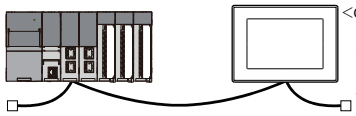
Connection to MELSEC iQ-R series with Ver.2 compatible

This section describes the setting method of the GOT and the Ver. 2 compatible CC-Link module (MELSEC iQ-R series) in the system configuration shown below.

Point

CC-Link module (MELSEC iQ-R series)
For details on the CC-Link module (MELSEC iQ-R series), refer to the following manual.
📖MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)

■System configuration



<GOT>(Use the default value for settings other than the following.)
Station type : Intelligent device station
Station No. : Station No. 1
Extended cyclic setting : Single
Number of stations occupied : 1 station occupied
Transmission speed : 156kbps

<CC-Link module>*1 (Use the default value for settings other than the following.)
Type : Master station
Station No. : Station No. 0
Mode setting : Remote network ver. 2 mode
Total number of connected devices : 1
Transmission speed : 156kbps

*1 The CC-Link module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link module is set to "0".

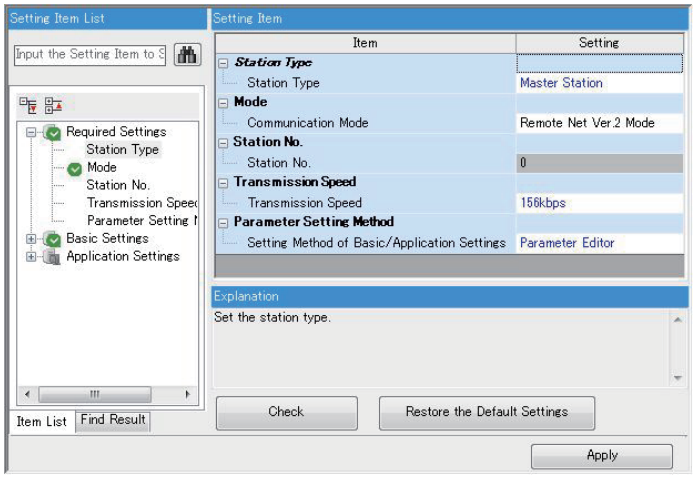
Point

When the switch setting has been changed
Turn off then on or reset the PLC CPU.

■Module parameter settings of GX Works3

• [Module Parameter] of GX Works3

Module parameter



○: Necessary, △: As necessary, —: Not necessary

[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	MELSEC (compatible)

12.3.5 Access range for monitoring

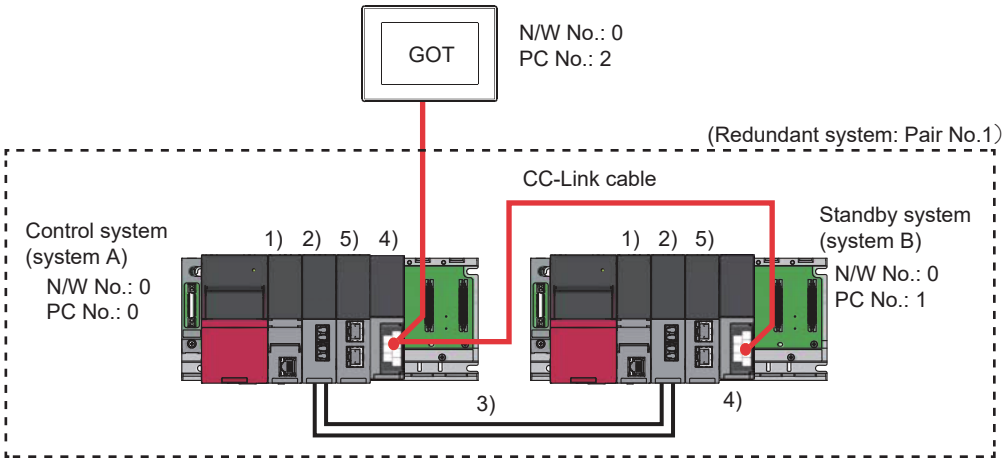
Only the connected CPU can be accessed.

12.3.6 How to monitor a redundant system

One-to-one connection of the GOT and the redundant system

■System configuration example

The following connection configuration examples are explained.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link(ID)
5) CC-Link IE Field Network master/local module

■Connection method

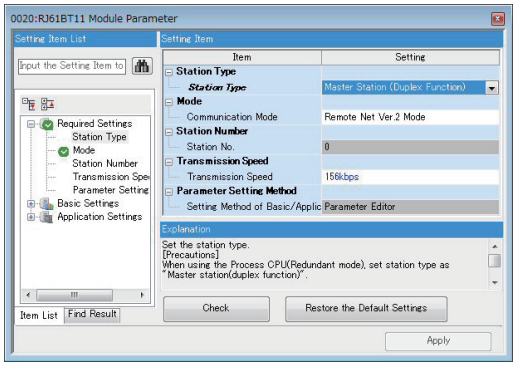
Connect the CC-Link module (intelligent device station) and the GOT.

☞ Page 1018 CC-Link connection (intelligent device station)

■PLC side settings (GX Works3)

• Control system (system A) PLC settings

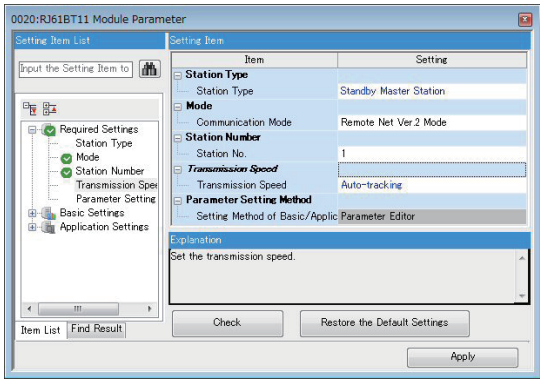
Module parameter



Item	Setting value
[Station Type]	Master station (duplex function)
[Mode]	Remote network Ver.2 mode
[Station No.]	0 (fixed)
[Transmission Speed]	156 kbps
[Parameter Setting Method]	Set in parameter (fixed)

• Control system (system B) PLC settings

Module parameter



Item	Setting value
[Station Type]	Standby master station
[Mode]	Remote network Ver.2 mode
[Station No.]	1
[Transmission Speed]	Auto-tracking
[Parameter Setting Method]	Set in parameter (fixed)

■GOT side settings

Set GT Designer3 as follows.

Setting item	Setting details		Model
[Controller Type]	MELSEC iQ-R, RnMT/NC/RT, CR800-D		GT37 SoftGOT3000
Device setting (Network setting)	Host	—	
	Other	Network number: 0	
		PLC station No.: Station number of the control system	
	Control system/ standby system	The system (control system/standby system) to be monitored can be specified. This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] shown below.	
MELSEC redundant setting	Select [Use the function of MELSEC Redundant]. A pairing setting is not required.  ☞ Page 1075 MELSEC redundant settings		

■Monitoring target change when system switching occurs in a redundant system

When system switching occurs, the CPU (Network No. 0, PLC station No. 1) becomes the control system and continues the control.

The GOT automatically starts monitoring according to the specified system.

MELSEC redundant settings

This section describes the settings for the GOT to automatically change the monitoring target of the RCPU redundant system.

Point

Before configuring the MELSEC redundant settings

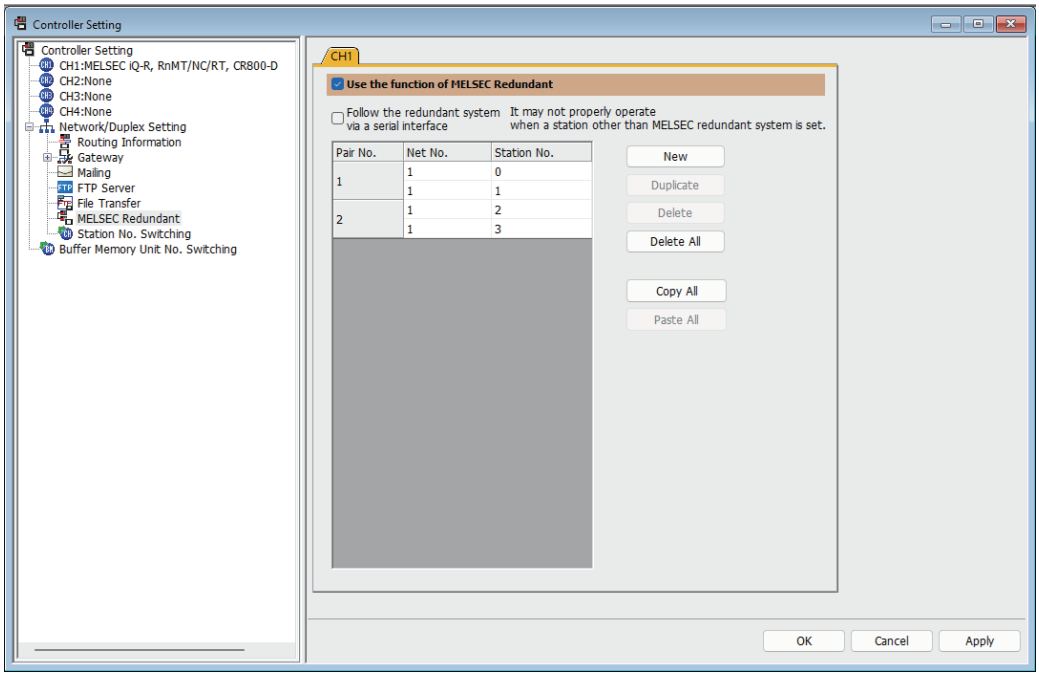
In the MELSEC redundant settings, do not set a station outside the redundant RCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC redundant setting dialog, settings can be made for each channel of the controller.

The following shows an example of the CC-Link connection (intelligent device station) (station No. 4) with redundant CPU pair No. 1 to No. 2, network No. 1, and redundant CPU station No. 0 to No. 3.

Ex.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Copies one setting of the selected pair number and adds it below the bottom row.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 1076 Pair number

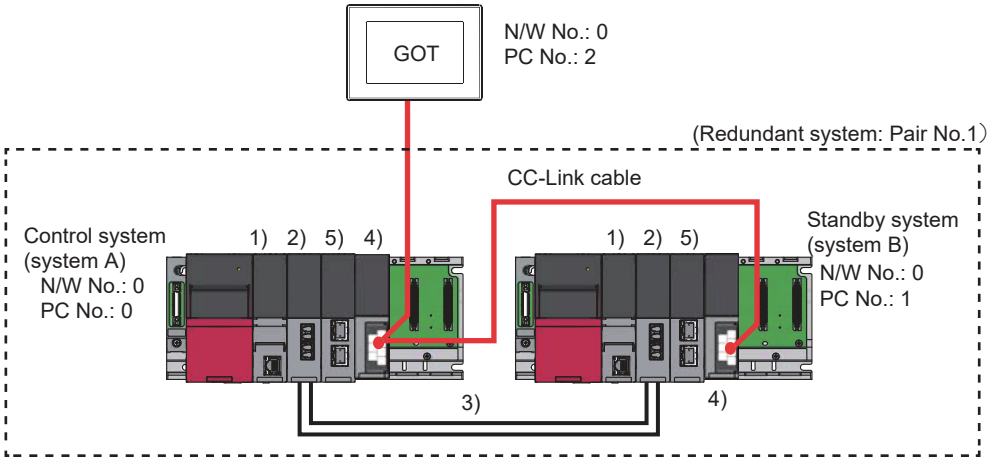
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of the CC-Link connection (intelligent device station) in the RCPU redundant system. (Pair No. 1)

Ex.



1) Process CPU
2) Redundant function module
3) Tracking cable
4) CC-Link(ID)
5) CC-Link IE Field Network master/local module

Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- The last station number and station number 1 (example: station number 64 and station number 1) cannot be paired.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the redundant mode of the RCPU redundant system, and does not support the process mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

- 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

[450: Path has changed or timeout occurred in redundant system.] appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, [451: The MELSEC redundant setting and actual system configuration do not match.] appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings. If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm [315 Device writing error. Correct device.] is not detected.

■CC-Link (ID) connection

When system switching occurs due to the following factors, data link control of CC-Link (ID) does not transfer from the master station of the new standby system to the standby master station of the new control system and the GOT cannot change the monitoring target.

Make the standby master station of the new control system take over data link control in the ladder program.

For details on the ladder program for data link control, refer to the following manual.

• MELSEC iQ-R series

📖MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Application)

<Factors of system switching>

• Execution of the system switching instruction on the PLC side

• Execution of system switching operation using the engineering tool

• Execution of system switching request from other network modules

<Reason why the GOT cannot change the monitoring target>

When system switching occurs due to the above factors, the standby master station does not take over data link control because the master station of the new standby system can communicate with the GOT.

Consequently, the new control system master station remains the standby master station.

As a result, the GOT monitors the master station without considering the new control or standby system, which prevents it from monitoring the redundant system.

12.4 MELSEC iQ-F series (CC-Link connection (intelligent device station))

☞ Page 1078 Connectable devices
☞ Page 1078 System configuration
☞ Page 1083 GOT side settings
☞ Page 1089 PLC side settings
☞ Page 1098 Access range for monitoring

12.4.1 Connectable devices

The following table shows the connectable models.

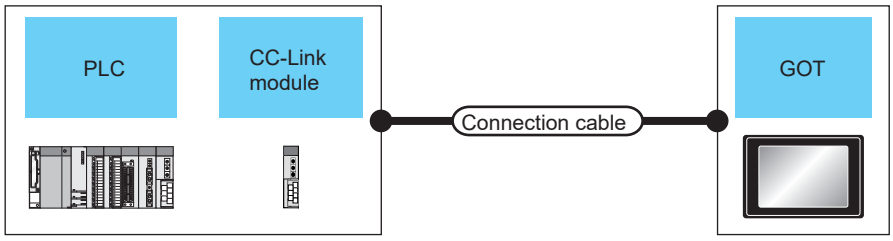
○: Supported, —: Not supported

Controller	Model	Clock	CC-Link module	Connectable model
MELSEC iQ-F series	FX5U FX5UC	○	FX3U-16CCL-M*1 FX5-CCL-MS	GT37 SoftGOT3000
	FX5UJ	○	FX5-CCL-MS	GT37 SoftGOT3000

*1 When the FX3U-16CCL-M is used, the bus conversion module (FX5-CNV-BUS) is required.

12.4.2 System configuration

Connection with CC-Link Ver.1 compatible



For details on the overall length, refer to the following.

☞ Page 1079 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1079 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC iQ-F series (FX5U, FX5UC)	FX3U-16CCL-M*4 FX5-CCL-MS	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000
MELSEC iQ-F series (FX5UJ)	FX5-CCL-MS	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual
FX3U-16CCL-M User's Manual
*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/
*3 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1083 [Controller Setting]
*4 When the FX3U-16CCL-M is used, the bus conversion module (FX5-CNV-BUS) is required.

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual

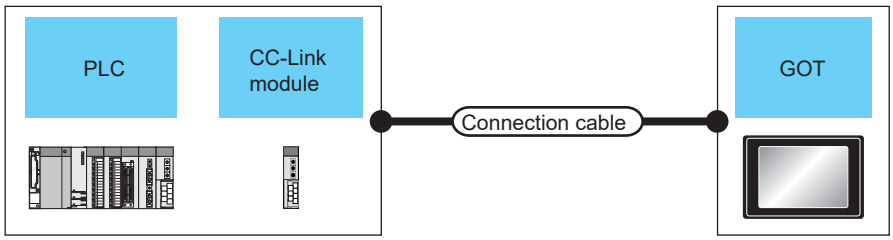
FX3U-16CCL-M User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC iQ-F series	8 GOTs

Connection with CC-Link Ver.2 compatible



For details on the overall length, refer to the following.

☞ Page 1080 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1080 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC iQ-F series (FX5U, FX5UC)	FX3U-16CCL-M*4 FX5-CCL-MS	CC-Link (Ver.2)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000
MELSEC iQ-F series (FX5UJ)	FX5-CCL-MS	CC-Link (Ver.2)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

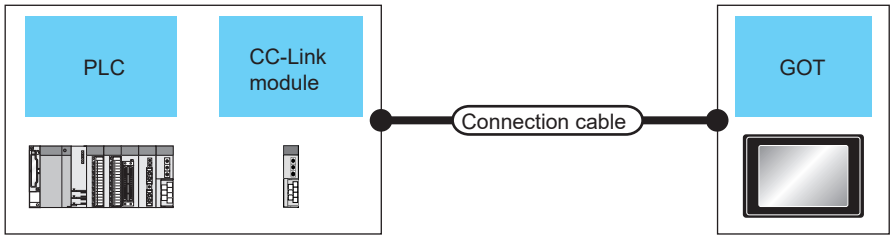
📖FX3U-16CCL-M User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC iQ-F series	8 GOTs

Connection with CC-Link Ver.1/Ver.2 compatibles mixed



For details on the overall length, refer to the following.

☞ Page 1080 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1081 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC iQ-F series (FX5U, FX5UC)	FX3U-16CCL-M*4 FX5-CCL-MS	CC-Link (Ver.2)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000
MELSEC iQ-F series (FX5UJ)	FX5-CCL-MS	CC-Link (Ver.2)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
📖MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual
📖FX3U-16CCL-M User's Manual

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.2.
For details on settings, refer to the following.
☞ Page 1083 [Controller Setting]

*4 When the FX3U-16CCL-M is used, the bus conversion module (FX5-CNV-BUS) is required.

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

📖MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual

📖FX3U-16CCL-M User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC iQ-F series	8 GOTs

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

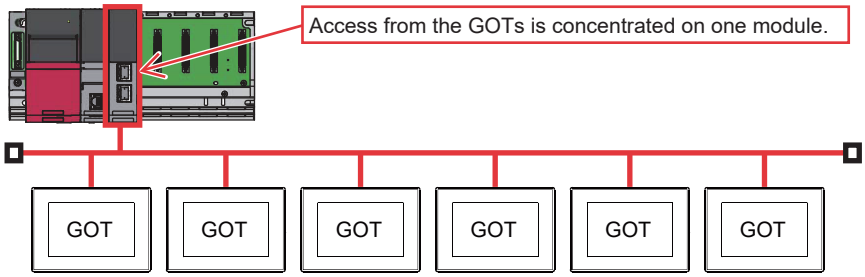
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

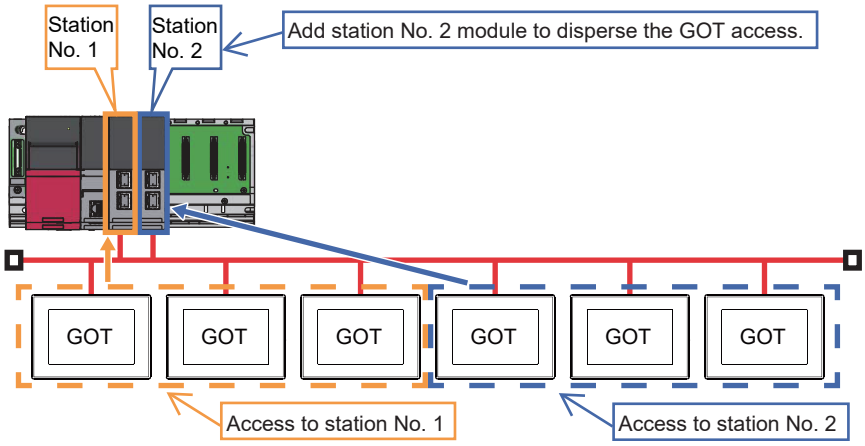
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

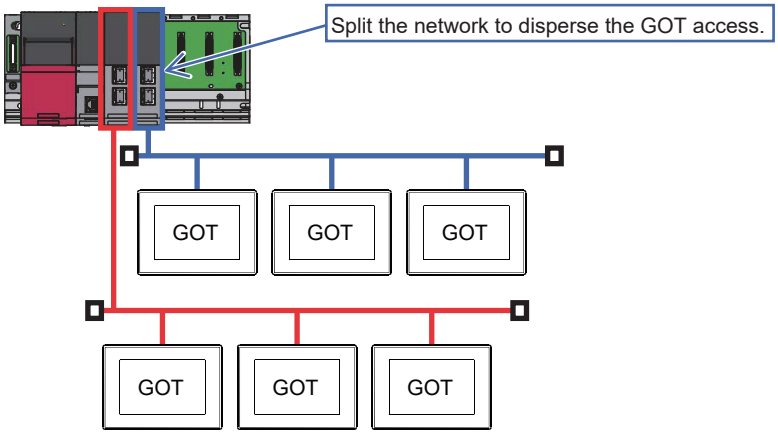
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT in CC-Link connection (intelligent device station)

For the CC-Link connection (intelligent device station), the data link is started approximately 10 seconds after the GOT startup.

■When a network error occurs in the system alarm

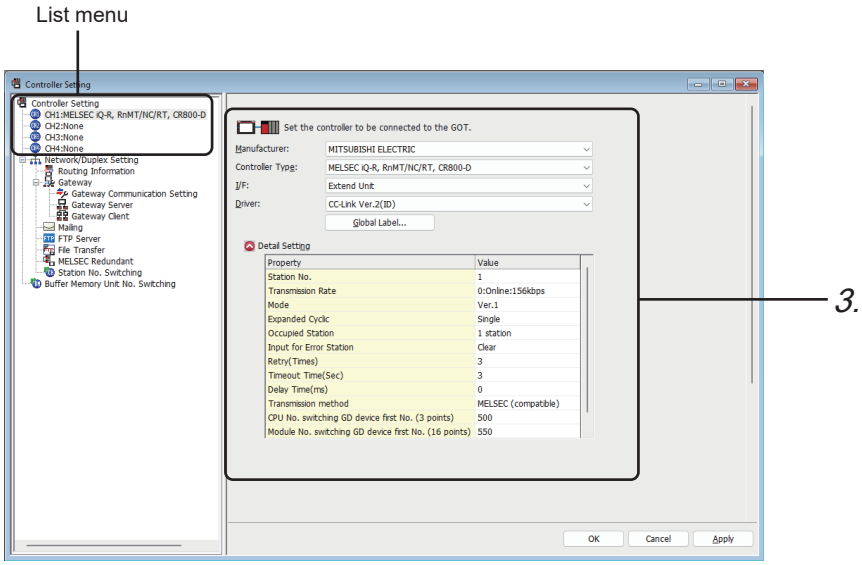
In the CC-Link connection (intelligent device station), when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

12.4.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]*1	[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[I/F]	[Extend Unit]
[Driver]	[CC-Link Ver.2 (ID)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 1084 [Detail Setting]

*1 For the MELSEC iQ-F series, set the controller type to one of the following options.
[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
[MELSEC-QnA, MELDAS C6*]
[MELSEC-L]
[MELSEC-A]

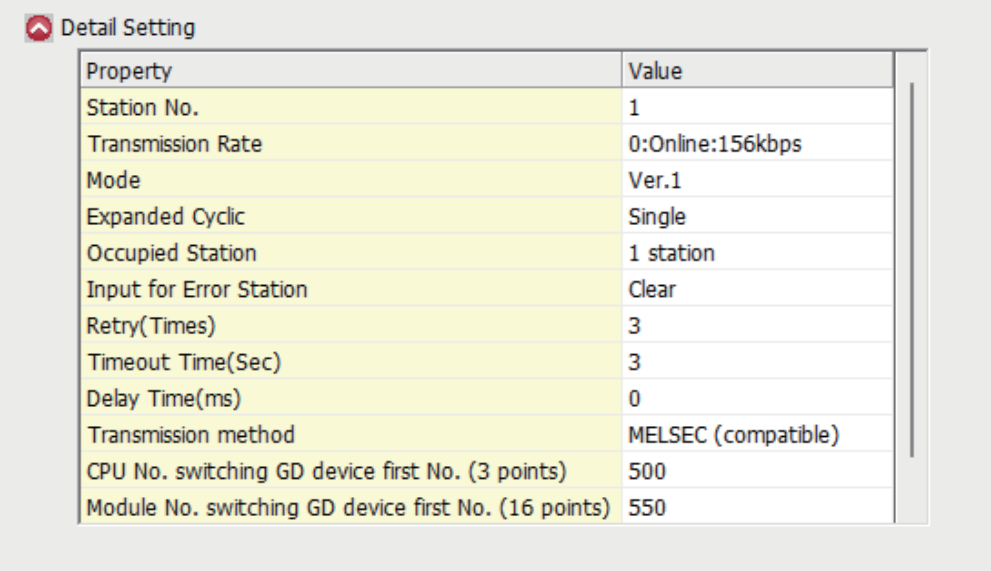
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Station No.]	Set the station number of the GOT.	[1] to [64]
[Transmission Rate]*1	Set the transmission speed and a mode of the GOT.	[0] to [E]
[Mode]	Set the operation mode of the GOT.	[Ver.1], [Ver.2], [Additional], [Offline]
[Expanded Cyclic]	Set the cyclic point expansion.	[Single], [Double], [Quadruple], [Octuple]
[Occupied Station]	Set the number of stations occupied by the GOT.	[1 Station], [4 Stations]
[Input for Error Station]	Set whether to clear or hold the error at an error occurrence.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Transmission method]*2	Set the CC-Link transmission method.	[MELSEC (compatible)], [Cyclic]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 1085 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 1086 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 1087 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Transmission speed settings

The following lists the transmission speed settings of the CC-Link communication.

Setting value	Description
0	Online: 156 kbps
1	Online: 625 kbps
2	Online: 2.5 Mbps
3	Online: 5 Mbps
4	Online: 10 Mbps
5	Line test: 156 kbps
6	Line test: 625 kbps
7	Line test: 2.5 Mbps

Setting value	Description
8	Line test: 5 Mbps
9	Line test: 10 Mbps
A	Hardware test: 156 kbps
B	Hardware test: 625 kbps
C	Hardware test: 2.5 Mbps
D	Hardware test: 5 Mbps
E	Hardware test: 10 Mbps

For details on the hardware test, refer to the following manual.

MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual

FX3U-16CCL-M User's Manual

*2 Set the transmission method to [Cyclic].

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Precautions

■Using cyclic transmission

• I/O signals for the master station

Do not turn on the reserved output signals in the output signals (remote output: RY) to the GOT from the master station.
When the reserved output signal is turned on, the PLC system may malfunction.
For the assignment of I/O signals in the GOT, refer to the following manuals.
📖MODEL GT15-J61BT13 CC-Link communication unit User's Manual
📖GT15 CC-Link communication unit User's Manual

• Access range for monitoring

The remote I/O (RX and RY) and remote register (RWr and RWw) monitoring ranges vary depending on the mode of the master station in the CC-Link system.

Mode of master station	Monitoring	
	Data for each station compatible with CC-Link Ver.1	Data for each station compatible with CC-Link Ver.2
Remote network mode	○	—
Remote network Ver.1 mode	○	—
Remote network Ver.2 mode	○	○*1
Remote network additional mode	○	○

○: Available, ×: Not available (All "0"), —: System configuration not available

*1 Monitoring is available only when the GT15-J61BT13 CC-Link communication unit is used.

• When the GOT malfunctions

The state of cyclic output before fault is held.

■Connection with CC-Link Ver.1 compatible

For connection with CC-Link Ver.1 compatible, the device setting must be configured within the range of the specifications of the controller.
When a device number out of the range is set, proper monitoring may not be possible.

12.4.4 PLC side settings

Model		Reference
MELSEC iQ-F series	FX5U FX5UC	☞ Page 1090 Connection to MELSEC iQ-F series and CC-Link module (FX3U-16CCL-M) with Ver.1/Ver.2 compatibles mixed ☞ Page 1096 Connection to MELSEC iQ-F series and CC-Link module (FX5-CCL-MS) with Ver.1/Ver.2 compatibles mixed
	FX5UJ	☞ Page 1096 Connection to MELSEC iQ-F series and CC-Link module (FX5-CCL-MS) with Ver.1/Ver.2 compatibles mixed

The GOT operates as the stations with the following specifications in the CC-Link system.

Station information	Description
Station type	Intelligent device station, Ver.1 intelligent device station, or Ver.2 intelligent device station
Number of stations occupied	1 station or 4 stations

Point

Number of stations occupied

The number of stations occupied is the setting for determining the number of link device points (RX/RY/RWw/RWr) used by the GOT.

To use multiple numbers of link device points in cyclic transmission between the GOT and CC-Link module, set the number of stations occupied as 4 stations occupied.

The number of link device points when 1 station occupied or 4 stations occupied is shown below.

• CC-Link Ver.2

Link device	Extended cyclic setting							
	Single		Double		Quadruple		Octuple	
	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote output (RY)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote register (RWw)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points
Remote register (RWr)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points

• CC-Link Ver.1

Link device	Number of stations occupied	
	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points
Remote output (RY)	32 points	128 points
Remote register (RWw)	4 points	16 points
Remote register (RWr)	4 points	16 points

Connection to MELSEC iQ-F series and CC-Link module (FX3U-16CCL-M) with Ver.1/ Ver.2 compatibles mixed

This section describes the setting method of the GOT and the CC-Link module (FX3U-16CCL-M) when Ver. 1/Ver. 2 compatible modules are mixed in the system configuration shown below.

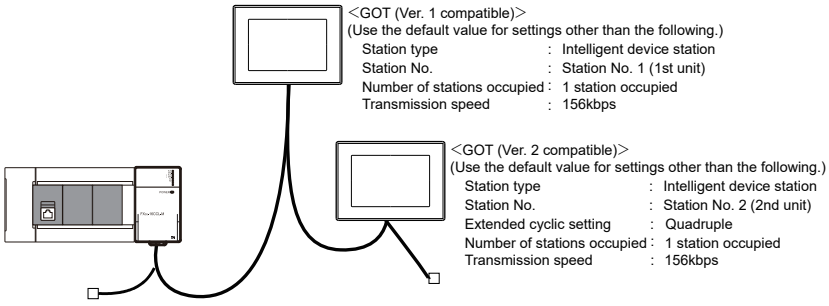
Point

CC-Link module (FX3U-16CCL-M)

For the details on the CC-Link module (FX3U-16CCL-M), refer to the following manual.

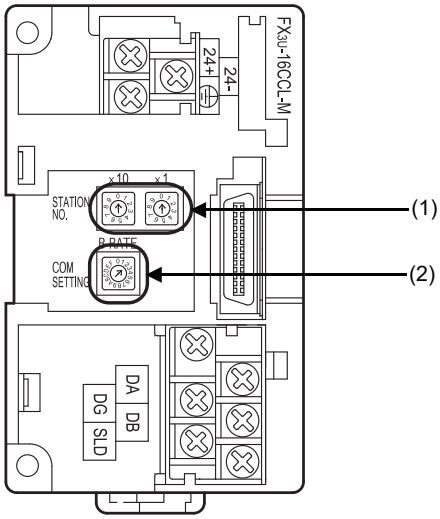
FX3U-16CCL-M User's Manual

■System configuration



■Switch settings for the CC-Link module (FX3U-16CCL-M)

Set the station number setting switch, transmission speed/mode setting switch.



• Station number setting switch

○: Necessary, △: As necessary, —: Not necessary

Station number setting switch	Description	Setting value	Setting for GOT connection
	Station number setting (master station)	0 (fixed)	○

• Transmission speed/mode setting switch

○: Necessary, △: As necessary, —: Not necessary

Transmission speed/mode setting switch	Description	Setting value	Setting for GOT connection
	Transmission speed and mode setting (Online: 156 kbps)*1	0	○

*1 Set the same transmission speed as that of the GOT.

Point

When the switch setting has been changed
Turn off then on or reset the PLC CPU.

■Parameter settings

Station information setting

台数/局番	局種別	拡張サイクリック設定	占有局数	リモート局点数	予約/無効局指定
1/ 1	Ver.1インテリジェントデバイス局	1倍設定	1局占有	32点	設定なし
2/ 2	Ver.2インテリジェントデバイス局	4倍設定	1局占有	64点	設定なし

Station information setting of station No. 1 (GOT)

○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Ver.1 intelligent device station (fixed)	○
[Number of Occupied Stations]*1	1 station occupied	○
[Reserved/Err Invalid STA]	No setting	○

Station information setting of station No. 2 (GOT)

○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Ver.2 intelligent device station (fixed)	○
[Expanded Cyclic Setting]*1	Quadruple	○
[Number of Occupied Stations]*1	1 station occupied	○
[Reserved/Err Invalid STA]	No setting	○

*1 Set the same setting as that of the GOT.

Point

When changing the network parameter

After writing network parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• Settings with sequence program

The program writes parameters to the buffer memory and starts the data link automatically when the PLC CPU status changes from STOP to RUN.

Point

Connection to MELSEC iQ-F series

When connecting with the MELSEC iQ-F series, the network parameters cannot be set with GX Works3. Set the network parameters in the sequence program.

I/O signals of the CC-Link module

FX3U-16CCL-M User's Manual

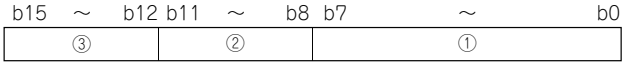
Device used by user

Device	Application
D0	Mode
D1	Number of connected modules
D2	Retry count
D3	Automatic reconnection station count
D4	Operation specification when CPU is down
D5	Data link faulty station specification
D6	Case of CPU STOP setting
D20	Station information (1st unit)
D21	Station information (2nd unit)

Buffer memory settings used in the present example

Buffer memory address Dec (Hex)	Item	Setting value
0 (0H)	Mode	2 (Remote network Ver.2 mode)
1 (1H)	Number of connected modules	2 (2 modules)
2 (2H)	Retry count	7 (7 times)
3 (3H)	Automatic reconnection station count	2 (2 modules)
6 (6H)	Operation specification when CPU is down	0 (Stop)
12 (CH)	Data link faulty station specification	1 (Clear)
6 (DH)	Case of CPU STOP setting	0 (Refresh)
32 (20H)	Station information (1st unit)*1	2301H
33 (21H)	Station information (2nd unit)*1	C104H

*1 Details for the station data are shown below.
For 1), 2), and 3), make the settings the same as the settings of the station number, number of stations occupied, and expanded cyclic of the GOT.



1) Station number (Make the setting the same as the station number setting of the GOT.)

01H to 10H: Station No. 1 to Station No. 16

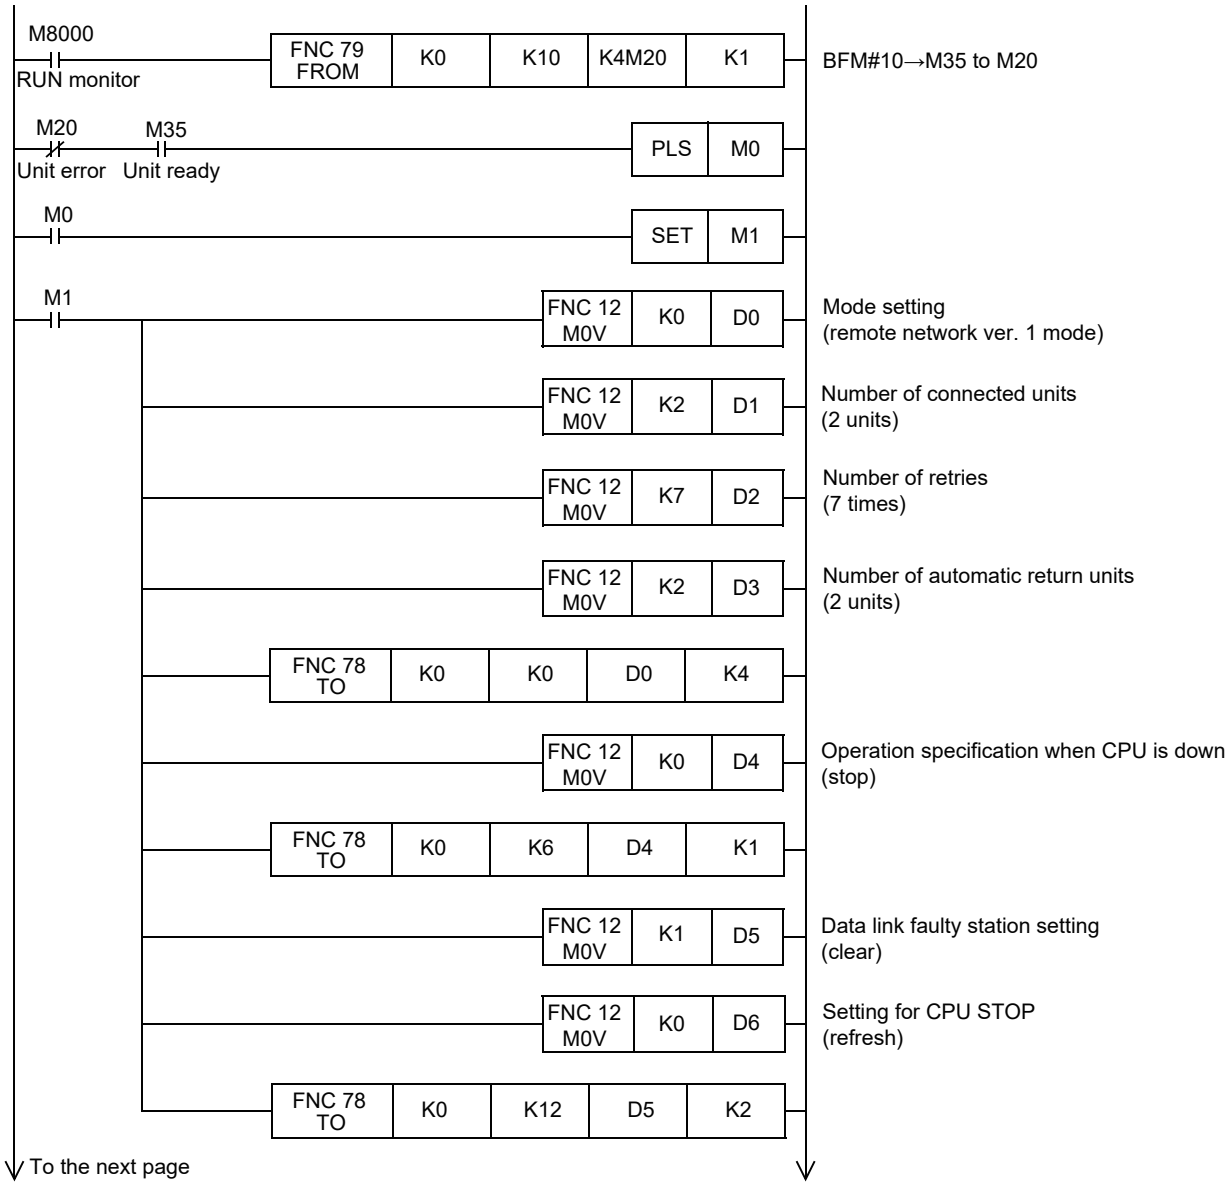
2) Number of stations occupied (Make the setting the same as the number of stations occupied setting of the GOT.)

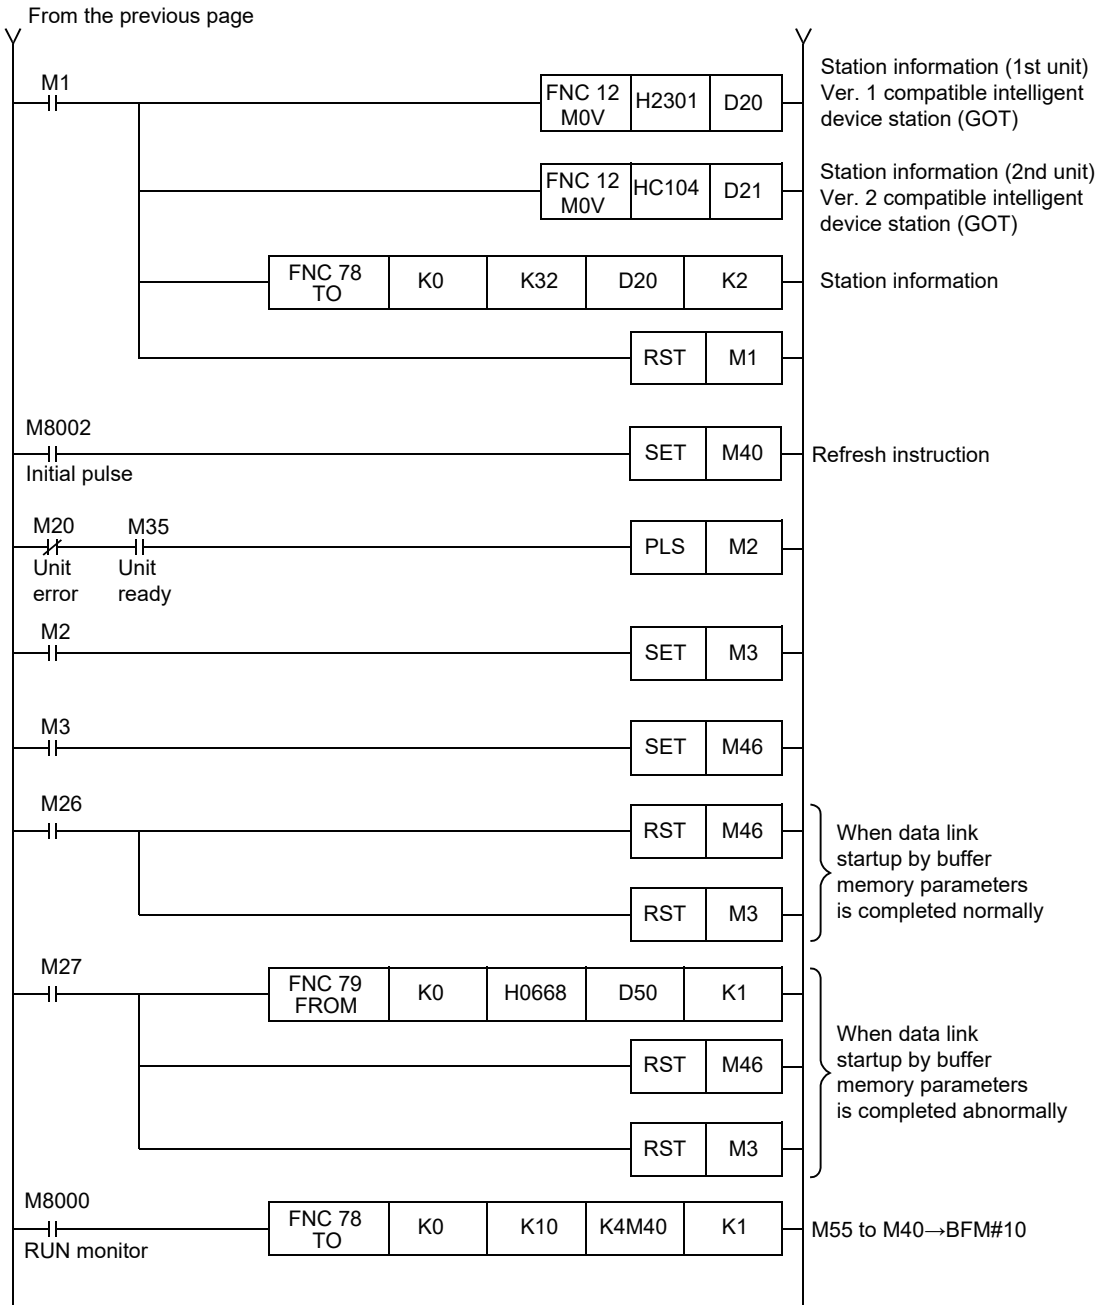
1H: 1 station occupied
2H: 2 stations occupied
3H: 3 stations occupied
4H: 4 stations occupied

3) Station type

2H: Ver. 1 compatible intelligent device station
6H: Ver. 2 compatible single intelligent device station
9H: Ver. 2 compatible double intelligent device station
CH: Ver. 2 compatible quadruple intelligent device station
FH: Ver. 2 compatible octuple intelligent device station

Example of sequence program





Point

When changing the sequence program

After writing the sequence program to the PLC CPU, turn off then on or reset the PLC CPU.

■[Controller Setting] in GT Designer3

• Communication settings of station No. 1 (GOT)

Item	Setting value
[Station No.]	1: Station No. 1
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.1: Remote network Ver.1 mode
[Expanded Cyclic]	—
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	Cyclic

• Communication settings of station No. 2 (GOT)

Item	Setting value
[Station No.]	2: Station No. 2
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.2: Remote network Ver.2 mode
[Expanded Cyclic]	Quadruple
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	Cyclic

Connection to MELSEC iQ-F series and CC-Link module (FX5-CCL-MS) with Ver.1/Ver.2 compatibles mixed

This section describes the setting method of the GOT and the CC-Link module (FX5-CCL-MS) when Ver. 1/Ver. 2 compatible modules are mixed in the system configuration shown below.

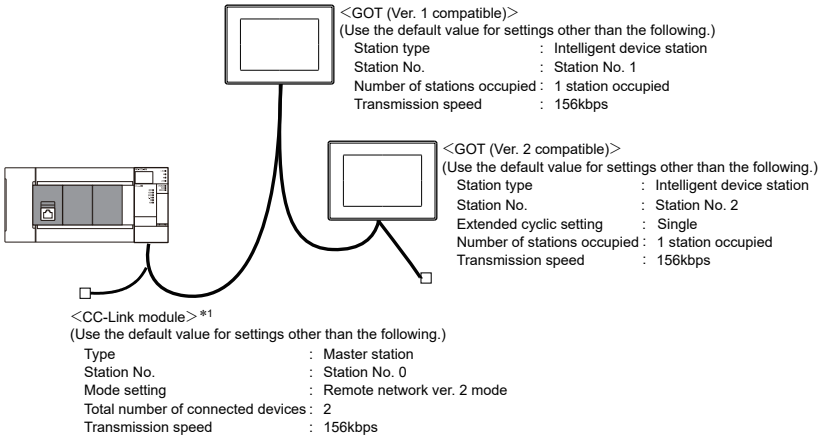
Point

CC-Link module (FX5-CCL-MS)

For the details on the CC-Link module (FX5-CCL-MS), refer to the following manual.

MELSEC iQ-F FX5 CC-Link System Master/Intelligent Device Module User's Manual

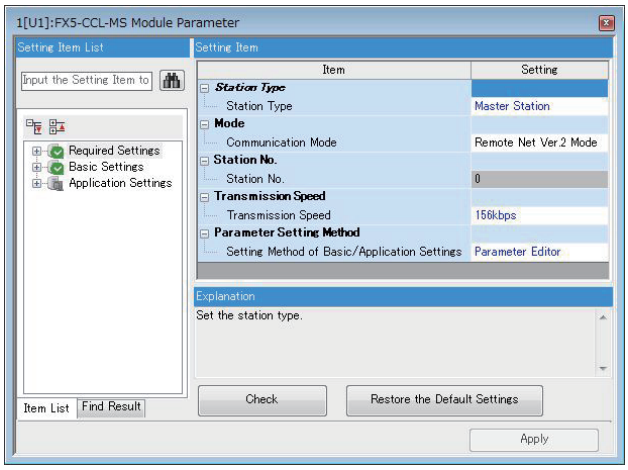
■System configuration



■Module parameter settings of GX Works3

• [Module Parameter] of GX Works3

Module parameter

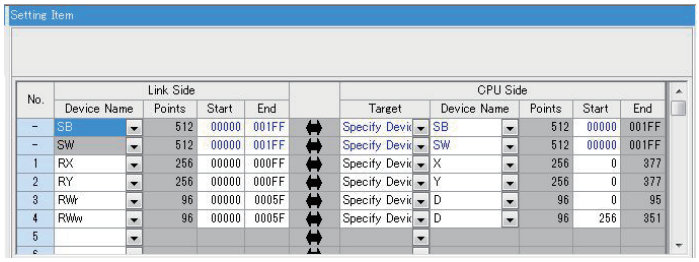


○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Station Type]	Master station	○
[Mode]	Remote network Ver.1 mode	○
[Station No.]	0 (fixed)	△
[Transmission Speed]*1	156 kbps	○
[Parameter Setting Method]	Set in parameter	—

*1 Adjust the settings with the GOT settings.

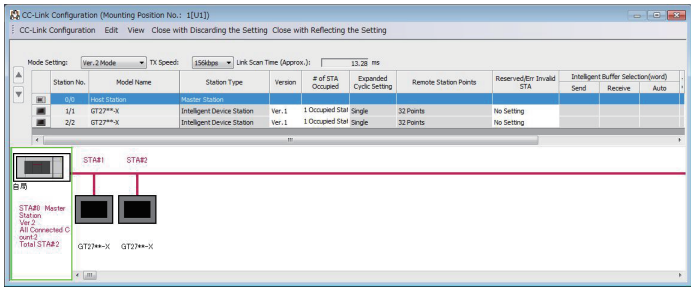
Link refresh setting



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Special relay (SB) refresh device]	Set this item as necessary.	△
[Special register (SW) refresh device]		△
[Remote input (RX) refresh device]		△
[Remote output (RY) refresh device]		△
[Remote register (RWr) refresh device]		△
[Remote register (RWw) refresh device]		△

CC-Link configuration setting



CC-Link configuration setting of station No. 1 (GOT)

○: Necessary, △: As necessary, —: Not necessary

Item*1	Setting value	Setting for GOT connection
[Station Type]	Ver.1 intelligent device station (fixed)	○
[# of STA Occupied]*2	1 station occupied	○
[Reserved/Err Invalid STA]	No setting	○
[Intelligent Buffer Selection(word)]	(Use default value)	—

CC-Link configuration setting of station No. 2 (GOT)

○: Necessary, △: As necessary, —: Not necessary

Item*1	Setting value	Setting for GOT connection
[Station Type]	Ver.2 intelligent device station (fixed)	○
[Expanded Cyclic Setting]*2	Single	○
[# of STA Occupied]*2	1 station occupied	○
[Reserved/Err Invalid STA]	No setting	○
[Intelligent Buffer Selection(word)]	(Use default value)	—

*1 When the [Mode] of the CC-Link module is set to [Remote Net Ver.2 Mode], [Remote Station Points] can be set.
[Remote Station Points] is a setting for the remote I/O station.
The default value (32 points) must be used on the GOT.

*2 Set the same setting as that of the GOT.

Point

When changing the module parameter

After writing module parameters to the PLC CPU, turn off then on or reset the PLC CPU.

■[Controller Setting] in GT Designer3

• Communication settings of station No. 1 (GOT)

Item	Setting value
[Station No.]	1: Station No. 1
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.1: Remote network Ver.1 mode
[Expanded Cyclic]	Single (Use default value)
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	Cyclic

• Communication settings of station No. 2 (GOT)

Item	Setting value
[Station No.]	2: Station No. 2
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.2: Remote network Ver.2 mode
[Expanded Cyclic]	Single
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	Cyclic

12.4.5 Access range for monitoring

Only the connected CPU can be accessed.

12.5 MELSEC-Q series (CC-Link connection (intelligent device station))

☞ Page 1099 Connectable devices
☞ Page 1101 System configuration
☞ Page 1106 GOT side settings
☞ Page 1112 PLC side settings
☞ Page 1128 Access range for monitoring
☞ Page 1129 How to monitor a redundant system

12.5.1 Connectable devices

The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	CC-Link module	Connectable model
MELSEC-Q (Q mode)	Q00JCPU Q00CPU*1 Q01CPU*1 Q02CPU*1	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
	Q02HCPU*1 Q06HCPU*1 Q12HCPU*1 Q25HCPU*1	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
	Q02PHCPU Q06PHCPU Q12PHCPU Q25PHCPU	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
	Q12PRHCPU (main base) Q25PRHCPU (main base) Q12PRHCPU (remote extension base) Q25PRHCPU (remote extension base) Q12PRHCPU (extension base) Q25PRHCPU (extension base)	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
	Q00UJCPU Q00UJCPU-S8	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
	Q00UCPU Q01UCPU Q02UCPU Q03UDCPU	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000

Controller	Model	Clock	CC-Link module	Connectable model
MELSEC-Q (Q mode)	Q04UDHCPU Q06UDHCPU Q10UDHCPU Q13UDHCPU Q20UDHCPU Q26UDHCPU	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
	Q03UDECPU Q04UDEHCPU Q06UDEHCPU Q10UDEHCPU Q13UDEHCPU Q20UDEHCPU Q26UDEHCPU Q50UDEHCPU Q100UDEHCPU	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
	Q03UDVCPU Q04UDVCPU Q06UDVCPU Q13UDVCPU Q26UDVCPU	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
C Controller module (Q series)	Q12DCCPU-V*2 Q24DHCCPU-V Q24DHCCPU-LS Q24DHCCPU-VG Q26DHCCPU-LS	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
Motion CPU (Q series)	Q172CPUN*3 Q173CPUN*3 Q172HCPU Q173HCPU Q172DCPU Q173DCPU Q172DCPU-S1 Q173DCPU-S1 Q172DSCPU Q173DSCPU Q170MCPU*4 Q170MSCPU*5 Q170MSCPU-S1*5	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
CNC C70	Q173NCCPU	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000
Robot controller (Q series)	CRnQ-700 (Q172DRCPU) CR750-Q (Q172DRCPU) CR751-Q (Q172DRCPU) CR800-Q (Q172DSRCPU)	○	QJ61BT11 QJ61BT11N	GT37 SoftGOT3000

*1 To configure a multiple CPU system, use a CPU with function version B or later.

*2 Use a module having a serial number stating with 12042 or later in the first 5 digits.

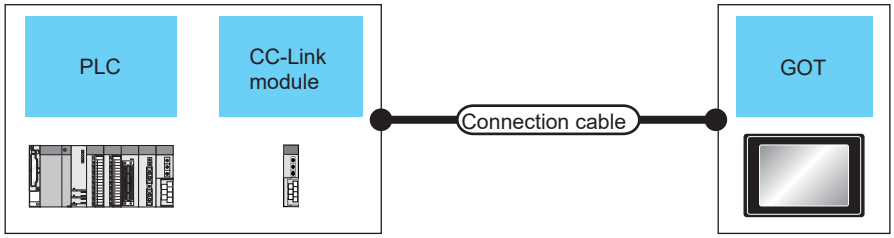
*3 When using SV13, SV22, or SV43, use a Motion CPU with the following version of OS installed.
- SW6RN-SV13Q□: 00H or later
- SW6RN-SV22Q□: 00H or later
- SW6RN-SV43Q□: 00B or later

*4 Only the first step can be used on the extension base unit (Q52B/Q55B).

*5 The extension base unit (Q5□B/Q6□B) can be used.

12.5.2 System configuration

Connection with CC-Link Ver.1 compatible



For details on the overall length, refer to the following.

☞ Page 1101 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1101 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC-Q (Q mode) C Controller module (Q series) Motion CPU (Q series) CNC C70 Robot controller (Q series)	QJ61BT11 QJ61BT11N	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC-Q CC-Link System Master/Local Module User's Manual

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1106 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

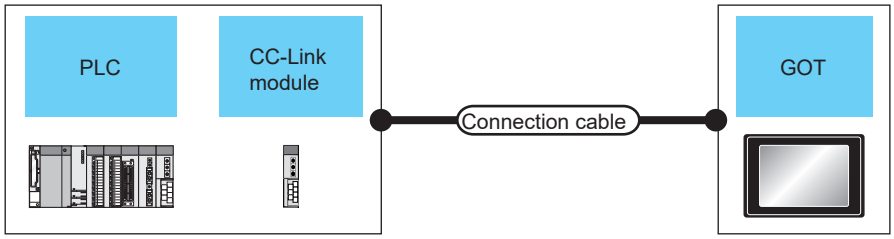
MELSEC-Q CC-Link System Master/Local Module User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	Number of connectable devices
MELSEC-Q (Q mode) C Controller module (Q series) Motion CPU (Q series) CNC C70 Robot controller (Q series)	26 GOTs

Connection with CC-Link Ver.2 compatible



For details on the overall length, refer to the following.

☞ Page 1102 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1102 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC-Q (Q mode) C Controller module (Q series) Motion CPU (Q series) CNC C70 Robot controller (Q series)	QJ61BT11N	CC-Link (Ver.2)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC-Q CC-Link System Master/Local Module User's Manual

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.2.
For details on settings, refer to the following.
☞ Page 1106 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

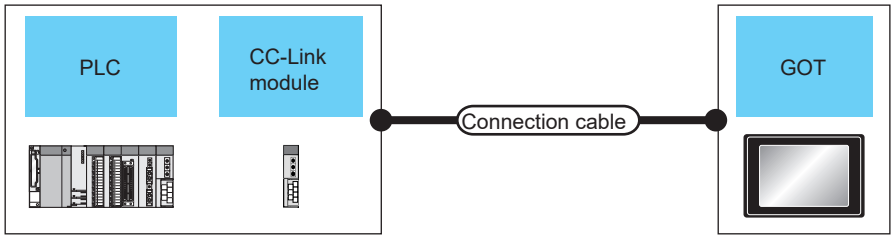
MELSEC-Q CC-Link System Master/Local Module User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	Number of connectable devices
MELSEC-Q (Q mode) C Controller module (Q series) Motion CPU (Q series) CNC C70 Robot controller (Q series)	26 GOTs

Connection with CC-Link Ver.1/Ver.2 compatibles mixed



For details on the overall length, refer to the following.

☞ Page 1103 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1103 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC-Q (Q mode) C Controller module (Q series) Motion CPU (Q series) CNC C70 Robot controller (Q series)	QJ61BT11N	CC-Link (Ver.2)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000
		CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*4	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC-Q CC-Link System Master/Local Module User's Manual

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.2.
For details on settings, refer to the following.
☞ Page 1106 [Controller Setting]

*4 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1106 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

MELSEC-Q CC-Link System Master/Local Module User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	Number of connectable devices
MELSEC-Q (Q mode) C Controller module (Q series) Motion CPU (Q series) CNC C70 Robot controller (Q series)	26 GOTs

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

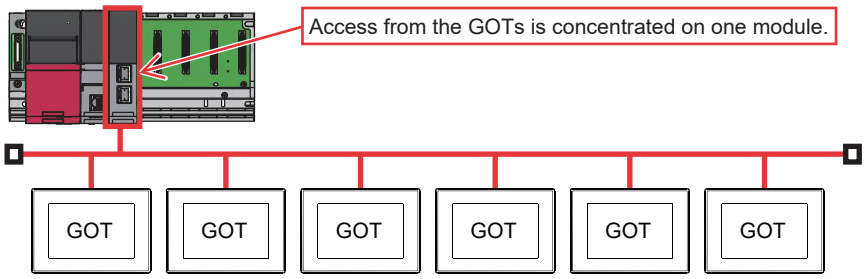
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

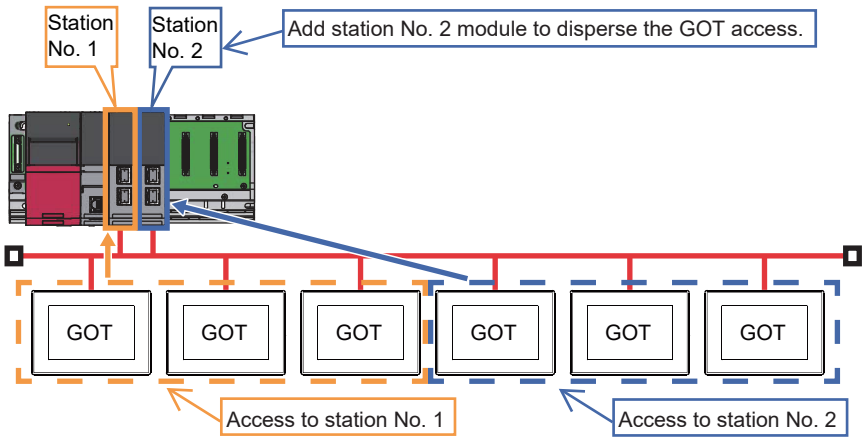
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

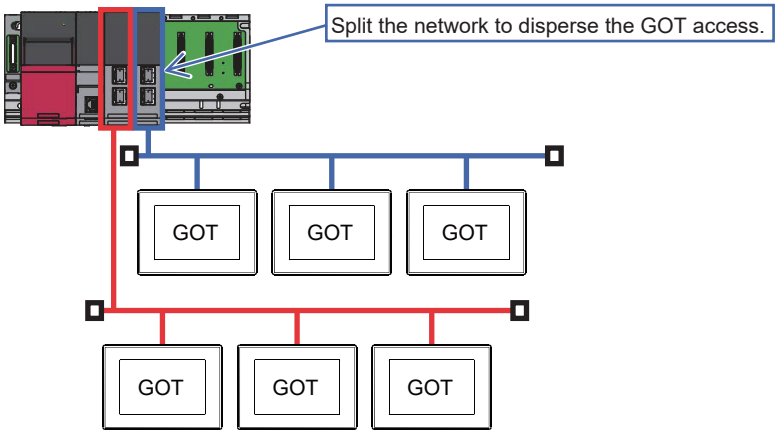
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Connection via the multiple CPU system

When the GOT is connected via the multiple CPU system, the PLC takes 10 seconds or more to run.

If you start the GOT before the PLC runs, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

Connection to Q17nDCPU, Q170MCPU, Q170MSCPU(-S1), CNC C70, CRnQ-700, or CR800-Q (Q172DSRCPU)

The Q17nDCPU, Q170MCPU, Q170MSCPU(-S1), CNC C70, CRnQ-700, and CR800-Q (Q172DSRCPU) are applicable to CC-Link Ver. 2 only.

For connecting to the CC-Link (ID) network system, set to the CC-Link Ver. 2.

Connection to Q170MCPU or Q170MSCPU(-S1)

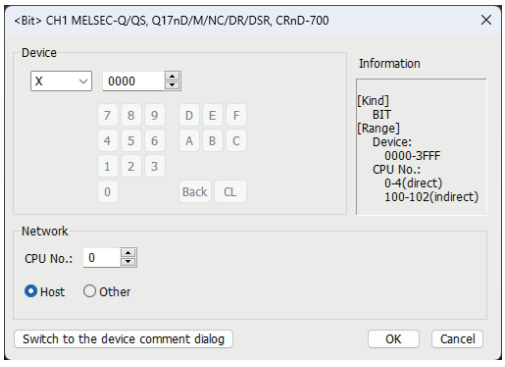
Set [CPU No.] to 2 in the device setting to monitor the device of the Motion CPU area (CPU No. 2).

When [CPU No.] is set to 0 or 1, the device on the PLC CPU area (CPU No. 1) is monitored.

When [CPU No.] is set to the number other than 0 to 2, a communication error occurs and the monitoring cannot be executed.

For the setting of [CPU No.], refer to the following manual.

GT Designer3 (GOT3000) Screen Design Manual



Precautions

■Starting the GOT in CC-Link connection (intelligent device station)

For the CC-Link connection (intelligent device station), the data link is started approximately 10 seconds after the GOT startup.

■When a network error occurs in the system alarm

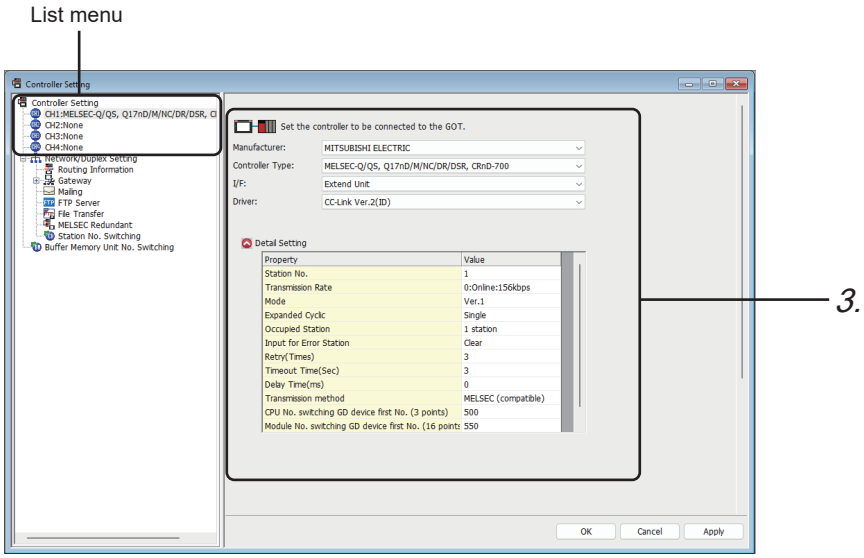
In the CC-Link connection (intelligent device station), when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

12.5.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
[I/F]	[Extend Unit]
[Driver]	[CC-Link Ver.2 (ID)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 1107 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

Point

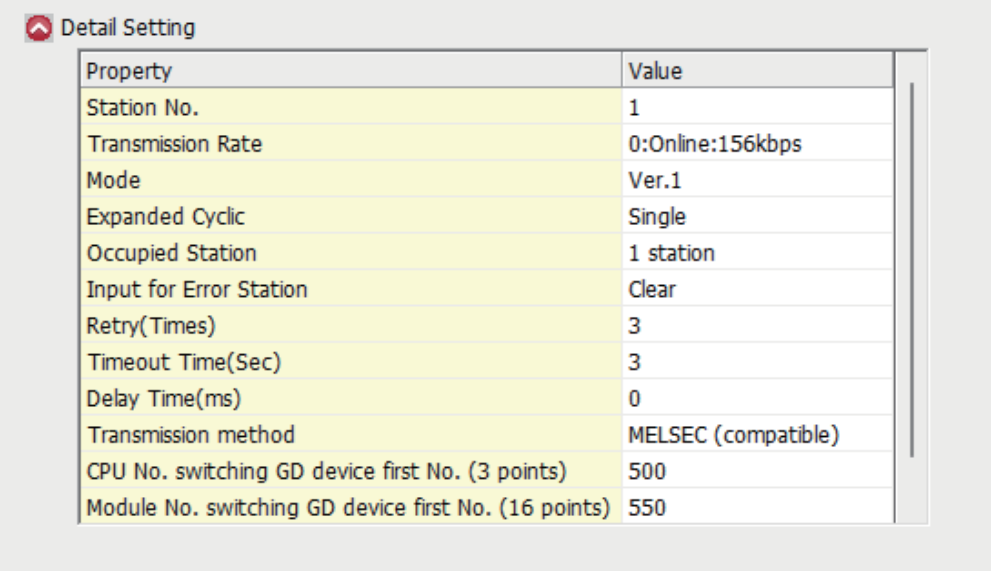
The controller settings can be configured and checked in [I/F Communication Setting].

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Station No.]	Set the station number of the GOT.	[1] to [64]
[Transmission Rate]*1	Set the transmission speed and a mode of the GOT.	[0] to [E]
[Mode Setting]	Set the operation mode of the GOT.	[Ver.1], [Ver.2], [Additional], [Offline]
[Expanded Cyclic]	Set the cyclic point expansion.	[Single], [Double], [Quadruple], [Octuple]
[Occupied Station]	Set the number of stations occupied by the GOT.	[1 Station], [4 Stations]
[Input for Error Station]	Set whether to clear or hold the error at an error occurrence.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Transmission method]	Set the CC-Link transmission method.	[MELSEC (compatible)], [Cyclic]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 1108 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 1109 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 1110 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Transmission speed settings

The following lists the transmission speed settings of the CC-Link communication.

Setting value	Description
0	Online: 156 kbps
1	Online: 625 kbps
2	Online: 2.5 Mbps
3	Online: 5 Mbps
4	Online: 10 Mbps
5	Line test: 156 kbps
6	Line test: 625 kbps
7	Line test: 2.5 Mbps

Setting value	Description
8	Line test: 5 Mbps
9	Line test: 10 Mbps
A	Hardware test: 156 kbps
B	Hardware test: 625 kbps
C	Hardware test: 2.5 Mbps
D	Hardware test: 5 Mbps
E	Hardware test: 10 Mbps

For details on the hardware test, refer to the following manual.

MELSEC-Q CC-Link System Master/Local Module User's Manual

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Precautions

■Using cyclic transmission

• I/O signals for the master station

Do not turn on the reserved output signals in the output signals (remote output: RY) to the GOT from the master station.
When the reserved output signal is turned on, the PLC system may malfunction.
For the assignment of I/O signals in the GOT, refer to the following manuals.
📖MODEL GT15-J61BT13 CC-Link communication unit User's Manual
📖GT15 CC-Link communication unit User's Manual

• Access range for monitoring

The remote I/O (RX and RY) and remote register (RWr and RWw) monitoring ranges vary depending on the mode of the master station in the CC-Link system.

Mode of master station	Monitoring	
	Data for each station compatible with CC-Link Ver.1	Data for each station compatible with CC-Link Ver.2
Remote network mode	○	—
Remote network Ver.1 mode	○	—
Remote network Ver.2 mode	○	○*1
Remote network additional mode	○	○

○: Available, ×: Not available (All "0"), —: System configuration not available

*1 Monitoring is available only when the GT15-J61BT13 CC-Link communication unit is used.

• When the GOT malfunctions

The state of cyclic output before fault is held.

■Connection with CC-Link Ver.1 compatible

For connection with CC-Link Ver.1 compatible, the device setting must be configured within the range of the specifications of the controller.
When a device number out of the range is set, proper monitoring may not be possible.

The GOT operates as the stations with the following specifications in the CC-Link system.

Station information	Description
Station type	Intelligent device station, Ver.1 intelligent device station, or Ver.2 intelligent device station
Number of stations occupied	1 station or 4 stations

Point

Number of stations occupied

The number of stations occupied is the setting for determining the number of link device points (RX/RY/RWw/RWr) used by the GOT.

To use multiple numbers of link device points in cyclic transmission between the GOT and CC-Link module, set the number of stations occupied as 4 stations occupied.

The number of link device points when 1 station occupied or 4 stations occupied is shown below.

• CC-Link Ver.2

Link device	Extended cyclic setting							
	Single		Double		Quadruple		Octuple	
	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote output (RY)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote register (RWw)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points
Remote register (RWr)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points

• CC-Link Ver.1

Link device	Number of stations occupied	
	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points
Remote output (RY)	32 points	128 points
Remote register (RWw)	4 points	16 points
Remote register (RWr)	4 points	16 points

Connection to MELSEC-Q series with Ver.1 compatible

This section describes the setting method of the GOT and the Ver. 1 compatible CC-Link module (MELSEC-Q series) in the system configuration shown below.

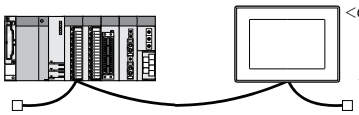
Point

CC-Link module (MELSEC-Q series)

For the details on the CC-Link module (MELSEC-Q series), refer to the following manual.

MELSEC-Q CC-Link System Master/Local Module User's Manual

■System configuration



<GOT>(Use the default value for settings other than the following.)

Station type	: Intelligent device station
Station No.	: Station No. 1
Number of stations occupied	: 1 station occupied
Transmission speed	: 156kbps

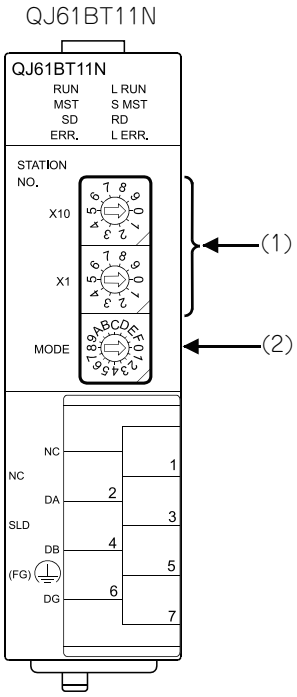
<CC-Link module> *1 (Use the default value for settings other than the following.)

Type	: Master station
Station No.	: Station No. 0
Mode setting	: Remote network ver. 1 mode
Total number of connected devices	: 1
Transmission speed	: 156kbps

*1 The CC-Link module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link module is set to "0".

■Switch settings for the CC-Link module (Q series)

Set the station number setting switch, transmission speed/mode setting switch.



• Station number setting switch

○: Necessary, △: As necessary, —: Not necessary

Station number setting switch	Description	Setting value	Setting for GOT connection
	Station number setting (master station)	0 (fixed)	○

• Transmission speed/mode setting switch

○: Necessary, △: As necessary, —: Not necessary

Transmission speed/mode setting switch	Description	Setting value	Setting for GOT connection
MODE	Transmission speed and mode setting (Online: 156 kbps)*1	0	○

*1 Set the same transmission speed as that of the GOT.

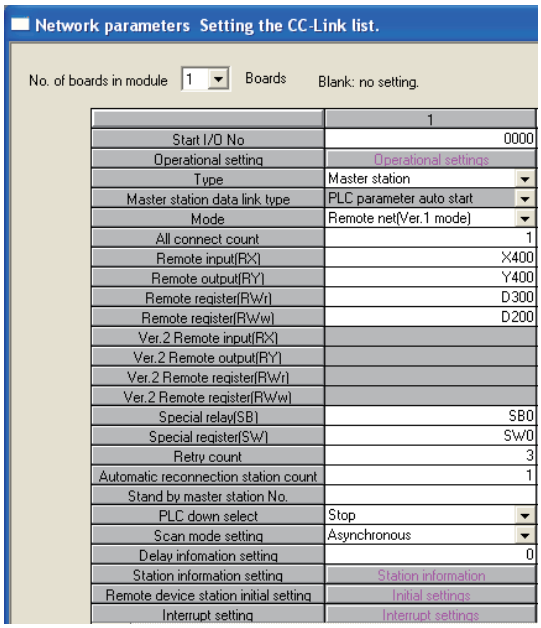
Point

When the switch setting has been changed
Turn off then on or reset the PLC CPU.

■Parameter settings (when connecting to MELSEC-Q or QS series)

• [Network parameter] of GX Developer

Network parameter



○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
[Numbers of modules]	1	○
[Starting I/O No.]*1	0000H	○
[Operation setting]	(Use default value)	△
[Type]	Master station (fixed)	○
[Mode]	Remote network Ver.1 mode	○
[All connect count]	1	○
[Remote input (RX) refresh device]	X400	△
[Remote output (RY) refresh device]	Y400	△
[Remote register (RWr) refresh device]	D300	△
[Remote register (RWw) refresh device]	D200	△
[Special relay (SB) refresh device]	SB0	△
[Special register (SW) refresh device]	SW0	△
[Retry count]	(Use default value)	△
[Automatic reconnection station count]		△

	[Intelligent buffer select(word)]		(Use default value)	—

*1 When the [Mode] of the CC-Link module is set to [Remote net(Ver.1 mode)], [Remote station points] cannot be set.

*2 Set the same setting as that of the GOT.

Point

When changing the network parameter

After writing network parameters to the C Controller module (Q series), turn off then on the C Controller module (Q series).

■[Controller Setting] in GT Designer3

Item	Setting value
[Station No.]	1: Station No. 1
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.1: Remote network Ver.1 mode
[Expanded Cyclic]	Single (Use default value)
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	MELSEC (compatible)

Point

[Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 1106 [Controller Setting]

Connection to MELSEC-Q series with Ver.2 compatible

This section describes the setting method of the GOT and the Ver. 2 compatible CC-Link module (MELSEC-Q series) in the system configuration shown below.

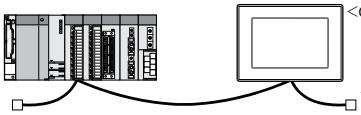
Point

CC-Link module (MELSEC-Q series)

For the details on the CC-Link module (MELSEC-Q series), refer to the following manual.

📖MELSEC-Q CC-Link System Master/Local Module User's Manual

■System configuration



<GOT>(Use the default value for settings other than the following.)
Station type : Intelligent device station
Station No. : Station No. 1
Extended cyclic setting : Single
Number of stations occupied : 1 station occupied
Transmission speed : 156kbps

<CC-Link module>*1 (Use the default value for settings other than the following.)
Type : Master station
Station No. : Station No. 0
Mode setting : Remote network ver. 2 mode
Total number of connected devices : 1
Transmission speed : 156kbps

*1 The CC-Link module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link module is set to "0".

Point

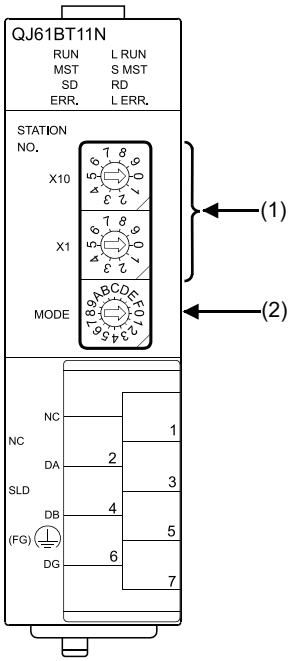
Connection to Q170MCPU or Q170MSCPU(-S1)

For connection to Q170MCPU or Q170MSCPU(-S1), the start I/O number of the CC-Link module is set to "70".

■Switch settings for the CC-Link module (Q series)

Set the station number setting switch, transmission speed/mode setting switch.

QJ61BT11,QJ61BT11N



- Station number setting switch

○: Necessary, △: As necessary, —: Not necessary

Station number setting switch	Description	Setting value	Setting for GOT connection

	[Other settings]	(Use default value)	△

Item[*1]			Setting value	Setting for GOT connection
[Station information settings]	[All connect count]		2	○
	[Station Type]	[Sta. No. 1]	Ver.1 intelligent device station	○
		[Sta. No. 2]	Ver.2 intelligent device station	○
	[Expanded cyclic setting] [*2]	[Sta. No. 1]	Single	△
		[Sta. No. 2]	Single	○
	[Occupied number][*2]	[Sta. No. 1]	1 station occupied	○
		[Sta. No. 2]	1 station occupied	○
	[Remote station points]	[Sta. No. 1]	32 points	○
		[Sta. No. 2]	32 points	○
	[Reserve/invalid station select]	[Sta. No. 1]	No setting	○
		[Sta. No. 2]	No setting	○
	[Intelligent buffer select(word)]		(Use default value)	—

*1 When the [Mode] of the CC-Link module is set to [Remote net(Ver.2 mode)], [Remote station points] can be set.
[Remote station points] is a setting for the remote I/O station.
The default value (32 points) must be used on the GOT.

*2 Set the same setting as that of the GOT.

Point

When changing the network parameter

After writing network parameters to the C Controller module (Q series), turn off then on the C Controller module (Q series).

■[Controller Setting] in GT Designer3

• Communication settings of station No. 1 (GOT)

Item	Setting value
[Station No.]	1: Station No. 1
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.1: Remote network Ver.1 mode
[Expanded Cyclic]	Single (Use default value)
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	MELSEC (compatible)

• Communication settings of station No. 2 (GOT)

Item	Setting value
[Station No.]	2: Station No. 2
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.2: Remote network Ver.2 mode
[Expanded Cyclic]	Single
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	MELSEC (compatible)

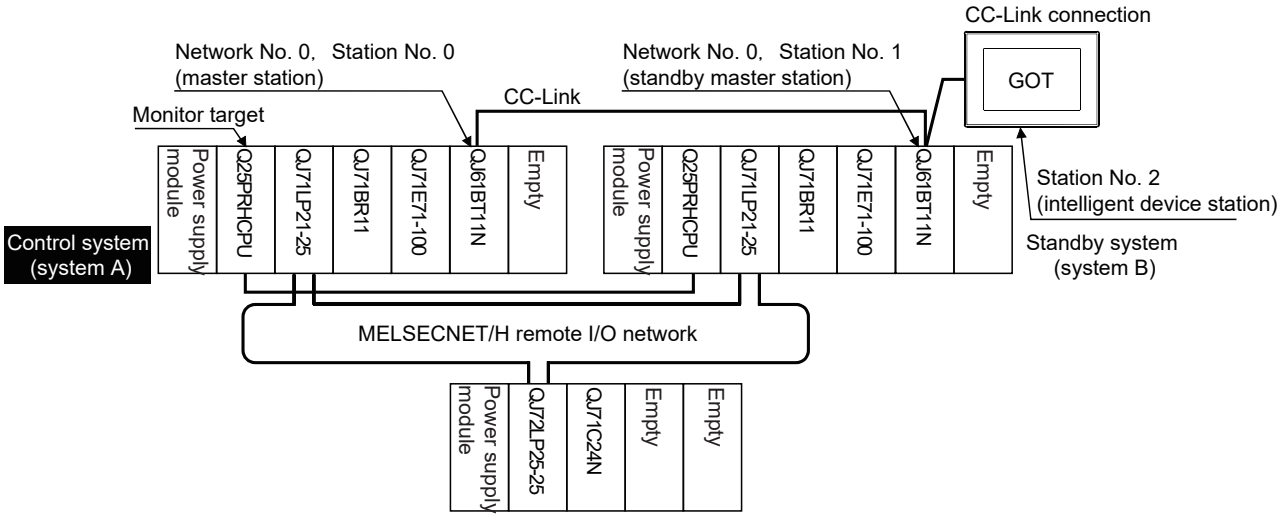
12.5.5 Access range for monitoring

Only the connected CPU can be accessed.

12.5.6 How to monitor a redundant system

The following describes the CC-Link connection (intelligent device station), in which the GOT set as the intelligent device station is connected to the CC-Link network.

The following shows an example of connecting the GOT set as the intelligent device station to the CC-Link network.



Connection method

Connect the CC-Link network system to the GOT.

For details, refer to the following.

☞ Page 1018 CC-Link connection (intelligent device station)

Settings in GT Designer3

Set GT Designer3 as follows.

Setting item	Setting details		Model
Model	MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700		GT37 SoftGOT3000
Device setting (Network setting)	Other	NW No.: 0 (fixed)	
		PLC Station No.: 0 (master station)	
MELSEC redundant settings	Do not set this item.		

In this case, the GOT monitoring is performed by transient transmission of the CC-Link network system. Therefore, a longer time-lag occurs for displaying objects compared with direct monitoring of the PLC CPU.

To display objects with a shorter time-lag, set the devices for RX, RY, RWw, and RWr of the host station set in the CC-Link network and execute the cyclic transmission.

For details, refer to the following.

☞ Page 1111 Using cyclic transmission

Monitoring target change when system switching occurs in a redundant system

■System switching due to an alarm occurred in the control system

When system switching occurs, the CC-Link switches the station No. 0 of the master station and the station No. 1 of the standby master station on the network.

The CC-Link module of the new control system after system switching takes over the control as the master station.

Since the GOT monitors the master station, the monitoring target is automatically changed to the new control system after system switching.

■System switching due to a network communication error occurred in other than the CC-Link of the control system, or due to switching by the user

When system switching occurs, the CC-Link does not switch the station No. 0 of the master station and the station No. 1 of the standby master station on the network.

The CC-Link module of the new control system after system switching takes over the control as the standby master station. Since the GOT monitors the master station, the monitoring target is not automatically changed to the new control system after system switching.
To automatically change the monitoring target of the GOT to the new control system after system switching, switch the data link control from the standby master station to the master station by the sequence program of the new control system.
For details on the sequence program, refer to the following manual.
QnPRHCPU User's Manual (Redundant System) (Appendix 4 Sample Programs When CC-Link is Used)

Point

CC-Link network settings
To automatically change the monitoring target in the QCPU redundant system when using the CC-Link connection, set the CC-Link master station as System A and the standby master station as System B.
For details on using the CC-Link network in the redundant system, refer to the following manual.
MELSEC-Q CC-Link System Master/Local Module User's Manual
QnPRHCPU User's Manual (Redundant System)

MELSEC redundant settings

This section describes the settings for the GOT to automatically change the monitoring target of the QCPU redundant system.

Point

Before configuring the MELSEC redundant settings

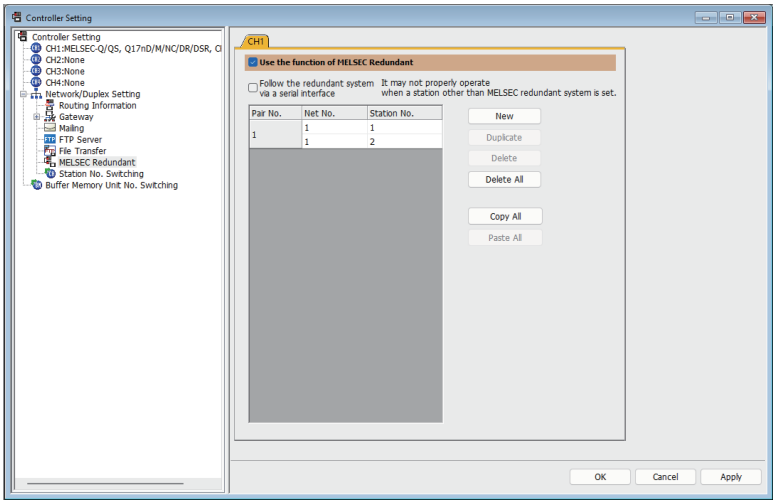
In the MELSEC redundant settings, do not set a station outside the redundant QCPU.

1. Select [Common] → [Controller Setting] → [MELSEC Redundant] from the menu.
2. The setting dialog box appears. Configure the settings by referencing the explanation that follows.
3. Configure the MELSEC redundant settings.

In the MELSEC redundant setting dialog, settings can be made for each channel of the controller.

The following shows an example of the CC-Link connection (intelligent device station) (station No. 5) with redundant CPU pair No. 1, network No. 1, and redundant CPU station No. 1 to No. 4.

Ex.



Item		Description	Model
CH1 to CH4		Select the tab of the channel number to configure the MELSEC redundant settings.	GT37 SoftGOT3000
[Follow the redundant system via a serial interface]		Select this item to monitor the control system as a host station at serial connection.	
[Pair No.]*1	[Net No.]	Set the network number (1 to 255) for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The same value as the value set for the first redundant CPU is displayed.)	
	[Station No.]	Set the station number (0 to 120) of the redundant CPU for each pair number (1 to 64). • Upper row: Setting for the first redundant CPU • Lower row: Setting for the second redundant CPU (The setting value for the first redundant CPU + 1 is displayed.)	
[New]		Adds a new pair number.	
[Duplicate]		Copies one setting of the selected pair number and adds it below the bottom row.	
[Delete]		Deletes one setting of the selected pair number. After deletion, the succeeding pair numbers are renumbered to fill the deleted pair number.	
[Delete All]		Deletes all the pair number settings.	
[Copy All]		Copies the MELSEC redundant setting on the selected CH No. tab.	
[Paste All]		Pastes the copied MELSEC redundant setting in the selected CH No. tab.	

*1 For details, refer to the following.

☞ Page 1132 Pair number

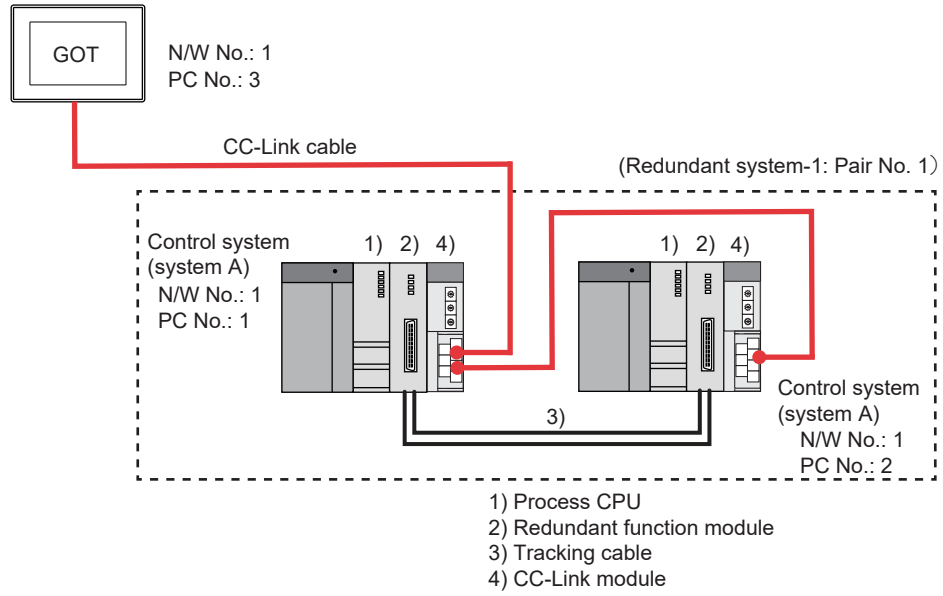
■Pair number

Redundant CPU pair means the redundant CPUs (System A / System B) in the redundant system configuration.

Pair number is the number assigned to each redundant CPU pair.

The following shows an example of the CC-Link connection (intelligent device station) in the RCPU redundant system. (Pair No. 1)

Ex.



Point

Precautions for configuring the MELSEC redundant settings

Pay attention to the following items when configuring the MELSEC redundant settings.

- The last station number and station number 1 (example: station number 64 and station number 1) cannot be paired.
- Make sure that the QCPU in the station for which MELSEC redundant settings are configured is a redundant CPU. If any of the QCPUs to which the MELSEC redundant settings are configured is not a redundant CPU, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- Before configuring the settings, make sure to check the station numbers of the network modules. If the MELSEC redundant settings and the actual network module station numbers are inconsistent, the GOT fails to automatically change the monitoring target to the control system when the system is switched.
- GOT supports the backup mode, which is the operation mode of the QCPU redundant system, and does not support the debug mode and separate mode.

Precautions

■Start of the redundant system

The GOT starts monitoring the redundant system after the control system and standby system have been determined, regardless of the starting order of PLC systems A and B.

The GOT starts monitoring when both systems start.

(In a redundant system with a redundant extension base unit, the GOT monitors the control system that starts first.)

Power on the redundant system within the time set in the GOT (communication timeout time and number of retries) so that the GOT can start monitoring after the redundant system starts (after the control system is decided).

If the GOT does not start within the set time, the GOT stops monitoring for safety reasons, and the following system alarm occurs.

- 451: The MELSEC redundant setting and actual system configuration do not match.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

■System switching

When system switching occurs through the user program, the communication path remains unchanged, and the GOT will continue monitoring.

No system alarm occurs.

When system switching occurs due to disconnected cable or other causes, the GOT changes the communication path and continues monitoring.

[450: Path has changed or timeout occurred in redundant system.] appears as the system alarm.

■Redundant system configuration and operation mode

• System alarm display

If the MELSEC redundant settings do not match the actual configuration of the redundant system, or if the operation mode of the redundant system is not set to backup mode, [451: The MELSEC redundant setting and actual system configuration do not match.] appears as the system alarm, and the GOT will not be able to correctly monitor the redundant system's CPU.

If the system alarm occurs, restart the GOT (reapply or reset the power supply) to start monitoring again.

• Changing the MELSEC redundant settings

Always reset the GOT after changing the MELSEC redundant settings. If not reset, the changed MELSEC redundant settings will not be applied on the GOT.

■Monitoring a non-redundant system with the MELSEC redundant settings configured

If the MELSEC redundant settings were set for a non-redundant system, the GOT will operate normally.

In this case, if an abnormality (such as powering off or communication timeout error) occurs in the PLC CPU for which the MELSEC redundant settings are configured, the PLC CPU may not operate as intended.

■Monitoring a redundant system without configuring the MELSEC redundant settings

When the MELSEC redundant settings are not configured, the GOT does not automatically change the monitoring target even if system switching occurs in the redundant system.

When the GOT is connected to the standby system, data written to a device are overwritten by the data of the control system, failing to be reflected.

In this case, when data is written to a device in the standby system normally, the system alarm [315 Device writing error. Correct device.] is not detected.

■CC-Link (ID) connection

When system switching occurs due to the following factors, data link control of CC-Link (ID) does not transfer from the master station of the new standby system to the standby master station of the new control system and the GOT cannot change the monitoring target.

Make the standby master station of the new control system take over data link control in the ladder program.

For details on the ladder program for data link control, refer to the following manual.

• MELSEC iQ-R series

📖MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Application)

<Factors of system switching>

• Execution of the system switching instruction on the PLC side

• Execution of system switching operation using the engineering tool

• Execution of system switching request from other network modules

<Reason why the GOT cannot change the monitoring target>

When system switching occurs due to the above factors, the standby master station does not take over data link control because the master station of the new standby system can communicate with the GOT.

Consequently, the new control system master station remains the standby master station.

As a result, the GOT monitors the master station without considering the new control or standby system, which prevents it from monitoring the redundant system.

12.6 MELSEC-L series (CC-Link connection (intelligent device station))

☞ Page 1134 Connectable devices
☞ Page 1134 System configuration
☞ Page 1139 GOT side settings
☞ Page 1145 PLC side settings
☞ Page 1150 Access range for monitoring

12.6.1 Connectable devices

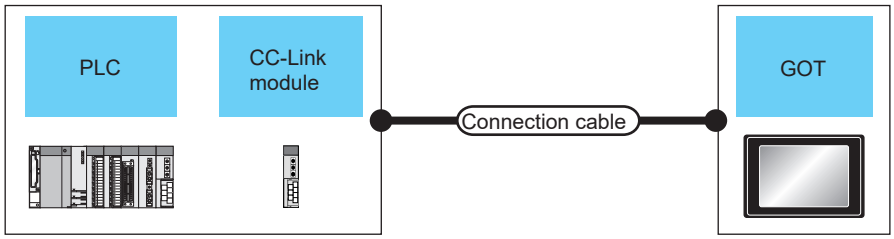
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	CC-Link module	Connectable model
MELSEC-L series	L02CPU L06CPU L26CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT	○	LJ61BT11	GT37 SoftGOT3000
	L02SCPU L02SCPU-P	○	LJ61BT11	GT37 SoftGOT3000

12.6.2 System configuration

Connection with CC-Link Ver.1 compatible



For details on the overall length, refer to the following.

☞ Page 1135 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1135 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC-L series	LJ61BT11	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000
MELSEC-L series (L26CPU-BT)	—	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
MELSEC-L CC-Link System Master/Local Module User's Manual
*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/
*3 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
Page 1139 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

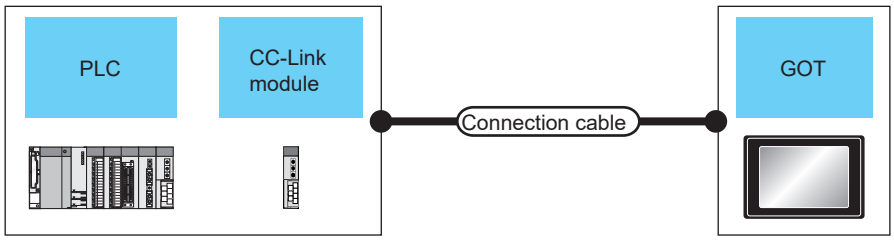
MELSEC-L CC-Link System Master/Local Module User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC-L series	26 GOTs

Connection with CC-Link Ver.2 compatible



For details on the overall length, refer to the following.

Page 1135 Overall length

For details on the maximum number of connected devices, refer to the following.

Page 1136 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model

MELSEC-Q CC-Link System Master/Local Module User's Manual

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.2.
For details on settings, refer to the following.
☞ Page 1139 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

MELSEC-L CC-Link System Master/Local Module User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC-L series	26 GOTs

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

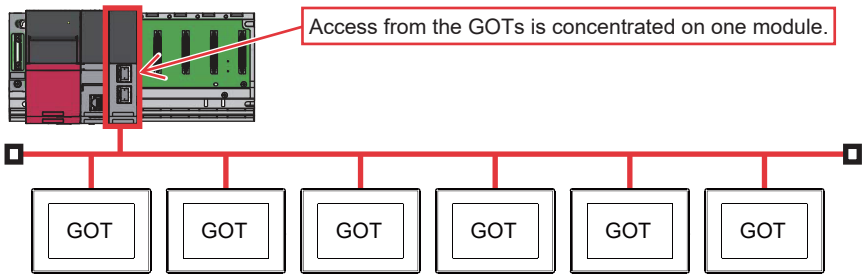
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

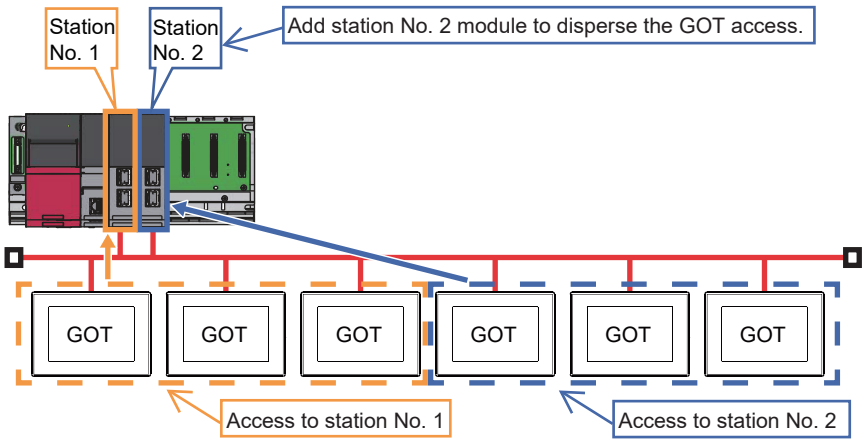
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

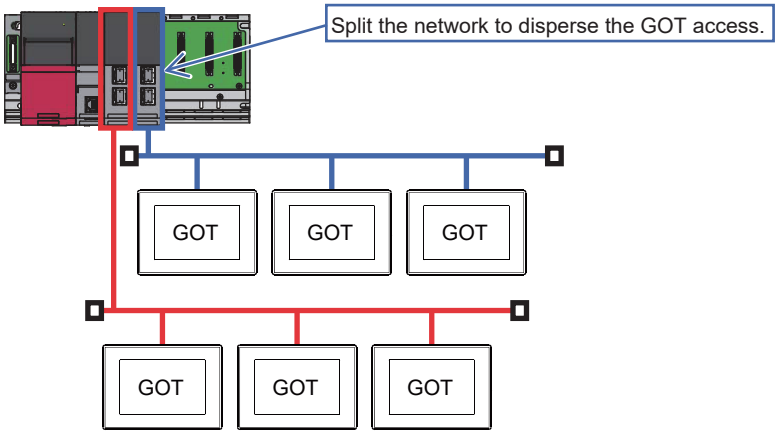
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Connection to LCPU

LCPU may diagnose the SD memory card (file system check, recovery processing, etc.) when the LCPU is turned off then on or reset.

Therefore, it takes time until the SD memory card becomes available.

If the GOT is started during this time, a system alarm occurs.

Adjust the time to display the GOT startup screen to prevent a system alarm.

GT Designer3 (GOT3000) Screen Design Manual

Precautions

■Starting the GOT in CC-Link connection (intelligent device station)

For the CC-Link connection (intelligent device station), the data link is started approximately 10 seconds after the GOT startup.

■When a network error occurs in the system alarm

In the CC-Link connection (intelligent device station), when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

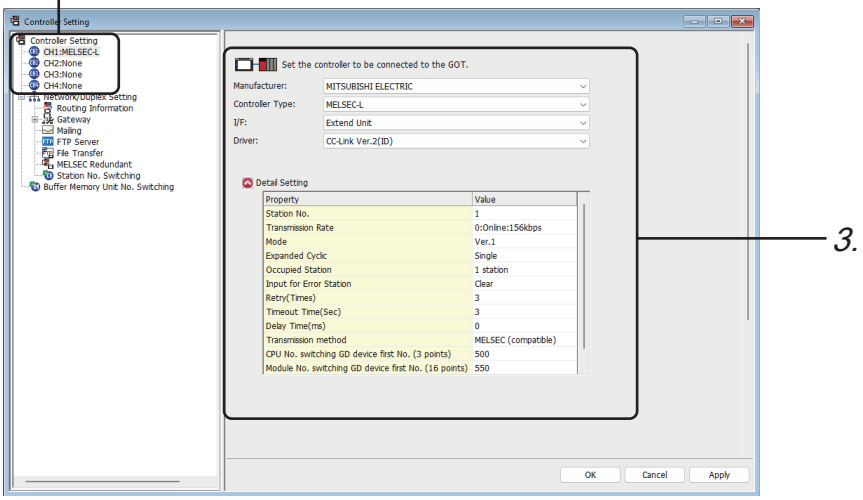
To cancel the system alarm display, restart the GOT.

12.6.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.

List menu



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-L]
[I/F]	[Extend Unit]
[Driver]	[CC-Link Ver.2 (ID)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 1140 [Detail Setting]

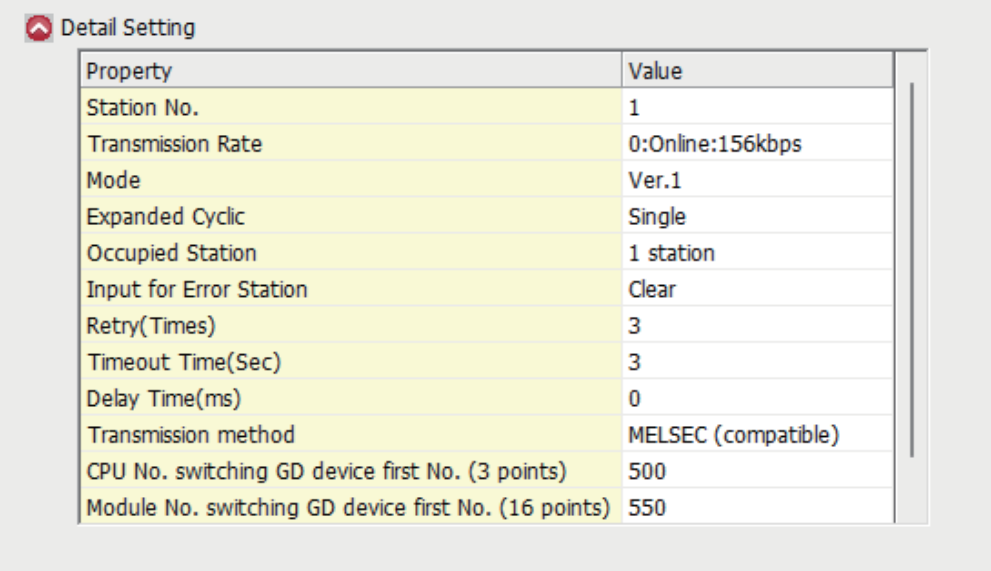
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Station No.]	Set the station number of the GOT.	[1] to [64]
[Transmission Rate]*1	Set the transmission speed and a mode of the GOT.	[0] to [E]
[Mode Setting]	Set the operation mode of the GOT.	[Ver.1], [Ver.2], [Additional], [Offline]
[Expanded Cyclic]	Set the cyclic point expansion.	[Single], [Double], [Quadruple], [Octuple]
[Occupied Station]	Set the number of stations occupied by the GOT.	[1 Station], [4 Stations]
[Input for Error Station]	Set whether to clear or hold the error at an error occurrence.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Transmission method]	Set the CC-Link transmission method.	[MELSEC (compatible)], [Cyclic]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 1060 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 1061 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 1062 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Transmission speed settings

The following lists the transmission speed settings of the CC-Link communication.

Setting value	Description
0	Online: 156 kbps
1	Online: 625 kbps
2	Online: 2.5 Mbps
3	Online: 5 Mbps
4	Online: 10 Mbps
5	Line test: 156 kbps
6	Line test: 625 kbps
7	Line test: 2.5 Mbps

Setting value	Description
8	Line test: 5 Mbps
9	Line test: 10 Mbps
A	Hardware test: 156 kbps
B	Hardware test: 625 kbps
C	Hardware test: 2.5 Mbps
D	Hardware test: 5 Mbps
E	Hardware test: 10 Mbps

For details on the hardware test, refer to the following manual.

MELSEC-L CC-Link System Master/Local Module User's Manual

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Precautions

■Using cyclic transmission

• I/O signals for the master station

Do not turn on the reserved output signals in the output signals (remote output: RY) to the GOT from the master station.
When the reserved output signal is turned on, the PLC system may malfunction.
For the assignment of I/O signals in the GOT, refer to the following manuals.
📖MODEL GT15-J61BT13 CC-Link communication unit User's Manual
📖GT15 CC-Link communication unit User's Manual

• Access range for monitoring

The remote I/O (RX and RY) and remote register (RWr and RWw) monitoring ranges vary depending on the mode of the master station in the CC-Link system.

Mode of master station	Monitoring	
	Data for each station compatible with CC-Link Ver.1	Data for each station compatible with CC-Link Ver.2
Remote network mode	○	—
Remote network Ver.1 mode	○	—
Remote network Ver.2 mode	○	○*1
Remote network additional mode	○	○

○: Available, ×: Not available (All "0"), —: System configuration not available

*1 Monitoring is available only when the GT15-J61BT13 CC-Link communication unit is used.

• When the GOT malfunctions

The state of cyclic output before fault is held.

■Connection with CC-Link Ver.1 compatible

For connection with CC-Link Ver.1 compatible, the device setting must be configured within the range of the specifications of the controller.
When a device number out of the range is set, proper monitoring may not be possible.

12.6.4 PLC side settings

Model		Reference
MELSEC-L series	L02CPU L06CPU L26CPU L26CPU-BT L02CPU-P L06CPU-P L26CPU-P L26CPU-PBT L02SCPU L02SCPU-P	☞ Page 1146 Connection to MELSEC-L series with Ver.1 compatible ☞ Page 1148 Connection to MELSEC-L series with Ver.2 compatible

The GOT operates as the stations with the following specifications in the CC-Link system.

Station information	Description
Station type	Intelligent device station, Ver.1 intelligent device station, or Ver.2 intelligent device station
Number of stations occupied	1 station or 4 stations

Point

Number of stations occupied

The number of stations occupied is the setting for determining the number of link device points (RX/RY/RWw/RWr) used by the GOT.

To use multiple numbers of link device points in cyclic transmission between the GOT and CC-Link module, set the number of stations occupied as 4 stations occupied.

The number of link device points when 1 station occupied or 4 stations occupied is shown below.

• CC-Link Ver.2

Link device	Extended cyclic setting							
	Single		Double		Quadruple		Octuple	
	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote output (RY)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote register (RWw)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points
Remote register (RWr)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points

• CC-Link Ver.1

Link device	Number of stations occupied	
	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points
Remote output (RY)	32 points	128 points
Remote register (RWw)	4 points	16 points
Remote register (RWr)	4 points	16 points

Connection to MELSEC-L series with Ver.1 compatible

This section describes the setting method of the GOT and the Ver. 1 compatible CC-Link module (MELSEC-L series) in the system configuration shown below.

Point

• CC-Link module (MELSEC-L series)

For the details on the CC-Link module (MELSEC-L series), refer to the following manual.

MELSEC-L CC-Link System Master/Local Module User's Manual

• CC-Link function built-in CPU

For details on the CC-Link function built-in CPU, refer to the following manual.

MELSEC-L CC-Link System Master/Local Module User's Manual

■System configuration

<GOT>(Use the default value for settings other than the following.)

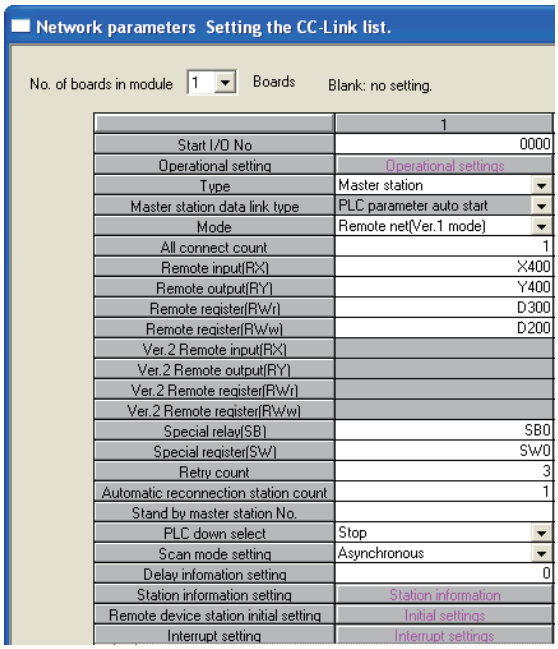
Station type	: Intelligent device station
Station No.	: Station No. 1
Number of stations occupied	: 1 station occupied
Transmission speed	: 156kbps

<CC-Link module> (Use the default value for settings other than the following.)

Type	: Master station
Station No.	: Station No. 0
Mode setting	: Remote network ver. 1 mode
Total number of connected devices	: 1
Transmission speed	: 156kbps

■[Network parameter] of GX Developer

• Network parameter



○: Necessary, △: As necessary, —: Not necessary

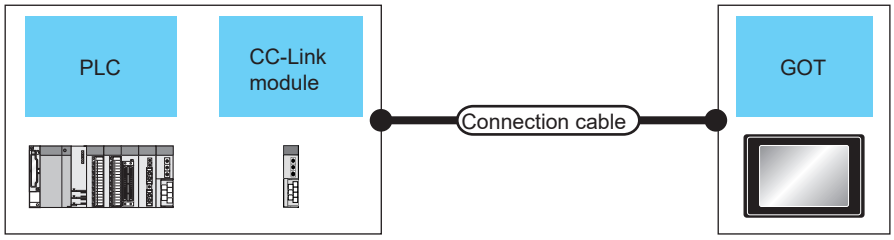
*1 Transient transmission is available only to the CC-Link module with function version D or later and software version J or later.

12.7.2 System configuration

Connection with CC-Link Ver.1 compatible



For details on the overall length, refer to the following.

☞ Page 1152 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1153 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC-A (AnCPU) MELSEC-A Motion CPU (A series) large type	AJ61BT11*4	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000
MELSEC-A(AnSCPU) Motion CPU (A series) small type	AJ61BT11*4 A1SJ61BT11*4	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
📖CC-Link System Master/Local Module Type AJ61BT11/A1SJ61BT11 User's Manual

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1155 [Controller Setting]

*4 Transient transmission is available only to the CC-Link module with function version D or later and software version J or later.

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

📖CC-Link System Master/Local Module Type AJ61BT11/A1SJ61BT11 User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC-A series Motion CPU (A series)	26 GOTs

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

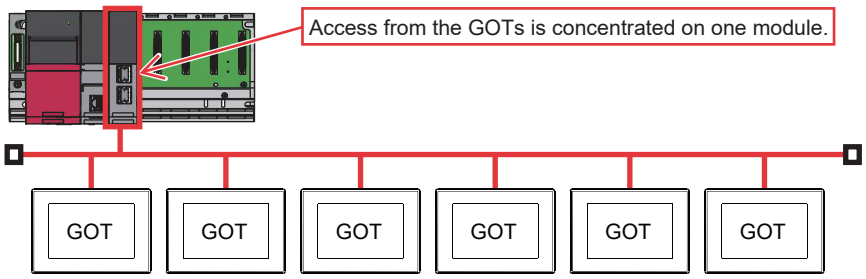
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

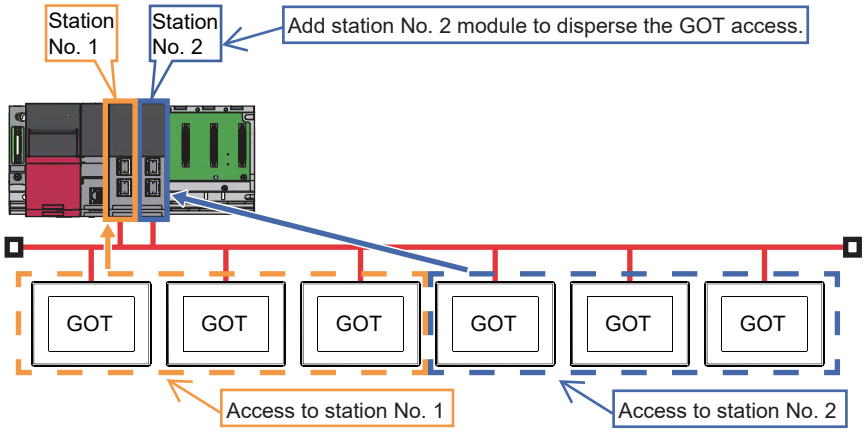
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

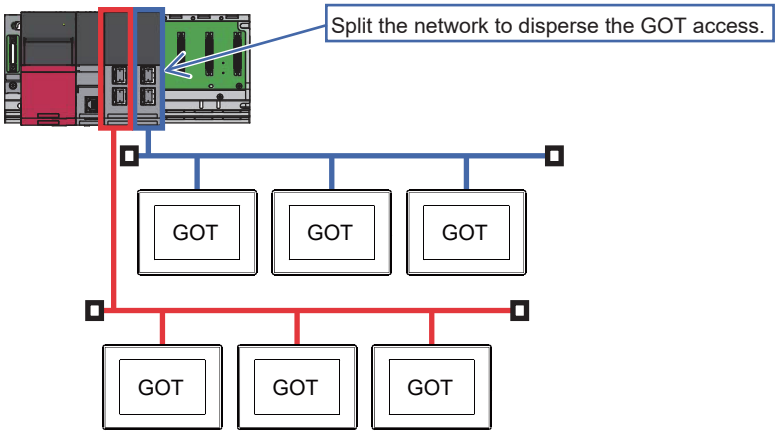
- Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■For transient transmission

Mount the CC-Link module with function version B or later and software version J or later to the PLC CPU when performing the transient transmission with the following CC-Link modules.

Only cyclic transmission is available for the CC-Link module with function version A or earlier and software version I or earlier.

- AJ61BT11
- A1SJ61BT11
- AJ61QBT11
- A1SJ61QBT11

■Starting the GOT in CC-Link connection (intelligent device station)

For the CC-Link connection (intelligent device station), the data link is started approximately 10 seconds after the GOT startup.

■When a network error occurs in the system alarm

In the CC-Link connection (intelligent device station), when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

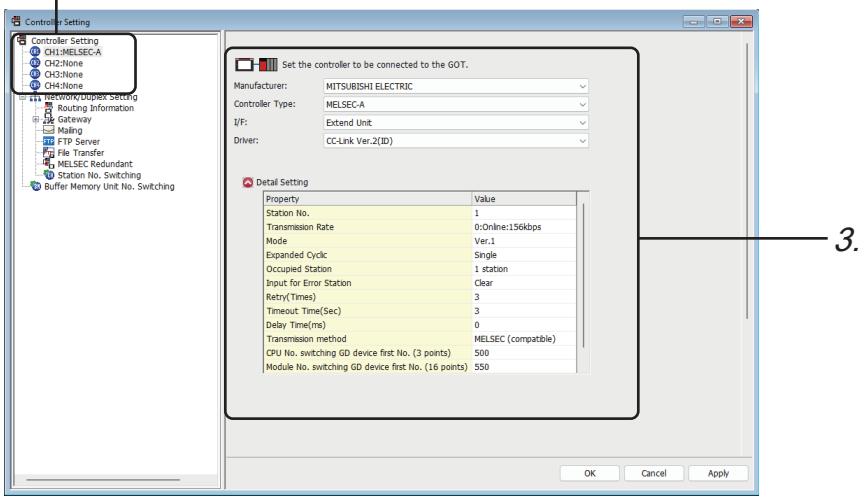
To cancel the system alarm display, restart the GOT.

12.7.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.

List menu



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]	[MELSEC-A]
[I/F]	[Extend Unit]
[Driver]	[CC-Link Ver.2 (ID)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 1156 [Detail Setting]

4. When you have completed the settings, click the [OK] button.

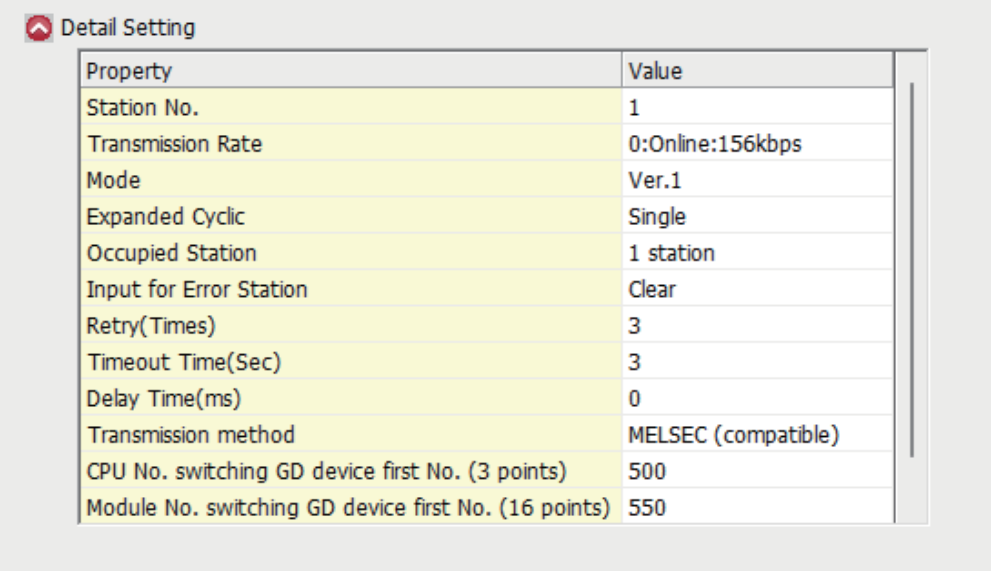
Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

PART 3

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Station No.]	Set the station number of the GOT.	[1] to [64]
[Transmission Rate]*1	Set the transmission speed and a mode of the GOT.	[0] to [E]
[Mode Setting]	Set the operation mode of the GOT.	[Ver.1], [Ver.2], [Additional], [Offline]
[Expanded Cyclic]	Set the cyclic point expansion.	[Single], [Double], [Quadruple], [Octuple]
[Occupied Station]	Set the number of stations occupied by the GOT.	[1 Station], [4 Stations]
[Input for Error Station]	Set whether to clear or hold the error at an error occurrence.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Transmission method]	Set the CC-Link transmission method.	[MELSEC (compatible)], [Cyclic]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 1157 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 1158 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 1159 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Transmission speed settings

The following lists the transmission speed settings of the CC-Link communication.

Setting value	Description
0	Online: 156 kbps
1	Online: 625 kbps
2	Online: 2.5 Mbps
3	Online: 5 Mbps
4	Online: 10 Mbps
5	Line test: 156 kbps
6	Line test: 625 kbps
7	Line test: 2.5 Mbps

Setting value	Description
8	Line test: 5 Mbps
9	Line test: 10 Mbps
A	Hardware test: 156 kbps
B	Hardware test: 625 kbps
C	Hardware test: 2.5 Mbps
D	Hardware test: 5 Mbps
E	Hardware test: 10 Mbps

For details on the hardware test, refer to the following manual.

CC-Link System Master/Local Module Type AJ61BT11/A1SJ61BT11 User's Manual

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

Specify [CPU No.] with the three consecutive GD devices, starting the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station No. of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Precautions

■Using cyclic transmission

• I/O signals for the master station

Do not turn on the reserved output signals in the output signals (remote output: RY) to the GOT from the master station.
When the reserved output signal is turned on, the PLC system may malfunction.
For the assignment of I/O signals in the GOT, refer to the following manuals.
📖MODEL GT15-J61BT13 CC-Link communication unit User's Manual
📖GT15 CC-Link communication unit User's Manual

• Access range for monitoring

The remote I/O (RX and RY) and remote register (RWr and RWw) monitoring ranges vary depending on the mode of the master station in the CC-Link system.

Mode of master station	Monitoring	
	Data for each station compatible with CC-Link Ver.1	Data for each station compatible with CC-Link Ver.2
Remote network mode	○	—
Remote network Ver.1 mode	○	—
Remote network Ver.2 mode	○	○*1
Remote network additional mode	○	○

○: Available, ×: Not available (All "0"), —: System configuration not available

*1 Monitoring is available only when the GT15-J61BT13 CC-Link communication unit is used.

• When the GOT malfunctions

The state of cyclic output before fault is held.

■Connection with CC-Link Ver.1 compatible

For connection with CC-Link Ver.1 compatible, the device setting must be configured within the range of the specifications of the controller.
When a device number out of the range is set, proper monitoring may not be possible.

The GOT operates as the stations with the following specifications in the CC-Link system.

Station information	Description
Station type	Intelligent device station, Ver.1 intelligent device station, or Ver.2 intelligent device station
Number of stations occupied	1 station or 4 stations

Point

Number of stations occupied

The number of stations occupied is the setting for determining the number of link device points (RX/RY/RWw/RWr) used by the GOT.

To use multiple numbers of link device points in cyclic transmission between the GOT and CC-Link module, set the number of stations occupied as 4 stations occupied.

The number of link device points when 1 station occupied or 4 stations occupied is shown below.

• CC-Link Ver.2

Link device	Extended cyclic setting							
	Single		Double		Quadruple		Octuple	
	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote output (RY)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote register (RWw)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points
Remote register (RWr)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points

• CC-Link Ver.1

Link device	Number of stations occupied	
	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points
Remote output (RY)	32 points	128 points
Remote register (RWw)	4 points	16 points
Remote register (RWr)	4 points	16 points

Connection to MELSEC-A series

This section describes the settings of the GOT and CC-Link module (MELSEC-A series) in the system configuration shown below.

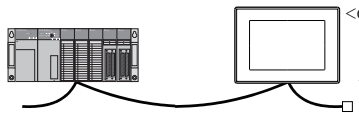
Point

CC-Link module (MELSEC-A series)

For the details on the CC-Link module (MELSEC-A series), refer to the following manual.

CC-Link System Master/Local Module Type AJ61BT11/A1SJ61BT11 User's Manual

■System configuration



<GOT>(Use the default value for settings other than the following.)
Station type : Intelligent device station
Station No. : Station No. 1
Number of stations occupied : 1 station occupied
Transmission speed : 156kbps

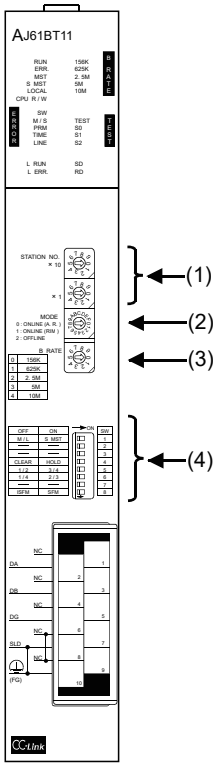
<CC-Link module> *1 (Use the default value for settings other than the following.)
Type : Master station
Station No. : Station No. 0
Mode setting : Remote network mode
Total number of connected devices : 1
Transmission speed : 156kbps

*1 The CC-Link module is mounted on slot 0 of the base unit.
The start I/O number of the CC-Link module is set to "0".

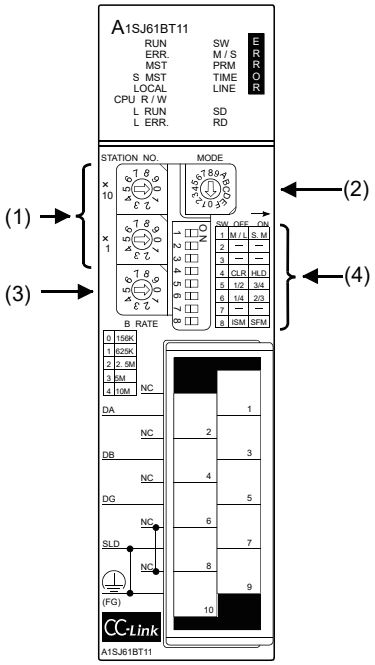
■CC-Link module (A series) settings

Set each setting switch.

AJ61BT11



A1SJ61BT11



• Station number setting switch

○: Necessary, △: As necessary, —: Not necessary

Station number setting switch	Description	Setting value	Setting for GOT connection
STATION NO. 	Station number setting (master station)	0 (fixed)	○

• Mode setting switch

○: Necessary, △: As necessary, —: Not necessary

Mode setting switch	Description	Setting value	Setting for GOT connection
MODE	Mode setting (Online: remote network mode)	0 (fixed)	○

• Transmission speed setting switch

○: Necessary, △: As necessary, —: Not necessary

Transmission speed setting switch	Description	Setting value	Setting for GOT connection
	Transmission speed setting (156 kbps)*1	0	○

*1 Set the same transmission speed as that of the GOT.

• Condition setting switches

○: Necessary, △: As necessary, —: Not necessary

Condition setting switches	Setting switch	Description	Setting value	Setting for GOT connection
	SW1	Station type (master station/local station)	Off (fixed)	○
	SW2	Not used	Off (fixed)	—
	SW3			
	SW4	Input data status of the data link faulty station (clear)	OFF	△
	SW5	Number of occupied stations*1	Off (fixed)	—
	SW6			
	SW7	Not used	Off (fixed)	—
	SW8	Module mode (intelligent mode)	Off (fixed)	○

*1 Valid when the CC-Link module is a local station.
In the case of the master station, turn off it.

Point

When the switch setting has been changed
Turn off then on or reset the PLC CPU.

■Sequence program

The sequence program for parameter setting and data link startup request is required.

• Programming condition (for CC-Link dedicated instructions)

The program sets the network parameter and automatic refresh parameter and starts the data link automatically when the PLC CPU status changes from STOP to RUN with CC-Link dedicated instructions.

I/O signals of the CC-Link module

CC-Link System Master/Local Module Type AJ61BT11/A1SJ61BT11 User's Manual

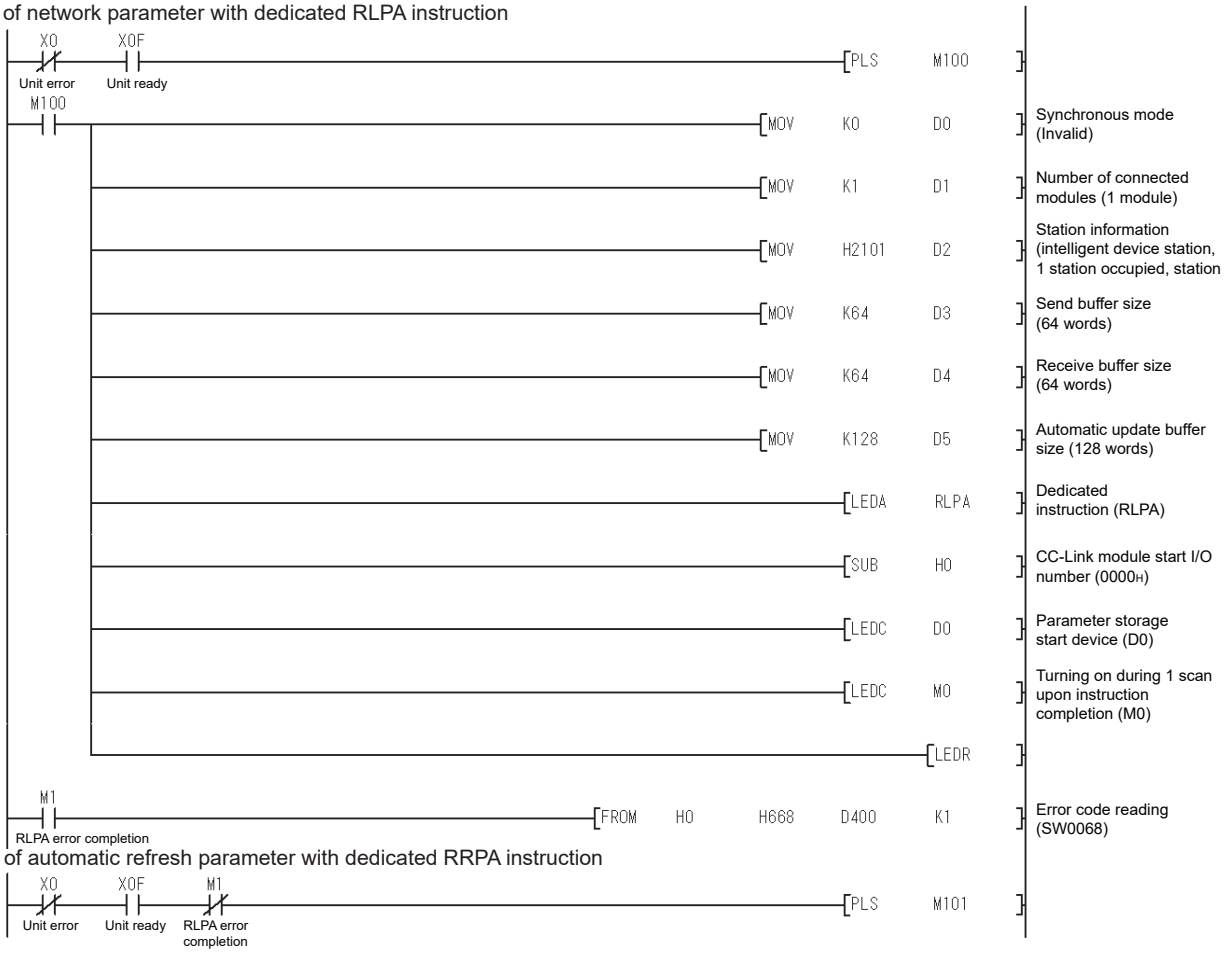
Device used by user

Device	Application
M0	RLPA instruction normal completion flag
M1	RLPA instruction error completion flag
M100	Network parameter setting flag
M101	Automatic refresh parameter setting flag
D0	Synchronous mode valid/invalid
D1	Number of connected modules
D2	Station information
D3	Send buffer size
D4	Receive buffer size
D5	Automatic update buffer size
D400	Error code in the case of error completion of RLPA instruction
D100 to D103	Automatic refresh setting (RX)
D104 to D107	Automatic refresh setting (RY)

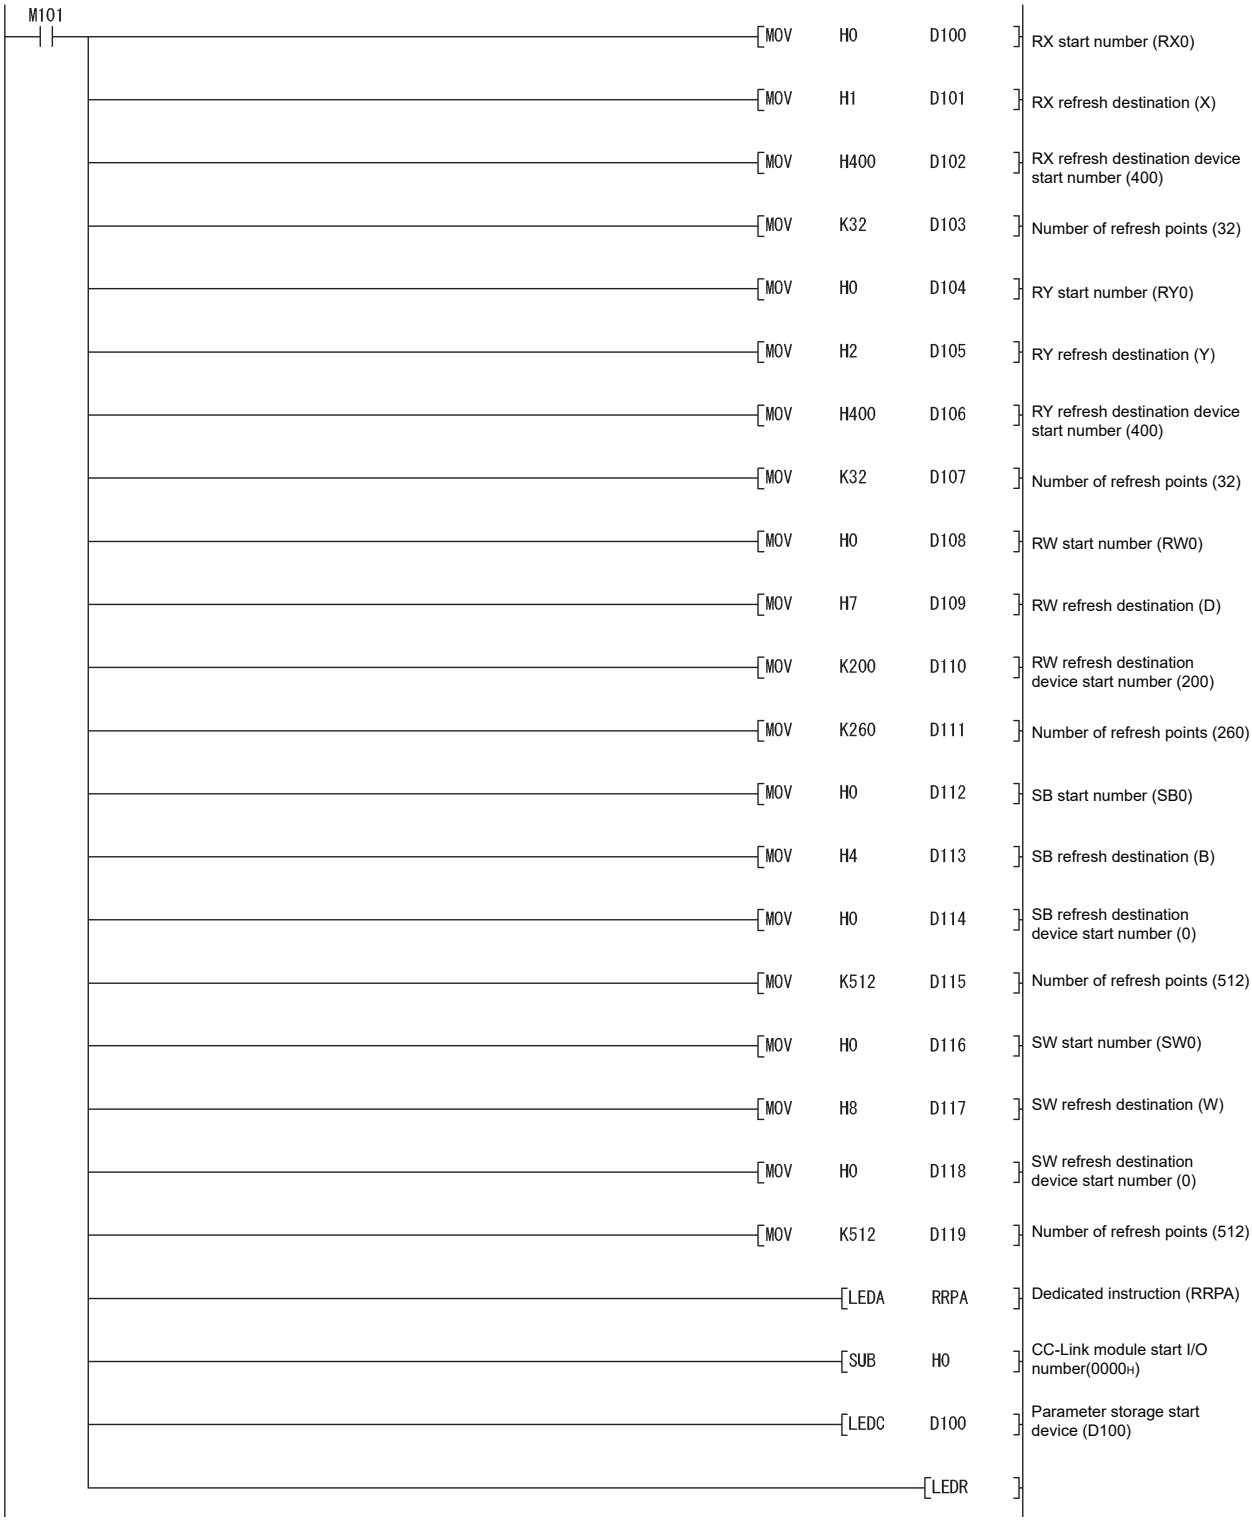
Device	Application
D108 to D111	Automatic refresh setting (RW)
D112 to D115	Automatic refresh setting (SB)
D116 to D119	Automatic refresh setting (SW)

Example of sequence program (CC-Link dedicated instruction)

* Setting of network parameter with dedicated RLPA instruction



* Setting of automatic refresh parameter with dedicated RRPA instruction



Point

When changing the sequence program

After writing the sequence program to the PLC CPU, turn off then on or reset the PLC CPU.

• Program condition (for FROM/TO instruction)

This program writes parameters to the buffer memory and starts the data link automatically when the PLC CPU status changes from STOP to RUN with FROM/TO instruction.

I/O signals of the CC-Link module

CC-Link System Master/Local Module Type AJ61BT11/A1SJ61BT11 User's Manual

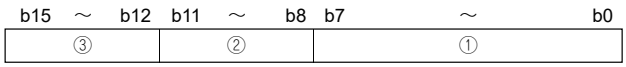
Device used by user

Device	Application
M100, M101	Flag for parameter setting
M102, M103	Flag for data link startup
D0	Number of connected modules
D1	Number of retry
D2	Automatic reconnection station count
D3	Operation specification when CPU is down
D4	Reserved station specification (Station No. 1 to Station No. 16)
D5	Error invalid station specification (Station No. 1 to Station No. 16)
D6	Station information (1st unit)
D400	Error code in the case of data link startup failure

Buffer memory settings used in the present example

Buffer memory address Dec (Hex)	Item	Setting value
1 (1H)	Number of connected modules	1 (1 module)
2 (2H)	Number of retry	3 (3 times)
3 (3H)	Automatic reconnection station count	1 (1 module)
6 (6H)	Operation specification when CPU is down	0 (Stop)
16 (10H)	Reserved station specification (Station No. 1 to Station No. 16)	0 (No specification)
20 (14H)	Error invalid station specification (Station No. 1 to Station No. 16)	0 (No specification)
32 (20H)	Station information (1st unit)*1	2101H

*1 Details for the station data are shown below.
For 1) and 2), make the settings the same as the settings of the station number and number of stations occupied of the GOT.
For 3), the setting is fixed.



1) Station number (Make the setting the same as the station number setting of the GOT.)

01H to 40H: Station No. 1 to Station No. 64

2) Number of stations occupied (Make the setting the same as the number of stations occupied setting of the GOT.)

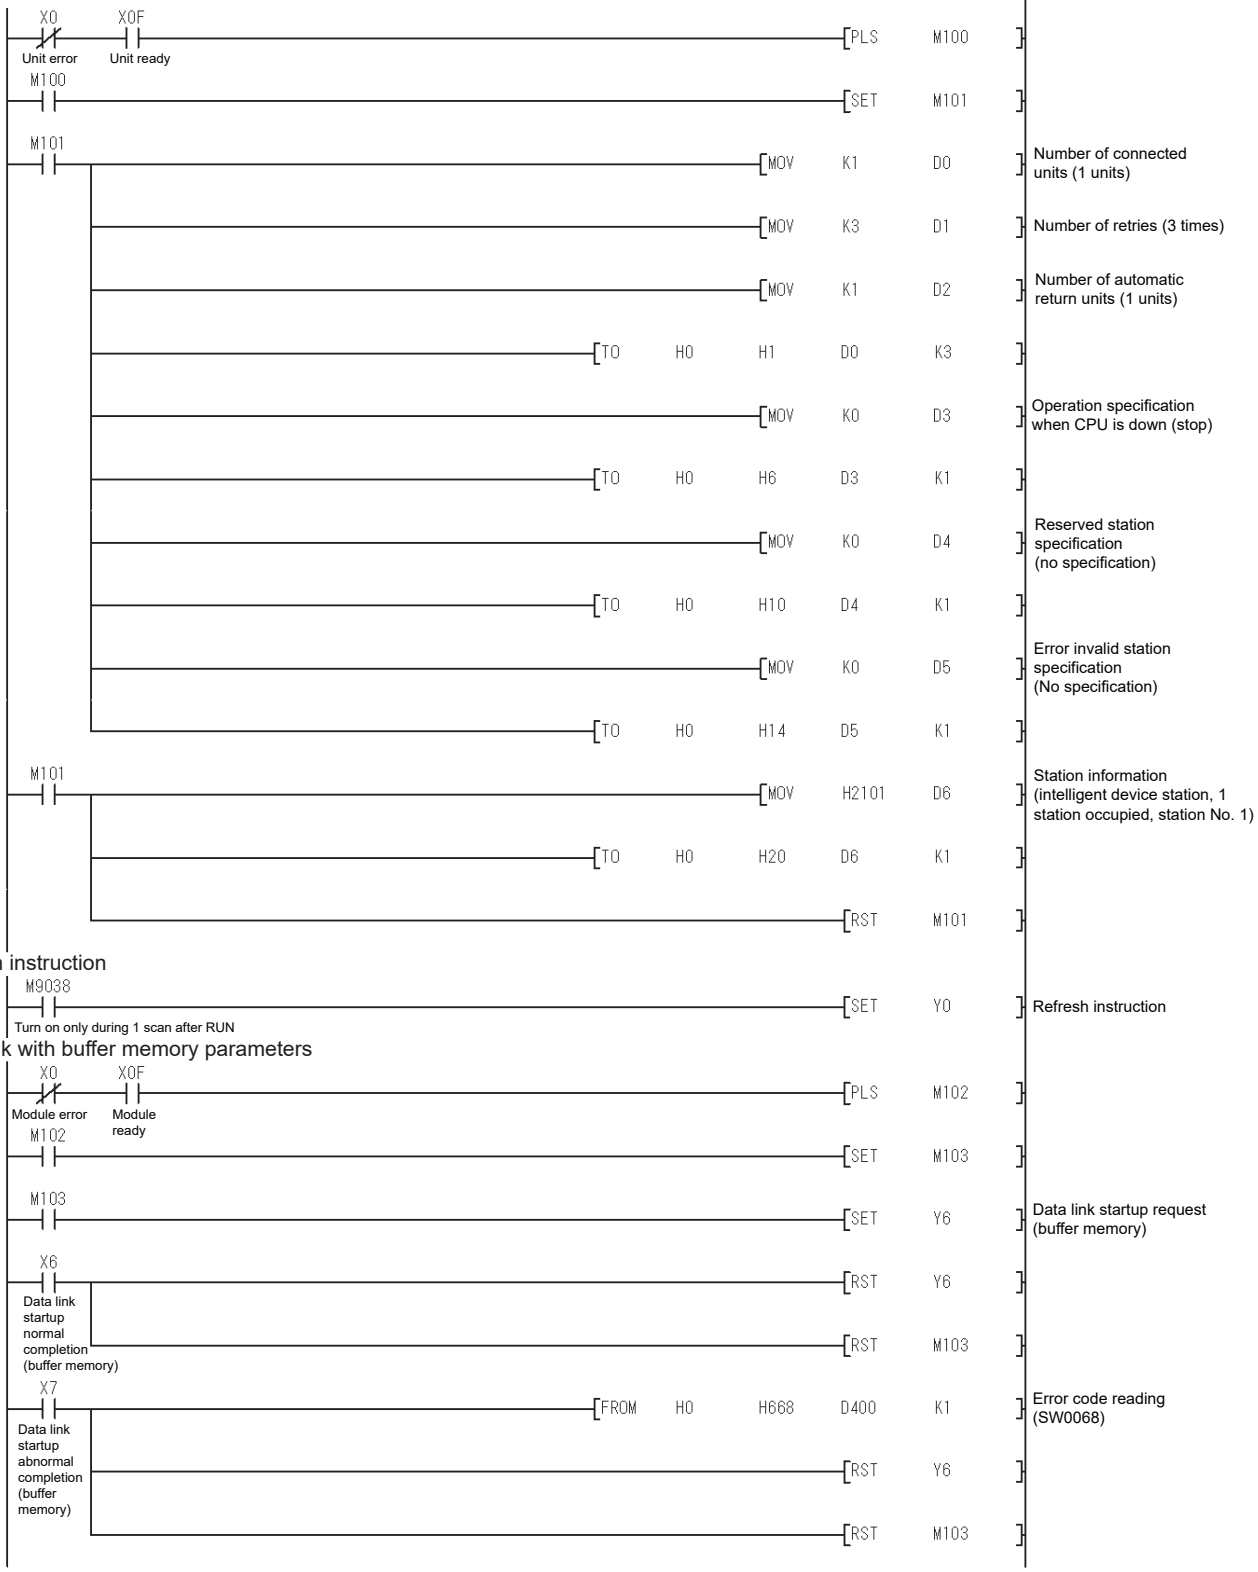
1H: 1 station occupied
2H: 2 stations occupied
3H: 3 stations occupied
4H: 4 stations occupied

3) Station type (Set to 2H: Intelligent device station.)

0H: Remote I/O station
1H: Remote device station
2H: Intelligent device station (including a local station)

Example of sequence program (FROM/TO instruction)

* Parameter setting



* Refresh instruction

* Data link with buffer memory parameters

Point

When changing the sequence program

After writing the sequence program to the PLC CPU, turn off then on or reset the PLC CPU.

■[Controller Setting] in GT Designer3

Item	Setting value
[Station No.]	1: Station No. 1
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.1: Remote network Ver.1 mode
[Expanded Cyclic]	Single (Use default value)
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	MELSEC (compatible)

Point

[Controller Setting] in GT Designer3

For the setting method of [Controller Setting] in GT Designer3, refer to the following.

☞ Page 1155 [Controller Setting]

12.7.5 Access range for monitoring

Only the connected CPU can be accessed.

12.8 MELSEC-F series (CC-Link connection (intelligent device station))

☞ Page 1170 Connectable devices
☞ Page 1170 System configuration
☞ Page 1174 GOT side settings
☞ Page 1180 PLC side settings
☞ Page 1187 Access range for monitoring

12.8.1 Connectable devices

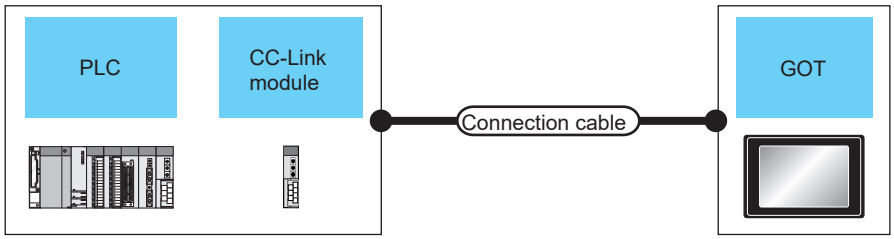
The following table shows the connectable models.

○: Supported, —: Not supported

Controller	Model	Clock	CC-Link module	Connectable model
MELSEC-F series	FX3G FX3GC FX3U FX3UC	○	FX3U-16CCL-M	GT37 SoftGOT3000

12.8.2 System configuration

Connection with CC-Link Ver.1 compatible



For details on the overall length, refer to the following.

☞ Page 1170 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1171 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC-F series	FX3U-16CCL-M	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
FX3U-16CCL-M User's Manual

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1174 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

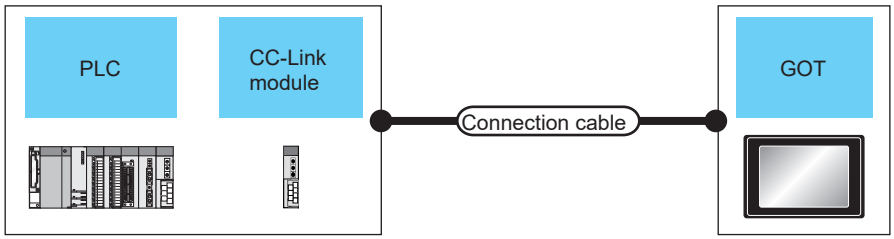
FX3U-16CCL-M User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC-F series	8 GOTs

Connection with CC-Link Ver.2 compatible



For details on the overall length, refer to the following.

☞ Page 1171 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1171 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC-F series	FX3U-16CCL-M	CC-Link (Ver.2)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
FX3U-16CCL-M User's Manual

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.2.
For details on settings, refer to the following.
☞ Page 1174 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

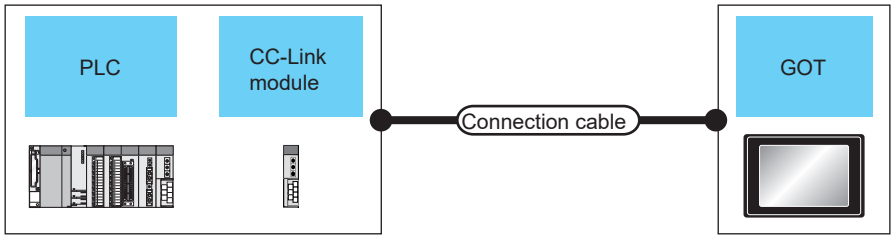
FX3U-16CCL-M User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	**Number of connectable devices**
MELSEC-F series	8 GOTs

Connection with CC-Link Ver.1/Ver.2 compatibles mixed



For details on the overall length, refer to the following.

☞ Page 1172 Overall length

For details on the maximum number of connected devices, refer to the following.

☞ Page 1172 Maximum number of connected devices

Controller	CC-Link module*1	Communication type	Connection cable	GOT	
				Interface	Model
MELSEC-F series	FX3U-16CCL-M	CC-Link (Ver.1)	CC-Link dedicated cable*2	GT37-IF2000 + GT15-J61BT13*3	GT37 SoftGOT3000

*1 For the system configuration of the CC-Link module, refer to the following manual.
FX3U-16CCL-M User's Manual

*2 For the specifications of the CC-Link dedicated cable and the contact information, refer to the following.
CC-Link Partner Association website: http://www.cc-link.org/

*3 In the controller settings, set the mode to Ver.1.
For details on settings, refer to the following.
☞ Page 1174 [Controller Setting]

■Overall length

The maximum overall cable length and cable length between stations vary depending on the conditions such as the type of the cable used and the transmission speed.

For details, refer to the following manual.

FX3U-16CCL-M User's Manual

■Maximum number of connected devices

The following shows the number of connectable GOTs.

Controller	
Model	Number of connectable devices
MELSEC-F series	8 GOTs

Connecting one PLC to multiple GOTs

When multiple GOT units are simultaneously accessing one PLC, the GOT writing process (transient/cyclic) and reading process (transient) may slow down.

This slow access can be remedied with the following countermeasures.

<Countermeasures>

■Improve response speed on PLC side

Insert a COM instruction on the PLC to increase the response speed.

Note that caution is required as the scan time will increase.

■Screen design using cyclic devices

Create the screen with cyclic devices instead of using transient devices.

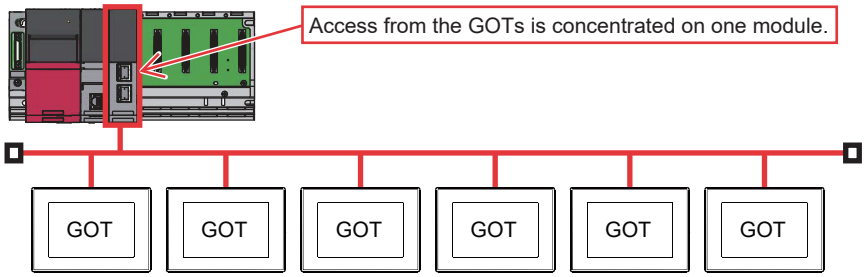
■Split GOT connection destinations into several systems

Add a master/local module to the PLC side, and split the GOT connection destinations into several systems.

Improve the current system configuration.

(Example of current system configuration)

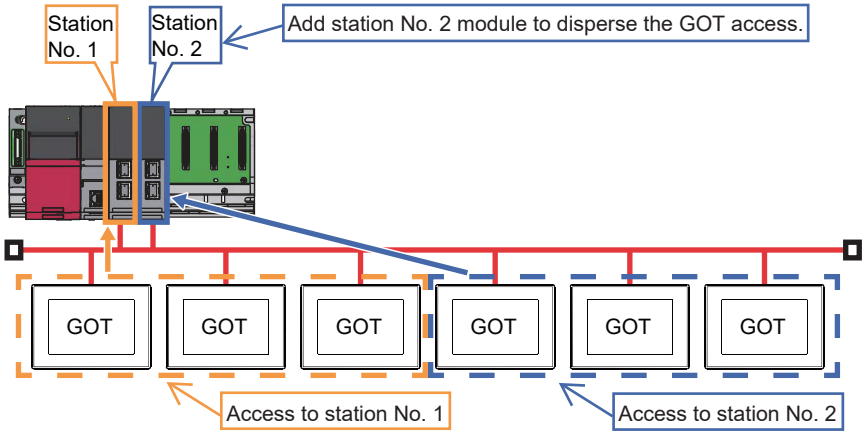
In the following system configuration, access from the GOT is concentrated on one module.



(Improvement measure)

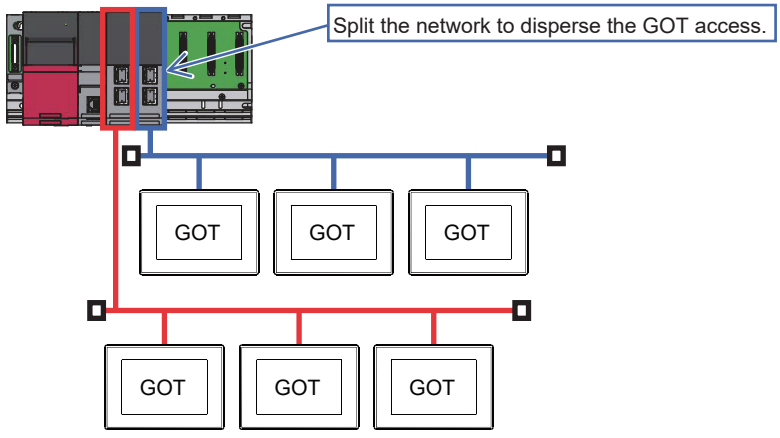
• Adding a module to the PLC side

Add a module to the PLC side to disperse the GOT access destinations.



• Split the network

Split the network to disperse the GOT access.



Precautions

■Starting the GOT in CC-Link connection (intelligent device station)

For the CC-Link connection (intelligent device station), the data link is started approximately 10 seconds after the GOT startup.

■When a network error occurs in the system alarm

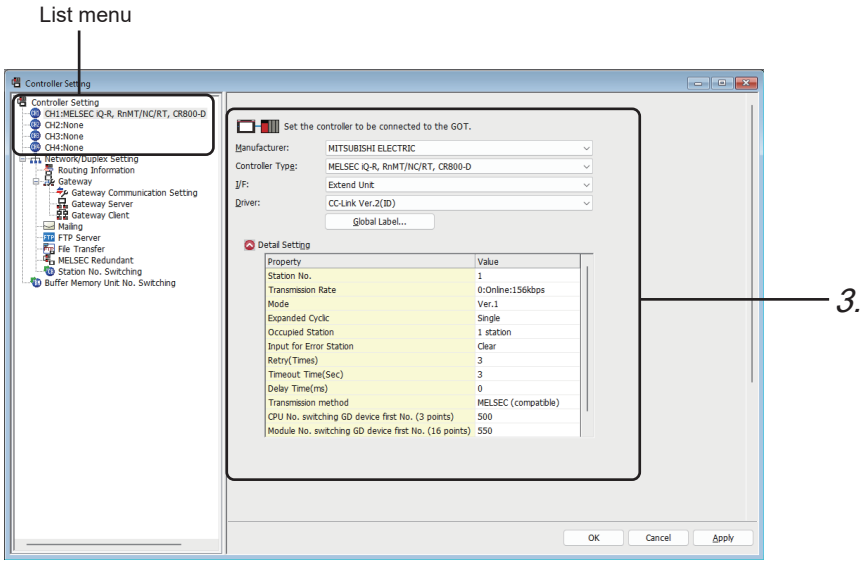
In the CC-Link connection (intelligent device station), when a network error occurs in the system alarm, the system alarm display cannot be canceled even though the causes are removed.

To cancel the system alarm display, restart the GOT.

12.8.3 GOT side settings

[Controller Setting]

Set the channel of the connected controller.



Operating procedure

1. Select [Common] → [Controller Setting] from the menu.
2. In the [Controller Setting] window, select the channel number to be used from the list menu.
3. Set the following items.

Item	Description
[Manufacturer]	[MITSUBISHI ELECTRIC]
[Controller Type]*1	[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[I/F]	[Extend Unit]
[Driver]	[CC-Link Ver.2 (ID)]
[Detail Setting]	Configure the settings according to the usage environment. ☞ Page 1175 [Detail Setting]

*1 For the MELSEC-F series, set the controller type to one of the following options.
[MELSEC iQ-R, RnMT/NC/RT, CR800-D]
[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
[MELSEC-QnA, MELDAS C6*]
[MELSEC-L]
[MELSEC-A]

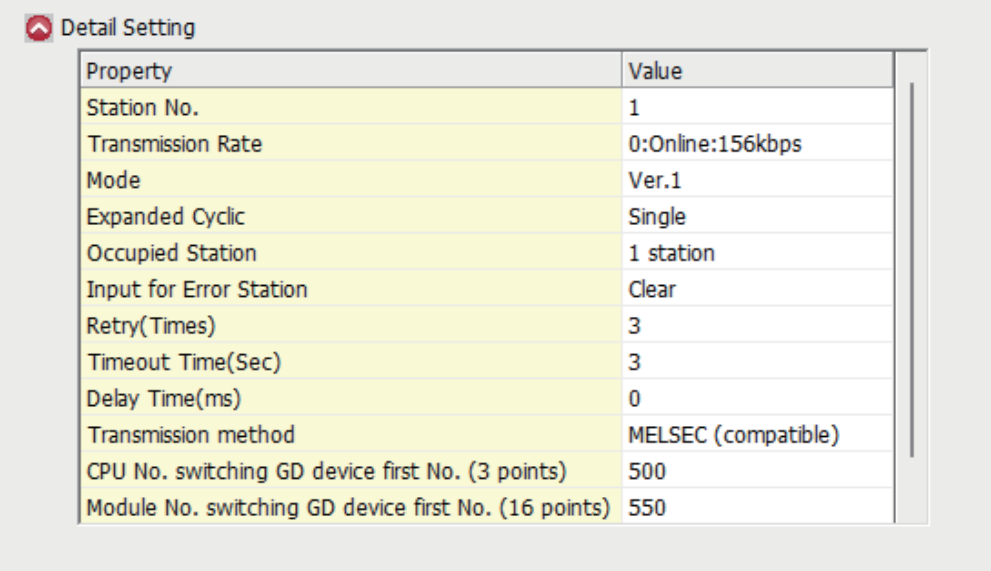
4. When you have completed the settings, click the [OK] button.

Point

The controller settings can be configured and checked in [I/F Communication Setting].
For details, refer to the following.
GT Designer3 (GOT3000) Screen Design Manual

■[Detail Setting]

Configure the settings according to the usage environment.



Item	Description	Range
[Station No.]	Set the station number of the GOT.	[1] to [64]
[Transmission Rate]*1	Set the transmission speed and a mode of the GOT.	[0] to [E]
[Mode Setting]	Set the operation mode of the GOT.	[Ver.1], [Ver.2], [Additional], [Offline]
[Expanded Cyclic]	Set the cyclic point expansion.	[Single], [Double], [Quadruple], [Octuple]
[Occupied Station]	Set the number of stations occupied by the GOT.	[1 Station], [4 Stations]
[Input for Error Station]	Set whether to clear or hold the error at an error occurrence.	[Clear], [Hold]
[Retry]	Set the number of retries to be performed when a communication timeout occurs. When receiving no response after retries, the communication times out.	[0] times to [5] times
[Timeout Time]	Set the time period for a communication to time out.	[1] second to [90] seconds
[Delay Time]	Set this item to adjust the transmission timing of the communication request from the GOT.	[0] ms to [300] ms
[Transmission method]*2	Set the CC-Link transmission method.	[MELSEC (compatible)], [Cyclic]
[CPU No. switching GD device first No. (3 points)]	Set the start device number of the GD devices for CPU number switching. For details, refer to the following. ☞ Page 1176 Start device number of the GD devices for CPU number switching	[0] to [65520]
[Module No. switching GD device first No. (16 points)]	Set the start device number of the GD devices for module number switching. For details, refer to the following. ☞ Page 1177 Start device number of the GD devices for module number switching	[0] to [65520]
[Servo axis switching GD device first No. (16 points)]	Set the start device number of the GD devices for servo axis switching. For details, refer to the following. ☞ Page 1178 Start device number of the GD devices for servo axis switching	[0] to [65520]

*1 Transmission speed settings

The following lists the transmission speed settings of the CC-Link communication.

Setting value	Description
0	Online: 156 kbps
1	Online: 625 kbps
2	Online: 2.5 Mbps
3	Online: 5 Mbps
4	Online: 10 Mbps
5	Line test: 156 kbps
6	Line test: 625 kbps
7	Line test: 2.5 Mbps

Setting value	Description
8	Line test: 5 Mbps
9	Line test: 10 Mbps
A	Hardware test: 156 kbps
B	Hardware test: 625 kbps
C	Hardware test: 2.5 Mbps
D	Hardware test: 5 Mbps
E	Hardware test: 10 Mbps

For details on the hardware test, refer to the following manual.

FX3U-16CCL-M User's Manual

*2 Set the transmission method to [Cyclic].

Point

• Communication interface settings in the GT37 utility

The communication interface setting can be changed in [Communication setting] of the GT37 utility after writing [Controller Setting] in project data.

For details on the GT37 utility, refer to the following manual.

GOT3000 Series User's Manual (Utility & Maintenance Functions)

• Priority of the settings in [Controller Setting]

When settings are configured in GT Designer3 or the GT37 utility, the most recent settings are effective.

■Start device number of the GD devices for CPU number switching

• Indirect specification of a CPU number

[CPU No.] can be indirectly specified with the GOT internal registers (GD devices) by specifying a value (100 to 102) to [CPU No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [CPU No. switching GD device first No. (3 points)].

[CPU No.] is specified with three consecutive GD devices, starting from the set device number.

When [500] is set to [CPU No. switching GD device first No. (3 points)], GD500 to GD502 are used to specify [CPU No.] as shown in the following table.

CPU No.	GD device	Setting range
100	GD500	1 to 4 Setting a value outside the range causes a communication timeout error. Specifying a nonexistent CPU number or a CPU number not supporting a multiple CPU system with a device causes a controller error.
101	GD501	
102	GD502	

• Indirect specification of a CPU number on the initially displayed screen

Set [CPU No. switching GD device first No. (3 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a CPU number for multi-channel connection

If the setting range of [CPU No. switching GD device first No. (3 points)] set for each channel overlaps, the monitoring target CPU number set to each channel is switched simultaneously.

Set [CPU No. switching GD device first No. (3 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a CPU number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [CPU No. switching GD device first No. (3 points)] in a different channel switches the monitoring target CPU number and station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [CPU No. switching GD device first No. (3 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for module number switching

• Indirect specification of a module number

For connection via a Simple Motion module, [Unit No.] can be specified with the GOT internal registers (GD devices) by specifying a value (100 to 10F) to [Unit No.] in the device setting dialog in GT Designer3.

Set the start device number of the GD devices to be used in [Module No. switching GD device first No. (16 points)].

[Unit No.] is specified with 16 consecutive GD devices, starting from the set device number.

When [550] is set to [Module No. switching GD device first No. (16 points)], GD550 to GD565 are used to specify [Unit No.] as shown in the following table.

Module No.	GD device	Setting range
100	GD550	00 to FF Setting a value outside the above range causes a device range error.
101	GD551	
102	GD552	
103	GD553	
104	GD554	
105	GD555	
106	GD556	
107	GD557	
108	GD558	
109	GD559	
10A	GD560	
10B	GD561	
10C	GD562	
10D	GD563	
10E	GD564	
10F	GD565	

• Indirect specification of a module number on the initially displayed screen

Set [Module No. switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a module number for multi-channel connection

If the setting range of [Module No. switching GD device first No. (16 points)] set for each channel overlaps, the module number of the Simple Motion module via the servo amplifier device of each channel is switched simultaneously.

Set [Module No. switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a module number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Module No. switching GD device first No. (16 points)] switches the module number of the Simple Motion module via the servo amplifier device and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Module No. switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

■Start device number of the GD devices for servo axis switching

• Indirect specification of a servo axis number

For connection via a Motion CPU or Simple Motion module, a servo axis number can be indirectly specified with GOT internal registers (GD devices) by specifying a value (100 to 115) to the axis number of the servo amplifier device.

Set the start device number of the GD devices to be used in [Servo axis switching GD device first No. (16 points)].

Specify a servo axis number with 16 consecutive GD devices, starting the set device number.

When [10] is set to [Servo axis switching GD device first No. (16 points)], GD10 to GD25 are used to specify a servo axis number as shown in the following table.

Servo axis No.	GD device	Setting range
100	GD10	1 to 64 Setting a value outside the above range causes a device range error.
101	GD11	
102	GD12	
103	GD13	
104	GD14	
105	GD15	
106	GD16	
107	GD17	
108	GD18	
109	GD19	
110	GD20	
111	GD21	
112	GD22	
113	GD23	
114	GD24	
115	GD25	

• Indirect specification of a servo axis number on the initially displayed screen

Set [Servo axis switching GD device first No. (16 points)] so that the values of the GD devices are retained and monitored upon the GOT startup.

• Indirect specification of a servo axis number for multi-channel connection

If the setting rage of [Servo axis switching GD device first No. (16 points)] set for each channel overlaps, the axis number of the servo amplifier of each channel is switched simultaneously.

Set [Servo axis switching GD device first No. (16 points)] for each channel so that the setting range does not overlap.

• Indirect specification of a station number and a servo axis number for multi-channel connection

When GD10 to GD25 are used to specify the station number of an inverter or non-Mitsubishi temperature controller connected, setting [10] to [Servo axis switching GD device first No. (16 points)] switches the axis number of the servo amplifier and the station number of an inverter or non-Mitsubishi temperature controller set to each channel simultaneously.

Set [Servo axis switching GD device first No. (16 points)] so that the setting range does not overlap the station number of an inverter or non-Mitsubishi temperature controller.

Precautions

■Using cyclic transmission

• I/O signals for the master station

Do not turn on the reserved output signals in the output signals (remote output: RY) to the GOT from the master station.
When the reserved output signal is turned on, the PLC system may malfunction.
For the assignment of I/O signals in the GOT, refer to the following manuals.
📖MODEL GT15-J61BT13 CC-Link communication unit User's Manual
📖GT15 CC-Link communication unit User's Manual

• Access range for monitoring

The remote I/O (RX and RY) and remote register (RWr and RWw) monitoring ranges vary depending on the mode of the master station in the CC-Link system.

Mode of master station	Monitoring	
	Data for each station compatible with CC-Link Ver.1	Data for each station compatible with CC-Link Ver.2
Remote network mode	○	—
Remote network Ver.1 mode	○	—
Remote network Ver.2 mode	○	○*1
Remote network additional mode	○	○

○: Available, ×: Not available (All "0"), —: System configuration not available

*1 Monitoring is available only when the GT15-J61BT13 CC-Link communication unit is used.

• When the GOT malfunctions

The state of cyclic output before fault is held.

■Connection with CC-Link Ver.1 compatible

For connection with CC-Link Ver.1 compatible, the device setting must be configured within the range of the specifications of the controller.
When a device number out of the range is set, proper monitoring may not be possible.

12.8.4 PLC side settings

Model		Reference
MELSEC-F series	FX3G FX3GC FX3U FX3UC	☞ Page 1180 Connection to MELSEC-F series with Ver.1/Ver.2 compatibles mixed

The GOT operates as the stations with the following specifications in the CC-Link system.

Station information	Description
Station type	Intelligent device station, Ver.1 intelligent device station, or Ver.2 intelligent device station
Number of stations occupied	1 station or 4 stations

Point

Number of stations occupied

The number of stations occupied is the setting for determining the number of link device points (RX/RY/RWw/RWr) used by the GOT.

To use multiple numbers of link device points in cyclic transmission between the GOT and CC-Link module, set the number of stations occupied as 4 stations occupied.

The number of link device points when 1 station occupied or 4 stations occupied is shown below.

• CC-Link Ver.2

Link device	Extended cyclic setting							
	Single		Double		Quadruple		Octuple	
	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote output (RY)	32 points	128 points	32 points	224 points	64 points	448 points	128 points	896 points
Remote register (RWw)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points
Remote register (RWr)	4 points	16 points	8 points	32 points	16 points	64 points	32 points	128 points

• CC-Link Ver.1

Link device	Number of stations occupied	
	1 station occupied	4 stations occupied
Remote input (RX)	32 points	128 points
Remote output (RY)	32 points	128 points
Remote register (RWw)	4 points	16 points
Remote register (RWr)	4 points	16 points

Connection to MELSEC-F series with Ver.1/Ver.2 compatibles mixed

This section describes the setting method of the GOT and the CC-Link module (FX3U-16CCL-M) when Ver. 1/Ver. 2 compatible modules are mixed in the system configuration shown below.

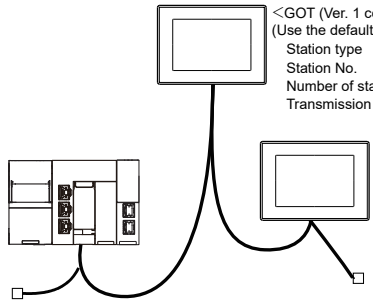
Point

CC-Link module (FX3U-16CCL-M)

For the details on the CC-Link module (FX3U-16CCL-M), refer to the following manual.

FX3U-16CCL-M User's Manual

■System configuration



<GOT (Ver. 1 compatible)>
(Use the default value for settings other than the following.)

Station type	:	Intelligent device station
Station No.	:	Station No. 1 (1st unit)
Number of stations occupied	:	1 station occupied
Transmission speed	:	156kbps

<GOT (Ver. 2 compatible)>
(Use the default value for settings other than the following.)

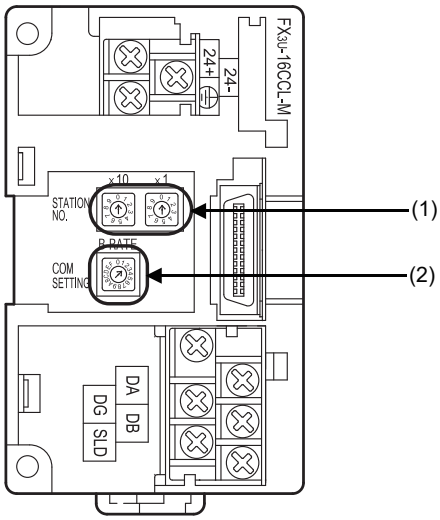
Station type	:	Intelligent device station
Station No.	:	Station No. 2 (2nd unit)
Extended cyclic setting	:	Quadruple
Number of stations occupied	:	1 station occupied
Transmission speed	:	156kbps

<CC-Link module>
(Use the default value for settings other than the following.)

Type	:	Master station
Station No.	:	Station No. 0
Mode setting	:	Remote network ver. 2 mode
Total number of connected devices	:	2
Transmission speed	:	156kbps

■Switch settings for the CC-Link module (FX3U-16CCL-M)

Set the station number setting switch, transmission speed/mode setting switch.



• Station number setting switch

○: Necessary, △: As necessary, —: Not necessary

Station number setting switch	Description	Setting value	Setting for GOT connection
	Station number setting (master station)	0 (fixed)	○

• Transmission speed/mode setting switch

○: Necessary, △: As necessary, —: Not necessary

Transmission speed/mode setting switch	Description	Setting value	Setting for GOT connection
	Transmission speed and mode setting (Online: 156 kbps)*1	0	○

*1 Set the same transmission speed as that of the GOT.

Point

When the switch setting has been changed
Turn off then on or reset the PLC CPU.

■Parameter settings

• [Network parameter] of GX Works2

Network parameter

📖FX3U-16CCL-M User's Manual

Station information setting

Station No.	Station Type	Expanded Cyclic Setting	Number of Occupied Stations	Remote Station Points	Reserve/Invalid Station Select
1/ 1	Ver.1 Intelligent Device Station	Single	Occupied Station 1	32Points	No Setting
2/ 2	Ver.2 Intelligent Device Station	Quadruple	Occupied Station 1	64Points	No Setting

Station information setting of station No. 1 (GOT)

○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
Station type	Ver.1 intelligent device station (fixed)	○
Number of occupied stations*1	1 station occupied	○
Reserve/invalid station select	No setting	○

Station information setting of station No. 2 (GOT)

○: Necessary, △: As necessary, —: Not necessary

Item	Setting value	Setting for GOT connection
Station type	Ver.2 intelligent device station (fixed)	○
Expanded cyclic setting*1	Quadruple	○
Number of occupied stations*1	1 station occupied	○
Reserve/invalid station select	No setting	○

*1 Set the same setting as that of the GOT.

Point

When changing the network parameter

After writing network parameters to the PLC CPU, turn off then on or reset the PLC CPU.

• Settings with sequence program

The program writes parameters to the buffer memory and starts the data link automatically when the PLC CPU status changes from STOP to RUN.

Point

Connection to MELSEC iQ-F series

When connecting with the MELSEC iQ-F series, the network parameters cannot be set with GX Works3.

Set the network parameters in the sequence program.

I/O signals of the CC-Link module

FX3U-16CCL-M User's Manual

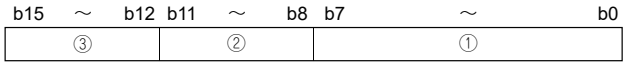
Device used by user

Device	Application
D0	Mode
D1	Number of connected modules
D2	Retry count
D3	Automatic reconnection station count
D4	Operation specification when CPU is down
D5	Data link faulty station specification
D6	Case of CPU STOP setting
D20	Station information (1st unit)
D21	Station information (2nd unit)

Buffer memory settings used in the present example

Buffer memory address Dec (Hex)	Item	Setting value
0 (0H)	Mode	2 (Remote network Ver.2 mode)
1 (1H)	Number of connected modules	2 (2 modules)
2 (2H)	Retry count	7 (7 times)
3 (3H)	Automatic reconnection station count	2 (2 modules)
6 (6H)	Operation specification when CPU is down	0 (Stop)
12 (CH)	Data link faulty station specification	1 (Clear)
6 (DH)	Case of CPU STOP setting	0 (Refresh)
32 (20H)	Station information (1st unit)*1	2301H
33 (21H)	Station information (2nd unit)*1	C104H

*1 Details for the station data are shown below.
For 1), 2), and 3), make the settings the same as the settings of the station number, number of stations occupied, and expanded cyclic of the GOT.



1) Station number (Make the setting the same as the station number setting of the GOT.)

01H to 10H: Station No. 1 to Station No. 16

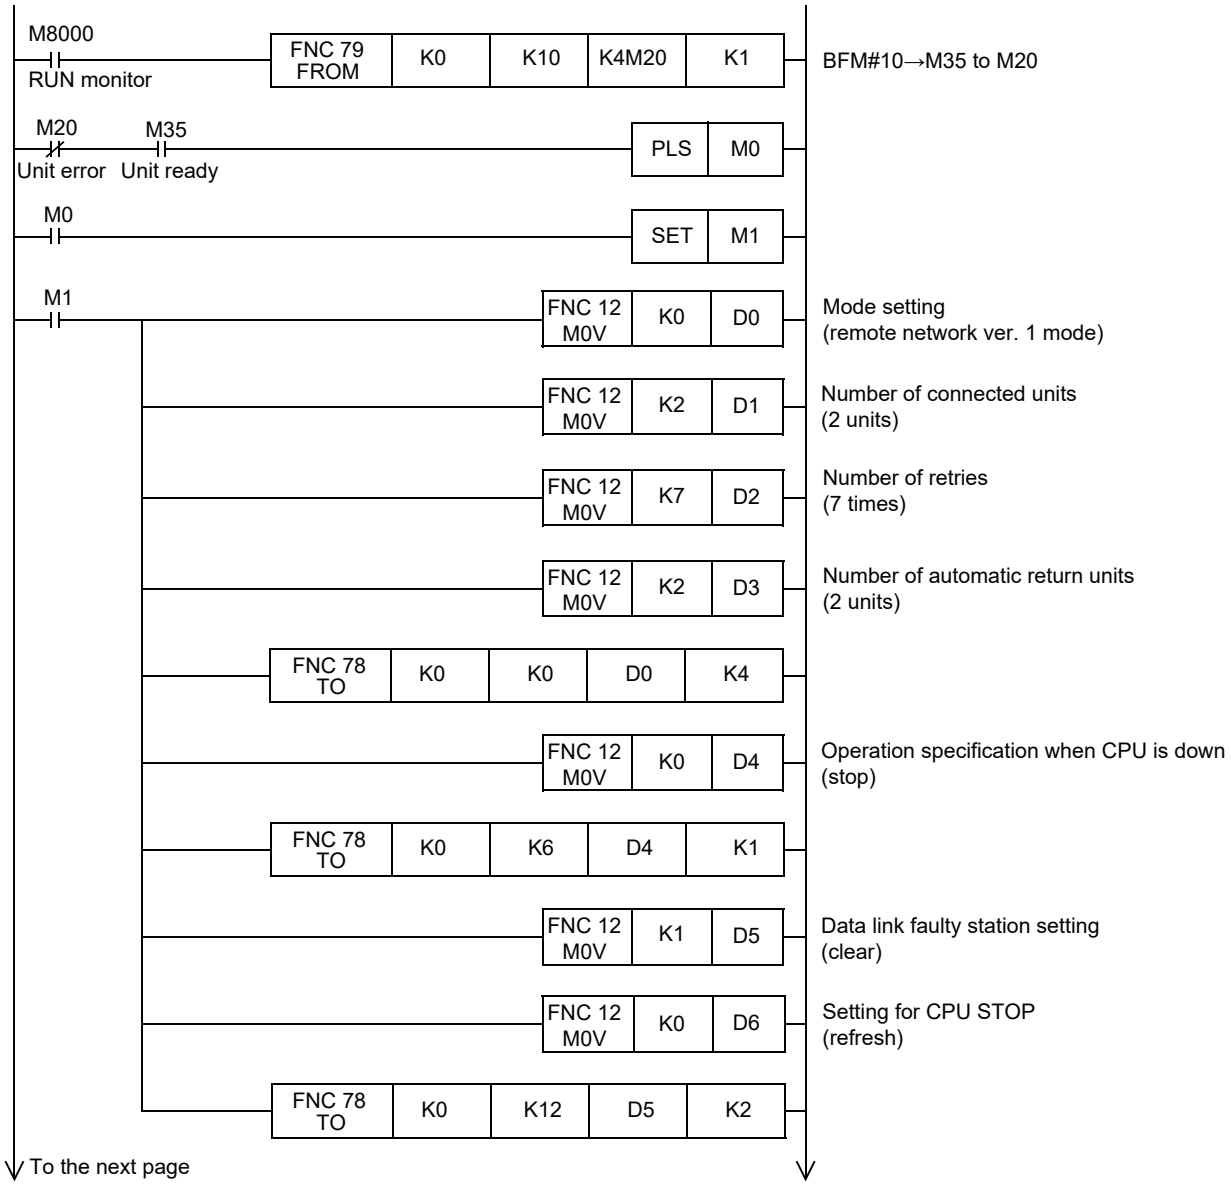
2) Number of stations occupied (Make the setting the same as the number of stations occupied setting of the GOT.)

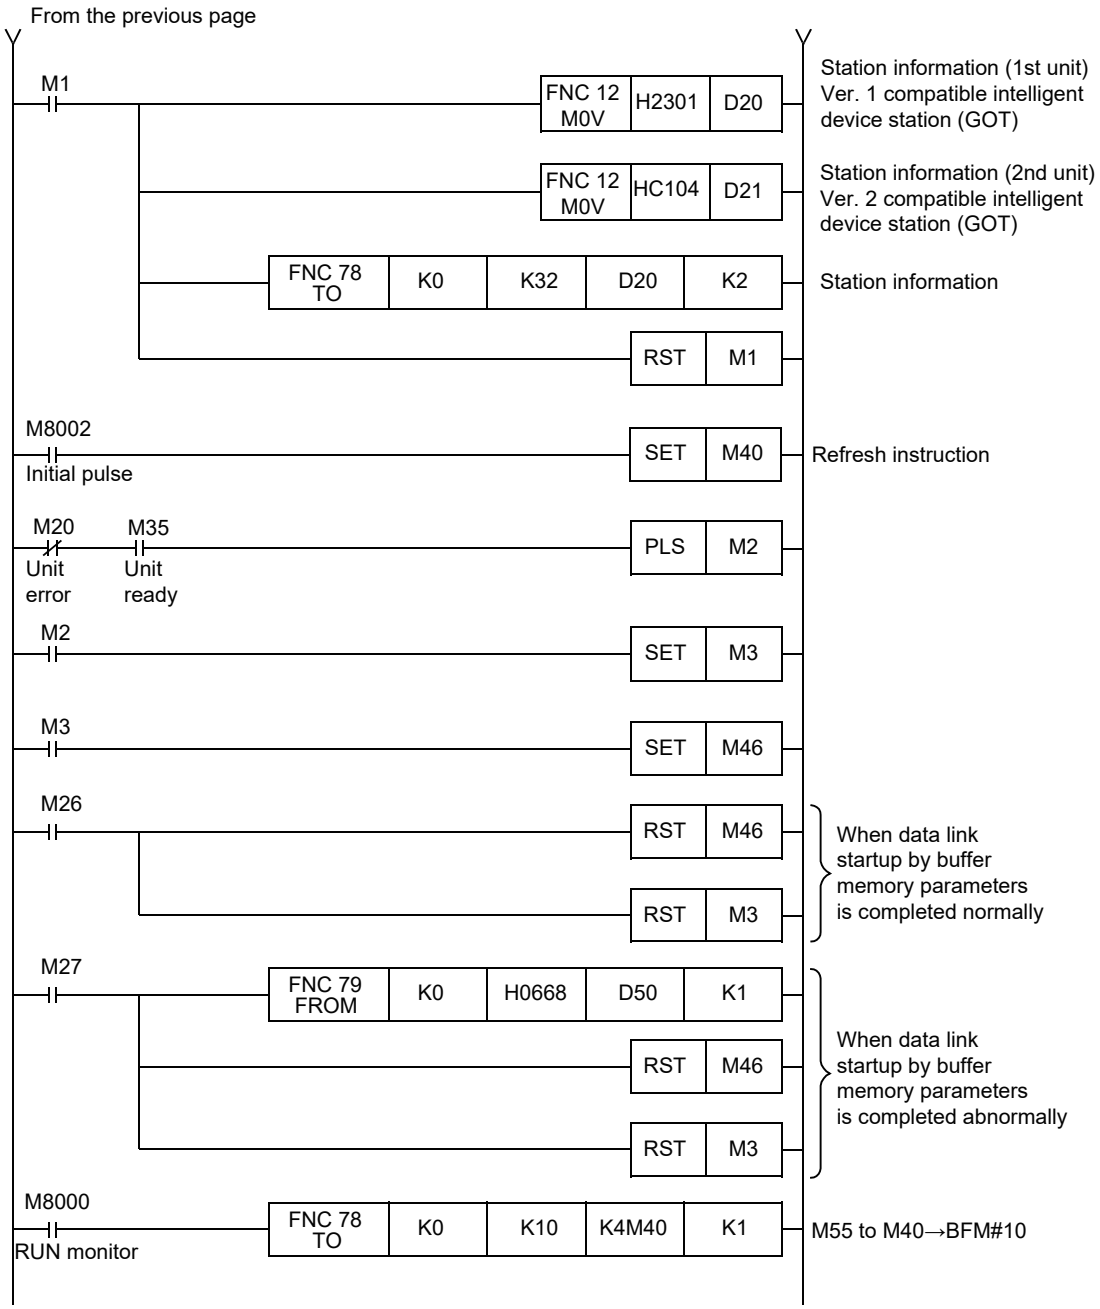
1H: 1 station occupied
2H: 2 stations occupied
3H: 3 stations occupied
4H: 4 stations occupied

3) Station type

2H: Ver. 1 compatible intelligent device station
6H: Ver. 2 compatible single intelligent device station
9H: Ver. 2 compatible double intelligent device station
CH: Ver. 2 compatible quadruple intelligent device station
FH: Ver. 2 compatible octuple intelligent device station

Example of sequence program





Point

When changing the sequence program

After writing the sequence program to the PLC CPU, turn off then on or reset the PLC CPU.

■[Controller Setting] in GT Designer3

• Communication settings of station No. 1 (GOT)

Item	Setting value
[Station No.]	1: Station No. 1
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.1: Remote network Ver.1 mode
[Expanded Cyclic]	—
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	Cyclic

• Communication settings of station No. 2 (GOT)

Item	Setting value
[Station No.]	2: Station No. 2
[Transmission Rate]	0: Online 156 kbps
[Mode]	Ver.2: Remote network Ver.2 mode
[Expanded Cyclic]	Quadruple
[Occupied Station]	1 station
[Input for Error Station]	0: Clear
[Retry]	3 (Use default value)
[Timeout Time]	3 (Use default value)
[Delay Time]	0 (Use default value)
[Transmission method]	Cyclic

12.8.5 Access range for monitoring

Only the connected CPU can be accessed.

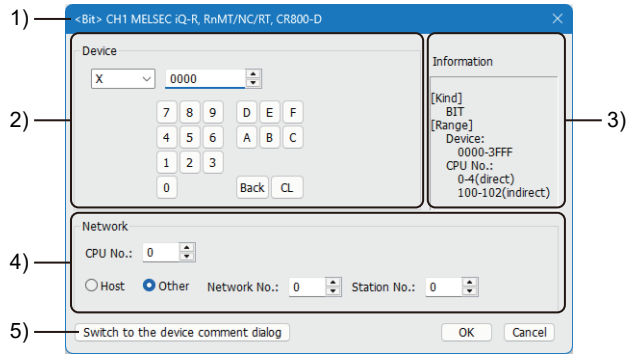
13 Settable device range

This chapter describes the range of devices settable in GT Designer3.
The settable range varies with the selection for [Controller Type] in the [Controller Setting] window.
Configure the device setting according to the specifications of the controller to be used.
Device specifications differ depending on the controller model even among the controllers of the same series.
If a nonexistent device or a device number out of the range is set for an object, other objects for which correct devices are set may not be monitored.

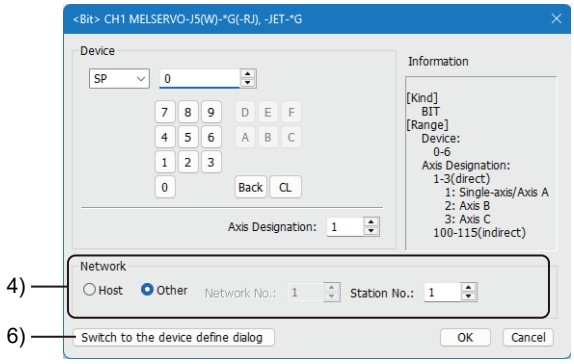
☞ Page 1189 Device setting dialog (Mitsubishi Electric equipment)
☞ Page 1196 [MELSEC MX Controller]
☞ Page 1223 [MELSEC iQ-R, RnMT/NC/RT, CR800-D]
☞ Page 1314 [MELSEC iQ-F]
☞ Page 1329 [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]
☞ Page 1347 [MELSEC-L]
☞ Page 1362 [MELSEC-A]
☞ Page 1366 [MELSEC-FX]

13.1 Device setting dialog (Mitsubishi Electric equipment)

Set a device to be monitored.



[MELSEC iQ-R, RnMT/NC/RT, CR800-D]



[MELSERVO-J5(W)-*G(-RJ), -JET-*G]

Item		Description
1)	Title	Data type and channel number of the device to be set
2)	[Device]	Set the device name and device number. If a bit number needs to be specified, the setting item is displayed. Example) Setting of X0000  The setting items vary with the selected device name.  When [X] is selected for the device name  When [SP] is selected for the device name

Item		Description
3)	[Information]	Displays the setting range of each setting item according to the selected device.
4)	[Network]	Set the station number of the controller to be monitored. The setting items depend on the controller setting. ☞ Page 1191 Network setting for connection to the Mitsubishi Electric PLC ☞ Page 1193 Network setting for connection to the Mitsubishi Electric servo amplifier ☞ Page 1194 Network setting for connection to the Mitsubishi Electric inverter
5)	[Switch to the device comment dialog] button	You can open the device comment setting dialog to check the device comments imported to GT Designer3. For details, refer to the following. 📖GT Designer3 (GOT3000) Screen Design Manual
6)	[Switch to the device define dialog] button	You can open the device definition setting dialog to check the definitions of the virtual servo amplifier or inverter devices. For details, refer to the following. 📖GT Designer3 (GOT3000) Screen Design Manual

For the formats of devices, refer to the following.

For details, refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

For the specifications of each device, refer to the following.

☞ Page 1196 [MELSEC MX Controller]

☞ Page 1223 [MELSEC iQ-R, RnMT/NC/RT, CR800-D]

☞ Page 1314 [MELSEC iQ-F]

☞ Page 1329 [MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700]

☞ Page 1347 [MELSEC-L]

☞ Page 1362 [MELSEC-A]

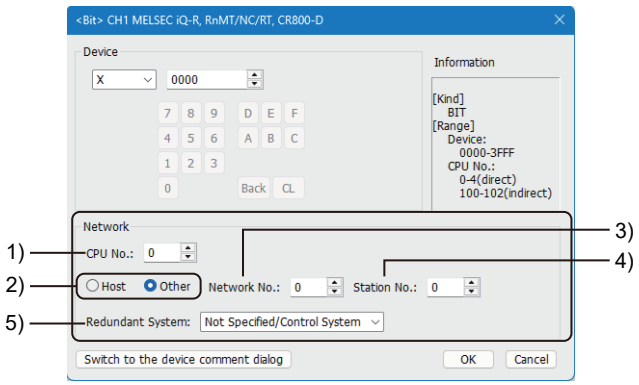
☞ Page 1366 [MELSEC-FX]

13.1.1 Network setting for connection to the Mitsubishi Electric PLC

Configure the following settings for connecting to a Mitsubishi Electric PLC.

Ex.

Device setting dialog of [MELSEC iQ-R, RnMT/NC/RT, CR800-D]



Item		Description
1)	[CPU No.]	Set the CPU number of the controller. ☞ Page 1192 Setting the CPU number
2)	Station type specification	Select the station type (host or other) for the controller to be monitored. • [Host]: The controller to be monitored is the host station. • [Other]: The controller to be monitored is not the host station. When monitoring link relay (B) and link register (W) assigned in link parameter and network parameter, select [Host]. If [Other] is selected, the cyclic transmission will be changed to the transient transmission irrespective of the network type, resulting in delay of the object display. Set RX, RY, RWw, RWr, LB, or LW as [Host] when monitoring a cyclic device.
3)	[Network No.]	This item appears when [Other] is selected for the station type. Set the network number.
4)	[Station No.]	This item appears when [Other] is selected for the station type. Specify a station number.
5)	[Redundant System]	This item can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] of the [Controller Setting] window. The following shows the items to be selected. • [Not Specified/Control System] • [Standby System] Example) Display terminology of the control system 1-1/1-S W0.b0 [-S] is displayed for a device of the standby system. For details, refer to the following. 📖GT Designer3 (GOT3000) Screen Design Manual

Setting the CPU number

The setting range depends on the system configuration of the monitoring target.

Item	Description
When monitoring a single CPU system	Set the CPU number to [0].
When monitoring a multiple CPU system	Set the CPU number to any of [1] to [4].
When monitoring an inverter	Set the CPU number to [0].

To specify a CPU number with the value of a GOT data register (GD), refer to the following.

☞ Page 1192 Indirect specification of a CPU number

Indirect specification of a CPU number

To set a GOT data register (GD) to specify a CPU number, set [CPU No. switching GD device first No. (3 points)] in the [Controller Setting] window.

For details, refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

When using GT SoftGOT3000, [CPU No. switching GD device first No. (3 points)] can also be set in GT SoftGOT3000.

📖GT SoftGOT3000 User's Manual

The following shows the correspondence between CPU numbers and GOT data registers (GD).

Ex.

When 500 is set to [CPU No. switching GD device first No. (3 points)]

Three consecutive devices, starting from GD500, are set to specify CPU numbers.

CPU No.	GOT data registers (GD)	Setting range
100	GD500	[1] to [4] (Setting an invalid value causes a communication timeout error.)
101	GD501	
102	GD502	

Upon the GOT startup, 0 is stored in the specified GD devices until values are set.

If you set the GD devices on the screen that appears upon the GOT startup, a communication timeout error occurs.

To avoid such situation, set the GD devices so that their values are retained at a power failure.

For details, refer to the following.

📖GT Designer3 (GOT3000) Screen Design Manual

Precautions

■When the multi-channel connection is used

When specifying GD devices for multiple channels, set different GD devices to [CPU No. switching GD device first No. (3 points)].

GD10 to GD25 are used to specify the monitoring targets, such as the station number of an inverter.

When setting GD devices for a different channel, set different GD devices to [CPU No. switching GD device first No. (3 points)].

■When the indirect specification function is used

Do not change the value of the specified device while a touch switch with the bit momentary is being pressed.

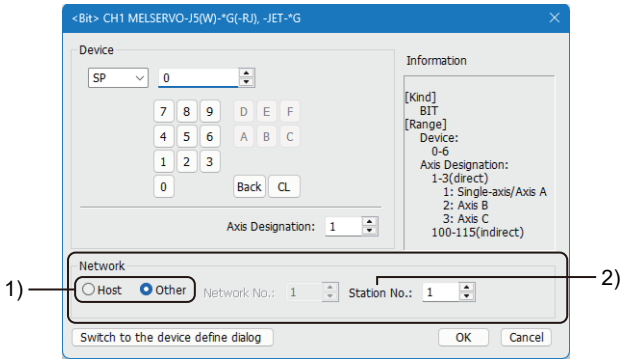
Doing so may cause the touch switch to exhibit unintended behavior.

13.1.2 Network setting for connection to the Mitsubishi Electric servo amplifier

☞ Page 1193 Network setting for Ethernet connection
☞ Page 1193 Network setting for non-network connection type (serial connection)

Network setting for Ethernet connection

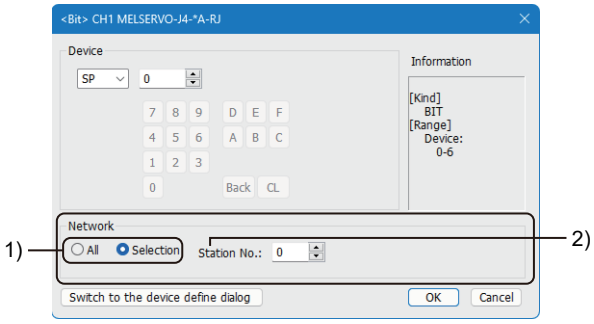
Ex.
Device setting dialog for [MELSERVO-J5(W)-*G(-RJ), -JET-*G]



Item		Description
1)	Station type specification	Select the station type (host or other) for the controller to be monitored. • [Host]: The controller to be monitored is the host station. • [Other]: The controller to be monitored is not the host station.
2)	[Station No.]	This item appears when [Other] is selected for the station type. Specify a station number.

Network setting for non-network connection type (serial connection)

Ex.
Device setting dialog for [MELSERVO-J4-*A-RJ]



Item		Description	
1)	Monitor target specification	Set the monitoring target of the set device.	
		[All]	Select this item when writing data to all the connected servo amplifiers. During monitoring, the servo amplifier of station number 0 is monitored. When data is input from a numerical input object, the data is written to all the connected servo amplifiers. When no data is input, the servo amplifier of station number 0 is monitored. When [All] is selected for a device, network number 0 and station number FF will be displayed in the device list or the printed report.
		[Selection]	Select this item when monitoring the servo amplifier that has the specified station number.
2)	[Station No.]	This item appears when [Selection] is selected for the monitor target specification. The setting range is [0] to [31] (direct) or [100] to [115] (indirect). For indirect specification of a station number, refer to the following. ☞ Page 1194 Indirect specification of a station number (for connection to a servo amplifier)	

■Indirect specification of a station number (for connection to a servo amplifier)

When you specify any of 100 to 115 for the station number, the value of the corresponding GOT data register (GD10 to GD25) is used as the station number.

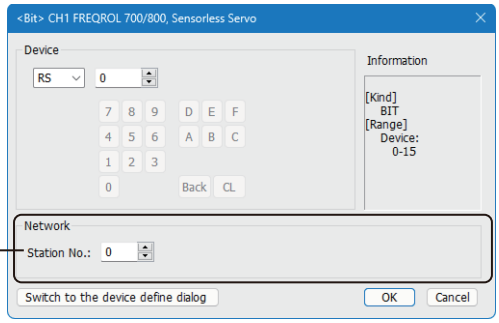
The following shows the correspondence between station number setting values and GOT data registers (GD).

Station No.	GOT data registers (GD)	Setting range
100	GD10	[0] to [31] Setting a value outside the range causes a timeout error.
101	GD11	
:	:	
114	GD24	
115	GD25	

13.1.3 Network setting for connection to the Mitsubishi Electric inverter

☞ Page 1194 Network setting for [FREQROL 700/800, Sensorless Servo]
☞ Page 1195 Network setting for [FREQROL 800/E700NE(Batch monitor)]

Network setting for [FREQROL 700/800, Sensorless Servo]



Item		Description
1)	[Station No.]	Set the station number of the inverter to be monitored. The setting range is [0] to [31] (direct) or [100] to [115] (indirect). For indirect specification of a station number, refer to the following. ☞ Page 1194 Indirect specification of a station number (for connecting an inverter)

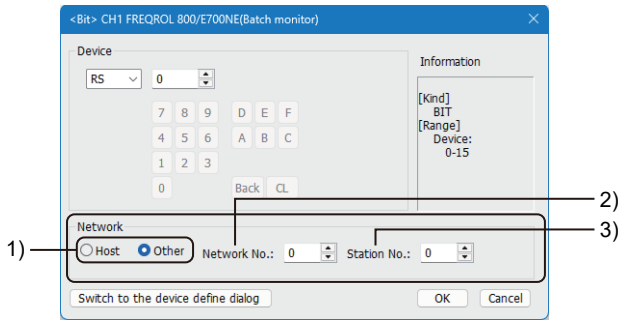
■Indirect specification of a station number (for connecting an inverter)

When you specify any of 100 to 115 for the station number, the value of the corresponding GOT data register (GD10 to GD25) is used as the station number.

The following shows the correspondence between station number setting values and GOT data registers (GD).

Station No.	GOT data registers (GD)	Setting range
100	GD10	[0] to [31] Setting a value outside the above range causes a device range error.
101	GD11	
:	:	
114	GD24	
115	GD25	

Network setting for [FREQROL 800/E700NE(Batch monitor)]



Item		Description
1)	Station type specification	Select the station type (host or other) for the controller to be monitored. • [Host]: The controller to be monitored is the host station. • [Other]: The controller to be monitored is not the host station.
2)	[Network No.]	This item appears when [Other] is selected for the station type. Set the network number. The setting range is [1] to [239].
3)	[Station No.]	This item appears when [Other] is selected for the station type. Set the station number of the inverter to be monitored. The setting range is [1] to [120]. Valid station numbers vary depending on the connection type. For indirect specification of a station number for non-network connection type, refer to the following. ☞ Page 1194 Indirect specification of a station number (for connecting an inverter)

SASC	Safety retentive timer coil	Decimal	0 to 35487	×	×
SASS	Safety retentive timer contact	Decimal	0 to 35487	×	×
SASM	Safety special relay	Decimal	0 to 4095	×	×
BL	SFC block	Decimal	0 to 319	×	×
BLS	Step relay (block)	Decimal	BL(SFC Block No.)-S(Device) Notation example: BL1-S3 • SFC Block No. (decimal): 0 to 319 • Device (decimal): 0 to 511	×	×
SP[*2]	Servo amplifier request	Decimal	☞ Page 1200 Setting virtual bit devices for servo amplifiers ([MELSEC MX Controller])	×	×
OM[*2]	Operation mode selection	Decimal	☞ Page 1200 Setting virtual bit devices for servo amplifiers ([MELSEC MX Controller])	×	×
TMB[*2]	Instruction demand (for test operation)	Decimal	☞ Page 1200 Setting virtual bit devices for servo amplifiers ([MELSEC MX Controller])	×	×
OTI[*2]	One-touch tuning instruction	Decimal	☞ Page 1200 Setting virtual bit devices for servo amplifiers ([MELSEC MX Controller])	×	×
GFDI[*2]	Gear failure diagnosis instruction	Decimal	☞ Page 1200 Setting virtual bit devices for servo amplifiers ([MELSEC MX Controller])	×	×
ECCDI[*2]	Encoder communication circuit diagnosis instruction	Decimal	☞ Page 1200 Setting virtual bit devices for servo amplifiers ([MELSEC MX Controller])	×	×
JnX	Link input (link direct)	Hexadecimal	J(Network No.n)-X(Device) Notation example: J1-X0000 • Network No.n (decimal): 1 to 239 • Device (hexadecimal): 0000 to 3FFF	○	○
JnY	Link output (link direct)	Hexadecimal	J(Network No.n)-Y(Device) Notation example: J1-Y0000 • Network No.n (decimal): 1 to 239 • Device (hexadecimal): 0000 to 3FFF	○	○
JnB	Link relay (link direct)	Hexadecimal	J(Network No.n)-B(Device) Notation example: J1-B0000 • Network No.n (decimal): 1 to 239 • Device (hexadecimal): 0000 to 1FFFF	○	○
JnSB	Link special relay (link direct)	Hexadecimal	J(Network No.n)-SB(Device) Notation example: J1-SB000 • Network No.n (decimal): 1 to 239 • Device (hexadecimal): 000 to FFF	○	○
IOST[*3]	I/O terminal monitor	Decimal	0 to 127	×	×

Device name		Device No. representation	Setting range	Specifications of EG devices*1	
				Assignment to EG devices	Access using a client
CMD*3	Operation command	Decimal	0 to 63	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
GT Designer3 (GOT3000) Screen Design Manual

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 1221 Virtual servo amplifier devices ([MELSEC MX Controller])

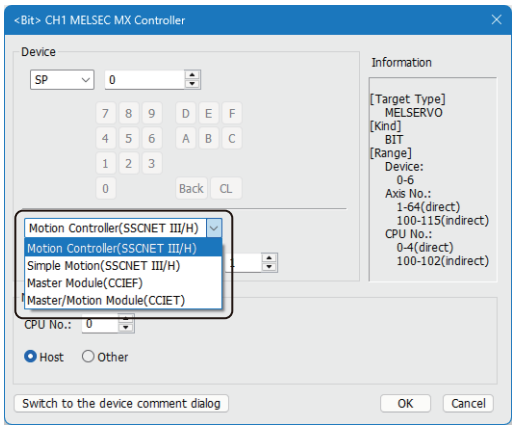
*3 Virtual inverter device
For details, refer to the following.
☞ Page 1222 Virtual inverter devices ([MELSEC MX Controller])

*4 If a bit-specified word device is used in the random read processing, GT Simulator3 uses the value of the bit device in block No. 0 only. The bit device status depends on the SFC program status (active or inactive). When the SFC program is inactive, the bit device is off (stores 0).
If a step relay (S) is used in the random read processing, specify the relevant step relay (block) (BLS).

13.2.2 Setting virtual bit devices for servo amplifiers ([MELSEC MX Controller])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (RD77MS). The following items are displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (RD77GF).
[Master/Motion Module(CCIET)]	Select this item to connect the GOT through the master station on the CC-Link IE TSN and a Motion module (RD78G(H)). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
SP	[Motion Controller(SSCNET III/H)]	A(Axis No.)-SP(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	A64-SP0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-SP(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	UFF-A64-SP0
	[Master Module(CCIEF)]	SP(Device) • Device (decimal): 0 to 6	SP0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-SP(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	AA3-SP0

Device name	Device notation and setting range		Notation example
OM	[Motion Controller(SSCNET III/H)]	A(Axis No.)-OM(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	A64-OM0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OM(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	UFF-A64-OM0
	[Master Module(CCIEF)]	OM(Device) • Device (decimal): 0 to 2, 4 to 5	OM0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-OM(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 4 to 5	AA3-OM0
TMB	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMB(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	A64-TMB1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMB(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	UFF-A64-TMB1
	[Master Module(CCIEF)]	TMB(Device) • Device (decimal): 1 to 6	TMB1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMB(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 6	AA3-TMB1
OTI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-OTI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	A64-OTI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OTI(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	UFF-A64-OTI0
	[Master Module(CCIEF)]	OTI(Device) • Device (decimal): 0 to 5	OTI0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-OTI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	AA3-OTI0
GFDI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-GFDI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A64-GFDI1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-GFDI(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A64-GFDI1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-GFDI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-GFDI0
ECCDI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ECCDI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A64-ECCDI1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ECCDI(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A64-ECCDI1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ECCDI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-ECCDI0

For indirect specification of a module number, axis number, or axis designation, refer to the following.

☞ Page 1202 Indirect specification of a module number ([MELSEC MX Controller])

☞ Page 1203 Indirect specification of an axis number or axis designation ([MELSEC MX Controller])

Indirect specification of a module number ([MELSEC MX Controller])

To set a GOT data register (GD) to specify a module number, set [Module No. switching GD device first No. (16 points)] in the [Controller Setting] window.

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

In GT SoftGOT3000, set [Module No. switching GD device first No. (16 points)] in the [Communication Setup] dialog.

GT SoftGOT3000 User's Manual

The following shows the correspondence between module numbers and GOT data registers (GD).

Ex.

When 550 is set to [Module No. switching GD device first No. (16 points)]

Sixteen consecutive devices, starting from GD550, are set to specify module numbers.

Module No.	GOT data registers (GD)	Setting range
100	GD550	[000] to [0FF] Setting a value outside the above range causes a device range error.
101	GD551	
:	:	
10E	GD564	
10F	GD565	

Upon the GOT startup, 0 is stored in the specified GD devices until values are set.

If you set the GD devices on the screen that appears upon the GOT startup, module No. 0 is monitored unintentionally, or a device range error occurs.

To avoid such situation, set the GD devices so that their values are retained at a power failure.

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Precautions

■When the multi-channel connection is used

When setting GD devices for multiple channels, set different GD devices to [Module No. switching GD device first No. (16 points)].

GD10 to GD25 are used to specify the monitoring targets, such as the station number of an inverter.

When setting GD devices for a different channel, set different GD devices to [Module No. switching GD device first No. (16 points)].

■When the indirect specification function is used

Do not change the value of the specified device while a touch switch with the bit momentary is being pressed.

Doing so may cause the touch switch to exhibit unintended behavior.

Indirect specification of an axis number or axis designation ([MELSEC MX Controller])

To use GOT data registers (GD) to specify an axis number or axis designation, set [Servo axis switching GD device first No. (16 points)] in the [Controller Setting] window.

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

In GT SoftGOT3000, set [Servo axis switching GD device first No. (16 points)] in the [Communication Setup] dialog.

GT SoftGOT3000 User's Manual

The following shows the relationship between the axis number or axis designation and the GOT data register (GD).

Ex.

When 10 is set to [Servo axis switching GD device first No. (16 points)]

Sixteen consecutive devices, starting from GD10, are set to specify an axis number.

Axis No. or axis designation	GOT data registers (GD)	Setting range
100	GD10	• Axis number [1] to [64] • Axis designation [1]: Single-axis/Axis A [2]: Axis B [3]: Axis C Setting a value outside the above range causes a device range error.
101	GD11	
:	:	
114	GD24	
115	GD25	

Upon the GOT startup, 0 is stored in the specified GD devices until values are set.

If you set the GD devices on the screen that appears upon the GOT startup, a device range error occurs.

To avoid such situation, set the GD devices so that their values are retained at a power failure.

For details, refer to the following.

GT Designer3 (GOT3000) Screen Design Manual

Precautions

■When the multi-channel connection is used

When specifying GD devices for multiple channels, set different GD devices to [Servo axis switching GD device first No. (16 points)].

GD10 to GD25 are used to specify the monitoring targets, such as the station number of an inverter.

When setting GD devices for a different channel, set different GD devices to [Servo axis switching GD device first No. (16 points)].

■When the indirect specification function is used

Do not change the value of the specified device while a touch switch with the bit momentary is being pressed.

Doing so may cause the touch switch to exhibit unintended behavior.

13.2.3 Availability of writing/reading data to/from bit devices ([MELSEC MX Controller])

The following shows the availability of writing/reading data to/from bit devices by device type.

When the device type is other than the bit type, set the device No. in multiples of 16.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type				
	Bit	Byte (8 bits)	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)
X	R/W	-/-	R/W	R/W	-/-
Y	R/W	-/-	R/W	R/W	-/-
B	R/W	-/-	R/W	R/W	-/-
M	R/W	-/-	R/W	R/W	-/-
L	R/W	-/-	R/W	R/W	-/-
S	R/-	-/-	R/-	R/-	-/-
F	R/W	-/-	R/W	R/W	-/-
TC	R/W	-/-	-/-	-/-	-/-
TT	R/W	-/-	-/-	-/-	-/-
CC	R/W	-/-	-/-	-/-	-/-
CT	R/W	-/-	-/-	-/-	-/-
SC	R/W	-/-	-/-	-/-	-/-
SS	R/W	-/-	-/-	-/-	-/-
SB	R/W	-/-	R/W	R/W	-/-
SM	R/W	-/-	R/W	R/W	-/-
RX	R/W	-/-	R/W	R/W	-/-
RY	R/W	-/-	R/W	R/W	-/-
LB	R/W	-/-	R/W	R/W	-/-
LTC	R/W	-/-	-/-	-/-	-/-
LTT	R/W	-/-	-/-	-/-	-/-
LCC	R/W	-/-	-/-	-/-	-/-
LCT	R/W	-/-	-/-	-/-	-/-
LSC	R/W	-/-	-/-	-/-	-/-
LSS	R/W	-/-	-/-	-/-	-/-
SAX	R/-	-/-	R/-	R/-	-/-
SAY	R/-	-/-	R/-	R/-	-/-
SAB	R/-	-/-	R/-	R/-	-/-
SAM	R/-	-/-	R/-	R/-	-/-

13.2.4 Monitoring-supported word devices ([MELSEC MX Controller])

The following table shows monitoring-supported word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 1215 Availability of writing/reading data to/from word devices ([MELSEC MX Controller])

○: Available

×: Not available

Device name		Device No. representation	Setting range	Specifications of EG devices*1	
				Assignment to EG devices	Access using a client
TN	Timer current value	Decimal	0 to 9319295	○	○
CN	Counter current value	Decimal	0 to 9319295	○	○
SN	Retentive timer current value	Decimal	0 to 9319295	○	○
D	Data register	Decimal	0 to 10484223	○	○
SD	Special register	Decimal	0 to 9999	○	○
W	Link register	Hexadecimal	000000 to 9FF9FF	○	○
SW	Link special register	Hexadecimal	000000 to 9FF9FF	○	○
R	File register	Decimal	0 to 32767	○	○
ER	Extension file register(Block)	Decimal	ER (R block)-(Device) Notation example: ER255-100 • R block (decimal): 1 to 318 • Device (decimal): 0 to 32767	○	○
ZR	Extension file register	Decimal	0 to 10452991	○	○
Z	Index register	Decimal	0 to 23	○	○ Not usable as bit data
G	Buffer memory (Intelligent function module)	Decimal	U(Unit No.)-G(Device) Notation example: UFF-G100 • Unit No.(hexadecimal): 00 to FF • Device (decimal): 0 to 268435455 For the module No., set the first 2 digits of the 3-digit number that represents the start I/O number of the buffer memory for the intelligent function module.	○	○
Ww	Remote register	Hexadecimal	0000 to 1FFF	○	○
Wr	Remote register	Hexadecimal	0000 to 1FFF	○	○

JnSW	Link special register (link direct)	Hexadecimal	J(Network No.n)-SW(Device) Notation example: J1-SW000 • Network No.n (decimal): 1 to 239 • Device (hexadecimal): 000 to FFF	○	○
U3E0G	CPU buffer memory access device	Decimal	U3E0-G(Device) Notation example: U3E0-G100 • Device (decimal): 0 to 268435455	○	○
RD	Refresh data register	Decimal	0 to 4194303	○	○

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
📖GT Designer3 (GOT3000) Screen Design Manual

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 1221 Virtual servo amplifier devices ([MELSEC MX Controller])

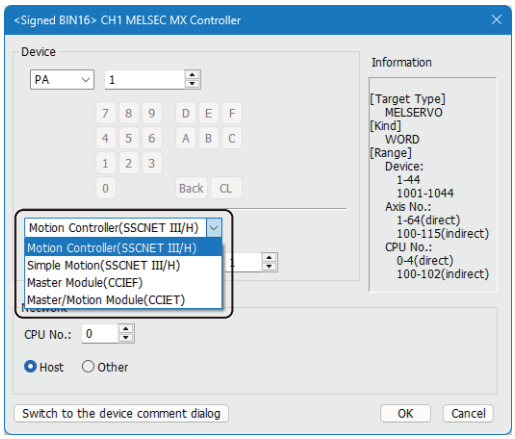
*3 The device name depends on the servo amplifier.
MR-J5-G(-RJ) or MR-J5W□-G: Motor extension setting parameter
Other than MR-J5-G(-RJ) or MR-J5W□-G: Linear servo motor/DD motor setting parameter

*4 PVS is a virtual device corresponding to the servo parameter (PV) of MR-J5-G(-RJ), MR-J5W□-G, and MR-JET-G.
Use the virtual device (PVS) to read/write data from/to the servo parameter (PV).

13.2.5 Setting virtual word devices for servo amplifiers ([MELSEC MX Controller])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (RD77MS). The following items are displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (RD77GF).
[Master/Motion Module(CCIET)]	Select this item to connect the GOT through the master station on the CC-Link IE TSN and a Motion module (RD78G(H)). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
PA	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PA(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	A64-PA1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PA(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	UFF-A64-PA1
	[Master Module(CCIEF)]	PA (Device) • Device (decimal): 1 to 44, 1001 to 1044	PA1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PA(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	AA3-PA1

Device name	Device notation and setting range		Notation example
PB	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PB(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	A64-PB1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PB(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	UFF-A64-PB1
	[Master Module(CCIEF)]	PB(Device) • Device (decimal): 1 to 92, 1001 to 1092	PB1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PB(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 92, 1001 to 1092	AA3-PB1
PC	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PC(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	A64-PC1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PC(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	UFF-A64-PC1
	[Master Module(CCIEF)]	PC(Device) • Device (decimal): 1 to 90, 1001 to 1090	PC1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PC(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	AA3-PC1
PD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PD(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	A64-PD1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PD(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	UFF-A64-PD1
	[Master Module(CCIEF)]	PD(Device) • Device (decimal): 1 to 72, 1001 to 1072	PD1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	AA3-PD1
PO	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PO(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	A64-PO1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PO(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	UFF-A64-PO1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PO(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 2, 1001 to 1002	AA3-PO1
PS	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PS(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	A64-PS1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PS(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	UFF-A64-PS1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	AA3-PS1

Device name	Device notation and setting range		Notation example
PU	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PU(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	A64-PU1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PU(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	UFF-A64-PU1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PU(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 44, 1001 to 1044	AA3-PU1
PT	[Master Module(CCIEF)]	PT(Device) • Device (decimal): 1 to 90, 1001 to 1090	PT1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PT(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 90, 1001 to 1090	AA3-PT1
PL	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PL(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	A64-PL1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PL(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	UFF-A64-PL1
	[Master Module(CCIEF)]	PL(Device) • Device (decimal): 1 to 72, 1001 to 1072	PL1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PL(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 72, 1001 to 1072	AA3-PL1
PN	[Master Module(CCIEF)]	PN(Device) • Device (decimal): 1 to 32, 1001 to 1032	PN1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PN(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	AA3-PN1
PVS	[Master/Motion Module(CCIET)]	AA(Axis designation)-PVS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 32, 1001 to 1032	AA3-PVS1
ST	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ST(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	A64-ST0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ST(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	UFF-A64-ST0
	[Master Module(CCIEF)]	ST(Device) • Device (decimal): 0 to 48	ST0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ST(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 48	AA3-ST0
PE	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PE(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 88, 1001 to 1088	A64-PE1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PE(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 88, 1001 to 1088	UFF-A64-PE1
	[Master Module(CCIEF)]	PE(Device) • Device (decimal): 1 to 88, 1001 to 1088	PE1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PE(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 88, 1001 to 1088	AA3-PE1

Device name	Device notation and setting range		Notation example
PF	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PF(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	A64-PF1
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-PF(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	UFF-A64-PF1
	[Master Module(CCIEF)]	PF(Device) • Device (decimal): 1 to 99, 1001 to 1099	PF1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-PF(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 99, 1001 to 1099	AA3-PF1
NPA	[Master/Motion Module(CCIET)]	NPA(Device) • Device (decimal): 1 to 12, 2001 to 2032	NPA1
PW	[Motion Controller(SSCNET III/H)]	A(Axis No.)-PW(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 40, 1001 to 1040	A3-PW1
ALM	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ALM(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 11 to 59, 200 to 215, 220 to 235, 240 to 255, 260 to 275, 280 to 295, 300 to 315	A64-ALM0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ALM(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 11 to 59, 200 to 215, 220 to 235, 240 to 255, 260 to 275, 280 to 295, 300 to 315	UFF-A64-ALM0
	[Master Module(CCIEF)]	ALM(Device) • Device (decimal): 0 to 2, 11 to 59, 200 to 215, 220 to 235, 240 to 255, 260 to 275, 280 to 295, 300 to 315	ALM0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ALM(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2, 11 to 59, 200 to 215, 220 to 235, 240 to 255, 260 to 275, 280 to 295, 300 to 315	AA3-ALM0
POS	[Master Module(CCIEF)]	POS(Device) • Device (decimal): 1 to 255, 1001 to 1255	POS1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-POS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-POS1
SPD	[Master Module(CCIEF)]	SPD(Device) • Device (decimal): 1 to 255, 1001 to 1255	SPD1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-SPD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-SPD1
ACT	[Master Module(CCIEF)]	ACT(Device) • Device (decimal): 1 to 255, 1001 to 1255	ACT1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ACT(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-ACT1
DCT	[Master Module(CCIEF)]	DCT(Device) • Device (decimal): 1 to 255, 1001 to 1255	DCT1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-DCT(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-DCT1
DWL	[Master Module(CCIEF)]	DWL(Device) • Device (decimal): 1 to 255, 1001 to 1255	DWL1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-DWL(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-DWL1
AUX	[Master Module(CCIEF)]	AUX(Device) • Device (decimal): 1 to 255, 1001 to 1255	AUX1
	[Master/Motion Module(CCIET)]	AA(Axis designation)-AUX(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-AUX1

Device name	Device notation and setting range		Notation example
MCD	[Master/Motion Module(CCIET)]	AA(Axis designation)-MCD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 1 to 255, 1001 to 1255	AA3-MCD1
MD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-MD(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 21	A64-MD0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-MD(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 21	UFF-A64-MD0
	[Master Module(CCIEF)]	MD(Device) • Device (decimal): 0 to 21	MD0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-MD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 21	AA3-MD0
GFDS	[Motion Controller(SSCNET III/H)]	A(Axis No.)-GFDS(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	A64-GFDS0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-GFDS(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	UFF-A64-GFDS0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-GFDS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	AA3-GFDS0
ECCDS	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ECCDS(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	A64-ECCDS0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ECCDS(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	UFF-A64-ECCDS0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ECCDS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5	AA3-ECCDS0
OTS	[Motion Controller(SSCNET III/H)]	A(Axis No.)-OTS(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5, 3000	A64-OTS0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-OTS(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5, 3000	UFF-A64-OTS0
	[Master Module(CCIEF)]	OTS(Device) • Device (decimal): 0 to 5, 3000	OTS0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-OTS(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 5, 3000	AA3-OTS0
DI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-DI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	A64-DI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-DI(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	UFF-A64-DI0
	[Master Module(CCIEF)]	DI(Device) • Device (decimal): 0 to 6	DI0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-DI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 6	AA3-DI0

Device name	Device notation and setting range		Notation example
DO	[Motion Controller(SSCNET III/H)]	A(Axis No.)-DO(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 4	A64-DO0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-DO(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 4	UFF-A64-DO0
	[Master Module(CCIEF)]	DO(Device) • Device (decimal): 0 to 4	DO0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-DO(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 4	AA3-DO0

For indirect specification of a module number, axis number, or axis designation, refer to the following.

☞ Page 1202 Indirect specification of a module number ([MELSEC MX Controller])

☞ Page 1203 Indirect specification of an axis number or axis designation ([MELSEC MX Controller])

13.2.6 Availability of writing/reading data to/from word devices ([MELSEC MX Controller])

The following shows the availability of writing/reading data to/from word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of word data
TN	R/W	R/W	-/-	-/-
CN	R/W	R/W	-/-	-/-

13.2.7 Monitoring-supported double-word devices ([MELSEC MX Controller])

The following table shows monitoring-supported double-word devices.

To check whether writing/reading data to/from each device is available, refer to the following.

☞ Page 1220 Availability of writing/reading data to/from double-word devices ([MELSEC MX Controller])

○: Available

×: Not available

Device name		Device No. representation	Setting range	Specifications of EG devices*1	
				Assignment to EG devices	Access using a client
LTN	Long timer current value	Decimal	0 to 2621055	×	×
LCN	Long counter current value	Decimal	0 to 4933727	×	×
LSN	Long retentive timer current value	Decimal	0 to 2621055	×	×
ZZ	Index register (32 bits)	Decimal	0 to 22	×	×
LZ	Index register (32 bits)	Decimal	0 to 11	×	×
ALD*2	Life diagnosis	Decimal	☞ Page 1218 Setting virtual double-word devices for servo amplifiers ([MELSEC MX Controller])	×	×
TMI*2	Input signal for test operation (for test operation)	Decimal	☞ Page 1218 Setting virtual double-word devices for servo amplifiers ([MELSEC MX Controller])	×	×
TMO*2	Forced output of signal pin (for test operation)	Decimal	☞ Page 1218 Setting virtual double-word devices for servo amplifiers ([MELSEC MX Controller])	×	×
TMD*2	Set data (for test operation)	Decimal	☞ Page 1218 Setting virtual double-word devices for servo amplifiers ([MELSEC MX Controller])	×	×
AL*3	Faults history	Decimal	0 to 899	×	×
LPr*3*4	Parameter (32-bit)	Decimal	0 to 1500	×	×
OP*3	Operation parameter	Decimal	0 to 5	×	×
PV*3	Current value monitor	Decimal	1 to 143	×	×

*1 For the devices assigned to EG devices (gateway devices) and the compatible clients, refer to the following.
GT Designer3 (GOT3000) Screen Design Manual

*2 Virtual servo amplifier device
For details, refer to the following.
☞ Page 1221 Virtual servo amplifier devices ([MELSEC MX Controller])

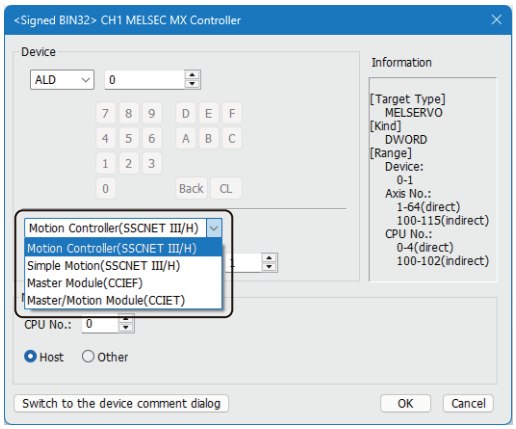
*3 Virtual inverter device
For details, refer to the following.
☞ Page 1222 Virtual inverter devices ([MELSEC MX Controller])

*4 If you specify LPr900 to LPr935, the following item is displayed in the device setting dialog.
[Setting items (for calibration parameters)]: [Bias/gain value], [Analog input value]
Enclose the device number in parentheses when selecting [Analog input value].
Example 1) Notation when [Bias/gain value] is selected: LPr900
Example 2) Notation when [Analog input value] is selected: LPr(900)
When LPr900 or LPr901 (Calibration parameter) is specified, selecting [Bias/gain value] or [Analog input value] does not affect the monitoring target.

13.2.8 Setting virtual double-word devices for servo amplifiers ([MELSEC MX Controller])

For virtual servo amplifier devices, the notation differs according to the connection type between the GOT and the servo amplifier.

Select one of the following according to the control type in the device setting dialog.



Item	Description
[Motion Controller(SSCNET III/H)]	Select this item to connect the GOT through a Motion controller. The following item is displayed. • [Axis No.]: Set the axis number to be monitored.
[Simple Motion(SSCNET III/H)]	Select this item to connect the GOT through a Simple Motion module (RD77MS). The following items are displayed. • [Unit No.]: Set the first 2 digits of the 3-digit number that represents the start I/O number of the Simple Motion module. • [Axis No.]: Set the axis number to be monitored.
[Master Module(CCIEF)]	Select this item to connect the GOT through the master station on the CC-Link IE Field Network or a Simple Motion module (RD77GF).
[Master/Motion Module(CCIET)]	Select this item to connect the GOT through the master station on the CC-Link IE TSN and a Motion module (RD78G(H)). After the selection, set a device that enables axis designation to display the following item. • [Axis Designation]: Set the axis to be monitored.

The following shows the notation and setting range of virtual devices.

Device name	Device notation and setting range		Notation example
ALD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-ALD(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	A64-ALD0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-ALD(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	UFF-A64-ALD0
	[Master Module(CCIEF)]	ALD(Device) • Device (decimal): 0 to 1	ALD0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-ALD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1	AA3-ALD0

Device name	Device notation and setting range		Notation example
TMI	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMI(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	A64-TMI0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMI(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	UFF-A64-TMI0
	[Master Module(CCIEF)]	TMI(Device) • Device (decimal): 0 to 2	TMI0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMI(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 2	AA3-TMI0
TMO	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMO(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0	A64-TMO0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMO(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0	UFF-A64-TMO0
	[Master Module(CCIEF)]	TMO(Device) • Device (decimal): 0	TMO0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMO(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0	AA3-TMO0
TMD	[Motion Controller(SSCNET III/H)]	A(Axis No.)-TMD(Device) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	A64-TMD0
	[Simple Motion(SSCNET III/H)]	U(Unit No.)-A(Axis No.)-TMD(Device) • Unit No. (hexadecimal): 00 to FF (direct), 100 to 10F (indirect) • Axis No. (decimal): 1 to 64 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	UFF-A64-TMD0
	[Master Module(CCIEF)]	TMD(Device) • Device (decimal): 0 to 1, 3	TMD0
	[Master/Motion Module(CCIET)]	AA(Axis designation)-TMD(Device) • Axis designation (decimal): 1 to 3 (direct), 100 to 115 (indirect) • Device (decimal): 0 to 1, 3	AA3-TMD0

For indirect specification of a module number, axis number, or axis designation, refer to the following.

☞ Page 1202 Indirect specification of a module number ([MELSEC MX Controller])

☞ Page 1203 Indirect specification of an axis number or axis designation ([MELSEC MX Controller])

13.2.9 Availability of writing/reading data to/from double-word devices ([MELSEC MX Controller])

The following shows the availability of writing/reading data to/from double-word devices by device type.

R/W: Both read and write

R/-: Read only

-/W: Write only

-/-: No read/write access

Device name	Device type			
	Word (16 bits)	Double-word (32 bits)	Quad-word (64 bits)	Bit of double-word data
LTN	-/-	R/W	-/-	-/-
LCN	-/-	R/W	-/-	-/-
LSN	-/-	R/W	-/-	-/-
ZZ	-/-	R/W	-/-	-/-
LZ	-/-	R/W	-/-	-/-
ALD	-/-	R/-	-/-	-/-
TMI	-/-	-/W	-/-	-/-
TMO	-/-	-/W	-/-	-/-
TMD	-/-	-/W	-/-	-/-
AL	-/-	R/-	-/-	-/-
LPr	-/-	R/W	-/-	-/-
OP	-/-	R/W	-/-	-/-
PV	-/-	R/-	-/-	-/-

13.2.10 Virtual servo amplifier devices ([MELSEC MX Controller])
